STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. a Sales and amount written off (b) Investments.

(j) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Re. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 756 in the debentures section:—

‡ Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent or by purchase at or 102 per cent.

(c) Option of repayment at any time at 3 per cent. premium.

(h) Bearer bonds of Rs. 1,000 each repayable at par.

(e) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1 000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

(e) Redeemable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1 000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March 1954 but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months' notice.

MARKET GOSSIP

(Concluded from page 711)

London. The table below shows the price-trend of some of the leading tea scrips in the Calcutta market:

• • • •

What is the special reason for the new interest which the investors have displayed in tea scrips? Tea, both in the Calcutta and the London auctions, has been looking up. For instance, clean black pekoe and clean common broken pekoe, to take only two varieties, were being quoted at Re. 1-9 and Re. 1-11 per lb. in March this year. They are now being bought at Re. 1-13½ and Re. 1-12½ per lb. In London, the Indian Common tea is quoted in the neighbourhood of 3½ a. a lb. which is the highest level touched since the auction sales were resumed in April, 1951. Behind this impressive rise in tea prices lies the strong statistical position of tea. The estimated outturn figures for North India for the month of August, 1953 are 76.6 million lbs., as compared with 87.5 million lbs. in the corresponding month, in 1952, bringing the total outturn to the end of August to 267.9 million lbs., as compared with 299.9 million lbs. in the previous year. Thus, there has been a decline of 32 million lbs. in the outturn of tea.

• • • •

This shortfall in production has encouraged North Indian tea producers to review the crop restriction scheme which they had adopted in March this year. Each tea garden, under this scheme, agreed to restrict its production to 87½ per cent. of the best crop in the years 1947-52. South Indian tea gardens, however, did not participate in this scheme. But in North India, the gardens which participate in it account for some 80 per cent. of the total North Indian tea crop. The scheme, it was then believed, would bring the supply more into line with the demand for tea. In recent weeks, however, it was felt that the restrictions had been over-done, and that a too pessimistic view of the demand position had been taken. The gardens, therefore, decided last month that it would be sufficient if production were curtailed to 88½ per cent. of the basic year's output, instead of the 87½ per cent. level to which they had agreed earlier. It has been calculated that this relaxation of the crop restriction scheme would mean an additional output of 6 million lbs. of tea. On a further review of the position, the tea gardens further relaxed, last week, the restriction on crop outturn; accordingly, the gardens are now free to produce up to 90 per cent. of the basic year's level. The effect of this measure, it is computed, is an additional crop of 6 million lbs.

• • • •

This relaxation will certainly benefit many gardens. They stand to gain not only by the increased quantity which they can hope to market but by the higher prices which they can obtain for the tea they sell. But it is not all tea gardens that can benefit, at this stage of the season, from the relief now granted. The gardens which cannot take advantage of this relief will, it is stated, assign their rights in favour of the gardens which would be able to increase their output. Thus, some tea gardens may conceivably gain more than the permitted 1½ per cent. increase in output. It would appear that a few in Assam are in this fortunate position. They are anxious to utilise not only the 1½ per cent. increase, now permitted, but also any additional proportion that other gardens might assign in their favour. Lest any one should think that the increased income, which these relaxations are bound to bring in their wake, would be followed by no increase whatever in expenditure, it is necessary to point out that most tea gardens are engaged in a review of the wage levels, which were reduced as a result of the slump in the tea industry during the last season. The management of the gardens in the Dooars and Terai region have already raised the wages of the workers. And a similar change, it is learnt, may take place in the Darjeeling and Cachar gardens, too.

DELHI LETTER

(Concluded from page 716)

possible measures to tap additional resources for the implementation of the Plan, such as the enhancement of water rates, flotation of loans, intensification of the savings schemes, etc. The lines of action suggested by him were: (1) establishment of an Industrial Finance Corporation in each State; (2) Central assistance to States in scarcity-affected areas for initiating permanent schemes; (3) grants for road-building activities and execution of small power projects, and (4) expansion of technical training. According to him, new schemes to be included in the Plan should be capable of producing results within the planning period. It was agreed at the Council meeting that State Governments should undertake legislation for the imposition of such levies as soon as possible with a view to making the irrigation projects a paying proposition.

Enterprise of the Punjabis

The inauguration of Chandigarh, the new capital of the Punjab, by the President of the Indian Republic this month, marks the beginning of a new era in the post-Partition history of this country. In a short time, this new capital will not only satisfy the enterprising and energetic Punjabis of their requirements of an administrative centre but will also serve as a nerve centre for all their activities—political, economic, social and educational. The skill and the resourcefulness of this sturdy population is manifest in another sphere also, particularly in agriculture. The West Punjab Sikh and Hindu peasantry has been able to effect a marked change for the better in the cultivation methods of East Punjab during the last five years. These agriculturists have been able to increase the output of wheat to such an extent that hardly within four years after the Partition, this new State has become a surplus area in wheat. The provision of more irrigation facilities by the construction of extensive canals and tube wells has increased the production of rice and other commercial crops. During the current year, East Punjab is expected to supply a handsome quantity of two lakh tons of rice to the deficit areas in the Indian Union. The capacity to produce more rice, wheat, cotton, etc., will register a substantial increase when the Bhakra-Nangal Project is completed. The Nangal Project will begin supplying water for irrigation purposes in the southern districts of the State, including the arid tracts of Hissar District and also start supplying power to Delhi and other stations en route in June next, when the Prime Minister Mr. Nehru, is scheduled to inaugurate these projects. In the production of cotton, too, the State has made considerable progress and bids fair to replace the West Punjab of the pre-Partition days in regard to the supply of long-staple cotton to the Bombay and Ahmedabad mills. During the current season, the output of cotton is estimated at about six to seven lakh bales of which better staple varieties are expected to form the major portion. It is stated that in irrigation areas, the Sikh farmers have already been able to produce well above 400 lbs. of cotton lint per acre, as against less than 100 lbs. in the Indian Union. The new varieties such as 320F. and 216F. have become popular. The developments in the Punjab provide a sure indication that it is possible that India can produce four million bales of good staple cotton if only irrigation facilities are provided for cotton cultivation for about a like number of acres.

MARKET REPORTS

(Concluded from page 745)

In addition quantitative restrictions had been removed throughout India, and the Government was decontrolling wheat in almost all States."

The increase in production this year, he said, led to an improvement in the marketable surplus and the emergence of a large number of surplus States, Assam and Saurashtra,

Who else must sweat and toil and gain but scanty fare."
William Blake

VOL. LXXXVII. No. 2228 BOMBAY, 24 OCTOBER, 1953 PRICE Rs. 1/8

SOME THOUGHTS ON THE PLAN

REPORTS from New Delhi to the effect that preparations are being made to evolve a second Five-year Plan are unlikely to create any enthusiasm even in informed circles. On the contrary, they may evoke a certain measure of derision, for the first Five-year Plan itself is very nearly a fiasco. Only two weeks ago, the Plan was scrutinised and found that its progress had not been as satisfactory as it should have been. It was also found to be inadequate to provide sufficient employment opportunities to meet the needs of an ever-growing population. Accordingly, it was decided to expand the scope of the Plan by providing for new schemes of the order of Rs. 150 to Rs. 175 crores. Full details of this additional expenditure are yet to be worked out. The failure of the first Plan to come up to expectations, however, need not be a disqualification for chalking out the outlines of what needs to be done after the period of the first Plan. It is certainly better to begin this work sufficiently early, so that plenty of time may be given for carefully considering the various projects that may be put forward for implementation under that Plan. One of the serious defects of the present Plan is that it was finalised nearly two years after some of the projects had got under way and that it had, therefore, to be trimmed suitably to accommodate them. It is desirable to avoid the repetition of a similar defect. While thus advance planning is a good thing, it will cease to be so if the planners do not learn from the experience of their first attempt. The authorities must, therefore, make an honest effort in assessing the causes for the failure of the first Plan, without any preconceived notions.

There are several reasons for the failure of the first Plan in a number of directions. In the first place, there was too much paper planning. The bulky final version of this Plan is more a report on policy and principles relating to almost everything under the sun than a carefully drawn programme of development which is what a plan really ought to be. There are in it many vague generalisations of a doubtful nature. The Planning Commission's targets of production have turned out to be underestimates of the country's productive capacity in some cases and overestimates in others. Its estimates of resources have proved to be very wide of the mark. An explanation for these mistakes is that it attempted to go too much into details, without the support of reliable statistics. Perhaps, these mistakes are inevitable in any first attempt. But it is arguable that they, and the consequent disappointments, could have been minimised, had more practical-minded men than armchair economists and visionaries been associated with the planning. If the second Plan is not to share the fate of the first, this defect must be remedied at an early date. There are, of course, places where these learned men will be more useful than in planning. The economists, for instance, can go back to their universities which need them very badly and the visionaries can return to the public platforms which are now bereft of good preachers.

The second cause for the inadequate success of the Plan is the failure of the States to carry out the tasks allotted to them with single-minded devotion. It can be stated without fear of contradiction that the State Governments did not toe, and are still not toeing, the line drawn by the Central Planning authority. We do not have in mind the aspect of raising resources alone, but also their failure to implement the various projects. In fact, the latter, in our opinion, is a more serious lapse than the former. In the majority of States, the Governments have been so bedevilled either by party strife or by the fads of some powerful ministers that they have little time to implement the Plan. Where attempts have been made to implement the projects, adequate results have not flowed because of mismanagement, corruption and inefficiency. The latest disturbing development is the agitation for the division of States on linguistic lines. It will be useless even to proceed with the present Plan, let alone the preparation for the second Plan, unless this uncertain factor is removed.

There are serious doubts among competent persons whether the Planning Commission has been right in allocating to the Governments the major role in the development of the country. Even assuming that the Commission is right, experience has clearly brought out the necessity for shifting the emphasis in favour of private enterprise. The States have failed to rise to the occasion and, in spite of all the planning during the last two and a half years, the upward trend of unemployment still persists. It is, therefore, no use diverting the major portion of the limited financial resources to the public sector which has been unable to put them to maximum advantage and which has been frittering away a good part of them by resorting to unproductive expenditure. It is high time the powers-that-be realised this and gave greater scope for the private sector to play its part in the economic development of the country. In saying this, it is not suggested that that part of the Plan which seeks to increase the basic resources needed for sustaining a strong industrial economy should be sacrificed. On the contrary, it is absolutely necessary for that part of the Plan to be implemented as quickly as possible and, if the State Governments are unable, for some reason or other, to carry out this work according to schedule, they must be helped, if necessary, with the co-operation of the private sector.

The resources estimate of the Plan has proved to be guess-work. The States, for instance, were expected to raise Rs. 176 crores from current revenues, but indications are that they may not be able to collect anything more than Rs. 110 crores, leaving a gap of Rs. 66 crores. Again, they were expected to raise Rs. 230 crores by way of additional taxation. As against this, they are said to have raised only about Rs. 28 crores so far and, in the remaining half of the Plan period, they may be able to gather another Rs. 35 crores. This will leave a balance of Rs. 167 crores to be covered. It is incredible that they will ever be able to close this large gap, unless, of course, those States which are addicted to Prohibition can be weaned from that habit without much loss of time. But this is a fond hope, for the advocates of this fad are strongly entrenched in power and the Centre is not prepared to force its views on them. At the last meeting of the National Development Council, the Deputy Chairman, Mr. V. T. Krishnamachari, appealed to the States to introduce betterment levy and increase the water rates wherever they were low. Some States have made a move in this direction; others have chosen to subject agricultural crops grown by corporations such as sugarcane plantations to penal rates of taxation on water. But most of the States are reluctant to impose additional burdens on the rural side for political reasons.

Even assuming they are prepared to introduce these levies, it is doubtful whether the yield will be as large as the planners expect. Most of the land that will be brought under cultivation, as a result of new irrigation facilities made available under the Plan, will require a sizable amount of capital expenditure in the initial years. A high rate of betterment levy may prove a disincentive to pioneer farmers in these areas. Such taxation will necessarily have to be at a low rate and spread over a long period. Another source of funds suggested is the rural savings and the success of the Madras State Loan in July last has given rise to the hope that there is plenty of capital in the interior. There may be something in this, but it could be exaggerated. Again, if the rural savings were to be drained away heavily, there might not be enough funds in the countryside for financing agriculture and the small-scale and cottage industries, not to mention the petty trader.

Taking all this into consideration, it is better for the planners to proceed on the assumption that the resources available in the country are less than those assumed in their first Plan and to rely either on foreign capital or on forced savings to a greater extent than they have done. Since the latter is a most undesirable method of raising resources and may impose hardships on people to an extent the consequences of which may be serious, it is better to seek foreign assistance and Plan for its successful absorption. Fortunately for us, conditions for getting such assistance are far more favourable to-day than they were two years ago. There is an easing of international tension. The supply of capital and durable goods has increased. And there are sure signs of a growing inclination among the economically advanced Western nations such as the U.K., the U.S. and Canada, to help the underdeveloped countries, as witness the address of Mr. Cobbold,

Governor of the Bank of England, at the Lord Mayor's Banquet in London last week, to which a reference is made elsewhere in this issue, and the speeches delivered by the representatives of the Western nations in the Colombo Plan Conference. It now rests with us to devise ways and means of getting assistance from these sources and putting it to profitable use.

ECONOMIC ADMINISTRATION IN CANADA AND THE U.S.

EVER since India decided to adopt the federal pattern of government, it has been clear that it will have increasingly to draw upon the experience of the U.S., Canada and Australia, which are the three leading federal countries of the world. Since these countries also happen to be economically more advanced than India, the conviction that a study of the administration in these countries could offer valuable lessons for India's guidance has gained considerable strength in this country. From this point of view, a notable publication, which deserves the attention of the Central and State Governments, and more especially of the legislators in this country, is the report entitled *The Role of the Canadian and U.S. Governments in the Promotion and Execution of Economic Development Schemes with particular reference to Federal-Provincial Relations*, drawn up by Mr. O. K. Ghosh, Deputy Secretary, Economic Affairs Department, Ministry of Finance, Government of India. Mr. Ghosh recently studied the economic administration in these two countries, thanks to a U.N. Economic Development Fellowship.

A great deal of valuable information on public administration lies in this 80-page document. Indeed, it is surprising that so much could ever have been compressed in so short a compass. This is also in a way the weakness of this document, for there are many points which could and must receive more extended treatment, if only because Indian administrators and students of Indian administration are not always familiar with the details of the system of economic administration in these two countries. But the report itself has been extraordinarily well written, thanks to the author's great economy in the use of words.

The significance of this report, however, lies in the variety of its content, in its emphasis on the principles as well as practices of the administration in the two countries. To an Indian student of economic administration, what impresses most about Canada is the happy blend of private enterprise and Governmental initiative which prevails in that country. The author of the report points out that the Canadian has "all along been wedded to the philosophy of private enterprise." People readily agree that "governmental action should be confined to the narrowest possible limits." But this has not prevented the Canadian Government in taking a more active, and even direct, interest in the economic improvement of the country. Public investment, however, forms only about 20 per cent. of the whole national investment. Such investment is in the shape of Crown companies. The Crown company method of administration, according to Mr. Ghosh, is a "bold and ingenious device for fast-moving operation, combined with the essentials of Parliamentary control." Since this is a special problem, which India too faces, the author would have done well to describe the operation of these companies in greater detail.

By and large, Canada believes in aiding private enterprise. The Industrial Development Bank (capital: $25 million) gives loans to eligible industrial concerns at a rate of interest, which is generally 5 per cent. The outstanding loans of the I.D.B. at present are about $45 million. Apart from this direct assistance, the Government provides considerable help in the shape of special measures of relief in taxation. Special depreciation allowances at rates varying between double and one-half of ordinary rates upto 80 per cent. of the cost of new investment in buildings, machinery and equipment were granted on investments made during 1944-49. Since 1951, a system of "accelerated" depreciation allowances has been introduced. But this applies only to defence production. In 1951, a new kind of measure, called "deferred depreciation," was introduced to discourage less essential forms of capital expenditure. Commending the use of the system in this country, the author says that it is an "instrument to influence investment patterns in the direction of capital expenditure in heavy industries as opposed to semi-luxury or service industries."

This suggestion deserves notice, though it must be pointed out that the problem in India is slightly different from the one in Canada. The problem in this country is not so much prevention of investment in non-essential industries as promotion of investment as such.

The other country, which the author studied, was the U.S. This country, too, as is well known, believes in the philosophy of free enterprise. An illuminating extract from the Employment Act of 1946, which the author has done well to quote, brings out the essence of this philosophy. The Act emphasises that the Federal Government's objective is to utilise the services of all sections of national life for the "purpose of creating and maintaining, in a manner calculated to foster and promote free competitive enterprise and the general welfare .... to promote maximum employment, production and purchasing power." There is one aspect of the American administration which will be of perennial interest to this country, namely, the regulation of the relations between the Federal Government and the State Governments. Any keen observer of the Indian and the American Governments cannot fail to be struck by the difference in the politicial climate between that country and India. In the U.S., the States are so anxious to maintain their independence that there is a certain reluctance to accept Federal aid in any shape or form. In India, the States are no doubt jealous about their independence—as witness their stand on the sales tax and prohibition issues—but are equally anxious to secure the maximum possible aid from the Centre.

Be that as it may, the U.S. Federal Aid to the States is growing. It is of the order of "$2 million annually and constitutes roughly one-fifth of the total State revenues." In general, Federal grants are apportioned on the basis of (a) uniform amounts per State, (b) population, (c) area, (d) financial need, (e) other need factors and (f) amount spent by the States on some projects which the Federal Government thinks are essential. Grants are also made on a special basis. Thus, for hospitals, the proportion is one Federal dollar for two State and local dollars, and for airports it is dollar for dollar. There is a Federal agency which has supervisory powers over the aided programmes, including the power to issue rules and regulations and to audit expenditures. The author has rightly stressed the need for a similar authority in this country in "charge of all general Government grants and loans as a co-ordinating agency."

Yet another of the author's suggestions, which have a special significance to Indian conditions, is the need for an agency that will be a sort of clearing house of information for State Governments. This suggestion is based on a study of the functions of the Council of State Governments in the U.S. This Council acts as: (1) a medium for improving legislative, administrative and judicial practices in the States, (2) an agency for securing full co-operation among the States in solving inter-State problems, both regional and national, and (3) a means of facilitating and improving Federal-State relations. The Council is a joint Governmental agency, established by the States and supported by the States, for service to the States. Giving an instance of the Council's usefulness, the author says that, if a given State is considering the introduction of a new governmental technique or adoption of a new public service, or improvement of an old one, it can obtain information through the Council as to the action taken by other States on similar problems. The Council undertakes special studies of inter-State problems. Much of the Council's work relates to facilitating inter-State action in fields such as education, civil defence, river problems, coastal fisheries and crime control. There is urgent need for an organisation of this kind in this country, which will act as a joint assembly of the State Governments. Far too little of the problems in one State is known in the other States. Indeed, such an organisation can help co-ordinate States' policies. There is sometimes a psychological resistance to accept suggestions when they come from the Centre. But when the suggestions are made by a body representative of the States themselves there is bound to be a better appreciation of the necessity for co-ordination, uniformity and joint action. Again, it is well to remember that, if there is some lively co-operation among the States to-day, it is because there is one single political party which holds power in all the States. If this stabilising force were disturbed, there is bound to be more scope for friction. This danger could be greatly minimised, without necessarily invoking Central control and direction, if there is a joint organisation of the State Governments. After all, the opportunities for the joint study of common problems by the States Governments is strictly limited to the occasional conferences of the States' Ministers, which are held under the auspices of the Central Government. And there is no organisation which keeps the inter-State problems under constant scrutiny. These defects could certainly be remedied by a joint body of the States.

SO NEAR AND YET SO FAR

AT the turn of the last century, a romance entitled "Round the World in Eighty Days" used to be a favourite book of juvenile fiction with many a teen-age pupil. To travel round the globe in so short a period was then considered a miracle of speed. What with the Comets and other speed-mad monsters of the air, the world has certainly shrunk a great deal since that time. But in India there are still several areas and sectors where time stands almost motionless, and things can only move, if they move at all, at the proverbial snail's pace. One of these is the Indian railways. There has, no doubt, been some welcome improvement in the efficiency of our railways through modernisation and reorganisation. But they continue to be backward in certain sectors where the speed of modern locomotion has yet to be felt. A typical instance is provided by the Bombay-Manmad-Dhond region, as all those who gathered at the recent Deccan Sugar Technologists' Conference at Belapur (Manmad-Dhond line) realised to their cost in time. There was some bitter irony in the whole situation, in that while the Conference was meant to take stock of the advances in one sphere of science, the delegates to the Conference and others interested in it were painfully reminded of what appeared to be a complete absence of the use of technology of communications.

Belapur, where the Conference was held, or for that matter, any place on the Dhond-Manmad line, is only at a distance of about 150 miles from Bombay, as the crow flies. The railway distance to Belapur and to other centres along the line is, however, a little longer, about 220-250 miles. On the map, the places appear to a person in Bombay so attractively, so invitingly, so tantalisingly near. But the map proves deceptive, when one undertakes the journey, for it takes over 13 hours to reach any of these centres from this city. How impossibly distant these places are from Bombay will be evident from the fact that it is possible to reach Calcutta by air in less than half the time it takes to reach any place along the Manmad-Dhond line.

But the time it takes to cover the distance is by no means the only irritating part of the journey. The unfortunate passenger bound for, say, Belapur, has to change trains at Manmad, in the dead of night, after wasting a few precious hours in what is an apology for a waiting room in that station, before he arrives at his destination—that is, if he is lucky enough to alight there at all without being overcarried in the sleep that must overtake him after all this battle for Belapur. The return journey is even more unpleasant. At Manmad, the change of trains is more difficult to negotiate, since the incoming trains are packed to capacity. And it will require all the patience of a Job, all the persuasiveness of a Mark Antony to gain a non-violent entrance into a railway carriage in the small hours of the morning when some of the mail trains steam into Manmad station. This gruelling experience at Manmad is sufficient to drive any man mad.

Must all this journey between that rapidly growing industrial area, the Manmad-Dhond region, and Bombay, where the concerned management interests live, be made as painful as all that? Is it beyond the wit, the ingenuity and the flair for organisation of the Central Railways to devise some means by which the journey could be made less unpleasant? Can nothing be done to shorten the journey-time? Is it really difficult to avoid the change of trains at Manmad? Surely, a through railway carriage from Bombay to Dhond via Manmad will by no means be the last difficult straw on the Nagpur Mail's back. And yet, that will lessen the rigour of the journey. If the argument is that it does not pay the railways to give this additional comfort, it might well be asked whether an area, which pays lakhs of rupees as freight on the ten lakh sugar bags it sends out by rail, does not deserve to receive a small convenience in the shape of through travel—a convenience which any traveller may claim even on ordinary grounds of common humanity.

SHORT-COVERING LIFTS UP EQUITIES

I.I.S.CO.—COTTON—U.S. FARM SURPLUS—LIVERPOOL GRAIN EXCHANGE

THURSDAY, 5 P.M.

ALTHOUGH the commodity and the bullion markets have been ruling extremely weak, the share markets have brightened up quite a lot. A large number of industrials have gone up for the second or third week in succession and, if the position is viewed against the background of what it was a month ago, the gain in values is a pleasant surprise. Steels, of course, have been prominent in this upward movement. Thus, on 21st September, 1953, Tata Deferreds stood at Rs. 1,797-8; to-day, they were as high as Rs. 1,912-8, an appreciation of Rs. 115, before closing at Rs. 1,907-8. During this period, Tata Ordinaries have gained Rs. 12-12 to stand at Rs. 324-12. Indian Irons have moved up from Rs. 22-2 to Rs. 24-8. Other equities, too, have advanced. Belapurs, for instance, have jumped up by nearly Rs. 30 to Rs. 263, A.C.C. by Rs. 8-12 to Rs. 176, Bombay Burmahs by Rs. 16-4 to Rs. 340, Wimcos by Rs. 10 to Rs. 240 and Scindias by a rupee to Rs. 14-4. Although the reports from the cloth and yarn markets are far from encouraging and, over the past month, prices of cotton goods must have suffered a fall of about 10 to 15 per cent., textile shares are not drooping. On the contrary, a good number of them have picked up some strength. Kohinoors, for instance, show a net addition of Rs. 10 during the past month. Similarly, Bombay Dyeings have spurted by Rs. 20. Even New Greats, which had remained neglected all along, have been receiving some attention and they are now standing at Rs. 153, as against Rs. 144-4 a month ago. The Calcutta market is closed for the *Puja holidays*, but kerb trading indicates a firm tone. The Madras market also is in good form.

MARKET GOSSIP

• • • •

Why is it that share markets alone are cheerful, when the other markets are looking down? The improvement in jute and tea shares in Calcutta is, of course, understandable, because both tea and jute manufactures are now fetching better prices than they did some time ago. Even the recovery in Indian Irons can be appreciated, for, after a prolonged strike, labour generally works a little harder than before and, on this ground, it can be argued that the scars of the strike on the Company's finances may not be visible. But how is one to account for the performance of the other scrips in Clive Street and Dalal Street? Has anything significant happened to justify the rise in values? There is some reason or other for explaining the rise in most of the individual scrips. But there is one explanation which is applicable to most of them. In one word, it is "short covering."

• • • •

In the recent past, bears had been quite active, but they were not supported by investors. The latter did not come out and unload their holdings. Generally speaking, individual investors are nowadays apathetic. They do not get alarmed even if their scrips lose quite a bit. To some extent this apathy is due to the stiffness of the tax authorities. If an investor operates frequently, he is liable to be treated as a speculator by the tax collector and his profits, if any, will be treated, as such and taxed. It is a troublesome business for an investor to prove that he bought and sold purely as a genuine business, taking into consideration the variations in economic conditions in the country or in the industry in which he is interested. One, therefore, prefers to stick to one's holdings. Another reason for the lack of following for the professional bears is the withdrawal from the Stock Exchange of the speculative-minded business men who formerly used to dabble in the Stock Exchange fairly regularly. Since speculative losses are not now allowed to be set off against business losses, these business men, for whom speculation is only a side line, are keeping out of the market.

• • • •

The absence of floating scrips, consequent on the apathy of holders of shares to the fluctuations in the market, is a great handicap to the bears. On every settlement, they have to pay a fairly high price for carrying forward their commitments. And, if they do so on four or five settlements, the cost of their transaction goes up and, at some stage or other, they have to cut their sales in order to limit their loss. In the case of Belapurs, for instance, the budli rate in the last settlement was as high as Rs. 5 per share! Some, it would appear, had sold short, taking an unduly pessimistic view of the outlook for the sugar industry, when Mr. Kidwai rattled the sugar millowners and dealers by announcing a plan for dumping sugar in the principal markets. They must have continued to hang on to their sales even when Mr. Kidwai changed his mind and protected the industry by suitably readjusting his policy in regard to imports of sugar. Some others, however, were clever enough to see the real significance of these changes to the industry. It would appear that one or two institutional investors thought that Belapurs were a good buy and had bought a few hundreds of them. And when they decided to take delivery, the bears were badly caught.

• • • •

The rise in Tata Steel Deferreds has also been due primarily to bear covering. With bright prospects for the success of the conversion scheme, the bears seem to have realised that it is a risky thing to continue to stick to their sales. Further, as compared with Tata Steel Ordinaries, the Deferreds were well below the parity on the basis of the conversion ratio of 1:6. This induced some investment buying. At current rates, of course, this disparity has been nearly corrected. Moreover, both Deferreds and Ordinaries had been unduly depressed and a recovery was overdue.

• • • •

The improvement in textile shares is probably due to the impression in some circles that the slump in cotton goods has been adequately discounted. Enquiry, however, has been of a selective nature, being confined to shares of only well-managed mills. Rumours of a bonus issue by some of the mills have also contributed to the recovery of this section. Gokaks and Bombay Dyeings, in particular, are involved in these rumours.

• • • •

The rapid recovery in Indian Irons is due partly to bear covering but mostly to large-scale buying by a big speculator in Calcutta, who is said to take a bullish view of the market. It is reported that he has so far bought quite a few lakhs of shares and that he is being financed by some banks. It is further reported that, although he is demanding delivery of shares in the open market, he has an arrangement with the biggest seller for carrying forward his purchases at a rate of interest which works out to a little over 6 per cent. per annum, a rate which is more than what he can hope to earn by way of dividend. If this is true, then he must be trading beyond his resources. As a result of these manipulations, the market in this scrip has become highly artificial. The bull operator is believed to be banking on a favourable recommendation by the Tariff Commission in regard to the Company's request for higher retention price. There is a belief that this price will include an adequate margin which will enable the Company to recoup the loss incurred during the strike period. Because of this belief, it is readily assumed by some operators that the Company will be able to maintain the dividend in the coming years as well. According to one source, the Government's decision on the retention price for the Company will most probably be announced before the close of this year.

• • • •

Be that as it may, reports from Calcutta on the working of the Indian Iron and Steel Co., Ltd., are encouraging. All the workers are said to have rejoined. Production is now more or less normal and the factory is expected to work at full capacity shortly. Hitherto, the Company's works were working on two shifts of 10 hours each, against normal three shifts of 8 hours each. The three-shift system will soon be introduced, if it has not already been done, first in the rolling mills and later in the furnaces, too. Determined efforts are being made to step up the productivity of workers, so that they may regain a part of the wages they have lost on account of their ill-advised strike. Apparently, the bull operator has anticipated these favourable developments. All the same, the Company is unlikely to pay anything more than a rupee by way of ordinary dividend. On this basis, these shares, at their current market value, yield only a fraction more than 4 per cent. free of tax.

• • • •

An event of some importance to the Gilt-edged market is the issue of a new loan by the Hyderabad State Government. The amount of the loan is Rs. 3.25 crores. The terms are identical to those offered by some of the State Governments which borrowed in July last. Thus, the period of maturity is 10 years. The rate of interest is 4 per cent. per annum. The issue price is at a discount of As. 8. The subscribers are given an additional attraction by way of interest for a week, for, though the list opened only to-day, the interest is payable from the 15th inst. The list is scheduled to be open upto 31st October, 1953, but may be closed earlier if it is fully subscribed. The Government of Hyderabad will create a sinking fund, as well as a depreciation fund, for purchasing this loan from the market for cancellation. In view of the fact that, in recent weeks, 4 per cent. loans have been in good request, the issue has been well-timed and may be taken up by the market in full. In fact, by coming into the field at a time when there is no other competitor for long-term capital, the Hyderabad State should be able to get its requirements with much less difficulty than that experienced by some of the other Part B States, such as Mysore and Saurashtra.

• • • •

Among commodities, cotton has been the worst sufferer this week. At the time of writing, I.C.C. February is standing at Rs. 602-8 and I.C.C. May at Rs. 609-4, as against Rs. 611-4 and Rs. 615-8 respectively, a week ago. Expectations of a large crop of 42 lakh bales, at a time when the outlook for cloth and yarn is uncertain and when the world has a large surplus, are primarily responsible for grounding the price at a level which is only Rs. 52 higher than the floor. Well-informed circles are of the view that the near delivery contract can at worst go down by only Rs. 20 or Rs. 25, but that the basis will shrink further when the weight of the crop makes itself felt. They are afraid that, if the better staple varieties were to sell cheap this season, the farmers would have no incentive to grow even the same amount of cotton next season. They, therefore, contend that the Government should allow exports of cotton of varieties upto 1" staple and reduce, at the same time, the export duty on them to Rs. 125 per bale. They further feel that, by doing so, the Government can not only hope to earn a sizable amount of revenue but also avert the possibility of having to support the cotton market at the floor levels.

• • • •

The U.S. is faced with the problem of finding markets for its cotton, the supply of which threatens to be considerably larger this season than it was in the last. In its fourth (October) estimate for cotton, the U.S. Department of Agriculture has, as is now well known, placed the 1953-54 crop at 15,596,000 bales, an increase of 437,000 bales over the September estimate. The condition of the crop is given as 77 per cent. The present estimate of about 15.6 million bales compares with that of 14.6 million bales estimated in August, and of 15.2 million bales for 1952-53. This increase in production is attributed to the use of modern methods of cultivation. It is stated that the prospective yield per acre at 315.4 pounds for the current season is the highest ever recorded and exceeds by nearly two pounds the previous peak in the 1948-49 season.

• • • •

Be that as it may, the total supply of cotton in that country, it is now clear, will be considerably larger than it was in the 1952-53 season. Inclusive of the carry-over stocks, at the beginning of the current season, estimated at 5.5 million bales, the total supply of cotton in this season will amount to 21.1 million bales, which compares with a supply of about 18.0 million bales in the 1952-53 season, made up of a production of 15.2 million bales and a carry-over of 2.8 million bales at the beginning of the season. Thus, the current season's supply will be nearly 3 million bales above that in the last season. Despite this larger supply position, there has been no serious setback in cotton prices, thanks to the U.S. Government's price support scheme. It is expected that anything between 4 million and 5 million bales will go into the loan. But, the Government is already worried over these accumulations and is thinking in terms of restricting the crop next year. The Secretary of Agriculture has already proclaimed a national marketing quota of 10 million bales for the 1954 cotton crop and has ordered a referendum on 15th December by growers for securing their approval of his action. Nevertheless, the problem of disposing of the excessive supply of cotton during this season remains. In this connection, it is interesting to note that the Export-Import Bank expects to begin soon the insurance scheme for U.S. cotton stored abroad. The programme, authorised by the Congress during its last session, permits the Bank to underwrite insurance companies on agricultural commodities—particularly cotton stored abroad—against loss through "expropriation, seizure and other political risk."

• • • •

Burdened as the U.S. has been with a large surplus of farm produce, including cotton and wheat, it is now trying to evolve a scheme whereby it could market the surplus in a way that would not imply an expenditure of dollars by the buying countries. Thus, the U.S. is making a move to dispose of its farm surpluses abroad in exchange for inconvertible currencies. For instance, the U.S. might sell its wheat to India and expect to be paid not in dollars but in rupees. This means that the U.S. would either accumulate rupees for any non-dollar currency, for that matter) or utilise such currency to buy its requirements from the non-dollar area. This move has at least three important implications for the non-dollar world, more particularly for the sterling area which is an important section of that world. In the first place, the willingness of the U.S. to take non-dollar currency as payment for its produce will serve to bring down the premium which the competing non-dollar commodities used to command in the world markets. The premium which these commodities command is clearly due to the fact that the world, which is suffering from a chronic dollar shortage, has been willing to pay a better price if it could get a certain commodity, in the sterling area, that is otherwise available only in a dollar country. In other words, the market for the produce of these non-dollar countries will shrink somewhat. Indeed, the U.S. move has, it is stated, already alarmed Burma which sees in it a loss of market for its own rice surpluses. Conceivably, Pakistan's cotton prices might be affected. Secondly, the U.S. will be able to reduce its expenditure of dollars on its own purchases from the soft currency area, since they could be paid for by its accumulated foreign exchange resources, consisting of soft currencies. This would tend to widen the dollar

BULLISH TREND IN SHARE MARKET

BOMBAY DYEINGS IN FAVOUR

(From Our Own Correspondents)

BOMBAY, *22nd October*

FOR the third week in succession, the Stock Exchange continued to maintain the bullish trend during the week under review. Though the gains in values, as compared with those in earlier weeks, were moderate, the undertone remained firm. For, during the week, sentiment of operators hardened further under the influence of several favourable factors. The growing feeling that deficit financing will be on a higher scale, in view of the increase in outlay under the first Five-year Plan, the report that preliminary details regarding the setting up of the Industrial Development Corporation are being worked out and the assurance given by the Deputy Finance Minister in Nagpur on Wednesday that the Planning Commission contemplated doing something to accelerate the pace of investment in the private sector, were all factors which pepped up the tone of the market.

Besides, there were also specific factors which helped enlarged trading in the textile and steel sections. Thus, the Government of India's decision to permit export of cloth manufactured for domestic use, but not price-stamped, for shipment up to 31st December, 1953, was considered helpful to augment exports of cloth. Again, decline in cotton prices and reported preference of the mills for switching over from the manufacture of fine varieties of cloth to that of medium and coarse cloth commanding better market also aided sentiment in textile shares. The approaching date for carrying out the Tata Deferred Conversion scheme caused a shortage of scrips and this gave strength to the steel section. Consequently, the technical position in the share market was in favour of a revival of prices, despite the weakness in other commodity markets.

In the steel section, Tata Deferreds displayed a narrowly irregular trend during the major part of the week. After dropping from Rs. 1,897-8 to Rs. 1,885 on the opening day, they staged a smart rally to Rs. 1,907-8 on Monday, only to relapse on scattered realising to Rs. 1,888-12. But, to-day, heavy covering by sellers and bull support lifted the shares to Rs. 1,912-8—a new high after they were listed *ex-dividend* on 4th September last. They, however, wound up the week slightly lower at Rs. 1,907-8. Tata Ordinaries were steady, closing with a gain of As. 8 at Rs. 324. Indian Irons manifested a firm trend early in the week, staging a spurt from Rs. 24-2½ to Rs. 24-12½, on good support from Calcutta interests, but reacted to close to-day at Rs. 24-6.

In the textile section, Bombay Dyeings provided the highlight with a smart advance to Rs. 382-8 to-day from last week's closing of Rs. 367-8, on strong speculative support inspired by rumours of a bonus issue and better working results for the current year. On profit-taking, however, they closed a shade lower at Rs. 378-12. Kohinoors were steady with a gain of Rs. 2-8 to Rs. 288-8. Central Indias were maintained at Rs. 157 and Centurys hardened by a rupee to Rs. 261-8. Finlays were a quiet feature at Rs. 248, while Gokaks received good support to go up by Rs. 5 to Rs. 237-8. Indu Ordinaries added As. 1½ to Rs. 10-2½, and New Greats as much as Rs. 4-8 to Rs. 153, while New City dropped a fraction to Rs. 150-10. Simplex were maintained at Rs. 129 and Standards at Rs. 305. Svadeshis receded by Re. 1-8 to Rs. 243. Ahmedabad Advances moved up by Rs. 2-8 to Rs. 140 and Bradburys by Rs. 5 to Rs. 725.

Bank shares were quietly steady. Central Banks were a fraction down at Rs. 64, while their new shares were a shade higher at Rs. 66-4. Imperial Fully-paids were marked down by Re. 1-4 to Rs. 1,836-4, whereas their Contributories were placed Rs. 2-8 higher at Rs. 455. Barodas were unchanged at Rs. 107. Bank of Indias were taken up As. 8 better at Rs. 157-8 and United Commercials As. 4 at Rs. 36-12.

Business in insurance shares was small and variations were few and fractional. Orientals experienced some enquiries, but in the absence of sellers the quotations were maintained at Rs. 6,900. Empires were held at Rs. 662-8. New Indias were dull at Rs. 39-8 and Indian Mercantiles at Rs. 38. British India Generals changed hands As. 8 better at Rs. 13-8.

Electricity shares displayed a firm tone, despite profit-taking in Tata Hydro shares towards the latter part of the week. Ahmedabad Electrics held their own at Rs. 114-6. Bombay Suburbans were marked up by Rs. 3-12 at Rs. 124-6. Surats gained As. 10 to Rs. 126-4, Poonas As. 10 to Rs. 128-2, Broach Electrics As. 1½ to Rs. 8. Andhra Valleys picked up Rs. 15 to Rs. 1,280, Tata Hydros, after being taken up from Rs. 137-8 to Rs. 138-8, reacted to Rs. 136-8. Tata Powers closed with a gain of Rs. 5 at Rs. 1,365, although at one time they touched a high of Rs. 1,380.

Prices strengthened further in the miscellaneous industrial section. A.C.Cs experienced speculative buying and short-covering early in the week on suggestions of a bonus issue, resulting in a rise from Rs. 173 to Rs. 177-4, but subsequently reacted to Rs. 175-4. Belapurs advanced by Rs. 2 to Rs. 262. Bombay Burmahs were a notable exception with a reaction from Rs. 343-12 to Rs. 338-12. B.I.Cs were steady at Rs. 8-13½. National Rayons touched a high of Rs. 124, but met with selling pressure to close with a loss of Re. 1 at Rs. 120. Tata Chemicals were done at Rs. 8-15½ and Tata Oils at Rs. 31-4. Wimcos added Re. 1-4 to close at Rs. 240. Phaltan Sugars were a special feature with a rise of Rs. 12 to Rs. 106, on reports that the Company's shares may be placed on the forward list.

In the transport section, Scindias came up from Rs. 14-3 to Rs. 14-7, but wound up at Rs. 14-2½. Indian Steamships held ground at Rs. 7-13. Bharat Lines were done up to Rs. 91.

In the engineering and mining group, Alcocks picked up Rs. 5 to Rs. 315, Premier Constructions Rs. 5 to Rs. 96 and Shivrajpurs Re. 1 to Rs. 65. B.B. Petrols were concerned in interested buying and, therefore, rose by As. 4½ to Rs. 2-3. Indian Coppers were unchanged at Rs. 2-14½.

Madras Stock Exchange

MADRAS, *20th October*

Despite the intervention of the *Dussera* holidays, the Madras Stock Exchange put on a comparatively better appearance this week. Sentiment of the operators was slightly better in sympathy with the improved tone in the Bombay and Calcutta share markets. A feature of trading was that selling this week was generally less pronounced than in the previous weeks, while buying of a selective nature was visible, especially in rubber and tea shares. Electric shares also attracted some attention. Textiles, however, presented a mixed trend. The undertone was quietly steady.

The textile section was colourless. Coimbatore Kamala, Rs. 100 paid-ups, were done at Rs. 85-8 *ex-div.*, as against Rs. 90, and Rs. 50 paid-ups at Rs. 43-12 *ex-div.*, as against Rs. 46. The Directors have declared a dividend of 4½ per cent. on the ordinary shares for the year 31st December, 1952, as against 6 per cent. for the previous year. Buckinghams lost Re. 1 to Rs. 120 and Rangavilas As. 4 to Rs. 44. Vasantas, however, gained Re. 1

As the Calcutta Stock Exchange remained closed during the week, on account of the *Puja* holidays, our customary review of the Calcutta Stock Exchange is not published this week—ED.

to Rs. 160 and Trichinopolys As. 5 to Rs. 9. Maduras improved from Rs. 39-6 to Rs. 39-10. Travancore Rayons were better at Rs. 5-1.

Among plantings, teas evoked selective enquiry. Periakaramalais disclosed a gain of As. 6 at Rs. 7-4 and Parksides As. 4 at Rs. 14. Devasholas rallied As. 2 to Rs. 16-10. Chembras were fractionally better at Rs. 2-6. But, Waterfalls were unchanged at Rs. 3-5 and Kalasas at Rs. 9-14. Blue Mountains (tea and rubber) were slightly lower at Rs. 3-14, while Balanoors (tea, rubber and coffee) improved by As. 4 to Rs. 13-12.

Rubbers continued to attract support. Thamarapallys put on As. 4 to Rs. 14-4, Teekoys As. 2 to Rs. 7-4 and Thirumbadis an anna and a half to Rs. 3-2½. Rajagiris were done at Rs. 12-4, as against Rs. 12-2. Cochin Malabars and Kallas gained an anna each to Rs. 6-7 and Rs. 3-3, respectively. Malankaras, however, lost Re. 1 to Rs. 101. But Pullangodes were unchanged at Rs. 2-13.

Among coffees, Consolidated Coffees lost As. 2 to Rs. 17-14. Nil. Neergundis were fractionally lower at Rs. 3-5½. Balmadies, however, were higher by As. 2 at Rs. 3 *cum-div.* and Puthuthottams by an anna at Rs. 3-10 *cum-div.* Kadur Coffees remained unchanged at Re. 1-8. Kil Kotgiris (tea and coffee) were done at Rs. 5-7 *cum-div.* as against Rs. 5-5 *ex-div.* The Directors have declared an interim dividend of 10 per cent. on the ordinary shares.

In the miscellaneous section, Kirlampudi Sugars lost Rs. 5 to Rs. 35. India Cements were lower by As. 12 at Rs. 15-4. Andhra Cements 'B' declined by an anna and finished at Rs. 10. But Deccan Sugars gathered As. 4 to Rs. 20-6. Mysore Chemicals and Fertilisers improved by As. 3 to close at Rs. 7-14. Ranes, Rs. 100 paid-up, were done at Rs. 155 *ex-div.*, as against Rs. 175 *cum-div.*, and Rs. 50 paid-up Rs. 77-8 *ex-div.*, as against Rs. 87-8 *cum-div.* Cochin State Electrics were quiet at Rs. 9-7 *cum-div.* South Madras Electrics were unchanged at Rs. 10-3 *cum-div.* The Directors have declared an ad-interim dividend of 3¾ per cent. on the ordinary shares for the year 1953-54. Vellore Electrics, too, were colourless at Rs. 13-2. The Directors have maintained the dividend of 10 per cent. on ordinary shares for the year ended 31st March, 1953.

MARKET GOSSIP

(Concluded from previous page)

deficit of the sterling area. Thirdly, it might impose a severe strain on the U.K. which would be called upon to convert the U.S. sterling holdings into dollars, if and when the convertibility of the pound takes place. In other words, the U.S. move might conceivably tend to postpone the day of convertibility of the pound. In fact, it is in this light that the U.S. move is viewed in London. There is, however, no doubt that the U.S. move will enable many countries, especially in the South-East Asia region, which are in need of dollar goods but are unable to pay for them, to buy them without having to wait for dollars to come their way.

• • • •

There has been, from time to time, certain alarming predictions, particularly by the economists of the countries behind the Iron Curtain, of the crisis which is soon to overtake the American economy. By implication, they have warned those countries which rely too heavily on the U.S. There have, of course, been many similar prognostications—though made in a less alarming tone—by other economists in the free world. In this context, it is interesting to read the sober review of the prospects for American economy, which was given by Sir Oliver Franks, Deputy Chairman of Lloyds Bank and a former Ambassador in Washington, when he addressed the recent session of the U.K. Cotton Board Conference. On the possibilities of an American recession in trade, Sir Oliver said he did not think the greatest skill in the world could enable a country to keep "at high boom condition for ever and ever." Referring to the view that, when an American recession did come, it would be catastrophic, he said, "that attitude is probably wrong." He cited, in this connection, the fact that the U.S. economy had changed a great deal in the last 25 years. Many "useful tools" had been introduced to control the economy of the country. There was no great speculative boom on the stock exchanges, the farmers were not heavily mortgaged, and the whole economy was healthy. He added: "If there is a recession, it will not be unduly severe."

• • • •

Sir Oliver suggested that the world was entering what he described as the "post post-war period"—a period, which could be regarded as "normal." Referring to Russia, he said that, although there was no justification for the view that the "grand strategy" had changed, there might be a little less feeling of tension. He thought that there might be a slight increase in the trade with countries behind the Iron Curtain. Dealing with Britain's economic outlook, he said there was an element of precariousness about the gold reserves position, since this surplus was being achieved only at the cost of having to control the trade with the dollar area. Although convertibility of the pound was bound to come, it would have to be achieved, he added, by a "natural balance of trade between the dollar and sterling areas."

• • • •

Now that the U.K. Government has turned over the import trade of wheat to private hands, the corn interests in that country are beginning to think in terms of reviving the grain futures market at Liverpool. Trading in wheat for futures delivery, according to a statement issued by the Liverpool Corn Trade Association, will begin on 1st December, 1953. The authorised delivery months will, however, be decided later. The Liverpool market, it may be mentioned here, was an international market for wheat in pre-war years. Efforts are also being made to restore futures trading in maize and barley. In London also, arrangements are being made to start futures market in maize and barley. It is, of course, too early yet to say anything about the probable trend of prices in the Liverpool futures market in wheat, when it starts functioning. There is, however, a surplus of wheat in nearly all wheat-growing countries, so that it is unlikely that many traders would want to buy wheat ahead. Also, the U.K. is believed to be well stocked in wheat, thanks to imports and good domestic crop. But it is stated that the Liverpool futures trading will benefit the millers who do not now possess any cover arrangement for the stocks they hold. To many in this country, the whole arrangement will stand out in refreshing contrast, for, while the U.K., a country which depends on foreign food to a larger extent than India, has taken the plunge and decided on freedom for wheat, India has not even thrown off its rationing shackles yet in many centres.

Notices

DYER MEAKIN BREWERIES LIMITED

NOTICE IS HEREBY GIVEN THAT THE Share Transfer Registers of the Company will be closed from about 15th November, 1953. Shareholders are requested to send in their Transfer Deeds for registration, as no transfers received after that date will be registered until the books reopen after the Annual General Meeting expected to be held shortly thereafter.

K. G. KHANNA,
Secretary.

SOLAN BREWERY,
20th October, 1953.

THE BENGAL FLOUR MILLS COMPANY, LIMITED

THE BOARD OF DIRECTORS HAS DECIDED to recommend to the forthcoming Ordinary General Meeting of the Company a dividend at 12½ per cent. per annum for the half-year ended 30th June, 1953.

By Order of the Board,
BALMER LAWRIE & CO., LTD.,
Managing Agents.

21, NETAJI SUBHAS ROAD,
CALCUTTA, *13th October*, 1953.

NEWS IN BRIEF

THE total capital invested in mechanised soap factories in India is about Rs. 12.5 crores.

The new Andhra State grows over three times the tobacco grown in the residuary Madras State, but its average yield of tobacco is nearly 3 lbs. less per acre.

The total amount of materials so far purchased for the Damodar Valley Project is Rs. 29.80 crores, of which those from indigenous sources aggregated Rs. 8.96 crores.

The gross traffic receipts of the Indian railways during 1952-53 exceeded an average of Rs. 74 lakhs a day, against a daily average expenditure of Rs. 61 lakhs.

The paddy breeding section of the Madras Agricultural Department has evolved improved strains of paddy, capable of giving increased yields ranging from 10 to 15 per cent. as compared with local varieties.

A convention of tele-communication engineers, university professors and scientists will be held in New Delhi from 2nd to 4th November, at the time of the telegraph centenary celebrations. This will be the first convention of its kind to be held in India.

An area of 260,000 acres of land is expected to be reclaimed in Madhya Bharat by the end of the next season by the four units of the Central Tractor Organisation working in the State for the past four years. The target of reclamation under the State's Five-year Plan is 300,000 acres.

The Government of India proposes to work out details, in conjunction with the Planning Commission, for setting up a synthetic petrol plant in India. The idea of setting up such a plant was originally considered in 1948, but was given up on account of the huge financial outlay involved.

The Government of India is reported to have turned down the Pakistan Government's proposal to extend the Indo-Pakistan Trade Agreement by another three months upto 31st December, 1953, as it feels that no useful purpose will be served by such extension.

The Ahmedabad Millowners' Association has requested the Bombay Government to drop the purchase tax (under the Sales Tax Amendment Bill) on goods needed for manufacturing purposes, the sales tax on textile machinery and the special tax on fine and superfine cloth.

The Government of Bombay has appointed an Advisory Board under the Bombay Minimum Wages Act, 1948. The Board consists of representatives of employers and employees in 10 scheduled professions and will advise the Government in the matter of fixing and revising minimum rates of wages under the Act.

The Travancore-Cochin Government has appointed a five-man Advisory Committee to enquire into labour conditions in plantations and to suggest measures for revising the minimum wages in force. The Committee will consist of two representatives each of employers and employees.

The next conference of the Commonwealth Finance Ministers will be held in Canberra, Australia, about 8th January, 1954. Preliminary discussions between officials of the Commonwealth countries will, however, be held a week earlier, when the agenda for the Conference will be prepared.

A tea publicity organisation will be set up in Germany, in which both the Government of India and Hamburg tea importers will participate. The aim of the organisation is to increase German tea consumption. The cost of the organisation is estimated at 350,000 marks (about £29,160). Ceylon also will share in the financing of this organisation.

Imports of locomotives and wagons will be stepped up during the current year, according to the Union Minister for Railways. The present import programme will be revised, in order to meet the railway's requirements, as also to make up the arrears, as power and wagon shortages are the biggest difficulties. Line capacity for transport of goods on various railways will also be increased.

The Gujerat Sugar Merchants' Association has submitted a memorandum to the Bombay Government, on the Sales Tax Amendment Bill, 1953, suggesting the levy of a single-point tax of half an anna per rupee to be collected at entry points in the State. It has also suggested that when sugar is exported to other States, the sales tax levied should be refunded, so that inter-State trade might improve.

The Government of Bombay has decided to remove the control on the sale, distribution and price of wheat in Bombay, Poona, Ahmedabad, Sholapur and seven other cities in the State with effect from 1st January, 1954. Statutory rationing will, however, continue in these cities in regard to other foodgrains. All foodgrains will be derationed as from that date in the rest of the State.

The Central Government has asked its food officials in Bombay to enquire into a report that large stocks of imported wheat in the State are of poor quality. This is a sequel to the statement made by the Minister for Civil Supplies, Bombay, at a meeting in Surat, that the imported wheat started deteriorating within eight days. No official complaint to this effect has, however, been received by the Central Ministry of Food.

The Madhya Pradesh State Government has taken a preliminary decision to enhance land revenue assessment by 33 per cent. in the Nagpur District, 25 per cent. in the Jubbulpore District, 33 per cent. in the Wardha District and from 20 to 33 per cent. in the Akola, Nimar, and Sagar Districts. The enhancement has been proposed because of the considerable improvement in the economic conditions of cultivators and because re-settlement has been long overdue.

Topmost priority has been given to the construction of a railway line in the Garo Hills in Assam, so that the produce of the area can be brought at least to the national highway and the river Brahmaputra. This linking of Garo Hills by rail will not only enrich Assam by the exploitation of its hidden resources but will also help other industries requiring cheaper coal, etc. The Garo Hills area is estimated to contain about 1,000 million tons of coal reserves and a vast quantity of agricultural produce and timber.

• • • •

From Abroad

Belgium has informed the current session of the G.A.T.T. that it must continue its remaining controls on imports from the dollar area.

The Government of Ceylon has freed from import control restrictions a wide variety of goods from the sterling area. Import restrictions have been relaxed in the case of some goods from the dollar area also.

West Germany has decided to abolish gradually all transfer restrictions with regard to current earnings of foreign capital. This is in response to a recent request by the Organisation for European Economic Co-operation.

The Japan Iron and Steel Export Association will set up branch offices in six foreign countries in order to promote iron and steel exports of Japan. Branches will be established in Karachi, Djakarta, Calcutta, Bangkok, Manila and Buenos Aires.

The G.A.T.T. session at Geneva adopted a resolution calling on the U.S. to discontinue the restrictions on imports of dairy products. It also requested the U.S. Government to report before the ninth session on the action which it has taken.

The first official estimate of the 1953-54 Egyptian cotton crop places production 38 per cent. lower than that of last year. The estimate foresees a production of 5,927,000 kantars of ginned cotton, as against 9,713,000 kantars in 1952-53. (One kantar=99.05 lbs.) In 1951-52, the crop was 7,840,000 kantars.

The U.S. Foreign Operations Administration has offered to sell American surplus farm products worth $175 million to friendly countries in the Far East, Europe, the Middle East and Latin America for local currencies. Discussions with European Governments are going on about the proposed programme and negotiations with the Far East and other nations are to begin soon.

Steel production in the U.S. is now at a little above 90 per cent. of capacity. If this rate of production is maintained for the rest of the year, the production in 1953 will be between 111 million and 112 million tons, thus setting a new record with at least 6 million tons to spare. The best year so far has been 1951, when output reached 105 million tons.

The first shipment of 30 tons of monazite from Ceylon to America was taken last week by a U.S. liner. Ceylon's entry into the American monazite market followed India's ban on the export of the mineral. By about June next, 100 tons of monazite will be ready for sale, including 40 tons now available for immediate export. It is estimated that Ceylon can produce about 1,500 tons of monazite annually. Ceylon has sold monazite to America at £125 per ton, but a Dutch firm is stated to have offered £200 per ton.

PERSONAL

MR. M. A. Menshikov, Russian Ambassador-designate to India, has arrived in India.

The Hon. Mr. C. C. Spencer, C.M.G., Financial Adviser to the Government of Uganda, is on a short visit to Bombay.

Mr. K. Ramiah, a co-operative specialist, will be sent by the I.L.O. office at Bangalore, to the Philippines to advise the Government on organisation of co-operatives.

Mr. E. Arbizzoni has been appointed Managing Director of Messrs. Ciba Dyes Ltd., Bombay, in place of Mr. R. R. Jacques who retired from India in July last.

Mr. T. Swaminathan, Textile Commissioner, Government of India, returned to Bombay on Wednesday last after a six-week study tour of Japan and has since assumed also charge of member of the Forward Markets Commission.

Mr. C. W. Hicks, an expert from the U.S., has arrived in Bombay, at the invitation of the Government of India to conduct a survey for installing ground control approach equipment at Santa Cruz airport.

Mr. M. K. Vellodi, Secretary, Ministry of Works, Housing and Supply, Government of India, has been appointed Secretary to the Ministry of Defence, vice Mr. H. M. Patel, who has been appointed Secretary to the Ministry of Food and Agriculture.

Mr. F. A. C. Guepin, a Managing Director of the Royal Dutch Shell Group of Companies and a Director of Burmah-Shell, arrived in Bombay last week in the course of his tour of countries where Shell organisations are established.

OBITUARY

Mr. Ben Marsden

We regret to announce the death last week, in England, of Mr. Ben Marsden. The late Mr. Marsden had been actively engaged in the cotton textile industry in India for many years, first in Bombay and subsequently for many years in Ahmedabad, in which city he floated the Marsden and the Monogram Mills. He had been indisposed for some time and his death took place in a nursing home. One of his sons, Mr. T. Marsden, takes an active interest in the family mills at Ahmedabad.

4 Per Cent.

HYDERABAD STATE DEVELOPMENT LOAN, 1963

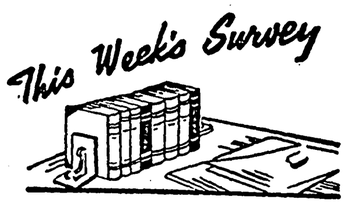
I.G. Rs. 325 Lakhs **Issue Price I.G. Rs. 99-8%**

The loan will bear interest from the 15th October 1953 and will open on the 22nd October and close on the 31st October 1953 or earlier without notice.

Subscriptions will be received in the form of cash/cheque.

Applications will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore, at the offices or branches of the Hyderabad State Bank and treasuries and sub-treasuries within the Hyderabad State.

N. B.—**Copies of the Notification and Application Form may be obtained at any Receiving Office.**



MANAGEMENT OF INDUSTRIES

THE enquiry into the alleged mismanagement in the running of the India United Mills, Bombay, and certain sugar mills in the U.P., is the first of its kind the Central Advisory Council of Industry has instituted. Although the report submitted by the special officer appointed by the Government of India under section 15 of the Industries (Development and Regulation) Amendment Act, 1953, proves *prima facie* that there has been mismanagement in the running of the India United group of mills, the Government has appointed a non-official sub-committee with Mr. A. Ramaswami Mudaliar as Chairman to investigate into the affairs of this Company, in order to allay misgivings that the Government has been unnecessarily interfering with the working of these mills. The sub-committee will enquire not only into the working of these mills, but also the sugar mills against which also the charge of gross mismanagement has been made.

Speaking on this subject at Madras last week, Mr. Ramaswami Mudaliar made it clear that the Government had kept an open mind and came to no conclusion on the report of the preliminary investigator into the working of the India United Mills and had left the matter entirely to be carefully studied by the sub-committee. He further stated that the sub-committee would itself keep an open mind on the issues it has to examine and would discuss the issues with the concerned managements, before it reported to the Government. The sub-committee will not only report on the facts of the cases referred to it, but also suggest such solutions as might be necessary. It has to submit its report, according to him, by 15th November, 1953, if possible.

This enquiry acquires special significance to private enterprise as a whole, by reason of the large size of the mills concerned; this group has 240,842 spindles and 6,412 looms. The sub-committee's findings will naturally enough be watched with great interest by all business men. Speaking on this subject, Mr. T. T. Krishnamachari, Minister for Commerce and Industry, said:

"If you come to the conclusion that the report indicates gross mismanagement and all that follows thereafter, you cannot ignore the repercussions for better or for worse of any decision that might be taken on the entire textile industry as a whole."

The remedial action that can be taken in regard to a matter of this nature as prescribed by sections 16 and 18A of the Act does not, however, allow any scope for devising alternative methods such as those prescribed in section 153C of the Indian Companies Act. Section 153C of the Indian Companies Act deals with the power of a court to deal with a situation when a company acts in a "prejudicial manner" or "oppresses" any part of its members. Section 16A of the Industries (Development and Regulation) Act provides that the Central Government may, if it is satisfied, after investigation, that action is necessary, issue such directives to the industrial undertaking as may be appropriate in the circumstances for all or any of the following purposes:

(a) regulating the production of any article or class of articles by the industrial undertaking or undertakings and fixing the standards of production;

(b) requiring the industrial undertaking or undertakings to take such steps as the Central Government may consider necessary to stimulate the development of the industry to which the undertaking or undertakings relates or relate;

(c) prohibiting the industrial undertaking or undertakings from resorting to any act or practice which might reduce its or their production, capacity or economic value;

(d) controlling the prices, or regulating the distribution, of any article or class of articles which have been the subject matter of investigation.

Section 18A gives powers to the Central Government to assume management or control of an industrial undertaking in certain cases. But neither of these two sections leaves any scope, Mr. Krishnamachari said, for devising alternative methods such as those prescribed in section 163C of the Indian Companies Act. He added:

"It may be that, in the actual working of this Act, we find that this defect must be remedied and there should be a tie-up between the provisions of the Indian Companies Act and the provisions of the Industries (Development and Regulation) Act. . . . But that is not now what we are concerned with. Our main concern is to find some method of remedying the defects in the administration of this group of mills, defects which the report indicates to be of a grave nature. If I may be permitted to do so, I would like to request the Council to approach the problem entirely from an objective point of view, in view of the fact that, in a case of this nature, the Council, as well as the Government, are before the bar of public opinion and any action that the Government might take, on the advice of the Council, would be scrutinised and dissected by very critical minds. If I might import the analogy of the court house, you are now in the position of a jury sitting in judgment over this particular industrial unit. I would, therefore, request you to consider all aspects of the problem, not merely from the comparatively limited angle of the future of this particular unit, but also of the possible repercussions on the working of this Act in future."

It is gratifying to note that Mr. Krishnamachari emphasised the need for appropriate action in order to place the working of this group of mills on a sound basis rather than the investigation aspect, as such. After all, investigation and enquiry are only means to an end, the end being better industrial management.

PROGRESS OF COLOMBO PLAN

Much light on the economic progress in the individual countries of what is now known as the "Colombo Plan" region is thrown by the annual report of the Plan, adopted by the Consultative Committee of the Colombo Plan which concluded its deliberations last week-end. The full text of the report is yet to be published, but the Press summary shows that the report contains a succinct account of the progress made in individual countries. It would appear from this that in nearly all countries of the area, there has been an extension of land under cultivation. Industrial production, too, has increased, notably in India and Pakistan.

The report pays a tribute to the countries for having shown that they can plan both "boldly and realistically" and readjust themselves to "good fortune and bad" in the face of the magnitude of the task that confronted them. The "courage and resourcefulness" displayed by the countries, according to the report, justify the confidence that the Colombo Plan will "come upto and even surpass the hopes with which it began."

The report recognises that, although the larger part of an economic development programme in any country has to come from the resources of the country itself, external aid "nevertheless has a vital role to play." Such aid has been forthcoming in one form or another in recent years. Grants and loans so far made available by the countries outside the area for economic development purposes since the end of 1950 aggregate $1,000 million (or about £360 million). This assistance has come from Australia, Canada, New Zealand, the U.K., the U.S. and the World Bank. Perhaps, the Consultative Committee would have done well to assess the region's future financial requirements, its adequacy to meet the needs of development, and indicate the conditions which would facilitate a larger flow of external aid, particularly in the shape of foreign investment. But the underdeveloped countries should realise that gifts or grants will not, by themselves, promote development, unless there is an integrated plan for economic improvement and a willingness to move fast along that road. How vital this consideration is to the economy of the region will be evident from the fact, revealed by Mr. Reginald Maudling, leader of the U.K. delegation to the conference, that India was not able to utilise fully the releases made by the U.K. from the sterling balances. There is, however, no doubt that, with the contemplated increase in the tempo of development in this country, there will be use for all the re'eases that might be made. Be that as it may, this fact alone should serve to emphasise the need for well-thought-out plans for spending and investment.

So far as the flow of investment capital is concerned, Mr. Maudling did well to put the whole matter in a nutshell when he said: "If you want foreign capital to be invested in your country, you must make it clear that there is no danger of nationalisation of that capital within a reasonab'e period." It is to be hoped that this consideration will be borne in mind by the planners in this region. After all, the need for such investment is more urgent now than even before. The fall in commodity prices has affected, as the Colombo Plan report has recognised, the economy of this region, with the result that it is unable to take advantage of the favourable factor, namely, the easier availability of capital equipment. The report has rightly urged that, while it is clearly necessary that the countries of the area should make "maximum efforts to mobilise their own resources", the need for external aid to supplement these resources "continues to be at least as great as in the initial years of the Plan." The flow of external assistance, it cannot be too strongly reiterated, will depend on the degree of their determination to be realistic in their economic policies.

KEEPING OLDER PEOPLE AT WORK IN THE U.K.

While the problem of finding jobs for the growing number of unemployed young men is being actively considered in India at Government levels, a somewhat different problem, namely, of keeping older men at work beyond the conventional age limits of retirement, is engaging the attention of the U.K. Government. According to Sir Walter Monckton, Minister for Labour, people in Britain are "growing older and living longer" and they "cannot afford to retire early or at a fixed age." Though the problem is not easy of solution, the British Government has been earnestly trying to find some palliatives. In March, 1952, it set up a National Advisory Committee on the employment of older men and women. The Committee has just submitted its first report.

The Report reveals some interesting information. It points out that older people can and should remain at work beyond the conventional retiring ages. The problem is becoming acute, because the number of older people is increasing. According to a survey made by the Committee, in 1911, one in every 15 was a man of 65 and over or a woman of 60 or over. By 1951, the proportion grew to two in 15. It is estimated that, by 1977, it will be three in 15. By 1962, the number of people with ages between 20 and 40 will be less by about 7 per cent. than in 1952, while that between 50 and 60 will rise by about 17 per cent. Dispelling the conventional ideas about the limits of usefulness of older people, the Committee has suggested that people capable of efficient services at 60 can continue up to 70. The reasons given by the Committee for retaining the older people at work are realistic. It says that work may prevent a man from ageing and the older person has positive advantages on jobs requiring accuracy and attention to detail. What is more, he is probably more adaptable and trainable than is commonly thought.

About 400,000 out of 800,000 men aged 65 to 70 are now working in the U.K. Out of 1.25 million aged 70 and over, only 250,000 work. There is no national crisis to justify the retention of such people in employment, but it is felt that the needs of the nation require that their skill should not be lost or unnecessary idleness encouraged. The Committee has, therefore, suggested that no one capable of effective service should be retired against his will.

The adoption of the above scheme is not without administrative difficulties. The question of adjusting pension plans is one of them. The pension plans will require to be so arranged that it does not cost the employer more when a man is taken on late in his working life. To overcome this difficulty, the Committee has suggested that the pension paid should not be greater than the superannuation benefits related to the acturial value of his and the firm's contributions.

MARKETING FARM PRODUCE

The intelligentsia in this country is quite conscious of the importance of improved and scientific methods of marketing agricultural produce to the rural economy. But unfortunately, excepting the adoption of the practice of Agmarking certain products, very little has been achieved in this direction. This poor performance cannot be attributed to either lack of data or know-how. The marketing problems of almost all the important commodities have been studied and commented upon by research workers. If still no worthwhile progress has been made, it is because of lack of determination on the part of the authorities to tackle an admittedly difficult problem.

What is the problem? A simple answer to this is not possible, as it is a complex one. In brief, it involves formation of associations of owners of small plots, introduction of scientific farming for producing the required types of crops, winning the small farmers from the clutches of the moneylender and the middleman by providing credit facilities, gradation of crops and storing them in proper warehouses, and finding better prices for them in the markets. Because there are very few agencies, even after taking into account the co-operative societies, which are equipped fully to deal with these varied tasks, the marketing of farm produce in India to-day is still being done on antiquated lines. The middleman continues to dominate the scene, with the grower getting only a fraction of the price paid by the consumer.

It is in the fitness of things that the question of improving marketing practices in rural areas should figure prominently at this week's conference, at New Delhi, of Marketing Officers representing nearly all States. Inaugurating this conference, Dr. Punjabrao Deshmukh, Union Minister for Agriculture, put the present position of marketing of rural produce in a refreshing manner thus:

"Whenever I visit the *mandis*, whether in the rural or municipal areas, I feel as if time has come to a stop so far as agricultural marketing is concerned, and conditions are as they were when I was a child.

"It is the same bullock cart in which the individual producer wends his weary way to the market. It is the same set of middlemen, who, under cover of a piece of cloth, pull one another's fingers in a mysterious fashion to determine prices. It is the same malpractices of one set of weights for buyers and another for sellers and of arbitrary deductions for the service of various functionaries and in the name of religion, the sacred cow or some deity, which are inflicted on the primary producer who, in a phlegmatic helplessness, continues to take things for granted. It is the same dirt and filth that get mixed up with agricultural produce in the course of its movement from the field to the kitchen. The wastage of produce that occurs during this journey continues to demonstrate our incapacity to handle things properly. All this too persistent a phenomenon contains a challenge to a nation like ours steeped in poverty and struggling hard to plan for prosperity."

That in a nutshell is the most distressing picture of the problem which the Conference of Marketing Officers was called upon to tackle. The Conference, in its two-day session under the chairmanship of Mr. P. A. Gopalakrishnan, went into sub-committees to consider (1) the plan for marketing surveys, grading and quality control, regulated markets, co-operative marketing, establishment of warehouses, standardised weights and measures and market news service, (2) propaganda and publicity for Agmark products, (3) improvement of rail and road transport, (4) organisation of Central and State staff, and (5) arrangements for training in marketing work. Of these, the sub-committee relating to the first item has before it an undoubtedly heavy task. Whatever decision it reaches, it should bear in mind that such should have a bearing on the question of utilising the services of the Community Projects and National Extension Services. For these agencies are intended to establish contacts at the village levels and their aim is to help improve the well-being of the farmer.

U.P.'S FIVE-YEAR PLAN

In the light of experience of the working of the U.P.'s Five-year Plan during the last two years, the Government has made certain minor adjustments in the Plan. The effect of these adjustments is that the original estimate of Rs. 120.97 crores of expenditure during the period of five years is likely to go up to Rs. 130.04 crores. This increase in expenditure is exclusive of the cost of the Rihand Dam project, which is estimated at Rs. 35 crores, awaiting sanction. Press reports from Lucknow indicate that, under the State's power programme, the original five-year provision of Rs. 21.40 crores has been revised to Rs. 21.49 crores. Under the revised Plan, the estimate of expenditure for the development of industries has been increased from Rs. 5.82 crores to Rs. 6.24 crores. The bulk of this extra money will be spent on the cement factory which the State is building at Robertsganj at Mirzapur. The factory, which will have a capacity of 700 tons a day, is expected to go into production next year. There are small increases under various heads of cottage industries and training schemes. The money to be spent on backward classes has been increased from Rs. 2.36 crores to Rs. 2.79 crores. There are also increases in sections dealing with animal husbandry from Rs. 1.34 crores to Rs. 1.37 crores, dairying and milk supply from Rs. 20.60 lakhs to Rs. 24.13 lakhs, education from Rs. 17.16 crores to Rs. 17.30 crores and medical aid from Rs. 3.49 crores to Rs. 3.55 crores. Further, there is stated to be a substantial increase in expenditure under community projects.

There are, however, a few items on which the expenditure has been revised downwards. Thus, the expenditure in the agricultural sector has been cut from Rs. 21.25 crores to Rs. 16.27 crores, forests from Rs. 1.65 crores to Rs. 1.41 crores and public health from Rs. 2.46 crores to Rs. 2.21 crores. But the expenditure on roads at Rs. 5.22 crores, co-operation at Rs. 1.30 crores and fisheries at Rs. 6.2 lakhs remain unchanged.

Although many adjustments have thus been made, the main emphasis in the Plan is the realisation of the target of 1,150,000 tons of additional production of foodgrains. The actual increase in the first two years of the Plan was 413,000 tons, despite adverse crop conditions. More rapid progress, however, is expected in the coming years. This is because the irrigation projects, both those that are completed and those that are nearing completion, will provide water for more than 550,000 additional acres of land. The five-year target of land for which irrigation facilities are to be provided has been raised from 2,477,000 acres to 2,605,000 acres.

OFF THE RECORD

(By "ROVER")

THAT the country is in a bad way economically can no longer be covered by a profuse use of platitudes. The policies of the Government have mostly misfired and, what is worse, many of the bullets have rebounded and hit back those holding the guns. The calculations of the Planning Commission have all gone awry, as they were bound to do. Even if it had been manned by the best brains in the country, its Plan would have flopped after a little, hectic flutter, because the Plan had to be cast in a mould which would be acceptable to the antediluvian and fad-ridden section in the Congress Party. With the emergence of unemployment on a noticeable scale, as the first visible fruit of their wrong policies, both the Government and the Party have now been rattled. But this fact, instead of bringing to their mind a realisation of their mistakes, has rendered them more stubborn and more determined to pursue these policies to a bitter end. Having destroyed the atmosphere which alone could encourage expansion of the field for economic activity and, consequently, for employment, the wild and die-hard elements in the Party are now out first to cripple and finally to kill commerce and industry, which alone could bring prosperity to a country and provide gainful work for its teeming millions.

It is not my purpose at present to analyse these policies and to show how and where they were unsuitable for conditions obtaining in our country during the last six years. You cannot eradicate poverty and raise the standard of life of the large mass of people in an overpopulated country on the basis of an economy of *charkha* and *ghani*. Secondly, our labour policies, though not wrong in the essence, have been untimely and definitely detrimental to expansion which we aimed at in the field of industry. To a large extent, these two important aspects of our economic policies have been responsible for the heavy incidence of unemployment which plagues us to-day and which is driving some of our planners and party leaders crazy. In trying to force the pace of improving the lot of those already in employment and thus to win their support or maintaining their party in power, the over-enthusiastic champions of workers have virtually closed the door for additional millions who come of age every year and seek for work in vain. In the final analysis, labour will possibly discover that, instead of doing them any good by a plethora of hot-house legislation, these short-sighted friends have done workers, as a class, a great and possibly a lasting wrong.

What is now at stake is not merely the private sector of industry but the whole economy of the country. If the more orthodox and fanatical section of the Congress, with its prejudices against private enterprise and its purely sentimental attachement to a century-old order of things, is allowed a free run for another five years, there would be nothing left to save and we would all be back in the dark, medieval ages, with its deplorably much lower standard of life for the masses than even the low standard of to-day. Fortunately for the country, the Congress Party is not really a political party in the sense in which it is understood in the context of democracy, but a mere collection of people accommodating within its fold every shade of opinion on matters economic ranging from the most progressive and modern to the most reactionary and primitive. If the more enlightened and less selfish section of the business community, as much concerned about the future of the country as other groups, were to wake up to the danger and come to the fore, it would find common meeting ground with the saner element in the Congress, which is as much dissatisfied with and disturbed at the recent developments as the rest of us.

In any case, I feel that the time has now come for leaders of the business community to come out in the open and take a greater interest in public affairs and politics. There would be nothing but failure and possibly ignominy too for them, if they did this on a narrow and selfish platform of self-interest, to preserve their wealth and to protect their privileges. They would have to convince the public that though they happen to be wealthy, they too are attached to the country and keen on securing public weal. They shall also have to make it clear that they stand for certain values and that it is for preserving these values, which are in danger to-day and for securing progress along peaceful lines, that they want a place in the political life of the country. I had this suggested to me recently in a letter I received from a regular reader of this feature in *Commerce*, who is no "bloody" capitalist, but a poor man serving in a business concern, with a large family to bring up. This man of robust common sense without any ideological entanglements wrote to me:

"A permanent solution can only be attained by industrialists and business men coming forward to take part in political life. Kilachand Devchand did it. Thus we can lend character and sobriety to our Government, which now is nothing better than an old women's club, all members of which (1) must have served long sentences in jail and (2) learnt their fads at Mahatma Gandhi's Ashram.

"You often say you are poor. I do not know whether you are as poor as I am and with seven children too! But without our rich men—and may God make them more rich—we are going to be still more poor."

Curiously enough, I had more or less the same thing suggested to me by one of our most prominent business men in Calcutta, who, I could see, was visibly distressed by the way industry and commerce were being ruined by a set of unseeing and unthinking politicians. I am merely throwing out this idea for what it is worth, without elaborating it in any manner, in the hope of receiving the reactions of those who flatter me by reading this column every week.

Our Misunderstood and Misquoted Ministers!

How long is the Press in this country going to be allowed to victimise poor Central and State Ministers? It is making it almost impossible for many of the members of this sorely harried tribe to open their mouth even in far, out-of-the way places of the country. One would have imagined that at least in these silent and sleepy backwaters of Rajasthan, Saurashtra, Madhya Bharat or Travancore-Cochin, a Party-pecked Minister would be allowed to unburden his overladen soul of some of its personal irritations and embarrassments and be his own genial self for a little while. But the hounds of the Press, ever on the alert for some indiscrimination or equivocality on the part of these furtive fugitives from the thrice cursed discipline imposed on their wayward tongue by the Party, the exalted position they hold and a tyrannical public, dog their footsteps even in such remote places as Rajkot. Though these poor creatures are entitled to the same consideration, latitude and sympathy as the erring husband of a termagant shrew, or even more, the harassed Ministers are not even allowed a short escape or respite by the cruel journalists often hunting their prey in packs.

They say that it is more difficult for a practising politician to hold his tongue on delicate issues than for a woman to leave the last word to a mere man, lawfully delivered to her tender mercy for perpetual torture under a sacred troth. Due allowance should, therefore, be made for this natural handicap in their case, especially if they happen to hold positions of responsibility. It behoves the representatives of the Fourth Estate of the Union to turn a deaf ear when a Minister trips in his talk. As men of the world, they should understand that a robust and full-blooded man like Dr. Punjabrao Deshmukh was bound to have some domestic differences with the more finical members of his Party. Oppressed by the all-pervading humbug and hypocrisy in his puritanic polltical home, it was but natural that he should want to air his more progressive views regarding the favourite fad of prohibition of his Party, to a group of congenial souls whom he had invited for a quiet and off-the-record fireside talk. It is not as if he was addressing the lay public, whom you could not trust to exercise discretion. Trusting in the good sense of the Press people suitably to edit his effusions, the poor fellow allowed himself to be off his guard and to relax in the semi-somnolent atmosphere of a small, Part B State capital for, perhaps, a matter of only five minutes. He told his guests how it would act as a tonic for the empty exchequers of some of the States, if people were allowed to drink for a decade longer.

It was very unkind of the reporters to go and broadcast to all the world the honest views of this confiding man and to get him into serious trouble with his bosses. I am glad the betrayed Minister, even though he lacked the courage of his convictions, had the courage to expose the machinations of these gentlemen of the Press. They worm out the most secret and sacred beliefs of a man by putting leading questions to him. Ignoring what the logicians call the universe of discourse, they twist and turn and torment his words out of all recognition and then go and insidiously present them in their bald and distorted shape, deprived of all the illuminating background and all the unspoken reservations in the mind of their victim, to a gullible public. If these wretched scribes had been a little more circumspect and a little less enthusiastic about informing the public that at least there was one level-headed and courageous Minister who, if he had his way, would want them to drink liquor, of course, not out of any spirit of self-indulgence, but for the purely unselfish reason of helping the country's effort to rehabilitate the crumbling economy of the country and to finance the Five-year Plan, it would not have caused many a sleepless and anxious night to this hard-working man, not to say anything of the jeopardy in which his precious Ministership itself was placed.

It may be that the local journalists in a small, one-horse town like Rajkot were intellectually incapable of understanding and appreciating the fine metaphysical distinction between the drinking of alcohol indulged in by subjects of a pure and uncontaminated, newly formed linguistic State and that by the unreclaimed citizens of old, multi-lingual units like Bombay, Madras and Madhya Pradesh. Being dense to a degree, these local yokels could not see that his mind at the time was

(Continued on page 799)

MOVE TO DRAFT SECOND FIVE-YEAR PLAN

GREATER EMPHASIS TO BE LAID ON INDUSTRIALISATION

(From A Special Correspondent)

New Delhi, 20th October

DELHI LETTER

TALKS on the second Five-year Plan have already begun in the Capital. This Plan is expected to be appreciably bigger in scope both in regard to the total outlay and implementation. In order to maintain and increase the economic tempo in the country, the expenditure in the public sector will be well above Rs. 600 crores per annum, gathering further momentum as the years roll on. It is possible that the total expenditure will amount to between Rs. 3,500 and Rs. 4,000 crores. Although the agricultural sector has received considerable attention in the first Five-year Plan, it will not be relegated to the background. For many of the big projects like the Bakhra, the Chambal, the Kosi, the Krishna, etc., will be still under construction or in the final stage during the second Plan period. Further, some other multi-purpose valley projects in the Godavari and the Narbada might be taken up. All these projects will absorb a sizable sum.

Primary attention is, however, likely to be devoted to the industrial sector and determined effort will be made to expand the steel, heavy chemical and heavy electrical industries. As the Government is anxious to provide new employment opportunities to the middle class educated people, the expansion of industries in the private sector will also be encouraged. Stress will be laid on the development of cottage and small-scale industries and some funds will be exclusively earmarked for this purpose. The development of community projects will be intensified and efforts will be made to bring in as large area as possible under this scheme, so as to create more enthusiasm among rural people. Educational and health schemes, which have not received much attention in the first Five-year Plan, are expected to be taken up during the second period. As Government control in some key industries will be progressively increasing in the coming years, it is likely that the Government will create an economic civil service on a permanent basis, with a view to administering efficiently Government-controlled industries. The Government is already considering a scheme for imparting higher training to suitable young men for manning these key administrative posts.

Production Ministry's Plans

The Government of India is also anxious to fill, to some extent at least, some of the lacunæ in the industrial economy of this country. The Production Ministry has already begun to revive its idea of starting the manufacture of aviation spirit, motor fuels, refined phenols, etc. In view of the strategic importance of this industry and the scope it will provide as a training ground for highly skilled technical personnel, the Government wants to take up this line of synthetic petroleum manufacture. At the same time, the Government is trying to intensify the search for oil in Assam and West Bengal by using the latest geophysical methods of exploration.

In the meanwhile, the Government of India has decided to appoint a technical committee, known as the Advisory Committee on Irrigation and Power Projects, to make recommendations about the various irrigation and power schemes that may be included in the next Five-year Plan to the Planning Commission, which will thereafter determine priorities. The Committee will consist of the Deputy Minister for Irrigation and Power as Chairman, the Chairman of the Central Water and Power Commission, the President of the Central Board of Irrigation and Power, a representative of the Ministry of Finance, and two engineers not in the service of any Government in India, as members, the Chief of the Natural Resources Division of the Planning Commission, as Secretary, and a Director of the Central Water and Power Commission, as Additional Secretary.

The functions of the Committee will be to examine the projects proposed by the State Governments and to ensure that (1) the schemes have been prepared after detailed investigation, (2) the estimates are complete and correct technically, and (3) the financial forecast and estimates of benefits derived are based on accurate data and are reliable.

The Committee will first have the new schemes technically examined by the Central Water and Power Commission or by a sub-committee, and may arrange for such additional technical examination as may be necessary. The C.W.P.C. will examine each project in close consultation with the Chief Engineer-in-charge and, where necessary, with officers of the Central Ministry concerned. A copy of the report of the C.W.P.C. or of the sub-committee will be made available to the State Government concerned, who may send a further note to the Committee. Thereafter, the Committee will examine the schemes and submit its report to the Government of India.

New Industries

Despite the fact that the capital market of the country has been lying practically prostrate during the last seven years, resulting in the total disappearance of new issues, industrial development in a number of sectors has been progressing satisfactorily, largely due to the ploughing back of profits and accumulated reserves for purposes of renovation and expansion. In the absence of any reliable statistical data, licences granted by the Licensing Committee under the Industries (Development and Regulation) Act provide some indication about the manner of industrial development in recent months. It is noteworthy that special efforts are being made to develop engineering industries. The manufacture of steel castings and special alloy steel is being expanded. In the Coimbatore area of South India, a number of spinning mills are proposed to be established. The cement industry has been showing progressive expansion in Orissa, Bihar, P.E.P.S.U., and other States. The manufacture of articles such as electric motors, power transformers, electrical goods, caustic soda, hydrogen peroxide, plastic insulated cables and flexibles, many kinds of pharmaceuticals and drugs, dyestuffs, tennis balls and rubber belts, is either proposed to be undertaken or expanded. Efforts are also being made to establish factories for the manufacture of such items as cycle chains, pumps, thermos-flasks, gilded glass and artificial pearls in the coming months.

Generally speaking, the Government of India has been anxious to encourage and foster healthy industrial traditions in the country. In licensing new units in any industry, an extra margin is usually allowed over and above the assessed demand for the articles in question, so as to encourage healthy competition within the industry and to ensure that adequate supply of cheap and good quality products are made available to consumers. Foreign capital is being welcomed and Government is prepared to grant assurances as to non-discrimination, reasonable facilities for transfer of profits and repatriation of capital and a fair and equitable compensation in the event of nationalisation. The Government is of the opinion that the inflow of foreign capital will bring along with it scientific, technical and industrial knowledge. However, an unlimited field is not allowed to foreign capital and at the time of granting licences, the Government tries to take into consideration factors, such as installed capacity, local production, quality of local products and the nature of technique involved in its manufacture. Generally, the Government is not inclined to favour foreign capital in the trading section. If foreign participation is in the form of royalty payment, the maximum rate generally allowed is 5 per cent. on sales. Regional distribution of industries is looked upon with favour but the establishment of uneconomic units is being discouraged.

Textile Industry

In regard to the textile industry, the Government of India does not favour the establishment of new composite mills during the planning period, but with a view to encouraging the handloom industry to become independent in regard to the supply of yarn and also with a view to fostering industrial development in the backward areas, licences are being granted to new spinning mills or for further expansion of spinning capacity up to certain limits. As a general rule, mills with 10,000 spindles or less are permitted to expand the spinning capacity up to 25 per cent. of the installed capacity, or by such spindleage as is required to raise the total capacity to 10,000 spindles without obtaining a licence under the Industries Regulation Act. The mills with more than 10,000 spindles are permitted to expand up to 25 per cent. of their installed capacity without obtaining a licence. Installation of new or additional looms is not favoured by the Government at present.

PAKISTAN NOTES

MARKED FALL IN REVENUE DURING FIRST QUARTER

EXPENDITURE UNDER CONTROL

THERE was a sharp fall in the revenues of the Pakistan Government during April-June, 1953, the first quarter of the fiscal year. Thus, the revenue receipts during the period under review were Rs. 343.3 million, as against Rs. 418.2 million during the same period last year. This discloses a fall of Rs. 74.9 million. The fall was chiefly accounted for by customs which dropped from Rs. 189.8 million during April-June, 1952, to Rs. 126.8 million, a drop of Rs. 63 million. This was mainly due to reduced exports and reduction in export duties. The revenue under "taxes on income" was lower at Rs. 17.9 million during April-June, 1953, as against Rs. 21.3 million in the same period last year. Indirect taxes fetched a revenue of Rs. 63 million, as compared with Rs. 72.9 million. The revenue from railways and other public utility services, however, increased from Rs. 120.4 million during April-June, 1952, to Rs. 123.5 million during the first quarter of the current fiscal year, thereby disclosing an increase of Rs. 3.1 million.

The expenditure during the period under review was well under control. It amounted to *Rs. 248.8 million, as against Rs. 261.4 million* during the same period last year. Except in June, the monthly receipts were higher than the expenditure. The reduction in expenditure was chiefly accounted for by the civil administration expenditure, which declined from Rs. 30.6 million during the first quarter of the last fiscal year to Rs. 22.7 million during April-June this year, a decline of Rs. 7.9 million. Defence expenditure was lower by Rs. 4.9 million, the expenditure during the three months April-June, 1953, being Rs. 106.4 million, as against Rs. 111.3 million in the same period last year. Expenditure on tribal areas was Rs. 10.7 million, as against Rs. 14.5 million.

The monthly breakdown of revenue and expenditure during the period under review were as follows:

(In million Rs.)

Month	Revenue	Expenditure	Surplus or deficit
April	106.4	74.9	+31.5
May	152.8	83.2	+69.6
June	84.1	90.7	—6.6
Total ...	343.3	248.8	+94.5

Development Projects

The results so far achieved by Pakistan in regard to multi-purpose and irrigation projects under the Colombo Plan is satisfactory. It was disclosed at the Colombo Conference, which concluded its five-day deliberations at New Delhi on the 17th inst., that the total electric power capacity has increased from 70,000 to 140,000 kw. The cotton textile industry has made remarkable progress while the jute textile industry has made satisfactory progress. Two woollen mills have gone into operation. Four cottonseed oil plants with an annual crushing capacity of 19,000 tons have gone into production and an additional 57,500-ton capacity is under construction. A sugar mill with an annual capacity of 35,000 tons of sugar has been established. A 50,000-ton ammonium sulphate plant is under construction.

Indo-Pak Trade Pact

The Government of India has informed the Pakistan Government that the extension of the Indo-Pakistan Trade Agreement, which expired at the end of September, by three months till December, 1953, as suggested by Pakistan, would serve no useful purpose. For the present import policy of Pakistan virtually bans the import of such items as *bidis, bidi* leaves, *bidi* tobacco, spices, drugs and medicines, hard cotton waste and the like. It may be noted that Pakistan did not invite applications for the import of some items during the half-year ending 30th June, 1953, notwithstanding the fact that provision for their import had been made in the Trade Agreement. These items were mustard oil, *bidis, bidi* tobacco and spices. When the agreement was due to expire at the end of June, 1953, it was extended for three months. In the meantime, Pakistan announced its import policy for July-December, 1953. This also did not make any provision for the import of the above mentioned commodities. On the other hand, *bidi* leaves, wood and timber, which were included in the list of importable items during January-June, 1953, are missing from the current half-year list. In the case of unmanufactured tobacco, Pakistan has invited applications for import from dollar area only, even though bidi tobacco is included in schedule "A" to the agreement.

Consequently, Government circles at Delhi feel that no purpose will be served by extending the Agreement, unless both the parties to *the Agreement implement its terms.*

Claims of Ex-employees

The Indo-Pakistan Secretariat-level talks held at Karachi last week is reported to have met with considerable success. The representatives of both the Governments have accepted 30th June, 1954, as the target date by which the claims of all displaced ex-employees of Provincial Governments and local bodies should be cleared. At present, there are nearly 15,000 outstanding claims forwarded to Pakistan by the Indian Claims Organisation. There is an almost equal number of claims preferred by the Pakistan Government. Under the agreed arrangement, the claims organisations of the two countries will be strengthened by the appointment of additional staff so that the work can be completed before the prescribed date. Efforts will be made to eliminate cross references pertaining to individual cases which hold up progress. Monthly progress reports will be exchanged between the two organisations beginning from next month. In the case of retired Government servants, it has been agreed that anticipatory pensions should be sanctioned, if any delay is likely to occur in the issue of final sanction. The decisions reached at the conference are subject to ratification by the two Governments.

(Concluded from page 764)

Sugar Industry

In regard to the sugar industry, expansion in uneconomic units upto a crushing capacity of 800 tons per day is being freely allowed. Applications for installation of new plants by importing machinery are also favourably considered if such proposals are likely to lead to modernisation of the sugar industry. Applications for expansion, which were allowed by the State Governments prior to the coming into force of the Industries (Development and Regulation) Act, and which could not be carried out during the sanctioned periods, are also favourably considered. The Government of India does not favour any further expansion in the *Vanaspathi* industry, except in cases where new factories are proposed to be set up by using one of the plants lying idle in the country, or where certain expansions in capacity are considered essential with a view to securing increased efficiency in production. As for the installation of plants for the solvent extraction of oilcakes, the location of the plants is generally settled in consultation with the Food and Agriculture Ministry. Further, the Government is anxious to distribute the industry amongst various States with a view to avoiding concentration of too many plants in any particular area. In regard to the pharmaceutical and drugs industry, permission is given where the manufacture is from a basic material and the existing assessed demand is greater than the existing capacity available in the country. If the only operations involved are, however, bottling, tabletting, ampouling, vialling, etc., permission is generally refused.

Cement Industry

In regard to the establishment of the cement industry, the following aspects are taken into consideration. Adequate limestone deposits should be available near the proposed factory site. The availability of transport facilities is also taken into consideration for purposes of obtaining raw materials and distributing the finished product. The potential demand and the capacity already set up in a particular region are other guiding factors for the expansion of existing units or establishing new factories. However, if the proposed factory is able to compete in external markets, licensing is being favourably considered. The economic unit in regard to a cement factory is between 100,000 and 150,000 tons. The internal demand for cement is now estimated at about five million tons. The present installed capacity is placed at about 4,300,000 tons. Before the end of the first Five-year Plan, it is expected that the total capacity will reach very near the six-million-ton mark.

U.K.'S TRADE TRENDS

NET SURPLUS IN PAYMENTS POSITION

(From Our Own Correspondent)

London, 17th October

LONDON LETTER

THE third quarter of this year has reversed the trend running since a year ago towards steadily increasing imports. The monthly average on a c.i.f. basis has been £276 million, while, in the previous quarter, it was £292 million. But September, the last month included in the above figures, has shown an upward jump. The chief reason for the rise in imports has been a reversal of the general recession in trade of a year ago, with increased stocks moving to production and consumption. Price has accounted for a substantial part of this last quarter's drop. But, while imports have reflected the healthy state of domestic business, exports have been sluggish and have throughout this year stuck at a little under £220 million per month f.o.b. including re-exports. The September figures just published show that the daily rate in this month was lower than at any other time this year, so that, although the third quarter as a whole gives a trade deficit less than in the second quarter, for the month of September, it is at the very high figure of £60 million. If this figure were to persist month by month, the year would show a substantial overall deficit on trade account, but, fortunately, there are no indications that September is going to be typical even of the future.

The following table shows the trade picture for the first nine months of this year compared with the same period last year:—

(£ millions)

	1953	1952
Imports c.i.f.	2,500	2,690
Exports and re-exports f.o.b	1,969	2,036
Adverse trade balance ...	531	654

If a round 10 per cent. allowance is made for freight, then the amended balances become:—

(£ millions)

	1953	1952
Imports adjusted to f.o.b. ...	2,250	2,420
Net adverse visible balance	281	384

The year to date thus shows an improvement on trade account of approximately £100 million over last year. Allowing for invisibles, the first half of this year is estimated to throw up a surplus of about £85 million and the second half of this year of about £65 million. Both of these figures admittedly include a substantial slice of American defence aid, which amounted to some £53 million in the first half of this year. Nevertheless, the surplus is there.

It is clear, however, that, taking all items into account, this year is not going to be as good as last when (including U.S. defence aid) the surplus was £300 million. This figure is, in the Government's view, the amount needed annually to provide for external investment and for a steady rise in the gold and dollar reserves. Is it likely to be achieved again in the near future? Present world economic conditions are much more favourable to the U.K. than at any time since the war and if they so continue—as seems reasonable to expect—then there is a reasonable chance that 1954 will see the overall favourable surplus back to £300 million, allowing for some £70 million of American defence aid.

But the Chancellor is going to the O.E.E.C. shortly and he has indicated that he expects a much better reception than when he went before—to announce Britain's austerity import programme. This is a bull point for liberalisation and whatever Britain gives away to Europe in Paris will diminish the estimated surplus for next year.—*All Rights Reserved.*

TEXTILE MACHINERY EXHIBITION

A ten-day international textile machinery exhibition, the largest of its kind ever held, opened in Manchester on the 14th inst. Two notable features of the display are the effect of man-made fibres on machine design and the continued development of short-cut processing in the first stages of manufacture as a means to greater productivity. Machine designers have also made great headway in tackling the problems of end breakages and irregularities caused by inadequate preparatory cleaning. The exhibition features a wide range of accessories, including air-conditioning plant, power and transmission equipment, and a diversity of automatic counting devices.

LONDON MAYOR'S BANQUET TO BANKERS

FLEXIBILITY OF BANK RATE EMPHASISED

TO bankers anywhere in the world, and not in India alone, the speeches delivered at this year's annual banquet of the Lord Mayor of London to bankers and merchants of the City should prove as stimulating as those on similar banquets in the past. For it is well known that this is an occasion on which the Chancellor of the Exchequer makes a mid-year survey of the U.K.'s economic position and the Governor of the Bank of England, who rarely speaks in public on finance, gives expression to his views on the *important events* pertaining to his sector. Usually, the toast is proposed by the President of the Stock Exchange, who avails himself of this opportunity to take a critical view of the Government's economic policy.

At the Mansion House banquet held on the 14th inst. this year, the economic picture of Britain was painted over a broad canvas by Mr. R. A. Butler, Chancellor of the Exchequer. He summed up the position by saying "so far as I can tell, we are steering a fairly even course at present between the primrose path and the waste land." He said that the Budget had been designed to encourage greater production and the year had seen a significant expansion in this sphere. So far, revenue was upto expectations, and expenditure had run even. But the Exchequer outlay was less by £50 million. The *Bank rate had* been reduced and this was doing good and useful work as an instrument of monetary policy. Enlarging this point, he said: "We have recently shown that it is a flexible instru*ment.* I hope that you have understood and approved the actions of the authorities. I will not define the constituent parts of this olympian and anonymous power." Proceeding, he stated that *the reduction in the* Bank rate was followed by the loan operation which was wholly successful, and provided an opportunity to redeem floating debt.

The reduction in the Bank rate in Britain was *preceded by many moves.* These were clearly brought out by the Chancellor of the Exchequer in order to emphasise the point that "liberty is sweet and will yield big rewards." *Thus, food and all major raw materials* were restored to private trade and restrictions on consumption removed. General steel allocation was ended. Cereals, animal feeding stuffs, rice, *starch, linseed oil,* coffee and bananas were handed back to private trade. Tea, sweets, sugar and eggs were taken off the ration. Again, by returning all main industrial raw materials to private trade freedom was given to industries "*from many* irksome restrictions which bedevilled its efficiency." Import restrictions, too, were widely lifted, thereby encouraging reciprocal trade. *Cereals, softwood,* pitwood, most metals and petroleum were freed and could be imported from any source. Freedom was also given to great commodity markets such as the London Metal Exchange, so that the City of London might have the opportunity of re-establishing itself as the trading centre of the world to the great advantage of the country's balance of payments. Exports, too, kept up, and, in the first half of the year, the U.K. had a payment surplus on current account of £80 million. This, however, compared unfavourably with a corresponding surplus of £270 million in the whole year of 1952. But this lower rate was due to higher imports resulting from relaxation of import controls. In the third quarter as a whole, the Chancellor added, Britain and its partners in the sterling area had not done badly; they had *added $119 million* to their dollar reserves and that at a period "when there is always an adverse seasonal trend."

Restoration of Freedom and Flexibility

Restoration of freedom and flexibility to the *economy on* the economic as well as financial front, as stated above, was also alluded to by Mr. C. F. Cobbold, Governor of the Bank of England. Explaining how the freedom had benefited both the commodity and foreign exchange markets in London, he observed:

"The year has seen the reopening of various commodity markets; they are bringing business to this country which we can handle better than any other centre in the world. More goods from all parts of the world can be traded in London. More goods can be bought and sold for sterling. This is all helping to make sterling a more useful and desirable currency throughout the world and to increase our earnings from international trade and services.

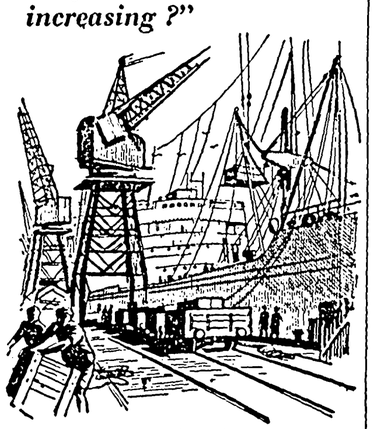
"On the financial side, the foreign exchange market in London is again operating efficiently, quoting close and competitive rates of exchange. Arbitrage facilities have been established between London and the leading Continental centres, in both spot and forward rates of exchange. Steps have been taken to ease the granting of credit facilities for the movement of goods.

"Thus, we have moved, and perhaps more rapidly than is generally supposed, away from the rigidities of war-time and of the immediate post-war years, to a system more capable, I believe, of standing up to whatever strains may develop. The City of London has been able to show that it has not lost its marketing skill in money, in goods and in exchange."

Consolidation of Currency Position

Summarising the country's progress in 1952, Mr. Cobbold stated that the year was one of steady, though not sensational, consolidation in the field of currency stability, the forging of closer links with the Commonwealth and the movement towards freedom in exchange, leaving much still to be done in each sphere. Besides, the year 1952, according to him, proved that, in *modern conditions,* monetary policy could still have a potent and helpful effect on the general economy. In 1953, this conclusion had been reinforced, he said. Although much had been written on the Bank rate and money rates, and though divergent conclusions had been drawn, Mr. Cobbold felt that the position resulting from the changes in monetary policy was more realistic. Influence could now be exerted, he said, more effectively in either direction—up or down, if such were found to be advisable. He was, however, not quite sure in which direction the change would come in *the coming months.* Sole reliance on changes in monetary policy in times when Government expenditure dominated the economic picture for restoring balance is to court disappointment and invite more troubles. Drawing attention to this aspect of the problem, Mr. Cobbold observed as follows: "The prominence given to changes in interest rates and to their effect over the last 18 months carries a danger with it—that too much may be expected of or left to, monetary policy. In these days, public expenditure—direct and indirect, central and local—is predominant in the economic picture as a whole. Monetary policy can only work effectively, if it is supported by, and is in line with, the general financial policy of the Government."

"Is your Overseas trade increasing ?"



With a network of almost 1,700 Branches in England and Wales as well as Agents and Correspondents throughout the world, Lloyds Bank has helped many of its customers to expand their overseas business as the Bank is specially equipped to deal with every aspect of overseas trade.

Let LLOYDS BANK look after *your* Overseas interests

Lloyds Bank Limited — Incorporated in England

LB/Gen—1953

These are sage words which students of economics, business men and administrators in this country will do well to note. There are some in this country who believe that all that has to be done to lift our drooping economy is to reduce the Bank rate. These persons should pause and reflect on these remarks of Mr. Cobbold.

Bankers Look to Further Cut in Bank Rate

Sir John Braithwaite, Chairman of the Stock Exchange, also touched upon the monetary policy in his speech. He stated that the City took the medicine of a 4 per cent. Bank rate cheerfully, because it believed in the Chancellor of the Exchequer and because it felt that there was a sure purpose and a realistic policy behind that action. He pointed out that the marked difference between the country's position as it was then and now was the measure of the Treasury's success so far, and welcomed the reduction in the rate to 3½ per cent. He, however, appeared to have not been satisfied with the reduction, for he pleaded for a further cut in the Bank rate. Thus he remarked: "We look with confidence, Mr. Chancellor, barring some stroke of fate which no one could foresee, for a further reduction, in your own good judgment and time, and we look for a budget next April which will take us some modest step further along the road to that lower taxation which is the key that will unlock so many of our problems and which will fully restore our credit and standing in the markets of the world."

Reduction in Taxes Necessary

The plea for a reduction in taxes made by the Chairman of the Stock Exchange found a champion in Mr. Cobbold. The vigorous manner in which he supported this plea is evident from his forceful expression thus: "The fact remains, and must be faced, that the present level of taxation is a danger to our industrial and exporting prospects. Industries must be kept modern and efficient; plants must be renewed, ships and aeroplanes must be replaced, factories must be re-equipped. All this must be paid for. It will be hard to maintain for long our efficiency and our competitive position, unless tax policy leaves more savings available to provide new capital and more profits to plough back into business. A high level of investment in industry is necessary at any time. To-day, with a changing world market and with increasing competition for exports, it is our life-blood."

Every word of Mr. Cobbold quoted above applies to this country, too. The only difference is that the relief in taxation in this country is needed not so much from the point of view of maintaining our export trade—though that is also important—as from that of stimulating more and more industrialisation without which there can be no improvement in the standard of living of the people of this country.

£5 MILLION LOAN OFFER TO INDIA

An offer of a loan of £5 million to India by the World Bank was revealed by Mr. Reginald Maudling, Economic Secretary to the British Treasury and leader of the U.K. Delegation to the Colombo Consultative Committee, at a Press Conference held at New Delhi last week. The loan is part of the £60 million which the U.K. has decided to release from its capital contribution to the World Bank for the development of Colombo Plan countries.

Mr. Maudling stated that the World Bank loan was in connection with the D.V.C. and steel projects. The Government of India was, according to him, considering the offer. He did not know whether the Government would finally accept the offer and whether it needed the amount, as till now the Government had not been able to utilise fully the release from the sterling balances. He, however, believed that, with a rise in the development expenditure, India would find use for all its sterling balances and even more. Interest on the proposed £5 million loan would be at the normal rate of the World Bank, he added.

Official reactions to Mr. Maudling's revelation of the loan offer indicate that the acceptance of the loan by the Government would be deferred until the source of supply of the equipment to be purchased was known. An official spokesman of the Government is reported to have pointed out that the World Bank had already made two loans for the projects referred to by Mr. Maudling, one of $19.5 million in January this year for the Damodar Valley Corporation and the other of $31.5 million in December last for the Indian Iron and Steel Company, Ltd., the total being of the order of (in sterling) £18.2 million. The British Government's offer of £5 million, when accepted by India, would enable the World Bank to make part of these loans in sterling currency and would help India avoid, to that extent, the repayment of loan in dollars. He stated that India did not need the loan of £5 million outside the two loans already taken.

Perhaps one of the reasons why the Government of India is chary of accepting this offer is the fact that the rate of interest which it will have to pay on this loan will be higher than what it earns on its sterling balances with Britain. So long as India has enough sterling balances, there is no point in taking sterling loans through the World Bank. In other words, the need for such a loan will arise only when India's sterling balances come down to an irreducible minimum.

PROVISION OF AGRICULTURAL CREDIT

SOME USEFUL SUGGESTIONS

By SARDAR MOHAN SINGH, Managing Director, Bank of Patiala, Patiala)

AGRICULTURE *is the* mainstay of a vast majority of the population of India. In spite of such predominant position in the economy of the country, agriculture is, at the moment, the most backward of all occupations in this country. The problem of rural indebtedness which was considered to be one of the shackles on the progress of rural masses has no doubt received some attention from the Government during the past four decades, but the little that has been done in this respect has not yet touched even the fringe of the problem. As far as *the problem* of rural credit is concerned, it needs bold and imaginative handling.

Despite the mechanisation of agriculture and use of modern methods based on scientific advancement in the field of land improvement and cultivation in other countries, Indian agricultural methods, for the most part, are still very primitive. Due to the continuous increase in population every year, it is imperative to expand proportionately the agricultural production of the country and to achieve this it is essential to reorientate our methods.

It is heartening to find that, in the Five-year Plan, the development of agriculture and its allied problems of irrigation, etc., have been assigned the major portion of the expenditure envisaged by the Plan. For the reorientation of agriculture, on a long-term basis, however, and its proper development, the farmer has to be assisted by way of long- and medium-term credit which the present institutional machinery cannot do. With the liquidation of the local moneylending agencies, namely, the village *sahukar*, the farmer finds it difficult now to arrange for even short-term credit. The commercial banks, due to the nature of their deposits, cannot afford to block their funds in long-term investments. Specialised agencies for this purpose, with their specialised methods of raising funds and investing them are, therefore, most essential.

Land Mortgage Credit In Other Countries

Such specialised agencies exist in all European countries like Germany, France, Switzerland, Denmark, Norway, Sweden, Ireland and England. Similar facilities are also provided in the U.S., Canada, Australia, New Zealand, South Africa and Japan. Even Burma and Ceylon have such institutions. There are, of course, variations in their set-up in the different countries, but all of these have more or less the following features common to them:

1. Special legislation has been passed by the countries concerned to bring these institutions into being in order to regulate and facilitate their operations.

2. They work under the close supervision of the Government and receive adequate assistance from them. Most of the countries have contributed funds liberally from State revenues, without interest in many cases, to these institutions.

3. Their working is dovetailed into the working of other departments directly connected with the rural economy. In the U.K., for instance, the Ministry of Agriculture and Fisheries has given free grants to the Corporation for development programmes and, with the aid of these grants, the Corporation is able to charge on its advances interest rates lower than those at which it is able to float debentures.

4. The bonds or debentures issued by the Corporations are usually guaranteed by the Government.

Pattern of Land Credit Institutions

There can be two types of land mortgage institutions, namely, Federal and Unitary. In view, however, of the enormous size of the country, neither the Federal nor the Unitary structure can suit India. A via media will, therefore, have to be devised in the form of regional organisations. Of course, so far as the particular region, is concerned, it will have to be a Unitary unit.

The results achieved by the co-operative movement in the country, generally speaking, have been far from satisfactory, as, in the village primary units, nepotism and favouritism are usually rampant. This retards proper development of these institutions. The credit facilities, therefore, naturally are very much restricted. Illiteracy of the peasant is another important obstacle in the growth of co-operative machinery with which local elements could be associated and constantly consulted. Except in the States of Madras and Bombay, the land mortgage banks have not developed to any appreciable extent. It is, therefore, necessary to make an attempt at organising some other institutions on lines which have been tried in other countries and found successful.

During my tour of the West last year, I had an occasion to study the working of such institutions in many countries, but more intimately the system of land mortgage finance in the United Kingdom. The Agricultural Mortgage Corporation Ltd., in England, was set up under the provisions of the Agricultural Credits Acts of 1928 and 1932, with an authorised capital of £750,000, subscribed between themselves by the following banks:

Bank of England; Barclays Bank Limited; District Bank Limited; Glyn Mills & Co.; Lloyds Bank Limited; The Manchester and County Bank Limited; Martins Bank Limited; National Provincial Bank Limited; Westminster Bank Limited; and Williams Deacon's Bank Limited.

In addition to the capital thus raised, the Government has offered the Corporation £1,800,000 free of interest for 60 years. There is a provision for the further increase of this amount to £2½ million.

Long-term Loans

Long-term loans for a maximum period of 60 years are granted by the Corporation for purposes of agricultural improvement to owner-occupiers and landowners and so long as the borrower complies with the terms, the loan cannot be called up or in any way disturbed until the end of the period of the loan. The Corporation has only one office in London. All the necessary formalities are carried out free of any charge or obligation by the shareholding banks. Interest is charged at 5½ per cent. per annum only with half-yearly rests. From time to time, the Corporation issues debenture-stock against mortgages in its hands in order to raise further funds.

The Absolute Order creates in favour of the Corporation a charge which has priority over every other existing and future charge and encumbrance, except quit rents, Crown rents, chief rents, and other charges incidental to tenure, tithe redemption annuities, charges created or to be created under Acts authorising advances of public money for improvements, and any prior charges created under the Acts relating to the improvement of land.

Purposes of Loans

The Corporation grants loans for the following purposes:

1. Erection and reconstruction of cottages required for occupation by agricultural labourers essential for the proper cultivation or agricultural holdings.

2. Erection, replacement, and reconstruction of farm buildings (including cases where the work is necessary to comply with the requirements of the Milk and Dairies Regulations, 1949) essential to the proper cultivation of an agricultural holding.

3. Drainage, including pipe draining and mole draining, and straightening, widening, or deepening of drains, streams, and watercourses, on agricultural land, in order to maintain or increase food production.

4. Provision of essential water supply in connection with an agricultural holding.

5. Enclosing, straightening of fences; re-division of fields which includes provision of fencing essential for the proper management of an agricultural holding.

6. Making of farm roads and farm bridges essential to the working of an agricultural holding.

7. Irrigation, warping, and reclamation of agricultural land.

8. The erection, replacement and reconstruction of farmhouses and other residential houses essential for the proper management of farmland or the working of an agricultural holding.

9. Works required for the installation of electricity for lighting and power purposes in farm-houses, farm cottages and farm buildings.

10. The planting of fruit trees and the clearing of land therefor.

11. Provision of means of disposal of sewage.

12. Construction of permanent silos.

13. Provision of permanent sheep-dipping accommodation.

Regional Corporations for India

As I have stated above, India is too big a country for one institution of this type to serve the entire country. The system of land tenures, means and methods of cultivation and the set-up of the villages is different in the various States. The recent agrarian reforms which differ in every State have made matters still worse. Therefore, it will be advisable to divide the country into more or less homogeneous units and set up independent corporations for each unit. For Northern India, the zone may comprise the States of the Punjab, P.E.P.S.U., Delhi and Himachal Pradesh.

In order to meet the requirements of all types of credit needed by the farmer, it would be necessary for this organisation to work in close co-operation with the other agencies providing the credit needs of the farmers. So far as P.E.P.S.U. is concerned, the Bank of Patiala could play a very significant and useful role by entering an arrangement with the Corporation on the lines of the share-holding banks in England. It can easily disburse the loans sanctioned, collect the loan instalments and provide the requisite facilities to the officers of the Corporation or assessors and valuers. Its mobile offices can play an important role in this respect. Similarly, the other commercial banks could also play a very useful role.

The Punjab State have recently organised a Finance Corporation. This very organisation could be adapted to serve the purpose. It could be divided into sections, one dealing with industrial and the other with agricultural credit. As it happens, no State organisations have so far been set up in P.E.P.S.U., Himachal Pradesh and Delhi for providing industrial finance. The area of operation of the Punjab Corporation could, therefore, easily be extended to these States after putting through the necessary legislation. The advantages of the same concern looking after both industrial and agricultural credit are obvious.

National Service

The Agricultural Mortgage Corporation of England has not paid any dividend since it was set up. When, during the course of my conversation on the subject with the Chief Executive of one of the "Big Five" in England, I touched upon this subject, he promptly replied that it was a national service and that the subscribing banks were motivated by the larger interests of the country. This is a wonderful gesture on the part of English bankers and I wish the bankers in this country, too, were guided by similar patriotic considerations.

Our farmer, particularly in the Punjab(I), is second to none in the world, provided he gets similar facilities. During my visit to California last year, I was very happy to meet our Punjabi farmers some of whom own ranches as big as 2,500 acres. As a result of their hard, honest and conscientious work, they have converted waste arid deserts into beautiful green fields. My visit to the Imperial Valley in California brought to me memories of the old Canal Colonies, now in Pakistan, where our farmers have left indelible imprints of their enterprising spirit, hard and patient work. During my recent visit to West Punjab, some prominent landlords of Lyallpur actually confessed that they missed the Sikh farmer, the like of whom they cannot find. With the improved power and irrigation facilities on the completion of the Bhakra Dam Project, the only thing needed will be the provision of medium and long-term agricultural credit in order to develop the tremendous natural resources, which include the wonderful human material that we have at our disposal, in order to develop the economy of this region to its maximum.—*All Rights Reserved.*

DEBATE ON STOCK POSITION IN TEXTILE MILLS

CENTRAL ADVISORY COUNCIL FAILS TO GIVE CORRECT LEAD

TO those who expected that the Central Advisory Council of Industries would give a correct lead to the textile industry, its deliberations must cause some serious disappointment. The debate was no doubt informative, in that it resulted in a statement by the Commerce and Industry Minister, Mr. T. T. Krishnamachari, who gave some more details about the closure of mills and the consequent unemployment than had been indicated in these columns. But it is a pity that the Council could neither suggest nor arrive at decisions which would help relieve the mills of the accumulated burden of cloth stocks. Surely, the Council's tripartite structure ought to have enabled it to take or at least help the Government take appropriate measures for solving the problem.

Lala Shri Ram, the leading industrialist, was certainly not indulging in fanciful exaggeration when he suggested at the meeting that, if the offtake, which had not increased in October, continued to remain at the current low levels, there would be a "crash" in the industry before the end of the year. But another leading industrialist, Mr. G. D. Birla, thought that it would be better to wait till the end of the year in order to assess the gravity of the "stocks" position. Mr. Kasturbhai Lalbhai, the Ahmedabad millowner and industrialist, made a very important point when he said that the demand for cloth had failed to respond even to the 40 per cent. cut in prices effected since May this year.

The official reaction to the mills' problem of accumulated stocks was expressed by Mr. T. T. Krishnamachari and Mr. Gulzarilal Nanda. The former was, however, content with a mere statement of the figures relating to the closure of mills. He said that 14 mills had given notice of closure, involving 8,510 workers. Of these mills, two had already closed down, resulting in a loss of employment for 1,400 workers. The stocks with the mills ranged from 4 to 18 weeks' production. If Mr. Krishnamachari did not offer any remedy for the industry's ills—he merely suggested that at the root of the problem lay the decontrol of cloth, though the problem would have arisen just the same whether there was control or not—his Cabinet colleagues, Mr. Nanda, was distinctly less helpful. Mr. Nanda deplored that on the one side there was the complaint that the country did not produce enough consumer goods but, when production did increase, the industry was faced with the accumulation of stocks. He described the situation as "tragic." And yet, when one comes to think of it, the real tragedy lies perhaps less in the accumulation of stocks than in the Government's failure to provide a solution for the industry's manifold problems, of which the accumulation of stocks is only one, though a very disturbing, phase.

In any case, there is no truth in the allegation, made by certain labour leaders, that the mills have wantonly put up closure notices or are otherwise exaggerating the gravity of the situation. It does not, of course, do anybody the least good to draw an unduly dark picture of the textile stocks position. So far as the closure of the mills is concerned, no mill, as Mr. G. D. Birla pointed out, really wants to close down, because that means "greater loss than running the mill." It would, however, be wrong to be complacent about the situation. A little complacency might have been justified if the problem was confined to one centre only. Actually, it seems to be a more widespread malady. Apart from the situation in the Bombay State, to which reference was made in these columns recently, the Madhya Bharat textile region reports accumulation of stocks to the tune of 33,836 bales, valued at about Rs. 2.37 crores, despite the fact that prices have been reduced by 10 to 20 per cent. In Madhya Pradesh, nine out of the eleven mills in the State, it is stated, held, as on 1st September, 1953, about 17,370 bales of cloth and about 3,400 bales of yarn. These stocks are stated to be the "highest level of uncleared stocks on record during the past three or four years, representing well over 2½ months' production." Textile mills in Kanpur have 42,670 bales of cloth and 6,145 bales of yarn, valued at Rs. 4.17 crores. Large stocks of yarn are reported to have accumulated in South Indian mills. In the face of this evidence, it is idle to pretend that the situation does not warrant a more dynamic approach than a mere "wait and watch" attitude.

It must, however, be conceded that the textile offtake has improved somewhat in the last two weeks. Up-country dealers are effecting seasonal purchases of coarse-medium varieties. That some satisfactory demand might develop in the near future is the hope expressed by the cloth dealers who ought to be in a position to estimate the offtake. At least, the rot seems to have been stemmed, in that there has been no further reduction in prices during the past few days. The bumper harvest, which has been reported in more than one agricultural commodity, is itself an encouraging factor which should lead to a better offtake of cloth. But it is also recognised that there is support only at the current floor levels and that any increase in prices would definitely stiffen consumers' resistance.

It is now felt, more strongly than ever, that, if distress sales are to be prevented, the Government should change its attitude to the imposts on the industry. Some of the forms in which the Government could grant relief to the industry have been stressed in these columns ere now. Apart from the relief in the shape of reduction in excise duty and the substitution of single-point sales tax in place of the present multi-point sales tax, which the Government could give, there are other lines along which equally urgent action needs to be taken. Some mills, for instance, have suggested the suspension of the regulation which insists that 80 per cent. of a mill's production should be packed and sold in a limited period.

In the sphere of export trade, the Government has so far announced two measures. In the first place, it has permitted, till the end of this year, the diversion of the cloth, which is manufactured for domestic consumption but not price-stamped, to export markets. But exporters point out that, unless a satisfactory procedure for the refund of excise duty, already paid on this cloth, is evolved the measure may not yield satisfactory results in the shape of export transactions. It should be easier to evolve such a procedure now than in the past since the excise duty is a specific duty, and not collected on an *ad valorem* basis as formerly.

The second measure, which the Government has announced in order to stimulate export trade, is the announcement of the export quota for yarn. The Government has announced its decision to allow exports of yarn by mills or their nominees on the same basis as was followed during the period January to June, 1953. Many exporters, however, feel that, if the announcement had been made a month earlier, it would have been possible to book some business on better terms, since the prices offered for Indian yarn were better then than now. Again, it is felt that the basis on which the exports are allowed is not conducive to a larger export trade in yarn. This basis, it may be mentioned here, rests on the allotment of export quotas to mills in accordance with a certain proportion of the deliveries of cotton yarn made by the mills to the domestic market. It is a pity that an export quota should be based on delivery of cotton yarn to the domestic market, although the concerned mill may never have had export connections, while established exporters of yarn are denied the facilities for the export of yarn. It would appear that the quotas allotted to certain mills in the first half of the year actually lapsed because the mills could not effect any export trade. In view of these limitations, these two measures cannot be of any great value to the mills burdened with cloth stocks.

On the larger question of the export trade in cloth, in general it seems necessary to reiterate the stand that the Government should take a realistic decision on the question of export duty. Already, the frequent rumours relating to the abolition or reduction of the duty are telling upon the export trade. The question must be viewed in the light of the altered conditions in the domestic and overseas markets. Exporters are no longer in a position to pay a premium on their purchases of cloth from mills. Actually, the mills are willing to sell their cloth to exporters at below ex-mill prices. Thus, the mills are anxious to dispose of their cloth as speedily as possible. It is true that so far exports this year have been somewhat better than in 1952, despite the continued closure of the Pakistan market and the general recession in textile trade. But the Burma market is a shrinking market for Indian textiles, thanks to the revision of tariffs at that end. Also, Japanese competition is developing rapidly.

In these circumstances, the Government will be well advised to anticipate events in the textile field, and take a correct decision now, rather than allow itself to be forced into a decision at a later date through the turn of events in the world textile markets. But a more pressing problem, which deserves to be tackled urgently, is the question of the refund of the import duty on raw material in the case of exports of cloth manufactured out of foreign cotton. Since Japan and India's other rivals in the overseas markets do not have to pay such a duty on raw cotton—these rivals also import cotton for manufacturing purposes—Indian fine and superfine cloth suffers from an initial handicap in these markets. The least the Government should do is to allow a drawback on exports of such cloth to the extent of the import duty on cotton.

BRITISH TEXTILE INDUSTRY'S EFFORTS TO IMPORT WORKERS FROM ABROAD

SALE OF COTTON MILL CONTEMPLATED

(From A Special Correspondent)

MANCHESTER, 13th *October*

MANCHESTER LETTER

AT the official sessions of the Cotton Board's conference at Harrogate this week-end the discussions will range over export problems in Africa, the industry's raw material, union relationships with the employers and the general economic scene. Outside the conference hall, however, a constantly recurring theme among the delegates will be the labour position and its likely effect on future prospects for Lancashire trade.

Conditions vary in different localities and the situation is not as bad in some areas as in others. Yet the overall picture is one of an industry struggling against odds caused by idle machinery which cannot be restarted owing to lack of man-power.

There is increasing pressure for a revival of a central scheme to recruit labour, if necessary from outside this country. Already individual firms are making their own arrangements to import workers from abroad, either from Ireland or European countries. There is, however, a limit to what can be accomplished in this way. And the attitude of the trade unions is bound to be defensive, in view of the local workers who might still be induced to return to the trade.

Many of these former operatives either lack confidence in the ability of cotton to provide them with unbroken periods of employment or they are hanging back in the hope that wages and conditions will show a further improvement before they can be persuaded to resume life in the mill. In some districts competition for operatives is so keen that managements are forced into adopting special measures to extend amenities for their workpeople.

The emphasis is now so strongly upon the ability to offer early delivery of goods that those firms with well-manned machinery are in an advantageous position. Without the stimulus of such generous profit margins then prevailing, some sections of the trade are already well back on the road towards the conditions of two years ago.

Shift Work

In an effort to raise output, evening shift work has restarted in some mills and this would seem to be the nearest approach the cotton industry can make to the recommended adoption of double shifts. Faced by such an appalling shortage of labour on a single shift the introduction of two shifts would require not only a social revolution in an industry employing so many women but a vast reorganisation scheme to halt a large proportion of the machinery involved so as to run the rest twice as long.

Far-reaching plans of this calibre are occasionally proposed but, human nature being what it is, few people can be expected to recommend the possible closing down of their own mills even if it means that the remainder will run more effectively. Little has been heard of any tangible move to extend shift working since consultations took place earlier in the year.

A number of leaders of the industry may be in favour of the scheme in principle but in practice it must be a very slow process of development. Many divergent views on the subject are known to be held by prominent traders. It is to be hoped that an opportunity of hearing some ideas on how to improve recruitment and gain more labour for the mills will be provided at Harrogate for the immediate outlook for the trade hinges on this vital question.

Foreign Workers

Protests that in some Lancashire weaving mills British girls lost their jobs while Continental girl workers were kept on during the cotton industry's textile slump were made last week by Weavers' Amalgamation leaders.

They will voice their protests again at a specially summoned meeting with millowners on 20th October, called to discuss future recruitment of foreign workers for Lancashire weaving mills.

A Weavers' Amalgamation spokesman said feelings were still "running high" over incidents in which Lancashire girls lost their jobs first. Employers would now be asked to enter into a new joint agreement covering the employment of foreign workers in weaving mills. This new agreement would lay down clearly that in the event of redundancy foreign workers must be the first to go. "Such an agreement already exists in the spinning industry," said the Weavers' Amalgamation spokesman.

Weaving millowners claim that union leaders have taken unilateral action in putting a ban on further foreign workers. Individual Lancashire mills are planning to "import" more Continental mill girls to speed orders and restart Lancashire plant standing idle because of the industry's acute labour shortage.

Unemployment Falls

Fewer British cotton operatives are out of a job than at any time since November, 1951. Latest Ministry of Labour returns show that at Mid-September little more than 2,000 Lancashire mill workers were idle—slightly less than when the first signs of recession were detected.

The strides made by the industry on the road back to prosperity are indicated by a comparison of the current out-of-work figure with that for 12 months ago when 37,200 operatives were affected by mill closures and temporary stoppages.

A Ministry of Labour spokesman in Manchester disclosed that 6,000 vacancies in cotton mills had been reported to employment exchanges in the region. Of these, 4,200 were in the spinning section, 1,700 in cotton weaving sheds and 400 in finishing.

Mill Grouping Plans

A new phase has opened in a £2,000,000 textile deal which the organisation controlled by Cyril Lord, 42-year-old textile chief, is planning to launch before the end of the year.

The Directors of the Soudan Mill Co., Ltd., the Middleton spinning firm, have announced that the offer of 18s. per 5s. unit have been made by Cyril Lord Ltd. In a circular to stockholders they advised acceptance of the offer which remains open until 24th October, and will be effective if supported by more than 90 per cent. of stockholdings.

The prospective buyer is, therefore, prepared to pay nearly £864,000 for the two working mills owned by the Soudan Co., and the two other mills which have been stripped of machinery. The Cyril Lord organisation has undertaken to continue operating the mills as at present and the interests of the workpeople will be safeguarded.

Purchase of the Soudan Mills would add a further 160,000 spindles to the machinery already controlled by the Cyril Lord group, bringing total spindleage involved to around 430,000 together with 3,300 looms. Mr. Lord, whose original business was based on Northern Ireland, has become one of the most dynamic textile personalities since the war. Since 1949 he has obtained control over the Lily Mills, Shaw, the Devon Mill, Hollinwood, Brook Mill, (Leyland) Ltd., the Ken Mill, Whittle-le-Woods, and the Greenfield Mill, Chorley. Earlier this year he took over chairmanship and control of H. Ledgard (Silmyra Fabrics) Ltd., owning the Queens Mill and Embroidery Mill at Preston.

Want Jap Ban

"Considerable anxiety" about the possible admission of Japan to the General Agreement on Tariffs and Trade was expressed in a resolution by the International Federation of Master Cotton Spinners' and Manufacturers' Associations, the text of which was released this week. From its Manchester headquarters the International Federation represents the interests of cotton employers in more than a dozen countries.

Referring to the tariff discussions which have been taking place at Geneva, the resolution says that the International Federation has taken into account the differences in standards of living which exist between Japan and other exporting countries and is convinced that these are so acute and substantial as to constitute a threat to stability in international trade.

The resolution goes on: "Even in pre-war conditions when every country was to a greater extent free to pursue its own policies, Japanese trading methods and practices led to disruptive competition which intensified a tariff war and seriously reduced the volume of international trade. The consequences in a situation in which so many countries would be inhibited from immediate defensive action could be disastrous."

Testing Plant Deal

A contract for equipment worth £65,000 for a new cotton testing laboratory at Alexandria has been signed by Mr. A. Naguib, Under-Secretary for Cotton Affairs in the Egyptian Ministry of Finance, with Platt Brothers, the Oldham firm of textile machinery makers.—*All Rights Reserved.*

EXPORTS OF INDIAN COTTON

LOWER DUTY DEMANDED

THE Government has announced, as is now well known, an export quota of 175,000 bales of the 1953-54 crop of short-staple cotton, consisting of Bengal Deshi 75,000 bales, Mathia, Kalagin and Dholleras, 50,000 bales and C.P. I, C.P. II, Central India Deshi and Oomra Deshi 11/16" and below, 50,000 bales. The announcement has been welcomed by the cotton exporting interests, particularly because it has been made promptly enough—that is, early in the current season. Indeed, there was a repeated demand for the early declaration of export quotas. They are also impressed by the official announcement that the present quota is not a final one, since they feel that there is scope as well as need for a larger quota for the export trade.

There has, however, been much dissatisfaction among exporters over the fact that the Government has not yet thought fit to reduce the export duty on cotton, particularly the duty on non-deshi varieties. The question has been taken up both by the East India Cotton Association (E.I.C.A.) and the Cotton Buyers Association. In a representation to the Government, the authorities of the E.I.C.A. have acknowledged the "prompt action" taken by the Government in the matter of the early release of the export quota. But they point out that it was not possible to complete the last season's quota, because it was found, in practice, that the duty of Rs. 200 per bale prevented a larger export trade from taking place. They admit, however, that it was possible to complete the quota for Bengal Deshi in view of its being a "monopolistic variety." But the incidence of the duty on Oomras-Dholleras, it is held, is on the "high side." In this connection, they have quoted a few illuminating figures in regard to the price-trend of foreign varieties of cotton which compete with Dholleras-Oomras in the overseas markets. It will be recalled that the duty on these varieties was reduced from Rs. 400 per bale to Rs. 200 per bale in March, 1952. Between March, 1952, and October, 1953, the prices of those varieties of Pakistani cotton, which compete with Oomras-Dholleras, have declined by Rs. 700 per candy. The prices of similar varieties of Brazilian cotton have declined, over the same period, by Rs. 600 per candy and those of Burma cotton by Rs. 200 per candy.

Need for Lower Duty

The authorities of the E.I.C.A. have, therefore, contended that it is impossible to export the non-deshi exportable varieties of Indian cotton unless the duty on these varieties is reduced. They suggest that the duty should be reduced at least to Rs. 150 per bale. They have further rightly urged that, since these varieties of cotton do not enjoy a protective floor, it would be unfair on the part of the Government not to adopt such measures as will facilitate their absorption by foreign markets.

A similar representation has been made by the Cotton Buyers Association. This Association recalls that the Government has already reduced or abolished export duties in a number of instances wherein circumstances justified such reduction or abolition. It holds that the case for reduction in the present export duty on Oomras, Dholleras and other exportable varieties "carries much force." It will be recalled that in November, 1952, the duty on Bengals was cut from Rs. 200 per bale to the present level of Rs. 125 per bale, but no such reduction was made in the duty on other exportable varieties of slightly longer staples. The Association points out that, although Bengals, being a "class by itself," can stand the export duty of Rs. 125 per bale, Oomras, Dholleras, etc., cannot bear such a high duty as Rs. 200 per bale which forms 60 to 75 per cent. of the price of these varieties. Moreover, the world textile situation has "now changed very drastically, giving way to buyers' market conditions." Also the lower growths of Brazilian cotton which are comparable to Oomras and Dholleras are now available at rates at which the latter, loaded with the heavy export duty of Rs. 200 per bale, cannot compete effectively with them. It has accordingly urged that the Government should review the position and adjust the present export duty on Oomras and Dholleras in "such a manner as to make them competitive with other foreign growths available in India's overseas markets." The Association has suggested that the rate of the duty on these two varieties should be reduced at least to the level of Bengals, namely, to Rs. 125 per bale.

Both the representations have made out a clear case for the reduction of the duty on non-deshi varieties of exportable cotton. The Government, it is to be hoped, will take an early and favourable decision on this question.

INDIAN COTTON

There is a fear in cotton circles that cotton prices might slump heavily if no action is taken by the Government to help maintain cloth production at the present high levels. The consumption of Indian cotton has averaged about 3 lakh bales in recent months. But it is rightly felt that the continued maintenance of this level of consumption will depend on the adoption of a sound cloth policy. Since the Government has given no indication of its desire to adopt such a policy, the cotton market has been showing signs of sluggishness. Already, the turnover of cotton firms, it is stated, has declined by 60 per cent. The demand for long-staple varieties, which are used by the Indian mills, is stated to be poor. This trend, it is feared, will be accelerated with the approach of the time for the movement of the new Indian crop into the market, that is, by about the middle of next month. This is the first time in the last seven years that cotton interests have been perturbed over the outlook for cotton. In recent years, the Government's chief concern was only to prevent the piercing of ceilings for cotton.

In this context, the reported decision of the Government of India to allot to the mills for the 1953-54 season the same quota as was given to them in the 1952-53 season is to be welcomed, for this will probably lend some support to the sagging cotton markets. This decision, it may be mentioned here, is in conformity with the reported recommendations of the Central Advisory Board which met early this month in Bombay. The Board, it is stated, suggested that the present quota system and zonal system should be suspended. If this suggestion was unacceptable to the Government, then the mills should be allotted, with immediate effect, cotton equivalent to 100 per cent. of their consumption of Indian cotton during the season 1952-53. It also recommended that the mills should be permitted to purchase their requirements in any part of India, that is, the zonal system should be suspended. Again, the Board recommended that the mills should not be compelled to consume as much foreign cotton as they did in the past, particularly in view of the easier supply position of Indian cotton. It, therefore, suggested that the mills which ask for increased allocation of Indian cotton should be given such increase upto 50 per cent. of their consumption of foreign cotton during the year 1952-53. Other recommendations of the Board included the abolition of the system of transport permits for movement of cotton from one State to another and the increase in the export quota of cotton from 175,000 bales to 275,000 bales.

The Government has now accepted only a part of these recommendations, namely, the suggestion for the allotment of 100 per cent. quota to the mills. Judging from the fact that the Government has not taken any action on the Board's suggestion for the removal of zonal restrictions, it would appear that the Government wants to keep these restrictions in force for the present.

WORLD COTTON SUPPLY POSITION

In our issue dated 3rd October, we reviewed the supply of cotton in the free world, as estimated by the International Cotton Advisory Committee. Since then, the figures relating to the world supply and distribution of cotton—that is, inclusive of the supply position in the communist countries, namely, the U.S.S.R., Eastern Europe and China—have become available, thanks to the compilation of such statistics by the Committee. The Committee estimates the world supply of cotton in the 1952-53 season at 50.5 million bales, as against 47.3 million bales in 1951-52.

The following table gives the supply and distribution of cotton in the 1938-39, 1951-52 and 1952-53 seasons:

(In 000 bales*)

	1938-39	1951-52	1952-53 (e)
Supply:			
Stocks as on 1st August (b) ..	25,200	11,600	14,900
Production	29,500	35,700	35,600
Total ..	54,700	47,300	50,500
Distribution:			
Consumption (c)	30,600	32,300	33,500
Destroyed (d)	200	100	200
Stocks on 31st July (b)	23,900	14,900	17,000
Total ..	54,700	47,300	50,500

* Bales of 478 lbs. net except for running bales for the U.S.
(a) Preliminary. (b) Includes estimates for cotton afloat.
(c) Includes estimates for non-commercial consumption. (d) Estimates of cotton burned or otherwise destroyed or unaccounted for.

THE NEPTUNE ASSURANCE COMPANY, LIMITED

NEED FOR GOVERNMENT-SPONSORED REINSURANCE CORPORATION

SHETH AMRATLAL KALIDAS'S SPEECH

PRESIDING over the Twenty-second Ordinary General Meeting of the Neptune Assurance Company, Ltd., held at Bombay, on 20th October, 1953, Sheth Amratlal Kalidas, Chairman of the Company, emphasised the need for a Government-sponsored reinsurance corporation. He argued that if such a corporation were started and the companies were asked to cede a particular proportion of their surplus business before reinsurance is effected elsewhere, it would lessen the drain on the country's foreign exchange resources.

The following is the text of Sheth Amratlal Kalidas's speech:

"GENTLEMEN,

"The report of the Directors and audited accounts for the year 1952 have been with you for some time and I expect you will permit me to take them as read.

"The progress of the life department of the Company has continued to be satisfactory. The completed business shows an improvement of Rs. 50,000 and stands at a figure of Rs. 42,63,250. The life fund stands at a figure of Rs. 93,11,539 showing an addition of more than Rs. 6,00,000 over the figure of last year. I am sure that before the close of this year the life fund will reach its first crore mark.

"The 'Saving Clock Insurance' scheme has again been reintroduced after a lapse of about 15 years. The licence granted to us for the import of saving clocks was very small. Our efforts to secure bigger licence have not yet met with any success in spite of the fact that the saving clocks have been accepted as the best medium for encouraging middle and working class people to go in for insurance. The additions to the funds of insurance companies are bound to help the Government in the successful implementation of the Five-year Plan. We have again approached the Government to liberalise our quota of import of saving clocks and I am sure that if we are permitted to import larger quantities of clocks which, by the way, are not being manufactured in this country, our business will show a marked improvement.

Handsome Bonus

"The triennial valuation for the period ending December, 1951, disclosed a very decent surplus enabling the Company to declare an interim and reversionary bonus of Rs. 10 per thousand per year on whole life policies and Rs. 8 per thousand per year on endowment policies. The declaration of this handsome bonus will also help the field workers in securing more business for the Company as bonus payment will make our policies more competitive.

"Coming to the general departments, there has been a fall in the direct premium income in the fire and accident departments. This is due to the falling commodity prices and bad harvest all over the country during last year. Expense ratio under the Insurance Rules has been fixed on the direct premium income. While the premium income has gone down the expenses have remained the same and in some cases have gone higher. The new grades and the gratuity scheme, in addition to the provident fund system for the staff, were introduced early in 1952 and the consequential addition of approximately 25 per cent. over the salaries had its full effect on the Company's working during the year 1952. The higher wages bill has shown an increase of 2 per cent. over the last year's ratio and has only slightly crossed the limit. The management and the staff decided early in 1953 to make a voluntary cut in the salary bill and I hope that in the year 1953 the expenses of the general department also will be much lower than in 1952.

Need For Reinsurance Corporation

"There was a big drain on our income by way of reinsurance premium ceded to our foreign Treaty companies. We have now been able to secure reciprocation from our Treaty friends and I am sure that it will go a long way to improve the figures of our profit and loss account. Here, I must make a reference to the need for a Government-sponsored Reinsurance Corporation. The Code of Conduct is so framed that no big business is displaced. Bigger insurance companies, with a few exceptions, having the bulk of big business, are more in favour of exchanging business with foreign reinsurance companies than to cede business to their Indian colleagues. Perhaps, it may be considered an act of narrow nationalism if a State Reinsurance Corporation is started and if the companies are asked to cede a particular percentage of their surplus before reinsurance is obtained elsewhere but it will be worthwhile as there will be smaller drain on our foreign exchange and that will help the smaller and medium-sized companies in establishing themselves. This is the practice in many South American and other countries.

"The Estate Duty Bill has come into force from the 15th of this month. The exemption of Rs. 5,000 on insurance policies cannot be considered as a provision satisfactory to afford the needed impetus to the people to effect savings through insurance policies. Encouragement of life insurance savings, which has been recognised as the best means for the community at large in order to effect savings, small and large alike, should have been given by more liberally providing for exemption limits for life insurance policy amounts in the Estate Duty Bill. The exemption limit of Rs. 5,000 for life insurance policies has to be considered as too small.

"Before I conclude, I would like to thank the members of the staff and the field workers of the Company for their sincere co-operation during the year."

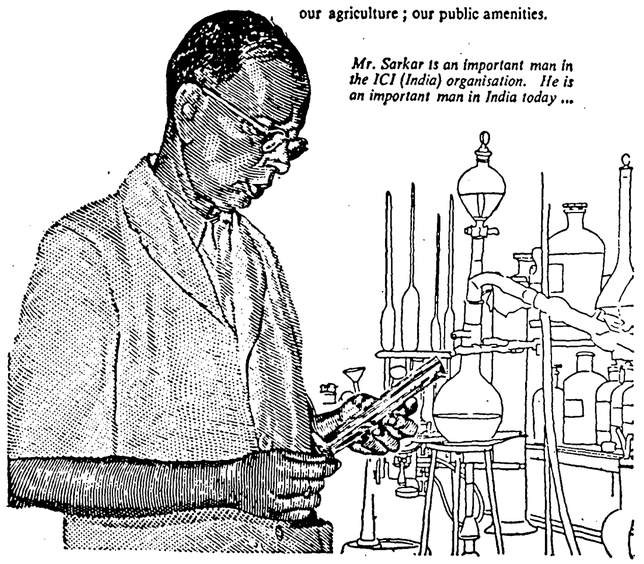
The Philippines Government has now permitted all non-life insurance companies operating in the Philippines, to conclude reinsurance treaties with non-admitted foreign companies on the conditions that (i) the reserves corresponding to the re-insured part are set up in the books of the company and (ii) that the full amount of the reserve fund required under section 186 of the Insurance Act is kept in the Philippines as long as the risk concerned is in force, and (iii) that the State Insurance Commissioner is furnished with the annual statement of accounts of the assuring company as at the end of its fiscal year preceding the reinsurance agreement—within four months from the date of the said agreement and annually thereafter within four months of the end of the fiscal year of the reinsurance company. The annual statement should be duly certified by the Philippine Consul in the place where the reinsurer is located or if no Philippine consul is available by an American consul.

Various proposals for compulsory insurance, it is stated, are being considered by the Belgian legislature. The legislature is concerned to see that no victim of a road accident, caused by a motor vehicle, shall be without compensation. To that end all mechanically-propelled vehicles other than those on rail will come under the new Act. The duty to insure will rest with the proprietor of the vehicle and the insurance must be for an unlimited amount and must not be subject to a franchise. Naturally, there will be recourse to the negligent motorist, but the insurer who can in no case invoke a franchise clause or any other clause which might invalidate the policy as regards the assured. Insurance can be taken out only with an authorised company which is a member of the Motor Insurers Bureau which has created a guarantee fund that will compensate injured third parties in all cases where the insurance cover is inoperative.

Chemicals take Command

Today Chemicals are playing an increasingly vital role in practically all aspects of our life. Heavy and fine chemicals are necessary to make the wheels of our industries go round ; chemical fertilizers to help us grow two ears of grain where one grew before ; pharmaceuticals to defend us from fevers and diseases.

Mr. N. N. Sarkar, who is seen here, is the Chief Chemist in our Technical Service Laboratory in Calcutta. He has been with us for about 20 years. He works to solve the many varied and difficult problems that the ever-increasing use of chemicals naturally raises. His work and its results impinge on all aspects of our national life and every one of us. It helps our industries ; our power projects ; our agriculture ; our public amenities.



Mr. Sarkar is an important man in the ICI (India) organisation. He is an important man in India today ...

... contributing to India's progress and prosperity

SUGAR FACTORY AREAS IN DECCAN

MOVE TO BRING THEM UNDER PANCHAYATS ACT

THERE is a proposal by the Government of Bombay to include the sugar factories in the local area of villages, under the Bombay Village *Panchayats* Act, 1933. Such a move is resented by the factories, for it would create new difficult problems. The Government has so far not given the reasons for sponsoring this proposal. It has even rejected outright suggestions for considering individual cases of sugar factories wishing to be exempted from the Act.

Although the Village *Panchayats* Act has been in force for the past 20 years, it has so far not been applied to most of the areas in which the factories in Maharashtra are situated. This has not resulted in any loss to the villages concerned or to factory employees. The object of a village *panchayat* is to carry out certain local needs of a very simple and elementary nature, such as supply of water, construction of roads, public lighting, sanitation and the like. Most of the sugar factories are not only providing all these amenities at their cost, but also other facilities such as education and entertainment, physical training, technical education, markets, co-operative societies and stores, which no village *panchayat* has dreamt of providing even if its resources are large enough for providing these facilities. Consequently, so far as the population living together in blocks within these industrial areas and working in the factories are concerned, there is no need for bringing them under the Village *Panchayats* Act.

Taxes

If the factories are brought under the purview of the Bombay Village *Panchayats* Act, the position will be different. In such a case, the factories will be subject to taxes under the Village *Panchayats* Act meant to be used for the facilities to be provided to villagers. The factories will be absolved from the obligation of providing any facility to its employees. For few can expect a factory to provide these facilities and at the same time continue to pay the taxes imposed by the village *panchayats*.

The Village *Panchayats* Act is not designed to facilitate the *panchayats* to deal with such large-scale problems of finance and management as would devolve on them, if the factory areas were included within their limits. One of the more important sources of income to a village *panchayat* is tax on the owners or occupiers of houses, including farm buildings. Normally speaking, the income of a village *panchayat* is a few thousand rupees and the *Panchayats* Act itself is so framed as to secure this income needed by the *panchayat*. If factory areas are included, taxes on houses and premises where machinery is run, even if levied on a modest scale, will run into huge amounts, because the cost of these buildings is several lakhs of rupees. It will, certainly, be beyond the ability of *panchayats* even to arrange for the valuation of these premises or to ascertain their rateable value.

Village *panchayats* have also power to impose octroi and taxes on sales of goods. When the Act was framed, these taxes were expected to provide a part of the finances needed by the *panchayats*. The Legislature, it would appear, never contemplated the inclusion of sugar factories under the jurisdiction of *panchayats*. The value of goods produced and sold in these areas amounts to crores of rupees. Their inclusion will change the whole structure of the village *panchayats* radically. As the village *panchayats* are elected, the calibre, ability, vision and intellect of those who are likely to be elected as members of the *panchayats* may not be of a nature as to discharge their responsibilities efficiently.

False Analogy

There is often a tendency to draw an analogy between the case of sugar factories situated in village areas now proposed to be brought under the jurisdiction of the Village *Panchayats* Act, and that of industries situated in large cities like Bombay, Ahmedabad, Poona and Sholapur. It is argued that industrial premises in these cities are not excluded from the jurisdiction of local bodies like municipalities or corporations. This analogy is false, for there is no similarity between these two cases. In the case of cities, the area occupied by industrial buildings forms a very small part of the total area under the jurisdiction of the municipalities or corporations. There is very little of industrial housing attached to the factories. The factories form small islands in big cities and cannot be separated. Again, most of the workers, numbering thousands or even lakhs, live scattered within the municipal jurisdiction in rented houses, where the municipalities are required to cater to their needs such as roads, lighting, sanitation, health, education, etc. The factories in the cities do not undertake the provision of all those primary necessities of life to workers as their counterparts in the villages of the Deccan. In these circumstances, it is but natural that the factory areas cannot be excluded from the municipal rules and regulations.

The case of sugar factories in Maharashtra is, however, entirely different. Each factory, together with its farms, constitutes more than a village. The population directly dependent on these factories outnumbers generally the population depending on other avocations. All their needs which the *panchayats* or the municipalities are supposed to supply are, as pointed out earlier, being provided by the factories' management at their own cost and on a very much larger scale. It is, therefore, not only convenient but necessary to exclude the factory areas from being brought under the operation of the Village *Panchayats* Act, if and when *panchayats* happen to be established in the villages of which they technically form a part.

Administrative Difficulty

There is a further difficulty in the case of the sugar industry in Maharashtra regarding their proposed inclusion within the jurisdiction of village *panchayats*. Some of the factory areas cover not only more than one village but cut across, in some cases, the boundaries of two talukas or even two districts. Administratively also, therefore, inclusion of these areas in the simple village *panchayats* will create a number of complications and difficulties for the authorities and a good many insurmountable difficulties for the managements of the factories and people living in the factory colonies. Similarly, the functioning of *nyay panchayats* and the exercise of the civil jurisdiction vested in these bodies are also likely to be not only inadequate and difficult to exercise, if not impossible, but might further prove to be very detrimental to the running of the industry.

In the light of the above facts, the Deccan sugar factories contend that the proposal to bring the sugar factory areas under the Village *Panchayats* Act is full of complications. They argue that there is time even now for the Government to carefully consider the implications of its move before coming to a final decision. Under the Act, the Government has powers to exclude specified areas from the rest of the village and to declare that these areas shall cease to be a village. They suggest that, under this exemption, the Government can conveniently exclude factory areas from *panchayat* control.

SUGARCANE WAX

Waxes derived from animal and vegetable sources find wide application in industry. They have become industrially important not only as protective coatings and polishes but also as essential ingredients of products such as carbon paper, stencils, paper and textile aids, inks, photographic preparations, cosmetics, pharmaceuticals, lubricants, electrical insulating agents, flame-proofing agents, etc.

The natural waxes are widely distributed in nature but their extraction, on a commercial scale, is limited to those which can be gathered in quantity and those which are easily obtained or to those which possess outstanding qualities which justify their extraction, irrespective of the cost of extraction. In recent years, there has been an increasing demand for sugarcane wax for various industrial applications. Indian sugar mills crush about 15,000,000 tons of cane annually from which about 45,000 tons of wax can be obtained.

Sugarcane wax occurs as a thin white layer on the exterior of the stalks of cane. Indian cane is reported to contain 0.34 per cent. wax. When cane is milled and the juice clarified, the wax is concentrated in the press cake. From the press cake, the wax can be easily extracted by a common organic solvent. Alcohol seems to be the ideal solvent under Indian conditions, as it is abundantly available. Though extraction of wax by alcohol, under normal conditions, is not satisfactory, extraction at higher temperature and pressure or use of mixed solvents such as ethyl alcohol and ether gives satisfactory results. The crude wax as no direct industrial value. Depending on the nature of application, the wax has to be further refined or modified.

A review article appearing in the October issue of the *Journal of Scientific and Industrial Research* deals with the occurrence, composition, extraction, and refining of sugarcane wax, and indicates the type of extraction plant that is suitable for use in India.

ESTABLISHMENT OF NEW SUGAR FACTORIES

IS THERE NEED FOR REGIONAL RESERVATION ?

LAST week we dealt with two problems facing the Deccan sugar factories, namely, the inadequate supply of, and excessive rates of taxes on, water, to which Mr. Gulabchand Hirachand referred in the course of his address to the Tenth Annual Convention of the Deccan Sugar Technologists' Association held at Harigaon (Belapur) recently. These, of course, were not the only aspects of the sugar industry covered by Mr. Gulabchand. Another important subject which received his attention on this occasion, but to which we could not refer for considerations of space, was regulation of the establishment of new sugar factories on a regional basis. The issue he raised was whether there was need for such control in the case of the sugar industry.

Mr. Gulabchand deprecated regional allocation of permits for the establishment of new units, when certain regions are not in a position, for various reasons, to avail themselves of the quota of new factories reserved for them. It is true, he admitted, that considerations of defence strategy, as well as those arising from overcrowding in cities require that the industrial units should not be located at vulnerable places. These factors, according to him, however, do not operate in the case of the sugar industry, as it is almost exclusively established in the rural areas and away from ports and busy industrial centres. There is, therefore, in his view, no need for trying to spread out sugar factories into areas, where capital is not available for such enterprise, even though agricultural conditions might be suitable. Proceeding, he said: "It would certainly be better to allow factories to be set up in places, where people are ready to put up the required capital and where supply of cane is assured, than to import sugar from abroad, while waiting for these quotas for various States being fulfilled at some future date."

Pertinent Observations

These observations of Mr. Gulabchand are, indeed, pertinent. It is true that regional development of sugar factories is a desirable and necessary measure in a country of long distances like India, where periodical regional sugar crises are a common phenomenon, owing chiefly to transport bottlenecks. Such a development will further facilitate orderly dispersal of the factories over the length and breadth of India. But, if capital is not forthcoming in a particular region, and, consequently, the region is not in a position to take advantage of the quota of factories offered to it, there does not seem to be any valid reason to refuse permission to allocate the quota to any other region, where capital is available. When adequate capital is forthcoming in the other regions, permission can be granted to them. There need be no fear of overproduction. For consumption of sugar is not static. It rises as the standard of living increases. This is evident from the increase in consumption of white sugar in recent years. Moreover, in the long run, it is desirable to replace production of *gur* with white sugar, as the former is a terrible waste of national resources. Readers are aware that, in the process of *gur* making, the recovery of sugar from the cane is poor, the machinery used by *gur* makers being inefficient. Quite a lot of energy-giving juice is left behind in the cane which is allowed to dry and then used as fuel. If all the sugar needs of the people were to be met through white sugar, there would be no need for the country to grow as much cane as it is doing at present and thus quite a large part of the area under sugarcane can be diverted to production of food or other crops. In any case, if it is found that, as a result of the other tropical areas in the country taking to production of sugar, there is an undisposable surplus, the number of units in the North could be reduced by compelling the closure of the uneconomic units in those areas. After all, it is a long-established fact that the sub-tropical regions in the North are relatively unsuited for growing sugarcane, as compared with the dry tropical tracts in the South. And in any scheme of national planning provision must be made for the utilisation of land on scientific lines.

The Tripartite Conference of the Uttar Pradesh sugar industry authorised Dr. Sampurnanand, Labour Minister, on the 13th inst., to appoint a committee to determine the rate of bonus to workers for the 1952-53 season. The committee will consist of four representatives each of the employers and the workers with the Labour Commissioner as Chairman.

STOWING IN COAL MINES

CAN SAND BE SUBSTITUTED?

THE question of stowing in coal mines, for safety and conservation, with materials other than sand, has been engaging the attention of the Coal Board for some time past. The latest reports indicate that the Board, with a view to encouraging stowing with materials other than sand, has invited applications for assistance. The move is to be welcomed, as the utility of stowing, by whatever method it may be, as a means of not only conserving coal but also preventing accidents and mishaps, needs no emphasis.

We are told that stowing can be practised successfully with the mixture of a reasonable amount of sand, ash, clinker and colliery rejections. Even the presence of small quantities of combustible materials in ash or clinker will not, it is stated, render the materials unsuitable to stowing. At present, hydraulic stowing with crushed stones is being effectively practised in Angarpthra colliery; this colliery is utilising stone and debris of the goafed areas for stowing purposes. This process is said to have helped the colliery in recovering lost coal from the goafs. There are certain other collieries which are stowing with a mixture of sand and ash on a 50-50 basis. A few others are said to be using properly sized and crushed rejections with a high proportion of water for stowing, but they have built stoppings as a precautionary measure to isolate the areas stowed in cases of emergencies.

Stowing in coal mines with materials other than sand is of particular importance to collieries. For sand stowing is costly, although sand has been found to be the most suitable material for stowing and lends itself particularly to hydraulic stowing. Sand has to be transported over wide distances. At times, the distances are so vast that the use of sand for stowing purposes becomes uneconomic. In fact, the cost of transport of sand to areas where it is needed most for stowing is a formidable obstacle to the widespread adoption of stowing, despite improvement in the methods of transport as, for instance, the aerial ropeway system. Again, although the availability of sand is for the present considerable, it is not unlimited. The sand that is removed from river beds for stowing is replaceable only by floods. The rate at which it can be replaced is a factor which is entirely beyond human control. This factor, as well as the cost of transport, clearly points to the need for suitable cheap and abundant materials to replace wholly or partially sand for stowing purposes. It is only when suitable substitutes for sand, wholly or partially, are discovered that stowing can be effectively carried out on a large scale.

Unfortunately, stowing is not practised in the majority of collieries in India for obvious reasons. Consequently, vast quantities of coal, especially high-grade and even metallurgical, are being wasted through the ordinary process of mining or improper stowing. If the present situation persists, it is feared that, in the next few years, quite a few million tons of coal will be lost. The loss of coal owing to inadequate stowing is estimated at as high as 50 per cent. of output; in Jharia coalfields, the loss is estimated to be even more. It is, needless, therefore, to emphasise that steps should be taken as early as possible to make stowing applicable to all mines and on a large scale.

I.L.O. COAL MINES COMMITTEE

The fifth session of the Coal Mines Committee of the International Labour Organisation will be held at Dusseldorf, in the Federal Republic of Germany, from 30th November to 12th December, 1953. The agenda before the meeting will be as follows:

(1) General report, dealing particularly with: (a) action taken in the various countries in the light of the conclusions of the previous sessions of the Committee; (b) steps taken by the office to follow up the studies and enquiries proposed by the Committee; (c) recent events and developments in the coal-mining industry; (2) productivity in coal mines; and (3) social welfare facilities and services in the coal-mining industry.

India is a member of this Committee. Each delegation to the Committee may include two Government representatives and two representatives each of the employers and the workers. The delegates may be accompanied by advisers but their expenses will have to be borne by the organisations concerned. Employers' and workers' representatives will be nominated in agreement with the most representative of their respective organisations.

INTERNATIONAL TEA AGREEMENT

FUTURE DEPENDS ON GOVERNMENT OF INDIA'S POLICIES

THE concluding part of the F.A.O. commodity report on tea, to which a reference was made in our previous two issues, not only throws fresh light on the International Tea Agreement but raises an issue of considerable significance to India, as the chief producer of tea in the world, and on which the future of the International Tea Agreement depends. It involves the very principle by which international commodity agreements are bound. A study of the Tea Agreement on the basis of the F.A.O. report is topical, in view of the reported move to change the basis of assessing crops in tea estates in India, for the first time since the original standard crop quota was fixed for individual estates in 1933, as also of the suggestion by some for increasing the export quota for the season 1953-54 from the present level of 122 per cent. of the standard export figure in order to meet the large demand for tea. These moves, coupled with the relaxation of restriction on the output of tea by the tea gardens in North India are indicative of the producers' desire not to exploit consumers, taking advantage of the International Tea Agreement.

Tracing the origin of the International Tea Agreement, the F.A.O. report says that the first Tea Agreement was brought about by the crisis in the world tea industry of the early thirties. The crisis was the outcome of the coincidence of two forces. One was the large increase in tea output stimulated by the favourable prices that ruled in the twenties; the supply was further aggravated by the improvement in collection methods. The second force was the onset of world depression in 1929-30. The combined effect of over-production in a depression period was a drastic fall in prices of tea to unremunerative levels. Naturally, tea producers were concerned more with the question of prices than with that of maintaining the volume of exports. The Indian and Ceylon Producers' Associations, therefore, readily agreed to consider the proposal made by the Amsterdam Tea Association at the end of 1932, to regulate the exports of tea. In February, 1933, the first International Tea Agreement was signed by the representatives of the producers' associations of India, Ceylon and the Netherlands East Indies.

Operative Provisions of the Agreement

The operative provisions of the Agreement were: (1) regulation of exports by reference to "standard exports" in 1929-31, and (2) cessation of new planting in participating countries during the life of the Agreement, except in defined special circumstances and to a prescribed limit. Regulation of exports was to be undertaken through Governmental action in signatory countries. A memorandum of recommendations attached to the Agreement provided for collection and publication of statistics on production, consumption and exports; for study of the progress or regression of tea consumption and the reasons therefor; explorations of ways and means of increasing consumption; and for prohibition of the export of tea seed from regulating countries. The internal administration of the scheme was carried on in the three regulating countries by legislation enacted by the respective Governments. The efforts made to associate the other producing countries (China and Japan) with the scheme were, however, not successful.

During the life of the first agreement, the Governments and tea producers of Kenya, Uganda, Tanganyika, Nyasaland and Malaya agreed to support the scheme partially, in that they undertook to support it only to the extent of limitation of planting in accordance with special circumstances in each country. During the life of the second agreement, 1938-43, the Governments of African territories enacted legislation for regulation of exports also. It was also arranged that planting of tea in Malaya should be limited to an area sufficient to provide for internal consumption only. After the partition of India, Pakistan readily joined the scheme. The scheme is now governed by the representatives of the four main producing countries, namely, India, Pakistan, Ceylon and Indonesia.

The establishment of export quotas under the Tea Agreement during the years 1933-37 at an average of 85 per cent. of the standard exports and the knowledge that quotas could and would be reduced any time, if prices fell substantially, were largely responsible for the rise in prices during that period. Control was greatly facilitated by two factors. First, production was concentraed in what were then British and Dutch colonial territories. Secondly, most of the production was by European-owned estates, organised in strong associations. The quotas were extraordinarily effective; actual exports from regulating countries were constantly up to the permitted quotas. Regulating countries were, however, somewhat concerned over the danger of losing markets to non-regulating producers; for the exports from the latter increased. But the virtual prohibition of export of seed from regulating countries, lack of suitable land, labour or capital resources and other factors rendered it difficult for other non-member countries to expand production to any large extent.

Reasonable and Moderate Policies

As a result of the Agreement, while tea prices in 1933-38 were higher than otherwise would have been, the F.A.O. report recognises the undeniable fact that the industry followed reasonable and moderate policies. "It might be argued," the report adds "that, in so far as the Agreement made possible maintenance of employment and wages in the producing countries of very low living standards (as compared with tea importing countries), it had much to commend it. However, the distribution of benefits in agreements of this sort, as between the various sectors of the industry, is exceedingly complicated, and much depends on the nature of the local social and legislative frameworks."

So far as the industry was concerned, the result of the Tea Agreement, the F.A.O. points out, was that it was spared of the economic problems faced by other industries and the necessity of making painful adjustments. "The live and let live policy," it comments, "enabled practically all established producers to continue in existence, including many small units, with relatively high overhead costs." In the face of these prosperous conditions, the F.A.O. goes on to observe, the industry took little effort to simplify the corporate structure of estates and reduce the consequent high administrative costs. That was not all. There was no incentive to seek ways and means of reducing production costs through introduction of high yielding varieties and better agricultural practices, such as existed in, say, the sugar industry. This is a definite charge against the tea producers and it will be interesting to know what reply they have to offer.

Tracing the working of the Agreement during the post war years, the F.A.O. comes to the interesting conclusion that, whereas the Agreement was beneficial to producing countries during the pre-war years by giving support to tea prices, it did not give such support since the war, particularly in the last two or three years. This was partly due to the liberal quota policies followed by the International Tea Committee. In contrast to pre-war years, when quotas, as was pointed out earlier, effectively limited exports from signatory countries, the annual quotas since 1947 have been on an average of 31 per cent. above exports.

Future of the Agreement

On the future of Tea Agreement, the F.A.O. has some significant observations to make, which the Government of India and tea producers in India would do well to take note of. It says:

"At present, the future of the Tea Agreement is uncertain. Much will depend on the policies which will be pursued by the Government of India, which has shown increasing interest, for internal socio-economic reasons, in expanding tea production by small farmers and in developing bilateral arrangements for increased marketing of Indian tea. Serious differences may emerge concerning future quota policies, especially in view of the price and marketing developments of the past year or two. Expansion of production in non-member countries, if continued, might enhance the difficulties of regulation, although this is not likely to become a serious factor in the foreseeable future, since most of the new areas are colonial territories where production is carried on by European-owned estates."

It is contended by some that the International Tea Agreement is only an agreement between the four main producing countries and that it is, therefore, not truly international in

(Continued on page 785)

STOCKS OF JUTE GOODS IN SEPTEMBER

POSITION SLIGHTLY BETTER

THE stocks of manufactured goods with Indian jute mills, at 118,373 tons as on 30th September, 1953, show a decrease of abcut 15,000 tons over those at the end of August, 1953. In fact, they are the lowest for any month since December, 1952, when they stood at 114,938 tons. The stock position at the end of each month since December revealed an upward trend, which persisted till May, 1953, when the stocks stood at as high a level as 138,789 tons. After declining to 133,840 tons in June, they rose again to 136,807 tons in July this year. Since that month, however, there has been a steady fall to 133,459 tons in August and still further to 118,373 tons in the month under review.

The decline in the month under review should not, however, be regarded with complacency, as the stocks are still 16,887 tons higher than those in September, 1952. A point to be noted here is that the mills are not only not working with full complement but are working shorter hours per week. Until the mills are able to despatch what they produce in a normal working week of 48 hours with none of the looms sealed, there is need for caution in judging the state of the industry.

There are, however, some distinct signs of improvement in the outlook for jute goods. Total despatches during September are estimated at 88,100 tons which are stated to be not only a record for the current year but far better than the month's production at 73,100 tons. Reports indicate that, with the reduction in export duty on hessians last month, Continental manufacturers are being priced out by Indian mills. America is now showing greater interest in the Calcutta market than in recent months. The U.S. burlap consumption in September is placed at 80.4 million yards, as against 74.8 million yards in August. It is also anticipated that Australia and New Zealand will shortly appear on the scene as buyers of Indian sackings, as stocks of high-priced goods there have been depleted. While thus the position is improving, it is rather disquieting to hear that labour in the jute industry is getting restive and threats of strike are being made in order to enforce its demand for bonus. In the existing financial position of a number of companies, such a demand, if conceded, would cause a big dent in their cover, already rendered thin by trading losses for several years.

The table below shows the position of the various types of stocks of jute goods in each of the three months ended September, 1953 and as at the end of September, 1952:

	As on			
Civil	30-9-53	31-8-53	31-7-53	30-9-52
Hessian	36,125	41,468	44,403	30,967
Sacking	79,203	83,938	89,216	54,881
Others	2,162	1,834	1,681	1,078
Total ..	117,490	132,240	135,302	86,926
Government				
Hessian	536	517	537	1,515
Sacking	347	699	933	3,045
Others	..	3	35	..
Total ..	883	1,219	1,505	4,560
Grand total ..	118,373	133,459	136,807	91,486

From the table above it will be seen that the fall in total stocks has been shared by both the principal types of goods, namely, hessians and sackings. Hessian stocks have gone down from 41,985 tons in August to 36,661 tons in September, 1953, and sacking stocks from 89,637 tons to 79,550 tons. The fall in hessian stocks is significant considering that, during the month, the output of this variety rose by as much as over 3,000 tons. In the output of sackings, too, there was an increase of about 2,000 tons.

Production of jute goods in September, 1953, as compared with that of the preceding month, was higher by 4,759 tons. Thus, it rose from 68,138 tons in August to 73,097 tons in the month under review.

The table below shows, at a glance, the output of the various categories of goods at the end of September, 1953, as compared with that in the preceding two months as also in August, 1952:

	As on			
Civil	30-9-53	31-8-53	31-7-53	30-9-52
Hessian	32,701	30,056	33,465	22,831
Sacking	36,611	34,671	39,964	43,569
Others	2,636	2,420	2,496	2,971
Total ..	72,038	67,146	75,925	69,371
Government				
Hessian	821	637	1,892	99
Sacking	239	302	518	525
Others	..	3	15	..
Total ..	1,059	902	2,425	624
Grand total ..	73,097	68,138	78,353	69,995

ASIA'S ELECTRICITY PROBLEMS

SUGGESTIONS BY E.C.A.F.E. CONFERENCE

THE Electric Power Conference, held under the auspices of the United Nations Economic Commission for Asia and the Far East, which concluded its five-day session at Bangkok, on the 9th inst., discussed Asia's electricity problems. Representatives from Burma, China, France, Pakistan, the Philippines, the U.S., Cambodia, Japan, Thailand, the U.S.S.R., the U.K., Korea, Malaya, British Borneo, Brunei, Sarawak and Viet Nam and Laos were present at the Conference. Observers from the F.A.O., the W.H.O., the International Chamber of Commerce and the International Confederation of Free Trade Unions also attended the Conference.

At the outset, the delegates to the Conference urged top priority to the development of electric power projects, including rural electrification. This is only as it should be, for although more electric power is now being generated than ever before, the demand for industrial and domestic power has been growing at a rate much more rapid than the increase in the rate of supplies, with the result that many urban areas in Asia are still starved of electricity. The position in respect of villages and small towns is still worse, for electrification of rural areas in most Asian countries has hardly started.

According to the E.C.A.F.E.'s *Power Bulletin* submitted to the Conference, the progress of electric power generation in some of the important countries of Asia in recent years is as follows:

(1) India commissioned, early in 1953, one of the largest thermal plants with a capacity of 150,000 kw.;

(2) considerable diesel capacity was installed during the past 18 months in Indonesia. It consists mainly of 24 generating sets of 1,000 kw. each, and two sets of 1,500 kw. each. A small hydro plant with a capacity of 4,500 kw. is under construction;

(3) according to a semi-annual power survey conducted in October, 1952, the peak load in Japan is expected to increase from an estimated 7.8 million kw. in 1952 to 10.4 million kw. in 1957. If generation capacity grows as planned, the capacity of power systems at the time of the annual December peak-load should increase from approximately 6.3 million kw. in 1952 to 8.9 million kw. in 1957 under medium hydro conditions.

Japan's requirements (on the basis of unrestricted use of power) exceed the annual energy output for 1952 by almost 11 per cent. This deficiency, although gradually decreasing, is unlikely to be eliminated before a considerable expansion of the present construction programme can be carried out;

(4) the major works under construction or contemplated in Pakistan aggregate some 135,000 kw. to 235,000 kw. of hydro plant in 1951-57. As much as 10,000 kw. of hydro power were completed in 1951, and another 25,000 in 1952 or a little later. Installation of 140,000 kw. of thermal plant is planned, including some 35,000 kw. of diesel plant;

(5) an additional 7,000 kw. of thermal power and 30,000 kw. of diesel plant were installed in Bangkok (Thailand) in 1952-53;

(6) in the Philippines, construction on a 23,000 kw. hydro plant to supply a fertiliser factory is well advanced. Work is also proceeding on a very large installation, which is ultimately to provide 175,000 kw., the first stage involving 75,000 kw.;

(7) in Singapore, a 72,000 kw. thermal plant was commissioned early in 1953, with an ultimate capacity of 152,000 kw. A very serious power shortage in Singapore has already been relieved, as a result of this plant coming into operation; and

(8) in Taiwan, the local power company is implementing a 5-year plan (1953-57), which provides for the addition of 14 generating plants with an aggregate capacity of 300,730 kw., of which 214,750 kw. will be hydro and 86,000 thermal. Some of the plants are already under construction and one plant of 53,000 kw. is to come into production in 1953.

Need for a Grid System

A notable feature of the Conference was its strong recommendation for establishing an integrated power system, which would link the existing hydro-electric with the thermal systems. There can be little dispute with this recommendation, for the grid system guarantees the most efficient exploitation of the available power sources, ensures a more reliable and uninterrupted supply of power and provides the consumer with power at the minimum cost. Again, within the framework of the integrated power system, the potential minor supply sources such as wind power, tidal power, etc., can also be made use of. Consequently, it is necessary that, in all existing electrification programmes, provision should be for the establishment of a grid system, as recommended by the experts. It may be noted, in this connection, that, in the U.K., a super grid of 275 kw. was recently established, in addition to the then existing grid of 132 kv. Russia, according to the Soviet representative, who attended the Conference, has adopted a transmission voltage of 400 kv., over a distance of some 900 kilometres, whereby a transmission capacity of 600,000 kw. is achieved. In the U.S., the American Gas and Electric Company is constructing a grid of 345 kv., which will be commissioned next year.

In order to facilitate electrification in rural areas, the delegates suggested that the Asian Governments themselves should take a hand in building power stations and encouraging increased electricity production and supplies by subsidising existing power stations. The electricity tariffs in rural areas should not, the delegates agreed, exceed those in urban areas, despite the high cost of supplies. The system of two-point tariff was generally considered as the best form of tariff suitable for rural areas. This system provides for a fixed basic power charge (the kw. charge) and the energy consumption charge (kw.h. charge). These recommendations are timely, because enough capital is not forthcoming for development of electricity supply, for the return in the initial period is either nil or restricted. The merits of the case for subsidising private enterprise either as an alternative, or in addition to State enterprise, deserve to be carefully studied. Further, unless electricity is supplied to rural areas at the same rates as to urban areas, it will be difficult to popularise use of electricity in rural areas for the development of rural industries.

Utilisation of Lignite

The Conference considered in detail the question of utilisation of the rich lignite resources of the region. Suggestions were made for adjusting existing boilers and other equipment to the burning of lignites, but it was pointed out that much extra expense could be saved, if expert personnel were to be associated with the exploitation of lignite from the start of the project. The utilisation of lignite in Asia is of great importance, because, except in India and China, almost all the other countries are suffering from acute shortage of power resources. Many of them are, however, endowed with large lignite deposits which can be exploited for making good the shortage in their power resources. The deposits are at least equal in quality, if not superior to those of some of the countries outside Asia, where lignite is now being exploited extensively on an economic basis.

The Conference considered a standard contract form, drawn up by the Electric Commission for Europe, for the supply of plant and machinery for export as far as it affected electricity supplies. A special study, published in the E.C.A.F.E. *Electric Power Bulletin*, draws attention to substantial savings that can be achieved in some cases by utilising heavy residual fuel in diesel electric sets. It suggests that expert assistance may be made available, on request, from the U.N. Technical Assistance Administration. The Soviet Union has made a limited offer of technical assistance to Asia and the Far East in the field of integrated power development and rural electrification. It has invited definite proposals, indicating the practical form this assistance could take.

IRRIGATION PROJECTS

The Government of India has appointed a committee to enquire and report on measures necessary for the efficient operation and maintenance of construction plant and machinery used on river valley projects. The Committee will visit the major projects now under execution in the country, namely, the Bhakra-Nangal, the Sukhrawa Dam, the Damodar Valley, the Hirakud, the Tungabhadra, Lower Bhavani, Gangapur and Vaitarna. The Committee, which is expected to submit its report to the Ministry of Irrigation and Power by 10th December, consists of the following members:

Mr. K. Gopala Iyengar, retired Superintending Engineer, Tungabhadra Project, Madras; Mr. B. H. Lundmark, Mechanical Engineer attached to the Nangal Project and Mr. E. R. Harvey, Colombo Plan Specialist attached to the Hirakud Dam Project (member); and Mr. G. G. Dhanak, Public Works Department, Bombay (member-Secretary).

The Committee will make recommendations on standardisation of the makes, types and sizes best suited for various kinds of work, the combination and matching of plants where more than one unit is involved and the correct apportionment of labour. It will also make suggestions regarding the mode of calculation of the working cost of each type of plant per hour, compute unit cost of work performed by each type of plant during the last working season on the various projects and explain the variations in costs. It will draw up a unified rate of depreciation to be followed on all projects, standard forms for the history sheet and log book of each type of plant and machinery and the various factors involved in efficient operation, emphasising the adverse factors responsible for low output and poor maintenance on the various projects. Further, it will make a comparative study of the cost of the work executed through machinery with that done by manual labour. In the light of this investigation, it will make recommendations regarding the type of work which should normally be carried out with machinery.

HOUSING IN INDIA

RURAL CELL ESTABLISHED

THE Ministry of Works, Housing and Supply may be said to have made a big stride forward in its march towards the consummation of the rural housing programme by the formation of what is known as a Rural Cell in New Delhi. The Cell is intended to design suitable houses for different village areas in the country, keeping in view the availability of local building materials and climatic conditions. The Cell consists of one town planner-cum-architect and one assistant engineer and a senior architectural draftsman. The plans, which the Cell will evolve for the various rural areas, will be transmitted to villagers through the Community Projects Administration (C.P.A.) which, with its administrative staff, will encourage them to adopt the designs.

The need to set up such a Rural Cell arose out of a reference to the Ministry by the authorities connected with rural housing for the advice of its technical officers on problems of rural housing. In one case, where such advice was sought by the C.P.A., the Ministry's technical officers had to make an intensive study of the local conditions, constructional methods and materials before giving their opinion. The reference was made to the Ministry, because the Housing Adviser to the Ministry is also the Adviser to the C.P.A. regarding rural housing. It is common knowledge that the comprehensive development programme of the C.P.A. includes improvement of rural housing standards and, for this purpose, the C.P.A. has earmarked Rs. 75,000 for expenditure on housing in each project area. Loans are advanced to families when a village is remodelled. Direct subsidies are given for clearing wells, providing drains and erecting platforms around one or two big trees in the villages concerned to serve as community centres. The principle underlying the problems of improvement of housing standards in rural areas is, however, self-help.

Experimental Unit

The Ministry has also set up an Experimental Unit, consisting of one executive engineer, one assistant architect, one assistant engineer, and one compiler, and has attached it to the Planning Circle of the Central Public Works Department. The function of this Unit will be to draw up plans, estimates and detailed specifications of the various types of buildings on the basis of changes considered desirable by experts. It will also prepare notices, inviting tenders, study their rates and analyse the cost of building before and after construction. An intensive supervision of construction of buildings and investigation into the manner in which the buildings would withstand sun, rain and wind over a considerable period will also be one of the functions of the Unit. After observations, the Unit will recommend for general adoption designs, plans and specifications of the various types of buildings.

The intention in establishing this Unit is that a certain percentage of the new houses to be constructed by the Central Public Works Department in Delhi should be according to specifications based on the latest research. If these experiments stand the tests of durability and serviceability, they will be adopted for regular construction. The necessity for such a Unit was felt on account of the intense desire in the country to reduce the cost of construction of buildings to the minimum. It is true that the Government had set up several committees to suggest ways and means to achieve this end, but their recommendations were only of a general character.

Further, considerable research in building practices all over the world, including India, has been in progress, but most of the results achieved in the laboratory have not been put into practice. While changes suggested by research engineers may be found to be architecturally and structurally sound, its adoption in general building practice may depend on various factors such as climatic conditions, habits of living of the people for whom the buildings are to be constructed and availability of suitable materials. In view of these factors, it is felt that experiments should be conducted, before improvements suggested by research engineers and architects are accepted and adopted. As the Government of India has its own works programme, it is considered desirable to try out the results of research and establish a unit for this purpose.

INSURANCE TRENDS IN LEADING COUNTRIES

POST-WAR EXPANSION IN LIFE ASSURANCE

HOW has insurance, particularly life assurance, fared in the leading countries of the world in the war and post-war years? This is a question of great interest not only to insurers but to all students of world economy. Since insurance represents the savings of a whole nation, by all sections of a country's population, it affords a convenient, though not a very accurate, index by which one could judge the overall economic trends in that country. From this point of view, the article on "World Trends in Insurance" in the Annual Review Number of the *Oriental News*, published by the Oriental Government Security Life Assurance Company, Ltd., will be read with interest. It carries an analysis of the progress of life assurance in many of the leading countries of the world.

In order to get some idea of the immense progress which life assurance has made in recent years, it is necessary to consider the life assurance in force in different countries over a period. The following table gives the life assurance in force in different countries in 1939, 1949 and 1950, together with the proportion which it forms to the national income in each country:

Life Assurance in Force

(000,000's omitted)

		1939	1949	1950	Percentage of increase in 1939-50	Percentage of insurance in force to 1 year's national income
Argentine	(1)..	826	2,408	2,823	242	4.1
Australia	(2)..	539	1,147	1,275	137	44.8
Brazil	(3)..	3,295	20,056	20,961	536	11.8
Canada	(4)..	6,776	14,409	15,746	132	100.0
Chile	(5)..	1,843	5,866	6,419	248	5.8
Denmark	(6)..	2,867	5,910	6,220	117	31.4
Finland	(7)..	14,100	80,852	97,755	593	23.7
France	(9)..	67,798	592,916	753,410	1,011	10.7
Greece	(9)..	1,335	6,713	13,376	902	..
India	(10)..	2,718	7,395	7,750	185	8.8
Italy	(11)..	26,891	425,000	540,000	1,906	8.4
Japan	(12)..	30,378	485,119	537,350	1,669	14.7
Netherlands	(13)..	3,260	7,155	7,678	136	47.2
New Zealand	(14)..	170	353	..	..	..
Norway	(15)..	2,161	4,049	4,259	97	9.0
Portugal	(16)..	1,055	2,696	2,799	165	8.0
Sweden	(17)..	6,618	11,990	12,873	95	88.0
Switzerland	(18)..	4,617	8,229	8,830	91	48.0
U.K.	(19)..	3,500	5,470	5,800	66	52.7
U.S.	(20)..	111,851	213,766	236,047	110	91.2

National currencies :—(1) Pesos, (2) £A., (3) Cruzeiros, (4) Dollars, (5) Pesos, (6) Kroner, (7) Markka, (8) Francs, (9) Drachmes, (10) Rupees (11) Lire, (12) Yen, (13) Guilders, (14) Pounds, (15) Kroner, (16) Escudos, (17) Kronar, (18) Francs, (19) Pounds, (20) Dollars.

It will be seen from the table above, that life assurance gained "substantial increases" in the 12 years ended 1950 in many countries of the world. Post-war inflation, coupled with sharp currency devaluation in many countries, accelerated this trend. Although life assurance has made considerable progress in nearly all countries, it will be seen from the table that the expansion has been particularly marked in countries which suffered heavy damage during the war. Thus, France, Italy, and Japan show some of the largest increases in life assurance since the pre-war years. But it must be remembered that these countries have suffered from inflation in currency so that the value of protection cannot possibly be very considerable.

Hence, the better test would be to investigate the proportion which life assurance bears to the total national income. If this test is applied, the countries which emerge creditably are Canada, the U.S., the U.K., the Netherlands and Australia; in these countries, life assurance forms respectively 100 per cent., 91.2 per cent., 52.7 per cent., 47.2 per cent. and 44.8 per cent. of their national incomes. That Indians are very inadequately protected by life assurance is evident from the fact that the total of such assurance forms only 8.8 per cent. of India's national income.

Yet another conclusion, to which the journal draws pointed attention, is that insurance has made rapid progress in countries which have a balanced economy, that is, the countries which have a well developed agricultural as well as a well advanced industrial sector. To this class of countries belongs Canada, Australia and the U.S. But the progress of insurance in these countries has also been assisted by other factors, such as the fact that they suffered relatively less by destruction caused by the war. Again, insurance-mindedness is very widespread in these countries.

The following table shows the index number of new business done by insurers in India and of wholesale prices in India from 1939 to 1951:

Index Number of New Life Business

(Base: 1939=100)

Year	All companies	Indian companies	Wholesale Prices*
1939	100.0	100.0	100.0
1940	78.0	76.7	91.4
1941	84.0	79.8	109.1
1942	83.4	82.5	136.1
1943	143.6	141.9	188.3
1944	220.2	213.8	194.4
1945	278.8	276.3	195.0
1946	299.6	293.4	219.3
1947	263.5	260.2	244.4
1948	253.0	249.8	299.5
1949	236.2	235.2	306.8
1950	278.8	274.0	326.2
1951	279.6	253.8	346.0

* Base: 7 months ended March, 1940=100.0.

It is true that India, too, has made some rapid headway in recent years. Over the period 1939-50, the total life assurance in force increased by 185 per cent. New business also has increased, as table 2 above will show, from year to year. But this must be set against the background provided by the increase in prices, which has been of the order of 226 per cent. between 1939 and 1950, to realise that the increase in life assurance has not kept pace with the fall in the purchasing power of the rupee. The journal lists the following as among the factors which contributed to this relative backwardness of insurance in India:

"(1) Absence of saving power among urban middle classes due to the fall in real incomes;

"(2) absence of clear demarcation between business capital and family estate among large sections of the trading class, resulting in large-scale transfers of business capital that should legitimately stay in the business to personal estates;

"(3) lack of insurance-consciousness, helped, no doubt, by emphasis on other forms of investments and by the traditions of the joint family system;

"(4) existence of a predominantly rural population with little medical facility and with little knowledge of the benefits of modern insurance. Farmers everywhere are, as a rule, slow to accept insurance as an essential part of their economy, for the nearness of the land makes them depend more and more upon that land for their future than upon any other form of estate; and

"(5) partition of the country resulting in the loss of highly developed territories."

Among these factors, the really important are (1) and (3), quoted above. The absence of saving power among all classes, rural as well as urban, and the lack of insurance consciousness, particularly in the rural areas, are the factors which largely explain the inadequate progress which insurance has made in this country. Of these two defects, the first can be remedied only by a change in the general economic policy of the Government in order to stimulate savings, while it is the duty of all insurers to remove the second defect, namely, the lack of insurance-mindedness in this country.

H. C. MacCOLL, Manager.

ALCO INSURANCE CO., LTD.

The Alco Insurance Company, Ltd. (General Manager: Mr. S. R. Idgunji, Bombay), is a small but progressive insurance office, transacting fire and miscellaneous business on a steadily increasing scale. This is evident from its latest annual report, which relates to the year 1952, for, between 1950 and 1952, the premium income in the fire department more than doubled to Rs. 3.14 lakhs, and the premium income in the miscellaneous department improved by Rs. 0.63 lakh to Rs. 1.72 lakhs. In 1951, the premium income in each of these two departments was considerably less at Rs. 2.74 lakhs and Rs. 1.29 lakhs respectively. Thus, the combined premium income in both the departments rose from Rs. 2.49 lakhs in 1950 to Rs. 4.03 lakhs in 1951 and still further to Rs. 4.86 lakhs in the year under review. This is a more creditable record than what many of the larger insurers can show.

The following table gives the working of the Company during the three years ended December, 1952:

(Rs. in lakhs)

		Year ended 31st December		
		1952	1951	1950
Fire Department—				
Premium income		3.14	2.74	1.40
Losses		0.61	0.37	0.20
Loss ratio	%	19.5	13.43	14.60
Profit		0.47	0.45	0.31
Fund (at end of year) ..		1.57	1.37	0.70
Miscellaneous Department—				
Premium income		1.72	1.29	1.09
Losses		0.75	0.73	0.85
Loss ratio	%	43.7	56.9	31.75
Profit (+) or loss (—) ..		—0.10	—0.44	—0.15

A feature that deserves notice is that the loss ratio is extremely modest in the fire department. It was only 19.5 per cent. in 1952, though it was even lower at 13.43 per cent. in the previous year. In the miscellaneous department, the loss ratio was comparatively high at 43.7 per cent.—it was, however, higher at 56.9 per cent. in 1951—though it is not a high figure when compared to the general claims experience in the accident department of most other insurers, whether in this country or abroad. The cost of claims has, as is well known, risen enormously in recent years.

The working of the fire department resulted in a profit of Rs. 0.47 lakh, as compared with Rs. 0.45 lakh in the previous year. In the miscellaneous department, there was a loss of Rs. 0.18 lakh as against a loss of Rs. 0.44 lakh in 1951. The Company's combined profit position over the last five years has been as follows:

	Rs.
1948	40,142
1949	40,089
1950	20,785
1951	14,388
1952	47,235

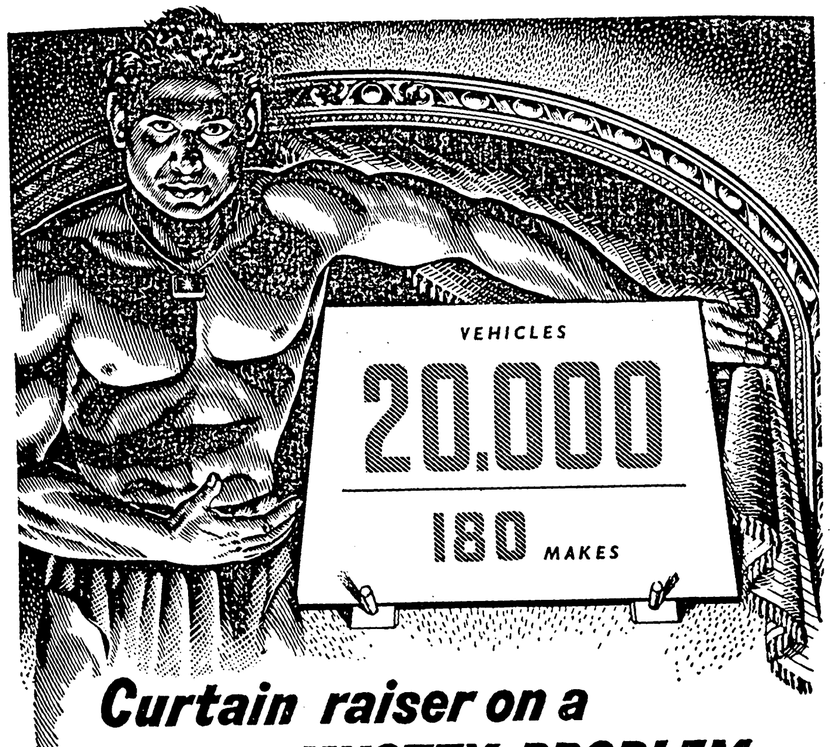
In his address to the shareholders of the Company, Mr. Y. A. Jasdanwalla, Chairman, referred to the progress in the Company's results, and said:

"The underwriting policy of your Company has continued to be selective and conservative with the result that the progress made, though not very spectacular, shows a steady improvement. In order to improve the quality of service and efficiency, the Company has mechanised its routine work, being the first attempt of its kind among general insurance companies."

After taking into account the interest earned on investments and the departmental profits and other income, there was a balance of Rs. 47,235 available for appropriation, which together with Rs. 4,204 brought in from the previous year's accounts, made in all Rs. 51,439. The Directors transferred Rs. 15,000 to reserve for doubtful debts, leaving a balance of Rs. 36,439 to be carried forward, subject to taxation. Thus, the Directors have once again thought it fit, in the interests of the Company, not to recommend any dividend.

The balance-sheet total of the Company has increased from Rs. 11.82 lakhs to Rs. 13.32 lakhs. Assets are principally investments which, together with cash, increased from Rs. 6.80 lakhs to Rs. 7.88 lakhs. The Company's financial position is sound. As against a capital of Rs. 5 lakhs, its reserves and other funds aggregate Rs. 3.59 lakhs, inclusive of fire fund of Rs. 1.57 lakhs and miscellaneous fund of Rs. 0.86 lakh.

The Company's foreign business is a growing account. During 1952, it derived from its foreign portfolio a premium income of Rs. 1.00 lakhs as against Rs. 0.62 lakh in the previous year. The Company has branches at Karachi, Chittagong, Colombo and Nairobi. It would appear that the branches in Pakistan have now been fully established and that a "good beginning" has been made in Colombo, though the Nairobi branch has "not got going due to difficult circumstances prevailing in that part of the world."



Curtain raiser on a
KNOTTY PROBLEM

India presents the strange spectacle of as many as a total of 180 varieties of makes, models and types of automobiles competing for an annual market of about 20,000 trucks and cars—an average of less than 150 vehicles per make!

There are three different categories of suppliers to this market: importers; assemblers; manufacturers. The manufacturers have a programme for manufacturing complete trucks and cars in India.

The Premier Automobiles Ltd. is one of the manufacturers who have sunk crores of rupees into this enterprise. Here are some important facts relating to The Premier Automobiles Ltd.

CAPITAL
Authorised Rs. 10 crores
Paid-up Rs. 2,16,71,500
Foreign Nil

STAFF
Total number of employees 2,100

AREA
Total area-37,87,065 sq.ft
Total built up area consisting of manufacturing plants, sheds, office premises & residential colony-5,88,733 sq. ft.

MANUFACTURING CAPACITY: The factory is well laid out and equipped to undertake, stage by stage, the manufacturing of all the major and minor components of a vehicle. Already a number of components are being produced by the Company and plans for production of complete engines, transmission, chassis frame and rear and front axles are now being put into execution.

Because of imports of so many varieties of makes and models and the mere assembling of cars by firms with no manufacturing programmes, a genuine manufacturer like The Premier Automobiles Ltd. hitherto has not been able to run its plant to its full manufacturing capacity.

With the recently announced policy of Government to encourage automobile manufacture in India, The Premier Automobiles Ltd. will be able to supply a large part of the country's automobile requirements and thus aid in national self-sufficiency, transport and defence.

SHELLAC INDUSTRY IN BIHAR

ENQUIRY COMMITTEE SUGGESTS REHABILITATION MEASURES

LAC is one of those commodities which have been hard hit by the slump that followed the Korean War boom. Early in January, 1942, it was quoted at Rs. 140 a maund. The quotation fluctuated between Rs. 137 and Rs. 170-3 before closing at Rs. 194 in March, 1952. Subsequently, a rot set in following the collapse of world commodities on Korean peace news. Prices of lac, therefore, gradually came down to as low as Rs. 68 per maund in December the same year. The price in London in the same month was as low as £8 per cwt. as compared with £19 per cwt. a year previously. Since then, in sympathy with the rise in other commodities, there has been some improvement in the value of shellac in India as well as in London. In Calcutta, the rate is at present moving between Rs. 90 to Rs. 92 per maund, whereas in London it is ruling between £11 7s. and £11 17s. per cwt.

Last year's slump, however, has resulted in at least one good thing, in that it evoked the attention of both the Government of India and the State Government of Bihar where nearly 60 per cent. of the country's lac is produced. On behalf of the former the Indian Central Lac Cess Committee met at Calcutta in December last and after carefully reviewing the position of the industry, recommended certain concerted measures to be adopted by the Government of India for rescuing the industry from its plight. As these have been dealt with in *Commerce* dated 13th December, 1952, there is no need to recall them here. As Bihar producers were severely affected by the slump, the State Government appointed a committee, known as the Bihar Shellac Enquiry Committee, to make specific recommendations for the rehabilitation of the industry. This Committee has now submitted its report, a Press summary of which, released a few days ago, reveals that some of the Committee's far-reaching conclusions merit the attention of the State Government.

Role in Indian Economy

Lac plays an important role in India's economy. The output in 1951-52, the latest year for which official figures are available, was 1,219,400 maunds, as compared with 1,002,900 maunds in 1950-51 and the pre-war ten-year average of 1,151,000 maunds. Bihar accounted for 666,000 maunds in 1951-52. The industry provides employment for about three million workers, in addition to thousands of workers engaged in subsequent stages of processing the commodity. India exported 685,754 cwts. of lac, valued at Rs. 7.59 crores in 1952-53, as compared with 712,744 cwts. valued at Rs. 14.84 crores in 1951-52 and 660,758 cwts. at Rs. 11.88 crores in 1950-51. The fall in value and volume of exports in 1952-53 is mainly due to poor demand for Indian lac, the Bihar Shellac Enquiry Committee's explanation for it being as follows:

"The slump of 1952 created a situation of great concern in the State, the number of factories having had to close down being 129. It is estimated that 10,000 workers of all descriptions were thrown out of employment. The Committee has held that the principal cause of the slump was the slackening of foreign demand due to relaxation of the political tension following the Korean truce negotiations and unlimited speculation resulting in constant fluctuation in prices. Other contributory factors were the increasing exports of seedlac and severe competition from synthetic resins and slamese seedlac."

With a view to eliminating speculation, the Committee has recommended a ban on speculation in shellac trade and its replacement by a system of specific delivery contract under the Forward Contract Regulation Act. Thus this recommendation brings another commodity along with jute, oilseeds, pepper, and silk yarn and a few other commodities essential to the community to be examined by the newly appointed Forward Markets Commission without delay.

The Committee has suggested that the ban should be followed by fixation of minimum and maximum prices for stabilising prices of shellac. Says the Committee:

"The only effective solution for this seems to be fixation of minimum and maximum prices of both shellac and seedlac at the export level. As Calcutta is the principal export market, there should be two sets of regulated prices, namely, the selling price for delivery to the shippers and the export prices for shipments."

The Committee claims that this measure will not only stabilise the exports but also throw open the doors for recapturing the shellac markets in the U.S.A. and other countries which were lost chiefly due to speculative fluctuations in prices. It may be recalled here that the Governing Body of the Indian Lac Cess Committee which met, as already stated, at Calcutta last December, also felt the need for regulation of forward trading in shellac through the recognised associations, but it was of the opinion that fixation of floor and ceiling prices was not feasible. We may add that mere fixation of these prices by itself will not be of much use for the stabilisation of prices. To be effective, it must be backed by a policy of price support requiring the State or the Central Government to buy when prices fall below the floors. This in turn involves a series of other complex problems of administration, availability of trained staff, finance, co-operation of the trade and industry and of demand for, and supply of, the commodity both at home and abroad. The Bihar State Government, therefore, should have these problems carefully examined before accepting the recommendation. Again, the Committee has recommended that the fixation of prices should be at the export level. The Press version does not contain details regarding the operation of the mechanism at that level. In the absence of details, one has to defer expression of opinion on the practicability of the suggestion.

Export of Seedlac

The Committee has drawn pointed attention to the progressive increase in the export of seedlac as compared with that of shellac. The export of seedlac, according to it, went up from 6,230 tons in 1951-52 to 14,912 tons in 1952-53, while the export of shellac decreased from 26,000 tons in 1951-52 to 15,985 tons. Commenting on this unhappy trend of trade, the Committee has rightly said that, "if this trend is not arrested, it will reduce India from a manufacturing country of shellac to that of exporter of raw materials in the shape of seedlac or sticklac." It has, therefore, recommended a ban on export of sticklac, a suggestion with which also the Board of the Lac Cess Committee is in full agreement.

Stress has been laid by the Committee on quality control as a measure for stimulating exports of both shellac and seedlac. It points out that the scheme of quality control, introduced at the instance of the Calcutta Shellac Trade Association, has given satisfaction to shippers and foreign buyers. The manufacturers, however, do not seem to be satisfied with the scheme, as they seem to be keen on getting a fair deal through a testing laboratory established for the purpose. The Committee, has, therefore, recommended that one central laboratory at Calcutta and regional testing laboratories in Balrampur, Jhalda, Daltonganj and Pakur may be set up by the Central Lac Cess Committee.

With a view to improving the cultivation of lac, creation of a separate division in the State Forest Department to co-ordinate work in connection with lac development, as suggested by the Central Lac Cess Committee, the extension of agricultural loans to lac growers and the subsidisation of lac growers' co-operative societies have been suggested.

Amalgamation of small lac manufacturers into co-operative societies, introduction of a system of licensing manufacturers and the formation of a syndicate by large manufacturing units are other measures suggested by the Committee. With regard to transport, it has recommended that the railway authorities may be approached to accept priority to the movement of all kinds of lac on the Eastern Railway, without insisting on a certificate confirming that the goods to be sent to ports are for export only. The Committee has recommended that the Central Lac Cess Committee should be reconstituted into a Central Regulation Board with the States of Bihar, Madhya Pradesh and West Bengal having direct representation on it. The transfer of this Board to the control of the Ministry of Commerce and Industry is also suggested in view of the economic importance of this industry to the country.

In order to expand foreign markets, the Committee has recommended the inclusion of shellac under the list of trading items under trade agreements. It has further suggested the establishment of industries such as micanite, oil-cloth, moulding powders, insulating varnish and sealing wax for boosting home consumption of shellac.

CESS ON OIL MILLS AND MATCH FACTORIES

Oil mills and match factories are two more victims proposed to be sacrificed by the Production Programme Committee of the All-India Khadi and Village Industries Board, at its meeting held at Bombay last week, at the altar of the inefficient cottage units in the two sectors. The Committee has recommended the imposition of a cess on the production of large-scale units in this sector with a view to raising funds for improving the efficiency of the small units. This policy of discrimination against large-scale industry is already in operation in the sphere of cotton textiles where a special excise duty is being collected from the mills for the benefit of handlooms.

With regard to oil mills, the Committee has recommended to the States to amend the existing rules governing sales tax with a view to giving exemption to ghani oil (bullock-pressed oil). In so far as the Bombay State is concerned, this exemption already exists. Further, it has recommended a cess of Re. 1-4 per maund (of 80 pounds) on oil produced by the mills. As if this is not enough, the Committee has decided that the rate of subsidy to be given to the cottage oil industry should be fixed at Rs. 2 per maund in the first year and Re. 1-8 per maund in subsequent years. It has been decided to provide the subsidy to cottage ghani oil units through registered co-operative societies.

After examining at length the present position of the match industry, the Production Programme Committee has recommended that a cess of As. 4½ per gross match boxes be levied on 'A' class match factories. For the other classes, namely, 'B' 'C' and 'D' rates of subsidies at As. 1½, As. 4½, and As. 6 respectively have been recommended. For this purpose, the match factories have been divided into four categories. Under A category are included factories producing more than 5 lakh grosses of match boxes yearly. Factories producing less than 5 lakhs a year are classed under B category. Classes C and D have been defined as those producing 100 gross boxes and 25 gross boxes per day, respectively. According to the Committee, the cost of production of the village match industry would not be more than that of the large-scale industry.

The Press Note issued by the All-India Khadi and Village Industries Board states that India requires about 36 crores of match boxes every month. The village match manufacturing industry in the first year would provide employment to nearly 5,000 working men in the country and help relieve to that extent the unemployment problem. The Press Note further adds that "80 per cent. of the match supply at the moment is made by only 5 factories owned by the W.I.M.Co. All the other factories, numbering about 72, situated in different parts of India, had to be closed down during the last 3 years owing to the competition and powerful marketing machinery of W.I.M.Co."

The discriminatory policy of penalising large-scale units for the benefit of small-scale units owes its origin to the Planning Commission's recommendations. In advocating a common production programme for both large-scale and small units, the Commission suggests consideration of one or more of the following 3 principles: (1) reservation of spheres of production, (2) non-expansion of the capacity of a large-scale industry, (3) imposition of a cess on a large-scale industry, (4) arrangements for the supply of raw materials and (5) co-ordination for research training, etc. Of these, principles (1) and (3) have been applied to the cotton textile industry. The application of the third one is now proposed to be extended to the oil mill and the match manufacturing industry. The last two have received emphasis but no concerted action has been taken with a view to securing the necessary result.

It must be mentioned here that the Planning Commission, as is evident from the above, has not subscribed to the view of granting subsidies to the village units. While discussing the position and prospects of the match industry in its *Programmes of Industrial Development*, no mention has been made even of levying a cess on the large match manufacturing units, let alone subsidies, as has now been recommended by the Programme Committee. Experience has shown that provision of subsidies does not bring about any improvement in the efficiency of inefficient units. On the contrary, it tends to perpetuate inefficiency, especially when it is applied to cottage industries consisting of numerous units spread all over the country. The Committee's suggestion to grant subsidies to the small match producing units is, therefore, ill-advised. These units have failed to organise themselves properly and manufacture matches at low cost. The point is that the Committee itself says that the cost of production in the village cottage industry would not be more than that of the large-scale industry. If this is so, where is the need for a subsidy. The prosperity of smaller units lies not in subsidies paid out of taxes on the efficient ones but in reorganising their production and marketing. Central or regional corporations should be formed for buying raw materials, stores, etc., needed by the cottage units and for distributing their finished products. Adoption of the latest methods of production suited to cottage-scale production should be encouraged. Unless a solution is sought in these directions, no amount of money spent on these inefficient units would bear result. Since this money is proposed to be got by penalising economic units, ultimately it is the consumer who will have to foot the bill, which may amount to, on matches alone, about Rs. 70 lakhs. And as both oil and matches are necessaries of life, it will be most unfortunate to load them with the cost of maintaining uneconomic units. Further, the course advocated by the Board will adversely affect the ability of the large-scale units to compete effectively in foreign markets. The States, therefore, will do well to attend to the organisational aspect of village industries instead of placing handicaps on efficient units through cesses and duties.

LAND REFORMS IN MADRAS

PROF. LADEJINSKY'S VIEWS ON TANJORE ACT

THE views of Professor Kenneth H. Parsons on land reforms in India were, as readers are aware, outlined in *Commerce* last week. Along with Prof. Parsons were also invited last year two other experts in agricultural economy to study the agricultural situation in this country. After conducting detailed investigations, these experts, too, submitted their reports separately. Of these, Prof. Wolf I. Ladejinsky, who carried out a study of land reforms in Japan, visited Madras, Punjab and Kashmir, and reported his findings, among others, on the controversial Tanjore Tenants Act. The weighty views expressed by him are summarised here, as they deserve to be studied by a wider section of the public.

Prof. Ladejinsky is of the considered opinion that the obstacles to reforms are not due either ignorance of the existing state of affairs or to absence of expert advice on the right kinds of measures for adoption. They lie rather in the hesitancy on the part of the authorities to face the issues squarely when quick action is necessary. Although what the peasants want most is land ownership, he considers that they may agree to settle for much less now than at a future date, provided other reforms such as reduction in rent, occupancy rights and farm wages and the like are no longer taken up as half measures merely to meet Communist penetration into the countryside. The Professor stresses, in this context, the need for the authorities to carry to the cultivating farmers and agricultural workers a lasting meaning in terms of "hopes and aspirations." In this task, the landlords in Madras State, judging from their attitude towards land reforms in Tanjore and elsewhere in the State, may prove a stumbling block as, by and large, they seem to have dedicated themselves to the "proposition of maintaining their rights" through thick and thin. The remedy for this opposition to reform is, according to him, "determined and enlightened Government leadership."

Need for Intelligent Leadership

Prof. Ladejinsky cautions that it is well to keep in mind that even substantial changes initialed by an intelligent Government leadership will be less disrupting and infinitely more stabilising than if carried out from below by farmers themselves by taking the law into their own hands. The Professor points out that, even when desirable legislation is enacted and enforced, "the millennium will not have arrived in Madras." For there simply is not enough land to satisfy the cultivating owner-proprietors, tenants and agricultural workers whose numbers are rising year by year; only by industrialisation and consequent syphoning off of some agricultural labour, coupled with a sharp rise in agricultural productivity, can a real dent be made in the vicious circle of more people, less land and growing poverty.

Prof. Ladejinsky has prefaced his report by a general background of agricultural conditions in Madras. Observing that Madras is unique in several aspects, the Professor says:

"Primarily an agricultural State, with some very rich soil but with uncertain rainfall, Madras is normally a food importer, and the standard of living of a large group of the actual cultivators is abysmally low. The State is noted for its educational progress and as a breeding ground for some of India's keenest leadership; yet poverty is rampant as if these are unrelated phenomena. There are regions in Madras where education of women is one of the highest in India, and yet in those very regions, the growth of the population is most marked. Rural society is very backward, caste and religious prejudices still rule supreme and yet this centre of orthodoxy can also be the centre of rebellion; it is in Madras that Communism gained its most noted victories. Madras is the first State to carry out *zamindari* abolition, and the last to attempt—or rather be forced—to deal with the urgent problems of private ownership of land. Until the very recent enactment of the Tanjore Ordinance, only one district in the State, Malabar, had the benefit of tenancy legislation; but that, too, is dormant now. ... To sum up, nothing can be taken for granted in Madras, for reality and appearance are often worlds apart."

As against this socio-economic background, Prof. Ladejinsky has evaluated the Tanjore Tenancy Legislation in the following terms:

"Judging by the reaction to the Ordinance on the part of the tenant, agricultural worker, and landlord, it is clear that each group has some misgivings about it. From our point of view, the landlord should have none, because as Chief Minister C. Rajagopalachari has correctly pointed out, if the landlords did not make any concessions, they would be facing the danger of losing everything. He, therefore, exhorted them to accept the Ordinance, in order to save themselves from a worse fate. We agree with the revenue officers that the landlords' attitude will become clear three months from now when the new harvest will be in, but it seems to us that, even if the landlords accept the Ordinance, the tenants will not prove to be lasting, because they do not satisfy the basic requirements of the tenant and farm worker.

"Rent reduction from 70-80 per cent. to 60 is indeed a welcome measure, but it is our strong impression that the tenants will not rest content with a 40 per cent. share of the crop. The *rumblings for revision are already in the air; if* it is not 60 per cent. for the tenant, then it is one-third for the landlord, one-third to the tenant, and one-third to whoever bears cultivation expenses. The Communists have already seized on this and nailed it to their banner for the next round of the fight. One of their leaders stated that their *(the mirasdars) calculations are simple.* They expect that the peasant, given only 40 per cent. of the share and saddled with cultivation expenses, will not be able to pay the landlord his share and will default. Then, once more, they will proceed with eviction as freely as before. The statement ends with these portentous words, 'so a new stage in the Tanjore *kisan* movement opens up. And no doubt, strengthened by his victory in the battle against eviction, the Tanjore *kisan* will acquit himself as he has done in the last decade.'"

Expenses of Cultivation

The Tanjore Act provides that all expenses, other than harvesting which is to be shared equally by the landlord and the tenant, are to be borne by the tenants. This has created the impression that the Act has saddled the tenant with heavy expenses. But, according to Mr. Rajagopalachari, "the Ordinance only puts down in words the customary practice in regard to expenses incurred for seeds, manure and cultivation." Commenting on this aspect, the Professor remarks:

"The issue of who paid what expenses is not clear cut: some tenants may not have shouldered all the burden. Furthermore, in practically all cases, the landlords extended them cultivation-credit. The Ordinance legalised what is supposedly a custom with no exceptions, and indirectly it created a mood among landlords of not advancing credits any longer. Assuming that this is the custom, a land reform intended for the benefit of the tenants need not necessarily protect what is customary, especially when the custom is bad. The custom plus the high pre-Ordinance rentals left most tenants with barely anything: the custom with reduced rentals will leave him a little something if credit is not denied him. One of the most responsible revenue officials, and a supporter of the Ordinance, told us that, with the Ordinance in force, a tenant can count on a net share of the crop of about 10 per cent. It could be idle for the Government to expect any increase in production when the tenant's share is much smaller than the landlord's and the responsibility for cultivation also rests on him. It gives the Communists a rare chance to keep up the agitation for a further reduction in rent or sharing of cultivation expenses or both."

There is also another serious defect in the Act, according to the Professor. It attempts to deal with the evil of eviction by providing the tenants security of tenure. In order to realise that end, the Act lays down that all tenants who were cultivating the land on 1st December, 1951, shall have tenancy rights for five years and that those who have since been evicted must be restored to exercise their rights. Alluding to this aspect, the Professor observes:

"They are seemingly good measures, but, upon an examination, their effectiveness appears rather limited. To be reinstated, a tenant must file an application within 30 days of the enactment of the Ordinance. This right is likely to go by default in many cases since many of the tenants are illiterate and find it difficult to get from the village officers the survey numbers of the land they need in order to file the application with the conciliation officer. Secondly, no restoration can take place unless the applicant makes good any arrears of rent and reimburses the landlord or the tenant in possession of the land for any expenses incurred on the land since the applicant's eviction. It is questionable if an evicted tenant is financially capable to cover such expenses before he had raised a crop. The timing, if nothing else, is not helpful. Thirdly, the Ordinance does not apply to tenants evicted prior to 1st December, 1951. This is a significant omission for most of the evictions had taken place in 1949-50, the years of active disturbance in Tanjore. The five-year security period entitles the tenant to limited tenancy rights. Every landlord can take back his land after five years. And he can take it back within the five years, if the land is not cultivated well, perhaps because of the difficulty of securing seed and manure, or other unavoidable causes. This is a severe limitation on the security of tenure; the threat of eventual eviction is a weapon of coercion in the hands of unfriendly landlords, a category into which most of the landlords might fall. The rent reduction provision can be gravely compromised, because it cannot be enforced without real bargaining power, and the tenant does not get it under the Ordinance."

"Pannaiyal's" Position

Again, the *pannaiyals* (farm workers) dismissed prior to 1st March, 1952, have no redress under the Act. Those dismissed between 1st March, 1952 and the enactment of the legislation may apply for reinstatement, while those dismissed after the promulgation of the Ordinance are given one week within which to apply for reinstatement. Prof. Ladejinsky says that the time limit is "too short to do the *pannaiyal* much good." Further, "the legal procedure of reinstatement, as outlined in clauses 2, 3 and 4 of section 12, is too complicated and involved to assure speedy settlement of the cases and the practical validity of the reinstatement provision may be questioned." He feels that better results can be achieved if a problem of this kind is resolved by a committee consisting of representative groups of villagers.

With regard to *pannaiyal* wages, the legislation is not very helpful. For it gives the *pannaiyal* the choice of the old or the new schedule. If he accepts the new schedule, it means more wages, but he will get paid only on the days on which he works and he is not entitled to any bonus which, under the old system, meant one-seventh of the crops of six and two-third acres only, if the *pannaiyal* harvested the crop. This is, says the Professor, an incentive measure to ensure the *pannaiyal's* interest in raising better crop. Moreover, the *pannaiyal* does not know how it will all work out, and it will take at least a season or two to determine the effect of this measure. The Act also makes no attempt to consider the casual labour problem.

Tenure Practices

In so far as tenure practices go, clause B of section 3 provides that wet holdings of 6¼ acres or less, or dry land of 20 acres or less, are not subject to the provisions of the legislation. The average holding in Madras State is 2.6 acres of wet land in wet districts and 6.5 acres of dry land in dry districts. The number of title holders made up of 10 acres of wet land and 15 to 20 acres of dry land is about 6.5 million or roughly three-fourths of the existing number of proprietors. This means, according to Prof. Ladejinsky that, roughly calculated, approximately half the proprietors escape the jurisdiction of the legislation. In view of the extreme mildness of the Act, he has found it difficult to understand why it has allowed the small landlords, who constitute the bulk, to continue the tenure practices which have been denied to bigger landlords. Their exemption, therefore, does not seem reasonable or justifiable.

In conclusion, Prof. Ladejinsky observes:

"The Ordinance does not compare well with the main recommendations of the Land Revenue Reforms Committee of Madras, of 1950, known as the Subramaniam Committee. Those recommendations, which were never applied, were by no means bold or comprehensive, but at least they concerned themselves, even though from our point of view largely in a negative way, with such important issues as peasant proprietorship, acquisition of land beyond a certain limit, ceilings on personal cultivation and restrictions on sales of land to non-cultivators. In addition, the report recommended the sharing of rentals on the basis of 40 to 45 per cent. (depending upon the type of land) to the landlord and 55 to 60 per cent. to the tenant. The Ordinance does not go even that far. For these and other reasons, the Ordinance betrays a fear to standstill, a fear induced by the events of the past few years, at the same time betraying an even greater fear to move ahead. Hence its failure to deal drastically with the causes which made for the disturbed conditions in Tanjore.

"Nevertheless, the Ordinance served its purpose. It was a reminder to the landlords that the status quo cannot be maintained and that more substantial concessions from the landlords are perhaps in the offing. While the landlords oppose the very conservative provisions of the Ordinance, actually, it is the shape of things to come that troubles them more than what they are called upon to grant now. The desire to sell out their holdings, which is quite prevalent among landlords, is an expression of that fear. The Ordinance whetted the unassuaged appetite of the tenants and farm workers for terms more nearly in accord with their desires and needs and this must be counted among the welcome developments."

CENTRE'S LOAN TO MADRAS

The Government of India has agreed to provide a loan of Rs. 60,00,000 during the current financial year for new special minor irrigation schemes in Madras State (undivided) in addition to a loan of Rs. 22,00,000 required for similar schemes taken up during the previous year. Besides this, the State Government has also been allowed additional loans amounting Rs. 37.16 lakhs for its filter-point tube-wells programme, the supply of oil engines and electric motors. These amounts are in addition to those which the State Government has carried over from the funds provided for the same purpose during the previous year. Apart from these new schemes, a decision has also been reached in respect of the claims put forward by the State Government for subsidies under certain other schemes undertaken in the State in previous years. The total amount involved on this account is Rs. 61.8 lakhs under the well subsidy scheme from 1951-52 to 1953-54, Rs. 29.94 lakhs in respect of the tank improvement scheme in 1952-53, Rs. 2.17 lakhs on account of a lift-irrigation scheme in 1951-52, Rs. 6.6 lakhs for the distribution of phosphatic fertilisers in 1951-52, Rs. 3,815 in connection with the river-pumping scheme in 1951-52, and Rs. 5.74 lakhs on account of grow-more-food staff schemes of 1952-53.

U.S. FARMS LARGELY OWNER-OPERATED

According to the U.S. Department of Agriculture, individuals own approximately 88 per cent. of the land now in farms in the United States. In round figures, this percentage represents more than 1,000 million acres. The survey was made by Agriculture Department experts who investigated a belief that there had been rapid growth of huge corporate-owned farms. The survey showed, however, that mechanisation had enabled fewer farmers to till more land—a fact which accounts for both the expansion of individual farm ownership and the increase in the size of farms. The survey also showed that corporate-owned farmland had increased over the past five years, but mainly in the two States of Florida and California. These States produce speciality crops—such as citrus and sugar —and corporate ownership of such commodities as sugar accounted for much of the rise. The survey showed that compared to the more than 1,000 million acres of individually-owned farmlands in the United States, corporate-owned farms total about 51 million acres.

NAGPUR MILL WIPES OFF LOSS AND STEPS UP DIVIDEND

PROFIT OF AHMEDABAD ADVANCE LOWER, BUT DIVIDEND MAINTAINED

THE financial results of the Central India Spinning, Weaving and Manufacturing Co., Ltd. (familiarly known as Nagpur Mills) and the Ahmedabad Advance Mills Ltd., both of which are under the management of the Tata Industries Ltd., Bombay, for the year ended 30th June, 1953, disclose divergent trends, as compared with those for the previous year. Thus, while the former has been able to earn a gross profit of Rs. 24.75 lakhs for the year under review, in refreshing contrast to the gross loss of Rs. 16.33 lakhs for 1951-52, the latter has suffered a further shrinkage in earnings, the gross profit being no more than Rs. 3.33 lakhs, as compared with Rs. 4.09 lakhs in 1951-52 and Rs. 16.93 lakhs in 1950-51. The profit of the Central India, after providing for depreciation, is sufficient not only to wipe off the previous year's loss but also to leave a small surplus. The only gratifying feature of the results of Ahmedabad Advance is that the contraction in profit is negligible, as compared with the sharp decline noted in the previous year.

In conformity with the trend of profit, the Directors of the Central India have proposed to step up the dividend from 2 per cent. paid for the previous year to 5 per cent. The Directors of the Ahmedabad Advance propose to maintain the distribution at 10 per cent. paid for the previous year, but with one difference, namely, that this year's distribution includes a bonus of 3 per cent. in commemoration of the Company's Golden Jubilee, while the whole of last year's distribution represented dividend. Thus, the dividend rate proper is lower at 7 per cent. In the case of both the Companies, the proposed returns to the shareholders have not been fully earned. The profits of both have had to be supplemented from the dividend equalisation fund.

The following comparative table, showing the salient features of the Companies' results for the past two years, brings out clearly their progress during the year:

(In lakhs of rupees)

	Ahmedabad Advance		Central India	
	For the year ended		For the year ended	
	30-6-1953	30-6-1952	30-6-1953	30-6-1952

* Dividends paid out of the dividend equalisation fund.
† On the increased capital of Rs. 33 lakhs.
‡ Includes a Golden Jubilee bonus of 3 per cent.

The rise in sale proceeds, closing stocks of cloth, yarn and wastes and expenses in the case of the Central India suggests that the Company's production must have been on a higher level, presumably on account of the better supply position of cotton and gradual relaxation of controls on prices and distribution of various varieties of cloth. Unfortunately, the complete decontrol on prices and distribution of cloth came at a time when the market was suffering from a glut of cloth. It, therefore, led to a depression in prices.

While the Company's sale proceeds of cloth, yarn and wastes show an increase of only Rs. 28.79 lakhs, the closing stocks are higher by as much as Rs. 37.59 lakhs. Of the rise of Rs. 32.51 lakhs in expenses, consumption of raw materials accounts for Rs. 6.11 lakhs, fuel, energy and stores for Rs. 13.36 lakhs and salaries and wages for Rs. 12.94 lakhs (including Rs. 2 lakhs representing bonus for 1949-50). The Company's contribution to provident fund shows an increase of Rs. 2.49 lakhs.

After providing for all expenses, Managing Agents' commission and depreciation, the net profit amounts to Rs. 17.12 lakhs. After wiping out the loss of Rs. 16.28 lakhs brought in from the previous year, the surplus left is a modest sum of Rs. 84,000, out of which a sum of Rs. 75,000 has been transferred to the dividend equalisation fund. The distribution of the 5 per cent. preference dividend and the proposed ordinary dividend requires Rs. 4.84 lakhs, which has been provided out of the dividend equalisation fund, so that the net drain on the fund amounts to Rs. 4.09 lakhs, out of Rs. 14.31 lakhs standing to its credit at the end of last year.

Referring to the trading conditions which have affected the results of the Ahmedabad Advance Mills, the Company's Directors observe:

"Trading conditions were far from satisfactory during the year under report. While the cost of production continued to rise on account of increase in the prices of raw materials and labour costs, the value of manufactured goods declined owing to a general fall in demand, both in the internal and overseas markets."

The decline of Rs. 47.75 lakhs in sale proceeds has been counteracted to some extent by a decline of Rs. 17.23 lakhs in expenses. Cotton consumed shows a decline of Rs. 17.72 lakhs, salaries and wages Rs. 1.91 lakhs and repairs and renewals Rs. 2.66 lakhs. Offsetting these are the increases of Rs. 4.58 lakhs in fuel, electricity and stores consumed and Rs. 1.41 lakhs in the Company's contribution to provident fund. After providing for depreciation and despite the Managing Agents' surrendering almost the whole of their minimum commission, the net profit is only Rs. 1.55 lakhs. After transferring Rs. 1.50 lakhs to the dividend equalisation fund, the Directors propose to withdraw from the fund Rs. 3.80 lakhs for distribution to the 5 per cent. preference shareholders, as well as to the ordinary shareholders at the aforesaid rate.

The following table gives the synopsis of the Companies' balance-sheets as on 30th June, 1953, which provides an idea of their satisfactory financial position.

	Ahmedabad Advance	Central India
Liabilities	Rs.	Rs.
Capital	43,01,000	98,47,500
Reserves and surplus	88,84,143	84,22,221
Provision for taxation	4,15,176	6,65,740

	Rs. 1,39,03,204	3,46,70,156

In pursuance of the scheme of rehabilitation and renovation of the mills, the Directors of the Central India have spent, during the year under review, Rs. 16.20 lakhs on additional machinery, plant, etc., besides Rs. 4.62 lakhs on works under construction and machinery received but not installed. They have also sanctioned a sum of Rs. 10 lakhs for purchases of machinery for humidification of No. 1 and 2 Mills and for installation of fluorescent lighting in No. 4 and 5 Mills. The Directors also propose to consider shortly a scheme for the reorganisation of No. 4 Mill, dyeing, bleaching and finishing, covering a better layout of the existing plant and later on the purchase and installation of additional finishing machinery.

The gross block of the Ahmedabad Advance Mills shows an increase of Rs. 11.17 lakhs, representing additions to the machinery and plant made during the year and of Rs. 14.46 lakhs, representing works under construction and machinery received, but not installed, under the Mills' rehabilitation and renovation programme.

FORT GLOSTER JUTE CO. SUFFERS LOSS AGAIN

DIVIDEND PASSED OVER

THE ordinary shareholders of the Fort Gloster Jute Manufacturing Co., Ltd. (Managing Agents: Messrs. Kettlewell Bullen & Co., Ltd., Calcutta) have had to go without any dividend for the six months ended 31st March, 1953, this being the second consecutive occasion when they are getting no return. There was another occasion when they did not receive anything; this was the six months ended 30th September, 1949. The dividend record of the Company for the subsequent five half-years was an unsteady one, having fluctuated from 5 per cent. to 40 per cent. per annum. The passing over of the ordinary dividend for the latest half-year has been occasioned by a net loss of Rs. 2.95 lakhs suffered by the Company. It is, however, gratifying to note that this loss is relatively less than that (Rs. 12.07 lakhs) sustained in the previous half-year. As in the previous half-year, the Directors have had to draw from the reserves not only to cover the loss but also to pay the dividends on the first and second preference shares.

It will be recalled that the half-year ended 30th September, 1952, was a disappointing period for jute mills, on account of the depression in prices and lack of demand for manufactured goods, despite the reduction in export duty on hessian and sacking in May, 1952. The half-year under review did not see an improvement in trading conditions to such an extent as to enable all the mills to work at a profit. Referring to this, the Directors of Fort Gloster observe in their report:

"Trading conditions remained difficult throughout the period covered by this report, the prices of both raw material and finished goods registering further sharp decline. A welcome improvement in values was witnessed after the close of the half-year, but with the general price level of manufactures failing to keep pace with the rise recorded in quotations for jute, simultaneous business was seldom profitable.

"On the 28th February, Government announced a further reduction in the export duty on sacking goods (to Rs. 80 per ton), but this, unfortunately, did little to encourage demand from the main overseas markets and resulted in only a temporary improvement in prices. On the 25th March, discussions between the Governments of India and Pakistan led to the abolition of the discriminatory licence fee on jute exported to India and a decrease in the export duty on the kutcha bales brought into this country. This agreement was of considerable importance, for mills were thus enabled to obtain more adequate supplies of the better qualities of jute essential for the maintenance of a satisfactory standard of manufacture."

The effect of the adequate supply of better qualities of jute from Pakistan, referred to above, is not fully reflected in the Company's results for the half-year under review, as the agreement was effected only just before the close of the half-year.

The salient features of the Company's results for the half-year under review are presented against the background of those for the previous three half-years in the following table:

(In lakhs of rupees)

	Half-year ended			
	31-3-1953	30-9-1952	31-3-1952	30-9-1951
Sale proceeds	140.11	196.73	292.65	207.00
Closing stocks	67.36	36.04	110.53	95.61
Expenses	154.06	210.34	275.42	244.26
Gross profit (+) or loss (—) ..	—1.54	—10.12	+9.49	+12.15

Transfer from reserves	3.65	12.50	..	..
Dividends—				
Preference	0.66	0.66	0.66	0.66
Ordinary	..	..	2.10	2.62
			(10% p.a.)	(25% p.a.)
Carry forward	0.04	0.02	0.20	10.14

The Company's financial position, as seen from its latest balance-sheet, is satisfactory. Notwithstanding the withdrawal of Rs. 16.15 lakhs in the last two half-years, the reserves and surplus stand at Rs. 54.44 lakhs, which is equal to nearly 130 per cent. of the paid-up capital of Rs. 42 lakhs. Besides a mortgage debenture loan of Rs. 25 lakhs, the Company's current liabilities and provision for taxation amount to Rs. 66.74 lakhs, of which secured loans account for Rs. 48.31 lakhs. The value of the gross block as at the end of the half-year amounts to Rs. 268.42 lakhs, the book value of the same having been written down to Rs. 87.98 lakhs. Current assets (excluding the small sum of Rs. 28,631 representing balance of debenture issue expenses to be written off) aggregate Rs. 100.51 lakhs, which more than adequately cover the current liabilities, as well as the provision for taxation, by a handsome margin of Rs. 33.77 lakhs.

Points From The Chair

U.S. Attitude To Natural Rubber

"AS befits a great creditor nation, the U.S.A. has, in the post-war period, extended to less fortunate countries an unexampled generosity. This renders more bewildering the denial of freedom and fair trading in respect of an industry, upon which depends so largely the welfare and perhaps, too, the security of the peoples of Far Eastern territories. It may well be that under conditions of free and fair trading, the synthetic product might prove a strong competitor to natural, but even so the establishment of such conditions would remove the occasion for a not unwarranted resentment, as well as dissipate the uncertainties which bedevil the rubber outlook. Natural rubber producers would then be encouraged to embark on long-term improvement programmes, stimulated to greater effort along practical lines and less disposed to seek relief by resort to doubtful expedients."

SIR JOHN HAY,
Kamuning (Perak) Rubber and Tin Co., Ltd.

Efficiency and Value of Agriculture in U.K.

"The efficiency and value of the agricultural production of this country is not generally realised. The wealth of this country is based on the two main extractive industries of food and of the raw materials of power, which is coal. Mining extracts coal from underground; agriculture extracts food from the surface soil. There are great reserves of coal beneath our soil, and there are also great possibilities of increased food production which could be realised by more intensive farming. It is interesting to compare the economic efficiency of these two industries. Coal mining produces coal to the value of £507 million per annum by the employment of 715,000 workers. Agricultural workers number 549,000 males, and 103,000 females, or a total of 652,000, and they produce to the value of not less than £1,043¼ million per annum."

F. A. PERKINS,
Lawes Chemical Co., Ltd.

British Goods in Overseas Countries

"I have recently returned from a tour of certain North European countries, where I had the opportunity of meeting our agents and representatives, as well as a number of leading industrialists and bankers. My impression was that we in this country have too long relied on the quality of British goods as the main selling point, and that the majority of our overseas customers are simply not willing to pay the extra price for this. I am not suggesting that we should manufacture poor quality goods, but I am quite sure that, unless British manufacturers can cheapen production, both by better methods and by use of less expensive or different raw materials, we may be priced out of many of our Continental markets. Any large increase in wages would, of course, be a vital factor in this connection."

D. G. N. LLOYD-LOWLES,
Tap and Die Corporation Ltd.

***Future of British* Electric Industry**

"The future of every British company in the electrical field depends fundamentally on the progressive development of the world and the part we, in Great Britain, are capable of playing in it. The field in front of our Company and the need for our help is unlimited. The world is crying out for fuller use of existing applications and for research in many fields hardly yet surveyed. The forward march in certain countries, or in certain fields, may be delayed by lack of capital, by artificial restrictions, by adherence to ideological labels, or by ill-conceived demands, but it cannot be stayed. There is no industry from which greater progress is expected than the electrical industry."

SIR HARRY RAILING,
General Electric Co., Ltd.

Problems of Textile Industry

"Conditions in the textile industry are considerably better than they were a year ago, as far as volume is concerned, but margins remain low. Competition is severe, due to the Government giving prior consideration to the textile industries of other nations against our own. One cannot understand the Government pleading for increased exports and, at the same time, squandering valuable currency on textile imports—materials which could readily be produced in this country. Western Germany, for example, a valuable hard currency area, is allowed, together with the rest of Europe, especially Italy, to export unlimited quantities of textiles to this country, which is virtually a dumping ground for Continental manufacturers who wish to maintain price levels in their own countries. The theorists who talk of a decline in textiles ignore the age of synthetic fibre development, which could be as important to us as the development of the jet engine. We intend to exploit this valuable new field to the maximum possible extent. Whilst margins on these new fibres are better than on the old traditional lines, the volume of imports into this country and our Empire markets jeopardise the chances of the industry becoming strong and efficient. If motor cars were allowed to be imported as freely as textiles, the motor car industry would be in no better position than the much criticised textile industry. Initiative and enterprise are by no means lacking and, if given the chance, will operate to as great advantage as in any other industry. After all, with the valuable contribution which they make to the country's economy, textiles have been ignored and neglected for far too long, except as a means of raising further revenue in the form of purchase tax."

CYRIL LORD,
H. Ledgard (Silmyra Fabrics) Ltd.

PLANTING

(Concluded from page 774)

character. It is further argued that, unlike the other international commodity agreements, the consuming countries are not signatories to it. This is a lacuna which may adversely react on the Agreement at any time. Drawing pointed attention to this aspect, the F.A.O. observes:

"The attitude of importing countries to international control of the commodity by producers only has been favourably influenced in recent years by the liberal quota policies followed by the regulating body. However, under certain economic or even political circumstances, importing countries might raise serious objections to the system, in view of the principles concerning international commodity agreements which have been recommended by the Economic and Social Council of the United Nations (Chapter 6 of the Havana Charter). Before the adoption of the last Tea Agreement of 1950, the Interim Co-ordinating Committee for International Commodity Arrangements (I.C.C.I.C.A.) wrote:

'This Committee considers that, in accordance with the principles recommended as a guide by the Economic and Social Council, discussions, open to participation by all Governments considering themselves substantially interested in the production and consumption of, or trade in, tea, are a desirable preliminary to any new agreement. . . . The present arrangement, although controlling exports, nevertheless, does not provide for equal representation of producing and consuming countries.'

"While the 1950 Agreement contains a provision that the terms of this Agreement may be subjected to fresh consideration and review at the request of any of the Governments of the producing countries in the light of any international obligations which . . . (they) may assume during the currency of the Agreement, I.C.C.I.C.A. pointed out that 'so far as this Committee is aware, other countries were not invited to participate in the preparation of the new Agreement'. The Committee, therefore, concluded 'that its comments on the 1948-50 Agreement (quoted above) are equally applicable to the present Agreement.'"

Chances of Survival

The F.A.O. has done well in reminding the signatories of this important aspect of the question, because of the change in the political relationship between the principal tea producing and the consuming countries. India, Pakistan, Ceylon, and Indonesia are all now politically free; whereas, in the past, the first three were subject nations of Britain, the largest consumer of tea in the world, and the fourth was a colony of the Netherlands. Under the latter set-up, there was scarcely any danger of differences of opinion between the producing and the consuming countries. But now the scope for it is there. Further, Britain and other consuming countries may demand representation on the controlling body operating the Agreement. If this issue has not so far risen since independence, it is because of the link provided by the British-owned and managed tea estates in India, Pakistan, Ceylon and even in Indonesia. Another reason is, of course, the fact, referred to at the outset, that all along the Agreement has been worked in a manner which has given no room for complaints of restrictive practices from consumers. Given the continuation of these two features, the Agreement has a good chance of survival.

Notices

THE SHOLAPOOR SPINNING AND WEAVING COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE 78th Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company, Standard Building, Fort, Bombay, on MONDAY the 30TH NOVEMBER, 1953, at 4 p.m. (S.T.), for the transaction of the following business:—

1. To receive and adopt the Directors' Report and Audited Statements of Accounts for the year ended 31st March, 1953.
2. To appoint Auditors for the current year and to fix their remuneration.

The Transfer Books of the Company will remain closed from TUESDAY the 10TH NOVEMBER, 1953 to WEDNESDAY the 2ND DECEMBER, 1953 (both days inclusive).

By Order of the Board of Directors,
B. W. AMBAYE,
Assistant Secretary.

BOMBAY, 15th October, 1953.

(The Board desire to draw attention to the provisions of the Sholapoor Spinning and Weaving Company (Emergency Provisions) Act, XXVIII of 1950, under which, no resolution passed by the Company at any meeting of the Shareholders of the Company shall be given effect to unless approved by the Central Government.)

N.B.—The Shareholders of the Sholapoor Spinning and Weaving Company, Ltd., and in particular to:—

Mr. Ahmed Ismail, Rode Port, Transvaal (South Africa).

Mr. Ismail Essack, Rode Port, Transvaal (South Africa).

Mr. John Hankinson, Agnes Silver and John Cookson, 3 Fox Street, Preston, England.

Mrs. Dinmai Nariman Kotwal, c/o Sadar E.I. Lines, Karachi (Pakistan).

Mrs. Mehra Phiroje Cooper, c/o National Bank of India Ltd., Lahore (Pakistan).

Mr. Satya Ranjan Paul, c/o Mr. M. R. Paul, Pleader, Khulna (Bengal).

Seth Labharam Raisaheb, 7G, Model Town, Lahore (Pakistan).

Mr. Manilal Manekchand, Gharia Street, Diu.

Mr. Sorab Byramji Warden, 91, Ladbroke, Grove, London, W. II.

GOVERNMENT OF MYSORE
STORES PURCHASE COMMITTEE

NOTICE

Enquiry No. 11734

LAMP REPLACERS FOR THE ELECTRIC DEPARTMENT

SEALED TENDERS WILL BE RECEIVED BY the Secretary, Stores Purchase Committee, for the supply of the above equipment upto 2nd November, 1953.

Intending tenderers may, on application to the Secretary, Stores Purchase Committee, obtain the requisite tender forms on which tenders should be submitted. Applications should be accompanied by a cash remittance of Rs. 5 which is the price fixed for a set of forms and which is not refundable.

Cheques, Crossed Postal Orders and Postage Stamps will not be accepted towards the cost of forms nor will the forms be sent by V.P.P.

I. P. MALLAPPA,
Secretary,
Stores Purchase Committee.

UNITED INDIA BUILDING,
BANGALORE, 5th October 1953

WAGON SHORTAGE AFFECTS WORKING OF HINGIR-RAMPUR COAL

BALMADIES TO PAY RECORD DIVIDEND

Hingir-Rampur Coal Co., Ltd.

THE directors of the above Company (Agents: Messrs. Killick Industries, Ltd., Bombay) submit the the audited accounts of the Company for the year ended 30th June, 1953.

The bulk of the raisings during the year was again won from No. 10 pit. The total raisings for the year from No. 10 pit amounted to 1,18,508 tons and from No. 11 pit 57,848 tons, making a total of 1,76,356 (1,81,369) tons. There is a decrease of 5,013 tons over the previous year. Although raisings for the year can be regarded as satisfactory, they would have been considerably higher, had there not been a continued shortage of wagons. Raisings, therefore, had to be restricted resulting in the dumping of coal at the depots. Another contributory factor was a strike at the colliery which commenced on 16th June, 1952 and terminated on the 18th July, 1952.

The total sales for the year amounted to 1,70,440 tons as compared with 1,71,449 tons for the preceding year. This figure too would have been substantially exceeded but for the factors mentioned above. The controlled price of the Company's steam and slack coals remained unchanged throughout the year at Rs. 15-6 and Rs. 14-6 per ton respectively.

Development work in No. 11 pit is progressing satisfactorily and this pit will shortly be in a position to produce more coal at reasonal costs. Construction of a sub-station, a labour rest shed and oil issue room and 44 blocks labour quarters was completed during the year. In addition extensions were carried out to the hospital and magazine buildings, while construction of two blocks of staff quarters and 31 blocks labour quarters was in progress during the year under review. Work was retarded due to non-receipt of cement quotas. Cement from local factories had been earmarked for Government multi-purpose schemes.

Agency Agreement and Articles of Association.—An extraordinary general meeting of the shareholders was held on 26th June, 1953, for the purpose of passing the necessary resolutions for amending certain of the Articles of Association and also for the deletion of clause 9 of the Agency Agreement dated 26th May, 1950, between the Company and Killick Industries Ltd., in order to meet the listing requirements of the Stock Exchange. Accordingly, the Company's shares have been officially admitted to dealings on the Stock Exchange with effect from 2nd July, 1953.

Energetic steps have been taken to increase sales, as a result of which the Company's Selling Agents, Messrs. S. D. Shethia and Co., Ltd., were successful in securing loco orders to the extent of 12,420 tons per month with effect from August, 1953. This now brings the total monthly commitments to approximately 20,000 tons which it is hoped to fulfil, subject to wagon indents being met in full by the Eastern Railway.

The net profit for the year, after setting aside Rs. 2,08,003 (Rs. 2,43,342) for depreciation amounts to Rs. 70,466 (Rs. 2,53,212). After providing Rs. 22,000 (Rs. 80,000) for taxation and Rs. 36,000 (Rs. 36,000) for payment of dividend on the 4½ per cent. (tax-free) redeemable cumulative preference shares, there is a sum available of Rs. 12,466 (Rs. 97,236 after provision for reserves) which when added to Rs. 60,000 (nil) transferred from the equalisation of dividends reserve and to the balance of Rs. 1,377 (Rs. 141) brought forward from last year, makes a total of Rs. 73,843 (Rs. 97,377) which the directors recommend, be disposed of in payment of a dividend at the rate of Rs. 3 (Rs. 4) per ordinary share, free of tax absorbing Rs. 72,000 (Rs. 96,000) leaving to be carried forward Rs. 1,843 (Rs. 1,377).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	20,00,000	Block ...	18,02,965
Reserves ...	1,57,000	Stock of coal	42,000
Provision for taxation ...	72,513	Stores, etc. ...	6,05,689
Liabilities ...	7,40,233	Debts, deposits and advances ...	5,03,510
Profit and loss account ...	1,843	Cash ...	17,426
Rs.	29,71,589	Rs.	29,71,589

Balmadies Plantations, Ltd.

The directors of the above Company (Managing Agents: Messrs. Planting Agencies, Ltd., Madras) submitted the audited accounts of the Company for the year ended 31st May, 1953.

The result of the Company's working during the period under review is a profit of Rs. 67,123 (Rs. 39,582), to which has to be added a sum of Rs. 16,105 (Rs. 2,743), being balance brought forward making a total of Rs. 83,228 (Rs. 42,325). Out of this the directors transferred to general reserve fund Rs. 25,000 (nil) and dividend equalisation fund Rs. 10,000 (nil), leaving a balance of Rs. 48,228 (Rs. 40,605), which amount the directors recommend be appropriated as follows:—

To pay a dividend of 6 (6) per cent. per annum, tax-free on the preference shares for the year ended 31st May, 1953, Rs. 4,500 (Rs. 4,500), and a dividend of 12½ (10) per cent. on the ordinary shares Rs. 25,000 (Rs. 20,000), leaving a balance of Rs. 18,728 (Rs. 16,105) to be carried forward to next year.

Out of the total of 500 debentures, the Company has drawn for payment to the end of May, 1953, 450 debentures of Rs. 100 each; of which three debentures are outstanding, having ceased to carry interest. The balance of 50 debentures amounting to Rs. 5,000 will be paid on the 1st January, 1954. In these circumstances, the debenture reserve fund is no longer necessary and therefore, the amount of it has been transferred to the general reserve fund which together with a sum of Rs. 25,000 credited during the current year will stand at Rs. 1,50,000.

The crop harvested was 54.1 (36.5) tons at a cost of Rs. 121 (Rs. 137-8) per cwt., as against the estimate of 60 tons at an estimated cost of Rs. 85 per cwt. The failure to harvest the full estimated crop is due to the long and severe drought conditions that prevailed and affected the proper development and ripening of the berries. The total expenditure remained the same as all the works were systematically carried out during the year. The year's crop has been valued at Rs. 2 per point which is a conservative valuation and the Company expects to realise more in due course.

The Company has spent this year a further sum of Rs. 10,295 in addition to Rs. 8,332 spent last year for the construction of four more rooms as labour quarters. This is in pursuance of the Company's policy to conform with the Government standards for labour quarters. The estate was sprayed twice in the year and have received the full and requisite dose of manure. A sum of Rs. 3,769 has been spent under this head which with the sum of Rs. 7,728 spent in previous years represents the expenditure on new clearings during 1949, 1950, 1951, 1952 and 1953. All the new clearings are coming up satisfactorily.

An estimate of 50 tons has been estimated for the coming year, 1953-54.

The Minimum Wages Act has been in operation for the past two years. Due to careful management and "rationalisation" of labour, the directors report that the estate expenditure has been kept down to a reasonably low figure though all the cultivation works have been carried out as in previous years.

Though there have been no labour troubles on the estate, the unions have made some demands on this estate as on 221 other estates in South India. The concillation tried by the Commissioner of Labour having failed, the Government of Madras have referred the matter for adjudication by the Industrial Court. The managing agents have taken all the necessary advice and legal opinion on this matter and it is hoped that it will be settled early so that production may not be hampered.

The shareholders are probably aware that the Government of India recently introduced the Coffee Bill before the Parliament and it is expected that it will be taken up before the end of this session. It is at present difficult to indicate what the effect of this new legislation will be. There has also been a proposal by the Government of India to modify the Indian Coffee Board. The directors trust that the Government would keep in view the interests of both the growers and the consuming public.

Since the Government policy towards the Coffee Board and Coffee Control is not known, the traders are very nervous about the future of the coffee market. Consequently there has been very heavy withdrawals in the recent Pool Auctions. Moreover, the Government have not allowed any export of coffee during this year which has resulted in large stocks of coffee from out of 1952-53 season being held back by curers, whilst the 1953-54 season crop will be coming into the market shortly. It is, however, expected the Government may permit coffee exports as there is a good demand for coffee in the foreign markets and higher prices are quoted.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	2,75,000	Block ...	3,70,799
Debentures	5,000	Stores ...	11,316
Reserves ...	2,30,628	Debts and advances ...	1,16,280
Liabilities ...	10,800	Investments	1,424
Profit and loss account ...	48,228	Cash ...	69,837
Rs.	5,69,656	Rs.	5,69,656

Bengal Bhatdee Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

After providing Rs. 6,000 (Rs. 4,225) for depreciation, Rs. 5,500 (Rs. 5,000) for taxation, there is a balance of Rs. 10,504 (Rs. 9,524) at the credit of profit and loss account from which the directors recommend payment of a dividend at As. 2 (As. 2) per share absorbing Rs. 5,617 (Rs. 5,617) leaving to be carried forward Rs. 4,887 (Rs. 3,907).

Raisings were 44,189 tons as compared with 33,770 tons in the previous half-year and despatches 42,208 tons as compared with 31,565 tons.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,49,350	Block ...	3,18,456
Reserves ...	70,000	Stores ...	309
Provision for taxation ...	14,894	Debts, and advances ...	1,69,692
Liabilities ...	1,79,301	Cash ...	2,29,975
Profit and loss account ...	4,887		
Rs.	7,18,432	Rs.	7,18,432

Parasea Collieries, Ltd.

The directors of the above Company (Managing Agents and Secretaries: Messrs. Deepchand Kishenlall, Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1952.

The Company's profit for the half-year ending 30th June, 1952, after providing Rs. 24,659 (Rs. 24,544) for depreciation is Rs. 27,239 (Rs. 51,833). To this is added the balance brought forward from last account of Rs. 20,999 (Rs. 18,705), making a total available sum for disposal of Rs. 48,239 (Rs. 70,539). The directors propose payment of dividend to the holders of 8,000 preference shares at the rate of 5½ per cent. per annum taxable for the year ending 31st December, 1950. This would absorb a sum of Rs. 32,450 leaving a balance of Rs. 15,789 (Rs. 70,539) to be carried forward to the next half-year.

Output and Despatches

	For the Half-year ending June, 1952 in tons.	For the Half-year ending Dec., 1951 in tons.	For the Half-year ending June, 1951 in tons.
Raisings ...	38,732	26,775	37,563
Despatches ...	24,150	27,952	28,954
Stock after boiler consumption	12,706	2,125	5,964

During the half-year under review, the output showed considerable improvement over the previous half-year; but the despatches could not be maintained on the same level due to acute shortage of wagons prevailing during this period.

The directors inform, that South Parasea Collieries, Limited in which the Company holds shares, are making steady and satisfactory progress.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	16,34,000	Block ...	10,95,907

		Cash ...	3,11,947
Rs.	20,29,688	Rs.	20,29,688

Midland Rubber and Produce Co., Ltd. (And Reduced)

The directors of the above Company (Managing Agents: Messrs. A. V. Thomas & Co., Ltd., Alleppey) submit the audited accounts of the Company for the year ended 31st March, 1953.

The total area of the estate amounts to 6,486.57 acres.

The table below gives particulars of crops raised during the year:—

Estate	For the year ended 31st March, 1953		For the same period last year	
	Estimate	Crop secured	Estimate	Crop secured
Tea	Lbs.	Lbs.	Lbs.	Lbs.
Arnakal Rubber ..	9,60,000	11,87,204	8,60,000	11,46,717
Mukampala ..	3,45,000	2,56,945	2,40,000	2,62,460
Perinaad ..	5,44,000	6,18,865	6,10,000	5,45,725
Sittar ..	2,00,000	2,29,143	2,00,000	2,80,730
Total ..	10,79,000	12,03,973	10,40,000	10,84,915

It will be seen from the above statement that the tea crop on Arnakal Estate has been extremely satisfactory with an average yield of 1,011 lbs. per acre. The estate cost of production for the year was 125.93 cents per lb. as compared to the estimate of 124.63 cents per lb.

The rubber crop on Mukampala, Perinaad and Sittar exceeds estimate in total by 1,24,973 lbs. This is an excess by 1,19,058 lbs. over the crop secured during the previous year. It is satisfactory to note that the young budded clearings are yielding in full in accordance with expectations. The estate cost of production was 55.72 cents per lb. compared to the estimate of 63.00 cents per lb.

It may not be out of place here to mention, that notwithstanding the good crops, the increase in the incidence of cost of production over that of last year is due to the adoption of the Minimum Wages Act which came into operation during the year under report.

After allowing for depreciation and the outgoings as usual, and providing a sum of Rs. 4,00,000 (Rs. 5,80,000) for income-tax, the net profit for the year amounted to Rs. 8,11,201 (Rs. 9,20,066). To this has to be added the previous year's carry forward of Rs. 83,433 (Rs. 88,167), making a total of Rs. 8,94,635 (Rs. 10,08,233). Out of this the preference dividend for the year amounting to Rs. 1,03,200 (Rs. 1,34,800) was paid out, and after making a provision of Rs. 5,000 (nil) towards reserve for bad and doubtful debts, the balance is Rs. 7,86,435 (Rs. 8,53,433) which the directors recommend be disposed of as under:—

Payment of a dividend of 15 (15) per cent. on ordinary shares Rs. 4,05,000 (Rs. 4,05,000), transfer to rubber replanting reserve (making Rs. 3,75,000 (Rs. 2,75,000) Rs. 1,00,000 (Rs. 75,000), transfer to dividend equalisation fund (making Rs. 3,50,000) Rs. 80,000 (Rs. 2,70,000), transfer to an investment depreciation reserve Rs. 50,000 (nil), transfer to staff pension fund Rs. 10,000 (Rs. 20,000), transfer to general reserve (making Rs. 15,60,000) Rs. 46,990 (nil) and carry forward to the next season Rs. 94,445 (Rs. 83,433).

With reference to the application for the consent of the Central Government for the renewal of the managing agency with Messrs. A. V. Thomas & Co., Ltd., on the terms already notified to the shareholders by notice dated 26th May, 1953, calling the extraordinary general meeting, the Government have been pleased to accord consent. The managing agents have also been directed in that consent letter not to take any buying or selling commission from the Company which they have agreed to. In the matter of directors' remuneration, the Government have agreed to sanction the revised remuneration as from 1st April, 1953.

Estimate for 1953-54 of tea is placed at 10,50,000 lbs. at 112.19 cents per lb. and rubber at 11,10,000 lbs., at 65.46 cents per lb.

The properties of the Company were regularly visited during the year by the visiting agents and the managing agents' staff and reported to be in excellent order and condition. All concerned with the management have had a very difficult time during the year, though labour activities by the unions in so far as our Company's estates were concerned, were not so adverse compared to previous years resulting in unmanageable unrest. But with the various legislative enactments now before the Parliament at Delhi pertaining to plantation products and labour, it will be futile to predict with any precision what exact reactions such enactments may visit on the otherwise normal prosperity of this Company.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	44,20,000	Block ...	60,22,688
Reserves ...	21,33,010	Stock-in-trade	5,47,465
Provision for taxation ...	6,36,084	Stores and spares ...	2,28,193

Profit and loss account ...	7,86,434	Debts, deposits and advances ...	2,71,391
		Investments	1,08,766
		Cash ...	10,39,868
Rs.	82,69,600	Rs.	82,69,600

Sapoi Tea Co., Ltd.

The directors of the above Company (Secretaries and Agents: Messrs. James Finlay & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1952.

The loss sustained by the Company, after charging depreciation, amounts to Rs. 80,549 (profit of Rs. 24,759), from which has been deducted the credit balance brought forward from last year of Rs. 18,568 (Rs. 8,810), leaving a debit balance of Rs. 61,981 (credit of Rs. 33,568). To this sum has to be added—adjustment for taxation on previous year's results Rs. 7,181 (nil) leaving a debit balance to be carried forward of Rs. 69,162 (credit balance of Rs. 18,568 after paying 2½ per cent. dividend).

In their last report, the directors stated that tea prices had dropped sharply in 1952 and further reference is made to this below. Although the total expenditure went up as a result of the higher outturn and the introduction of the Minimum Wages Act which necessitated the payment of higher wages to labour and staff, the cost per lb. compared with 1951 was reduced by As. 2.00 through strict measures of economy but unfortunately this reduction was more than offset by the fall in prices.

The total capital expenditure incurred during the season amounted to Rs. 1,71,583 which has been added in full to block; depreciation has, however, been charged on buildings and machinery in order that the accounts may conform to the normal accounting practice in this regard.

The directors are able to say that Central taxes on all years up to 31st December, 1951, have been finally assessed and the liabilities settled. Further, the excess of payments under Section 18A over the tax liabilities amounting to Rs. 1,39,135 and interest on such advance payments amounting to Rs. 8,822 have been refunded during the current year.

Weather conditions were on the whole favourable during the first half of the year but rainfall was excessive during the second half, the total rainfall recorded being 136" as against a normal of 110". The final crop came to 11,026 maunds which showed an increase of 1,197 maunds on the 1951 crop and 1,691 maunds on the average crop for the past five years.

The serious recession in tea prices which set in during the year had a disastrous effect on the results of working of the estate and the average sale price realised was only As. 21.50 per lb., as compared with As. 24.82 in 1951 and As. 26.11 in 1950. The crop was disposed of as follows:—

	Lbs.	Per lb. As.
Export auctions	239,369	19.33
Internal auctions	212,168	17.25
London auctions	328,448	26.80
Outmarket sales ...	98,401	18.50

An extension of 12.37 acres was put out during the year, making the total planted area as at 31st December, 1952, 901.67 acres as against 889.30 acres as at 31st December, 1951.

Estimate for 1953.—The original estimate provided for a crop of 11,000 maunds at an all-in cost of Re. 1-3-8 per lb. on a Calcutta ex-warehouse basis. The Company was a signatory to the Crop Regulation Scheme and the crop allotted to Sapoi is 9,754 maunds under this scheme, but if favourable weather conditions are experienced and production rights are obtainable, a larger crop may materialise.

To the end of August, 50,113 lbs. of 1953 season's teas were sold at an average price of As. 28.27 per lb., but as it represents a small percentage of the crop, it is too early yet to take a view on the anticipated results of the season's working, although they should be reasonably satisfactory.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	6,00,000	Block ...	11,33,598
Reserves ...	2,82,640	Stock of tea	10,49,318
Provision for taxation ...	59,900	Stores ...	1,36,256
Liabilities ...	17,97,868	Debts, deposits and advances ...	3,52,327
		Investments	2,048
		Cash ...	66,861
Rs.	27,40,408	Rs.	27,40,408

By Order of the Board,
CHANDRIE & CO., LTD.,
Managing Agents.

MADRAS, 5*th October*, 1953.

Note.—The Dividend Warrants will be posted on or after 15th November, 1953, to the members whose names stand on the Register of Members on the 5th November, 1953, if the dividend is sanctioned at the General Meeting.

MONEY EASY

(From Our Own Correspondent)

BOMBAY, 21st *October*,

Activity in the short-term money market was dull during the week under review and the undertone was easy. Though there was no glut of funds, money rates declined. This was due to predominance of lenders and paucity of borrowers. Due to *Poojah* holidays at Calcutta, funds could not find gainful employment at that centre. This had an effect on the Bombay market also. Lenders were, therefore, prepared to offer their surplus funds at lower rates.

Inter-bank call money among the Exchange banks and the big Indian banks was placed at 1 per cent. for most part of the week. Towards the close, some funds were available even at ¾ per cent. The corresponding rate among the smaller Indian banks was 2 to 2½ per cent. House money at call was quoted at 1½ to 2 per cent.

Some banks appeared to be less keen on making a bid for big deposits in the term money section, as they were not able to judge clearly the extent of demand for funds in the coming months. They were, therefore, prepared to pay not more than 2 per cent. for 1 month deposit, 2¼ per cent. for 2 months and 2½ to 2¾ per cent. for 3 to 6 months.

The Treasury Bill rate, however, did not show any change from Rs. 2-6-8 per cent. per annum, which had prevailed in the previous four weeks. But the amount offered at Rs. 2.58 crores was considerably more than that of Rs. 1.81 crores last week.

The statement of affairs of the Reserve Bank of India for the week ended 16th October, 1953, as compared with that for the previous week, does not show any notable variations, except in the deposits of the Central and the State Governments as well as in those of banks. Notes in circulation reveal a rise of no more than Rs. 77.27 lakhs and notes held in the Banking Department a decline of Rs. 48.91 lakhs. Central Government deposits have fallen by Rs. 14.17 crores, while those of the State Governments and banks have risen by Rs. 10.08 crores and Rs. 3.01 crores, respectively. Cash balances are lower by Rs. 48.70 lakhs and balances held abroad by Rs. 45.87 lakhs.

A fall of Rs. 4.52 crores in demand deposits and an increase of Rs. 1.20 crores in time deposits are disclosed by the Scheduled Banks' statement for the week ended 9th October, 1953, as compared with that for the previous week. Inter-bank borrowings are higher by Rs. 97.31 lakhs. While borrowings from the Reserve Bank show a decline of Rs. 42 lakhs, those from the Imperial Bank disclose an increase of Rs. 1.07 crores. Advances are better by Rs. 36.54 lakhs and bills purchased and discounted by Rs. 38.75 lakhs. Investments have increased by Rs. 2.94 crores. Cash on hand has risen by Rs. 1.61 crores, while the balances with the Reserve Bank have declined by Rs. 6.51 crores. Money at call and short notice has increased by Rs. 1.56 crores.

The Gilt-edged market ruled dull during the week under review, with no activity worth noting. The keen enquiry for the 4 per cent. State Loans, which was in evidence in recent weeks, seemed to have abated, but prices held their ground in the absence of sellers. Among the Central Government loans, 3 per cent. 1957 and 1958 held their own at Rs. 98-6 and Rs. 98-2, respectively. 3 per cent. 1959-61 changed hands an anna lower at Rs. 96-1. 3 per cent. 1963-65 was in request and gained an anna to Rs. 92-9, while 3 per cent. 1964 stood at Rs. 92-8. 3 per cent. 1966-68 shed an anna to Rs. 90-2. 3 per cent. 1970-75 was placed at Rs. 86-7 *ex-voucher*, as against Rs. 86-9 *cum-voucher* last week. 3 per cent. 1986 Conversion Loan fell back by an anna to Rs. 82-1. 3½ per cent. 1961 N.P. bonds had business at the unchanged rate of Rs. 98-8. Among the State loans, 4 per cent. 1963 Bombay was unchanged at Rs. 101-2, Madras at Rs. 100, M.P. and U.P. at Rs. 99-12. 4 per cent. 1964 Bombay was placed at Rs. 101-2, Madras at Rs. 100, U.P. at Rs. 99-12 and West Bengal at Rs. 100-10.

The Hyderabad State Government has announced its decision to float a loan of Rs. 3.25 crores for development purposes. The loan will bear interest at the rate of 4 per cent. per annum (taxable). The issue price is Rs. 99-8. The list will be open for ten days from the 22nd inst. Interest, however, is payable from the 15th inst.

In the foreign exchange section, the rupee continued to show strength in terms of the U.S. dollar during the week under review also. The U.S. dollar, which was quoted at Rs. 477¼ per $100 (banks' selling) last week, dropped to Rs. 476¾ yesterday. Banks' buying rate similarly moved down from Rs. 473¼ to Rs. 472¾. This was in tune with the growing strength displayed by the pound sterling in New York. The spot sterling advanced from $2.80 5/16-2.80 7/16 on the 13th inst., to $2.80 1-2.81 yesterday. Likewise, the forward rates strengthened from $2.79½-2.80 to $2.80 0/16-2.80 11/16 for three months and from $2.79½-2.79¾ to $2.80 5/16-2.80 7/16 for six months.

KANPUR HIDES FEATURELESS

(From Our Own Correspondent)

KANPUR, 18th *October*

During the week under review, conditions in the local hides and skins market were rather featureless. There was a slight lull in the activity due to *Dasara*. The new arrival was substantial. Madras dealers were hesitant whereas the local tanners were very keen for upper grade cow and buff. The latest quotations are as follows:—

Wet salted cow, 1st grade superior at Rs. 360 and 2nd grade light at Rs. 280 per score; wet salted buff, 2nd grade superior at 1 lb. 10 ozs. and 2nd grade light at 2 lb. 6 ozs. per rupee; goat, 1st grade at Rs. 350 and 2nd grade at Rs. 225 per 100 pieces; and sheep at Rs. 360 per 100 pieces.

LANDSLIDE IN BULLION

(From Our Own Correspondent)

BOMBAY, 21st *October*

The bullion market witnessed a debacle in prices, due to heavy bull liquidation and bear hammering, during the week under review, as a result of which both silver and gold touched to-day the lowest levels for the last ten months. Though just towards the close of to-day there was a smart recovery, the loss over the week was sizable, namely, Rs. 3-7 per 100 tolas in silver and Re. 1-13 per tola in gold.

Early in the week itself gold displayed a tendency to soften on reports that gold from the Hyderabad mine and Bhopal were being offered for sale in Bombay, in addition to the usual quantity of Mysore gold by the National Bank of India. The main factor which started the rot was an agency report to the effect that the Reserve Bank contemplated offering gold in the market as a measure to bring down prices and make smuggling unremunerative. Though this report was subsequently denied by the Reserve Bank, the nervousness caused by the report brought about such heavy liquidation by bulls and short-selling, that even the denial failed to restore values to their former levels. On top of this came the regular offering of Mysore gold and large arrivals of smuggled gold. The attempts on the part of operators to keep prices above the levels at which margins would have to be paid proved unsuccessful. When the price of gold went below Rs. 80 to-day, a good demand for ready metal came forth. This induced brisk replacement buying by bulls and bear covering resulting in a fair measure of recovery.

In addition to the nervousness caused by the weakness of gold, the decline in silver was assisted by uninterrupted influx of unrefined silver and absence of sufficient demand in the ready section. A leading bull operator was reported to have liquidated a considerable part of his holdings.

Silver for forward delivery (23rd October) opened at Rs. 152-3 and slipped down to Rs. 151-2 on Friday. Early on Monday, there was a revival to Rs. 152-1, but this was not sustained and the price toppled down to Rs. 149 at the close yesterday. As this rate was well below the level of Rs. 150-13 at which margin clause was operative, the sellers had to pay a margin of Rs. 500 per bar on their outstanding sales. But his failed to stem the selling pressure and the price dropped further to-day to Rs. 147-6, before recovering to Rs. 148-13 at the close on brisk bear covering and revival of buying. The arrival of unrefined silver to-day was also small and this, in turn, helped sentiment to improve. Business in the next settlement began on Friday at Rs. 152-6 and closed for the week at Rs. 149-7.

Ready silver (.996 Mint) was placed on par with the forward rates for the October settlement. The floating stocks of silver are placed at 2,300 bars. The arrivals of unrefined metal were estimated at an average of 40 bars per day. The offtake was poor at 10 to 15 bars on an average.

Gold for forward delivery (22nd October settlement) commenced at Rs. 82-7 and dropped in successive stages to Rs. 81-5 at the close on Monday. As this rate was below the level (Rs. 81-9½) at which margin had to be paid, the bears were obliged to pay a margin of Rs. 7 per tola on their outstanding sales. Nevertheless, the price continued to recede, due to factors already stated, and touched to-day a low of Rs. 79-11, the lowest since 26th December, 1952. There was, however, a smart recovery at the close to Rs. 80-10 on good offtake in the ready section. Trading in the next settlement commenced on Friday at Rs. 81-11 and finished the week at Rs. 80-3.

Ready gold opened at Rs. 83 and closed at Rs. 80-14. The floating stocks of gold are reported to be 30,000 tolas. The daily average arrivals were 6,000 tolas, while the offtake was 5,000 tolas on an average.

The following comparative table shows the trend of the market during the week under review:

	21-10-53	Highe	Lowest	14-10-53
	Rs. a.	Rs. a.	Rs. a.	Rs. a.

LINSEED PRICES WELL MAINTAINED

(Messrs. A. Bradley & Co.)

CALCUTTA, 19th *October*

There has been no notable change in conditions in the linseed market during the week. Whilst prices have been generally well maintained, trading has been reported on a somewhat limited scale. There has been a keen demand for ready goods from local crushers, but owing to poor arrivals stocks are scarce and sellers are reserved; activity has been confined mainly to small daily transactions for forward delivery. Reports for fresh enquiries from overseas have helped to maintain prices in the oil section, although no actual business has as yet resulted owing to higher price levels prevailing locally.

The latest quotations are as follows: Ready Rs. 19-12 and October-November Rs. 19-4 per maund.

COTTON WEAK

(From Our Own Correspondent)

BOMBAY, 21st *October*

The centre of interest in cotton is slowly but very effectively shifting from Bombay to small up-country centres, where the grower sells his seed cotton to small merchants and ginners. In fact, Sewri and Kalbadevi are taking their cue from these smaller markets. There the grower and the small merchants are obsessed by the size of the crop and the falling markets. At some places cotton has already begun to move into the market and at others a large volume will do so in the course of November-December, 1953. Hedging pressure, therefore, will be at its highest during these months and it is not likely that the forward market will be able to resist this pressure successfully, because even if the mills and the big spot houses in Bombay purchased cotton they will also want to hedge it. The mills are reported to be reluctant to go beyond their immediate requirements even though the prices are tempting at present both in view of the likely further fall in prices and talks of cut in production of cloth. Ahmedabad mills are conspicuous in this respect of not purchasing Indian cotton on a large-scale, though they are buyers for bargain lots of imported cotton.

With this background it is easy to understand how prices came to slump rather heavily in the forward market during the week under review. During the earlier part of the week, the market was able to show some resistance to selling pressure, but during the last two days it had to succumb to it and the ruling quotation at the time of writing is dangerously near Rs. 600. Knowledgeable circles in the market feel that, at some time or other during this year, the market is bound to touch the floor. The other commodity markets and the behaviour of the Bullion Exchange are also responsible to a certain extent for the bearish mentality that is gaining ground. The only hope of the market now lies in the slight improvement which has been reported in the piecegoods market both with regard to internal consumption and enquiries from abroad. It is feared, however, that this will only prove to be a temporary feature because the demand in a measure is due to the coming holidays and that textiles will once again experience a slump after *Diwali*.

In the spot market, enquiries for good styles are still there on a reduced scale. But the activity is centred more around exportable varieties for early lots of new Bengals and also to a certain extent for Oomras, which had so far been neglected. Old crop varieties such as Lakshmi and Jayadhar are also finding buyers for immediate delivery and the balance of activity in the spot market is made up of imported cotton which is in short supply at present. No large-scale buying, however, is possible in imported cotton till the Sudan crop is ready for sale and the position with regard to East African cotton is cleared up. As usual, the Ahmedabad mills are more interested in Egyptian Karnak and Giza 30 and though some good business is reported in these cottons, the tendency generally is to wait in view of the comparatively high prices prevailing at Alexandria.

I.C.C. February opened the week at Rs. 612 and declined, under heavy bull liquidation, to Rs. 606 to-day, before it closed higher at Rs. 608½. I.C.C. May fluctuated between Rs. 619½ and Rs. 611½ before it closed at Rs. 614½. The following is the trend of prices in the forward market during the week under review:

	Opening	*High*	*Low*	*Closing*
I.C.C. Feb. ...	Rs. 612	614½	606	608½
I.C.C. May ...	Rs. 616	619½	611½	614½

The following are the latest available quotations in the spot market:

Bengal *Deshi* Rs. 580; Berar *Jarilla* Rs. 670; Khandesh Rs. 750; Vijay Rs. 850; Oomra *Deshi* Rs. 585; Mogal Rs. 580.

At Karachi, there has been a slight reduction in the prices of some of the varieties such as N.T. and 4F and there has been some stray buying from the U.K. The R.C.C., however, has not yet entered the market and the Continental centres, though definitely interested in Pakistan cotton, find it above their ideas regarding prices. With a reasonable readjustment of prices, good demand is likely to materialise at Karachi from Germany, Italy, Belgium and even France, though the last had recently resold some of the cotton it purchased from Karachi. In spite of this, Pakistan will have to look to Japan for the disposal of a good part of its production during this year. There is a lull in the market and it looks as if the operators are waiting for some important developments. The following are the latest available quotations for the Karachi market: Old crop prices unchanged. New crop: Sind *Deshi* Rs. 57½; Punjab *Deshi* Rs. 53½; 4F Punjab R.G. Rs. 56½; S.G. Rs. 60; L.S.S. Punjab R.G. Rs. 59; S.G. Rs. 63; N.T. R.G. Rs. 60½; S.G. Rs. 65; 289F Punjab R.G. Rs. 64; S.G. Rs. 69.

At Alexandria, unlike all other centres, activity has continued to be brisk, with interest shifting from Ashmouni to Karnak for early deliveries. It is expected that in view of the high premia commanded by Ashmouni and Giza 30 both in the up-country and Alexandria markets, the authorities would soon revise their selling differentials in conformity with the ruling trend in these two varieties which are in short supply. As the demand for sterling in Egypt continues to be firm, the shippers are in a position to allow a discount of 4½ per cent., to purchasers who pay in sterling. The general belief is that the high prices in the Alexandria market will rule only so far as Sudans and East Africans are not openly in the market for extensive sales. With their entry, the prices would come down and Indian purchasers, who obtain about 25 per cent. of the foreign cotton requirements of the country from Egypt, would do well to wait for prices at Alexandria to come more in line with world prices.

At New York, the technical reaction after the heavy slump which was expected has materialised. Large-scale entries in loan have also helped in stabilising prices. It is believed that by the beginning of this month, about 5,63,000 bales had already entered into loan and a good quantity must have gone since then to swell this figure. If there is no substantial increase in prices, it is held in cotton circles in New York that entries into loan this year might be to the extent of more than five million bales. There is no improvement in the export position and, till this is in evidence, any big rise in prices is ruled out. It is estimated that exports till the end of September were between 15 and 20 per cent. less than last year for the same period. At the same time, it is feared that, if the increased political tension in Eastern Europe and the Middle East comes to be reduced in the coming weeks, the prices in New York might react unfavourably. On the other hand, any precipitate action on the part of either Italy or Yugoslavia might lead to a steadier trend in the U.S.A. markets.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	21-10-53	14-10-53	6-10-53
Spot	33.50	33.40	33.25
December	32.80	32.71	32.69
March	33.24	33.11	32.12
May	33.51	33.41	33.39
July	33.45	33.33	33.34

ART SILK YARN IRREGULAR

(From Our Own Correspondent)

BOMBAY, 21st *October*

The art silk yarn market presented an irregular trend during the week under review. The easiness witnessed last week persisted during the early part of this week also, on continued deterioration in the offtake of rayon cloth and in sympathy with the sharp decline in prices of cotton. Reports from almost all important consuming centres proved to be bearish. Consequently, sockists became nervous and forced sales on an unwilling market, with the result that prices staged a sharp decline. But at this level, there was short covering, on rumours that export of yarn would be made free. Prices once again looked up, but the trend was short-lived, as the rumours were negatived by the announcement, on the 17th inst., by the Government of India of its decision to allow export of yarn by mills or their nominees, only on the same basis as during the January-June, 1953 period. Subsequently, speculative support appeared and prices rallied once again. But much headway was not possible, as the market was in a state of flux on rumours that the Government of India had doubled the quota for export of yarn. But, till the close of the market there was no confirmation of the report. On balance, however, prices disclosed small gains.

In the forward section 150D October, which opened at Rs. 665 as against Rs. 682, declined to Rs. 663 on the 15th inst. At this level some buying on covering by shorts appeared, and the rate gradually improved to Rs. 691 on the 20th inst. Profit-taking, which ensued at this stage, pushed down the rate to Rs. 684, at which level it closed to-day. 150D November, which was enquired at Rs. 669, as against Rs. 686, was done to-day at Rs. 688. 120 Japan gained an anna and six pies to Rs. 4-1 and 150 Japan six pies to Rs. 4. 120 Italy and 150 Italy were in demand at Rs. 3-14 and Rs. 3-11-6, as against Rs. 3-13 and Rs. 3-7, respectively.

The staple fibre yarn also continued to present an easy trend early in the week, on reports of large arrivals from South Indian mills and decline in offtake. Thereafter, it recovered in sympathy with the art silk yarn market. 40×2 October, which was done at Rs. 632 early in the week, as against Rs. 642, gradually improved to close at Rs. 657. November delivery, while was lower at Rs. 616 on the 15th inst., as compared with Rs. 623 on the previous day, finished the week at Rs. 641.

The table below gives the prices of art silk yarn and staple fibre yarn quoted to-day, as compared with those on the 21st inst. and 7th inst.

Art silk yarn	21-10-53 Rs. a.	14-10-53 Rs. a.	7-10-53 Rs. a.
150D October (per case of 200 lbs.)	684 0	682 0	709 0

Staple fibre yarn			
2/40s October (per case of 200 lbs.)	657 0	642 0	648 0
2/40s November	641 0	623 0	633 0

MIXED TREND IN OILSEEDS

(From Our Own Correspondent)

BOMBAY, 21st *October*

The oilseeds market presented a mixed trend during the week under review. There was very little activity in groundnuts, as buyers were reluctant to commit themselves in expectation of announcement of export policy in groundnuts. In castorseeds, futures trading was more or less easy, on discouraging advices from overseas markets, while spots were somewhat bright on short covering at low levels. But, the linseed section was steady, due to lack of floating stocks. *Kardi* seeds improved on enquiries from shippers. So also, *niger* seeds put on a better show, on buying from Gujerat interests.

There was a rumour that the Government of Saurashtra might shortly cut export duty on groundnut and groundnut oil by 10 per cent. to 15 per cent. of the existing rates. It may be noted that the present rates of export duty are: groundnut *kernel* As. 12 per *desi* maund (40 lbs.); groundnut As. 8 per *desi* maund; and groundnut oil Rs. 1-12 per *desi* maund. The Saurashtra Government is authorised to levy export duty on groundnut and oil till the end of 1955, according to the provisions of the Federal Financial Agreement with the Government of India, and its policy is to effect a step-by-step reduction in the original rate. In accordance with this policy, a 25 per cent. reduction, in the rates imposed in 1950, has since been made.

In the groundnuts section, Bold F.A.Q. was steady at Rs. 40. December-January delivery, however, lost As. 12 to Rs. 28-6. But, Khandesh quality was higher by Re. 1-8 at Rs. 38-8. October delivery was unchanged at Rs. 35, while November delivery lost As. 8 to Rs. 30-12. Groundnut oil *ex*-mill was down by As. 12 at Rs. 22, and railway receipts by As. 8 at Rs. 21-8. October, November and December deliveries were enquired at Rs. 19-6, Rs. 16-7 and Rs. 15-6, as against Rs. 19-4, Rs. 16-8 and Rs. 15-12, respectively.

The fluctuations in the castorseeds section were narrow. May delivery, which opened at Rs. 112-8, as against Rs. 113-12, fluctuated between Rs. 114-8 and Rs. 112, before closing at Rs. 113-12. F.A.Q. ready gained As. 12 to Rs. 30-12, while ready Madras lost As. 12 to Rs. 31-8. Castoroil B.S.S. declined from Rs. 17-10 to Rs. 17, I Pressure from Rs. 17-4 to Rs. 16-14 and Commercial from Rs. 16-8 to Rs. 16-2.

In the linseed section, Bold ready advanced from Rs. 25 to Rs. 25-8. October-November delivery rallied As. 8 to Rs. 23-8. February-March delivery was better at Rs. 22-12. Linseed oil was unchanged at Rs. 14.

Among others, *kardi* seeds were enquired in the Continent at £43 per ton and *niger* seeds at £51 per ton. *Kardi* Bold F.A.Q., consequently, gained Re. 1-8 to Rs. 21-12 and October-November delivery As. 12 to Rs. 21. *Niger*, F.A.Q. improved from Rs. 31-8 to Rs. 33 and Madras from Rs. 32-4 to Rs. 34.

The following table shows the prices of oilseeds and oil on the 21st inst. as compared with those at the end of the previous two weeks.

	21-10-53 Rs. a.	14-10-53 Rs. a.	7-10-53 Rs. a.

Commercial (per quarter)..	16 2	16 8	17 4

DEMAND FOR SUGAR TAPERS OFF

(From Our Own Correspondent)

BOMBAY, 21st *October*

Demand for sugar, from the Deccan and Malabar sides, which was very active last week, tapered off during the week under review. With the next ship due after about a fortnight, spot holders are inclined to unload their holdings in anticipation of profit-taking by tenderers of British refined sugar per s.s. *Atlantico*, due to arrive next month. Unofficial forward trading has also declined, and *Asho* and *Kartik* deliveries which had improved last week to Rs. 86-12 and Rs. 85-4 per 2 cwts., have since declined to Rs. 86 and Rs. 84 per 2 cwts. respectively. Undertone of both the spot and forward sections is slightly weak, owing to predominantly profit-taking tactics of operators.

Arrivals of indigenous sugar into Bombay during the week amounted to 3,300 bags, and the spot quotations for the small, medium and large grains are Rs. 89, Rs. 91, and Rs. 97-Rs. 98 per bag respectively. A loss of Re. 1 is revealed in British refined sugar which has receded from Rs. 87-4 to Rs. 86-4 per 2 cwts. Transactions were done in Mexicans, As. 8 lower, at Rs. 86. Java sugars were quoted, As. 12 lower, at Rs. 91-8.

Since we reported last week, there would appear to have been some improvement at least in the collection, in full, of the balances due from those whose tenders for imported sugar have been accepted by the Food Ministry. For under the terms of the contract, the tenderers are required to pay the outstanding balances a week in advance of the arrival of ships. Now that the s.s. *Atlantico* is scheduled to arrive in Bombay in the first week of November, the tenderers are required to make payment of their dues outstanding by the 27th inst. It is reported that tenders for minimum quantities of 200 bags each of sugar per s.s. *Atlantico* have been accepted in full, while those for more than this quantity have been given an allotment of 70 per cent. of their offers. The s.s. *Fiducia* is expected by about the second week of November, and as such, the allotment letters for Mexican sugar will be issued before the end of this month.

PEPPER DULL

Messrs. Parekh & Co.)

BOMBAY, 21st *October*

The session under the week was shortened by the intervening holidays and the pepper market proved a dull affair, there being a limited interest by the New York buyers in the nearby and distant afloat as also in the shipments by the named steamers only. Alleppey, after maintaining a level of Rs. 2,250, for a day or two, showed softer tendency owing to the absence of export demand. The growers at all primary centres were anxious sellers at Rs. 2,200 and appeared ready to give further concession in the price, if sizable quantities are offered but buying was thin. A section in the trade attributes the present softness in the selling attitude of the growers to the recent optimistic report on the coming crop, while the other attributes it to a passing psychological reflection of lower prices in other commodities, though pepper is reported to be statistically sound because World's pepper production has not still outstripped its yearly requirements. At New York, the premium for the spot is reported to be fast narrowing, and it is now hardly 6 to 7 cents as against 25 to 30 cents some time ago. Dealers there, are reported to be seeking to lighten their stock and replace it with afloat and shipment positions.

In A.S.T.A. section, October after having touched the highest of $1.02 is now offered at $0.99, while November and December are offered at $0.94 and $0.89½, the highest being $0.97 and $0.93 respectively. In delivery section, prices for October and December delivery having once reached the level of Rs. 1,980 and Rs. 1,670 are now quoted at Rs. 1,940 and Rs. 1,610 respectively. Exporters in India are watching keenly the developments in Korea and Yugoslavia and are reported not so anxious as to make large short sales at cut prices in foreign markets, because there is always an uncertainty at this time of the season regarding the final result of the new crop and because of their opinion that lower prices are sure to increase consumption both locally and in the foreign countries.

Following are to-day's nominal quotations:—Ready delivery Rs. 280-95 per cwt. and October delivery Rs. 1,910-30 and December delivery Rs. 1,590-1,610 per candy of 5½ cwts.

TEAS QUIETLY STEADY

(Messrs. Forbes, Ewart and Figgis, Ltd.)

COCHIN, 17th *October*

The offerings in sale No. 21, which was held on Tuesday, 13th October, amounted to approximately 11,90,000 lbs. Quality amongst the high-grown teas showed some improvement and there were some attractive flavoury invoices on offer. There was a good general demand, although prices showed an easier tendency. Common, low medium and medium brokens were half to one anna easier, but, low fannings remained steady. Medium fannings met strong support and were irregularly one anna dearer. Best liquoring high-grown teas met good competition and where quality showed improvement, prices were As. 2 to As. 3 above valuations. Whole leaf teas were again well supported. The following were the quotations:—

	1953 Rs. a. p.	1952 Rs. a. p.
Low-grown Travancore B.O.P.	1 12 0	0 15 0
		to 1 0 0
Medium Travancore B.O.P.	1 13 0	1 13 6
Anaimallais B.O.P.	1 15 6	2 1 6
		to 2 2 6
Best liquoring Nilgiri B.O.P.	2 10 3	3 7 0
Well made black leaf O.P. ...	2 3 6	2 4 0

London Market.—Irregularly easier. Commons farthing to half penny down. Dooars best feature.

Colombo Market.—Good demand. Prices slightly lower, except good liquoring fannings.

Calcutta Market—Export.—Good general demand. Prices irregularly firm to half an anna lower.

Dust.—Fair general demand. Medium Dooars and Assams irregularly half an anna easier. Darjeelings and C.T.C. Assam sold well.

Export Quota.—Business has been done at 17¼ pies.

Forthcoming Auctions.—Sale No. 22 will be held on Tuesday, 27th October.

As we go to Press, Messrs. Forbes, Ewart and Figgis, Ltd., wire as follows:—

"*Dust Sale U.*—1,25,000 lbs. General demand. Low sorts and clean black grainy types fully firm. Others inclined easier half to one anna."

LITTLE CHANGE IN FOODGRAIN PRICES

(From Our Own Correspondent)

HAPUR, 10th *October*

"India need not import any foodgrains in the next calendar year. On the other hand, it may even export some quantity," thus a top Food Ministry official told the Press this week. He was commenting on the favourable monsoon this year and the ideal *kharif* crop which, coupled with the satisfactory storage facilities in Government godowns, would make 1954 an all-time record on the road to self-sufficiency and surplus production. The only food imports in 1954 will be the one million tons of wheat which India has to buy annually, for the next three years, under the International Wheat Agreement. At the end of 1953, India will have 20 lakh tons of foodgrains in store for feeding the ration shops and for meeting emergency. This includes a little over one million tons of wheat 700,000 tons of rice and three lakh tons of other grains.

Rationing of foodgrains will end in all towns in Bombay State with populations of less than a lakh from 1st January, 1954. The State Government has decided to take this step in view of the much improved food supply position in that State.

Madhya Bharat's Food Minister has announced that the food situation in the State was quite satisfactory at present and nowhere was any shortage of foodgrains being felt. The Food Minister announced removal of ban on inter-district movement of *jowar* and gram, reduction of the levy on gram from 40 per cent. to 20 per cent. of the exported quantity, sale of gram through ration shops at Rs. 12-8 per maund without any restriction of quantity and continuance of the present controls on wheat comprising monopoly procurement through licensed traders in the open market at Rs. 13-8 or Rs. 14 a maund, according to quality, and ban on inter-district movement. He revealed that the *kharif* crops of *jowar*, *bajri*

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. a Sales and amount written off. (b) Investments.

(f) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 800 in the debentures section:—

(a) Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium

(b) Bearer bonds of Rs. 1,000 each repayable at par.

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole for in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

(e) Retractable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time on or after 30th June 1947 on six months' notice.

PROGRESS OF COLOMBO PLAN

THE progress made by the member countries of the Colombo Plan has been reviewed by the annual report which was adopted by the Consultative Committee of the Plan which met recently at New Delhi. The highlights of the economic progress achieved by these countries are:

Burma: It is still engaged in rehabilitating its economy after the extensive damage of the war period. A considerable amount of land has been reclaimed and is now under cultivation. In 1952, an area of 633,000 acres of additional land were sown to paddy. A cotton seed farm was established for long-staple cotton; a dairy farm was set up with imported cows from Pakistan; seedlings were procured for planting 300,000 coconut trees. A large oil refinery is under construction and a small sulphuric acid plant is nearing completion. A number of Government buildings have been erected and several housing projects are under way.

Ceylon: About 20,000 more acres of irrigable land were opened up in 1952-53, mainly under the important *Gal Oya* Scheme, work on which continues to make satisfactory progress. The rural development scheme was *in successful operation*. Satisfactory progress was maintained in fisheries development. The improvement of Colombo harbour was well under way. Stage I of the Hydro-electric Scheme at Norton Bridge was completed, resulting in an increase *in capacity of* 25,000 kw. The plywood factory was reorganised and satisfactory progress was made with the vegetable oil, D.D.T. and caustic soda factory and with the paper factory.

India: Irrigation works benefited 3.5 million acres of land during 1952-53. The Central Tractor Organisation reclaimed about 510,000 acres. Owing partly to good seasons, but also as a result of these and other developmental measures, the production of food increased by nearly 5 million tons as compared with 1951-52. Work on Bhakra Nangal, Damodar Valley, Hirakud and Tungabhadra and other projects was progressing satisfactorily. Power generation capacity was increased by 315,000 kw. The Sindri Fertiliser Factory, the Chittaranjan *Locomotive Factory* and the Telephone Factory went into production. The production of fertiliser increased from 35,000 tons in 1951-52 to 230,000 tons in 1952-53. The construction of three ships was completed. 333 new railway *locomotives were commissioned*, which included 90 procured from domestic production. The two principal producers of iron and steel were expanding their production capacity. Two oil refineries were being erected near Bombay. The production of *cotton cloth reached 4,700 million* yards, a post-war record. The production of coal increased from 32 million tons in 1950 to 36 million tons in 1952, and that of steel from 1,004,000 tons in 1950 to 1,103,000 tons in 1952.

Indonesia: Considerable progress has already been made in approaching the goal of self-sufficiency in foodstuffs, especially rice, imports of rice were reduced *from* 600,000 tons in 1951-52 to 300,000 tons in 1952-53. Rural education centres were set up to intensify extension work. The import programme for the transfer of population from over-populated areas to under-populated areas was under way. Work continued on irrigation projects during recent years. Nearly one million miles of irrigation canals have been constructed. Progress was made with highway construction and other communication. A start was made on the South Borneo Drainage Plan, involving an area of nearly 500,000 acres. The motorisation of the *fishing fleet began*. The *production* of petroleum products was greatly increased. Various projects concerning industry, labour, health, social development and education were under way.

Malaya and British Borneo: In the Federation of *Malaya the resettlement* of over 400,000 squatters was completed. 50,000 acres were replanted with high-yielding rubber. At Tanjong Karang the irrigation of 50,000 acres of paddy land was completed. The first (40,000 kw.) of the Connaught *Bridge* Power Station was completed. The gap in the East Coast Railway was closed by the relaying of 200 miles of line.

Singapore: A new station with an *interim* capacity of 50,000 kw. has been brought into operation. Substantial progress was made with the new airport and with housing schemes.

Sarawak: Progress was made in the development of roads, air transport, and tele-communications.

North Borneo: Schemes for irrigation, communications, electricity and housing were under way.

Nepal: *The construction* of 79 miles of motor road to connect Kathmandu and Bhaise was started in September 1952 and the track has already been rendered fit to be negotiated by jeeps. Five important districts were connected with each other by air services. A systematic *geological survey* of Nepal was got under way. A central livestock development farm was established at Kathmandu. A Village Development Scheme was inaugurated with trained workers.

Pakistan: Satisfactory progress was made with the various multi-purpose and irrigation projects. The lower Sind barrage was brought to an advanced stage. The total *electric power capacity* increased from 70,000 to 140,000 kw. The cotton textile industry made remarkable progress. The number of spindles installed or in the process of being installed, amounted to 950,000 as against 178,000 at the time of Partition. Similarly, the number of looms increased from 4,824 to 13,300. The jute textile industry also made satisfactory progress. 3,000 looms were already in production and were able to meet the internal requirements of the country in respect of jute goods. Two woollen mills with 9,652 worsted spindles and five mills with 4,906 woollen spindles, went into operation. Machinery for 3,660 woollen and 1,060 worsted spindles had arrived and was under installation. Four cotton seed oil plants with an annual crushing capacity of 19,000 tons had gone into production and additional capacity for 57,500 tons was under construction. A sugar mill with an annual capacity of 35,000 tons of sugar was established. A 50,000-ton ammonium sulphate fertiliser plant is under construction.

Viet-Nam: The area under rice has increased by nearly 500,000 acres since 1951. The consumption of electric power increased from 195 million kw.h. in 1952 to 238 million kw.h. in 1953. The output of coal increased from 638,000 tons in 1951 to *894,000 tons* in 1952 and is expected to exceed 1,000,000 tons in 1953.

OFF THE RECORD

(Concluded from page 763)

full of matters connected with the formation of a new State and that what he said about the tonic effect of alcohol on State revenues was in the context of this scheme of his. Perhaps, this promised escape from prohibition to the subjects of the present State of Bombay was an important plank in this project of United Maharashtra, with Bombay as its capital.

It needs some shrewdness and intelligence to discover the subtlety underlying this clever move of Dr. Deshmukh. He naturally suspected that there was bound to be a good deal of opposition to his scheme for grabbing Bombay for United Maharashtra, both from influential people in Bombay and Gujerat. If these thirsty people, groaning under heavy taxation, were assured that, in the new set-up of linguistic States, they would be able to quench their thirst and that this in its train would lead to the lessening of the burden of taxation, all opposition to his scheme would automatically be submerged in a wave of enthusiasm. If he had advocated an all-round abrogation of prohibition, including even the multi-lingual States of to-day, this idea of Dr. Deshmukh would have ceased to work as an incentive for people to wage a war for securing new linguistic States. It would be silly to ask

RELIEF TO COTTON MILLS INADEQUATE

THE threefold measures announced by the Government of India for improving the marketability of mill-made cotton piecegoods have come not a day too soon. On the contrary, they are very belated. If they had been taken some months ago, they might have yielded more tangible results than they are likely to do now. Inordinate delay is not the only criticism that one has to offer on the Government's action. Inadequacy is also an equally valid criticism. There is no doubt whatever that what the Government has done is not enough. It should have gone further in reducing the imposts on the industry which were imposed at a time when the demand for cloth exceeded supply. The parsimonious manner in which the Government has given relief, coupled with the steps it has taken to safeguard the interests of workers, suggests that either its understanding of the industry's malady is imperfect or it is deliberately following an ostrich-like policy. It will not be surprising, therefore, if it finds ere long the necessity for taking further action to stimulate the offtake of cloth.

Readers must by now be familiar with the gravity of the situation facing the mill industry. This was described at some length in some of our previous issues, particularly in those dated 26th September, 1953, and 10th and 24th October, 1953. A reference to these issues will show that cloth of the value of about Rs. 75 crores had accumulated with the mills by the end of September and that, although the customary busy season for the cloth market had arrived and the mills had reduced prices very substantially, the offtake showed no signs of improvement. The only alternative which most of the mills had was to enforce a cut in production, with all its consequences on employment in the country, as the Government had paid no heed to their requests for a reduction in the incidence of indirect taxes on the industry. It was only when the Government was faced with the prospect of immediate retrenchment of workers in the textile industry that it condescended to take some action.

It is obvious from this that no amount of suffering by the mass of consumers or investors will move the Government, but the possibility of a few thousand workers being thrown out of employment will be sufficient to make it sit up and take notice of the situation. It is this attitude of the Government towards the problems of industries that tends to encourage the undesirable tendency among some employers to pinch the labour in order to obtain relief. The remedy for this surely lies in the hands of the authorities themselves. By this we do not mean that they should admonish the employers, as the Commerce and Industry Ministry has done in its Press communique issued last weekend. What we mean is that the Government should be prompt in redressing the genuine grievances of the industry and in giving relief to it in respect of burdens imposed to meet a particular situation which does not obtain any longer.

What are the reliefs which the Government has given to the industry? In the first place, the export duty of 10 per cent. on medium counts cloth has been abolished. Secondly, the excise duty on superfine cloth has been reduced from As. 3-3 to As. 2 per yard. And, thirdly, provision has been made for granting a drawback of duty on imported cotton used in the cloth exported from this country. These concessions are welcome, but, as stated at the outset, they do not go far enough. The first and the third reliefs are designed to encourage exports, while the second is expected to stimulate domestic consumption. Following the abolition of the export duty, the competitive capacity of medium counts produced by Indian mills is no doubt a little better than it was when the 10 per cent. duty was on. But it is too early to say whether it will produce any spectacular results, because the competition for export markets is very keen. The U.K. and Japan may seek to buttress their position by reducing their prices and by offering better credit facilities and they are in a position to do so because of their higher productivity and lower cost of production. If the Government had taken this step some three months earlier, the results might have been quite substantial.

The granting of a drawback of duty on imported cotton was overdue by more than eighteen months. The Government had hardly any justification for withholding this concession so long. By not giving a refund of the import duty on cotton used in the manufacture of goods for export, the Government was placing the Indian mills at a disadvantage *vis-a-vis* their confreres in other countries which have not been subject to such a handicap. The varieties affected were not merely fine and superfine goods manufactured entirely out of imported cotton but also medium counts, inasmuch as foreign cotton was used in the manufacture of these varieties too. So long as the latter were subject to an export duty as well, they suffered from two handicaps. Consequently, exports of medium counts in the past were smaller than those of either the coarse or the fine counts. In 1952, for instance, out of a total export of about 394 million yards, while coarse and fine accounted for 168 and 265 million yards, respectively, the share of mediums was no more than 139 million yards. But, considering the fact that medium counts account for as large a proportion as about 60 per cent. of the total production in the country, they should, really speaking, hold the first place in our exports of piecegoods. Now that both the handicaps have been removed, the medium counts should fare better. Whether, however, they will actually do so will depend upon the trend of the world textile markets.

It is, indeed, a misnomer to describe the granting of a drawback of import duty on raw material as a concession, for the Government has no right to resort to this form of taxation and no Government in the world does so. What the Government has done now, therefore, amounts to no more than remedying an injustice. Further, in doing so, the Government has shown no special favour to cotton mills, for, under the Ordinance issued last week-end, all export industries which are using raw materials subject to an import duty are entitled to a drawback. A further point that needs to be noted, in this connection, is that a mere drawback of import duty on cotton is not sufficient, because it does not fully reimburse the industry the effect of import duties which the industry has been paying on fuel oil, dyestuffs, various types of mill stores, spares, chemicals, etc. It may be argued that this contention does not hold good now that a large part of these goods is being produced within the country itself. But this argument is not wholly correct, for the cost of these materials is higher than in the countries with which India has to compete in the overseas markets for cloth. There is thus no doubt that, in regard to all these things, the competitors of Indian mills are more favourably placed.

The half-hearted nature of the Government's action is evident from its decision to continue the export duty on coarse counts and to maintain the excise duty on fine, coarse and medium counts unchanged. The Government, which has gone out of its way to make many unwarranted and irrelevant statements in the Press note, issued by the Ministry of Commerce and Industry, announcing the reliefs mentioned above, has not cared to explain its reasons for continuing these imposts. The Government admits that the industry is "undoubtedly facing difficulties," that "the mills in Bombay and Ahmedabad have made perceptible reductions in the prices of cloth," and that, "in the present circumstances, there is little hope for further reduction in prices by the mills." If that is so, why has the Government decided to continue these imposts? What more proof does it need for removing them? By reducing the excise duty on superfine cloth, the Government has conferred some benefit on only a small section of the industry. Superfine cloth, it may be interesting to note here, accounts for only about 5 per cent. of the total production of mill-made cloth in the country. The remaining 95 per cent. of production gets no relief in excise duty. Since this duty is as heavy as 15 pies per yard on fine counts, which constitute a little over 25 per cent. of the total cloth production, the Government should have at least halved it. There is another reason why it should do so. In the last Budget, the excise duty on this particular variety of cloth was more than doubled, that is, from about 7 pies per yard to 15 pies, all in the name of readjusting the duty from *ad-valorem* to specific duties. The strong protests made by the industry were quietly ignored by the Government. It might have done so under the impression that the traffic could bear that rate of taxation. But now that the market position has deteriorated in favour of buyers, the duty has become very onerous.

Equally urgent is the need for abolishing the export duty on coarse counts. It can, of course, be argued that, inasmuch as the Indian mills have the advantage of getting their raw material at well below world prices, they can afford to carry this burden. It can further be argued that coarse cloth being the poor man's cloth, the Government is not very much interested in providing a special incentive to mills for exporting this cloth free of any duty. But it must be remembered that the advantage of lower cotton prices is nearly, if not fully, offset by high labour costs in terms of workers' productivity and that a part of this burden is

being passed on to the cotton grower. If the export duty on coarse counts is abolished, the mills will ultimately be able to pay a higher price for the cotton used in its manufacture. As production has gone up to record high levels and as the supply of cloth in the country is plentiful, there is no need for continuing the export duty on coarse counts with a view to keeping their exports under check. But, if after investigation the Government finds it necessary to ensure sufficient stocks of certain types of coarse cloth for domestic consumption, it can continue the export duty on these varieties, leaving the rest to be exported free of duty.

It must, however, be added that, even if all the foregoing suggestions are implemented by the Government to-morrow, the problem of maintaining production at the current level of 4,900 million to 5,000 million yards cannot be completely solved. At best, these measures can bring down the costs only by a fraction. A very substantial reduction in the price of cloth will be necessary to stimulate both domestic consumption and exports and that can be brought about only if the cost of production is lowered. As there is scarcely any scope for lowering the cost of cotton, the only other item of cost that can be substantially reduced is the wage bill. A direct reduction in wages is, however, neither feasible nor desirable, unless it can be achieved through lower cost of living. The only way out, therefore, is an increase in the productivity of both men and machines. We thus come back to the self-same problem of modernisation of machinery and rationalisation of production. The workers must agree to mind more spindles and looms, and where the managements are inefficient and corrupt, they must either mend their ways or be made to vacate their position in favour of more efficient managers. All this requires the wholehearted co-operation, not to mention mutual confidence, of labour, management and the Government.

TAXES ON AGRICULTURE

IT is now becoming increasingly clear that the Five-year Plan might founder on the rock of finance, if the Central and State Governments do not evolve a fiscal policy which will enable the Governments to find the necessary finance for development purposes without killing individual initiative and enterprise. The deliberations of the National Development Council which met early this month in New Delhi, the utterances of the Finance Minister, Mr. C. D. Deshmukh, and the Deputy Chairman of the Planning Commission, Mr. V. T. Krishnamachari, all make it abundantly clear that, if large-scale deficit financing is to be avoided, it will be necessary to make every attempt at closing the leakages in revenue and searching for new sources of income. Among the sources, for which a special plea was made at the meeting of the Council, was the Development levy—the levy on lands that benefit from the successful completion of the irrigation projects. But this levy forms part of a whole range of taxes on agriculture. Without necessarily running the whole gamut of issues presented by this somewhat intricate subject, which in any case will be examined at great length by the Taxation Enquiry Commission, it will perhaps be useful to consider the objectives and scope of taxes on agriculture.

Any examination of this subject must take into account the admitted paucity of sources of tax for the States and the equally admitted reluctance of State Governments to exploit the sources which are available to them. Since agriculture has been included in the States' list, the taxation of land and of agricultural income is the responsibility of the State Governments. If these Governments have not shown any great enthusiasm for tapping this source, it is because of the fear that they might incur the displeasure of a very large section of people who have been largely responsible for voting them into power. Thus, it has become a political issue. On purely economic considerations, there is no doubt that agriculture, which has benefited greatly from the increase in prices in recent years, ought to bear its share of the tax burden. And yet, neither land revenue rates nor other imposts on agriculture have been revised upwards. The State Governments have, by and large, made up the loss of revenue through prohibition by sales tax. But it is unlikely that this tax will continue to yield a revenue on the same scale as it has done in the past. This consideration, apart from the more compelling reasons of finding finance to pursue the Five-year Plan, must make the State Governments revise their fiscal attitude towards agriculture. But even if they are prepared to adopt a more realistic attitude in this matter, they may not be able to get such a large revenue as they would have obtained in the past. In fact, they are fast missing the bus. This is because agricultural prices are coming down not only here but also abroad. The revenue through agricultural taxes, which might have been the State Governments' for the mere asking in the early post-war years of agricultural prosperity, will now be only slow in coming. In any case, it is better to revise the attitude towards taxes on agriculture. It is still not too late, for some of the crops continue to fetch good prices and the situation affords scope for a judicious revision of these taxes.

Among the fiscal burdens, which agriculture might be asked to bear, agricultural income-tax is one of the most important. Although many States have taxes on agricultural income, the tax falls only on large estates and plantations. Further, in most cases the dividends paid out of agricultural income are also assessed for purposes of income-tax, though in some cases they are exempted. This is a somewhat anomalous position which could be rectified, as the Bengal Chamber of Commerce and Industry has pointed out, only through the creation of a single co-ordinating authority which will determine an assessee's taxable income, from whatever source. The agricultural portion of that income could then be taxed either by the Centre on behalf of the States or by the latter on a uniform basis. But it must be recognised that agricultural income-tax, as such, is not likely to yield a very large revenue, thanks to the progress of land reforms, the abolition of *zamindari*, the voluntary land gifts movement, and the move in many States to impose a ceiling on land that could be owned by individuals. But the question bristles, as all civil administrators have recognised, with serious difficulties, since it will at all times be difficult to determine agricultural income, and still more difficult to arrive at the taxable income by making allowances for expenses of cultivation. The scope for evasion will be large and the cost of inspection high in outlying areas. It is the essence of a tax system that it should be simple, easy of comprehension and administration. From this point of view, the suggestion made by the Bombay Chamber of Commerce, namely, that the rent, which a landlord can collect from the tenant, may be made the basis for calculation of agricultural income, deserves the consideration of the State Governments.

Apart from agricultural income-tax, which is an innovation in India's fiscal sphere, there is the traditional source of revenue, the land revenue. The question whether agricultural lands, in the context of the large increases in the prices of agricultural produce in recent years, cannot bear a higher rate of revenue has never been investigated satisfactorily. It is true that agriculture is subject to special risks, such as famine and floods, and deserves to be treated with some special consideration. Even so, it should be possible to upgrade the land revenue rates. But any such revision should follow intensive propaganda in the rural areas, in order to make the rural population realise that the additional revenue is being collected for purposes of development. Allied to this question is that of periodical settlement. Here, administrative practices vary from State to State, the ordinary term of settlement ranging between 20 and 40 years. Although it is recognised that the interval should be sufficiently large, it should not be so large as to make land revenue unresponsively rigid for any great length of period in relation to changes in the prices of agricultural produce. Perhaps, a 30-year term, as has been suggested by the Bengal Chamber, would be an appropriate interval.

By far the most topical issues in the sphere of agricultural taxation are the betterment levy and irrigation rates. It is now a well recognised principle that the people who benefit from the improvement in land, through irrigation or other projects, which are carried out at the expense of the general taxpayer, should be made to bear a larger burden of taxation. Although this principle should never be, and has neyer been, carried so far as to make the entire cost of the projects recoverable from the immediate beneficiaries, there is no doubt that State Governments should not hesitate to recover as much of the increased income accruing to the beneficiaries as possible, consistent with the capacity of the agriculturists to bear the additional burden and the need for leaving them sufficient margin for covering the cost of developing the land. It must be recognised that the provision of water alone is not sufficient for bringing new land under cultivation or for introducing intensive cultivation of the existing culturable land. In either case, the land has to be developed and made fit for raising irrigation crops. This involves substantial capital expenditure. The farmer will have no incentive to undertake such development, if the rates of development taxes are fixed at high levels.

Charges for water supplied for irrigation from Governmental canals and works are levied in various forms such as water rate, increment in land revenue, irrigation cess and betterment levy. The Planning Commission itself recognised that, as the projects now under construction are "considerably more costly than projects executed in the past and also the cost of maintenance and operation is higher than before, the State Governments should re-examine the water rates, etc., which they recover from the cultivators for the supplies of irrigation waters." It is not clear what steps have been taken by the State Governments to implement this suggestion. But in doing so, the State Governments will do well to bear in mind the aforesaid consideration. They will also do well to take note of two notable suggestions that have been made by the Bombay Chamber of Commerce in its reply to the Taxation Enquiry Commission's questionnaire. Water rates, once determined, the Chamber rightly insists, should not be changed too frequently. Secondly, unnecessary complications will arise in the system of assessing water rates, if concessional or incentive rates for particular crops or farming techniques are imposed.

Betterment levy is on a somewhat different footing from the other forms of levy. While the other levies are generally designed to take away a portion of the excess income which accrues to the agriculturists through the completion of irrigation and other projects, betterment levy seeks to prevent speculation over the increase in the capital cost of the lands that acquire a new value when they are within the area served by the projects. It is an irreproachable principle that the State should benefit from this unearned increment in the value of such lands. In any case, it is right that the State should prevent speculation in land prices that generally follows the execution of irrigation projects. Many States have already taken steps to impose betterment levy. It is to be hoped that other States will soon adopt similar measures and mop up at least a portion of the increment in land values. But how is the rate of levy to be determined? The Bombay Chamber of Commerce feels that, even if as much as 50 per cent. of the increased value of the lands is absorbed by the State by way of a betterment levy, it should not be considered excessive, provided the levy is collected only at the time of the sale of holdings. Explaining this point further, the Chamber observes:

"The provision of irrigation facilities makes such an enormous difference in the value of the land and the potential standard of living of the landholder that there is every justification for a betterment levy. The assessment and collection of the levy, however, must present very serious administrative problems. The simplest method of collection might be one which comes into operation at the time of transfer of the improved landholding by sale. It should be relatively easy to determine the difference between the value at the time of the last sale and sales effected after the provision of irrigation facilities. To some extent, this method can yield certain revenue even before a project comes into full operation as land values will appreciate in anticipation. Further appreciation, that is appreciation after the first sale following on construction of the project, presents a more difficult problem; the same land should not be subjected to a second betterment levy unless it is possible to devise a method of assessing further automatic improvements in the value of holdings unconnected with the efforts of the landholder. If the proposal to realise betterment levies by a charge at the time of registering subsequent sales of land is accepted, it will not be difficult to impose a betterment levy on lands already benefited by an existing irrigation work provided it is possible to estimate the standard improvement in land values in the area."

If this well-reasoned suggestion is accepted, it will mean that immediate benefit by way of betterment levy will not be appreciable. As an alternative to this method, the betterment levy may be spread over a period of years. But, even in this case, the annual collections cannot be large, as the rate of levy will have to be kept at a low level. The conclusion is, therefore, irresistible that the States will not find in the agricultural sphere any rich source of income that will compensate the loss of revenue through prohibition, the fall in sales tax and other non-agricultural sources of taxation, and that will help meet the increased demand for development expenditure.

TREND OF ALL MARKETS BETTER

FREE MARKET IN GOLD—MR. SHROFF ON TEXTILE SITUATION—BARCLAYS BANK CAPITAL CHANGES

THURSDAY, 5 P.M.

ALL the markets have fared better than in last week. In the share market, equities have registered further gains. There has been a wide-spread improvement in textiles, in which section almost all counters have gone up. The reliefs to the textile industry, announced by the Government last week, took the market by surprise, for it had given up the hope that the authorities would come to the rescue of the industry. Although the millowners are not quite satisfied with what the Government has done, the share market no doubt feels encouraged by it. In the iron and steel section, too, there has been a sizable improvement in values. In fact, the gain in Tata Deferreds, Tata Ordinaries and Indian Irons during this week has been greater than in the past week, thereby belying those who felt that the upward momentum was losing its force. Advices from Calcutta and Madras also point to the existence of a firm trend.

MARKET GOSSIP

• • • •

The tone of the commodity markets, too, has improved. The downward trend, noticed in the previous two weeks, seems to have been arrested for the time being at any rate. Raw cotton, which had gone down to as low a level as Rs. 602 last week (for I.C.C. February), has looked up to Rs. 614. There has been some enquiry from mills, presumably as a result of the measures taken by the Government to stimulate the offtake of cloth. Among oilseeds, groundnuts have recovered a little, the rise being more perceptible in the November delivery than in the ready. Castorseeds have ceased going down; if anything, they are a fraction higher. Linseed, however, is an exception, in that it has lost further ground. It would appear that higher domestic production and keener competition in overseas markets from Argentina and Canada are the main causes for the depressing outlook for this commodity. If this tendency persists for some more time, the Government will have to give up a part, if not the whole, of the export duty on this commodity.

• • • •

The cloth markets both in Bombay and Ahmedabad have been active since the Government announced the reliefs for the cotton mills, thereby justifying, in a way, the optimism of the share market. There has been a good demand for seasonal varieties of cloth from up-country markets. There has also been a considerable broadening of enquiries from almost all the overseas markets. Hong Kong, Singapore, Aden and Red Sea ports, in particular, have booked a sizable volume of business. Australia is somewhat lukewarm and is trying hard to strike a bargain at lower prices. Floating stocks of exportable varieties have shrunk considerably, though stocks meant for domestic consumption are still heavy. Prices of cloth for export have gone up by about 5 per cent. since last week. In other words, the mills have not passed on to overseas buyers the entire relief they got by way of abolition of export duty. It is said that, at to-day's prices, Indian medium counts are the cheapest in the world and that so far Japan has shown no signs of cutting its prices for the corresponding varieties. Exporters of cloth aver that the only strong point of Japan to-day in these varieties is their high quality. They, therefore, feel that, if the Indian mills pay some attention to the quality of their manufactures, they should be able to have a distinct advantage over Japan.

• • • •

So far as the U.K. is concerned, no stiff fight need be expected, as it is suffering from shortage of man-power. London advices reveal that "the rebound to recovery has caught Lancashire somewhat off its guard." Domestic demand is nearly back to what appears to be its normal post-war level. Export orders are flowing in at a satisfactory rate. It is estimated that the proportion of exports consisting of cloth wholly produced in the U.K. has risen from 80 to 90 per cent. It is further estimated that total orders now reaching the industry would be sufficient to maintain output at about 90 per cent of the pre-recession level. But, as shortage of workers in all sections has prevented output from rising to more than 88 per cent. of the level, the delivery periods are lengthening. It is this feature that is worrying the Lancashire millowners. More so, because they expect that, in the next few months, demand from overseas is likely to increase further, now that import restrictions in Australia and other countries are being relaxed. If Lancashire is unable to compete effectively on deliveries when this demand comes up, they are afraid that their business would go to other countries. This development has given rise to hopes in the local cloth market that Lancashire may turn its attention to India again and revive imports of cloth in grey state which it can bleach and finish for meeting the needs of its export markets. Now that the export duty on medium cloth has been abolished and a drawback of import duty on cotton is allowed, the situation is believed to be conducive to the revival of this business.

• • • •

In the bullion market, there has been a smart rise in silver which discloses over the week a gain of Rs. 3-3 in spot and Rs. 3-1 in forward. This recovery is due partly to the revival of speculative buying and partly to the fall in arrival of kutcha metal from up-country centres. As regards gold, there has been a small improvement of As. 3 or As. 4 in value, as compared with the previous week's closing rate. But the downward drift seems to have been arrested. It would appear that the prospects of large arrivals have been fully discounted and that, at about Rs. 80 per tola, the margin of profit for the smuggler is not attractive. In the free markets of the world, however, the price of gold has been gradually declining in recent weeks. In Paris, the lowest level for gold in the post-war years was recorded yesterday. The world free market price for gold in terms of U.S. dollar, as indicated by quotations on the leading Continental centres in the past week, dipped below $36 a few days ago and is now being quoted at $35.80 per ounce. Only two years ago, it was standing at about $45 per ounce. Much the same story comes from other international centres in the Middle East, where prices have dropped back to their pre-Korean levels and, in some cases, even to still lower levels. What are the reasons for this decline in the price of gold? Answering this poser, the *Financial Times*, London, observes as follows:

"What are the causes of this sharp decline in prices? One of them, of course, has been the increase in the amount of newly-mined gold offered on these markets for the sake of the premium which it would fetch over the official price. Another reason is the decline in the offtake of gold for hoarding account which has followed the end of the war in Korea. Further, there is the return of a greater measure of confidence in paper currencies in view of the evidence of waning inflation and of a general improvement in the economic position of many countries. Even in France, in spite of the position of the franc, there has been a falling off in demand. The relaxation in several cases in controls over the form in which the gold can be marketed has contributed to the flow of the metal in world markets, and certain other markets, notably China, which formerly bought the metal on a considerable scale, are now closed. Opinion is divided as to the extent to which gold has come out of hoarding and it may be true that there are still many people who, having bought at the inflated levels of the past, are still holding on in the hope of an eventual recovery, but, in such case, the problem of financing stocks is becoming serious. Even if these speculators, as a whole, have not reached the stage at which they feel they should cut out, they may well have decided that they cannot add to their burden and, to that extent, their potential support will be lacking.

"Another factor is the waning hopes of a change in the world official gold quotation of $35 per ounce. For many months speculative demand came from people who were counting on a change in the American Treasury view towards the official price of gold. More recently it has become clear that nothing is likely to be done about the official gold price before the recently appointed American Commission on U.S. external economic policies has reported—that is to say, not until next year is well advanced, at the earliest. Hitherto, market operators have pointed out that, although buyers of gold are now more difficult to find, especially since the French lost their traditional interest in the metal during the summer, it has always been possible to find a buyer in the region of the $36-per-ounce level sooner or later. They have stressed that it was because of the existence of this 'basic' demand that it has been possible for the free markets to absorb the great quantities of newly-mined gold which flow in month by month. Now that the price has broken below that 'basic' level, it will be interesting to watch events. Maybe optimistic buyers, prepared to lock up funds for years, if necessary, will come forward in the belief that 'everything comes to him who waits'."

• • • •

Another development of interest to the gold market is the decision of the South African Government to abandon its self-imposed restriction that gold sold on the free markets must be in the form of "processed" metal. This decision means that a restriction which was initially imposed as a gesture to the authority of the International Monetary Fund, but which has been abandoned for some time by other gold producers, is now to be abandoned by South Africa itself. It will be recalled that other producers started on a similar basis in the premium market but later not only ignored the previous restrictions on the form which metal thus sold should take, but also removed the 40 per cent. limit on the premium sales. Thus, in December, 1951, Australia started to dispose of virtually the whole of its gold production on the "free" market, the Commonwealth being soon followed in April, 1952, by Southern Rhodesia and the Gold Coast, both of which had formerly been following South Africa's 40 per cent. limit.

• • • •

Mr. A. D. Shroff had some encouraging information to give the shareholders of the Central India Spinning, Weaving and Manufacturing Co., Ltd., when he addressed them, as their Chairman, this week. He said that, after a long time, he found himself in the happy position of being able to report that the labour situation in the Company's mills had shown a "marked improvement over the previous years." The management, on its part, has been solicitous of labour's welfare, as witness the construction of a welfare centre for labour in one of the labour colonies of the Company. Also, the Directors, Mr. Shroff announced, had decided to avail themselves of the facilities offered under the Government of India scheme for building houses for industrial workers; an application had been made by the Company for the construction of sixty houses (115 single-room tenements) under the Government's industrial housing scheme.

• • • •

On the plant renovation front, too, the Chairman had some interesting details to give. In the past, he had repeatedly urged the need for rehabilitation and renovation of the Company's "age-old" plant and machinery. The "old and outmoded" plant, he said, was responsible not only for lower efficiency but also for "poorer quality of products and excessive costs of repairs." Being alive to these handicaps, the Company has been progressively ordering new machinery. It would appear that out of Rs. 35 lakhs of machinery bought so far, the Company has received machinery to the tune of Rs. 27 lakhs. The internal transport system in the Company's mills has been mechanised. The humidification system in No. 5 Mill of the Company has worked satisfactorily. This has encouraged the management to sanction the installation of similar equipment in the Company's two other mills.

• • • •

Despite all these measures, the Company, along with several other textile companies, has had to fight a losing battle on the price front. The average realisation per pound of cloth was only Rs. 2-13-1, as against Rs. 3-4-11 in the previous year. This drop may be taken as an index of the fall in cloth prices in the country. But it has not prevented the Government from imposing additional burdens on the industry in the shape of Employees' Provident Funds Act and the Employees' State Insurance Act; in the case of the Central India, these two welfare schemes have meant an additional impost of as much as Rs. 2.50 lakhs.

• • • •

Viewed against this background of decline in prices, increase in production costs, new levies for carrying out labour welfare measures such as health insurance and provident fund, Mr. Shroff's general remarks about the conditions in the textile industry acquire a fresh significance. He pointed out how every cotton mill in the country was accumulating stocks of unsold cloth despite the large reduction of prices that the mills had effected, and how the merchants were very reluctant to take delivery of cloth already sold by the mills. He said that the two definite directions in which the Government could provide relief to the industry were the abolition of export duty and a drastic reduction in the excise duty on cloth, the "incidence of which has become more onerous as a result of the fall in prices." It would be a tragic commentary on the Government's solicitude for the cause of greater production, Mr. Shroff said, if as a result of its policies the industry, which had shown record output, were compelled to curtail production. His views on the Government's new measures designed to assist the textile industry, are practically identical with our own views, expressed elsewhere in this issue (vide first leader). Thus, he said: "The action recently taken by the Government is halting, hesitant and half-hearted and lacking in full and realistic appreciation of the situation. The continuance of the export duty on coarse cloth is absolutely unjustified and the excise duty on fine must be reduced by at least 50 per cent."

• • • •

That the Government has been half-hearted in granting the concessions to the industry is evident as much from the inadequate and belated nature of the concessions announced as from the language in which the announcement was made by the Commerce and Industry Ministry. The concessions might have been announced straightaway, in the cryptic manner adopted by the Finance Ministry while announcing the granting of drawback of import duty. There was no need to issue an elaborate statement. As it is, it is laboured and gives the impression that the Government has been stampeded into taking action. The official Press note almost amounts to saying: "We do not like these concessions. We were forced into them. We might have been spared all this, if the mills had not yielded to panic and the Press had not agitated for them." All this sounds meaningless considering that the Government itself admits that the situation facing the mills is difficult and that the mills need some assistance. Still worse is its observation that when the mills found that production began to increase they chose the "easy way" of closures. This is the unkindest cut of all. Surely, the Government ought to know that the closure of a shift, or of a whole mill, is not a pleasant prospect, since the overhead costs per unit of production will then increase or become a dead-weight on the mills. No mill would take the decision merely for the sake of creating panic. The stakes it will have to pay in the shape of overhead costs and the difficulties of resuming shifts or of re-starting the mills, are too high to encourage the mills to embark lightheartedly on closures. The only conclusion that one can draw from this unwarranted attack on the mill industry is that the Ministry is trying to throw the blame on the industry in order to shield its complacency.

• • • •

It is seldom that a British bank, especially a member of the Big Five, undertakes any departure from the traditions of constant dividends. This tradition was broken early this year by the National Provincial by raising its dividend level. This provided some material for controversy among financial experts who argued the case for and against changes in banks' dividend levels. It also led to a certain amount of discontentment among the shareholders of other banks, some of whom were very vocal. Now another subject for discussion has opened up with the decision of Barclays Bank to alter its capital structure. The Bank has three classes of shares—A, B and C. All classes rank equally upto 10 per cent. dividend level. Beyond that, the B. and C. shares rank equally. Of these two classes, the C class is not publicly held, so that, in effect, the B class shareholders benefit from any surplus that might be

(*Continued on page 847*)

EQUITIES MAINTAIN BUOYANT TONE

TEXTILES ACTIVE

(From Our Own Correspondents)

BOMBAY, 29*th October*

THE buoyant tone noted on the Stock Exchange in the previous three weeks received further strength this week. The buying movement, coupled with heavy short-covering, witnessed previously, continued to persist. Activity widened to such an extent that it was not possible precisely to assess how much of the hardening of values was due to genuine buying and how much to bear covering. Nevertheless, the volume of buying increased to such an extent that the unloading by a big operator at one time during the week was easily absorbed.

The highlight of the trading during the week was provided by textile shares, which, after several months, came to assume the leadership of the market. This was chiefly due to the fillip given by the Government of India's announcement on Saturday evening regarding abolition of export duty on medium cloth, reduction in excise duty on superfine cloth and allowance of a rebate on imported cotton used in the manufacture of cloth that was exported. The removal of export duty on medium cloth was regarded as a definite stimulus to export of this variety. While the reduction of excise duty on superfine cloth was welcomed, market circles felt that the Government would have done well in affording a similar relief in respect of fine cloth also, which commands a better market—next to medium cloth—than fine varieties. However, the rebate allowed on import duty paid on foreign cotton was a welcome relief, as such cotton is largely used in the manufacture of fine and superfine varieties. The reliefs thus provided by the Government were considered to be adequate enough to expand sales of cloth both at home and abroad. More than anything else, they were considered as proof of the welcome change in Government's attitude to private industry. Trading in textile shares was, therefore, enlivened with quotations registering substantial gains over the week.

Sectionwise, steels experienced strong speculative support. The move on the part of a section of the Tata Deferred shareholders to throw out the conversion scheme at the forthcoming meeting of the shareholders did not have any effect on the sentiment of operators. The consensus of opinion in the market is that the scheme would be carried through without any difficulty, although some appeared to be not so dogmatic on the success of the scheme.

Tata Steels after an initial dip from Rs. 1,907-8 to Rs. 1,895 early in the week, advanced to touch a high of Rs. 1,935 to-day before closing at Rs. 1,931-4, a rise of Rs. 23-12 over the week. Tata Ordinaries were boosted up from Rs. 324 to Rs. 327-12, at which rate they bore a ratio of about 5.9 per cent. to the Deferreds. Indian Irons, which came up from Rs. 24-6 to Rs. 24-15½, shaded off to Rs. 24-11½ at the close.

The measures announced by the Government of India to stimulate cloth trade had a salutary effect on the cloth market which experienced considerable activity in the last two days. This, coupled with the belief that the Government might also reduce the excise duty on fine varieties of cloth, hardened the sentiment in the textile section. Leading speculative scrips as a result recorded smart gains. At one time, Bombay Dyeings came up to Rs. 389-6, but finished at Rs. 386-4, Rs. 7-8 more than last week's closing. Kohinoors, Central Indias, Centurys, Simplex, Svadeshis, Standards and Finlays were all actively supported. Kohinoors added Rs. 4-12 to Rs. 293-4, Central Indias as much as Rs. 11 to Rs. 168, Centurys Rs. 10 to Rs. 271-8, Simplex Rs. 6 to Rs. 135, Svadeshis Rs. 9 to Rs. 251, Standards Rs. 9-6 to Rs. 314-6, and Finlays Rs. 4-8 to Rs. 252-8. Gokaks changed hands at Rs. 240 *ex-div.* (dividend Rs. 5), as against Rs. 237-8 *cum-div.* a week ago. Indu Ordinaries were prominent on buying from interested circles and rose by As. 5½ to Rs. 10-8. New Greats hardened by Rs. 2 to Rs. 155. New Citys were done this week at Rs. 150, as against Rs. 150-10 last week. Tata Mills were put through at Rs. 42-8, as against Rs. 41.

Bank shares remained in the background with minor recession in values. Centrals lost a fraction to Rs. 63-12 and their New shares to Rs. 66. Imperial Fully Paids were done Rs. 3-12 lower at Rs. 1,832-8 and Contributories Rs. 1-4 down at Rs. 453-12. Indias were a shade lower at Rs. 157 and United Commercials at Rs. 36-8, while Barodas were unchanged at Rs. 107.

Barring New Indias which declined by Re. 1-12 to Rs. 37-12, other insurance shares maintained a steady tone, though the volume of business was small. Empires were sought Rs. 12-8 better at Rs. 675 and Orientals had business Rs. 10 higher at Rs. 6,910. All-India Generals looked up a bit to Rs. 2-10.

A revival of investment enquiry was noticed in electricity shares. Ahmedabad Electrics were maintained at Rs. 114-6, Bombay Suburbans were in demand and went up by Re. 1-14 to Rs. 126-4, Surat Electrics were taken up at Rs. 124-6 *ex-div.* (dividend Rs. 2-8) as against Rs. 126-4 *cum-div.* a week ago. Andhra Valleys put on Rs. 3-12 to Rs. 1,278-12 and Tata Hydros Re. 1 to Rs. 137-8, while Tata Powers were well held at Rs. 1,365. Andhra Valley Rights were done Rs. 12-8 lower at Rs. 152-8, Hydro Rights Re. 1-8 lower at Rs. 22 and Power Rights Rs. 6-4 lower at Rs. 237-8. It appears that some of the big holders, having preferred not to exercise their rights in these shares, have sold them.

In the miscellaneous group, A.C.Cs. were conspicuous with a decline of Re. 1-8 to Rs. 173-12, in distinct contrast to the general trend of the market, due to pessimism regarding the working results of the Company, for the year ended 31st July, 1953. Moreover, on yield considerations, some holders of these shares seemed to have switched over to Tata Ordinaries. Belapurs again moved ahead by Rs. 2-8 to Rs. 264-8 on bear covering. Bombay Burmahs showed no change at Rs. 338-12. Scindias were sought for As. 4½ higher at Rs. 14-7. National Rayons were a shade quiet at Rs. 119-12. Tata Oils had business at Rs. 31-8 and Tata Chemicals at Rs. 8-14½. Wimcos looked up by Re. 1-4 to Rs. 241-4. Killick Industries were picked up at Rs. 157, as against Rs. 154. The Directors have declared a final dividend of 6 per cent., making a **total of 10 per cent. for the year ended 30th** June, 1953, which is the same as that for the previous year. Among engineering and mining shares, Alcocks were better by Rs. 5 at Rs. 320 and Premier Constructions by Re. 1 at Rs. 97. Shivraipurs changed hands As. 8 lower at Rs. 64-8. B.B. Petrols eased to Rs. 2-2. Indian Coppers were better at Rs. 3.

Calcutta Stock Exchange

CALCUTTA, 28*th October*

After the eleven-day closure on account of the *Poojahs*, the Calcutta Stock Exchange reopened on Monday this week. During the last three days steady conditions were maintained. Business put through also was moderate. Quotations were lower to-day on account of profit-taking. This was not altogether surprising, as operators had to fulfil the orders accumulated during the holidays. Reports from Korea added further enthusiasm for speculative businesses. It would, however, be a pleasant surprise if the present trend towards buoyancy is maintained in the coming days.

A number of encouraging factors helped a steady opening after the holidays. The granting by the Government of some of the demands of the cotton textile millowners, with a view to relieving the accumulated stocks with mills by increasing exports and sales for internal consumption, although belated, is recognised by market circles as denoting New Delhi's readiness to appreciate the difficulties of industry and to take remedial measures. The only grumble heard is that it takes time for officialdom to examine the trade grievances and suggestions and that during the interregnum, which is invariably rather too long, depression sets in deep. So much so, after the announcement of remedial measures, revival takes time.

A ministerial announcement that the Planning Commission proposed to take some measures so that the pace of private investment in industry would be speeded up was not without its good effect on the market; but at the same time market men are eager to know, if this announcement means that Government has at long last realised that sufficient incentives are lacking at present for attracting all usable private funds in the country's development. There is naturally the feeling among investors that, if Government has changed its mind, it has to say so, as also pronounce its policy on levying cess on mechanised industry to support the cottage industry.

Sectionwise, engineering shares were very steady. Expectations of an early announcement granting higher retention prices set in keen activity in Indian Irons which impressively advanced from Rs. 24-2 to Rs. 25, before the holidays. To-day, however, the rate eased to Rs. 24-12 on account of profit-taking. Burn & Cos. were lifted to Rs. 326 yesterday and further to Rs. 332 to-day on hopes of maintenance of dividend for the year ended April 1953 at 15 per cent. and of a bonus issue of one share for every existing share. At Rs. 16-4, Indian Galvanizings recorded an increase of Re. 1-2, while Britannia Engineerings spurted from Rs. 19-15 to Rs. 23. Texmacos were put through at Rs. 6-7, and Marshalls at Rs. 5-11. Good attention was afforded to Jessop & Cos. and Braithwaite & Cos. which were steady at Rs. 24-14 and Rs. 11-12, respectively.

The improvement in the prices of jute goods was naturally reflected by increased business at hardening rates in the jute section. After the rises on Monday and Tuesday, prices receded to-day with a reduced volume of business. Speculative Howrahs were pushed up from Rs. 23-8 to Rs. 23-14, and Indias, after realising Rs. 125, gave way to Rs. 122. A smart advance was recorded in Alliances from Rs. 152 to Rs. 161, while Chitavalsahs were better at Rs. 34. Gourepores were supported at Rs. 282, as against the previous rate of Rs. 260. A firm note was displayed in Unions at Rs. 159. Other steady features were Barnagores at Rs. 150, which, however, receded to-day to Rs. 147, Champdanies at Rs. 149, and Empires at Rs. 21-10. On the other hand, Lawrences eased to Rs. 154, Ganges to Rs. 72-8, and Dalhousies to Rs. 124. Anglo-Indias, after receding to Rs. 202 rose to Rs. 206, and Nellimarlas were firm at Rs. 37-4.

For reasons already stated, textile shares were in the forefront. The number of transactions rose impressively. Cawnpores rose from Rs. 8-1 to Rs. 8-4, and Elgin Mills from Rs. 17-2 to Rs. 17-5. New Victorias changed hands at Re. 1-5, and Kesorams were higher at Rs. 20.

In the coal section, Raneegunges improved from Rs. 7-12 to Rs. 8-8. South Karanpuras, after being higher at Rs. 11, eased to Rs. 10-11. Central Indias changed hands at Rs. 5-5. Churulias were fractionally better at Rs. 2-13 and Khatras Jherriahs at Rs. 38-8, while Burrakurs reacted from Rs. 9-5 to Rs. 9-2.

A number of features were noted in the miscellaneous section, where Indian Cables improved from Rs. 20-4 to Rs. 20-7 and India Steamships were steady at Rs. 7-14. Renewed interest in British Burma Petroleum made the rate further advance to Rs. 2-5. F. & C. Oslers moved between Rs. 6-14 and Rs. 7-2, before closing to-day at Rs. 6-15. Indian Wood Products gained to Rs. 34-10. Rohtas Industries were unchanged at Rs. 9-2 and Alkali Chemicals at Rs. 17. India Paper Pulps were put through at the higher rate of Rs. 178. Titaghur Papers realised Rs. 36-8 and Orient Papers came to business at Rs. 37-8. Martin Burns changed hands at Rs. 19-1, B.I. Corporations at Rs. 8-15, and Sone Valley Cements at Rs. 7. Calcutta Trams were quiet at Rs. 12-12 and Rallis at Rs. 62. There was a spurt in Dunlop Rubbers to-day from Rs. 29-8 to Rs. 31-8.

Moderate interest was shown in tea shares and buying was cautious in view of the recent rises. The volume of business was lower. Banarhats were raised from Rs. 336 to Rs. 337-8, Ananda Assams from Rs. 14 to Rs. 16-4 and Teesta Valley from Rs. 21-8 to Rs. 22-12. Teliaparas were steady at Rs. 133, while Teen Alis were maintained at Rs. 22-4. On the other hand, Seajulis eased from Rs. 21-4 to Rs. 20-12 and East Indias from Rs. 19-10 to Rs. 19-7.

• • • •

Madras Stock Exchange

MADRAS, 27*th October*

The week under review was eventful for the Stock Exchange in that it witnessed (a) the abolition of export duty on medium varieties of cloth, (b) reduction of excise duty on superfine cloth and (c) the promulgation of an ordinance requiring payment of compensation to labour in case of lay-off and retrenchment. At first, the third measure tended to unsettle the sentiment of the Share Market, but later it was realised that its adverse effects would be outweighed by the advantages conferred by the first two measures. Consequently, the textile section put on an improved tone with activity becoming broad-based. The planting section also presented a cheerful appearance. Teas were in the limelight, following improved demand on encouraging export enquiries and better trend in the recent tea auctions at Calcutta. Rubbers continued to gather support and coffees followed suit. The miscellaneous section too was no exception to the generally upward trend. As a result, trading in the market was brisk and prices recorded sizable gains.

Textiles came in for considerable enquiry during the week under review. Dhanalakshmis put on Rs. 3 to Rs. 188 and Coimbatore Cotton Rs. 2 to Rs. 159. Balasubramanias B gained Rs. 2-6 to Rs. 58. Balasubramanias, Rs. 40 paid-up, rallied Re. 1 to Rs. 34-8. Metturs were better at Rs. 194, as against Rs. 193, and Coimbatore Pioneers at Rs. 118, as against Rs. 117. Janardanas gathered Re. 1 to Rs. 62. Buckinghams were higher by As. 8 at Rs. 120-8. Rangavilas, however, lost As. 8 to Rs. 43-8, and Coimbatore Spinnings an equal amount to Rs. 38-8. But Maduras were lower by As. 2 at Rs. 39-8.

Among plantings, teas met with some selective support. Devasholas advanced from Rs. 16-10 to Rs. 17-8. Kalasas improved from Rs. 9-14 to Rs. 10-2. Periakaramalais hardened by As. 2 and closed at Rs. 7-6 *cum-div.* Talayar Tea, however, lost an anna to Rs. 8-7 *cum-div.* Twyfords were dull at Rs. 11-6.

The upward trend in rubbers gathered further momentum this week, on speculative support. Thamarapallys shot up from Rs. 14-4 to Rs. 15. Rajagiris were better by As. 4 at Rs. 12-8 and Vaikundams by an anna at Rs. 15. Tirumbadis and Be Bes were slightly higher at Rs. 3-3 and Rs. 2-5, respectively. Peninsulars were done at Rs. 9 *ex-div.*, as against Rs. 10-8 *cum-div.*

Among coffees, Coffee Lands improved from Rs. 10-5 to Rs. 10-7 and Consolidated Coffees from to Rs. 3-8. Puthuthottams changed hands at Rs. 3-5½ *ex-div.*, as against Rs. 3-10 *cum-div.* Mysore Coffees were dull at As. 8.

Miscellaneous scrips were also in favour. Rallis gathered Rs. 2-4 to Rs. 64-4. Mysore Gold was higher by As. 6 at Rs. 2-10. India Cements were done at Rs. 15-8, as against Rs. 15-4. Vellore Electrics disclosed a gain of As. 6 at Rs. 13-8 *cum-div.* and Cochin State As. 5 at Rs. 9-12 *cum-div.* India Sugars were up by As. 4 at Rs. 22-4. Madras Safe was higher by Rs. 5 at Rs. 30 *cum-div.* Central Scientifics were enquired at Rs. 5-4 *ex-div.*, as against Rs. 5-12 *cum-div.* Parrys, however, lost As. 2 to Rs. 4-6.

NEWS IN BRIEF

THE total capital invested in the electric industry in India is Rs. 18.31 crores, out of which foreign capital is Rs. 4.77 crores.

At the end of August, 1953, the number of towns under statutory food rationing was 101, with a total population of 24.2 million.

The Kashmir Government proposes to abolish customs duty and lift controls on import of salt and sale of cloth with effect from 16th November, 1953.

The annual meeting of the International Cotton Advisory Committee is scheduled to open on 2nd November, 1953. At this meeting the proposal for an international commodity agreement for raw cotton will be considered.

The Taxation Enquiry Commission, appointed by the Government of India to examine the taxation structure in the country, met in Bombay on the 26th inst., under the chairmanship of Dr. John Matthai, and finalised the programme for its tour beginning on 12th November, 1953, from Nagpur and the list of witnesses to be examined at some of the places to be visited by the Commission.

The International Labour Organisation has offered its services to India to help it tackle the problem of unemployment in the country. The Deputy Director-General of the I.L.O., Mr. Jef Rens, who is now in India, held discussions recently with the Labour and Planning Ministers and high officials of the Government of India on the problem of unemployment.

The Tariff Commission has prepared questionnaires for producers, importers and consumers in connection with its enquiries into the continuance of protection to the (1) calcium chloride, (2) cocoa powder and chocolate, and (3) cotton and hair beltings industries, beyond 31st December, 1953. Copies of the questionnaires can be obtained from the Secretary, Tariff Commission, Contractor Building, Nicol Road, Ballard Estate, Bombay 1.

The Government of Bombay has decided to deration wheat and coarse grains in 63 towns of the State with effect from 1st December, 1953. Rice and paddy will continue to be rationed and distributed through licensed dealers. Full rationing, as at present, will, however, continue to be in force in eleven cities, namely, Bombay, Ahmedabad, Poona, Sholapur, Baroda, Surat, Nasik, Ahmednagar, Kolhapur, Belgaum and Hubli.

The Andhra Government is considering the revision of the Five-year Plan in respect of electricity schemes in Andhra State. The total cost of the Plan for Andhra is about Rs. 51 crores, which includes cost of electricity schemes. The State Government will shortly consider the question of entering into agreements with the Madras and Mysore Governments on the continuance of power supply to the Andhra areas.

A firm in Bombay will, it is learned, shortly purchase rice in Iran in exchange for Indian goods like textiles, machinery and tea, for distribution in Madras, Mysore and other non-rationed areas. This is in pursuance of the Government of India's policy of allowing private traders to import rice from non-dollar countries and distribute the same in decontrolled areas. Rice worth Rs. 15 crores will thus be imported from Iran shortly on private account.

The fifth course of training in statistical quality control is scheduled to commence in November and will last for about 2½ months. The number of candidates to be admitted is 30 and the minimum qualification for admission is Intermediate standard of a recognised university. Applications should reach the Chairman of the Board of Management for Quality Control, Mercantile Bank Building, Fort, Bombay, before 10th November, 1953.

The Government of India has accepted in principle the policy of decontrol of wheat and coarse grains in all parts of the country. Inter-State restrictions on their movements will, however, be retained. Control over rice also will continue, in view of the difficult supply position. It is left to the States to decide on the date of implementation of this policy depending upon local conditions and circumstances. The new policy is expected to be implemented throughout India before 1954.

The Hyderabad Government has constituted wage boards to recommend fixation of basic wages and dearness allowance for those employed in a number of industries. In fixing the basic wages, the boards will take into consideration such factors as cost of living, paying capacity of the industry and effects of demonetisation of Osmania currency, if any, on the economy of the State. The boards, which will begin functioning on 1st November, 1953, will submit their reports to the Government within six months.

A conference of the representatives of the Union Government, West Bengal and Bihar Governments and the Damodar Valley Corporation was held on Monday this week to consider the Rau Committee report on D.V.C. and other important matters connected with its future. The Conference appointed two sub-committees. One Board was to study the desirability of increasing the power generating capacity of the D.V.C. and the extension of its transmission lines to Calcutta, Patna and Gaya, and the other to examine the revised financial forecasts of the Corporation.

The work in connection with the abolition of *zamindari* in the Madras State, including survey and settlement operations and the payment of compensation, under the Madras State's (Abolition and Conversion into *Ryotwari* Act of 1948 is expected to be completed earlier than anticipated. The Act empowers the Government to take over 2,810 *zamindari* estates, covering an area of 213 lakh acres, involving payment of compensation of Rs. 12.5 crores. The share of the residuary State of Madras, after partition of Andhra, is only Rs. 4 crores. The composite State has so far paid Rs. 3.14 crores as compensation.

The Government of India has issued an Ordinance under which the total funds at the disposal of the Rehabilitation Finance Administration will be increased, with effect from the 24th inst., from Rs. 10 crores to Rs. 14.5 crores. Of this, Rs. 12.5 crores will be available for grant of loans directly to displaced persons and the balance for reimbursement of losses to Scheduled Banks in respect of loans advanced by them and which are guaranteed by the Administration. The Ordinance enables the Government to undertake full guarantee of the losses suffered by the Scheduled Banks, as against 50 per cent. provided in the Act. The Ordinance also provides for extension of the period of repayment of loans from 10 years to 15 years. This is intended to diminish the hardship of the loanees, which a shorter period necessarily entails.

From Abroad

Ten world oil companies are reported to have asked the Federal Government of Libya for permission to prospect for oil in the Libyan desert.

The U.K. Government proposes to set up a plant for producing atomic power on a commercial scale. When this is set up, it will be the first of its kind in the world.

Under the Italian agrarian reform programme, 51,566 landless peasant families have so far been allotted about 640,000 acres expropriated from big landowners since Parliament enacted land reform legislation three years ago.

A commercial tyre made with super-tenacity rayon cord has been developed by the United States Rubber Co. The tyre, called U.S. Royal Super Fleetway, is claimed to be 20 per cent. stronger than tyres with ordinary rayon.

For the first time since World War II, Indonesia has regained its status as an exporter of sugar, according to the International Sugar Council. It has already sold 21,000 tons of sugar to Iran and 5,000 tons to India.

The U.S. Government has relaxed its export restrictions on shipment of rice to foreign countries. U.S. exporters will now be able to ship rice to most countries under general licence, instead of individual export licences which had been required so far.

The Japanese Ministry of International Trade and Industry has negotiated a $60 million credit from the Export-Import Bank in Washington to finance the import of U.S. cotton into Japan. It is expected that imports of 300,000 bales of raw cotton will be financed by this loan.

The output of oil in the Middle East during the first nine months of 1953 was a record quantity of just over 90 million metric tons. This is only about 10 million metric tons less than the output for the whole of 1952 and compares with 78 million metric tons in the corresponding period of 1952.

A number of American, French, German and British firms have directed their overseas experts to study the possibility of expansion of their business into Iran. This is consequent on the Iranian Government's announcement that new investment laws are being framed to safeguard the interests of foreign capital and to encourage foreign business men to enter the Iranian market.

The Norwegian merchant fleet has increased by 300,000 gross tons to 6,300,000 tons last year. Norwegian merchant tonnage is now 30 per cent. more than that at the outbreak of war. This increase is confined to tanker tonnage which now constitutes more than half the total tonnage. Dry cargo and passenger tonnage has not increased at all as compared with 1939. Of the 3,000,000 gross tons on order, about 75 per cent. consists of tankers.

The Imperial Chemical Industries of Australia and New Zealand has applied to the Australian Tariff Board for a protective duty of 95 per cent. on alkalis made in Australia. The Company has also asked for lesser protective duties on certain chlorine products. It has pointed out that, despite improved efficiencies and larger manufacturing capacity, a serious drift in costs has occurred since 1947.

The Colombian Government has now permitted the operating subsidiaries of the South American Gold and Platinum Company to sell their output of gold in the free markets of the world. Until now, the Company had been operating under a Government bonus plan for gold based on the U.S. buying price of $34.92½ per fine ounce. It is estimated that the Company can now get about $36.15 per ounce in the free markets.

The United Nations has announced plans, drafted by the officials of the T.V.A. with the support of the U.S. State Department, of a scheme for providing irrigation and electric power for Jordan, Syria and Israel from the waters of the River Jordan. The cost of the scheme is $121 million.

The scheme will help resettlement of about 200,000 Palestine Arab refugees in Jordan and in the part of Palestine occupied by Jordan since the end of the Palestine war.

An increase of about 1½ per cent. in the world production of raw wool in the current season is estimated by the Commonwealth Economic Committee. World production is estimated at 4,400 million lbs. (greasy basis), as against 4,327 million lbs. in 1952-53 and an average of 3,802 million lbs. over the pre-war period 1934-38. Australian production will, it is estimated, reach a new record level of 1,290 million lbs. as compared with 1,280 million lbs. in 1952-53. Production in New Zealand and South Africa is estimated at 421 million lbs. and 278 million lbs. respectively, as against 418 million lbs. and 268 million lbs. in 1952-53. Small improvements are expected in several other countries, including the U.S., Argentina, and the U.K. The clean weight of the world clip is placed at 2,550 million lbs., as against 2,503 million lbs. in 1952-53.

PERSONAL

SIR Joseph Kay, K.B.E., Managing Director, Messrs. W. H. Brady & Co., Ltd., returned to Bombay this week from the U.K.

Mr. C. F. Cobbold has been reappointed Governor of the Bank of England for a further term of five years.

Sir Cowasjee Jehangir, Bart., has returned to Bombay from a holiday in Europe.

Mr. Bhagwat Dayal, Ambassador of India at Djakarta, has been appointed India's Ambassador to Afghanistan.

Mr. J. R. D. Tata, Chairman of Tata Sons Ltd., who had been to Montreal to attend the meeting of the International Air Transport Association, returned last week.

Mr. F. D. Hall, Manager of the Bombay branches of Lloyds Bank Ltd., has returned from England and resumed charge of these branches.

Mr. A. C. N. Nambiar, formerly Counsellor in the Legation of India, Berne, has been appointed India's Minister to Sweden and concurrently as India's Minister to Denmark and Finland.

Mr. B. N. Nanda, Deputy Secretary, Central Ministry of External Affairs, has been appointed Commissioner for the Government of India in British West Indies (including British Guiana).

Mr. F. D. Griegh, Director of the Middle East and Asian Department of the World Bank, who was in Bombay to hold discussions with the officials of the Reserve Bank of India, left for Colombo this week.

Dr. S. Chandrasekhar, Professor and Head of the Department of Economics in the University of Baroda, who has been appointed a senior Nuffield Foundation Fellow in the U.K. for a year, left for England on Saturday last.

Mr. H. C. B. Mynors, at present a Director of the Bank of England, has been appointed Deputy Governor of the Bank for a term of five years from 1st March, 1954. He will succeed Mr. D. G. M. Bernard, the present Deputy Governor, who will retire at the end of February next.

Sir Edward Benthall, a former President of the Associated Chambers of Commerce, Calcutta, and Member for Transport in the Viceroy's Executive Council from 1942 to 1946, will lead a British Trade Mission of prominent business men to the Middle East to explore markets for British goods.

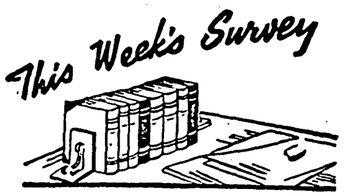
"COMMERCE" 1928

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, 3*rd November*

Bombay Trade Expansion

That the worst storm has passed, so far as the trend of trade is concerned, is evident from the report for the past financial year of the seaborne trade of the Bombay Presidency, excluding Sind. The figures of 1927-28 indicate that, after several years of depression, the import trade at least has turned the corner. Imports of private merchandise rose in value from Rs. 76.88 to Rs. 86.39 crores, or by nearly 12½ per cent. The improvement has been general. There were larger arrivals of cheap American cotton, but this only accounts for Rs. 1.77 crores of the increase. The long delayed revival of the import trade is no doubt a reflection of the better conditions prevailing in the United Kingdom and Europe generally, and, in particular, of the absence of serious labour trouble and the greater stability of the world's currencies. The growing confidence of the Indian consumer is in some measure shown by his increased takings of merchandise, and decreased takings of gold and silver. Bombay, which is India's great bullion market, imported in 1927-28 nearly Rs. 7½ crores less of the precious metals than in the previous year, and Rs. 23 crores less than in the year before that. It is only the restricted imports of bullion that is responsible for the small falling off in the total value of the private foreign trade. In merchandise, there is a betterment of over Rs. 6 crores.



INTER-STATE TRADE

MR. M. C. Shah, Union Deputy Minister for Finance, reiterated in Madras this week the Government of India's decision to convene shortly a conference of the Finance Ministers of the various States to devise ways and means of resolving the difficulties in respect of inter-State trade arising from sales tax. This is a welcome announcement, in view of the fact that the position of inter-State trade has been rendered more difficult by reason of the recent Supreme Court's judgments. The net effect of these decisions is that a transaction which is essentially of an inter-State nature becomes an intra-State transaction if the goods are delivered by a certain State in another State for consumption in the latter State. The "receiving" State is thus empowered, if it has sales tax law on its statute book, to collect sales tax on the transaction. These decisions have given rise to a number of difficulties. In the first place, it is difficult to decide whether an article is delivered for eventual consumption or resale. Secondly, the State Governments have utilised the Supreme Court's judgments in order to claim taxes with retrospective effect. This has imposed a severe strain on the assessees since they themselves have not collected taxes on their sales. These matters have been the subject of repeated representation to the Government of India. In this connection, Mr. Shah revealed that the Union Government had requested the State Governments not to issue tax notices to assessees in other States in respect of past transactions. It would, however, appear that a few States have not cared even to reply to the request.

Many suggestions have been made in order to see that the sales tax laws in several States do not interfere seriously with inter-State trade. There is, for instance, the suggestion that the Centre should take over sales tax and distribute the revenue among the States. This would require a constitutional amendment, and might, as Mr. Shah said, not be easy. After all, the State Governments have few important sources of revenue—most of them have thrown away the excise revenue on liquor—so that it is difficult to persuade them to agree to a Central sales tax, since the rates under a system of Central sales tax would have to be conceived in relation to what the least developed State in India could bear, the economically advanced States might feel that they are prevented from securing a larger revenue. Short of centralisation, there is, however, a great deal that could be done in the sphere of sales tax administration. Mr. Shah said that the Centre was trying to "get at a uniform formula acceptable to all by general consent of the States." Surely, it should be possible to evolve such a formula now since there is the same Party in power in the Centre and in the States. If this opportunity is not utilised to bring about uniformity now, it might be difficult at a later date, when political affiliations may differ, to bring about any sort of uniformity in sales tax or in any other sphere of administration.

CRISIS IN COFFEE

A major crisis seems to be developing in the coffee industry. The special meeting of the Indian Coffee Board, held in Bangalore on Monday the 26th instant, is believed to have discussed the Government of India's decision to permit the export of 2,000 tons of *robusta* coffee under an export duty of Rs. 62-8 per cwt. The Government appears to have completely ignored the coffee growers' request that the premium to be obtained through the export of coffee should be used to subsidise, that is to say, to bring down, the internal price of coffee. Instead of that, the Government appears to be determined that the premium should go to the Exchequer in the shape of export duty. This is, indeed, a strange development, inasmuch as the Government has often expressed a desire that the internal price should be brought down further to benefit the consumer. If that is the Government's real desire, it is understandable why the relief could not be given now, by using the premium on exports to subsidise the internal prices, as urged by the growers. It is expected that, if the premium on 2,000 tons is utilised in this way, it would mean a reduction of about 1 anna per pound in the internal price and that if the Government agrees to export a further 2,000 tons, for which there now seems to be every justification in the large stocks with the Board, the relief would amount to 2 annas a pound.

It is probably not known to many consumers that the excise duty now levied on coffee used for internal consumption is Rs. 21 per cwt., or 3 annas a pound, which represents 10 per cent. of the average retail price of coffee. If the Government's intention to levy an export duty of Rs. 62-8 a cwt. on exports is unalterable, then the least that Government can do now is either to abolish the excise duty altogether or to levy only a nominal excise duty of, say, one anna a pound. That would directly give a relief of 2 annas a pound to the consumer. Otherwise, the Government's expression of solicitude for the poor consumer has really no meaning. In the alternative, the Government should agree to utilise the sum of Rs. 25 lakhs to be raised by export duty on 2,000 tons to subside the local prices.

The Government, it is regrettable to hear, has already turned down the coffee industry's request that the whole structure of marketing and other matters concerning coffee should be referred to the Tariff Commission for a comprehensive enquiry. The Government Cost Accountant has finished his enquiry into the cost of production and has, it is believed, submitted his report to the Government. So far the findings of the Cost Accountant have not been published, but there are strong rumours that the Government may seek to make an arbitrary reduction in the basic price even before announcing the result of the Accountant's survey. It is to be hoped that these are no more than rumours and that the Government will not take any such action against the unanimous opinion of the coffee industry and the Coffee Board.

Apart from this threat of a price reduction, the coffee growers are greatly troubled by an attempt on the part of the Income-tax Department to treat a portion of their income as arising from industrial operations and, therefore, liable to income-tax. It is stated that one or two assessments have already been made in this light, and that some growers have been asked not only to say why they should not be assessed but also to say what is, in their opinion, the portion of the income that should be assessed. We cannot understand this attempt to assess coffee to income-tax, for unlike in the case of tea, no industrial process is involved in the preparation of coffee for the market. If the operation known as "curing" is considered by the Income-tax Department as constituting an industrial process, then we submit that even dehusking of paddy would amount to an industrial process and, therefore, a portion of the income from paddy growing should also be liable to income-tax. We think there is a fundamental error somewhere in the Income-tax Department's attempt to levy tax on incomes which so far have always been held to be agricultural. The proposal, therefore, needs further consideration before assessments are actually made.

INDIAN TELEGRAPH CENTENARY

The Indian Telegraphs Department, which will celebrate its centenary to-morrow, has had so far a romantic career. It was early in November, 1850, that the first experimental telegraph line was laid between Calcutta and Diamond Harbour. But it was only three years later that the large-scale construction of telegraph lines was commenced. In October 1854, the first Telegraphs Act was passed and in February, 1855, the public in India were allowed to use the telegraphs. India and Ceylon were, for the first time, connected by Cables in 1858. In January, 1865, the first Indo-European Telegraphs Communication was established, on the completion of the Baghdad-Fao section of the Turkish line. The first wireless telegraph station was established between Saugour islands and Sandheads in 1902.

Such has been the early history of the Indian Telegraphs. The Department has made more rapid strides of progress in recent years. On the eve of Independence and the Partition, India had 117,201 miles of post lines, 769,036 miles of wires and 5,259 miles of cables. Since Independence, progress in the field of telegraphic expansion has been rapid. Not only has there been an extension of land lines and V.F.T. carriers, but also an extensive development in the field of wireless services. Special emphasis has been laid on extending tele-communications to the rural areas and popularising Indian languages. Hindi telegrams were first introduced in 1949.

The rapid expansion of the telegraphs is due to the fact that it soon came to be regarded as an instrument of power and so it radiated from Calcutta, the seat of the then rulers, to places of political and strategic importance. That alone explains the reason why the lines were laid towards Agra and Peshawar in the west, towards Burma and the Chin Hills, what is now called Assam in the east, and towards Sikkim and then Afghanistan across the Khyber Pass and southwards to Madras. While the British Army extended the frontiers of its growing empire, it was the iron and copper wire of the Telegraph Department which consolidated its position. It was a battle against high mountains, rushing rivers, sharp-clawed animals and wild tribes. In earlier years, granite masonry pillars were used for carrying one or two wires at the most, later bamboo and wooden poles were erected and, sometimes, even palmyra posts were used. Eventually, the Department caught up with the Iron Age and the first iron posts were erected in 1872.

The Indian Telegraphs Department has over 400,000 miles of iron, copper and bronze wire, roughly 20 times the equatorial circumference of the earth and about 245,000 miles of channel crossing, almost 10 times the equatorial circumference. It is one of the largest in the world in open carrier equipment and the oldest Government-owned public utility service in the world. It is the second largest public utility in India, employing a staff of about 221,000, including 1,000 gazetted officers. Its channel mileage is the third longest in the world.

The future of the Indian Telegraphs Department is, indeed, bright, inasmuch as considerable expansion and modernisation of tele-communications are required to cover the whole country. Telegraph facilities are expected to be extended by the end of the Five-year Plan period to 800 more stations at a cost of Rs. 60 lakhs. Installation of more V.F.T. systems is also planned. At present, there are 8,360 telegraph offices in the country and the number of telegrams sent is about 30 million. In large cities, a printer-gram service will be introduced and the renting of tele-printers encouraged. The mechanisation of the Bombay Central Telegraph Office is expected to be completed by the middle of 1954, at a cost of Rs. 21 lakhs, and the telex-service, already introduced in Bombay, will be popularised, so that private subscribers can contact each other directly over their tele-printers. All this will certainly mean no small achievement to a developing country of vast distances.

MANAGEMENT ACCOUNTING IN U.S.

Management accounting, or what is popularly known as cost accounting, is stated to have been more effective in the U.S. than either in the U.K. or on the Continent. While there are only minor differences in the theory and application of cost accounting practices adopted in America and Europe, a vast difference is noted in the extent to which industries in the U.S. have made use of management accountancy. This problem has, therefore, attracted the attention of the cost and works accountants of the U.K. At a meeting, convened last week, by the Institute of Cost and Works Accountants in London to discuss "What makes management accountancy so effective in the U.S.", the members of the Institute had the opportunity of hearing an illuminating address on the subject by Mr. R. W. Parker, Finance Director of the Scottish Division of the National Coal Board, U.K., who had led the Management Accountancy European Productivity Team to the U.S.

According to Mr. Parker, the four main reasons for the greater effectiveness of management accounting in the U.S. are: (1) it is used to reduce costs; (2) there is co-operation between and mutual confidence in accountants and operators; (3) management has accepted that, by careful analysis and often by scientific investigation, costs can be predetermined; and (4) management has further accepted that corrective action can and must be taken when performance varied from expectation without adequate reasons.

No cost system can be of any value, unless there is clear appreciation of the merits of the system by the management. In the U.S. every man who is concerned with the management of industry, from foreman to the president, appreciates and welcomes the assistance which the industrial accountant can give and offers willingly the co-operation and confidence needed to make the system a success.

Speaking of the close attention which is being paid to cost accountancy by all grades of American management, Mr. Parker told the members of the Institute that the cost systems in America were evolved for the purpose of assisting management to control costs and to support management in its decisions. "In contrast to the practice in many European countries, where costs are usually historical records for price fixing," he added, "the mentality of American management is looking ahead and this is achieved by the use of standard costs." The standard costs were used to measure actual costs and facilitate their control. They also served as a means of analysis of the variations in costs due to different causes, which gave the management the opportunity to focus attention on the exceptional and the irregular and to apply the principle of exception in controlling the business. The American management was primarily interested in what cost should be. Generally, it was not content with information only after events had taken place. The American management, of course, conceded that competition would ultimately fix the selling prices of products and that, therefore, the primary usefulness of any cost accounting system for ascertaining unit costs was limited. Nevertheless, it attached great importance to the costs system, as knowledge about unit costs was necessary to determine the profitability of individual lines.

In short, the success of industrial accounting and management accounting in the U.S. rests on the fact that both accountants and practical management have accepted four fundamental theories, namely, (1) what the cost of any operation ought to be can be determined in advance by careful analysis and scientific and technical investigation; (2) the relation of classes of expense to volume can be determined in advance; (3) cost system will reveal quickly and accurately variations from the anticipated level; and (4) the management can be expected to take effecive corrective action, if performance falls short without good and sufficient reasons.

ROLE OF CIVIL SERVICE

The efficiency of Government departments is dependent on the character and abilities of the personnel which man the Civil Service. High standards are, therefore, always set for recruiting persons to the Service. Emphasis is laid on young men of high intellectual attainments and proved ability with a robust will to overcome temptations and mental inertia. These standards have been maintained in the Indian Civil Service which is modelled on the British system. Since Independence, however, cataclysmic political and economic changes which have taken place in the country have also called for a complete change in the attitude and functions of the officials belonging to the Civil Service. More or less similar changes have also manifested themselves in Western countries such as Britain where socialist philosophy is gaining ground. An idea as to how the Civil Service has been gradually adjusting itself to the new conditions was given at a study circle, held a few days ago at Madras, by Mr. S. V. Ramamurthi, Adviser to the Planning Commission, and Dr. W. A. Robson, Professor of Public Administration in the London School of Economics and Political Science.

Both the administrator and the administered in this country have much to take note of in the metamorphosis of the Civil Service in India in recent years, as pointed out by Mr. Ramamurthi. India is now no longer a Police State. The country is now planning for a Welfare State. In a Police State, emphasis is laid on the collection of revenues and the maintenance of law and order. In a Welfare State, on the contrary, the officials should be well trained and disciplined in order that their services might be used in developing the resources. They have to function efficiently, if they are to succeed in this task. In view of the changed conditions in the country, the Civil Service now has a new vista before it and it should be prepared to shoulder the responsibility. Mr. Ramamurthi's observations in this context are noteworthy. He said: "The Administrative Service in India should not only be intellectually efficient, but also morally superior. It should not only help in the maintenance of law and order but also contribute its best towards the development of the resources of the country." The greatest civil servant India has produced was, according to him, Gandhiji. He seemed to be in full accord with the decision of the Madras Government to have the unit of development not a district as at present, but a contiguous region.

Dr. Robson's remarks on the Civil Service in a modern State too are noteworthy. There has been, according to him, an expansion of the scope

(*Continued on page 847*)

OFF THE RECORD

(By "ROVER")

DR. F. P. Antia, Chairman of the Bombay Branch of the Indian Roads and Transport Development Association, cries, year after year, in the wilderness, for more roads and a rational policy for road transport taxation. His mute and unvoiced indictment of the authorities on these two counts, backed up by a powerful array of facts and figures and tempered by a moderation of tone and timbre, just goes over the heads of the State Ministers, without having the slightest effect on their otherwise-engaged minds. The plans are there; the money for building roads and bridges is there. In nine cases out of ten, when one goes to the Government with a request for some constructive and socially wholesome activity, it is suavely turned down on the plea of financial stringency. Not being able to put forward this plea for denying us better and more roads, the Government just chooses to ignore both the repeated request of amiable men like Dr. Antia and the more strident and insistent voice of the Press.

If there was even a grain of sincerity and genuineness in the professed concern of the Congress Governments for the rural areas and the plight of the crores who are required to pass their lives in the villages and small towns of the country, they would have put aside many of their fads for more opportune times and concentrated their attention and resources on the provision of a network of all-weather, servicable roads to as many of these as possible. In a country of our size and the impenetrable width dividing rural poverty and urban affluence, roads constitute the foundation not only of all economic but educational, cultural and social regeneration. Without roads, you could achieve but little and that only at an exorbitant price in time, money and effort. On the other hand, if you can give good roads to the villages, the rest will follow almost automatically and inevitably.

For a demonstration of this truth, one has only to look at the villages nestling near important cities with good approach roads. Their prosperity is amazing and life there combines most of the good points of cities and villages, without the discomfort and isolation of the villages or the noise and the restlessness of the big towns. Living on Ridge Road and only occasionally venturing into distant villages for an hour or two in superbly springed cars, our Ministers, though politically and hypocritically professing great concern for the welfare of the village folks, cannot have any idea of what difference a good road connecting them with the rest of the country could make to the crores living in the seven lakhs of villages and thousands of small towns. If they had, they would have known that provision of quick and cheap transport to and from the villages would mean, in course of time, abolition of the rough edge of rusticity, with its filth and squalor and its spirit of fatalism and reaction. While deploring their lack of proper values, I do not question the good intentions of our Government. But I cannot, at the same time, help reminding myself that good intentions alone, unaided by effective, enlightened and fruitful activity are of no avail.

When I read Dr. Antia's address to the annual meeting of the Bombay branch of I.R.T.D. Association, I was also reminded of what that great industrial genius who passed away only very recently from amongst us, the late Mr. Walchand Hirachand, said about transport in an inspired moment. These words are charged with such an urgent message to our rulers that they would easily bear any number of repetitions. Mr. Walchand said:

> "When you take away all its trimmings, when you strip it of all its garments, when you study it in the raw, the history of man's civilisation in its essence, is the history of Transport. Man will go where his transport will take him. He is too restless a creature to be satisfied with his immediate surroundings. He will use anything and everything from a pair of legs to a space-splitting rocket and God knows what other things will follow, to enlarge his surroundings, his field of vision and action. For a man to be fully a man, for a nation or a race to rise to its full stature, development of its means of transport is, amongst various other things, very necessary."

Even the most kindly critic of this Government cannot close his eyes to some of the important aspects of its total failure to give us more roads during its seven years of almost unlimited power and an equally unlimited supply of funds for this purpose. Even if under these ideal conditions and functioning under an urgency which would brook no delay, the Government could provide no more than five hundred miles of new roads in five years, the verdict of history was bound to be that it must have been a singularly inefficient Government. No Government, perhaps, could have succeeded in constructing all the 11,000 miles of roads which were required for an adequate road system in the State (exclusive of the merged areas), but any Government worth its name could certainly have reached a much higher average than the 100 miles per year which was all that this Government of ours could give from 1948 to 1952. The recent record of Sir Winston Churchill's Government in the U.K. in the matter of housing can go to show what a determined and resourceful Government can do even within a short time to meet a crying public need. With regard to housing also, the Bombay Government's achievement is such as would disqualify every member of it from holding office again. So long as it remains preoccupied with such matters as prohibition, horse-racing, crossword puzzles, smoking in buses and cinema theatres and hours of closing for tea shops and restaurants, it will never be able to pay adequate attention to primary needs of the people.

But there is a still more important aspect of this question to which only a few have paid any attention so far. Some of the taxes which are being levied by this and the Central Government are specifically for the purpose of constructing roads and bridges. Some of these were freshly levied or increased, even when crores of rupees earmarked for this purpose had been lying unused year after year. The Government, which should really have been in a penitent and apologetic mood, should not have had the temerity to place new burdens on the road transport industry and car owners in general, for constructing roads, which they knew they were not capable of giving. It has crippled this industry and the automobile industry in the country as well by this crushing levy and closed the doors for employment for at least a lakh of people by its harsh licensing policy at a time when unemployment is gnawing at our vitals. Legally it may not amount to collecting money from people under false pretences, but morally the Government cannot escape this charge easily. This and the use of the proceeds from sugarcane cess which some State Governments are making should deprive them of the right of sporting the national motto "Truth Alone Succeeds" on their seals and letterheads. If they had been genuinely truthful in letter and in spirit, they should have desisted from collecting these taxes and cesses beyond what they were able to use for the specific purpose for which they were levied.

Coming to the more constructive part of Dr. Antia's speech, his suggestion for the creation of an autonomous, statutory authority to impart the necessary drive to the planning and execution of road programmes, with the road section of the P.W.D. working directly under it, should prove a very useful one. The State Ministry for Public Works has been given enough opportunity to demonstrate its prowess in this direction and it is now in no position to make a grievance of it, if this work is taken away from it and entrusted to another authority which can possibly deliver the goods. In fact, it should feel relieved of this responsibility, as it would enable it to pay more attention to its routine tasks. The Government as a whole, too, should not have any objection to the creation of one more body of this nature, as it has, of its own accord, sponsored two such organisations for housing and road transport. As Dr. Antia said, with the creation of such an authority, with adequate powers and its own separate budget, charged with the responsibility of completing the road programme at an early date, "the main handicap in the way of road development will have been removed."

Whatever difference of opinion there might be with regard to the advisability of the State undertaking the running of road transport services at this stage of our economic development, there could be no denying the fact that the executive authority, placed in charge of organising this huge concern within a phenomenally short time, has done as good a job of it, as it was possible to do for anyone working under difficult conditions. The expansion has been breath-taking, and, while I have no desire to minimise the value of the general guidance, which those in charge of execution received from the two successive non-official Chairmen, both high ranking business men, the real credit for creating this vast and intricate structure involving an expenditure of over ten crores, goes to the top executive, Mr. D. D. Sathe, the Motor Transport Controller and Vice-Chairman of the Corporation. If a similar Corporation is brought into existence with a man of Mr. Sathe's flair for organisation and his detailed knowledge of conditions of road and transport in the whole of the State at its head, I have no doubt that the execution of the road programme would be speeded up enormously. Such an undertaking would also open up opportunities for employment for a large number of young unemployed for years to come in the rural areas. Here is an opportunity for the discredited State Government to retrieve its lost prestige, before the Five-year Plan period is over and before the General Election is upon it, when it would be required to account for its stewardship to the electorate, if it would only take it with courage and confidence. If it does not, it would go to prove that the will to build roads on its part is lacking.—*All Rights Reserved.*

U.S. INVESTMENTS IN PLANT AND EQUIPMENT

Heavy expenditure planned by American industry for plant and equipment reflect increased confidence in the nation's business future. The Commerce Department and the Securities and Exchange Commission reported recently that investment in plant and equipment during 1953, will reach $27,821 million. This would be a gain of five per cent. over last year's previous record high of $26,455 million. This year's planned investments by American industry also exceed the total contemplated by the same businesses earlier this year.

The agencies indicated that American business plans to spend $14,400 million on plant and equipment during the last half of this year. Public utilities planned to spend $4,400 million this year. This is 15 per cent. above the rate for the last six months of last year. Manufacturers are expected to increase their expenditures about six per cent. to $12,700 million. Non-durable goods industries show the largest increase in this category.

The chemical, electrical machinery and beverage industries showed the largest gains, ranging 20 per cent. or more above last year. Significant gains also were shown by non-electrical machinery, paper, petroleum and fabricated metal products companies. Small increases were shown by the mining and commercial companies, while railroads were the only major group expecting a significant decline from last year—about seven per cent.

EXPANSION OF RAILWAY TRANSPORT FACILITIES CONTEMPLATED

CONTROL OVER KOSI—COFFEE PRICES TO BE CUT

(From A Special Correspondent)

NEW DELHI, *27th October*

ECONOMIC problems of the country are now being studied and tackled by the Government of India from the angle of employment and the ideal of the Welfare State. In other words, the Government is anxious to maintain the steady improvement witnessed in recent months in industrial production, safeguard the interests of labour, especially where there is every justification for the same, and reduce the intensity of unemployment by recourse to some ameliorative measures. The series of measures undertaken by the Government this week to safeguard the textile industry provide an indication of its approach in finding solutions to some of the complex problems facing the Government.

DELHI LETTER

The levy of an excise duty at penal rates on the production of *dhotis* by the mills in excess of the quotas permitted to them should also be viewed from the angle of employment. Here, too, the Government of India is desirous of ensuring employment to as many handloom weavers as practicable. In the course of a Press note explaining the ordinance to protect the interests of the handloom industry, the Government has observed that "since legal proceedings against the offending mills would be a cumbersome process, it has been decided instead to impose a deterrent excise duty on a progressive scale on all excess production of *dhotis*. The duty is to be on a graduated scale ranging from two annas per yard to eight annas per yard on the quantity of *dhotis* produced in excess of the permissible quota. It may be noted that the production of *dhotis* by the mills is now about 60 per cent. of the normal.

Railway Equipment

A sizable part of the additional sum that is proposed to be allocated for fighting the unemployment problem during the next two years is expected to be earmarked for the purpose of expanding railway transport. It will be remembered that, under the Plan, the railways have been allotted an aggregate sum of Rs. 400 crores or about Rs. 80 crores on an average per annum for the rehabilitation and extension of the railways. During the last 30 months and more, the Railway Board has been able to spend the budgetted amount for the abovementioned purposes with the result that there has been a gradual improvement in the transport services. Since industrial production has been moving up, which means more movement of goods and raw materials, the railways will be called upon to play a greater part in the coming years in the country's communication sector. Being well aware of this fact, the Railway Board has already begun to place firm orders with a number of foreign countries such as the U.K., Germany, France, Belgium, Japan, etc., for rolling stock. It has also been taking pains to ensure that such rolling stocks as locomotives, wagons, coaches, etc., are delivered as early as possible. At the same time, the Board has proposed to utilise to the maximum the wagon-building capacity in the country, besides taking measures to expand it to yield fruitful results in the immediate future.

Special attention is being devoted to remove the transport bottlenecks wherever they are found. The ghat section in the Vindhyas is being expanded by the construction of more looplines wherever necessary. By next year, similar efforts will be made in the Bezwada-Madras line. The line capacity in the north-east railway is expected to be increased by about 40 per cent. From the operation point of view, the Railway Board will try to convert the metre-gauge lines into broad-gauge, particularly in South India. Further, in certain sections electrification of the railways will be extended, as, for instance, between Madras-Vilupuram. More railway stations are also to be opened.

Irrigation and Flood Control

The extension of irrigation facilities and flood control measures is also one among the many to fight out the unemployment problem. For instance, the taming of the Kosi—the river of sorrow as it is called in Bihar—will be started within the next few months. The original but costly plan of constructing a dam at Barahkshetra has been given up for the present. Instead, a barrage will be erected either at Belka or near Theri Bazaar with embankments and canal systems on both sides of the river. The barrage will control the river channel upstream and also for a few miles downstream. It is expected to be used for regulating the distribution of the flood water among the river's other channels. It will be designed to feed the canals for irrigating Bihar territory. The canal system will provide irrigation for about 2.5 million acres of land at an approximate cost of Rs. 18 crores. Among the benefits that the above scheme will confer, mention may be made of the prevention of the river from meandering and spreading its waters, the creation of some security against the devastating floods, provision of more irrigation facilities, the increase in the production of food and commercial crops and the control over sand nuisance which renders fertile lands unproductive. There is also a plan to build a second barrage with canals to irrigate more areas, which will cost another Rs. 20 crores.

Coffee Prices

The Government of India has, for some time past, been anxious to ensure a fair price to the consumers of coffee, without unduly harassing the producer. This was one of the purposes for which the Secretary to the Ministry of Commerce and Industry had recently been to the South. The Government is particularly keen to secure the co-operation of coffee producers, especially as it is desirous of stepping up the output of coffee in the country in the coming years. Prompted by these motives, as it were, the Ministry of Commerce and Industry has suggested to the Coffee Board a proposal to scale down the prices of coffee for internal consumption. The proposal is based on the principle that, while the grower must be assured of a fair price, he should, at the same time, be entitled to nothing more than a fair price. The fair price will be revised year after year according to the general price level prevailing in the country, providing at the same time adequate incentives to increase the output of coffee. The Government has suggested that the price paid to the grower should be on the basis of Rs. 2-4 per point for the Plantation variety, with suitable adjustments to Robusta and other varieties. It has already allowed an export quota of 2,000 tons out of the last season's (1952-53) crop of slightly over 23,000 tons and announced a levy of Rs. 62-8 per cwt. as export duty. It has proposed that, should the internal price fall below Rs. 180 per cwt. for Plantation, it would compensate the producer out of the proceeds from the export duty. It is generally felt that the Coffee Board would be able to accept Government's suggestions regarding the price, etc., in the spirit it is being offered and establish cordial relations with the consumer who has been paying high prices for his coffee all these years. In the event of the Coffee Board not agreeing to this proposal, it is likely that the Government will assume more powers for the regulation of the coffee industry.

(Concluded from next column)

out of touch with their members who have lost confidence in them." So the initial action of the employers who failed to consult the men on the changes in conditions of work, supplemented by the union leaders who refuse to put the "unofficial" demands before the employers and refuse to negotiate any further till the strike is off, and ending with the strike leaders who will not resume work till at least one of their grievances is temporarily conceded, must inconvenience the whole public—to say the least—and bring production and distribution to a standstill. Though troops are now called in, there is the great danger that other drivers may refuse to run vehicles supplied by "black" petrol and the last state of the nation be worse than the first. There is a clear need for the Government to knock together the heads of the three parties to the dispute and not to allow childishness on anybody's part preventing negotiations continuing forthwith so that the trouble may be brought to an end at once.—*All Rights Reserved.*

THE "UNOFFICIAL" STRIKE

WHO IS TO BE BLAMED ?

(From Our Own Correspondent)

LONDON, *24th October*

IT is magnificent irony that, in the very week of the Motor Show, when the latest petrol-driven vehicles of every type from the most splendid to the most economical have been unveiled to the public, the whole motor transport of the metropolis should be gripped in a growing paralysis. Not till Thursday did the unsuspecting public learn that for three days already no petrol and oil had been delivered from the four great depots that supply the whole of the London area and that the pumps were beginning to run dry. Queues of cars and taxi-cabs began to beseige those garages that still had supplies, until these, too, had to reserve their remaining gallons for essential services. By Friday, petrol had ceased to be purchaseable and, though traffic seemed little diminished, every vehicle was running on what was in its tank alone. The drought had already extended to 50 miles round London and by the week-end other areas had begun to be affected with the strike spreading to the north of the country.

LONDON LETTER

Transport Affected

The cause of the drought is the strike of 3,000 road-tanker drivers employed by the oil companies and by contractors working for them. It has come after some weeks of sterile negotiation between the union representing the drivers and the employers and it is carried on against the instructions of the union leaders, so that it is "unofficial" and the strikers are without pay and dependent only on public relief. Once again, therefore, the public—this time indeed the whole life of the nation—is being put in peril by a strike, allegedly "unofficial", but, in fact, supported by 100 per cent. of the men involved. The taxi-cabs were the first to suffer, and only one-quarter of London's 5,600 vehicles are running to-day. Some buses have already been withdrawn from service and, if the strike continues till Monday, the whole London Transport fleet of 8,000 vehicles will be out. Commercial transport is already seriously affected with deliveries of milk and bread delayed. It is clear that the movement of non-perishable goods by road will cease after this week-end, although the strikers have undertaken to keep supplies going for the distribution of foodstuffs and for the maintenance of essential services: they have already undertaken to keep the police, ambulances and fire brigades supplied and the police in turn are helping out doctors and widwives. But so dependent is our complicated economy on petrol that, with the foregoing exceptions, it is rapidly coming to a halt.

A bewildered public is demanding the reason for this hold-up and no clear answer has yet been given. "Communist influence" cry some—but, in fact, the Communist members of the unions had no hand in starting this strike, and have tagged on to the movement only when it was under weigh. The employers are to blame for creating the initial grievance, for ShellMex and B.P. decided to transfer their haulage to private contractors instead of doing their own distribution. The oil companies required two trips a day from their men and provided each lorry-driver with a mate. The contractors demanded three trips a day and refused mates at their discretion. The men thereupon asked for pay increases and to negotiate agreed terms of employment with the contractors. The next trouble was the employment of five non-union men at one contractor's depot—and the strikers are demanding a "closed shop": indeed, they have said they will go back to work at once if the five men are temporarily withdrawn pending agreement. Finally, the men want a ten-shillings-a-week pay rise.

Views of London "Times"

The Transport and General Workers Union —biggest in the country—which represents the men is piqued at their indiscipline, refuses to negotiate with the employers on the men's terms and has broken off all negotiations until the men resume work. Even the London *Times*, indignant at having the country held up to ransom, declares that the men might not be striking "if the machinery for investigating their causes of discontent were less ponderous and less antiquated. Trade union leaders are too often

AMERICAN LETTER

IMPROVEMENT IN BUSINESS

CUBA'S DEVELOPMENT SCHEME MAY TELL ON INDIAN JUTE INDUSTRY

(From Our Own Correspondent)

NEW YORK, *23rd October*

WHILE some business men have been talking of adjustments and recessions, industry has become more optimistic in recent weeks, as the profit outlook has been improving owing to the certainty of tax reductions next year, primarily. Better stock prices are a reflection of this sentiment. What is happening at the moment is that the United States economy is moving from an overtime speed of feverish activity which has prevailed since and before the outbreak of the Korean war to normal employment levels. While this means somewhat lower payrolls and income, in many industries it is likely to cut costs and improve profitability. Thompson Products Co., for example, announced the other day that net income in 1954 is likely to hold or be above 1953 levels, despite an expected 17 per cent. drop in volume.

Thus, the days of good earnings and good dividends are by no means a matter of the past. Republic Steel issued its third quarter report showing record sales and profits jumped sharply from a year ago when the prolonged strike hampered operations. This is all the more interesting, because, for the first time in a decade, steel operations are down from the full capacity level. Republic Steel officials said that, with added capacity and without excess profits taxes, the Company should do as well in 1954 as in the current year. Alleghany Ludlum Steel said it could earn a profit at an operating rate of as low as 65 per cent. or better. Inland Steel said that the industry welcomed sharper competition. It was of the view that lower operating rates were healthier than 100 per cent. of capacity operations which are expensive and wasteful.

Savings at Record Levels

I mention all this because there is a group of professional economists in this country who are broadcasting tales of alleged woe, that the United States is facing a serious recession, in fact that it has already begun. All this is a question of degree and opinion, but, so far, there is not the slightest indication in statistics of any calamity. Savings continue at record levels and an entirely new class of savers is emerging. It is the broad middle class, skilled labour and white collar workers. They pay the mortgage on their house, buy a car and a television set, but beyond that they have no expensive desires. Therefore they can and do save. The older class of savers, the well-to-do, who were responsible for the accumulation of capital previously, have been taxed out of the savings class. They can no longer afford to save and maintain the standard of living they are accustomed to.

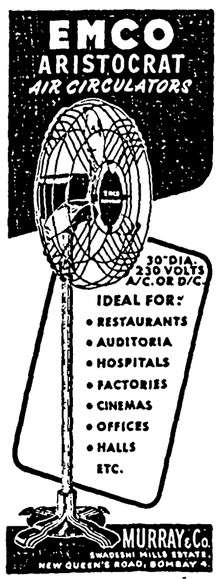
In mutual savings banks alone, there are some 20,000,000 accounts, aggregating about $26,000 million in 525 such institutions. Most of the 14,000 independent commercial banks, as well as savings and loan associations also, have savings account and the steady flow of funds continues into these channels, into Treasury savings bonds and life insurance companies with no indication but, perhaps, of a slight letdown. Thus, it would seem hardly justified even to think of a great recession in our economy.

Much of the wailing emanates from quarters which, for the first time in 20 years, have to face normal competition. Rising prices during the past inflationary cycle developed the psychology of a sellers' market. Now it has become a normal competitive buyers' market. A few industries are rediscovering the old mass production axiom that lower prices stimulate sales, but, of course, there are the normal cross-currents now of a relatively free economy, since most Government controls have been removed. Messrs. Mohawk Carpet Company announced the other day that it had postponed to 1st November, 1953, its recently announced price increases, and it cut the price of one line by 10 per cent. immediately. Oil companies, which are suffering somewhat from oversupply, are cutting prices as well in certain areas and the answer to the still overstocked situation in automobiles will probably have to be solved in the same manner, but it is certainly no calamity.

Another point which should interest Indian readers are the experiments going on in Cuba. I have just returned from a trip to Havana where a United States mission, together with Cuban specialists, is hard at work under the Mutual Assistance Programme, to get the Cuban economy out of its ancient handicap of being supported essentially by just one crop—sugar. The plan is crop rotation—sugar, fibres and rice. The fibre experiments envisage that Cuba will be able to manufacture her own bags for her huge annual sugar crop, reduce her jute purchases from India and eventually enter the export market for bags. So far, the fibre process has not been commercially feasible, but indications are that it soon will be and, after the training of Cubans in this field is completed, the work will get under way and, eventually, it will no doubt affect Indo-Cuban trade.

The Mutual Assistance Programme, centered in the U.S. Embassy at Havana, is entirely removed from politics and is run by scientific specialists. The general aim is a laudatory one. To use the natural resources of Cuba the year round, not just for the brief sugar growing and its harvest and thereby promote a greater general well-being. If successful, the movement may gradually soften the great disparity of income between the 'haves' and the 'have nots.' It may help the emergence of a strong middle class which, it is felt, might be a strong stabilising influence domestically.

Since general prosperity is the main basis for rejecting communism which is strong in some parts of Latin America, the general target has the support of many thoughtful people in the United States and in Cuba. The Cuban Government bears the cost of the operation and the joint work between Cubans and Americans proceeds smoothly and harmoniously. The work done on the island has received international attention. Experts from France, England and other parts of Europe have come to Havana for studies of the new experimental station of agriculture and they seem to be much interested in using the fibre process elsewhere too. While economic conditions vary greatly, there is a chance that the fibre process may become in due course a serious competitor to Indian jute and the established bag industry. This is not an immediate threat, but it might well bear watching for its long run implications.—*All Rights Reserved.*



PAKISTAN NOTES

JAPAN'S TRADE WITH PAKISTAN

ADVERSE BALANCE CAUSES CONCERN

JAPAN'S adverse balance of trade with Pakistan is causing anxiety in Japanese official circles. Japan imported from Pakistan from April, 1953, when a trade agreement was entered into between the two countries, upto 31st August, goods worth £15,567,000 while Pakistan imported from Japan commodities, worth £1,471,000. Thus Japan had an adverse balance of trade to the tune of £14,096,000. Although trade has since then reported to have made considerable improvement in favour of Japan, consequent on larger imports of cotton yarn imports by Pakistan, the position still is said to be not satisfactory.

It will be recalled that, under the trade agreement between Pakistan and Japan signed on 10th April, Japan had agreed to buy from Pakistan commodities worth £32,000,000 during the current financial year. These include 650,000 bales of raw cotton and 250,000 bales of jute, besides cottonseeds, hides and skins, cotton linters, rock salt, ephedrine, etc. This is in addition to about 200,000 bales of raw cotton contracted for during January-March, 1953. Japan also agreed to supply capital goods and machinery worth at least £6,000,000 on a long-term credit basis facilitating payment in instalments without any interest. In return, Pakistan agreed to import £5,500,000 worth of cotton fabrics, £1,000,000 worth of cotton yarns, £1,500,000 worth of rayon and other textiles and £1,500,000 worth of metals exclusively from Japan and, in addition, agreed to throw open general currency import licences for the first time to Japan.

It is contended that, while Japan has been liberal in regard to import of cotton, Pakistan has not adopted a reciprocal attitude. Japan sanctioned, during July-September, 1953, foreign exchange for the import of 250,000 bales of cotton from Pakistan. Recently, it also sanctioned $9,300,000 for the purchase of 65,000 bales during October-December, 1953, period. It is now expected to make available foreign exchange for another 235,000 bales of cotton.

Indo-Pakistan Trade

With the refusal of the Government of India to extend the Indo-Pakistan trade agreement which expired on 30th September, all licences for sterling area, issued by the Pakistan Government, are applicable to India also. So far as coal and jute trade between India and Pakistan is concerned, it will not be affected, as it is covered by a separate three-year agreement signed in March last.

The Indian Government's refusal to extend the trade pact up to 31st December, 1953, has not, however, evoked much comment from official circles in Pakistan. They, however, point out that restrictions on imports were not aimed at India. They were general inasmuch as they were designed to set right its precarious balance of payments, which is expected to persist unless drastic measures are taken to curtail imports. It is stated that so far as Pakistan's trade with India is concerned, Pakistan is having a favourable balance of trade under the agreement. But, it is adverse, if the Government's import trade outside the agreement is taken into consideration. The Government of India refused to extend the agreement, because Pakistan virtually banned the import of several items from India listed in the schedule to the agreement. The following table gives some of the items agreed upon to be imported under the agreement and the quantity stated to have been actually imported against it:

Commodities	*Under the Indo-Pak Agreement*	*Actual Imports*
	(Tons)	(Tons)
Ferro-manganese	200	....
Ferro-silicon	200	....
Rails	17,149	1,816
Heavy structural steel	10,000	121
Hard wood (including sal but excluding teak)	10,000	20,297
Deodar oil	10,000	..
Other soft wood	15,000	113
Soft railway sleepers	13,500	..
Hard railway sleepers	1,500	..
Mustard oil	5,080	4,774
Cotton waste	1,000	..
	(Value in Rs.)	(Value in Rs.)
Herbs, drugs, etc.	70 lakhs	12,10,014
Lime and limestone	5 lakhs	4,01,955
Bardi leaves, tobacco	1 crore	23,83,209
Printed books and journals	35 lakhs	8,71,975
Spices	1 crore	10,64,880
Road rollers	23 lakhs	..

LIQUIDATION OF DEFAULTING BANKS

ORDINANCE PROMULGATED FOR PROVIDING SPEEDY RELIEF TO DEPOSITORS

AN Ordinance was promulgated by the President of India on the 26th inst., with a view to expediting the procedure for liquidation of defaulting banks in India. The necessity for resorting to the use of the President's emergency powers in this connection is stated to be the urgency for expediting the liquidation of the several banks that have defaulted in recent years in order to give speedy relief to depositors and the inability of Parliament to consider the relevant Bill in its last session as it was preoccupied with other immediate business. The Ordinance has been promulgated under Article 123 of the Constitution and will have to be replaced by an Act of Parliament before the expiry of six weeks of the reassembly of Parliament.

The facts leading to the existing situation fully justify the Government taking recourse to the emergency legislation. As many as 321 banking companies were in liquidation at the end of 1952, involving thousands of depositors owning as much as Rs. 30 crores. There is, of course, provision for liquidation proceedings in the existing law but the procedure laid down in it is "cumbersome, prolonged and expensive." There are numerous instances where liquidation proceedings have dragged on for several years, as the liquidator of each bank has to file as many suits as there are debtors to the banks and in several courts all over the country. The prolonged delays also involve expenditure and the proceedings thus become costlier. Consequently, by the time the liquidation proceedings come to a close, in many cases, the balances left in the end are negligible and the depositors scarcely get anything worth mentioning.

With a view to simplifying the procedure, the Government of India appointed in July, 1952, the Banks Liquidation Proceedings Committee under the chairmanship of Mr. D. N. Mitra, a former Solicitor General of India, to recommend changes in the law and procedure that may be necessary for (a) expediting liquidation of banking companies, (b) the more effective and expeditious enforcement of liabilities of directors and other officers of the companies, and (c) the satisfactory working of schemes of arrangement for banking companies.

After studying the position in great detail, the Committee suggested certain administrative, as well as legislative, measures. These suggestions were circulated by the Central Government among the Reserve Bank of India, State Governments and High Courts, which seem to have approved of them, barring a few minor additions and alterations here and there. On the basis of these recommendations the Government of India formulated a Bill for the consideration of Parliament. But as Parliament could not find time, the consideration of the Bill had to be postponed. Meanwhile, numerous complaints were received by the Government from depositors, particularly from Bengal, on the delays and difficulties experienced by them. But, under the present law and procedure, both the Government of India and the Reserve Bank were helpless and could do no more than pass on the complaints to the courts under whom liquidators are working. In the circumstances, the only course open to the Government was to issue the Ordinance referred to at the outset. Under the Ordinance the Government of India is empowered, among others, to take the following legislative measures:

(1) Treatment of small depositors as preferential creditors. It is proposed that every depositor in a savings account should be entitled to a preferential payment upto Rs. 100, and similar priority for a sum of Rs. 100 should be allowed to current accounts not exceeding Rs. 500.

(2) The outstanding problem being the expeditious realisation of assets, a simple procedure is prescribed for settlement of loans of debtors on the analogy of the list of contributories under the Indian Companies Act. Within six months of the date of the winding-up order, the official liquidator will have to file in the court lists of debtors of the banking company which will be settled by the court on a date to be arranged after suitable notice is given to the debtor concerned. No appeal will be allowed when the amount of debt is less than Rs. 5,000. The above procedure will be available to the liquidator without prejudice to his rights to recover the debt due to a company in the ordinary course of law, but it will not be availed of by him in cases where there are debts due to the bank secured by a mortgage of immovable property and there are other mortgages of the same property.

(3) The courts are given the discretion to order the recovery, where necessary, of the decrees of the liquidator through summary land revenue processes.

(4) The courts are empowered to examine at their discretion persons who have been directors of the banks. Depositions in such examinations may be used in evidence against such directors in all civil or criminal proceedings. The courts may also disqualify any director for periods up to five years from being a director of a banking company, if upon such examination he is found incapable or incompetent.

(5) The court and the Government are empowered under the Ordinance to order inspection by the Reserve Bank of all banks under liquidation and to bring irregularities to the notice of the liquidator for consideration by the court. The Reserve Bank will have power to obtain information from liquidators on any matter relating to the liquidation.

(6) Provision is also made for the appointment of a court liquidator to every High Court for conducting proceedings regarding winding-up of banks. The Central Government may, however, exempt certain High Courts from the operation of this provision, if it is satisfied that the number of banks in liquidation in any particular area is not such that such an appointment is necessary.

(7) All proceedings pending before any official liquidator other than the court liquidator shall stand transferred to the court liquidator, unless the High Court otherwise directs.

The foregoing provisions should be welcomed as they are bound to go a long way towards safeguarding the interests of small depositors. As the directors are answerable for any mismanagement under its provisions, the Ordinance is sure to have a salutary effect on the existing managements of banks which are prone to overlook the importance of establishing sound principles of banking. If the provisions of the Ordinance are implemented in the right spirit, the liquidation proceedings can certainly be expedited and the cost of operation substantially reduced.

AN AMERICAN VIEW ON LOWER BANK RATE IN BRITAIN

Full six weeks have elapsed since the discount rate of the Bank of England was reduced from 4 per cent. to 3½ per cent. Naturally enough, the interest of banks and business men in this development has now shifted from mere discussion as to the need for a change in the Bank rate to the assessment of the effects of the new policy of lower interest rate on the general economic conditions in Britain. In the course of an interesting article in its latest *Monthly Letter* (October, 1953), the National City Bank of New York, for instance, mentions some of the distinct advantages of the lower Bank rate, a move which it considers can hardly be swept aside as inconsequential.

"Is your Overseas trade increasing ?"

With a network of almost 1,700 Branches in England and Wales as well as Agents and Correspondents throughout the world, Lloyds Bank has helped many of its customers to expand their overseas business as the Bank is specially equipped to deal with every aspect of overseas trade.

Let LLOYDS BANK look after *your* Overseas interests

Lloyds Bank Limited — Incorporated in England

LBO/148—1953

The *Monthly Letter* shares the view generally held by many banks that the unification of the Bank of England rates by lowering the discount rate, instead of by raising the special rate, must signify, to some extent, increased confidence in the country's financial and economic position. In this connection, it is noteworthy that the Bank rate was lowered at a time when sterling exchange was tending to soften after a period of sustained strength.

A second significant feature of the British Bank rate change has been the bringing about of a general realignment of and reduction in open market money rates. To quote the Bank: "In the British market, commercial bank lending rates are traditionally related to the Bank rate proper. Hence the existence of the Bank's lower Special rate of Treasury bills has had the effect of producing a wide spread between rates charged by the commercial banks on loans to their customers and those charged to the Government on Treasury bills. ... The reduction in the central bank discount rate paves the way to a lowering of the rates charged by the commercial banks to their trade and industrial customers. Meantime, the general level of open market money rates, including bank deposit rates, has already moved down by about ¼ of 1 per cent., with the rate for prime commercial bills falling more sharply, following abandonment of the pegged rate and adoption by the authorities of the policy of permitting the rate to fluctuate freely. Both the industry and the Government will be able to obtain credit more cheaply, with a narrowing of the unnatural rate differential between the two classes of paper. While the effective rate the market must pay at the Bank of England remains unchanged at 3½ per cent., as already stated, it will now be possible to borrow at that rate on approved commercial bills, instead of only on Treasury bills. All this doubtless appears highly technical to the American reader. What is significant is the move towards more normal and flexible relationships in the money market, and placing the discount rate in a position to regain its traditional role in influencing credit conditions."

Another significant feature of the reduction in the Bank rate is said to be the strong response recorded in the British security markets. Thus, according to the *Letter*, share prices moved up sympathetically, reflecting both the decline in yields of Gilt-edged and in psychological lift of the lower Bank rate. Most immediately, the British Government stands to benefit, in that the funding of £989 million of the national debt, scheduled for redemption next month and March, 1954, will be made easier and less costly. Again, the steel share marketing—to be carried out in connection with the denationalisation of the steel industry—will be facilitated. Looking further ahead, the *Letter* expects the improvements in the security markets to provide a stimulus to the economy at large. "Rising security markets," it says, "tend to generate optimism and to encourage business concerns to invest more freely and expand their activities. Whether this kind of development would be desirable in Britain under the circumstances is questionable. Already, the country is operating at full employment and some concern has been expressed over the proportion of production that has been going into the domestic economy rather than into export."

The *Letter* then refers to the broader significance of the new rate change, which, in its opinion, lies in the further evidence it affords of a generally lower trend of world interest rates. This, in turn, "reflects the dying down of the inflationary fires by World War II and rekindled by the outbreak of the Korean war and the launching of the vast programmes of rearmament."

Proceeding, the *Letter* seeks to stress that the general level of European Bank rates has fallen definitely below the maximum reached after Korea (1950-53), now that Britain, France and Denmark have joined the move towards lower Bank rate. To bring out this point clearly, the *Letter* gives the following table relating to the Central Bank discount rates of selected countries:

	Maximum 1950-53	Present rate		Maximum 1950-53	Present rate
	%	%		%	%
Austria ..	6	5	Netherlands.	4	2.5
Belgium ..	3.75	3	Norway ..	2.5	2.5
Canada ..	2	2	Portugal ..	2.5	2.5
Denmark ..	6	4.5	Spain ..	4	4
Finland ..	7.75	5.75	Sweden ..	3	3
France ..	4	3.5	Switzerland.	1.5	1.5
Germany ..	6	3.5	Turkey ..	4	3
India	3.5	3.5	Union of South Africa.	4	4
Italy	4	4	United Kingdom ..	4	3.5
Japan ..	5.84	5.84	United States	2	2

In conclusion, the Bank observes: "Though there is some fear that the embers might still flare up, Central banks generally are apprehensive of overstaying the need for restraining policies."

U.S. INVESTMENTS ABROAD

The U.S. Commerce Department's survey of American investments abroad, released for publication last week, makes impressive reading. A highlight of the survey is the large amount of direct American investments aggregating $14,000 million at the end of 1952. This figure is based on a comprehensive study of U.S. foreign investments during the period 1943-50. The survey reveals that there was a steady rise in these investments abroad even from as back as 1920, when they stood at only $4,000 million. In the subsequent years, they gradually rose to stand at $11,800 million in 1950 and to $14,000 million last year.

The chief factor which has been responsible for inducing, in recent years, a greater outflow of private investments abroad is the keen interest evinced by the U.S. Government. The Government concluded special treaties with the countries importing U.S. capital to end discriminatory treatment of American investors. It liberalised income-tax laws on earnings of these investors. The prospect of earning comparatively higher returns on capital invested in certain countries as, for instance, Latin America and Canada, also contributed to the flow of capital abroad.

The survey reveals that the income earned by the U.S. investors averaged about $1,200 million per annum during the six years ended 1952. Of this, on an average, $630 million a year was reinvested, as new capital in foreign enterprises. In addition, approximately $500 million a year in the earnings were retained by foreign subsidiaries. This also constituted a source of further new investments in those countries. By selling to the U.S. goods manufactured with the help of new investments, the subsidiaries helped the foreign countries to earn large amounts of dollars. Again, by substituting local production of goods which were formerly purchased from the U.S., they helped the countries also to save dollars. Calculations reveal that the foreign countries earned slightly more than $1,000 million in revenue from income-tax on U.S. direct-investment enterprises. Other types of taxes and royalty payments provided more direct forms of revenue which made possible the implementation of development programmes which could not otherwise be carried out.

The area-wise distribution of the $11,800 million invested abroad at the end of 1950, reveals that the share of Latin America was the largest at $4,700 million. Canada came next, accounting for $3,600 million. Europe absorbed $1,700 million. The balance of $1,800 million was shared among Africa, Asia and Australia.

Industry-wise analysis of the U.S. investments discloses that some $3,800 million was invested in manufacturing industries. The petroleum industry absorbed $3,400 million. Investments in railways and public utilities amounted to $1,400 million and in mining $1,100 million. Only $600 million was invested in agriculture, while all others accounted for $1,500 million.

The survey shows that the flow of investments underwent two notable changes during the period 1943-50. Thus, investments in the contiguous or neighbouring areas of Canada, Mexico and West Indies fell from 50 per cent. of the total in 1929 to 40 per cent. in 1950. But investment in Latin America, directed mostly to petroleum and manufacturing enterprises, rose by 75 per cent. from 1943 to 1950. Again, there was a marked increase in the value of direct investments in Asia. These rose from $403 million in 1943 to $1,044 million in 1950. During the same period the increase was from $129 million to $353 million in Africa, from $114 million to $200 million in Australia and from $75 million to $149 million in the Philippines. Part of the increase in investment in these areas is due to the shift of investments from Europe.

Investments in Europe dropped from 23 per cent. of the total in 1943 to nearly 15 per cent. of the total in 1950, because, the survey adds, most of the American capital flowed into other areas of the world. However, during this period $500 million was reinvested in the European enterprises. In 1950 alone, we are told, new investments increased by more than $270 million. The flow of U.S. capital to Britain increased from one-third of the total in Western Europe to one-half in the seven-year period ended 1950. Other countries with large American investments were France, $217 million and Germany, $204 million. Investments in Western European dependencies increased from $155 million to $435 million between 1943 and 1950.

The Bank of Mysore becomes the Agent of the Reserve Bank of India in Mysore State from 1st November, 1953. According to a Reserve Bank communique released this week, an agreement to this effect has been executed on the 28th inst., the parties concerned being the Rajpramukh of Mysore, the Reserve Bank and the Bank of Mysore.

In the third week of December 1952, the Government of Mysore appointed the Reserve Bank of India as its sole banker with effect from 1st January, 1953. It was indicated at the time that the Bank of Mysore would be appointed the Reserve Bank's agent in Mysore as soon as the necessary preliminary arrangements were concluded.

The Bank of Mysore will now perform the agency functions at Mysore, Shimoga and Mandya. At these centres, it will, on behalf of the Reserve Bank, transact the banking business of the Government of Mysore and also that of the Central Government. This business will include transactions pertaining to railways. The Bank of Mysore will also provide necessary exchange and remittance facilities to the banks and the public at these centres. The agreement provides for the Bank of Mysore performing similar agency functions at such other centres in Mysore State as may hereafter be decided upon by the Reserve Bank in consultation with the Government of Mysore.

The Bank of Mysore is the second bank in a Part "B" State to be appointed as the Reserve Bank's agent. The first was the Hyderabad State Bank which has been functioning in that capacity since 1st April, 1953.

The securities of the 4 per cent. Hyderabad State Development Loan, 1963, subscriptions to which are being received from the public with effect from 22nd October, 1953, have been specified as approved securities for the purposes of the Insurance Act, 1938, according to a notification issued by the Government of India, Ministry of Finance, on 22nd October, 1953.

TEXTILE MILLS IN COIMBATORE

AGREEMENT REACHED ON BONUS ISSUE

THERE is a no more pleasant news in the industrial world than a negotiated agreement between the employers and the workers, which is reached without going through the painful means of a strike or the protracted course of a full dress trial at the court of an industrial tribunal. For this reason, if for no other, the reported agreement between the textile labour and the Coimbatore millowners deserves to be welcomed. The credit for this peaceful settlement of an old dispute must go as much to the mill authorities, as to the workers' representatives.

The Southern India Millowners' Association, Coimbatore, and the Coimbatore District Textile Workers' Union, it is stated, have arrived at an agreement in their dispute in respect of bonus and arrears thereof for the years 1948, 1949, 1950 and 1951. *This dispute is pending before the* Labour Appellate Tribunal in respect of the bonus for 1948 and before the Industrial Tribunal, Coimbatore, in respect of the bonus for *other years. It is stated that 27 mills,* according to the agreement, will pay 50 per cent. of the basic earnings and two other mills will pay 33⅓ per cent. of such earnings in accordance with *the award of the Industrial Tribunal,* Coimbatore. For the years 1949, 1950 and 1951 there is no award, since the dispute is pending before the Tribunal. Nevertheless, it has been possible to arrive at an agreement with the workers. Thus, for the year 1949, 28 mills will pay two months' and one mill one month's bonus. For 1950, 27 mills will pay two months' and one mill, one month's bonus. For 1951, 26 mills will pay three months' and one mill two-and-a-half months' bonus and another two months' bonus. No deductions, it has been agreed, are to be made by the *management* towards any advance made by them from bonus payment under this agreement. All workers who have worked for the respective years are entitled to the bonus irrespective of the number of days of attendance. For women, who had been on maternity leave, actual maternity allowance drawn by them will be included in their earnings for purpose of calculating the bonus. The total payment of bonus will be made in two instalments, one before 31st October and *the other on or before* 31st December.

As regards the bonus for 1952, it would appear from a Press statement issued by Mr. R. Venkataswamy, Chairman of the Southern India Millowners' Association, that the Association itself took the initiative in examining the working of the mills in the Coimbatore area and reaching an agreement with the workers. The Chairman says:

"At a meeting of the Association held on 20th October, 1953, the working of the mills for the year 1952 in the Coimbatore area was reviewed so as to explore possibilities of payment of bonus to workers for that year. Statements of accounts prepared by auditors of the Association for the Coimbatore group of mills were examined and fully discussed. During the year under review most of the mills had incurred losses and only two mills had shown surplus profits for payment of bonus. Four other mills have made very small profits, inadequate for any payment of bonus.

"On an overall picture, therefore, there was no possibility of declaring bonus for the year 1952 industry-wise as only two out of 32 mills have made profits to *justify any payment.* Therefore, the Association has recommended in regard to these two mills that declaration of bonus for workers for the year 1952 be left to their discretion. The Association very much regrets to announce *that the industry is not in a position to declare* any bonus for the year 1952 in respect of other mills.

"However, to avoid hardship to labour and in the interests of general peace and harmony in the industrial sector in Coimbatore, the Association authorised Mr. K. Venkatesalu, Honorary Secretary of the Southern India Millowners' Association, to negotiate with trade unions in Coimbatore and explore possibilities of settlement of the various issues pending before the Industrial Tribunal, *Coimbatore,* and the Labour Appellate Tribunal at Lucknow so that under the final settlement workers may get some money for the ensuing *Deepavali.* We are glad to announce that it has been found possible to come to an agreement with the Coimbatore District Workers' Union, Singanalur, regarding bonus payment for the years 1948 to 1951 (both years inclusive), about which a dispute is pending before the Labour Appellate Tribunal, Lucknow, and the Industrial Tribunal, Coimbatore. According to this agreement a final settlement has been arrived at between the parties.

"According to this final settlement, the bonus works out to a month's basic period. We are sorry to report that it has not been found possible to reach final settlement in respect of two mills of Coimbatore area on the bonus issue. We hope that better counsel would prevail and an amicable settlement would be arrived at. The financial position of these units is causing anxiety and labour, we trust, would realise the serious implications and repercussions in making heavy demands on these two unfortunate units. We sincerely hope that a settlement would also be possible in the near future in respect of these mills. It is also strongly hoped that the spirit of compromise and conciliation shown on both sides at the recent meetings would continue to prevail towards the development of harmonious capital-labour relationship and ensure the future prosperity of the country."

It would, however, appear that all the aforesaid agreements were reached only with a section of workers and that, therefore, they do not carry the support of all the trade unions. The Tamil Nad Indian National Trade Union Congress, for instance, is not a party to this agreement. The Secretary to the Union, Mr. G. Ramanujam, has criticised the agreement on three grounds. In the first place, the agreement is "not lawful," since the 1948 bonus dispute is pending before the Labour Appellate Tribunal. Secondly, the agreement provides for less bonus than the award which is the subject of appeal *before the Appellate Tribunal. Thirdly,* under the agreement, the "basic wage" does not take into account production allowance, and the bonus amount will accordingly be less than what it would otherwise be. He feels that his rival union was "unduly hasty" in concluding the agreement.

We do not wish to comment on the purely legal aspects of the agreement. But the question, which deserves to be considered, is whether this agreement does not give, in the present context of the troubled conditions through which the industry is passing, sufficient satisfaction to the workers concerned. It is to be hoped that the labour leaders, to whatever section of the labour movement they may belong, will examine the settlement in an objective manner. If such impartial examination leads, as we feel it will lead, to the acceptance of the agreement, then the Coimbatore textile workers will be spared the inconvenience of the prolongation of a dispute which has dragged on, in all conscience, for an unduly long time already.

EMPLOYMENT IN THE CLOTHING INDUSTRY

CENSUS FIGURES ANALYSED

AT a time such as the present when the threat of unemployment faces many a worker in the textile industry, it will certainly interest many persons to know what an important role the textile industry plays as a source of employment. From this point of view, the Government of India's latest publication on census, entitled *Census of India Paper No. 3 of* 1953, which gives a summary of demographic and economic data, will be read with great interest. This report shows that, in the industrial sector, as distinguished from the agricultural, the textile industry is the single largest source of employment to the people.

India's total population, according to the latest census (that is, the 1951 census), is 356.6 million. The number of persons who are described as belonging to the agricultural classes is 249.1 *million.* The rest are employed in various industries, or engaged in other services, or support themselves by other sources of income, such as pensions, agricultural income or merely by begging. It has been computed that there are about 32.4 million persons who are engaged in industries and services. Of this number, the various branches of the textile industry claim about 3.41 million persons as workers or employers or independent workers. This number is distributed as follows:

(In millions)

	Men	Women	Total
Cotton textiles	1.83	0.22	2.05
Weaving apparel (except footwear) and made-up textile goods	0.60	0.05	0.65
Other textile industries ..	0.65	0.16	0.71
			3.41

In the cotton textile industry, there are thus 2.05 million persons. This number includes employers (0.05 million), employees (0.98 million) and independent workers (1.02 million). The overall number of 2.05 million persons refers to "self-supporting" persons who are defined as possessing an income sufficient for their maintenance. An employer is defined as a person who has necessarily to employ other persons in order to carry on the business from which he secures his livelihood. Thus, if a person employs a cook or other person for domestic service, he is not regarded as an "employer" merely for that reason. An "employee" is a person who ordinarily works under some other person for a salary or wage in cash or kind. An independent worker means a person who is not employed by anyone else and who does not also employ anybody else in order to earn his livelihood. It will be seen from the figures already given, that independent workers predominate in the cotton textile industry. This is presumably because the handloom weavers have also been included in the census as those who are dependent on the textile industry.

The following table gives the region-wise classification of persons engaged in the cotton textile industry:

	Men*	Women*
India—		
Rural	754,053	116,690
Urban	1,078,804	111,304
Total	1,833,757	227,994
North India—		
Rural	129,604	16,933
Urban	114,858	6,250
Total	244,462	22,183
East India—		
Rural	87,425	22,531
Urban	45,172	4,289
Total	132,597	26,820
South India—		
Rural	277,829	41,519
Urban	219,242	33,903
Total	497,071	75,422
West India—		
Rural	74,048	7,600
Urban	481,010	40,344
Total	555,058	47,944
Central India—		
Rural	118,455	11,103
Urban	162,684	16,590
Total	281,139	27,702
North-West India—		
Rural	67,591	18,004
Urban	55,829	9,919
Total	123,420	27,023

* Includes employers, employees and independent workers.

(Concluded from next column)

It will be seen from the table above that, although the cotton textile industry is an urban industry in India, taken as a whole, there are parts of this country, where it is carried on as a rural enterprise. If data had been collected on the income levels of the persons engaged in this industry in the rural and urban areas, they would have served to bring out the difference in incomes between the "rural" textile workers, who are generally handloom weavers, and the "urban" textile workers who are generally engaged in the organised textile industry.

The figures relating to persons connected with the textile industry seem to differ widely from the accepted figures relating to the handloom industry. The total number engaged in the textile industry, according to the census, is 2.05 million. It is known, from other sources, that the organised mill industry employs about 800,000 persons. This would leave about 1.25 million people for the handloom industry. But this industry, according to the Fact-finding Committee on Handloom Industry, employs about 2.4 million persons. Either the figures given by the census are serious under-estimates or the *generally accepted figures of employment* in the handloom industry are wide of the mark. Perhaps, the only explanation that could be offered for the discrepancy between the two estimates *is that the census does not take into account* the partially-employed persons in the handloom industry. In any case, the whole matter deserves some careful statistical study, in order to arrive at some acceptable estimate about the persons employed in the handloom sector of the textile industry.

Apart from those who are directly engaged in textile production, there are numerous other classes who are connected with the industry such as cloth merchants, cotton traders and so on. An important section of this class is the retail dealer in cloth. It is unfortunate that the report does not show the figures of retail dealers in cloth separately but clubs them with dealers in leather goods. There are, according to the report, about 560,000 persons engaged in the retail trade in textile and leather goods, either as employers or employees or independent workers.

SIR RAYMND STREAT'S WARNING TO BRITH TEXTILE INDUSTRY

DECLINE IEXPORTS OF MILL MACHINERY

(*From A Special Correspondent*)

MANCHE, 20th October

SIR Raymond Streat, Chair:of the Cotton Board, told 1,000 executi·managers and union officials at the openin‹the industry's Annual Conference at Harro‹this week-end

MANCHESTER LETTER

thaport customers wo‹turn from us and· elsewhere" if the‹on industry's deli periods grew lon‹ and longer. "Civals and competi‹in other countries in many cases have a‹ of labour on which they can draw to inse output and give relatively prompt deli. We cannct count upon being protecte‹manently by special measures imposed upcovernments by reason of the currency si‹on," said Sir Raymond.

Describing higher produ‹ty per worker as "more than ever our mos‹ical need," he added: "The sterling area mproving and overseas countries in the ster area will buy from others if we cannot gi‹em the terms they desire."

The net productivity in spinning between 1947 and 1951 had ‹ 3.7 per cent., while in weaving there had‹n a gross rise of 8.2 per cent. "These factors‹w that something has been done but over whole industry the effect has been small. I‹k it is certain that what has actually happe‹is that many units have increased productivity‹by much more impressive percentages whil‹hers have not achieved any increase at all."

In nine months of slump‹cashire mills lost 65,00(workers and so fa‹ly 23,000 had been recruited back to the ind‹y. Production had risen to 88 per cent. of ‹level achieved before the slump and the revi‹of buying had so outstripped the growth of‹ductive capacity that order books had gra‹lly lengthened and longer delivery times for ‹hed goods had had to be quoted.

Trade Prospec

An increase in trade t‹igh the Iron Curtain, coupled with an enraging review of economic prospects in the ‹ted States, was predicted at the final session ‹he Conference by Sir Oliver Franks, Dep‹ Chairman of Lloyds Bank, and a former Bi‹h Ambassador at Washington. He said th‹the easing of internal conditions in Russia‹e reduction in prices of goods and the incse in supplies indicated that the new Soviet‹time was more concerned with the standard living of the people.

He anticipated no great ch‹e in American tariff rates. "Results will be‹dest," he told the Conference. "There will a gentle movement. Things will improve, ‹not profoundly alter. There will be no trurt-call to bring the tariff walls crashing dow‹

Points from the papers given at the Conference included:

Mr. A. D. Campbell, leader of the cotton team to East Africa: "The industry should experiment with a particular branded cloth of fast colours worded in Swahili. The brand should be centrally advertised by the industry throughout East Africa. We do not recommend that Lancashire should try to recapture the market for cheap goods for native consumption, on the lines followed by Japan, but an effort should b‹ made to obtain a certain share of the better end of the bulk trade."

Mr. Campbell urged the Lancashire textile industry not to shirk "the unpleasant problem of price." Lancashire prices, he declared, were too high, not only in terms of Japanese and Indian prices but competition from the Continent was also very severe.

Mr. Ernest Thornton, M.P. for Farnworth, and former Secretary of the United Textile Factory Workers' Association, said the industry needed an efficient well-paid labour force, a little larger than at present but smaller than in 1951. Bold and generous schemes of redeployment on existing machinery and re-equipment at a speedier rate would offset the inevitable loss of labour in the older age groups during the next few years.

Cotton's Place

Pointing out that cotton still provides 72 per cent. of the clothing material of the world, Professor A. J. Brown, Head of Leeds University Economics and Commerce Department, told the Harrogate Conference: "Cotton is still very much King, though not quite such an absolute monarch as he used to be."

Rayon, Professor Brown said, now equalled in quantity about one-twelfth of annual cotton output—"not an enormous quantity as yet but appreciable and coming up fast." In the 20 years to 1952 rayon had actually brought its prices down, despite an upward movement in labour, materials and nearly everything else in the world. There was no obvious reason, he believed, why the price of rayon should rise much in future but the position of cotton was different.

Increasing population and increasing demand for food, he continued, might press more heavily upon cotton than on wood-pulp used for making rayon. Suppliers of raw cotton, mainly into the port of Liverpool, had changed in the past generation. The United States was exporting only 60 per cent. of the level in the 1920's and India and Pakistan had reduced exports to a fraction of the pre-war level. Outside growths had been responsible for 35 per cent. of world cotton exports in the last three years against less than 5 per cent. before World War I. A quarter of raw cotton for Lancashire spinning mills now comes from Sudan and other parts of Africa outside Egypt.

Machinery Exhibition

Comments on the scale of re-equipment in Britain's textile industries were made when what was described as the largest and most comprehensive display of textile machinery, accessories and ancillary equipment assembled was opened in Manchester last week.

The exhibition is about 60 per cent. larger than its 1949 predecessor, providing accommodation for 276 exhibitors, of whom 58 came from overseas. A feature of the display was the return of German textile manufacturers, 19 firms showing their products for the first time since 1936.

Opening the exhibition, Sir Andrew Naesmith, former Secretary of the Operative Weavers' Amalgamation, said that the best equipped mills in Lancashire were as good as any in the United States. Progress in modernisation and re-equipment, however, he declared, was far too slow and limited. "I want to see the backward firms taking examples from the more progressive units in order that the whole tempo of production can be increased," he added. "It is no exaggeration to say that between our best mills and our worst there is a difference of something like 30 per cent. in productive efficiency."

Mr. W. A. Grierson, an ex-Chairman of the Redeployment Committee of the Master Spinners' Federation, agreed that the scale of re-equipment in Lancashire over the past seven years had been too small. Dealing with the current shortage of 42,000 operatives in spinning and weaving, he said: "This is a challenge to management. There is now a golden opportunity to reach 1950 production figures with a smaller, compact, well-paid and highly skilled labour force. We are suffering from a shortage of workpeople only because in so many cases they are not effectively employed and they never can be on machines and methods which are 50 years old."

Some of the most spectacular machinery on show at the exhibition was specially designed for processing man-made fibres.

Machinery Exports

Competition in textile machinery is growing as rapidly as it is in the finished textile material. British manufacturers of plant have done extremely well since the war, and aided by high prices have been able to establish new currency earning records. The peak, it would seem, has for the moment been passed as shipments this year, both by volume and value, are substantially lower than in 1952.

For the eight months to the end of August the quantity of textile machinery shipped abroad was 1,172,421 cwts., valued at £28,367,772, compared with 1,520,465 cwts., worth £33,728,620 in the same period last year. The value of this year's exports, however, is second only to the highest level yet recorded, in 1952.

Practically every country in the long list of those which buy textile machinery from manufacturers in Britain have taken smaller quantities than a year ago, but it is noticeable that purchases of spinning machinery have declined more than those of other processes. In the eight months spinning machinery shipments totalled 670,225 cwts., against 882,270 cwts., while weaving plant exports amounted to 204,899 cwts., against 243,172 cwts.—*All Rights Reserved.*

PROPERTIES OF STANDARD COTTONS

RESEARCH RESULTS PRESENTED

ALTHOUGH India ranks, along with the U.S., Pakistan and Egypt as one of the principal cotton-growing regions of the world, it differs from the rest in the relatively larger number of varieties of cotton which are grown in this country. The other countries raise a large quantity of one variety or a strictly limited number of varieties of cotton. This difference arises, as Mr. C. Nanjundayya, Director, Technological Laboratory of the Indian Central Cotton Committee, remarks in the report entitled *Technological Reports on Standard Indian Cotton, 1952*, just published, from the fact that, in this country, cotton is grown in a vast area which has "widely varying geographical and climatic conditions." It has thus become necessary to grow a large number of varieties of cotton in India, each variety being suitable to a particular tract from the point of view of yield and quality.

It is, therefore, hardly surprising that Indian cottons possess a wide range of fibre properties and spinning value. At one end of the scale, there are the short-stapled Bengals, which are suitable for only 8s and 10s reeling, while at the other end, there is the fine and long-stapled Madras Uganda I which is capable of being spun upto 32s warp or 40s weft under mill conditions. The following table gives the various types of cottons produced in India, and their fibre and spinning characteristics:

Characteristics of Indian Cottons

	(a) Output 1950-51	Grader's staple length 32nd inch	Mill flow Room loss (Per cent.)	(b) Mill spinning capacity
Bengals				
U.P. Deshi ..	53,000	14 to 18	9-11	8s-10s reeling
Rajputana Deshi ..	160,000	12 to 16	9-11	"
Punjab Deshi ..	229,000	14 to 18	9-11	"
Mollisari ..	31,000	14 to 18	9-11	"
Americans				
Punjab American LSS ..	106,000	26 to 28	6-10	24s warp
M.P. American (Hurl) ..	57,000	29 to 30	9	25s warp
Hyderabad American ..	39,000	28	8-10	24s/28s warp
Oomras				
C.P. and Nimar Oomras.	156,000	18 to 22	7-10	8s/16s warp
Berar Oomras	55,000	18 to 20	10	8s/12s warp
M.P. Verum	44,000	24 to 26	9	20s/22s warp
Jarilla	206,000	24-to 27	9-13	22s/24s warp
Harsi Nagar (including Hyderabad Oomras) ..	68,000	18 to 20	9-11	8s/12s reeling
C.I. Oomras	105,000	16 to 20	12-15	8s/12s warp
Malvi	115,000	22 to 24	10-12	14s/16s warp
Hyderabad Gaorani ..	106,000	25 to 30	6-13	24s/26s warp
Broach Vijay	216,000	24 to 28	6-8	24s/26s warp
Surti Suyog	85,000	25 to 30	7-8	24s/26s warp
Dholleras (Wagad, Latio, Kalasia)	320,000	21 to 26	12-15	14s/18s warp
Madhya	40,000	16 to 18	15	10s/12s warp
Southerns				
Kumptas	104,000	22 to 28	14-16	14s/22s warp
Jayawant	109,000	26 to 29	12	20s warp
Dharwar-American (Gadag I) ..	33,000	26 to 28	7-9	24s/26s warp
Westerns (Hagari I) ..	59,000	26	10-12	24s warp
.. (other than III)	46,000	22 to 26	11-13	16s warp
Northerns	9,000	26 to 28	8	22s warp
Nandyal 14	3,000	20 to 25	9	24s/26s warp
Coranadas and Warangal	12,000	22 to 26	6-10	14s warp
Chinnapathi ..	2,000	..	..	..

Karungannis	53,000	26 to 28	6-8	24s warp
Cambodia	134,000	28 to 34	5-8	28s/32s warp
Nadam, Rourbon and Uppam (Salem) ..	3,000	22 to 26	6-8	14s/18s warp
Comillas	19,000	12 to 14	6-8	8s/10s reeling
Grand Total ..	2,026,000			

(a) In bales of 392 lbs. each.
(b) Based on average mill performance.

Before the State Agricultural Departments undertook systematic work in connection with the evolution of better varieties of cotton, the cultivators used to grow whatever variety those chose. More recently, however, this practice has been replaced by a more organised effort designed to grow the varieties which show a decided improvement over the existing varieties in respect of such factors as hardihood, yield, ginning percentage, resistance to diseases and pests, staple and grade. The improved varieties are maintained as standard cottons in the many experimental stations which are dotted all over the cotton-growing tracts of the Indian Union. These cottons are grown each season from pure seeds and under as nearly the same conditions as possible to serve as standards of reference. Although the standard cottons generally remain unchanged they are sometimes omitted from the list or new ones are added to the list when some of them have definitely proved unfit or when better varieties of cotton are evolved.

The following is the list of standard cottons which have been arranged State-wise:

Bombay State: Jayawant; Jayadhar; Gadag 1; Laxmi; Vijay; 1027 A.L.F.; Suyog; Jarilla and Virnar.

Punjab State: Punjab American L.S.S.; Mollisari.

Madhya Pradesh State: H. 420.

Hyderabad State: Gaorani 6.

Madras State: Cambodia Co.2; Madras Uganda I (Co.4 B40); Nandyal 14 (Northerns); Westerns 1; Karungani (K1); Karungani (K2); Karungani (K5).

Uses of Testing

Standard cottons, it is noteworthy, are subjected to a large number of tests in each season along with those varieties which may be evolved from time to time, the former serving as standards of reference. There are four objects in testing the standard Indian cottons. In the first place, these tests, which are conducted on the same varieties under nearly the same conditions, serve to establish a scale of reference for the entire Indian cotton crop. Thus, it would be possible to compare the results of the performance of the commercial Jarilla crop with that grown from pure seed in an experimental farm. Secondly, tests on standard cottons grown in successive seasons are helpful in studying the seasonal variations in fibre properties and spinning performance for these cottons. Thirdly, the data collected on standard cottons are very valuable in determining the connections between fibre properties and their spinning value. The importance of this relationship cannot be overemphasised, in view of the fact that the cotton cultivator has to produce a strain which can yield a lint acceptable to the spinner. Finally, these tests help place in the hands of the trade detailed information regarding the standard Indian cottons which have been evolved after considerable research work extending over a number of years and which represent improved varieties grown on a commercial scale by the cultivators.

Changes in Performance

The report under review presents the results of the tests made on standard Indian cottons belonging to the 1951-52 season together with the results of the previous seasons. The report on each cotton gives the agricultural details, the grader's valuation report and the spinning master's report and complete information regarding the treatment, waste percentage, yarn breakages and the test results carried out on fibre and yarn. Reviewing the changes in the performance of these cottons, as revealed by the tests carried out over a period of two decades ended 1950-51, Mr. Nanjundayya says:

"It was stated in former issues of this Bulletin that the standard cottons of 1930-31 gave, on the whole, much better performance than those of 1929-30, but this improvement was not maintained in the following season. The setback, however, proved temporary and the 1932-33 cottons registered, on the whole, better performance than those of 1931-32. This improvement was maintained in the following two seasons and in 1934-35, the cotton yielded, on the whole, even better results than in the previous season. Thus, in a majority of cases, these cottons registered a steady improvement from 1930-31 to 1934-35. This improvement, however, suffered a setback in the 1935-36 season, from which there was a welcome change for the better in the 1936-37 season. The 1938-39 season witnessed an improvement in a few cases, but this was offset by a falling off in the performance of a larger number of cottons, while the 1939-40 season indicated a general improvement in most cases. This improvement was not maintained in 1940-41, but the 1941-42 season had, on the whole, given better results than the previous one which has been generally maintained in the next six seasons 1942-48 but there was a setback in 1948-49 which was partially recovered in 1949-50. This recovery was maintained in the 1950-51 season as well."

The latest report refers, as already stated, to the results of the tests performed on the standard cottons of the 1951-52 season. These results show that Gadag I and Cambodia Co.2 were "definitely better" than the same cottons produced in the previous season, whereas three varieties, namely, Jayadhar, Suyog, and Gaorani 6, were "definitely poorer" than the same cottons in the previous season. The performance of the other standard cottons remained "approximately the same" as in 1950-51.

(Concluded from next column)

(In million bales)

	1938-39	1951-52	1952-53
China	3.30	3.10	3.10
U.S.S.R.	3.81	2.80	3.15
Eastern Europe ...	0.86	1.21	1.28
Total	7.97	7.11	7.53

It will be seen from the table above that the consumption of cotton in the Communist countries in the 1952-53 season would have been still lower than what it is—that is, as compared with the pre-war years—had it not been for the encouraging increase in the offtake of cotton by the East European countries. The fall in consumption as compared with the previous season is negligible and may be more than made good in the current or the next season in view of their decision to encourage production of more consumer goods.

WORLD CONSUMPTION OF COTTON IN 1952-53

SLIGHT INCREASE RECORDED

WORLD consumption of cotton in the 1952-53 season has been provisionally estimated by the International Cotton Advisory Committee at 33.33 million bales of 478 lbs. each as against 32.27 million bales in the previous season. There has been an estimated increase in consumption of 640,000 bales in the last season. It must be noted that the use of cotton in the world recedes from the impressive total of 33.07 million bales reached in 1950-51 to 32.27 million bales in 1951-52. But cotton consumption has, during the season 1952-53, not only recovered the loss sustained in 1951-52 but even exceeded the 1950-51 level. Of the total consumption of 33.33 million bales in the 1952-53 season, the Communist countries accounted for 7.52 million bales, as against 7.11 million bales in 1951-52 and 6.52 million bales in 1950-51.

The following table gives the consumption of cotton in free world in 1938-39, 1951-52 and 1952-53:

(In bales of 478 lbs. each)

	1938-39	1951-52	1952-53†
North America	7,408	9,020	10,222
of which

† Estimates.

The free world's leading consumers of cotton, as the table above shows, are (in the order of importance): U.S., India, Japan, the U.K., France and Germany. Of these, the only countries which show a slight decline in consumption are France and the U.K. Presumably, the consumption of cotton in France has been affected adversely by labour unrest, while what the Committee recently described as "price and inventory" factors, while the U.K. consumption has suffered partly by the recession in the textile export trade and partly by the shortage of labour. In all the other leading textile countries, the consumption of cotton shows an encouraging increase over the previous season's levels.

Some interesting facts about the world cotton textile industry emerge when the cotton consumption in individual countries is compared with that in the pre-war period. Between 1938-39 and 1952-53 some of the leading textile countries of the world have reduced their consumption. Thus, Japan, which consumed 2.68 million bales in 1938-39, now consumes barely 2 million bales. It has, therefore, not yet completely recovered from the effects of the damage to its textile industry suffered during the war. Nevertheless, it has made considerable headway—a factor which makes this country so much feared abroad—as is evident from the fact that consumption of cotton has improved from a mere 0.73 million bales in 1948-49 to 2.10 million bales in 1952-53. France, Germany and the U.K. among the countries which show a decline in cotton consumption, though in the case of the U.K., the decline is particularly marked. Among the countries which have recorded notable increase in cotton consumption since 1938-39, mention must be made of the U.S. and India.

The increase in the free world's cotton consumption since pre-war years has been of the order of three million bales. This increase deserves some explanation, in view of the fact that some of the leading textile producing countries have, as already mentioned, curtailed their consumption. The explanation lies in the rapid progress of the textile industry in countries which never figured prominently in the past as cotton consuming countries. Many countries have secured, in recent years, important positions in the world's textile map. To this group of countries belong Mexico, Australia, Turkey, Pakistan, Egypt and nearly all the South American countries. The quantity of cotton consumed in some of these new textile producing countries during the 1952-53 season with the 1938-39 cotton consumption figures in brackets is given (in 000 bales) below:

Mexico 330 (245); Australia 60 (30); Turkey 250 (135); Argentina 350 (150); Brazil 800 (642); Chile 75 (20); Columbia 115 (55); Ecuador 18 (10); Peru 55 (30); Uruguay 25 (1); Venezuela 20 (11); Belgian Congo 70 (7); Egypt 320 (121); South Africa 40 (1); Pakistan 275 (—).

Although the consumption of cotton in the Communist countries has increased from 7.11 million bales in 1952 to 7.5 million bales in 1952-53, it is slightly less than the total consumption in these countries in 1938-39. The following are the details of the consumption of cotton in the Communist countries in 1938-39, 1951-52 and 1952-53:

(Continued in previous column)

GIANT DAMS OF THE UNITED STATES

ACHIEVEMENTS OF BUREAU OF RECLAMATION

WHEN the first settlers entered the western part of America, they found it a vast land of rolling prairies, sage brush deserts, grassy plains, and towering rugged mountains. They also found that the region had two outstanding characteristics—continuous sunshine and dryness. In many parts of the 17 western States, lying to the west of the Mississippi River, rainfall is scant or irregular and does not provide enough water for the raising of crops. Much of the west is wasteland that cannot be profitably cultivated in its natural state. When it is irrigated, however, it becomes fertile and productive. Fed by the melting snows of the high mountains, great rivers flow to the oceans. The settlers learned that to grow crops and maintain homes in the absence of normal rainfall, water had to be diverted from the rivers and streams and applied to the soil. In order to use the available water for the greatest benefit of all the people, the U.S. Congress in 1902 created the Bureau of Reclamation. The functions of this bureau are to conserve and develop the water resources of the 17 western States and to put them to beneficial use by building and operating dams and other works for the reclamation by irrigation of arid and semi-arid lands in these States.

Since 1902 the Bureau of Reclamation has built more than 170 dams and 96 water-storage reservoirs, 20,000 miles of irrigation canals, and 200,000 irrigation structures. To-day, some 6,700,000 acres of arid and semi-arid lands are irrigated by these projects. Irrigation means homes and livelihood for 500,000 persons living on 50,000 farms. Areas that would have remained largely wasteland—some of it barren desert—are now thriving agricultural and industrial sections as a result of the water and power that have been made available. In 1951, crops worth more than $800,000,000 were harvested on farms located on irrigated land. This was the sixth consecutive year in which the products of these farms had exceeded $500,000,000 in value. More than 22,000,000 tons of food, forage crops and fibres were produced on reclamation lands in 1951, compared with 11,000,000 tons in 1945. The bureau's programmes has also stimulated manufacturing, processing and other industrial operations in the western States. Retail trade and service industries have likewise expanded.

Hoover Dam and the Colorado River

Hoover Dam, completed in 1936, was the first of the great multipurpose dams to be constructed by the Bureau of Reclamation to tame and put to work the great rivers of the American West. Towering 726 feet above the bed of the Colorado River in the narrow confines of Black Canyon, the dam is the key structure in the control and development of the lower Colorado River. The drainage basin of the river covers 224,000 square miles, one-twelfth of the land area of the United States. Before Hoover Dam was constructed, the river swelled to a torrent each spring from the rapidly melting mountain snows, sweeping over its banks and flooding the country for miles around.

Hoover Dam is the highest dam in the world and provides a reservoir which has capacity to store twice the average annual flow of the Colorado River. Thus, it protects from flooding the rich farmlands of a large area in the southwestern United States and at the same time insures a year-round supply of irrigation water in States where the annual rainfall is far below the needs of growing crops. It is estimated that nearly 2,000,000 acres of irrigable lands are located below the dam. The reservoir impounds more than five years' full irrigation supply for the farmlands below, removing the danger of drought. One of the most important developments made possible by the Hoover Dam and other smaller dams located below it on the Colorado River has been the creation of two large and extremely rich agricultural regions—the Imperial Valley and the Coachella Valley. Both of these are in southern California, a dry land of seemingly perpetual sunshine.

Two irrigation canals—the 80-mile long All-American Canal and the 124-mile long Coachella Canal—have brought Colorado River water to the two valleys. The two canals are man-made rivers that supply about 700,000 acres of land with water. The importance of this development can be realised by the fact that the two valleys' areas to-day supply a large share of the winter vegetables supplied to markets in all parts of the United States.

Harnessing the Columbia River

Grand Coulee Dam, which harnesses the Columbia River, is the key structure for the Columbia Basin project. This Bureau of Reclamation project in the State of Washington, will ultimately supply water for a total of more than 1,000,000 acres of land in the far north-western corner of the United States. The largest concrete dam in the world, four-fifths of a mile long, Grand Coulee's spillway is more than twice the height of Niagara Falls. Behind the dam is a 133-square mile reservoir, the Franklin D. Roosevelt Lake. When the entire area to be irrigated by the Grand Coulee Dam has been developed, it is estimated that homes will be provided for more than 250,000 persons on the irrigated farms and in towns and cities dependent upon them. Large-scale irrigation began in 1952 when water became available to 87,000 acres. According to present plans, an additional 70,000 acres will be irrigated each succeeding year. To help new settlers starting farms on this land, the U.S. Department of Agriculture has established four development farms, situated in different parts of the Columbia River project. On these farms many different crops are being tested under varying conditions and with varying methods of irrigation.

The Central Valley Project

The Central Valley project, in the western State of California, will be virtually completed in 1953. Its primary purpose is to provide irrigation for the rich but inadequately watered lands of California's great 500-mile long Central Valley. This valley is one of the most highly developed agricultural areas in the United States. Other benefits of the project include providing water supply for home and industrial uses, flood control and the production of electric power. The development of the Central Valley of California was made possible to a large extent by earlier irrigation works, which turned a desolation of swampland and desert into an area of rich farms and prosperous cities. To-day it has thousands of highly productive farms, orchards, vineyards, cotton fields, dairy farms and cattle ranches—as well as vast tracts of dry land that are not yet irrigated. There has been for many years the threat of water famine in the valley. The underground water levels have sunk lower each year in many areas. It has been necessary to abandon some irrigated acreage, and other areas have been threatened with a similar fate. The function of the Central Valley project is to supply the land with an ample and permanent supply of irrigation water, so that lands now in use will be saved and so that new areas can be developed. The valley's fertile land, and the water that gives it life, are to-day only about one-half developed. About 5,000,000 additional acres of irrigable land remain unirrigated.

The principal features of the project are three great dams—the Shasta, Keswick and Friant dams. The Shasta Dam, 602 feet high, spans the Sacramento River at the northern end of the Central Valley. Behind it, a reservoir stores 4,500,000 acre-feet of water, which is released through canals for irrigation purposes. Nine miles downstream is Keswick Dam, which helps to regulate the water released from the Shasta Dam. The Friant Dam is built across the San Joaquin River, which flows from north to south through the central and southern parts of the valley. This dam stores the San Joaquin flood waters and releases them for irrigation through three long canals—each equal to a new river. The system of irrigation canals connected with these and smaller dams can move water virtually the entire 500-mile length of the valley, the longest distance man has ever transported a major water-supply.

The Missouri River Basin Project

The Missouri River, 2,500 miles in length, is the longest river in the United States. The river flows through an immensely varied area. Some tributaries rush down narrow mountain gorges; others wind placidly through flat and fertile fields on the great American plains. The river's drainage area—the Missouri River Basin—is 1,300 miles long and 800 miles wide. It embraces one-sixth of the area of the United States. In this vast area, rainfall is unreliable and often insufficient. Farmers who raise wheat by dry-farming, without irrigation, can be sure of getting a good crop every other year, sometimes once in only three or five years. Drought in the Missouri River Basin reached catastrophic proportions in the 1930's. In addition, floods ravaged the lower Missouri Valley year after year. In 1944, after the Bureau of Reclamation and the Corps of Engineers of the U.S. Army had made repeated surveys of the basin, the U.S. Congress decreed that the mighty Missouri River must be brought under control and put to useful work. The Flood Control Act of 1944 launched this programme—the most comprehensive river programme ever undertaken in the United States.

Under the programme, the Bureau of Reclamation and the Corps of Engineers, working together, are to build more than 100 new dams, about 150 irrigation units which will serve some 6,000,000 acres, 30 power plants, and hundreds of miles of flood-control levees and dikes. Water-supplies are to be furnished for some 20 large cities and the river is to be deepened to provide 760 miles of safe navigation. Work was started on this vast project in 1945 and has been carried forward since then in each of the 10 States included in the Missouri River Basin. To date, about one-tenth of the entire project has been completed. Fifteen dams have been built, and irrigation canals have begun to spread out through the surrounding farmlands.

The first of the Missouri River dams, which was started prior to the beginning of the comprehensive Missouri River Basin plan and completed in 1943, was the Fort Peck Dam. Located in the State of Montana, it is the world's largest earth-fill dam, its top being nearly four miles long. Its function is to store the flood waters of the first 200 miles of the Missouri River. Below the Fort Peck Dam, a number of other large dams are in course of construction. Nearest to completion is the Fort Randall Dam, about 300 miles below the Fort Peck Dam, which should be finished in 1954. Already it has completely blocked the river and created a huge reservoir with a 1,500-mile shoreline to store water for flood-control and irrigation. Other smaller dams located at different points on the main river and its tributaries are also in operation, and irrigation canals are bringing new land under irrigation at the rate of about 60,000 acres a year.

Such projects as the control and beneficial use of the Missouri River and its many tributaries call for co-operative effort on the part of many communities and individuals. This fact was emphasised recently by President Dwight D. Eisenhower, when he said:

"The basic objective of the United States is to carry forward the tradition of conservation, improvement and wise use and development of our land and water resources initiated 50 years ago under the leadership of President Theodore Roosevelt. To do this will require the maximum co-operation among the States and local communities, farmers, business men and other private citizens, and the Federal Government. And it will require comprehensive river basin planning with the co-operation of State and local interests."

TRANS WORLD AIRLINES

The Trans World Airlines flew 29.1 per cent. more revenue passenger miles in the first nine months of 1953 than in the corresponding period last year, that is, an increase from 1,705,056,000 to 2,201,550,000 in 1953. This was the first time in the Company's history that it has flown more than two billion revenue passenger miles in a nine-month period. All other phases of TWA's operations showed substantial gains for the period over last year. Total revenue ton miles were up 26.7 per cent., mail ton miles 10.3 per cent., express ton miles 36.5 per cent., freight ton miles 20.3 per cent., and revenue plane miles 17.5 per cent. The most striking increase for the period was in the number of passengers carried via international sky tourist. The nine-month figure shows a 248 per cent. increase in this type of service to Europe and the Middle East. Domestic sky tourist passengers also showed a gain of 102.5 per cent.

BURMAH-SHELL REFINERY

The work on the 2-million-ton Burmah-Shell Refinery is proceeding apace. In order to allow construction work on the Refinery site area to proceed freely, a diversion of the three Bombay Port Trust oil-lines which at present cross the site, has been taken in hand. For this purpose, Burmah-Shell Refineries Ltd. will be laying some 27,000 feet of pipeline to replace the existing 21,000-foot odd Bombay Port Trust lines. In addition, a temporary 12-inch steel line is being built. Of this, 6,000 feet (supported on something like 1,000 pipeline supports) has already been welded in position. The foundations for three tanks needed for use in conjunction with the crude distillation unit have been completed. These three tanks will each have a capacity of 3,750,000 gallons, and will be 102 feet 6 inches in diameter and approximately 52 feet 10 inches in height. About 2,000 tons of steel, including some 300 tons of steel piping, will be needed for constructing the crude distillation unit.

TREND OF SUGAR PRODUCTION IN 1952-53 SEASON

OUTPUT LOWER, BUT RECOVERY HIGHER

THE 1952-53 sugar season has just come to an end and the 1953-54 season commences tomorrow. It will be premature to anticipate the trend of production in the new season. But the general expectation for some months past has been that production will be a little lower than in the 1952-53 season. One reason for this view is that the availability of sugarcane in the Deccan and other parts of South India will be less, because of the drought and inadequate irrigation facilities in the 1952 planting season. It was being hoped that, to some extent, this fall would be offset by better cane supplies in North India. This calculation, however, may go awry, because of the considerable damage suffered by the standing sugarcane crop in East Uttar Pradesh and Bihar owing to the floods. Nevertheless, it is possible that, in view of the increase in the minimum price for cane payable by the factories and the downward trend in the prices of *gur* in recent weeks, the factories will be able to command a good supply of cane and thereby be in a position to maintain their production. In this context, the value of a free market for sugar will prove to be a great advantage.

As far as the 1952-53 season is concerned, the performance of the sugar industry was not disappointing. It is true that production during the season did not touch the peak level established in the previous season, but it was the next highest since the pre-war period. Thus, the output during 1952-53 was 1.32 million tons, as against 1.48 million tons during the previous season; the output in the 1950-51 season was 1.10 million tons. While comparing the output in the 1952-53 season with that in the previous one, one should not forget that the output of 1.48 million tons in the 1951-52 season was achieved under abnormal circumstances. As the Director of the Indian Institute of Sugar Technologists rightly says, in the course of his customary review of the trend of production of sugar directly from cane in vacuum pan factories during the 1952-53 season, published in the latest issue of the *Indian Trade Journal*, the record output in 1951-52 was realised "at the cost of efficiency" and, therefore, "it should not be considered for comparison with any other season."

Although the price of sugarcane was reduced to Re. 1-5 per maund at gate and Re. 1-3 per maund at out-stations, as against a uniform rate of Re. 1-12 per maund in the previous two seasons, there was no dearth of cane to sugar factories in general during the season under report. The production of *gur* and *khandsari* sugar fell considerably, due to the unremunerative prices of these commodities in the beginning of the season. With the fall in production and a good offtake from a number of centres, there was, however, a sharp increase in the prices of these two commodities as the season progressed. In fact, at one time *gur* fetched in some centres as high a price as the white sugar itself.

The total number of factories in India is 157. Of these, only 134 factories worked during the season now drawing to a close, the corresponding figure for the previous season being 139. The following table gives the State-wise distribution of factories that worked, cane crushed and sugar produced during the 1952-53 and 1951-52 seasons:

States	Number of factories worked		Cane crushed (100 tons)		Sugar produced (100 tons)	
	1951-52	1952-53	1951-52	1952-53	1951-52	1952-53
Punjab	1	1	2,134	1,590	201	161
Uttar Pradesh	66	66	89,992	71,741	9,340	6,993
Bihar	27	27	21,696	27,205	2,240	2,723
Madras	12	13	11,470	8,596	939	806
Bombay	15	14	14,250	12,064	1,374	1,339
West Bengal and Assam	1	1	659	772	72	80
Orissa	1	1	288	293	26	24
Madhya Bharat	5	3	1,945	797	181	75
P.E.P.S.U.	2	2	3,219	1,828	279	150
Rajasthan	2	1	876	59	75	6
Mysore	1	1	3,190	2,455	371	279
Hyderabad	3	3	4,026	4,046	390	422
Travancore-Cochin	1	1	675	531	44	39
Bhopal	1	—	405	—	37	—
Ajmer	1	—	127	—	8	—
Total	139	134	154,982	131,971	14,831	13,103

The crushing in the factories in U.P. started much later than in the previous season, while in Bihar the reverse was the case. By 28th November, 1952, only 10 factories in U.P. had started crushing, as against 47 in the previous season. Almost all the working factories in U.P. were running their season by 12th December in the 1951-52 season, as compared with only 42 factories during 1952-53. In Bihar, on the other hand, 19 factories were working by 5th December, as compared with only 10 at the same time in 1951-52. In Madras also, the crushing season commenced later than in the previous season. Except in Bihar and Eastern U.P., the factories closed their crushing season earlier than in the season 1951-52. The actual duration of the season in the U.P. was 118 days, as against 148 days in the preceding season. It may be noted that the factories in Western U.P. had to close down earlier due to shortage of cane. In Bihar, however, there was a prolonged season and the actual number of working days was higher at 118, as compared with 99 days during 1951-52. The all-India duration was, however, lower at 113 days, as against 133 days. The average number of days worked in the U.P. was 118 as against 148, Bihar 118 as against 99, Madras 89 as against 151, Bombay 118 as against 148 and the rest of India 97 as against 108.

The total quantity of cane crushed by all the mills in India amounted to 13.19 million tons, in 1952-53, as against 15.49 million tons in 1951-52. The maximum quantity of sugarcane crushed by a factory in India was 339,800 tons during the season 1952-53, as compared with 365,500 tons in the previous season. The average of cane crushed by a factory during the 1952-53 season was: U.P. 108,700 tons, as against 136,400 tons; Bihar 100,800 tons, as against 80,400 tons; Madras 66,100 tons, as against 95,600 tons; and Bombay 86,200 tons, as against 95,000 tons. The average rate for the rest of India was 88,300 tons, as against 92,400 tons. The average for all-India was 98,500 tons, as against 111,500 tons. The all-India average rate of crushing of cane was 870 tons per day, an increase of 34 tons as compared with that in the 1951-52 season. The average rate of crushing per day remained the same in U.P., but in all other major States it increased.

It will be seen from the table above that, except Bihar, West Bengal and Hyderabad, all the other States recorded a fall in the production of sugar in the 1952-53 season. The percentage of share of U.P. to the total production in India works out to 53.16, that of Bihar 20.72, Madras 6.12, Bombay 10.54, Hyderabad 3.26, and Mysore 2.12.

Improvement in Sugar Recovery

The season under review, however, witnessed a welcome improvement in the recovery percentage of sugar. The maximum recovery for any factory in India was 12.79 during 1952-53, as against 12.45 in the preceding season. The average recovery of "sugar per cent. cane" increased in all the major States, except Bihar, P.E.P.S.U. and Mysore. The all-India recovery percentage of sugar was 9.97, as against 9.57. The average recovery in U.P. and Bihar was 9.75 and 10.03, as compared with 9.27 and 10.32 respectively. The following table gives the State-wise recovery of sugar per cent. cane:

Recovery of Sugar per cent. Cane
(Actual)

States	1951-52	1952-53
Punjab	9.41	10.21
Uttar Pradesh	9.27	9.75
Bihar	10.32	10.03
Madras	8.62	9.38
Bombay	11.08	11.51
West Bengal and Assam	10.87	10.33
Orissa	9.02	8.14
Madhya Bharat	9.31	9.39
P.E.P.S.U.	8.68	8.22
Rajasthan	8.50	9.73
Mysore	11.61	11.37
Hyderabad	9.68	10.60
Travancore-Cochin	6.58	7.32
Bhopal	9.04	—
Ajmer	6.25	—
Total	9.67	9.97

The quantity of sugar in stock with the factories only on 1st November, 1952, was 503,000 tons, as against 170,000 tons in the preceding season on the same date. Owing to the increase in the consumption of crystal sugar caused largely by the rise in prices of *gur* and *khandsari* sugar, the stocks of white sugar with factories on 31st July, 1953, were much lower, that is, at about 530,000 tons, as against 710,000 tons at the same time last year. It is, however, expected that the production of sugar in 1953-54, coupled with a carry-over of about 200,000 tons to 250,000 tons at the end of the 1952-53 season and imports of about 200,000 tons, will meet the requirements of the country in the current season.

SUGARCANE FARMING IN INDIA

VAST SCOPE FOR RAISING YIELD PER ACRE

THE result of prize-plot competitions conducted in some parts of the Deccan and South India disclose immense possibilities of increasing the yield per acre of sugarcane. Thus, the winner of the first prize, Mr. K. J. Deshpande, in the latest competition, held under the auspices of the Deccan Sugar Technologists' Association, secured from a ten-acre plot, as much as 106.40 tons of cane per acre, which yielded 13.2 tons of sugar. Mr. R. G. Koppar, of the Phalton Sugar Works Ltd., who secured the second prize, was not far behind the first, inasmuch as he succeeded in getting 105.30 tons of cane per acre, yielding 13.02 tons of sugar. Another competitor, Mr. Godbole, belonging to Walchandnagar Industries, produced even more remarkable results. He secured a slightly smaller quantity, namely, 102.01 tons of sugarcane per acre, but the sucrose content of that cane was higher than that of the other two competitors. Thus, the sugar produced from this cane was as high as 13.61 tons per acre. This gentleman, however, missed the first prize on some technical grounds.

In East Godavari (Andhra), Mr. Bolla Paparao, the recipient of the first prize in the sugarcane crop yield competition in the 1952-53 season, secured as high as 107 tons of sugarcane per acre. Reports from East Godavari disclose that the crop, which brought him the first prize, was first planted early in February, 1952. It was fourteen months on the ground and was harvested in the first week of April this year. The per acre yield obtained by him was 107 tons and 270 lbs. No indication of the recovery percentage of this cane is, however, available. The average length of millable cane was 18 to 19 feet and it was kept erect by heavy propping up with bamboos. He had used 20,000 three-budded sets three links (nine inches each) apart per acre. He had applied large quantities of bulk organic manures, 25 cart-loads of farm yard manures and 25 cart-loads of press mud, before planting, and had applied 230 pounds of nitrogenous manure in three doses.

The yield of cane per acre, as above, is in refreshing contrast to the average yield in the various States. In Bombay, for instance, according to targets achieved in 1951-52 season, the yield of sugarcane per acre in the Deccan canal area was 40.5 tons and in Karnatak tract 23.8 tons. In Madras, it was 33.5 tons, Uttar Pradesh 18.4 tons, the Punjab (I) 17.8 tons, West Bengal 16.8 tons, and Bihar 16.1 tons. It is clear that these fall far short of those achieved on the prize plots. The results of competition held on fairly big plots show that these yields can be raised very substantially, if scientific methods of cultivation are followed.

The present poor yield per acre, as indicated above, is due to ignorance and lack of enthusiasm on the part of the grower. It is also due to absence of sufficient encouragement by the Government by way of provision of adequate manures, irrigation facilities and the like. Certainly, if the practice adopted by the successful competitors were to be popularised, the main problem facing the Indian sugarcane industry since its inception, namely, of securing a larger yield of sugarcane of high sucrose content on a lower acreage will shortly be a thing of the past. By resorting to intensive and scientific cultivation, the output of sugar can be increased without bringing additional acreage under cultivation. In fact, it will be possible even to divert a part of the acreage now under sugarcane to other commercial or food crops.

SUGAR PRODUCTION AND STOCKS

The opening stocks, production, despatches and closing stock of sugar in respect of Central sugar factories in India, during the fortnight ended 30th September, 1953, were 329,306 tons, 133 tons, 52,024 tons, and 277,415 tons, respectively, on the basis of returns received under the Sugar Production Rules, 1935. The figures for the corresponding fortnight of the previous season were 604,076 tons, 3,232 tons, 42,634 tons, 564,674 tons, respectively. Figures for the current fortnight relate to 126 factories representing 91.65 per cent. of the total cane-crushing capacity, while the figures of the previous year relate to 131 factories representing 96.00 per cent. of the total cane-crushing capacity.

The total figures for the production and despatches of sugar for the season 1952-53 are reported to be 13,17,650 and 14,81,866 tons, respectively, as against the corresponding figures of 14,89,631 and 10,77,664 tons during the previous season. Production during the fortnight being 133 tons of sugar pertaining to season 1953-54 has been excluded from the to-date production of 1952-53.

NEW PUBLICATIONS

India's Food Problem. By P. A. Gopalakrishnan. "Eastern Economist" Pamphlets. Manager, The Eastern Economist Ltd., 52 Queensway, New Delhi. Price: Re. 1-4

ALTHOUGH the food position in India has undergone a remarkable change for the better, the country is not yet completely out of the wood. During the past 12 years, it passed through a very critical period and had to struggle hard to feed the ever-growing population of the country. The country's experiments in measures for tackling the chronic food shortage by means of control over prices, procurement, movement and distribution of foodgrains, its struggles against rising prices, blackmarketing, and transport bottlenecks, and its schemes for raising output under an integrated scheme of agricultural production, all constitute a rich experience which should stand the country in good stead, if a similar crisis overtakes it. All this experience has been ably assessed by Mr. P. K. Gopalakrishnan in his pamphlet on *India's Food Problem* published by our Delhi contemporary.

In the course of eight little chapters the author, a distinguished member of the Indian Civil Service, examines the various aspects of the food policy of the Government of India in the most objective way. Although the author himself was associated with the formulation of the policy, the detached manner in which he assesses it makes the study a scientific one.

A special feature of the pamphlet is the care taken by the author to remove certain common fallacies and misleading notions regarding the food policy. It is generally believed, for instance, that the population of this country continues to multiply without any regard for the availability of food supplies. Characterising this statement as fallacious, he points out that population has not grown faster than in many other countries of the world and that with it also has increased the national output correspondingly. Another instance is seen in his attempt at disproving the belief that overall food shortage or surpluses in the country has something to do with calamities such as starvation deaths, etc. He says that there were 31 famines in India in the nineteenth century when to all accounts India had a large surplus of foodgrains, and adds that mere increase in the food production in the country cannot solve the problem of famines. The pamphlet is replete with instances such as these seeking to clarify common fallacies. A study of this pamphlet will certainly add something valuable to one's knowledge of India's food economy. Our parliamentarians, in particular, should not miss reading this publication.

Important Company Data, Compiled by Mr. N. K. Lavingia, B.Com., 76 Stock Exchange New Building, Apollo Street, Bombay 1. Published by the New Book Company, Kitab Mahal, Hornby Road, Bombay 1. Price: Rs. 6-8

The movement of prices of equities on the Stock Exchange is generally influenced by the behaviour of the shares of certain leading companies. The pattern of movement of these shares reflects largely the economic condition in the country. The comparative analysis of the financial positions of these companies, therefore, makes an interesting study to both the investors and others. The presentation of this analysis in a tabular form supplemented by other relevant data relating to the companies provides an easy and interesting study.

In the publication under review, the author, who has for long specialised in the statistical study of the various companies, presents a detailed analysis of balance-sheets, profit and loss account with information relating to various items of assets and liabilities, revenues and expenditure and appropriation of profits, as also dividend record of eleven companies, in neat and compact tables. The companies chosen for such an analytical study are: (1) Associated Cement Companies Ltd., (2) Bombay Burmah Trading Corporation Ltd., (3) Bombay Dyeing and Manufacturing Co., Ltd., (4) British India Corporation Ltd., (5) Central Bank of India Ltd., (6) Century Spinning and Manufacturing Co., Ltd., (7) Indian Iron and Steel Co., Ltd., (8) Kohinoor Mills Co., Ltd., (9) New India Assurance Co., Ltd., (10) Scindia Steam Navigation Co., Ltd., and (11) Tata Iron and Steel Co., Ltd. Originally the data relating to these companies were published in loose cards and contained a record for eleven years from 1940 to 1950. But these have been brought up-to-date in the form of a supplement and the whole record published in the form of a file. The publication is in a handy form which facilitates reference to the figures.

Indian Banking Analysed (Directory of Banking in India, Pakistan, Burma and Ceylon). Published by the Banking Experts, Post Bag 1001, T. Nagar, Madras 17. Price: Rs. 15

The above book was first published in 1946, when it confined itself only to banking and banking offices in India, including the area that now constitutes Pakistan. The second edition, published in 1949, was not only an enlarged and exhaustive one but also included the effects of Partition of India, a discussion of the prospects of banking in the newly created dominion of Pakistan, and a critical exposition of the Banking Companies Act, 1949. The many changes that have taken place recently in the economic structure of India, Pakistan, Ceylon and Burma, have necessitated a further revision of the book. The author has taken this opportunity to include an account of banking and statistics relating to banks in Ceylon and Burma in the latest (third) edition under review. This has not only made the volume more comprehensive but provides a picture of banking in these four South-East Asian countries.

In the theoretical portion of the book, the author has embodied an analysis of (1) the nature and functions of a bank, (2) growth of Indian banking and its present position and, (3) banking in Pakistan, Burma and Ceylon. A chapter on the working of banks abroad, one on safety tips to bankers and another on definition of banking terms, are the other features of Part I of the book. The value of the book suffers from errors in printing. Besides, some of the definitions given are not precise.

Part II of the volume consists of banking statistics, in which the author has provided a comparative analysis of the financial position of banks in India, Pakistan, Burma and Ceylon. The addresses of banks, arranged city-wise, will be found useful to business men. Besides, there are chapters on clearing houses, bankers' who's who and miscellaneous matters relating to banks.

Gold and Silver Thread Industry in Surat. By Prof. D. R. Gadgil and Prof. R. K. Patil. Publishers: Shri Chunilal Gandhi Vidyabhavan, Institute of Learning and Research, Sarvajanik Education Society, Surat. Price: Re. 1-8.

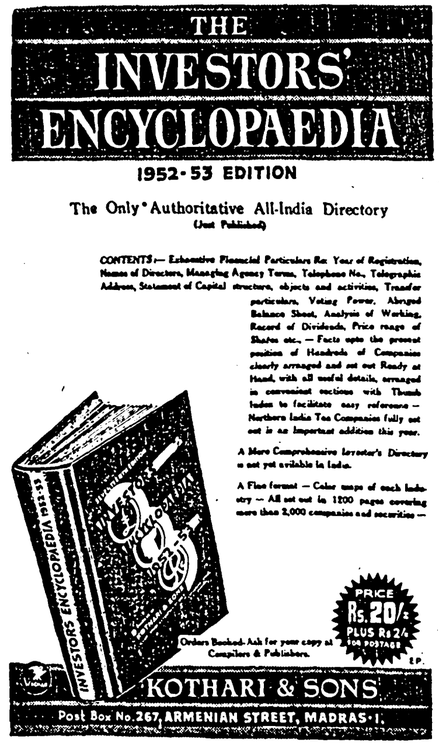
The book contains two surveys conducted severally by Prof. D. R. Gadgil and Prof. R. K. Patil at different periods, which coincidentally happen to be identical, so far as the fortunes of the gold and silver thread industry are concerned. Prof. Gadgil had conducted his survey in 1930 before the tottering demand for the commodity received a fillip by way of protection since 1930. The industry is again suffering from a similar lack of demand since the last two years. The problems of the industry have remained the same to-day since Prof. Gadgil surveyed the industry in 1930. It is one of organising the market for the industry, domestically as well as in foreign countries.

The *jari* industry is an ancient industry in India. Notwithstanding the competition of the cheap products from Lyons (France) and Italian factories, it is noteworthy that the industry still survives in two centres in India, Surat and Banaras. The industry gives employment to quite a large number of persons and deserves the attention of the Government which is trying to enlarge the scope of employment in the country.

Both surveys are of a preliminary nature and Prof. Patil proposes to undertake a more detailed survey. It is gratifying to note that such institutions as the newly founded Shri Chunilal Gandhi Vidaybhavan of the *Sarvajanik* Education Society of Surat are taking keen interest in economic research.

Bankers Annual Number, 1953. Edited by S. V. Kale. Published by the Honorary Secretary, the Poona Banking Association, 261, Budhwar Peth, Poona. Price: Rs. 2-8.

Bankers, too, like business men in other sectors, have their own problems. Changes since independence have so altered the political, social and economic conditions in the country that bankers have been called upon to handle new situations, and to deal with new problems. Thus, slow capital formation, inflation, unemployment, banking legislation, financing of industry, implementation of the Five-year Plan and a host of other problems have been continuously taxing the minds of bankers. An idea as to how they are grappling with these problems may be had from *The Bankers Annual Number*, 1953 published from Poona. The number contains a few articles contributed by some of the reputed practical bankers. Notable among these is one on "Bank Managers and Unemployment" from the pen of Mr. B. T. Thakur, General Manager, the United Commercial Bank Ltd., Calcutta. Equally enlightening is the contribution by Mr. Pranlal Devkaran Nanjee, who, in his article on "Banking and Industries in India," emphasises the need for constructive and practical endeavours for creating wealth in the country. Among the other articles, mention may be made of an interesting discourse on "Practical Training Scheme for Bank Employees" by Dr. S. G. Panandikar.



CALCUTTA TEA SALES IN SEPTEMBER

PRICES FIRM, EXPORTS ENCOURAGING

THE tea sales held in Calcutta during the month of September, both for export and for internal consumption, were notable for two features. While there was a further sharp rise in prices, particularly for all commons and low mediums, the quality of the offerings showed a steady decline. The latter aspect was more in evidence in teas from Assam gardens. Although it is encouraging to note that the trend of prices realised shows that the industry is going ahead on the road to recovery, the decline in quality is an unhealthy development. The industry would be well advised to take particular care of the quality of its product, if this welcome recovery were to be sustained, as it should be for not just one season but for many seasons, so that the financial loss suffered by it in 1952 may be recouped in full.

The sharp rise in prices was more in evidence after the release of the figures of the North Indian crop for the month of August. These revealed a sizable decline of 32 million lbs., as compared with those for the previous year, and of over 10 million lbs. from the average for the last three years. The decline in crop was much greater than generally anticipated and there was, therefore, a rush for all "teas for price." As the season was half-way through, buyers seemed to realise that there was every likelihood of a short-fall in crop by the end of 1953. Commenting on this, Messrs. J. Thomas & Co., Ltd., Calcutta, in their monthly report for September, observe: "It is easy, however, to be disillusioned at this stage of the season into thinking that there is not yet time for the crop deficiency to be largely made up. Last year, saw an exceptionally early close and with the present high prices, a similarly early close to the season is not expected." The relaxation of restriction on crop production from 87½ per cent. of the best crop in the years 1947-52 to 88½ per cent., decided upon by the North Indian tea producers recently, serves to support this view.

The following table provides an idea of the variations in prices of the several varieties during the month, against the background of those a year ago:

	1953		1952	
	September	August	September	August
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
Clean B.P.	1 13 6	1 13 0	1 7 0 to 1 7 0	1 8 0
Clean common B.P. .. to	1 12 0 1 12 6	1 10 8	0 12 0	0 0 14 0
Medium Assam B.P. ..	1 13 6	1 11 6	1 1 6	1 5 0
Good Assam B.P. .. to	2 2 0 2 3 0	2 6 0 to 2 8 0	2 1 0 to 2 3 0	2 8 0 to 2 10 0
Medium Dooars dust ..	1 10 0	1 8 6 to 1 9 0	0 15 0 to 0 15 6	1 4 0
Medium Assam grainy dust	1 10 6	1 9 6	—	—
Best Assam C.T.C. dust .. to	1 14 6 1 15 0	2 0 0 to 2 1 0	2 0 0 to 2 1 0	2 5 0 to 2 6 0

It will be observed that the increase in prices, as compared with those a year ago, was more notable in the case of common and medium varieties, than in others. Another interesting feature disclosed by the above table is that commons fetched nearly the same prices as mediums. Commons were quoted only one anna less than mediums, as against As. 5-6 lower a year before. Drawing pointed attention to this, Messrs. Thomas & Co. say: "This is regarded by many as an exaggerated and unhealthy sign, but the fact remains that many gardens in Cachar, where the biggest losses of last year were felt, are making a cleaner and sweeter tea than some of the gardens in Assam where the medium category teas are normally grown."

The decline in price of good Assam B.P. and best Assam C.T.C. dust is due partly to the preference for cheap tea and partly to steady decline in their quality. Many gardens in Assam are stated to be using C.T.C. machines in order to obtain more colour and strength in cup. Unfortunately, much of the tea thus manufactured during the rains and offered on this market, according to Messrs. Thomas & Co., has sharply fallen away both in appearance, which has become rough and stalky, and in cup quality, which has sometimes become soft and dull, resulting in a correspondingly sharp decline in prices for these kinds. Those gardens, however, which have maintained a good standard of C.T.C. manufacture are still realising prices for brokens and fannings grades several annas above the rates paid for the teas of ordinary manufacture.

For some months past, Eire has been purchasing its requirements of tea direct from the country of origin. It is stated that it is finding great difficulty in securing its needs from the Calcutta market. During the month under review, there was keen and sustained buying in teas suitable for Eire. Consequently, there was a steady rise in prices throughout the month in these teas, which include low to good medium broken orange pekoes and orange fannings. The prices realised by these varieties in Calcutta now are stated to be more favourable than those being paid in the London auctions, in spite of the fact that best second flush quality is being sold in London, while in Calcutta the quality now being offered is of ordinary rains standard.

It will also be noted from the table above that dusts also shared in the rise in prices, but to a lesser extent than in others. Red Assams were an exception, with a decline in prices, which is accounted for partly by the increased quantity now manufactured and partly by the fact that many of these red dusts have become mixed and fibrous.

The trend of exports of North Indian tea during the current season so far is, on the whole, very encouraging, *vis-a-vis* the fall in output, as will be evident from the following table:

North Indian Tea

(In thousand lbs.)

	1st April to 3rd October		
	1953-54	1952-53	1951-52
Britain	115,109	96,037	83,356
Australia	634	3,760	1,833
New Zealand	537	268	109
Canada	7,104	7,214	5,881
U.S.	6,165	8,593	5,544
S. America, Central America and West Indies ..	1,194	3,276	1,200
Eire	4,256	4,418	12,381
Amsterdam and Rotterdam.	1,518	3,374	1,444
Hamburg and Bremen ..	1,824	1,018	579
Istanbul	1,544	2,508	2,827
Iran	134	168	4,846
Persian Gulf	3,133	5,270	5,093
Egypt	5,782	1,606	744
Red Sea Ports	3,123	4,451	918
Burma	441	467	387
Pakistan	22	146	183
Other places	1,812	2,147	1,700
Total ..	154,332	144,721	129,025

It will be noted that there has been a drastic decline in exports to Australia, American countries, Amsterdam and Rotterdam, Turkey, Persian Gulf and Red Sea Ports. But this has been more than offset by the increase in the exports to Britain, Egypt, New Zealand and Hamburg and Bremen.

The favourable exports and the recovery in prices have placed the industry in a more favourable position than a year ago, as the prices allow a reasonable margin of profit. It will, however, be wrong to draw too rosy a picture of the industry's future. In this connection, the observations of Sir Percival Griffiths, on the future of Indian tea, made in the course of an article contributed to the *Financial Times*, London, recently, are pertinent and must be carefully considered by all those who may be contemplating to make a demand on the fortunes of the tea industry. He says:

"Tea companies to-day may be making satisfactory profits, but many of them last year suffered heavy losses and came to the very limit of their borrowing capacity. Nothing less than two or three good years can restore them to a healthy financial condition, or put them in a position where they could again meet adversity. If important sections of the industry are to survive, two or three good years are essential, and it is important that during the period of recovery extravagant labour claims should be rejected by the Governments whose own financial stability is so closely linked with the prosperity of the industry."

BAG SELF-SUFFICIENCY DRIVE IN PHILIPPINES

The Philippines seek ultimately to eliminate their dependence on Indian supplies of jute manufactures essential for sacking the country's cereal and commercial crops, according to the Indian Central Jute Committee.

With that end in view, as also to utilise the optimum production capacity of the local sacking plants, the Philippines imported more raw jute and other fibres, during 1952, than in any previous year in the recent past to supplement supplies of indigenous grown fibres, the production of which is also being stepped up. The full effect of their increased output on imports of jute cloth and bags is shown by their drop in value during 1952 by over 6,000,000 pesos, as compared with 1951.

RAW JUTE IN PAKISTAN

PRICES HARDEN IN INDIA

THE crisis which seemed to threaten the raw jute market early this month appears to have gradually receded to the background since. Early this month Assam jute, for instance, was quoted at as low as Rs. 20-8 per maund, as compared with Rs. 27 per maund early in September. Since then, there has been a gradual improvement in the quotation and at present Assam bottoms are ruling at Rs. 25 per maund. This improvement is attributed not only to the prospect of a comparatively lower crop but also to expectations of better offtake of raw jute by mills this season.

The better sentiment in the raw jute market is also in consonance with the trend of the market in Pakistan. The Pakistan markets have been steady ever since the first week of this month following the assurances given in Parliament by the Pakistani Prime Minister, Mr. Mohammed Ali, regarding the accuracy of statistics relating to the final raw jute forecast. In reply to the debate on jute policy in the House he said: "There are more than 4,000 field workers in East Pakistan who visit from plot to plot and take an actual survey of jute under cultivation. There is, therefore, no reason to suppose that our statistics are wrong. Apart from that, there are agencies of large trading interests of importing firms who take their independent survey, because they want to be sure of the production of jute and, therefore, these reports are published in various jute papers and journals in Calcutta, in Dundee, in Karachi and in Dacca and there is always the possibility of a check and a double check and, therefore, there is no ground to suppose that there is any inaccuracy in the figures which I supplied to the House, the other day."

Commenting on the allegation that jute was being grown in unlicensed areas, the Minister said: "It is of the utmost importance that jute cultivation should be restricted. With that object in view, the Central Government did restrict cultivation of jute. They went to such an extent that, wherever jute was grown in unlicensed areas, drastic steps were taken, including destruction of the standing crop. We did not want to take any risks which would have endangered the very economy of the country."

Speaking of self-sufficiency in raw jute aimed at by India, the Minister stated that he did not agree with the view that Pakistan was driving India to work for self-sufficiency. He admitted that, owing to the boom in the demand for stock-piling of jute, large areas of land, not used for jute, had come under the crop and some increased production did take place. But he reminded the House of India's commitments to buy 18 to 25 lakh bales of jute from Pakistan under the Indo-Pakistan trade agreement, and said that this pricked the bubble of India's claim regarding self-sufficiency. Proceeding further, he pointed out that the output dropped by 50 per cent. this year and, therefore, India would continue to be dependent on Pakistan.

The Pakistan Prime Minister's review of the position of raw jute, as noted above, strengthened the tone of the raw jute market there and helped prices improve. Thus, Mill firsts, which stood at Rs. 140 per bale towards the close of September last have since then improved to Rs. 165 per bale. Similarly, Dundee Daisee has risen from Rs. 125 to Rs. 145 per bale.

Apart from moving upward in sympathy with the Pakistan market, Indian jute has put on a steady note in anticipation of good demand by Indian mills. The market expects that, sooner or later, the mills will have to increase their output of jute goods in order to replenish the stocks which are now being gradually depleted on account of increased despatches. The recent enlarged offtake by the U.K., the U.S., the expectations that Australia, New Zealand and Burma will be placing large orders for sackings and the fall in production in October are taken as an indication that in the coming months, production will be stepped up by jute mills. Consequently, it is felt that many mills, which were not in a position to buy and hold adequate stocks of raw jute formerly, will appear in the market again. There seems, therefore, no inclination on the part of sellers to cut prices and dispose of their holdings. Mills, however, appear to be cautious and are still buying on a hand-to-mouth basis.

WORLD AUTOMOBILE INDUSTRY

PRESENT POSITION AND PROSPECTS

THE thirty-eighth International Motor Exhibition, which concluded its ten-day session at Earl's Court (London) to-day, had greater appeal than any during the several years past. Almost every leading manufacturer of automobiles exhibited his latest models of cars, motor boats, marine engines, caravans and light trailers, accessories and components, transport-service equipment and tyres. It was significant that each manufacturer had done his best to display the competitive potential of his makes over those of his confreres.

The importance of this Exhibition, especially in view of the changed conditions in world markets for motors, needs no emphasis. With the inflationary conditions under check in most of the countries and with taxation, especially on motor and motor traffic, remaining at high levels in those countries, there is not so much purchasing power with the people as to provide a market for any make. It is now common knowledge that only that manufacturer whose model is not only competitively cheap with those of others but also has the greatest public appeal, can hope to stay in the industry. This demands not only a constant reduction of the prices of cars and other automobiles so as to be within the purchasing power of the persons concerned, but also a continuous and sustained change in the makes so as to suit their changing tastes.

A glance at the distribution of motor vehicles in terms of population figures of the world discloses that there is one vehicle for every 78 people in South America and one for over 1,000 in Asia, excluding the U.S.S.R. These are in significant contrast with one vehicle for three persons in the U.S. Nearly 70 per cent. of the world population in the underdeveloped countries have less than 6 per cent. of total vehicles, while the U.S., with 7 per cent. of the population of the world, has 70 per cent. of the vehicles.

Insufficient Purchasing Power

The general cause for the lack of increasing offtake of cars, especially in the underdeveloped countries of Asia and the Far East, is the chronically insufficient purchasing power. The restrictions on imports of vehicles with a view to conserving foreign exchange needed for importing capital equipment and other essential requirements constitute another reason for the poor supply of vehicles in these areas. Besides, there are a few countries such as India, which are regulating imports of automobiles in order to give protection to their nascent automobile industry.

The U.S. is the most important country, outside the Soviet orbit, manufacturing cars in the world. It produces some 70 per cent. of the world's output of cars. During the first six months of the current year, it produced 3,239,569 cars and 638,300 commercial vehicles, a total of 3,877,869 units. The output during the corresponding period last year was 2,845,811 units. It is estimated that, by the end of this year, production will touch a peak of about 8 million units, as compared with 5,538,958 in 1952 and 6,765,263 in 1951. Next in order comes the U.K. The other important countries manufacturing cars are Germany, France, Italy and Canada. Apart from these, a number of other countries in the world are chiefly confining themselves to assembling of British and American vehicles.

The following table shows at a glance the production of automobiles by some of the important countries in West Europe:

(In thousands)

* October 1937–September 1938 † 1936.

Of the total production, only about 10 to 11 per cent. of the motor vehicles produced outside the Soviet Union (including chassis as well as completed vehicles) are exported. It will thus be noted that the major portion of the cars produced are consumed by the domestic markets. The European and American car makers are making strenuous efforts to keep ahead of the newcomers in the improvement of existing designs and the adoption of new techniques. Experiments are being conducted with diesel and gas-turbine engines in passenger cars in an attempt to gain greater mechanical efficiency and lower fuel costs. On account of the heavy weight of these engines, research into these new types of propulsion has necessarily been associated with the manufacture of new powerful models. There have also been innovations in the realm of the very small car. The object of these innovations is to produce a car at a price which will suit the pockets of those belonging to the lower income bracket who have hitherto been largely excluded from the ranks of automobile owners. The small cars may not be suited to a country of long distances served by *kutcha* roads. But, because of their low running expenses, they are eminently suited to the needs of city dwellers and of the inhabitants of countries where motoring is subjected to heavy taxation. Although Britain has the lead in the export trade in these small cars, keen competition in the near future seems to be in store, because the Continental makers, especially France and Germany, are emerging as successful producers of powerful models at low prices.

The fact that motor vehicles can be conveniently used only in areas where serving facilities are available and spare parts can be quickly obtained gives an advantage for established suppliers (usually domestic manufacturers in producing countries) over new competitors and for large operators over the small. In no industry have the advantages of mass production been so fully demonstrated as in the automobile. It is clear that the larger the sales, the more efficient the production can be, thereby leading to lower costs of production.

Cost of Automobiles

Everyone connected with the motor industry is in general agreement that the cost of the automobile must be brought down. In approaching this problem, both the factory and commercial costs should be borne in mind. The former comprises all factors contributing to the saleable product, while the latter includes all factors which help in getting the vehicles from the factory to the consumer and then keeping him satisfied. Although all manufacturers will not necessarily agree, item for item, in allocating the expenditures under these heads, a broad division of this kind is generally used.

So far as the cost of the motor vehicle to the consumer is concerned, nearly 70 per cent. of the home market list price comes under factory costs. But a large part of the factory cost is beyond the motor manufacturer's direct control, as the motor industry depends on independent machine-tool makers and others for a large portion of the parts and components of the automobile. It is estimated that, in some cases, the parts and components that the manufacturer buys in finished condition ready for assembly into a vehicle accounts for about 40 per cent. of the aggregate factory cost of the vehicle. Of the remainder, a very large part is accounted for by labour.

Commenting on the trend of costs, Mr. S. C. Butler, Assistant to the Managing Director, Vauxhall Motors Ltd., in the Motor Industry Supplement of the *Financial Times*, London, observes as follows:

"Given the conviction that factory costs must come down, some of the methods available for the motor manufacturers may be mentioned briefly. Product policy is governed by more factors than cost, but nevertheless there is a continuous searching for opportunities under this heading. Proposed new features are vigorously examined and compared from the standpoint of comparative costs: 'commonisation' of parts among the range of vehicles being, or about to be, made still allows some scope for cost saving; and the old question—whether to buy or make?—although seldom answered solely on cost grounds, must be influenced by them.

"This leads to the general subject of manufacturing methods. When choice is possible, the method adopted for making a part or assembly will depend very largely on the proposed daily or other rate of output, and with some qualifications it may be said that higher daily rate and lower unit cost go together.

"Manufacturers know that every hindrance to increased daily output is a hindrance to cost cuts, and in particular they believe purchase tax to be 'penny wise pound foolish.' It has been continued too long, and it is wrong now to expect British manufacturers to hold their place in highly competitive low-profit export markets without a reasonable domestic volume.

"In regard to vehicle costs, other than commercial, and their trend in export markets, it has long been evident that local manufacture of parts and components is a factor of increasing importance. British manufacturers (and their competitors) have to make the best of circumstances as they are, and as they may become, and although, at times, this factor has an unfavourable influence on costs, it is also the case that economies are being obtained in some places abroad by sending out their fixtures and other equipment to facilitate local assembly."

Commercial Costs

The importance of commercial costs lies mostly in times of transition from a sellers' to a buyers' market. For it is then that advertising and sales promotion efforts require reinvigoration. It seems inevitable that this trend must continue upward for some time to come. Referring to this issue, Mr. Butler makes the following interesting observations:

"A more controversial aspect of commercial costs in the home market is given by the discount and rebate system. In the 'thirties, there were sharp differences of opinion among competing manufacturers, and also among dealers, about the appropriate scale of basic discounts, and about the desirability of deferred rebates, the rates of which for any dealer varied with his total sales during the operating year. Some return of these arguments is already evident. Manufacturers, who favoured quantity rebates, used to support a simple theory of payment by results with reference to profits accruing after their 'break even' points had been reached, and since, on these grounds (here rather over-simplified) an apparent increase in cost might prove with luck to be a cost-saver, the current renewal of interest is not surprising.

"Another side of commercial costs in the home market has not been of importance lately, but may soon become so. A healthy market for new vehicles, and especially for new cars, requires a healthy used-vehicle market, and it may be that manufacturers will take an active interest in the promotion of used-vehicle reconditioning, more attractive display, and in used-car and truck marketing generally. Expenditure for promotional work of such kind might start as an addition to commercial costs, but, by contributing to dealer stability and growth, turn out to be money well spent.

"In export markets the principal competitors have a variety of changing conditions to meet, and are making commercial outlays which, while adding to current costs, are calculated to reduce overall costs in the not-very long run. The importance of parts availability is well understood, and 'service' generally is being provided far and wide in anticipation of, and indeed, as a necessary foundation for, growing markets.

"The pursuit of economy in shipping and other overseas transport continues vigorously, and much ingenuity is being shown by 'boxing engineers' in their attempts to reduce packing space needed for vehicles and parts, and also to obtain protection from climatic and other expensive hazards."

The future of the automobile industry is a foregone conclusion.

Although there might be a temporary setback, owing to causes beyond control such as political uncertainties, low standard of living and the like, it has bright prospects in the long run. As the development of underdeveloped countries progresses, the demand for transport vehicles, especially trucks, will increase. By reducing the dependence on rail and water, the availability of motor vehicles provides, as it has provided elsewhere, for the industries to grow up in areas which would not have been thought of in the nineteenth century. It may be noted here that the development of motor engineering helped the U.K. to compensate for the cessation of the great expansion period in railway engineering and the growth of foreign competition in other industries on which its prosperity had previously been based. Apart from the cost aspect, the demand for small cars and sports cars is dependent chiefly on the rate of increase in the standard of living, particularly of the vast masses of the underdeveloped and undeveloped countries. There is good demand for sports cars of the U.K. in the U.S. The U.S. manufacturers, who, at one time thought that demand will be a passing craze, are watching the trend, as the demand has persisted. Of late, some of them have been entering this field also.

MINING ROYALTIES

The Royalty and Dead Rent Committee of the Mineral Advisory Board, Ministry of Natural Resources and Scientific Research, has set up three sub-committees to enquire into mining royalties. The first committee, which will confine itself to coal, iron ore, chromite and limestone mining, consists of Mr. B. Srinivasan, Government of Orissa, and Mr. B. Sen of Tatas as its members. The second committee will enquire into royalties relating to manganese, mica and china-clay. Dr. C. S. Pichamuthu, Government of Mysore, and Mr. Chandumall Rajgarhia, are its members. The third committee will engage itself with gold, copper, lead, zinc and kyanite mining. Mr. N. Prasad, Government of Bihar, and a representative of the industry, yet to be selected, will be its members. The Committees have been asked to submit their reports not later than 31st December, 1953.

It will be recalled that the State Governments have, for some time past, been urging the Centre to enhance the existing rates of royalty and dead rent, as these rates are considered by them to be out of tune with current economic trends. The industry, on the other hand, sees little justification for a modification of the rates, unless it be downward, in view of the necessity to prevent its costs from rising and to keep its prices at a competitive level. Consequently, the main task of the Royalty and Dead Rent Committee will be to reconcile these divergent interests by rationalising the existing rates structure and placing it on a proper scientific footing.

It may be noted, in this connection, that royalties are levies charged by the State Governments to the legal owners of mining enterprise. They are calculated as a percentage of the value of extracted mineral at the pit-head. The enterprises which have obtained mining concessions but are not engaged in extraction have to compensate the State Governments by paying dead rents. The dead rents vary from mineral to mineral and have been prescribed in the Mineral Concession Rules, 1949.

PROPOSED NUCLEAR POWER REACTOR

The U.S. Atomic Energy Commission's announcement Thursday last that it is beginning work on a nuclear power reactor that will generate electricity is one of the most significant developments in harnessing the atom for peace-time use. It means that industrial atomic power is within the grasp of this generation. It means that scientists are moving slowly toward the goal of producing atom-generated electricity in commercial quantities. It means that the atom may eventually challenge the old sources of power—coal, oil, gas and captive water.

This first full-scale nuclear power producer, which the Commission hopes to have ready in three to four years, will not, of course, be the final answer to the question of industrial atomic power. It is not expected, for instance, that the reactor will produce electricity on an economical, competitive basis. That is something that later research—an immense amount of research—must do. The reactor will produce a minimum of 60,000 kilowatts or more, enough electricity for a city of 50,000 people.

In this, the eleventh year of the atomic age, it is good news, indeed, that the atom, so often referred to as a means of destruction, is to be employed for industrial power as well as medical and other beneficial uses for which it is already being utilised.

Those countries which lack sufficient coal, oil, gas or water-power to generate electricity economically will be especially interested in the new atomic development.

The nuclear power reactor is the second significant peace-time atomic development in the United States this year. Last June, American scientists reported on an experimental atomic furnace capable of producing nuclear fuel at least as rapidly as it is consumed. This process is known as "breeding" of atomic fuel. It is conceivable that, at some time in the future, this breeding principle might be combined with the just-announced principle of atom-generated electricity. If that should occur, the scientists say, then it could theoretically be possible to generate almost unlimited industrial electricity and, at the same time, new atomic fuel could be produced for this machine just as fast as it was consumed. But that day is far off and will require vast research and engineering.

MYSORE IRON AND STEEL WORKS

At a Press Conference held recently at Bhadravati (Mysore State), Mr. S. Muninanjappa, Director of the Mysore Iron and Steel Works, explained the various developments that had taken place in the Works. Welcoming the addition of Bellary to the Mysore State, the Director averred that the manganese and iron ore of Sandur would increase the scope for development of the steel industry. Proceeding, he said that the Works were advancing both in production and in profits, especially after the introduction of the production bonus system. The gross profit for the year was Rs. 59.53 lakhs and the Works had set apart a sum of Rs. 20.31 lakhs towards depreciation and about Rs. 2 lakhs for the amenities fund. For the first time in the history of the Iron Works, it had been able to set apart Rs. 9.5 lakhs as reserve. The depreciation fund to-day amounted to over Rs. 3 crores or more than half the capital outlay itself. Revealing the latest production figures, he said that pig iron was produced to the extent of 92,000 tons per year. Besides, 260 tons of cement, one ton of acetic acid and about 10 to 12 tons of ferro-silicon were also produced per day. The Government of India, he disclosed, has taken the responsibility of marketing the entire pig iron produced at Bhadravati. The steel conversion scheme was still under examination and the spun-pipe scheme had been sanctioned for utilising the pig iron produced.

EXPORT OF MANGANESE ORE

The exporters of manganese ore are worried over the Centre's recent licensing policy, which affects export quotas of those who have been doing modest export business for the last two years. Under the present policy, export of manganese ore from Calcutta is subject to quota restrictions, whereby established shippers are allowed up to 25 per cent. of the best year's export of three years ended 31st March, 1953.

Trade circles feel that the present restriction is unnecessary, because the supply position is satisfactory. Reserves of manganese ore are now estimated to be at about 60,000,000 tons, while previously, it was believed to be at about 25,000,000 tons. Furthermore, a new process, which improves the quality of low-grade ores, thereby making them exportable, has been evolved. Moreover, there is a sustained demand for manganese ore from overseas countries, especially the Continent and Japan.

Free export of manganese ore, according to trade circles, will provide employment for a large number of persons and earn the much-needed foreign exchange. India is one of the biggest producers of manganese ore, and exports in recent years have shown a tendency to expand. Last year, India's exports aggregated 1,400,000 tons, valued at Rs. 21 crores.

GROWTH OF CREDIT INSURANCE

ITS SIGNIFICANCE TO EXPORT TRADE

A REMARKABLE feature of the economic development in the West is the ever-increasing applications of the principle of insurance to divergent fields of business activity. One such feature is the introduction of the principle of insurance into export business. The continued prosperity of export business depends on a number of factors such as stable economic conditions in the exporting country, and the ability to withstand competition from the country's rivals in the field. Some of these factors are unpredictable and beyond the control of the exporting country. To this class of adverse factors belongs sudden outbreak of political or currency disturbances in the importing country. In such circumstances, an exporter may sustain serious losses for no fault of his. Similar losses may be sustained when there is an unforeseen default of payment by the importers. Although it may be possible in many cases to recover the losses, there is no doubt that it will involve considerable delay and expense and the locking up of precious working capital till the issues are satisfactorily settled. Credit insurance is a device which seeks to protect the exporter precisely against these hardships. Although this device is generally intended to protect exporters against losses in their trade with overseas countries, there are several countries where credit insurance institutions cover losses in domestic trade as well.

The early efforts at providing credit insurance could be traced to the last century. But these efforts ended in disastrous failure, largely because many uneconomic risks were underwritten by credit insurers, and the provision of credit insurance led to reckless overtrading by exporters. These two defects provided the key to the improvement of the technique of credit insurance. Credit insurers now make a careful survey of credit risks in different fields. Also, they cover only a part of the losses that might be sustained by the insured, so that the latter are compelled to exercise at least some caution in their business activities. The development of the credit insurance institution in a number of countries in Western Europe was followed in 1928 by the formation of an alliance of these organisations, called the International Credit Insurance Association. This Association has provided a useful arena for the discussion of the problems of mutual interest to credit insurers.

The story of the growth of credit insurance has been described as the growth of co-operation between the insurers and the Governments of exporting countries. Generally speaking, the Governments cover the losses which arise from political and currency disturbances in the importing countries, such as exchange restrictions in overseas countries, whereas the credit insurers protect the exporters against purely commercial risks, such as continued default of the concerned importers in the overseas countries or insolvency of the importing parties. Broadly speaking, credit insurers issue two types of policies. There is the "global" or "whole turnover" policy, in which the commercial risks of the exporter in the entire sphere of his business are covered. There is another type of policy which covers only specific transactions of the exporter or a certain part of the trader's transactions. The premium for the former is lower, about 0.001 per cent., while that for the latter is generally much higher, about 1 per cent. It has been computed that, in Western Europe, credit insurers cover about £2,000 million worth of trade turnover. In the U.K., the Government's Export Credit Guarantee Department handles the vast bulk of the export credit insurance, while the domestic field in credit insurance is covered by the Trade Indemnity Company. These two organisations, it is estimated, cover a total business of over £1,000 million.

Yet another country where credit insurance is well developed is Canada. Some interesting details of the credit insurance scheme in that country have been made available by Mr. O. K. Ghosh, whose report on his study tour in Canada and the U.S. we reviewed last week. Credit insurance in Canada is undertaken by the Export Credits Insurance Corporation. The Corporation was set up with an operating fund of $5 million, with powers to borrow up to five times the paid-up capital. The Corporation is administered by a Board consisting of the Deputy Minister of Trade and Commerce, the Deputy Minister of Finance, the Governor of the Bank of Canada, another official of the Finance Department and the General Manager of the Corporation. There is also an Advisory Council of 13 members. The accounts of the Corporation are subject to continuous audit by the Auditor-General.

The main function of this Corporation is to insure exporters against losses arising from credit and political risks involved in the export trade. Policies are issued on a yearly basis, covering exporters' sales to all countries. In detail, the main risks covered are: insolvency or protracted default on the part of the buyer, exchange restrictions in the buyer's country preventing the transfer of funds to Canada, sudden cancellation of an import licence or the imposition of restrictions on the importation of goods, the occurrence of war or political revolution.

Although credit insurance affords valuable protection to the exporter, it costs him a comparatively small sum. It would appear that the banks are prepared to make advances to an exporter at a lower rate of interest, if he holds a credit insurance policy on his export sales. In fact, the slogan of credit insurers is: "Credit insurance pays itself."

There is no doubt that there is great scope for the development of credit insurance in this country. India is a vast country, with a growing domestic and export trade. The collection of outstanding debts even within the country imposes a severe strain on many a trader, because of the long distance which separates him and his customers. Exporters to overseas countries in India, too, are bound to appreciate the value of credit insurance. Indian insurers, as well as the Government of India, will, therefore, do well to examine the scope for developing this form of insurance. It must, however, be added that, if the scheme has to be successful, it must be based on a careful study of the business practices of Indian traders and exporters and of the frequency and magnitude of the losses which they sustain from time to time.

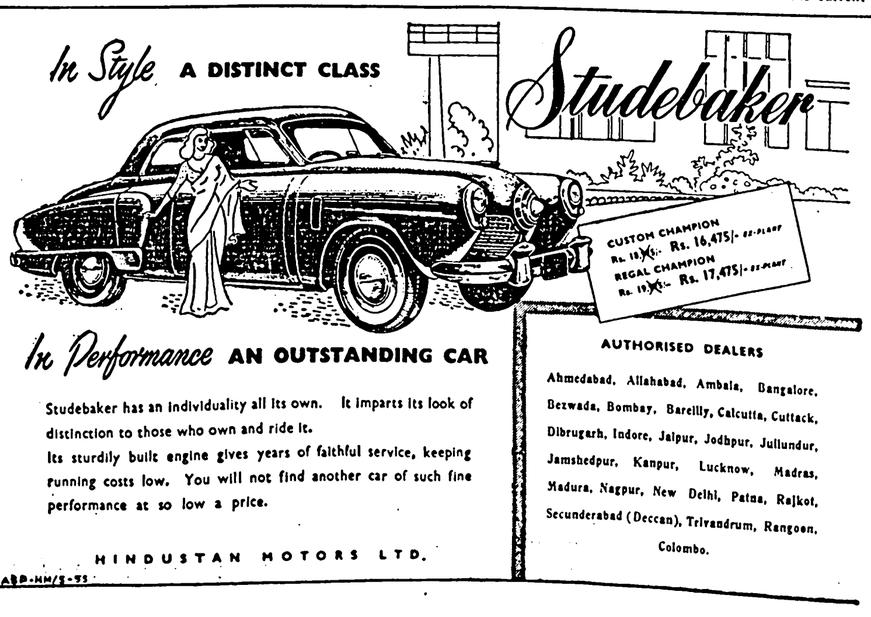
NEPTUNE ASSURANCE COMPANY, LTD.

A slight increase of Rs. 0.49 lakh in new life business, amounting to Rs. 42.63 lakhs, is disclosed by the Directors' report and accounts of the Neptune Assurance Company, Ltd. (Manager: Mr. B. M. Mehta, Bombay), for the year ended 31st December, 1952. Although there has thus been a small improvement in new life business, it must be remembered that the Company, like many other insurers in the country, has not been able to maintain its earlier records of new business which amounted to Rs. 81.19 lakhs in 1949 and Rs. 71.00 lakhs in 1950. But there is one factor which should enable the Company's field workers to put in greater effort in the cause of life business, namely, the encouraging surplus revealed by the latest valuation report, which has resulted in the declaration of a bonus of Rs. 10 per Rs. 1,000 on whole life policies and Rs. 8 per Rs. 1,000 on endowment policies. This level of bonus places the Company alongside some of the leading insurers in the country.

The total premium income in the life department amounted to Rs. 15.25 lakhs, as against Rs. 15.62 lakhs in the previous year. The total claims, paid and outstanding, were higher by Rs. 1.59 lakhs at Rs. 5.76 lakhs. The net interest earned on investments receded from 3.49 per cent. to 3.47 per cent. The expense ratio moved up from 15.37 per cent. to 17.35 per cent., due mainly to the introduction of new grades of salaries, the gratuity scheme and the provident fund scheme introduced during the year under review. It is, however, extremely gratifying to note that the management and the staff decided early in the current year to take a "voluntary cut" in the salary bill. This decision should have a beneficial effect on the expense ratio this year.

The net premium income in the fire and miscellaneous departments stood at Rs. 2.21 lakhs and Rs. 1.36 lakhs, respectively, as against Rs. 2.57 lakhs and Rs. 1.92 lakhs in the previous year. The claims, both paid and outstanding, amounted to Rs. 0.29 lakh in the fire department and Rs. 0.47 lakh in the miscellaneous department. Both the departments worked at a loss. Thus, the working of the fire department resulted in a loss of Rs. 0.01 lakh, as against a loss of Rs. 0.16 lakh in 1951 and of the miscellaneous department in a loss of Rs. 0.11 lakh as against a profit of Rs. 0.26 lakh in the previous year.

After taking into account the income by way of interest and dividends and the profit on sale of investments and providing for losses in the two general departments, there was a loss of Rs. 1,831 which was carried to the profit and loss appropriation account. This loss, together with the loss of Rs. 28,176 carried forward from the previous year, made in all a total loss of Rs. 30,007. This loss, together with the need for providing Rs. 11,000 as depreciation on investments, have been met by the transfer of Rs. 24,671 from the shareholders' life profit account, leaving a net loss of Rs. 16,336 to be carried forward to the current year's account.



TAX MUSINGS

ACCUMULATED DEPRECIATION OF A BRANCH IN MYSORE STATE

CAN IT BE SET OFF AGAINST PROFITS MADE IN "A" STATES?

By R. K. DALAL, B.Com., F.S.A.A., F.C.A.

A RATHER interesting and intriguing point is being raised in a case relating to a company which has its head office at Bombay and a branch at Bangalore. At Bangalore, the branch manufactures and sells plywood, timber, etc. At Bombay, the Company sells a part of the plywood manufactured at Bangalore and also trades in cotton. The point that is raised is whether depreciation accumulated after the assessment year 1950-51 should be allowed to be set off against probable profit that the Bombay office (in a Part "A" State) may make in future in cotton, cloth, etc.

Briefly stated, the facts of the case are:

The Bangalore branch had been making losses and the accumulated depreciation on plywood manufacture business amounted to Rs. 8,15,000 till the end of 1949-50 (assessment year) under the Mysore Act. In 1950-51 the Mysore State was included in taxable territories. During the assessment year 1950-51, the following position arose:

1. The Bombay branch made a profit in cotton business of Rs. 14,00,000.
2. The Bangalore branch made a loss in manufacture and sale of plywood of Rs. 4,00,000 (without depreciation).
3. Depreciation of the Bangalore branch for that year (assessment year 1950-51) amounts to Rs. 4,00,000.
4. Accumulated depreciation of the Bangalore branch under the Mysore Act was Rs. 8,50,000.

Now, the question that has arisen is which out of the last three items above will be allowed to be set off against the profit of the Bombay branch?

Even after the assessment year 1950-51, the Bangalore branch has not been making profits sufficient to meet the current depreciation of each year. The question is:

Will the depreciation accumulated after the assessment year 1950-51 be allowed to be set off against a probable profit that the Bombay office may make in future in cotton, cloth, etc?

According to Taxation Laws (Part 'B' States) Removal of Difficulties Order, 1950, clause 3, the loss can be carried forward to the same extent as if the State law was still in force. Clause 3, reproduced in Kanga and Palkhiwalla's book on page 214, reads as under:

"*Carry forward and set off of previous losses.*—Where, in any previous year prior to the previous year for the assessment for the year ending on the 31st day of March, 1950, an assessee has sustained a loss of profits or gains in any business, profession or vocation carried on by him, and such loss would, had the State law continued to be in force, have been set off against the profits and gains, if any, from the same business chargeable to tax in the said year of assessment or in any year subsequent thereto, such loss would be so set off in the same manner, to the same extent, and up to the same year of assessment, as it would have been set off had the State law continued to be in force."

Thus, it appears that accumulated depreciation allowed under the Mysore Act can be allowed to be carried forward under the Indian Income-tax Act for the assessment year 1950-51 when the Mysore State was brought under the Indian Income-tax Act on account of its integration with the Indian Union.

The next question is carry forward of depreciation under section 10 (2) (vi). Section 10 (2) (vi) of the Indian Income-tax Act reads as under:

"In respect of depreciation of such buildings, machinery, plant or furniture being the property of the assessee, a sum equivalent (where the assets are ships other than ships ordinarily plying on inland waters) to such percentage on the original cost thereof to the assessee as may in any case or class of cases be prescribed (and in any other case, to such percentage on the written down value thereof as may in any case or class of cases be prescribed)....

Provided that

(a) the prescribed particulars have been duly furnished;

(b) where full effect cannot be given to any such allowance in any year (not being a year which ended prior to the 1st day of April, 1939) owing to there being no profits or gains chargeable for that year, or owing to the profits or gains chargeable being less than the allowance (then, subject to the provisions of clause (a) of the proviso to sub-section (2), of section 24); the allowance or part of the allowance to which effect has not been given, as the case may be, shall be added to the amount of the allowance for depreciation for the following year and deemed to be part of that allowance, or if there is no such allowance for that year, be deemed to be the allowance for that year, and so on for succeeding years; and

(c) the aggregate of all such allowances made under this Act or any Act repealed hereby, or under the Indian Income-tax Act, 1886 (II of 1886), shall, in no case, exceed the original cost to the assessee of the buildings, machinery, plant or furniture as the case may be."

It will be seen that the above section provides for a carry forward of depreciation allowance to the extent that profits are not sufficient to absorb it. Not only that but it deems the carry forward next year and years thereafter, as part of the depreciation allowance of that year. The effect of this rule seems to me to regard depreciation for the year plus the aggregate as part of that year's allowance—a charge against profits of that year.

The above section does not regard the arrears of depreciation as merely a carry forward to be given effect to after the profits are computed under section 10, but it is made eligible for a large deduction as a part of the computation of that year itself, because it is being given as a deduction under section 10 2 (vi). Not only the eligible depreciation allowance for that year but the previous years' arrears are deemed to be allowance for the year under assessment. If that is true, then accumulated depreciation and depreciation for the year stand on the same footing and the resultant loss under the head of business is the loss of the assessment year and could be availed of as a set off under section 24 (1).

The difference between depreciation allowance and loss carried forward under section 10 and other loss under section 24 (2) is that, under section 24 (2), the carry forward of loss is given effect to under certain restrictions:

(a) such loss can be carried forward under the *same* business

(b) such loss can be carried forward for a period of six years only.

Depreciation allowance, on the other hand, has no such restrictions placed thereon. The position, as is generally understood, is that:

(a) such a loss can be set off under any other business under section 10 and also under section 24 (1) against other sources in the same year;

(b) it can be carried forward without time limit until exhausted.

If this theory is valid then:

(a) The Company's plywood business in Bangalore and cotton business in Bombay must be treated as one and depreciation for the year can be set off and net profit only subjected to tax.

(b) The accumulated depreciation, being deemed to be a depreciation allowance for that year, can similarly be set off as a deduction against profits made on cotton.

(c) The set off of loss on account of accumulated depreciation against profits in cotton may be achieved without resorting to liquidation or even taking over the business by another company.

What is required to be carefully considered is whether the proviso to section 10 (2) (vi), enables the assessee to claim as a deduction in a year not only the depreciation due for the year but also inclusive of accumulated depreciation carried forward from the past. If it is deemed to be a deduction under section 10, the computation will result in a loss which loss (though due to depreciation) can be set off against profits made in cotton, because all businesses carried on by the assessee are subjected to tax under section 10 and any business has been interpreted as all businesses.

In this connection, attention may be drawn to the fact that, prior to the Amendment Act, 1939, and the insertion of section 24 (2) introducing a carry forward of loss, section 10 (2) (vi), enabled the assessee to carry forward arrears of depreciation. In so doing, it was not necessary to resort to section 24. Section 24 (2), when enacted, was found to operate harshly against the assessee, because of the two losses —one due to business and the other due to depreciation.

It was not clear whether the revenue loss could be given priority, because while business loss was limited to be carried forward for six years, the depreciation loss could be carried forward until exhausted. The reference in section 24 (2) is with a view to clarifying the position that loss under section 24 (2) due to business shall have the priority to the loss carried forward and given effect to under section 10 (2) (vi) on account of arrears of depreciation.

The two losses, therefore, are not of the same nature and not governed by the same section. One is governed by section 10 (2) (vi) provisos (*b*) and (c) and the other is governed by section 24 (2). Further, in giving effect to the loss under section 24 (2), the computation under section 10 must precede the carry forward under section 10 (2) (vi). The effect of carry forward of depreciation is given and made part of the computation of section 10. Therefore, the net profit worked out under section 10 is profit or loss for the accounting year and can be set off under section 24 (1). This being the distinction between the operation of the two sections, is the assessee correct in claiming a set off of accumulated depreciation and loss on account of manufacturing of plywood in Mysore against cotton profit made in Bombay? The profit on cotton is purely a trading profit not due to speculation, so that the Amendment Act, which isolates speculation profit from the trading profits, will not apply.

There does not seem to be any direct authority in point. But the view taken by the assessee should, it seems, prevail in law.—*All Rights Reserved.*

WHAT IS A SOUND TAX POLICY?

In its memorandum submitted to the Taxation Enquiry Commission, the Bombay Chamber of Commerce has given a cogent reply to the Commission's question—this, of course, is only one of the many questions which the Commission has asked and which the Chamber has replied—as to the objectives of a sound tax policy. The following is the Chamber's reply:

"The main objective of a sound tax policy must be to increase production and so raise the standard of living. If the main objective is to be realised:

"(a) the taxable capacity must be fairly determined, taxation accordingly imposed, and thereafter not increased; certainty and stability are essential if capital is to be made available for investment in whatever sectors of the economy;

"(b) there must be a competent administration; the machinery for the collection of revenue must be effective otherwise taxation must be increased beyond taxable capacity.

"If there is incentive to work, to save and to invest there will be an accumulation of wealth by personal or community effort and production; from that accumulation the appropriate quantum can be channelled by taxation to the revenue. But if accumulations are to grow and production expand, the quantum of the accumulation left in the hands of the individual or the community must be such that the assets with which the wealth is created can be maintained in a condition in which they may continue to increase.

"Savings and investment must be encouraged by all possible means but without direction of savings into particular channels; the risk differential will operate to ensure that available resources will be correctly employed. The reactions of the natural laws of supply and demand will control the inflationary and deflationary tendencies in the economy and it should not be the objective of taxation policy, as distinct from monetary policy, to attempt to regulate supply and demand. If the inflationary and deflationary tendencies are allowed to adjust themselves, the external balance of the economy will automatically find its own level.

"It may be necessary, at times, to resort to controls, physical and monetary, but controls should not be regarded as an inevitable constituent of an overall State policy. Controls should be used only to deal with extraordinary circumstances which have disrupted the working of the natural economic laws since they are usually too late when imposed or revoked to effect a cure.

"In a country dependent upon exports of primary products for its external balance of trade, taxation of the exportable product must be such that it is not priced out of its markets whether by direct internal taxation or by export duties. Export duties may destroy the competitive power to sell in world markets. The levy of an export duty on commodities which enjoy a monopoly or near monopoly in source of supply (e.g., jute and manganese) causes overseas buyers to look for substitutes or to seek alternative sources of supply. The first has happened in the case of jute and the second is about to happen in the case of manganese. The principle should be to sell at the best price obtainable in the export market leaving it to well organised trade associations to adjust their production, selling arrangements and prices in a market which they understand and which, for their own benefit, they will do everything to preserve.

"While the reduction of inequalities of income and wealth is desirable it cannot be a primary objective since in the result overall living standards may thereby be reduced.

"Taxes should be levied over the whole population, equitably according to ability to pay but in no case so severely as to impair incentive. A sound tax policy will not destroy the incentive to work, to save and to invest."

EIGHTH SESSION OF THE G.A.T.T.

EXTRACTS FROM DELEGATES' ADDRESSES

THE eighth session of the contracting parties to the General Agreement on Tariffs and Trade (G.A.T.T.), which began at Geneva on 17th September, 1953, concluded last week, under the chairmanship of Mr. Johan Melander, Director of Commercial Policy, Norwegian Ministry of Foreign Affairs. We give below extracts from the speeches of the delegates of some of the important countries which participated in this meeting, as they will show the attitude of these countries to this branch of international co-operation.

To begin with the speech of the Chairman, Mr. Melander said:

"In my closing speech at the end of the seventh session, I expressed the hope that, in 1953, Governments would work together to agree upon a concerted programme of action for removing the causes of the persisting disequilibrium in trade and payments, and for advancing towards the abolition of trade restrictions and discriminatory practices. Since then, of course, these important questions have been the subject of active international discussion, following the Commonwealth Conference of November last year and the formulation of a plan for the restoration of the convertibility of sterling. It was not to be expected that such far-reaching proposals, involving so many countries, should lead to immediate decisions. In particular, it is understandable that the new Government in the United States needs time to reflect upon the very important decisions which must be taken if that country is to make a substantial and appropriate contribution to a collective attack on the basic problems of international trade and payments. It is, of course, too early to foresee exactly the detailed principles which should govern such a new system of trade and payments, but it seems clear that we can only hope to move from a regime which is supported by extraordinary financial aid into one which rests upon normal movement of goods and investments if both creditor and deficit countries are prepared to adopt appropriate policies.

"Having now entered upon my third and last period as Chairman of the Contracting Parties, I hope you will permit me to speak for a moment about our work here as contracting parties to the General Agreement on Tariffs and Trade. Again I would like to recall something which I said at the close of the last session. Our work here is dedicated to the creation of a multilateral trading system, freed from quantitative restrictions and from discriminatory practices. But we do not think of this goal as an end in itself. It would, perhaps, suffice if I were to refer, as I did last year, to the objectives laid down in the preamble to the Agreement, but I would like to develop these ideas a little further.

"It seems to me that the major problem that faces us arises from the contrast between the limitation of the world's resources and the pressing need for food, clothing and shelter that comes from the increase in the world's population and from the necessity of affording higher standards of living to hundreds of millions of people who, in the past, and still to-day, are living at bare subsistence levels. This problem can only be solved by making the most efficient allocation of resources that are available. It is because protectionism, restrictionism and discrimination interfere with this required efficiency that we must turn our back on such policies. This is not a matter of attachment to economic doctrines, nor of any conviction that one set of economic policies has any moral superiority over another. It is a question of recognising facts and dealing with them realistically.

Difficult Problem

"We all realise, of course, how difficult it is to adopt more liberal policies in matters of foreign trade. Immediately after the war, the problems confronting each particular country were of such magnitude that there was no chance of solving them through the operation of market mechanisms alone and all countries, therefore, turned to a system of controls relating both to their domestic and to their external economic activities. No one denies that the abolition of such controls is difficult. Too many interests—sectional interests—have naturally grown up around them, and it is also true that there is a great difference in political feasibility between the adoption of new protection, in whatever form, on the one hand, and the abolition of such protection on the other. Whenever new protection is adopted, immediate and visible advantages accrue to a few, while the price which we know must be paid by the population at large, is less clearly discernible. If, on the other hand, protection is abolished, the position is the reverse. Politically, the difference is that the few who profit or lose are vocal, while the public at large has no spokesmen. To put it somewhat pointedly, we cannot hope to arrive at an efficient allocation of the world's resources, unless Governments are prepared to show a certain amount of political courage in adopting policies which, in the short run, are most likely to be unpopular.

"The situation is essentially the same when it comes to considering not sectional interests within a country but the interests of particular countries in relation to all others. There again, it is possible, let us admit it, that, by discriminatory protectionist devices, apparent advantages may be derived within a limited area. But these apparent benefits are achieved at the cost of the world economy as a whole and this, in the long run, will react adversely on the country or countries pursuing such policies. Nor can one leave out of account the political frictions which they inevitably engender.

"I should also, at this point, like to say a few words about the countries whose productive resources are as yet not fully exploited, and which are frequently referred to by the unattractive phrase—'the underdeveloped countries.' I have often thought, as I presided over sessions of the Contracting Parties, that many of the questions which we discuss around this table may appear remote from the most pressing problems confronting these countries. And yet looking at our work in the way which I have outlined this afternoon, it would be difficult to instance matters of greater moment to them. For in their countries live the greatest number of the under-privileged of whom I have spoken. Their hope of a better life depends, to my mind, entirely on an expanding world economy in which there is a high and rising demand and remunerative prices for the raw materials and foodstuffs which they produce, increasing opportunities to acquire capital equipment, to develop their industrial production, and an expanding output of consumers' goods at prices within the reach of people with relatively low money incomes. None of these three conditions will exist in an unstable or shrinking economy which is the best that can be expected if international trade is tightly controlled or dominated by motives of protection and discrimination. The responsibility for developing and maintaining that strong and expanding economy which we all desire must be shared by all of us.

What is G.A.T.T.?

"The G.A.T.T., therefore, is not a list of restraints and prohibitions reluctantly accepted by Governments, but a set of principles and rules which all of us accept, because they are in the common long-run interest, and, therefore, in the interest of each of us. This I think, is a way of looking at things which cannot be too strongly or too often emphasised, since the pressure of special interests is constantly at work in all countries to present the picture in a different light, and public opinion is, therefore, frequently confused on the simple but basic questions with which we deal.

"Now having outlined the philosophy underlying the G.A.T.T., and for that matter the International Monetary Fund Agreement, I may, perhaps, be permitted to touch upon a matter which you all may consider delicate, but which I consider fundamental.

"To put in very pointedly: the philosophy underlying the G.A.T.T. and the I.M.F. agreement is that, if quantitative restrictions, together with other barriers to trade, are abolished, the objectives laid down in the two agreements, and indeed in others, such as in the United Nations Charter, will automatically be realised. But I think experience shows that this is not necessarily the case. It depends on other aspects of economic policy, financial and monetary policies, fiscal policies, rates of interests, investments policies. It is not, therefore, enough that countries follow the trade and foreign exchange policies laid down in the G.A.T.T. and the I.M.F. Agreement. They must also pursue financial and monetary policies which are neither inflationary nor deflationary, and they should consider this as equally important as to abolish quantitative restrictions and other restrictive trade and exchange practices.

"This, of course, raises the fundamental question: should international action not go beyond direct controls of trade and payments, and deal with financial and monetary policies? As I have said, this matter is delicate and difficult, and I do not want to do more than to raise the question.

"It seems probably, however, that we shall soon have reached a point where we shall wish to resume the terms and the operation of the General Agreement and to consider what changes may be necessary in order to make it a more effective instrument for advancing our common policies. At that time, I think that we should take the opportunity to restate in clear language the problems we face and the reasons why the path we have chosen is the only one which holds out any real hope of solving them.

"Some of the ideas I have put forward may seem elementary to many representatives around this table. But I do think that, if we are to succeed against the many forces and pressures with which we have to contend in the field of commercial policy, it is necessary to have and to state a positive and dynamic philosophy. Given this approach, I am sure the problems of individual countries can be met and overcome."

India's Views

Speaking at the session, Mr. D. P. Karmarkar, Commerce Minister, Government of India, observed:

"Five years have elapsed since the finalisation of the Havana Charter and the commencement of the operation of the General Agreement on Tariffs and Trade. My Government has all along been taking a great interest in the evolution of both the Charter and the General Agreement. We believe in the general principles embodied in the Havana Charter and the basic objectives underlying the General Agreement, namely, the liberalisation of trade and the progressive removal of avoidable trade barriers, and to that end we have extended full support to the G.A.T.T.

"While in the field of tariff reduction, this organisation has achieved fairly impressive results, my delegation feels that progress in the direction of liberalisation of trade has not been marked, because of various economic and financial difficulties. Most countries have had to face difficult economic and financial problems during the post-war period. The economic *malaise*, which characterised the post-war economy of many countries, tended to distort the pattern of trade and gave rise to import restrictions on balance of payments grounds. Even now, conditions have not returned to normal and the disequilibrium persists, although there is evidence of substantial improvement. We in India have also had to face difficult economic problems, but, despite these difficulties, we have endeavoured to do everything possible to promote multilateral trade and we are always ready to co-operate in a collective approach to questions connected with multilateral trade and payments. It is significant that several countries are at the moment engaged in the study of their economic and commercial policies. The United States of America—a great creditor country—is reviewing its economic and commercial policy. When this study and review are completed and revised policies are put into effect, it should be possible to make an assessment of the future of the G.A.T.T. and my Government would then wish to reconsider our general attitude.

Pre-requisite for Success

"My delegation feels that the success of this new international experiment will, to a great extent, depend on the policies adopted by the highly industrialised countries to liberalise trade, lower tariff barriers and to assist countries in the process of industrial development, by providing more capital and technical assistance. Production must be stepped up if the expansion of world trade is the objective, but the great resources of the underdeveloped countries cannot be fully developed without large capital investments. My delegation hopes that it will be possible for those of the industrially advanced countries which are in a position to so so, to liberalise trade and make available more capital and technical aid to the partially-developed and the underdeveloped countries. The main problem in India, as well as in other South Asian countries, is the raising of the standards of living. This is the chief motivating force in India's Five-year Plan and we are doing everything practicable to put this plan, which is a very realistic and balanced one, into effect as expeditiously as possible.

"Finally, I should like to say that the G.A.T.T. organisation has been a useful forum for discussing and resolving the difficulties and problems connected with international trade and it is gratifying to note that, in most cases, a satisfactory adjustment has been found possible. I should like to pay a tribute to the zeal and efficiency which has distinguished the contribution of Mr. Wyndham White and his colleagues in the secretariat, in the executive functioning of the organisation. My delegation feels, however, that the need for speedy decisions in urgent matters cannot be overemphasised. This, I think, could be achieved by providing effective machinery, not only during the sessions but also between sessions."

U.K.'s Views

Representing the U.K. at the meeting, the Right Hon'ble Peter Thorneycroft stated:

"The United Kingdom has more than a minor interest in these problems. We live by exports; they represent no less than one-fifth of our total national income. In such circumstances, we need to consider international trade policy with greatest care. If our judgment is wrong, we do not injure just a small group of producers. We strike at the foundations of our economy. Nor have we ourselves alone to consider. Something like half the world's trade is conducted in sterling. It is an international as well as a national responsibility to see that sterling is strong. The United Kingdom has supported and continues to support the General Agreement on Tariffs and Trade, an organisation for dealing with the problems of international trade which is a major interest to a country which lives by it. The objectives of the General Agreement on Tariffs and Trade cannot, however, be attained and the multilateral system cannot work or work fully until an end is put to the chronic unbalance of trade which exists to-day. After all, the General Agreement on Tariffs and Trade was based upon the assumption of transitional and not permanent disequilibrium.

Responsibility of the U.S.

"Any attempt to cure the chronic unbalance which exists to-day is doomed to failure, unless there is a fundamental change in American commercial policy. A large range of potential exports to America are faced with tariff rates 50 per cent., 60 per cent. or even more. There are notorious difficulties of customs valuation which vastly increases the real burden of tax. There is the Buy American Act. There is the discriminatory shipping policy. There are the very reciprocity provisions which inhibit the unilateral lowering of trade barriers, which is axiomatic to a solution of unbalanced trade. These are substantial obstacles which stand between all of us and achievement of that wider area of trade and payments which we desire to achieve. Having said this, I would add that this is not a problem which can be solved solely by the United States. Debtors have obligations as well as creditors. There is, indeed, no surer way to a balance of payments crisis than a failure to preserve a proper balance in one's internal economy. Nothing the United States can do can balance trade with the rest of the world, no matter how generous she is, if the rest of the world pursues inflationary internal policies. One thing further is plain. It is wholly unrealistic to expect the United States of America to take decisions on these major problems in a matter of a few weeks. The examination of their external policy is just starting—it must be completed—this is a process which will require a little time. When it is completed, we must follow up the suggestions by the Chairman yesterday of a re-examination of some of the fundamental problems of international trade as applied to the General Agreement on Tariffs and Trade.

"In the United Kingdom, we have taken a number of effective and at times unpopular decisions in order to achieve that internal stability upon which alone larger hopes of the collective approach to freer trade and freer currencies, or even the more limited approach to liberalisation of European trade, can effectively be based. The next step is with the creditors. We must await it, knowing it will be taken with that sense of responsibility which has always characterised the post-war conduct of American policy in the international field.

No Major Policy Decisions

"What then should our policy be for this session of the General Agreement on Tariffs and Trade? First, we should not try to plan for a world the exact nature of which we do not yet know. Secondly, we should not attempt to take decisions of major policy calculated to strain the whole structure of the organisation. Thirdly, we must co-operate in dealing in a workmanlike way with technical difficulties which give rise to urgent practical problems. Fourthly, we should seek by all means to preserve the foundations of the organisation which we have by our joint efforts built up. Let me illustrate what I mean by reference to a few items on the agenda. During this interim period, it would surely be wise to preserve the main tariff structure by a continued deferment of the operation of Article XXVIII. In other words, we should keep the bound items bound. We in the United Kingdom do, however, need some freedom on the unbound items. Here is a technical difficulty which gives rise to an urgent and real problem for the United Kingdom Government. I would, however, emphasise now that we seek a solution which is consistent with the basic provisions of the General Agreement on Tariffs and Trade and safeguards the interests of other Contracting Parties.

Japan's Admission

"Finally, there is the difficult issue raised by Japan's application at this stage for provisional association. This application raises many difficulties for a number of us. I feel bound to say that I wish that this issue could have been postponed till after the difficult transitional stage through which the General Agreement on Tariffs and Trade is now passing. I believe that, even now, all concerned should ponder whether it is really in anyone's interest (and I include in this the Japanese) to press the issue at the present time. If it were so pressed, and I say this in no spirit of animosity against Japan, then the United Kingdom would abstain from participation.

"I would conclude by summarising the approach of the United Kingdom to the business of this session as follows. The speeches we have heard are all emphatic on two points. The first is the size of the problems of policy confronting us. The second is the fact that solutions cannot be found to all of them at this session. We must await the review on American commercial policy now in hand. We must await it with hope and confidence. For the time being we must hold on to what we have already attained; it is not inconsiderable. We must preserve the foundations in order that we may build upon them in the future."

U.S. Views

Speaking on behalf of the U.S., Mr. S. C. Waugh said:

"President Eisenhower and Secretary Dulles have asked me to express to this meeting their hope that the business which will occupy us will be brought to a successful conclusion. The President has also asked that the following message be read to you:

"'The Eighth Session of the Contracting Parties to the General Agreement on Tariffs and Trade seems to me to be one of special significance. Many nations of the free world, including the United States, are now actively engaged in re-examining their international economic policies.

"'In this process of reappraisal, it is important that we keep our sights clear—that the nations of the free world remain firmly dedicated to our common purpose of developing that higher level of profitable international trade necessary to the economic strength and well-being of all our peoples.

"'I am confident that through the accomplishments of this session, the Contracting Parties will again demonstrate that the nations of the free world have the will and the means to reach this goal.'

"We have come through the period of post-war economic troubles and turmoil. The Marshall Plan has fulfilled its task and has passed into history. The economic challenge presented by the Korean emergency has been met and substantial progress in building our defences against the threat of future aggression is now evident. Nevertheless, too many parts of the free world are still too far short of achieving that degree of economic strength and resiliency which is needed to protect our common security and enrich the lives of our people. An effective multilateral trading system, general convertibility of currencies, an adequate flow of international capital, satisfactory development of underdeveloped areas—these essential ingredients of a productive international economic system *are not yet within our grasp*. It is appropriate, therefore, that all should now begin to re-assess our present policies and institutions, to see how they can be improved, and to chart a course for the future which can lead us more surely and effectively toward our common goals.

"All will enter on this task of re-assessment faced with certain basic, inescapable, facts. Events of the past 15 years make us realise that there is no longer any such thing as isolation on this shrunken globe of ours—that no people can long remain aloof from all the rest, secure from military threat and free of economic cost. We know that, in the years immediately ahead, we must find ways of living with one another by rules and institutions which do not lead to a terrible war in every generation. The people of my country, like those of virtually every other country of the free world, have come to accept these propositions as fundamental. For us, as for other countries, there is no longer any such thing as splendid isolation. We are in the business of international co-operation to stay.

"Planning ahead for a period of greater and more effective co-operation on economic matters, there are a few basic tenets on which we can build. To begin with, it is crystal clear that the trade relations of nations cannot be effectively established on a bilateral basis. The basic rules by which nations allow goods to move across their borders must be developed jointly by all the nations concerned and must have their common consent. To-day, modern transportation allows nations to draw their basic raw materials from the four corners of the globe. Nations find their markets thousands of miles away. At virtually every point in the free world, the interests of three or four or a dozen trading nations have to be reconciled. There is no bilateral method, or any other kind of 'closed' system, which can deal with this situation in a way which gives trade an opportunity to flourish and to bring nations the full benefit of which trade is capable.

"Another lesson has been learned from the events of recent years. We now know there is an inseparable link between the 'internal' policies of nations and their trade patterns. There was a time when nations felt that the waves of destructive inflation or equally disastrous deflation to which their economies were being peribdically subjected were purely internal matters, on which other nations were not entitled to express an interest. But this view, too, has passed. We now recognise that the ability of the free world to create a multilateral system of trade and payments requires action not only in the field of international trade and monetary policy, but also the adoption of appropriate internal policies. Persistent inflation in important trading countries can easily wipe out any prospect of a wider and freer system of international trade. Serious deflation can do the same. International co-operation of the future must be built upon a fuller recognition of these relationships than has been had in the past.

Process of Re-assessment

"Many of our Governments are now in the midst of a healthy process of re-assessment and re-appraisal, taking stock and formulating plans for the future. It is important, however, that this process should not take too long. It is our hope and aim that our own Commission on Economic Foreign Policy will be in a position to report to the President and the Congress in time for appropriate legislative and other necessary action to be taken during the early months of next year. If these plans materialise, our Government would then be able to discuss more definitively the role which it is prepared to play in further international co-operative efforts in the economic field.

"Of primary importance for the future will be the kind of international trading arrangements and institutions which will best serve our common interests. Our Chairman yesterday suggested that we look forward to plans for undertaking a basic review of the operation of the General Agreement on Tariffs and Trade and for considering proposals which Governments may put forward for such changes, or such new arrangements, as may prove desirable. While it may be unwise to establish too rigid a time-table for international discussions on this subject, it is the present thinking of my Government that the coming year may prove to be an appropriate time. In the months ahead, the free world may well be in a better position to move toward more effective international co-operation than at any time since the end of the Second World War. Those of us attending this eighth session of the Contracting Parties to the General Agreement on Tariffs and Trade as representing our respective Governments should put forth every possible effort toward the creation of a sound and productive economic system which is the goal of all free nations."

Plea for Action

Speaking for West Germany, Prof. Dr. Ludwig Erhard stated:

"The aims of the G.A.T.T., which in their logical consequence mean a world-wide free exchange of goods on the basis of free payments, do not call for any modification but rather for more emphasis and clear-mindedness. In spite of all progress made so far, the present picture of the integration of the world's economy is still far from encouraging, and I feel, we have every reason to stop and think. It is true that the binding principles of the General Agreement are clear: to reduce tariffs and to lower trade barriers, to eliminate quantitative restrictions and to stop discriminating in the international trade, but it is quite another question how far we have got in our efforts to achieve all this. With all due understanding of the fact that it has been necessary in the years behind us to make exemptions from the rule, it seems to me that now the time has come to review these exemptions and, to put it more bluntly, to apply stricter criteria. In this connection it must again be demanded, as a matter of particular urgency, that the national economies stop distorting by export subsidies and other open and

hidden measures of a so-called export drive, the honest competition of efficiency in the private economy. If the G.A.T.T. organisation is to fulfil its task, it cannot and must not let that sort of thing go on without doing something about it.

Honesty of Purpose Needed

"Indeed, sessions of this kind can only be fruitful and yield results if their basic feature is the courage to be honest and to face facts. Now it is my personal opinion that, as long as national States, with a view to their balances of payment or to the consequences of the war or even to protecting their own economies, depart from the rules of the game, there is little chance really to move forward towards a true order, based on the principles of the market, on a supra-national level. Is there at all a country which could not, by invoking one fact or another, find arguments for a withdrawal, and by what means could a country with this tendency be prevented from adopting a policy to that effect? Indeed, in the framework of the G.A.T.T., the question is simply this: have we really beyond the certainly beneficial tariff agreements, arrived at a generally binding commercial policy in accordance with the moral obligations involved in the ideals of order in freedom, or have we not rather got stuck in what is practically a merely technical approach? We must understand that to get stuck in what has been achieved is tantamount to sliding back, because, if the dynamic power of the G.A.T.T. dwindles, then this institution is doomed to barrenness and everybody will soon want to go his own way again. By this I mean to say that, to my mind, any relaxation and any backward movement should be out of the question.

"The problems involved in an international economic co-operation are now becoming apparent with an increasing clarity which almost gives me the hope that there is a chance of a genuine solution. Not only within the G.A.T.T., but also within the O.E.E.C. or in the co-ordination of the countries of the European Coal and Steel Community, e.g., the principle of a free competition of efficiency is uncontested, and it is unanimously agreed that the international exchange of goods and services must be free from State intervention of any kind. Thus, the principle of economic order—a free market economy as against Governmental regimentation—is no longer the issue at all. But if this is so, then there must be certain conclusions which impose themselves on the individual nations with regard to their own economic and financial policies, and that is why I feel that it is here rather than anywhere else that the decisive action should be taken. We may, on an international level, have the most beautiful proclamations and declarations, but these will never be more than idealistic standards, unless they are backed by the serious determination of nations, to guarantee, within the sphere of their own responsibility, an economic and financial stability. The more a country tries to evade this responsibility, the more it will have protectionist desires and the more it will contribute towards a destruction of the free exchange of goods between the nations. The world has become too small for us to indulge in the luxury of divergent interests.

"Just as we are discussing, with the countries of the European Payments Union, a 'consolidation' of that system, it will become necessary to review also within the framework of the G.A.T.T. the question of authority or, if you prefer it that way, even of institutional power. Let me repeat: to stand still is to step backward, so the G.A.T.T. will not prosper if its efforts are strictly limited to the fields of tariffs and quotas. It must rather have room for a wider concept of freedom. Although I am in priciple very much in favour of all plans like the Pflimlin plan or the Ohlin plan, I am at the same time somewhat afraid lest unilateral action in tariff policy might provoke an intensified governmental interventionism in reaction to the greater freedom of movement which is aimed at. In theory, therefore, the harm might be greater than the good which is planned to be done. After all, the tariff policy is just one of the aspects of an international commercial policy, just one of the instruments by which States can influence the international exchange of goods, so an isolated consideration and handling of this problem cannot bring forth satisfactory results. I would not want to be misunderstood: I am of course in favour of a lowering of tariffs, and I also like low tariff rates, but I should not like to see stipulated tariffs used as an argument in favour of increased interventionism or as an excuse for the lack of willingness to co-operate on an international level. Each country should realise that it carries a great responsibility not only for itself but also for the whole world, as there will hardly be any authority sufficient to compel a country to keep order and to adopt a commercial policy which will find favour in the eyes of men, so that we all depend on whether or not each of us is doing his best to serve the community of the free nations, and to promote peace and freedom in the world. Let this session be a searching of hearts and a solemn reminder.

G.A.T.T. Must Succeed

"Unless the G.A.T.T. is to prove a failure, it will have to be intensified to the greatest possible extent so as to become really serious about trade barriers, quantitative restrictions and all kinds of discriminatory commercial practices. We must have the courage to be free and the courage to have order. We must get rid of the illusion that a protectionist and nationalist policy can be of benefit to a country. We must rather realise that it is our duty to obtain for our nations a maximum of wealth and the best possible opportunities, and it is here that it becomes quite obvious that only the widest imaginable basis for an economic co-operation will offer a maximum of security. The isolation of a national economy in poverty is the worst prescription, politically, and is bound to have tragic results in the long run. Such a national policy would keep the free world from getting United or would cause it to split up again, because we would either get all caught in poverty and primitiveness for good or each of us would again go his own way. Both would be equally disastrous. If, however, the G.A.T.T. reaches its aims or at least makes progress on its way, then it will be another side from which the conditions are established which will permit us to overcome a regimented foreign exchange system and to re-establish the free convertibility of currencies. I am, therefore, inclined to feel that this idea should no longer remain outside the efforts of the G.A.T.T., because, if these efforts are successful, free convertibility will, as it were, fall into our hands like a ripe fruit. In this sense, convertibility would, indeed, be the crowning achievement of the G.A.T.T.

Value of Free Market Economy

"I certainly do not want to blight hopes, and above all, I do not wish to discourage any efforts, but I am sceptical if I regard the development up to this day. The experience so far made within the framework of the G.A.T.T. or of the E.P.U. does not readily bear out the conviction, that the nations will quite voluntarily strive for and attain complete freedom. There are too many ifs and buts to be overcome, and too many mistaken interests are thrown into the scale. To my taste, there is everywhere too much talk about the impossibility to do without a so-called autonomous economic policy, but this means in the end only that there is little inclination to have the comfortable way into domestic instability blocked by international commitments. To renounce stability is, however, tantamount to turning one's back to a free economic order, as it is set forth in the General Agreement on Tariffs and Trade. Let me give you some hope by referring to the experience gathered in my own country. We are truly witnesses to the elementary and wholesome force which is inherent in a free economic order. I am convinced that the world will recover, that all tension and disturbances can be overcome, that distrust and envy will disappear and peace will spread in the economic sphere if we, after having so long gone astray, find our way back to good order. Since all national economics have lived all too long in barren isolation we have lost our sense of the functions of a truly free world economy and vastly overrate the dangers implied in the re-establishment of full freedom of movement. Freedom is not a danger but a blessing for all. To have said this does not mean to belittle what has no doubt been achieved in the course of the development of the General Agreement on Tariffs and Trade; we acknowledge with gratitude what has been done, but because of that very fact it is incumbent on us not to let this endeavour die for want of fresh air but to go on with it and to make it bear fruit."

Australia's Views

Giving the views of Australia Mr. V. A. Clark stated:

"My Government's experience of the operation of the General Agreement has led it to a firm conviction that a comprehensive review of the General Agreement is much overdue. It is a fact well known to all of us that when the Contracting Parties first negotiated the Agreement in 1947, it was never intended that it would continue to operate for more than a year or two in its present form; this is evident from the terms of Article XXIX of the Agreement itself. However, it has so happened that the Agreement has run on year by year for almost six years. The Contracting Parties will agree that these six years have not been easy years for the General Agreement. On every occasion when the Contracting Parties have met, there has been a number of intractable problems the solution of which, in accordance with the present provisions of the Agreement, has become increasingly difficult. Some of these matters have persistently failed to be solved and have, therefore, equally persistently been resubmitted to the Contracting Parties.

"These things have happened at every session of the Contracting Parties, although the Agreement is being applied only provisionally. It seems clear, therefore, that there are conflicts between some of the principles of the General Agreement and the policies which sometimes must be followed by Governments in the national interest. These situations raise serious doubts about the suitability of the G.A.T.T. in its present form. The fact that it has applied only provisionally is perhaps one of the principal reasons why it has continued for so long without challenge. Any question of its definitive application would, it is felt, immediately raise questions of a fundamental character as to its suitability and adaptability as a permanent form of international agreement.

"There have been many significant changes in world economic and trading conditions during the past six years, and some parts of the Agreement, the effects of which have until now been obscured, are becoming increasingly onerous. It is a fair commentary on the restrictive nature of its provisions that some of its chief sponsors are finding increasing difficulty in living up to the obligations of the Agreement. A reference to the agenda of the present session will serve as a clear illustration of this. It seems therefore, that there is a considerable weight of argument in favour of a review of the Agreement which, whilst acceptable as an attempt to deal with conditions as they existed in 1947, is not adaptable in full measure to the requirements of the present and the foreseeable future. We cite no particular instances; we are merely trying, objectively, to envisage the future of the General Agreement, and we cannot escape the conclusion that with the G.A.T.T. as it is now written, new and increased difficulties are in store.

"It is the Australian Government's view that a general revision of G.A.T.T. is required, and that this is a matter of urgency. It believes that the review should commence next year. It believes also that the review should be comprehensive and unrestricted by any article of the present Agreement; it should relate not only to Parts II and III of the Agreement but also to Part I. It will be necessary in the course of a review to consider a great number of questions. Some of these, from the Australian point of view, are already apparent; other Contracting Parties will no doubt have matters of their own to raise. My delegation does not intend, at this stage, to indicate any particular proposals which its Government might eventually wish to make for amendment of the Agreement; it is, of course, not necessary to do so. But it is clear enough that all Governments will have to consider whether there is sufficient balance in the present Agreement, whether, for example, the developmental problems of a number of Contracting Parties receive adequate recognition compared with the tariff agreement aspects of the existing Agreement. Whether, in fact, it might be possible to distinguish more clearly between provisions which lay down a code of good behaviour in international commercial relations and those provisions which are necessary to safeguard tariff concessions.

"Other thoughts suggest themselves. There are the further questions whether the wording of certain of the draft Charter articles is better than the wording of the corresponding G.A.T.T. articles and whether any action is to be taken in relation to the sections of the Charter which are omitted from the G.A.T.T. Contracting Parties must consider, I suggest, the fundamental question of whether the new G.A.T.T. is again to be a detailed Agreement with escape procedures designed in advance to meet certain situations, or whether it should take some form, such as the form of the Charter, or the form simply of a statement of principles. These things I mention for illustration; they will no doubt be added to. In themselves they pose question of a most fundamental character. In the view of the Australian Government, it is essential that during the current session, the Contracting Parties should make firm arrangements for a comprehensive review of the General Agreement to be undertaken during 1954."

DISCRIMINATION AGAINST OIL MILLS

The All-India *Khadi* and Village Industries Board seems to have gone a step ahead of the recommendations of its Production Programme Committee on the policy of discrimination against the large-scale units in the vegetable oil industry. The Committee had, as reported in these columns last week, recommended a levy of Re. 1-4 per maund of oil crushed by oil mills and the grant of a subsidy of Re. 1-8 per maund, in the first year, and Rs. 2 per maund in the second year, of oil crushed by the bullock-driven *ghani*. The Board, which met in Bombay for two days last week, has accepted the first recommendation, namely, the levy of a cess of Re. 1-4 per maund of oil produced by the mills, without making any alteration. But it has decided that the subsidy to be given to *ghanis* should be Rs. 2-8 per maund of oil produced from the inception of the legislation for the purpose. Thus the Board has not only increased the subsidy, but, by recommending the increased rate from the first year itself, has rejected the principle of differentiation in the rate of subsidy payable in the first year and the subsequent years, as suggested by its Committee.

The Board in making its recommendations has not stopped at that. It has made a few more onerous suggestions aimed at progressive reservation of spheres of production to the *ghani* industry. Thus, it has recommended that the State Governments should fix quotas of oilseeds for the mills on the basis of the average performance of each mill during the last three years, so that the balance may be a closed preserve for the *ghanis*.

With a view to encouraging the production of edible oils by the *ghani* industry, a few more recommendations have been made by the Board, and these mainly relate to the crushing of cottonseed and the use of cottonseed oil. In order to promote the crushing of cottonseed by mills, the Board has suggested the abolition of inter-State levies and duties on cottonseed. Secondly, the *vanaspati* factories are to be compelled to use cottonseed oil upto 10 per cent. of the output of this soil. Thirdly, soapmakers are to replace groundnut oil by cottonseed oil as far as possible. Lastly, the State farms are to purchase cottonseed oil cakes for cattle feed and to carry on publicity for a similar use of the cake by other farmers.

The Board has requested the Union and State Governments to take early steps to enact the necessary legislation to enforce its above decisions. The Board has also decided to acquire about 20 acres of land at Borivli, 25 miles north of Bombay, for the construction of a research institute and laboratory devoted to the development of the *ghani* industry.

THE
CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA
(Incorporated in England by Royal Charter, 1853)
(Liability of Shareholders Limited)
Capital (Paid-up) - £3,500,000

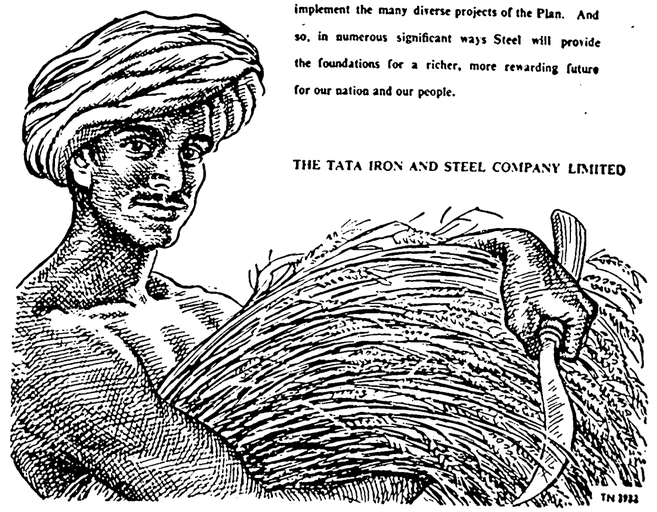
"What a future—my future. What hope these five years hold for me! Up the river a giant wall of steel and concrete is going up . . . they are building a dam. There will be water to irrigate my fields and the fields beyond. No more shall I have to depend on the mercies of the monsoon!"

These eager words of a simple farmer symbolise the will of a nation. The Five Year Plan provides Rs. 795 crores for improving the condition of agriculture—for transforming this India from a land of poverty to a land of plenty. In this mighty work of national reconstruction, the contribution of the tiller of the soil will be great.

Truly, these are men who hold destiny in their hands.

reaping the rich harvest



Hundreds of thousands tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

THE TATA IRON AND STEEL COMPANY LIMITED

What is NEWALLS 85% Magnesia?
It is a blended mixture of not less than 85%, by weight, of Pure Hydrated Carbonate of Magnesia. The balance is made up of high quality Asbestos fibre.

Why is NEWALLS 85% Magnesia so efficient?
Because millions of crystals in each cubic inch trap an infinite number of 'dead' air spaces. These reduce heat transmission most effectively.

Why is NEWALLS 85% Magnesia cheaper?
Because its covering capacity is very high (one ton applied evenly 1" thick over a flat surface will cover 2,200 sq. ft.) and because its higher efficiency results in a higher saving of heat. And heat costs money!

Manufactured by NEWALLS INSULATION CO., LTD.

AMY-S

INDIA'S SEA- AND AIR-BORNE TRADE IN APRIL-JUNE, 1953

ADVERSE BALANCE AMOUNTS TO RS. 43 CRORES

THE total value of the sea- and air-borne trade of India in the first quarter of the fiscal year 1953-54 discloses, as compared with the corresponding period of the preceding year, a fall of 22.4 per cent., although it shows an increase of 9.4 per cent. over that of the preceding quarter, namely, January-March, 1953. Thus, in the quarter under review, the value of total trade aggregated Rs. 278.44 crores which is Rs. 80.18 crores lower than that in April-June last year and Rs. 25.40 crores higher than that in the quarter ended March this year.

The value of imports in April-June, 1953, amounted to Rs. 160.66 crores, as compared with Rs. 124.94 crores in the preceding quarter and Rs. 219.61 crores in April-June last year. The larger imports during the quarter under review were due to relaxation of import controls for the period January-June, 1953, announced by the Government of India at the end of 1952, following an improvement in the balance of payments position of the country.

Exports Decline

The value of exports from India, on the contrary, showed a marked deterioration in the quarter under review. During April-June last year, India's despatches of goods abroad, both by sea and air, amounted to Rs. 139.01 crores. This dropped to Rs. 128.11 crores in the first quarter of the current calendar year and declined further to Rs. 117.78 crores in the subsequent quarter, namely, April-June, 1953. This recession may be attributed to the continuance of heavy export duties, fall in values of commodities, relaxation of tension in the world, and keen competition for export markets.

Owing to the changes noted above, the accounts for the period under review, namely, April-June, 1953, show a marked increase in the adverse balance of trade of the country. Of course, the country had an adverse balance of trade of the order of Rs. 80.60 crores at the end of June, 1952. But this had changed into a favourable balance of Rs. 3.18 crores at the end of January-March, 1953. The change did not persist long, as the Government had liberalised trade controls at the end of December, 1952. The volume of imports, as a result, gathered momentum in the first quarter of the current year, while there was also considerable recession in goods despatched from this country. Consequently, during April-June, 1953, the balance of trade turned adverse to the extent of Rs. 42.88 crores.

The following table shows, at a glance, the value of imports, exports, the total trade and the balance of trade during the first quarter of 1953-54, as compared with the preceding quarter as also the same quarter a year ago.

(Rupees in crores)

	April-June, 1953	Jan.-March, 1953	April-June, 1952
Total Imports	160 66	124 93	219 61
Total Exports	117 78	128 11	139 01
Total Trade ..	278 44	253 04	358 62
Balance of Trade (+) or (—)	—42 88	+3 18	—80 60

Imports

During the quarter under review, the total value of imports amounted to Rs. 160.66 crores, as compared with Rs. 219.61 crores in the corresponding quarter of 1952. Of these imports, foodstuffs which accounted for as much as 39 per cent. of the total in April-June, last year, declined to 26 per cent. of the total in the same period this year. This is reflected by a fall in the value of grains and flour from Rs. 76 crores to Rs. 57.07 crores in the three-month period ended June, 1953. Imports of vegetables and oilman stores, under this category, rose slightly from Rs. 1.07 crores and Rs. 1.34 crores to Rs. 2.30 crores and Rs. 1.97 crores, respectively.

Among raw materials imported during the period, raw cotton showed a marked fall in value from Rs. 36.90 crores to Rs. 19.26 crores. Imports of oils of all types, however, rose from Rs. 20.31 crores to Rs. 23.10 crores.

Machinery of all kinds accounted for as much as Rs. 22.45 crores of the total value of manufactures imported during the quarter under review. Imports of yarns and fabrics amounted in value to Rs. 7.99 crores, as against Rs. 4.54 crores in the same quarter in 1952. The offtake of electric goods, too, rose from Rs. 2.94 crores to Rs. 4 crores, so also imports of dyes and colours from Rs. 2.52 crores to Rs. 3.37 crores. Purchases of vehicles, other than locomotives, however, dropped by nearly 50 per cent. from Rs. 9.10 crores to Rs. 4.78 crores. Among other imports which registered a decline were chemicals and drugs from Rs. 7.69 crores to Rs. 6.23 crores, iron and steel manufactures from Rs. 7.33 crores to Rs. 5.40 crores and metals from Rs. 5.25 crores to Rs. 3.51 crores. The total percentage of manufactures to the total imports declined from 46 per cent. to 42 per cent. during the quarter under review.

The table below gives the value of certain principal items of imports under the three main heads, namely, food, raw materials and manufactures during April-June, 1953, as compared with that in the preceding quarter as also that in the same quarter a year ago.

Imports

(In crores of rupees)

	Three months April - June		
	1951	1952	1953
CLASS I			
Food, Drink and Tobacco	**46 56**	**80 70**	**43 20**
Grain, pulses and flour	40 10	76 01	57 07
Fruits and vegetables	1 40	1 07	2 30
Provisions and oilman's stores ..	1 43	1 34	1 97
Spices	2 34	1 00	1 38
CLASS II			
Raw Materials	**86 17**	**61 68**	**47 74**
Oils	16 62	20 31	23 10
Raw cotton	40 57	36 90	19 26
CLASS III			
Manufactures	**84 56**	**76 24**	**68 42**
Machinery of all kinds	24 01	23 60	22 45
Chemicals and drugs	7 57	7 69	6 23
Iron and steel manufactures ..	4 72	7 33	5 40
Yarns and fabrics	12 18	4 54	7 99
Vehicles (excluding railways) ..	5 93	9 10	4 78
Electrical goods	2 22	2 94	4 00
Dyes and colours	6 93	2 52	3 37
Metals	5 46	5 25	3 51

Exports

While the total value of imports declined by 26.8 per cent., that of exports recorded a fall of 15.3 per cent., thus narrowing down the adverse balance of trade from Rs. 80.60 crores in April-June, 1952, to Rs. 42.88 crores in the quarter under review, as stated earlier. Exports of Indian merchandise amounted to Rs. 117.78 crores, as compared with Rs. 139.01 crores. The recession in value was mainly due to the decline in prices of goods such as, jute manufactures, spices, vegetable oils, gums, resins and lac, raw cotton, mining products, etc.

In the food group, exports of tea improved from Rs. 10.31 crores to Rs. 12.15 crores. Despatches of tobacco, however, remained steady at Rs. 4.56 crores; so also spices at Rs. 4.38 crores and fruits and vegetables at Rs. 4.16 crores. In the raw material section, vegetable oil exports registered a sharp drop from Rs. 8.60 crores to Rs. 3.41 crores. Shipments of gums, resins and lac receded from Rs. 2.26 crores to Rs. 1.58 crores. Coal exports, too, were lower at Rs. 1.42 crores. Raw cotton shipments dropped from Rs. 7.34 crores to Rs. 6.42 crores. But a marked improvement was noticed in metallic ores and scrap iron exports which rose from Rs. 5.98 crores to Rs. 8.52 crores.

The table below shows the value of principal commodities exported abroad during April-June, 1953, as compared with those in the same period in 1951 and 1952.

Exports

(In crores of rupees)

	Three months April-June		
	1951	1952	1953
CLASS I			
Food, Drink and Tobacco	**27 73**	**27 33**	**26 87**
Tea	12 86	10 31	12 15
Tobacco	3 79	4 65	4 56
Spices	6 62	4 64	4 38
Fruits and vegetables	3 21	4 95	4 16
CLASS II			
Raw Materials	**82 11**	**37 88**	**30 07**
Oils (vegetable, minerals, etc.) ..	8 78	8 60	3 41
Metallic ores and scrap iron or steel ..	3 60	5 98	8 52
Gums, resins and lac	5 47	2 26	1 58
Non-metallic mining products ..	4 87	2 66	2 71
Coal	1 42	2 50	1 42
Raw cotton	35 11	7 34	6 42
Hides and skins (raw)	3 86	1 47	1 56
Seeds (for oil)	4 16	2 13	0 78
CLASS III			
Manufactures	**118 46**	**73 33**	**58 86**
Jute yarns and manufactures ..	73 58	44 07	24 65
Cotton yarns and manufactures ..	18 36	15 62	17 20
Other yarns and manufactures ..	4 16	1 14	1 84
Tanned hides and skins	9 14	2 94	6 48
Chemicals, drugs, medicines ..	1 34	0 86	1 01

In the manufactures group, the value of exports of jute manufactures, in recession as the table above shows, from Rs. 44.07 crores to Rs. 24.65 crores. There was, however, some improvement in cotton manufactures which rose from Rs. 15.62 crores to Rs. 17.20 crores. Exports of tanned hides and skins staged a commendable recovery from Rs. 2.94 crores to Rs. 6.48 crores.

The index number of average unit of declared values of imports for May, 1953, the latest month of which the figure is available (with 1948-49=100) was 119.7. The figure reveals a fall of 15.2 points as compared with that for the same month a year ago. Similarly, there was a fall of 17.4 points in the index figure for exports at 111.3. Again, the quantum index for imports shows a rise of one point from 98 to 99, whereas, in the case of exports, the quantum index discloses a fall of as many as 12 points from 113 to 101. It will be seen from these figures that the terms of trade were adverse to India. Although the value of imports declined in terms of volume, such a recession in the case of exports was far greater.

Geographical Distribution

During the quarter under review, there was a sharp fall from Rs. 65.28 crores to Rs. 54.66 crores in India's exports to Commonwealth countries. Part of this decline was due to lower offtake by Pakistan which amounted to Rs. 23 lakhs only as against Rs. 7.92 crores in April-June, 1952. Ceylon's purchases too, were lower, being no more than Rs. 3.81 crores as against Rs. 4.19 crores. Similarly, purchases by Australia fell from Rs. 7.84 crores to Rs. 4.93 crores. The offtake by the U.K., however, improved from Rs. 23.81 crores to Rs. 25.74 crores, this country being the best customer of India as in the past. Cargoes lifted by Aden also improved from Rs. 1.78 crores to Rs. 3.08 crores.

Among non-Commonwealth countries, the U.S. continued to top the list, accounting for purchase of goods valued at Rs. 22.65 crores. This, however, was Rs. 5.5 crores less than the offtake in the same period last year. Shipments to Burma amounted to Rs. 5.54 crores, as against Rs. 8.15 crores. The offtake by Japan, however, increased from Rs. 5.5 crores to Rs. 8.60 crores. West Germany's purchases were slightly lower at Rs. 2.19 crores, while those of the Netherlands dropped from Rs. 3.23 crores to Rs. 1.34 crores. Shipments to Italy also went down from Rs. 2.85 crores to Rs. 1.38 crores, and those to Egypt from Rs. 1.96 crores to Rs. 1.11 crores.

As compared with April-June, 1952, the value of imports from Commonwealth countries also registered a setback, from Rs. 67.16 crores to Rs. 69.29 crores. This reflects partly the fall in imports from the U.K. from Rs. 36.57 crores to Rs. 33.96 crores and from Canada from Rs. 9.49 crores to Rs. 2.81 crores. Purchases from Australia, however, rose from Rs. 5.38 crores to Rs. 11.02 crores. Indian offtake of goods from Kenya rose from Rs. 5.93 crores to Rs. 7.47 crores. Imports from Singapore and Bahrein Islands were better at Rs. 3.80 crores and Rs. 4 crores, respectively.

Among non-Commonwealth countries, the value of cargoes received from the U.S. dropped heavily from Rs. 99.77 crores to Rs. 29.42 crores. Imports from Egypt, however, rose from Rs. 3.01 crores to Rs. 8.73 crores, but those from Burma rose from Rs. 9.51 crores to Rs. 12.93 crores. Indian purchases from Japan also improved from Rs. 3.91 crores to Rs. 4.25 crores. West Germany's exports to India also advanced from Rs. 5.34 crores to Rs. 7.02 crores. Cargoes valued at Rs. 3.74 crores and Rs. 6.48 crores were received from the Netherlands and Italy respectively.

POOR KATKI LAC CROP

According to the preliminary estimates of the Indian Lac Cess Committee, the Katki Lac Crop in India for the year 1953 is expected to be 1,71,000 maunds as against a normal crop of 2,98,000 maunds. The estimates for the same crop for the previous year was 1,36,000 maunds.

The poor crop throughout the country is due to mainly to brood shortage caused by a poor Bysakhi crop and a very hot summer. The crop is poor even in areas round about Gondia in Madhya Pradesh where the Katki is usually good.

DEVELOPMENT OF MARKETING FARM PRODUCE

DELHI CONFERENCE DECISIONS ANALYSED

THE decisions reached at the Conference of Marketing Officers at New Delhi last week have accounted for a marathon Press release. As one scans this omnibus release, one cannot but resist the conclusion that the decisions contained in it are no more than a hotchpotch of long- and short-term measures. There has been no attempt on the part of the Conference to device a scheme which can ensure to the village farmer a fair price for his produce, a need which is now more urgent than at any time before, in view of the falling markets for agricultural produce. What is rather strange is that the representatives seem to have attended the Conference with no clear cut short-term plans for the consideration of the Conference. All that the Conference has done is to adopt a resolution directing the States to prepare plans for marketing agricultural produce, so as to make them fit into the framework of the Plan and to submit them to the Planning Commission for approval. This means the ryot has to wait till the plans are drawn, submitted and approved by the Commission and the State Governments concerned. Again, even after the final acceptance is obtained, the plan will have to wait for its implementation till the wherewithal is found by the State Governments. Again, finances being limited as they are, the States can scarcely afford to provide any worthwhile assistance to the ryots.

No Priorities Drawn

The limited financial resources at the disposal of States underline the need for evolving a scheme of priorities. These priorities should lay down the measures in the order of the extent to which each of them would contribute, directly and immediately, towards increasing the return to the farmer. Collection of the produce, grading and selling it in the market, for instance, should get first priority over every other measure. Others should come next. Attention to Agmarking, marketing of *ghee*, initiation of research schemes, organisation of all India market news service, broadcasting price schedules thrice daily through the A.I.R., sending marketing staff abroad for training in marketing and a host of other measures mentioned in the Press release are certainly not unimportant. They have their own use. But they cannot be taken up all at once, for that means enormous outlays, and no State Government can find the wherewithal for implementing all these measures. Some of them could be held in abeyance, others could be taken up as and when farmers' conditions improve. Sending Indian staff abroad for training, for instance, could certainly wait till the last, as techniques learned there may not be wholly applicable here. Besides, Indian conditions of farming and raising crops need marketing techniques specially evolved on the native soil. What is needed, therefore, is the listing of these items according to their end-uses and their end-results. The order in which the decisions have been enumerated provides no evidence of a conscious effort at drawing up a list of priorities at the Conference.

Use of Existing Procurement Agencies

The Conference has, however, done well in requesting the Community Projects Administration (C.P.A.) to carry out, with the co-operation of Central and State marketing staffs, a scheme for developing marketing facilities in the Community Project areas which could serve as a model for other areas to be brought under the National Extension Service. As both these agencies are being organised to tackle rural problems at the village level and on the spot, it is necessary that the idea of associating them with the function of selling the farm produce should certainly receive a very high priority. Meanwhile, the State Governments should examine the prospect of converting their procurement agencies into organisations for the collection, storage and sale of crops belonging to farmers. The godowns which are being used for storing Government grain can come in handy for storing and grading the grain before putting it on the market at the best rates. There are three main considerations in support of this measure. In the first place, it provides direct and immediate assistance to the farmer in selling his produce. Secondly, with a minimum amount of training, the procurement agencies can be converted into marketing organisations. Thirdly, it solves the question of providing employment to the staff retrenched in the Food Departments of States. The scheme, of course, will succeed only if the staff associated with the work approaches it in a spirit of national service and with a certain amount of imagination and zeal to stand by the helpless peasant.

With a view to securing for the producer the maximum return for his produce, the Conference has urged the State Governments to organise marketing co-operatives at all levels and link them with credit and multipurpose institutions. In addition, it has emphasised also the need for such co-operatives providing facilities for transport, processing and grading of produce and for bringing about closer liaison between the Marketing and Co-operative Departments of the State. This suggestion too deserves consideration wherever the Co-operative Movement has sufficiently developed to undertake the work.

Legislation for Warehousing

The States should, as has been recommended by the Conference, also initiate legislation not only for controlling the quality of exports of agricultural and animal husbandry products under Agmark, but also for making warehouse receipts negotiable for financing the marketing of produce. This will, of course, take a considerable amount of time, since it involves the solution of a series of issues such as provision of warehousing facilities, proper methods of grading, storing and handling of grains against which warehouse receipts have to be issued.

Standardisation of weights and measures is a reform which is long overdue. In the war years, an attempt was made to introduce the metric system of weights along with decimal coinage. Unfortunately, other pressing problems such as food shortage, drawing up a Constitution for India, etc., diverted the Government's attention from proceeding with the move. The Conference has done well in requesting the State Governments to pass and enforce the requisite legislation in order to replace the local maund and seer by a standard maund and seer and to entrust the administration of the Acts to their Marketing Officers. A suggestion has also been made to amend the Indian Weights Act, 1939, so as to restrict the use of avoirdupois system of weights to export trade only. The establishment of a separate Marketing Department on a permanent basis, as has been emphasised by the Conference, requires the prompt attention of the State Governments, though the question of sending the staff to foreign countries may be deferred till there is some improvement in their financial resources.

Construction of Roads

The Conference has called upon the States to give "the highest priority" to the construction of all-weather feeder roads in agricultural areas for facilitating the movement of agricultural produce to the assembling markets or despatching stations. This recommendation is unlikely to find favour with State Governments on considerations of finance. For there is already considerable backlog in repairing and maintaining the existing State roads, let alone construction of new roads. Consequently, the implementation of this recommendation calling for "the highest priority" is likely to be deferred for the time being, if not indefinitely. Construction of rural roads has been included as an important item in the scheme of the Community Projects. The *Shramadan* movement has been entrusted with this work and, therefore, the Marketing Officers should take up the question with the C.P.A. as part of their scheme for marketing agricultural produce. The Conference has, however, done well in pressing for wagon facilities from the railways. The railways, which have been doing good work in connection with the transport of foodgrains, should bestow greater attention on providing adequate facilities for transporting other agricultural commodities as well from producing to consuming centres. In this sphere, too, a clear cut plan is needed.

The Conference has requested State Governments to provide sufficient funds in the budgets for issuing posters, leaflets and films for educating the public and the producers regarding improved methods of marketing. This suggestion should receive the highest priority next to handling, processing and marketing of grain. The implementation of this measure needs careful preparation, as one should take into account the extent of literacy in a particular area, the type of crop grown, the nearest market served, etc. Of course, the radio could take a prominent part in the dissemination of marketing methods, but, unfortunately, the number of radio installations in rural areas is too inadequate to yield any results. The exhibition of films through mobile vans is, however, a workable proposition which, if carried out diligently, will pay good dividends.

FOOD AND AGRICULTURE ORGANISATION

EXPERTS HELP SOLVE FARM PROBLEMS

IN view of the fact that two out of every three persons in the world are farmers, the work of the United Nations Food and Agriculture Organisation (F.A.O.) in dealing with the long-range problems of food and farming cannot be overestimated. As one of the U.N. specialised agencies, the F.A.O. is an association of nations pledged to contribute to an expanding international economy by working to raise the standards of living of the world's peoples. It strives constantly to bring about a more efficient production and distribution of agricultural products and to better the living conditions of rural populations in underdeveloped areas.

Most of F.A.O.'s workers are specialists in fields of science related to food or agriculture. Some are experts on soil and water conservation. Others are horticulturists or veterinarians, and still others are authorities on fisheries or forests. The F.A.O. has been particularly active in the fields of soil and water, the most basic of all agricultural resources. Much had been learned about these two resources by the ancient civilisations of Asia and the Middle East. But modern science has contributed to that older knowledge a great deal that enables agriculturists to make better use of soil and water for the good of all men. To-day, farmers can get a larger production from their land without damaging the soil and have learned to convert their wastelands into new sources of food.

The Problem of Cost

Even in highly developed modern areas production can be greatly increased by the proper use of land and water. It is estimated that, by 1975, agricultural production in the United States could be increased by 200 per cent., if every farmer used fertiliser up to the economic limit. In any analysis of an agricultural economy, however, the chief question is one of cost. The problem is to determine how much any farm, community, nation or group of nations can afford to spend to increase their agricultural production and what it would be worth in terms of economic and social gains.

In the Near East and Africa, extensive work in soils, land use and the employment of fertilisers is under way in co-operation with the F.A.O. Israel has a broad programme that includes land-use, land classification and water conservation. A number of F.A.O. technologists are making land and soil surveys, in Pakistan, as well as working in the fields of irrigation engineering, well-drilling and ground water geology. In Saudi Arabia the development of the Wadi Jizan area calls for intensive work in surveying, land reclamation, irrigation engineering and well-drilling. Iran has a number of F.A.O. technologists working on soils, land use, irrigation and fertilisers. Libya also has a broad land-conservation programme, and similar work is under way in Iran, Nyasaland and Syria. Work on soils, fertilisers and dry-farming is in progress in Ceylon, and there is a F.A.O. soil study and mapping project in North Borneo. Water development projects have been started in India, Korea, Nepal and East Pakistan.

Projects concerned with land classification and soil conservation are also being carried out by F.A.O. specialists in such Latin American countries as Brazil, Chile, Colombia, Ecuador, El Salvador, Jamaica and Trinidad. In Europe, Yugoslavia is getting help from the F.A.O. in programmes designed to conserve the soil and reclaim, swamp-lands. There are also pasture management programmes in nine countries: British Guiana, Chile, India, Iran, Libya, Mexico, Pakistan, Syria and Yugoslavia.

BEGG, SUTHERLAND SUGAR GROUP'S DISAPPOINTING RESULTS

EFFECTS OF DROP IN PRICES AND HEAVY EXCISE DUTY

THE audited accounts of the four sugar companies namely, Champarun Sugar Co., Ltd., Balrampur Sugar Co., Ltd., Ryam Sugar Co., Ltd., and Samastipur Central Sugar Co., Ltd., in the group managed by Messrs. Begg, Sutherland & Co., Ltd., Kanpur, for the year ended 30th June, 1953, fully reflect the impact of the Government of India's sugar policy and the heavy incidence of State Governments' cane cess and sugar excise duty on the financial results of sugar companies in general. The earnings of all the four companies for the year under review have suffered a precipitous fall, as compared with those for the previous year, despite the substantial increases in the quantity of cane crushed and sugar produced in every case.

The individual performances of the four Companies can be seen from the comparative table published at the bottom of these columns. A general idea of the extent to which the group, as a whole, has suffered from the effects of the factors stated above, can be gained from the fact that their aggregate gross profit has dwind led from Rs. 33.02 lakhs for 1951-52 to Rs. 13.27 lakhs for the year under review, a fall of 59.8 per cent. Their total net profit amounts to Rs. 3.86 lakhs, as compared with Rs. 12.11 lakhs for the previous year. It must, however, be stated that, of the four, Balrampur was the only one to suffer a small net loss. The dividends of Champarun, Ryam and Samastipur Central have been halved, while Balrampur provides a solitary exception by passing over the dividend and that too for the second year in succession. It may, incidentally, be noted that the dividend of Champarun for the year under review is the lowest paid since 1939-40. The dividend of Ryam is brought back to that paid for 1941-42, though in the intervening years—in March, 1948, to be precise—the ordinary paid-up capital was doubled. The latest dividend of Samastipur Central is the same as that paid for 1946-47.

Production Higher

The quantity of cane crushed during the season by all the four Companies shows a substantial rise over the year to a record or near-record level. Thus, Champarun crushed a record quantity of 48,92,437 maunds of cane, as compared with 39,96,367 maunds in 1951-52, Balrampur also a record of 51,42,603 maunds (39,33,538 maunds in 1951-52), Ryam 23,79,823 maunds (18,73,915 maunds in 1951-52), the highest in the last 15 years, and Samastipur Central 24,10,481 maunds (19,42,763 maunds in 1951-52), the second highest. The quantity of sugar produced also shows an impressive increase, Champarun from 4,16,220 maunds to 4,86,311 maunds, Balrampur from 3,68,621 maunds to 4,78,256 maunds, Ryam from 2,11,452 maunds to 2,42,759 maunds, and Samastipur Central from 1,94,547 maunds to 2,44,376 maunds. The increase in the quantity of cane crushed and sugar produced was due to the longer crushing season, but this factor was also responsible for the decline in percentage of sugar recovery in all cases, except Samastipur Central.

The main reason for the setback in results is the reduction in the price at which the large carry-over of sugar stocks from the previous season had to be sold. In respect of the controlled sugar held on 30th June, 1952, however, the loss sustained by the Companies was made good by the Government by a subsidy, equal to the difference between the controlled price in the 1951-52 season, namely, Rs. 31 per maund and that in 1952-53, namely, Rs. 27 per maund. In regard to free sugar, the price of which declined in sympathy with the reduction in the control price, no compensation was received to cover this loss. In the case of Ryam Sugar Co., the accumulated stocks of uncontrolled sugar could not be moved out due to the flooding of the tramway line and feeder roads servicing the factory, which stopped the despatch of sugar from the factory. The question of obtaining some compensation for the loss caused by circumstances beyond the control of the management has been referred to the Central and the State Governments.

A striking feature disclosed by the table published below is the decline in the cost of raw materials consumed and manufacturing charges of the Companies by Rs. 13.70 lakhs. This is due to the reduction in cane prices made in November, 1952, which afforded some relief against the cost of transport. But the fall in expenditure on this account, coupled with the subsidy of Rs. 17.04 lakhs received by them from the Government, has been more than offset by the increase in cane cess and excise duty, which have gone up in the aggregate by Rs. 5.55 lakhs and Rs. 32.19 lakhs, respectively. The increase in excise duty paid is partly accounted for by the additional excise duty of Re. 1 a maund, levied by the Government to compensate sugar factories for the loss incurred by them in disposing of the previous season's carry-over stocks at reduced prices, and partly by the increase in production of sugar.

The Board of Directors of the Balrampur Sugar Co., Ltd., has approved a scheme for replacing some of the plant and machinery at the Company's factories by more modern and up-to-date equipment with a view to effecting a saving in the cost of production. The scheme will be spread over a number of years and it is to be hoped that the Company will derive considerable benefit therefrom.

COCHIN STATE POWER AND LIGHT CORPORATION LTD.

The Cochin State Power and Light Corporation Ltd. (Managing Agents: Messrs. Chandrie & Co., Ltd., Madras) has earned a gross profit of Rs. 2.16 lakhs for the year ended 31st March, 1953. As compared with that of Rs. 1.11 lakhs for the previous seven months (the Company's official year-end was changed last year from 31st August to 31st March, consequent on the integration of Travancore-Cochin State in the Indian Union), the profit for the twelve months under review is relatively higher. A provision of Rs. 41,820 has been made for depreciation under the Electricity (Supply) Act, 1948. Managing Agents' remuneration absorbs Rs. 13,041 and provision for taxation Rs. 65,000. The Directors have set apart Rs. 4,934 towards contingency reserve under the Electricity (Supply) Act, 1948. In May, 1953, the Company paid an interim dividend of 5 per cent., absorbing Rs. 30,000. A final distribution of 5 per cent., requiring another sum of Rs. 30,000, has now been proposed for the year under review. Thus, the total dividend for the year works out to 10 per cent. per annum, same as that for the previous accounting period.

Despite the restriction on offtake of power during the summer months, the Company's progress during the year has been satisfactory. In view of the prospects of a better supply of power by the State Government from its various hydro-electric projects, the Company proposes to extend its area of distribution. In order to take up the extension programme and to finalise the plans on hand, the Company proposes to raise a sum of Rs. 2 lakhs by making a call of Rs. 2-8 per share from the existing shareholders, thus making the shares Rs. 10 fully paid-up.

PERIA KARAMALAI'S PROFIT DECLINES

DIVIDEND SLIGHTLY REDUCED

AFTER having maintained an upward trend since the year 1948-49, the earnings of the Peria Karamalai Tea and Produce Co., Ltd. (Managing Agents and Secretaries: Messrs. Peirce Leslie & Co., Ltd., Kozhikode, Malabar), have suffered a setback during the year ended 31st March, 1953. The gross profit of the Company, which had advanced from Rs. 13.67 lakhs for 1948-49 to a record high of Rs. 34.52 lakhs for 1951-52, has receded to Rs. 28.73 lakhs for the year under review. This decline reflects the extent to which the severe crisis, through which the industry, as a whole, passed during the past year, has affected the Company. It is, however, gratifying to note that the Company's profit for the year under review, at Rs. 28.73 lakhs, is the second best in its history.

The dividend has been slightly cut from the record one of 45 per cent. per annum paid for 1951-52 to 40 per cent. But part of the dividend for the year under review is on an increased capital, raised during the year by capitalisation of a portion of the reserves. In April, 1951, it will be recalled, the Company capitalised a sum of Rs. 10.86 lakhs from out of the general reserve and distributed bonus shares of Rs. 7-8 each at a *pro rata* basis of one share for every two held by the then existing shareholders, thereby raising the paid-up capital to Rs. 32.60 lakhs. The final dividend of 25 per cent. paid for 1950-51 was on this increased capital. The two interim dividends of 10 per cent. each and the final one of 25 per cent., making a total of 45 per cent. paid for 1951-52, were also on this enhanced capital of Rs. 32.60 lakhs. For the year under review, the Company paid only one interim dividend of 15 per cent. on this capital, instead of two of 10 per cent. each as in the previous year. In August, 1953, however, the Company capitalised again—for the fourth time in its history—a sum of Rs. 2.17 lakhs, out of the amount standing to the credit of its general reserve, and issued a scrip bonus of As. 8 each, thus raising the paid-up capital to Rs. 34.77 lakhs. The Company now proposes to pay a final dividend of 25 per cent. on this increased capital.

The salient features of the Company's results for the year under review are presented against the background of those for the previous three years:

	For the year ended 31st March			
	1953	1952	1951	1950
	Rs.	Rs.	Rs.	Rs.
Sale proceeds	61,20,252	69,58,111	49,21,808	42,03,078
Stocks	5,97,223	11,56,227	3,44,223	4,42,324
Expenditure on estates	38,87,219	36,64,541	20,73,663	23,42,234
Gross profit	28,72,718	34,52,037	22,04,834	17,03,023
Managing Agents' commission	1,44,812	1,23,458	1,03,857	84,031
Other expenses	2,99,656	2,60,160	1,65,615	1,22,705
Depreciation	1,94,213	2,00,322	1,97,232	1,58,856
Taxation	4,22,000	4,80,000	3,00,000	1,75,000
Net profit	19,55,855	23,08,400	14,61,722	12,36,714
Reserves	5,00,000	7,00,000	4,00,000	4,50,000
Pension fund	30,000	30,000	30,000	30,000
Dividend	13,58,175	14,56,829	10,32,213	8,69,232
	(40%)	(45%)	(35%)	(40%)
Carry forward	1,43,975	1,81,295	71,715	72,206
Tea crop in lbs.	38,27,311	30,25,059	23,47,665	28,58,417
Coffee crop in cwts.	350	100	210	205
Cost of production per lb. of tea	As. 15.73	As. 15.35	As. 16.63	As. 15.71
Average price realised—				
Tea per lb.	As. 27.84	31.04	29.36	25.52
Coffee per cwt.	Rs. 179	179	152.92	145.02

It will be noted from the foregoing table that the Company's crop of tea constitutes a fresh record. The coffee crop, which had suffered a decline in the previous year, has also surpassed all the previous performances. If, despite such record production, the profit has turned out to be lower, it is because of adverse market conditions and an increase in cost of production, thanks to the introduction of the Minimum Wages Act. In fact, the drop in profit would have been much higher than it is now but for the reputation which the Company's tea and coffee enjoys in the market. In tune with the decline in earnings, the allocation to the general reserve has been cut from Rs. 7 lakhs to Rs. 5 lakhs, as also the distribution to the shareholders.

Some notable changes have taken place in the capital structure of the Company. The paid-up capital, as at the end of the year under review, was Rs. 32.60 lakhs, made up of 434,616 shares of Rs. 7-8 each. But this has since not only been raised to Rs. 34.77 lakhs, as already stated, by the capitalisation of a part of the general reserve in August, 1953, but the shares have been split into those of Rs. 2 each. At the time of the issue of bonus shares in August last, the Company sub-divided the Rs. 7-8 paid-up shares into 15 shares of As. 8 each and issued 434,616 new shares of As. 8 each as bonus shares at the rate of one such share for every 15 split.

Points From The Chair

Need for Reinsurance Corporation

"THERE was a big drain on our income by way of reinsurance premium ceded to our foreign Treaty companies. We have now been able to secure reciprocation from our Treaty friends and I am sure that it will go a long way to improve the figures of our profit and loss account. Here, I must make a reference to the need for a Government-sponsored Reinsurance Corporation. The Code of Conduct is so framed that no big business is displaced. Bigger insurance companies, with a few exceptions, having the bulk of big business, are more in favour of exchanging business with foreign reinsurance companies than to cede business to their Indian colleagues. Perhaps, it may be considered an act of narrow nationalism, if a State Reinsurance Corporation is started and if the companies are asked to cede a particular percentage of their surplus before reinsurance is obtained elsewhere, but it will be worthwhile as there will be smaller drain on our foreign exchange and that will help the smaller and medium-sized companies in establishing themselves. This is the practice in many South American and other countries."

AMRATLAL KALIDAS,
Neptune Assurance Co., Ltd.

Stable Buying Policy for Tin

"The tin price continued to be satisfactory until April of 1953, when the price fell by approximately £200 per ton of metal and was followed by a rapid decline to the very low level of £568 per ton of metal, equivalent to £409 per ton of tin ore. Since then there has been a small recovery, but the price remains at an uneconomic level for the majority of both Chinese and European mines in Malaya, as in other tin producing countries. It has recently been announced that the Malayan and United Kingdom Governments are in favour of re-convening the Geneva Conference. If the conference is held, we must hope that no attempt will be made to stabilise the price of tin too near the present low level. It is the variation in consumer demand which has so influenced the variation in the price in the past and a first essential is a more stable buying policy on the part of consumers."

STANLEY WICKETT,
Kent (F.M.S.) Tin Dredging Ltd.

Buyers' Market for U.K. Coal

"Things have now changed considerably and we are back to a buyers' market. We are, therefore, compelled to live up to specifications which are somewhat exacting, and it is fortunate that, if developments are quickly centred upon those valuable reserves of saleable coal for export, we shall still be able to hold many of the markets where high prices can be obtained, even though we may find it necessary to import domestic and industrial qualities which are in plentiful supply in Europe without having to expend dollars for American coal. The Coal Board has an enormous task in hand, but its progress is too slow and expenditure upon modernisation is behind time. It is also to be hoped that the appeals which are being made for greater effort and increased output per man employed will, without further delay, be more fully appreciated by those who have in their hands the well-being of the greatest or our national industries and, to a large extent, the control of the country's trade balance."

SIR HERBERT MERRETT,
Powell Duffryn, Ltd.

(*Concluded from previous page*)

shares of As. 8 each. After the issue of bonus shares, four shares of As. 8 each were consolidated into one share of Rs. 2. The present paid-up capital of the Company (Rs. 34.77 lakhs) is thus made up of 1,738,464 shares of Rs. 2 each. It will be interesting to record here that the Company has in the course of the past 14 years, raised its capital by Rs. 21.53 lakhs by way of capitalisation of reserves alone. This shows how prudent the Company's management must have been in conserving its resources. After the capitalisation of the said sum of Rs. 2.17 lakhs, the reserves and surplus stand at Rs. 19.98 lakhs. There is a debenture liability of Rs. 9 lakhs, after redeeming stocks worth Rs. 1 lakh during the year. The current liabilities, besides a tax provision of Rs. 1.03 lakhs, aggregate Rs. 23.14 lakhs. The gross block of Rs. 61.10 lakhs (including an addition of Rs. 5.43 lakhs made during the year under review) has been written down to Rs. 45.88 lakhs. The current assets amount to Rs. 42.03 lakhs and cover the current liabilities, including the provision for taxation, by a handsome margin of Rs. 17.86 lakhs.

KHATAU MAKANJI SPINNING AND WEAVING CO., LTD.

The sale proceeds of cloth, yarn and waste of the Khatau Makanji Spinning and Weaving Company, Ltd., for the year ended 30th June, 1953, have declined by Rs. 27.52 lakhs only and not by Rs. 67.52 lakhs, as was stated on page 740 of our issue dated 17th October, 1953. The increase in cost on account of salaries, wages, bonus and food allowance works out to Rs. 8.42 lakhs and not Rs. 13.47 lakhs as mentioned in our review. The Company's production for the year under review was higher than that in the previous year and the presumption that it must have been lower because of the decline in sale proceeds and in the cost of raw materials and stores consumed is not correct.

COMPANY MEETINGS AND DIVIDENDS

MADRAS SAFE DEPOSIT CO., LTD. Annual General Meeting, Madras, 9th November, 1953. Dividend: Rs. 2-8 per share. Transfer books closed from 26th October to 9th November, 1953, both days inclusive.

BHARAT AIRWAYS LTD. Annual General Meeting, Calcutta, 9th November, 1953. Transfer books closed from 27th October to 9th November, 1953, both days inclusive.

PORT SHIPPING CO., LTD. Half-yearly General Meeting, Calcutta, 11th November, 1953. Dividend: As. 8 per share. Transfer books closed from 31st October to 11th November, 1953, both days inclusive.

COCHIN STATE POWER AND LIGHT CORPORATION LTD. Annual General Meeting, Ernakulam, 12th November, 1953. Dividend: As. 6 per share. Transfer books close from 5th to 12th November, 1953, both days inclusive.

BENGAL FLOUR MILLS CO., LTD. Half-yearly General Meeting, Calcutta, 13th November, 1953. Transfer books close from 2nd to 13th November, 1953, both days inclusive.

VELLORE ELECTRIC CORPORATION LTD. Annual General Meeting, 15th November, 1953. Dividend: Re. 1 per share, free of tax. Transfer books close from 1st to 15th November, 1953, both days inclusive.

WESTERN INDIA TANNERIES LTD. Annual General Meeting, Bombay, 17th November, 1953. Transfer books close from 2nd to 16th November, 1953, both days inclusive.

NEW KAISER-I-HIND SPINNING AND MANUFACTURING CO., LTD. Annual General Meeting, Bombay, 18th November, 1953. Transfer books closed from 31st October to 18th November, 1953, both days inclusive.

ARYAN BRUSH CO., LTD. Annual General Meeting, Bombay, 21st November, 1953. Transfer books close from 12th to 21st November, 1953, both days inclusive.

SHOLAPOOR SPINNING AND WEAVING CO., LTD. Annual General Meeting, Bombay, 30th November, 1953. Transfer books close from 10th November to 2nd December, 1953, both days inclusive.

CALCUTTA ELECTRIC SUPPLY CORPORATION LTD. Interim dividend of £3 per cent. net (tax applicable at 9s. in the £) for year ending 31st December, 1953, payable on 16th November, 1953.

COIMBATORE KAMALA MILLS LTD. Dividend of Rs. 4-8 per share, for the year ended 31st December, 1952.

ALAGESWAR ESTATES LTD. Dividend As. 2 per share for the year ended 30th June, 1953. Transfer books close from 1st to 11th December, 1953, both days inclusive.

COORG TEA CO., LTD. Dividend of As. 8 per ordinary share, for the year ended 31st March, 1953. Transfer books close from 15th to 21st November, 1953, both days inclusive.

SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LTD *Ad-interim* dividend of As. 6 per share (tax-free), for the year 1953-54. Transfer books close from 17th November to 2nd December, 1953, both days inclusive.

KILLICK INDUSTRIES LTD. Final dividend of Rs. 6 per share, free of income-tax, for the year ended 30th June, 1953. Transfer books close from 2nd to 16th November, 1953, both days inclusive.

COMPANY REGISTRATIONS

Notices

THE MORARJEE GOCULDAS SPINNING & WEAVING CO., LTD.

NOTICE OF 82nd ORDINARY GENERAL MEETING

NOTICE IS HEREBY GIVEN THAT THE Eighty-second Ordinary General Meeting of the Shareholders of the Morarjee Goculdas Spinning and Weaving Company, Limited, will be held at the Registered Office of the Company, Soparibaug Road, Parel, Bombay, on Monday, the 16th November, 1953, at 1-0 p.m. (S.T.) to transact the following business:—

1. To adopt the Directors' Report and Audited Statements of Accounts for the year ended 30th June, 1953.
2. To declare a Dividend on Ordinary and Preference Shares.
3. To elect a Director in place of who retires by rotation but is eligible for re-election.
4. To elect Directors in place of those who vacate office but are eligible for re-election.
5. To appoint Auditors and fix their remuneration.
6. To transact such other business as may be brought before the meeting by the Chairman.

The Transfer Books of the Company will remain closed from Wednesday, the 11th November, 1953, to Saturday, the 28th November, 1953 (both days inclusive).

By Order of the Board of Directors,
For PIRAMAL & SONS,
MOHANLAL PIRAMAL,
Partner,
Agents.

SOPARIBAUG ROAD, PAREL,
BOMBAY, 19*th October*, 1953.

Note.—The Dividend, if sanctioned, will be payable to those Shareholders, whose names stand on the Register of the Company in the evening of Tuesday, the 10th November, 1953 and Dividend Warrants will be posted to the registered addresses of such Shareholders.

THE PEERMADE TEA COMPANY LIMITED

(*Incorporated in Travancore*)

NOTICE IS HEREBY GIVEN THAT THIS Company will pay a first interim dividend of 10 per cent. on the Ordinary Share Capital of the Company in respect of 1953 working on the 14th November, 1953.

The transfer books of the Company will remain closed from the 7th November, 1953, to 14th November, 1953, both days inclusive.

ASPINWALL & CO. (TRAVANCORE) LTD.,
Secretaries.

ALLEPPEY, 23*rd October*, 1953.

TIP JET ENGINE FOR HELICOPTERS

The U.K's. first helicopter blade-tip jet engine has been announced. Developed by Saunders-Roe, the new engine is just short of 4 feet in length and is shaped something like a giant cigarette-holder. Intended primarily for military helicopters, the Saro, as the engine is named, can be run on almost any fuel, and gives a thrust of 45 lbs. The company is already working on an engine that will be capable of 120 lbs. A 10,000-lb. load could be lifted by five of the new engines fitted to a five-blade rotor.

It is less than two months since the announcement that two other British firms, namely, Fairey and Bristol, had been given a Government contract to build prototype twin-engined helicopters suitable for commercial airline service. One of these, the Fairey Rotodyne, is powered by two turbine engines, but, in this case, the exhaust from the engines is fed from the fuselage up through the blades and out of the blade tips to impart thrust.

AMALGAMATED COALFIELDS REDUCES DIVIDEND, DESPITE HIGHER PROFIT

NILGIRI NEERUGUNDI SUFFERS LOSS

Amalgamated Coalfields, Ltd.

THE directors of the above Company (Managing Agents: Messrs. Shaw Wallace & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st March, 1953.

The Company's profit for the half-year after the inclusion of Rs. 25,799 (Rs. 38,939) brought forward and provision for previous periods' taxation no longer required Rs. 35,000 (nil) is Rs. 3,38,754 (Rs. 3,30,266). After making provision for taxation Rs. 87,088 (Rs. 1,37,000), there remains Rs. 2,51,666 (Rs. 1,93,266). Out of which the directors have placed to machinery replacement and development reserve Rs. 1,03,577 (nil) and recommend the payment of a dividend at the rate of 10 (12½) per cent. per annum, free of income-tax absorbing Rs. 1,27,500 (Rs. 1,59,375) leaving to be carried forward Rs. 20,589 (Rs. 33,891).

The Company has incurred further heavy expenditure on modernisation of machinery and development and considerable further finance on this account will be required in future. Bearing this in mind, the directors have transferred Rs. 1,03,577 from this half-year's profit to this account. In addition a sum of Rs. 71,423 being E. P. T. post-war refund received during the half-year has also been allocated to this account.

Output and despatches for the last three half-years are as follows:—

Half-year ended	*Raisings*	*Despatches*
	Tons	Tons
31st March, 1953	3,72,975	3,68,886
30th September, 1952 ...	3,55,863	3,52,808
31st March, 1952	3,55,525	3,44,795

Wagon supply improved during the closing months of the half-year and is reflected in the larger output and despatches.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	25,50,000	Block ...	22,60,000
Reserves ...	17,50,000	Stock of coal	2,93,759
Provision for taxation ...	2,15,000	Stores ...	16,20,512
Liabilities ...	27,21,115	Debts, deposits and advances ...	28,28,086
Profit and loss account ...	20,589	Investments	1,12,500
		Cash ...	1,41,847
Rs.	72,56,704	Rs.	72,56,704

Nilgiri Neerugundi Estates Co., Ltd.

The directors of the above Company (Managing Agents and Secretaries: Messrs. Peirce, Leslie and Co., Ltd., Kozhikode, Malabar) submitted the audited accounts of the Company for the year ended 30th June, 1953.

After providing for depreciation and all charges except taxation, the accounts showed a loss of Rs. 66,258 (profit of Rs. 1,45,648). Deducting the balance brought forward from last year of Rs. 54,700 (Rs. 17,460), 7 per cent. cumulative preference dividend for the year ended 30th June, 1953 Rs. 10,500 (Rs. 10,500), and provision for taxation Rs. 800 (Rs. 1,200), there was a loss (adjusted against reserves) of Rs. 22,858 (carry forward of Rs. 54,700 after paying 10 per cent. dividend). The loss was incurred as a result of the poor coffee crop and also of the low prices received for green leaf tea. In view of the loss the directors recommended, that no dividend be paid for the year.

After adjusting the loss incurred during the year, there remains a total reserve of Rs. 3,81,680. The 1953-55 Government of India Loan for Rs. 50,000 has since been redeemed and the proceeds used for estate working expenses. There remains the 1957 Government of India Loan for Rs. 25,000 on investment account. The ninth redemption of 105 debentures was carried out on 30th June, 1953.

A total tea crop of 8,66,926 lbs. green leaf was harvested during the year which compares favourably with the 7,79,124 lbs. leaf harvested during the previous year. The cost of production was As. 3.57 per lb. and the average price realised was As. 3.73 per lb. The crop for 1953-54 is estimated at 10,00,000 lbs. and is sold forward As. 4.75 per lb.

The Company was allotted 1,56,732 lbs. export quota, which is equivalent to 86.5 per cent. of the basic crop. These rights were sold as usual. A preliminary issue of 70 per cent. of the basic crop has been received for season 1953-54.

The coffee crop harvested during the year was tons 38-7-1-14 against tons 99-1-2-16 last year. This has been delivered to the Coffee Pool and valued at Rs. 2-4 per point or Rs. 160.43 per cwt. The cost of production was Rs. 304.17 per cwt. For 1953-54 a crop of 100 tons is estimated to be harvested at a cost of Rs. 134.88 per cwt.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3,67,221	Block ...	6,32,514
Debentures ...	62,600	Stock-in-trade	63,617
Reserves ...	3,81,680	Stores & spare parts ...	25,345
Liabilities ...	64,002	Other assets	25,283
		Debts, deposits and advances ...	24,072
		Investments	76,400
		Cash ...	28,272
		Profit and loss account ...	Nil
Rs.	8,75,503	Rs.	8,75,503

Bharat Airways Ltd.

The directors of the above Company (Managing Agents: Messrs. Birla Brothers Ltd. Calcutta) submit the audited accounts of the above Company for the year ended 31st December 1952.

The accounts show a gross profit of Rs. 9,932 (net loss of Rs. 5,99,818). After making sundry adjusments and after writing off the brokerage on the issue of shares and preliminary expenses, a net debit balance of Rs. 22,17,288 (debit of Rs. 23,98,366) is carried forward to the next year's account.

The working of the Company during the year under review shows a better result than before, in spite of the increase in the price of petrol and reduction in rebate of petrol duty. In fact the result could have been better, had it not been hampered by Official policies which not only put extra burden on the industry but also reduced its efficiency.

The directors state that the Company has had the unique position of operating without any fatal accident. Probably this is the only Company in India that has had this safety record with so much of flying during the last six or seven years. This could be possible on the one hand by scrupulously adhering to all rules of safety and taking all possible precautions in this connection and on the other hand by the high sense of responsibility displayed by all the members of the staff in the discharge of their duties. The directors would, therefore, like to place on record their sense of appreciation of the work done by the members of the staff during all these years. In spite of all these, the cost of operation compares quite favourably with the cost of other operating companies in the country.

While the Company was in the midst of its expansion programme with a view to stabilise its economy the Government decided to nationalise the Air Transport Industry towards the close of 1952. This was against the declared pronouncements of the Government in the past, whereby the public and the Companies were assured that Air Transport Industry will remain in the hands of private sector for a period of ten years. Having passed through all the difficulties involved in the early stages in any aviation concern, the Company had just begun coming out of the woods, as would be clear from the results of the Company's working for the period, 1st January, 1953, to 31st July, 1953. Had the nationalisation not come about, the directors feel that the Company would have shown satisfactory results in future. It is thus an irony of fate that after having suffered colossal losses during the development period, when the Company had reached the stage of reaping the benefits of its pioneering efforts, the Government decided to take over the industry and that too on extremely unreasonable and inequitable terms of compensation. There may be different views regarding the principles of nationalisation but there cannot be any doubt that the private enterprise played its part very creditably in the development of civil aviation in India.

During the various discussions that the management had with the various spokesmen of the Government, it was strongly suggested that any scheme of compensation must be linked with the present market price of the assets. The Government, however, did not agree to this but decided that the compensation should be based on the depreciated book-value of such assets. The Company strongly protested against the decision, but unfortunately with no success. This scheme of compensation has undoubtedly helped the Government in acquiring the industry at a ridiculously low price but it has dealt a heavy financial blow to the Company. For example, the two sky-masters that the Company had, could be sold in the world market for about rupees forty-five lakhs, but under the scheme of compensation, the Company is not likely to get more than rupees eight lakhs for these two planes. The management has been trying to protect the interests of the shareholders to the best of their ability and had also kept them informed about the developments in this connection from time to time.

Knowing that the industry was being nationalised and the Company's assets were being acquired by Government shortly, the Company tried to avoid unnecessary losses and with that end in view requested the Air Transport Licensing Board for permission to suspend some of the uneconomic operations. Unfortunately even such a reasonable request was turned down resulting in the increased burden on the resources of the Company. According to the Indian Air Corporation Act, a major portion of the compensation will be paid to the industry in the form of 3½ per cent. negotiable bond. The exact amount payable to the Company cannot, however, be ascertained until after the full details of all the assets and liabilities are thoroughly examined into. The directors earnestly hope that the question of compensation will be settled amicably. In case, however, the matter is not settled as stated above, the question of calculating the compensation will have to be referred to the Special Tribunal to be appointed in accordance with the provisions of Air Corporation Act.

The directors have always held the view that nationalisation of Air Transport Industry was not in the interest of the country at this stage, but now that the nationalisation is an accomplished fact, the directors wish the best of luck to the Indian Airlines Corporation in their enterprise and trust that all members of the staff who had worked so hard and efficiently in the cause of civil aviation, will continue their laudable efforts and see that this important step in the direction of nationalisation meets with all success.

Accounts in brief are as under:

Liabilities	Rs.	Assets	Rs.

Tengpani Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Gillanders Arbuthnot & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December, 1952.

Weather conditions were on the whole favourable for growth throughout the year though the total rainfall measured was less than in previous years, 87.47 ins. compared with 91.27 ins. in 1951. The garden did not suffer from blights.

The total crop harvested during the year amounted to 7,137 mds. compared with 7,102 mds. cropped in 1951. The crop was sold partly in Calcutta and partly in London. The recession in prices which set in towards the end of 1951, continued throughout the greater part of 1952, and as a consequence the average prices realised for the Company's teas were lower than the average price of previous years. After Christmas 1952, prices improved, and the teas sold in later auctions realised satisfactory prices, but the improvement unfortunately came too late to offset the poorer prices obtained for the Company's teas earlier in the season, and the combined average of prices paid in London and Calcutta was below that of the previous year.

The combined average sale price per pound of tea was Re. 1-13-7 in 1952 as compared with Re. 1-15-10 in the previous year. The net sale proceeds realised and estimated amounted to Rs. 9,74,032 compared with Rs. 10,81,678 in 1951. The drop is due to the lower sale average.

The total garden outlay amounted to Rs. 8,18,318 which includes Rs. 2,17,787 incurred on the loss on the sale of rice and other foodstuffs compared with the total garden outlay of Rs. 7,65,233 in 1951 of which Rs. 2,51,166 covered loss on sale of foodstuffs and dearness allowance.

With effect from 30th March, 1952, Government introduced the Minimum Wages Act, the result of which was to increase still further the very high rate of wages already being paid to labour without giving any alleviation to the burden of concessional foodstuffs and compulsory allowances which remain at an unreasonably high level.

The gross profit for the year amounted to Rs. 1,14,710 which compares with the gross profit in 1951 of Rs. 2,68,380. After providing for staff commission, leave and passage reserve, contributions to provident and pension funds, depreciation and taxation and an adjustment on account of 1951 there remained an available balance of Rs. 1,25,374 (Rs. 1,88,083), which includes a carry forward of Rs. 68,083 (Rs. 36,074) from the previous year. The directors disposed of this amount as under:—by paying a dividend of 7½ (15) per cent. on the issued share capital of the Company without any deduction in respect of income-tax payable by the Company Rs. 30,000 (Rs. 60,000), placing to general reserve Rs. 30,000 (Rs. 40,000) and in carrying forward to 1953 Rs 65,374 (Rs. 68,083).

The result of the season's working is disappointing, and is due to the combination of two causes, the depression in the market which affected the industry generally so acutely in 1951 and 1952, and the higher cost of production attributable to the continuance of inflated wage scales.

The directors are able to advise shareholders that market conditions have improved as a result of measurers taken by the industry, and prices so far realised for the 1953 crops have been satisfactory. By effecting economies at the garden the directors have been able to reduce the estimated cost of production for 1953, which they trust will be reflected in the working results of the season.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,00,000	Block ...	5,60,248
Reserves ...	5,10,127	Stock of tea	4,61,410
Provision for taxation ...	87,507	Stores, etc. ...	1,37,630
Liabilities ...	2,67,066	Debts, deposits and advances ...	2,10,650
Profit and loss account ...	1,25,374	Cash ...	20,136
Rs.	13,90,074	Rs.	13,90,074

New Manbhoom Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Octavius Steel & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the half-year ended 31st March, 1953.

The revenue account showed a loss of Rs. 20,439 (loss of Rs. 1,11,801) as a result of the half-year's working and after debiting and crediting sundry items, there was a gross loss of Rs. 48,551 (a gross loss of Rs. 1,20,429). After adding the balance brought forward from the previous half-year and also Rs. 4,572, on account of sundry adjustments in respect of previous half-years, there was a debit of Rs. 60,718 (Rs. 2,10,056) on profit and loss account to be carried forward.

The raisings for the half-year amounted to 62,429 tons, despatches being 68,079 tons. This compares with 59,003 tons and 62,321 tons respectively for the previous half-year and with 55,375 tons and 40,585 tons respectively for the corresponding half-year in 1952.

In view of the ample supplies of coal available from 10 and 17 seams, it is unfortunate that this coal has been officially graded as grade II, for which there is only a limited demand.

Development has progressed satisfactorily and every effort is being made to get the Colliery working on a profitable basis once more.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.

Jaipur Metals and Electricals Ltd.

The directors of the above Company (Managing Agents: Messrs. Poonamchand and Brothers, Ltd, Jaipur) submitted the audited accounts of the Company for the year ended 31st December, 1952.

The accounts showed a profit of Rs. 1,86,631 (Rs. 1,92,012). From this amount was transferred to depreciation fund Rs. 72,948 (Rs. 48,866), to insurance fund Rs. 4,000 (Rs. 4,000), to provision for taxation Rs. 27,201 (Rs. 1,55,306) and to dividend equalisation fund Rs. 15,000 (nil). There was a balance of Rs. 74,578 (Rs. 77,596). From this sum, the directors made payment of dividend on 6 per cent. cumulative preference shares at Rs. 6 (Rs. 6) per share (less income-tax) Rs. 37,920 (Rs. 40,500), dividend on ordinary shares at Rs. 3 (Rs. 3) per share (free of income-tax) Rs. 33,969 (Rs. 30,000), and carried over to next year's account Rs. 2,089 (Rs. 7,096).

The working of the Company during the year, was satisfactory. The main manufacturing activities of the year were copper conductors for power transmission and electric house service meters. The directors report that the first stage of electric house service meters manufacturing scheme, has been completed. The meters are established in the market and sales are on the increase. The preparations for the next and final stage of the scheme are under progress. Suitable representations to give protection to this new and important industry have been made to the Government of India.

The directors have received sanction from the Goverment for change of the name of the Company. The Company will now be called "Jaipur Metals and Electricals Ltd."

Accounts in brief were as under:—

Port Shipping Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

After providing Rs. 12,233 (Rs. 12,703) for depreciation and Rs. 65,000 (Rs. 11,000) for taxation, and after transferring Rs. 75,000 (Rs. 2,00,000) to reserve for rapairs, there is a balance of Rs. 1,26,259 (Rs. 49,388) at the credit of the profit and loss account. The directors recommend payment of a dividend of As. 8 (As. 8) per share, absorbing Rs. 70,411 and leaving a balance of Rs. 55,848 (Rs. 50,538) to be carried forward.

Freight earnings during the half-year were satisfactory.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	14,08,220	Block ...	26,63,272
Reserves ...	24,75,000	Stock of foodstuffs ...	2,161
Provision for taxation ...	94,891	Debts, deposits and advances ...	7,51,184
Liabilities ...	5,87,199	Investments	1,33,798
Profit and loss account ...	55,848	Cash ...	10,70,743
Rs.	46,21,158	Rs.	46,21,158

Champarun Sugar Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Begg, Sutherland & Co., Ltd., Kanpur, U.P.) submit the audited accounts of the Company for the year ended 30th June, 1953.

The results for the year, after making the usual charges including provision for taxation, show a profit of Rs. 4,57,619 (Rs. 10,58,673), from which has been deducted depreciation Rs. 2,00,000 (Rs. 2,50,000) and rehabilitation reserve Rs. 50,000 (Rs. 3,00,000), leaving a balance of Rs. 2,07,619 (Rs. 3,33,673). To this sum has to be added the carry forward from the previous year of Rs. 17,488 (Rs. 43,815) leaving at credit of profit and loss account Rs. 2,25,107 (Rs. 3,77,488). This balance, the directors recommend, should be disposed of in payment of a dividend of Re. 1 (Rs. 2) per share, free of income-tax, for the year ended 30th June, 1953, Rs. 1,80,000 (Rs. 3,60,000) leaving to be carried forward to next account Rs. 45,107 (Rs. 17,488).

Both the factories crushed the maximum quantity of cane available. At Barrah 22,44,465 maunds of cane were crushed, while at Chanpatia there was the large crush of 26,47,972 maunds of cane. Unfortunately, the yield of sugar per 100 maunds of cane was lower than in previous years, Barrah obtaining 10.12 per cent. and Chanpatia 9.79 per cent. Barrah factory started crushing on the 18th December, 1952 and finished the season on the 13th April, 1953. Chanpatia started the season on the 1st December, 1952 and finished on the 16th April, 1953.

The large carry-over of sugar stocks from the previous season was sold at much reduced prices. In respect of controlled sugar, however, the loss sustained was made up by a subsidy from Government of an amount equal to the difference between the controlled price in the 1951-52 season and the controlled price in the 1952-53 season. The loss sustained on the stocks of free sugar, however, for which no compensation was received, is reflected in the reduced profit for the year under report.

The cane prices fixed by the Government of India were Re. 1-5 per maund for gate cane, and Re. 1-3 per maund for cane delivered at out-stations, which is the first occasion that the Company has obtained any relief against the cost of transporting cane.

The Company's estates continued to produce cane both for crushing and as seed for distribution to cultivators. Both factories have been maintained in good condition.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	18,00,000	Block ...	15,64,911
Reserves ...	33,12,562	Stock-in-trade	46,84,105

		Cash ...	2,84,401
Rs.	1,43,21,952	Rs.	1,43,21,952

Pathemara Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Octavius Steel & Co., Ltd., Calcutta) submit the audited accounts of the company for the year ended 31st December, 1952.

A crop of 4,556 maunds was manufactured and has been disposed of for sale in Calcutta, for export 3,914 maunds, and for sale in Calcutta, for internal consumption 642 maunds.

The average price per lb. realised was Re 1-1 as compared with Re. 1-3-10 per lb. obtained for the previous season's crop of 4,151 maunds. The Company's export quota for season 1952 was 3,025 maunds.

No extensions were put out during the year and the area under cultivation remains unchanged at 498 acres as at 31st December, 1952.

The revenue account shows a loss of Rs. 2,24,437 (loss of Rs. 76,924) and after adding to this, gratuities to retired employees Rs. 4,400 (nil), depreciation Rs. 6,477 (Rs. 530) and deficit on 1951 London tea sales Rs. 11,378 (nil) there is a loss for the year of Rs. 2,46,692 (Rs. 77,454). After adding to this the debit balance of Rs. 1,10,182 (debit of Rs. 19,575) brought forward from the previous year, and deducting Rs. 90,000 (nil) and Rs. 13,232 (nil) being the amounts transferred from reserve account and working capital account respectively, there is a debit balance of Rs. 2,53,642 (debit of Rs. 97,029) on profit and loss account, which is carried forward.

In common with other Cachar producers, the Company experienced a disastrous year's trading in 1952. A higher scale of wages had to be introduced with effect from 1st April, 1952, in order to comply with the requirements of the Minimum Wages Act as applied to tea estates in Cachar, and this unfortunately coincided with a collapse in the market for common tea. At the end of 1952, prospects were so unpromising that it was found necessary to close the garden temporarily. Later, however, the Government of Assam announced a modification in the wage scale and this, together with a recovery in the tea market, enabled the Company to resume operations. The prospects for 1953 may be regarded as satisfactory. The estimates for season 1953 are as follows:

Garden	*Crop*	*Expenditure*		*Total*
		Garden	*Calcutta*	
	Mds.	Rs.	Rs.	Rs.
Pathemara	5,000	3,20,516	91,585	4,12,101*

* Excluding capital expenditure estimated to amount to Rs. 4,217.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	2,59,050	Block ...	2,97,830
Liabilities ...	7,13,727	Stock of tea	2,51,473
		Stores, etc. ...	1,07,903
		Other assets	5,471
		Debts, deposits and advances ...	47,313
		Investments	1,000
		Cash ...	8,125
		Profit and loss account ...	2,53,642
Rs.	9,72,777	Rs.	9,72,777

Grob Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Octavius Steel & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December, 1952.

The following table shows the total crop made and the quantities sold respectively for sale in Calcutta for export and internal consumption:

Gardens	*For sale in Calcutta for export*	*For sale in Calcutta for internal consumption*	*Total*
	Mds.	Mds.	Mds.
Dessole	4,485	524	5,009
Kanu	8,738	1,825	10,563
Total ..	13,223	2,349	15,572

The average price per lb. realised was Re. 1-5-10 as compared with Re. 1-11-7 a lb. obtained for the previous season's crop of 12,481 maunds. The Company's export quota for season 1952 was 10,264 maunds.

The area under cultivation as registered with the Indian Tea Licensing Committee at 31st December, 1952, was 1,392.88 acres.

The revenue account showed a profit of Rs. 1,97,357 (Rs. 4,46,041) and after deducting from this pension to retired employees Rs. 1,200 (Rs. 1,200), staff commission and bonus Rs. 13,491 (Rs. 27,641), managing agents' commission on profits Rs. 3,998 (Rs. 8,670), reserve for taxation Rs. 37,000 (Rs. 1,00,000) and depreciation Rs. 43,951 (Rs. 39,232) there was left a sum of Rs. 97,717 (Rs. 2,69,093) to this amount was added forfeited dividends Rs. 2,400 (nil), sale of machinery Rs. 1,000 (Rs. 5,000), post-war refund of E.P. tax (net) Rs. 2,071 (nil) and excess provision for taxation —written back Rs. 24,000 (nil), making a total of Rs. 1,27,188 (Rs. 2,74,093). After adding to this the credit balance of Rs. 88,566 (Rs. 30,324) brought forward from the previous year, there was a credit balance of Rs. 2,15,754 (Rs. 3,04,417) on profit and loss account. The directors disposed of this sum by paying a dividend of 20 (20) per cent. for season 1952, without any deduction for income-tax paid by the Company Rs. 1,47,030 (Rs. 1,47,030) place to reserve account Rs. 35,000 (Rs. 75,000) and leaving to be carried forward Rs. 33,724 (Rs. 82,387).

The estimates for season 1953 are as follows:

Gardens	*Crop*	*Expenditure*		*Total*
		Gardens	*Calcutta*	
	Mds	Rs.	Rs.	Rs.
Dessole	4,382	4,07,015	72,075	4,79,090
Kanu	9,243	7,91,613	1,54,493	9,46,106
Total ..	13,625	11,98,628	2,26,568	14,25,196*

* Excluding expenditure of a Capital nature estimated to amount to Rs. 60,073.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	7,35,150	Block ...	12,74,482

General Investment and Trust Co., Ltd.

The directors of the above Company (Secretaries: Messrs. Bird & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the half-year ended 28th February, 1953.

Including the sum of Rs. 2,938 (Rs. 1,067) brought forward from the previous half-year, and after providing Rs. 2,000 (nil) for taxation and special reserve and utilising Rs. 4,530 (Rs. 10,847) to write off depreciation on investments, there was an available balance of Rs. 14,921 (Rs. 11,927). The directors disposed of this balance by paying a dividend on the 1st cumulative preference shares at the rate of 5 (5) per cent. per annum, without any deduction for income-tax paid by the Company Rs. 2,500 (Rs. 2,500), dividend on the 2nd cumulative preference shares at the rate of 6 (6) per cent. per annum, less income-tax at 25 pies plus 5 per cent. surcharge on income-tax Rs. 2,212 (Rs. 2,212), and a dividend on the ordinary shares at the rate of 5 (5) per cent. per annum without any deduction for income-tax paid by the Company Rs. 5,625 (Rs. 5,625) leaving to be carried forward Rs. 4,584 (Rs. 1,590).

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,25,000	Investments	4,62,723

Rs.	4,88,985	Rs.	4,88,985

N.B.—Figures within brackets relate to the corresponding period of the previous year.

MONEY RULES DULL

(From Our Own Correspondent)

BOMBAY, 28*th October*

The short-term money market experienced another week of dull conditions. With supply of funds continuing to be comfortable and demand remaining slack, activity in the inter-bank call money sector was at a low ebb. Neither the Ahmedabad Municipal loan for Rs. 67 lakhs which was oversubscribed nor the Hyderabad State loan, the list for which is still open, had any effect on the market. The re-opening of the markets in Calcutta after the *Puja* holidays on Monday this week also did not lead to any perceptible increase in the demand for funds. On the contrary, conditions in Calcutta were easier than before, with inter-bank call money rates having declined from 2½ per cent. to 1½ per cent. Inter-bank call money among the Exchange banks and the big Indian banks in Bombay was available at ¾ per cent. throughout the week. The corresponding rate among the smaller Indian banks was 2 to 2½ per cent.

Term deposits were offered at 2 per cent. for one month, 2¼ per cent. for two months and 2½ per cent. for three months. One of the Exchange banks offered to lend one month's money to banks even at 1¾ per cent. House money at call was placeable at 2 per cent.

The lack of demand for funds is clearly reflected in the Treasury Bill results this week. Against the usual invitation for Rs. 1.50 crores, the amount offered was as high as Rs. 4.10 crores, an increase of Rs. 1.52 crores over that tendered in the past week. The average rate of accepted tenders receded by a fraction from Rs. 2-6-8 per cent. per annum to Rs. 2-6-7 per cent. On account of the delay in the onset of the busy season, some banks were reported to have evinced some interest in these Bills this week.

A contraction of Rs. 7.17 crores in notes in circulation is disclosed by the Reserve Bank's statement for the week ended 23rd October, 1953, as compared with that for the previous week. Notes held in the Banking Department, however, show an increase of Rs. 7.88 crores. The decline of Rs. 14.16 crores in the Central Government's deposits noted in the previous week has been followed by a further fall of Rs. 5.47 crores in the week under review. Deposits of State Governments and banks have gone up further by Rs. 3.94 crores and Rs. 6.42 crores, respectively. Cash balances have improved by Rs. 7.93 crores. No notable variations are seen in other portfolios.

The Scheduled Banks' statement for the week ended 16th October, 1953, as compared with that for the previous week, records a decline of Rs. 2.07 crores in demand deposits and an increase of Rs. 1.41 crores in time deposits. Inter-bank borrowings have gone down by Rs. 35.94 lakhs. Advances show a fall of Rs. 76.46 lakhs and bills purchased and discounted Rs. 1.64 crores. Investments are lower by Rs. 36.08 lakhs. Cash-on-hand has shrunk by Rs. 1.41 crores, while balances with the Reserve Bank have improved by Rs. 2.66 crores. Balances with other banks are down by Rs. 10.59 lakhs and money at call and short notice by Rs. 50.23 lakhs.

The Gilt-edged market was quiet with activity on a very small scale. Barring the small demand for 3½ per cent. National Plan Bonds, there was no interest in most of the Government of India securities. The 4 per cent. 1963 and 1961 State loans, which were the centre of attraction in recent weeks, remained in the background.

Among Central Government loans, 3 per cent. 1957 and 3 per cent. 1958 were stagnant at Rs. 98-6 and Rs. 98-2, respectively. 3 per cent. 1959-61 changed hands at Rs. 96-2, an anna better than last week. 3 per cent. 1963-65, the selling rate of which was stepped up last week by the Reserve Bank by an anna to Rs. 92-9, was done at Rs. 92-9. 3 per cent. 1964 had enquiries, but the quotation was unchanged at Rs. 92-8. 3 per cent. 1966-68 had sellers at the unchanged rate of Rs. 90-2, 3 per cent. 1970-75 was offered an anna lower at Rs. 86-6. 3 per cent. 1986 Conversion Loan drifted from Rs. 82-1 to Rs. 81-15, but recovered towards the close to Rs. 82-1. 3½ per cent. 1961 N.P. Bonds put on an anna to Rs. 98-9. Among State issues, 4 per cent. 1963 Bombay had sellers and lost As. 2 to Rs. 101. 4 per cent. 1963 Madras, on the other hand, was an anna better at Rs. 100-1. All the other issues were unchanged.

In the foreign exchange section, rupee continued to develop strength in terms of the U.S. dollar during the week. The U.S. dollar which was quoted at Rs. 476¾ per $100 (bank selling) last week dropped to Rs. 476¼ yesterday. Banks' buying rate likewise declined from Rs. 472¾ to Rs. 472½. In New York, for the first time after several weeks, both the spot and three months' sterling crossed the $2.81 per £ rate during the week. Over the week, the spot sterling gained from $2.80⅞—2.81 to $2.81¼—2.81½. The rates for three months advanced from $2.80.9/16—2.80.11/16 to $2.80⅞—2.81 and for six months from $2.80.5/16 —2.80.7/16 to $2.80⅝—2.80¾.

HIDES FEATURELESS

(From Our Own Correspondent)

KANPUR, 25*th October*

The local hides and skins market continued to be featureless during the week under review also. The new arrival was considerable. Madras dealers and the local tanners were the main purchasers. The latest quotations are as follows:—

Wet salted cow 1st grade superior Rs. 360, 1st grade light Rs. 260, 2nd grade superior Rs. 350, and 2nd grade light Rs. 180 per score; wet salted buff 1st grade 1 lb. 10 ozs. and 2nd grade 2 lb. 6 ozs. per rupee; goat 1st grade Rs. 350 and 2nd grade Rs. 225 per 100 pieces; and sheep Rs. 360 per 100 pieces.

SILVER RECOVERS

(From Our Own Correspondent)

BOMBAY, 28*th October*

A feature of the trading on the Bullion Exchange during the week was the smart recovery in silver prices from the low levels touched towards the close of the previous week. Gold, on the other hand, depicted an irregular trend, with movements confined to a narrow range.

The improvement in silver was due to keen buying by prominent bull operators and heavy covering by short-sellers. Though there was no sizable increase in demand in the ready position, the fall in arrivals of the unrefined metal considerably helped the sentiment. On balance, the white metal gained Rs. 2-7 per 100 tolas over the week.

Gold, however, followed an unsteady trend. At one time during the week under review, it touched a new low level of Rs. 79-1 (for forward delivery), reflecting the market's nervousness caused by persistent arrivals of smuggled gold and offerings of Kolar gold by the National Bank of India. Some improvement in offtake was also noticeable, but it was too small to match the large arrivals.

Silver for forward delivery (23rd October settlement) opened the week at Rs. 148-11 and sagged to Rs. 147-15 on Friday before the settlement ran out on that day at Rs. 149. Dealings in the next settlement (delivery on 23rd November) began at Rs. 149-3 and reacted to a low of Rs. 148-8. At this level, a fresh wave of buying and heavy short-covering emerged, lifting the rate upto Rs. 151-12 to-day just before the market closed at Rs. 151-4.

Ready silver (.996 Mint) reacted from Rs. 148-12 to Rs. 147-14 early in the week, but responded favourably to the revival of buying and fall in arrivals and came up to Rs. 151-12 to-day before closing at Rs. 151-4. The floating stocks of silver are estimated at 2,300 bars. The daily average offtake was about 29 bars.

Opening at Rs. 80-8, gold for forward delivery (22nd October settlement) closed at Rs. 80-9 on Thursday when the settlement ran out. Transactions in the next (21st November settlement) began at Rs. 80. On Saturday, the rate was a little higher at Rs. 80-9. But this recovery did not persist for long. For, on Monday, it again came down to a low of Rs. 79-1 on selling pressure induced by larger arrivals. Further decline was, however, arrested by the strength of silver and buying from Calcutta. This helped the yellow metal to move ahead to Rs. 80-3 to-day before closing at Rs. 80-1.

Ready gold which opened at Rs. 80-10, that is at a premium of As. 10 over the forward rate for the November settlement, finished to-day at Rs. 80-7, the premium over forward being As. 6. The narrowing of the premium indicated that the weight of arrivals of the metal must be heavy, despite the improvement in offtake. The floating stocks of gold are placed at 30,000 tolas. The daily average arrivals were 10,000 tolas, while the offtake was 8,000 tolas on an average.

The following comparative table shows the trend of the market during the week under review:

	28-10-53	Highest	Lowest	21-10-53

STRONG DEMAND FOR TEAS

(From Our Own Correspondent)

CALCUTTA, 27*th October*

Although there was strong demand during yesterday's export auction, prices of a few varieties of tea declined fractionally. The decline should be considered insignificant in the face of the additions to prices during recent sales. Offerings aggregated 62,500 packages. The commonest varieties were in good demand and well-made pekoes realised firm prices. Orange fannings and tippy B.O.Ps. realised prices which were As. 2 above valuations, while neat orange pekoes possessing style rose an anna above the last rate. C.T.C. Assams and fannings eased by half an anna, prices for mediums and common brokens moving down an anna below brokers' valuations. The rates were: Best C.T.C. Assam B.P. Rs. 2 to Rs. 2-4, clean black pekoe Re. 1-13-6 to Re. 1-14, medium Assam B.P. Re. 1-12, and clean common B.P. Re. 1-11-6. There was no sale last week, owing to the *Pujas*.

The last internal auction in tea was held on the 13th inst., when dusts and leaf offered aggregated 16,790 and 700 packages, respectively. There was moderate demand for dusts. Good support was given to the commonest types, while valuations were reached by bright Dooars, C.T.C. Assams and black grainy types suitable for export. Prices for the remaining offerings were easy. The rates were: Best Assam C.T.C Re. 1-14-6 to Re. 1-15, medium Assam grainy dusts Re. 1-10 to Rs. 1-10-6, and medium Dooars Re. 1-9-6 to Rs. 1-10. Conditions in the leaf market were easy.

COTTON STEADY

(From Our Own Correspondent)

BOMBAY, 27*th October*

A drowning man clutches at a straw. When he does this he does not know whether it is a straw or a plank. The cotton markets which seemed to be drowning last week have been provided with something to clutch by the Government during the week-end, in the shape of the Ordinance issued to help the textile industry to tide over its present crisis. This was not done with a view to saving cotton prices from crashing, but it came handy for the sinking markets. It is too early still to say whether this will prove a straw or a plank.

Analysing the effects of this Ordinance one finds that there is not very much for Indian cotton to rejoice over, except for the removal of the 10 per cent. export duty on medium cloth, which would mean a slightly increased demand for Indian cotton. One has, however, to work out the actual increase in the quantity of cloth of this variety which will be exported as a result of this concession and the extra quantity of Indian cotton consumed for this. In the first place, cloth exports constitute about one-seventh of the total production. Of this, medium cloth forms only one-third which means about 7 per cent. of the cloth produced in the country. The net increase both in medium cloth export and in the consumption of Indian cotton from this step would be, therefore, only about 1 per cent. or so. On the other hand, the reduction in the excise duty on superfine cloth will mainly help imported cotton, but considering the offtake of cloth at present, this reduction is not likely to help the mills at all.

To induce people to use more superfine cloth in these days of reduced purchasing power, prices of superfine cloth will have to be reduced much more than is warranted by this reduction in the excise duty. The net increase in the use of Indian cotton as a result of this concession can, therefore, be easily ignored, so far as price trends are concerned. If excise duty on fine cloth had been reduced or comes to be reduced in future, this might have a bullish effect on Indian cotton. Similarly, the rebate of duty on imported cotton used in export of cloth will also help towards slightly greater imports of cotton possibly to the detriment of the consumption of Indian cotton. On the whole, therefore, the cotton market has been very wise in not overestimating the effect of this step on cotton prices. The increase in the forward market was confined to about Rs. 8 per candy, in the first flush of enthusiasm but a part of this was lost in subsequent transactions. In the spot market, with its more realistic appreciation of the situation, the increase has been only of about Rs. 5 per candy.

This step, however, is bound to have a psychological effect on the markets. It will prove a check, to a certain extent, to the tendency to hammer down prices. Future developments, however, will depend mainly on the effect of the concession given by the Government on the attitude of the mills with regard to the purchase of Indian cotton. If they do so in greater quantity now instead of sitting on the fence and waiting for further developments, the market would get a good fillip. There is some enthusiasm in evidence on the part of the mills to enter into the spot market and to make some purchases. There is, however, a justifiable apprehension that this would prove only temporary so far as Indian cotton is concerned. The abolition of export duty on medium cloth may not necessarily result in greater shipment during coming months. Because, in the first place, the buyers outside would expect this advantage of reduced duty to be passed on to them and, in the second, those who are competing with Indian cloth in the foreign markets will also try to safeguard their own sales by a corresponding reduction in the price of exported cloth. If cloth prices harden as a result of this step here as it frequently happens in the wake of such concession, cloth exports may not improve appreciably and in this case the cotton market would be just where it was before the Ordinance.

The next few weeks are, therefore, critical for the cotton market and nobody can say with confidence that the worst is over or that cotton has turned the corner. The most likely result of this important step would be to confine fluctuations in the forward market within a comparatively narrow range, instead of the heavy fluctuations we have witnessed during the last two months. One should not be surprised if cotton prices remain confined within the limit of Rs. 600 to Rs. 620 per candy. A slightly improved position with regard to turnover might result in the spot market, though even here, perhaps, attention will be diverted to the section dealing with the imported cotton from the more readily available Indian styles for obtaining which, the mills need be in no hurry.

I.C.C. February opened the week at Rs. 607½, as against the previous closing of Rs. 608½, and gradually moved down to touch a low of Rs. 598¼ on 23rd inst. Some support was forthcoming at this level, thanks to the Central Government's announcement of the removal of export duty and reduction in excise duty. It recovered to Rs. 608¼ on 27th inst. But the recovery was short-lived, for it touched a low of Rs. 604 to-day though it improved to Rs. 608 towards the close of the day's session.

I.C.C. May had a similar trend. After opening the week at Rs. 614 it fluctuated between Rs. 614¾ and Rs. 604½ before it finished the week at Rs. 614¼.

The following is the trend of prices in the forward market:

	Opening	High	Low	Closing
I.C.C. Feb. (Rs.) ..	607½	608½	598¼	608
I.C.C. May (Rs.) ..	614	614¾	604½	614¼

The following are the latest available quotations from the spot market:

Bengal *Deshi* (new crop) Rs. 575; Berar Jarillas (new crop) Rs. 650; Khandesh (new crop) Rs. 690; Vijay (old crop) Rs. 840; Oomra Deshi (old crop) Rs. 570; Moglai (new crop) Rs. 570.

At Karachi, while there has been no change in old crop prices, those for the new crop have remained steady during the week, with a tendency towards a slight hardening. Possibly this has been a result of good enquiry from the U.K., both by the R.C.C. and the contracting-out mills, with substantial business developing in the 4F variety. Japan and Germany, two of Pakistan's best customers, are still out of the market, as they have been able to satisfy their requirements for some time from Brazil at comparatively cheaper rates. Some deals have taken place during the week in the *Deshi* styles and the hardening of prices is more in evidence in this section than in the longer staple varieties. The following are the latest available quotations for the Karachi market: (New crop) Punjab *Deshi* Rs. 56; 4F Punjab R.G. Rs. 57 to Rs. 58; S.G. Rs. 60½ to Rs. 61½; L.S.S. Punjab R.G. Rs. 59½ to Rs. 60; S.G. Rs. 64 to Rs. 64½; N.T.R.G. Rs. 62 to Rs. 62½; S.G. Rs. 66½ to Rs. 66½; 289 Punjab R.G. Rs. 64½ to Rs. 65; S.G. Rs. 69½ to Rs. 70.

At Alexandria, spot premia over official buying prices in all varieties have been well maintained, as many shippers have yet to acquire cotton against their commitments for early shipments. In view of this, there is a hesitation on the part of the producers to sell their cotton as they expect better prices in the near future. As a result of the extreme shortage in the supply position of Ashmouni, the Government have decided to increase the acreage under this variety next year by 10 per cent. Exports up to the middle of this month from Alexandria amounted to more than 60,000 bales against less than 25,000 bales during this period last year.

At New York, the tense political situation has helped the upward trend in prices during the week and a part of the recent losses has been recovered, with the December position standing at near the 33 cent level. This would have been still better but for some liquidation in this position. So long as the international situation remains uncertain, this upward swing in prices is likely to continue, with technical reactions from time to time. It may be noted that Indian mills' interest in U.S.A. cotton has revived to a certain extent during recent weeks.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	27-10-53	21-10-53	14-10-53
Spot	33.65	33.50	33.40
December	32.97	32.80	32.71
March	33.44	33.24	33.11
May	33.71	33.51	33.41
July	33.69	33.45	33.33

ART SILK YARN LOOKS UP

(From Our Own Correspondent)

BOMBAY, 28*th October*

After presenting an irregular trend during the first four sessions of the week under review, the art silk yarn market tended to look up during the subsequent two sessions. The initial irregular trend was due to the absence of any encouraging development. Traders showed very little inclination towards fresh business and values of yarn moved within narrow limits. The sentiment of operators, however, brightened yesterday when encouraging demand for yarn from weavers and mills and reports of improvement in cloth markets induced short covering and pushed up prices. The firmness of staple fibre yarn also hardened the sentiment. Operators anticipated good demand for yarns from rayon mills for replacing stocks of rayon fabrics depleted by Diwali sales. Consequently, yarn prices registered handsome rise which persisted to-day also. Not only the previous losses were completely erased but the closing quotations stood very much higher than those a week ago.

Art silk yarn (150D) for October delivery, in the forward section, fluctuated irregularly between Rs. 684 and Rs. 680 and forged ahead to touch Rs. 697, the net rise over the week being 13 points. November contract opened at Rs. 688 and improved to Rs. 692 on the following day. After receding, however, to Rs. 685 on Monday, it recovered to finish the week higher at Rs. 703. The ready section was fully steady. 120 Japan gained an anna to Rs. 4-2. 150 Japan and 120 Italy were unaltered at Rs. 4 and Rs. 3-14, respectively. 150 Italy, on the other hand, was easy at Rs. 3-8, as against Rs. 3-11½ last week.

The notable recovery in values of staple fibre yarn witnessed last week gathered further momentum during the week under review. Thus, stable fibre yarn 40 x 2 October delivery rallied 23 points to Rs. 680. November delivery advanced by Rs. 29 to Rs. 670, but finished slightly lower at Rs. 664.

The table below gives the prices of art silk yarn and staple fibre yarn quoted to-day, as compared with those on the 21st inst. and 14th inst.

Art silk yarn	24-10-53 Rs. a.	21-10-53 Rs. a.	14-10-53 Rs. a.
150D October (per case of 200 lbs.)	697 0	684 0	692 0
150D November	703 0	688 0	688 0
120 Japan (per lb.)	4 2	4 1	3 15½
150 Japan	4 0	4 0	3 13½
120 Italy	3 14	3 14	3 13
150 Italy	3 8	3 11½	3 7
Staple fibre yarn			
2/40s October (per case of 200 lbs.)	680 0	657 0	642 0
2/40s November	664 0	641 0	623 0

OILSEEDS DULL

(From Our Own Correspondent)

BOMBAY, 28*th October*

The oilseeds market has remained generally dull this week. The groundnuts section is somewhat easy, on large arrivals. The linseed section is slightly easy in sympathy with groundnuts. Operators have disclosed a feeling of hesitancy in their anxiety to know the Government's policy regarding the demand for a reduction in export duty on linseed oil. In the castorseeds section, futures lack support, while trading in spots has not been encouraging enough. *Nigers* and *kardis* too are no exception to the generally dull undertone of the market. Consequently, very little business is being transacted in the market and price fluctuations are confined to narrow limits.

The Bharat Chamber of Commerce, Calcutta, has submitted a memorandum to the Government of India seeking the removal of export duty on linseed oil. It has pointed out that Indian linseed oil has been virtually out of the Continental and other overseas markets, owing to the cheaper rates at which the oil is being offered by Argentina, Uruguay and Canada. Indian linseed oil, for instance, is now quoted at about £113 to £115 per ton, as against £95 to £98 per ton for oil from Argentina and Uruguay.

The difference between forward and ready positions in the groundnut section is gradual narrowing on increased arrivals of the seed. For instance, the spread between Bold F.A.Q. ready and forward was as much as Rs. 11-10 on the 20th inst. The spread is now narrowed to Rs. 1-14. F.A.Q. is now ruling at Rs. 36, whereas, Bold December-January stands at Rs. 28-2. Coromandal ready new is done at Rs. 35, as against Rs. 37. Khandesh quality has lost Rs. 2 to Rs. 36-8. October and November deliveries have changed hands at Rs. 35-4 and Rs. 31-6, as against Rs. 34-8 and Rs. 30-12, respectively. Groundnuts *ex*-mill have receded from Rs. 22 to Rs. 19-3 and railway receipts from Rs. 21-8 to Rs. 19-4. October, November and December deliveries are on request at Rs. 18-9, Rs. 16-2 and Rs. 15-4, as against Rs. 19-6, Rs. 16-7 and Rs. 15-6, respectively.

In the linseed section, Bold ready has eased from Rs. 25-8 to Rs. 24-8. October-November delivery has lost Re. 1-8 to Rs. 25-8 and February-March Re. 1-2 to Rs. 22-12. Linseed oil is, however, higher by As. 8 at Rs. 14-8. Advices from London are bearish. It is reported that some business has been done in linseed oil with Australia in Calcutta at £105.

The castorseed section has put on a mixed trend. May delivery which opened at Rs. 113-8, as against Rs. 113-12, fluctuated between Rs. 113-10 and Rs. 111, before closing at Rs. 111-14. But F.A.Q. has gained As. 4 to Rs. 31, while Madras ready is colourless at Rs. 31-8. Castoroil B.S.S. is done quiet at Rs. 17. Oil First Pressure has, however, eased from Rs. 16-14 to Rs. 16-12 and Commercial quality from Rs. 16-2 to Rs. 15-12.

Among others, *kardi* ready Bold has disclosed a loss of As. 4 at Rs. 21-8, while October-November delivery remains unchanged at Rs. 21. *Niger* F.A.Q. ready has lost As. 8 to Rs. 32-8. Ready Madras is lower by Rs. 2 at Rs. 32. December-January delivery, however, has gained As. 4 to Rs. 26-8.

The following table shows the prices of oilseeds and oil on the 28th inst. as compared with those at the end of the previous two weeks.

	28-10-53 Rs. a.	21-10-53 Rs. a.	14-10-53 Rs. a.

SUGAR STEADY

(From Our Own Correspondent)

BOMBAY, 28*th October*

Following definite reports that British refined sugar per s.s. *Atlantico* would be available for delivery only after Diwali, the Bombay sugar market presented a steady trend during the week under review. The steadiness was further assisted by two other factors, namely, tight stock position in the spot section and active demand. The buying support that ensued as a consequence pushed up the prices of sugar. Thus, in the forward section, sugar for *Kartik* delivery, which had dropped to Rs. 83-4 per bag last week-end, improved to Rs. 84. Business in *Asho* delivery was squared up at Rs. 86-8, which compares with Rs. 86-0 to which it had declined last week. In sympathy with the rates for forward sugar, spot quotations also registered a rise. The prices of small and medium sugars were higher by Re. 1 and Rs. 3 at Rs. 90 and Rs. 94, respectively; the large grain sugar was just steady at Rs. 97. Foreign sugars, too, recorded a handsome improvement in prices. British refined sugar was quoted at Rs. 88. Mexican at Rs. 87-8 and Java at Rs. 94, all per bag of 2 cwts. The corresponding rates a week ago were Rs. 86-4, Rs. 86 and Rs. 91-8, respectively.

As already stated, stocks of sugar in the market are poor, amounting to only 15,000 bags, which include both foreign and indigenous sugar. Arrivals also have been small, the quantity that actually arrived during the week being 2,600 bags, as against 3,300 bags a week ago. Small available lots from the Deccan mills are being taken up in anticipation of higher spot prices. A few small parcels of U.P. sugar are reported to be on their way to Bombay.

Further tenders for two shiploads of British refined sugar per s.s *Cyclops* and s.s *Luciano* have been invited by the Union Food Ministry. The last date for the submission of tenders is the 30th inst. These ships are scheduled to arrive in Bombay in the third week of next month. According to information so far available, the s.s *Atlantico* is expected to arrive on 6th November, 1953.

SLUMP IN PEPPER

(Messrs. Parekh & Co.)

BOMBAY, 28*th October*

The weakness in pepper reported in our last report deteriorated into a slump, and prices at all primary centres went down rather steeply, growers at Alleppey having sold about 150 candies at prices from Rs. 1,900 down to Rs. 1,800 under pressure of demand for margin by the banks which advanced money against stock. Stocks of such distressed pepper is estimated to be about 400 candies. Unless these are absorbed, there appears little chance for improvement in the general tone of the market. The future of the market now seems to depend upon the new arrivals, which is at present nil, owing to heavy rain in almost the whole of Malabar. The general opinion in the trade is that, given proper sunshine after the present heavy rain, there will be fair arrival of matured pepper somewhat earlier than expected before. Nervous selling of afloat consignments by the Indian exporters in New York market seems to have scared away buyers, and, as usual with them, they do not want to give firm bid in a downscale market even if they want to buy.

The continuation of fall in pepper price will create problems which the Government will have to tackle sooner or later. New Delhi is reported to have admitted the fact that the buyers' market in pepper has come to stay. If it is so, when are the Government going to revise their present policy of heavy export duties on dollar-earning items such as Malabar black pepper, thus giving much needed fillip to our export trade. But, as usual the Government seem to be dallying and when they are compelled to take measures for stimulating export, perhaps it will be too late, and we shall have missed the bus. Foreign buyers seem to have postponed their buying, owing to the present uncertainties and an immediate definite announcement either way is desired and may bring forth the pent-up demands.

In the A.S.T.A. section, liquidation by longs brought down the prices and November was done at as low as $0.84½, while December is nominally quoted at $0.82 without much doing. In the cellvery section, the turnover is poor and every fall in price is being resisted. December and February are quoted at Rs. 1,450 and Rs. 1,350 respectively.

Following are to-day's nominal quotations: Ready delivery Rs. 260-70 per cwt., November Rs. 1,450-70 and December Rs. 1,350-70 per candy of 5½ cwts.

LOW MILLED DUST TEAS FIRM

(Messrs. Forbes, Ewart & Figgis Ltd.)

COCHIN, 24*th October*

The total offerings in dust sale 'U' which was held on Tuesday, 20th October, amounted to approximately 1,25,000 lbs. There was a useful general demand and low milled dusts were firm to dearer. Medium dusts declined by half to one anna, but clean, black, grainy types and best liquoring were fully firm.

London Market.—Best Assams firm to dearer, others irregular; but strong demand at half penny drop.

Colombo Market.—Good general demand. Best liquoring high-grown brokens and fannings firm to dearer. Below best declined to 8 cents. Others fully firm.

Calcutta Market.—No sale this week.

Export Quota.—Due to the *Puja* holidays, the market has been very quiet with business done at 17 pies.

Forthcoming Auctions.—Dust sale 'V' will be held on Tuesday, 3rd November.

As we go to Press, Messrs. Forbes, Ewart and Figgis Ltd. wire as follows:

"*Sale* 22.— 13,00,000 lbs. Good demand, but prices irregular. Common and low medium fully firm. Medium and good medium easier to buy. Best liquoring strong, following quality."

JUTE GOODS IMPROVE

(From Our Own Correspondent)

CALCUTTA, 27*th October*

Bear-covering was the chief feature on 19th October when trading was resumed after the *Puja* holidays. Ready hessians 40" 10 oz. gained to Rs. 45-4 from the previous rate of Rs. 44-10 and B. twills to Rs. 95-4 from Rs. 94-12. A section of the market entertained fears of shortage of goods, especially in hessians, in view of the trend of demand which, in September, not only out-stripped production, but, caused depletion of a portion of the accumulated stocks in both hessians and sacking goods. Production of all constructions in September amounted to 73,100 tons, an increase of 5,000 tons. The decline in stocks was by 15,000 tons, so that sales aggregated 88,100 tons, a highly satisfactory figure. All these factors invited a good amount of speculative attention to offers. Prospects of a strike in mills over the bonus issue also supported higher prices. Mills even entered into commitments for April-June deliveries. Foreign buyers showed reluctance to follow up the rises, but the market was steady on Tuesday with hessians realising Rs. 45-4 and B. twills Rs. 94-12. Covering was again a feature, and mills continued selling. At higher rates, holders appeared as sellers and took their profits, however small they were. On Wednesday, the opening was quiet, as business with foreign buyers was lacking. The rates were declining, but mills were rightly out of the market. Weak holders were content to take small profits. B twills gave way to Rs. 93-4 and 40" 10 oz. hessians to Rs. 44-8. Reports that Burma had placed an order for heavy Cees at lower rates was also a factor which shook sentiment in the

(Continued on page 847)

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. F=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. I=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. a Sales and amount written off. (b) Investments.

(1) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 848 in the debentures section:—

§ Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium.

(b) Bearer bonds of Rs. 1,000 each repayable at par.

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole for in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

(e) Retainable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months' notice.

FLOW OF CAPITAL FROM BRITAIN

COMMONWEALTH COUNTRIES BENEFITED

(By PAUL BAREAU)

IN political terms, the Commonwealth may have been built, as the saying goes, "in a fit of absent-mindedness," but there was no such nonsense about the investments which developed the wealth of areas as widely separated and divergent as, say, Canada, Australia, Malaya and South Africa. It was almost exclusively Britain's capital which began, and in some cases completed, the task of converting the immense potential of these territories into the massive production of wheat, wool, rubber, gold—all of them symbols of the present diversity and wealth of the Commonwealth.

For more than a century, Britain was the unquestioned leader among the great capital markets of the world. It often acted in concert with syndicates of bankers and issuing houses in Paris, Amsterdam, Zurich, New York; but until World War I, it headed the syndicates. It did much more than merely export capital—it also exported the men, the skill, the "know-how," above all, the able and honest administrators without whom the mere export of capital would have been a barren operation.

What of to-day? It has often and rightly been stated that the financial burdens of two world wars have converted the United Kingdom from the greatest creditor to the greatest debtor nation. The debts, let it be added, are honourable scars. But to admit this revolution is not to imply that Britain's role as a great investment banker is finished. The situation is quite otherwise. The banker may no longer possess the capital and reserves of which he once could boast, but the essence of banking is wise borrowing and lending. The United Kingdom still does this on a substantial scale and, furthermore, provides a substantial contribution to what it lends out of its own current resources. It is still the principal source of external capital for the development of many parts of the Commonwealth.

In 1952 the new issues floated in the London market for Commonwealth countries amounted to £52,400 000 and the total for the four years, 1949-52, was £196,700,000. These figures compare with a total of £28,100,000 for the last pre-war year. Allowing for changes in the purchasing power of money, these comparisons suggest that the flow of real capital from the United Kingdom to the rest of the Commonwealth is being maintained at roughly the same level as in the immediate pre-war period.

The character of this investment has, needless to say, been influenced in recent times by the need to achieve balance in the international payments of the sterling area and, in particular, by the dire necessity to economise scarce dollars. The problem was discussed in the course of the Commonwealth Economic Conference held in London towards the end of 1952. It was then stressed that, while there is wide scope for expanding the production of essential supplies in the Commonwealth, efforts devoted to that development should, in the first place, be concentrated on projects which will contribute directly or indirectly to an improvement in the balance of payments of the sterling area with the rest of the world. Priority is being given to increased production of commodities which can earn dollars or which can take the place of goods which now have to be imported in substantial quantities from the dollar markets.

This is not an attempt to become self-sufficient or to insulate the sterling area from the dollar world, but a frank recognition of the harsh facts of economic life and an adjustment to the realities of the present world payments situation.

At the end of this Commonwealth Conference, it was pointed out that Britain remains the traditional source of external capital for Commonwealth investment and has special responsibilities in the non-self-governing territories. The United Kingdom Government expressed its determination to maintain and even increase the flow of capital from London for sound development throughout the Commonwealth. To carry out this decision the great financial houses of the City of London, under the leadership of the Bank of England, have established a Commonwealth Development Finance Company. This institution will supplement what is already a highly developed machinery through which Commonwealth investment is canalised.

That machine is as diverse as the operations which it handles. It should, in the first place, be realised that all issues for capital of £50,000 or over must receive the approval of the Capital Issues Committee. The self-governing Commonwealth countries borrow "under their own steam," using their own issuing houses. The non-self-governing territories place their issues through their "business managers," the Crown Agents for the Colonies. Since the beginning of 1953, there has been a £10,000,000 issue for Southern Rhodesia and another £10,000,000 has been promised to New Zealand to finance a pulp and paper project at Murupara. Pakistan has been lent £10,000,000 to finance capital projects. Many other Commonwealth loans are now being considered.

Britain has still a big role to play as an exporter of capital. There are many constructive acts to come and a highly promising one is being played at this very moment.

MARKET GOSSIP

(Concluded from page 803)

distributed after they have had their first 10 per cent. along with A class shareholders. What is now attempted by the Bank's authorities is to amalgamate the 'A' and 'B' into one class, called the ordinary stock. The details of this capital reorganisation scheme are too complicated to be described within the space at our disposal. Moreover, they may not be of much interest to our readers. Suffice it to say that the reorganisation scheme involves the capitalisation of £7.06 million of the Bank's reserve fund.

• • • •

The aforesaid action of Barclays Bank has given rise to an impression in London City circles that other banks also may follow suit and issue bonus shares. It has set many people thinking whether other big banks might not similarly alter their capital structures. These speculations include the possible call for new capital. Among the Big Five, however, it is only Barclays that have an issued capital which is fully paid up. Others have partly-paid shares. It is held that, if these Banks want to increase their capital, they would call for the uncalled liability or reduce such liability by bonus issues from reserves. It is only after doing this, London City circles feel, that the Banks would think of inviting fresh capital. Incidentally, it is pointed out that it is more than a quarter of a century since the large British banks raised capital in the capital market. The issues that are discussed are: Will any increase in capital, that might take place, add greatly to the banks' earning capacity? What part is played by capital in the working of the banking institution? Commenting on these questions, the Money Market correspondent of the *Financial Times* says:

"The exact role which 'capital' plays in modern banking is not easy to define. In the old days, the capital account was an additional security for the depositor, but, with the spread of limited liability, this function has long disappeared. As circumstances are to-day, indeed, it is difficult to say just what relation should exist between capital and total liabilities. In fact, the position is so artificial that it is doubtful whether normal criteria are of much value in determining what is, and what is not, desirable. It is not easy to support the idea of capital increases for purely banking or economic reasons. Any capital increase would merely buttress the ratio of capital resources to deposit liabilities; it would not noticeably alter the composition of their assets, or increase their earning power. That capacity is determined by the level of bank cash and by the superstructure of assets which the banks build on that basis."

• • • •

Many bankers in this country, however, may not agree with these conclusions. It is true that the real function of capital in a bank's operations has lost something of the significance it might have possessed in the past when deposits could not be attracted easily. But it is not unlikely that the banks may once again come to appreciate the value of larger capital. This is because, the banks in many countries now find that, although they lend only against the current assets of their borrowers, the money they lend is being used for relatively longer-term operations such as renovation of old machinery, and modernisation of equipment. This means that the banks have to think not merely in terms of short-term financing but in those of medium-term financing also. In this context, a more broad-based capital structure is regarded as a great source of strength to the banks. Perhaps such considerations are beginning to influence the British banks' attitude towards capital structure. It is, of course, wrong to generalise too dogmatically from the example of a capital reorganisation scheme undertaken by a single British bank. But it is the aforesaid considerations that induced some of the big banks in this country to raise their capital structure.

SURVEY

(Concluded from page 807)

and functions of Government. The functions now range from economic planning to town and country planning, industrial relations and health services. In keeping with these changes, the character, role and attitude of the Civil Service have also changed. The Service has now become more positive, constructive and creative. Civil servants are now actively engaged in the drawing up of plans. They have to deal not only with a variety of local problems but also with international organisation which have a very important impact on national administration. They are to-day having much more contact with the industrial and business communities and with the daily life of the people than in the past. "Wherever we look," said Dr. Robson, "we notice, whether in Communist Russia or in capitalist America, both in underdeveloped and in advanced countries, a great change taking place. Everywhere bureaucracy is on the ascendancy and is being asked to undertake bigger and more important tasks."

One of the great problems in large organisations such as a Government when it is spread over a large territory is, according to this learned doctor, the need for co-ordination of work. If what is being done to-day by one official differed from what was done yesterday by another or what will be done to-morrow, there will be confusion and criticism. His suggestion to avoid this is the supply of a book of instructions on every possible difficulty that may arise for the guidance of officials. Although this may tend to introduce

RELIEF TO A PRIVILEGED FEW

NOWADAYS almost every action of the Government pertaining to the business world has a political bias. Rarely decisions are taken on the merits of the issue. The latest instance where political considerations have weighed with the Government of India is the Ordinance providing for payment of relief to workers laid off for a short period or retrenched for some reason or other. No doubt this issue has been under consideration of the Government and the interests concerned for some time now and has been discussed at some of the tripartite conferences. But it was distinctly understood that a suitable measure dealing with this subject would be placed on the Statute Book through the normal process of legislation. Why then did the Government decide to use its emergency powers which give no opportunity for the interests concerned to have their say? Apparently, the Government was anxious to assure the workers that it was not unmindful of their interests. The Government found it necessary to give some relief to the textile industry, with a view to stimulating the offtake of cloth. If it had not simultaneously made the announcement in regard to relief to workers, large numbers of whom were faced with the threat of unemployment, thanks to the notices of closure of one or more shifts put up by quite a number of mills in Ahmedabad and a few other centres, the Government would have certainly been accused of partiality towards millowners. The fear of this criticism, however unjustified it may be, has been the main cause of Government's hurried action. Thus, on practical considerations, one could justify the Government invoking its special powers. But that does not mean that what the Government has done is right in all respects.

Before examining the merits or demerits of this unique action, a brief description of the Ordinance is necessary. To begin with, it must be stated that the Ordinance does not apply to the textile industry alone. Barring a few exceptions, it covers all industrial establishments employing more than 50 persons, other than a badli or casual worker. If it is prominently mentioned with the textile industry, it is because its promulgation was precipitated by the threat of depression in this industry. The Ordinance can be conveniently divided into two parts. One part deals with relief to workers afflicted by involuntary unemployment. The other deals with workers who are retrenched. Under the former section, whenever a workman on the rolls of an industrial establishment employing more than 50 workmen is laid off, he should be paid compensation equal to 50 per cent. of the total basic wages and dearness allowance that would have been payable to him had he been working. The maximum number of days for which such compensation is payable shall in no case exceed 45 in a year. Workers employed in industrial establishments which are of a seasonal character or in which work is performed only intermittently are, however, not entitled to this compensation for involuntary unemployment.

A few conditions have been prescribed for a workman to be eligible for this relief. Thus, no compensation is payable to a workman who has been laid off: "(i) if he refuses to accept any alternative employment in the same establishment from which he has been laid off, if, in the opinion of the employer, such alternative employment does not call for any special skill or previous experience and can be done by the workman, provided that the wages which would normally have been paid to the workman are offered for the alternative employment also; (ii) if he does not present himself for work at the establishment at the appointed time during normal working hours at least once a day; (iii) if he works elsewhere, for the days on which he so works; (iv) if such laying off is due to a strike or slowing-down of production on the part of workmen in another part of establishment."

The second part of the Ordinance, which applies even to industrial establishments of a seasonal character, provides that no workman, who has been in continuous employment for not less than one year under an employer, shall be retrenched, until he has been given one month's notice and also a gratuity calculated at 15 days' average pay for every completed year of service or any part thereof in excess of six months. The principle of "last to come, first to go" will have to be ordinarily observed in effecting retrenchment. It is further provided in the Ordinance that, when an employer who has retrenched workmen proposes to employ more persons, he should give an opportunity to retrenched workmen to offer themselves for re-employment and give them preference over others.

Following the introduction of this legislation, we have, for the first time in this country, a definition of "lay off" and "retrenchment." Under this definition, a worker will be deemed to have been laid off when an employer is unable to give employment to his regular worker, within two hours of his presenting himself for work, owing to shortage of coal, power, raw materials, or accumulation of stocks or breakdown of machinery or for any other similar reason. Retrenchment means "the termination of service of a workman for any reason whatever otherwise than as a punishment inflicted by way of disciplinary action." It will thus be seen that employers have now power to retrench a worker for all economic reasons, provided they are prepared to pay the prescribed amount of compensation.

The foregoing measure is good in parts. Viewed purely from human considerations, it sounds quite a reasonable one, in that it provides the worker with something more than his provident fund, if any, to fall back upon when he loses his job for no fault of his. But whose responsibility is it to provide such relief, the State or the industry? Perhaps, the industry could be expected to pay some compensation for involuntary unemployment, as the burden may not be very heavy and as the industry affected may be expected to resume work again within a reasonable period. And in the last meeting of the Standing Advisory Labour Committee held at New Delhi, the employers' spokesmen appreciated the reasonableness of this suggestion and agreed to pay compensation. But it is too much to expect an industry or sectors of an industry to pay unemployment relief when it is compelled to close down, either partially or fully, for reasons beyond its control. Really speaking, it is the responsibility of the State to provide relief to workers in all such cases. If the Government is anxious to protect the workers from future uncertainties, it should establish unemployment insurance as part of its social security programme. The Government, however, knows that this is a tremendous task beyond its resources and ability. So, it has passed on the baby to individual employers. Incidentally, this question was not even discussed at the last meeting of the Standing Advisory Committee on Labour. It is, therefore, wrong to claim on the part of the Labour Ministry that it has the support of the spokesmen of employers.

It is ununderstandable as to why workers employed in industries alone should be assured of unemployment relief when all other workers and those countless millions who have no work at all get no such relief. Industrial workers in this country have already become a privileged class and this latest measure provides them with one more privilege to the exclusion of others. Then, there is the question of cost, for somebody has to pay for this relief. In a sellers' market, it could be passed on to the consumer. But when such a state of affairs prevails, there will scarcely be any need for retrenchment. It is only when the buyers' market is in full swing and competition is strong that the necessity for curtailing production and retrenching workers will arise. In these circumstances, it is those who are prudent enough to save and invest in industries that will have to meet the cost of unemployment relief. Thus, the Government is subjecting risk capital to one more handicap at a time when it requires to be encouraged. The consequence of this measure will, therefore, be a restriction on the scope for fresh employment. An employer will now think a thousand times before expanding his sphere of activity, lest he should be liable to pay compensation for his employees if his venture were to prove a failure. Labour leaders are naturally happy over this action of the Government, for they are interested more in keeping the workers who are already employed, and whose support they need, contented and happy than in seeing an expansion in the scope for additional employment for those who are unemployed.

Some argue that, although the Government has done something which was not strictly agreed to at the last Tripartite Conference, it is not worse than the existing position. At present, an employer who wants to retrench his workers has to go in for arbitration by a Tribunal or an Industrial Court, unless he is able to reach an understanding with his workers, a very, very remote possibility. He has to accept whatever award the adjudicator gives and pay compensation accordingly. The Ordinance, however, removes this uncertainty about the quantum of compensation by laying down a common standard for all employers. This is an advantage no doubt, but it is of no significance, because the employer may still be dragged to an industrial court and his decision to retrench workers is liable to be challenged by the appropriate State authorities. The Ordinance, which is an amendment to the Industrial Disputes Act of 1947, leaves section 10 of the Act untouched. The provisions of this section are so wide that it enables an appropriate Government to treat any case of retrenchment as a dispute and refer it to a tribunal. Thus, the employer gets the worst of both worlds.

PROBLEMS OF COAL INDUSTRY

THERE is, perhaps, a no more over-governed industry to-day than the coal industry. The impressive increase in coal raisings which amounted to 36 million tons in 1952, as against 34 million tons in 1951 and 28 million tons in 1939, has availed the industry little. It continues to be subject to the strait-jacket of controls of many varieties. The outcome of all these controls is, as is only to be expected, that the industry is showing signs of weakening in the battle for increased production and higher exports. Mr. G. A. S. Sim, Chairman of the Pengal Coal Co., Ltd., warned, in his address at the half-yearly general meeting of the Company, that coal output this year would not exceed the 1952 level. During the first half of this year, it was only 15.20 million tons, as against 15.33 million tons in the corresponding period of 1952.

The performance of the coal industry is rather in striking contrast with the general trend of industrial production in the country. Why should coal strike a discordant note in the general chorus of higher production? Mr. Sim's reply was that "it is useless to plan for increased production unless transport is available." Few industries are so desperately dependent on transport as coal which, as anyone conversant with its economics knows, is mined in a few centres and hauled over long distances to reach consumers. It is true that stocks at the end of July, this year, were only 3.29 million tons, as against 3.37 million tons at the end of July, 1952. But the decline in stocks, as Mr. Sim pointed out, is "more than accounted for by the decrease in raisings." He did not subscribe to the official view that the coal industry was not utilising, in full, the wagons allotted to it. The experience of the Company, which is an important producer of coal, is that transport has by no means been freely available. He complained that the control over distribution was more acute now than in the difficult days when coal was in short supply. This is a question which deserves to be examined by the Government, without delay.

The present system of distribution control was designed to suit the conditions of a time when there was a shortage of coal. Should it be allowed to stay even in a period of comparative affluence in coal supply? Mr. Sim rightly urged that the consumer should be allowed a "free choice regarding the type, quality and source of supply of the coal he requires." And yet, the consumer is not only not given any freedom of choice but actually told to prefer one type of coal to another. It would appear that the Coal Commissioner's Combustion Engineers offer a great deal of gratuitous advice—of course, backed by peremptory orders—on the way in which coal should be utilised. That such advice, which might stem from lofty motives of conservation of coal, is apt to result in serious disadvantage to the consumers is evident from the instance of the experience in a paper mill, cited by Mr. Sim. He said that, if the mill had been allotted 100 per cent. selected 'A' coal, instead of only 66⅔ per cent., it could "produce more and better paper out of all proportion to the additional outlay on coal." Here is an instance which shows that even coal conservation, important as it is, could become a fetish and a dogma.

Although internal coal consumers could thus be compelled to conform to official regulations, it is easy to see that overseas importers of Indian coal cannot be asked to alter the pattern of their coal consumption to suit such regulations. Mr. Sim again cited a concrete instance, his Company's experience in dealing with the Ceylon market, to show that the omnibus regulation of export trade in coal by prescribing the qualities that might be exported might cost the country dear in the shape of a loss in export markets. Even India's natural markets for coal, from Hongkong in the East to Aden in the West, are likely to be lost through the adoption of excessive control on the quality of exports. In the Far East, China and Australia, as Mr. Sim pointed out, have already emerged as competitors. South Africa is making a bid to capture many markets, notably Pakistan, Ceylon, and Singapore. A look at the trend in coal exports reveals the decline that has taken place on this front. Thus, the exports of coal during the six months ended June, 1953, were only 762,375 tons, as against 1,474,540 tons in the corresponding period of 1952. Against this background and the world coal position which shows the emergence of a strong buyers' market, Mr. Sim's plea for "complete freedom" for the Indian exporter to supply coal according to the overseas consumers' needs acquires a special significance.

The prosperity of the coal industry, like that of any other industry, depends on the co-operation of the workers with the management. Here, the coal industry faces some very difficult problems. Apart from the fact that the industry is asked to shoulder burdens of welfare schemes, from which many other industries are exempt, there is the problem of the intrusion of politics into the sphere of coal labour. Mr. Sim's references to the rivalry of the Congress Party and the Praja Socialist Party for getting control of his Company's labour unions and to the illegal strike to which this has led make depressing reading. In fact, Mr. Sim's graphic description of the labour situation in West Bengal and his enlightened views on trade unionism reflect the general attitude of all progressive employers in this country. Far too long has the labour movement remained a happy hunting ground for political leaders, whose main—and at times the only—preoccupation is politics and not labour welfare, and who see in labour only a means for the furtherance of the party aims. It is high time, therefore, that some suitable measures were taken to divorce trade unionism from politics.

ROAD TRANSPORT POLICY

THE Central Government's decision to reconsider the "entire transport policy" will be widely welcomed. Recent events in the sphere of transport, particularly road transport, have been disquieting. The continued inability of the railways to remove the war-time vestiges of the problem of wagon shortage, the wholly unnecessary nationalisation of air transport, the heavy burden of taxation on motor vehicles, the poor progress of the motor vehicle industry and its failure to respond satisfactorily to the country's automobile needs, the State Government's scheme of road transport nationalisation and, above all, the tardy rate of progress of road development are all factors which must make many pause and doubt whether the Central or State Governments have, between themselves, a dynamic, or any road transport policy at all. It is, therefore, gratifying to note that the entire transport policy will be reconsidered by the Planning Commission and the Ministries of Railways and Transport. The Government has recognised that a comprehensive road transport policy must necessarily take into consideration the capacity of the existing railways, their future programme of expansion, the requirements of the State Governments, the scope for expansion of road transport and the employment opportunities it offers. The Government will also examine, it is announced, the question of the proper maintenance of roads and bridges at a "satisfactory level" so that they can stand the strain of heavier traffic.

Neither the Central nor any of the State Governments has so far admitted the need for a thorough overhaul of its transport policy. The closely reasoned report of the Motor Vehicles Taxation Enquiry Committee has been shelved. The Governments have paid no attention to the repeated demands made by private road transport operators for a halt in the policy of nationalisation of road transport, and for a sizable reduction in the burden of taxation on motor transport vehicles. It may be wondered, therefore, why the Central Government has developed a sudden interest in transport policy. Obviously, it is now convinced that railways, by themselves, cannot serve the entire field of transport, and that road transport vehicles have still a vital role to play in the country's transport system. It further looks as though the Government is convinced that a little less enthusiasm for nationalisation of road transport might yield better results in terms of employment. In its 11-point programme for relieving unemployment, it will be recalled, the Planning Commission placed considerable emphasis on the expansion of road transport, and invited the attention of the State Governments to the fact that the "heavy" taxation of motor vehicles "hinders" the development of road transport.

The Planning Commission, we are now told, followed up this exhortation to the State Governments by sending them another communication in which it had emphasised the need for preventing the slump in agricultural prices that invariably occurs in the crop season. It would appear that the Commission had suggested the stockpiling of goods by the State Governments and the expansion of road transport as appropriate measures. The Commission's emphasis on road transport stems from the realisation that the development of railways is necessarily a long-term project, and that, in the short-term period, the speedy movement of goods could be accomplished only through the development of road transport. The Commission also realised that bottlenecks in transport could upset the working of the various development projects. In its communication to the State Governments, the Commission pointed out how quick transport was vital to the maintenance of production itself both in the matter of supply of raw materials and in the distribution of manufactured articles, and also how insufficient transport facilities would tend to depress prices in the centres of production and lead to shortages in the centres of consumption. The Commission, therefore, asked the State Governments to make a "comprehensive review of the existing position" regarding road transport, the State Government's licensing policies, action, if any, taken towards nationalisation of road transport and their suggestions regarding the future course of action."

In response to the Commission's enquiry, the State Governments have now expressed their views on the transport situation in the country. These show that on the more specific question of road transport services, or expansion of road development, they have not been helpful. Indeed, there is no indication whatever that they are anxious to build more roads and repair the existing ones. Similarly, there is no evidence of any change in the attitude of the Governments towards private road transport operators or taxation of motor vehicles. In their replies to the Commission's communication, the State Governments have recognised that road transport services for carrying freight need considerable expansion in conjunction with the railways. But there is no mention of the need for enlisting the services of private operators. It is pointed out that a few States have Government-owned road transport vehicles which run along with private transport. No attempt has, however, been made to show whether the States' transport services are more efficient than those of private operators.

Again, the State Governments have pointed out that it is their experience that nationalised transport absorbs a larger number of men than private transport. Thus, in Madhya Pradesh, it is stated that 7.2 persons are employed on a bus owned by the State, as against four in a bus owned by a private individual. Surely, this is an indication of inefficiency of the nationalised transport services. Why appoint 7.2 persons when four persons can do that job quite well? But so obsessed has the country become with the problem of unemployment that what is normally regarded as a defect is now applauded as a great achievement of State ownership. There is also another point in this reasoning of State Governments that needs to be highlighted. And it is this. A State-owned road transport service creates unemployment in other sectors, such as service workshops and retail trade in spare parts, because the State road transport services maintain their own workshops and buy their spare parts requirements in bulk.

The real justification for nationalisation of road transport must, however, be based not on the fresh employment it might or might not create, but on whether private enterprise is or is not willing to enter this field. If private enterprise is willing to shoulder the responsibility, the State Governments would be extremely ill-advised to squander their slender resources on nationalising road transport. So far as efficiency, measured in terms of passenger or freight rates, is concerned, the State undertakings have yet to demonstrate that they can offer a cheaper service than private transport operators. Before any such comparison is made, it will be necessary to take into account the enormous advantage of tax reliefs which the State undertakings enjoy. These considerations do not seem to find any place in the State Governments' replies. They are, of course, stated to "appreciate the need for a liberal licensing policy" in regard to private transport. But this realisation is meaningless, because no private operator will come forward and undertake the responsibility of organising and running road transport, so long as the Damocle's sword of nationalisation hangs on this sector. The Central Government will, therefore, do well to concentrate on securing modification of transport policy along three lines. In the first place, it should persuade the State Governments to reverse the policy of nationalisation of road transport. Where nationalisation has been carried to some extent, the State Governments must be asked not to proceed further and allow the private sector to expand in the zones where State transport is not operating. Secondly, the burden of taxation on motor vehicles should be reduced, in the interests both of cheap transport services and India's young automobile industry. And thirdly, State Governments must be directed to give high priority for road building, as it offers not only a short-term remedy for the evil of unemployment but an accepted means of carrying prosperity to the rural areas.

BULLISH TREND IN SHARES PERSISTS

BELAPUR DIVIDEND—LONDON AND WALL STREET—STAMP DUTIES

WEDNESDAY, 5 P.M.

THE share markets, especially in Bombay and Calcutta, are still in good form. Equity values have advanced further over a broad front, though the extent of ground gained is not as substantial as in the previous week. The fact that prices have gone up further, despite a slightly downward trend in commodities, is itself significant, in that it shows that sentiment has undergone a distinct change for the better. *How far it is justified* is a moot point. In spite of this improvement in values, leading brokers complain that the turnover has not improved and that genuine investment buying is not worth talking about. One of them said that quite a few members were contemplating to retire from stock-broking after this year's *Moorat* trading, as their income was not sufficient even to meet their office expenses.

MARKET GOSSIP

• • • •

The outlook for shares depends on the progress of industries. There is no reason for one to take a pessimistic view of the future of the iron and steel industry. Its profit-margin is assured. There is no fear of overproduction. The labour situation in the works of the bigger of the two steel companies, namely, T.I.S.Co., is peaceful. The workers of this Company have been guaranteed higher emoluments and the output is being maintained on the high side. The production of T.I.S.Co. in October is higher than expected and is the highest since March, 1953. The Chairman of this Company has given broad indications that it should be possible to repeat the present handsome dividend even on the increased capital, that is, the increase that will take place when the proposed scheme for capitalisation of reserves is implemented. Whatever improvement has taken place in the value of the T.I.S.Co. shares is thus fully justified. In fact, as the yield on these shares, even at their current market value, is good and as the future trend of interest rates seems to be downward, a further rise in their value will not be out of tune with the prospects for the industry.

• • • •

One cannot, however, say the same thing about the I.I.S.Co. shares. It is true that the labour situation in the Company's works has improved and that production is now running at a satisfactory level. It is also likely that the Company will be able to pay the same rate of dividend as in the previous year, namely, a rupee per share. The yield on these shares, however, is now a little less than 4 per cent., a level not high enough to attract the support of investors. This fact has been known to the market for a long time now, but it has made no impression on it, because the lack of support from investors has been more than made good by the keen interest evinced by speculators in this scrip. The only snag, however, is that the affections of a speculator cannot be of a sustained nature. Any improvement in value based on such support is, therefore, undependable. The long-range prospects are often mentioned in favour of the rise in the value of I.I.S.Co. scrips. There is force in this line of reasoning but the risks involved are quite substantial.

• • • •

Textile shares have received a lot of stimulus from the reports of improvement in the offtake of cloth, following the relief measures announced by the Government last week. It is risky to generalise the outlook for textile shares, for, while some mills are said to be faring better, others are stated to be struggling hard. As in the case of the T.I.S.Co. shares, the gain registered by first class mill shares is, perhaps, justifiable. But, taking the industry as a whole, it will be premature to say that the industry is out of the wood. Whatever the Textile Commissioner may have to say about the relief afforded by the Government to the industry—that he protested too much in his statements to the Press on Tuesday is quite evident—the fact remains that the Government has done precious little to encourage consumption of cloth in the country which has to absorb nearly 84 per cent. of the present rate of mill production. The withdrawal of closure notices served by the Ahmedabad and other up-country mills was chiefly due to political pressure and the promulgation of an Ordinance stipulating payment of heavy compensation to workers who will be affected by such closure. It cannot, therefore, be regarded as a sign of return of remunerative trading conditions. In short, though the state of the cloth market may be a little better than a few weeks ago, the profit margins in most sections of the industry are appreciably low and may, perhaps, be lower still in the coming months. It is conceivable that the volume of trade in cloth may increase, but it is inconceivable that profit-margins will improve to a level which could be regarded as adequate, having regard to the present-day cost of re-equipment and extensions which have to be carried out by a large section of the industry if it is to survive.

• • • •

It is not our intention to make a detailed survey of the outlook for all the industries in this country. But the aforesaid remark about the profit margins is applicable to almost every one of them, especially tea and jute. Of late, there has been an improvement in the offtake of the products of these industries, but their profit-margins are small. Several units belonging to these industries have debit balances to be wiped out or reserves to be replenished before they can pay sizable dividends. The outlook for coal is by no means rosy, as can be seen from the observations of the Chairman of the Bengal Coal Co., Ltd., published elsewhere in this issue.

• • • •

In recent weeks, Belapurs have been a firm feature. In the month of October, they gained over Rs. 20, from Rs. 240 to Rs. 264 to be precise. During the last two days, they had gone up a little higher, the closing rate for the week at Rs. 266-8 being the peak for the current year and only Rs. 2 lower than the highest level seen in 1952. At one time during this year, they had gone down as low as Rs. 199-8. All this improvement in the value of this sweetest scrip belonging to the sugar industry has not been in vain, judging from the decision of the Directors of the Company to-day to repeat last year's dividend of Rs. 16 per share, equivalent to 32 per cent. per annum, for the year ended 30th September, 1953. Thus, for the second year in succession, the Company has been able to pay a handsome dividend. It is reliably learned that the Company made history is several respects in 1952-53. Nevertheless, the net profit is believed to be a little less than that for 1951-52, which is understandable because of the additional excise duty of Re. 1 per maund which the industry had to pay. The dividend, however, has been fully earned and maintained without effecting any cut in the transfer to reserves. On an ex-dividend basis (of Rs. 250 per share), the yield on these shares works out to 6.4 per cent., free of income-tax.

• • • •

Although the firm trend displayed by the share markets in this country may not be fully justified by the uncertain outlook for most of the industries, it is fully in accord with the changed atmosphere in the U.S. and the U.K. where fears of an economic recession have yielded place to confidence in the future. From London come reports that the bull market in equities has definitely arrived. After months of patient waiting, investors now find their holdings are appreciating in value.

We wish all our Hindu readers
A Happy Diwali
and
A Prosperous New Year

This trend has, naturally enough, hit the headlines in the front page of the financial Press. Over the week ended 31st October, 1953, the *Financial Times* index of industrial ordinary shares (Base: 1st July, 1935=100) rose by 3.3 to 130.3. The index is now at its highest since November, 1951, but is about 10 points below the all-time high of 140.6 reached in January, 1947. Despite the rise in prices, some of the first class equities on the London Stock Exchange yield 4 to 6 per cent. Thus, Woolworth yields 4.6 per cent., I.C.I. 5.1 per cent. and Dunlop Rubber 6.3 per cent.

• • • •

The rise in equity prices is attributed to investment buying on behalf of institutions. What prompted this institutional interest in industrial shares? Many reasons are given. But the most important is the very constructive decisions taken in the "board rooms" of many public companies; the Directors are increasingly adopting a more liberal distribution policy. It would also appear that private business reports are also encouraging. These are said to be the main factors which influenced the upward trend in the market. Less remote factors, though no less important, were the reduction in the Bank rate and the somewhat healthier trend witnessed in Wall Street. Although the U.K., like many other countries, was apprehensive about the possibility of a recession in the U.S., it has derived no small satisfaction by the repeated declarations of the American Government that, if any setback did come, they knew how to deal with it. More than these factors, it is clear that the men in British business and industry have drawn their main comfort from the return of freedom to trade and industry, made possible by the present Conservative Government in that country.

• • • •

The recovery staged by Wall Street has been far more pronounced than that by Throgmorton Street. Despite growing difficulties of American industry, the Dow-Jones industrial index has moved up by more than 20 points in the past six weeks. This feeling of robust confidence in the future is based on the belief that the U.S. Government is not only anxious to prevent an economic recession but also capable of stemming a recession. Wall Street believes that the present Administration has dropped the hard or "honest" money policy so vigorously advocated early this year, that President Eisenhower is determined not to allow defence expenditure to be reduced to the point of risking national safety, that there is a prospect of very large new expenditure on civil defence projects "to construct a shield against the hydrogen bomb," and that the U.S. economy is now less vulnerable to the effects of trade cycle than it was during the pre-war years. Wall Street seems to share the view of an U.S. official spokesman that, in an expanding America, any reversal of economic conditions can be only temporary.

• • • •

A similar view is expressed by Mr. A. W. Zelomek, President of the International Statistical Bureau, in his book, *No Major Depression in Our Lifetime*, published a fortnight ago. Although the author foresees a series of "declines and readjustments" in the American economy, he believes that "there will not be another major depression in our lifetime." His basic thesis is that, because of the stabilisers built into the economy since the early 1930's and because of virtually unlimited growth potentials of the country, a major depression can be ruled out even as a possibility. These "built-in stabilisers," he explains, are such things as unemployment insurance, bank deposit insurance, farm price support, and automatic tax reductions as incomes fall. Mr. Zelomek, a leading business consultant, also believes that dynamic forces for expansion remain in the United States, despite the passing of the physical frontier. These forces include, he says, an expanding population of more than 2.6 million a year, the need for new housing and for all the products which go with them, the need for improved transportation facilities, application of atomic energy to peaceful pursuits, the potentialities of new industries and new products, and the urgency for new schools, hospitals and other public works. These forces, according to him, "will provide for continuous expansion and help to prevent any major decline." In his forecast of the future, Mr. Zelomek predicts a long and uneasy peace, but says that average security expenditures are not likely to decline lower than $30,000 million to $35,000 million a year, because "the threat of communism will be with us during our lifetime." Addressing himself to business men, Mr. Zelomek, however, warns that business is entering one of the most competitive periods in American history. There will not be prosperity for all, but for those who promote a business intelligently, a period of good earnings is, he says, practically assured.

• • • •

Commenting on the behaviour of Wall Street, the *Financial Times*, London, makes the following interesting observations:

"The stock markets may well be taking too blithe a view of present movements; such a strong rise in the face of current economic reports seems to be unduly optimistic. Their basic confidence, on the other hand, may be justified. Whenever the halt had come, as after the end of the Korean war it was bound to do, it would have made people fear that the post-war prosperity had reached its term. There is no reason at present to suppose that the recession which now exists in the United States will be allowed to go too far. It does admittedly seem likely that the next few months will be a period of sharper competition in the United States as elsewhere. Many American firms will find their profits trimmed. But none of the evidence suggests that this year, or the next, the American economy is going to revert to its pre-war type."

• • • •

The world-wide trend towards easier money continues. The latest instance of a country which has joined the ranks of those that have lowered their Bank rates is Belgium. The Bank of Belgium announced last week a reduction in its principal discount rate from 3 per cent. to 2½ per cent. The subsidiary discount and advance rates were also cut by ½ per cent. except for advances on Treasury Certificates with less than a year to maturity on which the rates vary between 2 per cent. and 2½ per cent. This is the second time in less than a year that Belgium has cut its Bank rate. It may be recalled that the principal discount rate was reduced from 3½ per cent. to 3 per cent. in December last year.

• • • •

Some interesting comment on the present provisions relating to stamp duties is available in the ably argued replies to the Taxation Enquiry Commission's questionnaire, submitted by the Bombay Chamber of Commerce and the Bengal Chamber of Commerce. Under the Constitution, the Union Government, as is well known, is empowered to fix the rates of stamp duties in respect of bills of exchange, cheques, promissory notes, bills of lading, letters of credit, transfer of shares, debentures, proxies and receipts, while the State Governments are empowered to fix the rates for all other stamp duties. Among the documents which might be subjected to stamp duties, the stamp duty on cheques, it may be recalled, was abolished in 1927. Both the Chambers have rightly urged that there should be no reversion to the old system of stamp duty on cheques, which was abolished with a view to stimulating the banking habit in India. Regarding the duty on bills of lading, the Bengal Chamber points out that, although the Central Government contemplated a minimum rate of As. 4 only, the actual rates have been far in excess of this rate. In Calcutta, it is as high as As. 8. In several other centres, it is As. 6, though it is only As. 4 in Bombay. The Chamber has urged the need for uniformity and has advocated the rate of As. 6. Referring to the stamp duties on transfers of shares, debentures, proxies and receipts, the Bengal Chamber says:

"At present the rate of stamp duties on the transfers of shares, debentures, etc., is As. 12 per cent, and in the opinion of the Chamber, there is little doubt that this rate leads to losses to the Government revenue, because of the encouragement which it gives to the holding of shares under blank transfers. It is, therefore, considered that, in this case, the Government revenues might benefit from a reduction in the rates which would encourage more frequent registrations."

• • • •

The Bombay Chamber has discussed the common methods of evasion of stamp duty and the means of preventing them. It says:

"There is a substantial loss in the revenue from stamp duties in a condition in which (a) the

BUOYANCY IN SHARES KEPT UP

TEXTILES STILL IN FAVOUR

(From Our Own Correspondents)

BOMBAY, *4th November*

THE Stock Exchange witnessed cheerful conditions during the week under review also. Textile shares were again in the lead under the stimulus of good offtake of cloth in the piecegoods market. Strong speculative support to Indian Irons, buttressed by rumours of a fresh issue of shares by the Company and expectations of maintenance of dividend for the past year, also contributed to the firm tone of the market. The growing belief that the Tata Deferred Conversion scheme would be carried through without any great difficulty sustained interest in the steel section. Steady advices from the commodity markets and bullion fanned further the enthusiasm of operators. The cumulative effect of these factors was brisk activity in the main body of shares on the Exchange. Under heavy professional buying and active short-covering, values once again forged ahead, showing widespread gains over the week.

The Stock Exchange will remain closed from to-day till the 7th inst. on account of *Diwali*. It will, however, remain open for *Moorat* trading for one hour on Friday, 6th November, between 5-30 and 6-30 p.m.

Sectionwise, steels maintained good form under the lead of Indian Irons which experienced a fresh bout of speculative support. The shares, as a result, advanced from Rs. 24-11½ to a high of Rs. 25-7½, the highest level since 3rd June, 1953, before winding up at Rs. 25-5. Tata Steels also made useful gains, but the rise over the week was not as spectacular as in the previous week. Deferreds suffered a mild reaction from last week's closing of Rs. 1,931-4 to Rs. 1,926-4 early in the week. They, however, staged a brisk recovery to Rs. 1,951-4 yesterday before closing at Rs. 1,943-12. Tata Ordinaries came up to Rs. 330-4, from last week's closing of Rs. 327-12, but finished at Rs. 328-12. The market was anxiously awaiting the outcome of to-day's meeting of the Tata Deferred shareholders when they have to give their verdict on the conversion scheme. At yesterday's meeting of the ordinary shareholders the scheme was approved by an overwhelming majority. The Company's production figures for the month of October received to-day are very encouraging and constitute a record for the Company's current financial year so far. The output of pig iron amounts to 99,500 tons, as compared with 94,200 tons in the previous month, steel ingots 94,000 tons, as against 91,100 tons in September and finished steel 68,500 tons, as compared with 61,900 tons. The latest output figures for all the three varieties, namely, pig iron, steel ingots and finished steel were the highest for any month since January, 1953.

During the four sessions of the week under review, Bombay Dyeings scored a smart gain from Rs. 386-4 to Rs. 396-4, but closed a shade lower at Rs. 392-8. Kohinoors had a good spell of support to go up from Rs. 293-4 to Rs. 297, before finishing at Rs. 295-8. Central Indias moved ahead from Rs. 168 *cum-div.* to Rs. 166-8 *ex-div.* (dividend Rs. 5), reflecting the operators' response to the encouraging speech of the Chairman. Century added a gain of Re. 1-8 to Rs. 273. Finlays staged a spurt from Rs. 252-8 to Rs. 261. Gokaks put on a rupee to Rs. 241, Indu Ordinaries As. 4 to Rs. 10-12 and Indore Malwas as much as Rs. 13-2 to Rs. 102-8. Khataus were put through, Rs. 2-8 better, at Rs. 180, New Greats Rs. 4 at Rs. 159 and Svadeshis Rs. 6 at Rs. 257. On strong speculative support from knowledgeable circles, Simplex recorded a sharp rise of Rs. 16 to Rs. 151. Standards were steady around Rs. 315. Tata Mills were well supported and taken up Rs. 3-12 to Rs. 46-4.

Bank shares were steady, but activity was on a very small scale. Barodas, on small buying support, rose by Rs. 2 to Rs. 109. Centrals were unchanged at Rs. 63-12, while their new shares put on As. 8 to Rs. 66-8. Imperial Fully Paids dropped Rs. 5 to Rs. 1,827-8, while the Partly Paids gained Rs. 2-8 to Rs. 456-4. Indias moved up by As. 12 to Rs. 157-12.

Business in the public utility section was selective. Andhra Valleys were on offer and were down by Rs. 6-4 to Rs. 1,272-8, while their Rights were bid, Rs. 8-12 higher, at Rs. 161-4 and Coupons, Re. 1-8 better, at Rs. 32. Tata Hydros, however, added Re. 1 to Rs. 138-8. Their Rights put on Rs. 2 to Rs. 24 and Coupons Re. 1 to Rs. 8-4. Tata Powers changed hands, Rs. 5 higher, at Rs. 1,370, while their Rights lost Rs. 5 to Rs. 232-8 and Coupons a fraction to Rs. 46. Ahmedabad Electrics were a fraction down at Rs. 114-1, Bombay Suburbans As. 10 lower at Rs. 125-10.

Several bright features were noted in the miscellaneous section and the undertone remained firm. A.C.Cs hardened on bear covering by Rs. 2-4 to Rs. 176 and Belapurs by Rs. 2 to Rs. 266-8. Bombay Burmahs, which were in the background last week, rallied Rs. 6-14 to Rs. 345-10, on expectations of better results than generally anticipated. B.I.Cs were steady at Rs. 8-12. Scindias responded well to buying enquiries and rose by As. 4½ to Rs. 14-11½. Alcocks spurted from Rs. 320 to Rs. 331-4 due to scarcity of stocks. Professional buying lifted Premier Constructions from Rs. 97 to Rs. 101. Shivrajpurs advanced by Rs. 3 to Rs. 67-8. Tata Chemicals had business at Rs. 9-4, a rise of As. 5½ over the week, due to optimism regarding the annual report. Tata Oils were quiet at Rs. 31. Wimcos were dealt in Re. 1-4 higher at Rs. 242-8. Killick Industries Partly Paids were in demand to rise by Rs. 3-2 to Rs. 125-10. National Rayons were just steady at Rs. 119.

• • • •

Calcutta Stock Exchange

CALCUTTA, *2nd November*

Some of the recent gains were partially lost on the Calcutta Stock Exchange during the last four sessions from Thursday onwards. The volume of business was also not as large as during the three sessions covered by our last report; nevertheless, conditions were steady. Following the good increases in prices of jute goods, interest in jute shares widened. Jutes again came into their own and provided leadership to the market. Operators noted with enthusiasm that, in September, the favourable balance of Rs. 4.5 crores in the country's foreign trade was due to an increase in the value of exports. The news that measures to boost cloth exports were meeting with the desired result also encouraged long-term commitments, although this factor had less bearing on mills in West Bengal than those in Ahmedabad and Bombay. But this State's production of medium and coarse cloth can find a wider internal market if the better varieties in other States record higher exports.

Coal shares were shown only nominal interest, and the fall in exports of coal and the presence of the transport bottleneck in collieries were problems that kept down genuine investment in coal shares to an absolute minimum level. Engineering shares held firm ground, and Indian Irons continued to attract attention which resulted in further gains. Confirmation of earlier rumours of bonus share issues in respect of Burn & Co. and the Indian Standard Wagon Company was favourably responded to by these scrips, with a rise in their values. As usual, selected interest was shown to miscellaneous shares. Teas were quiet, and such a

trend did not cause surprise in view of the recent heavy additions.

Section-wise, Indian Irons opened at Rs. 24-8 last Thursday and at the time of closure on Saturday the rate had risen to Rs. 25-2. To-day there was a further rise to Rs. 25-6. After a rise to Rs. 332 last Wednesday Burn & Cos. receded to Rs. 328, at which rate they were steady. To-day there was again a spurt to Rs. 332. Indian Galvanizings were supported at Rs. 16-6, while Jessops eased fractionally to Rs. 24-11. Marshalls came to business at Rs. 5-11 and Kumardhubis were higher at Rs. 8-2. Texmacos realised Rs. 6-9.

Jutes were generally steady. Howrahs were raised from Rs. 23-8 to Rs. 24-4 while Anglo-Indias spurted from Rs. 206 to as high as Rs. 211. Kinnisons advanced from Rs. 188 to Rs. 193. Deltas gained from Rs. 221 to Rs. 225, and Reliances from Rs. 15-4 to Rs. 16-8. On the other hand, Kanknarrahs receded to Rs. 143.

In the coal section, New Beerbhooms were a feature with a rise from Rs. 19 to Rs. 19-10, while Bengals eased from Rs. 510 to Rs. 506. Dhemo Mains attracted interest at Rs. 8-12, as against Rs. 8-4 previously. Burrakurs were fractionally lower at Rs. 8-14, but East Indians were better at Rs. 24-5. South Karanpuras were quiet at Rs. 10-7, as were Western Bengals at Rs. 4-8. Khatras Jherriahs were shown interest at the fractionally improved rate of Rs. 39-4, and Central Indias realised Rs. 5-1.

Miscellaneous shares were steady, although rises were few. The strong feature of the week was National Tobaccos which, in interested buying, were raised from Rs. 10-2 to Rs. 11-11. Dunlop Rubbers were a shade easier at Rs. 30-8, and Indian Cables, after receding to Rs. 19-14, regained to Rs. 20.

Madras Stock Exchange

MADRAS, *2nd November*

Except the textile section, all other sections presented a quiet trend on the Madras Stock Exchange. Textile shares persisted their upward trend, on reports of better export enquiries for cloth and yarn. But, among the rest, the performance of plantings was uninteresting. Teas were dull in the absence of any encouraging factor. Coffee scrips lacked enthusiasm, on reports of difficulty in the disposal of accumulated stocks. Rubbers displayed no better trend. Miscellaneous scrips met with poor response, although a few of them came in to receive some attention. Consequently, activity in sections other than textiles was at a low ebb with prices showing no notable variations. Textiles, however, recorded sizable gains on good support.

The improved sentiment witnessed last week in the textile section persisted this week also. Thus, Metturs shot up from Rs. 194 to Rs. 197 and Radhakrishnas, Rs. 100 paid-up, from Rs. 158-8 to Rs. 162-8. Vasantas gained Rs. 2 and finished at Rs. 162 and Coimbatore Pioneers Re. 1 to close at Rs. 119. P. Andavars 'A' were done at Rs. 65-8, as against Rs. 64-8.

In the planting section, teas were virtually dull. Nilgiri Teas lost As. 3 to Rs. 10-13. Devasholas were unchanged at Rs. 17-8 and Kalasas at Rs. 10-2. Twyfords lacked support at Rs. 11-6. Chandramalais, however, gathered As. 2 to Rs. 2-15-6 *cum-div.*

MARKET GOSSIP

(Concluded from previous page)

transmission of a share is possible without evidence of probate or letters of administration; (b) it is the custom to hold shares on blank transfers; (c) the stamp duty on a transfer of shares is paid by adhesive label. It is commonly provided by Articles of Association of Companies that the directors may, in their absolute discretion, dispense with the production of probate or letters of administration or such other legal representation by the person claiming title to the shares of a deceased member of the Company. There is substantial avoidance of probate duties as a result. It is important that the avoidance be checked. It may, at the same time, be noticed that avoidance of the probate duty will continue to be possible so long as the obligations proposed to be imposed by the Estate Duty Bill may be discharged without an application for probate or letters of administration. In the result, there will be a diversion of revenue from the States to the Centre.

"It is doubtful whether the practice of abstaining from securing the registration of shares has appreciably abated since the Bombay High Court held, in *Shri Sakti Mills Ltd. vs. Commissioner of Income-tax* (reported at 1948 I.T.R. 187), that credit under section 18(5) of the Income-tax Act for the tax paid by the Company could be claimed only by the person registered as the holder of the shares. The payment of the stamp duties on the transfer is avoided, if the shares are held under a deed of transfer executed only by the transferor to the extent that the property in the shares may pass through a number of hands without the registration of any transfer, and it may be observed that certain banks customarily make advances upon the pledge of such shares without requiring their registration either in the name of the bank or in the name of pledger. No stock or share may be sold under sanction of the rules of the London Stock Exchange, unless registered in the name of the vendor. There can be no escape from payment of the duties on the transfer. The enforcement of that rule is rendered practicable by arrangements for securing the completion of transfer within the shortest possible time, believed to be 48 hours at the most. In India the time taken for the completion of a transfer of shares extends to three months or more. It may not be practicable in India to adopt the English law and practice; the evasion of the payment of stamp duties on transfers of stocks and shares may, however, be substantially abated if the banks are prohibited from making an advance upon the pledge of stocks or shares not registered in the name of the pledger or in the name of the bank or its nominees. Even if cancelled as by an indelible rubber stamp at the time a transfer is approved the adhesive label by which the stamp duty on a transfer of shares is paid is easily removed and used a second time. The label does not carry the date of its issue as does the impressed label. It is believed that a substantial evasion of duty derives from the use of the adhesive label and that the revenue would be benefited if the stamp duty on a transfer of shares were to be paid by impressed label."

• • • •

Some States, notably Bombay, levy stamp duties on transactions in forward markets. Opposing this form of levy on transactions in forward markets, stock exchanges, etc., the Bengal Chamber emphasises that, in properly regulated markets, transactions in these exchanges should play a valuable part in the organisation of commodity sales and in mobilising credit. The Bombay Chamber of Commerce also emphasises that forward transactions, which are a form of insurance indispensable to all traders in or users of commodities, would be impeded by the imposition of a stamp duty. But the Chamber concedes that, if it were possible to distinguish between the genuine hedge and the speculative contract, the latter should be heavily taxed, though it recognises that there "seems to be no means of identifying the speculative contract excepting only that in shares in the case of which a speculative transaction may be presumed if there is no delivery."

NEWS IN BRIEF

THE Government of India has extended to 31st July, 1954, the date by which the Press Commission is required to submit its report.

The Government of India has appointed a technical committee to make recommendations in regard to a thorough reorganisation of air routes in India.

The Tariff Commission has undertaken an enquiry into the question of continuance of protection to the electric brass lamp-holders industry beyond 31st December, 1953.

The next meeting of the Import Advisory Council will be held on Saturday, 28th November, 1953, in New Delhi under the chairmanship of the Minister for Commerce and Industry. The Export Advisory Council will meet on the following day.

The Government of India has granted a sum of Rs. 3 crores as its assistance to the Hyderabad State for implementing a large number of medium-sized and minor irrigation projects in the State.

The Central Government has agreed to finance, under the Five-year Plan, the execution of irrigation schemes in Bihar upto a maximum of Rs. 3.5 crores on certain conditions. Only such schemes as are likely to cost Rs. 10 lakhs or more and can be completed within two years are to be taken up.

The Government of India has decided to extend the shipment validity of export licences of the items of cotton piecegoods and cotton manufactures freely licensed (other than cotton waste blankets) which were issued on or before 23rd May, 1953, till one year from the date of issue or till 30th June, 1954, whichever is earlier.

A conference of representatives of the States will be held at Secretariat level in New Delhi on the 10th inst., for preliminary discussion on the food policy for the ensuing year. Another conference at Ministerial level will be held early in December when a full picture of the harvests in the States will be available.

Questions relating to the production of food yeast, which is a highly nutritious substance, containing proteins and vitamins, were discussed last week by Mr. K. D. Malaviya, Union Deputy Minister for Natural Resources and Scientific Research, with the Chief Minister of Bombay. If the plans now under discussion are finalised, Bombay will soon have a food yeast plant.

The Madras Government will receive, in the course of the next two months, a sum of Rs. 85 lakhs out of the Handloom Cess Fund from the Central Government. The handloom industry will receive assistance out of this amount through the medium-sized co-operative societies in the State. The items of expenditure will, however, have to be approved by the Central Government.

The three-day meeting of the Central and State Statisticians, held in New Delhi last week, appointed a committee of ten to go into the question, from all points of view, of having legislation to enable collection of statistics in various spheres of activity, including agricultural and sociological, and, if possible, to draft a Bill or Bills in accordance with constitutional provisions on Central, State and Concurrent lists of subjects.

The Forest Research Institute, Dehra Dun, has succeeded in making printing paper of good quality from bagasse and bamboo pulps. The paper was made on a commercial paper machine at a high speed of 312 feet per minute. The trial showed that bagasse stock mixed with bamboo stock can be run on commercial paper machines. It has also been found that insulation boards can be made from pith separated from bagasse. Wrapping papers of high strength were also made on a pilot plant from castor stems.

The establishment of a National Fertiliser Association to develop the use of fertilisers in India has been recommended by the Development Council for Heavy Chemicals (Acids and Fertilisers) which was constituted by the Ministry of Commerce and Industry under the provisions of the Industries (Development and Regulation) Act, 1951. The Council considered the possibility of establishing the manufacture of barium salts in India and, in the light of the abundance of the necessary raw materials and potential demand for barium salts, it has recommended that full encouragement should be given to those taking up their manufacture.

The Inter-State Conference on the Damodar Valley Corporation, held in New Delhi last week, decided to extend the power transmission system of the D.V.C. to Calcutta, Patna and Gaya. The extension of the power supply to Calcutta will necessitate additional generating equipment, for housing which provision has already been made in the Bokaro Power House structure. The programme, in this connection, will be reviewed after a year, depending on the growth in demand for power in the D.V.C. and Calcutta areas. The Conference discussed the comments of the West Bengal and Bihar Governments and the D.V.C. on the Rau Committee report. In the light of the views expressed at the Conference, the Central Government will now take final decisions on the recommendations. The Conference considered the revised financial analysis of the Damodar Valley projects, the main feature of which is the omission from the first phase of the hydro-electric portion of the Konar project estimated to cost Rs. 3.85 crores.

An understanding has been reached between the Governments of the United States of America and India regarding the utilisation of the interest that has accumulated on the U.S. wheat loan of $190 million to India. Under the agreement providing this loan, interest of 2½ per cent. per annum would fall due from 30th June, 1952, while the principal shall be paid from June, 1957, in sixty equated half-yearly instalments. The agreement further provides that, out of the interest that accrues up to 1st January, 1957, a sum, not exceeding $5 million, shall be placed in a special deposit fund with the Government of the U.S. for utilisation on certain mutually agreed projects between India and the U.S. At present, a sum of $1 million has accrued to this fund, and, recently, an understanding was reached between the two Governments to the effect that this amount would be utilised mainly for supply of books and laboratory equipment from the U.S. to Indian universities and also for exchange of scientists and scholars between India and the U.S. Details of the programme are now being worked out.

From Abroad

The I.M.F. has sold £10 million sterling to Brazil to enable the latter to settle its commercial debts in Britain.

Exports of wheat from the U.S. are likely to continue to decline through 1954 to an annual rate of 200 million bushels, according to the officials of the U.S. Department of Agriculture.

The United States has decided to slash by two-thirds the Japanese debt arising from the aid, which America supplied to Japan immediately after the war, evaluated by America at about $2 milliard ($2,000 million). This aid mainly consisted of foodstuffs.

Britain expects to produce electricity for its grid system by atomic energy within a few years. It has recently begun to construct a thermal reactor from which power will be produced in industrial quantities, and is expected shortly to build a fast reactor.

Canada will continue to sell wheat to Britain, even though Britain is outside the International Wheat Agreement. The price at which Canada sells wheat to Britain will be fully competitive on the British market, agreement or no agreement, according to the Canadian Trade Minister.

The O.E.E.C. has lifted the ban on the use of nickel, nickel alloys and nickel plating for manufacturing purposes. Restriction on the use of nickel by member countries was imposed in May, 1952 and the present removal of restriction has been enabled by the improvement in nickel supplies.

The London Grains Futures Market will reopen on 4th January, 1954, with trading in maize and barley. Trading in wheat futures will not commence until some time after that. The Liverpool Grains Futures Market, however, will reopen on 1st December, 1953, and trading will initially be in wheat.

Rationing and controls over prices and distribution of fats and milk products in the U.K. will come to an end next year and imports on private account will be resumed. The precise date of each step in the decontrol measures, which will be a complex operation, will be determined in relation to the circumstances of each commodity.

The Government of Ceylon has introduced, with effect from 30th October, 1953, an export duty at a flat rate of 45 cents per lb. on all tea exported from Ceylon, in place of the existing sliding scale. This step has been taken, according to the Finance Minister, in view of the fact that, since the sliding scale was introduced some time ago, shippers have exploited the situation to serve their end at the expense of the country.

PERSONAL

MR. D. P. Karmarkar, Minister for Commerce, Government of India, has returned to India after attending the session of the G.A.T.T. held at Geneva.

Mr. W. Jenkins of the Belapur Co., Ltd., and Mr. K. J. Somaiya of the Godavari Sugar Mills Ltd., have been elected President and Vice-President, respectively, of the Deccan Sugar Factories Association for the ensuing year.

Mr. G. R. Kamat, Joint Secretary, Ministry of Finance, Government of India, has been elected one of the members of the United Nations Advisory Committee on administrative and budgetary questions for a period of three years.

Mr. Chimanlal B. Parikh, Vice-President of the Indian Central Cotton Committee and the East India Cotton Association, Bombay, left last week for the U.S. to attend the International Cotton Advisory Committee meeting, now in session.

Dr. Rustom C. Cooper of Messrs. P. C. Hansotia & Co., Mr. N. R. Mandviwalla of Messrs. Gondolia and Mandviwalla and Mr. P. N. Shah of Messrs. Bhogilal Chimanlal Shah & Co., Chartered Accountants of Bombay State, have been selected to undergo a specialised course in Estate Duty at the Central Board of Revenue, New Delhi.

Mr. C. T. Whyman, Chief Executive Officer in charge of the trade marks branch of the Patent Office, U.K., has been appointed an adviser to a committee which is being set up by the Government of India to review the working of the Indian Trade Marks and Merchandise Acts. The services of Mr. Whyman have been made available to the Government of India under the Technical Co-operation Scheme of the Colombo Plan.

Mr. P. S. Narayan Prasad, Economic Adviser to the Reserve Bank of India, and Mr. V. G. Pendharkar, Director of the Balance of Payments Division of the Reserve Bank of India, who have been appointed India's Directors on the Board of the International Monetary Fund and alternate Director on the I.M.F., respectively, left for London last week, *en route* to Washington. Mr. Pendharkar is alternate Director on the Board of the World Bank also.

"COMMERCE" 1928

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *10th November*

Population and Food Shortage

In China, a terrible winter is foreshadowed by increasingly bad crop reports. Rice has suffered particularly owing to a widespread drought. It is expected that there will be a serious shortage in an area of at least 400,000 square miles involving a population of nearly 200,000,000 most of whom normally live close to starvation line. The authorities of the Peking Bureau of Public Safety state that 256,000 people are destitute in Peking. Russia, too, is famine-stricken. Despite censorship, alarming reports are leaking out which show that the country is practically reduced to starvation. Official Soviet newspapers confess that there is a scarcity of wheat and rye all over Russia. In Moscow, the plight of the inhabitants is pitiful. There is no fuel and little or no grain. Long queues of shivering men, women and children can be seen every day waiting for food. Queues in Leningrad are strictly rationed and are sometimes offered apples instead of flour. Peasants in the valley of the Volga are holding up grain until supplied with manufactured articles, including vodka, and, as a result, the district is destitute.

GO-SLOW TACTICS

THE Industrial Tribunal of Madras has adjudged that go-slow tactics constitute a strike under section 2 (q) of the Industrial Disputes Act. It has ruled, in a dispute between Messrs. Ashok Motors, Ennore (Madras), and its employees, resulting in the closure of the assembly department of the Company, that go-slow tactics are "a covert sabotage effected by conscientious withdrawal of efficiency often developed into a fine art of wasting time." It has held that, in view of the workers' go-slow tactics, the management could not have chosen any other line of action, except to close the assembly plant.

This decision deserves to be noted especially by labour unions. Only recently, the Labour Appellate Tribunal, Bombay, also pronounced a similar judgment in a dispute between the Firestone and Rubber Co. of India *vs.* its employees. After all, the workmen, whatever their grievances may be, should not take charge of a machine and produce only as much as they like. The company concerned has a right to expect from the workmen a normal day's work for the agreed wage, particularly because dearness allowance and bonus are *now linked to attendance and not to production*. It is wrong for a worker to monopolise a machine, secure a full day's work and allowance and produce as little as he chooses. Certainly, go-slow tactics, unlike strikes, are not a recognised weapon in the armoury of workmen in any conflict with employers. In fact, it is an insidious method of undermining the stability of the concern which employs them. These tactics constitute a clear case of misconduct and they are so designated in the model standing orders, which have been appended to the relevant enactment, namely, the Industrial Employment (Standing Orders) Act 1946. Section 3(2) of the Act, it may be mentioned here, requires the standing orders of a concern to conform to the model as far as practicable.

TOWARDS FREER EUROPEAN TRADE

Western Europe bids fair to move forward towards eventual free trade. For at a two-day session, the Ministerial Council of the Organisation for European Economic Co-operation (O.E.E.C.) has reaffirmed its determination to abolish all import restrictions. In order to achieve this aim, four conditions are required to be fulfilled, and these have been embodied in a resolution adopted by the Council. They are: (a) a suitable multilateral system of payments must be agreed upon from 1st July, 1954; (b) the marked inequality between the different degrees of trade liberalisation among member countries must disappear; (c) France must comply fully with her obligations under the O.E.E.C. liberalisation code. This provides for an end of restrictions on imports covering 75 per cent. of the whole import range, and (d) the escape clauses in the code must be tightened up.

France was the only country to raise a dissenting voice. It proposed to increase its liberalisation from 8 to 20 per cent. only. But the Council has asked it to report back to the Organisation before 1st March, 1954, on steps taken by it to obey the code, as the Council decided to meet again a month after, that is, on 1st April, 1954.

The Council also accepted the British suggestion that, in future, member countries must justify restrictions they maintain for reasons other than balance of payments.

The Council discussed a report from the Managing Board of the E.P.U.—the financial clearing house of the O.E.E.C. members—on the question of convertibility and of reinforcing the Union's reserves. Proposals were made for a change in the rules under which creditor countries of the E.P.U. received payments in the form of gold and credit. Debtors now meet their obligations half in gold and half in credit. It was urged that this proportion be changed to 65 per cent. in gold and 35 per cent. in credit. Holland and Germany supported the change. The British representatives opposed the move, as Britain had run a great risk already in liberalising its import restrictions which will be dealt with presently. In the end, the Council approved a resolution stressing that convertibility should not be achieved at the expense of continued trade liberalisation. The Managing Board was called upon to examine problems that would arise, if one or more European currencies became convertible, as well as methods to ensure an orderly transition from the present form of E.P.U. to a wider payments system.

The credit for the success of the Council's meeting goes mainly to the U.K. which gave a lead by announcing its intentions to liberalise imports. Mr. R. A. Butler, British Chancellor of the Exchequer and also Chairman of the Ministerial Council, stated that Britain would liberalise its imports by 75 per cent. before the end of the year. He announced that the foreign tourist allowance also would be increased from £40 to £50 annually. The level of liberalisation upto now has been 58 per cent. This move had a tonic effect and provided encouraging evidence of the sincerity of Britain in its professions of freer trade.

But in committing itself to the policy of liberalisation of imports, the U.K. is taking a big risk—risk of a sharp rise in imports upsetting its balance of payments position. Against this risk, however, there are chances of expanding exports and earning more dollars. For fewer restrictions on imports provide a stimulus to competitive efficiency, help reduction in cost of production, and increase exports. It remains to be seen how far this process of stimulus to competitive efficiency will be fruitful. And this depends on the extent to which the U.S. opens its doors to European goods, but so far the U.S. has made no decision on the request by Europe for trade and not aid. All indications go to show that no change in the U.S. foreign economic policy can be expected before next summer.

WHOLESALE PRICES SINCE KOREAN WAR

It is now clear that the boom in world commodity prices which was witnessed in the period following the Korean war has worked itself out. A review of the wholesale price movements in 44 countries during the past three years since the outbreak of the Korean war, published in the *U.N. Monthly Bulletin of Statistics*, shows that wholesale prices in general reached their peaks in most countries in late 1951 and early 1952 and have since turned downwards or levelled off. The decline in prices is not, however, so large as to wipe out in full the increases which were registered in the early months of the Korean war. As a result, the general level of wholesale prices is now higher than at the beginning of the Korean war in 39 of the 41 countries for which current data (that is, data, at least up to April 1953) are available. The increases range from 2 per cent. to 10 per cent. in nine countries, from 11 per cent. to 20 per cent. in seven countries, from 21 per cent. to 30 per cent. in eight countries and from 31 to 50 per cent. in nine countries. Six countries—Brazil, Chile, Greece, Indo-China, Israel and Japan—show increases of over 50 per cent.

The following table gives the index number of wholesale prices (Base: 1948=100) in 1938, 1951, 1952 and the latest month in 1953 for which information is available:

(Base: 1948=100)

	1938	1951	1952	1953*
Australia	59	163	184	184 (6)
Belgium	26	121	114	108 (6)
Brazil	27	154	172	183 (6)
Canada	53	124	117	115 (6)
China	..	447	550	593 (5)
Egypt	31	116	113	109 (5)
France	5	138	145	137 (7)
Germany	51	112	114	111 (6)
India	26	120	105	111 (7)
Indo-China	5	117	132	139 (5)
Indonesia	14	349	331	359 (3)
Iran	17	89	93	107 (6)
Italy	2	103	97	97 (6)
Japan	1	268	273	275 (6)
Sweden	52	140	144	139 (7)
Switzerland	49	105	102	94 (7)
Turkey	21	103	104	106 (6)
Thailand	6	104	109	102 (4)
U.K.	46	146	149	150 (7)
U.S.	49	110	107	100 (7)

* The number within brackets refers to the number of the calendar month in the year 1953.

It will be seen from the table above that the latest available index number of wholesale prices is, for many countries, well below the average touched in 1951 or 1952. But the extent of the recession cannot be clearly seen in the table since the number given for the years 1951 or 1952, when the peak levels were touched, *represents only the average for the whole year*. In order to bring out more effectively the decline in wholesale prices since the peak levels touched during the Korean boom, it would be necessary to study the movement of index numbers based on the prices which prevailed in June, 1950. Such index numbers have been constructed by the authors of the review in respect of a few European countries. The index number of wholesale prices in June 1953 (Base: June 1950=100) and the peak level touched, together with the months in which this occurred, within brackets are given below:

Belgium 113 (131-March, 1951); Denmark 121 (138-June, 1951); France 134 (147-January, 1952); Germany 121 (125-November, 1951); Italy 113 (123-February, 1951); Netherlands 117 (127-May, 1951); Switzerland 109 (118-May, 1951); Turkey 115 (120-March, 1951); U.K. 128 (130-January, 1952).

The extent, as well as the rate of growth and decline, of the national index numbers have varied from country to country. But, striking similarities, as the report points out, have been observed among countries situated in the same area and possessing the same type of economies.

Referring to the price-trend in individual countries, the report says that, in the U.S., the peak was reached in February, 1951, 16 per cent. above the June, 1950 level, though the level is now only 9 per cent. above that in June, 1950. In most of the European countries, wholesale prices rose sharply in the nine-month period following the Korean war, and advanced still further but at a less rapid pace during the remainder of 1951. There has been a decline in prices since 1952. Except in the case of a few countries, the declines are, however, small as compared with the earlier increases. The boom in the prices of export commodities of the Latin American countries explains the steep rise in the index numbers of wholesale prices in the countries. But they have climbed down, though they are still above the pre-Korean war level. This is true of many other countries too. The wholesale price index in Japan, however, rose by 49 per cent. between June, 1950, and June, 1951, and has remained at approximately that level in the following two years.

WORLD FUND FOR UNDERDEVELOPED COUNTRIES

President Eisenhower's declaration soon after assuming office that he proposed to divert a part of the savings from disarmament to economic development of underdeveloped countries would now appear to be a far cry. For the U.S.A. seems to have taken the stand that it cannot make any contribution to the fund till disarmament, according to its blueprint, has been accepted by all countries including the communists. It seems to be *unwilling* to hand over the moneys which it is now directly distributing to the needy countries to an international authority. The chief cause of this change in the U.S. attitude is reported to be the Government's anxiety to cut its budget and to undertake *no further foreign aid* commitments.

The change in the U.S. attitude would appear to have come to the surface in the course of a discussion on a draft U.S. resolution at a meeting of the Economic Committee of the U.N. General Assembly. The draft resolution stated that the fund to be effective should have at least 250 million dollars capital and thirty nations participating. The British representative at the meeting interpreted the resolution to mean that "it looked to the time when sufficient progress was made in internationally supervised world-wide disarmament to devote a portion of saving from disarmament to a U.N. fund to assist underdeveloped countries." He opined that the resolution was unnecessarily raising false hopes in underdeveloped countries at a time when the burden of armaments was so heavy in the major exporting countries. He declared that the defence effort was relevant because it gave the people in these countries such security as was possible in the present troubled state of the world. He added that defence was of vital importance to the whole free world and was the pre-condition for economic development. Consequently, he felt that it was both unwise and impossible at the present time to take practical steps for creating such a fund.

These views seem to have prevailed at the meeting referred to above and, in a way, were considered responsible for a split in the ranks of the needy countries. India and 19 other countries proposed the appointment of a commission of member countries to explain the details of the fund and persuade them to support it. But Pakistan, Haiti and Greece were content to ask the Economic and Social Council to study the views of the member nations regarding the fund and make recommendations to the Assembly. Such divergence of views, as also the unwillingness on the part of the U.K. and the U.S. to proceed with the move for the establishment of the fund, does not augur well for the proposal to take concrete shape in the foreseeable future.

MEASURES FOR CHECKING UNEMPLOYMENT

MR. K. D. JALAN ADVOCATES AN INTEGRATED PROGRAMME OF ECONOMIC ACTIVITY

THE problem of unemployment constitutes a major challenge to the Government of this country. Although there are signs to show that the Government has accepted this challenge, *there is no* evidence to prove that the Government has yet formulated a programe that could be regarded as a workable solution of the problem. That the Government is seized of the gravity of the problem as well as the importance of finding an early solution for it is, however, clear from the pronouncements of the Ministers of the Central and State Governments, and the members of the Planning Commission. It is gratifying to note that not only the Planning Commission but also the industrialists are aware of the seriousness of this problem. While the former has been revising the Plan as required by circumstances to provide greater scope for employment, the industrialists have been contributing their mite in their own way in tackling the problem. Mr. K. D. Jalan, a prominent industrialist, has, through a brochure entitled *Unemployment in India*, offered various suggestions to solve this social and economic problem.

A noteworthy feature of this work is the brief review of the unemployment situation in the thirties in the U.S., Germany and Japan. This will help one appreciate how far the remedial action taken by these countries can form a model for similar action in this country. But Mr. Jalan has taken care to point out at the very *outset* that the nature of the problem of unemployment in India is different from the problem as it developed in the thirties in the U.S. and Germany. For the increase in unemployment in these countries was due to reduced exports, overproduction and reduced prices. The balance of payments difficulties were supposed to be one of the causes of unemployment. In such cases, the remedy lay in pumping greater purchasing power into the hands of the public to the extent needed through public works programmes and adjustments in financial and commercial policies, taking care to see that they do not give rise to an inflationary spiral. The problem facing India is different. It is mainly one of a rapid rise in population and the inability of the gross national product to keep pace with it. A special feature of the problem is the rapid increase in the number of educated unemployed.

Magnitude of the Problem

Mr. Jalan insists that unemployment in India is, by *all available indications*, of such a magnitude that no single measure can touch even a fringe of the problem. He advocates the need for an integrated programme for the promotion and implementation of interrelated economic development, together with a change in the social pattern of the country. Although the problem might call for short-term remedies, it is essentially of a *long-term nature*. But any plan or policy drawn up to meet the short-term aspect must be integrated with the long-term needs in order to avoid maladjustment at a later date. Having discussed the general principles that should be borne in mind, he proceeds to indicate the broad lines on which the solution for the problem could be attempted. He discusses the solution under eight heads, namely, (1) population policy; (2) agriculture; (3) industry; (4) foreign trade; (5) building activity; (6) public works; (7) monetary and fiscal policy; and (8) special programme for the educated unemployed.

So far as India is concerned, although it may be argued that the present rate of increase in population is not higher than that in *many* other countries, it is clear, as Mr. Jalan points out, that the annual increase in population nullifies the effect of the present and planned *developmental* work designed to improve the standard of living, inasmuch as, at the end of each year, we find that more heads have been added than the number *provided* with jobs. Even the maintenance of the existing levels of income with the population increasing at the present rate will itself absorb a substantial portion of the addition to the national income expected during the First Five-year Plan period. And to improve the standard of living in these circumstances will prove an impossible task, especially when a part of the national income is to be saved and invested in capital equipment. If, therefore, employment is to be found for all people in the country and that, without reducing the *per capita* income, it is absolutely essential that suitable measures should be taken to put a check to the present rate of growth and lower it substantially. This certainly demands the formulation of a suitable population policy. The Planning Commission's efforts in this direction are woefully lacking. It must, however, be admitted that whatever population policy may be adopted, it will take at least 10 to 15 years for it to yield any result. Meanwhile, there is need to look to other sources for the immediate solution of the problem.

Mr. Jalan then discusses the role of agriculture in the country's fight against unemployment. Agriculture absorbs about two-thirds of the total population of India. But the yield per acre is low. The rural development schemes, the community development projects and the national extension service, all these cover only a limited area. It should be examined whether some more measures of a transitional nature cannot be taken up with regard to the area not covered by the schemes at present. Japanese cultivation methods should be popularised and loans might be given liberally to farmers for installing tube-wells, pumps and the like. Short-term training course should be formulated for training educated persons in the broad principles of soil conservation, use of fertilisers, intensive cultivation and the like.

Need for Taxation Incentives

For the industrial sector, Mr. Jalan has urged the need for taxation incentives in order to stimulate private investment. He suggests the following measures of tax reliefs:

1. Establishment of new industries naturally involves risks and extra incentive is needed for the people to undertake them, when normally a substantial portion of the profits is taken away at the end of the year by the Government. The income from investments in new industrial undertakings and expansion of the existing ones should be exempted from income-tax and super-tax for a period of ten years from the date of their starting production.

2. While the existing income-tax law allows, for purposes of assessment, the recurring expenditure incurred in research incidental to the business of the concerns, the capital expenditure has got to be spread over five years. In order to encourage private undertakings to establish individual research units, they should be allowed to write off the capital expenditure in any one or more of the first five years whenever they are able to do so. This will not only have the effect of making our industries more scientific research minded, but encourage research by private enterprise and provide employment to those classes of the educated unemployed who possess scientific knowledge.

Some industries with the necessary capital outlay are not working to their full capacity. The engineering industry is one such. The utilisation of the idle capacity can be planned, provided the goods that are being imported are produced at home. At present, India is importing engineering goods to the tune of about Rs. 150 crores. If Indian engineering factories knew the nature of the engineering goods imported into India, they would be in a position to assess their own capacity to manufacture these goods. Mr. Jalan has accordingly pleaded for a survey of the unutilised capacity, publication of the details of imports against the requirements of the Government so as to enable the engineering industry to plan its production and the like. In this connection, Mr. Jalan has welcomed the setting up of the Engineering Capacity Committee and hopes that it will be able to suggest means for utilising the idle capacity of engineering factories. He has also suggested that the Government should publish the details of all the imports made by it against its requirements during the last three years with the fullest details with regard to quantity, prices, specification and if possible with drawings. He has further suggested that the Central and State Governments should plan the requirements on a five-year basis and make the necessary details available to the manufacturers and suppliers. He has advocated the setting up of permanent museums in Bombay, Delhi and Calcutta, where representatives of the industry could get information with regard to the requirements of Governments. Another suggestion of his is that the Government should, generally speaking, permit the importation of the machinery of only those manufacturers who make arrangements for the manufacture of spare parts to the maximum possible extent in India itself. Finally, he has urged the need for a change in the Government's indenting policy so as to permit the local manufacturers to make an attempt at the manufacture of the items of goods which the Government needs. The other lines on which the Government, according to Mr. Jalan, should take action in order to relieve unemployment are placement of orders on the indigenous manufacturers in place of foreign ones, revision of Government purchase policy, scrutiny of orders before placing them in foreign countries, provision in foreign orders for manufacture of specified components in India where feasible, as in the case of wagons, placing orders for new items in bulk instead of in small quantities wherever possible so as to make their manufacture economic, supply of adequate quantities of pig iron and some categories of steel which are in short supply, arrangements for giving "cast iron scrap arisings" of the railways to the industry regularly and a lower pace of, and amendment to, labour legislation.

Development of Small-scale Industries

Mr. Jalan has urged the development of small-scale industries as a complement to large-scale industries. He observes: "The national economic interests demand that a balance must be struck between the large-scale and small-scale enterprise and for this purpose, we can draw lessons from the economy of Japan." He says that, if small-scale industries should be developed, what the country needs are a financial agency in each State to provide loans at rates of interest comparable with those available to large-scale enterprise, an insurance agency for the financier to guarantee the repayment of such loans, an organisation to procure and distribute the raw material requirements and a marketing organisation to sell the finished products.

By reorganising the pattern of India's export trade so as to stimulate exports to our natural markets in the neighbouring countries, it should be possible, according to Mr. Jalan, to bring about an expansion in economic activity. He points out that, apart from Japan, India is the only country in the East, which is in a position to supply the needs of the markets in this region. He says:

"It cannot be denied that these countries are the only good potential markets for our products which cannot be taken up by the developed Western countries. Bilateral agreements should be negotiated with these countries to stimulate mutual trade. For the development of our export trade, we have to explore new markets and produce goods needed by them."

Mr. Jalan rightly sets much store by measures for stimulating constructional activity as part of the Government's programme to fight unemployment. Apart from the need for suitable relaxation of the rigour of the rent control legislation, he suggests that building materials should be made available to builders at reasonable and controlled prices. He emphasises the need for setting up a technical bureau of information on building and construction with branches in different important cities, for giving relief to new buildings in respect of local taxes to the extent of 50 per cent. for a period of three years, for granting loans to prospective builders at low rates of interest and for relaxation of restrictions on investment by insurance companies, so as to permit the investment of

CONTROL OF THE KOSI RIVER

LIBERALISATION OF IMPORT RESTRICTIONS LIKELY

(From A Special Correspondent)

NEW DELHI, 2nd November

DELHI LETTER

DURING these days, a number of important conferences is being held in the Capital. The conference of engineers which was inaugurated on 26th October by the Prime Minister continued right up to 31st of that month. The Prime Minister, in his own informal manner, reminded the engineers that they were the builders and creators of wealth and prosperity and asked them to devote their attention to the right type of planning for the future after taking into account the resources and material available in the country. He also stressed the urgent need for expanding engineering education and training facilities in the country in order to ensure a constant flow of skilled talent required for the river valley and other projects under execution or likely to be undertaken in the near future.

The Conference discussed many problems of engineering interest, but the prominent among them related to measures for controlling the Kosi River against its periodical devastating floods, the evolving of suitable design against silt in canals and the devising of the effective measures for preventing recurrent floods in a number of rivers. The Kosi River control was, it is reported, discussed from a number of angles. Although there was a lack of unanimity regarding the methods to be adopted to bring this river under control, the consensus of opinion was that there should not be any delay in the starting of works to prevent the Kosi from damaging large fertile areas in Bihar. The problems of the Kosi such as the control over sands, gradation, meandering, embankment, spread of the flood waters, etc., were considered somewhat peculiar and lacked precedent in this country. In China, however, the big Yellow River is reported to have had similar problems. The study of the technique adopted in the control of this river is stated to be necessary and hence it is possible that some distinguished engineer may be sent to that country in order to have a thorough study of the measures adopted in the control of that river.

At the conclusion of the symposium, Mr. Gulzarilal Nanda, Minister for Irrigation and Power, stated that Government was considering the appointment of a committee to visit the various river valley projects and scrutinise their rates and examine where and why there had been additional costs. Such an investigation would be useful in planning for the future. A compact conference is proposed to be held in the first week of December, in which leading engineers of the river valley projects will discuss ways and means of reducing rates and costs. At the same time, the Government of India will consider the creation of a central pool of high level engineers who could be used as experts on various projects and investigations as and when the need arises. The question of devising an all-India cadre on the model of the former Indian Service of Engineers is also stated to be under the consideration of Government.

At the same time, the Government of India will hereafter emphasise that various State Governments, which take up big irrigation projects, should enlist the co-operation of the public of the concerned area in the execution of these projects. According to Mr. V. T. Krishnamachari, Deputy Chairman of the Planning Commission, "the people must be made aware of their rights and obligations, namely, the benefits that would accrue in them and the necessity for sacrifice and savings in order to make such schemes possible." Unless the public were inspired with a sense of partnership in these great projects, it would not be possible for the Government to launch new projects, so necessary if the waters of the rivers that now run to waste were to be harnessed in the service of man. In other words, every locality must regard itself as the proprietor of a project and make sacrifices for it.

The periodical meeting of the Bhakra Control Board is also being held at present in the Capital. This meeting is expected to provide additional funds over and above the budget allotment. It is stated that the total expenditure incurred on this project upto July last amounted to Rs. 57.68 crores. Before the current fiscal year is out, the total expenditure will go up very near to Rs. 75 crores. In other words, nearly 50 per cent. of the sum allocated on this project must have been expended by 1953-54. Most of the Punjab canals on the Bhakra main line and Narwana Branch will be ready by May, 1954, in time for the *kharif* season. In view of the above, the execution work on the canals in the P.E.P.S.U. area is expected to be expedited.

Food Conference

The customary conference of Food Ministers of States and the Centre is to be held next week. Generally, this meeting used to assess food prospects, particularly of the *kharif* crop, and then to decide the import policy in respect of food every year. During the current year, reports from various States suggest a bumper crop. It is believed that, as compared with last year, the *kharif* crop will show an increase of more than four million tons in outturn over that of last year. It is, therefore, likely that food imports will be restricted to the minimum in order to maintain continuity of imports and also as a safeguard against future lean years. Imports of rice from Burma, in regard to which the Government of India has to give intimation before December, must largely depend on the price factor. Although the Government has signed the International Wheat Agreement, it is not obligatory on its part to buy wheat unless the Wheat Council offers to sell wheat at the minimum price of 155 cents per bushel. Anyway, food imports during the current half-year (1953-54) will be very limited, which will in turn reflect in the balance of trade and payments position. In case the U.S. Government were to offer a sizable quantity of about two lakh bales under the Indo-U.S. Mutual Aid Programme against rupee payment, the balance of payments position will show further improvement. Since the second half of the fiscal year will generally disclose an improvement in the country's trade balance, being associated with crop movement, and increased exports, it is possible that the favourable trade balance will be very much pronounced during the coming months. Exports of jute goods have already begun to show a definite improvement and the successive reductions in the export duty have restored the competitive capacity of Indian jute goods. The offtake of Indian tea is good, as also prices. The shellac market has been relatively firm. In view of the greater production of oilseeds, it is likely that the export trade in oilseeds and oils will revive gradually in the coming months. The quantum of short-staple cotton exports is expected to be maintained at last year's level.

Liberal Imports Likely

All these make out a strong case for the liberalisation of imports in the coming months. Liberalisation will not, however, be in that direction in which increased imports will act as a deterrent against the indigenous industry. Perhaps imports of more luxury goods with an eye towards the tax revenue will be looked upon with favour by Government. Further, the Government is expected to expedite the imports of machinery and the necessary capital goods for State projects. It may be mentioned that, at the Colombo Conference, some delegates are reported to have pointed out that the Government of India had been unnecessarily following a restrictive import policy and accumulating sterling balances. For instance, some time last year, the total sterling balances declined below Rs. 680 crores but, during the last many months, they were standing well above Rs. 720 crores. Although they have receded to Rs. 702 crores, it is possible that they will show an upward trend in the coming months in view of the improved trade position of the country. Already September has disclosed a favourable trade balance of about Rs. 4 crores, which will be intensified in the coming months. It may be noted that the Government of India has not been utilising the 35 million sterling release as per agreement with Britain and efforts will be made to utilise the outstanding balances towards industrialisation projects. The Chief Controller of Imports and Exports is already on tour in order to ascertain the views of the mercantile community in the leading maritime States on Government's policy on imports and exports. After his return from tour, the Government is expected to formulate a slightly liberal import policy.

O.E.E.C. AND G.A.T.T.

IMPORT RESTRICTIONS LIBERALISED

(From Our Own Correspondent)

LONDON, 31st October

LONDON LETTER

THERE was much lifting of eyebrows amongst Continental countries when it was known that, at the recent G.A.T.T. Conference, this country was going to ask for the right to impose duties on continental produce, without any corresponding duty on similar produce from the Dominions. This did not strike other members as quite in accord with the spirit of the G.A.T.T. and certainly not as a pointer towards that increased liberalisation of British trade for which they were looking. In the end, the British Government got its way on specified horticultural products, the import of which from the Commonwealth is of no account, and is thus able to increase duties to protect the home farmer without a corresponding increase in duties applied against the Commonwealth. But the circumstances in which the concessions were made rule out its purpose from Britain's point of view—no wedge has been inserted into G.A.T.T. which will enable this country to increase Dominion preference by the device of stepping up duties from extra-Dominion sources.

The arrival of the U.K. Delegation at O.E.E.C. was regarded much more hopefully and it was welcome news when the British Chancellor conceded an increase in the annual travel allowance from £40 to £50 per head, with the removal of any limitation in the case of the Scandinavian countries. But the most welcome step was the British decision to remove quotas from 75 per cent. of its imports from the European countries against the 58 per cent. at present free. This restores the position to what it was before November, 1951. The restrictions imposed then and in the following March more than doubled the list of items subject to quotas from 25 per cent. to 56 per cent. and made this country next to France the least liberal of the Western European community. The French have, in vain defence of the franc, removed all goods from the free list.

The "liberalisation" of trade involved in this exercise is, of course, only a lifting of quota restrictions and not a removal or reduction of tariffs. But, nevertheless, it does make some £60 million of additional trade subject only to tariff barriers. Nor does the good which this move has done stop here, for the defections of Britain and France were making the other O.E.E.C. members increasingly restive and Mr. Butler was probably aware that, if Britain had not gone the whole way to restore the 1951 position, other countries would have decided to reduce their free lists as well. As it is, the O.E.E.C. is now able to take a further look forward to the complete removal of all quota restrictions between member countries. There had been a hope earlier that this might have been achieved by the spring of 1954; instead, the Secretariat will examine in the next five months what further steps can be taken to abolish quota restrictions and the O.E.E.C. will meet next April to agree upon the next stage.

Nominally, a still greater contribution can be made by the British Government to the freeing of trade as it steps out of the field of buying a wide range of foodstuffs which still includes meat, butter, fats, bacon, eggs and sugar. In the course of next year, butter, fats and sugar will be returned to private trade, and in all probability eggs and bacon. The future of meat is still uncertain. It is unlikely that the freeing of these products will make very much difference to the Continent's sales to the United Kingdom, but it will introduce a greater measure of competition between countries such as Denmark and Holland and the acceptance of the principle of liberalisation will both satisfy the aspirations of the Continental Liberals and in all likelihood mean cheaper food for this country.

The O.E.E.C. session could not conclude without some reference to convertibility. The German Finance Minister tried to insert a substantial wedge by asking that the gold content in the E.P.U. settlements should be increased. The British Chancellor rightly pointed out that any such move would defeat the movement towards liberalisation by making countries more cautious of obtaining E.P.U. credit. Convertibility, he declared, must follow trade and, as countries acquire the means of settling their obligations in gold, so they will be willing to accept the liability to do so.—*All Rights Reserved.*

CONTROLS HAMPER PROGRESS OF COAL INDUSTRY

COMPETITION FOR LABOUR LEADERSHIP MENACING INDUSTRIAL PEACE

MR. SIM'S SPEECH AT BENGAL COAL COMPANY'S GENERAL MEETING

A COMPREHENSIVE review of the affairs of the coal industry was given by Mr. G. A. S. Sim, Chairman of the Bengal Coal Company, Ltd., at the Half-yearly Ordinary General Meeting of the Company held at Calcutta on 29th October, 1953. The survey covered labour relations and the controls on production, despatches, allocation of wagons, quality of coal produced and exports. Mr. Sim expressed concern at the deterioration in the labour situation brought about by the manœuvres of political parties to get the control of workers' unions. He questioned the necessity for retaining the control over the quality of coal permitted to internal and foreign consumers, as there was no shortage of high grade coal for steam raising purposes and as keen competition was developing even in those overseas markets which were India's by virtue of their proximity. He convincingly pointed out that, unless the irksome controls on exports were abolished, India might lose a good part of its established markets. He felt that the capacity of the railways had not expanded sufficiently to cope with the increased production of coal.

The following is the full text of Mr. Sim's speech:

"GENTLEMEN,

"The shareholders of the Bengal Coal Co., Ltd., have been accustomed to receive a review by the Chairman of the Company's affairs, and of the affairs of the coal industry, once in every year since 1908, and it has hitherto been traditional for the Chairman to make this review at the half-yearly meeting held in March. I have decided to break with this tradition, and to give you my review at this meeting, and in future years at the half-yearly meeting normally held in this month. I have been prompted to make this change, because, in the first three months of the calendar year, and particularly in the month of March, speeches are made at the annual meetings of several bodies and associations connected with the coal industry and most of these reach yourselves and the public through the medium of newspapers and periodicals. It may, therefore, be of more interest to shareholders and to other members of the public interested in the coal mining industry, if the review of this Company is made mid-way in the coal industry's traditional year.

"You will have seen that Mr. K. C. Neogy resigned from your Board in May on his appointment as a member of the Planning Commission. Mr. Neogy's wide experience and advice have been of great value to your Company, and the loss of them will be keenly felt. In the much wider sphere of the Planning Commission, however, his talents will be used for the benefit of India as a whole.

Dividend Policy

"The accounts for the half-year ended 30th April, 1953, which are before you, are in their usual form, and there seem to be no items which call for particular comment, although I shall be pleased to answer any questions which shareholders may wish to put later in this meeting. The Directors, as you already know, are recommending that the bonus to be distributed out of profits, after payment of the ten-rupee dividend, should revert to Rs. 7-8 per share in place of the Rs. 10 bonus which was paid for both half-years of 1952. On the face of the Profit and Loss Account, it may appear to some that the bonus might have been maintained, but two considerations influenced the Directors in making their recommendation. One of these is the uncertainty of future trends within the industry, to which I shall refer in greater detail later. The other is the fact that the weight of taxation on your Company's profits over the past few years has been concealed by large initial depreciation allowances on the Company's block. Gross block has increased by more than two and a half crores of rupees since the large-scale development programme was begun in 1945-46. This development programme is nearing completion, although a sum of Rs. 19 lakhs was added to block in the April half-year, and we have already reached the stage at which some of the earlier completed developments have been fully depreciated. This tendency will increase and should our gross profits remain at recent levels it will be necessary to make considerably greater provisions for taxation. Although initial depreciation has been more than covered by allocations to reserves, these allocations should be continued and, in fact, stepped up if working capital, already severely strained as can be seen from the balance sheet, is to be conserved.

"Raisings have increased by 1,58,000 tons as compared with the previous half-year, and while this increase is largely seasonal it has enabled us to keep raising costs at about the same level as for the October, 1952, half-year, in spite of a general tendency for costs to rise.

Labour Relations

"For several years now, there has been no major breach in our relations with labour, the last stoppage of importance being a strike at your Seetalpur colliery early in 1949. In March, 1952, your Chairman told you that it was a matter of satisfaction to him that labour relations had remained good, but he mentioned at that time that the West Bengal elections had left something of a vacuum in the trade union movement in the Bengal coalfield, which seemed likely to be a source of future trouble if it remained unfilled. I am sorry to say that this state of affairs has continued to the present day, and has been the cause of a strike at certain of your collieries since the conclusion of the period covered by the accounts now before you.

"The established and recognised union at the majority of your collieries is the Colliery Mazdoor Congress, which is affiliated to the Indian National Mineworkers' Federation, and in turn to the I.N.T.U.C. The leadership of this union has been the subject of political manœuvre between the Congress Party and the Praja Socialist Party, further aggravated by differences between the President and the Secretary of the union. Consequently, field work amongst the workers has been neglected over a period of years, leaving the more volatile elements vulnerable to exploitation by extreme left-wing political parties who have accepted this opportunity to intervene and cause disruption. We ourselves believe in a strong trades union movement, and, as unionism should be divorced from politics, we desire nothing more than a strong responsible union, fully representative of the labour, with which to deal. It is, however, impossible to maintain a sound labour relationship when rival political leaders are competing for the control of labour in their struggle for power, and care nothing for the real interests of the workers whom they claim to represent. The weapons they use are promises which they can never fulfil, instigation to violence, and, in many proved cases, the employment of *goondas* for the coercion of the rank and file whose desire is to be left in peace to pursue their normal way of life.

Unions Lack Leadership

"In exploitation of this unfortunate state of affairs, a former worker of the Colliery Mazdoor Congress, recently released from jail, succeeded in persuading a section of the workers at Banksimula 7 and 8 pits to go on strike on the morning of 31st August last. This man had previously endeavoured to bring about a widespread strike. The Conciliation Officer made it clear that the workers' demands were not of a nature warranting a strike, as they were either already before Government and the industry, or were covered by the provisions of the Conciliation Board Award, enforcement of which was in his hands. As the real object of the organiser of the strike was to establish himself as leader of a new union, he went on hunger strike to gain the sympathetic support of the labour. Finding, that this action was only partially successful, he persuaded the small group of his supporters, including workers of a colliery unconnected with us in any way, to resort to violence and intimidation in bringing about a stoppage of work. A large crowd of men led by this man's supporters later succeeded in bringing about a complete stoppage of all the collieries in the group. When an attempt was made to stop the central workshop by force, there was a clash with the police who had to fire in self-defence and one man was killed.

"The whole subject was again referred to the Conciliation Officer, and later events have shown, without a shadow of doubt, that the majority of the men were not in favour of the strike, but that they had not the strength, organisation, or right leadership to face the militant minority who were under the influence of this unrecognised and self-styled labour leader. The situation created by this man gave an opportunity to an extremist group to contact and influence labour with the object of extending the period and scope of the strike. Prompt action by local officials in externing the ringleaders of this group from the area prevented a situation being created in which serious breaches of the peace would undoubtedly have occurred.

"This illegal strike affected your Banksimula 2 and 4 pits, Banksimula 7 and 8 pits, Banksimula 11 and 12 pits and Girimint colliery, together with Pretoria and Seebpore collieries under the same managing agency. The strike continued from 31st August to between 7th and 10th September, and about a quarter of a lakh of tons of output was lost. The cost to the Company during the current half-year will be considerable, as will the cost to the workers, who have, as a result of participation in an illegal strike, forefeited their right to a bonus for the quarter in addition to losing their wages for the period of the stoppage.

"The sequence of events follows closely that at the Burnpur Works of the Indian Iron and Steel Co., Ltd., the trouble in both cases being due to external political influences in no way related to an actual dispute between employer and labour force. The same potentially dangerous situation persists, leaving the Bengal coalfield open to exploitation by extremists and political opportunists. It is in similar circumstances that there has been nurtured the widespread and contagious spirit of indiscipline from which industries and services managed by both private and public bodies and the general public themselves have suffered in the Calcutta industrial area these last four months.

Labour Wants More

"In the wider aspect of labour relations I can only hope that wise counsels will prevail in those departments of Government now faced with the direct and indirect implications of a move for revision or modification of the Conciliation Board Award of 1947. As you are aware, the wage-price structure of the coal industry depends upon that Conciliation Board's Award, which laid down prescribed minimums in the matter of both wages and amenities for coalfields labour. The Indian National Mineworkers' Federation has submitted 16 demands, which are in the nature of an application for revision of this Award. The Government has had these demands under consideration for some time, and we understand that they contemplate setting up a special Tribunal to consider these demands of labour, or, alternatively, the appointment of a new Conciliation Board. This might be preferable to a Labour Tribunal, since if employers and labour sit down at a table to debate each other's points of view before an independent adjudicator the result should reflect the nearest approach to mutual agreement. It appears, however, that much additional information on this wide subject may be required before either course can be followed, as the results must inevitably be felt far beyond the confines of the coal industry. It has been calculated, from the figures of 14 coal companies under six managing agencies, that, if these demands had been met and had applied to the 1952 output, the average cost of production would have risen by Rs. 8.075 per ton. The consequent appreciable increase in price to the consumer could only result in a wave of inflation affecting all basic industries, throwing out of gear the intricate calculations of the Planning Commission, and inevitably disrupting the whole economic structure of the country. In enquiring into these matters, therefore, it is to be hoped that the Government will give full emphasis in the terms of reference not only to the points of view of labour and employer, but to that all-important third factor—the economy of the country.

"In accordance with the Planning Commission's wishes, overall production of coal has increased rapidly in recent years. It was 27 mil-

(*Continued on page 887*)

PATTERN OF BANK ADVANCES

SHARE OF INDUSTRIES REGISTERS DECLINE

A FALL of Rs. 19.87 crores is disclosed in the total advances of all commercial banks in India at the end of June, 1953, as compared with those in June, 1952. Thus the total advances stood at Rs. 585.83 crores in June-end this year as against Rs. 605.70 crores a year previously. The fall was mainly due, according to a survey of bank advances conducted by the Banking Research Department of the Reserve Bank of India, to a decline of Rs. 23.20 crores in advances to industry which, to be precise, moved down from Rs. 218.70 crores to Rs. 195.50 crores. A part of this fall was, however, offset by fractional increases in advances of other categories. The advances to agriculture, for instance, rose from Rs. 24.88 crores to Rs. 25.11 crores, to personal and professional classes from Rs. 51.64 crores to Rs. 52.28 crores and to others from Rs. 29.74 crores to Rs. 32.19 crores. Although commerce which continued to absorb the bulk of the advances remained, in absolute figures, more or less the same at Rs. 280.73 crores, its share, in terms of percentage to total advances, improved from 46.4 per cent. in June, 1952 to 47.9 per cent. in the month under review. The share of industrial advances which figured next, however, declined by nearly three points from 36.1 per cent. to 33.4 per cent.

The table below shows the overall position of advances purposewise as at the close of June, 1953, as compared with that a year before.

(Rupees in crores)

Purpose of advances	June, 1953		June, 1952	
	Amount	Percentage to total	Amount	Percentage to total
Industry	195.50	33.4	218.70	36.1
Commerce	280.73	47.9	28.75	46.4
Agriculture	25.11	4.3	24.88	4.1
Personal and professional	52.24	8.9	51.64	8.5
All others	32.19	5.5	29.74	4.9
Total ..	585.83	100.0	605.70	100.0

Scheduled Bank Advances

Of the total bank advances of Rs. 585.83 crores, as much as Rs. 544.87 crores were accounted for by Scheduled banks. This compares with Rs. 566.24 crores in June, 1952. Commercial advances by these banks amounting to Rs. 262.65 crores, were lower by only a crore, as compared with those a year previously. Expressed, however, in terms of percentage to total, these advances rose from 46.7 per cent. to 48.7 per cent. The share of industry, on the contrary, declined from Rs. 211.11 crores to Rs. 188.98 crores. Their ratio to total advances also came down from 37.4 per cent. to 34.7 per cent. Scheduled banks' advances to agriculture were steady at Rs. 22.99 crores, as against Rs. 22.71 crores. So also personal and professional advances at Rs. 41 crores. But advances to all others improved from Rs. 26.19 crores to Rs. 29.25 crores.

The table given below indicates the purposewise distribution of advances of Scheduled banks only as at the end of June, 1953, as compared with that in June, 1952.

(Rupees in crores)

Purpose of advances	June, 1953		June, 1952	
	Amount	Percentage to total	Amount	Percentage to total
Industry	188.98	34.7	211.11	37.4
Commerce	262.65	48.2	263.65	46.7
Agriculture	22.99	4.2	22.71	4.1
Personal and professional	41.00	7.5	40.60	7.2
All others	29.25	5.4	26.19	4.6
Total ..	543.87	100.0	564.26	100.0

Major Indian Banks

Of the total advances of all banks of Rs. 585.83 crores in June, 1953, the 12 major Indian banks accounted for Rs. 327.56 crores. As much as 44 per cent. of this was made to commerce and 40 per cent. to industry, cotton mills and sugar mills receiving Rs. 40.13 crores and Rs. 30.67 crores, respectively. Exchange banks advances amounted to Rs. 153.43 crores of which the respective shares of commerce and industry were Rs. 43.56 crores and Rs. 84.28 crores. Advances to wholesalers by these banks were of the order of Rs. 63.40 crores. Other Scheduled bank advances amounted to Rs. 63.89 crores, the balance of Rs. 40.95 crores coming from Non-scheduled banks.

Industrial Advances

The bulk of industrial advances by Scheduled banks went, as in the past, to the cotton textile industry. Of the total of Rs. 188.98 crores, advances to this industry alone amounted to Rs. 30.76 crores, but these were Rs. 10.59 crores lower than those a year previously, and their ratio to the total declined from 10.9 per cent. to 9.3 per cent. Advances to the sugar industry, too, receded from Rs. 35.70 crores to Rs. 32.74 crores, their ratio to total declining slightly from 6.3 per cent. to 6.0 per cent. Only a slight rise was seen in the advances to engineering from Rs. 14.07 crores to Rs. 14.58 crores. There was, however, a marked fall in the advances to the jute industry, in that they receded from Rs. 17.96 crores to Rs. 11.92 crores, and the ratio to total retreated from 3.1 per cent. to 2.2 per cent. Advances to iron and steel and *vanaspati* and soap rose from Rs. 5.78 crores and Rs. 7.28 crores to Rs. 6.04 crores and Rs. 8.65 crores, respectively. But advances to chemicals, dyes and paints were slightly lower at Rs. 8.44 crores.

Commercial Advances

Commercial advances by Scheduled banks declined, as stated already, by Rs. 1 crore from Rs. 263.55 crores to Rs. 262.65 crores. But the ratio of these advances to total rose from 46.7 per cent. to 48.2 per cent. Of this total, wholesale trade accounted for Rs. 172.68 crores or about Rs. 8 crores less than in June, 1952. Agricultural commodities such as cotton (Rs. 27.5 crores), jute (Rs. 11.67 crores), oilseeds (Rs. 10.73 crores), sugar (Rs. 2.60 crores) and others (Rs. 41.23 crores) absorbed Rs. 93.78 crores. The balance of Rs. 78.89 crores was made up of credit to non-agricultural commodities. The major part of the fall of Rs. 8 crores in advances to wholesale trade was due to declines in cotton and jute. Advances, however, to both oilseeds and sugar registered increases. Advances to bullion dealers dropped from Rs. 2.07 crores to Rs. 1.93 crores, while those to banks and other institutions rose from Rs. 25.13 crores to Rs. 28.43 crores.

There was a rise of Rs. 41 lakhs in the Scheduled bank advances to foodcrops and of Rs. 1.06 crores to cash crops. Personal and professional advances remained more or less unchanged at Rs. 41 crores. Advances to all others improved from Rs. 26.19 crores to Rs. 29.25 crores.

An idea of the distribution of all bank advances according to security as at the end of June, 1953, as compared with those a year previously, can be had from the table below:

(Rupees in crores)

Types of security	June, 1953		June, 1952	
	Amount	Percentage to total	Amount	Percentage to total
Government and trustee securities	42.45	7.2	40.11	6.6
Bullion including ornaments	19.76	3.3	18.67	3.1
Shares of joint stock companies	43.34	7.4	46.31	7.7
Merchandise	206.21	50.6	323.37	53.4
Real estate	29.88	5.1	30.08	5.0
Other securities ..	66.00	11.3	67.05	11.1
Total ..	497.64	84.9	525.59	86.8
Unsecured clean advances	88.19	15.1	80.11	13.2
Total ..	585.83	100.0	605.70	100.0

It is seen in the table above that the secured advances declined from Rs. 525.59 crores in June, 1952 to Rs. 37.95 crores. The major part of the fall is accounted for by a recession of Rs. 26.93 crores in secured advances by Scheduled banks. They stood at Rs. 467.33 crores, as against Rs. 494.26 crores at the end of June, 1952. Unsecured advances, however, rose from Rs. 80.10 crores to Rs. 88.19 crores and their ratio to total advances rose from 13.2 per cent. to 15.1 per cent.

Among secured advances, the fall was heaviest in advances against merchandise which declined by Rs. 27.20 crores to Rs. 288.28 crores. Consequently, their ratio to total went down from 55.9 per cent. to 52.9 per cent. This fall was almost due to a fall of Rs. 26 crores in advances against merchandise hypothecated. The decline is accounted for by sharp recessions in agricultural commodities other than foodgrains and non-agricultural commodities. The former went down by about Rs. 5 crores and the latter by nearly Rs. 15 crores.

Secured advances against Government securities rose over the year from Rs. 39.91 crores to Rs. 42.14 crores. The share of secured advances against gold and silver ornaments including bullion, too, rose but from Rs. 11.47 crores to Rs. 13.02 crores. Advances against shares, however, receded from Rs. 45.22 crores to Rs. 42.31 crores. Advances against real estates and other securities stood at about Rs. 21 crores and Rs. 61 crores. Advances against fixed deposits rose from Rs. 10.73 crores to Rs. 11.13 crores.

As much as Rs. 327.56 crores of the total bank advances of Rs. 585.83 crores were from the 12 major Indian banks. The major portion of these advances was against merchandise amounting to Rs. 178.80 crores. The advances by these banks against Government securities aggregated Rs. 38.30 crores. The Exchange banks' share of the total advances was Rs. 153.43 crores. Of these, Rs. 29.22 crores were unsecured. Advances against merchandise amounted to Rs. 87.42 crores and against Government securities Rs. 3.10 crores. Credit given against bullion by these banks accounted for only Rs. 20 crores.

Non-scheduled Banks

An analysis of purpose-wise distribution of advances by Non-scheduled banks shows a rise of nearly Rs. 1 crore in their advances to commerce which in June, 1953, stood at Rs. 18.08 crores or 44.2 per cent. of the total. Personal and professional advances improved from Rs. 11.04 crores to Rs. 11.28 crores. Industrial advances of Non-scheduled banks declined from Rs. 7.59 crores to Rs. 6.52 crores, their ratio to total coming down from 18.3 per cent. to 15.9 per cent. Advances to agriculture were slightly lower at Rs. 2.12 crores.

A security-wise analysis discloses that advances of Non-scheduled banks at Rs. 41 crores were more or less the same as in June, 1952. The share of unsecured advances was Rs. 10.65 crores as against Rs. 10.10 crores. The bulk of the secured advances was against real estates which accounted for Rs. 9.03 crores. Merchandise came next, receiving Rs. 7.93 crores, as against Rs. 8.08 crores. Advances against gold and silver ornaments, including bullion, amounted to Rs. 6.74 crores as compared with Rs. 7.19 crores, their ratio to total declining from 17.4 per cent. to 16.5 per cent. Bills purchased and discounted amounted to Rs. 1.9 crores or 4.6 per cent. of total advances. Bad and doubtful debts were of the order of Rs. 1.6 crores. The provision made for these amounted to Rs. 1.2 crores.

The structure of interest rates on advances, as at the end of June, 1953, remained more or less unchanged, barring one or two cases. These exceptions related to advances and loans against hypothecated cash crops and non-agricultural commodities. The rate of interest charged by the major Indian banks against the former rose by 2½ per cent. to 9 per cent. and against the latter by 2 per cent. to 9 per cent.

Exchange banks reduced their rate on loans against Government securities from 6 per cent. to 5 per cent. and against hypothecated non-agricultural crops by ½ per cent. to 6 per cent. The rates for pledged foodgrains charged by Exchange banks, which ranged between 4 and 7 per cent. in June, 1952, were a little higher, moving between 5½ and 6½ per cent.

"Is your Overseas trade increasing ?"

With a network of almost 1,700 Branches in England and Wales as well as Agents and Correspondents throughout the world, Lloyds Bank has helped many of its customers to expand their overseas business as the Bank is specially equipped to deal with every aspect of overseas trade.

Let LLOYDS BANK look after *your* Overseas interests

LBY/AB—1953

FOREIGN EXCHANGE FOR CAPITAL GOODS INTO PAKISTAN

With a view to encouraging imports of capital goods from Japan, the U.K. and other countries, the Government of Pakistan has decided to allow special forward exchange cover for such imports on deferred payment basis. Accordingly, importers in Pakistan can now secure forward exchange cover from their respective bankers in respect of the amounts due for remittance to exporters abroad. Details of the new arrangements are as follows:

Importers of capital goods desirous of obtaining special forward exchange cover should open special accounts with their bankers and deposit therein full or part value of the machinery to be imported from Japan and other countries. The authorised dealers may, with the prior approval of the control and in respect of funds deposited in these accounts up to 30th June, 1954, allow cover in sterling for the funds held in such special accounts for payment during the period when the amounts became due for remittance to the country concerned under the contract made with the exporters, provided the funds in such special accounts until remitted are kept invested in Pakistan Government Treasury Bills and are not utilised for other purposes.

Where special accounts, as mentioned above, are not opened, the facilities for forward exchange cover for import of capital goods would be available under the arrangements already in force. In such cases, the cover will be for a period of 12 months at a time and for the amount due for remittance to the country concerned within 12 months.

The modification in the foreign exchange rules now announced by the Pakistan Government is a sequel to the need for bridging the wide gap between the resources locally available and the actual requirements for purposes of rapid industrialisation. In the Pakistan-Japanese Trade Agreement recently concluded, there is a clause which provides for the import of Japanese machinery and capital goods on deferred payment. In pursuance of this clause, a cotton mill in Pakistan has finalised a deal with the Japanese manufacturer for the import of 20,000 spindles and 1,000 looms on deferred payment basis.

RELIEF TO COTTON TEXTILE INDUSTRY

MILLOWNERS URGE ABOLITION OF ALL EXCISE AND EXPORT DUTIES

COMMENTING on the measures announced by the Government of India for improving the marketability of mill-made cotton piecegoods, we stated last week that the relief which the measures sought to give to the cotton mills was inadequate. This conclusion was based on two considerations, namely, that competition in the world textile market is becoming keener than before and that the purchasing power of the people in this country has generally deteriorated. That these observations are not at all exaggerated is clearly borne out by the views on the Government's new textile policy expressed by several millowners, as well as by the textile trade. For instance, in the course of a well-reasoned statement issued to the Press on Friday last week, the Millowners' Association, Bombay, points out that the measures announced by the Government "do not go far enough." Indeed, in its considered opinion, there is nothing in the concessions which help to promote much internal offtake. In support of this contention, the Association has made some very pertinent observations which are reproduced below:

"At the present rate of production in cotton mills, which is likely to exceed 5,000 million yards per annum, exports, even assuming that India attained the export target aimed at Buxton, would amount only to 20 per cent. of the country's mill production, which means that 80 per cent. of such production, amounting to about 4,000 million yards, with another 1,250 million yards representing the production of the handloom industry, must be consumed within the country itself. While the Association does not underrate the value and importance of maintaining our export trade in cotton piecegoods, there is nothing in the concessions announced by Government which help to promote this much internal offtake. The reduction of excise duty on superfine goods is welcome, but these goods constitute only 6 per cent. of the total production of Indian cotton mills, and even with the reduced excise duty, they are beyond the reach of the poorer classes of the population.

"In assessing the value of the concession regarding the abolition of the export duty on medium goods, it is pointed out that exports of Indian mill-made goods in the first 9 months of this year amounted to 495 million yards, which included 178 million yards of medium goods, and the chances of substantially improving this figure are very remote, in view of the fact that the privileged position which India enjoyed in certain countries, such as Burma, East Africa, etc., *vis-a-vis* the manufactures of Japan, will not be available in the future. There might, however, be a switch-over in the exports from coarse goods, which attracts the export duty, to medium goods, as the latter, without the export duty, would be cheaper in some varieties than coarse goods, in respect of which the duty is still payable.

"Out of a total Indian mill production of 415 million yards per month, 330 million yards consist of fine and medium goods, and it is in this range of production that relief would have been most helpful."

Reduction of Production Costs

Anyone who has cared to follow the developments on the cotton textile front, in India as well as abroad, will fully appreciate the reasoning behind these observations. It is needless to point out that the cost of cotton textile production has already gone up considerably, thanks to the series of burdens imposed by the Central and State Governments. Considering the buyers' market for cotton textiles the world over, the need for a substantial downward revision in the cost structure is most urgent. This is the only effective way of enhancing the competitive capacity of the Indian cotton mills in the overseas market and of improving the chances of their acquiring a more extensive domestic market. Looked at from the point of view of production and employment also, the need for reducing production costs is equally urgent. It is a pity that the authorities in India should have simply overlooked these aspects. Surely, no one is so blind as those who refuse to see. The Government will do well to take note of the significant remarks of no less a person than Mr. A. D. Shroff. Thus, presiding over the annual meeting of the Ahmedabad Advance Mills, on Friday last, Mr. Shroff said:

"In 1952, the industry achieved a record production of 4,600 million yards of cloth and at present is operating even at a higher capacity. At the same time, exports have barely reached 60 per cent. of the target. The main problem the industry is confronted with to-day is to market its entire production at a reasonable level of prices, so that the operating capacity of the industry could be maintained and unemployment avoided. Unfortunately, however, the situation has so substantially deteriorated during the last few weeks that a number of units in the industry, particularly in Ahmedabad, have already been compelled to notify the closure of second shifts. It is really an irony of fate that, when the largest organised industry in the country had achieved a production target in excess of that indicated in the Five-year Plan, it should be compelled, by pressure of events and circumstances, to curtail its operating capacity. Diverse reasons have been ascribed to this intriguing situation. Whatever be the nature of validity for each one of them, one thing appears to be indisputable, that a general deterioration in the purchasing power of the community at large is largely accountable for the drop in offtake of cloth, although the prices have suffered a fair recession. ... The excise duty on cloth, which is of a specific character, bears more heavily when prices of cloth decline and to that extent causes sales resistance. In the case of certain varieties of cloth, the incidence of excise duty makes the cloth more expensive by 25 to 40 per cent."

Similar views have been expressed by Mr. M. L. Shah, President of the Bengal Millowners' Association. According to Mr. Shah, the Government of India's recent measure reducing the excise duty on superfine cloth will not benefit the West Bengal mills or the consumers, as the mills in the State produce mostly medium and fine varieties of cloth. The middle class people are the principal consumers of such varieties. Under the present-day market conditions, fine varieties of cloth are selling at unremunerative prices and the excise duty acts as a serious deterrent to the industry.

Plea Justified

The foregoing account lends admirable support to the plea for the abolition of excise duty on cloth, or at least for a substantial downward revision of it. There is also no justification whatever for the continuance of the export duty on coarse cloth. To quote Mr. Shroff again:

"... The slackening in export activity is, in some cases, due to disturbed conditions in some of our export markets, like East Africa, and partly due to increasing competition felt from other countries. In the case of Burma, the cessation of preferential treatment to India has created an additional handicap for Indian exports. I am, however, of the opinion that, in both cases—I mean the internal and external markets—Government can make a substantial contribution towards improving the situation. ... I have consistently advocated that export duties are most unscientific and inelastic, particularly in the case of cloth where we have to meet with increasing competition in foreign markets."

Mr. Shroff accordingly appealed to the Government to abolish the export duty on coarse cloth forthwith. The Government, he said, might well benefit from its experience as to how India had lost its markets for hessians because of the continuance of heavy export duty on hessians until recently. He even went to the extent of urging the Government to explore the ways and means of stimulating larger export of cloth by offering a special bonus or premium on exports, with a view to maintaining employment in the cotton textile industry at the high level it has reached this year.

EXPORTS OF COTTON YARN

The Government of India announced the export policy for cotton yarn for the period July-December, 1953 only recently. The delay in the announcement of the policy is clearly ununderstandable. Perhaps, the Government desired to watch the situation following the decontrol of cotton textiles before it formulated a policy for yarn exports. The policy for the current half-year, now announced, is on the lines similar to that followed in the previous year. Accordingly, exports of yarn are allowed to all permissible destinations other than Nepal, Tibet, Portuguese and French possessions in India. Quotas are fixed for mills or their nominees which have supplied a portion of the yarn produced by them to handlooms as prescribed by the Government of India. This supply of yarn is fixed on the basis of supplies made by the mills in 1950-51 plus 25 per cent. of the production resulting from any new spindles installed since that year.

The Government's decision to allow exports of cotton yarn on the same basis as in the previous half-year has greatly disappointed exporters. The Government, it is felt, has done serious injustice to a large number of established exporters of cotton yarn who have been denied the privilege of direct exports. After all, it is pointed out, it is due to the sustained efforts of these exporters for the last many years that export markets for Indian cotton yarn have been built up. To deny export quotas to this class of exporters at this juncture, it is further pointed out, is unfair. Referring to the Government's yarn export policy, Mr. Sankalchand G. Shah, President of the All-India Exporters' Association, observed, in the course of his address at the last quarterly meeting of the Association, as follows:

"Since there is sufficient surplus of cotton yarn in the country and since production thereof has steadily increased for the last several months, particularly because of the fact that our natural export markets, such as Aden, Sudan, Burma, Hongkong, Singapore and others, are in real need of our cotton yarn at present and are able to absorb at least the same or similar quantities of cotton yarn that are licensed for export to our mill friends, I strongly urge the Government of India and our energetic Textile Commissioner to grant export quotas to the established exporters for at least the same quantity. The action should be taken without any delay, particularly at this juncture, when such additional quotas, I am convinced, would be willingly absorbed by our neighbours abroad, who are bearing a strong bond of goodwill and friendliness towards us. I most advisedly urge the authorities not to overlook this matter which is vital to the promotion of our export trade. I strongly feel that, if the matter is overlooked and delayed, our competitors like Italy, Japan, the U.K. and others would take the utmost advantage of the situation and it will then be too late and I am afraid we will 'miss the bus' at a time when the need for exports is more and still more. I hope and trust that our Government will take prompt measures in this direction, before it is too late."

EXCESS OUTPUT OF "DHOTIS"

An ordinance seeking to impose a penal excise duty on those cotton mills which have produced *dhotis* in excess of the permissible quota was promulgated by the Government of India on 26th October, 1953. It will be recalled that, with a view to assisting the handloom industry, the Government of India had passed orders in January, 1953, restricting the production of *dhotis* by mills to 60 per cent. of their average monthly production during the period April, 1951 to March, 1952. Under these orders, the production of mill-made *dhotis* was brought down to about 30,000 bales per month, as compared with the average monthly production of 50,000 bales in 1951-52.

While the average quantity of *dhotis* produced by mills has been within this figure, certain units are alleged to have produced *dhotis* in excess of their permissible quota. The Government had been considering what would be the most suitable method of achieving its objective, namely, to ensure that the production of *dhotis* by all mills is restricted to their permissible quota. As legal proceedings against the mills which have contravened the order are considered to be a cumbersome process, the Government has decided to impose a betterment excise duty on all excess production of *dhotis*. The duty is on a graduated scale, ranging from As. 2 to As. 8 per yard on the quantity of *dhotis* produced in excess of the permissible quota.

The Jammu and Kashmir Government has granted, it is stated, an interest-free loan of Rs 5 lakhs to the Ladakh Wool and Pashmina Syndicate Ltd., with a view to developing the cottage wool industry in that part of the State. After organising the trade in wool, the Syndicate proposes to start manufacture of carpets and *gudmas*.

The Government of India has decided to release for export a supplementary quota of 400,000 lbs. of Madras and Mysore silk waste. This is in addition to the quota of 200,000 lbs. of Madras and Mysore silk waste announced for export during 1953 on 16th April, 1953.

STEPS TO IMPROVE PAKISTAN'S COTTON EXPORTS TO U.K.

YARN OUTPUT MOVES UP

(By A Special Correspondent)

MANCHESTER, *27th October*

RECIPROCAL arrangements to increase the use of Pakistan cotton in Lancashire while stimulating the sale of finished Lancashire goods to Pakistan are likely to follow the establishment of a Lancashire-Pakistan Cotton Committee which has been proposed by the Cotton Board. This was the view widely expressed in Lancashire textile circles after the announcement that the Committee is to be formed. The Cotton Board has already held consultations with the various sections of the industry as to the best means of improving trade relations with Pakistan and long-term prospects for Lancashire trade.

MANCHESTER LETTER

In addition to a Chairman and Vice-Chairman, the Committee will include members representing raw cotton interests, the spinning, manufacturing, finishing and merchanting sections and the Shirley Institute. According to a statement issued by the Cotton Board, the industry is of the opinion that it has a contribution of real value to offer to Pakistan's prosperity over a period of years. It intends to make this contribution increasingly effective and by methods of promotional and technical activities it can create a larger market for Pakistan cotton in the United Kingdom and can make that market secure and stable.

It is anticipated that an inaugural meeting will be held in Manchester before the end of the year to establish a policy and programme for the industry at large and invite the collaboration of the various sections of the trade.

New Committee

The new Committee follows the lines of the pre-war Lancashire/Indian Cotton Committee which was formed in the early 1930's. Reciprocity in trade between Lancashire and India in raw cotton and cotton goods led to an increase in mill consumption of Indian cotton by the British cotton industry from 183,000 bales in 1932 to 428,000 bales 5 years later. Practical demonstrations for the benefit of Lancashire spinners showed the possibilities of Indian cotton in new lines of manufactures and extensive trials took place with the collaboration of the Shirley Institute. The Committee established a close relationship with the Indian Trade Commissioner in London.

Due to import restrictions, shipments of Lancashire cotton goods into Pakistan this year have slumped to less than 2,500,000 square yards, valued at £400,000 compared with over 40 million square yards in the first 9 months of 1952 valued at more than £4,750,000. Arrivals in Britain of Pakistani cotton in the 1952-53 season to the end of July amounted to 111,617 bales.

The British spinning industry produced over 140,000,000 lbs. of cotton and rayon yarn more in the first three-quarters of the year than in the first 9 months of 1952.

A Cotton Board survey shows that in the 9 months the mills produced 695,680,000 lbs. of yarn compared with 553,700,000 lbs. over the same period last year.

In the week ended 10th October, output aggregated 20,350,000 lbs.—the highest weekly output for 20 months. This compared with a production of 20,220,000 lbs. in the previous week and 16,710,000 lbs. in the corresponding week last year.

The Third Quarter

However encouraged the industry in Lancashire may be by the general trend of trade in cotton goods this year, the export situation can hardly be described as satisfactory. There was little sign of any important change in the position last month and the value of all cotton goods shipped abroad was almost identical with the August figure at £10,635,605. This brought total earnings for the 9 months to £97,282,946 against £114,775,515 in the same period of 1952.

Although the value of shipments has declined, the volume at the end of September showed little variations on the corresponding 1952 returns. Cloth exports were 524,948,000 square yards, against 525,844,000 square yards, the yarn shipments were 29,491,600 lbs., against 26,365,700 lbs. The table indicates the volume of cotton goods exported during recent years:

Cloth (In 000 sq. yds.)

	1951	1952	1953
1st quarter	211,690	211,705	173,401
2nd "	246,403	161,140	169,092
3rd "	213,964	152,939	182,450

Yarn (In 000 lbs.)

1st quarter	10,668	12,199	9,879
2nd "	10,113	7,438	9,033
3rd "	15,007	6,729	9,674

Overseas cloth shipments in the third quarter this year reached the highest level since the early part of 1952 before the slump began to affect exports. The average price obtained for cotton cloth up to the end of September was 29.67d. per square yard, against the average of 34.05d. in the whole of 1952.

Chief Customer

West Africa remains the chief customer of Lancashire mills, having so far taken 104,056,000 square yards, followed by Australia 67,592,000 yards, South Africa 65,110,000 yards and East Africa, New Zealand and Malaya all near the 20,000,000-yard mark.

The continued steadiness from month to month of yarn shipments this year has been a feature. Leading buyers have been Australia 4,091,600 lbs., Irish Republic 3,655,800 lbs., and Canada 3,152,000 lbs.

"Disappointing" was the word used by Sir Raymond Streat at the Cotton Board Conference to describe the export picture. He pointed out, however, that Lancashire's comparative position had not deteriorated since 1950-51, the local share of world trade remaining at 15 per cent. of the reduced level of trade, which for the first half of this year was running at about 4,550 million square yards annually, against 5,715 million yards in 1950-51.

A slightly more favourable prospect is held out by the fact that Lancashire could at least hold its own at a time when trade restrictions in important markets such as Australia and New Zealand were in force. On the other hand, shipments from this country have gained by the exclusion of Japanese cloth from certain Colonial markets during the same period.

The important thing to remember is that before the war Lancashire claimed 27 per cent. of international trade in cotton piecegoods, and even as recently as 1948-49 the share was 18 per cent. Nor is the position any more healthy in rayon cloth. In the first half of this year world exports of rayon goods were higher than at any other time, but shipments from Britain only made up 12 per cent. of the total, compared with 18 per cent. in 1950-51.

Mill Probe

An examination of general conditions in Lancashire mills is to be undertaken by a specially-appointed committee of the 50,000-strong Cardroom Workers' Amalgamation.

Announcing the appointment of the Committee in his quarterly report, Mr. Alfred Roberts, Amalgamation General Secretary, said improvements, in cases substantial, had taken place in conditions in the mill since the war, but these had been improvements necessary for firms to retain their old operatives and attract new ones. Taking the industry as a whole, however, the improvements had been "patchy."

It was because of this and because it was felt there was still cause for dissatisfaction that the examining committee had been appointed, said Mr. Roberts. It would investigate such subjects as lighting, ventilation, spacing of machinery and dust removal.

Mill Deals

Cotton mill deals were again in the news in Lancashire this week. Latest Company to be sought by an undisclosed buyer is the Briar Mill Ltd., Shaw, engaged in spinning, winding and beaming. A bid of 13s. 6d. per 4s. share was made after dealings had taken place at below 9s. 6d.

The Directors advised shareholders to hold on in the light of this £327,879 offer and promised a further statement within a fortnight. They also announced a dividend of 4d. a share, prior to completion of the sale. The mill, containing more than 120,000 spindles, was built in 1906.

The completion of the Soudan Mill deal by which Cyril Lord Ltd., has acquired the issued capital for £863,925 in an 18s. bid for each 5s. stock unit was also announced this week. The Cyril Lord organisation has thus gained control of 4 more mills, of which 2 are actually at work. Spindleage of the group has been raised to more than 425,000, while looms controlled number 3,300.—*All Rights Reserved.*

HIGHER SUGAR PRODUCTION WANTED

U.P. LABOUR MINISTER'S APPEAL

THE fervent appeal to labour and management in the sugar industry to strive hard in order to augment the output of sugar, made by Dr. Sampurnanand, Minister for Labour, Government of Uttar Pradesh, in the course of his address at the U.P. Sugar Industry Tripartite Labour Conference held at Lucknow recently, has a special significance in the present context when the prospects of a high level of sugar production during the current (1953-54) season have turned out to be somewhat bleak. Present indications are that sugar production is not likely to register any improvement. On the contrary, it is expected to record a decline, thanks to the damage to the sugarcane crop caused by the floods in East Uttar Pradesh and Bihar. Even if sugar production is to be maintained at the previous season's level, namely, 1,319,710 tons—if not improved—it will call for special effort by the sugar millowners and the workers. The responsibility will be all the heavier in the case of Uttar Pradesh, inasmuch as this State accounts for a considerable part of the country's aggregate sugar output. On this aspect of sugar production problems, Dr. Sampurnanand said:

"A heavy responsibility rests on Uttar Pradesh for sugar production in the country and, if anything brings about a fall in production, it will be a loss not merely to producers and workers but to the whole country. We all have, therefore, to work in our respective fields to increase the production of sugar . . . I appeal to the producers and the labour leaders not to do anything that will affect sugar production adversely. . . . I appeal to you to create a spirit of understanding and co-operation between yourselves."

It is easy to appreciate the U.P.'s Labour Minister's anxiety to see that sugar output is maintained at a high level, when one remembers that consumption of sugar has registered a steep rise in recent months, the rate of consumption being about 1.5 million to 1.6 million tons per annum. If, therefore, sugar output during the current season is not sufficiently high, sugar will have to be imported in larger quantities than in the previous season. This means waste of precious foreign exchange—every ton of sugar imported costs as much as Rs. 700—which can as well be utilised for purchasing necessary machinery and equipment. An even more important point is that a high level of domestic production will have a soothing effect on the internal market for sugar. For it must be remembered that, even after a long period of 18 years of protection enjoyed by the sugar industry, the consumer continues to pay an exorbitantly high price for sugar *vis-a-vis* his confreres in other parts of the world. It is to be hoped that the sugar millowners and the workers will strive hard and maintain the sugar output at as high a level as possible.

Attitude of Governments

An equally heavy responsibility devolves on the Central and State Governments, since their attitude to the sugar industry has all along been none too satisfactory. They have not only failed to pursue correct policies but also subjected the industry to penal taxation. As has been pointed out in those columns ere now, if the sugar industry is to expand, as it must, in order to meet the increase in consumption, the Governments must come forward to reduce the tax burden on the industry, on the one hand, and take such steps as will ensure sufficient supplies of sugarcane to the factories at an economic cost, on the other.

To revert to Dr. Sampurnanand's address at Lucknow. Referring to the plea for a further upward revision in the price of sugarcane, he said that he was not against such an increase, provided, of course, the employers, workers and cane growers all desired it. Nevertheless, he emphasised that the practical aspect of the question should be considered seriously. Dr. Sampurnanand alluded, in this connection, to Press reports regarding the plea, made by certain sugarcane interests, for bringing pressure upon the sugar mills in order to make them pay higher cane prices. He warned against such a course of action and said: "If pressure means adoption of a method which may affect production, it will be a dreadful thing. What the Government will do in such a case is for them to decide, but the loss that the cane growers, workers and the industry will suffer as a result of this deserve serious thought." This warning is, indeed, quite timely. For, as Dr. Sampurnanand rightly pointed out, nobody, after all, is going to gain, if the sugar industry topples down."

The two specific problems to which the U.P. Labour Minister drew attention relate to the housing of workers and their wages. While on the former, he stressed the need for providing houses to workers, and revealed that the Government had created a molasses fund of Rs. 41 lakhs for helping the sugar factories. He deprecated the tendency on the part of a few factories to evade the question. Some mills, it would appear, had even refused to take up the construction of houses. It is not known on what grounds the factories have refused this amenity to the workers. Maybe, financial difficulties have prevented some factories from embarking on a housing scheme. But this cannot be true of all factories. There is no reason why the factories which have the necessary funds should not construct houses for workers.

Wages

Referring to the question of wages for sugar factory workers, the Minister said:

"According to my information, about 30 to 35 mills have given *ad hoc* increments to their labour, whereas 31 mills are still defaulters. If it is a matter of one or two mills, I would have thought that they may not be in a financial position to give it. There is no statutory obligation or legal pressure on the mills to pay the *ad hoc* increment, but it is a sort of gentlemen's agreement. The non-payment of ad hoc increment on the part of 31 mills cause inconvenience to the labour and their representatives. The Government has, however, waited for one year and now it is forced to refer this matter either to adjudication or to find some way out under section 3 of the Industrial Disputes Act. I will watch the attitude of the mills in this respect for a few days and, if nothing is done, I will have to find a way out."

It is to be hoped that the defaulting mills will make an earnest effort to implement the gentlemen's agreement, to which the Minister referred. If there is any genuine difficulty, they will do well to bring it to the notice of the Minister, so that some satisfactory solution of the problem could be evolved through joint action by the industry, the Government and the workers.

ADDITIONAL EXCISE DUTY ON SUGAR ABOLISHED

The Government of India has announced the abolition of the additional excise duty of one rupee per maund introduced in December last under the Sugar (Temporary Additional Excise Duty) Act, 1952, on sugar manufactured from the sugarcane crop of 1953-54.

This decision is a sequel to the need for preventing any increase in the price of sugar as a result of the higher price fixed for sugarcane crop for the current year than that of last year. The price of sugarcane, it will be recalled, has been fixed this year at Re. 1-5 per maund in the field and Re. 1-7 at the factory, as against Re. 1-3 and Re. 1-5, respectively, last year.

(*Concluded from next column*)

ment had planned to manufacture power alcohol themselves and, for the purpose, had approached the sugar factories to supply them with molasses at a price which would enable the Government to manufacture power alcohol at an economic rate. In the national interest, we had offered to supply the required quantity at a low price from certain factories, but the Government, instead of appreciating our offer, imposed unreasonable stipulations which we could not agree to."

Considering the importance of utilising the by-products of the sugar industry, as a means of reducing the cost of sugar manufacture, the need for relaxation of rules relating to storage and movement of molasses is imperative. Mr. Dahanukar did well to urge the Government to allow at least those factories which have distilleries to manufacture power alcohol and afford facilities in this behalf. He did well also to draw pointed attention to the need for the Government enacting two important legislations, one for procuring lands on lease within the demarcated factory area and the other for exempting the sugar factories from the operation of the Act of compulsory cultivation of food crops in areas primarily meant for growing sugarcane.

WOES OF DECCAN SUGAR MILLS

REVISION OF GOVERNMENT POLICY IMPERATIVE

WHEN Mr. D. M. Dahanukar, President of the Deccan Sugar Factories Association, stated, in the course of his address at the fourteenth annual meeting of the Association held in Bombay on Monday last, that, unless labour ceases to make exorbitant and unjust demands on the industry and unless the present staggering rates of taxes were removed, the price of sugar could not at all be competitive, he was emphasising a very pertinent but oft-repeated point. Although attention has been repeatedly drawn to this point ere now, it has not had any effect on the outlook of either labour or the Governments, Central and State. Thus, while labour continues to make their own demands, the Governments are only too eager to net in as much revenue as possible by way of manifold taxes.

Mr. Dahanukar chose for special comment the stepmotherly treatment accorded to the sugar industry in the Deccan by the Government of Bombay. He alluded, in particular, to the series of heavy imposts on the industry, such as high water charges, irrigation cess and *gram panchayat* taxes. He gave a vivid description of the adverse effects of these imposts on the progress of the industry. It is unnecessary to go into these details again, as a detailed reference to them was made in these columns only three weeks ago. Even at the risk of repetition, it must, however, be stated that the Government should reduce the burden of taxation on the industry and expand the availability of water-supply for sugarcane cultivation. The authorities should be realistic enough to admit that the present method and incidence of taxation have set in motion the law of diminishing returns, which, if allowed to hold sway for some more time, would react even more adversely on the employment situation in the country. If they are wise administrators, they will appreciate that, by making a judicious readjustment of their taxation and labour policy, aimed at increasing the incentive to greater and greater investment, they can, in course of time, get more revenue than they are getting at present and create, at the same time, better chances of employment.

Labour Laws

In the field of labour laws, the Deccan sugar factories have had to contend with various difficulties. The Government of Bombay, for instance, has withdrawn the exemption from the operations of section 46(2) of the Bombay Industrial Relations Act (B.I.R. Act), the agricultural operations of the sugar factories. This is certainly a hastly step adopted just to appease labour. For, as Mr. Dahanukar rightly observed, the agricultural operations of the sugar industry are intermittent and depend upon several uncertain features such as rain, heat, pests, etc., over which the industry has no control. Agricultural activities have, therefore, to be adjusted according to the exigencies of the time and it is impossible to foresee the occasions on which it will be necessary to effect changes. The Bombay State Labour Advisory Board, it may be mentioned here, had appreciated the force of this contention and had approved the inclusion of a proviso to section 2(4) investing the Government with enabling powers to exclude any section or occupation of the sugar industry (or any industry) from the operation of the B.I.R. Act. The Government, however, has not only dropped the proposed *amendment* but actually widened the scope of the Act itself by treating the supervisory and technical staff drawing a basic salary up to Rs. 350 per month as "employees" under the B.I.R. Act. Certainly, this attitude of the Bombay Government, as Mr. Dahanukar said, is "extremely unjust and inequitous."

Another aspect of the Bombay Government's sugar policy which the President of the Deccan Sugar Factories Association severely criticised related to molasses and power alcohol. He observed:

"As a result of rigid rules prescribed for storage, movement and disposal of molasses and the restrictions imposed by the licence conditions, these valuable by-products cannot be fully utilised. The sugar factories, which have distilleries attached to them, are not permitted by the Government to manufacture power alcohol from molasses. The importance of the manufacture of power alcohol in times of national emergency cannot be overstressed, nor can the consequential saving in valuable foreign exchange at present spent in importing petrol be ignored. The Bombay Govern-

TAXATION SYSTEM IN INDIA

REFLECTIONS ON SOME OF THE QUESTIONS RAISED BY ENQUIRY COMMISSION

(By R. K. DALAL, B.Com., F.S.A.A., F.C.A.)

THE Taxation Enquiry Commission has issued a comprehensive questionnaire on all aspects of taxation, inviting public opinion. The aspect which concerns the ordinary taxpayer most is income-tax. The question of tax on income has become so important these days that a cynic has said, "it is easier to earn income than to pay tax on it." Further, in days gone by, tax was a fraction of the income. In these days of high taxation, income has become almost a fraction of the tax payable. The following reflections on the various aspects covered by the questionnaire are offered from the ordinary taxpayer's point of view. They are by no means comprehensive, but may help stimulate further thoughts on the subject in quarters interested in it.

The objective of a sound tax policy should be to distribute the burden of taxation as equitably as possible over all sections of the community, bearing in mind the capacity to pay and the state of the economy of the country. India is in a relatively early stage of development in all spheres, that is, agricultural, industrial, etc., and, in its present position and in view of the intention to develop, the tax policy should give primary importance to encouragement of incentives to work, to save and to invest. With this end in view, there is need as well as scope for reduction in certain direct taxes. In an extreme emergency, tax policy may have the objective indicated in (*c*) and (*d*), namely, countering of inflationary and deflationary tendencies, and maintenance of the external balance of the economy, of question 1 of the questionnaire, but that should be limited only to a temporary period, that is, as long as the emergency lasts. The objective of a sound tax policy should never be the reduction of inequalities in income and wealth by taxation, which, in a backward economy such as ours, would result merely in levelling down of incomes without any material benefit to the community. An important principle that must be borne in mind is that, in a democratic State, encouragement must be given to individual effort.

The present system of taxation might be modified to ensure that all sections of the community bear an equitable share of the tax burden, by levelling down taxes wherever they are high now and by devising indirect taxes like salt tax, levy of a surcharge on land revenue, levy of betterment charges and other similar forms of taxation, which are capable of securing a high revenue yield and, at the same time, spreading the burden over all sections of the population. Such taxes would be relatively easy to collect with the existing machinery.

With this introduction, I may now proceed to answer the questions *seriatim* set out in Part II of the questionnaire issued by the Taxation Enquiry Commission.

Residence

At present section 4A defines residence on three main categories:

(1) residence of an Individual,

(2) residence of Hindu undivided family (*H.U.F.*), *firm and association* of persons,

(3) residence of a company.

Individual: Section 4A (*a*) divides residence of individuals into four parts—each being an alternative to the other. These alternative tests widen the scope, so that residence qualification is attracted either under one or the other.

Since residence status is attracted by reason of a sojourn or stay in India, the fact of being in India for the requisite number of days should be further clarified by providing that it must be a stay coupled with the objective of establishing a residence. Merely the fulfilment of a physical presence for 182 days should not suffice. Casual visits of persons not intending to establish residence should not attract residence status.

Residence status under clause (iv) of section 4A (*a*) needs to be clarified to the effect that it is intended to give relief, not to further increase liability. Therefore, it should be invoked in favour of a person, not against him. It may also seem reasonable to restrict such relief to Indian nationals abroad, who wish to settle down or retire in India, who, because of the provisions of section 17, may be taxed at the maximum rate of income-tax and super-tax, without any minimum exemption, and at the rate applicable to the first slab of super-tax. The clause at present worded gives the Income-tax Officer power to review cases of non-residents who have subsequently acquired the status of a resident for a period of three years. Such a view creates hardship and should be avoided.

Clause (iii) needs a clarification, inasmuch as it is not clear as to what is meant by occasional or casual visit. But, if my suggestion is accepted that stay in India for 182 days must be coupled with the condition of his intention to establish residence, this difficulty will be avoided, for any visit not coupled with the condition of establishing residence would be deemed to be occasional and casual.

H.U.F. Firm and Other Association: The test of residence of H.U.F. provided in the Act is that, unless the control and management of its affairs is wholly situated without India, the H.U.F., firm or the association will be presumed to be resident. In other words, these entities are all presumed to be resident. This requires to be changed, inasmuch as the control and management from India should be situated and positively reside in India. The word "wholly" should be changed to "substantially" with a view to preventing easy manipulation of the status.

It may be added here that, under the U.K. Act, a firm is subjected to tax at the rates applicable to individual partners and aggregate assessment is levied on the firm. Thus, the assessment is levied at a figure which would be equivalent to an assessment of a registered firm. Under the U.K. Act, a firm is not regarded as an entity for purposes of assessment.

Company: Unlike a firm, H.U.F. and other associations of persons, the test in the case of a company is a positive test. Is the control exercised wholly in India? That is, is it exclusively exercised in India? If not, the presumption is it is a non-resident company. If, for instance, 95 per cent. control is exercised in India and 5 per cent. exercised abroad, such a company would be non-resident, whereas, rightly speaking it should be treated as a resident. The word "wholly" should, therefore, be changed to "substantially" in order that a company the substantial control of which is exercised in India may not escape the liability of a resident status, merely by the expedient of transferring a part of the control abroad.

A company has also an alternative test, namely, it is a resident company if its income in India exceeds its income abroad, notwithstanding that it is a company the control and management of which is wholly exercised abroad. But this clause leads to an evasion of tax, which the framers of the Act have overlooked. To give an instance. A company in the year A becomes resident, because its foreign income is a loss of Rs. 10,00,000 and its income in India is Rs. 5,000. On the basis of the alternative test, such a company in the year A will be resident entitled to set off Rs. 5,000 under section 24 (1) and also carry forward Rs. 9,95,000 as a loss under section 24 (2) for a period of six years. In the year B, the company's foreign profit is Rs. 10,00,000 and income in India Rs. 5,000. In that event, the first test in section 4A (c) will make it a non-resident. Thus, while foreign profits, when made, will not be reached for tax purposes, foreign losses can be availed of by such company to wipe out whatever big or small profits it might make in India. Appreciating this loophole, the Income-tax Investigation Commission has recommended that such foreign company should not be allowed to carry forward loss, unless it is agreeable to set off against it an equal amount of foreign profit in a subsequent year.

The status of a "not ordinarily resident" should be deleted from the Act, as recommended by the Investigation Commission. A status which is better than either the resident or the non-resident for a person who is at best a bird of passage is intolerable. It should not be allowed even from the point of the nationals, who, by the mere expedience of staying away for full one year at the end of each five years, can successfully avoid the status of an ordinarily resident being acquired by him, with its attendant heavy incidence of tax.

Non-resident Status

Non-resident status should be maintained as now, namely, those who do not acquire the status of a resident become non-residents. A precaution, however, is called for where a normal resident goes out of India for a full taxable year—not with a view to settling down abroad, but deliberately to avoid tax on his accumulated savings when remitted and brought into India under section 4 (1) (b) (iii). In case of nationals, temporary stay out even for a year should not enable change of their residence status. The sudden change in the Act of dropping the "not ordinarily resident" status may create some hardship, because the non-resident who becomes not ordinarily resident for the first two years would not have to pay tax on his foreign income arising abroad. But if non-resident status is retained with the right of exempting all remittances into India, much of the hardship will be mitigated. Further, by a recent amendment substantial relief is given to the resident who wishes to bring his past savings, by not subjecting them to tax under section 4 (2) (b) (iii).

A non-resident is taxed at the maximum rate or at the appropriate rate of a resident, whichever is higher, unless he has opted in favour of the appropriate rate of tax of a resident individual. In determining such rate, the world income is deemed to be his total income and the rate fixed for his Indian income is at the world rate. Inasmuch as Indian income will be taxed at world income rate, which may be higher, this has an advantage, but the Indian income may have also to be exempted if the world income is a loss. Must Indian income of a non-resident escape taxation merely because the world income is a loss? We would suggest that the 'world income' should be coupled with a condition that, in any event, it shall not be less than the total income in India.

Income

The definition of income needs modification in the direction of mutual insurance company's profits being exempted from tax. Profits of a mutual insurance company are not profit within the normal definition of the word. English Courts have held that such profits are not taxable. There should be a similar exemption under our Act also.

A prominent feature of the Indian Income-tax Act is that it is frequently interspersed with deeming processes of law. Thus, at several places, fictions of law have been created. What cannot be got at legally is sought to be caught under a fiction of law. There is a fiction where capital profit is deemed to be revenue profit; there is a fiction about the year of accrual; there is a fiction as to the ownership—income of the wife or minor child deemed to be the income of the husband or father. Income arising to a company outside India is deemed to arise to the shareholders in India. Law does not seem to have considered the effect of introducing so many fictions in regard to taxing a person's true income. Their presence affects the computation of the real income. If the ability to pay tax is to be measured by the real income, creation of such fiction wrongly misrepresents such ability of the taxpayer to pay. If the total income is the measure of a man's ability, it must be the total of what he has and not what he is deemed to have; further, it must be something of the nature of incoming of an income and not incoming of capital, for it must not be forgotten that what is sought to be taxed under the Act is "income" and not "capital."

If a non-resident receives sale proceeds, a liability under section 4 (1) (*a*) arises, for sale proceeds, it has been held, contain an element of profit. A large number of drafts cleared by the exchange and other banks on behalf of their foreign constituents represents large untapped source of revenue which is, at present, not subjected to tax or not adequately taxed. But at the same time, to impose a vicarious liability on the resident by making him an agent on behalf of the non-resident penalises a person—a national—for the non-payment of tax by the non-national. The liability under section 42 can be imposed whether the agent has the non-resident's funds under his control or not. The right of retention given under the Act is more illusory than real. Where, as is now, the practice for the non-resident is to insist upon opening letters of credit abroad as a condition of trading, the agent here does not get any funds of the non-resident to enable him to exercise this right of retention. The agent does not know the world income of the non-resident. An arbitrary estimate is made and the resident is called upon to pay the non-resident's tax. The law under section 65 gives the agent an indemnity, but of what use is this indemnity, if the payment of non-resident's tax does not entitle him legally to recover it from the non-resident? Ultimately,

(*Continued on page 874*)

MODERNISATION OF JUTE INDUSTRY

URGENT ATTENTION NECESSARY

FEW would contend the need for modernisation of the jute industry. The urgency for renovating plant and machinery in jute mills emerges from the fact that a greater part of the competing jute mill industry in other parts of the world has been reconstructed in recent years. Most of the mills have expanded their capacity through modernisation of equipment. Besides, new jute mills with up-to-date machinery have come into being in a number of countries which had none before. These mills are able to produce not only a variety of products but also at considerably lower costs. Thus, there is substantial jute processing capacity in Europe, South Africa, Brazil and the Philippines. Japan, too, has started building up a jute manufacturing industry with the latest types of machinery.

What is more disturbing is the growth of factories in Far Eastern Asia which either weave jute cloth or are engaged in spinning domestic fibre for the manufacture of substitute fabrics for jute. It is reported that Burma and Thailand are also producing a kind of jute for use for their jute mills either erected or planned. One jute mill has already been installed in Thailand and another is under construction in Burma.

New Mills in Pakistan

Most important of all is the birth of the jute industry in Pakistan—the home of the golden fibre. According to reports from Karachi, Pakistan is now in a position to meet nearly 85 per cent. of its requirements of manufactured jute goods from indigenous output. The estimated annual demand is about 122,000 bales. As against this, the output of jute goods during the last twelve months is placed at 103,000 bales. The value of foreign exchange saved by Pakistan, as a result, is of the order of Rs. 3.5 crores.

There are now 1,350 looms in operation in Pakistan—1,250 looms in the Adamjee Mills at Narayanganj and 100 looms in Ispahani Mills at Chittagong—all working two shifts. There is, besides, another mill in partial production. The total capacity of all the three mills is 45,900 tons per annum. Pakistan banned imports of jute goods in August, 1952.

A point to be noted here is that these mills are equipped with machinery of the latest type design. It is learned that roving frames have been replaced by high speed triple thread finisher drawing frames and sliver spinning frames have replaced those fed by rover bobbins. These machines are driven by individual electric motors as a matter of course. The processes, the choice of machines, the mill layout—all are dictated by the desire for high speed working with a much smaller labour force. In fine, through modernisation, the jute mill industry outside India is deriving considerable benefits. For modernisation has brought with it advantages in the shape of increased production, lower cost of production and additional competitive power. These advantages are something to reckon with by jute mills in India.

Opinions Differ

The importance of modernisation is fully recognised by the jute mills in India, but there seems to be a certain amount of confusion, owing to different versions of the present position of the industry and the replacement requirements of the mills given by different sections within the industry itself, as well as by the Government. Here are the versions. In a recent article contributed to the *Statesman*, Mr. G. J. Gardner, Chairman, Indian Jute Mills Association, stated: "Despite the heavy demands made upon it during the war years and the difficulties then experienced in its maintenance, the machinery of the industry is in general well looked after, efficient and capable of good production at an economic cost." In July, 1952, Mr. W. B. Moncur, former Chairman of the I.J.M.A., stated: "The existing machinery is not obsolete. Only new machinery will give us additional competitive power." The Government of India's views go to show that the extent to which modernisation would help would vary from mill to mill. "Some mills in India", according to the Government, "are already reasonably efficient units and, taking into account the lower capital cost of their present installed machinery, it would not seem worthwhile to replace existing plant with new." "Others might need," it opines, "to make improvements in sections rather than on a whole basis." "There are also mills," it thinks, "where something approximating complete renovation may have to be undertaken."

There is, besides the above, another version as presented by a special correspondent of the *Statesman*, Calcutta, which remains uncontradicted so far either by the industry or the Government. The correspondent observes: "The machinery in all departments—softening, carding, preparing, etc.—installed in such vast quantities just after the turn of the century is now largely obsolete. Nevertheless, this style of machinery predominates in the Indian jute industry to-day, and the problem of its replacement is of urgent concern."

Proceeding, the correspondent says that, at the turn of the century, when the installations took place, labour was abundant and wage rates were low. The choice of one machine against another was dictated primarily by the production which could be obtained and the cost of the machine itself. The cost of running it which included the necessary labour was a minor consideration. Since then, there have been considerable developments in the various departments of processing jute. Most of the improvements were seen in the evolution of high speed labour-saving machinery widely adopted in Europe and America. Drawing and spinning frames have also been improved. The machine producing standard warp yarn has been improved in speed. Developments in carding also have been considerable. In the sphere of weaving, circular looms which can weave both plain and twill cloth have come into use more widely in the industry outside India. But the flat jute looms working in so many Indian mills are the looms built fifty years ago. Despite the backlog in rehabilitating the industry by equipping it with the latest devices, the correspondent concedes that the mills have started using new types of machinery. He, however, opines that "in view of the present situation in the Indian jute industry, a decision on this vexed problem of modernisation cannot be deferred much longer. Competition outside India, buttressed by the most modern machines, is becoming more and more severe, and India cannot meet it without similar tools." It looks as though what this correspondent says is the most accurate indication of the present position of the industry.

Four Main Snags

The observations of the Industrial Correspondent of the same daily from Calcutta on the subject also deserve mention. According to him, modern machinery has been installed, or is on order, in respect of about 9.8 per cent. of the total loomage of mills in the membership of the I.J.M.A. Investments so far made, or to be made, shortly are estimated at Rs. 5 crores. Finance required is estimated at Rs. 45 crores. Spread over a number of years, the programme of modernisation involving this sum is considered practicable. There are, however, four main hurdles to cross before implementing the programme. The first one is the availability of foreign exchange. As the machinery is to come from the sterling area, this problem, he says, should present no insuperable difficulty. Assistance from the State and the World Bank can help the industry to obtain the wherewithal to meet the cost.

The second difficulty is the prohibitively high cost of the machinery. Opinion appears to be divided on this question. Mr. Gardner says that modern machinery is expensive and its installation is wise and prudent only when it is justified on economic grounds. "Considerable progress has already been made," he says, "in the re-equipment of the mills, much more remains to be done and will be done, but the industry's programme cannot be completed overnight and nothing spectacular should be looked for." As against this, there is another section which seems to feel that, once installed, the latest machines require little or no maintenance. Since introduction of new machinery will result in a saving of labour, it will ultimately enable the industry to sustain a labour force at a higher level of wages than now. Besides, the new machines would also considerably strengthen the competitive ability of the industry. As special varieties of cloth could be manufactured with the help of the new machinery, the industry would be in a position to cater to the tastes of a wider market than at present. It is thus argued that considerations of high cost of machinery should not matter much in re-equipping the industry with new machinery.

Availability of New Machinery

Granting that foreign exchange is available and the industry agrees to purchase the machinery unmindful of the cost, there is the problem of overcoming the inability of the machinery manufacturers to meet the large orders from India. It is pointed out that the order books of the few factories in the U.K. which are engaged in the production of these machines, are already full and that, therefore, it may take a full decade for them completely to satisfy the demand from India. This appears to be a really great limiting factor in the programme of modernisation of jute mills in India.

And then there is the question of displacement of labour resulting from modernisation. The industry now employs about 300,000 workers. Total modernisation may affect about 40,000 workers. But the retrenchment of these workers could be rendered painless by retaining existing workers in new vacancies as and when they occur over the period during which modernisation is completed.

Despite the snags of modernisation, as noted above, the jute industry must pay greater attention than it is doing at present to the problem of raising its efficiency through modernisation. Labour and the Government must realise that this industry is an important export industry, that India has no longer a monopoly in the supply of jute goods, that if jute goods are to retain their utility as a packaging material, they have to be produced at a low cost and that it must have the same tools which its competitors in other countries are employing. Only if they realise all these things, they will be in a position to appreciate the necessity for aiding the industry in modernisation of its machinery. Labour can help by not placing impossible demands on the industry in regard to work-load, retrenchment of surplus labour, etc. The Government can help by following a liberal taxation policy and by securing long-term finance at favourable rates of interest.

FORWARD TRADING IN RAW JUTE BANNED

The Government of India has, by a notification in the *Gazette of India Extraordinary* dated 29th October, 1953, prohibited forward trading (except non-transferable specific delivery contracts) in raw jute in any form. Under this notification, all forward contracts (except non-transferable specific delivery contracts) entered into before 29th October, 1953 shall be deemed as closed at the rate prevailing at the close of the forward market on 29th October, 1953.

A Press note issued in this connection says: "It will be recalled that forward trading in jute was banned by the Government of West Bengal in August, 1948. That ban has continued ever since the notification, however, prohibited dealing in screwed baled raw jute only, as, at that time, there was forward trading in that form. Recently, however, forward trading has developed in *kutcha* bales and loose jute and this has resulted in unhealthy speculation and harm to genuine trade. The object of the present notification issued by the Government of India is to put an end to this recent development."

Apart from plugging the legal loophole thus, the notification, having been promulgated by the Centre, applies, in the absence of any specific limitation of its jurisdiction, to all States and not merely to West Bengal.

The ban on futures trading in raw jute must be considered timely in that it has appeared at a time when raw jute was just assuming a firm trend in sympathy with the growing demand for jute goods. In the absence of this ban, unscrupulous speculators would have taken advantage of the improving tendency in jute goods market (in which also forward trading has remained suspended from 18th December, 1952) and pushed up the prices of raw jute to levels which would have rendered manufacture and sale of jute goods uneconomic.

The fact that "non-transferable specific delivery contracts" have been excluded from the purview of the notification, provides scope to carry on legally forward trading within limits. The term is defined in the Forward Contracts (Regulation) Act, 1952, to mean "a specific delivery contract, the rights or liabilities under which or under any delivery order, railway receipt, bill of lading, warehouse receipt or any other document of title relating thereto are not transferable."

A point to be noted here is that, in taking a decision to ban forward trading in raw jute the Government has not waited for the decision of the official Jute Enquiry Committee appointed by it to enquire into the pattern and practices of the jute trade. As this Committee is still in the midst of its investigations, it may be long before it submits its decision. The Government has also constituted the Forward Markets Commission to keep a watch over the forward markets and advise the Government on the working of the Forward Markets Regulation Act, 1952. This Commission, which was appointed only at the end of September last, is yet to develop into a full-fledged expert body. It is, therefore, unlikely that the Government had consulted the Commission before deciding to ban forward trading in raw jute.

put 'Paludrine' on your payroll
Absenteeism is today a serious problem, which employers of labour everywhere are forced to face. In India Malaria as the greatest single cause of illness has a direct effect on the absentee rate.
'Paludrine' prevents Malaria
Put it to work today in your factory and establishment. Let regular 'Paludrine' dosage raise the level of health among your employees, and so cut down that rising curve of lowered efficiency and lowered production, which always accompanies absenteeism.
All over the world today 'Paludrine' is doing just this job in many establishments and organisations, where its continued use bears silent but irrefutable testimony to its efficacy and power.
Yes—put 'Paludrine' on your payroll and fight one of the most serious causes of absenteeism in India today.
We shall be happy to co-operate with you in implementing a scheme for 'Paludrine' Protection in your establishment. Special rates are available for bulk purchases. Please write today to the nearest office of I.C.I.

AMENITIES FOR RAILWAY PASSENGERS

SHORTAGE OF COACHES HOLDS UP PROGRESS

THE National Railway Users' Consultative Council concluded its two-day session at New Delhi on the 28th ultimo. The Council, which was set up in July last, to advise railway administrations and the Railway Ministry on matters pertaining to the services provided by the railways and their efficiency, discussed, among others, subjects relating to granting of railway concessions to certain all-India bodies, with a view to facilitating activities of educational, cultural and social importance, improvement of catering and vending at stations and in trains, removal of beggar nuisance and improvement of rail transport capacity so as to cope with the demands of expanding industry and trade

Addressing the Council, Mr. Lal Bahadur Shastri, Minister for Railways and Transport, claimed that greater attention was being paid to the convenience of passengers than at any time before. He substantiated this statement by stating that the railways had paid special attention to provide fans in third class coaches. He declared that, within a period of three years, all the third class coaches could be expected to be fitted with fans. Indeed, it could be achieved earlier but for the inadequate number of coaches. Anyway, a sufficient number of coaches are being withdrawn for being fitted with fans. As regards the new third class coaches, which are being manufactured here or are being imported, the Minister stated that they would have fans fitted in them even before they were put on the rails. He highlighted the policy of the Government towards reducing classes on railways by the abolition of first class in all trains. Already, first class had been abolished in a number of routes.

The Council devoted some time to the type of carriages to be introduced in future. It recommended that second class coaches should be of the compartment type, whereas the air-conditioned coaches could be of the corridor type. As regards the third and inter-class coaches, the Council favoured the continuation of the type of carriages recently introduced. It also urged the need for the improvement of catering facilities at stations and in trains and for the removal of the beggar nuisance. It generally approved the present policy of granting rail concessions but made certain suggestions, for the consideration of the Government, in regard to revision of the list of bodies entitled to the concessions. A list of 32 bodies at present entitled to rail concessions and lists of other bodies to which concessions had been refused were circulated to the members.

Shortage of Coaches

One of the most important problems facing the Railway Ministry now is the shortage of coaches, wagons and locomotives. It is true that the present position is better than before, but still, a good deal remains to be done. Mr. Shastri expressed the hope that the position would go on improving, as the railways proceeded ahead with the implementation of their plans designed to increase the line capacity at various points and the number of wagons and locomotives. In this connection the Minister gave some statistics which are worth recording here.

Out of orders for 769 locomotives placed during the years 1951-52 to 1953-54 (407 from sources in India and 362 from abroad), as many as 379 have been received (100 from home production and 279 from abroad). Action is being taken to place orders for another 750 locomotives. As regards carriages, orders have been placed for 3,800 and it is proposed to place orders for an additional 2,000. Almost all the stock is being arranged through production at home. Only electric multiple stock and a small proportion of the other coaching stock are being obtained from external sources of supply. In the three years 1951-52 to 1953-54, as many as 42,293 wagons have been ordered, 29,288 from Indian sources and the rest from abroad. Orders for another 19,000 wagons are being arranged and the possibility of procuring this lot from Indian production is being explored. If indigenous capacity is unable to meet the demand in full in time, it is clear, some wagons may have to be imported from abroad. At present, home sources of supply are being utilised to the maximum extent possible, with a view to eliminating imports altogether as soon as practicable.

The Council discussed the current operating position of the railways. It expressed satisfaction in regard to the results achieved but, at the same time, urged that necessary measures should be taken by the Ministry to ensure sufficient transport capacity.

Whatever the improvement in rail transport, it will not be complete, unless it is co-ordinated with road and water transport. It is gratifying to note that the Planning Commission is giving thought to the expedient of diverting some traffic in goods from the railways to the road, especially near the bigger cities. It is hoped, meanwhile, that nationalised road transport authorities in the various States would plan and take up this work, of course, with due regard to the facilities already available. On the shipping side, too, the Transport Ministry is making efforts to add to the existing tonnage.

The Council discussed the loss caused to the railway by ticketless travel and recommended that suitable measures should be adopted by the Railway Ministry for improving the efficiency, calibre and integrity of the ticket-checking officials. It further stated that measures for securing public co-operation in the eradication of this evil should be taken. The Council was of the view that it must be effectively impressed on the public that it is the duty of each individual to stop the national loss resulting from ticketless travel. The Council suggested further that its members and the members of the zonal committees should be enabled to call upon the ticket-checking staff to make checks in their presence.

BENEFICIATION OF LOW-GRADE MANGANESE ORE

Research in the beneficiation of low-grade manganese ore has been successfully carried out by the Indian Bureau of Mines and the National Metallurgical Laboratory, Jamshedpur, and some industrial enterprises have benefited from the Bureau's suggestions in the matter of extraction of manganese from rejected material.

Manganese ore has been worked in India since 1892, almost the entire production being exported. The price of high-grade ore before World War II was from Rs. 15 to Rs. 20 per ton at ports, as against from Rs. 100 to Rs. 200 per ton at present. The prices also vary according to grade, rising sharply for every unit of manganese above, say, 45 per cent. There has, thus, been a tendency to pick and choose the ore that fetched lucrative prices, the inferior grades being relegated to dumps. Huge dumps of ore have thus grown up in most of the Indian manganese mines. After 1948, when the U.S.S.R., the largest producer and exporter of manganese ore in the world, stopped its exports and an expansion of steel production took place in the U.S. and Britain, a heavy demand arose for the ore and manganese ore from 32 per cent. and above are being offered attractive prices.

About 3.75 million tons of marketable ore are available in dumps in Madhya Pradesh and the reserves of ore in dumps in the Srikakulam district of Andhra have been estimated at about 1.2 million tons. Total dumps in Bihar and Orissa, where manganese mining has been started comparatively recently, amount to about 2 lakh tons.

Industrial units producing over 50 tons every day can afford to set up full heavy media beneficiation units, which cost a few lakhs of rupees. For mines which produce from 10 to 50 tons per day, a medium size plant has been designed, as a result of the investigations conducted by the Indian Bureau of Mines in collaboration with the National Metallurgical Laboratory. This unit costs between Rs. 70,000 and Rs. 1 lakh. As the erection of costly machinery is difficult for industrial units producing from 5 to 10 tons per day, research in cheaper methods was undertaken by the Indian Bureau of Mines. Low-grade ore from the Keonjhar area, with 35 per cent. manganese content, has been upgraded by a comparatively cheap method to 47 per cent. manganese content and it is expected that this cheap process will be finalised shortly. Similar satisfactory results have been obtained with ores from other areas also. Ores from Mansar in Madhya Pradesh have been upgraded from 32 per cent. manganese to 48 per cent. by the process of magnetic separation and tabling, the recovery being 65 per cent. Another sample from the Kachidana dumps in Madhya Pradesh has been upgraded from 41 per cent. to 49 per cent. by jigging and tabling, the recovery being 82 per cent. Ore from a Bombay dump has been upgraded from 36 per cent. to 46 per cent. by hydraulic classification and tabling, the recovery being 75 per cent.

INDIAN PUMP INDUSTRY

In the course of his presidential address to the first annual general meeting of the Indian Pump Manufacturers' Association held at Bombay on 30th October, Mr. M. W. Gurjar pleaded for an extension of the range of restrictions on imports of pumps. At present, there are only restrictions on the import of pumps upto 6", but Mr. Gurjar wanted the restrictions to be extended upto 14". In fact, he wanted that imports of pumps upto 6" should be completely banned. He further pleaded for raising the import duty from the extising 10½ per cent. to 30 per cent. *ad valorem*.

It is stated that there are huge stocks of pumps with the various manufacturers and that the installed capacity of the industry is adequate to meet the entire demand for centrifugal pumps from 1" to 14". The Planning Commission has fixed a target of 85,000 centrifugal pumps a year. There is a section which feels that this estimate errs on the high side. In support of this view, it is pointed out that the Indian pump manufacturers are finding it difficult to sell their goods. At present, there are 20 organised factories, with a rated capacity, assessed on an 8-hour single-shift basis, of 428,000 pumps per annum. The actual production of these and some other smaller factories is estimated at about 50,000 pumps.

Mr. Gurjar touched the subject of exports also. He made out a case for unlimited exports without any further delay, in view of the difficulty in selling pumps at home. In addition, he made the following suggestions:

(1) India should adopt a long-term export policy and do everything possible to maintain its contacts in the foreign markets, even though this would involve some sacrifice and some difficulties to our nationals within the country;

(2) the Government should adopt a policy of appointing representatives of industries and trade as trade commissioners in foreign countries, as such representatives would be the proper persons to handle matters connected with trade;

(3) the Government should encourage private initiative in developing export markets wherever and whenever such is forthcoming; and

(4) the Government should take an active part in organising trade delegations to foreign countries and establishing a permanent trade officer in South-East and Middle East Asian countries as well as in the States of South America.

Few will deny that the Government's export policy should be so flexible as to see that exports and indigenous consumption keeps the productive capacity of an industry as fully employed as possible. Surely, if, owing to the difficulty of marketing the pumps at home, some of the units find it necessary to curtail production and reduce the labour force, the best thing to do will be to liberalise exports, if not permit unlimited exports, to the extent needed. Moreover, the importance of developing export markets especially in South-East and Middle East Asian countries needs no emphasis, at least from the long-term point of view. Already, Japan is taking steps to organise trade offices in these countries in order to establish itself firmly there.

MYSORE IRON AND STEEL WORKS

It will be recalled that, in our issue dated 3rd October, 1953, we pointed out that the Mysore Iron and Steel Works has submitted a scheme for the installation of a cast iron pipe plant, at an estimated cost of Rs. 45 lakhs. Commenting on this proposal, Mr. Ratanchand Hirachand, M.A., J.P., questions the advisibility of pursuing this scheme. He is of the opinion that the project may not be a success, because spun concrete pipes, which can be successfully used for water mains, are cheaper in cost. He states that Hume pipes are used for water distribution in several towns in Hyderabad State. Describing the advantages of spun concrete pipes over cast iron pipes, he points out that "bore" can be used in the pipe even after the pipe is laid by using "saddle" on the pipe. Ready-made ferrules are also provided for in the pipes at the time of manufacture and such pipes are used in large numbers at various district places for the distribution of water. Pre-stressed concrete pipes, which will be in the market within three to four months, compare very favourably with cast iron pipes. It is true, he admits, that spun cast iron pipes are lighter in weight but, he says, the capital expenditure involved in manufacturing these pipes is larger. He, therefore, feels that the cast iron plant will not be an economic proposition.

Continuing, he contends that, if a plate rolling mill were to be installed instead of a plant casting pig iron, it would serve a double purpose. First, the steel plates can be sold at an economic price and, secondly, the plates can be utilised for making pipes of high pressure required by hydro-electric works. He is of the considered opinion that pig iron saved from making cast iron pipes can also be exported to earn the much needed foreign exchange.

INSURANCE AS SOURCE OF EMPLOYMENT

SMALL PROPORTION OF WORKERS IN RURAL REGIONS

INSURANCE, whether life assurance or general insurance, enjoys a unique position as a source of employment. Apart from the direct employment which insurance companies give to people who work in their offices or as their agents, it promotes employment in an indirect manner by canalysing the savings of the whole community into productive channels. Among the manifold services which insurers give the country, mention must, therefore be made of the direct employment which they create and the indirect employment which they help create and the facilities which they offer to insured persons or property through covering the risks of death or damage.

The report, entitled *Census of India* (Paper No. 5), gives some interesting information about the number of people who earn their living by working in the insurance field. The following table gives the number of people employed in insurance in India, as a whole, and in the six divisions into which India has been divided for census purposes:

Employment in Insurance

		Total	*Employers*	*Employees*	*Independent worker*
India					
Rural	.. .. ..	7,802	463	2,469	4,470
Urban	.. .. ..	29,926	1,137	22,936	6,393
	Total ..	37,728	1,600	25,205	10,863
North India					
Rural	.. .. ..	469	11	107	351
Urban	.. .. ..	1,999	159	895	945
	Total ..	2,468	170	1,002	1,296
East India					
Rural	.. .. ..	1,624	21	1,176	627
Urban	.. .. ..	8,625	87	6,705	1,833
	Total ..	10,249	108	7,881	2,260
South India					
Rural	.. .. ..	4,353	316	1,360	2,677
Urban	.. .. ..	5,725	325	4,131	1,269
	Total ..	10,078	641	5,491	3,946
West India					
Rural	.. .. ..	276	24	179	73
Urban	.. .. ..	10,358	486	8,263	1,604
	Total ..	10,634	510	8,447	1,677
Central India					
Rural	.. .. ..	212	91	38	83
Urban	.. .. ..	2,084	50	1,570	464
	Total ..	2,296	141	1,608	547
North-West India					
Rural	.. .. ..	668	..	9	659
Urban	.. .. ..	1,335	30	827	478
	Total ..	2,003	30	836	1,137

It will be seen from the table above that there are 37,728 persons who support themselves by working in the insurance field. These persons are described in the Census report as "self-supporting persons." A self-supporting person is defined as a person who is in receipt of an income which is "sufficient at least for his own maintenance." Two features of the table deserve notice. In the first place, the most numerous class among insurance men are the "employees." The number of employees is as large as 25,625 as against 10,863 who constitute independent workers. It is not, of course, clear what criterion has been used in distinguishing employees from independent workers. Presumably, the employees represent the actual workers in insurance offices, whereas the independent workers are the people who make a living by working as agents.

Secondly, the table shows that insurance men are nearly four times more numerous in the urban centres than in the rural areas. This fact has been known before, though it has never been statistically computed. The Census report shows that, in the rural areas, there are only 7,802 persons, who support themselves by work connected with insurance, as against 29,926 persons in the urban centres. There is certainly greater need for spreading the gospel of insurance in the rural areas of the country. But it must be admitted that few rural regions are attractive for the agents, since the low living standards in these areas are a deterrent to sustained insurance representation. Even so, it should be possible to spread the insurance habit among the rural population through well-conducted publicity designed to make them appreciate the benefits of insurance.

It is, however, interesting to note that South India has a relatively larger proportion of rural insurance workers than any other part of India. Of the total number of 10,078 persons in the South Indian insurance field, as many as 4,353 work in the rural areas. In West India, on the other hand, the number of rural insurance workers is only 296, although West India, as a whole, has a larger number of insurance workers than any other part of India, the number being 10,634.

The number of insurance workers given in the Census report does not represent the whole class of workers in this field. This is because the census takes into account only those who support themselves entirely by insurance work. There are, as is well known, a large number of workers who are part-timers. Although this class of persons has done much to expand the insurance business, the fact that their interest in insurance is only secondary to some other main occupation, detracts greatly from the service which they could otherwise give. Also many part-time workers give up insurance work as soon as they complete the insurance business of the small circle of their acquaintances, relations and friends. This is reflected in the trend of insurance licences issued by the Government of India in recent years:

Insurance Agents' Licences

	No. of licences issued		
	Fresh	*Renewal*	*Total*
1947	85,245	88,924	1,74,169
1948	82,220	87,696	1,70,016
1949	85,389	95,348	1,80,737
1950*	65,937	66,526	1,32,463
1950†	15,677	34,796	50,473
1951	64,200	62,491	1,26,691

* Relates to the period 1-1-1950 to 31-8-1950.
† Relates to 1-9-1950 to 31-12-1950.

Note:—Licences issued till 31st August, 1950, were for a period of one year. From 1st September, 1950, licences are issued for a period of three years.

In a country like India, where the *per capita* insurance is very low as compared with other advanced countries, there is no doubt that insurance can provide employment for a much larger number of persons than it does to-day. Any extension of the sphere of employment in insurance will, however, depend on the rise in living standards and the spread of the insurance habit. These are essentially long-term factors. In the immediate future, much could be done to enlarge the scope for employment in the sphere of insurance through training young men in the art of insurance salesmanship. This is a task which the insurers will do well to perform both in their own and in the national interest.

ACCIDENT INSURANCE IN U.K.

General insurers in the U.K., it is stated, have been devoting greater attention towards making the accident policies more popular by trying to meet the peculiar requirements of the people who take out accident insurance policies. Referring to some of the special efforts that are being made by British insurers, in order to make the policies more attractive to the community, the Insurance Correspondent of the *Financial Times*, London, says:

"Since the war a determined effort has been made to present personal accident insurance in a more attractive form. Most companies and underwriters to-day offer a wide range of policies, presented in well-designed prospectuses, each of which is calculated to attract the attention of a particular section of the community. Further, quotations are freely given for variations of the printed scale of benefits, and, in fact, some companies invite the proposer to select that combination of benefits most useful to him and, to assist his choice, show the rate of premium applicable to each section of the cover in the prospectus. Thus the individual receives a policy moulded to meet his particular needs and pays only the premium required to insure these needs.

"The peculiar requirements of certain professions have also engaged the attention of insurers. Until recently the contingencies insured under personal accident policies followed certain fixed lines; generally the only capital sum payments provided under the policy were in respect of death or the loss of one or more of the major members, and the amount insured was arbitrarily fixed as a percentage of the death benefit without taking into account the degree of disability involved. Little attempt was made to provide payment of a substantial fixed sum in respect of other forms of injury which, in certain circumstances, may be as permanently crippling to the individual as the loss of a leg or the loss of the sight of an eye.

"Many professional men rely entirely upon their hands for their livelihood. Permanent injury to a hand or even the loss of a finger can destroy the earning power of surgeons, concert musicians, dentists, artists and others. Similar considerations arise in the case of stage and screen artists, whose earning power largely depends upon their physical attractions. An accident causing permanent scarring of the face would probably destroy the career of celebrities such as these. The consequences of deafness in musicians and singers or apparently trivial leg injuries to ballet dancers can also be disastrous to the individual. The need for insurance against these risks is now recognised and to-day professional men and women can protect themselves at moderate cost against those injuries which, possibly minor in themselves, would nevertheless destroy or seriously diminish their future earning powers.

"While it is true that the volume of this class of business on insurers' books is not great at the moment, the demand for protection is steadily growing. From the insurers' point of view it is probably as well that this growth is gradual, as the underwriting of these risks requires great care. Particular attention must be paid to the proposed sum insured which must not be excessive in relation to the proposer's probable earning power."

GENERAL ASSURANCE SOCIETY LTD.

In the review of the General Assurance Society's report and accounts, published in our issue dated 17th October, 1953, it has been stated that the Society's new life business during 1952 "aggregated Rs. 2.03 crores, as against Rs. 2.45 crores in 1951." This should read: "The Society's new life business during the year under review aggregated Rs. 2.03 crores, as against Rs. 1.89 crores in 1951." It is gratifying to note that the Society's new life business in 1952 had increased, despite the general recession in economic conditions witnessed during that year.

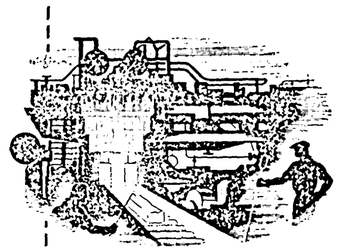
NICKEL ALLOYS


For more than a century Henry Wiggin have been pioneers in the production of high-nickel alloys, seeking always to be ahead of the engineer's demands for better properties. Continuous research for improved materials coupled with constant care and precision in manufacture ensure the high standing and international reputation of Wiggin high-nickel alloys. During the past year or so, world-wide demands have far exceeded the supply. But although some of our products are still not freely available we are doing our best to meet your requirements.

MONEL . . . corrosion-resisting alloy
NICKEL . . . in all forms
INCONEL . . . heat- and corrosion-resisting alloy
BRIGHTRAY . . . series of electrical resistance alloys
NILO . . . series of controlled expansion alloys
MANGONIC . . . stronger and more resistant than nickel in moderate sulphur-containing atmospheres
THERMOMETAL . . . for thermostatic devices
NICKEL ANODES . . . for nickel electrodeposition
OTHER NICKEL ALLOYS to meet special requirements

INDIA'S BALANCE OF PAYMENTS POSITION

CONTRACTION OF SURPLUS IN FIRST HALF OF 1953

THE preliminary accounts prepared by the Balance of Payments Division of the Reserve Bank of India disclose a fractional surplus of Rs. 50 lakhs in the current account of India's visible and invisible foreign trade during the first half of 1953. This surplus compares unfavourably with that of Rs. 63.5 crores for the preceding half-year, namely, July-December, 1952. A point to be noted here is that this surplus of Rs. 63.5 crores in current account noted in the second half of 1952 contracted considerably during the first quarter of the current year, namely, January-March, 1953, for which period the account showed a surplus of only Rs. 14.1 crores. Even this small surplus disappeared subsequently, and by the end of the second quarter the country ran into a deficit of Rs. 13.6 crores, revealing thereby a small net surplus of Rs. 50 lakhs at the end of June, 1953.

The trends in the current account mentioned above are clearly brought out in the table below, giving a summary of India's balance of payments position in the first half of this year as compared with the two half-years of the preceding year.

(Rs. in crores)

	1952		1953		
	1st half	2nd half	1st half	April-June	Jan.-March
Imports (c.i.f.)—					
(a) Private ..	256.7	209.4	211.8	114.0	97.8
(b) Government ..	150.7	85.8	79.5	42.5	31.7
Total (a) and (b) ..	447.4	295.2	291.3	156.5	134.8
Exports (f.o.b.) ..	335.3	313.8	251.4	122.1	129.3
Trade balance ..	—112.1	+18.6	—39.9	—34.4	—5.5
Official donations (net) ..	+7.7	+4.3	+.8	+5.7	+2.4
Other invisibles (net) ..	+42.6	+40.6	+32.4	+15.1	+12.2
Current account (net) ..	—61.8	+63.5	+0.5	—13.6	+14.1
Errors and omissions ..	6.3	11.0	17.3	—34.8	—7.3
Capital account (net) ..	—69.1	+23.7	+17.8	—2.6	+20.4

The table above reveals certain notable features. First, both exports and imports have registered a decline in their value, the former from Rs. 313.8 crores in the second half of 1952 to Rs. 251.4 crores in the first half of 1953 and the latter from Rs. 295.2 crores to Rs. 291.3 crores. Thus, the fall of Rs. 62.4 crores in the value of exports was far larger than that (Rs. 3.8 crores) in exports. With the result, the surplus of Rs. 18.6 crores on the trade account for the second half of 1952 was converted into a deficit of Rs. 39.9 crores. Of this deficit, as much as Rs. 34.4 crores took place in the second quarter of the current year. In this quarter, the fall in exports was accompanied by a rise in imports of Rs. 21.7 crores, chiefly due to an increase in private imports.

As compared with the first half of 1952, the trade position in the first half of the current year makes satisfactory reading. Although the absolute totals of imports and exports were smaller in January-June, 1953, than in the corresponding period of 1952, the adverse trade balance was appreciably smaller, at Rs. 39.9 crores, as against Rs. 112.1 crores. Similarly, the net current account showed a surplus of Rs. 50 lakhs, as compared with a deficit of Rs. 61.8 crores. This was so in regard to the capital accou t, too. Thus, as against a huge deficit of Rs. 6. crores during the first six months of 1952, the corresponding period of 1953 saw a handsome surplus of Rs. 17.8 crores.

Imports

Among the factors which accounted for the increase in imports in the second quarter of 1953, most important was the liberalisation of restrictions on imports with two objects in mind, (1) to allow of imports of a few articles with a view to providing a certain element of competition in the country to domestic manufactures so that they may have an urge to increase in quality of their products, and (2) to increase the customs revenue by way of import duties in order to offset, as far as possible, the fall in export duties. Fortunately for the authorities, the surplus which had been accumulated in the previous year came in quite handy for making an attempt to fulfil these objectives. To what extent this attempt succeeded is a different matter. The fact, however, remains that the nominal surplus in the payments position for the first half of the year was deliberately brought about to a large extent. The deterioration was, of course, also due to an increase in the unfavourable relation between import and export prices. Thus, the import policy for January-June, 1953, maintained over 70 per cent. of imports at July-December, 1952 levels but was liberal to the extent that for the remaining items the cuts imposed in the preceding licensing period were restored either partially or fully. In addition, small quota licences were issued for items for which no quotas had been given for over a year. On the other hand, quotas for some items, the indigenous manufacture of which had improved, were reduced. An additional factor which facilitated imports, particularly of raw cotton, was the resumption of purchases from Egypt from May, 1953.

Government imports at Rs. 79.5 crores were Rs. 6.3 crores lower than in the previous half-year. Nearly Rs. 8 crores of these were financed by aid received under the Colombo Plan and Indo-U.S. Technical Co-operation Agreement (I.T.C.A.) as compared with Rs. 3.9 crores in the previous half-year. If receipts under these aids are excluded, it will be seen that the fall in Government imports was about Rs. 10.4 crores; this was mainly because of the decline in imports of food.

Exports

As stated already, the value of exports fell sharply by Rs. 62.4 crores during the half-year under review, both prices as well as quantities declining considerably. Although a part of the decline in export earnings was seasonal, the major part probably reflected the fall in the demand for our goods from foreign countries. The commodities particularly affected were tea, jute manufactures and cotton textiles. The fall in tea exports, especially in the second quarter, appears to be seasonal. The effect of the reduction in the export quota of tea in April from 135 per cent. of the standard quota of 348.25 million lbs. in 1952-53 to 115 per cent. for 1953-54 will be chiefly felt, if at all, later in the year.

A part of the fall in prices of exports took place through the lowering of export duties. The duty on coarse and medium varieties of cotton textiles was lowered from 25 per cent. to 10 per cent. *ad valorem* on 4th January, 1953. (Last week even this 10 per cent. was abolished in respect of medium varieties.) The export duty on sacking was reduced from Rs. 175 per ton to Rs. 80 on 27th February, 1953. Similarly, the duties on linseed and linseed oil were reduced from Rs. 100 and Rs. 200 per ton to Rs. 25 and Rs. 50 per ton, respectively, on 12th May. With a view to promoting exports the Government extended the period of validity or export licences for some commodities and the free licensing period of most items.

The net terms of trade (that is, the relation between import and export prices) deteriorated during the half-year under review. The average index figure for the period was 88, as compared with 91 in the second half of 1952 and 98 in the first half of 1952. Between the first two quarters of 1953, there was, however, an improvement from 84 to 91 owing mainly to the fall in import prices.

Now to turn to the current and capital accounts in regard to the financing of India's international transactions. The table below summarises the position:

(Rs. in crores)

	1st half of 1952	2nd half of 1952	1st half of 1953
A. *Goods and services*—			
Exports (f.o.b.) ..	335.3	313.8	251.4
Imports (c.i.f.) ..	447.4	295.2	291.3
Trade balance ..	—112.1	+18.6	—39.9
Non-monetary gold ..	1.0	..	..
Investment income ..	—6.8	—6.3	—5.2
Government not included elsewhere ..	+4.1	+5.7	+2.3
Other services ..	+37.2	+31.6	+23.0
Total ..	—77.6	+50.6	—14.8
B. *Private donations and capital movements* ..	+3.1	+9.4	+10.6
C. *Special official financing* ..	+7.9	+5.0	+6.9
D. *Extraordinary transactions*	..	..	..
E. *Errors and omissions* ..	—7.3	—34.8	+17.3
F. *Surplus or deficit A to E* ..	—73.8	+30.2	+19.9
G. *Compensatory financing*—			
(1) Barter deals ..	—0.2	—3.0	..
(2) U.S. food loan ..	+33.5	+14.1	..
(3) Transfers of Indian currency ..	—22.1	—6.7	—10.7
(4) Foreign official holdings ..	..	..	..
(5) Short-term liabilities ..	—20.6	—16.8	+8.8
(6) Foreign exchange assets ..	+78.2	—17.8	—18.0
Total ..	+73.8	—30.2	—19.9

It will be seen from the table above that the net deficit on goods and services amounted to Rs. 14.8 crores in the half-year under review. This deficit compares unfavourably with a surplus of Rs. 50.6 crores in the previous half-year. But net receipts under "private donations and capital movements" (*vide* B) and "special official financing" together amounted to (Rs. 10.6 + Rs. 6.9) Rs. 17.5 crores, representing an increase of Rs. 3.1 crores over those in the previous half-year. The main items under "special official financing" were aid received under the Colombo Plan and I.T.C.A. amounting to Rs. 8 crores as already stated. Drawings from I.B.R.D. loans were only of the order of Rs. 0.6 crore, as against Rs. 2.3 crores. Repayments also were of the same order as in the previous half. After allowing for errors and omissions for these various groups, the net position showed a surplus of Rs. 19.9 crores (*vide* F). Of this, a sum of Rs. 10.7 crores was utilised for liquidating liabilities with Persian Gulf territories in connection with the repatriation of Indian currency. The foreign exchange assets also rose by Rs. 18 crores, but were offset to the extent of Rs. 8.8 crores by a rise in short-term liabilities.

A region-wise analysis of the pattern of payments shows a reduction in the surplus with the sterling area (excluding Pakistan). The table below summarises India's balance of payments position on current account, with the various currency areas during the period under review:

(Rs. in crores)

	1952		1953		
	1st half	2nd half	1st half	April-June	Jan.-March
Sterling area—					
Excluding Pakistan ..	+42.0	+42.5	—3.7	—15.5	+11.8
Pakistan	+30.0	+9.3	—0.2	..	—0.2
Dollar area	—119.6	+8.4	+10.2	+8.0	+2.2
O.E.E.C. countries ..	—12.7	—8.3	—24.3	—14.9	—9.4
Rest non-sterling area ..	—1.8	+11.6	+18.8	+9.1	+9.7
Total ..	—61.8	+63.5	+0.5	—13.6	+14.1

It will be noted from the above table that the payments position of India worsened with the sterling area, Pakistan and the O.E.E.C. countries. There was, however, an improvement in the position relating to dollar area and the rest of the sterling area.

The payments position with the sterling area, excluding Pakistan, changed from a surplus of Rs. 42.5 crores in the second half of 1952 to a deficit of Rs. 3.7 crores in the half-year under review. This is attributed to larger payments for imports, together with a fall in the net invisible receipts. Thus, over the half-year, the payments for imports rose by Rs. 24.5 crores mainly on account of commercial imports. Export earnings fell by Rs. 17.8 crores.

Transactions with Pakistan reveal that a surplus of Rs. 9.3 crores in the second half of 1952 changed into a small deficit of Rs. 0.2 crore in the period under review. Both imports and exports showed drops. This was due to low offtake of raw jute by India and the imposition of severe import restrictions by the Pakistan Government.

India's payments position with the dollar area moved up from Rs. 8.4 crores to Rs. 10.2 crores. Both imports and exports fell, but the declines offset each other. Commercial imports declined by Rs. 14.1 crores and Government imports by Rs. 0.9 crore. If imports financed by the aid received from the U.S. and Canada are excluded, the fall in Government account will be Rs. 6.5 crores. Of the surplus of Rs. 10.2 crores, merchandise transactions account for Rs. 2.5 crores, but the reduced payments for imports, especially of foodgrains, are the main factor.

The worsening of the position with O.E.E.C. countries as compared with July to December, 1952, was due to the fall in exports, such as jute manufactures and vegetable oils. Imports rose by Rs. 3.4 crores, the entire rise being noticed in commercial imports.

The current account position with the rest of the non-sterling area improved by Rs. 7.2 crores to Rs. 18.8 crores. The major contribution towards this improvement came from the cessation of foodgrain imports from Thailand and China. Export receipts also fell during the period, but the net invisible receipts improved by Rs. 1.9 crores. Imports rose by Rs. 2.8 crores due to increased purchase of Egyptian cotton.

WORLD INDUSTRIAL PRODUCTION UP BY 8 PER CENT.

Data prepared by the Statistical Department of the United Nations disclose a record rise of 8 per cent. in the world's industrial production in the first six months of 1953, as compared with that in the corresponding period of 1952. The volume of world production, excluding that of the Soviet Union, has, according to the latest issue of the *U.N. Monthly Bulletin of Statistics*, risen in the second quarter of 1953, 3 per cent. above the record

garba dancers of gujrat
During the nine nights of the Navaratra, a festival devoted to the worship of Durga, girls in Gujrat villages perform the Garba dance. Each bears on her head the 'garbi'—a lighted earthenware pot, which gives the dance its name. The dance is performed to the accompaniment of a song, each line being sung first by the leader and then by the rest in chorus. The beats are stressed by the clapping of the hands, the dancers bending gracefully sideways at every clap and the hands sweeping upwards or downwards in beautifully formed gestures.
Ahmedabad, a city worth a visit in its own right, is an excellent starting-place for a tour of Gujrat. The city, 306 miles by road from Bombay, offers all facilities a visiting motorist may require. Roads radiate from here to Baroda, Lunwada and other important towns of the region. Ready access to the numerous places of interest in Gujrat is assured by the safety and comfort of road travel made possible by J. B. Dunlop's invention of the pneumatic tyre.

KILLICK INDUSTRIES' PROGRESS WELL MAINTAINED

DIVIDEND REPEATED ON HIGHER CAPITAL

SATISFACTORY progress is disclosed by the financial results of the Killick Industries Ltd. (Managing Directors: Messrs. E. D. Sheppard and K. G. Milne, Bombay) for the year ended 30th June, 1953. The gross profit of the Company for the year amounts to Rs. 31.67 lakhs, which, as compared with that of Rs. 28.66 lakhs, reveals an increase of 10.5 per cent. This improvement is primarily due to the encouraging results achieved on the manganese ore mine at Kachidana, Madhya Pradesh acquired by the Company during the year. A sizable part of the increase in gross profit has, however, had to be utilised to provide for larger depreciation, including that on the new mine. Nevertheless, the Directors have been able to provide a decent sum to the various reserves and maintain the dividend to the shareholders at 10 per cent. per annum on a higher capital.

The following comparative table gives the salient features of the Company's results for the last four years, which will enable the reader to get, at a glance, an idea of the Company's progress in recent years:

(In lakhs of rupees)

	For the year ended 30th June			
	1953	1952	1951	1950
Gross income	50.42	39.44	27.58	25.12
Stocks	4.85*	..	..	..
Expenses	23.59	10.78	8.23	7.15
Gross profit	31.67	28.66	19.35	17.96
Depreciation	2.38	0.90	0.98	0.84
Taxation	13.00	11.60	9.00	7.00
Net profit	16.29	16.16	9.37	10.32

	(10%)	(10%)	(8.5%)	(8%)
Carry forward	0.21	0.03	0.01	0.03

* Closing stock-in-trade of Kachidana mine.

A break up of the gross income shows that the Company's earnings during the year under review by way of commission and office allowances from managed companies have declined from Rs. 21.36 lakhs to Rs. 16.24 lakhs. The fall in income from this source has, however, been more than made good by the receipt of Rs. 13.86 lakhs from the newly acquired manganese mine, by the increase of Rs. 1.88 lakhs (from Rs. 16.67 lakhs to Rs. 18.55 lakhs) in dividends and interest earned and by a rise in other income from Rs. 1.41 lakhs to Rs. 1.77 lakhs. Of the increase of Rs. 12.81 lakhs in expenses, the outgo on the Kachidana mine accounts for Rs. 13.18 lakhs, while other expenses show a reduction from Rs. 10.78 lakhs to Rs. 10.41 lakhs. The Directors have set aside Rs. 1.33 lakhs as provision for depreciation on the Kachidana mine, besides raising that on the Company's assets in Bombay from Rs. 90,411 to Rs. 1.05 lakhs. The increased earnings have naturally meant a larger provision for taxation too.

After making larger provisions for depreciation and taxation, the net profit shows a small increase which does not permit of a larger allocation to reserves. On the other hand, the Directors have had to prune down the addition to the reserves from Rs. 7.37 lakhs to Rs. 6.61 lakhs. In May, 1953, the Directors had paid an interim dividend of 4 per cent. and they now propose to distribute a final one of 6 per cent. making a total of 10 per cent. per annum for the year under review. Both these distributions are on a capital higher than that in the previous year.

The latest balance-sheet of the Company shows an increase in the paid-up capital from Rs. 84.99 lakhs to Rs. 89.98 lakhs, consequent on the first call made on the new shares issued in November, 1951. Since the close of the year, the Company has made a second call on these shares, making them Rs. 75 paid-up. The amount paid in advance on calls stands at Rs. 5.23 lakhs. Reserves and surplus aggregate Rs. 23.95 lakhs, which, however, include Rs. 3.99 lakhs representing premium on shares. The gross block amounts to Rs. 17.65 lakhs, including Rs. 4.70 lakhs being the cost of the Kachidana mine, on which a provision of Rs. 4.98 lakhs has been made for depreciation. Investments in managed companies and others aggregate Rs. 1.35 crores (at cost), as against which a depreciation reserve of Rs. 4.25 lakhs has been built up. Current assets amount to Rs. 12.13 lakhs. Current liabilities aggregate Rs. 41.04 lakhs.

The Company acquired during the year a manganese ore mine at Kachidana in Madhya Pradesh. It is also negotiating the acquisition of an interest in a coal mining lease at Korba in Madhya Pradesh. These acquisitions will enable the Company to broaden its field of activities to a wide variety of industries, namely, a large textile mill, three electricity companies, one railway company, two manganese mines and two coal mines, besides having a joint membership in the Cement Agencies Ltd.

The Company's Rs. 100 paid-up shares are being currently quoted at Rs. 157, at which rate the dividend for the year under review gives a yield of 6.4 per cent. per annum, free of tax.

AHMEDABAD ADVANCE MILLS LTD.

The year ended 30th June, 1953 was an important landmark in the history of the Ahmedabad Advance Mills Ltd. (Managing Agents: Messrs. Tata Industries Ltd., Bombay) inasmuch as it saw the completion of fifty years of the Company's existence. Started in 1903 on a very modest basis with a capital of about Rs. 7 lakhs and a few hundred workmen, the Company has now grown into a big institution, with a paid-up capital of Rs. 43 lakhs employing over 1,700 workmen. The Company owes its present stature of strength and prosperity to the great foresight and matchless enterprise of the late Mr. Jamsetji N. Tata, the founder.

These fifty years of the Company's history did not constitute a period of unchequered prosperity. It had to pass through many vicissitudes, but, happily, it survived all the stresses and strains. To commemorate the occasion of the Company's Golden Jubilee, the workers and staff have thought it fit to present the Company a marble bust of the founder, the late Mr. J. N. Tata. The Company, on its part, has decided to give all the employees a bonus equivalent to half a month's basic earnings during the year, and the shareholders a Jubilee bonus of Rs. 3 per share, in addition to the dividend of Rs. 7 per share for the year.

However, by a coincidence, the Company's Golden Jubilee year happened to be one of those periods of great stress and strain which it had experienced in its history. It witnessed, during that year, a recession in its earnings, as was pointed out in our review (in our issue of 24th October, 1953), of the Company's financial results for the year ended 30th June, 1953, as compared with those for the previous year. Addressing the shareholders of the Company at their annual general meeting held on Friday, the 30th ultimo, Mr. A. D. Shroff, Chairman of the Company, drew their attention to the causes that led to the decline in earnings and the very heavy burdens which the industry, in general, and the Company, in particular, had had to bear during the year. The main explanation for the lower profit, according to Mr. Shroff, was the fact that the Company realised, on an average, As. 8 per lb. of cloth lower than in the previous year, although its production was about 500,000 lbs. of cloth more. This was not the peculiar experience of the Ahmedabad Advance Mills alone; for the cotton textile industry as a whole has, for more than a year now, entered the new phase of a buyers' market.

While, on the one hand, the industry is faced with the problem of disposing of the increased production even at reduced prices, it has to meet a rising cost of production, on the other. Giving some examples of such burdens, Mr. Shroff said that the average monthly dearness allowance of a worker during the year under review was Rs. 74-2-7, as against Rs. 70-7-7 in the previous year, which meant an increase of Rs. 2.61 lakhs for the same number of workers. "The higher burden of dearness allowance," he added, "constitutes a special handicap to Ahmedabad mills against similar mills in Bombay. In the case of our mills, if we had been located in Bombay, the cost of dearness allowance would have been reduced by Rs. 4.50 lakhs." The Employees' Provident Fund Act and the Employees' State Insurance Act imposed additional burdens, the former having cost the Company Rs. 1.40 lakhs for the eight months it had been in operation during the year (this means Rs. 2.10 lakhs per annum) and the latter Rs. 40,000 during the year, calculated on a nominal charge of ¾ per cent. of the total wage bill. The full benefit of the Employees' State Insurance Scheme do not now apply to Ahmedabad and when this is extended, and the full contribution prescribed under the Act is levied, the Company will have to pay about Rs. 2 lakhs per annum on this account.

These burdens, which go to reduce the profit margin of the Company, have not deterred the Directors from going ahead with their programme of rehabilitation and renovation of the mills. For it is only through modernisation of the mills that its efficiency can be improved. During the year under review, the Company received machinery worth Rs. 27 lakhs and some more thereafter. The construction of the new dyeing and bleaching house was completed during the year and machine bleaching started working in February, 1953. The erection work of the dyeing, printing and finishing machines has been taken in hand and is expected to be completed shortly. Orders for further machinery, particularly, spinning, for renovation purposes were placed during the year. Though it will take some time before the target set before them for a thorough overhaul of the mills is reached, the Directors are convinced that they must pursue vigorously their programme of modernisation progressively.

SETBACK IN PROFIT OF INDIAN COPPER

FINANCIAL POSITION SOUND

THE audited statement of accounts of the Indian Copper Corporation Ltd. (Managing Agents: Messrs. Gillanders Arbuthnot & Co., Ltd., Calcutta) for the year ended 31st December, 1952, shows a setback in its earnings. From the record level of £889,712 touched in the previous year, the gross profit has declined to £723,889, that is, a fall of 18.6 per cent. The Directors, however, have been able to step up the allocation to the general reserve—albeit by a small sum—and maintain the dividend at 12½ per cent. per annum, free of income-tax. This has been possible because of the substantial saving in taxation, as a result of the transfer of control to India during the year.

The production of the Company fell during the year. Thus, the quantity of ore treated amounted to 346,285 short tons, a decline of 48,838 short tons from that of the previous year. The output of concentrates, at 29,624 short dry tons, was also lower than that of 33,358 short dry tons in 1951. The quantity of refined copper produced declined from 7,083 long tons in 1951 to 5,079 long tons, and the overall recovery from ore to refined copper was a shade lower at 93.12 per cent. as against 93.22 per cent. in the previous year. The Company's output of rolled products aggregated 3,689 long tons (including 2,382 tons of cold rolled brass and 416 tons of cold rolled copper), which shows a substantial drop from 6,907 long tons produced in 1951. The precipitous fall in production of rolled products is attributed to poor market conditions which prevailed during the year.

The Company's despatches of ingots for sale, however, were higher by 1,033 long tons; that is, they rose from 7,210 long tons to 8,243 long tons, during the year. These despatches include 3,393 tons of copper ingots in the year under review, as compared with 1,980 tons in 1951. This improvement in despatches was largely due to the export of 2,000 tons of copper ingots to the United Kingdom, the permission for which was granted by the Government of India towards the close of the year under review, when there was restricted demand for the Company's products in India. Despatches of kyanite ore were also higher at 14,682 tons, as compared with 11,428 tons in 1951.

During the year under review, there was a heavy fall in metal prices, including zinc, but copper prices were fairly steady. The following are the average prices realised by the Company on its products during the last two years:

	(£ per ton)	
	1952	1951
Copper ingots	241	240
Rolled brass	270	277
Yellow metal circles	281	302
Rolled copper	275	301
Copper circles	285	334

Export prices of kyanite increased from £22 to £28 per ton upto September, but, thereafter, fell to £25 per ton by the end of the year. Since the close of the year, there has been a further fall to £20 per ton.

The following comparative table shows the Company's progress during the last three years:

(In thousands of £'s sterling)

	For the year ended 31st December			
	1952	1951	1950	1949
Net sales and adjustment of stocks ..	1,056	2,190	1,829	1,807
Other income	161	61	97	61
Expenses	1,413	1,367	1,313	1,235
Gross profit	724	890	620	694
Managing Agents' remuneration	87	..	..	..
Depreciation	115	100	85	85
Taxation	265	455	347	843
Mining development and general expenditure written off	..	..	96	..
General reserve	185	175	50	100
Dividend	114	114	60	63
Carry forward	(12½%)* 63	(12½%)* 66	(12½%) 40	(12½%) 83

* Free of tax payable by the Company. In the previous years the dividends were less U.K. tax.

The Company's financial position, in so far as it can be judged from its latest balance-sheet, is sound. The reserves and surplus aggregate £1,123,598, which represent about 123 per cent. of the paid-up capital of £914,200. The gross value of the block amounts to £1,704,558. Of these, mining rights and permanent works, at £349,872, have not been written down, while buildings, machinery, plant, etc., have been written down from £1,354,686 to £440,750. The current assets amount to £2,160,735 and more than adequately cover the current liabilities and tax provisions aggregating £913,559.

The outlook for the Company during the current year does not seem to be bright. After the close of the year under review, there was a strike in the Company's works, resulting in a complete cessation of production from 28th February to 5th June, 1953, the effects of which, according to the Company's Chairman, Sir Anthony J. Elins, "will be reflected in the accounts for 1953."

MEASURES FOR CHECKING UNEMPLOYMENT

(*Concluded from page 855*)

their funds in buildings, upto a maximum of 5 per cent. of their funds.

It is possible, according to Mr. Jalan, to check rising unemployment by a well thought-out public works policy. It is necessary to increase the tempo of expenditure on the projects already drawn up. But new plans should also be prepared to cover a wider ground than what was originally proposed by the Plan, particularly in the case of fisheries, afforestation, development of minerals by scientific surveys, roads, housing, schools and hospitals. Transport should receive particular attention, as their development naturally results in opening new avenues for trade and industry, thereby creating direct and indirect employment.

So far as monetary policy is concerned, Mr. Jalan has urged the need for the reversal of the tight money policy, in order to stimulate economic activity, as business activity is now at a low level and forces are gathering momentum which, according to him, might lead to a recession. He has also urged a reduction in the tempo of drawings from the public, that is, in taxation and loans, and advocated the need for a greater dose of deficit financing than that envisaged in the Five-year Plan.

The effective remedy for unemployment among the educated lies in reforming the educational system itself, "so that degree holders are not produced every year without a practical bias for their future." He has suggested training in some handicrafts and cottage industries at the secondary stage, study of agriculture in the primary, secondary and higher standards, the formation of teams of persons for lecturing in rural areas on the necessity for, and ways of, restricting population and the like.

This is only a brief summary of Mr. Jalan's eminently readable pamphlet on unemployment. He has covered wide ground within the compass of a little over 40 pages. It might be possible to question his assumptions, here and there, to ask for a more detailed explanation of his views on certain matters, or to dispute some of the points he has raised. It might be wondered, for instance, why he has not emphasised in his scheme for the enlistment of the services of Indian manufacturers in the supply of equipment normally imported from abroad, the need for the maintenance of proper standards. Barring such minor shortcomings, which Mr. Jalan would have made good in a larger work than a mere pamphlet, there is no doubt that the pamphlet, taken as a whole, is a most comprehensive statement of a realistic economic policy. It is for this reason that we heartily commend it to the attention of the Central and State Governments, local bodies and the men who are charged with the responsibility of either formulating or implementing India's economic policy.

COMMERCE AND INDUSTRIES

(*Concluded from page 870*)

high level of the previous two quarters. The quarterly data relating to industrial output of the Soviet Union were not available to the Department. Basing on a Moscow official report which claimed a rise of 10 per cent. in the Union's industrial production over that of the *six-month* period of 1952, the *Bulletin* estimates the increase in the total world output at 8 per cent. as stated at the outset.

The most significant factor in the maintenance of the high level of world industrial output during the half-year under review was the record performance by the U.S. The rise in the U.S. production was pronounced in the second quarter when it rose by 14 per cent. as compared with that in the same period last year. This was due to a remarkable rise in the production of steel, automobile and textiles.

Canada's industrial activity also showed a marked expansion. The output in the second quarter of 1953 topped the 1952 production in the same period by 9 per cent. Western Europe produced 3 per cent. more in the first half of 1953 than it did in the first six months of 1952.

Japan's performance was the most impressive, in that the total output during the half-year under review was 16 per cent. higher than in the same period last year. India, too, reported higher production, the output showing a rise of 7 per cent. over that in the first half of last year. Especially notable was the gain in India's textile industry which produced 15 per cent. more in the first half of 1953 than it had done in January-July, 1952.

The figures published in the *Bulletin* bring into focus the tremendous industrial development in the world since the pre-war year. During this period, the global world production of electric power rose 418 million kw.h. annually to 1,070 million kw.h. The production of crude oil went up at a similar rate from 250 million tons a year to 608 million tons. Crude steel output also doubled —from 92 million tons to 198 million tons. Rubber production of the world increased since pre-war days from 924,000 tons annually to 1,776,000 tons in 1953. But it has fallen off somewhat during the past two years from an annual record output of 1,915,000 tons in 1951 to a yearly production rate of 1,776,000 tons this year.

Notices

THE BANGALORE TRANSPORT COMPANY, LIMITED

NOTICE OF THE THIRTEENTH ORDINARY GENERAL MEETING OF THE COMPANY

NOTICE IS HEREBY GIVEN THAT THE Thirteenth Ordinary General Meeting of the Shareholders of the Bangalore Transport Company, Ltd., will be held at the Registered Office of the Company at No. 449, Wilson Gardens, Bangalore, 2, at 3 p.m., on Monday the 30th November, 1953, to transact the following business:—

1. To receive and adopt the Directors' Report and Audited Statements of Account for the year ended 30th June, 1953.
2. To declare Dividend.
3. To elect three Directors in place of the following Directors who retire by rotation and being eligible, offer themselves for re-election:—
   (1) Dharmaprakasa Sri. L. S. Venkaji Rao
   (2) Sri. A. C. Sitaram
   (3) Sri. Karim Khan.
4. To appoint Auditors and fix their remuneration.
5. Ratification of payment of the sum of Rs. 6,000 paid to the Director in charge Flying Squad by way of Honorarium.

The Share Transfer Books of the Company will remain closed from 16th to 30th November, 1953 (both days inclusive).

By Order of the Board,
M. V. VENKATARAMIAH,
Secretary.

BANGALORE, 2, 22*nd October*, 1953.

Note: 1. The Dividends, when declared, will be made payable after 7th December, 1953.

2. No dividend will be paid at the Registered Office of the Company.

3. Dividend Warrants will be posted to Shareholders whose names stand on the Register of Members as on 16th November, 1953.

4. Dividends of Rs. 5 or less will be remitted by Money Order.

BURN AND COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Fifty-ninth Ordinary General Meeting of the Shareholders of Burn & Co., Ltd., will be held on Monday the 23rd November, 1953, at 11 o'clock in the forenoon, at the Registered Office, 12, Mission Row, Calcutta, to transact the following business:

(1) To receive and adopt the Directors' Report and Audited Accounts for the year ended 30th April, 1953.

(2) To declare a Dividend.

(3) To elect a Director.

(4) To appoint Auditors for the current year and to fix their remuneration.

The Ordinary Share Register of the Company will be closed from the 16th November, 1953 to 23rd November, 1953, both days inclusive.

By Order of the Board,
MARTIN BURN LTD.,
Managing Agents.

CALCUTTA, 31*st October*, 1953.

Note.—If the Dividend as recommended by the Directors is passed at the Meeting, it will be paid on or after the 3rd December, 1953, to those shareholders whose names are on the Company's Register on the 23rd November, 1953.

THE SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LIMITED

TIRUCHIRAPALLI

NOTICE

THE DIRECTORS HAVE SANCTIONED THE payment of an *ad-interim* tax-free dividend for the year 1953-54 of 3¾ per cent. on Ordinary shares and also usual dividends of 2¾ per cent. on Preference Shares.

2. The warrants will be made out in the names and addresses of shareholders standing registered in our books as on 2nd December, 1953, and posted on and after 8th December, 1953. The shareholders are requested to notify immediately any change of their address to the Company.

3. The Register of Members and Share Transfer Books of the Company will be closed from 17th November, 1953 to 2nd December, 1953 (both days inclusive).

N.B.—Holders of blank transfers are advised to have the shares registered in their names in time before closure of books.

By Order,
SESHASAYEE BROTHERS LTD.,
Managing Agents and Chief Engineers.

TIRUCHIRAPALLI, 15*th October*, 1953.

HUKUMCHAND JUTE MILLS, LTD.

NOTICE TO SHAREHOLDERS

NOTICE IS HEREBY GIVEN THAT THE next Annual General Meeting of the Shareholders will be held at the Registered Office of the Company, 9, Brabourne Road, Calcutta, on Monday the 30th November, 1953, at 4 p.m., for the following purposes:—

(1) To receive and pass the Directors' Report and Audited Accounts for the year ended 31st March, 1953.
(2) To declare Dividends.
(3) To elect Directors.
(4) To appoint Auditors.
(5) To transact any other business that may be brought forward before the Meeting.

Dividends, if declared, will be paid to Registered Shareholders on application.

The Share Transfer Register of the Company will be closed from the 21st November, 1953, to 30th November, 1953, both days inclusive.

By Order of the Board,
RAMDUTT RAMKISSENDASS,
Managing Agents.

THE BLUE MOUNTAIN ESTATES LIMITED

MADRAS

NOTICE IS HEREBY GIVEN THAT THE Tenth Ordinary General Meeting of the above Company will be held at the Registered Office of the Company, "Oriental Buildings," Armenian Street, Madras, on Monday the 7th December, 1953, at 4 p.m., to transact the following business:

1. To receive and adopt the Directors' Report and Audited Statement of Accounts of the Company for the year ended 30th June, 1953.
2. To declare a dividend on the Ordinary shares.
3. To elect a Director in the place of Messrs. C. M. Kothari & J. M. Mehta who retire by rotation and are eligible for re-election.
4. To appoint Auditors and fix their remuneration.

The transfer books of the Company will be closed from Monday the 16th November, 1953, to Monday the 7th December, 1953, both days inclusive.

By Order of the Board,
KOTHARI & SONS (AGENCIES) LTD.,
Managing Agents.

MADRAS, 31*st October*, 1953.

Note.—The Directors have recommended a dividend of 12½ per cent. on the shares which if passed at the meeting will be paid on Tuesday the 8th December, 1953, to those Shareholders whose names are on the Company's Register on the 7th December, 1953.

PROFITS OF AMLUCKIE TEA HIGHER

BENGAL FLOUR RESUMES DIVIDEND

Amluckie Tea Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1952.

The season's working resulted in a profit, before providing for depreciation, of Rs. 1,50,022 (Rs. 14,870) to which must be added adjustments account season, 1951, Rs. 7,872 (Rs. 5,861) and profit on sale of motor lorry Rs. 655 (*nil*) making a total of Rs. 1,58,549 (Rs. 46,383). From this sum must be deducted provision for taxation Rs. 28,352 (*nil*) and depreciation for 1952 of Rs. 37,733 (Rs. 32,372) leaving a balance at credit of profit and loss account of Rs. 92,464 (Rs. 5,250). This sum, the directors recommend, should be dealt with as follows:

Transfer to buildings and machinery reserve Rs. 42,643 (*nil*), in payment of a dividend of 7 per cent. for the year on 750 cumulative participating preference shares of Rs. 100 each, absorbing Rs. 5,250 (Rs. 5,250), together with an additional dividend of 14.8573 (*nil*) per cent. on these 750 cumulative participating preference shares of Rs. 100 each, absorbing Rs. 11,143 (nil) and in payment of a dividend of 7½ (nil) per cent. for the year on 4,457 ordinary shares of Rs. 100 each, absorbing Rs. 33,428 (nil).

The saleable crop weighed out at 11,561 maunds, as against an estimate of 9,168 maunds and price realised was As. 22.87 per lb., as against price realised was As. 22.87 pepr lb., as against As. 28.09 for the previous season.

The estimate for season 1953 provides for a saleable crop of 9,000 maunds at an all-in cost of Rs. 9,20,787. The record crop produced in 1952, has enabled the Company to make a profit in spite of the considerable fall in the average prices realised.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital	5,20,700	Block ...	5,32,543
Reserves ...	5,45,626	Stock of tea	5,87,418
Provision for taxation ...	27,500	Stores, etc. ...	3,69,515
Liabilities ...	6,08,438	Debts, deposits and advances ...	2,06,244
		Investments	1,107
		Cash ...	5,437
Rs.	17,02,264	Rs.	17,02,264

Bengal Flour Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Balmer Lawrie & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

The profit for the half-year, after providing for taxation and depreciation was Rs. 1,01,513 (loss of Rs. 65,705) to which is added the balance brought forward of Rs. 11,382 (Rs. 49,086) and refund of E.P.T. Rs. 1,121 (*nil*) making a total of Rs. 1,14,046 (debit of Rs. 16,619). From this sum is deducted items relating to previous year Rs. 3,961 (*nil*) leaving a sum of Rs. 1,10,086 (debit of Rs. 16,619). The directors recommend that the total available for distribution be dealt with as follows:—

Dividend on 1,20,000 shares at 12½ (*nil*) per cent. per annum Rs. 75,000 (*nil*) and carry forward Rs. 35,086 (debit of Rs. 16,619).

During the half-year the prices and distribution of wheat and *atta* remained under the control of the West Bengal Government. The manufacture and sale of flour and associated products continued under a modified form of decontrol and there was a keen and sustained demand for the Company's branded products.

Since the end of the period under review the mills have been closed for about six weeks for electrification and other remodelling. The changeover has been effected without undue trouble and has provided a more regular and economic running with an increased outturn.

The recent announcement by Government that the export of flour will be permitted is most welcome, but to date details passed on to the Company are rather indeterminate, though the complications that affect Government over wheat imports are appreciated. If the export market is to be built up again, however, it is essential that difficulties should be straightened out quickly. It is also to be hoped that the fact that flour exports are to be permitted will, in turn, mean that Government will now be able to cease the importing of flour, which has been a considerable embarrassment to the Mills during the current year.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	12,00,000	Block ...	3,37,800
Reserves ...	4,20,000	Work under construction ...	37,108
Provision for taxation	1,14,500	Stock-in-trade	6,99,845
Liabilities ...	16,08,243	Stores & spare parts ..	2,13,677
Profit and loss account ...	35,086	Goods-in-transit ...	10,162
		Debts, deposits and advances ...	12,75,206
		Investments	34,649
		Cash ...	7,69,382
Rs.	33,77,829	Rs.	33,77,829

Tyroon Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1952.

The season's working resulted in a profit, before providing for depreciation, of Rs. 86,660 (Rs. 3,98,500) to which must be added adjustments account season, 1951 Rs. 820 (Rs. 21,344) and balance of profit brought forward from 1951 of Rs. 15,567 (Rs. 5,778) making a total of Rs. 1,03,047 (Rs. 4,15,654). From this sum must be deducted loss on sale of roller Rs. 71 (*nil*), loss on Grow-more-food campaign Rs. 10,676 (*nil*), loss on farming Rs. 33,990 (Rs. 7,933) and depreciation for 1952 Rs. 1,15,659 (Rs. 1,05,291), leaving a balance at debit of profit and loss account to be carried forward to 1953 Rs. 57,349 (credit of Rs. 2,07,567 after transfer to reserves and payment of dividend at Rs. 2 per share).

The saleable crop weighed out at 14,208 maunds, as against an estimate of 12,973 maunds and a crop of 13,841 maunds for 1951. The average price realised was As. 24.35 per lb., as compared with As. 29.68 for the previous season.

The estimate for season 1953 provides for a saleable crop of 12,847 mds. at an all-in cost of Rs. 12,65,878. The huge drop in the prices realised in 1952 as compared with the previous season, has considerably affected the trading results.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,20,000	Block ...	12,52,690
Reserves ...	9,50,000	Stock of tea	8,18,800
Provision for taxation ...	77,445	Stores, etc. ...	4,36,261
Liabilities ...	13,28,934	Debts, deposits and advances ...	2,57,255
		Investments	1,107
		Cash ...	52,917
		Profit and loss account ..	57,349
Rs.	28,76,379	Rs.	28,76,379

Kirloskar Oil Engines Ltd.

The directors of the above Company (Managing Agents: Messrs. Kirloskar Sons & Co., (Kirloskarwadi, Poona) submitted the audited accounts of the Company for the year ended 31st March, 1953.

The result for the year was a loss of Rs. 9,00,444 (profit of Rs. 2,05,364) without allowing for depreciation.

As forecast in the report for the year 1951-52, the year just ended has been an extremely difficult one for the Company. In the early months of 1952, there was a steep fall in the demand for nearly all commodities, including diesel engines. Depressed trading conditions continued throughout the year, and in the case of diesel engines the situation was aggravated by heavy imports of foreign made engines under the blanket import licences in force during 1952. Sales of the Company's engines dwindled and stocks piled up both at the factory and with the Company's distributors.

To meet this situation, production was reduced and all possible economies effected even to the extent of a general retrenchment of workers, which was a step the directors were most reluctant to take. Representations were made to Government and timely aid was forthcoming from the Government of India who directed State Governments to draw their requirements of engines from indigenous sources as far as possible, and also from the Government of Bombay who placed an order with the Company for engines to the value of Rs. 4 lakhs and advanced the necessary funds to enable production to continue on a reduced scale. Further, the Government of India banned the import of small diesel engines and this ban which has been of the greatest assistance to the indigenous industry is still in force.

One of the important considerations that weighed with the directors in keeping the factory going, even in the face of such adverse circumstances was, to prevent the workers from being thrown out of employment and adding to the growing unemployment in the country.

Although there are still considerable stocks of imported engines in the market, the immediate outlook is not unfavourable. The Company's engines are in demand for development schemes being carried out under the Five-year Plan, and the Company is at present executing an order for 1,000 engines coupled to pumps, for the Hyderabad Government. Satisfactory rains have increased the demand for engines and sales are slowly but appreciably improving. Provided that the ban on imports continues, the directors feel confident that satisfactory results will be recorded in the year 1953-54.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	24,07,490	Block ...	35,83,246
Reserves ...	9,93,966	Stock-on-hand	31,16,402
Liabilities ...	47,17,398	Debts, deposits and advances ...	2,79,071
		Cash ...	2,41,691
		Profit and loss account ...	9,00,444
Rs.	81,20,854	Rs.	81,20,854

Vellore Electric Corporation, Ltd.

The directors of the above Company (Managing Agents: Messrs. Chandrie & Co., Ltd., Madras) submit the audited accounts of the Company for the year ended 31st March, 1953

During the year under review, the progress has been satisfactory and 293 consumers have been added, thus bringing up the total number of consumers in the licence area to 7,463. Though there was an addition in the number of consumers, the working of the Company resulted in a lower profit as compared to last year's working owing to two reasons, viz., (1) the restrictions imposed by the Government of Madras on account of the failure of monsoon during the year under review went up to 66⅔ per cent. and (2) the full effects of the reduction in tariff rates effected by the directors last year are seen in this year's account.

In fact, the directors expected that even with the reduction in tariff and the restriction of supply up to 40 per cent. they would be able to make a reasonable return as per the Act; but unexpectedly the cut imposed was as high as 66⅔ per cent. Hence they are diverting Rs. 3,086 from the tariff and dividend control reserve to enable to maintain the 10 per cent. dividend on ordinary shares. As reported last year, the directors were not able to take up further extensions contemplated by them in view of the power position. The directors are considering taking up the same this year. In spite of these adverse conditions, the working of the Company reveals satisfactory progress as can be seen from the following comparative statements:

		1950-51	1951-52	1952-53
Total units purchased in kwh.	...	51,02,134	65,88,933	65,52,963
Cost of units purchased	Rs.	1,81,949	2,22,642	2,23,047
Units sold	...	44,34,373	58,15,031	57,94,927
Gross revenue	Rs.	5,01,705	6,54,490	6,32,220
Total consumers connected	...	6,543	7,170	7,463
Maximum demand in kws.:				
Vellore	...	940	990	1,030
Ranipet	...	400	720	925

Consumers' fund which had been referred to the Arbitrator, was decided against the Company, and the Company is in correspondence with the Government further in this connection.

The net profit of the Company after providing for reserve for depreciation on assets Rs. 61,944 (Rs. 50,999), taxes on income Rs. 22,000 (Rs. 45,000), contingent reserve ¼ (¼) per cent. Rs. 3,843 (Rs. 6,346), debenture security fund Rs. 2,000 (Rs. 1,340) and charities and donations Rs. 750 (*nil*), is a sum of Rs. 42,450 (Rs. 54,409). To this is added excess provision for taxes made last year and tax refund, etc., of Rs. 12,544 (Rs. 2,763) and profit brought forward from previous year after payment of dividends for 1951-52 Rs. 68,494 (Rs. 56,857) making a total of Rs. 1,23,487 (Rs. 1,14,030). From this sum is deducted tariff and dividend control reserve relating to previous years Rs. 8,836 (*nil*) and consumers' fund Rs. 8,836 (*nil*) leaving a sum of Rs. 1,05,816 (Rs. 1,14,030). After adding the appropriation from tariff and dividend control reserve of Rs. 3,086 (*nil*) there is a net available sum of Rs. 1,08,902 (Rs. 1,14,030). Out of this, it is proposed to recommend a dividend of 6 per cent. less tax on preference shares and 10 (10) per cent. tax-free or Re. 1 per share on ordinary shares for the year ended 31st March, 1953, which will absorb Rs. 45,536 (Rs. 45,567) leaving a balance of Rs. 63,367 (Rs. 68,963 carry forward) for adjustments in regard to the consumers' fund, which is still indefinite.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,25,000	Block ...	10,76,142
Debentures	1,00,000	Stores, tools, etc. ...	2,03,281
Reserves ...	4,10,127	Other assets	1,479
Provision for taxation ...	22,000	Debts, deposits and advances ..	1,54,222
Liabilities ...	4,01,465	Investments	51,914
Profit and loss account ...	1,05,816	Cash ...	77,370
Rs.	15,64,408	Rs.	15,64,408

N.B.—Figures within brackets relate to the corresponding period of the previous year.

(Concluded from page 863)

the tax comes to be borne by the agent, which is neither just nor equitable nor fair.

The terms of section 42 are wide enough to catch within its taxation net not only trading in, but also trading with, India. The latter category of transactions under most tax systems of the world are never taxed; but, in India, it is otherwise. It discourages foreign connections and imposes unfair burdens on the residents for the transactions.

Capital Gains

Imposition of capital gains under a fiction of law inhered in the Income-tax Act is basically wrong. Whatever may be the merits or otherwise of taxing capital gains, it must be done through a separate Act. Capital gains may be a species of income, but the Income-tax Act deals with the only single species known as revenue income—as opposed to capital income. If capital gains are subjected to tax when they arise, there would be a double tax burden if these are, as they must be, again subjected to Estate Duty. Capital gains tax has rightly been repealed and it should not be revived in any form again.—*All Rights Reserved.*

MONEY IN GOOD DEMAND

(From Our Own Correspondent)

BOMBAY, 3rd November

Conditions in the short-term money market underwent a distinct change during the week under review. With banks experiencing sudden call for funds, particularly from Monday onwards, money became usable and there was a sharp rise in interest rates. The long-awaited crop movement having started, there was a demand for funds to finance it. Funds were required by the cloth trade also. In addition, there was the usual drawings on banks by the public on account of *Diwali*. The inter-bank call money, among the Exchange banks and big Indian banks, which was unlendable at ½ to 1 per cent. last week, was, therefore, bid up to 1½ per cent., though the representatives rate was 1½ per cent. Some of the Indian banks, who were lenders till last week, were reported to have turned keen borrowers and even offered better rates than Exchange banks. The corresponding rate among the smaller Indian banks also hardened from 2½ per cent. to 2¾ per cent. House money fetched 2½ per cent. as against 2 per cent. last week.

Having found that enquiry for funds had gathered strength, banks turned their attention to gather term money offering better rates of interest. One month money was absorbed at 2¼ per cent. as against 2 per cent. last week, 2 to 3 months' deposits at 2½ per cent. and 4 to 6 months' at 2¾ per cent.

The change for the better in the conditions of the money market is also reflected in the results of *this week's sale of three months'* Government of India Treasury Bills. The amount offered, against the usual tenders for Rs. 1.5 crores, aggregated only Rs. 2.71 crores, as against Rs. 4.10 crores in the previous week. The average rate of accepted tenders, which had declined by a fraction last week to Rs. 2-6-7 per cent. per annum, rose this week to Rs. 2-6-10 per cent. per annum, the highest rate since 12th May, 1953.

The statement of affairs of the Reserve Bank of India for the week ended 30th October, 1953, is not available at the time of writing, as we have to go to press a day early on account of the *Diwali* holidays.

The consolidated statement of position of Scheduled Banks for the week ended 23rd October, 1953, as compared with that for the previous week, shows an expansion of as much as Rs. 13.34 crores in the Banks' demand deposits and Rs. 10.07 lakhs in their time deposits. Inter-bank borrowings repayable on demand have declined by Rs. 2.12 crores, while those of a time nature have gone up by Rs. 1.34 crores. Advances show a decline of Rs. 7.56 crores, while inland bills purchased and discounted a rise of Rs. 63.47 lakhs. Investments have recorded a rise of Rs. 2.15 crores, cash on hand and balances with the Reserve Bank have together gone up by Rs. 6.19 crores, balances with other banks in current account and money at call and short notice by Rs. 52.50 lakhs and Rs. 74.40 lakhs, respectively.

Barring some demand for the Government of India National Plan Bonds, which provided a firm feature, the Gilt-edged market experienced dull conditions during the week. Buying interest was scarce in almost all counters and hardly any variations in prices were noted. The volume of business was small.

3 per cent. 1957 was on offer at Rs. 93-6. 3 per cent. 1958 had sellers at Rs. 98-1, but hardly any business of note was reported done at that rate. There were buyers at Rs. 96-1½ in 3 per cent. 1959-61. 3 per cent. 1963-65 had enquiries at Rs. 92-8½, 3 per cent. 1964 at Rs. 92-8½. 3 per cent. 1966-68 attracted sellers at Rs. 90-2½. 3 per cent. 1970-75 was on request at Rs. 86-6 and was on offer at Rs. 86-6½. 3 per cent. 1986 Conversion Loan declined earlier by an anna to Rs. 82, but later recovered to Rs. 82-1. 3½ per cent. National Plan Bonds were done As. 3 better at Rs. 98-12. The Reserve Bank of India which was a seller of this loan at Rs. 98-10 till yesterday, withdrew from the market to-day. Among the State loans, 4 per cent. 1963 Madras was marked up by an anna to Rs. 100-2. 4 per cent. 1963 and 1964 Bombay were neglected at Rs. 101 and Rs. 101-2, respectively.

In the foreign exchange section, there was no change in the rupee-U.S. dollar rates, while in New York, £ sterling ruled quiet with a fractional fall in values in terms of dollar. Thus, the spot £ declined from $2.81¼-2.81½ to $2.81-2.81¼ over the week, three months forward from $2.80¾-2.81 to $2.80.11/16-2.80.13/16 and six months from $2.80¾-2.80½ to $2.80.7/16-2.80.9/16.

KIPS PRICES RISE

(From Our Own Correspondent)

MADRAS, 2nd November

Arrivals of kips have been on a small scale, due to rains. Improved demand is in evidence from U.K. importers, and higher prices have been paid for certain lines. Raw market has improved and tanners are quoting higher prices as a consequence. It is believed that the kip market will not go lower, although shipments to U.K. during October, 1953 were large.

In the tanned skins section, price of goat skins has firmed up considerably and that of sheep to a small extent. Stocks of tanned goat skins in the local bazaar are small and those of sheep find ready buyers.

Shipments during October, 1953 were: to the U.K. 4,729 bales tanned cow hides, 217 cow calf, 152 buff hides, 265 buff calf, 939 tanned goat, 679 tanned sheep and 2 bales tanned snake skins; to the Continent: 10 bales tanned buff hides, 339 tanned goat skins, 46 tanned sheep and 12 bales drysalted goat skins; to the U.S.A.: 84 bales tanned cow hides, 6 cow calf, 100 buff hides, 30 buff calf, 112 tanned goat skins, 222 drysalted goat skins and 13 bales tanned snake skins.

BULLION IRREGULAR

(From Our Own Correspondent)

BOMBAY, 3rd November

An irregular trend in prices was noted in both silver and gold on the Bullion Exchange during the week under review. There were no wide fluctuations in prices and the undertone was steady, having been influenced by the improvement in demand for ready delivery of both the metals. The report that the proposed amendment to the by-laws, with a view to restricting the penalty for non-delivery, would take some time before they are found legally flawless, also helped revival of speculative buying.

Opening at Rs. 151-5, silver for forward delivery (23rd November settlement) hardened on speculative support to Rs. 152 on the first day of the week. But this recovery was soon checked and there was a recession to Rs. 150-3 on Saturday on speculative selling induced by arrivals of unrefined silver and weakness of gold. But renewed speculative buying and an improvement in spot demand restored the forward rate to Rs. 152 to-day before it closed at Rs. 151-9.

Ready silver (.996 Mint) began at Rs. 151-7 and, after a decline to Rs. 150-6 on Saturday, advanced to close at Rs. 151-11. The ready rate which was on par with the forward at the close of last week, claimed a premium of As. 2 this week, thereby reflecting the slight improvement in spot demand. The floating stocks of silver are placed at 2,300 bars. The daily average offtake was 30 bars.

Forward gold (21st November settlement) commenced the week at Rs. 80-2 and, on brisk demand from Calcutta and Delhi, moved forward to Rs. 80-9. This gain was, however, not consolidated, because of continued arrivals of smuggled gold and drop in prices of gold in Paris. The bull unloading which ensued brought down the forward price to a low of Rs. 79-6 on Saturday. There was, however, a smart recovery to Rs. 80-4 to-day, following reports of a decline in arrivals and an improvement in offtake; the closing rate to-day was Rs. 80.

Ready gold, which had commanded a premium of As. 6 at the opening of the week, later came to be quoted at As. 11 over the forward at the close. The floating stocks of gold are estimated at 25,000 tolas. The daily average arrivals were 9,000 tolas, while the daily average offtake was 10,000 tolas.

The following comparative table shows the trend of the market during the week under review:

	3-11-53	Highest	Lowest	28-10-53
GOLD	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready (.99 fine Mint)	80 11	81 1	80 1	80 7

TEA FANNINGS DEARER

(Messrs. Forbes, Ewart & Figgis Ltd.)

COCHIN, 31st October

Approximately 13,00,000 lbs. were catalogued for sale in sale No. 22 which was held on Tuesday, 27th October. There was good demand, but prices were irregular. Commons and low medium brokens remained steady, whilst fannings were occasionally slightly dearer. Medium and good medium descriptions were well supported, but were easier to buy. Best liquoring Nilgiri teas met with good competition and prices advanced with the improvement in quality. Whole leaf grades were stronger and slightly dearer. The following are the quotations:—

	1953	1952
	Rs. a. p.	Rs. a. p.
Low grown Travancore B.O.P.	1 11 9	0 15 0
	to 1 0	0 0
Medium Travancore B.O.P.	1 13 0	1 13 6
Anaimallais B.O.P.	1 15 0	2 1 6
	to 2 2	6
Best liquoring Nilgiri B.O.P.	2 12 6	3 7 0
Well made black leaf O.P.	2 4 0	2 4 0

London Market.—Best and clean commons fully firm to dearer. Mediums irregular, but about steady.

Colombo Market.—Fair demand. Market generally lower, particularly tippy sorts and Persian Gulf teas.

Calcutta Market—Export.—Good general demand at slightly lower rates. Commons half an anna, mediums half to one anna lower. Leaf teas fully firm. Tippy teas strong demand at one to two annas higher.

Dust.—Fair general demand. Prices irregularly half anna lower. C.T.C. fairly well supported.

Export Quota.—The market has shown an easier tendency and business has been done at 15½ pies.

Forthcoming Auctions.—Sale No. 23 will be held on Tuesday, 10th November.

As we go to press, Messrs. Forbes, Ewart and Figgis, Ltd. wire as follows:—

"*Dust Sale V.*—1,76,000 lbs. Market irregularly half to one anna easier for everything, except good liquoring and black leaf types which are fully firm."

COTTON STEADY

(From Our Own Correspondent)

BOMBAY, 3rd November

Following encouraging reports from piecegoods markets, the cotton futures market put on a cheerful note. I.C.C. nearby delivery evoked renewed demand. With the shorts covering their sales and the bulls lending good support, the market recorded some improvement in values. A few extended support induced by hopes of reduction in excise duty on fine cloth and export duty on cotton. Towards the close yesterday, however, there was a slight setback on account of profit-taking and speculative selling; a part of the previous gains was thus lost. The undertone of the market was steady.

I.C.C. February opened the week at Rs. 610 and, after improving to Rs. 619-8 yesterday, receded to Rs. 613½ to-day. The net gain over the week was thus reduced to Rs. 3½. I.C.C. May improved from Rs. 616 to Rs. 625. The improvement was not maintained to-day, the closing rate being lower at Rs. 620. The spread between the rates for the two contracts, which was as low as Rs. 4 in the beginning of the week, was Rs. 6½ at the close. The spread a week ago was Rs. 3¾.

The following is the trend of prices in the forward market:

	Opening	*High*	*Low*	*Closing*
I.C.C. Feb. ...	Rs. 610	619½	608¾	613½
I.C.C. May ...	Rs. 616	625	614¾	620

There was a broadening of activity in the spot market. Turnover was fairly large. Mills continued to evince interest in Khandesh new 197/3 and Berar *Jarillas*, while offices had their attention on Bengal, Khandesh and Vijay. The following are the latest available quotations in the spot market:

Bengal *Deshi* (new crop) Rs. 580; Berar *Jarillas* (new crop) Rs. 655; Khandesh (new crop) Rs. 700; Vijay (old crop) Rs. 840 and (new crop) Rs. 735; Oomra *Deshi* (new crop) Rs. 585 and Moglai (new crop) Rs. 580.

The Karachi cotton market has been weak, following reports that the U.S. is likely to accept payment in sterling for the cotton sold to other countries. Renewed slackness in overseas demand has also imparted weakness to the market. Japan, Germany and the U.K., *some of the most* important purchasers of Pakistan cotton, are reported to have turned their attention to Brazilian cotton which is being offered at cheaper rates. Consequently, prices of cotton at Karachi have suffered a fall. The latest available quotations for the Karachi market are: New crop: Punjab *Deshi* Rs. 58; 4F Punjab R.G. Rs. 56 to Rs. 59; S.G. Rs. 61-12 to Rs. 62-12. L.S.S Punjab R.G. Rs. 61; S.G. Rs. 65-4; N.T. R.G. Rs. 62-8 to Rs. 63; S.G. Rs. 66-8 to Rs. 67; 289F. Punjab R.G. Rs. 65-8; S.G. Rs. 70-8. Old crop: Sind *Deshi* Rs. 59-8; Punjab *Deshi* Rs. 56-8; 4F Roller Rs. 53-8; L.S.S. Roller Rs. 58-8; N.T. Rs. 60-8; 289F Rs. 61-8.

At Alexandria, activity continues to be active, with good buying support for practically all varieties. Thanks to heavy uncovered export commitments for prompt shipment and reluctance of farmers to sell, spot premiums over official selling prices continue to rule high. There has been a considerable fall in fresh export business. New crop stocks with the Cotton Commission are scarce. With a view to enuring adequate supplies of cotton to indigenous mills, the Commission has imposed a ban on export of Ashmouni and Zagora grading good and lower. The news relating to the possibility of the reopening of the Liverpool cotton futures market in June next year has been widely welcomed by the cotton trade. This reopening, coupled with the *improvement* in the Egyptian cotton situation it is stated, has brightened the chances of the reopening of the Alexandria market which has remained closed since November, 1952.

Offerings in the 1953-54 cotton crop of Sudan are expected to be commenced by the Gezira Board shortly. The offerings will, in the first instance, be limited only to grades X4 and below. It is understood that the contracts will contain an escape clause which seeks to permit the Board to deliver cotton against the quality bought, either of two types which grades just above or below it. The quantity of lower grades XG4S to G6S and XG4L to CGRL that will be offered at present is estimated at 20,000 bales.

The upward trend in cotton prices witnessed at New York last week persisted during the week under review also. This confirms the expectation held by a considerable section of the cotton trade that, until the tense political situation prevailing at present eases, the trend will be steady to firm, with, of course, technical reactions from time to time. Trading in New York's futures market is reported to be quite brisk, the bullish fervour being fanned further by optimistic reports regarding exports following authorisation of a $60 million credit to Japan by the U.S. Export-Import Bank for the purchase of American cotton. There were, besides, encouraging private advices on exports, with enlarged demand from overseas countries, as a result of diminishing supplies of Mexican cotton and high prices of several other foreign growths. The improvement in prices of cotton would have been more marked but for the setback on Monday created by high crop ideas and rumours of an increase in cotton acreage allotment. Trading in old crop positions, however, has been dull and prices have recorded a slight fall, under the influence of profit-taking and light hedge trading, while distant new crop deliveries remain neglected, as traders are inclined to await the outcome of Congressional efforts to raise acreage allotment of 17,910,000 for the 1954 crop set by the U.S. Secretary of Agriculture.

The following are the latest available quotations from New York as compared with those a week and a fortnight before:

(In cents per lb.)

	2-11-53	27-10-53	21-10-53
Spot	33.50	33.65	33.50
December	32.84	32.97	32.80
March	33.25	33.44	33.24
May	33.45	33.71	33.51
July	33.27	33.69	33.45

Cotton circles are evincing keen interest in the annual meeting of the International Cotton Advisory Committee, Washington, which commenced yesterday. Discussions at the meeting centre round the problem of stabilising world cotton prices by means of an international pact. The twin objectives underlining such a pact are to ensure cotton supplies to importing countries at fair prices in years of short crop and to assure markets to exporting countries in times of surplus. The two proposals that have been put forward in pursuance of the achievement of these objectives are (1) a multilateral contract for cushioning fluctuations in prices and (2) an international buffer stock agreement.

ART SILK YARN DULL

(From Our Own Correspondent)

BOMBAY, 3rd November

Despite highly encouraging reports from rayon fabric markets, the art silk yarn market presented dull conditions during the week under review. Traders showed little interest in fresh business, as they were busy with squaring up the year-end transactions so that they may open fresh account on *Diwali*, the New Year Day. Moreover, they preferred to watch further developments in the coming weeks in the yarn and cloth markets. They now feel that the trend of art silk yarn values would hereafter be influenced not so much by the conditions in the rayon fabric market as by the state of the cotton yarn and piecegoods markets, now that the Government has reduced excise duty on superfine cloth and abolished export duty on medium counts. Consequently, volume of business in art silk yarn remained greatly restricted and prices moved within narrow limits. The undertone of the market was steady.

In the forward section, 150D November contract improved from Rs. 703 to Rs. 705 on Friday. But it receded temporarily to Rs. 696 the following day. Subsequently, however, on fresh support, it recovered to finish at Rs. 705. Business in December contract commenced yesterday at Rs. 700. The contract finished to-day with a gain of Rs. 8. October contract was terminated at Rs. 690. Business in this contract opened at Rs. 790 on 3rd September, 1953. The highest and the lowest levels touched were Rs. 800 on 4th September, 1953, and Rs. 665 on 15th October, 1953, respectively. The net gain over the period of this contract was Rs. 100. Prices of yarn in the ready section were well maintained.

The notable recovery in values of staple fibre yarn witnessed in the past two weeks persisted during the week under review too. 40×2 November delivery advanced by Rs. 11 to Rs. 675. October contract terminated at Rs. 678. Business in this contract commenced at Rs. 670 on 14th September.

The table below gives the prices of art silk yarn and staple fibre yarn quoted to-day, as compared with those on 28th and 21st October, 1953:

	31-11-53 Rs. a.	24-10-53 Rs. a.	21-10-53 Rs. a.
Art silk yarn			
150D October (per case of 200 lbs.)	—	697 0	694 0

2/40s November	675 0	664 0	641 0

OILSEEDS BEARISH

(From Our Own Correspondent)

BOMBAY, 3rd November

The oilseeds market ruled bearish during the week under review. The trend was pronounced in the groundnuts section. Prices recorded a sharp fall, following reduction in duty on exports by the Saurashtra Government announced on the 28th inst., and on large arrivals in up-country centres. Traders were not inclined to support the market for fear of a further fall in prices. The linseed section ruled easy in sympathy with groundnuts. In the castorseed section, futures came in for limited activity, while spots ruled easier. This was chiefly due to discouraging overseas advices. Castoroil B.S.S., quoted in the Continent at £135 per ton, is £10 below the cost to Indian exporters. Consequently, the meagre export quota in castor oil, announced on 30th October, did not have any perceptible influence on the market. As a result of all these factors, there was generally selling pressure in almost all the sections and prices on balance recorded sharp drops over the week.

The Government of Saurashtra has announced a 66⅔ per cent. reduction in the duty on exports of groundnut seeds and groundnut oil with effect from 29th October. A reduction of 75 per cent. in the export duty on groundnut oil cake, *vanaspati* and refined groundnut oil has also been announced. An official notification in this connection gives the following revised rates of duty, following the reductions: groundnut whole (per *deshi* maund of 40 lbs.) As. 3; groundnut seeds As. 4; groundnut oil As. 6; groundnut oilcake As. 2; *vanaspati* As. 6; and refined groundnut oil As. 6.

This announcement, coupled with larger arrivals, induced a bearish feeling among operators in groundnuts. Bold ready December-January declined from Rs. 28-2 to Rs. 27. Khandesh quality was done at Rs. 32, as against Rs. 35-4. November delivery fell from Rs. 31-6 to Rs. 29. Groundnut oil ex-mill disclosed a loss of Re. 1-5 to Rs. 18 and railway receipts, Re. 1-12 to Rs. 17-8. November and December deliveries changed hands at Rs. 15-9 and Rs. 14-10, as against Rs. 16-2 and Rs. 15-4, respectively. It is reported that Holland has entered into contract for buying H.P.S. groundnuts at £94 per ton, subject to export quota Groundnut oil is quoted in the Continent at £124 per ton.

In the linseed section, Bold ready eased from Rs. 24-8 to Rs. 24 and October-November delivery from Rs. 24 to Rs. 23-12. February-March sustained a loss of Re. 1-6 to Rs. 20-4. Linseed oil suffered As. 8 to Rs. 14.

The Government of India has decided to permit the export of medicinal castoroil by manufacturers holding licences for its manufacture under the Drugs Act of 1940. The last date of applications is 20th November. Eligible applications will be granted quotas equal to 10 per cent. of the certified production, and quota licences will be valid for shipment up to the end of March, 1954. (Medicinal castoroil is described as a fixed oil, nearly colourless or pale yellow, at first bland in taste but afterwards slightly acrid.) As far as ordinary castoroil is concerned, the export policy for the period August to December is to give quotas to exporters for quantity equal to one-fourth of total exports effected by the exporters during the period January-July.

This decision did not have any encouraging effect on the market, as stated at the outset, because of *discouraging* overseas advices. May delivery, which opened at Rs. 112-4 as against Rs. 111-14, fluctuated between Rs. 112-12 and Rs. 106-4, before closing at Rs. 112. F.A.Q. was down by Rs. 3-8 at Rs. 27-8. Madras quality also disclosed a similar loss at Rs. 28. Castoroil B.S.S. lost As. 4 to Rs. 16-12. First pressures suffered Re. 1 to Rs. 15-12 and Commercials As. 12 to Rs. 15.

The following table shows the prices of oilseeds and oil on the 3rd inst. as compared with those at the end of the previous two weeks.

	3-11-53 Rs. a.	28-10-53 Rs. a.	21-10-53 Rs. a.

SUGAR FIRM

(From Our Own Correspondent)

BOMBAY, 3rd November

A firm undertone prevailed in the Bombay sugar market during the week under review, thanks to strong buying support induced by heavy offtake on the eve of *Diwali*. The stocks with traders, which had already been depleted, could not cope with the demand and prices of sugar forged ahead. Even the release of the balance of 21,000 tons of sugar from the 1952-53 season's output for sale in the free market, announced by the Government of India on Wednesday last, failed to arrest the upward swing in prices. Thus, in the ready section, indigenous small grain sugar jumped up from Rs. 90 to Rs. 95 per bag. Medium grain sugar advanced by Rs. 3 to Rs. 97. Large grain sugar sugar was quoted higher at Rs. 98 to Rs. 100, as against Rs. 97 last week. *Similarly, foreign sugar also recorded handsome improvement.* Java sugar spurted by Rs. 5 to Rs. 99 per bag of two cwts. British refined sugar and Mexican gained Rs. 4-8 each to Rs. 94-8 and Rs. 93, respectively. Forward sales in British refined sugar per s.s. *Atlantico* are being made at Rs. 86 per bag. The demand is reported to be fairly good.

Despite the slightly larger arrivals of sugar into the market—the quantity that actually arrived was 2,900 bags, as against 2,600 bags in the previous week—stocks of sugar in the market are poor. The total floating stocks are estimated at not more than 7,000 bags. The stock position may, however, be expected to be better in the coming weeks, that is, after the pre-*Diwali* demand for sugar tapers off and when the sugar produced in the current (1953-54) season begins flowing into the market. Already, one or two factories in the Deccan are said to have commenced crushing operations and a few more mills are expected to begin crushing next week.

Tenders for British refined sugar per s.s. *Cyclops* and s.s. *Luciano*, it is said, have been very heavy. All tenderers are expected to be allotted only a minimum quantity of 200 bags each.

PEPPER QUIET

(Messrs. Parekh & Co.)

BOMBAY, 3rd November

Pepper at all terminal markets during the week ruled quiet with uncertain undertone and prices at Alleppey moved within a narrow range of Rs. 50, the highest and the lowest being Rs. 1,900 and Rs. 1,850, respectively. Prices at Cochin were *comparatively* lower and the garbled variety was offered at as low as Rs. 325 per cwt. without attracting much business. The growers at all centres are reported willing to shade their prices to attract buyers, but so far there are no buyers of sizable quantity as foreign dealers are said to be holding off. With the advent of the bright weather, the arrivals of light berries are likely to increase, but the heavy pepper of the exportable quality will not be available until the middle of December. A section in the trade opines that there will be good demand for light berries and heavy pepper for inland consumption because of the present lower prices. Inland consumption is expected to increase to a great extent in view of pepper's comparative cheapness, as against the price of red chillies. Consumers of pepper who took to red chillies owing to high prices of black pepper during the past couple of years, are now likely to revert to the use of peppers, as the commodity is getting cheaper. The present signs of weakness in the attitude of the growers appear to have emboldened some of the bears to go short in almost all positions locally as well as on the New York market, and it is reported that some short sales for December and January-Feb-March were done by the Indian exporters in New York at as low as $0.80 and $0.76 respectively. With the absence of offers from Lampong, India will have the market more or less to itself for the coming six months and knowing the past behaviour of growers, present level for short sales are considered dangerous by the intelligentsia in the trade.

Following are to-day's nominal quotations: Ready delivery Rs. 270-90 per cwt., December delivery Rs. 1,420-40 and February delivery Rs. 1,320-40 per candy of 5½ cwts.

RAW JUTE STEADY

(From Our Own Correspondent)

CALCUTTA, 2nd November

Very steady conditions were in evidence in all sections of the market during the week, and the feature was the impressive increase in prices of both raw jute and jute goods. Sellers were reserved, and this factor helped to hold the gains, although there were fluctuations in goods. Mills were in the market for buying impressive quantities of raw jute, and purchased as much as 600,000 maunds during the three days to Saturday. Stockists of raw jute expect mills to buy more and more, as demand for jute goods has reached a satisfactory level and it is necessary for mills to stock as much of the raw material as possible so that production can be planned much ahead. There is a strong opinion that demand, which is at present more than production, would soon wash away the accumulated stocks in their entirety, and that mills would have to consider the question of resumption of full working hours. There is no dearth of raw jute for producing all the goods needed. Northern bottoms gained Rs. 23-12 from Rs. 25-8 and daisee bottoms, which were preferred by mills, to Rs. 26-8 from Rs. 26. Assam supervised tossa bottoms changed hands at Rs. 27-8, and Pakistani jat bottoms had buyers at Rs. 27-8. Assam bottoms realised Rs. 25-8, Bimli was traded at Rs. 23, and Cossimbazar tossa bottoms invited interest at Rs. 28.

One of the notable events of this week was the placing of an official ban on forward trading in raw jute in any form except non-transferable specific delivery contracts.

Moderate business was put through in jute goods, and mills were reserved sellers for all positions. Orders were booked for deliveries up to April-June next. Expectations that stocks of jute goods, as at the end of October, would record a further welcome decline added cheer to the already lively trading conditions. Hessians 40" 10 oz. have now become difficult to be located, although no actual shortage is expected. The market opened steady last Tuesday, and the early rise was almost erased on account of the subsequent profit-taking. B. twills closing at Rs. 95-12 and 40" 10 oz. hessians at Rs. 45. Prices could not, however, decline in view of expectations of good business from overseas countries. On Wednesday, B. twills were pushed up to Rs. 97-4 and hessians to Rs. 46, the respective January-March goods advancing to Rs. 98 and Rs. 43-14 from Rs. 96-8 and Rs. 43. There was good amount of speculative buying of 40" 10 oz. hessians, as a result of which it is expected, normal flow of supplies would be affected during this month. On Thursday, prices were a little easy at Rs. 97-4 for B. twills and Rs. 45-8 for hessians 40" 10 oz. On Friday, the feature was the presence of moderate covering demand, which pushed B. twills to Rs. 98-2 and hessians to Rs. 45-10. Reports of further Argentine interest in hessians were noted by stockists. There was again keen activity by bears on Saturday who, on *account of the necessity to cover*, raised prices. B. twills reached a high of Rs. 99-12, with the January-March position crossing the hundred-rupee mark. Ready 40" 10 oz. hessians steadily rose to Rs. 46-4. During the week as a whole, D.W. flour bags gained to Rs. 117-8 from Rs. 115, and heavy Cees plain at Rs. 99 added Rs. 2-8. From Rs. 114, A. twills were pushed to Rs. 117-8. In the hessian section also impressive improvements were recorded in respect of other constructions not dealt with above. To-day quotations were fractionally lower, B. twills being priced at Rs. 99-4, and 10 oz. hessians at Rs. 46-2 f.a.s. and Rs. 50-3 f.o.b. The 8 oz. was quoted at Rs. 38-4 f.a.s. and at Rs. 41-8 f.o.b.

BASE METALS HESITANT

(From Our Own Correspondent)

CALCUTTA, 2nd November

Despite encouraging advices from foreign markets, prices of base metals in Calcutta fluctuated within narrow limits during the week. This was due to the hesitancy of consumers to enter into commitments. Manufacturers of metal products have experienced lately the problem of increasing stocks, as customers are inclined to delay taking delivery in view of the tight money conditions. Another difficulty experienced by manufacturers relates to securing of booking space on the railways, and there have been instances when the sender has had to wait for weeks together before consigning the goods. The railways have claimed that they have maintained a steady improvement in meeting commercial demands. Experience of senders has shown that facilities are becoming restricted. As compared to the previous weeks, tin was steady and the price rose by Rs. 3 to Rs. 401, although the closure was at Rs. 399. A Government enquiry for 50 tons was a feature, and stockists were comforted by the somewhat improved trend in the Far Eastern market. World production has indeed surpassed demand, and restriction in output, as in the case of Indian tea, is the favourite remedy of market men. Mercury was quiet at Rs. 493 a flask. Nothing of importance transpired in the copper section, where the electrolytic ingots were quoted at Rs. 163 and the fire-refined at Rs. 147. Zinc and lead were offered at Rs. 53-8 and Rs 63-8, respectively.

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figure except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. a Sales and amount written off. (k) Investments.

(D) Made up of an interim dividend of Re. 1-12 per share on 1,20,000 shares and final dividend of Re. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 888 in the debentures section:—

H Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium.

(b) Bearer bonds of Rs. 1,000 each repayable at par.

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

(e) Returnable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months' notice.

CONTROLS HAMPER PROGRESS OF COAL INDUSTRY

(Concluded from page 857)

lion in 1948 and rose to 30 million in 1949, 32 million in 1950, 34 million in 1951 and 36 million tons in 1952. This led to the belief that, during the current year, there would be a further increase, and that the industry was overproducing in relation to the offtake, including that proportion which is exported—or more specifically to the ability of the railways to transport the coal to every potential consumer. The true potential national consumption is almost impossible to estimate, as it is clear, for instance, that there would be an almost limitless demand for coal for brick-burning and domestic purposes if it were possible to deliver coal to the villages. It is, however, now apparent that the total production of West Bengal and Bihar in 1953 will not exceed that for 1952. The total raisings for the first six months of 1952 amounted to 15,327,178 tons, while those for the first six months of 1953 amounted to 15,204,840 tons. There has, therefore, been an overall decrease in output of 122,338 tons during the first half of 1953, as compared with the corresponding period of 1952.

"Turning to despatches, which are as important to a producer as raisings, the corresponding figures for the first half of 1952 and 1953 are 11,834,486 and 12,151,942 tons. There has, therefore, been an overall increase in despatches of 317,456 tons during the first half of 1953, as compared with the corresponding period of 1952.

"The picture is completed by comparing stock figures, total stocks at the end of July in 1951, 1952 and 1953 being 2,380,069, 3,371,877 and 3,286,030 tons respectively, i.e., between the middle of 1951 and the middle of 1952 stocks increased by practically a million tons, while during the last year they were reduced by only 85,847 tons, which is more than accounted for by the decrease in raisings.

"I do not suggest that these figures indicate tendencies likely to react to the benefit or otherwise of the national economy, as they are overall figures affecting all sections of the industry, but they show that overall production has decreased for the first time for very many years, in spite of the wish of the Planning Commission that there should be a progressive increase in production.

Transport

"The conclusion I draw from these figures is, not that coal production has outstripped demand, but that the improved rail transport position has not improved enough, and it is useless to plan for increased production unless transport is to be available. I cannot subscribe to the recent declarations of the Railway Administrations that surplus wagons are not being fully utilised. Our experience is that, until two months ago, we were unable to obtain all the wagons we required. During the past two months, when the railways have experienced the usual seasonal monsoon decline in the demand for wagons, we have been unable to obtain the wagons we have required to carry the coal to the destinations where it is needed. This, I believe, is largely due to the policy of rationalisation which has been pursued by the railways, and in particular by the Eastern Railway, which serves your collieries, during the present year. Instead of withdrawing restrictions, the railways have progressively increased geographical restrictions, with the result that the control over distribution is more acute now than in the difficult days when coal was in short supply and had to be distributed to essential consumers. In other words, the means, in the form of railways, is shaping the end, in the form of the coal industry and the consumer, and all sorts of routine restrictions are being imposed on the ground that this will economise rail transport. These restrictions are encouraged by the continued operation to-day of a system of controls designed in 1943 for famine conditions in the supply of coal, and of war-time demands—in fact, the complete antithesis of the present position.

"Indeed, the whole approach to controls, both by the Government of India and by the Railway Administrations, should before now have been reviewed and a new set-up devised appropriate to the changed circumstances. The broad concept of future control should be that, if production now equals, if it does not exceed, demand, there is in principle no call to restrict the user in the choice of his quality or of his supplier. This should bring us back very much to the position when priorities were regulated by the railways to ensure only that essential industries, services and shipments were adequately served. One is prompted to ask whether it is the policy of the railways to devise facilities to deal with the traffic offering, or to accept the defeatist policy of limiting traffic to the facilities available. The consumer should now be allowed a free choice regarding the type, quality and source of supply of the coal he requires. He will not draw coal from a greater distance than is absolutely necessary as the rail freight will be higher. It appears to be far too widely assumed that the quality and source which the consumer finds most economic will necessarily be uneconomic to the transport system.

Control Over Quality of Coal

"Before leaving this subject of controls, I must refer again to the control over the quality of coal permitted to internal and foreign consumers. As regards internal consumers, the Coal Commissioner's Combustion Engineers continue to visit mills and factories and submit reports which, they claim, justify that the plant or boilers can use coal of grades lower than that which they are using. This would have been reasonable if the experts had been available ten years ago when the amount of coal produced was not enough for industry, and when in particular there was a shortage of better grades. There is now no shortage of high grade coal for steam-raising purposes. Why, therefore, should a consumer be restricted in the choice of the type and grade of coal he buys? Obviously, he will not pay for better, and higher priced coal, unless it is in the interests of efficiency that he should do so. We in this managing agency have had recent experiences of the activities of these experts at our Paper Mill as a result of which the mill is forced to take one-third of its allocation in selected 'B' grade coal. This is a permanent source of worry to an industrial unit which has planned its boiler capacity to maintain steam from selected 'A' grade coal, and it has had a marked result on the productive capacity of the mill. Our figures show conclusively that, if the mill could have 100 per cent. selected 'A' coal at a small extra cost, we could produce more and better paper out of all proportion to the additional outlay on coal. I quote this specific example, as it is particularly apt, and as it illustrates how the present outdated controls are restricting the efficiency of industry generally.

Exports

"And now a word about exports. Immediately after the war, India was able to benefit by shipping coal to countries whose productive capacity had been impaired as a direct consequence of the war. In these conditions, your Company was able to make shipments to the United Kingdom, Australia, New Zealand, Japan, Denmark, Egypt, Italy and other Mediterranean countries, which could not, in normal circumstances, have been expected to import coal from India. The export market has now become extremely competitive, and India is forced back on her legitimate export sphere, which ranges from Hongkong in the East to Aden in the West, with particular emphasis on Malaya, Burma and Ceylon. In the Far East, China and Australia have emerged as competitors, and, while Australian coal has been shipped to Hongkong, Singapore and Chittagong, South Africa has re-entered the market by sending cargoes to Pakistan, Ceylon, Singapore, and even as far as Hongkong. Unfortunately, we have been obliged by controls to ship up to 50 per cent. of selected 'B' grade coal in the mistaken belief that there is not sufficient high volatile selected 'A' grade coal available for shipment. Nobody suggests that we should give away our best coal to the detriment of the internal consumers, but, at the end of September, we ourselves had 105,000 tons of selected 'A' Dishergarh and Poniati coal in stock, and yet were obliged to sup

PROMOTION OF TEXTILE EXPORTS

MR. T. T. Krishnamachari, Minister for Commerce and Industry, Government of India, did well to come down to Bombay to attend the meeting of the Cotton Textiles Fund Committee, held here this week, which is entrusted with the task of promoting not only technical research in the manufacture of cotton goods but also exports of these goods. This Committee, an organisation set up by the Government, has been very slow in producing an acceptable scheme for stimulating exports of Indian cotton piecegoods. It, therefore, had to be given a push and this Mr. Krishnamachari did on Tuesday last by explaining the Government's attitude towards the problem and by drawing the attention of the Committee to the urgency of tackling it successfully without any further delay. The keen interest evinced by the Minister in this subject and his commendably practical approach to it is symptomatic of the Union Government's anxiety to encourage exports and to give sufficient freedom to private enterprise to do this job.

One of the reasons why the millowners did not pay much attention to the move made by the Textiles Fund Committee to check the quality of cloth exported was that it contemplated a rigid scheme of inspection of cloth before shipment by a special directorate. This may no longer be a stumbling block to prescribing a suitable form of regulation for securing an improvement in the quality of export goods and, in particular, for seeing that these goods conform to the specifications laid down by the importer. For Mr. Krishnamachari made it quite clear, in his address to the meeting of the Cotton Textiles Fund Committee, that the Government was by no means keen on acting as a policeman in this sphere and that, on the contrary, he was anxious that a non-official body, with expert knowledge and free from the restraints of Government routine, should move quickly in the interests of the promotion of textile exports. He felt that the administration of quality control might be usefully left to this non-official body. On the controversial question of the exact form of this quality control, he was not in favour of the Government taking any hasty action which might interfere with the flow of exports from the country. He has, therefore, left it to a Sub-Committee of the interests concerned to go into the whole question and evolve a practical scheme for inspection of textile exports which would ensure for the foreign buyer good quality in his purchases of textiles from this country. This is undoubtedly a constructive attitude on the part of the Minister. It is now for the millowners and exporters to hit at a suitable plan. And this they must do without undue delay, if they wish to avoid bureaucratic interference in the highly complicated export business and, more important than this, to preserve the existing markets for Indian cloth and to find new markets for it in the face of keen competition.

If employment in the Indian cotton mill industry is to be maintained, if the industry's productive capacity is to be fully utilised and if the handlooms are not to face a depression, it is very necessary for this country to export 25 per cent. of its mill-made goods. The target of 1,000 million yards fixed at the Buxton Conference is the minimum to be reached. In these days of growing competition from cotton, as well as synthetic textiles produced by countries which have superior equipment, efficient labour, and talented salesmanship, this target cannot be hit, unless a vigorous export drive is launched. A special organisation to undertake this task is necessary. It is true that there is the Export Advisory Council. But it is a too unwieldy body, representing all sorts of interests, to fulfil this task successfully. Mr. Krishnamachari's suggestion for the formation of a non-official export council, which will be exclusively concerned with the promotion of textile exports, is, therefore, commendable. In fact, it deserves to be applied to all the other principal export commodities and manufactured goods also, in which case, of course, there will be no need to have the present Export Advisory Council.

The proposed Textile Export Advisory Council will have, according to Mr. Krishnamachari, four important functions to perform. First, it will have to ensure the quality of cloth that is exported. Secondly, it will have to collect market information in various important markets accurately and expeditiously. Thirdly, it will have to conduct effective publicity and propaganda in favour of Indian textiles in all the important markets. And, fourthly, it will have to collect statistics and disseminate information, from time to time, in regard to the progress of exports of Indian textiles. The Council will be assisted by permanent representatives in the more important markets and correspondents in the less important ones, who would keep the Council continuously informed about market conditions, designs, and the reception accorded to Indian textiles in their respective markets. All these functions, as well as the machinery suggested to implement them, are, we must say, appropriate and well thought out.

Where is the money to come from for carrying out all these functions? At the moment, this question does not present much difficulty. The Cotton Textiles Fund, though a diminishing one, has still a couple of crores of rupees to its credit. This Fund was built out of the proceeds of export duty on piecegoods exported in the years 1944 and 1945. It is only in the fitness of things that a part of this Fund should be spent on measures calculated to stimulate exports at a time when the buyers' market is in full swing. It may be that, in course of time, the resources of this Fund may be found inadequate to carry on the export drive. In such an event, the Government will have to provide a grant, as it is doing now in the case of the jute mill industry. Mr. Krishnamachari has already indicated that the Government is not averse to this idea. Thus, finance is not the problem; the real problem is essentially one of finding the right type of persons to man the Council and obtaining the co-operation of all millowners for drawing up a scheme.

There are no two opinions on the need for instituting a check on the quality of piecegoods and yarn exported from this country. Not all the mills, of course, can be accused of exporting goods of dubious quality. There are certain mills which have done pioneering work in establishing export markets for their production by supplying them goods of guaranteed quality. These have been successful in retaining their markets by sticking to quality, even at some sacrifice in their profit-margin, and by discharging their obligations to importers according to the terms of the contract. But, in recent years, many mills have entered the export market and have been sending cloth of doubtful quality, packed in a careless manner. Serious complaints that a number of mills has not been supplying goods according to the terms of contract have also been alleged. Delay in delivery, poor markings, defects in weaving, submission of incomplete invoices, and reluctance to settle disputes promptly are some of the other charges made against Indian exporters. An *ad hoc* survey conducted in certain selected mills in Bombay and Ahmedabad revealed that defects in respect of length, weight, picks, etc., were far less numerous than weaving flaws which spoiled the texture of cloth to such an extent as to bring a bad reputation to the country. These defects still persist, although a buyers' market has been in existence for nearly two years now, thereby disproving the contention of some that return of competitive conditions will automatically do away with the need for inspection. Only a few days ago, we came across a complaint from Canada, backed by solid proof, about a shipment of grey drill cloth produced by one of the big mills in Bombay under a well-known managing agency house. The cloth was supposed to be high-grade drill, but it was so poor in quality that it was classified, after proper laboratory tests, as "rejects." It contained considerable starch and very many weaving defects. This cloth was so defective that the importer, whose idea in buying it was to bleach and sanforize it, had to use it for making bags! Even the Millowners' Association, Bombay, which has been rather touchy on this subject, has always admitted the necessity for controlling the quality of cloth meant for export.

There is, however, a keen controversy on the form of control and the method of its administration. The Bombay Millowners' Association, for instance, has been contending that the suggestion made by the Export Sub-Committee of the Cotton Textiles Fund Committee towards the close of 1951, envisaging the establishment of a special organisation for inspecting cloth before shipment, is unworkable. The Association is of the view that, even with a large army of inspectors examining cloth before despatch for export, there will be scope for malpractices. It has adduced sufficient evidence in support of this view. During the war years, for example, despite an elaborate scheme of inspection, there were several cases of substandard material being despatched to the Ordnance Depots, even though such had been officially passed by the Inspectorate. It is indeed, pointed out that this scheme, if implemented, might do more harm than good. For, if, after the institution of inspection and certification, unsatisfactory materials were exported

from India, it would completely wreck all confidence in the commercial integrity of the country and nothing that individual mills have been doing to help promote exports would be of any avail. The Association's suggestion has been the adoption of a system of standard contract. Such a contract provides, the Association claims, several features which will adequately protect the interests of importers, without providing scope for corruption and malpractices, the inevitable evils of control.

The contract provides, to mention some of its advantages, for a correct description of the cloth, together with quantities, particulars of delivery, assortment, prices, etc., a standard requirement as regards packing, with every contract being supported by signed basis samples. It provides, besides, for grant of export samples, inspection by the buyer or his representative before the goods are exported, and defines the rights and liabilities of both the parties under the contract. Further, the contract provides for arbitration under the rules of the Association, in the event of any dispute arising from the contract which would give ample opportunities to the buyer to place his complaint before two impartial commercial arbitrators. What is more, compulsory obligation is to be imposed on the mills becoming party to any arbitration, even if it is held in certain overseas markets, and becoming liable, as though the award was made against them, in spite of the cloth being actually supplied to the overseas markets through a middleman. There is considerable force in this suggestion of the Association, but, for some reason or other, it does not seem to have received the unanimous support of the industry. If it had, it should have been working in full swing by now. The issue is thus a complicated one and it remains to be seen what satisfactory solution will be offered by the Sub-Committee of the Textiles Fund Committee which has been asked to draw up a practical scheme by the Commerce and Industry Minister.

Whatever scheme the Sub-Committee may recommend, it cannot, by itself, automatically lead to an improvement in the volume of India's export trade in cloth, unless every mill that participates in the export trade, is honest, subjects itself to self-discipline and makes a conscious effort to fulfil its commitments according to the terms of the contract. Many of the complaints from overseas markets could have been eliminated if all the mills had a regular system of inspecting cloth produced by them and of rejecting faulty production. Unfortunately, there are only a few mills in this country which have this system. Again, the defects in the quality of cloth cannot be completely eliminated, unless the workers cooperate and raise their efficiency, and the machinery employed is modern and up to date. The old and outmoded machinery, which accounts for the major portion of the industry's equipment, is as much responsible for low level of efficiency, poor quality of products and high cost of production, as bad management and indifferent labour. If the Indian textile industry is to make any sustained headway in the world trade in cotton textiles, these basic defects in it must be remedied as quickly as possible.

U. K.'S ACHIEVEMENTS

IT is now two years since the present Conservative Government in the U.K. was sworn into office under the dynamic leadership of Sir Winston Churchill. It came to office at a time when the country was passing through a crisis in its balance of payments position, and a further devaluation of the pound was the most popular of the market rumours. The threat to world peace still loomed large. It commanded but a narrow majority in Parliament—a position which has not changed significantly since then. After two years of strenuous work, it can look back on some solid achievements to its credit. Last week, when Queen Elizabeth II addressed the Houses, followed by the British Premier, Sir Winston Churchill and the Chancellor of the Exchequer, Mr. R. A. Butler, there was quiet optimism in all that they said. Neither the Premier nor the Chancellor boasted of spectacular results. But the speeches did ring true whenever references were made to what the Government had done.

What then have been the results? First and the foremost of Britain's achievement has been in the field of balance of payments. No longer does Britain face the crisis in its external trade position, which was by far the most serious problem it faced in 1951. The following tables summarise the volume and value of total imports and exports of the U.K. during the third quarter of 1953, compared with earlier periods:

Period	Trade as declared	Index Numbers	
		Average value	Volume
U.K. Exports:	(£ million)	(1950 = 100)	
1953—			
3rd quarter ..	634.7	118.7	97.1
2nd quarter ..	630.0	119.6	95.7
1st quarter ..	625.6	121.2	93.7
1952	2,583.6	123.5	95.0
1951	2,614.0	117.3	101.2
1950	2,202.4	100.0	100.0
Total Imports:			
1953—			
3rd quarter ..	824.4	113.2	111.6
2nd quarter ..	875.0	115.4	116.1
1st quarter ..	817.1	117.7	106.4
1952	3,483.5	129.5	103.0
1951	3,905.9	133.0	112.5
1950	2,611.4	100.0	100.0

It will be seen from the table above that the deficit invisible external trade, witnessed in 1951, was converted into a surplus in 1952, though this had been achieved only through a sizable reduction in imports. Judging by these figures, the outlook for the current year is not very bright. But then, one will have to take into account the invisible items of trade too. The following table gives the overall picture of Britain's external trade:

U.K.'s External Trade (Current Account)

(£ million)

	1951	1952	Jan.-June 1953
Total debits .. .. of which	4,283	3,771	1,835
Imports	3,496	2,927	1,457
Total credits .. .. of which	3,869	3,919	1,861
Exports and re-exports ..	2,749	2,825	1,317
Balance (credit+ debit—)	—414	+148	+28

The improvement in the balance of payments position is reflected in the U.K.'s decision to relax restrictions on its import trade with the E.P.U. countries. It is also reflected in the sterling area's gold and dollar reserves. Elsewhere in this issue, the movement of these reserves has been reviewed at some length. These reserves, as a reference to the article will show, stand at $2,520 million as at the end of October, 1953, as compared with $2,486 million at the end of the previous month and $1,685 million at the end of the third quarter of 1952.

More impressive to observers outside the U.K. are the great efforts that are being made by the present Government to return to freedom of trade. Many materials, such as grains and non-ferrous metals, which were subject to centralised buying, have been returned to private hands. Rationing restrictions have been relaxed or ended in the case of a large number of commodities. Steel and transport have been denationalised. This has been made possible not only by world factors, such as the easier availability of commodities, notably grains, but also by the continuing high level of industrial production. The index number of industrial production (Base: 1948=100) was 110 for July, 1953, though it was much higher in May and June, this year, at 123 and 118, respectively. The average for 1952 as a whole was 114 and for 1951, 117. Provisional estimates of production in September, 1953, place it at as high as 125-126. Many industries have shared in this increase in production. The output of food, drink and tobacco has increased over the level in 1952 by 6 per cent., of vehicles by 6 per cent., of textiles by 30 per cent., of clothing by 15 per cent. and of chemicals by 14 per cent.

How have these results been achieved? What is the mainspring of the recent upsurge in business activity in the U.K.? Apart from Britain's traditional national virtues of hard work, perseverance and grit, which the country continues to possess despite the recent trend towards the soft life under a Welfare State, the main reason for Britain's recovery must be sought in the sense of realism which the present Government has brought to bear on the country's economic policies. In his buoyant survey of the Government's intentions, Sir Winston Churchill emphasised that their main aim was to reduce controls and restrictions and to reverse, if not to abolish, Socialist method of purchase and marketing. He added: "We hope instead to develop private enterprise, founded on the law of supply and demand, and to restore to the interchange of goods and services that variety, ingenuity and incentive on which we believe the fertility and liveliness of economic life depend." Mr. Butler spoke in the same vein. He claimed that the Government's policy was to move towards the operation of the economic mechanism of freedom of initiative and to give the individual the opportunity of expansion and development without which the country could not be saved. The aim is thus to restore the ancient Anglo-Saxon virtue of personal initiative and effort. In fine, the present Government is determined to see that freedom is restored to as wide an area of economic activity as possible. Here is something which this country, still struggling hard to attain economic stability, might well ponder. If the U.K., which depends on imported food and on imported raw materials, such as cotton, to a relatively larger extent than India, can adopt bold policies of freedom for private enterprise, is not this country unduly cautious when it refuses to make a move in the same direction? Although national characteristics vary, they do not differ so widely as to eliminate human nature. This is evident from the fact that, even in this country, the sectors which have shown the most outstanding results—food and textiles, for instance—are those which have been rescued from the strangle-hold of bureaucratic restrictions. What Indian economy needs to-day are the invigorating air of freedom and some incentive for enterprise.

All this is not to suggest that the U.K. is out of the economic wood. Perhaps, Mr. Butler knows this more than any other person, for he emphasised that, although a "remarkable improvement" had taken place in Britain's internal position, "miracles could not be expected." Much has been done. But much remains still to be done. There is no knowing whether, and if so when, the pound will become convertible. And what is more, it must be remembered that even the achievement in the sphere of external trade could be wiped out, if there were further wage inflation. Mr. Lionel Robbins estimated recently that a wage inflation of 10 per cent. relatively to wages elsewhere would price Britain out of a great many markets. Mr. Butler, therefore, rightly pleaded for both dividend and wage restraint. It also remains to be seen how well the U.K. would be able to stand up to the steadily rising competition from its old rivals, Japan and Germany. In saying "Well done" to Britain, one must, therefore, be careful not to overdraw the picture. Nevertheless, if Britain's performance in the last two years is any guide, it should be able at least to maintain its rate of progress.

LIVERPOOL COTTON MARKET

THE U.K. Government has taken one more step towards freedom for trade through its decision to wind-up the Raw Cotton Commission, as soon as possible, after 31st August next. Many commodities, including non-ferrous metals and grains, have already been returned to private trade. Last year, the Government gave partial freedom to cotton users who were permitted to make their own arrangements for the import of cotton. About 30 per cent. of the spinners chose to avail themselves of this opportunity. This year, the proportion rose to 56 per cent. Obviously, the British Government now feels that the entire cotton import trade could be safely entrusted to private channels. Lord Woolton, Minister for Materials, announced last week that the Government intended to enable the private cotton futures market to reopen at Liverpool and that steps would be taken to wind-up the Raw Cotton Commission.

Towards this end, the Government has framed a new Cotton Bill. The purpose of the Bill is to provide the necessary facilities—without restrictions except on re-export—to obtain cotton from all sources, so that a private futures market could be reopened. The Bill seeks to end the activities of the Raw Cotton Commission which will cease to provide cover for the industry at the end of August next year. It will thus remove the Commission's obligation to buy, import and sell all the raw cotton needed by the U.K. industry. This change takes place immediately the Bill becomes law with retrospective effect from 1st September, 1953.

The termination of the functions of the Raw Cotton Commission removes the main obstacle in the way of the resumption of the Liverpool cotton futures. So long as the Commission remained, some mills would continue to use its services. Its removal would compel all the mills to make their own arrangements for the import of cotton, or, more generally, to utilise the private trade channels for this purpose. There is, however, one more obstacle before the Liverpool Cotton Exchange, closed since 1941, could resume its services. This obstacle relates to the restriction on the import of dollar cotton. It would appear that freedom for the import of American cotton could be conferred on the trade any time by changes in administrative regulations.

BUSINESS MEN SLIGHTLY OPTIMISTIC

UPWARD TREND IN JUTE AND JUTE GOODS—PLIGHT OF ELECTRICITY UNDERTAKINGS

THURSDAY, 5 P.M.

THE Hindu New Year has been received by the business community in a spirit of mild optimism. Although the trend of prices in *Moorat* trading was not uniformly upward in all the markets, business men were in good cheer. For some inexplicable reason, they all felt that the new year would bring prosperity to the country.

MARKET GOSSIP

A few, however, argued that this was not a mere formal sentiment on an auspicious day but that it had some substance behind it. Their contention was that pressure of circumstances would force the Governments to follow a more realistic economic policy, giving a little more freedom to private enterprise. The Taxation Enquiry Commission would submit an interim report and any recommendation that it might make could not but be in favour of a reduction in the burden of taxation, so ran the thoughts of this section of business men. It expected also a further relaxation in the credit policy of the Government and a reduction in the Bank rate in the coming summer, on the eve of the flotation of new loans by the Central Government. The downward trend in prices of raw materials and food was not interpreted by it in a bearish manner, as some seem to do. On the contrary, it was regarded by this section as a pointer to lower cost of living and an improvement in the purchasing power of the rupee. It is easy to counter these arguments and paint a convincingly pessimistic picture. That, however, will serve no useful purpose. To hope for the best is always better than to fear the worst, even if there be some justification for it. There is no doubt that general economic conditions in the country are still inherently sound and that it is not yet too late to take the country back to the path of swift and sound progress, provided the powers-that-be, both in the Centre and the States, give up their fads and reorientate their economic policies on realistic lines. It is to be devoutly hoped that wisdom will dawn on them before it is too late.

• • • •

Over the week, equity values do not show much appreciation. On the other hand, the number of scrips which have suffered losses is greater than those that have registered some gains. This suggests that the curve which has been moving upward in recent weeks is once again tending to flatten out, albeit at about the high levels seen during the past few days. If it does so, it will be the most logical thing to happen, for the rise in prices has been due more to speculative activity than to genuine investment buying. The cushion provided by the large short position, which had existed for a long time now in some of the leading counters, seems to have thinned down for the present. The significance of this situation is that the market may be more vulnerable to adverse developments than ere now.

• • • •

Although the performance of equities during the first week of the Hindu New Year has not been as encouraging as in the closing weeks of the old year, some of the scrips have been displaying renewed strength since Tuesday last. Notable among these are the cotton textile shares in Dalal Street and jute shares in Clive Street. This, however, is understandable in the light of slightly encouraging reports from the cloth and gunny markets. The turnover in cloth has improved perceptibly at steadily hardening rates. It is not possible to give a precise indication of the extent of improvement in this market, but it is reported that prices have looked up by 8 to 10 per cent., since the reliefs announced by the Government of India a fortnight back. A description of the gunny market is given in subsequent paras. It will be seen therefrom that, in the past one and a half months, both sackings and hessians have risen in value by about 12 per cent. These developments are doubtless encouraging, but it is too early yet to draw the conclusion that the jute and the cotton textile industries are out of the wood. Investors in the shares of jute and cotton mill companies will, therefore, do well to make a cautious move, for reasons mentioned in these columns last week. An additional point to be made here in regard to jute shares is that the rise in raw jute has been steeper than in that of jute goods. Scope for selective buying, however, may be there, because companies under prudent management ought to be in a position to report fairly good profits and pay decent dividends.

• • • •

Two important companies, the shares of which are active counters on the Stock Exchange, have announced their dividend results this week. One is the Indian Iron and the other Bombay Burmah. To take the former first, the dividend at the rate of Re. 1 per share is in accordance with the expectations of the market. The only element of surprise about it is that it was announced a little earlier than expected. Market circles were feeling that, in view of the recent strike in the I.I.S.Co.'s works at Burnpur and of the delay in the Tariff Commission's decision on the Company's plea for raising the retention price for its products, there would be some delay in the publication of the Company's accounts and payment of dividend. They have, of course, been correct in holding that view, for the Company's accounts have not yet been published. But the Directors have sprung a pleasant surprise on the market by deciding to let the shareholders have their return in the form of an interim dividend. They have, of course, made it clear that there will be no final dividend and that what is now declared as interim will be the only distribution for the year ended 31st March, 1953.

• • • •

The I.I.S.Co.'s dividend result has been well received by the market. Pricewise, however, it has had no appreciable effect on the Company's shares. But the continued firmness of this scrip is due partly to the strength of jute shares and partly to the Company's production results for October, 1953. During this month, the Company produced 55,800 tons of pig iron and 17,850 tons of finished steel, as against 21,320 tons and 2,840 tons, respectively, in September, 1953. A comparison with the production in the previous month cannot give a correct indication of the Company's progress, for the simple reason that the Burnpur Works were not working at full pressure throughout that month. A comparison with the output in some of the months before the strike commenced will be the proper thing to do. Such a comparison will show that, in the month of May, when a section of the workers indulged in go-slow tactics, the output of both pig iron and finished steel was higher than in October, the exact quantity turned out being 57,810 tons and 19,700 tons, respectively.

• • • •

The Bombay Burmah Trading Corporation has announced a final dividend of 8 per cent. for the year ended 31st May, 1953, as against 12 per cent. for the preceding year. It will be recalled that, in August last, the Company paid an interim dividend of 4 per cent., as against 6 per cent., the corresponding distribution for the previous year. Thus, the Company has reduced both the interim and final dividends for 1952-53, the total for the whole year being 12 per cent., as compared with 18 per cent. for 1951-52. In other words, there has been a cut of 33⅓ per cent. in the dividend. This is not surprising, considering that the prices of tea realised during the major part of the year were poor and unremunerative. In fact, having regard to this development and to the unsatisfactory trading conditions in timber in the past year, even a return of 12 per cent. must be considered satisfactory. Incidentally, the market seems to have anticipated a cut in the final dividend also, for the trend of the Company's shares even during the recent upward movement of equities in general was not impressive. After rising from Rs. 323-2 in September to Rs. 346-14 a few days ago, they were hammered down from Rs. 343-12 on the *Moorat* day to Rs. 323-12 on Monday. Thereafter, there was a slight recovery, the closing rate being Rs. 330-10. At this rate and on the basis of a dividend of 12 per cent. per annum, the yield works out to a little over 4.5 per cent., free of income-tax. This is doubtless too low a yield as compared with what can be had on other first class shares, but a point that needs to be borne in mind, in this connection, is that the Company's financial position is quite strong and its management is efficient, as well as enterprising. Further, tea prices in recent months have gone up and it is not unlikely that the Company will be in a position ultimately to show better results for the current year.

• • • •

The jute and jute manufactures markets in Calcutta have been displaying a firm trend. They have evidently shaken off the lethargy one witnessed in the fortnight following the cut in hessian export duty on 15th September last. Cheerful conditions which came to prevail early in October have persisted since then. Under sustained speculative activity, prices of both jute goods and raw jute have made an impressive headway. Despite intermittent profit-taking, both hessians and sackings have forged ahead and their quotations to-day are about 12 per cent. higher than they were early in October. The improvement in the prices of raw jute was more pronounced than in those of finished goods, in that they have, in the course of the past six weeks, registered a rise of 27 per cent., notwithstanding the ban imposed on futures trading in the raw material.

• • • •

A clearer picture of the rise in prices can be had from the fact that B. twills have risen, in this period, from Rs. 91 per 100 bags to Rs. 101-10, and hessians 40 oz. x 10" from Rs. 43 per 100 yards to Rs. 48-8 in the ready section. Forward positions, too, are higher. It is reported that, in recent weeks, hessians were in good demand and that mills have booked orders upto March, 1954, and in some cases even upto June. A feature of the market is the keen demand for jute goods specialities which are free from export duties, but sellers in these are few. Accordingly, only stray deals are reported and that too at substantial premiums. Much of this firmness in hessians is attributed to bear-covering induced by favourable overseas advices. But the U.S.A. has shown no inclination to follow the increase in prices.

• • • •

The improvement in sackings is more significant. Although some of this improvement has been in sympathy with hessians, the main cause for the boost is the marked reduction in sacking stocks at the end of October. The I.J.M.A. figures reveal that they stood then at 70,100 tons, as compared with 79,800 tons a month previously. Besides, there have also been genuine overseas enquiries. Further, some exporters who had sold to Burma without cover in the futures market have been making feverish purchases for delivery before next shipment. It is also expected that both Australia and New Zealand, which have stayed away from the market for a pretty long time now, will resume their purchases sooner or later. And what is more, the bullish sentiment seems to have been strengthened by the belief, as has been pointed out by the *Financial Times*, London, that "a good demand for both jute and jute goods is likely to outlast this year." At the same time, the warning sounded by that paper to the effect that any sharp increase would again bring jute into competition with cheaper substitutes has, however, not yet made itself felt on the speculators.

• • • •

In the raw jute market, a firm undertone is noticeable, though at the current high levels, with Assam bottom ruling at about Rs. 27 to Rs. 28 per maund, mills are not showing much interest. They seem to be now fairly well stocked with raw jute, having made purchases to the extent of about two lakh maunds in the course of a couple of days last week. The low forecasts of the jute crop in Pakistan by officials of the Pakistan Government, the increase in jute prices in the U.K., the rising burlap consumption in the U.S. and the better competitive ability of Indian jute mills *vis-a-vis* their confreres in Europe have induced a robust optimism about the outlook for raw jute. Stocks with the trade have considerably gone down and arrivals from up-country centres have slowed down for two reasons. First, wagons seem to be not available freely for transporting jute from stations in North Bengal to Calcutta. Secondly, having been preoccupied with paddy-harvesting cultivators seem to be not keen on disposing of the jute held by them. Of course, large quantities of Pakistani old crop are on offer but buyers are chary of entering into commitments, because of the disappointment experienced by them regarding deliveries in the past.

• • • •

Inscrutable are the Government's ways at any rate so far as the electricity industry is concerned. There is no dearth of speeches made, emphasising the need for generation of electricity for industrial purposes, for bringing light to the dark homes in the rural areas, and for equipping the small-scale industries with power-driven machinery in order to enable them to increase their production. But when it comes to taking the necessary decisions that will enable the electricity undertakings to augment their capacity or will enable new units to start functioning, there is not only no willingness on the Government's part to concede the legitimate claims of the industry for an adequate return but even positive obstruction. The paradox is, in fact, too apparent to escape notice. And yet, it still escapes the Government's attention. Mr. K. G. Milne, Chairman of the Federation of Electricity Undertakings in India did well, therefore, in his forceful, ably-argued address at the recent annual meeting of the Federation, to draw the Government's attention to the many obstacles which block the way to larger production of power in this country.

• • • •

The chief of these obstacles is, of course, the Government's failure to grant even a small increase in the basic rate of return on investment which is now fixed at 5 per cent. The industry has consistently pleaded, during the last two years, for an increase in this rate, on the ground that it is inadequate to attract new money to the industry. But the Government has turned a deaf ear to these representations saying that it is unable to spare its Parliamentary time for moving the necessary amendments to the Electricity (Supply) Act. In this connection, Mr. Milne said: "The Bank rate may go up, the interest rate on Gilt-edged securities may in sympathy move forward, the fully secured loans of the Central Government's own Industrial Finance Corporation may even demand an interest rate as high as 6¼ per cent; and all these by executive moving in response to the day-to-day pressure of economic laws. Yet our request for a modest increase of one per cent. (making 6 per cent.) in the basic rate of ordinary equity risk return to be permitted to the investor in the electricity supply industry has to be taken before the seat of the Government itself, and for two years has been kept waiting in vain to get that far."

• • • •

Anticipating the possible objections to the industry's demand for an increase in the legal limit of return, Mr. Milne said that the Government was probably thinking that certain large electricity undertakings had been able to raise equity capital, despite the restriction on return, and that the level of dividends had not appreciably fallen. Answering these objections, he said that, if some companies had been able to raise equity capital, it was due to the "persistence of the confidence of habit among the investing public, coupled with an element of anticipation that the Government would soon accept the strength of the industry's case for raising the rate of return." So far as the second objection was concerned, he warned that it was due to such "lingering strength" as remained in the companies' past revenue reserves.

• • • •

Yet another problem which faced the industry was that of double taxation, which arises from the difference between the law of income-tax and the electricity legislation in the matter of taxation of electricity companies. In this connection, he said: "Having failed so far to persuade the revenue authorities to amend the income-tax procedure, attention, for the present, has been switched to certain income-tax appeals pending before the Appellate Tribunal in Bombay and the High Court in Madras." An equally serious source of trouble for electricity companies lies in the Companies Bill, for the Bill's provisions relating to the remuneration of managing agents are materially different from those of the Electricity (Supply) Act. Mr. Milne recognised that the Bill specifically laid down that its provisions in relation to electricity undertakings would hold good only in so far as they were not repugnant to the provisions of the

EQUITIES REVIVE AFTER EARLY DECLINE

BOMBAY BURMAHS WEAK

(From Our Own Correspondents)

BOMBAY, 12*th November*

TWO-SIDED movements in prices characterised trading on the Stock Exchange during the week under review. Early in the week, bearish sentiment was in evidence during the *Moorat* session and widespread losses were noted all round. The New Year, however, opened on a cautious note; but gradually, confidence revived and a certain measure of stability was achieved, as small replacement buying and covering by short sellers paved the way for a recovery of the major portion of the losses suffered during the *Moorat* transaction. The closing levels for the week were, therefore, slightly lower than those at the close of last week in most of the counters.

Activity was once again influenced by the behaviour of the textile shares during the week. During the *Moorat* session these shares bore the brunt of selling pressure, reflecting the operators' apathy towards the Textile Commissioner's statement indicating the Government's disinclination to grant any further concessions to the textile industry by way of reduction or abolition of export and excise duties. The wave of selling which followed in textile shares spread to other sections also. The revival during the latter part of the week was attributed to the Commerce Minister's proposal to form a Council for Promotion of Textile Exports. Further, the reports that some mills in Bombay had booked orders for their cloth for some months ahead also fanned speculative enthusiasm. However, activity was not as large as in the previous week.

In the steel section, the notable event of the week was the decision of the Directors of the Indian Iron and Steel Co. Ltd., to maintain the dividend for the year 1952-53 at Re. 1 per share. This was in accordance with the general anticipation in market circles. The shares of the Company maintained a steady front, moving between Rs. 25-14½ and Rs. 25-7 till yesterday. But to-day the shares hardened to Rs. 25-10½ on speculative support. Tata Deferreds dropped during the *Moorat* session on Friday from Rs. 1,943-12 to Rs. 1,935 and the recession continued on Monday also, when they touched a low of Rs. 1,923-12. Subsequently, there was, however, a recovery to Rs. 1,941-4 at the close. Tata Ordinaries were featureless and after experiencing narrow movements, finished a fraction better at Rs. 329.

In the textile section, Bombay Dyeings dropped from Rs. 392-8 to Rs. 381-4, but in the latter recovery, they could not regain their earlier losses completely. They finished, therefore, with a loss of Rs. 4-6 at Rs. 388-2. After an initial recession from Rs. 295-8 to Rs. 290, Kohinoors were concerned in strong speculative buying by a "syndicate." The scrips shot up, as a result, to Rs. 300-8 to-day before closing at Rs. 298-4. It will be noted that for the first time after nearly three months, Kohinoors crossed the Rs. 300 mark to-day. Central Indias finished with a small loss of Re. 1-8 at Rs. 165. Centurys picked up Re. 1-8 to Rs. 274-8, Gokaks a rupee to Rs. 242, Khataus as much as Rs. 16-4 to Rs. 196-4, New Greats a rupee to Rs. 160. Simplex dropped Re. 1-12 to Rs. 149-4, though at one time during the week they had touched a low of Rs. 144-8.

Bank shares were quiet and small losses were noted over the week. Barodas lost Re. 1-4 to Rs. 107-12, Centrals a fraction to Rs. 63-8, their new shares to Rs. 65-12, Indias Rs. 2 to Rs. 153-12, Imperials (F.P.) Re. 1-4 to Rs. 1,826-4 and Contributories Rs. 5 to Rs. 451-4.

In the electricity section, activity was mostly centred round the Tata Hydro group shares. Andhra Valleys were wanted Rs. 5 better at Rs. 1,277-8, their Rights Rs. 8-12 higher at Rs. 170 and Coupons Rs. 2-8, at Rs. 34-8. Tata Powers held their own at Rs. 1,370, while Rights hardened by Rs. 8-12 to Rs. 241-4 and Coupons by Rs. 2 to Rs. 48. Tata Hydros put on Re. 1-8 to Rs. 140, Rights Re. 1-4 to Rs. 25-4 and Coupons As. 12 to Rs. 9.

In the miscellaneous section, Alcocks wound up the week Rs. 2-8 lower at Rs. 328-12 and Belapurs Rs. 7 down at Rs. 259-8. A.C.Cs were steady around Rs. 176-12. Bombay-Burmahs proved a sad spot as on continued selling pressure they lost Rs. 15 to Rs. 330-10. The Directors of the Company have reduced the final dividend for the year ended 31st May, 1953, to 8 per cent. from 12 per cent. paid for the previous year. B.I.Cs were a feature with a rise of As. 7½ to Rs. 9-3½ on consistent buying from Calcutta. Killicks improved by Rs. 3 to Rs. 160.

• • • •

Calcutta Stock Exchange

CALCUTTA, 11*th November*

Despite the intervening holidays on account of *Kali Puja* and *Diwali* festivals, there was a broadening of activity on the Calcutta Stock Exchange during the week under review. Operators evinced keen interest in business on expectations of better trading conditions in the coming weeks. Firmness of the jute goods market and bullish advices from Bombay further hardened the sentiment of the market. The volume of transactions put through was fairly large with values of scrips moving upwards. The undertone of the market was fully steady.

Trading in the engineering section was particularly brisk this week. Speculative activity continued to be in marked evidence in Indian Irons, as the dividend of Re. 1 per share, announced by the Directors, was in accordance with the market's expectations. Further reports regarding steady uptrend in production at Burnpur Works and rumours of an early announcement of higher retention price for steel produced here also helped to strengthen the tone in these shares. The quotation for Indian Irons moved up from Rs. 25-4 to Rs. 25-10 and subsequently declined to Rs. 25-4 on profit-taking following the announcement of dividend. The announcement regarding the issue of bonus shares by Burn and Co., Ltd., led to a notable rise in the value of these scrips. They moved up from Rs. 337 to Rs. 342.

The jute section provided a bright spot, with improvement spread over all important counters. Notable among these were Anglo-Indians which rallied 20 points to Rs. 231 and Kinnisons which gathered Rs. 11 to Rs. 204. Howrahs were dealt in at Rs. 25-1, as against Rs. 24-3 early in the week. Deltas improved from Rs. 229 to Rs. 233.

Miscellaneous scrips were well maintained with B.I.Cs improving from Rs. 8-11 to Rs. 9-6. Calcutta Trams were better at Rs. 13-1.

The coal section, however, proved an exception and displayed easy conditions on reports of a downward trend in exports. Burrakurs came down to Rs. 8-12 and so also Central Indias to Rs. 5. Talchers lost As. 2 to Rs. 2-9.

• • • •

Madras Stock Exchange

MADRAS, 10*th November*

The Madras Stock Exchange ruled distinctly bright during the week under review. The steady undertone of the Bombay market lent some support. Textile scrips ruled steadier on reports of better offtake of piecegoods at the various consuming centres. Besides, cloth export advices were encouraging. Among plantings, tea scrips came in for brisk trading, on better prices fetched in tea auctions held at Calcutta. The performance of rubber scrips too was encouraging on speculative enquiry. Miscellaneous scrips proved no exception to the generally cheerful sentiment of the market. As a result, the volume of business done in the market was considerable and prices recorded sizable gains over the week.

Textiles were very active with favourites coming in to record sizable gains. Metturs shot up from Rs. 197 to Rs. 201. Venkateshas were higher by Rs. 3 at Rs. 70. P. Andavars 'A' and 'B' put on Rs. 2-8 each to Rs. 68 and Rs. 93, respectively. Bangalore Woollens were done at Rs. 272-8, as against Rs. 270. Balasubramania Rs. 40 paid-up and Rs. 70 paid-up, gathered Re. 1 each to Rs. 35-8 and Rs. 59, respectively. Krishna Rajendras too were higher by a similar amount at Rs. 48-8. Cambodias were better by As. 4 at Rs. 11 and Travancore Rayons by As. 2 at Rs. 5-5. Maduras, however, lost As. 4 to Rs. 39-4.

Among plantings, teas met with selective enquiry. Parkside disclosed a gain of As. 10 to Rs. 14-12 *cum-div.*, and Peermades As. 4 to Rs. 26-8 *cum-div.* Kalasas rallied As. 2 to Rs. 10-4, and Chembras an anna and a half to Rs. 2-12½. Periakaramalais and Chandramalais were slightly better at Rs. 7 and Rs. 3 *cum-div.*, respectively.

Rubbers too were active. Malankaras shot up by Rs. 3 and finished at Rs. 106. Vaikundams improved by As. 12 to finish at Rs. 15-12. Rajagiris gathered As. 8 to Rs. 13-6. Pullangodes advanced by As. 2 to Rs. 3. Cochin Malabars and Velimalais were better at Rs. 6-12 and Rs. 2-6, respectively.

In the miscellaneous section, Mysore Tobaccos advanced by As. 8 and finished at Rs. 10-6. E.I.D. 'B' Sugars were higher by As. 6 at Rs. 21-12. Mysore Chromes hardened by As. 4 and closed at Rs. 5-4 *cum-div.* Mettur Chemicals were up by As. 2½ at Rs. 4-11½.

(Concluded from next column)

Rs. 30 lakhs. Provision for taxation is as much as Rs. 90.24 lakhs and current liabilities stand at only a modest level of Rs. 40.96 lakhs. The gross block, at Rs. 69.24 lakhs, has been written down to a mere Rs. 13.91 lakhs. The current assets amount to Rs. 243.99 lakhs and exceed current liabilities and tax provisions by the huge margin of Rs. 130.79 lakhs.

BELAPUR'S PROFIT A SHADE LOWER

DIVIDEND REPEATED—FINANCES SOUND

AFTER having raised the dividend in three successive years, from 16.75 per cent. for 1948-49 to the record level of 32 per cent. for 1951-52, if the Directors of the Belapur Company, Ltd., as was mentioned in these columns last week, have chosen to repeat the dividend for the year ended 30th September, 1953, at 32 per cent., it suggests at once that the results for the latest year must have been equally satisfactory, if not more encouraging. The audited statement of accounts of the Company for 1952-53, now available, shows that the Directors' decision to repeat the dividend is amply justified. The year under review, the Directors state, was once again highly satisfactory and a record one in several respects. The earnings have been nearly maintained at the previous year's level, the gross profit for the year being Rs. 56.29 lakhs, as against Rs. 57.40 lakhs for 1951-52. This small recession in gross profit is stated to be due to the imposition of the temporary excise duty introduced by the Government of India on 6th November, 1952, and continued throughout the season.

The following table brings out clearly the salient features of the Company's results for the year under review, as compared with those for the previous four years:

(In thousands of rupees)

	Year ended 30th September				
	1953	1952	1951	1950	1949
Sale proceeds ..	1,77,62	1,18,55	93,77	1,12,00	1,05,09
Closing stock ..	14,37	41,19	19,28	1,04	58
Excise duty and sugarcane cess ..	28,10	17,62	13,55	16,02	12,94
Other expenses ..	68,57	63,25	58,83	57,02	54,19
Gross profit ..	56,29	57,40	45,28	42,63	39,28
Managers' remuneration.	5,73	5,90	4,67	4,40	4,05
Depreciation ..	4,76	5,48	4,95	4,77	3,77
Taxation ..	21,00	20,00	15,00	14,40	16,00

	(32%)	(32%)	(28%)	(25%)	(16.75%)
Carry forward ..	64	80	52	52	56

Commenting on the trading conditions that prevailed during the year and the working of the Company in particular, the Directors observe as follows:

"Sugar is still sold by releases under directions from the Government of India, and this year releases, while unsatisfactory in the early stages of the season, which resulted in the storage of large quantities of sugar and the locking up of substantial amounts of money, did ultimately work more satisfactorily, and, as will be seen, the stocks at the closing of the year were at reasonably low levels. An outstanding feature in the industry was the disclosure by the Government of India that the consumption of sugar throughout India had been very much higher than they had anticipated and this led to the import of foreign sugar by the Government of India.

"The efficiency of the factory was maintained at a high level during the year and the 'recovery' of sugar produced on cane established a new record. On the estate side also, new records were achieved in the amounts of cane, and sugar recovered per acre. We still grow under Government direction food crops on our estate and in the course of time this must have some effect on the fertility of our soils. No outside cane was available for purchase in the neighbourhood during the year, due to the very high price which prevailed for *gur*."

It will be noted that, although the gross profit for 1952-53 is a shade lower than that for the previous year, it is the second best since 1948, when the industry was free from control and when the Company made a record profit of Rs. 66.43 lakhs. So far as the allocation of net profit is concerned, there has been a slight deviation from the previous year's allocation. No sum has been set aside for crop insurance fund which had received Rs. 1.36 lakhs last year. Provision for the housing scheme has, on the other hand, been stepped up from Rs. 5 lakhs to Rs. 7 lakhs and the transfer to the reserve fund has been maintained at Rs. 3 lakhs. The stepping up of the allocation to the housing scheme is an indication of the Directors' keen desire to provide housing facilities for the Company's workers. The Company's scheme for housing many of its workers is said to be now nearing completion. It is expected that this will be formally inaugurated early in December this year.

The Company's financial position is quite sound. The reserves and surplus aggregate Rs. 79.70 lakhs which are equal to more than 150 per cent. of the paid-up capital of Rs. 47 lakhs. The reserves include a general reserve of Rs. 27.50 lakhs, crop insurance fund of Rs. 10.20 lakhs and housing scheme fund of

(Continued in *previous* column)

NEWS IN BRIEF

INCOME-TAX collections during the first six months of the current financial year amounted to Rs. 58.18 crores.

During the five years ended 1st September, 1953, a sum of Rs. 9.93 crores has been paid to coal miners who had subscribed to the Coal Mines Provident Fund Scheme.

The Government of India has granted a loan of Rs. 6.5 crores to the Madras Government for execution of three irrigation projects, under the Five-year Plan as revised by the Planning Commission.

The Madhya Pradesh Government has decided to give *taccavi* loans to the extent of seven times the land revenue, to persons receiving land under the *Bhoodan* movement, provided funds are available and collateral security is offered.

The Government of India has decided to decontrol completely wheat and coarse grains, but to continue the inter-State barriers as before. This decision has been taken on account of the further improvement in the food position in the country.

The Mysore Government has suspended its plan of collecting from employers 3 per cent. of the wage bill of workers for labour housing schemes, following the objection raised by the Government of India. A small sum had already been collected in this connection and this will be refunded to employers.

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India first estimate of *Tur* (*Arhar*) for 1953-54 puts the current year's area at 5,368,000 acres, as against 5,426,000 acres in the adjusted first estimate of last year. This shows a decline of 58,000 acres or roughly one per cent. in the current year as compared with last year.

Trend of capital formation in the Uttar Pradesh State is the subject of an investigation being taken up at Government level. The Government sector of capital is to be taken up in the first instance. The Economics and Statistics Department has asked all Government departments to prepare a list of their assets, on the basis of which valuation will be carried out by the departmental staff.

The Indian Coffee Board has resolved to reduce the release price of all varieties of coffee with effect from 1st December, 1953. The extent of reduction has not been announced, but it is expected that it will be Rs. 15 per cwt. for plantation and proportionate for other varieties. The Government of India's decision on the Board's resolution is awaited. There will be no pool auctions in November, but two auctions will be held in December.

The Government of India does not desire to subsidise the small-scale and cottage industries in the country at the cost of the large-scale industries. Disclosing this at the inauguration of the Industrial Finance Corporation of Saurashtra this week, Mr. T. T. Krishnamachari, Union Minister for Commerce and Industry, said that suggestions from certain quarters for the levy of cess on certain major industries to help develop the small-scale industries were not practicable.

The Mysore Government has accepted the recommendation of the Reorganisation Committee appointed by it to enquire into the working of the Mysore State Insurance Department and to create the post of Joint Secretary to Government in the Insurance Department to be in charge of new business, agency organisation, preliminary work for initiating pilot schemes. The Committee had also suggested that pilot schemes in agriculture and cattle insurance should be initiated in co-operation with the Departments of Agriculture and Animal Husbandry.

Negotiations for establishing a motor building works situated either in Bombay or in Southern India are now afoot, according to reports from London. The name of a well-known lorry-making firm of the U.K. is linked with another world-famous car manufacturing and distributing company already established in India. Negotiations are said to be well advanced as between these organisations and Indian industrialists for the formation of a corporation on an approximately 50—50 financial basis. The scheme envisages an outlay of £4 million.

The work in connection with the starting of a wool processing centre in North Arcot District (Madras) will begin almost immediately. The centre is intended to enable manufacturers of druggets in Madras and Mysore States to get the proper processed wool, so that druggets of standard quality can be produced and thus develop the drugget industry in South India. The total estimated cost of the centre is Rs. 11.3 lakhs, out of which the Governments of Madras and Mysore will together contribute Rs. 7 lakhs. The Government of India will give a grant amounting to one-third of the total estimated cost.

The Government of India has informed the Arab Governments of its willingness to participate as an active member in the Middle East Economic Organisation which the recent conference of Arab Ministers of Economy had decided to establish. India, in expressing its readiness to co-operate with the Arabs, has stated that it will back the resolution relating to the formation of this organisation when it comes before the United Nations Economic and Social Council. Apart from India, Turkey, Greece, Iran, Afghanistan, Pakistan, Abyssinia and all Arab nations will participate in the Organisation.

A comprehensive training scheme to help the plantation workers of Asia and India, in particular, has been undertaken by the International Confederation of Free Trade Unions. The scheme is expected to cost several lakhs of rupees and will be put into effect very soon. The scheme, which, in the first instance, will be in operation for a period of 12 months, is the direct result of the recommendations of Mr. T. S. Bavin, President of the International Dock and Land Workers' Federation who was asked to tour South-East Asia to study the condition of plantation workers.

The Conference of Postmasters-General, held in New Delhi recently, has recommended concrete steps to improve the delivery and despatch of mails, including clearance of letter boxes, delivery of telegrams and the telephone services in general. An officer will be appointed in each circle to attend to these matters. The Conference has also decided that, by the end of the first Five-year Plan, about 10,000 new post offices, 1,000 telegraph offices, 500 small telephone exchanges and public call offices should be opened. A sum of about Rs. 3½ crores is expected to be spent on telephone extension schemes in Bombay and Calcutta and another Rs. 10½ crores will be spent on long-distance trunk wireless links, extension of auto and other types of exchange.

The Rajpramukh of Travancore-Cochin has promulgated the Travancore-Cochin Public Debt Ordinance, V of 1953, which repeals and re-enacts the provisions of the Travancore-Cochin Public Debt Ordinance III which was promulgated on 13th July last. By the earlier ordinance, the provisions of the Public Debt Act, 1944 (Central Act 18 of 1944), had been made applicable to Government securities issued on or after 12th July, 1953. The ordinance was to have been ratified by the Legislature, but as it was dissolved on 24th September last and as, according to the provisions relating to ordinances in the Constitution, the ordinance would cease to operate after six weeks from 22nd September, 1953, the issue of the present ordinance became necessary.

The total production of cereals in India during the year 1952-53 was nearly 5 million tons higher than that in 1951-52 and about 1.6 million tons higher than in 1949-50 which was more or less a normal year from the point of view of agriculture in recent years. The increase of five million tons, compared to the previous year, was accounted for by 2.7 million tons of rice, 0.7 million tons of wheat and 1.6 million tons of other cereals, mainly millet. With the fall in the prices of commercial crops that took place early in 1952, the area under cereals increased to about seven million acres during the past two years. While the output of cereals in 1952-53 recorded a notable increase, the position in respect of other crops was less encouraging. The area and production of jute have remained steady over the past two years, but, in 1951-52, the commodity showed a large increase. In oilseeds, there has actually been a slight decrease. The decline in sugarcane has been even larger.

The Government of India has appointed an Advisory Committee for the Central College of Agriculture with its headquarters at the Indian Agricultural Research Institute, New Delhi. The functions of this Committee will include: (1) advice to Government on questions of policy, working of the institution, new courses of study and creation of posts of teachers and their duties and emoluments, (2) examination of budget estimates for Government's consideration, (3) recommendation of tuition fees for various courses and free studentships or half freeships, (4) advice to Government on fixation of qualifications for admission, in accordance with the requirements of the Delhi University, to the various courses, and (5) advice to Government on rules for the award of prizes.

From Abroad

The Indonesian Government has announced that it is prepared to resume the sale of rubber to Communist China.

The U.S. Tariff Commission has taken up for enquiry the question of increasing the import duties on lead and zinc.

The Yugoslavian Government has ratified the Yugoslav—Indian Trade Agreement concluded last June in New Delhi.

The tenth annual session of the E.C.A.F.E. will be held in Nuwara Eliya, Ceylon, from 20th January to 20th February, 1954. Two hundred and fifty delegates from 24 countries are expected to participate in the session.

Sweden has cut the prices of most types of Swedish quality steel for export, due to competition from Germany, the U.K. and the U.S. It is also stated that the export of quality steel has shown a decline since 1952.

The monthly output of cars manufactured in Britain during September reached a record total of 65,304. The previous highest monthly total was set up in June, when 57,535 cars were produced. Of the cars manufactured in September, 27,865 were for export.

The Australian Government is negotiating with the World Bank for a loan of $50 million. This loan forms the third instalment of the $520 million borrowing programme arranged by the Prime Minister of Australia in the U.S. in 1950. Australia has so far obtained $150 million from the World Bank.

PERSONAL

MR. W. Riddet, Director of the Dairy Research Institute at Palmerstone, New Zealand, is on a visit to India to advise the Government of India on dairy schemes.

Mr. J. M. Lobo Prabhu, I.C.S., Secretary to the Government of Madras, Development Department, has been appointed Secretary to the Government in the newly constituted Department of Industries, Madras.

Mr. C. M. Kothari, former President of the Federation of Indian Chambers of Commerce and Industry, and a Director of the Tea Council of America, nominated by the Government of India, returned to Madras last week after attending a meeting of the Tea Council and the International Tea Convention at White Sulphur Springs (West Virginia). Mr. Kothari also made an extensive tour of the U.S. and Canada.

"COMMERCE" 1928

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, 17*th November*

Selling Short

During the *Poojah* gamble at the jute counter of the Calcutta share market, when the local Stock Exchange was officially closed for the holidays, but unofficially open, a good deal of money was made, no doubt, by the 'talent'. But money must be lost, too, or it cannot be made, and it may be taken for granted that the unprofessional punter was almost invariably the loser. Now that the hubbub is over there are probably quite a large number of people who are lamenting their advent into a panicky market, in which jute shares were heavily slumping, apparently without rhyme or reason. The greatest losses, we have no doubt, were experienced by those who sold short when the slump had almost reached bottom, anticipating a further fall, followed soon afterwards by the upward reaction. It is axiomatic that there is always a risk of loss in selling what one has not got. A man may have a profound conviction that a marketable security is not worth nearly as much as the amount for which he can sell it and may feel reasonably secure in the belief that he will be able to buy it at a lower price before he has to deliver it, or, in other words, that he will be able to cancel his first bargain at a profit. This is the common position of the professional jobber who ventures to go 'short'. He sells to a broker a security of which he can buy none at the moment and of which he holds none. If it is one that is intermittently scarce he sometimes protects himself by an undertaking from the broker to give him time for delivery, or, as is usually phrased, not to press. His hope is to replace the sale "lower down," and he usually has good reason for his hope, founded on his experience and knowledge of the particular market. If he proves to be wrong, he takes his loss and thus realises the same misfortune as when he has bought and sold in the natural order with resultant loss. Both things represent an ordinary trade risk and are common occurrences.

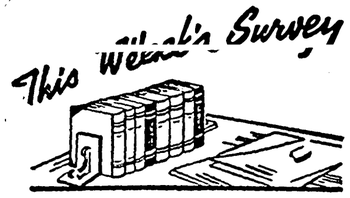
The Egyptian Government proposes to establish an oil refinery near Cairo. This will be linked to Suez by a 90-mile heavy oil pipeline and is estimated to cost 3 million Egyptian pounds (about £307,000 sterling). The refinery, which will be completed in two to three years, will have an annual output of 1 million tons.

Ceylon's financial position and matters relating to the Island's sterling balances will be discussed with the U.K. Government by the three-member delegation from Ceylon, consisting of the Finance Minister, Commerce Minister and the Governor of the Ceylon Reserve Bank, now in London. The delegation will also discuss a sterling loan, though no definite figure of the amount of loan has been fixed.

The Ministry of Materials, U.K., has increased the Jute Control's selling prices of all grades of raw jute ex warehouse by £5 per ton with effect from the 6th inst. The Control's selling prices of all imported goods have also been correspondingly increased. The increase has been necessitated by the further advance in shipment prices for raw jute in Pakistan. This is the second time in two successive weeks that the prices have been raised, the previous increase (£6 per ton) having been on 26th October, 1953.

A number of American industrial concerns has applied to the U.S. Tariff Commission for action against imports from Japan and other countries which are stated to have caused serious injury to their business in domestic markets. The action is demanded under the "escape clause" of the G.A.T.T., which provides that tariff concessions negotiated with foreign countries may be suspended, if the American concerns convince the Tariff Commission and President Eisenhower that competitive imports are responsible for serious loss of business in domestic markets.

The Trans World Airlines has announced the purchase of 12 new Super Constellation aircraft of the latest type, bringing the total number of these new planes on order to 20. Only two months ago, the Airlines purchased eight planes of this type. These planes are to be assigned to TWA's international routes. The 20 new planes will cost TWA approximately $45 million. This added equipment will enable TWA to cope with the demand for rapid extension of its routes. TWA's application is currently before the Civil Aeronautics Board for extension of its present routes to Tokyo. The Company already operates the world's largest fleet of Constellations, with 78 aircraft.



INDIA'S ECONOMIC POLICY

THE economic policy adopted by the Union and State Governments in this country, came in for some sharp criticism at the hands of Mr. B. T. Thakur, General Manager, the United Commercial Bank Ltd., when he addressed the Poona Rotary Club last week on "Present Unemployment in the Country." He said that the problem could be solved only through a "complete reversal" of some of the external and internal policies of the Government. This was the conclusion he reached after an impartial examination of the economic conditions within the country, the low level of national income, the steep increase in educated unemployment, and the decline in economic activity in the private sector. Presumably, Mr. Thakur had in mind the all too common assumption in the country that the encouragement of cottage industries, even at the expense of the large-scale units, would be a panacea for all our economic ills when he said that employment and prosperity could only be increased through "greater and harder work, coupled with modernisation of tools, supply of energy and improved know-how." He rightly urged the Government to enlist the fullest co-operation of business managers and financiers in the task of achieving economic progress. If he thus criticised the Government for lack of economic vision, he was equally critical of the Indian business manager for "abdicating his influence and authority in the face of dominating political immaturity." However unpalatable such fearless criticism of the defects of the present economic set-up, in both the official and non-official sector of national life, may be, there is no doubt that it is the only way in which all those, to whose charge the country's economic destiny is committed, could be compelled to adopt correct economic policies.

ROLE OF SYNTHETIC FIBRES

The view that competition from synthetic fibres is a "long-run" factor influencing the demand for cotton has been expressed by the International Cotton Advisory Committee (I.C.A.C.). This view is based on the ground that, following the marked progress in the field of chemical technology, viscose rayon, acetate and a number of new synthetics, such as nylon, Terylene, Arlon, have begun to compete directly with cotton. According to the Committee, not only has the production of these fibres increased rapidly but the fields in which they are used also have expanded. The world rayon output during 1952, for instance, accounted for as much as 42 per cent. (in equivalent terms) of the total raw cotton requirements of the ten most important cotton-importing countries (Belgium, Canada, France, West Germany, Italy, Japan, the Netherlands, Spain, India and the U.K.), the quantity actually produced being the equivalent of 3.5 million bales of cotton, as against 2.7 million bales in 1949. The increasing use of rayon in recent years, it is stated, has been rendered possible mainly by the price advantage which the fibre has been enjoying over cotton. Alluding to this, the I.C.A.C. observes:

"Rayon prices are lower than cotton in importing countries. . . . Consumption of rayon, instead of cotton, usually means a saving in foreign exchange expenditure for a cotton importing country. If raw cotton is imported from outside the national area, it involves a foreign exchange expenditure in its entirety. In comparison, for the rayon manufactured in a country, much of the raw material, some to all of the equipment, and all of the labour may be of domestic origin."

It is interesting to note, in this connection, that the rayon output of the free world during 1952 was the equivalent of 6.86 million bales of cotton. Although this figure is less than that for the previous year by 1.21 million bales, there are indications to suggest that the output for the current calendar year will be higher than that for the previous year. The Federal Republic of Germany alone has planned for a capacity of over 1 million bales of rayon for 1953. The aggregate capacity of the free world is expected to move up to 11.00 million bales by the end of next year, which compares favourably with 10.2 million bales in March, 1953. Of this increase, the ten aforesaid countries account for 300,000 bales, the capacity rising from 5.58 million bales to 5.86 million bales.

Although rayon remains the strongest direct competitor of cotton, the I.C.A.C. feels that recent developments in the field of commercial synthetics poses an additional threat. The productive capacity of the new non-cellulosic fibres in 1954 is estimated at 1,700,000 bales, which is twice the quantity actually produced in 1952. Until recently, these fibres had little effect on cotton consumption. But now that production is rising, competition from these fibres, according to the I.C.A.C., is bound to impinge more heavily on cotton consumption in future years. In its opinion, an important factor which has helped the implemention of the expansion programme for the fibres is the availability of the major raw materials within the countries themselves. Thus, Japan, which now relies on imports for a large part of the wood-pulp needed to produce rayon, has planned a bold development programme for the synthetic fibre industry for which the raw materials are plentiful at home. Similarly, in the U.K., a huge plant has been erected to produce nylon from coal.

The foregoing observations of the I.C.A.C. on the recent developments in the sphere of synthetic fibres raises an important question—how far these fibres will challenge the position held by cotton (and also wool and silk). Although the production of these fibres has increased in recent years and is expected to rise still further, they are unlikely to oust the natural fibres to any marked extent. For such an increase in output will be offset by enlarged demand for clothing from the underdeveloped countries when their economies are improved. From this point of view, the trade in the old natural fibres need not, perhaps, view the expansion of synthetic fibres as a source of great danger.

SMALL INDUSTRIES

Industrialisation in India is now at the crossroads. On the one side, the country has, for over half a century now, proceeded along lines of establishing large-scale mechanised industries. And even to-day private enterprise is being directed to start on those lines new industries for providing employment. On the other, these well organised industries are being subjected to heavy cesses and duties for subsidising small-scale and cottage industries. The latter are mostly unorganised, if not uneconomic, units, adopting antiquated processes of manufacture and producing, under unhygienic conditions, mostly goods of doubtful quality at high costs. Thus the cotton mills, oil mills and match factories are now to bear additional burdens in the shape of cesses for purposes of granting artificial stimulus to their limping village counterparts, namely, the handlooms, *ghanis* and the cottage match-making units. It is likely that this principle of discrimination against large-scale manufacture may be extended to other spheres such as soap factories, saw mills, smithies, etc. The time has thus come to pause and ponder awhile whether the country should pursue the road on which it has all along marched, that is, the establishment of large-scale industries, or to devite and follow the rutty path of bullock carts hardly conducive to achieving a fairly rapid improvement in the living standards. Mr. S. V. Ramamurti was really in this pausing mood last week when, at a meeting of the Association of Technologists, University of Madras, he posed the following question:

"A technology embodied along with science from Europe threatened the age-old handloom industry of India. The stress of competition between machine-made cloth and hand-made cloth was bearing heavily on the latter. What then was wrong with the introduction of textile technology in India that had produced so much distress among large sections of the population who had occupied a useful, valuable and honourable calling as artisans? Was there no place for hand-made goods by the side of goods made ultimately with power?"

In attempting to answer this poser, he did not rush to the conclusion that the handlooms should be protected by penalising the cotton mills. On the contrary, he proceeded to analyse the issues involved in the application of technology suited to conditions in foreign countries to those in India. Taking the instance of technological development as applied to the cotton mill industry in England, he said that it was unsuited to India. In the last century, England had before it world cloth markets to serve; but, in order to produce the required quantity of cloth, it needed a large labour force, and its population being relatively small, the country experienced shortage of labour. This shortage was overcome by the introduction of labour-saving technology in its industries. But such technology was unsuited to [illegible] homesteads all over the land. What it needed, and now needs, was a technology which could be used by a large number of small users. Mr. Ramamurti was, therefore, quite right in calling upon the technologists to apply their minds seriously to review the technology as borrowed from the West and readjust it to the conditions in India. He said:

"We need technological research which is better adapted to our conditions than the research of other countries which is suited to their own conditions. Experience at Coimbatore shows that a weaver with two power-looms and 2 kw. of power can increase his earnings from Rs. 40 a month to Rs. 120. Technology and power which have been used for a small number of large users must be adjusted to the use of a large number of small users."

While pleading thus for new technologies for the benefit of the small man, Mr. Ramamurti did well in placing before the technologists the objectives of their research. In the first place, the research should aim at making industry to provide an opportunity for not only consumption but also production. In this context, he pointed out that the economy of India, under the ægis of science, permits only a few to produce for the consumption of the many. To him this was not desirable, because the many could not consume unless they also produced. He, therefore, wanted the technologists to bear in mind this aspect of industry providing for the maintenance of a large population through gainful opportunities of employment. Secondly, it was also the responsibility of technologists to see to it that, in this process of providing opportunities, industrial development in India should take note of not only the vast manpower but also all the available economic resources in which the country was abundant.

There will be no two opinions on the aforesaid suggestions of Mr. Ramamurti. They are both constructive and practical, in that they aim at making rural industries efficient and useful, provided the technologists bring into play their creative faculties in the right direction. They do not seek to thwart the growth of large-scale industries by means of cesses and levies as has been preached by the All-India Khadi and Village Industries Board. It is common knowledge that it is on these very lines that Japan has attained eminence as one of the most advanced industrial countries in the world.

TRADE UNIONS

What is the difference between the Indian Trade Union Movement and the American? Prof. Van Dusen Kennedy, Berkley University, California, in the course of his address to the Mysore State branch of the Textile Association of India in Bangalore last week, stated that the striking difference was that the unions in the U.S. were led by men who had come up from the ranks of the working classes, while, in India, they were led by persons who had nothing to do with the concerned industry but belonged to some political party. Secondly, he said that labour-management differences in the U.S. were thrashed out between the parties concerned, whereas in India the Government and the tribunals came often, and very largely, into the picture. In the U.S., there were provisions for written agreements and their proper execution. Thirdly, there was a national union for each industry exercising full powers over its branches in the U.S., but there was no such centralisation in India, the units being knit together only very loosely in the form of a federation.

These observations of Prof. Kennedy bring out the essential difference between the Indian and American labour movements and the weakness of the former. As is well known, the Trade Union Movement in India is disrupted by a number of rival central associations dominated by one political party or the other. Thus, the all-India Trade Union Congress founded in 1920, and affiliated to the World Federation of Trade Unions, is dominated by the Communists. The Indian National Trade Union Congress, founded in May, 1947, and affiliated to the International Confederation of Free Trade Unions, is run by the Congress Party. The Hind Mazdur Sabha, founded in 1948, is a Socialist Party organisation. There is again the United Trade Union Congress, which broke away in December, 1949, from the A.I.T.U.C. The Trade Union Movement in India is thus dominated by India's political parties. Small wonder, therefore, that the economic and social interests of labour are sacrificed at the altar of political and persona jealousies. This alone explains the absence o mutual settlement of disputes and the interfer ence of the Government in labour disputes. Thi is not conducive to the development of trade unionism on healthy lines. So long as this trend persists, there is little prospect of ensuring harmonious labour-management relations.

ONE MORE SHIP LAUNCHED

With the launching of the s.s *Jalaputra* by Mr. K. C. Reddy, Minister for Production, on Monday last, the Visakhapatnam shipyard has completed 40,000 d.w.t. of the target of 150,000 d.w.t. expected to be built by it during the Five-year Plan period. The actual number of ocean-going ships built at the yard since the first keel was laid on 22nd June 1946 is, however, twelve, all of 8,000 d.w.t. each. The yard has in hand orders for five 7,000-ton and two 8,000-ton ships, all of which will be propelled by diesel engines. The keels for two of them have already been laid. Negotiations currently proceeding with the various shipowners and the Government departments will, it is expected, result in some further orders for the shipyard, including a few for naval craft and a passenger vessel for the India-Andaman service.

It is true that not only the rate of progress of shipbuilding at the yard is slow but the cost of production is also high. But this cannot be helped so long as the shipyard suffers from a number of handicaps. The chief among these is that it is not fully developed. Despite some recent additions, the shipyard is still below the economic size. It is, however, gratifying to note, in this connection, that the development plan of the shipyard, which was re-drawn this year with the assistance of French advisers, is at present under the examination of the Government.

Another important problem facing the building of ships at the yard is the persistence of the shortage of steel plates. Unfortunately, the only mill rolling shipbuilding plates in India, namely, the plate rolling mill of the Tata Iron and Steel Company, Ltd., Jamshedpur, has become rather old and suffers from occasional breakdowns, thereby holding up building activity at the yard and rendering labour idle. This has contributed in no small degree to the high cost of the ships built at the yard. Besides, the dimensions and thickness of the steel plates supplied by the mill are not suitable for shipbuilding so that they need re-shaping which results in some wastage. These and other defects have to be remedied before the yard could make any substantial progress.

OILSEEDS PROBLEMS

Both Mr. Hafiz Mohammed Ibrahim, Minister for Finance and Power, Uttar Pradesh, and Mr. Gujarmal Modi, Chairman of the Modi Industries, did well to emphasise, in their speeches made at the ninth Annual Convention of the Oil Technologists' Association of India held recently at Kanpur, the need for intensified scientific research for improving the quality of Indian oilseeds and for disseminating the knowledge gained to the maximum extent. The stress is certainly quite appropriate, because the quality of oilseeds is on the downtrend, despite the so-called research efforts at improving it made by the Central Oilseeds Committee. The deterioration in groundnuts is particularly marked, inasmuch as both the size and oil content of groundnuts have been far below what they were formerly. In the past, 38 groundnut beans were required for one ounce of oil, but to-day more than 55 beans are required for the same weight. Obviously, the results of research have not been carried to the farmer.

Although India accounts for one-fifth of world oilseeds production, this quantity is not enough to meet internal, as well as export, demand. Besides, trading in oilseeds and oils is very unhealthy. Prices are more subject to speculation than to the size of the crop and the genuine demand for it, be it in edible or non-edible seeds, as is evident from the recent performance of the groundnut and castorseeds sectors of the Bombay market, where specific delivery non-transferable contracts have degenerated into pure hedge contracts. This is deplorable, particularly because edible oilseeds are an item of diet as well as raw material to the soap, paint and varnish, lubricant and printing ink industries. It must be remembered, too, that oilseeds are the raw material for some 1,000 oil mills in the country, with an invested capital of about Rs. 33 crores, which provide employment to about 60,000 people and the wage bill of which amounts to Rs. 4 crores. The prosperity of the industry, its workers, not to mention the many farmers who cultivate oilseeds, is dependent not merely upon higher output of good quality seeds through the utilisation of research results, but also upon healthy trading practices. This is a question which the Forward Markets Commission will do well to tackle. It is to be hoped that the Commission will attempt a solution of this problem at as early a date as possible.

An important point to which Mr. Modi referred during his speech relates to cottonseed. He deplored that, although India produced 50 lakh tons of cottonseed, only a small proportion of this quantity was crushed. Most of this quantity is used as fodder, resulting in a huge waste of oil and lint. He pointed out that, if cottonseed were to be crushed, it would yield many valuable products such as oil, meal, lint and hulls. The monetary value of the saving that would accrue to the nation as a result of crushing cottonseed, instead of using it as cattle fodder straightaway, was estimated by him at Rs. 5 crores. Cottonseed oil, it may be mentioned here, is highly nutritive and is extensively used for edible purposes in the U.S. and Egypt. This could be done in India, too, particularly because this country is faced with the problem of shortage of edible oils.

OFF THE RECORD

(By "ROVER")

YOU must blame *Diwali* and the long string of holidays for my playing truant last week. I should have loved to extend the French leave to the end of this month, but I did not like to risk it, when the Editor is in the throes of putting together his Annual Number for 1953. In any case, for the first time, I am writing my column for this week, in the quiet and peace of the countryside, stretching away from the somnolent banks of the Ganges, almost a thousand miles away from the superficial gaiety and the raucous din of the *Moorat* markets in Bombay. The syncopated noise of crackers is heard now and then, but this is not half as irritating as the booms and bangs from forbidden rockets and atom bombs, echoed from all sides in Bombay, disturbing the comparative calm of even the dawn. This noise is soon dissipated in the vastness of the space before it is able to register itself on your only-half-awake brain.

And still, in this distant State of Uttar Pradesh, between the narrow strip at the meeting of the often turbulent and always temperamental Ganga and the placid and restful Jamuna, which to me appears as the most characteristically Indian bit of territory in this vast and variegated country of ours, I feel neither at peace with myself nor with the world around me. It is not the common hot spots like Korea and Kashmir, Trieste, Egypt, Israel and her Arab neighbours, the Saar in Germany, British Guiana or Indo-China, which rob me of my rest and sleep but what is happening in nearby Lucknow, Kanpur and Allahabad, which is responsible for my gloomy forebodings for the future. A certain degree of occasional conflict and even a thin thread of permanent tension between the generations is inevitable in these dynamic times. It would be strange and even disquieting if they were not there. But what I have been witnessing here spells a deeper and dangerous menace for this unhappy land.

It would be facile and easy to condemn the rowdyism and the spirit of destruction animating the activities of the youngsters. I am surprised that so understanding a man as our Prime Minister should have indulged in this cheap exit from the problem which faces him. Coming from one who has been universally acknowledged as one who is not merely a friend of youth, but a youth himself in outlook though not in years, it only goes to show that he has allowed himself to be carried away by his momentary irritation and that he has not had enough time to probe under the surface and to apply his mind constructively to finding a solution to this problem. What is the use of his patient and deep understanding of the thousand and one forces leading to international crisis after crisis, his untiring and persistent efforts against heavy and discouraging odds to isolate and localise the world tensions which erupt from time to time, if he cannot understand the urges which stir the student world in what has become almost a perpetual turmoil and spasmodic acts of violence.

I have been repeatedly amazed at the lack of patience and understanding of his own countrymen in general and the youth of India in particular, when Prime Minister Nehru can be infinitely patient and sympathetic to recalcitrant elements outside his own country. He may be, by all accounts he is, an international figure of great eminence and influence. Nobody, least of all his countrymen, would grudge him this position. Many of us, not excluding myself, even though I sound cantankerous at times, are even proud of it. But he should not forget that he is the Prime Minister of India and at the helm of affairs of this country. He owes a duty towards the people of this country beyond patching up the perpetual internecine quarrels and frequent sharp skirmishes amongst his own self-seeking party men in the States. In his preoccupation with foreign affairs, he can, perhaps with only small risk, throw the mute and long-suffering multitudes of the middle class to the wolves; he might, even with a flourish of indifference, castigate business men for their greed, which to my mind is less reprehensible than the love for lucre and power displayed by many of his own followers. But, most emphatically whatever the urgency of the calls on his time from abroad, he cannot afford to sacrifice the young men and women of India, who bore him bodily to the pinnacle of power and popularity which he is now enjoying, to some of the small-minded local blind bats in the States.

The outbreaks in the universities in Uttar Pradesh are only the visible symptoms of a disease which has poisoned the whole of the blood circulation system in the body politic of the country. He is running a very big risk in leaving the treatment for this distemper in the hands of persons like Munshi and Pant. I have had an occasion to look at groups of these unruly students, driven to desperation and mischief by unsympathetic and unsubtle handling. The first thought which came to my mind at the sight of these misguided but sorely misunderstood unfortunates was that even the extremely unreasonable prisoners of war of the United Nations, in charge of the Indian Custodian Force in the demilitarised zone in Korea, were being handled with greater care and consideration, patience and understanding, by Generals Thimayya and Thorat than our students here. If the Chancellor of the Lucknow University, a man endowed with great imagination and experience of university affairs and the Chief Minister of the State, Pandit Pant, a seasoned politician, had displayed in Lucknow but half the tact and foresight in evidence at the Indian Camp in Korea, they could have saved the situation from getting out of hand, even though they might not have succeeded in removing the causes for unrest in the student world for good.

For thousands of years, generations after generations have suffered cruelly for the sins of their parents. This very fact makes us responsible for the conduct and actions of our young people. If these young men and women at the threshold of life are behaving in an unaccountable manner, the fault is more ours than theirs. We must have failed somewhere, somehow, to lend them a little more balance and moderation in their struggle for achieving their unregulated aspirations. Perhaps, the larger and more comprehensive demands of the national struggle for independence blinded our eyes to the thorns we were sowing in the immature but active minds of the previous generation of students. But it is upto us now to recognise the responsibility for our own actions of yesterday and to deal with the harvest in a manner which would stop the mischief from spreading to the generations which are to follow.

If world affairs of great import could be settled, as Mr. Nehru believes they could be settled, at a round table conference of antagonists, aided by impartial and neutral friends of the warring camps, could not the same method prove efficacious in resolving the differences about the constitution of a university students' union. It is after all an organisation of the students and not of the teachers or the administrators of the University. Why should not the body of the students be allowed to frame it within well recognised and generally accepted limits. If only guidance and assistance had been offered to them in a tactful manner, enlightened by a sincere spirit of the utmost permissible tolerance and latitude, instead of a ready-made constitution being thrust down their throat, there would have been no trouble to speak of at this time. In an affair of this sort, where an important principle of self-government is at stake and where any show of authority or compulsion is bound to have an unfavourable reaction, it was the height of short-sightedness, if not actual folly, to have created a wholly unnecessary atmosphere of coercion, where the need of the hour clearly indicated co-operation and negotiation. The University and the State authorities, instead of inviting the students to talk over and iron out the differences, unwisely chose to throw out a challenge to the already irritated and suspicious boys and girls.

I must, however, say that I would have felt proud of them, if they had shown more discipline and clear-headedness in their organised resistance. As it is, obdurate reaction has been madly and ignobly matched by chaotic anarchy which does credit neither to the public leaders of the country of yesterday nor of to-morrow. My disappointment is all the greater, because youth has unfortunately failed to set a good example to their elders. We are now living in an age where it is the clear responsibility of the young to bring up their parents properly with tact, understanding and deep sympathy. In saying this, I am not indulging in a cheap paradox, but a conviction which I have enshrined in my heart for some years. In my individual dealings with my young friends of both sexes, I have found them remarkably alive to this new responsibility of theirs.

Now that they have temporarily suspended their campaign of unenlightened and lawless resistance, I hope the students of the Lucknow University would regain their vision and direct their movement in such a way as constructively to guide the authorities to see the error of their ways and to help them regain their self-respect and their sense of values, which lure for power and their advancing years had made them lose within so short a period as six years. The country can survive without much damage repeated failures on the part of Mr. Jawaharlal Nehru and Pandit Govind Ballabh Pant, but it cannot survive and retain its newly won independence for long a series of such tragic failures as witnessed at Lucknow, Kanpur and Allahabad during this memorable week of *Diwali*. The myriads of lights, which were lighted during this week of festivities, would not have burned in vain, if they have illuminated the dark path ahead both for the old and the young and brought them closer in a new spirit of understanding and devotion to the country, which they love more than their own little narrow selves.—

GOVERNMENT KEEN ON STARTING HEAVY INDUSTRIES

FALLING PRICES OF FOODGRAINS BEING WATCHED WITH ANXIETY

(From A Special Correspondent)

NEW DELHI, 10th *November*

THE *Diwali* festival was celebrated in the Capital this year with more than customary pomp and splendour. Although the tight money conditions had a restraining influence on the purchasing capacity of the public, the people wore a festive mood in view of the feeling that brighter days were ahead. Considerable optimism is also seen in Government circles which are now of the opinion that the country, having weathered the last four or five critical years, is safely set on the way to progress. During his recent tours, the Prime Minister has begun to place greater emphasis on the necessity for building heavy and key industries as against consumer goods producing factories. It is expected that the Government of India will be paying particular attention to this aspect of industrialisation in the coming months.

DELHI LETTER

An agreement has, for instance, been signed between the Government of India and Imperial Chemical Industries Ltd., with a view to establishing a new company to manufacture the country's requirements of commercial high explosives for blasting. It is stated that the demand for explosives has now increased in the country considerably in view of the development of the mining industry, as also the extension of irrigation works, road building, etc. When the factory goes into production, India will be self-sufficient in the manufacture of essential high explosives for commercial use. The agreement provides for the registration of a new company, to be known as Indian Explosives Ltd., with an authorised capital of Rs. 4 crores. Initially Rs. 2 crores of capital will be issued, of which 80 per cent. will be subscribed by I.C.I. and 20 per cent. by the Government of India. A site has already been selected for the factory close to the Bihar coalfields, so as to give the best possible service to the coal mining industry, which is the principal consumer of industrial explosives in India. The establishment of this important industrial undertaking marks another significant step forward in the country's industrial progress.

Manufacture of Aero Engines

Besides the above, the Government of India has proposed to take immediate steps to undertake the manufacture of aero engines so as to put the aircraft industry on a sound basis. It is also contemplating to start production of medium-sized tanks to safeguard the country's defence system. In the next few days, the German steel experts are likely to come to India, in order to select the site for the establishment of the Government-owned iron and steel plant. Once the site is selected, the construction work will begin from January next. The possibility of establishing another steel plant will depend on the observations made by the German steel experts regarding site, construction charges, cost of production, etc. The Government of India will shortly come to a decision regarding the establishment of a heavy electrical plant. Siemens from Germany had been to this country recently and will shortly be submitting the project report to Government. It is stated that U.S. and U.K. firms have not been evincing as much interest as they had shown before and it is, therefore, possible that, in this case also, Germany will be taking up the lead in building up the country's heavy electrical industry. In many of the key industries, the Government of India has been anxious to secure at least a moderate percentage of foreign capital so as to ensure proper development. The development of the shipyard has now been redrawn with the assistance of the Government's French advisers and some definite action is expected to be taken shortly with a view to expanding the shipbuilding capacity of the country. In the meantime, the development work in the shipyard is, we are told, being carried out. The pace of progress in this connection, however, appears to be very slow and the Government has to bestir itself if it were to achieve early results. Even the construction of a dry dock, estimated to cost Rs. 1 crore, is being delayed unnecessarily, although such a necessity has been felt for the last few years.

Falling Prices

The Government of India is watching with considerable interest, but not without anxiety, the reports emanating from various States on the rather sudden and rapid fall in the prices of foodgrains. A similar downward trend in commodity prices set in motion in the first quarter of 1952, but the intensity of the decline was largely pronounced in the first fortnight of March, 1952, when the wholesale prices index was marked down to the low level of 364.9. The difference between the present decline in prices and that which occurred some 20 months ago is that, whereas the downward movement a year ago was largely confined to important raw materials such as oilseeds, hides and skins, raw jute, etc., the present recession has commenced with the foodgrains sector, including the oilseeds. The appreciable decline in the prices of rice during the last few days is doubtless being welcomed by the much harassed consumer in the urban areas, as also the landless labourer, who have been smarting under the unbearable weight of the inflated foodgrain prices during the last five years and more. May be the present price recession is a sort of an adjustment process narrowing down the disparity between the procurement rates and the free market prices. The suddeness of the decline, however, will have some unfavourable influence on the general economy of the country, which the Government is anxious to minimise. It may be noted that the Government has all along been anxious to provide as much incentive as possible to the agriculturists in order to maximise the production of foodgrains in the country. Since any sharp downward twist in prices is likely to curb the enthusiasm of agriculturists, it is possible that the Government will take some measures to prevent distress selling at the peak marketing season below the procurement rates. In other words, the Government might extend the procurement organisation and buy foodgrains at specified rates so as to forestall the activities of speculators. This question is being discussed at a Conference of the Secretaries of the Food Departments of the States and those of the Food Ministry at the Centre this week. This Conference will also consider the rice procurement plan for 1953-54. Only the Secretaries of the surplus States are participating in the discussions, prominent among them being those from Orissa, Madhya Pradesh, P.E.P.S.U., Punjab, U.P., and Andhra. Last year, the procurement from the surplus States amounted to the satisfactory figure of well over 800,000 tons and, in view of the bumper crop this year, the procurement from these States is likely to be substantially higher over that of last year.

Generally speaking, the Government of India will not let itself be hustled into action immediately with a view to stabilising prices at a particular level, but will wait until a sort of parity or equilibrium is reached between prices of foodgrains and those of industrial raw materials. It is well known that, during the last five years, certain agricultural commodities such as rice, wheat, groundnut, pepper, betelnuts, some spices, etc., have recorded a disproportionate rise in their prices as compared with those over many others. The whole problem will again come up for discussion at the forthcoming conference of Agricultural Ministers. It is unlikely to consider favourably any plan for supporting prices on any large-scale, unless prices of foodgrains slump so heavily as to cause the production of these grains unprofitable.

Winter Session of Parliament

The winter session of Parliament will commence on the 16th inst. For the present, the House will sit from 1-30 p.m. to 7 or 8 p.m., as the case may be, with a short interval for tea. It has a heavy legislative programme in hand. There are as many as 30 Bills to be disposed of within a very limited period of 24 working days. Generally speaking, priority will be given to Bills to replace ordinances promulgated during the inter-session period. Next, financial Bills and Bills relating to the amendment of the Indian Tariff Acts will be given priority. It is only after these that Parliament will take up other Bills if it has sufficient time. Further, the Bills which have already been passed by the Council of States also need to be considered. Besides these, there are certain important Bills on social reform and mention may be made among those of the Bills relating to the Hindu law, such as the Special Marriage Bill, the Hindu Marriage and Divorce Bill and the Hindu Minority and Guardianship Bill. Some sort of priority is expected to be accorded to these pending measures and a decision on this will be arrived at this week.

Rajasthan

The economic progress of Rajasthan has not been proceeding according to schedule. For the five years of the Plan period, the total amount of expenditure for various developments is put down at Rs. 16.81 crores. During the first two years, the State could not spend more than Rs. 4.22 crores. For the current year, the sum earmarked for development purposes is placed at Rs. 3.60 crores. The inability to implement the schemes according to the schedule is attributed to the lack of trained personnel and skilled administrators at the lower levels. However, at present, considerable improvement has taken place in the availability of the requisite personnel and the State authorities are confident that the leeway could be made up in the coming years. The Jawai River irrigation, the execution of which was delayed for some extent due to technical reasons, is expected to be completed by July next. Substantial progress is being reported in the execution of minor irrigation works, especially in recent months. As against a target of 235,000 acres of land to benefit from medium and minor irrigation works, about 74,000 acres were provided with irrigation in the first two years. Outside the Plan, about 50,000 acres of land have been brought under irrigation during the last two years. During this period an extra 9,000 kw. supplies of power have also been made available.

TATA DEFERRED CONVERSION

The scheme for converting the deferred shares of the Tata Iron and Steel Company, Ltd., into ordinary ones, at the ratio of six ordinary shares for each deferred share on the basis of the award given by the mediator, Mr. M. C. Setalvad, has almost become an accomplished fact, judged purely from the figures of proxies collected in favour of and against the scheme. At the meeting of the ordinary shareholders of the Company, held on the 3rd inst., it was disclosed officially that the number of proxies received in favour of the scheme was about 175,000 and about a hundred against. At the meeting of the deferred shareholders held on the 4th inst., it was revealed that about 30,000 proxies were lodged with the Company in favour and 3,180 against the scheme. Two scrutinisers were appointed to count the proxies and votes of each class of shareholders. The results of counting will be made public in the course of this week and then forwarded to the High Court for necessary action.

Addressing the ordinary shareholders, Mr. J. R. D. Tata, Chairman, drew their attention to the difficulty of issuing bonus shares prior to the success of the conversion scheme. As had been expected earlier, the main voice of protest to the scheme of conversion on the basis of 1 : 6 came from Mr. Ambalal Narshidas, one of the members of the Action Committee of deferred shareholders, at the meeting of the deferred shareholders. He reiterated that the ratio of conversion was unfair and unjust to the deferred shareholders. The scheme, according to him, meant, more or less, the winding-up, inasmuch as the deferred shareholders were asked to give up their rights once and for all and this class of shareholders was entitled to 60 per cent. of the surplus in the event of liquidation. He also stated that, in the event of nationalisation, they would get a much larger compensation than they would be getting under the conversion scheme.

Mr. Tata, in his speech to the deferred shareholders, expressed his gratification that the completion of the scheme of conversion, which had been originally mooted 12 years ago, had almost been achieved. He complimented the shareholders on the keen interest evinced by them in the scheme and in thrashing out the issues involved. There was, however, some dissenting shareholders and it was at their instance, Mr. Tata pointed out, that the mediator was appointed. It was, therefore, unfair on their part, he said, to reject the award of the mediator at this juncture, having gone so far in carrying out the scheme. If the idea of mediation was only to get a ratio which would provide a basis for further haggling upwards, then that was not his idea of what was fair. He wanted them to accept the scheme, unless the opposition was to the principle and not to the ratio. Referring to the question of compensation in the event of nationalisation, Mr. Tata drew the attention of the critics of the conversion scheme that, even in such an event, there was no guarantee that the Government would compensate the Company on the market value of their assets. In support of his statement, he quoted the instance of the recent nationalisation of airways, under which the private companies received only a fraction of the market value of their assets. He felt that the implementation of the conversion scheme would have an excellent effect on official circles. The immediate advantage to the shareholders was the capitalisation of reserves and, in the years to come, more benefits might accrue to the shareholders by the elimination of the deferred shares.

PAKISTAN NOTES

CONSTITUTION FOR PAKISTAN

ECONOMIC SYSTEM NOT TO BE BASED ON ISLAMIC PRINCIPLES

THE decision of the Pakistan Constituent Assembly to name the State as the "Islamic Republic of Pakistan" is a regrettable development, since utmost emphasis is being laid all over the world in disassociating religion from politics. All legislation enacted by the future Parliament of Pakistan would be in consonance with the teachings of the *Quran* and the *Sunnah*. It is indeed a very sad commentary on those at the helm of affairs in Pakistan that they should have allowed themselves to be swayed by the ideas of a few religious fanatics. The aforesaid decision goes counter to the very basic principles of civilisation, namely, liberty, equality and fraternity.

Even the late Mr. Jinnah had not insisted on a theocratic State of the type that is now contemplated. That his followers should have tried to formulate the Constitution of Pakistan on the basis of the *Quran* and the *Sunnah* is, therefore, more regrettable. Some of the Muslims themselves are opposed to this decision in which they see a danger to democracy. "The country," to quote the significant words of a Muslim legislator of the Pakistan Constituent Assembly, "is well set on a theocratic course and nothing short of an intellectual revolution can now save Pakistan from the abyss of religious fanaticism."

An even more depressing decision that the Constituent Assembly had taken relates to the introduction of separate electorate for the Hindus. The Hindus are themselves to be divided, for electoral purposes, into caste Hindus and scheduled castes. Further, there will be a special organisation for the purpose of propagating the teachings of Islam. These decisions are certainly a denial of equal rights to non-Muslims in Pakistan, of whom Hindus alone number as many as 11 million, or 14 per cent. of the population of Pakistan. The move has evoked a chorus of opposition and all the Hindu members of the Assembly have resolved not to take part in the discussion on the Basic Principles Committee's report. How much dissatisfied and frustrated have the Hindus become will be evident from the statement made by Mr. Satish Chandra Chattopadhyaya, the leader of the Congress Party in the Assembly. Said he:

"The method of arriving at decisions (on the Constitution) in the House is undemocratic and definitely prejudicial to the interests of the minorities. Frequent reference about an Islamic Constitution and undue emphasis on it has created an atmosphere that makes our presence in the House useless. . . . The members of the Muslim League Party want to make a theocratic State against democratic principles. This is to drive out all Hindus having any self-respect from Pakistan."

A Practical Measure

There is, however, one practical measure which the Pakistan Constituent Assembly has adopted and this relates to the decision to exempt, for a period of twenty-five years, all monetary and fiscal measures from the constitutional provision that no legislature should enact any law repugnant to the *Quran* and the *Sunnah*. Evidently, the constitution-framers in Pakistan have fully realised that the mechanism of the economic system cannot function on the basis of the injunctions of the *Quran* and the *Sunnah* under which payment and acceptance of interest are strictly forbidden.

It will be interesting to recall, in this connection, that, while inaugurating the State Bank of Pakistan more than five years ago, on 1st July, 1948, to be precise, the late Mr. Jinnah had advised his countrymen to work their destiny in their own way and present to the world an economic system based on the true Islamic concept of equality of manhood and social justice. Mr. Zahid Hussain, former Governor of the Bank, also had spoken in the same strain on this subject. Commenting on these remarks, we had clearly stated then (vide page 58 of *Commerce* dated 10th July 1948) that, despite its existence for thirteen centuries, Islam had not been able to realise this lofty ideal. Similarly, writing about the task that Mr. Jinnah had entrusted to the Research Department of the Bank, namely, the task of evolving "banking" practices compatible with Islamic ideals of social and economic life," we had expressed our own doubts about the success of the Department in this direction. That these misgivings were not at all unfounded is clearly borne out by the acknowledgment, by the constitution-makers in Pakistan, of the fact that economic policies cannot be based on the high ideal of Islam, namely, "prevention of concentration of wealth, without killing the initial incentive to individual initiative and enterprise." Viewed thus, the latest decision of the Pakistan Constituent Assembly to continue to base the fiscal and monetary policies of the country on the economic system of the West, instead of on Islamic principles, must be said to be the most sensible one.

Production Drive

The Government has constituted a seven-man committee, with Mr. Ghulam Faruque, Chairman of the Pakistan Industrial Development Corporation, as the Chairman, to report on the "immediate steps necessary for bringing existing industries in Pakistan to maximum production in the minimum space of time." The Committee is also to report on the plans needed for accelerating the completion of industrial units, now under installation, and for establishing new manufacturing capacity for important items of consumer goods. The report is expected to be submitted in about two or three weeks' time.

Announcing the setting up of the Committee, Mr. Mohammed Ali, the Prime Minister, declared: "It is the Government's decision to mobilise all available resources in the country for the purpose of increasing production, with a view to (1) reducing the shortage of consumer and other essential goods, and (2) effect economy in expenditure of our foreign exchange earnings. All such savings could be better utilised for increasing the tempo of industrial development of the country." The Prime Minister alluded to the severe economic depression which had the country in its grip and claimed that the position was now much better. He thus said: "Prevailing jute prices are better than those of last year and have been showing a slight upward trend. Exports have also improved. What is more, we are now able to meet nearly 85 per cent. of requirements of manufactured jute goods from internal production. This, in effect, means a saving in foreign exchange to the tune of Rs. 3.5 crores."

Paper Industry

The paper industry is one of the basic industries for the development of which the Industrial Development Corporation of Pakistan has devoted particular attention. The project that is now being implemented envisages the establishment of two paper mills, one at Chandragona in East Pakistan and the other at Nowshera in the N.W.F.P. The estimated annual capacities of the two mills are 30,000 tons and 7,500 tons, respectively. The paper factory at Chandragona has made good progress. One unit has already commenced production, the rate of output per day being 40 tons. Two other units are expected to go into production shortly. The factory is manufacturing paper out of the pulp imported from abroad. There is some delay in setting up the pulp producing unit, but, by the middle of next year, the factory will be working on its own pulp produced from bamboos which abound in the Chittagong hill tracts. Forest reserves have been earmarked for the mill and bamboos are being stacked in the mill area. According to business experts, the establishment of the Chandragona paper mills is a great achievement of the Pakistan Government. The total cost is of the order of Rs. 5.12 crores; the whole of it has been financed by the Government.

Import Policy

The import policy of the Government of Pakistan for the shipping period January-June, 1954 is expected to be announced by the end of this month. It is difficult to say what shape the new policy will take. According to informed sources, however, it is gathered that imports will be liberalised, particularly those of machinery, raw materials and essential consumer goods.

ENDING WARTIME CONTROLS

NEW AGRICULTURAL POLICY

(From Our Own Correspondent)

LONDON, 7th *November*

THE Government has gone into battle this new Parliamentary session with a Queen's Speech that shows no lack of courage or fear of controversy. It has decided to tackle the problem of controlled rents—although this renders it open to the charge of raising the cost of living for the benefit of the landlords—by permitting increases of limited amount for the purpose of effecting repairs of property; it has decided that the nation is to have a Television service additional to that provided by the B.B.C. with some commercial sponsorship; it will free the market in raw cotton; and it has committed itself to proceeding with long-term schemes for the marketing of the guaranteed agricultural products. Some of these measures will be unpopular, but the Government—which in this context means the Prime Minister—has told the Commons that there will be no election next year: the Government will continue in office till its term is run out.

LONDON LETTER

Economically, the most important part of the Speech was the reference to agricultural policy. Food rationing will end altogether in the U.K. next year and the last of the rationed commodities, meat and bacon, will be returned to private trade on a free market. The meat industry, with a turnover in home meat of £300 million, is the largest sector of the agricultural industry and the farmers have been insisting on a Producer Marketing Board to take over the slaughterhouses and all the functions at present performed by the Ministry of Food. But the Government has decided on freedom, on dismantling the elaborate machinery of centralised marketing, while telling the farmers they are free to devise a Marketing Board and to set up a new system of centralised marketing if they can produce a scheme acceptable to all parties.

Guarantee Price for Meat

The farmer is at present guaranteed a price for meat, which he gets on all animals delivered to the controlled slaughterhouses or to the bacon factories. The guaranteed price, which is subsidised, is on a weight basis and has only broad regard for quality. The Government wished to introduce a scheme of free marketing whereby the farmer got what he could on the free market plus the later payment of the average amount per pound by which all sales by farmers realised less than the guaranteed price. This sort of deficiency payment system makes the individual farmer subject to his local market forces and obliges him to pay great attention to quality.

The new Government proposals, incorporated in a White Paper, are a compromise between the searches for freedom and for security. The farmer is guaranteed a minimum price as an individual and an average price collectively. He will market his meat as best he can, but if the price does not realise the minimum the farmer will recover the exact difference from the State. In addition, at the end of the year, if the average price received by all farmers falls short of the guaranteed average, all farmers will receive their proportionate share of the deficit regardless of the actual results of their own trading. Thus, the farming community as a whole is guaranteed an average price and each individual producer knows the floor price for his animals. If it can be made to work in practice the system may reconcile producers to the loss of the fixed prices by which they set such store.

On other farm products the Government has decided to restore the trade in milk to the Marketing Board which was responsible before the war, in spite of the protests of the distributors who hate the return to a monopoly sellers market. On eggs, the Government has said it is prepared to see a producers board; cereals have already had the general shape of their future determined; sugar-beet, potatoes and wool are all likely to have fairly rigid marketing schemes established in the course of the next two years.

The war-time system, set up by the coalition Government, of food controls and centralised marketing, has thus received its death sentence. In many cases, Producer control will be substituted for Government control—whether to the consumers' advantage remains to be seen—in others, the market will come into its own again.—*All Rights Reserved.*

STERLING AREA GOLD RESERVES IMPROVE FURTHER

RATE OF INCREASE, HOWEVER, SHOWS DECLINE

A MODEST surplus of $34 million was recorded by the sterling area gold and dollar reserves in October, 1953. This compares with a surplus of $17 million in September and $13 million in August, 1953. The gold and dollar reserves at the end of October stood at $2,520 million, crossing thereby, for the first time, the $2,500-million mark since November, 1951, when they were at $2,707 million. On 1st January this year, they stood at $1,864 million; thus, the increase in the reserves during the 10 months ended 31st October, 1953, is of the order of $674 million.

The surplus of $34 million included (a) receipts of $13 million from the U.S.A. as defence aid, (b) $6 million received in gold in part payment of the September surplus with the European Payments Union, and (c) $15 million representing the sterling area's gold and dollar balance with the rest of the world, notably the dollar area outside the West European countries in the E.P.U. Commenting on these figures, a Treasury spokesman said that what was not revealed by the figures was the fact that, while the results for the first half of October were not favourable, there was a distinct improvement in the second half of the month. On the other hand, the E.P.U. results for October show that the U.K. is by no means out of the wood in this sector of its payments, because Britain had a deficit in October with the Union of £10.8 million which will have to be settled in November by a payment of £5.4 million in gold and £5.4 million as credit granted to the U.K. by the E.P.U. which at the end of October stood at £172 million.

The deficit of £10.8 million with the E.P.U. forms, in fact, a disquieting feature of the official statement on the position of the sterling area gold and dollar reserves. The deficit compares with a surplus of £4.3 million in September and a deficit of £10.6 million in August. A point to be noted is that the September surplus of £4.3 million arose out of a payment to Britain by France of an annual instalment of £8.7 million on the loan of £100 million granted to that country in 1946. Without this French payment, the U.K. would have been in deficit with the E.P.U. to the extent of £4.4 million even in September. Then there would have been deficits each month in the second half-year so far, as compared with a series of surpluses every month from September, 1952 to June, 1953. These deficits are usually attributed to British tourist expenditure during the three main holiday months of the year.

Satisfactory though the sterling area gold and dollar reserves position is, as at the end of October, the trend of the monthly surpluses, however, is less encouraging. For month by month, the rate at which these surpluses are rising shows a gradual decline. Thus, in the first quarter of 1953, the average monthly rise was $106 million. In the second quarter this dropped to $67 million, and in the third to $40 million. Now the October surplus at $34 million is below this last average. The reasons for the falling rate given by the *Financial Times* in the course of a leading article are interesting to note. Says our contemporary: "There have been three reasons for the falling rate at which the reserves have been rising. First of all, our balance with the E.P.U. has been falling and would, in fact, have shown a deficit in September as well as in October, had it not been for the French loan payment which fell due in that month. This deterioration is partly the result of the liberalisation of trade granted this spring; partly it results from the fact that the summer is doubly unfavourable to the United Kingdom's balance with the European countries: not only is this the tourist season, but it is also the season of low purchases by European countries from the sterling area. The second reason is simply the fall in payments on account of American aid, very little counterbalanced so far by payments for off-shore purchases. The third reason is again a matter of the seasons. Because of the timing of the wool sales and cocoa sales, the direct dollar earnings of the sterling area always drop in the second and third quarters of the year."

Now that Britain has decided to liberalise imports from Western Europe and to increase the tourist allowance from £40 to £50 per individual per annum, payments to the E.P.U. are likely to continue at a comparatively higher level than hitherto. This risk was deliberately taken in the interests of expanding free trade in Europe. Against this risk, there are also the chances of increasing the British exports to those countries. Again, there may be increased receipts from the U.S. on account of American off-shore purchases, and there is, besides, the prospect of the sterling area earning more dollars in the current quarter. But, in the same quarter falls due for payment the interest on the American and Canadian loans. As a result of these variations in receipts and disbursements, it can hardly be expected that there would be any spectacular rise in the sterling area gold and dollar reserves at the end of the current year. There should, therefore, be no room for taking a jubilant view. On the contrary, the situation underlines the need for increased exports by Britain and the sterling area, so that there may be a rise in the rate of accretions to the gold and dollar reserves. It also indicates that the prospects for the convertibility of the pound sterling are still distant.

USE OF STERLING RECEIVED FROM SALE OF U.S. SURPLUS FARM PRODUCE

It will be recalled that some three weeks before, we had made a reference to the U.S. Foreign Operations Administration's offer to sell American farm surplus to friendly countries for local currencies. The latest reports from London say that negotiations for the use of sterling acquired by the F.O.A. by sale of such surplus farm produce to the U.K. have ended almost successfully. The U.S. is reported to have agreed to make the sterling available to the U.K. Government primarily for the defence effort. The U.K. is considering the purchase of tobacco and several kinds of foodstuffs valued at between $40 million and $70 million.

The U.S. Foreign Operations Administration has with it plans for selling surplus foodstuffs of a value ranging between $175 million and $250 million. Of this about $130 million worth of foodstuffs have been earmarked for sale in European countries against payment in their own respective currencies. With most of these countries the Administration is reported to have commenced negotiations for putting through the sales.

All the sales of surplus foodstuffs are being arranged under section 550 of the Mutual Security Act, 1953. Under this Act, the President is authorised to sell surplus agricultural commodities to friendly countries for local currencies. The commodities include wheat, tobacco, cotton, butter (of which the U.S. Department of Agriculture now has 280 million lbs. on hand), cheese (270 million lbs.), and dried milk (420 million lbs).

In effecting the sale of these commodities, the President is required to observe certain conditions. He should sell the surplus foodstuffs at prices "consistent with maximum world prices of commodities of similar quantity." Secondly, the commodities purchased under the Act must not be substituted for supplies received from other sources but must be in addition to them. Thirdly, they must be imported through private channels and must not be re-exported.

The Mutual Security Act, it may be mentioned here, lays down elaborate provisions regarding the use by the U.S. of the local currencies it received in payment for the goods. The payments known as "currency counterparts" may be used for military assistance or for purchases of goods for American stockpiles or for any other purpose. Further, they may be used as loans or grants to friendly countries to increase their production of goods, especially of a strategic nature.

The sale of surplus farm produce arises out of the fact that the U.S. Department of Agriculture has with it large quantities of these commodities. Under its price support policy, it is required to purchase farm produce offered to it, whenever the market prices for it go below the support prices fixed by the U.S. Government.

A FAMOUS BANKING SERVICE WITH WORLD WIDE CONNECTIONS

Lloyds Bank has Branches in the East at

AMRITSAR — KARACHI (three Branches)
BOMBAY (two Branches) — LAHORE
CALCUTTA (two Branches) — MADRAS (two Branches)

ARGENTINA'S CONCESSION TO FOREIGN INVESTORS

Details now available regarding the Argentine Foreign Capital Investment Law reveal that Argentina has shown several concessions for encouraging foreign investments in that country. The new law, which came into force on 26th August last, provides liberal conditions for repatriation of both capital and interest thereon. Interest on capital can be remitted abroad to the extent of 8 per cent. per annum. The interest is not subject to any deduction either of taxation or other charges. The net 8 per cent. is calculated in the currency of the country of origin of capital investment and at the free market rate of exchange. If investors failed to exercise their rights of remittance in any one year, they will forfeit their rights to transfer an equivalent sum in question.

The Argentine law also provides for withdrawal of capital. Such withdrawals are to be effected in instalments. The Government has, however, reserved the right to interrupt the remittance of instalments once commenced, but the investor has the right to resume them whenever suitable to him.

The law lays down also conditions under which foreign investments are permitted. Foreign capital must be employed only in those industries mentioned in the Five-year Plan, or in activities which would serve to provide or to conserve foreign exchange.

The above concessions are not applicable to investments in agricultural activities. The law does not, however, preclude foreign investments in these activities, but they do not rank for remittance of earnings or repatriation of capital.

All accumulated earnings on foreign capital invested in Argentina at the time of the promulgation of the law was registered as foreign capital for investment in the Five-year Plan industries. Consequently, they are entitled to get the concessions under the new law.

U.K. CURRENCY AND BANK NOTES BILL

A new Currency and Bank Notes Bill was presented to the British Parliament by the Chancellor of the Exchequer on the 5th inst. The Bill fixes the statutory limit to the fiduciary issue at £1,575 million, which, it is stated, corresponds with the present level of the issue. A similar Bill seeking to fix the limit at £1,400 million was introduced last year but was not proceeded with beyond the first reading stage. Consequently, the 1939 Act, under which the Treasury had powers to increase the fiduciary issue above the £300-million mark fixed by it, continued to remain in force. And the Treasury had no rights under this Act to continue the fiduciary issue at a level above £300 million for a period longer than two years without Parliamentary authority. In the meantime, the Bank of England's note issue increased well above £1,400 million, and in July 1953 it went up to £1,625 million, though reduced later to £1,575 million on 20th October.

Under the new Bill, there is no time limit fixed for the maintenance of the fiduciary issue under the figure of £1,575 million. If, however, the Treasury were to maintain it above the figure for more than two years, it would have to issue an order and this order would have to be laid before Parliament for approval. Thus, the Bill provides for changing the amount of the issue by administrative action. The initiative for making the change would remain with the Bank of England. If the Bank at any time were to represent to the Treasury that it would be expedient to change the fiduciary issue, the Treasury, by means of an executive order, would direct the Bank to raise the amount to a level agreed by both the Bank and the Treasury.

The Currency and Bank Notes Bill contains provisions under which the Bank may only issue notes of denominations approved by the Treasury. Another provision of the Bill provides for issue and calling in of all Bank of England notes.

SAVINGS DRIVE IN RURAL AREAS

A new scheme to stimulate savings in rural areas has been approved by the Central Ministry of Finance. Under this scheme, persons holding responsible positions in rural areas would be appointed as authorised agents for the collection of small savings. It has been introduced as an experimental measure in two districts of West Bengal, namely, 24 Parganas and Nadia, as from the 1st inst.

All persons holding the office of the President of a Union Board in the two districts will be eligible for appointment as authorised agents. The President of a Union Board will hold, on appointment, the agency in his personal capacity, so that he may be free to retain the commission earned on sales of certificates through him. The commission will be at a flat rate of 1¼ per cent. on all sales of Rs. 5, Rs. 10 and Rs. 100 National Savings Certificate of the 12 years' series, the only condition being that money thus invested should not belong to a provident fund. Every authorised agent, before his appointment, has to provide two sureties for Rs. 1,000 each or pledge with the National Savings Commissioner National Savings Certificates of the issue price of Rs. 100.

The new scheme is another step forward in the move to mobilise small savings. At present extra departmental branch post masters are also being appointed as authorised agents for selling National Savings Certificates. Besides, about 100 women's organisations all over India are carrying on savings work as authorised agents.

U.S. DEFENCE EXPENDITURE IN 1952

Out of a total public expenditure of $101,000 million, the United States spent $40,000 million on national defence in 1952. The latter figure includes amounts directly used for the purpose, and not expenditures on defence related purposes such as, foreign economic and military aid ex-servicemen's benefits, atomic energy development, civil defence, and interest on national debt.

The $101,000 million figure for public expenditure covered sums spent by Federal, State and local Governments. It works out to a *per capita* expenditure of $646.

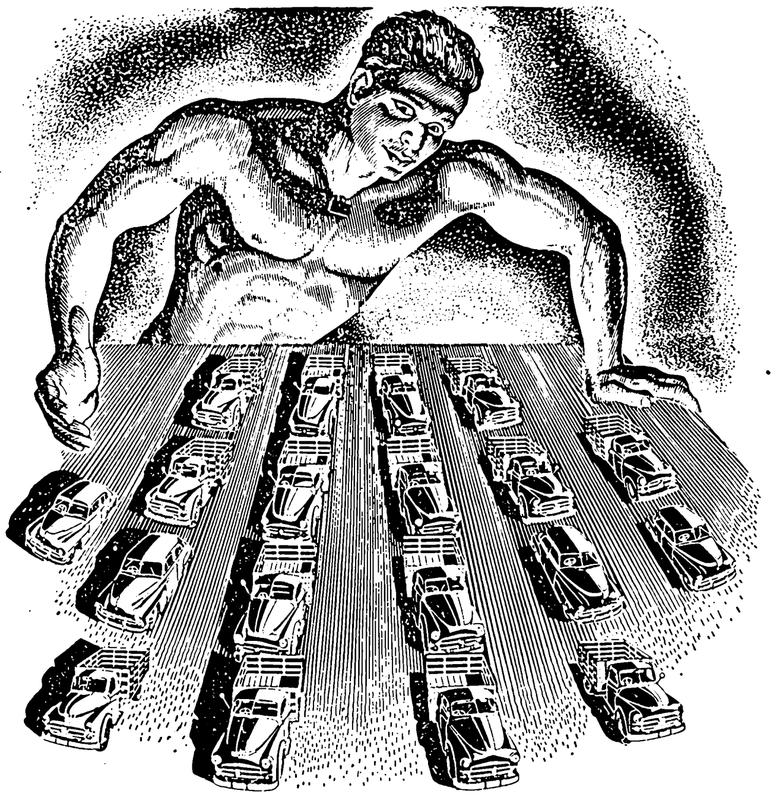
Next to defence, education was the second largest item in the nation's bill, accounting for $9,600 million in 1952. This included public schools, State colleges, universities and Federal educational benefits to veterans.

Most of the spending was financed by taxes which yielded $79,100 million for the Federal State and local Governments. This figure was 24 per cent. more than total taxes at $63,000 million in 1951 and nearly four times the 1942 tax total of $20,800 million. The share of the Federal Government was $59,700 million, State Governments $10,000 million and of local Governments about $9,500 million.

BURMA'S DEBT TO BRITAIN SETTLED

All outstanding financial questions arising out of the Anglo-Burmese Treaty of 1947 have been settled as a result of negotiations between the Governments of Burma and Britain. Under the Treaty, Burma owed Britain £27½ million. The debt, which comprised mostly army equipment handed over to the British forces when they withdrew on Burma's independence, had to be paid in 20 equal instalments beginning from 1st April, 1952. Burma pleaded inability to pay and, after renewed negotiations culminating in the agreement reached last week, Britain has agreed to reduce the debt by about £20 million.

Under the new agreement, Burma has taken over Britain's obligation to pay £3.3 million to the Union Bank of Burma in respect of currency redemption. This represents money against pre-war Burma notes and British military Administration notes demonetised by the Burma Government in June, 1950. Britain in its turn, has accepted a round figure of £4 million in single payment as final settlement of the Union Government's total indebtedness under the Burma Independence Treaty mentioned at the outset.



Today's army marches on wheels

In the independent India of today, we have still a long way to go in building up mechanisation. The earlier India gives up her dependence on foreign countries for vehicles and obtains all her requirements from within the country, the better for all of us. From the commencement of our activities in 1946 with a *manufacturing* programme of making trucks and cars in India, we have already supplied a large number of trucks, cars, utilities and power wagons to the Defence Department. All such vehicles have been fitted with major components completely designed and manufactured in our plant.

But this is not all. In times of national emergency, the automobile industry can easily switch over to the manufacture of armaments. Our plant—by virtue of its modern machinery and the skill acquired in making precision parts—is well geared to shift to defence production, requiring great skill and precision. Therefore, should an emergency arise, we will be ready to play our part in the defence of our sacred motherland.

NO MORE RELIEF TO TEXTILE INDUSTRY?

MILLOWNERS GREATLY DISAPPOINTED AT GOVERNMENT'S DECISION

AT a Press Conference in Bombay on Tuesday last week, the Textile Commissioner to the Government of India, Mr. T. Swaminathan, stated that no further relief would be given to the cotton textile industry by way of a reduction in the excise duty on fine cloth and of reduction in or removal of the export duty on coarse cloth. This decision of the Government, the Textile Commissioner said, stemmed from the necessity for large funds for developmental expenditure. He, however, gave the assurance that the situation would be kept under continuous review and that the question of granting further concessions would arise only in "very exceptional" circumstances.

The aforesaid announcement has greatly disappointed textile interests all over the country, who had earlier represented to the Government that the burden under the specific rate of excise duty on fine cloth had fallen very heavily as compared with the *ad valorem* rate. It is, indeed, unfortunate that, despite repeated representations, the Government of India should have refused to recognise the need for the abolition of the excise duty. The present rate of duty, namely, 15 pies per yard, is very high and accounts for as much as 20 per cent. on lower categories of fine goods which constitute the poor man's cloth. Such a high level of excise duty has already resulted in considerable consumers' resistance and the mills are finding it difficult to sell fine goods, particularly those with 36s warp and 40s weft made from foreign cotton imported at heavy cost. Incidentally, it may be noted that fine cloth accounts for nearly 25 per cent. of the total production; in the case of Ahmedabad, the percentage is still larger, being 48. It is not surprising, therefore, that the bulk of the cloth stocks lying unsold with the mills represents fine varieties. Indeed, the problem of the disposal of these varieties has been rendered so difficult that the mills are compelled either to close the second shift, as several mills in Ahmedabad have done, or to use more of the finer varieties of Indian cotton, supplies of which are not very large.

Clearly, the need for the abolition of excise duty on fine goods is most urgent. As the Ahmedabad Millowners' Association has very aptly put it, in the course of a statement issued to the Press last week, "when units after units are making heavy losses, the Government should not make a fetish of prestige and continue the levy." After all, the Government should remember that the fortunes of the cotton mill industry are closely linked, not so much with the export market as with the domestic market, a large part of which is still untapped, thanks to the poor purchasing power of the consumer. In fact, even if the excise duty on fine (and also superfine) cloth were abolished, it would not automatically lead to a substantial increase in consumption. For the prices, even after the abolition of the duty, would continue to be high, because these varieties are manufactured out of the costly cotton imported from abroad. If, therefore, the prices are to be lowered to a level which suits the pockets of the common man, there is also the necessity for reducing several other imposts on the cotton mill industry, especially the import duty on cotton. Nowhere among the major textile producing countries in the world does such a duty exist. There is absolutely no economic justification for its imposition, inasmuch as it amounts to no more than a tax on raw material. It is an accepted canon of taxation that raw materials of industry should be exempted from tax.

As regards the export duty on coarse cloth, the Government's decision to ignore the demand of the industry and trade for its abolition is deplorable. The chief consideration which weighs with the Government in its present attitude towards the demand for the abolition of the duty seems to be that the competitive position of India in the world export trade in coarse goods is great *vis-a-vis* Japan, the U.K. and other countries, inasmuch as the Indian mills have the advantage of getting raw cotton supplies at well below world prices. It is, therefore, argued that the Indian mills can afford to carry the burden of the export duty. This line of reasoning is hardly convincing, in that it ignores the fact that the advantage has been nullified, to a great extent, by higher labour costs in terms of workers' productivity, not to speak of the rise in manufacturing expenses. It also ignores the fact that a part of the burden is being passed on to the cotton grower.

Withdrawal of Export Duty on Coarse Cloth

Considering the way in which developments are taking place in the sphere of the world trade in cotton textiles, it looks as though India's exports of coarse cloth also would receive a setback. Thus, the renewed efforts that Japan has been making to promote exports of cloth, particularly superior quality cloth at cheaper prices, will greatly affect the demand for India's coarse cloth. As readers are aware, the cotton mills in Japan enjoy the advantage of a highly efficient labour force, as compared with their confreres in this country. Again, the introduction of rationalised means of production by installing modern and up-to-date machinery and equipment has considerably enhanced the competitive position of the Japanese mills, particularly in plain cloth varieties of 30s, 40s and above.

The moral of it all is that India cannot maintain a high level of cloth exports, unless the Government explores ways and means of stimulating larger exports. One of the surest ways of doing so is to abolish the export duty on coarse varieties as well.

RESTRICTIONS ON CLOTH DEALERS IN BOMBAY

The Government of Bombay has clarified the position with regard to the trade in cotton piece-goods in the State of Bombay. It will be recalled that, more than two years ago, in October, 1951, to be precise, the Government announced its decision to relax certain restrictions imposed on cloth dealers under the Cloth Licensing Order. Accordingly, a dealer could effect sales to any dealer of the same class, or of a different class, and at any margin of profit, provided that the maximum retail margin did not exceed 14 per cent. over the ex-mill price. Subsequently, the price controls on cloth were removed by the Government of India. Following this development, the Government of Bombay permitted any class of dealers to purchase cloth from manufacturers direct. The position that now exists is as follows:

(1) Any class of dealer can purchase cloth from the mills direct.

(2) Any dealer can effect sale to another dealer of the same class or of any other class.

(3) Wholesalers, that is, A or B class dealers, cannot effect retail sales, that is, cannot sell to the consumer direct or sell cloth by yardage.

(4) D class dealers can act only as commisison agents or as brokers.

(5) A retailer cannot sell cloth wholesale, that is, in packed bales.

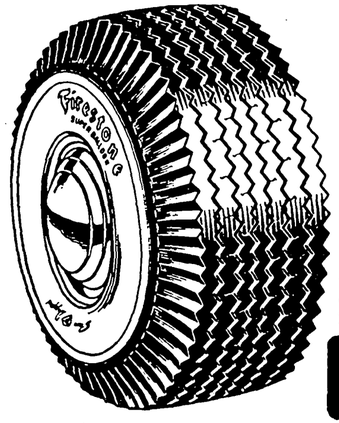
The dealers in Bombay State are warned that any infringement of the existing provisions are liable to be punished in a court of law.

OCTROI ON HANDLOOM CLOTH AND YARN

The municipalities in Bombay State have been asked by the Government to consider the advisability of discontinuing the levy of octroi on yarn used for handlooms and handloom cloth, including *khadi*, and to submit the necessary proposals for the amendment of their rules so as to provide for exemption of the yarn and cloth from payment of octroi. The Standing Handlooms Committee of the Cottage Industries Board has requested that handloom cloth and yarn should be exempted from octroi and other local charges, with a view to enabling the handloom industries to sell their cloth at reduced price and find a ready market for it. With a view to giving encouragement to cottage industries, the Government considers that the request made by the Committee deserves consideration.

In order to improve the style, designs and colour schemes of handloom textiles and the technique of their manufacture, and to evolve new designs and reproduce some of the attractive patterns which command a good market, sanction has been accorded by the Government of Bombay to the establishment of a small research laboratory-cum-sample production centre. The estimated cost of the project during the current financial year is about Rs. 40,000.

ON WINNING CARS AT PIKE'S PEAK CLIMB FOR 23 CONSECUTIVE YEARS



The Pike's Peak Auto Hill Climb is truly "the world's most spectacular auto race." This "race for the clouds" up gruelling mountain roads demands the utmost from men, machines and tyres. It's a real test of champions. Year after year daring drivers stake their chances of victory on Firestone Tyres because they know that on the treacherous curves and switchbacks, their very life depends on their tyres. Time and again only Firestone Tyres have had the strength to withstand the punishment of this brutal grind. You, too, can enjoy the non-skid safety and blowout protection of Firestone Tyres on your car. Firestone Tyres are the only tyres built that are "Safety-Proved on the Speed-way for Your Protection on the Highway."

Take a tip from the champions and equip your car with Firestone Tyres for safer, longer, year-round driving.

YOUR SAFETY IS OUR BUSINESS AT FIRESTONE

RESTARTING LIVERPOOL COTTON FUTURES MARKET

SEARCH FOR NEW OUTLETS FOR TEXTILES

(From A Special Correspondent)

MANCHESTER, 3rd November

MANCHESTER LETTER

RAW cotton affairs in Lancashire, never far below the surface, have jumped into prominence again as a result of the widespread belief that the Liverpool futures market will once more be functioning early next year. Although the decision has been accepted in principle for some time it is unlikely that details of the contract to be offered or the system by which the market will restart can be disclosed in the immediate future. Many people closely connected with the venture are still in the dark as to some aspects of the project.

One of the main uncertainties is the future of the Raw Cotton Commission. It is generally agreed that the cover facilities now offered to spinners will be finally withdrawn next year, leaving the trade to its own devices by the operation of futures contracts. The merchanting section of the Commission, however, may still be retained as a sort of group distribution agency, although there is considerable opposition to such a proposal. Dispersal of the Commission's stocks provides another unsolved problem which is bound up with the question as to whether sufficient stocks are now being built up by private merchants to satisfy the requirements of the mills.

In responsible circles within the industry there is considerable agitation over the prospects in connection with raw cotton. Most of the industry welcomes the re-establishment of the futures market in the belief that eventually there will be greater choice of supplies at keenly competitive prices. Yet all will be glad when the change-over has been accomplished, for the interim period has created problems of its own which can now only be solved by a full return to private dealings.

Foreign Labour

Lancashire cotton employers want to bring in foreign workers from Austria, Italy and Ireland to start up machinery left idle by the drift of workers to other industries during the recession. The T.U.C. was told this in a report from its North-West Regional Advisory Committee.

"The marked improvement in the cotton industry has revealed a shortage of labour in all departments and to meet this need employers are asking for permission to bring in foreign workers from Italy, Austria and Ireland," said Mr. Lewis Wright, General Secretary of the 80,000-strong Weavers' Amalgamation, in the report.

"If this marked improvement in trade conditions continues there is greater likelihood of ex-cotton workers returning to the industry, where they are very much needed. Many workers who left during the slump of 1952 are showing reluctance to return until there are surer signs of employment."

Commenting on the labour problem in the spinning section of the industry, Mr. Alfred Roberts, General Secretary of the Cardroom Operatives' Amalgamation, said order books for yarn were getting longer and there was a danger that unsatisfactory delivery dates might result in loss of orders.

Imported Cloth

Merchants, manufacturers and finishers in Lancashire have never seen eye to eye over the post-war problem of the importation of foreign grey cloth—for obvious reasons. The subject has become a talking point once more as a result of comments made by Mr. Roger Lee at the annual meeting of the Calico Printers' Association.

One of the effects of last year's recession in trade has been the startling reduction in the quantity of foreign cloth imported into Britain for processing and re-export. Such a move was inevitable when many thousands of operatives were out of work and mills were standing idle. The transformation in trade this year has revived the idea that Lancashire's production is still insufficient to cater for all the demands made upon it.

By an arithmetical process Mr. Lee has worked out that the present level of employment and output in Lancashire weaving sheds is only sufficient to provide the home trade requirements of cotton and rayon cloth and leave 400 million yards of fabric available for exports. Even allowing for the fact that manpower is steadily rising, and production with it, the picture illustrated is not a rosy one.

Sir Cuthbert Clegg was quick to reply for the manufacturers, accusing Mr. Lee of approaching the problem from "a sectional short-term angle." He urged the encouragement of greater productivity and recruitment based on being able to assure workers of long-term security of employment. Complaints from weavers, he continued, about lengthening delays in finishing processes did not square with talk of unused capacity.

Shortages of Waste

All sections of the textile industry in Lancashire were not equally affected by the recession which clouded so much of last year's trading. Producers in the waste spinning and manufacturing branch, for example, were able to maintain a reasonable flow of activity, as Mr. J. W. S. Utley, Chairman of the Condenser and Allied Spinners' and Manufacturers' Association, pointed out at the annual meeting. Subsequently, there has been a slow but steady improvement in this section of the trade generally.

According to Mr. Utley, a slight shift in the balance between supply and demand might quite easily bring about a serious shortage of better quality waste, affecting output of yarn and cloth. Dollar-saving is made the pretext for the rejection of the trade's request to import comber waste from the United States. An allocation of dollars for this purpose was refused by the Board of Trade because the Association was unable to provide detailed information of what proportion of the textile goods made from waste were eventually re-exported to dollar markets.

Export Drive

The intensified competition for trade in world export markets and the industrial resurgence of countries whose productive capacity has been curtailed as a result of the war has greatly stimulated the efforts by firms in the Manchester area to find new outlets for their manufactures.

Board of Trade regional headquarters here are having to deal with a volume of enquiry about world markets which much exceeds the rate of demand for advice in 1952. A Board spokesman estimated that in the first nine months this year between 250 and 300 firms in North-West Britain sought assistance in appointing agents in overseas countries. "Quite apart from this, we have been constantly supplying people with information about export markets and lists of imports abroad," he said.

There has been a noticeable upsurge in interest among engineering firms in the region in challenging for orders in new markets. The recovery of Germany and other continental nations is undoubtedly prompting them to tap every likely source of new trade.

Lancashire textile firms are also constantly on the look-out for new opportunities to sell their goods abroad, particularly now that more countries which were formerly their customers are steadily building up their own textile industries so that home textile requirements can be met by local labour.

The North-West firms endeavouring to find new outlets cover a wide range of manufactures. Last month alone the goods produced by the concerns wanting to appoint overseas agents ranged from drugs, agricultural trucks, catering equipment and dumper loaders to lathes, soaps, textiles, foodstuffs, paints, brick-making machinery and knitting wool.

Yarn Output

For the third successive week Lancashire spinning operatives produced more than 20,000,000 lbs. of cotton and rayon yarn in the week ended 17th October.

Cotton Board returns of output and recruitment showed that the mills spun 20,310,000 lbs. single yarn during the week—3,530,000 lbs. more than in the corresponding week last year.

The mills recruited 212 more full-time workers than they lost and there was an additional gain of 70 part-time operatives. Out of the 112,030 workers on spinners' books, the number at work during the week was 103,420.—*All Rights Reserved.*

WORLD STOCKS OF COTTON HEAVY

PROS AND CONS OF PROPOSED AGREEMENT

THE cotton world is likely to feel the adverse effects of the heavy stocks brought into the current season (1953-54) as the season advances, unless the world textile situation improves sufficiently well to enable the mill industry to absorb larger quantity of cotton. Presenting its estimate of the world cotton stocks (including those of Communist countries) on the eve of the meeting of the International Cotton Advisory Committee, which concludes its deliberations this week, the U.S. Department of Agriculture says that the stocks, as on 1st August, 1953, were 17.1 million bales (of 478 lbs. each) or 15 per cent. higher than the 14.84 million bales on the same date last year, or 45 per cent. higher than the 11.81 million bales two years ago. It may be mentioned, in this connection, that world stocks aggregated 25.16 million bales on 1st August, 1938. They are thus appreciably below the pre-war levels.

Analysing the cotton stocks figures in the net exporting and net importing countries, the Department points out that stocks at the end of the 1952-53 season in the former group of countries increased by 3.02 million bales, while they declined by nearly 750,000 bales in the latter group of countries. Stocks in net importing countries as a group declined from 6.4 million bales to 5.6 million bales, with the greatest decreases in India (265,000 bales) and the U.K. (266,000 bales). With the exception of the U.K., Sweden, Switzerland and Italy, stocks in the importing countries, it is stated, were "generally down to a minimum working stock level of about three months' requirements." Stocks in Japan were practically unchanged. The U.S. alone accounts for 2.7 million bales or 84 per cent. of the increases in the exporting countries. The U.S.'s cotton stocks at 5.5 million bales at the beginning of the current season are nearly twice as large as they were last year. This explains this country's anxiety to find a market for its cotton, though other countries, too, face a similar problem. Brazil is another among the net exporting countries to report a substantial increase (estimated at 600,000 bales) in its stocks. Analysing the stock position in terms of the cotton varieties held in stock, the Department says that almost the entire increase in world stocks is composed of American-type cotton. Referring to the effect of the cotton policies, now being pursued by the exporting countries, the Department says:

"Cotton price policies now in effect in most foreign exporting countries are intended to reduce prices to the level necessary to liquidate surplus stocks and trade data indicate that such stocks are rapidly being reduced. No significant stocks of exportable surpluses are expected to remain in these countries at the end of the current season except in Brazil, where stocks of low-grade, old-crop cotton are probably too large to dispose of in one year, and in Egypt where a large portion of the stocks are composed of the lower grades of Karnak, which generally move more slowly than other qualities."

If world cotton output in the current season is maintained at the 1952-53 level of about 35.6 million bales, the world supply will be of the order of 52.5 million bales, as against 50.5 million bales in 1952-53 and 47.3 million bales in 1951-52. Of the total world supply for 1953-54, the share of the non-Communist countries is estimated at 43.7 million bales, as against 42.1 million bales in 1952-53. Thus supplies will be larger by 1.6 million bales. Consumption of cotton in these countries, however, is not expected to register any significant increase. It is expected to remain, to quote the International Cotton Advisory Committee, "reasonably close" to the last season's level. On this basis, the consumption in 1953-54 may be placed at between 25.5 million to 26 million bales. It is against this background that one should consider the deliberations of the annual meeting of the International Cotton Advisory Committee which was in session in Washington.

There was one important item on the agenda of the meeting—a world scheme for cotton similar to the International Wheat Agreement; the aim is to provide means by which supplies might be assured to importing countries at fair prices in years of short crops and markets might be assured to exporting countries in times of surplus. The two proposals that have been put forward so far pursuant to this aim are:

(1) A multilateral contract to cushion rises and falls of prices; here, a maximum and a minimum price for cotton is fixed by agreement countries. Buying and selling of definite quantities of cotton during the agreement period takes place between these limits. Any surplus which an exporting country may have above its guaranteed exports is sold in the free market at whatever price the exporter can get for it. The International Wheat Agreement works roughly on these lines; and

(2) An international buffer stock agreement. Countries acceding to such an agreement decide on the extremes to be set to price fluctuations. An international executive is then set up to buy in a stock of cotton large enough to exert a powerful influence on world prices. When prices weaken, in times of abundant supply, the executive buys cotton and when they tend to fall will release stocks.

The Committee is also reported to have discussed a scheme combining features of both these proposals.

It may be recalled that, at its meeting in May, 1952, the International Cotton Advisory Committee received from its Standing Committee a survey of certain arrangements that might be used to bring greater stability to international trade in cotton. After a preliminary consideration of these proposals, the Committee decided that its Standing Committee should be asked to undertake further studies on this subject. Presumably, the Committee has now received a more detailed proposal for a world cotton agreement. Particulars of this scheme are not yet available, but this is a highly controversial question on which even experts are divided. Some are of the opinion that a world scheme for cotton would bring stability to countries that produce, export and consume cotton as well as to processors and manufacturers. Export quotas for producing countries, it is argued, would assure them a guaranteed market for a portion of their cotton in excess of domestic demands. It would also relieve the need for annual adjustments in production due to changes in world demand. Import quotas set up under the plan would assure cotton consuming countries of their raw material requirements. Definite prices for various grades of cotton, it is further contended, would give producing nations a known return for their output, while consuming countries would know how much they would have to pay.

Many experts, however, feel that it might be difficult to evolve an agreement which would be acceptable to all interests. They point out that economic conditions in the cotton textile world have changed since the subject of a world cotton agreement was taken up for consideration two years ago. At that time, there was fear of shortage, thanks to the Korean boom. But the world is now faced with a large surplus and prices are tending to fall. The main importing countries cannot, therefore, be expected to take even the little interest they formerly took in this scheme. This school of thought cites the instance of the U.K. which chose to remain outside the International Wheat Agreement when it saw the emergence of the surplus position in wheat. Further, cotton differs from wheat, in that the former is used to make cloth which has itself an international market. It is not, therefore, clear how the principles of a world commodity agreement followed in the sphere of wheat, can be applied to cotton. Again, it is asked whether a cotton agreement could possibly ensure that cotton users in both importing and exporting countries obtain their cotton on equal terms. Other factors which, it is stated, would render the formulation of an acceptable agreement difficult of achievement are: the existence of price support legislation in different countries and the system of differential prices in terms of different currencies for identical varieties of cotton, and the continuing difficulties in the balance of payments position in different countries.

Notwithstanding these difficulties, it is believed by some that a world agreement for cotton may take the form of a multilateral contract scheme on the lines of the International Wheat Agreement. Under such a scheme, there would be fixed a maximum and minimum price for cotton, there would, of course, be a free market also. The exporters would be under an obligation to sell the agreed quotas at the maximum price if the importers insist on it. The importers could be compelled by the exporters to buy the agreed quotas at the minimum price. The chief advantage of this scheme is that it assures a market for the exporters, at least to the extent of the agreed quotas and also a source of supply for the importers to the same extent, though both are free—that is, outside the terms of the agreement—to engage in trade upto any quantity which they can buy or sell, and do so at any price. Apart from the fact, that it is difficult to devise a system of maximum and minimum prices for cotton which consists of a very large number of varieties with an intricate price-pattern of premiums for different grades, the defect of this system is that an unusually heavy crop in the exporting countries would leave them with a large surplus above their contract quotas. Another defect of the scheme is that, although it stabilises the price of supplies traded under quota arrangement, it causes prices on the free market to fluctuate more than if no agreement existed at all.

Finally, the simultaneous existence of quota and non-quota cotton would lead, as Mr. D. R. Atkinson pointed out in an article contributed to the May issue of the *Egyptian Cotton Gazette*, to a two-price system in the importing countries. The two-price system did not matter in wheat which was mainly—and still is, in many countries—bought and sold by the Governments. But cotton trade is in private hands in a large number of countries. The cheaper of the two cottons—that is, the quota and the non-quota cotton—will oust the other. If the free market price is lower than the quota price, cotton will be bought by private importers as far as possible from non-member coun-

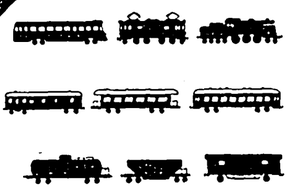
768000 SKF ROLLER BEARING AXLEBOXES
supplied to railways throughout the world!



138000 SKF roller bearing axleboxes
280000 SKF roller bearing axleboxes
350000 SKF roller bearing axleboxes
768000 SKF roller bearing axleboxes

In 1911 — 42 years ago — SKF axleboxes were first fitted to railway rolling stock. In 1919 the first SKF spherical roller bearing axleboxes were introduced — axleboxes that have since gained a world-wide reputation for reliability and efficiency. Up to the present a total of 768,000 roller bearing axleboxes have been supplied to the railways of the world for locomotives, passenger coaches and goods wagons of all types — a total far in excess of that of any other rolling bearing manufacturer. That is why no other rolling bearing manufacturer can offer such long and varied experience in the railway field as SKF. SKF spherical roller bearings are designed to carry heavy, rapidly fluctuating loads accompanied by shock loading, i. e., just those conditions encountered in railway service.

PROBLEMS BEFORE SUGAR INDUSTRY

TOO MUCH OF OFFICIAL INTERFERENCE DEPLORED

FEW would remain unimpressed with the way in which Lala Shri Ram, one of the leading sugar millowners of India, approached the problems confronting the sugar industry, in the course of his inaugural address at the twenty-second Annual Convention of the Sugar Technologists' Association of India, held at Kanpur the other day. Lala Shri Ram not only drew pointed attention to the series of handicaps that faced the sugar industry but also put forward several notable suggestions for improving the conditions in the industry. Indeed, there is considerable force in his statement that there must be a "living" sugar industry before scientific activities and aspirations of technologists could have any scope. This, of course, presupposes a reorientation in the attitude of the Central and State Governments towards the sugar industry. That such a reorientation is imperative is clearly borne out by the continued lack of stability in the industry, despite the protection enjoyed for a long period of 18 years, necessitating imports of sugar from abroad.

What are the causes for this lack of stability in the sugar industry? Those who have cared to follow the developments in the industry will readily admit that it is the excessive and undue interference by the powers-that-be in the affairs of the industry which has been responsible for its present ills. Lala Shri Ram minced no words when he remarked: "It is a poor tribute to those responsible for the prolonged and detailed control over the sugar industry that, after 15 years of continuous control at various points and in different degrees, imports should have again become necessary on the ground that indigenous production is not sufficient." The pertinent points that Lala Shri Ram cited in support of his charge deserve reproduction. These are:

(1) The price of sugarcane which accounts for 60 per cent. of the total cost of sugar manufacture, is controlled by the Government.

(2) The areas of supply are equally controlled. The factory has no choice as to the place from which it will take cane.

(3) The wages paid by the factory and the strength of the staff are regulated by the Government. Even a single person cannot be discharged, except with the permission of a Government authority.

(4) Transport and despatches are controlled officially and the sugar mills cannot move their goods as and when they find it advantageous with reference to market conditions.

(5) Even in the manufacturing processes, any attempt at introducing improved methods or up-to-date machinery brings the factories at once against the often insuperable hurdles of retrenchment and Government control.

(6) As much as 93 per cent. of the expenses of the factories is subject to official control even to the smallest detail.

Taxation Very Heavy

It is not the official interference in the working of the factories alone that has hampered the progress of the sugar industry. The growing tendency on the part of the Governments to treat the industry as a milch cow has done it equally great harm. The proof, if proof were needed, of this tendency could be found in the imposition of several taxes and cesses, not merely by the Central and State Governments, but by the local bodies as well. The taxation on sugar is very heavy; it comes to more than 20 per cent. of the price of the commodity. What is worse, there are certain levies, such as cess on sugarcane at a rate which is nearly equal to an excise, that have least economic justification. Not only is the rate of cess too heavy—it accounts for 15 per cent. of the cost of cane—but the proceeds also are not being properly utilised. By doing so, the State Governments have laid themselves open to the bitter and universal complaint of misappropriation of funds. There is no exaggeration whatever in the statement of Lala Shri Ram that "if an individual or a joint stock corporation, instead of a Government had done such things, it would perhaps have been answerable for a civil breach of trust to make good to the beneficiaries the amounts wrongfully appropriated."

Inasmuch as the future of the sugar industry rests on the progress in the sphere of cane cultivation, the first step required is for the State Governments to spend the entire cess on development of cane. It was this very aspect which Mr. Desraj Narang, President of the Association, emphasised while presiding over the Kanpur Convention. A specific suggestion which Mr. Narang made was that the onus of cane development work should shift from the Governments to the factories concerned, with adequate finances made available to the latter. Said he: "Let a five-year experiment be tried in this direction. The basic requirements of cultural methods should be enforced and means provided to the cultivator to enable him to apply the required doses of manure and water. I am sure that, if the responsibility for cane development is passed on to the factories, the sugar technologists of factories will make an all-out drive to obtain the desired results."

A Pertinent Suggestion

This is indeed a very pertinent suggestion and deserves most careful consideration by the Planning Commission and the Government of India. We advisedly do not say "State Governments," because it is no use appealing to them. They scarcely care for the suggestions of the Press. Secondly, this specific suggestion will be most unpalatable to them, because it amounts to asking them to give up their rights. The present Union Minister for Food and Agriculture himself is fully aware that the State Governments are not spending the proceeds of the cane cess for the purpose for which it has been collected. Since the Governments have misused the proceeds of this fund, they are no longer morally entitled to its dispersal. It is high time the Centre intervened and drew up a plan, in consultation with the factories, for the development of cane production. The finance for the execution of this project must be obtained from the cess collected by the States. The execution of the project should be left to the factories, as suggested by Mr. Narang.

A disquieting feature of the economy of the Indian sugar industry, which is absent in the industry in other countries, is the unstable relationship between sugar and its substitute, *gur*. As Mr. Narang aptly put it, "we have seen, year after year, that, whenever *gur* prices are unremunerative, cane supplies are diverted towards sugar, and, conversely, when *gur* prices are attractive, sugar production suffers. The fortune of the sugar or the *gur* industry waxes and wanes, according as the price of one gets the better of the other." Lala Shri Ram also stressed this point, for he remarked that "violent fluctuations in the price of *gur* necessarily upset, with equal violence, the intended balance between cane and sugar."

Balance Between Sugar and Gur

The foregoing account clearly emphasises the need for striking a balance between the two sectors of the sugar economy. To this end we must first make up our minds as to the relative necessity of production of both the commodities. Alluding to this, Mr. Narang observed:

"Facts show that consumption of sugar is increasing year after year and, at the slightest opportunity, it sometimes increases beyond control. Therefore, while we cannot shut our eyes to the weakness of the people for sugar, we must concede that *gur* production is as important as sugar, not merely because it has a place in the daily diet of millions of our countrymen, but also because it is a source of employment and ready money to a large number of cane-growers who are remote from the factory zones. It occurs to me, therefore, that we should have a planned production of both. If 1.5 million tons represent the target for white sugar, let there be a target fixed for production of *gur* also. The production of *gur* ranged from 2.75 to 3.5 million tons and that of *khandsari* sugar from 175,000 to 105,000 tons during the last four years. We can, therefore, reasonably take the figures of 3.5 million tons and 100,000 tons as the optima in respect of *gur* and *khandsari* sugar production, respectively. Along with 1.5 million tons, as the target of sugar production, 3.5 million tons must be taken as the target for *gur* production."

The attainment of the target noted above is unlikely to present any insuperable difficulty, considering the fact that the production of sugarcane is, more or less, commensurate with the actual requirements of the two sectors of the sugar economy. But what hampers the supplies of cane to the sugar factories is the severe competition from *gur* producers. Even the Planning Commission has recognised this aspect, as witness its remark that "the absence of restrictions on the manufacture, price and movement of *gur* and the lack of control over the price of cane paid by the *gur* industry have enabled *gur* production to be increased to the detriment of sugar production." This problem too must be satisfactorily solved if the sugar industry is to be placed on a stable footing. Two courses of action are open. One is to control the *gur* industry on a par with the white sugar industry, while the other is to give the same freedom to the white sugar industry as is being enjoyed by the *gur* industry now.

NEW SUGARCANE GRINDING PLANT IN EGYPT

The Egyptian sugar industry, represented by the powerful Societe Generale des Sucreries et de la Affinerie D'Egypte, has just doubled the productive capacity of its mills, as compared with that of the years directly before the last world war. This is due to erection of new equipment supplied by the Société Francaise de Constructions Mecaniques, which in 1929 and 1931 had supplied the original equipment of this Company. In 1952, the Egyptian Company placed an order for a new set to double the capacity of the already existing installation, the crushing capacity of which has now reached 10,000 tons per day.

This installation comprises one cane-shredder and six 935×2.200 mm. grinders. The first unit is engine-driven, the other six are driven two at a time by three engines. The latter, which are of the Cail type, have been specially designed for the sugar industry. The distributing and regulating mechanisms are simple, visible and of direct access. The sturdy construction is designed to reduce friction to a minimum. It is on account of this sturdiness that the old machines still look like new after 24 years.

Their speed may be varied from single to double, that is, from 45 to 90 r.p.m. simply by turning a push-button. Finally, admitting steam up to 16 Hp. with overheating up to 325°, they have a very low consumption, between 8 and 10 kg. steam per h.p. hour, as against 14 to 20 in the other driving methods. Thanks to their flexibility and their economical operation, these engines are ideal driving means for grinders, specially when the operation at the start and at the end of the season is not regular.

The grinders are provided with the latest improvements. They are characterised by greater extraction, thanks to carefully designed cylinder grooves and the great mobility of the upper cylinder which produces the hydraulic load. This flexible motion is the result of a careful selection of the materials used, of the study of the guiding parts and particularly of the transmission of the hydraulic press strain through a roller-socket joint arrangement. The press joints are of cast synthetic material and require no maintenance for several seasons.

The intermediate conveyors are of the rake type and are of ample dimensions. As designed, it is suitable for a very high capacity and has the advantage of being extremely clean, permitting no fall and leaving no deposit likely to ferment. These conveyors have been provided with forced-feed rollers and a bagasse-container of a Cail patented system. The auxiliary equipment of the grinding plant, cane conveyors, devices for soaking and filtrating cane-juice, gangways, etc., has been supplied and the total weight of the equipment delivered amounted to 1,600 metric tons.

A wide use of cast steel was made in the construction of grinders as well as in the construction of transmissions, the latter having no cast iron components. This installation was successfully tested in April, 1953.

SUGAR PRODUCTION AND STOCKS

The opening stocks, production, despatches and closing stock of sugar in respect of central sugar factories in India during the fortnight ended 15th October, 1953, were 290,216 tons, nil, 46,902 tons and 243,314 tons, respectively. The figures for the corresponding fortnight of the previous season were 524,284 tons, 3,199 tons, 48,301 tons and 479,182 tons. Figures for the current fortnight relate to 126 factories representing 92.08 per cent. of the total cane-crushing capacity, while those for the previous year relate to 121 factories representing 89.02 per cent. of the total cane-crushing capacity.

The total production and despatches of sugar for the season 1952-53 are reported to be 1,317,650 tons and 1,533,634 tons, as against 1,489,277 tons and 1,127,040 tons, respectively, during the previous season.

COAL RAISINGS AND EXPORTS

TREND DOWNWARD

A PERCEPTIBLE fall in the output of coal is disclosed by the latest available statistics. Thus, raisings upto the end of August, 1953, the latest month for which figures are available, were 24,098,788 tons, as against 24,372,510 tons during the corresponding period of 1952, that is a decline of 273,722 tons. On the basis of these figures, it is expected that the total production for the year 1953 will be about 400,000 tons less than that in 1952, when it touched a peak of 36 million tons. This is no doubt fractional but the point is that the upward trend in production has suffered a reverse in the current year. One of the reasons for this is the lack of transport facilities. Another is a marked fall in export demand. The control over distribution is also a contributory factor.

Exports of coal by sea (excluding Pakistan) during the nine months January-September, 1953, were 974,019 tons, as compared with 1,644,334 tons in the same period in the previous year, a precipitous decline of 670,315 tons. This decline, despite the abolition of surcharge on exports, is a disquieting feature. If this were to persist, it might have a telling effect on the future trend of production and employment in collieries. Exports to Pakistan during January-September, 1953 were 610,420 tons, as against 965,614 tons in the same period last year.

The decline in exports is due chiefly to China, Australia and South Africa emerging as keen competitors to India. Australian coal is being shipped to Hongkong, Singapore and Chittagong. South Africa has been sending its coal to Pakistan, Ceylon, Singapore and even to Hongkong. Reports from Colombo indicate that a trial consignment of Australian coal has been delivered to the Ceylon Government Railways and that tests are now being conducted to find out all possible modes of using it, if possible in preference to Indian coal. The decline in exports is attributed also to the fact that there are controls on the export of high grade coal which is in great demand in the overseas markets.

The future of India's export trade in coal depends initially on the extent of freedom given to the export trade to supply in full the quality of coal needed by the importing countries. Secondly, if the export markets for Indian coal are to be stabilised, the prices should be reasonably competitive. Thirdly, adequate transport for the carriage of coal from pitheads to ports and storage facilities at the ports should be provided, as early as possible. Finally, washing and blending of coal should be encouraged, with the assistance of the Government wherever possible and need be, so that India could export a larger quantity of higher grade coal with, of course, as little interference as possible with the policy of conservation of high grade coal.

COAL MINES PROVIDENT FUND

The ninth meeting of the Board of Trustees of the Coal Mines Provident Fund, held recently, decided that some principle for utilising the corpus of the "reserve account" of the Fund for the benefit of the members should be evolved. It agreed upon the principle of charging interest at 0½ per cent. on employers, if they failed to pay their contributions within the prescribed period. The Chairman, Mr. K. N. Subramanian, Secretary, Government of India, Ministry of Labour, expressed the view that provident fund money should not be paid to a retrenchee immediately but only if he remained unemployed for a period of one year. This was due, among others, to the consideration that the purpose of the fund was to provide for assistance during old age and that when a man was healthy he should strive for finding alternative employment and not fall upon the benefits of the fund.

COAL AND COKE STATISTICS

Over 2,60,000 tons of soft, hard and other kinds of coke were manufactured by seven coke plants during August, 1953. The output was over 83,000 tons more than that by eight coke plants in the previous month. About 2,747,000 tons of coal were produced by 824 collieries during August, as against over 2,753,000 tons produced by 820 collieries in July. During the month under review collieries and coke plants employed on an average over 328,200 persons daily, working over 7,915,000 manshifts. The corresponding figures for July are about 310,000 and about 8,000,000, respectively. The percentage of absenteeism was 13.82 in August, as compared with 14.20 in July. The output per manshift during August for miners and loaders was 1.04 tons, for all persons employed in underground and open-workings 0.56 and for all persons employed 0.34. The corresponding figures for July are 1.07, 0.56 and 0.34 tons, respectively.

POWER FOR BOMBAY'S HOMES & INDUSTRIES

Nestled in the hills of the Western Ghats the Andhra Valley Power Station supplies power for Bombay's homes and industries. In 1922 General Electric equipped and installed 60,000 kw capacity generators, transformers, switchgear and other electrical equipment. For 31 years this installation has been in continuous service, a major contribution to the ever increasing power demands from an expanding city.

There are many other major installations in India with large G-E generators including those at Sivasamudram, Shimsha and Jog in Mysore, and Mahora in Kashmir.

General Electric is the largest electrical manufacturing organization in the world with a production range of 200,000 different items—from tiny switches to giant generators, from lamps to locomotives.

Inaugurated 75 years ago in U.S.A., when its parent company was first established, General Electric's unlimited resources, skill and research have been used and are available to India for the development of her natural resources.

This is General Electric's 50th Anniversary of Service in India

PLANTATIONS IN TRAVANCORE-COCHIN

PLEA FOR RELIEF FROM REPRESSIVE TAX MEASURES

THE economic set-up of the Travancore-Cochin State is based on the agricultural development of land, and plantations account for a substantial part of agriculture in the State. The burden of agricultural taxation is heaviest on plantations in all parts of India and more so in Travancore-Cochin State. Heavy taxation, as every student of economics knows, is a strong deterrent to initiative and enterprise. If agriculture in the State is to make further progress and add to the wealth of the people, the burden of taxation on plantations must be appreciably lightened. The recent visit of Dr. Kailash Nath Katju, Home and States Minister, Government of India, to the State was, therefore, availed of by leading planters of the State to make a representation to him on this subject. Incidentally, they drew the attention of the Minister to a few other problems as well, such as law and order, labour relations, and land reform which adversely affect the working of plantation estates on efficient lines.

In the course of an interview granted to planters of the State by Dr. Katju at Kottayam last week, Mr. P. Kurian John, Managing Director, Malankara Rubber and Produce Co., Ltd., Kottayam, first dwelt on the problem of security. In recent years, planters had felt the necessity of maintaining law and order, particularly with the commencement of labour union activities. Political parties of various shades and colour had been encouraging low output and indiscipline among the labourers on the estates. The maintenance of law and order had been rendered more difficult by the fact that estates were generally situated far away from towns and sometimes in jungles. In this connection, Mr. Kurian John pointed out that a Government without substantial support from its legislature would be in a difficult position to adopt any firm policy in such matters and urged the need for a stable Government in the State.

Referring to the recent trends in trade union movement in the country, Mr. John pointed out how the managements of estates had been unable to concentrate on better cultivation and processing of crops owing to the various demands of labour. There were a large number of trade unions working in India under different political parties—and they all vied with one another to get control over labour. With a view to gaining popularity, each party competed with the other in inducing the workers to put forward unreasonable demands and make extravagant claims on the managements. Alluding to the Minimum Wages Act, Mr. John disclosed that the plantation industry in Travancore-Cochin State was paying the highest wage paid in plantations anywhere in India. The piece rates of planters in Travancore-Cochin were also very high. The planters did not mind paying higher wages, provided it led to an increase in the workers' productivity and better understanding between labour and management. But, unfortunately, Mr. John said, they had not been able to achieve that end. The higher wages were being paid without receiving any worthwhile return.

Mr. John expressed the planters' concern over the prospects of tampering with the existing policy of land holdings which would affect economic production. He said that planters did not subscribe to the theory of low production and high prices. Their aim was to produce more and bring down the price charged to the consumer. But the various taxes and levies imposed on planters by the Central and State Governments and local bodies made it impossible for them to bring down their costs. Quite apart from the heaviness of the tax burden, what has made matters more complicated is the anomalies of the various tax measures. Referring to the tax burden, Mr. John drew the Union Minister's attention to the fact that the plantation industry was the most highly taxed one in the whole of India. Tea estates in Travancore-Cochin State were paying from about Rs. 500 to Rs. 750 per acre per annum, depending upon their annual crop, to the Central and State Governments, by way of excise and export duties, income-tax, cess and sales tax. Besides these, they were also paying taxes levied by village panchayats, municipalities and other local bodies, as well as indirect taxation on materials consumed in estates.

The various anomalies in the taxation measures of the different States, to which Mr. John made a pointed reference, make interesting, but depressing, reading. A high rate of agricultural income-tax and super-tax is levied on the earnings of planters in Travancore-Cochin State. No such tax is payable in the neighbouring States of Madras, Mysore, etc. To this extent, the plantations in other States are, therefore, placed in an advantageous position vis-a-vis the estates in Travancore-Cochin. Although the Central Income-tax Act has now provided for a rebate or allowance to assessees against agricultural income-tax paid at source by companies on their agricultural dividends, the relevant sections in the State Agricultural Income-tax Act are still to be amended. All pending agricultural income-tax assessments for many years are to be completed in order to enable assessees to get their rebate provided for in the Central Income-tax Act. The two sections of the State Agricultural Income-tax Act are stated to be conflicting in effect and have complicated matters considerably for shareholders of agricultural companies.

As regards sales tax, the produce of estates in Travancore-Cochin is generally sold for consumption in other States or for export. Sale of teas for export with export rights at Cochin auctions are being subjected to Madras sales tax. The sales tax question on inter-State transactions has not yet been finally settled. As already pointed out, local panchayats, municipalities or corporations levy taxes. Although relief in regard to double taxation is provided for in the Panchayat Act, there is no such relief from double taxation under the Municipalities Act, except between municipalities. There is also no limitation to taxation by municipalities on company profits in the Travancore-Cochin State.

While the various Governments and local bodies vie with one another in extracting their dues from the planters and labour unions clamour for higher wages, there does not seem to be any appreciation on their part of the responsibility of the planter. It is to this aspect that Mr. Kurian John drew the special attention of the Minister. "It is often forgotten," he said, "that a planting company employing about 500 labourers may have over a thousand shareholders depending on their dividends to meet at least a portion of their annual expenses on bare necessities of life. It is also generally disregarded that a small holder, employing a couple of labourers, under our present Minimum Wages Act, has to support over half a dozen dependents out of his income from the land." He, however, hoped that the labour unions and Governments which now pursued a policy of enlarging the wage bills and tax bills of estates, would, in course of time, give a little more consideration to the vital necessity of (a) increasing output at cheaper cost, (b) making adequate allocation from profits for replanting old or low yielding areas, for which no depreciation or amortisation was now allowed either in the State Agricultural Income-tax Act or in the Central Income-tax Act, and (c) giving a reasonable return to the shareholders of a large company or to the small holder of an estate, on his present worth of investment.

(Concluded from next column)

countries such as South Africa, a crore of rupees worth of jute manufactures. He was of the opinion that Pakistan jute manufactures were of better quality and that there would be absolutely no danger of being beaten in competition by India or any other European country. This robust optimism of Pakistan in its ability to hold its own in world markets is born of the advantage the country enjoys in respect of not only the high quality of jute and its availability to its mills, but also the high efficiency of the mills equipped with the latest type of machinery. It must be remembered that Pakistan mills are not bound by any working agreement as Indian mills are. Consequently nothing binds the mills in Pakistan to work like Indian mills 42½ hours a week with 12½ per cent. of the looms sealed. They can also work double or even treble shifts, whereas the mills in India, especially those efficient ones, are prevented from working even a full shift. Moreover, Pakistan jute mills are not subject to rigid labour laws, as their Indian confreres are. Thus unfettered by any kind of restrictions; Pakistan jute mills have a good start in their bid to conquer the world markets. Pakistan's growing competition, therefore, is a factor to reckon with by mills in India.

JUTE INDUSTRY IN PAKISTAN

SHORTAGE OF QUALITY JUTE ENVISAGED

THE latest information on the position of raw jute and jute industry in Pakistan now comes from Mr. N. M. Ispahani, a pioneer East Pakistan jute millowner and one of the senior Directors of the Pakistan Industrial Development Corporation. In the course of a Press interview at Karachi last week, he disclosed his reading of the situation in regard to the supply of raw jute this season in both India and Pakistan and gave a clear picture of the progress so far made by Pakistan in the manufacture of jute goods. These views of Mr. Ispahani are of much significance to the jute industry in India, in that they convey a warning that it will not be long before Indian mills will have to face formidable competition from Pakistan.

Commenting on the prospects for raw jute, Mr. Ispahani stated that the Government of India's estimate of jute production in India of 3.2 million bales during 1953-54 was incorrect. He placed the Indian production far lower than that, at 2.7 million bales. Pakistan's jute production, according to him, was 2.8 million to 3 million bales. It was very difficult, he said, to estimate the carry-over from the last season, but he had no doubt that the entire carry-over was of inferior quality—a quality which was unsuited to the manufacture of hessians. Some estimated the carry-over of such inferior jute at 1.5 million bales to 2.5 million bales, but he was of the opinion that it was about 1.8 million bales. Thus, according to Mr. Ispahani, the total quantity of raw jute available this season in Pakistan would be of the order of 4.6 million to 4.8 million bales.

Speaking of consumption of raw jute, Mr. Ispahani estimated the consumption of good quality jute by countries other than India at 3.2 million bales. As India was out of the Pakistani market at present, he visualised the prospect of this country being at a disadvantage later on in the season. For, by the time India entered the market, good quality jute would have been sold out, and the balance available for sale in the open market would not be the better quality jute required for the manufacture of hessians. Consequently, India, he said, would have to enter the world jute goods market for selling inferior jute goods manufactured out of the poor variety jute.

There is, of course, some force in this contention of Mr. Ispahani. For Indian jute mills till very recently had been buying jute very sparingly in the market, as they could not afford to lock up their funds in jute at a time when stocks of jute goods were accumulating in their godowns. There is, however, no proper indication to adjudge that the quality jute available this season will be far short of requirements, as was pointed out by Mr. Ispahani. Anyway, Indian mills will do well to bear in mind the warning given by the Pakistani jute millowner. It is, however, interesting to note that, though good quality jute might be in short supply, there would be, according to him, enough jute in both India and Pakistan to keep mills engaged throughout the year. In his opinion, there was no danger of any mill closing down during the current season for want of jute.

What is, however, of more interest to Indian jute mills is the progress of the jute manufacturing industry in Pakistan. On this aspect, Mr. Ispahani had much to say. The present production was on the basis of 50,000 tons per year. By December this year, it would go up by another 40,000 tons. Thus the production of jute manufactures by Pakistan at the end of this year would be about 90,000 tons per annum. By the middle of next year, on a two-shift basis, Pakistan jute mill production would be at the rate of 185,000 tons a year. The present loomage, according to him, was 1,375 in the Adamji mills and 150 in the Ispahani mills. By June next year, there would be an addition of 1,000 looms to the Adamji mills and 500 looms to the Ispahani mills. Besides, Amin mills would have by then 500 looms working, Crescent mills another 500, and Peoples' mills another 750. During July-December, 1954, three more units of 250 looms each, namely, Ghani, Ibrahim, and Chittagong Baling and Shipping mills would be in production.

Pakistan's own consumption of jute manufactures was 4,500 tons a month. This is already covered by the present production.

Mr. Ispahani pointed out that Pakistan had already exported to the U.S. and certain other

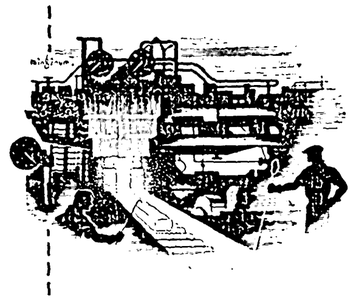
NICKEL ALLOYS

For more than a century Henry Wiggin have been pioneers in the production of high-nickel alloys, seeking always to be ahead of the engineer's demands for better properties. Continuous research for improved materials coupled with constant care and precision in manufacture ensure the high standing and international reputation of Wiggin high-nickel alloys. During the past year or so, world-wide demands have far exceeded the supply. But although some of our products are still not freely available we are doing our best to meet your requirements.



MONEL . . . corrosion-resisting alloy
NICKEL . . . in all forms
INCONEL . . . heat- and corrosion-resisting alloy
BRIGHTRAY . . . series of electrical resistance alloys
NILO . . . series of controlled expansion alloys
MANGONIC . . . stronger and more resistant than nickel in moderate sulphur-containing atmospheres
THERMOMETAL . . . for thermostatic devices
NICKEL ANODES . . . for nickel electrodeposition
OTHER NICKEL ALLOYS to meet special requirements

RIVER VALLEY PROJECTS IN INDIA

RS. 40 CRORES TO BE SPENT ON IRRIGATION WORKS IN SCARCITY AREAS

THE symposium on the "Determination of costs and benefits of river valley projects (including irrigation, power, flood control and navigation)," organised by the Central Board of Irrigation and Power, recently at New Delhi, provided an opportunity to engineers for the exchange of views on the subject. Mr. V. T. Krishnamachari, Vice-Chairman of the Planning Commission, inaugurated the session, while Mr. Gulzarilal Nanda, Minister for Planning, presided.

Addressing the symposium, Mr. Nanda disclosed that the Government of India was thinking of taking concrete steps to have a central pool of technical experts and engineers on the lines of the former Indian Service of Engineers. The perspective of the Five-year Plan, he said, should be revised from time to time, depending on the demands of the people. At one time, the demand for food was the greatest and so irrigation was given the topmost priority in the Plan. New problems were coming up such as unemployment, etc., and the planners had to view the river valley projects with reference to them. The Planning Commission was, therefore, studying the employment potential of the river valley projects. Proceeding, Mr. Nanda stated that the use of machinery in the execution of the projects should be such as would justify itself, because manpower was available in abundance in the country. He was not against mechanisation as such, but he felt that it should be done on a stronger ground than mere economy. It was essential that the available manpower should be made the best use of.

Mr. Nanda was in full sympathy with the difficulties the Indian engineers were faced with in the execution of the river valley projects, because they were new to river valley projects of such dimensions and were, therefore, liable to make mistakes. They were working in difficult circumstances and the resources at their disposal were limited. He felt that the country did not have enough trained personnel in all sectors. Some trained personnel of the higher intermediary cadres were available, but, at the lower level, he said, there was a large deficit of experienced men. So far as labour was concerned, Mr. Nanda was of the opinion that the full benefit out of them was not obtained at present, because the workers were not properly trained.

The Minister for Planning and Irrigation had the impression that some of the projects like the D.V.C., Hirakud and Bakra were started in a hurry. He remarked that, before a project was taken in hand, detailed preparation and preliminary investigation must be made and completed as thoroughly as possible.

Irrigation Works in Scarcity Areas

Inaugurating the session, Mr. V. T. Krishnamachari revealed that, in the remaining two and a half years of the Five-year Plan, it was proposed to spend Rs. 40 crores on irrigation works in scarcity areas. These works would be taken up in addition to the regional projects already embodied in the Plan.

Mr. Krishnamachari expressed surprise at the discussion often centering round the relative usefulness of multi-purpose projects, large and medium projects, minor irrigation schemes and so on, as if there was a conflict among them. This, he said, was a mistaken view. Every one of those projects had its own use. There were certain areas in the country in which there was scope for multi-purpose projects and such areas were limited. There were areas in which there was scope for large and medium projects. Practically all over the country, minor irrigation schemes were necessary. There was not very much of a conflict between these schemes. The question before the planners of the country was about giving the right place to these various kinds of projects in the general scheme—how many to be included and in what proportion. Their task was to see that all types of schemes were included in such a way that they would prove to be "profitable, remunerative and useful."

Mr. Krishnamachari pointed out that, in the present Five-year Plan, there were eight projects costing Rs. 5 crores each, 16 costing between Rs. 5 crores and Rs. 1 crore each, 21 costing between Rs. 1 crore and Rs. 50 lakhs each, 27 costing between Rs. 10 lakhs and Rs. 5 lakhs each and a number of others costing less than Rs. 5 lakhs each. The aim of the Commission had been to include the different kinds of projects wherever suitable in the Plan. But all these projects had their own advantages and disadvantages.

The advantages of the big projects were that they ensured a much more secure irrigation than other kinds of projects, and they were not affected by any vicissitudes of seasons. Such projects were helpful in generating electricity and bringing about a revolution in the country. On the other hand, there were also disadvantages like their high cost, the need for vast technical organisation and the long time taken for execution. So far as medium projects were concerned, the same sort of balance of advantages and disadvantages was present. But, in the case of medium projects, the advantages were more in that their organisation was easier and development of irrigation could take place more quickly. Regarding minor irrigation projects, their advantage lay in that they had facilities for the execution of the projects all over India. Mr. Krishnamachari said that the cost of small projects was small and they could get co-operation of the public much more easily. But there was a great disadvantage in that these projects were entirely dependent on rainfall. The maintenance of these projects had to be organised by the village communities themselves. It was not possible for Government departments to maintain a large number of small works all over the country and the responsibility for maintenance of such projects had to be placed on the village communities. Such a process gave rise to many administrative problems.

Question of Priorities

The Vice-Chairman of the Planning Commission then referred to the question of priorities and declared that, on this point, every attempt would be made to reconcile all-India needs with those of the individual regions. They had the pressing problem of making India self-sufficient in food. From that point of view, they should carry out as quickly as possible the most remunerative schemes which yielded the largest results from the point of view of expenditure incurred. But that could not be the only consideration in the laying down of a plan. It was their duty to see that regional development was not neglected. There were, for example, certain chronic scarcity areas in the country which should get their due share of development. In the early stages, greater emphasis was laid by the planners on all-India considerations, but, at present, they had to reconcile the all-India needs with regional needs. Sooner or later, better sooner than later, regional development must find emphasis in the programme. The proposal to spend Rs. 40 crores on irrigation works for the benefit of scarcity areas in the remaining two and a half years was an indication that the Planning Commission was seized of the importance of the need for small projects.

The main emphasis of Mr. Krishnamachari's address was on the necessity for ensuring public co-operation. It was imperative, he declared, that, if the projects outlined in the Plan were to be executed with speed, steps should be taken to make the people feel that they were partners in a grand enterprise. People should see that they were the owners of the projects and had to share in the rights and obligations. Unless this change in outlook was brought about in a revolutionary way, he feared that India would not be able to have any large programme of multi-purpose projects. The development of irrigation and the scheme for utilisation of power should go side by side. In this connection, he commended the practice of the Madras Government, which, before undertaking execution of a project, went to the villages concerned, explained to them the financial and other implications and asked in what manner they could contribute to the successful execution of the projects.

Finally, he turned to the question of financing the various projects. He revealed that multi-purpose projects were a great strain on the financial resources of the Centre and that, if the Centre got bogged down in two or three big projects for years together and if, in addition, the Centre was called upon to bear the expenditure needed for improving other irrigation projects, there was no prospect of the Centre being able to take up and implement many more multi-purpose projects for which there was great demand all over India. The conclusion of this analysis is clear. It is that the State Governments must take over the task of finding the wherewithal for the construction of the medium-sized and minor projects by following a judicious financial, fiscal and spending policy, and let the Centre to concentrate its attention on the execution of the bigger and multi-purpose river valley projects, which require not only a large amount of finance but also considerable administrative talent of a high order.

RAILWAY STATISTICS

Disclosing that the Railway Ministry had placed orders for the delivery of 400 locomotives, at a cost of Rs. 15 crores, with Japanese and Australian firms recently, in the course of a Press interview at New Delhi, Mr. P. C. Bhattacharya, Finance Commissioner of Railways, stated that the programme of the Ministry was to purchase an additional 750 locomotives from abroad for delivery before the end of March, 1956. On 1st April, 1951 the date of commencement of the Five-year Plan, there were 8,200 locomotives, of which 32 per cent. were over-aged, having served for 40 years. Of the orders placed for 769 locomotives (407 with Chittaranjan Workshop and Telco. and the balance with foreign countries) during the last 30 months, only 390 had been actually received so far. The production programmes of the Chittaranjan Workshop and Telco. had not been kept up to schedule, presumably because of the difficulty of getting parts from abroad. Orders already placed with these two firms were sufficient to keep them fully employed for the next two years and there was, therefore, he stated, no intention on the part of the Railway Ministry to place any further orders with them, out of the proposed purchase of 750 locomotives. Negotiations were still proceeding with foreign firms in regard to the supply of the remaining 350 locomotives. It was possible that some of the locomotives might be bought out of the aid that might be received from foreign countries. Payments for locomotives now ordered would be in sterling. Mr. Bhattacharya stated that, if the programme for the import of locomotives was maintained according to schedule, the percentage of over-aged locomotives would be brought down by the end of the Plan period to about 20 which might be regarded as normal.

Mr. Bhattacharya also revealed that, of the orders placed for the delivery of 3,800 passenger coaches and 32,300 wagons during the three years 1951-52 to 1953-54, only 3,000 passenger coaches and 19,500 wagons had so far been received. Another order for 10,000 wagons was also placed under the import programme for the year 1954-55. The total number of coaches in India on 1st April, 1951, was about 20,000 and of wagons 201,000. The over-aged wagons accounted for 24 per cent. and the over-aged coaches for 36 per cent.

Proceeding, the Financial Commissioner stated that, so far as passenger coaches were concerned, the intention of the Railway Ministry was mainly to replace the over-aged ones. Passenger traffic was steadily declining and would probably stabilise at a somewhat lower level this year than that in the previous year. The level of goods traffic was being maintained and it was possible that passenger and goods earnings might ultimately stabilise in the ratio of 40 per cent. and 60 per cent., as against the present 43 per cent. and 55 per cent. As regards wagons, Mr. Bhattacharya said, it was not proposed to import them in large numbers. The Government scheme was to encourage existing firms of wagon manufacturers in India. The main difficulty was in regard to getting steel and it was likely that some quantity might have to be imported. It was expected that the wagon production capacity might be increased by about 25 per cent. in the near future. If there was any great difficulty about increasing internal production of wagons, the Government might purchase about 4,000 or 5,000 wagons from abroad.

SPHEROIDAL GRAPHITE CAST IRON

A new publication entitled *Spheroidal Graphite Cast Iron—Engineering Properties and Applications* has been issued by the Mond Nickel Co., Ltd., London.

In 1947, when the direct foundry production of Spheroidal graphite cast iron was first announced, this news was hailed as the greatest metallurgical advance of the century for it provided a whole new range of materials combining the advantages of cast iron with much of the strength and toughness of steel.

The present publication deals largely with the two main grades of S.G. iron in wide current use but also mentions other special grades such as Acicular and Austenitic cast iron with the graphite in the spheroidal form. The two normal grades are similar except that one is in the as-cast condition while the other is annealed. The first can be expected to give a tensile strength of 35-45 tons per sq. in., with 1-5 per cent. elongation, while the second gives 27-35 tons per sq. in. tensile strength with an elongation of 10-25 per cent.

Among the general data are a diagram comparing the main mechanical properties of S.G. iron, with other cast irons and with cast mild steel, a table of all the mechanical properties of both as-cast and annealed S.G. iron necessary for design purposes, details of the production characteristics and a description of service properties. In addition, reference is made to the American Society for Testing Materials Standards for S.G. iron and a valuable summary of typical applications is included. In all, the booklet provides a clear picture of the current position and future possibilities of this new material, which is now being produced in India, and there will be few engineers who will not be able to visualise immediate further applications in their own spheres. The publication is available free to all interested parties on application to: The Mond Nickel Co., Ltd., Technical Office, 1 Forbes Street, Fort, Bombay 1.

IT COSTS LESS...

Freight rates are only part of your total shipping costs. You have to think of many other things too – packing, insurance, loading charges, dock dues, etc.
When you fly your cargo, these charges are either reduced or avoided altogether; so you start with a substantial saving.

Insurance, for instance, is based on the *time* your goods are travelling. By air, they take only hours instead of weeks; so you save 90 per cent or more on the premium.
You save on handling costs, too. No warehouse charges, no dock dues, and the minimum delay in Customs.

Packing costs are cut right down, because your goods need less protection by air. They mostly travel with light cargo, and they are treated gently. A simple cardboard carton is enough, even for perishable goods.

Finally, we make standard reductions for bulk shipments of 100 lb. or more. And for many types of goods, we offer special reduced rates.
It's worth while to find out how much you save, when you fly your goods by A.I.I. Why not write to us today? Or give us a ring, and our representative will call on you.

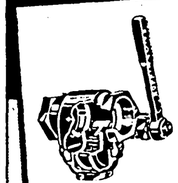
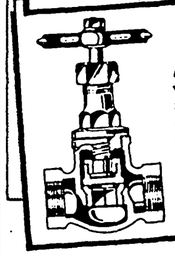
Hopkinsons' VALVES FOR ALL PRESSURES & TEMPERATURES

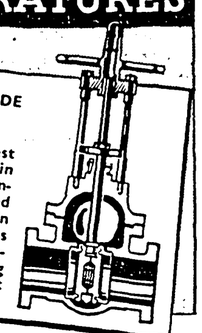


PARALLEL-SLIDE LINK-VALVES
For compressed air, steam, water, oil or thick heavy liquids. Opens with less than a quarter turn of the handle: easy to operate under all conditions.



'S.T.S' VALVES
A general purpose valve of simple design and sturdy construction. Can be relied upon for long, fluid-tight service. Sizes 1/2" to 3" bore. Supplied with flanged or screwed connections.

PARALLEL-SLIDE VALVE
One of the best known valves in the world—designed and patented by Hopkinsons in 1881. Maintains fluid tightness under severe working conditions without wedging action.



The valves illustrated are a typical selection of the Hopkinson range of products.

PREVENTING ACCIDENTS ON ROADS

IMPORTANCE OF ORGANISING "SAFETY FIRST" WEEK

INSURERS, as a class, have a "vested" interest —if the word "vested" could be used at all to describe so laudable an objective—in the prevention of accidents. For they are vitally concerned in ensuring safety on the highways, which gives them the advantage of a low claims ratio in respect of the insured men and vehicles. They ought, therefore, to take a lively interest in the work of the Safety First Associations and other social service organisations which are constantly at work educating the people to live in safety. From the insurers' point of view, as indeed from the point of view of national well-being, it is gratifying to note that at least in one centre, namely Delhi, much attention is being given to the problem of preventing accidents. Sponsored jointly by the Central Government, the Delhi State Government, the Delhi Municipality, the Rotary Club and the National Safety Association, the "Safety First" Week, which was observed in that city last week, was designed to bring home to the people the importance of observing "safety first" principles.

It is noteworthy that the Press co-operated with the organisers in bringing out safety first supplements. Thus, the *Statesman* issued a special supplement, which makes not merely interesting but most instructive reading. The articles in the supplement dealt not only with the causes of accidents but the best means of preventing them. What is the main cause of accidents? We think that Mr. Lal Bahadur Shastri, Minister for Transport, emphasised the correct cause of all accidents when he said, in a message to the paper, that what "generally leads to an accident is inadequate knowledge of traffic regulations and improper training of those who drive vehicles." He added:

"It is to be regretted that traffic rules and regulations have only become more of a record in Government offices, and the public, including owners and drivers of vehicles, are hardly made aware of them. Even those who are acquainted with the rules are unmindful and indifferent towards them, but this should be an additional reason for a constant reminder of the importance of observing them, which means giving them adequate publicity. Training in traffic regulations should, in fact, start right from the primary schools and should find a place in the text-books."

Bad Roads

It would, of course, be wrong to fix the responsibility for all accidents entirely on the drivers of vehicles. But it was found in Delhi, according to Sardar Rajendar Singh, State Transport Controller, Delhi, that, in about 90 per cent. of road accident cases, the "responsibility for the accident rests on the vehicle." Even so, bad roads, especially insufficiently broad roads and ill-lighted roads, cause more accidents than is generally realised, for even a bad motorist could possibly avoid many dangerous accidents if the roads were sufficiently broad. Nevertheless, the motorist should know not only the traffic regulations in force, but also the dangerous consequences of high speed, which is often the main cause of accidents. Mr. Singh asks, in this connection, whether many motorists know that, when a car is travelling at 30 miles an hour, it takes 104 feet to bring it to a stop in an emergency and that, when it is travelling at 50 miles an hour, it takes 239 feet to bring it to a halt. He adds:

"Motorists are heard saying that speed in itself is not dangerous. This may be theoretically true. But even the best of drivers are liable to human error, and a burst tyre or a mechanical defect, which may be harmless at low speeds, could result in death at high speed.

"For too many drivers cut corners, attempt to overtake on bends or crests of hills where visibility is restricted, and ride the centre line without any thought of the dangers involved.

"Driving long hours puts a heavy strain on the nerves and causes weariness. The law requires that drivers of public vehicles should not be required to drive for more than nine hours a day or 54 hours a week, but it seems that drivers of public goods vehicles, in this country are always on duty. They get very little rest. Many of the accidents on the highways are the result of the driver having felt drowsy at the wheel."

An important cause of accidents in this country is the simultaneous presence on the road of different vehicles with divergent speed capacities—the hand cart, the bullock cart, the tonga, the cycle, the motor cycle, the goods lorry and the passenger car. There is, of course, the slowest-moving vehicle, the "human vehicle," the pedestrian himself, who does himself the greatest injury by ignoring traffic regulations. The "safety first" propaganda must be primarily designed to educate the three important classes of travellers, the motorists, the cyclists and the pedestrians, who are the people that are generally involved in accidents. During the Safety First Week in Delhi, the publicity campaign included the following instructions:

Motorists: Dip your lights—don't dazzle

Cyclists: Maintain your cycles in good condition, particularly the brakes.

Pedestrians: Think and look before crossing the roads.

High Speed

Apart from observing traffic regulations, the motorist should know that, if he dazzles the pedestrian by a too brilliant light, he is only increasing the chances of an accident. He should also learn the importance of being sober, when he is at the wheel. Since most States in India have prohibition, "excess liquor," which is a major cause of accidents in the West, ought to cease to be an important cause of accidents in this country. It may, however, be wondered whether the very fact that liquor is not so freely available will not induce a motorist to help himself to an additional drink when he comes by illicit liquor. Be that as it may, it is necessary, at all times, for the motorist to realise that high speed should be avoided if accidents are to be prevented. The Government should also realise that traffic regulations should be properly enforced. Some motorists feel that the State Governments in this country punish them for trivial offences, and do so without giving them sufficient notice or warning, while more serious offences are sometimes ignored.

The cyclists too must realise that they should keep their vehicles in good condition. Many of them do not realise the importance of efficient brakes, of good light, and of having a red signal at the back wheel. Nor do they appreciate the value of the advice that they should never ride abreast, since they occupy more space and thereby help increase the chances of accidents.

The pedestrians must be told that they expose themselves to needless risk if they indulge in "jay-walking"—that is, going along the main road, without using the pavements.

Highway Safety

The challenge to highway safety, according to Mr. H. P. Mathrani, Ministry of Transport, can be met only if it is tackled simultaneously on the three 'E' fronts—engineering, education and enforcement. Referring to the place of each of these factors in the fight for safety, he says:

"The primary function of roads is to afford uninterrupted and safe circulation of traffic at reasonable speeds. To achieve this various factors, viz., speed, nature and intensity of traffic, length of visible road, gradient, curvature—horizontal as well as vertical—minimum turning radius, type of pavement, width of traffic lane, lighting, etc., should be given careful consideration. Traffic characteristics and disposition should be studied.

"It is very necessary to spread information concerning the rules of the road and to make the public safety-minded and safety-conscious. Recourse may be had to the following practical expedients: (a) publicity vans; (b) organisation of "safety" weeks at regular and short intervals; (c) lectures in colleges and schools; and (d) films, posters and the radio. Cinematography and photography are some of the best media suitable for propaganda work. Photographs and pictures make the public more forcibly aware than words ever can of the horrible effects of accidents. Organisation of "safety weeks" and the production and exhibition of "safety films" should yield rich results and lighten considerably the task of ensuring highway safety.

"It has been observed that almost invariably the accident curves descend as the curve of warnings, arrests, and convictions rises. So the motorist or any other road user, who completely disregards and/or treats with contempt laws and regulations enacted to ensure safety on the road, should be properly dealt with. Mobile trying courts should be encouraged for speedy and effective action against recalcitrants on the spot."

It should thus be clear that it requires the joint efforts of several classes of persons, who may be broadly classified as the road users and the Government, before the roads cease to be the "death traps" they frequently are to-day and can become safe places which all may use without danger. In this task, the insurers can play a vital role by sponsoring or participating in movements that are designed to propagate safety first principles among the people.

BIRTH AND DEATH RATES

A general decline in death rates is a favourable factor for insurers, since it indicates an encouraging mortality experience. They will, therefore, be gratified to find that the "crude" birth and death rates per one thousand of the population, published by the August issue of the U.N. publication, entitled *Monthly Bulletin of Statistics*, show that, in many of the leading countries of the world, birth rates show an upward trend, while death rates show a marked decline since the pre-war years. The following table gives the birth and death rates in some of the leading countries:

Birth Rates

	India	Italy	Japan	U.K.	U.S.
1937 ..	33.7*	22.9	30.6	15.8	17.1
1938 ..	33.3*	23.8	27.1	15.6	17.6
1948 ..	25.2	22.0	33.7	19.1	24.2
1949 ..	26.4	20.4	32.8	17.0	23.0
1950 ..	24.8	19.6	28.2	16.2	23.6
1951 ..	25.0	19.1	25.0	15.8	24.5
1952 ..	23.2	17.6	26.0	15.7	24.6

Death Rates

1937 ..	22.0*	14.3	17.0	12.6	11.8

MIDLAND RUBBER AND PRODUCE COMPANY, LIMITED

SPEECH OF MR. THOMAS AT SIXTEENTH ANNUAL GENERAL MEETING

PLEA FOR BETTER OPPORTUNITIES TO PLANTERS FOR CO-OPERATION WITH GOVERNMENT

ADDRESSING the shareholders of the Midland Rubber and Produce Company, Ltd., at their Sixteenth Annual General Meeting held at Alleppey on 26th October, 1953, Mr. A. V. Thomas, M.P., admitted that, in the present altered set-up of things in the country, which has as its objective the realisation of a Welfare State, a certain amount of governmental control over the administration, production and sale of many of the commodities was necessary. He even went so far as to concede that a healthy control under which the Government would not interfere in the normal trade activities, but act promptly in an emergency, could be productive of really good results. If, however, the desired objective of the Government were to be achieved, Mr. Thomas felt that the *modus operandi* of administration of control measures should be altered to suit each industry, according to its position and the exigencies of circumstances. He also pleaded that greater opportunities should be given to those who were in the know of the difficulties, achievements and purpose of the various industries, for collaborating and co-operating with the Government.

The following is the full text of the speech delivered by Mr. Thomas:

"GENTLEMEN,

"I welcome you to this the sixteenth annual general meeting of the Company. The Directors' report together with the audited balance-sheet and profit and loss account have been in your hands for the stipulated time. The year's working and the results achieved have proved to be very satisfactory. The Directors' report contains a fairly full account. However, I would like to refer to some aspects of the plantation industry, in general, and of our products, in particular, before I move the report and accounts for the year for adoption.

Control Over Plantation Industry

"The plantation industry, as many other important industries in the country, is sought to be controlled by the Central Government with a view to stepping up its usefulness to the overall national economy. Normally, in the altered set-up of things and the objective of the realisation of a Welfare State, governmental control in one form or other must be acceptable. With the first Five-year Plan in active adoption and the prospect of similar plans being repeated, it is perhaps permissible that the Government should have some effective voice in the administration, production and sales of many of the commodities that are produced in India. In fact, a healthy, helpful control, keeping the interference of the Government least in the normal trade activities, but being always in a position to step in at any time, can be productive of really good results. For this, the undoubted and essential prerequisite is a comprehensive knowledge in the hands of the Government of the exact state of the industry, the difficulties that are confronting it, and the remedies that would be possible to help the industry. I am saying this, because there is an overall feeling in the country that most of the control measures, at any rate, in the form in which they are enacted and administrated, are ill-digested and may not be helpful in achieving that purpose for which they are being put on the Statute Book. Therefore it is, that I have been trying, wherever I had the privilege, to represent that, on a good national cause, I could never fail to see eye to eye with Government in their objective, but the *modus operandi* in their administration will have to be altered, to suit each industry according to its position and exigencies of circumstances warrant. It is not fair to use the same yardstick of control oblivious of the difficulties, achievements and purpose of the various industries that are in the country. If the democratic set-up, which is the avowed ideal of our Government, is really practised and people, who are actually in the know of such things, are given greater opportunities to collaborate and help to co-operate with the Government, at any rate, the stigma that most of the legislations that are put on the Statute Book have been made without comprehension, could be eliminated.

"The production, processing and sales of tea have been now put under the enactment of the Indian Tea Act. Tea is one of the largest foreign exchange earners of our country. Tea, as you know, is one of the industries which provide considerable employment for the manual workers of the country, as well as to the educated middle class in the estates, in the offices, in the sales section and in so many other ways. The Act has been at one time felt by me as something which has helped the Government to take very much more powers than what the situation would admit of. But it is one thing to have the powers, and it is altogether another thing not to abuse it. Therefore, even if the Act appears to have gone too far to merit its usefulness for stabilising the tea industry in this country and take it away from the periodical booms and slumps, it can still serve usefully the industry, provided the administrative set-up understands the problems of the industry from time to time, and quickly, and adopts remedial measures. Let us hope that the various assurances given in this connection will be fully lived up to by the Government.

"Coming nearer home, our crops have been good and, in fact, in the very tight and competitive economy and ever-mounting cost of production, the only way to balance and stabilise the producer is to step up his production per acre high enough to offset the increase in the cost of production per unit. In this, your Company has not stinted to employ all the agricultural cultivation and manurial application and treatment of pests and diseases which science has taught us to be adopted systematically in the estates. You would have seen that, for the year under report, the average yield per acre on our Arnakal Estate is 1,011 lbs., which must be considered extremely satisfactory. Notwithstanding the increase in cost of production by the adoption of the Minimum Wages Act, the overall cost has been lived up very near to the revised estimate.

Rubber

"What I have said in the matter of legislative enactment under tea, applies equally to rubber. However, the legislation in respect of rubber is still in the Bill stage and it is expected to be taken up in the ensuing session of Parliament. Representations have been made to the Government, and are being continuously made, with regard to the various aspects pertaining to this industry and with the better knowledge that the Legislature and the Government now possess, the Act that will come out of Parliament may be something, I hope, against which you, as rubber producers, will not have to be very much militant.

"So far as our rubber properties are concerned, you are aware the whole of Mukampala Estate and a third of the area on Perinaad are under budded rubber. We have an immature new addition, under budded rubber, in South Travancore close to Mukampala and as part of it, to the extent of 151 acres.

"Our anxiety is that, if India has got to stay successfully on rubber, notwithstanding the closed economy under which the production and marketing of this commodity is controlled, at least 50 per cent. of the total area of the old, worn out, exhausted, estates in the country, must be replanted scientifically with improved heavy yielding material. In fact, the capital formation for this is not easy even normally, but in the present tight money conditions, it is almost futile to expect new or fresh capital for this purpose. Nevertheless, the replanting of the old estates has got to be recognised as an inescapable necessity. It is on this issue that considerable agitation was focussed by the producers to get the margin in the price for ploughing back into the industry. This alone will help better production, at cheaper cost, of a commodity whose strategic importance has been already recognised by the Government.

"We, for our part, at any rate, cannot get out of our rubber estates, whether the price factor is helpful or not and your Directors have in contemplation a planned and spread cut replanting programme for the old rubber in Sittar and Perinaad, for which adequate provision is being made by suitable appropriation from the profits year by year. The satisfactory position with regard to our production of rubber is that some of the new experiments, we have adopted in the matter of tapping, cultivation, etc., have proven their values and you will find that the crop during the year under report exceeds the estimate by 1,24,973 lbs. This is also in excess by 1,19,058 lbs. over the crop secured during the previous year. However, the production for the current year cannot keep this up, as, under the new enactments, the industry has been mostly compelled to suspend tapping on Sundays, which, in itself, will be responsible for some stepping down in crop.

The Plantation Act

"The Plantation Act, the implementation of which has been deferred, might probably be put into working operation at any moment. I am not one who will hesitate to support any measure which will bring in a better standard of living for the worker and the common man, giving him a larger measure of happiness. Even when the matter affected our economics, I am one of those who always believed, and continued to believe, that a healthy and contented labour force in the estates is an asset whose value can never be underestimated. I dare say no sensible thinking man in our country to-day will dispute the desideratum of the ideal of our Government to provide employment for all healthy people, helping them to improve their standard of living and well-being which is the first *sine qua non* of a successful Welfare State.

"But whether mere legislative enactments divorced of their practical possibilities would serve to achieve this object, I am not so sure of. Ideological enthusiastic approach to this problem, no doubt, is the essential prerequisite; but mere enthusiasm without a realistic approach to the situation and without fully appreciating the overall economic set-up of our country, can more probably mislead us than help us to serve and realise the laudable object. It is in this I am very particular that all phases of the industry must be fully taken into confidence and they must also be fully put in possession of the pros and cons of every attempt and the possibilities of the results, before they can be adopted as a standard yardstick.

"I will challenge anybody who will feel that we, as planters, are slow to appreciate this necessity either in comparison with our compeers in the urban industrial areas, or even with the Government themselves. Practical wisdom and great experience of the people, who are actually handling this, should be fully brought into play and availed of to realise the betterment of the common man and the worker, if not immediately, at least soon enough surely.

"The health of the labour in estates is generally satisfactory. The Company has been also paying more attention to the question of labour sanitation, hospital facilities, sick leave and maternity benefits, and other helpful measures to improve generally the health conditions of the estate workers.

"There has, no doubt, been some labour unrest on one or two of our estates, but it seems to be in common with most of the estates in the district. The problem is being sought to be tackled industry-wise in collaboration with other estate owners. Though the strike position during the year under report is less poignant than it was in the previous year, in the vital necessity of greater production at cheaper cost, I hope there will be wisdom on those concerned to do all that they can to admit of better cordial relationship between the employer and the employee.

Profit and Loss Account

"Gentlemen, coming nearer home, and turning to the profit and loss account and balance-sheet, I believe you will appreciate that the results for the year have been good indeed both in the matter of crops harvested and prices realised. This is more so because it was feared at one time that the drop in tea prices would continue to go unchecked, ultimately depressing the industry to a state more consequential than a passing slump. Actually this has not happened.

"With regard to rubber, the accumulation of stock and consequential deterioration in quality, besides the compelling necessity in some places to distress sales, due to overall tightness for money, have not fully helped the producer

(*Continued on page 913*)

TAXATION SYSTEM IN INDIA

REFLECTIONS ON SOME OF THE QUESTIONS RAISED BY ENQUIRY COMMISSION—II

(By R. K. DALAL, B.Com., F.S.A.A., F.C.A.)

TAXATION of profits accruing to a resident abroad (Question No. 49) may be a fit subject of taxation, but the administration of the law as regards foreign income and recovery of tax are made difficult by the following circumstances:

(1) Financial embargo on remittance;

(2) absence of double income-tax relief;

(3) a person may attract double ordinary residence both in India and abroad;

(4) manner of calculating income artificially under two Acts may differ in quantum and relief is granted only on the lower of the two amounts;

(5) payment of taxes at both ends may amount to a figure more than the income itself, unless relief or postponement is granted by the authorities;

(6) prompt collection of tax by deduction at source, advance payment, provisional payment and final payment all make a deep inroad on a business man's capital, while his refunds and computations of losses are inordinately delayed.

In case of nationals wishing to settle down in India, foreign accumulated savings brought into India should not be taxed even if such a person technically attracts the status of a resident in the year of his arrival. These incoming sources of capital should be encouraged by making them tax-free. Further, realisation abroad of capitalised income with a view to bringing it into India should not be deemed to be income. Such capitalisation should be recognised, unless there is a reasonable doubt as to the *bona fides* of the transactions.

Bonus Shares (Question 50)

"Bonus shares" are normally regarded as capital distribution, but section 2(6A) specifically catches certain capital distribution artificially as dividend. Clause (c) needs a little consideration by reason of an express omission of the words "profit, whether capitalised or not." This phrase is used in clauses (a), (b) and (d), but strange enough it is omitted in clause (c). The legal connotation of this phrase seems to be that revenue profits so capitalised will still retain the characteristic of revenue, if subsequently the capital is paid off, reduced by a release of assets. If that is the meaning, then the absence of the phrase in clause (c) creates a clear lacuna, that is, under clause (c), whatever is once capitalised does not retain the revenue character, although distribution entails release of assets. A company about to go into liquidation might first capitalise its profits accumulated during six years and then go into liquidation. Distribution in liquidation of accumulated profits during six previous years would be deemed to be dividend. But, if once capitalised as aforesaid, they would cease to be so treated. If this is the legal interpretation, the section needs a modification in this direction so as to stop the loophole disclosed.

At present, there is no provision under which a company which capitalises its reserve can be called upon to pay tax on loans given to the shareholders for reasons other than business consideration. Such withdrawals by shareholders in the aggregate should be treated as dividend distributed on the footing of the shareholders' holdings in the company.

Hence, bonus shares issued by the company out of any accumulated profits should be taxed in the hands of the shareholders to the extent of the loans advanced to them or any firm or private limited companies in which such shareholders are interested either as a partner or a shareholder or a director as the case may be and to the extent the company's funds are invested in shares or debentures of such companies.

Business Connection (Question 51)

Business connection in respect of export trade should not be made the basis of taxation under section 42 read with section 43 to encourage our industries and trade. In case of imports of goods from foreign countries, the provisions of this section should be invoked where transactions are purely principal to agent. In case of transactions entered into as principal to principal, where the non-resident has no interest in the goods after they are shipped from abroad, no liability should be imposed on the resident importer. In case of a concern in India, the business of which is to indent goods on behalf of the residents in India, the liability should not be imposed on the resident where he simply acts as a media, unless he has acted as an agent on behalf of the non-resident principal holding some authority to act on behalf of the non-resident.

Agricultural Income (Question 52)

About agricultural income the suggestion is that such income will be taxed twice—once in the hands of the company to agricultural tax and again in the hands of the shareholders, as the Department has begun to disregard the principle that, when a company distributes agricultural profits to its shareholders, it retains the character of agricultural income, with the result that agricultural dividends are subjected to tax. This is not fair, for a company is but a legal entity interposed between the shareholders and its transactions. The shareholders are not the creditors of the company; they are the owners, though, for purposes of management, the law provides that a limited company, when it acts, it does not act on behalf of the shareholders; it acts on its own behalf as a legal entity. There is thus, it is argued, no legal relationship of a principal and agent so as to imply that the tax paid by the company is paid on behalf of the shareholders. This is true but that is not the whole truth. If the company's incorporation does not affect the mutuality of transaction between the members, why should the incorporation prevent the shareholders, who participate in the fund available for dividend, being regarded as having earned indirectly what the company has earned directly, of course subject to legal formalities? Similarly, does not a capital profit, when distributed by the company, remain capital dividend in the hands of the shareholders? There is thus no reason why agricultural profit, when distributed, should not remain agricultural profit. It is, therefore, necessary to make express provision in the Act, so as not to deprive the shareholders of their right of exemption from agricultural dividend in their hands. Accordingly, the agricultural portion of dividends should be specifically included in the definition of agricultural income under section 2(1), so also the forest income.

Integration of Agricultural with Non-agricultural Income (Question 53)

It is argued that agricultural income, if it is added for rate purposes, will more adequately measure a man's ability. That is true, but then, a question may be raised as to the desirability or otherwise of including in the total income elements which are not taxable. If exempted income finds place in the total income, in order to measure his ability to contribute to the exchequer, why not capital gains also? Thus, the issue would raise too many problems. And, unless a formula is found which will resolve all such conflicts, the present position should continue as it is, that is, excluding agricultural income even from aggregation for rate purposes.

Agricultural and non-agricultural income, it may be added here, now stand on different footings as follows:

(1) Agricultural incomes are not governed by the Income-tax Act;

(2) these incomes are totally exempted from charge; and

(3) method of the computation of non-agricultural income is not the same as applied to agricultural income.

Following the reasoning that agricultural income should continue to be exempted, the reply to question No. 54 is that the distinction between the two types should continue.

Fluctuating Incomes (Question 55)

Fluctuating income is a species of income and, from the point of view of ability, should not be regarded as income which creates a regular source for the assessee. The source may yield irregular income, but the source must exist. So long as the source exists, any yield from it should rightly be regarded as income and taxed. But this is not true with regard to isolated, non-recurring receipts. If such incomes are brought to tax, the question of allowing set off for losses will also arise. And something which is taxed with a view to adding and increasing the revenue may not turn out into a loss by allowing assessees to set off losses against their income. The question of taxing the income on average basis will involve a review of past years' assessments which may not be administratively easy to carry out. Similar difficulty is likely to confront the spreading of receipt over a number of years. I think that the balance of view seems to be to continue the present exemption except in cases like gratuity, for instance, where it is possible to spread the income over the years of man's services or compensation over the years the service is lost because of the termination.

If, however, the principle of spreading over a period of years the income of irregular and fluctuating character is to be accepted, it is necessary that a general provision should be made. The provision at present is confined to royalties, copyrights and fees for literary or artistic work. There are other incomes also of this nature which call for a similar treatment, viz., in the case of film undertaking receipts in a year for the right of exhibition of a film for a period of years; lumpsum payments on termination of employment or compensation for loss of employment; gratuity on retirement; cumulative preference dividend and profits on long-term contracts. All these need to be spread over a period of years the benefit is felt.

Exemptions

Charitable Trusts (Question 56): Exemption for private charitable or religious trust is not recognised. But where the trust provides no benefit to the settler or his relatives, some form of abatement should be allowed in rates, if not total exemption, e.g., these amounts actually spent for such objects as are charitable under the Act or which could be regarded as religious having regard to the denomination of the assessee, i.e., whether he is a Hindu, Parsi, Mahomedan or Christian. Ample safeguards may, however, be necessary to preclude abuse of this right.

Co-operative Societies (Question 57): Profits of a co-operative society should continue to enjoy the present exemption. The ambit of their liability should not be widened. Co-operative societies do not exist for profit motive, but for economic uplift of the community and hence they deserve all the State support. The present exemption restricts itself to one source only, namely, business. All incomes, of whatever nature, which fall under section 10 are exempted, even though it may not be strictly within the co-operative movement, e.g., profit on sale of Government securities. Sources like property, interest on securities and other sources should continue to be taxed as before. But it is necessary to lay down a uniform method of working out the income of co-operative societies all over India. Some Income-tax Officers regard investment as capital, others as stock-in-trade. It is suggested that some definite rules should govern the computation of a society's investment income as a capital investment or stock-in-trade; if it is to be regarded as the latter, what should be the method of its valuation: cost or market value whichever is lower or cost or market value whichever the assessee opts to adopt? Some guidance is also necessary as to the capital computation to determine the amount of interest to be allowed as a set off against interest income under section 8. This is necessary, for part of the capital is without interest—being the shareholders' capital and part of it is depositors' money at varying rates of interest. Relief should be given in computation of working capital by excluding shareholders' capital which is without interest and including only the borrowed capital in shape of deposits in case of co-operative banking societies. The rate of tax at present obtaining should be continued. Income from sources other than business should be arrived at after deducting proportionate expenses.

The question with regard to co-operative housing societies needs careful consideration. According to the present law, income of co-operative societies under section 9 is not exempted from tax. Co-operative housing societies, therefore, do not derive any benefit from the exemption. On the contrary, by reason of the co-operative society owning the whole building as an asset in its balance-sheet and the members having only contributed to its capital, co-ownership cannot be recognised, with the result that every co-owner of a flat in such building has to contribute tax at the rate applicable to the total income of the society, instead of its aliquot part. Where a building is constructed under co-operative housing scheme and the members have taken a flat therein on ownership basis, each co-owner should be separately taxed on his share of property at the rate applicable to his total income as a co-owner under section 9.

New Industries (Question 58): Concession given under section 15C must continue. Any depreciation allowance each year should be reduced by the profits, if any, made by such undertakings and allowed to be carried forward next year and so on, just like any other assessee.

Foreign Branches of Indian Banks (Question 59): Foreign profits of a bank incorporated in India and having its head office in India should not be subjected to tax in the first three years of the working of the branch. Similarly, losses made by such foreign branches in the first three years of their working should not be allowed to be carried forward and set off against their profits in subsequent years.

Life Insurance and Provident Fund (Question 60): In respect of life insurance abatement, the present restrictions are reasonable. But, in order to induce this type of saving in the lower grades of income, the present one-sixth should be advanced to one-fourth upto the total income of Rs. 15,000, one-fifth upto Rs. 25,000 and one-sixth thereafter. There is another difficulty that is experienced in case of minors whose income is aggregated with that of the father and that is this: where a minor pays his life insurance out of his own income, the minor's income does not get the benefit of abatement, because his income is added to that of the father and because the abatement under section 15 is allowable only to an assessee. It is suggested that, unless the minor is individually taxed, the income that is added to the income of the father should be subject to abatement under section 15. The present Act may have to be suitably amended to meet the suggestion.

Under the present Act, there is a distinction made between exemption granted to recognised provident funds and those provident funds which are governed by the Provident Fund Act, 1925. Continuation of this preferential treatment to Government servants really results in lower basis of taxation for income earned by Government servants as compared with others. Such preferential treatment is ethically incorrect. It is, therefore, suggested that the Income-tax Act should be suitably amended so that all recognised provident funds, including provident fund of the Government employees, are treated on uniform basis for purpose of relief.

Allowances

Depreciation (Question 61): With regard to depreciation allowance, it is felt that the present method of allowances—initial, normal and extra allowance and double shift allowance—seems to cover adequately the wear and tear loss suffered by the company; but, on account of increased cost of replacement of these assets at the end of their life, these allowances will not be adequate. Specific provision is called for and the method that recommends itself for acceptance is the creation of a special rehabilitation reserve, transfer to which should be treated as an admissible expense. There should, however, be certain conditions attached to this relief, such as:

(1) The funds shall be earmarked only for replacement of plant and machinery;

(2) the funds shall not be utilised for distribution as dividend;

(3) the funds shall be invested in Government securities;

(4) if meanwhile, there is a liquidation of the company, these funds shall be treated as profits in the hands of the liquidator.

Classification of Assets (Question 62): As compared with machinery, depreciation rate on furniture needs to be adequately increased so as to compensate this class of assets for the loss of initial and extra depreciation allowances allowed to the former.

Strange as it might seem, it is nonetheless true, that, in regard to furniture, the rule of obsolescence does not prevail, with the result that, on its sale, the assessee is not called upon to make good the depreciation previously allowed, if the asset is sold at profit and not at a loss. This seems to be a lacuna and needs plugging up.

Under the British Act, depreciation is allowed at the rates determined by the Commissioners of Inland Revenue, as appropriate to particular industry. In case of abnormal depreciation, there is a provision to make a claim before the Board of Referees. There is no such provision in our Act where in case of abnormal depreciation suffered in an industry, or in an individual case, a claim for higher depreciation can be made to the higher authorities. It is necessary to have a similar provision incorporated in our Act.

Mineral Resources (Question 63): In order to encourage development of mineral resources, adequate relief by way of depreciation is called for even in connection with the mining industries. The relief should be on the lines of the British Act. The relief, in short, is this. Under the British Act, two kinds of allowances are granted. An initial allowance on the capital expenditure incurred in the acquisition of wasting assets and an annual allowance calculated by reference to the output is, it is understood, granted. The Taxation Inquiry Commission should recommend a provision for relief for undertakings involved in exploiting wasting assets like mines, oil wells, etc. The details of the basis on which such allowances should be granted may be formulated and settled in consultation with organisations representing such mining and other interests.

Personal and Family Allowances (Question 64): The first suggestion is that the present first slice of exemption should be raised from Rs. 1,500 to Rs. 2,500. Abatement of tax should be allowed to an individual assessee in respect of his family members and dependents, Rs. 500 for each school-going child, Rs. 250 for each dependent member, like incapacitated mother or father or widowed sister or daughter. It is necessary to recognise even late in the day that the true ability of a person to contribute to the country's exchequer cannot be measured unless these family calls on the family budgets are recognised and admitted. If the family allowances are granted, the present exemption of the first slice of Rs. 1,500 should be retained. In case of H.U.F., the family allowances will have to be restricted to the sons of adult members, not exceeding a fixed number.

As regards family allowances, it would be interesting to point out that, in countries like the U.S., Canada, Australia, etc., medical expenses actually incurred in the year are allowed.

Admissible Expenses (Question 65): The present law is defective as regards admissible allowances in several ways. It does not recognise expenses which are purely business expenses (being neither personal nor capital) and such as would not have been incurred but for the fact that the assessee was carrying on business. These should be allowed provided they are proved to be revenue, not personal or capital, and incurred for the present or future advantage of business. With the very high rate of tax, the question of approximating the true taxable income to the real income of the assessee has assumed a very great importance. Expenses of the following nature should be allowed:

(1) Entertainment expenditure on business, provided the evidence of the expenditure incurred is genuine and not in dispute.

(2) Travelling expenses to foreign countries where there is ample evidence as:

(i) to the fact that the journey was undertaken for business;

(ii) that the assessee's business has benefited by the increased sales, improved manufacture or new contracts and agency. Securing of new agencies of short duration should not be regarded as capital;

(iii) even if the journey has not resulted in definite business contracts, but has led to improved manufacture or enabled the assessee to introduce new lines of manufacture, sale, etc.

(3) (i) Legal expenses in civil suit arising out of business transactions should be allowed whether the assessee loses or wins the suit;

(ii) legal expenses in criminal cases should be allowed only if the person charged is acquitted. If he is convicted, it would mean he has infringed the law—an action incompatible with trading within the law;

(iii) Where suit is against the directors of a company for an offence of Control Order, etc., if these persons are acquitted of a personal charge and the company under its articles is bound to indemnify them, their legal costs should also be normally allowed.

(4) Cost of engaging counsel or accountant in fighting out the assessee's case should be allowed irrespective of whether the expenditure relates to appeal or original assessment if the assessee wins his appeal. The argument in favour of the concession is that the assessee should not suffer for the error, misjudgment or lack of experience of the Income-tax Officer. If he justifies before the appellate authorities that his point—either of law or fact—was correct, he should be allowed this deduction.

(5) The arbitrary fixation of what salary a business man should pay his servant must be left to the discretion of the assessee and all such salary, commission or bonus paid should be allowed. The Income-tax Officer should not be allowed to adjudicate and assess the value of such services. Only in case of evidence—which must be not merely a vague suspicion—to the effect that these salaries are not real but bogus and actuated merely with the motive of avoiding the legitimate payment of tax, that the Income-tax Officer should take action. If such salaries are so disallowed, the Government in fairness should not tax the employee on the sum so disallowed, but treat the income in his hand as duly taxed. The reasoning behind the concessional treatment could be summarised thus:

If an amount debited as salary is disallowed, the effect is that it ceases to be a charge against profits and the profits are increased by the amount. If, for services rendered by the employee under contractual obligation these profits are shared by the company with the employee, it becomes an appropriation of taxed profits and must not be taxed again. At present, the tendency of the Department is to interpret the notification of the Government, issued under section 60, in such a way of as to deprive the employee of the benefit.

(6) Recent amendment of the Act in 1953 tightened the net of allowances by expressly providing that any expense for which a specific head is provided in section 10 (2) is inadmissible under that head and it shall not be open to the assessee to claim the same under the omnibus section 10 (2) (xv). This is to counteract the decision of the Bombay High Court in *C.I.T. vs. David Mills Ltd., Bombay.* (Ref. No. 17 of 1950) where, in regard to repairs, the Court held that the claim under section 10 (2) (v) failed, because the repairs failed to satisfy the condition of the repairs being *current*, but since the repairs were wholly and exclusively incurred for the business and were not of capital nature, the claim should succeed, if not under clause (v), then under clause (xv) at least. Now this wholesome principle is sought to be negatived by throwing the net of allowances still closer. Why should an assessee be deprived of his right to claim a deduction either under one or the other of the heads, if the general principles of the deductibility of expenses are amply satisfied? These principles are:

(1) expenditure is wholly and exclusively laid out or expended for business;

(2) such expenditure is not in the nature of capital expenditure or personal expenses of the assessee.

The expenditure allowed under section 10 (2) is already narrow and, therefore, under section 10 (2) **(xv)** there should be no restriction to an allowance, which, while it may not fulfil the specific condition of the express clause, fulfils the conditions mentioned in clause (xv).

(7) Bonus paid to employees is allowed arbitrarily only on the basis of three months' salary. Anything in excess, even if *bona fide* and paid purely to retain their services and keep them well satisfied, is always disallowed. This arbitrary rule should go. Unless the *bona fides* of payment are challenged or the nature of payment is such as to be suspicious, these should be allowed on their merits.—*All Rights Reserved.*

to realise the controlled prices. I must feel happy and advise you that the average price which our rubber has fetched is definitely better than most others similarly placed as ourselves.

"Gentlemen, you are aware that the managing agency has been renewed for a period of another 10 years under some altered terms and conditions, of which you had already been notified in the minutes of the extraordinary general meeting held on 29th June, 1953.

"The difficulties that are confronting the plantation industry are not few or far between, but still, I believe, from the position of the area, capital and profit-earning capacity among planting companies, our Company appears to possess many years of reasonable prosperity before it. I must mention here that it is in no small measure due to the unstinted co-operation and enthusiasm for work of all those concerned in it."

INDEPENDENT INDIA'S FIRST CENSUS REPORT

GROWTH IN POPULATION AND DECLINE IN 'PER CAPITA' CULTIVATION

THE All-India Census Report, 1951,* which has been released this week, is notable not only for the reason that it is the first census report since India attained independence, but also for the more detailed information it gives relating to the economic conditions of the people. The Report shows that India is more densely populated than Europe which is itself the most densely populated region of the world. In relation to the natural resources available for the production of food, India is even more heavily populated than Europe. But the Indian is more resourceful than the European in so far as his quest for cultural land is concerned, for while the European has brought only 30 per cent. of his land under the plough on the average, the Indian has brought 43 per cent. of his land under cultivation. The pressure of population on land in this country will be evident from the fact that, although the land area of the U.S. and Soviet Union put together is nine-times as large as India's, these two countries have together a smaller population than this country.

Prepared at a cost of Rs. 1.49 crores (or Rs. 4¼ per 1,000 persons enumerated as against Rs. 1½ per 1,000 enumerated in the 1931 census), the Report of the 1951 census, conducted under the overall supervision of Mr. R. A. Gopalasami, Census Commissioner for India, is presented in 17 volumes which are divided into 63 parts. The first of these volumes contains the All-India Census Report comprising five parts of which the first part (Part 1-A), the narrative proper, is published this week. Part I-B consists of appendices. Parts II-A, B and C consist of statistical tables accompanied by introductory notes. The other 16 volumes which are divided into 58 parts contain State Census Reports. In addition to this All-India Report and the State Census Report, 307 District Census Handbooks have been compiled, each handbook relating to one district separately. It may be mentioned here that summarised versions of the demographic and economic data contained in the All-India Census Report have been published in the form of six brochures entitled: (1) Final population total, (2) Population zones, (3) Sample verification of the 1951 census count, (4) Religion, (5) Summary of demographic and economic data and (6) Special groups. The brochures which are under preparation are: (1) Maternity data, (2) Languages, (3) Displaced persons, (4) Age tables, (5) Life tables, (6) Literacy and educational standards and (7) Subsidiary tables.

Area of Land per Head

The first chapter of Part 1-A of Volume 1, dealing with the land and the people, focuses attention on the area of land per head of population available in the country as a whole, describes how this varies in different parts of the country and how this variation is relatable to variations in topography, soil and rainfall. After dividing the country into five natural regions and 15 sub-regions in terms of these factors, a description is given of the salient facts of population and land use in three groups of sub-regions which are distinguished from one another as high, low and medium density sub-regions. Finally, a comparison is instituted, with other countries of the world which leads to the conclusion not only that there is a very notable shortage of "land area per capita" in our country but that the utilisation of usable land within this limited area has proceeded very far already.

The second chapter headed "The Pattern of Living—1951" begins with an account of total numbers and numbers in different size-groups of villages and towns and the distribution of the people among them. Then there is a description of houses and households—information regarding the relative proportion of households of different size-groups as well as their composition being a new feature of this census. This is followed by a description of the variations of the sex ratio in different parts of the country. The age-structure of our people is then described and compared with that of other countries of the world. As a result of systematic study, reasonably firm conclusions are reached regarding the levels (which prevailed during the decade ending 1950), of our true birth rates and death rates (as distinguished from our registered birth rates and death rates). Estimates are furnished not only for India as a whole, but six broad zones (North India, East India, South India, West India, Central India and North-West India); and they are then compared with similar rates of other countries. Under the section "Sex Ratio" in this chapter the Report states that the census figures have revealed not only that males and females are unequal in numbers but also that the magnitude of this inequality is also different in different parts of the country. In the country as a whole, the sex ratio was 947 (i.e., 947 females per 1,000 males) according to the 1951 census. It varied widely among the zones. The lowest value was 883 in North-West India and the highest was 999 in South India where practical equality of the sexes was attained. The other four zones varied thus: 910 in North India, 938 in West India, 945 in East India and 973 in Central India. Regarding the marital status pattern, the Report states that in the country as a whole roughly every other male person is unmarried; while rather less than two out of five females are unmarried.

Births have occurred during the ten years 1941-50 at an average rate of 40 per thousand per annum; and deaths have occurred during the same period at an average rate of 27 per thousand per annum. Hence the natural increase of the population has been occurring during the decade preceding the 1951 census at an average rate of 13 per thousand per annum.

The third chapter entitled "Livelihood Pattern—1951" contains a complete accounting of how the people obtain their means of livelihood and explains how the pattern varies from one zone to another. According to the survey, there are 402 landless agriculturists for every one thousand agricultural landholders. There are enormous differences in this respect from State to State. This number of landless agriculturists per thousand agricultural landholders is smallest in U.P. (161) and largest in Travancore-Cochin (782). The numbers for other major States arranged in order are: Mysore (190), Assam (235), Orissa (271), Bombay (383), Madhya Bharat (397), Madhya Pradesh (413), Hyderabad (507), Bihar (510), Rajasthan (544), West Bengal (609) and Madras (714).

"The Great Divide"

The fourth chapter headed "Before and Since 1921," like the three previous chapters, is strictly factual; but it lays the foundation on which the assessment of the population problem present in the last chapter is subsequently erected. It is a fundamental conclusion of the study—of which the results are set out in this Report—that 1921 is the "Great Divide." Our pattern of growth subsequent to that year is entirely unlike the pattern of growth before that year. The fact that there is a sharp contrast is first established by a detailed analysis of the relevant figures of all parts of India. Then the reasons which account for that fact are established by documentary evidence. The growth of population had been checked by famine and pestilence repeatedly before 1921. Except for one tragic exception, population grew unchecked after 1921. The next section of this chapter is devoted to showing that 1921 is the "Great Divide" in another respect. Before 1921, cultivation had more than kept pace with the growth of population; after 1921, cultivation was lagging far behind while the population total was forging ahead. Developing the conception of "land area *per capita*," we have the area of cultivated land *per capita* and based on it, of productivity of cultivation *per capita*. This had been stationary or moving up before 1921; after 1921, it was falling steeply.

The third section of this chapter explains how the livelihood pattern has been changing in response to unchecked growth of population and the decline of cultivation *per capita*. The economic strength of the average household is seen to have weakened. The last section of this chapter brings out the final and most important aspect of the "Great Divide"—the growth of food shortage. Notwithstanding the famines of the last century, India used to be surplus in food. Round about 1921, India developed a shortage of foodgrains and this shortage has been growing ever since—slowly but steadily. The relevant statistics have been brought together from different sources and they bring out unmistakably how the change came about over a series of years.

Future Growth of Population

The last chapter entitled "The Prospect—1981" poses the question—what will be the pattern of our growth during the next thirty years? It is fully realised and made clear at every stage of the discussion of this question that the nature of the material is such that widely varying views can be and are being held both in respect of the facts themselves and the appreciation of the significance of the facts. The various views held on the subject are set out and reasons given for reaching a particular conclusion, which reads thus:

"First, if we can be sure that food will be available to the people during the next thirty years, at least as well as it has been during the last thirty years, and if no popular movement in favour of limiting births develops (as it has done among Western peoples), then the further course of population growth may be foreseen with confidence. Our number will grow from about 36 crores in 1951, to about 41 crores in 1961, 46 crores in 1971 and 52 crores in 1981. The growth will, indeed, be somewhat more rapid as (in the conditions assumed) the expectation of life will continue to increase.

"Secondly, the likelihood of the last figures being actually reached is, however, small. The govern-

SOME PROBLEMS OF IMPORT CONTROL

I.M.C.'S DISCUSSIONS WITH THE CONTROLLER

WITH seven weeks to go for the turn of the year, this is just the time when the Union Government will be busy taking stock of developments in the sphere of trade and industry for formulating its new policy for licensing imports and exports during the ensuing licensing period. In this connection, it is customary to consult chambers of commerce and trades associations and ascertain their views. The talks held last week in Bombay between Mr. K. B. Lall, Chief Controller of Imports-Exports and the Committee of the Indian Merchants' Chamber are, therefore, in accordance with this custom. They would be helpful to the Government in understanding the views of at least a section of the trade on its policies.

In the talks referred to above, the Committee of the Chamber drew the attention of the Controller to the need for taking into consideration indigenous production, while formulating import policy. If the country was self-sufficient in respect of a particular item, the Committee opined, the import of that item should not be allowed. Where indigenous production fell short of the total requirements of the country, licences should be restricted to import the quantity required to cover the gap between demand and internal supply. This course, it may be pointed out, is helpful in two ways: (*a*) it ensures the saving of foreign exchange, and (*b*) safeguards the interests of indigenous industries. Where the country was self-sufficient as a result of domestic production, the Committee, however, agreed that "token imports," as a means to induce indigenous manufacturers to improve the quality of their products, should be allowed. As the Government had already accepted the principle of "token imports," the Committee urged the Controller to consider the feasibility of extending this principle to some more items where the product was below the standard quality.

The foregoing suggestions, if accepted in full, especially in respect of protected industries, might infringe the Government's declared policy of not using import controls as an instrument of protection. No restrictions on imports can be justified, unless they are solely for the purpose of conserving foreign exchange or such have been advocated by the Tariff Commission, or there is clear evidence of dumping. In the ordinary course of events, if the foreign exchange position is comfortable, imports of a protected industry should be freely allowed, even if the country is self-sufficient in the products of that industry; for that is the only way to build up a strong and efficient industry and protect the interests of consumers. The policy of "token imports" in these cases does not go far enough. Such imports do not have much effect on the domestic producer. On the contrary, the high prices commanded by imported goods, thanks to the very small quantity in which they are allowed, induce them to sell their goods also at a high price. The consumer is thus placed at a definite disadvantage. The application of the principle of liberal imports, however, can be relaxed in exceptional circumstances, as in the case of an industry the productive capacity of which exceeds the demand by a wide margin, thereby providing scope for competition, and the efficiency of which is reasonably satisfactory.

Extension of Basic Period

Another point raised by the Chamber related to the extension of basic period to cover the fiscal year immediately preceding the period of licences. The basic period fixed for the selection of the basic year for established importers' licences, for the current licensing period, is 1st April, 1945 to 31st March, 1952. This excludes the fiscal year 1952-53. Last year, when the question of extending the basic year to 1952-53 came up, the Government decided that the basic period should be allowed to remain unaltered in the interest of simplicity. The Chamber referred to this decision and observed that the exlusion had denied some importers an opportunity of having a larger import quota. It requested the Import Trade Controller to include always the fiscal year immediately previous to the period of licensing. The Controller, however, pointed out that, if the suggestion was accepted, it would cause delay, as the work of licensing was, at present, based on quota certificates. But he assured that the Government would consider sympathetically any individual cases which suffered as a result of excluding the year under reference.

The import policy relating to established importers having more than one office also figured prominently in the discussions of Mr. Lall with the Chamber. Previously, the importer was allowed to select different years as basic years for his head office and branches. For the last two years, a different policy was being adopted, in that importers were required to select one and the same basic year for the head office and its branches. This procedure has worked against certain firms which have opened new branches at different places. The Chamber, therefore, suggested that the previous policy in the selection of basic years should be restored. Commenting on this suggestion, Mr. Lall stated that, although permission to select different basic years for the head office and the branches would benefit only a small section of importers, the same would cause a great deal of difficulty and inconvenience in administrative and procedural matters.

Actual Users' Licences

Licences granted to actual users seem to be providing continued headache for both the import trade and the control authorities. For, at the meeting, the Chamber reiterated its previous view that actual users' licences should be strictly confined to basic essential raw materials required for the manufacturing activity concerned. It further suggested that, where the actual user's licence was granted for any particular commodity, established importers should also be granted quota licences in respect of that item, so as not to be excluded altogether from that particular trade. This plea of the Indian Merchants' Chamber stems from the fact that some manufacturers have abused this facility by utilising it to serve their personal ends. From the assurances given by Mr. Lall it is evident that the Government is alive to the problem. But the fact remains that the Government has not been able to stop this undesirable tendency of misusing licences by manufacturers.

The Chamber did well in focussing the Government's attention on the difficulties experienced by importers in getting correct official information and guidance in regard to Import Trade Control classification in respect of certain items which clashed with the customs schedule classifications. This question has remained unsolved for a long time now. It will be recalled that last year the Government appointed Mr. P. M. Mukerji, who was at one time in the Import Trade Central Organisation, as an officer on special duty to go into this question of revising the import schedule. He prepared a draft schedule which was expected to come into force from July-December, 1953. This expectation has not materialised so far. It is learned from Mr. Lall that it will be taken up for consideration at the forthcoming meeting of the Import Advisory Council.

The Chamber next suggested that, for the success of the export promotion drive, it was essential to maintain continuity of supplies of various articles to the foreign markets. Towards that end, it was essential to review the export control policy in respect of various items, constantly, with a view to liberalising the exports thereof. Further, it was pointed out that export policy should be announced sufficiently in time, as otherwise, there was the danger of foreign markets being lost to Indian products, as a result of foreign buyers procuring supplies from alternative sources. Answering this point, Mr. Lall said that the Government realised the importance of liberalising export policy. It also recognised the importance of timely announcement, but stated that the delay was invariably due to the need for consulting the various interests concerned before the policy was finalised.

SAGO INDUSTRY CLAIMS FIVE-YEAR PROTECTION

The protection granted to the sago industry is due to expire at the end of the current year. Consequently, the Tariff Commission has taken up for review the industry's claims for continuation of protection. The present rates of protective duty on both sago globules and tapioca pearls are 24 per cent. preferential and 36 per cent. standard. In addition, a surcharge of 5 per cent. is levied on the import of these commodities. The rate of protective duties is based on the tariff values of sago and tapioca fixed at Rs. 40 and Rs. 42, respectively.

Opening the enquiry into the progress made by the industry during the period of protection and its present position, Mr. M. D. Bhat, Chairman, Tariff Commission, gave some very useful data. According to him, the industry has made considerable headway during the past few years. In 1950, 40 units were stated to be engaged in the manufacture of tapioca globules. The number has since gone up to 109 units. But the Salem Sago Manufacturers' Association has furnished data in respect of only 95 units. All the units in the industry are unregistered individual proprietary concerns and most of them are run on small cottage-industry scale.

The estimated rated capacity of the industry has risen from 19,500 tons in 1950 to 30,576 tons now, and the actual production from 6,000 tons to 21,577 tons in 1952; it was 19,608 tons in the nine months January-September, 1953. The importance of the industry to the small proprietary investor can be gauged by the extent of the capital investment in the industry which increased from Rs. 20 lakhs in 1951 to Rs. 26 lakhs in 1953. The number of workers employed has risen from 4,400 in 1951 to about 6,000 during the subsequent two years. The average daily rate of wages paid to male and female workers employed in the industry is stated to be Re. 1 and As. 10 respectively. Being thus a source of employment to the small man and a supplier of processed food, the sago industry undoubtedly deserves encouragement and assistance.

Several difficulties seem to have been blocking its rapid progress. One of them is the shortage in the supply of tapioca root, the only raw material of the industry. The industry is at present localised in Salem town and surrounding villages. It has to receive its supplies of the root from Malabar and surrounding areas of Salem. In Malabar itself it is an important item of food. Consequently, its price is generally high and to this has to be added the heavy charges incurred on its transport by railways or trucks. Thus, the price of the root has gone up from Rs. 5-6 to Rs. 5-12 per Bengal maund in 1951 to Rs. 9-1 to Rs. 9-15 per maund in 1953. The high prices account for the lag between the rated capacity and actual production. The industry has estimated the present requirements of sago at 12,000 to 15,000 tons and the future demand at 15,000 to 20,000 tons. This differs widely from the estimates of the Commerce Ministry at 9,000 tons. These figures need scrutiny.

The quality of sago is considered satisfactory, but there are still certain deficiencies which require to be removed. Thus poor swelling of sago globules while cooking, presence of grit, unhygienic process of manufacture, poor recovery of starch from the root, and lack of proper organisation among the units are the defects which need to be tackled in order to place the industry on a sound footing.

The industry has claimed continuance of protection for a further period of five years. As there is a ban on imports of tapioca globules on considerations of foreign exchange, it is requested that the ban should be continued for some time more. Important among the other concessions demanded are procurement of technical assistance from abroad and a reduction in railway freight. While these suggestions deserve the attention of the Tariff Commission, it must be stated here that the demand for continuation of the ban on imports of sago has no justification, in that the industry is given full tariff protection, under the cover of which alone, it should try to improve its position and became independent of continued State assistance as early as possible. It would be most unwise on the part of the industry to seek any highly artificial stimulus such as ban on imports, lest such should lead to complacency and continued inefficiency. Mr. Bhat has, therefore, done well in emphasising this point at the opening of the enquiry. He stated: "The survival and healthy development of the industry would depend largely on the steps it will take to reorganise itself and improve its methods of production. It will not do to lean permanently on protection and import ban, because that would be a sign of weakness. Ultimately, the justification for protection to the industry would lie in its ability to strengthen itself to such an extent that it can stand foreign competition without the aid of protective duties." These observations deserve to be taken note of not only by the sago industry but by every protected industry in this country, if it is to carry the support and sympathy of the public.

JAPAN-CHINA TRADE PACT

A unofficial Japanese trade mission has signed a £30 million trade pact with China in Peking. The Japanese Trade Ministry has, however, refused to accept responsibility to implement any trade agreement signed by the unofficial mission.

Following the trade pact came the U.S. Government's decision to slash by two-thirds the Japanese debt arising from the aid which America supplied to Japan immediately after the war. The value of the aid was $2,000 million. Construing the cut in this aid as an attempt to thwart the Japan-China trade pact, Mr. Kei Hoashi, leader of the unofficial mission, called upon the U.S. Government not to obstruct the trade pact. He pointed out that, if the agreement were put into effect, Japan's trade with China and Soviet Russia would still be less than 10 per cent. of its total trade. Emphasising the need for the pact, he said that Japan's current economic picture was grim. It had lost 60 per cent. of its overseas territory in the war and since then its population had increased by 10 million. He averred that Japanese people could not keep going under such conditions, unless they improved their international trade.

FACTORY FOR MANUFACTURING EXPLOSIVES

The Government of India has entered into an agreement with Imperial Chemical Industries, Ltd., for the establishment of a factory to manufacture commercial blasting high explosives in India. The agreement envisages the setting up of a new company with an authorised capital of Rs. 4 crores to be jointly subscribed by I.C.I. and the Government. Initially Rs. 2 crores of capital will be issued, of which 80 per cent. will be subscribed by I.C.I. and 20 per cent. by the Government of India. The balance of the capital required will be met by loans, a substantial portion of which is expected to come from the Industrial Finance Corporation of India.

A site has been selected for the factory close to the Bihar coalfields, so as to give the best possible service to the coal mining industry, which is the principal consumer of industrial explosives in India. In consequence of the development of mining in India, of the large public expenditure on water, power and irrigation works, and on road building, the demand for explosives has so increased that an explosives factory can now become an important factor in the national economy. When the factory goes into production, India will be self-sufficient in the manufacture of these essential industrial commodities.

Under the agreements, I.C.I., through its Nobel Division, will be responsible for planning the layout of the factory and providing designs for the plant and equipment, and will be responsible for its erection and setting to work. I.C.I. will also provide all the technical "know-how" required to operate the factory, and also continuing information on research. It will be drawing on its long experience of blasting explosives, which dates back to 1873 when Alfred Nobel established the first factory in Great Britain for the manufacture of high explosives containing nitroglycerin. I.C.I. will provide initially all management staff required and a number of key workers. I.C.I. will train Indians to take over responsible positions.

By agreement with the new company, I.C.I. (India) Ltd. will handle the distribution and sales of the Indian-manufactured explosives, will operate the extensive series of magazines which they own throughout the country and will continue to give their technical service to consumers in India.

The establishment of this important industrial undertaking marks a significant step forward in the achievement of India's industrial plans.

PROTECTION TO CALCIUM LACTATE CONTINUED

Continuance of protection to the calcium lactate industry for a period of three years from 31st December, 1953, as recommended by the Tariff Commission, has been accepted by the Government of India. The rates of protective import duty to be in force during this period will be the same as at present, namely, 27.3 per cent. (preferential) and 37.8 per cent. standard. However, if during the period, the quantum of c.i.f. prices of imports jeopardises the position of the domestic industry, the industry may apply for a review of the scheme of protection.

The Government has also accepted the Commission's recommendation that the Central and State Governments should purchase indigenous calcium lactate to meet their entire requirements, provided the producers maintain the necessary standard of quality and charge reasonable prices.

The total rated capacity of the industry now is 162 tons and production increased from 10.95 tons in 1949 to 32.55 tons in 1952.

A resolution requesting the Government of India to withdraw or modify suitably the ordinance making provision for payment of compensation to workers affected by lay-off or retrenchment in factories was passed by the West Coast Industrialists' Association, Kozhikode, at its meeting held last week. The resolution says that the ordinance imposing, as it does, onerous burdens on all industries alike, especially at the present moment, is ill-timed and injurious to the industries of the West Coast consisting of tiles, plywood, saw mills, etc. Feeling that the burdens would result in the closure of some of these industries, it prays that "the ordinance be withdrawn or at any rate, be substantially modified so that the obligations imposed bear reasonable proportion and relation to the capital involved in the industry, the amount of turnover, the percentage of profits earned, the amenities and other advantages already available, or being made available, and the percentage of labour cost to the entire cost of living."

in Calcutta... they know that

more motorists use triple action Mobiloil

than any other motor oil in the world!

Under the benign influence of Shantiniketan, Calcutta, centre of many great Indian industries, has become a home of the arts as well. Music, dancing and sculpture flourish here; and the 'Bengal school' of painting continues to grow in stature and popularity.

With their wise regard for both spiritual and material values, the motorists of Calcutta naturally throng to the sign of the Flying Red Horse — not only for its artistic merits, but also for its promise of smooth, economical running. No music is sweeter to their ears than the sound of an engine lubricated with Mobiloil, the *Heavy-Duty* motor oil giving greater protection than regular or premium-type oils; and they know that Mobiloil...

SAVES ON WEAR *by lubricating properly at all temperatures;*

SAVES ON REPAIRS *by preventing harmful carbon deposits in the engine;*

SAVES ON PETROL *by preventing acids eating away the metal parts, which causes loss of power.*

Stop at the sign of the Flying Red Horse

The Flying Red Horse is the sign of helpful service for your car. Go there for regular Mobilubrication — the *complete* motor service — and for Standard-Vacuum products backed by 87 years of leadership in the oil industry.

TRAINING FOR LABOUR LEADERSHIP

AN AMERICAN EXPERIMENT

(By MARTIN CATHERWOOD, Dean, New York State School of Industrial and Labour Relations)

ORGANISED labour in the United States has a growing responsibility to the nation and the world, and leaders and workers alike are recognising that this requires professional leadership. The defensive, growing phase of unionisation is largely over, and consolidation and co-operation of this important element of society are the problems of to-day. One very necessary step in the realising of this goal is the training of labour professionals, and the educating of the ranks of labour and management in the problems of one another and of the community. Most labour unions in America employ a professional Director of Education, but these directors and their small staffs find it difficult to completely meet the educational needs of large memberships, often numbering in tens of thousands and frequently scattered across the country. To relieve this situation, the American universities have opened their doors to provide local and regional labour groups with a great diversity of adult education courses, seminars, conference workshops, institutes and lecture series.

Because of my greater familiarity with the programme at Cornell University, I will largely centre this discussion around this school. The New York State School of Industrial and Labour Relations at Cornell University is financed by the State of New York, is administered as part of Cornell University, and is one of the 30-some units which constitute the State university of New York. In its seven years of operation to date, the school has conducted work in three major areas: first, the normal on-campus undergraduate and graduate curricula to train career labour workers; secondly, adult education and "extension" work, carried on throughout the State; and thirdly, a substantial research and publications programme.

Academic work on the campus at Cornell, Ithaca, New York, consists of courses directed at educating young men and women for careers in labour-management relations. Currently 300 under-graduate students and 70 graduate students are enrolled here in programmes combining broad educational background and intensive specialisation in labour-management subjects. Scholarships and graduate assistantships are provided to encourage under-graduate and graduate students from foreign nations to enrol. The school, aided by unions and industry management, obtains between-term jobs for students, in the field, in order that the students may have on-the-job professional experience in the research, education, contract negotiation and administration phases of unions. Noted union officials, as well as management representatives frequently appear as guest lecturers. A well-known labour leader has recently been engaged to conduct a graduate seminar on union management and organisation at the school. In addition, three officers from the New York State labour organisations are currently members of the Board of Trustees of Cornell University (including the liberal arts and graduate colleges), and the Advisory Council of the School of Industrial and Labour Relations includes representatives of labour, of business and of the public.

Adult education and extension work is an important phase of Cornell's operations. Experts from the school make themselves available to local workers and management who cannot attend full-time. Evening lectures are set up in factories and union halls, covering subjects like labour legislation, labour union history, collective bargaining, time and motion study, parliamentary procedure, grievance procedure, and shop stewardship. Experts in many subjects are available—economics, business administration, sociology and psychology—and the service is made possible for business and industrial organisations and other interested persons, as well as labour union personnel.

One of the most notable experiments in this extension education is that planned and financed by the Fund for Adult Education, a unit of the philanthropic Ford Foundation. The programmes of eight universities (Universities of California, Illinois, Wisconsin, Chicago, Pennsylvania State College, Roosevelt College, and Rutgers and Cornell universities) are co-ordinated by the Inter-university Labour Education Committee, which includes representatives of each university involved, and also representatives of A.F.L. and C.I.O., the two large inclusive labour organisations in the United States. With money grants from the Ford Fund, each participating university will present experimental educational programmes for labour in one or more of three subjects: international relations, economic education and community participation. As citizens better understand the problems of the world, and the problems of labour and management in relation to them, the wiser will be the solutions proposed.

An important aspect of the labour-education programmes is the labour-related research being conducted by faculty and graduate students in universities throughout the country. Cornell recently completed a number of important studies: a compilation of sources of information on union-management relations; a study of welfare collective bargaining; research on the question of seniority rights for supervisors; a history of unionism in the non-ferrous mining industries in western United States; and various studies of New York State laws on apprenticeship, industrial safety and health. Findings are published largely in bulletin form and distributed free to residents of New York State. Future research plans include such topics as human relations within unions, private pension plans in manufacturing concerns, the use of injunctions in New York State, and many more.

Each of the labour education programmes at the various universities is independently administered, and no two are quite alike in organisation or subject matter. Information about academic and adult education programmes and research projects is exchanged among universities via bulletins, the scholarly quarterly, *Industrial and Labour Relations Review*, and through meetings of the professional society, the Industrial Relations Research Association.

None of the participants in this phase of labour education pretend that these programmes will end all labour-management differences. They do believe, however, that the development of effective relationships between industry and labour can be furthered in three ways: (1) by increased knowledge and appreciation on the part of labour and management of one another's, the community's, and the nation's economic and social problems; (2) by better understanding of their own problems which have an impact on labour-management relations; and (3) by the development of skills and techniques required of each individual, whether he be an employee or an employer, in carrying out the specialised functions for which he is responsible. Furtherance of knowledge and understanding in these ways is a responsibility which American higher education has come to recognise and to accept.

RESULTS OF TATA HYDRO-ELECTRIC GROUP ENCOURAGING

DIVIDENDS WELL MAINTAINED

AN appreciable improvement in the working of the three hydro-electric Companies under the management of Messrs. Tata Hydro-electric Agencies Ltd., Bombay, namely, the Tata Hydro-electric Power Supply Co., Ltd., the Tata Power Co., Ltd., and the Andhra Valley Power Supply Co., Ltd., is disclosed by their Directors' reports and audited accounts for the year ended 30th June, 1953, as compared with those for the previous year. There has been a sizable increase in the sale of power of all the three Companies, thus reversing the declining trend in sales noted since 1947-48. The revenue from sales of energy, which had suffered a setback in the previous year, has also risen considerably in respect of all the Companies, the increase during the year having more than made good the decline in the previous year. The aggregate gross profit of the Companies shows a rise from Rs. 157.06 lakhs to Rs. 177.24 lakhs, an increase of 12.8 per cent. over the year. The dividends to ordinary shareholders have been maintained at the uniform level of 7½ per cent. per annum, free of tax.

The performance of the individual Companies can be judged from the following table in which the salient features of their financial results are compared with those for two previous years:

(In lakhs of rupees)

	Tata Hydro			Tata Power			Andhra Valley		
	Year ended 30th June			Year ended 30th June			Year ended 30th June		
	1953	1952	1951	1953	1952	1951	1953	1952	1951

† Includes Rs. 6.50 lakhs provided for deferred taxation reserve.

The number of units of electricity sold by the Tata Hydro-electric Power during the year was 210.78 million, as compared with 192.98 million in 1951-52, an increase of 27.89 million units or 15.2 per cent. The corresponding increase in revenue was Rs. 7.51 lakhs or 17.6 per cent. The sales of Tata Power amounted to 536.45 million units, as against 477.44 million in the previous year. As will be noted from the foregoing table, the revenue from sale of energy rose by Rs. 14.49 lakhs or 12.8 per cent. In the case of Andhra Valley, the increase in sale of energy was from 264.46 million units to 300.67 million, or 13.7 per cent., and that in revenue Rs. 9.59 lakhs or 15.5 per cent.

The substantial increase in sales and revenue is attributed to two factors, namely, (1) sale of energy during 1951-52 had gone down considerably owing to deficient rainfall in 1951; and (2) the railways returned during the year under review 36.79 million kw.h. to the Companies out of 41.16 million kw.h. given on loan to them in earlier years. Under the inter-company reciprocal agreement, 20 per cent. of the increased sales from these units has been allotted to Tata Hydro, 50 per cent. to Tata Power and 30 per cent. to Andhra Valley. There has been an increase in operating expenses in all the Companies; however, that in Tata Hydro is negligible. The sharp rise of Rs. 6.47 lakhs in expenses of Tata Power, which wipes out nearly half the increase in gross revenue, is mainly due to an increase of Rs. 4.77 lakhs in interest on debentures charged to revenue and an increase of Rs. 1.54 lakhs in salaries and wages (including bonus). The expenses of Andhra Valley have gone up by Rs. 2.22 lakhs, mainly on account of the increase of Rs. 1.19 lakhs in the commission payable to the Tata Hydro-electric Power Supply Co., Ltd., and of Rs. 82,669 in salaries and wages (including bonus).

The provision for taxation has been reduced by Rs. 3.33 lakhs in the case of Tata Power on account of increased special initial depreciation allowance on additions to fixed capital assets made during the year. The increase of Rs. 2.76 lakhs in the provision for taxation made in the case of Andhra Valley is in accordance with the increase in profit.

The total depreciation, including initial depreciation under the provisions of the Income-tax Act and Rules, substantially exceeds the depreciation which the Companies provide in their annual accounts, in accordance with the provisions of the Sixth Schedule to the Electricity (Supply) Act, 1948. The tax on the excess, according to the Directors, will have to be made good by the Companies when the total depreciation permitted by the Income-tax Act and Rules has been absorbed by the Companies' profits. The Directors have, therefore, considered it prudent that provision should be made from year to year towards meeting this future tax liability. But the profits of Tata Hydro and Andhra Valley are not sufficient for the purpose. They have, therefore, been unable to make such a provision and have postponed the creation of a deferred taxation reserve to a future year when profits may be adequate for the purpose. However, the profit of Tata Power permits of setting up such a provision. The Company's Directors have, accordingly, transferred from the year's profit a sum of Rs. 6.50 lakhs to a deferred taxation reserve.

Commenting on the power supply position during the year under review, the Directors observe in their reports:

"Even with the addition of 24,000 kw. capacity to the railway generating plant in the month of January 1953, the power supply was not adequate to meet all demands on the system. Hence, staggering of mill and factory holidays was continued during the year. In addition, consumption of energy by existing mills and industries during the nine months of the dry season was restricted to the quota assigned to them on the basis of their average consumption for the six-month period April to September, 1951. The Government of Bombay continued to restrict connections to new undertakings other than essential services such as sewage and water pumping. Small domestic loads for lighting and refrigeration, however, were allowed freely.

"As a result of the power shortage, the power pool set up last year remained in operation and utilised about 6,000 kw. of auxiliary generating plant available with consumers to meet requirements in excess of consumers' quotas as well as the urgent demand of new consumers. The high cost of auxiliary generation, which was inevitable, was, however, a drawback to development of new undertakings. Nevertheless, the textile industry and other industries were materially assisted in maintaining full production with the assistance of the pool."

The Companies propose to enter into an interchange agreement for the purpose of sale and purchase of surplus energy on a suitable basis, with the railways. Explaining this, the Directors state:

"The railways, having completed the installation of their 12,000 kw. sets, now have a surplus of kw.h. and negotiations have been resumed for an interchange agreement to permit the sale and purchase of energy on a suitable basis. It is proposed that the hydro companies should sell to the railways secondary energy during the monsoon period which would otherwise be wasted by spilling of water and the railways, in their turn, should sell energy to the companies when required. The rates for supply are under negotiation."

In the course of his address to the shareholders of the three Companies at the last annual general meeting, the Chairman had pointed out the necessity to revise the existing tariffs for electricity supply on account of the substantial increase in operating costs, due, chiefly, to the higher cost of electricity to be purchased from the railways and from the Bombay Government, to meet the additional demands from the consuming public. The existing tariffs, which have been in force since some time before the war, are out of line with present operating expenses and costs of plant replacements. The Directors now report that, due to uncertain factors, such as the charges of the Bombay Government for power to be purchased from its thermal plant, the framing of the new tariffs has been postponed for the present; but, as an interim measure, a surcharge of 12½ per cent. on all bills has been levied and made effective towards the end of the financial year to meet the increasing costs of operations and charges in respect of plant replacements at present-day costs.

One of the major development works undertaken during the year was the construction work on the 100 kv. double circuit transmission line of 24.7 miles from Kalyan to Bombay. The work is stated to be proceeding satisfactorily. This new line is required for transmitting the 54 m.w. additional power from the Bombay Government's new thermal plant at Chola to load centres in Bombay. It is expected that this line will be completed before the end of the calendar year. The capital cost of this transmission line is estimated at Rs. 53 lakhs and will be shared by the three Companies in the proportion of 20 : 30 : 50 (Hydro-Andhra-Power).

RESULTS OF BURN & CO. SATISFACTORY

BONUS SHARES TO BE ISSUED

THE year ended 30th April, 1953, has proved to be yet another satisfactory one for Messrs. Burn & Co., Ltd. (Managing Agents: Messrs. Martin Burn Ltd., Calcutta), inasmuch as the steady progress noted in earlier years had been well maintained during the year under review also. The turnover of the Company in 1952-53 increased by 25 per cent., as compared with that in the previous year. The gross profit, which had advanced from Rs. 41.81 lakhs in 1950-51 to Rs. 45.49 lakhs in 1951-52, has further risen, albeit by a very small extent, to Rs. 45.67 lakhs in the year under review. The additions to the various reserves have been stepped up from Rs. 10.75 lakhs to Rs. 12.25 lakhs, a sum representing more than a fourth of the gross profit. The dividend on ordinary shares has been well maintained at 15 per cent. per annum, a rate which the Company has consistently paid from 1949-50.

The following comparative table brings out clearly the progress made by the Company during the last three years:

(In lakhs of rupees)

	Year ended 30th April			
	1953	1952	1951	1950
Sale proceeds	537.89	423.38	381.67	353.28
Other income	10.12	9.74	4.71	8.18
Gross profit	45.67	45.49	41.81	43.70
Agents' commission	5.45	4.72	4.59	4.41
Provision for—				
Taxation	13.00	12.00	12.00	12.00
Depreciation	10.30	9.90	8.27	10.44
Net profit	16.92	18.87	16.95	16.84
E. P. T. refund	3.36	...	...	...
Reserves	12.25	10.75	8.75	8.75
Dividends—				
Preference	1.81	1.81	1.81	1.81
Ordinary	6.30 (15%)	6.30 (15%)	6.30 (15%)	6.30 (15%)
Carry forward	0.85	0.94	0.92	0.83

It will be observed that sale proceeds for the year under review have recorded a rise of Rs. 1.12 crores over those for the previous year. This is due to the fact that all the Company's works were busily engaged on a large volume of orders during the year. If, despite this larger turnover, the gross profit has not gone up by any notable extent, it was due to the sharp rise in expenses. The provision for taxation has been stepped up by Rs. 1 lakh and that for depreciation by about Rs. 40,000. After these higher provisions, and after providing for managing agency commission, the net profit is lower by Rs. 1.95 lakhs. But this decline in net profit has been more than made good by the receipt of Rs. 3.36 lakhs, being the post-war refund of E.P.T. after deduction of tax thereon. The sum available for allocation is, therefore, higher by Rs. 1.41 lakhs and the Directors have taken the opportunity to step up the total allocation to the reserves. Commenting on this allocation, the Directors say: "Apart from the rebuilding of kilns at the Jabalpur works, which continues steadily, the various major reconstruction schemes that were put in hand in recent years have largely been completed. There are, however, several sectors of the various works that are in need of modernisation. So the Directors have again set aside Rs. 5 lakhs for works reconstruction and Rs. 3.5 lakhs, representing this year's non-recurring revenue receipts, to the account for works rehabilitation programme." The sum added to the works reconstruction reserve is the same as that transferred in the previous year, while that set aside for works rehabilitation reserve is Rs. 1.50 lakhs more. The addition to the reserve for debenture redemption has been maintained at Rs. 3.75 lakhs.

The Company's financial position, as seen from the latest balance-sheet, is quite impressive. The paid-up capital of Rs. 70 lakhs is supplemented by reserves and surplus aggregating Rs. 107.75 lakhs. Current liabilities and provision for taxation amount to Rs. 300.60 lakhs. The gross block of the value of Rs. 352.30 lakhs has been written down to Rs. 138.98 lakhs. The current assets aggregate Rs. 339.37 lakhs and exceed current liabilities and the tax provision by a margin of Rs. 38.77 lakhs.

On a review of the Company's capital structure, the Directors have felt that the share capital of the Company should be brought more in line with the actual capital employed in the business. They have, accordingly, made an application to the Controller of Capital Issues for permission to capitalise reserves to the extent of Rs. 42 lakhs and to make an issue to the ordinary shareholders of one bonus share of Rs. 100 for each existing share held.

The Company's Rs. 100 fully paid-up ordinary shares are being currently quoted at Rs. 328, at which rate the proposed dividend of Rs. 15 per share gives a yield of 4.6 per cent. per annum, free of tax.

Points From The Chair

Responsible Trade Union Desired

"THE established and recognised union at the majority of your collieries is the Colliery *Mazdoor* Congress, which is affiliated to the Indian National Mineworkers' Federation, and in turn to the I.N.T.U.C. The leadership of this union has been the subject of political manœuvre between the Congress Party and the Praja Socialist Party, further aggravated by differences between the President and the Secretariat of the union. Consequently, field work amongst the workers has been neglected over a period of years, leaving the more volatile elements vulnerable to exploitation by extreme left-wing political parties who have accepted this opportunity to intervene and cause disruption. We ourselves believe in a strong trades union movement, and, as unionism should be divorced from politics, we desire nothing more than a strong responsible union, fully representative of the labour, with which to deal. It is, however, impossible to maintain a sound labour relationship when rival political leaders are competing for the control of labour in their struggle for power and care nothing for the real interests of the workers, whom they claim to represent. The weapons they use are promises which they can never fulfil, instigation to violence, and, in many proved cases, the employment of *goondas* for the coercion of the rank and file whose desire is to be left in peace to pursue their normal way of life."

G. A. S. SIM,
Bengal Coal Co., Ltd.

Windscreen for Aircraft

"Few people realise the problems involved in the design and production of an aircraft, which, in a matter of seconds, travels from ground level upto great heights, perhaps 60,000 feet or even more, and then on occasion dives back to near ground level before you can say 'Triplex.' The different changes of humidity and temperature through which an aircraft goes naturally create great problems in visibility. In a moment a screen may be misted or iced over so as to deny the pilot any visibility at all. He cannot open his screen to see what is ahead of him; he is virtually blinded, unless the windscreen is of a type which will deal with ice, frost and mist as rapidly as they form. This is a problem which your Company has faced up to and is now engaged in tackling. We are, initially at our own expense, putting in plant to produce special aircraft screens which, it is believed, will be superior to any in the world."

SIR GRAHAM CUNNINGHAM,
Triplex Safety Glass Co., Ltd.

Development of Home-produced Food

"More than ever in these days the nation must rely on home-produced food. The aim of the Government is to increase agricultural production by at least 60 per cent. over pre-1939 levels, and it has not merely set the farming community an idealistic target, but is taking all practical steps possible to attain that goal. These latest guarantees in regard to cereal crops are an example. We have been more than happy to associate ourselves with this campaign, and I feel, I may say, with due modesty, that in ensuring adequate supplies of first-class quality seeds to our farmer customers we have played no small part. We know the Government will not relax its practical aid and encouragement, and certainly we shall not fail to co-operate to the utmost in our power in any future efforts for which agriculture may be asked."

THOMAS R. GARTON,
Gartons Ltd.

COTTON

(Concluded from page 902)

tries, and this will undersell cotton bought under the agreement. Governments, which have guaranteed imports, may thus find themselves having to take up imports of quota cotton at prices higher than those ruling in their own countries' cotton markets.

A buffer stock scheme is free from these defects. It envisages an agreement in respect of maximum and minimum prices and an international authority which will both buy and sell cotton in order to keep the prices within the agreed range of prices. Such a scheme would eliminate the defect of dual prices, from which the multilateral contract scheme suffers. But the adoption of the scheme implies that the countries are willing to delegate powers of regulating cotton prices to an international authority. This would require a high degree of international co-operation. Since all countries cannot be represented on the supranational executive body which would be in charge of the scheme it might generate a feeling among certain countries that their national sovereignty is being infringed without even the compensating advantage of possessing a vote in the decision of the executive organisation.

Such are the essentially complicated nature of the problems involved in reaching an international agreement on cotton. But there is no doubt that stability in cotton prices would mean a great advantage to both cotton growers and cotton users. After all, cotton is a commodity which has suffered from wide fluctuations in recent years. In this respect, it is in striking contrast with its rivals, the synthetic fibres. If cotton must hold its own against its competitors, it would be necessary to see that the prices of this commodity are reasonably stable.

COMPANY MEETINGS AND DIVIDENDS

MORARJEE GOCULDAS SPINNING AND WEAVING CO., LTD. Annual General Meeting, Bombay, 16th November, 1953. Transfer books closed from 11th to 28th November, 1953, both days inclusive.

THE INDIAN IRON AND STEEL COMPANY, LIMITED

NOTICE

OWING TO THE ABNORMAL CONDITIONS that have prevailed at Burnpur, submission to the shareholders of the Accounts for the year ended 31st March, 1953, is unfortunately delayed. In order to obviate the hardship that would be caused should payment of the dividend on the Ordinary share capital have in the normal way to await declaration by the shareholders in General Meeting, the Board of Directors have to-day declared an interim dividend of One Rupee per share in respect of the year on the Ordinary share capital, being at the rate of 10 per cent. per annum free of tax. In this connection the Board would make it clear that this dividend though termed "interim," will in fact be the final dividend for the year and that no further distribution in respect of the year ended 31st March, 1953, will be recommended.

Payment of this interim dividend will be made on or after the 30th December, 1953, to the holders of Ordinary shares so entitled, whose names appear on the Company's Registers on the 19th December, 1953. The Ordinary Share Registers of the Company will be closed from the 5th to the 19th December, 1953, both days inclusive.

By Order of the Board,
T. L. MARTIN,
Chairman.

AMALGAMATED ELECTRICS REPORT SATISFACTORY RESULTS

REWA COALFIELDS PAYS HIGHER DIVIDEND

Amalgamated Electricity Co. (Belgaum), Ltd.

THE directors of the above Company (Managing Agents: The Consolidated Electric Agencies Ltd., Bombay) submit the audited accounts of the Company for the year ended 31st March, 1953.

The Company has made a profit of Rs. 11,77,055 (Rs. 10,27,127), in the year under report. After appropriating Rs. 3,28,127 (Rs. 3,19,635) to depreciation, Rs. 21,333 (Rs. 16,259) to arrears of depreciation, Rs. 32,870 (Rs. 37,009) to contingencies reserve, Rs. 8,345 (Rs. 19,948) to tariffs and dividends control reserve, Rs. 8,345 (Rs. 19,948) to consumers' benefit reserve, and after writing off Rs. 6,614 (Rs. 6,615), Rs. 3,486 (Rs. 1,159) and Rs. 728 (Rs. 871) from purchase consideration, electric licence expenses and preliminary and amalgamation expenses respectively, and with the addition of Rs. 8,91,274 (Rs. 8,95,387) brought over from the last account, there is a balance of Rs. 16,58,481 (Rs. 15,01,070) which the directors recommend to appropriate as follows:—

To dividend for the year, on 11,650 preference shares of Rs. 100 each at 5½ per cent. per annum free of income-tax Rs. 64,075 (Rs. 64,075), on 17,100 (5,000) preference shares of Rs. 100 each at 5 per cent. per annum free of income-tax Rs. 85,500 (Rs. 25,000), on 5,41,000 (4,15,948) ordinary shares of Rs. 10 each at 7½ per cent. per annum free of income-tax Rs. 4,05,750 (Rs. 3,11,961), dividend for four months—1st December, 1952 to 31st March, 1953—(six months—1st October, 1951 to 31st March, 1952) on 3,095 (12,100) preference shares of Rs. 100 each at 5 per cent. per annum free of income-tax Rs. 5,158 (Rs. 30,250), and on 54,264 (1,25,052) ordinary shares of Rs. 10 each at 7½ per cent. per annum free of income-tax Rs. 13,566 (Rs. 46,894), leaving a balance, subject to payment of taxes on income, of Rs. 10,84,432 (Rs. 10,22,889) to be carried forward.

The following table shows the progress of the Company during the last three years:—

Years	Units generated	Total load in k.w.	Consumers
1950-51	1,63,24,913	15,447	20,045
1951-52	1,90,33,639	16,981	29,794
1952-53	2,12,30,397	18,184	34,264

The plant capacity of the power houses at Ajmer and Dohad has been augmented by installation of a generating set of 880 b.h.p. at Ajmer and of 436 b.h.p. at Dohad. Two sets of 974 b.h.p. each for Belgaum and Malegaon have been received. One set of 974 b.h.p. ordered for Jalgaon is yet to arrive. Transmission lines are also being extended to meet growing demand.

Sangli State has been merged into Bombay State and consequently, Shahapur licence granted by the Sangli State, has been withdrawn and the said licence area has been now included in the Belgaum licence. The assets hitherto shown separately under the head "Shahapur" have, therefore, been included in Belgaum assets.

The directors report the payment, in their discretion, to the employees of the company, of an additional salary to the extent of one month's salary in the year under report as done hitherto. The staff at Belgaum, Bulsar, Bhiwandi, Jalgaon, Malegaon, Ajmer, Dohad, Chalisgon and Bhusawal are fully covered by insurance under Workmen's Compensation Act. All buildings, plant and stocks are covered by fire and earthquake insurance.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Reserves ...	28,95,710	Block ...	1,35,49,701
Capital ...	91,37,140	Stores and loose tools	16,33,497
Liabilities ...	28,86,927	Other assets	1,61,466
Profit and loss appropriation account	16,58,481	Debts, deposits and advances ...	9,84,776
		Investments	88,387
		Cash ...	1,60,431
	Rs. 1,65,78,258		Rs. 1,65,78,258

Rewa Coalfields, Ltd.

The directors of the above Company (Managing Agents: Messrs. Shaw Wallace & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

The Company's profit for the half-year after the inclusion of Rs. 36,004 (Rs. 18,992) brought forward is Rs. 3,34,937 (Rs. 3,64,599). And after making provision for taxation Rs. 1,22,973 (Rs. 1,58,000), there remains Rs. 2,11,964 (Rs. 2,06,599). Out of this amount the directors have placed to development reserve Rs. 50,000 (*nil*) and recommend payment of a dividend at the rate of 20 (15) per cent. per annum, free of income-tax, absorbing Rs. 1,35,000 (Rs. 1,01,250) leaving to be carried forward Rs. 26,964 (Rs. 35,349).

Output and despatches of steam and other grades of coal for the last three half-years are as follows:—

Half-year ended	Raisings Tons	Despatches Tons
30th June, 1953	1,45,493	1,42,358
31st December, 1952 ...	1,67,990	1,65,004
30th June, 1952	1,49,417	1,49,773

Short supply of wagons referred to in the previous report, unfortunately, continued throughout the half-year and adversely affected production. Since the close of the half-year there has been a slight improvement. Negotiations with the Railway authorities for the construction of a siding at Amlai Station to serve the new mine are still in progress.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	13,50,000	Block ...	6,06,000
Reserves ...	7,38,385	Stock of stores	7,03,574
Provision for taxation ...	2,65,000	Stock of coal	96,867
Liabilities ...	13,62,272	Debts, deposits and advances ...	12,16,767
Profit and loss account ...	26,964	Investments	1,47,200
		Cash ...	9,72,213
	Rs. 37,42,621		Rs. 37,42,621

Upper Jumna Valley Electricity Supply Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Martin Burn Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st March, 1953.

Although normal development has taken place during the period under review, it is too early to assess what effect the electricity duty of 25 per cent. up to a maximum of one anna per unit imposed by Government will have on the revenue of the undertaking in the future, as this duty only came into force in the early part of the year 1953. It is estimated that the duty to be paid by consumers on present consumption will amount to over Rs. 3,00,000 per annum. The following schedule shows the sales and revenue for the past three years.

Half-year ended	Units sold	Revenue Rs.
30th September, 1950 ...	3,327,768	6,17,137
31st March, 1951 ...	3,185,992	6,39,499
30th September, 1951 ...	3,339,707	6,53,129
31st March, 1952 ...	3,174,549	6,49,675
30th September, 1952 ...	3,635,698	6,66,947
31st March, 1953	3,537,022	6,56,433

After complying with the provisions of the Electricity (Supply) Act, 1948, and making adequate provision for liabilities and setting aside Rs. 13,000 (nil) to development and extensions account, there remains a balance of Rs. 57,554 (Rs 57,595) including Rs. 28,864 (Rs. 25,796) brought forward from the previous half-year available for distribution, and this the directors recommend be disposed of as follows:—

In payment of a dividend at the rate of 10 per cent. per annum, free of income-tax, Rs. 24,875 (Rs. 24,875), an additional payment of As. 2 (*As.* 2) per share free of income-tax Rs. 6,219 (Rs. 6,219), and in carrying forward to next half-year Rs. 26,460 (Rs. 26,502).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,98,750	Block ...	5,56,912
Reserves ...	4,12,321	Stores ...	3,06,963
Provision for taxation ...	1,03,736	Tools and instruments	7,688
Liabilities ...	13,50,413	Debts, deposits and advances ...	6,48,927
Profit and loss account ...	57,554	Investments	21,980
		Cash ...	8,82,304
	Rs. 24,24,774		Rs. 24,24,774

Mlamallay Tea Estates, Ltd.

The directors of the above Company (Chairman: Mr. K. J. Alexander, Kottayam) submitted the audited accounts of the Company for the period ended 31st March, 1953.

The directors reported, that owing to a variety of causes, they were compelled to place before the shareholders, a statement of accounts resulting in a loss. The vagaries of weather—the failure of N.E. Monsoon continued by a long draught—adversely affected the crop position. It is to be particularly mentioned that the rainfall during the year, was 30.56 inches lower than that of the previous year which recorded 99.56 inches. Increased wages, allowances and bonus to labour consequent on the several labour enactments accounted for the *increased cost of production.* To add to this, the calamitous fall in tea prices which occurred since the beginning of the official year contributed to heavy loss in tea sales. The cumulative effect of these, is fully reflected in the profit and loss account which shows a deficit of Rs. 96,493 (profit of Rs. 2,29,191 from which the directors paid 50 per cent. dividend on ordinary share, paid preferential dividend, etc., and carried forward a credit balance of Rs. 6,691) as a result of the year's working. It may also be noted that no depreciation on the assets of the Company has been charged to expenditure in the profit and loss account during the year, due to the loss incurred.

Against an estimate of 4,00,000 lbs., the crop harvested during the year amounted to only 3,81,618 lbs., against 5,09,213 lbs. produced last year. The cost of production was 114.24 cts. (Re. 1-2-3.34) per lb. against 82.91 cts. (As. 13-3.19) in the previous year. The average price realised was 97.33 cts. (As. 15-7.25) which was less than the last year's average by 64.11 cts. (As. 10-3.10).

Though, as stated above, the crop for the year was below estimate, the result for this year so far seen is satisfactory. Against an estimate of 4 lakhs lbs., the crop harvested till 30th August, 1953, amounts to 2,36,999 lbs. Tea market has also improved since the accounting period.

The necessity for extending the Company's tea factory on Mlamallay Estate and thereby increasing the withering accommodation also to cope with the increased crop became evident, especially in 1951, when the Company harvested a bumper crop, and it was, therefore, decided to extend the factory by 37 feet in length, thus making the total length of the factory 148 feet. Accordingly, after obtaining the final estimate for the work from Messrs. Harrisons and Crosfield Ltd., Engineers, Quilon, by the end of 1951 a firm order was placed with them for the supply of the structural materials as well as for the extra machinery required, a part of which was received early in 1952 and accounted for in the previous balance sheet under item "Advance for Machinery and Factory Extension." All the structural steel materials for the work were supplied by them and they also carried out the whole erection works of the factory and the installation of the machines. New machinery installed consists of one 4 ft. super e.c.p. drier, 1 myddelton tea stalk extractor and grader and 1 brittania duplex tea packer. The expenditure of Rs. 1,10,280 for these works was made up of Rs. 47,185 for tea factory and Rs. 63,095 for tea machinery and accessories. To meet the above expenditure, the amount available under "reserve fund for capital expenditure" was utilised.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	6,00,000	Block ...	4,71,961
Provision for taxation ...	14,403	Stock-in-trade	39,542
Liabilities ...	2,69,201	Stores and spares ...	51,397
		Debts, deposits and advances ...	38,802
		Investments	77,009
		Cash ...	1,15,090
		Profit and loss account ...	89,803
	Rs. 8,83,604		Rs. 8,83,604

Chrestien Mica Industries Ltd.

The directors of the above Company (Managing Agents: Messrs. Ram Kumar Agarwala & Bros., Calcutta) submitted the audited accounts of the Company for the year ended 31st December, 1951.

The profit and loss account showed a credit balance of Rs. 5,98,538 including the sum of Rs. 38,652 brought forward from the previous year, after making the following provisions and payments:—

Depreciation Rs. 1,53,920, provision for scientific research Rs. 2,00,000, reserve for taxation Rs. 15,00,000, general reserve Rs. 5,00,000 and interim dividends Rs. 3,23,338. Out of the above sum of Rs. 5,98,538, the directors have at their meeting held on 19th July, 1952, declared further interim dividends absorbing the sum of Rs. 3,23,338, leaving a balance of Rs. 2,75,201 to be carried forward to next year. The directors at their meetings held on 2nd November, 1951 and 19th June, 1952 declared the following interim dividends which will be treated as final dividend for the year 1951:—

A dividend at 5½ per cent. on the preference shares less income-tax Rs. 1,21,675, a dividend at 10 per cent. on ordinary shares without any deduction for income-tax payable by the Company Rs. 3,00,000, and a dividend at 15 per cent. on deferred shares without any deduction for income-tax payable by the Company Rs. 2,25,000, absorbing a total sum of Rs. 6,46,675.

Acounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	75,00,000	Block ...	44,57,538
Debentures	15,00,000	Stock-in-trade	29,80,849
Reserves ...	20,50,000	Stores, etc.	9,25,692
Provision for taxation ...	27,68,616	Debts, deposits and advances ...	23,25,914
Liabilities ...	27,28,672	Investments	21,30,848
Profit and loss appropriation account	5,98,538	Cash ...	43,24,985
	Rs 1,71,45,826		Rs 1,71,45,826

Madras Safe Deposit Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Kothari & Sons, Madras) submitted the audited accounts of the Company for the year ended 30th June, 1953.

The directors report that the Company continues to make good progress and the working for the year showed a profit of Rs. 5,582 (Rs. 9,371) which with the addition of Rs. 1,440 (debit of Rs. 4,931) brought forward from the previous year made a total of Rs. 7,022 (Rs. 1,440). The directors disposed of this amount by paying a dividend of 3½ (nil) on the paid up capital of the Company Rs. 4,888 (nil), by writing off a part of the preliminary expenses Rs. 1,000 (nil) and in carrying forward Rs. 1,134 (Rs. 1,440).

The directors inform the shareholders that the demand for lockers in the vault continues and the public are taking advantage of the services given by the Company and there is an increase in the number of lockers leased. The managing agents have as in the previous years waived the office allowance of Rs. 3,000 for the current year and have in addition borne the Company's expenses to the extent of Rs. 1,320.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	1,56,430	Block ...	82,143
Liabilities ...	34,908	Other assets	7,048
Profit and loss account ...	7,022	Deposits and advances	43,674
		Cash ...	65,495
	Rs. 1,98,360		Rs. 1,98,360

N.B.—Figures within brackets relate to the corresponding period of the previous year.

Notices

THE BELAPUR COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Thirty-fourth Ordinary General Meeting of the Belapur Company, Ltd., will be held on Tuesday the 1st day of December, 1953, at 4-00 p.m. (S.T.), at the Registered Office of the Company, Royal Insurance Buildings, Veer Nariman Road, Bombay, to transact the following business:—

By Order of the Board,
G. D. BHAGAT,
Chairman.

CALCUTTA-7, *4th November,* 1953.

STRINGENCY IN MONEY

(From Our Own Correspondent)

BOMBAY, 11*th November*

Conditions reminiscent of the stringent days of the busy season were witnessed in the short-term money market during the week under review. The demand for funds which started last week broadened this week to such an extent that a scarcity of funds was felt at one time and even banks had to seek the aid of the Reserve Bank. There was, therefore, a sharp spurt in interest rates, though, just before the close to-day, they tended to soften, consequent on some improvement in the supply of funds.

Soon after we went to press last week, the inter-bank call money rate among the Exchange banks and big Indian banks jumped up from 1¼ per cent. to 2¼ per cent. on Wednesday and to 2½ per cent. on Thursday. The reopening of the market after the *Diwali* holidays witnessed a further rise, inter-bank call money having been bid up to 3 per cent. till this morning by a section of the banks. Some of the Exchange banks were, however, reported to have been not prepared to pay over 2¾ per cent. They preferred to get funds by selling sterling or by discounting usance bills with the Reserve Bank, rather than borrow inter-bank call money at 3 per cent. and pay brokerage in addition. With such a high rate in Bombay, the Calcutta centre (where conditions were easy, with call money being bid at no more than 2 per cent.) would appear to have diverted some funds to this city this afternoon. Some of the funds drawn by the public for *Diwali* also found their way back to the banks' coffers. This brought about a little comfortable conditions after clearing hours and the rate eased to 2¼ per cent. with more lenders than borrowers. The call-money rate among the smaller Indian banks hardened from 2¼ per cent. to 3 per cent. and remained at that level throughout the week.

Term money was bid at 2¼ to 2¾ per cent. for one to six months. House money was quoted at 2¼ per cent.

The conditions in the short-term money market prevailing as described above are clearly reflected in the results of this week's sale of three months' Government of India Treasury Bills. The amount offered was only Rs. 50,000 more than the amount called for, namely, Rs. 1.50 crores, as against Rs. 2.71 crores offered in the previous week and Rs. 4.10 crores two weeks ago. There was a further rise in the average rate of accepted tenders to Rs. 2-7 per cent. per annum, from Rs. 2-6-10 per cent. last week, to which level it had risen from Rs. 2-6-7 per cent. a fortnight ago. In spite of the waning response to the tenders for these bills, the Reserve Bank has not reduced the amount of tenders for next week, such remaining unchanged at Rs. 1.50 crores.

After two weeks of successive contraction aggregating over Rs. 13 crores, notes in circulation have risen by as much as Rs. 31.04 crores during the week ended 6th November, 1953. The Reserve Bank of India's statement for that week discloses a decline of Rs. 22.83 crores in notes held in the Banking Department. The consequent increase of Rs. 8.21 crores in total notes issued has been covered by a rise of Rs. 10 crores in foreign securities and a fall of Rs. 1.78 crores in rupee coin. In the Banking Department, Central Government deposits have recorded a fall of Rs. 8.68 crores. A decline of Rs. 13.48 crores is also noted in deposits of banks. On the assets side, cash balances are lower by Rs. 22.88 crores and balances held abroad by Rs. 4.89 crores. Loans and advances to banks have gone up by Rs. 2.17 crores.

The Scheduled Banks' statement for the week ended 30th October, 1953, as compared with that for the previous week, discloses no notable variations in deposits. Inter-bank borrowings repayable on demand are higher by Rs. 1.41 crores. On the assets side, advances show a decline of Rs. 4.16 crores and bills purchased and discounted a rise of Rs. 50.57 lakhs. Investments have increased by Rs. 1.39 crores. Cash balances have dwindled by Rs. 1.52 crores, while balances with the Reserve Bank have improved by Rs. 3.86 crores, and money at call and short notice by Rs. 1.38 crores.

Hardly any activity was noted in the Gilt-edged market during the week under review and idle conditions prevailed. Some of the medium-dated loans were reported to be offered at quoted rates, but due to paucity of buyers, business was very limited. 3 per cent. 1957 had sellers and it declined by an anna to Rs. 98-5. 3 per cent. 1958 was unchanged at Rs. 98-2. 3 per cent. 1959-61 changed hands at Rs. 96-2. 3 per cent. 1963-65 had sellers at Rs. 92-9 and 3 per cent. 1964 at Rs. 92-8. 3 per cent. 1966-68 held its own at Rs. 90-2 and 3 per cent. 1970-75 at Rs. 86-6. 3 per cent. 1986 Conversion Loan declined by an anna to Rs. 82. 3½ per cent. N.P. Bonds were hardly active at Rs. 98-12. Among State loans, 4 per cent. Bombay 1963 had sellers at Rs. 101. 4 per cent. Madras 1963 was unchanged at Rs. 100-2. 4 per cent. Bombay 1964 and Madras 1964 stood at Rs. 101-2 and Rs. 100, respectively.

The Hyderabad Government's 4 per cent. 1963 Development Loan for Rs. 3.25 crores, the list for which was open for public subscriptions from 22nd to 31st October, 1953, was oversubscribed to the tune of Rs. 15 lakhs. About Rs. 75 lakhs were, it is reported, subscribed by the Nizam and about Rs. 1 crore were subscribed from outside the State. The Reserve Bank of India subscribed about Rs. 33 lakhs, the Hyderabad State Bank Rs. 1 crore, the Mysore Government Rs. 12 lakhs and the Madras Government Rs. 5 lakhs.

(Concluded from next column)

and light Rs. 160 to Rs. 180 per score; wet salted buff, 1st grade 1 lb. 10 ozs., 2nd grade 2 lbs. and 3rd grade 2 lb. 10 ozs. per rupee; goat skins, 1st grade Rs. 350 and 2nd grade Rs. 200 to Rs. 225 per 100 pieces. Sheep skins, Rs. 360 per 100 pieces.

BULLION STEADY

(From Our Own Correspondent)

BOMBAY, 11*th November*

The bullion market maintained a steady tone during the week under review. Fluctuations in prices were again two-sided in both silver and gold, but they were by no means hectic. Variations were mainly influenced by the day-to-day statistical position of the respective metals and heavy short-covering. Though the arrivals of unrefined silver were on a lower scale, the white metal could not make much headway due to absence of any improvement in offtake. Arrivals of gold continued to be on a fair scale, but the sentiment remained unaffected by the good demand in the ready position and covering by a prominent bear operator.

Silver for forward delivery (23rd November settlement) rebounded early in the week from Rs. 151-9 to Rs. 152-12 on Thursday last, following reports of slackened arrivals of unrefined metal and persistent support from a leading bear operator, who was reported to have gone long in silver. The *Moorat* trading held on Friday was uneventful and the post-Diwali session on Monday witnessed a recession, due to lack of fresh support and reports of arrivals of unrefined silver and the price fell back to Rs. 151-6. In the last two days, however, silver disclosed a hardening tendency and earlier loss was fully recouped when the price touched Rs. 152-12 to-day, on support from a new bull operator. The closing was a shade lower at Rs. 152-4.

Ready silver (.996 Mint), which had commanded a premium of As. 2 at Rs. 151-11 over the forward price at the close of last week, came to be quoted on par with forward and closed at Rs. 152-4. The floating stocks of silver are placed at 2,600 bars. The daily average offtake was about 20 bars.

Opening at Rs. 80-2, gold for forward delivery (21st November settlement) advanced to Rs. 81 early in the week due to dearth of floating stocks and bear covering. But this recovery was short-lived and the price fell to Rs. 80 on Tuesday morning on reports of slackening in offtake and some selling in the ready position. Towards the close, however, there was a good improvement to Rs. 81-1 on resurgence of demand. The closing was steady at Rs. 80-14.

Ready gold began at Rs. 80-13 and hardened to Rs. 81-11, only to react to Rs. 80-8. The closing was, however, better at Rs. 81-6. The floating stocks of gold are estimated at 25,000 tolas. The daily average arrivals and offtake were even at 8,000 tolas.

The following comparative table shows the trend of the market during the week under review:

	11-11-53	Highest	Lowest	3-11-53
GOLD	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready (.99 fine Mint)	81 6	81 11	80 8	80 11
Forward	80 14	81 1	80 0	80 0
Sovereign	57 4	57 8	57 4	56 8
SILVER				
Ready (.996 fine Mint)	152 4	152 14	151 6	151 11
Forward	152 4	152 12	151 5	151 9
London Ready	74*d.*	—	—	74*d.*
London Forward	74*d.*	—	—	74*d.*
New York Ready	85½c.	—	—	85½c.

TEAS IRREGULARLY EASY

(Messrs. Forbes, Ewart and Figgis Ltd.)

COCHIN, 7*th November*

The offerings in dust sale "V", which was held on Tuesday, 3rd November, amounted to approximately 176,000 lbs. There was a fair general demand, but prices were irregularly half to one anna easier for all types except better liquoring and clean, black, grainy dusts which remained fully firm.

London Market.—Market dearer and generally half penny above last week. Fannings strongest feature, often penny dearer.

Colombo Market.—Strong demand. Good liquoring teas 10 to 15 cents dearer; corresponding fannings firm; others slightly lower; commonest declined 10 cents; bright low-grown steady.

Calcutta Market—Export.—Strong general demand, at practically unchanged rates. Pekoe and pekoe fannings strong feature.

Dust.—Strong general demand. Market firm to very occasionally dearer. Commonest strongest feature.

Export Quota.—The market has strengthened slightly and business has been done at 16½ pies.

Forthcoming auctions.—Dust sale "W" will be held on Tuesday, 17th November, 1953.

As we go to Press Messrs. Forbes, Ewart and Figgis, Ltd. wire as follows:

"*Sale* 23.—14,25,000 lbs. Strong general demand, particularly for low medium and medium, which are finally firm to half an anna dearer. Good medium steady, but best liquoring selling As. 2 to As. 3 below valuations."

HIDES EASY

(From Our Own Correspondent)

KANPUR, 8*th November*

The hides and skins market was slightly easy during the week under review. Prices of wet salted cow registered a fall. New arrivals were a shade above the average. The main purchasers were the local tanners and the Madras dealers.

The latest quotations are: Wet salted cow, 1st grade superior Rs. 340 to Rs. 360 and inferior Rs. 280 per score; wet salted cow 2nd grade superior Rs. 330 to Rs. 350, medium Rs. 220 to Rs. 230

(Continued in previous column)

COTTON FEATURELESS

(From Our Own Correspondent)

BOMBAY, 11*th November,*

Dull conditions characterised the trading in the cotton market during the week under review. The categorical statement of the Textile Commissioner that the Government of India had decided not to reduce the export duty on cotton and that it did not contemplate an additional export quota of Bengal *Deshi* dampened the enthusiasm of operators. There was very little inclination towards fresh business. Even the transactions on the *Moorat* day were a dull affair. Turnover was greatly restricted, with fluctuations in values confined to a narrow range.

In the forward section, I.C.C. February opened the week on a nervous note at Rs. 609, as against Rs. 613-8, following the Textile Commissioner's statement and reports of large arrivals of new crop cotton from up-country centres. It dropped to Rs. 606 during *Moorat* trading, although, towards the close, it was a little higher at Rs. 606-8. On Monday, again, the market was subjected to hedge selling and unloading by bulls, which pushed down the price to Rs. 605-8, the lowest level for the week. Lower levels, however, evoked some support and the previous loss was completely made up. In fact, to-day's closing quotation was Rs. 613, which is Rs. 4 higher than the opening rate. I.C.C. May moved in sympathy with the February contract. Opening at Rs. 615, it slided down to Rs. 612-8 during *Moorat* trading. Thereafter, it improved to finish at Rs. 619-4, the net gain over the week being Rs. 4-4. The spread between the two contracts, which had narrowed down to Rs. 3-12 last week, widened to Rs. 6-4 at the close to-day.

The following is the trend of prices in the forward market during the week under review:

	Opening	*High*	*Low*	*Closing*
I.C.C. Feb. ...	Rs. 609	614½	605½	613
I.C.C. May ...	Rs. 615	620½	612½	619½

In the spot market, the Textile Commissioner's statement brought about a landslide in values in the early part of the week. During the subsequent sessions, however, a marked recovery was in evidence, thanks to keen interest envinced by mills in Berar, Vijay and Bengal Cotton and to hopes of some relief in cotton exports still entertained in certain sections. The following are the latest available quotations in the spot market (new crop):

Bengal *Deshi* Rs. 580; Berar *Jarillas* Rs. 665; Khandesh Rs. 710; Vijay Rs. 735; Oomra *Deshi* Rs. 590; Moglai Rs. 580.
