Mr. Master, who is an undisputed authority on shipping, says that, even if the present rate of surcharge is doubled, it will not be possible to balance the budget of the Port in the future. He argues that this suggestion is the result of an incorrect appreciation of the financial position of the Port. He points out that the aggregate surplus of Rs. 3 crores accumulated during the last 3 years, as revealed by the budget of the Port Trust, is more apparent than real. For it is accountable partly to an increase in receipts of surcharge and partly to demurrage. But demurrage is only in the nature of windfall and cannot be relied upon. Already, it has been on the down-trend, thanks to the improvement in the working of the Port which has relieved congestion to a considerable extent. It is bound to go down further in future. That apart, the surplus does not take into account the liability of over Rs. 60 lakhs by way of municipal taxation and the amount of about Rs. 1 crore to be paid under the Minimum Wages Act. Further, the Port will have to pay, in the coming years, an additional sum of Rs. 28 lakhs per annum under the Minimum Wages Act. In other words, the additional annual expenditure will go up by that amount from next year. In addition, there are proposals for a re-adjustment of dearness allowance, etc., which will mean a new burden to the extent of Rs. 15 to Rs. 20 lakhs per annum. Municipal taxation will also add a further sum of Rs. 6 lakhs per year. All these and a host of others will impose a very heavy burden on the finances of the Port. Summing up this position, Mr. Master observed:

"When we add up all these figures, a more realistic picture will emerge before us, and we shall find that, not only the surplus will disappear, but the Port will also have seriously to consider how to find revenue for covering the additional burden of Rs. 125 to Rs. 130 lakhs, year after year. Even if the Port were to double the present rate of surcharge, it will not be able to balance its budget in the future."

Mr. Master does not leave the issue of balancing the budget there. He proceeds to point out the possible adverse effects of increase in the rate of surcharge on India's exports at a time as the present when the sellers' market has almost come to an end. To quote his words: "Unless the Port and other handling charges are kept within limits, we cannot sell our wares in foreign markets." He opines that, with the construction of Kandla, the diversion of cargo from sea to rail, on account of lower freight rates and the like are bound to affect the trade of the Port resulting in lesser revenue. In view of all these considerations, Mr. Master holds, not without justification, that the amount of Rs. 4.17 crores, which the Government is prepared to offer as loan, is grossly insufficient. He pleads for outright grants to some extent. He urges that such amounts as may be given by way of loan should be free of interest at least for a period of 12 years from the time the refineries begin to function and the scheme for the modernisation of the docks is completely executed.

As regards the scheme for the establishment of a Marine Oil Terminal, the Planning Commission has earmarked finance up to Rs. 8 crores. This includes the cost of nearly Rs. 3 crores for removing the dump from the Butcher Island. As a result, the exact sum that will be available for the establishment of the Terminal will be about Rs. 5 crores. The Port Trust, it may be noted, is of the opinion that the removing of the dump is not its liability, but that of the Government and, consequently, the Government should bear the cost. Dealing with this question, Mr. Master pertinently remarks:

"In view of the inexplicable haste with which we are asked to set up the Marine Oil Terminal and complete all the arrangements in connection therewith, the cost is unfortunately mounting. It is estimated that the Marine Oil Terminal scheme would cost us about Rs. 7 to Rs. 8 crores. It may go up even to Rs. 9 to Rs. 10 crores. It is difficult to say what the final cost will be. The Government have not yet made it clear that, whatever may be the ultimate cost of the scheme, the finance necessary for the execution of the scheme will be provided *in toto* by the Government. May I, therefore, request you to make the position crystal clear to us in this matter?"

Even in this case, Mr. Master pleads for assistance from the Centre by way of grants and loans with an interest-free period. He desires that permission should be given for recovery of the amount of money which the Port Trust will require for meeting the cost of interest, sinking fund charges, maintenance, depreciation, repairs, etc., from the oil trade, as it is that alone which will benefit from the huge expenditure incurred on the Terminal. He is opposed to the diversion of a portion of the general revenues to meet the cost incurred in respect of the Oil Terminal. The arguments of Mr. Master in this regard seem to be convincing.

The Central Government has allotted Rs. 80 lakhs during the Plan period for loans to State Governments for improvement of 31 minor ports. The total estimates submitted by the States come to Rs. 154 lakhs, but only Rs. 80 lakhs have been granted by the Centre and the States are expected to find the balance.

(Concluded from next column)

the National Planning Commission, the Government of Mysore, it is stated, is conducting fresh surveys of the project. The project, estimated to cost over Rs. 35 crores, is expected to generate power to the extent of about half a million kilowatts. Honnemaradu, it may be noted, is about five miles up the Sharawati river from the Jog hydro-electric generating station. The project envisages the construction of a reservoir at Honnemaradu, about three miles down the river, from Hirebhaskar dam, which impounds 15,000 million cubic feet of water. It is calculated that a reservoir constructed to a height of about 165 feet will impound over 100,000 million cubic feet of water. The Government of Mysore is urging the Centre to render financial assistance for taking up the construction of the project.

SUPPLY OF POWER FROM MYSORE

REVIEW OF INTER-STATE AGREEMENTS

RECENT trends indicate that the State of Mysore will, before long, be the biggest supplier of electric power in South India. It has either already entered, or is entering, into agreements to supply large blocks of power to neighbouring States. At present, negotiations are being conducted with the Governments of Hyderabad and Andhra, with a view to revising the agreement originally entered into with the composite State of Madras which provided for the supply of 4,000 kw. of power to the Ceded Districts. The revision of the agreement is prompted by the break-up of the State of Madras leading to the creation of Andhra and the merger of certain parts of Madras with Mysore State.

Reports from Kurnool indicate that the Kurnool area will be supplied with power from the Jog hydro-electric system under a scheme, which is being considered by the Andhra State Cabinet. The scheme envisages linking of Kurnool with Yemmiganur, which is already receiving power from the Jog system. Kurnool is, at present, supplied with power by the local thermal station, the capacity of which is 800 kw. The present consumption is 640 kw. When power from the Jog system becomes available, the major part of the thermal station will be closed, leaving only one or two generating sets for emergency purposes.

Mysore has entered into an agreement with Madras which provides for the supply of power to South Canara district by the middle of 1957. Mysore will supply at first 2,800 kw. and two years thereafter a total of 3,500 kw. and two years subsequently 6,000 kw. in the aggregate.

The Government of Mysore has also entered into an agreement with Bombay State. The agreement envisages a supply of 1,500 kw. power from Jog to Dharwar district in the near future. The Government of Mysore has also agreed to supply 10,000 kw. of power to North Canara district of the Bombay State. The Government of Bombay, it is stated, is erecting the necessary transmission lines.

The State of Mysore has entered into an agreement with the State of Coorg too. The agreement provides for a supply of 1,000 kw. of electric power to Coorg. Under the terms of the agreement, the Government of Mysore has itself agreed to lay transmission lines up to Coorg border at an estimated cost of Rs. 30 lakhs, which will be advanced by the Government of Coorg. Central aid to Coorg in this regard is anticipated in the near future.

In the meanwhile, the State of Mysore is trying to increase the generation of power, with a view to meeting the increasing demand for power not only from several areas of the State itself but also from the neighbouring States referred to above, which are short of natural facilities for generating power. It is anxious to take up early the construction of Honnemaradu hydro-electric power project. In response to the direction for alternative suggestions, made by

What is NEWALLS 85% Magnesia?

It is a blended mixture of not less than 85%, by weight, of Pure Hydrated Carbonate of Magnesia. The balance is made up of high quality Asbestos fibre.

Why is NEWALLS 85% Magnesia so efficient?

Because millions of crystals in each cubic inch trap an infinite number of 'dead' air spaces. These reduce heat transmission most effectively.

Why is NEWALLS 85% Magnesia cheaper?

Because its covering capacity is very high (one ton applied evenly 1" thick over a flat surface will cover 2,200 sq. ft.) and because its higher efficiency results in a higher saving of heat. And heat costs money!

AMY-5

MEETING OF EMPLOYEES' STATE INSURANCE CORPORATION

MR. V. V. GIRI'S CALL FOR MAKING SCHEME A SUCCESS

ALTHOUGH it is now more than five years since the Employees' State Insurance Act was placed on the Statute Book, it is deplorable that the Scheme itself should be functioning only in three areas, namely, Delhi, Kanpur and the Punjab. What makes it more deplorable is the *fact* that employers all over the country are compelled to contribute their share of expenses under the Scheme, though there is no relief to them so far as their obligations under the *Workmen's Compensation Act*, the Maternity Benefit Act and other labour laws are concerned. Thus, the failure of the authorities of the Corporation to extend the Scheme as rapidly as they *once thought* possible has imposed an unnecessary financial burden on employers. Even labour leaders are frankly critical of the progress of the Scheme.

The only redeeming feature of the whole situation is that no one is more conscious of the effects of continued failure on the part of the authorities to make more rapid progress in implementing the Scheme, than the Minister for Labour, Mr. V. V. Giri, himself. He warned in his recent address at the meeting of the Corporation, at New Delhi, that "unless substantial progress is made in the implementation of the *Scheme in the year 1954*, the forces of discontent and opposition might gather such momentum as even to wreck the Scheme." He called for a "little bit of heart-searching" to see whether all had "pulled together themselves adequately" in order to make the Scheme a success. He added:

"Responsible sections of employers have been complaining of the burden placed on them through the levy of the special contribution without an adequate return for the large sums they contribute. *While the levy* of what is essentially a general tax from all employers in the country might be justified for a time, it would be difficult to continue these levies for too long a period. I have, on behalf of the Corporation, given assurances to employers that *in the coming year* we would exert ourselves to the utmost and try to make good our promises and their expectations. It is for every one of you, representing employers, workers and State Governments, to back us in this endeavour if you are as *anxious as I am to see* that this difficult scheme is made a success."

The workers' grievance against the authorities of the Corporation stems not only from the *fact that the Scheme* is being only very slowly implemented but also from the consideration that the quality and standard of medical treatment given under the Scheme is not satisfactory. *Referring* to this complaint, Mr. Giri gave the assurance that he was himself "most anxious" to raise the quality and scope of the medical relief rendered under the Scheme. He revealed that *they were examining* how far they could go in this direction "having regard to our limited finances." But he counselled "patience," adding that "every big scheme starts in a small, and *often unimpressive* way, but given goodwill and the desire to make good, there is nothing which cannot be achieved."

State Governments

The State Governments are no less critical of the Scheme than the employers and the workers, for many of them have felt that their share of expenditure under the Scheme (one-third of the cost of medical care) is on the high side. On this question, Mr. Giri said that the State Governments will do well not to raise the issue of their share of expenditure at present, since it will be some time before the Scheme is implemented in its entirety. He said, in effect, that there will be time enough to consider the whole formula regarding the State's share of expenditure. Making an earnest appeal to the State Governments to co-operate, and even to take the initiative in seeing that the *Scheme is well* established, he said:

"I would, therefore, appeal to them not to reopen, for the time being, the present formula for the *sharing* of the cost of medical relief between the Corporation and State Governments. Before the end of the financial year 1955-56, we shall have gained valuable experience of the working of the Scheme in all important places and secured reliable statistics of the incidence of cash benefits and of the cost of medical care. Let us hope that experience will show that the amount which we are now *setting* apart, on the basis of actuarial estimates, for cash benefits is excessive and that a portion of it could be diverted to augment the expenditure on medical relief. That would be the time to consider whether the burden on State Governments, which would by then have attained the full extent, could not be adequately eased. If no such diversion becomes possible and State Governments find it difficult to contribute the full one-third of the cost of medical care, the Corporation will have to consider the question of increasing the rates of contributions of employers and employees. But any such increase at this stage will hardly be justifiable. I would, therefore, assure State Governments that we shall lighten their burden *before* its full weight is felt and would appeal to them not to reopen the question at this juncture as that must inevitably postpone implementation of the Scheme."

Finally, Mr. Giri revealed that the authorities had taken steps to "streamline" the administrative machinery of the Corporation. He hoped that this step would soon be reflected in increased efficiency. It would appear that they have taken care to see that the "utmost economy is exercised in the matter of staff and other incidental expenditure connected with the administration." All this will certainly go to commend the Corporation's services to those who benefit by them and also pay for them.

Hospital Treatment

The Corporation approved, at the session which Mr. Giri addressed, a scheme for setting up hospitals and specialist centres. Under the plan, a sum of Rs. 220 lakhs is proposed to be spent on providing 1,250 beds in independent hospitals and 400 beds in annexes to existing hospitals. The Corporation agreed that hospital treatment should be provided to T.B. patients among the insured persons and directed that a survey should be undertaken to find out the extent to which the existing T.B. hospitals could be utilised for purposes of treatment. It accorded sanction for establishing two X-ray-cum-laboratory centres in Calcutta and Howrah District at a capital expenditure of Rs. 1.9 lakh and recurring expenditure of Rs. 75,000.

The question of utilisation of the employers' existing facilities for providing medical care to insured persons under the Scheme was examined. It was agreed that these facilities should be utilised and the employer should be paid for all outdoor treatment including domiciliary visits and cost of all medicines, at a rate not exceeding Rs. 6 per insured person per annum, provided that the employer is spending an equal amount on the medical care of the insured persons.

Yet another important decision, taken at the meeting, was the one relating to the delegation of powers to regional boards. The Corporation decided, it is stated, to delegate certain financial and administrative powers to regional boards. This is a wise decision since it will enable these boards to take an active interest in the work of the Corporation. After all, the regional boards will be in constant touch with the local problems, so that a certain degree of local autonomy and decentralisation will make for increased efficiency in the working of the scheme.

HEALTH INSURANCE IN U.S.

Health insurance protection, which people purchase voluntarily, is expanding in the United States with striking rapidity each year. Both the number of people and of families protected against the financial costs and losses of illness and the types and amounts of coverage of their expenses and losses are growing constantly. To-day, more than 91 million persons, representing almost 60 per cent. of the population, have insurance protection against the expenses of hospitalisation; 73 million have surgical expense coverage; and 36 million are protected against medical expense. An estimated one million also are protected against extremely heavy medical expense arising from very serious illnesses or accidents. Last year alone, more than $2,000 million in benefits were paid to individuals and their dependents under voluntary health insurance policies. About $1,000 million of the benefits were to help meet the cost of hospitalisation, $500 million for surgical and doctors' bills, and another $500 million for benefit payments to replace income lost through sickness or injury.

The growing popularity of this type of insurance protection can be judged by the fact that in 1941 only 16 million persons were insured under group and individual hospitalisation plans, in contrast with the 91 million now protected. The increase in 1952 alone was more than 5.5 million. In 1941, less than 7 million persons were covered for surgical expenses, compared with 73 million protected to-day. About 3 million persons had medical expense coverage in 1941, *in contrast with 36* million at the beginning of this year. For the most part health insurance is maintained on a voluntary basis in the United States by insurance purchased under individual or group policies from private insurance companies or from non-profit organisations. The largest of the non-profit plans is the Blue Cross; its subscribers number more than 43 million.

TAX RELIEF FOR MUTUAL INSURERS

We reviewed, in our issue, dated 28th November, 1953, some salient features of the memorandum submitted by the Association of Mutual Life Offices in India to the Taxation Enquiry Commission. The memorandum dealt with the case of the mutual insurers for exemption from income-tax and cited a judgment given by the U.K. House of Lords in support of their claim. It would now appear that the Supreme Court of Canada has given a similar judgment in which it has upheld the contention of a mutual insurance company, known as the Stanley Mutual Fire Insurance Company, that the Company should not be assessed to income-tax. When the Stanley Mutual Fire Insurance Company was assessed under the Income-tax Act on the surplus arising after payment of losses and expenses, it appealed against this decision to the Income-tax Appeal Board, contending that, being a true mutual company, it did not have any profit or gain. The Board upheld this contention and allowed the appeal. The Government then appealed against this decision to the Exchequer Court. This Court allowed the Government's appeal, on the ground that as there was no complete identity between the contributing members and the participation in the surplus or reserve funds, such funds are profits of the Company.

The Company appealed against this decision to the Supreme Court of Canada. This Court allowed the appeal of the Company for the following reasons: (1) The business of the Company is properly described as a mutual insurer; (2) since it is the Company that incurs the obligations to the members by issuing policies of insurance, of necessity the reserve fund must be its property as its whole purpose is that it may be resorted to in satisfaction of the Company's liabilities; (3) the fund is accumulated, as directed by statute, not in pursuance of a profit-making enterprise but in furtherance of a mutual insurance plan; and (4) it is clear that on the winding-up of the Company, the surplus, if any, remaining after payment of the liabilities, would be returned to the members of the Company.

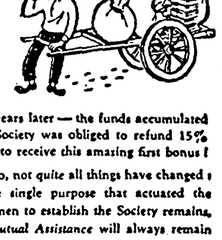
Retrospect . . .

On 3rd December, 1870, seven men of different creeds and stations in life pooled seven rupees towards a single purpose, Mutual Assistance.

Their "bank" consisted of a pair of legs. These legs also carried the accountant, secretary, cashier, clerk and peon all rolled into one. But they were steady legs supported by the faith and confidence of seven trusting members.

In 1871, Trade Unions were legalised and workers the world over rejoiced at having obtained a sort of employment security. In the same year, THE BOMBAY MUTUAL LIFE ASSURANCE SOCIETY came into being, pledging financial security to all. The Society had no address.

But the spirit of these insurance pioneers was catching. The members talked to their friends, friends told their families and families gossiped with their neighbours. Within a week the new-found Society issued policies involving a lakh of rupees. With no fixed address the situation was embarrassing to the promoters!



Then, in 1895 — barely 25 years later — the funds accumulated to such an extent, that the Society was obliged to refund 15% of the total premiums. Policyholders were startled to receive this amazing first bonus!

Today, the 7 men have changed to 7 lakhs of men, the 7 rupees have multiplied to nearly 40 crores of rupees and the all-supporting legs have given place to magnificent edifice which forms the hub of agencies scattered across the length and breadth of India, touching remote villages and extending across the borders into Ceylon, Burma and Pakistan.

No, not *quite* all things have changed for the single purpose that actuated the seven men to establish the Society remains, and *Mutual Assistance* will always remain the gulding principle of the Bombay Mutual, transcending thoughts of business for profit alone. This is one reason why the Bombay Mutual commands such universal respect and is able consistently to discharge promptly and efficiently its debts to its myriads of policyholders.

TAXATION SYSTEM IN INDIA

REFLECTIONS ON SOME OF THE QUESTIONS RAISED BY ENQUIRY COMMISSION—VI

(By R. K. DALAL, B.COM., F.S.A.A., F.C.A.)

AN important aspect of the administration of income-tax law is the place of the income-tax consultants who appear on behalf of the assessees. In the Commission's questionnaire, question No. 87 deals with the effective representation of assessees and the professional efficiency of these representatives. Although some unqualified income-tax experts, who appear on behalf of the assessees, are really good and honest, their number is small. It is in the interest of the Department to do away gradually with unqualified experts. Only chartered accountants and lawyers should be allowed to practise. The rule should be made more and more rigid to shut out undesirable elements.

The syllabus for the examination for qualifying for the position of chartered accountant is proposed to be revised so as to include a special paper on income-tax. The Department can also help in the training of income-tax experts by making available to the public an up-to-date revised edition of: (1) the Income-tax Manual; (2) the table of computation; and (3) the Central Board of Revenue's circulars which give certain relief to the taxpayers in the assessment or refunds. The Department should also publish an annual of leading decisions of the Tribunal on the latter's views in regard to: (i) important sections of the Act; (ii) practice recognised by them as sufficient for acceptance of accounts; and (iii) guidance as to the observance of certain rules and requirements as to registration of partnership or order accepting partition of the H.U.F. These should be made available without, of course, disclosing the identity of the assessee, so as not to offend section 54 of the Indian Income-tax Act.

Disclosure of Names (Question 88)

Although the practice of disclosure of names prevails in some countries, it is thought that such a drastic measure is not likely to improve matters since among the names published, might be the names of persons with whom a smaller assessee might not be ashamed to keep company. One cannot say definitely as to the result of such an experiment, unless it is tried for a time and public reactions and revenue results studied therefrom.

There are penalties prescribed under the Act for concealment of income which are more than sufficient for a check on tax evasion. There is, therefore, no need for publishing the names of persons who are penalised for concealment of income.

Perquisites to Employees (Question 89)

It is difficult to say what loss of revenue the Government suffers by permitting the exclusion of perquisites from taxable profits. *Prima facie*, it is not thought to be considerable. Unless it develops into a scale which endangers public revenue, the present practice should continue.

The perquisites in the shape of rent-free quarters are taxable under section 7, explanation 1. Other perquisites such as medical aid, entertainment and mess expenses of the employees are not taxable under the aforesaid section. In view of the absence of any stability in employment, or such benefits as provident fund or pension as in Government or semi-Government institutions, it is not desirable to treat such perquisites given to employees of business undertakings as part of salary under section 7. Besides, the revenue to the Government will be very negligible if such small perquisites are made taxable under the aforesaid section.

Tax Due by Company in Liquidation (Question 90)

A company in liquidation should safeguard its funds to the extent of taxes levied by making it a first charge on the assets of the company and making the liquidator responsible for it, unless, after due notice and enquiry, he distributes the funds in his hands. If, any liability arises thereafter under section 34, only the recipient shareholders, who received the dividends, should be held liable and not the liquidator.

Powers of Income-tax Authorities (Question 91)

Larger powers in the hands of present personnel are likely to result in more harassment, greater corruption and smaller revenue. In very exceptional cases, searching of premises may be permitted but only during office hours; it must be carried out by a person of responsibility duly authorised by the Commissioner who must make careful enquiry and not rely upon the report of his lower staff. Also, this must be resorted to only if other measures are not likely to yield the result which the Department has in view. With such safeguards, these powers may be permitted. The power to enter premises must not be left to anyone below the rank of the Inspecting Assistant Commissioner, duly authorised by the Commissioner of Income-tax in writing. If the result shows that the enquiry was infructuous, the reasons should be submitted by the Inspecting Assistant Commissioner to the Commissioner of Income-tax in writing. Care should be taken to see that authorities do not act upon an anonymous report written by a rival in trade, enemy, disgruntled employee or a blackmailer. If action is taken on the report of such a person the Department must in duty bound disclose the name of the informant for suitable action by the assessee, if the report is proved to be false, baseless and actuated merely by malice or intention to blackmail and harass.

Large powers conferred on executives have often been misused both to the detriment of the Government and the assessees. There are sufficient powers already vested in the Income-tax Officers under the Act and any further power that may be given to them will surely result in unnecessary harassment of the taxpayers. What is required is the cordial, courteous and sympathetic attitude on the part of the taxing authorities towards the taxpayers who are heavily crushed under the excessive burden of taxation.

Creation of Legal Entities (Question 92)

The present practice of converting private property into trusts or private limited companies wih a view to mitigating heavy tax incidence, is not so widespread as to merit legislation against it. The legitimate way of reducing one's tax burden by the formation of companies, partnerships, trusts, etc., should not be disturbed so long as the transactions are *bona fide* and genuine and not a camouflage for avoiding tax under false pretences.

It is inconceivable that a taxing statute could penalise a person for legal avoidance of tax. The law, as it stands now, has made sufficient safeguards against possible evasion of tax. The provisions for penalty rates will not help either the Government or the trade and will ultimately scare the business community from their normal business activity and thus retard the progress or expansion of trade and commerce of the country.

Tax Due by a Partner (Question 93)

In case of a registered firm, the firm is an assessee but the tax is recovered from its partners. If any tax is unrealised, the provision for recovery of such tax may really conflict with the principle of individual assessment. Why should partners' unrealised tax be borne by the firm when the assessment proceeds on the principle of individual responsibility? But, if any such provision is made it must be clearly provided that only such part of personal tax may be recovered from the firm or other partners as relates only to his share in the partnership business.

Machinery of Recovery (Question 94)

Where the Department itself is lethargic in making assessments, which are delayed for a number of years for no fault of the assessee, sufficient time should be given to the assessee for payment of the tax for more than one year in one financial year. No penalty for delay in the payment of taxes in the aforesaid circumstances should be levied. The arrangement for the recovery of tax is quite adequate. What is required is vigilance and efficiency on the part of the Department for the recovery of the tax. There is adequate machinery prescribed under the Act for enforcing recovery of the tax from the resident assessees. It is only in the case of a non-resident or a foreign assessee that some special machinery for enforcing payment of tax is called for and especially in the case of a foreign company under liquidation to avoid heavy loss to revenue. Similar special machinery may be prescribed for other resident persons who are likely to leave India for the purpose of settling down abroad with no intention to return to India.

Private Companies (Question 95)

Private companies' tax should be met out of the assets of the company and not from the shareholders. When the assessment proceeds on the assumption that a company pays its own tax as an entity on behalf of the shareholders, how does it stand to reason to say that the company's unrealised tax shall be recovered from the shareholders? One cannot keep one's cake and eat it. One must not be allowed to tinker with a principle. One cannot say that for purposes of assessment, the company's legal entity will be recognised, and also say that when this tax is unrealised the legal entity will cease to operate. For purposes of assessment, a company is deemed to be a company but when recovery proceedings start, it suddenly becomes a partnership, each partner becoming liable to pay not what he receives, but what the company earns, whether it is distributed or not. To vary the principle to suit the exigencies of recovery is bound to make nonsense of the principle underlying the functions of a company and hold it up to ridicule. A more straightforward method will be to declare that all private companies will be to declare, for assessment and rate purposes, as a partnership, and not as a company, but that the shareholders will be taxed as a registered firm.

Property Income (Question 96)

Here also, there does not seem to be any logic. Why should the income of one be treated as the income of the other? If it is on the ground that the income, though legally transferred to another, really belongs to the transferor, the person who is taxed should be responsible for the tax; why should one man bear a liability to pay the tax of another when legal liability is not his? If the transfer is not real but a camouflage, then the law is strong enough to pursue its remedies against the so-called transferee as a benamidar of the real owner.

Public Relations (Question 97)

The greatest need of the taxpayer and the Department is to find ways and means to make the Department more reasonable in its demands for tax and the taxpayer to be honest and straightforward. Each must realise that on the improved tone of relationship between the taxpayer and the taxgatherer, depends the smoothness of the working of the tax machinery, recovery of revenue and the general satisfaction that the taxes are not only properly collected but are willingly paid as a mark of good citizenship. This can only be done when the laws are neither harsh nor inequitable and the citizens learn the duty of paying the taxes willingly without resort to manipulation or fraud. Taxpayers must be made to realise that the tax wrongly avoided, must weigh on the community as a whole in terms of either higher taxes or harsher laws. It does not pay to avoid paying one's true taxes. But, in order to achieve this, the Department must be scrupulously fair; their anxiety must not be to collect tax anyhow, as someone put it bluntly, by hook or by crook. In this matter, one should recall the maxim that it is not sufficient to do justice, but make the taxpaying public feel that justice is done. They must not be suspected; their statements should not be open to challenge, unless some evidence justifies such inference. Assumptions and presumptions must give way to proofs and evidence.

The Income-tax Officers must see that an assessee is not harassed through rejection of his books on flimsy grounds, adoption of unconscionable gross profit or demand for immediate payment of taxes, irrespective of the state of his finance. His assessment must not be delayed, prolonged scrutiny being made year by year, although nothing is detected or found; refunds should be paid as promptly as tax demands are recovered. Appeals should be heard and disposed off judicially and not in an atmosphere where everything that the Income-tax Officer says is believed, everything the assessee says is rejected. For this, the creation of the office of a liaison officer is a crying need. This officer should be scrupulously fair and beyond the reach of temptations, efficient, sympathetic and judicial by temperament. He should be able to control the vagaries of some officers and offer taxpayers of lower brackets advice as to filling in of returns, maintaining of simple accounts, claiming refunds and help in expeditious disposals of his old assessments. He should give free advice to the small assessees on the subject and also see that their genuine grievances are immediately looked into and redressed by proper approach. It must be his duty to see that taxpayers, who come and complain against authorities, are not victimised by them.

Any enquiry, either oral or written, from an assessee on various matters relating to the assessment proceedings, such as the disposal of refund applications, adjournment of applications, for examination of records, etc., should be promptly dealt with by the Income-tax Officer concerned. In any case, there should be no delay, longer than a month, for merely replying to such enquiries. Cases have come to light where the applications for rectification of apparent mistakes under section 35 have remained unattended for more than a year and penalty has been levied on the assessee for non-payment of tax even before the order under section 35 is made by the Income-tax Officer. The facts, agreed to between the assessee and the Income-tax Officer, should be recorded by the Income-tax Officer and a copy thereof should be supplied to the assessee to avoid dispute at a later stage.

Assessment and Appellate Procedure (Question 98)

With regard to the issue of notices and simplification and filing of returns, the present practice requires no change, except that the practice, which allows notices, asking for information and completing assessment within a few days before the year, to become barred should be discouraged. Where taxes are imposed for the current year as well as previous years together, reasonable time should be given to the assessee for payment.

The notice should be served always on the assessee and not on any other person, unless a special authority has been given by the assessee to some other person to receive it and such authority has been recorded by the Income-tax Officer. The form of return should not be very elaborate and complicated but simple and intelligible. The present amended forms of return are in some respects beter than old ones.

Penalties levied now for technical offences should be discouraged. The Act itself is so complicated that even experts are baffled by its obscurities. Penalties should be by way of a deterrent, not with a view to collecting larger revenue. Any such motive to collect revenue frustrates the principle of deterrence and punishment. The provisions for the recovery of tax are comprehensive enough and need no further tightening up. An under-estimate for advance payment of tax in the case of a business with wide fluctuations of profits should not be the ground for penalty unless it is definitely proved that the assessee has deliberately furnished inaccurate particulars of his income. An omission, on the part of the assessee, to add certain apparent disallowables by itself should not be the ground for invoking the penal section, unless the assessee has deliberately omitted them in order to defraud the revenue. The rejection of accounts on the ground of lower margin of profit and addition to the actual income disclosed by the books should not attract penalty for concealment of income, unless the Department can definitely lay their hands on some serious omissions or defects in the accounts.

Again, penalty should not be imposed in cases of cash credits, in the accounts of the partners, proprietors or other persons, which the Department merely suspects as secret profits without any evidence in its possession. The onus of proving that such cash credits are secret profits must lie on the Department before a penalty may be levied.

Where an assessee has applied for the rectification of a mistake apparent on records, under section 35, within the time prescribed for the payment of tax, returning the challans and requesting the Income-tax Officer to postpone the collection of tax till the mistake is rectified, no attempt should be made by the Income-tax Officer either to recover the tax or levy penalty for non-payment of tax before the mistake is rectified under section 35.

Where a refund is due to the assessee from one Income-tax Officer on account of, say, excess profits tax deposit, excess profits tax refund, business profits tax refund, etc., he should not be called upon by another officer to pay the demand, ignoring the refund due to the assessee. The refund due to him should be adjusted against the demand made against him and only the net demand should be enforced. Where the assessments are delayed for no fault of the assessee, the demand made for more than one assessment year in one financial year should not be enforced without giving sufficient time to the assessee, unless the Department has information that the assessee is likely to dispose of his assets and/or is likely to leave India to settle abroad.

No mother can resist the appeal of eager little hands. The world is every baby's birthright and mother does her best to ensure for her baby all that is best in it. And all mothers hope that their children when they grow up will enjoy the blessings of prosperity in the great new India we are all striving to build.

(3)

The practice of Income-tax Officers calling assessees on particular dates and at particular time and making them wait outside their rooms for long hours could be easily avoided if the Income-tax Officer does his work expeditiously, instead of seeing friends and other officers for a chat, in the midst of his duties, or trying to attend to some office work without consulting the convenience of the assessee. Nothing could be easier for the Income tax Officer than to give a fresh date, if the preceding case has taken an unexpectedly long time.

The work of assessment should also be prompt and not delayed by meticulous enquiry or collection of information which leads to no useful result. There are cases in which for years there is not much difference between income returned and income assessed. In such cases, liberal use of section 23(1) is called for. Further, such assessment should be reviewed every three to four years to mark wide fluctuations in incomes and expenses from the usual. Small assessees should not be harassed on account of imperfect book-keeping. Accounts should not summarily be rejected. He is likely to feel the extra incidence the hardest. Much revenue is not likely to be lost if meticulous scrutiny is not resorted to, except in cases of definite information in the possession of the Income-tax Officer.

Appellate procedure needs a change. The Appellate Assistant Commissioners should not be placed under the Commissioner of Income-tax. No amount of assurance to the effect that they are free to act judicially without fear or favour will satisfy the public when their pay, promotion and transfer are vested in the hands of an executive officer like the Commissioner of Income-tax. The ever-present danger of getting into the bad books of the Commissioner of Income-tax and of constant disagreement with the Inspecting Assistant Commissioner with regard to his decision makes him hesitant in giving relief to the taxpayer, lest the Department might go to the Tribunal in appeal against his order. Sometimes, the relation between the Appellate Assistant Commissioner and the Inspecting Assistant Commissioner is so bad and strained that every order of the Appellate Assistant Commissioner is appealed against by the Department to the Tribunal. The Appellate Assistant Commissioners should also have no power to enhance assessment. That is an executive function incompatible with the judicial post he holds.

Delay in Assessment (Question 99)

Undue and inordinate delays in income-tax proceedings have become almost chronic, as witness the large number of arrears in the Department. The undue delay is due to inefficiency of the Income-tax Officer. It is also due to the fact that delays do not matter so much to the Department, since the main part of the taxes has already been collected, as to the assessee who has large uncertain liabilities to meet and has to find finance for them. In order to expedite assessment and avoid undue delays, the following considerations should be borne in mind:

(i) Meticulous scrutiny of accounts every year should not be necessary where the previous records show a clean assessment. Such cases should be disposed of quickly on the basis of the standard information given along with the return.

(ii) Refunds should be expeditiously disposed of within, say, three or four months of applications for refunds under section 48. Similar prompt reliefs should be granted under the Appellate Assistant Commissioner's orders or the judgments of Tribunals.

(iii) Remand reports should be promptly attended to and made within the time given by the Appellate Assistant Commissioner and not after six months or a year thereby delaying disposal of appeals.

(iv) Technical errors should not be magnified into serious omissions and penalty levied for the default, necessitating long appeal procedure.

(v) Taxes should be collected giving the assessee facilities of instalments or postponement according as the tax imposed is large and major portion of which is in dispute and in appeal. Such disputed points should be left to the determination of the Appellate Assistant Commissioner in case of difference of opinion between an assessee and the Income-tax Officer.

(vi) Confidence should be generated amongst the tax-paying public that honest assessees would get courteous treatment and their cases expeditious disposal, that the Department is considerate and sympathetic towards the trader in regard to his finances.

(vii) Quarterly advance payment must now be discontinued. And the old method of collecting tax on assessment should be restored.

There is a tendency, at present among Income-tax Officers to take up some assessments only in the last month of the year lest they may get time-barred in the next year. This creates many difficulties and much embarrassment to the assessee who has to comply with the various requisitions of the Income-tax Officer within a short time. The assessee is thus required to preserve his old records for more than five years in some cases. On the slightest excuse of not furnishing a particular book or record, there is a tendency on the part of some of the officers to proceed with the assessments hurriedly without sometimes giving proper thought or consideration to the submission made by the assessee. In order to end or check these practices on the part of the Income-tax Officers, there should be proper review of such cases by the higher authorities. The Income-tax Officer should, in all cases, be asked by the higher authorities to take up the assessments within a reasonable time from the date of submission of the return. Otherwise, there is a likelihood of loss of considerable revenue to the Government and unnecessary hardship and trouble to the honest taxpayers.

The cases of assessees who declare losses or claim refund, should not be given a differential treatment by the Income-tax Officers. They should also receive the same attention and treatment as the other assessees. Their assessments should not be delayed unduly for a long time.

The cases which have already been taken up, for which information has been collected for purposes of assessment, should not be left over by an Income-tax Officer, if he knows that he is under transfer and the transfer is not made in the mofussil. In such circumstances, the Department will do well to see that transfers are delayed for a short period in order to avoid the unnecessary expense and worry involved to the assessee in producing all over again the books of accounts and documents already produced before his predecessor.

Special Business Taxes (Question 100)

In these days of recession in business conditions and stringent financial conditions it will be ruinous to impose new taxes on the already overburdened industry and commerce of the country. It will lead to closure of industrial and trading establishments and result in widespread unemployment. It will neither benefit the Government nor the taxpayers but only add to the already heavy administrative cost to the Government.

Moreover, the excess profits tax and the business profits tax were brought into existence to meet the peculiar conditions of war-time prosperity. Since such conditions do not now exist, these special taxes should not figure in our statute book. Taxes of abnormal nature should be reserved for meeting abnormal conditions.

Estate Duty Bill (Question 101)

The Estate Duty Act has been brought into force at a time when there is acute depression in industry and trade and consequent acute unemployment in the country. It will retard the progress of industry and trade. It may thus indirectly increase unemployment in the country. The levy will kill the incentive of the individual industrialist and business man. The limit for exemption prescribed under the Act should be raised, say, to Rs. 2,00,000 instead of Rs. 75,000 in the case of an individual and Rs. 1,50,000 in the case of an H.U.F., instead of Rs. 50,000 as at present. The rates of duty should suit Indian conditions and should be much lower than in the countries which are more advanced economically and socially than India. Again, there should be liberal exemptions for funeral expenses, life insurance policies assigned in favour of wife or children, dwelling house, jewellery, household, furniture and utensils, etc.

Self-acquired and Inherited Property (Question 102)

The maintenance of the distinction between self-acquired property and the inherited property of the deceased is desirable, so that differentiated rates may be applied to these kinds of property. The rates for self-acquired property should be lower than those for the property which is inherited by the deceased.—*All Rights Reserved.*

IMPORT CONTROLS ATTAIN LARGE MEASURE OF STABILITY

EXPORT COUNCILS FOR COMMODITIES VISUALISED

MANY outstanding problems of trade and industry figured prominently in the proceedings of the Import and Export Advisory Councils at their respective meetings held early last week in New Delhi. Apart from those which were dealt with in the Market Gossip columns last week, there were a few other problems which could not be considered there for considerations of space, but which deserve equal attention.

The speech delivered by Mr. Karmarkar, Minister for Commerce, who presided over the meeting of the Import Advisory Council, was, by itself, very encouraging. Mr. Karmarkar claimed that the import policy had won a very wide measure of approval from diverse interests. Few would grudge conceding this claim, as the present policy is undoubtedly an improvement over what it was several years ago. Thus, at present, the import policy is announced for all the scheduled items ahead of the licensing period which was not the case formerly. Over a wide field, there is now a large measure of stability. Quotas are generally left unchanged, and in a few cases where articles are internally available, even cuts have been administered. The resulting savings in foreign exchange is utilised for importing stores and equipment not manufactured in the country. Provision has been made for importing essential consumer goods. The value and significance of token imports is now more widely recognised. Procedural changes have been introduced to help small traders. The minimum value of the licences for most items, for instance, has been reduced to Rs. 500. The period of validity of licences for all items valued at Rs. 1,000 or less has been extended to twelve months. Licensing of even specialised items has been decentralised. The scope of multiple licensing system has been widened. There has been comparatively a more even flow now than in the past of licences and applications from the beginning of the licensing period. Prodigious effort is being expended on the prompt and methodical handling of applications. All these have made a good impression on the trading community, as evidenced by the high tributes paid by the spokesmen of this community at the meeting of the Import Advisory Council.

Decline in Machinery Imports

Another point raised by Mr. Karmarkar was the steady decline in imports, particularly of plant and machinery. Thus in 1952-53, only Rs. 82 crores were used for importing industrial equipment, as against Rs. 100 crores in 1951-52, and Rs. 107 crores in 1949-50. There was a spurt in the quarter, April-June, 1953, when machinery valued at a little less than Rs. 29 crores was imported; but, in the succeeding quarter, it dropped to a little over Rs. 20 crores. The position in respect of industrial goods is somewhat similar. During the period January-June, 1953, these imports were valued at Rs. 135 crores, as against Rs. 140 crores in the preceding six-month period. But in July-September, 1953, the position improved, as in that quarter imports touched a high figure of Rs. 72 crores. This trend, as a whole, is disquieting indeed. It clearly reflects the setback in the implementation of the Five-year Plan. In the circumstances, the stress laid, by some members of the Import Advisory Council, on imports of plant and machinery deserves attention. It is, however, not known how far the decline in imports was due to vagaries of import controls. But the suggestion of the Federation of Indian Chambers of Commerce and Industry favouring grant of emergency licences, in respect of spare parts and other materials needed for meeting sudden breakdowns, is noteworthy. It has suggested the liberalisation of the issue of actual users' licence in the case of cotton mills for the import of such essential mill stores as mutton tallow, starch, china-clay, and caustic soda. The trade, however, is strongly opposed to the issue of users' licences. Referring to this issue, the official spokesman struck a via *media* which should please both the users and the importers. He said that the Government had received contradictory advice in regard to licensing for actual users. He thought it was not necessary to repeat the arguments justifying facilities for actual users to import their requirements, as they were familiar to trade and industry. He, however, stated that frequent allegations regarding abuse of actual users' licences were causing considerable anxiety to the Government. He assured that vigorous steps would be taken to bring the defaulters to book and to put a check to malpractices by actual users as well as by established importers. In advocating liberalisation of the import of such machinery, tools, and raw materials as would encourage cottage and small-scale industries, Mr. A. R. Macgillvray put forward a notable suggestion.

Token Imports

On the principle of token imports, there was some discussion at the meeting of the Import Advisory Council. One of the members opposed token imports because, in several items imported under the scheme, local industries had a surplus capacity. The imports thus led to the creation of unemployment. Another member who supported token imports stated that they were necessary because of their favourable effect on quality and prices of the indigenous product.

Many members pleaded for a census of industries which had to close down recently—causing thereby further unemployment owing to adverse import policy. It was also stated that such census should also cover industries lying idle because of labour trouble and the high taxation policy of the Government. The demand for a census of industry arises from the belief that the existence of idle capacity and closure of industrial units are due to wreckless imports. No categorical denial or acceptance is possible unless relevant data are available. The Minister, however, stated that he had not come across any instance in which the import policy had adverse effect on employment. He expressed his willingness to explore the items the imports of which needed to be liberalised for more rapid industrialisation of the country.

Complaints were made regarding the difficulties experienced by importers in observing the Import Trade Control Schedule. Referring to these complaints, the Minister stated that the special officer appointed to go into the question had submitted his report pointing out the lines on which the schedules would have to be revised. The revised schedule was ready for consideration by the Council but the Minister felt that the need for revision of the schedule was less now on account of fewer complaints. The Council, therefore, agreed to postpone consideration of the report till its next meeting.

Export Advisory Council

The speech of Mr. T. T. Krishnamachari, Minister for Commerce and Industry, delivered at the Export Advisory Council meeting, covered certain notable aspects which need to be noticed here as they could not be covered last week. It is necessary to mention, at the outset, Mr. Krishnamachari's emphasis on long-term objective of export policy. This policy, according to him, is "to limit our normal imports to what we can pay for normal net export receipts, visible and invisible. On this view, it would be clear that constant attention should be devoted not only to the maintenance but the steady development of our exports." But the country's exports in 1953 were distinctly lower on account of a decline in the export earnings from major items of its exports the prices of which fell sharply. These were jute goods, black pepper, tobacco, mica, lac, raw wool, and oils and oilseeds.

In view of the decline in exports, the Minister did well in stressing the need for cultivating India's natural markets. He stated that through the Trade Commissioners' service, the Government was trying to do what it could to bring the goods offered by India to the notice of consuming markets. He reminded industry and commerce in the country that, unless they set up appropriate organisations to do propaganda, to conduct market research, to promote standardisation and quality control, and to do such other things as were necessary to persuade foreign buyers to buy Indian goods, it would be difficult to attain the long-term objective. He was in favour of having separate export organisations for several commodities. He quoted the instance of jute and tea, where the associations concerned had been doing good work for establishing useful contacts abroad.

State Efforts

Speaking of the Government's efforts to step up India's export trade, the Minister for Commerce and Industry stated that the All-India Handicrafts Board was taking steps to set up a central organisation for marketing handicrafts in the U.S., U.K., and Canada. There would shortly be also a Coir Board, he said, to promote the use of coir manufacture, both in the country and abroad. The problems of the cashew industry also were under the review of the Government. The sports industry had been advised to concentrate on building up regulation and prestige of certain hall-marks in export markets. He expected that those connected with the textile industry and trade would organise market research, depute trade representatives, appoint correspondents, and institute a system of inspection to promote exports of textiles. He visualised the possibility of expansion of tobacco exports, as already two officers had been appointed to help the Government in the matter. But the position here is that there has already been heavy accumulation of tobacco in overseas ports despatched from India on consignment basis. The Indian Central Tobacco Committee has recommended the imposition of a ban on tobacco exports for a period of six months. There is, therefore, need for the Government to move quickly to bring relief to the exporters concerned.

The Ministry of Commerce and Industry has also taken some steps for promoting exports. According to Mr. Krishnamachari, a Deputy Secretary is now in sole charge of export promotion work. He is expected to provide facilities for setting up commodity Export Councils which are to operate in and around the ports through which exports take place. These Councils are expected to be of immense help to Trade Commissioners abroad.

During discussions on issues connected with exports, the Minister supported the view favouring the institution of export credit guarantee to cover risks of non-payment for shipment of goods abroad. He admitted that freight for coastal shipment was high. So far as Conference lines were concerned, the Government was clear, he said, that it should not allow freight rates loaded against Indian exports. He promised that the Government would study the whole question of shipping freight.

INDO-RUSSIAN TRADE PACT

Further details regarding the Indo-Russian trade pact made available shortly after we went to press last week, are quite revealing. The agreement, signed on the 2nd inst. covers a period of five years. It aims at strengthening trade relations between India and Russia on principles of equality and mutual benefits. The agreement sets out the procedure for trade and shipping as well as the settlement of accounts between the two countries. There is, however, nothing new in this agreement, as it is similar in almost all particulars to other agreements which India has signed with several other countries. The only significant feature of it is that it replaces the barter system which characterised the trade between the two countries in the preceding three years.

Among the goods which India has agreed to export to the U.S.S.R. during the first year of agreement are: jute manufactures, tea, coffee, tobacco, shellac, black pepper and other spices, wool, hides and skins, vegetable and essential oils and a number of other goods.

The list of goods which Russia has undertaken to send to India includes foodgrains (wheat, barley), crude petroleum products, timber and paper, iron and steel manufactures, chemicals, dyestuffs, medicaments, optical goods, cinematograph films, printed matter and other goods as well as a wide range of industrial equipment, including boring, mining, and road-building equipment, excavators, compressors, electrical equipment for textile, shoe, food and polygraphical industries, tractors and agricultural machinery, various machine tools and instruments.

Along with the signing of the trade agreement, the parties have exchanged letters on the establishment and status of the trade representation of the U.S.S.R. in India in regard to the technical assistance to be provided by the Soviet Union connected with the delivery of Soviet equipment to India. The presence of this clause is probably due to the failure in the past of the attempts by some Indian importers to purchase Russian tractors for sale in India, as Russians declined to render technical and other servicing assistance in the same manner as other foreign manufacturers.

The agreement provides that all payments between India and the U.S.S.R. may be made in Indian rupees. For this purpose, the State Bank of the U.S.S.R. will maintain one or more accounts with one or more commercial banks in India authorised to deal in foreign exchange. In addition, the State Bank of the U.S.S.R. will, if it considers necessary, maintain another account with the Reserve Bank of India. All commercial transactions to be financed in rupees will take place through the accounts maintained with the commercial banks. The account with the Reserve Bank will be used only for replenishing the balances with the commercial banks as and when necessary.

Payments permitted to be made by residents of India to residents of the U.S.S.R., under the Indian exchange control laws will be effected by crediting the amount of such payments to the abovementioned accounts of the Russian State Bank with the commercial banks. Payments made to residents in India by residents in the U.S.S.R. will be effected by debiting the said account with the commercial banks.

Any balance in the rupee accounts maintained by the State Bank of Russia with the Reserve Bank of India or with a commercial bank authorised to deal in foreign exchange will be convertible on demand into sterling at the usual banks' selling rate for sterling as fixed, from time to time, by the Indian Exchange Banks' Association.

PROTECTION TO PLASTIC BUTTONS INDUSTRY

The Government of India has accepted the Tariff Commission's main recommendation that the plastic buttons industry needs protection against imports from Japan, and that the protective duty on such buttons should be fixed at fifty per cent. ad valorem or 12 annas per gross whichever is higher and that this duty should remain in force up to 31st December, 1955.

No protection has however been recommended by the Commission for the indigenous dumnut, mother-of-pearl or metal buttons against competition from the same varieties of buttons imported from any source.

in New York...

they know that **more motorists use**

triple-action **Mobiloil**

than any other motor oil in the world!

New York, city of skyscrapers and centre of commercial progress, today gains added glory as the home of the United Nations, the meeting ground of delegates from all over the world.

But the delegates represent the countries of the world in another sense, too; for as they drive to their homes, they are united in their recognition of the Flying Red Horse as the symbol of progress in lubrication. They know that Mobiloil is a *Heavy-Duty* motor oil, giving greater protection than regular or premium-type oils – and that it ...

SAVES ON WEAR *by lubricating properly at all temperatures;*

SAVES ON REPAIRS *by preventing harmful carbon deposits in the engine;*

SAVES ON PETROL *by preventing acids eating away the metal parts, which causes loss of power.*

Stop at the sign of the Flying Red Horse

The Flying Red Horse is the sign of helpful service for your car. Go there for regular Mobilubrication – the *complete* motor service – and for Standard-Vacuum products backed by 87 years of leadership in the oil industry.

STANDARD-VACUUM OIL COMPANY

Notices

Sanction of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Principal Office of the Company. It must be distinctly understood that in giving this sanction, the Government of India do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

THE BIRLA JUTE MANUFACTURING COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the members of the abovenamed Company will be held at the Principal Office of the Company, 8, Royal Exchange Place, Calcutta, on Wednesday the 6th January, 1954, at 3-30 p.m. in the afternoon, to consider and if thought fit to pass with or without modification the following resolutions, viz.:—

ORDINARY RESOLUTIONS

1. (*a*) That the 35,000 new shares of Rs. 100 each created by the resolution of the shareholders passed at an Extraordinary General Meeting of the Company held on the 28th June, 1946, which have not been taken up nor agreed to be taken up by any person be and the same are hereby cancelled and the authorised capital is diminished by Rs. 35,00,000.

(*b*) That the Authorised Capital of the Company be increased from Rs. 65,00,000 to Rs. 1,45,00,000 by the creation of 8,00,000 new ordinary shares of Rs. 10 each.

2. (*a*) That a sum of Rs. 60,84,000 being part of the undivided profits of the Company standing at the credit of the General Reserve account be capitalised and that this amount be utilised as a Capital Bonus which shall be applied on behalf of the persons who are on the 6th day of January, 1954, holders of the existing 3,04,200 issued and subscribed ordinary shares of the Company of Rs. 10 each in payment in full for 6,08,400 new ordinary shares of Rs. 10 each and that such 6,08,400 new ordinary shares credited as fully paid up shall be accordingly allotted to such persons respectively in the proportion of two new ordinary shares for every one ordinary share held by them on the 6th day of January, 1954, and that the said new ordinary shares so distributed shall rank in all respects *pari passu* with the existing ordinary shares save and except that they will not participate in any dividend declared in respect of any period prior to and up to the 31st March, 1953, and shall also be treated for all purposes as an increase of the capital of the Company held by each such ordinary shareholder and not as income.

(*b*) That pursuant to the above Resolution and in satisfaction of the said special capital bonus, the Directors be and are hereby authorised to allot and distribute 6,08,400 new ordinary shares credited as fully paid up amongst the persons who are on the 6th day of January, 1954, holders of the existing 3,04,200 ordinary shares of the Company in the proportion of two such new shares for every ordinary share held by them and with full powers to the Directors to make such provision for the issue of fractional certificates or otherwise as they may think expedient in the case of fractions.

(*c*) That the draft of the Agreement providing for the Allotment of the said new ordinary shares in satisfaction of the said capital bonus and submitted to this meeting and signed in the margin by the Chairman by way of identification be and the same is hereby approved and that the Directors be authorised to affix the Common Seal of the Company to duplicate engrossment of such agreement and that the same shall have been signed on behalf of the members holding the existing ordinary shares in the Company on the 6th January, 1954, by some person to be appointed by the Directors in that behalf under Article 177 of the Company's Articles of Association.

SPECIAL RESOLUTION

3. That clause 3 of the Memorandum of Association of the Company be amended so as to include a new sub-clause 17A as detailed below:

"To carry on, in all its branches, the business of manufacturers, importers and exporters of and dealers in Calcium Carbide and other chemicals including heavy chemicals and all products analogous to or connected therewith and to purchase and vend all material raw processed or otherwise and all articles in any way connected with the aforesaid business."

The Share Transfer Books of the Company will remain closed from 21st December, 1953, to 6th January, 1954, both days inclusive.

By Order of the Board,
BIRLA BROTHERS LTD.,
Managing Agents.

CALCUTTA, 5*th December*, 1953.

In particular to all the Shareholders to whom a notice is required to be addressed under Article 184 of the Articles of Association of the Company.

THE BIRLA JUTE MANUFACTURING COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the members of the abovenamed Company will be held at the Principal Office of the Company, 8 Royal Exchange Place, Calcutta, on Wednesday the 6th January, 1954, at 3-45 p.m. in the afternoon, to consider and if thought fit to pass with or without modification the following resolutions which will be proposed as ordinary resolutions, viz.:—

(1) That 12,00,000 Ordinary Shares of Rs. 10 each be consolidated into 4,00,000 Ordinary Shares of Rs. 30 each and such consolidation be effected as follows:

(*a*) That the existing issued and paid up 3,04,200 Ordinary shares of Rs. 10 each and the newly created issued and paid up 6,08,400 Ordinary shares of Rs. 10 each in the capital of the Company be consolidated in such manner that every one of the said 3,04,200 Ordinary shares of Rs. 10 each and every two of the said 6,08,400 new Ordinary shares of Rs. 10 each together shall constitute one paid up Ordinary share of Rs. 30 each.

(*b*) That the unissued and unpaid 2,87,400 Ordinary shares of Rs. 10 each including the Ordinary shares newly created be consolidated in such manner that every one of such ordinary share of Rs. 10 each together with every two of such ordinary share of Rs. 10 each shall constitute one Ordinary share of Rs. 30 each.

(c) That the existing certificates of the said issued and paid-up Ordinary shares of Rs. 10 each be called in by the Directors for suitable amendment.

(2) That Clause 5 of the Memorandum of Association of the Company beginning from the words "The Capital of the Company" and upto the words "Rs. 100 each" do now read as follows:

"5. The Capital of the Company is Rs. 1,45,00,000 divided into 4,00,000 Ordinary shares of Rs. 30 each and 25,000 Preference shares of Rs. 100 each."

The Share Transfer books of the Company will remain closed from 21st December, 1953, to 6th January, 1954, both days inclusive.

By Order of the Board,
BIRLA BROTHERS LTD.,
Managing Agents.

CALCUTTA, 5*th December*, 1953.

In particular to all the Shareholders to whom a notice is required to be addressed under Article 184 of the Articles of Association of the Company.

SETBACK IN EARNINGS OF BOMBAY BURMAH TRADING

FINANCIAL POSITION, HOWEVER, SOUND

THE decision of the Directors of the Bombay Burmah Trading Corporation Ltd. (Secretaries, Treasurers and Managers: Messrs. Wallace & Co., Bombay), to prune the distribution to the shareholders for the year ended 31st May, 1953, from 18 per cent. for 1951-52 to 12 per cent., is fully justified by the financial results for the year under review. The trading profit of the Company for the year shows a decline from a high of Rs. 85.81 lakhs to Rs. 53.38 lakhs (the lowest since 1948-49) or a drop of 37.8 per cent. The net profit amounts to Rs. 10.40 lakhs and compares with Rs. 24.76 lakhs earned for the previous year. On account of the unfavourable results for the year under review, the Directors have not been able to add anything to the reserves. It may be noted, in this connection, that, except in the year 1950-51, the Directors have made no allocation to the reserves out of current earnings since the year 1947-48. Further, the Directors have not been able to declare any preferential dividend for the year under review on the Rs. 2,500 fully paid-up shares.

The following comparative table fully reflects the progress made by the Company in recent years:

(In lakhs of rupees)

	For the year ended 31st May			
	1953	1952	1951	1950
Trading profit on—				
Timber	21.25	41.84	52.89	32.67
South Indian plantations ..	23.77	34.76	21.86	19.93
Namsban tea factory ..	7.83	8.09	8.30	10.89
Furniture	..	..	..	—0.14
Sundries	0.53	1.13	0.70	1.34
Total trading profit ..	53.38	85.81	83.75	64.69
Other income	14.43	9.51	8.07	2.92
Special income	..	..	60.26	..
Establishment and other expenses	26.37	19.01	20.67	18.25
Secretaries' commission ..	11.34	14.67	15.66	9.64
Depreciation	12.99	14.14	10.71	13.25
Provision for taxation ..	6.70	22.75	44.31	5.00
Net profit	10.40	24.76	57.92	21.45
Excess credited on exchange written off ..	..	..	..	7.27
Reserves	..	..	10.00	..
Dividend	11.34 (D. 12%)	17.01 (D. 18%)	25.35 (D. 18% +10.12½%)	11.34 (D. 12%)
Preferential dividend ..	..	7.14	19.44	2.61
Carry forward	0.63	1.57	0.07	0.84

It will be observed that there has been an all-round decline in the Company's trading results. Timber trading, which constitutes the Company's main business and which had suffered a setback in the previous year, has been affected to a greater extent during the year under review. Commenting on the Company's timber trade, the Directors observe:

"In Rangoon, it has become more and more difficult to find royalty-paid logs for salvage, and this source of income, while still profitable, is very much reduced. Sundry trading and agencies in your Rangoon branch were also less remunerative. The results of your teak operations in Siam, though not so good as in the previous two years, were, nevertheless, satisfactory. Profits were reduced by higher royalty and taxation and by unfavourable exchange rates, and there is a tendency for costs to rise. Although a larger quantity of hardwoods was produced in Sarawak, the quality of timber was disappointing and it has, subsequently, been decided to close down this branch and to concentrate resources in your new forest area in the neighbouring territory of North Borneo, where production of timber is being rapidly expanded."

The decline in the trading profit of the Company's South Indian plantations (mainly tea) and from the tea factory in Burma should not occasion any surprise in the context of the steep fall in tea prices which occurred during 1952. Moreover, the Company's output of tea in South India suffered a decline, mainly because of the failure of the pre-monsoon rain in 1953. The output of tea from the Company's South Indian plantations for the year under review was 44,92,176 lbs. which was 4½ lakhs lbs. less than that in the previous year. Again, while cost of manufacture was higher at As. 19.27 per lb., as against As. 18.16 in 1951-52, the price realised for tea was lower at As. 26.90 per lb., as compared with As. 29.44 for the previous year. The Company's tea factory in Burma produced 8,50,478 lbs. at a cost of Rs. 2-5 per lb., as against 8,34,390 lbs. at about the same cost. Despite the slight increase in the factory's output, the lower prices realised for tea actually resulted in slightly reduced profits.

The Company acquired, during the year under review, a new coffee estate in Coorg and the first season's working of the estate, under the Company's ownership, is stated to have shown satisfactory profits, the total outturn of coffee being 5,906 cwts.

The rise in the item "other income," shown in the table, is mainly due to the transfer of Rs. 3.10 lakhs from the investment reserve, representing a portion of the accumulated profits of the Bombay Burmah Plantations Ltd. (in voluntary liquidation) received last year and to the receipt of Rs. 1.55 lakhs representing a similar income received during the year under review. This improvement in "other income" has been more than offset by the increase in expenses. Again, in spite of substantial additions to the block account made during the year, the provision for depreciation is lower at Rs. 12.9 lakhs. The provision for taxation has been reduced from Rs. 22.75 lakhs to Rs. 6.70 lakhs, of which that for Indian super-tax and foreign tax accounts for a reduction from Rs. 14.75 lakhs to Rs. 5.20 lakhs and Indian income-tax from Rs. 8 lakhs to Rs. 1.50 lakhs.

During the year under review, the Company received a supplementary *ex-gratia* grant of Rs. 1.21 lakhs from the British Government for purposes of capital rehabilitation. It also received a net sum of Rs. 5.01 lakhs from the Burmese Government for the Company's forest assets in Central Burma which the former had taken over. These sums have been added to the respective reserves. Besides, an aggregate sum of Rs. 27,266 has been added to the general reserve and insurance reserve. Fixed property reserve shows a reduction of Rs. 1.03 lakhs on account of the loss on sale of a steam launch and investment reserve a reduction of Rs. 1.08 lakhs, in spite of the appreciation in the sterling securities.

The Company's financial position is quite impressive. As against a paid-up capital of Rs. 94.50 lakhs, its reserves and surplus stand at Rs. 375.70 lakhs. Provision for taxation amounts to Rs. 67.84 lakhs. The current liabilities aggregate Rs. 181.68 lakhs. There has been an addition of Rs. 44.20 lakhs to the gross block, besides an addition of Rs. 20.26 lakhs, representing the value of buildings and machinery in erection, bringing the total value of gross block to Rs. 201.89 lakhs. The gross block has been written down to Rs. 176.65 lakhs. Current assets amount to Rs. 543.17 lakhs, of which stock-in-trade accounts for Rs. 123.67 lakhs, stores, etc., for Rs. 47.58 lakhs, debts and advances for Rs. 150.81 lakhs, investments for Rs. 76.01 lakhs and cash for Rs. 192.68 lakhs. These assets exceed the current liabilities and provision for taxation by a very wide margin.

The Rs. 125 paid-up and Rs. 50 paid-up shares of the Company are being currently quoted at Rs. 355 and Rs. 127-8, respectively, at which level and on the basis of the dividend for the year, the yield works out to 4.2 per cent. and 4.7 per cent. per annum, respectively.

BLUE MOUNTAIN ESTATES TO ISSUE BONUS SHARES

The Blue Mountain Estates Ltd. (Managing Agents: Messrs. Kothari & Sons (Agencies) Ltd., Madras) has had another year of successful working during the twelve months ended 30th June, 1953. Notwithstanding the severe slump in tea trade, in general, during 1952 and the poor yield of the Company's coffee crop, the Company has nearly maintained its profit. The gross profit for the year under review amounts to Rs. 8.47 lakhs, as compared with Rs. 8.72 lakhs for 1951-52. After making a slightly lower provision for reserves, the Directors have been able to step up the dividend from 10 per cent. paid for the previous two years to 12½ per cent. Incidentally, it may be noted here that the dividend for the year 1952-53 is the highest paid so far by the Company.

The sale proceeds of tea and coffee show a slight decline from Rs. 27.86 lakhs to Rs. 26.47 lakhs, mainly due to the drop in the output of coffee. The output of tea, on the other hand, shows a rise from 10,64,655 lbs. to a record level of 11,66,119 lbs. The yield from the Company's tea estates has shown a progressive rise in recent years, in spite of the adverse climatic conditions which South India has experienced during these years, thanks to manuring and cultivation. The net price realised for tea is lower at Re. 1-13-5, as against Re. 1-15-5 per lb. in the previous year. The output of coffee has, as stated above, suffered a decline from 4,111 cwts. in 1951-52 to 1,732 cwts. Expenses have gone down from Rs. 19.48 lakhs to Rs. 18.58 lakhs. While the cost of production of tea has dropped from Re. 1-0-5 to As. 15-4 per lb., that of coffee has gone up from Rs. 127 to Rs. 217 per cwt. Managing Agents' commission is lower at Rs. 79,304, as against Rs. 82,581. Provision for depreciation has been maintained at Rs. 65,000 and that for taxation at Rs. 1 lakh. The transfer to the dividend equalisation fund has been doubled from Rs. 1.50 lakhs to Rs. 3 lakhs. No addition has been made to the general reserve, which had received Rs. 2 lakhs last year. The payment of dividend absorbs Rs. 3.15 lakhs, as against Rs. 2.50 lakhs taken up last year. A sum of Rs. 26,103 is proposed to be carried forward, which compares with Rs. 38,721 brought in.

The Company's financial position is very satisfactory. The reserves and surplus aggregate Rs. 27.76 lakhs and exceed the paid-up capital by Rs. 2.76 lakhs. The debenture stocks have been redeemed to the extent of Rs. 10.80 lakhs up to the end of the year under review, the balance outstanding being no more than Rs. 1.20 lakhs due for repayment on 1st January, 1954. As these debentures have been redeemed out of current earnings, the debenture redemption reserve, amounting to Rs. 12 lakhs, has been unutilised and has, therefore, been added to the general reserve raising it to Rs. 21 lakhs. The reserve for taxation stands at Rs. 2.50 lakhs and current liabilities at Rs. 5 lakhs. As against a gross block of Rs. 47.20 lakhs, a depreciation reserve of Rs. 4.19 lakhs has been built up. The current assets, amount to Rs. 18.45 lakhs, cover the current liabilities and provision for taxation by nearly 2½ times.

The Company proposes to approach the Government of India for permission to capitalise a part of the reserve fund and, if such permission is received, the Directors will issue bonus shares in the ratio of one share for every two held. The issue of bonus shares requires a sum of Rs. 12.5 lakhs to be capitalised.

IMPRESSIVE RESULTS OF DELHI CLOTH AND GENERAL

RESERVES STRENGTHENED —DIVIDEND RAISED

THE Directors of the Delhi Cloth and General Mills Co., Ltd. (Managing Agents: Messrs. Bharat Ram Charat Ram & Co., Ltd., Delhi), who had paid a dividend of 4½ per cent. for the year ended 30th June, 1952, and followed it up with a scrip bonus of one ordinary share of Rs. 25 each for every Rs. 150 face value of ordinary shares held by the shareholders, have now proposed, for the year ended 30th June, 1953, a dividend of 7 per cent. on the increased capital. Such an enhancement of the distribution to the shareholders, even after transferring a substantial sum to the reserves, reflects the encouraging results of working during the year under review. The gross profit for the year has jumped from Rs. 181.61 lakhs to Rs. 243.78 lakhs. The net profit shows an advance from Rs. 51.78 lakhs to Rs. 76.94 lakhs. The reserves of the Company have been strengthened by the addition of Rs. 50 lakhs, as compared with Rs. 37.50 lakhs added last year.

The following comparative table shows how the Company's financial results, which had received a setback in the previous year, have been more than made good in the year under review.

(In lakhs of rupees)

	For the year ended 30th June			
	1953	1952	1951	1950

* On the increased capital of Rs. 329.35 lakhs.
† After drawing a sum of Rs. 6 lakhs from the dividend equalisation fund.

It is to be noted that, besides the increase in sale proceeds, the substantial fall in expenses has been responsible for the rise in gross profit. It is gratifying to note that nearly 75 per cent. of the net profit has been conserved and added to the reserves. A sum of Rs. 10 lakhs has been transferred to the general reserves, as compared with Rs. 5.08 lakhs in the previous year, Rs. 25 lakhs to the reserve for fall in prices and Rs. 15 lakhs to the reserve for renewals. The latter two funds had not received anything in the previous year. The amount thus ploughed back in the last three years alone aggregate about Rs. 1.20 crores. This policy of conserving financial resources is fully justified in the light of the vastness of the Company's operations and must stand the Company in good stead in future years.

Commenting on the working of the various departments, the Directors observe as follows:

"The market for cloth and yarn developed into a clear buyers' market, with progressively falling prices, and it has become a problem to sell goods. Exports also were smaller and at lower prices. Our Lyallpur Mills worked well and the results are quite satisfactory.

"The sugar industry continued to work under uncertain and discouraging circumstances. Between the unrealistic awards by Labour Tribunals and the restrictive rules by the State Government against reduction of staff or wages (including compulsory payment of bonuses without relation to profits), on the one side, and the absence of any improvement in the quality of cane, on the other, the position of the sugar industry is bound to continue to deteriorate. The distillery worked well, but the confectionery section suffered from severe competition for a dwindling market, leading to unfavourable results. The decontrol of sugar has also reduced the demand for sugar cubes. Efforts are being made to improve this section.

"The working of the chemicals division has been much better. It is showing steady improvement all round. Caustic soda and *vanaspati* showed better results. The acids section, however, consequent on the abolition of the superphosphate pool, under which the Government of India took up the entire output of superphosphate in the country, needs a closer watch.

"Just as the decontrol of sugar adversely affected our confectionery department, the decontrol of cloth had adversely affected our garment factory, but every effort is being made to solve the difficulties. A redeeming feature is that our markets are expanding and now extend outside India also. The tent business continued as in recent years on a small scale."

It may be recalled that, last year, the paid-up capital of the Company was raised from Rs. 3.26 crores to Rs. 3.74 crores, by the capitalisation of a sum of Rs. 48.48 lakhs. For this purpose, the

(Continued on next page)

Points From The Chair

Outlet for Surplus Chlorine

"THE production of caustic soda in India continues to present a problem to all manufacturers, because of the difficulty of finding an outlet for surplus chlorine. Although the installed capacity of the Indian industry is 37,000 tons of caustic soda per annum, production during 1952 was only 17,000 tons and will not exceed 20,000 tons in 1953. Whilst the installed capacity of 37,000 tons predicted by the Planning Commission for 1955-56 has been already reached, it is doubtful if their production target of 33,000 tons will be attained, unless a solution is found to the problem of the disposal of surplus chlorine. Our own efforts to solve this problem are likely to bear fruit in the near future, as mentioned in the Directors' Report. After a careful examination of various schemes we have embarked upon the manufacture of benzene hexachloride. This highly effective insecticide, which requires chlorine in its manufacture, offers a large and growing field in India, in view of the extensive programme of plant protection, malaria control, locust control, etc. undertaken by the Central and State Governments. The raw materials for the manufacture of this product are available in the country. The demand in India is estimated at 2,500 tons per annum, of which only about 500 tons are produced in the country at present, the balance being imported."

J. R. D. TATA,
Tata Chemicals Ltd.

Prospects for Indian Plantations

"Judging from the statistics available regarding the production, consumption and demand for tea and coffee in several countries, I personally feel that both these plantation crops have a bright future. Regarding tea, though America is the second largest importer of tea to-day, being next only to Great Britain, it is surprising that the level of consumption per head in America is only 0.6 pound, as against 9.3 pounds in the U.K. and 5.9 pounds in Australia and 3.6 pounds in Canada in 1952. Hence, there is great scope for increased consumption in the States which can be brought about by intensive propaganda. There is also scope for increasing home consumption which is now only half a pound per head. . . . In regard to coffee, the prospects are satisfactory. During recent years, the internal consumption has increased from 19,000 to 20,000 tons compared with the pre-war consumption estimated at 8,000 tons. Our yearly average production is only 20,000 tons per annum. As Indian coffee is highly valued in foreign markets for its better quality, it can always be sold at a premium in those countries."

C. M. KOTHARI,
Blue Mountain Estates, Ltd.

Country Should Adopt Low Cost Economy

"Speaking generally and without special reference to our own factories, I have no doubt in my mind that the only effective method, under existing conditions, of augmenting purchasing power in this country is to bring down the cost of living, and more particularly the cost of food, which is about 60 per cent. of the cost of living of the less prosperous classes. This can, and should, be brought down gradually in stages, so regulated that there is no adverse effect on the production of agricultural or factory production, and, on the contrary, there is a salutary effect. With a lower cost of living and greater purchasing power, we shall have increased production all round, leading to reduced costs of production and still further increased consumption and so on. This circle of progress would definitely benefit the poorer classes far more than the richer ones. In short, the country should adopt a low cost and low price economy, instead of a high cost and high price economy."

LALA SHRI RAM,
Delhi Cloth and General Mills Co., Ltd.

Serious State of Roads in U.K.

"There is, however, another aspect of the changing economics and habits of the population, on which I have spoken many times—but, I am afraid, with less success. I refer to the question of the roads in this country. Surely, whatever its politics the Government of the day cannot afford much longer to ignore the serious state of the roads in the United Kingdom. Roads—the lifeline of our being—have, with minor exceptions, remained unaltered for years."

SIR WILLIAM ROOTES,
Rootes Motors, Ltd.

DELHI CLOTH AND GENERAL MILLS

(Concluded from page 1102)

"I have already referred to the excellent work done by all ranks of the staff and the management—from L. Bharat Ram and L. Charat Ram downwards—during the year. Even a heavier call will be made on them in the near future. Slackening demand for goods, the prices of which have to be progressively reduced, will require our utmost efforts to increase productivity, to improve quality and to reduce costs. Side by side with this, we have to renew and modernise our plant and machinery, and also expand our capacity where this course will be profitable. All this will mean a strain on our staff and the management, but I am confident that their ability and devotion to duty will accept the challenge and meet it with complete success. I came back to work in 1951 largely on the insistence of our staff; I know that they will not let me down; and I wish to mark this occasion by an acknowledgment of how much the Company owes its success to them."

Notices

THE ALEXANDRA JUTE MILLS LIMITED

NOTICE IS HEREBY GIVEN THAT THE Ninety-sixth Ordinary General Meeting of the Shareholders of THE ALEXANDRA JUTE MILLS, LIMITED, will be held at McLeod House, No. 3, Netaji Subhas Road, Calcutta, the Registered Office of the Company, on Monday, the 28th December, 1953, at 3 p.m., for the following purposes:—

MCKENZIES LIMITED

NOTICE

THE FORTY-EIGHTH ORDINARY GENERAL MEETING of the Shareholders of McKENZIES LIMITED will be held at the Registered Office of the Company, Sewri, Bombay, on Wednesday the 30th December, 1953, at 4-00 p.m. (S.T.), to transact the following business:—

(1) To adopt the Directors' Report and the Audited Statements of Accounts of the Company for the year ended 31st July, 1953.

(2) To declare Dividends on Cumulative First Preference Shares.

(3) To elect two Directors in place of those who retire by rotation but are eligible for re-election.

(4) To elect a Director in place of Mr. Tenubhai D. Desai who retires pursuant to Article 124 of the Articles of Association of the Company, but is eligible for re-election.

(5) To appoint Auditors and fix their remuneration.

The Transfer Books of the Company will be closed from Wednesday the 23rd December, 1953 to Wednesday, the 30th December, 1953, both days inclusive.

By Order of the Board of Directors,
PURSHOTAMLAL JHUNJHUNWALA,
Managing Director.

BOMBAY, 11*th December*, 1953.

For Preference Shareholders:

The copy of the Profit and Loss Account, Balance Sheet, Auditors' Report, Directors' Report, and Notice calling the Ordinary General Meeting is sent to you in compliance with the provisions of the Indian Companies Act and the Company's Articles of Association.

You are, however, reminded that in terms of the Company's Articles of Association, you are not entitled to be present and vote at the General Meeting of the Company to be held on Wednesday the 30th December, 1953.

COMPANY AFFAIRS

(Concluded from previous page)

Directors drew a sum of Rs. 32.48 lakhs from the capitalisation fund and Rs. 16 lakhs from the reserve for fall in prices. Even after such capitalisation, the reserves and surplus of the Company stand, as on 30th June, 1953, at the satisfactory level of Rs. 1.66 crores. The provision for taxation amounts to Rs. 1.36 crores. A sum of Rs. 79.86 lakhs has been spent during the year, in pursuance of the programme of development, modernisation and expansion, raising the value of the gross block to Rs. 6.77 crores. A depreciation fund of Rs. 3.88 crores has been built up against this gross block. The current assets amount to a huge total of Rs. 7.80 crores and exceed the liabilities and provision for taxation at Rs. 5.28 crores, by a margin of Rs. 2.52 crores.

Some idea of the progress of the Company's programme of expansion and modernisation can be obtained from the following observations of the Directors:

"As part of our programme of developments, modernisation and expansion, we have decided (a) to erect a cotton textile mill at Hissar, for which we have received a licence, and also finalised negotiations with the Punjab Government for acquisition of land, (b) to expand the Swatantra Bharat Mills, partly by transferring some machinery from the Delhi Cloth Mills and partly by the purchase of new machinery, and (c) to establish a silk weaving shed in the industrial area, machinery for which has been ordered. The expansion of our Lyallpur Mills, referred to in last year's report, is nearing completion. We are also expanding our caustic soda plant at Delhi. In view of the uncertain outlook of the sugar industry, we are proceeding slowly with our schemes of improvement and expansion and, in the meantime, are attending to the best possible maintenance of the plant. Since our last report, the Government have decided to own and run the D.D.T. Factory themselves, but the factory, which has not yet been set up, will be located in our land and will take its raw materials from our chemical factory."

The Rs. 25 paid-up ordinary shares are being currently quoted around Rs. 30-8. At this rate and on the basis of the latest dividend, the shares give a yield of 5.7 per cent. per annum, free of tax.

EARNINGS OF KESORAM COTTON MAINTAINED

PATRAKOLA TEA RESUMES DIVIDEND

Kesoram Cotton Mills Ltd.

THE directors of the above Company (Managing Agents: Messrs. Birla Brothers Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st March, 1953.

After providing Rs. 7,62,376 (Rs. 10,74,130) for depreciation and Rs. 25,00,000 (Rs. 34,00,000) for taxation, a balance of Rs. 15,72,648 (Rs. 13,34,217) remains at the credit of the profit and loss account. To this has been added Rs. 84,976 (*Rs. 85,759*) being the balance brought forward from the previous year. Thus Rs. 16,57,624 (Rs. 16,24,976) remain at the credit of the profit and loss account (*without* taking into account the profit and loss of the Gwalior Branch) which the directors disposed of by paying a dividend on 20,000 preference shares at 7 (7) per cent. per annum free of income-tax Rs. 1,40,000 (Rs. 1,40,000) and dividend on 8,00,000 ordinary shares at Re. 1-12 (Re. 1-12) per share free of income-tax Rs. 14,00,000 (Rs. 14 00,000) leaving to be carried forward Rs. 1,17,624 (Rs. 84,976).

During the year the Gwalior Branch of the Company sustained a loss of Rs. 13,830 (Rs. 10,326) to which has been added the debit balance of Rs. 1,360 (*credit of Rs. 8 965*) brought forward from the previous year. The debit balance of Rs. 15,191 (debit of Rs. 1,360) has been carried forward.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	1,40,00,000	Block ...	2,26,87,000
Reserves ...	2,38,25,730	Stock ...	1,37,90,818

Liabilities ...	82,48,721	Debts, depositsand advances ...	69,05,328
Profit and loss account ...	1,02,434	Investments	44,23,324
		Cash ...	11,56,453
	Rs. 4,96,82,731		Rs. 4,96,82,731

Patrakola Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1952.

The accounts disclose a profit of Rs. 6,78,551 (loss of Rs. 1,98,551). On transfer of this sum to profit and loss account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 7,19,643 (credit of Rs. 3,69,317), of which we have transferred Rs. 2,50,000 (*nil*) to revenue reserve.

The values of the Company's current assets and liabilities in Pakistan have been converted into Indian currency at the current rate of exchange, now recognised by the Government of India, and the resulting unrealised profit has been carried to an exchange suspense account.

In spite of continued efforts both by the managing agents and by their associated Company in East Bengal it has not so far been found possible to effect any remittance of the net trading profits earned by the Company's estates outside India since 1947 and although there is now a substantial balance of unutilised funds in Eastern Pakistan, the Company has been obliged to depend very largely on the managing agents for finance to meet its commitments in this country. Another severe handicap is the present burden of taxation, which has been aggravated in the case of this Company by the fact that existing agreements between the Governments of India and Pakistan do not include any provision for relief in regard to the double taxation of agricultural profits. As a result the Company's income is subjected to tax at a rate exceeding 75 per cent. of the profits earned and in order to make full provision for accumulated liabilities on this basis it has been necessary to utilise the sum of Rs. 10,50,000 standing to credit of contingencies reserve.

Dividends on the preference shares were paid on 9th December, 1952 and 1st May, 1953, respectively, leaving Rs. 3,97,643 (Rs. 1,72,317) now to be dealt with. It is proposed to pay a dividend of 5 (*nil*) per cent. on the ordinary shares and to carry forward Rs. 2,17,643 (Rs. 1,72,317).

The total tea crop raised during the year amounted to 68,568 (70,584) maunds. Estimates for 1953 provide for a total crop of 58,500 maunds in Pakistan and 16 500 maunds in India at respective costs of Rs. 44,79,550 and Rs. 18,21,570 inclusive of inland freight and sale charges.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	48.00.000	Block ...	40,00,000
Reserves ...	27,61,432	Stores and supplies ...	7,28,827
Provision for taxation ...	16.63.475	Tea sales receivable ...	45,88,689
Liabilities ...	23,03,608	Advances and deposits ...	12,66,378
Profit and loss account ...	2,17,643	Investments	14,763
		Cash ...	11,49,501
	Rs. 1,17,48,158		Rs. 1,17,48,158

Tinnevelly-Tuticorin Electric Supply Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Octavius Steel & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st March, 1953.

The revenue account shows a profit on the year's working of Rs. 2,14,674 (Rs. 2,28,790). After adding to this the forfeiture of security deposits Rs. 73 (*nil*) there is a total of Rs. 2,14,747 (Rs. 2,50,990). After deducting from this arrears of depreciation Rs. 4,215 (*Rs. 4,216*), bonus to employees Rs. 20,102 (Rs. 19,255), contribution to Vallabhbhai Patel National memorial fund Rs. 526 (*nil*), loss on realisation of investments Rs. 703 (*nil*), expenses for valuation of assets Rs. 144 (Rs. 7,773), provision for taxation Rs. 20,700 (Rs. 61,000), reserve for deferred taxation Rs. 47,000 (Rs. 30,000) and appropriation under the Electricity (Supply) Act, 1948 Rs. 6 048 (*Rs. 20,878*), there is a net profit for the year of Rs. 1,15,309 (Rs. 1,06,504).

After adding to this Rs. 6,376 (Rs. 6,872) the amount brought forward from previous year, and Rs. 1,738 (*nil*), on account of forfeiture of dividends, and also Rs. 31,609 (*nil*), being transfer from reserve for tariffs and dividends control in accordance with paragraph 11 (2) of the sixth schedule to the Electricity (Supply) Act, 1948, there is a credit balance of Rs. 1,55,031 (Rs. 1,13,376) on profit and loss account. The directors recommend that this amount be disposed of as follows:—

Pay a dividend of 10 (10) per cent. for the year ended 31st March, 1953, *without any deduction* of income-tax paid by the Company Rs. 97.000 (Rs. 97.000) and transfer to general reserve Rs. 50,000 (Rs. 10.000) leaving to be carried forward Rs. 8,031 (Rs. 6,376).

Due to restrictions having been in force over a considerable period during the year, the number of units sold recorded a fall of about 1 per cent. as compared with the previous year. The total number of consumers connected during the year was 11,404 (10,691) and the connected load in kw. 10,889 (10,451). The total number of units sold during the year 1952-53 amounted to 8,002,631 as compared with 8,115,701.

As the demand for additional load continues and the amount of power which the Company is permitted to draw from the Government Electricity System for purposes of distribution has been increased, the prospects of further expansion of business are considered good. The Government of Madras have made no pronouncement as to the date by which the Company will be taken over, and it is understood that this proposal has been postponed indefinitely.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	9,70,000	Block ...	17,07,833
Reserves ...	6,42,473	Stores, tools, etc. ...	3,29,525
Provision for taxation ...	21,180	Debts, deposits and advances ...	1,66,380
Liabilities ...	6,49,685	Investments	1,87,735
Profit and loss account ...	1,55,031	Cash ...	46,893
	Rs. 24,38,369		Rs. 24,38,369

Hindustan Motors Ltd.

The directors of the above Company (Managing Agents: Messrs. Birla Brothers Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st March, 1953.

The revenue account showed a profit of Rs. 5,37,392 (Rs. 17,77,221) which, after providing for part depreciation and making a provision for taxation reserve showed a credit balance of Rs. 31,336 (Rs. 46,752) to which was added the previous year's carry forward of Rs. 3,47,260 (Rs. 3,00,508) making a total of Rs. 3,78,597 (Rs. 3,47,260). This amount was carried forward. Depreciation amounting to over Rs. 120 lakhs still remains to be provided up to the end of the accounting period.

The manufacture of castings has been going on satisfactorily and all types of castings for Hindusthan cars are now being manufactured in India. Forging operations were also started during the period. At present, all forgings required for Hindusthan cars are being made in your plant.

During the accounting year, diesel engines were produced and placed in the market. Sales of the same have been poor owing to heavy import, but it is hoped the position henceforward should improve, as imports have now been restricted. The manufacture of tools for V-8 engine is continuing satisfactorily and some parts of the engine will be made in the factory in the current accounting year. It is hoped that most of the important parts of this engine will be made in 1954. The manufacturing operations of the plant were resumed in the later part of 1952 as already reported and have continued on a restricted basis owing to excessive imports. However, it is hoped that sales will improve henceforward, as Government have considerably restricted further imports.

The report of the Tariff Commission was duly published in April, 1953 and in pursuance of their policy, Government have now decided to allow only a certain number of manufacturers to remain in the field. The import of vehicles will also be regulated and it is hoped that such a policy of the Government will help the industry.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,96,12,650	Block ...	2,83,68,147
Reserves ...	62,45,519	Stock-in-trade	38,13,858

		Cash ...	62,55,523
	Rs. 6,29,36,216		Rs. 6,29,36,216

Kesar Sugar Works Ltd.

The directors of the above Company (Managing Agents: Messrs. Kilachand Devchand & Co., Bombay) submitted the audited accounts of the Company, for the year ended 31st July, 1953.

The working of the year shows a profit of Rs. 5,03,863 (loss of Rs. 4,20,871) after charging the amount of Rs. 17,98,057 (Rs. 18,62,368) for excise duty, Rs. 6,84,674 (Rs. 9,58,610) for cane cess and providing Rs. 3,37,447 (*nil*) for depreciation for the year 1951-52. After deducting the debit balance of Rs. 4,15,271 (credit of Rs. 59,758) carried forward from last year, the amount available for disposal comes to Rs. 90,592 (Rs. 65,944) which the directors recommend to dispose off as under:—

To pay a dividend at 5½ per cent. on preference shares Rs. 82,500 (Rs. 82,500), less income-tax Rs. 21,656 (Rs. 21,656) leaving a balance to be carried forward to next year's account of Rs. 29,748 (Rs. 4,15,271 after adjustment).

The factory started operations on the 4th January, 1953. The quantity of cane crushed was 36,45,472 maunds, during 131 days of crushing as compared with 50,05,920 maunds during the previous season. The sugar produced out of the same, during the year under report was 3,40,149 maunds as against 4,34,808 maunds during the preceding year. Although the quantity of cane crushed was lower the recovery during the year was better than in the previous year, being 9.3 per cent. as against 8.69 per cent.

The sugar season for India for 1952-53 opened with a carry-over of about three lakhs tons of sugar in the country. As this carry-over appeared to be large the Government permitted exports of sugar outside the country, but the exports were negligible. Then, owing to the slump in the prices of sugar caused by the large carry-over, many factories started crushing in the 1952-53 season later than usual resulting in the production of sugar being less by about two lakhs tons than during 1951-52. On the other hand, the consumption of sugar considerably increased owing to the higher prices of *gur* with the result that the large carry-over together with this year's production was not only consumed but the Government had to import foreign sugar in order to check an undue rise in prices. It is, therefore, advisable that the Government should adopt a long-range policy with a view to maximising production. In this context it is gratifying to note that the Government has fixed the prices of sugarcane for two years. This policy will give the farmer an assured return on his production for the next two years thereby creating stability and the industry will also be able to plan out its programme. It is essential that the production of sugar is not only maintained but increased and even if in any year a very much larger production takes place, then care should be taken that a situation similar to that in the latter part of 1951-52 season does not arise and the country has not to import foreign sugar as in 1952-53.

The Central Government has fixed the prices for sugarcane for the season 1953-54 at Re. 1-7 per maund for factory delivery and Re. 1-5 for outstation delivery. The Government has simultaneously removed the temporary excise duty on sugar of Re. 1 per maund on the production of sugar during the ensuing season, but this does not fully compensate for the increase in the price of sugarcane. It is unfortunate that the fixation of price is continued to be done as in the past irrespective of considerations of quality of sugarcane. It is, therefore, time that a method is evolved whereby the price to be paid for sugarcane should be according to the quality of cane supplied.

Although rains have been favourable this year in the Uttar Pradesh as a whole, the acreage under the cane has gone down owing to diversion of the areas under sugarcane to paddy crop due to Government carrying on intensive propaganda for growing more rice within the State. Crop prospects for sugarcane for the new season are, therefore, uncertain.

The production of power alcohol plant in the factory at Baheri was higher than during the last season but the plant could not be worked fully continuously as the State Government did not take up even the quantity that was produced. As reported last year, the Government was approached for an upward revision of the price of power alcohol in order to make it remunerative. Although over a year has elapsed, no decision has been taken by the Government. This also is coming in the way of achieving optimum production of power alcohol in the country. It is, therefore, essential that the Government should take the necessary measures without any further delay.

The Company's Chemical Factory has been able to maintain its production. The Tariff Commission has given some consideration to the difficulties of the indigenous hydroquinone industry and it is hoped that the factory will be able to resume production of this chemical in the future. Production of X-Ray chemicals is steadily going up and it is well received in the market.

The approval of the Central Government has been obtained to the change in the constitution of Kilachand Devchand and Co., the managing agents of the Company and that firm now consists of Shri Ambalal Kilachand, Shri Chimubhai Kilachand, Smt. Vimla Tulsidas, and Smt. Malti Ramdas. The managing agents have resumed management of the affairs of the Company.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	33,00,000	Block ...	73,26,508

Indian Vegetable Products, Ltd.

The directors of the above Company (Managing Agents: Messrs. Forbes Forbes Campbell & Co., Ltd., Bombay) submit the audited accounts of the Company for the year ended 30th September, 1953.

The accounts show a profit of Rs. 4,36,613 (Rs. 3,09,780) to which is to be added the net carry forward from 1952, of Rs. 17,408 (Rs. 59,384 including Rs. 40,000 transferred from dividend equalisation fund) which produces a total of Rs. 4,54,021 (Rs. 3,69,164). The following transfers have been made:—

Depreciation fund Rs. 1,00,000 (Rs. 50,000), provision for taxation Rs. 1,25,000 (Rs. 65,000) and staff gratuity fund Rs. 16,536 (Rs. 35,256) leaving available the sum of Rs. 2,12,485 (Rs. 2,18,908). From this balance the directors recommend the declaration of a dividend of Rs. 10 (Rs. 10) per share, free of income-tax, which will absorb Rs. 1,81,500 (Rs. 1,81,500) and bonus to staff Rs. 22,000 (Rs. 20,000) leaving a balance to be carried forward of Rs. 8,985 (Rs. 17,408).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	18,15,000	Block ...	24,67,828

Smith, Stanistreet and Co., Ltd.

The directors of the above Company (Chairman: Mr. R. Menzies, Calcutta) submit the audited accounts of the Company for the year ended 30th June, 1953.

After providing for depreciation, taxation and all other charges, and transferring Rs. 76,000 (Rs. 2,29,316) to the rehabilitation reserve, there is a profit of Rs. 1,25,441 (Rs. 93,956) to which is to be added the balance carried forward from last year of Rs. 48,158 (Rs. 54,202) making the total sum available Rs. 1,73,599 (Rs. 1,48,158) which sum the directors recommend should be disposed of as follows:—

Dividend for the year to 30th June, 1953, on the preference shares at 10 (10) per cent. per annum, free of income-tax Rs. 50,000 (Rs. 50,000), and dividend for the year, on the ordinary shares at the rate of 10 (10) per cent. per annum, free of income-tax Rs. 50,000 (Rs. 50,000) leaving to be carried forward to the next account Rs. 73,599 (Rs. 48,158).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	10,00,000	Block ...	4,40,133
Reserves ...	8,45,867	Stock-in-trade	22,92,902
Provision for taxation ...	2,80,178	Goods-in-transit	1,18,290

SENDRA COAL CO., LTD. Half-yearly General Meeting, Calcutta, 23rd December, 1953. Transfer books closed from 9th to 23rd December, 1953, both days inclusive.

MYSORE SUGAR CO., LTD. Annual General Meeting, Bangalore City, 23rd December, 1953. Transfer books closed from 8th to 31st December, 1953, both days inclusive.

SUTLEJ COTTON MILLS LTD. Annual General Meeting, Bombay, 30th December, 1953. Transfer books close from 17th to 30th December, 1953, both days inclusive.

MIDNAPORE ZEMINDARY CO., LTD. Annual General Meeting, Calcutta, 30th December, 1953. Dividend: Re. 1-8 per share. Transfer books close from 16th to 30th December, 1953, both days inclusive.

ASSOCIATED CEMENT COMPANIES LTD. Annual General Meeting, Bombay, 15th January, 1954. Dividend: Rs. 9-8 per share, free of income-tax, payable on and from 21st January, 1954.

WOODLAND ESTATES LTD. Dividend of Re. 1 per share, for the year ended 31st March, 1953.

BABABUDIN COFFEE AND PRODUCE CO., LTD. Dividend of As. 6 per share, for the year ended 30th June, 1953. Transfer books closed from 16th to 22nd December, 1953, both days inclusive.

STANES AMALGAMATED ESTATES LTD. Dividend of Re. 1 per share, for the year ended 30th June, 1953. Transfer books close from 17th to 29th December, 1953, both days inclusive.

COMPANY REGISTRATIONS

NATIONAL POWER SUPPLY CORPORATION LTD. (First Director: Mr. K. K. Sen.) Business: Supply of Electricity. Authorised capital: Rs. 10,00,000. Public company. Address: 23B, Allanby Road, Calcutta, 20.

SREE ANNAPURNA LTD. (First Director: Mr. B. L. Agrawal.) Business: Stock and Share Brokers, etc. Authorised capital: Rs. 5,00,000. Public company. Address: 43, Zakaria Street, Calcutta.

MUSIC MASTERS LTD. (First Director: Mr. K. N. Kapoor.) Business: Manufacturers and Dealers in Gramophone Records, Phonographs, Gramophones, Radios, and other Musical Instruments, etc. Authorised capital: Rs. 5,00,000. Private company. Address: National House, 6, Tullock Road, Apollo Bunder, Bombay.

QUESTION HOUR IN PARLIAMENT

Payment of Wages Act

THE Government of India has under consideration the question of amending the Payment of Wages Act to enable its application to persons employed in public motor transport services for carrying goods or passengers. The contemplated legislation will not cover drivers of private motor cars.

—Deputy Minister for Labour

Industrial Undertakings

The Licensing Committee under the Industries (Development and Regulation) Act considered 226 cases for new industrial undertakings or substantial expansion of new undertakings. After 34 cases were rejected, 11 were referred back for further investigation. The sub-committee of the Central Advisory Council of Industries reviewed the recommendations of the Licensing Committee and submitted its report to the Central Advisory Council. The rejections were generally for one or more of the following reasons:

(1) The scheme proposed was not in accordance with Government policy in regard to the industry concerned; (2) existence of unduly excessive capacity in the industry; and (3) unsuitability of the location proposed, either on account of (a) difficulties in the transport of raw materials and finished goods and/or (b) supply of raw materials.

• • • •

Cottage Industry Products

The non-availability of regular supplies of cottage industry products is one of the reasons why they cannot be marketed in America. The head of an American departmental store came to India at the Government's invitation and surveyed some of the products. At his suggestion an exhibition of selected products was arranged in Paris and it was successful. Further samples are now being sent to America and, if favourable response is received, negotiations will be entered into with that store for marketing in the U.S. products of Indian cottage industries.

—Minister for Commerce and Industry

Investment in Oil Refinery

Representations to the Government that the Indian investing public should be afforded opportunities of participating in the ordinary capital of the oil refining companies are under consideration.

—Minister for Production

Indian Shipping

Indian shipping carried, in the first six months of this year, 350,760 deadweight tons of imports and exports in India's foreign trade. During 1952, Indian shipping carried 653,145 tons and the previous year 744,689 tons.

—Parliamentary Secretary to the Minister of Transport

Deep-sea Fishing

A private company which proposed to undertake deep-sea fishing on a commercial basis on the west coast has approached the Central Government for help in the form of technicians and equipment under the T.C.A. The company, which has made the proposal through the Travancore-Cochin State, has also asked for a loan from the grow-more-food funds. The proposal is under the Government's consideration. Procurement of equipment and technicians worth $2,014,699 has been authorised under the T.C.A. on expansion and modernisation of marine fisheries. Services of fisheries experts from the T.C.A. and F.A.O. have been secured. Indents have been placed for 144 marine diesel engines, 11 insulated road vans, three trawlers, seven boats and other equipment.

• • • •

Tube Wells

A Technical Working Committee has been set up for recommending allocation of 2,650 production tube-wells under the T.C.A. Programme in U.P., Bihar, Punjab and P.E.P.S.U. On the basis of preliminary geological data available with the Government of India suitable areas in Madras and Travancore-Cochin have been selected for the construction of 80 exploratory tube-wells under the Indo-American Technical Assistance Programme for 350 exploratory wells all over the country. Further programmes of tube-well construction in these areas will depend upon the results of these exploratory wells and upon further geological and hydrological data. The assistance of the State Governments concerned will, of course, be taken in this work.

—Deputy Minister for Food

Interest on Wheat Loan

Up to the half-year ended 30th June, 1953, $4,656,736.96 were paid to the U.S.A. as interest on the wheat loan. The payment was made in dollars from the cash balances of the India Supply Mission in Washington. The interest was calculated at 2½ per cent.

• • • •

D.V.C. Loan

Till 31st August, 1953, $14,085,206 were drawn out of the first D.V.C. loan amounting to $18,500,000.

—Finance Minister

Income-tax Cases

The number of income-tax cases referred for recovery under the Public Demand Recovery Act during 1952-53 was 27,530 and the total amount involved Rs. 25.08.25,029. Of these, 4,881 cases were disposed of during the year, the amount involved being Rs. 1,13.54,960. These amounts do not include figures for Assam and Tripura, which were not available.

—Deputy Minister for Finance

CALL MONEY RATE UP

(From Our Own Correspondent)

BOMBAY, 9th December

There was a perceptible change in the conditions of the short-term money market during the week under review. Demand for funds, signs of which appeared towards the close of last week, became fully evident early in the week under review and gathered momentum as the week rolled on. Large-scale movement of agricultural crop and advance payment of income-tax for which the last date is the 15th inst. were responsible for the resurgence of demand. The volume of floating funds was small and the call for funds was on a relatively larger scale, so that the demand could not be fully met. There was, therefore, a stiffening of money rates.

Inter-bank call money among the Exchange banks and larger Indian banks, which was unlendable at 1 per cent. almost throughout last week, was bid up to 2 per cent. this week. Some transactions were reported to have been done at even 2¼ per cent. The surplus funds with banks having been used up, some of them had to seek help from the Reserve Bank. Exchange banks were reported to be calling off their surpluses with their foreign offices, in order to meet the local demand, as the inter-bank call money rate had crossed 2 per cent. Among the smaller Indian banks, inter-bank call money was bid at 2¼ per cent., but even at this rate supplies were not readily forthcoming.

House money was quoted at 2¼ per cent. Short-term deposits were keenly sought at 2¼ to 2¾ per cent. for one to two months and at 2¾ to 3 per cent. for three to six months.

For the first time since the Government of India resumed sale of Treasury Bills on 9th September, 1952, it had to pay as high a rate as Rs. 2-7-2 per cent. per annum this week, as against Rs. 2-7 per cent. last week, which was the highest rate till then. In the corresponding week of last year, it may be recalled, the average rate of accepted tenders was no more than Rs. 2-5-11 per cent. per annum. The amount offered this week against the usual tenders for Rs. 1 crore was a little over Rs. 1.71 crores, as compared with Rs. 1.10 crores last week.

In contrast to the contraction noted in the previous two weeks, notes in circulation have risen by Rs. 17.57 crores during the week ended 4th December, 1953. Disclosing this, the Reserve Bank's statement for the week under review shows a drop of Rs. 18.53 crores in notes held in the Banking Department. There are, therefore, no sharp variations on the assets side of the Issue Department. In the Banking Department, deposits of the Central Government show a fall of Rs. 7.66 crores, part of which may be due to payment of half-yearly interest on some of the Government loans which fell due on 1st December. Deposits of State Governments are also lower by Rs. 2.14 crores. A decline of Rs. 9.03 crores is noted in deposits of banks, which is attributable to withdrawals by banks to meet the seasonal demand for funds. Deposits of others are higher by Rs. 1.23 crores. Cash balances have shrunk by Rs. 18.63 crores, while balances held abroad have risen by Rs. 3.29 crores. Ways and means advances to Governments and other loans and advances (including advances to Scheduled Banks against usance bills) show no worthwhile variations. There has been no change in the advances to Scheduled Banks against usuance bills during the week. Investments have gone down by Rs. 2.01 crores.

The consolidated statement of position of Scheduled Banks for the week ended 27th November, 1953, shows a rise of Rs. 10.15 crores in demand deposits of the Banks and of Rs. 1.23 crores in their time deposits. Inter-bank borrowings have risen by Rs. 1.21 crores. Borrowings from the Imperial Bank have declined by Rs. 77 lakhs. On the assets side, advances are lower by only Rs. 32.12 lakhs, while inland bills purchased and discounted have risen by Rs. 1.68 crores. Cash on hand and balances with the Reserve Bank show an increase of Rs. 8.11 crores and money at call and short notice Rs. 1.77 crores.

Conditions in the Gilt-edged market brightened up during the week under review, with a revival of demand. Short, medium and undated issues found buyers, accentuated by demand from Calcutta, on speculation regarding prospects of a reduction in the Bank rate. 3 per cent. 1957 had buyers at Rs. 98-6, but there was no change in quotation over the week. 3 per cent. 1958 and 3 per cent. 1959-61 each put on an anna to Rs. 98-2 and Rs. 96-2, respectively, following the increase by an anna in the Reserve Bank's selling rates. Good business was reported to have been done in these loans at these rates. 3 per cent. 1963-65 passed hands at Rs. 92-8. 3 per cent. 1964 gained an anna to Rs. 92-10, due to proximity of interest payment. 3 per cent. 1966-68 was done at Rs. 90-2 and 3 per cent. 1970-75 at Rs. 86-8. 3 per cent. 1986 Conversion Loan rose sharply by As. 9 to Rs. 82-8 on good support and short covering. 3½ per cent. N.P. Bonds hardened by As. 2 to Rs. 98-15.

KIPS EASY

(From Our Own Correspondent)

MADRAS, 7th December

The kip market which has been marking time, shows signs of easing, due to absence of shipment business. Prices of light weights and cow calf are easy in the local market, while medium and heavy weight kips and buff heavies rule steady. Buff calf market continues firm, due to good enquiries from the U.K. and the U.S.

There has been no change in the tanned skins market, and the course of U.K. auctions this week will determine the trend of prices in this section.

BULLION STEADY

(From Our Own Correspondent)

BOMBAY, 9th December

Barring a mid-week recession the bullion market presented, on the whole, a steady tone, with a moderate rise in prices of both the metals. On balance, forward silver gained Re. 1-13 per 100 tolas and forward gold As. 13 per tola. These gains, however, show that the metals could not regain anything more than a part of the previous week's losses, on account of the uncertainty about the proposed changes in the by-laws.

The steady tone of the market was due to revival of bull support, induced by firmer advices from upcountry centres and better offtake in the ready position, and followed up by sizable short covering. The mid-week reaction was attributed to weakness of gold, consequent on heavy arrivals on Saturday and professional selling in silver on expectations that the Board would ultimately decide upon changing the by-laws.

The representatives of the Board of the Bombay Bullion Association met the Advocate-General of Bombay on Friday last to elicit his opinion on the proposed amendments to the by-laws. The Advocate-General is reported to have expressed the view that all the three alternative amendments which the Board had suggested are legally valid. The Board can, therefore, adopt any one of the amendments. The Board held a meeting on Saturday and decided to convene an informal general meeting of the members of the Association on Wednesday, the 9th inst., that is to-day, to elicit the opinion of the members in regard to the amendments. Accordingly, the informal meeting was held to-day, but the outcome was not known at the time of writing.

To revert to the market trend. Silver for forward delivery (23rd December settlement) opened on a better note at Rs. 150-6, as against the previous week's closing of Rs. 149-12 and hardened to Rs. 151-3. In the reaction that took place mid-week, the forward rate touched a low of Rs. 150-3, but soon rebounded on revival of support. In this process, it touched a high of Rs. 152 to-day before closing at Rs. 151-6.

Opening at Rs. 150-10, ready silver (.996 Mint) gained some ground, touching Rs. 152-4 to-day. But the closing was a shade lower at Rs. 151-10. The floating stocks of silver are placed at 2,600 bars. The daily average offtake was 20 bars.

Gold for forward delivery (21st December settlement) began the week at Rs. 80-12 and closed higher at Rs. 81-8, after fluctuating within a narrow range. Opening and closing levels in ready gold were Rs. 80-15 and Rs. 81-12, respectively. The floating stocks of gold are estimated at 30,000 tolas. The daily average arrivals was 7,000 tolas, while the offtake was 6,000 tolas on an average.

There was a fractional drop from 74d. to 73⅞d. per fine ounce in the spot and forward prices of silver at London on Friday last. The U.S. price of silver was, however, unchanged at 851 cents per fine ounce.

The following comparative table shows the trend of the market during the week under review:

	9-12-53	Highest	Lowest	2-12-53
		Rs. a.	Rs. a.	Rs. a.
GOLD				
Ready (.99 fine Mint)	81 12	81 15	80 8	80 13
Forward	81 8	81 11	80 6	80 11
Sovereign	86 8	87 0	86 0	87 0

London Ready ..	73¾*d.*	74*d.*	73¾*d.*	74*d.*
London Forward .	73¾*d.*	74*d.*	73¾*d.*	74*d.*
New York Ready .	85½*c.*	—	—	85½*c.*

LINSEED REACTS

(Messrs. A. Bradley & Co.)

CALCUTTA, 7th December

Although conditions were slightly easier during the early part of the week, owing to the Government's decision to retain present export duties, a reaction set in towards the close and prices are back to former levels. A good demand for ready goods continued from local crushers, but, with arrivals very poor and firm advices from upcountry, sellers were very reserved, and trading was on a small scale at better prices. Fair activity was reported in the oil section, despite limited local stocks, with keen enquiries from local consumers for ready goods.

The latest quotations are as follows: Ready Rs. 20-12 and December Rs. 20-8 per maund.

STRONG DEMAND FOR BUFF

(From Our Own Correspondent)

KANPUR, 6th December

The most noteworthy feature of trading in the Kanpur hides market during the week under review was a heavy demand for all qualities of wet salted buff. Prices, therefore, showed a tendency to rise. The new arrivals were slightly less than the weekly average. The purchasers were mainly local tanners and Madras dealers. The latest quotations are as follows:

Wet salted cow, 1st grade Rs. 300 to Rs. 320, 2nd grade Rs. 250 and 3rd grade Rs. 160 to Rs. 180 per score; wet salted buff, 1st grade 1 lb. 12 ozs. and 2nd grade 2 lbs. per rupee; goat, 1st grade Rs. 275 to Rs. 300 and 2nd grade Rs. 230 to Rs. 250 per 100 pieces; and sheep, Rs. 300 per 100 pieces.

FORWARD COTTON FIRM

(From Our Own Correspondent)

BOMBAY, 9th December

There was a slight discrepancy visible in the sentiment in the spot and forward sections of the cotton market here earlier during the week under review. The buoyancy which was in evidence at Kalbadevi last week gave place during the week-end to hesitancy and a clear desire to book profits on the part of the bulls. The range of fluctuations was widened and prices went up and down each day. All this was changed suddenly yesterday and the closing prices for the week show a remarkably firm trend. The earlier easy undertone of the market was mainly due to profit-taking by the longs rather than to any important development in the situation. It is true that but for the timely strike of cotton traders and producers in Madhya Pradesh, protesting against the levy of a very heavy sales tax on cotton, the price trend might have been, even if not distinctly unfavourable, at least, not so firm as it has emerged. It might be changed, however, if the strike were suddenly to come to an end, and in that case, even the spot premia which are ruling high at present might come to be affected. But there are no visible signs, at present, of the strike fizzling out or the issue being settled amicably and to the satisfaction of all the parties involved in it.

Another important feature of forward trading during the week has been the almost complete vanishing of the gap between the February and the May settlement. This points to the markets' belief that, though the supply position when the contract matures in February might be a little tight, eventually the larger crop expected this year was bound to tell. Weather reports from production centres are more or less favourable and though some slight reduction is expected in the case of Madhya Bharat, conditions in Broach, Surat and the southern parts of the country all point to a very satisfactory crop. Against this, one must allow for the fact that non-official ideas about the ultimate size of the crop have undergone some change lately and there are those in the trade who place the output even below 40 lakh bales. Ultimately, it is this factor which will dictate the price trend in the coming months.

Another factor affecting the forward trade in cotton is the influence of other markets, especially bullion, on cotton trading. Some of the prominent operators are common in these two markets and the fortunes of these in one market often have an exaggerated influence on the sentiment in the other. Something like this is again happening in cotton at present. The weakness in the bullion market is believed to have created difficulties for some of the longs in cotton and it is feared that they might be forced to lighten their burden of commitments in cotton later on if there is a heavy slump in the price of bullion. This is a very unhealthy feature of forward trading in our country, which requires the attention of the authorities controlling it.

In the forward section of the local cotton market, I.C.C. February opened the week under review at Rs. 646 and moved up to Rs. 656½ on 5th inst. There was a slight setback on 7th when it touched Rs. 649½. But there was a swift recovery on 8th and 9th inst., and the contract firmed up to Rs. 666 before closing the week at Rs. 659. I.C.C. May fluctuated between Rs. 666½ and Rs. 648½ and closed at Rs. 661.

The following is the trend of prices in the forward market over the week under review:

	Opening	*High*	*Low*	*Closing*
I.C.C. Feb.	Rs. 646	666	645½	659
I.C.C. May	Rs. 649½	666½	648½	661

In the spot market mill demand has continued to be steady. The early arrivals in Madhya Pradesh and Khandesh are believed to be of inferior quality and this fact has been responsible for a slight softening of prices. But good quality cotton fetches good premia and even increased arrivals during the coming weeks are not likely to affect the price trend adversely in the spot section. There is not much activity so far in Vijay, Surti and Gaorani 6, because the ginners are not prepared to commit themselves in advance before cotton begins to arrive in the market. The spot market has, therefore, turned its attention for better staple cotton towards foreign varieties and Egyptian and East African cotton are being enquired for.

There seems to be some kind of a race between State Governments where cotton is produced for taxing it. The incidence of tax keeps on increasing and in the case of Madhya Pradesh, where agitation at present is at its height, it has reached an unbelievable figure of about Rs. 24 per *khandi* which is three times the rate in Bombay and 50 per cent., higher than that obtaining in Hyderabad. These Governments seem to hold that the tax is ultimately passed on to consumers outside the State, but in actual analysis, it has been found that a greater part of the tax has to be borne by the growers. The East India Cotton Association is, therefore, right in requesting the Central Government to intervene and to bring about some kind of uniformity in the matter of sales tax in an important inter-State trade like cotton. The following are the latest quotations from the Sewri market:

Bengal *Deshi* Rs. 615; Berar *Jarilla* Rs. 745; Khandesh Rs. 785; Vijay Rs. 820; Oomra *Deshi* Rs. 660; Moglai Rs. 660.

At Karachi, it has been a featureless week with no development either in the official policy or in the price trend. The rates have remained more or less unchanged with very narrow fluctuations during the week.

The latest available quotations from Karachi are: Sind *Deshi* Rs. 69½; Punjab *Deshi* Rs. 65; 4F, R.G. Rs. 62; S.G. Rs. 67; L.S.S. R.G. Rs. 67; S.G. Rs. 72½; N.T. R.G. Rs. 69; S.G. Rs. 75; 289F. R.G. Rs. 79; S.G. Rs. 80.

The debate over the Government's proposal in the U.K. to wind up the R.C.C. before the next cotton season begins in October, in Parliament last week, has brought out fears of shortage of cotton stocks in the country at a later stage and unemployment resulting from such a situation in the textile industry there. The Labour Party which was responsible when in office in 1947 for bringing the R.C.C. into existence stressed the point that there was a declining tendency in the price of cotton the world over. Neither the textile mills nor private traders were likely to carry sufficient stocks to enable the industry in Britain to function uninterruptedly. Only a body like the R.C.C. could afford to carry big stocks of cotton under the present circumstances. The Opposition has moved an amendment which would make it possible for the R.C.C. to remain in existence and to perform certain functions until October 1955. The debate over this issue is to be resumed to-morrow.

The market at Alexandria has been quietly steady, the previous volume of enquiry having decreased to a certain extent. One of the reasons for this is the change in the official basis of prices from December to March futures in New York, with a consequent rise in the price of Karnak for which previously there had been a good demand. This rise in the official price schedule has affected the premia paid by private traders in upcountry centres, though they still continue at a clearly high rate in the case of Ashmouni and Giza 30 which are in short supply. Entitlement premia for sterling have also been on a lower scale during the week. The Egyptian Government has announced that its policy for buying and selling of the cotton crop in 1954-55 will continue to be the same as at present. With regard to the re-opening of the Alexandria forward market in cotton, the Egyptian Ministry's note laid down two factors as essential, one of these was the creation of foreign markets to establish an equilibrium in cotton prices outside and inside Egypt, to check monopoly transactions or the manipulation of prices, while the other one was the creation of machinery for currency conversion between Alexandria and other markets. This note further states that there was risk in commencing forward business at Alexandria at present owing to the smallness of the crop this year.

The U.S. Department of Agriculture has announced the long expected State-by-State breakdown of the acreage allotments for the 1954-55 season. These allotments aggregate 17,910,448 acres, with a crop expectation of 10 million bales. As the full allotment is generally not availed of by the farmers, who like to leave a safe margin to remain within the fold of full official price support, the total acreage sown next season might be a little less than this total. These acreage allotments will not be subject to the voting result at the national referendum of farmers to be held on the 15th inst., for fixing marketing quotas. The declining tendency in the forward market continued as a result of progressive hedge selling in March which also affected some of the distant positions for the new crop.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	8-12-53	3-12-53	24-11-53
Spot	33.55	33.55	33.85
March	33.08	33.26	33.45

ART SILK YARN LISTLESS

(From Our Own Correspondent)

BOMBAY, 9th December

Listless conditions prevailed in the art silk yarn market during the week under review. Extreme caution was the keynote of trading. Operators preferred to wait and see in anticipation of import policy for the ensuing half-year. Reports from rayon fabrics market also were not favourable. Nor was demand in the ready section encouraging. Purchases by traders were confined to immediate requirements so much so that values of art silk yarn fluctuated very narrowly. Over the week, however, values were well maintained.

In the forward section, 150D December delivery opened the week firm at Rs. 719, as against Rs. 714 last week-end, but receded to Rs. 712 on Saturday on account of profit-taking. Lower levels attracted some support and the contract staged a notable recovery thereafter, the rate at one time to-day being Rs. 721. There was, once again, bull liquidation at the close and the rate slided down to Rs. 715. The net gain over the week was just a rupee. January delivery moved in sympathy. After opening Rs. 6 higher at Rs. 723, it fell to Rs. 714 on the 5th inst. Subsequently, however, it recovered to Rs. 724 to-day, before finishing lower at Rs. 718. Yarn prices in the ready section were fully steady. 120 Japan, 150 Japan, 120 Italy and 150 Italy were all unaltered at Rs. 4-3, Rs. 4-1, Rs. 3-13 and Rs. 3-9½, respectively.

The table below gives the prices of art silk yarn quoted to-day, as compared with those on the 2nd inst. and 25th November, 1953:

	9-12-53	2-12-53	25-11-53
	Rs. a.	Rs. a.	Rs. a.
150 December (per case of 200 lbs.)	715 0	714 0	732 0
150 January (" ")	718 0	717 0	—
120 Japan (per lb.)	4 3	4 3	4 3
150 Japan "	4 1	4 1	4 1½
120 Italy "	3 13	3 14	3 14½
150 Italy "	3 9½	3 9½	3 10½

Arrivals of art silk yarn into the market have somewhat been lower in recent weeks, owing to a fall in imports. The quantity of yarn actually imported during November, 1953, for instance, was 2,053,428 lbs., as against 2,621,504 lbs. in the previous month. Despite poor arrivals, floating stocks in the market are reported to be quite normal. Bulk of the imports during November came from Italy, the quantity actually imported being 984,329 lbs. Imports from Japan were very negligible, being only 13,000 lbs., thanks to high level of prices.

Forward trading in staple fibre yarn has remained suspended. The question of resuming traing in January contract will be discussed by the Committee of the Yarn Merchants Association, Bombay, at its meeting convened on Saturday next. The decision of the Committee is eagerly awaited by traders. It is expected that forward trading will be allowed with effect from the 14th inst. It is also expected that restrictions on counts and tests will be removed for January fixed delivery, since these are creating difficulties while tendering the goods. Hitherto, it may be noted, only staple fibre yarn (40 x 2) was being allowed to be traded in the forward section.

An extraordinary general meeting of the Yarn Merchants Association, Bombay, will be held on the 18th inst. to discuss the question of amalgamating this Association and the Bombay Yarn Exchange Ltd.

GROUNDNUTS FIRM

(From Our Own Correspondent)

BOMBAY, 9th December

The oilseeds market presented a firm trend this week. The groundnuts section led the market, despite advices from Veraval, Hyderabad and Madras markets. This was because speculators got busy on good buying by Saurashtra interests who had gone long in Rajkot and Jamnagar. This arrested the nervous selling which followed the Commerce and Industry Minister's statement last week indicating the possible withholding of exports of groundnut oil next year. Besides, renewed firmness in cotton futures also contributed to tone up the sentiment of the market. This had a favourable effect on other sections also. The castorseeds section also moved forward in sympathy with groundnuts and on expectations of announcement of liberal export policy for the first half of next year. The linseed section continued to depict a bright sentiment, on shortage of floating stocks. Business done in the market was, therefore, considerable and prices staged a sharp rise, thereby disclosing sizable gains over the week.

In the groundnuts section, Bold ready shot up from Rs. 27-12 to Rs. 30-6. December-January and February-March deliveries gained Rs. 2-12 each to Rs. 30-4 and Rs. 30-14, respectively. Khandesh quality ready new advanced from Rs. 29 to Rs. 31-6. Groundnut oil ex-mill rallied Re. 1-4 to Rs. 16-8, and railway receipts Re. 1-2 to Rs. 16-6. December delivery gathered Re. 1-6 to Rs. 16, and January on equal amount to Rs. 16-2. February delivery which opened at Rs. 15-9, on the 28th ultimo, was done to-day at Rs. 16-4.

Trading in castorseeds futures was of a purely speculative nature. May delivery which opened at Rs. 112-6, as against Rs. 113, fluctuated between Rs. 118 and Rs. 111-10, before closing at Rs. 116-12. F.A.Q. rallied Re. 1 to Rs. 26-8 and ready Madras As. 8 to Rs. 27. Castoroil B.S.S. was quiet at Rs. 16-4, while I Pressures and Commercials lost As. 4 each to Rs. 16 and Rs. 15, respectively.

In the linseed section, Bold ready advanced from Rs. 24-8 to Rs. 27-8. February-March disclosed a gain of Re. 1-8 at Rs. 23-8. Linseed oil was higher by Re. 1 at Rs. 15-4. It is stated that the merchants are reluctant to release stocks in expectation of a higher price for the seeds.

Among others, *kardi* Bold ready was up by Re. 1-4 at Rs. 23-8. Niger F.A.Q. gathered Re. 1 to Rs. 29.

The following table shows the prices of oilseeds and oil on the 9th inst. as compared with those at the end of the previous two weeks.

	9-12-53	2-12-53	25-11-53

SUGAR EASY

(From Our Own Correspondent)

BOMBAY, 9th December

The easy conditions that prevailed in the Bombay sugar market last week gathered momentum during the week under review and prices continued their downward march. The chief bearish factor, which influenced the trading, was the renewed expectation of large arrivals from northern and Deccan factories in the next few days, based on a further release for free sale of sugar produced during the fortnight ended 15th December, 1953, announced by the Union Food Ministry on the 9th inst. This release is in addition to the previous release of the entire production of sugar in the mills up to the end of November during the current season. There was, besides, the confirmation of reports of a further purchase of a couple of shiploads of East German crystal sugar by the Food Ministry, believed to be at £34-3 per long ton c.i.f. Bombay.

In the forward section, Posh delivery shed As. 8 to Rs. 84-4 and *Magshar* delivery As. 4 to Rs. 83-8 per bag. In the spot section, medium grain sugars dropped Re. 1-8 to Rs. 93-8. Small and large grain sugars were neglected, although their quotations were maintained at last week's levels, namely, Rs. 91 and Rs. 97 per bag, respectively. Arrivals of sugar into the market during the week amounted to 8,700 bags. Among imported sugars, Mexican refined lost As. 2 to Rs. 40-10 per bag of 110½ lbs. (net). British refined sugar, however, proved an exception in that it improved by As. 12 to Rs. 85-8 per 2 cwts. This was due to the tendency on the part of holders of this sugar to hoard stocks in expectation of a rise in prices. The expectation is based partly on the fact that no more of this quality is likely to be imported in the near future and partly on the belief that there will be a spurt in demand from confectionery manufacturers and sweetmeat traders.

The Central Food Ministry has invited tenders for Cuban sugar per s.s. *Marceller*. There is reported to be a great rush in the submission of tenders. Each tenderer, it is expected, will be allotted only 550 maunds, as in the case of the s.s. *St. David*. Both the s.s. *St. David* and the s.s. *Norton* are expected to arrive in Bombay by this week end. With the arrival of these ships, the deliveries of British refined sugar, so far programmed to be unloaded at the port, will be completed.

Since the prices of British refined sugar are a bit higher, the Central Food Ministry has naturally switched over to the purchase of Continental sugar. As already noted, a couple of shiploads of East German crystal sugar has been purchased. The Ministry is also reported to have decided to import at least 30,000 tons of raw sugar from Cuba at about £30 per long ton c.i.f. Bombay. The imported sugar, according to the tentative programme drawn up by the Government, will be distributed to sugar mills in this country for purposes of processing. The ex-mill cost of processed sugar is estimated at Rs. 27 per maund. This sugar is to be treated as part of the mills' production. In other words, the mills will be free to sell Cuban sugar to buyers of their own choice at free market prices.

UPWARD TREND IN PEPPER PERSISTS

(Messrs. Parekh & Co.)

BOMBAY, 9th December

The upward trend in Malabar black pepper referred to in our weekly report ended 25th November, continued under pressure of buying by New York. Grinders and dealers in New York, are making purchases for spot, afloat and nearby shipments, in view of the possibility of the renewal of Longshoremen strike when the period of injunction under "Ifartly Taft Law" ends around Christmas. New York dealers who sold short December and January delivery are being forced to cover at a loss, for the greater part of the stock of spot pepper in New York is reported to be in strong hands and November shipment from India proved smaller than generally expected. Stock with grinders who refrained from buying in a declining market is believed to be meagre and their enquiry for replenishment after the yearly inventory was one of the contributory factors for the present buoyancy in the market. Fair sized buying orders for afloat and for shipment during the first half of December and December from New York have made Indian growers and exporters tight sellers, as the existing stock of old pepper is small and the new arrival is not up to the mark.

London and New York buyers who were all along trying to bear Indian market, by giving out bearish news very frequently also came to buy and they are reported to have paid for afloat as high as $0.97, for the first half of December $0.94 and for December shipment $0.92. The intelligentsia in the market who sold December and January-February-March in expectation of reduction in the export duty, withdrew from the market as from what the Government spokesman told the Export Advisory Council at its meeting, it felt that the Government was not likely to reduce the duty in the immediate future. At Alleppey price moved from Rs. 1,900 to Rs. 2,100, Cochin quoted Rs. 365 with small sellers.

In the A.S.T.A. section December was done from $0.87 to $0.93, January-February-March from $0.84 to $0.87, January from $0.85½ to $0.89. In the delivery section, prices also firmed up from Rs. 1,620 to Rs. 1,770 for December and from Rs. 1,590 to Rs. 1,660 for February delivery.

Following are to-day's nominal quotations: Ready delivery Rs. 270/90 per cwt., December delivery Rs. 1,760/80 and February delivery Rs. 1,660/80 per candy of 5¾ cwts.

JUTE GOODS STEADY

(From Our Own Correspondent)

CALCUTTA, 8th December

The week under review in the jute goods market was characterised by an early easing tendency followed by a recovery later in the week. Fluctuations were wide in the case of B. twills and narrow in the case of hessians. The early recession resulted from profit-taking by weak holders and from lack of sufficient business with foreign buyers; but when details of the Indo-Russian Trade Agreement were announced and Russian demand for sacking goods was expected, losses were more than made good. In sympathy, hessians was also marked up. The trade agreement, which mentions jute goods as an item of export from India to Russia, does not stipulate the quantities of the exportable items and the fact that Russia has not been usually buying jute goods from this country has been taken to signify that the country is self-sufficient in its packaging requirements. Russia has been buying raw jute from East Bengal at

INTERNATIONAL PAYMENTS POSITION

(Concluded from page 1095)

new gadgets. It can be done only through wise national and international policies. The International Monetary Fund will make its resources available, when necessary, to member-countries pursuing such policies.

Avoidance of Inflation

National policy in all countries must start with eliminating and avoiding inflation through strong budgets and tight credit. Obviously, this is not consistent with the extreme view that there must not be any unemployment at any time in any sector of the economy. On the other hand, I do not believe that a sound financial policy need involve widespread or persistent unemployment. It should prevent a persistent rise in costs. But there must also be sufficient flexibility in the economy to allow resources to be moved to the production of the goods which the country needs for its own use and for its exports. This seems to me consistent with a moderate policy directed to maintaining high-level employment without inflation.

In the underdeveloped countries, there must be some moderation in their policy of rapid development at any cost. Many of these countries would welcome a policy of balanced development that would enable them to produce efficiently for the export and the home markets. Such a policy would require them to limit investment to the amount that they can finance by foreign capital and home savings without inflation. If foreign capital is available on a generous scale, a policy of balanced development can be made effective. It would enable the underdeveloped countries to import on a larger scale, widen the sources of supply for foodstuffs and raw materials, and make it possible for industrialised countries to earn dollars in third markets.

U.S. Tariff Policy

So far I have spoken of what *they*, the deficit countries, should do. I must supplement this with what *you*, the surplus country, should do. First, large as your imports are, they are still too small for your own best interests and too small for the needs of a world driven by circumstances to be much more dependent on the exports of the United States. It is true that half of your imports, mainly foodstuffs and raw materials, are duty-free. But some raw materials and foodstuffs and most manufactured goods are still burdened by tariffs and other impediments. In particular, some agricultural goods that your consumers want and which your producers are unable to supply adequately are wholly or partly excluded from your market by prohibitions or quantitative restrictions. It is encouraging to know that so able and public-spirited a group as the Public Advisory Board for Mutual Security is now re-examining the trade and tariff policy of the United States for consideration by the new Administration. We look forward to their report.

There is one other field in which the United States can take the lead in restoring balance in the world economy. The European countries, which were large foreign investors in the past and which still invest abroad, will not be in a position to increase their foreign investments until they secure a surplus in their payments. In the meantime, if the underdeveloped regions are to have an opportunity to expand their productive capacity without resorting to inflation, it will have to be through a larger capital flow from the United States than at present. I recognise, of course, that the real barriers to international investment are the political uncertainties and the economic risks, some of them the consequence of unwise policies in the countries seeking foreign capital. I believe, nevertheless, that constructive steps can be taken jointly by the United States and these countries to encourage investment on a sound basis and on a larger scale than at present.

Gold and Dollar Reserves

There is one further point I should mention. The level of gold and dollar reserves of many members of the International Monetary Fund is too small to allow an adequate margin of safety for payment fluctuations when exchange restrictions are relaxed. These countries, therefore, often hesitate to allow a greater measure of freedom in trade and payments, even when their payments position becomes stronger, because of concern for their reserve position. Of course, no level of reserves is adequate unless members are prepared to adopt policies which will bring their payments into balance within a reasonable period. Whenever members do adopt such policies and desire to relax restrictions, it will be the policy of the Fund to assist them.

In brief, this is what I believe can be done on international payments. It is possible, by proper measures in both deficit and surplus countries, to meet the hard core of the payments problem that persists. As international payments become better balanced, we can gradually approach the convertibility of currencies. In the meantime, a prompt remittance system can be established in those countries in which arrears in remittances for current transactions tend to be accumulated. What can be achieved will depend principally on sound financial policies in the deficit countries. The greatest contribution the United States can make to achieving balance in the world economy is to increase its imports and join in a larger programme of foreign investment for the balanced development of other regions. The Fund will do all it can to encourage countries to follow the right policies and it will not hesitate to use its resources to help countries with balance of payments difficulties that are striving to achieve its objectives. In these ways we may hope to move forward to the achievement of the goal of this Foreign Trade Convention, "a better world through increased production and wider consumption."

BURMA'S DEBT TO INDIA

The Government of India's representative, Mr. M. V. Rangachari, Joint Secretary, Finance Ministry, is now in Burma to hold preliminary negotiations in connection with the settlement of debt owed by that country to India. Burma's total debt to India amounts to Rs. 70 crores and comprises mostly railway and telegraph assets left by the Government of India when that country was separated in 1937. Burma paid regular instalments on the debt upto 1942. These instalments were discontinued following the Japanese war. Since the end of the war, the country has been pleading inability to resume payments in instalments owing to economic difficulties.

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. a Sales and amount written off. (b) Investments. ‡ For ten months ended 31st December 1951.

(f) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 1132 in the debentures section:—

‖ Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium.

(b) Bearer bonds of Rs. 1,000 each repayable at par.

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

(e) Returnable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice on 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after Rs. 25,17,685.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947.

Shaw Wallace & Co.

MARKET GOSSIP

(Concluded from page 1087)

prices. When, at those prices, supply exceeded demand in any particular year, the authority would accumulate stocks; when demand exceeded supply, it would release them. "The essential problem faced by a buffer stock scheme," Prof. Brown writes, "is the same as that faced by a Central Bank in administering its gold reserves, or by an exchange equalisation account." The rules are the same: when stocks show a persistent tendency to increase, lower price; when they show a persistent tendency to decrease, raise it. He argues that, in the absence of a control scheme, price adjustments are often greater than even permanent changes in supply or demand could justify. But an authority, with large stocks and reserves of credit, could take its time before changing prices in the face of a discrepancy between supply and demand.

MARKET REPORTS

(Concluded from page 1121)

regular intervals, and last year took a considerable quantity. In view of all these, it is very difficult to estimate the quantity of jute goods Russia would buy from the Indian market. It is perhaps this realisation which made speculators cautious once again. Prices of heavy goods were again marked down yesterday. Market circles have noted the Karachi report which stated that Pakistan had agreed to supply South Africa with 4.5 million jute bags early next year. In view of the Indian trade sanctions against it, South Africa is purchasing its requirements of jute from distant sources and this means increased costs. Consequently, now South Africa can buy directly from Pakistan at cheaper rates than before.

Ready hessian 40" 10 oz. was quiet at Rs. 47-2 on last Tuesday as was B. twills at Rs. 103-8. Business in standard constructions with foreign buyers was lacking, but specialities changed hands. Mills could not make offers at these rates. Profit-taking was a feature on Wednesday, and this coupled with the absence of any worthwhile actual business reduced hessian to Rs. 45-12 and B. twills to Rs. 102-4. Fears that the stock figures of mills as at the end of November especially relating to sacking, when published, would not come up to earlier expectations affected sentiment further, although expectations of good business for January-March delivery arrested the decline in prices. At this stage, some business was put through with buyers on behalf of Saigon for delivery between December and January, and further enquiries were received from Africa and Australia. There were anticipations of business in sacking goods with Russia, and some orders from Burma were also expected. For all these reasons, B. twills recovered to Rs. 104-4 towards the week-end, and in sympathy, hessians 40" 10 oz. picked up strength to Rs. 47-6. Lack of business, however, led to a fractional decline in quotations yesterday when hessians 40" 10 oz. were lower at Rs. 47-2 and B. twills at Rs. 103-8. From the trend of this week, it is seen that B. twills fluctuated in a haphazard way in both directions.

Raw jute prices eased by about As. 8 this week. Even so, a tendency among stockists to hold on to their possessions was in evidence. This was due to expectations that prices would move up with the continuance of better demand for jute goods. Northern bottoms changed hands at Rs. 28 a maund, while middles were quoted at Rs. 31. *Bimli* f.a.q. declined to Rs. 25 from Rs. 25-8. The quotation for Assam upper bottoms was Rs. 27-8, and middles Rs. 30-8. Daisee middles were steady at Rs. 33-8.

FOODGRAINS EASY

(From Our Own Correspondent)

HAPUR, 7th December

The overall food situation in the country maintained its all round progress during the week under review. Dr. Punjabrao Deshmukh, Union Minister for Agriculture, in a recorded talk, stated that "we have not only turned the corner, but are definitely on the road to more propitious and prosperous times." The food deficit, he said, should soon be a thing of the past and they might, in no distant future, be confronted with surplus stocks. The Union Food Minister, Mr. Rafi Ahmed Kidwai, in a statement at Calcutta this week, said: "The all-round production of rice has gone up and there is every hope that it will rise further with increased facilities for irrigation and greater availability and use of fertilisers next year. It is the first time in several years that India has not imported rice. The possibility of increasing the quantum of rice ration in Bombay and Calcutta is being explored." In another place, Mr. Kidwai said that, if the progress of improvement in food production in the country was maintained for another two years, there might not be any necessity for food rationing. Mr. Kidwai added that the Government might not have to import rice next year, in view of the improved rice position in India. He could not, however, visualise the time when rationing could be ended altogether.

With the steady improvement in the foodgrains supplies position, following a rice *kharif* crop, foodgrain prices have been declining steadily for some time past. It is authoritatively stated that the Government of India is having under active consideration measures to be taken in the event of an abrupt fall in the prices of foodgrains. The Government does not consider that any immediate steps are called for at the moment.

The all-India estimates of maize, *ragi* and *jowar* crops have been published this week, and in each case, this year's sown acreage shows an increase over last year's figures. *Kharif* crop yields are moving to the markets, as a result of which scarcity patches in all the States have virtually disappeared. There is no trade demand for wheat, gram or coarse grains from any quarter.

Some time ago, the Government of India had announced its decision to grant import licences for rice to the trade. It is now revealed that, so far, 39 applications, out of the total of 46 received, have been disposed of covering import of about 48,000 tons at a cost of Rs. 4.13 crores.

Here is a round up of news from different States. About 40,000 acres of land were brought under the Japanese method of paddy cultivation in the Punjab during the current year. The total area under paddy in the State was 552,000 acres. To popularise the Japanese method among cultivators, 104 training centres were opened in the State by the Agricultural Department. A high level conference between the Union Food Minister and the Andhra Food Minister will be held in the near future to discuss questions of food zones, production and procurement in Andhra. Orissa is expected to export about 350,000 tons of rice to deficit States in the next *kharif* year beginning from 31st December, 1953, as against 3 lakh tons in the current *kharif* year. The State will receive a surcharge of Re. 1 per ton of exports exceeding 250,000 tons and As. 8 on the first 250,000 tons.

In the U.P., coarse grain prices have recorded further fall this week, as seasonal arrivals are taking place at all places. Since the discontinuance of rice procurement by the Centre, prices have been steadily falling in that section also. Pulses prices too have declined in sympathy. The latest quotations (per maund) in the Hapur market are: Wheat Rs. 15-12 to Rs. 17; gram Rs. 13 to Rs. 14; barley Rs. 10-12; *bejhar* Rs. 10-12; maize Rs. 11-12; *bajra* Rs. 12; *jowar* Rs. 10-2; *guwar* Rs. 10-8; rice Rs. 29 to Rs. 19; peas Rs. 12-4

SOUND ADVICE FROM PRIVATE ENTERPRISE

THE tendency to generalise when faced with specific issues is a common trait of the present Government of India. In this art, Mr. Jawaharlal Nehru, our Prime Minister, is a past master. He displayed this quality to a remarkable degree when he spoke at the annual meeting of the Associated Chambers of Commerce held at Calcutta on Monday this week. Mr. E. J. Pakes, President of the Chamber, presented a masterly exposition of the economic ills afflicting the country and outlined the remedies for them in a specific manner. Mr. Nehru, as is usual with him, did not touch the details, but spoke in general terms on the aims and objects of the Government's economic policy and delivered a homily to private enterprise, in particular, and workers, in general. Taken as a whole, there was not much in his speech to which private enterprise can take exception, though it is easy to join issue with him on some of his remarks such, for instance, as the one relating to the importance of material incentives to secure increased production. But the stage was long past for this sort of barren controversy; in fact, it should have ended with the publication of the final report of the first Five-year Plan in which all these general issues have been discussed at length and decisions taken. What the country needs to-day is action, specific measures which will facilitate the successful implementation of the current Five-year Plan and its successors. It was accordingly quite appropriate that Mr. Pakes should have chosen this subject as the main theme of his address. It was, however, unfortunate that Mr. Nehru did not give specific replies to the specific issues raised by the President of the Chamber, even though he must have received a copy of the latter's speech well in advance.

It is reassuring to be told by the Prime Minister that he regards the private sector as very important with a significant part to play in the implementation of the Five-year Plan, that there should not be any conflict between the private sector and the public sector, that the Government not only welcomes private capital and private enterprise but is also prepared to help industries in the private sector, and that there should be no clash between cottage and power industries. Speaking from a different platform at Calcutta on the same day, Mr. C. D. Deshmukh, India's Finance Minister, was even more categorical in his assurances to private enterprise. He asked the industrialists not to hold the "bogey of nationalisation in their bosoms" and averred, in all seriousness, that "the Government realises that there is further room for expansion in the private sector beyond the target set down in the Five-year Plan." These assurances are welcome as far as they go, but they do not mean much, because similar assurances were given in the past only to be followed soon by certain actions by the Government that were completely contrary to them either in spirit or in action. It is not surprising, therefore, that they (the reassuring statements) have failed to carry conviction even to an enlightened and liberal-minded employer like Mr. Homi Mody. Speaking on Thursday this week, at the twenty-first annual general meeting of the Employers' Federation of India in his capacity as its Chairman, Mr. Mody said:

"While free enterprise has been assigned a definite role and reassuring statements of Government's intentions are made from time to time, the blunt truth is that the actions of Government lack cohesion and consistency and create a state of uncertainty in which it has become very difficult for the private sector of industry to make any substantial contribution to the development of the country. The representations made by industrial interests from time to time seem to receive little attention. The flow of labour legislation, the irksome controls over profits, production and distribution, the refusal to provide adequate incentives to either old or new enterprises, and the irresponsible opinions indulged in by some of those who hold positions of influence continue; they are not only sapping the morale of the industrialist, but are destroying the confidence of the investor. Such a state of things cannot indefinitely go on. If costs keep continually going up through levies of one sort or another, if even ordinary discipline is not allowed to be maintained in factories, if surplus labour cannot be retrenched except at heavy cost and through protracted proceedings, and if installation, even where the necessity is established, of new or additional machinery is hampered for one reason or another, the situation becomes intolerable and free enterprise becomes free only in name. I am not arguing against the concept of a controlled economy; we have all accepted it; but controls have to be reasonable and must pay sufficient regard to the problems and difficulties of the enterprises which are sought to be regulated in the public interest."

The foregoing remarks are very pertinent. In this short paragraph, Mr. Mody has given the gist of what Mr. Pakes, another representative of employers, discussed in his speech at some length. The most important point that needs to be noted here is that mere assurance against nationalisation is not enough. What is more important for the effective functioning of private enterprise is freedom of action within the overall conception of a mixed and planned economy. It is this freedom that is lacking. And, even in the general and meandering speech of Mr. Nehru, there is enough evidence to show that the powers-that-be do not appreciate this.

Both Mr. Pakes and Mr. Mody strongly deprecated the tendency on the part of the Government to rush through important pieces of legislation, without giving adequate time to the interests affected to examine them and put forward suggestions. Hasty and ill-considered legislation, it is needless to add, has an unsettling effect on existing and potential enterprise and upsets the country's commerce and industry. Elucidating this point, Mr. Pakes said:

"By all means let us agree or fail to agree on the necessity and justification for, or on the principles to be incorporated in, the legislation which is thrust upon us from all sides. But do, I plead with the Government, give, whenever possible, responsible organisations of the business community more adequate time in which to analyse the proposed legislation and to put forward well-balanced opinions on it before it is placed on the Statute Book. We do, I can assure you, endeavour in this representative and democratic association of chambers of commerce to look at those problems from a broader angle than the narrow one of immediate expediency; but, with our business to look after in what are not easy times, we find it quite impossible to do justice to these subjects, and to give adequately the assistance and the benefit of our experience we feel we should be giving to the Government within the brief time limits allowed for the purpose."

Speaking on this feature of the Government's policy, Mr. Homi Mody, too, criticised the authorities for resorting to the use of Ordinances even for purposes for which there was no need to fall back upon such emergency legislation. An Ordinance, on the face of it, is an emergency measure and should be resorted to only in cases where delay in the enactment of any measure is calculated gravely to affect the interests of any section. Mr. Mody gave instances to show how, in the past two years, this extraordinary step was taken without conforming to this principle and added:

"A particularly obnoxious feature of this mode of proceeding is that, while the interests affected by a Bill which is circulated for opinion have some opportunity of putting forward their objections and shaping the measure which is ultimately placed before Parliament, there is little chance of a Bill which seeks to replace an Ordinance undergoing any material changes. In other words, when a piece of legislation flows from an Ordinance, it is just an embodiment of the viewpoint of Government, uninfluenced by public criticism."

Mr. Nehru in his speech sought to answer this criticism but he was not convincing. Stating that the Government was always eager to meet representatives of industry and other interests and to hear their points of view, he observed that the problem was not a simple one, in

view of the democratic structure of the present Government. There were various interests involved and the interests of 350 million people of the country came in and their viewpoints had to be heard. In deciding its policy, the Government's primary concern was the interest of the people at large and, ultimately, it was their voice that mattered. When faced with conflicting points of view, the Government, he said, had to try and strike a balance. This is a fallacy, though it may not seem to be so. The flaw lies in Mr. Nehru's assumption that the interests of the people as a whole and those of business men conflict. It need not necessarily do so, for honest and far-sighted business men do appreciate that they cannot exist and thrive unless the whole nation does. They cannot advocate something which is not in the general interests of the country as a whole. As Mr. Pakes said, there are responsible organisations of the business community which can and do look at problems concerning them from a broader angle. There are undoubtedly black sheep in the business community as there are in every community, not excluding—we mean no offence to Mr. Nehru when we say this—that large sector of men and women who administer this country. But that is no adequate reason for condemning the entire business community as a selfish lot or discrediting the system of private enterprise. Be that as it may, it is gratifying to find that, in his speech, Mr. Mody roundly condemned dishonest business men. His remarks, in this connection, bear reproduction:

> "The malpractices, which have come to light in the working of some industrial establishments, call for our unqualified condemnation. We can have no truck with those who are out to exploit, by whatever means they can, the undertakings of which they have acquired control. Where the guilt has been brought home, it is the clear duty of the organisations to which the offenders may belong to expel them. Their actions are apt to bring discredit upon private enterprise and the least that can be done is to show that they are not, in any sense, representative of the general body of employers in the country."

It is to be hoped that all responsible business organisations will realise that to-day the existence of private enterprise is at stake and that, if they are to survive and raise themselves in the estimation of the people, they must scrupulously follow Mr. Mody's advice.

The subject of labour relations figured prominently in the speech of Mr. Pakes. He showed convincingly that, in this sphere, there were many impediments to the more rapid expansion of industry in the private sector and to the flow of capital into these channels. While he was not opposed to the degree of regulation implied in a dual economy, he maintained that it was idle to hope that capital would happily come forward "under conditions in which an expanding or new industrial establishment may find itself totally unable, in times of recession, to shed its surplus labour, even on the most generous terms of compensation; in which technological improvements are impeded by the clamour against the resultant temporary retrenchment: in which rising wage levels and bonus awards imposed from outside sap the capacity of Indian industry to supply the home and external markets at reasonable and competitive prices." It is this aspect of the labour situation, as he rightly contended, which, above all, repels new enterprise and expansion.

Another aspect of labour relations to which Mr. Pakes referred related to wages. He conclusively proved that wages must be related to production and no increase in living standards of either the industrial workers or the masses as a whole could be achieved merely by raising the level of remuneration to workers. Since there is considerable confusion on this particular subject even among educated men, it is worthwhile quoting the well-thought-out observations of Mr. Pakes:

> "I suggest, with great emphasis, that the time has come to consider what value in terms of work and output is to be placed on the rupee. Is it to buy one day's work, half a day's work or half an hour's work? The vast majority of the people of this land buy only the produce of India. They do not buy foreign goods. So, if the standard daily wage of a worker is, say, Rs. 2, he can, when he goes to the market, buy with this sum only one day's output of a worker—it may be food, it may be cloth, it may be cooking utensils and in it may be included a portion of the day's work of a transport worker and of a shopkeeper. Whatever it be, he can buy, in total, only one day's work. If the standard minimum wage should be Rs. 5 instead of Rs. 2, all he will be able to buy will be only one day's work, because the prices of all his necessities will have correspondingly increased. Even if it were Rs. 50 a day—to take the figure to an absurd extreme—nevertheless, when the economy settled down at this inflated level, all the individual could buy would still be the equivalent of one day's work. He would be no better off. So it seems clear that the answer is not to keep increasing wages and thereby depreciating the purchasing value of the rupee. The remedy must be to increase the output of the worker in return for his daily wage, to introduce technological improvements in our methods of production which should enable Indian industries to reduce their costs, and to improve agricultural methods so as to reduce the price of food. By such methods alone will it be possible to increase the purchasing value of the rupee and thus increase the standard of living in the country."

Mr. Nehru's reply to all these well-reasoned elucidations of the important problem of labour relations and economic development of the country took the form of vague generalisations. Considerations of space do not permit a detailed analysis of what he said. The burden of his song was that employers must cultivate a human approach to the worker in the factory. As a general statement, this is unexceptionable and all employers will accept it without reservation. There is also much that remains to be done by employers in this direction. But, as Mr. Mody rightly pointed out, Mr. Nehru and many of his colleagues do not seem to have realised the basic fact that undue regimentation of employer-employee relations is not calculated to bring about mutual understanding; on the contrary, it will continue to keep the two sides indefinitely at arm's length. About a year ago, there were signs that the Government was fully aware of this, as witness the famous "Giri Approach." But, unfortunately, the Government seems to have recanted, with Mr. Giri himself losing faith in the stand he advocated and Mr. Nehru emphasising, in his speech at Calcutta, the need for the Government to act as a third party to arbitrate in the disputes between workers and employers.

On the question of retrenchment, Mr. Nehru's views lacked clarity. He said he was not opposed to retrenchment where it was necessary. He did not suggest that the textile or any other industry should carry on with "useless staff." But, at the same time, he argued that social reasons had to be taken into consideration while resorting to retrenchment. Nevertheless, he seems to have added that a situation should not be created which would cause new difficulties or further complicate the existing ones. It will be seen from these words that the problem of retrenchment is a dilemma to Mr. Nehru. That is understandable, but the dilemma must be faced and solved. Mr. Pakes has shown in his speech how this could be done. Since Mr. Nehru and his advisers have been unable to indicate an effective alternative solution which will be in consonance with the democratic mode of life the country has chosen, we do not see why they should hesitate to try the methods advocated by this able spokesman of private enterprise.

AN UNWISE ACTION

APART from the impropriety of rule by ordinances, especially when they are promulgated on the eve of a legislative session, there are other valid grounds on which the recent Madras Ordinance, which seeks to grant a year's moratorium for agricultural debts, deserves to be opposed. Briefly, the Ordinance aims at giving protection to agriculturists who "have borrowed or added to their debts during the years of drought." It states that, if they are freed from the obligation to pay their debts, they would be enabled to rehabilitate themselves. Accordingly, it prohibits, for a period of one year, the institution of any suit for the recovery of agricultural debt. This relief does not, however, extend to a company or registered firm engaged in the cultivation of land. Nor does the freedom from payment of debt extend to the agriculturists who have borrowed from co-operative societies or from any corporation formed in pursuance of an Act of Parliament of the U.K. or of any special Indian law.

It is not clear what economic urgency there was for a measure of this kind. It is true that the Madras agriculturists have faced some lean years in the recent past. But they have had, as the Ordinance recognises, good weather this year. Surely, they ought now to be able to repay at least a part of their debts. By encouraging them not to discharge their debts and by preventing the creditors from exercising their right to collect debts from individual agriculturists, the Ordinance serves the agricultural debtors merely to postpone the difficult day of reckoning to a future which, as the world agricultural situation now stands, might be more difficult than the past. Bumper crops are reported all the world over, prices are falling and there is a genuine fear of burdensome surpluses. In any case, there is no evidence to show that there was any keen public demand for a moratorium for agricultural debts.

The Ordinance itself is defective in many ways, and might even defeat the very purpose it has in view. Thus, it is not clear why it should apply to all agriculturists, rich and poor, nor why it should not apply to registered firms and companies. Again, it is true that agricultural production has suffered in recent years through drought. But this is not true of all produce. Some commodities, notably plantation produce, have fared exceedingly well. Similarly, not all parts of the Madras State have suffered from drought and other vagaries of nature. The deltaic regions have always fared better than the dry parts of the State dependent upon rain. But this omnibus Ordinance clubs all agriculturists together, irrespective of the districts to which they belong and their status and irrespective also of the particular commodity they produce. Yet another objectionable feature of the scheme is that it places co-operative bodies, corporations and certain other institutions in a privileged position. These institutions can enforce their debts, but this right is denied to private parties. If the argument is that the liquidity position of co-operative credit institutions should not be jeopardised, it is not clear why private moneylenders do not deserve the same consideration. This feature of the Ordinance may have a totally unintended effect. The Ordinance might foster the impression that the farmers can borrow from private moneylenders with impunity, since they can expect moratorium on their debts. This feeling would encourage borrowings from private parties rather than from co-operative institutions.

Clearly, the Ordinance proceeds on certain wrong assumptions, that a creditor is necessarily a wicked person, that creditors and debtors are distinct groups of people, and that a moratorium for debt is the only real form of relief. None of these assumptions is correct. In the first place, a creditor in a village is, very often, a person of small means. He cannot afford to keep his money locked up indefinitely. He too has suffered from the effects of drought as much as those to whom he has lent a part of his savings. He has not been able to collect either the interest or the principal for the past several years. Secondly, a man may be both a creditor and borrower in varying degrees. Thirdly, the Ordinance does not provide for any relief to deserving cases of creditors such as widows or disabled persons who have no other means of living. These considerations apart, the after-effects of the Ordinance on rural credit would be very serious indeed. Credit, as any student of economics knows, is a tender plant which will wither away if confidence is upset. The present move will give a severe jolt to confidence among lenders to agriculturists. The volume of agricultural credit has already suffered a heavy reduction by former measures such as the Agricultural Debt Relief Act. This Ordinance will make the position still worse, especially because neither the co-operative credit institutions nor the joint-stock banks are able to take the place of the much misunderstood private moneylender who continues, despite all his shortcomings, to be the prop of India's rural economy. Such measures as this Ordinance will drive the honest and fairminded moneylenders out of the field and force the agriculturists to seek credit from usurers who are capable of collecting their debts without the aid of law courts. It will, therefore, be no exaggeration to say that the Ordinance is a distinct disadvantage rather than an advantage to the agriculturist who invariably needs a certain amount of credit to carry on his activities. It is a shortsighted measure. Many in this part of the country are surprised to find that its author is Rajaji who has come to be regarded as a farsighted and sagacious political leader.

SETBACK IN SHARE MARKET TECHNICAL

SILVER IN LONDON—INDIAN SHIPPING—WARNING TO INSURERS IN U.K.—NEW DEAL FOR TIN

THURSDAY 3 P.M.

THE upward trend in share markets, which had been fairly sharp in the past three or four weeks seems to have been arrested for the present.

MARKET GOSSIP

The leading speculative counters have actually suffered a relapse. At one time during the week, Tata Deferreds had registered a drop of Rs. 80 from the week's opening level, though the loss over the week is only about Rs. 46. Tata Ordinaries have lost about Rs. 10, Indian Irons As. 4, Bombay Dyeings Rs. 6, Kohinoors Rs. 4, A.C.C. Re. 1-8 and Belapurs Rs. 2-8. The closing rates for all these shares are, however, a little above the lowest levels witnessed earlier in the week. Advices from Calcutta also indicate the existence of a subdued trend in almost all the scrips which had become active ere now. This setback is but a natural reaction to the rapid rate at which equity values had climbed up in recent days. In fact, this is a healthy development, inasmuch as the technical position of the market which was tending to become lopsided has been corrected somewhat. Those who are in the know of things feel that the market has not yet fully digested the profit-taking indulged in by the bulls since the beginning of this week. Nevertheless, they feel that this week's fall in prices reflects no more than a technical correction and that there is no reason to feel that this is the beginning of a new downward trend. On the contrary, they are of the opinion that the basic causes—increased Governmental expenditure under the Five-year Plan in the coming months and the chances of a fall in interest rates—that induced the revival of strong bullish fervour are still there.

• • • •

While the expectation that the Government will resort to a large volume of deficit financing in the next two years is not unjustified, it is well to bear in mind that there may be other developments capable of offsetting the bullish implications of this factor to equities. It is, therefore, rather risky to depend on that factor alone. The most important points to be considered, in this connection, are the level of savings and the prospects for industries. As regards the first point, there are no signs that the volume of savings in the hands of the people who are accustomed to invest in shares will increase to any perceptible extent. Speaking at Calcutta, on Monday last, the Finance Minister made it very clear that the Government did not propose to give any interim relief in taxation, pending the report of the Taxation Enquiry Commission. He revealed that the findings and recommendations of the Commission would be reflected only in the 1955-56 Budget and that no major change in taxation was expected in the next Budget. This remark might not mean a bearish factor to some, but it is not a bullish one either. There is also no justification to hope that the savings of the class of people referred to above would improve through a fall in cost of living. For, if deficit financing were to be indulged in, price levels in the country would go up again.

• • • •

As regards the second point, namely, the prospects for industries, the position of our major industries such as cotton textiles, jute, rayon, sugar, tea, cement and iron and steel is now relatively better as compared with that a year before, in that the offtake of goods has improved. But, at the same time, the prices of raw materials have once again started going up and the cost of labour has become extremely rigid. Since the beginning of this month, raw cotton has gone up by Rs. 50 per candy, while there has been no corresponding rise in prices of cloth and yarn. Similarly, the cost of raw jute has been going up and the possibilities of a further rise are not ruled out. The gunny markets are also firm, but the improvement in prices for the finished goods is somewhat smaller than that in the cost of the raw material. Another point that has to be borne in mind is that the improved prospects for industries have already been discounted in most cases. In short, while there is no cause for pessimism, there is none for taking an absolutely rosy view either.

• • • •

In striking contrast to the setback suffered by the share market, the commodity markets have been displaying a strong undertone for the second week in succession. Raw cotton has taken the lead, with I.C.C. February and May positions touching a high level of Rs. 700 on Wednesday. At the time of writing, they are well below this peak (I.C.C. February at Rs. 684-12 and I.C.C. May at Rs. 682), but the undertone is still firm. Oilseeds also have recorded a sizable rise. In Calcutta, raw jute has staged an advance. This buoyant undertone of commodity markets is partly due to an overestimate of the size of the new crops and partly to the revival of demand for finished goods. In cotton and oilseeds, in particular, there had been heavy short-sales in the expectation of bumper crops. These sales were being covered in the past fortnight.

• • • •

Among oilseeds, there has been a handsome gain in groundnuts, despite the decision of the Government not to allow exports. Thus, during the past fortnight, the Khandesh quality has shot up from Rs. 29-4 to Rs. 33-8. The rise has been even more sharp in forward deliveries. Bold December-January is now standing at Rs. 32-10, as against Rs. 27-14 two weeks before. Similarly, Bold February-March has advanced from Rs. 28-11 to Rs. 33-3. It may be that the bulls are squeezing the bears, as the arrivals into Bombay are not large. Trade estimates of the crop indicate an increase of 100,000 tons more than that in a normal year, but most of this increase will be offset by the acute short-fall suffered in the past year. The ready stocks of this commodity are still not substantial for this time of the year. The Government of India is reported to have decided to get a firsthand idea of the crop by sending three of its officials to all the producing areas to collect the necessary information. Evidently, it wants to have an independent view of the crop, so that it may formulate its export policy correctly. This bid for freedom is admirable; only, it is to be hoped that the officials concerned will make no serious mistakes. Be that as it may, the Government's earlier decision not to allow exports of groundnut has been fully vindicated by the recent rise in prices. If it had fallen a victim to the insistent demand from interested parties for granting export quotas, the position would have been worse, with the poor consumer suffering most. Mr. T. T. Krishnamachari deserves to be congratulated on having correctly sized up the situation. Many a prominent operator on the Oilseeds Exchange was annoyed at this Minister's categorical refusal to issue export quotas, until prices of oil and oilseeds had come down to reasonable levels, from the consumers' point of view. Strong pressure was brought to bear on him, but he steadfastly resisted it.

• • • •

A notable development of the week which is of some interest to the bullion market is the decision of the British Treasury to discontinue the practice of furnishing, from official stocks, silver needed for essential purposes in the U.K. and allow the trade to meet these requirements through making purchases in the cheapest markets abroad, including if need be, those in the dollar area. This amounts to a limited step towards the re-establishment of a free market in London, though other import and export restrictions continue to be as stringent as before. This limited freedom to the bullion trade in the U.K. has been possible, because the flow of silver from soft currency areas has increased. In recent weeks, London has been receiving a fair amount of the white metal from Russia, Burma and Japan, all of which are short of sterling. Sales by Russia alone are said to be running at the rate of 14 million ounces per annum. Following this development, the free market price of silver in London has moved under the official quotation of 73¼d. per fine ounce. This means that the price of silver in London is cheaper than in New York, thereby making the former more popular among foreign buyers. The suspension of official sales will enable the authorities to devote the silver derived from the demonetisation of silver coinage to building up the stocks that will be required to return the silver obtained from the U.S. during the war years under lend-lease arrangements. This debt is repayable by 28th April, 1957, the quantity involved being 88 million ounces.

• • • •

Although the Government envisaged the grant of loans to the tune of Rs. 19½ crores to the shipping companies in order to enable the industry to augment its tonnage by 215,000 tons over the period of the Five-year Plan, there has been, as is well known, no satisfactory response from the Companies themselves for the Government's offer of assistance. Referring to this problem, Mr. Lal Bahadur Shastri, Minister for Railways and Transport, revealed, in the course of his speech, this week, at the Marine Engineering College, Calcutta, that, after the recent discussions he had with the shipping companies at Bombay, two or three of them had come forward for the purchase of new ships. He added: "I am keen that we must achieve our target fixed for the first Plan period and I hope shipping companies will fully co-operate in this matter."

• • • •

Although the Minister's affirmation of the Government's desire to see that the shipping target is reached and his reference to a few companies' efforts at augmenting their fleet are welcome, in a way, the shipping counters in the leading stock exchanges have not been able to attract any increased support. They are, if anything, a shade dull. It is, however, gratifying to note that among the Companies which have being drawing up plans for expansion of their fleet, India Steamship is one. The Chairman of the Company, Mr. A. Ramaswami Mudaliar, had some cheerful information to give to the shareholders at their recent annual general meeting. He said that the Company had bought the s.s. *Indian Commerce* by taking advantage of the Government's policy of financial aid to shipping companies. He revealed that the Directors were negotiating for the construction, at one of the Continental shipbuilding yards, of one vessel at least, and perhaps two vessels, of 10,000 tons d.w., equipped in the most modern way. For financing this purchase, he stated that they were "in communication with the Government of India for the grant of an appropriate loan on suitable terms." The vessels or vessels, now under negotiation, will, it is stated, be delivered by the end of 1954 or early in 1955. The Company has also agreed to place orders for further ships with the Hindusthan Shipbuilding Yard; these orders are expected to be completed by the yard in 1956 or 1957.

• • • •

Despite those notable improvements, it should be clear that the Company, like others in the field, is facing conditions of "severe competition," thanks to the end of the boom in freight rates which prevailed in 1951 and 1952. These conditions, which resulted from the natural laws of demand and supply, are not perhaps so difficult as those which are wantonly created by the more well established maritime countries. For some time past, the overseas maritime countries, which have more than their fair share of the world shipping tonnage, have questioned the propriety of the attempts at improvement made by the less fortunate maritime nations. Any measure which a country adopts in order to give some direct or indirect aid to its own shipping industry, is cited as an act of "flag discrimination," a convenient enough phrase for discouraging the legitimate aspirations of the countries which do not figure prominently on the world's maritime map. This unfair attitude on the part of the industrially advanced nations sometimes takes a more reprehensible form of open denial of the very reasonable demands made by the shipping industries of the underdeveloped countries. One such instance is furnished by the treatment meted out by the shipping companies of certain countries to the India Steamship Co., Ltd., which has been making a modest attempt at increasing its overseas traffic. Naturally enough, Mr. Ramaswami Mudaliar had some forthright remarks to make on this subject.

• • • •

It would appear that the Company has not yet been admitted to the Colombo-U.K. Conference, the Colombo-Continent Conference, the U.K.-Port Sudan Conference and the U.K.-Aden Conference, although these conferences relate to ports which are on the route from India to the U.K. or Continent. Mr. Ramaswami Mudaliar regretted that, although India is a member of the British Commonwealth, the U.K. lines have "consistently refused to allow the Indian lines the membership of any conference where the trade regulated does not emanate from an Indian port but, emanating from a wayside port, ends in a U.K. port or emanates from the U.K. and ends in a wayside port." The net effect of this refusal by the conference members to admit India into these conferences is that Indian shipping lines can carry freight from an Indian port to Colombo, Aden and other ports, but, after discharging their freight, they are compelled to go in ballast. Likewise, Indian shipping companies are prevented from carrying freight from the U.K. port to other ports on their way to India and Pakistan. It is to be hoped that the members of these conferences will revise their decision on the applications for membership made by this country, abandoning what Mr. Ramaswami Mudaliar rightly described as an "absolutely untenable, and almost an unfriendly, attitude."

• • • •

All this led Mr. Ramaswami Mudaliar to examine the appropriateness of the agitation against "flag discrimination." Mr. Mudaliar said:

> "The members who raise these questions overlook the fact that the practices complained of and many other practices, far more serious and restrictive, were resorted to by their own Governments in the not distant past and that these practices really enabled the shipping industries of such countries to attain their present position. Far more important and inexplicable is the fact that no reference is made to the restrictive business practices which are resorted to by some of the shipping companies which have established themselves in the past."

• • • •

These words, coming as they do from a person who is deservedly respected as a front rank international statesman, ought to bring greater sanity into the proceedings of the Conference lines, and also induce the leading maritime nations to take a less parochial and a more sympathetic attitude towards the very modest aspirations of the underdeveloped countries.

• • • •

The shipping industry of these countries have suffered severely, for a long time now, through neglect by their Governments (till recently, not their own) and through competition from better organised and more well established shipping companies of other countries. Any attitude which does not recognise the uneven development of the world's shipping industry and which fails to take into account the historical factors which have led to this development is bound to create a perpetual, and from the wider point of view of world trade, definitely harmful, schism between the privileged few and the unprivileged many. It is a pity that some countries, which have developed their own maritime position by means, both fair and not-so-fair, now think it fit to preach the doctrine of laissez faire in shipping. This doctrine, as Mr. Dharamsey M. Khatau, Chairman of the Scindia Company pointed out early this year, seeks nothing more than the perpetuation of a situation in which "the weak would struggle in vain with the most powerful and in which, therefore, the few, but financially mighty would soon crush the many.

OUR NEXT ISSUE

The 1953 Annual Review Number of *Commerce* will be published on or about New Year's Eve. The Number is free to subscribers, but extra copies can be had at Rs. 7-8 each.

There will be no further regular issue of *Commerce* this year, in view of the Christmas and New Year holidays, and the first issue of 1954 will be the one dated 9th January.

We take this opportunity of wishing all our readers a Merry Christmas and a Happy and Prosperous New Year.

EQUITIES MARKED DOWN

HEAVY SELLING IN TATA DEFERREDS

(From Our Own Correspondents)

BOMBAY, *17th December*

AFTER an early cheerfulness, the Stock Exchange put on a bearish trend during the rest of the week under review. The initial brightness was mainly influenced by encouraging advices from Calcutta and the bullish trend in the cotton and commodity markets. Speculative activity was broadbased and, in active dealings, equity prices registered swift advances all round. Tata Steel soarcd to new high levels, and other equities moved smartly in sympathy with them, notwithstanding end-of-account considerations.

The bullish enthusiasm could not be sustained in the new account which opened on Monday. For prices were hammered down under a wave of liquidation caused by reports regarding U.S.-Pakistan military alliance and heavy overbought position. It was assisted by further reports that some of the "bears" in the cotton market who were caught unawares by the boom in cotton unloaded their holdings of Tata Steels. Consequently, these shares led the market in its downswing in the same manner as they had given the lead in the upward trend in previous weeks. Occasional attempts at recovery were too feeble to change the weakened sentiment. Barring a few selected counters, equities, over a wide front, disclosed fair losses.

The Stock Exchange will remain closed from 25th to 30th December, 1953, both days inclusive, on account of Christmas holidays.

Starting on a bright note at Rs. 2,058-12, Tata Deferreds dominated the opening day's trading and, under a spell of speculative support, advanced to Rs. 2,062-8, the highest since the middle of June, 1951. From Monday onwards, however, values broke under nervous selling and touched a low of Rs. 1,981-4 *yesterday*. There was a recovery to Rs. 2,015 this morning, but this could not be consolidated on recurrence of selling pressure. Tata Ordinaries spurted on the opening day from Rs. 349-8 to Rs. 353-8, but dipped to Rs. 337-8 before closing to-day at Rs. 340. Indian Irons moved between Rs. 26-8 and Rs. 26-1 before winding up at Rs. 26-2.

The main body of textile shares followed the general pattern of steel shares, though, at times, some of them offered good resistance. However, there were a few bright spots, which disclosed gains on balance. Bombay Dyeings hardened from Rs. 402-8 to Rs. 406-4, but receded to Rs. 391-4 yesterday. After retrieving to Rs. 402-8 to-day, they closed at Rs. 396-14. Kohinoors were marked down from Rs. 295-12 to Rs. 292, though at one time they touched a low of Rs. 289-8. In the Tata group, Central Indias were the most conspicuous with a smart rise of Rs. 13-8 to Rs. 187, on support from knowledgeable circles. Svadeshis added Rs. 2 to Rs. 269-8 and Tata Mills Rs. 2 to Rs. 51-8. Ahmedabad Advances, on the other hand, lost Rs. 5 to Rs. 128-12. Finlays dropped Rs. 3-8 to Rs. 257, Gokaks Rs. 4-8 to Rs. 245, Indu Ordinaries As. 5 to Rs. 11-6, and Indore Malwas Rs. 3-2 to Rs. 96-14. Standards recorded a loss of Re. 1-4 to Rs. 336-4. New Greats were taken up Rs. 2 better at Rs. 167, Simplex Re. 1 higher at Rs. 155 and Bradburys Rs. 5 at Rs. 785.

A further gain of Rs. 2-8 to touch Rs. 43 in United Commercials was the highlight in an otherwise dull bank section. Barodas lost Rs. 2-4 to Rs. 105, Imperial Fully Paids Rs. 5 to Rs. 1,855, Contributories Rs. 2-8 to Rs. 456-4 and Barodas Rs. 2-4 to Rs. 105. Indias were held at Rs. 156.

In the insurance section, Orientals were picked up Rs. 10 higher at Rs. 7,410. New Indias, on the other hand, moved down by Re. 1-8 to Rs. 40 and All-India Generals by Re. 1 to Rs. 3. Other counters were featureless and unchanged.

Selling pressure was in evidence in the public utility section and moderate recession in prices was noted in most counters. Ahmedabad Electrics suffered a loss of As. 8 to Rs. 113-7 and their new shares by Re. 1-12 to Rs. 108-4. Andhra Valleys drifted down by Rs. 47-8 to Rs. 1,197-8 and Rights by Re. 1-4 to Rs. 96-8, while Coupons are better by a rupee at Rs. 40. Tata Powers dropped Rs. 10 to Rs. 1,347-8, while their Rights put on Rs. 5 to Rs. 267-8 and Coupons Rs. 2 to Rs. 53. Tata Hydros lost a rupee to Rs. 138 and their Rights Rs. 5-8 to Rs. 27, but Coupons were unchanged at Rs. 9. Bombay Suburbans were done at Rs. 122-8 *ex-div.*, as against Rs. 125 *cum-div.*

In the miscellaneous section, Associated Cements were marked down by Re. 1-8 to Rs. 184-12 and Belapurs drifted down by Rs. 2-8 to Rs. 259. Bombay Burmahs, after receding from Rs. 362-8 to Rs. 351-4, firmed up to Rs. 362-8. Scindias experienced some selling and reacted from Rs. 16 to Rs. 15-13. B.I.Cs. were quiet at Rs. 9-4½, Indian Coppers at Rs. 2-13¾ and Killicks at Rs. 156-8. National Rayons, on the other hand, were in the limelight again on sustained enquiry, and firmed up by Rs. 6-8 to Rs. 135-8. Premier Constructions were in keen demand and advanced by Rs. 4-12 to Rs. 116-8. Shivrajpurs declined by Re. 1 to Rs. 68. Tata Chemicals by As. 6½ to Rs. 10-15 and Tata Oils by As. 8 to Rs. 33. Wimcos were well held at Rs. 199-6. Phalton Sugar drifted lower by Rs. 2-4 to Rs. 97-4.

Calcutta Stock Exchange

CALCUTTA, *16th December*

Although the volume of transactions did not show an impressive increase during the first half of the week under review on the Calcutta Stock Exchange, quotations were firm and selected counters recorded gains. Subsequently, an easing tendency set in. Earlier in the week, rumours of an impending increase in the steel retention prices for the Indian Iron and Steel Co., Ltd., resulted in intense activity in Indian Irons. This was further aided by the satisfactory production figures for November. The fall in activity in the tea section did not cause any surprise, as demand having been satisfied, operators desired to pause and think before entering into further commitments. Although export of tea is expected to go up, the supply position for the next season should be watched, as this year it is the voluntary regulation of crop coupled with the climatic vagaries which brought down supply almost equivalent to demand. Jutes were active counters earlier, but were easy during the last three sessions, following the drop in prices of jute goods and the lack of adequate demand from foreign buyers.

Although the Prime Minister's views on the tax structure in his speech to the meeting of the Associated Chambers of Commerce last Monday was guarded and non-committal, his statement that borrowing was one of the methods by which industrialisation could be accelerated and that taxation aimed at the equalisation of incomes and the reduction of big disparities of wealth was noted by market circles. The Five-year Plan has been enlarged by Rs. 175 crores which has to be found. It is certain that the present taxation structure would not be disturbed until the Taxation Enquiry Commission has completed its labours and its report considered by the Government. The feeling is, therefore, gaining ground that the extra sum required would be found by more deficit financing, borrowing, external aid and savings. In the light of what Mr. Nehru said, it is difficult to expect any tax relief as such in the forthcoming Budget apart, perhaps, from minor changes either way. It is this realisation which made operators cautious during the last three sessions and that resulted in an easing tendency.

Up to Saturday last, jutes were noted for better conditions, but subsequently interest shown in the shares shrank and gains were affected. There is nothing alarming in the latter tendency which was in the nature of profit-taking. After rising to Rs. 25-12 Howrahs were marked down to Rs. 25-1 and Alliances were at one time as high as Rs. 181-8. Indias advanced to Rs. 134 from Rs. 131, but afterwards gave way to Rs. 131-8. Champadanies were traded at Rs. 149 but Kinnisons were quiet at Rs. 202. After easing to Rs. 182, Orients staged a partial recovery to-day to Rs. 183-8. Support was provided to Agarparas at Rs. 17-4, Nuddeas Rs. 50, and Nellimarlas at Rs. 11-8. Earlier features included Cheviots at Rs. 248, Megnas at Rs. 109, and Budge Budges at Rs. 161-8.

Coals were quiet. Bengals received attention at Rs. 507. Raneegunges, after being steady at Rs. 11-2, receded to Rs. 10-11. Dhemo Mains were fractionally lower at Rs. 9-12, as were Equitables at Rs. 32-2. New Manbhooms rose to Rs. 11-4 from Rs. 9. South Karanpuras were unaltered at Rs. 10-14 and Khatras Jherriahs came in for business at Rs. 41-2. New Beerbhooms were wanted at Rs. 18-7 and East Indians at Rs. 24-15.

In the engineering section, Indian Irons, in the first instance, advanced to Rs. 25-8 from Rs. 25 but later fluctuated around Rs. 25-1, the closing to-day being Rs. 25-3. A distinct feature was the improvement in Braithwaites to Rs. 13-11 from Rs. 12-9 on interested buying. Jessops were better at Rs. 25-8, while Kumardhubis were lower at Rs. 8-2. Texmacos were taken at Rs. 8-14 and subsequently improved to Rs. 9-5.

An early feature in the miscellaneous section was Bengal Papers which at Rs. 53-8 gained one point. Indian Cables changed hands at the fractionally higher rate of Rs. 19-12. After being lower at Rs. 61-8, Ballis recovered to Rs. 62-8, B.I. Corporations changing hands at Rs. 9-4. National Tobaccos gave way to Rs. 10-9 from Rs. 10-14, but Rohtas Industries moved to Rs. 10-14 from Rs. 10-9. Ganges Ropes were lower at Rs. 195-8. Jardine Hendersons were brought to business at Rs. 117. B.B. Petrols were steady at Rs. 2-5, and India Steamships were wanted at Rs. 7-5.

Profit-taking in teas continued, the volume of business declining. Thus Hasimaras gave way to Rs. 31 from Rs. 32, Teloijans to Rs. 15 from Rs. 15-4 and Bishnauths to Rs. 33-8 from Rs. 35-6. However, a distinct feature was provided by Gairhattas rising to Rs. 200 from Rs. 181. Brooke Bonds hovered around Rs. 12-4, and Basmatias at Rs. 33-4. Hattikhiras were unchanged at Rs. 14-11.

Madras Stock Exchange

MADRAS, *15th December*

The Madras Stock Exchange presented fairly steady conditions this week. Activity in the textile section was broad-based, on continued demand from consuming centres for piecegoods. Advices from overseas for cloth were also favourable. Among plantings, teas were in the lead with favourites coming in for considerable enquiry. Rubbers also displayed a similar trend, while coffees were uninteresting. Miscellaneous scrips witnessed selective demand. Business, as a whole, reported done in the market was sizable, and the quotations, on balance, disclosed appreciable gains spread over a wide list of shares.

The textile section ruled generally bright with some of the backline shares coming to the fore. Venkateshas shot up from Rs. 77 to Rs. 82 and Metturs from Rs. 212-8 to Rs. 216. Vasantas gained Rs. 3 to Rs. 168 and Premiers Re. 1 to Rs. 83. Balasubramanias 'B' improved from Rs. 60 to Rs. 61. Ranga Vilas rallied As. 12 to Rs. 45-8 and Lakshmis 'A' As. 8 to Rs. 40. Lakshmis (Rs. 50 paid-up) were enquired at Rs. 80 as against Rs. 79, and Janardanas Rs. 63 as against Rs. 62. Pankajas, however, lost Rs. 8 to Rs. 67 and Rajapalayam Re. 1 to Rs. 72. Coimbatore Spinnings eased from Rs. 38 to Rs. 37-8.

Among plantings teas came in for some enquiry. Udayagiris gained As. 12 to Rs. 6-12 and Highland Produce As. 8 to Rs. 12-4 *cum-div.* Coonoor Teas were higher at Rs. 25-8, as against Rs. 25. Parksides were higher by As. 6 at Rs. 16 and Periakaramalais As. 2½ at Rs. 7-8½. Peermades, were, however, unchanged at Rs. 27-4 and Halleyburias at Rs. 14.

Rubbers came in for considerable support. Malankaras gathered As. 8 to Rs. 109 and Vaikundams As. 4 to Rs. 16-8. Peninsulars hardened by As. 2 and finished at Rs. 9-8. Thirumbadis moved up by an anna and finished at Rs. 3-4. Vellmalais were also higher by a similar amount at Rs. 2-8. But Rajagiris lost As. 2 to Rs. 10-12. Kallas and Pullangodes were fractionally lower at Rs. 3-8 and Rs. 2-15½, respectively. Teakoys were done at Rs. 8-2 *cum-div.*, as against Rs. 7-10 *cum-div.*

Coffees lacked interest except for Consolidated Coffees which put on As. 5 to Rs. 17-7 *cum-div.*, and Sheuroys which were fractionally higher at Re. 1-4, the rest were practically easy or unchanged. Coffee Lands, for instance, were lower by As. 4 at Rs. 8-12 *cum-div.* and Puthuthottams As. 2 at Rs. 3-2. Mysore Coffees were quiet at As. 13½ and Kadur Coffees at Re. 1-8.

Among miscellaneous scrips, Guntur Electrics gained Rs. 14 to Rs. 124 cum-div. and South Arcots Re. 1 to Rs. 94. Stanes Motors were higher by As. 8 at Rs. 12. Mysore Chemicals and Fertilisers advanced from Rs. 8-13 to Rs. 9-1. Aluminium Industries disclosed a gain of As. 6 at Rs. 11-14. But Rallis lost Rs. 2-4 to Rs. 61-12. Mettur Chemicals eased from Rs. 5-8½ to Rs. 5-5 and F.A.C.Ts. from Rs. 3-9 to Rs. 3-6.

JUTE EXPERT COMMITTEE

Readers may kindly note that, in the article on "Cultivation of Quality Jute" appearing on page 1002 of *Commerce* dated 28th November, 1953, wherever the term "Export Committee" occurs, it should be read as "Expert Committee."

Notice

THE MYSORE SPINNING AND MANUFACTURING COMPANY, LIMITED

NOTICE OF 82nd DIVIDEND

NOTICE IS HEREBY GIVEN THAT THE Directors by virtue of the power vested in them under the Articles of Association have determined to pay an Interim Dividend of Rs. 3 per Ordinary Share of Rs. 50 and a Dividend of Re. 1-2 (less income-tax) per 4½ per cent. Cumulative Preference Share of Rs. 50 for the half-year ended 31st August, 1953.

The Dividend will be payable at the Imperial Bank of India, Bombay, on and from Thursday the 4th February, 1954, to those shareholders whose names stand on the Register of Members on the 25th January, 1954.

The Transfer Books of the Company will remain closed from the 25th January, 1954 to the 1st February, 1954 (both days inclusive).

By Order of the Board,
N. SIRUR & Co., LTD.,
Managing Agents,
V. N. CHANDAVARKAR,
Managing Director.

Registered Office:—
TEMPLE BAR BUILDING,
70, FORBES STREET,
FORT,
BOMBAY, *14th December*, 1953.

NEWS IN BRIEF

OUT of a little over two lakh acres put under the Japanese method of cultivation last season throughout India, West Bengal's share was 61,800 acres.

About 88 per cent. of the new passenger coaches and 58 per cent. of the goods wagons, placed on the line during the two years ended March this year, were manufactured in India.

A sum of Rs. 101.6 crores will be spent on the National Extension Service during the Five-year Plan period. The Centre's share will be Rs. 68.3 crores and that of the State Governments Rs. 33.3 crores.

The House of the People passed, during the week, the Forward Contracts (Regulation) Amendment Bill and the Indian Tariff (Third Amendment) Bill. The Council of States passed this week the Banking Companies (Amendment) Bill, which had been earlier passed by the House of the People.

The final forecast of jute output in West Bengal for 1952-53 places the production at 2,412,000 bales, an increase of 82,200 bales over that for the previous year. The area under jute this year is 836,300 acres which shows a drop of 39,800 acres from last year's figure. The yield per acre is 14.4 maunds, as against 13.3 maunds.

A new plant for the manufacture of fountain pens and inks will be set up near Bangalore in collaboration with a leading British firm of fountain pen and ink manufacturers. The capital outlay for the plant will be Rs. 5 lakhs and will be entirely Indian. The English firm will supply the necessary technical know-how.

A scheme, costing Rs. 3.28 lakhs, for carrying out investigations into methods and practices of farming in different States, for which purpose the country will be divided into six agricultural regions, has been approved by the Advisory Board of the I.C.A.R. The investigations will be carried out over a period of three years.

The Advisory Board of the Indian Council of Agricultural Research has accepted a scheme for carrying out model agronomic experiments in the country over a period of two years, 1954-55 and 1955-56. The scheme will cost Rs. 4.77 lakhs. The experiments will be conducted at 34 centres, including 18 already in existence for T.C.A. work, in co-operation with cultivators.

The amount of foreign capital invested in the industries managed by the Industrial Trust Fund, Government of Hyderabad, is Rs. 18.5 lakhs. Revealing this in the State Assembly during question hour, the State Commerce and Industries Minister said last week that no information was available about the foreign capital invested in other industries in the State.

The Travancore-Cochin Government has fixed the minimum wages for employment in the cashewnut industry in the State. The wages have been fixed on the recommendations of a committee appointed by the Government for the purpose. An adult male will receive a minimum time rate of Re. 1-14 per day and an adult female Re. 1-4. These rates will be given effect to from 30th December, 1953.

In reply to a question in the House of the People, Mr. M. C. Shah, Deputy Finance Minister, said that no change in the present basis of depreciation allowance was possible. A rebate on the undistributed profits ploughed back into industry was already being given. The Government, he added, did not favour any change pending consideration of the recommendations of the Taxation Enquiry Commission which was examining the problem.

The nine-man Committee appointed by the tripartite conference of representatives of sugar factory-owners in U.P., labour and the State Government has recommended payment of bonus to employees of sugar mills in U.P. for 1952-53 who were on the rolls during that year at a rate 25 per cent. higher than that paid for the previous year. The Committee has appointed a three-man sub-committee to examine the cases of 16 sugar factories which have claimed relief from payment of bonus.

The Government of Bihar proposes to set up a State Financial Corporation, with an authorised capital of Rs. 2 crores, to provide financial assistance to medium- and small-scale industries. The authorised capital will be divided into 2 lakh fully paid-up shares of Rs. 100 each. Out of this only 50,000 shares will be issued in the first instance. The allocation will be: State Government Rs. 17.5 lakhs, Reserve Bank of India Rs. 10 lakhs, Scheduled Banks Rs. 12.5 lakhs, and other parties Rs. 10 lakhs.

The Government of India has decided to extend the term of the Income-tax Investigation Commission by two years up to 31st December, 1955. The Commission was set up under the Taxation in Income (Investigation Commission) Act, 1947, with a view, among other things, to investigating particular cases of tax evasion referred to it by the Central Government. The Commission has already been in existence for about six years and its existing term of appointment expires on 31st December, 1953. The extension now granted to the Commission is necessitated by the fact that the Commission has still a large number of cases, the disposal of which is expected to take another two years.

The Rajasthan Government has decided to extend the compulsory life insurance scheme of the former Jaipur State to all employees of the Rajasthan Government. The scheme will be compulsory for all permanent Government servants drawing a substantive pay of more than Rs. 50 per month and aged 50 and below. It will be optional for those drawing a substantive pay of Rs. 50 per month and below. The scheme will come into force in January, 1954. Those already insured with private insurance companies on the date of applicability of the scheme may be exempted to the extent they are already insured. Six and a quarter per cent. of the substantive pay will be deducted towards monthly insurance premium. Those who desire may contribute at the rate of 12½ per cent., subject, however, to medical examination.

• • • •

From Abroad

Private pension funds of workers in the U.S. are growing at an annual rate of about $2,000 million. More than $17,000 million have now accumulated in such funds covering over 10 million workers.

The U.S. cotton crop this year will be the fourth largest on record, according to the Department of Agriculture. The estimated production of 16,437,000 bales is almost 1.3 million bales above the 1952 crop and well above the ten-year average of 12,216,000 bales.

The Commodity Credit Corporation of the U.S. proposes to launch a programme to bolster American wheat exports by selling its huge holdings at world market price, that is, at 60 cents per bushel below the American support price, which is the price at which the C.C.C. acquired the wheat.

American private enterprise spent $2,500 million for research last year, according to a survey just published by the Harvard Business School. Manufacturers of aircraft, industrial chemicals and electrical machinery spent the most on research, but over one quarter of the companies in every segment of U.S. industry support a significant amount of research work.

The Government of Uruguay has signed the Annecy Protocol of Terms of Accession and has consequently become a contracting party to the G.A.T.T. on the 16th inst. The Government of Uruguay has also signed the Torquay Protocol. The accession of Uruguay has brought the number of G.A.T.T. contracting parties to thirty-four.

For the first time since the war, the Soviet Union bought at the London wool auction last week considerable quantities of a type of wool used primarily for the manufacture of fairly good worsted material and knitting yarns. It is estimated that over 500 bales of about 300 lbs. each were bought by Russia. The competitive nature of purchase by Russia caused prices to go up.

Three leading car makers in Japan are turning out cars at a peak level. During October last, these three manufacturers produced 3,070 regular size cars and 1,778 baby cars. In addition to Japanese makes, production and sales of foreign cars, now being assembled in Japan, are also brisk. The country's automobile industry is thus said to be enjoying the greatest boom since the end of the war.

The International Bank for Reconstruction and Development expects to offer on or about 12th January, 1954, a $100 million issue of United States dollar bonds through a nation-wide underwriting syndicate managed by the First Boston Corporation and Morgan Stanley & Co. The maturity of the new issue is expected to be approximately fifteen years. The exact maturity, the price and interest rate for the issue will be determined in the light of market conditions prevailing at the time of the offering.

Japan and Burma have signed a trade agreement which will be valid for four years. The provisions of the G.A.T.T. will be applicable in trade between the two countries. Additionally, Japan will accord to Burma as much facility as possible with regard to technical assistance. Under the agreement, Japan will import, beginning in 1954, 300,000 tons of Burmese rice at £50 per ton during the first year. During the subsequent three years, the imports will be between 200,000 tons and a maximum of 300,000 tons at prices to be agreed through consultation.

PERSONAL

MR. W. Jenkins, Director, Messrs. W. H. Brady & Co., Ltd., left for New Zealand this week on three months' holiday.

Mr. Padamji Ginwala, Director, the Indian Iron and Steel Co., Ltd. Calcutta, has returned from a visit to Europe.

Mr. Herbert Hill, Director, Messrs. Begg, Sutherland & Co., Ltd., Kanpur, has been elected President of the Upper India Chamber of Commerce, Kanpur, for the year 1954.

Mr. A. C. N. Nambiar, Minister of India to Denmark, Sweden and Finland, has been conferred upon, by the President of India, the personal rank of Ambassador of India during his present term of appointment.

Dr. Phillip Vincent Cardon, an eminent agricultural scientist of the U.S., has been elected Director-General of the U.N. Food and Agriculture Organisation, in succession to Dr. Norris Edward Dodd who held this post for the past seven years.

Mr. K. N. R. Ramanujam of the Reserve Bank of India, Bombay, will be one of the members of the Indian delegation to the Commonwealth Finance Ministers' Conference to be held in Sydney, and not Mr. Ramaswamy, as was reported in these columns last week.

Prof. C. N. Vakil, Director, University School of Economics and Sociology, Bombay, has returned from the U.S., which he visited as a leader specialist on the invitation of the U.S. Government. Prof. Vakil has been elected a member of the Executive Committee of the International Economic Association for a period of three years.

Mr. A. K. Chanda, Secretary, Ministry of Production, Government of India, has been appointed Comptroller and Auditor-General of India, in succession to Mr. V. Narahari Rao who is due to retire in August, 1954. Mr. Chanda will relinquish his present post at the end of February next and join the Office of the Auditor-General as Officer on Special Duty, before taking over the post of Comptroller and Auditor-General.

Mr. R. A. Butler, Chancellor of the Exchequer, U.K., is expected to visit India in the fourth week of January, 1954, on his way back home from the Commonwealth Finance Ministers' Conference to be held in Sydney on 8th January. Mr. Butler will lead the U.K. delegation to the Conference. The other members of the delegation are: Mr. J. G. Foster, Under-Secretary of State for Commonwealth Relations, the Earl of Munster, Under-Secretary of State for the Colonies, Sir Leslie Rowan, Second Secretary at the Treasury, Sir Frank Lee, Permanent Secretary of the Board of Trade and Mr. R L. Hall, Director of the Economic Division of the Cabinet Office.

"COMMERCE" 1928

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

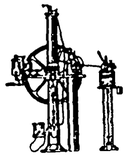
CALCUTTA, 22nd December

India's Western Gateway

The opening of King George's Dock at Calcutta next week by the Viceroy calls to mind the ceremony when Lord Hardinge visited Bombay in March, 1914, to open the new Alexandra Dock and the visit of H.R.H. the Prince of Wales to open the Prince's Dock, Bombay, in November, 1875. These ceremonies are but milestones on the road of progress, each leading up to greater possibilities. They mark the growth of industries generally, to which the dock-gates are the portals. It was in 1689, the year before Sir John Child moved the headquarters of Government from Surat to Bombay, that the need of a dry dock was brought to the notice of the Court of Directors in London. They manfully responded to the appeal and sent out large quantities of iron for use in the construction and repair of ships; but, in spite of their sanction, it was half a century before steps were taken to build a dry dock and to improve the "wretched arrangements hitherto deemed sufficient for repairing ships." History does not explain the delay, but it must be remembered that at that time there was little "hustling" and the example of Sir John Child, who pocketed the funds for building Bombay Cathedral, may have been imitated by his subordinates.

LABOUR CRISIS? . . .

DO YOU WANT TO INCREASE YOUR PRODUCTION?



'MIRA' SODA WATER MACHINE

GIVE A BOTTLE OF AERATED WATER TO YOUR WORKERS. IT WILL HELP THEM TO WORK MORE.

INSTALL ONE 'MIRA' AERATED WATER MACHINE WITH AUTOMATIC CORKING AND FILLING IN YOUR CANTEEN AND INCREASE YOUR PRODUCTION. PRICE RS. 1,200. COST OF PRODUCTION ANNAS 2/- PER DOZEN. FREE SERVICE.

ESSENCE & BOTTLE SUPPLY (INDIA) LTD.

14, RADHA BAZAR STREET, CALCUTTA-1

FOOD SURPLUS

THE paradox of poverty amidst plenty has for long been the bane of the world's food economy. And it looks as though it will continue to provide the greatest stumbling block to all energetic economic planners. World food output has, no doubt, shown some encouraging improvement in recent years. It averaged about 10 per cent. more than before the war in the three years 1948-49 to 1950-51 and rose by 13 per cent. about the pre-war level in 1951-52 and by 17 per cent. in 1952-53. In the Free world, the output improved by 15 per cent. during the period 1948-49 to 1950-51 over the pre-war level, by 19 per cent. in 1951-52 and by 23 per cent. in 1952-53. Thus, in the last few years, food output has exceeded the growth of world population, estimated at 1.4 per cent. per annum. It was this performance on the world's food and agricultural front that induced Mr. N. E. Dodd, the erstwhile Director-General of the Food and Agricultural Organisation (F.A.O.), to remark, in his foreword to the F.A.O.'s report, entitled the *State of Food and Agriculture, 1953*, that the year 1952 marks a "new phase in the post-war food and agricultural situation."

This creditable performance, however, masks certain depressing possibilities and trends. In the first place, the expansion of agricultural and food production, as the F.A.O. report pointed out, owes much to good weather and harvests in most regions in 1952-53. But one or two years of bad weather, as the report warned, "would set back the world food position considerably." This means that the margin is not wide enough for viewing the position with optimism. Secondly, the trends themselves are diverse. Although the world food output has improved by 17 per cent. in 1952-53 over the 1934-38 level, there are certain regions where the position is not really quite so comfortable. Thus in the Far East (excluding China), the increase is only of the order of 3 per cent.

In sharp contrast to the Far East stand North America, Latin America, Oceania and Africa where food production has improved by 46 per cent., 34 per cent., 18 per cent., and 34 per cent., respectively. These countries are thus burdened with surpluses, while there are many parts of the world where food intake is still below the pre-war levels which themselves were abnormally low. In India, for instance, the *per capita* calorie content of food is only 1,620, as against 1,970 before the war. Nearly 70 per cent. of the world's population live in the less developed regions. To raise their average diet to the present average for the world as a whole —the world level itself is only about one-half of the American level—would require, according to Mr. Dodd, an "additional supply equal to the total 1952-53 production of North America and Oceania combined." There can thus be no lack of demand for food. But it is only potential demand, since the underdeveloped regions lack the necessary purchasing power. This large but ineffectual demand exists in certain parts of the world, while other parts are burdened by growing surpluses of food.

It is, therefore, hardly surprising that the F.A.O. Conference, which concluded its three-week session at Rome last week, should have considered the problem of increasing the food consumption in the less developed regions and the more immediate problem of the food surplus in certain areas of the world. The Conference has stated that, until the "economic progress of the less developed regions raises the purchasing power of their people, there can be no final solution to the problem of malnutrition and no satisfactory balance of international trade in agricultural products." It reaffirmed its faith in commodity agreements to stabilise agricultural prices and appealed especially to hard currency countries, to help remove trade obstacles by liberalising imports. On the question of the disposal of food surpluses, it recommended that the F.A.O. member Governments should dispose of their surpluses "in an orderly manner, so as to avoid any undue pressure resulting in sharp falls in prices on world markets." As an immediate measure, the Conference instructed the F.A.O. to draw up special distribution programmes, such as feeding of children, together with the World Health Organisation and the U.N. International Children's Emergency Fund. A special F.A.O. Committee will meet at Washington early in 1954 to study the best means of disposing of surpluses. This Committee's deliberations will, naturally, be watched with interest in this country, which still remains, despite sizable increase in food production, a large importer of foodgrains.

MADRAS-ANDHRA RICE DEAL

The new rice deal agreed to by the two Governments of Madras and Andhra is of a type that would certainly shake one's faith in the formation of new linguistic States in the country. Before the Partition of Madras, the State Government got rice from the surplus Andhra districts for distribution in the deficit districts of the composite State. Rice flowed freely without any price restriction between the districts under the zonal arrangement for distribution of the commodity. After the Partition, the Government of the 11-week old linguistic infant State demanded discontinuance of the regional system which linked certain Andhra districts with certain deficit districts of the residuary State. Further, it asked for payment of a bonus of As. 8 to a rupee for every maund of rice exported from Andhra. Madras being a deficit State, the demand gave rise to a piquant situation, requiring the urgent intervention of Mr. R. A. Kidwai, Union Minister for Food and Agriculture. Mr. Kidwai has of course, brought about a settlement but only at the cost of a sound principle. Thus, the agreement conceded that the Government of a State which has a surplus of food can extort a special price from the neighbouring State which is deficit in that commodity. That this is an unsound principle, capable of doing great harm to the unity of this country, needs no reiteration.

The Madras-Andhra deal is linked to the purchases of rice made by the Madras Government in Andhra areas in 1953. This year the Government of Madras got 200,000 tons of rice from the Andhra area—100,000 tons by procurement levy and another 100,000 tons by other arrangements. Under the new deal, the same quantity is required to be sold by the Andhra Government in 1954. Of this quantity, sale of 100,000 tons would be on a Government-to-Government basis and the balance will be sold by the Andhra Government to the merchants of Madras. The price at which the Madras Government would pay for the rice would be the same at which it got rice this year, though the trend of prices is generally downward. It is stated that the Andhra Government would make a profit of As. 3 to As. 4 on every maund sold to the Madras Government. The price payable by the Madras merchants would be lower than those paid by them hitherto; they would, however, be slightly higher than the price charged to the Madras Government. But what is most important is that on this sale, the Andhra Government would earn a profit of As. 12 on every maund of rice sold to merchants. Thus on all the sales made to Madras State the Government of Andhra would make a profit of As. 8 per maund. It is said that this is the same as the bonus paid to Orissa on every maund of rice it exports, but the point is that before the State was partitioned, the people in Tamilnad and other parts of the Madras State had not to pay this additional price for the rice they got from the areas which now constitute Andhra. That apart, a mistake once made (in the case of Orissa) cannot be an excuse for making more mistakes.

When asked to explain the presence of the bonus element in the price charged by the Andhra Government, Mr. Kidwai stated:

> "The Madras Government will not have to pay a single pie extra to the Andhra Government for the rice they require. They have agreed to take rice from Andhra because they will be getting it at a price at which they themselves got this year. Madras merchants who were paying a higher price in the open market in Andhra will get rice in the coming year at a lower price. So everybody should be satisfied."

Mr. Kidwai's explanation would, of course, be sound and reasonable, if prices next year were to remain higher, or at the same levels as those this year. But the world trend, as also the expected bumper rice crop in this country, suggests the possibility of a declining trend in rice prices next year. In that event, the Madras State would certainly stand to lose by the agreement which has allowed bonus payment through the backdoor. This apart, it is strange that the State Government should have resorted to profiteering—about Rs. 25 lakhs—at the cost of the deficit districts which formed part and parcel of one State till almost yesterday. People in this country are even to-day told to believe that formation of linguistic States would not affect the economic well-being of the country as a whole, and that it would not threaten the unity of the country. That these views are not dependable is proved by the bellicose attitude adopted by the Andhra Government towards the Madras State. The rice deal under reference is a clear indication of the separatist economic tendencies which have cropped up between Andhra and Madras. It should serve as both a lesson and a warning of the dangers which are pregnant in the formation of linguistic States.

PLANNING POWER OUTPUT

Reports from New Delhi aver that the Planning Commission is concerned over the fate of its plan for power output from multi-purpose projects. It is stated that the estimated capacity that is being, or is shortly to be, installed bears no relation to the foreseeable demand for it. Consequently, the Planning Commission is stated to have decided to set up a technical committee to enquire into the matter, taking into consideration the resources available for development plans in general. So far, the only project where prospects for the consumption of the entire quantity of power generated are bright is believed to be the Damodar Valley. It is feared that there may not be sufficient demand in the foreseeable future even for the electricity generated by the only power plant which the Government has decided to set up at Bhakra-Nangal. Similar views are held in regard to the Hirakud.

The picture thus presented is certainly intriguing. There are two schools of thought, one holding that the demand for power should precede supply and the other, that the supply will create, as has happened in the State of Mysore and elsewhere, its own demand in course of time. We have generally supported the latter school and we have no reason to change our view. Nevertheless, it must be admitted that the question whether it is wise to create an excessive surplus through simultaneous generation of electricity at all multi-purpose projects, leaving demand to wild speculation is an important one. Certainly, there should be some reasonable relation between installed capacity and the expected demand determined by the possible decentralisation of industries, the establishment of new industrial units and the popularisation of electricity for lighting, cooking and other non-industrial purposes.

RAJASTHAN'S TAX PROBLEMS

In the leader on the subject of the Rajasthan State Government's memorandum to the Taxation Enquiry Commission, which appeared in our last issue, a reference to an important feature of this document, namely, the Government's views on the objectives of a sound tax policy, was unfortunately left out, when the page was made up, for considerations of space. In view of the realistic stand taken by this State Government, it deserves to be recorded in these columns. A sound taxation policy, according to the Rajasthan Government, should aim at "equal distribution of income, encouragement to workers engaged in productive activities and maximum social advantage"; it is not opposed to estate and inheritance taxes. But the Government hastens to emphasise that inequality in the distribution of income is inevitable. It adds that all that a sound taxation system should aim at is only the "diminution of inequalities," and that, even in this respect, the principle should not be "stretched to the extent of discouraging savings" so essential to the economy of the nation." This is an eminently reasonable stand, indeed, which, in these days of uncritical socialistic tendencies, needs to be particularly emphasised.

EUROPEAN ECONOMIC SCENE

Once again, the Organisation for European Economic Co-operation has administered the warning—in the course of a survey issued this week—that hesitant approach on either side of the Atlantic will harden the division between the dollar and non-dollar areas and will strengthen resistance to the changes required. If, therefore, a freer competitive economy in the international sphere is to be re-established, new initiatives in scope, as well as purpose, are, according to the Organisation, necessary. In its considered opinion, a lasting solution to the world's dollar disequilibrium lies in a change in the basic economic policies of the U.S. and the European countries.

These are indeed very pertinent remarks which indicate how vital a role the countries of Europe and the U.S. play in shaping the world economic set-up. That the European countries have fully realised this factor will be evident from the importance attached to the problem of maintaining a high level of economic activity. Two notable aspects of the changed policies of the Governments of these countries are: (1) Greater reliance on material incentives to stimulate production and deliveries and (2) recognition of the principle, particularly in countries other than the U.S.S.R. and its camp-followers, that private enterprise has a continuing part to play in economic progress. An idea of how far and to what extent such a shift in emphasis in the economic policies have helped in the task of economic development can be had from the *Economic Bulletin for Europe—Second Quarter, 1953*, recently published by the Secretariat of the Economic Commission for Europe.

According to the *Bulletin*, industrial production in most of the West European countries registered improvement during the second quarter of 1953. Similarly, in the field of agriculture, the outlook is believed to be generally promising. Wheat crop, for instance, is expected to reach record levels. The output of other grains, particularly barley, is also expected to be appreciably higher than that a year before. In the field of trade and payments, too, the majority of countries improved, during the period under review, their balances of trade. The terms of trade improved further for almost all countries, as commodity prices continued to decline. Both overseas imports and exports were higher in volume. The proportion of overseas imports coming from the dollar area has been diminishing since the second quarter of 1952. Exports to dollar countries continued to increase. Additions to reserves from transactions with the U.S. were even higher than they had been in the first quarter of 1953, mainly because of the seasonal increase in tourist earnings and a new rise in exports to the U.S. In Latin American and Middle Eastern markets, Western Germany continued to advance at the expense of the U.K.

Additions to dollar reserves from transactions with the U.S. which had been secured in Continental Europe since the second quarter and in the U.K. since the third quarter of 1952 were even higher than in the first three months of 1953; such additions to Europe's convertible reserves reached $530 million during the second quarter. A good two-thirds of this was gained by the U.K. and W. Germany. The only countries which suffered significant losses of gold and dollar reserves during the quarter were Belgium and Norway, both of which paid gold to the E.P.U. This further strengthening of European dollar reserves was due mainly to the seasonal increase in tourism (with direct receipts from travel rising by $66 million from the first quarter to a level roughly one-fourth above that of the second quarter of 1952) and a new rise in exports to the U.S.

Commodity prices, which began to fall in the early spring of 1951, continued to decline gradually throughout 1952 and the first eight months of 1953 and were, in a number of cases, no longer above those ruling before the outbreak of the Korean conflict. The fall in foodstuff prices had been much less marked. Disparities between prices charged by hard and soft currency countries, which had widened during the Korean crisis, began to narrow down in the third quarter of 1951 and for a number of commodities had disappeared by the middle of 1953. During the quarter under review, the prices of some commodities—petroleum, wool, cotton, lead and sugar—rose moderately, while those of wheat, tin and rubber fell substantially.

In the East European countries, the second quarter of 1953 witnessed the adoption of further measures with a view to achieving the objective of bettering the lot of the consumer. Priority was thus given to augment supplies of consumer goods. It is necessary, however, to distinguish in this respect between the U.S.S.R. and other E. European countries. On the most general level, the increased emphasis on consumption constitutes a sharper reversal of policy elsewhere in E. Europe than in the U.S.S.R. In the latter country, the successive annual reductions in retail prices are evidence of a continued increase in consumption during the last several years. The more rapid growth of consumption now envisaged is represented as a natural development of this trend, now that a particular level of economic development and military preparedness has been achieved. In other E. European countries, by contrast, no such continuity of policy is claimed. The policy changes are often explicitly recognised as corrections of a previous over-emphasis on investment and other forms of accumulation at the expense of consumption levels, which do not appear to have improved.

The need for a higher rate of investment in agriculture has now been officially recognised in many E. European countries and the importance of material incentives to farmers has been re-discovered. In the U.S.S.R., the unsatisfactory level of agricultural production has attracted notice and several important reforms have been introduced. The measures adopted fall under two broad groups. First, increased resources—capital and current—are channelled to the agricultural sector. The second group of measures represents essentially a change in attitude. The main features are acceptance of the need to rely more on material incentives to raise output from collective farms, and recognition that individual enterprise, as practised on the plots of land which members of collective farms are still allowed to retain for private cultivation, has a continuing and important part to play in Soviet agricultural production. The importance of raising output on private plots, it is stated, has been explicitly affirmed, and a substantial part of expenditure on acquiring cows is allowed to be set off against tax liabilities in 1953 and 1954.

OFF THE RECORD

(By "ROVER")

WITH both the Prime Minister and the Finance Minister addressing important gatherings in Calcutta, the eyes and ears of the country's business community had naturally been turned towards this eastern metropolis this week. Even otherwise, December is an important month for commerce and industry, as the policy decisions behind the budget of the Government of India and those of the States are taken about this time. However, closely the secrets of the budget are guarded, there is always some scope left for intelligent anticipation, by shrewd observers able to read between the lines of authoritative pronouncements of Ministers, controlling the fiscal and financial policies of the country. When these utterances are specifically directed towards important sections of the business community, they are bound to reveal the way the Ministers' minds are working on important issues.

While there was much in the public addresses of both these Ministers at Calcutta, to create a sense of confidence amongst business men about their future, it remains to be seen how far they would have this wholesome effect and promote expansion of industrial activity in the coming year. It is not the first time that top-ranking Ministers have given expression to similar sentiments about the usefulness of and scope for the private sector in the country's economy. What is amiss is with the policies which are pursued simultaneously with these rather empty assurances. They have failed to create that sense of confidence, without which no enterprise and enthusiasm are possible.

Leaving it to others to analyse the contents of these speeches, which business men all over the country are scanning carefully, I should like to say a word about the general tone and tenor of these seasonal revelations. So far as the Finance Minister, Mr. C. D. Deshmukh, is concerned, there is little to look for in this direction. He is always his suave and soft-spoken self, at least at public gatherings, even though he may reveal a bit of a temper and impatience very occasionally in Parliament. He may not (few Finance Ministers can really afford to) say what might gladden your heart and set at rest your general misgivings. But Mr. Deshmukh can be depended upon to wrap up the bitterest medicine which he might have to administer in a coat of sugar or honey, to ensure that his victims swallow it without making a wry face. Even the medical profession has failed so far to press into its service the anæsthesia of words and sweet reasonableness which Mr. Deshmukh has discovered, to make his painfully unpleasant pills, potions and incisions harmless in their appearance. It would be sheer waste of time to analyse the form into which his speeches are cast to get a peep into his secretive mind. All that one can gather from what he said at Calcutta is that no one should expect anything by way of tax relief from him in the coming budget. There was a lingering hope in some quarters that he might be prevailed upon to give some direct incentive to industry at this critical moment when stagnation threatens it. If it can be taken for granted by implication that there would also be no fresh burden imposed on it, that in itself should be construed as incentive enough in the present circumstances.

But it is exactly the reverse with the Prime Minister. What Mr. Nehru says and how he says it often reflect not only the working of his mind but as much his mood of the moment and his temper. Though he is one of the most prominent figures in the world of diplomacy to-day, he has, perhaps, the least resemblance to the diplomat of tradition or even the more aggressive, smooth and demonstrative type which the U.S.S.R. has now made familiar to the international world. Mr. Nehru is too sincere and outspoken to suit either pattern. But what marks him out as a public figure, from the usual run of politicians strutting on the international canvas, is not so much his impulsiveness as his habit of groping and searching in the company of those he is dealing with or talking to, for a solution to any given difficulty rather than the professional attitude of selling one already decided upon by him, adroitly to his listeners.

For him, not only conversation but even a more formal mode of address is an occasion for an intellectual adventure in company with others in thinking out aloud the various perplexities of a situation. He has his share of prejudices and propossessions like any other mortal, but he does not start with these as his unshakeable premises. Neither has he any mental reservations, when he is in this mood of indulging in what I would like to call a mental adventure in search of a synthesis for his thesis and antithesis. It is a delightful trait, which generally does not fail to endear him even to those who fail to see eye to eye with him on momentous issues For some time, this distinguishing characteristic of his had not been in evidence in his public dealings. It may be that he has been overburdened with anxieties and work: it may be that he has not been in the best of health recently. Whatever the cause, Mr. Nehru's speeches and even his general attitude towards the many problems and happenings which are bound to beset a busy man of his position and status, have been marked recently by a lack of this quality of taking his listeners completely into his confidence, adventuring forth hand-in-hand with them and revealing to them his misgivings and his leanings. In fact, his reactions on occasions have been marked at times with peevishness and oftener by a lack of general appreciation of the other fellow's difficulties.

Apart from the vaguely reassuring statements which he made and the sentiments he gave expression to in connection with the future economy of the country and the undefined and the still very uncertain place of the private sector in it, it was his return to his former form at Calcutta, while addressing the Associated Chambers of Commerce, which brought good cheer to my heart. After a lapse of months, Mr. Nehru was his old self again. In spite of the proposed U.S.-Pakistan military pact weighing heavily on his mind, the Prime Minister was keenly alive to the extremely fluid economic situation in the country to-day and anxious to find a fair, just and workable basis for stabilising it. He was not dogmatic, as he is apt to be when put out by some unexpected development. He appeared, unlike some of his colleagues, even prepared to concede that whatever conflict had arisen was there not because of uncontrolled selfishness, greed or unreasonableness on the part of business men but because of the nature of things themselves and had to be resolved in a spirit of compromise and not compulsion of one element or another.

What, for instance, could be more conciliating and disarming than Mr. Nehru's ready admission about the vulnerability as well as the cracks and crevices in the national Plan? He even went to the length of confessing that it was not so much a plan as an approach to the problems facing us to-day. He defined it as an attempt to evaluate the available resources and the best method of utilising them for the benefit of the country. There is little you can say to a man in high authority, who comes out with a candid statement that "we are learning by error and trial," even though it be obvious that many of his fellow ministers, in spite of many errors and trials, had learned precious little from experience. Similarly, his attempt at explaining to the business community the Government's difficulty about arriving at clear cut and quick decisions arising from the necessity imposed by the democratic set-up, was in the nature of pleading for patience and understanding. It was at the same time another way of saying that all the decisions which were taken could not be based on merit. It is not infrequently that the business community is driven to accuse the Government of submitting to political compulsions and appeasing recalcitrant interests, instead of dealing in a just and fair manner with all the interests concerned. Self-preservation being as powerful an instinct with institutions and Governments as with individuals, the business community has to get reconciled to this fact.

I do not think I am alone in holding, after a careful perusal of this speech of his, that Mr. Nehru was not only aware of the various contradictions and weaknesses of his Government's economic policy, but that he was either consciously or subconsciously apologetic about it. He possibly wanted the business community to understand the limitations within which his Government had to work in the economic field and the care and compromise with which it had to meander its way in a field strewn with land mines. He was obviously at great pains not so much to justify as to explain the stark reality of the situation which made him countenance and give his consent to policies, which could not possibly stand a test of logic and reason.

And finally, the Prime Minister neither belittled nor ignored any of the major points raised by Mr. E. J. Pakes, President of the Associated Chambers of Commerce, in his address. He freely and openly avowed that they were important. He did not question the validity of most of these. All that he asked from business men was that they should try to look at these problems from a different angle, meaning, of course, the angle from which a man in his position and with his responsibility had, perforce, to view them. Used as we are either to evasions or more often to airy and arbitrary dismissals of crucial points raised in any controversy with some of the arrogant State Chief Ministers and partisan Ministers even at the Centre, this refreshing candour and the innate courtesy of approach in the attitude of the Prime Minister must have come as a pleasant and welcome surprise.

There is another aspect of this speech to which I should like to draw the pointed attention of those engaged in industry. An important and more demonstrative section of the party in power over which the Prime Minister presides is burdened with a cramping heritage of hatred for machines. These people are blind to the otherwise easily ascertainable fact that it is not the machines in themselves but the greed and the cruelty which form part of the human mind, which have made of industrialisation so ugly and unhealthy a form of economic organisation of society. There were no machines in the age when human slavery or untouchability flourished and were looked upon as economic necessities of the social order of the day. Exploitation of fellow human beings began long before the Machine Age. Only it took different forms in those days. All the same, this section, moved more by preconceived prejudices, has found in the present increase in unemployment an excuse for attacking the machines and those who use them for profit. Being highly gifted with a rationalist and scientific turn of mind, the Prime Minister obviously does not share in this prejudice and he must have had to do great violence to some of his cherished convictions in accepting some of the policies based on it, as can be seen clearly by reading between the lines of his Calcutta address. The business community is naturally alarmed at this new anti-machine prejudice which has already found recognition in some official circles and has begun affecting Government policies. The only solace for mechanised industry lies in the fact that the Prime Minister, with his obvious leaning towards what he calls a "jet plane economy," might be trusted to keep the wilder men from attempting completely to ruin industry in their misplaced zeal.

GOVERNMENT ALIVE TO PROBLEM OF UTILISING IDLE PRODUCTIVE CAPACITY?

TARIFF COMMISSION ON RIGIDITY OF COSTS

(From A Special Correspondent)

NEW DELHI, 15th *December*

WAYS and means of reducing the idle capacity in industry as far as practicable have begun to engage the attention of the Government of India. Although the Government has been aware of this need for some time past, the unemployment problem and the report of the Expert Committee on Engineering have made it realise that a careful and well designed policy might bring about fruitful results especially if suitable measures of co-ordination were taken to utilise fully the inherent capacity of the various sections of industry from the point of view of maximising production. In some of the basic metal industries, the output has been a mere fraction of the installed capacity. This is particularly noticeable in the manufacture of pipes and tubes, machine screws, razor blades, etc. The present rate of production of diesel engines is barely 40 per cent. of its capacity. The position is not encouraging either in regard to twist drills, plain calico looms, complete ring spinning frames, carding engines, conduit pipes, etc. Some industries like malleable iron castings complain of excessive imports of certain types of goods which could be produced by the industry itself, non-utilisation of its capacity by the railways to the desired extent and difficulties in the procurement of steel melting scrap at controlled prices. Similarly, the machine tool industry, and a number of machinery manufacturing concerns engaged in production of machinery for the jute, sugar, tea industries, etc., have been complaining that their capacity is not utilised fully for some reason or other.

DELHI LETTER

The Government of India recognises the fact that mere restriction of imports will not solve the problem, without, at the same time, ensuring quality production in all these matters. The whole problem is now being examined afresh at high levels. At first, the Government is likely to take such measures as are necessary to facilitate imports of essential raw materials for augmenting the output of these industries. In regard to the engineering industry, for instance, the Government is likely to liberalise imports of special quality steel and also some essential non-ferrous metals. Now that the steel supply position in Europe and the U.S. has eased considerably and the prices of steel are being revised downwards, there will be no difficulty in getting adequate quantities of steel from abroad. At the same time, the Government may give greater preference to the use of indigenously manufactured goods in its departments, as well as in quasi-Government concerns, with a view to stabilising the progress of the country's engineering industries. The import policy is now being reviewed from this angle.

Electrical Industry

The idle capacity in the electrical industry is also being estimated at the same percentage as is prevalent in the engineering industry. This fact was revealed by the President of the Indian Electrical Manufacturers' Association, which held its meeting here this week. "The underlying causes," he pointed out, "are, to a large extent, attributable to the rigidity of economic conditions, under which the Indian industries are carrying on their production. The cost structure has attained a rigidity on account of the enforcement of the Minimum Wages Act and it has become impossible for the industries to compete with foreign manufacturers. The situation becomes worse when factors governing production costs are conveniently ignored in placing Government orders." The President further suggested the appointment of a Development Council for the industry, so that it might keep pace with the rapid growth in the country of the generation of electrical energy and to co-ordinate the various sectors of the industry along lines of progressive development. This meeting was inaugurated by the Production Minister, Mr. K. C. Reddy, who assured the industry that Government would always pay particular attention to the production potentialities of these industries in its formulation of the import policy. He also told them that the Government would not duplicate production in its Dry Core Cable Factory or for that matter in its proposed Heavy Electrical Plant Manufacturing Company.

The rigidity of cost structure of industry has received considerable prominence of late in Government, especially after the note submitted to it by the Vice-Chairman of the Planning Commission, Mr. V. T. Krishnamachari. He stated: "It is commonly felt that, owing to welfare legislation, labour costs have increased, with no corresponding increases—rather decreases—in output and that the diversion of surplus labour in some fields into useful directions has become impossible. *This requires careful examination and* remedial action." The Government has now appointed a committee of high officials to examine and report on the question to the Cabinet.

Tariff Commission's Views

This aspect of the problem has also received particular *mention in the latest report of the* Indian Tariff Commission. The Report says:

"Examination of the cases of several industries by the Tariff Commission during 1952-53 (October-September) revealed a trend towards an increase in costs, particularly in labour costs. The retention prices or control prices of commodities like steel, raw rubber and tin plate had to be revised upward after the necessary enquiries. Protected industries continued to complain of consumers' prejudice and to put forward this as a ground for continuance of a measure of protection. In some of the protected industries, as well as in the industries seeking protection, it was found that proper scientific system of costing did not exist and, therefore, the determination of the precise quantum of protection required by the industry, was somewhat difficult. Complaints from consumers against protected industries for taking advantage of protection to charge high prices were remarkably few. Several protected industries represented to the Commission that the liberalisation of import policy had reduced or nullified the effective protection enjoyed by them and asked for review of the position. A noticeable feature of several cases of industries coming up either for fixation of prices or grant of protection was the high cost at which their fixed capital, including machinery and buildings, had been acquired and installed. This is of the greatest significance not only to the competitive position of the industries themselves but also to the building up of a sound low cost industrial economy for the country."

Of the 44 industries currently enjoying protection, protection has been granted to 25 by the mere conversion of the revenue duty into an equivalent protective duty, says the Report. The significance of such conversion is that, once an industry is protected, the quantum of protection can be varied from time to time by a notification under section 4 (i) of the Indian Tariff Act, 1934. In these cases, no additional burden has been imposed on the consumers. The remaining 19 industries have been granted protection by an increase in the revenue duty in force prior to the grant of protection. For many of the industries, protection has been renewed after the initial period. One or two industries enjoyed subsidy also in addition to protection, some time ago; at present, no industry enjoys subsidy.

The general price trend in many of the protected industries has been very steady. Among these mention may be made of sewing machines, cotton belting, grinding wheels, ring frames, oil pressure lamps, hurricane lanterns, spinning rings, spindles, looms, bicycles, machine screws, etc. In some of them, there was even a slight decline in prices. The Report, however, fails to give a critical review of the progress of the various industries in regard to production, the extent of self-sufficiency, quality of the products manufactured, etc. Viewed thus, it is a very disappointing performance. The country expects a more critical assessment of developments in the protected sector and of the Government's policy pertaining to it, inasmuch as it is not an appendage of the Government but an independent commission.

(Concluded from next column)

electricity instead of coal; the promotion of greater fuel efficiency in industry; the better cleaning of coal at the pits. As the report admirably sums up: "It is simply a question of balancing the cost and inconvenience of enforcing a more efficient and scientific use of our fuels against all the advantages to be obtained in health, convenience and economy from a clear atmosphere." So the doom of Britain's "smog" can be decreed.—*All Rights Reserved.*

"SMOG" NUISANCE IN U.K.

ADOPTION OF CONTROL MEASURES NECESSARY

(From Our Own Correspondent)

LONDON, 5th *December*

A LONG-SUFFERING public, inured to the rigours of an English winter—never sufficiently certain to enable adequate precautions to be taken against them—was startled a few weeks ago by a medical group who warned them of the deadly nature of their familiar London fog and offered them a mask to wear for protection. Fog, the public were told, was one thing, inescapable from this island's climate, but it was made deadly by the addition of smoke, grit and sulphur particles which combined to produce "smog". Of course, "smog" and the "smog mask" immediately became a London joke—until the Minister of Housing introduced this week the Interim Report of the Special Commission on Air Pollution which he had set up to study the phenomenon and to make recommendations. Now "Smog" has received official recognition and the Meteorological Office is to issue "smog" warnings whenever an area is likely to be affected for more than 24 hours.

LONDON LETTER

The arch-criminal in this pollution of the British climate is the domestic fire which accounts for half of the two million tons of solid matter that is deposited over this country every year as a result of inefficient fuel combustion. Industry, including the power stations, accounts for nearly the other half, leaving a small balance to be made up by railway engines and motor cars—the latter contributing oil particles and carbon monoxide. On the fuel side, the loss caused by inefficient combustion is put between 5 and 10 million tons—approaching 5 per cent. of the total solid fuel output of the country. But apart from this loss there is a vast damage to property, a huge national laundry bill and ill health. The Commission put the national loss, in so far as it is calculable—apart from the fuel loss—at some £100 million a year. If this were all it would be worth special measures, but in December, 1952, the prolonged fog killed 4,000 persons and caused suffering to many thousands more. And year by year, we are told, the smoke and the sulphur absorbed by the respiratory system weakens the nation's health and renders the population more subject to other diseases.

Apart from smoke, especial damage is done by sulphur and there industry has the chief responsibility, supplying three-fifths of the pollution, while the balance is jointly contributed by the power stations and the domestic grates.

Remedy For the Trouble

The Committee points the way to remedy the trouble. There are 12 million old-fashioned grates in this country which will take time to replace: they cannot burn smokeless fuels. Modern grates must gradually become standard and enough smokeless fuel must be produced for all the large urban areas to use. Already local authorities are required by law to install grates of certified efficiency in new buildings—the same should be required of all private builders. While if the Government were to lay down that in 10 or 15 years' time, only smokeless fuels could be burnt in open fires in scheduled urban areas, the problem would be well-nigh solved. Perhaps they are awaiting the final report of the Committee before taking such a drastic step.

So far as industry is concerned—half the smoke and three-fifths the sulphur—the problem, says the Committee, is completely solvable. Smoke-abating devices already exist and industry only creates half the pollution caused domestically per ton of fuel consumed. Though the general introduction of fully-efficient smoke abators would mean substantial capital expense, the saving to the nation would far outweigh the cost. Smoke pollution by industry could be ended in a very few years, if the country so decided.

Can anything be done meanwhile? The smoke control measures in industry could be brought to full efficiency for this winter; greater care could be taken in stoking; householders should use coke or smokeless fuels to the capacity of their equipment whenever fog is forecast and avoid banking up their coal fires at night; no rubbish should be burnt, while the "emergency" lasts. These are the palliatives—the longer term measures include the production of more smokeless fuels; greater use of gas and

AMERICAN LETTER

CONFLICTING TRENDS IN U.S. ECONOMY

NO SERIOUS RECESSION, HOWEVER, FEARED

(From Our Own Correspondent)

NEW YORK, 10th *December*

THE improvement of sentiment, noticeable for the past few weeks, continues here. The stock market, which, rightly or wrongly, is looked upon as the barometer of business conditions, has perked up in a mild sort of way. The conclusion is that whatever mild recession may occur will not be serious. The markets were cheered particularly by the continuation of an avalanche of year-end dividends and by the consideration that the promised elimination of the excess profits tax and the reduction in income-taxes makes for a happy 1954 corporate outlook. In fact, the news is such as to make it possible for optimists to find evidence that business is well maintained and for the pessimists to see signs of a downturn. Total employment and retail trade are certainly well maintained, although the ten days' newspaper strike in New York led to some reduction of volume locally.

On the whole, however, such merchants as automobile dealers, furniture and appliance stores, lumber and hardware shops and food chains have been doing more business than last year. This encouraging sales experience occurred without the aid of the large increases in Instalment debt which helped sales last year.

Signs of Downturn

Signs of a downturn include the fact that industrial output in November was 5 per cent. below the spring peak. Factory employment, while still high, has declined for three months and the percentage working overtime was off again. Claims for unemployment insurance have been rising, and in recent weeks, they have been up to 50 per cent. higher than last year. Also, in order to move inventories, substantial price concessions had to be made in some lines. It may be said that, in most durable manufacturing industries, shipments exceed new orders so that order backlogs are declining and this process seems to be accelerating.

So far as the capital expenditure programmes for 1954 are concerned, they seem to be off from the respective 1953 figures. They will even be cut more, if business does not turn out to be as expected. Capital expenditures have been one of the prime factors in U.S. business and should be watched closely. Failure to expand means slackness, at least in the American industrial vocabulary. Indeed, the expansion of American industry helped by inflationary tendencies over the past decade has been so rapid that it is most difficult to evaluate a trend based on normalcy. For, what is "normal"?

Those who measure the level of business in terms of normal, as the current bulletin of Northern Trust Company in Chicago says, suggest that business is slipping, as the many unusual factors that have stimulated activity in recent years lose force. But whether and how far business may fall below "normal"—whatever that is—is a subject of much speculation and difference of view at this time. Transportation—ground and air—one of the most sensitive indicators, certainly is off in all parts of the country.

So far as defence spending is concerned, it is now indicated that something less than $3,500 million will be cut from the Defence Department budget. Earlier, it had been hinted that the cut might run as high as $6,000 million. This will undoubtedly be an issue in the Congressional elections of 1954. Both parties, the Democratic and Republican, are now beginning to formulate their strategy.

Communists in Government will be another issue which Senator Joseph McCarthy of Wisconsin probably will not let die. His recent contest with the White House certainly was revealing. His proposal is for Washington to cut off any funds for any Government which is doing business with Communist China, for example. The Senator urged, in a radio broadcast, for anyone to make their respective positions known to President Eisenhower.

As a result, the White House was swamped with telegrams and letters. The final result is not yet known, but the telegrams alone are running two to one in Senator McCarthy's favour. This, of course, does not prove a thing, except that a small segment of the middle western farm population still has an anti-foreign sentiment which is the outgrowth of the preceding isolationism. Those who state such opinions, obviously, have not at their disposal the facts that the State Department has, and the opinion to judge what harm and what good would be derived in following the Senator's ideas.

Support to Eisenhower Administration

Meanwhile, the Democrats in Congress are expected to support the Eisenhower Administration on such matters as broadening of social security, boosting the minimum wage and extending the reciprocal trade law. Congressional decisions and the lawmakers' mood will naturally be much influenced by the business climate. At present, the state of mind is dominated oy uncertainty.

Statistically, however, things still do look fine. The grand total of consumer credit is still rising, but at a much slower rate than previously. In October last, for example, there was a rise of $139 million, as against $521 million in the corresponding 1952 month. The total at the end of October was $28.200 million, up $4,000 million over the figure 12 months previously.

The November volume of construction was one of the bright spots in the economy. New highs were set in both public and private building work and commercial building "rose contraseasonally to a new all-time monthly high," the Federal report says. For the first 11 months of 1953, total new construction outlays came to $32,100 million, which was 7 per cent. higher than in the corresponding 1952 period.

The number of unemployed rose by about 300,000 in November to 1,428,000, according to figures of the Department of Commerce. At the same time, the number of people working in non-farm jobs was 55,200,000, a new November high. Also, income payments to individuals in the first 10 months of 1953 were at the annual rate of $284,500 million, which was nearly $17,000 million higher than a year before.

The whole point is that, at the present time, there are many conflicting tendencies and inconsistencies. If any generalisation can be made at all, it seems to me that there is neither an up nor a pronounced downtrend in the American economy. The present state is one of rolling adjustments which is likely to prevail for some time.—*All Rights Reserved.*

per annum. This, it is said, will result in a saving of Rs. 4 crores worth of foreign exchange.

An important event in the history of Pakistan's currency is the decision of the Government to introduce, with effect from 1st April next, the decimal coinage system. Accordingly, the Pakistani rupee will have 100 pice. As a measure of economy, no new coins are proposed to be minted, except the new pice; 25 of them will make the present quarter rupee and 50 the present half rupee.

PAKISTAN NOTES

INDO-PAKISTAN TRADE

CHINA'S COAL FOR E. BENGAL

TRADE between India and Pakistan is at present practically at a standstill. The Indo-Pakistan trade agreement, entered into last year, expired on 31st August, 1953. Neither has the period of the agreement been extended nor any efforts made by the Governments of the two countries to revise the agreement or to sign a new one. The trade is, therefore, now confined to arrangements made between private parties on either side. Considering the complementary economic relationship that exists between India and Pakistan, a full-fledged and comprehensive trade agreement between them is imperative, whatever may be the political differences. It is to be hoped that the authorities in both the countries will make earnest efforts to bring about happy and cordial trade relations.

Be that as it may, the volume of Indo-Pakistan trade has been steadily declining. The aggregate value of this trade during the period 8th August, 1952, to 21st August, 1953, for instance, was not more than Rs. 26.29 crores, which compares unfavourably with Rs. 105.61 crores during February, 1951-June, 1952. The fall in value is accounted for by both exports and imports. Exports from India to Pakistan during the period of the trade agreement were of the value of Rs. 17.26 crores, as against Rs. 65.25 crores in the period covered by the previous agreement. Imports from India also dropped from Rs. 39.36 crores to Rs. 9.05 crores. The balance of trade was favourable to Pakistan to the extent of Rs. 8.21 crores. The favourable balance in the previous period was Rs. 25.89 crores.

It would not be out of place here if a brief reference were to be made to the latest position regarding India's balance of payments with Pakistan. India's transactions with Pakistan during the first half of this year were characterised by the re-emergence of a deficit—there was a surplus in 1952—although the deficit was negligible, being only Rs. 0.2 crore. The table below (taken from the Reserve Bank of India *Bulletin*) indicates Indo-Pakistan's balance of payment on current account during the first half of 1953 as compared with the position in the previous two half-yearly periods.

(In crores of rupees)

	1953 (preliminary)			1952	
	1st quarter	2nd quarter	Half-year	2nd half	1st half
Imports c.i.f.	3 2	2 3	5 5	12 0	15 4
Exports f.o.b.	2 2	1 3	3 5	17 4	40 1
Trade balance	—1 0	—1 0	—2 0	+5 4	+24 7
Official donations (net) ..	..	..	..	..	..
Other invisibles (net) ..	+0 8	+1 0	+1 8	+3 9	+5 3
Current account (net) ..	—0 2	..	—0 2	+9 3	+30 0

Both imports as well as exports fell, but the fall in the latter, amounting to about Rs. 14 crores, more than offset the fall in the former. While the reduced purchases of raw jute accounted for the low level of payments for imports, the imposition of severe import restrictions in Pakistan in November, 1952, following the deterioration in its balance of payments, accounted for the fall in exports to that country.

Purchase of China's Coal

A recent report from Calcutta avers that imports of coal from China into East Pakistan have considerably increased in recent weeks, the average number of shiploads per week being two. To quote the report: "Ships carrying Indian coal to Japan used to return in ballast formerly. Now, they touch Chinese ports to pick up coal for East Pakistan." While imports of Chinese coal into East Pakistan have thus been increasing, those from India are reported to be on the downward trend. During the month of November, 1953, for instance, imports amounted to only 15,000 tons. The orders placed this month are said to be even less, being 7,600 tons. The Indo Pakistan trade agreement signed in March last, provided for the maximum import of 48,000 tons of Indian coal into East Pakistan every month. Imports of Indian coal into West Pakistan, however, have been according to schedule, that is at the rate of 33,000 tons per month.

Jute Goods Import

The Government of Pakistan is understood to have decided not to import any jute goods next year. Disclosing this, a spokesman of the Pakistan Industrial Development Corporation is reported to have stated in Karachi recently that 1,400 jute looms, established so far in East Bengal, would help the country meet its own requirements of about 40,000 tons of jute goods

(Continued in previous column)

RESERVE BANK OF INDIA ACT AMENDED

HIGH DENOMINATION NOTES—RURAL CREDIT

THE House of the People passed last week the Reserve Bank of India (Amendment and Miscellaneous Provisions) Bill. The Bill seeks to provide Rs. 5 crores for medium term agricultural credit and permit the issue of high denomination notes. An amendment proposing to increase the amount of Rs. 5 crores to Rs. 25 crores was rejected by the House.

The objects of the Bill as stated above being simple, there was practically no difficulty in getting the Bill through the House. With regard to the clauses seeking permission for issuing new high denomination notes, the Deputy Minister, Mr. A. C. Guha's preliminary explanations were enough to convince the House of the need for accepting them. It would be recalled that, in the past one or two years, this journal voiced on more than one occasion the need for resuming issue of high denomination notes. It is gratifying to note that the arguments put forward by the Deputy Minister are more or less the same as those advanced by us then. Thus, he admitted that the absence of notes valued higher than Rs. 100 was causing hardship to the business community. It was, therefore, decided to issue notes of Rs. 1,000, Rs. 5,000 and Rs. 10,000. He revealed that preparations for their issue had been completed and that the Government was awaiting the passage of the Bill. Even after the new notes are issued, those that were demonetised in 1946 would continue to be invalid. It is stated that up to now notes of higher denominations worth Rs. 1.25 crores (out of a total issue of Rs. 138 crores) are still in the hands of the public.

Incidentally, the Deputy Minister drew attention to the fact that one of the clauses of the Bill intended to extend foreign exchange facilities at any branch of the Reserve Bank of India to the Government. At present only four branches of the Bank provide these facilities.

The other objective of the Bill, namely, the provision of additional rural finance, was also welcomed by all sections of the House, because it was intended to alleviate distress in rural areas through expanded rural credit facilities. Practically every member who spoke agreed with the objective, though a few availed themselves of the opportunity to emphasise that the measure of assistance sought to be provided was inadequate. It was pointed out that the amount of Rs. 5 crores was pityfully low as compared with the credit requirements of the rural areas. A few others wondered whether this move would at all be of any help to the poor peasants. Some others wanted the Reserve Bank to remember that its responsibility was not over, once the State Government had given a guarantee for a particular loan. It must see as to how the loan was utilised. They, however, did not show how the Reserve Bank could do this. Some actually strayed out and made irrelevant demands. Thus, just because rural credit was sought to be given also through the Imperial Bank's new branches, some members pressed for the nationalisation of that Bank.

The reply to the various points raised in the course of the debate by the Deputy Finance Minister, Mr. A. C. Guha, falls into two broad divisions. One related to the credit facilities sought to be created by the Bill and the other to the suggestion for the nationalisation of the Imperial Bank of India.

Dealing with the credit facilities, Mr. Guha stated that he agreed that the sum of Rs. 5 crores was not sufficient for the purpose, but pointed out that it was in addition to Rs. 12 crores being given every year to State Co-operative banks for seasonal agricultural operations. The Land Mortgage banks, too, had received a little over Rs. 1 crore from the Reserve Bank. Then, there was other forms of agricultural loans. Besides, the Reserve Bank was not the only machinery for financing agricultural operations. The Government had, he said, under its consideration, a proposal to set up an Agricultural Finance Corporation. The final decision on the issue would be taken after the submission of the report by the Commitee appointed by the Reserve Bank of India to enquire into the entire agricultural credit system in the country. He assured the House that the Reserve Bank would supervise the activities of Co-operative banks and keep an eye on the rates of interest charged by them.

Under the present Bill, Mr. Guha said, the Government wanted to provide for short-term and medium-term loans to State Finance Corporations and Co-operative banks to help small-scale and cottage industries. Repayment of these loans and interest thereon should be guaranteed by the State Governments. A limit of Rs. 5 crores had been placed for loans to State Co-operative banks. In the case of the Industrial Finance Corporations a limit of Rs. 3 crores had been placed on medium loans. There was no limit for short-term loans to the Corporations.

The loans were intended, the Minister said, to cover marketing of crops and commodities such as, butter, cream, ghee, gur and milk. Processing such as hulling of rice and ginning and pressing of cotton would also benefit by the loans.

The arguments in favour of nationalisation of the Imperial Bank were: (a) The personnel of the higher ranks was mostly non-Indian in character; (b) the Bank discriminated against Indians, while granting advances; and (c) the Bank enjoyed unfair advantages over other banks in regard to facilities such as transfer of funds. The reply given by Mr. Guha to those arguments was quite convincing. He gave figures showing that the number of non-Indians in the higher ranks of the Bank was far smaller than in 1946. In that year, the number of Europeans in the senior grade was 101. This had been brought down to 29 in 1952. In 1946, there were 15 Europeans and one Indian as senior staff officers. In 1952, the number of the former came down to 11, while that of the latter rose to 12. In regard to (b) Mr. Guha revealed that a representative of the Government of India, Mr. A. D. Gorwalla, attended the weekly meetings of the Bank and was satisfied that there was no discrimination against Indian companies. As regards the third argument that the Bank enjoyed unfair advantages, it was pointed out that similar facilities were extended to all other banks also. He added that the Imperial Bank had opened 34 branches during the last two years and was going to open some more branches. These branches were "expected to do something in the realm of rural credit." The overwhelming majority of the share capital was now in the hands of Indians, and on the Board, Indians formed the majority. The Managing Director was now an Indian. "For all practical purposes the Imperial Bank is," Mr. Guha declared, "almost a nationalised institution. It is not a State Bank, but its management is now mostly in the hands of Indians."

These arguments convincingly prove that the Imperial Bank is a full-fledged national institution. They should set at rest all the suspicions of those in the country who have been unnecessarily labouring under erroneous impressions regarding this great financial institution which has been rendering a distinct service to the country for a long time now. Much of the valuable time of the House has been wasted in the past in discussing the affairs of the Imperial Bank and even members who ought to know better have not hesitated to cast aspersions on the national character of the Bank. In view of the satisfactory explanations given by the Government's spokesman, it is to be hoped that the House will not be called upon, in future, to discuss these points again and again. The Speaker too, will do well to bear this point in mind and prevent wastage of time over further discussions on these issues.

Centuries of overseas trade

For well over two centuries Lloyds Bank has served the needs of merchants trading abroad and, today, business men know that they can rely upon Lloyds Bank for its shrewd and friendly advice on all matters relating to overseas trade and upon its integrity for their protection in all financial transactions.

TRAINING FOR CO-OPERATION

The Ministry of Food and Agriculture announced, last week, that, in consultation with the Reserve Bank of India, it was setting up a high-power committee, under the chairmanship of Mr. V. L. Mehta, to examine the facilities for the training of personnel for the co-operative departments and institutions. The lack of adequately trained personnel is partly explained by the paucity of arrangements for training in Co-operation. Only in a few States like Bombay and Madras are there any satisfactory arrangements for the training of the higher and subordinate officials as well as the staff of co-operative institutions. It was with a view to meeting the increased requirements of the Movement, including those arising from the reorganisation of the co-operative credit structure in several States which is now in progress, that the Reserve Bank initiated, in April 1952, an all-India training centre at the Co-operative Training College, Poona. At this centre, two types of courses are being provided—a short-term course for a period of six months for the higher officials of the co-operative departments and institutions and a long-term course, for a period of six months for the intermediate officials of the co-operative departments and institutions. Since such a centre will hardly meet the requirements of a vast country like India, it is now proposed to organise regional training centres for the intermediate staff. The Poona College will, in addition, continue to provide the training facilities for higher officials.

The Committee which, we understand, is meeting in the last week of this month, is expected to consider the organisation of training centres, with a view to attracting sufficient personnel. It is also proposed to provide, by way of inducement, several financial concessions such as stipends and travelling allowance, etc. Co-operative training should be intended to benefit three categories, namely, the higher staff, the intermediate staff and the subordinate personnel. Although there is, according to the Government resolution, a separation of functions between the Reserve Bank and the Government of India, the fact that one committee is in charge of the entire arrangements will ensure that there will be an integrated scheme of co-operative training. Regional training centres to be started by the Reserve Bank will train the intermediate staff, while the Central Government's help for the training of subordinate personnel will take the form of initiating arrangements for training where they do not exist and of giving subsidies and other financial assistance to institutions which are fulfilling such functions already. One of the limiting factors which have prevented full use being made of the training facilities available has been the fact that co-operative training involves financial strain for the trainees. It is understood that, with a view to providing some inducement to State Governments and institutions to have their personnel trained, some financial concessions such as stipends will be granted. The Committee, at its first meeting, is expected to survey the existing facilities and take steps for new schemes to be introduced in the next two years.

CEYLON SEEKS WORLD BANK LOAN

Ceylon will try to get a loan of Rs. 10 crores from the World Bank to finance the second stage of the Laxapana Hydro-electric Scheme, according to Sir Oliver Goonatilleke, Finance Minister of Ceylon, who passed through Bombay this week on his way to New York from Colombo.

The three-man delegation, headed by Sir Oliver Goonatilleke, will discus the question of the loan with the World Bank authorities. The other two members of the delegation accompany Sir Oliver are Mr. N. U. Jayawardhane, Director of Central Bank, Ceylon, and Mr. R. Kumaraswamy, Assistant Secretary to Treasury.

Sir Oliver told reporters at Santa Cruz airport that Ceylon had already spent Rs. 10 crores on the first stage of the Scheme. A similar big amount would be required for the third stage, he added.

Sir Oliver will fly to Sydney from New York to attend the Commonwealth Finance Ministers' Conference, commencing there from 4th January, 1954.

It may be noted that a Ceylon official delegation which had been to London to seek a sterling loan, returned to Colombo only recently. The delegation was headed by Sir Oliver Goonatilleke, who stated at Bombay, while on his way back to Ceylon, that their talks were very satisfactory. Ceylon would be re-entering its traditional market for a loan to cover its development works as and when the need arose.

The Finance Minister characterised as incorrect the rumours that a devaluation of the Ceylon rupee was considered either in Colombo or in his recent discussions with the U.K. authorities. Making this statement some time back in Ceylon, he observed: "There is not the slightest ground for any apprehension that the Ceylon rupee is likely to be devalued." This observation was made when his attention was drawn to the allegation that as a result of the rumour, funds of the order of £1 million had been sent out of Ceylon through banks by various devices.

THE BATTLE OF SAVOY

SHAREHOLDERS IGNORED

(From Our Own Correspondent)

LONDON, 12th December

SINCE your correspondent's last letter about take-over bids, the case to which he referred —that of the Savoy Hotel—has created vast excitement to the exclusion at the moment of any more serious topics in the City. The original trouble, it will be recalled, arose from the fact that the Savoy Hotel Company which controls three of the largest London hotels showed its assets substantially undervalued in its balance-sheet and the shares, as a result, stood at a level which would have shown a substantial profit to all shareholders on a revaluation. Accordingly, one operator, acting with his own and other funds, began steadily buying these shares, which rose over a relatively few weeks from 26d. to 62d. Another operator—a Mr. Clore—who was the first to come into the public eye, was at the same time buying these shares with the object of acquiring control.

The Board of Trade enquiry into the circumstances of the recent acquisition of the shares revealed the first operator as a Mr. Samuel who had by then got more than 20 per cent. of the shares. This, it was considered, would probably give him an adequate control over the Company. With the existence of Mr. Samuel's hold revealed, Mr. Clore withdrew from the contest, sold his shares to Mr. Samuel and left the battle to him and the existing Directors who, incidentally, only control 7 per cent. of the shares. It then became known that Mr. Samuel wanted, as soon as his control was established, to pull down one of the three hotels, the Berkeley, which was not making a profit—and to use the site for building shops and offices. The existing Directors were horrified at this proposal and took a most extraordinary step. They immediately formed a subsidiary company entirely controlled by a small block of very low par value shareholders (1s. each)—the bulk of the capital in preference shares not exercising effective control. The controlling shares were issued to the Trustees of the Savoy Hotel Staff Benevolent Fund and the rest of the shares were held by the Savoy Hotel Company.

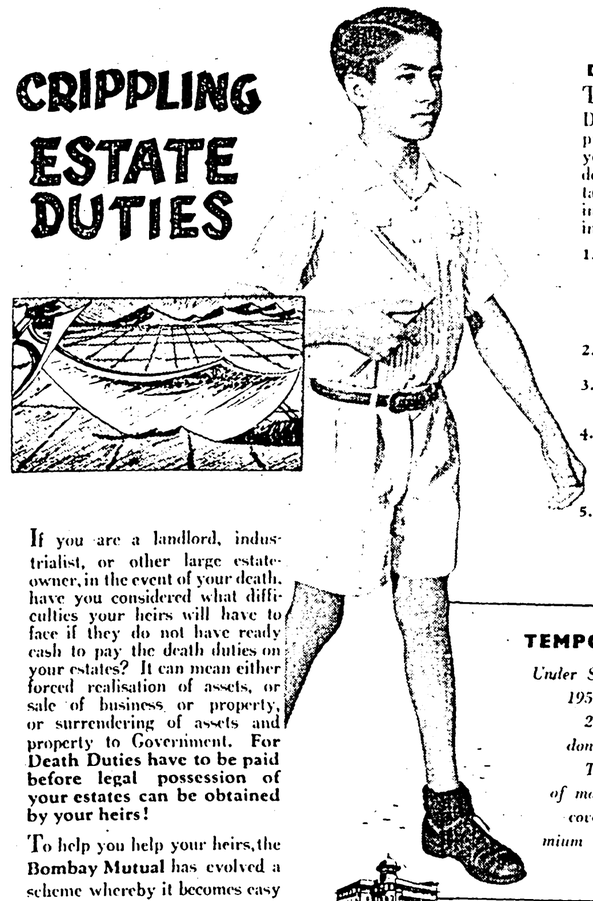
The Directors of the Savoy Hotel Company had, by this action, voluntarily alienated from themselves control over their subsidiary company which now owned the Berkeley Hotel. Their object was, of course, to prevent Mr. Samuel, should he acquire control of the Savoy Company, from being able to carry out his plans with the Berkeley Hotel site—for Mr. Samuel would find that, although he had control over the greater part of the capital of the new subsidiary company, he had no control over that part of the capital, relatively trivial in amount, which controlled the Company!

The propriety of the action of the Savoy Company Directors is now being questioned. It is argued that the Directors have no right, without consulting their shareholders, to alienate from their control a substantial part of the property of a company, even though that part, as in this case, was not earning much profit. The Savoy Directors will no doubt hold that they have acted in the best interests of the shareholders and it is also likely that, although the Trustees of the Staff Benevolent Fund control the Berkeley, the Trustees may, in turn, be controlled by the existing Directors—one of the three anyway is also Managing Director of the Savoy! The principle, however, remains and we have probably not

(Continued on page 1179)

Save your heirs the burden of

CRIPPLING ESTATE DUTIES



If you are a landlord, industrialist, or other large estate-owner, in the event of your death, have you considered what difficulties your heirs will have to face if they do not have ready cash to pay the death duties on your estates? It can mean either forced realisation of assets, or sale of business or property, or surrendering of assets and property to Government. **For Death Duties have to be paid before legal possession of your estates can be obtained by your heirs!**

To help you help your heirs, the **Bombay Mutual** has evolved a scheme whereby it becomes easy for you to provide your heirs with the necessary cash to enable them to take possession of their rightful inheritence without hardships.

ESTATE DUTY POLICIES DELIVER ESTATES INTACT

The **Bombay Mutual** Estate Duty Policies are designed to prevent the disintegration of your estates in the event of your death, and to enable your heirs to take possession without incurring heavy liabilities. The following are the chief advantages:

1. **The amount of the Estate Duty Policy is available immediately on the death of the policy holder—no tedious and irritating legal and other formalities are required.**
2. **The amount of the Estate Duty Policy is free of Estate Duty.**
3. **The premiums on these policies rank for income-tax abatement, subject to the usual limitations.**
4. **It prevents the disintegration of property in the event of the heirs being unable to provide the amount of Estate Duties on their own.**
5. **In the case of claims arising under these policies, policy moneys would be considered for payment direct to the Estate Duty Authorities.**

TEMPORARY ASSURANCE

Under Section 9 of the Estate Duty Act 1953, gifts made within a period of 2 years prior to the death of the donor are liable for Estate Duty. This risk of death within 2 years of making gifts can be adequately covered by a two-year Single Premium Temporary Assurance Without Profits Policy.

DEVELOPMENT OF HANDLOOM INDUSTRY

SCHEMES COSTING RS. 2.15 CRORES RECEIVE GOVERNMENT OF INDIA'S SANCTION

BOTH the millowners and the handloom weavers, not to speak of the consumers of cloth, are eagerly awaiting the findings of the Cotton Textile Enquiry Committee. This is only to be expected, considering the keen—rather unfortunate—controversy, handlooms versus mills, that has all along been raging since Mr. C. Rajagopalachari, Chief Minister of Madras, put forward, early in September, 1952, a vigorous plea for the reservation of markets for certain items of cotton goods exclusively for handlooms. Naturally enough, one expects that the findings of the Committee and the Government of India's decisions thereon, would lay at rest this controversy. This expectation, of course, presupposes that any pattern for the cotton textile industry which the Committee might lay down would be, as Mr. T. Swaminathan, Textile Commissioner to the Government of India and Chairman of the All-India Handloom Board, has very aptly put it in his preface to the survey of the Board's activity just published, "a dynamic pattern, changing, from time to time, with the increase in population, employment and purchasing power, and the advance of technology and economic organisation." So far as the handloom industry is concerned, there is no gainsaying the fact that it plays an important role in the country's economy and as such calls for sympathetic and careful handling.

Whatever measures are adopted for developing the handloom sector, however, should not be at the expense of the more efficient mill sector. This point has unfortunately not been recognised by the powers-that-be, thanks to political considerations. How else can one explain the Government of India's policy of imposing restrictions on the manufacture by mills of *dhotis, saris, lungis* and *gamchas, chaddars*, bedsheets, bed covers and counterpanes, low reed pick cloth, tablecloths and napkins, dusters, towels, and coarse cloth of plain weave? The cost of this restriction, as reflected in the prices of the types of cloth affected, has to be borne by consumers, not all of whom can afford to do so.

Schemes of Assistance

Besides trying to provide a closed market for handlooms, the Government of India has taken several steps for the development of the handloom industry. During the last three months, for instance, the Government has approved of several handloom development schemes submitted by State Governments, costing about Rs. 2.15 crores out of the Rs. 4 crores earmarked for 1953-54, according to a Press note issued by the All-India Handloom Board on Saturday last. It has under consideration 67 more schemes of seven other State Governments, involving an expenditure of Rs. 45 lakhs, sanction for which is expected shortly. Before the end of the month, the remaining States are expected to submit their schemes.

The amount of Rs. 2.15 crores, which has already been placed at the disposal of the States, will be spent mainly on rebates on (1) sales of handloom cloth from co-operative stores and Government emporia—the sum actually provided for this purpose is nearly Rs. 1 crore—and (2) organisation of weavers on sound lines by advancing as loan the working and share capital and weavers' co-operative societies. The schemes cover, besides, provision of mobile vans which will tour the rural areas as propaganda-cum-mobile sales depots, opening of sales depots and emporia at several centres, and supply of improved types of accessories to weavers. The chief consideration which has weighed with the Board in laying particular stress on co-operation is that, "if the large majority of the unorganised handloom weavers is brought into the co-operative fold and adequate facilities are provided for marketing the cloth produced by them, it will not be difficult to ensure a reasonable living wage for the workers."

While all these are indirect measures of assistance, the Handloom Board has decided to implement two important schemes on its own initiative. The sanction of the Government has already been obtained and the schemes are under way. Those schemes are:

(1) Internal marketing scheme. An organisation, called the Central Marketing Organisation, has been set up with headquarters at Madras. This organisation will have branches at Madras, Bombay, Nagpur, Gwalior, Banaras and Calcutta. The functions of this organisation and its branches will be to study and explore markets for handloom cloth, to keep the industry informed of the requirements of the consumer, to standardise production, to conduct publicity and propaganda, and to correlate the activities of the States. The Board has also approved in principle a scheme for setting up an All-India Handloom Co-operative Society, the main function of which will be to improve the markets for handloom fabrics both within and outside the country.

(2) External marketing scheme. This scheme envisages the appointment of four Handloom Cloth Marketing Officers to be posted at Singapore, Rangoon, Colombo and Baghdad and to set up sales emporia in several foreign countries. These officers will be mainly concerned with developing the existing markets and exploring fresh markets for Indian handloom cloth. The Officers have been selected already and are expected to be in position very soon.

Stimulating Demand

It will be evident from the above that the Handloom Board recognises the need for stimulating the demand for handloom cloth not merely within the country but in overseas countries as well. With proper organisation, propaganda and standardisation of production, India should, it feels, be able to export without difficulty about 100 to 150 million yards of handloom cloth per annum. It is expected, for instance, that this year's export of handloom goods will be over 60 million yards. Up to the end of October, 1953, 52.70 million yards, valued at Rs. 8.3 crores, were exported and another 12 to 14 million yards are expected to have gone out by the end of the year. It is, therefore, not unreasonable to hope that exports will show marked improvement when the proposed machinery for improving external marketing of handloom fabrics gets down to work. It is true that some of the countries in which Indian handloom fabrics were once popular have, quite naturally, been developing their own handloom industry with a view to providing subsidiary employment for their agricultural population. Nevertheless, our handloom industry is based on skill acquired over hundreds of years and need not necessarily compete with the newer handloom industries developed elsewhere. There are also fresh markets which can be explored.

"CLOTHING INDIA'S MILLIONS"

Since clothing constitutes one of the three basic necessities of life—the other two are food and shelter—the industry which caters to the clothing requirements of the people plays a vital role in a country's economy. This is especially so in such a vast country as India with a population of over 350 million. It is no wonder, therefore, that the cotton textile industry should rank as the single largest industry in India. In view of the remarkable progress which the industry has achieved, the public is now evincing more than ordinary interest in the developments of the industry. Further, several ill-informed criticisms are being made against the industry and there are several snipers at it, each one of them trying to mislead the public. Viewed against this background, the efforts of the Millowners' Association, Bombay, at publishing an illustrated booklet on the cotton mill industry in India are indeed commendable. Appropriately enough, the booklet is entitled "Clothing India's Millions."

In about 30 pages, the publication under review depicts the story of cloth in India in all its phases—from the stage in which cotton, the primary raw material, enters the factory to the stage in which the finished product reaches the consumer. All stages of cotton textile manufacture are lucidly described with the help of illustrations. The utility of the publication is enhanced by a brief review of the latest position of the industry. Also given at the end is an account of the contri-

TEXTILE RESEARCH INSTITUTE

MILLOWNERS' SCHEME APPROVED

AT long last, the Bombay Millowners' Association's scheme for the establishment of a textile research institute in Bombay has received the approval of the Cotton Textiles Fund Committee. It was as early as in May, 1950, it will be recalled, that the Committee decided to go ahead with its original decision to have two textile research institutes—one at Bombay and the other at Coimbatore—provided the textile mills in these two regions were prepared to meet part of the capital and recurring expenditure. Subsequently, the Committee appointed a sub-committee to go into the question of evolving a scheme for the setting up of a regional institute at Bombay. The matter was taken up for consideration by the Millowners' Association towards the end of October, 1952. The Association decided to undertake the responsibility for promoting the institute and to collect for that purpose a sum of about Rs. 50 lakhs for capital expenditure. A sub-committee was accordingly formed to draw up a detailed scheme, including the establishment of a Research Association, to be registered under the Friendly Societies Act of 1860 which would handle all the monies and be in charge of the proposed institute. It is this scheme which has since received the approval of the Cotton Textiles Fund Committee.

The new Research Association, the memorandum and articles of association which have already been approved and will be presented for registration in the next few days, proposes to raise from members, through entrance fees, a sum of Rs. 50 lakhs. A like sum will be contributed by the Committee. The aggregate sum of Rs. 1 crore thus will be utilised for meeting the capital expenditure on land, buildings and equipment of the Research Institute "which will be owned and controlled by the newly formed association."

Salient Features of the Institute

The Institute will be capable of undertaking research in all departments of the cotton textile industry. It will have fully equipped sections dealing with spinning, physical laboratory, weaving, bleaching, dyeing, and finishing, chemical laboratory, engineering, industrial psychology and operational research departments, and liaison department. The management of the Institute will be vested in the hands of a Council consisting of 15 members. Among them, eight members are from the industry, three are the Directors (for the time being) of the Regional Research Institutes in Ahmedabad, Bombay and Coimbatore, three from the Government of India, and the Secretary of the Association. The recurring expenditure of the Institute in the initial stages may be about Rs. 2½ lakhs per annum, rising gradually to Rs. 11 lakhs when the Institute begins to work to its fullest capacity. Half of the recurring expenditure is to be met from the Cotton Textiles Fund, the other half being raised by members of the organisation by means of annual subscriptions.

The establishment of the Research Institute fulfils a long-felt need for promoting scientific and technological research in the sphere of the cotton textile industry. The need has become all the greater in the present context of the buyers' market for textiles the world over. Unless the inherent strength of the textile industry is improved through scientific research, the chances of the industry holding its market both in India and overseas are slender. It is only in the fitness of things that, as the premier organisation connected with the Indian cotton textile industry, the Bombay Millowners' Association should have sponsored the aforesaid Research Institute. Indeed, the establishment of the Institute is a great achievement in the history of the Association of which it can legitimately feel proud.

Considering the competition from synthetic textiles and the need for producing cloth at as cheap a cost as possible, the task before the Research Institute is indeed a heavy one. How far and to what extent the Institute will succeed in fulfilling this task will depend, to a large extent, on the range of equipment and technical personnel employed by it. These must be of the highest calibre, and comparable to those provided in the British Shirley Institute, one of the world's famous textile research promoting centres.

(Concluded from previous column)

buttons which the industry has been making to the Exchequers—Central and State—by way of taxes and levies. Written in simple language, the booklet is meant for those who are ignorant about the elementary facts of the industry. It will, if widely distributed, surely create, what Mr. Neville N. Wadia, Chairman of the Millowners' Association, has pertinently remarked in the foreword to the publication, a wider interest among the public in this premier industry of India.

SURVEY OF BRITISH EXPORT TRADE IN TEXTILES

MILLOWNERS' VIEWS ON FUTURE OF COTTON SUPPLY

(From A Special Correspondent)

MANCHESTER, 8th December

SURVEYS of Lancashire trade have lately come from several quarters covering a period of recovery after strain which tested the resources of every branch. There is general agreement that had it not been for the price maintenance schemes adopted in some sections the slump would have been much worse.

MANCHESTER LETTER

Sir John Reynolds, Chairman of Combined English Mills, says the early recovery of the spinning trade was in a large measure due to the steadying effect of the Yarn Spinners' Association. Other sections of the trade were at one time critical of the firm stand taken by the spinning section but, as he says, it is now generally recognised that the "floor" which spinners provided shortened by many months a movement which had the makings of a serious slump.

On the same lines, Sir Joseph Napier, Chairman of the Yorkshire Dyeing and Proofing Company, says the necessity of price maintenance on a fair and equitable collective basis is one of the most misunderstood aspects of industrial life to-day. Denying that any monopoly exists among textile finishers, he estimates that there has been ten times as much re-equipment since the formation of the Dyers' Price Associations than during the period of ruthless competition in the 1930's. He adds:

"One cannot re-equip without profits. It has been proved beyond doubt that the peculiarities of our industry are such that only in odd pockets here and there can profits be made consistently, and quality and efficiency maintained, without an agreed schedule of reasonable prices."

Raw Cotton Buying

Those companies which are direct buyers of raw cotton are naturally affected by the forthcoming change in the system of obtaining their supplies and certain comments have been made by chairmen on this subject. Mr. T. Marshall Brooks, of Horrockses, Crewdson & Co., has described the beneficial effect obtained by purchasing raw cotton through private traders. At the same time he, along with other important figures in the trade, is more than a little apprehensive about the prospects after the winding-up of the Raw Cotton Commission.

In his annual statement, Mr. Brooks says he hopes that the Commission will be allowed to continue its present cover scheme "until such time as an effective alternative has been established. Precipitate action in this connection could lead to grave difficulties, particularly for vertical concerns."

Fewer doubts about the future are expressed by Sir John Reynolds, whose Combined English Mills contracted out to the extent of 40 per cent. last year and has now completely left the Commission. "Individual mill managers have found a new freedom in their ability to depend on continuity of grades and qualities of cotton," he says.

Costly Stocks

Even so, Sir John has to admit that the Combine needed to secure its requirements for an appreciable period ahead prior to complete contracting-out in September. As a result, considerable stocks of cotton have been accumulated which are valued in the balance-sheet at over £2,600,000, against £1,770,000 12 months previously.

The fact that it will be necessary in the future for the mills to maintain large supplies of cotton has been taken up by the trade unions, who are very upset about the Government's decision to wind-up the Commission. Mr. Charles Schofield, Secretary of the Operative Spinners' Amalgamation, has estimated that individual spinners will have to set aside a sum of £60,000 to finance cotton stocks. Even with the healthy cash resources of most mill companies these days, this represents a substantial amount of capital to be tied up.

What the unions are primarily afraid of is a dislocation in the steady flow of supplies of cotton to the mills, resulting in unemployment. There will certainly be widespread resentment and antagonism should such a situation arise.

Pakistan Plant Order

An order, stated to be worth £3,000,000, for textile machinery, electrical equipment and boilers, for the Valika Textile Mills, Karachi, has been placed with firms in the North of England.

The order has been placed by Mr. Valika Saifuddin, a director, who has just completed a two-month stay in England. It involves the supply to the Karachi mills of textile spinning, weaving and finishing machinery, boilers, electrical transformers and cables.

Mr. Saifuddin disclosed that his order brought the value of contracts placed in England by Pakistan industrialists during 1953 to about £9,000,000. He is now planning a visit to Italy to purchase textile printing plant.

Mr. Saifuddin said Pakistan preferred to buy its machinery requirements from Britain but warned that Britain would have to look again at prices and delivery dates if the latter wanted to win orders in face of foreign competition.

Standard Cloth Scheme

Production by the British cotton textile industry of a special standard cloth for sale in Kenya, Uganda, Tanganyika and Zanzibar—an innovation urged by the U.K. cotton textile mission to East Africa four months ago—has been criticised in Manchester by leaders of the Cotton and Rayon Merchants' Association, representing 1,000 firms.

Reporting on discussions which have taken place among its executives, the Association said in a report:

"Grave doubts were expressed regarding the practicability and desirability of introducing a standard cloth in any market. Such a standard cloth, branded and advertised, it was felt, would be a target for both internal competition and attack from other producing countries. The executive appreciated the political need for some assurance from the United Kingdom which would satisfy the market of East Africa, but, speaking on behalf of the U.K. export trade, as a whole, were convinced that the mission's proposal, if carried out, would cause serious repercussions in other important markets in the Dominions and elsewhere."

When the Association executives discussed shipping priority for cotton and rayon textiles up to the end of December, it was stated that the East African Governments were reviewing the position and it was hoped that the priority would be extended.

U.S. Trade Review

Efforts made by a few Lancashire textile firms to stimulate trade with North American markets are bearing fruit, Sir Raymond Streat, Chairman of the Cotton Board, said in Manchester on his return from a visit to Canada and the United States.

Figures of Lancashire textiles supplied to both markets were slightly better and this, he said, was no doubt the result of some good selling efforts which a few Lancashire firms had been putting in over recent years. This increase was also a tribute to the attractions of Lancashire's special goods.

Sir Raymond said that both the Canadian and American markets were well supplied with a wide range of cotton industry products and opportunities for Lancashire lay mainly in the direction of special English styles and the better types of cotton goods in which Lancashire specialised. "At times, when our prices are attractive, more standard goods can be sold on purely price competition," he declared. Sir Raymond added that order books in Lancashire were lengthening while those in North America were not.

Shuttle Wage Demand

Negotiations on a wage claim tabled on behalf of workers in the Lancashire shuttle manufacturing industry have broken down and the issue is to be submitted to the Ministry of Labour conciliation officers at regional headquarters in Manchester.

The dispute concerns a union demand for an extra 6d.-an-hour for shuttlemakers, which has been rejected outright by the employers.

Workers at Blackburn, Bury, Radcliffe, Heywood, Todmorden and other textile accessory centres are affected, as well as a number of Yorkshire shuttlemakers.

The decision to submit the dispute to the Ministry of Labour's Industrial Relations Department follows deadlock in negotiations between the Society of Shuttlemakers and the Shuttle Manufacturers' Association.—*All Rights Reserved.*

FLEXIBLE EXPORT DUTIES FAVOURED BY COTTON INTERESTS

SALES TAX ON COTTON OPPOSED

THE importance of taking prompt decision on the export duty on cotton when the duty becomes too heavy a burden, of total or partial abolition of the import duty on cotton, and of specific as distinguished from *ad-valorem* rates for duties on cotton has been emphasised by the Cotton Buyers' Association in its reply to the questionnaire of the Taxation Enquiry Commission. The Association has expressed its opposition to the imposition of sales tax on raw materials for industries, such as cotton which is the raw material for the textile industry.

The Association urges that the raw materials required by India's essential industries should "invariably be free from the purview of the import duties." Referring to the import duty on cotton, it says:

"An import duty of six pies per lb. on foreign cotton had been imposed originally, with the idea of protecting Indian cotton and assuring a reasonable price to the indigenous farmers of cotton of 1" and shorter staple. This was specially done at the time when American cotton was available in the world markets at prices relatively cheaper than the equivalent descriptions of Indian cotton. In the early thirties, the import duty was raised to one anna and subsequently to As. 2 per lb. Out of this duty of As. 2, one anna was earmarked for the cotton fund and the balance for purposes of revenue. Subsequently, a further 5 per cent. surtax was levied, so that the existing import duty amounts to 2.1 anna per lb. The purpose of the import duty on cotton was fully justified in pre-war days, but developments after the end of the war have been such that the reasons put forward for this duty do not hold good any longer. For the last several years, Indian cotton, as compared with world prices of all foreign cottons, has been very much cheaper, with the result that the protective character of import duty has no longer any justification. The import duty is now purely a matter of revenue and has been tending to raise the price of foreign cotton resulting in higher selling prices of textiles manufactured from imported cotton. The Association is of the opinion that the present import duty on cotton would be a serious handicap if the indigenous production is insufficient to cover the requirements of the Indian industry and needs to be supplemented by imports of foreign cotton stapling 1" or less in future."

An important question in the Commission's questionnaire relates to export duties. The Commission has asked under what circumstances should export duties be imposed. Replying to this question, the Association says that it is opposed to the levy of export duties, "except as a measure devised to retain essential raw materials in shortage in the country." The Association agrees that the Central Exchequer would be justified in appropriating a portion of the income earned by the trade when there is a "marked disparity in the internal and international price of exported goods." It would, however, be wrong for the Government, according to the Association, to depend on export duties as a "stable" source of revenue. Emphasising the need for greater flexibility in the rate of export duties in the light of the changing conditions in India's export markets, the Association cites the experience of the cotton exporters to justify its contention that the Government's tardiness in reducing the duty on cotton has harmed the export trade in this commodity. It says:

"The past experience, in so far as the cotton trade is concerned, clearly demonstrates that Government's action has been belated and relief has come in only after export trade has been seriously damaged by the duties in question. For instance, there had been, in the past, a uniform rate of export duty of Rs. 200 per bale on raw cotton allowed for export. In November, 1952, the duty on Bengal *Deshi* was reduced to Rs. 125 per bale, whilst on other short-staple varieties of Indian cotton allowed for export, duty was retained at Rs. 200 per bale. As a consequence, the export quota released for Bengals was fully absorbed, whilst a fairly large part of the quotas released for other short-staple varieties remained unutilised last season, owing to the heavy export duty on these growths. The position with regard to these rates of export duty remains still unaltered with the result that the initial quota released for Bengals for the present season has already been absorbed, whilst the quota released for other exportable varieties remains still unsold, largely as a result of the heavy incidence of export duty on these growths. The Association, therefore, suggests that, once the duty is imposed, Government must be vigilant in assessing the impact of such duty on the country's export trade in consultation with the interests concerned and should not hesitate to withdraw or reduce the duty as promptly as it was imposed."

On the question whether the revenue from export duties should be funded for financing the development of the export trade, the Association says that such a policy could be pursued provided the revenue is used for the purposes of promoting the trade which is directly concerned with the commodities on which they are imposed. In other words, the Association is not in favour of appropriating the revenue from export duties for general purposes of export promotion.

Justifying the superiority of the specific duties over *ad-valorem* duties, the Association points out that the chief drawback in the latter form of duties is that, since the values cannot be determined with precision, it "generally leads to undesirable practices." Specific duties, on the other hand, do not give rise to any dispute. They are also easier to administer.

The views expressed by the Association on the subject of taxes on cotton are in conformity with those held by the trade in general. Thus, there is no doubt that the Government should be prepared to revise export duties on cotton when the situation demands it. There is also no justification, as the cotton mill interests have repeatedly urged, for the present duty on imported cotton. So far as sales tax on cotton is concerned, there is much to be said for withdrawing this tax, which prevails in many States, in view of the fact that the sales of cloth are subject to tax.

Freight rates are only part of your total shipping costs. You have to think of many other things too — packing, insurance, loading charges, dock dues, etc.

When you fly your cargo, these charges are either reduced or avoided altogether; so you start with a substantial saving.

IT COSTS LESS...

Insurance, for instance, is based on the time your goods are travelling. By air, they take only hours instead of weeks; so you save 90 per cent or more on the premium.

You save on handling costs, too. No warehouse charges, no dock dues, and the minimum delay in Customs.

Packing costs are cut right down, because your goods need less protection by air. They mostly travel with light cargo, and they are treated gently. A simple cardboard carton is enough, even for perishable goods.

Finally, we make standard reductions for bulk shipments of 100 lb. or more. And for many types of goods, we offer special reduced rates.

It's worth while to find out how much you save, when you fly your goods by A.I.I. Why not write to us today? Or give us a ring, and our representative will call on you.

MODERN HOUSING FOR WORKERS OF BELAPUR COMPANY

BETTER LIVING CONDITIONS WILL ENSURE CONTENTED LABOUR, SAYS SIR JOSEPH KAY

HARIGAON, the little rural town in Belapur (Ahmednagar District), hummed with activity on Saturday last, when the opening ceremony of the Belapur Company's new housing colony was performed by Mr. Girja Shankar Bajpai, Governor of Bombay. The ceremony marked the fruition of an ideal cherished by the Directors of the Company for a long time, namely, to provide housing for all permanent staff, including labour. The cost of the housing colony, the construction of which began some eighteen months ago, is estimated at about Rs. 55 lakhs; of this sum, Rs. 30 lakhs have already been provided out of the profits of the Company. This is, perhaps, the only instance in the State of Bombay where a sugar factory has undertaken a scheme on such a vast scale to house its workers. Indeed, the scheme is one of the best labour housing schemes ever ventured by private enterprise, giving spacious and comfortable accommodation to labour and staff, having up-to-date sanitation, water-supply and electricity.

With the opening of the new housing colony, one more important—and significant—chapter has been added to the history of the progress and development of the Belapur Co., Ltd. The idea of providing housing to workers is not as already stated, of recent origin with the Directors of the Company. They had realised the necessity to give this comfort to workers even before the war. But they could not translate it into action for reasons beyond their control. This will be evident from the following extract from the brief speech of Sir Joseph Kay, K.B.E., Chairman of the Company, delivered on the occasion of the opening ceremony:

"First of all, the Directors felt that the Company's affairs should be developed fully before embarking on such an extensive scheme. Then came the war; building materials of all kinds were controlled and difficult to obtain and even then at inflated prices, and with that goes the fact that any housing scheme which we considered must go forward, must be such as would meet the full requirements of our permanent employees and not undertaken in piecemeal fashion."

A Wise Investment

After the war, the Directors waited for some time to see whether the conditions would improve. The difficulties referred to above, however, did not subside to any appreciable extent. Nevertheless, the Directors decided some two years ago to go ahead and took bold action. The result is that to-day the Belapur Company has attained the distinction of being the first in the field, in this part of India at any rate, to provide modern housing on a scale which none of its confreres has done for its workers. Those who pay a visit to this colony will find that the Company has really done something worthy of emulation by other employers. They will also admit that the Company is a typical example of enlightened private enterprise. There may be some among the shareholders of the Belapur Co., Ltd., who may feel that the management has squandered away profits that belonged to them. If there are any, they are, we must say, living in an age which is past and which will never return. Actually, the Company's management has been far-sighted enough to do gracefully a thing which other employers may be compelled to do by the State in the not distant future. In any case, the Company has not done something which is not within its resources. In our opinion, the Directors of the Company have made a wise investment the return on which will be in the form of advantages that accrue from having a contented labour force.

It is significant that the Company has not sought any assistance from the State for providing this amenity to its workers. A pointed reference to this feature was made by Sir Joseph in his speech. He said:

"In the view of many, housing, particularly industrial housing, should be the responsibility of the State. It is true that the Government of India have introduced a subsidised housing scheme for industrial workers; at the same time, they are pressing employers—especially in new concerns—to provide suitable housing accommodation for their employees, but after consideration, the Board of Directors decided that, situated as we are in the Deccan, with a certain amount of money at our disposal, we should embark upon the present scheme, which contains our own ideas and which will be completely under our own control."

Sir Joseph detailed at length the salient features of the housing scheme—these will be referred to presently—and expressed the hope that better living conditions would help bring about the much desired higher standard of living, from the point of view of both health and enjoyment, which was so necessary in the changed India of to-day. "The Company," to quote him again, "has been lavish in its expenditure in the hope that the better living conditions which the new colony provides will tend towards our having a still more contented labour force and will improve the lot of the workers. As time passes, social and recreational events will be organised, with a view to giving change from work, for both mind and body, and thus lighten the toils of everyday life, of which many of the workers are in such need and which I hope will be appreciated."

Here is an admirable example of the employer being not only prudent but also enlightened in outlook. Certainly, the management of the Belapur Company deserves every word of praise that the Governor of Bombay showered on it. Said the Governor:

"I congratulate the Directors of the Belapur Company on the completion of the housing and recreational project of buildings for their workers. I am sure that they will reap their reward in the greater contentment and consequent greater efficiency of their employees. ... Amenities such as housing and recreational facilities could legitimately be regarded as labour's due and not luxuries, and whether the State or the employers should provide them is a question of which the merits do not affect the contentment of the worker. The prudent and enlightened employer does not wait for the conclusion of the debate. What we have to remember in India is that the resources of the State are limited and that social forces impart urgency to practical measures for improving the workers' lot."

Timely Advice to Workers

With the provision of better amenities to labour, one would naturally expect labour to raise its productivity and thereby help augment output. Concurring with this view, the Governor of Bombay gave the following piece of timely advice to industrial workers in this country:

"It is as much to the advantage of the workers as of their employer, be the latter Government or private agency, that the growth of the economic prosperity of the country should not be hindered or hampered by conflicts which hold up or impede production. I suggest that they cannot afford to hold up their advance along this road owing to disputes over ideologies. Practical achievement counts for far more than theoretical argument. If you look at the U.S.S.R. or China—both have remarkable progress to their credit—you must not forget what Western Germany and Japan have accomplished. They too represent Phœnix-like transformation of their national economies. The need of the moment is the maximum of effort, based on complete co-operation and understanding among all the parties that are engaged in production."

There is no doubt that, on careful and calm reflection, the interests to whom the aforesaid remarks are addressed will admit, if they have an open mind, that there is a lot of truth in what the Governor has said.

Dilating on the problems of the sugar industry, the Governor of Bombay paid a handsome tribute to the pioneers in the field of sugar manufacture. Here are his own words:

"The sugar industry is one of the most important in India and reference to old controversies and old struggles is relevant only because of the courage and enterprise of the early pioneers. What Sir Joseph Kay has said about the difficulties and financial losses encountered and incurred by the Belapur Company in its early years illustrated the hazards to which these *entrepreneurs* were exposed. Among the critics of the protagonists of a sugar industry for India were many who sought support for their arguments in the climatic advantage of Java, the superiority of its soil and the difficulty of mechanical cultivation of sugarcane in this country on account of the smallness of agricultural holdings. While North India, where the bulk of the industry is still located, is liable to frost, genetical science has not tried unsuccessfully to produce frost-resisting varieties of cane. Moreover, factories had grown up in the centre and the south of the country where frost occurred rarely, if at all. And, in the Deccan, the handicap of small holdings have been overcome by the leasing of comparatively large tracts of land where the yield of cane per acre and the sucrose content of the cane have both been increased by the production of new varieties and their effective cultivation by modern scientific methods. As the souvenir programme of this function tells you, this Company produced, in 1952-53, 54 tons of cane per acre, against 24 tons, in 1924-25, and the rate of recovery of sugar from the cane rose from 8.14 per cent. to 12.30 per cent. during the same period. These figures must be eye-openers to old-time Jeremiahs."

Mr. Girja Shankar Bajpai laid particular stress on the need for reducing the cost of producing sugar which is at present high in all conscience. Reduction of costs, he said, was desirable in the interests of both the consumers in this country and exports. In saying this he was not unaware of the fact that, with the general increase in the cost of living which had necessitated increase in wages, and the socio-economic policy of guaranteeing a minimum price for the cane to the cultivator, an appreciable fall in production costs was problematical at the moment. In view of this, he felt that greater efficiency of production offered "the only prospect of reducing production costs."

History of Belapur Company

To revert to the new housing colony of the Belapur Company. On the occasion of the opening ceremony of the colony, both the management and the labour of the Company could certainly look back with satisfaction upon a career which stands out as a remarkable performance in the history of the Indian sugar industry. Although the Company was registered on 27th October, 1919, the first chapter in its history began only with the year 1924, that is, when Messrs. Marshall Sons and Company retired from the managing agency, giving place to Messrs. W. H. Brady & Co., Ltd. Since then, the Company has made remarkable progress and has become one of the most successful producers of sugar in India. This is due mainly to the perseverance, foresight and confidence of its Managing Director, Sir Joseph Kay. The Company has achieved the distinction of delivering quality sugar and that at the lowest possible price, thanks to the efficient organisation and liberal price policy. This happy position has largely been rendered possible by the continuous effort of the management to keep production costs down, despite the series of tax imposts imposed by the Central and the State Governments.

That the Belapur Company has made notable progress will be evident from the fact that the production of sugar has gone up from a bare 2,067 tons in 1924-25 to as much as 18,317 tons. The output to-day accounts for more than 13 per cent. of Bombay's total production of 138,800 tons. The rise in sugar output is mainly the outcome of the improvement in the technique of sugarcane cultivation. Realising full well that sugar is made in the ground and not in the factory, the management has spared no efforts to improve the quality of cane produced on scientific lines. These efforts have met with considerable success. Not only the yield of cane per acre has increased—from 23 tons in 1924-25 to 54 tons in 1952-53—but the recovery percentage of sugar in cane also has improved—from 8.14 to 12.30. These figures compare very favourably with the all-India average per acre yield of 12 tons and recovery percentage of 9.27. The following comparative table showing the trend of sugar output and sugarcane cultivation will bear full testimony to the achievements of the Company:

Statement showing acreage, yield of cane per acre, yield of sugar per acre, recovery, etc., obtained by the factory from the season 1924-25 onwards.

Year	Acreage	Tons cane per acre	Tons sugar per acre	Cane crushed in tons	Sugar made and estimated in tons	Recovery percentage
1924-25 (a)	1,114	23.00	1.86	25,304	2,067	8.14
1925-26	1,071	22.45	1.87	24,063	2,072	8.32
1926-27	1,606	19.52	2.04	32,648	3,423	10.49
1927-28	1,574	23.71	2.30	37,322	3,628	9.72
1928-29 (b)	1,604	18.67	1.68	29,234	2,651	9.39
1929-30	1,715	24.69	2.67	42,348	4,578	10.81
1930-31	1,803	32.42	3.81	58,462	6,330	10.83
1931-32	1,792	34.06	3.94	62,686	7,074	11.54
1932-33	1,889	33.10	3.84	63,790	7,318	11.12
1933-34	1,758	42.73	4.75	78,158	8,677	10.98
1934-35	2,040	36.35	4.04	90,814	10,716	11.19
1935-36	2,581	38.07	4.12	105,347	11,321	10.76
1936-37	2,701	41.09	4.71	114,391	13,072	11.43
1937-38	2,618	43.87	4.83	115,537	12,723	11.02
1938-39	2,711	43.38	4.90	117,602	13,282	11.30
1939-40	2,780	39.11	4.86	108,205	11,877	10.97
1940-41 (c)	2,382	45.45	4.77	110,921	11,610	10.50
1941-42 (d)	2,878	38.02	3.60	110,114	10,429	9.47
1942-43	2,924	38.03	3.91	111,221	11,466	10.31
1943-44	2,854	38.88	4.12	109,726	11,274	10.74
1944-45	2,969	33.40	3.60	99,614	10,722	10.76
1945-46	2,564	34.29	3.76	87,578	9,636	11.00
1946-47	2,351	41.94	4.56	98,610	10,729	10.88
1947-48	2,621	38.95	4.64	114,344	13,652	11.85
1948-49	2,693	39.36	4.84	118,962	12,904	11.04
1949-50	2,718	42.84	5.24	116,653	14,272	12.23
1950-51	2,744	41.44	4.99	113,858	13,900	12.04
1951-52	2,707	45.08	5.62	145,337	16,985	11.89
1952-53	2,738	54.0	6.64	148,957	18,317	12.30

(a) In this year, 678 acres had been carried over from the previous year.
(b) Frost year.
(c) An area of 406 acres had to be carried into the season 1941-42, on account of the strike, hence lower acreage harvested.
(d) This yield is including carryover cane. Excluding that, the outturn was 38.39 tons per acre.

The all-round development in sugar production and cane cultivation is fully reflected in the highly encouraging financial position of the Company. As against a net loss of

Rs. 1,69,769, in 1923-24, the Company earned a gross profit of Rs. 56.29 lakhs in 1952-53. The reserves and surplus of the Company stand at the impressive level of Rs. 79.70 lakhs which represent about 169.5 per cent. of the paid-up ordinary capital of Rs. 47.00 lakhs. The gross block is Rs. 65.05 lakhs, as against which there is a depreciation fund of Rs. 51.14 lakhs. The surplus of current assets over current liabilities and provision for taxation as on 30th September, 1953, was as much as Rs. 112.79 lakhs.

Apart from providing employment to about 2,400 workers and satisfying the sugar requirements of over 4.7 million consumers—on the basis of the Planning Commission's estimated *per capita* consumption of 8.3 lbs.—the Belapur Company contributes quite a good bit to the Central and State Exchequers by way of taxes. During 1951-52, for instance, the Company paid about Rs. 73 lakhs as income-tax, excise duty, cane cess, irrigation charges and land taxes.

Housing Scheme Described

The management of the Belapur Company has always looked to the welfare and happiness of its staff with genuine concern, as witness the introduction of various welfare schemes for the employees. The ambitious new housing colony, referred to at the outset, is an instance in point. The colony is located at a very short distance from the actual factory and covers an area of about 100 acres. The area is self-draining, being on high and rocky ground. The salient features of the colony, as described by Sir Joseph Kay in the course of his welcome address, are as follows:

576 "D" type quarters for workers and others. 96 buildings, each of 6 tenements, each consisting of 1 living room with verandah on both sides, with a kitchen and a courtyard, with washing place and fuel store and with separate lavatory blocks for every 36 tenements consisting of 6 flush lavatories and 6 bathrooms. In these quarters, the density of population works out to only 66 persons per acre and, therefore, retains the rural and spacious atmosphere for living conditions.

44 "C" type quarters for junior staff of the Company consisting of 1 bedroom, a living room, a dining room, a kitchen, a bathroom and a flush lavatory, with an enclosed court yard.

16 "B" type quarters for senior staff of the Company consisting of 2 bedrooms, a living room, a dining room, a kitchen, a bathoom and a flush lavatory, with verandahs on both sides.

2 "A" type bungalows for departmental heads consisting of 3 bedrooms, a living room, a dining room, a kitchen, 3 bathrooms, and 3 flush lavatories.

In addition to the above, the following have been provided:—

A separate gymkhana building provided with inside badminton court, library room, office room and separate card room, dressing room and flush lavatories for ladies and gents. Two verandahs—one 8' wide at front entrance and the other 28' wide sitting verandah (capable of being used for two ping-pong tables) facing two tennis courts and a lawn has been provided.

A reinforced concrete water reservoir built at a height of 40' to be filled with water from six 30' wells that were dug for this purpose, providing water to the buildings of the whole colony by means of pipes and taps for drinking, washing and flushing of lavatories.

Flush type lavatory blocks with a net-work of drainage pipes leading to two septic tanks which deliver the effluent to the nala.

A market place with raised platforms to hold weekly bazaar.

A separate building just adjacent to the colony to serve as grain shop and a consumers' co-operative grocery and provision shop for the use of the employees of the Company.

Huge lawns and garden area in the centre of the colony and separate lawns provided between "D" type quarters to be used as playground and open space for ventilation and fresh air.

Street lights on all the 40-ft. roads of the colony.

The hospital has been extended.

The Company conducts a primary and secondary school up to Standard VII (old English third standard) for education of the children of its employees. The number of pupils attending the main school is 480 and those attending the branch schools is 75.

The foregoing descriptive account of the Belapur Company's new housing colony is a clear indication of the earnest desire of the management to provide its labour with several basic amenities. Indeed, these and other indirect contributions by the factory will soon turn Harigaon into a thriving model township. If the vast rural areas of this country were studded with such thriving model townships, we would have that happy blending of village and town life which will undoubtedly make for the sound economic progress of this country. Further, if the noble example of the Belapur Company were followed by more and more industrialists, the future of private enterprise, nay, of democracy itself, would be well assured and protected against the onslaught of Communism.

MINING LIGNITE IN ASIA AND FAR EAST

REPORT OF E.C.A.F.E. AND T.A.A. EXPERTS

THE report of the Economic Commission for Asia and the Far East and the U.N. Technical Assistance Administration Study Group of lignite experts on their visit to Australia contains a number of recommendations relating to problems of prospecting, sampling, mining, processing, utilisation and the organisation and management of lignite mining operations. It will be recalled that the experts from Burma, China, India Indonesia, Japan, Korea, North Borneo, Pakistan, the Philippines and Thailand, accompanied by E.C.A.F.E. and T.A.A. experts on lignite recently visited 29 principal mines, plants and organisations in the States of Victoria, South Australia and New South Wales, with a view to obtaining a complete picture of the Australian advanced techniques in lignite mining and utilisation and find out how far they can be adopted in Asian countries to develop lignite resources. Their findings are of particular importance to India as arrangements to exploit the lignite resources in South Arcot are now in progress.

The experts have prefaced their findings by laying emphasis on two things. One is the basic importance of developing lignite and other low-grade coal deposits in Asia and the Far East which are woefully short of high-grade coals. The other is the emphasis on the value of group study tours. They have stressed the benefits derived from team work which, by pooling individual knowledge, experience and initiative, can make possible the gathering of a large quantity of data and information in a comparatively short period of time. They have recommended study tours, similar to the one they made in Australia, to Europe, especially France and Germany, and the U.S.S.R. in the near future. They have further suggested that any visit to the U.S.S.R. should include experts both in lignite exploitation and utilisation as well as geological survey and prospecting, as it is understood that geological survey and prospecting for mineral resources have been proceeding simultaneously on a large scale in the U.S.S.R.

The experts have pointed to the vital need for intensive and extensive prospecting that will establish as to whether sufficient quantities of lignite reserves at a workable depths are available, before plans for utilisation are made. They have also pointed out the need for a thorough knowledge of the distribution of lignite resources, with a view to avoiding grave mistakes such as the building of a town on a site where later on considerable reserves of coal might be discovered.

As against these general observations, the lignite experts have made the following suggestions in regard to coalfield investigations:

(1) Scout drilling to define the structure of the coal seam;
(2) test drilling to test the quality and quantity of coal;
(3) close grid drilling to provide data on overburden and sea thickness; and
(4) pitting to provide bulk samples for testing.

In planning for mine layout, the experts have urged the following factors to be kept in mind:

(1) Total reserves; (2) thickness of coal; (3) thickness of overburden; (4) character of overburden; (5) hardness of coal; (6) outline of deposit; (7) partings and cracks; (8) production rates and required reliability of continuous supply, and (9) maintenance of machinery.

The characteristic features of coal affecting utilisation in steam generation are: (1) moisture content, (2) ash content and ash-fusion temperatures, (3) sulphur content, (4) foreign substances in the coal as mined and (5) sizing of coal. Dealing with these aspects, the experts have made certain suggestions which are as follows:

(1) Sampling practice and moisture determination as accepted in Australia should be practised in E.C.A.F.E. countries. Proper sampling is one of the most important phases in the exploitation of lignite deposits, for the most precise method of analysis will be wasted on a poor sample, and such wastage should be avoided. The economic value of lignite is, to a large extent, determined by the moisture content at which bulk tonnages are eventually supplied to the final consumer. The moisture content of coal should, therefore, be determined, as accurately as possible.

(2) Hand firing in small furnaces can be used for lignites of fairly high moisture contents.

(3) Underfed screw stokers can be used with lignite of medium moisture and breeze coke might be added to avoid packing.

(4) Spreader stokers cover a great range of fuel of different properties. Extremely low grade coal can be successfully combusted. Operation and control is simple. High peak loads can be met easily and quickly as well as extremely low ratings at off-load periods.

(5) Mill firing will be necessary when the boiler capacity rises above 200,000 lbs. of steam per hour. For small boilers, mill firing is not advisable because of the high cost of installation and operation.

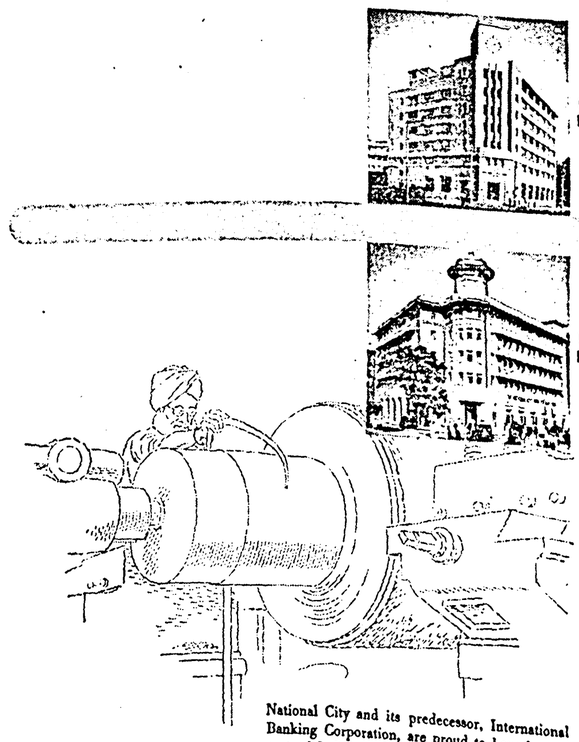
So far as lignite processing is concerned, the experts have observed that "in the preparation of lignite, the improvement in sizing is one of the most important and cheapest methods. The combustion process is basically a physical problem as well as a chemical one, and the volume-surface ratio of the fuel is a factor in achieving the desired result of efficient combustion or reaction at a required high technical rate." As some of the coal reserves in the region, particularly those of higher ranks will not briquette without a binder, the manufacture of ordinary briquettes with pitch or other binder will have to be considered. A combination of carbonising and briquetting might be adopted for some of the Asian coals.

The experts have felt that Lurgi pressure of gasification of lignites appear to be of major importance in the realisation of lignite projects. They were particularly interested in inspecting the large plant now under construction in the State of Victoria for the gasification of lignite under pressure of the Lurgi process for the manufacture of town gas. It was realised that complete gasification of lignite would be applicable not only in connection with the manufacture of town gas of normal standard but also in combination with advanced methods of synthesis. It appears to offer prospects for full beneficiation for various types of synthesis gas and/or liquid products.

The group was impressed by the possibilities of utilising low-grade coals for cement plants with modern vertical kilns which do not require large capital outlay. These plants should be able to use lignite coke or coal screenings including dust of below ¼" sizes or other slack fuels, which were hitherto regarded as waste materials, and would produce cement at low cost.

The importance of this report to the countries of Asia and the Far East are enormous because the region is rich in lignite resources. The quality in many cases is equal, if not superior to those in Germany and Australia. Proper exploitation and utilisation will greatly improve the Asian fuel situation and facilitate industrial development which is being held up by the acute shortage of coal.

50 YEARS IN INDIA



National City and its predecessor, International Banking Corporation, are proud to have been a part of India's past half century of commercial growth. Today . . . with branches or correspondents in every commercially important city of the world . . . National City offers Indian business and industry comprehensive world-wide banking service.

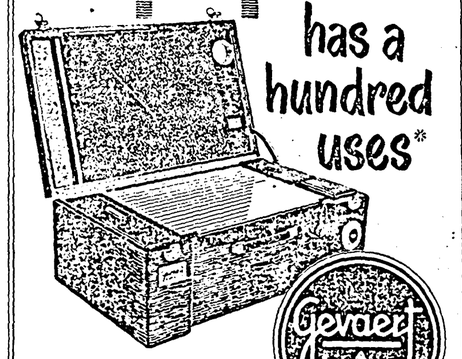
dupliphot has a hundred uses*



Gevaert 'dupliphot' is a very useful apparatus proving its value to-day in several modern offices where reproduction of important documents is a frequent necessity. Easy to operate and maintain 'dupliphot' is a photographic device with which copies of any kind of printed or written document can be taken out on a special kind of sensitised paper within 6 minutes. Photographic reproduction is the most accurate, the cheapest and the quickest – and 'dupliphot' is the best machine yet designed for the purpose.

FACTS ABOUT INDIAN COFFEE

REASONS FOR RISE IN PRICES EXPLAINED

(From A Special Correspondent)

COFFEE prices have been the subject of considerable controversy in recent months and the Government's attitude, as expressed by Mr. T. T. Krishnamachari on several occasions, is that it is too high. Whether a price is high or low depends on so many factors, but the most obvious and comparable ones are the following:

(1) Coffee prices in India, grade for grade, have been Rs. 50 to Rs. 250 per cwt. less than what coffee would fetch in the foreign markets. This has been the position since 1949.

(2) The rise in the price of coffee since 1939 has not been as great as the rise in the prices of comparable commodities, such as tobacco or betelnut. Here are some statistics to prove this point:

Wholesale Index Number (Base: 31st October, 1953	1939=100)
Coffee (Plantation P.B.)	537
Tobacco (Local Natu graded)	1893
Betelnuts (Deshi)	1238

(3) Nor has the price of coffee risen above those of the goods the producers of coffee have to buy in order to live and work, as will be seen from the following facts:

Wholesale Index Number (Base: 31st October, 1953	1939=100)
Rice	751
Wheat, Hapur	641
Groundnut, bold	637
Copra	818
Coconut oil	808
Bleached Mull	651

(4) A very important question, in this connection, is, what is the share of coffee in the cost of living of the average person. Is it as great as of rice, wheat, copra, cloth or tobacco or betelnut? Without going into figures it is obvious that it is not.

Unchallengeable Fact

The unchallengable fact about coffee is that the Indian producer gets about Rs. 117 for robusta variety which will fetch him Rs. 230 to Rs. 240 in the foreign markets. He gets only Rs. 180 for Plantation A which would fetch him Rs. 460 in London. This has been more or less the position during the last five years. Yet, it has been charged that Indian prices are too high, that the Indian Coffee Board which is alleged to be dominated by the producers, has been rigging up prices to the detriment of the Indian consumers. That the price was a mere Rs. 38 per cwt. for Plantation A in 1940 and that it is priced Rs. 212 at present and that it once went up to Rs. 351. These figures are quoted out of context and it is not all truth. In the first place, the Indian Coffee Board is dominated by the Government, not by its members, because under the existing Act the Government could set aside any decision taken by the Board if it did not approve of it. That was how the Board's cost figure of Rs. 2-7-1 has been set aside, the Board's marketing policy was altered since the middle of December 1952, the Board could not export any coffee in spite of the proved surplus since March until permission was given in October and in 1949, 1950, 1951 and 1952 coffee had to be exported against the wishes of the Board. On this Board apart from the overall reserve powers vested in the Government, there are 11 official members representing the Central and State Governments, including a Joint Secretary of the Commerce and Industry Ministry and a Minister of the State of Mysore. Out of 30 members, only 14 are producers of whom 3 are nominated by Mysore.

Price Variations

The price ranged between Rs. 38 and Rs. 45 per cwt. in 1940. India exported more than 50 per cent. of its coffee output before the war and, in 1940, the whole of the European market was lost to us as a result of the war. That left us with a surplus which forced prices down. Besides, throughout the thirties, world price of coffee was below cost of production and it would be wrong and misleading a comparison to base it on the minimum fetched during that period. Price of plantation A ranged between Rs. 70 and Rs. 90 per cwt. in 1926, 1927, 1928, 1929 and 1930.

It was since 1946 that the cost of all primary necessaries began to go up in the general inflation and the workers had to be compensated against a fair share of this increase. Besides, the Plantation Industrial Tripartite Conference decided upon new increases in wages and certain amenities. Since 1950, there have been further additions to wages, and, again in 1952, when all the States introduced the Minimum Wages Act. All these additional charges have reflected on the prices at which coffee could be sold.

It is, however, true that at one time, in 1952, there had been a steep rise, far above what was fixed as the basic price of coffee by the Board. In March 1952, the price of plantation A was Rs. 196-7. In September, it was Rs. 316-11. Similarly, robusta coffee rose from Rs. 166-8 to Rs. 239-15. The reason for this rise, as well as for the temporary rises in 1949, 1950 and 1951, however, arose primarily from the Government's policy. Early in 1950 the Board was asked to export 4,000 tons of coffee. The Board advised the Government against this. Eventually, 3,331 tons were exported. Next year, there was again pressure from the Government to export coffee against the Board's advice.

The entire mechanism of price control consisted of having enough stocks with the Board and the removal of this safe margin of stock made the Board powerless to control the market. It was the Government which forced the Board to export, thereby rendering the Board helpless to control internal prices—close to the basic prices—the Board itself considered adequate for the growers. It is on record that the Government wanted export, "even if it meant some hardship to the Indian consumers." It is also on record that the Board made representations against exports to the Government and one of the subjects dealt with by a Coffee Board deputation to the Minister for Commerce and Industry on 7th January, 1951 was a request to allow the Board to retain the unexported part of the coffee.

Board Cannot be Blamed

In 1952, there was again a demand for export in excess of a safe margin. Both the Chairman and Chief Coffee Marketing Officer of the Board had to visit New Delhi urgently to plead for a modification of the order in March. Although the quantity was reduced to 2,000 tons, there was again a query in July whether 1,000 tons more could be exported. The Government with its insistent demand for export against a marginal stock position rendered the Board helpless against the speculative forces in the market. That is the real reason behind the unusual rise in the price of coffee in 1952. Nevertheless, the average price realised for plantation A at Rs. 251-11 per cwt. was less than Rs. 288-13 realised for Santos 4 in the New York market and considerably less than the price realised for comparable coffees in Europe. Still, it was far more than what the producers in fairness asked for and the Board fixed as adequate. But the Board could control the prices only if it had enough stock of coffee and with the Government's insistence on export this was not possible. Yet, in 1953, the Board is blamed for all the consequences that flowed from a wrong policy on which the Government insisted in spite of earnest advice to the contrary.

Late in 1952, the Government's policy was reversed and, since then, the insistence was on reducing the price in the internal market. The growers would heartily co-operate with this policy, because it was also their own policy as expressed during the last five years. The present controversy arises from the fact that the blame for all what was the natural consequence of the Government's coffee policy of the previous four years is sought to be placed on the Board, on the growers and certain individual members. An effort is being made arbitrarily to decide on prices which should properly be determined by a fair and comprehensive enquiry. A frustrating attitude is taken in the relations with the Coffee Board, with the result that its considered and responsible views are disregarded and it is attacked openly without providing it the freedom to answer. Individuals are named and attacked in public where they have no opportunity to defend themselves.

Since December, 1952, the Government has been in direct control of marketing coffee and during this period, although prices have been ruling at Rs. 210 to Rs. 220 for plantation A and Rs. 142 to Rs. 148 for robusta, the quantity of coffee sold was about 35 per cent. less than normal. With repeated public statements threatening further reduction, the trade was disturbed and nobody could buy coffee for fear of the price being reduced at any time.

The Main Issue

The most important issue is whether the coffee industry should remain static or gradually decline or whether it should expand at least at the rate it did during the last ten years. The world coffee situation offers a tremendous opportunity to India which produces a premium coffee. Consumption within India is also expanding. There are large areas on both sides of the Western Ghats where coffee can be successfully grown without taking away land from other crops. Every 1,000 acres of coffee newly planted means:

(1) An additional Rs. 10 lakhs in exportable product; (2) 800 new jobs; (3) the removal of about 1,500 people from the crowded rural plains and their settlement on the under-populated hills, new houses and schools and other facilities; (4) the development of a township, trade and other services on the hills where there are none at present; (5) the introduction of anti-malarial and other health measures making the jungle area inhabitable; (6) extension of communications and modern facilities to areas where there are none now; (7) conservation and care of soil; and (8) creation of demand for other goods worth an additional Rs. 10 lakhs.

There are over 100,000 acres available for immediate planting. If 3,000 tons of export will allow a reduction in internal price by As. 3 per point or Rs. 15 per cwt., an export of 6,000 tons will cheapen coffee by Rs. 30 per cwt. If the duty of Rs. 62-8 had not been levied, it would have cheapened coffee for the consumer by an additional Rs. 15 per cwt. So increased production of coffee is in the nation's best interest. That large production can come about only if the Government's policy towards the growers is fair and constant is obvious. The attack on the Board and the producers and the threat to the trade have not created that confidence.

COFFEE PRICES

The retail selling price of coffee powder sold by the Coffee Houses run by the Indian Coffee Board has been reduced by one anna per lb. with effect from the 16th inst., in accordance with the decision taken by the Coffee Board at its meeting held in Bangalore on the 7th inst. The revised selling prices of the different varieties of powder are: Plantation Rs. 2-12, Cherry Rs. 2-8 and Robusta Rs. 2-3 in South India and Rs. 2-14, Rs. 2-10 and Rs. 2-5 in other places. The price of liquid coffee sold in Coffee Houses has also been reduced. The Board also decided to make a pool payment of As. 3 per point to coffee growers on the 1952-53 crop during the current month, bringing the total payment to Re. 1-14 per point. The Board requested the Government of India to enhance its borrowing power from Rs. 2 crores to Rs. 3 crores, in order to make sufficient funds available for pool payments. In the meantime, the Board would make an initial payment to growers on the 1953-54 crop at 50 per cent. of last year's rate. However, outright payments to small growers would continue to be made at Rs. 2-4 per point.

According to the revised estimates, the 1953-54 crop would yield 24,500 tons of coffee, made up of 17,500 tons of Arabica and 7,000 tons of Robusta, as against the original estimate of 22,750 tons. The question of export allocation out of the 1953-54 crop would be considered after watching the trend of internal consumption during the next two months.

The Marketing Committee of the Board made a preliminary study of the Government's Cost Accounts Officer's report sent to the Board for its views. As a number of points required clarification, the Board decided to request the Government to depute its Cost Accounts Officer to meet the Cost of Production Sub-Committee. The Board had an opportunity of hearing Dr. Leslie C. Coleman, an eminent scientist, on coffee research. In his address to the Board, Dr. Coleman emphasised the need for increasing production of Arabica coffee in India, as it was the quality coffee of the country and has established a high reputation for itself in world markets during the past decades. One way of increasing production, he said, was to educate the small growers in the country in the improved methods of coffee cultivation. The need for continued research on all aspects of coffee, especially in breeding high-yielding, disease-resistant strains, was stressed by Dr. Coleman.

ELECTRICITY SUPPLY INDUSTRY

NEED FOR UPGRADING STANDARD RATE OF RETURN

ONE more opportunity was availed of by Mr. K. G. Milne, President of the Association of Electrical Undertakings, Bombay State, to highlight the problems of the electricity supply industry in India, in general, and Bombay, in particular. This was the thirteenth annual meeting of the Association held in Bombay last week. The main problems facing the industry are the need for (1) upgrading the standard rate from the existing level of 5 to 6 per cent., (2) permissive provision for the creation of a deferred taxation reserve and (3) the creation of a rehabilitation reserve. So far as Bombay is concerned, the biggest problem is the tussle between the Tatas and the Government of Bombay regarding the capacity of the proposed Trombay thermal project.

Mr. Milne deplored, at the outset, the delay on the part of the Government of India to liberalise the Electricity (Supply) Act, 1948, especially with regard to the need for increasing the standard rate. He declared that such was virtually undermining the stability of the industry. Few can dispute this statement, for, with the standard rate pitched at the present limit of 5 per cent., it is becoming increasingly difficult to raise the capital needed for expansion of electric supply. A survey made by the industry, at the request of the Government, of the efforts by individual investors to raise finance has confirmed that such success as there had been was confined to exceptionally large and well-established undertakings and, even here, investment interest was at a low ebb. After all, the primary object of the financial provisions of the Electricity (Supply) Act is to ensure a fair price for good service. A fair price is that which allows sufficient margin of profit which will enable the undertakings to declare a decent rate of dividend, without which it will not be possible to attract the supply of capital needed for financing the expansion of industry. The urgency of this demand has been emphasised so often in the past. Most of the existing electricity undertakings have now reached a stage at which it will not be possible for them to maintain their dividend on the capital recently raised by them unless the standard rate is increased.

Out of Date

That the standard rate has become out of date will be obvious to those who have been following the developments in the capital market in the last two years. It is an accepted fact that the cost of capital has gone up. The Bank rate has gone up; the interest rate on Government loans has risen and the lending rate on the fully secured loans of the Industrial Finance Corporation has advanced by 1 per cent. to 6½ per cent. If the yield on fixed interest-bearing investments have gone up by this much, that on equities has necessarily to be much higher, because investors always expect a higher rate of return on equities than on either preference shares or debentures. It is, therefore, absurd to keep the return permitted to the electric supply industry unchanged at 5 per cent., a level which is very much below the current ideas of return on investment.

The industry's case for amending the Electricity (Supply) Act, so as to allow for deferred taxation reserve and rehabilitation reserve, is also important and calls for early action. The creation of a deferred taxation reserve will reduce the shock the electricity consuming public will receive when the incidence of deferred taxation begins to be felt in future years when it will be called upon to make good the present concessions in taxes. In other words, the incidence of deferred taxation must be spread over a period by means of advance provision for deferred taxation so that the shock when it came is lessened. In these days of high cost of plant and machinery, the need for the creation of rehabilitation reserves is too obvious to need reiteration.

The formation of State Electricity Boards is a long overdue measure. Section 4 of the Act originally provided a two-year period from 10th September, 1948, to State Governments for constituting Electricity Boards as visualised under the Act. This time limit has been extended from time to time, the latest extension being upto 31st March, 1954. But, so far, only a few States have constituted such Boards. It is deplorable that the Government of Bombay, the originator of the Electricity (Supply) Act itself, has not yet constituted such a Board. As Mr. Milne pertinently pointed out, in his speech referred to above, the delay means to the commercial sector of the industry that (a) the consultative machinery visualised in the Act has been kept in abeyance, and (b) an important potential source of finance visualised by the Statute is also withheld from many undertakings which are otherwise without recourse. To the public, the effect of the delay appears particularly in the halting approach to electricity policy, which is responsible for the continuing shortage of power in the Bombay-Poona area.

Mr. Milne then referred to the Trombay thermal controversy. He warned that any prolonged determination by the Government of Bombay to limit the capacity of the projected thermal station at Trombay to 50,000 kw. would leave a serious deficiency in power until power from Koyna was available and it would be worse if more accidents as the recent rockfall in the Bhira hydro-electric generating tunnel were to occur.

Supply and Demand

One does not know when Koyna would become a reality. The Union Deputy Minister, Irrigation and Power, had stated recently that there was no chances of any work starting on Koyna "this year," by which he evidently meant the 1953-54 fiscal year. The Bombay Government, which was all along saying that Koyna would be ready to supply power in 1956-57, is stated to have admitted, according to Mr. Milne, that it would take six full working seasons from the date work starts on the Koyna Project. This means that, if work were to start in 1954-55, the project would be ready not earlier than 1960-61. Will there be enough power to supply the needs of the Bombay-Poona region in the interval? The estimates of demand for power present a very disturbing picture. In this connection, the following account of the present power supply and demand position in the area and the general outlook for 1954, 1955 and 1956, that is, until the Trombay station comes into operation, prepared by the Association, will be read with interest:

(1) Since October, 1948, the demand on the Tata-railway system has increased from 255 m.w. to 285 m.w. or by 30 m.w. This increase of 6,000 kw. per year average has been due chiefly to the addition of new residential (principally lighting) consumers, who are now being added at a rate of between 15,000 and 16,000 per year, and some essential demands authorised by Government. The same rate of increased for these requirements will necessitate an increase in production capacity of 18,000 kw. in the next three years;

(2) the Government has committed itself to supply the refineries and the penicillin factory, and they will together require an increase in production capacity of 18,000 kw.;

(3) the railways, it is understood, have indicated that they have not ordered generating plant for an expected increase in traction demand of 14,000 kw. in the next three years. Consequently, this will require an increased generation of 10,500 kw. If to this is added the electrical production to supply certain Central Government enterprises, a combined increase of 18,000 kw. will be required;

(4) the first unit of the Bombay Government plant at Chola has been undergoing trial runs and it will, it is understood, be ready for commercial operation shortly. There are three generating sets each with a peak capacity of 18,000 kw. It is believed, however, that the full 54,000 kw. output will not be produced until the installation of the fifth boiler, which is due for completion about the end of 1954;

(5) the full output of the new Government plant, without any provision for standby, will therefore be required for the demands outlined in (1), (2) and (3) above; and

(6) this leaves no scope for meeting the vast pent-up, or new industrial, demands and the substantial unrequited domestic (heating, cooking, etc.) demands, or for the removal of factory working hours or holiday staggering.

This leads to the conclusion that, for the three-year period 1954 to 1956, until the Trombay station comes on loan, the power that will be available for the public will, on the most optimistic basis, be to the extent of 18,000 kw., taking into account such margin out of the power reserved for other purposes as will result from diversity of load. This amount of power will be hardly enough for normal growth of domestic load on its present restricted basis, and leaves no scope whatever for expansion of ordinary industrial load.

In limiting, for the present, the capacity of the Trombay station to one set of 50 m.w., the Government may be reckoning on the prospect of load demand in the area being equal to the production capacity until power from the Koyna Project becomes available by 1961. However, if past and prospective load development are any indication, the region would appear to be heading towards a serious power crisis between the period the Trombay station would be on load and the time the Koyna Project is commissioned.

In view of all these, the following suggestions put forward by Mr. Milne to meet the power requirements of the region deserve the attention of the authorities concerned:

(1) The Government of Bombay should review its decisions on the question of the capacity of the Trombay station and permit Tatas to proceed immediately with the installation of a 100,000 kw. power plant there;

(2) the railways should agree without demur to place such further orders for plant at their Kalyan power station as may be necessary fully to maintain the newly reacquired self-sufficiency;

(3) most urgent steps should be taken to overcome existing difficulties in fully commissioning the plant at the Government's new power station at Chola; and

(4) the Government should forthwith announce its stage-by-stage plans for the removal of all restrictions on power consumption in the Bombay area, including the removal of the holiday and factory-working-hours staggering schemes.

CASCADE GENERATOR

The million-volt Cascade Generator, recently installed at the Tata Institute of Fundamental Research, has now reached full operation. It will be recalled that work on its installation was started in May last. The purpose of a Cascade Generator is to produce high energy atomic particles which are used to study the structure of the atomic nucleus. The first high tension generator of this type was constructed by Cockroft and Walton under Lord Rutherford at the Cavendish Laboratory in Cambridge and produced the first artificial disintegration of the atomic nucleus. Since then there has been a number of improvements and the Cascade Generator now functioning at the Tata Institute of Fundamental Research was developed by Messrs. Philips Electrical Company at their establishment at Eindhoven, Holland. It produces a high tension of one million volts with a combination of condensers and rectifiers. The voltage from a 100,000-volt transformer is multiplied 12 times to give a nominal voltage of 1.2 million volts. Charged particles such as protons and deuterons are produced at the top of an accelerating column, which is an insulated tube across which is supplied a high tension of one million volts. These charged particles travel down the accelerating column, which is kept under high vacuum, and bombard a target which is at ground potential.

The great advantage of this type of high tension unit is its ability to give a high flux of charged particles. Thus deuterons of about 300 micro-ampere beam current, bombarding a target, produce about two thousand million high energy neutrons per second. This is approximately equivalent to the radiation from a 200-gram radium beryllium source. Very interesting nuclear reactions take place when these particles bombard targets of light elements like deuterium, tritium, lithium, beryllium, boron and carbon. For example, 1,000,000-volt protons bombarding lithium give high energy gamma rays, whilst fast deuterons hitting a tritium target produce a high flux of very fast neutrons.

The Cascade Generator installed at the Institute is only one step in the plans of the Indian Atomic Energy Commission for developing atomic energy in India. It will be used to obtain nuclear data necessary for the design of an atomic reactor and for fundamental research into the structure of the nucleus, such as the study of the fission caused in heavy elements by high energy gamma rays, nuclear energy levels and so on. For this purpose, high efficiency detectors, developed in the Institute, will be employed. The high flux of neutrons will enable the preparation of artificial radioactive isotopes, some of which have such a short life that they cannot be imported from abroad. These isotopes will, in due course, be made available for research in physics, chemistry and medicine to other research centres in the country.

USE OF ATOMIC POWER FOR PEACE

PROPOSAL FOR AN INTERNATIONAL COMMISSION

THE proposal put forward by President Eisenhower for an international atomic commission, in the course of his address to the U.N. Assembly on atomic power last week, is an act of the highest statesmanship. So bold and so reasonable is the proposal that even the Soviet Union has found it hard to reject it outright and has been giving it, in the words of M. Vyacheslav Molotov, the Soviet Foreign Minister, "serious consideration". The main object of Mr. Eisenhower's proposal is "to lead straying humanity off the road to atomic doom" and make a "historic beginning" in pooling knowledge and resources in atomic energy for the betterment of humanity.

The proposal has come at the most appropriate time, because the monopoly of atomic power once possessed by the U.S. is no longer there, inasmuch as not only the U.K. and Canada, but also the Soviet Union possesses it. It may be that, because of an earlier start, the U.S. may have accumulated what is to-day a quantitative advantage. But this superiority in number (consequently, a greater capability of devastation) is in itself no preventive against the fearful material damage and toll of human lives that would be inflicted by surprise aggression. As Mr. Eisenhower pertinently remarked:

"The awful arithmetic of the atomic bomb does not permit of any such easy solution. Even, with the most powerful defence, an aggressor in possession of the effective minimum number of atomic bombs for a surprise attack could probably place a sufficient number of his bombs on the chosen targets to cause hideous damage."

It is true that, should such an attack be launched against the U.S., the reactions will be swift and resolute. The retaliation capabilities are so great that an aggressor's land could be laid waste. But, surely, no sane member of the human race can "discover victory in such desolation" and wish his name "to be coupled by history with such human degradation and destruction." And the U.S. is no exception to this. To quote the memorable words of the President:

"Occasional pages of history do record the faces of the 'great destroyers', but the whole book of history reveals mankind's never-ending quest for peace and mankind's God-given capacity to build. It is with the book of history, and not with isolated pages, that the United States will ever wish to be identified. My country wants to be constructive, not destructive. It wants agreements, not wars, among nations. It wants itself to live in freedom and in the confidence that the people of every other nation enjoy equally the right of choosing their own way of life. So my country's purpose is to help us move out of this dark chamber of horrors into the light, to find a way by which the minds of men, the hopes of men, the souls of men everywhere, can move forward toward peace and happiness and well-being. In this quest, I know that we must not lack patience."

The need of the hour, therefore, is to seek "an acceptable solution" to stop the atomic armaments race which overshadows "not only the peace but the very life of the world." It is certainly no shallow vision incapable of realisation. All that is needed is a little amount of goodwill among the nations of the world, particularly on the part of the Communist nations.

The peaceful uses of atomic energy are so enormous that they may easily be considered as dreams about the future. But they are no longer dreams. This is already evident from the significant developments in nuclear research. To-day, the U.S. Atomic Energy Commission (A.E.C.), for instance, has in operation a fantastic power plant capable of producing its own fuel. The reactor employed in the successful experiment has been generating electric power in experiments since 20th December, 1951. The successful operation of the breeder reactor and a number of developments were responsible for the decision taken by the A.E.C., in October last, to construct the first full-scale power reactor capable of producing a minimum of 60,000 kilowatts, a quantity of power enough for a city of 50,000 people. Scientists say that it is now only a question of development to bring the costs of atomic electricity down to where they can compete with those of electricity from conventional sources. "The potential power to be harnessed from the atom for mankind's peaceful purposes staggers the imagination," to quote Mr. Gordon Dean, a former Chairman of the U.S. Atomic Energy Commission. "There is," according to him, "the same amount of energy in one pound of fissionable material as in 2,600,000 pounds of gasoline."

The most useful atomic by-product, the radioisotopes, has been the greatest research discovery since the microscope. These radioisotopes, which are ordinary chemical elements such as sodium, iron or carbon which have been made radioactive in an atom reactor, have proved valuable in medical science both in diagnosis and therapy. Radioactive iodine is used in diagnosis and treatment of hyperthyroidism and in the location of thyroid cancer and brain tumors. Radioactive strontium is effective in treating lesions and tumors, without surgery, in highly sensitive areas such as the eye. Radioactive phosphorus is now standard treatment for certain blood disorders. Radioisotopes have enabled agricultural scientists to trace fertilising materials from the soil into plants, to measure the speed of their movement, and to determine at which stage, in its growing cycle, a plant needs fertiliser most. This results in more effective use of fertilisers at less cost. Radioisotopes also are used to determine more effective uses for insecticides and weed-killers.

Numerous industrial uses also have been found for radioisotopes. They are used to look inside heavy castings, to measure the wearing process under different lubricating conditions and to study processes for producing petrol synthetically from coal and oil. Isotopes also help in steel and rubber manufacturing.

Current research also holds out the hope that man, through atomic energy, may learn how nature produces food and fuel from sunlight, air and water—the process called photosynthesis. To quote Mr. Dean, again:

"All of this progress has been made in a little more than one decade. . . . it is without parallel in history. No one can predict the future, but, if past performance is any gauge, we need only look at the astounding rate at which the Atomic Age has progressed in its first decade to be convinced that the potential benefits of atomic energy are truly enormous."

Since 1947, the U.S. Atomic Energy Commission has been conducting an export programme, whereby a limited variety of radioisotopes are made available to users in other nations for the specified purpose of scientific and medical research and medical therapy.

CONTROL OF VEHICULAR TRAFFIC

PROBLEM OF INCREASE IN ACCIDENTS

WE reviewed, in *Commerce* dated 14th November, 1953, the observance of the Safety First Week in New Delhi, and the causes of accidents on India's roads. Since the safety first principle in transport is of the utmost importance to insurers who, in the long run, stand to benefit by the wider acceptance and adoption of this principle by the motorists, cyclists and pedestrians, we made a fervent plea to insurers to interest themselves in the work of the Safety First organisations. In this connection, Indian insurers will be interested to know that some illuminating details relating to the number of vehicles, and of accidents in 49 of the world's largest towns, have been compiled by the Copenhagen Police Department and published by the Committee for Road Safety, appointed by the Danish Ministry of Justice under the title *World's City Traffic*.

The year 1951, according to the pamphlet, saw a "tremendous" increase in the number of motor vehicles. In 1949, the mean figure was 117.50 per 1,000 inhabitants. In 1950, the figure was 121.49, but in 1951 it had risen to 134.04. The numbers of cycles and cyclists also rose considerably during 1951. The mean figure for 1950 was 136.06 cycles per 1,000 inhabitants, rising to 152.15 per 1,000 in 1951. In other words, cycles still outnumber motor vehicles in a large number of towns. The following table shows the number of motor vehicles and cycles in some of the leading towns in the world:

Name of city	Motor vehicles Per 1,000 inhabitants 1951	1950	Bicycles Per 100,000 inhabitants 1951	1950
New York ..	180.31	169.06		
Sydney* ..	183.34	167.73	157.80	162.65
Bombay ..	15.00	13.93		11.67
Calcutta ..	36.06	32.76	10.20	9.80
Detroit ..	532.81	507.76	25.64	24.45
Madras ..	9.13	7.46	24.24	22.65
Singapore ..	38.01		126.45	
Copenhagen† ..	84.87	48.65	667.50	639.46
Lahore ..	21.34	15.37	235.43	235.57
Zurich ..	83.41	71.12	301.95	304.59

* Figures cover the whole of New South Wales.
† Figures cover Frederikaberg as well as Copenhagen.

In the context of the large increase in the number of motor vehicles and other means of road transport, the number of people killed and injured in traffic accidents again rose in 1951. Whereas traffic fatalities in 1950 averaged 8.62 per 100,000 inhabitants, they rose to 9.13 in 1951. The mean figure for injured persons rose from 3.94 per 1,000 in 1950 to 4.34 in 1951. The following three tables give the information relating to persons killed, children killed and persons injured in traffic accidents in some of the leading cities:

Persons killed

Name of city	Per 100,000 inhabitants 1951	1950	Per 100,000 motor vehicles 1951	1950
London ..	7.00	7.39		
New York ..	7.13	6.78	39.67	40.08
Sydney* ..	21.67	19.34	118.22	115.31
Bombay ..	8.75	7.87	583.22	567.80

* Figures cover the whole of New South Wales.
† Figures cover Frederikaberg as well as Copenhagen.

It will be seen from the tables above that among the Indian towns, for which information has been collected, namely, Bombay, Calcutta and Madras, the "safest" town, so far as traffic accidents are concerned, is Calcutta. The number of fatalities per 100,000 inhabitants is 2.79 in Calcutta, as against 8.73 in Bombay and 4.69 in Madras. The number of fatalities per 100,000 motor vehicles is also low at 75.99 in Calcutta as against 582.22 in Bombay and 513.29 in Madras.

The survey mentions that two particular measures are taken to prevent traffic accidents, namely, propaganda and police intervention (possibly resulting in fines or other penalties for traffic offences). Traffic regulations include the imposition of speed limits and parking restrictions. In most towns, there is a fixed speed limit. In Athens, Copenhagen and Hamburg, for instance, the speed limit is 25 miles per hour. In the U.K. it is 30 m.p.h. In Bombay in 1950, excessive speed and reckless driving accounted for 102 deaths. The penalties for excessive speed and reckless driving, it is stated, are severe in the U.S.

In a separate pamphlet, entitled *Parking*, compiled and published by the Copenhagen Police Department, the authors observe that a perusal of the information collected from all the principal cities of the world "compels the conviction that parking is nearly everywhere the greatest traffic problem of the present day and one that causes not only the users of the roadways but also the authorities the very greatest difficulties."

In many cases, there are restrictions on the period of time, usually half an hour, for which cars may be parked. This period is further restricted in certain hours of peak traffic conditions. In some towns, drivers are allowed to stop only in front of even house-numbers on even dates and outside odd house-numbers on odd dates of the month. To prevent streets being used as garages, many towns have laid down a general maximum period, 18 or 24 hours, in which a car is permitted to remain stationary.

It cannot, however, be too strongly emphasised that the problem of reducing the number of traffic accidents can be solved satisfactorily only when education in safety first principles becomes more widespread among all road users —drivers, pedestrians and others. It is necessary to reiterate the point we have stressed ere now, namely, that in this task of educating the people in safety first principles, insurers should play a more active role than now.

CREDIT INSURANCE

Although India has a large and growing export trade, there is, as is well known, no export credit guarantee scheme in operation in this country. In our issue dated 31st October, 1953, we dealt with the importance of this scheme for India and outlined the measures that have been taken in other countries in order to provide insurance against risks in export credits. It is gratifying to note that the Government of India is alive to the need for an export credit guarantee scheme for India, as witness the following remarks made by Mr. T. T. Krishnamachari, Minister for Commerce and Industry, in the course of his address at the Export Advisory Council, which met at New Delhi, last month:

"One of the suggestions which has been considered from time to time is whether we should have in India an Export Credit Guarantee Scheme somewhat on the lines of the U.K. scheme. This scheme works on the commercial principle of insurance. The risks of non-payment for any shipment are borne not by the particular shipper who happens to be unfortunate, but is shared by the exporters as a class. These risks arise not only from the overseas buyer becoming unable to pay when the documents are presented to him but also in other contingencies such as a governmental restriction on remittances. We recently had that experience in the case of shipments to Brazil. Whether it would be desirable to introduce any arrangement of this kind is a matter which could well be considered. Incidentally, we can also think of this system in the reverse. Very often, overseas buyers are nervous of making new contacts with Indian buyers whom they do not know. It is equally possible to think of a guarantee scheme in the reverse which will, upto a point, cover the overseas buyer against the risk of default or non-fulfilment of contract by an Indian exporter. These are no more than ideas at present which the Council may like to think about."

If India makes a concrete move in the direction it will be only in line with many European countries which are devoting their attention to the problem of export credit, for they realise that a scheme of insurance against these risks is necessary in the interests of export trade. Italy, for instance, lacked export credit insurance and the former Government contemplated the introduction of such a scheme before it was swept away by the last general election. A scheme which had been submitted to Parliament last March was discussed by a committee without coming to a decision whether to accept Government insurance on the British model or adopt the plan of the private insurance companies based on private enterprise with Government backing and reinsurance regarding the political risks involved in present-day export credit insurance. The new Government regarded the boosting of the export trade as one of its most urgent duties and among the new measures approved by the Government to this end is one granting export credit insurance through the Instituto Nazionale delle Assicurazione with the cooperation of private insurance companies as intermediaries in the administration of the scheme. The Government thus rejected the scheme of the companies and established a Government plan, limiting the guarantee for 1953-54 and 1954-55 to Ltr. 60,000 million (about £35 million).

Again, Sweden is yet another country where the Government guarantees export credit. It is now stated the trade interests have urged the Government to continue this scheme. Thus, continued Government guarantees for export credits during the period July 1954-June 1957 are recommended by the Swedish Board of Trade, the General Export Association of Sweden, the Chambers of Commerce and a number of other organisations in their comments on a proposal by the Export Credits Board. The stiffening competition on the world markets is cited as the principal motive underlying the recommendation. The Board of Trade stresses that the guarantees have so far corresponded to only a minor share of the total export value. A relaxation of the present stipulations would probably lead to increased utilisation of such guarantees, which is a desirable development in the present situation, the Board says. The growing difficulties experienced by the Swedish engineering industry on foreign markets are likely sooner or later to affect the steel works and the iron ore consumption. Furthermore, should the lull in shipping persist, this will result in difficulties for the large Swedish shipyards in utilising their full capacity at the end of 1954. The Board of Trade, therefore, finds that an investigation into the possibilities of furthering exports, especially by means of credits, should be undertaken without delay.

TITAGHUR THE LARGEST PAPER MILLS IN INDIA

MILL INDUSTRY'S CLAIM FOR FURTHER RELIEF

NON-FISCAL MEASURES INDICATED

MOVING the resolution on the need for further relief for the Indian cotton mill industry, at the annual meeting of the Associated Chambers of Commerce of India at Calcutta this week, Mr. R. L. Coghlan showed that, even if the Government was unwilling to adopt measures which would in any way curtail the revenue it was now deriving, it could make a few changes which, without affecting its revenue, would serve as a relief to the industry. Since such proposals deserve a wider audience than those who attended the Chamber's meeting, we reproduce below the speech made by Mr. Coghlan:

On behalf of the Bombay Chamber of Commerce, I beg to propose the following resolution:—

"While recognising that, by reducing the excise duty on superfine cloth, and removing the export duty on medium cloth, the Central Government have taken some steps to lighten the manifold burdens imposed by themselves and by the State Governments upon the cotton mill industry, this Association considers that, in view of the rapidly deteriorating circumstances in which the industry finds itself, further relief is urgently necessary, and in particular, urges that those restrictions, which serve no fiscal purpose but merely hamper the working of the industry, be removed."

Last year the Bombay Chamber moved a somewhat similar resolution, which was seconded by the Madras Chamber and supported by Upper India. When preparing this speech, I referred to the proceedings of the meeting last year, and was struck by the appropriateness of what was said then to the situation as it is now. Almost every point the speakers made on that occasion, applies with equal force to-day—in fact, with added force, because the cotton mill industry is largely as a result of the continuance of the burdens against which protest was made, in by no means so prosperous a condition now as it was one year ago.

True, there have since then been the reduction in the excise duty on superfine cloth, and successive reductions in export duty, from 25 per cent. on coarse and medium varieties to 10 per cent. on coarse cloth only. The latter reductions are considerable, and show that the Government are alive to this aspect of the industry's problems, and are concerned to see a nearer approach being made to the target figure for export of 1,000 million yards per year. This figure will certainly not be reached in 1953, but it is too early yet to say that the remaining duty on coarse cloth makes it impossible to achieve it in a full period of 12 months.

Turning to the home market, one may say that the small concession of one anna per yard in the excise duty on superfine cloth has been more than counterbalanced by the effects of restrictive labour legislation and other disadvantages. I would be going outside my brief if I did more than mention the chaotic position resulting from the variations in incidence and interpretation of the various States sales tax laws, and the losses arising from the risks and uncertainties they engender.

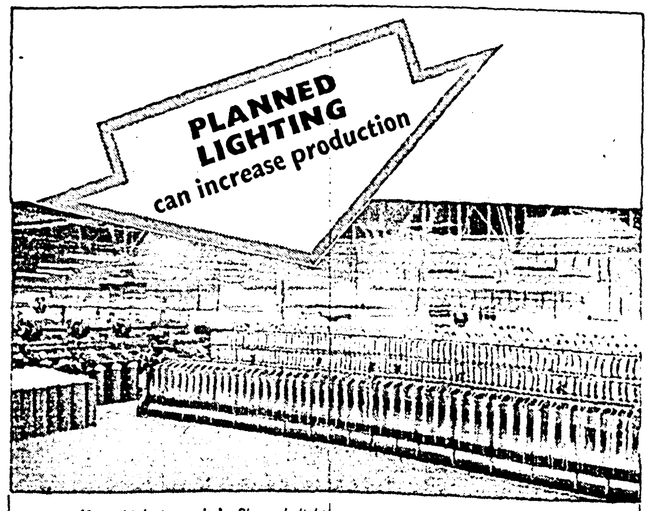
I should like to say a few words about the curious legacy which has been left by the departed price control, in the form of production control. This type of production control is quite different from that designed to protect the handloom industry, and arose, at the time price control was introduced, from the difficulty in devising formulæ for the fixation of ceiling prices, which could be applied to all varieties of cloth. As a result of this difficulty, it was decided to restrict production to cloths conforming within fairly narrow margins with a limited number of standards, and the manufacture of varieties which did not so conform was prohibited, even if they were well-established qualities which had been selling for years. To fix equitable ceiling prices on cloths which differed fundamentally in construction from the standards would have been a Herculean task, and the Government cannot be blamed for taking the easier course of prohibiting their manufacture. However, when price control was removed, these restrictions were retained, although they have now completely outlived their purpose, and merely constitute a handicap, both on producers and consumers, which does nobody any good and for which there is no justification whatever. One can only suspect that the reason for their retention is that it provides work in the Textile Commissioner's Office for those whose services, since the abolition of price control, have become redundant.

I do not propose to go into the merits of the case for production control in the interests of the handloom industry, but would like to comment on the way one form of this, namely, the restriction on the production of *dhotis*, is administered. When this was first introduced by Ordinance, the restriction was imposed on production. Mills could not, in any month, produce more than 60 per cent. of their monthly average in the basis period. This meant that the yardage of cloth which came off the looms during that month must conform to the quota. It was pointed out that the computing of the quota at this stage introduced unnecessary difficulties for the mills in balancing their production programme, without doing anything to help the handloom industry, which could not equally well be done, if the quota were reckoned at the stage of packing, not of production. The Government accepted this, and the next Ordinance changed the basis of reckoning to packing. Now, this Ordinance has been followed by an Act, which changes the basis again, this time from packing to clearance from the mill. This last alteration makes the mills' position almost worse than it was to begin with, because clearance is a matter largely outside their control; goods are normally cleared only when the buyers pay for and take delivery of them. The mills are therefore liable to forfeit their quota, if, for any reason, their buyers fail to come forward and take delivery of their purchases within the quota period.

Another form of Governmental restriction from which the industry suffers arises from the reluctance of the Government to allow the installation of modern labour-saving machinery, owing to their fear that this may lead to a reduction in the number of workers employed. There is, for example, now a prohibition on the installation of automatic looms. These looms not only have the advantage of requiring fewer hands to operate them, but also produce better cloth, and they are therefore particularly suitable for manufacturing cloth for export. The Government's policy in this respect is, therefore, inconsistent with their desire not only to increase the export of cloth from India, but also to improve its quality, and one feels that at least those mills, which manufacture largely for the export trade, should be free to install them without restriction.

The administration and collection of the excise duty provide the mills with another series of headaches. Innumerable complicated forms have to be filled and records maintained, involving the necessity for additional staff, and also delays in effecting delivery of the goods concerned. I suggest that fiscally the same results could be achieved by the Government far more simply by substituting for the present complicated excise system, a tax on cotton received in the mills. A standard weight per bale should be taken for the purpose rather than actual weight, and the rates of tax could be varied according to the type of cotton. The same results could then, in effect, be achieved as by the present system of rates of excise which vary according to the type of cloth.

I have concentrated mainly on those forms of Government restriction which hamper the industry without bringing the Government any revenue, in the hope that where no loss of revenue is at stake, the chances of redress are greater than where it is. That the industry is in need of more sympathetic and helpful treatment from Government is only too obvious from the decline in profits revealed in the annual accounts of mill companies published in recent months, and this decline is continuing.



You think it can't? Planned lighting was installed by Philips in one factory which thereafter booked a production increase of 25%. Why? Because good lighting on the job obviously results in greater precision of work, fewer rejects, minimum wastage. But at the cost of high overheads? No, very much the contrary. Philips "T L" Fluorescent Lamps give three times more light than the ordinary bulb for the same current consumption. And . . . have long and efficient life.

Why don't you consult Philips Lighting Service Bureau for free specialized advice. Address- "Philips House", Calcutta 20.

PROBLEMS OF CHEMICAL INDUSTRY

PRODUCTION WELL BELOW INSTALLED CAPACITY

BOTH the heavy chemicals and pharmaceutical industries have been passing through difficult times for some time now. Recognising the importance of both to the Indian economy, the Government has appointed a Development Council for the former and an Enquiry Committee for the latter. The two bodies have the heavy responsibility of seeing the two industries out of the wood. Both seem to be facing the same set of difficulties. The rated capacity of most units in both is nearer the targets fixed in the Five-year Plan, but the percentage of unutilised capacity is high. High railway freights, and low priority for the movement of raw materials and the finished products have been their longstanding difficulties. Lack of co-ordination between State policies, imposition of cesses, fall in demand, inadequate State assistance in several directions, etc., have been held responsible for the difficulties of these industries. Despite vast potentialities, the chemical industries in India are still in an undeveloped state. The capital employed in the private sector of the industry, for instance, is estimated at Rs. 30 crores only, as against Rs. 200 crores in textiles, Rs. 70 crores in jute and Rs. 50 to Rs. 55 crores each in the iron and steel, engineering, sugar and vegetable oil industries.

The recognition of this poor growth of the chemical industry was perceptible in the proceedings of the last annual meeting of the Indian Chemical Manufacturers' Association, held at Calcutta on 30th November last. Availing himself of the presence of Mr. K. C. Reddy, Minister for Production, Government of India, who inaugurated the session, Mr. Purshotamdass Popatlal, the outgoing President of the Association, chose to draw the Minister's attention to the difficulties facing the two industries.

Idle Capacity

The problem of idle capacity appears to be very disquieting. For, according to Mr. Purshotamdass, the percentage of installed capacity utilised was 49.6 in sulphuric acid, 50.1 in caustic soda, 44.7 in liquid chlorine, 20.5 in bleaching powder, 17.2 in superphosphate and 36.4 in bichromates. In many of these, the rated capacity has reached the targets fixed by the Five-year Plan. The measures suggested by the Association for utilising the idle capacity are: (1) long-term tariff protection, (2) recognition of import policy as a means of protection, (3) restriction of foreign capital only to such industries as required highly specialised technique and large capital not available locally, (4) guidance of State Governments in formulation of their policies so as not to be in contradiction to the Union Government's policy, and (5) State assistance in the form of accelerated tax amortisation, bulk purchase and resale of vital materials, direct loans, loan guarantees, commitments to purchase at specified floor prices and Government financing of part of the cost of exploration of minerals. Commenting on these demands, Mr. Reddy stated: "The Government has not lost sight of the suggestions and, while appropriate and feasible action has already been taken in certain directions, they are on the watch to see what other action should be taken in the light of the varying circumstances, keeping in view the needs of the manufacturers as well as consumers." He also drew the attention of chemical manufacturers to the fact that the Government had instituted an enquiry in certain spheres in connection with the utilisation of idle capacity.

Development Council

Mr. Reddy welcomed the formation of the Development Council for the heavy chemicals and fertilisers industry and hoped that it would influence and shape the course of development of this sector of the chemical industry along sound and healthy lines. He revealed that the Council had recently recommended the formation of a National Fertiliser Association for the wider dissemination of knowledge and demonstration about fertiliser utilisation and for improving the offtake of fertilisers.

The President of the Association attributed the difficulties of the sulphuric acid industry to the fall in the production of superphosphate consequent on closure of the Central Phosphatic Pool. The disbandment, he said, resulted in delinking the consumption of nitrogenous fertilisers with phosphatic fertilisers. For, when the Pool was in operation, both ammonium sulphate and superphosphates were distributed by the State agencies, whereas now the former alone, which is produced in Sindri, is being pooled and distributed through the State agencies. Dealing with this subject, Mr. Reddy stated the disbandment of the Superphosphate Pool merely meant the return of its sale to private enterprise. The Pool had been established under war-time conditions and now that there were normal conditions, the Government felt that there was no point in continuing the control. He said that the Government's policy was to encourage the use, in adequate proportions, of both phosphorus and nitrogen as nutrients for crops. He added that the State Governments would also give credit facilities for superphosphates in the same manner as they were giving to sulphate of ammonia. The Union Government had stopped the imports of superphosphate in order to leave the entire field to be served by the indigenous industry. He believed that, as a result of these measures, the consumption of superphosphates would maintain last year's level.

The difficulties experienced by the pharmaceutical industry as a result of the dual control exercised by the Health and Commerce and Industry Ministries were highlighted by Mr. Purshotamdass. The manufacturers' licences prescribed by both the ministries were not identical as the qualifications required varied widely. Mr. Purshotamdass remanded the setting up of a Development Council for the pharmaceutical industry also. Replying to this demand, Mr. Reddy stated that the Ministry of Commerce and Industry, in giving licences, was concerned with the regulation of quantitative manufacture of products, while the licences under the Drugs Act were concerned with qualitative control only. He hoped that the question of co-ordinating the issue of licences under the two Acts, namely, the Industries (Development and Regulation) Act and the Drugs Act would be dealt with by the Pharmaceutical Enquiry Committee.

Salt Cess

Mr. Purshotamdass complained that the alkali industries were greatly handicapped by the incidence of the cess on salt. The industry had been pressing for the total abolition of the cess and for this it had the support of the Planning Commission, the Salt Expert Committee, the Salt Advisory Committee and the Tariff Commission. The relief sought by the industry would amount to, it is stated, only 5 per cent. of the total revenue from the cess. While it would cause no great sacrifice to the revenues, the relief would mean a reduction in the cost of production, of the order of Rs. 7 to Rs. 13 per ton of caustic soda or soda ash. Speaking on this point, Mr. Reddy stated that the plea for exemption of the payment of cess would be re-examined in all its aspects. He did not, however, forget to remind them that, while fixing controlled price, allowance had been made for the cess. Although there was some truth in the fact that the industry had not been realising the controlled price at a time when there was no demand, Mr. Reddy observed that such was only a temporary phase. For the indigenous production, according to his information, had latterly been in good demand and he, therefore, felt that complaints against lack of demand was not quite well founded. He, however, assured the Association that problems such as incentives for greater production, fiscal, import and export policies, transport difficulties, co-ordination of Government policies as affecting the chemical industry would continue to receive the attention of the various Ministries of the Government of India.

CONTROL OVER STATE UNDERTAKINGS

FINANCE MINISTER EXPLAINS POSITION

THE debate last week on the need for exercising Parliamentary control over the State-owned industrial concerns revealed certain notable features. It has brought out the variegated nature of these concerns over which no proper method of Parliamentary control exists. It has also shown that the problem bristles with certain complicated issues on account of which the Government has not been able to take a decision as to the shape such control should take. Lastly, by insisting on the need for establishing Parliamentary control, the debate has confirmed the country's faith in its adherence to the principles of democracy.

The variegated nature of the State-owned industrial concerns is evident from the fact that, on the one hand, there are the Railways and Posts and Telegraphs. These are not corporations, but they continue to be under the vigilance of Parliament. On the other, there are the river valley projects managed departmentally. Then there are also statutorily established corporations, such as the Damodar Valley and Industrial Finance Corporations, which are supposed to be autonomous. Again, there are certain industrial concerns such as the Sindri Fertilisers, Hindustan Shipyard, Hindustan Aircraft, registered under the Indian Companies Act. It is stated that about Rs. 400 crores are invested in these public-owned Corporations over which Parliamentary control is not defined.

Complaints made in Parliament in this context are worthy of attention. Dr. Lanka Sundaram, to whom goes the credit for initiating the debate on this important subject, drew the attention of the House to the unsatisfactory manner in which the companies were incorporated. From the beginning officials, and not the Ministers, conducted negotiations and entered into preliminary contracts. Once these companies were brought into existence, they became impervious to public or Parliamentary control. They became, he averred, official propositions. Even the Public Accounts Committee came into the picture only *ex post facto*. The Estimates Committee too had not been able to go into the affairs of any single corporation so far. He pointed out that the Auditor-General had described these private limited companies "as a fraud on the Companies Act and on the Constitution." This official had also complained that his authority and the right to report to Parliament through the President was sought to be taken away. Conversion of Government concerns into private concerns solely by Executive action was considered unconstitutional. Besides, most of these concerns had a monopoly, each in its own field, and there was no competition, with the result that the consumers' interest had been completely forgotten. They had become, Dr. Sundaram added, something like an *imperium in imperio*. He, therefore, wanted that a Parliamentary Committee, charged with the work of looking into the affairs of the corporations, should be set up under the direction of the speaker.

The Finance Minister, Mr. C. D. Deshmukh, in replying to the debate, clarified the present position as also the possible future policy of the Government in regard to the management of the State-owned industries. He admitted that there was a great deal of substance in what the Auditor-General had stated in regard to the concerns, but objected to the description "fraud," as they had been set up out of funds drawn from the Consolidated Fund. The various companies had been set up, he observed, as a sort of emergency measure for making certain arrangements in regard to the production of materials like fertilisers. It was, however, not the final position. The Government intended either to come forward with legislation authorising the setting up of a State Corporation for carrying on business or industry by the Government or, in the alternative, to introduce in the Company Law Amendment Bill, awaiting to be introduced in Parliament, a separate chapter in regard to companies which are owned either wholly or predominantly by the State.

The real issues posed by the Finance Minister were: (a) the powers of the Comptroller and Auditor-General, (b) the authority of the Executive and (c) Parliamentary control over the organisations in regard to financial matters. In regard to (a), he said that, when the special legislation was brought forward, it was proposed to introduce suitable provisions to ensure that

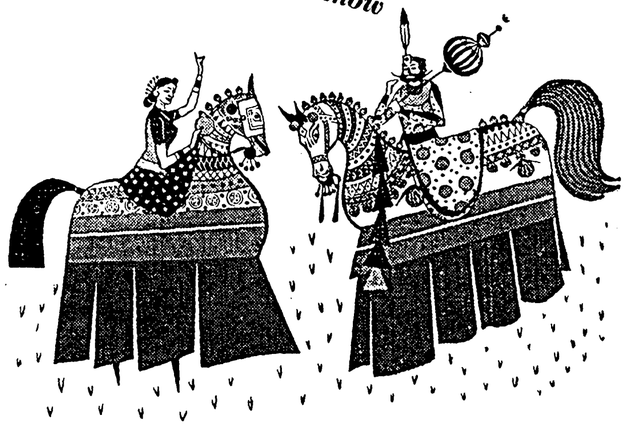
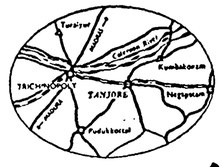
Tanjore's dummy horse show



Tanjore, the home of Bharata Natyam, is also famous for its dummy horse show, performed during the year-end festive season. Drawing upon mythology for themes, the dances—an intricate pattern of expressive movements and gestures—are performed to the accompaniment of classical music. The brilliantly coloured horses may weigh up to 1¼ maunds, and the performance, often running to several hours, calls, therefore, not only for great skill but also much stamina.



Tanjore is 34 miles east of Trichinopoly which stands 248 miles down south on the road leading from Madras to Cape Comorin. Both accommodation and petrol are available in Tanjore. A visit to the scenes of India's famous festivals ranks high among the pleasures of motoring, made possible by John Boyd Dunlop's invention of the pneumatic tyre.

HARM CAUSED BY SPURIOUS DRUGS

MR. E. L. C. GWILT ON NEED FOR STERN MEASURES

[In view of the great importance of preventing the manufacture of spurious drugs which cause irreparable harm to the unsuspecting buyers who use them, it is gratifying to note that the Associated Chambers of Commerce of India adopted, at its annual meeting held at Calcutta this week, a resolution urging the Government to take stern measures against this practice and to amend the Drugs Act so as to make the manufacture of spurious goods a cognisable offence. The speech, which Mr. E. L. C. Gwilt made in support of the resolution on this subject, throws a flood of light on the nefarious ingenuity of the manufacturers of faked goods.—ED.]

AT the Annual General Meeting of the Associated Chambers of Commerce of 1951, the Bombay Chamber moved a resolution in much the following words:

"This Association views with great concern the alarming increase in the manufacture of spurious drugs and of the practice of misrepresenting chemicals and pharmaceutical preparations. The Association is of the opinion that a contributing factor is the deficiencies of the Drugs Act, and the Rules thereto, and accordingly urges upon Government:

1. "so to amend the Act as to make the manufacture of spurious drugs and of misrepresenting chemicals and pharmaceutical preparations, cognisable offences;

2. "to enhance the penalties for these offences and to take such steps as may be necessary to ensure that law is enforced."

On their behalf I do so again. The resolution, which was carried, was designed to draw attention to the menace to public health from the alarming increase in the practice of manufacturing spurious drugs and it aroused a good deal of publicity in the lay and trade and medical Press, all of which supported it. Since then almost every month there has been reported in the papers the activities of the spurious drugs gentry; as recently as the 17th November the papers reported that a machine used for manufacture of sulphadiazine, etc., all found to consist only of chalk, had been unearthed in Calcutta by the Enforcement Branch Police.

In seconding the resolution, the representative from the Upper India Chamber drew attention to the fact that India was experiencing what countries in the West had already done. He noted that, in the year 1951, we were debating a matter which had aroused attention in England exactly a hundred years before, and that in 1851, the year of the great Exhibition in London, *The Lancet* had launched a campaign against the adulteration of drugs and food which led to modern legislation on this subject. He also referred to the practice of the evil in the United States. India is, as he said, only repeating what has happened in other countries of the world, but it was not until public opinion was roused in England and America, and their respective Governments urged to take appropriate legislative action, that those who indulged in the manufacture of spurious drugs were made to realise that the offence was not worth the profit accruing.

Drugs Act

On the 29th December of last year, that is of 1952, at Kanpur, in the speech made by the Union Health Minister in inaugurating the 13th session of the All India Pharmaceutical Congress held jointly with the 5th Session of the Indian Pharmaceutical Congress, she made the following observations:

"I have received representations from time to time that the provisions of the Drugs Act are not sufficiently deterrent and that steps should be taken to enhance punishment for offences under it. The Union Government is actively considering what measures should be set on foot in this regard and I hope before long that adequate steps will be taken to remedy any defects in the present legislation. More important than legislation, however, is the machinery which enforces the provisions of any Act. This must be adequate and above all it must maintain a high standard of integrity."

That was twelve months ago.

The resolution to which I have referred stated that, in answer to a question put in Parliament to the Minister of Health on the 16th February, 1951, it was stated that it was not possible to indicate the quantity and value of spurious drugs manufactured in India, since the manufacture was carried out surreptitiously. The Minister, however, laid on the table of the House a statement giving the names of 26 products spuriously compounded which had, up to then, been detected by the drugs Standard Control authorities in various States. The Minister went on to say that certain amendments to the Drugs Act of 1940 were under consideration, with the object of making the penalty clause more stringent. That was more than two years ago. So far as we are aware, no amending Bill to the Drugs Act has been moved in the House of the People, but on the 18th November last, a resolution issued by the Ministry of Commerce and Industry states that the Government of India consider that the laws bearing upon Trade Marks and Merchandising Marks upon goods need to be reviewed to see what changes and modifications are necessary, particularly to ensure effective remedies against the infringement of such marks and also against the sale of spurious goods. The resolution announces the appointment of a Trade Marks Enquiry Committee with terms of reference that include the consideration, particularly, of the Trade Marks Act of 1940, the Merchandising Marks Act, the Indian Penal Code and the Drugs Act of 1940, and other laws in their relation to infringement and fraudulent imitation of trade marks and merchandising marks, and to suggest ways and means of dealing more effectively with such anti-social activities. Despite the fact that the emphasis of the resolution applying to the Committee's terms of reference is heavily in the direction of the Trade Marks and Merchandising Marks Act, nevertheless mention is made of the Drugs Act, and I would therefore commend the following remarks to the Committee for their consideration.

No offence committed under the Drugs Act to-day is cognisable, and any investigation by the Drugs authorities cannot be undertaken without the previous sanction of a Presidency Magistrate. If and when such sanction is obtained, the Magistrate proceeds to instruct the C.I.D. to investigate. Experience has shown that applications for investigations made in open court, which is customary practice, frequently lead to information reaching the suspect before a raid can be carried out at his premises, so that incriminating evidence has vanished by the time the authorities arrive.

As the Act stands, the maximum penalty it provides is but one year's imprisonment or a fine of Rs. 500 or both. If a manufacturer of pharmaceutical preparations in India to-day has reason to believe that any of his products are being manufactured spuriously, he has to take action not only under the Drugs Act, but also under the Indian Penal Code. If offences under the Drugs Act were made cognisable, many of the impediments in the Act would disappear.

New Powers

In a notification issued in the *Gazette* on the 26th November, the Bombay Government have vested certain officers with powers to issue warrants for the arrest or search of any person, building, vessel, or place whom they have reason to believe has committed an offence under the Dangerous Drugs Act, or where dangerous drugs are kept or concealed. These officers include, the Director of Excise and Prohibition, the Collector of Customs and the Collector of Central Excise. I would urge that similar powers in respect of offences suspected to have been committed under the Drugs Act should be granted to Drugs Controllers, or to their deputies. The duties of a Drugs Controller are onerous and his responsibilities heavy, and surely the post should be a whole-time one. In at least one State the Civil Surgeon is also the Drugs Controller. I submit that one of his functions must suffer severely, and recommend that a whole-time Drugs Controller, with a pharmaceutical degree, should be appointed in each State, and that he be provided with a sufficient number of inspectors to make his work effective.

In this respect I quote from the *Times of India* leading article of the 7th December:

"The official announcement on the extension of the Drugs Act and the various regulations under it to the entire Bombay State makes pathetic reading in the context of the confirmed futility of present legislation and of the failure of the enforcement machinery to curb the sordid trade in spurious medicines. Like the other outstanding danger to public health, the adulteration of foodstuffs, the sale of fake drugs continues to flourish. Recent raids in various parts of the country have shown that in terms of total volume and the variety of drugs involved, the illicit traffic has become extensive. Central and State Ministers admit this state of affairs and are eloquent in describing the menace as a social scourge. Action, however, has been limited to directing appeals to doctors, dealers and pharmaceutical firms. Apparently, it is forgotten that these interests suffer equally with the general public from the activities of the racketeer and they have been in the forefront in agitating for effective measures by Government."

I have here two bottles, each containing a different antibiotic—aureomycin and chloromycetin—both taken from stocks alleged to be spurious. The carton, bottle, label on the bottle, and leaflet inside the carton in respect of each appear to be genuine. The leaflet of the aureomycin states that its indications, *inter alia*, are acute intestinal amebiasis, various virus infections for which it, and it only is specific, and many other serious medical conditions.

The illness in the treatment of which chloromycetin is most widely prescribed in this country is typhoid, the gravity of which complaint I need not dwell upon. The manufacturers use for the closing of their capsules a grey gelatine strip. Whoever counterfeited the particular capsules I have here has most ingeniously enamelled upon them a grey band, and unless each capsule is meticulously examined it is difficult to detect any difference in the width of the band.

Empty Bottles

The price the *jaripuranawala* is said to obtain from the spurious drugs manufacturer for an empty bottle of either of these products, provided its carton and label and leaflet are intact and in good condition, is Rs. 2. The controlled maximum selling price of aureomycin is Rs. 23 per bottle and of chloromycetin, Rs. 22 per bottle, although the actual price in the bazar for each is a little less, but dealers in spurious drugs invariably offer them at prices substantially less than bazar rates.

The contents of the capsules in bottles seized and accompanying those I have here and that have been analysed are alleged to be, in the case of the aureomycin, soda bicarb with some colouring material to give the capsule its characteristic yellow colour, and in the case of the chloromycetin, plain soda bicarb. Empty gelatine capsules can be bought anywhere in any of the larger bazars in India and so, too, of course, can soda bicarbonate, so at the price at which these two anti-biotics can be sold and still be well below controlled price, provides a very handsome profit to the spurious manufacturer, even if he only sells a dozen bottles of each per day, and if he gets caught the risk is a year's imprisonment and a Rs. 500 fine. I know of no instance where a magistrate has imposed the maximum penalty, however, heinous the offence.

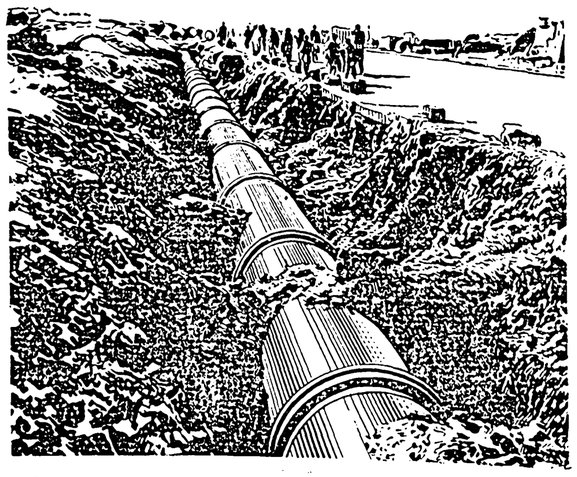
Procaine Penicillin

Bottles of alleged spurious procaine penicillin seized recently are said, by a competent analyst, to be powdered sulphanilamide tablets. These tablets, which are very cheap, contain a little starch, as a disintegrating agent and if powdered and mixed with water, the powder goes into suspension in a manner identical with procaine pencillin, which the label on the bottle would indicate the contents to be, thus arousing no suspicion on the part of the doctor administering it.

The Government have appointed a Pharmaceutical Enquiry Committee to investigate, *inter alia*, the existing manufacturing potential and the needs of the country for pharmaceutical products, and the quality of the drugs concerned. It is to be hoped that this Committee will give particular attention to the subject of spurious drugs, which are calculated to do the industry of this country irreparable damage when it commences exporting its products.

I hope I have shown that the Drugs Act, more than ever, requires amendment to deal adequately with those ruthless and unscrupulous persons who indulge in the practice of spurious drugs manufacture, and the danger that exists of their worthless products being administered to patients suffering from conditions in which their lives are at stake, and possibly at a time when they are desperately ill, and their friends too over-wrought with anxiety to distinguish the almost imperceptible evidence which could arouse suspicion, if, indeed, suspicion ever entered their heads.

longevity



Pipe mains conveying water and distributing gas, providing sanitary services and carrying oil, are the lifelines of civilisation.
Today the Cast Iron Pipe, with Spigot and Socket Joints, provides the most widely used medium for the transmission of water and gas.

Notices

THE INDIAN IRON AND STEEL COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Thirty-sixth Ordinary General Meeting of the Shareholders will be held at the Registered Office of the Company, No. 12, Mission Row, Calcutta, on Wednesday, the 30th day of December, 1953, at 11 a.m.

AGENDA.

(1) To receive the Directors' Report and pass the Audited Accounts for the year ended 31st March, 1953.

(2) To confirm the dividend declared on the Ordinary Share Capital.

(3) To elect Directors.

(4) To appoint Auditors and fix their remuneration.

By Order of the Board,
MARTIN BURN LIMITED,
Managing Agents.

CALCUTTA, 10*th December*, 1953.

NOTE TO THE SHAREHOLDERS

The last General Meeting of the Company was held on the 14th November, 1952, and since the Indian Companies Act requires a company to hold a General Meeting once at least in every calendar year and not more than fifteen months after the holding of the last preceding meeting, it has been necessary to convene the above meeting before the close of the current calendar year.

Owing to the conditions that have prevailed at the Company's Works at Burnpur it has not yet been possible to complete the audit of the accounts of the Company for the year ended 31st March, 1953, and therefore it will be proposed at the meeting that the meeting be adjourned *sine die*. If this is approved by the Shareholders, the Directors' Report and the Accounts for the period together with the remaining business on the Agenda will be considered at the adjourned meeting which will be held at as early a date as possible. Due notice of the adjourned meeting will be given to all Shareholders and copies of the Directors' Report and Accounts circulated therewith.

Your Directors very much regret the inconvenience caused by the delay in the presentation of the Accounts, which however is due to circumstances entirely beyond their control.

INDIAN PLASTICS LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE 9th Ordinary Annual General Meeting of the Shareholders of the Company will be held at the Office of the Managing Agents at Imperial Bank Annexe Building, Bank Street, Fort, Bombay, at 4 p.m. on Tuesday, the 29th December, 1953, to transact the following business:—

1. To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31st March, 1953.
2. To declare Dividend.
3. To elect Director in place of one of the Directors who retires by rotation.
4. To appoint Auditors and fix their remuneration.
5. To transact such other business as may be brought before the meeting with the consent of the Chairman.

The Share Register of the Company will be closed from 22nd December, 1953 to 5th January, 1954 (both days inclusive).

By Order of the Board,
BIRLA BROTHERS LTD.,
Managing Agents.

BOMBAY, 7*th December*, 1953.

THE PHALTAN SUGAR WORKS LIMITED

NOTICE

THE TWENTY-SECOND ORDINARY GENERAL Meeting of the Phaltan Sugar Works Ltd. will be held on Monday the 28th December, 1953, at 3 p.m. (S.T.), at the Factory Office of the Company at Sakharwadi, District Satara North, to transact the following business:

(1) To adopt the Directors' Report and Audited Statements of Accounts for the year ending 30th September, 1953.

(2) To sanction payment of Dividend.

(3) To elect Directors in place of Messrs. Arvind N. Mafatlal and Himatlal Kantilal who retire by rotation but being eligible offer themselves for re-election.

(4) To elect Director in place of Seth M. L. Apte who retires in pursuance to Article 123, but being eligible offers himself for re-election.

(5) To appoint Auditors for the current year and fix their remuneration. A notice has been received by the Company from one of the shareholders of the Company proposing that Messrs. C. C. Chokshi & Co., of Bombay, be appointed Joint Auditors with Messrs. G. M. Oka & Co., the present Auditors.

(6) To transact any other business that may be brought forward by the Chairman.

The Transfer Books of the Company will be closed from 21st December, 1953, to 13th January, 1954, both days inclusive.

By Order of the Board of Directors,
For MAFATLAL, APTE & KANTILAL LTD.,
L. V. APTE,
Managing Director,
Managing Agents.

SAKHARWADI (DIST. SATARA NORTH),
3*rd November*, 1953.

N.B.—The Dividend when declared will be made payable at the Factory Office at Sakharwadi, on and after 28th January, 1954. The Dividend Warrants will be posted to those shareholders whose names stand on the Company's Register on the 20th December, 1953.

McLEOD AND COMPANY, LIMITED

THE 30TH ORDINARY GENERAL MEETING of the Shareholders of McLEOD & CO., LTD., will be held at "McLeod House," No. 3, Netaji Subhas Road, Calcutta, the Registered Office of the Company, on Tuesday the 29th day of December, 1953, at 3 p.m., for the following purposes:—

1. To receive the Directors' Report and the Auditors' Report and to pass the Accounts for the year ended 31st December, 1952.
2. To declare Dividends.
3. To elect Directors.
4. To elect Auditors and fix their remuneration.

The Share Transfer Books of the Company will be closed from 22nd December, 1953, to 29th December, 1953, both days inclusive.

By Order of the Board,
McLEOD & Co., LTD.,
C. L. BAJORIA,
Director.

"McLEOD HOUSE,"
3, NETAJI SUBHAS ROAD,
CALCUTTA—1, 4*th December*, 1953.

Note.—Payment of any dividend declared will be made only to those members whose names are registered in the Books of the Company on the 29th day of December, 1953, or to their mandatees.

No applications for warrants will be necessary. Claims on behalf of holders of shares on blank transfer will not be entertained.

RESULTS OF BIRD-HEILGERS GROUP OF COAL COMPANIES

BORREA COAL STEPS UP DIVIDEND

THE Directors' reports and audited accounts of the group of coal companies under the management of Messrs. Bird & Co., Ltd. and Messrs. F. W. Heilgers & Co., Ltd., Calcutta, for the half-year ended 30th June, 1953 indicate that the period was none too smooth sailing for the companies. To mention a few of the difficulties that faced them. The cost of production remained high, transport bottlenecks, though not as bad as in previous years, continued to hamper despatches and there was a loss of export markets, owing to a number of factors over which the industry had no control. Consequently, the Companies had to work on a narrow margin of profit. Although the aggregate gross profit of these companies for the half-year under review is a shade better than that for the previous half-year, one should not jump to the conclusion that the companies must have turned the corner; for it does not give a correct picture of all the companies' position. Out of the seven companies belonging to the group, only two have been able to earn substantially higher profits than in the previous six months. The profits of three others are only slightly better, while those of the remaining two disclose a further setback.

The performance of each company will be evident from the following table, which presents the gross profit of each for the half-year under review against the background of those for the previous two half-years:

(In lakhs of rupees)

	For the half-year ended		
	30-6-1953	31-12-1952	30-6-1952
Bhulanbarares	+ 0.27	— 0.23	+ 0.76
Borrea	+ 5.06	+ 2.73	+ 4.37
Burrakur	+ 10.30	+ 13.92	+ 14.99
Churulia	+ 0.12	— 0.10	+ 0.11
Ondal	+ 3.59	+ 1.81	+ 1.69
Sendra	— 0.70	— 0.59	+ 0.23
Standard	+ 2.93	+ 2.36	+ 2.07
Total ..	+21.57	+19.90	+24.35

The pattern of dividend distribution of these companies is as varied as the profits themselves. Only one, namely Borrea, has been able to step up the distribution from 25 per cent. to 30 per cent. per annum and that too by raising only the bonus part of it from 5 per cent. to 10 per cent. per annum. By this increase, the total distribution is restored to that paid for six successive half-years upto the end of June, 1952. Churulia, Ondal and Standard have been able to maintain the dividend, the first one at 1.9/16 per cent. and the other two at 20 per cent. per annum. Burrakur has had to cut the dividend from 5 per cent. to 2½ per cent. per annum—the lowest for the last 10½ years, it being the same as that for the half-year ended 31st December, 1942. Bhulanbararee and Sendra have had to skip over the dividends, the former for the second half-year in succession and the latter for the third half-year. What is more, these two companies have had to carry forward small losses for the current half-year.

Of the above seven companies, only four, namely, Bhulanbararee, Borrea, Burrakur and Sendra, have their own collieries, while the other three depend on the earnings from their investments in other collieries and other investments. The raisings and despatches of the first mentioned four companies for the half-year under review, as compared with those for the previous two half-years, are as follows:

(In tons)

	For the half-year ended		
	30-6-1953	31-12-1952	30-6-1952
Bhulanbararee—			
Raisings	72,010	72,015	80,355
Despatches	69,457	71,424	85,601
Borrea—			
Raisings	72,735	77,426	81,034
Despatches	71,056	75,593	81,216
Burrakur—			
Raisings	509,461	492,571	526,000
Despatches	493,292	503,326	481,959
Sendra—			
Raisings	71,691	71,051	75,461
Despatches	64,929	65,899	74,036

The reduced output of Borrea is said to be within the target fixed by Government in implementation of its policy for the conservation of metallurgical coal, and appreciably below the production capacity of the colliery. In spite of the satisfactory raisings of these companies, despatches have lagged behind considerably. This is mainly attributed to transport bottlenecks. In this connection, the following remarks culled from the Directors' reports of these companies bear reproduction:

"Although general wagon availability in the Bengal and Bihar coalfields improved to the extent of some 90 wagons per day on average over the preceding six months, there persists a feeling that the railways might with advantage plan ahead, so that the last possible reason for the retention of 'movement controls,' under which the industry suffers, may, ten years, after the necessity first arose, be done away with."

As regards production of and demand for coal in the country, the Directors do not seem to agree with the general view that there is sufficient demand in the country to consume all the production. The Directors thus observe:

"It is no satisfaction to us to point out that we foresaw the loss of the export trade. We do not subscribe to the view that there is a large unsatisfied internal demand. The majority of consumers have substantial stocks of coal, and where there are shortages, these are mainly caused by transport bottlenecks and restrictions. In our view, there is surplus production of coal above the country's needs, and this has led to the offering by some colliery owners of illegal rebates below the Government-controlled selling prices."

Sand stowing has been accepted as a vital process in the recovery of the maximum quantity of the country's coal reserves. But the industry complains that the subsidy paid to it is so unremunerative that it may become necessary to close some of the collieries. Commenting on this state of affairs, the Directors of the Burrakur Coal Co. have made the following interesting comments:

"Conservation of the country's resources of coking coal is now an accepted policy of the Government of India and it is generally agreed that the most effective means of securing this end is by sand stowing, which reduces to an absolute minimum the coal lost in the course of extraction. In pursuance of this policy, the Government has assisted those collieries which adopt this means of conservation by granting them a subsidy. As most of the coal sought to be conserved is, in fact, situated at a distance from sand-getting points, your Company has always contended that the rate of subsidy is uneconomic. Since 1948, this subsidy has been at the rate of 75 per cent. of actual expenditure for every ton of coal extracted with sand stowing with a maximum of Re. 1-4. The increases in the cost of labour, food and stores in the intervening period and the reduction in the selling price of the coal has worsened the position, so that there is no longer a margin, inside which to carry 25 per cent. and more of the cost of these stowing operations.

"Four of your Company's collieries are stowing and these have all worked at a loss during the half-year, despite the fact that a percentage of the coal is raised without sand. It is estimated that after taking credit for the sand subsidy, the cost of stowing borne by these collieries is in some cases as large as Re. 1 per ton of sand stowed.

"As pioneers in sand stowing, your Directors feel that it is inequitable that your Company should be penalised to this extent for carrying out a policy that is approved and encouraged by the Coal Board. It is, therefore, hoped that the Government of India will take early steps to raise substantially the rate of the sand stowing subsidy, even if this means a small increase in the stowing cess. If action along these lines is not taken, any increase in the percentage of coal raised in the coalfields with sand replacement is most unlikely and your Company may be forced to consider the permanent closure of certain collieries that are uneconomic under the present rate of subsidy."

WATERFALL ESTATES PAY RECORD DIVIDEND

The audited accounts of the Waterfall Estates Ltd. (Managing Agents: Messrs. Kothari Mehta & Co., Ltd., Madras) for the year ended 30th June, 1953, show encouraging results, as compared with those for the previous year. The gross profit reveals an appreciable increase from Rs. 6.28 lakhs earned in 1951-52 to Rs. 7.40 lakhs. The net profit has gone up from Rs. 4.32 lakhs to Rs. 5.69 lakhs. The reserves have been considerably strengthened by the addition of as much as Rs. 4.25 lakhs, as against Rs. 2 lakhs added last year, and the dividend on the ordinary shares has been stepped up from 10 per cent. paid for the previous two years to 12½ per cent., which is a record one in the history of the Company.

The Company's tea crop for the year under review has yielded a record output of 925,152 lbs., an increase of 102,418 lbs. over the previous year's output of 822,734 lbs., thanks to an increase in yield per acre from 923 lbs. to 1,038 lbs. The higher yield has been due to postponement of pruning and the more elaborate methods of manuring and up-to-date cultivation practice. The cost of production of tea is a shade lower at As. 13-2, as against As. 13-8 per lb. in 1951-52. But this fall has been more than offset by the decline in net price realised from Re. 1-14-6 to Re. 1-12-3 per lb. The output of coffee has suffered a decline from 704 cwts. to 117 cwts. which is below the average. The yield per acre has fallen from 4 cwts. to 0.78 cwt. The cost of production has risen sharply from Rs. 44 to Rs. 235 per cwt., accompanied by a drastic fall in price realised from Rs. 214 to Rs. 152-2 per cwt.

The sale proceeds have advanced from Rs. 15.15 lakhs to Rs. 17.48 lakhs. Expenses have gone up from Rs. 10.05 lakhs to Rs. 10.36 lakhs. The gross profit, Rs. 7.40 lakhs for the year under review, as already stated, compares favourably with Rs. 6.28 lakhs for 1951-52, but, it may be mentioned here, that it is sizably lower than that of Rs. 9.61 lakhs for 1950-51, despite a lower output of tea at 812,468 lbs. and poor crop of coffee at 48 cwts. in that year. The higher profit for 1950-51 was mainly due to the good price realised for tea at Rs. 2-3-10 per lb. The managing agency commission for the year under review absorbs Rs. 70,354, as against Rs. 60,011 for 1951-52, provision for depreciation has been raised from Rs. 36,000 to Rs. 40,870, while that for taxation has been reduced from Rs. 1 lakh to Rs. 60,000. The addition to the general reserve has been raised from Rs. 1 lakh to Rs. 3 lakhs, while that to the dividend equalisation fund has been maintained at Rs. 1 lakh. The Directors have also transferred a sum of Rs. 25,000 to the reserve for redemption of redeemable preference shares, which had not received anything in the previous year. The distribution of dividend on the 6 per cent. preference shares absorbs Rs. 30,000 and the ordinary dividend, Rs. 1.75 lakhs. The sum left to be carried over is Rs. 28,379 which compares with Rs. 89,927 brought in.

The Company's financial position is quite comfortable, as will be seen from the following synopsis of its latest balance-sheet:

Liabilities	Rs.	Assets	Rs.
Capital ..	19,00,000	Gross block	26,71,951
Reserves and surplus ..	24,53,379	Less—Depreciation	3,07,033
Debenture ..	50,000		
Provision for taxation ..	2,00,459	Net block ..	23,64,918
Liabilities ..	3,75,536	Stock ..	97,225
		Stores ..	1,48,905
		Debts, deposits and advances ..	4,70,379
		Investments	11,30,972
		Cash ..	7,66,975
	Rs. 49,79,374		Rs. 49,79,374

It will be noted that the current liabilities and provision for taxation are more than adequately covered by the cash balances alone. The Company has, up to the end of the year, redeemed of 500 debentures to be redeemed in January, 1954. As the debentures have so far been redeemed out of current earnings from year to year, the debenture redemption fund amounting to Rs. 5 lakhs, is unutilised. The unredeemed debentures can be easily paid off out of the cash balances. The Directors have, therefore, transferred the debenture redemption fund to the general reserve. The reserve for redemption of redeemable preference shares stands at Rs. 5.25 lakhs. The Company has the option to redeem the preference shares of the total paid-up value of Rs. 5 lakhs at a premium of 5 per cent. after ten years from the date of issue, that is, 1st May, 1943, on giving six months' notice.

The Directors propose to approach the Government of India for permission to capitalise a part of the reserve fund and, if such permission is received, they will issue bonus shares in the ratio of one ordinary share for every two held. The sum required to be capitalised for such an issue will be Rs. 7 lakhs.

MYSORE SUGAR'S PROFIT DECLINES

A sharp decline of Rs. 29.10 lakhs in trading profit, that is from Rs. 70.27 lakhs (a record level) to Rs. 41.17 lakhs, is disclosed by the audited statement of accounts of the Mysore Sugar Co., Ltd. (Managing Director: Mr. A. G. Bandi Gowda, Bangalore), for the year ended 30th June, 1953, as compared with that for the previous year. Though this decline in profit may be attributed partly to the fall in the average price realised on sale of sugar, it is due, to a large extent, to the fall in the Company's production for want of adequate supply of cane. The profit for the year under review, however, should be considered satisfactory, inasmuch as it is the second highest in the history of the Company. The net profit has dropped from Rs. 29.29 lakhs to Rs. 17.73 lakhs. This profit, together with the sum of Rs. 8.27 lakhs brought in from the previous year, is large enough to add something to the reserves and also to maintain the dividend. Nevertheless, the Directors do not propose to add anything to the reserves. They have decided to repeat the dividend of 20 per cent. paid for the previous 13 years and to carry over an undistributed surplus of Rs. 21.65 lakhs. They consider it desirable to carry forward such a huge balance, in view of the "uncertain conditions" during the current year's working.

The Company's factory commenced crushing of sugarcane on 12th July, 1952, and continued to work till 6th February, 1953, the total number of milling days being 195. This compares unfavourably with 243 days in the previous year. The early closure of the factory was necessitated by shortage of cane caused by the unsatisfactory watersupply position in the canal. The quantity of cane crushed during the period was 2,45,500 tons, as compared with 3,19,268 tons in 1951-52, and that of sugar produced 27,962 tons, as against 37,155 tons. The Company's distillery continued to work satisfactorily, though, during the closing months of the year, manufacturing operations had to be suspended for want of water.

The following comparative table brings out clearly the progress in the working of the Company during the last three years:

	For the year ended 30th June			
	1953	1952	1951	1950
Cane crushed (in tons) ..	2,45,500	3,19,268	24,719	1,76,822
Sugar produced (in tons)	27,962	37,155	2,015	16,783
	Rs.	Rs.	Rs.	Rs.
Trading profit (+) or loss (—) ..	+41,17,161	+70,27,695	—8,88,695	+23,45,745
Other income ..	70,240	92,418	51,041	1,44,278
Expenses	2,45,649	3,15,595	1,96,497	1,84,418
Depreciation ..	3,70,356	4,76,064	..	3,23,145
Taxation	16,00,000	32,00,000	..	9,00,000
Net profit (+) or loss (—) ..	+17,73,396	+29,29,266	—8,12,151	+10,82,462
Transfer to reserves ..	..	14,12,030	..	2,00,000
	4,35,856	1,35,856	4,35,856*	4,35,856
Dividend	(D. 20%)	(D. 20%)	(D. 20%)	(D. 10% + B. 10%)
Carry forward ..	21,64,837	8,27,296	—2,64,063	5,88,067

* Paid out of dividend equalisation fund.

The provision for depreciation has been reduced, in spite of the substantial addition made to the gross block during the year. The cut in the provision for taxation is only in tune with the drop in earnings.

The Company's financial position, as is seen from its latest balance-sheet, is strong. As against a paid-up capital of Rs. 21.79 lakhs, the reserves and surplus amount to as huge a sum as Rs. 111.91 lakhs. The reserves include general reserve at Rs. 60 lakhs, cane price stabilisation fund Rs. 11 lakhs, dividend equalisation fund Rs. 7.50 lakhs, bad and doubtful debts reserve Rs. 8.98 lakhs and stores depreciation fund Rs. 2.50 lakhs. Provision for taxation stands at Rs. 52.50 lakhs and other liabilities at Rs. 42.28 lakhs. The Company has made considerable additions to the buildings, plant, machinery, farms, etc., at a cost of Rs. 13.25 lakhs, which brings the total value of the gross block, as at the end of the year under review, to Rs. 108.06 lakhs. The written down value of this block is no more than Rs. 39.89 lakhs. The current assets aggregate Rs. 188.60 lakhs, of which stock-in-trade accounts for Rs. 18.86 lakhs, stores, spares, etc., for Rs. 44.31 lakhs, debts, deposits and advances for Rs. 53.06 lakhs, investments (including call deposits with banks amounting to Rs. 30 lakhs) for Rs. 56.02 lakhs and cash balances for Rs. 16.34 lakhs. Thus, the current assets exceed the current liabilities and provision for taxation by a huge margin of Rs. 93.82 lakhs.

The Rs. 10 paid-up shares of the Company are being currently quoted at Rs. 43-4 cum-div. On an ex-div. basis, the latest dividend gives a yield of 4.8 per cent. per annum, free of tax.

Points From The Chair

Convertibility of Sterling

"WE have to find a means of achieving a state of affairs in which the great trading area, based on the pound, can work freely with the other great trading area, based on the dollar. Much has been said and written on the subject of convertibility. Although the extent of the reserves that would be needed to bring this about is an important consideration, it is by no means the only one. It seems to me that the arguments have centred too exclusively on this point. We must not forget that whatever figure our reserves might reach, or however large the credits that might be arranged, they will certainly prove inadequate, unless the underlying policies are sound. If the two areas follow mutually incompatible policies, based on faulty economics, no truly effective 'arrangement' will ever be possible between them. On the other hand, if they were to be founded on mutual trust and a real understanding of the basic principles of trade, then I believe 'convertibility' could not only be achieved but achieved soon."

J. S. CROSSLEY,
Barclays Bank (Dominion, Colonial and Overseas).

Coffee Prices to Growers

"The Government of India and the Indian Coffee Board have come to an agreement that price should be paid to the grower for Plantation 'A' on the basis of Rs. 2-4 per point and proportionately for other grades. The result should mean an assured return to the grower, at the same time safeguarding the interests of the consumer. I personally feel that although Rs. 2-4 per point would work out to about Rs. 175 to Rs. 180 per cwt. for Arabica coffee and Rs. 130 to Rs. 140 for Robusta coffee, it is certainly lower than the price of coffee realised during the last two years which went up to Rs. 2-12 per point, on which basis the price of coffee worked out to Rs. 200 for Arabica and Rs. 170 for Robusta. For an estate which gives an average crop of 2½ to 3 cwts. per acre, the new price level may be considered a reasonable return, although the average yield of many coffee-growing estates in South India is not more than 1½ to 2 cwts. per acre."

C. M. KOTHARI,
Waterfall Estates Ltd.

Australia's Economy

"Australia enjoys, and is entitled to, a high standard of living, but this standard can only be maintained with an appropriate effort. Her people cannot support for long an economy based on costs disproportionately higher than world levels, and the need for increased production to lower unit costs is very obvious. The relatively high prices which Australia has received for her exports over the last few years, particularly for wool and other primary products, have masked to some extent this vulnerable point in her economy. Should these prices fall substantially, or should a widespread drought reduce the volume of exports, one might well see a serious situation arise."

THE HON. DAVID F. BRAND,
English, Scottish and Australian Bank, Ltd.

CLASSIFICATION OF JOINT STOCK COMPANIES

The Government of India has considered it necessary to revise the existing classification of joint stock companies. An inter-departmental committee has drawn up a tentative list for comment taking into account (i) the standard International Industrial classification; and (ii) the classification adopted for (a) the Census of Manufacturing, (b) the Census of Population, 1951, (c) income-tax assessment, and (d) factories statistics. The same has been circulated to various chambers of commerce. After consultation with the connected associations, the Bengal Chamber of Commerce and Industry has submitted a list of suggestions and amendments to the list. Some surprise is felt that tea plantations and tea factories should have been classified separately and it is pointed out that this might lead to confusion; so far as is known, there are no joint stock companies of this type in India which own factories but do not own plantations.

Notices

BURN AND COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Board of Directors has sanctioned payment of the Dividend on 6 per cent. and 7 per cent. Preference Shares of the Company for the half-year ending 31st December, 1953. Payment will be made on or after the 11th January, 1954, to those shareholders whose names appear on the Company's Registers on the 31st December, 1953, or in accordance with their instructions.

By Order of the Board,
MARTIN BURN LTD.,
Managing Agents.

12, MISSION ROW,
CALCUTTA, 16th *December*, 1953.

THE K.C.P. LIMITED, MADRAS

NOTICE TO SHAREHOLDERS

NOTICE IS HEREBY GIVEN THAT THE Twelfth Annual General Meeting of the Shareholders of the K.C.P. Ltd., will be held on the 30th December, 1953, at 3 p.m., at the Registered Office, Madras, to transact the following business:—

1. To receive and adopt the Directors' Annual Report and the Audited Accounts for the year ending 30th June, 1953.
2. To declare further Dividend.
3. To ratify the sanction of 5 months' pay as Bonus to the permanent employees of the Company.
4. To elect Directors in the place of those who retire from the Office of Director under Article No. 101 of the Company's Articles of Association but are eligible for re-election.
5. To appoint Auditors for the year 1953-54 and fix their remuneration.
6. To consider any other subject that may be placed before the Meeting.

Notice is also given that the Registers of Members of the K.C.P. Ltd. will be closed from 24th December, 1953, to 31st December, 1953, (both days inclusive), during which period transfer of shares will not be registered.

By Order of the Board,
M. SITHARAMARAO,
Secretary.

VUYYURU, 10th *December*, 1953.

THE ALKALI AND CHEMICAL CORPORATION OF INDIA, LIMITED

NOTICE OF AN EXTRAORDINARY MEETING

AN EXTRAORDINARY MEETING OF THE Members of the Alkali and Chemical Corporation of India, Ltd., will be held on Monday, the 11th January, 1954, at 3-30 p.m., at the Registered Office, 18, Strand Road, Calcutta, to transact the following business:—

To appoint Mr. Edward Martley, General Manager of the Company's Rishra Factory and a person holding an office of profit under the Company as a Director of the Company under Section 86E of the Indian Companies Act, 1913. For this purpose the following ordinary resolution will be proposed:—

"That Mr. Edward Martley, General Manager, Rishra Factory be and he is hereby appointed a Director of the Company from the 11th January, 1954."

By Order of the Board,
IMPERIAL CHEMICAL INDUSTRIES (INDIA) LIMITED,
Secretaries.

CALCUTTA, 14th *December*, 1953.

To,

The Shareholders of The Alkali and Chemical Corporation of India, Limited, and in particular to:—

Mr. J. V. A. e Brito, Mr. W. A. Bell, Mrs. A. L. Baxendale, Her Highness Bada Maharani Deela Kumari Devi, Mrs. M. Duncan, Mrs. H. C. D'Cruz, Mrs. M. A. Edney, Mrs. E. M. Fanthome, Mrs. J. Guest, Mr. P. H. Guest, Mr. W. A. T. Hollingbery and Mrs. E. M. Hollingbery, Commdg. Genl. Mohun S. S. Jung B. R. and Major Genl. Bijaya S. S. Jung B. R., Genl. Sir Baber S. S. Jung B. R., and Major Genl. Mrigendra S. S. Jung B. R., Mr. A. Y. Kadwa, Mr. F. J. C. Molhuish, Mrs. N. M. McCann, Major Sirdar K. M. Panikkar, Mr. S. P. Upadhya, Mr. C. R. Witcher, Mr. K. W. Young.

RESULTS OF SOME MCLEOD GROUP JUTE COMPANIES

EARNINGS OF NELLIAMPATHY LOWER

Chitavalsah Jute Mills Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submit the audited accounts of the Company for *the half-year* ended 30th June, 1953.

The accounts show that the *profit* for the half-year after providing for depreciation Rs. 1,25,000 (*Rs.* 1,10,000), amounts to Rs. 5,37,379 (Rs. 1,86,797) to which must be added the credit balance brought forward from the previous half-year Rs. 1,07,364 (Rs. 1,92,345) and amount received on account of post-war E.P.T. refund (Net) *Rs.* 1,87,710 (*nil*) making a total of Rs. 8,32,453 (Rs. 3,79,142). From this sum has been deducted payments made to workers on account of bonus *for 1951 and fixation* of wages and dearness allowance as per Appellate Tribunal Award effective from 13th October, 1952, to 31st December, 1952, amounting to Rs. 5,83,324 (*nil*) leaving a balance of Rs. 2,49,129 (Rs. 3,29,142). The directors recommend that, this amount should be distributed as follows:—

Dividend on 5,000 preference shares at 7 per cent. per annum for the half-year ended 30th June, 1953, or Rs. 3-8 (Rs. 3-8) per share Rs. 17,500 (Rs. 17,500) and dividend on 1,00,500 ordinary shares at 25 (50) per cent. per annum for the half-year ended 30th June, 1953, or Rs. 1-4 (Rs. 2-8) per share Rs. 1,25,625 (Rs. 2,51,250) leaving to be carried forward Rs. 1,06,004 (Rs. 60,392).

Jute stocks are shown at or under cost. Sold stocks of goods have been calculated at contract sale price and goods unsold on 30th June, 1953, have been valued at market rates.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	15,05,000	Block ...	16,60,457
Debentures	10,69,000	Stock ...	38,02,682
Reserves ...	46,90,000	Stores ...	5,30,753
Provision for taxation ...	3,77,537	Debts, deposits and advances ...	12,67,705
Liabilities ...	19,72,937	Investments	8,43,007
Profit and loss account ...	1,06,004	Cash ...	16,15,874
	Rs. 97,20,478		Rs. 97,20,478

Empire Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

The accounts show that the profit for the half-year, after providing for depreciation Rs. 95,000 (Rs. 1,05,000) and taxation Rs. 89,000 (Rs. 6,000) *amounts to Rs.* 1,19,901 (Rs. 16,454), to which must be added the credit balance brought forward from the previous half-year of Rs. 47,730 (Rs. 12,159), leaving an available balance of Rs. 1,67,631 (Rs. 1,55,656), which sum the directors recommend *should be distributed as follows:*—

Dividend on 10,000 preference shares at 7 per cent. per annum for the half-year ended 30th June, 1953, or Rs. 3-8 (*Rs. 3-8*) per *share* Rs. 35,000 (Rs. 35,000) and dividend on 1,50,000 ordinary shares at 10 (10) per cent. per annum for the half-*year ended* 30th June, 1953, or As. 8 (As. 8) per share Rs. 75,000 (Rs. 75,000) leaving to be carried forward Rs. 57,631 (Rs. 45,656).

Jute stocks are shown at cost. Sold stocks of goods have been calculated at contract sale price and goods unsold on 30th June, 1953, have been valued at market rates.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	25,00,000	Block ...	21,41,862
Debentures ...	8,86,000	Stock ...	20,31,528

Provision for taxation ...	2,94,200	Debts, deposits and advances ...	6,88,942
Liabilities ...	7,32,412	Investments	8,69,496
Profit and loss account ...	57,631	Cash ...	15,14,074
	Rs. 77,20,243		Rs. 77,20,243

Kelvin Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submit the audited accounts of the Company for *the half-year ended* 30th June, 1953.

The accounts show that the profit for the half-year, after providing for depreciation Rs. 95,000 (*Rs.* 1,00,000) and taxation Rs. 1,40,000 (Rs. 85,000) amounts to Rs. 1 81,924 (Rs. 1,17,411), to which must be added the credit balance brought forward from the previous half-year Rs. 1,15,895 (Rs. 70,010) making a total of Rs. 2,97,820 (Rs. 2,99,629). This amount the directors recommend should be distributed as follows:—

Dividend on 10,000 preference shares at 7 per cent. per annum for the half-year ended 30th June, 1953, or Rs. 3-8 (Rs. 3-8) per share Rs. 35,000 (Rs. 35,000) and dividend on 21,000 ordinary shares at 15 (15) per cent. per annum for the half-year ended 30th June, 1953, or Rs. 7-8 (Rs. 7-8) per share Rs. 1,57,500 (Rs. 1 57,500) leaving to be carried forward Rs. 1,05 320 (Rs. 1,07,129).

Jute stocks are shown at cost. Sold stocks of goods have been calculated at contract sale price and goods unsold on 30th June, 1953, have been valued at market rates.

In accordance with the main and supplementary working time agreements of the Indian Jute Mills' Association, working hours were 42½ hours per week with 12½ per cent. of the total looms sealed. Due to a re-allocation of looms hours on a group basis, the mills worked 48 hours per week with 12½ per cent. of their total looms sealed. During the period there was considerable labour unrest and a strike occurred, the mills being closed from 17th to 26th June, 1953.

Difficult trading conditions continued throughout the period with an improvement in prices during May and June, 1953. A further recession in prices of both hessian and heavy goods has since taken place, and the Government announced a further reduction on hessian export duty of Rs. 155 per ton on 15th September, 1953.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	31,00,000	Block ...	21,70,372

Nellimarla Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

The accounts show that the profit for the half-year, after providing for depreciation Rs. 88,300 (Rs. 87,000) amounts to Rs. 3,59,840 (loss of (Rs. 1,38,364) to which must be added the credit balance brought forward from the previous half-year of Rs. 1,23,783 (Rs. 1,75,436) and the amount transferred from general reserve account Rs. 1,00,000 (Rs. 1,00,000) making a total of Rs. 5,83,623 (Rs. 1,86,345). *From* this amount is deducted, payments made to workers on account of bonus for 1950 and 1951 and fixation of wages and dearness allowance as per Appellate Tribunal Award effective *from* 13th October, 1952 to 31st December, 1952, amounting to Rs. 4,61,728 (nil) leaving an available balance of Rs. 1,21,895 (Rs. 1,86,345), which the directors recommend should be distributed as follows:—

Dividend on 5,000 preference shares at 6 per cent. per annum for the half-year ended 30th June, 1953, or Rs. 3 (Rs. 3) per share Rs. 15,000 (Rs. 15,000) and dividend on 75,000 ordinary shares at 20 (40) per cent. per annum for the half-year ended 30th June, 1953, or Re. 1 (Rs. 2) per share Rs. 75,000 (Rs. 1,50,000) leaving to be carried forward Rs. 31,895 (Rs. 21,345).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	12,50,000	Block ...	9,13,121

	Rs. 76,05,329		Rs. 76,05,329

Presidency Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th *June*, 1953.

The accounts show that the profit for the half-year after providing for depreciation Rs. 90,700 (Rs. 1,02,500) amounts to Rs. 2,12,658 (loss of Rs. 4,82,703). Deducting therefrom the debit balance brought forward from the previous half-year of Rs. 3,93,006 (credit of Rs. 5,816) this is a debit balance to be carried forward, of Rs. 1,80,348 (debit of Rs. 4,76,887).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	25,00,000	Block ...	19,38,510
Debentures	8,00,000	Stock ...	15,53,914

		Profit and loss account ...	1 80.348
	Rs. 47.89 413		Rs. 47.89 413

Nillampathy Tea and Produce Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. A. V. Thomas & Co. Ltd., Alleppey) submit the audited accounts of the Company for the year ended 30th June, 1953.

The tea crop harvested is less than the estimate for the year by 20,836 lbs. owing to unfavourable weather conditions, *the rainfall during the* year being only 88.94" as compared to 110.67" for the previous year. The cost of production was higher than the estimate, mainly *on account of* higher wages to labour consequent on the implementation of the *Minimum* Wages Act.

The rubber crop harvested this *season* was a record one, being 13,700 lbs. more than the estimate (62,500 lbs.), the average yield per acre amounting to 610 lbs. This extremely satisfactory result was achieved by the systematic improved methods of tapping and cultivation adopted on the Company's rubber property. Notwithstanding the high yield secured, the cost of production, though lower than the estimate for the year, was higher than that of the previous year due to higher wages paid to workers.

The coffee crop harvested during the year amounted to 57.37 cwts., against an estimate of 20 cwts. and the cost of production was Rs. 1,057.09 per cwt.

The cardamom crop harvested during the year was 15,990 lbs. very satisfactory having exceeded the estimate by 9,990 lbs. and naturally the Estate cost of production was lower than that estimated.

The tea seed obtained was 30 maunds as estimated, though the cost of production was slightly higher than the estimate.

The net profit for the season, after providing for depreciation and *income-tax*, amounts to Rs. 1,47,372 (Rs. 1,78,923) to which has to be added the amount of Rs. 49,322 (Rs. 52,399) carried forward from last year making a total of Rs. 1,96,694 (Rs. 2,31,322). From this a sum of Rs. 27,000 has to be deducted towards 6 (6) per cent. dividend paid to preference shareholders for the year and also a sum of Rs. 7,500 towards reserve for bad and doubtful debts leaving a balance of Rs. 1,62,194 (Rs. 2,04,322) available for distribution, which the directors recommend be disposed as under:

Payment of a dividend of 12½ (12½) per cent. for the year 1952-53 on ordinary shares Rs. 1,50,00,000 (Rs. 1,50,000) and carry over to next year Rs. 12,194 Rs. 49,322).

Estimate for season 1953-54 are as under:

	Crop	Cost of production
Tea ...	7,00,000 lbs.	100 64 cts. per lb.
Rubber ...	62,500 lbs.	63 98 "
Coffee ...	40 cwts.	Rs. 1,453 99 per cwt.
Cardamom ...	10 000 lbs.	Rs. 4 65 per lb.
Tea seed ...	35 Mds.	Rs. 152.23 per md.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	16,50,000	Block ...	17,49,401
Reserves ...	3,00,280	Stock-in-trade	1,70,411
Provision for taxation ...	1,99,878	Stores, etc. ...	1,28,699
Liabilities ...	99,373	Debts, deposits and advances ...	1,64,404
Profit and loss account ...	1,62,194	Investments	12.907
		Cash ...	1,85,903
	Rs. 24,11,725		Rs. 24,11,725

Midnapore Zemindary Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 13th April, 1953.

The accounts show clearly the *effects* of the contraction of income resulting from the loss of the Company's *East Pakistan* and Bihar Concerns. Total collections including selami were Rs. 11,45,525 (Rs. 8,18,989) lower than last year and, by the exercise of strict *economy*, *expenses* have been proportionately reduced. The amount at the credit of profit and loss account before providing for taxation is Rs. 6,30,151 (Rs. 8,18,989).

As mentioned in the last report, the Company no longer holds any rent-receiving interests in East Pakistan or Bihar. No compensation has yet been received from either Government for the property taken over from the Company.

A bill for the abolition *of zamindari* in West Bengal is now before the Assembly.

After providing Rs. 4,50,000 (Rs. 6,80,000) for taxation and Rs. 43,810 (Rs. 43,810) for the preference dividend there remains at the credit of *profit* and loss account a sum of Rs. 1,45,031 (Rs. 1,92,608) including Rs. 4,609 (Rs. 93,984) carried forward from last year] from which the directors recommend a dividend of Rs. 1-8 (Rs. 2) per share absorbing Rs. 1,41,000 (Rs. 1,88,000) leaving Rs. 4,031 (Rs. 4,609) to carry forward.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	1,02,76,200	Block ...	98,01,698
Reserves ...	35,56,933	Stores ...	69,598
Provision for taxation ...	23 88.208	Crops-in-stock	4,416
Liabilities ...	24,97,583	Debts, deposits and advances ...	36.28.651
Profit and loss account ...	4,031	Investments	34.72,468
		Cash ...	19.46:127
	Rs. 1,87.22 958		Rs. 1,87.22 958

Great Eastern Shipping Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. A. H. Bhiwandiwalla & Co., (Bombay) Ltd., Bombay) submit the audited accounts of the Company for the year ended 30th June, 1953.

The Company has maintained its progress. During the year under report the total freight earnings in respect of owned and chartered vessels amounted to Rs. 1,70,28,297 as compared with Rs. 93,44,707 for the previous year. After meeting the unusually heavy general survey repair charges amounting to approximately Rs. 9,00,000 in the *case of s.s. "Jag Vijay"* the Company has earned a gross profit of Rs. 25,05,944 (Rs. 25,14,527). After deducting the normal depreciation of Rs. 8,75,716 (Rs. 4,72,528) initial depreciation of Rs. 2,16,723 (Rs. 10,72,223) and the managing agents' commission of Rs. 1,42,159 (Rs. 99,429), there is a net profit of Rs. 12,71,346 (Rs. 8,70,347). Adding Rs. 54,532 (Rs. 44,184) brought forward from the previous *year*, the amount available for appropriation aggregates to Rs. 13,25,877 (Rs. 9,14,531). The directors recommend the *following appropriations:*—

Dividend at 10 (10) per cent. on the 3 (2) lakhs fully paid-up ordinary shares of Rs. 10 each Rs. 3,00,000 (Rs. 2,00,000), dividend at 10 (*nil*) per cent. for 6 months on 2 lakhs partly paid-up shares of Rs. 10 each (Rs. 5 paid-up) Rs. 50,000 (nil), reserve to meet taxation liability Rs. 6,00,000 (Rs. 2,60,000) and to reserve fund Rs. 3,00,000 (Rs. 4,00,000), leaving to be carried forward to next year Rs. 75,877 (*Rs.* 54,531).

The partly paid-up shares participate in the profits of the Company from 1st January, 1953, and therefore dividend provision as recommended above has been made in their case.

The four-yearly general survey of *s.s. "Jag Vijay"* was due during the year under report. In view of the survey requirements heavy repairs were carried out at a German repair yard. The vessel is now in a very good condition.

During the year under report four owned and a few time chartered vessels were under operation. The *"Jag Vijay"* was laid up for special survey repairs at the repair yard for a period of 63 days and was not available for employment.

The Company purchased *s.s. "Fidra"*, renamed the *"Jag Bindu"* for Rs. 6,57,000 during the year. The conversion of *s.s. "Jag Bindu"* from coal burning to oil firing and purchase of another vessel m.v. *"London Artisan"*, to be renamed *"Jag Laadki"* relate to the period subsequent to that under report. After the cost of conversion from coal burning to oil firing and other alterations are taken into account *s.s. "Jag Bindu"* would be worth over Rs. 9,00,000. M.V. "London Artisan" has been purchased by the Company for a sum of Rs. 40,00,000. The Government has advanced a loan of Rs. 26,66,000 to assist the Company in the purchase of this vessel. The loan of Rs. 15,75,000 due to the Government in respect of purchase of *s.s. "Jag Rani"* has since been repaid in full to the Government far ahead of the scheduled date of 1st June, 1957, specified by the Government for the repayment of the last instalment.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	40,00,000	Block ...	1,22,23,144
Reserves ...	57,65,273	Stores ...	2,446

	Rs. 1,62,99,422		Rs. 1,62,99,422

Bengal Jute Mill Co., Ltd.

The directors of the above Company (Managing *Agents*: Messrs. Soorajmull Nagarmull, Calcutta) submitted the audited accounts of the Company for the *year* ended 30th June, 1952.

The accounts *showed* a gross profit of Rs. 10,33,746 (Rs. 96,77,796). After providing Rs. 2,19,380 (Rs. 3,40,176), for depreciation and Rs. 2,56,297 (*Rs.* 13,05.898) for interest, commission, allowance and other expenses, there was an available balance at credit in profit and loss account *of Rs.* 5,58,069 (Rs. 80,27,722). To this sum was added the amount brought forward from the previous year of Rs. 4,07,701 (Rs. 1,09,979) making a total of Rs. 9,65,770 (Rs. 81,37,701). The directors set aside as a reserve for taxation (income, supertax, etc.) a sum of Rs. 2,57,000) (Rs. 40.00.000) leaving a balance of Rs. 7,08,770 (Rs. 41.37.701). out of the above sum the directors paid a dividend of 5½ per cent. per annum on 10,000 redeemable cumulative preference shares for the year ended 30th June, 1952, (free of income tax) Rs. 55,000 (Rs. 53,000) and a dividend on 2,25,000 ordinary shares of Re. 1 (Rs. 3) per share (free of income-tax) for the year ended 30th June, 1952. Rs. 2,25,000 (Rs. 6,75,000), leaving to be carried forward Rs. 4,28,770 (Rs. 4,07,701) after transferring Rs. 30,00,000 to reserve account.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	32,50,000	Block ...	29,46,837

Notice

GILLANDERS ARBUTHNOT & COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Nineteenth Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office, Clive Buildings, Netaji Subhas Road, Calcutta, on Wednesday the 30th December, 1953, at 3-15 p.m., for the following purposes:—

1. To receive and adopt the Directors' Report and the Audited Accounts for the year ended the 31st March, 1953.
2. To declare and confirm Dividends.
3. To elect Directors.
4. To appoint Auditors and fix their remuneration.
5. To transact any other ordinary business of the Company.

Notice is also hereby given that the Register of Members of the Company will be closed from the 24th to the 30th December, 1953, both days inclusive. Dividend Warrants will be sent only to Registered Shareholders or to their Mandatees.

By Order of the Board,

For GILLANDERS ARBUTHNOT & CO., LTD.,

K. R. FETTES,
Managing Director.

CLIVE BUILDINGS,
NETAJI SUBHAS ROAD,
CALCUTTA, 11th December, 1953.

(*Concluded from page* 1160)

the Auditor-General exercised his functions in the case of these organisations as required by the Constitution. A different situation would, however, arise in the *case of corporations* or companies in which the Government might have a share. In such cases, there might be a need to fix the limit of Government's share, above which a concern could be regarded as a State concern to attract the exercise of the functions of the Auditor-General.

With regard to the exercise of financial control by the Executive, Mr. Deshmukh said that a certain pattern had been evolved as a result of experience. For avoidance of red-tape and for facilitating administrations, the companies or corporations were invested with certain financial powers. But two precautions were taken to safeguard the interests of the Government. One was the appointment of a representative of the status of a Joint Secretary to serve on the Boards of these concerns, and the other the power vested in Government of issuing directives to the concerns. After gaining some experience in this pattern of control, it would be possible, he said, to define the precise pattern later on.

Commenting on the control to be exercised by Parliament, Mr. Deshmukh said that Parliament had the right to set up a committee if it so desired. For his part, he thought that the appointment of such a committee to go into details of the industrial concern was not desirable. "It seems to me," he said, "that at the present state of industrial development of the country and expansion, there is a danger of going too far in immersing ourselves too much in the administration." He asked: "Is it not better to enable the Corporations to manage its affairs and then call the Executive to give an account in the way in which it always called the Executive *to account*?" Proceeding, he added: "if we hurry too much in this matter, there is always the danger of our throwing out the baby with the bath water." Finally, Mr. Deshmukh remarked:

"For certain reasons, partly historical, some very big utility services like the Railways or Posts and Telegraphs have never been created into corporations and, therefore, they continue to be under the continuous observation and vigilance of the House. Then for certain purposes, as for instance for the fancied advantages of so-called business management, we are now trying out this organisation of corporations or companies. We have not yet made up our mind as to which of these two forms is superior or whether one should be chosen to the exclusion of the other. That is a matter of convenience. So far as Government are concerned, I believe that there will be advantages in both, and it may be that we might both have to put in that amendment to the Company Law and we might have to provide separately for State Corporations."

STRINGENCY IN MONEY GROWS

(From Our Own Correspondent)

BOMBAY, 16th December

Conditions in the short-term money market became perceptibly stringent during the week under review, following further call for funds on banks for income-tax payments and for financing crop movements. Although the demand for funds was not heavy for this time of the year, the supply was not enough to satisfy the demand fully. Exchange banks had to call for funds from their foreign offices. Inter-bank call money, among the Exchange and big Indian banks, which had declined from 2 per cent. to 1¾-1¾ per cent. on Saturday last, firmed up to 2¼ to 2¾ per cent. from Monday onwards. Among the smaller Indian banks, inter-bank call money was bid at 3 per cent.

As the current year is drawing to a close, inter-bank money rate is expected to fluctuate fairly frequently on the basis of day-to-day position in regard to supply and demand. A factor that has to be taken into account here is that each bank will generally be keen on maintaining a high level of cash balance in view of the annual closing of accounts.

Some keen bidding was noted in short-term deposits for 3 to 4 months at 2¾ to 3 per cent. One month deposits were taken up at 2¼ per cent. and two months' at 2½ per cent.

This week's tenders for Rs. 1 crore three months' Government of India Treasury Bills did not bring an offer of more than Rs. 1 crore as against Rs. 1.71 crores last week. The average rate of accepted tenders was Rs. 2-7 per cent. per annum, that is, a fraction lower than last week's record rate of Rs. 2-7-2 per cent.

The Reserve Bank's statement for the week ended 11th December, 1953, as compared with that for the previous week, shows an expansion of Rs. 8.77 crores in notes in circulation, as against Rs. 17.57 crores a week ago. Notes held in the Banking Department are up by Rs. 75.54 lakhs. The rise in total notes issued, at Rs. 9.53 crores, is offset by an increase of Rs. 10 crores in foreign securities and a decline of Rs. 47.27 lakhs in rupee coin. Deposits of the Central Government are higher by Rs. 1.79 crores, while those of other Governments and banks are lower by Rs. 2.93 crores and Rs. 5.02 crores, respectively. Cash balances have risen by Rs. 80.25 lakhs, while balances held abroad have declined by Rs. 7.74 crores. Loans and advances to Governments show an increase of Rs. 1.15 crores. Other loans and advances do not record any notable variation. Despite the reported stringency in the money market, there has been no borrowing by banks against usance bills. Investments have declined by Rs. 3.46 crores. Government Treasury Bills purchased and discounted have risen by Rs. 3.61 crores.

The Scheduled Banks' statement for the week ended 4th December, 1953, shows a decline of Rs. 6.86 crores in demand deposits and Rs. 1.53 crores in time deposits. Inter-bank borrowings have gone down by Rs. 1.43 crores. Advances and bills discounted and purchased have risen by Rs. 1.73 crores, while cash on hand and balances with the Reserve Bank have together dwindled by Rs. 10.12 crores and money at call and short notice by Rs. 1.74 crores.

The Gilt-edged market was not as active as in the previous week. There was a tapering of demand, but the undertone remained steady, with selected counters showing further gains. 3 per cent. 1957 and 3 per cent. 1958 held their ground at Rs. 98-6 and Rs. 98-2, respectively. 3 per cent. 1959-61 was well maintained at Rs. 96-2. 3 per cent. 1963-65 was taken up at Rs. 92-8. 3 per cent. 1964 closed at Rs. 92-8 *ex-voucher*, as against Rs. 92-10 *cum-voucher* last week. 3 per cent. 1966-68 was in request and changed hands As. 2 higher at Rs. 90-4. 3 per cent. 1970-75 was done at Rs. 86-8. 3 per cent. 1986 Conversion Loan was keenly bid early in the week and rose from Rs. 82-8 to Rs. 82-13, but reacted to Rs. 82-8, before closing higher at Rs. 82-10. 3½ per cent. 1961 N.P. Bond was unchanged at Rs. 98-15.

TIN PRICES MAINTAINED

(From Our Own Correspondent)

CALCUTTA, 15th December

Although buying was meagre, prices were maintained in the metal market during the week. Tin opened at Rs. 416 and encouraging advices from Singapore raised the rate to Rs. 418. Over the week-end, the quotation receded to Rs. 416. The announcement regarding the results of the International Tin Conference held in Geneva was noted. The main aim of the draft agreement is price regulation, and this would be achieved by the creation of a buffer stock which would be operated by a manager, who would buy if the price declined below £800, and sell if the price rose above this level. No indication as to whether mining should be kept at a lower level in order to keep production in satisfactory relationship to demand is given, but this is perhaps left to the mining countries themselves who would have to consider the problem sooner or later. Producers can be ensured of fair prices only if most of what is mined is bought. Electrolytic copper ingots were better at Rs. 164, but this quotation was nominal in the absence of ready supplies. Some scrap, which is also in tight supply position, changed hands for being melted and made into billets. Electrolytic zinc opened at Rs. 53-8 and declined to Rs. 53 following the anxiety of stockists for business. The AZ material was, however, in moderate demand. Lead was dull at Rs. 65, as buyers were not interested in offers.

BULLION FEATURELESS

(From Our Own Correspondent)

BOMBAY, 16th December

Trading on the Bullion Exchange was featureless during the week under review. Movements in prices were narrowly erratic. The undertone was quietly steady.

The informal meeting of the General Body of the Bullion Association, held on Wednesday last week, considered the alternative proposals of the Board to fix the penalty for non-delivery of goods at the settlement, and approved of the one fixing the penalty over the highest rate touched during the settlement. Later on, the Board decided to fix the rate of penalty at Rs. 2 per 100 tolas in the case of silver and at Re. 1 per tola in the case of gold. The Board has forwarded the final proposal to the Bombay Government and a directive from the Government is awaited.

Silver for forward delivery (23rd December settlement) opened on a quiet note at Rs. 151-1, but soon staged a smart recovery to Rs. 152-14 on Friday on revival of support from Calcutta interests and short-covering by a prominent bear operator. Firmer advices from cotton and other commodity markets also fanned the speculative enthusiasm. Uninspiring demand in the ready section and increase in arrivals of unrefined metal brought forth some unloading on Saturday which depressed the price to Rs. 150-14. Subsequently, the white metal made some headway and touched Rs. 152-2 yesterday on reports of good offtake. There was, however, renewed unloading which brought back the price at the close of to-day to Rs. 151-5.

Ready silver (.996 Mint) commanded a premium of As. 4 over the forward in the earlier half of the week, but, towards the close, the premium widened to As. 10 (the opening and closing rates being Rs. 151-5 and Rs. 151-15, respectively), thereby reflecting the revival of demand for ready metal in the last three days. The floating stocks of silver are estimated at 2,500 bars. The daily average offtake was 20 bars.

Gold for forward delivery (21st December settlement) began at Rs. 81-3 and, on reports of large arrivals and paucity of sufficient offtake, drifted lower to Rs. 80 on Saturday. A decline in arrivals in the last three days helped the metal to look up to Rs. 81-10, but this recovery could not be sustained at the close when the price reacted to Rs. 80-13.

Opening at Rs. 81-7, ready gold moved down to a low of Rs. 80-1. After coming up to Rs. 81-12, the metal finished lower at Rs. 80-13. The floating stocks of gold are estimated at 35,000 tolas. The daily average arrivals were 7,000 tolas, while the offtake was 5,000 tolas on an average.

The following comparative table shows the trend of the market during the week under review:

	16-12-53	Highest	Lowest	9-12-53
GOLD	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready (.99 fine Mint)	80 15	81 12	80 1	81 12
Forward	80 13	81 10	80 0	81 8
Sovereign	56 8	56 8	56 4	56 8
SILVER				
Ready (.996 fine Mint)	151 15	153 2	151 1	151 10
Forward	151 5	152 14	150 13	151 6
London Ready ..	74d.	—	—	73⅞d.
London Forward .	74d.	—	—	73⅞d.
New York Ready .	85½c.	—	—	85½c.

PEPPER STEADY

(Messrs. Parekh & Co.)

BOMBAY, 16th December

Malabar pepper in all the primary markets during the week remained steady, the highest and the lowest at Alleppey being Rs. 2,100 and Rs. 1,850 respectively. There were constant enquiries for shipment to New York by specified steamers, and U.S. dealers are reported to have paid $0.94 for named steamers and $0.91 for shipment during the whole of December, though shipments during January and Jan-Feb-March were reported to have been neglected. In the local A.S.T.A section, some of the prominent exporters remained buyers for January and Jan-Feb-March in equal monthly lots, as they thought the market would improve, if Russian enquiries for January shipment materialised into business. They are reported to have paid $0.88½ for January and $0.87 for Jan-Feb-March.

Arrivals of new crop at Cochin and Alleppey are increasing though slowly, but so far all the arrivals of matured pepper are said to have been fully absorbed. Enquiries for light berries for internal consumption being not so satisfactory, stock of the variety is reported to have accumulated with the growers. As to the future of the market, much depends upon the buying policy of New York, for from now onwards, new arrivals will be on the increase, and if these arrivals exceed the demand, the market is likely to go down, in view of the fact that no grower would like to start storing pepper in the very beginning of the season.

In the delivery section, December and February improved to Rs. 1,750 and Rs. 1,650 respectively with small business passing.

Following are to-day's nominal quotations: Ready delivery Rs. 240-70 per cwt., December delivery Rs. 1,700 and February Rs. 1,610-30 per candy of 5½ cwts.

SPURT IN COTTON

(From Our Own Correspondent)

BOMBAY, 16th December

The rate at which the forward cotton market is sprinting precludes any possibility with regard to speculation about its next stopping place. When the season is still young and the pressure of the full crop has hardly been felt, forward prices have jumped from below Rs. 600 to Rs. 699 almost in the twinkling of an eye. No change of any importance has occurred in the prospect about the total crop of the season. The season everywhere has been about as good as it could be expected to be at this time of the year and still the crop seems to have shrunk from 4.2 million to 3.9 million bales or even less. The same crop which at one time was believed to be so big as to be practically unsaleable is now so small that there would not be enough Indian cotton to go round during the season. The only important change that has occurred is in the offtake of coarse and medium cloth. High prices had reduced demand for this cloth; at lower prices, the demand has naturally increased. But there is no improvement in the purchasing power of the people which would ensure that the demand for cloth would continue at its present level even if prices were increased further.

What is now obvious even to an indifferent observer is that as usual some speculative interests have combined to corner the market and to squeeze the unwary short sellers. There would be little to worry about these desperate struggles between bulls and bears, if they had centred round some unimportant commodity which did not affect the general interest of an important industry or a large class of consumers. For instance, nobody bothers about the heavy fluctuations in mercury. If there had been a genuine and overall shortage in supplies, the May position in cotton would not have been quoting at a discount. The overall shortage is sure to be felt more severely during the latter months of the season than in December. This fact alone is enough to show that forward trading has ceased to serve the legitimate interests of industry, trade and the producers and has taken a form where it might do more harm than good.

The first effect of the inevitable rise in the price of cloth would be to affect the volume of exports. It was to render some assistance in this direction to the textile industry that the Government agreed to sacrifice the export duty on medium cloth. If this sacrifice is to be rendered void by a corresponding increase in the price for exports due to a phenomenal rise in the price of cotton, the sacrifice of public revenue would appear to be useless. The accumulation of stocks with mills had threatened the volume of employment in the textile industry. Increase in the price of cloth will once again dry up the demand which has been in evidence and what little advantage has been gained in this direction also will disappear with rising prices. It seems the cotton trade and, especially, the speculative element in it which dominates the scene, is cutting its own throat in this manner by engineering sudden booms and depressions in the market and leading it to a stage of either controlled or co-operative buying and selling of cotton.

Neither industry nor agriculture could be allowed to be transformed into a playground for speculators. The same thing is happening in other commodity markets also and it is feared that it might attract the attention of the authorities and invite them to intervene. A certain amount of elasticity and a slight over-emphasis on certain temporary aspects in the course of free trading is inevitable. But what is happening is something beyond this permissible range and the sooner the speculators draw their horns in, the better it would be for the trade. It is for the E.I.C.A. to devise ways of controlling unhealthy tendencies from within. It is only when business organisations fail to exercise such control that authorities get an excuse for interference.

In the spot market, conditions with regard to prices are naturally reflected in day-to-day trading. But the rise has been so hectic that the turnover has naturally been affected. Though there has been a fairly good demand for Vijay and Mathia, with the present bases and 'ONs' mills cannot be expected to be keen buyers beyond their immediate requirements. Even imported cotton has gone up in value during the last two or three days. It is, however, expected that the imports this year will be the lowest during recent years, as the textile industry is concentrating more and more on the production of coarse and medium cloth. The only foreign variety favoured at present is Egyptian Karnak, for which stray transactions are reported frequently. With the recent rise in prices which covers also short-staple cotton, export demand has disappeared completely.

In the forward market, I.C.C. February opened the week under review at Rs. 654 and moved up to touch a high of Rs. 699 to-day before closing the week a shade lower at Rs. 692½. I.C.C. May fluctuated between Rs. 692 (this rate was touched to-day) and Rs. 656½ before finishing the week at Rs. 688. The following is the trend of prices over the week under review:

	Opening	High	Low	Closing
I.C.C. Feb. ..	Rs. 654	699	654	692½
I.C.C. May ..	Rs. 656½	692	656½	688

The following are latest available quotations from the Sewri market:

Bengal *Deshi* Rs. 620; Berar *Jarillas* Rs. 780; Khandesh Rs. 820; Vijay Rs. 860; Oomra *Deshi* Rs. 690; Mogtai Rs. 690.

This has been another uneventful week at Karachi. During the latter part of the week under review, there was a slight easiness in prices due to lack of demand from abroad and selling pressure from producing centres. Till apprehensions with regard to the export policy of the U.S.A. Government for disposing of its surplus product are set at rest one way or the other, the Continental centres in Europe which are interested in Pakistan cotton are not likely to come out in the open and make purchases for their future requirements during the year. The latest available quotations from the Karachi market are:

Sind *Deshi* Rs. 67; Punjab *Deshi* Rs. 62; 4F Punjab R.G. Rs. 61; S.G. Rs. 66; L.S.S. Punjab R.G. Rs. 66; S.G. Rs. 71½; N.T. R.G. Rs. 68½; S.G. Rs. 74½; 289F Punjab R.G. Rs. 72½; S.G. Rs. 78½.

Even at Alexandria trading has not been as active as in the past weeks, except in Karnak for which France, the U.K. and India are moderate buyers. This drying up of demand for varieties other than Karnak has resulted in a slight reduction in the premia for Ashmouni and Giza 30 by about a penny to a penny and a half per £. The Government has asked for completion of ginning operations earlier this year, i.e., 15th February, in Upper Egypt and 15th March, in Lower Egypt. The obvious result of this would be to increase the stocks at Alexandria, with a consequent drop in prices as soon as the effect of this measure is felt.

At New York, the market has absorbed, with a certain degree of ease, the increase in production revealed in the December forecast. The trade there has taken it for granted that the additional production will only go into loan and not affect the general trend of prices. Export demand is bound to remain slack in view of the fact that the authorities might at a later stage offer some further incentives for export. The expiry of December contract last Monday had a bearish effect on prices temporarily, because of additional hedge selling in March and May positions. A similar depressing effect was felt also from a likely increase in the acreage for the next season. But the price trend, after these factors were discounted, has been on the whole steady and is likely to remain so.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	16-12-53	8-12-53	3-12-53
Spot	33.40	33.55	33.55
March	32.98	33.08	33.26
May	33.22	33.32	33.40
July	33.01	33.06	32.22
October	32.36	33.37	32.46

ART SILK YARN FULLY STEADY

(From Our Own Correspondent)

BOMBAY, 16th December

Trading in the art silk yarn market was extremely cautious this week too. Conflicting rumours regarding import policy for the coming half-year and advices from rayon cloth markets were not encouraging. There was, therefore, very little inclination on the part of traders to enter into sizable commitments; most of the purchases were for meeting day-to-day needs only. Interest in business was so dull that it remained uninfluenced by reports of an upward revision—ranging from 2d. to 3d. per lb.—in rayon yarn prices by Italviscosa, one of Europe's leading producers of the commodity. Transactions put through remained, as a consequence, greatly restricted, with values of yarn recording minor fluctuations. As compared with last week-end rates, to-day's closing quotations were, however, much better. The undertone of the market at the close was fully steady.

Art silk yarn (150D) for December delivery began the week firm at Rs. 722, as against Rs. 715, and improved to Rs. 725 on Friday. After gradually receding to Rs. 717 yesterday, it staged an impressive recovery to Rs. 726 to-day. Not only the previous losses were completely erased but the closing quotation was 11 points higher than the previous week's closing rate. January contract rose from Rs. 718 to Rs. 728 and, after dropping to Rs. 7 to Rs. 721 on Tuesday, recovered to Rs. 730. The net gain over the week was 12 points. Values of yarn in the ready section were well maintained. 120 Japan advanced by As. 2 to Rs. 4-5. 120 Italy rose by an anna to Rs. 3-14. 150 Italy was half an anna higher at Rs. 3-10. 150 Japan was fully steady at Rs. 4-1.

The table below gives the prices of art silk yarn quoted to-day, as compared with those on the 9th and 2nd inst:

	16-12-53 Rs. a.		9-12-53 Rs. a.		2-12-53 Rs. a.	
150 December (per case of 200 lbs.)	720	0	715	0	714	0
150 January (" ")	730	0	718	0	717	0
120 Japan (per lb.)	4	5	4	3	4	3
150 Japan "	4	1	4	1	4	1
120 Italy "	3	14	3	13	3	14
150 Italy "	3	10	3	9½	3	9½

As already stated, Italviscosa, the art silk yarn producing firm in Italy, has raised the prices of yarn by 2d. per lb. for finer counts above 100 deniers and by 2d. per lb. for lower counts below 100 deniers. The increase in price, it is reported, applies only to yarn supplied by the Company to established importers in overseas countries and not to actual consumers. This has, to a certain extent, diverted the attention of local traders to watch the attitude of other Continental producers, such as Switzerland, Germany and France, as also Japan. Some feel that there will not be any similar upward revision in price. For "forward business even at low prices," to quote one report, "has become increasingly difficult, on account of the continued slackness in demand and low offtake of rayon yarns during the last several months, mainly due to unremunerative prices realised by actual consumers, namely, silk weaving mills."

Contrary to expectations, forward trading in staple fibre yarn was not commenced on the 14th inst., as the Committee of the Yarn Merchants Association, Bombay, could not take any decision at its meeting held on Saturday last. The Committee is expected to meet again next Monday to consider the question. In the ready section, offtake of yarn, particularly 2×40s, has been quite satisfactory, thanks to good demand from powerlooms and handlooms. Yarn of 20s, however, has suffered a fall in price, due to heavy stocks and poor offtake.

GROUNDNUTS FIRM

(From Our Own Correspondent)

BOMBAY, 16th December

The oilseeds market ruled generally firm during the week under review. Groundnuts led the market, followed by other seeds. Prospects of the groundnut crop turning out to be lower than earlier expectations and keen *vanaspati* enquiries provided the driving force. The firm trend in the cotton market proved an additional influence. The sentiment of operators, therefore, hardened and the linseed section also responded sympathetically. In the castorseed section, futures witnessed some fluctuations, while the spots were quietly steady. The market was expecting export quotas in, and reduction of export duty on, castorseeds and castoroil.

From the trend of price movements in the groundnut section, it appears as though the probable ban on exports next year, contemplated by the Government, is justified. For, if exports are allowed, chances of speculative elements boosting the prices far higher than what they are to-day would be great, to the detriment of consumers' interests. That groundnut prices have recorded a rise of more than Rs. 5 over the past fortnight is a clear indication of what is likely to happen if exports are allowed.

Groundnut Bold is quoted to-day at Rs. 32-8, as against Rs. 30-6 on the 9th inst., and Rs. 27-12 on the 2nd inst. December-January delivery is enquired at Rs. 32-10 as against Rs. 30-4 end of last week and Rs. 27-8 on 2nd December. February-March is done to-day at Rs. 33-3, as compared with Rs. 30-14 on the 7th inst., and Rs. 28-2 on the 2nd inst. Khandesh quality has shot up by Re. 1-12 to Rs. 33-3 over the week and Rs. 4-2 over the fortnight. Groundnut oil ex-mill, and railway receipts advanced from Rs. 16-8 and Rs. 16-6, respectively, on the 9th inst., to Rs. 17-4 each. December, January and February deliveries were done at Rs. 17-4, Rs. 17-6 and Rs. 17-9 as against Rs. 16, Rs. 16-2 and Rs. 16-4, respectively, end of last week.

The linseed section also came in for good enquiry with few sellers. Bold ready rallied Re. 1-12 to Rs. 29-4 over the week. February-March delivery gained Re. 1-10 to Rs. 25-2. Linseed oil was done at Rs. 16 as against Rs. 15-4.

In the castorseeds section, May delivery, which opened at Rs. 116-4 as against Rs. 116-12, fluctuated between Rs. 121-4 and Rs. 115-6, before closing at Rs. 120-2. Ready F.A.Q. was quietly steady at Rs. 26-8 and Madras quality at Rs. 27. Castoroil B.S.S. rallied As. 4 to Rs. 16-8. Commercials gathered an equal amount to Rs. 15-4, while First Pressures were steady at Rs. 16.

Among others, *kardi* Bold advanced from Rs. 23-8 to Rs. 25. *Niger* ready F.A.Q. was higher by As. 2 at Rs. 29.

The following table shows the prices of oilseeds and oil on the 16th inst. as compared with those at the end of the previous two weeks.

	16-12-53 Rs. a.	9-12-53 Rs. a.	2-12-53 Rs. a.

SUGAR BEARISH

(From Our Own Correspondent)

BOMBAY, 16th December

Satisfactory supplies of cheap imported sugar and liberal releases from current season's production engendered heavy selling pressure in the Bombay sugar market during the week under review. The interior markets displayed a lack of interest. Sugar mills in the Deccan are reported to have cut down the ex-mill prices by about Rs. 2 per bag, following a reduction of As. 12 per maund in the ex-mill price of sugar effected by northern mills. Even at such reduced rates, demand for sugar was not encouraging. Consequently, sugar prices slided down. The undertone of the market was distinctly bearish.

The fall in prices over the week was particularly in evidence in the forward section. Sugar for *Magshar* delivery dropped a rupee to Rs. 82-8 per bag and that for *Posh* delivery receded by As. 8 to Rs. 83-12. In the ready section, small grain sugar fell from Rs. 91 a week ago to Rs. 90. Medium grain sugar was quoted at Rs. 93-8, as against Rs. 92-94. Large grain sugar was neglected at Rs. 97: previous week's quotation for this variety was Rs. 97-102. Arrivals of sugar into the market during the week amounted to 7,000 bags, which are 1,700 bags less than those a week before. Imported sugars also suffered losses, although they were met with good buying enquiries. Thus, British refined sugar retreated from Rs. 85-8 to Rs. 84—Rs. 84-4 per 2 cwts. Mexican sugar declined by As. 6 to Rs. 40-4 per bag of 110½ lbs. before finishing higher at Rs. 40-8.

As reported last week, both the s.s. St. David and the s.s. *Norton* arrived in Bombay last week-end. Deliveries of sugar from these ships are in progress and offtake at existing levels is fairly satisfactory.

Tenders for Cuban refined sugar per s.s. *Ameriki* have been invited by the Union Food Ministry, the last date for submission being the 21st inst. Initially, there was some hesitation on the part of traders to submit tenders, as a result of the free sale of Mexican sugar. Subsequently, however, the sentiment improved and it is now reported that tenders are steadily increasing.

The Central Government's scheme for importing raw sugar from Cuba, referred to in our previous week's issue, has raised a chorus of protest from a considerable section of the sugar industry and the trade. Several representations have been made to the Government to revise the policy. As a sequel to these representations, the Government, it is understood, has shelved the programme, at least temporarily. It is believed that a tentative programme has been drawn up to import 400,000 tons of refined sugar during 1954. Whether this quantity will be imported after the crushing season is over or whether the flow of imported sugar will be maintained at the ports all the year round, leaving the interior areas to be fed with indigenous sugar, are, however, issues on which no final decision has yet been taken. In so far as the releases of sugar produced during the current season are concerned the Government is expected to continue its present liberal policy.

DUST TEAS DEARER

(Messrs. Forbes, Ewart and Figgis Ltd.)

COCHIN, 11th December

There has been no auction sale in Cochin this week, but sale No. 25, the last sale of 1953, is due to be held on Tuesday, 15th December. This sale contains over two million pounds and quality is fully equal to the previous sale. Some of the high-grown teas show an improvement and have attractive flavour. In the private market, prices have remained fully firm.

After sale No. 25 there will be no further sale this year, due to Christmas holidays; the first sale of 1954 will be held on 5th January, 1954.

London Market.—Prices hardened, as sale progressed, 1½d. dearer.

Colombo Market.—Strong demand. High-grown brokens declined 10 cents. Mediums firm. Low-grown brokens and commonest five cents dearer.

Calcutta Market—Export.—61,000 packages. Very strong demand upto Rs. 2 per pound. Advances of As. 2 to As. 2½ were recorded.

Dust.—Strong demand. Market generally half to one anna dearer and strengthened as the sale progressed. C.T.C. fairly well supported.

Export Quota.—The market opened easier with sellers at 27½ pies. Later, however, it again hardened and business was done at 30 pies. To-day's quotation is 31 pies sellers.

As we go to press, Messrs. Forbes, Ewart and Figgis, Ltd., wire as follows:

"*Dust Sale Y.*—1,15,000 lbs. Strong general demand. Market one to two annas dearer all round."

"*Sale* 25.—20,65,000 lbs. Very strong general demand. All common and low medium teas fully two annas dearer. Mediums irregularly one to two annas. Best liquoring dearer, following quality. Whole leaf very strong."

HIDES ACTIVE

(From Our Own Correspondent)

KANPUR, 14th December

The hides and skins market ruled active during the week under review and considerable amount of business was done. Madras dealers and local tanners were keen purchasers. Arrivals were also adequate. There are said to be prospects of good business in the coming weeks.

The closing quotations are: Wet salted cow hides, 1st grade Rs. 300, 2nd grade Rs. 220 and 3rd grade Rs. 220 to Rs. 250 per score; wet salted buffalo hides, 1st grade 1 lb. 12 ozs., 2nd grade 2 lbs. 6 ozs. and 3rd grade 2 lbs. 8 ozs. per rupee; goat skins, 1st grade Rs. 280 to Rs. 310 and 2nd grade Rs. 240 to Rs. 260 per 100 pieces; sheep skins, 1st grade Rs. 430 and 2nd grade Rs. 320 per 100 pieces.

JUTE GOODS RECEDE

(From Our Own Correspondent)

CALCUTTA, 15th December

Conditions in the jute goods market were extremely dull yesterday, and this was reflected in prices dropping noticeably. Foreign demand was conspicuous by its absence and small holders indulged in profit-taking. Earlier in the week prices were well maintained and the feature was the moderate business in sacking goods that was put through with buyers on behalf of Australia and East Africa. The market expects more business from these quarters. The interest now being shown by Australia is considered significant, as its annual requirement of heavy goods is considerable and Government stocks there have reached the

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. s.d.=Ex-Dividend. c.d.=Cum. Dividend. I=Interim Dividend. F=Dividend for first half of the year.

Shares:—*If a company has different classes of shares*—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends:—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. a Sales and amount written off. (k) Investments. ‡ For ten months ended 31st December 1951.

(j) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 1180 in the debentures section:—

§§ Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium.

(b) Bearer bonds of Rs. 1,000 each repayable at par.

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

(e) Redeemable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months' notice.

MARKET GOSSIP

(Concluded from page 1135)

but financially puny." And yet what the "puny" demand is not equality with the "mighty" but only a fair field in which they can attain their legitimate stature.

• • • •

Readers of this journal are already aware that, with the restoration of freedom to private enterprise by the present Government in the U.K., speculators have been active, cornering shares with the ulterior motive of getting control of companies. But the authorities there seem to be quite vigilant and taking prompt measures to nip the evil in the bud. A circular letter addressed recently by the Bank of England to insurance companies and banks in the U.K., asking them not to associate themselves with speculative deals, is a sequel to the emergence of this new type of speculative activity, which has come to be known as "take-over bids." Some property-owning companies are being bought, not with a view to running them but in order to gain a large profit by selling the real estates at the high prices such estates command now. Insurance companies have been asked by the Bank not to buy property, if it appears to assist the negotiation of a transaction of a purely speculative nature. They have been requested to take a broad view in regard to their investments in property and to consider the motive behind financial deals, in which they are asked to join. The Governor of the Bank of England has asked banks to pay particular attention to their loans policy, especially in respect of loans granted for property deals. In this connection, the banks' attention has been drawn to the directive given by the Chancellor of the Exchequer in 1951. The Chancellor had told them not to give facilities for the speculative buying or holding of securities, real property or stocks of commodities. In short, the banks were asked not to lend for purposes which were not in the national interest.

• • • •

The British Insurance Association, while refraining from commenting on the Governor's letter, has issued a statement explaining the insurance companies' investment policy. The statement says: "There have been suggestions in the Press that insurance companies have been aiding what are described as 'take-over bids,' which are said to be speculative in character. The insurance companies' attitude in investing their funds has been to give at all times close regard to the interests of policyholders and the nation. If there were a feeling that any 'take-over bid' would be detrimental to the nation, the insurance companies would be the first to be careful not to facilitate it by financial co-operation." Though the Bank of England's statement was of a general nature and made no reference to any particular transaction of a speculative character, the general belief that a few of the insurance companies—may be a small minority—have been associated with some deals of the nature mentioned above in one way or another, must have induced the Bank to give a precautionary alert to these companies. The fact that such a statement from the Bank of England has received wide publicity in the U.K. is liable to give the public an unpleasant impression about all insurance companies, whether they have been connected with such deals or not. The British Insurance Association's statement quoted above has not made any effort at removing any possible odium. Although no such 'take-over bids' by insurance companies in India are reported now, they do not seem to have withstood the temptation to engage in transactions in speculative equities. This practice, to which we referred in these columns last week, is no less serious than the kind of transactions against which the British insurance companies have been rightly warned.

• • • •

The International Tin Conference, which concluded its plenary session in London last week, has formulated a draft scheme for controlling the marketing of tin. This is a welcome event, since the scheme is designed to avoid excessive fluctuations in the prices, such as those witnessed in the recent past. The price of tin to-day is about £658 per ton, as against £581 per ton at the end of July and £960 per ton in January, 1953. The price of tin was fairly stable in 1952 at about £960, the extreme points touched being £1,005 in January and £918 in August. The main tin producers, namely, Malaya, Indonesia and Bolivia naturally want to avoid wide fluctuations in the prices, which arise principally from the inelastic nature of the demand for this commodity. Since the economies of these countries are to a great extent dependent on the price fetched by tin, the violent swings in its prices have impeded plans for their economic development.

• • • •

The draft scheme seeks to set up an International Tin Council to operate in London. It envisages the creation of a buffer stock in tin and the allocation of export quotas among producing countries. Its authors have taken into consideration an estimated surplus of about 25,000 tons, on the basis of the world output of 170,000 tons, which will influence the trend of prices. The scheme does not propose any rigid price structure unrelated to supply and demand. It has fixed a floor and a ceiling price at £640 a ton and £880 a ton, respectively. If the market price is in the upper third (£800-£880) of the margin, the authorities will sell tin from the buffer stock. In the middle third (£720-£800), they will not operate. In the lower third (£640-£720), they will buy tin. This is a notable feature of the scheme. Action, designed to control prices, is not postponed till the floors or the ceilings are pierced, for the market might then be in a too demoralised condition to make the correct response to official buying or selling. The prices, which would attract official intervention, are fixed at safe levels—they are both well below the ceilings and well above the floors—so that there is larger room for manœuvres by the authorities and for adjustment by the market.

The resources of the buffer stock are sought to be built in an ingenious manner. The producing countries are to contribute the equivalent of 15,000 tons in metal and cash; the proportion of the metal is not, however, to exceed 75 per cent. of the contribution. The maximum expected in tin and cash is an amount equivalent to the value of 25,000 tons. As soon as the metal reserves of the buffer stock reach 10,000 tons, the export control machinery will come into operation; producers would be allocated export quotas in proportion to their output.

• • • •

Since export quotas are to be allocated among the producing countries in proportion to their present (or eventually revised) output, it is clear that the present high level of production will be maintained, if not increased. A significant feature of the scheme is that it contains a suitable provision for rewarding efficient producers. Thus, 20 per cent. of the allocated quotas will be deducted annually and put at the Council's disposal for a special export allowance to producers as a stimulus to efficiency. It is, however, not clear from available reports how the efficiency of the different producers could be measured when the price mechanism is not allowed to operate freely.

• • • •

The implementation of the scheme rests on its final ratification by the countries concerned, the date for which is fixed between 1st March and 30th June, 1954. It is stipulated that the draft scheme should come into force only when countries representing 90 per cent. of the producers and 33 per cent. of the consumers ratify it. The votes have been distributed in proportion to current production and consumption. But the voting strength is so adjusted as to avoid the position which would give the U.S. an absolute majority among the consuming countries, although it consumes more than 50 per cent. of world tin output. In other words, the voting system is so arranged as to permit the scheme to function without the concurrence of the U.S., which has expressed its reluctance to commit itself, until the report of the Randall Commission on U.S. foreign policy becomes available.

• • • •

Although the draft agreement is so framed as not to make its execution depend on the concurrence of the U.S., the scheme will lose its substance without American support, since the U.S. is the largest consumer of tin. The Indian delegate, Mr. S. Sen, rightly emphasised that the labours of the Conference "have been made theoretical" since they "did not know the position of one of the most important consuming countries." Indications are that the U.S. will ratify the scheme, as it has not raised any objection to the regulation of tin supplies. It is to be hoped that the U.S. will appreciate the producers' case and support the scheme in the interest of avoiding unnecessary fluctuations in tin prices and of ensuring a stable economy in the countries producing this commodity.

BANKING

(Concluded from page 1143)

heard the last of this unprecedented case in company control, especially as Mr. Samuel, who is principally affected, is demanding enquiry into this action.

Mr. Samuel's next move, after finding himself frustrated over the Berkeley, was to offer all his shares to the Directors of the Savoy Company at the top market price which, one can calculate, would have given him a capital untaxed profit of some £200,000. The Directors have turned down his offer feeling that the shares are grossly overvalued at that price. Mr. Samuel has replied that, since they will not buy his shares, he now proposes to buy as many more Savoy shares as he can at the price at which he offered to sell in order to obtain definite control over the Company. He has avowed that he has no intention of disposing of the assets of the Company but simply proposes to ensure that the properties are operated in the most profitable way for the shareholders.

Battle has now been joined and the City and the shareholders await with interest the outcome. But, unless a great number of unorganised shareholders of the Savoy side with the existing Directors, the odds may go against them, while, no doubt, many will be tempted by the capital profits they can realise by selling out at present prices. The whole case emphasises the helplessness of the ordinary shareholders who, apart from not being consulted, are not even informed of the economics of the battle!—*All Rights Reserved.*

MARKET REPORTS

(Concluded from page 1169)

border of exhaustion. There were also enquiries from and subsequent business with Indo-China and Burma.

B. twills opened firm at Rs. 103-4 last Tuesday, and, in the moderate business that resulted, improved to Rs. 104-8 by Thursday. At this stage, a reaction set in taking the price down to Rs. 103-10 by the week-end. The fall was due to speculative activity, and took the quotation to as low as Rs. 102-4. Ready hessian opened on Tuesday at Rs. 47-2 and were taken up to Rs. 47-6 on Thursday. Week-end reports that American consumption of burlap in November fell to 73.5 million yards from 83 million yards in October resulted in an easing tendency and the price gave way to Rs. 46-10. Moreover, advices from New York were discouraging, as buyers there were willing to wait for entering into commitments on the expectation of a further drop in prices. The rate fell further to Rs. 45-14 yesterday. The 8 oz. hessian was offered at Rs. 37-8 f.a.s. and at Rs. 40-12 f.o.b.

The raw jute market was steady. The quantity that changed hands was in the neighbourhood of 300,000 maunds. Support from mills was forthcoming. Arrivals showed an increase and were mainly the poorer varieties. *Bimli* f.a.q. was bought at Rs. 25-8, the latter declining to Rs. 25. Daisee bottoms were paid Rs. 29-8. Northern bottoms were for a time better at Rs. 29 and middles Rs. 32.

SUGAR PRICES DECLINE

(From Our Own Correspondent)

HAPUR, 14th *December*

Crystal sugar markets remained quiet to bearish during the week under review and there was a slight decline in prices. The Government of India's decision to release for free sale all sugar produced by the factories up to 15th December, 1953 and speculations regarding the Government's contracts with foreign countries for importing raw sugar to the tune of 200,000 tons acted as great dampers. The fear in the business community is that this would perpetuate State trading in sugar and thus directly affect the interests of private enterprise.

Fresh arrivals of imported sugar at the ports, particularly Calcutta and Madras, have made the supply position considerably easier, with prices receding gradually, resulting in the easy trend of the markets there. Other markets have also receded in sympathy. Production of sugar has been going ahead in all the States.

The Bihar Government

INDIA STEAMSHIP COMPANY, LIMITED

FREIGHT EARNINGS RISE—CASH RESOURCES SATISFACTORY

SIR A. RAMASWAMI MUDALIAR SURVEYS SHIPPING PROBLEMS

ADDRESSING the Shareholders of the India Steamship Company, Limited, at its Annual General Meeting held at Calcutta on 10th December, 1953, Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon), Chairman of the Company, said:

"GENTLEMEN,

"The audited accounts and Directors' report for the period ended 31st March, 1953 has been in your possession for some time. With your permission, I shall take them as read.

Trading Experience

"It will be noticed from the Directors' report that the freight earned during the year is Rs. 3,93,00,000, the highest freight earned so far. Conditions during the year were not, however, uniform, the rates of freight, as well as charges for bunkering, having varied during the course of the year. The turnround of the ships took a longer time, owing to delays and detentions at some of the ports, resulting in the time taken for a round voyage by a ship being longer than estimated. This, in its turn, presented a serious problem to the operation department in its attempts to keep a regular schedule of service at both ends of the voyage. The expenditure under salaries and wages and under bunkering charges shows an increase over the former year and is due to rates of pay being revised in some cases and to the normal increase due to the earning of increments. Insurance premium also was higher, as, owing to the prevailing cost of ships, the amount for which the fleet was insured had to be raised. It is gratifying to note that, in spite of all these factors, the Company has made a gross profit of Rs. 59,00,000.

Financial Position

"In accordance with the decision of the Board of Directors which was announced at the last annual general meeting, the debentures amounting to Rs. 25,00,000 have been fully redeemed. The Directors have provided the normal depreciation of Rs. 23,00,000 and have transferred a sum of Rs. 18,00,000 to the general reserve bringing up that reserve to Rs. 50,00,000. The cash resources of your Company are, therefore, in a satisfactory position.

Coastal Trading

"In my last address, I referred to the part which your Company desired to play in the coastal trade of the country. We had put one of the ocean-going vessels—the *Indian Importer*—on the coastal trade, but your Directors felt that there was need for putting a smaller vessel also on the coast and the nearby trades and, therefore, taking advantage of the Government's policy of offering loans for the purchase of vessels, both coastal and ocean-going, your Directors have purchased a vessel built in 1952 and christened it the *Indian Commerce*. This vessel is now regularly plying on the coast of India and may also be utilised for trade between India/Burma or Ceylon.

Delays at Ports

"The delays caused at some ports in getting berths and in discharging or loading freight has been referred to in previous addresses. The 'go-slow' tactics adopted by dock labour has been causing serious concern to all shipping companies. An additional factor which has recently emerged and which is equally disturbing, owing to its effect in delaying ships, is the dispute about the number of gangs that must be employed for a particular load. I do not wish to go into the details of this question, as I understand that the subject has been referred to the Government. I can only say that your Company, along with others, desires to co-operate in providing all reasonable salaries and amenities to labour, but wishes also to emphasise that the labourer must be worthy of his hire and that he should do that amount of work which may reasonably be expected of him.

Shipping Industry

"I referred to the sympathetic attitude of the Minister for Transport and of all the officers concerned with shipping in my last address. I am glad to report, as a redeeming feature in the situation, that this sympathy continues to be extended and that the Minister for Transport, the Secretary of the Ministry, the Director-General of Shipping and other officers connected with the Ministry have shown a deep and abiding interest in the progress and welfare of Indian shipping and in its expansion.

Loan for Development of Shipping

"The Five-year Plan has stated that there should be at least 600,000 tons of Indian shipping owned and operated by Indian shipping companies by the end of the period of the Plan, that is, by the end of 1955-56. The present tonnage of Indian shipping is about 400,000 tons and it is obvious that, if this has to be increased by another 200,000 tons within the next two years, both shipowners and Government have to play their part in obtaining this result. At a recent meeting of the Consultative Committee on Shipping held at Bombay, the Minister for Transport exhorted the Indian shipping companies to make progress in adding to their fleet and increasing the Indian tonnage and stated that the Government would consider the grant of liberal loans for the purpose. Your Company had taken advantage of this policy of the Government at an earlier stage and had bought the vessel the *Indian Commerce*. It is now negotiating for the construction of one vessel at least and perhaps two vessels of 10,000 tons d.w., equipped in the most modern way, at one of the Continental shipbuilding yards and is in communication with the Government of India for the grant of an appropriate loan on suitable terms. We hope to have the Government of India's approval for the loan very shortly, in which case the vessel or vessels will, it is expected, be delivered by the end of 1954 or very early in 1955. It would be clear from what I have stated already about the operation difficulties with the fleet which we now possess that it has become an acute necessity to add to our fleet and to maintain a regularity of service, if we have to fulfil the requirements of the shippers at either end.

Hindusthan Shipbuilding Yard

"As you are aware, the Government of India has taken over the Shipbuilding Yard at Vizagapatam and with expert foreign advice and assistance is engaged in expanding and improving the Yard. It is expected that the Yard will be in a position to build shortly not only coastal vessels but ocean-going vessels of the requisite tonnage. The need for supporting the shipbuilding industry in the country hardly requires emphasising. Indian shipping companies are naturally expected to place orders for ships at the Vizagapatam Shipbuilding Yard. Your Company desires to play its part in promoting this industry and has, therefore, agreed to place orders for further ships at this Yard. It is expected that such orders as are placed will be completed by the Yard in 1956 or 1957.

Competition

"The boom period which prevailed in 1951 and in the early part of 1952, as much in shipping as in other industries, has practically ended and shipping companies are facing severe competition. This competition is not always fair, notwithstanding the rules of the Conference and, in addition, where newcomers are concerned with their small fleet and the consequent infrequency of service, advantage is inevitably taken by owners of some large fleets. There is all the more reason why your fleet should be strengthened and the number of vessels on the India/U.K./Continent trade increased. The Board of Directors are well aware of this fact and are taking all possible steps to meet the situation, and I trust I shall be in a position at the next meeting to place before you concrete facts about substantial additions to your fleet.

Conference Membership

"I referred on the last occasion to the applications that your Company has made for the privilege of becoming a member of certain other Conferences. These were the Colombo/U.K. Conference, the U.K./Colombo Conference, the Colombo/Continent Conference, the U.K./Port Sudan Conference and the U.K./Aden Conference. It will be noticed that all these conferences relate to ports which are on the route from India to the U.K. or Continent, ports at which normally the Indian shipping lines have to call on their way to or from the U.K. or the Continent. I deeply regret to state that we have made no progress in the matter of admission as members to any of these Conferences. I feel that the time has come when a plain statement of facts should be placed before the public in this country and before our shipping colleagues in the U.K., in particular. The facts are these. The Indian shipping companies have been allowed into Conferences which regulate the trade only between Indian ports and ports in the U.K. or on the Continent. They are not allowed into any Conference which regulates the trade between a wayside port on the normal route of Indian shipping companies and any port in the U.K. It will be crystal clear that, where trade emanates in India and is destined for any port in the U.K. or emanates from the U.K. with India as its destination, it would hardly have been possible even for the powerful U.K. shipping lines to have refused membership to the Indian shipping companies. Indeed, even here, membership was not allowed to the Indian shipping companies till a guarantee was given that a certain number of ships would be regularly plying on this trade. But, notwithstanding the fact that India is a member of the British Commonwealth, the U.K. lines have consistently refused to allow the Indian lines membership of any Conference where the trade regulated does not emanate from an Indian port but emanating from a wayside port ends in a U.K. port or emanates from the U.K. and ends in a wayside port. The practical picture which arises out of this situation is as follows.

Change in Attitude Urged

"Indian shipping lines can carry freight from an Indian port to Colombo, Aden, etc., but, after discharging that freight, they cannot carry further freight from such ports to any of the ports in the U.K. and, therefore, will have to go in ballast to that extent. Conversely, from the U.K., Indian shipping can only carry freight to India and Pakistan and cannot carry any freight to the wayside ports, including Port Sudan, Aden and Colombo. I can only hope that the shipping companies, particularly those of the U.K., will review this situation and abandon an absolutely untenable, and almost an unfriendly, attitude and trust that it will not be the painful duty of Indian shipping companies to break into a Conference arrangement by which certain interests are safely entrenched.

I.M.C.O.

"I have on more than one occasion referred to the Organisation which is contemplated for regulating maritime affairs and to the suggestion that the Government of India should seriously consider the desirability of becoming a member of the International Maritime Consultative Organisation. At long last, it looks as if this Organisation will come into existence during the course of the next year, as the main difficulty of securing membership of seven countries with more than one million tonnage seems to have been resolved. Whether India should become a member and the practical steps it should take before accepting such membership are matters which are under consideration of Government. It is my firm conviction that India will stand to lose much, even if she does not gain anything, by not becoming a member of this Organisation at the appropriate time.

State Intervention

"It has become the fashion at annual conferences of the International Chambers of Commerce and of the International Shipping Federation for certain members who are safely entrenched in trade and in shipping particularly to raise the question of 'flag discrimination' and to suggest that certain Governments have resorted to them by certain practices. The members who raise these questions overlook the fact that the practices complained of and many other practices far more serious and restrictive were resorted to by their own Governments in the not distant past and that these practices really enabled the shipping industries of such countries to attain their present position. Far more important and inexplicable is the fact that no reference is made to the restrictive business practices which are resorted to by some of the shipping companies which have established themselves in the past.

"Having attended some of these Conferences and having followed closely the attitude of the Government of India in the bureaucratic past as well as in the present Republican Democracy, the representatives of Indian shipping companies can certainly state that the Indian Government has been so scrupulously fair, so concerned about allegations of 'flag discrimination' that it has ignored, rather than furthered, the primary claims of Indian shipping, claims which are recognised directly or indirectly, by almost every Government in the world interested in its national shipping. The loan that the Government of India has promised for developing the Indian fleet will not, I believe, be called a case of 'flag discrimination' by any shipping company of any nation, as, in the recent past, practically every Government has given liberal loans to its shipping companies. Indeed, it is an open secret that some Governments at least have no intention of requiring these loans to be repaid.

Bilateral Treaties

"In the International Conferences referred to above, the bilateral treaties of commerce which the Government of India has sometimes entered into with different countries have sometimes come in for criticism. A clause in such treaties speaks of each Government undertaking to help the national shipping of the other Government as far as possible. That this clause has practically remained a dead letter and that no way has yet been found whereby the promises held out in the signed treaties can be translated into practice does not disturb the critics. It is only further proof of the fact that vested interests will go to any length while maintaining their past position and, in fact, trying to improve on it by various methods of indirect discrimination, to cry out before they are hurt, and to condemn Governments and shipping companies without the slightest justification.

"I have always held the view that the mercantile fleet of various countries should be allowed to develop in their own way without restrictions or interventions by Government, but I have also held the view that the phrase 'freedom of the seas' should not be a pious expression but should have a purpose and a meaning which no one can cavil at. The more I see of 'restrictive business practices' by well established shipping concerns, the longer I follow the proceedings of Conference Lines and the manner in which applications for membership are dealt with, the more I am convinced that it is only the strength of a powerful fleet backed up by its Government, which seems to influence some at least of the members of a Conference to accept proposals made by such a fleet. It is a sad reflection that strength only pays and justice or fair play are sometimes secondary considerations in arriving at decisions. I trust that the lessons that Indian shipping companies have learned during the past few years will be taken note of by the Government of India and I trust even more that Conferences will even now adopt attitudes which will make it unnecessary for national shipping concerns to invoke, directly or indirectly, the intervention of their respective Governments.

Industrial Development and Shipping

"India is now in the process of vast industrial development in both the public and private sectors. So far as the public sector is concerned, the Government has undertaken the starting and development of certain essential industries. The huge steel factory that is intended to be set up at a cost of nearly Rs. 80 crores, the integrated coach building factory near Madras, the explosives factory shortly to come into existence, the three oil refineries which will refine crude oil and other Central and State concerns which are under execution or are being planned will involve the import of plant, machinery and other materials in vast quantities. I trust the Government has paid some attention to the means of transport to be employed for the carriage of the vast amount of materials, plant and machinery which will have to be imported into this country in connection with these many schemes. Here is an opportunity for the Government of India, without any reference to trade clauses, to provide that Indian shipping gets a fair share and not a monopoly of the freight which has to be imported in connection with schemes which the Government of India is finding the money for.

Tribute

"I have already referred to the special interest that the Minister of Transport has shown in the progress of Indian shipping and in additions to the Indian fleet. The Director-General of Shipping and his assistants have been always co-operative and I should like to thank them all for the advice and assistance that they have given to your Company from time to time. I should also like to refer to the co-operation that has been extended to your Company as, indeed, to other companies, by the Port Trust authorities at various ports and, in particular, at the port of Calcutta. To the shippers who have patronised us both here and overseas and who have been loyal to us throughout, we are extremely grateful. But for their consistent support which I hope will be copied by other shippers, we could not have made the progress shown in this report.

"It is no conventional language that I am indulging in when I state that I should like, on your behalf and on behalf of the Directors, to convey our thanks to the executive and supervisory staff and to all employees of the Company, both ashore and afloat for their good and enthusiastic work throughout the year.

"I shall now be pleased to answer any question that the shareholders may wish to ask regarding the Accounts."

EXPORT DUTY ON COARSE CLOTH

ABOLITION URGED

(By M. V. SITARAM)

"EXPORT More," "Export or Perish," these and other similar slogans have been in vogue for some time in order to see that more goods are exported and thus the country is made richer. Towards the promotion of exports, various encouraging statements by Central and State Government Ministers, industrialists and representatives of trade have fed the Press sufficiently and raised hopes among traders. The recent statement of the Commerce and Industry Minister, made at the Export Advisory Council meeting, is a step forward in giving encouragement to the trade. The suggestion of the Minister to establish an Export Promotion Organisation on a permanent basis to conduct market research, depute trade representatives to important markets, appoint correspondents in less important ones and also to take steps to institute systems of inspection on a voluntary or compulsory basis is really encouraging.

The Commerce and Industry Minister has advised the trading and industrial interests to set up appropriate organisations to do propaganda, conduct market research, promote standardisation and quality control and do a lot of other things that are necessary to persuade foreign buyers to buy our goods. Although the advice is sound and wholesome, it is to be considered whether any amount of propaganda and/or persuasion will have any effect when our prices do not compete favourably in the foreign markets. Let us examine the position of textiles. With the high cost of manufacture of Indian cloth, together with the export duty, it is hardly possible to create a sellers' market. The export duty on coarse cloth still persists and this has to be removed to make it attractive to buyers in the countries of the Indian Ocean which are our main purchasers of coarse varieties.

Price Factor

When there is huge accumulation of stocks, it is but natural that one tries to unload them when there is offer to buy. In the face of such huge accumulation of stocks, it is unnatural for the trade to put up prices directly after reductions in duties are announced. It will also be recalled that the Government removed the export duty on medium varieties when the mills threatened to close down one shift owing to increasing accumulation of stocks in the absence of perceptible offtake. Price is the main obstacle to the promotion of textile exports and removal of export duty is the way out. In a country dependent upon export of primary products for its external balance of trade, taxation of exportable products must be such that these are not priced out of the markets, whether by direct internal taxation or by export duties. Export duties destroy the competitive power to sell in world markets. The levy of an export duty on commodities which enjoy a sort of monopoly in the source of supply causes overseas buyers to look for substitutes or to seek alternative sources of supply. India's jute trade had to face a similar situation.

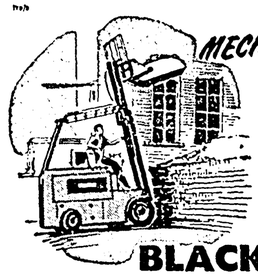
An examination of the shipment figures of textiles of each of the major participants of the Buxton Conference and the targets assigned to them gives a clear picture of the prevailing situation. Japan, which was assigned a target of 1,100 million yards, shipped 470.92 million yards during the first seven months of the current year. India, with a target of 1,000 million yards, hopes to reach somewhere around 700 million yards according to official estimates. Britain, with a target of 1,350 million yards, has shipped 409.66 million yards during the eight months ended August. The record is hopeful and it should be the business of the trade, with Governments' sympathy and 'nursing,' to see that the markets so far covered is maintained, the markets lost are regained and the target fixed is reached.

(Continued in previous column)

With regard to the continuance of the export duties on coarse cloth, it is argued that India has a great advantage in growing its own cotton and that Japan—the major competitor to India in these varieties—has to import its raw material. It is felt in Government circles that, as long as Indian cotton prices remain at current levels, and as long as Japan has to import its cotton, the possibility of India's markets for coarse cloth being seriously affected seems remote. If the cheap Japanese labour, cheap power and all-round cheap cost of production in Japan, as also the fact that accumulation of coarse and medium varieties is daily mounting up in the Indian mills which necessitated the mills to give notice to the Government to close down one shift, are taken into consideration, it should be clear that export duties work as deterrent to the export move.

Commenting on the continuance of export duties, the *Hindu* of Madras states: "In a period of declining prices and the turning of overseas markets in the buyers' favour, export duties may have a crippling effect on trade. As a mode of raising revenue, export duties are generally out of favour, except in regard to a very limited number of commodities in which a country may have a quasi-monopoly. The Commerce Minister referred to the fact that removal of export duties resulted sometimes in the internal prices going up. This might happen—and to the extent it does the Exchequer might ultimately benefit—but that is no ground for not taking a step the purpose of which is to leave sufficient elbow room to exporters to counter conditions in foreign markets."

If the markets that are still with us are to be retained, if the markets already lost are to be regained, if the target fixed at the Buxton Conference is to be reached, and if our country is to unload all the textiles that are now lying accumulated in the mills and thus create less unemployment, then the export duty on coarse varieties, which works as a handicap, should be removed.



MECHANISE YOUR HANDLING!

STACATRUC fork-lift fitted with "STACASCOOP". Suitable for handling all forms of loose material. There is a STACATRUC accessory to convert fork-lifts into efficient handling machines for any kind of goods. For all handling problems — contact:

QUESTION HOUR IN PARLIAMENT

Foreign Firms

A SUM of Rs. 11.88 crores was remitted abroad as profits by foreign firms and companies during the period January to August, 1953. This represented an increase of Rs. 3.78 crores over the corresponding period in 1952. The question of ensuring that the profits of foreign firms and companies in India are ploughed back in India is left to the discretion of the companies concerned, though the Government of India tries to create conditions favourable for ploughing back. The Government has given a guarantee from the exchange point of view that anyone who wants to remit profits abroad will be permitted to do so. Only by leaving the doors open can we ensure that a large part will be ploughed back as had happened in the past.

Aid Under Colombo Plan

Upto 30th June, 1953, India received assistance by way of training facilities abroad for 352 Indian candidates, services of 35 foreign experts and equipment worth £31,074 under the Technical Co-operation Scheme of the Colombo Plan.

—*Parliamentary Secretary to the Finance Minister*

Income-tax Arrears

The arrears of demand (income-tax) outstanding collection in the whole of India as on 30th September, 1953, amounted to Rs. 184.14 crores. Out of the arrears, a sum of Rs. 110.24 crores represents the arrears out of the demand for 1951-52 and earlier years, Rs. 43.51 crores out of demand for 1952-53 and Rs. 30.36 crores out of demand for 1953-54. Out of the total arrears, Rs. 26.33 crores represent the amounts pending settlement of double income-tax and other relief claims, Rs. 9.64 crores due from persons who have left India and have no assets in India, Rs. 4.14 crores due from companies under liquidation and Rs. 53.82 crores relating to amounts covered by certificates issued to collectors, but excluding earlier categories. A sum of Rs. 18.49 crores relates to amounts pending disposal of appeals and Rs. 3.76 crores represent amounts, in respect of which penalties under section 46 of the Income-tax Act have been levied (but excluding amounts due in earlier categories). A sum of Rs. 4.87 crores is considered irrecoverable for other reasons (for example, persons in India who have no assets in India) while a sum of Rs. 4.49 crores probably irrecoverable. Out of the balance recoverable, Rs. 39.47 crores represent amounts fallen due before 30th September, 1953, and Rs. 25.09 crores represent amounts not fallen due before that date.

Cost of Living Index

The question of compiling an all-India middle class index and later integrating it with the present all-India working class cost of living index is under active consideration in consultation with the Central Statistical Organisation. An all-India working class cost of living index with base 1944 is being regularly published since the report of the Dearness Allowance Committee.

Training in Estate Duty Work

No Income-tax Officers have been deputed to England for technical training in Estate Duty work. The Government has, however, under consideration a proposal to send a few selected officers to the United Kingdom for technical training in Estate Duty work. The likely number is two Assistant Commissioners and four Income-tax Officers. They are being selected on the basis of their experience and suitability for the particular kind of work.

—*Deputy Finance Minister*

Burnpur Strike

The strike and lockout in the Indian Iron and Steel Co. during 1953 resulted in a loss of about 88,000 tons of steel worth Rs. 4 crores.

Concession to Textile Industry

As a result of the recent concessions given by the Government to the textile industry, cloth stocks have been reduced from 420,000 bales at that time to 234,000 bales at the end of last week. In Bombay particularly, stocks are less than three weeks' production now.

Apprentices Act

The Government is considering proposals to amend the Apprentices Act of 1850 so as to make training of craftsmen an integral part of the activity of every industrial concern. The initiative in the matter has been taken by the Madras Government which wants to amend the Act itself, but the Central Government feels it more appropriate, if it introduced amending legislation on an all-India scale. The Government is consulting various State Governments and is also awaiting the report of the Shiva Rao Committee on employment exchanges.

—*Minister for Commerce and Industry*

Sample Surveys to Estimate Rice Production

Sample surveys for estimating production of rice are being carried out in the main rice-producing States (except Orissa), but the results of such surveys will not be available before February or March, 1954. The present indications, however, are that the rice crop this year will be much better than last year. There has been a fall in the prices of rice in West Bengal, Madhya Pradesh, Madras and Andhra during the last three months, the extent of fall ranging roughly between Re. 1 and Rs. 4 per maund in the four States. There has been a substantial drop in the prices of rice in certain areas during the last few months, and it is anticipated that this falling tendency in the prices will persist during the next few months of the harvest season. The Government is watching the situation very carefully. In case it is found that the prices in any area fall below the economic level, suitable measures will be taken to give necessary support to the price-level, so as to ensure reasonable prices for the producers. The internal surplus of rice this year is expected to be sufficient to meet the requirements of the deficit States, but it may not be possible to purchase any substantial quantity of rice internally to build up a central reserve.

Census of Land Holdings

A letter will be sent shortly to all States regarding the lines on which they should conduct a census of land holdings. The object will be to collect such data relating to holdings and cultivation of agricultural land as well enable each State Government to determine the maximum area which an individual might hold.

Reserve Surplus of Foodgrains

The reserve surplus of foodgrains in the current year is expected to be about 1,600,000 tons, including rice, wheat and other foodgrains. No rice will be imported except small quantities which private trade may import under the relaxations recently allowed, or the rice that the Government may import for building up a central reserve. As regards wheat, the Centre and States hold large stocks and there will be no need to import more than the 1 million tons wheat quota under the International Wheat Agreement.

—*Deputy Food Minister*

Second Five-year Plan

The objectives in the terms of reference to the Planning Commission for the first Five-year Plan will mostly stand for the second Five-year Plan too. If at any stage the Government felt that fresh terms should be issued to the Commission, it will be done. So far, the main step taken towards the formulation of the second Five-year Plan is the appointment recently of an advisory committee on irrigation and power projects. The committee will examine various proposals from the technical, financial and economic aspects and will help ensure that all projects are fully investigated. There has also been preliminary consideration of priorities and man-power requirements for the second Plan. The question of laying down fresh terms of reference to the Committee has not received consideration so far. A proposal to reorganise the present planning machinery so as to make it democratic and enable planning from the bottom is under consideration. Some discussion on this subject took place at the recent meeting of the National Development Council.

—*Minister for Planning*

Employment Schemes

Replies have been received from all State Governments, except Jammu and Kashmir, to the Central Government's proposal for the removal of unemployment within a stipulated period. The State schemes are being considered and a statement will be laid on the table after decisions have been reached. It will take about two months to come to a decision. The State schemes include expansion of road construction programme, small-scale and cottage industries and agricultural expansion. About Rs. 46 crores have been provided for rehabilitation of displaced persons in townships, Rs. 10 crores for road construction and Rs. 40 crores for irrigation projects in scarcity areas.

Loan to Mysore

It is proposed to give to the Government of Mysore loan assistance to the extent of Rs. 3 crores on the basis of an agreed programme for the construction of the first stage of the Lakkavalli Project. Details will be settled on receipt of the proposed programme from the State Government.

—*Deputy Minister for Irrigation and Planning*

Development of Ports

A total of Rs. 14.70 crores has been set apart as loans in the Five-year Plan for the development of major ports in India. Of this, Calcutta will receive Rs. 6.59 crores, Bombay Rs. 4.17 crores, Madras Rs. 3 crores and Cochin Rs. 93 lakhs. The ports have incurred some expenditure from their own resources, but no loans out of the allotment have so far been drawn.

Manufacture of Salt

Steps to ensure that salt produced by non-licensees came up to the standards prescribed by Government are under the active consideration of Government. The Government is going thoroughly into the question to decide the future policy in regard to manufacture of salt. Various State Governments have been consulted and their opinions are awaited.

—*Minister for Production*

H.T. 2 Planes

The H.T. 2 type of aeroplane manufactured in the Hindustan Aircraft factory is expected to cost approximately Rs. 73,000, excluding the price of the radio equipment. No final price has yet been fixed. While the production is now 60 a year, it can be increased to 120. It is proposed to offer them for sale abroad after meeting the country's requirements.

OFF THE RECORD

(*By "ROVER"*)

LOOKING back over the twelve months which have passed, since I wrote my last piece for this feature for the 1952 Annual Review Number, I see little evidence for taking a hopeful and reassuring view of the future. This might sound shockingly surprising to many. A few loose coins in one's trouser pocket can be made to produce a sound which is pleasant to the ears. The possession of these, however, constitutes no sign of great wealth. Examined individually, some of our economic activities during the year might create an illusion of health and well-being. The monsoon for once has been merciful. Crops are good and many of the irksome and annoying restrictions regarding food have been removed. Production in several of the important industries has increased. The share bazaars and other speculative markets are ruling strong. Yes, we have plenty of petty coins which jingle pleasantly. But they would not add up to more than a few rupees and would not buy more than a meal or two for us. They would not take us far beyond the New Year.

Behind this seeming masque of returning prosperity and deep below the surface of smiling plenty, new and destructive forces are gathering, which, though they may not overflow one day like a volcanic eruption, threaten to undermine and corrode the whole socio-economic structure slowly and gradually from within, so that it might collapse one day by its own dead weight and inertia. This is supposed to be a festive season and I fully realise the incongruity of my dismal forebodings. But the imaginary point of time which marks the end of a year and the beginning of a new one is known, apart from the good cheer and new hope which it brings to many a mind, to induce a reflective and receptive mood and a degree of sensitivity which it lacks at other times. I have no desire to make a secret of my intention to profit by this mood in which many thoughtful and serious minds are cast at the time of the year, by revealing to them some of the fears which weigh on me heavily and getting them not only to share these, but to seek remedies which will save our economy from the danger of early disintegration to which it is exposed to-day.

There is enough happening outside our country to-day to make us apprehensive regarding our future and to eschew our internal differences and to close our ranks. Strange as it may seem, fear is driving mankind to new follies, which can bring the dreaded disaster only earlier. Racial differences are being whipped up into passions, which might start a conflagration enveloping the whole earth in it. The cauldron of Korea might be on the boil at any moment. It would not take much to set the inflammable Middle East ablaze any moment. The proposed entanglement of Pakistan in the cold but no less fierce war is bound to bring unforeseen economic and political complications in the countries of South-East Asia and create additional hardships for the common man in this region whose living standards are woefully low.

But serious as these are, it is not these things that I want to write about at present. Adversity, especially danger emanating from forces beyond one's control, often has the effect of eliminating petty differences of opinions and submerging selfish and personal interests into the need for closing one's ranks. If there be genuine love for our country amongst our people, if the patriotism, about which our politicians have been so generous in display in their wordy speeches and statements, has a sound basis in selflessness, if we deserve to survive as a nation, these external dangers to which we are exposed today would certainly serve as a cementing force and help us to unite in common dedication to the country and the cause of peace which we profess to love. Those who survive a storm are often left battered in bodies but strengthened and buttressed in spirit.

What has depressed me so heavily in the course of this retrospection is the series of reactions set up in the minds and behaviour of our public men, who control the economic destiny of the country, by the emergence of unemployment on a large scale during 1953. This is the one single factor which has overshadowed the whole of this economy and started false trains of thought, which, if persisted in, might wreck it beyond repairs. This running sore of unemployment is no new thing. It has always been there, causing a pain under the skin and a swelling above it. The sepsis has been there in the organism, coursing its way through the blood stream. It has now found a weak spot and emerged as a symptom, drawing attention to the poison which the system has generated in the form of a boil which has burst open.

There have been similar outlets on the moral side also for some time, which should have opened our eyes to the presence of this disease. The increased incidence of crime, crimes of violence, lust and greed, during the last six or seven years, the sudden and otherwise unexplained lowering of the moral standards were the earlier signs of the state of degradation and desperation induced by a lack of gainful employment for a large number of people and the systematic lowering of living standards for large classes of semi-educated people which results from it. The quacks amongst our political pundits, some of whom attained positions of great influence and authority because of the vast opportunities thrown up by a sudden change in the political set-up, failing to understand the genesis of this degeneration, applied remedies, with an assurance which few genuine experts could have felt and which could spring only from crass ignorance, which, instead of attacking the cause of the disease, aggravated it. Whatever other harm some of the desperate moral reforms introduced by some of our State Governments might have caused, they certainly did succeed in closing up some of the avenues of employment.

Unemployment and underemployment have always been the twin evils of our economy. This has been a feature of it for such a long time that our whole social organisation has come to be moulded to suit the conditions created by this aspect of our economy. One of the reasons which has brought this disease prominently to our attention, apart from the political capital which can be made out of it by ambitious but unemployed public men, is the inevitable breakdown of the joint family and the caste system, which more or less indifferently shouldered the burden arising from it. But for World War II and the sudden impetus it gave to economic expansion and the increase in the avenues of employment in other directions also, conditions in this respect would have been more distressing to-day.

In fact, those who have long memories and still remember the depression which assailed us in the thirties, which destroyed opportunities for gainful work even in agriculture unlike to-day, can easily recall the appalling conditions of those days. And it was no better even in the earlier decades which were not marked either by famine or marked economic depression. We have always had more people than we could find regular work for. I still remember as a child the scramble I witnessed about fifty years ago amongst able-bodied men in a big village for a temporary official, full-time job which carried the magnificent salary of five rupees a month! The pathos of that grim struggle is something which I shall never forget.

I do not propose here to ride my hobby horse and inflict my views about restricting the rise in our population strictly in proportion to the economic expansion which we are in a position to secure within a given period. My purpose at present is to examine some of the reactions to our new awareness of growing unemployment in the country. This unemployment has not resulted from a sudden contraction of our economy. Nowhere have people been thrown out of employment in large numbers by the closing of factories or of banks, offices, shops, godowns, etc. There are many more people employed in industry, commerce, agriculture, domestic service, transport services and Government departments than at any other time in the past. Most of those who are without work to-day are so not because they have lost their employment, but because they have never been able to find it. Nobody could claim with any show of logic or justice that the ranks of the unemployed are made up mostly of those thrown out of their jobs or because old hands when they die or retire are not being replaced by an almost equal number of new hands. Our primary concern in the circumstances, therefore, should be not for those already in receipt of wages or salaries, but for those who are denied the opportunity of earning their living.

And yet, perversely, as it seems to me, some of our wisest rulers are trying to solve the problems of unemployment by concentrating their energies not on some dynamic and creative plan for enlarging opportunities for millions, who are without any visible means of subsistence, but on the purely punitive and police action of seeing that the wicked employers are obstructed in their fell designs to discharge a few hundreds here and a few score there. This grotesque vigil extends even to concerns which have come to grief and where some hands are rendered superfluous precisely because of the Government's own policies in placing restrictions on outlay. I have watched children on the beach trying to stem the incoming tide of the ocean by throwing up a six-inch high dam of shifting sands. Their effort, though equally futile, is at least amusing to witness. If it were not fraught with tragic consequences both for industry and for those without work, we might derive some entertainment from these juvenile activities of our politicians.

No business organisation could be made to carry a bigger complement of workers than it actually needs, without sacrificing efficiency and without immediate weakening and future disaster. Any thoughtless effort to save a few men from being retrenched to-day in this manner can only end, not only in discouraging employers from launching any experiments for expansion, but in jeopardising the livelihood of many more, who would otherwise have been assured continued employment by a timely retrenchment of but a few. Besides, these petty politicians are in no wise naive as the children playing on the seashore. They know very well that neither the problem of unemployment is going to be solved nor the plight of those without work likely to be lessened, by preventing justifiable retrenchment. They, however, persist in this perverse course, because, while creative and positive work involves sweat and toil and taking of risks and responsibility, harassing of industry in this manner brings them all the satisfaction of having performed a public duty and won the support of the unemployed and the employed for the next election.

This misguided activity does not stop merely with the so-called friends of workers playing this game of safeguarding the security of workers already in employment. Apart from their utter neglect of undertaking anything constructive for securing opportunities of employment for millions who are forced by circumstances to be idle, except by way of making fatuous suggestions for disallowing imports of new machinery and prohibiting use of improved machinery which alone can secure the much needed expansion, they are actually busy boosting up cost of production by compelling employers to give concessions and amenities to workers, at a time when everything possible should be done to increase demand for and production of goods. The Government has already raised this cost by its ruinous policies of taxation and controls to a point where it has begun to tell on the rate of expansion. If, after reducing the return on capital by various devices to a figure which has ceased to draw forth enough capital for natural expansion, the workers are to be continuously egged on to make further demands, and if technical improvements are to be tabooed lest they should reduce the number of men employed on a job, there could be no hope of prices being reduced.

If prices are not reduced, demand cannot increase either at home or abroad. And without the possibility of an increased demand, it would be idle to look for any expansion at least along the line of established industries. There could thus be no future for the additional millions, who attain the age of employment every year, so long as our economy remains arrested within this vicious circle. We all agree that half a loaf is better than no bread. But, unless those already in jobs are advised by their own leaders not to insist on a whole loaf, so that the rest who are not so lucky as themselves can have a chance of having the other half, it is useless for these leaders to pretend that they have the interest of the un-

employed at heart or that they are helping their cause in any way. If the unemployed have to blame anybody for at least a part of their plight to-day, it is clearly not the employers but the Governments and those securely employed, who are creating conditions against industrial and business expansion.

The very mention of unemployment to-day is capable of raising deep-seated but slumbering prejudices, passions and hatreds. The sense of guilt, which every politician feels subconsciously for allowing this evil to grow unchecked during wasted years when he had both the power and the opportunity to do something to mitigate its effects and to minimise its toll, drives him desperately to cloak these prejudices and passions in terms of high-sounding principles of abolishing inequalities of income and securing social justice or favouring 'a human' as against an economic approach to problems which perplex and plague us. No sooner a reference is made to the misfortune of the millions of unemployed, all eyes in the politicial world are turned instinctively to the industrialists and the employers, as if they were responsible for the prolonged agony undergone by these unfortunate souls. With the economy of the country as it stands to-day, the unemployed constitute a national problem and by no stretch of imagination or moral quibble could we place the responsibility for it on commerce or industry. If anything, the private sector has done more towards absorbing surplus workers by its phenomenal progress during the last half century than either agriculture or the agencies of employment directly controlled by the Government. It has done this, in spite of every possible discouragement by an alien Government and positive obstructions placed by our own Governments during the short period after independence. Instead of being grateful to it for what it has done and what it is still striving to do, albeit the heavy yoke placed on its neck, and encouraging it by word and deed to do more, we have become so cantankerous as to frown upon it for not doing more.

The reason behind this unjust and illogical attitude is not so much our concern for the out-of-work as our envy and hatred of the few, who have managed, in the course of bringing about industrial develoment and organising business enterprise, to enrich themselves and the ostentatious manner in which some of these are splashing about their wealth. We have developed this hysteria of our hatred for the rich to a point where we would rather be satisfied with a lower rate of progress or even a setting back of the clock, and the increased poverty and the greater distress flowing from it, than suffer a few people to amass wealth in the process of building up new business or enlarging existing units. We are not exactly a nation of sportsmen, but some hidden and unhealthy streak in our character is goading us all to engage ourselves in baiting and hunting the rich as a national sport, perhaps, in an effort to drown our pangs of poverty, misery and disappointment. It is quite an exciting sport and now that it has become fashionable, most of us would soon be ready to join in this pastime.

Personally, I have no objection to this, if it affords even a temporary relief and respite to our sorely tried people. In the first place, millionaires, as a class, are not very attractive specimens of humanity, though I have found some individually to be quite human. The only question which troubles me is whether we can afford to indulge in this frivolity, favoured by many of our progressive politicians, at a time when we are sorely beset by great difficulties. I also ask myself if the extermination of this species at this time will secure social well-being or result only in increasing our perplexities and pressures. I grant that the wealthy millowner, or his counterpart in any other industry, has a knack of absorbing large sums of money from anything he undertakes. But I also find, from my perusal of the last hundred years' economic history of our country, that he does not exactly build up his wealth by robbing people of what they have, but by enabling large numbers to earn more. He does this by launching new enterprise and organising them successfully and thus creating new values and expanding credit and production. Without this expansion, which we have witnessed especially during the last half century, life for millions of us to-day would have been even poorer than it is to-day, just in the same manner as in Iran, Afganistan or Indo-China. There is no possibility of the State replacing him completely to-day, except by way of a bloody revolution, which would, while destroying the few rich, also destroy much that we hold as of greater value in our national life.

I have no doubt that, if we go seriously about it and in right earnest, we might succeed within the next few years in eliminating this breed. But now when we have only succeeded in frightening him and creating a suspicion in his mind about his future, we already see the effect in the sphere of industry and commerce. If we hunt him down to his lair, the only result would be that confidence, which is only lacking to-day, will be destroyed, and the economic edifice, which to-day shelters millions, will begin to crumble perceptibly. The volume of unemployment would in no way be decreased but multiplied possibly tenfold. Living standards would slump to those obtaining to-day in some of the less developed and more primitive countries. When we are reduced to this sorry state of affairs, the fact that we have achieved a greater equality of incomes (which incidently would be lower than even the lowest income to-day) and that we have no rich men amongst us would be a poor consolation for the actual and potential loss suffered by the country. We are already taking a good bit of the wealth which the millionaires make for themselves in his pursuit of private enterprise by way of taxation and the path of wisdom lies, if not in encouraging them, at least in making use of them so long as our economy needs them.—*All Rights Reserved.*

U.S. LOCOMOTIVES FOR INDIA

India's railway system will receive 100 new locomotives and 3,000 new freight cars as a part of United States economic aid to India during 1954, under an agreement signed in New Delhi on 24th December by representatives of the Government of India and the U.S. Technical Co-operation Mission. The contract calls for expenditure of $20 million of U.S. funds and Rs. 3.2 crores. The project is part of the planned rehabilitation of Indian railways under the Five-year Plan. United States funds will go for the purchase of the locomotives and cars outside India. Rupee costs will be used for ocean transportation to India, handling costs, and assembly of freight cars imported under the agreement.

Under the five-year development plan, India has already placed orders for 769 locomotives and will place orders for 500 more during the last two years of the plan. These are to be paid for in resources available to the railways themselves. Similarly, orders have been placed for 32,293 new freight cars already and 29,000 more will be ordered in the last two years of the plan.

By March, 1956, however, some 3,600 locomotives will be over 40 years old. Many of these were bought before World War I and are already uneconomical to operate. It is estimated that, once the accumulated arrears of repairs and replacements are overtaken, the present level of traffic can be moved with about 7,800 locomotives with an average age of 20 years. At this level, replacement requirements will be about 200 locomotives a year, well within the productive capacity of India's two locomotive plants. As for freight cars, some 73,000 are over-aged already or will be during the period of the Five-year Plan. The normal annual requirement, once arrears are cleared, would be about 6,000 cars and this also can be met from present manufacturing capacity.

THE TAJ GOLDEN JUBILEE

GLIMPSE INTO MR. HOMI MODY'S SOCIAL PHILOSOPHY

(By "ROVER")

UNLESS Mr. Homi Mody is careful, he stands to-day in the imminent danger of becoming an institution in this glamorous city of Bombay, instead of being a mere respected and loved citizen. He is getting so popular that any gathering where he is not scheduled to speak becomes dull by comparison. In these distraught days, when taxation pursues us even beyond the grave or the funeral pyre and all sources of diversions and avenues of escape (even if they are only momentary) from the dreary routine of circumscribed existence are being frowned upon officially, it is given to few to be able to laugh in the face of unpleasant adversities. It is given to fewer still to help their compatriots to defy depression and dispel gloom. Mr. Mody happens to be one of these very few. The Goddess of Fortune is universally regarded as highly capricious. In the case of Bombay, she has been very considerate. While sending some prophets of gloom, to save the city from becoming too frivolous, to rule over it, she has compensated it and restored the balance by forthwith despatching Mr. Homi Mody to rescue it from an overdose of austerity.

I have often seen Mr. Mody extemporising brilliantly and having a sly dig at friend and foe alike, not sparing even his own self from the pricks of his sprightly genius. But one of the best occasions when he administered his medicine in the most effective manner was when he welcomed guests with a set speech on behalf of the Directors of Tatas at the Golden Jubilee celebrations of the Taj Mahal Hotel on Wednesday, the 16th of this month. The occasion, as well as the audience provided the most perfect background, atmosphere and setting for Mr. Mody's sallies, which came in quick succession in an address characterised as much by brevity as by brilliance. Except to those, who look upon laughter as lewdness and regard any reference to conjugal relations as insufferable levity, barring those to whom pulling a long face is an outward sign of inner virtue and pleasantries are paving stones on the path to perdition, Mr. Mody's scintillating speech must have come as a great and thoughtful sermon on tolerance and the social value of righteous rejoicing.

It is easy to declaim invectives against social abuses or tyrannies from platforms. It is equally easy to lead an open and frontal attack on unpopular official policies. It is no less easy to frighten timid people with threats of fire and brimstone into an outward show of morally correct behaviour. But it needs a highly sensitive mind, deep thinking and a penetrating sense of humour to attack evils and uphold great truths with the gentle aid of a story, a joke and a spontaneous smile. What Mr. Mody says sounds light and frivolous. But he has a serious purpose behind every laugh that he raises among his listeners. The subtle criticism of some of the ways of our Governments, which he conveyed at this pleasant gathering, can prove more corrosive and disintegrating than any acid known to chemistry.

But it would be a mistake to think that Mr. Mody can only be destructive in his effect, though it is true that he can demolish humbug and hypocrisy, which would otherwise take a lot of hammering, with a phrase. Real humour, humour which does not arise from cruelty and bitterness of spirit, from venom and vendetta, has its great constructive side also. Our sense of values is apt to be vitiated and our sense of proportion to be distorted by prejudices and prepossessions, by passions and partisanships. Mr. Mody's humour, as I discovered in this speech of his at the Taj Mahal Hotel and on many an occasion previously, arises from his essentially benevolent and balanced outlook on life and its diverse aspects. It is, therefore, genial and constructive. What a wealth of meaning and a mine of political wisdom lie behind his very simple-sounding observation that, by keeping people interested and amused, the Taj Mahal Hotel is trying to help in solving some acute domestic problems in its own little way!

In fact, the claim made by Mr. Mody on behalf of the Taj Mahal Hotel in Bombay is more modest than it could justifiably be. It is not only the domestic tensions which are eased by providing gaiety and amusement to any class of citizens. Group tensions culminating in the long run into class hatred, social maladjustments and anti-social acts are also dissolved in an atmosphere of hospitality and good cheer. It is of the essence of good and progressive government and a prime necessity for the maintenance of law and order in society that the authorities should aid and encourage places and institutions, which provide entertainment for various classes of people of differing tastes and standards. There could be no greater folly than to look askance at such places and to try to regulate them out of existence, as is being attempted by some of our spartan ministers. The life force at every stage of social development must find adequate expression in joy and delight. If you repress it by blocking its natural outlets, it needs must break out in vice and violence.

"The Taj" as it is affectionately known over the five continents, has, as shown by Mr. Mody, admirably served the purpose of its founder, Mr. Jamshedji Tata. One of the most characteristic and lovable traits of the great mass of people in the U.S.A. is their love for and pride in their home towns. The community life of each little township or even a village means a great deal to every citizen and he considers it his primary duty to enrich and enlarge it. It was this spirit which animated Mr. Tata almost sixty years ago in establishing the Taj Mahal Hotel, as the lavishly illustrated and artistically got up souvenir, issued by the management on this happy occasion, brings out. Nothing but his deep affection for the little community cell in which he lived could have induced this great pioneer, occupied with the problems of his gigantic industrial schemes, to waste his thoughts and time on what was obviously an uneconomic venture.

Mr. J. N. Tata had travelled wide and far, when travelling was neither so common nor so comfortable as to-day. He understood the value of a good hostelry in the scheme of international political, cultural and commercial relations. He could not remain unmoved by the fact that his country and his home town was without a well-appointed and fitting centre of hospitality for visitors from abroad, who were bound to be attracted to our shores in greater numbers, and contacts between the eminent nationals and the country's guests. He, therefore, set about in earnest to fill this gap. It would have been obvious even to the meanest intelligence of the day that it was a hopeless venture, so far as money-making went. And Mr. Tata possessed one of the keenest brains in this country, where we have never lacked in brains. It was as a form of social service, a very necessary form of public service as we have realised only now, that he looked upon it. And, fortunately for Bombay and for India, the House of Tata has ever since regarded the Taj as one of its many contributions to the well-being and international prestige of this city.

Imagine Bombay without the Taj Mahal Hotel! The attractive souvenir states that the modern resident of Bombay gets something of a shock on seeing a photograph of Apollo Bunder without the Gateway of India. Many of there residents would get a similar shock if asked to visualise Bombay without the Taj. I am in no position to compute the social service rendered by this institution in terms of averted divorces, by providing citizens, afflicted with wives unable to cook, with good food and thus enabling them to keep their wives as pets, instead of being compelled to divorce them. It was Mr. Mody who facetiously suggested this to the patrons of this hotel as one of the services the Taj could render to them. Of course, I do not claim to know whether Mr. Mody's great regard and affection for the Taj originates from its having rendered a similar service to him in years gone by and helping him thereby to steer clear of the Parsi Matrimonial Court. But I do know that, whatever the nature of this claim of the Taj on Mr. Mody's affections, it has rendered great service to Bombay by promoting its culture, commerce and industry by providing a cosmopolitan venue for social intercourse.

SURVEY OF THE WEEK

TRAINING FOR CO-OPERATION

THE inauguration of the Central Committee for Co-operative Training on the 22nd inst., by Mr. Benegal Rama Rau, Governor of the Reserve Bank of India, marks a very notable step forward in building up the Co-operative Movement on sound lines. As stated in the last issue of *Commerce*, the Committee, under the chairmanship of Mr. V. L. Mehta, has been set up jointly by the Government of India and the Reserve Bank. The Committee has before it the great responsibility of providing the Co-operative Movement with a regular and adequate supply of trained men —fully equipped with the knowledge of the technique of Co-operation and understanding of its spirit—for expanding the movement far and wide in the country.

Judging by the constitution and the resources at the disposal of the Committee, there seems no reason why the Committee should not succeed in discharging the functions assigned to it. It must, at the outset, be said that it is not an *ad hoc* Committee, as was pointed out by Mr. Rama Rau, to produce a report, but a standing committee to produce results. It consists of well-known co-operators such as Mr. V. L. Mehta and Mr. R. G. Saraya who have made a mark in the service of the Co-operative Movement in the country. There is in the Committee, besides, a co-ordination of all relevant authority—non-official and official, Central and State Governments, and the Reserve Bank of India. The latter is represented by one of the ablest civil service men in the country, Mr. B. Venkatappiah. The Committee is also assured of reasonable financial aid for the training schemes it might draw up. Moreover, thanks to the initiative and enterprise of the Governor of the Reserve Bank, a scheme for training of co-operative personnel is already in operation in Poona and the experience gained there should prove useful to the Committee in drawing up a well co-ordinated scheme of training for the country as a whole. One can, therefore, look forward with confidence to the Committee making a significant contribution to the development of the Co-operative Movement in India.

The magnitude of the task set before the Committee is evident from the importance attached to the training of co-operative personnel in the scheme of co-operative credit activity with which the Reserve Bank is concerned as also in the Five-year Plan. The inaugural address delivered by Mr. Rama Rao on the occasion of the meeting, in this context, is notable in that it draws the attention of the Committee to two points, namely, (*a*) the targets for agricultural credit set by the Five-year Plan, and (*b*) the progress made so far in reaching these targets. A perusal of the speech brings also into relief how the work of the Reserve Bank has been handicapped by lack of trained personnel to man the co-operative institutions.

The targets for agricultural credit —both Government and co-operative —set by the Plan are Rs. 100 crores per annum for short-term credit, Rs. 25 crores for medium credit and Rs. 5 crores for long-term credit. Towards reaching this goal, the Reserve Bank has initiated several steps. These steps consist of (*a*) liberalisation, legal provisions and procedure governing the supply of credit to co-operative banks, and (*b*) creation of conditions in each State for the eligibility for credit facilities placed within the reach of co-operative institutions. The latter category of measures is largely concerned with the (*a*) setting up of new co-operative banks, (*b*) reorganisation of existing ones, (*c*) establishment of central and district co-operative banks, (*d*) rehabilitation of primary credit societies, and (*e*) creation of land mortgage banks. In all these five directions considerable progress has been made during the last few years. And what is more, some of the States have come forward with zeal to co-operate with the Reserve Bank with a view to taking advantage of the agricultural credit facilities provided by the Bank. The reorganisation of co-operative credit agencies so far carried out has enabled the Reserve Bank to provide credit for these States which could not make use of the facilities hitherto. According to Mr. Rama Rau, credit limits of Rs. 10 lakhs each have been sanctioned for Saurashtra and P.E.P.S.U., Rs. 20 lakhs for Assam, Rs. 25 lakhs for Hyderabad, and Rs. 60 lakhs for Punjab. Besides, a sum of Rs. 75 lakhs has been granted to the new State Co-operative Bank of Andhra. Apex banks already accommodated by the Reserve Bank have been encouraged to make larger use of the credit facilities. An idea of the large use that is made of these facilities is provided by the outstandings with apex banks as at 12th December, 1953, in some States. In Uttar Pradesh, for instance, such outstandings have been Rs. 53 lakhs as against Rs. 27 lakhs last year, Rs. 71 lakhs as against Rs. 39 lakhs in Madhya Pradesh and Rs. 258 lakhs as against Rs. 190 lakhs in Bombay. If the Bank has not been able to achieve more, it is due, in the main, to organisational difficulties experienced by the Bank. The essence of the problem of overcoming these difficulties is, in its turn, one of finding trained personnel needed for manning the co-operative institutions not only in the credit sphere but also in other spheres, such as marketing, farming and consolidation of holdings. It is to an examination of these difficulties and formulation of a suitable scheme for providing training for co-operative personnel that the present Committee has been asked to address itself. It will have at its disposal a sum of Rs. 10 lakhs for two years allotted by the Planning Commission and of Rs. 5 lakhs per annum contributed by the Reserve Bank for expenditure on co-operative training schemes.

PROPERTY RIGHTS

The Supreme Court's judgment in the case which arose out of the assumption of control by the Bombay Government of the Sholapur Spinning and Weaving Co., Ltd., restates certain principles in relation to property rights under the Constitution in a most significant manner. The main facts of the case are: When the mills run by the Sholapur Company closed in August, 1949, a labour problem was created. In order to solve this problem, the Central Government appointed, under the powers conferred on it by the Essential Supplies Emergency Powers Act, 1946, a Controller to supervise the Company's affairs. The Controller asked the Directors of the Company to make a call of Rs. 50 per share on the preference shareholders. The Directors refused this requisition, since they felt that it was not in the interests of the Company. Thereupon, the Central Government issued, in January, 1950, the Sholapur Spinning and Weaving Company (Emergency Provisions) Ordinance under which the mills could be managed and run by the Directors appointed by it. Acting under section 15 of the Ordinance, the Government later delegated all its powers to the Government of Bombay, which later appointed certain Directors who took over the assets of the Company. They passed a resolution making a call of Rs. 50 on each of the preference shares. A preference shareholder questioned, in a suit filed in the Bombay High Court, the validity of the Ordinance and also the right of the Directors to make the call. When the High Court dismissed the suit, the shareholder appealed to the Supreme Court where the decision holding the Ordinance and the subsequent Act of Parliament *ultra vires* the Constitution was given by the Constitution Bench of the Supreme Court.

Mr. Justice Mahajan subjected the provisions of the Ordinance to a scrutiny in the light of the property rights guaranteed by the Constitution. He said that the result of its provisions was that all the properties and assets of the Company passed into the hands of the persons, nominated by the Central Government, who were not members of the Company or its shareholders or in any way connected with and who were merely the creatures of the Central Government or its dummies. Thus, the Central Government became vested with the possession and control of the property of the Company and the normal function of the Company under its Articles and the Indian Companies Act came to an end. The shareholders' most valuable right to appoint Directors, His Lordship observed, had been taken away. The shareholders, the Directors and the Managing Agents had been completely deprived of the possession of the property. Rejecting the contention of the Attorney General that the Ordinance merely gave the Government powers of superintendence and it did not affect the Company's title to property, His Lordship held that the Act had overstepped the limits of legitimate social control legislation. The Act had, therefore, infringed the fundamental rights of the Company guaranteed to it under Article 31(2) of the Constitution. Briefly, Article 31(2), it may be mentioned here, states that no property, movable or immovable, including any interest in, or in any company owning any commercial or industrial undertaking, shall be taken possession of or acquired for public purposes, unless the law provides for compensation for the property taken possession of.

In the course of his judgment, Mr. Justice Mahajan observed that the Indian Constitution, subject to certain exceptions, had guaranteed the fullest protection to private property. It had not only provided that no persons could be deprived of property by the executive without legislative sanction, but it had further provided that even the Legislature could not deprive a person of his property, unless there was a public purpose and even then, only on payment of compensation.

It should, therefore, be clear that the judgment has categorically reiterated the rights of private property conferred by the Constitution. The Central and State Governments would, perhaps, do well to examine how far the various legislative or executive measures are in consonance with the letter and spirit of the provisions in respect of the rights of private property, as provided for in the Constitution and as now interpreted by the Supreme Court. In effect, the judgment means that the mismanagement of a company or of any property cannot be made the ground for dispossession of property rights of the owners without payment of compensation. This constitutes a charter of economic liberty and property rights. This charter may sometimes make the task of the Government, which is anxious to stem the rot that may have set in in any unit of the private sector, unduly difficult. But the Government should not, on that account, sacrifice property rights at the altar of expediency. These rights are too valuable to be ignored even for the sake of what the Government might regard as the public good. To say that they might be ignored is to place a far too dangerous weapon, that might not always be wisely used, in the hands of the executive.

SCRAMBLE FOR TEA EXPORT QUOTA

The Government of India has announced an increase in the export allotment of tea for 1953-54 from 424.86 million lbs. fixed earlier, to 437.05 million lbs., representing 125.5 per cent. of India's standard export figure, the allotment to take effect from 17th inst. This is the second increase made during the year. In April last, the Government fixed the export allotment at 115 per cent. of the standard export figure (namely 348.25 million lbs.) equivalent to 400.49 million lbs. Under the International Tea Agreement, India is permitted to make an export allotment of 135 per cent. of the standard export figure for the current year. But the Government of India decided to restrict it to 115 per cent. in view of the low prices fetched in tea auctions. This was followed by a second release of 7 per cent. in August, making a total release of 122 per cent. or 424.86 million lbs. In view of the abnormal rise in the price of tea export quota rights, this has, as stated at the outset, now been raised further to 125.5 per cent. or 437.05 million lbs.

The latest decision of the Government has been welcomed in tea trade circles, inasmuch as they have for some time now been asking for an additional allotment. Large-scale speculative activity has been rampant for some weeks past in export quota rights, the price of which rose to as much as 40 pies per lb. in both Calcutta and Cochin last week. It is reported that there has almost been a squeeze in the market for getting export quota rights. An idea of the extent to which speculative activity has been carried can be gauged from the trend of quotations for export quota rights during recent months. For instance, in the middle of April, that is prior to the notification by the Government of India fixing the export allotment for the season 1953-54, business in special export licence was done at 1½ pies per lb. When it was known that the Government had decided to restrict the export allotment to 115 per cent. of the standard export figure, a large quantity of export quota changed hands at 13 pies per lb. As the demand for tea abroad picked up considerably and as the export allotment came to be exhausted, the price of export quota rights shot up to 22 pies in the second week of July. Following the announcement of the second release in August, the market declined to 11½ pies, from which it advanced to 18 pies early in November. It was then rumoured that the Indian Tea Licensing Committee would make available in the following two weeks a second allotment of quota. Consequent on this rumour, the market weakened to 15 pies. Subsequently, it strengthened to as much as 40 pies last week.

The present scramble for export quota rights is evidently due to the very keen demand there is for Indian tea in the overseas markets, particularly in the U.K. Despite an increase of 53 million lbs. in the export of Northern Indian tea to the U.K. during the current season, there is a shortage of floating stocks in that country, which are estimated at only 95 million lbs. or 12 million lbs. less than in the corresponding period of last year. The situation arising out of the increasing pressure of external demand and the possible offtake of at least 30 million lbs. from Russia during 1953-54 under the Indo-Russian trade agreement recently concluded, *vis-a-vis* the export allotment, restricted till recently to 122 per cent., has been seized by the speculators to push up the quota prices beyond uneconomic limits. This is an undesirable trend, in that it adds to the cost of marketing tea abroad and may result in consumer resistance in foreign countries. The latest decision of the Government of India in increasing

the export allotment is, therefore, a step in the right direction.

The larger export allotment may not result in tea becoming costlier in the internal market, as is feared by some. For the North India tea crop for the current season will be only 10 million lbs. less than in the previous year, as against 50 million lbs. fixed under the voluntary crop restriction scheme. The South India crop will actually exceed last season's level of output by about 4 to 5 million lbs. There is, therefore, no fear of any shortage of tea for internal consumption.

BOMBAY STATE FINANCE CORPORATION

The Bombay State Finance Corporation, inaugurated on the 21st inst. by Mr. Morarji Desai, Chief Minister of Bombay, has come not a day too soon. For, ever since the Union Parliament passed, on 28th September, 1951, The State Financial Corporations Act, enabling the States to form such Corporations, scores of small- and medium-scale industries in this State have waited for the establishment of this institution. Of about 6,800 factories in the State, barring about 700 public limited companies, many of which can avail themselves of the accommodation from the Industrial Finance Corporation of India, the rest are completely bereft of any dependable source of accommodation. Many of these industries are experiencing difficulties in the shape of either lack of raw materials or competition from large units or from imported materials. But the most important of these difficulties is the lack of finance. Now that the State Finance Corporation has been established—under the chairmanship of Mr. Purushottam Kanji—many industrial establishments may look to this institution for necessary support.

It will, however, take some time before industries can expect actual assistance from the Corporation. For it has yet to approach the money market for the issue of its share capital. It is learned, from the appeal made to the investing public by Dr. Jivraj Mehta, Finance Minister of Bombay, who spoke at the meeting of the Board of Directors and other invitees, that the Corporation will issue the shares for subscription in the first week of January, 1954. The authorised capital is Rs. 2 crores, of which only Rs. 1 crore, divided into 100,000 shares of Rs. 100 each, will be issued. The Bombay Government and the Reserve Bank of India have taken up shares of the value of Rs. 31 lakhs and Rs. 20 lakhs, respectively. The balance of Rs. 49 lakhs will be offered for subscription by institutional investors and other parties. The repayment of the principal, as also a minimum dividend of 3½ per cent. per annum, has been guaranteed by the State Government. The minimum dividend is free of income-tax. It is in line with the present pattern of yields on Gilt-edged securities and, therefore, are attractive to insurance companies, investment trusts, co-operative banks and other institutions.

When the Corporation commences its loan operations industrial units will have to go through many procedures and formalities before submitting their loan applications. Experience, has shown that, on account of the complexity of the various rules, many applications are liable to be rejected. Hence, considerable delays are caused. With a view to avoiding such delays, the Corporation will do well to establish a simplified code or rules and circulate it amongst industrial organisations in the State beforehand. This will certainly facilitate quick disposal of loan applications.

INDIAN LABOUR CONFERENCE

SETTING UP OF WAGE BOARDS TO BE DISCUSSED

MANY important issues of great significance to industrial relations in the country will come up for discussion at the forthcoming thirteenth session of the Indian Labour Conference, scheduled to be held from 7th to 10th January, 1954, at Mysore. Since the tripartite character of this Conference ensures that the decisions reached there will form, as they deserve to form, the basis for any possible changes in the Government's labour policy, it is well to consider the subjects that will come up for discussion at this Conference. The most important item on the agenda of the Conference relates to the need for the setting up of wage boards at the Centre and in the States. Among others, the Conference will also discuss problems relating to technical assistance. Another problem it will consider is the economic and social status of women workers, with particular reference to the possibility of evolving a Central law designed to bring uniformity in legislation relating to maternity benefits.

Latterly, the importance of establishing a wage fixing machinery has been assuming increasing importance. The need for a standard wage fixing machinery was stressed by the I.L.O. long ago. Two conventions, namely, the Minimum Wage Fixing Machinery Convention (No. 26), 1928, and the Minimum Wage Fixing Machinery Agriculture) Convention (No. 99), 1951, have been adopted by the I.L.O. These Conventions emphasise that a permanent wage fixing machinery should be set up in industry and trade as well as in agriculture to advise and to review from time to time minimum rates of wages for workers covered by them. Although the Government of India has not been able to ratify them so far, it has accepted the principle of establishing such a machinery on a tripartite basis.

The Planning Commission has recommended in the First Five-year Plan that separate wage boards for important industries in the States will be found very useful. Such wage boards may also be established at the Centre to which issues affecting an industry in the country as a whole may be referred. It has also recommended that permanent wage boards with a tripartite composition should be set up in each State, and at the Centre, with a view to dealing comprehensively with all aspects of the question of wages, initiating necessary enquiries, collecting data, reviewing the wage situation from time to time and taking decisions regarding wage adjustments suo motu or on reference from parties or from the Government.

It is better that the wages are fixed by the wage boards rather than by industrial tribunals. For the workers have to start an industrial dispute before the matter of fixing minimum wages can be referred to the industrial tribunals. Besides, the tribunals do not consist of experts. But wage boards might be expected to function more effectively, as they consist of representatives of employers, employees and the Government. Wage levels would then be determined by mutual agreement as a general rule.

Wage Regulation

The most important function of wage boards is to ensure that the worker is paid a minimum wage which will guarantee a reasonable standard of living. But this should not be carried so far as to increase production costs and to price the products out of the markets. In such cases, the only principle that should be followed is "what the traffic can bear" and not prescription of wage levels and other amenities which cut right at the root of the new industries and thus eliminate what little chances there might be for increasing employment in the country. It is also true that, where workers cannot be given a decent living wage, wage levels must bear a reasonable relation to the market value of the product of labour. At the same time, the return on investment should not be neglected. The problem, therefore, is one of striking the golden mean between the investors' and workers' interests.

How difficult is the task of prescribing minimum wages will be evident by the fate of the Minimum Wages Act, 1948. The process of implementation of the Act, even after allowing for the fact that the Act came into force in Parts B and C States much later than it did in Part A States, has been rather slow, even with regard to sweated industries, let alone agriculture. It is true that the last date for fixing minimum wages in industries given in Part I of the schedule of the Act expired on 31st March 1952, while that in agriculture mentioned in Part II of the schedule is to expire on 31st December, 1953. The Government has sponsored an amending Bill to extend the two dates till 31st December, 1954. But it is doubtful whether the States will be in a position to implement the Act completely even by that time, especially in the agricultural sector.

Fair Wages Bill

Meanwhile, the Government is considering the question of reviving and reintroducing in Parliament the Fair Wages Bill, 1950, which was originally introduced in the provisional Parliament, and which now stands lapsed. It has asked the Conference to suggest modifications, if any, to the Fair Wages Bill. But we feel that it is not wise to revive the Bill now. After all, when it has become difficult to assure even minimum wages, the prescription of fair wages tantamounts to a mockery. It is argued that the increase in wage rates above the minimum level may be expected to improve the distribution of incomes, thereby increasing the savings of the middle class and workers for purposes of investment. But this will not be the case in underdeveloped countries like India, where the consumption levels are very low. It is to be hoped that the Conference will consider this subject in the light of these factors.

Technical Assistance

Technical assistance programmes are a recent development in the field of international co-operation. They aim at accelerating through mutual help, the pace of economic development of underdeveloped countries. The contribution of the programmes of technical assistance to economic development is twofold. Firstly, by helping to increase productivity in industry and agriculture, they directly promote economic development. Secondly, they help to tackle human and social aspects of development.

The important programmes of technical assistance are the Regular and Expanded Programmes of Technical Assistance of the United Nations and the Specialised Agencies, the Colombo Plan Technical Co-operation Scheme, and the Technical Co-operation Programme (also known as Point Four) of the Government of the United States. The technical assistance provided usually takes the form of expert advice, fellowships and scholarships, pilot and demonstration projects, training of local technicians in underdeveloped countries, seminars, dissemination of technical information, equipment and supplies.

The effectiveness of technical assistance obtained by India in the labour field can be improved considerably and the scope enlarged through proper planning and scrutiny, follow-up, and the streamlining of assistance to the requirements of the country. All this requires forethought and a continuous watch on the part of Government, employers and workers. Prompt and speedy action to take advantage of the technical assistance schemes is equally important. It may be mentioned that the subject of technical assistance will be discussed at the 37th session of the International Labour Conference to be held in Geneva in June, 1954. The Indian Labour Conference is expected to make suggestions for a fuller and more effective use of programmes of technical assistance and find out whether the State Governments and employers' and workers' organisations would like to obtain any further technical assistance.

Employment of Women

Employment of women is assuming greater importance nowadays as, in these days of high living costs, the earnings of the male members are not enough to maintain the whole family. Women already constitute a considerable portion of the adult labour force in the major sectors of industrial activity of the country. Thus, in 1931, they constituted 11 per cent. of the total labour force in factories, 20 per cent. in mines and over 47 per cent. in plantations. Other important industries from the point of view of the number of women employed are food, gins and presses, tobacco, non-metallic mineral products and chemical and chemical products. They are also employed in large numbers in some unorganised industries such as bidi making.

It will appear that, though the total employment in factories increased considerably since 1927, there has been no corresponding increase in the total number of women employed; the percentage of women workers to the total labour force has fallen from 16.95 in 1927 to 11.3 in 1951. But the number of women employed in mines has increased considerably during the decade ended 1950. The percentage of women to the total labour force in the mining industry rose from 17.9 to 20.5.

The wages of women workers have generally been lower than those of men, either because the value and nature of work are different in the two cases, or because of historical developments and social and economic factors, which have generally made for the fixation of lower rates for women workers irrespective of the nature of their work. So far as wage rates under the Minimum Wages Act are concerned, in a majority of cases, no differentiation has been made between men and women. But the policy followed has not been uniform. Generally speaking, differential rates for men and women have been fixed in specific industries like plantations, road construction and building operations in certain States, while, in some others, differential rates have been fixed in almost all the industries.

It would appear that there is a tendency towards narrowing the gap between the wages of men and women but the application of the principle of equal pay for men and women for work of equal value has not been general. While, for instance, the principle has been applied in a large section of the textile industry, the position in the factory industries generally seems to be different. In most of the recent adjudications equal basic wages have been awarded in some cases, but there are cases in which differential rates have also been fixed.

Equal pay for men and women for work of equal value is one of the Directive Principles of the Indian Constitution and the I.L.O. has also adopted a Convention on this subject. Although it has not been possible for India to ratify the Convention in the absence of any job-appraisal machinery, its adherence to the principle nevertheless remains.

While the application of the principle through legislation may appear premature at this stage, progressive application may be achieved through voluntary action. The industrial tribunals as well as the wage fixing machinery, under the Minimum Wages Act, may also be directed to keep this principle in view, while considering fixation of wages.

Specific Points

While discussing these problems the Conference is expected to consider the following specific points among others:

(i) what measures should be taken for expanding women's employment opportunities and in what fields?

(ii) what measures should be taken to stop or reduce the decline in employment opportunities in industries and occupations in which women were formerly employed in larger numbers?

(iii) what measures should be taken to encourage women to join occupations and trades which are specifically suitable for them, e.g., teaching, nursing and welfare work?

(iv) how should recruitment of women workers be improved, e.g., through increased utilisation of Employment Exchanges?

(v) what training facilities are required by women and in what industries and occupations? How should these be arranged, and

(vi) how should the full application of the principle of equal pay for work of equal value be secured in as short a time as possible. What difficulties are standing in the way of universal application of the rate for the job and how should these be overcome? How should job-appraisal be secured?

The Conference will also consider how the welfare measures for the protection of women could be improved. It will examine, in particular, the problems relating to the enactment of a Central law to lay down minimum uniform standards in respect of maternity protection. If Central legislation is not favoured at this stage, it will consider the question of drawing a list of agreed points concerning these standards.

1953 In Retrospect

ALTHOUGH A.D. 1953 brought with it reassuring indications that the danger for the world from a devastating war had receded, it is lapsing without witnessing any further significant improvement in the political situation. The world is still marred by cleavages and threatened by discords. The U.S., leader of the Western world, and Russia, leader of the Communist world, continue to be as far apart as they were a year ago. Their fears and suspicions of each other are greater and each is continuing the task of building positions of strength against the other. The result is that the cold war is threatening to envelop a wider area of the world. India's sincere efforts to bridge the gap between the two blocs and bring them together have yielded no tangible results. The only "beam of light amid so much darkness and confusion," to quote the words of Sir Winston Churchill, who has been ceaselessly striving to bring about an understanding between Russia and the Democratic countries, is the latest proposal of President Eisenhower for international co-operation in the use of atomic energy for peaceful and constructive purposes. If this experiment in co-operation for peaceful purposes were successful, it would, in the opinion of competent political observers, become easier to deal with the negative problem, namely, the control of destructive atomic weapons. Another important development is the informal conference of four powers, scheduled to take place in Germany early next year, in which an attempt will be made to reach an understanding with Russia. These latest efforts to steer mankind into safer waters give a new hope for world peace. It is, however, difficult to say how far this hope is well founded, for the Communist powers are a very intractable lot and invariably put forward demands which exasperate even the most patient peacemaker in the world. Be that as it may, the next few months promise to be a crucial period in the history of this planet.

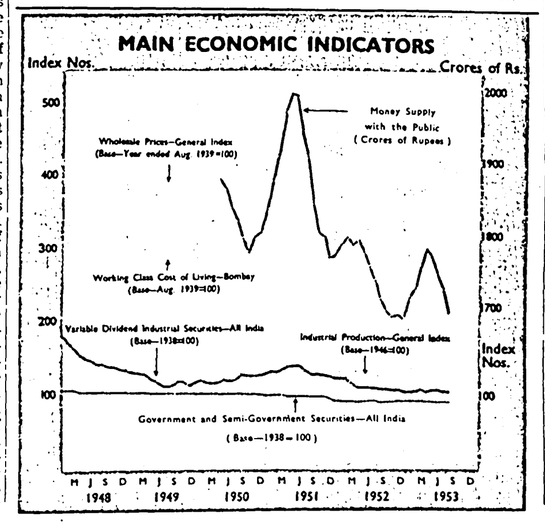
In the economic sphere, the year that is fast closing was one of relative stability, as compared with the recession suffered in 1952. There was a world-wide increase in production, resulting in a perceptible expansion in world trade, virtual abandonment of several Government controls in favour of flexible measures of monetary and fiscal policy, and greater freedom of choice for consumers. Inflationary pressures ceased over large parts of the free world and price levels declined. The *Financial Times* index number of world commodity prices (base 1st July 1952=100), for instance, declined from 94·02 at the close of 1952 to 84·70 in the third quarter of this year, though at the time of writing it is somewhat higher at 86.24. Over the year, the decline is of the order of 8.5 per cent. and this reflects the fall in prices of basic raw materials as well as food. Unlike in 1952, the Governments of many countries were, during 1953, more concerned with the problem of averting an economic recession than with fighting inflation. There was, therefore, a slight reversal of the steps taken to keep inflation under check. The outstanding among these were a reduction in Bank rate, relaxation of credit restrictions, lowering of tax burdens and further restoration of freedom to private enterprise. Though there was keen competition for markets in foreign countries, the industrial countries of the West were successful in having a fairly comfortable balance of payments position, especially with the dollar area. This was due partly to the terms of trade being in their favour and partly to the high level of economic activity in the U.S. which enabled the latter to buy more goods from other countries. The dollar problem, which seemed intractable till last year, was almost forgotten during the year under review. The disappearance of the dollar gap reflected partly the tightening of trade controls in some countries, partly the increase in U.S. imports from non-dollar areas and partly the readjustment of world supply and demand for many commodities. Generally speaking, the closer balance that was achieved in international trade during the year under review has improved the prospects for broader inter-convertibility of currencies, although it must be admitted that many uncertainties remain to be solved.

While the industrial countries of the West experienced fairly comfortable conditions in the year now drawing to a close, the Eastern countries, especially those producing primary raw materials, had to face difficult conditions. The sharp fall in the prices of their principal export commodities led to a decline in their national incomes. The effect of this development on these countries would have been far more serious but for an increase in their production. As the prices of goods imported by them fell comparatively little, most countries in this area suffered a further deterioration in the terms of their trade. An outstanding exception was Burma, because the price of rice, its principal export, continued to rule high. For two or three other countries, notably Ceylon and Malaya, the terms of trade are even now considerably better than in 1948, the reason for this being that prices of a few products, such as rubber and copra, are higher than they were in that year. The terms of trade of India and Indonesia, however, have deteriorated by about 9 per cent. even as compared with those in 1948.

Although prices of agricultural commodities have fallen in South East-Asia, the costs of labour and construction have remained rigid. Cost of living in most of these countries is still high and the problem of chronic underemployment, arising primarily from lack of capital and sufficient arable land, coupled with growing populations, continues. The only redeeming feature is that the Governments of these countries have been pushing ahead with their plans for economic development. It is noteworthy that, despite the fall in their revenue, consequent on the adverse developments in foreign trade, they managed to spend, according to the second Annual Report of the Colombo Plan Consultative Committee, more on their development programmes in 1952-53 than they expended in 1951-52. This has been possible, because of the substantial surpluses accumulated during the Korean War boom. Consequently, the external assets and the internal reserves of the Colombo Plan countries have been severely reduced. The problem of continuing their development plans in the coming years, therefore, is a grim one.

For India, 1953 has been one of gains and losses. It is difficult to strike a balance of the two and indicate the net result, for the result will depend on the emphasis one places on them. Some of the main economic trends of this country have been similar to those of the industrial West, while others have been in consonance with those of the South-East Asian region as a whole. This is not surprising considering the fact that the Indian economy has the features of both. In the matter of production, money and banking, and balance of payments, the experience of India has been similar to that of Europe, while the trend of employment, investment, volume of trade and terms of trade was in tune with the experience of South-East Asia and in striking contrast with that of the West. In short, the turn of the year sees India in a financially sound position, but that does not necessarily mean that the general economic health of the country is quite good. If the needs of its growing population are taken into account, its economic health is not as good as it ought to be; in fact, it is a little weaker than a year ago, in that the progress that has been made falls short of even the minimum that is needed to cope with its ever-rising responsibilities.

The upward trend in industrial production in India which began in 1951 continued during the year under review. Thus, the average interim general index of production (1946=100) for the first eight months of 1953 stood at as high as 133.8, as against 128.9 for the whole of 1952, 117.2 for 1951 and 108.4 for 1950. As compared with 1948, the increase in industrial production was higher by nearly 25 per cent. The pace of expansion in 1953, however, was perceptibly smaller than in 1952, whereas it ought to have been higher to ensure at least the same rate of *per capita* income as in the previous year. The fall in the rate of expansion in industrial output reflects, in the main, a drop of 8.4 per cent. in steel (based on the aggregate production for nine months ended September, 1953, as compared with the corresponding period of the preceding year), 10.3 per cent. in sugar, and 9.4 per cent. in jute, all of which belong to major industries. Cotton textiles and cement are the only two major industries to record an increase in their production, the former by 6 per cent. and the latter by 5.4 per cent. The output of coal showed neither a fall nor a rise; it was just maintained at the previous year's level. But according to the Five-year Plan, coal production this year ought to have gone up. The fact that it was maintained is, therefore, no cause for satisfaction. It is true that production of woollen manufactures, paper, matches, salt, chemicals and a section of engineering industries was higher, but this was offset to some extent by a fall in a number of other industries.



The slowing down in the rate of increase in industrial production is due partly to the fall in demand, both internal and external, and partly to unrest among a section of industrial workers. The latter factor was the cause for the fall in steel production. The decline in the output of jute and a number of minor industries, as well as the failure of coal output to expand, was the outcome of a recession in demand. The only notable instance of a fall in output for want of adequate raw material was sugar. *Vanaspathi* is, perhaps, another instance, but its position became easier in the latter half of the year, thanks to liberal imports of palm oil, coconut oil and cottonseed oil. In the case of other industries, the supply of raw material did not present a problem. Where domestic production was found insufficient, liberal imports were allowed and this was made possible by an improvement in the balance of payments position. The rise in production of some of the industries was in fact due to larger availability of raw material, as, for example, cotton textiles. At the same time, there was at least one instance, where plenitude of raw material proved a hindrance to production. This was the jute industry. Large supply of raw jute in this sub-continent, in the absence of any effective price support scheme, had a demoralising effect on prices of jute which, in turn, affected those of finished goods too.

The progress of production in some cases was also retarded by the large stocks brought in from the previous year. Tea and sugar are typical instances. In the case of tea, producers decided, towards the close of last year, to restrict production, with a view to bringing about a readjustment of supply to demand. In the case of sugar, the large accumulation of stocks compelled several producers in North India to delay the commencement of crushing in the 1952-53 season. Both the industries were concerned over the poor offtake of their products and felt that demand would not be equal to the then prevailing rate of production. Fearing that the country would not be able to consume all the sugar that was available then, the Government allowed even exports of both *gur* and white sugar. But later developments showed that this view was wrong. After a sluggish start, demand for sugar picked up and exceeded all expectations. The available supply fell short of the requirements to such an extent that the country had to import foreign sugar in large quantities, in order to keep prices within reasonable levels. Similarly, both external and internal offtake of tea improved as the year progressed, resulting in a marked recovery in prices. Indeed, the tea markets both in London and in India ruled so buoyant that producers found it necessary to relax, in the closing months of this year, a good part of the self-imposed restrictions, lest prices shou'd overshoot the mark. The Government of India, too, found it necessary to increase the export quota, in order to permit exports of a larger quantity.

The demand for other manufactured goods was at a low ebb during the year under review. The fall in prices of some of the cash crops, coupled with the rise in prices of foodgrains, edible oils and other necessaries of life, reduced the purchasing capacity of people over a large part of the country. Scarcity conditions caused either by drought or by floods constituted another cause for the fall in the demand for goods other than the absolute necessaries of life. Even in regard to the latter, those goods the consumption of which can be deferred, as for instance cloth, were severely affected, because people had to pay more for their food. This state of affairs caused hardship to several industries. One way of meeting the situation would have been to cut costs, but there were serious limitations to this, as wages had become rigid following the Government's policy of pampering the industrial workers. The only alternative was to reduce the incidence of indirect taxation. The Government was thus compelled to provide some relief to industries in this direction by a reduction in export, import and excise duties. Industrialists found it extremely difficult in convincing the Government of the necessity for this relief. In the first place, the Government was reluctant to give up its revenue, even if it was of a diminishing nature. Secondly, it did not have confidence in the spokesmen of the industry. Not until it actually found that export markets were being lost and that workers were threatened with unemployment did the Government act. Even then, the reliefs provided by it were inadequate. This kind of belated and halting actions of the Government dealt a serious blow to the confidence of industrialists and induced a sense of frustration among them.

In the field of industrial relations, the position was not as satisfactory as in the past year, when the relationship between employers and employees had been not only peaceful but also quite happy. Complete statistics relating to industrial disputes in 1953 as a whole are not available at the time of writing. The figures for nine months ended September, 1953 show that the number of disputes declined from 889 (in the corresponding period of 1952) to 690, workers involved from 757,566 to 407,913 and man-days lost from 2.56 million to 2.05 million. These figures suggest that there was less industrial strife in 1953 than in 1952. But they do not reflect the real state of affairs. While the disputes were fewer than in the past year, the loss to the country in the form of production and wages not only in the industries affected but also in the other sectors dependent upon them must have been heavier. For, whereas, in 1952, there were no major strikes, there was, in 1953, at least one big strike, namely, the one at the Indian Iron and Steel Works at Burnpur. This strike was preceded by a "go-slow" movement for several months. The direct loss from this strike alone was of the order of 88,000 tons of steel, valued at Rs. 4 crores, and of over Rs. 40 lakhs of production bonus which workers would otherwise have received. But the total loss, direct and indirect, resulting from this dispute, must have been very much larger than this.

"Go-slow" tactics were not confined to the Burnpur works alone. Reports of their wider application by workers were far more numerous this year than in the past year. There are, of course, no data to prove this. Again, in distinct contrast to the welcome feature witnessed in 1952, of employers and employees settling their disputes mutually without going to industrial tribunals, almost every dispute during the year was referred to a tribunal. This lack of mutual confidence was borne out by the fact that disputes relating to bonus in the cotton textile industry in Bombay, Nagpur and Coimbatore and in the U.P. sugar industry had to be adjudicated by Industrial Courts, whereas last year they were amicably settled by direct negotiations between the parties concerned.

Another disquieting development in the sphere of industrial relations was the increase in rivalry among labour leaders to get control of the workers' unions. This rivalry often led to violence and breach of peace in industrial centres. Inevitably, it resulted in loss of production also. This trend manifested itself to a menacing extent particularly in West Bengal. It was precisely this rivalry that precipitated the strike and lockout in the Burnpur Works. What was even more regrettable was the failure of the authorities to nip all such trouble in the bud.

Unlike in the case of industrial production, there is no composite index number to indicate the trend of agricultural production as a whole. One has, therefore, no alternative but to relate the performance of each individual commodity. Commenting on the relaxation of controls on foodgrains, we stated in our last *Annual Review* that such would result in an increase in production and minimise the need for imports much earlier than was believed by many. This expectation, we are gratified to find, has been fulfilled in an impressive manner. Production of foodgrains, including pulses, has gone up by as much as 11.8 per cent. from 47.78 million tons to 53.42 million tons. Here are some statistics which will show at a glance the performance of the principal foodgrains:

(In million tons)

	1951-52	1952-53	% Rise in yield	% Rise in acreage
Rice	20.7	23.4	+12.9	+ 1.4
Wheat	6.0	6.8	+12.0	+ 2.5
Jowar	5.9	6.0	+ 1.0	+ 7.2
Bajra	2.3	2.9	+27.1	+10.7
Maize	2.0	2.6	+29.1	+ 9.0
Barley	2.3	2.7	+15.2	— 4.3
Ragi	1.2	1.3	+ 1.9	— 0.2
Small millets ..	1.8	1.9	+ 2.2	+ 2.8

A more pleasant feature than the absolute increase in the output of foodgrains is the fact that percentage of rise in yield in the major grains such as rice, wheat and *bajra* has been far greater than the increase in acreage devoted to them. While favourable weather may have been responsible for this rise to some extent, the major cause must have been the improvement in culturable practices and intensive cultivation, with the aid of fertilisers, etc. This is undoubtedly the most outstanding gain of the year for this country. There is no doubt that the removal of controls on prices and distribution of foodgrains has provided a tremendous incentive to agriculturists to strive for more production. The people of this country must be greatly indebted to Mr. C. Rajagopalachari and Mr. Rafi Ahmed Kidwai for this development, for it was they who sensed the situation correctly, took courage in their hands and removed the controls in the face of severe opposition not only from their opponents but also from their colleagues in the Congress, as well as in the Administration. They took this step with faith in the innate goodness of our farmers and merchants, as well as in the virtues of a free market economy. Their faith and vision have been amply justified. If their colleagues in the Government, to whose charge industrial development in the private sector is committed, had displayed these qualities, we are sure the country's economic health would have been far more satisfactory than it is now.

There is a school of thought in this country which feels that the statistics of foodgrains production are not reliable. Their insinuation in saying this is that these figures give an exaggerated account of output. Even supposing there is a grain of truth in this contention, the fact remains that, despite a growing population and despite the relaxation of restriction on consumption in almost all parts of the country, imports of foodgrains have declined. From 1st January, 1953 to 9th December, 1953, these imports amounted to a little over 2 million tons only—2,017,850 tons to be precise—as against 3.90 million tons in 1952 and 4.70 million tons in 1951. This argument also does not seem to convince these critics, for they contend that, because of higher prices following the removal of food subsidies and abolition of price controls, consumption of food has gone down. There may be some truth in this, too, but it is clear exaggeration, because the benefits of control and subsidies, when they existed, were available only to a small section of the population and even this section was paying a higher price for its food, as the rations were of bad quality and had to be supplemented by purchases in black markets at fancy prices, a fact which was not reflected in the cost of living indices.

The increase in foodgrain production does not seem to have adversely affected other agricultural crops. Some of them have no doubt suffered a reduction in outturn, but there is no convincing proof to establish that it was the result of land having been diverted to food crops. The main reason for the fall in the production of commercial crops was adverse weather conditions. The output of cotton declined by about 300,000 bales, or 2.6 per cent., to 3.63 million bales, while that of jute was well maintained at 4.70 million tons. There was a sizable drop of 5.2 per cent. in groundnuts, but castorseed and linseed improved by 1.9 per cent. and 12.3 per cent. Sugarcane sustained a fall of 13.2 per cent., whereas tobacco registered a rise of 12.1 per cent.

A point that does not seem to have received much notice is that the expansion in production of foodgrains took place in a year in which India's export trade had to pass through difficult weather. It is not difficult to imagine what would have been the balance of payments position of India this year but for the saving of nearly 2 million tons in imports of foodgrains. Some idea of the fall in India's exports this year can be had from the fact that, during the nine months ended September, 1953, the value of exports was only Rs. 380 crores, as against Rs. 470 crores in the corresponding period of 1952 and Rs. 580 crores in the same period of 1951. Notwithstanding the sharp contraction in food imports, the balance of trade was adverse to the tune of Rs 63 crores. If, in spite of this, India's foreign exchange reserves show an increase of nearly Rs. 10 crores between 26th December, 1952 and 11th December, 1953, it is because of the invisible receipts (including loans) which this country had during this year.

The Finance Minister's budget speech on the last day of February, 1953 envisaging a large dose of deficit financing, had raised expectations that the year would end with inflation raising its head again and that price levels and cost of living would stay high. While the latter has come true, the former has not. Monetary and banking statistics reveal no abnormality. Over the 12 months ended November, 1953, money supply shows an increase of only Rs. 27.9 crores. If we take the period 11 months ended November, 1953, the currency in circulation is actually lower by Rs. 15.46 crores. The monthly average volume of currency in circulation for these 11 months was only Rs. 1,232.41 crores, as against Rs. 1,252.04 crores in the same period of 1952. There has been a fall in bank credit also. The Scheduled banks' advances and bills purchased have declined by Rs. 19.29 crores, from Rs. 468.33 crores on 26th December, 1952 to Rs. 449.04 crores on 27th November, 1953. The average for this 11-month period is also lower at Rs. 494.6 crores, as compared with Rs. 534.7 crores. Deposits of these banks show an increase of Rs. 27.87 crores to Rs. 838.2 crores, but the major portion of this rise reflects the expansion in time deposits. It will be seen from these facts that there has been no credit or currency inflation during the year.

From the review made so far, two points emerge. One is that there has been no monetary inflation and the other is that supply of goods has been greater. Why then have price levels and cost of living continued to remain at levels higher than they were a year before (*vide* the chart published on the previous page, as well as the detailed survey of cost of living and commodity prices published on page 150 of this issue)? This paradox is not inexplicable. First, there has been no appreciable fall in wages. Secondly, the increase in the supply of foodgrains has not been large enough to make an impression on price levels. Thirdly, in the past, the price levels and cost of living were artificially low, in that they did not reflect the prices ruling in black markets. Fourthly, there is always a time lag in the adjustment of price levels and cost of living to the supply position. Fifthly, a part of the rise in prices is due to the recovery in prices of export commodities such as tea, jute, cotton and cotton textiles. Sixthly, the transport capacity, though considerably higher than a year before, has not expanded as much as it should have to move the increased supply of goods. And, finally, there has been some increase in speculative activity, which is not unusual, considering the freedom from controls that most of the commodities and finished goods enjoy.

The outlook for the coming year is not depressing for consumers. Thanks to good monsoons and fair weather, production of foodgrains, oilseeds, cotton, cloth and several other goods promises to be higher than in the year now fading into history. The sugar output may be somewhat smaller, but the supply can be easily maintained through imports. As the weight of the new crops makes itself felt on the markets, price levels may go down to some extent. The trend of world commodity markets also supports this conclusion. While thus the immediate outlook is reassuring from the point of view of supplies and prices, the larger aspect of demand for these goods and the long-term prospects for the economic advancement of the country are uncertain, if not bleak. Demand can be maintained only if there is a high level of employment which, in turn, will be possible only if there is adequate capital investment. In spite of the fact that India is now in the third year of its first Five-year Plan, the progress that has been made in this respect has been quite inadequate. The Government has chosen mixed economy as its economic system. A large area for development has been reserved for the State and an equally wide area has been left for private enterprise. Neither sector, however, has been able to complete even the modest targets laid down under the Plan. Nor is there any indication to show that progress will be rapid in the coming years at least. The private sector has been deprived of its resources and freedom to act—its plight has been forcefully stated by an eminent contributor in the article published on the next page. And the public sector is lacking in administrative efficiency, drive and single-mindedness of purpose. Unless the powers-that-be wake up, realise their faults and rectify them in time, the country will fall between the two stools.

GŌSAMVARDHAN OF PRIVATE ENTERPRISE

By M. A. Sreenivasan
Chairman, Kolar Gold Field Mining Companies

THE splendid way in which the infant Republic of India weathered menacing post-Independence and post-Partition problems that assailed her, and her impressive record of achievement in certain fields of national and international endeavour have won the admiration of the world and filled every Indian heart with thankfulness and pride. Unfortunately, the obverse of the medal is not so fair and resplendent. There is growing anxiety and disappointment in the minds of increasing numbers of men and women of all classes and parties, not excluding some associated with Government, over the worsening position in regard to many matters affecting the daily lives of the people.

It is in the economic field that the deterioration is most markedly felt. The fall in purchasing power, the deepening distress of unemployment among the educated as well as the uneducated, the decline of savings and capital formation and the lagging of the country's economy behind even the modest pace set by the well-thought-out Five-year Plan, are some of the symptoms of the economic malaise the country is suffering from.

What is the nature of the ailment and what are its causes?

It is not difficult to see that what has been called the private sector, which provides most of the revenues of the State, and 80 per cent. of the employment of the people, is debilitated and depressed, and suffers from all the effects of what medical men would call the anxiety neurosis syndrome. The landowner and the shopkeeper, the manufacturer and the business man, are, with few exceptions, feeling dispirited, insecure and nervous about the future.

Now, the health of a community, as of an individual, is greatly influenced by two factors—first, climate, and, secondly, the environment or living and working conditions.

It is common knowledge that the economic climate of India has changed a great deal since the attainment of Independence. A change was expected; unfortunately, the change that has come is not exactly exhilarating to the individual *entrepreneur*.

On the role of private enterprise in the Welfare State, opinions may vary as widely as the brands and hues of Socialism. They would vary also with the degree of willingness of the country's rulers to learn from the experience of other countries. But leaving opinions aside, it is an undisputed fact that private enterprise has made and can make a signal contribution to India's economic progress. It is in recognition of this fact that the wise men of the Planning Commission prescribed, and the Government of India accepted, what has been called a mixed economy as being the best for the country.

Unfortunately, there is much muddled thinking about the mixed economy. Stray statements by political leaders and certain ill-considered steps recently taken by the Government have added to the uncertainty and confusion.

One thing that has, more than any other, contaminated the climate for private enterprise with the fearful germs of insecurity during the last two or three years is the majority-armed readiness with which pledged word and covenant are set aside or scrapped by the State, even amending the Constitution, if necessary, for the purpose. This shakes the very foundation of what has been called the sanctity of contract upon which all free enterprise and credit, national and international, are based. It is also the negation of the Hindu Dharma, which ceaselessly reminds one of how many a mighty emperor, and even *avatars* of God, held the pledged word more sacred and inviolable than life itself.

This new sacrilege is sought to be justified on various grounds, most of which have a familiar ring of plausibility—such as that the contract is an anachronism, or that the party was not happy about it when he signed. Another somewhat novel argument frequently urged is the pressure or compulsion of events.

The argument of anachronism is one that really begs the question, as the very purpose of a contract is to safeguard against repudiation with the passage of time. The plea of individual unhappiness over a joint decision is more than an admission of disunity; it is an open invitation to the next unhappy individual in power to repudiate what the present one is happy with.

The excuse of compulsion of events is as disingenuous as it looks plausible. It suggests a belief in fatalism. It paints the picture of a party to the contract tearing it up with tears of helplessness in his eyes, almost seeking the victim's sympathy in his doing so. It evades the fact that it is the art as well as the duty of the administrator and the statesman, as it is of the engineer and the scientist to control and to guide pressures—not let the pressures control him or lead him astray. No self-respecting engineer would dream of pleading pressures as the excuse for the bursting of a dam, or the collapse of a building.

Coming now to the more immediate environment and the conditions in which the private *entrepreneur* finds himself. Not many years ago, when England ruled India, the picture was often drawn of the Indian industrialist or business man manacled, and chained to Imperial Britain's chariot and dragged helplessly along. To-day the manacles and chains are off and he is free—and how he longs to feel the thrill of it! He finds himself hemmed in by rolls of barbed wire controls and restrictions and piles of new ordinances and laws. Taxes have multiplied and are so heavy that the more his earning capacity, the larger is the number of working days he spends toiling for Government account, nearly half the year if he is hapless enough to earn five thousand rupees a month. Has he, he wonders, ceased to be a slave only to enter a more respectable and expensive serfdom to an omnipotent Welfare State? Or has he exchanged the tranquil captivity of the stall-fed cow for the freedom of the cow one sees in the streets of Calcutta and Madras, turned loose after milking time, to wander at will and pick up the sustenance she can while being bumped about and generally looked upon as a nuisance?

During the struggle for Independence, many an industrialist and business man fought side by side with or generously supported the freedom movement openly or on the quiet. He probably was also in jail. He is, perhaps, still a habitual wearer of *khadi*. Now, after the victory, he sees a rift between himself and his erstwhile political comrade which gets wider as the comrade climbs higher up the ladder of office. Once flatteringly referred to as a patriotic captain of industry, or a public-spirited merchant prince, he now finds himself called a vested interest, if not an anti-social capitalist or a greedy employer by the very *men he worked with—men he* trusted and who trusted him. He has liberty, but fraternity seems lost.

To-day, there is an abnormal exaltation of politics above economics and a predominance of politicians both in number and influence over producers of wealth and employment. This is a hangover of the unarmed battle for political independence just as indiscipline and disrespect for authority are of the Civil Disobedience Campaign. Had it been an armed fight one would have seen a similar preponderance of soldiers in uniform. It is like finding stones and rails and sheds in the site of a newly constructed reservoir or building.

Further, a fragment of the great respect the people had for the immortal leader and his great generals still attaches to every politician in the land, as flowers or confetti are found on the clothes of persons near the hero in a procession.

In a world which thus seems dominated by politics and politicians, the *entrepreneur* finds himself regarded as a second class citizen whose voice is unheard, a species threatened with extinction but tolerated meanwhile as tax- and sermon-fodder to be lectured at, in season and out, and asked to adjust and behave himself. He is puzzled by the din and hullabaloo against the earning of profit—profit which pays the taxes that keeps the State solvent and the politicians in power; profit which is the source of capital that finances development, expands production, and creates employment. It would seem that the profit motive is a deadly sin while the power motive is wholly meritorious. It is unworthy to seek a profit, but noble to seek a vote. Indeed, if the current whoops and slogans of competing vote-seekers were to be believed, it would look as though they would transform the land into an Eldorado, where there would be capital without capitalists, enterprise without reward, aid without appreciation, and quid without quo.

It is high time a halt was called to this harmful Utopia-peddling. It is time that all the collaborators in enterprise—not labour alone—are taken into confidence by those in power, and that each one of them too is encouraged, consulted, and given equal sympathy and consideration.

It is essential that the atmosphere is cleansed of fear, and insecurity and of the tensions they create. Let not the scare of Communism or of violence be tolerated as an excuse for any action that undermines credit and confidence such as expropriation. If a cobra is sighted, surely the thing to do is to kill it and not amputate the limbs of the people in the region, in anticipation of a snake-bite.

In the international field, India is striving, under the leadership of its great and respected Prime Minister, to remove the causes of world tension and to promote world security. It is certainly not too much to hope that, under his bold captaincy, the anxieties and insecurities that haunt and vitiate the domestic economic scene will also be dispelled, and cheer and confidence restored. One dearly wishes, too, that the distrust and bickering that now divide and sour the relations between labour, capital and the State, will soon vanish and that the three limbs, now brought together only for periodical tripartite wrangles, are united in a great triple confluence that will refresh and enrich the land.

The Moghul emperors are said to have had a special taste for the tongues of peacocks. Perhaps, they could afford it. In more recent times, a new taste has been developed, in political laboratories, which the Governments of certain great nations are finding ruinously expensive—the taste for the meat of the goose that lays the golden eggs. In India, the cow has been held in high reverence through the ages. Following this tradition, a clause is embodied in the new Constitution urging the protection of cows, and the prevention of cow slaughter. Accordingly, cow-killing is banned in several States, and Gosamvardhan—the protection and nurture of cows—has received official blessing and support. The need now is even more urgent for the Gosamvardhan of private enterprise—the milch cow of India's economy.

INDIA AND THE WORLD BANK

POLICY OF ASSISTANCE EXPLAINED

By Eugene R. Black

President of the International Bank for Reconstruction and Development

IN 1944, at the height of the war, India joined with other countries of the free world in the deliberations at Bretton Woods, which led to the decision to establish the International Bank for Reconstruction and Development. Since then, her association with the Bank in all aspects of its work has been close. On the one hand, India has from the beginning been one of the five largest stockholders of the Bank, and has had a permanent seat among the Executive Directors. She has thus played a considerable part in formulating the Bank's policies and in guiding the conduct of the Bank's operations. On the other hand, the Bank has made five loans to India, totalling over $113 million, and has kept in constant touch with the Government of India. I myself visited India in 1952. Many other visits have been paid by members of the Bank's staff, not only to watch the progress of the projects for which the Bank has made loans but also to gain at firsthand knowledge of the problems and conditions of India to-day.

Seven years have now elapsed since the Bank came into being. In these seven years, the post-war economic problems of the world, which could not have been foreseen with any precision at Bretton Woods, have emerged with greater clarity. At the same time, the Bank has shown that it is able to make a significant contribution to the solution of these problems. For these reasons this is an appropriate time to consider, particularly in relation to India, what the problems are and how far the Bank has helped, and can in the future help to solve them.

World of To-day Different

The world of to-day is very different from anything envisaged by those who met at Bretton Woods. The early hopes of a harmonious settlement of international political problems have been disappointed; and events of the post-war years have intensified the economic problems which proved, in any case, far greater and more intractable than was foreseen in 1944.

The hopes and preoccupations of that time are reflected in the Bank's Articles of Agreement. It was naturally expected that the first task of the Bank would be to help in the reconstruction of those countries whose economies had been worst hit by the war. Undoubtedly, this task had to have priority over others; and the Bank did in fact make large loans for reconstruction. It is easy to see in retrospect that the resources of the Bank were inadequate to this need, and that the problems of post-war reconstruction had to be attacked by other means. But this question is now largely a matter of historical interest; for the requirements of reconstruction decreased within a few years. In any case, India was fortunate in that her territories almost wholly escaped the direct devastations of war. India's problem was related to the second of the Bank's purposes—assistance to countries in need of long-term capital for economic development.

At the Bretton Woods Conference, it was thought that a large part of the Bank's work in helping development would be concerned with supporting private investment, notably by guarantees. It was laid down in the Articles of Agreement that the Bank should "promote private foreign investment by means of guarantees or participations in loans and other investments made by private investors" and it was provided that only "when private capital (was) not available on reasonable terms" was the Bank "to supplement private investment by providing . . . finance for productive purposes . . ." In other respects, too, the field within which the Bank could operate was closely defined. Thus, assistance of whatever kind was to be given only after paying due regard to the prospects that the member country, whether as borrower or guarantor, would be in a position to meet both its local currency and its foreign exchange obligations. Save in exceptional circumstances, loans were only to be made for specific projects, and only in foreign exchange.

The Bretton Woods Conference was concerned to avoid the misfortunes which overcame a great part of international lending in the inter-war period. And the experience of the post-war period has shown that this concern was not unjustified. We do not have difficulty in finding since the war examples of investment in projects which were ill conceived or ill prepared, with a resulting waste of resources difficult to excuse in times of acute shortage of capital.

If the specific field of Bank operations is borne in mind, the pattern of its lending will be understood. It will be apparent that large sectors of the development plans of various countries lie beyond the scope of the Bank's activities. Investment in schools and hospitals and similar forms of social capital cannot be regarded as directly "productive" in the sense intended by the Bank's Articles of Agreement. Other programmes of investment may be unsuitable, because they cannot be cast in the form of "specific projects" or because the expenditures are largely in local currency.

Object of Loans

Consequently, in India the Bank has aimed, in consultation with the Government, to give help by the provision of foreign exchange for projects in those sectors which can be regarded as basic to India's development. As readers of *Commerce* will be aware, loans have been made for the rehabilitation of the railways; for the reclamation of weed-infested land; for the development of electric power, for irrigation and for flood control in the Damodar Valley; and for the expansion of iron and steel production. Furthermore, the Bank is now examining projects for the expansion of electric generating capacity in Bombay State.

All these projects meet vital needs. In addition, the Bank's loans in India are conforming to a pattern which has marked the Bank's operations in a large number of underdeveloped countries, in that the greater part of the loans are devoted to increasing the capacity of those basic services without which industrial expansion would be impossible. I am confident that this is the right pattern. Unless plentiful supplies of power and efficient transport facilities exist in major industrial areas such as those around Bombay and Calcutta, India's hopes of rapid growth in industrial output will be small. And the importance of these basic services is not confined to local enterprise. For their absence constitutes in all underdeveloped countries one of the major discouragements to the entry of foreign capital.

Other Causes

Of course, the absence or shortage of these services is not the only reason for the failure of foreign capital to flow in larger quantities to India. Indeed, to-day it is probably not even the most important reason. I have already mentioned the expectation held at Bretton Woods that the Bank would primarily be concerned with the promotion and support of foreign private investment in underdeveloped areas; and the Bank has constantly emphasised the need for steps which can be taken by underdeveloped countries to attract foreign investors. At this year's Annual Meeting of the Board of Governors, held in September, 1953, the Bank arranged for an informal discussion of this question by a panel of experts, of which Sir Benegal Rama Rau, Governor of the Reserve Bank of India, was a member. It is not possible within the limits of this article to refer to the points there made. But it is worth noting that, of the various factors mentioned during the discussion as having inhibited the flow of private foreign capital to underdeveloped areas, many were of a kind which could be affected only by the initiative of the country concerned.

The Bank is ready to promote private foreign investment by every means available to it. But the first steps must clearly be made by the private investors themselves. It is doubtless disappointing to a country like India, which has made many efforts since the war to provide a hospitable climate for the foreign investor, to find that the inflow of funds, and of the technical expertise that could accompany such inflow, has been small in relation to the needs of the country. We can hope, however, that India's efforts will be rewarded. The various contracts which have been made with foreign firms with provision for some Indian share in the equity of the concern have indicated a new and hopeful technique. Equally encouraging are the agreements recently concluded with three oil companies for the building of refineries.

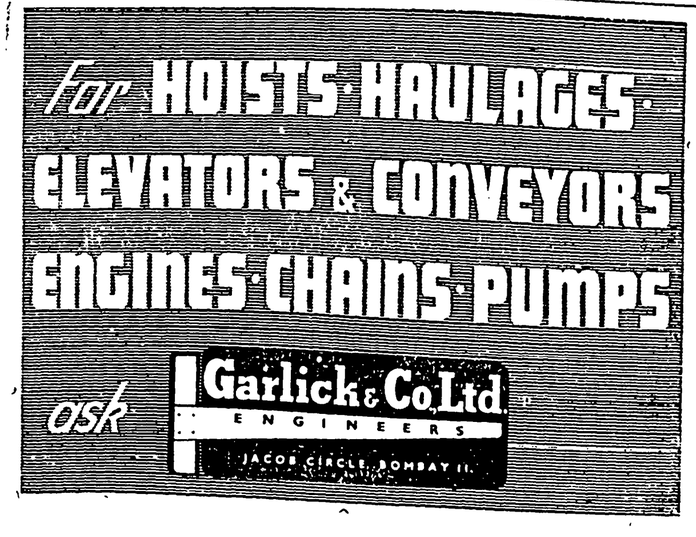
The confidence of foreign investors takes long to build up and can be very quickly dissipated, even by events beyond the boundaries of India. It is now generally appreciated that the lack of basic facilities, although important, is not the only deterrent to foreign investment in underdeveloped regions. But it is a hopeful sign there is an increasing intention throughout the world, amongst private individuals and in Governments, to deal with the other deterrents.

Revolution in Social Outlook

It must be remembered, too, that, in an important economic sense, the India of to-day is a new India. It is not merely that she has emerged since the war as a full sovereign power. She has also, like many other countries, undergone a revolution in social outlook. The people and the Government are aware to-day more than ever before of the possibilities of, and the necessity for, improving the standard of living of the vast majority of the population. The Five-year Plan is a reflection of this awareness.

I should, however, like to repeat what I have often said before. The process of development cannot depend on the provision of funds alone, whether these come from the Bank, or from foreign private investors, or from domestic saving. As the Government of India well knows, if the aims of development are to be achieved the real impetus must come from the people of India. There must be fundamental changes in the outlook of townsman and villager alike. Progress of any kind involves the abandonment of some old ideas, not only among managers and landowners, but also among the people themselves. For this reason the Bank is watching with great interest the course of the Community Development Programme.

Much has been learned from the experience of the past few years, both by the Bank and by India. Given a continuation of the political stability which has been a feature of the Indian scene since the war, and of the approach which the Government of India has made toward solving the economic problems which face it, there is ample ground for hope that the objectives of the Five-year Plan will be achieved. The Bank shares India's desire to accelerate her economic development, and will continue to support the Plan in all ways that appear sound and practicable.—*All Rights Reserved.*



SYNTHESIS OF RURAL AND URBAN LIFE

DEVELOPMENT OF ELECTRIC POWER CAN ACHIEVE IT

By Sir S. V. Ramamurthy

I.C.S. (Retd.)

INDIA, like the rest of Asia, has long developed a predominantly rural civilisation. Eighty per cent. of the people of India live in villages. In Europe, with the Industrial Revolution, there was a growth of urban civilisation, without losing the old quality of rural areas. In America, civilisation is being developed predominantly as an urban one, with the result that some 80 per cent. of the people of the United States live in cities. The tendency of the modern world, under the impetus of science and mass production, is towards the rise of the urban way of life, replacing the rural way.

Primarily, rural life has agriculture for its basis, while urban life grows around industry. The quality of rural life is set by man's dependence on nature, while the quality of urban life is set by man's conquest of nature. In rural life, the objective of a man is to attain self-sufficiency in growing and making things that he needs for his life, while in urban life the object is commercialism, under which man produces more than he needs and by selling the surplus he gets the rest of the things that he needs. In rural life, the strength of family life continues, whereas, in urban life, individualism tends to replace the strength of family ties. Being in closer contact with nature, rural life continues its attitude of faith in religion, whereas, in urban life, more and more rationalism, bounded by the facts and hypotheses of science, tends to govern man's attitude towards the world. The pace of rural life continues to be slow, unlike that of urban life which seeks more and more of motion. There is a greater integrity in rural life, where art is woven with business, whereas, in urban life, art and the business of life are kept apart.

Not only in time but also in space the quality of rural life differs from that of urban life. Rural groupings are small. Urban groupings tend to be large. Roughly speaking, a population of 500 living together in a place may be regarded as a hamlet. A population of 5,000 may be regarded as a village. A population of 5,000 to 20,000 may be treated as a modern town. Beyond 20,000, municipal life gathers momentum and at a stage of a couple of lakhs of population the large city life is evolved. It is surprising how all these changes of quality from hamlet to village, village to small town, small town to big town are paralleled by a change of quantity. There is a well-known principle in philosophy that quantity is incipient quality. If a man has a few rupees in his hand he is poor, but, as the number of rupees with him rises to a hundred, thousand, ten thousand, he becomes rich. As this again grows to 50,000, a lakh, a million, he becomes a millionaire. If, therefore, we feel the need to change the quality of any given continuum of life, one might study the quantitative basis of existing continua and by striking a middle quantity attain a middle quality.

In India, we feel that 80 per cent. of rural life, with its corresponding emphasis on agriculture, is too heavy a factor for enabling the life of the country to grow apace in modern times. While 20 per cent. of village life is too small, 80 per cent. of urban life as in America is too large. There are no doubt advantages attached to each way of life. I was once talking to a leading journalist in Italy and, when he spoke of the objectives of Italian nationalism, I felt that, if I substituted India for Italy in what he said, much that he said could apply to India. His main thesis was that Italy sought the development of rural civilisation, because it was much less liable to crisis than urban civilisation. While, however, a large rural civilisation has the advantage of security and stability, lack of growth of an urban way of life tends to deprive man of the growing advantages of modern science and industry. Some kind of a balance between the rural and urban, between agriculture and industry, between dominance of nature and of man, between security and progress, between self-sufficiency and a large economic life has got to be struck. It is hardly possible to change the quality of rural life at its own end or that of urban life at its end. A synthesis of these two must be found in some middle region which can act as a buffer between the rural and the urban.

We often hear of the cry, "Back to the land." People have moved from villages to towns, because of the lack of amenities which modern life makes possible and desirable. People in a village lack decent roads, a pure water-supply and shops to get modern necessaries. One feels cut off from the various events of world life by being in belated touch with newspapers, with rare possibilities of hearing the radio or seeing the cinema. When people in towns feel the need of a more secure life than the vissicitudes of urban civilisation make possible or when the nation feels that intelligence and energy are being drained out of villages to the towns to the detriment of village life which is the major part of Indian life, the cry of "Back to the village" rises. I have known several people who tried to do this but rarely they stayed on in the village. They found life too uncomfortable, they found the minimum necessaries of life to which they have become accustomed missing. They feel also the ideology of village life to be something which they have overcome. The course of urban life makes them unfit for strong family ties, unfit for the daily religious life centering around the temple in a village, unfit to look on life as something desirably self-sufficient. We are thus left with the dilemma of a rural life, which is unsatisfying in some ways but necessary to national life and of an urban life the growth of which is necessary but which does not give a satisfying life to the many that may crowd there from villages.

The remedy to this seems to me to be the development of a type of life which combines both the rural and urban qualities of life. On the theory that quantity develops quality, could we not maintain a predominantly agricultural life with a population of, say, 20,000 people, spread over a number of villages which are linked together by a common centre from which modern amenities could flow back to the villages? Twenty thousand people live together in what is called a town where we have a high school, a hospital, shops, cinemas and other amenities of modern life. Such an arrangement has been possible, because, though the number of people there is large, the area in which they live is small. With the means of communication and transport that have been in the past available, it was not easy to have group life for the 20,000 people when they were spread over a comparatively large area. But modern science, both mechanical and electrical, has made it possible for 20,000 people spread over a largish area yet to live a sufficiently compact life.

We have witnessed a somewhat similar phenomenon in the continent of India being knit together politically into a country by the British rulers who introduced modern transport and communications in India. When, in the old days, it took long to send an order from Delhi to Madras and therefore it was difficult to realise a common administration for India, the position changed when railway trains, telegraph and aeroplanes brought distances such as between Delhi and Madras to small proportions. It is an advantage to India that it should become politically one Union instead of a bundle of many States. So also it would be an advantage for a population of 20,000 people not being spread in so many villages but forming one compact administrative entity where people could on the one hand attend to their accustomed occupations yet live together in newer relationships. To an area that develops such a type of life, the word "rurban" can be applied. It is a synthesis of rural and urban. The quality of "rurban" life is the synthesis of the quality of rural life and of urban life. Agriculture can be combined with cottage and small-scale industries. This is particularly possible by the use of electrical power which permits democratic decentralisation. One reason for urban life in Europe developing with a concentration of large populations was that power for large industry was only supplied through coal and oil and the development of such power required a concentration of work and workers. The use of electricity, on the other hand, permits mass production in a decentralised form. The use of large-scale industrialisation in Europe led Indian thinkers for a time to object to the use of power, but it is being recognised that the use of electricity is as attuned to rural life as it can be to urban life.

With the first production of electricity in India, the tendency has been to use it for large-scale industry. When power was generated, the question was asked where was the load for it, because it was felt that power could be used only in large-scale factories, as was the case with coal and oil power. But now the feeling is growing that the use of electric power is socially more advantageous when it is adjusted to the use of a large number of small users rather than the use of a small number of large users. It is no longer necessary for the development of modern industry with the use of electrical power to have large concentration of population or, in other words, large towns for the purpose of industry. One could have smaller groups of population better educated than in small villages, but carrying together intelligent and skilful processes with the aid of electricity, without requiring the growth of large towns. A "rurban" way of life, therefore, can be sustained and stimulated by the use of electrical power just as the urban way of life was sustained and stimulated by the use of large mechanical power.

In a country like India, where the balance between the rural and the urban is lopsided, we need to reduce the preponderance of rural life. My own feeling is that 60 per cent. of rural life, 25 per cent. of "rurban" life and 15 per cent. of urban life would make for a good balance in the structure of Indian economic life. The "rurban" way as a middle way, bringing together rural life, on the one hand, and urban life, on the other, makes for a synthesis of the rural and the urban.—*All Rights Reserved.*

THE UNEMPLOYMENT PROBLEM

NECESSITY FOR A LONG-TERM SOLUTION

By A. D. Gorwala

AN understanding of the occupational structure of India is the beginning for any consideration of the problem of unemployment. How are Indians mainly employed? Employment falls into two broad classes, employers and independent workers being one and employees the other. Agriculture dominates the employment field. In it self-employment is of great importance. So, too, self-employment is very significant in small industry, trade and transport, and service activities including professions. The large bulk of the employees are to be found in the public force and administration, education, health and sanitary activities, railway and other public transport, large industry and mining, small industry and trade, the professions and domestic service. For both these categories, unemployment can be overt or disguised. Disguised unemployment is often termed underemployment.

The measurement of the dimensions of unemployment, overt and disguised, is difficult in the extreme. Taking even the urban sector, there is great lack of information. Proper unemployment data, as found in many other countries, are not available even in organised manufacture and mining. There is always a large peripheral labour force which makes difficult any approach to exactness. Such a force, moreover, is peripheral from the points of view of both occupation and location, for its members are liable to change both, making the keeping of proper statistics even with the best of will a problem in guessing. Total employment is known for some categories such as factories, industries and mines, and Government services, inclusive of railways and other State transport. Any conclusions that may be drawn from these total figures are, however, vitiated by the difficulty of defining the labour force affected. Employment Exchange data may be of some use as an index of general urban employment, but it gives no overall measurement of unemployment. Nor is the census data, available for some States only, of particular help from the all-India point of view.

Some Sample Surveys

Turning to some samples which specific surveys have made available, we find in the Gokhale Institute Urban Socio-Economic Surveys that, in 1936-37 in Poona, the proportion of unemployment was 3 per cent. of the total occupied and 5-6 per cent. of the employed. The Sholapur Survey of 1939-40 held by the same Institute showed 1 per cent. and the Kolhapur Survey of 1944 also showed 1 per cent. The passage of time and the increase of employment during the war accounted, perhaps, for the reduction in unemployment. An interesting feature of these surveys was that the percentage of unemployed among the literate in all languages was the same as that among those literate in English. From these surveys, it appeared that the main categories affected were the depressed classes, some artisan groups and the advanced classes, broadly in that order. While urban employment is usually on a weekly or monthly salary basis, in rural employment, only a small percentage is annual and the rest mostly on a daily basis, making unemployment more difficult to measure.

About rural employment, in fact, there is even less information available than about urban. Although there have been agricultural labour enquiries and pilot village surveys, the data generally given is in terms of overall annual days of work. This comes to between 150 and 200 per annum. There has also been an ambitious attempt by the Bombay Bureau of Statistics to measure both unemployment and the discontinuous employment from which cultivators suffer largely. The difficulty here often arises from the need to distinguish between reportable unemployment and idling or doing trifling work. What, for instance, are to be the criteria? When does the agriculturist report that he is actually unemployed? The Bureau data is classified in terms of persons and seems to indicate that the amount of unemployment, as distinguished from underemployment or discontinuous employment, is small even among agricultural labourers. Other data compiled by the Poona Section of the National Sample Survey in 1950-51, which is classified in terms of man-day employment, shows broadly a larger degree of unemployment in certain regions, especially in the South, for instance, 6 per cent. among non-cultivating adult males.

The comparatively low figures in all these surveys indicate the difficulty of properly measuring unemployment in rural areas. And this is understandable, for the status of the persons considered does not remain static throughout the time. Transfers within the various categories continuously take place. Agricultural labourers or rural artisans revert to the status of self-employed. Even landowners, with reasonably sized holdings, are often in receipt of cash wages. Considering both the urban and rural sectors, it has to be admitted that the measurement of unemployment is, in the Indian situation, not easy.

Two propositions can be safely made. Chronic unemployment is almost non-existent in the rural sector, though there is a great deal of disguised unemployment resulting in considerable hardship. Because of the influx and efflux of the labour force, it is extremely difficult to identify a hard core of permanent unemployed in the urban sector.

Types of Unemployment

The situations regarding unemployment that arise in more developed countries can be isolated into distinct types. There is the seasonal unemployment, which is normal and to be found in almost any year for certain trades, professions, etc. There is the structural unemployment often associated with technological advances. Changes in the structure of economic society bring about unemployment. There is the cyclical unemployment which owes its origin to industrial fluctuations and trade cycles.

The Indian situation has certainly a chronic element of technological unemployment in it. This is so especially in relation to small industries. The situation would also seem to have been detrimentally affected for some months at least by cyclical factors, though these seem to be losing their strength recently. In the main, however, the Indian situation does not fall into the usual patterns. The effects of an economy with inadequate resources, lacking a proper relationship between the factors necessary for the employment of modern technique, are aggravated by a constantly growing population. This, considered in conjunction with the occupation distribution, explains how unemployment pressures in large backward structures are compatible with full employment in organised industry and how, therefore, even organised industry working at full capacity is no guarantee of the absence of unemployment in other parts of the economic fabric.

Principal Remedies

The Indian problem is, in fact, connected with the total character of the economy. It must necessarily be considered as such. The placing of emphasis on the educated unemployed, natural as it is, in view of the vocal character and political possibilities of that class, is likely to be misleading. The greatest sufferers from the present situation would seem to be landless agricultural and non-agricultural rural labourers, casual urban labourers, workers in rural and urban small industries and wage-artisans. In all these categories, the lower socio-economic grades suffer the most. In social terms, these are, broadly speaking, the depressed classes, the aborigines and the lower artisan categories. This does not mean, of course, that there is no suffering among other classes. It is all a question of proportion and degree.

The principal remedies by which other countries attempt to meet the ravages of unemployment are extensive price support of agricultural commodities and large public expenditure. With the aid of these, they aim at providing stable incomes thus leading to full employment. Now these devices have a very limited application in Indian conditions.

Full employment in terms of the total use of the industrial capacity available can be comparatively easily attained here. But since that capacity is itself extremely limited in terms of real employment needs, that is not likely to make any substantial impression on the unemployment problem. Again, as the agricultural sector occupies a very large place in national production, price support can also have very limited application. All that would seem to be possible by price support is some correction of the terms of trade between the agricultural and non-agricultural sectors and the maintenance of the correction over a period of time. The natural correction of the terms of trade of the 'thirties that followed from the shortage of agricultural commodities during the early war years was later maintained by measures of price-support such as Government buying and price control of agricultural and non-agricultural commodities. As regards public expenditure, because of the narrow margin of full capacity employment, too greatly increased public expenditure generates quickly inflationary forces, leading on to further hardship even for the employed. A consideration of this problem of provision of employment in terms of the familiar short-run equilibrium is then not likely to be fruitful. In fact, as the normal working of our economy does not give the investment quantum required by our technical backwardness and increasing population, this method of dealing with it will not be successful.

Educated Unemployed

Obviously some other more fundamental requirement has to be met. That is to be found in man acting on what employs labour or affords employment, namely, national resources and capital. With modern technology, the importance of capital increases considerably, while the Indian capital saving performance is by no means satisfactory, since consumption leaves but little for investment. The educated unemployed are in a very special sense the product of this failure of capital to meet real needs, for they can only find employment as adjuncts to the activities engendered by the use of capital. As units by themselves, their use is extremely limited indeed. Public action, then, if it has to have any effect on employment, must have a double aim, short-run and long-run, it being remembered all the time that the short-run does not automatically lead to proper long-run results. The aims must be, while maintaining full employment and stable income, to increase substantially the rate of appropriate investment.

The Implications

The implications of this for public policy are many. They relate to Government expenditure, regulation, control and direction, both of investment and of consumption and to settling the area of the public sector. Given the aims, a *laissez faire* solution, is evidently out of question. The consumption-saving dilemma must be faced. The general consumption must be cut down and yet the consumption of the poorer classes must be maintained at a minimum. Private profits must be kept down and yet the product must be increased by proper investment.

The importance of broadening basic production must be realised. Initial investment must lead to the larger base on which further industrialisation can follow. It must not so far as possible impinge on present spheres of production employing large personnel and low technique. That development can follow later, a programme of transition being properly worked out. All these results are, to say the least, unlikely, if a large private sector operating on *laissez faire* principles continues. Only by rationalising consumption and foreign trade, directing investment where it is wanted, deciding upon the proper allocation between the production of consumer goods and producer goods can that increase in the national product be brought about, which will enable the further investment that will increase employment sufficiently.

Long-term Plan

The plan obviously must be a long-term design. It has to be remembered that such a plan can only be worked if there are a certain minimum of social security measures in the form of public health amenities, poor relief, etc. The situation of the least privileged must be ameliorated to a certain extent, while they are being called upon to bear the discipline and sacrifices that go with such a plan. In this connection, the experience of famine works is very relevant. A policy of properly worked famine relief often results in a better consumption level for the poorest classes during a famine, because of the provision of regular work, some amenities and the distribution of food at a fixed price. The results of a rightly directed famine policy can, on the other hand, be a large series of public works, meaning increased capital and lack of discontent.

One further prerequisite for a sensible solution of the unemployment problem is a proper campaign of population control. In the conditions of this country, with its existing natural resources, unrestricted growth of population must, despite even the most vigorous efforts, lead to a lowering of the standard of living and a glut upon the labour market of educated or uneducated alike. Not the least important factor, then, in a proper employment policy must be full consciousness of the need for holding the population.—*All Rights Reserved.*

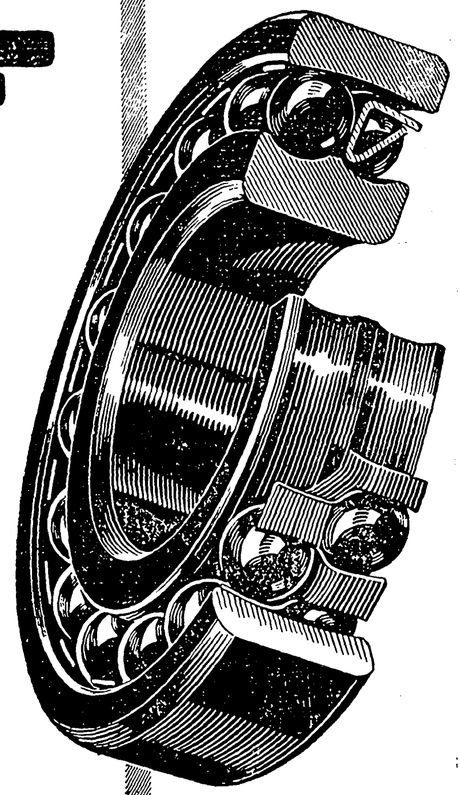
People of European origin increased more than twice as fast as non-Europeans between 1650 and 1950, growing from about 100 million to 800 million, while the non-European population in the world grew only from 445 million to 1,600 million, say the authors of a new report brought out by the Twentieth Century Fund.

Real wages in the United States—goods and services that can be bought with an average hour's work—doubled in the 67 years ending with 1914, but took only 33 years to double again after 1914.

Each year about two million young people in the U.S. get their first jobs or begin to look for a job, while roughly one-and-a-half million workers die or retire because of age or disability.

SKF

Manufacturing the most comprehensive range of ball and roller bearings . . .



In every division of India's industry—in heavy steel plants, in large textile mills, and in small workshops—wherever Ball and Roller Bearings can make operations smoother and production cheaper, there you will find SKF. SKF has its own organisation in India with a technical staff always at hand to help you select the most suitable and economical bearings from a range so complete that the correct bearing-type for any application can be supplied and installed.

COMMUNITY DEVELOPMENT PROJECTS

FAMILY PLANNING NEGLECTED

THE target of any national reform in our country must be evolve ultimately—not revolutionise overnight even were it possible—a casteless, secular, welfare State in reality (and not on paper or in the Constitution as we have it to-day), free from all traditional uneconomic, fear-fostering and inertia-breeding fetters. A major step towards this goal is to raise the level of living of the backbone of our population—the rural millions who lead a parody of life in the countryside. This means not only the reconstruction of the rural scene, but also rehabilitation of the rural man. Efforts at rural reconstruction in the general sense date from a pre-Gandhian era and are now more than half a century old, but, judging from the present situation, there seems to have been no improvement deserving the term "progress." What then is the difficulty?

The difficulties have been many, but the major ones seem to me the segmental or the isolated approach (whether it is official or voluntary), lack of the will to better themselves on the part of the people involving a kind of fatalistic approach and, finally, the inordinate (in relation to the available economic and other resources) growth of population in the country as a whole. Now that the National Extension Service and the Community Development Projects, set up by the Planning Commission with the co-operation and the financial and technical aid of the Ford Foundation, have completed a year of their labours, their approach and its adequacy may be briefly examined in the light of the triple major obstacles to rural reconstruction mentioned earlier.

Chief Aims

What is a Community Development Project? The Community Development Project aims to bring about an all-round development of the human and material resources of rural India. The term is new, but the concept is really old. First, it is not a sectional or a segmental approach. It is a multi-pronged attack, developing the various inextricably interdependent sectors of the rural economy. It is now realised that all the rural interests are intimately related and that no lasting results can be achieved if individual aspects are dealt with in isolation. Secondly, though it is a an official programme, it is not something to be thrust down upon the villages by the Government servants at the top in their superior wisdom of what is good for the countryside. Here again, fortunately, the approach has been a correct one, in the sense that these Projects have tried, and often successfully, to awaken the interest and active support of the villagers themselves. Once our villagers are convinced of the desirability and the profitability of the new integrated approach in raising their standard of living, their spontaneous initiative and drive can be effectively channelled toward this effort.

But the third criterion of population control, advanced earlier as a major difficulty, has not been touched at all. The reason for this unfortunate omission seems to be that neither the Government of India nor the Ford Foundation appears to be eager to touch the explosive population question in the villages. Even those obscurantists, who subscribe to the theory of "The more the merrier" in our present economic context, must concede that one of the biggest obstacles in the path of our national development—rural and urban—continues to be our high birth rate, something in the order of 40 per 1,000, which is among the highest fertility rates registered in the world.

The simultaneous and integrated development of all the rural sectors and the resulting cumulative effect in a few years is bound to be impressive, if nothing untoward happens to the Projects. More irrigation, better seeds, better-bred cows and bulls, scientific ploughs, compost, double cropping, diffusion of some elementary knowledge of scientific agriculture, subsidiary occupation to the under-employed farmers in the cottage industries, all these are bound to give us more food and more money. There is no doubt about the utter desirability or the ultimate effectiveness of these simple and yet revolutionary reforms. Besides these, we are building more rural roads which will ease transportation problems resulting in easier marketing, and provide good drinking water all

By Dr. S. Chandrasekhar

Professor of Economics, Baroda University, and Nuffield Foundation Fellow, London School of Economics

the year round which will lead to drastic reduction in the rate of rural morbidity. The Development Projects are also improving public sanitation and hygiene, involving a more rational disposal of garbage and night soil. These will effect a reduction in our overall death rate. Then there are new schools springing up in these areas built with the villagers' voluntary labour and these schools are bound to open up, at least a little, the big, wide world beyond the horizon of the village. Apart from the traditional three R's, the schools and the Adult Social Education centres that accompany them will lead to some welcome discontent with the traditional way of life and the existing pattern of accepted respectabilities. They may, in course of time, awaken the latent spirit of adventure among the villagers and the present poverty may not be accepted any more as a part of the divinely ordained scheme of things. This will result in an insistent desire for a better and a higher standard of living, demanding more of the things they have to-day and some of the good things they never had before. When this social change comes about, it will be all for the good, for we are hoping and working for some similar change in the minds of our rural people.

Population Control

What will be the final effect of all these reforms? The effect, of course, will not be quick or immediate, but it is part of "planning" that we look ahead, far ahead if necessary. Our villages will have better health, suffer perhaps from fewer diseases, if at all (!), marry early, live long and have more children—children who will not die in numbers before they reach their first birthday as they do to-day, because of more milk, better food, more sanitation and some modicum of medical care and wonder drugs. The rural population will increase. But then, we shall also have more food, thanks to better agriculture, self-help and the co-operative atmosphere in the village. All this is very well—but more people and more food will simply mean the same old standard of living, made perhaps a little worse by the fact that there will be fewer deaths among the adults and the children. Then, the vicious circle will begin all over again. This may be too pessimistic a forecast and this may happen only in the very distant future. Possible. But the pattern is clear and we must try to plan now to avoid this picture of the future.

Before it is too late, therefore, it is to be hoped that the Village Level Worker and the numerous voluntary social work agencies, not to speak of the Government agencies, will be encouraged to preach, to our rural mothers particularly, that there is no need to marry early or to multiply fast and that there is something called planned parenthood. There is nothing in our religious or rural mores to interfere with this supposedly new doctrine of planned parenthood. If the Village Level Worker can only tell the people that it is patriotic to have only three children, it is quite possible that our villagers might respond sooner than we imagine and this gospel of three children per couple might solve the unhappy problem of improvident maternity.

Increased production must be accompanied by a decreased number of mouths to be fed if the per capita share of everything is to increase. In our present situation, there is no other way for a higher standard of living. Had the question of population control been included in the programme in the 55 Project Areas launched on 2nd October, 1952, now, a year later, some results might have been registered. Even if the result were not one of less people sharing increased production, it could at least have been in the direction of discussion and thought on this question in our villages. The problem of our poverty is of such an incredible dimension that we should attack it from all possible angles without inhibition or irrationality. It is exactly because the Community Project is a many-sided approach that this aspect of inculcating the small family habit cannot be ignored. It is true that the desire for a small family implies an understanding of and advancement in certain other sectors of rural material and cultural life, but the Projects have launched schemes to improve these very sectors that impinge on the desire for a small family. It is realised that social change is not an overnight process. It does take time and it is normally the result of a silent social revolution in which the mental outlook of millions is transformed to aspire for higher and better goals in life. But I believe that some effort should be directed towards this aspect to change the climate of public opinion in our villages on this question.

Multi-purpose Agent

Let it not be said that the Village Level Worker of the Community Project areas is not an expert on contraceptives and that he cannot do everything. The Village Worker is really a multi-purpose agent. He must be both a "specialist" on every rural topic and a Jack-of-all-village-trades. His concern and interest must embrace the entire gamut of the rural scene. If he is sympathetic to the needs and aspirations of the villagers, he must also be alive to the limitations of the resources at his disposal. He must be able to balance the legitimate needs and the available resources and see whether both could be increased and met. An easy way is to increase production and decrease the number of mouths to be fed.

Apart from this criticism of the approach towards rural problems, the actual set-up of the Community Development Projects leaves little to be desired. The development programmes fall into two separate but interrelated parts. The first is supervised by the Community Projects Administration, with substantial financial assistance from the Indo-American Technical Co-operation Fund. The Projects planned for under this part of the programme consist of three types: (1) the "basic" community development project, (2) the "composite" development project and (3) the training centre for instructing the Village Level Workers.

In the "basic" community development projects, major emphasis is laid upon increasing agricultural production, with some efforts at improving public health, village roads and schools. Each Project area roughly covers an area of about 300 villages with a population of 200,000, about 500 square miles in area with some 150,000 acres of cultivated land. The Project area consists of three development blocks, each block covering about a hundred villages. The cost of "basic" development projects has been estimated by the Planning Commission at Rs. 6.5 million over a period of three years, of which Rs. 0.65 million will be foreign assistance. In the "composite" development projects and blocks the primary emphasis will be on the development of small industries and rural crafts. The "industrialisation" of the villages will be after the pattern developed in Nilokheri and Faridabad rehabilitation colonies.

The total cost of this part of the Community Projects Programme during the next three years will be roughly Rs. 380 million. The United States Government are providing Rs. 50 million in dollars under the Indo-U.S. Technical Co-operation Agreement entered into in 1952.

The Training Centres, which form the Rural Extension Service to the programme, are located in community development projects or blocks so as to facilitate the training of student village workers. The cost of these Training Centres is also covered by the financial assistance given by the Ford Foundation. Each of the Training Centres provides facilities for the training of fifty village workers at a time. The overall work undertaken in all the three types of Community Projects are distributed in the country as shown in the table at the foot of this page.

The Community Projects Administration have completed a year since the inauguration of the Programme in October, 1952. The first-year anniversary is marked by the publication by the Administration of a journal called *Kurukshetra* reminding us of a great war fought in an earlier and great epoch of Indian history. The present *Kurukshetra* against poverty and all its attendant evils as recorded in the journal makes impressive reading. If this *tempo* and quality of progress registered in the first year are kept up in the subsequent years, we are bound to witness substantial development in our villages in the years immediately ahead. Talking of these Community Development Projects, Mr. Nehru, India's Prime Minister, recently observed:

"All over India, we have centres of human activity which are like lamps spreading their light more and more in the surrounding darkness. This light has to grow till it covers the land. Among these centres, there is Nilokheri which has achieved a great deal of fame in India and outside. That brings a great responsibility on Nilokheri and other like centres. They are the examples for others to follow and they must keep up high standards, because it is quality that will tell in the end, not quantity."

This message from Mr. Nehru brings us to our main criticism, that we cannot have both quantity and quality; we can have quality only at the expense of quantity.—*All Rights Reserved.*

from perseverance and industry

come prosperity and progress

In any field of activity the success or failure of an enterprise depends on human endeavour — the persevcrance and industry that man devotes to the execution of a given task.

Symbolic of this are the various multipurpose projects that are being implemented under the Five Year Plan at great cost and enormous human effort which will ultimately lead to a new era of better living and prosperity for millions in this country.

In the field of industry, the vast and extensive activities of Sahu Jain Ltd., are the result of years of planned endeavour and demonstrate that the efforts of man combined with money and materials build up the economic strength and prosperity of the country.

EFFECT OF POPULATION TRENDS ON ECONOMIC DEVELOPMENT

BETTER TO RELY ON LOCAL CAPITAL GENERATION

THE subject matter of this article is one which seems to have received insufficient attention in our consideration of the whole field of economic development; that is to say, the effect on economic development of the wide forces at work in the world to-day on the population of our planet. Let us first examine what we mean by economic development. Is it not fair to say that the modern meaning of this term so widely used to-day is the process of expanding the availability of the necessary things of life for consumption by the widest possible segment of the population? To attain this increase in the availability of food, clothing, shelter, means of transportation and the like, we must also produce more raw materials and capital goods, for these are essential to a continuation of the process of expansion of production of items for consumption. We must also increase the availability of the services upon which we increasingly depend, such as for communications, as well as facilities for wider education and a greater dissemination of the cultural and religious values of life. It is a complex market basket, but I think it has built into it the notion that, as the generations succeed each other, the individual himself should be able to look forward on a per capita basis to a fuller and fuller market basket. As the economists would say, this is the concept of the increasing standard of living per capita.

Those last two words are of enormous importance, for they set up a mathematical relationship. The available supplies of goods and services, increasing as they may be, must continually be divided by the number of people which must share in them, also increasing as they are. If the standard of living per capita is to grow, the divisor must grow less rapidly than the numerator. Our increase in available goods and services must be at a faster rate than the people who must partake of them. This is all rather elementary and you have heard it stated many times. The very statement of the case, however, generates widespread differences of opinion as to the forces at work in the rate of increase of both goods and people. I propose briefly to analyse some of these views, particularly with reference to the conditions so prevalent in the Far East.

Pools of Population

Generally speaking, the pools of world population are divided into three somewhat distinct classes. There are in the world to-day:

First, the old primarily agrarian countries, little industrialised, but supporting at a distressingly low subsistence level very large populations exhibiting the age-old pattern of very high death rates and correspondingly high birth rates. The average level of living in these areas is, of course, very low, because the divisor of the equation is very large.

Secondly, there are those countries which have gone far in the direction of a new pattern of population stabilisation, with low death rates, a greatly increased span of life, and low birth rate. This pattern is typical of the Western European countries and North America. Industrialisation is usually far advanced, although the agricultural production of many of these countries is still substantial. In many of these countries, both the birth and the death rates have steadily declined for many years, albeit with a significant lag in the decline of the birth rate.

Finally, there are those countries which are in the position of transition from the first category to the second. Some of these countries are already heavily populated. Other nations have the good fortune of possessing still large unpopulated areas of potential production, such as Brazil, Australia, and parts of Africa. In general, we see in this category fairly rapidly falling death rates, but birth rates with a marked tendency to remain high and to decline, if at all, rather slowly.

Most of the countries of the Far East, with the notable exception of Japan, fall into either the first or the third of these categories. These are the explosive areas from a demographic point of view, for their populations are frequently increasing at two or three times the rate for the world as a whole.

In studying economic development in such countries, one is confronted with a number of basic realities which necessarily heavily influence the planning for such development. The more important of these are:

By Samuel W. Anderson

Assistant Secretary, United States Department of Commerce

1. Very low overall level of living, high rate of consumption in relation to earnings, and, in consequence, very low capital generation, because of lack of savings;

2. a great lack of modern agricultural and industrial production techniques as known in the Western world, except in the newer industrial sectors of the economy;

3. relatively poor and expensive transportation facilities so necessary for the internal movement of goods in large volume;

4. non-existence or complete inadequacy of anything approaching modern sanitary conditions or healthy environment.

Certainly, one of the most universal reactions of the Western mind to the social and economic conditions in the countries, with which we are now dealing, is an intense and entirely creditable desire to improve the physical lot of the masses of people living on a low level of nutrition and with inadequate treatment for their many ills. Agency after agency and foundation after foundation have come to grips with this problem in wide areas of the Far East, as elsewhere in the world. Readers know better than I the history of these efforts for the improvement of public health in the Far East. But in recent years, something new has been added. We have discovered new and miraculous drugs and chemicals, the application of which on a wide scale at comparatively minor cost has a spectacular effect upon the health of the population. Let me give a few startling examples.

Ceylon

In only one year, Ceylon's death rate fell from 20.3 per thousand in 1946 to 14.3 in 1947, as a result of an anti-malarial campaign based mainly on residual spraying with D.D.T. at a cost of 15 cents per capita. The birth rate remained high, at about 40. As a result, Ceylon's annual rate of growth increased about 50 per cent. (from 14.5 to 25.1 per thousand). In 1950, the population of Ceylon was about 7.6 million—a density of over 300 persons per square mile and only half an arable acre per person. Even now, Ceylon imports food, and her problems will increase, because at the current rate of growth, her population will double in only 25 years.

In the largest single public health programme in the world, the U.S. Technical Co-operation Administration sprayed some 1,200 tons of D.D.T. in 9,000 Iranian villages to kill malarial mosquitoes. As a result, according to Dr. Palmquist, the incidence of malaria was reduced at once from about 90 per cent. of the population to 19 per cent. Picture for yourself the decline in the death rates in those 9,000 villages and the resulting increase in their populations which lies ahead.

Position in India

Before World War I, what was then British India and the Indian States was a typical example of the first category. According to Kingsley Davis, in his monumental work on the population of India and Pakistan, the average annual death rate in the decade of 1911 to 1921, was 48.6 per thousand, the highest on record, largely due to the severe epidemics of 1918. The death rate started a decline after 1920, which brought it to about 35 per thousand in the thirties, where it remained, with variations, until the end of the Second World War. There is some evidence that there have been appreciable declines in some areas in recent years. In the meantime, birth rates remained relatively unchanging at a plateau of around 43 in the two decades from 1920 to 1940. There is some suggestion that there may have been slight declines in recent years, but, if so, they are far less than the decline in the death rates.

India's 1.2 per cent. annual rate of population growth at present is not nearly as high as in many other lands. But the very massiveness of her population of about 360 million, the divisor in our equation, poses a great problem in economic development. At present rates, about 50 to 55 million additional consumers, a population considerably greater than Great Britain, must be cared for each decade.

If, as a result of improved public health measures, coupled with an increased level of consumption contemplated by the Five-year Plan, India's death rate drops substantially in the future, the population increase would, of course, be correspondingly enlarged in the absence of a severe decline in the birth rate.

Food Problem

To illustrate the problem, let us look at India's foodgrains problem. Twenty years ago, the per capita consumption was 370 pounds. By 1950-51, this had declined to 315 pounds. To hold it at that level for the estimated population of 378 million in 1956, an additional 7.2 million tons of grain must be available. To make a start back in the battle for an improved diet, more millions of tons must be provided. Bear in mind that the present caloric intake of India is about 1,660 daily, as compared with 3,150 in the United States. In the words of the National Planning Commission:

"The food problem has existed for about two decades. The separation of Burma reduced internal supplies of foodgrains by 1.3 million tons, the Partition in 1947 by a further .77 million tons. The lesson of the Bengal famine and, even more, of recent events, is that India's food problem is not a temporary disequilibrium between supply and demand; it is a manifestation of the continually growing pressure of population on food supply. It has, therefore, to be resolved, not through short-term expedients, but through careful and sustained application of relatively long-term measures.

"The shortage of food and raw materials is at present the weakest point in the country's economy. Measures to increase agricultural production have, therefore, been assigned the central place in the Five-year Plan. As each year passes, the growth of population makes more difficult the task of producing enough to meet the country's needs."

So far, using India as an illustration, I have sought to show that the bete noire of economic development is the growth in numbers—a tide against which all efforts for economic development must swim. Success for the economic development swimmer will depend on the strength of the tide against which he must swim; the strength of the swimmer—that is, are his muscles strong enough and his reserve resources able to sustain his efforts; and finally, how long will his swim have to last—when will the tide slacken or cease?

Again, let us take India as an example. We can say that comparatively, the Indian tide is not great at present, as compared, let us say, with Mexico's 3 per cent. per year increase.

What of her power to stem the tide? To stay even, she must add, in the field of food, 700,000 tons of grain each year. The Planning Commission has established goals calling for increases, in the five years ending 1955-56, of 8.9 million tons of foodgrains, 19.7 million acres of irrigated land, 1.2 million kw. of installed generating capacity, and so forth, over a wide range of items.

The Plan is an operating reality calling for capital expenditures over the five years of about $4.3 billion, of which about $1.2 billion have already been raised and spent by India. This figure includes about $400 million obtained from loans from the International Bank, and grants and technical assistance from the United Nations, the Colombo Plan and from the United States.

Perhaps the most significant point, however, is the fact that India's total tax collections are only 7 per cent. of national income, as against figures several times that amount in many other countries. What is even more significant is the fact that capital generation in India to-day is only 5 per cent. of gross national product, as compared, for example, with 16 per cent. in Japan. The Plan contemplates that capital formation will rise gradually to 7 per cent. in 1956 and to 20 per cent. in 1968. The per capita income of $57 is projected to double by 1974.

Poor Yield

Departing from this approach, it is worth noting that yields per acre in India are about one-third of those in the United States and manpower per acre is roughly 8 times that in the United States.

Does this mean that the swimmer's resources will let him not only stem the tide but make progress against it? The Planning Commission says "yes" for the first five years, if it can find an estimated $700 million still not in sight. Whether this will be true of the second and third five-year plans is difficult to judge.

The cornucopia school of thought, for which Dr. Jose De Castro speaks, generally takes the position that the potential increase in the production of the land and its raw resources into food and necessary goods and services is fully equal to the demands of the compound interest curve of population growth. Those of us who are sceptical of this line of reasoning feel an awesome respect for the compound interest curve and we also try to do some simple calculating as to the capital needs. Bear in mind, please, that, at the present average rate of increase per year of 1 per cent., the world's population will double in 70 years. If this situation had existed heretofore, the present world's population of 2.4 billion would have been generated had Adam and Eve lived at the time of Julius Cæsar.

In the United States, at to-day's prices, I estimate that it takes about $4,000 to $5,000 of capital investment of all sorts to produce, at our stand-

ard of living, the necessary goods and services for one new person as a consumer. In the first category of countries with their excessive population, the figure would be much less, because of present primitive methods and low consumptive levels.

Large Capital Investment Needed

Suppose we were to say that, to stay even in his struggle, our swimmer must have a continuous supply of capital energy of about $300 for each new consumer, or about 1/15 of the United States figure. There is some support for this figure in a recent study of Pakistan. Then, in the case of India with her present annual population increase of almost 5,000,000, new capital of the magnitude of $1.5 billion would have to be generated each year, to stay even. The Planning Commission estimates that the 1950 capital generation in India, excluding outside assistance, was about 5 per cent. of national income, or approximately $900 million. If this is correct, it would appear that the capital resources available to our swimmer to hold his own with the present strength of the tide, may be even less than his needs, unless, as the Planning Commission suggests, a very considerable part of the projected increase in national income is saved in the form of new capital. Bear in mind, too, that, as success attends a county's efforts in industrialising and improving efficiency of agricultural production, the capital investment *per capita* tends to rise quite steeply. As standards of living rise above subsistence levels, consumption demands require larger relative capital investment. That is to say, the modest $300 figure might grow rapidly.

Since capital, as I have attempted to show, is one of the most essential elements, if not the very keystone of economic development, its generation, its use and its transfer has come in for an immense amount of discussion as part of the whole drive for development. There is a good deal of confusion about this matter. As we survey the world, we often find, for example, a great deal of confusion in the distinction between capital and credit. We must always keep in mind that true capital is only born out of the forgoing of consumption of consumer goods and services, so that a large share of production may be applied to the expansion of productive capacity. In many parts of the world, where the urge for development and industrialisation is particularly strong and where the monetary systems are not very well organised or managed, Governments and peoples have yielded to the temptation to use credit made available by unsound fiscal and monetary policies as a substitute for capital. This has invariably resulted in an inflationary spiral, the outstanding effect of which is an involuntary form of taxation falling most heavily upon the masses. Such conditions are the fertile seed beds for authoritarian regimes in which the power of the Government is constantly extended through a series of chain reaction controls. This leads so often to deteriorating living conditions which invite the desperate remedy of communism

Import of Foreign Capital

Another phase of this complicated matter is that there exist widespread misconceptions with respect to the importation of foreign capital for the purposes of supporting economic development, as distinguished from the internal generation of true capital by the savings of the people. Here, again, the problem depends upon a basic understanding of the functions of capital and of the monetary system. Imported foreign capital can take various forms. It can take the form of importation of capital goods for installation of facilities designed to raise the level of production. In many of these instances, the resulting increased production will relieve the host country of the necessity of spending foreign exchange for necessary imports, or, alternatively, will create a greater production of goods for export to earn foreign exchange. In these cases, certainly, the use of foreign capital is not inflationary and fulfils a constructive role. Such importation of capital can be legitimately in the form of long-term loans from such institutions as the International Bank and Export-Import Bank. If the investment climate is attractive, such imports of capital may be excellently suited for the private capital market attracted by the normal incentives of the free enterprise system. We, in the Government, hope that this latter flow of capital will increase and that the Governments of capital deficient countries of the world will see to it that fair and realistic rules are established to attract this type of sophisticated capital usually accompanied, as it is, by skilled know-how.

Where foreign capital is imported for conversion into local currency, destined to be spent on labour and local materials for projects or services such as roads or other worthwhile projects, there may be a tendency to initiate an inflationary trend, although this is not always the case. To the extent, for example, that such enlarged expenditures in local currency generate an increasing demand for imported consumers' goods, the importation of such capital in the form of foreign exchange sometimes has an anti-inflationary effect.

The Alternatives

In any case, where a capital-deficient country striving for development utilises foreign capital in the form of loans or in the form of private investment, such capital imports have an inevitable impact on the future demands for foreign exchange to render proper service on the loans or on the equity investments. These forces must be calculated with care, if the international credit standing of the country is not to be seriously impaired, an event which will have the effect of slowing down or stopping the inflow of both loan and equity capital. Thus, it is fair to say that the capacity of those countries, which have only recently embarked on programmes of economic development, to borrow or to attract foreign public or private capital is clearly limited by a ceiling which, I suspect, is far below the general needs of the nation for capital in the abstract. The inescapable conclusion from this is one of two alternatives—either the great demand for capital must be largely supplied by the savings of the people of the country itself, or foreign capital must be supplied on a grant-in-aid basis imposing no future claims for repayment of principal or interest.

It would be unrealistic to expect that grants-in-aid from the capital-exporting countries, such as the United States, can long continue or can be expected, in any case, to be of significant volume. We are all aware that neither the giver nor the receiver is genuinely happy with grants-in-aid. We must also bluntly face the fact that capital is inadequate everywhere. The differences between countries in this respect are only relative. The interest rate set in the market place is perhaps the only proof needed of this statement.

Capital Generation

Thus, we are inevitably thrown back, it seems to me, on the possibilities for capital generation in the economic developing countries. One may question my estimates of the amounts of capital needed in the process of economic development, but I think no one can doubt that the capital requirements are large. Granting this, it seems inevitable that these pools of capital must, somehow, mostly be generated locally. Experience with countries in transition suggests that difficult choices will have to be made and that considerable restraint and austerity will be necessary by virtue of the limitations on the ability to generate the necessary capital. Thus, reasonably careful selection of projects must be undertaken, and some measure of direction will be necessary. Indeed, I cannot see how that unpopular word "planning" can be completely avoided. I, for one, hope that the plans can be drawn with wisdom and that they will exert a minimum restraint on the operation of a free enterprise system.

Crucial Elements of Development

This analysis of the problem also suggests that one of the most constructive forms of activity which might be sponsored far more energetically by developing countries is a speeded-up effort to introduce into their economies some of the modern schemes for encouraging and mobilising local capital generation. I am referring to modern-type savings banks, life insurance companies, Government savings bond schemes and creation of an open capital market. In this connection, the United Nations Economic Commission for Asia and the Far East has been doing much useful work. To create such agencies and institutions is not an easy task. They must, of course, stand on a base of non-inflationary finance, but, when they are so anchored, they may prove to be crucial elements of development. In my judgment, they are far more important than is generally realised. Some rather spectacular examples of recent successes in this direction are visible around the world. In Brazil to-day, a genuine and very useful investment banking business is rapidly developing, utilising fully the know-how of the great capital nations. For the first time in its history, El Salvador marketed a $12½ million local bond issue to the public with the assistance of only one trained investment banker. There is much room for progress and improvement in the methods and management of such institutions as social security funds, housing co-operatives, savings banks and insurance companies.

Finally, let us look at the strength of the tide again and examine the possibility that it may abate. As I pointed out previously, the present 1.2 per cent. annual population increase in India is not large in itself. Those who have studied demography may quite properly say to me—yes, we recognise that a compound interest curve is very hard to keep up with, but experience shows that population curves finally turn out to be "S" curves in which the rate of increase gradually tapers off, because, after the period of steep rise caused by declines in the death rate, the birth rate also declines to a point more nearly in balance with the rate of death. Experience in general would support them. Fertility does tend to decline with a rising standard of living and greater urbanisation and industrialisation. But, and this is important, as far as we can tell now, the leveling off process is not likely to happen, or at any rate, will occur only very slowly, *unless* there is, during the period, a significant rise in the average real income *per capita*.

The Big Question

The big question is: Where, in the "S" curve is any country at any particular time? India is barely beginning the transition which Western countries have experienced in the past century. If that pattern is to be repeated, a period of very rapid growth is in prospect. During the century of transition, between 1850 and 1950, the population of the United States tripled. In Asia, even where the initial population is already quite dense, the same pattern seems to prevail. Since 1853, when Commodore Perry's visit initiated a revolution in Japan, the population has also mutiplied by about three. Japan is now approaching the level-off point, but is still at least a generation in the future and population seems destined to increase many more millions before that point is reached.

I think all will realise that most, if not all, of the Governments in the Far Eastern countries are becoming increasingly aware of the impact of potential population increases upon their plans for economic development. This is emphatically the case in India and, indeed, in Japan. In India particularly, the Government is moving vigorously forward in promoting research and programmes of action designed to provide increasingly effective answers to the possible run-away increase in its population, incident to the carrying out of plans of the National Planning Commission.

In closing this article, I would like to make one appeal. We are all interested in economic development, because it leads to improved living standards for our peoples. We are embarked on a wide horizon on programmes and efforts towards this goal. But let us have the wisdom to study and assess the deeper consequences of these plans and programmes.

WORLD BANK LOAN TO BRAZIL

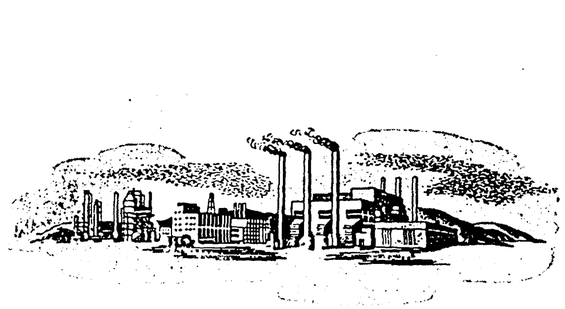
The International Bank for Reconstruction and Development granted two loans aggregating $22.5 million to Brazil on 18th December, 1953. The first is a loan of $12.5 million to the Government of Brazil. It will be used primarily to meet a part of the cost of importing passenger train units urgently required to maintain the suburban service of the Central do Brasil Railroad in Rio de Janeiro. The second is a loan of $10 million to the Usinas Electricas do Paranapanema S.A. (U.S.I.N.A.S.), a corporation owned almost entirely by the State of Sao Paulo. This loan is guaranteed by the Brazilian Government. It will be used to pay for imported equipment for the construction of a hydro-electric plant at Salto Grande on the Paranapanema River in the State of Sao Paulo and associated transmission and distribution facilities in the States of Sao Paulo and Parana. The power will serve the rapidly growing agricultural and urban centres, and will help electrify the Sorocabana Railroad, one of the State's important railways.

The railway loan of $12.5 million is the second that the Bank has made for an emergency programme to rehabilitate and improve the services of the Central do Brasil Railroad. This railroad connects Brazil's major industrial centres and a loan of $12.5 million was made in June, 1952 to cover the Central's immediate needs for freight cars and other equipment to increase the carrying capacity of the railroad. At that time, the Bank indicated that it would be prepared to consider an additional loan for the suburban service as soon as effective steps were taken to improve administration and operating conditions on the suburban lines. These steps have since been taken.

The total cost of the project will be equivalent to $34 million. Of this, $20.4 million will be in foreign exchange, of which the Bank's loan will meet $12.5 million; the Central is covering the remainder under credit arrangements with the British firm which is supplying the cars. The local currency costs, equivalent to $13.6 million, will be financed from Brazilian sources. The Bank's loan of $12.5 million is for a term of 15 years and carries interest of 4½ per cent. per annum, including the 1 per cent. commission which, under the Bank's Articles of Agreement, is allocated to a special reserve. Amortisation payments will begin on 1st July, 1959.

The Salto Grande project is the first step in the development of the power potential of the Paranapanema River, which is situated in an area devoted primarily for the raising of coffee. New wealth from coffee has brought about immigration from other parts of the State and rapid development of urban centres. The privately owned utilities serving these communities are at present unable to keep up with the demand for power, but will be able to do so when they can obtain power wholesale from Salto Grande and distribute it over their extended systems. The Sorocabana Railroad connects these agricultural areas with the city of Sao Paulo and power from the project will enable the railroad to extend the electrification of its lines.

The total cost of the Salto Grande power project is estimated at $39 million. The Bank's loan will pay the foreign exchange costs. The local currency costs, equivalent to about $29 million, will be met principally by the Government of the State of Sao Paulo; the remainder will be financed from private sources. The power plant and transmission lines are scheduled to be completed and in operation early in 1957. The Bank's $10 million power loan is for a term of 20 years and carries interest of 5 per cent., including the statutory 1 per cent. commission. Amortisation payments will begin on 1st July, 1958.



'BEHAR'-the dependable name in fireclay refractories

For over 30 years 'BEHAR' FIRECLAY REFRACTORIES of every variety and description are being successfully used by leading Iron and Steel Works, Cement and Glass factories, Sugar and Cotton Mills and other users throughout the Country.

Extensive use of 'BEHAR' FIREBRICKS over years have proved their superior quality, high refractory value and strong resistance to slag penetration, spalling and abrasion. That is why the name 'BEHAR' today stands as the symbol of quality and dependability in FIRECLAY REFRACTORIES

SMRITI BE I E

OUR AGRICULTURAL PROBLEMS

SCOPE FOR MECHANISATION LIMITED

By Prof. V. G. Ramakrishna Aiyar

IT is often remarked that India now stands in economic development where European countries stood previous to the industrial changes of the nineteenth century and that India is now following the beaten path of economic development which other nations have trodden. It is said that, in the city of Bombay, the Industrial Revolution has already been accomplished and the brazen villages and never-ending fields with which we have been familiar are the India which is passing away and Bombay is the presage of the future. In the village life of India, in the conditions of agriculture and the absolute dependence on the harvest, in the peasants' indebtedness, in the position of weavers in the economic organism, etc., there are, it is further said, endless similarities between India to-day and the Europe as it was, and, with the spread of knowledge and growth of capital, the India of to-morrow will bear a general resemblance to Europe of to-day.

A considerable part of the educated classes seem to insist with patriotic fervour on the industrialisation of the country and the greatest possible development of manufactures. One is sometimes inclined to ask whether such a future is likely or desirable. It is an unfortunate consequence of the British connection that industrialisation should present itself to Indians as the royal road to prosperity and to a dignified position among nations. Because Britain in the Middle Ages bore many resemblances to India and because industrialism has since made Britain and few other European countries rich and powerful, the poverty of India is automatically attributed to the lack of industrialisation. Of course, some important industries well suited to Indian conditions, as jute, cotton, etc., have already come into being and India has come to be recognised as one of the countries making strides towards industrialisation. But it is a misreading of the real economic development of India if we regard Bombay as the presage of India's future. If we pay due regard to the climatic conditions, the aptitudes and habits of our people, it seems true that India will obtain more wealth by diverting a good part of her capital to the improvement of agriculture.

Prosperity Through Agriculture

The manufacturing nations have now reached the highest point of their relative advantage and the balance of exchange will move in future in favour of those countries the advantage of which lies in the extent of fertility of their soil. The prosperity of India in the future depends on the development of only those industries for which conditions are well suited, but there is good reason to believe that it is to be achieved largely by the application of more skill and knowledge, of more capital to the methods of agriculture. Every diversion of indigenous capital from agriculture, where our potential advantage is great, to manufacturing industries, where our relative position is weak, will be ultimately to the detriment of our real economic strength and prosperity. The mills of Bombay and Calcutta figure too large in the public eye. They will have an insignificant influence on the general level of economic well-being throughout the whole extent of the country. The raising of the level of comfort among the vast mass of population must be brought about by the application to the *land* of the brains and capital of new India. India will not find in mills and factories the non-economic goods which make up, along with wealth, the dignity of a nation.

It is against this background that we must view the present position and future possibilities of Indian agriculture. Agriculture in India is the livelihood of about 70 per cent. of the population. It is backward and the causes are partly agricultural and partly economic. The agricultural causes are soil erosion, excess or scarcity of water, general poverty of certain soils, and infestation of weeds, lack of proper manure and improved seeds, absence of an organisation to bring scientific farming within the easy reach of the poorest and most ignorant cultivator. The economic causes are rural indebtedness, defective land system and of sub-division and fragmentation of holdings. The small size of holdings and their dispersal in small parcels over a large area are the biggest handicaps to better farming. The physical unit of village varies from State to State, the average size of a holding being 4½ acres of which one acre is irrigated. Even this figure is misleading, because 60 to 75 per cent. of the holdings in each State are below this average.

The phenomenal success of tractor ploughing in Soviet Russia has led people to think that unit yield and total production could be increased in India also. The fundamental fact is no technological schemes of increased production or better farming can work on uneconomic holdings of a size of no more than three to four acres. It is only in large holdings that specialised and expensive machinery can work continuously and the farm can operate economically. Can large holdings be brought into existence?

Collective Farming

The example of Russian collective farm is often mentioned. There collective farming was part of an organised attempt to abolish private property in all branches of economic life by a powerful State. In India co-operative and compulsory consolidation of holdings attempted by Provincial Governments in the past has not been very effective, partly on account of complexity of ownership and tenurial rights in land and absence of a common consciousness of common welfare. There has been much loose thinking on the subject of mechanisation in our agriculture. Mere use of large tractors and harvesters would not increase agricultural production. Complicated agricultural machinery is used primarily in grain farming by prairie methods, as, for example, in the U.S.A. and the U.S.S.R. This type of farming is not quite suited to a crowded country like India. Much smaller editions of multi-furrow ploughs, 40 horse-power tractors are more suitable to us. Moreover, the peasant in India could use with advantage various kinds of small barn machinery, e.g., the root slicer, the chaff-cutter, the hay-elevator and the threshing machine, the water pump, the liquid manure pump, etc. The scope for tractor ploughing in India lies mainly in weed eradication and even here it is limited by the period in which ploughing can be carried out.

Mechanisation is desirable, but the peasants must be educated in the use of mechanical appliances. We should make a beginning with less complicated machinery, less expensive, easier to handle and likely to be of more practical value. As regards large-scale farming, mere consolidation, voluntary or compulsory, will not go far enough; an exact replica of Russian *Kolkhoz* is also not suitable. Experiments in co-operative or collective farming show that the Indian peasant still values his right of ownership or other rights in the soil. Large-scale farming can only take the form of co-operative farming on a proper scale. Co-operative farming is not a mere combination or pooling of lands on the part of small owners; it also implies social control over the management of land, that is, society should carry on cultivation itself employing the members as paid workers and distributing the proceeds minus the expenses to the members in proportion to work. Small plots of land to the members on an occupancy basis may be allowed. Besides, the size of the field, organisation, capital and technique are important.

Planning in Agriculture

Recent discussions of agricultural planning to bring uncultivated lands under the plough, to increase the acreage under protective food crops, to diversify agricultural operations, to increase unit yield by use of improved seeds, better manures and by irrigation and by drainage or bunding according to local conditions seem to indicate the right approach to the problem.

As regards targets for production, opinions may differ as to how much we can increase our yield by various experiments mentioned above. That a new spirit is now manifesting itself may be seen from the plans recently adumbrated for increasing agricultural production on the basis of such plans. The Bombay Plan, the first of its kind, envisaged increasing of agricultural production in a period of 15 years. Dr. Burn's note on "Technological Possibilities of Agriculture in India" disclosed possibilities of increase of yield of 30 to 50 per cent. in rice and wheat, 10 to 20 per cent. in other cereals and 100 to 200 per cent. in sugarcane. The Imperial Council of Agricultural Research also adumbrated a plan of national self-sufficiency in foodstuffs and pointed out that production must be increased by 10 per cent. of cereals, 20 per cent. of pulses, 250 per cent. of fats and oils, 50 per cent. of fruits and 100 per cent. of vegetables. The Government of India Reconstruction Committee adumbrated a plan for development of agriculture and animal husbandry, increasing agricultural production by 50 per cent. in ten years, and 100 per cent. in fifteen years.

Planning in action may be said to have begun with the Five-year Plan. It envisages for agriculture an outlay of Rs. 361 crores constituting 17.5 per cent. of the total expenditure. It accords the highest priority to agriculture, including irrigation and power projects which together account for 44.6 per cent. of total expenditure to be incurred in the public sector. Among the targets for agricultural production suggested in the Plan, that of foodgrains is the most important. The Planning *Commission* has suggested various measures for increasing the production of foodgrains by 8.9 million tons during the five-year period.

Agriculture

	1950-51	1955-56
Foodgrains (million tons)	52.7	61.6
Cotton (lakh bales) ...	29.7	42.2
Jute („) ...	33.0	53.9
Sugarcane (million tons)	5.6	6.3
Oilseeds („) ...	5.1	5.5

It may be observed, in this connection, that agricultural plans, particularly the food plans that are based on the monsoons, are no *plans* at all and that they are in the region of possibilities rather than of actual achievements. In fact, so far as food problem is concerned, it is a *quantitative* problem of increasing our food production, a *qualitative* problem of a balanced diet, an administrative problem of effective distribution of food free from transport bottlenecks, hoarding, inter-State restrictions, and finally it is ultimately an *economic* problem of low purchasing power. The most effective remedy from this aspect of the problem is not only rationalisation of agriculture, but also increasing industrialisation along particular lines in which India can hold its place in the internal and international markets.

Finally, it is well to observe that the Malthusian riddle of food supply *versus* population is unresolved and any scheme of agricultural planning as a long-term measure will have to be accompanied by planning of population. It is a good augury for the future that, in recent years, there is a growing awareness of this problem.

Centre's Responsibility

While much of the detailed planning must fall on the shoulders of the States, the Centre must take the lead in many matters if progress is to be rapid. It must accept the main responsibility for fundamental research and should no longer remain entirely aloof from the extension of the results of research into farm practice. Self-sufficiency in respect of food and raw materials for industry, together with the production of raw materials for an export market, must be the broad aim of a national policy.

In fine, the broad aims of a national policy in regard to agriculture may be summed up as: (i) the securing of adequate nutrition to our growing population (India must produce an adequate quantity of food of all kinds required for a balanced diet); (ii) the production of adequate raw materials for the growing industries of the country, in view of the fact that industrial expansion in India would make increasing demands on raw materials such as fibres, sugarcane, oilseeds, etc.; and (iii) the production of raw materials for which, with or without processing, there is an export market. This is necessary, in order to obtain the foreign exchange necessary for the country's programme of economic development.—*All Rights Reserved.*

SOIL CONSERVATION IN U.S.

Scientific conservation of land, water, forest and wild life resources has, more than anything else, contributed to the development of American agriculture. Research, education, surveys and successful application of conservation measures have brought the farmers to a new concept of the importance of land and of the need for keeping it permanently productive. National Conservation Week, observed every year in December throughout the country, is but one of the many ways in which the economy and efficiency of soil conservation farming are brought home to the farmer.

The U.S. Congress took emergency measures in 1933. Among other things, it created the Soil Conservation Service as a federal agency to work with farmers. This agency has carried on a nation-wide campaign against soil erosion. It has provided soil scientists, engineers, agronomists and other specialists to help farmers improve their land. The results have been amazing. The scars of the old "dustbowl" are healed. Once barren fields are yielding good crops, year after year. Every section of the country is now producing 25 to 30 per cent. more food and fibre than was being produced 20 years ago. Most of the credit must go to the farmers themselves. They have voluntarily banded together into more than 2,400 soil conservation districts embracing 1,332 million acres and 1.94 million farms. The planting of millions of trees in the once treeless Great Plains region—lying between the Mississippi River and the Rocky Mountains, and comprising about one-fifth of the nation's land—is an outstanding achievement in the conservation programme. Started in 1934, more than 300 million trees have been planted on 60,000 farms in the Great Plains, under a programme known as "shelterbelts." Experts trained in the specialised fields of agricultural science make up the personnel of the Soil Conservation Service, which provides all assistance to farmers through the farmers' own soil conservation districts.

Mobiloil wins highest honour for brand names!

U.S. Brand Names Foundation award—"in Recognition of Continuous Service".

This year, Mobiloil proudly accepts America's highest honour for any brand name — the Brand Names Foundation Award. This is given only to brand names which, for fifty years or more, have held the confidence of the public.

Motorists the world over know the greater protection of Triple-Action Mobiloil. Stop at the sign of the Flying Red Horse today, and fill up with Mobiloil — for over half a century, the greatest name in motor oil!

REGULATION OF FUTURES TRADING

FUNCTIONS OF FORWARD MARKETS COMMISSION

By
Dr. B. V. Narayanaswamy Naidu

IN the eighteenth century, particularly before the advent of the Industrial Revolution, the marketing of agricultural commodities did not present a serious problem to the world, as it exists to-day. The industrial expansion of the nineteenth century in the U.K., the U.S.A., the Continent and Japan increased the demand for agricultural commodities, which formed the raw materials for their key industries. As most of the industrial countries were not producers of the raw materials required by their industries, they had to depend on the so-called backward or agricultural countries for these raw materials. Thus, during the nineteenth century, production of cash or commercial crops gained considerable importance in these agricultural commodities. Those were the days of "Free Trade" and so their prices were determined by the free interplay of the law of demand and supply. The reduction of crop in one country, for instance, of a particular agricultural commodity influenced the prices in the markets of other countries during the course of a few hours. Hence, the need arose for the evolution of some mechanism for reducing price risks, particularly for the convenience of manufacturers and traders. Those were the days of *laissez faire* and the problem of insuring against price fluctuations was solved by the trading community themselves to a limited extent by what is known as "forward trading." The technique of forward trading was developed considerably during the course of the last half century, with the result that traders were in a position to reduce price risks by resorting to the mechanism of "hedging." The technique of hedging or "futures trading" as it is popularly known, is one of the recognised methods of forward trading and it is well developed in the U.S.A. In India, the fairly well developed forward markets are mainly in Bombay.

Meaning of Forward Trading

In simple language, forward trading means a transaction for the sale or purchase of a commodity at a future date and at a specific price. It is different from a ready transaction, in that the delivery of the article does not take place immediately after the completion of the contract. The delivery may take place, say, after one month, two months or such dates as agreed upon between the buyer and the seller. Another distinguishing feature of a forward contract is that the transaction may be closed even without giving delivery of the commodity, i.e., by settlement of the transaction between the buyer and the seller at such agreed terms through the medium of recognised Exchanges. In that regard, the Commodity Exchanges, which provide facilities for their members to enter into forward transactions, render certain useful functions. The by-laws, rules, etc., of these Exchanges provide for the regulation and control of forward contracts and the prices established in such markets become the barometer of price trends ruling in that area.

Is Forward Trading Necessary?

On this issue, there may be a difference of opinion, particularly in the case of India, where it is generally stated that the cultivator does not make use of the Commodity Exchange for selling his produce. But it has some utility, in that it serves as a guide of the price trends and helps in diffusing risks to some extent. It is said that, in the absence of forward trading, what would happen is that the normal distribution of the crops would be impeded. To illustrate this point: let us take the case of cotton. India produces annually about 40 lakh bales of cotton. This year the production is expected to be about 42 lakh bales, which, based on the ruling level of prices, will be worth about Rs. 140 crores. Bulk of this cotton is consumed by the mills in India itself and their annual consumption of Indian cotton is about 36 lakh bales. From this one cannot jump to the conclusion that the crop, when harvested, can readily find its way to the consuming mills. Nearly 75 per cent. of our crop moves within a period of 4 to 5 months, i.e., between the months of December and April, and it is a well-known fact that our farmers' holding capacity is very poor. What he does is that he sells his crop immediately after the harvest at whatever price is obtained at that time. The farmer does not sell it in the form of cotton but in the form of seed-cotton or *kapas*. Therefore, it is the business of the trader to buy the *kapas*, get it ginned and pressed and rail it to the mill centres. All this will take 2 or 3 months. Meanwhile, prices may go up or down. Therefore, unless the trader is given some means to insure his price risk, he will not come forward to buy *kapas* in large quantities and the result will be a fall in prices in the up-country markets.

On the demand side, the mills do not buy all their annual requirements during the period of a month or two, as this involves a lot of finance. They generally spread their purchases. All this means that there should be somebody to carry the cotton until the mills make their purchases, and, in order to induce the traders to carry heavy stocks of cotton, they should be given some means to insure the price risk and that is done through the existence of forward markets and forward trading. So far as the cultivator is concerned, the existence of a forward market helps him incidentally, in that he knows even at the sowing period as to what price he is likely to get and it is not uncommon that he finds a buyer even before the crop is harvested. In short, therefore, forward trading offers advantages to the cultivators, traders and the manufacturers. But, then, forward trading has to be developed on healthy lines and it is with a view to achieving this object that legislation, namely, the Forward Contracts (Regulation) Act had to be passed by Parliament in 1952.

Need for Regulation

In India, the problem of regulating the activities of forward markets assumed great importance, particularly after the outbreak of World War II. In the absence of Governmental legislation for controlling speculative activities, forward markets dealing in commodities like cotton, jute, yarn, oilseeds, pepper, bullion and metals became the playground of speculators. The war-time inflation also assisted the speculative activities, with the result that prices in these markets shot up to dizzy heights during the first half of 1943, despite the fact that, in a commodity market like cotton, actually there was no shortage and the real problem then was one of finding an outlet for the pretty large surplus of cotton in the country, as a result of the loss of Far Eastern markets. The Government of India, therefore, banned forward trading in a number of commodities such as foodgrains, oilseeds, oilcakes, vegetable oils, raw cotton, spices, sugar, etc., as an anti-inflationary measure under the Defence of India Rules. This was subsequently relaxed in respect of cotton and jute, subject to certain conditions. After the lapse of the Defence of India Rules, powers were assumed under the Essential Supplies (Temporary) Powers Act, 1946 and some of the orders prohibiting forward trading issued earlier in respect of such commodities as foodgrains, oilseeds and oils, etc., were kept in force.

Utility of Forward Markets

A forward market, if worked properly, can render genuine economic service in regard to the orderly distribution of the commodities and provide some sort of price insurance. The fact that the forward markets do not transact ready delivery contracts (i.e., contracts, which provide for the immediate delivery of the goods against payment), but only forward contracts offer plenty of scope for speculation, because there is a time lag between the date of the contract and the date of its performance. In view of the fact that forward markets are not solely guided by the laws of supply and demand but also by market sentiment, this gives rise to speculative activity. Such activity, if allowed to remain within limits, will not be harmful, but unhealthy speculation hampers the proper working of the markets and this is detrimental to the interests of the grower, trader and the consumer. This is what has been happening in some of the forward markets in our country, and one of the ways of controlling them is by means of Governmental regulation.

The ban imposed by the Central or the State Governments during the war and post-war period were only interim measures, and, as it is not the intention of Government to deprive producers and traders permanently of the hedging facilities, the Government of India thought of bringing in a uniform legislation to regulate the forward markets. Until the inauguration of the Constitution, the Central Government did not have the power to enact any long-term legislation on an all-India basis for regulating forward trading. This difficulty has now been removed, since, under the new Constitution, the subject of "Stock Exchanges and Futures Markets" has been included in the Union List. As a result of this change, the State Governments are no longer competent to enact any fresh legislation with regard to forward markets. As already mentioned, the Forward Contracts (Regulation) Act was passed by Parliament in 1952. With the coming into effect of the Central Act, legislative measures, undertaken by the State Governments, will cease to operate to the extent to which they are inconsistent with the Central Act. This provision is being made clear by the Amending Bill which is before Parliament now. The main objects of the Forward Contracts (Regulation) Act, 1952, are to provide for the regulation of forward trading, the prohibition of options, and the prevention of unhealthy speculation.

Forward Markets Commission

In order to assist the Central Government in the exercise of the powers under the Act and in the administration of the Act generally, the Government of India have set up the Forward Markets Commission. The functions of the Commission, as set out in the Act, are: to advise Government in respect of recognition or withdrawal of recognition of associations conducting forward trading; to keep forward markets under observation; to draw the attention of Government to the various developments that are taking place in the different forward markets, with suitable recommendations; to collect and publish information (including information regarding supply, demand and prices) as regards trading conditions in respect of markets falling under its jurisdictions; to submit periodical reports to Government on the operation of the Act and on the working of forward markets; and to inspect accounts of recognised associations, and to make recommendations generally, with a view to improving the organisation and working of forward markets.

How the Act Will be Implemented

Chapters II to IV (inclusive) of the Act have already come into operation with effect from 24th August, 1953. Under section 15 of the Act, the commodities and the areas to which the regulatory provisions of the Act would be applied have to be notified. This question is now under the consideration of the Commission in consultation with the Government. As soon as the commodity and the area are notified, all associations concerned desiring recognition should apply to Government in accordance with the rules which will be prescribed for the submission of applications, together with copies of their by-laws, rules and memorandum and articles of association. The rules are being finalised and will be published in the *Gazette of India* in due course.

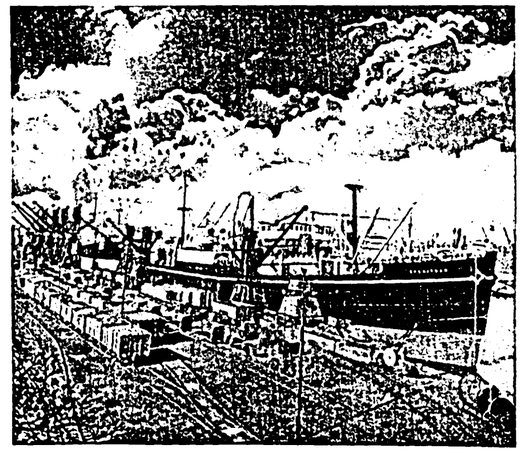
COAL

FOR THE NATION'S INDUSTRIAL REQUIREMENTS...

Our groups of Collieries in Bengal and Bihar mine some of India's finest coals, including the famous Dishergarh and Poniati Seams. Coal for gas production, steam raising and coking is available in large quantities from these Collieries.

The increasingly specialised requirements of the Nation's expanding industries are being satisfied by our "Quality" coals, known as "Selected Grade."

COAL FOR EXPORT...



Our output in 1952 was well over three million tons and represented approximately one-tenth of India's total coal production.

Apart from meeting the needs of the country's industries, we exported over a million tons to overseas markets.

In recent years our overseas buyers included Aden, Australia, Ceylon, Denmark, East Africa, Egypt, Finland, Hongkong, Italy, Japan, Indonesia, Mauritius, New Zealand, Pakistan, the Sudan, Straits Settlements, Sweden, and the United Kingdom.

ROMANCE OF TATA DEFERRED

IS THERE A SUCCESSOR TO IT?

SO great has been the influence of the Deferred share of the Tata Iron and Steel Company on the investment climate in India for nearly half a century that its passing away, now a certainty, can well be described as the passing of an age.

From 1907, when the Tata Steel Company was floated, to 1953, when the scheme for the conversion of the Deferred was accepted by a very large majority of both the Deferred and the Ordinary shareholders of the Company, was the era on the Stock Exchange in which the Deferred ruled like an oriental monarch, swaying the court by its own fitful and highly temperamental character. It is a stormy history in which the turbulent armies of bears and bulls, both claiming adherence to the Deferred, waged relentless war against each other, attacking and counter-attacking, with heavy casualties on either side. Like all battles, it was, perhaps, inevitable, though profitless and even painful for many of the contestants. But the story is of far-reaching significance and is so closely woven into the texture of India's industrial development as to merit closer study.

The Tata Iron and Steel Company, the great steel producer of India and the East, is not only the pivot but also the symbol of Indian industrialisation. The crucial role it has played was particularly demonstrated during the two world wars. The first phase of the Company's rise ended soon after World War I, when, encouraged by war-time profits, the Company embarked on further expansion by raising additional share capital. With the developing world recession, hard times followed for the Company in the twenties and early thirties, before it was able to regain the measure of stability which had not prevailed for nearly two decades. But, while at the end of 1918, additional capital included further issue of Deferred capital, the outlook has so changed since then that, almost by general consent, reorganisation of the Company's capital structure has now come to be viewed in a manner where the elimination of the Deferred share is regarded as helpful to the Company's further progress.

Speculative Feature

The phenomenal influence which the Deferred share has unquestionably exercised, particularly during the last 30 years, on the Stock Exchange has aroused so much controversy that it would be worth while to disentangle its positive from the negative side. It is as the speculators' paradise that the Deferred share is fixed in the public mind. The unwary multitudes, in search of a short cut to fortune, have so often succumbed to the temptation of dabbling in Tata Deferreds with dire consequences to themselves that the Stock Exchange activity has often, though erroneously, been regarded as little more than gambling in Tata Deferreds. The wild, capricious price oscillations in this counter have always been so colourful and tantalising that new crowds have been allured even while others had suffered grievously and retired disillusioned. There was hardly a year when the range of price fluctuation was under Rs. 500 (if not nearer Rs. 1,000). Such movement, coupled with the sharpness and suddenness with which it took place in either direction, tempted large crowds to play in this scrip, making the ground fertile for the few large professional speculators, who always made it their exercising ground, with abundant scope for employing all their ingenuity and resourcefulness in day-to-day operations. It is, however, noteworthy that, while in the trial of speculative strength, the common man so often lost to the wily operator, over a period, many of the operators themselves were hoist with their own petard. The history of Tata Deferreds on the battlefield of the stock market is the tale of many a commander who came to conquer, led for a while, but, ultimately, perished at the hands of other stalwarts.

It is significant that, while fluctuations in Tata Steel Ordinary shares were almost always in line with those in the Deferreds, with only minor exceptions, relatively little notice was taken of the Ordinary, while the Deferred always caught the public fancy. The secret no doubt lay in the peculiar capital structure of the Company, in which the 48,750 Deferred shares of Rs. 30 each, out of a total paid-up capital of Rs. 14,62,500, had a right to participate in nearly half of the Company's stupendous annual profits. No wonder that, with the annual dividend on this share during the last 15 years

By H. T. Parekh

ranging from Rs. 65 to Rs. 172 (average for the period Rs. 100) per share, the scope for price change was always large enough to catch the imagination of all.

While the peculiar capital composition of the Deferred made for its wide popularity as the most suitable counter for a flutter, it must be said that indulgence in its gambling was encouraged by the absence of anything better to do. With the deep-rooted and widespread trading propensity of the Bombay public, any field was worth exploring where there was room for exercising one's judgment and taking one's chance. In the earlier period, particularly the war and pre-war years, the stock market offered too narrow a field for investment with too few investors and too few public companies; this aided the tendency to indulge in speculation and gambling by those who depended on the market for a living and by those whom they could influence. In the post-war period, stock markets have been far more broad-based than in earlier days and far less capable of being influenced by manœuvres of a few operators that they have ceased to be the same fertile field for manipulation. In fact, this has been particularly so in the last few years. Marketwise, therefore, the Deferred share has outlived its utility and the plea for its removal no longer arouses such bitter opposition as it used to in the past. Further, the public attitude, as well as the Government's approach, is now one which does not tolerate a state of affairs which encourages wasteful speculation. State regulation of the economic sector is fast taking the place of *laissez faire* thought and it is generally recognised that the Deferred share has become an anachronism.

Positive Role

With these negative features of trading in the Deferred is interwoven a positive side which needs to be recognised. Being the market leader with vast influence, the ups and downs in the Deferred determined, in large measure, the price trend over the entire stock market in Bombay and thereby on other exchanges all over the country. That is, its rise or fall set the pace for the course of prices in the country's capital market generally. It followed that, during the period of declining prices in Tata Deferred, the climate in investment market was depressing and unhelpful for new development. And, similarly, in periods of rising tempo of Deferred, the ground was regarded as favourable for new capital issues. The booms of 1936-37 and 1945-46 significantly were periods, when hectic activity in the Deferred created highly favourable conditions in the new issue market. Likewise, the depression which swept over the market in 1948 reflected in no small measure the crisis which gripped the Deferred at the time. The immense impact of one single scrip on the pace of the country's industrialisation through influencing investment psychology is altogether a unique feature, perhaps without parallel in any other country. This aspect, while reflecting the backwardness of the economy, also amply indicates that, out of the frenzy of speculation in Deferred, often arose a climate under which Indian industry could surge forward. The passing away of Deferred may not be regretted, but the signal role that it has played and the titanic influence it has wielded in the investment life for over half a century deserve to be boldly underlined.

The void which the disappearance of the Deferred will soon create raises the question: What of the future? The leadership which the Tata Company holds is still undisputed and, as its counterpart, the now enlarged Ordinary share capital could hardly fail to interest the Stock Exchange in great measure. In the new phase of industrial development, it is, perhaps, more fitting that speculative propensities should be discouraged and more sedate influences allowed to work on the economic scene. In place of the dramatic and the colourful, a more orderly development must permeate where there is room not for heroics but for boldness coupled with cool calculation.

The New Look

The new look which the Stock Exchange will, therefore, present will be so vastly different from the old that it will need an effort on the part of those interested to get adjusted to the changed climate. The Stock Exchange will no longer appear the disdainful arena for cruel bull fights, or bear raids, because no price changes will be so volatile or large as to hit the headlines in newspapers. It will gain a more solid and respectable appearance and, in due course, be able to attract increasingly the investing public. There is no other Company with the same strength, popularity and all-India appeal the shares of which can even aspire to take the place of the Deferred. Neither the Bombay Dyeing or Kohinoor in the textile section nor any of the other active scrips such as the Bombay Burmah, Scindia or Associated Cements in the miscellaneous section has the basic characteristics which make for leadership of the market. Nor can it be regarded as marketwise necessary that, in the new economic order, a substitute to Deferred as a plaything of the market is desirable. It seems fairly certain that, more in keeping with present-day conditions, the leadership of the market will rest with the Tata Ordinaries. As with the U.S. Steel, so long as the Tata Company remains in the forefront of Indian industry, its share will receive country-wide support which will not diminish even after the elimination of the Deferred. The decline in speculative activity which could result is sure to be made up at least in part by the fillip to investment activity which the enlarged Ordinary share will receive.

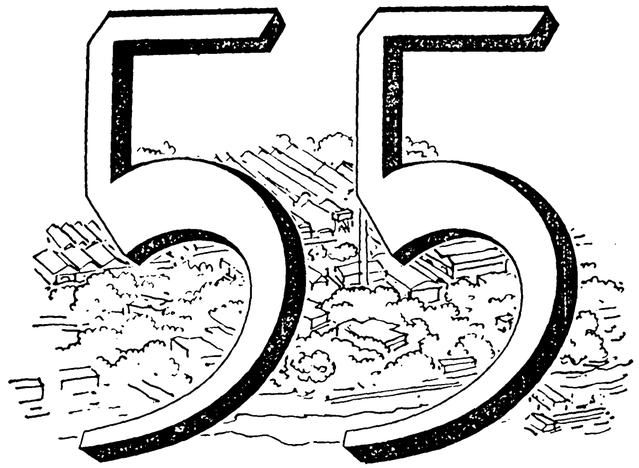
Industrial investment, though popular in the country, is still greatly limited. The vast mass of the people, apart from its inability to invest, has a well-founded, legitimate distaste for such investment, due to lack of a sense of safety of such investment. The tradition of sound management is still not sound enough to inspire the investor's confidence. But, even in this field, conditions are improving. The widening field of Government regulation, as reflected in the new elaborate Companies Bill, the control of forward markets, including regulation of the Stock Exchange on all-India basis, the vigilance of the Government in checking malpractices in company managements through active operation of the Industries (Regulation and Development) Act amply indicate that laxity in company management cannot easily flourish. Moreover, a heartening sign is the equal awareness on the part of the investing public itself to fight its own battle with management where it sees evidence of mismanagement or embezzlement. With improved company management which must result from such conditions, a sense of new confidence must sooner or later permeate the industrial investment sector, so that the little men's savings could flow in a larger measure in public companies. The Stock Exchange could then play a more positive and wider role in accelerating the pace of industrialisation of the country.

New Industrialisation

An investor's confidence generally depends upon the steady and regular character of a satisfactory return on capital which he can realise from his investment over a sufficiently long period. In the U.S.A. and U.K., for instance, numerous industrial investments are available on the Stock Exchange, with unfailing annual dividend record extending for 25 or 50 years if not more. As in the case of Gilt-edged and public utility investment, the public must have a full sense of security that not only its capital would be safe and may grow but that it will yield a constant return over years. Such fruitful character of investment presupposes faith in the management which will keep abreast of new scientific development, so that individuals may come and go but the corporation would go on for ever, growing from strength to strength. India has still to go a long way in the direction of modern, scientific management which transcends individuals and gives the corporate entity a character of its own.

But even in this direction distinct progress is noticeable. Not only the Tata Company has an unfailing dividend record for the past 15 years but several other companies such as Associated Cements, Bombay Dyeing, Belapur Sugars, to name only a few, have also a longer dividend record, even over 25 years. Only when such instances can be multiplied that the investment climate can be regarded propitious for drawing the small man's savings for industrial development.

The role which the Government has played in the positive development of public companies is still negligible in this direction. In its new-found, immature enthusiasm of developing the so-called "public sector," wrongly regarded as the antithesis of the private sector, much development is being retarded. Unless the Government can bring to bear a new understanding on the dynamic character of industrial progress which depends vitally upon increasing profits utilised for continued development and unless the Government ceases to view profits as an evil, industrialisation can hardly be expected to make rapid strides. The case of the Tata Company itself is an illustration; in this case, through a wrong understanding of the function of profits, the Government has done much to retard the Company's development which could well have grown far greater than at present. If only the secret, which has brought into existence such great corporations as the U.S. Steel, the General Motors, Imperial Chemicals, General Electric, etc., were to be grasped by those in authority what rapid progress could the country attain in its march towards economic freedom!—*All Rights Reserved.*



Years of Dunlop Enterprise

John Boyd Dunlop invented the first practical pneumatic tyre in 1888. Ten years later, Dunlop enterprise brought the first pneumatic tyres to India. In the following years, a marketing network was gradually built up; today there are thirteen Dunlop offices distributed throughout the country. In 1936, when the volume of demand justified local manufacture, Dunlop set up India's first tyre factory at Sahaganj, 35 miles from Calcutta. In the 17 years since, Dunlop enterprise has continually expanded the manufacturing range. Starting with car, truck, cycle, and bullock cart tyres in 1936, aero tyres were added in 1940, cycle rims in 1946, and tractor tyres in 1948. Production of Dunlopillo, the original latex foam cushioning, commenced in 1951. In 1952, the factory started manufacturing industrial belting—yet another Dunlop contribution to the progress of India's rubber manufacturing industry.

DX 1806

CONVERTIBILITY OF CURRENCIES

KEYNESIAN CONCEPT HAS LOST CONSIDERABLE GROUND

LONDON, 30*th November*

WHEN that greatest of contemporary economists, John Maynard Keynes, struck at the gold standard as a "barbarous relic," he declared a war to dethrone gold from its place as the financial unit of convertibility and to replace it by units of indebtedness in terms of goods and services. We shall come back to that phrase later in this article. Meanwhile, we must see how that war has fared—how gold, battered by the shock troops of events and harassed by the guerillas of Keynes went underground, leaving the open war to be fought by the dollar, how the civilised "units of indebtedness" gained ground, seeming almost at one time to have complete victory, but how, in the end, above ground or below (in a sense as literal as metaphoric) gold has remained king of all.

When the United Kingdom abandoned the gold standard 22 years ago, gold disappeared from the Bank of England accounts to be sunk into an Exchange Equalisation Fund, whose operations opened an era of managed currencies. But, in those days, sterling, having first found its level in terms of other currencies, could be freely exchanged for them, which meant that it could be freely exchanged for dollars. Those were the days, when "hot" money ebbed and flowed, but the resources of the Exchange Fund were always great enough to contain such movements. They were days also of protectionism, of quota restrictions which cut at the sources of the flow of trade, while leaving capital movement unimpeded. So, at the same time, a new concept of convertibility arose, embodied in the sterling area, which, initially, was an area distinguished rather by its trade being free of quota restrictions than as an area enjoying special freedom of currency convertibility. It was an area, that is, contained within a commercial rather than a financial ring fence.

War and After

Only eight years after the beginning of the managed currency area came the second war, opening a new era of exchange restrictions and non-convertibility, from which the first departures were not made until five years ago. Even to-day, the basic principles of non-convertibility have not been touched as between one half of the world and the other. But it was, strangely enough, in this era of non-convertibility that the Keynesian concept of a unit of indebtedness not linked to any metallic standard came to perfection in the sterling area. What Keynes had wanted to see was currency convertibility without gold, that is, the free exchange of currencies, coupled with some degree of international economic management to prevent excessive indebtedness between one country and another, and that is exactly what the sterling area became and still is. Nowhere else has this ideal of convertibility been achieved. Within the area trade is unhampered by quota restrictions, currency is freely exchangeable, and the associated countries concert mutually agreed policies for keeping their foreign exchange affairs in order and for preventing any one country being an excessive drain on the resources of the area as a whole.

Outside the sterling area, the strength of currencies depended not merely on the economic relations between the countries concerned but on the convertibility of their currencies into gold and dollars. Hence, of course, the preoccupation of the sterling area itself as a whole with the gold and dollar reserves in the United Kingdom which governed the relations of sterling with the rest of the world.

Keynes's Ideal Has Drifted

Keynes, of course, would have liked to have seen the International Bank and the International Monetary Fund, which he helped to found at the close of the war, a means of extending the concept of the sterling area to embrace the world. He would have liked both institutions to do for the world what the Bank of England, the Exchange Equalisation Fund, and the Conference of Commonwealth Ministers did for the sterling area. But this would have meant as close economic co-operation between the countries adhering to the International Bank system as then existed between the individual countries of the Commonwealth, and for this integration the world was not ready. Instead, Keynes's ideal has drifted further and further away from the

By G. O. Hoskins

original concept. The International Bank nominally dealing in bancor was, in reality, dealing in dollars, and the dollars were themselves broadly based on a capital mainly subscribed in gold by the United States. Neither Bank nor Fund, indeed, made any real attempt to concert economic policies or to get themselves used as an accounting centre for the very good reason that to have so would have—in the state in which the post-war world found itself—meant an immediate drain on these central dollar resources and the building up of unliquidable debts by all the non-dollar countries. The only practical approach to the question of mutual interchangeability of currencies through the Bank would have been first to achieve international agreement on economic and monetary policies.

Yet though this was not possible on a world scale, in Europe, the European Payments Union was established, attempting, again by dealing in E.P.U. units offsetting intra-European debts one against the other, to liberate the countries of the Union from the dead hand of gold. While, however, the sterling area had successfully achieved this, the E.P.U. never got more than half-way—the balances owing by debtor countries ultimately had all to be settled in gold. The reason again for the partial failure was the lack of true economic integration. Thus, in this new era of the International Bank and the E.P.U., gold had only gone into the background and as it disappeared openly from the stage so the dollar emerged and the cry for convertibility became a cry not for gold but for dollars.

World Bank

To-day, the search is no longer for an extension of the sterling area, for whose existence, indeed, British Governments have been too apologetic in the face of American criticism; the E.P.U. tends to think in terms of more of its debt settlements being in gold instead of less; nor is it regarded feasible to extend the functions of the O.E.E.C. towards that sort of close economic co-operation which would keep all the member-countries in line regarding the factors bearing on their external indebtedness; the Iron Curtain divides Europe and equally prevents the Economic Council for Europe performing the same task, which at the outset it was hoped it might do; while the International Bank for most of the world is simply a place, from which a borrower, who is *persona grata* to the United States, can, under sufficiently strict conditions, borrow money, and which once a year issues a report urging the desirability of convertibility—which, if achieved, would incidentally remove the object of the Bank's existence!

Thus the "trade" unit of indebtedness, the Keynesian concept, has lost ground all along the line, dollar dominance has made non-convertibility merely the prerogative of respectable poverty and attention has been diverted to the narrow issue of making all currencies convertible into gold and dollars. At home, this has become a cardinal point of Government policy and, since 1951, the present Government has been steadily working towards it.

Foreign Exchange Markets Reopened

In pursuance of this, the foreign exchange market was reopened two years ago, and, whereas up till then all exchange transactions had had to be done ultimately with the Bank of England, the market was allowed to buy and sell currencies against each other, buying and selling final balances only at the Bank. The first step was taken with American and Canadian dollars, Swiss, Belgian and French francs, Dutch guilders and Portuguese escudos, and the three Scandinavian currencies. It was also permissible to swop American dollars for Canadian dollars, but not till six months ago was this freedom of swopping currencies against each other extended to all the currencies mentioned above, plus the West German mark. This autumn, the final step forward was taken of permitting forward exchange dealings, so that there is now a fully effective foreign exchange market in London for all the most important currencies—a market which has regained on this side of the Atlantic its former preeminence.

But, of course, freedom to exchange currencies is meaningless if the goods from which the currencies flow are themselves restricted. Immediately after the war, 80 per cent. of this country's trade was carried out by the Government and, therefore, settled by the Bank of England. Even five years later, one half of the country's trade was still centrally bought and settled, but the last three years have seen a rapid transfer of this half back to private enterprise, and, in 1954, only about 5 per cent. will remain on Government account. This parallel growth of the free commodity market and the free foreign exchange market has meant that, in practical terms, sterling is a convertible currency, except against dollars. For sterling is convertible not only in the sterling area, but throughout the E.P.U. system and, in practice, with the Iron Curtain currencies, where the limitation arises from the hindrances to trade rather than to exchange the proceeds. Even the dollar exception has been dented by the freedom now given to private trade to buy American grain for dollars and to bring it in without restriction or to sell it again also for dollars. An attempt was made a year ago to permit grain bought in the U.S.A. to be sold to the E.P.U. countries, but this caused too heavy a rush by the E.P.U. countries to use their sterling to buy dollar grain.

This brings us to the fundamental difficulty facing this country on its way to full convertibility. It is not enough for the United Kingdom and the sterling area to have sufficient economic strength *vis-a-vis* the dollar area to permit free exchange between sterling and dollars. Sterling must also bear the brunt of any demands made on it by other currencies which are dollar hungry. It would probably be possible to make sterling convertible into dollars in the near future at the expense of making it unconvertible into the E.P.U. currencies and other non-sterling, non-dollar currencies, which this country at present deals in freely. In terms of liberating trade, which is the real objective, this would be a backward step. The problem of convertibility is not then a problem which this country can look at in isolation, it is a problem of the sterling and E.P.U. areas combined. Are the prospects at present any better than they were a year ago for achieving this objective?

Reserves Inadequate

In discussing the power of a country to maintain convertibility, it is not enough to think in terms of a year or of the current position. Looked at long-term, this country is earning a surplus on balance of payments account of £100 million certain and at most £300 million. This is not adequate, without strong capital backing, to provide a reserve against all the pressures of demand for dollar convertibility via sterling that might arise under complete freedom—as things are at present. Moreover, the figure of £300 million is the one which the Chancellor of the Exchequer has designated as the minimum necessary to enable this country to maintain an adequate flow of overseas investment: thus the country's surplus at the present foreseeable maximum is largely mortgaged for investment and not available to build up annual reserves to meet either capital demands or demands on current account for dollars. What then of the capital backing of sterling?

The gold and dollar reserves are no more than £900 million. This is little more than one-quarter of a year's import trade, or, if we reckon that one half of the gold and dollar reserves must be regarded as an absolute non-expendable minimum, the fluid reserve is only about one-eighth of the country's import trade. Given a more substantial reserve, the risk could be taken of permitting current account business through sterling to be done without limitation and, indeed, *if there is to be no further freedom of import from dollar countries* we may be much nearer that sort of convertibility than the British Treasury is prepared to accept. But one-way convertibility is not a very good proposition for the sterling area with assets held widely in non-convertible European currencies. Though the U.K. could "convert" if it made sterling "hard" for Europe and put itself on a gold basis for the non-sterling, non-dollar world, this would be a blow at world trade, and weaken the international position of sterling. From a practical point of view, it is far better to concentrate on liberalising trade with North America and indeed with other countries than in making sterling itself convertible into dollars: this means concentration on still further strengthening British exports to improve the current margin of safety.

If the E.P.U. economies greatly improved so that they were as strong individually dollar-wise as is the U.K.—under restricted imports—then all E.P.U. currencies could simultaneously be made convertible: and that is the only sensible solution in the present state of the non-dollar world. Convertibility on capital account is another story, and would need to be a second stage in the general move to freedom.—*All Rights Reserved.*

The great inter-continental migrations of the nineteenth century made the world enormously richer in material goods by bringing men closer to untapped stores of natural resources.

TASKS BEFORE INTERNATIONAL MONETARY FUND

BASIC PREMISES FOR ITS OPERATION

THE International Monetary Fund is an international organisation, whose main purpose is co-operation in the solution of payments and exchange problems. At present, 55 countries are members of the Fund. It has an executive Board of 16 members, each of the five countries, with the largest subscriptions, appointing one director, and the remaining members electing 11 directors. The purposes, powers, and scope of operations of the Fund are set out in its Articles of Agreement. The United States membership was authorised by the Bretton Woods Agreements Act of 1945.

The basic premise on which the Fund was established is that orderly exchange arrangements are necessary in a world increasingly dependent on international trade and investment. It was foreseen that the world would have serious payments difficulties in the post-war period. Before and during World War II, there had already been a wide extension of abnormal exchange practices, and the post-war difficulties of a world, in which many countries had inadequate reserves, would probably mean still more disorderly and discriminatory exchange and trade practices. Standards of fair exchange practice were accordingly set out in the Fund Agreement. The Fund was given resources in gold and currencies which were to be used to give temporary assistance to its members. It was made, in effect, an international reserve bank for the central banks and treasuries of its members.

The Fund has had to operate in an environment of persistent payments difficulties. In 1946, par values were established for the currencies of nearly all its members, with the knowledge that many of them would have to be changed after the post-war sellers' market had come to an end. In 1949, the currencies of many members of the Fund were devalued, and both before and since 1949 several other changes of individual par values have been agreed with the Fund. These adjustments were made in an orderly way, despite the difficulty of determining appropriate exchange rates under the abnormal conditions that often prevailed.

Jurisdiction Over Exchange Practices

The Fund has been entrusted by its members with a certain jurisdiction over their exchange practices. Many countries still make use of exchange restrictions and discriminations, particularly against dollar imports. These are a natural consequence of persistent payments difficulties, which still manifest themselves largely as a dollar problem. Members that continue exchange restrictions and discriminations have an obligation to consult with the Fund. During 1952 and 1953, the Fund has been almost constantly engaged in such consultations, some of which have proved fruitful in leading to the simplification or relaxation of restrictive and discriminatory systems. An important aspect of the consultations has been the opportunity afforded for fruitful exchange of views on actual and possible economic policies conducive to the relaxation of restrictions and discriminations.

The Fund has resources equivalent to $8.7 billion, of which $1.7 billion is in gold, $1.3 billion in U.S. dollars, and substantial amounts in other currencies. The Fund is authorised to use these resources to help its members to meet temporary payments difficulties. Without help from the Fund, some members would probably have felt obliged to resort to more stringent restrictions and discriminations. The availability of Fund resources encourages members to rely more on financial policy and less on direct controls as instruments for maintaining international and domestic equilibrium, and, as their payments position improves, to take the risks involved in a gradual relaxation of restrictions and discriminations.

The total of these transactions is now over $1 billion ($1,052,800,000). Because the Fund is, in effect, a reserve institution, the volume of transactions must be expected to vary considerably from year to year. In 1947 and 1948, the Fund sold $675 million of currencies. During this critical period before the Marshall aid programme, the Fund adopted a bold policy for helping its members. From 1949 to 1951, the total transactions of the Fund were only about $135 million. Many of the larger members of the Fund were at that time receiving aid from the United States and were, therefore, advised to conserve their position in the Fund for future needs.

By Ivar Rooth

Managing Director and Chairman of the Board of Executive Directors, International Monetary Fund

In 1952 and 1953, the Fund has again been operating on a larger scale, and sales of currency to members and stand-by arrangements have so far together aggregated more than $290 million in these two years.

Two Dozen Countries Assisted

In all 24 countries have purchased foreign exchange from the Fund, some on two or more occasions. Nine of these countries have repaid in full. Two other countries have repaid their first loans, but subsequently borrowed again and are still indebted to the Fund. Repayments in gold and dollars have amounted to $266 million. In addition, $135 million in currencies which some members had paid to the Fund when drawing dollars have subsequently been purchased by other members. Thus, of the Fund's total transactions of over a billion dollars, more than three-eighths has been repaid. Several loans have been repaid within one or two years.

Most of the Fund's transactions (about 85 per cent. of the total amount) have been in U.S. dollars. The Fund has also sold three other currencies—sterling, German marks, and Belgian francs. Of this year's transactions of $155 million, $84 million has been in sterling.

The Basic Problem

Fund resources are intended to be a second line of reserves. Therefore, the basic problem in connection with their proper use is to get members to regard a drawing on the Fund in the same light as a transaction involving the use of their own monetary reserves. Members must be as cautious in using Fund resources as they would be in using their own reserves, and they must restore their position with the Fund when their reserves increase. For the Fund, the problem is to give members assurance that its resources will, in fact, be available for temporary use in helping to achieve the objectives of the Fund.

In the past two years, the Fund has taken several steps to make these policies clear. Members using the Fund's resources know that they are expected to repay the Fund within a period suited to their payments problem, not in excess of three years, and as a general rule, with an outside limit of five years. The Fund has established procedures to give assurance about their use of Fund resources. A member has a practical assurance that it will be able to purchase from the Fund up to an amount equal to the gold or dollars it has contributed to the Fund. The Fund has also instituted a system of stand-by arrangements under which members can agree with the Fund in advance for specified drawings during a limited period.

Future Role

In considering the future role of the Fund, the first task is to help to restore international balance. Most countries are still confronted by a more or less difficult payments problem which manifests itself largely, though not exclusively, in the form of a dollar payments problem. Aid from the United States and off-shore military purchases have been substantial factors in improving the international payments situation. Recently, however, despite the necessity in many countries of providing large resources for defence, there has been encouraging evidence of recovery based on firmer and more permanent foundations than external aid can provide. The payments problem can be substantially solved if the members of the Fund pursue proper policies—that is, if the deficit countries apply policies that restrain excessive expenditure and costs, and the surplus countries policies that encourage high levels of production and international trade. Exchange and financial policies that encourage foreign investment would, of course, also help to solve the world payments problem.

Appropriate national policies are the only effective means of solving payments problems. Indeed, one of the most important tasks of the Fund is to provide technical assistance to help members to establish such policies. The Fund can help, encourage, and advise its members. But it is they, and they alone, who can put into force the right policies. The role of the Fund should be similar to that performed by central banks. The Fund can be the advocate of sound policies and a persuasive force in securing their adoption. In recent years, countries have come to recognise more clearly than before the central role of financial policy in determining their payments position. This has made it possible for the Fund to exert a greater influence upon its members. The modifications of policy required by changing conditions are, however, too long delayed, both in debtor and in creditor countries. The failure to appreciate the importance of flexibility not only in budgetary and monetary, but also in commercial policy has been one of the factors that have in recent years slowed down our progress toward a stable international equilibrium.

Convertibility of Currencies

The second big task of the Fund is to help its members in establishing the convertibility of their currencies. The maintenance of general convertibility depends upon the restoration of international balance. That does not mean, of course, that all payments have to be solved before any currency can be made convertible. The convertibility of the leading currencies would be a powerful force inducing both the countries immediately concerned and others to put into effect and to continue the sound financial policies that are essential for a lasting solution of their payments problems.

There are to-day a few major currencies that are approaching the position where they could be made convertible. When a country decides to establish convertibility, it must indeed be sure of its ability, even under pressure, to maintain convertibility. The domestic situation must be free of inflationary pressures, the payments position must be strong, the country must have accumulated reserves of its own. Assurance will probably also be needed of adequate financial support to meet the initial stress or subsequent unforeseen difficulties.

Convertibility is an essential requirement for effective competition in international trade. It is the only way by which countries can sell freely in any market the goods that they produce most efficiently and buy freely in any market at the lowest possible price the goods that they consume. Convertibility would also help create conditions favourable to an expansion of international capital movements. The extension of convertibility is in the direct interest of the countries immediately concerned. But it is also in the interest of the rest of the world, and in particular of the United States. As U.S. foreign aid declines, some adjustments will be necessary in the U.S. economy. These adjustments will be less difficult if other countries have the economic strength associated with convertibility. This is in turn dependent upon the possibilities open to them to earn dollars, which are linked with the freedom allowed to them to sell in U.S. markets. It would thus help them to maintain their demand for U.S. products. Progress is now being made in establishing the basis for convertibility. The payments position of many countries and regions has been strengthened and the reserves which are indispensable for convertibility are being accumulated. The recovery of the reserves of some of the great trading countries from very low levels has already been an important factor in making possible a liberalisation of their import and exchange policies. It is in the best interests of the United States that these reserves should be still further strengthened.

Further practical steps are now being taken in many countries to liberalise their trade and to minimise currency discrimination in their import policies. For example, in the United Kingdom, private trade in raw materials and some foodstuffs has been restored. Several commodity markets have been reopened. Others will follow. Every such decision is a step toward convertibility.

Avoidance of Business Fluctuations

The third big task of the Fund is to minimise the international impact of business fluctuations. A recession in a great trading country has a considerable impact on the payments position of other countries. Even a 5 per cent. decline in the national product of the United States could result in a 15 per cent. reduction of total U.S. imports and a substantially larger reduction in U.S. imports of certain raw materials. This would hurt some raw material producers very severely. If other countries were then compelled to reduce their imports to the depressed level of their foreign exchange receipts, the export industries of the United States would be affected, and the recession would spread from country to country with increased intensity. If countries could use Fund resources to supplement their own reserves in maintaining a tolerable level of imports, the international effects of a recession could be moderated. The sensible policy in international finance, as in domestic finance, is not to intensify a recession by deflation but to alleviate it by a judicious use of credit.

The Fund is fully aware of its responsibilities to act with determination to assist its members in lessening the balance of payments impact of any future depression. The Fund can operate with sufficient flexibility in a depression without changes in the Agreement. It believes that, with its present machinery and even with its present resources, it can make a useful contribution to that effect.

The present resources of the Fund are enough to meet calls for temporary assistance under existing conditions. They are enough to permit even substantial stand-by arrangements for members planning to esta-

RURAL BANKING IN A PLANNED ECONOMY

SOME CONCRETE PROPOSALS FOR DEVELOPMENT OUTLINED

INDIA is throbbing with new life. A great plan of national development has got into its stride. The plan has been born in vision and inaugurated under inspiring auspices. The authors of the plan envisage that the Reserve Bank will play an active role in creating "the machinery needed for financing developmental activities all over the country." This machinery is intended to be so designed that, while it will be properly equipped to undertake some "judicious credit creation somewhat in anticipation of the increase in production," it should be adequately efficient in encouraging savings so that the same may be employed in "productive use" and not tucked into "mere hoarding." The authors expect that necessary funds will be provided to meet "large credit needs of agriculture and industry, especially of cottage and small-scale industries," and that "a network of institutions" will be created to "mobilise savings in the rural areas and disburse credit on a large scale." And yet, there are signs of faltering steps. Doubts and suspicions assail the common man; and bewilderment seems to cloud view and stultify action.

Problems of Development

The problems of Indian economic development have been subjected to anxious and elaborate examination during last two decades, at both expert and administrative levels. It is commonly agreed that the task involves not only growth but also rehabilitation, a turning of the growing drift towards urbanisation, a decentralisation of productive activities, and an integration of rural and urban economics to ensure orderly production of raw materials in accordance with varying needs of industries and also to provide an expanding market for increasing industrial output. It has been found that the transition, though slow and wobbling, from agricultural to industrial economy, embracing the last 40 years, has been accompanied with gradual disintegration of rural life, with consequent disruption of the rural credit structure, growing neglect of agriculture as an instrument for creating economic wealth and disappearance of subsidiary and ancillary rural employments. The results have been more disastrous then those experienced in England in the eighteenth and nineteenth centuries, when, in the wake of the industrial civilisation, employment was contracting and distress in rural areas was deepening.

Need of the Hour

Industrial advancement in England was built on colonial acquisition of raw materials and geopolitical exploitation of foreign markets; whereas, like in the U.S.A., industrial development in India will have to depend basically on internal supplies of raw materials and internal organisation of extensive markets, though both imports and exports may serve as marginal and corrective forces and may even sustain individual industries like tea and jute. It is not necessary here to enter into a controversy over the rationale of an introvert market, because whatever may be the merits or demerits of a 'closed economy,' the inescapable fact remains that extended industrial activities in India will end in chaos and ruin, unless the vast rural hinterland is *active enough to keep* supplies of raw materials rolling and vital enough to absorb goods and services turned out by an awesome industrial engine.

The disorganisation caused by insidious decay of rural life has been assuming disquieting proportions. Though industrial production has been rising, market is receding, purchasing power has been falling and inventories have been accumulating. The Planning Commission believes that bold and energetic measures are called for to revitalise economic life, and to this end, indicates a schedule of "priorities for development" to be followed in both rural and urban spheres. The need of the hour is, therefore, to set up and bring into action a machinery which will extend credit to stimulate rural activities (both agricultural and industrial), mobilise savings and rationalise money supply, create enthusiasm and promote confidence, and thus help towards an all-purpose development of rural life, including mobilisation of "local effort for local development."

Several alternative patterns of the contemplated machinery have been discussed and considered. There may be an extension of branch banking

By A Banker

activities into villages, vigorous propaganda may be launched to popularise co-operative societies and postal savings banks and steps may be taken to start new societies and open new postal savings departments. The Rural Banking Enquiry Committee, which was appointed in 1950, recommended that, while commercial banks should be encouraged to open branches at taluka and *mandi* towns and other towns of commercial or industrial importance, the vast remaining area of the country should be served by the co-operative and postal systems; co-operative banks being required to cover the towns and larger rural areas, and co-operative societies and postal savings banks to extend to smaller villages. The Committee also suggested that, in certain areas and regions, institutions like Agricultural Credit Corporations or State-sponsored Agricultural Banks might be set up to strengthen the activities of co-operative banks and societies. The measures which the Committee considered necessary for satisfactory implementation of its recommendations are as follows:

(i) A well developed transport system, (ii) acceptance by banks of accounts from illiterate customers, (iii) use of regional languages in books and forms of banks, (iv) association with banks of local persons as directors and employees, (v) propaganda to educate people regarding use of banking facilities, to be undertaken by Government as well as associations of banks, (vi) sympathetic dealings with the rural people by officials of banks, and active interest to be taken by such officials in rural social life and agricultural problems, (vii) non-application of Shops and Establishments Acts and awards of Industrial Tribunals to offices of banks situated in towns having a population of less than 50,000, so that operating costs of rural branches may be kept down, (viii) treatment of commercial banks on par with co-operative institutions in respect of legislations relating to money-lending and debt relief, (ix) liberalisation of remittance facilities to ensure cheap transfer of funds between different places served by banks, co-operative institutions and indigenous bankers, (x) adequate facilities for conversion and exchange of notes and coins, (xi) facilities for banks to keep their iron safes and chests in the strong rooms of treasuries and sub-treasuries, (xii) active steps for promotion of warehousing, and in particular, establishment of a Warehouse Development Board, (xiii) special assistance and subsidies for co-operative institutions and (xiv) higher rates of commission on turnover at new branches and Treasury pay offices of the Imperial Bank for a period of five years.

It will be noticed that the measures suggested by the Rural Banking Enquiry Committee extend differential treatment in favour of co-operative institutions and the Imperial Bank. In spite of forty years of special nursing of co-operative societies under official patronage, agricultural credit societies had aggregate deposits of only Rs. 7.5 crores, as against borrowed funds of Rs. 24.8 crores as at 31st March, 1951. It is doubtful, therefore, as to how far the above stated measures will help in breaking the long tradition of the rural population regarding co-operative societies as sources of loans rather than as depositories of savings. Again, unless the Imperial Bank modifies its semi-bureaucratic approach and follows normal methods of commercial banking, it does not seem reasonable to expect it to develop fruitful local contacts or to undertake such credit creation as is visualised in the plan. Moreover, further continuance and/or extension of discriminatory treatment in favour of the Imperial Bank will place other commercial banks under a handicap and also run counter to the principle of providing equal opportunities for private enterprises in the same class.

Let Private Sector Do It

It seems also obvious that branches of big banks (whether the Imperial Bank or other commercial banks) with a metropolitan outlook, lacking special interest in any local area of its operation, and assuming a distant, though correct, attitude to the local people will fail to create the necessary measure of enthusiasm. On the other hand, co-operative institutions lack necessary funds of their own, are not integrated with the urban money market and have no means or tradition to train personnel in sound methods of accounting, proper business practices and knowledge of banking law. Though the State and the Reserve Bank may provide necessary funds to co-operative institutions, the access to funds thus opened will fail to form part of a bank's regular programme of operation and will depend on decisions made from time to time at distant headquarters, and thus be vitiated *in a more accentuated form* by the same evils which are attributable to the functioning of big banks through their branches in villages. Again, though the Planning Commission expects the State to provide Rs. 10 lakhs for improvement of the co-operative personnel, and the State may, therefore, organise and finance the training of personnel for co-operative institutions, such training will fail to be directly related to experience of practical working and will also involve State assistance in the private sector in a matter which may well be organised by private resources.

It should be remembered that, while the State should not fight shy of meeting calls for assistance or intervention in any sector, the demand on its resources is so great that it should not spend its energy or resources where the private sector possesses reasonable capacity. As regards postal savings banks, irrespective of other advantages or disadvantages, the fundamental fact that the system cannot efficiently handle money supply and that the savings collected by the postal banks will flow into channels of State investment and will not thus be available for productive employment in the private sector, seems sufficient to render it unfit for the role which is envisaged by the Planning Commission for the new machinery of credit institutions. It should also be borne in mind that, in spite of much-publicised shift in income, the availability of rural savings will depend on cheap and rationalised credit supply, access to wider money and commodity markets and a healthy relation between prices of primary produce and of manufactures. It appears, therefore, that, while an urban plant should not sprout on the rural soil, an appropriate scheme *designed* to meet the peculiarities of the position and its special needs should be so devised as will integrate "all the channels of credit" and ensure purposeful co-operation of the commercial banking system.

Scheme Outlined

It is suggested, therefore, that a scheme prepared on lines similar to those indicated below may be considered suitable for the purpose:

(i) Rural banks should be established at the rate of one in each sub-division of a district, with pay offices in sufficiently built up areas within the sub-division of each bank's operation. These banks should be shareholders' banks, with a paid-up capital of Rs. 1,00,000 for the principal office and Rs. 10,000 for each pay office. The whole of the country should be covered by the scheme within five years, though pay offices may take longer, say, further two years to be fully extended.

(ii) Such banks should be sponsored by Scheduled Banks of at least five years' standing and working at a profit, as their subsidiary concerns. It would generally be obligatory for the Scheduled Banks to join the scheme, opportunity being given to them to select their areas of operation as far as practicable. The "sponsor bank" should subscribe half of the capital of the rural bank, the balance being subscribed by the public, and, failing adequate public subscription, by the Government to the extent of the shortfall arising.

(iii) The "sponsor bank" should lend to the affiliated rural bank upto three times the amount invested by it in the paid-up capital of the latter, the loan being guaranteed by Government.

(iv) Capital losses, if any, incurred by Scheduled Banks in respect of the working of rural banks within the first seven years must be reimbursed by the Government.

(v) The sponsor banks will be entitled to commission at the rate of 1/8 per cent. of annual outstanding deposits of rural banks for a period upto the fifth year of incorporation.

(vi) A deposit insurance scheme should be introduced for rural banks.

(vii) The rate of tax on the income of rural banks should not exceed 25 per cent. of the rate for public companies in general, upto a period and size of profit, and thereafter, the undistributed profits of these banks should be wholly exempt from tax.

(viii) The sponsoring Scheduled banks, if conforming to prescribed standards of size and efficiency, should be entrusted with the cash work of Government Treasuries or sub-treasuries in the respective areas allotted to them.

(ix) It should be permissible for rural banks to run mobile offices.

R.B.E. Committee's Objections

A scheme formulated on the above lines was submitted to the Rural Banking Enquiry Committee in 1951 but encountered objections on the following grounds:

(a) Co-operative banks and post offices can go deeper into the rural areas than commercial banks.

(b) (i) The scheme involves guarantees, payments of subsidies and concessions of taxes for which State finances are not sufficiently strong and which, however, justifiable in respect of other undeveloped industries, is not tenable in relation to banking which is neither an 'infant industry' nor is it in need of protection against foreign competition. Moreover,

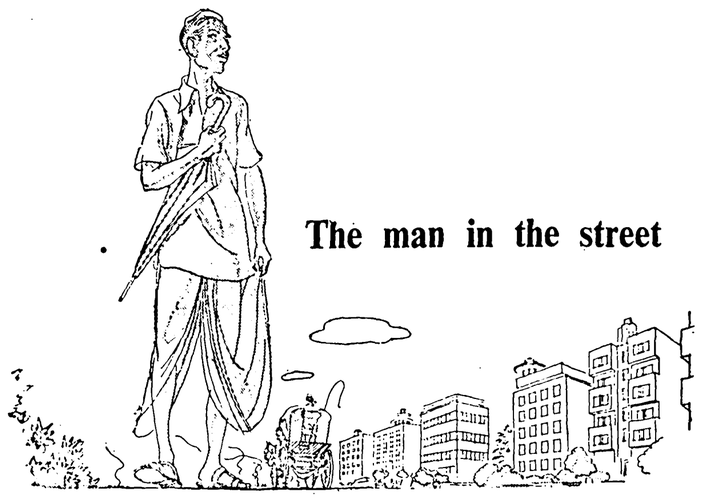
MADRAS GOVERNMENT



The man in the street

THE past few years have brought about many changes. Some have been surface changes only. Some have driven deep into the fabric of the nation.

There is one thing that has not changed and will never change... the desire of the man in the street for a better way of life. In the constant effort to realise this ideal the people of today recognise the need to improve and raise their standards of health and hygiene. Only then will they have gained a foothold on the future.

The struggle to fight dirt and disease is made easier today by the scientific manufacture of soap. The responsibility which the soap-maker owes to the man in the street is told in his continual effort to widen the base of the distribution of soap products and to stabilise prices at a level which can be comfortably afforded by everybody.

One organisation which has linked arms with the consumer in India since 1934 in this desire to raise the standards of life is Lever Brothers (India) Ltd., which has maintained throughout the years of war and peace the same high quality which has made such names as Sunlight, Lifebuoy, Lux Toilet, Lux and Vim famous the world over.

Lever Brothers (India) Ltd. remain constant in their aim to provide high quality and fair prices to a loyal and growing public which has purchased their Indian-made goods for nearly 20 years. In continuing to meet the increasing demands of the Nation, Levers employ Indian labour, use Indian raw materials and Indian skill in perfecting the latest methods in their honest endeavour to give the man in the street a square deal.

LEVER BROTHERS (INDIA) LIMITED

banking losses in initial periods are normal and, therefore, should legitimately be borne by banks expanding their business.

(ii) The question of practicability of a scheme of deposit insurance should be considered after the banking system is properly consolidated.

(iii) Subsidies and concessions involved in the scheme will operate in competition with those now being extended to the co-operative system.

(iv) The subsidies, etc., though intended for short periods, have the knack of claiming continuance.

(c) The scheme will raise complicated issues regarding allocation of various regions to different Scheduled Banks.

It may also be argued in some quarters that a scheme for setting up rural banks as subsidiaries of commercial banks will give rise to serious misgivings regarding Government policy in the field of finance; that success of the scheme will require detailed supervision of and direction of rural banks, which will be administratively difficult and may even be resented by the banks themselves; and further that co-operative agencies will be in a better position than commercial banks to develop contacts and build up a rural clientele.

Criticisms Answered

It seems that the criticisms levelled against the scheme are based on an insufficient conception of the part that the postal system can play in the economic set-up of the country. As already indicated, savings collected by Post Office Savings Banks are utilised for finance in the public sector and thus will not be available for the much needed finance for the private sector; again, the postal system is not a part of the normal money market, nor can it conduct money supply which, in the interest of a well-regulated policy of credit and currency, should be integrated in the organised banking system. As regards co-operative institutions, also, it has been noted that tradition has fitted them into a role of intermediary lending institutions, and experience of low deposits and high borrowings shows that they are not suitable agencies for mobilising savings or operating currency.

A policy of encouraging the co-operative and postal systems to undertake the role, for which they are not organisationally designed and naturally competent, may soothe one's conscience with a sense of having done the best that is possible, but will hardly achieve the desired result. The criticisms relating to the States' inability to meet the cost of guarantees, subsidies, and remissions of taxes seem to overlook the fact that such assistance is already being extended to, and planned to be further increased in respect of, the co-operative system, and that considerable outlay is being made on propaganda to popularise the postal system. As regards the objection against the proposed guarantees and protection for rural banks, it should be borne in mind that they will not create new wastage or destruction of assets but are intended only to disperse the burden of losses which will in any case arise, and if left to weigh on a localised sector, will cause aggravated economic losses by dislocating the economy.

Rural Banking Still An Infant

Though it may also be possible to maintain that banking, and especially rural banking, is still an infant industry in India, it is not necessary to dwell on the issue, as guarantee and protection are intended to subserve the well-being of the larger economy and do not relate simply to the narrow question of infancy. Creation of credit in pursuance of development finance, furthering a plan with both time and achievement targets, will, in the nature of things, be attended with failure and misdirection of productive and distributive activities, in individual sectors, and, unless the larger economy is protected by a well-prepared scheme of protection and guarantee, the plan itself will stand the risk of foundering on unseen rocks. It will, therefore, also, logically follow that a scheme of insurance will make a creative contribution and serve best only before the banking system is fully rationalised and consolidated, and that such scheme may be necessary only as a routine measure after the system succeeds in dealing with or overcoming the factors of uncertainties and disturbances.

Issue Should Not Be Distorted

The question of competition with the co-operative system should not be allowed to distort the issue, because it is contended that co-operative institutions are no fit to function as credit agencies and that, while they may be utilised as intermediary lending agencies and in other fields of co-operative endeavour, they should not be called upon to take part in conducting currency and credit. Moreover, unlike guarantees for co-operative institutions, it is possible to evolve guarantees for banks on a self-sufficient basis and arrange that the premia and surcharges levied on the members of the banking system and credit-users, respectively, will be sufficient to meet the cost of guarantee and protection, and thus to minimise, if not to eliminate, the necessity of drawing on State funds. Again, income enhanced by accelerated economic activities will not only augment national income but will also bring increased revenue to the State.

As regards the danger of perpetuation of the system of assistance and guarantee, the legislators and administrators functioning under an organised plan should be expected to be firm in resisting unnecessary demands and yet to be responsive to the needs of the situation obtaining from time to time; and, in any case, such danger will equally affect the liberal provisions made for grants and assistance to the co-operative institutions. The allocation of various regions to different Scheduled Banks should not present any formidable problem for the Reserve Bank which is already called upon to perform a similar but more complicated function of licensing branches of banking companies under section 23 of the Banking Companies Act.

The apprehension that the proposal for setting up rural banks on the lines suggested above, will create special misgivings in the public mind seems to be unfounded. It is true that Governmental activities in the economic field are sometimes viewed with distrust; but this attitude will be more pronounced in relation to Government's association with an inefficient and wooden system represented by the present structure of co-operative credit than that with a system which will succeed both in mobilising savings and creating credit. In view of the policy of control and supervision already adopted and enforced in respect of banks and co-operative institutions, the argument against its practicability or acceptability seems also to be out of place; further, the availability of trained personnel and useful experience through co-operation with commercial banks will make it increasingly possible to lessen the rigidity and elaborateness of supervision and direction.

An Important Benefit

Lastly, rural banks originating in the area of their operation but organisationally linked with Scheduled Banks will enjoy the benefits of specialised training and sound traditions, and yet, will breathe the local spirit and be in complete harmony with the local atmosphere. It is quite within the range of practicable politics to organise 500 rural banks, with 4,000 pay offices, that, within five years of their inception, they will raise deposits of the order of Rs. 45 crores, as against a sum of less than Rs. 8 crores raised by agricultural co-operative credit societies, with a background of forty years of propaganda and official assistance; and the facilities provided by sponsor banks should also be expected to help in preparation of a programme of expenses which need not exceed the income of a rural bank even in the first year of its existence.

Conclusion

The Planning Commission emphasises the necessity of stimulating co-operative activities in the rural field and contemplates that rural credits to the extent of Rs. 100 crores per annum shou'd be extended by the Government and the Reserve Bank through Co-operative institutions. It is respectfully submitted, however, that the Commission does not take into sufficient account the fact that co-operative institutions, as now constituted and controlled, do not contain the necessary elements of co-operative adequacy. Supply of credit, which is the principal function of a credit agency, does not originate in the Indian co-operative system but has to be borrowed from outside agencies, whereas rural banks functioning in close association with commercial banks, will succeed not only in collecting savings but also in operating money supply; and thus credit extended by them will be based on resources raised under conditions of co-operation between banks and local people, and not like the so-called co-operative societies, on funds obtained from outside sources.

Again, immense outlays borne or commitments undertaken by the State in respect of co-operative societies, in connection with training, supervision, propaganda, subsidy and guarantee, will have to be met out of general revenues of the State, whereas the burden of similar costs and obligations may reasonably be expected to be distributed among their direct beneficiaries. It may not, therefore, be presumptuous to maintain that the proposed system of rural banks will more effectively answer the purpose of the Planning Commission in bringing about that "institutional reform" which the Commission considers to be an essential part of the implementation of the Five-year Plan, than an extended scheme of finance and assistance for credit societies belonging to the organisation built on present laws relating to co-operative societies. While, therefore, co-operative societies may, at best, discharge in a credit system functions similar to those assigned to small wells in a scheme of irrigation, rural banks will fill the role comparable to that of a D.V.C. project in an all-embracing scheme, serving not only the purpose of irrigation, but also of flood control, power generation and navigation.—*All Rights Reserved.*

BIHAR FINANCIAL CORPORATION

The Government of Bihar proposes to set up a State Financial Corporation with an authorised share capital of Rs. 2 crores to provide financial assistance to medium and small-scale industries. The Corporation will be a statutory body, with its head office in Patna.

The authorised capital of the Corporation will be divided into two lakh fully paid-up shares of Rs. 100 each. Out of this, only 50,000 shares of the total value of Rs. 50 lakhs will be issued. In the first instance, the allocation of shares will be as follows: State Government Rs. 17½ lakhs; the Reserve Bank Rs. 10 lakhs; the scheduled banks Rs. 12½ lakhs; and other parties Rs. 10 lakhs.

ROLE OF COMMERCIAL BANKS IN INDUSTRIAL FINANCE

IDEA OF MIXED BANKING OBSOLETE

By S. T. Sadasivan

Deputy General Manager, United Commercial Bank Ltd.

THE Industrial Policy Statement of 1948 and the Five-year Plan formulated by the Planning Commission have laid down that certain basic industries of national importance shall be reserved for development by the State and the remaining industries left for operation, subject to regulation and control by the State to private enterprise. The financial resources needed for carrying through the developments envisaged by the Plan are also estimated and allocated between the public and the private sectors, so that each sector might get its proper share of available resources.

The pattern of finance envisaged by the Planning Commission for the private sector reveals that a sum of approximately Rs. 383 crores will be required for investment on expansion, modernisation and replacement and Rs. 150 crores for working capital. The sources of finance indicated for carrying through this programme are as follows:

(In crores of rupees)

(a) Savings of corporate enterprise in the industrial sector	200
(b) New issues	90
(c) Assistance from the public sector ..	5
(d) Industrial Finance Corporation ..	20
(e) Refunds of excess profits tax deposits	60
(f) Banks and other sources of short-term finance	158
Total ..	533

It is significant that banks are classified under sources of short-term finance and the amount to be provided by these interests is approximately equal to the working capital requirements of private industry.

The question that arises is whether banks are in a position to provide an additional Rs. 150 crores of finance for industry and in this context we might examine also the general question whether banks can help industry in respect of its requirements of long-term finance either through participation in the ordinary and preference share capital or through subscription to debentures.

The total deposits of scheduled and non-scheduled banks as on 31st December, 1952 were Rs. 814.36 crores and Rs. 43.96 crores, respectively, making a total of Rs. 858.32 crores. This total was composed of demand deposits Rs. 436.95 crores, savings deposits Rs. 143.66 crores and time deposits Rs. 277.71 crores. Treating savings deposits, from its nature, as time deposits, half the total deposits were payable on demand and half on fixed dates within twelve months. The classification of the ownership of these deposits reveals that private individuals held Rs. 409.82 crores, industrial concerns Rs. 79.09 crores, commercial concerns Rs. 239.02 crores and others (mostly Government and quasi-Government bodies) Rs. 130.38 crores. The industrial and commercial deposits are susceptible to very rapid turnover, while the personal and other deposits are subject to a small rate of turnover.

The examination of the growth of the resources of the commercial banking system from the year 1939 reveals that, as a result of war finance, the deposits of banks rose from Rs. 277.5 crores in 1939 to Rs. 948.9 crores in 1952. During the same period, the holding of Government securities (investment by banks in the public sector) rose from Rs. 79.8 crores to Rs. 347.1 crores and the advances of banks rose from Rs. 167.5 crores to Rs. 548.1 crores. From this it is clear that banks have contributed their share to developments both in the public sector and in the private sector.

Since the coming into force of the Banking Companies Act, 1949, four years ago, classified figures of advances to industry, commerce, agriculture and other interests have been published by the Reserve Bank of India and, though only the figures for the past four years are available, it is reasonable to assume that the figures give a true picture of the general pattern over a period of years and of the underlying trend where changes have occurred. The following table gives the analysis of advances of all banks (scheduled and non-scheduled) as at the end of the years 1949, 1950, 1951 and 1952 and also as on 31st March, 1951 and 1952. The figures within brackets give the percentage to total advances and at the foot of the table is given the ratio of advances to deposits:

Analysis of Advances of Scheduled and Non-Scheduled Banks According to Purpose

(In crores of rupees)

	31-12-1949	31-12-1950	31-3-1951	31-12-1951	31-3-1952	31-12-1952
Industry	138.57	160.1	203.4	201.7	241.1	186.4
	(29.6)	(30.9)	(32.4)	(32.4)	(35.7)	(34.0)
Commerce	237.77	263.6	225.4	223.2	231.1	253.1
	(50.7)	(50.8)	(52.8)	(52.0)	(49.9)	(46.2)
Agriculture	9.95	13.5	14.9	15.4	19.0	23.4
	(2.1)	(2.6)	(2.4)	(2.5)	(2.7)	(4.3)
Personal and professional ..	45.37	54.1	54.2	54.1	54.0	50.3
	(9.6)	(10.4)	(8.7)	(8.7)	(8.0)	(9.1)
All others	37.05	27.6	28.7	27.2	30.8	34.9
	(7.9)	(5.3)	(4.2)	(4.4)	(4.6)	(6.4)
Total advances	468.1	519.7	627.6	621.6	675.0	548.1
Ratio of advances to deposits.	47.3	52.0	67.0	63.8	76.0	57.7

The figures provide very interesting reading. During the period 1st January, 1950 to 31st December, 1951, advances rose from Rs. 468.7 crores to Rs. 518.7 crores and, in the three months from 1st January, 1951 to 31st March, 1951, there was a further steep rise by Rs. 108.9 crores to Rs. 627.6 crores. The figure fell to Rs. 621.6 crores on 31st December, 1951, but, on 31st March, 1952, advances again rose to Rs. 675.0 crores. At the end of December 1952, the figure fell to Rs. 548.1 crores. The banking system was thus called upon to meet a tremendous demand for advances in 1951 during the period of the Korean War boom. These advances were not liquidated in the slack season of 1951, but were carried over into 1952 and on the top of this carry-over was superimposed the seasonal demand for advances of the 1952 season of nearly Rs. 55 crores. Over a short period of one year and three months, the banking system showed itself capable of expanding its advances by the very huge figure of Rs. 156 crores despite a fall in deposits of Rs. 32 crores. Of this increase, advances to industry rose from Rs. 138.59 crores on 31st December, 1949 to Rs. 241.1 crores on 31st March, 1952.

The banking system has thus shown itself capable of almost doubling its advances to industry. The strain was very great and this tremendous expansion in banking credit was made possible by sale of Government securities, by borrowings against Government securities and also by borrowings against usance bills under the bill market scheme formulated by the Reserve Bank of India. This scheme was brought into operation not one moment too soon and, but for its introduction, the banking system in the country would have been subject to an unprecedented severe strain.

Examining the figures for 31st December, 1952, advances to industry constitute 35.1 per cent. of the total advances while those to commerce, agriculture, 'personal and professional' and 'all others' constitute 46.7 per cent., 4.2 per cent., 7.8 per cent. and 6.3 per cent. respectively. Within the industrial group, the cotton textiles industry gets 26.6 per cent., sugar 15.4 per cent., engineering 9.6 per cent., jute 7.9 per cent. and other textiles 5.5 per cent. Obviously the textile industry, being the oldest established, gets the largest share of advances from banks and the sugar industry, which, in recent years, has recorded rapid development, comes next in importance. Cement, although it is a very important section of industry, is largely financed by internal resources and its share in bank advances is only 0.6 per cent.

It would appear, *prima facie*, that established industry is getting all its working capital requirements from banks, but the question arises whether the banking system is in a position to meet an additional demand of the order of Rs. 150 crores for industry envisaged by the Planning Commission. The answer to that depends entirely on whether, as a result of the execution of the Plan in the public sector, there would be a large increase in deposits in the commercial banking system.

It goes without saying that, if deposits were to expand during the Five-year Plan period by about Rs. 600 crores, bank advances could increase by Rs. 300 crores and, if a certain bias in favour of advances to industry were to be exercised, they could be stepped up by Rs. 150 crores. The trend of bank deposits in recent years has been downward or at best stagnant. Advance collection of income-tax, borrowings by the Government of India, State Governments and Local Bodies and diversion of funds from banks into the Government treasuries through the operation of the State scheme for compulsory provident fund for industrial employees, all have the cumulative effect of draining of the natural accumulation of funds in banks. In these circumstances, it would be grossly optimistic to assume that an expansion in deposits of the order of Rs. 600 crores would materialise in the next three or five years.

The deposits of commercial banks declined from Rs. 1,168.48 crores in 1946 to Rs. 956.60 crores in 1952, while, in the same period, the advances had increased from Rs. 530.73 crores to Rs. 675 crores and then declined to Rs. 579.34 crores. The net increase in advances has been financed by a reduction in the portfolio of Government securities held by the banking system. In the busy season of 1951 and 1952, the percentage of bank advances to deposits reached dangerously high levels and it was the decline in commodity prices which set in in the first half of 1952 that made a return to normal conditions possible.

The record of service of banks to industry has been impressive. As has already been pointed out, when industry needed additional working capital during the years 1950 to 1952, banks readily came to their assistance by increasing their loans to industry by over Rs. 100 crores. The total of advances of the banking system today, after the collapse of the post-Korean war boom, is of the order of Rs. 500 to Rs. 550 crores and, even after making provision for seasonal needs of industry and commerce, banks are well placed to handle a fair amount of acceptable new business relating to industrial finance. It is, no doubt, true that, in the slack season, the advances come down and deposits go up and money becomes easy, but, considering that advances can increase by Rs. 70 to Rs. 80 crores in the busy season and deposits could go down by about Rs. 30 crores, the banks have to be prepared for a shift of funds of the order of Rs. 100 crores. This they are able to do by borrowing against Government securities and also by resorting to the bill market scheme introduced by the Reserve Bank. While, therefore, it is possible that a certain amount of additional finance for new industry can be handled by banks, the conclusion is irresistible that, on the basis of present deposits of the banking system, commercial banks have reached their limit for advances to industry and commerce.

The small size of the excess cash balance reserves of the banking system with the Reserve Bank over and above the statutory minimum which banks are required to keep provides a further confirmation that the banking system has reached the limit of its ability to give advances to industry and commerce. This excess, which was very pronounced in the war years and in the period following the termination of the war, has steadily dwindled, with the result that, in February, 1952, the excess fell to a mere Rs. 8.10 crores. The minimum was touched, when the ratio of scheduled banks' advances to their deposits rose to 68.5 per cent.

In contrast with the experience of the commercial banks, the co-operative banks and the post office savings banks recorded a spectacular rise in deposits. Deposits of co-operative banks rose from Rs. 57.80 crores in 1946 to Rs. 105.66 crores in 1952 and those of post office savings bank from Rs. 115.05 crores in 1945 before the Partition to Rs. 199.81 crores in 1952. Thus, while the commercial banking system has experienced a shrinkage of resources, the co-operative banks and the post office savings bank, which contribute to the finances of the quasi-public and public sector, have registered very great improvement. This is a convincing proof of the shift of income and saving capacity from the urban to the rural area and from the middle and upper classes to the agriculturists and industrial workers. This shift, coupled with the Government's budgetary and development policies, does not give much hope of an expansion of the resources of the banking system, except in the event of inflation of currency and credit through the operation of the Five-year Plan.

Leaving out the possibility of inflation, the question is whether on the basis of the present banking structure any large increase in banking credit other than for seasonal requirements is feasible. Theoretically credit could be expanded by reducing the holding of Government securities and by working on a narrower basis of cash. These two methods have already been in operation for some time as is borne out by the following table:

Cash and Investments in Government Securities of all Banks

(In crores of rupees)

	31-12-1949	31-12-1950	31-12-1951	31-12-1952
Cash on hand and with banks and money at call ..	201.9	165.8	162.5	152.9
(%, to deposits)	(20.5)	(16.6)	(16.7)	(16.1)
Investments in securities of the Government of India and State Governments and in Trustee Securities ..	378.3	341.9	312.1	347.1
(%, to deposits)	(38.4)	(34.2)	(32.0)	(36.6)
Borrowings against investments	34.3	37.9	50.5	40.1

Under the provisions of the Banking Companies Act, it is incumbent on banks to keep in the form of cash and unencumbered Government securities a sum equal to 20 per cent. of deposit liabilities. But this is a minimum requirement and in practice banks find it prudent to work on the basis of 40 per cent. ratio.

This liquidity ratio is one which has to be decided in the light of experience and varies from country to country. Also the concept of what constitutes a liquid banking asset varies. In India, the securities of the Government of India and the State Governments are considered liquid, as it is possible, under the provisions of the Reserve Bank of India Act, to borrow moneys against them at all times. Likewise, in the United States, Government securities are looked upon as a liquid asset. In the United Kingdom, however, securities of the British Government are not considered liquid asset in the technical sense and it is only cash, holdings of first class bank bills and of Treasury Bills and moneys lent out at call and short notice to the money market against bills and short bonds that are considered liquid assets and the banks work on the basis of a ratio of these liquid assets to deposits of 30 per cent. In Germany, Government securities are not looked upon as a desirable banking asset and banks there treat commercial bills rediscountable at the Central Bank as a liquid asset.

In recent times, the concept of liquidity itself has undergone a change. Whereas years ago any security that could be easily realised without loss or any advances or bill which might be deemed to be self-liquidating was considered a liquid asset, the stress now is more on the shiftability of assets and it is only those assets that can be passed on to the Central Banking institution in times of crisis for the purpose of advance or rediscount that would now be deemed to be liquid assets. In the light of this development, it is only those assets which would be bought, advanced against or discounted by the Reserve Bank of India under the provisions of the Reserve Bank of India Act that should, strictly speaking, be deemed to be liquid assets. From this point of view, there should be no difference between Government securities and commercial advances backed by usance bills, because both are acceptable as collateral for advances by the Reserve Bank of India.

If a lower holding of Government securities is offset by a larger holding of commercial bills eligible for deposit with the Reserve Bank of India by way of collateral security for call loans, there is no impairment of liquidity. In actual practice, however, the turning of all or a majority of advances into bills acceptable to the Reserve Bank of India is not a feasible proposition, except to a limited extent for the purpose of seasonal expansion of credit and, therefore, considerations of liquidity suggest that the holding of Government securities should not be further reduced. The experience of the busy season of 1952 clearly indicates that a large expansion of credit not backed by an expansion in banking resources is beset with potential dangers. The idea of a reduction of holding of Government securities to provide the basis for an increase of bank credit to industry must, therefore, be ruled out.

A Prerequisite

The other alternative that presents itself is that the cash ratio of the banking system could be reduced to provide the basis of credit expansion. British banks over a period of time have reduced their cash ratio by gradual steps from about 15 per cent. to 8 per cent. Treating balances with other banks in current account and money at call and short notice as cash, banks in India work on the basis of a cash ratio of 12 to 15 per cent. and there is some room for economy provided remittance facilities and telecommunications are speeded up. At present large cash balances have to be kept at widely scattered centres, because it takes one day to transfer funds even from Bombay to Calcutta and *vice versa* and longer in the case of remittance to mofussil centres. If the "telex" system of communication is brought into wide use or, at any rate, if all the banking offices operating in the country are brought together by a system of "bank wire" whereby instantaneous communication is possible between any two banks, however far-flung they may be situated, it would be possible to move cash by "bank wire" in a matter of seconds and idle cash now lying in the vaults of branches of banks can be put to use as the basis for expansion of credit.

Long-term Finance

Turning to the requirements of equity capital and long-term finance for industry, it must be admitted that, with the competition for finance from Central and State Governments for the execution of their heavy development programme, industries find it difficult to raise capital from the open market. Established industries have to depend for expansion more and more on their own internal resources such as depreciation funds, renewal and replacement reserves and undistributed profits. So far these industries have not had much difficulty in securing their long-term capital requirements by the issue of equity capital, preference shares or debentures. An active demand exists for first class preference shares and debentures and banks themselves have not been averse to subscribing for debentures with a view to pass them on, in due course, to investors. These are, however, not liquid assets as they are not capable of being tendered to the Reserve Bank of India in the last resort as security for advances; but, as it is not necessary for banks to work on the basis of 100 per cent. liquidity, it is permissible for banks to divert a portion of their resources to investment in debentures.

The Industrial Finance Corporation of India, with a paid-up capital of Rs. 5 crores and a debenture borrowing of Rs. 7.80 crores, is performing a very useful function and the claim of the Chairman at the annual general meeting that "but for the help rendered by us many industries which have taken loans from us could not have started schemes whether of expansion or of modernisation or of new lines on which they have launched" is well founded. Several Finance Corporations sponsored by State Governments are slowly coming into being. They may be expected to assist the medium-sized industries in the same manner as, broadly speaking, the Industrial Finance Corporation of India is assisting the bigger industries.

Mixed Banking

There is one point to be stressed in connection with the share capital issues by these corporations. They are, in all cases, guaranteed by the respective Governments as to safety of capital and minimum dividends and are declared to be Trustee securities. The Governments and the Reserve Bank of India between themselves take up 50 to 60 per cent. of the capital and the bulk of the remaining capital is offered to financial institutions. Banks would more freely subscribe to these issues if they are assured that the shares would be treated on a par with Government securities and freely accepted as collateral security for loans. The Reserve Bank of India at present would appear to look upon these shares as a sort of second class security against which no advances should normally be granted and, if this impression is correct, it is not right on the part of the Reserve Bank of India to authorise these flotations with the reservation of such a large part of the capital for subscription by banking interests. It is no wonder that banks who pay special regard to the liquidity aspect of their investment portfolio feel chary about subscribing to these shares.

The problem of new industries, however, is a very different one. The shortage of capital in the country in quarters accustomed to undertake risks necessitates new methods of raising capital. The idea that found favour a quarter of a century ago that commercial banks should adopt the mixed industrial-*cum*-commercial banking system in vogue in Germany and sponsor new industries by subscribing the whole or a part of the capital required by companies floated for the purpose, and retain investments in their portfolio till such time as the companies make a success of their venture and thereafter sell the shares in the open market has now become obsolete and would no longer find favour with the monetary authorities charged with the regulation of and control over the banking system. Liabilities of commercial banks are predominantly demand liabilities and even their time liabilities are repayable within one year. The policy of borrowing short and lending long has always proved disastrous in the past and there is no need for Indian banks to learn that lesson in the hard school of experience.

The fact that commercial banks cannot sponsor new industries and that the capital market has not the resources of risk capital to absorb the capital issue of new industries does not mean that no steps should be taken in the starting of new industries. The idea is already in the field that Government should set up a Development Corporation to start new industries and see them successfully through the initial stages of development till they reach a profit-earning stage when they should be turned over to private enterprise. Such a corporation should have a capital of, say, Rs. 100 crores. It should sponsor new industries and offer their capital to public subscription if thought fit. The Development Corporation should take up the entire capital of companies which are floated in public and make good the deficiency of capital not subscribed by the public in the case of companies whose capital is offered for public subscription.

There is also roim for the formation of financial companies specialising in the issue of new capital not on the scale of the suggested Development Corporation but on the lines of the Issue Houses in London. They would form a welcome addition to the Indian financial system and perform useful service even long after planning and priorities disappear.—*All Rights Reserved.*

WHY HAS THE FIVE-YEAR PLAN FAILED?

FINANCIAL BASES FAULTY

By Prof. D. R. Samant

THE First Five-year Plan (referred to hereafter as the Plan) has been by now in operation for nearly three years. The consensus of opinion is that the Plan has not succeeded in delivering the goods so far at least. Nor do the developments so far hold out any reassuring prospects of the objectives being fulfilled during the remaining period of the Plan. This failure of the Plan to set in motion economic activity, leading to all-round economic development, cannot be attributed to any unexpected extraneous factors. Consequently, it must be due to certain inherent shortcomings of the Plan itself. In the considered opinion of the present writer, the Planning Commission (referred to hereafter as the Commission) has made a wrong approach to the problem of economic development and has, consequently, raised faulty financial scaffolding which cannot allow any vigorous growth of the economy. It is needless to mention that financial policies play quite an important and decisive role in money economy, especially with free enterprise and free market. It is, therefore, proposed to examine here some of the important aspects of the financial bases of the Plan.

At the outset, it would be better to note some basic facts regarding planning for the economic development of India. These may be mentioned as follows:

(1) There is large-scale unemployment in India in respect of all types of labour, excepting, perhaps, highly specialised technicians. They too can be quite quickly and easily trained, as the basic knowledge and training is already there.

(2) The public economic activity in India is only a part of the total economic activity and the public developmental programme is only a part of the total economic development.

(3) Planning in India is going to be of the induced type, with private enterprise functioning under market mechanism.

It is quite necessary to remember these basic facts while framing or evaluating a plan for India's economic development. As we shall try to show presently, the Commission has not paid proper attention to the significance of these facts in drawing up the Plan and so its utility for achieving the objective, namely, rapid economic development of the country, has been greatly diminished.

Wrong Assumption

The Commission starts with the admission that "the material well-being a community can attain depends, in the main, on the stock of capital at its disposal" and proceeds to explain how the investments necessary for increasing the stock of capital can be achieved. Here, the Commission admits, "an underdeveloped country has a certain advantage, in that it has large resources of unutilised or underutilised manpower." "Still in practice," it adds, "mobilisation of idle manpower on a large scale cannot but result in the generation of considerable money incomes in advance of a corresponding increase in output. This is likely to create inflationary pressures which might be felt strongly at particular points in the system, infringing more heavily on the real income of some sections of the population than on others."

From this analysis the Commission jumps to the conclusion that. "A measure of privation to start with and austerity for a fairly long period are thus unavoidable under conditions of rapid development even in countries with vast unutilised resources." This conclusion is not warranted under the above assumptions. Inasmuch as investments can be undertaken by utilising idle manpower, there need not be any increase in privation and austerity for the community as a whole. On the other hand, the investment programme, by giving employment and income to the unemployed, will only result in redistributing the given production of consumption goods. Such redistribution is obviously socially desirable and will result in reducing privation for the community as a whole, instead of increasing it. Here, of course, care must be taken to see that the pressure of demand will not lead to a greater degree of inequality through speculative profits. This is one of the purposes of planning and the Commission would have rendered more useful service by pointing out how such undesirable effects of the inflationary pressure can be avoided. Instead of that, it just proceeds to draw up a plan free from the possibilities of inflationary pressure. But the Commission, perhaps, does not realise that, in doing this, it also reduces the possibilities of economic development. This is like throwing away the baby with the tub water.

Influence of Worn Out Theories

The fact is that the Commission has not been able to overcome the influence of the old and worn out economic theories of the Classical School which are based on the assumption of full employment and so are inapplicable in the case of a country like ours. It, therefore, finds, itself torn between facts and theories which it cannot correlate. The result is contradictory and illogical statements and policy recommendations. For instance, look at the following statement:

"The programme of investment," says the Commission, "that can be undertaken at any particular time depends primarily on two factors: The rate of saving in the community and the volume of unutilised human and material resources which can be used for direct investment." This is a confused statement. Of course, a community cannot undertake investment without using real resources—human and material. Under a state of full employment, therefore, the size of investment depends upon the resources set free, or rendered idle, by saving, that is, by reducing consumption. But, with unutilised resources, investments can be said to depend upon saving only when they are planned to exceed the utilisation of idle resources. But the Commission, without giving any estimate of how far the proposed investments are going to exceed the utilisation of unutilised resources, is only harping constantly upon the need for privation and saving. The fact is that it cannot ignore the existence of unutilised resources nor can it forget the classical theory that investments depend on prior savings. For instance, the next sentence in the Plan runs as follows:

"In the earlier stages of development, though the unutilised resources would be considerable, the scope for using them for stepping up the rate of capital formation might be restricted by either lack of technical skill or shortages of specific commodities and services. In this period, therefore, the reliance on savings has to be correspondingly greater."

But does the Commission mean that the sort of technical skill, the specific commodities and services needed for capital formation are the same as are used at present for the production of consumption goods, say, food and clothing? If so, are not such technical skill and services available at present in excess of their use in the consumption goods industries? As a matter of fact, there has been a constant complaint regarding large-scale unemployment in these occupations. The obvious conclusion is that either these skills and services are useless for capital formation or they are not being used to the fullest extent. In either case, there is no sense in asking the people to reduce their consumption for capital formation. Rightly speaking, the Commission should have given a clear idea of the nature and amount of the technical skill and services needed for carrying out the proposed capital formation programme and shown how far it was necessary to withdraw them from their present use in the consumption goods industries, and, consequently, what amount of curtailment of consumption was called for. Instead of doing so, to make frequent mention of the vague generalisation that capital formation depends upon the community's willingness to save looks like an attempt to shirk the issue by shifting the responsibility to someone else.

Commission's Ignorance

The Commission's ignorance of the theories of employment and income can well be seen from the following sentences which constitute the foundations of its investment policy:

"In the initial stage," says the Commission, "there are clearly two alternatives open. One is to impose on the community a high rate of saving through taxation, loans, price inflation, or by any other means and to utilise the resources thus made available for a sharp increase in the rate of capital formation. This has certainly its merits, as, in this way, not only would development be rapid but there would be immediately a large increase in employment."

In the first place, in spite of its own admissions regarding idle resources, etc., the Commission does not seem to be able to get over the obsession that economic development depends upon prior savings. Secondly, strangely enough, saving "through taxation, loans, price inflation, or by any other means" is all rolled together, as if they are all of the same kind when, as a matter of fact, each one of these methods is widely different in its economic characteristics and consequences. Saving through taxation, for instance, imposes involuntary cuts in consumption; the purpose being to release resources for the production of capital goods by reducing their use in the production of consumption goods. This, excepting the extent to which taxes are paid at the cost of savings, cannot lead to any increase in total output or employment; only, the nature of output and employment gets changed. Not only that, but the increase in taxation may result in reducing private investments due to excessive taxation of income or reduced demand for consumption goods. In either case the capital formation in the public sector will not mean a net addition to the normal rate of capital growth, perhaps not even to the existing capital stock.

Saving through loans represents a part of the income not normally spent on consumption. The investment of this amount will result in maintaining the income flow which otherwise would have been reduced. But, in so far as these savings would have been otherwise invested in the private sector, their investment by Government does not lead to any net increase in the total investments. Government borrowing will result in increasing total investment only if it reduces hoardings, past or current. On the other hand, the extent to which Government borrowings are in competition with and at the cost of private investments, capital formation in the private sector will suffer. If Government borrowings, for instance, raise the rate of interest, it will depress private investments. Surprisingly enough, the Commission has completely ignored the possible effects of public investments by taxation and borrowing on private enterprise and has proceeded to calculate capital formation and national income as if Government investments constitute a net increase.

Price Inflation

The third method of imposing on the community a high rate of saving, as mentioned by the Commission, is through price inflation. Price inflation can lead to saving, that is, curtailment of consumption, only if, alongside of the rise in prices, the total money income remains constant, as, for instance, when prices rise due to excise duties, sales taxes, import duties, etc. Another way in which prices of consumption goods can rise without there being any rise in total money income is when the total output remains the same but the proportion of consumption goods in it decreases. But such increase in the production of capital goods, alongside of declining consumption, can come about only in the public sector where investments are undertaken without profit motive. But, if such public investments are to be undertaken without increasing the total income, they must be financed out of taxation, leading to curtailment of production and employment in the private sector.

Normally, price inflation comes about as a result of increase in total money income. The increase in money income increases the demand, but, as the supply, especially of consumption goods, does not increase in the same proportion, prices rise. Here, there is no saving in the sense that consumption now is less than what it was before. The thing is that consumption does not increase in proportion to the increase in demand at prior prices. The equilibrium in the present supply and demand is thus brought about by the rise in prices. There is, therefore, no question of "imposing on the community a high rate of saving," in the sense of bringing down consumption from the former level. The only effect of price inflation is not to allow consumption to rise in proportion to the rise in income.

Importance of the Demand Factor

Apart from the merits of the various methods of saving, the point to be remembered here is that it is not possible to bring about "a large increase in employment" by "imposing on the community a high rate of saving." Saving, by reducing consumption, releases resources from production of consumption goods. When the money equivalent of these released resources is used for the production of capital goods, the employment created is equal to the employment reduced in the consumption goods industries. The total employment, therefore, remains the same, though the nature of employment is changed. The increasing rate of saving that we find in the case of developing economies is not achieved by reducing consumption; it is the result of increase in national income at a rate greater than the increase in consumption. In such a process, consumption and capital formation both increase. An increase in national income cannot take place through a prior increase in the rate of saving; but it is a prior increase in the national income that leads to a rise in the rate of saving. That is why, as the Commission found in the case of England, "In prosperous years" the rate of saving was high. Very often increase in income causes increase in demand in excess of the increase in the supply of consumption goods and this leads to price

inflation. This is also why economic development is almost always accompanied by a rise in the price level. The smaller the increase in the supply of consumption goods as compared with the increase in the national income the greater will be the rise in the price level. So, the rise in prices is not the cause of disparity between consumption and income but the effect of it.

Another important point to be remembered, in this connection, is that capital formation in the private sector will never increase, unless the demand for consumption goods increases. Capital goods are just the means of producing consumption goods and so private enterprise will never think of acquiring capital goods, unless the demand for their products increases. To increase the accumulation of capital goods when demand for consumption goods is not increasing will prove a losing proposition. And so, in so far as the private sector is concerned, no increase in capital formation can be expected, unless the demand for consumption goods increases.

After explaining the importance of a high rate of saving for the economic development of a country, the Commission turns to the problem of how such a high rate of saving can be accomplished and the national income be raised. This the Commission has tried to explain, with the help of some illustrative calculations, how the per capita incomes in India can be doubled by about 1977. Starting with Rs. 10,000 crores as the national income in 1955-56, certain curves are drawn to depict the rate of progress in regard to national income and consumption standards that could be attained, if, from 1956-57 onwards, investment is stepped up each year by an amount equal to 50 per cent. of the additional output. The underlying idea is that, if a certain amount out of the income accrued during a particular period is saved and invested, the total output during the next period will increase by nearly one-third of the total investment and, if 50 per cent. of this additional output is saved and added to the initial investment, the total output in the following period will increase by one-third of the total increased investments; and so on for the consecutive periods.

Confusion Galore

All these calculations involve a good deal of confusion. In the first place, increase in investments may lead to an increase in productive capacity but that does not mean that it will also automatically lead to increase in production. Increase in production will depend upon the increase in national income, that is, aggregate demand.

Let us take some concrete figures. According to the Commission, by 1955-56, national income will have gone up to about Rs. 10,000 crores and 6¾ per cent. of this will be saved. That means savings in 1955-56 will amount to Rs. 675 crores. As the entire savings are being invested, the total output in 1956-57 will rise by nearly Rs. 225 crores. This deduction regarding the actual increase in the total output is not warranted. The investment of Rs. 675 crores increases productive capacity by so much as the total annual output may now increase by Rs. 225 crores. But that does not mean that that increase in output is actually realised. The realisation of that increase will depend upon there being increase in the demand for that output, in which case the total national income will have to rise to Rs. 10,000+225 crores. But such increase in income can never come about, as pointed out earlier, as a result of investments of savings out of earlier incomes, however high the percentage of savings. In the absence of the required increase in national income and demand, the increased productive capacity will remain unused and the idle capacity will frighten away prospective investors in the following periods. If as a result of this, investments happen to be less than the average propensity to save, total national income will decrease.

As the Commission's calculations contain no source of increasing national income alongside the increase in productive capacity, the estimates of increase in output can never be realised. If the total output, i.e., national income, is to increase by a given amount, the investments must exceed the prior savings, under a given multiplier, by an amount equal to the multiplicant of the expected increase. For instance, supposing the multiplier to be three, deficit spending to the extent of nearly Rs. 80 crores will be necessary just to utilise the increase in productive capacity brought about by the investment of savings mentioned above. Without such deficit spending, which must go on increasing as the productive capacity increases, there will not be any increase in the total output, however high the rate of saving.

The Demand Factor and Private Sector

The Commission does not seem to have grasped the fact that investments and output in the private sector cannot expand without prior expansion of demand. In so far as private enterprise is concerned, the output is determined not by the size of the productive capacity but by the state of effective demand. Private investments are induced investments, that is, determined by the current, or expected, market conditions. In other words, private investments are never pushed up either by the available productive capacity or the volume of savings; they are to be pulled up by the expanding demand which means expanding money incomes.

The Commission, on the other hand, seems to believe, in the perfect classical tradition, that the more the savings the more the investments. For instance, while assuring the public that Government investments are not going to reduce supply of investible funds to private enterprise, it maintains: "Moreover, the State is not, as it were, drawing from a given capital fund; it is in a position, through fiscal and other measures, to regulate consumption standard within limits and thus release for investments resources which might not otherwise have been forthcoming." What this means, in short, is that Government will raise funds by making people reduce their expenditure on consumption and thus would leave to that extent the supply of savings unaffected for private enterprise. But it does not realise that, if demand for consumption goods is reduced, whatever the supply of savings, investments by private enterprise will not increase. Investments by private enterprise can increase only when demand increases, that is, when the money income of the community increases. For such increase in national income, investments, as pointed out earlier, must exceed prior savings; in simpler words, there must be deficit spending.

No doubt the Commission admits that "a persistent upward trend in production and trade cannot be sustained, without an expansion in the supply of money and credit." But "this must come about," according to it, "through extension of credit institutions which will impart the necessary elasticity to money supply without generating inflationary pressures." The parts played by deficit financing and commercial bank credit in income expansion are, however, quite different. Bank credit helps to increase production in response to increased demand for it. Banks are rather passive financial agencies; they cannot initiate any increase in demand for output; they can only help the producers to satisfy the increased demand. To cause an increase in demand is the function of deficit financing. The additional money needed to increase production in response to the increase in demand caused by the deficit financing is supplied by the credit institutions. So, in short, mere extension of credit institutions cannot be expected to bring about expansion of national income.

Deficit Financing

Of course, the Commission does not altogether debar deficit financing. But it looks upon it as the last resort, a sort of *pis aller*. This can be seen from the following remark: "There is thus still left a gap of Rs. 365 crores," says the Commission, "which can be met only from external resources or, in the absence of it, by additional measures of internal taxation and borrowing or by further deficit financing." From this it should be clear that the Commission has not fully grasped the significant part played by deficit financing in the programme of economic development. This faulty approach to the whole problem of economic development has led the Commission to keep deficit financing dependent upon external assistance. The reason given for this is as follows: "The low levels of consumption prevailing in the country and the shortages of essential commodities even at these low levels—which are ultimately the factors that limit the scope for deficit financing—raise in a concrete form the problem of external assistance in relation to development." Deficit financing may no doubt lead to disparity between demand and supply by raising demand more than the supply. The undesirable price effects of such relative scarcities can be avoided either by controlling prices and demand or by augmenting supply by increasing imports with the external assistance. But, if deficit financing is considered necessary for expediting economic development, then to keep it dependent upon external assistance means to make economic development depend upon factors outside our control. From that point of view, it would be far better to make our own capacity to control the effects a determinant of deficit financing rather than the willingness of others to help us. Besides, if deficit financing is completely equalled by the purchase of imports, the development programme will not lead to any expansion of national output.

The foregoing lines are meant to throw some light on some of the faulty principles and ideas on which the Commission's approach to the problem of financing India's economic development is based. There are many more points that deserve attention and even those covered here cannot be said to have been discussed fully. But nothing more could be attempted in this article which has already exceeded even the limits so generously extended by the Editor.—*All Rights Reserved.*

ADJUSTMENTS IN FIVE-YEAR PLAN

"Although development expenditure in the public sector (under the Five-year Plan) has been stepped up, it needs to gather greater momentum if targets are to be reached within the Plan period. The required acceleration of development outlay in the coming years will in itself stimulate employment. There is need, at the same time, for some adjustments in the Plan in order to arrest and reverse the recent untrend in unemployment. The lines along which these adjustments are to be made and the extent to which total outlay may be raised are at present under consideration. Decisions in these matters are being taken now.

"To the extent that increased employment yields more consumable goods and services, an increase in outlay may not have adverse repercussions on prices or consumption. But, with low levels of production and low incomes prevalent in the country, there is danger of generating inflationary pressures. The prime objective in view is to stimulate investment both in the public and private sectors; adjustments in the development programme, however, will have to take into account the possibilities of augmenting supplies of consumer goods, especially of necessaries, from domestic sources or from imports."

MONETARY AND BANKING TRENDS IN PAKISTAN

SALIENT FEATURES REVIEWED

By A Banking Correspondent

SEASONAL influences have very pronounced effects on monetary and banking trends in Pakistan, because the major part of activity in the country's economy is associated with the movement and export of two cash crops, jute and cotton. Though the "busy season" is not a strictly definable period in the sense that it should cover an identical period of time every year, it is traditional to refer to the months August-March as the busy season, for it is usually in this period that the bulk of the cash crops is marketed. The increased *tempo* of economic activity in the busy season exercises an upward pressure on currency circulation and bank credit for obvious reasons. As against this, the "slack season" registers a perceptible diminution in export activity, giving rise to depressive influences on bank credit and currency circulation.

From the point of view of seasonal pressures, any year ending 30th September can be divided into four quarters, with some distinct characteristics. Thus, the quarter October-December marks an important stage in the progress of the busy season due to the intensification in seasonal expansion of economic activity. There is usually a sizable increase in bank credit and currency circulation during this quarter, due to the swiftly growing volume of export activity and Government balances and the country's foreign exchange reserves are also favourably affected. The next quarter is characterised by a continued expansion in seasonal activity and it is frequently in this quarter that the peak of the busy season is reached. The increased demand for short-term funds frequently generates conditions of severe stringency in the call money market and the Scheduled banks usually take increasing recourse to the State Bank for temporary financial accommodation.

The expansionary influences, however, begin to weaken after the peak of the busy season has been passed and the next quarter (April-June) registers a pronounced fall in seasonal economic activity. As the credit needs of merchants and traders are substantially reduced in this quarter due to smaller turnover, creation of bank credit assumes smaller proportions, while a good deal of previously outstanding bank credit is retired. On the other hand, idle funds begin to accumulate in the hands of individuals and business firms which tend to exercise an upward pressure on bank deposits. The fall in bank credit and increase in bank deposits improves the liquidity position of the banks, enabling them to retire a substantial portion of their indebtedness to the State Bank. The slackness in internal economic activity reduces the public demand for holding money for transaction purposes which has a depressive influence on the volume of money supply. The earlier portion of the quarter July-September continues to be characterised by slack season influences but expansionary forces associated with the new busy season begin to exercise their first influence on monetary and banking trends towards the close of this quarter. This completes the full cycle of seasonal changes during the year.

Though monetary and banking trends are powerfully affected by seasonal influences, they cannot be taken as the only influence. Thus, apart from the purely seasonal factors, monetary and banking trends are significantly affected by the state of overall economic activity in the country, the country's balance of payments, variations in national money income and pattern of income distribution, changes in banking habits, attitudes of business community, banks' lending policies and the credit control policies of the central banking authority. All these are dynamic factors and are, so to say, superimposed on seasonal influences. Monetary and banking trends in the country can, therefore, be best analysed only in the light of overall economic conditions prevailing during a particular period of time.

The greater part of the year under review was characterised by a depressed level of economic activity, particularly in the sphere of foreign trade. The developments that took place in world economy during the year were far from favourable for Pakistan. Several factors, both on the side of demand and supply, combined to reduce the demand for Pakistan's export products. Cotton was the greatest sufferer. In consequence of the falling tendency in its prices since past several months, its quotations reached in January, 1953, the lowest level ever since the Partition. Though sentiment in commodity markets improved somewhat in later months, prices were still considerably lower than in the previous year. There was thus a fall in money incomes in the agricultural sector engaged in the production of cash crops. The reduced foreign exchange earnings resulted in balance of payments difficulties and severe import cuts had to be imposed as from November, 1952. Though the Government revenues were adversely affected by the weak tone in commodity markets and the fall in the volume of imports, expenditures could not be reduced drastically due to the exigencies of economic development and inflexibility of certain expenditures. All these factors had far-reaching effects on monetary and banking trends during the year.

The creation of bank credit in the busy season of 1952-53 was on a far smaller scale than in 1951-52, due to lower sale prices of exportable products, quantitative and credit restrictions on the inflow and holding of imported goods, reduced level of internal business and slower turnover. Bank deposits, on the other hand, recorded a handsome gain over the year, due to increase in idle balances, consequent on the slackness in economic activity, sizable Government disbursements inside the country and a favourable turn in the balance of payments on private account. The ratio of bank credit to total bank liabilities, therefore came down to 40.03 per cent. in September, 1953 as against 54 per cent. a year earlier. The increase in bank deposits and decline in bank credit improved the liquidity position of the banks and recourse to the State Bank for temporary financial accommodation in 1952-53 was on a far limited scale than in the previous year. Bank balances with the State Bank were higher on average than in the previous year and there was a significant increase in the excess balances of the banks with the State Bank over and above the statutory minima. It was, perhaps, largely due to this easy availability of funds that the newly introduced bill discounting scheme of the State Bank did not achieve that degree of popularity which was originally expected of it.

A pronounced increase in activity was noticeable in the capital market and, besides Central and Provincial Government loans, many private limited companies issued their share capital which were heavily oversubscribed. Some conflicting influences were at work on the volume of money supply during the course of the year. While the weakness in commodity markets and decline in bank credit were the major depressive influences, an upward pressure was exerted on money supply by the excess of Government disbursements inside the country over the receipts from the public and a favourable turn in the balance of payments on private account. These, in general, were the main monetary and banking trends in the country during the year under review. The remaining portion of this article is devoted to a more detailed analysis of some of these trends. Attention is invited in this connection to the tables of monetary and banking statistics published on the next page.

Bank Credit

Bank credit registered a net decline of Rs. 11.72 crores during the year ended 30th September 1953, as compared with an increase of Rs. 19.29 crores in the year ended 30th September 1952. The net decline was due mainly to the fact that the retirement of bank credit in 1953 was far in excess of the creation of credit in the busy season for 1952-53. Though the quarter October-December 1952 recorded a modest increase of Rs. 3.51 crores in bank credit, the fall in the subsequent quarter (Rs. 4.02 crores) more than offset it, so that, during the six "active" months ended 31st March, 1953, bank credit recorded a net decrease of Rs. 0.51 crore in contrast to a rise of Rs. 33.19 crores in the corresponding period last year. It is noteworthy that the decline in bank credit started soon after the middle of January, 1953, and was almost continuous thereafter, though normally credit expansion continues upto the month of March. The peak level of bank advances and bills discounted (Rs. 81.08 crores) was reached on 16th January, 1953, which was less by Rs. 17.69 crores as compared with the corresponding figure of Rs. 98.77 crores attained in 1952. An important factor in this unusual "busy season" phenomenon of decline in bank credit was the retirement of the heavy outstandings of bank credit that were continuing since early 1952 due to the stagnation in export activity. Other causes responsible for this trend were the drastic reduction in import activity, decline in the prices of some exportable products, slower turnover of internal business and the existence of private idle balances which, to a significant extent, obviated the necessity for the creation of credit.

Bank credit registered a further decline of Rs. 11.21 crores in the six months ended 30th September, 1953, due to the intensification of slack season influences. Thus, the total decline in bank credit over the whole year amounted to Rs. 11.72 crores. The outstanding level of bank credit at the end of September, 1953, was Rs. 63.99 crores which was lower by Rs. 11.72 crores, as compared with the corresponding figure of the previous year. As a result of this decline in bank credit and the increase in bank deposits, the ratio of bank credit to total bank liabilities had come down to 40.03 per cent. in the last week of September, 1953, as compared to 54 per cent. a year earlier.

Bank Deposits

Bank deposits recorded an increase of Rs. 19.08 crores during the year, the share of demand and time deposits in this increase being Rs. 12.01 crores and Rs. 7.07 crores, respectively. Though in absolute amount, the increase under demand deposits was larger than that under time deposits, the percentage increase in the case of time deposits was far larger than in the case of demand deposits due to the comparative smallness of time deposits in total bank deposits. The larger percentage increase in time deposits can be attributed partly to the further rise in the interest rates on fixed deposits as from October, 1952, and partly to the lack of sufficiently attractive alternative outlets for private funds.

There was an almost continuous rise in bank deposits since the beginning of the calendar year 1953 to the end of September, 1953, the largest increase taking place in the quarter April-June, 1953, when slack season

GREAVES COTTON & CROMPTON PARKINSON LTD.

P.O.BOX 91, BOMBAY. P.O.BOX 166, CALCUTTA.

influences were at their height. Total bank deposits stood at Rs. 157.55 crores at the end of September, 1953, as compared with Rs. 138.47 crores a year earlier. The increase seemed to have originated principally from reduced commercial activity, especially in the sphere of import trade, with consequent increase in idle balances. Other factors exerting an upward pressure on bank deposits during the year were a surplus in the balance of payments on private account and excess of Government disbursements inside the country over receipts from the public.

The easy availability of funds was an important factor in sustaining the activity in the capital market at a high level. In the shares market, several scrips, especially the industrial ones, recorded handsome gains. Eight public limited companies floated their share capital during the year and the shares in most cases were heavily over-subscribed. The Central Government floated four loans during the year under review, which brought in a cash subscription of Rs. 32.16 crores. Amongst the Provincial Governments, East Bengal was the only one to enter the market during the period, receiving a loan subscription of Rs. 3.34 crores. The issue of Treasury Bills with 90 days' maturity was also resumed as from July 1953. Total subscriptions till the end of September, 1953, amounted to Rs. 9.45 crores.

Liquidity Position

The improved liquidity in the banking system was instrumental in keeping the Scheduled banks' indebtedness to the State Bank at a far lower level in 1953 than in 1952. Early in the first quarter of the year under review (i.e., October-December, 1952), the Scheduled banks were able to arrange considerable repayment of outstanding central bank credit. This brought down "Other Loans and Advances" of the State Bank (representing mainly loans and overdrafts to the scheduled banks) from Rs. 10.43 crores in the beginning of October, 1952, to a mere Rs. 1.66 crores in the middle of November, 1952. Thereafter, for a few weeks the banks took increasing recourse to the State Bank for financing their busy season needs, so that the amount under this head rose almost steadily to reach the highest figure of Rs. 11.46 crores for 1952-53 on 9th January, 1953. This compared with the peak of Rs. 17.15 crores on 18th April, 1952, attained in 1951-52. Since 9th January, 1953, there was an almost continuous fall in Scheduled banks' indebtedness to the State Bank, consequent on the greatly improved liquidity position of the banks and the level of "Other Loans and Advances" as at the end of September, 1953, (Rs. 0.09 crore) was the lowest on record since the middle of 1951.

Inter-Bank Call Money Rates

Conditions in the money market were generally less stringent during the year under review than in the previous year. The last quarter of the previous year (i.e., July-September, 1952) had witnessed an unusual stringency in the money market, due to the heavy speculative imports of consumer goods and tardy repayment of previously outstanding bank advances due to the stalemate in commodity markets, so that the inter-bank call money rate at the end of September, 1952, was 2 per cent., as compared to a mere ¼ per cent. a year earlier. The year under review, therefore, began with an abnormally high call rate of 2 per cent. which was soon pushed up to 2½ per cent. due to the pressure exerted by the seasonal demand for short-term funds. Further rise in the interbank call money rate was, however, checked, due to subsequent developments such as the drastic reduction in import activity, low level of export prices and steady improvement in banks' cash position on account of the retirement of previously outstanding bank credit and rise in bank deposits. Easier conditions began to develop in the money market from March, 1953, and, as the volume of floating funds kept on increasing in subsequent months while the demand for short-term funds was on a reduced scale, the call rate registered a steady decline to reach a nominal ¼ per cent. in May, 1953. In June, available supplies of investible funds were scarcely usable even at this rate and, at times, the Scheduled banks had to carry excess reserves with the State Bank of as high a magnitude as Rs. 18.7 crores. Though activity in the short-term money market was on a very limited scale even in the last quarter of the year under review, somewhat larger funds could be placed at the rate of ¼ per cent.

Money Supply

Money supply (representing currency circulation and demand deposits of the Scheduled banks) recorded considerable fluctuations from month to month but the figure at the end of September, 1953, (Rs. 342.69 crores) represented a rise of Rs. 25.48 crores over the year, the shares of currency circulation and demand deposits in this rise being Rs. 13.47 crores and Rs. 12.01 crores, respectively. Creation of bank credit and seasonal expansion in economic activity did not play any significant part in this rise in money supply; in fact, the rise in bank deposits originated principally from reduced business activity. Excess of Government disbursements inside the country over the receipts from the public and a favourable turn in the balance of payments on private account were the two main factors responsible for the rise in money supply during the year.

Banking Developments

Despite the fact that economic and commercial activity in the country was on a reduced scale during the year under review as compared with the previous year, commercial banking in Pakistan continued to register steady progress. In pursuance of the programme of banking development and extension of banking facilities in all the regions of the country, banks opened new offices, so that the total number of bank offices had risen to 223 by the end of September, 1953, as compared to 198 a year earlier. Another bank, namely, the Bank of Tokyo, was added to the list of Scheduled banks during the year, raising the number of Scheduled banks to 32. The progress registered by the National Bank of Pakistan deserves special mention. The number of its branches rose from 34 to 47 during the year and it completed the taking over of the agency work of the State Bank from the Imperial Bank of India. In addition to its normal activities in the fields of cotton and jute financing, the National Bank of Pakistan also played an important part in the financing of Government stock-piling schemes and foodgrains procurement programme of the Government of East Bengal. Commercial banks in Pakistan are also beginning to give attention to the opening of branches in foreign countries and to the building up of foreign contacts. An important step forward in this connection was taken with the establishment of the Habib Bank (Overseas) Ltd., with the objective of opening offices outside Pakistan. This Bank has already opened a branch at Rangoon and is actively considering the establishment of offices in some other countries having intimate trade relations with Pakistan.—*All Rights Reserved.*

BRITAIN'S ECONOMIC AND FINANCIAL POSITION

A POST-WAR REVIEW

By Oscar R. Hobson
City Editor of the
News Chronicle and *Star*, London

THERE is, nowadays, such a mass of statistics, official and unofficial, available that one could string together, with a few connecting sentences, a score or more of tables, illustrative of different phases of Britain's economic and financial life and present it as a picture of the present situation. It would, however, be more of a "blueprint" than a picture and as such would hardly be intelligible, except to readers who were economic experts and probably already had access to the official sources of statistics. The contrary procedure is for the writer of the article to present his own personal assessment of the state of Britain today, not burdening his argument, or running the risk of wearying his readers, with statistical material. The weakness of that method is that it requires that the reader shall repose in the writer's competence and judgment a degree of confidence which he may not be sure is justified.

I, therefore, propose to follow an intermediate course and try to present my own appraisal of the economic state of Britain to-day, but to support it and, I hope, to clothe it with a greater degree of credibility than it might otherwise command, by a restrained use of official statistics when that appears desirable. I shall apply myself mainly to those phases of our economic life which may be supposed to interest the ordinary reader, our production, employment and unemployment, imports and exports, our cost of living and standards of living, our social services and our defence programme.

War Damage

Any account of our situation to-day which is worth anything must start with some reference to the economic state in which World War II left us It is true that the end of the war is over eight years away and that it is more important now to look forward than to look back, and it is true, too, that it is all too easy to make the war the excuse for failures and shortcomings on our own part for which the war cannot properly be held accountable. Nevertheless, the war is so obviously and so certainly the cause of the main economic difficulties which we have suffered since its end that it is proper and, indeed, imperative to indicate at the start the magnitude and nature of the damage which the war inflicted upon our economy.

Of all the allied countries which escaped the fate of hostile occupation, Britain suffered much the heaviest material losses. Moreover, the losses were of a kind to inflict particularly severe handicaps on a country so dependent upon overseas trade as Britain. Three-fifths of her pre-war merchant fleet was destroyed by enemy action and total direct physical damage, including bomb damage to industrial establishments, dock, homes and railways, amounted to the big figure of £2,600 million (reckoning at 1950 prices).

Further indirect physical losses due to the running down of industrial plant during the war, when adequate maintenance was impossible, amounted to £1,200 million. That, however, was hardly the worst. In the all-out mobilisation of her resources for the war effort, Britain was driven to sell a large portion of her accumulated overseas investments and to borrow heavily from abroad. Overseas investments to the amount of £1,000 million were sold, the whole of the Treasury's gold reserve, almost to the last pound, was liquidated before Lend-Lease assistance from the United States began, loans were raised both in the United States and Canada and, finally, some £3,000 million was borrowed from India and other sterling area countries in the form of additions to their "sterling balances" held in London In all, Britain's external capital position deteriorated by some £4,800 million, bringing the total material loss she suffered during the war up to the huge figure of over £8,500 million.

Further Borrowing Necessary

After the war, moreover, further borrowing from overseas became necessary to tide her over the transition period of demobilisation and the restoration and reconversion of her industry to peace-time production. Dollar loans to an amount of 5,000 million dollars were raised from the United States and Canada and there were further increases in the "sterling balances" debt to the Commonwealth.

For a century and more past, Britain had been more dependent upon imports than almost any other country in the world. The damage suffered by her shipping and the loss of her overseas investments thus hit her in a particularly vulnerable spot. Before the war, thanks to these assets, she enjoyed an "invisible" overseas income which enabled her to obtain about one-fifth of her imports free, in the sense that they did not require physical exports to pay for them. This one-in-five free cargo of imports no longer existed at the end of the war. It had now to be paid for by an export trade which had to so great an extent been, voluntarily or involuntarily, jettisoned during the war that, by 1943, the physical volume of United Kingdom exports had shrunk to only 28 per cent. of pre-war.

These are the circumstances which were responsible for Britain's severe and recurring "balance of payments" difficulties after the war. Those difficulties were encountered notwithstanding tremendous efforts to meet them both by cutting imports and expanding exports. To drive home this point, let me quote a few statistics. Here first are figures of Britain's "balance of payments" in each of the post-war years including U.S. Defence Aid:

(£ millions)

	Surplus (+) or deficit (—) on current account
1946	—298
1947	—443
1948	+ 1
1949	+ 31
1950	+298
1951	—410
1952	+269
1953 Jan.-June (Provisional)	+ 81

And here are indices in terms of the average for the five pre-war years of the volume of our imports and our exports:

Trade Volume

	Imports	*Exports*
1934-38	100	100
1946	113	78
1947	74	97
1948	84	135
1950	84	127
1951	95	159
1952	86	149
1953 (1st 9 months)	92	149

Britain thus has suffered this global balance of payments deficit of £690 million in the seven post-war years, notwithstanding that in no one of those years did the volume of her imports reach the pre-war volume and notwithstanding the building up of her export trade to a volume of over half as much again as the pre-war volume.

In attacking this task of re-establishing external financial balance, a further serious obstacle, not so far mentioned, was encountered—the deterioration of the price relation between the goods we import and the goods we export. The effect of this adverse movement of the "terms of trade" was that the amount of imports which a given volume of United Kingdom exports would buy fell almost continuously from the end of the war until 1951, when it was less than seven-tenths of what it had been in 1938. Then, there was a slight recovery, but, in 1952, we still received only three-quarters the quantity of imports which we had received in 1938 for a given quantity of exports. If we had suffered no ill-effects from the war, we should still have had to increase our exports by one-third in order to purchase the same quantity of imports.

Here are the yearly figures showing the changes in the terms of trade since 1947:

(Quantity of imports bought with a fixed quantity of exports)

1938	100	1950	79
1947	86	1951	69
1948	84	1952	75
1949	85	1953 (1st 9 months) ..	69

These figures indicate how greatly the relative rise in import prices following the outbreak of war in Korea contributed to the balance of payments crisis of 1951.

But now let me come to the heart of our post-war economic problem—production. The efficiency of United Kingdom industry, the competence of United Kingdom management and productive effort of United Kingdom labour have been the subject of unending and often excited controversy, both in Britain and overseas, ever since the end of the war. I have no *ex-cathedra* statements to make on the subject. It is undoubtedly true that the achievements of industry in Britain leave in many respects much to be desired. It is true that, in a number of industries, particularly, though not exclusively, the older industries, which have long histories of recurring unemployment, restrictive practices exist which it is utterly impossible to justify; and it is true that, short of deliberate restrictionism, there are many practices and methods which are out of date and could be reformed to the great benefit of both sides of industry and of the community at large. There has since 1945 been no series of great strikes in key industries such as followed World War I, but it would be idle to claim that relations between managements and men have been uniformly cordial.

American Council was succeeded by the British Productivity Council).

I could not claim the competence to present a balanced and judicial summary of the conclusions arrived at by all these teams. But I think it would be fair to say that, while many of them found that the best practices of United Kingdom industries compared favourably with those of the American industries and that the standard of craftsmanship was certainly not inferior to the American, yet nearly all the teams reported that the average productivity was substantially higher in the United States.

It is also, I think, fair to say that most teams found that the most important single cause of this superior productivity lay in the greater degree of mechanisation of American industry—the greater horse-power at the elbow of the United States factory worker than of his United Kingdom comrade—and that United States industry enjoyed a further advantage in the size and nature of its market which permitted of greater standardisation of product.

Nevertheless, most teams, including, of course, the workers' representatives on them, admitted frankly that, on the matter of productivity, there was "a different attitude of mind in the United States from that prevailing in many quarters of the United Kingdom" (these words are quoted from the final report of the Anglo-American Council on Productivity). They found that the United States' workers showed more zest in their work, because they had greater confidence that they would enjoy, with capital, a fair share of the return from the increased production which their efforts helped to bring about. The United States' worker, in other words, saw more clearly that a higher standard of living can come only from higher production.

Lesson Learned

Many of the leaders of Trade Unionism in Britain have now fully learnt this lesson and are striving hard to bring it home to the rank and file of organised labour.

Those readers of this article who desire to do so will form their own judgment on these matters and on the general performance of industry in Britain since the war. To help them in this I give below two tables indicating the progress of production in the past five years. The first one (based on the official index of the Central Statistical Office) gives production of a number of individual industries or groups of industries.

Britain's Industrial Production by Industries

	1948	1949	1950	1951	1952	1953 (1st 9 months)
Mining and quarrying	100	103	104	108	104	..
Bricks, cement	100	104	111	115	121	..
Metal manufacture, ferrous	100	105	111	115	121	..
Metal manufacture, non-ferrous	100	94	102	115	118	..
Engineering, shipbuilding, electrical goods ..	100	109	119	116	115	..
Vehicles	100	111	116	127	128	..
Chemicals, etc.	100	109	124	124	123	..
Textiles and clothing	100	102	119	124	121	..
Food	100	106	117	116	99	..
Drink and tobacco	100	108	94	108	114	..
Building	100	105	101	99	98	..
Gas, electricity, water	100	107	110	124	127	..
All Industries	100	106	114	117	114	118

On the other hand, it is also true that unremitting efforts to improve methods of production, in which employers' organisations and trade unions have co-operated, have been made. A very notable move in this direction was the establishment by Sir Stafford Cripps in 1948 of the Anglo-American Council on Productivity, composed of representatives of management and labour, both in the United Kingdom and the United States to promote exchange of knowledge on industrial organisation and technique between the two countries. Under the auspices of this Council, some 60 to 70 teams representing managements and labour of different United Kingdom industries visited the United States to study United States' methods and furnished written reports on their return. (A year ago, in November 1952, the United Kingdom Section of the Anglo-

This table shows how the engineering, vehicle and chemical industries have forged to the front, how, thanks to the great expenditure on new electricity generating stations, the gas, electricity and water group has increased its output by more than a quarter in the last five years, and how, despite large expenditure on mechanisation of the coal mines, mining and quarrying output has made only small gains.

One great obstacle to raising production has now to be mentioned. It can be presented as lack of capital or as overtaxation—it amounts to much the same thing. The need to repair the physical damage and the shortage of housing due to the war, as well as to establish the extensive and expensive "social services" for which an over-whelming majority of the people voted at the end of the war, meant (1) that the savings of the

community became inadequate for the purposes they had to cover and particularly for industrial re-equipment, (2) that taxation had to be increased to a level never before experienced in peace-time.

The people of Britain complain (but are, perhaps, secretly rather proud of the fact) that they are the most highly taxed nation in the world. Whether or not this is literally true, it might be difficult to establish—the Chancellor of the Exchequer in his last budget speech only claimed that Britain is "among the most highly taxed countries"—but the following table taken from the Economic Commission for Europe's *Economic Survey of Europe Since the War* certainly lends colour to the belief:—

Taxation as Percentage of Gross National Product

	1938	1946	1951
United Kingdom ..	29	35	33
Denmark	19	20	18
Holland	16	17	26
Norway	15	22	24
Sweden	14	19	..

Thanks to the willingness of the people to bear high taxation, Britain's budget was balanced in the second year after the war and, in spite of all vicissitudes and misfortunes experienced, has been kept in balance since. These figures provide the proof of that statement:

(£ millions)

Financial year	*Ordinary revenue*	*Ordinary expenditure*	*Surplus or deficit —*
1945-46	3284.5	6484.3	—2199.8
1946-47	3341.2	3910.3	— 569.1
1947-48	3544.8	3209.5	+ 635.3
1948-49	4000.6	3173.6	+ 831.0
1949-50	3924.0	3325.3	+ 649.7
1950-51	3977.8	3257.3	+ 720.5
1951-52	4433.4	4053.6	+ 379.8
1952-53	4438.7	4350.6	+ 88.1
1953-54 (estimated)	4368.2	4259.3	+ 108.9

The inflation suffered after the war and the devaluation of sterling in 1949 were not due to the elementary error of an unbalanced budget, for the budget provided each year surpluses to go towards the capital expenditure of the "public sector." They were due rather to a general overloading of the economic structure—to trying to do too many things at once.

The two biggest loads—and I am not criticising either—have been the Social Services and Defence. One official analysis made earlier this year of the social services put the total cost (exclusive of capital expenditure on new houses provided by local authorities) at £1,521 million distributed as follows:

(£ millions)

Insurance and pensions	511
National Health Services	440
Education	281
Family allowances, national assistance, nutrition services and child care	218
Housing (current expenditure)	71
Total ..	£1,521

Of this amount, some £1,107 million was provided by the Central Exchequer and the remainder by the boroughs and county councils from the proceeds of local taxation. The amount falling on the budget compares with about £280 million in 1938-39 and represented just over one-third of the total ordinary national expenditure in 1951.

On the top of the burden imposed on the taxpayer by the social services has come since 1950 the added cost of defence. This amounted, in the last financial year, 1952-53, to £1,549 million and it is estimated that it will in 1953-54 amount to £1,635 million. This latter amount represents about 38 per cent. of total budget expenditure. Defence and Social Services between them account for over 70 per cent. of that expenditure.

So much for our "burdens." There is also the other side of the account and it is important. The burdens and the strain have been borne without harm to the health of the people or to the standards of life of the great majority of it. On the contrary, whatever excesses and extravagances they may have involved, the health services have paid good dividends in relieving suffering and improving the general standard of health.

Furthermore, the standard of living of the wage-earning and lower-income classes, has improved rather than declined. Wage rates have kept in step with the rising cost of living. The average standard of nutrition, as measured by consumption of calories, is rather better than before the war. All this has been brought about by a tremendously steeply graduated system of taxation, fuller employment and such direct social benefits as family allowances. There has been a great levelling of real incomes. The standard of living of the moderate and high income brackets has fallen in increasing degree up the scale.

In ending this account of Britain's financial and economic situation, it seems right to refer to certain trends of development which have become discernible. For a century and more before the war, Britain was not only a great industrial country, doing a large import and export trade on her own account, but she was a great mercantile and financial centre maintaining exchanges and markets in raw materials of many kinds and banking, insurance, shipping and other services, which the world at large was glad to use. At the outbreak of the war, all these markets and services had either to be completely closed down or else subjected to severe restrictions and limitations.

After the war, it was found impossible for many reasons, but predominantly owing to balance of payments difficulties and the need to maintain foreign exchange control, to make rapid progress in restoring these world-trading facilities. Nevertheless, as it was generally recognised that the revenue from these services was an indispensable contribution towards the balancing of our overseas accounts, a start was made, under the Labour Government of 1945-50, which re-established the London free markets in rubber and tin. The Labour Government, however, believed in Government bulk purchasing and in the maintenance of "direct" controls over prices and it was not until these last two years under the present Conservative Government that massive progress was made in the restoration of the free markets and general mercantile freedom.

In a word, Britain has, in the past 12 months, been moved rapidly back towards her traditional freedom of trading and exchange. But there is still the act of freedom of exchange to be accomplished—the restoration of the "convertibility" of sterling into dollars or other "hard" currencies. This is now the officially-adopted objective of the Governments of the whole Commonwealth. Though progress has been made towards restoring the practical advantages of convertibility, the final step may still have to be delayed for some time. When it has been taken, and only then, can Britain resume in reasonably full measure the position of a world-centre of finance and commerce which she held before the war.—*All Rights Reserved.*

ECONOMIC TRENDS IN U.S.

TRADE POLICY LIKELY TO BE LIBERALISED

NEW YORK, 30*th November*

AS the United States passes into the new year of 1954, the country has completed one of its most satisfactory years, business-wise, and is looking forward to continued high level activity, with continued adjustments as well in lines where output temporarily exceeds demand.

The Federal Reserve Board estimates that the U.S. lifted itself to a new high level of good living in the calendar year 1953. The gross national product, the total value of all goods and services performed, will aggregate $360,000 million, it is projected. This is not only a record in dollar value, but also in the outpouring of production. It is at least 5 per cent. more than in 1952. Contributing factors in achieving this were the absence of any major labour disturbances in 1953, while, in the preceding year, the prolonged steel strike depressed figures in all lines using steel and also the completion of many new industrial facilities planned years ago.

Personal income, probably, will also set a record for 1953 at about $285,000 million, or 6 per cent. over the previous year. These figures belie all the *pronunciamentos* of learned university professors here who have been telling the world, the U.S. has been in a real recession. This is not to say that the lull in the textile industry of several years' standing, which is now, more or less, surmounted, has not been followed by an over-production of certain hard goods. But even in this respect, no generalisations can be made.

Competition

While some manufacturers and dealers in the appliance field complain bitterly of lagging sales, others like Westinghouse and General Electric report record performances and expect more of same in 1954. If the complaints are traced, it may be found in most instances that those who lose are mostly non-competitive in one way or another. The sellers' market is definitely a thing of the past, shortages, except in a few isolated lines, have become non-existent and merchandise must be sold again. It works to the advantage of the most efficient and those without effective sales efforts fall by the wayside. It has been so long that such a condition of that type exists that a few people and concerns cannot readily adopt themselves to this state of affairs. It is from these quarters that the loudest complaints are heard—yet, overall statistics disprove the claim of an existing calamity.

Farm income was about the only downward line on the Federal Reserve Board's charts of economic conditions from January to December. Income of farm proprietors has declined markedly and it is back at the post-war low reached at about 1949, valued at $16,250 million. However, while farmers are complaining, the height of commodity prices, reached after the outbreak of hostilities in Korea, was so abnormal that, by any standards other than war-time, present income can hardly be regarded as unsatisfactory. In fact, a pattern of new normalcy may be developing.

What seems quite certain is that inflationary tendencies in the U.S. have definitely been arrested and what is emerging is the aimed-for flexible stability. Such a condition may involve a decline in the cost of living in the coming winter months, owing to lower commodity prices. At the same time, necessary adjustments to higher costs in, say, transportation may bring higher rates in individual sectors of the economy. Since mid-year 1953, the growth of inventories has slowed somewhat. It resulted in fewer new orders and it has been the chief factor in the slight economic downturn—of about 1 per cent.—since the high which was reached last spring.

Substantial Economic Achievement

The year as a whole was one of substantial economic achievement in terms of utilisation of manpower and industrial resources, additions to productive capacity, higher consumer, standards and overall stability of prices. Indeed, average wholesale prices have been remarkably stable, consumer prices have increased steadily, but, in October, they were only about 1 per cent. higher than a year previously. Federal expenditures for national security programmes are estimated to be only moderately larger in 1953, accounting for about one-seventh of total output.

On the other hand, State and Local Governments have purchased about 7

From Our Own Correspondent

per cent. more in the open market than they did in 1952. What helped business substantially in 1953 was that private outlays for fixed investments, such as new industrial facilities and durable equipment, topped the record year of 1952 by about 5 per cent.

Funds for mortgages, tight earlier this year, have become more plentiful and purchases of new automobiles have accounted for the bulk of the year's increases in spending. Passenger car output in 1953 will probably be tabulated, finally, at 6,100,000 automobiles, second only to the record of 6,700,000 cars in 1950. The total number of housing units started in 1953 is projected at about 1.1 million, about the same as in 1952 and 1951, but spending for non-farm residential construction has declined about 10 per cent. during last year. All told, there is no cause to shed tears over 1953 in the United States, except in the few isolated instances of hardship which invariably develop in any circumstances.

1954

So far as 1954 is concerned, everyone seems to look for a decline in spending for defence and the resulting slack will have to be taken up by civilian consumption. Superimposed on all this is the outcome of a possible four-power Foreign Ministers' Conference. Also, of further developments in Korea. On the basis of past experience, nothing along those lines can be projected too far in advance. Indeed, the impact of events on the people of the U.S. with their volatile temperament is often so great that it is useless to predict anything. An example was the invasion of Northern forces of South Korea which sent everybody on a buying spree which was virtually unparalleled, in the circumstances, and which sent commodity prices zooming. All that can be done in any projection of future events, therefore, is to consider the various possibilities.

Continuation of present conditions will mean continued good business in the coming year. Cuts in defence spending is so long-range that the aircraft industry, for example, will not be affected for the next two years. The backlog in the machine tool industry so far as orders are concerned is almost 18 months. In other words, most of the lessening in Government spending in relation to 1954 is more or less groundless. What is possible, in normal circumstances, is that people may save a larger proportion of their income and not spend as freely as during inflationary periods. But that is salutary in many respects, although retail sales may be affected slightly. If such a setback occurs, which is quite possible, it may or may not lead to a reduction of, say, 5 per cent. in the national product. In case this is accompanied by further redistribution of U.S. gold and an additional increase in American imports, there is no reason why such a development should be harmful to overseas countries.

New Trade Policy Likely

In fact, there are great hopes in informed quarters within and without the Eisenhower Administration that a new U.S. trade policy will be formulated which, in effect, would liberalise not only the procedure, but also the protective tariff walls now surrounding this country. Some of this easing in legislation may very well be accomplished in the first half of the coming year and may bring some lift to world trade generally.

There is also a movement afoot, supported by the National Foreign Trade Council, that American restrictions in respect of trade with Soviet Russia and the satellites should be eased so that non-strategic goods could move more freely than heretofore. The last convention of the Council adopted a resolution to that effect, recommending that the gates of trade should be opened more widely, but not quite as wide as they are in some other countries. The group pointed out that the U.S. could use profitably many of the goods Russia and the countries under her domination had to offer.

Little to Fear

The expiration of the excess profits tax and reduction in Federal income-tax in 1954, likewise, has hopeful implications. It should enable business and industry either to plough back more earnings or pay more in dividends. Both is salutary, economically. The demand for funds for corporate and civic improvements is likely to continue on a very large scale throughout the year and beyond. Now that interest rates have flattened slightly from their peak in the early part of 1953, many borrowers are expected to come into the market to provide growing needs of a growing population, such as new schools, hospitals, playgrounds, airports, roads, housing, etc. On balance, therefore, there is very little to fear about business conditions in the coming year. The pattern of economic behaviour may change, of course, as it has over a period of years. Metropolitan department stores, for instance, have lost some business, but that was made up in suburban branches. The dispersion of the population is at the root. Yet, the total has remained more or less unaffected. These normal shifts are no more of a calamity than the invention of the automobile who drove many blacksmiths out of business who had to adjust themselves to changing conditions. This, in brief, is the pattern for 1954 under normal conditions.

Korean War May Flare Up

Although many indications point against it, the chance still exists that the Korean war may flare up again for one reason or another. This, in my opinion, would reverse almost immediately the normalcy policies of the Republican Administration here. Pressure of public opinion would cause an immediate stepping up of defence measures and spending and a drift back into inflationary cycles would be almost inevitable. The now envisaged four-power Foreign Ministers' Conference, it is felt here at this writing, may either end in a deadlock or enhance the chances for peace or war. From this vantage-point, it seems unrealistic to assume that the Kremlin will offer the proverbial olive branch as was done after the death of Stalin. This does not conform to Soviet policy and it is not in the Russian interest internally, because a constant emergency pressure has to be maintained to keep the system together.

It is quite possible, therefore, that Moscow will demand concession from the Western world for her co-operation in the reunification of Germany and an Austrian peace treaty, to mention just two problems. Such concessions could be so severe as to be unacceptable in the West and the chances for outbreak of Atomic War I could certainly be boosted, insiders suggest. In the event of outbreak of all-out war, all forecast must be off for 1954 and beyond. The material destruction from bombings is impossible to calculate and the final economic effect on the world must remain an unknown factor.

Significance of Nixon's Visit

One thing is certain that, with the shift of Administration in America, a lot more importance is being placed on Asia than before. The extensive visits of Far Eastern capitals by Vice-President Nixon is a concrete example. He was not only the spokesman of the President of the United States on his mission, but of the Congress, and his final report may make an effective contribution to U.S. foreign policy. I have reason to believe that neither Eisenhower nor Nixon have started their administration with any preconceived ideas and pending a full study, their plans are flexible. Perhaps, they have been too flexible, because the popular impression is that, so far, very little leadership has been provided by the new Republican Administration in either the foreign or domestic field.

The Congressional elections next November will probably reflect the sentiment which may be prevailing then in the light of decisions made in the first half of the year. These elections will be important to watch, because Eisenhower's plans stand and fall, of course, with the extent of his support in Congress. If the choice is made along party lines, a loss of Republican seats may be serious. At the same time, many Democrats may continue to support the President, despite their label. In that sense, 1954 will be a critical year for America and a year of decision for the new Administration.—*All Rights Reserved*

U.S. IMPORTS OF ASIAN PRODUCTS

U.S. imports of a number of Asian products registered significant gains in September, 1953, the most recent month for which import figures are available. Crude rubber imports, for instance, amounted to 132 million pounds valued at $27.6 million, as compared with 100 million pounds valued at $21.9 million in August and 115 million pounds valued at $31.1 million in September, 1952. Imports of unground black pepper aggregated to 2.9 million pounds valued at $3.3 million, as compared with 1.9 million pounds valued at $2.5 million and 2.4 million pounds valued at $3.7 million. Imports of copra amounted to 74.7 million pounds valued at $6.0 million, compared with 45.7 million pounds valued at $3.8 million and 47.0 million pounds valued at $3.5 million. Imports of tea aggregated 10.4 million pounds valued at $4.7 million, as against 7.8 million pounds valued at $3.5 million and with 9.5 million pounds valued at $4.0 million. Imports of sisal and henequin aggregated 12,269 tons valued at $2.7 million, as compared with 9,735 tons valued at $2.1 million and 9,380 tons valued at $2.9 million. Imports of tin in concentrates amounted 1,910 tons valued at $4.7 million, as compared with 1,214 tons valued at $3.1 million and 1,136 tons valued at $2.9 million.

On the other hand, imports of tin metal, which had been among the leading imports earlier in 1953, declined to 13.7 million pounds valued at $11.2 million, as compared with 16.7 million pounds valued at $15.0 million in August, 1953 and 18.4 million pounds valued at $21.5 million in September, 1952.

ECONOMIC TRENDS IN BRITAIN

PRODUCTION SUBSTANTIALLY HIGHER

LONDON, *27th November*

IT is not only the outside world which has studied with interest during 1953 the doubtful movement of the U.K. towards surplus in her overseas payments, for, domestically, the foreign trade progress of this year has been the most interesting single development in the economic field. "Progress" in this sense has meant rather a survey of what has been happening month by month, for it cannot be said that the country is much better off, in a balance-of-payments sense, at the end of 1953 than it was at the beginning. On the other hand, the improvements over the low period of 1951 have been consolidated and it is indubitable that the gold and dollar reserves at £900 million are some £290 million higher than a year ago. This is no mean achievement even allowing for the U.S. Defence contribution.

Nevertheless, it is the movement of trade on current account which is the best index of a country's overseas strength or weakness and here the showing is not so good, although the money figures at first indicate an improvement. For the first 10 months of this year, imports have totalled £2,792 million, which, after allowing 10 per cent. for freight and insurance, gives a net £2,512 million. Over the same period, British exports and re-exports have totalled £2,207 million. This leaves an adverse balance of just over £300 million or an annual rate of some £360 million.

Balance of Payments

In 1952, the first ten months showed imports of £2,958 million which, again allowing for freight adjustments, left £2,660 million, while exports and re-exports gave £2,291 million, an adverse balance of £370 million and an annual rate of, say, £440 million. So there is an improvement to show over all on trade account of some £80 million, and, if 1952 showed a net surplus on balance of payments of the order of £100 million, this year should yield twice that figure.

The following table shows the trade figures for the current year in a little more detail:—

(In £ 000,000's)

1953	*Imports c.i.f.*	*Exports f.o.b.*	*Re-exports f.o.b.*
1st quarter ..	819	626	30
2nd quarter ..	881	630	24
3rd quarter ..	812	635	25
October	280	228	9
Total for 10 months.	2,792	2,119	88
Allow for freight..	280		
Imports f.o.b. ..	2,512	Total exports ..	2,207

In terms of volume, the first quarter's imports showed a 6 per cent. increase over the previous year, the second quarter showed a 16 per cent. increase, and the third quarter an increase of 12 per cent. On the other hand, exports have averaged this year about 5 per cent. less than in 1952. In other words, although there has been some monetary improvement in the balance of payments, this has been in spite of an increase in the volume of imports and a decline in the volume of exports. Indeed, the terms of trade have moved 10 per cent. in favour of this country over the year, and our position has been improved by virtue of the fact that we can buy more cheaply and still sell more dearly.

Competition Becoming Severe

It is very unsatisfactory to note that, while British exports fell by 5 per cent. over the year, world exports have risen by 7 per cent. The indications are that competition with other countries is becoming more severe. As compared with pre-war, our exports are 50 per cent. higher, although, as the above figures have shown, the relative volume is beginning to decline. Germany now exports one-third more in volume than before the war, and the relative increases have been progressive in recent years. Similarly, Japan, which has been out of the export field and which exports to-day only one-third of her pre-war volume, is steadily increasing her trade. Other European countries and even the Commenwealth countries are becoming severer competitors and, with the exception of North America, British exporters are in fact failing to hold their ground. There is nothing to indicate that British prices are too high and the export price index has, in fact, dropped 3 per cent. over the past year. But delivery dates are generally worse than those which countries such as Western Germany can offer—a pointer to the effects on production of being saddled with an arms programme.

On the other side of the picture, the year has shown continued reward for the steady pressure to expand British exports to the United States

From Our Own Correspondent

and Canada. For the first eight months of the year, exports to both these areas reached £215 million—an increase of £40 million or more than 20 per cent. over the corresponding figure of a year ago—and the increases have been in all branches of the export trade. The trade with Canada has shown the most spectacular increases, particularly in machinery, engineering equipment and cars. Incidentally, there is a general impression that, with Britain restricting her dollar expenditure, we import less from Canada than before the war, but, in fact, we are taking about twice as much Canadian wheat and, among raw materials, about eight times as much aluminium as before the war. The growth of the trade with North America has meant that this country now earns a surplus on its direct dollar trade. The present prospects are that the American trade should, subject to the maintenance of internal prosperity in that country, continue to improve, particularly if the hurtful Customs regulations ever get amended.

Production Trend

If the export market in general has failed to expand, the domestic market has more than made up for this over the past year. In the first quarter, total national production rose by 1 per cent., in the second quarter by 6 per cent., and in the third quarter, by 7 per cent., all compared with the corresponding periods of a year before. If one takes the manufacturing industries alone, the rise has been even greater—the third quarter's increase being as much as 10 per cent. The production of steel ingots and castings is a good illustration of a trend that has been general throughout the engineering and heavy industries: in the first quarter of this year, output, which has been running at something like 300,000 tons a month, was 123,000 tons higher than a year before; in the second quarter, it was 108,000 tons, and in the summer quarter 31,000 tons higher: a cumulative increase over the year of well over a quarter of a million tons. On this showing, 1953 will have yielded a steel output approximately 10 per cent. higher than that of 1952. But from shipbuilding and motor vehicles to cotton and woollens the picture is the same. Not that this gives the Chancellor of the Exchequer any great satisfaction, since, while higher production is the cause of the rising import bill, the diversion of output to the home market is a reflection of the failure to expand exports. Is the Chancellor going to decide that his "soft" budget of last spring and the slight easing of domestic monetary policy have some responsibility? or—as he seems at present inclined—will he go on exhorting exporters to make a better showing with the increased production at their command? That is one of the economic problems to be carried over into the new year, in spite of the Chancellor's indication that he is not dissatisfied with his past deeds.

A good deal of responsibility for the internal diversion of increased production must lie at the door of the highly successful housing programme. In the first three quarters of this year, 55,000 more houses have been completed than in the same period last year, and, by the end of the year, the Government's target of 300,000 houses completed will have been achieved. This has meant—since there has been no diminution in the scale of factory or office block building—a demand for more bricks, cement, tiles, metal fittings and all the furnishings and equipment that go into the finished houses.

Unemployment Less

Not surprisingly, unemployment has again receded to a little over a quarter of a million, some 30,000 less than for the corresponding period a year ago. Although this is not quite as low as the bottom of the trough—180,000—reached in that inflationary year 1951, it is as good as 1950. The total working population which stands at 23¼ millions has shown little change over the year, although the curve is still slightly upwards in conformity with the population curve which has almost flattened out.

The recovery from the recession of 1952 has been accompanied by an upward swing in the monetary indices. Bank deposits, which range around £6,200 million, are £200 million higher on the year and the total of currency in circulation, which this summer reached a new peak of £1,500 million, is some £90 million higher than a year ago. Nor has this increase only been due to Coronation spending, as the Coronation merely increased the rate of currency circulation sooner than would otherwise have happened.

Wholesale Prices

It is encouraging in the light of all these factors to find that prices have moved only slightly. These do not yet appear to have finished their upward rise, but wholesale prices rose over the past year only 1 per cent. and are now at much the same level as that of two years ago. Retail prices have risen much more—about 3 per cent. over the year and as much as 10 per cent. over the figure of two years ago: in January, the index stood at 38 per cent. over the 1947 level, during the summer it rose seasonally to 41 per cent. over, and is now running at 40 per cent. over.

On the stock market, Gilt-edged showed a little change over the year till the Bank rate fall in September gave a slight fillip to the market which now stands about 5 per cent. over last year's average. Industrial Ordinaries have continued the change of fortune which began in the summer of 1952: after a slumping slowly over since 1950, the upward turn had brought them back to the 1950 level at the start of the year. A spectacular rise began in June which jumped the index 13 per cent. in four months. November has shown a slight recession and it may be that the boom is now over, though company profits give no hint of this.

To sum up, thanks to the swing back of the terms of trade in this country's favour, the economy is set fair at present. It is true there are some rumblings—foreign competition is getting stronger and it will not be easy either to stop the decline in exports or to step up exports; at home, wages dissatisfaction is also growing, largely because of the higher profits industry has been showing and declaring, but this rumble, though important, may mean only some redistribution of the national wealth without prejudice to export costs.

Nothing Very Much Wrong

If because of recession in America or for any other reason the economic weather turns cloudier in 1954, the economy—freer to-day than at any time for 15 years—may be put to the test of the old-fashioned trade cycle. A Conservative Government would then have the task of controlling the economy to prevent deflation. But to-day Ministers are not obsessed by such nightmares: they are putting the final touches to the freeing of foodstuffs and the liberalisation of imports. On the latter, they believe that they have gone as far as possible for the moment, and that is in line with the only point on which the economy gives any sign for nervousness. The former is in line with the general policy of freedom, which has, of course, partly contributed towards the increase in consumer spending. So far as the public as a whole are concerned, the economic situation is becoming a matter of diminished interest—a sure sign that there is nothing very much wrong with it domestically. That is the note on which 1953 ends. But for the U.K. the factor of external trade is always too great, and is itself too subject to uncontrolled influences to make possible any assertions about trends of events in 1954.—*All Rights Reserved.*

SERVICES FOR EXPORTS

At his Press conference, Mr. Thorneycroft, President of the U.K. Board of Trade, said that there were three ways in which the Government could help exporters:

1—By ensuring that the home economy was soundly balanced and that there was no inflation.

2—By seeing that Britain had a fair deal abroad, and that, as far as possible export subsidies were abandoned, a policy in which Britain had given a lead.

3—By aid through the Government services. The Board of Trade Commercial Relations and Exports Department, which had a great deal of information on markets and opportunities oversea, the B.O.T. Officers in oversea countries, the Export Credits Guarantee Department, which took some but not all the risk out of exporting, and the Dollar Exports Council, which was concerned with the dollar area.

Finally, there were the Board's own Regional Officers, who tried to keep industry informed on the services.

Mr. Thorneycroft said that the Government was very anxious that every manufacturer who might export more or might export something different, or who might export to destinations he had not sent to before, should know about the aid which could be given. The Export Credits Department, which started in 1926, was giving guarantees on behalf of exporters at a rate of £61 million in 1939, £138 million in 1946-47, and £500 million in 1952-53, the last-mentioned representing a premium income of over £3 million. The position which has arisen over guarantees given for exports to Brazil has resulted in complete exhaustion of the Department's "capital reserve" of £13 million. A total of £22 million has been paid out, with a further £2 million due, but with the title to the Brazilian debts in its possession the position is expected to right itself.

U.K.'S EXPORTS IN NOVEMBER, 1953

British exports in November, 1953 were the highest since March, 1952. They reached a total value of £239,900,000, despite the fact that the month had only 25 working days. A notable increase has occurred in the last five months—July to November—when sales abroad averaged £220,500,000 monthly, as against an average of £202,600,000 in the corresponding period last year. Commenting on the figures at a Press conference in London, Mr. Peter Thorneycroft, President of the Board of Trade, said that the November result was obviously a good thing, though it was only one month's figure and should be seen in its right perspective.

British exports to North America at a provisional total of £25,100,000 during the month under review brought the average for October-November, 1953 to £26,000,000 a month, which was slightly less than the third quarter average. Exports to the U.S. in November at £11,300,000 were 19 per cent. below the high average for the second and third quarters. Exports to Canada at £13,800,000 were 8 per cent. more than the third quarter average.

ECONOMICS OF CONSUMPTION

PATTERN OF SPENDING MUST BE RELATED TO PRODUCTION

By
J. M. Lobo Prabhu, I.C.S.

THE Five-year Plan did not invent mixed economy. It had existed before, in India and other countries, even Communist countries in which private enterprise is now reappearing. What the Plan did was to recognise mixed economy, defining the public and private sectors so that they could support each other. The declared objective was "a progressive widening of the public sector and a reorientation of the private sector to the needs of a planned economy."

There should be no mistake about the size of the public sector. The gross value of the assets of the Central and State Governments (excluding Port Trusts, Municipalities and other semi-public agencies) is about Rs. 1.236 crores, the share of railways being Rs. 837 crores and irrigation works Rs. 230 crores. Against this, the assets of the private sector are estimated at Rs. 1,500 crores, factory establishments accounting for Rs. 1,100 crores, plantation Rs. 100 crores and motor transport Rs. 130 crores. It would appear that State and private enterprise are about equal, with this difference that a good part of private enterprise supplies the requirements of the Government. As far as the employment pattern is concerned, even after allowance for the large number employed in the Civil and Defence establishments, the State's share is smaller as compared with the large number employed in trade, professions and various occupations. This follows from the fact that the tax revenues of the State form only about 7 per cent. of the national income. Considered from this point of view, the State in India is less important in the economy than in the U.K., where tax revenues are 35 per cent. of the national income, in the U.S.A. 23 per cent. and in Japan 27 per cent.

Is There Any Antagonism?

Is there any natural antagonism between the public and private sectors? In several respects, the two sectors are complementary. To the extent the State expands basic services like power, irrigation, roads and communications, the private sector is provided with means and channels to expand itself, which may be beyond its own ability. To the extent, expenditure of the State increases incomes and purchasing power, the private sector is assured of its market. In this matter, the contribution of the State is very much larger than suggested by its volume, for the reason that the incomes assured by the State are first certain and regular; and second, are in the aggregate large and massive, as compared with those from diffuse and diverse private employment. In respect of purchasing power, development activities of the State to capitalise human and material resources increase general purchasing power on which private enterprise rests. Though the process may be indirect, it is certain that higher productivity and efficiency are reflected in sales of new and more items.

At the same time, the private sector is no less important to the public sector. Representing as it does 93 per cent. of the national income, it is the source of the taxes, loans and income of the State. The question, which is being asked, is whether the Five-year Plan has not ignored this sector, with the result that there is not only unemployment in this sector, but the public sector itself is adversely affected by falling taxes and failing enterprises. It is argued that, if this sector had been activated more fully, the public sector, which is functional, would have naturally grown.

It is, perhaps, not correct to say that the Five-year Plan has neglected the private sector. The Plan covers every department of national activity. The Plan starts with the ideal of full employment for which it recognises that the capital-labour ratio should be increased. This is subject, however, to two conditions, first that incomes should not outrun production, and second, that it is, therefore, necessary to rely on voluntary unpaid labour.

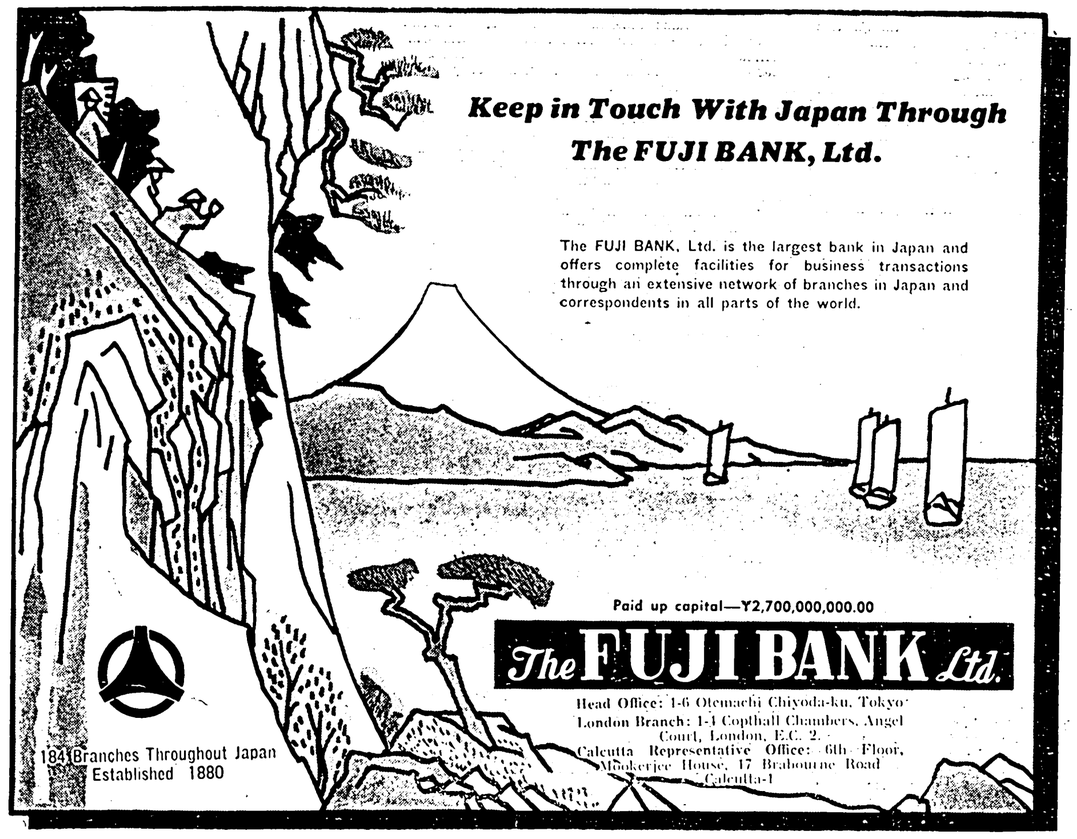
The validity of these two conditions is questioned. In respect of free labour, it is contended that this could not, even under pressure of propaganda, be anything but spasmodic and small. It is further argued that labour required for public works is largely rendered by the landless, who are unwilling and unable to donate it. In any case, if they did so, they would receive nothing directly to augment their purchasing power, and what the community received indirectly from public works would be intangible and distant. It is, therefore, argued that the labourer is worthy of his hire not only for his own sake, but for the sake of the community, the prosperity of which depends not merely on its amenities, but also on the income of all its members. Any money spent for new employment has, as Keynes has described, a 'multiplier effect', the man paid, in his turn, employing some four more in the chain reaction of his increased purchasing power.

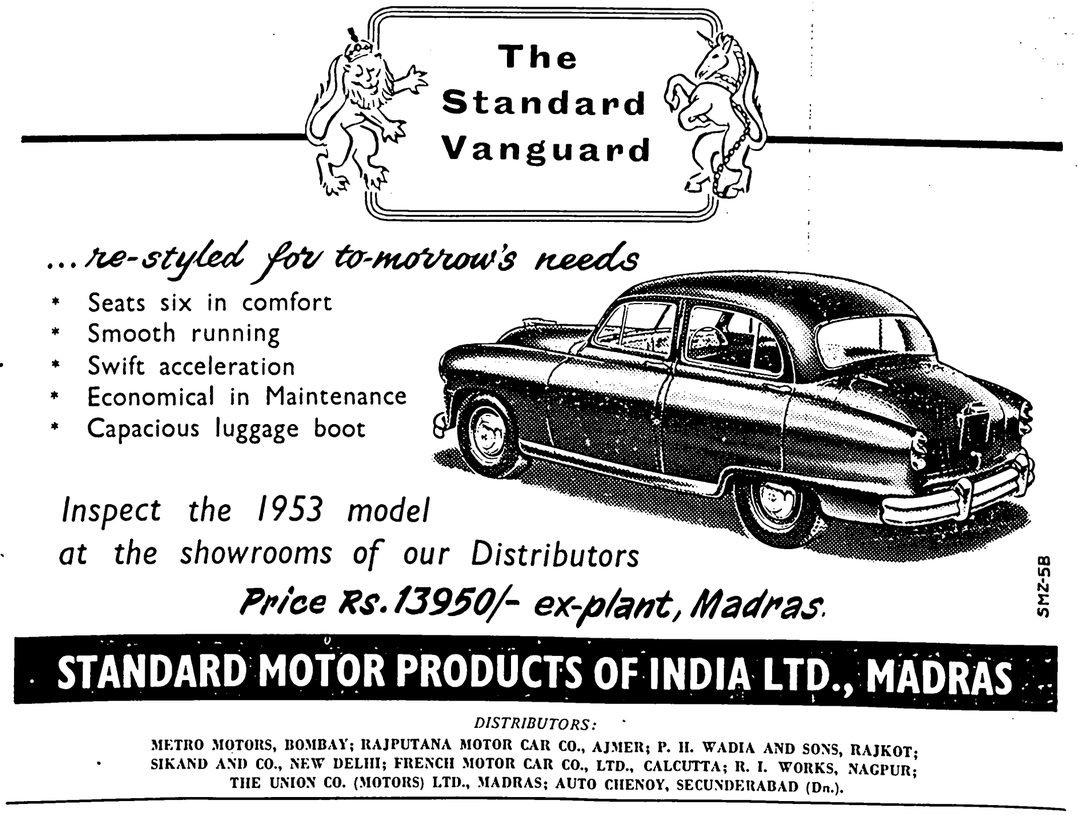
Question Must Be Re-examined

The question, perhaps, deserves to be re-examined, if idle labour should not be mobilised, by at least part payment, the balance being deferred till the benefit of the new work materialises. This touches the first condition that incomes should not outrun production. It is feared that this may lead to inflation by increasing pressure on articles in short supply, particularly food. There are some who consider that food scarcity is a bogey, that, in 1952-53, the food production touched pre-1939 levels, that in the current year, with the good rain received, it may well be high enough to cause a serious collapse of prices. It is also argued that there are limits to the food which can be consumed, that people, employed or unemployed, are eating as much as they can, and that, in fact, if their incomes were higher, they would eat less grain, but eat better things instead. This school also thinks that food shortage was due to food controls, which discouraged production to increase fallows even in the last three years by 7 per cent. and distorted distribution involving pockets of scarcity, which induced cyclonic movements of price. It argues that, since controls have crumbled, the food problem is now capable of solving itself. At worst, this school argues that food prices can always be controlled by automatic levy of all stocks when prices pass a fixed line, declared in advance. This would naturally keep prices below that line. In its opinion, the paramount consideration is to fully employ all labour, money being found without fear of inflation. As this idle population already consumes food and social services, labour in any form rendered by them is addition to the country's wealth, as well as their own. The spectacle of idlers, beggars and the unemployed in streets of cities, towns and villages is regarded by them as the greatest waste of national wealth. There are innumerable tasks waiting for them, if only the money can be found to set them working. The whole question is important as it is complicated and deserves more precise attention from economists than it has received. The economic climate is threatening to break, not only from the unemployment already in evidence but from overproduction of grain which will affect the large agricultural sector.

Money the Basis of Plan

Money is the basis of the Plan, as it is of all development. In respect of it, perhaps, there is a clash in the interests of the private and public sectors. For the public sector, the income of which is relatively inelastic, it is necessary that money should not lose its value. This is the basis of the policy of disinflation which the Plan has assumed. But the private sector cannot expand, if prices fall, for at least two reasons, first, the purchasing power of the consumers is reduced, and, second, even if manufacturers receive some advantage from the low prices of raw materials, they lose much more from the low prices of manufactured articles. The disinflation enforced during the last two years has affected the market, and is reflected in industrial activity generally. In the second place, the clash is from taxation policies. The public sector depends on taxes, which the private sector must pay. It happens that a very small part of the population pays the largest part of these taxes. This may be a socialising measure, but to the extent it reduces the savings of this class, industry is deprived of capital which it steadily requires. The Plan recognises that capital formation should be encouraged, because the economic standing of a community is related to the capital per head. The question then is whether capital formation for the private sector or tax increases for the public sector should have





precedence. The Taxation Enquiry Commission is examining this question precisely. Its questions seem to suggest that it is trying to discover how taxation can be purposive to the increase of the country's income. This in fact is the only text, and by it not only State revenues can be benefited directly by a greater volume of taxes, but indirectly form a greater field of income to tax.

Tax Structure

Our tax structure is largely inherited from rulers whose aims were limited to their trade and interests. In some ways, they could not make taxation an instrument of policy without rousing opposition which may have been too strong for them. Our economy suffers from defects bestowed by history. The disturbed conditions of the last two thousand years imposed a conservatism, which the British did not change, except to some degree in the towns. Everything has stood still, particularly in our villages, not only because, in the struggle for existence, no one has courage to change, but also because no one was sure of the fruits of his toil. Agriculture suffers not from want of knowledge so much as want of incentive and will to work. Conservation of water, soil, manures, use of better seeds, implements and methods, demand very little more than labour, of which there is plenty. The simple expedient of a higher rate of taxation on those who fail to do, what is within their ability, could immediately transform agricultural practices. Similarly, for good animal husbandry, what is required is that existing communal pastures should be improved by conservation of running water, by rotational grazing and proper seeding, all well within the labour capacity of the owners of cattle. For afforestation so necessary to conserve soil and increase precipitation of rain, it would be enough if the existence of a specified number of trees per acre of land is enforced by penalty of the cost of raising such trees on those who default.

In industry, those who fail to follow standards, within their capacity, may pay excise duties on their outturn. Export and import may be subject to taxes precisely related to national policies for development. Fallow land and vacant sites could be similarly taxed into being used. Even social service could be secured by taxing ascertained leisure. The whole purpose is first to pressure the population to render the best and full account of their labour, and, second, to secure for the State a large volume of taxes from those who make no return for their capacities and opportunities. There is a moral, as well as a material basis for taxing unused potentials. The question simply is, whether we are prepared to orientate our taxation to the definite purpose of increasing productivity by penalising inefficiency and indifference. By the minimum of pressure, not only will production be stepped up to optimum levels, but the State will, at the same time, benefit from increase in the rate and field of taxation. Purposive Taxation, the new concept, which I have elaborated, holds infinite promise to enrich both the private and public sectors of our economy. The concept deserves examination by economic experts, if the Taxation Enquiry Committee is to accept it.

Progress of Production

Otherwise, how is money to be found for development? During the first two years of the Plan, imports of capital goods have declined, production and investment in manufacturing industries has fallen and unemployment has been growing. The Plan has been behind schedule in most States, and a total of Rs. 1,485 crores, that is more than 70 per cent., remains to be spent in the remaining three years. Is this due to change in monetary policy, which coincided with this period? The report for the first two years of the Plan refers to the decline in money supply by Rs. 115 crores. At the same time, the cash balances of the State and Central Governments have been reduced by Rs. 102 crores. The Reserve Bank is holding Rs. 40 crores less of Government securities. In the first two years, no net increase in public debt has taken place; on the other hand, the net outgo from maturing securities was of Rs. 9 crores. The floating debt of the Central Government has been reduced by Rs. 45 crores. The Government's financial position has never been stronger arising from the definite policy of reducing currency and credit. Less money has not, however, meant lower retail prices. No doubt productivity programmes already under way have not been affected. Food output, as stated previously, has touched the 1939 mark. During the two years production of textiles, steel, cement, power has improved, the general index having risen from 104 in 1950-51 to 121 in 1952-53. Scarcity of money has, however, affected consumption.

Maintenance of Demand

The Five-year Plan and the monetary policy of the country have been based on production economics, without reference to consumption economics. It seems to have been ignored that, in economics, demand is more important than supply. Not to maintain demand, is to flatten supply by its own weight. Even if the smallest share of attention had been paid to demand, all policies regarding money, wages, employment would have been different. If demand is created, supply comes sooner or later into existence, but not *vice versa*. Consumption economics, which have been ignored, must now receive attention. The aim should be to equip people to consume more, at least as much as is being produced. This implies first, increase in the money supply. Dr. Bernstein of the World Monetary Bank, a conservative in his economics, thought that money supply can be increased at least equivalently to the increase in production. Since 1952, production has increased by 12 per cent., while money supply has decreased by at least the same percentage. While there has been more to sell, there has been less to buy it with. This has recoiled in accumulated stocks which are now reducing production, and increasing unemployment. The process is a vicious circle, only to be broken by more money. In the second place, even when money is available, it has not been spent in the same direction as the production planned. This has meant that certain shortages have persisted side by side with surpluses in other directions.

Crux of Problem

The economics of consumption requires, therefore, first, more money, and, second, a pattern of spending related to the pattern of production. I have been pressing for some time for the issue of development currency to increase the supply of money on the one hand, and to canalise its use on the other. As long as this currency is encashable only against specified production, it will not cause inflationary pressure, even while it accelerates turnover. A problem like that of handloom cloth could be solved in the shortest time, if people had part of their incomes paid in currency which can buy only this and other specified items. Otherwise, the pattern of expenditure may be determined by compulsory savings of all incomes in a fixed proportion, in the form which was enforced in the U.K. during the war. These savings, however, should be ploughed back at once into production, either as capital for industries, or amenities for the contributors concerned. Thirdly, consumption may be activated by concessions and preferences in State taxes and services. The tax structure, on the one hand, and services like transport, irrigation, power, on the other, will have to become purposive also in respect of the consumption pattern. They are so to some extent already and what is required is more precise attention and action. The private sector, therefore, depends a great deal on Government policies being more purposively related to consumption economics. This is a very important service the public sector can render to the private sector. The Five-year Plan has to consider both production and consumption, the latter a little more now, as it has been neglected so far.

To sum up, my thesis is first, that taxation should be purposive, and, second, that planning must take account also of consumption economics. Only thus can mixed economy prove a success.—*All Rights Reserved.*

FOOD CONSUMPTION

Are the peoples of the world eating more or less food than they did before the war, and what do they mostly eat? Approximate answers to these questions may be found in figures for the daily intake of calories per person, and for annual *per capita* supplies of cereals or potatoes, meat, milk and sugar. Latest figures for 40 countries for calories per person per day (generally 1950-51 or 1949-50) place these countries in the following broad categories:

3,000 *calories or over*:—Ireland, New Zealand, Australia, Switzerland, Canada, Sweden, Iceland (1948-49), Finland, United States, Argentina, Norway, Denmark, United Kingdom and the Netherlands.

2,800-2,999 *calories*:—Uruguay, Belgium-Luxemburg and Western Germany.

2,600-2,799 *calories*:—France, Austria, Cuba (1947-48), Czechoslovakia (1948-49), Israel, Union of South Africa and Poland (1947-48).

2,400-2,599 *calories*:—Greece, Turkey, Cyprus (1948-49) and Italy.

2,200-2,399 *calories*:—Chile (1948-49), Brazil (1948--49), Egypt, Colombia (1948-49), Mauritius and Venezuela.

2,000-2,199 *calories*:—Japan, Ceylon, Indo-China (1947-48) and Pakistan (1948-49).

Under 2,000 *calories*:—Burma (1947-48) and India.

SCIENTIFIC RESEARCH IN INDIA

SIGNIFICANT PROGRESS OVER WIDE FIELD

By
Dr. S. S. Bhatnagar, F.R.S.

IN the eighteenth century, when industry in the modern sense was still in its comparative infancy, an eminent writer described commerce as "the bringing into the country of whatever is wanting and carrying out of whatever is superfluous." This description may have suited the times, because exchange of primary commodities was then the main feature of commercial transactions. During the last two centuries, however, there has been a rapid change in the character of international trade and now industrial products figure as prominently, if not more, in the exchange of goods and materials between different countries as primary commodities. The emergence of industry as an important factor in the national and international sphere has also brought about a change in the concept of what the terms "commerce" and "industry" imply, with the result that to the layman the two terms more or less carry a similar meaning and for him a "merchant" and an industrialist are both "men of business," the distinction between the terms being more or less subtle.

The comparative affluence of industrialised countries and the international influence and prestige they enjoy have spurred countries, which had hitherto been content, more or less, to barter away their primary commodities for industrial products, also to realise the economic advantages which accrue from processing of raw materials and trading in finished goods. This realisation came to Indian business several decades ago and a gradual change in the pattern of Indian economy, accentuated by the world wars, has since been evident. The advent of independence has resulted in a setting of pace and there is a most welcome emphasis on hastening the industrialisation of the country. This shift in the economic structure of the country will no doubt also lead to changes in the pattern of India's trade and commerce, both internal and foreign.

Importance of Research

The role which scientific research can play in the industrial development of the country is now increasingly appreciated both by Indian industrialists and the Government of India. Apart from devoting a separate chapter to "Scientific Research," the first Five-year Plan makes constant references to problems in different spheres which science can help to solve. Most leaders of Indian industry are also agreed that, though apparently costly, scientific research, whether pursued for the sake of obtaining new knowledge or for application for specific purposes, is an essential investment for industrial development which pays handsome dividends in the long run. It is heartening to record that even the protagonists of village and small-scale industries have recognised that research is necessary for their logical development. Thus, the All Village Industries and India *Khadi* Board has appointed a research committee to draw up plans for a research organisation which will exclusively concern itself with fostering research in this sphere. One of the functions of this organisation will be to place the problems of village industries before existing research institutions and convey the results to smaller research centres and artisans.

The rapid implementation of the scheme of national laboratories formulated by the C.S.I.R. is a direct outcome of this interest. The current year (1953) has seen the completion of the first scheme, envisaging the establishment of 11 research institutes, the National Physical Laboratory, New Delhi, and the National Chemical Laboratory, Poona, dealing with general subjects, and the remaining nine as specialised institutions devoted to specific subjects.

Plans for the expansion of the scheme to cover other fields are being drawn up and, during the period of the first Five-year Plan, it is intended to establish three new research institutes dealing with salt, electronic engineering and mechanical engineering with special emphasis on cottage and small-scale industries. The Birla Education Trust has made a donation of Rs. 21 lakhs towards the cost of construction and equipment of the Central Electronics Engineering Research Institute, Pilani (the foundation-stone of which was laid by the Prime Minister in September, 1953); it has also promised to make an annual contribution of Rs. 50,000 towards its recurring expenses. The Mechanical Engineering Research Institute, to be located at Calcutta, will be the recipient of a donation of Rs. 21 lakhs from Mr. K. D. Jalan. The Central Salt Research Institute is housed in Raj Hotel, Bhavnagar, a gift of the Saurashtra Government.

These laboratories do not work in isolation; they keep in touch with industry in several ways, by personal contacts, by organising intelligence services and symposia, by encouraging personal visits and by having industrialists as members on their Advisory Board. These contacts help them in gauging the requirements of industry and taking up investigations to meet them. On several occasions, the Tariff Commission has suggested the direction in which national laboratories can assist in the development of particular industries. Similar suggestions are also contained in the "Programme of Industrial Development" laid down by the Planning Commission.

Wide Field of Activity

An idea of the wide field of activity to these laboratories, since their inception in 1950, is possible from a brief narration of their research activities.

The Fuel Research Institute, Digwadih, and its five Coal Survey Stations are continuing a detailed survey of Indian coals. Monographs on a "Preliminary Survey of Madhya Pradesh Coals" and "Utilisation Survey of Bermo Seam at Kargali and Dhori" have been published. Washability of coals is one of the main lines of investigation on which a further detailed report was published. The Institute has investigated the best manner of utilising slack coals from State railway collieries and shown that, by washing and carbonising the cleaned product to a high class coke, it is possible to make the slacks suitable for manufacture of calcium carbide and ferro-manganese. Till washeries and coke ovens are installed, the slack can be used in the Bokaro Thermal Power Station. Work has also been in progress on the coking properties of Madhya Pradesh coals, gas purification for removal of dust particles and sulphur, spontaneous combustion, desulphurisation of Assam coals, concentration of pyrites in coals, the Fischer Tropsch process of synthetic petrol manufacture, active carbons and ion exchangers from coals, etc. Of particular interest is the new method for determining phosphorus in coals and coke, inasmuch as it eliminates the error, ranging from two to 20 per cent., involved in the methods hitherto employed. A proposal has been submitted to Standardisation Organisation to adopt the method for international use in fuel analysis.

Beneficiation of manganese ores, chromites, uranium ores, etc., has been studied at the National Metallurgical Laboratory, Jamshedpur. A plant for beneficiating low grade manganese ores for industrial units producing 5 to 10 tons per day and another for smaller units has been devised. A process for electrolytic preparation of beryllium oxide from beryl has been worked out; beryllium oxide finds use in nuclear energy plants. Electrolytic production of high purity manganese metal and titanium metal is also being investigated. A detailed study of the conditions for producing high temperature refractories using sillimanite from Travancore beach sands has been carried out. Other subjects of study include nodular cast iron, structure of aluminised steel, low carbon ferro-chrome, fatigue resistance of steel structures and wear resistance of railway wheels, tyres and rails.

Glass and Ceramic Research

Survey and standardisation of raw materials used by glass and ceramic industries, clays, talcs, glass sands, etc., and improvement of their quality is a feature of the work of the Central Glass and Ceramic Research Institute, Calcutta. A detailed report on Indian Talcs has been published. Methods of producing chemical porcelain, traffic signal lenses and glasses, glazes and colours used in the ceramic industry and insulating compositions for wire wound resistors have been worked out and are awaiting utilisation by industry. It has been demonstrated that good sand lime bricks in a variety of decorative colours can be produced from the waste sludge of acetylene factories. Investigations on glass containers used by ink manufacturers have assisted in rehabilitation of the ink industry. Similar investigations on containers used by food and pharmaceutical industries are in hand. Alumina glasses are being studied. Conditions for manufacture of hæmatogical instruments were determined and manufacture of these instruments by industry is being arranged. Waste mica has been used in improving the performance of refractory bricks.

Chemical Laboratory

Amongst the important problems being tackled by the National Chemical Laboratory, Poona, is the production of fertilisers from indigenous phosphatic rocks without the use of sulphuric acid. Experiments on solubilisation of phosphatic rocks with magnesium salts and sea bitterns have yielded a product containing 80 per cent. of the total phosphate content in citrate soluble form. In extension of this work, mixed nitrogen-potassium fertilisers have also been prepared from sea bitterns and Epsom salt. Conditions for preparation of ammonium sulphate from Epsom salt have been determined.

Tests for identification of vegetable oils in the presence of other oils are being studied. Having established the possibilities of using tobacco seed oil in the manufacture of varnishes and paints, the Laboratory is determining in detail the physical and chemical properties of the oils obtained from tobacco seed grown in different parts of the country. Investigations on storage of *kamla* seed have shown that the seed can be stored under ordinary atmospheric conditions for six months without spoilage; after this period, it begins to deteriorate very rapidly. Work has now been started on stabilisation of *kamla* oil so as to preserve it without spoilage and gelation. Processes for economic production of nicotine sulphate from tobacco wastes and saponins from soapnuts have been developed and sugarcane wax, has been modified to compare with Carnauba wax in its properties.

At the instance of the Indian Council of Agriculture Research, investigations on manufacture and application of hormone type of herbicides have been initiated. Lightweight honeycomb type low pressure laminates for use in construction of aeroplanes and light houses are being studied. A process for the preparation of pectic enzymes which are useful in the curing of coffee has been evolved. A scheme for the preparation and supply of research chemicals for assisting research workers to get their requirements without inordinate delay and at a fair price has been inaugurated.

National Physical Laboratory

Intensive studies on the thermal effects of ultrasonics at the National Physical Laboratory, New Delhi, have culminated in the discovery of the relationship between sonic and thermal energies and it has been established that, whatever the form of energy, mechanical, electrical or sonic, the heat produced by it is the same so long as the value of that energy remains the same. The Laboratory has also designed for the Bhakra Nangal Concrete Laboratory an automatic temperature control unit for studying the temperature rise in mass concrete in different design mixtures with the object of fixing the cement content at a minimum and thus helping in the elimination of temperature cracks. An air duct for experimenting on the effect of air flow on heat flow was designed and constructed. A low temperature research unit has been established. A bone digestor for production of bonemeal for use as a fertiliser has been designed at the instance of the Ministry of Food and Agriculture and tests on the digestor are in progress. A new method of mode control of inter-digetal magnetron is being investigated, with the object of obtaining controlled operations in more than one mode. Investigations have been conducted on the colorimetic, photometric and transmission requirements of coloured signal glasses. A two dimensional paper chromatographic method for detection of phenols in bitumens is being developed.

Investigations on improving the depolorising properties of Indian manganese for use in dry cell manufacture are being conducted on a pilot plant scale and beneficiation of graphite ores by flotation is being studied. Insdoc (Documentation Centre), housed in the Laboratory, has organised document procurement, translation and information services and continues to provide facilities to Indian scientists by supplying the required literature references.

Food Technological Research

Breeding experiments on groups of young albino rats, using different rice samples at the Central Food Technological Research Institute, Mysore, have confirmed that husked rice is the best growth promoter and milled rice the most inferior; raw undermilled and parboiled undermilled rice fall intermediate, the difference in the growth-promoting values being statistically significant. Apart from production of tapioca rice and tapioca semolina, investigations are also in progress on the nutritive properties of other materials. Estimation of ascorbic acid (vitamin C) content of sulphited jack fruit squash and orange juice concentrates by a new method developed at the Institute itself has revealed that loss of ascorbic acid during concentration ranges from 7 to 32 per cent. in the case of Coorg and Sathgudi orange juices. Indian mangoes constitute a rich source of vitamin C and work to prepare a vitamin C rich mango

product is in hand. The true ascorbic acid content of several fresh material like pomegranate fruit and *amla* leaves has been determined and studies in the bio-synthesis of vitamin C in plants and its possible role in plant metabolism have been undertaken. Investigations on the preservation of *neera* (palm juice) by addition of citric acid and aeration with carbon dioxide have shown that, when so treated, no fermentation or off flavour develops in it even after a week. An experimental forced circulation evaporator has been installed for obtaining a high density evaporated groundnut milk as a preliminary to its conversion to the powder form.

Leather Research

Replacement of wattle bark by easily available indigenous tanstuffs is being attempted at the Central Leather Research Institute, Madras; amongst the materials being tried are *goran*, *karada* and *divi divi*. By modifying *goran* liquors, it was possible to obtain a light coloured leather similar to wattle tanned leather in strength and yield. *Karada* tanned kips are a bit looser in grain and darker in colour than wattle tanned leather, other properties being similar. A process for production of upholstery leather using *divi divi* as a tanning material and yielding a full and soft leather with good feel has been worked out. A systematic investigation on vegetable tanstuffs—physical, chemical tanning characteristics—available in the Madras State is in progress. The physical and chemical properties of goat skins, cured with naturally occurring Glauber's salt (Didwana salt) and their tanning characteristics, are under study. Analysis of sample of East Indian kios and chamois leather to lay down standards and prevent their adulteration have been completed. Researches have been undertaken to improve the wearing qualities of indigenous sole leather produced by bag as well as pit tanning and to compare their abrasion resistance.

Drug Research

A systematic study of the active principle of indigenous drugs is in progress at the Central Drugs Research Institute, Lucknow. Pharmacological investigations on the blood pressure lowering and hypnotic properties of the resinons residue of *Rauwolfia serpentina* have shown that the residue does not give any positive reaction for alkaloids. Chemical investigations on *Naukuj*, a plant reported to be useful a number of debilitating conditions, have been initiated. Preparation of peptones, enzymic make up of vibrio cholerae, antibiotics from higher plants and soil micro-organisms, curariform drugs are some of the other subjects under study. An "Indian Pharmaceutical Code" has been compiled and published.

Electro-chemical Research

Electro-chemical preparation of copper oxide for use in anti-fouling paints and as a fungicide, electrothermal preparation of iron and carbon disulphide using carbon and iron pyrites as the starting material, production of formaldehyde from carbon monoxide and hydrogen under high pressure silent electric-discharge, reclamation of pure aluminium from aluminium scrap by a simple process, electrolytic preparation of titanium and production of electrolytic white lead constitute some of the investigations undertaken by the Central Electro-Chemical Research Institute, Karaikudi.

Road Research

A test track for observing the behaviour of road materials under normal conditions of road traffic has been laid in the Central Road Research Institute, Delhi. The track will also be used for experiments with different forms of signals used for directing road traffic. The Institute is working on improving bullock-cart wheel axles and on rural roads. It has conducted plate bearing tests at 15 different sites at Chandigarh and the site of the proposed Supreme Court building in New Delhi to determine the bearing capacity of soil for designing foundations for multi-storeyed buildings.

Building Research

A new type of roofing tile from bamboo is being attempted by the Central Building Research Institute Roorkee. Experiments on manufacture of bricks from black cotton soil have shown that it is possible to obtain from it bricks of high compressive strength, comparable to those of bricks obtained from alluvial soils Utilisation of Indian blast furnace slag, preparation of solar charts for different places in India, use of Sindri ash as a puzzolana, exfoliation of raw vermiculite are some of the other subjects being studied. A small hut of stabilised rammed earth has been constructed for weathering tests. Corrugated concrete shell structures of a thin layer of concrete laid on jute fabric have been evolved.

The results of some of these investigations have been published for general information and use by industry Solar cookers, carbon slabs and rods for brushes for electrical machinery groundnut milk curds, thermo-couple ammeters, pristermerin and dulcitol are some of the items, the production of which has been arranged by agreement with industrial concerns Amongst the processes awaiting large-scale development may be mentioned production of vitamin C, cation exchange resin, air drying wrinkle finish compositions, drying oils from tobacco seed oil and safflower oil, plain or wrinkle finishes for protective and decorative purposes, cation exchangers from coal, ceramic colours and glazes, chemical porcelain, and nicotine from tobacco wastes.

Translation of laboratory research to commercial production is of importance from the industrial and commercial point of view. In industrially advanced countries, industry, in spite of its conservative nature, is generally on the look-out for innovations and inventions to improve their products and processes and to expand the yield of their activities. In India, however, barring a few exceptions, industry fights shy of new developments and looks askance at suggestions and proposals indicated by laboratory work till their intrinsic merits have been fully proved. This attitude has been partially responsible for retarding the pace of research development. In order to bridge the gap between research and development, a National Research Development Corporation of India has been established with the object of developing and exploiting inventions, whether patentable or otherwise, of C.S.I.R. patents and inventions of other Central and State Government research organisations, commodity committees and other research institutions and patents of university workers and individuals where public interest so demands. The Corporation will arrange trials of promising inventions in existing State-owned or private factories, or finance installation of pilot or prototype plants where desirable.

The activities of the Corporation will influence the country's economy in several ways. Apart from direct returns by way of premia and royalties, the establishment of new industries will open fresh avenues of employment, provide new opportunities of utilisation of indigenous raw materials, effect savings in foreign currency by reducing imports and bring in additional revenues by way of income and other taxes. In the case of existing processes, these activities will be helpful in reduction of costs and standardisation and improvement in the quality of the materials, both valuable considerations for facing competition in national and international markets.—*All Rights Reserved.*

TAXATION ENQUIRY COMMISSION

PART I OF ITS QUESTIONNAIRE CONSIDERED

THE questionnaire issued to the public by the Taxation Enquiry Commission last July is very comprehensive and exhaustive, containing as many as 228 questions and dealing with practically all the aspects of the economic life of our country. Some of the questions, especially in Part I, are such that a student can prepare a thesis for the Ph.D. degree of a University on any one of them. The questionnaire is divided into six parts, entitled the Tax System, Direct Taxes, Commodity Taxes, Agricultural Income-tax, Land Revenue and Irrigation Rates, other Taxes and Local Taxation. Of these parts, only the first is of interest to the general public, the other parts being more or less technical, and it is proposed to deal with this part only in this article. In doing so, the writer is guided by the basic conditions of the country, namely, a population which is not only the second largest aggregation in the world and one-sixth of the world's population, but which is increasing at the rate of 1.2 per cent. annually, low standard of life of the people, depressed further by the war and its aftermath, the urgent need for rapid economic development of the country, so as to increase progressively the production of goods and services and the need for stimulating private enterprise, work, savings and investment in order to bring about the economic development, because public enterprise, even if it is expanded, cannot, on account of its serious shortcomings, secure the development to the required extent and with the required speed. The writer acknowledges the benefit obtained by him from informal discussion of the questions with the representatives of a few chambers of commerce and industrial associations.

Sound Tax Policy

The first question of the Commission asks the reader's opinion about the objectives of a sound tax policy and the place of (a) reduction in inequalities of income and wealth, (b) encouragement of incentives to work, to save and to invest, (c) countering of inflationary and deflationary tendencies and (d) maintenance of the external balance of the economy in such a policy. The question further asks the modification required in the Indian tax system to achieve the objectives. The answer to this question is that the objectives of a sound tax policy are determined by the economic policy desirable for a country. In India, in view of what has been stated above, the primary objective should be to encourage the incentive to work, to save and to invest and to stimulate private enterprise and, at the same time, to secure an equitable distribution of the burden of taxation on all sections of the community, consistent with their ability to pay. At present, the feeling prevails among the upper and middle income groups living in urban areas that they have to bear an excessive share of the burden of taxation and that this seriously hampers the flow of their savings to productive enterprise. The Five-year plan has made the private sector responsible for providing Rs. 233 crores for new industrial development and Rs. 150 crores for making up the arrears in depreciation. Further, new employment to additional 1½ million workers each year, necessitated by the growth of population, can be provided chiefly by a rapid expansion of industry. These objectives can be achieved only by giving the private sector scope to work as free as possible from Government interference and with incentives sufficient to cover the risks attendant upon rapid industrial expansion.

Inequalities of income and wealth should be attempted to be reduced not by levelling down the upper incomes through high direct taxation, but by increasing the production of wealth and raising the standard of life of the people. Equal distribution of the present national income would give each Indian only Rs. 20 per month, that is, Rs. 5 per month in terms of the pre-war purchasing power of the rupee. This would mean a very low standard of living for all. As regards the objectives (c) and (d) mentioned in the question, they can arise only in an emergency and the tax policy may be modified temporarily to achieve these objectives, so long as the emergency lasts. But, even in an emergency, in an underdeveloped country like India, the above objectives are likely to be achieved much better by special measures, such as special incentives to exports,

By

Dr. S. G. Panandikar

quantitative import controls and exchange regulations, than by a modification of the tax system, because the proportion of the national income that can be taken away by taxation is much lower in an underdeveloped country than in an advanced country. Further, experience shows that customs duties in India are hardly the proper means of achieving a balance in external payments, because their effects are uncertain and often contrary to those which were intended.

Modifications Required

The important modifications required in the tax system are: (1) making the people living in rural areas, especially the well-to-do sections, bear their fair share of the burden of taxation and thus widening the base of the tax system; (2) some relief in the rates of income and super taxes on personal incomes, which, in their higher levels, are discouraging work, saving and investment; (3) some relief in the taxation of profits of companies, especially of their undistributed profits, which will increase the savings and investment of companies, without increasing personal incomes; (4) a scientific system of depreciation allowances, which takes into account the replacement cost, so as to alleviate the harmful effects of inflation and high cost on companies, and (5) extension of the present period of five years from the formation of new industrial concerns for the grant of concessions to them, such as exemption from income-tax and higher initial depreciation allowance, to a period starting from the formation of the concerns and ending with five years after the commencement of earning of profits by them.

Equity of A Tax System

The second question asks the criteria for determining the equity of a tax system and how far it is possible to secure it in the Indian tax system. The third and fourth questions are whether the Indian tax system conforms adequately to the principle of ability to pay and whether the taxable capacity of various sections of the community has been properly used by the Indian tax system. The answer to these questions is that the equity of a tax system is determined by the equitable distribution of the burden of taxation among different income groups and urban and rural groups, providing, at the same time, in a democratic State, encouragement to individual effort. The Indian tax system is not equitable and does not conform adequately to the principle of ability to pay, because, while the tax system is excessively progressive in respect of the higher income groups of urban areas, the people of rural areas, especially the higher income groups, appear to be bearing less than their fair share of the burden of taxation. The latter have benefited from the rise in the prices of primary products, which, on account of the war, have risen more than the cost of living in rural areas.

Redistribution and Incentive

Further, tax policy is only one aspect of economic policy, which is framed to increase the economic and social welfare of the community. This welfare can be secured better by an unequal distribution of riches than by an equal distribution of poverty. A tax policy which strives to make the standard of living of the people uniform, but which has the effect of lowering the standard, although it may be equitable in theory, is harmful to the welfare of the community. A tax policy which tends to produce this effect, by adversely affecting the incentive to work, to save and to invest, is opposed to the true interests of the community. It, therefore, seems necessary to reduce the present steepness of the direct taxes in India at their higher levels, in order to increase the above incentive and to devise indirect taxes like salt tax, surcharge on land revenue, betterment charges and agricultural income-tax, which can yield a substantial revenue and spread, at the same time, the burden of taxation more equitably over all sections of the population. It would not be difficult to collect such taxes with the existing machinery.

Finally, the tax system should be simple and clear to all; the taxes should be easy to calculate and to collect; the extent of liability for them should be clear; and capital undertakings should normally be financed by loans.

Tax Revenue and National Income

The fifth question asks whether the proportion of tax revenue to national income, which is stated to be lower in India than in several other countries, can be raised and, if so, the manner in which it can be raised. It is true that this proportion is small in India, being only about 7 per cent. But the comparison of India with other countries in this respect is misleading on account of India's vast population and low individual income, which puts 99.6 per cent. of the population below the level of direct taxes. The proportion is bound to be much lower in a poor country like India than in a rich country. Only the surplus over subsistence can yield tax revenue. This surplus is far smaller in India than in advanced countries. Further, the proportion depends upon the economic structure, willingness to pay taxes and administrative skill in collecting them.

As the foreign trade of India is small as compared to its national income, export and import duties, which are easy to collect and, therefore, very productive, cannot yield in India the proportion to national income which they do in a country like England. The income-tax cannot be made to yield more revenue in India at present. Its burden on the higher income groups is already excessive. It does not pay to lower the exemption limit for it, so as to broaden its coverage, because the expense of collecting it in small amounts from a large number of persons would be too heavy. The tendency in recent years has been to raise the exemption limit. The revenue from income-tax is capable of a substantial increase, if evasion can be minimised, but this is a matter of time. Any appreciable increase in the revenue from customs duties is impracticable at present, because they are already fairly high and because some of them are levied for considerations other than those of revenue. The burden of Central excises and State sales taxes is already high enough and an increase in the burden is not desirable. The only scope for obtaining additional revenue at present is through the salt duty, surcharge on land revenue, betterment charges and agricultural income-tax.

Direct and Indirect Taxes

The sixth question is whether the relative place of direct and indirect taxes in the Indian tax system is satisfactory. The answer is that at present direct taxes on urban people are exploited too much. The proportion of the revenue from them to the total revenues of the Central Government has been raised from 23 per cent. before the war to 38 per cent. now. In absolute figures, the revenue from them has increased from Rs. 17 crores before the war to Rs. 170 crores now. The high rates at the upper levels have made savings and the raising of equity capital very difficult. The estate duty, with its high rates on estates valued at over Rs. 1 lakh, will worsen the situation in this respect. More reliance should, therefore, be placed in future upon taxation of rural people, particularly of the higher income groups of the rural areas.

Non-tax Revenues

The seventh question is whether non-tax revenues are likely, in future, to occupy a more important place than hitherto in the public revenues of India. The answer is that they are likely to do so on account of Government undertakings such as Sindri Fertiliser factory, State road transport, irrigation projects, electrical undertakings, steel plant, etc., if they are managed efficiently and economically. But, in order to secure more and more of such revenues, Government should not extend the scope of nationalisation beyond its declared policy, namely, nationalisation only of those key and strategic industries which occupy a vital place in the national life. The reason is that public enterprises, whatever be their structural organisation, cannot secure the advantages of initiative, quick decision and willingness and ability to take risks, which are possessed by private enterprise, on account of the absence of economic incentive among the former.

Taxes for Specific Purposes

The eighth and ninth questions are whether receipts from particular taxes should be earmarked for specific purposes and whether cesses should be levied for special purposes. The answer to the former question is generally negative, because the principles on which taxes are levied are different from those according to which the revenues are spent on the various activities of the Government. Further, hard-pressed Governments are apt to divert the funds from the specific purposes for which they are collected. The earmarking may be desirable in those special cases in which it may make the taxpayers feel that the money taken from them is spent directly for their benefit and thereby reduce their opposition to such taxes. Thus, a cess may be imposed on a commodity in order to utilise its proceeds for promoting research in the production of the commodity or its marketing, e.g., the cess on sugarcane and tea. But the proceeds of such cesses should be spent fully on the objects for which they are levied. This is not the case with the sugarcane cess in U.P., Bihar

and Bombay, a large part of the proceeds of which is treated by the State Governments as their general revenue.

Further, in the absence of strict control, too many cesses may impose a penal burden upon an industry. A typical instance is provided by the cesses imposed upon the coal industry in Bihar and Bengal. These are: stowing excise duty, rescue excise duty, labour welfare cess, health board cess, water board cess, road board cess, district cess, primary education cess, etc. Furthermore, it is wrong to impose a cess on one industry in order to benefit another industry, as has been done in the case of the cotton mill industry for the benefit of the handloom industry.

State Undertakings

The tenth and eleventh questions are whether there should be further extension of State undertakings for revenue purposes, what their policies should be in respect of pricing and whether the net surplus earned by them should accrue to general revenues or be carried to a fund for financing projects of development or be reinvested in the undertakings concerned. The answer is that the industrial policy of the Government does not at present, and should not in future, envisage the establishment of State undertakings for revenue purposes. Even otherwise, for reasons mentioned above, there should not be extension of State undertakings, except in key and strategic industries and those industries which private enterprise is unable to take up.

The earnings of State undertakings should be dealt with in the same manner as those of private undertakings. This means that, from the gross earnings, all expenses and outgoings would be paid first, then interest on capital and income and super taxes, according to the commercial scale, would be paid to Government, then provision would be made for depreciation, replacements and rehabilitation, and the balance, if any, should be reinvested in the undertakings, and if there is no scope for reinvestment, it should be handed over to Government as repayment of capital invested in the undertakings. This procedure will give the managements of State undertakings some incentive to raise efficiency and to lower costs.

When the capital of an undertaking is repaid completely by means of the balances mentioned above, they may be used for financing other projects of development or may be wiped out partially by reducing the prices charged by the undertaking to the consumers. If an undertaking makes losses over a period of years, it should be closed down. The balance-sheets of all State enterprises should be made available to the Legislatures, as representing the proprietors, in the same way as those of companies are made available to shareholders, so that the Legislatures can exercise proper control and prevent the undertakings from becoming a burden upon the people.

The twelfth question is whether income, occupation or rural or urban residence should be the basis of differentiation in examining the incidence of taxation. The answer is that the basis of differentiation should be chiefly income but that residence, urban or rural, will have to be taken into consideration in order to achieve the aim of framing such a system of taxation as will make the incidence of taxation the same on the same income groups living in urban or rural areas.

Distribution of Burden

The thirteenth question is whether the burden of the present tax system is fairly distributed among the various classes of people and the different States. The answer is that the middle and upper income groups living in urban areas seem to be bearing more than their fair share of the burden of taxation, while similar groups living in rural areas seem to be bearing less than their fair shares of the burden, but the extent of the unfairness can be determined only by a study of the respective burdens based on family budgets. It follows from this that those States which have a higher proportion of urban population and of trade and industry bear more than their fair share of the burden. People living in these States may not, however, receive greater benefit from State activities.

The fourteenth question is whether shifts in the distribution of income in the community in recent years have altered the relative incidence of taxation on various classes of people. In answering this question, we should consider first the shift between different classes in the urban sector. It seems that there has been a shift from the middle income group to the upper and lower income groups. The shift seems to be largely corrected by the higher direct taxes, so far as the upper income group is concerned. The commodity taxes do not appear to have corrected the shift appreciably as between the different groups. It seems, therefore, that the incidence of taxation on the middle income group has increased. Then, there is the shift from the urban sector to the rural sector, on account of the greater increase in agricultural prices and incomes than in the rural cost of living. Cultivators of economic holdings and more especially well-to-do landlords seem to have benefited from this shift, as the land revenue has not been increased and as there is no agricultural income-tax except in a few States, in which also it is paid by a small number of persons. Hence, the incidence of taxation on such cultivators and landlords appears to have become unduly low.

Tax Regulations

The fifteenth question is whether the cost of compliance with tax regulations adds materially to the burden of taxation and, if so, in respect of what taxes. The answer is that compliance with tax regulations does impose further consequential burdens on trade and industry, on account of the prevalance of over-elaborateness in the collection of income and commodity taxes. The smaller concerns are obliged to maintain elaborate accounts and books only for complying with tax regulations. For the same purpose, large concerns have to engage a large staff to maintain the various registers, returns, etc. In addition to the statutory registers and returns, which have to be maintained and submitted to the various authorities, in connection with income-tax, sales tax, octroi, customs, excise duties, etc., information on a large number of points has to be supplied every time an assessment is made or a duty is paid. Further, the complicated nature of the laws and regulations, the absence of clear rulings or instructions and the frequent inadequacy and inefficiency of the personnel employed in their administration cause much delay and waste of time and money in appeals and *counter-appeals*.

Public Expenditure

The sixteenth question is whether the benefits accruing from public expenditure have a bearing on a consideration of the burden of taxation and if so, how this should be taken into account in considering the burden of Indian taxation. The answer is in the affirmative. In judging whether a particular section of the peop'e should obtain taxation relief or should be subjected to greater taxation, both the present burden of taxation upon it and the benefits which it is receiving from public expenditure should be taken into consideration. In recent years, Governments have been incurring increased expenditure in order to confer greater benefits on certain sections of the Indian people and, in fairness, these sections should contribute more to the revenues of the Governments.

The seventeenth question is whether the tax burden weighs particularly heavily on any individual industry or occupation. The associations of some industries, such as cotton and jute textiles, sugar, motor transport and *vanaspati*, have submitted detailed memoranda to the Commission, explaining how the tax burden weighs particularly heavily on them. Further, the tax burden appears to weigh particularly heavily on the professional classes, who do not have the benefits of incorporation and who have to provide for their old age and their families out of heavily taxed income.

Taxation and Borrowing

The eighteenth question is: what is the role that should be assigned to *taxation via-a-vis* various types of borrowing in finding the additional resources required for the development programme of the country? The answer is that additional resources should be found as far as possible by tapping the savings of institutions and individuals, where such resources are required for schemes of development which will benefit the future generations much more than the present generation. Such a policy would allow the grant of some relief to those sections which are very heavily taxed at present and would thereby enhance the incentive to work, to save and to invest. Further, with the progressive increase in the national income resulting from the development expenditure, the burden of interest payments in respect of the loans would become lighter in future. The success of the State Government loans and small savings campaign in the current year indicates that the adoption of suitable measures would enable a larger portion of the development expenditure to be financed by means of loans and small savings.

Economy in Expenditure

The nineteenth question is, in maximising the resources required for the financing of development, what degree of importance should be assigned to (*a*) economy and rationalisation in expenditure, (*b*) prevention of tax avoidance and tax evasion, (*c*) higher rates of existing taxes, (*d*) fresh taxes and (*e*) development of non-tax revenues. The writer would assign the first place to economy and rationalisation in expenditure not only in civil administration and defence but also in development projects, because the findings of the Kasturbhai Economy Committee and other committees and various admissions made in Parliament show that great waste is going on at present in all these directions. If this waste is checked substantially, large amounts of money will become available, which can be used partly for economic development and partly for reducing the present burden of direct taxes. The second place should be assigned to prevention of tax avoidance and tax evasion. The prevention will be greatly promoted by making the structure of taxation more reasonable, by making the tax laws simple, intelligible and precise by making the administrators of tax laws show better consideration and goodwill to the assessees and by speeding up the work of assessment. At the same time, care should be taken to see that measures of prevention did not raise the cost of compliance to the taxpayers, as far as possible. It has already been mentioned before that there is not much scope for (*c*), (*d*) and (*e*), except the taxes on the rural sections indicated a'ready.

Public and Private Sector

The twentieth and twenty-first questions are what tax policy would be suitable for the development programme of the private as well as the public sectors laid down in the Five-year Plan and what part can tax policy play in stimulating capital formation in the private sector consistently with the needs of the public sector. The answer is that the resources available for development are limited and that the private and public sectors have to compete for them. So far, the tax policy of Government seems to have been devised primarily in the interests of the public sector. But it is opposed to national interests, because it means a check to the development in the private sector, which has been given —and rightly so—an important place in the Five-year Plan. It is, therefore, necessary to reduce the direct taxation of companies and of the investing classes, so as to stimulate production, saving and investment in the private sector. Further, reinvestment of profits of companies in approved development projects in the private sector should be exempt from taxation or should be given substantial tax relief. The immediate loss of revenue resulting from suitable tax relief would be more than made up by the increase in savings and investment, which, in a few years, would lead to an increase in Government revenue also, as development in the private sector would have a snowball effect. Further, increased taxation of those classes which benefit from development projects in the public sector would give appreciable revenues for financing more such projects in the same sector.

Rate of Capital Formation

The twenty-second question is whether the rate of private capital formation in the community has been lower in the last few years as compared to the pre-war period and whether there has been a shift in recent years in the sources of capital formation in the private sector as between individuals, corporations and other institutions. The answer is that comparison with the pre-war period would not be satisfactory, because the value of the rupee then was about four times its present value. The proper comparison would be between the early post-war period and the present time. The ability and willingness to save in terms of goods and the ability and willingness to convert the saving into real capital at present are less than in 1947 and much less than in 1938. Examination of company accounts shows that industrial operations are now carried on with bank advances to a far greater extent than in pre-war years. The report of the Planning Commission on the working of the Five-year Plan during its first two years shows that the private sector has fallen far short of the investment target set for it. This situation is the result of high incidence of direct taxation, excessive regulation of commerce and industry, unrealistic labour policies, income-tax regulations which do not allow for adequate provision for depreciation and the threat of nationalisation.

The answer to the second part of the question is that there has been a shift in the sources of capital formation from individuals to corporations and institutions. Middle income groups can hardly save anything, the upper income groups cannot save much and the principal savings in the private sector are made available by provident funds, insurance companies and similar institutions, whose funds are not available for new risk investment. Individual savings can increase if the incidence of taxation and the cost of living are lowered.

Tax Relief to Middle Income Group

The twenty-third question is whether tax relief to the middle income group would assist the growth of savings or mainly promote consumption. The answer is that the relief would assist the growth of savings. This group is used to a certain standard of living and is also keen on making savings. In spite of this keenness, it is not able to save anything now, because, owing to the high incidence of taxation and high cost of living, it has to spend its entire income in trying to maintain the standard to which it has been habituated. Tax relief, especially if it is accompanied by a lowering of the cost of living, would enable it to maintain its usual standard and to resume its saving habit. Further, even if tax relief results in some increase in consumption, such a situation need not be regarded as unsatisfactory, because industrial development and expanding economy have to depend upon increasing consumption.

The twenty-fourth question is what tax measures are necessary to realise the Planning Commission's assumption of 50 per cent. of the additional output going into investment each year after 1956-57. The answer is that the assumption of the Commission is too high, considering the low standard of life of the population even before the war, its fall since the war and the growth of the population at the rate of 1¼ per cent. per annum. The only feasible tax measures would be such as would tap the areas and classes benefiting from the development measures.

The twenty-fifth question is what part tax policy can play in regulating consumption standards as a means of releasing larger resources for development. The answer is that, as the consumption standards of the vast majority of the Indian people are already very low, any regulation of them, resulting in depressing them further, would be undesirable. It would also impair the incentive to work. Higher taxation of the well-to-do class would not release even appreciable resources for development, as the number of persons belonging to this class is very small. Further, higher taxation would impair the incentive to work for this class also.

Tax Policy and Efficiency

The twenty-sixth question is how far tax policy can help to promote the efficiency of the productive system and how far multiplicity of taxes in India in respect of the same commodities and their lack of uniformity from State to State affect the efficiency of the economy. The answer is that the efficiency of the productive system depends primarily upon the working of the price mechanism, i.e., competition in the market and that the tax policy can promote the efficiency negatively by not interfering unduly with the above mechanism and positively by granting such reliefs as would help the modernisation of plant, etc. Further, multiplicity of taxes and their lack of uniformity do affect adversely the efficiency of the economy. For instance, the same sales tax has to be paid on the same goods in different parts of India, from the point at which the goods leave the factory in one State upto the point at which they are consumed in another State, causing hardship and inconvenience to business men and consumers. Each tax may be low, but, as they are many and imposed by different authorities, their total burden upon trade, industry and consumer becomes heavy. Such taxes should be centralised and the Central Government should distribute the proceeds among the other authorities.

The twenty-seventh question is: How far can the tax system be used to secure any order of priorities in the development programme in the private sector? It is not desirable to employ differential tax measures for this purpose, because their success in securing it is very uncertain. If it really becomes necessary to secure a particular order of priorities, Government can do so by acting under the provisions of the Industries (Development and Regulation) Act and also by giving positive help and support.

The twenty-eighth question is: What are the possibilities of tax policy as an instrument for economic development (*a*) by influencing overall demand, (*b*) by reducing consumption and unessential investment, (*c*) by positive inducement for desirable investment, and (*d*) by redistribution of income? The answer is that the success of tax policy in securing (*a*) and (*b*) is uncertain, especially in a country with an underdeveloped economy like India, that reduction in direct taxation would encourage (*c*) and that a tax policy operating as an instrument for economic development would tend to increase inequalities of income at first.

Taxation *Vs.* Monetary Policy

The twenty-ninth question is: What are the scope and efficacy of tax policy as compared to monetary policy and direct controls as an instrument of planned economic development in India? In the present and probable future conditions of India, tax relief would be the best incentive to economic development. If supplementary measures are regarded as essential, beneficial results are more likely to be secured from monetary policy than from direct controls.

The thirtieth and thirty-first questions are whether the present tax system in India makes for a reduction in inequalities of income and wealth and what modifications in it are necessary for securing a larger degree of economic equality consistently with maintaining the incentives to capital formation and higher production. The answer is that the present tax system goes too far to reduce inequalities of income and wealth, considering the great need for maintaining the incentive to capital formation and higher production. The best way to secure a larger degree of economic equality is to raise the general standard of living by increasing production.

The thirty-second question is: What is the place that should be assigned to public expenditure as compared with the tax system in achieving a greater measure of equality of income? As the taxation of higher incomes has already gone too far, it cannot be raised further to achieve a greater measure of equality of income. Hence, the only way to achieve this greater measure is to increase the public expenditure for the benefit of the lower income groups. But in doing so, the limited resources of the country and the great need for development should not be lost sight of. This means that the increased public expenditure should chiefly be for productive purposes.

Foreign Capital

The thirty-third question is: Are any changes necessary in tax policy in relation to the investment of foreign capital in India? Investment of foreign capital should be encouraged only in those fields in which Indian capital is not forthcoming on account of the necessity of employing huge capital at the initial stages and/or specialised technical skill. This should be done by concluding agreements with other countries for avoiding double taxation, by providing that the rates of tax payable by foreign capital on profit, interest and royalties would not be higher than those payable by Indian capital, by reducing the tax on dividends payable by Indian companies to foreign shareholder-corporations by the allowance of the maximum corporation-tax abatements and by exempting a subsidiary or a sub-subsidiary of a foreign company, in which the public is substantially interested, from section 23A of the Income Tax Act.

The thirty-fourth question is whether succession or estate duty on property other than agricultural land, terminal taxes on goods or passengers carried by railway, sea or air, taxes on railway fares and freights, taxes other than stamp duties on transactions on Stock Exchanges and futures markets and taxes on the sale or purchase of newspapers and on advertisements published therein, which may be levied and collected by the Union Government but the proceeds of which are to be assigned to the States according to Article 269 of the Constitution, should be levied. The answer is that estate duty has already been imposed, although the burden of direct taxation was already too heavy; that terminal taxes are really the province of local authorities; that taxes on railway fares and freights should not be imposed, because the fares and freights have been increased recently and substantially and are heavy enough; that additional taxes should not be imposed on transactions on Stock Exchanges, etc., because the burden of the stamp duty is heavy enough; that there should be no taxes on the sale or purchase of newspapers, because they would restrict the spread of knowledge and literacy; and that there should be no taxes on advertisements published therein, because the advertisers are already taxed heavily.

Prohibition

The thirty-fifth question is whether it is desirable to impose taxes on capital, salt duty, surcharges on land revenue, betterment levies, agricultural income-tax and social security tax and to modify the policy of prohibition. The answer is that there should be no additional taxation of capital, in view of the shortage of capital in the country and the need of attracting it into productive channels; that a moderate salt duty would yield a substantial revenue without making the burden felt by the people; that surcharges on land revenue should be imposed pending the next land revenue settlement, because the land revenue has remained unaltered since the war, although the prices of agricultural products have increased about four times; that betterment levies should be imposed, because the increase in income is due to the activities of the State and not to the labour or capital of the cultivator; that agricultural income-tax should be imposed, because well-to-do cultivators are bearing the burden of taxation much less than the urban people; that social security taxes may be imposed if they are to be paid by the beneficiaries, i.e., employees and not by employers; and that the present rigorous policy of prohibition should be modified, because, while it has mostly failed to achieve its object, it has involved the loss of large amounts of revenue and heavy expenditure on enforcement.

The thirty-sixth question is whether it is desirable to levy a tax on unearned increments in value of land and other property as a result of public projects of development. The answer is in the affirmative, in theory, because the increased values are due to public projects and not to the labour or capital of the owners, but there are serious practical and administrative difficulties.

The thirty-seventh question is: What are the measures that would increase the receipts from existing sources of revenue? The answer is that simplification of the present system of collection and adoption of more efficient methods of collection would do so.

The thirty-eighth question asks for other new sources of taxation. The answer is that none can be suggested beyond those already suggested in the answer to question 35 above.

Surcharges

The thirty-ninth question is as regards what taxes the powers of the Centre to impose surcharges under Article 271 of the Constitution should be used. The answer is that, as a rule, the levy of surcharges on taxes should be confined to the period of a war or any other grave emergency. The only exception to this rule is the surcharge on land revenue. This surcharge should be imposed for the reason given above, pending the next land revenue settlement.

Questions 40 to 45 invite opinion regarding the scope of the tax system for dealing with inflationary and deflationary conditions. The scope of the tax system for correcting an inflationary condition, by applying recent Western theories on the subject, is very limited in a country like India, having a poorly developed economy, in which the vast majority of the people live at the bare subsistence level. In recent years, direct taxes have been raised to the maximum, partly for counteracting inflation. But, by perpetuating the high rates, the Government has destroyed the flexibility of taxation, which is necessary for its use as an anti-inflationary weapon. Even the current rates, if fully paid, tend to have an inflationary effect, by discouraging productive effort, by encouraging company managements to indulge in unnecessary expenditure and by encouraging individuals to divest themselves of taxable income. Higher rates, if fully paid, would heighten the inflationary effect. The high rates, however, have resulted in considerable evasion. Moreover, direct taxes are paid only by a very small fraction of the Indian people, although the inflationary pressure is exerted by all incomes. In a deflationary situation, however, reduction in taxation, particularly direct taxation, will help reduce costs, and thereby increase consumption and exports. At present, tax reliefs will help reduce the existing high costs, stimulate the slackening activity and check the growth of unemployment. It may be argued that the need of Government for revenue comes in the way of an appreciable reduction in taxation. It need not necessarily be so; even if it is, it will be only for a short while for the expansion in economic activity that will follow the relief in tax burden will raise the Government's tax revenue, thereby more than offsetting the initial loss occasioned by the reduction in the incidence of taxation.

—*All Rights Reserved.*

BASIS OF TAX SYSTEM IN U.S.

"We must develop a system of taxation which will impose the least possible obstacle to the dynamic growth of the country. This includes particularly real opportunity for the growth of small businesses. Many re-adjustments in existing taxes will be necessary to serve these objectives and also to remove existing inequities. Clarification and simplification in the tax laws as well as the regulations will be undertaken."—*President Eisenhower*

"The basic issue in any tax structure is the balance between the different major sources of revenue. The United States, during most of history, has relied on customs duties, sale of public lands and excise and, after 1913, income-tax. With Government functions enormously expanded, a large total revenue is necessary and a dominant reliance on any single form of taxation would be advisable. At present, income-tax of individuals is the first major source of revenue, corporate income the second and excises, the third.

"In developing a proper balance among these three principal sources of revenue, one must be careful not to adopt doctrinaire attitudes concerning the supposed advantages of any one form. No tax is without inequities or repressive effects. When the rates are low, the inequities and adverse economic consequences may not be too serious; but, as rates become higher, the bad features of any one form of taxation become intolerable. A diversification of sources of revenue is likely to give a better approximation to an acceptable system than can exist when any one source is pushed to excessive levels. So long as total revenue requirements are large, a broad and diversified tax system will minimise both inequities and repressive economic pressure."—*Under Secretary to the U.S. Treasury.*

TRAINING FOR MANAGEMENT

CRUCIAL NEED OF THE DAY

By Dr. M. C. Munshi

ONE of the principal improvements in the final Five-year Plan on the draft Plan of 1951 is the pointed emphasis that the former has laid on leadership in industrial and administrative machinery—both in the government of business and in the business of the Government—for the success of the Plan. Undoubtedly, this emphasis by itself is nothing new, for "deficiencies in business experience and practical knowledge of technical details" were stressed even by the Indian Industrial Commission of 1916-18 "*as a more serious handicap often in the way of its promoters than lack of finance*" (italics ours). The draft Plan of 1951, while referring to "the drawbacks that have become prominent lately," stressed the need for "improvements in the administrative set-up, factory management, purchase and sales organisation, system of accounting, etc., which are essential for industrial efficiency."

All throughout the past generation, deficiencies of our managerial organisation were very vaguely, but increasingly, realised. It was, however, left to the Fiscal Commission of 1950 to draw forceful attention to it in a constructive manner. Before dealing with "labour efficiency in relation to industrial development," they examine the problem of management both in the public and private sectors of industry and their recommendations related not merely to "the urgency of a special Economic Civil Service" (this has become well known), but to "control and co-ordination in higher management" as also to "a proper co-ordination of the lines of industrial research" including management research, production processes and market research.

British Traditions: The Great Change

It is true that the almost total neglect of these problems in the last generation must be attributed to the prevalence of the managing agency system in our industrial enterprise. But it must also be explained—at least partially—by the manner in which we have (until lately?) followed the British traditions in our educational and business fields—modified by our own peculiar limitations—and seldom cared to look beyond these. It is true again that such traditions die hard; and the passive—though perhaps sublime—expectations with which New Delhi has been looking up for guidance at the great trek of "Foreign experts" in order to be able to set our house in order, would testify to the gradualness of this process of change. But, while speaking of British traditions, it must be noted that a veritable metamorphosis[1] has been wrought in the British methods during the last 8 or 10 years. This great change started during the war, with the appointment and work of the Percy Committee (1944) and was accelerated by the recommendations of the Scientific Man-power (Barlow) Committee (1946) and the Urwick Committee on Education for Management (1947). All these enquiries not only emphasised that "the United States have a wealth of equipment, of experience and of trained personnel in this field to which there is no parallel in Great Britain." But Parliament and the educational authorities have sought to make up this leeway as early as possible. These efforts were epitomised in the establishment of the British Institute of Management (B.I.M.), which was declared open by the late Sir Stafford Cripps in 1947. In the years that followed and up to 1951, no less than 25 committees of the British Productivity Teams of the Anglo-American Council on Productivity were almost unanimous in attributing much of the drive for higher productivity per man-year in American industry to the attitude of its executives.[2] Indeed, the Anglo-American Council had, by 1950, already decided to send out specialist teams for this purpose. The first Specialist Team on Universities and Industry reported in the spring of 1951 and another Specialist Team on Education for Management presented its report in November, 1951. While space would forbid us from causing to dilate upon the findings of these committees or even their recommendations, we may note that there are no less than 41 organisations in Great Britain which are devoting themselves to making up this leeway in Britain's education set-up.

But it would be misleading to read these post-war trends as being confined to educational reconstruction in Britain. Indeed, the activities of the Anglo-American Council—now British Council on Productivity—went far beyond this sphere. This can also be confirmed by the interest which Parliament, as well as the Trade Unions, then began to take in industrial productivity. The former appointed a committee under the chairmanship of Sir Charles Tizzard which submitted two reports and the Trade Union Congress efficiency collaborated with the employers and Government in the raising of the British workers' productivity.

These trends, read in the light of the performances of the British industry in recent years, would show not merely the result of the need for bringing university training and industry as close as possible to each other, but also the efforts made to answer the new demands on universities by the economic organisation, in general, and by British industry, in particular. The most important of these changes related to the swift building up of a Welfare State and, more particularly, Governmental control and regulation of industry.

The Crucial Problem

To the student of industrial economics, this increasing tempo of attention, care and organisation of management training does not signify merely a hurried approach to make up the leeway or profit by American methods, but institutional changes resulting from the new forms of organisation and control of industries and the patterns of industrial advance. Indeed, these changes during the last decade and a half, have meant reorganisation of industry in Great Britain; so that the crucial problem to-day is not socialism *versus* capitalism but the maintenance of initiative, of sense of responsibility and goodwill at their maximum. These developments may have meant, on the one hand, a widening of the perimeter of the control of industry by the State, but also should signify the devising of new forms of public control and ownership. It would be a superficial view of Britain's industrial structure if the more critical approach to nationalisation of industries to-day is interpreted as a retreat to liberalism or from the road to serfdom. One must delve deeper, in order to be able to see that the tremendous stress now being placed on management issues in Britain has been thrown up by the new patterns of development she is experimenting in her industrial structure.

What About Our Problems?

If in Great Britain, control and planning have been as novel and disturbing to the thoughts and habits of Government dealing with business, as to her business itself, the new and (more consciously) directed patterns of development in India are likely to raise important issues. Indeed, both the draft Plan and the final Five-year Plan have stressed the difficult problems of adjustment between the public and the private sectors and in the organisational changes in the sphere of industry while dilating upon their approach to objectives and techniques of planning (mixed economy and democratic planning). In the light of what we have said about the developments in Great Britain, it is unfortunate that the implications of these changes in the organisation of industries escaped the Planning Commission's proper emphasis, even after the Fiscal Commission had hinted at such changes. Perhaps it is still imperfectly realised that these adjustments imply much more than "the private sector visualising for itself a new role and accepting a new code of discipline."

Thus, for example, when we bear in mind the operative parts of the Industries (Development and Regulation) Act, we are only slowly learning that these organisational changes that we contemplate need (1) objective criteria for judging the performance (or want of it) in industries sought to be "investigated or regulated" and (2) business (or industrial) leadership. While we are not primarily concerned with the former, it would still be pertinent to note that, even with the first stages of the career of the Industries Act, these problems have arisen, as was seen in the Commerce Minister's report of the investigations into the working of a textile firm in Bombay. Let us leave this wider question after noting that the Planning Commission have dismissed this aspect with a general emphasis on the co-ordination between the public and the private sectors and on Industrial Productivity.[3]

Business Leadership

We have already alluded to the perspective in which the Fiscal Commission had tried to view the problems of Industrial Management. The draft Plan, however, reverted to the traditional view of seeking a reform of our managerial organisation by suitable changes in our Companies' Act. While the 52 specific clauses relating to managing agencies in the new Companies' Act Amendment Bill and the others relating to Directorates may help in checking "the abuses of the law" that have been "brought into prominence during the post-war period," it cannot be too strongly asserted that the real question is the raising of new leadership in industry at various levels and not merely that of reforming the managing agency system (the so-called mending it or even ending it). It is only slowly being realised that, while this leadership at the highest level may be born (like poets) and not made at the other rungs of the ladder, it can be made and that under modern conditions it needs to be trained at all levels.

In a limited manner, the Five-year Plan has addressed itself to this problem. While dealing with "education for commerce and management," they show some awareness of the developments abroad and quote with approval the Percy Committee (1944) referred to above. The task of organising this education for management "for young men who reveal aptitude for managerial work" was then left to the All-India Council for Technical Education. Indeed, this chapter shows that the plans for organising such studies for Industrial Administration and Business Management on a regional basis are already under way.

The Wider Perspective

We have reached a stage where it is of crucial interest to analyse properly our needs and examine the answers that we are framing. If in the foregoing paras we have stressed the importance of the wider outlook regarding our industrial organisation or its advance, it is because there is a very real danger of ignoring the lessons of the American and, more particularly, the (recent) British experience. The training for management should not be merely taken as one more extension of technological education or, say, one more branch of commerce curricula. The real objective is not so much to inflict one more type of teaching in industrial or production engineering or, say, in business administration resulting from the greater and greater specialisation of our times as to foster a breed of higher executives and leaders in industry. Further, and in a more important way, the success of the training presupposes a much closer and much more real contact between industry and the universities. By this is not implied merely a greater liaison between fields, factories and laboratories, but a readiness on the part of industry to appoint, select and depute from their personnel, from time to time, such men as might benefit from the training as also benefit their firms. This also means an equal readiness on the part of industry to allow universities and their trainees to bank on the talents and experience built up by industry. Both these, again, presuppose a proper selection and training of personnel within the industries themselves and a tacit acceptance of the responsibility of deputing the selected personnel.

Such an extension of management training should also lead to a widening of the field of enquiry and research in industrial economics. A greater familiarity with industrial units and a closer analysis of managerial problems should be expected to lead, besides a deeper understanding of the problems of the firm, to a desire to formulate objective standards of performance. Even the tool-maker in economics should welcome a widening of this perimeter of research, for, at a time when he is preoccupied with employment, investment and national income in economic development, the parallel approach of a cost analysis of the economy and a systematic approach in the measurement of performances should more often than not provide a much needed corrective.—*All Rights Reserved.*

---

[1] Vide, for example: "In particular, the experience of war has shown that the greatest deficiency in British industry is the shortage of scientists and technologists who can also administer and organise, and can apply the results of research to develop." Percy Committee Report, paragraph 2.

[2] See Reports of the two Specialist Teams which visited U.S.A. in 1951.

[3] While both the draft and the final Five-year Plan have expatiated upon the Development Councils, the need for or the methods of evolving such standards of performance are only being realised by experience.

WAGES AND PRODUCTIVITY

Americans can expect a continued rising trend of real wages over the next decade or two, which may average 2.5 to 3 per cent. a year if most factors are favourable, says a new study, *Employment and Wages in the United States*, by W. S. Woytinsky and a group of associates, published by the Twentieth Century Fund. Some other important findings of the study are the following:

Over the long run, the trend of real wages tends to parallel the trend of average productivity, or output per man-hour, for the economy as a whole, and any attempt to raise money wages much faster will push up the price level.

The most important factor in raising average productivity, and hence real wages, is a continuation, or even speeding up, of the pace of technological advance in industry.

PATENT SYSTEM IN INDIA

COUNTRY NEEDS TO BE EDUCATED ON ITS UTILITY

EVERY nation is built up on healthy industrial activities which should ever be progressive. Progress is possible by the contribution of new inventions, either for opening new industries or for the improvement of old industries. Inventions resulting in new manufacture or in the improvement of old manufacture require, therefore, to be encouraged, and it is for that reason that the patent system is necessary and exists in countries on the way to advancement. Any inventor, who, by dint of his merit and diligence and by the expense of his time and money, makes a new invention, would naturally hesitate to disclose it, and, instead, prefer to keep it secret, in the fear of being copied by others for their own benefit without himself getting any advantage. The patent system is evolved to give the inventor a protection to encourage him to disclose his invention to the public for the benefit of the nation.

The grant of patent monopoly gives the inventor or a person deriving title through him an exclusive privilege for a limited number of years of making, selling and using his invention and of authorising others so to do. When any person, therefore, wants to avail of the invention, he has to obtain a licence from the patentee on payment of royalty. The monopoly thus gives the inventor an opportunity of making a profit, which, in its turn, encourages him to disclose his invention. After the lapse of the limited period, the invention goes to the public and becomes their property, with the result that any person can then make free use of it. Had this encouragement not been given, for reasons stated above there would not be public disclosure of the invention and practical use of it for the benefit of the public. The attempt to keep it secret would mean that the invention would ultimately be lost to society, without any beneficial effect. Another advantage of the patent grant is that the patent specification which is required to be submitted by the inventor, leaves to posterity full and complete information of the invention to enable it to be performed. Patent specification is also the first document to transmit the knowledge of the invention to the public. One invention leads to another and thus a legion of inventions may crop up and improve the stock of knowledge of society.

First Legislation

The first legislation for the grant of monopoly for inventions in India was made in 1856, ninety-seven years ago. The right then conferred was referred to as an "exclusive privilege," and it was conferred to the 'inventors' which expression included the importers also, for inventions of new and useful manufacture. The exclusive right had its origin in law and was not derived by a grant from the 'Crown.' The procedure laid down in the Act was that a petition was presented for leave to file a specification. The petition contained a statement that the invention, the title and a description of which had been given, was new within the meaning of the Act, and it was accompanied by a declaration that the invention was of public utility and that the petitioner was the inventor or his assignee, executor or administrator. The petition was referred to experts at the expense of the petitioner and on their advice leave was granted to the petitioner to file a specification. On the filing of the specification, the 'exclusive privilege' sprang into existence by mere operation of law. The petition had to be written on stamped paper of Rs. 100 and the 'exclusive privilege' normally continued for 14 years. There was no provision for renewal fees.

The Act of 1856 was repealed in 1857, on account of certain technical defects, and was re-enacted in 1859 with certain modifications. The 1859 Act was amended in 1872 and 1883; the first of these amendments included within the meaning of the term 'new manufacture' any new and original pattern or design for which an 'exclusive privilege' was given for three years. In 1888, a consolidated Act was made to cover both inventions and designs and it incorporated some provisions of the U.K. Act of 1883. In this Act, the fees for securing the 'exclusive privilege' for 14 years were required to be paid in instalments and a sort of examination of the specification was introduced. It also included some other provisions, such as, for the purpose of binding the Crown, to impose conditions for Government servants, and for the grant of compulsory licence.

By H. N. Ghosh

Deputy Controller of Patents and Designs

The final Act, which is still in force, came into existence in 1911 and it has been amended from time to time since then. This Act was brought into conformity with the U.K. Act of 1907 and it includes, as in the 1888 Act, both inventions and designs. It was now for the first time that the term 'patent' was substituted for the expression 'exclusive privilege,' and the right was conferred on the sealing of a patent and not by the operation of law. The function of administering the Act was entrusted to an officer designated as Controller of Patents and Designs who would have an office known as Patent Office. The procedure for granting patents was changed and opportunity was given to the public to object to the grant or ask for the revocation of a patent in certain circumstances. The scale of fees was also changed and a system of the payment of annual renewal fees was introduced. The life of a patent at present normally continues for 16 years, subject to the payment of the renewal fees, and it may be extended for a further period of 5 or 10 years, if the invention is meritorious and the profit made is not adequate.

Functions

The function of the Patent Office is to maintain the Registers of Patents and Designs, where in all entries relating to them are entered. The Controller is empowered to grant patents and register designs which are new or original, not previously published in India, and to do all functions entrusted to him under the Act. The Act specifies certain requirements to be met before the grant of a patent. It is required by the Act that an application for a patent should be accompanied by a provisional specification, describing the nature of the invention, or by a complete specification, describing in addition the manner in which the invention is to be performed. In the former case, the complete specification is filed later on. When a complete specification is filed, the application is examined to find out whether it meets the requirements of the Act. For this purpose, the Controller has under him a number of Examiners conversant in different branches of science and engineering. When the requirements are fulfilled, the application is accepted and advertised; and the application and specification are open to public inspection. Any person is allowed to oppose the grant of a patent within four months from the date of the advertisement. The opposition is decided by the Controller or the Deputy Controller. When there is no opposition or if it is decided in the applicant's favour, the patent is sealed and the Letters Patent issued. By an amendment of the Act in 1950, the Controller is empowered to grant a compulsory licence under a patent in case of an abuse of monopoly, such that the invention has not been worked in India or that the demand of the patented article in India is not being met to an adequate extent or on reasonable terms, etc.

Public Support Needed

The achievement of the Patent Office depends on the use made of the patent system by the public. Although the law for granting monopoly for inventions has been in existence for nearly one hundred years and the law at present in force has been in vogue for over 40 years, it has not attracted much attention of the nationals of the country. The reason for this lack of interest is not far to seek. The patent system is closely associated with industries. Patents give exclusive right to make, sell and use the invention in the article patented. Unless there are manufacturing industries and unless there is fear of competition, there would not be a popular demand of the patent system. During the foreign domination in India, there was a dearth of industries in the country and the system had but a limited use. It was mainly taken advantage of by foreigners to have a safe and uncompetitive market for their goods manufactured and exported from abroad. With the growth of industries in India, with India changing from an agricultural country to an industrial country and with the opening of facilities for research, the patent system is bound to be popular and give a lead to the country.

This fact is borne out by the number of patent applications made annually before and after the last world war, since when India is having new industries. Before the war, on an average, there were about 1,000 applications annually and now the average is about 2,000. With the efflux of time, it may be expected that the annual number of patent applications will increase to a considerable extent and a majority of the inventions will originate in India itself. With the attainment of independence in India, the Government set up a committee in 1948 to recommend improvements to make the patent system more conducive to national interest. The Committee submitted its report in 1950 and the proposed change of law on its recommendation is now under way.

I have already said that the patent system in India has not yet attracted much attention of the nationals of our country. In that view, the Patent Office Society, a body consisting of the members of the Patent Office staff with its objective "to explore ways and means for encouraging invention and for increasing the utility of the patent system for promoting the economic and industrial progress in India," opened a stall at the All India Exhibition in Calcutta held at Eden Gardens in February, 1948. In this exhibition the inventors were invited to exhibit their patented articles, and lectures were given to the visitors explaining to them the purpose and utility of the patent system and how a patent can be obtained. The part the Society played in taking a place in the exhibition will be apparent from some of the expressions of persons of various positions who visited the stall. These expressions out of many others are:

'This is the most useful showroom in the whole exhibition' 'I am really thankful to the organizers for having this instructive stall here. . . .' 'Most interesting exhibition of Indian patented invention,' 'The stall will serve a very useful purpose of bringing the patentee and the industrialist together, in addition to that of creating some enthusiasm in the minds of new brains for inventing something,' 'The Patent Office stall is really interesting, educative and informative,' 'Such sections are needed to encourage public,' 'I hope they will work up more and more and do useful service to the public as they have started,' and 'More publicity is required for making people patent-minded.'

Needs Publicity

It is evident from these remarks that the country requires education on the utility of the patent system and needs encouragement for the inventors. It may be hoped that, in the new set-up of the Patent Office after the passing of the new Patents Act, there will be adequate provision in this direction as recommended by the Patents Enquiry Committee. The proposal for opening a National Research Development Corporation is also a step in that direction. It is not only the Government who can give the necessary facilities for the making of inventions and their utilisation, but it is necessary also that the industries as well should put their mind to that end. The other day I had a visit from a patent expert who came to India from America on a short tour. He said that the industrial concerns in America have invariably research departments of their own, and that they spend a huge sum in research. I should think that such should also be the policy of big industrial concerns in this country.

There is no provision in law so far which would enable the Controller to obtain any information regarding the working of an invention after a patent has been granted. It is not, therefore, possible to say to what extent the patents granted in India have been of any use in the industrial advancement of the country. To avoid this drawback, however, necessary provision has been made in the new Patents Bill, already circulated for public opinion, to give power to the Controller to call for information from the patentees.

An Example

The little information that is available in this office shows that the Indian Telephone Industries has set an example in which a new industry of great magnitude has been based on patents. Before the factory at Bangalore was started, Government entered into an agreement with the Automatic Telephone and Electric Co., Ltd., and got an exclusive licence under all patents owned by the Company. It was agreed that the Company would give full technical information and advice, and render the services of experts and technicians for the manufacture of telephone equipments. It may be presumed that the factory is engaged in the manufacture of telephone equipments for automatic exchange, which have been the subject matter of inventions in recent years, for use in the change from manual to automatic system. So long as we do not have the necessary technique and equipment, it is a healthy practice to come to an arrangement with the patentees from abroad, while opening new industries in this country.

Act Amended

In order to remove an obstacle in the early establishment of factories for the production of food, medicines and surgical and curative devices, the Patent Act was amended in 1952 to empower the Controller to grant licence liberally under patents for these articles. It was felt, however, that this provision was not sufficient to facilitate the early establishment of factories for the manufacture of insecticides, fungicides and germicides; and a Bill is now before

THE CANADIAN CROWN COMPANY METHOD

ITS APPLICABILITY TO INDIA EXAMINED

By O. K. Ghosh

Deputy Secretary, Planning Commission

INDIA is a country with a very ancient civilisation. She has had a chequered past, full of ups and downs. In her periods of greatness, she has built up systems of administration embracing the whole country. The fragments still surviving from the memoirs of the ambassador to the Court of Chandragupta Maurya, Megasthenes, the "Artha Sastra" of Kautilya, the travel impressions of impartial Chinese pilgrims like Fa Hian and Yuan Chuang, the "Ain-i-Akbari" of Akbar, the records of the Maratha Peshwas, all bear testimony to this organising genius and ability. At present, we have a running system deriving partly from our own past, and partly from British practices which seem to have, through long association, taken roots in this country. The administrative problems which have faced this country since 1947 have, so feel many, more or less been met and are being met. In this context, one may well ask: What is the necessity of trying to import foreign modes and upsetting the whole apple-cart? Indeed, is it at all necessary, and, if necessary, is it practicable, to import anything from a far-off foreign country? Why should we waste our time in considering Canadian and U.S. models?

Before we try to answer these questions we must try to gauge whether there is any necessity for fundamental structural changes in any portion of our administrative system. Our present system is a legacy of the past. In the past, the main problem of the State was to keep law and order. Any king or queen, who went beyond, was worshipped practically as a god or goddess. Thus, the legendary irrigation engineer king Bhagirath has the whole Ganges named after him; Sri Rama Chandra, who attempted to found some sort of a Welfare State, has become an incarnation of God; and in more recent times, it is only the intrusion of Western ideas and Western scepticism which has prevented the great eighteenth century Maratha Queen Ahalya Bai from being exalted to the position of a goddess. The Welfare State is now, however, our conscious goal, a goal which we desire to reach as fast as possible, and so catch up with the advanced nations of the world. In the process of transformation of the Law and Order State to the Welfare State, the Law and Order apparatus of administration has itself to suffer a sea-change into something—from the point of view of those used to old ways—"new and strange"! There has to be still greater integration with the daily lives of the people, and perhaps new forms of public participation in the administration.

Type of Change Required

Thus, if we consider the administrative system as a dynamic one, changing fast to meet the needs of a new kind of State, we will see the necessity for change in it, for the purpose of the old structure which we have inherited was essentially to keep law and order and ensure stability. I consider this philosophic matrix as a background to a discussion on the immediate subject matter necessary, as without such a background philosophy, the kind of attempt essayed in this article will have no purpose and hence no meaning.

Against this background of necessity for urgent change, we confine ourselves to the mechanics and technique of change in a limited sphere—the sphere of economic development schemes operated on or influenced by the Central Government. By this I mean schemes of industrial development like the manufacture of fertilisers, iron and steel, synthetic petrol, heavy electric plant, ships, machine tools, etc., as well as possible assistance to the private sector of industry. Railways and Posts and Telegraphs are excluded, as they have been running as separate organisations now for more than a century. Multi-purpose River Valley development schemes obviously form a different category from either posts and telegraphs, and railways or industrial schemes. They are also, therefore, excluded.

Now, in the sphere under consideration, what modifications in the present system are necessary to gear it more to the important needs of the public, and thereby to give the public a greater sense of oneness in its operations? This seems more a question of refashioning the structure and of making it a still more effective instrument of public service than at present rather than one of changing the philosophy of the personnel or of the personnel itself. The philosophy of the Social Welfare State has now gone deep even into bureaucratic and administrative cadres and hence a change of personnel—if anyone likes to consider this—would not only be unnecessary; it may cause even serious difficulties, as we are by no means rich in experienced people of different kinds required to run industries. Refashioning the structure out of extant material seems to be the only practical problem involved.

Coming back to the question of modifications in the system, it seems that these should be designed to:

(a) Help solve the budgetary problem—the difficulty regarding annual appropriations;
(b) Ensure unified direction in the public industrial sector;
(c) Make possible intensive market studies;
(d) Enable new links to be forged with the private sector of industry.

With these modifications, the objective of greater gearing with public needs and the giving to them of a sense of a greater participation will, it seems to me, be better served.

But is this not possible under the present system? Our public industries now have a public corporate structure. Men of affairs and men of proven worth in business are associated with such public corporations. What then is required?

General Features

I think it is at this point that I must digress and bring the Canadian Crown Companies in, describe their general features a little, and paint a picture of how I see their applicability to India. Having done so, I will go back to answer the questions posed in the preceding paragraphs.

The salient features of the Canadian Crown Company system can be described under four heads:

(a) Extent of operations, i.e., fields covered;
(b) Internal structure of these Companies;
(c) Relations with the legislature and sources of finance;
(d) Relations with the Executive, i.e., Government Departments.

A wide variety of activities figure under the Crown Companies list. To mention some of the most important Crown Companies: (1) Central Mortgage and Housing Corporations, (2) Canadian Farm Loans Board, (3) Dominion Coal Board, (4) National Research Council, (5) Eldorado Mining and Refining, (6) Trans-Canada Airlines Corporation, (7) Synthetic Polymers. (8) Canadian Maritime Commission, (9) Export Credits Insurance Corporation, (10) Canadian Travel Bureau, (11) Crown Assets Disposal Corporation, and (12) Canadian Broadcasting Corporation.

Item (5) refers to an organisation for the mining of uranium and other rare minerals, the sources of energy through atomic fission. Item (7) pertains to a giant plant at Sarina on the shores of Lake Ontario which manufactures synthetic rubber in abundant quantities for Canada's need and for export. All other items are recognisable by their nomenclature.

It will be thus seen that a very wide variety of activities come within the purview of the Canadian Crown Company system—not only 'developmental' activity, as commonly understood here, but also other activities, like scientific research, broadcasting, disposal of surplus assets, export credits, etc. The St. Lawrence Seaway Canal, when it matures, will also be constructed under the auspices of a Crown Company. It has been estimated that the volume of these operations constitute about one-seventh or so of total operations in the private sector in Canada. Nevertheless, as the list above shows, the activities of Canadian Crown Corporations are in vital and crucial sectors, where, for some reason or other, the resources of the private sector are not easily forthcoming, and where, as in the case of items (2), (4), (12), for instance, the varied interests of the nation as a whole are involved.

Structure of Corporations

Structurally, all these organisations follow a more or less similar pattern. The Chief Executive, variously styled General Manager, President, etc., is also the Chairman of the Board of Directors. This Chief Executive is also President of the Executive Committee which supervises the day-to-day operations of the Corporation. Each corporation is constituted under an Act, which lays down the number of members of the Board of Directors, their mode of appointment, their tenure, etc. In most cases, there are both members from the public services as well as from outside the public services on the Board. The Canadian Mortgage and Housing Corporation, for instance, is run by a Board consisting of a President, a Vice-President and 8 members, three of this 8 are from the public services and the balance from outside the services. There is thus non-official preponderance in this case. In a few cases—the Exports Credits Insurance Corporation, for instance—the preponderance is official. Indeed, the Export Credits Insurance Corporation has a Board constituted wholly of officials. It is not necessary thus for a Board to have a few non-officials in every case. The Chief Executive, who is also the President of the Board of Directors, is usually a man from the public services, and always a wholetime servant of the Corporation.

The President and other members of the Board are appointed by the Governor-General in Council, their terms being specified in the relevant Acts. The employees of the Corporations are not governed by civil service regulations—except a few civil servants seconded to the Corporations—but by such terms and conditions as may be determined by the Executive Committee. This gives flexibility of control and it is possible to give incentives to good work by way of quicker promotion. The Chief Executive has wider powers of appointment, dismissal, promotion, than permissible under the civil service regulations of most countries. In a way, therefore, he is a sort of a "fuhrer"—to use this unpleasant term, which means, however, only "leader"—and there is a great degree of *gleichschaltung* (to use another German word, meaning "co-ordination") affected by him and his aides. He is checked in whatever autocratic tendencies he may develop (for, as Lord Acton said, "all power corrupts, and absolute power corrupts absolutely") by the Executive Committee and the Board of Directors, the service conditions of employees laid down by the Executive Committee and the Board, and the vigilance of the employees themselves. Nevertheless, he wields great power and influence and it seems that, without the vesting of such power and responsibility, speed and decisiveness of action is well-nigh impossible.

Sources of Finance

The Acts constituting the Corporations lay down the sources of finance. Usually, a certain fixed amount is prescribed over a period from out of the Consolidated Revenues, with annual ceilings. Subject to this, the Corporation manages its own financial affairs without further Parliamentary appropriation and the General Manager is responsible not only for administrative matters but also for expenditure control. He has to have, of course, a unit for expenditure control under him. There is no dichotomy in administrative management and expenditure control as prevailing in the Indian bureaucratic system. The auditing is usually continuous, done by the Auditor General, and annual statements of accounts and audit reports have to be submitted to the Dominion Minister concerned, and these reports, and the Annual Administrative Report laid before Parliament, through the Minister, within 2 to 3 months after the end of each fiscal year, a period very much shorter than what most of the joint-stock companies in the private sector in this country take to submit their statement of accounts and directors' report to their shareholders. Thus, when Parliament discusses these Reports, it discusses something live and topical, and has opportunities for checking excesses and correcting mistakes. Usually, Parliament considers these Reports through various Committees, separate for separate Corporations, and constituted of men and women with special interest in the subject matter of the Corporation in question. These men and women question the General Manager and put him, so to say, 'on the mat', in a series of gruelling sittings. Thus, the scrutiny of the Annual Administration Report and of the statement of accounts gives Parliament a lever for control on broad issues of principle. Apart from this, the understanding is that Parliament refrains from asking questions on the day-to-day activities of the Corporations, although it has this sovereign right.

The Corporations are similarly free from pressure from Ministers and Executive Departments, as they are fully autonomous bodies. The Annual Reports are laid before Parliament through the Minister in charge of the subject, but the Minister and his department exercise no control whatsoever, on the day-to-day affairs of the Corporations, in practice as well as in theory.

How to Adapt the System to India

Now to paint a picture of the applicability of the Canadian system, just described, to India. We have our public Corporations, although, as regards their range, we are still at an infant stage of development, considering what might one day possibly be their ramification. The following reforms in their working, however, would make them more well-knit structures than at present:—

(a) By an amendment of the Constitution, if necessary, arrangements should be made to place these Corpo-

rations in funds for 3-5 years at a time. If it is deemed suitable, annual ceilings may be fixed by Parliament. Within these ceilings, Corporations should then be able to go ahead on their own without the necessity of any intercession from a Government Department or the legislature.

(b) The granting to the Chief Executive of the Corporations the same sort of status (Chairman of Board of Directors, as well as of the Executive Committee), which, together with the change suggested in (a), would lead to conditions where it should be easier to do more in the same period of time.

The practice of the legislature confining itself with regard to these Corporations, mainly to matters of principle, should also grow. It may be useful to have Standing Legislative Committees, which will become expert appraising bodies for the different Corporations.

The Implications

The suggested reforms would imply a series of practically independent Corporations. In Canada, the need for close co-ordination of the activities of such Corporations has not perhaps been felt. Each Corporation is "attached", in a very loose way, to the Department which deals with the subject matter in question. Canada, however, is practically an empty wonder-land with tremendous resources in the process of active exploitation, where the elbow room for making possible errors of judgment is much greater than in India. It is not necessary to labour this point in this short essay. But most people would, perhaps, agree that a Central Co-ordinating Body for all these Corporations is necessary. One can visualise the functions of such a Central Co-ordinating Body as follows:—

(i) Making recommendations to the Government of India regarding the amounts to be allotted to the various Corporations for the 3-5 year period mentioned above.

(ii) Making recommendations regarding the citing of new public industries, and the doing of all preliminary work till Corporations come into being.

(iii) Marketing studies for public Corporations.

(iv) Liaison work between the public Corporations, on the one hand, and research bodies and laboratories, on the other, for the improvement of processes, the invention of new techniques of manufacture, etc.

(v) Serving as link with the private sector of industry.

(vi) Handling any assistance that may be given to the private sector of industry.

Objective (v) would have to be served, to begin with, by cells attached to the recognised chambers of commerce, manufacturers' association, etc., if this finds favour with the private sector. Such a link will assist in (iii) and (vi) also.

For effective working, it seems to me that the Central Co-ordinating body should also be organised as a Corporation with funds of its own and with sufficient internal flexibility and resilience. This Corporation should also have a strong representation of elements from outside the public services.

It has to be emphasised that the painting that has been done is that of a piece of machinery. To what extent such a Central Body should have links with the private sector of industry and how and to what extent Government can aid the private sector of industry are wider matters of policy.

It has also to be emphasised that such a Co-ordinating Corporation would usurp some of the functions of existing agencies of Government. Methods will have to be devised to avoid duplication. The handing over of all such functions, where there might be duplication, to the Corporation as visualised would seem to be the way out.

I do not wish to make too much of the Canadian model. The Canadians themselves are extremely modest and unassuming about it, looking upon it as almost axiomatic. There is no doubt that we are able to devise systems on our own. But a good example in a country beyond the seas exists, and there is no reason why one should not borrow a leaf or two from another's book now and then, where this can be of help.

At this point our thoughts would flow back, almost naturally, to our starting point—our philosophical matrix regarding change. Only against the background of such a philosophy, would the necessity for urgent change be seen. Otherwise, if one thinks only of stabilising things as they are—with perhaps a slow rate of progress—then the necessity for change would not be seen and anything new would be regarded as not feasible and impractical.—*All Rights Reserved.*

PATENT SYSTEM IN INDIA

(Concluded from page 68)

Parliament to amend the Act, so that licence could also be given more freely in respect of patents for these articles. These provisions, it is hoped, will help in the establishment and production of the Indian Penicillin and D.D.T. factories, the arrangements for which are being made. Chemical compounds, in general, and therapeutics, in particular, have taken a leading place in the field of inventions in recent years and have resulted in a number of patents. If such medicines as anti-tuberculosis drugs, streptomycin, chloromycetin, etc., are manufactured in this country and are available at reasonable price, it will remove a great hardship which people in general have to bear at present.

Internal combustion engines, especially diesel engines, internal combustion turbines, motor vehicles and textile machineries are some of the subjects for patent which are expected to have application in the existing industries. For small-scale industries, inventions have been made on toys, soap, lanterns, lamp chimneys, furniture, cookers, tiffin-carriers, etc. —*All Rights Reserved.*

Notice

SHAW WALLACE AND COMPANY, LIMITED

DIVIDEND ON PREFERENCE SHARES

THE DIRECTORS HAVE DECLARED a second Interim Dividend of 3 per cent. less Income-tax on the Company's Prefrence Shares in respect of the year 1953, payable to Members whose names appear on the Preference Share Register on the 15th January, 1954. Warrants will be posted on or after that date in accordance with instructions recorded in the Company's books.

The Transfer Register of the Preference Shares will be closed from the 8th to 15th January, 1954, both days inclusive.

By Order of the Board,
R. H. D. CAMPBELL,
Managing Director.

4, BANKSHALL STREET,
CALCUTTA, *16th December*, 1953.

BINNY'S

a great name in India

BINNY'S cloth is a household word all over India, and the reputation of the cloths produced by The Buckingham & Carnatic Co. Ltd. and The Bangalore Woollen, Cotton & Silk Mills Co., Ltd. has helped to spread the fame of Indian textiles throughout the world.

BINNY'S engineering connections offer commodities vital to the expansion of India's economy – heavy electrical goods, diesel and gas engines, boilers, bearings, beltings, mill stores, ropes and cables, high grade paints, pumps, air conditioning plant, plywood, tallow and a host of others.

BINNY'S own Engineering Works fabricates steel tanks and all kinds of steel structures, cuts gears, casts in iron, brass and Meehanite, carries out oxy-acetylene and electric welding and marine and boiler repairs.

BINNY'S offer shipping, stevedoring, clearing and forwarding and insurance facilities.

BINNY'S ... *a great name indeed!*

SOME THOUGHTS ON THE COAL INDUSTRY

TRANSPORT BOTTLENECK STILL THE MAIN HANDICAP

SINCE 1948, when India produced 26,800,000 tons, the country's annual production of coal rose steadily. By 1949, the figure exceeded 29,000,000 tons and the graph continued its upward trend, until 1952, when it touched the highest ever total of 36,200,000 tons. In the early months of 1953, it seemed that the process would continue and, by the end of December, a figure even higher than 1952 would be attained. By the summer, however, the trend had received a check and, at the end of the first half of the year, the country had produced 100,000 tons less than the corresponding period last year.

Turning from production to despatches, the first half of 1953 showed a slightly better result than the first six months of 1952, a total of 12,100,000 tons having been despatched from pitheads during this period of 1953, as against 11,800,000 tons last year. The collieries, however, continued to carry very heavy stocks and, at the end of September, 1953, it was estimated that the total accumulations amounted to 3.13 million tons. Of this total, 2,800,000 tons had accumulated at the pitheads in Bengal and Bihar, where the corresponding stock figures at the end of September 1950 and 1951 were 1,700,000 tons and 2,000,000 tons, respectively.

Transport

Viewed together these figures show that, whilst the rail transport position has improved, it still lags behind productive capacity; in fact, the decline in raisings evident this year reflects a prominent view in the industry that, although there is a potential demand to absorb further increases in output, it would serve little purpose to raise more coal if the railways could not move it. The supply of wagons has always been subjected to seasonal fluctuations and, in relation to other traffic, the railways are in a position to allocate more wagons to coal during the monsoon months. Yet, at the end of September, when the 'easy' period was nearly, at an end, the colliery stocks stood at the formidable total of 3.13 million tons. This represents a very serious immobilisation of capital, and naturally carries with it a heavy financial strain on the producers. Transport difficulties have been further aggravated by various geographical restrictions imposed by the railways on the routing of coal wagons, and this practice has interfered considerably with the discretion of buyers in obtaining the quality of coal they want from suppliers of their own choice. The Chairman of the Bengal Coal Co., Ltd., in his recent speech to the shareholders of the Company, drew attention to this problem and said:—

"Instead of withdrawing restrictions, the railways have progressively increased geographical restrictions, with the result that the control over distribution is more acute now than in the difficult days when coal was in short supply and had to be distributed to essential consumers. In other words, the means, in the form of railways, is shaping the end, in the form of the coal industry and the consumer, and all sorts of routing restrictions are being imposed on the ground that this will economise rail transport. These restrictions are encouraged by the continued operation to-day of a system of controls, designed in 1943 for famine conditions in the supply of coal, and of wartime demands—in fact the complete antithesis of the present position. Indeed, the whole approach to controls, both by the Government of India and by the Railway Administrations, should before now have been reviewed and a new set-up devised appropriate to the changed circumstances."

The economics of the coal industry are very directly affected by the transport facilities available and a situation has now been reached when the development plans of the railways as well as their operational policy requires to be carefully reviewed so as to ensure that the needs of the consumers are adequately met, and that they are not subjected to avoidable restrictions on the normal flow of traffic in the name of rationalisation of transport.

Exports

In the sphere of exports, the year 1953 has seen a considerable contraction in the volume of trade. There are certain countries in close proxi-

Contributed

mity to India which have practically no coal resources of their own and are, therefore, India's natural markets. Thus, Burma, Ceylon, Malaya and Hongkong have traditionally been supplied with coal from India. In the years following the war, however, there was a world shortage of coal as the productive capacity of various other coal producing countries had been impaired. In these circumstances, India's range of exports were considerably extended and cargoes were sent to the United Kingdom, Denmark, Italy, Egypt, Libya, Australia, New Zealand and other countries which would not in normal circumstances have been expected to import coal from India. Unfortunately, during this period, the Government subjected India's export trade to high export surcharges and at the same time imposed restrictions on the grades of coal which could be sent overseas. Whilst one could appreciate the Government's anxiety to prevent the export of the best grades of metallurgical coal, the reserves of which are comparatively limited, it was difficult to follow the justification of extending these restrictions somewhat mechanically to high volatile coal, of which there is no shortage whatever in the country. The fact that overseas customers did not get the best Indian coal available as well as the inordinately high cost of this coal as a result of the surcharges, naturally led them to turn to other sources of supply as soon as opportunities occurred. Exports to the West have now virtually disappeared, and in the East Australia has emerged as an exporter in sharp contrast to the position two years ago, when we were shipping large quantities of coal to Melbourne. Australia is now a serious competitor and has shipped coal to Hongkong, Singapore and Chittagong, thus threatening India's position in her natural markets. South Africa has also entered the field by sending cargoes to Pakistan, Ceylon and Singapore. It is quite apparent now that the retention of even India's customary markets will require the utmost efforts on the part of exporters, and that these efforts should not be hampered by unnecessary Government regulations.

Labour

In the field of labour, one of the problems which the coal industry has had to face from its inception is that it never had an adequate force of settled miners. The typical coal miner when he came to work at a colliery did not sever his connections with the land and was always drawn back to it during the busy agricultural seasons. It has been calculated that between 30 and 40 per cent. of the miners migrated from the collieries to their native villages during the sowing season between June and July and again for the harvest in November and December.

This migratory character of labour is, however, undergoing a slow transformation. During the last war when labour conditions became acute the industry recruited a large force of miners from the United Provinces, who were prepared to make mining their sole occupation in life. It is quite likely that this corps of labourers, drawn mainly from the district of Gorakhpur, will eventually form the basis for a permanent labour force in the coalfields. It is of the utmost importance to have a well-trained permanent labour force if India is to lead Asia in coal production and if her coal industry is to keep pace with the various development projects contemplated under the Five-year Plan. The art of winning coal will inevitably have to conform to modern practice, implying increased mechanisation of the mines, and a settled labour force is much more amenable to absorb technical training than the semi-agricultural worker to whom mining is only a side line.

During the last few years, a number of measures has been introduced with a view to improving the economic condition of the workers. The most important step was the appointment by the Government of India in 1947 of a Board of Conciliation. This Board gave an award which until now has provided the basis of employer-labour relationship in the coalfields and has largely been responsible for maintaining comparatively peaceful labour conditions in the industry. The Award fixed the rates of wages and also granted the mine workers numerous facilities and amenities which they had not received before. For example, it spawned the Coal Mines Provident Fund scheme and the Coal Mines Bonus scheme. A welfare cess levied on the industry goes towards the servicing of a welfare fund for colliery workers. This fund finances a host of useful activities such as the building and maintenance of creches for women workers and their children, pithead baths built on the most modern lines, and the construction of hospitals at selected centres.

Healthy Trade Unions Needed

The end of World War II saw a big spurt in trade union activities in the coalfields. Unfortunately, the energy displayed was not canalised into the development of a strong and responsible trade union movement. Petty factionalism, personal rivalries and the subordination of political ends to genuine economic considerations led to the emergence of a number of rival unions fighting each other for prominence. In certain parts of the coalfieds, extreme left-wing political parties have endeavoured to exploit this situation, resorting at times to violent methods in pursuance of this aim. There is no reason, however, why the more responsible elements in the trade union movement should not gradually succeed in consolidating their position and in eliminating those factions whose avowed aim is to disrupt the industry. The growth of a powerful and healthy trade union movement would undoubtedly be a step forward in promoting mutual understanding and goodwill, which in turn would benefit not only the coal industry, but the country as a whole.—*All Rights Reserved.*

SIDELIGHTS ON SUGAR INDUSTRY

SOME WRONG NOTIONS DISPELLED

THE sugar industry, few can deny, has been playing a very important role in the national economy of the country, by supplying one of the most essential daily necessities of life to both rich and poor alike. Its development and expansion have been so phenomenally rapid that there is hardly a parallel to it in the industrial history of the country. Tariff protection was granted to the industry in 1932 and, within the short period of three years since then, over 100 plants came to be installed. The number of plants that were in operation before protection was granted was 31 and production of sugar therefrom was 1.58 lakh tons. By 1935-36, the number of plants had increased to 135 and production to 9.19 lakh tons and the country had been made self-sufficient in sugar. If sugar has been in short supply, thereafter, it is not so much due to any fault or wilful act on the part of the industry as to other causes—mostly man-made. Yet it is one of the most criticised and misunderstood industries. The criticism, as it so often happens in similar circumstances, is generally misplaced and is based on sheer ignorance of facts. The present-day tendency to criticise the industry when anything goes wrong is fundamentally unjust, because, if one were to analyse the causes, one would find, in the ultimate analysis, that things for which the industry is mostly blamed are those over which it has the least control.

The main criticisms levelled against the industry are:

(a) that the prices of sugar are very high and are beyond the means of the common man,
(b) that the prices ruling in this country are higher as compared with those prevailing in other countries, and
(c) that the sugar industry has been making high profits in utter disregard of the interest of the consuming public.

The three charges are, as a matter of fact, born of the mistaken belief that high prices are co-related to high profits and that prices could be appreciably reduced, if only the industry were willing to reduce its profits.

Before we deal with these charges, a short description of the background against which the sugar prices are fixed, may help the reader to a better appreciation of the problem. Whenever there has been any control on the sugar industry, the prices have been rigidly fixed, on the basis of a formula, popularly known as the "Srivastava Formula," which was evolved in 1936 by Mr. R. C. Srivastava, the then Director, Indian Institute of Sugar Technology. The price of sugar, according to this formula, is arrived at by taking into consideration, estimated duration of cane crushing and recovery as also the various items of cost of manufacture. The margin of profit is allowed at a fixed figure of 10 per cent. on block. More often than not, instead of the latter being realised, the industry, at the end of a season, used to find itself in a tight position, owing to the estimated duration and recovery figures, as assumed by the Government while fixing the sugar prices, having gone wrong.

The Srivastava formula of price fixation has influenced the fortunes of the sugar industry considerably, for even when there is no control over sugar, the price is calculated according to this formula. It is always there in the background as a handle to the critics to base their view of the "fair price" for sugar even when the prices find their own level governed by the economic laws of supply and demand and are influenced by the prices of *gur* and *khandsari* sugar.

Coming now to the criticism that sugar prices are very high and beyond the means of the common man, let us examine the facts in an impartial manner. The only barometer which could indicate as to whether the price of a commodity is high or low is the pre-war level of prices. It is not denied that sugar prices, as compared with the pre-war level, have registered an advance, but then it may be pertinent to ask as to which commodity has not shown an increase in its price since pre-war days. The general index of prices for the period ended 29th August, 1953 (base August 1939) shows an increase of 308.3 per cent. on the pre-war standard. (Source: *Reserve Bank Bulletin*, September, 1953.) The corresponding increase in sugar price is only about 170 per cent. If any conclusion is to be drawn from this, it could only be that the price rivulet of the sugar industry has not overflown its banks.

It should also not be forgotten that the various factors which constitute the cost of production of sugar have also gone up abnormally. The price of cane in 1939-40 was between Re. 0-5-3 and Re. 0-11-9 per maund, the average being about Re. 0-8-5. Now it is Rs. 1-7 per maund, which means an increase of 176 per cent. Minimum

By K. K. Birla

wages in 1939-40 were Rs. 11 per month and they are at present Rs. 55 per month; they have thus risen five times. Further, there was no bonus in those years; now the mills are required to pay bonus regularly every year. The Governmental levies have gone up by over 150 per cent. The cost of stores, packing material and other factors have all increased stupendously. How, then, could sugar alone sell at lower prices?

It may be further mentioned that, according to the 1952-53 season price structure in the sugar industry, 49.5 per cent. of the calculated price of sugar goes to the growers in the form of payment for cane, 21 per cent. to Central and State Governments against levies, 10.5 per cent. to workers for wages and 15.3 per cent. goes for overhead expenses. The gross profit left with the industry is only 3.7 per cent. of the total price. The industry has thus hardly any control on factors which constitute the cost. For example, cane prices, as determined by the Government of India, are fixed as *minimum* prices below which the factories are not permitted to pay. As to the expenditure on wages, it is essentially a multiple of the scale of wages and the number of hands employed. The industry has hardly any say in the former as the minimum wages for unskilled workers are fixed by the State Governments and wages of skilled workers have to be fixed relatively. Reduction in expenditure could no doubt be achieved if the number of hands could be reduced by modernising the plants. But then, where is the money to come from for such modernisation, when the margin of profit normally left in the hands of the industry is so meagre? Moreover, even where some units in a mill are mechanised by some factories, the State Governments are reluctant to grant permission to these factories to introduce rationalisation on the plea of unemployment increasing.

While, therefore, it is beyond the power of the industry to make any effective reduction in sugar prices, even taking the prices as they are, it cannot be said that they are unreasonably high. Many people unfortunately do not realise that there is a close connection between the price of sugar and *gur*. In fact, sugar is not the only commodity which supplies sucrose to the public. Sugar is used mostly by the urban population, which is only a fifth of the total population in India, whereas *gur* and *khandsari*, the two other most important sweetening items in the Indian dietary, are used by the vast rural population. The combined production of *gur* and *khandsari*, as a matter of fact, is three to four times the production of sugar. It is futile in the circumstances to expect that the prices of sugar should remain unaffected by either the prices which *gur* and *khandsari* fetch or by the circumstances which affect the prices of the latter. The comparative pattern of the prices of sugar, *gur* and *khandsari*, as they existed in 1952-53, shown below, demonstrates how sugar is bearing a heavier load of cost and yet offers the commodity comparatively cheaper:—

		Per maund
Gur	ex-*mandi*	Rs. 22 to Rs. 24
Khandsari	...	Rs. 28 to Rs. 30
Sugar	ex-factory	Rs. 27 to Rs. 30

It has to be remembered, in comparing these prices, that the production of *gur* and *khandsari* involves considerably less overhead and enjoys freedom from Governmental levies in contrast to the sugar industry. That sugar prices are in the ultimate analysis cheaper is to be seen from the fact that people who formerly consumed *gur* are now taking to sugar. Consumption of sugar has shot up in the current year and is estimated to be about 16 lakh tons. In other words, sugar, by its cheapness, has started replacing *gur*. What better testimony is needed to prove the cheapness of sugar prices?

To come to the second criticism that the prices ruling in other countries are cheaper than in India. It is no doubt true that sugar is cheaper in some of the other countries. But it is scarcely fair to blame the industry for this position, as the conditions that exist in those countries and in India are by no means similar. As would be seen from the break-up given above, sugarcane accounts for 49.5 per cent. of the cost of production and Governmental duties for 21 per cent. in India. Until these two costs, which together account for 70.5 per cent. of the total, are lowered and sugarcane is made available to the manufacturers at prices comparable with other countries, it will be unjust to blame the industry for the alleged high prices of sugar.

The price of sugarcane for the 1952-53 season was fixed at Re. 1-5 per maund and for this year, it has been fixed at Re. 1-7 per maund delivered at gate. The prices of sugarcane in other countries are mostly dependent on the price of sugar that the industry is able to fetch but, in the ultimate analysis, the cultivator gets about Re. 1 to Re. 1-4 per maund of cane. Besides, the quality of sugarcane grown in this country is so poor that about 10 maunds or more of cane are required to produce one maund of sugar, while, in other countries like Australia, Hawaii, Cuba, Peru and Puerto Rico, the quantities of cane which are required for yielding one maund of sugar are 6.98, 9.56, 8.16, 8.11 and 8.18 maunds, respectively. Nowhere in the world is the miller required to pay so high a cost for a cane so deficient in sucrose content as in India. The cost of sugarcane, therefore, per maund of sugar in India, as compared with other countries, works out as under:

Cost of Cane Per Maund of Sugar

India	Rs. 14-6-0
Australia	Rs. 6-15-8 to 8-11-7
Cuba	Rs. 8-2-0 to 10-2-6
Peru	Rs. 8-1-9 to 10-2-2
Hawaii	Rs. 9-9-0 to 11-15-3
Puerto Rico	Rs. 8-2-11 to 10-3-7

It will thus be seen that it is the sugarcane which is primarily responsible for the high cost of Indian sugar and forms the bulk of the cost of production. As a matter of fact, the protection that was granted to the sugar industry was not so much for the industry as for the grower. If the incidence of cost of sugarcane per maund could be brought down to the same level as in other countries, the price of Indian sugar, as would be evident from the above table, could immediately be reduced by Rs. 4 to Rs. 7 per maund and, if the high Governmental duties which are a "speciality" of this country are abolished, Indian sugar could sell at rates which would compare favourably with world prices.

The above analysis might lead the reader to shift the blame for the high cost of sugar from the industry to the cane grower but, in fairness to the latter, it must be stated that he is not responsible for it, in any way. While examining the economy of sugarcane, it must be conceded that there could be no possibility of its cost being lowered until its yield per acre is increased and the quality improved. Unfortunately, the *per capita* acreage holding of the farmer in India is very small. In the other sugar producing countries, cane is grown by farmers owning big farms of thousands of acres. It is thus cultivated both on an intensive and extensive scale and in a mechanised manner, applying all the modern methods of sowing, irrigation, manuring and harvesting. Naturally, the yield per acre there is much higher and thus the cost is automatically lowered. In India, on the other hand, except for some varietal improvements, sugarcane is cultivated in an antiquated manner, using ordinary bullock power and crude implements.

The only redeeming feature is that the cultivator is gradually becoming conscious of these facts and realises that his methods call for reorientation. But what modern implements could he use when his holding is confined to a few acres? He also realises that the cost of cane could be appreciably lowered if adequate irrigation and manure facilities are provided. But here again he has to look to the Government for these facilities.

In this respect, it is worthwhile examining the action taken by the Governments of U.P. and Bihar. When the cane cess was originally imposed on the sugar industry 17 years ago by these two Governments within whose jurisdiction the majority of factories are situated in India, the intention was to use the proceeds towards the development of cane. Actually, however, the money spent on development work forms a very small percentage of the total collections as the following figures of the last eight years will reveal:

(Figures in lakhs of rupees)

Year	U.P.			Bihar			Overall picture		
	Cess collection	Spent on development	% of expenses to collection	Cess collection	Spent on development	% of expenses to collection	Cess collection	Spent on development	% of expenses to collection
1944-45	111.02	2.57	2.3	7.49	...	...	120.41	...	...
1945-46	95.63	1.93	2.0	18.05	8.07	44.47	113.68	10.0	8.8
1946-47	87.05	1.17	1.3	25.10	0.62	2.4	112.15	10.79	9.8
1947-48	185.33	...	...	24.57	11.44	46.6	209.90	...	...
1948-49	298.78	37.82	12.7	63.19	14.38	22.8	361.97	52.20	14.4
1949-50	292.56	41.44	14.2	113.45	14.20	12.5	406.01	55.64	13.7
1950-51	216.87	41.29	19.0	125.66	14.31	11.4	342.53	55.60	16.2
1951-52	323.37	36.03	11.4	Not available.			Not available		

(Source: *Indian Sugar Manual*, 1952.)

If the Governments of U.P. and Bihar agreed to spend more money on sugarcane development, not only could the yield be increased but the quality of sugarcane could also be improved so as to yield higher recovery.

Technical Efficiency

We have so far examined the items of cost of cane and Government duties among the factors that constitute the cost. We have also referred to the scale of wages. The next item in the series is technical efficiency. It is gratifying to note, in this connection, what the Tariff Board had said in 1950 when it examined the problem: "Simultaneously with the expansion of the industry, the technical efficiency of the industry," said the Board, "has also improved considerably." It is not the intention of the writer to claim that top efficiency, comparable with other countries, has been achieved in the Indian sugar industry. All that is needed to be emphasised here is that the mill-owner is fully alive to the shortcomings of the industry and, given facilities, is eager to modernise the plants and to further improve the technical efficiency. Modernisation of plants is, however, dependent on funds, which are not easy to reach with the forces that are now found working against the industry, as explained earlier. It is not denied that there is scope for a reduction in the prices of sugar, but that scope can be had only if proper assistance is available to the industry in the matter of improvement of the quality of cane, Governmental levies, technical efficiency, rationalisation, etc., as already explained.

The next criticism against the industry is that it makes undule high profits. The preceding discussion will have shown the scope available to the industry for profits. They can hardly be high, even when it is possible to make them; and this will be further borne out if we examine the case of the industry as to how it functions *vis-a-vis* control and decontrol.

The calculation and fixation of price, according to the Srivastava formula, has already been referred to in the earlier part of this article. The price so determined is the statutory price during days of control and the so-called "fair price" when there is no control. During decontrol, economic factors like the law of supply and demand also come into play and influence the prevailing prices, but these are always supposed to revolve round the "fair price." We can, therefore, start with the "fair price" as our basis and investigate if the profit this price leaves to the industry is high or low.

Return Inadequate

It must be realised that, whereas there has been a general increase in the cost of various factors accounting for the cost of production of sugar, the only thing that has remained constant is the amount of profit reserved for the industry which has been maintained at 10 per cent. on a fixed block capital of Rs. 18 lakhs valued at pre-war rates.

A return of 10 per cent. on pre-war block might have been a reasonable one 15 years ago, when taxation was low and bonus was unknown to the industry. Ten per cent. gross profits then mean 8 per cent. net return on block, after providing for taxation. The position to-day is entirely different. Out of the 10 per cent. profits now permitted to the industry, approximately 20 per cent. of it is given away as bonus to labour. Of the balance, 50 per cent. goes in taxes. Thus, after providing for these expenses, the residue that is left to the industry is a mere 4 per cent. as the net return on block. And, as has been mentioned above, this return is on the value of the block calculated at pre-war rates. As the prices of capital goods have gone up by five times meanwhile, the net return would come to less than 1 per cent. in terms of current value and, in terms of the depreciated value of the rupee, it would come to a mere ¼ per cent. which is almost negligible. Few will believe this claim; many may ridicule it as unreal. To the latter, the fact may be mentioned that the Indian Sugar Mills' Association had carried out a very interesting survey of the audited balance-sheets of a representative number of units in U.P. and Bihar for the years 1944-45, 1945-46 and 1946-47. The result of this survey was as per table given below:

—	1944-45	1945-46	1946-47
No. of sugar factories analysed ..	67	64	57
	Rs.	Rs.	Rs.
Gross profit ..	1,21,14,000	1,05,63,000	1,14,27,000
Taxes paid ..	72,22,000	59,33,000	65,69,000
Net profit ..	48,92,000	46,30,000	48,58,000
Per factory			
Gross profit ..	1,81,000	1,63,000	2,00,000*
Taxes paid ..	1,05,000	92,000	1,20,000
Net profit ..	73,000*	77,000*	80,000*
Reserves† ..	3,82,000	4,42,830	4,30,595
Percentage of reserves to block—Rs. 90 lakhs ..	4.2%	4.9%	4.7%

* Profits include sidelines also.

† *The figures under "reserves" represent* the average reserve per factory accumulated from year to year from the very beginning as at the end of the year.

(The figures of years subsequent to these have not been analysed by the Association, but it would not show any improvement on the above facts as the basis of price fixation has not been changed.)

The meagreness of the profits made by the industry as depicted by the above table has its effect, the unwholesomeness of which is not yet fully realised. It cannot be denied that, unless the industry is left with some reserves in hand, it cannot go in for new and modern methods of manufacture; and a new factory at existing prices would cost something like Rs. 90 lakhs. According to the Srivastava Formula, what is allowed by the Government of India is only Rs. 1.8 lakhs towards profits and Rs. 0.7 lakh against depreciation. Against this, the depreciation alone on the new plant would cost something like Rs. 10 lakhs. Who will then come forward to start a venture under such conditions, or even undertake improvements, which cost so much, but yield so little?

Economic Truism

It is an economic truism that production cannot increase without the help of a proper incentive; and if there is no production, there can be no supply. True, the Government can import sugar for some time but can the country's economy stand such a procedure and is it advisable to do so? To kill an industry is easy, but to replace the loss to national economy such killing will effect, is not easy to repair. The proper way is to accept the realities and to find a solution out of them that will bring strength to the industry and good to the community. Imports will be unnecessary, if supplies are maintained and supplies can be maintained if a fair return is assured to the producers of cane and the promoters of the industry. If cane prices are fixed with no relation to the cost of production of cane or the parity of cane with the prices of other agricultural products, the supply of cane to the factories is bound to be affected. Likewise, if a fair return is not permitted to the manufacturer, he will hardly have any incentive to produce more by bringing cane from difficult areas. And if the production is less, the cost of production goes up and supply becomes restricted resulting in higher prices to the consumer. If this vicious circle is to be broken, the situation has to be faced boldly. Few even among the most pessimistic will desire dependence on foreign producers for a commodity which has a good soil to grow in this country and an experience of success to back it up. Fundamentally, therefore, one has to choose between:

(a) low-priced sugar but restricted supply, necessitating re-introduction of rationing and the accompanying evils like long queues and creation of black markets, etc;

or

(b) a somewhat higher price for sugar but full and adequate supply of it by offering fair profits to the cultivator and the industry.

Let the public decide which of the alternatives it wants.

Profit and Production

When people clamour for low profits, it is obviously with the object that sugar may sell at low prices. But the very object of this policy may be defeated, if, owing to low profits, production becomes restricted resulting in higher prices. A short review of how low profits have affected production during the regime of control may, perhaps, convince the reader of the point at issue.

Control was first imposed on sugar in the year 1942. The industry even at that time had suggested that it would be more prudent to divert the energies towards improving the production rather than imposing control on profits and distribution. But the suggestion did not find favour with the authorities concerned. The result was that control failed and production gradually declined and became stationary at about 9 lakh tons, as will be seen from the following fable:

Year	*Production (Lakh tons)*	*Remarks*
1942-43 ..	10.52	Crop was planted before announcement of control.
1943-44 ..	12.01	Loose control.
1944-45 ..	9.62	Control tightened.
1945-46 ..	9.23	,, ,,
1946-47 ..	9.01	,, ,,

As far as distribution during the period of control is concerned, in the cities, sugar was distributed through ration shops. In small places, it was usually given to dealers chosen by the district authorities. One of the main causes of the growth of the black market was that the sugar control order was effective on the price of sugar only at the factory stage. There was no effective control over prices at which thousands of dealers sold the commodity to the consumer. Besides, a large number of people, who were supplied with sugar ration but who were accustomed to taking *gur*, sold their sugar in the black market through the ration shops themselves. The price that one had to pay in the black market to get sugar was about Rs. 2 to Rs. 2-8 per seer. Thus, this rigid control neither benefited the industry nor the grower. The Government lost revenue, as profits made by the industry were very meagre. The public, too, did not benefit, as, except for a small quantity which they could get at controlled rates under their ration cards, they had to supplement their requirements of sugar from the black market. The only person to benefit with impunity in this vicious circle was the black marketeer. Yet this procedure continued not for a short period but for five long years, in spite of periodical representations from the industry pointing out the futility of following such a course of action and impressing upon the Government the desirability of improving production.

In 1947-48, control was lifted at the instance of Mahatma Gandhi, the Father of the Nation. Reasonable profit was provided for the industry and the grower, and the result was that production shot up. The production which had become stagnant at about 9 lakh tons and odd immediately shot up to 10.75 lakh tons. It is not denied that the industry and the grower earned a fair profit, but then, in view of the abundant supplies made available by production increasing, black markets were smashed and sugar, which was formerly selling in black markets at Rs. 2 and Rs. 2-8 per seer, fell precipitately and became available everywhere at prices ranging from As. 15 to Re. 1 per seer.

A Myth

It is no more than a myth to say that, during control, sugar sells at a reasonable price by introduction of rationing. It is common knowledge that only a small quantity is sold through ration shops at the controlled rates. The balance of sugar sells at a very high rate. The following interesting figures, compiled by the Indian Sugar Mills' Association and as published in their pamphlet *Control, Decontrol, Recontrol of Sugar*, will, illustrate that the real price of sugar is actually cheaper during the period of decontrol:

	Control price Rs. a.	*Black market price* Rs. a.	*Weighted real price* Rs. a.	*Remarks*
1939-40 ..	..	..	11 8	No control.
1940-41 ..	..	..	9 0	,,
1941-42 ..	..	..	10 8	,,
1942-43 ..	14 0	30 0	23 0	Control.
1943-44 ..	16 4	33 0	24 8	,,
1944-45 ..	16 4	60 0	41 0	,,
1945-46 ..	16 10	70 0	46 8	,,
1946-47 ..	21 7	75 0	53 0	,,
1947-48 ..	..	..	35 7	Decontrol.
1948-49 ..	..	..	29 0	,,
1949-50 ..	28 8	80 0	57 8	Recontrol.

Unfortunately, however, the policy of decontrol was not pursued the year next succeeding 1947-48 and sugar prices were drastically reduced resulting in lower production. As a natural consequence, prices started shooting up and control was re-imposed in the season 1949-50.

In the year 1950-51, better counsel prevailed with the Government of India who, with a view to giving incentive to the industry, introduced the scheme of "free sugar," whereby any factory, after producing its basic quota required under the scheme of control, was permitted to sell the balance of surplus production in the free market. The incentive thus provided, helped towards greater production which amounted to over 11 lakh tons. This scheme was continued the next year also and the industry had the proud privilege of registering a record production of 14.9 lakh tons which was the highest production ever achieved, thus fulfilling the Planning Commission's target for the year 1956 even before that year. The results were so encouraging that, in the next year, sugar was completely decontrolled, except in regard to releases. In the year 1952-53, the production, though lower than in the year 1951-52, was much higher than normal and was better than in any other previous year.

Prerequisite for Higher Production

The facts adduced above and the play of forces explained earlier will amply bear out, beyond the shadow of a doubt, that low profits make the running of sugar factories uneconomic, thereby seriously affecting the production and prices. If, therefore, sugar production has to be maintained at a reasonable level, a fair return has to be granted to the industry and to the grower which will automatically result in lowering of prices.

An attempt has been made in this article to dispel the doubts that are normally entertained by the public and to answer the criticisms that are commonly indulged in. It will have served its purpose if it has helped, if not to remove, at least to shake the wrong notion in the public mind that the industry has been trying to exploit the consumer. In truth, what the industry desires in its own interest is to see the economy of the country improved, which in turn will raise the purchasing power of the people. With the purchasing power will improve the supply position and with the supply position easing, the prices will automatically go down. Plenty and prosperity thus will go hand in hand, bringing wealth and happiness to every hearth and home in the country. The industry hopes and prays that such a millennium will not be long in coming to this country.—*All Rights Reserved.*

THE PAPER INDUSTRY IN INDIA

DEVELOPMENT MUST BE PROPERLY CO-ORDINATED

THE present state of development of the paper industry in India can, perhaps, best be appreciated against a background of its earlier history. The manufacture of paper by machinery started in Europe at the beginning of the last century. India also made a comparatively early start in the production of machine-made paper, the first paper machine in India being installed at Serampore, on the River Hooghly, early in the last century by Dr. William Carey, the Baptist Missionary. Paper mills were later established in other parts of the country, but, unfortunately, for many years the trade was not very prosperous. This was possibly due to the industry having to resort to jute waste, old rags and waste paper as raw materials, and, consequently, only cheap and unbleached qualities of paper were made. In the West, in the latter part of the nineteenth century, the use of wood-pulp for the manufacture of paper had been developed, and, due to its suitability and cheapness, alternative competitive raw materials were not easily introduced. Indian grasses (*Moonj* and *Sabai*) were, however, used to an increasing extent for the manufacture of paper in India, but it was not until the practical and economical application of the manufacture of paper from bamboo was established in the present century that the development of the paper industry in India began to make rapid strides.

Process of Manufacture

The manufacture of paper by machinery entails the installation of a very large complicated and expensive plant, as the raw materials are subjected to involved and costly mechanical and chemical processes. Briefly, the process is as follows:

The raw bamboo is first chipped and crushed and is then loaded into large digesters, together with the chemical reagent, where it is boiled under pressure and the cellulose fibres separated from the other material and reduced to pulp. The washed pulp is then bleached, the fibres beaten or teased out and mixed with sizing materials, fillers, colours, etc., and finally passed over a paper making machine, where, in the space of a few minutes, the "stuff," as it is now called, is changed from a milky-looking liquid into a continuous web of paper. After this, the paper web is cut into sheets of various sizes and packed ready for despatch.

The paper industry in this country grew under the shelter of tariff protection for 22 years and also developed under the stimulus of war-time conditions. Protection of the Indian industry was terminated in 1947, but a revenue duty on imported paper still remains. It is hardly necessary to stress the importance of making paper available in sufficient quantities for the spread of literacy and the propagation of knowledge. Although the paper industry in India has developed in respect of the number and size of units, as well as the quantum and variety of production, the total production is still small as compared with the population and educational needs of the country. The *per capita* consumption of paper in India was only 1 lb. in 1939, as compared with 152 lbs. in the U.K. and 174 lbs in the U.S.A. in 1935. The consumption of paper is largest in the U.S.A., where the *per capita* consumption in 1941 was about 300 lbs.

Trend of Production

During the war, the peak year for production of paper in India was 1944, when the total output was 103,783 tons. After that year, however, although the rated capacity had increased, the production of most of the Indian paper mills declined for various reasons, with the result that the actual *output for several years was only* about 80 per cent. of rated capacity, and the effective production not more than about 90,000 tons per year. The causes of the decrease in production can be traced to shortages of raw materials due to railway transport difficulties accentuated by the Partition, shortages of chemicals, coal, etc., and labour unrest. Fortunately, from 1949 onwards, although some of these difficulties have remained, established *mills have been able to produce* tonnage nearer to their rated capacities, and new units have also come into operation. Production has increased and, during 1952-53, an annual production figure of 137,045 tons was reached. The industry continues to expand.

During the war years, expansion and renovation programmes of the Indian mills had to be held in abeyance, but, immediately upon the cessation of hostilities, development programmes were resumed. Several new machines and ancillary plant have

By A Correspondent

already been installed and are in production.

In addition to the development in respect of the quantity of paper which India can produce, there has also been a wide expansion in the range of qualities of paper which can now be made in this country. Twenty-five to thirty years ago, only the cheapest grades of paper were produced in India, but now, with improved technique, additional machinery, etc., there are few qualities of paper which India is unable to make from indigenous raw materials. So far, only newsprint has not been manufactured on a commercial scale in India, but the installation of the machinery of India's first newsprint mill is already proceeding, and the promotors of this enterprise hope to start production of this quality of paper, using Indian woods as their raw material, at no far distant date. Arrangements for the manufacture of other qualities of paper hitherto not manufactured in India *have also been introduced* by other paper manufacturing concerns.

Requirements of India

It is difficult to assess exactly the present requirements of paper in India, as the demand continues to increase and the policy of the Government regarding education alone will call for further heavy requirements of paper. The consumption of paper in India will undoubtedly continue to increase as education programmes develop and the public require more reading matter. There is now a better equilibrium between supply and demand, but considerable tonnage of paper is still being imported from overseas. It is, however, to the interest of India to develop its own industry, and it is possible for India to be self-supporting and even an exporting country as regards paper, if the programme of development is handled in the right way.

The Government of India Panel on Paper, set up during 1944-45, arrived at the following production and consumption targets:—

	1951 Tons	1956 Tons
Consumption target	2,20,000	3,22,000
Production target	1,69,000	3,12,000

The Planning Commission, which examined the question, affirmed that, although the country has since been partitioned, the above targets fixed by the Government Panel might be considered as still holding good, education activities having increased since independence. The demand in 1951 did not, however, reach the high figure estimated by the Panel, but it was thought that, from the present tempo, this demand might be reached by 1953.

Raw Materials

In regard to raw materials, there is an adequate supply of bamboo in India, but it is most necessary to ensure that the forest wealth of the country is properly conserved. Bamboo has a prolific growth and, with discriminate felling, bamboo areas can be operated so as to give not only a satisfactory yield for present requirements, but also ensure adequate supplies for the future. For this reason, the Government of India Forest Research Institute has devised silvicultural rules for the working of bamboo areas, so that the valuable resources of the bamboo forests are not dissipated. Per contra, a policy of short-term contracts may easily result in complete denudation of areas near railheads and leave areas further away, with consequent more expensive extraction, undeveloped. This short-term policy must be avoided at all costs, as it will result in diminishing and more expensive supplies of paper-making raw materials, and India will find itself no longer able to compete in the world market in the economical production of pulp and paper.

To summarise, therefore, India's forest resources are sufficient for the purpose of building up a paper mill industry adequate for her needs. It is very necessary, however, that the eagerness of States to start new mills without sufficient regard to raw material resources should be curbed, and the programme of development co-ordinated by the Central Government, so that each mill has allotted to it sufficient resources to ensure its future. It follows that, in order to prevent the dissipation of these forest resources, leases should be given only to contractors, be they private contractors or mills, who are in a position to give adequate guarantees for properly utilising and conserving the forests. In addition, it is imperative that the transport system should be developed to enable it to carry the raw materials to the mills without the struggle which frequently goes on between the manufacturers, on the one side, and the railways on the other. The location of new units should be so arranged as not to outstrip the capacity of the railways to carry raw materials. The importance of this will be appreciated when it is realised that over eight tons of raw materials, coal, chemicals, etc., are required in the production of one ton of paper. For maintenance of production, which is so essential not only to meet the requirements of the country, but also to combat inflation, first attention must be given to feeding the existing units with their requirements so that they may produce up to their fullest capacity.—*All Rights Reserved.*

OUTLOOK FOR PAPER

"Paper being the handmaiden of the great range of industry and domestic life, the real consumption fluctuates mainly with the general trade activity and has little elasticity of its own. Recent experience, however, has shown that the demand on mills and merchants is rendered more fluctuating by the very fact that paper is, in larger measure, a minor but essential adjunct in the manufacture and distribution of so wide a range of goods. . . . On the long-term trend on the industry we can, I feel, look with hopefulness. Within a general economy which continues to progress, there is every reason to expect that the demand for paper will not cease to grow and its uses to extend, and with this the variety and efficiency of the industry's products. It is, therefore, my opinion that the paper and board making industry can look forward with confidence to the future."—WILLIAM WHITELEY, President, *British Paper and Board Makers' Association.*

Life Insurance is not a fair-weather friend, but a friend in need. It is a protection against the rainy day —a safe and sure coverage for future eventualities. It guarantees security to those who avail themselves of its benefits. And you can as well enjoy these benefits by placing YOUR INSURANCE with the HINDUSTHAN which is your own Company. It has a tradition of 46 years' dependable service to the nation.

REHABILITATION OF TEXTILE INDUSTRY

MAGNITUDE OF THE PROBLEM AND SOLUTIONS FOR IT STATED

THE phenomenal increase this year in cloth output by the cotton mills of India is apt to induce a feeling of complacency about the condition of their productive equipment. It is not readily realised that, in responding to the call for higher production, the industry is exerting greater pressure on its machinery which, in most units, is hardly in a condition to withstand such strain indefinitely. The fact is that the industry has had few opportunities for discarding its worn out and outmoded equipment, 90 per cent. of which, according to one reliable estimate, is at least twenty-five years old.

A series of adverse circumstances has prevented the industry from undertaking the programme of plant renovation on a large scale. Before the last war, the home market was dominated by imported textiles, leaving little scope for the indigenous industry to make profits sufficient to meet the cost of rehabilitation. As the Special Tariff Board reported in 1936, many mills in the country were forced to work 120 to 126 hours a week in three shifts of seven hours each in order to "reduce working costs so as to enable them to compete not only against foreign imports, but also against the products of longer established Indian concerns whose large accumulations of depreciation and reserve funds place them in a more favourable position." It was pointed out to the Board that, in spite of these strenuous efforts, quite a large section of the industry could not earn sufficient profits to cover the depreciation allowances to which the mills were entitled and the large amounts required for interest on borrowed money.

Opportunity Neutralised by High Cost

It is true that the last war brought about a considerable change in favour of the industry. Even units, whose viability had been seriously jeopardised by the depression of the 1930's, were able to shake off their infirmities and achieve a reasonable degree of financial stability. But these favourable conditions did not materially assist the industry in eliminating the arrears of rehabilitation which would certainly have been possible if machinery values had remained at a reasonable level. The abnormal rise in the prices of capital equipment has prevented most of the marginal units from renovating their worn out machinery. The cotton mill industry of India has not been built up on the basis of ploughed-back profits and does not, therefore, command sufficient reserves for purposes of rehabilitation.

In attempting to focus attention on the gravity of this problem, I can do no better than quote a few authorities on the subject. In its second annual report, the Industrial Finance Corporation observes thus: "during the war years, the machinery and plant of the textile mills were put to intensive use, and renewals and replacements could not be carried out on an adequate scale, partly as a result of restrictions imposed on imports and the diversion of the productive capacity of the supplying countries to war purposes. Since the cessation of hostilities, the supply of new machinery has not been adequate to meet the demand, and, while the prices are approximately three times pre-war or higher, deliveries are extended over long periods. Generally speaking, very few textile mills have adequate reserves or resources to pay for new equipment at present prices to replace their old machinery."

The Planning Commission is of the opinion that there are 150 'uneconomic' units in the industry, which require assistance in order to attain viability. The Commission rightly holds that the emphasis of industrial policy should be "on increasing the efficiency of existing plants by renovation and modernisation and by securing a better balance in the plants." The Working Party for the Cotton Textile Industry also recognises in its report, released this year, that there has been a back-log in the rehabilitation of the mill equipment and that "it is not possible at this stage to get new capital invested in the industry for the purpose of renovation and rehabilitation." The Working Party, however, strongly urges that "it is in the interest of the consumer, in the interest of the general economy of the country and in the interest of the large labour population engaged in the industry, that proper rehabilitation, renovation and replacement of these old and deteriorated plant and machinery should be undertaken."

By A Correspondent

It is evident from these authoritative pronouncements that, while the problem or rehabilitation is serious, the industry has no adequate means for grappling with it. There are no precise data to indicate how much money is required for purposes of rehabilitation but an approximate appraisal of the industry's needs has been attempted by the Industrial Courts in the cities of Bombay and Ahmedabad whose cotton mills account for nearly 55 per cent. of the total installed capacity of the industry. According to these Courts, cotton mills in Bombay City alone would require Rs. 72 crores for plant renewal and modernisation. Their findings in regard to the Ahmedabad mills put the figure at Rs. 55 crores. It is, however, not possible to accept these estimates as final, since they are made on the basis of the original cost of plant and machinery raised by 2.7 times only. In fact, in terms of present costs, mills in Bombay City alone are estimated to require Rs. 120 crores, while the resources at their disposal are most inadequate. It may not be far-fetched to say that the total modernisation cost of the industry as a whole would amount approximately to Rs. 360 crores, a staggering sum indeed!

Magnitude of the Problem

It is true that the Government is alive both to the seriousness and the magnitude of the problem but, in terms of tax concessions, its attitude towards the industry has been none too generous. Apart from the fact that the depreciation allowance permitted to it is based on historic or original costs of the machinery and not on the actual replacement costs, even this inadequate benefit can accrue to mills only when they make profits. Mill companies that have been able to build up sufficient reserves may have no reason to regard the present rate of depreciation allowance as inadequate, but the number of such fortunate mills is very small. It is the marginal units, and they are in preponderant numbers in the industry, which require assistance.

Many suggestions have been put forward for hastening the re-equipment of the industry's productive capacity. For example, it is urged that the present depreciation allowance should be calculated on the actual cost of renewal and replacement. This procedure is followed in France where the balance-sheet values of fixed assets are written up as a means of relating depreciation to current replacement costs. It is also suggested that the burden of taxation on undistributed profits should be substantially lightened, subject to effective safeguards to ensure that such profits are utilised for the specific purpose of machinery rehabilitation. It is further pointed out that investment of more moneys in the industry is seriously retarded by the heavy incidence of income-tax and super-tax on personal incomes. According to this view, tax relief would facilitate the flow of more capital into the industry and thus assist in solving the problem of rehabilitation.

It is unfortunate that official reactions to these suggestions have been most unhelpful. This was made clear some months ago when the Finance Minister declared in Parliament that the "necessity of prompt and immediate relief" to the industry was not apparent to him. It is true that the Taxation Enquiry Commission will examine this question, but its findings and the Government's decisions on them may not become available for at least a couple of years. Meanwhile, the marginal units in the industry have to struggle as best they can to remain in production without any expectation of early relief. Surely, such a policy towards the nation's premier industry cannot be held as enlightened, especially when Governments in other textile producing countries are doing everything in their power to help their industries in achieving greater efficiency and economy of production. In England, for example, the programme of machinery modernisation is assisted under the Spinning Industry (Re-equipment) Act of 1948, which provides for the allocation of funds for this purpose from the general revenues.

Machinery Import Policy

Nor is the Government's machinery import policy calculated to speed up the rehabilitation of the industry. It is readily conceded that protection and encouragement should be accorded to the indigenous manufacturers. No sane person would object to the development of a national machinery manufacturing industry, capable of emancipating home customers from dependence on uncertain supplies from abroad, but until such a happy position is reached, it would be short-sighted to prevent the mills from equipping themselves with the most modern plant and machinery. Even in industrially advanced countries, such restrictions on machinery imports as exist in India are unknown.

In the United States of America, which leads the world in industrial progress, there does not appear to be any prohibition on the import of capital goods. To cite a few more examples: France and Italy, themselves important machinery manufacturing countries of long standing, do not impose any ban on imports of textile equipment of a special nature. There is a move in England for the resumption of imports of machinery duty-free, which cannot be secured in the country. It is urged that such duty-free imports would help the national industry " to keep its equipment up to date and keep machinery makers in England on the alert." The need for adopting such a realistic policy in India cannot be gainsaid.

The fact is that, in other countries, the equipment of factories with the most modern and efficient machinery is regarded, not as a luxury, but as a vital need. To take two specific examples, in Japan, the cotton textile industry has taken big strides towards renovating its war-damaged equipment, 65 per cent. of which is now brand new. The industry has also succeeded in installing a large number of automatic looms which are used mostly for producing cloth for export. Since 1947, the average annual expenditure of the American textile industry on new plant and equipment is estimated at 500 million dollars. 40 per cent. of this huge sum of money is stated to be the share of cotton mills which, in terms of Indian money, are spending Rs. 95 crores yearly for the sole purpose of rehabilitation!

When other countries are spending on such a large scale in order to impart the highest possible efficiency to the productive capacity of their industry, we in India are doing next to nothing in that direction, despite the fact that the machinery in most of the mills is in need of replacement. If not for any other consideration, rehabilitation is necessary, at least in order to improve the quality of cloth and to make it available to the consumer at a price in keeping with his low purchasing power. Owing to the prevalence of cost inflation, rehabilitation and rationalisation offer the only means by which the manufacturing costs can be reduced and the benefit of the resultant economy in production passed on to the consumer. Price and quality are thus important factors in stimulating a higher rate of consumption.

Exports

Even from the point of view of broadening the demand for Indian textiles in foreign markets, modernisation of the industry's equipment is vitally necessary. In a steadily shrinking world market, where only the fittest can survive, India cannot possibly wage her battles with enfeebled weapons against competitors who are in a much stronger position. And yet she cannot ignore her export trade, especially in textiles. Indeed, if the industry is to maintain production and employment at current high levels, as it must, every effort must be made to reach the export target of 1,000 million yards per annum. By growing all the cotton she needs for producing coarse and medium cloth, India enjoys some advantage over her Japanese and British competitors in foreign markets, but she is unable to exploit this advantage owing to the high manufacturing costs of the industry, partly brought about by increased labour charges and antiquated machinery. But, with rehabilitation and a more scientific deployment of labour, it should be possible to reduce these costs and thus make Indian cloth acceptable to foreign consumers on a much larger scale.

Rehabilitation thus holds the key to the stability and prosperity of the industry. The problem is, however, too big for the industry to cope with single-handed, especially in a period of falling profits. The Government should, therefore, come to its aid by granting suitable tax reliefs. The fall in its income through such concessions will only be temporary, for, with increased output and consumption, the industry will eventually provide the State Exchequer with bigger revenues than at present.—*All Rights Reserved.*

FACTS ABOUT COTTON INDUSTRY

There are 453 cotton mills in the country. Out of these, 200 are located in Bombay State which holds the pride of place in the industry. There are 65 mills in Bombay City and Island, 74 in Ahmedabad, and 61 in the rest of the State. The State which has the second biggest concentration of mills is Madras, with its 90 units. There are 11,427,034 spindles and 203,786 looms. Over 60 per cent. of them are concentrated in Bombay State, the balance being distributed mostly in the States of Madras, Madhya Pradesh, Uttar Pradesh and Madhya Bharat.

The mills consume nearly 3 million bales of Indian cotton a year, valued at about Rs. 121 crores. Only a small quantity of the entire production, about 200,000 bales, is exported. The industry also consumes about 1 million bales of foreign cotton.

Besides supporting the cultivator and the handloom weaver, the industry engages 743,000 operatives. The cotton mills of Bombay City alone employ about 208,000 workers whose basic wage and dearness allowance amount to over Rs. 27 crores per annum besides bonus, provident fund, health insurance, leave with wages and paid festival holidays.

VANASPATI INDUSTRY AND THE FIVE-YEAR PLAN

PRODUCTION WELL BELOW INSTALLED CAPACITY

THE *vanaspati* or hydrogenated vegetable oil industry, is the second largest food processing industry in India—second only to the sugar industry. It is the largest of its kind in Asia and the fourth largest in the world. Nearly Rs. 25 crores have been invested in this industry. It provides employment to 15,000 people directly and about 60,000 persons indirectly. In addition, there are over 50,000 dealers selling *vanaspati* throughout the land. It is, therefore, natural that the industry should find a place among the 42 industries selected by the Planning Commission for further development during the first Five-year Plan and among the 45 industries controlled by the Union Government under the Industries (Development and Regulation) Act.

In the Five-year Plan, the Planning Commission has recommended increase in the production of *vanaspati* from 171,000 tons in 1951 to 300,000 tons by 1956. From the table given below, it will be observed that the industry has the requisite productive capacity to achieve the target, but the production of *vanaspati* has not been increasing at the necessary rate for lack of demand. However, before examining the factors impeding the increase in *vanaspati* output, it would be appropriate to consider the importance of the industry to our national economy and its post-war development, in order to obtain a proper perspective of the industry's problems.

Year	No. of factories	Production capacity Tons	Actual production Tons
1945	21	193,960	132,627
1946	22	149,960	142,049
1947	24	249,360	97,189
1948	26	298,960	127,664
1949	41	301,960	154,923
1950	46	339,360	171,425
1951	46	339,360	171,351
1952	44	334,960	190,723
1953 (10 months) ..	44	334,960	149,000*

* Estimated.

Vanaspati is only vegetable oil in a more palatable form. The oil is refined to remove unsaponifiable matter, odour and colour and hydrogen is added to its molecules to give a consistent (non-fluid) form. The *vanaspati* industry, therefore, does not add to the total fat resources of the country. But it helps to secure an optimum use of the available resources as explained below.

Importance of Taste

Food to do maximum good to a human body must not only be nutritious but also palatable. Hence taste is an important consideration in the use of oils in our diet. In India, there are strong regional preferences in this matter. People in the south-west prefer coconut oil, in the east and north-east mustard oil and in Maharashtra kardi oil. Ghee and til oil alone are generally acceptable over most parts of the country. These regional preferences seriously hinder rational use of our oil resources. To illustrate, although India has been the largest producer of groundnut in the world for many decades, groundnut oil, a first class edible oil, was not very popular before World War II and a large portion of the groundnut crop was exported. With the increasing popularity of *vanaspati*, largely made from groundnut oil, the oil has now a large domestic market. This development has given considerable impetus to the oil crushing industry, which, besides providing employment, helps to retain valuable oilcake for cattle feed and manuring.

Again, India produces about 1 million tons of cottonseed, containing 14 to 22 per cent. of good edible oil. At present, cottonseed is fed to cattle and its oil is wasted, since cattle do not require that much oil. At present, only about 5,000 tons of cottonseed oil is produced. But, if the cottonseed crushing industry is fully developed, nearly 100,000 tons of oil will be added to our limited edible fat resources. Cottonseed oil in crude form has a dark colour and an unpleasant smell, but refining eliminates these features and makes it fully edible. The *vanaspati* industry, therefore, provides a ready market for cottonseed oil and, in the form of *vanaspati*, it would be easier to overcome the popular misconception that cottonseed oil is inedible. Thus, the *vanaspati* industry helps overcome regional barriers of prejudices in the use of edible oils and promotes rationalisation of the country's fat resources.

The labelling regulations requiring mention of every oil used in the manufacture of *vanaspati* on the containers impedes, to some extent, the ability of the industry to promote

By Dr. A. C. Chhatrapati

rationalisation of the fat resources. For the difficulty of changing labels with every change in the oils used, of showing more than two or three oils in the required size of letters on small containers and the danger of development of consumer resistance if unfamiliar oils are shown, restrain the manufacturer from selecting edible oils according to their availability and price. Since the industry can use only oils approved by the Vegetable Oil Products Controller for India, it should be sufficient if the labels show that the product is made *from* vegetable oils *only*. This would ensure flexibility in the selection of oils and the supply of *vanaspati* at the cheapest possible price to the consumer.

Inadequate Supply

Although India is the third largest producer of oilseeds in the world, the available edible fat resources are very inadequate to provide even the minimum fat requirement of the people. The average *per capita* consumption of fat is only about ½ oz. daily, against the minimum nutritional requirement of 2 ozs. As fat provides twice as many calories as the same amount of carbohydrates, which cereals are, from the nutritional point of view, it would be better to devote all the additional land available for groundnuts, instead of grains and increase the fat consumption. Groundnut being a leguminous crop will help to enrich the soil and groundnut oilcake can provide protein for human beings as well as cattle. According to the Five-year Plan, however, all the additional land is to be devoted to foodgrains and the production of oilseeds should be increased by improved methods of cultivation only. The increase contemplated is only 400,000 tons which would be just sufficient to maintain the existing level of consumption at the current rate of increase in population. Hence the only way to increase fat consumption within the present scope of the Plan is improved utilisation of the available resources and the *vanaspati* industry can play an important part in this.

Vanaspati was first introduced into India after World War I by imports from Europe. Being similar to ghee, it rapidly became popular and, by 1928, about 23,000 tons were imported. The first *vanaspati* factory was established in 1930 and the levy of an import duty gave impetus to the growth of the industry. In 1939, there were eight factories, with a total capacity of 88,000 tons and actual production of 52,000 tons. During the last war, the demand for *vanaspati* by the defence services, as well as the civilian population increased very rapidly. Consequently, the number of factories continued to increase despite war-time difficulties of procuring machinery and construction materials. In 1945, there were 21 factories producing 132,600 tons of *vanaspati*.

More Factories Started

In the post-war period, Government decided to regulate the expansion and the location of the industry in accordance with its development plans through a system of licences. Licences were issued for the establishment of 59 factories with a total productive capacity of about 400,000 tons, as it was estimated that, by 1950, the demand for *vanaspati* would be 400,000 tons, including 50,000 tons for export. The war-time prosperity of the Industry attracted sufficient capital for the expansion of the industry. At present, 48 factories, with an annual productive capacity of 335,000 tons, are in existence and 11 more are under construction which, when completed, will increase the production capacity to 390,000 tons approximately. It is, however, doubtful whether all the factories under construction will be completed, because the demand for *vanaspati* has failed to increase at the expected rate and even the existing factories operate at about 50 per cent. of the capacity as evident from the table given above.

Reasons for Poor Growth

The following major influences account for the failure of the output of *vanaspati* to increase at the rate anticipated in the post-war plans:

(1) The unfortunate publicity given to an incomplete experiment on the nutritive value of *vanaspati* in 1947 and the subsequent political agitation against the industry created considerable prejudice against the product and hampered increase in its demand. As the Prime Minister, Mr. Jawaharlal Nehru, pointed out in June 1952, nearly three-fourths of the world is consuming *vanaspati* or its like and nobody has suffered from it. The eminent scientists of the country have, after extensive research, confirmed that *vanaspati* is wholesome. With the compulsory addition of synthetic vitamin A from 1st December, 1953, *vanaspati* is nutritionally as good as ghee. The Industry has, however, still to contend with the misconceptions created by the ill-informed criticism of *vanaspati* in the past and a long educational programme is necessary to eradicate them, in order to pave the way for a larger *vanaspati* market.

(2) High oil prices have limited the demand of *vanaspati* in two ways. First, the high cost of *vanaspati*, owing to the high cost of groundnut oil, has compelled people to continue to use cheaper oils as a cooking medium. Secondly, the high cost of *vanaspati* prevented development of an export market. Only 2,600 tons of *vanaspati* were exported in 1952, as against the original target of 50,000 tons.

(3) The partition of the country and the subsequent political tension between India and Pakistan resulted in the loss of a valuable market for *vanaspati*, as in West Pakistan, consistent ghee-like fats are popular.

(4) During the immediate post-war period, the shortage of essential raw materials like coal, chemicals and tinplate impeded production, e.g., until 1952, the industry was allotted only 40 per cent. of its tinplate requirement, calculated on the basis of actual production of *vanaspati*.

(5) The *vanaspati* industry has also been afflicted with transport difficulties in the same way as other industries. To move oil from upcountry oil mills, tank wagons are the most economical mode of transport. But the number of tank wagons available for vegetable oil traffic on the entire railway system is grossly inadequate. Consequently, the bulk of oil has to be transported in containers in ordinary wagons, involving higher cost by way of freight on containers both ways, depreciation on drums and loss of oil through leakage in transit. The supply of ordinary wagons, too, is insufficient to move both oil and empty containers. The position in the busy season is particularly difficult.

The transport of *vanaspati* is frequently held up for want of wagons and there have been many instances when factories had to curtail production due to accumulation of stocks.

(6) The enforcement of price control on *vanaspati* often led to reduction in output. This is not to criticise the control as such, but the manner in which it was enforced. Normally, the cost of oil accounts for nearly 75 per cent. of the cost of *vanaspati*. Hence in the absence of a control on oil prices, it was necessary to adjust *vanaspati* prices according to changes in oil prices. These adjustments lagged behind, especially when oil prices were rising rapidly. In the circumstances, the manufacturer had no choice but to curtail output. The decline in *vanaspati* output in 1947 and 1948 was largely due to this reason.

Price Control Removed

Since June, 1952, the control on the price of *vanaspati* has been removed and the supply of raw materials has also improved, though transport still remains a difficult problem. The industry is now confronted by another problem with regard to the supply of its principal raw material, namely, vegetable oils. In the last two years, the oil prices have been fluctuating very sharply which seriously hampers continuous production of *vanaspati* at an even rate. In a rising oil market, the price of *vanaspati* cannot keep pace with oil prices, as the industry, with a large idle capacity, is extremely competitive. On the other hand, in a falling market, the manufacturers have to bear heavy losses on their stock of *vanaspati*, as the price of *vanaspati* tends to fall simultaneously with the price of oil. To minimise losses on a falling market the production is naturally curtailed. It is the anticipation of decline in oil prices which has seriously curtailed the production of *vanaspati* in the second half of this year. The total production of *vanaspati* during 1953 will be less than that in 1952 largely on this account. No doubt, the scarcity of groundnut oil has also contributed to the decline in *vanaspati* output in 1953.

Heavy and Discriminatory Taxes

In the final analysis, the demand for *vanaspati* as a cooking medium depends on its price relative to that of other fats. Since *vanaspati* is made from vegetable oils with which it must also compete, the difference in their prices should not be such as to more than outweigh the advantages offered by *vanaspati* in keeping quality, nutritive value (with the presence of vitamins) and transportation (less leakage due to consistent form). The processing cost is only about 15 per cent of the cost of *vanaspati*. But the price of *vanaspati* to the consumer is considerably enhanced by the imposition of heavy and sometimes discriminatory taxes on *vanaspati*. The Union Government levies an excise duty of 1 anna per pound and the incidence of sales tax on *vanaspati* varies from 6 pies to nearly 15 pies in the various States. In addition, some local authorities, misguided by prejudices, impose discriminatory and penal octroi at the highest possible rate. The total incidence of commodity taxes in some places amounts to as high as 20 per cent. of the price of *vanaspati*. This substantially widens the difference in the prices of *vanaspati* and oils and restricts consumption of fat in the form of *vanaspati*. It is to be hoped that the Taxation Enquiry Commission will give due consideration to the effect of the unco-ordinated levy of commodity taxes by various Governments on the progress of industries such as the *vanaspati* industry as envisaged in the Plan.—*All Rights Reserved.*

FUTURE OF INDIAN JUTE INDUSTRY

MODERATE PROSPERITY, PROVIDED REALISTIC POLICIES ADOPTED

AS the export of jute goods is one of the biggest items in our exports, the fate of the jute industry of India has a special significance for our international trade position. The Planning Commission has set before the country a production target of at least five million bales of raw jute per year and an export target of one million tons of jute manufactures per annum, both to be reached by 1955-56.

Recent developments in the field of jute is causing some anxiety to the Government. A Jute Enquiry Commission has been appointed. It has prepared a very comprehensive *questionnaire*. I do not propose anticipating its recommendations in this article. I simply propose to discuss the future of this industry from the shareholders' point of view, because, to-day in India, there are a large number of people, especially of the middle classes, who are interested in the fortunes of this industry as shareholders. They are not concerned with targets or international balance-sheets. What they are concerned with is, what is going to happen to their investments and whether they will get an adequate return on the capital invested by them. In the last few years, the erratic state of affairs which has prevailed in this industry, is naturally giving some cause for anxiety to those whose money is sunk in this industry.

In the early decades of this century, especially before, during and after the First World War, this industry prospered to such an extent that an investment in good jute shares was considered the wisest thing to do. The shareholders not only earned handsome dividends but their investments progressively appreciated in value. I remember the time when, in many *Marwari* families, jute shares were considered as heirlooms and were not to be disposed of, unless the holders were in great distress. The late Seth Baldeodass Doodwala, who, at one time, was one of the biggest operators in jute shares on the Calcutta Stock Exchange, used to say that it was a marvel to him as to why shares of jute mills were available, and why shares of banking companies were saleable. His argument was that there was no limit to the earning capacity of jute mills, while the earning capacity of banking companies was limited. In those days, even at current prices, jute shares paid dividends at a rate which, in many cases, was more than double the rate at which interest was charged by banks on loans against jute shares.

Complete Change

Unfortunately, there has been an almost complete change in this state of affairs. Instead of being steady dividend-paying concerns, the fortunes of the Indian jute industry are subject to violent fluctuations. There is a wide difference in the state of the balance-sheets of individual jute mills. Whilst one makes a large profit, another loses heavily. The same mill sometimes makes a good showing in one half-year, while its results are disastrous in the second.

Naturally, all those who are interested in this important industry as shareholders, would like to know the reasons for the change that has taken place, and the future prospects for this industry as a whole.

I have been closely connected with the jute goods trade for more than 25 years and, after studying the present conditions and the attitude of those responsible for managing its affairs, I am led to the irresistible conclusion that, unless all concerned show a realistic attitude, and grapple with the situation in the right manner, instead of tinkering with the problem by adopting palliatives, the jute industry of India is likely to become a headache to all concerned.

On the eve of the Partition, I wrote to an American friend that the division of the country into two, India and Pakistan, was an event of the greatest importance to the jute industry of India. I quoted the Indian saying, "If there are two rival gods, I will never die and if there are two rival magistrates, I will never be punished."

Due to the fact that, whilst the entire manufacturing industry was located in India, the production of jute was done in Pakistan to the extent of 85 per cent. of the total crop, I expected that Pakistan would try to become independent of India, so far as the sale of raw jute was concerned, by trying to sell to countries other than India, and would also try to develop its own jute manufacturing industry. India, on the other hand, was bound to protect its interests by trying to grow all the jute that it required within the borders of this country.

By H. P. Bagaria

Director, East India Jute and Hessian Exchange Ltd. and Market Adviser to Messrs. Stein Hall & Co. of New York

This is exactly what is happening now. Rome was not built in a day. But, at the same time, the Roman Empire did not disappear also in one day. It takes years for certain markets to develop and to disappear. But, as time goes, the jute industry of India is bound to find the going more and more difficult.

Before the advent of Indians into the field of the jute manufacturing industry, the Scotchmen of Clive Street had sedulously fostered the idea that the running of a jute mill required technical skill of a very high order and that only Scotchmen from Dundee could successfully manage a jute mill. The *Marwari* business men of Calcutta were content with being brokers and dealers in jute and jute goods, while the Indian business men in Bombay were busy with the cotton industry. The myth of only Scotchmen being able to run a jute mill, exploded with the entry of Indian business men like Birlas and the late Seth Mafatlal in the field of jute manufacturing. The writer once had occasion to talk to the late Seth Mafatlal. He observed that the running of a jute mill was easier than even managing the waste department of a cotton mill.

Nature's Contribution

The real reasons why the jute industry prospered from its very inception upto a few years back are to be found in the peculiar circumstances in which this industry was placed by nature. Due to certain climatic conditions which prevailed only in Bengal, the production of raw jute was confined mainly to Bengal and, to a very small extent, to the adjoining Provinces of Assam and Bihar.

As the cultivators were economically weak, due to the superior organisation of the manufacturing jute industry, the jute mills could always count upon getting all the raw jute that they required at prices which left to them, on an average, a handsome manufacturing profit. Besides this, the jute industry of Calcutta confined its activities to the manufacture of certain types of jute goods which were not manufactured by any other country. Being thus in the position of almost the sole suppliers of certain kinds of goods which the whole world required, the jute industry in India was able to maintain profitable trading conditions through the device of working agreements whereby production was kept within the limits of world demand.

The jute industry had another advantage, inasmuch as it developed in Calcutta an outlet for its production which was collectively known as the Bazar. It consisted of a large number of dealers, who were at all times prepared to buy any amount of goods for ready or forward deliveries. Thus, the jute industry had not to wait for the disposal of its production till the foreign consumers required them for actual use.

Effects of the Partition

The creation of Pakistan has brought about a complete change in this situation. For a fuller study of this question, I would recommend to the readers a series of articles that I wrote some months back in *Indian Finance*. In short, the position now is that the jute industry can no longer claim that it is a monopoly industry. Pakistan is making strenuous efforts to induce other countries to expand the production of jute goods by assuring them ample supplies of raw jute. Besides, it is itself putting up a number of jute mills. Some are already in production and it is expected that, by the end of 1955, not only the entire internal demand of Pakistan will be supplied by its own jute mills, but there will be a surplus sufficient to export appreciable quantities of jute goods to other parts of the world as well.

The jute industry of India, to-day, cannot be sure of getting all the raw jute that it requires at comparatively cheap prices. Being no longer the sole suppliers of jute goods, this industry can no longer safely afford to continue to resort to the expedient of regulating its production to keep up prices by closing down a certain number of looms or by reducing the working hours. By continuing to do so, they will be giving a great advantage to their foreign competitors. The unique advantage of securing its profits by making simultaneous purchases of jute and sales of goods for forward deliveries is also no longer available due to the disappearance of the large body of dealers who avidly bought all that the mills wanted to sell.

No Proper Appreciation Yet

Unfortunately, up to now, there does not seem to be any proper appreciation of the changed circumstances by any of the parties concerned. A policy of *laissez faire* and adopting the line of least resistance seems to be still in vogue. It may be asked whether there is no hope for the jute industry.

After studying all available information on the subject, I think the position is not hopeless. But all concerned have to realise the dangers that threaten this important industry and have to make strenuous efforts to place it on a sound footing. So far as is known, nothing has been done up to now, except that the Government of India, by stages, have reduced the heavy export duties that were levied immediately after devaluation and after the start of the Korean trouble. The reduction of export duties is a step in the right direction. But the Government of India would be well advised to remove the export duties altogether. I do not know what justification there is for retaining even the present rate of export duties. Because either the jute industry is a monopoly industry or it is not. The present export duty acts as a sort of subsidy to foreign competitors of Calcutta. Besides, reduction by stages leads to agitation for further reduction which in turn makes the buyers adopt a waiting policy. According to the terms of the contract on which all sales of jute goods are made to foreign buyers, all changes in the export tax are on account of the buyers. The importers in foreign countries are irritated by finding the value of their holdings depreciating all of a sudden. But it has to be realised that as an Indian proverb says, "You cannot reduce the load of the dead body by shaving of a few hairs here and there," even assuming that the entire export duty is removed, the jute industry of India is likely to be faced with competition as time goes on and will have seriously to tackle that problem.

Ever since the jute industry was started, it was never threatened with any competition. Lack of competition breeds inefficiency. Up to now, the jute industry of India has been the most easily managed industry in the world. The question of relative costs of production or the question of a high degree of salesmanship did not trouble the owners of the industry.

Industry Must Look Ahead

This industry, if it is to survive, can no longer afford to ignore these questions. It cannot go on adopting a policy of complacency and those in charge of it should not look at these questions from the short-term point of view. If they go on doing so, the Indian jute industry will find itself sooner or later reduced to a position of minority, instead of being a Colossus in the realm of the jute goods market.

It may be considered presumptuous on my part to offer any advice to the jute mill industrialists, because I have no jute mill of my own. But I think they should seriously consider ways and means of placing this industry in a position of advantage as compared with its potential rivals. When I was in the U.S.A., I was told that the big industrial concerns in that country not only kept an accurate account of their own costs of production but kept themselves very well informed about the cost of production of their rivals.

Three Big Problems

In my opinion, the three big problems that face the jute manufacturing industry of India are:

1. The problem of not allowing Pakistan to have a stranglehold on the jute industry by having to depend for supplies of raw jute on that country.
2. Bringing down the cost of production to as low a figure as is humanly possible.
3. Developing a high degree of salesmanship.

I have no hesitation in admitting straightaway that the tackling of these problems is not so easy as it looks. Take the case of raw jute. There is no doubt about the fact that the Government of India are sincere in their desire to increase the production of raw jute in this country. During the last four seasons, there has been a tremendous increase in the quantity of jute produced in India. But it is my belief that this has been due almost entirely to the high prices realised for raw jute in the last few seasons. As the prices realised for the 1952-53 crop were comparatively lower than the previous three or four seasons, the 1953-54 crop is believed to be considerably smaller than the previous crop. This means that the production of raw jute in India can be kept at a high level only if the price of raw jute is kept at a high level. That in turn increases the cost of jute manufactures which means less demand.

Supply of Raw Material

This is a very difficult problem for the Government of India to tackle. In the past, the cultivators in undivided Bengal grew all the jute that the jute industry of the world required, because, as compared with other crops, jute paid them better. If the cultivators in India are to keep up the production of raw jute at a high level, they will do so only if they get a *comparatively* better price. I lay stress on the words "comparatively better," because the comparative price varies from time to time. It is a very serious problem and the Government of India would be well advised to appoint a small committee, consisting of some eminent economists, preferably one who has served on the Tariff Board, and some experienced businessmen with no axe to grind.

As regards the cost of production, in the last few years there has been a tremendous rise in all directions. In fact, the entire conception of values has changed. There has been a big increase in the emoluments paid to managers and managing agents and wages paid to labour. It is no use one section trying to make someone else sacrifice. The question has to be studied from the long-term interests of all concerned. To increase the cost of production at a time when the industry is threatened with competition, may prove fatal for the industry.

Rationalise Production

I think a great saving can be made if the production of jute goods is put on a rational basis. At present, the mills are keeping 12½ per cent. of their looms sealed and they work at the rate of only 42½ hours per week. If the mills in other parts of the world have not to keep a single loom idle and if they can work double shift or even triple shift, as some of the mills in Pakistan will be working, certainly their cost of production will be much lower than ours. The jute industry has seriously to consider the question of removing all restrictions on production and let the principle "survival of the fittest" work to its inexorable conclusion. Or it has to study the question of getting the present production on a portion of the total machinery now employed for the same purpose and put the machinery that will be released from the production of jute goods to some other productive use. This again has to be studied from all aspects by economic and business experts. It is not possible for a layman like me to pronounce an offhand judgment on this important question. But, if the jute industry wants to be in the race, it has to lighten the load that it is carrying; otherwise there is no hope of its being able to stay.

The jute industry upto now did not find it necessary to study the world markets, the needs and requirements of its consumers and ways and means to increase the use of jute goods. Being faced with the prospect of competition, the Indian jute industry has to give more attention to the requirements of the buyers. Only a year back, I found in New York half a dozen Japanese representing the Japanese jute industry. The latter is a tiny thing as compared with the size of the Indian jute industry. But the Japanese technicians were busy studying the requirements of the American buyers.

Sales Promotion

I was given to understand by some American buyers that, if the jute industry cared to manufacture certain special weights and constructions, they could use a few thousand bales of these per month. Unfortunately, I have received no positive response to my enquiries. The jute industry can no longer be content with delivering its goods to buyers in Calcutta and then forget about them. The industry has to set up a special organisation for sales promotion in all parts of the world.

The greatest good fortune of India is that we have in this country a large number of talented officers, public men and efficient business men. In the jute industry itself, especially in the Indian section, there is no dearth of talent. All that is necessary is a little more thought to the future, a changed angle of vision, and complete and sincere co-operation between the Government of the country and those who are placed to-day at the helm of affairs of this important industry.

From all that I have written above, it will be seen that the prospects for the shareholders in this important industry are not bright. They cannot expect any steady payment of dividends or any appreciable improvement in the value of their holdings. If things are tackled in the right manner, this industry can maintain a measure of moderate prosperity.

The shareholders should exercise strict vigilance over those whom they pay to look after their interests. Inefficiency and lack of market sense should no longer be tolerated. The proposed changes in the Indian Companies Act give enough power to the shareholders to protect and watch their interests. But they have to do it.—*All Rights Reserved.*

ROT-PROOFING JUTE FABRIC

A process for strengthening the resistance of jute and similar material has been evolved as a result of researches undertaken at the Indian Jute Mills Association Research Institute, Calcutta. Jute and other cellulosic textile materials can be rendered resistant to attack by micro-organism by treating with cuprammonium solution. The cost of the treatment is negligible, and during the last war, over 200 million yards of sandbag hessian was made rot-resistant by means of the cutch-cuprammonium process. The effect of the treatment was thought to increase the service life of the sandbags by five to eight times. Large stocks of the treated bags, left unused, were put to service after the war, but they were found to have markedly deteriorated in tensile and bursting strengths.

Investigations showed that sodium and ammonium sulphate which get precipitated on the fabric during the treatment were mainly responsible for the damage. The process, now developed, eliminates the presence of excess sulphate ion on the fabric. While retaining the rot-proofing efficiency of the older method, it leaves the tensile strength of the fabric unimpaired.

(*Concluded from fourth column*)

the former and join up with the sulphur-dioxide. The two liquids, kerosene and sulphur-dioxide will not mix just like oil and water will not mix, so that, upon standing, they settle out into two layers. These two layers are then separated, whereupon it is found that the quality of kerosene has changed considerably.

Similarly, other petroleum products like diesel oils, diesel fuels are separated, refined and extracted. The crude flows from the storage tanks through the whole process and emerges, via another set of pipes to another tank, as a refined product, ready for use. Delicate instruments record the rates of flow, as well as the processing conditions such as temperature and pressure. Tremendous quantities of material can be handled in this fashion by relatively few men. This plant, with a throughput (i.e., intake and output) of 875,000 imperial gallons per day must, therefore, use up a large part of the refinery space for storage tanks for crude oil and intermediate products as well as those for finished products.

The modern refinery is a symbol of Man's amazing technological and mechanical progress. A mere handful of technicians, relatively speaking, can now move 4,000 tons of petroleum in and out of the Stanvac Bombay Refinery each day. Behind them is decades of research and experience gained the hard way.—*All Rights Reserved.*

OIL REFINING INDUSTRY

MAIN PROCESSES EXPLAINED

THE oil refining industry, perhaps the most highly mechanised of all industries, uses more mechanical horse-power per man than any other manufacturing unit. This fact, perhaps more than any other, is not known to the average layman. Here in India, when the newspapers first flashed the news that the Standard-Vacuum Refining Company of India Ltd. was going to build the nation's first modern oil refinery, a lot of people envisaged a scheme of things to come, bristling with steel structures and maintained by a vast army of men. The truth is rather different. To understand it is to take the reader on a guided tour of the Stanvac Bombay Refinery.

The year is 1954. The place, Trombay. The Stanvac Bombay Refinery has gone "on stream." We motor down from Bombay, through the suburbs and down a broad new thoroughfare to the refinery gates. The first thing that strikes the tourist is the paucity of buildings. Instead, there are a large number of tanks.

By A Correspondent

surrounding some tall vertical and shiny cylinders, like huge bottles standing in a row. Leading to these spheres and cylinders are a complicated maze of roads. Close to the main part of the equipment, which looks surprisingly sparse in the midst of so many tanks, is a big smoke stack, reaching 200 feet into the sky. There is very little seeming activity, not very many people moving about. But the plant is working at full pressure, turning out the petroleum products which India needs. How is this done?

Secret of Tanks

The visitor must first probe the secret of the tanks. These contain the raw crude oil, which is a very complex mixture of many components. In order to derive the various products from the crude, it is first necessary to make a broad separation of the "lighter" and "heavier" materials in the crude petroleum. The material is separated by distillation into several parts, ranging from a pale, thin, water-like substance to a very thick, dark, oil material. The distillation—it is accomplished in the crude pipe still—is a purely physical process accomplished by progressively boiling out the lighter materials. The process is somewhat similar to taking gravel from a river bed and putting it through a series of screens so as to separate it into silt, fine sand, coarse sand and rock.

The material which is lightest in colour looks a great deal like petrol, except that there seems to be something not quite right with it. The colour is off-white, the odour is slightly unpleasant. If an attempt was made to run an automobile on this liquid, there would be no end of trouble. The reason, lack in "octane number." One of the problems of the refinery is to produce gasoline meeting all the necessary specifications. These include volatility to permit easy starting, sufficient octane number to prevent knocking, good odour to prevent customer irritation and no colour. The last indicates other good qualities with reference to corrosiveness and engine deposit factors. In the refinery, these quality points are subsequently treated through a chemical process to remove harmful components and by blending with other products to offset poor quality.

The next product separated from crude petroleum is a great deal like the first, except that it is heavier and has a higher boiling point. Although this material is sufficiently volatile to "fit" into motor spirits, its quality is even lower than the first fraction. This material is ordinarily referred to as reformer naphtha, because it is generally treated by a thermal cracking process known as naphtha reforming.

The term "cracking" requires explanation. But, as a preliminary, it must be understood that any petroleum substance, if exposed to high enough temperatures, begins to decompose, just as sugar does if put out in the sun. Sugar, thus exposed, first turns yellow, then brown, then darker brown and finally begins to produce carbon deposits. Similarly, petroleum products begin to decompose with the formation of gases and carbon. The products resulting from thermal decomposition of petroleum materials are influenced by pressure and it was discovered, several years ago, that the heavy naphtha fraction of crude oil, when partly decomposed by heat, yields a product with a higher octane content than the original crude fraction.

Petroleum technologists now have learned to control, with more certainty, the decomposition of petroleum hydrocarbons. When thermal treatment is used, very little control, is possible over the distribution of products which may be obtained. However, with the advent of what is known as catalytic cracking, a greater control of distribution to gas, gasoline and heavier products, as well as over the quality of these products can be exercised. The Stanvac Bombay Refinery incorporates the very latest commercial development of catalytic cracking in its Model IV Fluid Catalytic Cracking unit. In this equipment, the gas oil is decomposed to produce gas, gasoline and light and heavy cracked gas oils. Operations are carefully controlled so as to minimise the formation of gas, maximise the production of gasoline, and minimise heavier cracked materials. The latter are suitable as low viscosity blending agents for fuel oils. The cracked gasoline has excellent anti-knock properties and is used to blend the reformed naphtha and the straight-run gasoline distilled from crude oil to a finished mixture having highly desirable properties for use as motor spirits.

Before the final blend of gasoline is made, the now cracked gasoline and other cracked products must be put through yet another distillation process, after which it is chemically treated to remove all low quality components.

Another Material

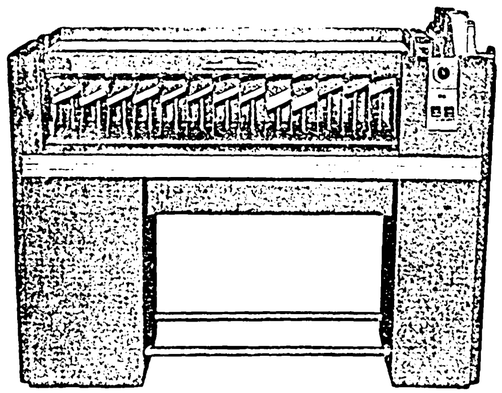
Yet another material which is separated from the crude is dark in colour, heavy and with a high boiling point. This liquid has a slightly oily feel and smells like a poor grade of kerosene. That is exactly what it is. However, as the quality is low, there is a tendency to burn with a smoky flame. Before this can be marketed as illuminating kerosene, its objectionable features have to be removed. This is done in the refinery via a process known as sulphur-dioxide extraction. While the actual processing equipment is exceedingly complicated, because sulphur-dioxide, normally a gas, is used under pressure in the liquid state, in reality, the treatment given to the material is relatively simple. The sulphur-dioxide is used as a solvent to extract all the objectionable compounds. It is rather like washing clothes. A mixture of cloth and dirt is soaked in soapy water in such a manner as to separate the dirt from the cloth. In the kerosene process, the kerosene plus its objectionable features are mixed up with a liquid sulphur-dioxide to cause the latter to leave

(*Continued in second column*)

Is your business "hiding something" from you?

IBM Punched Card accounting can find it... fast!

Modern business operates on data, on facts and figures which must be remembered, facts and figures which must be handy when you need them. Yet every businessman knows how easy it is to misplace important information ... to record it in too many different ledgers, so that it's hard to find and analyse.



IBM offers competent, close control of all data relating to your business

Shown above is the IBM Punched Card Sorter, part of a closely controlled system that records *any kind of data* on IBM Punched Cards. These cards put your business on paper, and keep it there – always at your fingertips.

An IBM installation includes, *on a continuing basis*, equipment maintenance, training and instruction of operators and supervisors – all the things that help you to obtain maximum value from your IBM equipment. Put an end to your accounting and statistical problems with IBM *Electric* Accounting!

Write to IBM World Trade Corporation. Our expert will call on you, and show you the moderate cost of IBM extra efficiency.

SOME VITAL ECONOMIC STATISTICS—(Concluded)

TRANSPORT AND COMMUNICATIONS IN INDIA

Total road mileage (excluding Municipal)	255,459
Of which : Metalled	91,857
Non-metalled	163,602
Waterways	
Approximate main waterways navigable by steamers and large country boats (in miles)	5,144
Shipping	
Total gross registered tonnage	411,333
Of which tonnage on : Coastal trade	236,333
Overseas trade	175,000
Railways	
Total route mileage	34,119
Number of locomotives	8,590
Number of passenger coaches	23,000
Number of wagons	220,500
Capital outlay (in crores of rupees)	861.55
Aviation	
Total unduplicated route mileage on scheduled services (in miles)	26,003
Average number of miles flown on both scheduled and non-scheduled services per month	2,000,000
Average number of passengers flown on both scheduled and non-scheduled services per month	47,333
Average amount of freight carried on scheduled and non-scheduled services per month (in lbs.)	13,000,000
Average amount of mail carried on scheduled and non-scheduled services per month (in lbs.)	730,000
Number of aerodromes owned by the Government of India	186
Number of aerodromes owned by State Governments	105
Number of aerodromes owned by Private Agencies	14
Automobiles	
Total number	308,263
Of which : Motor cars	147,932
Taxicabs	11,749
Buses run on diesel	2,145
Buses run on other fuels	32,225
Goods vehicles run on diesel	1,451
Goods vehicles run on other fuels	81,942
Motor cycles	27,012
Miscellaneous run on diesel	3,504
Miscellaneous run on other fuels	190
Total number of Assembling and Manufacturing Units	12
Of which those having manufacturing programmes	5
Aggregate assembling capacity of the 12 units (in numbers)	84,014
Total number of cars and commercial vehicles assembled per year	14,873
Posts, Telegraphs and Tele-communications	
Number of post offices	42,084
Of which : Rural	36,501
Urban	5,583
Number of telegraph offices including railway and canal offices	8,463
Total number of telegrams sent annually (inland and foreign)	30,000,000
Total number of telephone exchanges	4,594
Total number of telephones	201,813
Total number of wireless stations (excluding those run by defence services)	1,484
Total number of broadcast receiver licences	660,781
Total number of wireless messages sent per year	574,400

OUTLOOK FOR JUTE INDUSTRY

THREE-PRONGED ATTACK NEEDED TO IMPROVE IT

By K. D. Jalan

THE last decade has been a very critical period for the Indian jute mill industry. Its working has been handicapped throughout this decade by one factor or another. At times, it appeared that the constant and cumulative pressure of some of them would lead to its virtual breakdown and ultimately result in its extinction. During the thirties, short-term working was more or less a regular feature. But the difficulties faced by this industry during the war period were characterised by serious shortages of shipping space and of wagons for movement of coal and requisitioning of mill premises. Consequently, in spite of heavy demand, it could not produce and supply jute goods to the extent it would have done with more favourable situation in respect of these factors.

These difficulties remained in force to some extent even during the early years of the post-war period and the controls on prices and exports, coupled with heavy demand for jute goods, irritated the overseas consumers. The continued shortage of jute goods and difficulties in obtaining supplies led the consumers to a more vigorous search for substitute materials and methods than hitherto. The Partition and Indo-Pakistan trade deadlock made things worse and the shortage of raw material thereby caused in India forced the industry to curtail its production by reducing its working hours and/or sealing a portion of the looms. When the situation improved, with the increase in the production of jute in India and solution of the trade deadlock between the two neighbours, the high prices as a result of the high cost of the raw material and the increased export duty in India further widened the gap between the Indian industry and its principal consuming markets. During this period, our competitors made serious inroads into the markets that were hitherto our preserves. The Continental manufacturers could sell at lower prices, owing to the advantages they had in the form of supplies of better quality Pakistani jute at lower cost and the tax element in the prices of Indian jute goods which was altogether absent in their own.

Some markets were lost to the substitutes, mainly paper, and in some cases bulk handling. Return to cheaper prices of jute goods as a result of the drop in the cost of raw jute and the cut in export duty has been hailed by all the consumers and given them a new hope to some extent. While the developments since the last cut in export duty are encouraging, it is yet too early to say to what extent the damage caused to the Indian jute trade can be retrieved. The loss in some cases is so serious that the trends developed thereby will continue to forge ahead and the only way of countering their effects would be to look for new outlets. In any attempt to assess the position of jute goods to-day and forecast their future, it is necessary to review the developments that have recently taken place in our principal markets and affected the offtake of jute goods from India.

U.S.A.

The U.S.A. is by far the largest single importer and consumer of Indian jute goods. Immediately after the war, its consumption of burlap was running at an annual rate of more than 800 million yards, but dropped to 579 million yards in 1951-52.

In spite of increase in economic activity in the U.S.A., the market for jute goods has not expanded; what is worse, the importance of burlap in relation to its substitutes like paper has considerably gone down. India supplied 97.3 per cent. of burlap imported by the U.S.A. in 1946 and 77.2 per cent. in 1953 (upto 30th June). The statistics relating to the total forward purchases as at the end of July and August showed supplies from India at 66 per cent. and 57 per cent., respectively, and from other sources at 34 per cent. and 43 per cent., though the corresponding figures at the end of September were 84 per cent. and 16 per cent., respectively. This indicates the serious loss suffered by the Indian jute manufactures in the U.S.A. market. While a good portion of this market has been lost to substitutes, a further slice of India's share has been taken away by the European jute manufacturers.

Australia and New Zealand

Australia constitutes the most important market in the East. The delegation of the Indian Jute Mills Association that visited this country in the month of April this year found that, while our total trade was still much the same, our sales were not expanding in an expanding market. The insecurity of supplies is the main cause of the losses to substitutes, of which bulk handling is the most serious. For all practical purposes, wheat is now entirely bulk-handled in New South Wales, Victoria and Western Australia and to some extent in South Australia also. The sugar market can well be lost to bulk handling and consumer-packing in course of time. Fertilisers are now packed in paper to the extent of 20 per cent. of the total production.

New Zealand is also an expanding market, but here the paper pulp manufacturing project is the biggest threat. Development of *Phormium tenax* is also likely to affect the market for wool-packs, particularly as the use of sacks manufactured from this fibre is being officially encouraged. A substantial portion of the total production of fertilisers is now either handled in bulk or packed in paper bags. The entire cement market has been lost to paper.

South American Markets

In our South American markets, Argentina is the most important. Here jute goods are used mainly for handling of grains. Recent reports indicate that they have decided to construct grain elevators for bulk handling of grains and avoiding use of sacks. The importance of this market appears to have considerably dwindled. So far during the post-war period, its imports had not reached the pre-war level, though our exports to that country this year are likely to exceed the pre-war level. Brazil has become more or less self-sufficient in her requirements of bagging materials and her raw jute production is constantly going up. It was about 1,000 tons in 1941 and 25,000 tons in 1952. Her plans envisaged a crop of 50,000 tons in 1956. Peru has put up her own jute mill. Cuba is experimenting with *kenaf* and available information indicates that, in course of time, she may be successful in producing sufficient quantities of this fibre and manufacturing sacks to meet her needs. Bulk handling of sugar, which is now being resorted to to an increasing extent, may mean, in the long run, complete extinction of the Cuban sugar market for jute goods.

European Markets

To what extent Europe can be considered a market for Indian jute goods is an important question. The European jute industry has been completely rehabilitated. The high export duty in India on export of jute goods has enabled the European manufacturers to make handsome profits even after underquoting India and thereby helped them to modernise a major part of their equipment. The result is reduction in their working costs and increase in their productive capacity. They have presented a formidable competition for India in markets like the U.S.A., where practically 20 per cent. to 25 per cent. of the burlap supplies are now from countries other than India. The consumption of jute by the Continental manufacturers has considerably increased. The manufacturers in some of the countries have been working two shifts. Sweden, the Netherlands, Western Germany and the U.K. are the countries in instance. France is subsidising exports to the extent of 10 per cent. to 15 per cent. If the European jute industry finds any difficulty in meeting Indian competition, India's exports to Europe for their internal consumption are likely to be further affected as the Governments of these countries would naturally protect their industry, and further restrict imports from India.

Asian Markets

In the Asian markets also the situation is not encouraging. Pakistan has not only ceased to be a purchaser of Indian jute goods, but now exports its own products to foreign countries. It has just been reported that Pakistan has entered into an agreement with South Africa for supplies of a substantial quantity of jute goods during the next year. With the natural advantage to its industry by way of better quality jute available at lowest cost, coupled with most modern equipment and its plans for further expansion of the loomage, it will, in all probability, mean a formidable competitor for India in the near future.

The jute industry of Japan has been completely rehabilitated and now produces jute goods not only for internal consumption but also for export. Thailand has set up two jute mills which produce 20 per cent. of her requirements. Plans are reported to have been prepared for further development of one of the factories by additional investment of about Rs. 13 million. Indonesia has also planned to have a jute bag factory at a cost of Rs. 11.8 million to manufacture one-third of the jute bags needed by her. Jute mills have been set up in the Philippines. While they produce jute goods now for both internal consumption and export out of imported jute, they are planning expansion of cultivation of *kenaf* with a view to replacing jute. Burma has taken steps to extend cultivation of jute to meet her needs locally and some time back it was reported that she would set up a jute mill.

Middle East and Africa

Establishment of a sack factory in Israel, as reported some time back, would close that market for Indian jute goods and may even result in some exports from that country. Egypt has one jute mill and a Special Committee of the Permanent National Production Council of Egypt, appointed by the Government of Egypt, has stressed the need for official protection to this industry. The expansion plans of the present company are directed towards manufacturing all the jute bags required by Egypt. Cyprus is also said to have decided upon the erection of a factory to meet her needs of sacks. Experiments with Rama fibre as a jute substitute have been reported to have been successful in Nigeria and its production is now being encouraged with a view to exporting and using it in a local sack factory planned for 1953. The new sack factory established in Angola last year is expected to meet a large part of its requirements. South Africa has made remarkable progress and is now in a position to meet all her requirements of wool-packs and about one-half of the grain bags needed by her. The expansion of the factories has been going on and a considerable quantity of hibiscus fibre is now used as a substitute for jute. It is expected that the South African Government would announce a subsidy for the industry.

Causes for These Developments

These developments clearly show that the Indian jute goods no longer hold the same importance that they had in the world packaging markets. An analysis would show that the chief factors responsible for the generation and the acceleration of the pace of these trends are:

(1) Supply and cost of labour, (2) insecurity of supplies, (3) high prices, (4) Pakistan's jute policy, (5) Indian fiscal policy, and (6) consumer preference.

Countries like Australia, where labour is scarce and relatively very dear, have all along been anxious to find alternative packaging materials and methods which would reduce their dependence on labour involved in the use of jute bags. Here, the cost of bags was not at all important and saving in labour was the predominant factor. For this reason, in spite of heavy initial investment involved, bulk handling was naturally a great attraction and the ultimate reduction in the handling costs by this method, coupled with insecurity of supplies of jute goods, led to its widespread use in the grain-producing countries. Bulk handling of grains has come to stay and is being increasingly resorted to. Fertilisers are gradually switching over to this method. It is now being adopted for the transport of sugar. Huge investments are now being made in the arrangements for handling of sugar in bulk in many countries and, as I have stated earlier, this market is likely to be entirely lost so far as jute goods are concerned. To some extent, the diversion to paper bags can also be ascribed to this factor, as, by the use of labour-saving machinery for filling in paper bags, the labour costs were somewhat reduced. Even when the prices of jute goods become economic in relation to the costs of substitute materials and methods, there is very little possibility of the consumers returning to the former, as this would involve keeping the huge investments made for the use of the latter idle.

National Self-sufficiency

National self-sufficiency with regard to the primary needs was being pursued as an objective by some countries even during the pre-war period, as a result of which the use of paper and cotton as substitute material was being resorted to for packing some of the products where they offered some other advantages too. A notable example is that of cement. The cheapness of jute bags was, however, a great deterrent and paper could not make any serious headway, except in respect of those commodities where it had natural advantages. The difficulties faced by the overseas consumers during the Second World War and the post-war period in securing adequate supplies of jute goods and the consequent repercussions on their economy made them realise the great danger in depending upon a foreign country in the matter of such an essential item and vigorous efforts were made to find indigenous substitutes. Shortage of jute goods also led many countries to prohibit their use for certain purposes and consumers perforce had to seek something to pack their produce in. The result was bulk handling made a great headway, the use of paper bags increased by leaps and bounds and the search for substitute fibres was given a spurt.

The I.J.M.A. delegation to Australia found that insecurity of supplies was the predominant threat in that market, much more than the high prices. What the consumer resented was the restrictions placed by way of quotas, etc., on the exports of jute goods even when supplies were relatively plentiful and the need for conservation of supplies for armament requirements was over. The danger in depending upon India for jute goods became all the more apparent when shortage of raw jute in India after the Partition resulted in further shortage of jute goods.

With insecurity of supplies, the high prices of jute goods, due to the increased price of raw jute after the Partition earlier, and due to the high Indian export duty later, have been the most important factor in taking away our traditional consumers. Cheapness was the predominant influence in spreading the use of Indian jute goods all the world over. The continued high prices of jute goods in the post-war period for one reason or another made them uneconomic as a packaging material and they lost one of the great advantages in their favour. Even after taking into account their reuse value, they became uneconomic in comparison to paper and cotton. It was, therefore, natural that consumers switched over to substitutes and their use was thereby encouraged.

The Partition and After

All the countries were anxious to rehabilitate their industries after the war, but the cost of such rehabilitation in the case of the jute industry would have been normally considered uneconomic and prohibitive, when they had to depend upon India for the raw material and owing to the natural advantages in its favour the Indian jute industry was capable of supplying jute goods cheaper than others. With the partition of the country, the advantage of cheap and monopolistic supply of raw material was lost and India not only had to compete with its foreign counterparts to purchase raw jute from Pakistan, but, for a time, its supplies were completely cut off and then the cost of Pakistani jute to India became very high, due to the discriminatory export tax on exports from Pakistan and the unrealistic exchange ratio between the two countries.

The disadvantages arising out of these factors to India became advantages to the manufacturers in the Continent. Encouraged by these circumstances, they rapidly re-developed their industry. Other countries started thinking in terms of having their own manufacturing units to meet their requirements of jute bags. There was still enough demand from the consumers to take over their production and, with reduced costs of manufacturing due to modern machinery, coupled with the above advantages, they could now compete with India without much difficulty.

Increase in Export Duty

The increase in the export duty on jute goods in India provided the foreign manufacturers with an excellent opportunity and further protection. This tax increased the costs of Indian jute goods to the overseas consumers and the resultant high prices gave the foreign manufacturers a wide margin of profit, in spite of their underquoting India to some extent to secure the business. Out of this indirect subsidy from India they reaped a rich harvest. They worked double shift and earned windfall profits which they utilised for modernising the equipment. Perhaps, without this tax burden, the Indian goods would have competed the foreign products out, but the burden so placed on them was unbearable. Overseas offtake of jute goods from India was reduced and the industry has had to continue its short-time working of 42½ hours a week, with 12½ per cent. of its looms sealed, an expedient adopted earlier owing to shortage of supplies of raw jute. None else but the foreign manufacturers have benefited by this policy, as modernisation of equipment has helped to further reduce their manufacturing costs, increase their competitive capacity and give them a fresh lease of life. Although the duty has now been substantially reduced, with the changes in the structure of the competitors and consequent strengthening of their competitive capacity, they have been placed in a strong position and are now likely to put up a tough fight.

Demand for Smaller Bags

One more factor has been responsible for taking away some of the consumers from jute goods. For some time now, consumer packing is being favoured by the producers of articles of daily consumption such as sugar, flour, etc. Smaller packages are convenient for handling by the retailers as well as the consumers. In some items like potatoes, smaller bags have now come into vogue. The jute industry is quite alive to the new situation developed by these factors and has given considerable attention to it. In fact, 50-lb. potato bags are now manufactured and have found a ready demand in the U.S.A. It is expected that this season might see a return to the use of jute bags in this sphere. Similarly, it is my belief that, in many other spheres too, a return to jute bags should not be ruled out, provided smaller bags are developed according to the demands of the consumers and dealers. Co-operation between the industry, on the one side, and the producers and dealers, on the other, is capable of bearing good fruit by way of come-back to jute goods and halting further diversion to substitutes to any serious extent.

It is unlikely that cheaper prices of jute goods will affect the trends generated with regard to the expansion of bulk handling in the long run, though its further development could be slowed down and halted. The drive for national self-sufficiency is a grave threat. All the countries which have developed this industry will naturally protect it. Attempts will be continued to find suitable indigenous substitute fibres to replace jute. But, with increased production of raw jute (the crop is expected to be smaller this year and the consequent high price is likely to adversely affect the position of jute goods), it is now possible to produce more jute goods and compete with foreign manufacturers so far as their exports are concerned. If jute goods can be made sufficiently cheap, it is not unlikely that the forces working against them in certain spheres can be halted, further diversion to substitutes checked and a part of the markets regained.

A three-pronged attack is necessary to solve the problem. Adequate supplies of raw jute at a cheap cost are the first essential. Quality of jute is no less important. The question has been studied for a long time. The report of the Committee appointed by the Government to examine the matter has been submitted. What is now needed is implementation of the recommendations made by it with vigour and zeal. The yield, along with the quality, must be improved, for that alone can help us in reducing the cost of production of jute. No half-hearted action would do.

Reduction in labour costs is equally essential to make jute goods sufficiently cheap to gain ground. Only modernisation of equipment can help us, when labour costs are increasing from day to day, owing to new labour legislation and the additional financial liabilities thrown on the industry thereby. Plans of modernisation have been considered and talked about for a considerable time. Finance is the chief hurdle. But it is imperative to undertake modernisation as early as possible, otherwise it would be difficult to compete with the Continental industry on an equal footing.

The drive on these two sides should be supported by appropriate changes in the fiscal policy. At a time when the industry has to struggle for its existence and needs assistance from all sides with a view to regaining its old cheapness, it is only proper that all fiscal burdens by way of export tax on its products should be taken off. Action on these three lines, coupled with a dynamic policy on the part of the industry (a) to adjust the production to demand, (b) to vigorously pursue its public relations cam-

INDIA'S JUTE INDUSTRY FACES THE CHALLENGE

DETERMINED EFFORTS BEING MADE TO MEET CHANGING CONDITIONS

THE last few years have seen vast changes, dynamic events in the Indian Continent, changes in their speed, extent, and import, perhaps, unequalled in history. There have naturally been tremendous repercussions from these events affecting all sections of the economy of this subcontinent, but, perhaps, none has been more affected than has the jute manufacturing industry in West Bengal. Problems, difficulties, at first seemingly insurmountable, have faced the industry and fully absorbed the attention of all concerned at a time of important post-war changes in markets throughout the world. These difficulties have gravely handicapped the industry at a crucial time and have undoubtedly given rise to the belief, sometimes expressed outside this country, that the Indian jute industry is a spent force, using machinery that is obsolete, unable to keep abreast of the times and definitely on the decline. Were there any truth in this, there would be cause for the utmost concern, because the jute manufacturing industry, in addition to being the mainstay of the economy of West Bengal, is also one of India's foremost export industries and her principal source of dollar exchange. That the problems still facing the industry are formidable no one would deny; but these problems are a legacy of the even greater difficulties of the past, and the fact that the industry has survived—though not without loss—the tremendous crises of the post-war years is at once a tribute to its resilience and a sure indication of its ability to face the future.

Mistaken View

Those who doubt the Indian jute industry's future may, perhaps think it is incapable of properly appreciating its present problems or of adapting itself to changed conditions. Such a view could not be more mistaken. The industry knows what it is up against and its policy for the future is based on a careful assessment of the situation; but, before outlining some of the measures which are being taken, a brief account must be given of the situation itself and of its origin.

Although many other factors have been involved, the present difficulties of the Indian jute industry may be attributed principally to the dislocation of markets caused by the Second World War and, subsequently, to the Partition of the country. The two great advantages of jute as a packaging material have always been its ready availability and its cheapness. War-time conditions brought about an increase in prices, and, although the production of jute goods was greatly stimulated, the available supplies were, to a large extent, diverted from the civilian market to the military demand. Of themselves, these two developments might not have mattered so much, because all commodity prices were rising steeply, other markets were similarly affected and at such a time consumers did not expect to receive their normal supplies. Unfortunately, however, both tendencies persisted after the war. Wage rates continued to rise, with no corresponding increase in the productivity of labour, and, at a time when an all-out effort could have been made to re-establish and develop civilian markets throughout the world, the sub-continent of India was partitioned and the Indian mills were overnight separated from their principal source of raw jute. Mills had to adopt a system of rationing of their raw material with all the disadvantages and restrictions that any rationing scheme entails. In 1949, the devaluation of sterling should have afforded the industry a golden opportunity of vastly expanding its dollar markets, but the inability to obtain sufficient supplies of raw jute prevented this. Lastly, the stockpiling at the outbreak of the Korean war brought about an acute shortage of manufactured goods, forced prices to prohibitive levels and precipitated the situation facing the industry to-day.

Rising costs, shortage of raw material, high prices, heavy export duties: these were the principal causes of the present situation, and, although the causes themselves have, to some extent, been removed, the effects are only slowly being corrected. The world's raw materials—foodstuffs, fertilisers, cotton, wool, all the commodities which are packed in gunnies—have to be transported and transported quickly. If jute goods are not available or are too costly, the producers of these primary commodities are forced to look elsewhere for their packaging needs. This is in fact

By J. G. Walton

Deputy Chairman, Indian Jute Mills Association

what has happened; and, as a result, the Indian jute industry has lost a lot of ground through the encouragement given to the use of substitute packaging materials and the adoption of bulk handling methods, through the advantages afforded by high export duties to the jute manufacturing industries of other countries, and, finally, through the establishment of new jute mills in countries which had previously imported all their requirements of jute goods.

Fierce Competition

Competition from other packaging materials such as cotton and paper has, of course, been experienced before, but the Indian jute industry's misfortunes enabled, these materials to invade and establish new markets at the expense of jute, and competition from them, and particularly from paper, is now much fiercer than it was. Bulk handling, too, though a natural development in countries like North America, Canada and Australia where crops are large and labour expensive, was directly and greatly encouraged by the shortage and high price of jute bags. While jute has thus lost ground to other packaging media, the Indian industry has also lost markets to foreign competitors. The Continental mills in particular took full advantage of the protection afforded by the heavy Indian export duties to invade the American market at India's expense, and, whereas, in 1948, India supplied more than 95 per cent. of the total imports of hessian into the U.S.A., her share of this market had fallen by the end of 1950 to 87 per cent.; in August, 1953, it was only 71 per cent. In the Philippines the jute industry has expanded rapidly, until it now produces more than two-thirds of that country's requirements; Egypt is endeavouring to increase her production from 2,500 tons a year to 16,000 tons by 1957 and to reach self-sufficiency by 1960; nearer Home, Burma is reported to be already growing jute and to be contemplating the erection of a mill. Finally, and most significant of all, there is the emergence of a jute manufacturing industry in Pakistan, equipped with modern machinery and with unlimited supplies of good quality raw material readily available. This industry is already producing sufficient goods to meet Pakistan's own internal needs, and, if present reported plans are fulfilled, Pakistan will, by next year, be in a position to export substantial quantities to foreign markets.

The Challenge To Be Met

This, then, in broad outline, is the situation which now confronts India's jute manufacturing industry. What is being done to face the challenge? This article will deal mainly with the steps which are being taken by the industry itself; but, from what has already been said, it will be evident that the solution of the problem does not rest with the management alone, but will require the fullest co-operation of Government and labour and all sections of the trade.

In meeting the much keener competition which is now being experienced both from substitute materials and from jute manufacturing industries in foreign countries, the first essentials are to ensure that there should be a plentiful supply of jute goods at the lowest possible cost to the consumer. The Indian industry has sufficient productive capacity to meet any foreseeable world demand, the first requirement thus depends solely on the receipt by the mills of adequate supplies of raw material. Much progress has already been made in this direction. The acreage under jute cultivation in the Indian Union has been greatly extended in recent years, and, from a total of less than 17 lakh bales in 1947-48, the Indian jute crop increased by 1952-53 to nearly 47 lakh bales. The present crop is in the region of 35 lakhs bales and, while this is a good deal less than the last crop, the industry's position is much more secure. In present economic conditions, the lowering of prices is a bigger problem, but, in one direction at least, the remedy is available. Since 1949, the price which consumers have had to pay for Indian jute goods has been greatly increased by high rates of export duty. These duties have greatly handicapped the industry and the reductions already made in the rates have considerably improved the position. The last reduction took place on 15th September, 1953, when the duty on hessian was reduced from Rs. 275 to Rs. 120 per ton. It is still too early to assess the effect which this lowering of the duty will have on overseas demand, but it has certainly improved the Indian industry's position *vis-a-vis* its foreign competitors and it may enable India to recapture a large proportion of the markets lost to Continental mills. It is true that, even with the recent reductions, the rates of export duty are still higher than they were when India enjoyed a virtual monopoly of the jute goods trade and that, to this extent, the Indian industry is handicapped in its competition both with foreign industries and with other packaging materials; but the very existence of this handicap means that India has a margin in hand and that her competitive position can be improved by a further reduction or total abolition of the duties.

Modernisation

The industry is keenly alive to the need for reducing its manufacturing costs by continued and increased modernisation of machinery. This is not a question of increasing production—which could easily be achieved with the existing plant—but of producing the finished goods more cheaply. This is probably not appreciated by those who may disparage the Indian industry on the score of old type machinery, as if the machinery now in use were inefficient and incapable of producing high quality goods. Such a view reveals ignorance of the true position. It is important to realise that (apart from a very small number of circular looms, the possibilities of which

In the days of the East India Company, India attracted to her shores a new class of adventurers—Scientists and Chemists whose adventures lay in the realm of experiment and research.

Fired by a pioneering zeal, a number of them made Bathgate's Laboratory at Calcutta the home of their activities and they soon made important contributions to medicines and cosmetics. The fruits of their labour are best seen in the hundred years of tradition associated with THEIR FAMOUS MEDICINAL AND TOILET PRODUCTS.

These traditions, the seeds of which were sown about a century and a half ago, are being proudly upheld in the continued popularity of Bathgate's products.

are being examined by the Indian industry) the looms now being installed in new mills in other countries are of exactly the same type as those used in India. Modernisation in the jute industry thus means not a replacement of looms but the installation of new preparatory machines which supply the looms with yarn; and the reason for installing such machines is not that they produce a superior yarn but that they work at high speed and produce the yarn more quickly and more cheaply. While the machines themselves are expensive, the economy resulting from their use is considerable, and, in recent years, the Indian industry has spent more than six crores of rupees on their installation. Much still remains to be done before the entire industry is modernised, and finance is a major problem; but modernisation is proceeding at an increasing momentum. The Indian Government appreciates the importance of maintaining India's supremacy in the manufacture of jute and is already considering how best it can assist. In this process of modernisation, some dislocation of labour is inevitable and this will have to be faced, but the limited capacity of the machinery manufacturers will spread the process over a number of years, during which time the labour thus rendered surplus will, to a considerable extent, be eliminated by natural wastage. Within the limitations imposed by finance and the availability of new machines, the Indian jute industry is modernising and modernising fast, and it is true to say that there is already more modern machinery in India than in any other country of the world.

More Positive Steps Needed

So much for modernisation and the lowering of costs. In present circumstances, however, the strengthening of India's competitive position in world markets is not of itself enough. More positive steps are needed to recover old markets or develop new ones, and here again the Indian jute industry is taking vigorous action. Some markets—those where Indian jute goods have been replaced by bulk handling methods or by the production of indigenous industries—have been irretrievably lost, because the capital cost involved in the introduction of bulk handling methods and the establishment of new industries will ensure the continuance of such plants when once they have been established. On the other hand, the very fact that they are expensive tends to discourage such ventures, and every effort is being made, by ensuring regular supplies of jute goods at reasonable prices, to retard, if not altogether to arrest, their further development. In other cases, where markets have been lost to substitutes like cotton and paper, there is a real possibility of recovering some of the ground lost; and in countries like Australia, New Zealand and the Americas with their expanding economies and their plans for increased agricultural and industrial development, there are prospects of a larger demand for packaging materials.

Research

These markets cannot be captured without a struggle. Apart from the emergence of the Pakistan industry, competition from other packaging materials and especially paper is fierce; but jute has certain natural advantages—amongst others its greater strength and re-use value—and these must be pressed. With this object in view, the industry has been financing a large-scale publicity campaign in North America, designed to bring home the merits of Indian jute goods both to importers and to ultimate consumers by means of direct contacts, advertisements in the Press, broadcasts on radio and television and by exhibitions at Trade Fairs. Attention is now being turned also to the Australasian market, where a publicity campaign is being launched in New Zealand to combat the competition from paper and from woolpacks made locally from phormium tenax fibre. To keep the industry fully informed about market conditions in Europe and the all-important dollar countries, offices have been established both in London and New York. Delegations have been sent to America, Canada, Australia and New Zealand to assess the prospects of those markets, to establish personal contacts with consumers and to ascertain their difficulties and requirements. These missions, which have been highly successful in strengthening the ties between the Indian jute industry and its customers and in building up a fund of goodwill, will be continued in future. In its search for new outlets, the Indian industry realises that it can no longer rely solely on standard fabrics, and, in all these contacts with consumers, the attitude adopted is: "Tell us what you want and we will make it." If experiments and research are necessary before new requirements can be met, the industry has large and up-to-date laboratories in Calcutta fully equipped to carry them out. The research which enabled jute to be adapted to many special war-time needs is now being directed towards the discovery of new agricultural and industrial uses.

The Future

Upon the expansion of its present markets and the development of new markets the whole future of the Indian jute industry depends, and no effort will be spared to achieve this end. The difficulties are enormous and are not under-estimated; but India's jute industry is one of the most highly organised industries in the world, it has the advantages of established contacts and a vast store of experience, and it is determined to do everything in its power to adapt itself to changing world conditions.

During the past few years, the Indian jute industry has successfully faced and solved the most serious problems in its long history. It has done so without either internally supported prices or subsidised export prices; in fact, it has done so under the tremendous handicap of heavy export duties. The Indian industry can look forward not with complacency but with confidence in its strength and resilience to meet the challenge of the future.

JUTE MANUFACTURE IN EGYPT

The Egyptian Development Board has approved a plan for expanding the jute industry to satisfy the whole local demand for jute by 1959. According to the plan, the present jute company will increase its capital by £450,000, to be provided by a Pakistani industrial corporation. The Egyptian company will thus be able to add to its machinery and to import more Pakistani jute, so that its production will satisfy 30 per cent. of local needs in March, 1955, and 60 per cent. two years later. The Board has approved in principle a customs tariff protectionist policy for the industry and has recommended fixing prices for an initial period, thereby guaranteeing a reasonable profit for the company and its shareholders. The company at present produces only about 2,500 tons of sacks and wrapping materials, using 2,000 tons of raw jute from Pakistan and the raw flax planted in Egypt. The aggregate domestic demand for jute products is estimated at about 28,000 tons.

JUTE FACTORY FOR ISRAEL

Israel's first jute factory—claimed to be the only one in the Middle East—is scheduled to go into production next March. It will produce string, rope, sacking and other jute products. The plant represents an investment of I£1 million half of it in foreign currency. During the first stage of operations, the plant is scheduled to process 2,000 tons of jute per annum, which will gradually be increased to 3,000 tons. The company reports that it has already received an order for 500,000 yards of jute goods from abroad.

THE WORLD WOOL SITUATION

STEADY RISE IN PRICES—OUTPUT RECORDS INCREASE

WHEN the 1952-53 wool season ended last June, both growers and buyers had reason to be satisfied with the course it had taken. Growers could reflect upon the fact that, jute apart, wool was the only primary commodity to have steadily risen in price during that time. Buyers could take satisfaction from the record supplies of wool which, despite growing demand, kept wool prices within reasonable limits. A growing supply of wool, accompanied by a slow but steady recovery of prices from the low levels of 1952, made the 1952-53 wool season one of the most satisfactory since the end of the war.

Supplies of wool, at 2,780 million lbs. clean, were about 260 million lbs. more than in the 1951-52 season. Three-fifths of this increase was due to an expansion of current production, the remainder to an increase in stocks carried over from the previous season. The increase in production was largely the result of the growth in the Australian clip alone. Australia, by far the world's biggest producer, expanded output by no less than one-fifth—or an amount rather greater than the entire Uruguayan clip. This spectacular increase was in no small measure due to the effective campaign which reduced the rabbit population, improved sheep pastures, increased the number of sheep that can be fed from them, and gave a heavier clip per sheep. The average clip last season was higher than ever before. The restoration of mineral deficiencies to improve sheep pastures was another factor contributing to the increase.

Production in the other Dominions also increased, and in the United States the declining trend of recent years was at last reversed. The only important producer to show a decline in production was Argentina, where the continuing shift from sheep to cattle, combined with a drought and the depressing effect of large unsold stocks of wool from the previous season, caused her to give way to New Zealand as the world's second largest wool producer. Russia, with an estimated production of 225 million lbs. clean last season, stood fourth among the world's producers, but the Communist world as a whole still accounted for only 13 per cent. of the world's production of wool.

The increase in stocks carried forward, like the increase in current production, was also due mainly to one country. Argentina carried over into the 1952-53 season unsold stocks equal to about two-thirds of that season's clip. Uruguay had a smaller, but nevertheless considerable surplus. On the other hand, the stocks which New Zealand had carried at the beginning of the previous season, because of the water-front strike, had been liquidated. The final balance for the 1952-53 season showed a substantial increase in stocks.

By B. A. Robertson
Economics Department, International Wool Secretariat

Wool growers, therefore, had reason to fear, in the face of these additional supplies, a weakening, if not a reversal, of the price recovery which had begun towards the end of the previous season. These forebodings were not realised. Strong demand was evident from the beginning of the season, and prices became firmer, month by month, almost until the end of the season, so that the closing prices were about one-fifth above those ruling at the outset. Demand was sufficiently strong to take up nearly all the current clip, as well as the large South American surplus, at a rising price level. Apart from strategic stockpiling in the United Kingdom, the only accumulation of unsold stocks was in the United States, where the Commodity Credit Corporation took over a considerable part of the domestic clip under the loan programme.

What lay behind this strong demand for wool? Several factors must be noted. The most influential was certainly the revival of the wool textile industry from the depression that followed the break in wool prices early in 1951. During this slack period, stocks were run down, and the first promise of reviving activity consequently brought about their replenishment. The catching up on consumer demand, postponed while prices were still falling, gave additional impetus to the revival, and indeed, this backlog only recently seems to have been made up.

Another factor of importance has undoubtedly been the eventual post-war recovery of the German and Japanese textile industries. Japanese consumption of wool, which, as late as 1949, was only 16 million lbs. (on a clean basis), rose last year to 123 million lbs. and by all indications is still rising. Already the pre-war level of consumption (an average of the years 1934-38) is being exceeded by over 15 per cent., and last season Japan became Australia's third best customer for wool, buying half as much again as in the previous season.

With the exception of the United States, all other major importers of wool, such as the United Kingdom, Belgium and Italy, increased their overall wool purchases. Although the total imports of the United States were only down a little, a far larger proportion than in previous seasons came from South America; imports from Argentina rose sixfold, while purchases in the Dominions decreased by half.

Current Season

This brings us to a consideration of the current season which began in July. In many of its features, it differs from the last. According to estimates, the increase in the wool clip will only be 1½ per cent. or barely a quarter of the rate of increase registered last season. Against this increase of about 40 million lbs. clean, there must be set a decrease in stocks of some 160 million lbs. Supplies as a whole will, therefore, amount to 2,660 million lbs.—considerably less than last season and below the annual rate of consumption during the first nine months of this year. This indicates a reduced level of consumption for 1954.

At the opening sales in Australia at the end of August, and later in South Africa and New Zealand as well, prices followed the previous season's closing rates. Nor has any marked trend been discernible since then. Satisfaction has been expressed at the remarkable stability shown so far. In view of the tighter supply position, the fact that the upward trend has been halted may denote a slackening in demand. There is much to support this view. In the first place, the rate of recovery in the chief wool textile industries of the world has slowed down in recent months. In most countries, yarn production has also fallen, while that of tissues rose only slightly. Only in Germany, Japan and the Netherlands did production of both yarns and tissues during the third quarter exceed that of the previous quarter. The reason for the decline may, to a certain extent, be only seasonal, but it seems probable that the backlog of demand from the earlier recession has by now been almost satisfied and that the strength of the market at present is due to the temporary need for stock replacement. Only in the United States is there evidence of a more prolonged lack of demand.

Trade Agreements

Demand in the Dominion wool markets is affected by another factor, namely, the currency difficulties in which many of the Dominion's best customers at present find themselves. Japan in particular is short of sterling, and Russia whose trade with the sterling area is small, would encounter the same difficulty in any considerable expansion of imports from that source. Sterling scarcity is probably the cause of quite a number of the recently negotiated trade agreements between Argentina and such countries as France, Japan, Russia, Hungary and Austria, involving the exchange of wool against manufactured products.

This trend should not, however, be without its compensations for Dominion producers. The commitment of a large part of Argentina's current clip under trade agreements, and the absence of any carry-over of wool stocks in Argentina from last season, means that the United States is unlikely to be able to satisfy as large a proportion of her requirements in the South American market as last season. A reversion of the American buyer to the Dominion markets should go some way towards compensating for the switch of Japanese and some Continental buyers to South America.

Importance of the U.S.

This forecast rests on the assumption that the United States' total wool purchases will not be lower than last season. Unless the domestic market for wool textiles looks a great deal brighter by the new year than it did in the autumn of 1953, this is not at all certain. The American manufacturer, despite his low stocks of raw wool, is unlikely to make large purchases under the present slack conditions of demand. The possibility of an American recession, which may not be confined to textiles, is the darkest cloud upon the wool grower's horizon at the moment.

Other uncertainties also overhang the American market which deserve mention, because of the importance of America as a wool importer to-day. One is the rate at which the Commodity Credit Corporation is able to dispose of the 50 million lbs. of wool which it took over from domestic producers under the loan programme last season. Another is whether or not the United States will decide to raise the tariff on imports of raw wool under the G.A.T.T. escape clause. And, in the near future, there will be the findings of the Foreign Economic Policy Commission which will be presented next spring and are likely to determine the course of America's trading policy over the next decade.

Per capita consumption of wool to-day for the world as a whole is slightly higher than before the war, though because of the vast differences between country and country, continent and continent, such a global figure has little meaning. The prospect for an expansion of wool consumption depends upon both supply and demand factors. On the supply side, leaving apart, yearly fluctuations of output due primarily to climatic conditions which none can predict, the likelihood of an increasing wool supply will depend upon the price of wool relative to other farm products—and not only on the price but on its stability. At present, wool prices compare favourably with those of other commodities, relative to pre-war levels, and they have, moreover, since the stockpiling boom, been fairly stable. In the Dominions, a continuation of these factors is likely to be sufficient in itself to maintain an increasing wool supply. In the United States and Argentina, however, the competition of rival farm products is an important factor, and United States' wool growers are not likely to be encouraged by last season's demand for their wool.

Threat From Synthetics

On the demand side, the situation is more favourable in some respects than it was a year or two ago. The threat from synthetics is now seen to have been exaggerated, for it is becoming clear that their value is as a supplement rather than an alternative to wool. It is not the superiority of synthetics but their cheapness which is their real advantage Their increasing use, providing that the overall consumption of textiles is also increasing, may not be detrimental to wool consumption.

This leads on to one last point. *Per capita* consumption of wool in different countries is very closely related to *per capita* national income (leaving aside such obvious factors as climate). An increasing demand for wool can, therefore, follow upon the raising of living standards, especially in the underdeveloped nations of the world, whether this is undertaken by their own unaided endeavours or, as many hope, by joint international effort.—*All Rights Reserved.*

WOOL—THE MODERN WONDER FIBRE

"Scientists studying wool are constantly finding new and valuable properties in this ancient fibre. In this way, the scientists are confirming the judgment of these who termed wool "the modern wonder fibre." Wool is a profoundly complex fibre, with a unique combination of performance properties which enable it to meet the demands of to-day's consumer. Despite the barrages of propaganda used to sell other fibres those who promote wool are interested principally in the consumer's ultimate and continuing satisfaction.

"Our entire effort is devoted to the improvement in wool products, reduction in conversion costs, and keeping all consumers aware of wool's superior characteristics in the face of propaganda promoting competitive fibres. We are all too prone to slight those things with which we are most familiar, and to run after the promised pot of gold which we hope lies over the hills in unfamiliar territory. We do not believe that our responsibility ends with the final sale, but continues through the lifetime of the wool product. In spite of the public's interest in the new and the novel, and in spite of skilfully planned campaigns to interest the consumer in three-buttoned suits and pleated skirts for swimming pool use, we know that the best interests of our supporters, the wool growers, depend upon the consumer's ultimate satisfaction."—Giles E. Hopkins, *Technical Director of the Wool Bureau, Inc., New York.*

HOW THE MANUFACTURE OF CARS & TRUCKS CONTRIBUTES TO

National Progress

With her vast distances, dependence on agriculture, and industries in various stages of development, India needs many miles of roads and efficient road transport.

The huge automobile factory of Premier Automobiles was established in 1947 to bring this cherished goal nearer to realisation. Since then thousands of cars and trucks have left and are still leaving our factory to link the village with the city and the producer with the consumer.

Besides vehicles, there come out in a constant stream from Premier's factory all-steel cabs, mufflers, radiators, springs, propeller shafts, shock absorbers, and numerous other parts. Very soon auto engines, transmission differential, etc., will be made, to complete Premier's manufacturing programme of completely Indian-made automobiles and trucks.

Through this gigantic industry Premier Automobiles serves the country's transport needs, aids in national defence and provides work to thousands of workers in its own factory and allied industries.

Dodge, De Soto, Plymouth and Fiat Cars

ELECTRIC SUPPLY INDUSTRY

FACTORS IMPEDING ITS DEVELOPMENT

By K. G. Milne

THE development of public and private sources of supply of electricity is one of the most costly and important items in the Five-year Plan. In view of this, it is essential that the industry secures the funds needed for development and that this development is properly co-ordinated.

The first Five-year Plan dismisses the contribution of the private sector in the field of electric power development in a matter of a mere four lines, saying:

"Additions to generating capacity in the private sector are expected to total about 170,000 kw. in the period of the Plan. These will consist mainly of extensions at Calcutta, Ahmedabad and Lucknow and a new steam station at Trombay. They will meet the load growth in the areas served by these power systems."

This, however, is not the whole story. Apart from the major extensions mentioned above, a number of other electric supply undertakings in the private sector also have plans to augment the supply facilities in their areas. Altogether the expenditure is reckoned at about Rs. 30 crores during the currency of the First Five-year Plan and the additional power contemplated is of the order of 200,000 kw. Is there adequate incentive, at the present time, to attract such a sum from private investors?

The Sixth Schedule to the Electricity (Supply) Act, 1948, lays down certain principles which a licensee shall adopt in respect of finance. In particular, a licensee's rates of supply of electricity must not contain an element of profit greater than that permitted by this schedule. To quote from the statement of objects and reasons of the Act, the financial provisions "are designed to secure that a licensee shall not be permitted to earn more than is necessary to provide him with a reasonable return but which, at the same time, would enable him to raise funds in the market for the proper continuity of his public duties."

Insufficient Incentive

It is, therefore, clear that those who framed the Act paid particular attention to the need to attract adequate capital for the development of this industry. It cannot be said that this need is being satisfied at the present time. The Act relates the upper limit of return to the investor to a figure of 5 per cent. on a defined "capital base." (Roughly speaking, the "capital base" is the capital employed in the business of electric supply.) This limit was fixed in 1948, when money market conditions were easy, but times have since changed greatly. We are now deep in a crisis created by the old restrictive limit of 5 per cent. continuing to be in operation by force of statute so far as the electric supply industry is concerned, whereas all other market interest ratios such as the Bank rate, the interest rate on Gilt-edged investments, including State and Central Government loans, and the rate of interest on lendings by the Industrial Finance Corporation of India, have been raised by executive acts operating freely in response to economic pressures. In the case of *fully secured* lendings by the Industrial Finance Corporation of India, the rate of interest now imposed in 6¼ per cent., which is 1¼ per cent. above the basic limit permitted to the *equity* investor in the electric supply industry. A rise in the standard rate of return for the electric supply industry to 6 per cent. will, therefore, be absolutely fair and reasonable.

While the interest rate goes up all round, the electric supply industry has been helplessly watching its financial health slowly disintegrating because of an out-of-date limitation on its earnings. This inevitably inhibits the industry's growth, and, in this respect, the Electricity (Supply) Act has failed in its purpose.

The primary object of electricity supply rate regulation is to introduce into a field of quasi-monopoly those safeguards which elsewhere protect consumers through the impact of competition. The return allowed on the equity investment in any regulated industry should clearly not exceed that which can be obtained in an equally sound enterprise operating in a free market. The Sixth Schedule to the Indian Act very largely follows rate regulation precedents elsewhere, such as the above-mentioned governing principle which was enunciated in 1937 by the Federal Power Commission before the U.S. Supreme Court in an *amicus curiæ* ("disinterested adviser") brief. While the Electricity (Supply) Act certainly visualises such a return, its standard has lagged behind the change in the fundamental unit of measurement. The remedy is to raise the standard.

Need to Raise the Standard Rate

A suggestion was made to Government as early as 1951 that the basic standard rate should be upgraded to at least 6 per cent. Such an increase is not considered actually sufficient to allow a return on equity investment in the electric industry comparable to a return from an investment in another, and equally sound, enterprise operating in a free market, but regard had to be had to the probability of any attempt to secure a higher increase invoking correspondingly greater opposition from both Central and State Governments.

The limit of 5 per cent. is part of a statute and an increase in the standard rate to 6 per cent. involves an amendment to the Act. A Bill including only this amendment has been repeatedly suggested to Government, but so far Government has declined to consider it. Further, suggestions have also been made repeatedly when Parliament was in recess that an Ordinance dealing with this important matter might be promulgated, but these also have fallen on deaf ears.

Although the necessity to raise the standard rate by amendment to the Electricity (Supply) Act is the most urgent of all the needs of the industry, it is by no means the only one. There are complementary ways to assist in increasing the funds needed so much for healthy survival and development, but all of them depend on action by Government which has not yet been forthcoming.

Deferred Tax Reserve and Double Taxation

The Sixth Schedule does not specifically permit private electric supply undertakings to set aside amounts against liability for taxation presently deferred but which will later accrue. Initial and special depreciation allowances under the Income-tax Act result in private undertakings, which have recently installed new plant, obtaining a large amount of relief from income-tax and super-tax, but depreciation to be actually set aside in the books of the undertakings remains statutorily fixed by the Electricity (Supply) Act on an entirely different basis. Since this relief is inherently only temporary, the deferred tax liability will mature in the future in addition to non-deferred tax payable. Such undertakings should, therefore, be allowed to make advance provision over a period of time against the incidence of deferred taxation so as to avoid the necessity of sudden and heavy rates increases when the burden descends later. It has been understood that Government is favourably inclined to consider this proposal, which is similar to action already taken in the U.S.A., where accelerated amortisation facilities have been granted to certain utilities for augmenting plant for national defence. The more time is lost before Government acts, the more severe will be the future adjustment of rates to meet deferred taxation. Moreover, this reserve would meantime provide the industry with more sorely needed finance, which is after all the object of the income-tax special allowances. Action is also badly required to remove a serious element of double taxation which has arisen with respect to dividends paid during the period of tax deferment.

Electricity undertakings not being in a position to take any advantage of the initial and special depreciation allowances, the industry has suggested to Government that a sum not exceeding 1½ per cent. of the "capital base" should be allowed, in addition, yearly towards a special reserve for rehabilitation. This reserve is much needed now, because of the high cost of new plant essential for the renovation and development of the industry.

Contingency Reserve

The Sixth Schedule to the Electricity (Supply) Act at present provides that a certain portion of the year's earnings should be set aside to a reserve called the "contingency reserve" and invested in Trust securities. It has been suggested that the schedule should be so amended as to permit an undertaking to invest in its own development at least half of the "contingency reserve".

Another suggestion made is that the consumers' statutory share of any surplus profit should be merged in the, also statutory, tariffs and dividends control reserve, and not paid out in rebates to consumers as at present provided.

Electricity Boards

There are other flagrant examples of Government inaction where the electric supply industry is concerned. The Government of India, after the Second World War, recognised the need to constitute Electricity Boards for the co-ordinated development of electricity supply in India on a regional basis. The Electricity (Supply) Act embodied, therefore, a suitable provision. This Act specified a time limit of two years from September, 1948, in which State Governments should constitute Electricity Boards, but, unfortunately, the limit has been extended by the Central Government several times under the provisions of the Act at the request of the State Governments. The latest extension expires on the 31st March, 1954, and only Delhi State and Madhya Pradesh have constituted Electricity Boards.

The main duties of these Boards are to promote the co-ordinated development of supply of electricity within a State in the most efficient and economical manner, with particular reference to development of areas which are not at present served by any licensee. One of the objects of this Act was to promote the expansion of electricity supply in whatever manner, whether involving State or investor ownership, was the most suited to the needs of the particular area. The Electricity Boards would impart financial acumen, efficiency, responsiveness and a sense of drive and direction, so pronouncedly lacking at present, to the electricity policies of many State Governments.

Apart from the four multi-purpose projects (Bhakra-Nangal, Damodar Valley, Hirakud and Harike) which are responsibilities of the Central Government, all the other Governmental projects are operated by the various State Governments. Except in Madhya Pradesh and Delhi, the State schemes are handled by the various Public Works Departments and it is sure that these departments cannot effectively fulfil the role of Electricity Boards which they are assuming in practice, especially where successful supply systems run by licensed supply companies are serving large communities and where State schemes require close co-ordination with such companies.

It is understood that the Central Government would like to see Electricity Boards constituted by the State Governments at an early date, but the latter are not actively in favour of setting them up. Since electricity is a concurrent subject under the Constitution of India, the Central Government has apparently tried so far to persuade the State Governments to co-operate with them in the application of the Act. A firm refusal on the part of the Central Government to extend the time limit any further may now be needed to replace the persuasion.

Rural Electrification

The rural sphere is another where electrification could be much assisted by Government action. The very limited rural electrification which has so far taken place in India has led the Planning Commission to propose that a body be formed similar to the Rural Electrification Administration of the U.S.A., although some of the State Governments to whom this suggestion was made earlier by the industry had brushed it aside as being impracticable in this country. The Planning Commission, in making its proposal, had recommended that the organisation visualised should give long-term loans to village co-operatives for rural electrification and development. This will, however, remain a dead letter if a co-ordinated policy to bring into being such organisation is not actively pursued in the right quarters. The desired aim can best be achieved by the Central Government itself forming, on the analogy of U.S. practice, the nucleus of an organisation and providing it with adequate finance. Such an organisation could work in co-operation with the various State Electricity Boards and public utility undertakings in the private sector.

Unresponsive Attitude of the State Governments

This review of the conditions in which the private electric supply industry is struggling has directed attention to some of the major obstacles it meets in its attempts to attain even the limited objectives allotted to it in the Five-year Plan. Apart from the limitations imposed by the Electricity (Supply) Act, the approach of the various State Governments in dealing with the local problems of the industry has not always been helpful. Since electric supply development has been assigned top priority in the National Plan, the conditions under which each sector of the industry operates should enable it to give of its best. If these conditions do not exist, it will not be possible to fulfil the aim of the Electricity (Supply) Act, namely, that electricity supply concerns, State- or investor-owned, as the case may be, should be able to develop in the most efficient, economical manner possible.

Let the Central and State Governments remember that the expansion of private electric supply under the Five-year Plan requires the investment of very large sums of money, and the co-operation of all those who are concerned in the development of electric supply.—*All Rights Reserved.*

TEXTILE INDUSTRY IN SOUTH INDIA

ITS PROBLEMS AND PROSPECTS

By G. K. Devarajulu
Managing Agent, The Lakshmi Mills Company, Ltd., Coimbatore

THE problem of all the problems in the South to-day is that of making the handloom industry come into its own as it was, say, in the pre-war era and provide urgently the necessary work, and therefore living wages, for the 5 lakhs of weavers, who form one-fifth of the strength over the whole Union. Vociferous cries are raised now and then about their unemployment and underemployment and, sometimes, starvation deaths. Recently, it has been reported that many weavers have turned beggars and have migrated to Madras, so much so that the Corporation of the City has been compelled to open gruel centres for them.

It is difficult to understand how the weavers have come to such a pass and their deterioration has been continuing even after the conditions of the latter part of 1950 and early part of 1951 have worn off and the supply position of yarn has become so very advantageous to them. During the aforesaid period, all the blame was cast upon the mill industry for not producing yarn adequately for the internal supply position but exporting far too much with the result that yarn was not available to the handloom weaver at fair prices and in sufficient quantities. To-day, with the slackening of the overseas trade in yarn, together with record production reaching almost the Five-year Plan target, and the recession in prices, the handloom industry should have its needs supplied adequately. Yet, we find a poor offtake of the yarn produced by the mill industry. Surely, therefore, the cause for the malady lies elsewhere, more deep-seated than in the failings of the mill industry.

The Main Cause

To my mind, the serious fall in the purchasing capacity of the people all round, with the inevitable consumer resistance, accounts for the poor offtake of goods from mills, which in turn have their repercussions on the fortunes of the handloom industry. In the final analysis, there could be no denying the fact that the consumer has the last word on the subject of the law of supply and demand.

The question of affording permanent relief to the handloom weaver seems to be by way of attacking the purchasing incapacity of the masses. This is a larger politico-economic question. But it must be conceded that one way of increasing consumption of textiles is by bringing down the costs of production.

Dogmatic assertions in regard to this question can be of no avail. If handloom products have to sell cheaper and if the demand for them in the country is to increase, not only the production costs in that industry itself needs to be appreciably reduced but the raw material for this industry, namely, yarn, has also to be made available to it at a correspondingly workable rate. This means that the solution to the problem hinges on reducing the manufacturing costs of the mill industry.

Would it be possible for the mill industry to so reduce costs? Surely, the industry can be said to have attained a measure of efficiency now, which, although it may not compare very favourable with some of the more advanced countries, should be taken as good enough to permit economic production of textiles, given certain other conditions. Mere technical efficiency, in the absence of other prerequisites or co-existing conditions, cannot bring about the much desired reduction in costs.

It may be said that rehabilitation of machinery, rationalisation and more scientific research can all help to reduce the costs of production. But these are complicated questions with which other problems—for example, availability of foreign exchange, protection to indigenous machinery and many others—are related and hence these could only be long-range solutions for the problem of costs, or at any rate not immediate solutions which could bring succour to the distressed weavers.

Certain Hard Facts

Meanwhile, there are certain hard facts which are worthy to be noted and which make it practically impossible for the mill industry to market their yarn below par, without jeopardising their very existence now or in the near future. With the price of raw cotton at 8 annas and wages at 4 annas in the rupee, there is no possibility of effecting any reduction in prices. Governmental control over production, which has still not been withdrawn, the haphazard change in policy regarding import and export, and the spate of hurried labour legislations all act as disincentives to more production. And yet it is a truism that only by more production can the price of yarn be brought down.

This brings in the question whether production control is still necessary in the present context. Controls were necessary and introduced at a time when there were serious shortages in yarn and cloth, with the idea of ensuring equitable distribution of these commodities. Production having reached peak or record levels in 1952 and promising to be even better in 1953, the continuance of production control has become unnecessary. It can serve no useful purpose in the present context of a buyers' market. In this connection, I venture to put forth my humble suggestion that the time has come to implement the recommendations of the Working Party for the Cotton Textile Industry led by Sir A. Ramaswamy Mudaliar. The party reported that the industry itself, through the various millowners' organisations, should regulate the production control and check the tendency to produce unwanted varieties or of inferior quality by some of the mills. In order to maintain some production standard, the party has stated that the Government should revive the suggestions put forward by the Textile Production (Control) Committee of 1948 and appoint a team of technical experts whose main functions would be to suggest ways and means of improving the technical efficiency of the mills.

Is Reservation Necessary?

While on the subject of production control, something has to be said on the scheme of reservation in certain fields for the benefit of the handloom industry. This is a highly controversial subject and much might be said for and against it.

The humanitarian aspect of providing employment to the weavers has been stressed by Mr. C. Rajagopalachari to the exclusion of every other consideration. He knows better than anybody the peculiar condition of the handloom weavers, particularly in South India, and his mature wisdom and practical statesmenship can be depended upon to invest his utterances with the weight to which they are undoubtedly entitled. His sincerity and belief that the measure is bound to prove beneficial to this largest cottage industry cannot be denied, having regard to the background and historical development of the handloom industry in the South.

It is not only the 5 lakhs weavers in Madras State (before Andhra's separation) that have to be provided with their livelihood to continue their hereditary occupation, but four times that figure. As per the Fact-Finding Committee, we may assume that, on an average, there are three other dependents attached to every weaver. This means that virtually a population of 20,00,000 has to be supported by the handloom industry in the State. Nearly three-fourths of the weavers are employed in cotton weaving, while a small proportion only is engaged in making silk, woollen or other products. In Madras, again, 87 per cent. of the 5 lakhs are full-timers and only some among the rest are taking it as an occupation subsidiary to agriculture in the rural areas. We have it also on the authority of the Fact-Finding Committee of 1942 that, in the Madras and Andhra States alone, 39 per cent. of the looms were concentrated in about 49 urban centres. The percentage of weaver populations in cities like Madura, Coimbatore and Salem are 30.25 and 28, respectively.

Yarn Supplies

The volume of opinion against reservation of any kind is also considerable. In the first place, it is pointed out that, judging from the results so far seen, the scheme of partial reservation has not really been such a success as to merit its extension further. At any rate, so far as the South is concerned, there has been no real rivalry between the mill industry and the handloom industry, for they have been more complementary to each other for several decades. In spite of the growth of indigenous mills, the position of the handloom industry has not altered anything appreciably during the last 30 to 40 years. The quantum of availability of yarn to it remains steadily always just the same. The South Indian mills have played the game admirably by catering to the exact needs of the handloom industry in this part of the country. The counts of yarn most in demand by the handloom are upto 40s and the consumption of such yarn by the handlooms in Madras State is 81 per cent. counts above 40s accounting for the rest. The types of cotton locally or near about available, like the popular varieties Karunganni and Cambodia, could easily spin upto 40s warp. Mills in the South have not been slow in exploiting this natural advantage to the maximum extent and spinning mostly 40s and below with these cottons to supply the handlooms. Only mills which were spinning fine and superfine counts, in a few instances, were getting their requirements of long-staple cotton from the Punjab before the Partition or importing such cotton. In most cases, by utilising local varieties of cotton and thus saving on transportation charges, they were reducing their costs of production of coarse and medium counts required by the handloom. If the handlooms were dependent on the mills for their raw product, yarn, the mills equally found their advantage in the ready and nearer market for their goods at the handloom centres of the South. Such immediate chances of disposal and facilities for conversion of their invested capital into ready money acted as good incentives for more entrepreneurs to start spinning mills in the South. That accounts for Madras

taking the largest share in the spindlage expansion under the post-war expansion programme also.

Unintelligible

Again, all talk about reservation of manufacture of *dhotis* and coloured *saris* to handlooms becomes unintelligible when it is remembered that, by and large, the handloom weaving industry's products in the South comprise only *dhotis* and *saris*, which it has ever been doing. Madras handlooms manufacture 200 million yards of *dhotis* and *saris*, as against the all-India production of 600 million yards and the estimated demand in the country of 2,000 million yards. People in the rural parts still prefer handloom coloured *saris* to mill-made ones and India is made up of lakhs of villages. It may be noted here that, as much as 82 per cent. of India's total population lives in rural areas. According to the Fact-Finding Committee, only 5 to 10 per cent. of the handloom products are taken for home use, while 80 to 90 per cent. is sold in the Indian markets, the balance 5 to 10 per cent. being exported. The fears that mill production of *dhotis* and coloured *saris* will be to the detriment of the similar handloom productions are more imaginary than real. It is not the production as such that has to be tackled, but the more crucial question of costs. Other things being equal, there is no doubt that the masses prefer the handloom products.

Real assistance to the handloom industry will therefore lie in enabling it to reduce the cost of its manufactures and putting it on a firmer basis economically by strengthening the organisation. In this connection, I have to endorse two valuable suggestions made by the late Dr. S. P. Mookerjee. The first is that yarn has to be supplied at reasonable rates to the weavers which cannot be done without subsidising it. Secondly, production by handlooms should be standardised and a marketing organisation set up. This organisation should purchase the entire output and sell it to consumers at reasonable prices.

A Retrograde Step

It is seen, therefore, that any assistance given to the handloom industry at the expense of the mill industry, which has saved the country and come to its rescue at a crucial moment during war, will be retrograde in nature. Production by the mills is bound to suffer by any scheme of restrictions. That will inevitably raise the costs of manufacture to the mills with the result that the position will be rendered more difficult for mills to supply cheaper yarn to the handloom industry. Commenting on the multiplication of reservations, the Federation of Indian Chambers of Commerce and Industry has put it ably thus:

"Then in the context of the buyers' market, the mills can maintain or increase employment provided by them only by increasing the output of other varieties of cloth. To the extent that these other varieties are also produced by the handlooms, it would mean that either the mills would not be able to sell their production or that the handloom production of these varieties will have to be curtailed."

Lest I should be misunderstood, I hasten to say that Government should by all means do everything possible to resuscitate the vitality of the handloom industry in the country, which has existed for ages and had been at one time the glory of ancient India. But this must be done within the limits of their own resources and without affecting the future of a sister industry which has immense potentialities. It would be foolish to kill the goose that lays golden eggs.

Now the question may be asked whether, in view of the South Indian spinning industry playing such a notable part in the well-being of the handloom industry, it need remain only so or go on developing to perfection its role as a spinner of yarn for the handloom industry, without ambition to enlarge its weaving enterprises which are, comparatively speaking, very poor in the context of the total strength in the Union.

It is gathered from the Report of Sir A. Ramaswamy Mudaliar's Working Party that there are 85 mills in the Madras State, with a spindlage of 18,94,178 and loomage of 8,295 as on 31st August, 1951. In the whole of the Union, we have 445 mills, with 1,12,40,635 spindles and 2,01,484 looms. That is, our spindlage forms about 17 per cent. and loomage about 4 per cent. of the total. This great disparity between spindlage and loomage has got to be minimised, for it is reckoned that one loom is equivalent to 40 spindles. On this basis, we require yet over 39,000 looms to achieve the equilibrium, whereas, in the Bombay State alone, the looms form 67 per cent. of the total. We could, therefore, go a long way to increase production of cloth in the South. We have excellent natural facilities, such as climate, abundant labour, talent, etc., which, I am afraid, we have not availed of to the fullest extent that we can do.

Textile Machinery

The next problem with which we in the South should concern ourselves is what contribution we could make towards the further industrialisation of the country. By industrialisation, I contemplate not only the manufacture of consumer goods but also the manufacture of the necessary machinery to produce those consumer goods. Foreign competition is ever growing. If we want to exist against it, we must become self-reliant in our machinery manufacture, for only then we could reduce our cost of production and compare favourably with our competitors in the overseas markets for our products. India's imports of spinning, weaving and processing machinery were worth Rs. 141 millions in 1949-50, Rs. 72.7 millions in 1950-51 and Rs. 73.1 millions in 1951-52. What a colossal drain on our foreign exchange?

Thanks to the first Five-year Plan and the starting of the Textile Machinery Corporation (TEXMACO) Calcutta, the Textool Co., Ltd., Coimbatore, the Acme Manufacturing Co., Ltd., the Machinery Manufacturers' Corporation Ltd. (M.M.C.), the National Machinery Manufacturers' Ltd. (N.M.M.), the Ramakrishna Industrials Ltd., Coimbatore, we are indeed making some notable progress in spinning machinery manufacture. For looms there are the Texmaco (Gwalior) Ltd., the Cooper Engineering Ltd., India Machinery Co., Ltd., and the Mysore Machinery Manufacturers Ltd. We should wish for the ever-growing success of these institutions. In this connection, I have to point out the hope expressed by the Working Party that "by the constant guidance of the Tariff Commission, the capital goods industry which we wish to see encouraged and strengthened will play its proper part in furnishing to the country the right type of capital goods which can bear comparison in quality with any of the foreign imported goods."

Great Future Ahead

With proper planning, I hold that the textile industry in the South has still a great future before it, although the war (or post-war) boom has disappeared, recession in prices has occurred and a buyers' market has replaced a sellers'. The numerous hydro-electric projects that have already come into existence and the others yet to come could give us cheap power. With our experience, it has been proved that it is only a myth that one has to find Rs. 40-50 lakhs for starting a spinning unit, but that about Rs. 10-12 lakhs would be quite adequate. The special advantage of the South is that the mills here are small units, but quite efficient. Many of them have comparatively newer machinery. Last but not least, the advantage is that most mills are situated in cotton-growing-cum-consuming areas, which makes their output economical by avoiding huge transport charges, pressing and baling charges, etc.

Potentialities

Venturesome capitalists to start new undertakings or expand existing units could yet be found. With newer and up-to-date machinery, the South will be able to give better quality yarn to the handloom industry. As the South Indian mills have succeeded in capturing a good market in East Bengal and wrested the prerogative formerly enjoyed by the Bombay spinning mills, so too they will be able to hold their own pre-eminent position in spinning industry in the South, nay, in the whole of the Union, provided they proceed on right lines. The potentialities for their expanding in weaving departments are also largely present, only to be exploited. For spinning coarse and medium counts our local cottons will suffice, and if the State Government's efforts to evolve superior types of long-staple cotton with the assistance of the Union Government prove successful, ere long our mills can also take up the production of fine and super-fine counts more economically and compete on equal terms with our sister mills in Bombay and Ahmedabad. The era of controls, I hope, will soon pass. A large part of it has already gone. With Government direction and control confined to the barest extent necessary and the industry allowed to develop on private initiative, I am sure the South Indian mill industry will play a useful role in putting India on the industrial map of the world.—*All Rights Reserved.*

How banking serves the RUBBER INDUSTRY

RUBBER was first planted commercially in India in 1902. Today Indian rubber plantations, concentrated in Travancore-Cochin and Malabar, produce 20,000 tons of rubber every year, valued at four and a half crores of rupees. More than 250 Indian factories depend on this output for their production of finished goods.

Without banking, this growth could never have taken place. The facilities and guidance offered by a good bank, such as the availability of ready funds when needed and the collection of dues in any part of the country, have become part of the structure of the rubber industry.

We at Palai are proud that so many important rubber producers, and indeed leading firms in every field of business and industry in South India, employ the *complete* banking service we offer.

Current Accounts—Demand Drafts—Telegraphic Transfers—Bill Collection—Letters of Credit—Deposits—Investments—Loans & Overdrafts—Confidential Credit Reports, etc.

* * *

If you have business interests in the South, it will pay you to open an account with us. Our 24 branches are strategically located, 22 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

WORLD SUPPLY OF OILS AND FATS

PRE-WAR PER CAPITA AVAILABILITY RESTORED

THE current supply position of oils and fats throughout the world shows that many prophets during the earlier post-World War II years were too pessimistic and did not make sufficient allowances for the power of high prices to stimulate production. That the shortage of supplies during the first five post-war years was sufficiently acute to push prices to 10 or 12 times their pre-war level, when the general cost of living and the prices of other groups of commodities showed rises of only three to six times, is too painfully recent a memory to require recall to any oil or fat consumer, which includes all of us. The analysis of the current position in the world suggests, however, that, at least for the time being, the worst is over and we can look forward to a period during which prices will rule at about the three to four times pre-war level, at which the prices of so many other commodity groups and the cost of living indices of many countries seem to have stabilised.

The following table shows that, by 1952, world production over the whole range of vegetable, animal and marine edible and industrial oils and fats had reached a figure of 24,546,000 metric tons, or almost three million tons higher than the average of the five pre-war years. This increase corresponds to one of almost 330,000,000 in world population over the same period and gives an average *per capita* availability of 22 lbs. per annum, as compared with the figure of 22.3 lbs. prevailing before the war of 1939-45:

Estimated World Production of Oils and Fats
(In terms of oil or fat)
(Metric tons (000's)

	Pre-war	1952	Gain (+) Loss (−)
AMERICAS			
Production	5,100,000	7,433,000	+2,333,000
Exports	810,000	1,219,000	+ 409,000
Retained for use	4,290,000	6,214,000	+1,924,000
ASIA AND OCEANIA			
Production	8,417,000	7,884,000	— 533,000
Exports	2,709,000	1,793,000	— 916,000
Retained for use	5,708,000	6,085,000	+ 377,000
INDIA, CEYLON AND PAKISTAN			
Production	2,490,000	2,351,000	— 139,000

Retained for use	1,901,000	2,039,000	+ 138,000

The contrast afforded by these figures becomes even more marked when it is considered that, by far the largest part of the world population increase, which has taken place during the last one and a half decades, has taken place in the East and South-East Asian region, where the crops have declined whilst, in the North American area, which has seen the most considerable increase in supplies, the use of synthetic detergents has reached a point where considerable economy in the use of oils and fats can be effected to the benefit of the consumer of edible oils. Furthermore, the pre-war consumption of oils and fats per head in America was, at 65 lbs. per annum high enough to give little room for expansion, whilst the consumption per head per annum in East and South-East Asia at barely one-fifth of this figure was, and still is, so low as to be a growing source of anxiety to the Dietetic Experts and the Health Authorities of the area.

As we have seen above, one feature of this changed pattern of production and supply has been that the East and South-East Asian region has been contributing each year less and less supply to world markets and using a bigger proportion themselves. What little quantities have been exported have been as a result of the pressing need to earn foreign exchange rather than from any complacency based on the assumption that such quantities can be spared from a genuine surplus. On the other hand, stocks have been piling up in North America to a point where they are becoming a distinct embarrassment to the stockists and prices there have, in the last year or two, tended to decline to a point where, in spite of the dollar shortage, many countries have been tempted to buy from there, both to meet their day-to-day consumption requirements and to build up their strategic stockpiles.

Estimated World Production of Oils and Fats
(In terms of oil or fat)
(Metric tons (000's)

Oil or fat	*Main producing country*	*Pre-war*	1951	1952 *Preliminary*	1953 *Forecast*

	Estimated World Total	21,587	23,641	24,546	23,636

* Includes mowrah, niger, hempseed, perilla seed and other minor oils.

Within the total figure of world production, however, there are many sharp changes not only in the relative supply of various oils and various groups but, even more seriously, in the supply position in various areas, so that there is still a sharp degree of off-balance between the supply and the demand in many fields.

Increase Mainly in Americas

In the edible type soft oils, the increased supply has largely been in soya oil and that too mostly in the U.S.A. Cottonseed oil has also shown a marked increase, again predominantly in the U.S.A. On the other hand, groundnuts are still being produced in quantities lower than in the pre-war years by an amount equivalent to almost 200,000 tons oil, and the decrease in cropping is

Accumulation of Stocks

As was pointed out at the Congress of the International Association of Oilseed Crushers earlier this year in Holland, evidence shows that, although pre-war *per capita* consumption could have been restored in 1952, in fact average world consumption did not revert to pre-war levels and very large stocks have been built up. It is well known that the use of synthetic detergents both in industry and in the homes of the North American and European families to replace soap products has increased sharply over the last few years, until, by 1952, half a million tons a year of oils and fats, which would have gone to the soap industry, are now being saved for edible consumption. It is also apparent that, during the years when linseed oil was so highly priced and difficult to obtain in quantity, consumers have turned to a wide range of synthetic materials for use as vehicles in their paints, varnishes, printing inks, etc., and have found these new products very satisfactory. Now that linseed oil is again cheap and readily available, the buyers of pre-war days are not coming forward with any eagerness to revert to their pre-war formulae. Even after allowing for such known changes in the pattern of consumption, however, it seems as though other reasons must be sought to explain the huge stock build-up over the past few years. It may be that, in Europe, which was traditionally the biggest importing area for those oil and fats entering world markets, supplies have been so severely rationed for so long, either by Government action or by price, that dishes calling for a large quantity of fat have tended to drop out of the diet, except on special occasions, and that a permanent change of eating habits has been established in this habitually high fat-consuming area. In any case, as the rate at which stocks are accumulating or being liquidated is such a vital factor in any market, the extent of these stocks deserves a more detailed study.

Stocks

According to the figures presented to the International Association of Oilseed Crushers in June, 1953, the main excess stocks at the end of 1952 over the normal requirements of trade and consumption were as follows:—

	Tons
Estimated strategic stockpiles in U.S.A. and Europe	500,000
Further stocks held by the U.S. Government acquired under their Agricultural Price Support Programme for:—	
Cottonseed oil	400,000
Butter	50,000
Linseed oil	200,000
Total	1,150,000
Oil unsold in the hands of the producers from the 1951-52 whale and sperm oil catch at the end of 1952	100,000
Castor seed (as oil) from the previous crop unsold in the hands of Brazilian producers at the end of 1952	50,000
Surplus carry-over stocks of other oils in other producing countries at the end of 1952	300,000
Grand Total	1,600,000

It has been estimated that this huge excess stock, which represents almost 7 per cent. of the world annual production, or more significantly almost 30 per cent. of total world annual exports, has been accumulated, at least to the extent of one million tons, during 1951 and 1952. During these two years, the average world production was 24,095,000 tons per annum so that, if, each year, half a million tons went into the building up of stocks, the world would appear satisfied for the moment with only 23½ million tons or an average *per capita* consumption rate of about 21.4 lbs. per annum. If this is the case, the reduced production estimated in 1953 will still be sufficient to go round, even if none of the excess stocks held at the end of 1952 are liquidated during 1953 or early in 1954. This is particularly the case as most of the drop in production between 1952 and 1953 is in respect of olive oil, where the huge 1½ million tons crop in 1951-52 was followed by a slightly subnormal 758,000 ton crop in 1952 53. As the average crop and consumption is only 8/900,000 tons, there was a large carry-over into the latter crop year and supplies will be adequate to provide a slightly above normal carry-over into 1954.

U.S. Key Factor

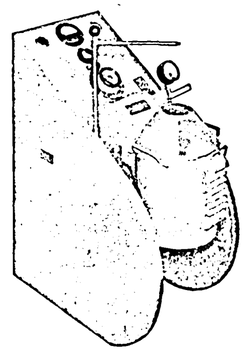
Even though, of the excess stocks mentioned above, it is unlikely that any Government will try to liquidate the strategic stocks built up at such great expense, there seem to be good reasons for assuming that the Commodity Credit Corporation is becoming increasingly anxious to liquidate some part at least of the large cottonseed oil and butter holdings, and they have already sold some 10,000 tons of their linseed oil. If these stocks are liquidated into the American domestic market, it can only frustrate the desire of the American Government to support prices for this and next year's harvests and curtail demand for soya oil, which will thus be driven on to the overseas markets or back into the hands of the C.C.C. It seems probable, therefore, that any liquidation can only take place after means have been found to overcome the shortage of dollars so as to make the liquidated stocks, or the other oils they replace, available to foreign markets. It also seems probable that the surplus stocks held in producing countries will be liquidated to a large extent as soon as buyers can be found, and it is virtually certain that neither producing nor importing countries will wish to increase stocks any further.

Although it is always very dangerous to attempt to prophesy, there do seem good grounds in all the above for hoping that, at least for the next year or so, price levels in international markets will fluctuate between three and four times pre-war, or in conformity with the apparent general decrease in the purchasing power of the various monetary units. In this context, it now behoves us to examine our own position and see how it compares with that of the rest of the world. In doing so we find that, when the rest of the world had reached a point where supply had at last caught up with or even outstripped demand, and prices were reverting to more reasonable levels, India found herself more short of edible oils, and with prices at a higher level, than was ever the case during the previous years.

India

The contradiction between the world position and that in India arises, as do so many of India's misfortunes, from the failure of the rains. The 1952 monsoon failed over many of the groundnut-growing areas which supply some 600,000 tons towards India's total fat supply in a normal season, a figure not exceeded even by ghee, the production of which, according to the latest estimate of the Ghee Marketing Committee, is only 411,000 tons out of the total fat supply of about 2,000,000 tons produced in India in 1952. As a result of monsoon failures in the groundnut-growing areas, only some 1,500,000 tons of groundnut seeds were harvested against a crop average over the previous five years of almost 2,000,000 tons of kernels. On

WILD-BARFIELD FURNACES



Above WILD-BARFIELD Electrode Salt Bath Furnace, Model ESB. 346, for hardening high speed steel. Available ex-stock.

Modern Heat-treatment furnaces manufactured by our Parent Company, Messrs. Wild-Barfield Electric Furnaces Ltd., and G.W.B. Electric Furnaces Ltd., of Watford and Dudley, England, coupled with the specialised technical service which we are able to offer to our customers in India, will guarantee you satisfaction in all respects.

We can supply all types of furnaces, ranging from the small laboratory muffles and ovens, to big industrial plants, either electric, oil, coal, gas or solid fuel fired furnaces. Standard electric furnaces are often supplied from ready stock.

We also have pleasure in announcing that our Principals now manufacture and supply G.W.B.-TAGLIAFERRI Arc Melting Furnaces.

BOMBAY AND CALCUTTA (INDIA) AND

Habib Bank (Overseas) Limited, RANGOON (BURMA) AND COLOMBO (CEYLON).

All kinds of banking business including foreign exchange business such as opening of Letters of Credit, collection and negotiation of Foreign Bills, remittances to Foreign Countries and issuance of Travellers Cheques, all over the world, undertaken.

this count alone, the supply for 1952-53 was reduced by 200,000 tons of oil, or almost 10 per cent. of the total, and other oilseeds growing in areas affected by the monsoon failure probably cost India a further 5 per cent. of her normal supply during the past 12 months. It can be seen, therefore, that the shortage of supplies during the last 12 months, and the consequent record high prices, are a result of a local condition and a temporary diminution in the harvest and cannot be regarded as having any material bearing on the future supply or price prospects. It must always remain a major factor, however, until such time as the efforts of the Indian Central Oilseeds Committee bear fruit, and the much discussed irrigation projects reach fruition, that a bad monsoon can leave India with insufficient fats to meet her needs for a year, and consequently make the markets again pass through a phase when there seems no limit to the height to which prices can go.

Prospects Comfortable

For the coming 12 months, the prospects look far more comfortable. The rains on the whole have been kind; in some areas, they have been even too plentiful and an even better crop would have been produced had they fallen with a little less weight or stopped a little earlier. On the whole, the crops are good, and the main contributor, the groundnut crop, should this year put into the oils and fats pool of this country rather more than the average for the past five years. The Government esimates are not yet available to us, but the trade have estimated the crop to be even as high as 2,500,000 tons of groundnut kernels which, if it were true, would presage prices lower than we have seen for many years. In view of partial damage in some areas arising from excessive and late rains, however, it would appear preferable to be cautious, as the Central Government have now learned, and make no wildly optimistic guesses about the crop. A conservative 2,200,000 tons might confidently be expected, which would nicely cover the fact that, with so little last year, the carry-over was much less than normal and the pipeline between the farmer and the oil consumer is empty. If there is more than this, and that will only be known in January when the Madras areas, which supply almost half of the total, are ready to harvest their goods, then the increased quantities might well be offered to the overseas markets through the medium of enhanced quotas. With the complete absence of carry-over stocks, however, for the Government to listen to the plea of interested shippers and allow large exports before the crop has been assessed with accuracy, could well cause a very serious shortage again should the crop not come up to present expectation. During the past few years, India has too often found herself sorry and, this year, we feel that the Government would be better advised to be safe.

As far as the other vegetable oilseeds are concerned, it also appears that the crops will show a marginally above-average yield, and generally it appears that, in 1954, India can look forward as happily as can the outside world to a period when supplies are available in quantity and at prices more in line with the general cost of living index than has been the case for a long time past. With the industrial oils, in which the price is so much subject to the manipulations of the speculator, linseed oil found its way into the diet in increased quantities when the normal oils were short and high-priced earlier this year and, should the foreign buyer not be prepared to pay for the surplus that India can produce, the same thing might well happen again, until the farmer decided to transfer some of the acres at present devoted to linseed into some other crop that brought him a better return and his country a higher food value. With castorseed, carry-over stocks from the past season seem high, largely because speculation over the past few months has prevented exports from taking place by holding the price out of line with that ruling abroad. With a new crop and a fairly good one expected shortly, it seems doubtful whether the speculators can continue to hold the price higher than that quoted by Brazil, and shipments should soon be resumed even if the Government do not come to the aid of the speculator by falling in with recent requests to reduce or remove export duties.

No Grounds for Complacency

Even though the world supply position for the immediate future looks reasonably secure, there can be no grounds for complacency, as the continued increase in the number of mouths to be fed is a fact that can never be ignored. Production, which was sufficient to allow for the accumulation of stocks during 1951-52, would be inadequate to feed the world's growing population a few years hence. Plans to increase supplies still further must, therefore, be pushed ahead, both in the outside world and more particularly in India where production has decreased and the population is increasing at a higher rate than in many other countries. One would have expected our Five-year Plan to have been more ambitious in this respect, and it is particularly surprising that the potentialities of increased food supplies through, for instance, increased groundnut production are almost ignored in Community Projects programmes. During the last 15 years or so, the yield per acre of land under groundnut has steadily declined; this should be remedied, as it could be by the use of more scientific methods and higher yielding seeds.

India's interests also require that not only must exports continue to be limited to prevent supplies being spirited away to countries with a higher purchasing power, but every effort to bring all available fat into efficient use must continue to be developed. The processing of all available supplies of suitable varieties of cottonseed, at present the largest unexploited source of oil, must be pushed ahead with all necessary Government support. To this end, it is of the greatest importance that Government should take the most energetic steps through education and propaganda to secure the full acceptance by the farmer of cottonseed cake as a feed for cattle, in lieu of whole cottonseed which results in the oil content of the cottonseed being largely wasted. The *vanaspati* industry must step up its efforts to spread the use of groundnut oil, despised as an edible oil in many parts of the country, by presenting it in the more palatable and wholesome form that *vanaspati* gives to it. The use of the more efficient power mill must be extended and not sacrificed to the emotional appeal of the inefficient *ghani*. These and all other possible methods of still further increasing supplies must be pressed forward as matters of urgency, if the *per capita* supply is to be brought up even to the world average, or if the added millions of five and ten years hence are to be maintained even at the present sub-standard dietary level.—*All Rights Reserved.*

NEW INDIA STORIES FROM LIFE 1

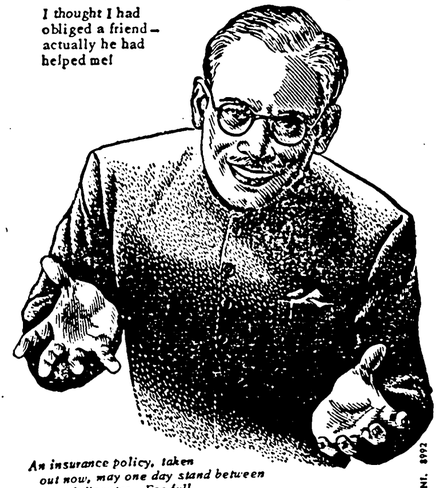
'My good turn helped me most'

MY FRIEND'S son came to sell me insurance. My business was doing well, and I thought I did not need any. But the boy was so young and enthusiastic, that just to encourage him and please his father, I agreed to take out a policy.

Some years later, business slackened and everything I touched seemed to fail. My business took some hard knocks; and my partner got too ill to share my problems. I had to reorganise, but where was the necessary capital to come from? The only solution was to sell our house—and it was my wife's pride and joy.

Then my young friend dropped in to remind me that my New India Endowment Assurance policy would mature shortly. What a wonderful relief! I would get the money I sorely needed at exactly the right time.

I thought I had obliged a friend—actually he had helped me!



An insurance policy, taken out now, may one day stand between you and disaster. For full information write to

PLANTING IN INDEPENDENT INDIA

ITS IMPORTANCE TO NATIONAL ECONOMY GREAT

IT was nearly half a century ago that India wrested the leadership from China as the largest exporter of tea. Since then, that position has remained unassailed and other plantation crops of India have been developed. Still, it is tea that remains the largest single plantation crop. Coffee is also an introduced crop, which pre-dates tea and has been grown in India for nearly three centuries. At one time, India produced enough coffee to meet the home demand and export over 25,000 tons. Rubber is another introduced crop but of comparatively recent origin.

The other plantation crops which are native to India or have been introduced in the far distant past are pepper, coconut, arecanut, cashew, tapioca and orange. But these crops are largely grown on peasant holdings and are not organised or held on a scale capable of being considered plantations. Yet, they are crops best exploited on a plantations scale, as is done in other countries which offer substantial competition to India in the world markets.

Plantations do not have a good name in subject countries or countries which still remember their colonial days. Most of the plantation crops were introduced to serve the needs of the colonial powers at the time and many cruel features of colonialism are closely associated with plantations. But for all its raw exploitation, it achieved two distinct economic gains for the countries where the crops were introduced. One was that plantation organisation and management pointed the way to applying the industrial concept of management to agriculture and the other was that it provided a source of earning of valuable foreign exchange.

A careful reappraisal of the role of plantations seems to be called for, particularly in view of the controversy that raged round the industry throughout 1953. Whatever its origin, the plantation industry is the largest organised industry, responsible for providing more employment and capable of expanding further than any other single industry in the country.

Importance of Tea

Tea, as stated earlier, is the most important among plantation crops. There are 752,244 acres under tea, yielding about 620 million pounds a year. India's requirement of tea is about 180 million pounds and all the rest finds a profitable outlet in the world markets. Last year (1952-53), India earned Rs. 80.30 crores in foreign exchange through exports of tea, of which over Rs. 10 crores were in dollars. India's earnings were higher in 1951-52 when the value of tea exported was Rs. 93.36 crores. During the two years, India exported 425¼ million (1951-52) and 423¾ million pounds and met 50 per cent. of the world demand for black tea or 45 per cent. of all, including green teas appearing in export trade.

Tea faced its second greatest crisis of the half century during 1952-53. But it was a crisis the causes of which are being still studied. Was it a wholly unexpected aftermath of the removal of control in Britain? Was it the result of trade manipulations? Was it the effective protest of consumers against coarse tea and high prices? Or, was there too much of tea in the world?

The war-time controls and distributive methods have introduced certain new features in trading which the trade cannot apparently discard for very good reasons. Price of tea is four to five times higher than pre-war and the trade has to invest as many times more capital on its stocks than it did before the war for the same quantity of tea. War-time distribution was so phased as to maintain a large control stock and a minimum quantity in effective circulation.

In the third quarter of last year, preceding the removal of all controls, the stock in the U.K. bonded warehouses remained as high as 140 to 160 million pounds or over three months' supplies. But trade opinion was that blenders and packers maintained a low inventory position.

It was firmly believed at one time that 1951-52 offered 37 million pounds of tea more than what the world could absorb and part of the restriction scheme introduced in 1952-53 rests on this belief. But, with less than 90 million pounds in the U.K. bonded warehouses, with no diminution in world exports prices appear to hold steadily at 1s. 6d. to 1s. 9d. per pound higher than last year at this time.

By Valale I. Chacko

The Northern Indian gardens which introduced the restriction scheme, has reduced the cut and India's total output may suffer only by about 10 million pounds at the end of the year. So, the tea available in 1953 is not any lower than in 1951 or 1952 and still the market holds up at 1s. 6d. higher per pound at the London auctions than they did last year or early this year.

World Consumption Higher?

If the world consumption of tea has been advancing to take care of the expanded output of the post-war years, the International Tea Market Expansion Board has done a better job than it has been credited with. What is more important, it indicates the prospects which face the world tea industry, in which India still retains a lead.

The depression in the 1952-53 season showed on what a precarious balance the economy of the tea industry rests. Tea is a pleasant beverage which adds to the enjoyment of life, but is by no means an indispensable item in the lives of people. Long habit may force some consumption, but high prices or non-availability can considerably reduce the frequency of consumption, and prevent the spread of the habit in new generations. Tea is not the only beverage available. There are many others available in countries where we seek to sell tea. So Indian tea faces competition not only from other world producers but also from other beverages as well. While competition has increased, the cost of production has also increased, making tea less capable of facing the competition. The rigidity set in costs by other factors than the real value of tea abroad is probably the biggest threat to the future of this valuable crop.

Danger of Static Phase

All products on which the production of tea depends are costlier than they have been and this affects all industries. If the cost structure is built up, including wages, on this basis, the position of tea would have been no better, perhaps, but assuredly, no worse than that of other commodities. But Independent India is going ahead with labour legislation and the welfare concept at a rate that the element of labour cost in the total is only capable of further increase. Rationalisation or mechanisation which involves a reduction of labour would be acceptable neither to labour nor to the Government. In other words, the industry's flexibility to adjust itself to the market has been practically eliminated by its obligation to maintain a static posture with regard to employment and employment conditions. The freedom to apply managerial techniques to reduce costs and to make the product more attractive is practically eliminated, whilst two imponderables hang over the industry. One is that the prices can fall, over which the producer has no control. The other is that India's competitors, bound by no such restrictions, can introduce modern methods of production and management and thereby cheapen their product. Faced with such prospects, the tea industry is in danger of entering a static phase, holding on to what it has, as best it could, and hesitant to invest either talent or money. The ease with which the economy of the tea industry in a whole district collapsed and wiped out the hard-won reserves of many years is symptomatic of the rigidity imposed on the industry.

Marketing Developments

Subject to these considerations, the development of the markets and the methods of marketing assume some importance. There was a fear that the re-opening of the London tea market would adversely affect the markets laboriously built up in Calcutta, Cochin and Colombo. Actually, the restoration of Mincing Lane auctions has not had the effect that was feared. Much of the tea that was contracted out to the Ministry of Food continues to go over on a consignment basis, but if there has been a gain it was all in favour of local markets. Both Calcutta and Cochin tea trade have increased the volume of tea they handle and in Ceylon the restrictions placed on consignable grades have increased the amount of high quality teas available on offer at the Colombo sales. The gradual adjustment which this permits, the change-over from a highly centralized and long established London market to local centres, is the most significant development in the world tea trade. The trading skills and handling facilities which were developed in over two centuries are now being drawn to Calcutta, Cochin and Colombo. It probably represents a far greater gain than any change forced by legislation.

It is not yet recognised by many in the country, as well as in the industry, that the creation of goodwill for a product and for the product of a country is indispensable as a part of building up a sales force.

A recognition of this is particularly lacking in India and, since the return for a given promotional effort is not precisely calculable, the role of propaganda itself is discounted. When political considerations enter this slippery field, the results of the type we have observed in the last year or two are unavoidable. The increasing intervention of the Government on methods of publicity and propaganda is directly traceable to a serious confusion of ideas. The Government has neither the professional skill nor the flexibility to operate efficiently in this highly specialised field and somehow the industry finds itself helpless against the Government attitude on this question. The sudden and unreasoned withdrawal from the International Tea Market Expansion Board was such a decision taken by the Government without even consulting the particular machinery set up by it to provide the necessary advice.

Of all the likely mistakes in the re-orientation of policies in keeping with national interests, the interference in the handling of trade publicity and propaganda are the least excusable. This is a mistake which may be sooner or later corrected but it is at the moment, inextricably confused with the larger industrial policies in which sphere the Government could usefully intervene. The provisions of the controversial Tea Act of this year indicate the direction in which Government's ideas of control are moving. It seeks not merely the right to overall supervision and regulation, but detailed direction and control. The representative character of the Indian Central Tea Board has been altered fundamentally and with that the nature of the Board. It is not the producers who shall select their representatives, but the Government who shall decide which organisations are to be recognised and who shall be their representatives. The Government reserves to itself the right to dismiss the Board and re-appoint a new one at any time it so desires. These amazing provisions are probably intended to provide the Government with absolute control over the Board. But, in doing so, it also takes away the scope for initiative from the Board and from those in the Board who fully understand the industry and could offer opinions that represent the views of the industry. It is likely, as the Minister for Commerce and Industry has often stated, that the Board will be largely left free to work itself. If this is in fact what happens when the Board is set up under the new Act, there are two dangerous possibilities and a long period of uncertainty.

Dangerous Possibilities

Uncertainty arises from not knowing in what matters and on what occasions the Government would intervene and where exactly the division of responsibility can be marked. In the absence of any clear idea of the sphere in which they can safely take a decision and effectuate it, there would be no initiative from within the Board. If the Board fails, the blame would more likely fall on itself than the Government. Bereft of initiative and dependent on Government pleasure, the Board would lose its dynamism and with it the industry and the leadership it has the right to expect since so much of power over the industry is legally vested in the Board.

The difficulty experienced in the setting up of industrial or commodity Boards is not confined to the plantations or to this country. The difficulty lies in trying to wed two conflicting interests by means of the Board. The producer and consumer interests are being placed face to face within the Board, the Government shifting its support from one side to the other. So long as the interests of the producers are most vitally concerned, it is they who will always prove to be the section which will take the closest interest in the working of the Board, and by replacing it without anything to take its place the Government paralyses the Board.

If this is true of the Tea Board, it is true of all the Boards that will be set up under similar legislation. The real difficulty is that the Government has no means to curb the interests of producers dominating all other interests in the working of the Boards and what it seeks to set up are Boards incapable of serving any interests.

Coffee

Next to tea, the best known plantation crop is coffee. This industry attracted even greater measure of criticism than tea during the year. Certain basic facts of coffee are still not known widely enough to place the criticism of the industry sensibly.

Coffee was introduced into India about three centuries ago and it has been cultivated on peasant holdings for a long time in Mysore. Its development on a plantation scale began only at the beginning of the last century. The tracts of the hill slopes of the Western Ghats were opened to coffee cultivation. At one time the acreage

exceeded 300,000 and production was large enough to enable exports of 25,000 tons.

Since the beginning of this century, coffee fell on evil days and what coffee could not be wiped out by pests and diseases were abandoned by poverty and helplessness. Most of the growers who remained were in debt and many had no right over the crops they raised, because they were already in debt to the money-lending merchants to whom the crops were mortgaged. The main achievement of the Coffee Board was that, in about ten years, coffee growers were re-investing their profits in the expansion of the industry, the improvement of cultivation and plants and the betterment of their workers' living conditions.

The area under coffee has increased from 1,80,412 acres in 1941-42 to 2,35,374 acres by 1950-51.

The crop has increased from about 16,000 tons to 23,000 tons. Workers employed in coffee have gone up from 1,06,038 to 1,77,297.

Consumption of coffee within India has risen from 7,500 tons to 18,000 to 20,000 tons.

Indian coffee prices since 1949 have been about two-thirds to one half of the world prices.

This formidable record of progress and achievement by an industry which had been in the throes of a chronic depression of ten years in 1939 and faced the unexpected loss of the Continental market in 1940, was something of a miracle. But, if it were a miracle, it was achieved by three or four consolidating measures which only a Board constituted as the Coffee Board was and commanding the confidence of the producers could have done. In the first place, the propaganda efforts of the Board were brilliantly conceived and ably carried out. Next, the centralised, co-operative marketing method gave effective control over the prices and the market. Thirdly, the research programme of the Board advanced planters' knowledge and cultural practices. The record of the industry is probably the best proof of the soundness of these measures. All the areas newly planted have not begun to yield and, if the average yield accepted for costing were taken as the normal, the total yield would be over 36,000 tons.

Most of the arguments applicable to control over tea is equally valid for coffee. But, in coffee, certain other factors have a bearing on the matter. Coffee prices are not legally controlled, but the existing provisions of the Coffee Act provide the Government with ample powers over the Board and it has been used to restrict the return payable to the growers from the proceeds of pool sales.

Government's Responsibility

The myth has been created, with a few strands of truth, that coffee prices are too high and that the Government must bring it down. The truth is that the Government itself was responsible for the forcing up of prices during 1952. It forced the Board to export more coffee than was safe, because, from 1948 to 1952, the Government was in favour of exports even if it hurt the Indian consumers. The reversal of this policy was a late 1952 product.

In early 1952, the price of plantation A was Rs. 222-2 per cwt., which included Rs. 21 excise duty, Re. 1 cess and the usual Board charges. At this rate, the net price of coffee was nearly half the world prices for equivalent coffees. If the weight of duty were taken out of the wholesale price index of coffee, the increase in coffee prices since 1939 would show to be smaller than many products with which coffee could be exchanged. These two comparisons would indicate the true price status of coffee. If coffee could be treated like any other agricultural crop and if the highly personal policies which were evident during this year are abandoned, coffee has the brightest future among plantation crops.

Rubber

The enquiry by the Tariff Commission and the fixation of prices have done much to stabilise the rubber industry and to encourage its development. The most important feature of this year's rubber market was the presence of large stocks with producers, the reduction of which became a problem. There appears to be some truth in the contention that many growers concealed stocks until the Tariff Commission report on prices was notified. Another fact was that there had been a genuine increase in production, as a result of areas planted since 1942 coming into bearing. The full effect of this development has not yet been felt, but it will be in the course of the next three or four years as new acreage of fresh, young trees of higher-yelding varieties come into bearing.

From the existing area of 173,000 acres over 23,000 tons of rubber can be expected when it is all in full bearing.

If the country's consumer potential for rubber goods of various types were fully exploited, the estimated production of rubber from the present area would be inadequate. In Indonesia, Malaya and Ceylon, rehabilitation of rubber is taking place at a quicker pace and yields of 2,000 lbs. and over per acre have been achieved. If a sound development policy were adopted, the area now occupied by rubber could be reduced, while increasing the output of rubber. Rubber is fortunately located in areas where the sub-marginal producer could put his land under substitute crops.

In both rubber and coffee, one of the biggest problems is the large number of uneconomic holdings. The lower the acreage the less efficient the production.

Coffee Yield According to Size of Holdings

Size of estates	No. of estates	Acreage	Production approximate basis	Average yield per acre
		Acres	Tons	Cwts.
Below 5 ..	21,442	30,532	1,750	..
5 to 10 ..	2,491	15,060	694	0 87
10 to 25 ..	1,820	28,217	1,219	0 93
25 to 50 ..	501	16,165	985	1 12
50 to 100 ..	357	23,870	1,600	1 35
100 to 150 ..	128	19,018	1,060	1 60
150 to 200 ..	56	11,775	1,005	1 88
200 and above	303	87,939	10,022	2 24
Unregistered Estates ..	1,204	2,950	100	..
.. Total	28,436	2,35,374	18,405	1 91
Arabica ..		..	1,68,010 acres.	
Robusta ..		..	67,358 ..	

The above figures indicate the significant relationship between size of holdings and yield. If the national average could be raised to the average already obtained by large holdings, it would mean the creation of an additional quantity of 8,700 tons in exportable coffee, about Rs. 7 crores in foreign earnings and gainful employment for a few thousands of people.

Other Plantation Crops

Tea, coffee and rubber do not exhaust the number of plantation crops. Cashew is a crop which is receiving more notice. The tree was introduced to India from Brazil by the Portuguese, who found it suitable for the prevention of soil erosion in the undulating country on the west coast. The tree is hardy and is well able to stand the drought conditions frequently met with in that area. The commercial exploitation of the kernel of its nuts as an edible article is of relatively recent origin. The first consignment was probably made in 1925. Since then, the development was rapid and, in 1952, about 27,000 tons of cashew kernels, representing 100,800 tons of raw nuts, were exported from India. Most of this went to the United States.

The cashew industry has certain special features in its factory organisation, production methods and export practices. For about 60,000-70,000 tons of raw nuts, India is dependent on East Africa from where Indian traders buy cashewnuts from the natives in exchange for textiles and other Indian goods. This trade is concentrated in the hands of a few people.

Indian production of cashewnut is in the neighbourhood of 45,000 tons, but 70 per cent. of the processing industry is concentrated in the Quilon area. One important reason for this particular development is that the raw nut is dried, roasted, shelled, peeled, sorted and packed for the market mostly by hand. The industry is estimated to employ about 100,000 people and there has been very small progress in the mechanisation of the processing operations.

Given below are figures relating to imports of raw nuts and exports of cashew kernels with their values:

Cashewnut Imports

	Tons	Rs.
1950-51	54,956	2,48,55,692
1951-52	42,356	3,27,10,343
1952-53	51,662	4,05,83,275

Export of Kernels

1950-51	25,393	8,55,12,663
1951-52	21,262	9,93,17,980
1952-53	27,417	12,70,42,581

Pepper

The pepper bonanza is coming to an end and concern is being expressed about its future. Pepper is the berry of a plant native to India and, during the last two and a half centuries, the world market was supplied by Indonesia and Sarawak which countries developed them on plantation lines. In 1941, the Indonesian export exceeded 70,000 tons. Indian exports normally did not exceed 3,000 tons in the inter-war period, but as imports were made in large quantities, it was not a net exporting country.

Indonesia, Sarawak, Indo-China and other suppliers were eliminated from the Western markets during the war, leaving India as the largest supplier. The war-time controls were relaxed in 1946 and all except destinational regulations removed from November 1947. By then two developments had taken place. One was that the large stocks held by the American trade had been exhausted and it was found that the producers in the Malayan Archipelago would take several years before their ruined industry would be rehabilitated.

The pre-war world consumption of pepper was estimated at 57,000 tons, of which the United States accounted for about 27,000 tons. In 1947 the total world supply did not exceed 27,000 tons. Some of the accumulated stocks with growers in India came out that year, and, during the next five years, India dominated the world pepper market. Prices reached fantastic levels; producers, who readily parted with their crop at Rs. 80 per candy in 1940, were reluctant to sell at Rs. 4.200 in 1950.

The United States was the largest market for pepper and given below are figures of imports and price per pound.

Black Pepper

	Tons	Price per lb. U.S. dollars
1947	16,271	0 304
1948	12,326	0 44
1949	11,243	0 82
1950	14,409	1 41
1951	10,510	1 56
1952	11,983	1 37

The war-time experience and the large finance involved in holding large stocks have transformed American ideas of large inventories and they turned to small stocks and quick turnover. The largest section of consumers, the meat packers, are doing with far less pepper than they have been used to. The American youth is now almost unfamiliar with pepper as a flavouring agent. These have their immediate and long-term effects. In addition to all these, 1953 brought into the market the first fruits of rehabilitation in Sarawak and Indonesia. Over 10,000 tons were offered from these two sources.

The future of pepper depends on popularising the spice and it cannot be promoted at a fancy price. As it is, the Government which imposed 30 per cent. export duty on the fixed value of Rs. 400 per cwt. when the price ruled at Rs. 700 per cwt. has not lowered the rate, although prices have been Rs. 300 per cwt. since August.

Lemongrass

Lemongrass oil produced by India is of the best quality available of its kind. Its high solubility and citral content have always commanded a premium in the overseas markets. Normal Indian output is below 400 tons, but, during 1950-51, no less than 512 tons were exported. The U.S. market, which received 80 per cent. of its lemongrass oil supply from India six years ago, reduced her indent on India to 15 per cent. by 1952. Guatemala and Haiti have largely taken over India's place as the larest supplier.

Lemongrass oil production in India is entirely primitive and cultivation of the grass is in small holdings. There are some 8,000 holdings, with a total acreage of 25,000 in this industry and most of it is concentrated in the areas adjoining Cochin. Yield per acre is low, being about three pounds per 1,000 pounds of grass, too low to give an economic return to the producer at current prices.

Coconut and Arecanut

Except a few units, coconut and arecanut holdings are not organised on a plantation scale. The Coconut and Arecanut Committees are devoting considerable attention to the development of these two crops, but their efforts are retarded by the unorganised nature of the industry. While tea, coffee and rubber have greatly augmented production and employment, the more important coconut industry is producing far short of the home demand. For a producer country, India pays the highest price for the coconut and arecanut products it consumes and it will change only when the industry is organised.

The greatest contribution that the planting industry has made is applying modern industrial management techniques to agriculture. This could not have been done without sufficiently large units of holdings and without a sound organisation of producers. It was inevitable that an industry so well organised as planting should also act as a force in the formation of other organisations. The labour movement in the industry is still in its infancy, but its vigorous presence is beginning to be felt. If the producers in coconut, arecanut pepper and cashew are not organised, their workers are even less organised. Therefore, planting is the only sector of agriculture which has a standard to maintain with regard to labour housing, medical help and physical well-being. In addition, it provides steady employment for most part of the year. The industry's outlay on housing, schools, communications, health measures and care of the sick and young is probably the highest in the rupee, as compared with any other industry in India. Yet the noisiest political clamour which emanated from the controversy this year had as its ideal the disintegration of units. Very largely, this attitude originates from the land-hunger of rural India. But the land put to use by the plantation industry is on the hills and slopes of mountains which does not take away the peasant's land on the plains. The planters wrested it from the jungle and malaria and extended communications, conserved top soil, increased employment and national wealth.

There are some 500,000 acres still capable of bearing plantation crops in the South in the shadows of the Sahiadri. Of the three hill crops mentioned, coffee has the greatest future and over 100,000 acres are suitable for growing coffee. Every 1,000 acres of plantations opened up adds nearly 1,000 workers to the ranks of the employed, 200 new housing units, new roads and communications perhaps, a new settlement and township on the hills and more exportable products for the nation. Planting has a role to play in the India of tomorrow.—*All Rights Reserved.*

THE CENTRAL BANK OF INDIA, LIMITED

(ESTABLISHED DECEMBER, 1911)

Head Office:

MAHATMA GANDHI ROAD, FORT, BOMBAY, 1

COFFEE--THE KEY TO THE MALNAD

VAST SCOPE FOR INCREASING EMPLOYMENT

By Ivor Bull
Managing Director, Consolidated Coffee Estates (1943) Ltd., Pollibetta

THE Malnad, literally the 'hill country' of the South, is confined, strictly speaking to the western hill areas of Bombay, Mysore, Coorg and Madras, which receive the south-western monsoon, but, by implication, the whole of the area, running eastwards from the mountainous spine of the Western Ghats from Bombay through the Wynaad to South Travancore, comes within this definition, including spurs such as the Nilgiris, the Palnis and the Anamalais. The rainfall decreases steeply from some 200" or so, where the S.W. monsoon hits the Ghats, to 45" to 50", where the Malnad joins the drier *maidan* country. It is this monsoon mountainous region, covered with evergreen jungle in the higher rainfall areas, bamboo deciduous jungle in the medium rainfall areas and including lakhs of acres of waste land under lantana and scrub jungle, which is the source of the streams and rivers which feed the great river projects of the plains.

It is largely a waste area particularly in the north, but it contains wide stretches of country capable of development under paddy, dairy farming, areca, cardamoms, pepper and above all under coffee. Communications are poor throughout much of the Malnad, and this has handicapped the development of one of the greatest of India's untapped natural sources of wealth. Malaria, which was until recently the scourge of this region, is successfully controlled to-day.

In the forests, timber awaits roads for its extraction; many of the swamps which are natural throughout this zone, and which are potential fertile paddy fields, lie neglected on account of poor communications or the ravages of wild animals. Further south, wherever the land has been opened up under plantation crops, most of the wet land is cultivated, for the wild animals have withdrawn to the jungles.

Main Plantation Crops

Tea and coffee are the main plantation crops, but cardamoms and pepper are also important, whilst rubber is chiefly grown in the lower foot-hills of the Ghats.

Of these crops, coffee and cardamoms are of outstanding value, for both are grown under a canopy of shade and the mulch from the shade trees provides a build-up of humus, which assists the retention of springs and streams, whereas severe erosion results from open cultivation and water supplies, which should be permanent, dry up annually. Neither crop is competitive with any food crop, but cardamoms require evergreen shade and unless grown in a valley, require heavy rainfall for their cultivation, and, of the vast area with a rainfall of 50" to 90", most of which is suitable for coffee, comparatively little is suitable for cardamoms. To increase the cardamom crop, the main need is for new roads driven right into the heart of the evergreen jungle, to reach the western side of the Ghats.

Home of Indian Coffee

Practically the whole of the Indian coffee crop is grown in the southern part of the Malnad, beginning with the Chickmagalur District of Mysore State, and tapering off in Travancore, and a planned expansion of this industry provides the simplest and cheapest way of developing most of this neglected area.

It is necessary to refer briefly to the past history of Indian coffee, so that a true appreciation of to-day's position may be made.

Coffee was introduced as a commercial crop about 1845, and its production quickly spread throughout our southern hills, reaching a peak area of some 3 lakhs acres in 1890. The market itself shows a constant history of booms, followed by violent recessions, and, as a result of these recessions, the area under coffee gradually shrunk, till, in 1939, the acreage was only 2 lakhs, and even much of this area was being cultivated on subsistence lines.

India produces just over 1 per cent. of the world's coffee supplies, but the high quality of Indian arabica coffee is so widely recognised that there is an unsatisfied demand for it abroad. There is also a steady demand for our robusta coffee.

For many years, Brazil was responsible for two-thirds of the world's production, and it used this dominating position to introduce various schemes to stabilise world coffee prices. Brazil alone paid for these schemes and other countries took advantage of them to increase their plantings. Finally, Brazil was unable to support the structure it had created and, in 1929, its last stabilisation scheme broke down and the coffee industry throughout the world entered on a painful and deep depression which lasted for ten years.

In India, the effects of the depression are fresh in the memories of all older planters, and the results of it are still evident in many districts. Much coffee and, in some cases, whole estates were abandoned; both the Mysore and Coorg Governments issued special distress coffee loans to assist planters; company dividends were negligible or nil; practically no capital expenditure on labour quarters and buildings could be undertaken, and, in most cases, either additional capital had to be pumped into the business to keep it going or heavy additional debts were incurred for the same purpose. Many of the skilled labourers left the industry for their villages and the loss of these highly trained cultivators is still felt. Ryots who supplied the estates with grain were equally affected, and the price of paddy fell to unprecedented levels.

Tea and rubber, due to their international marketing schemes, weathered the depression of the 'thirties with a measure of success denied to coffee, which was engaged in a struggle for survival.

Origin of Coffee Board

Coffee was still in the doldrums in 1939 and, with the outbreak of war, prices fell still further. When Germany overran Europe in 1940, the major part of our export market was lost, and as two-thirds of its production had always been exported, it was feared that the industry had received its death-blow. The Central Government came to the assistance of the industry and, following a conference of all interests held in 1940, an ordinance was issued, to be followed later by an Act, whereby the whole of the coffee produced on the larger estates, which was formerly marketed abroad, was delivered to the first Commodity Board to be established, the Indian Coffee Board, for its disposal. This was followed, two years later, by the compulsory delivery of the whole of the crop from all estates, and the co-operative system of marketing coffee assumed its present form.

To ensure that the grower received a return which would at least enable him to survive till the end of the war, a higher price was fixed for sales in India, so that the lower prices received from exports could be averaged up. Until 1945-46, the Indian consumer paid up to Rs. 15 to Rs. 17 a cwt. more than the world price for his plantation coffee, but from 1946-47 onwards, the export price has been higher than the internal release price. ("Plantation" coffee is washed arabica coffee, peeled, graded and prepared for the market. Cherry coffees are unwashed, being dried in the sun and then hulled, after which they receive much the same preparation for sale as does plantation coffee).

For the last five-years, the difference has been very great, and to-day the Indian consumer can purchase his plantation coffee at one-half and his robusta coffee at two-thirds of the price which these coffees fetch abroad.

Due to the work of the Indian Coffee Board, the period 1940 to 1953 has been one of steady development in the industry. The area under coffee has increased by 40,000 acres, much of which is still immature, for it takes from five to seven years to bring coffee into bearing; production has increased from about 17,000 tons to 22/23,000 tons, internal consumption has been increased by 8,000 tons, and employment has been practically doubled. Thanks to this increase in production, and the consequent rewards that exports have brought to the industry, internal prices have been subsidised to an extent which enables coffee to be sold in India at some Rs. 100 a cwt. for robusta and Rs. 200 a cwt. for arabica plantation, below the world price, and this, despite the fact that all coffee sold in India bears a heavy excise duty of Rs. 21 a cwt. These are some of the benefits which a well-designed and carefully administered Commodity Board have brought to the country.

Some Facts

To fill in part of the background of the coffee industry to-day, two tables are given below:

TABLE 1—*Area and production in the principal producing States*

States	*Acres*	*Average production for 4 years, 1949-50 to 1952-53 (In tons)*	*Percentage of column 4 to total*
1. Madras ..	99,770	6,193	29 82
2. Mysore ..	93,368	6,969	32 93
3. Coorg ..	47,940	7,340	34 07
4. Others	1,960	545	2 59
Total ..	2,40,038	20,987	100 00

TABLE 2—*Analysis of Estates according to their size and yield as in 1951-52*

Size of estates in acres	*Number of estates*	*Acreage acres*	*Production approx.*	*Average yield per acre in cwt.*
Below 5	21,412	30,532	1,150	..
5 to 10	2,491	15,060	694	..
10 to 25	1,920	28,217	1,219	0 97
25 to 50	565	16,105	915	1 12
50 to 100	347	21,879	1,606	1 35
100 to 150	194	19,048	1,606	1 66
150 to 200	88	11,775	1,106	1 88
200 and above ..	303	87,939	10,022	2 23
Unregistered estates ..	1,204	2,059	100	..
Total ..	24,430	2,33,374	18,408	1 91
	Acreage in 1952-53			
Arabica			..	1,68,300
Robusta			..	71,700
		Total ..		2,40,038

As will be seen above, two main varieties of coffee are grown—arabica and robusta. Until about 1910, only arabica coffee was produced, but about that year, robusta coffee was introduced from Java and planted out on a field scale. For a long time, the area under robusta was relatively unimportant, but, from the depression days of 1930 onwards, there has been a rapid expansion in its planting. In 1947-48, for the first time, the robusta crop of 8,830 tons exceeded the arabica crop of 6,970 tons. In 1952-53, the robusta crop rose to 10,667 tons, the arabica crop being 12,253 tons. In the twelve seasons between 1941-42 and 1952-53, the area under arabica has increased from 1,52,000 acres to 1,68,300 acres, though the six-yearly average annual crop has fallen from 14,017 tons to 13,405 tons. In the same period, the area under robusta has increased from 28,500 acres to 71,700 acres, and the six-yearly average crop has increased from 4,239 tons to 6,805 tons.

If times are more difficult, the turnover from arabica to robusta will be accelerated, for robusta is, in certain ways, hardier than arabica, though to obtain proper yields equal care has to be given to its cultivation. Its harvest is later and is more convenient for the many ryots and planters who also grow paddy, while its cultivation involves the employment of only two-thirds of the labourers employed in growing arabica. Its value is approximately two-thirds of the value of plantation coffee.

Factors to be Considered

The following factors have now to be considered:

(a) There exists a world shortage of coffee to-day, and as far as can be seen, this shortage will continue for some time ahead.
(b) It is estimated that there is at least 2½ lakhs acres in the southern hills, of unused land, which could be opened under first-class coffee.
(c) To cultivate 100 acres of arabica 100 labourers are required. To cultivate 100 acres of robusta 66 labourers are required. On an average, every labourer supports half a dependant.
(d) For every 1,000 labourers employed, approximately twenty educated staff or artisans are required together with two officer grade staff.
(e) If the present pattern of production between larger estates and ryot holdings is maintained, a further 28,000 ryots could be settled on some 95,000 of these acres, but, allowing for to-day's trends, it is more likely that 10/15,000 small planters would be settled on 1,80,000 acres and and that the remaining 70,000 acres would be more economically opened up by the larger estates.
(f) The protection which coffee gives both to the soil and to the moisture in the soil. Coffee and cardamoms are the only crops grown in these areas under which there can be an actual positive build-up of humus in the soil.
(g) India is already more than self-sufficient in her coffee production, and every additional ton produced will, therefore, add to her exports.
(h) An export of 1,000 tons of plantation to-day should earn ninety lakhs of foreign exchange. At the other end of the scale, an export of 1,000 tons of robusta will earn some forty-five lakhs of exchange. A planned increase in production must have a target figure which will more than double to-day's crop within fifteen years. This would enable some 24,000 tons of coffee to be exported annually, worth, say, Rs. 17 crores.

Employment Potential

Such a plan for the development of the coffee industry would rehabilitate and transform much of the neglected Malnad area. With the opening of coffee, the abandoned swamps would also come under paddy cultivation, pepper crops would be increased by several thousand tons, for in Coorg and the Wynaad pepper is readily grown as something more than a catch crop in the coffee estates, and ravine areas would come under cardamoms.

Another two lakhs families could find employment under coffee alone and almost an equal number would

be employed in the cultivation of other crops, and in the trading and development of the town, village and country life of this region.

There was correspondence which was recently dropped regarding a proposal to send 10,000 Indian families to Borneo. It is surely better for twenty times this number to be settled happily in the hills of their own country.

New life would be given to the villages and townships.

New home markets would be found for the products of the fertiliser factories, the cotton mills and other businesses which cater for the agricultural and building needs of estates and for the daily needs of those who work on them and in the villages.

Land revenue receipts would increase as also would agricultural income-tax receipts in States like Coorg and Travancore.

Are these possibilities of development and rewards for development dreams, or are they practical proposals? Of course, they can be carried out successfully, provided that knowledge, thought, confidence and patience are brought to the problem.

A Commission Needed

They require and deserve the study of an experienced and impartial Commission, and, as immediate results are possible, the work of the Commission might well be divided into three parts:

Part One.—To report on the quickest way in which the low average yield of coffee from the existing area can be increased.

Part Two.—To report on the best way of developing the vast area which is so suited for coffee cultivation.

Part Three.—To report on how to link Parts one and two with the general development of the whole Malnad area, remembering the assistance which coffee alone can give to the fulfilment of the final plan. Here the data already collected by the Malnad Improvement Committee should be of invaluable service.

There is a degree of urgency about the study of these problems. The world price of plantation coffee will not always remain at a premium of Rs. 200 a cwt. over its internal value, nor robusta at a premium of Rs. 100 a cwt. But, whilst any major premium exists, the cost of opening up this area can be greatly assisted by the consumer abroad, provided the development is properly planned.

Some Concrete Suggestions

It would be wrong to try and anticipate the findings of such a Commission, but, as regards Parts one and two, the following notes might receive consideration:

(i) In most cases, it will be necessary to confine the initial efforts to land which may have been opened under coffee one hundred years ago or more and later abandoned. Certain of these old estates have been successfully re-opened in recent years.

(ii) There were formerly coffee estates in Shimoga District and, although these have now practically disappeared, a scientific and practical attempt should be made to ascertain the northern boundary for coffee, using new plant material and modern methods of cultivation.

(iii) The Board's Research Department has brought valuable and practical results to the industry. In particular, the work on improved heavy bearing, disease-resistant strains of arabica coffee is far advanced and some strains have been developed which could transform many coffee estates.

(iv) The problem of passing the knowledge gained at the research station to planters is already being tackled by the Board through the organisation of an extension service which will soon be well under way. The officers engaged are being trained on selected, well run estates, so that, in addition to their technical capabilities, they will also understand the practical side of coffee cultivation.

(v) Private enterprise should be associated with every step of the development work. The training of the Extension Service Officers is an instance of what can be done. When suitable Government land is thrown open for settlement by planters, much waste of money will be saved if would-be planters receive a similar thorough training of at least one year on well-run private estates or on Government Demonstration Farms. This will sift the wheat from the chaff and give applicants an opportunity to decide after a year of estate work whether they really wish to become planters.

(vi) The successful food cultivator is rightly honoured and publicised as a Krishi Pundit. At the moment, the successful planter, for reasons which are obscure, sometimes appears to be considered as an anti-social individual. Yet, in both cases, the same observation, earnestness, study and love of one's work are required to bring success, and the same joy and pride of achievement are felt, only the crops are different. Unless these views alter, they will act as a deterrent to the progress of the industry.

Intensive Cultivation Needed

Some of the most efficient coffee planting in the world is being carried out on estates in India, the best work of all being on private estates. The results achieved and their method of achievement deserve the widest publicity, for it is only through improved methods that improved crops can be gathered; and it is only through raising the yield that costs can be reduced and any progress made in raising standards of living. The more intensive the cultivation, the greater the number of labourers who can be employed.

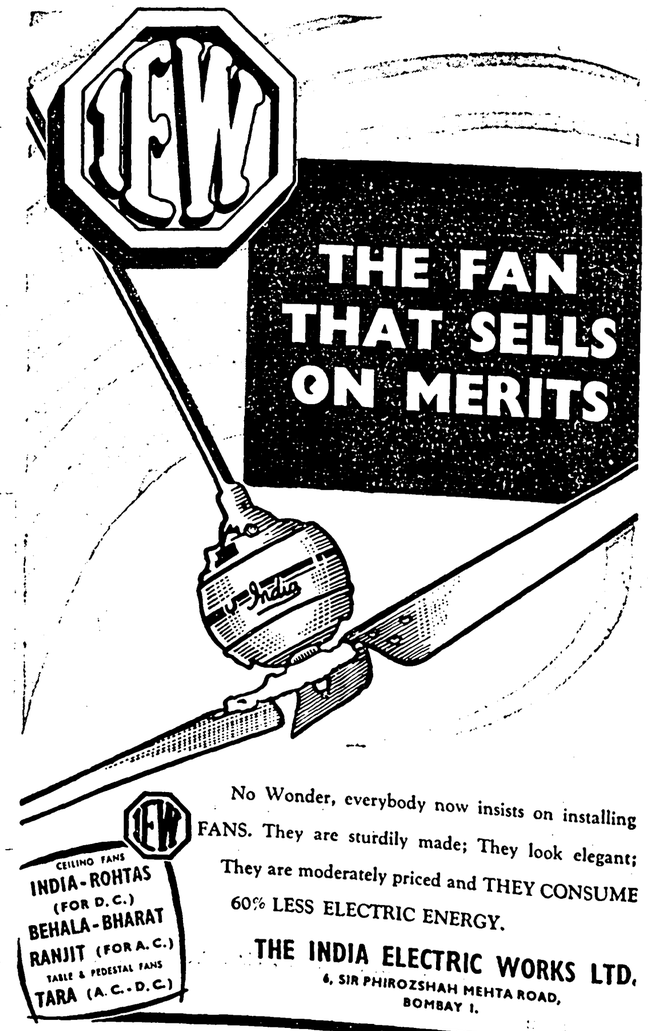
(vii) The first efforts of the Extension Service must be aimed at the smaller producer. Although there are many small ryots whose work is first class by any standard, it will be realised from Table 2 that, on an average, the lowest yields in the country come from the smallest estates. It is suggested that, in each coffee, zone, a selection of these small growers should be made by the Board whose estates could be used as demonstration farms.

Such demonstration farms would serve as models for their neighbours. Costs would have to be carefully kept, for the only answer which will really influence their neighbour is, does the practice recommended and the cost involved pay? This must be proved beyond doubt.

Let all these matters await the report of the Commission. Coffee can be the agent for transforming the face of much of this neglected area, for making a real easement of the unpublicised unemployment and marginal employment in the rural areas of the south. It could also be one of India's largest earners of foreign exchange.

One day, the potential wealth of the Malnad must be developed, and it is unlikely that it can ever be done in more favourable circumstances than those of to-day.

A plan for the development of the coffee industry can be the key which opens the door to the riches of this region. It is not too late for this project to be included even now in the last years of the Five-year Plan. The benefits would be immediate and lasting, and, with courage and determination brought to the task, the project could not fail.—*All Rights Reserved.*



No Wonder, everybody now insists on installing FANS. They are sturdily made; They look elegant; They are moderately priced and THEY CONSUME 60% LESS ELECTRIC ENERGY.

PLASTICS INDUSTRY IN INDIA
SCOPE FOR INCREASING EXPORTS

THE slump in March-April, 1952, had affected the plastics industry very adversely. There has, however, been partial recovery from it in 1953. Nevertheless, high cost of living and unemployment, and the consequent shrinkage of market, have brought about stagnation in production. Profit margins have been considerably lower, owing to paucity of demand and panic sales by weaker units. The rate of production is at present very low, although output of goods in individual units has recorded a slight improvement. There is, however, one encouraging development of late, namely, production of new varieties of plastic goods, which will surely have a salutary effect on the plastics industry as a whole.

In the face of all this, the properly organised units and the manufacturers with proper industrial basis in the form of facilities for new moulds, research, variety of products, different lines of manufacture (injection moulding, compression moulding and fabrication, etc.), and sound distribution organisation have been able to display some strength and to come into their own. Not that the lot of such manufacturers is better, but they have been able to avoid closure of factories and to continue production.

The prices of plastic goods have fallen considerably, while costs of raw materials and labour have increased. The margin of profit has, therefore, been substantially reduced. This has made it necessary for the manufacturers to increase their capacity or to go in for new products with a view to keeping their units economic. Thus, some factories have come to be endowed with double tasks, namely, of marketing their already existing production and of marketing new production. In these circumstances, a good selling organisation has become a vital necessity for manufacturers continuing production.

Raw Materials

Polystyrene moulding powder, the material which accounts for nearly 70 per cent. consumption of plastics raw materials in India, continued to be imported under O.G.L. from soft currency areas. This material is imported mainly from the United Kingdom. Of late, moulding powders are also offered from Germany and Italy, and it is expected that, in the near future, the bulk of the raw materials may come to be supplied from these countries.

Before 1952, the production of polystyrene moulding powder in the U.K. was very limited. At that time, this powder was allowed to be imported from the U.S.A. and Canada under O.G.L. The cancellation of O.G.L. for imports of powder from dollar areas, however, has resulted in a complete diversion of trade to the sterling area. In this connection, the following figures reveal an interesting pattern:

Total Imports of Plastic Materials and Manufactures Thereof

		1950-51	1951-52	1952-53
Synthetic resins and moulding powder	Cwt.	80,846	80,052	76,402
	Rs.	1,13,74,164	1,58,15,816	1,40,10,706
Semi-fabricated plastic materials	Qty. lbs.	46,66,928	97,07,330	87,53,401
Finished plastic goods (not otherwise classified) ..	Qty. Rs.	1,05,050	12,43,762	11,30,354

Country-wise Imports of Plastic Materials and Manufactures Thereof

	1950-51 Rs.	1951-52 Rs.	1952-53 Rs.
From U.K.	67,97,243	1,38,88,869	1,38,64,187
,, Canada	24,51,257	42,42,479	16,60,289
,, U.S.A.	53,40,228	43,91,624	41,20,466
,, Other countries	9,54,176	43,34,136	42,82,209
Total ..	1,51,46,942	2,68,56,063	2,39,03,551

It would be in the interests of the Indian industry if the raw materials were allowed to be freely imported from dollar areas also, as this would make imports possible at competitive prices and thereby resulting in reduction of costs of production, which is most essential at this stage.

Cellulose acetate moulding powder and urea formaldehyde moulding powder, which were under O.G.L. in 1952, have been brought under import control during 1953. Open general licence for urea formaldehyde moulding powder made imports of wood-filled urea powder possible, which directly competed with indigenously manufactured P.F. moulding powder; the present import control for U.F. powder is desirable from that point of view.

During the period, the search for new products has resulted in increasing consumption of materials like special P.F. powders, cellulose acetate, polyethylene and special grades of polystyrene.

Indigenous Raw Materials

P.F. moulding powders are being manufactured locally. The production in 1951, 1952 and during the eight months of 1953 is 459,600 lbs., 667,200 lbs. and 533,300 lbs., respectively. The

By R. C. Shah

average monthly production works out to 38 300 lbs., 55,600 lbs. and 66,600 lbs. for the years 1951, 1952 and 1953, respectively. It will thus be seen that there is increase in the production of P.F. moulding powders. The production of P.F. moulding powders locally will be further encouraged, if rebate of duty is allowed to all indigenous manufacturers. Presently, the manufacture of P.F. moulding powders is protected. For individual firms producing to the extent of 200 tons and above, a refund of duty is given on raw materials imported, namely, phenol and formaldehyde. The present estimated demand for P.F. moulding powders is only about 300 to 400 tons a year. Three firms are engaged in the manufacture of this product. As such, it is not possible that all the three firms can produce to the extent of 200 tons and above individually and can also market their production. At the same time, it is necessary that the production should be encouraged. In view of this, it is very desirable that the limit of production of P.F. moulding powders, required to qualify for rebate of duty on raw materials—phenol and formaldehyde—should be reduced from 200 tons to 50 tons per annum. The case for a review of the plastics industry for protection is coming up before the Tariff Commission, and it is hoped that this very important aspect of indigenous manufacture of phenol formaldehyde moulding powders will be reviewed in its proper perspective.

Laminated sheets are also now being satisfactorily manufactured and their production has improved. In the year 1952, their production was about 40 tons, while in 1953, it is expected to be about 80 tons. Production is also likely to commence during the year for P.V.C. plastics sheets (unsupported).

The industry is becoming more and more conscious of the need for indigenous manufacture of raw materials. Certain schemes are being examined by certain parties. Besides, the All-India Plastics Manufacturers' Association, in pursuance to the resolution passed at the sixth annual conference, has set up for raw materials manufacture a committee comprising representatives of plastics industry, chemical industry, and research and technical institutions to work out schemes for indigenous manufacture of raw materials, such as polystyrene, polyvinyl chloride, cellulose acetate, polyethylene, polyvinyl acetate, urea, formaldehyde and phenol.

Production

The production of plastics products was 1,446,000 gross and 1,544,400 gross during the years 1951 and 1952, respectively. The production during the first six months of 1953 was 633,600 gross. The monthly average of production works out to 120,500 gross for 1951, 128,700 gross for 1952 and 126,700 gross for 1953. It will be seen from these figures that the production during 1953 is much lower than in 1952. The conditions are actually worse, even as compared to conditions during 1952. Due to paucity of sales, some of the factories have actually closed down. Many other factories are also working on the basis of one or two shifts production, as against the usual three shifts production.

A further analysis of production reveals two marked trends. First, some factories had to close down or curtail production on account of unremunerative prices and accumulation of stocks, following lack of sales. Secondly, for factories, which continued production, output had to be increased, as there was the need to find a balance between falling prices, on the one hand, and increasing costs of raw materials and labour, on the other. Under these conditions, the factories had to struggle very hard against numerous odds.

Sales Tax

Apart from the general causes, such as a fall in demand, etc., the industry is much handicapped in respect of shortage of power, increase in cost of labour, and special sales tax levied on plastics products. Though the plastics industry is a basic industry, its products are subjected to a levy of special sales tax, besides the general sales tax. This one factor has done much harm to the continuance of the industry.

It is very significant that, while production in almost all other industries has increased in 1953, that in the plastics industry has gone down. This, in itself, very clearly indicates the critical position of the plastics industry at the moment.

Remedial Measures

The remedies for the alleviation of the difficulties lie in the grant of sufficient power, removal of special sales tax, reduction of duty on raw materials, drawback of duty on raw materials for export, utilisation of existing indigenous capacity fully, all Government purchases being made from local producers, and complete ban on all imported materials and items of stores where plastics is used.

At the moment, no machinery is being manufactured locally, except a few hand presses. The present position in respect of machinery is approximately as under:

	No. of machines	Machine capacity
Injection moulding ..	300	700 ozs.
Compression moulding ..	150	10,000 tons
Extruders	50	From 1" to 4"

Most of the machinery is imported, the suppliers usually being the U.S., England and Germany. In this respect, the following figures for machinery imported in India from the United Kingdom, as compared with the total exports from the U.K. of plastics presses gives very interesting information:

	1948				1949				1950			
	All countries		India		All countries		India		All countries		India	
	No.	Value £	No.	Value £	No.	Value £	No.	Value £	No.	Value £	No.	Value £
Hydraulic presses ..	145	1,34,437	12	16,714	241	2,92,825	42	48,904	224	3,30,081	35	49,550
Other presses ..	196	1,19,604	15	7,737	126	1,65,952	30	57,550	122	1,17,041	23	18,042
Total ..	341	3,03,041	27	24,501	367	4,58,780	72	1,06,454	346	4,47,122	58	67,592

By courtesy: "British Plastics."

Manufacture of plastics moulds is a very important aspect of the industry. There has been good progress in this field. More moulds are now being manufactured locally than before. Further, the manufacture of complicated moulds has also been undertaken now.

This particular aspect of the industry has received good attention during the year. The Government made available to the industry, through the U.N.T.T.A., the services of Mr. Robinson, a plastics expert from the U.K. Mr. Robinson has made a survey of the conditions of the plastics industry and has submitted a report to the Government about it and about the present position of the plastics mould making in India. Besides, Mr. Robinson stayed with certain factories and helped them to develop some moulds. He actually got certain moulds started under his supervision and advised technicians with the plastics factories for the development of these moulds, especially in respect of the designs of complicated moulds, from the point of view of suitable raw materials, types of steel to be used, hardening, run on machines and finishing, etc.

Conclusion

Apart from feeding the home market, the products of the plastics industry are also being exported to countries like South Africa, Iraq, Iran, Egypt, Ceylon, Burma, Indonesia, etc. It is possible to increase the exports of plastics goods to these countries. In order, however, to encourage exports, it is very much necessary that the industry should be allowed the drawback of import duty on raw materials used in the products meant for exports.

The plastics industry is at present producing a variety of products ranging from household items, such as soap boxes, tumblers, combs, etc., to industrial items like bobbins, pirns, pulleys and the like. There is no end to the variety of uses to which plastics can be put. In foreign countries, the plastics industry has achieved the position, not as a secondary or subsidiary industry, but as the main and leading industry. Under the present stage of industrial development of the country, particularly at the time of new projects, the plastics industry can play a very vital and important role.

The plastics industry has been making very valuable contribution to the general industrial development in the U.S.A., the U.K. and other industrialised countries. It has no more remained an "unimportant" industry. The necessity for strengthening this industry cannot be separated and minimised, in the face of increased essentiality for industries and projects like power, buildings, irrigation, radios, aircraft, automobiles, textiles jute, pharmaceutics, etc., to all of which, amongst others, the plastics industry acts as a feeder industry.—*All Rights Reserved.*

THE ALUMINIUM INDUSTRY

PLENTY OF SCOPE FOR EXPANSION IN INDIA

A QUARTER of a century ago, *Commerce* published a report which drew a somewhat alarming picture of the growing rivalry between tin and aluminium—alarming from the point of view of the holder of tin investments—and pointed out that aluminium had been permanently substituted for tin in many foreign countries in the manufacture of food containers. Since then, aluminium has expanded its uses vastly, no less than 4,000 end uses of the metal have developed, and it now competes favourably with copper, lead and zinc in performance and price for many uses. Aluminium's present uses range from spoons to ship superstructures. Its versatility offers a challenge to the ingenuity of designers and fabricators.

In India, however, the metal has only recently made its debut in various industrial applications and a vast potential field yet remains to be developed. This development work has, however, commenced and promises to increase the consumption of aluminium within the next few years to an extent which will fully justify the scheduled expansion of the industry under the National Plan.

The remarkable properties which have helped the metal to come to the forefront are lightness, high electrical conductivity, thermal reflectivity and resistance to corrosion. Malleability and ductility are equally notable properties. The basic characteristics of aluminium are well suited to the requirements of the present technological age, in terms of speed, economy and efficiency. Pure aluminium readily combines with other elements to yield a range of alloys which retain the distinctive lightness of the parent metal and acquire strength values of a high order. In an age of speed, the lightness of aluminium, combines with its high tensile strength, varying from 12,000 to 80,000 pounds per square inch according to the alloying ingredient, makes it the ideal metal for aircraft and other transportation purposes where the elimination of dead weight is of primary significance. The corrosion resistance of aluminium reduces the cost of maintenance, repairs and replacements. As a conductor of electric current aluminium is a serious rival of copper and is fast replacing it, especially for long-distance transmission lines. An excellent conductor of heat, aluminium lends itself well to the manufacture of cooking utensils, household articles and other types of hollow-ware. In other applications, such as roofing and siding the high heat reflectivity of aluminium comes into operation, the radiant heat of the sun being reflected and the interior of the buildings kept cool. Other recommendations of the metal are workability and appearance, helping fabrication and designing.

World Output

These characteristics, which extensive research and engineering have discovered and developed, have made possible the evolution of aluminium from a scarce semi-precious metal to an inexpensive and versatile medium which now leads all non-ferrous metals in volume of production. In 1952, world production of aluminium (excluding the U.S.S.R. and its satellites) was 1,774,000 metric tons, which was considerably greater than the average war-time production. World production has more than doubled at the end of every decade since the twentieth century. Table I shows the world production of aluminium since 1928. The phenomenal increase in the output within the last twenty-five years may be noted. In fact, the volume of world production of aluminium in 1952 for the first time in history exceeded the combined volume of copper, lead and zinc.

1951	1,567
1952	1,774

Aluminium constitutes 8.05 per cent. of the earth's crust and is the main element next to oxygen (46.67 per cent.) and silicon (27.60 per cent.) iron coming fourth with 5.03 per cent. But though the occurrence of aluminium is more than 1½ times that of iron, it is more difficult and more expensive to produce a ton of aluminium than a ton of iron. In fact, an economical solution to the chemical puzzle of releasing aluminium from oxygen, silica and iron oxide was not

By A. L. Sabharwal

accomplished until 1886, when the discovery of reduction by electrolysis was made independently but simultaneously by Hall in America and Heroult in France. This explains why, although widely distributed and the third most abundant element in the earth's crust, aluminium has been produced in metallic form only within the last hundred years or so.

The possibility of starting an aluminium industry in India was considered, from time to time, by scientists and industrialists since 1900, when a company called the Indian Aluminium Company (which had nothing to do with the present company of that name) was formed. The Company's main interest was hollow-ware and not primary aluminium, but it made little progress and soon went out of existence. The possibility of establishing an aluminium industry, however, continued to receive official and public attention and, in the years immediately preceding the last war, the aluminium industry in India was conceived with the formation in 1937-38 of the Aluminium Corporation of India Ltd., and the Aluminium Production Co. of India Ltd. (now known as the Indian Aluminium Company, Ltd.).

The Indian Aluminium Company set up its rolling mills near Calcutta, which started production in August 1941 using imported ingot. A smelter was shortly thereafter set up by the Company near Alwaye (Travancore-Cochin). Finally, in 1948, the Company achieved integrated production by establishing an alumina plant in Muri (Bihar) and bauxite mining facilities at Lohardaga (Bihar). The Aluminium Corporation of India has all its units located together at Jaykanagar near Asansol.

The annual primary aluminium and rolling capacities of these two producers on the eve of the Plan period were:

Annual Capacity

(In long tons)

	Primary aluminium	*Rolling*
I.A.C.	2,500	3,000
Aluminium Corporation	1,500	500
Total	4,000	3,500

Expansion Targets

The first Five-year Plan envisages the expansion of India's primary aluminium capacity to 20,000 tons by 1955-56, so that the respective capacities of the two producers at the end of the Plan period are scheduled to be as under:

Annual Primary Aluminium Producing Capacity

(In long tons)

	1950-51	1955-56
I.A.C.	2,500	15,000
Aluminium Corporation	1,500	5,000
Total	4,000	20,000

This target is to be accomplished by the expansion of the present reduction plants to 5,000 tons and through the building of a new 10,000-ton smelter at Hirakud (Orissa).

During the Plan period, the Corporation expects to increase its annual rolling capacity from 500 tons to 3,000 tons, while the Indian Aluminium Company's rolling capacity is expected to expand from 3,000 tons to 6,500 tons. Rolling is also done by several small fabricators, who are currently estimated to have a total annual capacity of about 6,000 tons.

The expansion has been based on an estimated consumption during the Plan period of 16,000 tons of aluminium per annum, made up of 10,000 tons of circles for utensils, 2,500 tons of wire bars for aluminium cables for power transmission lines, 2,000 tons of sheets for industrial purposes, and 1,500 tons of metal for miscellaneous uses including coiled strips for the manufacture of foil. Since the Planning Commission's report was published, two companies are setting up rod mills, with a total capacity of 8,000 tons per annum, for meeting the requirements of A.C.S.R.

Production

Table II shows the trend in production of primary aluminium in India since 1943:

TABLE II

Production

(In long tons)

Year		Year	
1943	1,272	1949	3,400
1944	1,723	1950	3,506
1945	2,254	1951	3,848
1946	3,236	1952	3,848
1947	3,214	1953 (estimated)	3,566
1948	3,301		3,500

The decline in 1952 and 1953, as compared with 1951, was mainly the result of power shortage.

Consumption

The current annual demand for aluminium in India is estimated at 8,000 to 10,000 tons. The metal is consumed mostly in rolled form. As the production of virgin metal in the country is below 4,000 tons, the balance of the consumption is met by imports.

Imports

Table III shows imports of aluminium in all forms into India since 1943:

TABLE III

Year	*Long tons*	Year	*Long tons*
1943	22	1949	8,699
1944	261	1950	7,033
1945	4,855	1951	10,314
1946	11,154	1952	7,079
1947	11,809	1953 (Jan.-Oct.)	3,859
1948	10,129		

Basis of Planning

Recently there has been a sharp controversy as to the advisability of the expansion programme laid down by the Planning Commission. This is entirely due to the misconception that aluminium, as at present, will continue to be used mainly for the manufacture of pots and pans. India is rapidly getting industrialised and, therefore, we can reasonably expect that this metal will find an increasing use in the industrial field as the following brief survey will show:

(i) Aluminium is the only non-ferrous metal which India can produce in large quantities. India's reserves of other non-ferrous ores such as copper, lead and zinc are either very inadequate or non-existent. The country has known reserves of about 250 million tons of bauxite, of which some 35 million tons are of high grade, sufficient to sustain a substantial aluminium industry for generations to come. The other raw materials required for producing aluminium are also obtainable in India, with the exception of cryolite, aluminium fluoride and fuel oil. The various hydro-electric projects planned by Government will make adequate bulk power available to the aluminium industry.

(ii) Aluminium is no longer a single metal; it is a family of metals, having a range of alloys suitable for varied industrial purposes. The aluminium industry in India has access to technical knowhow and can meet the demand for various alloys. Besides, a 1,000-ton extrusion plant is expected to be put into commission shortly, which will fabricate a wide range of sections for architectural and other uses. There is already a 500-ton powder and paste plant in Bombay State. The industry is thus prepared to meet the demand for aluminium in all forms.

(iii) The general industrial expansion scheduled under the Plan involves a considerable increase in the consumption of aluminium. In the manufacture of aircraft, railway coaches, bus bodies and other transport vehicles, aluminium has begun to be used in India and the use is increasing. The increase of power generation envisaged by the Plan in turn means more transmission lines, and, therefore, an increase in the demand for aluminium cables to carry this power. Several other industries expanding under the Plan promise to be users of aluminium, not the least among them being the light engineering industries which have already shown considerable development (see Table IV).

TABLE IV

Industry	*Production* *Unit*	1947 (a)	1952 (b)	*Percentage of increase — (b) over (a)*
Hurricane lanterns	000's	910	3,449	283
Electric lamps	000's	7,020	20,830	174
Bicycles	Nos.	31,000	195,571	514
Electric fans	000's	160	198	23

(iv) Aluminium, which has supplanted lead and tin plate for packaging in foreign countries, is already being extensively used in India for tea chest lining and wrapping retail packets, taper-proof pill-boxes and collapsible tubes.

Utility To Agriculture

Aluminium grain storage bins will solve a major agricultural problem in India. It has been estimated that faulty storage accounts for the loss of some five per cent. of current total grain supplies in India. Our present average annual production of foodgrains is around 45 million tons. We lose over 2 million tons in storage. Our national programme is to secure an additional production of 7.2 million tons of foodgrains by 1955-56. A third of the target could be achieved by scientific storage alone. The solution is the aluminium grain bin now being manufactured in India. It is inexpensive, rain-proof and affords complete protection against dampness, rodents and insects. The high reflectivity of aluminium holds the inside temperature to a minimum and eliminates the incidence of fermentation.

Another way in which the metal will serve agriculture is by means of sprinkler irrigation which is now being introduced in India. The traditional method of irrigation is by means of canals, ditches and furrows. But recently a new system of irrigation has been developed, especially in North America, a method which furnishes a controlled water supply in the form of spray, just like natural rainfall. This is portable sprinkler irrigation. It provides a profitable means of augmenting natural rainfall, and by conserving the water supply, helps to reclaim vast areas of arid land for cultivation. A prominent Canadian agriculturist has stated: "Aluminium sprinkler irrigation is one of the most significant advances in the development of agriculture in recent years." Heavy steel pipes were used for this system previously, but the labour of moving the pipes was excessive, while rust and corrosion in pipes gradually increased frictional losses and resulted in reduced water pressure. The substitution of aluminium pipes has brought about a revolution, for aluminium tubing weighing only one-third as much as other metal tubing, is easily handled and fully portable and remains free from rust or corrosion.

Elsewhere in this review the versatility and numerous end-uses of aluminium have been discussed. There is no reason why the metal cannot find a variety of uses in a developing economy. Space does not permit us to examine in detail the various developing and potential applications of aluminium in India. There can be no doubt that, while the utensil industry will continue to be a significant consumer of aluminium, equally significant will be the tonnage of metal absorbed by other industries. In fact, it was estimated in 1947 that the long-term production target to be secured at the end of 15 years would be 50,000 tons. It is clear, therefore, that not only will the projected total capacity of virgin aluminium production of 20,000 tons by 1955-56 be utilised in the country, but there will be need to plan further expansion.—*All Rights Reserved.*

TRADE UNIONISM IN U.K.

GROWING MEMBERSHIP

MEMBERSHIP of trades unions is increasing throughout the free world. This development is a complex and important field of study, as the movement varies in the countries in which it has taken root—but it has a vital role in all of them. Light can be thrown on the nature and potentialities of trade unions by considering the membership figures in any of these countries, not least those of the home of trade unionism, the United Kingdom, where up-to-date figures have recently been issued.

Trade unions in Britain have had substantial membership in the main heavy industries for 100 years. In this century the idea spread to other industries but the large numbers of new members recruited between 1910 and 1920 were not held. The steady upward climb began again in 1923 and this time the gains have been consolidated.

During the six years of World War II membership went up by 1,500,000 or 25

By Ray Boyfield

per cent. In the seven years since 1946 it has gone up further 1,600,000, the increases being particularly large in 1946-47 when men were being demobilised from the armed forces. Comprehensive statistics of membership and finances have recently been published by Britain's Ministry of Labour for 1952; these show a further increase of 43,000, bringing the total to 9,524,000.

The degree of trade union development cannot, however, be gauged solely by membership figures. Although keen members were hopeful, 20 years ago, that conditions of employment in all industries might soon be governed by collective agreements, it was only a minority who looked further forward to the time when unions would be influential outside industry in the wider fields of public policy.

Yet this is the position to-day. All political parties now join in praising the essential part unions play in the community. They are regularly consulted by the Government on economic, social and even defence questions. The general public now understands that unions are not simply concerned with the immediate wages of their members but, as a very large part of the nation, are interested in many aspects of the national life.

This change from grudging acceptance to wide recognition has also had its effect on the unions themselves. They are no longer "a permanent minority" and realise that to a very great extent the future prosperity of their members is now in their own hands.

Unions naturally hope for even larger membership but with several exceptions they are committed to the voluntary principle, and the policy of improving the wages and conditions not only of their members but of all workers in the trades which they organise. These liberal policies make organisations more difficult but the aim of trade unionism in Britain remains "100 per cent. membership by persuasion". At present membership is not evenly spread.

The proportion is much higher among manual than among office workers, higher in larger establishments than in small, twice as high among men as among women. Some sections are almost entirely unionised—for instance, certain of the crafts in printing or engineering. Types of employment with the highest level of membership in all grades are mining, transport and other utilities and government service. Sections with the lowest proportion of union labour include commerce and retail distribution other than by co-operative societies.

The pattern of organisation still shows many traces of its early origins. When unionism was first preached, only local societies were practicable and the necessary amalgamation of them to form nation-wide unions has proceeded unevenly. Despite many mergers in the 1920s there are still 690 separate organisations but 500 of these have under three per cent. of the total membership between them. Two-thirds of all members are now in 17 unions, each with over 100,000 members.

Financial Position

Figures of income and expenditure are not made public by all unions. They are, however, available from unions with 8,400,000 members, and a report on them is published annually by Britain's Registrar of Friendly Societies. His figures show that each member paid on average of £2 1s. 3d. in 1952 in contributions. This represents an increase of only 13 per cent. over 1938 which is small when account is taken of the far greater rise in wages and prices.

This small increase is explained in three ways. The much greater number of members makes for economy—for instance, the cost of negotiating for half the workers in a firm is not increased when the rest are recruited. Secondly, the proportion of union expenditure on strike and unemployment benefit is much lower than in the troubled years between the two World Wars. Thirdly, owing to the improved State provision for sickness and old age, a lower proportion of members now make additional provision for these through their unions.

Reserve funds are now over £70,000,000. They are, of course, highest in those unions which make extensive provision for superannuation payments; for example, in printing unions the average is £18 a member. Over the whole field the average reserves are £8 a member, and unions now believe these can safely be increased at a reduced rate. In 1952, only one-and-a-half per cent. of income was put by as compared with 14 per cent. in 1938, and 60 per cent. was expended in services to members.

In fact, steadily growing membership and stable employment have given confidence to unions. They feel their resources are more wisely used when invested in shaping the future through education than when hoarded in memory of past disputes.

BICYCLE INDUSTRY IN INDIA
ITS PROGRESS, PROBLEMS AND PROSPECTS

By S. K. Sen

Chairman, Sen-Raleigh Industries of India Limited

IT is difficult to say precisely when the first bicycles made their way to India, but there are in existence records to show that cycling clubs, with large numbers of enthusiasts, had sprung up in Bombay by the 1890's. A photograph dating back to 1899 shows old and young members of the Dharwar Cycling Club, clad in the typical Victorian costumes of the day, gathered for a cycle meet. Bicycling in India can, therefore, be said to have a history of at least 50 to 60 years.

In this fairly long span of time, however, the use of bicycles in India has not made the progress commensurate with the needs of her population. "In a country like India," says the Report of the Five-year Plan (Programmes of Industrial Development), "where conveyance and transport facilities are limited and inadequate, bicycles play an important role in the country's economy..." Despite its obvious importance, the use of bicycles in India still remains at a very low level. According to an estimate quoted by the Tariff Board Report on the Bicycle Industry (1946), the number of pedal bicycles in use per thousand of population was 3.85 in India, as compared with 255 in Britain, 463 in Holland and 539 in Denmark.

The import trade in bicycles had been more or less established before World War I. Dislocation of imports caused by the war lay behind the first attempts to manufacture cycle parts in India for replacement purposes. Both during and after the First World War, small workshops grew up for the production of frames. While manufacturing progress between the two wars was slow, the consumption of bicycles increased and imports continued to show an encouraging rise, reaching the figure of 170,000 in 1937-38.

Origin of Industry

It is from this time that the Indian bicycle industry properly originates. Between 1938 and 1941, three concerns went into operation—India Cycles Manufacturing Company, Ltd., Calcutta; Hindusthan Bicycle Manufacturing and Industrial Corporation Ltd., Patna; and Hind Cycles Ltd., Bombay. Due to the outbreak of war, the first company went over to the production of components such as bells, lamps, carriers, etc., while the two latter undertook manufacture of complete bicycles, with the exception of complicated parts, such as free wheels, chains, ball bearings, etc. During World War II, the Indian bicycle industry supplied to the Government more than 50,000 bicycles, apart from various other defence requirements such as mine contact frames, fuse percussions, etc. Imports necessarily declined during the war.

With the end of war and the easing of the shipping and supply situation, imports again began to rise. The potential of the internal market showed definite possibilities. The pent-up demand of the war years, it was realised, would provide a steady market for long; in spite of the economic distresses caused by the war, the signs of radical political changes were unmistakable, changes which could not but accelerate economic development. The bicycle industry, which had had to contend with the most serious difficulties during the war, was anxious to secure its future progress and applied for tariff protection.

The Tariff Board, which conducted the enquiry in 1946, while recommending protection, made some exceedingly valuable observations concerning the problems and tasks of the industry. The Tariff Board bore out the possibilities of the internal market. At the same time, it laid the utmost emphasis on the need to improve the quality of the Indian-made product. It concurred with the view of the Director General of Supplies that "the quality of the indigenous bicycle is passable but inferior to the best foreign make such as Raleigh or B.S.A...." The Tariff Board remarked that the poorness of quality was due to two factors:

(a) the raw materials used were not of proper specifications;

(b) sufficient attention was not paid to maintaining the accuracy of tools, dies, and gauges.

The Board recommended that the existing *ad valorem* duty of 24 per cent. (British Preferential) be converted into a protective duty at the same rate. This recommendation was accepted by the Government with effect for three years.

When this term of protection was due to expire, the Government ordered another Tariff Board enquiry which was concluded in 1949. Reviewing the progress during the preceding years, the Board observed that actual production had fallen short of the targets estimated at the previous Tariff enquiry, the actual production of complete cycles amounting in 1947 to about 43,400 against the estimated 65,000.

The Tariff Board noted that progress had been made in improving the quality of the Indian-made bicycle and components. "Notwithstanding the lack of suitable raw materials and machinery, the indigenous manufacturers have been able to effect substantial improvements in the design, structure and finish of their bicycles," observed the Board. But there were still serious complaints about the quality of Indian bicycles and the Board emphasised, in its turn, the paramount need to obtain suitable raw materials and machinery in order to bring the quality of the Indian bicycles up to the standard of the imported product.

Protective Duty Raised

The Board recommended the rising of the protective duty to 60 per cent. *ad valorem* (British Preferential), with a similar duty on bicycle parts and accessories. There can be no doubt that protection afforded to the industry was of considerable assistance in enabling it to develop and raise production:

Year	Production of complete cycles
1947	43,424
1948	61,896
1949	80,028
1950	103,152
1951	114,276

The year 1952 saw the addition of large and important units to the industry. Profiting from the experience of the pioneering units, the new enterprises have taken care to ensure quality in production right from the start. This has been facilitated by means of technical and financial collaboration between leading cycle manufacturers in the U.K. and Indian industrialists. Thus, T.I. Cycles of India Ltd. represents a tie-up with Tube Investments of Birmingham and Sen-Raleigh Industries of India Ltd. with Raleigh Industries of Nottingham as well as certain well-known German component manufacturers like Union.

The association with bicycle interests abroad has been of great assistance in the matter of obtaining capital equipment and technical guidance in the difficult stage of teething troubles.

Both T. I. Cycles and Sen-Raleigh have given their technicians a course of intensive training at the associated factories abroad. It may also be stated confidently that precision tools and complicated capital equipment which they have been able to obtain make these factories among the most modern and best equipped. The foundations for producing quality bicycles in India have been securely laid.

Know-how in the cycle industry is constantly improving in Britain and the Continent, some recent advances being in the technique of brazing, bonderizing, enamelling and nickelling processes. Light strips and steel alloys have replaced heavy gauges with greater strength resiliency. The results of this research and experiment in advanced countries are now immediately available in the production of the Indian bicycle, as a result of technical collaboration with foreign manufacturers. We are thus assured that the quality of the Indian-made cycle will keep pace with its foreign counterparts.

Atlas Cycle Industries of Sonepat, East Punjab, is the third of the large new units to go into production since 1952.

The installed capacity of each of these new units is 100,000 a year. Another concern, Messrs. Wearwell Cycle Industries, have received sanction for putting up a factory, with a similar installed capacity. The industry thus has at present six units (three old and three new) with one more proposed, and development programme for the industry, as visualised in the Five-year Plan, is as follows:

	1950-51	1955-56
Rated capacity ...	120,000	530,000
Actual production	*101,136	530,000
Quantity available for consumption	266,597	500,000
Available for exports	—	30,000

Five-year Plan Report

The Five-year Plan Report, commenting on the programme for the industry, says:

"It is expected that the potential capacity for the industry by 1955-56, which would be higher than the anticipated demand, would help in lowering prices, improving quality and thus also help in improving demand. Moreover, with an appreciable fall in price and an improvement in quality, there should be good prospects for the export of about 50,000 Indian bicycles to some of the neighbouring countries. . . "

Quite a large number of the parts that go into a bicycle are now being manufactured in India, such as frames, forks, mudgards, backstays, tyres, rims, pedals, etc. Precision components such as chains, free-wheels, etc., present a more difficult problem. Though there is a certain amount of local production in these, quality is still not up to the mark. However, the manufacturing programmes of the large new, well-equipped factories includes production of these components to a standard comparable with the imported products. In fact, some of the new factories are laid out so as to undertake manufacture of 70 per cent. to 90 per cent. of the bicycle parts themselves.

In regard to cycle accessories and parts, the Tariff Board Report (1949) has drawn attention to the large number of units producing on a cottage industry basis. These are localised chiefly in Calcutta and the East Punjab. Some 50,000 workers, mostly refugees, are thus employed in East Punjab alone, producing parts and accessories valued (in 1949) at Rs. 60 lakhs per annum. It is interesting to note, in this connection, that the value of cycle parts and accessories imported into India between 1936-37 and 1944-45 invariably exceeded the imported value of complete bicycles—an indication of the large internal demand for bicycle components both for replacements and for assembly into complete bicycles. Between 1946 and 1952, the value of imported bicycle parts was in the region of Rs. 8 crores and more.

The Tariff Board was of opinion that if these small units were properly organised and supplied with raw materials and technical supervision, they could develop into an important adjunct of the bicycle industry. The same view was upheld by the Planning Commission which recommended close co-ordination between the small-scale manufacturers of cycle parts and the large manufacturers of complete bicycles.

Raw Materials

If we turn to the problem of raw materials for the industry, it will be found that Indian cycle manufacturers are still dependent on imports for its basic requirements of steel. The major portion of the bicycle is fabricated from steel strips, bright bars, steel alloys and bright sheets. The steel tube for the frame is itself manufactured from strip steel. Of these materials, so far not one is manufactured in India to the requisite standards.

The manufacture of strip steel requires a cold reducing unit which does not yet exist in India. Some time ago, there was news of an agreement between Tatas and Stewarts and Lloyds for the setting up of a cold rolling strip mill and a steel tube works. How far this has progressed is not known, but there can be no denying that the bicycle industry eagerly awaits the fruition of this plan.

The Industry To-day

How then may we sum up the position of the bicycle industry on the threshold of 1954?

The grant of protection has acted as a boon, enabling the industry to expand output and encouraging new units to enter the field. The effect of this on total production was felt in the latter half of 1952 and, particularly in 1953, when these three new units went into steady production. At least one of these new units exceeded its initial target of production by 25 per cent. by the beginning of 1953.

As compared with 114,000 cycles produced in 1951, the figures for 1952 are 192,000; and for the first six months of 1953, the output was 120,000 cycles, which, with the usual increase in the last six months of the year, may well represent an annual rate of 250,000 to 300,000 cycles. Imports continued in 1952-53 but Indian-made cycles were able to meet this competition and establish themselves, indicative of the expansion undertaken by the industry of late are the estimates of additional plant and machinery installed during 1952-53. The larger units accounted for, possibly, about Rs. 27 lakhs of additional plant and various others for another Rs. 5 lakhs, a total addition to plant to the value of Rs. 32 lakhs approximately. There is every reason to hope that, by 1955-56, India will be self-sufficient in regard to bicycles and may even have a surplus for export.

Quality Improves

The quality of the Indian bicycles has shown marked improvement of late, while new units, established in collaboration with leading foreign manufacturers, have laid the groundwork for producing in India bicycles which can hold their own against any imported product in respect of quality and performance, the need for which had been strongly emphasised by the Tariff Board.

*This figure, quoted in the Five-year Plan Report, varies from the figure quoted earlier which referred to the calendar year 1951.—AUTHOR.

The manufacture of components is making steady progress and the next stage will be to undertake production of the more complicated parts like free-wheels, etc., with due regard for quality. All the new factories have expanded their plant during 1953 to undertake further stages of manufacture and, as a result of local production of many more components by 1954-55, bicycle prices may be expected to go down, thus helping to cater for a wider market. In this connection, encouragement has to be given to the numerous small producers of bicycle parts and accessories. With proper supervision and enforcement of standards, they may be expected to supply bells, carriers, and other accessories, concentrating for the most part on supplying the demand for replacements.

In regard to raw materials, the industry still depends on imports for its basic requirements in steel. In the interests of self-sufficiency, it is urgent that internal production of cold rolled steel in strips and bars should commence. Until that is done, as an immediate relief, customs duty on imported materials should be reduced, thus helping to bring down prices.

Future of the Industry

The current demand for bicycles is estimated at 400,000 and, though rated capacity is in excess of this figure, actual production is below it. The position will doubtless improve in 1954, but this requires a more sympathetic attitude from the Government. Delay in granting import licences for capital equipment, etc., has been one important reason for a slower rate of expansion than would have been otherwise achieved. Likewise, reduced duties on imported raw materials would go a long way in bringing down prices—a most vital consideration in the present context of shrinking purchasing power caused by unemployment.

Already the cycle market has experienced some mild shocks by way of slackening demand and the worsening employment situation cannot but have an adverse effect on the cycle industry and trade. The future of the industry is closely tied to the successful fulfilment of the Five-year Plan projects which promise to raise living standards and create greater employment.

The bicycle industry is one in which, to-day, profits are of the least importance. Manufacturers are anxious to build up reserves rather than distribute dividends. They are aware that this is still an infant industry which has to be carefully nursed, so that it can hold its own in a competitive world. Their attention is directed towards expanding production and improving quality, and it can be safely said that the industry now produces cycles equal to the world's best, thus overcoming the old prejudice against the Indian product.—*All Rights Reserved.*

DEVELOPMENT COUNCIL FOR BICYCLE INDUSTRY

The Central Government has formed a Development Council under the Industries (Development and Regulation) Act, 1951, for the bicycle industry. The personnel of the Council and the functions assigned to it have been announced in a *Gazette of India Extraordinary* of 18th December, 1953.

The Council will consist of 12 members. They are:

Mr. M. G. Vohra, Mr. I. C. Gupta, Sardar Balwant Singh Chhatwal and Mr. A. M. M. Murugappa Chettiar, to represent the interests of owners of undertakings in the industry.

Mr. P. L. Kumar and Mr. Ishwar Datt, appointed to be members as persons having special knowledge of matters relating to the technical or other aspects of the industry.

Mr. Ram Desai to represent the interests of persons employed in the industry.

Mr. D. C. Sutaria, Mr. Iqbal Singh, Mr. V. S. Rastogi and Mr. K. Eswaran to represent the interests of consumers of goods manufactured by the industry.

The twelfth member to represent the interests of persons employed in the industry will be appointed by the Government later. Mr. P. L. Kumar will the Chairman of the Council.

IRON AND STEEL INDUSTRY

MAIN DEVELOPMENTS REVIEWED

So far as the iron and steel industry is concerned, the year 1953 is one of outstanding events. The most notable among them is the provisional agreement entered into between the Government of India and Krupps and Demag, the world-famous German steel firms. The agreement provides for the technical and financial participation of these firms in the construction of new steel plant with an initial capacity of half million tons, capable of expanding into a million tons. Next in order comes the merger of the Steel Corporation of Bengal with the Indian Iron and Steel Company, with effect from 1st January, 1952. Thirdly, the Government of India announced, on 20th July, an increase in the retention price of steel, produced by the Tata Iron and Steel Company, by Rs. 32.31 per ton for the year 1952-53 and Rs. 47 per ton for the two-year period from April, 1953 to March 1955.

The foregoing developments are of considerable significance, inasmuch as they are aimed at making India self-sufficient in steel. The extent of dependence of India on foreign imports will be evident from the fact that, while the indigenous production of steel of the three major producers, namely, the Tata Iron and Steel Works, the Indian Iron and Steel Company and the Mysore Iron and Steel Works, is 1.07 million tons, the demand exceeds 2.4 million tons. These three companies, too, have plans for expanding their capacity. But the implementation of these plans would increase their aggregate output to no more than 1.6 million tons by 1956-57, when the demand is expected to be about 2.8 million tons. Thus, there will still be a deficit of more than a million tons.

Expansion Schemes

The expansion scheme of the Tata Iron and Steel Co., Ltd. is designed to secure an increase in production from the existing capacity of 750,000 tons per annum to 950,000 tons. The Indian Iron and Steel Company will step up its production from the existing level of 280,000 tons to 650,000 tons a year, besides setting up a blast furnace capable of producing 450,000 tons of pig iron a year. The Mysore Iron Works has also an expansion scheme to step up its production from 40,000 tons at present to 100,000 tons.

The production of finished steel during January-August 1953 was about 558,800 tons, as against 631,600 tons in the same period last year. The fall of 72,800 tons was due to labour trouble at the Indian Iron and Steel Works.

New Plant

The urgency for the establishment of the new State-sponsored steel project at a time when the gap between production and demand is large needs no emphasis. The final agreement between the Government of India and the Krupp-Demag firms is expected to be signed shortly. Already the Krupp-Demag delegation, led by Dr. Thum, Managing Director of Demags, now in India, has completed its tour of West Bengal, Orissa, Bihar and Madhya Pradesh, for carrying out a preliminary survey of the possible sites for the proposed steel plant. The German participants expect that the plant can be commissioned within a period of four years after the preliminary details are settled. The project is estimated to cost about Rs. 71.25 crores. The West German participants will contribute about Rs. 9.5 crores, the exact amount depending on the value of the plant that they may supply. If the volume of orders placed with the German firm equalled 20 million dollars, the German investment will be 25 per cent., upto the second 20 million dollars it will be 30 per cent. and in excess it will be 33⅓ per cent., subject to a ceiling of $20 million. Global tenders for supplies of plant, etc., will be invited; quality, price and delivery date will be the determining factors in the selection of suppliers. It is stated that, if the capacity of the proposed half-a-million ton plant is increased to one million tons, the additional capital investment that will be needed will be about Rs. 40 to Rs. 45 crores.

The proposed new steel project, however, came in for some criticism. It was argued that the private sector in the steel industry could have accomplished the same increase in output, as is now visualised by the Government, at a lesser cost. It was stated, for example, that the Tatas could do it at a cost of Rs. 40 crores and the Indian Iron and Steel Company at a cost of Rs. 60 crores. Thus, the Government project would entail an additional expenditure ranging from about Rs. 12 to Rs. 31 crores. It was feared that, if the Government was unable to make profits from the new project, it would be tempted to nationalise the entire steel industry.

Amalgamation of S.C.O.B. with I.I.S.C.

The amalgamation of the Steel Corporation of Bengal with the Indian Iron and Steel Company is expected to help production of steel by the latter company more efficiently and economically. The Company proposes to install the latest rolling mill and a continuous sheet bar and billet mill which will reduce the cost of sheet bars and billets considerably. The output of saleable steel products which now amounts to about 3 lakh tons per year is estimated to rise to 7 lakh tons per year by 1957.

Retention Price of Tata Steel

The increase in the retention prices of steel produced by the Tata Iron and Steel Company for the year 1952-53 by Rs. 32.31 per ton of saleable steel over the 1951-52 prices, including depreciation and 8 per cent. return on colliery block, was welcomed. But the grant of an increase of only Rs. 47 per ton for the years 1953-54 and 1954-55, as against the Tariff Commission's recommendation of Rs. 66.98 per ton of saleable steel over the prices prevailing in 1951-52, was a disappointment to the Company. The Tariff Commission has arrived at Rs. 66.9 per ton after taking into consideration depreciation and a return on the colliery block, and an increase in the rate of return on the total block from 8 per cent. to 10 per cent., but excluding the Company's claim for the inclusion of profit-sharing bonus as an item of expense. The Government of India declined to accept the Commission's recommendation for the inclusion of the colliery block for the purpose of calculating the depreciation and the return allowed on gross block, on the ground that it required further examination. It also ruled out the recommendation for an increase in the rate of return on gross block from 8 per cent. to 10 per cent. on the score that the advance by the Government of a loan of Rs. 10 crores to the Company on special terms to finance its modernisation and expansion programme made such an increase unnecessary.

Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Company, while expressing gratitude for the proposed loan, observed that the acceptance of the small increase recommended by the Commission would not have been inconsistent with the grant of the proposed advance, as the Government could have directed that it be used either to reduce the total amount of their loan, or accelerate its repayment. He maintained that a gross return of 8 per cent. on capital expenditure, leaving a net return of about 3½ per cent., was totally inadequate to attract risk capital, either Indian or foreign. He hoped that the Government would reconsider this question in the light of these observations.

Outlook

The outlook for the industry depends chiefly on the Government's policies towards encouraging the development of this industry. For there is neither dearth of resources nor of labour in the country. India has about 10,000 million tons of reserves of good quality iron ore (containing 60 per cent. of iron). This is exclusive of the quantities of laterite in several areas of Deccan tracts containing 25 to 30 per cent. iron ore. Besides, there are large tracts of unexplored regions which are expected to contain iron ore reserves. The consumption per head is so low that it is needless to say that there is a large scope for the growth of demand in future. The *per capita* consumption is deplorably low at 12 lbs., as against 1,300 lbs. in the U.S. and 530 lbs. in the U.K. What is needed for increasing the *per capita* consumption is the establishment of new industries in the country. These latter in their turn call for further expansion of the steel industry, which is to-day experiencing lack of finance. Certainly, it will not be possible for the industry to attract risk capital in the existing state of affairs, when not only the rate of return is not attractive, as Mr. Tata pertinently pointed out, but also the threat of nationalisation hangs over it.

• • •

Since writing the above, the final agreement has been signed. According to Press reports, the agreement falls into three parts, namely, (a) the promoters' agreement signed at Bonn recently which is now modified, (b) technical consultants' agreement and (c) the articles and memorandum of association. The agreement provides for the formation of a private limited company with the name Hindusthan Steel Ltd. The Company will have an authorised capital of Rs. 100 crores. It will have, at the outset, a subscribed capital of Rs. 5 lakhs, of which Rs. 1 lakh will be contributed by the German combine. The same ratio of four to one will be maintained in the capital structure, when subsequent issues of share capital will be made. The German combine will have representation on the Board in proportion to its contribution. The Chairman and the Managing Director will be the nominees of the Government of India.

The share capital agreement is for a period of ten years but this can be extended for another ten years. The agreement does neither provide for the issue of royalities, nor for relaxation of tax provisions. The German combine's maximum contribution is estimated at present at 20 million dollars (Rs. 9.5 crores). Provision has been made for audit by the Auditor-General. The German combine will provide all technical assistance needed for the erection and commissioning of the project to be completed in four years from the date of selection of the site. For this purpose, the combine will submit to the Company a list of names of technical experts for appointment.

The combine has undertaken to train Indians for every place of responsibility from the very start. The agreement also provides the penalty clause, which obliges the combine to pay to the Government of India a sum not exceeding the full amount of its consultants' fee of Rs. 21 crores, in the event of its not fulfilling its guarantee.

Outstanding New Features

1. Five distinct setting points, used singly or in combination, to control setting to .001 inch.
2. Johnson bronze bearings for cylinders and doffers.
3. Ball-bearing to lickerin pedestals.
4. Self-lubricating 'Oilite' bearings at several locations.
5. William's patent stripping motion for flats.
6. Drop lever with new disengaging handle.
7. Fluted lap roller with positive gear drive from feed roll helps uniform feed of lap at the back with minimum possible stretching
8. Roller-bearings to cylinder and ball-bearing. Comb Boxes also provided as optional equipment.
9. Cards can be geared for any production in a mill's organization.

PSMMC-6

U.K. TEXTILE INDUSTRY IN GOOD HEALTH

EFFICIENCY CONSIDERABLY HIGH

MANCHESTER, *15th November*

AFTER falling precipitately from the high post-war level of production and employment in 1952, conditions in the Lancashire cotton trade stabilised in the past twelve months and the trade entered upon a new era of relative prosperity. A period of slack business, with mills closed and operatives in thousands thrown idle, was followed by expanding operations which led to well-filled order books, over-full employment and more encouraging prospects by the end of the year.

It may be recalled that the post-war trade boom came to an end in the autumn of 1951. Rather suddenly, buying of goods ceased, and, owing to a falling tendency in raw material rates and a decline in prices for yarn and cloth, the attitude of customers was very strongly maintained. The change in the situation was said to be a trade recession, but a few months later it was more correct to describe the developments as a depression.

This very unsatisfactory state of affairs continued for approximately twelve months to the autumn of 1952. During that period, the most serious factor was the decline in the value of stocks of goods and deliveries against old orders booked at much higher prices than existed. Both producers and distributors had to bear heavy losses. It is significant, however, that no serious financial embarrassments were recorded. On the whole, merchants were more vitally affected than producers of goods.

A change in the conditions began to show itself towards the end of 1952. Enquiry on a larger scale was met with and there were indications of buyers being more prepared to operate, as in certain sections stocks had been cleared, but at very unsatisfactory prices. The lead began in the home trade section and it was largely a result of enterprise on the part of the stores, with extensive textile connections, taking the view that the time to replenish stocks had come round.

Steady But Slow

In the producing sections, the improvement was steady but rather slow. Gradually both spinners and manufacturers booked orders on a freer scale and the change for the better showed itself to a greater extent in the spring of this year. During the past six months, demand has broadened and the industries as a whole, both cotton and rayon, are now in a healthier position than for about two years back.

Very little improvement has shown itself in the sales of goods for export. In this connection, the price factor has been very important. Many cloths produced in Lancashire are relatively dear, as compared with the products of other countries. Repeatedly there has been reference to the competition from Japan, but India is increasing her output of textile goods and there is also evidence of Western Germany increasing her production. In some foreign countries, the import restrictions have been so severe that it has been impossible to export more than trifles, chiefly of the higher quality goods.

A large and persistent demand has been experienced in materials suitable for home consumption. The business done has covered a wide range of styles and qualities and favourable reports have been received as to clearances in the retail and wholesale establishments. This business has been very largely due to the increased spending power of the home population, which, to some extent, has been a result of the Government Budget last spring when taxation was reduced. At the same time, wages have tended to rise and the textile industries as a whole have derived considerable benefit.

Shortage of Manpower

A factor in the situation which has attracted increased attention has been the shortage of manpower. Great efforts have been made to secure more operatives, and, recently, the recruitment of school-leavers has been fairly encouraging, but it is quite evident substantial numbers of workpeople who were employed in the mills in 1951 have obtained other jobs and are not prepared to return to work in textile factories.

At the height of the boom in 1951, it was estimated that, in Lancashire spinning and weaving mills, 320,000 operatives were at work, but, during the trade recession, the manpower fell to 260,000. Since then, it is estimated that 25,000 have gone back to the mills, the total number at work being around 285,000. It is feared that about 35,000 have been permanently lost to the industry. There have been suggestions that foreign labour should be used in the mills, but a problem of this kind might lead to unsatisfactory conditions should the prosperity which is now being experienced fade away.

From Our Manchester Correspondent

Towards the end of 1952, the cotton unions made an approach to the employers for an all-round increase in wages of 10 per cent. This application was rejected and was put before the Industrial Disputes Tribunal in January. For the first time for many years, the unions were turned away empty-handed when making a wage claim, as a result of the refusal of the Tribunal to accept the application.

The situation was reconsidered later in the year, and, in May, 1953, a further claim for a 10 per cent. wage increase was submitted to the employers' organisations. This time the matter was not referred to the Tribunal and a joint agreement was reached in July, providing for an advance of 5 per cent. to operate from the beginning of August.

Before this claim was submitted, the Ministry of Labour had undertaken its usual half-yearly census of earnings as at the end of April. When the details of the survey were published, it was disclosed that the figures for cotton spinning and weaving were at the highest level yet recorded, being 3d. a week on average higher than the previous peak in October, 1951. Men were receiving average earnings of £8 6s. 1d. weekly and women £5 6s. 2d. Youths under 21 earned an average of £4 10s. 7d. and girls under 18 got £13 19s. per week. The average of all cotton workers was £6 4s. 8d. weekly.

Average hours worked by cotton spinning and weaving mills in April were 44.1 per week, as against 33.1 hours six months previously. In the spinning section the average was 43.9 and in weaving 44.5 hours per week.

One result of the shortage of operatives which became more acute as the year progressed was the revival of schemes introduced by individual firms to obtain foreign workers. There was no central recruiting plan sponsored by the trade organisations or the Cotton Board as was the case some years ago, but certain groups endeavoured to secure green labour from Northern Ireland and the Continent. Discussions have taken place between the trade unions and the employers over certain aspects of this development and safeguards are being drawn up to protect British workers in the event of any future contraction in trade.

The following tables show the latest position of employment, exports and production compared with recent years:

Employment in the Cotton and Rayon Industries

Raw Cotton Prices and Supplies

Events in the raw cotton situation during 1953 centred mainly in Britain on the moves to return to free enterprise buying and distribution of the raw material. The Government set up the Cotton Import Review Committee which was charged with the task of reporting on whether any change was desirable in the structure of the Raw Cotton Commission and the provision of cover to spinners.

As a result of its findings, it was determined to continue the trend towards complete freedom of trading in cotton and the eventual re-establishment of the Liverpool futures market. The Committee considered it was intrinsically undesirable that public funds should be risked to provide cover for the cotton spinning industry.

Towards the end of the year, the Government announced that legislation would be introduced to wind-up the Raw Cotton Commission during 1954 and facilitate the revival of a futures market in Liverpool. At the time of writing, detailed discussions on the procedure to be adopted were still in progress, but it was confidently predicted that the Liverpool market would reopen around June, 1954.

Spinners were given a second opportunity in July to decide whether to continue obtaining their supplies from the Raw Cotton Commission or to secure their cotton through private Liverpool and Manchester merchant firms. It was then stated that 131 cotton spinning firms had chosen to obtain all their requirements for 152 mills from the Commission; 64 firms had chosen to obtain their requirements for 152 mills privately; 10 firms chose to obtain part of their requirements for 54 mills from the Commission and part privately; 41 other users chose to obtain all their requirements from the Commission and 32 to obtain all their requirements privately.

On the basis of past consumption, the Ministry estimated that about 56 per cent. of the cotton, other than Peruvian and Californian, to be imported in the 1953-54 season would be on private account, compared with 30 per cent. in the previous season. In the American type group, 61 per cent. cotton would be purchased privately, against 35 per cent; Egyptian types 40 per cent., against 15 per cent., and in West Indian Sea Island 83 per cent., against 64 per cent.

Price Changes

It was later announced that, on the basis of past consumption, 47 per cent. of Peruvian and Californian cotton would be imported privately in 1954, against 36 per cent. in 1953. As a result of recommendations made by the Cotton Import Review Committee, the Raw Cotton Commission from the beginning of September separated its merchanting and cover sections. At the same time, a new system of calculating selling rates to spinners was brought into operation, incorporating a number of cover bases and more than 30 index prices. The following table shows price changes for leading growths during the year, week by week:—

World raw cotton affairs have centred on the abundance of supplies in the United States. The first Government estimate of the crop indicated an output of 14,605 000 bales, but by November this had been raised to over 16,000,000 bales. This increase in production was largely attributed to the expansion in yield per acre to a new all-time record of 325.4 lbs.

Considering the magnitude of available supplies, the effect on prices has been relatively small, although the trend has been generally downwards. The American Government loan to farmers is providing a "floor" for the market and values for some months remained steady at around this point.

(*Continued on page 131*)

MILLS CONSUME MORE INDIAN COTTON IN 1952-53

OVERALL SUPPLY SOMEWHAT LOWER

IF there is one factor which stands out more prominently than any other in the cotton economy of the Indian Union, it is the increasing consumption of cotton. Indeed, this factor, which became evident even in the 1951-52 season, became more pronounced in the 1952-53 season, the latter part of which coincides with the major portion of the calendar year 1953. Thus, the cotton consumption in the whole of the 1952-53 season amounted to as much as 4.46 million bales (made up of 3.61 million bales of Indian cotton and 0.85 million bales of foreign cotton), as against 4.07 million bales in the previous season, (consisting of 2.99 million bales of Indian cotton and 1.08 million bales of foreign cotton), an increase of 390,000 bales or 9.5 per cent. One must go back to the war years, 1942-43 to 1945-46, to look for a larger level of cotton consumption than the present levels, for it was in those years that the consumption of cotton ranged from 4.5 to 4.9 million bales. It would, therefore, be correct to say that the outstanding feature of the cotton trends in the current year was the rise in the consumption of cotton to the high war-time levels. In fact, the year was one in which the consumption of Indian cotton was the highest on record.

Cotton Supply

From the overall cotton supply point of view, the 1952-53 season reveals a slightly less comfortable position than in the previous one. Thus, the supply is estimated at 6.7 million bales, as against 6.9 million bales in the previous season. The supply for the 1952-53 season consists of carry-over stocks of 2.4 million bales (1.9 million bales of Indian cotton and 0.5 million bales of foreign cotton), estimated production of 3.6 million bales of Indian cotton and about 0.7 million bales of imported cotton. The lower supply position in the 1952-53 season, as compared with the previous season, is accounted for primarily by the fact that both production of Indian cotton and imports of foreign cotton were lower during the season at 3.6 million bales and 0.7 million bales, respectively, as against 3.9 million bales and 1.3 million bales in the 1951-52 season. The following table compares the supply and distribution of cotton during the 1952-53 season with that of the 1951-52 season:

Cotton Supply Position

(In 000 bales of 400 lbs. each)

	1952-53	1951-52
Supply		
Stocks at beginning of season:		
Indian cotton—		
Trade stocks	893	258
Mills stocks	1,260	1,236
Foreign cotton—		
Trade stocks	114	24
Mill stocks	331	301
Estimated production	3,630	3,993
Imports	685	1,264
Total	6,753	6,976
Distribution		
Indian cotton—		
Estimated exports	345	197
Mill consumption	3,612	2,947
Village consumption	270	270
Foreign cotton—		
Mill consumption	850	1,684
Total disappearance	5,077	4,538
End-season stocks	1,676	2,434
Total	6,753	6,906*

* Unexplained difference of 20,000 bales.

It will be seen from the table above that the total disappearance of cotton during the 1952-53 season is higher at about 5.0 million bales, as against 4.5 million bales in the previous season. This is due as much to the larger exports, estimated at 0.34 million bales for 1952-53 as against 0.19 million bales for 1951-52 as to the increase in cotton consumption which is placed at 4.46 million bales as against 4.07 million bales in the previous season. Reference has already been made to the steep increase in cotton consumption in the 1952-53 season.

The table below gives the trends in the mills' consumption of cotton during the decade ended 1952-53:

Mills' Consumption of Cotton

(In million bales of 400 lbs.)

	Indian cotton	Foreign cotton	Total
1944-45	2.99	1.90	4.89
1945-46	2.70	1.86	4.56
1946-47	2.14	1.72	3.86
1947-48	2.96	1.85	4.21
1948-49	3.12	1.13	4.25
1949-50	2.54	1.14	3.68
1950-51	2.92	1.10	3.62
1951-52	2.99	1.08	4.07
1952-53	3.61	0.85	4.46

A study of the table reveals that, for the first time during the last decade, the consumption of foreign cotton has fallen below the one million level, after having been consistently maintained at above that level. Again, it will be seen that the mills' consumption of Indian cotton crossed the three-million mark during the 1952-53 season and touched a high level of 3.61 million bales. There has been only one occasion during the last 10 years when a similar level was touched; it was in the 1948-49 season, but the actual figure was a little smaller than the one for the year under review.

It is against this background of increasing consumption of Indian cotton that one must study the plans for the improvement of cotton output in the country. For the 1952-53 season, the output of cotton has been estimated at 3.63 million bales, as against 3.89 million bales in the previous season. For the year 1953-54, no correct estimate is available yet. It was at one time believed that it would be as high as 4.2 million bales. But current estimates place it at no more than 3.8 to 3.9 million bales. In any case, there is reason to believe that the crop will be substantially larger than the 1952-53 season. From the point of view of the long-term outlook for production, it is noteworthy that the completion of the various multipurpose projects, which the Central and State Governments have taken in hand, will increase the land under cotton. Since much of this land will be under irrigation, it is reasonable to expect not only a quantitative increase but also a qualitative improvement in cotton. It may be mentioned, in this connection, that the Five-year Plan estimates the additional area to be gained for cotton at 18 million acres in 1955-56; the Plan's target for the output of cotton is 4.2 million bales. Perhaps, this target will be reached sooner than the date set for it. Already, some of the projects, contemplated by the Plan, have been completed. Thus, the Tungabhadra Project, which was completed during the year under review, will increase the production of long-staple cotton such as Laxmi, Jayadhar and even Punjab-American varieties, it is stated. The Lower Bhavani Scheme in Madras State, which is expected to yield results from next year, will enable 100,000 acres to be planted with MU1 (the new name for Rajapalayam and Uganda seed). The Kakrapara Scheme of the Bombay State is expected to bring another 100,000 acres under cotton during the 1954-55 season. This area will grow long-staple cotton up to 1.1/16". Thus, the outlook for the output of cotton in the near future seems bright, though much will depend on price and other factors.

It cannot be too strongly emphasised that the problem before cotton planners is not only the quantitative improvement of cotton but also its qualitative improvement. The latter aspect continues to receive the attention of the Indian Central Cotton Committee. A recent achievement, in this connection, is the isolation of IL.29 and 216F/14. These two strains, which have been developed in the Punjab, bid fair to outyield the existing strains LSS and 320F. In Rajasthan, good work in the evolution of American strains has been done. In Madhya Bharat, two improved Deshi strains, D46-5 and D48-154, are reported to have surpassed Jarilla in respect of yield and ginning quality. The strains, which are growing in popularity in the Bombay State are Kalyan, Vijay and Vijapala in Gujerat, Virnar in Khandesh, Jayadhar and Lakshmi in Karnatak. In the Madras State, work is in progress for the isolation of very high quality American cottons. The latest strain is Madras Uganda 2, which is superior to its previous sister strain MU1. The State has also been devoting its attention to the cultivation of cotton on paddy land during the off-season.

Short-staple Cotton

Although the need for qualitative improvement of cotton has been a recognised part of the Government's cotton policy, an interesting question, which figured somewhat prominently in the deliberations of the Indian Central Cotton Committee during the year under review, was whether the country should not grow more short-staple varieties, particularly, Bengal Deshi varieties, in order to facilitate larger export trade in these varieties. One section of expert opinion on this subject held that there was both scope and need for increasing the cultivation of this variety. The need for increasing the production of this variety, it was stated, arose not only from the imperative necessity to increase the exportable surplus of the variety, now estimated at about 2 lakh bales, to about 3 to 5 lakh bales, but also from the fact that larger quantities of this variety were needed for such non-mill purposes as the making of *rajais*, padding jackets, etc. Another section held that it was not in the country's interest to interfere with the present trend towards the larger production of better staple varieties. It was, however, generally conceded that the consideration of the question of the rationalisation of production of different varieties of cotton was "premature", until data for a few years under a decontrolled economy were available.

In the sphere of cotton control, the Government has, as is well known, been gradually moving towards decontrol. The movement gained further momentum during the year under review. Last year, the Government permitted trading in cotton futures. In July, 1953, the Government granted permission for futures trading in the 1953-54 crop. First, the permission was restricted to February, 1954 delivery only. This was followed by another announcement, in September, 1953, permitting trading in May, 1954 contract. The Government also decided, early in the current season, to abolish the system of zonal allocations of cotton to mills, except in the deficit area in the South. This was soon followed by its decision to increase the allocation of Indian cotton to mills upto 100 per cent. of their consumption during 1951-52. For the 1953-54 season, individual mill quotas have been increased by 20 per cent. over their consumption during the previous season. The general framework of the cotton control, however, remains unimpaired. Thus, the floors and ceilings remain and so also the system of licensing of dealers and of control over movement of cotton, as well as over exports and imports.

Foreign Trade

So far as the import trade in cotton is concerned, the Government decided, as far back as in October, 1952, to issue licences for the import of a limited quantity of 1952-53 crop American cotton stapling 1.1/16" and above to mills and importers nominated by each mill for the import of such cotton. Licences were valid for imports upto end of June, 1953. The import quota for the first half of 1953 was later fixed at 5 lakh bales of 400 lbs. each for both dollar and non-dollar areas; this quota was to include the quota already announced in October 1952. The Government also decided to extend the validity of outstanding licences for import of U.S.A. cotton of the previous season for shipment upto 30th June 1953, in addition to the import quota of 5 lakh bales. This quantity was estimated at 150,000 bales. Early in 1953, the Government, however, stopped entertaining cotton import licences for dollar area. Outstanding licences were made valid till June, 1953; the date was later extended to 31st December, 1953. In its import policy for the July-December, 1953 period, the Government stated that imports from non-dollar areas would be confined only to cotton stapling 1.1/16" and above.

An important event during the year, from the point of view of the country's cotton import trade, was the conclusion of the Indo-Egyptian Trade Agreement, which came into effect in July, 1953. Under the agreement, India is expected to purchase annually about 100,000 bales of Egyptian cotton, among other articles, and to send tea, certain items of machinery and other goods. The most noteworthy feature of the agreement is that Egypt will accept payment for its cotton in terms of 60 per cent. sterling and 40 per cent. Indian rupees.

Exports of Cotton

For the 1952-53 season, the Government permitted an export quota of 250,000 bales, made up of 150,000 bales of Bengal Deshi, 50,000 bales of Oomra Deshi, C.P.I, C.P.II and 50,000 bales of Dholleras and Mathias, Assam Comilla and Cocanadas were freely licensed for export. These quotas were announced in the last quarter of 1952. Early this year, the Government permitted the export of Bengal Deshi to the extent of 50 per cent. of the unutilised quotas of other varieties. Total exports of cotton during the season 1952-53 amounted to about 345,000 bales, the excess over the quotas allotted for the year representing exports allowed against the unutilised quotas of the previous season.

For the 1953-54 season, the Government announced, in September, an export quota of 175,000 bales, made up of 75,000 bales of Bengal Deshi, 50,000 bales of Mathia, Kalagin and Dholleras and 50,000 bales of C.P.I, C.P.II, Central India Deshi and Oomra Deshi 11/16" and below. Export licences are being issued for shipment upto 31st August, 1954. Cocanadas, Assam-Comillas and linters, Zoda and yellow pickings, it was stated, would be allowed to be exported freely.

The export trade has been disappointed by the Government's attitude towards the question of export duties on cotton. The prevailing rates of export duties are: Bengal Deshi, Rs. 125 per bale; Dhollera, Mathia and Kalagin, Rs. 200 per bale; C.P.I, C.P.II, C.I. Deshi and Oomra Deshi, Rs. 200 per bale; Cocanadas, Rs. 200 per bale; linters, Zoda and yellow pickings 30 per cent. *ad valorem*; Assam-Comillas, no duty. Now, it is felt that, unless the export duty on non-Bengal Deshi varieties of short-staple cotton is reduced from Rs. 200 per bale to the level of Rs. 125 per bale, the duty on Bengals, the export quotas of these (non-Bengal Deshi) varieties may not be fully utilised. At the time of writing, the demand for a reduction in the duty continues to form the subject of frequent representations by the trade to the Government. Although the Union Minister concerned has been repeatedly saying that he would not reduce the duty, many in market circles believe that the last word on it has not yet been said.

RECORD PRODUCTION OF COTTON TEXTILES

PRICE AND DISTRIBUTION CONTROLS ABOLISHED

IN the rough weather of growing competition in world trade in cotton textiles and amidst all the stresses and strains—production control, heavy tax imposts, power rationing and the vagaries of the Government's policies, to mention only a few—the Indian cotton textile industry earned the unique distinction of having produced an all-time record output of cloth during the calendar year 1953. The production of cloth for the year—on the basis of figures for the first 11 months—may be estimated at 4,845 million yards, which surpasses not only the previous record of 4,811 million yards attained in 1944 but also the target of 4,700 million yards fixed by the Planning Commission for 1955-56. The previous year's output was 4,599 million yards. Indeed, the performance of the industry was so encouraging that the industry must be said to have very successfully met the challenge for higher production, with a view to clothing the country's population in full and to making available adequate supplies for exports.

The record output of cloth during 1953 followed a high level of yarn production, estimated at 1,489 million lbs. This figure compares favourably with 1,450 million lbs. in 1952, but falls short of the Planning Commission's target of 1,640 million lbs. by as much as 151 million lbs. The improvement in yarn output, besides meeting the mills' own requirements for cloth manufacture, enabled the handloom industry to maintain a high level of production. Sufficient yarn supplies were also made available to power looms, hosiery factories, jute mills, and manufacturers of fishing nets, cotton braid, cotton tape, sewing thread and newar.

Claim for Complete Decontrol

Thanks to the impressive performance on the production front, the industry's claim for *complete* decontrol came to be fully justified. The Government, however, did not recognise this claim for *complete* decontrol, as witness its decision to abolish only the remaining price and distribution controls—with effect from 10th July, 1953—and to retain control over production. In the present context of free competitive markets—it is only this state of affairs that will ensure improvement in the quality of of cotton textiles—the Government should immediately withdraw the production control.

That the improvement in cloth and yarn production during 1953, as compared with the previous year, was very impressive will be evident from the following table which indicates the trend of output—month by month—during the two years:

(Cloth in million yards; yarn in million lbs.)

	Cloth		Yarn	
	1952	1953	1952	1953
January ..	345	416	114	131
February ..	341	379	111	117
March ..	346	399	112	119
April ..	365	417	116	122
May ..	391	422	117	126
June ..	378	414	113	125
July ..	424	436	132	134
August ..	411	414	127	129
September ..	393	399	124	126
October ..	388	413	122	131
November ..	397	369	126	105
December ..	422	369†	136	124†
Total ..	4,599	4,845*	1,450	1,489*

* Estimated on the basis of actual production in the first 11 months of the year.

† Estimated.

The improvement in cloth output noted above has been shared by all varieties, excepting fine counts. Thus, production of coarse cloth during the 10 months ended October, 1953, amounted to 494.21 million yards, which compares favourably with 397.54 million yards in the corresponding period of 1952. Similarly, production of medium and superfine cloth was higher at 2,615.37 million yards and 253.82 million yards, as against 2,221.97 million yards and 155.23 million yards, respectively. The output of fine counts, however, declined from 1,004.95 million yards to 743.97 million yards.

The following table depicts the pattern of production according to varieties during the current year as compared with the previous year:

(Figures in thousand yards)

	Coarse	Medium	Fine	S. Fine
1952				
January ..	33,825	214,108	80,886	15,772
February ..	32,063	209,381	84,093	16,062

December ..	N.A.	N.A.	N.A.	N.A.

Figures for September, October and November are provisional only.

N.A.—Not Available.

The significant improvement in cloth and yarn output during the year under review would not have been possible but for the availability of adequate supplies of raw cotton at relatively low prices. Another factor that was conducive to higher level of production was continued favourable relation between management and labour. There was no labour strike of any magnitude during the year. The number of disputes in the cotton mill industry during the first eight months of 1953 was lower at 87, as against 164 in the corresponding period last year. The number of workers involved was less, being 70,877, as against 161,013. The man-days lost too were lower at 276,896, which compares with 835,181 in January-August, 1952. A significant feature was that the number of disputes relating to claims for higher wages and dearness allowances was smaller than in the previous year, most of the disputes that arose being concerned with retrenchment and grievances relating to personnel.

The transport situation too was fairly satisfactory, though not to the extent found necessary. The number of wagons loaded with cotton manufactures in the eight months ended August, 1953, was 42,000, which was the same as in the corresponding period of 1952. Supply of wagons for cotton transport, however, was less, being 67,000, as against 80,000 a year before. Another helpful factor was the improved position in respect of power and fuel. The abolition of all price and distribution controls on all varieties of cloth was also a factor that induced the mills to step up their output.

Supplies for Domestic Consumption

Following the substantial increase in cloth output, unaccompanied by a corresponding rise in exports, the supplies of cloth for domestic consumption were plentiful. Excluding cloth exports, estimated at 700 million yards (on the basis of exports up to the end of November, 1953), the quantity of mill cloth that was available for internal consumption from the year's production may be placed at more than 4,145 million yards. This supply—it does not include carry-over stocks nor handloom production at 1,000 million yards—was considerably higher than the 4,000 million yards available in 1952 and 3,370 million yards available in 1951.

Internal offtake, however, failed to keep pace with increasing supplies, so much so that heavy stocks of cloth accumulated with the mills. The quantity of cloth lying unsold with the mills in the beginning of October, 1953, was, according to one estimate, as much as 475,000 bales valued at about Rs. 71 crores. Of these, Bombay and Ahmedabad cities alone held not less than 300,000 bales. Following such heavy stocks and difficulties in finding storage space and finance, 14 mills in India gave notice of closure, involving 8,510 workers. Two of these actually closed down in October, 1953, resulting in a loss of employment for 1,400 workers. There were also reports of forced liquidations of holdings.

Forced by circumstances thus and with a view to improving the marketability of mill-made cotton piecegoods, the Government of India announced, towards the close of October, threefold measures. These were: (1) Reduction in excise duty on superfine cloth from As. 3-3 to As. 2 per yard, (2) abolition of the 10 per cent. export duty on medium counts cloth, and (3) granting of a drawback of import duty on cotton used in the cloth meant for export. These concessions, though welcome, did not go far enough. Several mills continued to experience large accumulation of stocks. At the beginning of December, the mills still had about 334,000 bales worth about Rs. 50 crores.

Prices Still High

Despite the comfortable supply position, consumers had to pay higher prices for their cloth requirements during the major part of the year under review. The all-India average index number of wholesale price for cotton manufactures (Base: 1939=100) for the nine months ended September, 1953, was over 408, as against 399 in the same period last year. An idea of the rise in prices can also be had from the following table which gives the rates for some of the popular varieties of cloth in the Bombay market, as compared with those a year before:

Varieties of cloth	Prices 15-11-'52	15-11-'53	Percentage rise
Grey, unbleached—	Rs. a. p.	Rs. a. p.	
Shirting (35") ..	0 6 11	0 7 7	9.6
Drill (31")	0 13 3	0 14 9	10.31
Dhotis (44" × 10/2 yds.)	5 11 3	6 8 0	13.9
Saris (2" border 44" × 10/2 yds.)	6 7 6	6 9 6	1.9
White, bleached—			
Shirtinz (35") ..	1 2 4	1 2 4	
Drill (27") ..	0 15 0	1 3 0	26.6

It will be seen from the above figures that the prices of *dhotis* during 1953 were considerably higher than in the previous year. This was due to the marked reduction in the quantum of mill-made *dhotis* available for consumption, following a fall in output, thanks to the restrictions on *dhotis* production by mills to 60 per cent. of their average monthly output for 1951-52. The rate of production of *dhotis*, which averaged at one time 50,000 bales per month before the restriction, went down to as low as 29,000 bales, as against 45,000 bales which represent the optimum that is needed to meet the country's requirements. The gap between the supply of and demand for *dhotis*, which was expected to be largely covered by the handlooms, continued to remain. Consequently, there was a scarcity of supplies in the market, leading to an upward trend of prices, which had its inevitable reaction on prices of other varieties of cloth. What more proof is required to show that the restriction on output of *dhotis* by mills is a negative approach to the solution of the ills of the handlooms? It is time the powers-that-be realised this aspect and revised its decision.

Exports of Textiles

Exports of cotton textiles from India during 1953 registered some improvement over those in 1952. India exported about 623.7 million yards in the 11 months ended November, as against 549.5 million yards during the corresponding period last year. On the basis of this and assuming that the level of exports—at 68.7 million yards—in the month of November has been maintained in the subsequent month also, the aggregate exports for the whole calendar year may be estimated at 700 million yards. This no doubt compares favourably with the exports of 593 million yards in 1952. But, as compared with the target of 1,000 million yards fixed at the Buxton Conference, the figure falls short to the extent of more than 300 million yards. Incidentally, it may be noted that the free licensing of cotton piecegoods exports, which early in January was extended up to the end of June, 1953, has since been extended up to the end of June, 1954.

The improvement in cloth exports during the first 11 months of 1953 was shared only by coarse and medium varieties, the quantities actually exported being 236.1 million yards and 232.9 million yards, as against 146 million yards and 123.3 million yards, respectively, a year before. The significant rise in exports must be attributed to the reduction in the export duty on coarse and medium cloth early in January, 1953, and its final abolition on medium cloth on 24th October, 1953. Fine and superfine counts suffered a loss, their exports falling from 241.5 million yards and 20.2 million yards to 142.1 million yards and 12.6 million yards, respectively. The chief factor which has been responsible for the poor exports of these varieties of cloth is the high level of prices, thanks particularly to the import duty of As. 2 per lb. of foreign cotton. It is indeed gratifying that the Government of India has realised, although belatedly, this factor, as witness its latest announcement granting the drawback of import duty on cotton used in cloth meant for export.

An idea of the trend of cloth exports of different varieties during the year under review, as compared with that in the previous year, can be had from the figures given below:

(In million yards)

	Total	Coarse	Medium	Fine	'Superfine
1952					
January ..	30.7	8.0	8.2	14.2	0.3
February ..	29.4	4.4	10.0	14.8	0.2
March ..	22.4	4.3	3.8	14.1	0.4
April ..	26.0	3.9	2.6	19.0	0.6
May ..	46.4	7.5	4.6	30.3	4.0
June ..	54.9	15.1	12.8	37.2	3.8
July ..	69.4	26.0	17.4	22.6	2.4
August ..	82.6	33.9	23.9	22.4	2.4
September ..	65.7	17.6	13.8	31.5	2.8
October ..	63.0	15.4	17.8	24.4	2.6
November ..	49.0	15.0	13.3	19.7	1.9
December ..	39.4	14.0	9.8	14.2	1.4
Total ..	503.8	169.1	138.7	264.4	22.6
1953					
January ..	43.4	17.7	15.0	9.7	1.0
February ..	38.6	15.0	11.5	11.3	0.8
March ..	53.9	23.8	17.5	11.3	0.8

September ..	62.0	22.5	21.4	16.9	1.2
October ..	64.2	24.3	22.9	16.2	1.2
November ..	68.7	24.1	24.2	18.9	2.1
December* ..	68.7	21.9	34.2	11.9	1.4
Total* ..	692.4	258.0	267.1	152.9	14.4

* Estimated.

It will be seen from the above figures that exports of cloth since August, 1953, have been steadily moving up. From this, one should not, however, rush to conclude that prospects for cotton piecegoods exports are quite encouraging. For, as a recent review of the position in respect of export markets revealed, Hongkong and Singapore—two of India's best customers—continue to hold off. Burma's orders are negligible. Enquiries from U.K. and West African territories have slackened of late. Persian Gulf markets are quiet. Pakistan's import policy continues to be uncertain.

If the foreign trade in Indian cotton textiles is to be stabilised, it is of utmost importance that the Government of India should adopt a more farsighted policy based purely on economic considerations. So far as the industry and trade are concerned, hard work and concentrated attention are required. The move to establish an Export Promotion Council is certainly a step in the right direction.

The first stage in the setting up of this Council was completed on 18th December, 1953, that is, when, at a conference of the representatives of mill and exporting interests, a Working Committee was constituted to work out the details of the proposed Council. Mr. Neville N. Wadia, Chairman of the Bombay Dyeing and Manufacturing Co., Ltd., is the Chairman of the Committee. The other members are: Messrs. Kasturbhai Lalbhai, Krishnaraj M. D. Thackersey, T. V. Baddeley, Arvind Mafatlal, Navnitlal Shodan, Gautam Sarabhai, M. L. Shah, H. Hill, R. E. Castell, Ramnath Podar, Bharat Ram, Naranji Kara, M. N. Savani, Ramanlal D. Shroff, R. G. Saraiya, Ambalal Kilachand, W. Foges, R. M. Deshmukh, M.P., A. D. Gorwala, and T. Swaminathan, Textile Commissioner. The Committee is expected to submit its report towards the end of January or early in February next.

The work of the proposed Council will surely be watched with great interest. Considering the recent developments on the world cotton textile front, the responsibility that devolves on this Council will indeed be heavy. If the Council is to achieve the purpose for which it is designed, namely, the maintenance of a high level of exports, it is imperative that it should examine all issues relating to cotton textile exports in a dispassionate manner and recommend constructive measures. How important this issue is will be clearly evident from the pertinent remarks of Mr. T. T. Krishnamachari, Union Minister for Commerce and Industry, made in the course of his address at the recent Bombay Conference. Said the Minister: "I make no secret of the fact that a major responsibility for the disastrous decline in exports and the critical situation obtaining now should be accepted by exporters themselves—especially certain exporters—who ship inferior goods after taking orders on superior samples. I regret that the money-making tendency of this sort should have been allowed to damage irreparably India's export trade in textiles. I envisage the creation, early next year, of a special machinery which would officially inspect every yard of cotton textiles which would leave India's shores."

Expansion Plan For Textiles

The year under review witnessed a notable event in the history of the cotton textile industry, namely, the publication of the expansion plan by the Planning Commission. The plan is on the following lines:

		1950-51	1955-56
Rated capacity:			
Spindles		10,942,241	11,292,241
Yarn ..	(million lbs.)	1,669	1,722
Looms		194,411	195,849
Cloth ..	(million yds.)	4,744	4,779
Actual production:			
Yarn ..	(million lbs.)	1,179	1,610
Mill cloth	(million yds.)	3,713	4,700
Handloom cloth	Do.	810	1,700
Exports:			
Yarn ..	(million lbs.)	75	..
Cloth ..	(million yds.)	1,270	1,000
Raw cotton requirements	(million bales)	3.5	4.9

The foregoing statement clearly reveals that the Planning Commission has attached relatively greater importance to the expansion in the handloom sector as a means of augmenting cotton textile output. The production target for mill cloth has been fixed slightly higher at 4,779 million yards; even this increase is to be achieved, not by the establishment of any new composite mill, but by enhancing the efficiency of the existing units. The need for maintaining a high level of exports, however, has been fully taken into account.

U.K. TEXTILE INDUSTRY

(Concluded from page 127)

Exports

A disappointing feature of the trade expansion which has taken place in Lancashire, particularly in the second half of the year, has been the failure of exports to broaden. For the first nine months of the year, cotton goods shipped abroad were valued at £97,282,946, against £114,775,515 in the same period of 1952.

In the first three-quarters of the year, cotton cloth exports were 524,948,000 square yards, valued at £64,900,448, as against 525,844,000 square yards worth £78,023,946 in the previous year. The average price per square yard of cloth was 29.67d., against an average of 34.05d. throughout 1952. Cotton yarn shipments showed a slight improvement on the previous year, but were well below the post-war peaks established in 1950-51. For the first nine months of the year, they amounted to 29,491,600 lbs. valued at £11,872,352 against 26,365,700 lbs. worth £13,578,487 in 1952. The average price obtained for cotton yarn was 96.62d. per lb., against an average of 119.25d. per lb. throughout 1952.

British Commonwealth markets continued to absorb the largest quantities of Lancashire-made yarn and cloth, useful supplies being sent to British West Africa, Australia, South Africa, New Zealand, Malaya and East Africa. Import restrictions caused a sharp contraction in trade with Pakistan, which in the nine months shrank to only 2,435,000 square yards of cloth, as against 40,544,000 yards in the same period of 1952. Yarn exports to Pakistan were only 180,700 lbs., against 2,743,000 lbs. Shipments of cloth to India were also lower at 3,436,000 square yards, as against 4,719,000 yards.

Production of cotton and rayon goods in Lancashire by the middle of 1952 had fallen to about 55 per cent. of the high output achieved in the 1950-52 era. The labour force declined to 82 per cent. of its peak post-war level. The return of workers to the mills has enabled production to rise again to almost 90 per cent. of the rate achieved before the recession.

For several years back, there has been a reduction of looms in Lancashire, partly as a result of respacing by individual manufacturers. Since 1948, about 58,000 ordinary Lancashire looms have been scrapped, while the number of fully automatic looms has increased from 26,000 to nearly 42,000. Automatic weaving machinery now represents about 13 per cent. of the industry's total loom capacity, as against 7 per cent. five years ago.

In the spinning section, the number of mule spindles was being reduced at an annual rate of 740,000 in 1950-51, while ring spindles installed rose at an increasing rate up to 240,000 in 1951. Mule spindles in the industry now number 17,000,000 against 21,000,000 five years back, but the quantity of ring spindles has increased from 10,000,000 to nearly 11,000,000.

Considering the difficulties encountered during the past two years and the problems of expanding foreign trade in textile goods, the re-equipment of mills which has taken place has been substantial. It is more than likely that, in future, Lancashire will have to depend upon a limited industry, as compared with its former size; yet the pointers indicate that it will be more efficient than in the past and less vulnerable to foreign competition which tends to increase in all quarters.—*All Rights Reserved.*

Notice

THE ASSOCIATED CEMENT COMPANIES, LIMITED

NOTICE

THE SEVENTEENTH ANNUAL GENERAL MEETING of the Shareholders of THE ASSOCIATED CEMENT COMPANIES, LIMITED, will be held at the Registered Office of the Company at 1, Queen's Road (opposite Churchgate Railway Station), Fort, Bombay, on Friday the 15th January, 1954, at 4 p.m., to transact the following business:—

1. To receive and adopt the Directors' Report and Audited Statement of Accounts for the year ended 31st July, 1953.
2. To sanction the declaration of a Dividend.
3. To elect Directors.
4. To appoint Auditors for the current year and fix their remuneration.

By Order of the Board,

For THE ASSOCIATED CEMENT COMPANIES, LTD.,
CEMENT AGENCIES LTD.,
Managing Agents,
J. H. PATEL,
Managing Director.

BOMBAY, 27*th November*, 1953.

Note.—The Transfer Books of the Company were closed from Monday the 2nd November to Monday, the 30th November, 1953, both days inclusive.

The Dividend when sanctioned will be made payable on and after Thursday, the 21st January, 1954, to those Shareholders whose names stand on the Register on Monday the 30th November, 1953.

SUGAR MAKES SAD STORY

PRODUCTION DECLINES—PRICES RISE

IF the 1951-52 season ranked as the most eventful in the history of the Indian sugar industry, 1952-53 will go down in history as a season which greatly disappointed the consumer. Not only were the eager hopes of the consumer getting his requirements of sugar at lower prices completely belied but the country also was driven to the necessity of importing sugar at the cost of much precious foreign exchange. Indeed, the prospects of India being completely self-sufficient in sugar are bleak, unless, of course, the Governments at the Centre and in the States take energetic steps to remove the series of impediments to increased production. This is an important proviso which needs to be specially stressed in the present context of the growing tendency on the part of the powers-that-be to treat the sugar industry as their milch cow. The industry, it must be remembered, is the second largest industry in India, ranking next only to cotton textiles. Excluding the agricultural side of its operations, the industry provides employment to as many as 125,867 persons and produces over Rs. 100 crores worth of sugar every year, which represents more than 1 per cent. of the national income of India.

The 1952-53 season witnessed an appreciabe decline in sugar output. The quantity of sugar actually produced was only 1,316,300 tons, as against the peak level of 1,483,100 tons established in the previous season, which represents a fall of over 11 per cent. Nevertheless, the output was the second largest since the pre-war period. The pre-war record output was in 1938-39 when such amounted to 1,207,000 tons.

Causes for Lower Output

Two important factors were responsible for the marked fall in sugar output during the season under review, namely, accumulation of heavy stocks at the commencement of the season and inadequate supplies of sugarcane to mills. The carry-over stocks at the end of October, 1952, for instance, aggregated as much as 564,674 tons or nearly 38 per cent. of the total production during 1951-52. These heavy stocks, coupled with the downward trend in sugar prices then prevailing, both of which caused considerable difficulties and hardships to the mills, acted as a damper on the enthusiasm of the factories to crush more cane. It was no wonder, therefore, that the crushing operations in the factories generally commenced much later than in the previous season. Thus, by 28th November, 1952, only 37 factories had started crushing, as against 70 a year before. The number of factories working was also less, being 134—the total number of factories in India is 157— as against 137 during 1951-52.

Further, supplies of sugarcane to the factories were not adequate to meet their requirements. The extent to which they fell short will be evident from the fact that the quantity of cane crushed during 1952-53 was 13.2 million tons, which compares unfavourably with 15.5 million tons in the previous season—a decrease of 16 per cent. The fall in cane supplies was due to diversion of cane to the manufacture of *gur*. The removal of price and movement control on *gur* and *khandsari* and the permission to export these commodities, not to speak of the reduction in sugarcane prices, induced the growers to utilise the cane for the production of these sugar substitutes, instead of supplying it to the factories. The rise in the price of *gur*, thanks to enlarged demand both for direct consumption and for the manufacture of illicit liquor, provided further impetus to *gur* producers. In fact, at one time, *gur* fetched in some centres as high a price as the white sugar itself.

Another contributory factor for the inadequate supplies of cane to the factories was the reduction in the sugarcane crop. The aggregate yield of cane during 1952-53 was not more than 52.6 million tons, as against 60.7 million tons in the previous season—a fall of 13.3 per cent.

To revert to the production performance of the sugar industry. The table below indicates the trend of sugar output in the factories—classified according to the territories covered—during the season under review, as compared with the previous one:

	1951-52		1952-53	
	No. of factories	*Production*	*No. of factories*	*Production*
		Tons		Tons
Uttar Pradesh ..	66	834,000	66	699,800
Bihar ..	27	224,000	27	272,800
Bombay	15	157,800	14	134,800
Madras	12	94,900	13	80,600
Hyderabad ..	3	39,900	3	42,900
Mysore	1	37,100	1	27,900
P.E.P.S.U. ..	2	27,900	2	15,000
Punjab	1	20,100	1	16,100
Madhya Bharat ..	5	18,100	3	7,500
W. Bengal and Assam ..	1	7,200	1	8,000
Rajasthan ..	2	7,500	1	600
Travancore-Cochin	1	4,400	1	3,900
Orissa	1	2,600	1	2,400
Bhopal	1	3,700	..	..
Ajmer	1	800	..	..
Total ..	139	1,483,100	134	1,316,300

It will be seen from the above table that the trend of sugar output during 1952-53 was generally downwards. The decline was particularly marked in the case of Uttar Pradesh, where sugar production declined by 134,200 tons. Similarly, Bombay, Madras, Mysore and P.E.P.S.U. showed a sizable fall in output. The States of Punjab, Madhya Bharat, West Bengal, Assam, Rajasthan, Travancore-Cochin and Orissa also accounted for a decrease. There was no production of sugar at all in Bhopal and Ajmer. Bihar and Hyderabad, however, were the two States which registered an increase in sugar output.

Cane Crushed

As already noted, the total quantity of cane crushed during the season under review was lower than in the previous season (13.2 million tons, as against 15.5 million tons). The all-India average rate of crushing of cane was 870 tons per day; the figure for 1951-52 was 831 tons. This rate of crushing remained the same in U.P., but increased in all the other major States.

Consequent on reduced cane supplies to the sugar factories, the duration of the crushing period was shorter. The all-India duration during 1952-53 was 113 days, as against 133 days in 1951-52. The average number of days worked in the U.P., Madras and Bombay was 118, 99, and 118, as against 148, 151 and 148, respectively. The maximum figure for the whole of India was 196 days, as against 249 days in 1951-52.

While there was a fall in the quantum of sugar produced, the season under review witnessed a welcome improvement in the recovery percentage of sugar in all the major States, except Bihar, Mysore and P.E.P.S.U. While the quantity of cane crushed in the factories declined by more than 16 per cent., that of sugar produced fell by only 11 per cent. Accordingly, the all-India recovery percentage of sugar was 9.97, as against 9.57 in the preceding season. The maximum recovery for any factory was 12.79, as against 12.45. The State-wise recovery of sugar percentage, cane during the past two seasons is given in the following table:

	1951-52	1952-53
Bombay	11.08	11.51
Mysore	11.61	11.37
Hyderabad	9.68	10.60
West Bengal and Assam ...	10.87	10.33
Punjab	9.41	10.21
Bihar	10.32	10.03
U.P.	9.27	9.75
Rajasthan	8.50	9.73
Madhya Bharat ...	9.31	9.39
Madras	8.62	9.38
P.E.P.S.U.	8.68	8.22
Orissa	9.02	8.14
Travancore-Cochin ...	6.58	7.32
All-India average ...	9.57	9.97

Judged, however, by the enormous amount of money collected by the State Governments by way of sugarcane cess, the encouragement given by the Indian Central Sugarcane Committee, and the various schemes of assistance directly undertaken by the Government of India, the improvement in recovery percentage of sugar noted above pales into insignificance. For the recovery percentage in India continues to be the lowest as compared with the other leading producers of sugar in the world. The average recovery percentage of sugar in Australia, for instance, is 14.33, in Formosa 12.93, in Cuba 12.25, in Puerto Rico 12.23, in Mauritius 12.08, in Java 11.49 and Hawaii 10.46.

Despite the fall in sugar output, the supply position was quite comfortable, thanks to the large opening stocks. The production of 1,316,300 tons of sugar during 1952-53, together with 564,674 tons brought in from 1951-52 and imports of 52,000 tons, gave a total supply of 1,871,300 tons for the season under review, as compared with 1,653,100 tons in the previous season. Out of these, stocks with the mills as on 31st October, 1953 amounted to 503,000 tons. The balance of 1,371,898 tons (excluding exports of 6,432 tons), may, therefore be regarded as the quantity consumed within the country during the season under review. This compares with 1,184,000 tons in the previous season.

Sugar Prices

In spite of such comfortable supply position and of a reduction in sugarcane prices from Re. 1-12 to Re. 1-5 per maund, prices of sugar continued to stay at a high level. The average all-India price of sugar for the month of September, 1953, for instance, was Rs. 31-14 per maund, as compared with the previous control price of Rs. 29-12.

What then was the high level of sugar prices due to? The answer to this poser is not far to seek. Apart from factors like larger consumption, increase in *gur* prices, rigidity of wagon allotments and smuggling to Pakistan the Government of India itself is to be blamed. Although stocks of sugar were plentiful and prices low in the early months of 1953, the Government continued to exercise control on releases of sugar from the factories. This resulted in large supplies of sugar being withheld from the market and thereby helped the anti-social elements to indulge in speculation and to hoard sugar, and prevented the operation of the natural law of supply and demand. If the Government had completely decontrolled sugar, leaving the previous season's stocks and the production of the season under review to be marketed without any interference, the rise in sugar prices would certainly not have arisen to the extent it did. The country also would have been spared the need for importing sugar, entailing loss of foreign exchange.

Instead of adopting the aforesaid measure, the Government announced—on 16th June, 1953—a three-point plan to bring down the price of sugar. The three features of the plan were:

(1) Flooding the important markets like Bombay, Calcutta, Kanpur and Delhi with sugar released from factories by arranging special trains for its movement.

(2) Allotment of sugar from factories from their reserve stocks at a statutory ex-factory price of Rs. 27 per maund to State Governments and other agencies for distribution through fair price shops.

(3) As a supplement to the above measures, arrangements for importing sugar from abroad to the extent necessary to defeat hoarding, if any, on the part of the trade.

Imports of Sugar

The implementation of the first two measures did not, however, bring down sugar prices. The Government, therefore, decided to import sugar from abroad. It first decided to allow private traders to import sugar. And, with a view to bringing down the cost of foreign sugar to a level, which had been well above the domestic prices, the Government reduced the import duty from Rs. 14-14 to Rs. 7 per cwt. Within three weeks of the announcement—on 9th July, 1953 to be precise—the Government decided to import sugar on its own account. First tenders were invited for the delivery of 30,000 tons of sugar to the Government at specified rates, The Central Food Ministry concluded a direct deal with British refiners for shipment of 20,000 tons and with Mexico, Java and Cuba for the purchase of 30,000 tons each. The Government has since completed arrangements for the ourchase of 130,00 tons of imported sugar. According to the Deputy Minister for Food and Agriculture, India will probably import up to 400,000 tons next year.

Despite the imports, sugar prices all over the country still continue to be high, as will be evident from the following latest available quotations (per maund) for some of the important sugar markets: Hapur Rs. 31-0; Kanpur Rs. 30-6; Meerut Rs. 30-11; Calcutta Rs. 30-2; Bombay Rs. 35-1; Madras Rs. 34-12; and Delhi Rs. 32-3. It will be seen from these figures that the price of sugar now being quoted is higher than the fair ex-factory price of Rs. 27 per maund and the world price of about Rs. 14 per maund.

The one irresistible conclusion that follows from the foregoing account is that the Government of India's sugar policy for the past season had been based more on expedients, rather than being a planned effort, with a clear vision of the future. The latest policy, that for the current (1953-54) sugar season, announced by the Government on 24th September, 1953, is no exception. The salient features of the policy are indicated below:

(1) Sugarcane price was raised from Re. 1-5 to Re. 1-7 per maund and the revised rate was applicable for the 1953-54 and 1954-55 seasons.

(2) Special additional excise duty of Re. 1 per maund of sugar, imposed last year for the specific purpose of meeting the loss involved in reducing the price of the 1951-52 season's carry-over controlled stocks, was discontinued.

(3) The practice of fixing minimum price for cane one year in advance adopted.

(4) No statutory control was to be exercised on the price or distribution of sugar, but releases of stocks from factories would be controlled by the Government in the same manner as was done in 1952-53. Approximately 25 per cent. of the season's production will, however, be treated as reserve stock from which the Government will make releases at controlled prices, if and when necessary, if the market price of sugar rises unduly high. The possibility of reducing this controlled price below Rs. 27 per maund is being examined. The factories are free to sell the rest of their production at prices and to buyers of their own choice as in 1952-53.

Outlook for 1953-54

The withdrawal of the special additional excise duty was certainly a welcome development. But the benefit of this measure to the consumer has been more than nullified by the increase in the sugarcane price. For a two-anna rise in the price of sugarcane means an increase of 9.5 per cent. in the cost of sugar manufacture. Moreover, the indications so far available point to a fall in sugar output in the 1953-54 season; according to one estimate, the output will amount to no more than 1,250,000 tons. Thus, the sugarcane crop is expected to be smaller than in the previous season, following the expected reduction in acreage under cane from 4,376,000 acres in 1952-53 to 4,164,600 in 1953-54. On the basis of this and assuming that the average yield of cane per acre will be maintained at 12 tons, the aggregate production of cane may be estimated at 49.98 million tons, which falls short of the 1952-53 season's output by as much as 2.62 million tons. Again, *gur* prices have continued to rule high which will naturally keep at a high level the competitive capacity of *gur* producers *vis-a-vis* the sugar mills. All this means that the supplies of cane available to the factories will tend to be smaller than in 1952-53.

A disquieting feature of the Government's sugar policy is the retention of control on releases and the keeping of a reserve of 25 per cent. of the year's production as buffer stock. Evidently, the Government has never learnt from its past mistakes. Any artificial control on sugar, besides taking away the incentive for higher production, will provide no inducement to improve the quality.

Considering the anticipated fall in sugar output and the steady rise in consumption, one indeed wonders if the chances of the consumer getting sugar at reduced prices are not but slender. There is, however, one factor which suggests that prices of sugar may not rise unduly high. As the world supply position is quite confortable and prices have declined, the country can import sugar at a lower price. But imported sugar, it must be pointed out, accounts for only a part of the country's requirements. Moreover, the quantity of sugar that will actually be imported will depend on the availability of foreign exchange. Merely because sugar is available abroad at a cheap price, India cannot import considerable quantities. What is more urgently required is incentive to the sugar industry to augment output.

The scope for the development of the Indian sugar industry is vast, what with the steady rise in population, the migration of the people from the villages to urban areas, and the improvement in the general standard of living. The *per capita* consumption of sugar (including *gur*) per annum in the country is at the rate of 30 lbs.—23 lbs. *gur* and 7 lbs. sugar—as against 116 lbs. in Australia, 106 lbs. in the U.K. and 97 lbs. in the U.S.A. Considering the increase in the "sugar-tasting habit of the people of this country" in recent years, the need for expanding the sugar industry cannot be over-emphasised.

Viewed thus, the target of 1.55 million tons in the rated capacity of the sugar industry fixed for 1955-56 by the Planning Commission must be said to be rather low. The rated capacity depends, of course, on a number of factors, as, for example, daily cane-crushing capacity of each factory, duration of the crushing season, which depends on availability of cane supplies, quality of cane, efficiency of operation in a factory, and the number of units working in each season. But there is no gainsaying the fact that, in the next few years, the rated capacity will be found to be too insufficient fully to meet the domestic sugar requirements.

Notices

THE PHALTAN SUGAR WORKS, LIMITED

NOTICE

THE TWENTY-SECOND ORDINARY General Meeting of the Phaltan Sugar Works Ltd. will be held on Monday the 28th December, 1953, at 3 p.m. (S.T.), at the Factory Office of the Company at Sakharwadi, District Satara North, to transact the following business:

(1) To adopt the Directors' Report and Audited Statements of Accounts for the year ending 30th September, 1953.

(2) To sanction payment of Dividend.

(3) To elect Directors in place of Messrs. Arvind N. Mafatlal and Himatlal Kantilal who retire by rotation but being eligible offer themselves for re-election.

(4) To elect Director in place of Seth M. L. Apte who retires in pursuance to Article 123, but being eligible offers himself for re-election.

(5) To appoint Auditors for the current year and fix their remuneration. A notice has been received by the Company from one of the shareholders of the Company proposing that Messrs. C. C. Chokshi & Co., of Bombay, be appointed Joint Auditors with Messrs. G. M. Oka & Co., the present Auditors.

(6) To transact any other business that may be brought forward by the Chairman.

The Transfer Books will be closed from 30th December, 1953, to 22nd January, 1954, both days inclusive.

By Order of the Board of Directors,
For MAFATLAL, APTE & KANTILAL LTD.,
L. V. APTE,
Managing Director,
Managing Agents.

SAKHARWADI (DIST. SATARA NORTH),
3rd November, 1953.

N.B.—The Dividend when declared will be made payable at the Factory Office at Sakharwadi, on and after 6th February, 1954. The Dividend Warrants will be posted to those shareholders whose names stand on the Company's Register on the 29th December, 1953.

THE EQUITABLE COAL COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT the One Hundred and Seventeenth Ordinary General Meeting of Shareholders of the above Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Friday, the 8th January, 1954, at 2-30 p.m., for the following purposes:—

1. To receive and consider the Directors' Report and the Accounts for the half-year ended 30th June, 1953.
2. To declare Dividends.
3. To transact any other competent business that may be brought forward.

The Share Books of the Company will be closed from the 2nd to 8th January, 1954, both days inclusive.

By Order of the Board,
MACNEILL & BARRY LTD.,
J. LATIMER,
Managing Director,
Managing Agents.

2, FAIRLIE PLACE,
CALCUTTA, *23rd December*, 1953.

THE HURRILADIH COAL COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT the Eighty-fifth Ordinary General Meeting of Shareholders of the above Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Friday, the 8th January, 1954, at 2-40 p.m., for the following purposes:—

1. To receive and consider the Directors' Report and the Accounts for the half-year ended 30th June, 1953.
2. To declare a Dividend.
3. To transact any other competent business that may be brought forward.

The Share Books of the Company will be closed from the 2nd to 8th January, 1954, both days inclusive.

By Order of the Board,
MACNEILL & BARRY LTD.,
J. LATIMER,
Managing Director,
Managing Agents.

2, FAIRLIE PLACE,
CALCUTTA, *23rd December*, 1953.

THE DHEMO MAIN COLLIERIES, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT the Sixtieth Ordinary General Meeting of the Shareholders of the above Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Friday, the 8th January, 1954, at 2-50 p.m., for the following purposes:—

1. To receive and consider the Directors' Report and the Accounts for the half-year ended 30th June, 1953.
2. To transact any other competent business that may be brought forward.

The Share Books of the Company will be closed from the 2nd to 8th January, 1954, both days inclusive.

By Order of the Board,
MACNEILL & BARRY LTD.,
J. LATIMER,
Managing Director,
Managing Agents.

2, FAIRLIE PLACE,
CALCUTTA, *23rd December*, 1953.

THE WEST JAMURIA COAL COMPANY, LIMITED

NOTICE

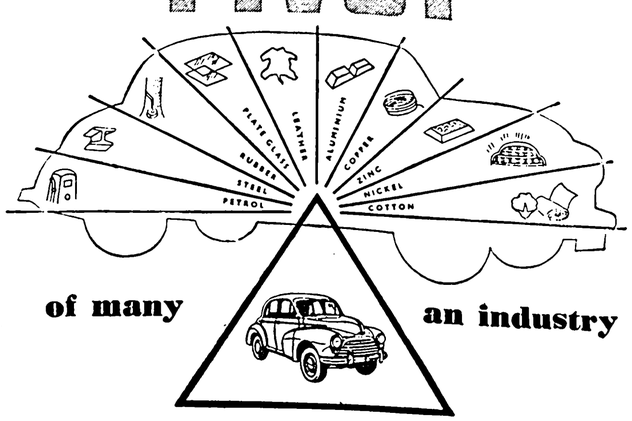
NOTICE IS HEREBY GIVEN THAT the Fifty-seventh Ordinary General Meeting of Shareholders of the above Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Friday, the 8th January, 1954, at 3-00 p.m., for the following purposes:—

1. To receive and consider the Directors' Report and the Accounts for the half-year ended 30th June, 1953.
2. To transact any other competent business that may be brought forward.

By Order of the Board,
MACNEILL & BARRY LTD.,
J. LATIMER,
Managing Director,
Managing Agents.

2, FAIRLIE PLACE,
CALCUTTA, *23rd December*, 1953.

The PIVOT of many an industry



In the post-Independence years, the efforts and attention of the Government have rightly been directed towards raising the general standard of living of the millions in this vast country. This urge to live well and live better has found expression in the first Five-Year Plan.

To achieve this economic prosperity the implementation of the all-round industrial development programme is the basic factor. The automobile industry directly encourages and supports many ancillary industries like petrol, steel, rubber, glass, leather, aluminium, copper, zinc, nickel, cotton and others. By establishing a full-fledged automobile manufacturing unit in India, Hindustan Motors are contributing their due share in raising the economic standard of the masses.

HINDUSTAN MOTORS LIMITED
8, Royal Exchange Place, Calcutta

A DISAPPOINTING YEAR FOR COAL

EXPORTS STAGE SHARP DECLINE

THE year that is just drawing to a close was a disappointing one for the Indian coal industry. It witnessed, for the first time since 1948, the arrest of the upward trend in the production of coal. Exports of coal staged a precipitous fall, and even the removal of surcharge on exports failed to reverse the down-trend. The transport situation also failed to rise up to expectations, inasmuch as the wagon supply position for loading coal in Bengal and Bihar collieries during the first nine months of the year showed no improvement, with the daily wagon supply being more or less in line with the number of wagons supplied in the previous year. Labour relations at the collieries were not very encouraging and the intervention of the Government was found necessary to settle disputes.

The year was, however, not altogether eventless for the coal industry. For it witnessed several outstanding developments which had a close bearing on the economy of the industry. Among these developments were the institution of a scheme of regional distribution of coal with effect from 1st July, the submission of *interim* report by the Washeries Committee, which was appointed in February, 1953, to examine problems relating to the establishment of coal washeries in India and the decision of the Government of India to work railway collieries departmentally by 1st April, 1954, by abolishing the contract system for raising coal. Facilities were also created for mines engaged in sand-stowing by relaxing restrictions on output of coking coal.

The raisings of coal during January-September 1953, the latest period for which figures are available, were 27,070,304, as against 27,137,835 tons during the corresponding period of 1952, that is a decline of 67,531 tons. On estimated output for the subsequent three months of the year, it is expected that the total production for the whole year, 1953, would be about 400,000 tons less than in 1952, when it touched a peak of 36.3 million tons. This is no doubt a fractional fall, but it is significant in that it marks the deviation in the production curve which continued to maintain its upward trend since 1948. The output in 1948 was 29.8 million tons. It shot up to 31.4 million tons in 1949. In the following year, it rose to 32 million tons. The upward trend persisted on its course and in 1951, it reached a high of 34.1 million tons, to be surpassed again in 1952 when an all-time high of 36.3 million tons was reached. The five-year old rise in production, however, received a check this year, when the output is expected to be no more than 35.9 million tons.

Despatches

The despatches of coal also recorded the same trend witnessed in production. No notable variations are visible in the total despatches. They were during the first nine months of 1952 as much as 22,908,716 tons, as against 22,861,201 tons in the same period during the previous year, that is a fall of 47,515 tons. The decline in despatches is also negligible. The total despatches during the year 1952 were 31,183,866 tons, as against 29,217,332 tons in 1951.

The output of hard and soft cokes was, however, substantially higher during the period under review, as compared with the corresponding period of 1952. Soft coke produced during January-September, 1952 was 97,438 tons, as against 79,877 tons, a rise of 17,561 tons. The output of hard coke was higher by 936,275 tons at 1,087,199 tons. The production of hard and soft cokes in 1952, amounted to 111,396 tons and 1,302,016 tons, respectively, as against 106,625 tons and 1,270,826 tons in the previous year.

Despatches of hard coke staged a small fall, while there was a marked fall in those of soft coke. Thus, despatches of hard coke during January-September, 1953, were 91,154 tons, as against 91,764 tons in the corresponding period of the previous year, a fall of 610 tons. The despatches of soft coke were 1,076,173 tons, as against 952,581 tons, a rise of 124,592 tons. The despatches of hard and soft cokes during the year 1952 were 120,806 tons and 1,319,874 tons respectively, as against 102,581 tons and 1,210,591 tons in the previous year.

The transport position remained almost static. Despite pressure from the industry for more wagons, the railways were unable to cope with the demand. The *status quo* was, however, maintained in regard to allotments of wagons during January-September, 1953, as compared with the same period in the previous year. The average loading in Bengal and Bihar collieries was 3,099 wagons per day, as against 3,108 in the same period the previous year. It is stated that the despatches and, consequently, production, would have shown improvement, had the collieries been supplied with more wagons. With a view to overcoming this handicap, recourse had to be taken to a scheme for regional distribution of coal by the Coal Board.

Regional Distribution

This scheme came into effect as from 1st July, 1953. According to the scheme, no movement of coal other than selected grades and coke is permitted from Bihar and West Bengal collieries to areas mentioned below:

(1) Stations beyond Chakradhara Pura on the original B.N. Railway. Consumers situated in areas outside this area are required to draw their supplies of coal from Vindhya Pradesh coalfields only;

(2) stations on and south of line Katni-Bina-Kotah;

(3) all stations via Nagpur on the Central and Western Railways; and

(4) all stations via Ujjain on the Central and Western Railways. These three areas are to get coal from Madhya Pradesh or Vindhya Pradesh coalfields;

(5) all stations on the Southern Railway; and

(6) all stations south of Balharshah on the Central Railway. Consumers situated in these two areas are to obtain their coal requirements from Madhya Pradesh or Singareni collieries in Hyderabad.

This scheme has been in operation for only five months and it is too early to assess the success of the scheme which is expected, among others, (1) to reduce difficulties in moving coal in Western and Central India through such junctions as Agra East Bank, Cheoki, etc., (2) to meet adequately the difficulties created by chronic shortage of wagons, (3) to improve the turn-round of wagons for Bengal-Bihar coalfields, (4) to avoid the necessity of hauling coal over long distances and (5) to give impetus to coal producers of the regions other than West Bengal and Bihar coalfields, for producing more by assuring a market for their coal.

Exports Discouraging

Statistics relating to exports are available only for the first nine months of the year. They depict a very discouraging picture. Exports of coal by sea, excluding Pakistan, during the first nine months, January-September, 1952, at 974,019 tons, as compared with 1,644,334 tons in the same period in the previous year, revealed a marked fall of 40.7 per cent. Exports to Pakistan also fell from 956,614 tons during January-September, 1952, to 610,420 tons during the same period in the current year, a drop of 55,194 tons.

The indifferent attitude of the Government towards promotion of coal exports from India in the first half of the year was one of the causes which were responsible for the marked fall in exports. The Government machinery was able to move only after repeated appeals by the industry. And, where it moved, the progress was halting. It ordered the abolition of surcharge on coal exports to Pakistan in March. But this concession was not extended to other countries until May. Permission was also granted to shippers to negotiate individually with foreign countries, other than Pakistan, for exports without prior consent of the Coal Commissioner. All this was not enough to revive an upward trend in coal.

There were also certain other causes for the decline in exports. China, Australia and South Africa emerged as keen competitors to India in the Asian and South-East Asian markets. Australian coal was—and is even now being—shipped to Hongkong, Singapore and Chittagong. South Africa has been sending its coal to Pakistan, Ceylon, Singapore and even Hongkong. It was reported that a trial consignment of Australian coal had been delivered to the Government of Ceylon Railways and tests were being conducted to find out all possible modes of using it, if possible, in preference to Indian coal.

Another cause for the decline is attributed to controls on export of high-grade coal, which is in great demand in the overseas countries. Consequently, doubts are expressed in regard to reaching the export target of 2 million tons for the year.

The future of India's export trade in coal depends initially on the extent of freedom given to the export trade to supply in full the quality of coal needed by importing countries. Secondly, if the export markets for Indian coal are to be stabilised, coal prices should be reasonably competitive. Thirdly, adequate transport for the carriage of coal from pitheads to ports and storage facilities at the ports should be provided as early as possible. Finally, washing and blending of coal should be encouraged with the assistance of the Government, wherever possible so that India could export a larger quantity of higher grade coal with, of course, as little interference as possible with the policy of conservation of high-grade coal.

While on this subject, attention has to be drawn to the eight-man Washeries Committee, with Mr. J. N. Mukherjee as Chairman, appointed in February last by the Government of India. The Committee was required to examine and report on problems relating to the establishment of coal washeries in India. The *interim* report of the Committee, published early in December, has, *inter alia*, urged the need for the establishment of central washeries at an early date, the determination of the basic structure of coal on the basis of useful heat units, payment of bonus on washed coal to encourage washing and the establishment of a central coal utilisation and marketing organisation.

Prices

The control on prices for internal distribution continued during the year under review. There were no changes in coal prices. The figures in the second column will give an idea of the controlled prices for some of the principal varieties of coal.

There was a move on the part of the authorities concerned to reduce the statutory prices of Grades II and III coal by Re. 1-5 per ton each. It was reported that the Coal Commissioner had asked the colliery interests concerned to show cause why the Grades II and III coal should not be subject to a price-cut, in view of the strong evidence of the prevalence of rebates ranging upto Rs. 4 on a large scale. No action was, however, taken in the matter till the close of the year.

Prices realised during the year on sales for export were, however, lower than those in 1952. On the basis of declared values in the sea-borne statistics, published by the Government of India, the average price realised in January-July 1953 was about Rs. 35-9-1 per ton, as against Rs. 36-6-7 in the corresponding period in 1952. But as compared with the same period in 1951 for which the average price was Rs. 30-1-5 per ton, the price realised during the period under review was very much higher.

Employment Situation

The coal industry employed more workers during the year. But the man-days lost were relatively larger than those of the previous year. Absenteeism was somewhat lower. Productivity per man-shift, however, remained unchanged, although there was a slight improvement in the productivity of miners and loaders. Labour employer relations in collieries were generally not cordial.

The monthly average number of workers employed in coal mines during January-July 1953 was 342,307, as against 300,179 in the corresponding period of the previous year, a rise of 42,128. The total number of man-shifts worked during the period under review was 8,494,213, as compared with 8,529,305. The number of man-days lost during January-July 1953 was 128,565, as against 116,791 during the corresponding period last year.

Figures relating to percentage of absenteeism in coal mines, also available only upto July 1953, show that the overall absenteeism during January-July 1953 was on an average 13.01 per cent. per month, as against 13.51 per cent., that is lower by 5 per cent. The average absenteeism per month among workers underground during the first seven months of the year was 14.94 per cent., in open workings 15.63 per cent., and on surface 10.89 per cent. The corresponding figures during January-July 1951 were 14.59 per cent., 14.21 per cent. and 10.34 per cent., respectively.

The productivity of workers in coal mines was practically the same during January-August 1953, as compared with the corresponding period in the previous year. Thus, the output per man-shift for all persons employed above and underground was unchanged at about 0.35 ton. The output per man-shift for all persons employed underground and on open-workings was 0.56 ton, the same as in the corresponding period in 1952. But the productivity of miners and loaders was higher at 1.05 ton, as against 1.03 ton.

Labour Disputes

Coalmine workers demanded the revision of the 1947 Conciliation Board Award. The present terms and conditions of labour employment in collieries are based on this Award. The demand for the revision of the Award covered provisions relating to a rise in the minimum basic wage, increase in dearness allowance proportional to the rise in the cost of living since 1947, and the calculation of provident fund contribution on the basis of pay plus dearness allowance as provided in the Employees' Provident Funds Act 1952. The industry, for its part, complained that the grant of these concessions would be suicidal to the future of the coal industry, especially when productivity of labour in mines had remained stagnant. As a major strike appeared to be imminent on the issue, the Government intervened and announced its decision to appoint a tribunal for adjudication.

Contract System in Railway Collieries

An outstanding development of the year was the abolition of the contract system in all railway collieries. It was decided to see to it that every endeavour was made for raising coal in all railway collieries departmentally by 1st April, 1954. The contract system was accordingly abolished in nine of the railway collieries. The change-over from the contract to departmental system is estimated to necessitate eventually a capital expenditure upto Rs. 20 lakhs on the acquisition of lands, construction of offices, godowns and a recurring expenditure of Rs. 6.5 lakhs on account of pay and allowances to staff. The abolition of the contract system is expected to usher in a new era of labour relations in railway collieries, in that the workers now become the direct employees of State collieries.

Report of Driver Committee

The year under review witnessed the publication of the Report of the Railway Fuel Enquiry Committee, of which Mr. D. C. Driver was the Chairman. The Committee made a number of recommendations with a view to effecting economy in expenditure on coal used in railways as fuel. The recommendations included, *inter alia*, the estimation of loco-coal requirements on the basis of suitability of each grade of coking and non-coking coal for different categories of locomotives, use of low-grade coal on shunting locomotives, the exclusion from future loco-coal programmes as far as transport permitted of coal, the calorific value of which is below 11,500 B.t.u./lb. and the electrification of certain sections of railways. The implementation of the recommendations of the Committee is expected to result in a saving of Rs. 6 crores annually for the next few years in the fuel bill of railways. It is estimated that the savings in the consumption of railways will be to the extent of 20 per cent. of the present consumption.

Another important event of the year is the decision of the Government of India to relax restrictions on the output of coking coal in the case of those mines which have undertaken sand-stowing and to reconsider ceilings on raising of coking coal of collieries proposing to introduce sand-stowing measures. These concessions, though small, are significant as they would go a considerable way towards encouraging stowing. The Coal Board also set aside Rs. 23 lakhs for granting loans to collieries for the purchase and installation of stowing plants and transport of stowing materials

JUTE INDUSTRY EMERGES FROM STOCKS CRISIS

UTILISATION OF IDLE CAPACITY IS THE MAIN PROBLEM

WITH heavy odds against it, the jute industry limped into 1953. The export duty of Rs. 275 per ton on hessians and Rs. 175 per ton on sackings together constituted about 18 per cent. of the value of jute goods early in the year. Stocks of jute goods with Indian mills were rising at an alarming rate, and godowns were jammed to capacity. Stocks early in January were the highest for the previous three years. Foreign demand was failing and the holding power of the industry and trade had been smashed by continued slump in prices. Continental jute mills were buying raw jute from Pakistan at a much lower rate than India. Owing to Pakistan's policy of discrimination against India regarding export of jute, India had to pay Rs. 129 (Indian) per ton more than its Continental competitors. With cotton and paper substitutes gaining ground in the packaging industry, bulk handling of grains in grain producing countries of the U.S., Canada, Australia and New Zealand expanding and use of second-hand bags increasing, the demand for Indian goods continued to shrink. Consequently, prices sagged and the industry was sequealing with pain of financial losses as the year 1953 turned in.

Placed in the most miserable situation thus, the year under review may be aptly described as one of "crisis of stocks" for the industry. With the raw jute position no longer acute, on account of plentiful supplies of jute in India and Pakistan, the industry was in a position to meet any conceivable increase in the world's demand for jute goods. But no expansion in production commensurate with the increased supply of raw jute took place. On the contrary, production was greatly hampered by the accumulation of stocks of manufactured goods. The table below gives an idea of the stocks held by the industry at the end of each month in the year under review, as compared with the corresponding months of 1952:

(In tons)

Month	1953	1952	Month	1953	1952
January	129,418	88,402	July	136,607	100,804
February	134,106	106,427	August	132,459	93,804
March	138,797	111,574	September ..	118,373	91,486
April	137,534	116,369	October	102,703	94,957
May	134,780	103,341	November	..	104,229
June	133,840	90,730	December	..	114,038

It will be seen from the table above that the malady of accumulating stocks from which the industry suffered in the year under review began as far back as October, 1952. Thus from 94,957 tons in that month, they rose continuously to see the year's peak at 138,797 tons in March, 1953. After a minor decline to 137,534 tons, the stocks at the end of each subsequent month revealed an irregular trend and stood at 118,373 tons at the end of September, which was equal to about six weeks' production by the mills working on the basis of 42½ hours a week, with 12½ per cent. of the looms sealed.

Output of Jute Goods

In these circumstances it is not surprising that production of jute goods showed no improvement. The extent of fall in output is indicated by the monthly production figures for 1953, as against those in 1952 given in the table below:

(In tons)

Month	1953	1952	Month	1953	1952
January	72,995	91,712	July	74,353	83,820
February	69,615	83,618	August	68,134	74,291
March	74,430	82,809	September ..	73,097	80,905
April	74,202	81,681	October	..	76,844
May	72,514	85,337	November	..	72,190
June	72,407	73,696	December	..	78,799

It will be noted from the table above that the monthly production of jute goods was appreciably below that in the corresponding months of 1952, except in September, 1953. The total output for the nine-month period of the year under review, amounted to only 655,271 tons, as against 724,049 tons in the same period of 1952, a decline of 68,778 tons or 9.5 per cent. In other words, the jute mills found themselves able to produce no more than a monthly average of 72,808 tons in the nine months ended September, 1953, as compared with 80,444 tons in 1952 and the rated capacity of 100,000 tons a month. This was because demand from important foreign markets continued to falter during the major part of the year under review. In this context, the table below, indicating despatches of jute goods during the nine-month period ended September, 1953, as compared with the same period in 1952, is revealing:

(In 000 tons)

	1953			1952		
	Exports	*Internal consumption*	*Total*	*Exports*	*Internal consumption*	*Total*
January	44.1	14.7	58.8	73.6	12.4	86.0
February	43.5	12.5	61.0	64.2	12.0	66.2
March	57.1	14.4	71.5	62.8	13.6	77.4
April	57.0	14.2	71.2	61.0	17.3	78.3
May	59.4	12.1	71.5	76.5	18.0	94.5
June	69.3	7.8	77.1	63.8	14.0	77.8
July	67.0	9.7	76.7	67.3	15.2	82.5
August	63.1	8.7	71.8	69.1	13.4	82.5
September	80.6	9.8	89.9	57.7	13.3	71.0
October						
November						
December						
Total ..	546.1	107.4	653.5	587.0	129.2	716.2

Despatches Decline

The total despatches during January-September, 1953, aggregated only 653,500 tons, as compared with 716,200 tons in the same period a year previously, a drop of about 8.8 per cent. Of the total, exports accounted for 546,100 tons and internal consumption for 107,400 tons, as compared with 587,000 tons and 129,200 tons. These figures indicate that, while exports declined by 7 per cent., internal consumption of jute goods went down by as much as 17 per cent. Exports which were weak in the early months of the year showed an improvement in the subsequent months, with the year's peak for any one month touching 80,600 tons in September, 1953. The trend was, however, otherwise in the case of the internal market, as the improvement witnessed in the first four months yielded place to a marked deterioration, with the monthly offtake continuing to remain less than 10,000 tons.

An important feature disclosed by the statistics relating to stocks, production and despatches discussed in the foregoing paragraphs is that, although the position of the industry was miserable in the first six or seven months, it began to improve in the subsequent months. Thanks to the reduction in export duties, to the details of which we shall refer presently, the offtake improved, stocks declined and production tended to look up. It will be observed that stocks in October were the lowest for the year, though relatively higher than those in the same month of 1952. Exports were better in June, July and August than in the preceding months. Production in September, 1953, was higher than in either August, 1953 or September, 1952. Latest advices from Calcutta on all these three aspects also make encouraging reading. One can, therefore, confidently say that the industry has managed to emerge from the crisis of stocks that dominated it in the earlier part of the year. This, however, does not mean that the position has become healthy. Far from it. Stocks are still substantially above the normal levels.

Export of Sackings Recede

An analysis of exports of jute goods variety-wise, discloses that, during the nine months ended September, 1953, exports of hessians showed marked progress in that they amounted to 275,900 tons, as compared with 209,700 tons in the same month in 1952. Exports of sackings, on the contrary, staged a marked recession. They aggregated during the period only 266,300 tons, as compared with 372,300 tons in the same period of 1952. Thus the sackings position continued to be most disturbing. Referring to this aspect at the annual general meeting of the Indian Jute Mills' Association held early in the year, the then Chairman, Mr. Moncur, stated that sackings represented 55 per cent. of the industry's production. In the early months of 1952, he said, the offtake was satisfactory, but demand tailed off in the latter months, and as a result, the industry was faced with a steady accumulation of stocks. The mills had been making very heavy losses on their sacking manufacture for some months and the problem before the industry was to stimulate the offtake of heavy goods at more satisfactory prices. The position since then has not changed much, though in the latter part of the year some large purchases were made by Argentina.

From the foregoing analysis, it is clear the Indian jute industry is faced with the twin problems of reduction of accumulated stocks and the utilisation of the idle capacity of the mills. The problems are so interrelated that the solution of the first one would automatically solve the second one. It will be interesting to examine here the various measures adopted by the State and the industry to solve this problem.

With regard to the first problem, namely, reduction of stocks, it is needless to add that the chief remedy lies in restoring the competitive efficiency of the industry in overseas markets. Competitive efficiency, in its turn, depends on availability of high quality raw material at reasonable prices, modernisation of plant and machinery, increased productivity of labour, and the co-operation of Government in removing impediments such as export duties, trade restrictions, controls, etc.

Raw Jute Supplies Adequate

During the year under review, by reason of a bumper jute crop both in India and Pakistan, jute mills did not experience any difficulty in getting their needs of raw jute. In the 1952-53 season (July to June), raw jute production in the Indian Union amounted to 4.7 million bales. With a carry-over of 1.16 million bales from 1951-52 and imports from Pakistan of 1.3 million bales, the total availability of raw jute was 7.18 million bales, as compared with 7.53 million bales in the 1951-52 season. Of this, mills consumed 5.65 million bales, while other consumption accounted for one million bales. In the result, the carry-over at the end of the 1952-53 season was estimated at 1.42 million bales.

In Pakistan too the crop in the 1952-53 season amounted to 6.8 million bales, as compared with 6.3 million bales in the previous year. Including carry-over stocks estimated variously between 2.5 and 3 million bales, the total availability in Pakistan was of the order of about 9 million bales. Thus the total availability of raw jute from both countries was about 16 million bales.

In addition to the plentiful supplies, flow of raw jute from Pakistan was made liberal by the Indo-Pakistan Agreement signed during March, 1953. The agreement was the outcome of a dispute between India and Pakistan regarding the discriminatory treatment against India in respect of a special licence fee of Rs. 2-8 per maund on exports of raw jute in India as also an additional export duty of Re. 1-4 on exports of *kutcha* jute bales to India. The dispute was taken to the G.A.T.T. by India and as a result Pakistan agreed to remove the discriminatory levies, while India agreed to buy 1.8 million bales of raw jute from Pakistan and, if need arose, even more, up to 2.5 million bales a year. The agreement was beneficial to India in two respects. By the abolition of the discriminatory export duty by Pakistan, India's competitive ability in overseas markets improved in respect of jute goods manufactured out of Pakistani raw jute. Secondly, India was able to purchase more jute this year than it did last year. Thus, in the nine months of the current year its purchases, at 1.05 million bales, were twice as much as those in the same period last year amounting to 513,000 bales.

Reduction in Export Duties

Another important factor which considerably strengthened the competitive ability of Indian mills was the reduction effected by the Government of India in the unduly high export duties on jute goods. The reduction was carried out in three stages during the year. The first cut came on 7th May, 1952, when the duty on hessians was reduced from Rs. 750 per ton to Rs. 275 per ton and that on sackings from Rs. 350 to Rs. 175 per ton. Again on 1st March, 1953 the latter was further reduced to Rs. 80 per ton. In July, a minor concession was given by the abolition of export duties on certain special types of jute goods. All this, however, did not help much to improve the position. The deterioration in the offtake of hessians continued and the Government was perforce obliged to reduce further the duty on hessians from Rs. 275 per ton to Rs. 120 per ton on 15th September, 1953. The cumulative effect of all these reductions began to make itself felt in October when stocks of jute goods came down to 102,713 tons, the lowest for any month in the year under review so far. The parsimonious manner in which the reductions were effected by the Government only delayed the process of recovery. Even the present levels of duty are considered to be high and the industrialists and the trade are urging the Government to abolish these duties completely. While the Indo-Pakistan trade pact and the reductions in export duties helped raise the competitive efficiency of the industry, at one time during the year suggestions were made by the industry for permission either to seal further loomage or to reduce hours of working. The Government, however, did well in not giving its approval to this suggestion. The matter was, therefore, dropped. Such a step would have only added to the cost of production and conferred a direct protection to the jute industry in other countries.

With a view to exploring further outlets to its goods, the industry sent

a delegation to survey the markets for its products in Australia, New Zealand and some Far East Asian countries. The delegation's investigations revealed that jute goods could still hold their own in these markets provided they were sold at comparatively low prices.

The extent of benefit derived from the aforesaid measures is reflected in the improvement in values of raw jute and jute goods. Early in the year under review, raw jute was quoted at Rs. 24 per maund (Assam bottoms). Owing to steady deterioration in the jute goods market, the rate declined to Rs. 17 per maund early in April. Towards the middle of November, it improved to Rs. 28-8 per maund. Similarly, B twills, after declining from Rs. 93-12 per 100 bags to Rs. 85-4 in April, recovered to Rs. 102-12. Hessian 40 oz×10" which were quoted at Rs. 43-4 per 100 yards early in the year, staged a setback to Rs. 37-8 in April, but recovered, thereafter, to Rs. 49-4. These recoveries, however, were painfully slow and halting.

Nevertheless, the improvement in prices is welcome, but by itself it is not enough, though it renders processing of jute remunerative. The chief problem before the industry to-day is the utilisation of its idle capacity. This would be possible only by recovering its original markets lost to Continental jute manufacturers and cotton and paper packaging substitutes. Besides, there is the threat of growing competition from the newly started jute mills in Pakistan. The Indian industry can cope with the task of regaining old markets and conquering new ones only by means of modernisation of its plant and machinery. Though according to some in the industry modernisation constitutes no urgent problem, the fact is that most of the plant and machinery is outmoded and requires to be rehabilitated.

Besides modernisation, there is the question of raw jute. The first estimate of raw jute for the Indian Union places the output for 1953-54 at about 3.2 million to 3.5 million bales, as compared with the actuals for 1952-53 at 4.7 million bales. This decline for the current season has exploded the hope of making the country self-sufficient in jute, a hope which was very much boosted by the Ministry of Agriculture. In addition to the fall in total production, there is the question of yield which at 2.6 bales per acre is quite unsatisfactory. Further, the quality of Indian jute leaves much to be desired. If the industry is to cater to the changed tastes of its customers abroad, not only the yield per acre but also the quality of jute should be improved considerably. In this direction, the work of the Indian Central Jute Committee is far from satisfactory.

A matter of utmost concern to the industry at present is to put back into operation its idle capacity. Before doing so, the industry should resume normal working. At present, it is working only 42½ hours a week. This must be increased to 48 hours. And then the 12½ per cent. sealed looms should be brought back into production. In order to enable it to achieve this state of normalcy, the industry should be assured of adequate supply of the right type of raw material at economic rates; for the cost of raw jute is by far the biggest item in the cost of production. In addition, cooperation of labour, tax concessions to the industry, total abolition of the export duty on jute goods are also required to help the industry not only to utilise the full complement of plant and machinery, but also to win back its former position in the world markets. The improvement in exports thus secured will adequately repay the State Exchequer by increase in employment and by means of the various taxes on income and consumption.

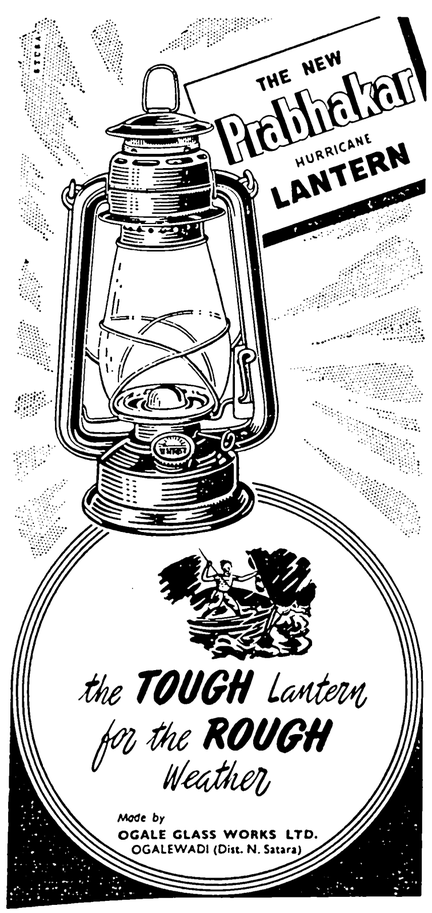
The prospects for the industry in the near future are dimmed to a certain extent by continued lack of attention to modernisation of plant and machinery, growing threat of competition from Pakistan and reduced output of jute estimated for the current season. Nevertheless, the industry can expect to fare better next year. Mills have to their credit vast experience of the problems of the industry and its markets. They have also established trade contacts abroad which can be turned to good advantage. The publicity sections in the U.S. and the U.K. should help serve the consumers in these countries to make their purchases in India. The fact that Pakistan has placed Indian mills in line with Continental mills in respect of raw jute exports by removing the discriminatory levy has improved the Indian Industry's ability to compete abroad. The Government has paved the way for freer flow of goods by reducing the duties and it can do much more in this direction by complete abolition of the duties, so that the industry may make a fresh bid to regain its lost markets.

OUTLOOK FOR JUTE INDUSTRY

(*Concluded from page 95*)

paign in the principal markets, (c) to keep a watch on the new developments in the packaging world and take effective measures and (d) to counter the threats, can ensure the maintenance of its markets and remove the threat to its existence which appears so virile on certain occasions.

Since the last reduction in the export duty, the offtake by overseas markets has improved. It is likely to continue to be so in the near future, but the existing export duty, even at the present level, is likely to afford protection to the foreign manufacturers. It might be contended that the competitive capacity of the jute goods has now been restored. But to be able to sell the production which is more than 20 per cent. below the normal level and to oust the competitors and regain the lost ground are two different things. In order to make up the losses caused to the Indian jute goods in the foreign markets, it is necessary not only to bring down the prices in level with our competitors, but also to reduce them to a level which would make it uneconomic for the foreign manufacturers not only to deter them from expanding their capacity and production, but also to put them in a position where they would not think of producing more than what they could sell in their own country for internal consumption. The supplies from India must be cheap and abundant. It is only then that there can be hope for the industry to survive.—*All Rights Reserved.*



PROGRESS OF PLANTATION INDUSTRIES

GOOD YEAR FOR ALL BUT COFFEE

So far as India's plantation industries are concerned, the notable features of the year 1953 have been the end of the slump and the realisation of improved prices for tea, the maintenance of the *status quo* in rubber, and the emergence of a difficult and anxious period for coffee. The production of the main plantation crops has been well maintained under improved weather conditions, though, in some areas, labour troubles have adversely affected production to some extent. De-rationing of foodgrains in many of the planting districts has helped to maintain the health of the labour and there is a feeling of satisfaction among the labour as a result of improved food supplies. Adequate supplies of ammonium sulphate and other fertilisers and of cement and building materials have greatly assisted in keeping crops, factories and labour and staff quarters in good condition. Costs of production of all plantation crops have risen further by comparison with the previous year. Important pieces of legislation affecting plantation crops have been adopted and some are on the anvil of Parliament and the legislatures. These and the recent shift in Government's policy in plantation labour affairs will be dealt with in detail later in this article.

Tea Recovers from Slump

After the distressing experiences of last year, when the tea market was nearing a collapse, it was good to see the tea industry back once again in its normal strides in early 1953, with tea prices and tea markets recovering gradually but steadily. The improvement has been maintained for the remainder of the year also, particularly in the export markets. The average price of North Indian tea in the London auctions rose from 2*s.* 8.67*d.* in the week ended 3rd December, 1952, to 3*s.* 0.10*d.* in the week ended 3rd December, 1953; and that of South Indian tea rose from 2*s.* 3.57*d.* to 2*s.* 9.34*d.* during the same period. The rise has not been quite so good in the internal market, but is regarded as satisfactory. In many cases, the increase has merely helped to offset the losses incurred in the previous year, and allows of no provision for building reserves for the rehabilitation of the gardens or of meeting the heavy expenditure that will be required when the Plantation Labour Act is brought into force. As readers will remember, the Rajaram Rao Committee of Enquiry recommended postponement of the implementation of the Act for a period of two years to enable the industry to tide over the economic crisis of last year, but the Government has so far not indicated its acceptance of the recommendation which is still believed to be under consideration.

Improved Quality and Reduced Output

A welcome sequel to last year's crisis in the tea industry has been the genuine attempt on the part of growers this year either to restrict total production or to produce good quality teas only in order to keep up the demand. In Northern India, a scheme of voluntary restriction of production has been put into operation and is stated to be working efficiently. In South India, there has been no such wholesale restriction, but more attention is being given to the production of better quality teas, and it was recently learnt that factories were urged not to manufacture teas of a quality which is below a minimum prescribed standard. It is doubtful, however, if these steps will help to reduce the total Indian output by more than a few million lbs., below the 1952 level of production, for two reasons: first, this year weather conditions throughout the planting districts have been extremely favourable to the production of tea, and second, a number of North Indian gardens which had closed down production in 1952 due to acute economic distress are now reported to be back in production. Nevertheless, it is the universal feeling that, with the certain emergence of a buyers' market and with consumption not keeping pace with output, it would be folly not to restrict production in one or the other of the above-said lines.

Tea Propaganda to be Intensified

Last year the decision of the Government of India to withdraw from the International Tea Market Expansion Board cast a gloom over the industry and was strongly criticised on the ground that it would seriously retard the propaganda for consumption of tea in foreign markets and that India would be the worst sufferer. Fortunately, however, the Government of India took other steps to ensure that the tempo of propaganda is maintained, especially in the U.S.A. Propaganda is now conducted by the Tea Council of America, of which India, Ceylon, Indonesia and the U.S. tea trade are the principal partners, India itself contributing $450,000 out of the total annual expenditure of about $1,400,000. It is learnt that a vigorous propaganda campaign is in progress, and that proposals are under way for using television and other modern aids for strengthening the campaign. A strong and concerted drive by the Central Tea Board to increase local consumption is also a vital necessity at the present time, as well as in the future, inasmuch as world production is continually rising (with East Africa particularly active) and going out of reach of world consumption.

The Tea Act

The Tea Act, which combines the main provisions of the existing Central Tea Board Act and the Indian Tea Control Act, was passed by Parliament in May this year, but has not been implemented up to the time of writing. It provides for replacement of the present Tea Board with a new Board, having such additional functions as the regulation and control of tea sales, the registration and licensing of brokers and blenders and the fixation of wholesale and retail prices at which tea may be sold. While no satisfactory explanation has been offered as to the necessity for assuming these sweeping powers, the provision that has been most strongly criticised is that the Central Government should appoint members of the Board from among persons capable, in their opinion, of representing the various interests concerned such as growers, labour, the State Governments and the chambers of commerce. The industry's modest request that it should be consulted in the matter of appointment of its representatives to the Board has not been conceded in the Act, but the Minister who piloted the Tea Bill is stated to have given a verbal assurance that this point will be considered. There is a general feeling, however, that by the Tea Act, the Government has displayed its intention to assume to themselves, without sufficient justification, a right to interfere in the normal day-to-day affairs of industries. This is a shift in the Government's policy which is worthy of note.

Central Excise Tariffs

In at least two matters concerning the tea industry, the Government has not acted in a manner that is altogether to the good of the industry. The recent change in the excise tariff on tea is one of them. Presumably with the intention of helping the small dealer and consumer of tea, the Government, in April this year, announced that tea packed in unit containers of more than 60 lbs. net will attract duty at the rate of 1 anna a lb. only, whereas tea packed in unit containers of smaller sizes will attract duty at 4 annas a lb. What Government did not consider is that many of the small dealers who sell tea to consumers do not buy tea in lots of more than 60 lbs. at a time, so that the small dealer and consumer do not, in effect, get the benefit of relief. It is still not too late, however, for the Government to modify this arrangement, so that unit containers of, say, 10 or 20 lbs. also will get the concession. Apart from this, there is also a real danger that the sale of large quantities of loose tea at concessional rates of duty will encourage adulteration in a large measure.

The other matter in which Government has taken an important decision affecting the tea industry is in regard to foreign-made tea chest panels. After several years of restricted imports, the Government has this year decided on a complete ban on imports, on the ground, presumably, that the indigenous plywood industry has developed to a position in which it can meet the full demand of the tea industry in respect of both quality and quantity. No doubt the indigenous plywood manufacturers have made very considerable progress with their industry, particularly in the last year or two. Nevertheless, it is open to question whether the local plywood industry has yet reached such a high standard of perfection as that reached by the foreign industry in all respects. That it has not done so is evident from the fact that the indigenous plywood industry has been asking for a further term of tariff protection (it has already enjoyed protection in the past five years) and the Government appears to view that request sympathetically. If the Government really feels that it will take some more years for our local plywood industry to stand full comparison with foreign plywood, then

the Government should really permit a further quota of imported plywood panels for such period, in order to prevent criticism of the condition of packing of Indian tea in foreign markets.

Rubber Enjoys *Status Quo*

There have been no excitements in the rubber industry in the past 12 months, with the exception of that hardy annual, namely, the problem of accumulation of unsold stocks with growers and dealers. This problem assumed more than customary importance this year, owing to the fact that the production of rubber reached the record figure of 19,860 tons in 1952, as compared wih 17,149 tons in the previous year, whereas consumption of rubber by manufacturers of rubber goods went down to 21,050 tons in 1952, as compared with 22,427 tons in the previous year. Early this year, large stocks had accumulated with growers and dealers and it was reported that, due to adequate supplies, many of the growers could not sell rubber except at prices well below the Government controlled prices. It was ascertained that the problem of stocks could be solved to a large extent if the manufacturers of rubber goods would adopt a programme of even purchases of raw rubber instead of the present practice of holding off purchases for indefinite periods. The Government's action in persuading the manufacturers of rubber goods to buy up more stocks of raw rubber yielded favourable results, and the stockpile has been going down monthly. Nevertheless, it is likely to go up again in December this year and early in 1954, and the Government would do well now to work out its plans to meet the situation. It is good to hear that the Secretary, Ministry of Commerce, who met producers' representatives in Cochin in September this year, stated that, although the Government was opposed to the idea of exporting rubber in order to solve the problem of stocks, the Government was not irretrievably committed to such a policy and that the position would be considered in future in the circumstances then prevailing. The production figures up to the end of October this year indicate that the year's output of raw rubber will almost touch last year's levels. The *status quo* continues as regards prices, the maximum being Rs. 138 per 100 lbs. for Grade I fixed by the Government in October, 1952.

The Rubber Bill

The important event in the Indian rubber industry this year is the proposal to amend the Rubber Production and Marketing Act, a Bill for which purpose was introduced in Parliament in December, 1952. As in the case of the Tea Bill, the Rubber Bill also proposes drastic changes in the constitution of the Indian Rubber Board, including proposals to fill all seats on the Board by Government nominees, to abolish the Rubber Price Advisory Committee, and to abolish the practice of the Government consulting the Indian Rubber Board before taking important decisions affecting the rubber plantation industry. The industry rightly considers these changes are unnecessarily drastic, undemocratic and undesirable. It was thought that the Bill might be considered during the November session of Parliament, but it is now learnt that it will only be brought up at the next session. Representatives of growers' organisations are believed to be taking steps to oppose the abovesaid proposals before the Select Committee, if and when it is appointed.

As in the case of tea, it is thought that Government interference in the affairs of the rubber industry should be kept to the minimum and that it will do no one, least of all Government, any good to ignore the considered opinion of representative bodies of growers and the Indian Rubber Board in dealing with the affairs of this industry.

Replanting of Rubber

The raw rubber industry to-day badly needs a Scientific Research Station as well as a scheme of replanting of old and uneconomic rubber trees. It is gratifying to learn that Government is considering a scheme of replanting some 70,000 acres over the next 10 years, at an estimated cost of Rs. 3,00,000 a year. There has practically been no replanting since 1947 until a year or so ago, owing to the fact that rubber planting during this period was largely unprofitable, but, with the recent increase in price, replanting and new planting have commenced again. It is up to the Government to realise the potentialities of this strategic industry and to render practical assistance to growers in stepping up production.

New Record in Coffee Production

Coffee production reached a new high level of 23,175 tons in the 1952-53 crop, this being the highest for the past six years. Under normal conditions, this would be welcomed as something of an achievement, but the conditions through which the coffee industry has passed this year are such that the industry is more alarmed than pleased with the big crop. At the end of October this year, unsold stocks of coffee in the Pool amounted to 12,600 tons, and the position has since turned out more alarming by the fact that the new season's crop of some 23 000 tons has already begun to be delivered to the Board.

With production and stocks at these levels and local consumption hardly rising above 18,000 tons a year, the coffee industry has had trouble in marketing the crop, and has been strongly urging the Government to export at least 5,000 tons with two objects in view: first, it would help to realise some cash with which to pay to the growers some of the Pool dividends that are already considerably overdue; and second, that it would yield a substantial premium by the fact that the foreign market price of coffee is considerably above the Indian price, and the premium could then be used to subsidise the price payable by the Indian consumer. After much persuasion, the Government has only so far agreed to export 2,000 tons of Robusta coffee, and this is considered hardly adequate for the purposes in view. While agreeing to export 2,000 tons, the Government also decided to mop up the difference between export and local prices by levying an export duty of Rs. 62-8 per cwt. on the said 2,000 tons. In other words, the Government does not agree that the benefit should go to the local consumer, in spite of its desire that the price of coffee should be more favourable to the consumer.

Owing to high crops and the Government's reluctance to export, the offtake of coffee at the auctions has steadily come down and prices have steadily declined over the past six months. In the Pool auctions, the price of Arabica dropped from Rs. 258-5 a cwt. in February to Rs. 211-8 in October, 1953, while in the local auctions it dropped from Rs. 247-12 in January to Rs. 221-4 in October, 1953. The reduction in auction prices and the difficulty in selling the large crops have resulted in the inability of the Board to find resources to pay the dividends to growers promptly, and growers in general, and small growers in particular, are suffering hardships on this account.

Prices Reduced

The industry is anxious that the Government should realise the importance of coffee in the economy of India and the need to maintain and develop that industry by every means. It requested Government early this year to ask the Tariff Commission to conduct a comprehensive enquiry into the coffee industry's affairs, including the cost structure and future development. The Government, however, rejected this request and merely arranged for a Cost Accounts Officer to enquire into and report on the cost of production only. Acting on the report of the Cost Accounts Officer, the Government expressed its intention to bring down the basic price of coffee from Rs. 2-7-1 to Rs. 2-4 per point, which is below the Coffee Board's own calculation of the cost of production. It is understood that the Board has questioned the calculation of the Cost Accounts Officer and has expressed a wish to discuss the details with him.

The Government has only been too ready lately to express its strong dislike of the so-called high price of coffee paid by the consumer. But does the Government realise that it is their own pet policy that brought about high prices? In 1952, when stocks were too low even for local consumption, the Government ordered the Coffee Board to export a large quantity of coffee against the considered opinion of the Board and the price of coffee promptly shot up in the local market. One wonders why the Government does not accept the blame for that extremely short-sighted action. And now, when stocks are high and the Board strongly urges exports, the Government again appears to be making a fundamental error in not accepting that advice wholeheartedly.

As in the case of tea and rubber, coffee too is sought to be brought under a rigorous legislative enactment. The Indian Coffee Market Expansion (Amendment) Bill was introduced in Parliament in December last year, but has not so far been taken up for discussion. The principal objectionable features of the Rubber Bill are there in the Coffee Bill also and the coffee industry proposes to make a strong representation before the Select Committee, if and when it is appointed.

The Minor Crops

In addition to the main crops, India's plantation crops also include cardamom, pepper and cinchona and these have passed through a relatively satisfactory period. Cardamom prices in November touched Rs. 7-4 a lb. for the best quality and black pepper touched Rs. 413 Rs. 565 respectively, in November last year. As for cinchona, the growers' request for an increase in the price of bark to meet the increased cost of production was rejected by the Government, which, however, reduced the price from 4 annas to 3 annas per unit. An important event of the year in the field of minor products was the investigation conducted by the Spices Enquiry Committee into the problems of production and marketing of various spices, but the result of the enquiry has not been published.

Big Tax Burden Continues

The plantation industries continue to be burdened with taxes of all sorts and, despite the most convincing arguments for relief, the Government has not so far thought fit even to confer a nominal relief. Instead, attempts have been made to increase the scope and the incidence of taxation in diverse directions. A case in point is the attempt on the part of the Income-tax Department to assess a portion of the income of coffee growers on the ground that it accrues from a manufacturing process in coffee, and one or two assessments have already been made. The industry will no doubt put up as strong a case as possible to prove that the cultivation of coffee is a purely agricultural operation and does not attract income-tax to the slightest extent, but an income-tax official is reported to have said that the present income-tax law does not exclude coffee from liability to tax! We suppose the next step—a truly logical one—would be to declare that the de-husking of paddy also involves a manufacturing process and hence part of the proceeds of the sale of rice is liable to income-tax!

Labour

Labour relations in the plantation industries have not been so happy during the year as they were in the previous year. Reports of hunger-strikes and *satyagrahas* by officials of the various workers' unions were more frequent than before. The resort to hunger-strike for the redress of workers' grievances is deplorable in the extreme and has been strongly condemned by our national leaders, but the practice continues, nevertheless. In nearly every case, it has been found that workers by themselves are hardly to blame, and the trouble is sponsored, directed and executed by agitators and politicians having no stake in the industries concerned. In spite of all this, negotiations have been and are still being carried on at union levels in many a case with mutual satisfaction. The plantation industries are under strict obligation to provide adequate housing, hospitalisation and other amenities and services for workers under legislation or under agreement with Government and are trying their best to discharge those obligations faithfully, in spite of all the handicaps provided by the professional agitators.

It will be seen from the way in which the Government has been handling the affairs of the tea, rubber and coffee industries that, of late, there is a definite shift in the Government's policy, in that it seeks to assume greater control of these industries. No one could possibly object to such control, if there was some proof that it would be exercised with care and sympathy and with the fullest appreciation of the position in which the industries are placed. Unfortunately, the manner in which these industries have been dealt with lately by the Commerce Ministry does not provide that proof. The plantation industries are mostly in the nature of agricultural industries and they should be dealt with as such. It would be interesting to know whether these industries cannot come within the scope of the Ministry of Agriculture in future. It is understood that the Government of India is shortly appointing an officer to undertake a full investigation into the affairs of the plantation industries and it is to be hoped that this point would be brought to his notice as one that is highly worthy of consideration.—*All Rights Reserved.*

PRESENT-DAY PROBLEMS OF FOUNDRY INDUSTRY
LARGER SUPPLY OF PIG IRON AT FAIR PRICES NEEDED

By M. L. Atta
Chairman, Indian Foundry Association

FEW industries in India are confronted with so many problems as the foundry industry. It has, unfortunately, not received the same attention as it deserves, in view of its importance to the nation. The Foundry Industry Panel, appointed under the Engineering Capacity Committee, has taken up the task of ascertaining the idle capacity of the industry and suggesting ways and means for utilising it. The findings of the Panel will be very useful, as they will, for the first time, focus attention of the public, as well as of the Government on the problems of the industry. So far, no organised effort has been made to study its problems. In the following paragraphs, I shall attempt to place before readers certain very important problems which must receive the careful attention of the Government.

Perhaps the most serious problem before the foundries—whether big or small—is lack of demand. What is significant to note is that the foundries are facing acute shortage of orders, even though the supplies of pig iron are much below the proven capacity. The foundries in the grip of depression are not able to sell their products. A large number of them are small proprietory concerns whose financial resources are very poor and the present depression has hit these foundries most seriously. These small foundries catering for ordinary consumer goods, such as cast iron pans, pipes and fittings, etc., had in Pakistan, particularly East Bengal, their most important market. Pakistan's decision not to import cast iron goods from India has very seriously affected many foundries, particularly in West Bengal.

What Needs to be Done

The situation would not have deteriorated had a corresponding market been available in the country. I am sure that, in a vast country like India, the foundry industry will always have a prospect, provided certain things are done. These are:

(1) A thorough investigation into the market conditions and the possibilities of new products is necessary. It is impossible for small foundries to undertake this work. The Indian Foundry Association is the only organised body which could undertake the job, but it is yet in its infancy and the magnitude of the problem requires that it should have co-operation from a considerably large number of foundries than what it enjoys to-day. The stereotyped casting would not do. The foundry industry should better-write off Pakistan as the principal market for many consumable goods, for Pakistan's policy is influenced by political considerations. Pakistan or no Pakistan, Indian foundries must so adjust their production programme that more and more goods will be consumed in the country alone.

(2) This leads us to the second important step that will have to be undertaken. Supposing the foundries are prepared to switch on to certain new lines of production. They should then be assured of continued orders, so that they can make necessary investment and engage hands with a sense of security. Detailed information regarding the estimated demand, present production, future programme and possibilities of exports in respect of the various items will be very useful. The absence of reliable data is a great hindrance to any planned production. If the detailed information, as envisaged above, is available with the various Chambers of Commerce, Associations, Directorates of Industries, etc., foundries will naturally feel sure that they can switch on to some other lines, if the one they are engaged in currently is not an economic proposition.

(3) The Directorate of Industries in each State can arrange small commercial museums where the foundries could see as to what castings are required by the Government and what would be their prospects.

(4) In order to maintain quality, suitable standards will have to be laid down with an eye to the special conditions prevailing in India.

(5) It would be necessary to advance loans to small foundries who cannot cover the additional need for capital for modernising their plants and machinery. State Finance Corporations can financially help small foundries by granting loans at reasonable terms.

(6) Numerous items are at present being imported. There are two reasons for such imports. First, the Government are, perhaps, not aware that certain items are actually manufactured or can be manufactured in India, without much trouble, or maybe the items are found wanting in quality. So far as the first is concerned, it would be very helpful if Government—particularly the Railways—could make out a detailed list of the articles (with specifications) required by them. Government should first ascertain whether these things can be manufactured in the country or not. Imports should be allowed only when they cannot be manufactured in the country. As regards the items that are found wanting in quality (on which the Government can ill afford to lose public money), the local foundries should be given the right type of pig iron, so that the quality can be improved.

(7) Production of specialised castings like high duty castings, alloy castings, etc., is at present not existent in the country. It would certainly be possible to gear the existing foundry facilities for the production of these items. A little initiative, know-how and Government assistance is all that is wanted.

(8) There are many foundries—particularly non-ferrous, whose major portion of capacity is lying idle. These foundries can be kept occupied, if orders are placed for railway parts. Instead of utilising their idle capacity, Government have set up new factories for which there was no justification whatever. It is necessary that, when the private sector is willing and capable of undertaking the job efficiently and to the satisfaction of the Government, the creation of additional capacity in the public sector be discouraged.

(9) It would greatly help the foundries if bulk orders are placed with them by the Government. For the healthy growth of the industry, it is essential that it should be assured of regular orders, so that it can engage men and money with confidence.

I am of the opinion that any steps that might be taken in other directions would not be productive of any result, unless and until the existing offtake of iron castings from indigenous foundries is substantially raised for mobilising the capacity of the foundry industry to the full. As castings, for a large part, are used as components of finished equipment and stores, this question can only be tackled in conjunction with the increased consumption of the latter.

Pig Iron and Its Price Structure

Shortage of pig iron is chronic and it requires no emphasis to establish that the present supplies to the foundries are far less than what they would require to keep their capacity utilised. For instance, according to the Development Wing, the proven annual capacity of the cast iron foundries borne on the Central List, based on the best performances of the individual units during the last six years, is 340,000 tons of serviceable castings. The screened demand of all the Central List foundries, during the year 1952 and 1953, for pig iron has been 257,000 tons and 221,000 tons, respectively. The allotments made during these two years have been only 156,000 tons and 168,000 tons, respectively. It is estimated that there is idle capacity in the cast iron foundry in the Central List to the extent of at least 170,000/180,000 tons of casting per year. Thus, 50 per cent. of the capacity of the Central List foundries is lying idle for want of pig iron. Similarly, about 50 per cent. of the capacity of State List foundry is also lying idle.

Production of pig iron cannot be increased overnight. It requires considerable advance planning. I do not want to lament over the past as to why no action was taken to increase the production of pig iron. What is surprising is that, even now, no steps seem to have been taken to increase pig iron production. The new steel plant, which is proposed to be started in conjunction with the German combines, does not envisage in its programme, it is understood, any pig for outside foundries. The existing main producers also do not appear to increase pig iron production—rather it is reported that I.I.S.CO's supplies of pig iron will be further reduced when their steel expansion programme is implemented early next year. The prospect is, therefore, gloomy and the fate of the foundries can better be imagined than described.

The general shortage of pig iron is further accentuated, owing to shortage of graded pig iron. While it is unlikely that the situation will improve unless additional blast furnaces are set up, I feel that, even now, improvement is possible, if the present price structure is revised so as to give incentive to the main producers to increase production of graded pig iron. The following steps may be taken to improve the supply position of pig iron:

(1) Off-grade pig iron has a relatively easy supply. But, with the exception of some organised foundries, the majority of the foundries are reluctant to use it, as they have neither the requisite technical experience nor finance for treating this iron with desiphirising agents such as fused soda ash and ferro-alloys like ferro-silicon, ferro-manganese, etc. Use of these alloys makes the cost of ordinary consumer goods so high that it becomes an uneconomic proposition. As the more organised foundries, including the railways and Government workshops, are technically equipped and financially sound, it would be better if they use more and more of the off-grade stuff. If by proper treating, off-grade can serve the purpose of graded pig, Government and railways foundries are best suited to use them, for they are not to worry about the cost of finished goods to the same extent as the private sector foundries are bound to.

Price Structure

(2) The present price structure will have to be revised on a scientific basis so that there is ample encouragement to the main producers. Prior to the recent increase of pig iron price by Rs. 20 per ton, the off-grade pig had registered an increase of 109 per cent. over pre-war price, as against less than 60 per cent. increase in case of graded pig iron. On 13th November, 1953, i.e., immediately before the Rs. 20 per ton increase, the prices of different categories of pig iron were as follows:

	Per ton Rs.
Basic off-grade	129
Grade No. 1	143
Grade No. 2	139
Grade No. 3	135
Grade No. 4	133
Specials	131

It does not require much imagination to conclude that, when the producer is getting good margin for off-grade, he will not bother for graded pig for a small difference. There should have been the same difference in the price of off-grade and graded pig as in 1939. As long as there is a premium in the price of off-grade, the country's interest in respect of graded pig iron will continue to suffer.

(3) At present a good deal of scrap is available from the railways, jute mills, etc. This scrap is better than the off-grade and I feel that, if this scrap is distributed through the proper channels, foundries will be benefited to a very great extent. The primary consideration should be that this scrap is a useful material for the foundries. It has special significance in the absence of adequate quantity of pig iron. It is the industry that should benefit and not the intermediaries who make capital out of the short supply of pig iron. As long as industrial users are available, no scrap should be sold to middlemen.

(4) No export of pig iron of any grade whatsoever and/or of any cast iron scrap should be allowed.

In a preceding paragraph, I have mentioned about the difficulties of the foundries due to depression and the stoppage of export to Pakistan. At a time when the foundries were exploring ways and means for disposing of their products and keeping their idle capacity utilised, the Government of India have suddenly increased the price of graded pig iron by Rs. 20 per ton and that of off-grade by Rs. 10 to Rs. 12 per ton. According to a Press report, the increase has been effected in order to enable the marketing of the costlier pig iron produced by the Mysore Iron and Steel Works, costlier in production than that of the two main producers, namely, T.I.S.CO. and I.I.S.CO. It has been decided that the difference between the present selling prices and the prices hitherto in force will be collected for an equalisation fund for subsidising the Mysore Iron and Steel Works.

Rise in Price Not Justified

I think that the present increase had no justification and the Government action shows that either they are ignorant of the difficulties of the foundries or they are under the impression that the foundries can also increase the prices of finished goods with the same freedom as they have done in the case of pig iron. Conditions are vastly changed. But can manufacturers raise the prices of finished goods? As a matter of fact, in the last two years, the general selling prices have gone down considerably, whereas the cost of production has gone up due to increase in price of the raw materials, increased remuneration and facilities to labour in the form of wages, D.A., bonus, compulsory provident fund, State insurance, etc. As a result, many marginal units have had to close down wholly or partially. Many others have had to curtail their production, because there has been no demand. The Government are aware that many small units have not even lifted their quota due to financial stringency. It is, therefore, very unfortunate that the Government of India have suddenly increased the price of pig iron just to give a fillip to the Mysore Iron and Steel Works. I am not aware as to the quantity of pig iron which the Mysore Iron and Steel Works have now started supplying to the outside foundries and whether this is only a temporary feature, but, in 1951, the Tariff Board observed as follows:

"This Company (i.e., Mysore Iron and Steel Works) has no surplus iron available for sale to the general trade and its expansion programme provides for the consumption of any increased production of pig iron within its own works."

Even supposing that the Mysore Works are now able to supply a few thousand tons to outside foundries, why should foundries situated, say, in West Bengal, Bihar, U.P., East Punjab, Madhya Pradesh and Bombay, be compelled to obtain supplies from the Mysore Works and for that matter impose a heavy burden on 95 per cent. of the foundries who were drawing their supplies from I.I.S.CO. and T.I.S.CO.? It would have been much better to arrange regional supply of the Mysore pig iron. Foundries situated in the neighbourhood of the Bhadravati Works could have saved the transport freight from I.I.S.CO. or T.I.S.CO., if they obtained their supplies from Bhadravati.

The higher cost of production of the Mysore Iron and Steel Works as compared to the cost of production of T.I.S.CO. and I.I.S.CO. need not have gone to penalise hundreds of foundries employing thousands of workers and catering to millions of consumers. The Government should have considered other ways of assisting the Mysore Works, so that they could have reduced the cost of production.—*All Rights Reserved.*

INDUSTRIAL PRODUCTION IN INDIA

PERFORMANCE GENERALLY SATISFACTORY

THE performance of industries in India in the sphere of production may be said to have been generally more satisfactory in 1953 than in 1952, despite the presence of certain adverse factors. The latest available production figures cover only up to August, 1953. During the first eight months of this year, the output of a large number of industries was distinctly higher than in the corresponding period of last year. The average number of general index of production for this period was 133.6, as compared with 128.9 for the whole of 1952 and 117.2 for 1951. This improvement occurred, despite a rise in the prices of raw materials and a fall in those of finished goods. Thus, the index figure for the former rose from 427.6 in January to 488.7 in August, 1953, representing an increase of over 14 per cent. The prices of finished goods, on the contrary, dropped from 385.8 to 364.5 or a fall of 5.4 per cent. in the same period. The fall in the latter is attributed to lack of purchasing power, consumers' resistance and a fair measure of competition arising from the coming into existence of a strong buyers' market in several goods. The rise in the prices of raw materials may be generally ascribed to speculative forces induced by prospects of lower output of agricultural raw materials due partly to diversion of some land to foodgrains (which became relatively more remunerative owing to a large measure of liberalisation of controls) and partly to adverse weather conditions (which affected certain crops such as cotton and oilseeds). The contrary trend in prices of raw materials and of finished goods resulted in a fall in profit margins and led to the closing down of certain units of production, especially those that fall under the description of sub-standard units.

Conditions Favourable

Nevertheless, conditions for industrial production were generally better, though not quite satisfactory. In the sphere of labour, man-hours lost were less this year than in 1953, although productivity per man-hour showed no change. Labour relations in certain industries, no doubt, deteriorated, but, in most others, the *status quo* was maintained. Industries found no difficulty in getting their credit requirements for working capital and at no time during the year were there any complaints of stringency. The wagon supply position improved to some extent, though certain industries, especially those having a low priority, experienced some difficulty. Certain concessions in indirect taxation, such as customs and excise duties, provided some relief to those industries which depend on export markets. The extent of this relief varied from industry to industry, but in almost all cases it was belated and inadequate. Nevertheless, it must be admitted that it did provide a prop to such major industries like jute and cotton.

The trend of production, as indicated by the general index, reveals that the number started the year at the high level of 131.1 in January, 1953. It advanced to 135.9 in February, but retreated to 131.1 in the following month. In April it recovered and shot up to 140.6, the highest level for the year so far. In the following three months it stood lower, more or less at 132.2, but improved to 133.2 in August.

Statistics of the volume of production available for the period disclose that production of cotton cloth, cotton yarn, woollen manufactures, paper, matches, dry cells, transformers, electric motors, copper conductors, rubber insulated cables, insulators H.T., salt, caustic soda, bleaching powder, sulphuric acid, sewing machines, bicycles and commercial plywood showed a marked improvement in varying degrees.

Major Industries

Among the major industries, the textile industry made a mark, in that it recorded an impressive rise in the output of both cloth and yarn. During the eight-month period, January to August, production of cloth amounted to 3,302.7 million yards, as against 3,001.8 million yards in the same period last year. The output of yarn rose from 539.1 million lbs. in January-August, 1952, to 998.9 million lbs. in the same period this year. This satisfactory progress in the output of cloth and yarn was due to improvement in the supply of cotton, both Indian and foreign, as also to higher offtake by foreign and internal markets. The latter tendency gathered further momentum following the announcement of reduction in excise and import duties on certain varieties of cloth at the end of October.

Manufacture of woollen goods during the period under review aggregated 11.6 million lbs. as against 9.6 million lbs. In other words, there was an improvement in output to the extent of 1.4 million lbs. or 15.6 per cent.

The jute industry, however, did not fare as well as it did last year. The output of all varieties amounted, during the eight-month period, to 582,100 tons, as against 653,000 tons in the same period last year. The lower production of jute goods was largely the result of a decline in exports. Consequently, despite lower production, stocks with the industry were, as a rule, higher than in 1952. Some improvement, however, became visible in the subsequent months, resulting from a reduction in the export duty on hessians as from 15th September last.

Production of steel fared better during the period under review. The output of steel ingots and metal for castings amounted to 998,100 tons, as against 900,000 tons last year. The production would have been better still had there not been labour troubles in the Indian and Iron steel factory, at Burnpur, where, on account of rivalry between two groups of workers to assume control over the labour union offices, the works had to remain closed for some weeks.

Coal

In the first eight months of this year, 24.1 million tons of coal were mined, as against 24.4 million tons a year ago. The slight decline may be attributed to accumulation of stocks at pit-heads on account of inadequate wagon supplies and fall in export following competition from South Africa, Australia, and China.

The upward trend noticed in 1952 in the output of cement continued its course in the current year also. In January-August, 1953, the output aggregated 2.43 million tons as against 2.3 million tons in the corresponding period last year. The paper industry too gave a good account of itself by raising its production from 90,355 tons to 92,922 tons. Production of matches also rose from 405,500 cases to 410,000 cases. Output of sugar improved from 1.17 million tons to 1.23 million tons. Lest this comparison should give a misleading impression, we hasten to add that in the 1952-53 sugar season (November to October) as a whole, the output was perceptibly lower at 1.32 million tons, as against 1.49 million tons in the 1951-52 season.

Engineering and Electric Industries

Among the engineering and electric industries, a mixed trend was noticeable. The output of machine tools, in terms of value, showed a small increase from Rs. 31.1 lakhs to Rs. 31.5 lakhs. There was a marked improvement in the output of dry cells which rose from 83 million to 94.9 million. A similar improvement was recorded in the output of transformers, the total being 196,800 k.v.a. as against 131,600 k.v.a. Manufacture of electric motors rose from 104,900 h.p. to 115,900 h.p. Copper conductors and rubber insulated cables rose from 2,633 tons and 2,084 tons to 5,903 and 3,341 tons respectively. H.T. insulators rose by 158,000 to 333,600 or more than 100 per cent.

But there were some industries in the above group which experienced a downward trend. Thus, the output of electric lamps was a shade lower at 13.4 million, as against 13.5 million. Electric fans also reported a lower output at 143,400, as against 146,900. There was a marked fall in the manufacture of radio receivers from 48,784 to 37,690. Similarly, storage batteries went down from 119,200 to 115,400. Production of L.T. insulators sustained a fall of 33 per cent. to 1.33 million.

Chemical Industries

In the chemicals group, production was exceptionally good in the first eight months of the current year. Salt production was a record at 797.28 lakh maunds, as against 675.41 lakh maunds. Caustic soda rose from 10,972 tons to 12,259 tons. The rise in soda ash was phenomenal, the aggregate output being 37,495 tons, as against 25,761 tons. Chlorine liquid improved from 3,902 tons to 4,667 tons, and bleaching powder from 591 tons to 1,093 tons. Bichromates too fared well at 1,383 tons, as against 967 tons. Sulphuric acid aggregated 63,752 tons, as against 58,949 tons. Superphosphates, however, experienced a declining trend, the output having fallen from 35,927 tons to 24,513 tons. There was, however, an impressive rise in the output of sulphate of ammonia which amounted to 178,874 tons, as compared with 146,872 tons.

Miscellaneous Industries

A large number of industries belonging to the miscellaneous group reported a better performance. Thus, the output of sewing machines rose from 34,015 to 38,976. Manufacture of hurricane lanterns was better at 2.87 million, as against 2.39 million. Bicycles turned out aggregated 157,663, as against 113,090. Cycle tyres and tubes amounted to 6.15 million, as against 5.57 million. Commercial plywood rose from 7.8 million sq. ft. to 8.7 million sq. ft. There was also an improvement in abrasives from 30,100 reams to 37,100 reams. Sheet-glass manufacture gave a better account at 13.11 million sq. ft., as against 4.8 million sq. ft. Sheet glass manufacture, it may be noted here, had been stopped for several months in 1952.

In the group of industries mentioned above, production of motor tyres and tubes declined from 994,000 to 958,000 and cigarettes from 138.6 million to 131.7 million. Tea chests also were down at 34 million sq. ft. as against 56.05 million. Refractories also were shade lower at 148,000 tons, against 163,000. Industrial alcohol fell from 4.59 million gallons to 3.96 million.

Although the general performance of most of our industries has, on the whole, been satisfactory, as is evident from the foregoing account, their total output is still far short of the latent demand of the country which remains unsatiated for lack of adequate purchasing power with the masses. The problem of augmentation of purchasing power in the hands of the masses, therefore, should be effectively tackled. This could be done by encouraging establishment of new industries and intensive agricultural production which is the only way of providing the masses in India with gainful occupation. For this a bold industrial and agricultural policy is quite essential. The keynote of such policy should be unstinted State assistance to private enterprise. Apart from tariff protection, State assistance should take the form of tax reduction, bulk purchases, direct loans, loan guarantees, research facilities, and freight concessions.

TASK BEFORE INTERNATIONAL MONETARY FUND

(*Concluded from page 32*)

blish convertibility. However, the Fund's resources alone are probably not adequate if stand-by arrangements were necessary to support the introduction of convertibility by all the leading countries, and certainly not adequate for a serious recession. The Fund and its principal members would be well advised to agree beforehand at least on some temporary increase in its resources whenever necessary. If the Fund can get increased resources before a recession becomes serious, it would no doubt assist its members more freely in the early stages of a recession. Such action would help to give confidence that a recession in one country would not grow into a world-wide depression.

• • •

N.B.—The above article is an extract from the statement recently made by Mr. Ivar Rooth, Managing Director and Chairman of the International Monetary Fund, to the U.S. Commission on Foreign Economic Policy (Chairman: Mr. Clarence Randall) which is currently studying tariffs and other aspects of the U.S. import policy.—Ed.

ARE YOU DIABETIC?

Are you undergoing painful, costly endless injections, failing to regain health and strength through repeated fastings and diet restrictions? Have you got all or any of the following symptoms? Check them with the indications given below and you will know the stage, the disease has reached in your case.

1st STAGE :— NERVOUS DEPRESSION, REDUCED WEIGHT, MUSCULAR DEBILITY, LOIN PAINS, DRY SKIN, DIM VISION, INSOMNIA.

2nd STAGE :— INCREASED DEBILITY AND LOSS OF NERVOUS ENERGY, INTENSE THIRST, VORACIOUS APPETITE, EXCESSIVE FLOW OF URINE, STRONGLY IMPREGNATED WITH SUGAR, LOSS OF SENSATION IN LOWER LIMBS.

3rd STAGE :— MARKED DECREASE IN VITALITY, SKIN DISORDERS, RHEUMATISM, GANGRENE, ATROPHY OF THE ORGANS AND MUSCULAR SYSTEM LEADING IN SOME CASES TO DIABETIC COMA AND DEATH.

If so, follow the lead given by thousands of one-time Victims, who, thanks to DIAMELIN, the NEW THEORY HOME-TREATMENT FOR DIABETES, are now quite free from the malady.

The notable medical discovery named DIAMELIN is based on a new theory and covers not only one accepted cause, DEFECTIVE PANCREAS, but several others, correcting DEFECTIVE NERVOUS SYSTEM, LIVER, KIDNEYS and Ductless Glands. Get a bottle to-day and quickly get rid of Diabetes at home, without being under the strict surveillance of doctors and WITHOUT INJECTIONS, DIETING, FASTING, PAIN OR SUFFERING.

DIAMELIN is available at all leading Chemists and Stores at Rs. 5-12 in phials of 50 tablets, and informative literature can be obtained free on application to the Diamelin Distributors (India), (C.M.S.), P. O. Box 107, Calcutta.

INDIAN LABOUR PROBLEMS

"GIRI APPROACH" SUFFERS SETBACK

FEW subjects evoked so much interest amongst the enlightened public as those relating to labour in the year 1953. First of all, there was the postponement of the "Giri approach"—so called because Mr. Giri was the first to give shape to it, though at one time it was vigorously mooted by Mr. Nanda—which was designed to encourage settlement of disputes by mutual discussions and voluntary conciliation. Then came the news that the Five-year Plan had failed to solve the problem of unemployment and, with it, the announcement of the 11-point Programme to mitigate the rigours of unemployment and the subsequent proposals to revise the Plan itself so as to provide more opportunities for employment. Further, there was the Industrial Disputes (Amendment) Ordinance, 1953, promulgated on 24th October, providing compensation for laid-off and retrenched workers; the Bill to replace and amend the Ordinance is awaiting the assent of the President. There was again the Employees' Provident Funds (Amendment) Ordinance, promulgated on 14th October last, a Bill to replace which is also awaiting the assent of the President. The Bill to amend the Factories Act, 1948, is on the legislative anvil. Other developments of all-India importance included the misuse of powers, by the Travancore-Cochin Government, of section 15 of the Industrial Disputes (Appellate Tribunal) Act, in setting aside the award of the Labour Appellate Tribunal, and the award of the Special Industrial Tribunal giving the Madras Electric Tramways' workers the right to participate in the unused reserves of the Company.

Throughout the year, the Centre pursued what many would regard as an unenlightened labour policy. It is true that each of the labour measures it undertook meant only a small additional burden on the industry, but the cumulative effect of all of them was to inflict a heavy burden indeed. No wonder, therefore that the Centre's policy came in for a good deal of criticism by the employers as being unwarranted in the context of the buyers' market which has come to prevail.

The trade union leaders took full advantage of the restless labour situation and inflamed it, with a view to advancing their own political and personal ends. Consequently, the tussle between capital and labour was aggravated, with the latter generally tending to adopt go-slow tactics. How political parties vied with each other for leadership of labour was prominently revealed in the Burnpur labour dispute, which resulted in the loss of not only wages to labour but also of more than a lakh tons of steel to the nation. Regrettably enough, the trade union leaders limelighted the rights of workers though they forgot their obligations. They seemed to think that the road to healthy labour relations was a one-way street, with the responsibility resting entirely on the employer.

"Giri Approach"

The setback to the "Giri approach" was the most disappointing development of the year. More so, because the author himself lost the zest for it at the very first sight of opposition and tried laboriously to explain away his failure to implement his plan by the argument that there was every justification for pursuing a cautious and, perhaps, conservative policy in the matter of labour-management relations, as the economy was showing visible signs of depression leading thereby to increase in unemployment. This explanation was hardly convincing. In fact, it was pointed out that the increase in unemployment was more due to increase in population than to any marked setback in economic activity and also that what the country was suffering from was the high-cost economy. This defect, it was further pointed out, could not be remedied by pursuing a doctrinaire approach to employer-employee relations or by impeding the wholesome attempts of employers at making their units economic and competitive, but by providing incentives for industrial and agricultural expansion on lines that would yield sustained results.

11-Point Programme

The Planning Commission's 11-point Programme did not evoke much enthusiasm. There was nothing new in this programme, for the suggested measures such as special assistance to individual or small groups of people for establishing small industries, development of road transport, encouragement of private building activities, provision of incentives for development of power sponsored by private capital and assistance to cottage and small-scale industries had either foundered on the rock of finance or was nullified by the threat of nationalisation. Moreover, it was not clear how the cottage and small-scale industries would succeed in a buyers' market when the cost of their products would be high and their quality low. Surprisingly enough, even the Centre's scheme, announced in August, for providing employment to 30,000 teachers in 1953-54 and to 50,000 in 1954-55, besides employment for a large number of social workers, and the subsequent announcement that the expenditure on the Five-year Plan might increase from the originally estimated Rs. 2,069 crores to Rs. 2,200 crores did not evince much enthusiasm. The Commission failed to emphasise the most important need for freeing private enterprise from the shackles of high taxation, threat of public ownership and the like. It failed to recognise that no living organism could grow when put into a strait jacket and, even if it did so, it would be unbalanced and ugly.

Industrial Disputes Act

The Bill to replace and amend the Industrial Disputes (Amendment) Ordinance, 1953, which is awaiting the assent of the President, is no doubt a good measure which no enlightened employer would oppose. But its chief drawback is that it will retard industrial development of the country, since it will act as a strong disincentive to the expansion of existing industries and to the establishment of new industries. New ventures need careful nursing and, should it become necessary to effect economies, the provision of gratuities calculated at 15 days' average pay for each completed year of service, or part thereof in excess of six months, would be found to be a significant additional liability. Those who seek to promote new concerns will naturally hesitate before doing so. The case of existing concerns which, on account of changed circumstances, are unable to continue to keep in employment surplus labour will be no different. Not only have they to suffer losses, but also to meet this fresh burden.

Provident Funds Act

The proposed amendment to the Employees' Provident Funds Act, 1952, which seeks to provide for the application of the Act to a factory, if the majority of the employees and the employer were agreeable, and for the inspection of factories, whether covered by the Act or not, to ensure strict compliance with its provisions, might be well-intentioned. But it suffers from the grievous defect of over-centralisation. It fosters in the mind of the illiterate workers, who constitute the bulk of the labour population, that the Government alone is the benefactor of labour.

Factories Act

Although the Bill to amend the Factories Act, 1948, is an improvement over the Act, it is not free from blemishes altogether. Thus, clause 13 of the Bill relating to the calculation of overtime wages, is fair neither to the employers nor to the workers. For it virtually compels the employers to treat even bachelor workers as standard families. It is not fair to employees either, for the employees with families larger than a standard family would not be entitled to any additional benefit. The wages should be related to circumstances obtaining in the case and should not be tied to any particular level. Again, the Bill treats the days of lay-off, maternity leave and leave earned in the previous year as days on which the worker had worked for computing the period of 240 days of active work. This again is not fair. It should be made obligatory on the worker to put in a qualifying period of 240 days of actual work, before he becomes entitled to leave with wages.

Appellate Tribunal's Award Ignored

The Travancore-Cochin Government's rejection of the Labour Appellate Tribunal's Award on the question of retrenchment of the employees of the Tata Oil Mills Co., Ltd., Ernakulam, has a far-reaching judicial and economic significance. The Labour Appellate Tribunal reversed the judgment of the Industrial Tribunal which had held that there was no justifiable necessity for retrenchment and held, instead, that it was the function of the management to determine the strength of the labour force it needed. The State Government's rejection of this award has created the impression that the judgment of the Appellate Tribunal is not binding on all parties to the dispute. It is true that discretion vests in a State Government to take such a decision, but this discretion should be exercised only in an emergency. But no such emergency prevailed at the time the Travancore-Cochin Government decided to ignore the Appellate Tribunal's judgment. The situation is one that calls for some remedial action, so that this instance may not be repeated in future. It is gratifying to note that the Ministry of Labour, being aware of the complications of the issue, has expressed the hope that it would be possible to evoke a formula, which would receive the general acceptance of all the parties concerned.

Unused Reserve Funds

The award of the special Industrial Tribunal set up by the Government of Madras to settle the industrial dispute that arose between the workers and the Madras Electric Tramways Company, following the heavy losses suffered by the Company and the stoppage of the tram service with effect from 12th April, 1953, is yet another subject of controversy. For, it held that the workers should be allowed to participate in the unused reserve funds of the Company provided for improvements and extensions, taxation and general purposes and that 50 per cent. of the funds should be divided amongst the workers who were on the rolls on the day of closure. The repercussions of such an award are really far-reaching. An appeal has been filed with the Labour Appellate Tribunal, the judgment on which is awaited.

These developments in the sphere of industrial relations are disquieting indeed. It is insufficiently realised that the future prosperity of this country rests, as that of any other country, on healthy labour-management relations. It is wrong to talk about capital and labour, as if they were two irreconcilable opposites—a conception leading only to discord and, via the class struggle, to destruction and never to a constructive goal. The responsibility for industrial peace rests not merely on the employer but also on labour and the Government. All must be prepared to give and take. This presupposes, at the outset, a healthy trade union movement in the labour sector and enlightenment on the part of employers.

So far as the Government is concerned, it should weigh the interests not only of labour and employer but also the consumer in formulating its labour policy. The history of the labour movement, since Independence, reveals that the Government has erred on the side of speed in enacting statutes. A positive cascade of Acts, Bills and expert committee reports has descended upon us. It might well be called a veritable avalanche considering how chilling the effects of some of the measures enacted, and proposed to be enacted, are on the incentive to investment, which alone provides the cure for the growing unemployment in particular and for the low living standards in general. It is true that, speaking from a purely humanitarian point of view, the labour laws are splendid pieces of legislation. But the present state of industrial economy is not in a position to bear its crushing weight. This is so because even the U.K., which has provided the inspiration for major labour legislation, has not itself departed from the salutary doctrine of gradualness. It is true that many social welfare measures have been adopted by the U.K. But it must be remembered that the U.K. did not attain this position overnight. The history of British labour clearly shows that the gains which labour has made have come only after the country had achieved a great measure of industrial prosperity and not before. This indicates the need on the part of the Government of India to "hasten slowly" with its social welfare measures and to consider their implications on the developing economy, before enforcing them.

Notices

THE FORT WILLIAM JUTE COMPANY, LIMITED

NOTICE

THE HALF-YEARLY ORDINARY General Meeting of the Company will be held at the Registered Office, No. 14, Netaji Subhas Road, Calcutta, on Monday, the 25th January, 1954, at 3-20 p.m. for the purpose of receiving the Directors' Report and Auditors' Report, passing the Accounts for the half-year ended 30th September, 1953, and transacting such other business as may be brought forward before the meeting.

The Share Transfer Register of the Company will be closed from 18th January to 25th January, 1954, both days inclusive.

By Order of the Board,
For FORT WILLIAM JUTE CO., LTD.,
Per Pro. BANGUR BROTHERS, LTD.,
R. N. BANGUR,
Managing Agents.

DATED 12*th December*, 1953.

THE BRITANNIA BISCUIT COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT an Interim Dividend of 3¼ per cent. on Ordinary Shares and 4 per cent. on Preference Shares has been declared by the Directors for the year ending 31st March, 1954.

The Dividend Warrants will be issued on or after the 15th January, 1954 to those shareholders whose names stand on the Company's Register on the 12th January, 1954.

By Order of the Board,
(Sd.) A. P. CHANDA,
Director and Secretary.

15, TARATOLA ROAD,
CALCUTTA-27, 18*th December*, 1953.

TREND OF INDIA'S FOREIGN TRADE

ADVERSE BALANCE NARROWS DOWN

THE year 1953 may be regarded as a turning point in the foreign trade of India for more reasons than one. A certain amount of stability came to prevail in this sector, especially during the second half of this year, with prospects of this tendency becoming pronounced in the next year. This improvement was made possible by a substantial increase in the production of foodgrains and other commercial crops such as raw cotton. From 1954 onwards, it is expected that the first fruits of the Five-year Plan will slowly but steadily manifest themselves, giving further strength to the general economy of the country and making it possible for India to export more.

Ever since the Partition, the authorities were motivated, from time to time, to modify the country's foreign trade in such a manner as to safeguard the exchange resources in order to enable them to import essential foodstuffs, industrial raw materials and plant and machinery. At the same time, they effected considerable liberalisation of the export trade, with a view to reducing the trade gap as far as practicable. Until mid-1952, the food position, as well as the supply conditions, in regard to raw cotton and raw jute, continued to dominate the attention of the Government. Real relief came to it only when the production of foodgrains in 1952-53 showed an increase of nearly five million tons and the position may become still better during the current year on account of the promising *kharif* and *rabi* crops.

Terms of Trade

Despite the improvement in the economic health of the country, India's foreign trade is not likely to show a heavy trade surplus during the coming months, due to the fact that the terms of trade have been running against this country since mid-1952. This factor was very pronounced during 1953. The index number of average unit of declared values for exports stood at 110.2 (1948-49=100) in January, 1953, as against 169.1 for the corresponding month in the previous year. The index for import values was higher than that for export at 120 for January, 1953, the corresponding figure for January, 1952 being 129. In other words, while the import index dropped by about nine points the export index receded by 59 points, indicating thereby that the country had to pay more for its imports than it earned on its exports. The export index moved within a narrow range around 110 during the crop-moving season early this year. From May onwards, it began to show some improvement, touching 113.1 in June. The import index always ruled higher than its counterpart, moving between 114.2 and 122.7 during the first half of the year. From the quantum index point of view, the terms of trade were decidedly against India, especially in the first quarter of 1953. While the average import quantum index stood at the low level of 75, the export index was high at 108 for this period. During the second quarter of 1953, however, the difference narrowed down to only one point in favour of imports.

On the sea- and air-borne trade account, India continues to experience an adverse trade balance, but the gap is tending to narrow down appreciably during 1953. In the first ten months, total imports on this account amounted to Rs. 469.50 crores, as against Rs. 421.18 crores worth of goods exported from this country. In 1952, imports into India amounted to the high figure of Rs. 768.66 crores, as compared with Rs. 592.44 crores of merchandise exported from India during that year, the adverse trade balance to India being Rs. 176.22 crores. A substantial portion of this adverse balance was incurred during the first half of 1952 when India had to import large quantities of foodgrains. During 1953, imports into India on sea- and air-borne account may be estimated at Rs. 550 crores, while exports are expected to amount to about Rs. 520 crores, the adverse trade balance being about Rs. 30 crores.

It may be mentioned that most of this adverse trade balance was experienced during the months April to August, when the contracted foodgrains began to arrive in sizable quantities. The last four months of 1953 are, therefore, expected to show a moderate trade surplus on the sea- and air-borne trade account. In September and October, the surplus amounted to Rs. 7.07 crores. Since imports of foodgrains have been negligible during the last two months of the year and as there has been a revival of exports on account of the improved flow of jute goods, cloth, tea, etc., it is possible that a favourable trend will be revealed when the actual figures are released for publication in due course.

Balance of Payments

Although the figures in respect of the balance of payments position for 1953 may not be available for some time, indications are that the position is not at any rate unfavourable to India. The index for this is provided by the total foreign balances held by the Reserve Bank. These balances have been remarkably steady for the last many months. They declined to a post-war low of Rs. 677.28 crores in August, 1952; from this level there was a steady improvement to Rs. 724.45 crores at the end of the first quarter of 1953. From this, they again receded to Rs. 700.38 crores by August, 1953, on account of heavy adverse trade balance during April to August this year. But thereafter they moved up again, the latest figure standing at Rs. 710.84 crores (20th November). This figure is expected to improve further during the coming months if the trend in recent years for this part of the year is any indication. To some extent, however, India's trade balances are being influenced by the donations received from the U.S.A., the Commonwealth countries and also by the loans from the International Monetary Fund.

The trend of India's sea- and air-borne trade month by month for the last three years is as under:—

(In crores of rupees)

	Imports			*Exports*		
	1953	1952	1951	1953	1952	1951
January	40.91	89.46	64.51	43.61	64.53	60.57
February	38.64	79.31	51.80	38.73	45.68	63.73
March	45.46	89.64	59.13	48.58	53.61	86.54
April	55.66	79.41	58.10	38.50	42.37	55.25
May	55.40	78.38	71.28	40.58	48.14	86.91

December	..	43.64	73.89	..	44.48	56.48
Total ..	469.50†	768.66	780.12	421.18†	592.44	762.82

† For ten months only.

On the land-borne account (principally the trade with Pakistan), the trade between India and Pakistan has not been developing as one would have liked. In 1952, imports from the landlocked countries like Pakistan, Afghanistan, Iran, etc., amounted to Rs. 32.93 crores, as against Rs. 73.97 crores in the previous year. In the first three quarters of 1953, the imports declined appreciably to Rs. 17.26 crores. A large part of the recession has doubtless been due to the heavy decline in the prices of raw jute. More than imports, the drop in exports from India has been very much pronounced, largely due to the severe import restrictions resorted to by Pakistan, in order to improve its balance of payments position. Despatches from India in 1952 aggregated Rs. 26.73 crores and indications are that they are not likely to exceed Rs. 10 crores in 1953, the actual for the first three quarters of 1953 being Rs. 4.84 crores.

Land Trade

The following table gives, in a nutshell the trend of India's trade on the land frontier account during the last three years:—

(In crores of rupees)

	Imports			*Exports*		
	1951	1952	1953	1951	1952	1953
1st quarter	6.75	13.24	5.48	6.74	9.49	1.60
2nd ,, ...	25.34	4.52	3.07	4.44	9.27	1.16
3rd ,, ...	22.76	4.34	8.71	5.01	5.42	2.08
4th ,, ...	19.12	10.83	..	8.20	2.55	..
Total ..	73.97	32.93	17.26†	29.39	26.73	4.84†

† Three quarters only.

On the import side, the decline in the value has been largely the result of the drop in foodgrains and raw cotton, the actual decline of both being nearly Rs. 154 crores which represent 75 per cent. of the fall in the values. During the first eight months of 1953, imports under the food, drink and tobacco group amounted to Rs. 89.81 crores, as against Rs. 198.66 crores in the corresponding period of the previous year. It may be mentioned that the quantum of foodgrains imported till the end of September, 1953 amounted to 16 lakh tons, as against 37 lakh tons during the same period of the previous year. Imports of raw cotton receded from Rs. 95.47 crores to Rs. 39.04 crores during the eight-month period, while those of mineral oils were slightly higher at Rs. 57.92 crores, as compared with Rs. 55.02 crores. Raw rubber imports were negligible, indicating thereby that India is fast approaching self-sufficiency in this respect. In the first eight months they amounted to barely Rs. 10 lakhs. Thanks to liberalisation of imports of copra, palm oil, cottonseed oil, etc., their arrivals moved up from Rs. 1.39 crores to Rs. 1.74 crores. Relaxation on imports of woollen goods is reflected in the higher intake of imported wool by the indigenous mill industry which increased from a mere Rs. 33 lakhs to Rs. 1.07 crores. Total imports under the raw material group receded from Rs. 166.80 crores to Rs. 111.74 crores.

In the manufactures group, the decline was slightly moderate, the figure coming down from Rs. 221.26 crores to Rs. 179.39 crores. Since imports under this group are scanned by the Government from time to time taking into account the stock position and the progress of indigenous manufacture, the intake of these also showed a downward trend. Imports of chemicals declined from Rs. 23.08 crores to Rs. 14.88 crores, dyestuffs and colours from Rs. 10.26 crores to Rs. 8.19 crores, cutlery, etc., from Rs. 11.95 crores to Rs. 9.70 crores, metals (iron and steel) from Rs. 18.80 crores to Rs. 13.67 crores, non-ferrous metals from Rs. 14.57 crores to Rs. 12.57 crores, vehicles from Rs. 27.21 crores to Rs. 15.39 crores and cotton yarn and manufactures from Rs. 3.71 crores to Rs. 2.32 crores. An unwelcome feature, however, was the drop in imports of millwork and machinery, which is a sure index of the progress of industrialisation and the rehabilitation of plant and machinery in India. During the eight-month period, they receded from Rs. 68.41 crores to Rs. 58.36 crores. Imports of electrical goods were, however, better at Rs. 10.66 crores, as against Rs. 8.61 crores a year ago; similar is the case with "other yarns and textile fabrics" which moved up from Rs. 5.85 crores to Rs. 8.72 crores largely due to imports of staple fibre yarn.

During the process of the return of normal times, underdeveloped countries exporting raw materials and semi-manufactured goods will necessarily have to take special measures for safeguarding their export trade. Since the prices of manufactured goods like machinery, etc., are expected to show substantial resistance, relatively speaking, as compared with those of raw materials—this was the position in the pre-war depression period—India must be vigilant in the coming years. In this connection, the measures that are proposed to be taken by Mr. T. T. Krishnamachari, Minister for Commerce and Industry, are in the right direction, especially the setting up of individual commodity committees in important ports from where they are being exported.

Total exports during the eight-month period declined from Rs. 331.17 crores to Rs. 240.94 crores, a substantial portion of which was accounted for by jute goods which declined from Rs. 124.78 crores to Rs. 57.33 crores. While the volume of jute goods was lower by about 8 per cent., the value receded by 49 per cent. Despite the improvement in the volume, the value of cotton textiles exported dropped from Rs. 49.62 crores to Rs. 40.21 crores. In a number of instances also, the decline in prices has acted adversely against India.

Shipments of cashew kernels declined from Rs. 11.20 crores to Rs. 9.73 crores, spices (mainly pepper) from Rs. 17.01 crores to Rs. 12.08 crores, tobacco from Rs. 10.17 crores to Rs. 8.32 crores, mica and other products from Rs. 7.30 crores to Rs. 6.06 crores and lac and resins from Rs. 6.40 crores to Rs. 4.64 crores. Following an improvement in prices, exports of tea rose in value from Rs. 47.09 crores to Rs. 51.32 crores.

Under the raw material group, exports of coal dropped from Rs. 6.66 crores to Rs. 3.46 crores and vegetable oils from Rs. 18.93 crores to Rs. 9.28 crores. Oilseeds were appreciably lower at Rs. 2.51 crores as against Rs. 4.79 crores. Raw cotton and wool also declined from Rs. 16.11 crores and Rs. 5.41 crores to Rs. 14.57 crores and Rs. 4.04 crores, respectively. Exports of manganese continued to move up, their value improving from Rs. 18.47 crores to Rs. 22.80 crores. Raw hides and skins remained very steady at Rs. 4.05 crores. In the manufactures section, a marked improvement was noticeable in the sendings of half tanned hides and skins, the value of which moved up from Rs. 10.23 crores to Rs. 17.35 crores.

Distribution of Trade

In the distribution of trade, there was a notable change in that there was a marked decline in the imports from the U.S.A. During the period of eight months, imports from that country declined sharply from Rs. 245.64 crores to Rs. 68.67 crores due to the reduction in the offtake of wheat, raw cotton and some coarse grains. As a result of this development, the U.K. once again came to occupy the first place in the import trade. Total imports from that country amounted to Rs. 93.68 crores, as compared with Rs. 108.64 crores in the preceding year. Imports from Canada also dropped from Rs. 22.54 crores to Rs. 13.38 crores, mainly due to a decline in the intake of wheat from that country. Australia, on the other hand, increased its exports to India from Rs. 12.25 crores to Rs. 22.95 crores. Trade with West Pakistan came to a standstill, imports from that country being negligible at Rs. 46 lakhs. Despatches from Ceylon declined from Rs. 3.67 crores to Rs. 2.99 crores. The intake from the free port of Singapore was somewhat better at Rs. 9.35 crores, as also from Kenya and Sudan at Rs. 13.25 crores and Rs. 5.36 crores, as against Rs. 10.65 crores and Rs. 1.93 crores, respectively. The intake from West Germany was very steady at Rs. 17.15 crores, while that from Italy improved from Rs. 7.01 crores to Rs. 13.28 crores. Despatches from Holland, France, Belgium and Switzerland were all lower at Rs. 7.29 crores, Rs. 6.71 crores, Rs. 4.27 crores and Rs. 5.21 crores, respectively. Among the neighbouring countries, imports from Burma receded from Rs. 19.74 crores to Rs. 16.72 crores. Imports from Japan also fell sharply from Rs. 14.35 crores to Rs. 8.59 crores, but those from Egypt improved from Rs. 15.54 crores to Rs. 17.83 crores due to an increase in the intake of raw cotton. On account of the cessation of oil imports from Iran, Saudi Arabia has begun to occupy a prominent place, exports from that country being as high as Rs. 9.26 crores.

From the export angle also, the U.K. turned out to be the best customer of India. During the first eight months of 1953, exports from India to the U.K amounted to Rs. 82.94 crores, while those to the U.S.A., were valued at only Rs. 63.72 crores, the figures relating to

(*Continued on page 171*)

COMMODITY PRICES AND COST OF LIVING

TREND IN 1953 UPWARDS

WITH the adoption of several disinflationary measures in 1951-52 and of the steps taken concurrently to augment supplies through higher production and larger imports, one thought that the back of price inflation in India, which had received a powerful impetus from the Korean War boom in commodities, had been broken and that prices would stabilise themselves at lower levels. The Union Finance Minister, Mr. Chintaman Deshmukh, also claimed, in his budget statement for 1953-54, that prices had, on the whole, "remained steady at lower levels." The year 1952, too, presented a price pattern which was more or less in line with this view. Subsequent events on the Indian price front, however, would appear to have belied this expectation, although, in recent weeks, prices have somewhat tended to decline. For the course of commodity prices during the major part of the year that is just drawing to a close was upwards.

The all-India average wholesale price index (base: year ended August, 1939=100), which stood at as low a level as 372.7 at the close of 1952, gradually, and at times sharply, rose to 410.4 in August, 1953, representing an increase of more than 10 per cent. Since then, there has been a slight recession. The index for the week ended 28th November, for instance, was lower at 388.6. But even this was higher by over 4 per cent. than the index for December, 1952. The decline in the number since August was mostly of a seasonal nature. Reports of increase in agricultural crops led to a certain amount of bear selling in commodities in October and November. But since then some of them have again gone up, which is a sequel to excessive selling in the former two months. To some extent, the fall in prices may also be attributed to liberalised import policy for the half-year ended December, 1953 and partly to imports of sugar, copra and palm oil at sharply reduced rates of import duty.

Causes for High Prices

Despite the improved supply position in respect of a number of commodities and the return of the buyers' market, as reflected in the downward trend in world commodity prices, it is rather queer that commodity prices should have managed to remain at a relatively high level. What are the factors which have been responsible for this state of affairs? The most important factor is the substantial relaxation in controls over prices and distribution of several consumer goods, including cloth, sugar and foodgrains, and certain categories of iron and steel manufactures. Further, suitable adjustments (reduction in export duties and liberalisation of controls) have been made in the export trade policy, with a view to maintaining and stimulating external demand for Indian products. There has also been an upward revision in the prices of pig iron, steel and rubber. There was, besides, a fall in the production of certain commodities in the 1952-53 season. Consequent on these, prices of commodities generally tended to go up. The rise in prices would have, perhaps, been more marked but for the reduction in prices of sugarcane and certain foodstuffs, and the extension of the period of the Essential Supplies (Temporary Powers) Act, 1946, and the Supply and Prices of Goods Act, 1950.

Taken as a whole, however, 1953 did not witness such wide and erratic fluctuations in prices as they did in the previous year. The difference between the highest and the lowest monthly averages in 1953, for instance, was only 33, as against 63 in 1952. Again, the rise in prices over the year was to the extent of only about 1.9 per cent., which is in distinct contrast to a fall of 11.9 per cent. in the previous year. The average general index of wholesale prices for 1953 (on the basis of figures for 11 months) works out to 394.4, as against 386.9 for 1952 and 439 for 1951.

Manufactured Goods Recede

A striking feature of the commodity prices during the year under review was the advance in the indices of all the component parts, with the exception of manufactured goods. The average index of food articles for 1953 at 382.8 was 6.4 per cent. higher than the figure in 1952 (359.8). Similarly the indices of industrial raw materials and semi-manufactures moved up from 453.8 and 346.5 to 462.1 and 356.8, respectively. The index of miscellaneous items was also higher by 19 points at 659.2. The prices of manufactured articles, however, registered a decline, the index for 1953 being 373.5, as against 377.5. The rise in raw material prices, on the one hand, and the fall in the value of finished products, on the other, clearly indicate the none too happy position in which Indian industries are placed at present. These industries have to pay high prices for raw materials, while they have to sell their products at comparatively low prices, thanks to the successful resistance by consumers. Clearly, this should serve as a pointer to those who argue that industries are making huge profits and that they can, therefore, bear a higher level of taxation, besides giving more to workers by way of increased wages, bonuses and various amenities.

To revert to the trend of prices. The index of food articles, which stood at as low a level as 344.5 in December, 1952, steadily advanced to touch 407.0 in August, the highest level for the past two years. The increase was shared principally by tea and gur, the indices of which rose from 196 and 175 to 409 and 328, respectively. The increase in tea price was chiefly occasioned by the revival of export demand and restriction on production. Rice, wheat, *bajra*, and *jowar* also contributed to the rise. Their indices were higher at 546, 588, 331 and 230, as against 492, 557, 245 and 199, respectively. Although sugarcane price was reduced and imports of sugar from abroad were allowed, sugar too registered an increase, thanks to enlarged demand for the commodity, following high level of *gur* prices. The index moved up from 263 to 278. Pulses and coffee, on the other hand, accounted for a fall in prices. The index of the former receded from 541 to 504 and that of the latter from 675 to 611. However, following favourable prospects for *kharif* crops, prices of food articles tended to decline in September. This downward trend persisted in the subsequent two months also, the index for the week ended 22nd November being 385.6. Barring tea which met with renewed overseas buying enquiries, all the components have recorded a decline.

Industrial Raw Materials

The index of industrial raw materials jumped up from 421.7 in December, 1952, to 488.7 in August, 1953, thanks chiefly to the spiralling of oilseeds prices. This was attributed to a marked fall in the groundnuts crop, persistent demand from crushers and *vanaspati* manufacturers, paucity of current supplies, and extension of the period of free licensing of linseed oil and castor oil. There were broadening of overseas enquiries for castor oil. The index of groundnuts, for instance, shot up from 557 to 851 and that of linseed advanced by 48 points to 438. Raw cotton index moved up from 388 to 461. Among the factors which contributed to the rise were good offtake by mills induced by relaxation in controls, reduced imports of foreign cotton and possibility of the 1952-53 cotton crop being lower than earlier estimates. Raw jute prices proved an exception and were maintained at around the levels existing at the close of 1952. Prices being controlled, the index of coal prices stood unaltered at 357.

The upward trend in the index of industrial raw materials was halted in September and, thereafter, there was actually a fall, the index for the week ended 28th November, 1953, being 444.3. The fall was mainly the result of decline in oilseeds, the index of which came down from 660 to 498. This was due primarily to reduction in the import duty on palm oil and discontinuance of free licensing of castor oil exports. Reports of increase in production also acted as a bearish factor. Prices of fibres and minerals also were downwards.

Prices of semi-manufactures, which showed a firm trend in the first eight months of 1953, gradually receded in the subsequent months. The index of this group climbed up from 342.6 to 365.4. In November, however, it was slightly lower at 355.6. The initial firmness was primarily accounted for by vegetable oils—this was the result of high level of oilseeds prices—the index of which rose from 422 to 595. The indices of oilcakes and cotton yarn were higher at 439 and 442, as against 400 and 439, respectively. Mineral oils did not show any marked variation. Leather and metals, on the other hand, experienced a downward pull in prices, their indices receding from 422 and 228 to 406 and 223, respectively. The last quarter of the year witnessed a gradual recession in the prices of vegetable oils, leather and cotton; the respective indices for the week ended 28th November were 506, 398 and 436. Oilcakes, however, continued to rule high, the index touching 465.

Manufactured goods were fully steady in the first eight months of the year under review, but suffered a break in the subsequent month, although a slight recovery has been in evidence in the past few weeks. The trend of price movements in respect of this group is given below:

	December 1952	March 1953	September 1953	Week ended 28-11-53
Cotton	398	409	394	393
Jute textiles	392	378	385	427
Cotton	400	408	410	397
Rayon and silk textiles	442	521	390	393
Woollen textiles	240	313	313	313
Metal products	342	336	337	337
Others	290	290	285	284

It will be evident from the above figures that the prices of jute goods and woollen manufactures have gone up considerably over the year, while those of rayon, silk and metal products have declined. The advance in jute goods prices was brought about by improvement in overseas demand, particularly from the Argentine, and reports of higher burlap consumption in U.S. Prices of cotton manufactures were maintained at a high level. In recent weeks, however, some recession has been noticeable. The decline is accounted for mainly by cotton textiles, which reflects some of the tax concessions given by the Central Government in the form of reduction in excise duty on superfine cloth, abolition of export duty on medium cloth and allowance of a rebate on import duty paid on cotton used in cloth produced for export.

Living Costs

The upward trend in commodity prices during the major part of the year under review, as noted above, was fully reflected in an increase in the cost of living in practically all industrial centres. The all-India working class cost of living index (base: 1944=100), which stood at 139 in December, 1952, shot up to 152 in August last. The extent of the rise over the eight-month period was 9.3 per cent., which is in striking contrast to a fall of 5 per cent. experienced during 1952 as a whole. The behaviour of living costs in the different industrial centres is depicted in the following table:

Centre	Base	Average for 1952	January 1953	August 1953
Bombay	June, 1934=100	337	340	376
Ahmedabad	July, 1927=100	239	260	285
Sholapur	Jan., 1928=100	310	310	325
Madras	June, 1936=100	330	327	352

WORLD COMMODITY PRICES

STABLE CONDITIONS NOTICEABLE

THE trend of commodity prices in 1953 has been characterised by far greater stable conditions than was anticipated at the commencement of the year. The most important factor influencing this trend was the economic activity of the U.S. which was surprisingly steady. Unlike the U.K. before 1914, that is, when it was a dominating factor in the world economy, the U.S., which has now stepped into its place has greater inherent strength than the former, for, besides being a great industrial country, the U.S. is a large-scale producer, consumer and exporter of foodgrains and industrial raw materials such as raw cotton, tobacco, etc. With the gradual disappearance of the threat of a world war and the enforcement of, albeit uneasy of truce in Korea, there was no longer the need for accumulating strategic raw materials. Consequently, prices of these goods began to display an easier trend. Since the U.S. had largely completed its stockpiling programme by 1952, this factor ceased to influence the price levels either way.

The shortage of dollar and the relatively high price support programme followed, by the U.S. to prop up farm prices helped a number of countries to step up production of raw materials such as cotton and foodgrains (for example, wheat), with the result that the shortage of many commodities experienced during 1951-52 began to disappear gradually. In fact, with the exception of coffee, no commodity was in short supply during 1953. Consumer resistance was noticeable in a greater degree this year than was the case previously, thanks to increased prospects of price recession. All the same, except in the case of some non-ferrous metals such as tin, lead and zinc and some other commodities like rubber, the price recession was not very pronounced during 1953, on account of the price support policy of the U.S. Government and also due to the unusual resilience of the economy of that country. The volume of goods entering the international trade during this year was somewhat lower than in the previous year, owing to the reduction in the exports of foodgrains, raw cotton, oilseeds, oil, etc.

Wariness Among Buyers

Since the prices of foodgrains play a very influential part in the determination of the price trend of other commodities, the increased supply position of wheat and other grains in many importing and exporting countries began to act as a bearish factor at the beginning of 1953. In fact, for the first time since 1939, world food production in the 1952-53 season caught up with the growth in world population. The good seasons experienced in 1952 and early in 1953 were largely responsible for the improved food position. Exports of wheat began to move somewhat slowly from the dollar area and many European and South American countries showed interest in Argentine wheat by entering into bilateral trade pact with that country. From the beginning of 1953, the downward trend began to manifest itself in a number of commodities such as foodgrains, base metals, rubber, etc. Perhaps, tin and raw cotton showed some resistance and, by the second week of February, the *Financial Times'* sensitive index number receded to 90.64. The turnover in almost all the important international markets began to shrink appreciably, due to the apparent wariness among buyers, particularly in the U.S. Metals began to come down in response to their increasing availability and lower consumption. At this time, exports of U.S. wheat were moving 40 per cent. below the comparable period of the 1951-52 crop year.

By April, prices of commodities such as tin, rubber and some other metals began to be influenced by the early prospects of peace in Korea. In particular, the cessation of purchase for stockpiling by the U.S. hit hard mainly rubber and tin, the production of which began to outpace normal consumption requirements. The signing of the Korean armistice took place early in August, but the various markets had discounted this event far earlier, because there was practically very little recession in August. The *Financial Times* index, for instance, showed a fractional rise in the first fortnight of August, when it stood at 84.78. Apart from grains, most commodities were able to retain their price levels and a few of them, notably copper, newly restored to free dealings, tin, the weakest, statistically, of the non-ferrous metals, and rubber recorded some advance. Wool, jute and copra were among the other more sensitive major commodities which moved up to some extent. All this happened when actual activity in most markets was, invariably, slight.

Continuous Optimism

In the last quarter of 1953, prices of most commodities displayed increasing steadiness and recorded moderate gains. This upward movement was assisted, to some extent, by a continuous movement towards restocking after the hesitant period when the Korean settlement was still under discussion. This favourable tendency became particularly pronounced after mid-October. Many non-ferrous metals became slightly firm, and even rubber, which at one time in October had come to the low level of 16d. per lb., began to recover the lost ground. Many other commodities, including cocoa, copra, jute, shellac, tea, etc., advanced to some extent. A notable exception was cereals, especially wheat, which were marked down to 189 cents per bushel in the last week of October. In sympathy with wheat, coarse grains showed some weakening signs. Nevertheless, a certain amount of continuous optimism was noticeable during the closing weeks of the year, resulting in stable price levels in a number of sensitive commodities in the world.

In the international commodity markets, a notable development has been the intensification of trade and bilateral agreements, particularly between the raw material and foodgrain producing nations and highly industrialised countries. This has been responsible, to some extent, for bringing down the cereals prices in the dollar countries to more normal levels. Argentina, for instance, entered into trade deals with a number of European countries such as West Germany, France, the U.K. and Soviet Russia, for exchanging its produce with machinery, electrical equipment, etc. In the Middle East, Egypt was seen pursuing a similar policy, exchanging its long-staple cotton for machinery and wheat, from a number of countries. Turkey had similar deals with Germany and other nations. Ever since the attainment of independence, India, too has been entering into bilateral agreements with various European countries with a view to fostering its trade.

Another significant development this year was the gradual restoration of free markets in a number of commodities, thereby doing away with rigid controls imposed during war years. Zinc was the first metal to be freed from control. This took place on 2nd January, 1953, and the opening free market rate at £93 was appreciably lower than the controlled rate of £110 per ton. When the truce talks in Korea were proceeding, zinc, lead and tin were adversely affected and prices receded to £71 for zinc, £89 for lead and £662 for tin by the end of June. At lower levels, there was considerable resistance, on apprehension that production of these metals would decline in case prices were marked down to uneconomic levels. In all these metals, price is an important determining factor in its use. Zinc, for instance, is used in die casting, pigments and rolled zinc, where the cost of the zinc constitutes the major part of the cost of the finished product. During most of the war years, this metal had been pegged at £25 15s., but, in 1951, it rose to £190, while the free price in Europe was even higher at £300. Copper was another non-ferrous metal which was restored to free trading in the second half of this year. Unlike lead and zinc, there was not impressive decline in its prices. Due to technical factors, as well as supply position, spot copper was standing around £230 per ton.

Fibres

In the fibres section, cotton, wool, sisal, etc., were remarkably steady in 1953, although some weakness became evident in December. In the case of wool, supply and demand were almost exactly in balance. In most manufacturing countries, the mills were active, barring, perhaps the U.S. where the trade was still inactive, largely as a result of the competition of rayon and other man-made fibres. The firmness was attributable to the exceptional demand for rebuilding working stocks which were depleted when wool prices touched phenomenal levels in 1951-52. When the new season sales began, prices were very steady, due to prospects of better demand from the U.S. The fact that Argentina had made some arrangements to supply wool to Japan, Russia, Italy and Germany, made the outlook more sober, despite the reports that clips would be higher this season, than in the previous season. Towards the end of the year, demand was forthcoming at every setback, indicating that the position in respect of this commodity was relatively good.

With regard to cotton, world production continues to exceed consumption, resulting in an improvement in stocks. The price support policy that is being followed by the U.S. in cotton, as well as in other commodities, has been giving some stimulus for other countries to grow more cotton, etc. Among plantation crops, tea has been able to emerge more hopefully from the depressed conditions of 1952. The statistical position has become healthy, as a result of the operation of the restriction scheme and the prevalence of adverse weather conditions in North India which have prevented heavy production in this region.

The position in regard to natural rubber is not so promising. During this year, prices of this commodity declined appreciably, with the result that, at one stage, production became no longer profitable. The total output this year is now estimated to be 170,000 tons more than consumption. Since the stockpiling demand from the U.S. for this commodity has declined considerably, the future for this commodity depends on the policy that the U.S. will follow in regard to its synthetic rubber industry.

Prospects for 1954

Prospects for the new year in respect of commodities will largely depend on the economic and business conditions in the U.S. A section of economists has already begun to forecast some recession, which means lower prices for commodities in 1954. In most commodities, no short supply is noticeable and, in case there is to be any slackening of activity in trade, the pace of decline in prices will gather momentum. Already, the price support programme has begun to cost the U.S. Government something like $2,800 million this year and many wonder as to how long it can afford to go on at this rate. The industrial capacity of this country has expanded enormously in recent years and even a small business recession will create considerable dislocation. Already, in certain sectors, demand has been slowing down but this, according to some, indicates a mere readjustment in the U.S. economy. The U.S. Economic Commission, appointed by the President, will be submitting its report by March next. In this report, the Commission is expected to suggest, among others, measures to be taken by that Government for maintaining stable economic activity in that country and the world in general. Much thus will depend on what the U.S. Government does in the next six months.

(Concluded from page 150)

The upward trend in living costs in most of the centres was the result of advance in the prices of food, the principal constituent in a worker's family budget. Higher cloth prices were also responsible for the rise in centres like Kanpur, Sholapur and Jamshedpur.

Since September, however, there has been a fall in living costs in some centres, which closely follows the decline in the wholesale price of commodities. Thus the indices for Bombay, Ahmedabad and Sholapur for the month of October—the latest month for which figures are available—were 370, 282 and 220 respectively.

INSURERS UNEASY OVER ESTATE DUTY ACT

KEEN COMPETITION FOR BUSINESS IN GENERAL INSURANCE

THE two outstanding events of the year 1953 in the sphere of Indian insurance were undoubtedly the grant of the much delayed tax-relief measure for life insurance companies through the passage of the Indian Income-tax (Amendment) Act, 1953 and the enactment of the controversial Estate Duty Bill which is of considerable significance to insurers. If the former Act was welcomed as a step in the right direction, the Estate Duty Act was considered, rightly, as a measure that was calculated to retard the progress of insurance in this country. These two issues figured both prominently and frequently in the utterances of Indian insurers. General economic conditions, which were the subject of deep concern to insurers last year, occupied a minor place in the discussions among insurers who were somewhat gratified to find that, although the Indian economy did not make a remarkable recovery from the low levels touched in 1952, there was at least no further deterioration.

The Income-tax Amendment Act, 1953, which received the President's assent on 24th May, 1953, is based on the findings of the Income-tax Investigation Commission. The Act has raised the limit of exemption from tax from 50 per cent. of the insurers' actuarial surplus to 80 per cent. For purposes of income-tax assessment, the profits of life insurance business are taken as either the gross external income of the preceding year less the management expenses of that year or the annual average of the valuation surplus for the latest inter-valuation period. In computing the surplus, the companies were allowed to deduct 50 per cent. of the amounts paid to or reserved for or expanded on behalf of policyholders. This proportion (50 per cent. of the amounts so reserved) has now been raised to 80 per cent. Although this concession is not as liberal as that given in the U.K., where 100 per cent. of the policyholders' share of the surpluses is rendered free of tax, it is recognised that the tax-relief, now granted, is sufficiently substantial.

Estate Duty Act

The provisions of the Estate Duty Act, 1953, which relate to insurance, were, on the other hand, the target of attack by insurers. The Act treats, as a general rule, the property accruing to a person through the insurance policy of the deceased policyholder as an estate on which duty is leviable. There are, however, important exemptions. Controversy centred round these exemptions which are regarded by the the insurers as inadequate. The exemptions (clause 31) include: (1) Money payable under one or more policies of insurance effected by the deceased on his life for the purpose of paying estate duty, but not exceeding Rs. 50,000 (2) insurance policies to the extent of Rs. 5,000 (3) insurance policies effected by a deceased parent or guardian to the extent of Rs. 5,000 for the purpose of the marriage of the female relatives dependent upon him. The relief granted by the second and third exemptions, according to Mr. Purshotamdas Thakurdas, Chairman of the 'Oriental', is so "meagre" that it is "hardly worth the name" of relief.

These and other clauses of the Act, which have a direct bearing on insurance, were criticised by the Indian insurers on the ground that they would hamper the spread of the insurance habit in this country. Commenting on these provisions, Mr. Purshotamdas Thakurdas said: "It is well-known that this country has a very low *per capita* insurance, as compared to other countries. The need for intensively fostering insurance consciousness and aiding the development of life insurance business is, therefore, all the greater in the country, because social security in the form of provision for one's old age and for the family in the event of his premature death has in India, as contrasted with other advanced countries, mainly to be provided for and arranged by the individual himself." These words sum up the general attitude of all the Indian insurers.

New Life Business

The latest available all-India figures relating to new life business refer to 1951 which, according to the *Insurance Year Book*, aggregated Rs. 132.9 crores, as against Rs. 132.1 crores in the previous year. The following table gives the trend of new life business over the ten years ended December, 1951:

New Life Business

(Rs. in crores)

	Indian Insurers	*Non-Indian Insurers*	*Total*
1942 ...	36.5	6.4	42.9
1943 ...	62.9	9.2	72.1
1944 ...	95.2	11.0	106.2
1945 ...	122.8	12.6	135.4
1946 ...	131.4	12.9	144.3
1947 ...	114.1	12.3	126.4
1948 ...	107.7	12.0	119.7
1949 ...	123.1	12.2	135.3
1950 ...	118.4	13.7	132.1
1951 ...	116.5	16.4	132.9

The net amount of life insurance business in force in India at the end of 1951 was Rs. 792.94 crores, consisting of Rs. 677.02 crores worth of business in the books of Indian insurers and Rs. 115.92 crores in the books of non-Indian insurers. The annual premium income of the insurers amounted to Rs. 39.74 crores, consisting of Rs. 33.32 crores being the premium income of Indian insurers and of Rs. 6.42 crores, the income of non-Indian insurers. The assets of Indian insurers amounted to Rs. 249.82 crores, as on 31st December, 1951, which included Rs. 121.66 crores of Indian Government securities, Rs. 1.61 crores of securities of Part 'B' States, Rs. 13.74 crores of Municipal, Port Trust and Improvement Trust securities.

The over-all new business figures for 1952 and 1953 are not yet available. Judging from the business figures of some of the leading insurers, it would appear that the new business in 1952 should at least be maintained at the 1951 levels, though it is too hazardous to generalise from isolated instances. So far as the year 1953 is concerned, most offices reported an encouraging trend in the early part of the year. It would, however, appear that this trend has not been kept up. It remains to be seen whether the records of new life business, reached in previous years, could be maintained. Growing unemployment among middle class and the high cost of living are factors that interfere with the spread of insurance since this class has been the mainstay of the Indian insurance offices.

Valuation Reports

The impact of the increase in Bank rate (from 3 to 3½ per cent.) on the income of the insurers is seen in the increasingly larger number of insurers declaring bonuses higher than what they declared in their previous valuations. The Bank rate, which remained unchanged at 3 per cent. since 1935, was increased, it may be recalled, to 3½ per cent. in November, 1951. Although this has led to some depreciation of the insurers' investments, it has also enabled them to earn a larger interest on their current investments. The *Insurance Year Book* publishes every year an analysis of these valuation results. The latest year for which such analysis is available is 1951. An analysis of the allocation of surplus made by 55 insurers whose valuation results for 1951 are available shows the following encouraging trend (figures in brackets represent number of insurers):

Higher rate of bonus distributed than as preceding valuation (12); preceding valuation surplus not distributed; bonus declared at 1951 valuation (11); preceding valuation deficit but 1951 valuation surplus not distributed (5); bonus rate maintained (3); both valuations surplus but not distributed(5); both valuations deficit (5); lower rate of bonus distributed than at preceding valuation (2); bonus declared at preceding valuation; 1951 valuation surplus not distributed (1)—Total (44).

General insurers have had to face the problem of continuing high costs of maintenance of office staff and other expenditure, coupled with the fall in insurable values through the set back in general price levels. They too have had to face the problem of keen competition—and much uneconomic competition—for the available business. The latest available all-India figures for general insurance business refer only to the year 1951. Between 1950 and 1951, the fire premium increased by Rs. 1.39 crores to Rs. 9.39 crores, marine premium income by Rs. 0.29 crore to Rs. 4.11 crores and income from miscellaneous insurance business by Rs. 4.91 lakhs to Rs. 4.85 crores. The average claims ratio worked out to 31 per cent. in fire business, to 55 per cent. in marine insurance business and to 51 per cent. in miscellaneous insurance business, as against 31 per cent., 37 per cent. and 45 per cent. respectively in the previous year. The expense ratio in fire, marine and miscellaneous businesses was 29 per cent., 23 per cent. and 27 per cent. respectively, as against 28 per cent., 24 per cent. and 27 per cent. in the previous year.

Claims Ratio

Among the problems which confronted the general insurers during the year under review, mention must be made of the increase in claims ratio, particularly in the miscellaneous insurance business, and the continuing uneconomic competition in the whole field of general insurance business. Many companies have reported an increase in the claims ratio in the motor section, thanks to the increasing cost of repairs. It was in order to remedy this defect that the general insurers were compelled to raise the comprehensive insurance premium rates for motor vehicles with effect from the beginning of the current year. This was done in order to meet the mounting repair costs of insured vehicles involved in accidents. Many insurers feel that these costs are sometimes wantonly inflated.

Code of Conduct

The other problem relates to the evils that have grown out of unhealthy competition for procuration of business. In order to overcome the evils of rebating and payment of unauthorised commissions, various efforts were made in the past but without success. A Code of Conduct for general insurers was finally evolved and put into effect from this year. The main provision of this Code are: (1) No insurer shall establish a branch within a distance of 40 miles from another branch of his. (2) The branch office shall not merely function as a channel for procuring of business but also engage itself in the issue of cover-notes, premium receipts, policies, etc. (3) The continuance of part-time employees is permitted only with the sanction of the Administrative Machinery which is set up for the purpose of administering the Code. (4) Till the end of 1954, the number of inspectors, organisers and other field workers is regulated on the basis of the various slabs of premium income of the general insurers. Every insurer is expected to furnish particulars in the form that may be prescribed by the Administrative Machinery. It will be some time before the effect of these restrictions on general insurance business can be seen clearly. In the meanwhile, the leading general insurers have generally welcomed the Code of Conduct to which they have pledged their wholehearted support. There is, however, one section which feels that the Code may not achieve the desired results and that it will only add to the many restrictions on insurance business. It looks as though this section is correct. For, despite the support pledged by almost all the insurers, serious allegations of rebating and cut-throat competition are persistently heard. It is common knowledge in insurance circles that the Code of Conduct is a farce. Many feel in their heart of hearts that it would be better if the Code were abolished and free competition restored, though, for obvious reasons, they do not give public expression to this feeling. It remains to be seen as to how long this make-believe will continue.

An event of some interest to general insurers was the nationalisation of airlines. Some Indian insurers have only recently begun developing an aviation insurance section. These insurers have been anxious to see that their aviation section does not suffer through State ownership of the aviation industry. Referring to the nationalisation of airlines, Mr. B. M. Birla, Chairman of the Ruby General Insurance Co., Ltd., hoped that the Indian companies which have established regular aviation departments would continue to get Government support to sustain their departments on a sufficiently firm basis so that they "may be counted as aviation underwriters of good standing in foreign countries."

Health Insurance

It has not been possible for the authorities of the Employees' State Insurance to extend the Scheme to a wider area as expeditiously as they once hoped. Inaugurated in Delhi and Kanpur in February, 1952, the Scheme was extended to the Punjab in May, 1953. It is believed that before the end of the year it would be possible to extend it to Coimbatore in Madras State and Calcutta and Howrah districts in West Bengal. In October, this year, a Regional Board was set up in Madras, which will look after the administration of the Scheme in Madras, Andhra, Hyderabad, Travancore-Cochin and Coorg. The benefits of the Scheme have been made available to 40,000 employees in Delhi, 84,000 employees in Kanpur and 32,000 employees in the Punjab. If it is implemented in Coimbatore, it will cover 36,000 employees. In Calcutta and Howrah districts, it will cover 235,000 employees. The experience, gained by the working of the Scheme in Delhi and Kanpur, shows that it is becoming popular with the workers. The growing daily attendance at the dispensaries and the upward curve of payment of sickness and disablement benefits are indicative of the Scheme's popularity. Nevertheless, the authorities have found it difficult to implement the Scheme over a wider area. This is due to two obstacles. In the first place, the State Governments have complained that the one-third cost of the medical care, which they have to meet is too heavy. Secondly, the doctors, who work under the panel system, feel that the remuneration paid to them is inadequate. As efforts are being made to overcome these two important obstacles, it is confidently hoped that it will be possible to implement the Scheme in 1954 more expeditiously than hitherto.

BANKING AND MONETARY TRENDS

NORMAL CONDITIONS RETURN

THE climate in the banking and monetary sector is more salubrious to-day than what it was two years ago. The year 1951 had been characterised by severe inflationary pressures and the year that followed witnessed the full effects of the new monetary policy initiated in November, 1951. Looking from a distance to-day, one must admit that the economy has undergone a process of healthy adjustment. The acceptance of the principle of deficit financing in the first quarter of 1953 as an important factor in carrying out the Five-year Plan suggested that monetary and credit instruments would be put to constant use. But there was scarcely any official intervention and the money markets functioned very smoothly during the year under review. There were two reasons for this. First, the *tempo* of development expenditure during the past twelve months fell short of expectations. Secondly, the behaviour of the private sector of the economy was quite normal, making it unnecessary for the authorities to take any further measures. The period may, therefore, be characterised as one of stable conditions for banks and money markets.

The economic developments following the outbreak of the conflict in Korea forced a change in the two-decade-old rigid policy of cheap money and brought about a decisive change in the conduct of the country's financial affairs. The official discount rates regained their importance as a normal weapon of credit policy. This policy was not without success. So far as England was concerned, as the *Economist* observed, "a 4 per cent. Bank rate has been more effective in checking inflation, despite the mildness of the Budget itself, than even the advocates of monetary policy generally dared to hope. It has not only helped to check stock building, it has induced a wholly healthy caution in both business and personal spending." In India also, the adoption of a slightly stringent monetary policy had the desired effect. The adjustments that followed the introduction of the new monetary policy initiated in November, 1951, curbed the speculative lending and enabled the Reserve Bank to exercise an effective control on the magnitude and purpose of bank advances.

Interest Rates

There were indications in 1953, especially in the latter half of that year, that the inflationary pressures, which had received a fresh lease from the Korean war and the re-armament programmes and which had showed definite signs of easing, had ceased to exist and that it was no longer necessary to continue all the anti-inflationary measures. Interest rates, for instance, generally showed a downward trend. As many as six important countries, namely, Austria, Holland, Germany, England, France and Denmark, cut their official discount rates. Towards the close of the year, Sweden joined the rest of the European countries by reducing its Bank rate from 3 to 2½ per cent. The result is that the European Bank rates to-day are definitely below the maximum levels reached after the Korean war. Perhaps, the only important instance of an increase in the Central Bank discount rate during the year under review was in the United States, where the Federal Reserve Bank of New York discount rate was raised by ½ per cent. in January, 1953. Nearer home Ceylon also raised its discount rate by ½ per cent. to 3 per cent. in July, 1953. But later in the year, even these two countries relaxed the restrictions on credit, with a view to neutralising in part the effects of higher discount rate.

In all the countries where the Bank rates have been adjusted in a downward direction, the authorities were at pains to bring home that the change was in the nature of a limited readjustment and that it did not betoken any fundamental deviation in their policy of sound money. The reductions were largely intended to facilitate trade and industry which had to overcome a strong buyers' market and to create a psychological atmosphere against recession which was being freely talked about. The authorities wanted to prove that the primary object of their interest rate policy was flexibility and not rigidity and that the interest rates would be varied either downward or upward according to the exigencies of the situation.

The monetary and economic changes can be better understood in the wider setting of money supply. The three most important factors that influence money supply, as readers are aware, are: (i) Budgetary policy as reflected in the movement of the Central Government's cash balance, (ii) net position in respect of external payments and receipts indicated by the change in foreign assets, and (iii) bank credit which may be either to the Government or to the public. In the post-war years, the principal factors that influenced the money supply were the external payments deficit and expansion of bank credit. In the current year, both these factors assumed lesser importance and it was the budgetary policy that had some effect on money supply.

Money Supply

Over the twelve months ended November, 1953, money supply (vide the relevant table in the statistical section for full details) shows an increase of Rs. 27.9 crores, as against a sizable decline of Rs. 78.2 crores and Rs. 31 crores in the corresponding periods of 1952 and 1951. The major portion of this expansion, namely, Rs. 23.7 crores, was accounted for by currency in circulation. The share of deposit money was smaller at Rs. 4.2 crores. In 1952, on the other hand, both deposit money and currency accounted for the contraction.

The seasonal variations in money supply were normal and according to the customary pattern. Thus, the expansion in currency supply was largely in the first few months of the period which coincided with the busy season and in the last two months, namely, October and November, which also form part of the busy season. This increase in money supply in the early months amounted to as much as Rs. 87.7 crores, as compared with only a nominal rise of Rs. 8.4 crores in the corresponding previous season. The large expansion that took place this year probably reflects the fact that there was no slump, as there was in the first quarter of 1952, and that the (1952-53) busy season was more normal than any in recent years. The slack season that followed was also a normal one; the contraction in money supply between the first week of May and the end of September, 1953, amounted to as much as Rs. 110.9 crores, which is almost the same as in the previous slack season. The next two months, October and November, however, witnessed a rise of Rs. 41.8 crores.

A notable feature was that the expansion in money supply did not stem from bank credit, as it used to in the earlier years. The main factors responsible were the budgetary deficit represented by the fall in Central Government deposits with the Reserve Bank. To some extent, this was offset by the improvement in the balance of payments position as reflected in the accumulation of foreign assets with the monetary authorities. With the stepping up of development expenditures and increased emphasis on deficit financing, the Central Government deposits have, over the twelve months ended November, 1953, suffered a decline of Rs. 59.0 crores, a fall which is Rs. 10 crores more than that in the corresponding period last year. If the eleven months from January, 1953 alone are taken, the decline in the Central Government's deposits is as large as Rs. 76.7 crores. When considering this decline, one must take into account the larger receipts by way of Government loans, on the one hand, and the lower *tempo* of business activity, on the other. The latter factor foreshadows a fall in tax receipts. It may be noted here that, owing to difficult trading conditions, the Government has had to grant several tax concessions such as reduction in customs and excise duties. The surplus of foreign assets for the year ended November amounted to Rs. 14.8 crores, in refreshing contrast to a huge deficit of Rs. 84.0 crores in 1952 and of Rs. 38.6 crores in 1951. This surplus during the year under review helped, to a great extent, the banks to finance the busy season, without having had to borrow large sums from the Reserve Bank. Actually, the banks resorted to larger borrowings from the Reserve Bank only after the busy season was over, the principal factors during the inflationary phase being the budget deficits and the foreign trade surplus. The fall in money in the slack season was largely the result of (a) an increase in the Central Government's cash balance, (b) deficit on the balance of payments, and (c) the disposal of securities by the Reserve Bank.

Seasonal Patterns

As already stated, the seasonal patterns, which were rather very erratic for some seasons, appeared to have come back to normal during the current year. The 1952-53 busy season started rather late and its commencement was not visible until the early days of December, 1952, but lasted for well over five months. The slack season also appears to have been a prolonged one, for, until the first week of December, 1953, there was scarcely any trade demand for money. Judging from the crop conditions, which, after many years, appear to be favourable, the 1953-54 busy season appears to be a promising one for bankers.

The variations in the various component items of the assets and liabilities of the banking system were of a smaller order than on the previous occasions, reflecting thereby the fact that the banks witnessed rather listless conditions. Bank credit expansion during the last busy season was moderate and what little increase there was, was gradual. The total increase in this head for the whole busy season was only Rs. 78.1 crores at Rs. 554.0 crores, the lowest rise in a busy season peak for many years. Even this peak for 1953 was considerably lower than the peak of Rs. 600 crores reached in March, 1952. The proportion of advances to deposit liabilities was also lower at 64 per cent., which was nearly 6 points smaller than a year before. One of the reasons for the low level of advances was the reluctance of the middlemen, who buy commodities from villagers and resell them to consumers and the shippers who buy for export were reluctant to take any big risk in the face of uncertain economic situation and vacillating policy of the Government in regard to export duties. Whatever little stocks of commodities they bought were disposed of quickly and the funds borrowed for financing these stocks were returned to banks within a short time, only to be sought again when an opportunity for making fresh purchases presented itself. This process not only reduced the volume of funds required for financing seasonal trade but also imparted a greater degree of liquidity to commercial advances. In this connection, it may be pointed out that, between the end of June, 1952 and 1953, the number of loan accounts outstanding increased from 428,451 to 511,541. The return of funds in the following slack season was also equally prompt and orderly, the total of advances standing at Rs. 449 crores at the end of November, 1953. The proportion of advances to deposit liabilities at the end of this month was only 51.38 per cent.

Usance Bills

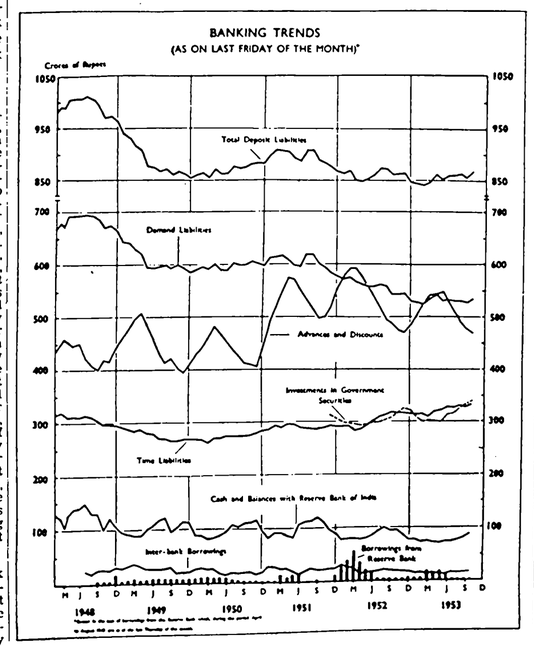
The provision of seasonal credit to trade did not place any perceptible strain on the banks during the year under review. This will be evident from the fact that the Scheduled Banks' indebtedness to the Reserve Bank (under section 17(4)(c) of the Reserve Bank of India Act) against usance bills, which had been practically eliminated by the end of October, 1952, amounted to Rs. 40 crores only upto the middle of May, 1953. Again, during the period January to June, 1953, such borrowings amounted to Rs. 60.8 crores, as against Rs. 74 crores in the corresponding period of 1952. But it must be noted here that this amount includes an increase of nearly Rs. 11.5 crores that took place in the second week of June. This accommodation was not for genuine trade purposes but for subscribing to the National Plan Bonds, as can be seen from the rise of Rs. 12 crores in the investment portfolio of Scheduled Banks during the same week.

Another evidence of the ease with which the banking system met the seasonal demand for credit is provided by the variations in the banks' borrowing from the Reserve Bank against Government securities under section 17(4)(a) of the Reserve Bank Act. During the first half of 1953, such borrowings amounted to only Rs. 89 crores, as against Rs. 136 crores in the corresponding period of the previous year. During the year, the banks generally preferred to finance the demand for accommodation through a reduction in their cash reserves, short-term borrowings from abroad and liquidation of Treasury Bills. It is significant that, during the busy season in the current year, the Exchange banks' foreign borrowings amounted to nearly Rs. 19 crores, as against Rs. 15 crores in the corresponding season of the previous year.

Advances

The slack season that followed witnessed the return of almost the entire funds advanced in the busy season. The funds thus returned were utilised by the banks to pay off their outside borrowings and to increase their investments—largely short-term. As a result, the investments formed, in the first week of November, 1953, as much as 40 per cent. of the deposit liabilities.

The pattern of advances, taken over a short period review of one year, have not showed any significant change. Commerce accounts for the bulk of the advances, with industry ranking next. Over a two-year period, that is, as compared with March, 1951, the share of commerce has suffered by nearly 6 per cent. in favour of industry and agriculture. The following table based on



the latest available figures shows at a glance the pattern of advances:

Percentage to Total Advances

	March 1951	June 1952	March 1953	June 1953
Industry	33.6	37.4	35.4	34.7
Commerce	53.1	46.7	48.0	48.2
Agriculture	2.1	4.0	3.7	4.2
Personal and professional	7.3	7.2	7.2	7.5
All others	4.0	4.6	5.8	5.4
	100.0	100.0	100.0	100.0

Though stringency in the money market during the 1952-53 season was not so very severe, inter-bank call money rate moved up to the previous busy season's levels of 3 per cent. for the larger Scheduled banks and 3½ per cent. for the smaller banks. This was in accordance with anticipations and reflected a proper adjustment of money supply to demand. During the slack season that followed, money rates declined to their normal levels but were somewhat higher, in that the inter-bank call rate stayed at ½ per cent. in the case of larger Scheduled banks, as compared with ¼ per cent. in 1952, and 1½ per cent., as against 1 per cent. in the case of small Scheduled banks. However, occasional stringencies were caused by temporary transfers of short-term funds from Bombay to Calcutta, owing to the differences in the interest rates. The Reserve Bank discount rate and Imperial Bank rates remained unchanged.

It must be said that the general pattern of interest rates did not show any considerable change. The long-term rate on trustee securities was at about 4.3 per cent., while the short-term three months Treasury Bill rate had more or less stabilised at 2.4 per cent. The rates charged by Scheduled banks on their advances, which had hardened a little during 1952, were lower in some cases and higher in some others, as can be seen from the following figures:

	Exchange Banks' June		Major Indian Scheduled Banks' June	
	1952 %	1953 %	1952 %	1953 %
Loans against—				
Government and Trustee securities ..	4–6	3–5	4–6	4–5
Shares ..	4½–6	4½–6	5–6½	4½–6½
Non-agricultural commodities ..	4½–6½	4½–6	3½–7	3½–9
Other secured advances ..	1½–6	3½–6	4–9	4–9
Clean advances.	2½–6	4–6	5–9	5–9

It will be noticed that the Exchange banks reduced their rate of interest on loans against Government securities, but raised it a little on clean advances and other secured advances. The major Indian banks also lowered their rate on loans against gilt-edged and shares, but increased it on loans against non-agricultural commodities. It will also be seen that the rates of interest charged by the major Indian banks were generally higher than those by the Exchange banks.

Deposits

It was mentioned last year that the downward trend in deposits in evidence since 1947 appeared to have been arrested. This view has been confirmed by developments during 1953. They reveal a tendency on the part of depositors to show preference for leaving money on time deposit accounts with banks. The higher interest rates and the uncertain commodity price trends have increased the value of money as a store of value, while restricting its usefulness as a means of payment in current transactions. Deposit liabilities, which were as much as Rs. 965.8 crores at the end of November, 1947, had declined year after year and reached Rs. 845.1 crores at the end of November, 1952. At the end of November, 1953, they stood at Rs. 858.6 crores, showing a net improvement of Rs. 13.5 crores, as will be seen from the following figures:

(In crores of rupees)

	Demand deposits	Time deposits	Total
24th November, 1947 ..	634.4*	311.4*	965.8*
24th November, 1950 ..	544.1	277.6	865.7
24th November, 1951 ..	559.5	293.3	852.8
30th November, 1952 ..	532.3	312.8	845.1
27th November, 1953 ..	526.4	332.2	858.6

* Only these include inter-bank borrowings.

While total deposits have gone up, the variations in demand and time deposits have been different. There has been throughout a continuous fall in the demand liabilities (including inter-bank borrowings) but demand deposits have been rising. It will be noticed from the above figures that, as compared with 28th November, 1947, while demand deposits have dropped over Rs. 125 crores, time deposits have actually gone up by a little over Rs. 20 crores. A feature of time deposits in 1953 was that the pace of expansion was a little slower than in 1952.

During the year, the trend of deposits with banks was more stable than in 1952. The demand deposits, for instance, fluctuated within a range of Rs. 30 crores, as against Rs. 45 crores in 1952, the highest and the lowest levels touched in 1953 being Rs. 543.7 crores and Rs. 512.9 crores, as against Rs. 585.4 crores and Rs. 540.4 crores, respectively. At the end of November, 1953, they stood at Rs. 538.93 crores, thus showing a decline of Rs. 5.2 crores only over the year, as against Rs. 39.4 crores last year. Time liabilities, which had recorded an increase of Rs. 25 crores in 1952, have staged an increase of Rs. 16.2 crores.

A lower cash ratio seems to have come to stay in our banking system. The excess over the statutory minimum, which in earlier years was of the order of Rs. 30-40 crores in the slack season, was scarcely Rs. 20 crores and that too only for half a dozen times. At the end of the busy season, the excess was only Rs. 5.7 crores. Thereafter, it fluctuated between Rs. 11 crores and Rs. 26 crores. The percentage of cash to deposits also was lower, the ratio touching a low of 8 per cent. on 8th May, 1953. Later, there was some improvement, with very wide fluctuations occasionally, and at the end of November, it was no more than 11.5 per cent. In the busy part of the season, the low-level of ratio indicated intensive use by banks of their deposit liabilities by way of commercial advances, while, in the slack season, it reflected an increase in investment in Government securities and Treasury Bills.

Treasury Bills

The resumption of the sale of Treasury Bills has imparted a certain measure of resilience to the short-term capital market. It has provided an opportunity for banks to invest a part of their surplus cash balances in these bills of short maturity, thereby enabling them to raise cash whenever the demand for funds arises, without upsetting their long-term investment portfolio. At the end of December, 1952, the holdings of Treasury Bills by the Scheduled banks amounted to Rs. 17.39 crores, but, by the end of June, 1953, they were only Rs. 3.09 crores. Thus, the liquidation of Treasury Bills of the order of Rs. 14.30 crores forms the major portion of the decline in the banks' investment portfolio of Rs. 23 crores between the end of December, 1952 and May, 1953. With the return flow of funds from trade in the subsequent months, the banks gradually built up their investments in Government securities, which, at the end of November, 1953, stood at Rs. 336.8 crores, showing a net increase of Rs. 11.8 crores over the year. Banks appear to have taken substantial interest in the new flotations by both Governments and local bodies. The addition by the end of November over the low level reached in May amounted to Rs. 37.2 crores. Of this, the share of Treasury Bills may be estimated at about Rs. 15 crores.

The hardening of interest rates had resulted in banks' borrowings becoming costlier. As the following table shows, banks have had to pay increased interest on larger amounts at the beginning of 1953 than in 1952:

Rate of interest (Per cent.)	1953 Amount (Rs. Crores)	1953 Percentage to total	1952 Percentage to total
Nil ..	190·5	31	32
0–1 ..	100·0	17	21
1–1 ..	78·1	13	16
1–1½ ..	64·7	11	10
1½–2 ..	30·0	5	6
Above 2 ..	137·4	23	14

There is no doubt that the average borrowing rate of the banking system has substantially gone up. This, together with the increasing cost of establishment, must result in profits being substantially lower than in the previous year, though the actual performance of individual banks may vary, in view of the keen competition that existed for the available business. The profits announced by the major banks for the first half of the year, it may be mentioned here, showed a substantial fall over those for the corresponding previous half-year. As the level of advances during the year was not very high and as repayments were also quicker, the amount of interest receivec must necessarily be less. It is, perhaps, these considerations that have compelled the banks to employ their resources to the maximum extent possible by keeping down the excess cash balance with the Reserve Bank at as low a level as possible.

The Government borrowing programme was more successful this year than in previous years. In June, the National Plan Bonds, 1961, fetched a cash subscription of Rs. 23.4 crores, besides enabling the Government to convert the 3 per cent. loan 1953-55 to the extent of Rs. 51.9 crores. Subsequently, as many as ten State Governments also successfully approached the market, offering 4 per cent. for 10-year loans. Total subscriptions amounted to Rs. 36.73 crores, of which conversions amounted to Rs. 2.72 crores.

Borrowings through small savings, however, were somewhat smaller than in the previous year, as will be seen from the following figures showing the net receipts:

(In crores of rupees)

	January to September 1952	1953
Post Office Savings Bank Deposits ..	+17.02	+11.77
National Savings Certificates ..	+14.20	+15.41
10-year Savings Deposits ..	+ 5.87	+ 5.47
Defence Savings Bank Deposits, P. O. Cash Certificates, Defence Savings Certificates ..	— 3.11	— 2.48
	+33.98	+30.24

Besides the foregoing, the Government borrowed through Treasury Bills also. The total amount of these Bills outstanding at the end of November were Rs. 17½ crores. The total of all these borrowings amount to a sizable figure of nearly Rs. 105 crores in cash. If we exclude the Treasury Bills and take Rs. 38 crores as the net small savings collected for the whole year, the net cash borrowings of long-term nature amount to Rs. 95 crores. With only Rs. 48 crores of maturing obligations in 1954 in the shape of 2½ per cent. loan, 1954 (Rs. 35 crores) and 3½ per cent. loan 1954-59 (Rs. 13 crores), the Government appears to be in a far more satisfactory cash position than in the previous year.

The capital market was equally responsive to the approaches made by the private sector and the local bodies. There were many placings both by semi-Government institutions and the private sector. Such borrowings were of the order of Rs. 25-30 crores on a rough estimate, a figure substantially higher than in the previous year. Amongst the important placings during the year may be mentioned the various municipalities, as, for example, Bombay for Rs. 1.5 crores, the Stanvac Refinery, the Tata Hydro, the Industrial Finance Corporation of Saurashtra, and the Central land mortgage banks of Saurashtra and Andhra.

Other Developments

The year has been notable for the absence of any important bank failures. But as many as five banks were refused licence during the year under section 22 of the Banking Companies Act, 1949 and, since they were not allowed to accept deposits any more, they were constrained to close down their business. It must be remembered that, under section 22 of the Banking Companies Act, a bank could continue to function until a licence is refused by the authorities. For this, as well as for other reasons, in all five banks were excluded from the second schedule to the Reserve Bank of India Act; in a few cases, they had actually ceased to function much earlier but were technically excluded now.

It was mentioned last year that two exchange banks ceased to function in India. During 1953, two new foreign banks established their offices in the Indian Union, namely, the National Bank of Pakistan and the Bank of Tokyo. As a result of these, the number of Scheduled banks at the end of November, 1953, was 91, as against 94 at the end of December, 1952. Although the number of Scheduled banks declined, there was no appreciable decline in the number of offices, as is borne out by the following figures:

	31-12-52	30-6-53	30-9-53†
Imperial Bank of India ..	410	419	420
Five leading Joint-stock banks ..	744	748	750
Exchange banks ..	64	65	65
Other Scheduled banks ..	1,480	1,466	1,475
Total ..	2,707	2,698	2,710

† Estimated.

During the period under review (upto September), as many as 73 new branches were opened, as against which 25 offices were closed. (This does not take into account the offices of banks that were removed from the second schedule during the period.) Of the new offices opened, ten were accounted for by the Imperial Bank in fulfilment of the programme of the Rural Banking Enquiry Committee. The tendency among the smaller Indian banks to open too many offices appears to have been arrested, they having accounted for a decline of as many as 14 offices. The number of offices of Indian banks in foreign countries other than Pakistan increased by seven to 39.

Central Banking

A significant development in the role of the central banking authority of the country has been the extension of its activities to some of the Part B States such as Hyderabad, Mysore and Travancore-Cochin. On behalf of these, as well as the Central Government and other Part A States, the Reserve Bank carried out, during the year, loan operation with considerable success. In Hyderabad, the demonetisation of the old currency has been carried out to a large extent and Indian currency is taking its place. The appointment of the Hyderabad State Bank as an agent of the Reserve Bank marks the first instance where the Reserve Bank has appointed a bank other than the Imperial Bank as its agent. In Mysore also, the Reserve Bank has assumed the function of bankers to Government and opened a new office in Bangalore; the Bank of Mysore was appointed as agent in the State to conduct treasury operations.

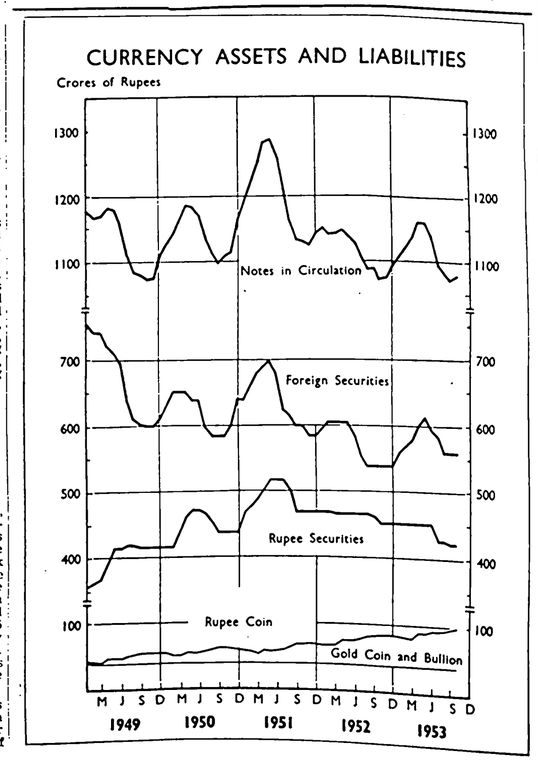
Apart from expanding the scope of the Reserve Bank's activities thus, several changes were made in the facilities for accommodation from the Reserve Bank. Owing to the success so far achieved, the Bill Market scheme, first introduced in January, 1952, was extended to Scheduled banks having deposits of Rs. 5 crores also, as against the previous limit of Rs. 10 crores. Moreover, in view of the higher rates of stamp duty in certain Part 'B' States, the Reserve Bank, which was refunding, under the Bill Market scheme, only half of the standard rate (viz., Re. 0-2-0 per Rs. 100), decided that, as an experimental measure and for a period of one year from 1st October, 1953, it would refund such portion of the stamp duty on usance bills or promissory notes, lodged with it as security for advances, as was in excess of Re. 0-1-0, which represents half the cost of the stamp duty in respect of these bills executed in Part A States and which is not refundable under the present scheme.

Agricultural Credit

Apart from these steps, the year under review witnessed evidence of the Reserve Bank taking far greater interest than before in the economic development of the country. In the sphere of agricultural credit, which is a special responsibility of the Bank laid down in the Statute, the Bank successfully promoted legislation to make itself eligible to give medium-term accommodation for agriculture and cottage and small-scale industries. The scope of the term "seasonal agricultural operations" was also widened so as to include mixed farming, processing, etc. And the Bank is now awaiting the Report of the Rural Credit Survey, which will help it to formulate more long-term policies in the sphere of agricultural finance.

The credit facilities for agriculture have been availed of in a number of States. Thus, advances for agricultural operations are now being availed of by as many as 12 States, as against only 7 in 1952. In the coming years, as a result of the active interest taken by the Bank in the reorganisation of the co-operative credit structure, more States are expected to avail themselves of the concessional finance and the quantum will be much larger than the Rs. 12 crores at which it has been standing for the last two years.

In the sphere of industrial finance, too, the Bank has been evincing keen interest, as witness the assistance it has been rendering in the setting up of Finance Corporations in the various States. The recent amendment to the Act passed by Parliament provides for medium-term advances to industrial co-operatives. Equally important, in this connection, is the appointment of the Shroff Committee to consider the ways and means of providing more finance to the private sector so that the objectives of the Five-year Plan may be achieved.



FRUITS OF FREE ECONOMY

INSPIRING IDEAL OF LIBERALISM

By Karodt A. Joseph

THE problem of combining an economic policy co-ordinated for a public purpose with a system which allows scope for individual enterprise and initiative is one which faces all states that are fighting for systems of freedom against totalitarian tyrannies. In the modern world, economic stress has been a great slayer of democracy and liberalism. To-day, when India is laying the foundations of a new democracy, it is necessary for every democrat to be reminded of the political significance of our economic organisation.

The mainstrings of democratic progress have been free enterprise and liberalism in the past, and these forces are bound to be the only durable basis of a free society. Freedom, like poverty, is indivisible. No society can be half slave and half free for long. Weakening of the forces of free enterprise and individual initiative all over the world, particularly since the beginning of the present century, has inevitably weakened democratic ideals everywhere. Free enterprise and free democracy are the twin products of liberalism—the most popular creed of the intellectuals. India's progress on democratic lines, inevitably depends on a revival of liberal traditions, a firm faith in individual initiative and freedom and a conviction that the prosperity and security of a modern State depend on the existence of a class of liberal-minded enterprising citizens who know their duties as well as their rights, and who are prepared to take risks in the noble adventure of building a free and prosperous India.

What is this inspiring ideal of liberalism that released humanity from feudal slavery and unmitigated drudgery and created a new world civilisation based on material prosperity and political freedom? During the golden age of European liberalism, this ideal referred to specific body of doctrines, having intellectual, economic, political and international significance. Intellectually, it championed freedom of thought, extolled technology, natural science and machine civilisation, and treated religion as a private affair of the individual conscience. In economics, it stood for individualism, for freedom of occupation and profession, for freedom of trade, for freedom of contract between the individual employer and the individual worker and for unrestricted competition in business and trade. It was hostile to the economic privileges of classes, the tariff and protectionism, to guilds and trade unions, and to Governmental regulations and control of commerce and industry.

In politics, liberalism regarded the ideal State as a "passive policeman," not concerning itself actively with the affairs of its individual citizens, but merely preserving order, protecting private property, fostering some public education and some public works. Likewise, it regarded as ideal a Government which would be constitutionally representative, and parliamentary, in which the propertied middle classes and educated professional classes, would predominate, and under which individual liberty would be large and taxation light. In international affairs, it was generally pacifist, though sympathetic to the "oppressed" people struggling for freedom. It condemned war as financially burdensome, as injurious to property and profitable trade, and as destructive of personal life and liberty.

Great Britain proved the most congenial home for the growth of liberalism, as it was a firm believer in free enterprise and a free political system. The unbroken peace and uninterrupted prosperity that the world witnessed for a century after Waterloo (1815-1914) was the product of liberalism. The intellectual revolution associated with the Renaissance and Reformation; the scientific outlook and technological progress leading to industrial revolution; the parliamentary supremacy, imperial expansion and urbanisation; absence of serious class conflict and co-operation between the nobles, the middle class and enterprising mercantile community;—above all, the British sense of practical realism, fair play and tolerance in politics and a scientific, progressive and hopeful outlook on life—all these made liberalism flourish in Great Britain. In the nineteenth century liberalism permeated the whole of Europe, though it became strong only in Western Europe. All over Europe, there was a romantic love for novelty and freedom from traditional controls that had long enslaved nations, inhibited individual initiative and impeded progress and efficiency. By the middle of the nineteenth century all classes in Europe—the intellectual middle class, progressive clergymen, humanitarian landlords, wealthy capitalists, professional men and urban dwellers—all came under the beneficial influence of liberalism.

Wherever liberalism penetrated, it served as an important leave on society and Government, it stimulated business enterprise and increased material prosperity; it infused a new spirit of hope and adventure for the common man. As the industrial revolution progressed, the basic concepts of individual initiative and enterprise permeated the whole society. It helped to shape public policies, breaking down traditional barriers of social and commercial intercourse and promoting an ever-widening extension of public works and popular education. Parliamentary democracy, territorial nationalism, abolition of slavery and fostering of colonial self-government were some of its political results. Revolutions in science and knowledge, the wonderful achievements in the field of production, transport and other economic activities, the building up of the modern machine civilisation were some of its other achievements. The daring and enterprise of the colonial adventurer, the pioneering spirit of the scientist and technician and the inspiring political achievements of Britain were the lasting products of liberal individualism. The sacred mystery of democracy, is that genius springs from the soil least prepared for it. Any restriction that kills enterprise, discourages adventure and fosters inertia and indolence, will ultimately weaken the culture, character and capacity of the whole community.

The tragic crisis of the twentieth century has been the crisis arising from a decline of liberalism and a weakening of the forces of freedom—economic and political. Rapid industrialisation led to the creation of powerful monopolies. Intense competition of a monopolistic nature led to the rise of militant nationalism and a strengthening of class conflict and sectionalism. Exploiting imperialism and colonialism, search for markets and raw materials, have all led to an unprecedented Europeanisation of the whole world. The dream of universal peace and secure prosperity gradually gave way to the nightmare of competitive armaments, class conflicts and political tension. Free enterprise and free democracy both became stifled and new popular movements took a combative and socialistic turn.

The future of world civilisation and progress, as in the past, depends on a revival of free enterprise in a free democracy—a restoration of liberal ideals which were mainly responsible for the wonders of the modern industrial society. As an ideal, liberal individualism has a great future. It nourishes self-reliance, encourages initiative, and combats unnecessary Governmental interference. It urges the recognition of the value of the individual in society and it helps to destroy useless laws of petty interference by Government against personal freedom.

It is an idle dream to hope for the fostering of a free society and prosperous community without reviving our faith in liberal individualism. If only we have a glimpse of what is happening under socialism and regimentation elsewhere—even in Britain, the stronghold of liberalism—one could easily recognise the political significance of discouraging free enterprise. The picture of Socialist Britain given by H. W. Seaman is most revealing, when he says, "The walls of the prison close in day by day; the area of enterprise shrinks day by day the ceiling of opportunity is lowered. The prisoners are charged more for the expense of the Multiplying Jailors. . . . There is no incentive to bold undertakings, except a heartless propaganda which urges all dogs, collectively to jump at the moon keeping them chained. Socialism as now interpreted is competition without prizes, business without hope, war without victory, statistics without end and boredom without relief." Socialism means more power for the State and that power

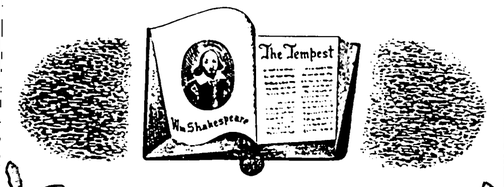
(Continued in column 1)

(Concluded from column 4)

whether in the hands of the prime minister or policeman is potential tyranny.

If free India desires to build a progressive democracy and efficient economic order, she has to avoid the road to serfdom. This means a revival of liberalism and an assertion of our faith in individual enterprise and initiative. Indian culture and civilisation have been essentially individualistic in character. In this age when liberalism is crumbling down, it is a prime duty of India to preserve this precious heritage of liberal individualism and lay firm foundations for a durable democracy. Individual initiative, competitive efficiency and intellectual liberty are the basis of a flourishing democratic society. India is fortunate in having a liberal democrat to guide its destinies in the person of the Prime Minister Mr. Jawaharlal Nehru. He has clearly stated his firm faith in liberalism in one of his addresses as follows, "I am myself a devotee of science and believe that the world will ultimately be saved, if it is to be saved, by the method and approach of science which values individual thinking and initiative. Any achievement that is based on widespread fear can hardly be a desirable one, and a social order that has for its basis the coercive apparatus of the State and cannot exist without it, is more like a military occupation than civil rule."

A free democracy can thrive only in a land fertilised by the refreshing sap of free enterprise and on a soil hardened by competitive efficiency. The people of India with all their patient industry, with all their noble literature, with all their cultivated taste, have yet to learn, that it can gain the arts which adorn life, the luxuries which sweeten it, the amenities which embellish it, the philosophy which ennobles it—only when the country secures, by effort and and sacrifice, the weightier matters of mental emancipation, civil rights and material prosperity. Free democracy can hardly survive, if its twin sister, free enterprise, is permitted to languish and perish—nay, is even slandered and oppressed!—*All Rights Reserved.*



"Such stuff as dreams are made on"

Paper is the stuff on which most ideas are born. And "stuff" is the word for it. By "stuff", those in paper-making mean the watery mixture resulting from the churning of wood-pulp and other materials with the necessary chemicals.

The stuff is then treated with bleaching powder to give paper its whiteness. Not to miss the wood for the trees, chemicals are as essential to paper-making as, say, the trees themselves.

Paper is one of a long list of industries to which we render a basic service. If you are in a business which uses chemicals, you will find it to your advantage to consult us

TREND OF THE MARKETS IN 1953

GAINFUL YEAR FOR EQUITIES

IMPLICATIONS OF FIVE-YEAR PLAN STIMULATES BULLISH ACTIVITY

(From Our Own Correspondents)

BOMBAY, 19*th December*

INVESTORS in equities on the Bombay Stock Exchange have every reason to feel gratified that after having suffered successive losses for a period of two years, the year 1953 proved a more prosperous period for their holdings. The trend of equity prices, for the major part of the year, was very steady with fluctuations confined to a relatively smaller range. This was encouraging enough after the experience of the two previous years. But what was definitely more encouraging was the fact that a very welcome optimistic note was struck in the closing months of the year. A boomlet developed in these months, not witnessed for the previous two years, with the result that the year's trading wound up with very smart gains in almost all scrips.

More than anything else, the rising trend in prices was due to the distinct change in the psychology of the operators from one of depression which had pervaded the market in the previous two years to one of confidence. The absence of any adverse factors to depress the sentiment was itself a helpful factor for the revival of confidence. In fact, there were several favourable developments which influenced the market's optimism. The main driving force behind the operators' activity was provided by the implications of the Five-year Plan. Although it was thought, at one time, that the financing of the Plan meant more tax burdens on the individual citizen and the industries, the Finance Minister's elucidation that a certain amount of deficit financing had to be resorted to, in order to finance the Plan, gave rise to hopes of inflationary conditions. This was not all. The absence of any fresh tax burdens in this year's Budget proposals and the Government's recognition of the place of the private sector in the implementation of the Plan and its verbal assurances of help to this sector, often given by the Finance Minister, were additional helpful factors. Some of the positive measures undertaken by the Government to aid the private sector included the relief given to the textile industry in the shape of (1) the reduction of export duty on cloth from 25 per cent. to 10 per cent., (2) the abolition of price and distribution controls on cloth, (3) abolition of the 10 per cent. export duty on medium varieties of cloth, (4) the reduction of excise duty on superfine cloth from As. 3-3 to As. 2 per yard, (5) grant of rebate of import duty on cotton in respect of exports of cloth manufactured out of imported cotton, and (6) the inauguration of the Export Promotion Council. These measures induced activity in textile shares and thus served to sustain the market sentiment. The offer of a Rs. 10-crore loan by the Government of India to the Tata Iron and Steel Co., Ltd., for financing its expansion programme and the scope given to the automobile industry to expand itself were further instances—at least, so the market interpreted—of Government's help to private industry. A notable feature of the trading during 1953 was the absence of hectic speculative activity. It must, however, be admitted that the market lacked large-scale genuine investment support.

This year's trading on the local Stock Exchange began on a cautious note. Barring occasional mild spurts in some groups, notably textiles, caused by the announcement of a reduction in export duty on cloth from 25 per cent. to 10 per cent., and in steels, on revival of rumours about increase in retention prices for steel, the market displayed lethargic conditions during the whole of January, with restricted turnover and narrow movements in prices. The market was under the grip of pre-Budget fears. Though pre-Budget apprehensions were not unusual for this part of the year, the market attached greater significance to this year's Budget than the earlier ones, inasmuch as this was to be the first Budget following the publication of the final version of the Five-year Plan. It was thought likely that proposals for financing the Plan might inflict a serious burden on industry. Prospects of heavier taxation, heavy death duties, regulation of profits and dividend, were all factors which chilled the enthusiasm of the operators. Besides, there was uncertainty regarding the Mediator's award in the Tata Deferred shares conversion dispute. Investors were chary of extending support. Values on balance disclosed modest losses, as indicated in the Reserve Bank of India group index of variable dividend securities for Bombay region from 122.8 (base 1938=100) in the week ended 27th December, 1952, to 120.6 in the last week of January, 1953.

A distinct change in sentiment for the better came over in the first week of February and was sustained right up to the end of the third week of March. The credit for ending the stalemate goes to President Eisenhower, whose pronouncements on Formosa and the Far East, in the course of his "State of the Union" message, revived the war scare. Further, the Union Finance Minister's statement in the course of an interview at Hyderabad early in February, about the Budgetary position *vis-a-vis* the Five-year Plan, indicating the prospect of resorting to deficit financing, was favourably interpreted by the market. Besides, the bright prospects of an early trade agreement between India and Pakistan, reports of an encouraging demand for cloth in the overseas markets, the firmness of bullion and commodity markets and renewed expectation of the grant of an increase in retention prices of steel, gave an additional stimulus to the market. The absence of fresh burdens on industry, by way of increase in freight rates, in the Railway Budget and the absence of fresh taxation measures in some of the State Budgets dispelled the earlier fears regarding the Union Budget. The Budget proposals presented in Parliament on 27th February confirmed the market's view. The exemption from super-tax given to certain categories of companies on such parts of their total income as consisted of dividends received from Indian companies formed and registered after 28th February, 1953, the trend towards deficit financing, the high level of capital expenditure envisaged, which implied a rising tempo of economic activity, were the main bullish factors for the market. The relaxation in distribution control on cloth on 12th March was well received by the market. There was, therefore, a marked expansion in activity and equity values rebounded, as witness the rise in the index number from 120.6 in the closing week of January to 128.0 in the week ended 21st March.

After a slight recession, during the three-week period ended 11th April, occasioned by fears about Estate Duty, which later on proved correct when the Select Committee recommended low limits for exemption from levy of the Duty, the sharp fall in bullion prices, the Chinese Premier's proposals to resume talks on exchange of prisoners and the award of the Industrial Tribunal for granting higher dearness allowances to labourers of cotton textile mills in Bombay, there was a revival of confidence. This improvement stemmed from the Finance Minister's gesture to provide more incentives to private enterprise, as indicated by the amendments made to the Finance Bill. The market welcomed particularly the exemption of genuine jobbing and arbitrage transactions by brokers of recognised Stock Exchanges from the category of speculative transactions for purposes of the clause in the Finance Bill restricting the set-off of speculative losses against profits from speculative transactions only and not against any other income. Further, the suggestion that the Finance Minister would hold consultations with party leaders on the Estate Duty Bill, with a view to accommodating any suitable suggestions, was taken to imply that there would be relaxations in the provisions of the Bill. The Union Government's proposal to lend Rs. 10 crores to the Tata Iron and Steel Co., Ltd., for the expansion of its works at Jamshedpur, the market's hopes of a higher retention price for steel, the spurt in commodity and bullion prices, the postponement of the final consideration of the Estate Duty Bill to the autumn session of Parliament, the encouraging advices from Calcutta, where jute shares came into the limelight after a long period, reports of comfortable profit-margins for cotton textile mills for 1953 and the announcement of the Mediator's award on Tata Deferred conversion scheme fixing the ratio of conversion at six ordinary shares for each deferred share, were the factors which fanned the bullish fervour, which continued up to the end of May, when the index number (base 1938=100) stood at 127.0 and that under the new series (base 1949-50=100) at 102.7, as against 124.4 and 100.2, respectively in the week ended 11th April.

This was, however, followed by a downward movement, which persisted till about the third week of September, except for a brief spell of steadiness in the last three weeks of July when the operators derived encouragement from reports of satisfactory results of working of textile mills in the first half of 1953, the removal of price and distribution controls on cotton cloth and yarn, the increase in retention prices granted to the Tata Iron and Steel Co. at Rs. 32 per ton for 1952-53 and at Rs. 47 for the two years 1953-55 and encouraging progress of the Tata Iron and Steel Company's development programme, as disclosed by the Directors' report for 1952-53. The downward trend, already referred to above, was assisted by (1) better prospects of peace in Korea, following the Communists' acceptance of the U.N. Plan for armistice, (2) deterioration in the labour situation at Burnpur leading to the declaration of a lockout in the works of the Indian Iron and Steel Co., Ltd. and the Indian Standard Wagon Co., Ltd., (3) weakness in commodity markets, and (4) reports of accumulation of cloth in textile mills. The cumulative effect was a decline in share values as indicated by the drop in the index number (base 1949-50=100) to 98.7 in the week ended 19th September.

Boom in Equities

The next phase of trading on the Stock Exchange was the most notable one for the year, inasmuch as there was a boom, the like of which was not witnessed in the previous two years, and which lasted almost upto the middle of December. Equity values in several leading counters touched new high levels not seen for several months. The recovery movement started in the closing week of September under the leadership of steels, sentiment having been favourably influenced by the improvement in the labour situation at Burnpur. Operators also welcomed the Finance Minister's statement in the Council of States indicating a larger investment under the Five-year Plan than was contemplated previously. The upward movement gained momentum mainly on professional support and short covering, the main bullish factors being: (1) the appointment of a committee by the Reserve Bank to examine the question of providing increased finance to the private sector of industry, (2) the optimistic view, taken by the market, of the Union Government's decision to increase the expenditure on the Five-year Plan by Rs. 175 crores for financing new schemes, (3) the measures taken by the Government to eradicate malpractices suspected in certain company managements, and (4) the measures announced by the Government to promote offtake in cloth. Shortages of floating stocks in some counters, such as steels, cements, etc., also assisted the firmness. The rise in equities values was particularly marked in November, under the stimulus of several favourable factors, namely, (1) the reports that leading textile mills had booked orders for several months ahead, (2) the Commerce Minister's proposal to form a council for promotion of textile exports, (3) the striking improvement in the production of the Tata Iron and Steel Co. and the Indian Iron and Steel Co. during October, (4) the favourable voting results for Tata Deferred Conversion Scheme, (5) the announcement of bonus issues by several companies and expectations of similar issues by others, and (6) firmer advices from Calcutta, where rumours about the possibility of a reduction in Bank rate gained currency. The steady advance in prices in the eleven-week period, beginning with the closing week of September can be gauged from the impressive rise of eight points in the index number from 98.7 to 106.8 in the week ended 5th December, the latest week for which the index number is available up to the time of writing.

Towards the close of the year (that is up to 19th December) there was a sharp reaction, on heavy liquidation touched off by reports about U.S.-Pakistan military alliance; prices over a wide front showed sizable losses.

Section-wise, steel shares gave the lead to the market and recorded impressive gains, reflecting the operators' faith in the prospects for the steel industry. Thus, Tata Deferreds gained as much as Rs. 306-4 over the year to stand at Rs. 1,998-12 on 19th December, in refreshing contrast to the loss of Rs. 83-12 recorded in 1952 and Rs. 141-4 in 1951. The highest level touched at Rs. 2,062-8 on 11th December was a record since the middle of 1951. Tata Ordinaries advanced by Rs. 39 to Rs. 302-8, as against a decline of Rs. 17-12 recorded in 1952 and Rs. 46-12 in 1951. The gains in Tata Steels was the cumulative effect of a combination of factors outlined in the foregoing paragraphs. Despite the serious labour situation at Burnpur, Indian Irons were in favour, on rumours that the Company would be granted a higher retention price to compensate the loss due to the strike. As a result, the share could gain Re. 1-13 over the year to stand at Rs. 26-2½, as compared with the drop of Rs. 4-9½ and Rs. 3-14 in 1952 and 1951, respectively.

Although the textile industry fared well with a record production to its credit, it faced with the problem of high labour cost and accumulation of stocks. But the measures taken by the Government to stimulate expansion of offtake in cloth (to which reference has been made earlier) encouraged operators to lend support to mill shares, particularly to the shares of well-known mills. Thus, there was a gain of Rs. 42-8 in Bombay Dyeings at Rs. 397-8, Rs. 34 in Kohinoors at Rs. 295, Rs. 31 in Centurys at Rs. 281, Rs. 42 in Central Indias at Rs. 185, Rs. 35-14 in Svadeshis at Rs. 272, and Rs. 46 in Gokaks at Rs. 244.

Bank Shares

Bank shares were steady, though they were not as active as the equities in other sections. However, Imperial Fully Paids netted a gain of Rs. 52-8 at Rs. 1,845 and the Contributories Rs. 10 at Rs. 450. Centrals suffered a small loss of Re. 1 at Rs. 64, as against a loss of Rs. 3-8 in 1952. The most notable rise was seen in United Commercials which stood Rs. 10 higher at Rs. 45.

Barring a sharp rise in Orientals, on expectations of favourable compensation in the event of mutualisation, the proposals for which were forwarded by the Company to the Government during the year, the insurance section was featureless. Orientals gained as much as Rs. 2,720 to stand at Rs. 7,410. New Indias were subdued at Rs. 40, a fall of Rs. 3 over the year.

Good support was extended to miscellaneous industrial scrips. For most part of the year Associated Cements were sluggish, but towards the close came to be supported on the Directors' decision to maintain the dividend at Rs. 9-8 and to issue bonus shares, subject to Government sanction, in the ratio of one share for every five shares. On balance, they stood Rs. 6-4 higher at Rs. 184-12. Belapurs added as much as Rs. 51 to Rs. 260, as against a loss of Rs. 54 in 1952. Bombay Burmahs, however, lost Rs. 23-2 to Rs. 363-12, but the decline was small, as compared with the fall of Rs. 169-6 in 1952. Premier Constructions advanced by as much as Rs. 32 to Rs. 118-8. Scindias were a gainer by Re. 1-2½ at Rs. 15-12½. The Directors of the Company have decided to step up the dividend for the year ended 30th June, 1953, from As. 8 per share to As. 12 and to write up the face value of the shares from Rs. 15 to Rs. 20, subject to the sanction of the Government, by capitalising the amount standing to the credit of the share premium account. Another notable scrip which came into the limelight was National Rayon. These shares were avidly taken on reports of excellent working results for the current year and expectations of a handsome maiden dividend. Consequently, they rose to a high of Rs. 135 at the close of the year, against Rs. 60 at the end of 1952.

Calcutta Stock Exchange

CALCUTTA, 1*st December*

The Calcutta Stock Exchange passed through some very difficult days, particularly in the early part of the year 1953, though the market was able to make considerable headway towards the close of the year. The change in sentiment was as welcome as it was unexpected. In fact, it was the more welcome for being unforeseen. The earlier weakness of the market reflected the difficult trading conditions both in the export and internal markets for industrial goods and the tight conditions in the money market. Also, the floating of Government loans at attractive terms and bearing interest higher than hitherto caused a depletion of the market funds which stood already depleted in view of the shyness of genuine investors. In the meanwhile, labour conditions became worse, and the numerous instances of holding employers in the Calcutta industrial area to "ransom" in the shape of *Pujah* bonus and other demands greatly shook the confidence of private investors. No wonder, therefore, that activity on the share market during the year was poor, although in the latter part of the year conditions took a turn for the better and widespread gains were recorded almost reminiscent of the days of war-time buoyancy. This improvement followed the gains in the prices of jute goods, tea and cotton piecegoods resulting from the increased export enquiries. From Table I, it will be noted that between 1st January and 30th November, the Calcutta market held 251 sessions of which only 52 or 20.72 per cent. were sessions which recorded business at hardening rates. But these few sessions were apparently more significant than the earlier ones, for, they recorded such a sizable improvement that many counters more than gained the ground lost early in the year. Table II gives a brief picture of the course of prices of the principal counters.

It should be hardly surprising that among the different sections of the Stock Exchange, the coal section was quiet during the year, since exports of coal declined in view of the stiff competition of other coal-producing countries. Burrakurs and Bengals fluctuated within narrow limits. Both these counters touched lower levels of Rs. 8-4 and Rs. 499 respectively, which compare with the lowest levels of 1952 at Rs. 10-5 and Rs. 495. Good dividend news here and there gave a periodic fillip to the counters concerned, as witness New Beerbhooms improving to Rs. 22-13 from Rs. 20-15 in February and March after a dividend of As. 8 was declared. In the same period, Bengals also were pushed to Rs. 545 from Rs. 522. These rises, however, could not be sustained. Despite unfavourable conditions, investors were interested in first class scrips at lower levels, and the counters which closed with gains in November over the opening levels of the year included Central Indias at Rs. 5-10, Raneegunges at Rs. 10-2 and East Indias at Rs. 24-14, while those which sustained losses included Dhemo Mains at Rs. 8-12 and Pench Valley at Rs. 22-8.

Cotton textile shares had a good start in the reduction of the export duty on cloth, and soon trading took a broadening turn. Muir Mills were one of the

early features, and at Rs. 225 added Rs. 17. During February also, the section kept the better appearance, on expectations of more prosperous export trade. In March too, sentiment was better since prices for the domestic consumer were rising in view of the official restriction on the production of *dhotis* and *saris* by mills. In May, two striking features were Dunbars, which were lifted to Rs. 220 from as low as Rs. 88, and Bowreahs which improved to Rs. 285 from Rs. 210. Further rises in these two counters were witnessed in August following the sale of these two companies from British to Indian hands. Subsequent profit-taking reduced the gains considerably, and Bowreahs receded to Rs. 277 from Rs. 312, and Dunbars to Rs. 171 from Rs. 220. In the meanwhile, a fall in internal demand and depression in the export market greatly added to the piecegoods stocks of mills, and it was only after the Government's announcement in October of measures designed to increase exports and sales for local consumption, a better feeling was in evidence in shares.

Jutes provided an irregular pattern of trading. The industry passed through a crisis, and on each occasion when official measures designed to increase sales of cloth were announced upward trends set in. These, however, proved temporary phases, since these measures were only half-hearted attempts. However, with the drastic reduction in the duty on hessian exports to Rs. 120 from Rs. 275 a ton as from 15th September, export sales rose and the market commenced taking not only the full production of mills but also the accumulated stocks. These factors enabled the industry to tide over the crisis, and jute shares regained confidence, although towards the close of the year they were tending to show losses on balance. Market circles are agreed that boom conditions can prevail only after the export duties are done away with. January and February were quiet months. March witnessed moderate activity following the reduction in the duty on sacking from Rs. 175 to Rs. 80 a ton. Howrahs advanced to Rs. 25-2 from Rs. 23-14 and Anglo-Indias to Rs. 230 from Rs. 214. Stocks of finished goods with mills began to increase and the subsequent months (till August) witnessed easy and dull trading, since the mills were faced with serious marketing problems. Foreign consumers preferred to buy less from India in view of the relative cheapness of the Continental products. Much water flowed down the Howrah bridge before the Government decided to revise the export duty on hessian, and since then, some of the leading counters have looked up.

Steels

The difficult labour situation which prevailed in Burnpur for more than six months and which brought production to almost an insignificant figure for two to three months affected considerably the trading in Indian Irons. This scrip could not thus provide any leadership to the market for many a session. It was the lock-out of the Works by the management at the end of August that paved the way for workers to resume work early in September and raise production to normal capacity. Latest output figures available relate to the month of October, when pig iron produced aggregated 55,880 tons, steel ingots 30,670 tons and semis and finished steel 31,230 tons. It was during this month also that the output reached almost normalcy, and the interest of operators which remained subdued up to now, began to increase and the quotation for Indian Irons tended to close steady for the year in the neighbourhood of Rs. 26. Expectations of higher retention prices for steel, the maintenance of dividend at Re. 1 per ordinary share for the year ended March, and the anticipation that the dividend for the current working year also would be maintained at 10 per cent., despite the loss in output suffered by the go-slow tactics of labourers, assisted recovery. It would be noted that the highest rate touched was Rs. 27-1 as against Rs. 29-6 in 1952. Other counters in the engineering section that provided keen activity at different periods were Burn & Cos., Jessop & Cos., Indian Galvanisings, Indian Standard Wagons and Texmacos.

The tea section provided a good number of features during the four months ended April, following the maintenance of demand in Calcutta auctions at a high level, expectations of higher exports to the United Kingdom and the United States, and the lower production costs for gardens in Assam and the Dooars. Thus, Hantaparas moved up to Rs. 142 from Rs. 100, and East Indians to Rs. 18-4 from Rs. 15-2. Confusion resulting from the readjustment of the excise duty on tea which was made in April induced easier conditions. It was not until June that steady conditions came to prevail. Many counters added gains, Patrakolas being raised from Rs. 101 to Rs. 125. Both August and September recorded transactions at hardening rates; but since October trading took a cautious turn and gains were fractionally lost. The outlook, however, remained satisfactory, and substantial rises were recorded in several counters. The voluntary restriction in output in respect of the North Indian gardens, the strong demand in Calcutta auctions and the possibility of business with Russia were an attraction for buyers of tea shares.

Occasional spurts were a feature in the sugar section. Although the Government's decision to import sugar imparted a quieter tone, the demonstration of the ability of mills to increase production to meet the increasing demand for sugar made good the earlier losses and added substantial gains towards the end of the year. Cawnpores were at one time as low as Rs. 24-8; after August, a higher trend set in, for the reason already stated; the closing level for the year at around Rs. 35 was impressive. Champarans were similarly raised to Rs. 24-8 from Rs. 16-14.

Miscellaneous Section

It was from the trend as recorded in the miscellaneous section which provided many features regularly, that the market derived its general strength. By the very nature of the varying types of industries represented by this section, each scrip had to be judged separately before operators entered into commitments. Early in the year shares of the now merged airlines were favourites of buyers and recorded impressive gains. Airways Indias were as high as Rs. 14-14 as against an opening of Rs. 7 and Indian National Airways hardened to Rs. 4-3 from Rs. 2-12. Digwarrah Rubbers were one of the features which had strengthened, by the end of June, to Rs. 18-8 from Rs. 10 in January. Alkali Chemicals, Indian Wood Products, India Steamships, Indian Cables, F. & C. Oslers, Titaghur Papers, Dunlop Rubbers, Ganges Ropes, National Tobaccos, and British Burma Petroleums were amongst the strong features of the year on different occasions. Midnapore Zemindaris and Bengal Flours also recorded impressive gains.

Although quotations tended to ease, during the early part of the year, considerable ground lost was regained towards the close of the year. This was possible due not a little to the changed outlook for the jute industry, the maintenance of the ordinary dividend at Re. 1 per share for Indian Iron and Steel Co., Ltd., and the strong export demand at the tea auctions. The future trends in the market will, of course, depend on the Government's fiscal policy. The market therefore closes the year with its attention on the Central Budget which is, naturally enough, awaited with interest.

Madras Stock Exchange

(*Messrs. Maconochie & Co.*)

MADRAS, 30*th November*

The year 1953 held out little promise for stock markets at the beginning but fulfilled much before the end. It was by no means a year of hectic trading or spectacular rises on Stock Exchanges. Nonetheless, it was remarkable for the transformation of sentiment from one of gloom and depression to a slow emergence of confidence in equity investments. For a large part, professional operators had to keep the interest alive, and it was not until the close of the year that there was investment support for selected shares. The absence of investment buying is understandable, having regard to the storms through which stock markets have sailed since the fateful year 1947. On the one hand, they had to contend against the aftermath of the partition and the liquidation of the princely order which was the backbone of the investment market, while, on the other, they had to measure up to the spate of socio-economic legislation which has deluged the country in the last five years. If stock markets have emerged successfully from these tribulations, it is due to the profound faith of the investor in corporate enterprise.

Last year, just about this time, the future seemed obscure, and, particularly for the Madras market, it was a difficult period, with the depression in tea prices and the unsettled outlook for textiles. It is remarkable how sentiment has changed in the short space of 12 months and how, during the closing weeks of 1953, the atmosphere got surcharged with that refreshing optimism which has been so rare in the last few years. The silent yet substantial achievement of 1953 may be said to be the resurgence of that elusive factor—"market sentiment."

More Practical Measures

By force of circumstances, Government had to resort to more practical measures to give relief to one industry after another during the course of the year. The bungling over the jute export duty had almost threatened to lose our market for the golden fibre and perhaps as a result thereof, the Government have shown greater awareness during the year, in giving tangible help to industries in the shape of abolition or reduction of export duty.

During the first week of January, the export duty on cloth was reduced from 25 per cent. to 10 per cent. *ad valorem*. This was followed by the introduction of the 35 per cent. power cut in South India in the areas served by the Mettur Electricity System. Normally, this would have been tragic, but, in the context of the accumulation of yarn and cloth, this was not a wholly unwelcome restriction at that time. The accumulation was brought about by the peak production of 4,609 million yards of cloth and 1,448 million lbs. of yarn during 1952, as compared with the previous record in 1948 of 4,422 million yards of cloth and 1,456 million lbs. of yarn. This coincided with the tapering off of demand both at home and abroad. On 28th January, 1953, the Textile Commissioner announced the Government's decision to allow the export of limited quantities of cotton yarn on a quota system. These measures stimulated, to some extent, the offtake of yarn and cloth but could not by themselves relieve the glut and further incentives had to be administered, as the year advanced.

On 24th October, 1953, an ordinance was issued, whereby the 10 per cent. export duty on medium cloth was abolished, the excise duty on superfine cloth was reduced from As. 3-3 to As. 2 per yard and the industry was given rebate of import duty on cotton in respect of cloth exported. That the industry required this fillip was clear from the fact that the production of cotton textiles had been running at a high monthly average of 413 million yards. These concessions induced further activity in textile shares and helped considerably in buttressing market sentiment.

At the turn of 1952-53, the tea industry was in the doldrums and several North Indian gardens had to close down. This coincided with India's withdrawal from the International Tea Marketing Expansion Board and fears, were entertained about the future of the industry, which depends largely upon the consumer in the U.K. Fortunately, however, the gloom has been dispelled and tea scrips finished the year at about the highest levels in the recent past. This transformation was possible, by the industry itself voluntarily restricting production.

To begin with, it was decided to restrict the Indian production to 570 million lbs., that is, 50 million lbs. less as compared with the previous year. Most of the estates voluntarily resorted to finer plucking and these measures were sufficient to steady up the price of the commodity both in the Calcutta and Cochin auctions. In Cochin, the price of low-grown Travancore B.O.P. which stood at Re. 1-1 per lb. a year ago improved to Re. 1-12-6.

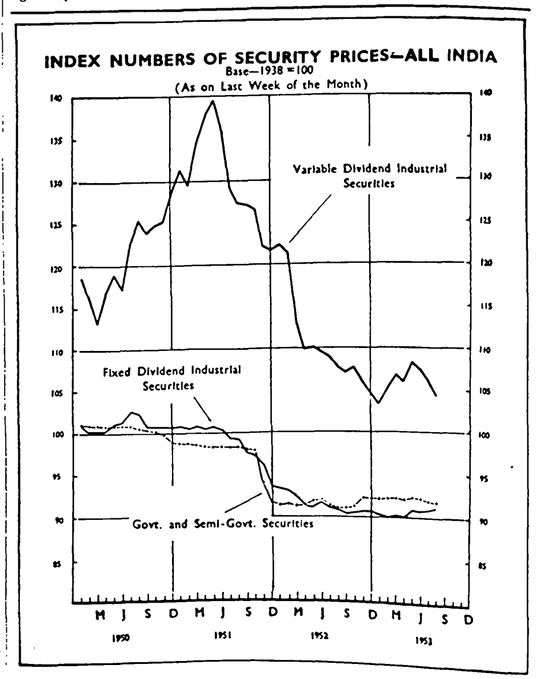
The industry benefited considerably by the change in the excise duty which was announced on the 15th April. Under the new set-up, estates pay an excise duty of one anna per lb., instead of 3 annas, while packers and blenders pay an additional 3 annas. Loose tea, that is, bulk packing of 60 lbs. and over were exempt from the additional 3-anna duty. This revised method of collection of excise duty eased the ways and means position of the estates considerably, in that their total outlay on the excise duty was reduced by two-thirds.

During the year, the statistical position of tea also moved in favour of the producer. Most of the South Indian companies reported satisfactory crops and the number of good balance-sheets and dividend announcements aided market sentiment. In consequence demand for tea scrips which was dormant during the middle of the year, became so aggressive by the close, that prices leapt up without corresponding expansion in business.

There was no excitement in the rubber section during this year, because the price of the commodity has been pegged at the maximum rate of Rs. 138 per 100 lbs. until 28th October, 1955. But there has been seasonal accumulation of stock in the producing centres, due to slow buying by manufacturers which in turn was due to the poor offtake of the manufactured commodity. The small estates, therefore, had to face difficult times and only the larger units could hold their own. Recently, a powerful plea has been put forward to Government for the sanction of a rehabilitation grant to estates to finance their replanting plans, because it is said that the present controlled prices do not leave enough reserves to be diverted for this purpose, from current earnings. If the outcome of this proposal is favourable, there is no doubt that the long-term prospects of this industry would have been placed on more solid foundations. It is some consolation that price control has conferred a degree of deserved protection to the producer, against the steady fall of the commodity in world markets.

For the first time in the last 10 years, investors in coffee shares suffered a rude shock. It was due to the steep fall in coffee prices which was brought about not by economic laws but by executive fiat. Indigenous production is still short of demand, and world prices continue to be much higher than the highest in the local auctions so far. But Government would not allow the industry to take advantage of the higher foreign prices, and had banned exports which in turn led to heavy accumulation of stocks with the Pool and delayed payment to the producer. The situation became so alarming towards the third quarter of the year and stocks of coffee with the Pool deteriorated to such an extent that a conference was convened in Madras which was attended by representatives of the Coffee Board and the Governments of Madras, Mysore and Travancore-Cochin.

Subsequent to this, the Government of India evolved a new formula for payment to the producer, whereby he would be guaranteed a minimum of Rr. 2-4 per point or Rs. 180 per cwt. for Plantation and Rs. 139-8 and Rs. 138, respectively, for Arabica and Robusta for the entire 23,000 tons of the 1952-53 crop. Of this, 9,000 tons had already been sold at higher prices and the Government has now allowed the export of 2,000 tons subject to an export duty of Rs. 62-8 per cwt. But what is most unsettling is the fact that prices for the 1953-54 crop have not been announced and as a result of interference by the Government, coffee marketing has been thrown out of gear. Coffee shares, therefore, fell out of favour during the year.



Electrics

There was keen investment demand for all public utility shares and prices improved greatly during the year. Cochin States improved from Rs. 9 to Rs. 10-8, Gunturs from Rs. 70 to Rs. 108, while Kumbakonams were unchanged at Rs. 10-6 and Negapatams about Rs. 8-12. Salem Erodes advanced to Rs. 14-4, South Arcot were steady at Rs. 94 and South Madras better at Rs. 10-13 *cum-div.* Vellores improved by a rupee to Rs. 13-12 and West Coast by Re. 1-4 to Rs. 13-4.

Sugars

There was selective buying in this section. All issues of E.I.D. were keenly sought after the 'B's particularly being in short supply. Deccan Sugars declined, the Rs. 25 paid shares falling from Rs. 28 to as low as Rs. 20 at one time and the Rs. 10 paid from Rs. 11-12 to Rs. 8-12. The Company passed over the previous dividend in 1952-53 and, owing to the poor quality of cane in its Pugalur factory area, the outlook has been rather gloomy. Mysores were subdued, the price falling from the opening quotation of Rs. 44-12 *cum-div.* to Rs. 43-4. Travancores declined from Rs 5-3 to Rs. 4-8, while Breweries improved to Rs. 160.

Tea

The avid buying of almost all tea shares that was evident at the close of the year was somewhat unexpected but nonetheless welcome. This was due to the spate of good balance-sheets and dividend announcements, coupled with the satisfactory crop turned out by several companies.

Mountains stepped up the dividend from 10 per cent. to 12½ per cent. and the shares improved over the year from Rs. 2-9 to Rs. 3-7 *cum-div.* Chandramalais paid ½ per cent. more for 1952-53 and the shares improved from Rs. 2-4-6 to Rs. 2-13-6 *ex-div.* Devasholas were scarce and the price improved from Rs. 15-15 to Rs. 18 buyers. Coonoor Teas put in Re. 1-8 to Rs. 24, Coorg Teas were higher at Rs. 6 compared with the opening of Rs. 5-3, while Highlands improved from Rs. 9-5 to Rs. 11-10. Kalasas dropped the dividend from 15 per cent. to 10 per cent. Kil Kotagiris were most popular and from the opening quotation of Rs. 4-13 improved to Rs. 6-2. The Company has harvested a considerably higher crop for the year ended October, 1953. Neelamalais stepped up the dividend by 2 per cent. and have declared a dividend of 12 per cent. The shares spurted up and closed at Rs. 5-1, as compared with the opening of Rs. 3-13. Neeliampathies improved from Rc. 1-12-6 to Rs. 2-5 and Nilgiri Teas from Rs. 10-6 to Rs. 11-6. Nonsuch noted the steepest rise from Rs. 21-12 to Rs. 30-12. Sellers were throughout scarce.

After remaining dull for the major part of the year, Parksides witnessed good activity to close at Rs. 15-8 *cum* the final dividend of 10 per cent. as compared with the opening quotation of Rs. 11-14.

In March, the Peermade Tea Company increased the ordinary capital from Rs. 12,75,000 to Rs. 17 lakhs and announced the issue of bonus shares in the proportion of one share for every three held. The shares opened at Rs. 40 and gradually declined to Rs. 35-8 *cum-div. cum-rights* towards the end of March when the bonus issue was announced. It fell further to Rs. 34 in April. The first *ex-right* quotation was Rs. 24 and since then the price has advanced to the closing figure of Rs. 26½. Periakaramalais altered the denomination of its share from Rs. 7-8 to Rs. 2 by writing up the Rs. 7-8 paid shares to Rs. 8 and subdividing the resultant share into four shares of Rs. 2 each. Owing to the exceptionally good crop harvested and better dividend prospects, the shares remained active throughout. The Rs. 2 share closed at Rs. 7-2. Stanes Amalgamated improved to par and United Nilgiri Teas were well absorbed, closing at Rs. 197 against the opening quotation of Rs. 165. Waterfalls also stepped up the dividend to 12½ per cent. and the shares closed at Rs. 3-6 *cum-div.*, as compared with the opening quotation of Rs. 2-10.

Rubber

For the best part of the year activity was subdued and only the popular shares were transacted. But towards the close there was good general buying. Cochin Malabars were about a rupee better at Rs. 7. Kailas doubled the dividend to 25 per cent. and the shares closed at Rs. 3-9. Kalpettas improved from Rs. 18 to Rs. 21. Malankaras have proposed the issue of bonus shares and for the year ended March, 1953, stepped up the dividend from 35 to 55 per cent. The shares consequently closed at Rs. 107-8, as against the opening quotation of Rs. 90. Midlands maintained the dividend of 15 per cent. and Pullangodes of 20 per cent. The latter were active and closed at Rs. 3-1-6, as compared with the opening quotation of Rs. 2-4-6. Rajagiris have declared a 17½ per cent. dividend and the shares closed at Rs. 12-8 *cum div.*, as compared with the opening quotation of Rs. 9-13. Teekoys were steady and closed at Rs. 7-9 Travancore Rubbers were well absorbed, closing at Rs. 13-10. T.R.T.'s were active, the shares improving from Rs. 6-8 to Rs. 8-6. Vaikundams after remaining quiet for a long time closed at Rs. 16-4.

Coffee

The first half of the year was uneventful, but the developments in the latter half naturally unnerved investors in coffee shares and the rise was halted. Consolidated from the opening quotation of Rs. 16 improved to Rs. 18-4 and Coffee Lands from Rs. 9-5 to Rs. 10-12. Neerugundis were out of favour and the price declined. Puthuthotams increased the capital by 50 per cent. by the issue of one bonus share for two shares. They were popular and closed at Rs. 3-4-6.

Textiles

There was good activity in the last quarter of the year in this section. The power cut at the beginning of the year affected sentiment and subsequently reports about the glut in the cloth markets were not conducive to active trading. All the same, there is at present growing optimism about the future outlook. South Indian mills have digested the stock of American cotton imported at high prices. There has been a fall in the price of cotton and an improvement in the price of yarn after decontrol. 1953 is expected to be a reasonably good year and the more efficient producers are expected to show profits.

Bangalore Woollens declared an interim dividend of 10 per cent. and closed at Rs. 282-8, against the opening of Rs. 214-8. Buckinghams have declared an interim of 4 per cent. and expectations of further 4 per cent. final dividend accounted for the shares being absorbed in large blocks, the price improving from Rs. 116 to Rs. 121-8. From par, Cambodias rose to Rs. 12. Pioneers improved to Rs. 119, while Krishnarajendras noted a steep rise from Rs. 39 to Rs. 50-8. Lakshmis were steady, while Metturs noted a steep rise from Rs. 179 to Rs. 214. Mysore Spuns noted a revival of buying, improving from Rs. 4-8 to Rs. 6. Radhakrishnas were fractionally better and Rajalakshmis were steady about Rs. 78. Rangavilas were unchanged. The biggest rise in this section was noted by Travancore Rayons which rose from Rs. 3-5 at the beginning of the year to Rs. 7-6 towards the close. Vasanthas had good investment buying and improved from Rs. 145-8 to Rs. 164.

Miscellaneous

In the miscellaneous section, prices were inclined to fall during the first nine months of the year and it was only towards the end that there was a revival of buying, mostly of a speculative character. Andhra Cements were absorbed and the price improved from Rs. 90 and Rs. 9 to Rs. 101 and Rs. 10-1 respectively for the 'A' and 'B' shares. F.A.C.T's fluctuated from the opening level of Rs. 3-11 and, after dropping to Rs. 3, closed at Rs. 3-15. India Cements passed over the dividend for 1952-53 and consequently the shares declined from Rs. 17 to Rs. 15-6. Indian Steel Rollings were absorbed and closed at Rs. 11-6. Mettur Chemicals noted a speculative spurt to Rs. 5-4 while M.C.F. closed at Rs. 8-10. Gold mining shares noted a few enquiries and Mysores were particularly strong closing at Rs. 2-14. Mysore Papers improved by Rs. 2 to Rs. 15. Parrys showed a steep fall from the opening quotation of Rs. 6-4 to Rs. 4-2. Rallis also declined from Rs. 76 and after being lower, closed at Rs. 67. Spencers were well supported, though the price declined from Rs. 16 to Rs. 14-8.

Exclusive To "Commerce."

Gilt-edged Market

BOMBAY, 20*th December*

The Gilt-edged market exhibited relatively more stable conditions this year than in 1952. Early last year, confidence in Gilt-edged had received a rude shock, as a result of the new monetary policy initiated by the Government in November, 1951. It was only in the second half of 1952 that there were signs of revival of this confidence, which gathered momentum this year. Price variations during 1953 were, therefore, confined to a narrower range. 3 per cent. Conversion Loan, for instance, moved between the range of Rs. 81-11 and Rs. 83-1 in 1953, as compared with that of Rs. 80-4 to Rs. 84-5 in 1952. Again, in 1952, there was no fresh borrowing by the Central Government, nor did any loan fall due for payment. Only four State Governments had floated loans amounting to Rs. 12.50 crores. In the current year, however, a larger volume of borrowing was put through. Besides a cash-cum-conversion loan issued by the Centre, ten States garnered something like Rs. 30 crores. A number of local bodies also raised a sizable amount of long-term capital. A large number of provident funds also supported the Gilt-edged market. The turnover was, therefore, substantial and the undertone remained steady to firm throughout the year.

The behaviour of Gilt-edged in the first half of the year was lively. Changes in values were rather more frequent than in the second half and were generally upward. Support from provident funds from time to time was a source of relief to the market. Confidence of operators was sustained by the desire of the Government to stabilise yields on Gilt-edged, as indicated by the Finance Minister in his Budget speech. The Reserve Bank, too, frequently appeared on the scene from the second quarter of the year and so conducted its open market operations as to impart stability to the market. Throughout the year, sellers were scarce and the floating stocks were so small that any substantial demand used to have a hardening effect on the rates.

An idea of the behaviour of the market in the first half of 1953 can be had from the price variations of some select loans. 3 per cent. Conversion Loan started the year at Rs. 82-13. It improved gradually in January, on short covering by a Calcutta operator who had sold short heavily earlier, and it touched the year's highest at Rs. 83-1 early in February. After remaining at about this level, it dropped to Rs. 81-11 in April, owing to selling pressure. Subsequently, on support from some financial institutions, it recovered to touch Rs. 82-13 by the end of June. 3 per cent. 1957 opened the year at Rs. 98-8 and slowly but steadily hardened to Rs. 98-13 in May, but gave way to pressure and stood at Rs. 98-5 at the end of June. 3 per cent. 1963-65 improved from Rs. 92-6 in January to Rs. 93 in the last week of May but again reverted to Rs. 98-5 towards the end of June.

The flotation of 3½ per cent. 1961 loan with the issue price at Rs. 98-4 per cent., announced by the Government of India on 31st May, 1953, was an outstanding development in the Gilt-edged market. This loan, known as National Plan Bonds, was for a sum of Rs. 75 crores. Subscriptions were in the form of 3 per cent. 1953-55 loan at par or cash. The 1953-55 loan fell due for payment on 15th July, 1953. Those who tendered the loan for conversion got interest up to and including 14th June, 1953. Those who subscribed in cash also got the benefit of interest for a week, as the list opened on 8th June. Cash subscriptions aggregated Rs. 23.3 crores. The amount of the maturing 3 per cent. 1953-55 loan tendered for conversion was stated to have aggregated Rs. 51.81 crores.

In the week ended 17th July, 1953, ten of the State Governments entered the market with loans bearing interest at 4 per cent. and repayable in 1961. The names of the State Governments, the amounts for which the loans were issued and their issue prices are mentioned below:

	Amount in crores of Rs.	*Price per cent.*
		Rs.
Bihar	1	99.8
Bombay	5	100.0
Madhya Bharat ...	1	99.8
Madhya Pradesh	1	99.8
Madras	5	99.8
Mysore	3	99.8
Saurashtra ...	1	99.8
Travancore-Cochin	3	99.8
Uttar Pradesh ...	5	99.8
West Bengal ...	3	100.0
Total ...	28	

The West Bengal, Bombay and Saurashtra loans were oversubscribed on the afternoon of the 17th July. The closing dates for Mysore, Madhya Bharat and Madhya Pradesh were extended upto 28th July as the response was not satisfactory. By this date, the loans were reported to have been fully subscribed. The total amount subscribed to the Madras loan amounted to Rs. 10.81 crores. Refunds claimed by those was about Rs. 42 lakhs only.

Subscriptions to State loans were not uniformly successful. The West Bengal loan was oversubscribed in no time. Madras received as much as Rs. 10.81 crores as against Rs. 5 crores. Bombay and U.P. met with some difficulty but managed to close their lists before time. Saurashtra and Bihar found it even more difficult to sell their loans. The position in respect of Travancore-Cochin loan was the same, if not worse. Mysore, Madhya Pradesh and Madhya Bharat had to extend the time limit and yet had to be given special assistance.

Bombay, West Bengal and Madras loans were successful, because the personality of the Chief Ministers of these States played a great role in influencing the public to support their respective State loans. Besides, the three States had the advantage of well organised money markets which offered special facilities. The economic development of these three States, which is in an advanced stage, was another factor for the success of these loans. Although U.P., Bihar—and Mysore and Travancore-Cochin to a certain extent—cannot be said to be underdeveloped, they lacked organised financial markets.

Excepting the interest evinced in the State loans, there were hardly any notable developments worth mentioning in the second half of the year under review. Barring occasional emergence of stray enquiries, the market continued to exhibit uninteresting conditions. Gilt-edged values remained mostly stationary. Activity was relatively smaller than in the first half. Price variations also were narrower and confined to a few selected securities such as 3 per cent. 1957, 3 per cent. 1958, 3 per cent. 1963-65, 3½ per cent. 1961 National Plan Bonds and some of the 4 per cent. State loans particularly of Bombay, West Bengal and U.P. The Madras loan, too came into the trading ring occasionally.

Early in July, the 3 per cent. Conversion loan was quoted at Rs. 82-11. On continued selling pressure, the rate declined to Rs. 82-1 at the end of the month. 3 per cent. 1963-65 also receded from Rs. 92-8 to the year's low for this loan at Rs. 92-5. 3 per cent. 1957 was, however, steady at Rs. 98-6. There were no worthwhile changes till September when a better trend was noticeable in sympathy with the firmness of the Gilt-edged securities in England, following the reduction in the Bank rate there. This improvement was, however, only short-lived, as it was soon realised that a similar reduction in the Bank rate in India was unlikely. Owing to profit-

NARROW MOVEMENTS IN BULLION

SMOOTHER TRADING—UNDERTONE STEADY AT LOWER LEVELS

BOMBAY, 12*th December*

IF the year 1952 had proved to be one of crises for the bullion market in Bombay, the year that is now drawing to a close can be termed as a relatively uneventful one. There was no crisis in the market during the year under review, whereas it was almost a recurrent feature in the previous three or four years. The main reason for this was that speculative activity was on a comparatively lower scale than in the previous years, thanks to the series of measures taken by the Board of the Bombay Bullion Association and the Government of Bombay in 1952. No doubt, efforts were made during the year by the Board further to amend the by-laws, but up to the time of writing no amendment was made, though one is in the offing. Shorn of hectic speculative activity, fluctuations in prices of both the metals were confined to a much narrower range than in the previous years.

Judged by all accounts, the year turned out to be one of smooth sailing for bullion, the like of which had not been seen in recent years. Silver (for both ready and forward deliveries) disclosed a loss of but As. 11 per 100 tolas over the year so far (up to 12th December, 1953). This is negligible as compared with a net drop of Rs. 44-10 in ready and Rs. 43-8 in forward in 1952. Similarly, in gold the loss was Rs. 3-2 (ready) and Rs. 2-9 (forward), as against Rs. 27-2 and Rs. 27-10 for ready and forward, respectively, in the previous year. The difference between the highest and the lowest levels touched during the year under review was Rs. 24-6 in the case of ready silver and Rs. 14-3 in the case of ready gold, the corresponding spread in the previous year being as much as Rs. 55-3 and Rs. 29-8, respectively. The year under review was also one of lower prices, the average price of silver for the year so far being Rs. 157-8, as compared with Rs. 164-12 in 1952 and Rs. 197-1 in 1951. The average price of gold was Rs. 86-11 as against Rs. 92-3 in 1952 and Rs. 113-3 in 1951. This is also evident from the highest points touched by these precious metals. Silver, for instance, did not go above Rs. 171-12 (ready) during the year so far, whereas it had touched Rs. 193-11 in 1952 and Rs. 207-13 in 1951. Likewise, the highest level touched by gold in 1953 was Rs. 93-10 (ready) as compared with Rs. 106-12 in 1952 and Rs. 118-12 in 1951.

Proposal to Amend By-laws

Although the year under review was conspicuous by the absence of any hectic fluctuations or one-sided movement leading to crises, there were a few occasions when the Board of the Bombay Bullion Association felt it necessary to take steps for checking what it considered to be excessive speculative activity. In February, 1953, the price of silver spiralled up to a level not recorded for many months before. This caused a flutter among some of the members of the Bullion Association and forced the machinery for declaring an emergency in the market. The Board considered this request and declared, on 10th February, that a state of emergency existed in the market. The Board also decided to impose a margin on every rise of Rs. 7 in silver and Rs. 4 in gold over the basic rates. It further decided to double the amount of margin from Rs. 500 per bar of silver to Rs. 1,000. But when the former decision of the Board was placed before the General Body of the Association on 13th February, it was not ratified, as it failed to secure the support of the minimum number of members required under the rules. The latter decision was not given effect to, as legal opinion was not in its favour. The Board accordingly decided not to take any action for the time being.

A section of the traders, however, refused to transact business as a protest against the Board's decision not to enforce its earlier proposal to levy a margin on every rise of Rs. 7 per 100 tolas in silver and Rs. 4 per tola of gold over the basic rates. There was, therefore, a deadlock in the market for a few days in the last week of February. Within a few days, however, the deadlock was resolved, thanks to the compromise brought about by the Board between the two sections of traders. Under the compromise terms, the opposite parties agreed to square up their outstanding positions in the then current settlement at Rs 168. Those who wish to carry over their contracts to the next settlement were permitted to do so at a carry forward charge of not more than Rs. 2.

Consequent on the aforesaid developments, the Board sought more powers to meet any possible "emergency" in the next settlement. It also proposed certain amendments to the by-laws governing the levy of margins and delivery and forwarded them to the Bombay Government. But the State Government asked the Board to place the amendments before the General Body of the Association so as to know the consensus of opinion of the members before giving its approval. At the extraordinary General Body meeting held on 25th March, the members did not ratify the proposed amendments.

Penalty for Non-delivery

Early in the month of September, the Board of the Bullion Association made a move to amend the by-law (No. 141) with a view to restricting the penalty for non-delivery of bars by sellers at the time of settlement. On 19th September, the Board decided to amend the said by-law and the proposed amendment stated: (*a*) when a seller defaulted to deliver goods in terms of his delivery order, he shall pay damages to be determined by an auction and (*b*) under no circumstances his damages would be higher than Rs. 3-8 per 100 tolas in the case of silver and Rs. 2 per tola in gold over the rate of current settlement prevailing on the auction day.

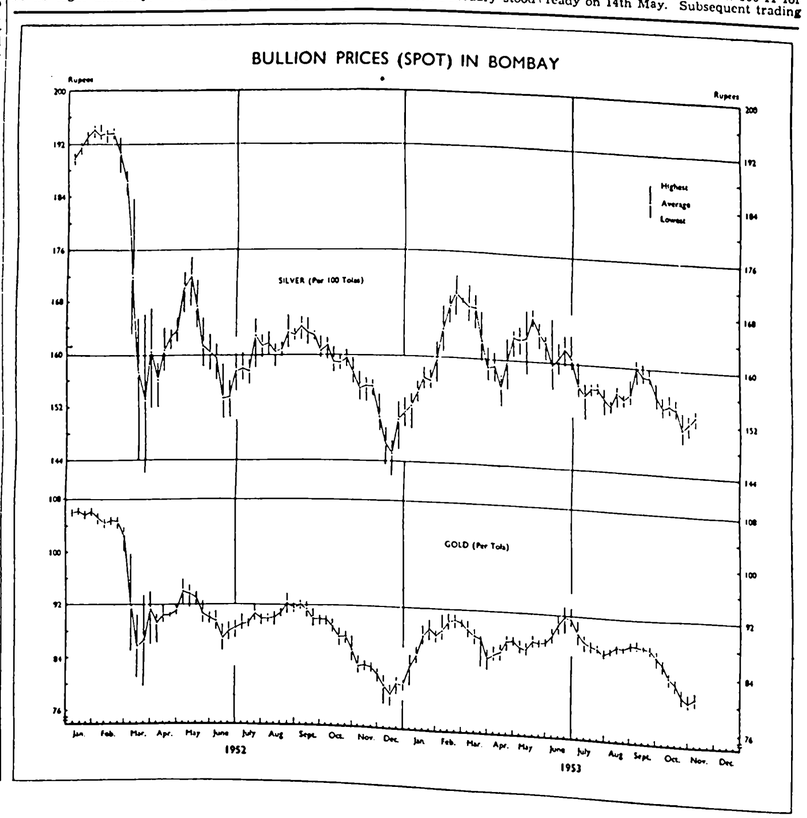
The above amendment to the by-law was opposed by a section of the traders which was of the opinion that it would unduly encourage speculators to indulge in short-sales and would restrict the penalty payable by him, if he failed to give delivery of the goods he had sold. In view of the controversy that had arisen over the legality of the proposed change in the by-law, the Board decided to take legal opinion before placing the proposal before the General Body. Accordingly, a questionnaire was prepared by two solicitors to be placed before the Advocate-General of Bombay. When the questionnaire was submitted to the Advocate-General, he gave the opinion that, if the amended by-laws was properly made, there would be no legal difficulty. The Board met again and drafted three alternative proposals for fixing the penalty, instead of one as decided by it earlier. The first proposal was to fix the penalty over the rate for the current settlement prevailing on the day of auction. The second was to fix it over the delivery rate fixed by the Board; and the third was to fix it on the highest rate touched during the settlement to which the auction related. No further move was, however, made by the Board in arriving at a decision. In the last week of November, in response to a request made by about 50 members, the Government of Bombay called upon the Board to take a decision whether it intended to amend the by-law or not and submit its decision to the Government before 5th December. On 26th November, the Board decided to place the proposals before a conference of the Advocate-General and legal advisers of the Association. In the meantime, about 75 members sent a joint note to the Board stating that there was no need for amending the by-law. The Advocate-General was of the view that all the three proposals were legally valid. The Board, therefore, convened an informal meeting of the members to elicit their opinion before taking a decision and submitting the same to the Government. This meeting was held on 3th December, at which the majority of members were in favour of fixing the penalty over the highest rate touched during the settlement. Subsequently, the Board decided to fix the penalty at Rs. 2 per 100 tolas in the case of silver and Re. 1 per tola in the case of gold. This decision has been submitted to the Government for its consideration and the latter's decision is not known at the time of writing.

Silver

The upward trend in silver noted towards the close of December, 1952, gathered momentum during January, 1953, the bullish fervour having been sustained by the improvement in offtake, higher advices from upcountry centres, spurt in the price of silver in New York and London and the strength of gold. Consequently, silver for forward delivery advanced from the previous year's closing of Rs. 151-11 to a high of Rs. 160-14 on 31st January. In the New York market, the price of foreign silver, which had remained at 83¼ cents per fine ounce since 24th July, 1952, rose to 83¾ cents on 13th January and, successively, to 84¼ cents on the 14th, 84¾ cents on the 15th and 85¼ cents on the 16th. The rise was attributed to the unexpectedly strong demand for silver for that part of the year, while supplies were very limited. Hectic bull activity, coupled with frantic bear covering, pushed up the prices further during the month of February. When the closing price on 4th February stood at Rs. 163-6, the automatic margin system came into operation under by-law 33-c (1) (*a*) and a margin of Rs. 500 per bar was imposed on all outstanding purchases. But this did not check the advance in price which touched a high of Rs. 167-13 on 9th February. In response to the request of some members, the Board of the Bullion Association declared a state of emergency, as already stated, but the general body of the Association did not confirm it. After a short-lived recession to Rs. 164-2 (forward) and Rs. 165-2 (ready) on the 13th, prices resumed their upward trend and came up to Rs. 170-12 for forward delivery and Rs. 171-12 for ready on the 19th—these rates were the peak for the year. The sustained rise in prices was due to (1) general upward trend in all commodity markets, (2) firmer advices from upcountry centres, (3) good demand in the ready position, and (4) development in the international political situation. The persistent spiralling up of prices caused a flutter in the market and forward trading remained suspended from 20th to 25th February, on account of the refusal of some traders to transact business as a protest against the Board's decision not to enforce its earlier proposal to collect margin on every rise of Rs. 7. Following the compromise effected between the two sections of traders, as stated earlier, prices reacted to Rs. 167 (forward) and Rs. 168 (ready) on 27th February.

In March there was a distinct fall in bullion values, forward and ready silver both coming down to a low of Rs. 156-2 on 26th March, consequent on selling pressure induced by the bearish view which the market seemed to have taken in regard to the amendments to the by-laws proposed by the Board. Following the rejection of the amendments by the General Body of the Association on the 26th March, there was a mild revival to Rs. 159-13 for forward as well as ready on the 30th. This revival was short-lived and the white metal suffered a setback early in April, the forward and ready quotations touching Rs. 151-11 on 6th April, the result of bull liquidation induced by the improved prospects of peace in Korea and the weakness of other commodity markets. A distinctly firm tone soon emerged, mainly on revival of bull support based on the then prevailing statistical position and reports of improved tone in the other commodity markets; forward silver rebounded to Rs. 163-8 and ready to Rs. 163-10 on 21st April.

After moving narrowly for a few days, recrudescence of strong bull support, based mainly on the tight statistical position, lifted up the price to Rs. 166-7 for forward and Rs. 166-11 for ready on 14th May. Subsequent trading



was characterised by a keen tussle between the bulls and bears and in this process they even changed their natural roles. Thus while, on the one hand, bull operators attempted to keep down prices to avoid payment of margins, in terms of by-law 33-d (1) (*a*) (i), on the other, they tried to extract as heavy a carry forward charge as possible from the bears by keeping the daily closing rate well below the basic rate for the current settlement. The bears, on their part, tried to place the bulls in the difficult position of having to pay heavy margin not only by sitting tight on their forward sales, but also by pushing up the daily closing rate above the basic rate through purchases in the ready position. However, in trying to outwit each other, both the bulls and the bears had to pay heavy margins, though the bulls succeeded in extracting a carry forward charge of as much as about Rs. 7 per 100 tolas (a record in living memory). On 30th May, the rates declined to close at Rs. 163-7 for forward delivery in May settement and at Rs. 157-3 for the June settlement. As the May settlement rate on that day was above the official starting rate of Rs. 162-10 and as the closing rate for the June settlement was more than Rs. 3 above the May settlement, the bulls had to pay a margin of Rs. 1,000 per bar on their outstanding purchases, in terms of by-law 33-d (1) (*a*) (i). This was not all. They had to pay a margin of Rs. 300 on their outstanding sales in June settlement also under by-law 33-c (i) b. This they had to do, because they were short in that settlement. The closing rate on 30th May for that settlement was more than Rs. 7 below the starting rate for that settlement. Under the same by-law, the bears also had to pay a similar margin.

Bears Pay Margin

The month of June witnessed a downward trend. After an initial recession, attributed mainly to the weakness in cotton, prices managed to move both ways, but the underlying trend was distinctly downwards. Towards the close, a sharp break was experienced on heavy liquidation by bulls induced by apprehensions about prospects of a decline in offtake in the next few months. Consequently, forward silver declined to Rs. 153-9 and ready to Rs. 153-11 on 30th June. As the forward closing rate on 29th June (at Rs. 155-5) was more than Rs. 7 below the official starting rate of Rs. 164-4 for June settlement, the bears had to pay a margin of Rs. 500 per bar on their outstanding sales. The slackening of the demand for silver in July and reports of large arrivals kept down the prices low throughout the month, the closing rate for the month being Rs. 150-7 for forward and Rs. 152-5 for ready. A feature of the trading towards the close of that month was a sharp rise in carry-over charges to as much as Rs. 4-6, on 28th July, against the bears.

During the major part of August, trading was featureless and turnover was restricted. But towards the close, activity revived following the introduction of the Estate Duty Bill in Parliament on 24th August. The bullish sentiment was assisted by the improved demand in the ready position and prospects of better offtake during the busy season, in view of the expectations of good harvest. Consequently, the price spurted to Rs. 157-6 for forward delivery and Rs. 159-10 for ready on 29th August. Sentiment of operators was affected during the first half of September by uncertainties over the proposal before the Board of the Bullion Association to amend by-law 141, with a view to limiting the penalty for non-delivery at the time of settlement. Subsequently, when the Board passed a resolution to this effect on 18th September, a sharp decline in price occurred, as operators were of the view that the amendment favoured the bears. This sentiment was further assisted by reports of large arrivals and weakness of the other commodity markets. Silver for forward and ready deliveries, therefore, slumped to Rs. 151-4 on 30th September.

After an initial rise to Rs. 154-12 for both forward and ready deliveries on 9th October, on expectations that the Board's resolution to restrict the penalty for non-delivery at the time of settlement would not be put into effect in the near future, silver reacted by stages to Rs. 147-6 (forward and ready), the lowest levels, for the year, on 21st October, due to the weakness of gold and continued slackness in demand. Towards the close of the month, there was a recovery to Rs. 152 for forward and Rs. 152-2 for ready on revival of bull support and short-covering. Trading in the month of November was featureless, values fluctuating within a narrow range due to uncertainties about the coming into effect of the Board's proposal to restrict the penalty for non-delivery. After moving between Rs. 150-11 and Rs. 154-6, ready and forward silver finished the month at Rs. 152-3. Thereafter there was a decline to Rs. 149-8 for forward delivery and Rs. 149-14 for ready on 2nd December, and at the time of writing (12th December) forward price is standing at Rs. 151 and ready at Rs. 151-4.

Gold

In consonance with the rise in silver during the month of January, gold also depicted a bullish trend in the opening month of the year, sustained by the decision of the French Government not to allow foreign exchange for import of gold. Despite occasional setbacks, the yellow metal had firmed up from the previous year's closing of Rs. 82-11 (forward) and Rs. 83-6 (ready) to Rs. 88-9 and Rs. 90-1, respectively, by 20th January. The undertone continued to remain firm up to the end of February, notwithstanding the emergency in silver and the suspension of forward trading from 20th to 25th February. This was attributed to the good offtake in the ready position, reports of decline in arrivals of smuggled gold, upward trend in commodity prices and developments in the international political situation. At the close of February, forward gold stood at Rs. 89-14 and ready at Rs. 90-3.

The bullish trend was reversed in the month of March on reports of larger arrivals and absence of sufficient offtake to balance the arrivals. Further, there was selling pressure, induced by the bearish view taken in regard to the proposed amendment to the by-laws of the Association. Prices, therefore, reacted to a low of Rs. 83-9 for both forward and ready deliveries. There was, however, a revival of bull support and the Select Committee's report on the Estate Duty Bill further aided bullish sentiment. Despite occasional profit-taking, successive higher levels were established in the months of April, May and June, forward gold touching the year's highest level of Rs. 91-8 on 22nd June and ready gold Rs. 93-10 on 16th June. The rise was more marked during the major part of June, due to speculative suppor: based mainly on (1) the improvement in offtake, (2) slackening of arrivals due to monsoon, and (3) suspension of operations in Kolar Gold Fields on account of stoppage of power supply. Although towards the close of the month of June, there was a minor recession from the peak levels touched earlier, there was a widening of carry-over charges to Rs. 3-4 on 29th June. As the forward rate at the close of the day was higher than the official starting rate and the carry-over charges was more than Re. 1-8, the automatic margin system, in terms of by-law 33-d (1) (*c*) (i), was enforced, requiring a margin of Rs. 14 per tola to be paid on all outstanding purchases.

Reversal of Trend

The month of July witnessed a reaction due to a slackening of demand, larger arrivals and the weakening of gold prices in Hongkong following the Korean truce agreement. Prices dropped to Rs. 84-12 for forward and Rs. 86 for ready on 27th July. During the major part of August, activity was restricted, but the undertone remained steady. Towards the close, the turnover broadened a little following the introduction of the Estate Duty Bill in Parliament. Forward gold came up to Rs. 88-12 and ready to Rs. 88-4 on 29th August. This sentiment was not sustained in September. Following the bearish interpretation given to the Board's decision to fix the penalty at Rs. 2 per tola over the current settlement for non-delivery of goods and reports of weakness of commodities, prices declined to Rs. 84-2 for forward and Rs. 85-4 for ready on 28th September.

The downward movement gathered momentum in October and the undertone was weak. The main bearish factors which affected the sentiment were (1) reports of large arrivals, including smuggled gold, (2) slackness in offtake, (3) rumours (since officially denied) about the possibility of the Reserve Bank selling gold, in order to check smuggling of gold into India, and (4) fall in price of gold in the free markets of the world, particularly in Paris. The fall was more pronounced in the latter half of the month. On 19th October, when the closing rate for forward delivery stood at Rs. 81-5, it was more than Rs. 5 below the official starting rate for the then current settlement. The automatic margin system, in terms of by-law 33-c (i) (*b*), under which bears had to pay a margin of Rs. 7 per tola on all outstanding sales, was, therefore, enforced. But this did not check the downward trend and prices slumped to Rs. 79-1 (forward) and Rs. 79-7 (ready), the lowest levels for the year, on 26th October. There was a smart recovery from this level to Rs. 84-5 (forward) and Rs. 84-9 (ready) on 19th November induced by good offtake and decline in arrivals, thanks to the vigilance of the Customs authorities. Subsequently, there was again a marking down in values due to paucity of demand from other contres and larger arrivals in Bombay. At the close of November, forward gold stood at Rs. 82 and ready at Rs. 82-5. At the time of writing, they stand at Rs. 80-2 and Rs. 80-4, respectively.

BUOYANT CONDITIONS IN TEA

PROSPECTS FOR 1953-54 PROMISING

CALCUTTA, 8*th December*

IN complete contrast to 1952, which experienced the greatest slump that the tea industry has ever known, 1953 has been a unique year. Prices started improving from the very first sale in January and advanced each week, until, by the end of the selling season in April, teas were selling at levels which were comparable to those ruling in December, 1951. The opening sales of the new season in June maintained the same strength and prices improved further with improving quality. By the end of 1953, prices of common and low medium descriptions of tea stood almost as high as they have ever been and general price average was as good as in the early part of 1951.

The recovery from the slump was as quick and unexpected as the fall in prices during the previous year. Before considering the reasons for this radical improvement, let us look into the causes of the slump of 1952. The early months of the season 1952 produced heavy flushes and, by the end of July, 1952, the comparative North Indian crop was 42½ million lbs. in excess of 1951, which was a record crop year in the history of North India.

Indonesia, which was left devastated by the war, returned into production and, by the beginning of 1952, shipments from that country to outmarkets offered serious competition, especially to the low-grown varieties of teas both from India and Ceylon. It appeared at this stage that the world markets by the end of 1952 were going to be flooded with tea and overseas buyers were led into a false sense of overproduction.

The Slump

On the other hand, the deterioning of tea in the U.K., by far the most important buyer of Indian tea, did not bring about the increase in demand which many had anticipated. Buying from the U.K. in the second half of 1952 fell considerably, while old stocks which had been built up by the wholesalers before deratioining were being used up. As a result, prices started falling and by December, 1952, reached levels which were much below the cost of production. Tea became difficult of sale for the first time since the war and nearly half the quantity on offer was withdrawn each week from the auction sales in Calcutta in the last few months of 1952. This led to the closure of a number of gardens, particularly in the Cachar and Darjeeling Districts, which were the most hard hit. A general restriction in plucking and attainment of higher quality standards were aimed at by all gardens and, by the end of 1952, the North Indian crop had been brought down to 507 million pounds, nearly 3 million pounds short of 1951. There was also a shortfall of 20 million pounds in the Indonesian crop. This altered the supply position considerably from what it appeared to be mid-season and buyers were suddenly faced with a possible world shortage. Large quantities of teas, sold at fantastically low prices in the last months of 1952, were used up in India and in shipments to some of the Middle Eastern countries and buyers found their stocks largely depleted in the early months of 1953 and had to resume free buying to make up their requirements.

Prices Harden

From January, 1953, the market went from strength to strength and, within three months, common teas had advanced by nearly a rupee. The extent of the recovery can be seen from the following quotations for clean, common broken pekoe on the Calcutta market:

(Per lb.)

	1952	1953
	Rs. a. p.	Rs. a. p.
March	1 1 6	1 11 0
June	0 15 0	1 11 0
September ..	0 12 0	1 12 0
December ..	0 13 0	1 12 6*

* Mid-November.

The producers in North India, after the experience of 1952, decided to enforce a scheme of voluntary regulation of crops. It was at first intended to restrict the crop by 12½ per cent. of the best crop year of each garden, bringing down the North Indian production by some 50 million lbs. Later, however, with the strengthening of the market, the restriction was eased to 10 per cent. with the expected cut in crop to amount to some 40 million lbs. less than the best crop-year.

The weather was unfavourable for growing in most districts in North India and with the reduction in the manure programme, the crop by the end of October, 1953, stood nearly 21½ million lbs. under the 1952 figure. This deficit is unlikely to be made up and the North Indian crop might well fall short by 15 million lbs. or even more.

Exports to U.K. Higher

Shipments during 1953 have shown an all-round advance over 1951 as well as 1952, the increase in the shipments to the U.K. being the heaviest. At the time of writing, shipments to the U.K. are 30 to 50 million lbs. in excess of 1952 and 1951, respectively. With the present low stocks in the U.K., this trend of heavy shipments to the U.K. is likely to continue. Shipments to Egypt shot up considerably owing to the easier availability of exchange with India, as compared to Ceylon, and large orders were also received from Eire during the last few months of 1953. Shipments to the American Continent, though a little under 1952, were considerably ahead of 1951. With the new propaganda drive sponsored by the Government of India in conjunction with the other producing countries and the Tea Buyers' Association of the U.S.A., it is expected that the offtake from these markets should increase in the coming months. With the improvement in the political situation in Iran, there is a possibility of the resumption of exports to this country from early in 1954.

Although the permissible figure according to the International Tea Agreement was 135 per cent. of the standard export figure, the Government of India made an initial release of 115 per cent. only, with a view to strengthening the export market. A further release of 7 per cent. was, however, made later, owing to the continued strong export demand and general scarcity of export quotas.

New Tea Board

During the year, the Tea Bill was passed by the Indian Parliament under which the Central Tea Board is to be wound up and a new Tea Board is to be set up. This Board is to be composed of representatives of the trade and nominees from various States and the Central Government and will have wide powers for regulation and promotion of the tea trade.

To provide relief to the producers after the slump, alterations in the rates of excise duty were announced by the Government during April. Duty payable by the estates was reduced from 3 annas to 1 anna per pound, but an additional duty of 3 annas was levied on "package tea" defined as any unit containing less than 60 lbs. net tea, payable by blenders and packers at the time of clearance. Tea sold loose or in packages of over 60 lbs. was to be exempt from this duty. The ratio of dutiable teas to non-dutiable being about 60-40, the loss on revenue to the Government on reduction in excise duty payable by estates was fully expected to be made up by the new duty to be borne by blenders and packers.

Tea share prices, in sympathy with the tremendous recovery in the tea market, improved considerably during 1953, and many scrips were selling between 25 and 50 per cent. over 1952. Consistent and active interest was shown by the buyers in tea shares right through the year and, with the prospects of a profitable season, current price levels are likely to be maintained.

Prospects Good

Prospects for the remaining part of the season 1953-54 are very good; although Ceylon and South India are expected to harvest slightly bigger crops than during the previous season, with the shortfall in North Indian crop, the aggregate world production of black tea is likely to be much the same as in 1952. Both the U.K. and Indian markets are considerably short of tea and a fairly high price level is anticipated for the rest of the season.

During 1954, producers will have to watch the situation carefully—crops will have to be regulated and efforts made to improve further the quality of North Indian teas, so that our position on the world markets remains competitive. Our greatest insurance is in the development and expansion of the home market and it is important that a concentrated internal propaganda drive is initiated by the Central Tea Board or the new Tea Board when it is formed. The export markets are to be maintained and expanded, but the absorption of surplus tea in India should provide the producers with an economic price for their export teas for a number of years to come. The expansion of the home market would also stand us in good stead in later years when competition from new tea-growing countries, such as East Africa, becomes intense.

SMOOTH TRADING IN COTTON

VALUES REMARKABLY STEADY DESPITE LARGE SUPPLY

BOMBAY, 21*st December*

THE forward cotton market has just completed one full year of successful operation, since the three-year-old inactivity was ended on 12th December, 1952, after protracted negotiations with the Government and several weeks' labour spent in hammering into shape the details of the regulations which should govern the trade in cotton futures. Although the market may congratulate itself on this score, there is no doubt that there have been some occasions during the year, when it was in the grip of speculative operators, who made successful attempts at manipulating prices, so that many observers were constrained to point out that forward trading had lost touch with the ready market. There was, however, no occasion when conditions deteriorated so far as to invite official intervention.

The enthusiasm of the cotton operators knew no bounds when future trading was opened on 12th December, 1952, for the I.C.C. February and May contracts experienced a rapid rise within the first week of the inauguration of the trading. Thus, February contract opened at Rs. 621 and, within less than a week, moved up to touch a high of Rs. 666; the May contract, which opened at Rs. 625, touched Rs. 674. The President of the East India Cotton Association was, therefore, compelled to issue a warning against the creation of conditions that would be detrimental to the smooth working of the forward market. This had a salutary effect and the February and May contracts declined gradually to touch Rs. 633½ and Rs. 642½ towards the end of January, 1953. In the following month, there was some improvement, thanks to speculative buying, so that the February contract was rung out of the trading ring at Rs. 665½, the number of bales tendered against the contract being 6,800.

Trading in August delivery commenced in February this year at Rs. 653½. Both May and August contracts derived some strength from the relaxation of distribution controls on textiles in March this year. May contract touch a high of Rs. 714½ and August contract a high of Rs. 725½ on 18th March, before closing the first quarter of the year at Rs. 690 and Rs. 701½, respectively. The spot market ruled firm during this period, with M.G. Jarilla fine moving up to Rs. 703, Vijay to Rs. 796 and Surti to Rs. 871.

Downward Trend

In the second quarter of the year, there was a sharp downward trend in cotton, which was more remarkable because the earlier part of the quarter had witnessed very high levels. Thus, in May, 1953, I.C.C. May touched a high of Rs. 738 and August contract a high of Rs. 744. The May contract faded out of the market at Rs. 730½, the tenders against the contract being only 2,450 bales. The high levels touched by the August contract attracted selling, so that, in the latter part of May and in the following month, there was a declining trend. This trend was assisted by renewed rumours of the devaluation of the Pakistani rupee and prospects of cotton arrivals from that country. In June, yet another bearish influence was exercised by favourable weather report. The August contract, therefore, slumped to a low of Rs. 660 towards the close of June, 1953. But the spot market was relatively firm, so that many shrewed market observers were constrained to remark that the hedge contract had become divorced from the spot market. Although the forward market has lost the confidence of operators, the spot market was steady over the second quarter of the year. Thus, M.G. Jarilla was quoted at the close of the second quarter at Rs. 690, Vijay at Rs. 800 and Surti at Rs. 850; these rates were practically the same as those quoted at the beginning of this quarter.

Trend Upward Again

The first two months of the second half of the current calendar year witnessed a sizable improvement in cotton prices. This applies particularly to the August, 1953 contract. The August contract moved up, in July, 1953, from Rs. 673½ to Rs. 710½, and still further to Rs. 735½ on 22nd August, before it was rung out at Rs. 731. An interesting feature of the trend of prices of this contract is that the bulls continued to maintain their grip over the contract till the last, despite the fact that tenders amounting to as many as 110,250 bales were submitted against it.

But the February, 1954 contract, it must be mentioned here, did not experience such buoyant conditions as the August 1953 contract. Thus the February, 1954 delivery opened at Rs. 665½ on 17th July, 1953, and moved up to touch a high of Rs. 677½ on 30th July. Thereafter, there was a setback, which caused it to decline to Rs. 638 towards the end of August. It is interesting to note that, when the February 1954 contract opened, it was quoted at a discount of about Rs. 8 under the August, 1953 contract. But this spread had widened to as much as Rs. 87 at the time of the running out of the August contract. This reflected the disinclination of the operators to commit themselves in the distant position (February, 1954 contract); in this, they were influenced by the optimistic estimates for new crop, although they could and did hold the price of the nearby position (August, 1953 contract) at a high level. In fact, on 5th September, 1953, when the trading in May, 1954 contract commenced it was also quoted at Rs. 635 or at a discount of about Rs. 3 under the February contract. This spread was very nearly maintained throughout September, towards the close of which the February, 1954 and May, 1954 contracts were quoted at Rs. 608½ and Rs. 611½, respectively. The spot market continued to rule firm, M.G. Jarilla moving up by Rs. 40 over the third quarter of the current calendar year to Rs. 731, Vijay by Rs. 77 to Rs. 877 and Bengal by Rs. 25 to Rs. 565.

The Last Quarter

Since October, the major influences have been the performance of the piece-goods markets, the Government's measures of relief for the textile industry and fluctuating crop ideas. It became known even in September that the mills were facing the problem of accumulated stocks of cloth. This induced a slight downward trend in cotton. The cotton market derived some comfort from the Government's measures (announced in October) of relief for the textile industry, which included the abolition of the export duty on medium cloth. That these measures were, on the whole, inadequate is clear from the fact that the cotton market did not record any great improvement. This is because exports constitute only a small part of the total production. The small reduction in excise duty on superfine cloth also made no impression on the market, because this applies mostly only to the cloth manufactured from imported cotton.

Although the gradual improvement in the piecegoods markets in October and November was well received by the market, the dominant influence was the new crop outlook. At one time, it was widely believed that the new crop would be of the order of 42 lakh bales. Small wonder then that the February and May contracts were quietly steady in October, this year, over the month, the net improvement was only Rs. 3, the former contract closing the month at Rs. 615 and the latter at Rs. 620½. But, in November, crop ideas underwent a downward revision, so that strong bull support for the contracts asserted itself, carrying the February and May contracts to a high of Rs. 659 and Rs. 660 respectively in the last week of November. The upward trend continued in the first half of December with I.C.C. February and May touching a high level of Rs. 699 and Rs. 692, respectively. Thereafter, there was some profit-taking the closing rate at the time of writing being Rs. 672 and Rs. 670. The undertone of the market, however, was steady.

New York Market

Narrow fluctuations in prices, increased movement of cotton into the hands of the Commodity Credit Corporation (C.C.C.) and fall in exports were the distinguishing features of the cotton economy in the U.S. during the year under review. Even early in the year, it became clear that the restrictions on crop output would become inevitable as the season advanced. The authorities were themselves so nervous about the outlook for cotton that they advised cotton farmers to cut down the acreage under cotton. These fears have been justified by events, for the decline in export trade and the consequent fall in prices have compelled the U.S. farmers, at the referendum held on 15th December, 1953, to vote for a reduction in cotton acreage for the 1954-55 season.

The New York cotton market opened the year with a hesitant tone. Exports of cotton had fallen to a low figure. They were no more than 1.8 million bales for the six months ended January, 1953 or less than 50 per cent. of the exports during the same period in the year 1951-52. Before the end of January, 1953, the March, 1953, delivery lost nearly 40 points to stand at 33.35 cents per lb. This trend continued in the following month, too, so that, at the end of February the March delivery lost 17 points to close the month at 33.08 cents. The distant positions, such as October, were relatively less affected, and the fluctuations were held within narrow limits. In March, all positions suffered a decline, thanks to continuing low export demand, reports of favourable weather in the cotton belt, and poor offtake in spot market. At the end of the first quarter, the May position came to be quoted at 33.28 cents, as against 34.14 cents in the beginning of the year, July at 33.34 cents as against 34.54 cents. In the second quarter, too the market was characterised by narrow fluctuations. Although the reports of unfavourable weather conditions, particularly in the Eastern and Central cotton belts, were interpreted as bullish factors, the continued slackness on the export front and in the cloth market was not calculated to improve sentiment. The July delivery declined over the second quarter by nearly 60 points to stand at 33.16 cents. Small gains were, however, recorded by the relatively distant positions, the October and December deliveries gaining 16 and 35 points to 33.79 cents and 33.96 cents, respectively.

Crop Reports

The second half of the current calendar year was, as usual, dominated by the series of crop reports that come through at this period of the year. As each crop estimate began to exceed the previous one, the market came to be more and more depressed. The estimates of the current season, crop made in August, September, October, November and December, were, respectively, 14.6 million bales, 15.16 million, 15.60 million, 16.09 million and 16.43 million bales. If, in spite of the progressive increase in crop estimates, the market was not completely demoralised, it was because the system of price support which prevails in the U.S. does not permit values to dip below the levels related to the support price. It is, however, noteworthy that the price trend has shown no signs of improvement, despite the fact that entries into the loan have rapidly mounted and are estimated at as high as four million bales. Thus, the December delivery, which stood at 34.01 cents at the end of July, moved down to as low as 32.97 cents at the end of September, though it was slightly higher at 33.01 cents when it went off the Board. The other contracts are quietly steady, with March, May, July and October positions being quoted at 33.00 cents, 33.23 cents, 32.98 cents and 32.46 cents respectively.

Uncertainties

The New York market is closing the year with uncertainties about the future. It is not clear, for instance, how the Government proposes to dispose of the large stocks it holds. Exports continue to be at a low level. The Government has, on its part, ruled out export subsidies. But an effort is being made to stimulate foreign offtake through a programme under which the buying countries are permitted to pay for the cotton in their own national currencies. One thing, it is known that the supply this season is substantially large, especially when it is seen against the reduced prospects for exports. During 1952-53, the supply was about 18.1 million bales (of 500 lbs. each) consisting of 2.8 million bales of carry-over cotton and production of about 15.2 million bales. Exports were only 3.2 million bales, as against 5.5 million bales in the previous season, while domestic consumption was about 9.4 million bales. All this left nearly 5½ million bales to be carried into the current season. Since production for the current season is placed at 16.4 million bales the U.S. is assured of a supply of between 20 and 21 million bales, against prospective disappearance of between 12 and 14 million bales (inclusive of probable exports of about 3½ million bales). Thus, the current season is bound to end with a record carry-over of some eight million bales.

Against this background, even the decision to restrict the 1954 cotton output (which will influence the supply in the 1954-55 season) to 10 million bales taken at the national referendum, in December, 1953, will fail to give the market a favourable turn. Only, the Government is now committed, in view of the farmers' favourable vote, to support the crop next year at 90 per cent. of the parity. Adverse voting would have meant the support price being lowered to 50 per cent. The acreage allotment, which will now follow this referendum, envisages 17.9 million acres under cotton. Although this measure will reduce the supply of cotton in the 1954-55 season, it would still be high enough at 18 million bales (about eight million bales of carry-over stocks and production of 10 million bales).

Pakistan Market

The Pakistan cotton market opened the year under review with heavy stocks, estimated at over 3 lakh bales. There was insufficient foreign demand to absorb increased offerings. The Pakistan Government was compelled on 9th January to exempt the then old crop cotton (1950-51 crop cotton) from export duty, and the duty in respect of certain qualities, which had been rejected by the Cotton Board, was reduced to Rs. 60 per bale. The export duty on the 1952-53 crop cotton was, however, kept unchanged at Rs. 90 per bale. Despite these measures, there was no great improvement in offtake. In the second week of January, the Karachi cotton market witnessed a debacle, the N.T. (roller ginned) touching the lowest level (Rs. 55 per maund) since the time of the Government's non-devaluation decision. The Government saw that drastic action was necessary in order to stem the rot which had set in. Accordingly, it prohibited, with effect from 22nd January, 1953, the export of cotton below certain fixed prices which were Rs. 56, for 4F, Rs. 58 L.S.S. and N.T. and Rs. 61 289F, all for roller ginned, with a premium of Rs 3 for S.G. varieties. The Government also decided to permit private barter deals of cotton against certain specified goods from other countries. These measures, coupled with some offtake by the U.K., Belgium, Germany and Italy, imparted a steady tone to the market, so that N.T. Rg., for instance, improved towards the end of the first quarter to Rs. 61.

Agreement with Japan

This tone improved further in the subsequent months, thanks principally to the good demand for cotton from Japan, Australia and China. Sind N.T. came to be quoted at as much as Rs. 67-69 towards the end of June. With slight variations, prices were well held in the quarter ended September, 1953. A factor which contributed greatly to this improvement in sentiment was the conclusion, in April, 1953, of the Pak-Japan trade agreement. The agreement stipulated the purchase by Japan of 650,000 bales of Pakistan cotton in exchange for 80 million square yards of Japanese fabrics. Japan agreed to buy its cotton requirements during each of the four quarters ending March, 1954, at the rate of 150,000 bales, 100,000 bales, 275,000 bales and 125,000 bales, respectively. Although the implementation of this agreement has been hampered by the non-availability of sterling on the Japanese side and by the alleged inadequacy of import licences for cloth on the Pakistani side, Japan has, during the 1952-53 season, been the most important customer for Pakistani cotton. Total exports of cotton by Pakistan amounted to 1.64 million bales in the 1952-53 season, as against 1.24 million bales in the previous season. The share of the U.K. in the total exports of Pakistan cotton improved from 86,827 bales to 138,907 bales, of Continental countries from 286,223 bales to 419,596 bales and of Japan from 299,068 to 700,655 bales. Since the cotton supply in Pakistan in the 1952-53 season is estimated at 1.9 million bales —400 lbs. bales—(inclusive of a carry-over of about 0.5 million bales), the exports at 1.6 million bales and mills consumption at between 0.3 and 0.4 million bales, leave the carry-over of cotton at the end of the 1952-53 season at about 300,000 bales. The output of cotton in the 1953-54 season crop has been estimated at about 1.6 million bales, which would give an overall supply of 1.9 million bales again for the current season, or nearly the same as the supply in the last season.

Trading in new crop cotton was permitted with effect from 8th August, 1953. Although new crop cotton prices ruled firm in the beginning, there has been a setback, following some lull in export activity. Thus, N.T. Rg. was quoted at as high as Rs. 72 at the time the Government granted permission for trading in the current season's crop. The future trend of prices will depend, among other factors, on the way in which the U.S. will dispose of its surplus cotton. If the U.S. chooses to market its cotton against the currencies of the consuming countries, Pakistan's exports are bound to be affected. The Pakistan Government has, however, made no change in its export policy. Thus, the schedule of the minimum export prices for the current season is the same as that fixed for the last season. The only notable change is that an export duty at the rate of Rs. 60 per bale on Bengals and Comillas has been re-imposed. A noteworthy factor in Pakistan's cotton situation is the increase in domestic consumption of cotton; it was a little over one lakh bales in the eve of Partition, but is now estimated at four lakh bales for the current season. Thus, Pakistan is developing an internal market for cotton which ought to act as a stabilising force in the economy of this commodity.

Alexandria Market

The recent history of the Alexandria market is a tale of frequent—and often unwise—official interventions. A whole series of such measures culminated in the closure of the market on 23rd November, 1952. The market continues to remain closed and official sources have denied all recent rumours that the market would be re-opened this season. Thus, the cotton prices continue to be controlled at levels which are based upon the New York market. The Government fixed, in November, 1952, it may be recalled, the price of long-staple Karnak at 67.50 T. per cantar and of Ashmouni at 60.0 T. per cantar, at which it would buy all the cotton offered to it. It also announced that it would sell cotton to exporters at prices based on the New York Middling 15/16" spot closing rate increased by 10 per cent. for Ashmouni and 30 per cent. for Karnak.

Barter Deals

In February 1953, the Government further announced that it would permit payment for the Egyptian cotton purchased by other countries in terms of 25 per cent. in dollars and 75 per cent. in Egyptian pounds. Exporters were free to utilise the sterling proceeds of their sales in any manner they chose. This concession has been an important factor in stimulating the export trade in cotton. Because sterling commands a premium in the Egyptian market, the exporters utilise the premium so obtained in order to reduce their selling prices for cotton. The result has been that the prices quoted by Egyptian exporters have often fluctuated in accordance with the premium rates fetched by sterling from time to time. In its cotton policy, the Government has not, however, relied entirely upon this currency device. Several barter deals and trade agreements have been concluded with a number of countries, including India (to which reference has been made already). The Government-sponsored trade missions have gone forth to many leading consuming countries in order to stimulate the offtake of Egyptian cotton.

There was some speculation in Egyptian cotton circles as to whether the authorities would be willing to re-open the market, in view of the decision of the British Government to permit the re-opening of the Liverpool futures market. But the Egyptian Cabinet has decided to continue the cotton policy "until a time when the re-opening of the Liverpool cotton market will have satisfactorily solved the problem of currency transfers." So, there is no immediate prospect of the market being re-opened. This means that, so far as the current season is concerned, the Egyptian Government will follow the last season's cotton policy of buying cotton at fixed prices and selling it to exporters at prices based upon the New York cotton market prices. The buying prices have, however, been revised for the current season. "Good" Ashmouni will be bought by the Government at 51.0 T. per cantar during December-January and at 52.0 T. per cantar from February upto the end of the season, the prices for "Good" Karnak during the respective periods are 59.0 T. and 60.0 T. per cantar. These export prices are about 9 tallarics less than those paid in the last season, a trend which is in consonance with the general fall in cotton prices in soft currency areas.

(Concluded from page 161)

taking by those who had bought in expectation of a rise in the Bank rate, the rates shrank all round. A quiet trend prevailed during the next two months and by the end of November the Conversion loan had come down to Rs. 81-15. 3 per cent. 1957 had reached a low of Rs. 98-5. 3 per cent. 1963-65, however, had managed to remain unaltered at Rs. 92-9 with no demand. The only redeeming feature was provided by the 3½ per cent. National Plan Bonds which stood at as high as Rs. 99-1 as compared with Rs. 98-5 early in July.

A distinctly better trend was in evidence in the first two weeks of December. On revival of rumours of a possible reduction in the Bank rate in India, emanating from Calcutta, Gilt-edged values staged a smart rally. 3 per cent. Conversion loan rose to stand at Rs. 82-11 on the 17th inst. from Rs. 81-15 on the last day of November. 3 per cent. 1957 improved from Rs. 98-5 to Rs. 88-5-9. 3 per cent. 1963-65 was, however, fractionally lower at Rs. 92-8. 3½ per cent. National Plan Bonds were also low at Rs. 98-15, 99-1. But the undertone as against Rs. 99-1. But the undertone of the market was fully steady, with operators remaining fully confident that the coming 12 months would witness a steady improvement in values, especially in those of the long-medium and the long-dateds.

COTTON YARN PRICES FAIRLY STABLE

ART SILK YARN STEADY

BOMBAY, 19*th December*

COTTON yarn is one of the few commodities in which stable conditions have come to prevail. An indication of this is provided by the fact that the current year witnessed a surfeit of cotton yarn supplies, thanks to the marked rise in output. There was no competition for securing requirements of yarn by handlooms, powerlooms and other industries. Values, therefore, did not register any erratic fluctuations. On the contrary, they moved within a narrow range and this was indeed in marked contrast to the violent fluctuations which yarn values witnessed in the period following the outbreak of the Korean war in June, 1950.

The Bombay cotton yarn market opened the year in a none-too-happy mood. Slackness in demand from consuming centres and notable expansion in deliveries led to accumulation of stocks, and prices drifted lower. Following, however, the export allotment granted by the Government, the market received some strength and a recovery was noticeable. This was further assisted by poor arrivals from Madras centres—most of the mills in this State are only spinning units—following substantial power cut. The average price of tendered current varieties of cotton yarn 10s improved from Rs. 12-14 at the close of last year to Rs. 13-2 per bundle of 10 lbs. as on 16th January, 1953. On this date, 20s stood at Rs. 19-12 and 40s at Rs. 27-8 per bundle of 10 lbs., as compared with Rs. 18-13 and Rs. 27, respectively, early in the year. The recovery was, however, short-lived. For in March, the State textile authorities in Bombay released about 10,000 bales of various counts held in stock by them. This had a depressing effect on the market and values staged a fall, the three different counts referred to above being quoted lower at Rs. 13, Rs. 16-9 and Rs. 26-6, respectively, on 2nd March, 1953.

The sentiment of the market improved in the subsequent weeks, thanks to scarcity of export allotments and good demand from Burma, Hongkong and Sudan. 10s rose to Rs. 14, 20s to Rs. 16-13 and 40s to Rs. 29-4 on 1st June.

A notable event that subsequently occurred in the sphere of yarn was the Government's decision—announced on 10th July, 1953—to abolish all controls over prices and distribution of yarn for the domestic market. With the decontrol, one thought that cotton yarn prices would once again soar. This, however, did not materialise. For the improvement in supplies, as a result of rise in production in Bombay mills and larger arrivals from Madras side, which followed restoration of power cut in Madras, acted as a bearish factor and cotton yarn values tended to decline. The latest available quotations at the time of writing are Rs. 14-12 for 10s, Rs. 16-15 for 20s and Rs. 25-10 for 40s.

Art Silk Yarn

The art silk yarn market presented a completely different pattern during the year under review. Not only was the depression that was in evidence during the second half of 1951 and practically the whole of 1952 arrested but the undertone of the market also improved considerably and remained more or less steady over 1953 as a whole. This behaviour of the market may at first sight appear quite surprising, in view of the appreciable improvement in supplies, due to rise in indigenous output and larger imports from overseas countries. The quantity of rayon yarn produced in the first nine months of 1953, for instance, was over 7 million lbs., which compares favourably with 5.56 million lbs. in the corresponding period of 1952. Similarly, imports of yarn during the period January-July, 1953, amounted to as much as 21.12 million lbs. valued at Rs. 7.18 crores, as against 8.15 million lbs. valued at Rs. 3.25 crores a year before. This distinct improvement in the supply position should have, in the ordinary course, depressed the market. But such did not happen for the simple reason that there were other factors which contributed towards maintaining steady conditions in the art silk yarn market during 1953. The most important among them was the upward trend in yarn prices in Italy and Japan. The prices of art silk yarn, for instance, were revised upwards twice in the course of the year by Italviscosa, one of the largest suppliers of rayon yarn on the Continent. The actual increase was to the extent of 5d. (As. 4½) for lower counts below 100 deniers and 4d. (As. 3½) for fine counts above 100 deniers. The local market responded favourably to this development, and in the absence of selling pressure, prices remained generally unaffected. Secondly, the trading in the market was also influenced by the firmness in the staple fibre yarn section, consequent on very meagre floating stocks. Besides, there was good demand from the rayon fabric manufacturing units following high level of cloth prices. These factors were responsible for a net rise in 1953 of Rs. 11 (per case of 200 lbs.) in the forward section. The rise is in striking contrast to the loss of Rs. 269 during 1952 and Rs. 629 in 1951. In the ready section, the prices of yarn registered improvement. 120D Japan rising from Rs. 4-2 to Rs. 4-5 and 150D Italy from Rs. 3-9 to Rs. 3-10. 150D Japan and 120 Italy, on the other hand, were a shade lower.

A notable feature of trading in the art silk yarn market during the year under review was the relatively smaller fluctuations in prices than those in the previous two years. The difference between the highest (Rs. 886) and the lowest (Rs. 665) levels touched in 1953 was only Rs. 221 per case of 200 lbs. in the forward section, as against Rs. 328 in 1952 (the highest and the lowest levels being Rs. 952 and Rs. 624, respectively) and Rs. 1,460 in 1951 (the highest and the lowest levels being Rs. 2,310 and Rs. 850, respectively). The difference in prices of yarn in the ready section varied from As. 11 to Re. 1-9 per lb., according to the variety of yarn, as against Re. 1-6 to Rs. 1-14 in 1952, and Rs. 6 to Rs. 6-11 in 1951.

Trend of Prices

The following table indicates the trend of prices in the art silk yarn market during 1953:

	31-12-52	*Highest*	*Lowest*	19-12-53
Forward	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
150 Deniers—(per case of 200 lbs.).	710 0 0	886 0 0	665 0 0	721 0 0
Ready				
150 D Japan (per lb.) ..	4 4	4 9	3 14	4 1
120 D Japan ..	4 2	5 3	3 15	4 5
150 D Italy ..	3 9	4 2½	3 6	3 10
120 D Italy ..	3 15	4 15	3 6	3 14

The markedly improved sentiment of operators in the market, following the fixation of floor prices for art silk yarn (as also staple fibre yarn) and imposition of a heavy margin of Rs. 250 per package on fresh rates by the Yarn Merchants' Association, Bombay, at the close of last year, continued to be in evidence in the first three weeks of this year. There were, besides, three other bullish factors, namely, (1) delay in the announcement of import policy for the January-June, 1953 period, (2) rumours regarding the possibilities of cancellation of licences to establish importers, and (3) disquieting news about deadlock in Korean peace talks. Consequently, art silk yarn prices registered a swift rise. The rising trend was not halted by the announcement of the import policy under which established traders were given a meagre quota of 10 per cent. This was too inadequate to have any disturbing influence on the trend of prices. As a result of the buying fervour which followed, the quotations for 150D April contract firmed up to touch the year's highest level of Rs. 886 on 18th March, as against Rs. 710 early in the year. In sympathy, values of ready yarn forged ahead. Thus, 120 Japan and 150 Japan touched a high of Rs. 5-1 and Rs. 4-8, as against Rs. 4-2 and Rs. 4-5, respectively. 120 Italy and 150 Italy advanced from Rs. 4 and Rs. 3-9-6 to Rs. 4 and Rs. 4-4, respectively. At higher levels, profit-taking set in and prices suffered a sharp recession which persisted till 6th April. The quotation for April contract on that day stood at Rs. 780. 120 Japan was quoted at Rs. 4-8, 150 Japan at Rs. 4-3, 120 Italy at Rs. 4 and 150 Italy at Rs. 3-15.

The sentiment of the market, however, changed for the better, following rumours of a further tightening of the import policy for the second half of this year. The buying support that ensued as a result, coupled with short-covering, led to a substantial recovery in art silk yarn values. May delivery touching Rs. 824 on 6th May. Prices in the ready section on the same date were higher at Rs. 4-7½, Rs. 4-3½, Rs. 4-3½ and Rs. 4-0½, respectively, for the various types of yarns mentioned above.

In the meantime, it was reported that the Silk and Art Silk Mills Association (S.A.S.M.A.) had entered into an agreement with the National Rayon Corporation, Bombay, for the purchase of yarn produced during the period October, 1953 to March, 1954. This report softened the tone of the market, because that meant an additional burden of goods on the market. In addition, reports that negotiations were being carried on between the representatives of Italviscosa—Italian manufacturers of rayon yarn—and the S.A.S.M.A. regarding the bulk purchase of yarn at 40d. per lb. also acted as an additional damper on the market. Art silk yarn prices, as a result, slided down. The contract receded to Rs. 750 on 25th June. 120 Japan, 150 Japan, 120 Italy and 150 Italy eased to Rs. 4-2, Rs. 3-15, Rs. 4-1 and Rs. 3-13, respectively. The above negotiations having failed to materialise, the market again put on a cheerful note and yarn prices registered impressive gains. August delivery, for instance, touched Rs. 820 on 1st August. Other varieties also scored fractional gains.

The subsequent ten weeks ended 15th October proved to be the worst period for the art silk yarn market in that they witnessed yarn prices shrinking appreciably. This was due to pressing sales induced by extremely adverse conditions in the rayon fabric market which followed the pattern of the cotton piecegoods market. Hedge selling by stockists of staple fibre yarn also added the downward trend in rayon yarn prices. October contract touched the lowest level for the year at Rs. 663 on 15th October. 120 Japan was easy at Rs. 3-15, 150 Japan at Rs. 3-14, 120 Italy at Rs. 3-13 and 150 Italy at Rs. 3-6. At these low levels, support appeared and the market staged a recovery which was also assisted by good demand in the ready section. November contract improved to Rs. 733 on 21st November. Ready yarns hardened to Rs. 4-1, Rs. 3-14, Rs. 3-11 and Rs. 3-11, respectively.

The closing few weeks of the year have not witnessed any marked change in the sentiment of the market. Transactions put through have been greatly restricted with fluctuations in values confined to narrow limits. The quotations to-day are Rs. 721 for December contract and Rs. 725 for January contract. 120 Japan, 150 Japan, 120 Italy and 150 Italy are quoted at Rs. 4-5, Rs. 4-1, Rs. 3-14 and Rs. 3-10, respectively. The traders are eagerly awaiting the announcement of import policy for the ensuing half-year.

Staple Fibre Yarn

In sympathy with the art silk yarn market, the staple fibre yarn section also experienced generally stable conditions during the year under review. Values revealed on the whole an upward trend and the net gain over the year was to the extent of Rs. 89.

The year began with a buoyant note, under the impetus of large buying support resulting from low yarn stocks in the market. Poor supplies of staple fibre yarn from the South Indian markets—those cater for nearly 50 per cent. of the total requirements of India—following further cuts in electricity supplies to Coimbatore and other mills also hardened the sentiment of operators. Some bull operators tried to exploit the situation and the value of 40/2 staple fibre yarn for January contract shot up from Rs. 701 on 2nd January to Rs. 805 on 22nd January. With a view to arresting a further rise in prices, the Committee of the Yarn Merchants' Association fixed—on 24th January—a ceiling at Rs. 800 per bale of 400 lbs. It decided also not to allow fixed delivery trading from March, 1953 onwards.

In the month of July, it was reported that some traders had entered into forward contract to the extent of 5,000 to 6,000 bales of yarn with Indian mills, of which about 1,500 bales had actually arrived in the market. The traders urged the Association to resume hedge trading in the stocks. As a sequel to this representation, the Association resolved—on 1st August—to resume forward trading in September, 1953, fixed delivery and onwards. Business in 40/2 yarn commenced at Rs. 730 on 1st August. Owing to hedge selling by stockists and lower prices of yarn quoted by Coimbatore mills, the contract slumped to Rs. 648 on 26th August. After staging a recovery to Rs. 692 on 4th September, due to profit-taking, the contract once again was subjected to selling pressure, following highly discouraging reports from the cotton piecegoods and the rayon fabrics markets. October delivery, therefore, drifted down to touch the lowest point for the year at Rs. 632 on 15th October.

Thereafter, the staple fibre section experienced hectic short-covering, induced by scarcity of floating stocks. Values, therefore, forged ahead. There was keen anxiety on the part of traders to cover sales in November contract, as the Association withheld permission to commence forward trading in December contract, thanks to shortage of supplies. The price of November contract shot up from Rs. 632 on 15th October to Rs. 790 on 21st November. But on reports that the Century Mills had sold in forward delivery about 500 packages of 40/2 yarn at Rs. 3-10 per lb., bear selling ensued and the contract declined to Rs. 760 on 25th November. It, however, recovered to Rs. 785 on 30th of that month at which rate the contract terminated.

Forward trading in staple fibre yarn remains at present suspended.

SPECULATIVE FORCES AT PLAY IN OILSEEDS

HIGHER PRICES HIT CONSUMERS

FEW commodities could boast of a steeper rise in prices than oilseeds during the year 1953. The steady trend witnessed at the end of the year developed a firm tendency early in the year. The trend gathered momentum as the year passed on and persisted till July when prices touched their highest for the year. This was mainly due to predominance of speculative forces, following bungling on the part of the Government in its policy of export and import controls. Some of the measures it initiated could bear partial results only in the second half of the year.

Generally speaking, the movement of prices during the year had hardly any bearing on the stock position of the market. It was the strength of the party, be it a bull or a bear, that determined the trend of prices rather than the forces of demand and supply. But, subsequently, however, a recession was in evidence, mainly on prospects of a bumper crop and larger imports of palm and other vegetable oils. The downward trend persisted almost upto the end of November, but thereafter, on revival of speculative support, induced by the possibility of the groundnut crop turning out to be lower than earlier expectations, the prices tended to stage a sizable rally. On balance, the close of the year saw values of oilseeds remaining at levels fairly higher than those at the beginning.

The most depressing feature of the oilseeds market, from the point of view of consumers, was the rocketing rise in the prices of edible seeds and oils, especially groundnuts and groundnut oil. This was mainly due to a fall in the output of groundnuts—an important item of the common man's diet—following the failure of the monsoon and appearance of drought in the principal growing centres last year, that is, 1952-53 season. The year's crop was estimated at 28.9 lakh tons, as against 30.4 lakh tons in the previous year. But the situation was aggravated by the bungling of Government in the administration of economic controls.

Belated Action

Despite the warning given in advance of the consequences of a short crop, the Government issued export quotas for 40,000 tons of oil for the first half of 1953, a portion of which was in the form of H.P.S.; the period of shipment for these quotas was subsequently extended upto 31st August. It permitted also free licensing of export of linseed oil, mustard and rapeseed oils, and *kardi* and *niger* seeds and their oils. To make matters worse, it continued this policy of free licensing in respect of minor seeds and oils even after the prices of groundnuts and its oil had shot up to record high levels. Fuel was added to the fire by permitting the resumption of trading in April in non-transferable specific delivery contracts in linseed and groundnuts, which had been suspended in May, 1952, by the Centre following the slump in seeds and oils. This led to the degeneration of forward trading into a virtual gamble in futures. It is true that, early in June, the Government banned all further sales of groundnut oil and H.P.S. groundnut for export, but this decision came so late that it had no effect on the upward trend in prices. It is also true that the Government removed *vanaspati* from O.G.L. for export, with effect from 27th March, and replaced it with a limited export quota of 3,000 tons, with a view to checking, if not reversing, the rising trend in prices.

All these were of no avail. Consequently, these measures were supplemented by yet a few others. Thus, on imports of palm oil, the standard rate of 43⅓ per cent. *ad valorem* was cut down to 10 per cent. and the preferential rate of 31⅓ per cent. was totally abolished. The effect of this concessions was, however, neutralised by changing over the oil from the system of O.G.L. imports to the licensing system. Even the reduction in duty on import of copra did not result in any immediate gain. In most of these cases, the Government's move was belated and half-hearted.

Small wonder, therefore, the prices kept on moving up under hectic speculative activity. Groundnut Bold, for instance, touched an all-time record of Rs. 55-8 per cwt. on 17th July, as against Rs. 32-8 early in the year. During the same period, Khandesh quality shot up from Rs. 32-12 to Rs. 55, Coromandals from Rs. 32-8 to Rs. 55. *Nigers* touched a peak of Rs. 40 and *kardi* of Rs. 27 in July, as against Rs. 32 and Rs. 23, respectively. Linseed Bold, which was at Rs. 27-6 early in the year, shot up to as high as Rs. 35 on 8th May. Subsequently, however, there was a sharp recession in prices, following the reduction in the export duty on linseed and linseed oil from Rs. 100 per ton and Rs. 200 per ton to Rs. 50 per ton and Rs. 25 per ton, respectively, on 11th May. Prices of linseed fluctuated between Rs. 30-8 and Rs. 33-8 in June-July.

Oil Prices Rise

The trend of the oil section reflected generally that in the seeds section. Thus, groundnut oil, which was enquired at Rs. 18-10 on 29th January, shot up to Rs. 29-4 on 23rd July. Linseed oil ruled in sympathy with groundnut oil, in that it shot up from Rs. 15 on 5th January to Rs. 19-2 on 23rd July. A clear picture of the extent of rise in the prices of oilseeds and vegetable oils will emerge from a glance at the behaviour of index numbers for these commodities. Thus, the index figure of oilseeds (base: 1939=100) stood at 488 in January. It steadily rose to 588 in November, 624 in May and touched 688, the highest for the year, in the week ended 18th July, as compared with the averages of 482 for 1951, and 484 for 1952. The index figure for vegetable oils, too, depicted a similar upward curve. From 443 at the commencement of the year, it gradually moved up to 481 in March. And this trend continued right up to July, when it touched a high of 688, during the week ended 18th July, to be precise.

From the fourth week of July, 1953, the market came under the influence of bearish factors and prices began to decline. The prospects of a bumper crop in the ensuing season, based on favourable weather and timely monsoon, dampened the enthusiasm of the bulls. Further, the sentiment was adversely affected by the decision of the Government of India on 7th August to allow imports of cottonseed oil upto 30th September and the abolition of preferential rate of import duty on this oil of 31⅓ per cent. and the reduction of standard rate from 43⅓ per cent. to 5 per cent. *ad valorem*. Besides, other unfavourable factors such as the weak trend of the world oil markets, large imports of palm oil, the determined resistance of consumers and expectation of a reduction in export duty on seeds and oils, joined to depress the sentiment further. The last straw that broke the camel's back came from Mr. T. T. Krishnamachari, Minister for Commerce and Industry, who declared at the meeting of the Export Advisory Council held towards the close of November, that there would not be any exports of groundnut oil in 1954, unless the prices came down to reasonable levels. Groundnut Khandesh quality, for instance, declined by stages from Rs. 55 on 17th July to Rs. 29-4 on 2nd December. Linseed Bold stood at Rs. 25-2 on 2nd December, as against Rs. 35 on 18th May and Rs. 29-6 on 19th February. Groundnut oil declined from Rs. 29-4 on 25th July to Rs. 15-8 on 2nd December and linseed oil from Rs. 19-2 on 23rd July to Rs. 14-6 on 2nd December.

TREND OF OILSEEDS AND OILS

	18-12-53	*High*	*Low*	31-12-52

Castor oil (per quarter) ..	15 0	19 14	15 4	17 12

The index for oilseeds came down from 688 in July to 498 on 28th November, 1953. The index for vegetable oils declined from 611 to 506.

As the year drew to its close, however, the market again tended to move up on speculative support, induced by the feeling that the groundnut crop would turn out to be lower than the earlier expectations. Accordingly, groundnut Khandesh quality shot up from Rs. 29-4 on 3rd December to Rs. 33-8 on 17th December and linseed Bold from Rs. 25-2 to Rs. 29-8. Similarly, groundnut oil ready gained Re. 1-12 to Rs. 17-4 and linseed oil Re. 1-10 to Rs. 16.

Castorseeds

Trading in castorseeds futures was subject to severe criticism during the year under review. Never in recent years was the tussle between bulls and bears so keen and determined as that witnessed in the September contract. In the tussle, bulls dominated the scene. Their grip on the market was so tight that the bears struggled for survival, with the result that the September contract (1953), which opened on 6th April at Rs. 157, shot up to Rs. 167 on 14th September. At this level, the Board of the Oilseeds Exchange decided to raise the margin against tenders of castorseeds for delivery, up-country, from 10 per cent. to 50 per cent. But this did not dishearten the bulls, who were in a strong position owing to paucity of stocks. The rate, therefore, went on moving upward, till it reached Rs. 291 on 30th September, when it closed. The Board fixed the due date rate at Rs. 208. Trading in May, 1953, commenced at Rs. 140 on 27th July, 1952, and the rate fluctuated between Rs. 128-8 and Rs. 167, before closing at Rs. 158 on 30th May. The May, 1954 contract opened on 20th July at Rs. 133-4. After fluctuating between Rs. 105-8 and Rs. 138-8, it closed on 1st December at Rs. 113-12. Among spots, castorseeds Madras which were enquired at Rs. 32 on 5th January, advanced gradually to Rs. 44 on 30th September. Thereafter, they staged a decline and the quotation on 7th December, stood lower at Rs. 26. Castor oil ready, which was done at Rs. 17-8 on 12th January, advanced to Rs. 19-14 on 20th February. Subsequently, it fluctuated between Rs. 18-14 and Rs. 15-4, before closing at Rs. 16 on 1st December.

The rise in prices may be attributed partly to a comparatively more liberal exports of castor oil. The Government had declared on 13th December, 1952, that the then existing quota holders, established shippers and new-comers would be granted further allotments of castor oil equal to their exports in July-December, 1952, for the period January-June and that shipments against individual allotments would be allowed from January, 1953. The Government decided on 31st January, 1953, to licence freely on shipping bills, from 1st February to 30th April, exports of castor oil, commercial as well as medicinal. This was extended subsequently upto July, 1953. Free licensing of castor oil was, however, discontinued subsequently and exports during August-December, 1953, were allowed on the basis of performance in the first half of the calendar year; licence for the export of castor oil upto the end of December, 1953, was issued to exporters for quantities equal to one-fourth of the total shipped by them in January-June, 1953. In October, the Government announced the export of castor oil for a quantity equal to one-fourth of the total exports, during January-July, 1953, instead of January-June, 1953. Further, on 30th October, the Government decided to permit the export of medicinal castor oil by the manufacturers holding licence for its manufacture under the Drugs Act, 1940. Eligible applicants were granted quotas equal to 10 per cent. of the certified production and the quota licences were made valid for shipment upto March, 1954.

Exports of Seeds and Oils

The exports of major seeds and oils during January-July, 1953, as compared with those during the same period in the previous year, were as follows:

	January-July	
	1953	1952
Groundnut oil in cwts. ..	321,531	833,254
Linseed oil in cwts.	125,309	360,501
Castoroil in cwts. ..	494,016	319,772
Groundnuts in tons ..	10,109	17,489

The high level of prices of oilseeds and vegetable oils generally and of groundnut and groundnut oil in particular caused serious hardship to consumers, especially to the middle and poor classes, for whom these constitute the only source of fat and who cannot afford to buy the high-priced milk and butter. It is undoubtedly one of the causes for the prevailing very high level of cost of living in the country. Even the prices of oilseeds and oils ruling at the time of writing this review are high and they should be brought down sizably, if any relief is to be afforded to consumers. The outlook for such relief appears to be somewhat better, in view of a possible increase in the output of oilseeds. Thus, the outturn of groundnuts, which was 28.9 lakh tons in 1952-53, as against 30.4 lakh tons in 1951-52, is expected to be nearly 31 lakh tons in 1953-54. The linseed crop, which was 3.55 lakh tons in 1952-53, as against 3.16 lakh tons in 1951-52, is estimated to be more or less maintained at the last year's level. The production of sesamum may be expected to be the same as in 1952-53 at 1.1 lakh tons, as against 1.05 lakh tons in 1951-52. The estimate of rape and mustard seeds are placed at 8.28 lakh tons, being the same as in 1952-53. The output of castorseed was 1.07 lakh tons in 1952-53, as against 1.03 lakh tons in 1951-52 and the same is expected to be maintained in 1953-54.

Supply Comfortable

The supply position in the current season is thus fairly comfortable. But the relief to consumers will depend on the extent of exports of oilseeds and oils allowed by the Government. The export policy will be determined, according to the Commerce and Industry Minister, on the study of the level of prices in the market when the crop movement is in full swing. The latest reports indicate that the Government of India has decided to constitute a three-man committee, consisting of officials of the Commerce and Food Ministries, to estimate the groundnut crop position in relation to demand and assess the exportable surplus. The Committee will tour Saurashtra, Hyderabad, Madras, Bombay and other groundnut-producing centres and report to the Government in a few weeks.

JUTE GOODS RECOVER AT CLOSE

GOOD DEMAND FOR RAW MATERIAL

THE jute and jute goods market passed through a very uncomfortable period for a great part of this year. Keen competition from Continental mills in world markets made Indian hessians and sackings dearer to the foreign buyer. The reductions in the export duties made in 1952, after which a healthy revival of demand was expected, proved inadequate to make Calcutta quotations attractive. The result was that business for Indian mills turned out to be poor, and at rates uneconomic to production. Stocks with mills began to accumulate, and soon presented mills with financing problems, since plant and machinery had to be worked and raw jute had to be bought and stocked.

In February, along with the budget proposals, the duty on sacking was reduced, the quantum of reduction proving once again inadequate. It was only in September, after months of dull activity and poor offtake, that the duty on hessian was slashed. This revision was not what was desired, and both the industry and the trade conclusively pleaded for the complete abolition of the duties. It was felt that the resulting increase in exports of jute goods would enable mills not only to start working 48 hours a week instead of 42½ hours at present, but also to unseal the 12.5 per cent. of the looms, that were sealed and provide more employment. The plea remained unfulfilled by the Government till the close of the year. After the reduction in the duty in September, the market trend considerably improved, and both hessians and sackings regained the losses suffered for most part of the year. The change of fortune for hessians enabled mills to transfer many sacking looms as possible to the production of hessians. On the whole, the year closed on a satisfactory note, but a firmer note could have been struck, had only the duties been revised earlier and the Government acceded to the demand for doing away with the duties altogether.

Trend of Prices

The raw jute market followed the trend of jute goods, and although plenty of raw jute was available it could not be consumed by mills on account of slackness in demand. A glance at the following tables gives the reader an idea of the trend of prices during the 11 months to November. Table I also shows that the year could be divided into four distinct periods as far as prices were concerned, namely, (a) from January to April—a period of quietness; (b) May and June when prices rose; (c) July, August and September when gains were lost; (d) October and November when steady conditions lifted prices to the best levels of the year.

The first four months of the year were a period of extreme quietness for all wings of the market. Restricted business with foreign countries forced hessians 40" 10 oz. to sink to as low as Rs. 37-10 from Rs. 43-4 and B. twills to Rs. 85-4 from Rs. 97-8. Mills could naturally give only restricted support to the raw jute market where the different varieties receded gradually, Assam bottoms declining to Rs. 17 from Rs. 24-8. The decline in raw jute prices was disproportionate to that in the rates for finished goods and, with accumulation of stocks, mills' purchases of raw jute dwindled considerably. This naturally disheartened stockists who, at one time, even put up a demand for permission to export *bimli* and *mesta* varieties. The factional gains in prices of goods in February and early March could not be sustained, because the mild improvement was mainly due to speculative activity and not to actual export business. Even the reduction in the export duty on sacking to Rs. 80 from Rs. 175 a ton made towards the end of February, failed to increase the turnover, apart from an initial spurt in quotation owing to speculative manipulations. Demand for sackings was so low that the need for restricting its production without affecting hessians was imperative. Comparison of export figures showed that exports to Far Eastern countries had failed to regain the pre-war rate, because they needed less number of bags on account of reduced agricultural production in these countries. The Government could not, however, agree to the suggestion of mills for restricting production of heavy goods. The refusal, pulled down hessian prices, as mills were left with no alternative other than to transfer as many of the sacking looms to hessians, thereby further increasing stocks of hessians.

Argentina Enters the Market

Towards the end of April, however, conditions began to change for the better, as Argentina appeared on the scene as a prominent buyer. Good enquiries also from the United States coupled with the American Army's order for 10,000,000 sand-bags and the expectation that mills would seal a further 7.5 per cent. of the looms aided the sentiment of operators. Consequently 40" 10 oz. hessians rose to Rs. 47-2 per 100 yards. B. twills to Rs. 105-4 per 100 bags, and Assam bottoms to Rs. 28-8 per maund. The U.S. Corps of Engineers was in further need of 22,630,000 bags, and American burlap manufacturers covered a portion of their tenders in India. The reports that Continental mills had begun to under-quote Calcutta did not affect prices. However, despite the improvement in market trend, stocks of both hessian and sacking continued to accumulate. Buyers were hesitant to enter into commitments, in anticipation of decline in rates. However, Argentina continued to be a consistent buyer, and by the end of June, it had bought half of its estimated requirements of 65,000 tons.

On lack of sufficient orders from foreign buyers, following keen competition from Dundee and manufacturers in other countries, the Jute goods market presented a dull appearance during the months of July, August and September, and thus make good part of the losses they were incurring by producing hessians and sackings in a dull market. Argentina continued to take small quantities of hessians, and mills hoped that demand from America would gather momentum in view of the persistent increase in the consumption of burlap there. The latter development was a matter of particular encouragement for both the trade and the industry alike, as it meant that burlap had become once again cheaper than its substitutes and that supplies were regular and assured. Prices, however, followed an irregular pattern. Hessians 40" 10 oz. at one time in September touched a low of Rs. 41, but in July and August they stood at about Rs. 46 for reasons already stated. The trend in the raw jute market was different, as stockists were prepared to hold on. For, on expectations of a reduced crop both in India and Pakistan, they expected prices to move up. The highest rate for the year in Assam bottoms was touched in August at Rs. 29-8. The superior quality fit for hessian manufacture was difficult to obtain.

Export Duty Reduced

The industry's demand for abolition of the duties was more than supported by the continued dullness in the market and, apparently in recognition of this, the Government of India reduced the duty on hessians to Rs. 120 a ton from Rs. 275, with effect from 15th September. This action was not only belated but half-hearted, as both the trade and the industry had been asking for not a reduction in the duty on hessians but total abolition of the duties on both hessians and sackings. Nevertheless, the concession had to be accepted in good cheer, as the jute industry had to be thankful even for a small favour believing that, as time went on, Government would see the reasonableness of the demand and accede to it. Even after this reduction, buyers were slow to enter into commitments, as they desired that sellers should pass on the benefit of the full reduction to the former. This was, in fact, done as since October, prices rose on account of strong demand for export to Argentina. Stocks of hessian at the end of October declined to one month's production and heavy goods to just two months' output. Also during October, production of all constructions at 66,800 tons showed a fall of as much as 6,300 tons. American purchases, however, did not come up to expectations, but it was stated that they desired to wait till the Argentine demand was fully satisfied in the hope that the market in hessians would then be mainly left to buyers on behalf of the United States. Ready 40" 10 oz. hessians gradually gained to Rs. 49-4 in the two-month period ended November; forward rates were discounted, suggesting the need for an organised futures market. Hessians ceased to be a marketing problem for mills, and, in fact, a shortage came to prevail in the ready goods.

Prices of heavy goods also improved since October; but the advances were in sympathy with the gains in hessians. The reduction in stocks of sackings in October was due to shorter production resulting from a transfer of looms from sackings to hessians. Measured by any yardstick, there is no justification whatsoever for a duty on sackings; the sooner the Government realised this and lifted the duty, the better, as mills would then be enabled to use all the raw jute available in India, a good portion of which is fit only to produce heavy goods. During November, ready B. twills touched as high a rate as Rs. 105-4, in view of revival of demand from Australia and Africa, and expectations of good business with Russia.

Crop Estimates

Since October, mills increased their volume of purchases of raw jute. Prices gained considerable ground lost prior to October. Assam bottoms improved to Rs. 28-8 from Rs. 21-8. After the *Puja* holidays early in October, arrivals of the new crop began to fall. This was because growers, after having satisfied their cash needs for the festivities, were prepared to wait for a better price. Besides, they were also engaged in paddy-harvesting. Calcutta stockists lost no time to put in a reserved air in their offers and these factors, coupled with the inspiring advices from the goods market, witnessed the realisation of growers' expectations. If mills increased their working hours, following the expected abolition of the export duties, there would likely have been a shortage in the better quality jute, fit for hessian production. The crop in India this season is estimated to total 35 lakh bales and that in East Bengal, according to the trade, another 35 lakh bales. Adding the carry-overs in both the countries, the availability comes to 104 lakh bales of which Indian mills are expected to consume 53 lakh bales, Pakistani mills 7 lakh bales and mills in other countries 40 lakh bales, so that the carry-over to the next season would be only 4 lakh bales. The Pakistani official forecast of 25.02 lakh bales, trade circles consider, is a gross underestimate.

TABLE I

Price Trends of Jute Goods and Raw Jute Goods During 1953

Month	Ready hessian 40" 10 oz. Per 100 yards		Ready B. twills Per 100 bags		Ready Assam bottoms Per maund

AN EVENTFUL YEAR FOR PEPPER

REDUCTION IN PRICE NEEDED TO STEP UP CONSUMPTION

(By I. T. PAREKH, Governing Director, Messrs. Parekh & Co.)

THE 1952-53 pepper season was an eventful one in more than one respect. For one thing, it was the first season when the post-war monopoly of India in supplying black pepper to the world market was broken by the advent of a new competitor in Sarawak, which sold black pepper at as low as $0.73 per lb. c. & f. New York.

Secondly, the closing month of the season saw a record crash in the price at Alleppey. Pepper was sold down to the level of Rs. 1,800 per candy which was Rs. 100 lower than the bottom level of the previous year and the lowest on record for the past five years.

Thirdly, owing to severe competition of Sarawak and to a small extent from Lampong, India's export to foreign countries made a poor show, it being only 10,700 tons, that is, 2,300 tons less than the previous year.

Fourthly, export restrictions to countries like Holland, Hongkong, Singapore, Siam, Syria, Lebanon and Tangier were removed. The Indian Government had banned the export of pepper to these countries for fear that those goods might ultimately be reshipped to the U.S.A. to earn dollars.

Fifthly, the Cochin market was often deadlocked, owing to heavy losses suffered by the trade as a result of the steep fall in the prices. This put the trade in garbled pepper for monthly deliveries out of gear at Cochin.

And lastly, the season saw various representations made by the trade and the growers, drawing the urgent attention of the Government to the need for reducing the present heavy export duty, with a view to making Malabar pepper competitive in the world market, thus affording relief to the growers who are already hit hard by the low prices obtainable for various other Malabar produce.

The foregoing are some of the outstanding events of the year under review. We may now proceed to indicate at some length the trading in Malabar Black pepper during the 1952-53 season.

Depressed Atmosphere

The trading in the 1952-53 season began in a depressed atmosphere. The enforcement of the multi-point sales tax in the Travancore-Cochin Union, holiday feeling in New York on the eve of the Presidential election, and the general fall in prices of other commodities in India, caused an easy tone. Prices began to move downward from the high level of Rs. 3,400. The volume of export began to shrink, though slowly, particularly because most of the overseas markets were buying hand to mouth, as pepper, along with other commodities, ceased to be a sellers' market. Then the Indian Government, with a view to encouraging business, lifted the ban that had been imposed on export to those countries which had been purchasing pepper from India in excess of their home requirements for re-export to New York for earning dollars. But this proved belated and failed to encourage business, because of the fall in premium on the price of U.S. dollars in the black market.

The major portion of the crop of Lampong and Sarawak Black having been already marketed, the future of the world market depended upon the policy of marketing by the Indian growers. But, as is usual with them, they prefer to sell as much as possible during the harvesting months of January, February and March and thereafter, February and March and thereafter, February and March and thereafter

MARKED IMPROVEMENT IN INDIA'S FOOD POSITION

WHEAT AND COARSE GRAINS DECONTROLLED

(By K. C. MAHESH)

HAPUR, 30th November

THE year 1953 marked the liquidation of the food problem in the country. There were bumper yields of all major *rabi* and *kharif* crops in most of the States, reduced imports, enlarged reserve stocks with the Central and the State Governments, declining prices, and gradual disappearance of all irksome food controls. This was not true of India alone. The world food situation during the year under review also was altered to the point of making the principal export nations canvass custom, instead of enjoying the privilege of considering requests from food deficit countries for imports. To quote *the Times (London) Annual Financial and Commercial Review*, published towards mid-October, 1953:

"While history may record the 1948 recession as the first readjustment of world market to peace-time conditions, it will almost certainly regard the first nine months of 1953 as the decisive turning point in the post-war fortunes of the grain trades. The most serious geographical dislocations of the grain trade, caused by the war, were not overcome until the harvesting of the 1952 crops, and the reappearance of large-scale surpluses did not make themselves felt until the beginning of the 1952-53 season. In recent months, the majority of the cereal markets have become genuine buyers' markets and this decisive change has begun to make itself felt far beyond the recession in prices. It enabled the U.K. in the autumn of 1953 to return to private trading in cereals and has transformed the whole basis of the International Wheat Agreement. The U.S. farm price support policy is beginning to face a crisis under the impact of mounting surpluses. Next year, indeed, the U.S. will return to acreage restrictions and marketing quotas for wheat and there is a strong possibility that other leading exporting countries will find it increasingly difficult to secure adequate markets for their crops."

World Wheat Output

According to the *Review*, "world production of wheat reached a new all-time high record of 7,320 million bushels in 1952-53, which compares with an average of 6,024 million bushels in 1935-39, and the world production of maize rose over the same period from 4,760 million bushels to the new record level of 5,600 million bushels. In both the cases, North America, that is the dollar area, made the chief contribution to the expansion. This expansion in supplies of dollar cereals has greatly overshadowed the international trade in recent years. The share of dollar wheat in world exports, which amounted to 35 per cent. before the war, reached the exceptional level of 85 per cent. For maize, the increase in the shape of dollar supplies was somewhat less impressive, although, even in this case, it has exceeded three-fifths of the total in recent years as compared with less than one-half before the war.

Trend of Prices

"The world price level for wheat has shown a marked fall since the spring of 1953. In August, 1953, the price reached a new low of 181 cents a bushel, as compared with 223 cents in April, when the new International Wheat Agreement was signed, and 233 cents at the end of September, 1952. The pressure of supplies and the greater crops in the deficiency regions have, for the first time since the war, begun to undermine the effectiveness of the American support policy."

The next 12 months, the *Review* points out, will be a severe testing time for cereals, in general, and for wheat, in particular. Although the 1953 world crops cannot yet be fully assessed and the present indications suggest that these may be reduced, conditions are working increasingly in favour of importers. In contrast with most other post-war seasons, the new crops in the deficiency countries appeared to have fared relatively better than those in surplus countries. Moreover, in the case of wheat, the U.K. and India, the largest importing countries, have accumulated considerable stocks. These developments will reduce the buying pressure in the world markets at a time when stocks in the surplus regions, following the extremely heavy carryovers from last season, have outgrown all available storage facilities.

Once again, the F.A.O. has repeated its warning that the world is facing starvation. Ever since it was founded some 8 years ago, it has been saying this and some of the scientists and experts outside the United Nations are beginning to wonder whether it is not crying wolf. In its annual report to the Economic and Social Council, the F.A.O. observes that the food production is not keeping pace with the increase in population and that the situation is at least as critical now as it was last year. Says the report: "What is happening is that farmers are not meeting the targets which the F.A.O. conference of 1951 set for them—to increase food production by one or two per cent. each year above the rate of population increase. In addition to the traditional importers, such as the United Kingdom, countries such as India, Pakistan and Yugoslavia, all net exporters before the war, are now, at least temporarily, forced to import considerable quantities of food. This should be a matter of intensive concern to food importing countries. Of the exporting countries, like the U.S., Canada and Australia, consumptive demand within these countries is rising rapidly, and unless special efforts are made to increase production, the quantities of food available for export may tend to decrease."

Stocks

The F.A.O. report admits that there are substantial stocks in some countries which would cushion, at least for a year, the reduction in yields due to unfavourable weather, but it adds that a series of semi-droughts, spread over several years, such as have occurred in the past, could reduce exports to a critical degree.

Food Supplies in India

The carryover of 2,000,000 tons of foodgrains, the fall in food prices as a result of increased production, the assurance of securing the bulk of 2,500,000 tons of grain imports, the targets for the 1953 year, and the new psychology of confidence in the country that the food crisis has generally been weathered, all provided a happy augury for the new year in India. At the close of 1951, the carryover was 1,300,000 tons and the year before it was 700,000 tons only. At the close of both 1951 and 1950, however, the Central Government had nothing in reserve. All the carryover was with the State Governments. For the first time, this year, the Central Government started with a reserve of 400,000 tons.

There was a Food Ministers' conference in the first week of January, 1953, which was inaugurated by the Prime Minister. The conference provided a measure of definition to the immediate and long-term objectives of the Government of India's food policy. The immediate objective for the year was to consolidate the visible gain of 1952 by maximising internal procurement and reducing imports to a minimum, just sufficient to cover the irreducible estimate of deficit, and add some thing to the carryover from last year to build up an emergency reserve and buffer stocks of 3 million tons or more. Looking ahead, the objective of the policy was to try and make the country self-sufficient in foodgrains within the period of the Five-year Plan. The conclusion of the Food Ministers' conference did not produce any finality regarding the food budget for the year, but a positive result was that the representatives of the various States accepted, in principle, that imports must be drastically curtailed and brought down to the minimum—not exceeding 3 million tons, of which 600,000 tons were to be rice. The Indian Food Minister, Mr. R. A. Kidwai, received a remarkably fervent endorsement in respect of his policy of permitting relaxation in food controls wherever possible. Contrary to the past practice of making annual food allocations to the States soon after the Food Ministers' conference, no such allocations were made this year. On the other hand, it was indicated that supplies would be sent to needy States, as and when demanded and after a scrutiny of their claims, keeping in view the Centre's overall supply target.

The Central Ministry of Agriculture planned an intensive drive to wipe out the country's entire 500,000 tons rice deficit during the year by a twin programme of propagating the Japanese method of paddy cultivation as extensively as possible and selling fertilisers on a subsidised credit basis. The programme, which was to be personally directed by the Minister of Agriculture, was accorded the highest priority.

Stocks of foodgrains increased during the year and prices were generally either steady or declining. The stocks of foodgrains with the Central and State Governments as on 24th January, 1953 amounted to 1,850,000 tons, as compared with 1,610,000 tons on the same date last year. On 23rd February, Mr. Kidwai expressed the hope that there would be no imports of rice from next year. This year, he said, the Government would supply all the deficit States with rice procured internally and it was trying to build up stocks with the rice it was importing.

Incentives to Cultivators

The belief that the target of food self-sufficiency laid down by the Government of India may prove impossible of attainment and that reliance on imports may become a permanent feature of our national economy has been expressed by Dr. Norris Dodd, Director-General of the F.A.O., in his analysis of India's food problem. Dr. Dodd couples this warning with another concerning the rapid pace of industrialisation which also, in his opinion is calculated to upset the food balance. Apart from emphasising the need for correlating any food plan with the overall national policy embracing such factors as the standard of living and relations with the neighbouring countries, Dr. Dodd suggests provision of rural incentives to cultivators, as against dramatic gestures, and educational facilities in the villages with the emphasis placed on the work of our primary producer.

The fears expressed by Dr. Dodd have proved to be as wide off the mark as those expressed by the F.A.O. in its annual report submitted to the Economic and Social Council. For, as the Union Food Minister claimed recently, India has very nearly attained self-sufficiency in food. India exports cash crops and in return imports some varieties of foodgrains which are cheaper in oversea markets in comparison with home markets. In times of emergency, land devoted to cash crops can easily be converted into food producing land.

The process of decontrol of foodgrains which had started last year was carried a stage further during 1953, and gradually, irksome restrictions were withdrawn one by one. Relaxation of food controls had been accomplished in a number of States by early March. The position then existing was that statutory rationing had either been completely given up, as in Madras, Bihar, Uttar Pradesh, Saurashtra and Madhya Bharat or reduced to a smaller number of towns than before, as in Hyderabad and Mysore. In all these States, however, fair price shops had been opened in place of statutory ration shops and the card holders had the option to draw from the fair price shops as they were entitled to before relaxation and supplement this quantity, if necessary, with purchases in the free market. In certain other States too, relaxations were affected. These relaxations were accompanied by inter-State movement of cereals, through the States of U.P., Bihar, Madhya Bharat, Saurashtra, Hyderabad, Mysore, Travancore-Cochin, and procurement of foodgrains had generally been suspended. In respect of millets and other coarse grains, although the existing inter-State cordons on the movement of these grains continued, the State Governments were free to buy these grains in any other State approved by the Centre and move them into their own States either on State-to-State basis or purchases through their own agencies.

No Shortage of Food

Towards the end of March, the Food Minister offered to supply any quantity of foodgrains demanded by the States. Nowhere in the country to-day, he declared at Bombay, was there a shortage of foodgrains; if anything, it was lack of purchasing power in certain areas hit by famine. He said that, since the inter-State barriers were lifted on millets, the grain was available cheaper than the official rates. Even in the matter of other foodgrains, where no control existed, they were available in better quality at official rates. On the working of decontrol, the Food Minister said that it had been working wonderfully well wherever it was introduced. Complete decontrol of foodgrains all over the country was not possible immediately, in view of the policy of controlled economy pursued by the Government, he added.

On 11th April, 1953, Dr. Punjabrao Deshmukh, the Union Agriculture Minister, appealed, while addressing an inter-State locust conference, to all the States to put in a joint and determined effort to fight the locust menace, which appeared to be more serious this year than in the past. The locust invasion of India gathered momentum during the second fortnight of May and about a dozen more swarms entered the country mostly through Rajasthan. Locust swarms continued to visit the different States of India in the following months with varying degree of intensity. The worst affected area was Rajasthan. Very prompt action was always taken to meet the pests and, fortunately, no substantial damage to the crops was done anywhere throughout the year.

In the third week of April, the Union Food Minister, Mr. Kidwai, went to Rangoon to negotiate a barter agreement with Burma for the import of rice. India wanted to import, besides 150,000 tons of rice for the purchase of which an agreement had already been concluded, another 350,000 tons for building up a comfortable reserve, equivalent to the Central Government's commitments in a year. It was officially indicated that, with the opening balance, the internal procurement and the quantity already purchased from Burma, the Central Government was expected to have sufficient stocks to meet the current year's requirements, and at the same time, carry forward a surplus. On his return from Burma, Mr. Kidwai announced that India would get 300,000 to 500,000 tons of rice in exchange for whatever Burma required.

As early as in May, Mr. Kidwai advised the wheat-growing States to step procurement, in view of the abundance of stocks in hand. India signed the new International Wheat Agreement, considering that the U.S. would continue to subsidise its internal price. Secondly, export of wheat was still controlled in most countries. The fall in prices, if any, would, therefore, be small notwithstanding the impending peace. India later ratified the I.W.A. in July but the ceiling of import fixed in the agreement for India was reduced from 1.5 million tons to 1 million tons a year. The reduction in the quota was sought by India, in view of its improved stock and crop position, and the contracting countries agreed to the reduced quotas. The Agreement, which was to be in force for three years, was signed by 36 countries in April and many of them have now ratified. Britain was the only principal importing country that declined to sign the Agreement. Under the provisions of the Agreement, the maximum price is fixed at $2.05 per bushel and the minimum price at $1.55. If the price falls below the minimum rate, it is obligatory on the part of the importing country to buy the contracted quantities of wheat at the lower price. Likewise, the exporting countries are under obligation to sell the contracted quantity of wheat at the ceiling price, even though prices in those countries rise above the maximum. The previous five-year Agreement expired in July, 1953, under which India imported one million tons in the first year and 1.5 million tons annually in the subsequent years.

Progress Report

A picture of steady and many-sided progress emerged from the preliminary progress report covering the first two years of the Five-year Plan. In the agricultural sphere, production showed substantial increase in jute, cotton and sugarcane. Precise data is not yet available, but tentative estimates indicate that, during 1951-52, the increase in foodgrains production was about 1.15 million tons, on account of the Grow-more-food campaign and as a result of the major irrigation schemes which increased the area under irrigation during the year by 800,000 acres. In 1952-53, an increase of about 6 million acres in the area under *kharif* cereals is reported. It is obvious that there has been an appreciable rise in production this year over last year. The Plan envisages the reclamation of 4.4 million acres through the Central Tractor Organisation and 1.2 million acres through State Tractor Organisations. The C.T.O. reclaimed 250,000 acres during 1951-52 and 150,000 acres up to 1953 in Madhya Pradesh, U.P., Madhya Bharat, and Bhopal. The State of Uttar Pradesh has reclaimed about 100,000 acres of the *Tarai* area and converted it into prosperous co-operative colonies and flourishing State farms.

Despite the late arrival of the monsoon, the general food situation in the country during June continued to be satisfactory, except in certain areas where the failure of the last year's rains and the fear of late rains this year sent up the prices of grains. This, however, was a normal occurrence at this time of the year. The stock position was comfortable with the Centre holding 400,000 tons of wheat and the States another 1,970,000 tons, including 980,000 tons of rice and 570,000 tons of wheat. The price of foodgrains in the decontrolled States, except those which were affected by last year's failure of the monsoon, were much below the issue prices at Government ration shops. Relaxation of control was in force in two-thirds of India. There was no food control in U.P., Punjab, Madras, Mysore and the rural areas of Bombay.

On 5th August, 1953, the Deputy Food Minister informed the House of the People that the Government of India had advised all the States, except Delhi, to remove control on wheat. Nine States—Bombay, Madhya Pradesh, Punjab, Bhopal, Ajmer, Assam, Vindhya Pradesh, Madras and West Bengal—had already followed the advice. The Minister told the House that the question of any further relaxation in the existing control of rice would be considered after an estimate was made of the condition of the rice crop of 1953-54. According to the statement of the Deputy Food Minister, the undermentioned controls generally existed in almost all the States. Inter-State movement of all foodgrains, except gram, was banned. Inter-State movement of gram was allowed, but in the case of the States of Punjab, Rajasthan, Madhya Bharat, U.P., Bhopal, Vindhya Pradesh, Bihar and P.E.P.S.U. it was regulated through permits after payment of a levy upto 40 per cent. on the exportable stock. Future trading in gram and wheat was prohibited. Some States also banned future trading in other grains. Restriction on inter-State movement of foodgrains were imposed in the procurement areas during the procurement period. Mr. Kidwai declared in Bombay on 21st August that wheat and other foodgrains would be decontrolled in the near future throughout the country. This was actually done on 5th November when the Government of India announced the complete decontrol of wheat and other coarse grains, following the improving food position in the country. Inter-State barriers were, however, retained.

Enquiries made in official circles revealed that the fall in world prices of wheat had as much to do as the improved stock position for the Central Food Minister's announcement of early decontrol of grains throughout India. Wheat prices in Chicago had fallen considerably. There was a definitely downward trend, because of the diminishing world demand following bumper crops in almost all wheat-growing areas, and there was every possibility of the floor prices being envisaged in the International Wheat Agreement (of $1.55 a bushel). The Central and State Governments held stocks of nearly one million tons of foodgrains and the offtake from the stock was extremely low. All the States had been given the option to remove restrictions on movement of grains within their territories and the next step was to remove restrictions on inter-State traffic.

India has Turned the Corner

On 8th September, Dr. P. Deshmukh, Union Minister for Agriculture, broadcasting from All India Radio, made the assertion that India had turned the corner on the food front. He said: "The cultivator is free to move his produce wherever he likes within the State and sell it at the best price he can fetch." Mr. Kidwai also characterised the then position as comfortable. He said that, all such imports of foodgrains which harmed the interests of the country had been almost stopped and that the cost of the imports had been integrated into the general pattern of foreign trade.

The months of September, October and November witnessed a rapid improvement in the food supply position in the country, accompanied by a downward trend in prices. A bumper rice crop was assured, due to favourable seasonal conditions and adoption of the Japanese method of paddy cultivation. This method gave wonderful results. In the Punjab and Uttar Pradesh the adoption of this method gave the cultivators 3 to 4 times the normal yield. Nearly three million acres, out of 75 million acres under paddy in the country, had been brought under the Japanese method of cultivation this year. Rice prices began declining even before the harvest. A further fall in prices was anticipated after the start of the crop yield movement to the markets. In some places, agriculturists feared that the rice price might even go down below economic levels. Paddy prices in West Bengal did go very low and caused serious apprehensions in the mind of the cultivators. It was rumoured that the Central Agricultural Ministry would advise the States to fix support prices for paddy, as in the case of raw cotton, on account of the tendency for paddy prices to fall to uneconomic levels in certain parts of the country. It was felt that the tempo of increased rice production that had been evident in the last year, could not be maintained unless the farmer was guaranteed a fair price for his crop and given a positive incentive to do better. Fixation of a floor support price for paddy would, it was hoped, stabilise the price of rice, as the State would always step in and purchase grain at floor price. The average farmer had little or no holding power and had to sell his crop as soon as possible after the harvest. This placed him at the mercy of the dealers who purchased the crop at prices far below the genuine market price.

Wheat and coarse grains were decontrolled early in November. Inter-State movement barriers were formally removed but it was confidentially hoped in unofficial circles that the Government's decision would help to restore the movement of grain between States through normal trade channels. The surplus States were instructed to stop procurement of wheat and millets on Government account, except to meet local scarcity, if any, in any State. Since plenty of wheat was available within the country, the Governments of deficit States were authorised to sell without limit from the stocks to the private trade. The Union Food Minister expressed the view that all remaining restrictions on consumption and schemes of rationed distribution of wheat and coarse grains should be withdrawn by the State Governments as early as possible.

As regards rice, it is officially stated that the estimated demands of deficit States in rice in India next year would be about 1,100,000 tons and internal procurement from surplus States would be 1,200,000 tons. The Government proposes to import no rice, except a small quantity which the private trade might import under the relaxation already allowed. In the light of the improved situation in regard to rice supply, the Government hopes to increase the quantum of rice ration wherever possible early next year. The Government also proposes to continue rice procurement and retain inter-State movement restrictions.

Trend of Prices

Fixation of prices for foodgrains during the period of control presented a series of difficulties, thanks to the vastness of the country, the differences in the surplus and deficit character of the States, the disparity between internal prices and the prices of imported grains, etc. Market prices were often entirely different from procurement prices and issue prices varied unduly in the States which were differently situated. The price structure of foodgrains in the country was, to a large extent, artificial and the organic relationship between the prices were often undetectable. But with the gradual decontrol of foodgrains, normal conditions began to be restored.

The officials of the Food Ministry claimed that foodgrain prices in the free market this year were generally lower than those of last year, as a result of the measures taken by the Government. They said that the aim of the Government had been to reduce the issue prices of foodgrains whenever possible. The pool price (per maund) of wheat had been progressively reduced from Rs. 20-8 in March, 1952 to Rs. 18-8 in June last year, to Rs. 17-8 in March, 1953 and further to Rs. 16-8 in July, 1953. A still further reduction of Re. 1 per maund was effected in the first week of November, 1953. The benefit of the reduction in the pool price is stated to have passed on to the consumers by way of lower issue price.

The issue price of rice had been reduced at several centres. In Bihar, it was reduced from Rs. 26-10 to Rs. 21-8 per maund with effect from the end of April, 1953. In Madras, there had been a reduction from Rs. 22-8 to Rs. 21-12 per maund for the superior variety of rice and from Rs. 18-12 to Rs. 17-4 for the second grade. In Calcutta, the price of fine rice sold in the fair price shops was reduced by Rs. 7 to Rs. 25 per maund in March, 1953.

Another step taken to ensure a lower price of grain was the opening of cheap grain shops in the scarcity-affected areas. The provision of relief in scarcity areas was mainly the responsibility of the State Governments, but, wherever it had been found necessary to run gruel centres, the Government of India agreed to contribute by way of a grant, 50 per cent. of the expenses incurred by the States concerned. In addition, foodgrains were also supplied at concessional rates for sale in the scarcity areas.

Imports

The post-Partition period of food controls in India was marked by increased imports, necessitated partly by the rise in the country's normal food deficit and partly by abnormal weather conditions which destroy the crops over large areas. The Government did not keep quiet, but resolved to make the country self-sufficient in foodgrains as early as possible. Special schemes were accordingly launched. The objective, however, could not be realised, due to unfavourable climatic conditions. The trend of imports since 1946 is indicated below:

(In million tons)

1946	2.25
1947	2.33
1948	2.84
1949	3.71
1950	2.13
1951	4.72
1952	2.90

The imports of 4.72 million tons in 1951 and 3.90 million tons in 1952 were necessitated largely by the Bihar famine and scarcity conditions in other areas of India. Bumper crops during 1952-53 seasons, good carry-over from 1952, and heavy procurements of rice and other grains in the country (procurements by the end of October, 1953 aggregated 1,614,650 tons, including 1,242,200 tons of rice and 212,750 tons of wheat) reduced the need of imports this year. The total quantity of foodgrains imported into India from 1st January to 4th November, 1953, was 2,009,266 tons. Of this, wheat accounted for 1,587,750 tons, flour for 71,700 tons, rice for 189,750 tons, milo for 102,200 tons and millets for 33,000 tons. Of the total wheat imported, the largest quantity—576,692 tons—came from the U.S., while 416,392 tons were imported from Canada, 374,101 tons from Australia, and 245,436 tons from Argentina of the rice imports, 157,404 tons came from Burma, 1,841 tons from Thailand, 22,922 tons from Pakistan and 7,564 tons from China. For the first time since 1943, no foodgrains were imported in the country during the first three weeks of November, 1953.

The imports of foodgrains from abroad during the period of control have all along been on Government account, although the method adopted for obtaining these imports have varied with the circumstances of each exporting country. The reason for the exclusion of trade from the import trade of grains is that both in regard to wheat and rice, the exporting countries, with the technical exception of the U.S., have set up monopolistic selling organisations. In the U.S., while it is possible to buy wheat and other foodgrains from a private merchant and import it into India, there is a Government-controlled corporation which keeps up market prices in accordance with a well defined policy and controls a considerable portion of the trade in foodgrains both internally and in the sphere of exports. There is, therefore, strictly speaking, no such thing as free trade or free prices of foodgrains which are exported from one country to another.

Foodgrain Production in 1952-53

The year 1952-53 was very favourable for agricultural production in the country, especially in respect of foodgrains. The total production of cereals during the year was nearly 5 million tons higher than in 1951-52 and about 1.6 million tons higher than in 1949-50, which was more or less a normal year from the point of view of agriculture in recent years. It is authoritatively stated that, since Independence, production of cereals in 1952-53 has been the highest. As the other notable features are: Since pre-war years, the area under *jowar, bajra* and maize, as well as under all *kharif* cereals, has been the highest. The acreage under all cereals established a new record of 200 million acres. Production of rice touched a new record of 23.4 million tons and is higher than even in 1949-50 and 1950-51, despite larger acreages in those years. Production of *jowar* and *bajra* this year has been highest since 1945-46. Production of maize has established a new record of 2.6 million tons and that of all *kharif* cereals has been the highest since the pre-war years except in 1943-44 when it was 39.5 million tons. Production of wheat has been highest since 1945-46. Output of barley has established a new record of 2.66 million tons. The production of *rabi* cereals has been highest since 1945-46. The overall production of cereals during 1952-53 has been highest since pre-war years, except in 1943-44, when it was 48.2 million tons; since 1945-46 it has, however, reached a new record. The following table indicates the trend of foodgrains output in recent years:

(In thousand tons)

	1948-49	1949-50	1950-51	1951-52	1952-53
Rice ..	22,597	23,170	20,295	20,741	23,424
Wheat ..	5,650	6,290	6,374	6,039	6,762
Barley ..	2,206	2,215	2,341	2,293	2,664
Jowar ..	5,022	5,777	5,503	5,944	6,038
Bajra ..	2,171	2,790	2,549	2,299	2,022
Maize ..	2,072	2,014	1,701	2,021	2,600
Ragi ..	1,465	1,520	1,407	1,212	1,235
Gram ..	4,535	3,667	3,593	3,293	3,771

The marked increase in the production of foodgrains during 1952-53, it is stated, has not been entirely due to the Grow-more-food schemes. In 1952-53, cotton declined in prices by 17 per cent., jute by 49 per cent., groundnut by 20 per cent. and linseed by 29 per cent., as compared with the price levels in 1951-52, while index of food articles declined only by 12 per cent. The farmer has, therefore, turned more and more to the production of foodgrains in preference to cash crops. The relaxation of food controls and reduction of the quantity procured by the State Governments leave him free to dispose of the major portion of his food crops in the free market. This has been another important reason for the increase in production of foodgrains. The minimum price of sugarcane to be paid by factories had been fixed too high till 1951-52. It was substantially reduced in 1952-53. Consequently, wheat acreage has gone up in place of the abnormal increase which had taken place in the area under sugarcane.

The present food policy of the Government of India was announced by the Deputy Food Minister in the Council of States on 24th November, 1953. He said: "It has been decided to decontrol wheat and coarse grains, except that inter-State barriers will continue as hitherto. It is not proposed to disturb for the present the existing rationing arrangements for the distribution of rice. The rice supply position in the country has improved considerably, but it is still not so easy as to justify complete derationing of rice. The supply position of wheat and coarse grains is quite satisfactory and the Government do not expect any undue increase in their prices. The Government also hold large stocks of wheat, which they could continue to issue through the Government depots to wholesale dealers without quantitative limit and this would further ensure against rise in prices."—*All Rights Reserved.*

TREND OF INDIA'S FOREIGN TRADE

(Concluded from page 149)

the corresponding period of the previous year being Rs. 80.06 crores and Rs. 89.46 crores, respectively. Exports to Ceylon were slightly lower at Rs. 11.54 crores, as against Rs. 12.49 crores in the previous year. Sendings to Aden and Singapore receded from Rs. 6.76 crores and Rs. 8.65 crores to Rs. 6.28 crores and Rs. 7.20 crores, respectively. Exports to Canada were more or less steady at Rs. 9.02 crores, while those to Australia receded from Rs. 20.87 crores to Rs. 10.79 crores. The intake of Indian goods by Nigeria, Kenya and Sudan was somewhat lower at Rs. 4.47 crores, Rs. 3.32 crores and Rs. 3.09 crores, respectively. There has been a marked decline in the exports of Indian goods to the Continental countries, the imports by West Germany and Italy dropping from Rs. 7.83 crores and Rs. 6.82 crores to Rs. 6.26 crores and Rs. 3.95 crores, respectively. Exports to Indonesia were steady at Rs. 3.73 crores, while those to Japan moved up from Rs. 15.29 crores to Rs. 19.16 crores. Imports of Indian goods into Burma declined from Rs. 17.56 crores to Rs. 13.57 crores and those into Egypt from Rs 5.67 crores to Rs. 3.55 crores. Among the South American countries, the trade with Argentina was very unsteady, exports showing a high figure of Rs. 12.52 crores, as against a mere Rs. 38 lakhs in the same period of the previous year.

Quality of Exports

The pattern of India's trade is still of a fluid nature, in view of its development programme, and it will take a few more years for the position to get stabilised. Generally speaking, it will not be impossible for this country to reduce imports of foodgrains still further when its irrigation projects are completed, as also to effect an appreciable reduction in the intake of long-staple cotton from countries other than Egypt by growing more long-staple varieties in irrigated areas. With the establishment of heavy electrical industries and the expansion of the steel and machine tool industries, imports of manufactured goods will also recede gradually in the coming years. The same will be the case with cycles and motor cars. Some improvement will, however, take place in the imports of specialised machinery and consumer articles. On the export side, India must take special measures to improve the quality of cloth production for export purposes and to grow high quality raw jute within the country to enable it to export better quality of jute goods.

In recent years, the country has been experiencing a substantially adverse trade balance with the European countries in view of the reduction in the exports of oilseeds, vegetable oils, short-staple cotton, coffee, raw hides and skins, etc., and it has, therefore, to take suitable steps to improve the trade at least in some of these goods with these countries. For this purpose, it has to grow more of edible oilseeds, coffee and medium-staple cotton. More than these, India has to concentrate its attention on the development of its export trade with its neighbouring countries, by improving the quality and reliability of its export products. It is to be hoped that the contemplated export promotion councils will be functioning in the country within the next few months. Nevertheless, there may not be any marked expansion in the volume of India's foreign trade in the coming years, inasmuch as the present trend of industrial and agricultural development is such as to make the country more and more self-reliant in the case of a number of goods both in respect of exports and imports.

HIDES EXPORTS IMPROVE

NO SERIOUS COMPETITION FROM SUBSTITUTES

MADRAS, 30th November

THE characteristics of the hides and skins trade during the year under review remained more or less unchanged as in 1952. The tanning industry was export-minded, although several tanners had no regard for the production of export-worthy merchandise. Buyers in the overseas markets were selective in their purchases and honest tannages enjoyed excellent call at all times at attractive prices. This should be an eye-opener to the tanners to refrain from the malpractice of fraudulently overloading the tannages; they should strive hard to produce genuine merchandise.

The Government of India has been greatly concerned over the deterioration in tannages. It is considering ways and means of enforcing shipments of E.I. tanned leather only under "Agmark" label, accompanied by official certificates of grading. It is hoped that exports through ports, other than Madras, would come under the regulation, as, otherwise, there could be heavy leakages, and the object of the measure would be defeated. It is proposed that the Central Leather Institute at Madras will analyse leather samples intended for export. This is a step in the right direction. To what extent will testing and grading be feasible to cover shipments of various marks, tannages and selections meticulously will, of course, remain to be seen, considering that over 7,800 bales tanned hides and skins monthly have been shipped overseas during 1953 from Madras.

The Madras Government has recommended the enactment of legislation to eliminate the adulteration of tanned hides and skins, by compelling the exporters to make a declaration to the customs that the hides and skins offered for export are free from adulteration, by imposing a fine on the exporter who makes a false declaration, and by banning the export of leather of a certain mark which is found to be adulterated on more than three occasions.

Adulteration in Tannages

The U.K. Leather Importers, Factories and Merchants' Association (L.I.F.M.A.), London, on the other hand, is pressing for clausing the contracts covering the import of E.I.tanned skins and hides on leather substance basis which will be an inducement to tanners to produce unadulterated leather. But the view held by the Indian section of the trade is against this proposal, as the tanners have no facility to test their output periodically to show the percentage of moisture, oil and grease, water solubles, ash of insolubles and leather substance (by difference) as desired by the L.I.F.M.A. Shippers are, therefore, now faced with the aforesaid three proposals, and the final outcome is awaited with interest. But the fact remains that adulteration in tannages has been on the increase and has to be put down ruthlessly without loss of time.

The Government of India has recognised that the compulsory ban on the slaughter of cattle would be wasteful and, if enforced, is bound to lead to a lower standard of cattle life and breeding in the country, as nearly 40 million cattle do not give milk and are a great drain on the available fodder and other cattle feed resources in the country. It would be an advantage if the Government were to penalise the flaying of animals by untrained men, as the loss due to bad flay has been estimated to cost Rs. 25 lakhs per annum.

Despite the poor quality of most of the tannages, there was an appreciable expansion in export trade from Madras during the year under review. Shipments of tanned hides and calf to the U.K. during the first half of 1953 amounted to over 30,000 bales of 600 lbs. each; this was double the figure for the corresponding period in 1952. During July-October, the respective figures were over 20,000 bales in 1953 and 16,000 bales in 1952.

Demand for E.I. tanned cow hides, cow calf and buff calf was good and for buff hides moderate. Price fluctuations were within fairly narrow limits, except for cow hides light weights and cow calf. The strength of the kip market during December, 1952, and early January, 1953, was short-lived, due to the U.K. importers' inability to get the equivalent advance for their dressed leather. Consequently, much hard bargaining took place before booking business and this was a feature during the year. Enquiries were mostly for top grades and lower selections were neglected and prices declined in consequence. Several shippers had to send to London consignments of tanned cow hides for later sale, whenever they found shipment prices unattractive. In March, trading was active, following good call for lower grades. There was a lull in buying during April, due to Easter holidays and to the improved Korean situation. Tanners got nervous and lower prices came through Madras, and this was fully taken advantage of by U.K. dressers who have been combing the market for cheaper lines and buying only for current requirements. The market steadied itself during June-July. Owing to August holidays in the U.K., trading tapered off and business continued to be difficult. During October and the first half of November, prices hardened, thanks to improved demand from the U.K., but declined again when dressers kept out of the market, as they were rather heavily committed and had to contend with contracted consumer demand. U.K. buyers desire to see a steady market, so as to ensure an even flow of business, and are willing to pay increases whenever advances are obtainable on finished leather.

Price Spreads

A notable feature in the kip trade with the U.K. during the period under review was the demand for lower and top grades to the unnatural exclusion of the intermediary selections. Importers widened the price differentials between grades to suit their leather requirements. But from the tanners' viewpoint, this is undesirable, because it is often difficult for them to foresee the tanned outturn of their raw purchases from several centres which reach them sometimes partially putrefied, due to heavy transit delays. In the interest of the shippers, it is essential that price-spreads between grades are narrowed down, because incentive will be strong for some shippers to upgrade the selections on a rising market, as it will be for some of the buyers to degrade them and claim compensation on a falling market.

In the tanned skins section, tanners of sheep skins enjoyed a fair measure of prosperity, while goat skins tanners met with several vicissitudes, as a result of price fluctuations in the overseas market. Demand for tanned sheep skins primes class and lining types ruled steady to firm throughout the year. As spot prices in the U.K. were higher than the price levels for shipment business, large quantities of tanned goat skins were shipped to the U.K. on consignment account for later sale. Shipments of tanned sheep skins to Japan have been large and importers have been buying not only lining types but also semi-prime sheep skins on a moderate scale. During the month of November, 1953, two steamers took nearly 537 bales of tanned sheep skins to Japanese ports. The steadiness in the sheep market was mostly due to the offtake on Japanese account.

Shipments of tanned skins to the U.K., the Continent and Japan have been on the increase and this has offset the decline in trade with the U.S.A., as the following figures will show:—

(In bales)

	1952		1953	
	1st half	*2nd half*	*1st half*	*July-Oct.*
U.K.	5,420	9,052	10,047	6,593
Continent	12,040	1,812	2,063	1,445
Japan	653	1,547	1,840	1,067
U.S.A.	1,420	943	857	477

As U.S. importers have been "price buyers," there was perceptible decline in the trade with the U.S. during the year under review. Importers have not been keen on buying E.I. tanned merchandise at U.K.-Continental levels, in view of their domestic raw hides being cheaper. Iraq skins and Brazilian goat skins have been more paying propositions to them by reason of their spread and price *vis-a-vis* those of South India. The average monthly shipments of E.I. tanned hides and skins and drysalted skins to the U.S. were 1,000 bales in 1951, 750 bales in 1952 and 500 bales in 1953. The decline is to be regretted, in view of the loss of dollar exchange to the Government of India.

E.I. tanned merchandise is dependent mostly on U.K. buying, and it is advisable for tanners to buy cautiously in the raw markets and regulate their output in relation to offtake. Export figures have proved that competition from leather substitutes has not made serious inroads into the trade. And, as leather remains a preferred material, the outlook for the new year seems quite good.

* * *

KANPUR, 2nd December

The general conditions in the hides and skins market during the year that is just drawing to a close were one of persistent insecurity. The main factor which affected the market was practically the end of the Korean war initiating a world-wide repercussion in the shape of a trade recession. The setback was particularly in evidence in the case of goat and sheep which are included in the O.G.L. The American demand for goat slackened and traders who had despatched considerable goods in the early months of the year experienced great difficulty in getting goods accepted after arrival with due grace. Occasionally, on flimsy grounds, claims which, it was alleged, were inspired by lower rates prevailing at the time of the arrival of goods in American ports, were made.

Sheep, however, did not register any sharp fall in price, owing to the fact that Tibetan wool not being easily available in India in the wake of the Chinese entry into Tibet, sheep skins were much in demand. The prices of sheep, as also of goat skins, would have been lower had it not been of a special category of raw materials which are obtainable only after slaughter for consumption. Wages having fallen, unemployment having increased against the background of the persistent fact of play-offs in the local mills, the number of skins available was less. But the price of sheep was not as high as would encourage slaughter on that account. Both the categories of wet salted cow and buff registered a sharp fall in prices during 1953, as compared with the previous year.

The advent of Pakistan had resulted in the emigration of a number of Muslim tanners to Pakistan, which had adversely affected the indigenous industry. But by 1952, things had been adjusted, and against the general scarcity, working with depleted hands in the tanneries had become a normal practice. In the circumstances, one naturally expected that hides and skins available in the markets would be readily disposed of. This expectation, however, has not materialised, thanks to the formidable competition from plastic goods which has placed leather in a defensive position. This development has emphasis itself so much in recent months th inroads made by plastics into th domain of leather seems to be of a per manent character. Nevertheless, stocks left unsold with traders are not as b as would justify their inclusion in O.G.L. of the prohibited items such cow and buff.

Cow Hides

The cow slaughter movement having persisted, cow hides are not as abundant as formerly. The downward trend in price is, therefore, doubly significant. Scarcity of cow hides obtained from slaughtered animal has encouraged a movement for saving the hides from naturally dead animals. *Sukti*, that is hides from dead animals, is fairly in demand and stockists are prone to take care of the quality and upkeep, so that the same may differ from wet ones as little as is inevitable. Country tanners who are keen buyers of *sukti* goods have been lukewarm ever since the fall in prices of staple agricultural crops, the peasantry being mainly interested in country-made shoes.

As far as the future is concerned, no optimism is noticeable either on the supply position or on the cow-slaughter movement or on the general conditions of world politics which has a direc bearing on trade. On the contrary, the general talk is that worse days lie ahead. Acute apprehension is the dominant note in the market.

During 1952, Britain imported hide and skins to the value of ab £16,000,00, representing about 60 to per cent. of the needs of the leath industry. This was three times th price paid for importations during th year before the war. Prices, whic reached an all-time high level in th spring of 1951—largely owing to th war in Korea—have fallen steadil are becoming fairly stable. In three years the value of direc of leather have been as follo

1950	£
1951	£15,
1952 (after the big fall in prices)	£13,400,(

These figures include some manu tured goods, but exclude footwe which accounts for an average £3,000,000 annually. In 1953, up to 1 September, leather exports produced about £9,000,000, which is one million pounds up on the corresponding period in 1952.

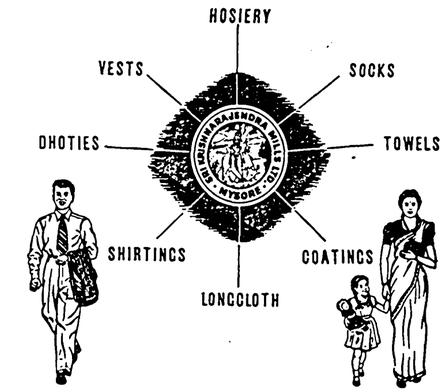
Lively Centre OF INVITING FABRICS



TEXTILE Fabrics by "SHRI KRISHNA" are a centre of attraction for Gents, Ladies and Children of all classes. Our fabrics are well known in the country for their cheapness, finish and durability. Expert handloom weavers all-over the country prefer our **QUALITY YARNS** for uniform strength and evenness. Children equally with the grown-ups love our **HOSIERY** and **CLOTH** for feel, finish and comfort.

"SRI KRISHNA" makes fabrics—as cotton and silk fabrics should be made—for full value and satisfaction.

MYSORE

Feeding the National Wealth

The THAPARS have always been keenly alert to the interests of India's nascent Industry and have made every effort to meet its many and varied demands. It is their deep-rooted conviction that our national wealth and prosperity can most effectively be promoted through India's industrial strength and progress. Working ever with this conviction at heart the THAPARS have set up a group of industries—such as, Coal, Paper, Sugar, Textile, Medicine, Radio—all so essential for the life of the community everywhere.

Thapar's contributions to India's Industrial progress include :—
