The section dealing specifically with economic and technical development abroad (as distinguished from proposed military aid) stated:

"Net budget expenditures for economic and technical development in the fiscal year 1955 are estimated at $1,028 million, compared with $1,555 million in the fiscal year 1954 and $1,960 million in 1953. This budget, as did the fiscal year 1954 budget, reflects proportionately greater emphasis on programmes in Asia, Africa and Latin America. It contemplates new appropriations for aid to very few European countries.

"In the Far East, there is a need for contributions to provide for relief in Korea and, now that hostilities have been terminated, for an expanded reconstruction programme for that war-devastated country. Funds are also recommended to maintain the strength and security of Formosa and to support further the effort of our friends combating Communist aggression in Indo-China.

"The budget also provides for technical assistance and economic development in India, Pakistan, the Philippines and other nations of Asia to encourage continued progress in their efforts to improve the living conditions of their people.

"With respect to the Near East, the budget provides for helping relieve the plight of Arab refugees through contributions to the U.N. refugee agency, and for technical assistance and supplementary economic development in the Arab States, Israel and Iran.

"Provision is also made in the budget for continuing the technical assistance programme for Latin America. This programme, which has existed for a number of years, contributes to a reduction of social and economic problems upon which communism feeds and which hampers the development of stable and growing economies."

Military Aid

The budget estimates a total of $4,275 million will be spent in the fiscal year 1955 for continuing the mutual military programme, which represents military assistance to help other free nations deter aggression. This compares with an estimated $4,200 million in the current year and about $4,000 million for the year before. The message does not break down the proposed military aid by area or country.

The President said the new budget represents a period of transition from heavy dependence by a large number of countries upon massive bilateral economic assistance from the United States to the use of such assistance in more limited circumstances. He noted that progress had been achieved through past aid from the United States and by "positive and constructive" measures taken by other countries. He added:

"My budget recommendations for the international programme of the Government will enable us to hold our newly won initiative in world affairs and move toward a lasting peace. Our national security and international programmes are designed to deter would-be aggressors against the United States and other nations of the free world and to strengthen our efforts for peace by all appropriate means, including diplomatic negotiations with the Soviets."

Atomic Energy

On the question of atomic energy, the President noted that authority is recommended "for new and advanced work on the peace-time uses of atomic energy in the earnest hope that present international relationships can be improved and the wonders of nuclear power can be turned gradually to the development of a

U.S. FOREIGN ECONOMIC POLICY

MAIN POINTS OF RANDALL COMMISSION'S RECOMMENDATIONS

THE eagerly-awaited report of the Randall Commission on foreign economic policy of the U.S. has now been published. This report contains more than a score of recommendations designed to advance international trade in a spirit of mutual confidence. From available reports, it is not clear whether this report, covering 100 pages, is the final report of the Commission or any further reports will be submitted. It has a minute of dissent, written by two out of the 17 members of the Commission. This minority is of the opinion that the majority report is "too indefinite, too hastily prepared and unrepresentative of the U.S. industry." Both the members who have contributed this note of dissent belong to the Republican Party and have long advocated high tariffs.

It will be recalled that, in August last, President Eisenhower appointed a committee of 17 members, under the presidentship of Mr. Clarence Randall, Chairman of the Inland Steel Corporation and Vice-Chairman of the International Relations Committee of the National Association of Manufacturers, to "find acceptable ways and means of widening and deepening channels of economic intercourse between ourselves and our partners in the free world." The following are the main points recommended by the majority of the Commission:

1. Economic aid on a grant basis should be terminated as soon as possible, and no further aid is justified, unless it contributes to the security of the United States.

2. The offshore procurement programme should be governed by factors of cost and availability, as it is in the United States, or on "broad strategic judgments." This programme should not be used as a form of general economic aid.

3. Where friendly nations require support to maintain their military forces—"connected with U.S. own security"—grants should be made, not loans. In other cases, where substantial economic aid is necessary "in the interest of the United States" but cannot be obtained from private sources, loans should be made, not grants.

4. The Technical Co-operation Programme should be pressed forward vigorously. It should not become a "big money" programme and should not involve capital investments.

5. The U.S. should continue to support the United Nations' expanded Technical Assistance Programme and the programme of the Organisation of American States, but no country should contribute as much as 60 per cent. of the financing of the world-wide co-operative effort.

6. The U.S. Government should do all it can to create "a climate" that would encourage private investments abroad, because private capital, in the main, must "undertake the job of assisting in economic development abroad."

7. The U.S. corporate tax on income from U.S. investments abroad should be reduced by "at least 14 per cent." and private individuals should be able to offset in full against their domestic tax, the appropriate foreign tax.

8. The existing programme of guarantees against expropriation or inconvertibility of exchange—being administered by the Foreign Operations Administration (F.O.A.)—should be given a further period of trial.

9. The Export-Import Bank should continue to make loans "which are in the special interests of the United States," and which are based on sound credit policies.

10. The International Wheat Agreement of 1953 should be used to the full in resolving pressing wheat problems while it is in operation and "its termination in 1956 be given consideration."

11. The U.S. should move "as rapidly as feasible" towards elimination of inflexible price-support programmes in agriculture "which result in fixed prices, open or concealed export subsidies, import quotas at home and abroad, excessive use of tariffs."

12. Fluctuating prices of raw materials cannot be stabilised by commodity agreements. Greater stability of world prices should be sought, rather, through relaxation of trade impediments, diversification of economies of the countries "now excessively dependent on a small number of products" and through continued consultation and co-operation with other nations to improve knowledge of world supply and demand and to explore possible means of lessening instability.

13. The "Buy American" Act should be amended, so that the President might exempt from its provisions the bidders from other nations "that treat our bidders on an equal basis with their own nationals." Meanwhile, the President should direct procurement agencies to consider foreign bids which satisfy all other considerations on "substantially the same price basis as domestic bids."

14. Congress should direct the President to have the Tariff Commission undertake a study of the tariff schedules immediately, with a view to ensuring greater simplicity of the tariff "definitions" and also possible changes in rates.

15. The President's power to negotiate trade agreements under the Trade Agreements Act and to place them in force should be extended for not less than three years, "with appropriate safeguards." It should include the authority to reduce any existing tariff rate five per cent. in each of the three years.

16. The issuance of passports and visas to tourists should be made less difficult, and duty-free allowance for tourists should be increased from $500 to $1,000.

17. The present ban on exports by the United States to Communist China and North Korea, and U.S. efforts to secure similar action by other free nations must continue, until the present threat to free world security has been removed.

18. The U.S. efforts to prevent exports to the European-Soviet bloc that might contribute to its military strength must continue until genuine peace is assured.

19. So far as it can be done without jeopardising military security, and subject to the embargo on Communist China and North Korea, the United States should acquiesce in more trade in peaceful goods between Western Europe and the Soviet bloc.

20. Gradual but positive progress towards currency convertibility is urged, but responsibility for introducing currency convertibility should rest on the countries concerned.

21. Convertible currencies are "indispensable" for the attainment of world-wide multilateral trade and the maintenance of balanced trade in a relatively free market.

22. The $3,300 million in the gold and convertible currencies holdings of the International Monetary Fund—a United Nations institution—should be used more actively to effect "a gradual and controlled" approach to eventual full convertibility.

The foregoing recommendations are not binding on the U.S. President or Congress. Until acted upon, they simply constitute proposals aimed at promoting world trade and strengthening the economies of the U.S. and its friends among the family of nations.

The minority views in the report included the following:

(1) Foreign aid recommendations envisage too much continued aid.

(2) Opposition to public foreign lending—loans by the U.S. Government—is too strong, considering that there are cases where such lending "is amply justified."

(3) The impact of U.S. farm policy at home must be fully considered in any consideration of farm prices in relation to U.S. foreign trade policies.

Even the 15 members, who have signed the majority report, did not reach unanimous agreement on each and all of their recommendations. We are told that on individual items there are more than 20 dissenting opinions.

INDIA'S SEA- AND AIR-BORNE TRADE IN APRIL-SEPTEMBER, 1953

EXPORTS STAGE CONTINUOUS DECLINE

ALTHOUGH the total value of the sea- and air-borne trade of India during the first half of the current fiscal year, namely, April-September, 1953, discloses a fall of 18.8 per cent. over that in the corresponding period of the preceding year, it shows a rise of 5.5 per cent. over that of the preceding half-year, namely, October, 1952 to March, 1953. Thus in the half-year under review, the value of total trade amounted to Rs. 547.22 crores, which is Rs. 126.59 crores lower than that in April-September, 1952-53, but Rs. 29.20 crores more than that in the previous half-year.

The value of total imports in April-September, 1953, was Rs. 300.10 crores, as compared with Rs. 251.67 crores in the preceding half-year and Rs. 382.93 crores in April-September, 1952. The improvement in the value of imports is due to the liberalisation of import controls for the first half of the calendar year, 1953, announced towards the end of 1952, following the improvement noticed in the balance of payments position of the country.

Exports from India, on the other hand, showed a continuous decline during the successive three half-years. Thus, the value of exports in April-September, 1952, was Rs. 290.88 crores. It dropped to Rs. 266.35 crores in the next six-month period, namely, October, 1952 to March, 1953, and still further to Rs. 247.12 crores in the half-year under review, namely, April-September, 1953-54. The recession may be attributed to the aftermath of the sudden slump in March, 1952, continued high level of export duties on certain articles, and the resurgence of a strong buyers' market, following competition from many producing countries in world markets.

The net result of the variations in imports into and exports from India, during the first half of the current fiscal year, is an adverse trade balance of Rs. 52.98 crores, as against a surplus of Rs. 14.68 crores, in the previous six months and a large deficit of Rs. 92.05 crores in the corresponding half-year of the previous financial year. It will be appropriate to recall here the observations of the Commerce Minister, Mr. D. P. Karmarker, made at the recent half-yearly general meeting of the Merchants' Chamber of U.P. on trade deficits and the Government's method to cover them. He said:

"Our main aim in the exercise of import control has been to ensure the maximum availability of goods required for the internal economy of the country within the limits of the availability of foreign exchange. The balancing of foreign trade has, therefore, not been the sole objective of our trade control. If that was so, it would have been an easy matter to cut down imports and show a favourable balance on paper. The effect on our economy of such a course would have been disastrous. What we have been aiming at is to attain a satisfactory balance of payments. The deficits in the balance of trade, which we have allowed, have been such that it has been possible for us, throughout the last two or three years, to finance them from within our own resources and releases from the sterling balances. In fact, we have not utilised fully the sterling balance releases for the last two exchange years. The balance of trade has also begun to improve and, according to the trade figures for September, October and November, there has been a net favourable balance of trade of Rs. 15 crores."

It is evident from the foregoing remarks that the trade deficit is well within the capacity of the country to manage and for the present the question of any balance of payments difficulty does not, therefore, arise.

The following table shows, at a glance, the value of total imports, exports, the total trade and the balance of trade of India in the first half of 1953-54, as compared with the two preceding half-years:

(Rs. in crores)

	April-September, 1953	October March, 1952-53	April-September 1952
Total imports	300.10	251.67	382.93
Total exports	247.12	266.35	290.88
Total trade	547.22	518.02	673.81
Balance of trade (+) or (—).	—52.98	+14.68	—92.05

During the half-year under review, the total value of imports, as stated already, amounted to Rs. 300.10 crores, as compared with Rs. 251.67 crores in the previous half-year. Of this total, imports of foodgrains accounted for Rs. 57 crores or 19 per cent. of the total. In the preceding half-year, these imports, amounting to as much as Rs. 119 crores, represented as much as 44.5 per cent. of the total. The fall in imports reflects the improvement in domestic production. The other three main items which figure prominently in imports under the category of food, drink and tobacco are: (a) provisions and oilman stores which have gone up from Rs. 3.96 crores to Rs. 4.24 crores, (b) fruits and vegetables which have risen from Rs. 2.93 crores to Rs. 4.01 crores, and (c) spices. Imports of the last named item too have improved from Rs. 1.94 crores to Rs. 2.86 crores.

Among raw materials imported during the half-year, raw cotton declined sharply from Rs. 52.49 crores to Rs. 33.14 crores. But imports of oils of all types rose from Rs. 38.89 crores to Rs. 47.31 crores.

Of the total value of manufactures imported, machinery of all kinds accounted for Rs. 43.26 crores or a drop of Rs. 2.12 crores, as compared with those in the preceding half-year. Imports of chemicals and drugs amounted in value to Rs. 11.90 crores, as against Rs. 14.59 crores. The intake of iron and steel manufactures also was slightly lower at Rs. 11.70 crores, as against Rs. 13.88 crores. There was a marked decline in the value of vehicles imported from Rs. 17.51 crores to Rs. 9.99 crores. Dyes and colours were more or less the same at Rs. 7.9 crores. Purchases of electric goods rose slightly from Rs. 6.46 crores to Rs. 7.73 crores, but those of metals receded from Rs. 9.99 crores to Rs. 7.60 crores. But imports of yarns and fabrics of all types rose from Rs. 10.15 crores to Rs. 14.48 crores. Among other imports, cutlery and hardware amounted to Rs. 7.28 crores and paper and pasteboard to Rs. 6.27 cores. as compared with Rs. 7.28 crores and Rs. 6.27 crores, respectively

The table below gives the value of certain principal items of imports during the half-year under review, as compared with the corresponding period of the preceding two years.

Imports

(In crores of rupees)

	Six months, April to September		
	1951	1952	1953
CLASS I			
Food, Drink and Tobacco	109.72	130.62	88.44
Grains, pulses and flour	96.04	119.07	57.02
Provisions and oilman's stores ..	4.20	3.96	4.24
Fruits and vegetables	2.51	2.93	4.01
Spices	4.60	1.94	2.86
CLASS II			
Raw Materials	120.24	101.64	82.87
Oils	86.95	88.89	47.31
Raw cotton	64.45	52.49	33.14
CLASS III			
Manufactures	172.93	148.76	135.94
Machinery of all kinds	53.84	45.38	43.26
Chemicals, drugs and medicines..	16.75	14.59	11.90
Iron and steel manufactures ..	10.27	13.88	11.70
Vehicles (excluding railways) ..	14.22	17.51	9.99
Dyes and colours	11.82	7.88	7.95
Electric goods	4.51	6.46	7.73
Metals	10.06	9.99	7.60
Yarns and fabrics	21.10	10.15	14.48
Cutlery and hardware	9.88	7.66	7.28
Paper, pasteboard and stationery.	7.95	5.89	6.27

Exports of Indian merchandise in April-September, 1953, aggregated Rs. 247.12 crores, as compared with Rs. 266.35 crores in the previous half-year, that is, October-March, 1952-53. Of this total, the food group accounted for Rs. 67.02 crores. As much as Rs. 41.39 crores of this total was due to exports of tea, which, in the same period of the previous year amounted to Rs. 34.12 crores. Fruits and vegetables exported, however, declined from Rs. 8.84 crores to Rs. 7.90 crores. There was also a recession in the shipments of tobacco from Rs. 8.27 crores to Rs. 7.81 crores. Despatches of spices also were low at Rs. 6.80 crores, as against Rs. 9.77 crores in the corresponding period of the previous year.

Among the raw materials, with the exception of metallic and non-metallic mining products, practically every other principal item of exports reported declines, as will be evident from the table below. The value of non-metallic mining ore shipments improved from Rs. 4.98 crores to Rs. 5.13 crores. Similarly, exports of metallic ores and scrap iron rose from Rs. 14.59 crores to Rs. 18.37 crores. But raw cotton dwindled from Rs. 17.29 crores to Rs. 9.18 crores. Vegetable and mineral oils dropped precipitously from Rs. 14.78 crores to Rs. 4.50 crores. Gums, resins and lac receded from Rs. 4.21 crores to Rs. 3.32 crores. Exports of raw hides and skins, however, were more or less the same at Rs. 2.99 crores. Shipments of coal fell from Rs. 4.70 crores to Rs. 2.54 crores. Exports of wool and seeds for oils were also lower at Rs. 2.52 crores and Rs. 1.12 crores.

Indian manufactures recorded a further recession. Jute manufactures, for instance, amounted to Rs. 55.82 crores as against Rs. 77.94 crores and Rs. 150.23 crores in the same period of the preceding two years, respectively. The offtake of cotton yarns and fabrics declined from Rs. 40.56 crores to Rs. 33.29 crores. But shipments of tanned hides and skins improved from Rs. 7.08 crores to Rs. 11.79 crores. There was also a slight improvement from Rs. 1.23 crores to Rs. 2.04 crores in the value of exports of woollen manufactures. Sales of chemicals and drugs were also slightly better at Rs. 1.97 crores. Apparel and cutlery amounted to Rs. 1.60 crores and Rs. 1.21 crores, as against Rs. 1.66 crores and Rs. 1.13 crores, respectively.

The table below shows the value of principal commodities exported abroad during April-September, 1953, as compared with the values of exports in the same period of the two immediate preceding years:

Exports

(In crores of rupees)

	Six months, April to September		
	1951	1952	1953
CLASS I			
Food, Drink and Tobacco	73.17	66.06	67.02
Tea	39.72	34.12	41.39
Fruits and vegetables	6.72	8.84	7.90
Tobacco	9.84	8.27	7.81
Spices	13.95	9.77	6.80
CLASS II			
Raw Materials	80.98	75.58	56.21
Metallic ores and scrap iron ..	7.40	14.59	18.37
Raw cotton	17.53	17.29	9.18
Non-metallic mining products ..	8.50	4.98	5.13
Oils (vegetable, mineral, etc.) ..	13.74	14.78	4.50
Gums, resins and lac	9.25	4.21	3.32
Raw hides and skins	5.26	2.73	2.99
Coal	8.29	4.70	2.54
Wool	0.72	3.94	2.52
Seeds (for oils)	5.87	2.82	1.12
CLASS III			
Manufactures	220.41	144.08	121.86
Jute yarns and fabrics	150.23	77.94	55.82
Cotton yarns and fabrics	28.37	40.56	33.29
Tanned hides and skins	16.84	7.08	11.79
Woollen yarns and fabrics ..	4.55	1.23	2.04
Chemicals, drugs and medicines..	2.77	1.64	1.97
Apparel	1.81	1.66	1.60
Cutlery and hardware	1.16	1.13	1.21

The index number of average unit of declared values of exports for August, 1952, the latest month for which the figure is available (with 1948=100), was 113.2. This figure reveals a fall of 3.4 per cent. over the figure for August 1952. Similarly, there was a fall of 9.7 per cent. in the index figure for imports at 110.5. Again, the quantum index for exports shows a fall of 30 points to 96 and that for imports a decline of 13 points from 98 to 85.

Geographical Distribution

During the half-year under review, India's offtake of goods from Commonwealth countries showed an increase from Rs. 136.45 crores to Rs. 145.18 crores. The U.K. continued to be the chief supplier, accounting for a total sale of Rs. 70.16 crores or nearly half the total imports from this area. The next in importance was Australia which shipped goods of the order of Rs. 20.76 crores, as against Rs. 7.33 crores in the corresponding half-year of the preceding year. Canada which held the second rank in April to September, 1952, moved two places down, having sold goods worth Rs. 9.30 crores as against Rs. 21.18 crores. Kenya's shipments amounted to Rs. 11.88 crores as against Rs. 12.16 crores. Imports from Singapore aggregated Rs. 8.26 crores, as against Rs. 6.09 crores. Behrein Islands shipped to India goods valued at Rs. 8.20 crores, as against Rs. 8.16 crores. Imports from Sudan rose from Rs. 2.08 crores to Rs. 5.87 crores.

Among non-Commonwealth countries, the United States continued to be the chief supplier. Out of a total of Rs. 154.02 crores of goods imported from these countries, the U.S. share was Rs. 48.47 crores, as compared with Rs. 134.50 crores in the same period of the 1952-53 fiscal year. Burma accounted for Rs. 15.20 crores, as against Rs. 19.69 crores, and West Germany Rs. 14.82 crores, as against Rs. 11.91 crores. Egypt's sales doubled from Rs. 6.8 crores to Rs. 13.51 crores. Despatches from Italy also doubled from Rs. 5.04 crores to Rs. 11.9 crores.

The value of exports from India to Commonwealth countries declined from Rs. 135.38 crores to Rs. 119.65 crores. Britain's offtake, however, rose from Rs. 53.02 crores to Rs. 64.07 crores. But sales of Indian merchandise to Australia receded from Rs. 11.57 crores to Rs. 8.43 crores. Ceylon too purchased less at Rs. 7.93 crores as against Rs. 8.58 crores. Canada's offtake was fractionally better at Rs. 6.98 crores.

Despatches to non-Commonwealth countries also dropped from Rs. 153 crores to Rs. 125 crores. Although the U.S. offtake was less at Rs. 44.93 crores, the country continued to be the second best customer next to the U.K. Shipments to Burma and Japan amounted to Rs. 13.11 crores and Rs. 12.34 crores, as compared with Rs. 13.84 crores and Rs. 15.87 crores, respectively. Exports to Argentina were better at Rs. 11.90 crores. Western Germany's purchases were, however, slightly lower at Rs. 5.07 crores, as against Rs. 6.03 crores.

LAND REFORM UNDER FIVE-YEAR PLAN

PROGRESS IN MANY SPHERES SLOW

THE Planning Commission's review of the progress of land reform in India during the first half of the Plan period reads more like a restatement of policy than like an accurate statistical assessment of progress so far made in the implementation of the land reform policies set down by the Commission. The review couches the progress in generic terms such as "land reform has received greater impetus," "progress, in varying degrees, has been made on many aspects of land reform," "in many States much remains to be done," etc. The Commission could not have done otherwise than generalise; for the issues involved are both very big and complex and in a democratic country such as the Indian Union, made up of over two dozen States with varying forms of land tenure, they cannot be solved in a short period. Besides, the executive authority in respect of land reforms is vested not in the Centre but in the States each of which differs greatly in regard not only to the level of administration but also to the state of economic progress. Moreover, land reforms touch the peasant classes and States Ministries are known to be chary of pushing ahead with these reforms, in the face of opposition from these classes. Consequently, no reform would be possible, unless the masses are educated to realise that a particular reform is in their as well as in the country's interests. The Commission is not unaware of these difficulties. For it observes:

"Land policy has to be worked out in each State in terms of local needs and conditions. Thus, while the pace of land reform and economic development cannot be the same all over the country, there should be a broad common approach in land reform progress. To ensure this, the Planning Commission had suggested the setting up of an organisation in the Central Government which could deal with the land reform problems as part of a national programme."

In pursuance of this, the Government of India constituted a Central Committee for Land Reforms in May, 1953. This Committee has, since its inception, advised on the land reform proposals of P.E.P.S.U., Delhi and Himachal Pradesh Governments. This is a notable step forward in the implementation of the Plan, even though the work done by this Committee hitherto was confined to tendering advice to the smaller States. The Commission expects the Committee to complete the first phase of the programme for the abolition of intermediaries and the reform of tenancies within the next two years.

Now let us turn to the Commission's review of the work done in several States in the various spheres of land reform, namely, abolition of intermediaries, reform of tenancy, fixation of rents, security of tenure, ceiling on land-holdings, sub-division and consolidation of holdings.

Abolition of Intermediaries

Abolition of intermediaries (such as *Zamindars*) between the State and the tiller of the soil, as a policy, has been universally accepted by all States. Since Independence, the States have been trying to implement the policy. The Planning Commission, too, has accepted it and urged the States to expedite the process. The progress in this sphere, however, seems to be not very encouraging. Most States have not passed beyond providing legislation for the abolition of intermediaries. Thus, all Part A and B States, except Mysore and Travancore-Cochin, have enacted legislation while, among Part C States, in Vindhya Pradesh, Delhi and Himachal Pradesh the relevant Bills have just been passed by the legislatures. The point to be noted here is that the mere passage of legislation does not mean that the reform has been carried out. For one thing, such legislation is not often effective, unless the concerned State has a well-developed Revenue-cum-Development Administration. If sufficient progress is to be made, there is need to establish a well-trained Revenue Administration in States where there have been no such agencies. This applies mostly to the areas ruled by the Princes in the pre-Independence period. For another, even where the agency exists, the enacted legislation is known to have not only resulted in a lot of confusion and agitation, but has brought the land improvement work almost to a standstill, because the State has merely stepped into the shoes of the *Zamindar* or other similar intermediary with no tangible improvement in the status of the tiller. Actually, in many places, the tiller is now at a disadvantage, because he is unable to have easy access to the officials of the State and get their assistance even for carrying out minor improvements in the land.

The fixation and payment of compensation for lands acquired under the *Zamindari* laws have not been fair in most cases. This has alienated the sympathies of these classes who were connected with the land development. The payment is mostly in bonds bearing low rates of interest from 2½ to 3 per cent. and redeemable after a long period which in some cases is upto 40 years. Preliminaries for issue of bonds, etc., are being worked out in various States. However, one good thing that has been done is that the intermediaries have been allowed to retain their home farm-lands. Attention is needed now to see to it that those who are willing to take to achieve cultivation and need of finance are provided with financial and other facilities required for land improvement and large-scale agriculture.

Tenancy Reform

Another sphere in which very little progress has been made is the tenancy. This problem, the Planning Commission itself admits, cannot be solved, until the rights of sub-tenants of intermediaries are properly safeguarded. These tenants form the bulk of the peasant classes and reforms relating to them are concerned with scaling down of rents, providing security of tenure and enabling tenants to purchase their holdings. The Planning Commission has laid down that the general level of rents should not ordinarily exceed one-fourth or one-fifth of the gross produce. In most cases legislation for reducing rents has been enacted, but "such regulation," says the Commission, "is not often effective, unless it is accompanied by security of tenure."

But the question of security of tenure is linked with the problem of fixation of limits for holdings of land. The Commission considered the problem in two separate parts, namely, (*a*) relating to tenants who hold lands more than three times the family holding and (*b*) tenants of small and middle-owners. With regard to group (*a*), confirment of occupancy rights on payment of the price of land as a multiple of rental value in instalments has been recommended. In the case of (*b*), the tenant has been given the right to purchase the land from the owner, if the latter were to fail within about five years, to resume land upto the limit of an area which the adult workers of his family can personally cultivate with the help of agricultural labour. These suggestions of the Commission still seem to be under consideration of Governments in a few States.

In many States, much remains to be done in regard to tenancy reforms. The States of Bombay, Madhya Pradesh, Orissa, Punjab, U.P., Hyderabad, Rajasthan, Mysore, Delhi, P.E.P.S.U. and Himachal Pradesh have decided on the area which a landlord can resume for personal cultivation. There are, however, variations regarding ceilings imposed by the State Governments. Again, some of the States like Assam, Bihar, Madras, West Bengal and Madhya Bharat have so far placed no limitations on the area which a landlord can resume for personal cultivation. Tenants' right of purchase of the land held by him in tenancy has been recognised in Bombay, U.P., Hyderabad, Madhya Bharat, P.E.P.S.U., Delhi and Himachal Pradesh. In most States, the provisions, however, have yet to be enforced.

Ceiling on Landholdings

Ceiling on landholdings has been the most debated problem. The Commission recommended (1) fixation of an absolute limit to future acquisition of land; (2) as an *interim* measure, the enactment of management legislation prescribing standards of cultivation and management and obligations to be observed by all landlords. Farms above a limit to be fixed should be divided into two groups, namely, those, whose break-up would lead to a fall in production and those which do not meet this test. In the case of the second group of farms, which will be the vast majority, the Government should take over management for the settlement of landless cultivators in co-operative groups; and (3) as a long-term measure, introduction of legislation for acquisition and redistribution of efficiently managed holdings, if such acquisition was considered in the public interests, after taking a regular land census.

The Commission dealing with this aspect says that U.P., Hyderabad, Madhya Bharat and Delhi have adopted legislation for imposing ceilings on future acquisition. In U.P. and Delhi, the ceiling is 30 acres, in Madhya Bharat 50 acres and in Hyderabad five-times the family holdings. Other States have yet to initiate action. In regard to the *interim* solution (2) above) only a few States have taken action. In Hyderabad and Himachal Pradesh, Bills have recently been passed by the State Legislatures. In other States, the matter is still under consideration.

The problems involved in the fixation of ceiling on landholdings have been dealt with at length ere now in some of the previous issues of this journal. Consequently, a repetition of these issues once again is not necessary. Suffice it to say that the end and aim of all land reforms is to improve the productivity of land. The present low agricultural production is not due to the existence of large holdings but to the fragmentations of holdings. Consequently priority in implementing land policies should be given to consolidation of landholdings and not to the break-down of large-scale farms. When once the consolidation of holdings is attained, a stage will be reached when the Government may think of imposing ceilings on landholdings, provided it finds, after the holding of a land census, that such ceilings are in the interest of the country. It is, therefore, to be hoped that the question of imposing a ceiling will be deferred till an approved scheme of consolidation is successfully implemented.

On this vital reform of consolidation of landholdings, the Commission observes that it is being effected voluntarily in many States but some States have introduced compulsion. In the U.P., Bombay, Punjab, P.E.P.S.U. and Delhi, compulsory consolidation has been introduced. Recently in Bombay, consolidation schemes have been prepared for 690 villages. In the Punjab, consolidation of 12 lakh acres has already been done and the initial aim is to complete the consolidation of the entire area throughout the State by 1956-57. Considerable progress has been made in P.E.P.S.U. and Delhi.

PAYMENT OF OCCUPANCY PRICE BY WATANDARS

Watandars, who are entitled to compensation under section 6(1) of the Bombay Paragana and Kulkarni *Watans* (Abolition) Act and have also to pay occupancy price for the resumed *watan* lands, regranted to them under section 4(1) of the Act, can have the amount of the occupancy price set off against the amount of compensation, according to the orders issued by the Government of Bombay in this respect recently.

According to the procedure prescribed, the holder of a *watan* who desires to appropriate a part or whole of the compensation due to him for the abolition of his cash allowance towards the payment of occupancy price payable for resumed *watan* lands regranted to him has:

(i) first to obtain a certificate in regard to the occupancy price payable by him from the *Mamlatdar/Mahalkari* of the *taluka/peta*, in which the resumed *watan* lands are situated;

(ii) then to apply to the *Mamlatdar/Mahalkari* of the *taluka/peta* from where he was getting a cash allowance for a certificate authorising payment of the occupancy price in full or in part, from the compensation money; and

(iii) then submit to the *Mamlatdar/Mahalkari* of the *taluka/peta* in which his lands are situated the certificate authorising payment of occupancy price from the amount of compensation.

In case the amount of compensation is less than the occupancy price payable, the *Mamlatdar/Mahalkari* of the *taluka/peta* from which the holder was getting a cash allowance will not issue the certificate authorising the payment of occupancy price from compensation money until the balance is paid in cash in his sub-treasury.

The applications to the *Mamlatdar/Mahalkari* are to be made in the forms which have been prescribed by the Government.

The holders have to submit to the *Mamlatdars/Mahalkaris* of *talukas/petas* in which their lands are situated the certificates authorising payment of occupancy price in full or in part from the compensation money before 30th April, 1954, in order to enable them to avail of the concession.

DISTRIBUTION OF AMMONIUM SULPHATE

The Central Fertiliser Pool, operated by the Government of India in the Ministry of Food and Agriculture, will be continued during the year 1954, the basis of distribution being the same as in the current year. The ex-factory price of the sulphate of ammonia produced at Sindri is Rs. 290 per ton, and the question of the ultimate price, at which it should be made available to the cultivators, is at present under consideration. Discussions are in progress with the State Governments in this regard.

As the indigenous production and the carry-over from the previous year is sufficient to meet local demands, there will be no import of ammonium sulphate during 1954, on Government or private account. Certain other kinds of fertilisers, which may be produced at Sindri later, under its expansion scheme, will, however, be imported for the present in small quantities on Government account only for experimental and demonstration purposes.

LAND TRACTS OF INDIA—II

SOIL AND RAINFALL POSITION ANALYSED

IN the first section of this article, published in *Commerce* dated 14th November, 1953, we gave an outline of the various land tracts of India, in terms of their topography, namely, mountain, hill, plateau and plain and the nature of soil in these tracts. These tracts, by themselves, are not useful for growing food unless they have access to water facilities. There is, therefore, the need to study the amount of rainfall in these tracts, particularly to determine how much land can be used to grow food and the degree of usefulness of the land for the purpose. Accordingly, this article deals with the rainfall belts of India as demarcated by the *Census Report*, 1951.

The amount of rain that falls on Indian territory every year is something colossal. An inch of rain falling on an acre of land weighs not less than 2,800 maunds. Now India gets, on an average, more than 42 inches of rain on every acre of land every year. In other words, an acre of land gets, on an average, well over a lakh of maunds of water every year.

There are, as stated in the previous article, 810 million acres of land in India. On the basis of rainfall calculated above, the quantity of rain received by this area will be 81,000,000,000,000 maunds of water. If only this amount of rain fell evenly both in space and in time, the amount of food which is grown on the land of India could be greatly increased. Unfortunately, nature distributes rain even more unevenly than it does soils. Some tracts get too much rain, many get too little, and what is more, a great deal of rain falls in such places and at such times that it cannot be used to any good purpose. On the basis of rainfall, the country has been divided into five broad rain belts: (*a*) areas with over 75 inches of rain, (*b*) between 50 inches and 75 inches, (*c*) between 30 and 50 inches, (*d*) between 15 and 30 inches and (*e*) below 15 inches. Regions under (*a*) and (*b*) cover exactly a third of the country. They are well provided with sufficient rain which is generally, though not invariably, also dependable. The region (*c*) covers exactly another third of the country, where rainfall, if timely, is adequate, but the vagaries of the monsoons are apt to cause occasional failure of crops and consequent distress. The regions (*d*) and (*e*) taken together comprise the remaining third of the country. Here seasonal fluctuations are so frequent that they are more or less regularly expected, and when they occur, they cause a great deal of hardship to the people and expense to the Government. The region (*d*) in which one-fourth of India's population lives, is exposed to special hazards which are a permanent problem for the people and the Government. The region (*e*) has so little rain that few people live there.

The cultivation of land depends not only on rainfall but also on topography and soil of the land. The division of the country should, therefore, be based on all these three factors. Accordingly, India is divided into two broad divisions, high density soil regions and low density sub-regions. The latter is again divided into five regions: (1) Lower Gangetic Plains, (2) Upper Gangetic Plains, (3) Malabar-Konkan, (4) South Madras, and (5) North Madras and Orissa coast.

The Lower Gangetic Plains include the whole of West Bengal, except the three sub-Himalayan Districts (Jalpaiguri, Darjeeling and Cooch Bihar), the whole of Bihar except Chhota Nagpur Division, and Eastern Uttar Pradesh (Banaras, Ghuzipur, Ballia, Gorakhpur, Deoria, Azamgarh, Gonda and Bahraich). The soils are among the best in India. West Bengal soils are almost wholly alluvial. North Bihar soils are alluvial and calcareous. In South Bihar plains, both alluvial and red sandy soils occur. The alluvial soils of East U.P. vary from sands to heavy clays. The rainfall is normally ample and the average rainfall varies from 44 inches in East U.P. and South Bihar to 56 inches in West Bengal. The area covers 538 lakh acres, 512 lakh acres of which are topographically usable. Of this, the net area sown is 356 lakh acres. About 700 lakh people live in the area, accounting for a density of 832 persons per square mile.

The Upper Gangetic Plains include all the remaining districts of the U.P., the five Himalayan Districts of Garhwal, Tehri-Garhwal, Nainital, Almora and Dehra Dun, the five upland and hilly districts of Jhansi, Jelum, Hamipur, Banda and Mirzapur. The soils of this region are mostly alluvial. They vary widely in texture from clay and loam to sandy types. Black cotton soils also occur. The rainfall is as heavy as in the Low Gangetic Plains. The main bulk of the plains (248 lakh acres) falls between 30 and 50 inches of rainfall and about 31 lakh acres come under 75 inches but above 50 inches. About 87 lakh acres fall between 15 and 30 inches of rainfall. Out of the total area of 366 lakh acres, 346 lakh acres are topographically usable. The net area sown is 237 lakh acres. About 389 lakh people live in the area; this area has thus a density of 681 persons per square mile.

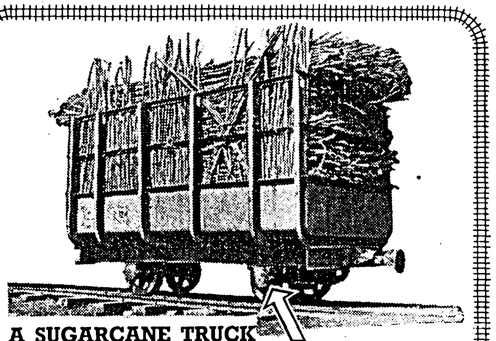
Malabar-Konkan includes the entire West Coast of India to the south of the Daman Ganga River. The soils vary from medium black in the north to red, loamy and lateric soils of the south. Rainfall is the heaviest in this part of India, being on an average above 100 inches. Out of the total area of 239 lakh acres, 128 lakh acres are topographically usable. The net area sown is 73 lakh acres. This tract, which has a population of 238 lakhs, has a density of 638 people per square mile.

South Madras consists mainly of Carnatic plains. In the major part of the interior of this region, there are red loams and medium black soils. Alluvial soils are found in the coasts. The principal rainy season of this region does not coincide with the south-west monsoon. The average annual rainfall is 37 inches. The months of October to December, cover the main rainy season when about 60 per cent. of the rain falls in the coastal strip and about 40 per cent. in the interior. The bulk of the sub-region (275 lakh acres) receives a rainfall of 30 to 50 inches. Out of 355 lakh acres 269 lakh acres are topographically usable. The net area sown is 134 lakh acres. Tallow land is relatively large, being 385 per cent. About 307 lakh people live in the region. The density of population in this area is 554 persons per square mile.

The sub-region of North Madras and Orissa coast includes all the East Coast Districts of Madras from Balsore, Cuttack, Puri, part of Gunjam, Visakhapatnam, Srikakulam, East Godavari, West Godavari, Guntur, Krishna and Nellore. The sub-region includes Eastern Ghats. The alluvial soils of the coast are very fertile. The average rainfall is 47 inches in the Orissa coastal division. The region covers a land area of 293 lakh acres. Of the land 193 lakh acres lie in the rainfall belt of 30 to 50 inches. The net area sown is 119 lakh acres, which gives a *per capita* land of 57 cents.

In the six low-density regions, namely, the desert, Western Himalayas, Eastern Himalayas, North-West Hills, North Central Hills and plateau and North-East plateau, the land area *per capita* is correspondingly high. The total population of the six sub-regions is 792 lakhs. The land area is 3,921 lakh acres. The *per capita* land area is 495 cents. The topographical conditions are dissimilar in different sub-regions. One sub-region where topography is eminently favourable is largely unusable on account of the desert. The rainfall conditions are somewhat more favourable here than in the country as a whole. About 55 per cent. of the area receives a rainfall of 30 inches to 75 inches, but where rain falls copiously, land suitable for cultivation is difficult to find. This region, however, possesses mineral resources of a distinctly higher range and value than any other part in India.

There are four medium density sub-regions, namely, trans-Gangetic plains, South Deccan, North Deccan, and Gujerat-Kathiawar, the total population of the four sub-regions is 974 lakhs. They cover a land area of 2,393 lakh acres. The soil, however, is poor and the rainfall unfavourable, with 60 per cent. of the land falling between the range of 15 ins. and 30 ins. of rainfall.



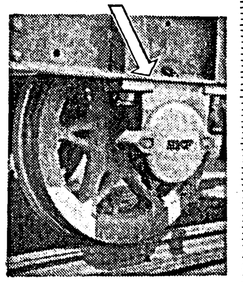
A SUGARCANE TRUCK WITH SKF ROLLER BEARING AXLEBOXES belonging to the Saraya Sugar Factory, Sardarnagar.

More than 200 trucks of the type illustrated with a maximum axleload of 8 tons were equipped with SKF Roller Bearing Axleboxes in 1939 - 1943. After 10 years of service the original bearings and boxes are still giving excellent service.

SKF Roller Bearing axleboxes help to reduce your transport costs.

As compared with plain bearing axleboxes the greatly reduced friction permits starting and hauling of much heavier trains with the same tractive effort. Maintenance and lubrication costs are drastically reduced as the only attention required is a relubrication once a year between seasons.

The services of our technical department are free and without obligation.



THE SKF BALL BEARING COMPANY LTD.

Bombay P.O. Box 71 Calcutta P.O. Box 588 Madras P.O. Box 66

PROFIT OF CAWNPORE SUGAR MORE THAN DOUBLED

FINANCES SOUND—BONUS SHARES TO BE ISSUED

THE decision of the Directors of the Cawnpore Sugar Works Ltd. (Managing Agents: Messrs. Begg, Sutherland & Co., Ltd., Kanpur) to maintain the dividend on the ordinary shares for the year ended 31st October, 1953, at 20 per cent. (*to which level it had been reduced last* year from 30 per cent.), notwithstanding the fact that the profit for the year is more than double that for the previous year, may be somewhat disappointing to the shareholders. The gross profit, for instance, has improved from Rs. 13.15 lakhs for 1951-52 to Rs. 27.31 lakhs for the year under review. It may be noted here that this is only Rs. 1.04 lakhs less than that of Rs. 28.35 lakhs earned in 1950-51, for which year the Directors had paid a dividend of 30 per cent. However, with a big slice of the profit having been absorbed by the provision for taxation and with an extensive rehabilitation programme on hand, for which purpose the resources of the Company have to be conserved, the Directors' decision not to enhance the dividend is understandable. Further, the shareholders will soon be compensated in another way, if the Directors' proposal to capitalise a part of the reserves receives the sanction of the Government.

The quantity of cane crushed by the two factories of the Company, during the year, is substantially higher than that crushed in the previous year. Thus, the Marhowrah Factory crushed 3,613,618 maunds, as against 2,922,907 maunds in 1951-52, a rise of nearly 700,000 maunds. The quantity of cane crushed at Gauri Factory was 2,309,918 maunds, as compared with 1,788,214 maunds in the previous year, and was the highest ever crushed in the history of the factory.

The average yield was the same as in the previous year at 10.58 per cent. "The quality of cane at both the factories," the Directors observe, "was very similar to that of the previous year, but the tendency to deterioration continues, particularly in Gauri Factory, where the growing of unapproved cane varieties cannot apparently be checked by Government. If the *State Government departments would* co-operate, the Company's estates could supply good healthy seed to improve the quality of the crop. An improved yield of sugar from cane would be in the interests both of the growers and of the nation."

The salient features of the Company's financial results for the year are presented against the background of those for the previous three years in the following comparative table, which gives an idea of the Company's progress in recent years:

(In lakhs of rupees)

	For the year ended 31st October			
	1953	1952	1951	1950
Sale proceeds ..	234.25	138.17	180.60	146.35
Government subsidy ..	6.94	..	..	..
Other income ..	2.14	1.78	1.01	1.89
Stocks	8.71	67.08	81.97	2.97
Manufacturing and other expenses	127.03	123.89	184.43	119.05
U.P. and Bihar Governments' cane cess ..	11.67	8.88	9.40	9.43
Sugar excise duty ..	29.13	9.96	12.29	10.50
Gross profit ..	27.31	13.15	53.35	13.19
Managing Agents' remuneration ..	2.23	1.30	3.60	1.54
Depreciation	5.75	5.00	5.00	5.50
Taxation	10.50	3.50	17.50	6.00

Ordinary	3.00	3.00	4.50	3.00
	(20%)	(20%)	(30%)	(20%)
Carry forward ..	0.94	0.43	0.28	0.76

It will be noted that the sale proceeds of sugar, molasses and spirit have gone up by Rs. 106.11 lakhs. This is evidently due to the larger quantity of cane crushed, the satisfactory prices realised on the sugar produced and the profitable disposal of the large quantity of sugar carried forward from the previous year.

Commenting on the cane price fixed by the Government, the Directors say, in their report to the shareholders, as follows:

"The cane price fixed by the Government of India at Re. 1-5 per maund was a reduction of As. 7 as compared with the previous season's rate. A concession was granted for cane purchased at outstations where the price fixed was Re. 1-3 per maund. It was the Government of India's view that the reduction in the cane price would result in a basic price for sugar of Rs. 27 per maund. In the event, however, despite the large carry-over of sugar stocks in India, the consumption of sugar in the country was such that the Government found it necessary to import sugar in order to stabilise prices. The sugar produced by both your factories realised satisfactory prices.

"The reduction in the cane price did not adversely affect plantings materially for the next crop, but disastrous floods during the monsoon of 1953 have reduced the crop available for crushing for the season 1953-54 both in quality and quantity."

Referring to the working of the Company's distilleries during the year under review, the Directors observe:

"The Company's distilleries worked intermittently throughout the year. Supplies of molasses and coal to the *Cawnpore Distillery* were more regular in the past year than in the previous year. At the Marhowrah Distillery, however, the imposition of an export fee on rectified spirit forced that Distillery to withdraw from the market. A further imposition of a cess on molasses increased the price of the Distillery raw material from As. 4 per maund to As. 12 per maund without a corresponding increase in the price obtainable for the spirit. Those impositions seriously affected operations at Marhowrah. The Government of Bihar has since removed the export fee and the cess on molasses and the Distillery can now resume normal working."

The Directors have approved of an extensive "capital replacement programme" covering both the factories of the Company. They have availed themselves of the favourable results produced during the year under review to transfer a sum of Rs. 5.66 lakhs to the rehabilitation reserves, in addition to Rs. 2 lakhs provided last year, in view of the high replacement cost of plant and machinery. They have also set aside from the year's profit a sum of Rs. 2 lakhs to the quarters building reserve, as they feel that the quarters provided for the supervisory staff and labour are inadequate and require to be extended and modernised.

The financial position of the Company, as seen from its latest balance-sheet, is quite satisfactory. The paid-up capital of Rs. 25 lakhs (made up of a preference capital of Rs. 10 lakhs, and an ordinary capital of Rs. 15 lakhs) is supplemented by reserves and surplus aggregating Rs. 63.53 lakhs, of which the general reserve alone accounts for Rs. 35.50 lakhs. Provision for taxation amounts to Rs. 10.49 lakhs and current liabilities Rs. 31.96 lakhs. The gross block of the value of Rs. 96.65 lakhs has been well written down to Rs. 18.57 lakhs. The current assets amount to Rs. 112.42 lakhs and cover the current liabilities and provision for taxation by a huge margin of Rs. 69.97 lakhs.

The Directors consider that the present issued capital does not adequately represent the current true capital position of the Company and, therefore, consider it desirable to increase the Company's issued capital. The Directors propose, as stated in these columns last week, to capitalise, subject to the sanction of the Central Government, a sum of Rs. 15 lakhs from out of the reserves and issue 150,000 ordinary shares of Rs. 10 each to the existing ordinary shareholders. This will work out to a ratio of one new share for one existing share.

The Rs. 10 paid-up ordinary shares of the Company are being currently quoted at Rs. 33, at which rate the latest dividend gives a yield of 5.1 per cent. per annum free of tax.

MYSORE SPINNING TO ISSUE BONUS SHARES

The Directors of the Mysore Spinning & Manufacturing Co., Ltd. (Managing Agents: Messrs. N. Sirur & Co., Ltd., Bombay), have decided to capitalise a sum of Rs. 4,96,700 from out of the amount standing to the credit of the reserve fund and issue 9,934 ordinary shares of Rs. 50 each as bonus shares to the holders of the existing ordinary shares as on 15th March, 1954. The paid-up ordinary capital at present is Rs. 19.87 lakhs, made up of 39,736 shares of Rs. 50 each. The bonus shares will, therefore, be issued to the holders of the said 39,736 ordinary shares in the ratio of one share for every four shares. The consent of the Central Government to this issue has been obtained.

The present paid-up capital of the Company is Rs. 27.32 lakhs, made up of 39,736 ordinary shares of Rs. 50 each and 14,801 4½ per cent. cumulative preference shares of Rs. 50 each. The reserves of the Company stand at Rs. 61.53 lakhs, of which general reserve alone accounts for Rs. 52.25 lakhs. The proposed bonus shares are eligible for all dividends declared after 1st March, 1954. Accordingly, these shares will be entitled to the final dividend for the year ended February, 1954, which will be declared some time in August or September, 1954.

If the present proposal is carried out, it will be the third occasion, during the past decade, in which the Company capitalises a part of its reserves. In February, 1946, the Company transferred Rs. 7.45 lakhs from its reserves to the capital account and issued 14,901 preference shares of Rs. 50 each as bonus shares to the then existing ordinary shareholders in the proportion of one such share for every two ordinary shares held. In September, 1947, the Company again capitalised Rs. 4.97 lakhs and issued ordinary shares as bonus to the then existing ordinary shareholders in the ratio of one share for every three shares held.

THIRUMBADI RUBBER'S RECORD PROFIT

DIVIDEND RAISED

THE Directors' report and audited accounts of the Thirumbadi Rubber Co., Ltd. (Agents and Secretaries: Messrs. Peirce Leslie & Co., Ltd., Kozhikode, Malabar), for the year ended 30th September, 1953, make very satisfactory reading, inasmuch as the output of rubber and the earnings have shown further, albeit small, improvement over those for the previous year. The crop harvested during the year amounted to 328,260 lbs., as compared with 325,000 lbs. in 1951-52. Though the increase of 3,260 lbs. was very much smaller than that of 21,121 lbs. noted in the previous year, it enabled the Company to establish a record crop since 1943-44. The improvement in crop harvested during the year, coupled with the higher price realised, led to an increase in the trading profit from Rs. 1,80,453 for 1951-52 to Rs. 1,96,486, the highest profit in the history of the Company. Incidentally, it may be noted that the Company's profit has, within the short span of five years, steadily advanced from Rs. 53,692 for 1947-48 to Rs. 1,96,486 for the year under review.

Commensurate with the rise in profit, the Directors have stepped up the allocation to the reserves during these years, the latest addition amounting to Rs. 1 lakh, being Rs. 25,000 more than that in the past year. The dividend has been stepped up to 30 per cent. for the year under review, after having been maintained at 25 per cent. for the previous two years. As compared with the dividend of 15 per cent. paid for 1947-48, the one that has been recommended for the year under review is double, but it is by no means a record one; for a dividend of 35 per cent. had been paid for the years 1944-45 and 1945-46.

The following comparative table brings out clearly the progress made by the Company during the last three years:

	For the year ended 30th September			
	1953	1952	1951	1950
	Rs.	Rs.	Rs.	Rs.
Sale proceeds of rubber .	8,62,778	8,06,121	9,58,625	8,05,618

Transfer to reserve ..	1,00,000	75,000	50,000	25,000
Dividend	91,350	76,275	76,275	61,020
	(30%)	(25%)	(25%)	(20%)
Carry forward	10,669	81,510	97,450	1,141
Crop harvested in Lbs. ..	3,28,260	3,25,000	3,03,879	3,09,140
Cost of production per lb.	As. 11.23	As. 11.04	As. 10.13	As. 9.31
Average sale price per lb.	20.63	19.83	17.90	18.08

The increase in rubber prices granted by the Government of India at the end of October, 1952, accounts for the rise in average sale price of the Company from Rs. 19.83 to Rs. 20.63 per lb. A part of it has, however, been offset by the increase in cost of production from As. 11.04 to As. 11.23 per lb.

The balance-sheet of the Company as on 30th September, 1953, discloses a comfortable financial position, as will be seen from the following synopsis:

Liabilities	Rs.	Assets	Rs.
Capital	3,05,100	Gross block	7,19,603
Reserves and surplus ..	3,65,704	Less—Depreciation ..	54,697
Provision for taxation ..	618		
Liabilities	1,16,453	Net block	6,64,906
		Stock-in-trade	99,907
		Stores, spares, etc. ..	41,098
		Advances	15,220
		Investments	50,338
		Cash	1,56,606
	Rs. 9,87,875		Rs. 9,87,875

Thus, the reserves and surplus stand at Rs. 5.66 lakhs and represent 185.5 per cent. of the paid-up capital of Rs. 3.05 lakhs. The gross block of Rs. 7.19 lakhs includes development expenditure of the order of Rs. 4.61 lakhs. The current assets aggregate Rs. 3.24 lakhs and provide more than adequate coverage for current liabilities and tax provision at Rs. 1.17 lakhs.

The Company's Visiting Agent, Mr. I. D. Edward, visited the Estate in April, 1953, and has since made a further visit in the current season. His reports indicate that the Estate is in good order throughout and that the new clearings are developing most satisfactorily.

The ordinary shares of the Company in units of Re. 1 are being currently quoted at Rs. 3-6 *cum-div.* On an ex-div. basis, the proposed dividend gives a yield of 9.73 per cent. per annum.

Points From The Chair

Significance of Reduction of U.K. Bank Rate

"It was not an 'easy money' move, though it did mean, for both public and private borrowing as a whole, cheaper money. Its deeper significance arose from other considerations. One of them was the fact that the change was announced in the time-honoured manner after the weekly meeting of the Court of the Bank of England—a different procedure from that followed on the occasion of the two preceding upward movements. Another was the removal, in effect, of the special rate for Bank of England loans to the money market against Treasury Bills, a new device introduced when the Bank rate was first raised, in November, 1951. The abandonment of this device gave greater flexibility to the market, so that, although the Treasury is *still by far the largest borrower*, and to that extent, 'calls the tune' the preference it enjoys from its top credit standing is no longer augmented by special discrimination in its favour. The margin between discount rates for Treasury Bills and prime bank bills is now just about the same as before the war. These facts point to the conclusion that, as in industry and trade generally, the policy of the Government is to move towards the rehabilitation of what is often called the 'economics of the market place.'"

LORD HARLECH,
Midland Bank Ltd.

Importance of Long-term Credit

"With the disappearance of the sellers' market everywhere, the giving of long credit as a competitive factor has now assumed very considerable importance, in addition, of course, to the other factors of price and delivery. This is only natural in the case of large and expensive installations of a capital nature and following upon reports that Germany, in particular, was granting very long credit, efforts have been made here to form specialised institutions to give help in the same way to ships and aircraft and more recently to the export of capital goods in the engineering and electrical goods industries. In all these cases the Export Credits Guarantee Department has given invaluable help, but it may be that in some quarters there is a mistaken idea that the banks have not done as much as they might. I am sure that, if all the facts were known, it would be fully appreciated that the banks have played and are still willing to play a very full part right up to the limits which prudence and long experience have shown to be most necessary, and I notice that, at the end of the year, the German banks found it necessary to issue a warning, indeed a protest, on this subject to their own Government."

SIR ERIC A. CARPENTER,
Williams Deacon's Bank Ltd.

Tea Act Not Useful to Tea Industry

"The Union Government have recently put on the Statute Book the Indian Tea Act, which provides for the control of the tea industry by the Central Government. It is accepted that in the larger interests of the nation's industrial and economic development, the Government should exercise reasonable control and regulate the development of the major industries in the country. Tea is one of the largest earners of foreign exchange for India, besides providing employment to over a million workers. It is in the fitness of things that the Government should take more interest in the affairs of the tea industry to ensure that it is developed on the right lines. The provisions of the Act were, however, so drafted as to make the tea producers feel that the Act has gone too far to merit its usefulness for stabilising the industry. In their opinion, the Government have sought to take more powers than what the situation warranted. The tea industry has its own peculiar problems which require careful study. But the new Act will have served the industry usefully, if the Tea Boards to be set up, makes an earnest attempt to understand the problems and adopt effective measures to remedy some of the difficulties that face the industry from time to time. The Government have agreed to consider the representations made by the producers, while framing the rules under the new Act. It is hoped that these promises will be implemented."

A. V. THOMAS,
Neelamalai Tea & Coffee Estates Ltd.

Banking in Australia

"The decline in pressure for bank advances has been followed by a further relaxation of the selective advance policy laid down by the Central Bank. *Advance control* which had been gradually eased virtually came to an end in October, 1952, and since then has been confined to a provision to ensure that large advances would not be extended in a manner contrary to capital issues control. Relaxation in official lending policy has been accompanied by a more liberal policy regarding liquid resources of the banking system. A large part of the trading banks' cash resources, which had been impounded in special accounts at the Central Bank in past years, was released during the second half of 1951 and in 1952 to help in meeting public demands upon the banks. Owing to a change in central banking policy special accounts were further reduced after advances had begun to fall, so that banks obtained additional liquid resources for investment in Treasury bills and Government securities."

THE HON. G. C. GIBBS,
Australia and New Zealand Bank Ltd.

Registrar.

KANPUR, *11th January*, 1954.

MANCHESTER LETTER

(*Concluded from page* 161)

world shortages of cotton and restrictions on supplies, no mill has ever had to stop for lack of raw material," he declared. "We find it difficult to believe there can be the same assurance for the future."

The biggest threat was to the small mill which could not tie up capital in raw cotton to the extent necessary to ensure continuity of production.

Cotton Imports

More privately-bought supplies of raw cotton reached British ports this week. Out of arrivals of 39,051 bales, private shippers obtained over 22,000 bales, leaving only 9,920 bales procured by the State-sponsored Raw Cotton Commission. Biggest supplies—all on private account—came from West African growers who sent 17,619 bales. Egyptian exporters provided 9,315 bales and American exporters 7,110 bales. Supplies at present at sea for Britain come from at least a dozen countries amounting to 45,604 bales, chiefly the Argentine, Pakistan, the United States and Brazil.—*All Rights Reserved.*

EARNINGS OF CONSOLIDATED COFFEE ESTATES LOWER

COIMBATORE SPINNING SUFFERS LOSS AGAIN

Consolidated Coffee Estates (1943) Ltd.

THE directors of the above Company (Managing Director: Mr. Ivor Bull, Pollibetta) submitted their tenth annual report and statement of accounts for the year ended 30th June, 1953.

The net profit earned by the Company for the year amounted to Rs. 19,29,700 (Rs. 19,32,315), to which was added the balance as per last directors' report of Rs. 4,37,964 (Rs. 3,74,070) of this sum, 6 (6) per cent. dividend on preference shares accounted for Rs. 1,12,500 (Rs. 1,12,500), reserve for debenture redemption fund for Rs. 1,00,000 (*nil*) and general reserve for Rs. 10,00,000 (Rs. 11,11,321), leaving a balance of Rs. 11,55,164 (Rs. 12,96,564). The directors disposed of this sum by paying a dividend of 15 (18) per cent. free of Indian Income-tax on the ordinary shares absorbing Rs. 7,15,500 (Rs. 8,58,600), leaving the balance of Rs. 4,39,664 (Rs. 4,37,964) to be carried forward.

The earnings from coffee were comparatively low, owing to the lower price fixed, but the income derived from a very heavy pepper crop and a substantial carry over of the profit from the previous years' coffee crop have enabled your Directors to recommend the dividend above-mentioned.

In December last, the Company offered for sale Rs. 10 lakhs of 5½ per cent. Indian Income-tax free Debenture stock 1957-63. This was very heavily over-subscribed and only a partial allotment was possible.

Crops—1952-53

	Estimated Tons	*Actuals* Tons
Coffee—		
Arabica	925	1,133
Robusta	700	804
Total coffee	1,625	1,938
Pepper	75	76
Cardamoms	1	1

Season 1953-54 Crop Estimate

	Arabica Tons	*Robusta* Tons	*Total* Tons
Estimated on blossom ..	1,100	873	1,973
Revised estimate	978	653	1,631
Pepper	Mds. 125	..	99
Cardamoms		..	..

Efforts are being made to complete the Company's labour housing programme as speedily as possible and, during the season, the total expenditure on buildings amounted to Rs. 5,57,459. The estates are in good condition. Crops of 1,938 tons was the highest to date by no less than 480 tons. The estimates for the year 1953-54 show a reduction of 342 tons, as compared with 1952-53. Considering the heavy crop of the previous year, this crop is reported to be satisfactory.

During the year under review, the Company cured 2,054 tons of coffee, as against 1,092 tons in the previous year. It is anticipated that there will be a further increase in curing this year.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	66,45,000	Block ...	82,46,245
Reserves ...	49,62,500	Work in progress ...	12,984

	Rs. 1,57,51,698		Rs. 1,57,51,698

Coimbatore Spinning and Weaving Co., Ltd.

The directors of the above Company (Agents and Secretaries: Messrs. R. G. S. Naidu & Co., Coimbatore) submitted the audited accounts of the Company for the year ended 30th June, 1953.

The directors regret that the result of the Company's working for the year under review resulted in a net loss of Rs. 7,52,342. Adding to this the previous year's balance of net loss of Rs. 2,70,999 the total loss amounted to Rs. 10,23,340 and this was carried forward. In view of the loss sustained by the Company no depreciation was provided on the assets of the Company.

The directors regret that for the second successive year the Company had to incur a loss mainly on account of the steep fall in the prices of foreign cotton in respect of the Company's outstanding commitments in this regard foreshadowed, last year. The Company had committed itself to very large purchases of foreign cotton as the market for higher counts of yarn was expected to be favourable and since the prices of such foreign cotton began declining very heavily by the latter half of 1952 with no signs of recovery, it was thought advisable to resell, which inevitably meant a loss in a falling market and or to settle a portion of the purchases by paying the differences. The Company had also to incur heavy carrying charges in respect of cotton held over by the suppliers.

Unfortunately, owing to reductions in the ceiling prices of yarn and the actual market prices declining to levels much below such ceiling rates and as the cost of cotton purchased was comparatively high, the parity between the price of yarn and cotton was very much narrowed down and, as such, a larger amount of trading profit could not be earned. The usual expenses of management which showed an increase of more than Rs. 2,00,000 when compared with the previous year, mainly as a result of increases in the expenditure under interest and insurance had also to be incurred. In addition, the Company had to face cuts in electricity, which is becoming a normal feature every year and to offset the effects of which the two generators were installed during the year under review. All these facts contributed to the loss sustained by the Company, which, in the circumstances, the directors consider could not be avoided. It was possible to keep down the loss sustained by the Company at a comparatively reasonable level mainly as a result of considerably writing down the stocks of cotton in the previous year itself.

The directors decided to bring the accounting period of the Company in line with the majority of the local mills and, accordingly, the accounts were closed again for the six months ended 31st December, 1953 and the necessary statement of accounts will be presented to the shareholders in due course. Thereafter, the accounts of the Company will be closed on 31st December every year.

In view of the losses incurred by the Company, the Agents and Secretaries took only the monthly allowance and waived the commission due to them on purchases and capital expenditure. The Directors hope that the Company's working will improve with better prospects prevailing in the future years.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	20,76,900	Block ...	48,00,946
Reserves ...	4,36,696	Stock-in-trade	42,28,000
Provision for taxes ...	3,61,985	Stores and spares ...	4,29,262
Liabilities	90,88,926	Debts, deposits and advances ...	14,60,732
		Investments ...	13,345
		Cash ...	8,882
		Profit and loss account ...	10,23,340
	Rs. 1,19,64,507		Rs. 1,19,64,507

Anderson Wright, Ltd.

The directors of the above Company (Chairman: Mr. G. J. K. Hook) submitted the audited accounts of the Company for the year ended 31st December, 1952.

The Company's profit for the year was Rs. 3,80,757 (Rs. 8,75,627), to which was added the amount brought forward from the previous year of Rs. 36,577 (Rs. 50,950). After deducting the provision for taxation of Rs. 70,704 (Rs. 3,50,000), there remained a sum of Rs. 3,46,630 (Rs. 5,76,577). Out of this the directors placed to debenture redemption reserve Rs. 50,000 (Rs. 1,00,000) and declared an interim dividend for the year ended 31st December, 1952, on the preference shares at the rate of 4½ (4½) per cent. per annum without any deduction in respect of income-tax paid by the Company Rs. 90,000 (Rs. 90,000), leaving a balance of Rs. 2,06,630 (Rs. 2,86,577). The Directors disposed of this sum in paying a dividend on the ordinary shares for the year ended 31st December, 1952, at the rate of 6 (12½) per cent. per annum without any deduction in respect of income-tax paid by the Company Rs. 1,20,000 (Rs. 2,50,000), leaving to be carried forward Rs. 86,630 (Rs. 36,577).

Trading conditions during the year under review continued to be difficult and there was a steep fall in the price of jute manufactures. This, coupled with the restricted import policy of the Government of India, resulted in reduced profits during the year.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	40,00,000	Block ...	42,53,197
Reserves ...	9,50,000	Stock-in-trade	3,97,969

Liabilities ...	93,28,193		
	Rs. 1,57,35,970		Rs. 1,57,35,970

Madhusudan Mills Ltd.

The directors of the above Company (Chairman and Managing Director: Mr. Dewan Dina Nath, Bombay) submitted the annual report of the Company together with the nineteenth audited balance sheet and profit and loss account for the year ended 30th June, 1953.

The profit and loss account for the year under report showed a profit of Rs. 2,19,528 (Rs. 10,85,051), after making a provision for taxation of Rs. 1,79,000. Adding to this the sum of Rs. 7,47,308 (Rs. 25,537), being the balance of the profit and loss account carried forward from the previous year and deducting Rs. 1,50,000 (Rs. 468,000), on account of reserve for depreciation of securities, the balance came to Rs. 8,16,836 (Rs. 11,10,608). The directors disposed of this sum in paying a dividend at 4 (4) per cent. on cumulative preference shares of Rs. 12-8 each (free of income-tax) Rs. 10,800 (Rs. 10,800), a dividend at the rate of Rs. 6-4 (Rs. 6-4) per ordinary A share of Rs. 100 each and Rs. 1-4 per ordinary B share of Rs. 20 each (free of income-tax) Rs. 2,02,500 (Rs. 2,02,500), leaving to be carried forward Rs. 6,03,536 (Rs. 7,47,308). The Directors sought confirmation for creating the above reserve of Rs. 1,50,000 for depreciation of securities.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	35,10,000	Block ...	2,65,364

Upper Ganges Valley Electricity Supply Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Martin Burn Ltd., Calcutta) submitted the audited accounts of the Company for the half-year ended 30th June, 1953.

The following table indicates the progress maintained by the Company:

Half-year ended	*Units sold*	*Revenue* Rs.
31st December, 1950 ...	3,264,547	5,08,254
30th June, 1951 ...	3,117,052	4,93,651
31st December, 1951 ...	3,301,039	5,40,694
30th June, 1952 ...	3,213,082	5,23,172
31st December, 1952 ...	3,475,879	5,80,689
30th June, 1953 ...	3,491,623	5,63,794

After complying with the provisions of the Electricity (Supply) Act, 1948, and making adequate provision for liabilities, there remains a balance of Rs. 35,768 (Rs. 29,270), including Rs. 9,228 (Rs. 5,902) brought forward from the previous half-year at the credit of profit and loss account as at 30th June, 1953, and this the directors disposed of in paying a dividend at the rate of 8¾ (7½) per cent. per annum free of income-tax Rs. 26,184 (Rs. 22,444), leaving to be carried forward to next half-year Rs. 9,584 (Rs. 6,826).

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,99,250	Block ...	4,79,059
Reserves ...	1,76,400	Stores, tools, etc. ...	1,17,384
Provision for taxation ...	61,702	Other assets	400
Liabilities ...	7,17,702	Debts, deposits and advances	2,31,953
Profit and loss account ...	35,768	Investments ...	3,89,883
		Cash ...	3,72,143
Rs.	15,90,822	Rs.	15,90,822

N.B.—*Figures within brackets relate to the corresponding period of the previous year.*

MONEY RATES UNCHANGED

(From Our Own Correspondent)

BOMBAY, 27*th January*

The already limited supply of floating funds in the short-term money market having dwindled further and the seasonal demand for funds having gathered further momentum, the degree of stringency was greater during the week under review than in the previous week. Exchange banks were not active in the inter-bank call money sector, but the big Indian banks were the chief borrowers, as their clients were stated to be taking full advantage of the credit facilities available to them. There was, however, no change in the inter-bank call money rate among the Exchange banks and big Indian banks; it was quoted at the self-same rate of 2½ per cent. The corresponding rate among the smaller Indian banks, too, was unchanged at 3 per cent. Short-term deposits fetched 3 per cent. for periods ranging from one to six months.

There was no change in the Government of India Treasury Bill rate this week, which remained at Rs. 2-8 per cent. per annum for the second week in succession. The response to this week's sale was a little better than that in the previous week, having brought an offer of over Rs. 1.31 crores, as against Rs. 1.01 crores. The poor response to the Treasury Bill sale in the previous week seems to have induced some market scribes to wonder whether the time was not opportune for the authorities to consider seriously the suspension of the sales of these Bills in a week or two. It may be stated, in this connection, that though the response to the Bills during this part of the season last year was equally poor, the authorities continued the sale throughout the season and when they increased the amount borrowed through this means to Rs. 1.50 crores, the slack season set in. Although funds are readily usuable now, the stringency in the money market is not so acute as to compel the authorities to drop the sale of Treasury Bills. It is true that, in such matters, one cannot be dogmatic, but the fact remains that the authorities have invited tenders for Rs. 1 crore next week also.

After four weeks of successive expansion, notes in circulation, as disclosed by the Reserve Bank statement for the week ended 22nd January, 1954, have recorded a contraction of Rs. 3.59 crores. Notes held in the Banking Department, on the other hand, have risen by Rs. 3.94 crores. The small increase of about Rs. 35 lakhs in the total notes issued is covered by a similar rise in rupee coin. Small variations are disclosed by the various portfolios in the Banking Department. Thus, deposits of the Central Government are higher by Rs. 66.34 lakhs and those of other Governments by Rs. 42.26 lakhs. Deposits of banks show a decline of only Rs. 42.94 lakhs, while those of others have gone up by Rs. 34.49 lakhs. On the other side, cash balances reveal an increase of Rs. 97.29 lakhs, while balances held abroad are almost unchanged. Ways and means advances to Governments have declined by Rs. 54 lakhs. Other loans and advances have risen by Rs. 1.46 crores. There have been no fresh borrowings by the Scheduled banks against usance bills during the week. Investments have fallen by Rs. 1.12 crores, as also Government Treasury Bills purchased and discounted by Rs. 3.01 crores.

The Scheduled banks' statement for the week ended 15th January, 1954, as compared with that for the previous week, reveals an increase of Rs. 3.55 crores in demand deposits and a fall of Rs. 97 lakhs in time deposits. Inter-bank borrowings have risen by Rs. 88 lakhs. A rise of Rs. 91 lakhs is noted in borrowings from the Reserve Bank, Rs. 1.16 crores in those from the Reserve Bank and Rs. 1.16 crores in those from the Imperial Bank. Advances and bills purchased and discounted show an increase of Rs. 4.93 crores, while investments have dropped by Rs. 4.33 crores. Cash on hand and balances with the Reserve Bank together account for a rise of Rs. 2.47 crores. Balances with other banks in current account show a fall of Rs. 55 lakhs, while money at call and short notice show a rise of Rs. 81 lakhs.

A steady undertone was maintained in the Gilt-edged market during the week, though business continued to be restricted and patchy. 3 per cent. 1957 stood at Rs. 98-6, though buyers appeared at Rs. 98-5½. 3 per cent. 1958 was in demand and improved by an anna to *Rs.* 98-2. 3 per cent. 1959-61 was wanted at Rs. 96-1½. 3 per cent. 1963-65, 3 per cent. 1964, 3 per cent. 1966-68 and 3 per cent. 1970-75 were all unchanged at the previous week's rates. 3 per cent. 1986 Conversion Loan attracted some investment demand and gained As. 4 to close at Rs. 82-11. Some moderate business was done in 3½ per cent. N.P. Bond at Rs. 98-13½.

HIDES STRONG

(From Our Own Correspondent)

KANPUR, 24*th January*

Conditions in the hides and skins market were marked by a note of confidence during the week under review. Almost all categories of goods were in demand. Fresh arrivals were considerable according to present standards. The main purchasers were the local tanners and the Madras dealers. The country tanners were in lower grade cow, goat and some sheep.

Latest quotations are: Wet salted cow, 1st grade Rs. 320 to Rs. 360, 2nd grade Rs. 320 and 3rd grade Rs. 190 to Rs. 220 per score; wet salted buff, grade Rs. 190 to Rs. 220 per score; 1st grade 1 lb. 8 ozs. to 1 lb. 11 ozs., 2nd grade 1 lb. 14 ozs. to 2 lbs., 3rd grade 2 lbs. 4 ozs., and 4th grade 2 lbs. 6 ozs., per rupee; goat, 1st grade Rs. 270 to Rs. 300 and 2nd grade Rs. 250 to Rs. 300 per 100 pieces; sheep, Rs. 250 to Rs. 300 per 100 pieces.

SILVER ACTIVE

(From Our Own Correspondent)

BOMBAY, 27*th January*

Activity in the bullion market during the week under review was dominated by silver, which staged a further sharp rise over the week. Gold, on the other hand, was featureless, but the undertone was steady. Although the offtake in silver did not come up to expectations, the bull operators did not seem inclined to relax their grip on the market. A prominent bull operator was reported to have bought 10,000 bars, while another leading bear operator was short to the extent of 6,000 bars. Anticipations of an expansion in demand would appear to have induced the bulls to sit tight on their holdings. Further, the Bombay Government's disapproval of the Bullion Association Board's decision to amend its by-laws gave a fillip to bull activity.

Gold was unimpressive and was not inclined to follow the rise in silver. However, the main factor which helped the yellow metal to maintain the steady undertone was that unauthorised arrivals were less prominent, the main source of supply being only the Kolar Gold Mines.

The Government of Bombay has rejected the changes proposed by the Board of the Bullion Association in the by-laws of the Association, with a view to restricting the penalty for non-delivery of bars in an auction. At the same time, the Government has suggested that the Association might consider the adoption of a provision under which the Directors could postpone the auction by 24 hours in order that the goods might be purchased on behalf of the defaulting sellers. This resolution, in order to be effective, should be passed by a two-thirds majority of the Directors present at the meeting, provided three-fourths of the total strength of the Board was present. This period can also be extended with the permission of the Government. Market circles, however, state that there is nothing novel in the suggestion of the Government, as under the existing by-laws, the Board of the Bullion Association has powers to postpone auctions. Be that as it may, no further action on the part of the Board is said to be in the offing, in view of the forthcoming elections to the Board.

Silver for forward delivery (January settlement) opened the week on a quiet note at Rs. 158-5 and shaded off to Rs. 158-2 before the settlement ran out on Thursday last. Forward silver for the next settlement (18th February) began at Rs. 159-1 and dropped to Rs. 158-9. But soon the recovery movement started on fresh support from bulls and nervous covering by some of the short-sellers. The Bombay Government's rejection of the amendment to the by-law gave an inspiration to further speculative activity and, in the process, forward silver advanced to touch a high of Rs. 161-10 today before closing at Rs. 161-2.

Ready silver (.996 Mint) was done at a premium of As. 4 over the forward rate for the February settlement. The floating stocks of silver are placed at 2,300 bars. The daily average offtake was 15 bars.

Opening at Rs. 84-5, gold for forward delivery (17th February settlement) declined to Rs. 83-10 on Saturday, but recovered to close at Rs. 84-6 today.

Ready gold opened at Rs. 84-7 and closed at Rs. 84-6. The premium of As. 2, which it commanded early in the week, disappeared as the week progressed. The floating stocks of gold are estimated at 25,000 tolas. The daily average arrivals were 6,000 tolas, while the offtake was about 5,000 tolas on an average.

The following comparative table shows the trend of the market during the week under review:

	27-1-54	Highest	Lowest	20-1-54

TEA PRICES DECLINE

(From Our Own Correspondent)

CALCUTTA, 26*th January*

During the export sale yesterday, offerings were approximately 58,700 packages. Conditions were easy and prices eased. The varieties that were badly affected were low mediums, commons and commonest teas, which were sold at As. 2½ below brokers' valuations. There was only limited demand for the best liquoring autumnals. However, tippy teas were sold at high prices, and stylish leaf grades were favoured by buyers. The rates were: best C.T.C. Assam B.P. Rs. 2-7-6 to Rs. 2-8, clean black pekoe Rs. 2-8-6, medium Assam B.P. Rs. 2-5-6, and clean common B.P. Rs. 2-4-6.

The recent gains were almost maintained during last week's sale for domestic consumption. Demand was strong, and dusts offered consisted of 20,533 packages. Best Assam C.T.Cs. ruled firm, while commonest as well as common varieties were sold at valuation prices. Darjeelings with flavour were favoured at good prices. All other varieties lost by half to one anna. Thus, best Assam C.T.Cs. were quoted at Rs. 2-4-6, medium Assam grainy dusts Rs. 2-1-6, and medium Dooars Rs. 2-1. Leaf offerings amounted to 8,133 packages, the largest quantity so far this season. Most of this quantity consisted of stalky and fibrous sorts, which were reflected in realisations which were As. 1½ to As. 2 lower than valuations.

FORWARD COTTON MOVES UP

(From Our Own Correspondent)

BOMBAY, 25*th January*

While speculative activity in the forward cotton market continues unabated, the operators have turned their attention gradually to the May contract from the one which is due to expire next month. As a result of this, the unnatural gap of nearly Rs. 9 to Rs. 10 between February and May in favour of the former was at one time reduced to Rs. 5. Weak holders without resources are liquidating their contracts in February and buying May, in spite of the fact that it is the sellers in the nearby contract who are more anxious to get out of their commitments, lest they should be called upon early to deliver cotton which they haven't got. One prominent bull is believed to have sold the whole of his holding of 60,000 bales in the February contract. Many like him will be buyers in May and there is every possibility of the May contract gradually approaching the ceiling in view of the present condition of the spot market. Some rapid fluctuations are likely to take place during the coming weeks in the expiring February contract.

It is, however, the spot market which is experiencing greater activity these days. There is an all-round clamour for every variety of cotton from the mills. High premia are being paid for all staple varieties and in some cases official ceilings are believed to have been overstepped in this eagerness to secure supplies. There have been several causes for this scramble. In the first place, the cloth market, including the export section, is in excellent form. Even the fine and superfine varieties are now in good demand, leading to a greater demand for imported cotton. Secondly, the broad hint given by the Government that there will be no further increase in the mills' quota for Indian cotton and the rumours regarding Government's intention to offer incentives for bigger imports by way of a reduction of excise duty by 6 pies on cloth of finer varieties, have led mills to acquire stocks to their maximum holding and spinning capacities. Thirdly, there is from the present expectation of coming inflation an inducement which has brought about an investment demand for commodities in all markets. People with money are in a hurry to convert their cash into goods before the money loses its value. Quite a good deal of buying in the spot market is of an investment nature and as this will go into strong hands, prices are bound to jump up fiercely, as shortage of supply is felt in the market. Rumours of a fresh quota for exports of Bengal have helped in the enquiry for this variety which was otherwise somewhat neglected.

Apart from Egyptian and East African cotton of which Indian mills had become keen buyers, the attention this week of consumers has turned towards Californians to a greater degree. A request has been made, according to market reports, to the authorities at New Delhi to remove import controls on U.S. cotton and to allow a free flow of this cotton to a specified quantity, especially as there is a possibility of the U.S. Government accepting payment for such sales in the currency of the purchasing country. In the meantime, not relying wisely on such relaxation, both the mills and importers have been trying to secure as much of East African and Egyptian cotton as possible and it is believed that purchasers from India will bid fairly high in the coming auctions by the Lint Marketing Board at Kampala, in February. In the meantime, prices in this market have firmed up in view of India's known interest and enquiries from the Continent.

In the forward section of the local cotton market, I.C.C. February opened the week at Rs. 713 and moved up to touch a high of Rs. 731 today, before closing the day's session at Rs. 729. I.C.C. May fluctuated between Rs. 719 and Rs. 705 and closed at Rs. 716½. The trend of prices in the forward section of the local cotton market during the week under review was as follows:

		Opening	*High*	*Low*	*Closing*
I.C.C. Feb. ...	(Rs.)	713	731	710½	729
I.C.C. May ...	(Rs.)	705	719	705	716½

The following are the latest available prices from the spot market:

Bengal Deshi Rs. 640; Berar Jarillas Rs. 800, Khandesh Rs. 860; Vijay Rs. 930; Oomra Deshi Rs. 710; Moglai Rs. 720.

At Karachi, the repercussions of the world markets are naturally felt. The U.K., Continent and the Far East have all once again turned their attention to this market. Unless the U.S. policy for disposing of certain surplus cotton takes the form of a separate price for exports or/and acceptance of payment in non-dollar currencies, Karachi will reap the reward of its patience. The future depends on the U.S. policy and here the Administration has promised that in their search for new and additional markets for their cotton, the U.S. will see to it that other countries having cotton to dispose of do not suffer or lose their customers. In any case, the market sentiment at Karachi is very favourable and shippers are in a mood to collect cotton with an eye both to the present and the future demand from abroad.

The following are the latest available quotations from the Karachi market: Sind Deshi Rs. 71; 4F Punjab R.G. Rs. 67-69; S.G. Rs. 75; N.T.R.G. Rs. 72½ to Rs. 73½; 289F Punjab R.G. Rs. 78; S.G. Rs. 84; L.S.S. Punjab R.G. Rs. 73½; S.G. Rs. 79.

At Alexandria, every week witnesses a more broadening activity. Now there are enquiries even for higher grades of Karnak and Giza 30. While a major part of this enquiry is from India, as stated above, other Continental countries and the U.S. have also been well interested. Ashmouni is in demand mostly for local consumption, with the result that premia for all varieties have gone up by ½*d.* to ¾*d.* over the previous week's levels.

It is, however, the position in the U.S. markets which is the most intriguing and to a very great extent confusing. Everything seems to be in

a fluid state there, as it is not known what final form the new farm programme will take. There are two opinions about changing the loan basis as well as having a two-price system and/or export subsidy. The market sentiment in the meanwhile is very firm because of the improved position of the cloth market, leading to a greater internal demand, a better export outlook and the volume of cotton going into Government loan.

The following are the latest available quotations from New York as compared with those a week and a fortnight before:

(In cents per lb.)

	22-1-54	19-1-54	12-1-54
Spot	34.25	34.15	34.00
March	33.58	33.53	33.29
May	33.82	33.74	33.46
July	33.62	33.70	33.34
October	32.84	33.86	32.76

COTTON YARN BUOYANT

(From Our Own Correspondent)

BOMBAY, *27th January*

Under the impetus of continued and steep rise in raw cotton prices, the cotton yarn market exhibited buoyant conditions during the week under review. Besides, highly encouraging reports from the local and Ahmedabad cloth markets hardened the sentiment. Enquiries for cotton yarn, therefore, broadened greatly and sellers were somewhat reserved on expectation of still better prices. Values of yarn swiftly rose, the gains spreading to almost all the counts.

Among 10s, J. Podar advanced by As. 10 to Rs. 12-14 per bundle of 10 lbs., Elphinstone by As. 8 to Rs. 13"and Modern by As. 4 to Rs. 13-6. Among 20s, Modern picked up As. 11 to Rs. 17-8. Hind, Edward and Madura were higher, each by As. 8, at Rs. 17-2, Rs. 16-11 and Rs. 18-8, respectively. The extent of the improvement in prices registered during the week by the other counts yarn is indicated in the table below:

	19th Jan. 1953 Rs. a.	27th Jan. 1953 Rs. a.
30s		
Madura	21 14	23 0
Indian	20 2	20 8
40s		
Lakshmi	24 14	23 12
Hind	27 8	30 0
Meenakshi	25 0	25 14

Sriram	58 0	60 4
Pioneer	43 0	45 0
Pankaja	37 0	39 0
Kothari	43 8	45 0
Hind	45 0	46 0
80s		
Elphinstone	60 0	63 0
Finlay	67 8	69 8
Sri Ram	64 8	66 0
90s		
Seksaria	57 0	57 8

After remaining hesitant on the opening day of the week, due to technical correction, the art silk yarn market staged a marked recovery in the subsequent sessions. The recovery was primarily assisted by firmness in the cotton yarn market and good offtake in the ready section, following favourable reports from the rayon fabric market. Art silk yarn (150D) for January contract, which had receded to Rs. 757, as against Rs. 762 last week-end, recovered to Rs. 766. Today, however, it was a shade lower at Rs. 764. In the ready section, 120 Italy moved up by As. 2 to Rs. 4-3. 150 Japan gained an anna to Rs. 4-5. 150 Italy was better at Rs. 3-14. 120 Japan was well supported at Rs. 4-10.

The table below gives the prices of art silk yarn quoted today, as compared with those on the 20th and 13th inst:

	27-1-54 Rs. a.	20-1-54 Rs. a.	13-1-54 Rs. a.
150 January (per case of 200 lbs.) ..	764 0	762 0	745 0
120 Japan (per lb.)	4 10	4 10	4 10
150 Japan ,, ...	4 5	4 4	4 4
120 Italy ,, ...	4 3	4 1	4 0
150 Italy ,, ...	3 14	3 13½	3 12½

The staple fibre yarn section was fully steady this week, thanks to limited stocks. Among Indian yarns (40×2), New Great and Hindustan hardened by an anna and a half to Rs. 4 and Rs. 3-11½ per lb., respectively. Sitaram was higher at Rs. 3-13, as against Rs. 3-12½. Hind, Century and Vasanta were better at Rs. 3-14, Rs. 3-15 and Rs. 3-13½, as against Rs. 3-13½, Rs. 3-14½ and Rs. 3-14, respectively, a week before.

GROUNDNUTS EASE AT CLOSE

(From Our Own Correspondent)

BOMBAY, *27th January*

The oilseeds market depicted a variegated pattern this week. The groundnut section ruled firm till almost the end of the week, on continued speculative support. Today, a reactionary tendency set in, on profit-taking, at the high levels touched. The castorseed section also disclosed a more or less similar trend. During the major part of the week, the bull grip on futures remained tight and prices shot up. The bearish trend witnessed thereafter was due to rumours that there was no possibility of the Government licensing exports of castor oil in the near future. The linseed section presented a zig-zag trend, for no other reason than speculation.

There is a greater desire to hoard groundnuts, with a view to making profits some time later, when prices are expected to go still higher up. It is estimated that nearly 2 lakh tons of groundnuts have already gone into the hands of hoarders. The position in the castorseeds section too is in no way different. Small wonder, therefore, the Government is reluctant to allow exports in either section. Trade circles estimate the current year's groundnut crop at 22 lakh tons.

Sectionwise, groundnut Bold, which opened at Rs. 36-4, as against Rs. 36, shot up to Rs. 36-10 on the 25th inst. Subsequently, it declined to Rs. 35-10, where it closed for the week. February-March delivery lost As. 14 to Rs. 35-5, over the week. April-May delivery opened at Rs. 37-8 on the 21st inst. Today, it was quoted at Rs. 36-2. Groundnut oil ex-mill and railway receipt lost As. 5 each to Rs. 18-10 and Rs. 18-8, respectively. February and March deliveries were done at Rs. 18-9 and Rs. 18-12, as against Rs. 19 and Rs. 19-2, respectively.

In the linseed section, Bold ready, which was done at Rs. 30-4 on the 21st inst., as against Rs. 30 on the previous day, declined to Rs. 29-8 on the subsequent day. Then, it shot up to Rs. 30-6 to decline again gradually to Rs. 29-4, where it closed. February-March lost As. 10 to Rs. 25-12. April-May opened at Rs. 25-14 on the 23rd inst. It was done today at Rs. 25. Linseed oil was done lower by As. 2 to Rs. 16-2. Trade circles have estimated linseed crop to be lower than in last year.

In castorseeds future, there has appeared a tussle between bulls and bears. May delivery, which stood at Rs. 116-12 early in the week, as against Rs. 117 end of last week, shot up to Rs. 121-10 on the 23rd inst. Thereafter, it gradually declined to Rs. 115-8, where it closed. Among spots, Madras quality lost As. 4 to Rs. 25. F.A.Q. was also lower by a similar amount at Rs. 24-12. Oil B.S.S. was done at Rs. 14, as against Rs. 15-8, and I Pressures at Rs. 13-12, as against Rs. 14-8. Commercials eased from Rs. 13-8 to Rs. 12-14.

Among others, *kardi* Bold lost Re. 1 to Rs. 23-8 and February-March Re. 1-4 to Rs. 23. *Niger*, F.A.Q. was down by As. 8 at Rs. 29-10. February-March was done at Rs. 29-4, as against Rs. 29-12.

Arrivals of oils and oilseeds from 1st to 21st January, as compared with those in the corresponding period last year, were as follows:

(In cwts.)

	1954	1953
Groundnuts	276,006	313,059
Linseed	4,337	3
Castorseed	2,291	43,653
Groundnut oil	84,870	24,477
Linseed oil	3,898	748
Castor oil	749	5,254

The following table shows the prices of oilseeds and oil on the 27th inst., as compared with those at the end of the previous two weeks.

	27-1-54 Rs. a.	20-1-54 Rs. a.	13-1-54 Rs. a.

SUGAR ADVANCES

(From Our Own Correspondent)

BOMBAY, *27th January*

Disquieting reports from Uttar Pradesh sugar centres regarding cane prices and revival of the feeling that the output of sugar during the current season would be less than 12 lakh tons imparted strength to the Bombay sugar market during the week under review. Poor arrivals and good offtake in the ready section also aided the bullish fervour of the market. On top of these, there were firm advices from *gur* markets. The buying support that ensued as a consequence lifted up the prices of sugar which had sustained a fall in the past week. The improvement would have been more marked but for the tenders for 8,500 tons of Czechoslovakian beet sugar per s.s. *Maria*, invited by the Central Food Ministry.

In the forward section, *Maha* delivery, which had touched a low of Rs. 83-12 per bag on Wednesday last, recovered to Rs. 85-12, but finished lower at Rs. 84-6 today. *Posh* delivery was squared up at Rs. 81-14, as against Rs. 81-10. Prices of ready sugar recorded handsome gains. Large grain sugar spurted from Rs. 96 to Rs. 97-99. Medium grain was higher at Rs. 94-95, as against Rs. 92. Small grain was fully steady at Rs. 92. In sympathy with indigenous sugar, foreign sugar also registered a rise in values. British refined sugar moved up by Re. 1-4 to Rs. 85 per bag of 2 cwts. Cuban sugar put on As. 8 to Rs. 37 per 100 lbs. Mexican sugar, however, proved an exception and suffered a loss of As. 4 to Rs. 40-4 per bag of 110¼ lbs.

Tenders for Czechoslovakian beet sugar (8,500 tons) per s.s. *Maria* have been invited. Another steamer carrying Czechoslovakian sugar is expected to arrive in Bombay by about the end of next month. Tenders for this, it is reported, will be invited during the first week of February.

Arrivals of indigenous sugar into the Bombay market were lower this week too, the quantity actually received being 7,200 bags, as against 11,300 bags a week before and 16,000 bags two weeks before.

DEMAND FOR PEPPER FALLS

(Messrs. Parekh & Co.)

BOMBAY, *27th January*

The pepper market during the week turned easy owing to the falling off of demand from New York, where spot price is reported to have gone down from $1.01 to $0.90, under pressure of sales of unsold parcels by the Indian and Sarawak interests. The increase in arrivals at Cochin and Alleppey and the absence of demand from foreign source made growers easy sellers. Some sales of ungarbled at Alleppey are reported done at Rs. 1,600 and of garbled at Rs. 300 per cwt., at Cochin. The position at the moment appears uncertain as most of their requirements for the January shipment is already covered by the Indian exporters and the arrival of the Russian steamer to load the cargo purchased by the U.S.S.R. is further delayed. The trade is expecting broadening of demand from foreign sources at round about the present level as stock in almost all the foreign countries is reported to be small. It is also expected that, at every further fall from the present prices, the resistance from the growers will increase. But, if America, for one reason or another persists in its present slow buying, a further fall in prices is inevitable, for, in the coming month, there will be competition among the sellers from North Malabar and Travancore-Cochin area.

In the A.S.T.A. section, January was done at $0.82, while February-March was done at $0.79½. In the delivery section, prices are easy with restricted turnover.

Following are today's nominal quotations: Ready Rs. 160-220 per cwt., February Rs. 1,420-40 and March Rs. 1,430-50 per candy of 5½ cwts.

TEA PRICES RISE

(Messrs. Forbes, Ewart and Figgis Ltd.)

COCHIN, *22nd January*

The offerings in sale No. 2, which was held on Tuesday, 19th January, amounted to approximately 9,35,000 lbs. Throughout the sale, there was a very strong general demand for all types and prices advanced As. 4 to As. 5 all round. Best liquoring Nilgiri teas showed some improvement in quality and these met with keen competition, and prices were irregularly dearer by As. 4 following quality. There was a much stronger demand for whole leaf teas, particularly O.P.'s. The following were the quotations:—

	1954 Rs. a. p.	1953 Rs. a. p.
Low grown Travancore B.O.P.	2 6 6	1 5 0
Medium Travancore B.O.P. ...	2 7 6	1 13 0
Anaimallais B.O.P.	2 11 0	2 0 6
Best liquoring Nilgiri B.O.P.	3 8 0	3 12 0
Well made black leaf O.P. ...	2 12 0	2 3 0

London Market.—Market generally farthing to half penny easier. Commonest weakest feature.

Colombo Market.—Very active. High-grown brokens firm to slightly dearer. Corresponding leaf and fannings advanced 15 cents. Low-grown and medium brokens fully 10 cents dearer. Egyptian types substantially dearer.

Calcutta Market—Export.—Easier tendency, as sale progressed, especially medium B.O.P.'s. and O.F.'s.

Dust.—21,000 packages. Market generally half an anna easier.

Export Quota.—At the beginning of the week, the market rose to 60 pies, but on Tuesday there was a steep decline and today's quotation stands at 42 pies.

Forthcoming Auctions.—Sale No. 3 will be held on Tuesday, 2nd February.

As we go to press, Messrs. Forbes, Ewart and Figgis Ltd., wire:—

"*Dust Sale B.*—2,90,000 lbs. Very strong general demand. Market opened As. 4 dearer and closed irregularly As. 4 to As. 6 dearer for all types."

SACKINGS DULL

(From Our Own Correspondent)

CALCUTTA, *26th January*

Although price movements were narrow, steady conditions were seen in the jute goods market during the week under review and moderate business was put through. The market remained closed last Saturday as well as today. The fractional decline in prices in New York was not taken notice of, and in December fell to 71 million yards from 74 million yards in the previous month did not have any effect on the market. Total consumption for 1953 was higher, by 2 millions, at 825 million yards, inclusive of deliveries to the army. Commercial consumption amounted to 809 million yards, an increase of 57 million yards as compared to 1952. This remarkable increase should not have been due to any proportionate increase in requirements of the packaging material, but suggests that burlap was able to capture consumers who had changed to substitutes. The new cheapness of burlap sustains the hope that this recovery would continue and that American purchases from this country would increase. Ready 40" 10 oz. hessians were steady at Rs. 43-11 last Tuesday, but when mills began to make offers, they declined to Rs. 43-4. Activity in the *fatka* aided this fall. Mills sat out of the market at this stage, and this factor coupled with some covering business by shippers pushed the rate to Rs. 43-14 on Friday. Conditions were visibly better yesterday, and a recovery to Rs. 46-7 was a feature following some business with foreign buyers.

In contrast with hessians, the sacking market was dull, and the pull throughout the week was in the downward direction. At the lower levels, mills did not make any offers. The lack of any concrete news from Australia relating to the proposed decontrol of the jute goods import trade was a factor for depression, and the consequent unloading caused prices to fall. From Rs. 104-10, ready B. twills touched a low of Rs. 103-2. Yesterday's quotation at Rs. 103-8 was nominal in the absence of business.

The raw jute market was steady. Only moderate support was visible from mills. Prices were well maintained. Business was transacted in locally packed northern jute at Rs. 27-8 basis bottoms. Assam upper bottoms were quoted at Rs. 28 and middles at Rs. 31. Murshidabad bottoms recovered to Rs. 26-8 from Rs. 25-8, while there was no change in northern bottoms and middles at Rs. 28-8 and Rs. 31-8 respectively. *Bimlis* were sought at Rs. 25, Westerns at Rs. 25-8, and Orissa bottoms at Rs. 29. The superior fibres were difficult to obtain and their supply position would become worse as the season comes to a close. No carry-over either in India or in Pakistan is expected, and the report from Karachi that the acreage in East Bengal would be doubled in the coming season was noted. This is indeed necessary, if Pakistan desired to maintain its markets for raw jute.

FOODGRAIN PRICES RECEDE

(From Our Own Correspondent)

HAPUR, *26th January*

The latest authoritative review of the overall food position in India indicates self-sufficiency not only in rice and coarse grains but also, to a large extent in wheat. Consequent on the improvement in the 1953-54 crop, a general fall in the prices of foodgrains is witnessed everywhere. This has also led to a decrease in demand for foodgrains from deficit areas and an increase in exports available from surplus areas. Since coarse grains and gram have been decontrolled with effect from the 1st inst., prices in the deficit and surplus areas are getting mutually adjusted. There is little rise in some areas and little fall in others.

The distribution of wheat by the States is being gradually withdrawn and the trade has started to regain its previous role. Direct sale of wheat from the Central Government's godowns to the trade at a price of Rs. 15-8 per maund has already started in some places, as, for example, in West Bengal, Orissa and Bombay. This will soon be followed in other places. The Union and State Governments hold wheat stock to the tune of 800,000 tons which are expected to carry us through for several months. If prices are suitable, the Government would import some wheat to build up stocks. The coming wheat crop is expected to be good. Only in the case of rice, controlled distribution is continuing, but, in 1954, the requirements of the country are expected to be fully met by internal surpluses.

Foodgrain markets in Uttar Pradesh remained quiet to bearish. The initial buying enthusiasm being over, coarse grain prices have declined in *Bajra*, gram and other deficit areas of the country. maize rates have fallen slightly in the surplus areas of Punjab, P.E.P.S.U., Uttar Pradesh and Rajasthan. In Delhi also, maize and *bajra* prices have fallen.

Coarse grain stocks in West U.P. *mandies* have been appreciably supplemented by receipts from Rajasthan. Substantial quantities of maize, *jowar* and *bajra* were received locally from the Rajasthan this week which induced good price decline. In U.P., the problem of disposing of the 53,000 tons of surplus imported wheat stock lying with the Government has been engaging serious attention for some time past. A few weeks ago, the State Government had allowed the export of flour to Bihar. But so far, only 18,000 tons of wheat out of the huge surplus at hand have been lifted by the flour mills. The latest news is that the U.P. Roller Flour Millers Association has now forwarded a proposal to the U.P. Government that it is prepared to lift, by the end of May, 30,000 tons of the 53,000 tons of surplus wheat. If the proposal is accepted, the remaining 23,000 tons may be utilised for austerity provisioning. It is further learned that the Food Ministry is favourably considering the suggestion that, pending disposal of the stock, imports of wheat into U.P. may remain suspended.

The pulses section too remained very unsteady. The declining trend in foodgrain prices, absence of demand, lower advices from east U.P. and Madhya Pradesh, and excellent next crop prospects have reacted very bearishly on the market sentiment. Prices have declined both in the ready and futures sections.

The Punjab exported 5,393 tons of rice during the fortnight ended 15th December, 1953, under the basic plan for the movement of foodgrains. This brings the progressive total of rice despatches to 31,674 tons. In all, the Punjab is to export 60,000 tons of rice out of the 1953-54 crop. Besides, 4,384 tons of paddy were despatched to Kashmir. The State Government purchased 9,997 tons of paddy under the rice monopoly procurement scheme during the fortnight, bringing the total purchases of paddy since September, 1953, to 156,744 tons.

It is authoritatively stated that the food situation in the Rajasthan State is very sound and that the Government is determined to go ahead with its programme of exporting 150,000 maunds of wheat from Bikaner outside Rajasthan. It is stated that a huge stock had been built up by the Government at Bikaner in 1952 and a large quantity was deteriorating. To avoid further deterioration and consequential financial loss, the Government has decided to sell the stock in Bikaner and create a fresh buffer stock of wheat. The Government has already expressed its willingness to sell wheat to the *Beopar Mandal* at the controlled rates till the next harvest.

Prices of coarse grains, *jowar* and *bajri* which had shot up in Bombay by about 20 per cent., following the introduction of free trade on the 21st inst., are now slumping and may go lower still as soon as supplies reach Bombay. It is expected that 4,000 tons of *bajri* would reach Bombay within a week's time. The railway administration has agreed to release a large number of wagons for the movement of *bajra* from Madhya Pradesh. Wagons will also be made available to transport *jowar* from the Punjab and P.E.P.S.U.

The latest quotations (per maund) in the Hapur market are: Ready wheat Rs. 17 to Rs. 19, gram Rs. 14, barley Rs. 11-6, *bejhar* Rs. 11-8, maize Rs. 12-10, *bajra* Rs. 11-12 to Rs. 13, *guwar* Rs. 10, *jowar* Rs. 9-12 to Rs. 11, white *jowar* Rs. 11-12, rice Rs. 30 to Rs. 19, peas Rs. 11-8, *arhar* Rs. 11-8, *urd* Rs. 17-8, *moong* Rs. 16-8, and *masoor* Rs. 16-4. Futures peas *jeth* Rs. 9-15, *arhar jeth* Rs. 10-8-9, *urd maha* and *baishak* Rs. 15-12 and *guwar maha* Rs. 8-9-6.

SUGAR BULLISH

(From Our Own Correspondent)

HAPUR, *26th January*

The threatened strike of the sugarcane growers reacted bullishly on the crystal sugar markets and prices tended to improve during the week under review. The strike constitutes a serious threat to the U.P. sugar industry, inasmuch as over 50 per cent. of India's total sugar production is accounted for by this State. Over 91 per cent. of the cane crushed, to the tune of 244 million maunds in 1952, was supplied through the co-operative societies which have now threatened to strike. The representatives of the sugar industry in U. P. are expected to meet in Lucknow this week to consider the whole situation and it is believed that, if goodwill prevails on both sides, the sugar factories might be induced to give up to As. 3 per maund extra, as against As. 5 demanded by the cane growers. What the growers are demanding is not an increase in the statutory minimum price of cane fixed by the Government of India but a share in the excess profits available to the industry because of the higher prices of sugar.

The Calcutta sugar market remained steady on scarcity of bold grains which was in demand. The Madras market eased, due to heavy arrivals of imported sugar. The Bombay market remained steady.

The *gur* markets were moderately active this week, with slightly reduced arrivals, on account of cloudy weather and restricted despatches, due to continued loading difficulties. In the ready section, sugar prices were maintained, thanks to sustained demand from the importing areas of Assam, Bombay and Gujerat. Reports from the South Indian *gur* exporting markets of Baramati, Akluz, Shrirampur, Kopergaon, Kolhapur and Ankapalli indicated increasing seasonal arrivals and an effective demand. There is general inclination in the deficit areas to stock *gur* at current prices. *Gur* arrivals have also begun in Madras State markets. Arrivals at Ankapalli are increasing appreciably and this would now be in a position to feed Bengal, Assam and a few other deficit areas.

Gur prices in the futures section moved erratically. The trend was very unsteady in the initial session of the week, in view of the threat to the sugar industry in U.P. The U.P. Sugarcane Growers Co-operative Federation has decided to stop supply of sugarcane to the mills in the State from 1st February, unless the supply rate was enhanced from Re. 1-7 to Re. 1-12 per maund. The Federation has also resolved to utilise the season's cane crop in manufacturing *jaggery* until the enhancement in prices demanded has been made by the mills. The futures section for some days were swayed by the concerted efforts of the bears, and prices suffered a precipitate fall on that account. Towards the close of the week, there was a good recovery. Not only profit coverings induced buyings, but prospects of the crisis in the sugar industry actually materialising were very much discounted.

Pansera *gur* in the ready section is quoted here at Rs. 15-6 per maund and Balti at Rs. 16-6 today. The lowest level touched during the week was Pansera Rs. 14-14. In the futures, Pagan is now quoted at Rs. 13-10-6, whereas the low touched earlier Rs. 14-12. There is increasing volume of business. Forward trading in *gur* has been resumed in Nizamabad also.

METALS STEADY

(From Our Own Correspondent)

CALCUTTA, *26th January*

The uptrend in the metal market was arrested this week mainly due to weaker advices from London. Prices were affected, but, as demand for the base metals was moderate, steady conditions were imparted later in the week. Electrolytic copper touched a low of Rs. 170, but as supplies were limited and demand was strong in comparison, only little time was necessary for the local rate to disregard London advices and recover to Rs. 175. The fire-refined ingots were priced at Rs. 155. Electrolytic zinc declined from Rs. 53-8 to Rs. 51-12, following the fall in London and the satisfactory supply position. Lead was lower at Rs. 60, the decline this week being by two points. Tin changed hands at Rs. 425.

KIPS IN GOOD DEMAND

(From Our Own Correspondent)

MADRAS, *25th January*

Shippers have been buying moderate quantities of *kips* arriving in the local market. Stocks have not accumulated in the bazaar. Sellers demand one anna above U.K. levels, but importers do not seem anxious to pay Madras prices. Tanned buff hides and buff calf superior tannages are in good demand. Cow calf, however, is neglected.

The tanned goat skins market has ruled steady and sheep weak, despite good clearance.

ECONOMIC RECONSTRUCTION OF INDIA

(Concluded from page 156)

an agreed draft can then be taken to Parliament. That will leave the States with powers derived under the explanation to sub-clause (1), augumented, so to speak, or made clear by the ruling of the High Court. There will be power for the States to impose either kinds of tax which are not confined within the four walls of the legislation under the second part of the Article. In that case, i.e., if, even after the helpful attitude by the Centre in the form of enabling legislation, some of the States, or one or two recalcitrant States, refuse to be convinced, it seems to me then that the Government will have to consider whether there is any case for deleting that explanation. Progress will have to be made along these lines, and I am afraid I cannot take this matter any further at the present moment. All I can say is that we are well seized of the matter, and it is, as the phrase goes, under active consideration."

Finally, Mr. Deshmukh's observations on the larger questions of economic policy are worthy of notice. He warned that there was no easy solution of India's economic ills. Said he:

"The point to remember is that whichever *ism* one might be committed to in practice, it is impossible to bring about a quick transformation of society so as to make it ripe for one *ism* rather than for the other, historically speaking these are slow-maturing processes and there is always necessarily a period of overlap.

"It is important to my mind that, during this period while the country goes on trying to decide which kind of economy would be in its best interest, all parties, whatever their creed, should co-operate in the joint effort and observe the rules of the game, while not ceasing to urge their own particular point of view on the attention of the people. What seems to be undesirable and prejudicial to the interests of the nation is either sullen non-co-operation or ruthless obstruction."

Confidence in Government

Proceeding, he observed that the Government was often blamed for encouraging social injustices and for not doing enough to reduce existing inequalities. While he welcomed criticism, he urged that it should not be carried so far as to question the Government's *bona fides*. He said:

"To my mind although it is completely right that these objectives and ends must be kept in view and that Governments must be judged vigilantly, there is a stage at which Government's *bona fides* must be accepted because any controversy beyond that level only leads to a contraction of effort which is not in the interests of the country. There is a misunderstanding which frequently arises in regard to incentives, especially incentives for private industry. There is a misunderstanding even in regard to, what the Planning Commission has called mixed economy, which in other countries is called dual economy. There are misunderstandings in regard to the level of taxation or to the distribution of taxes as between the direct and the indirect categories. There are even misunderstandings in regard to the profits that are allowed to be garnered by industry. It is not my purpose to enter on these controversial grounds at all. What I am trying to explain is that a stage comes when at least the *bona fides*, if not efficiency of Governments, no matter which Government it may be, must be accepted if any progress is to be made and that does not exclude any reconsideration of matters as fresh light is shed on these problems. Therefore, in a sense, the implementation of any plan involves an act of faith on the part of the people as well as an act of confidence in themselves and, as far as theory would permit them, in Governments."

JUTE.

(Concluded from page 166)

The unexhausted capacity of vegetative growth of plants sown in June-July might have something to do with their production of a larger number of fruits.

The flowering and fruit bearing were somewhat early due to vernalisation, that is, imparting cold and warm treatment to seeds before sowing. However, the vegetative growth with reference to the total heights reached, daily increased in height, and mean length of each internode did not show any statistically significant differences due to vernalisation treatments.

Dissemination of this knowledge among jute growers in the various States should go a long way towards increasing the per-acre yield of raw jute. But this is only one aspect of the cultivation of raw jute. It may be noted that the depth of sowing, preparation of the soil and the dose of the right kind of manure to be applied also materially improve the quantity of jute grown on a given plot. Then there is also the question of improving the quality of jute itself, a problem which needs increasing attention at the hands of our agronomists.

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nomina quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. ‡ Sales and amount written off. (k) Investments. † For ten months ended 31st December 1951.

(j) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 196 in the debentures section:—

H Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1¼ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium.

(b) Bearer bonds of Rs. 1,000 each repayable at par.

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

e Returnable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months notice.

LABOUR UNREST IN U.K.

MOVEMENT GATHERING MOMENTUM

(From Our Own Correspondent)

LONDON, 23rd *January*

LONDON LETTER

A NEW form of strike has suddenly directed attention to widespread labour unrest on the general level of wages. The labour unrest in itself is nothing new. Since last summer, union after union has been making claims for increased wages to keep up with the increased cost of living, and against these claims the attitude of both employers and the Government has hardened—the latter on the grounds that necessary expansion in this country's exports is made more difficult by increasing costs; the unions, on the other hand, argue that their proposals do not necessarily mean an increase in costs but a reduction in the amount of profit available for distribution.

The wages *versus* profit argument may be sound enough in the engineering industries, but it hardly applies to the claims by the transport workers or the miners—both in nationalised industries. Yet, interestingly enough, it is just in these industries that wage increases have already been granted! The railway men, for instance, who threatened to strike over the Christmas holidays because they were made an offer which they regarded as insulting, were induced to call off their strike on the promise of negotiations on a more reasonable level and in the end accepted an increase of nearly double the figure first proposed. The London busmen have had similar treatment, and a reasonable increase has also been negotiated with the mine workers. In all these cases, it is the public or industry which has to pay. Transport fares are being increased in order to meet the additional cost and industry will have a higher coal bill. But, in the competitive engineering industries, with their substantial export outlets, the same easy remedy is not available as it is to the public utilities. The increases would probably have to come out of profits—hence the very strong resistance to pressure by the unions.

Electrical Dispute

The present fight is between the Electrical Trades Union and the Electrical Contractors and covers only a small part of a field in which claims are being pressed by unions numbering some 5 million members.

In the public eye, the electrical dispute has assumed exceptional proportions, partly because of the Communist leadership of the unions, but mainly because of the way in which the strikes are being engineered. As regards the Communist leadership, this certainly exists; but, on the other hand; a Court of Enquiry set up to look into the dispute last autumn found no evidence at all that the dispute had any other than a wages objective. The Court rules out any suggestion of political motives. But the Union concerned has adopted an imaginative technique of organising strikes to take place at a moment's notice without warning—other than a general warning that strikes were proposed—and in individual firms or at individual plants at one time where they might have the maximum effect. Thus, a number of one-day strikes has taken place either in some of the Government's atomic plants or in small engineering concerns—and even in a large trade exhibition now taking place in London. Any firm employing members of the Union may find its work stopped without notice at any time: usually for one day, but possibly for longer, for the unions arrange to pay the men full pay and to call them out for an *indefinite* period. The employers for their part are retaliating by locking out the men on the day following a one-day strike, but, there again, the union pays the men the full rate.

In entering this battle, the Electrical Trades Union has counted on its many substantial funds to enable it to fight for a considerable period. But the employers, in spite of the inconvenience of this method of guerilla warfare, are so far showing no signs of yielding, fearing that to do so will prejudice their position in all other negotiations.

The general evidence is that an increase in wages is warranted on the cost of living increases, but the Union is reluctant to put the dispute to arbitration fearing that pressure from the employers would give an inadequate reward. Their strongest claim for consideration is the increases that have already been granted to the workers in the public utilities, and sooner or later the dispute may have to come to arbitration.

The real issue is whether the level of industrial wages ought to keep up with increases in the cost of living, and, although it could be argued academically that the "vicious spiral" of rising wages and prices has got to be stopped somewhere and that, until wage increases stop, there is no hope of preventing further price increases, yet the ground has been cut away under this argument by the increases awarded to the workers in the utilities. Why should the engineering unions be treated differently is the question that they are asking.—*All Rights Reserved.*

MARKET GOSSIP

(Concluded from page 151)

decision in favour of convertibility. It says that a "dash" for convertibility or letting the currency "find its own level" presents the danger of a vicious circle of inflation, and would require larger reserves than may be available to prevent currency depreciation from getting out of hand. It recognises that sterling, which finances about 40 per cent. of the total trade of the world, is a "key currency." In "proper" circumstances, the Commission would like to see the currency become convertible, in the interests of freer trade and payment in a world-wide multilateral system. Nevertheless, it advocates only "gradual and controlled approach to convertibility." To this end, it wants Britain's reserves to be strengthened. It recommends, in this connection, a "more active utilisation" of the I.M.F.'s holding of gold and convertible currencies, and reasonable relaxations by the Fund, such as relaxation of the time schedule for utilisation of quotas and the provision for maintaining fixed parities. It also suggests that the Federal Reserve System should explore with foreign central banks the possibilities of standby credits or line of credit arrangements. Such an arrangement, the Commission claims, would avoid an increase in the public debt of the creditor countries, could be handled more flexibly and effectively than a formal grant of credit by the U.S. Treasury. This suggestion is undoubtedly a great improvement over the proposal that the U.S. should open a stabilisation fund for underwriting the convertibility of the pound sterling.

• • • •

The key to the problem of convertibility lies as much in the sterling area's determination to cut down costs and increase its exports as in the U.S. willingness to adopt measures designed to augment its imports. And, in the matter of freer import trade, it is doubtful if the Commission's recommendations, admittedly cautious as they are, will be implemented. For one thing, the Commission is itself divided in its opinions; a powerful minority has dissociated itself from the Commission's recommendations. Secondly, the ultra-protectionist group is still in power in the Republican Party. Thirdly, the elections are approaching and the authorities are

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent Who else must sweat and toil and gain but scanty fare."
William Blake

VOL. LXXXVIII. No. 2242 BOMBAY, 6 FEBRUARY, 1954 PRICE Rs. 1/8

PROBLEM OF BONUS FOR LABOUR

THE defects in the system of buying industrial peace through payment of bonus which has been in vogue in this country for over a decade now are coming to light, as more and more industrial units cease making profits. The workers, who have been accustomed to getting large lump sums in cash by way of bonus, become disgruntled when they do not receive such payments for no other reason than the fact that the concerns in which they are employed have incurred losses. Human nature being what it is, this feeling of dissatisfaction becomes perceptibly strong and manifests itself in unpleasant forms when they find that their confreres working in other units belonging to the same industry receive some bonus. We thus have industrial unrest, instead of industrial peace for the maintenance of which the bonus system was introduced. This situation offers a wonderful chance to irresponsible rivals in trade unions for fishing in troubled waters and they do so with great delight to the discomfiture of those who are in authority both in the unions and the Government.

A striking instance of this state of affairs was provided the other day in this city. Under the award given by the Bombay Industrial Court for payment of bonus to mill workers for 1952, as many as 20 mills were exempted from payment of bonus on the ground that they did not show any profits, while the remaining 40 mills were ordered to pay 15 per cent. of their basic wage bill for 1952 as bonus. Workers of one of the 20 exempted mills protested against this award by staging a sit-down strike. One man was killed and six were injured when the police, in their attempts to disperse the workers who had become unruly after some time, resorted to firing. The Communist Union called for an one-day token strike as a mark of protest against the police action and the response to it exceeded expectations. Over 100,000 workers chose to stay away from work, even though they knew that this would cost them a day's wage. This seems to have caused some concern among the labour leaders belonging to the recognised trade union, namely, the I.N.T.U.C., about their hold over the rank and file.

This was, perhaps, the cause for two important suggestions, at last week's meeting of the State Labour Advisory Board, requiring an amendment to the Industrial Relations Act. One suggestion was that a registered trade union should be regarded, for all practical purposes, as the representative of all employees, whether they are its members or not. In order to give effect to this suggestion, the Act must be amended to provide that an agreement, settlement and submission of award to which a representative union is a party should be binding on all employees. The second suggestion related to the pooling of bonus. According to it, the Act should be so amended as to permit the distribution of the total amount of bonus awarded by the Industrial Court to all workers in the industry concerned in a particular centre, including workers in units which have suffered a loss. We propose to examine in this article only the latter proposition, leaving the former to be discussed in a subsequent issue.

The system of bonus that has been in force is a simple, though not a scientific, form of profit-sharing. It began as an *ex-gratia* payment by employers, but later the Industrial Courts described it as a deferred wage. The workers have got used to it so much and for so long that they have come to regard it as a matter of right. Nevertheless, the Industrial Courts have always held that a unit could be called upon to pay a bonus only if it shows a profit, after providing for essential allocations. The application of this principle to units belonging to an industry which has all along been paying bonus collectively, that is, industry-wise, has led to the present friction. The workers of those units of an industry which do not make a profit are not entitled to any bonus, while those belonging to units of the same industry that make a profit get a bonus. This state of affairs, as we stated at the outset, leads to discontentment and unrest. The easiest way to deal with it is to adopt the proposal made at the meeting of the State Labour Advisory Board. It can be argued in support of this proposal that, inasmuch as the workers of the most efficient mills, less efficient mills and marginal mills get the same rate of bonus so long as they all make a profit, irrespective of the margin of profit which each mill manages to earn, there is nothing wrong in stretching this practice a little further to include the sub-marginal units too, though they may not have made any profit. It can be further argued that the payment of bonus on a collective basis is a complement to collective wage determination and that it is necessary for a more equitable distribution of the surplus of the efficient units to which collective wage determination does contribute something.

The aforesaid argument sounds plausible, but it is fundamentally wrong, because the system of bonus itself is based on unsound economic principles. The bonus system came into practice as an expedient to distribute, as a sop to workers, a share of the excess profits arising from inflation. Its replacement by a more scientific wage policy, even when inflationary profits became a thing of the past, was never seriously tried, because it was most inconvenient. The greatest defects in the bonus system are that it is unrelated to production and that it confers equal benefit on the lazy and the industrious worker alike, thereby violating the principle of equal pay for work of equal value. This defect would be magnified many times if it were to be applied on a collective, industry-wise basis. It would simply drive a wedge right into productivity and penalise creative effort of individual workers.

Generally speaking, the bonus system, while suffering from all the defects of a profit-sharing scheme, possesses none of its virtues. Even in some of the most highly advanced industrial countries, profit-sharing scheme is losing its earlier supporters who thought that it could be used as an instrument of economic and social policy for relieving tension between capital and labour. In fact, trade unions all over the world are aiming generally at securing a fair share of the national product for all workers, not through profit-sharing, but through collective wage contracts. If, for some reason or other, this country is not in a position to discard the principle of profit-sharing as applied through the bonus system, then it will be well advised to do so only unit-wise. For it is only then the fundamental principle of profit-sharing, namely, that the worker should have a direct interest in the fortunes of the concern in which he works so that he can strive for higher production, can be fulfilled. This will inevitably mean no share for labour units which do not make profits. It is true that under this system, the efficient worker, who has the misfortune to be employed in an undertaking which makes no profit, must remain content with his normal wage, while an inefficient worker who has the good fortune to work in a profit-making concern will share in the prosperity of that concern. But should that be a ground for subsidising the inefficient concerns by the more efficient units in an industry? Surely, there is no sense in carrying the system of profit-sharing to such absurd limits as to reduce it to a scheme of special levy on selected units of an industry for the benefit of certain sections of labour not connected with them.

It is common knowledge that profits made by an industrial unit depend on several factors besides the efforts of labour. The productivity of labour itself is dependent upon, among others, the nature of equipment, efficiency of organisation and supervision. Profits depend not merely on productivity of workers but also on favourable trading conditions, monopolistic position of an industry and the like. Consequently, the bonus system in India, which is unrelated to productivity, gives a hotch

No profit-sharing scheme is free from defects. As a leveller of social and economic inequalities, the profit sharing system has proved a failure. Who gives, for instance, a share in profit to a school teacher, or a landless labourer, or a washerman, or a barber? Is a teacher in any way less productive or useful than an industrial worker? But the irony of it is that all these people, as consumers, have to pay for the cost of bonus to industrial workers. That apart, it has a great adverse psychological effect on investors and employers. The first question they invariably ask is whether labour will be prepared to share the losses too. What then is the alternative? This is a difficult question to answer. Indeed, the system of profit-sharing itself came into existence mainly because a finer and fairer system of remuneration proved difficult of getting a start. Nevertheless, the only equitable solution lies in evolving a wage policy which will ensure a just level of wages, taking into consideration the general economic standards of the country. This, however, does not mean that, in such a system, there will be no place for special bonus schemes which aim at securing increased production by rewarding hard and diligent work.

DEVELOPMENT OF ROAD TRANSPORT

THE last three weeks of February are always a period of expectation for business and industry in this country. For this is the period when all the State and Central Finance Ministries are busy giving final touches to their budget proposals for the new fiscal year to be presented to their respective Legislatures before the close of the month or early next month. This is also just the time when the business community avails itself of the opportunity for focussing public attention on the pressing problems of the day so that the Ministers may take note of them in framing their policies and programmes. Accordingly, the action of the Federation of Indian Chambers of Commerce and Industry (F.I.C.C.I.), in submitting to the Planning Commission a *memorandum* on the development of road transport and circulating it to other concerned authorities, is both timely and appropriate.

Owing to a lack of proper perspective of development problems, State Governments are noted for their being often caught napping by fast-growing events in the sphere of economic development. A typical instance of this is provided by the Bombay Government's policy towards generation of electric power in the State. While the demand for electricity has outstripped the supply, the State Government, which was caught unawares during the last war, has still shown no evidence of its being alive to the dangers of power shortage. It now looks as though, on account of a similar defect among State Governments, the country is heading towards a major transport crisis. For, judged by their reported replies to the Planning Commission's questionnaire on road transport, there is no indication, as was pointed out in these columns some time ago, that they are anxious to build more roads, to repair the existing ones and to allow private operators to participate freely in road transport services, in order to provide cheap, quick and efficient transport which usually results from competition. This complacent attitude towards road transport indicates that the State Governments are unwilling to take note of the writing on the wall, heralding the advent of an economic catastrophe, arising from the ever-widening gap between the stunted transport system and the all-round increase in domestic production.

It requires no prophet to say that the country's economic progress will soon be held up for want of adequate, speedy and economic means of transport. For this is clearly visible to all those who wish to see with some vision. Although the success in the implementation of the Five-year Plan has not been as much as one wished, there has undoubtedly been an appreciable improvement in both industrial and agricultural production during the first three years of the planned period, taken as a whole. Marked increases are noted in the output of cotton textiles, salt, cement, paper, power alcohol, and certain products of the chemical and engineering industries. In the field of agriculture, cereal production has registered tremendous increase. Food controls have been removed and movement of foodgrains in the country has expanded considerably. Many of the major industries such as steel, cement, etc., have expansion programmes which, when completed, will call for a large volume of transport facilities. The river valley projects and electric power schemes, on completion, will provide further immense scope for enhancing industrial and agricultural output in India. The population of the country has grown by several millions and promises to grow further. This means more and more movement of people and of goods needed by them. While all these factors make for increased transport of men and materials, the potential transport capacity in the country has not increased in proportion to its growing requirements.

India has no doubt several forms of transport, namely, railways, airways, water transport and roads. Of these, it is common knowledge that railways are overworked, airways are costly, inland waterways play only a limited part, and road transport remains neglected. Even if all these are pressed into full and effective service, they will fall far short of the growing needs of the country.

It is needless to add here that an easier and quicker solution to remove the transport bottleneck lies in tackling the country's road transport problem. This is the pressing need of the hour for several reasons. The expansion of road transport can effectively relieve the ever-growing strain on railways. The country can look to it as a fruitful source for providing increased employment for its unemployed, as is evident from the fact that road transport in the U.S. provides gainful occupation for over ten million people. Again, it is only a highly developed road transport system that can offer a market for our nascent automobile industry which is at present struggling through many difficulties and in which several crores of rupees have already been sunk and several more crores will have to be invested to achieve a large measure of self-sufficiency. In an agricultural country like India, where producing and consuming centres can easily be connected only by roads, a highly developed road transport system is necessary to prevent depression in the former and booms in the latter often created by a shortage of transport.

If, so far, there has not been a well co-ordinated, integrated and expanding road transport system in India, such is certainly not due to lack of any analysis of the problems involved. The Nagpur Plan is a concrete instance of much valuable thought having been paid to it. Not infrequently, the Press and the platform too have focussed public attention on the issues. In this context, the good work that is being carried on by the Indian Roads and Transport Development Association deserves to be commended. The Planning Commission, too, has shown sufficient evidence that it is quite alive to the importance of the problem, though it has not been able to do much for solving it. The latest warnings against the dangers of allowing road transport in the States to drift have come not only from the F.I.C.C.I. but also from a well-known Bombay M.L.A., Mr. N. Salivateeswaran, whose comprehensive note on the *Transport Problem* is reported to have evoked the attention of the Congress legislators at an informal meeting at Kalyani, presided over by the Prime Minister. These studies by various organisations and individuals provide ample material for those in authority to formulate a sound national policy for roads. But it is, we regret to say, the intransigence of the State Governments that is now blocking the implementation of such a policy.

Although we have analysed the problems of road development on several occasions ere now, we feel that, in view of the impending budget sessions of Parliament and State Legislatures, it is necessary, once again, to expatiate on them, so that the Ministers, M.P's and legislators may refresh their memories on this subject. Simply stated, the problem falls into two parts, one dealing with the road transport vehicles as such, and the other, the roads on which the vehicles are plied.

To take the latter, namely, road development, first. In India, road transport is severely handicapped by inadequate mileage of roads. The country has hardly 0.22 mile for every square mile of land. It has 256,000 miles of roads for 1,139,000 square miles, with a population of 360 million. Calculated on the basis of roads to villages, it has less than half a mile of road for every one of its 550,000 villages. The existing roads, besides being inadequate, are in a bad condition, owing to continued neglect of adequate repairs. While thus their maintenance is not quite satisfactory, the construction of new roads has fallen behind schedule, not always for want of funds, but invariably for lack of will and administrative deficiencies which, as has been pointed out by the F.I.C.C.I., has resulted in unspent balances even from the meagre amounts allotted for road development in the budgets both of the Centre and of the States. For instance, out of a planned expenditure of Rs. 15.8 crores for Part 'B' States, the actual expenditure on roads in the first two years of the Plan has been only about Rs. 4 crores. A similar state of affairs exists in the case of the Centre as well as 'C' States, not to mention the Part 'A' States. The problem thus is one of not only maintenance and development of roads and provision of adequate finances but also spending the same according to schedule.

As regards the motor vehicle, the position is most pitiable. The number of vehicles plying on the roads is also not adequate. How backward this country is will be evident from the fact that, for every 1,000 miles of road, there are only 829 vehicles in India as compared with 14,874 vehicles in the U.K., 12,146 in the U.S.A. and 3,717 in France. Again, according to the Federation, the number of persons served by one vehicle in India is on an average 1,270, as against 3 in the U.S. 5 in Australia, 15 in the U.K., and 16 in France. This unsatisfactory position is due, again, to paucity of funds for road construction and maintenance and to the high taxation of motor vehicles. It may be stated here that road vehicles in India are the most highly taxed item and are literally bleeding from various imposts. In addition, they have to spend more on their own upkeep, on account of bad roads, than in any other advanced country. It is calculated that the annual taxation per ton-mile comes to no less than 20 pies which is twice as much as the cost of moving goods by rail. To this has to be added the cost of repairs resulting from running the vehicle on bad roads. The Federation has calculated that the cost of operating a bus over 35,000 miles a year on bad roads would be some Rs. 2,900 more than if the bus were operated over good roads. Besides the high cost of operation, the threat of nationalisation and the policy of restricted licensing have also retarded the development of roads in India.

This depressing state of affairs is a sad commentary on the State Governments which seem to be blind to what revolutionary changes can be brought about in a free economy by the private-owned truck. Their attention has to be drawn, in this connection, to the following remarks which appear in the note prepared by the Bombay M.L.A. referred to already:

"Trucks in the U.S.A. not only haul the produce from the farms to the collecting point and to the consuming point but have also extended the stores trading area ten times. Big cities have been able to spread out, springing garden suburbs and relieving congestion in the heart. The suburban resident has no difficulty in getting all his requirements at his door, even as a city dweller does. He is able to lead a comfortable life, because of the service by trucks and buses. A New York daily employs 163 trucks to distribute its paper. The total number of trucks used by American newspapers for distributing newspapers works out to 10,000, travelling 200 million miles per year. In short, in America, all kinds of goods from pills to motor cars are carried by trucks. Cotton, tobacco and other raw materials, frozen food and household goods are all hauled by trucks. Highways transportation is the greatest simple combination of economic activities in man's history in America. It also yields 763 million dollars, one-sixth of the nation's taxes. It provides employment for over ten million people. It is also an important arm of National Defence. During the Second World War, not only trucks moved military personnel and military equipment and stores but the automobile factories, in their turn, contributed towards achieving the huge production of armaments in record time."

It is to be hoped that this quotation will open the eyes of our State Finance Ministers who now seem to be blind to the immense value of expanding road transport to the country.

In order to improve the road and the road transport system, the Federation has made some notable suggestions which deserve unstinted support. These suggestions include establishment of a Road Development Corporation at the Centre and in each State, provision of more finances for road development and maintenance, high priority for the construction of link roads, rationalisation of taxation of road transport, encouragement to private operators to enter the field, and creation of a class of contract carriers, as in the U.S., who carry goods under a special contract for particular clients. The State Governments need not feel that by reducing their taxes on vehicles they will incur a permanent loss in their revenue, for lower taxation will stimulate expansion in road traffic which will more than make good the loss they may suffer in the initial stages.

BULLS BOOK PROFIT IN ALL MARKETS

COTTON PHENOMENON—CEMENT PRICES—LABOUR UNREST IN COLLIERIES—AUSTRALIAN WHEAT

THURSDAY, 5 P.M.

THIS has been a week of profit-taking in all the markets, as a result of which values are generally lower at the time of writing. In the share market, equities do not show any appreciable fall over the week, but most of them are well below the highest levels touched earlier in the week. At the higher levels, leading bull operators seem to have thought it wise to book their profit and lighten their commitments. Although it is generally believed in market circles that the Central and the Railway budgets will not contain any fresh burdens on trade and industry, they are inclined to be rather cautious. While this may be one of the reasons why the upward trend in prices has received a check, a more satisfactory explanation is that the rise in recent weeks has been too rapid to continue without a break. Such a movement, as all students of markets know, is not a healthy one. The present reaction is, therefore, a good thing on the whole. In fact, it would appear that the shake-out has not been sufficiently strong to compel all the weak holders to retire from the scene with what little profit they see.

MARKET GOSSIP

• • • •

It would appear that some investors have availed themselves of the opportunity presented by the upward swing in prices to liquidate a part of their holdings. This is evident from the large delivery of shares, some of which are blue chips. Most of these investors are said to belong to the erstwhile princely class. There is nothing surprising about this, for, as we had pointed out on an earlier occasion, the princes have to pay super-tax on their income from non-Government securities and it does not pay them to hold large blocks of equities. While on the subject of liquidation by investors, we may add the market should remember that Estate Duty is now in force and that, as people of wealth die, large bundles of shares will come out for sale.

• • • •

The trend in the bullion and commodity markets has generally been downward. Following an improvement in arrivals and the failure of keen expectation that the Government would permit exports of castorseed and oil at lower rates of duty, oilseeds have receded for the second week in succession. Groundnuts today are standing at levels lower than those nearly a month ago and so also castorseeds. In the case of linseed, the current rates are the lowest since the middle of December last. But the sharpest fall in commodities has occurred in the futures section of the cotton market. Those who do not understand the intricacies of forward trading in this market are surprised why the Contract should have slumped as it has done, when the statistical position of Indian cotton is strongly in favour of holders and when the rates in the spot section are commanding a high premium, standing as they do very near the official ceilings.

• • • •

In so far as we can make out, the explanation is simple. The majority of operators who went long in the Contract must obviously be those who entered the ring purely for speculative profit and not for taking delivery of cotton. Another explanation is that, if any delivery were demanded, it may be given in such long-staple cotton as Laxmi which are high-priced and on which a large financial outlay must be made. This is not a simple affair, in the present seasonal stringency of the money market. Thirdly there are yet some 15 lakh bales of current season crop to be marketed; these will commence flowing into the market from next month onwards and what is more, most of it is high-priced cotton. Although at present the cloth market presents a cheerful picture and mills are working well, one cannot be dogmatic that mill activity will be maintained at the current level. Fourthly, the latest estimates place the crop a little above 40 lakh bales, as against 38 to 39 lakh bales a month ago. And, finally, though the statistical position is undoubtedly sound, the supply is nevertheless so large that it will be no easy joke to corner the Contract, as used to be done in the recent past. The task may not be within the resources of a few individuals. In any case, at the moment there does not appear to be any enthusiasm amongst any section of the market to indulge in this game. Whether an attempt will be made in this direction in future is, of course, something on which no one can be certain.

• • • •

It is said that the decision of the Government of India to permit imports of American cotton freely, albeit on mill account only, has been the factor that pricked the bubble in the cotton market before it gathered dangerous momentum. That may be so, for, in speculative markets, sentiment is an important thing and counts a lot. But the fact remains that Indian cotton and American cotton of staple 1.1/16" and over—anything shorter than 1.1/16" is not allowed to come into this country—are not competitive and the statistical position of the former will remain unchanged irrespective of imports of the latter. The Government's announcement, however, has made one thing clear. And that is that no extreme tightness in the supply of cotton will be allowed to take place. Further, by allowing imports of U.S. cotton, the Government has enabled the mills to buy the cheapest foreign cotton in the world today. At the moment, the mills are not showing much enthusiasm for American cotton, but it may not be long before they go in for it, as the prices of Egyptians and East Africans have hardened considerably. This does not mean that purchases of U.S. varieties will be as large as in 1951-52; at the most, they may amount to about 200,000 to 250,000 bales.

• • • •

Within a few days, the February Contract in the cotton market will run out, leaving only the May Contract to be traded in. The E.I.C.A. authorities, however, have already approached the Textile Commissioner for permission to allow trading in August delivery. We understand that the matter is receiving the attention of the Textile Commissioner and that an early decision is likely. Now that the upward trend in cotton has been reversed, he may be more inclined to give the permission than he would be if that trend had persisted. Although there may be no pressing need for this facility now, there is much to be said in favour of allowing two deliveries to function simultaneously. The most important consideration is that such may prevent wide fluctuations in prices and ensure a reasonable measure of stability. If there were to be only one Contract, it would encourage the speculators to concentrate all their attention on it and bring about marked variations in price either way.

• • • •

The long-awaited decision of the Government of India in regard to the selling prices of cement was announced this week. Thanks to the disclosure made by the Chairman of the Associated Cement Companies Ltd., at its last annual meeting, it was widely known that the Government did not see eye to eye with the recommendations of the Tariff Commission which had been asked, for the first time, to determine the fair price for this commodity. Nevertheless, the details that are now available reveal that the difference of opinion between the Government of India and the Tariff Commission is much wider than one had expected. Even now complete particulars are not available, as the text of the Government's resolution on this subject is yet to reach us. But sufficient information is available to show that the Government has ignored practically all the main recommendations of the Tariff Commission and followed its own understanding of the case. We, therefore, feel that the Government owes a detailed explanation to the public, as to why it has rejected the suggestions of an impartial body such as the Tariff Commission. This is all the more important, because the Government, as a large-scale consumer of cement, is an interested party. Moreover, its decisions are such that, while there is nothing to prevent it from meeting all its requirements of cement from the low cost producers, the public will have to take up a far larger proportion of, if not all, the cement produced by the high cost producers. This aspect makes one believe that, in taking a decision on the question of fair price, the Government was influenced by its own requirements.

NEW GREAT AND NEW CITY MILLS

As we go to press, we understand that the Directors of the New Great and the New City Mills, both of which are under the management of Messrs. W. H. Brady & Co., Ltd., have maintained the dividends of these Companies for 1953 at the previous year's level of 10 per cent. per annum. We further understand that, while the profit of the New City for 1953 is higher than that for 1952, such is somewhat lower in the case of the New Great.

• • • •

For considerations of space, we propose to mention here only the main recommendations of the Tariff Commission and the Government's action thereon. The Commission's recommendations were:

(1) There should be a uniform all-India selling price of Rs. 73 per ton of naked cement on f.o.r. destination basis.

(2) The basic price for all the companies should be fixed at Rs. 72 per ton f.o.r. destination, on the basis of the estimated price for cement adduced by the A.C.C. This basic price has been arrived at, after providing for a return of 10 per cent. on gross block and making a special allowance of Rs. 3.88 per ton for rehabilitation and expansion.

(3) An extra price of Rs. 8 per ton in the case of the Shree Digvijay Cement Co., Ltd., the India Cements Ltd., the Orissa Cement Ltd. and the Travancore Cements Ltd. and of Rs. 5 per ton in the case of the Mysore Iron and Steel Works should be allowed, in order to enable these high cost units to maintain their production and offset the disadvantage of the high cost of their plant and machinery.

(4) A fund should be set apart into which the difference between the basic price and the uniform selling price should be paid by the units other than the high cost ones. The proceeds of this fund should be used to reimburse the high cost units for the losses incurred by them owing to the fixation of a common selling price for all the units.

• • • •

Now let us see what the Government has done. It has rejected the Commission's recommendation for a uniform price for consumers of cement. This suggestion is undoubtedly a scientific one and the principle involved is in operation in regard to steel prices. It is not known why the Government has refused to follow it in the case of this commodity. Secondly, the Government has turned down the basis followed by the Commission in fixing the price payable to the factories, namely, return of 10 per cent. on the gross block. Instead it has adopted the rate of 8 per cent. on gross block, same as the one followed in fixing the prices for the products of the Tata Iron and Steel Co., Ltd. Incidentally, this makes one wonder whether the Government will agree to follow the basis of 10 per cent. return on gross block in fixing the prices for the products of the Indian Irons, a factor on which the share market is pinning its hopes now and boosting up the value of these shares. Thirdly, whereas the Tariff Commission recommended no restriction on the rehabilitation and modernisation allowance of Rs. 3.88 per ton except that it should be utilised for no other purpose, the Government has granted this allowance (adjusted to a round figure of Rs. 4 per ton), subject to the condition that its utilisation must receive the prior consent of the Government. This is a unique condition, in that it is being imposed for the first time; it is thus a new restriction on the freedom of private enterprise. While the A.C.C. and Dalmia Cement Companies have meekly reconciled themselves to this whittling down of their freedom, the Sone Valley Portland Cement Company, Ltd., has gallantly refused to compromise its freedom of action, with the result that it has been denied the allowance for rehabilitation and modernisation of its plant. The net loss to this Company, as a result, is a little over Rs. 2 per ton. This may constitute a substantial amount on its total production, a striking indication of its commendable courage of conviction and devotion to fundamental principles. In regard to the high-cost, that is, new, producers of cement, the Government is of view that there is no justification for providing for rehabilitation and expansion allowance, as they are not immediately in need of it. And, finally, the Government has made some adjustments in the extra price recommended by the Commission to high-cost companies. Thus, it has allowed an extra price of Rs. 12 per ton in the case of Travancore Cement and Rs. 8-8 per ton in the case of the Shree Digvijay Cement, as against only Rs. 8 per ton proposed by the Commission. It will thus be seen that the Government has made radical changes in the proposals made by the Tariff Commission. Although it is free to do so, this is the first instance where the Government has found it necessary to differ from the Commission on such a large scale.

• • • •

The emergence of a strong buyers' market in wheat is indicated by Australia's frantic search for buyers for its unsold stocks of wheat. The Australian Wheat Board has already sent a one-man Wheat Mission to four Singapore, Malaya, Hongkong, the Philippines and Japan. Another mission is shortly to visit South African towns, Aden, Bombay, Colombo and Djakarta. The object of these missions is to explore the prospects for selling its old wheat in these areas, before October next, when storage facilities have to provided for receiving the new crop. The Wheat Board estimates the crop to be of the order of 165 million to 170 million bushels, out of which it will have to provide accommodation for about 60 million bushels. Although officials are confident of expanding the storage capacity to take this surplus, the fact that sales have been slow is causing concern. This piquant situation seems to have been brought about by the improved supply position in most importing countries. Thus stocks of the U.K. Ministry would not be worked off for some months. With the recovery in rice production in Asian countries such as India and Burma, demand for wheat has fallen off. Again, due to improved stocks and hopes of price drops, many countries which need foodgrains are not buying far ahead. And bumper harvests in several countries have ended grain shortages. Moreover, Turkey has emerged as an exporter of wheat and is meeting the Middle East demand for soft wheat. France, too, has appeared in the market as a seller.

• • • •

In the face of growing competition and falling off of demand, Australia still hopes to do well in disposing of its wheat. It seems to be confident of holding its flour trade with Singapore, Indonesia and Malaya. In Japan, it sees a good customer for its flour, but any deals are only possible, if means of overcoming shortage of sterling facing Japan could be found. In this connection, the latest payments agreement which Britain has concluded with Japan providing for larger imports of Japanese goods into sterling area will be of some help to Australia. However, a point which strikes one most is, despite the difficulty in disposing of its stocks, the Board still plans to expand output and has offered to guarantee exports up to 100 million bushels per annum for five years. There is also no inclination to offer its wheat at competitive prices with a view to relieving the pressure on storage space. The position there is, therefore, worth watching. The price of wheat for local consumption at 14s. a bushel is close to the I.W.A. (International Wheat Agreement) floor of 13s. 10d. but still comfortably above the local production cost, estimated at 13s. a bushel.

• • • •

The Working Committee of the All-India Miners' Federation has threatened an indefinite nation-wide strike from 1st March, 1954, if the Government were to fail to take any steps towards settlement of its demand for the revision of the Conciliation Board Award, 1947, so as to provide for increased wages and other amenities. If this demand were to be conceded, the cost of production of coal would increase, we are told, by Rs. 8 per ton. It is reported that, by 31st January, all the affiliated unions of the Federation had served strike notices on their respective employers.

EQUITIES REACT AT CLOSE

HEAVY PROFIT-TAKING ERASES GAINS

(From Our Own Correspondents)

BOMBAY, *4th February*

THE upward trend in equities, noted on the Stock Exchange during the previous four weeks, was carried a stage further up to yesterday during the week under review, with most of the counters recording fresh high levels. But since yesterday, a reactionary trend has been in evidence on lack of follow-up support and heavy profit-taking. This has resulted in the wiping out of the earlier gains. Equities have, therefore, finished around the lowest levels for the week, with a sprinkling of losses over a wide front.

There has been no change in the economic situation over which market men had been enthusiastic in the previous weeks. Nor has there been any disturbing political factors to undermine their confidence. In fact, there have been a few favourable developments during the week. Thus exports of textiles in January have reached a record figure of 79.6 million yards. The industry is said to have not only tided over the crisis of the last quarter of 1953, but improved its position regarding stocks and prices. The market has been enlivened by reports on top level discussions held at New Delhi this week between the ministries of the Government and representatives of the World Bank over the proposal to establish an Industrial Development Bank for financing new industries. Besides, production at the Tata Iron and Steel Works for the last month (January), though a little lower than that in the previous month, has been higher than that in any one of the preceding months of the current financial year. It is also reported that talks between a group of foreign experts and representatives of the Company are being held now at Jamshedpur over the Company's expansion programme. In spite of these favourable factors, the market has come under considerable selling pressure. This is because the high levels to which prices had gone in recent weeks has been found to be quite attractive to many holders to book their profits.

In the steel section, Tata Deferreds opened on a quiet note at Rs. 2,096-4 and shaded off to Rs. 2,093-12 on end-of-account considerations and fears of heavy carry forward charges. But the new account opened on a optimistic note and under a spell of feverish buying Deferreds jumped to Rs. 2,132-8. After a drop to Rs. 2,115 on Tuesday, there was again a flare up, on heavy bouts of buying and short-covering, in which the shares came up to Rs. 2,136-4 yesterday morning. Subsequently, heavy profit-taking which followed the rise erased the earlier gains and the scrips closed at Rs. 2,101-4, registering a loss of Rs. 7-8 over the week. Tata Ordinaries, after being done up to Rs. 364-4, wound up at Rs. 367-12, that is Rs. 2-8 lower than the previous week's closing. Indian Irons displayed remarkable strength with an advance from Rs. 28-0½ to Rs. 28-12, but closed at Rs. 28-3. The shares would have gone down still further but for the heavy buying orders from Calcutta.

In spite of the encouraging position of the textile industry, textile shares became vulnerable to selling towards the close. Bombay Dyeings highlighted the section with a smart rise from Rs. 418-12 to a new high of Rs. 436-4, but receded to Rs. 422-8 at the close. Kohinoors, after being taken up from Rs. 319-12 to Rs. 326-8, moved down to Rs. 316-8. Central Indias disclosed a loss of Rs. 5 at Rs. 185, Centurys Rs. 3-12 at Rs. 209, Gokaks Rs. 2-8 at Rs. 253 and Indore Malwas Re. 1-4 at Rs. 98-12. New Greats were marked down by Rs. 7-8 to Rs. 167, Simplex by Rs. 3 to Rs. 154, Svadeshis by Rs. 3-12 to Rs. 282-4, Standards by Rs. 5 to Rs. 322-8 and Tatas by Rs. 2 to Rs. 52.

Bank shares appeared to have overcome the shock created by the lower profits and cut in dividend of the Central Bank of India. They were a steady feature with fractional gains over the week. Centrals were As. 4 better at Rs. 58-8 and their new shares Re. 1-4 at Rs. 62-4. Imperial Fully Paids moved up by Rs. 17-8 to Rs. 1,810 and Contributories Rs. 5 to Rs. 440.

In the miscellaneous section, Alcocks were a special feature with a rise of Rs. 7-8 to Rs. 341-4, on rumours regarding issue of bonus shares and expectation of higher dividend. Associated Cements came up to Rs. 179 from Rs. 176, but reacted to Rs. 176-8 at the close. Belapurs stood Re. 1-8 lower at Rs. 256-8, after touching a high of Rs. 260. Bombay Burmahs moved down by Rs. 3-12 to Rs. 385.

• • • •

Calcutta Stock Exchange

CALCUTTA, *3rd February*

Cheerful conditions were maintained on the Calcutta Stock Exchange during the week under review. The list of transactions covered a wide range and further gains were recorded. Jute shares came in for more attention, and although enquiries were not widespread selected counters scored attractive gains. Impressive spurts were seen in the textile section as prospects for exports of piecegoods were increasing. Coals maintained a firm ground and trading in teas was lively. In the miscellaneous section, papers and sugars attracted particular attenion.

Sectionwise, a striking feature among jutes was the further sharp advance in Fort Glosters from Rs. 400 to Rs. 470. Deltas, at Rs. 226, were a shade higher, and, at Rs. 183, Kamarhatties were better by Rs. 3. Nationals were fractionally raised to Rs. 24-10 but they closed a shade lower at Rs. 24-6. Speculative Howrahs appreciated from Rs. 24 to Rs. 24-8. Kanknarrahs hardened from Rs. 139-8 to Rs. 143, as were Chitavalsahs from Rs. 11-6 to Rs. 11-10.

Coals were in good form, and after the recent dullness Bengals were picked up at Rs. 516, the improvement being by Rs. 13. Telchers were strongly supported and in transactions were raised from Rs. 3-1 to Rs. 3-10, but subsequently reacted to Rs. 3-6. New Manbhooms were taken from Rs. 11-2 to Rs. 11-11, while Equitables stood at Rs. 31-12. Burrakurs had buyers at Rs. 8-12. New Beerbhooms closed at Rs. 18-8 being higher by As. 2.

In the engineering section, Indian Irons received distinct attention and on Thursday were taken up to Rs. 28-4, as against the overnight rate of Rs. 27-7. On Friday, the rate gave way to Rs. 27-13, but on fresh speculative support spurted to a new high of Rs. 28-12 yesterday before closing today at Rs. 28-6. Indian Standard Wagons gained from Rs. 61-8 to Rs. 62-8 and Indian Galvanizings, encountering fresh support, were taken to Rs. 17 from 16-7.

Sugar shares received some prominence, and a visible improvement was noted in Ramnugger Canes from Rs. 19 to Rs. 22-7. Champarans, at Rs. 24-3, were higher by As. 3, while Belsunds were steady at Rs. 9-1 and Carews strengthened from Rs. 7-6 to Rs. 8-8. Among paper shares, Titaghurs continued to be in the forefront with a rally from Rs. 37-4 to Rs. 39-2.

In the miscellaneous section, Alkali Chemicals were again keenly sought at, the rate improving further from Rs. 15-12 to Rs. 16-6. Dunlop Rubbers were shown considerable attention and were lifted from Rs. 30-6 to Rs. 33-12. Indo-Burma Petroleums were put through at Rs. 83-8, as against Rs. 79-12 previously.

• • • •

Madras Stock Exchange

MADRAS, *2nd February*

The Madras Stock Exchange ruled firm during the week under review in line with the markets in other parts of India. Textiles kept the lead gained some weeks ago on good export enquiries for and better offtake in cloth from the various consuming centres. India's cloth export business, which made an excellent start in the new year with a record figure of 79.6 million yards passed for shipment in January, hardened the sentiment of operators in this section. There was hectic trading in tea shares. There was also improvement in the values of rubber scrips on speculative support. Coffee scrips, however, presented a mixed trend, while miscellaneous shares kept pace with the generally upward trend in other sections. Consequently, a large volume of business was done in the market, with prices recording sizable gains over the week.

Textiles were in good form. Coimbatore Cottons and Rajalakshmis gained Rs. 10 each to Rs. 185 and Rs. 100-8, respectively. Dhanalakshmis shot up from Rs. 209 to Rs. 217 and Janardhanas from Rs. 65 to Rs. 70. Balasubramania (Rs. 70 paid-up) 'B' gathered Rs. 7 to Rs. 70 and Rs. 40 paid-up Rs. 2 to Rs. 40. Rangavilas were higher by Rs. 5-8 at Rs. 51. Vasantas hardened by Rs. 3 to Rs. 178. Bangalore Woollens improved from Rs. 290 to Rs. 295. Coimbatore Spinnings rallied by Rs. 2-4 to Rs. 46 and Coimbatore Pioneers by Rs. 2 to Rs. 135. Lakshmis (Rs. 50 paid-up) were done at Rs. 111 *cum-div.*, as against Rs. 87, and Rs. 25 paid-up 'A' at Rs. 55-8, as against Rs. 43. The Directors have declared an interim dividend of 10 per cent. for the year 1953-54. Krishna Rajendras advanced by Rs. 2-8 to Rs. 59 *cum-div.*

Among plantings, teas were again in the limelight. Mlamallays shot up from Rs. 38-8 to Rs. 40 and Udayagiris from Rs. 7-6 to Rs. 8-7. Nonsuch Teas gained Re. 1-12 to Rs. 34-12. Kalasas too were up by a similar amount at Rs. 13-10. Peermades were higher by Re. 1 at Rs. 31-4 and Twyfords As. 6 to Rs. 13-4. United Nilgiris disclosed a gain of Re. 1 to Rs. 212 *cum-div.*

Rubbers were firm. Nenmenys put on Re. 1 to Rs. 10 and Malankara As. 12 to Rs. 36-8. Mercaras advanced by As. 5½ to Rs. 3-6, Midlands by As. 5 to Rs. 12-10 and Be Bes As. 4 to Rs. 2-11. Kailas were done at Rs. 3-14, as against Rs. 3-10, and Vaikundams Rs. 16-8, as against Rs. 16.

In the miscellaneous section, Binnys and Rallis were higher by Re. 1 each at Rs. 122 and Rs. 61, respectively. Indian Cements gained As. 14 to Rs. 17-8 and Mysore Papers As. 12 to Rs. 17.

MARKET GOSSIP

(Concluded from previous page)

The threat of a nation-wide strike has been the outcome of the delay, on the part of the Govsment of India, to constitute a Tribunal, as announced by it in August, 1953. The reasons for this delay are not clear. One explanation is that the Government is still in two minds. Though, early this week, Mr. Abid Ali, Deputy Minister for Labour, reiterated at Calcutta the Government's decision to refer the dispute to a Board of Adjudication, there is a persistent report that the Government has not yet come to a final decision. The Government, according to this report, is wondering whether any quick and lasting result would materialise by leaving the issues to be decided by a Tribunal, especially in view of the sad experience in the field of banking, following the Shastri award. It is stated that the Government is inclined to feel that it would be better to appoint a Conciliation Board than a Tribunal.

• • • •

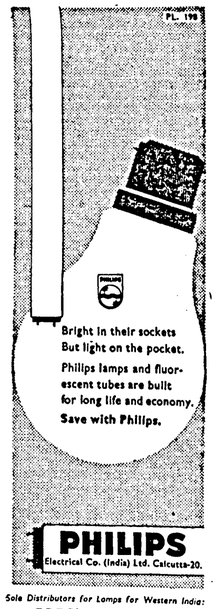
The workers want an increase in their minimum basic wage and dearness allowance in proportion to the rise in the cost of living since 1947 and the calculation of provident fund contributions on the basis of pay plus dearness allowance, as provided in the Employees' Provident Funds Act, 1952. This demand has naturally been opposed by the employers. They contend that the cost of production of coal is already high and that any further increase will price the product out of the markets, especially in South and South-East Asia. They point out that, unless the output per man increased, it would be difficult to justify an increase in wages and other emoluments. This can be brought about only by rationalisation of production techniques, which involves retrenchment of labour, and linking wages and bonus to productivity.

• • • •

The force of the employers' contention will be evident from the fact that the output per man-shift in India has been on the downward trend. It has declined from 0.45 ton in 1942 to about 0.34 ton at present. As against this, the output per man-shift in Australia is about 3.0 tons, in Canada 3.1 tons, in South Africa 1.8 ton, in the U.K. 1.2 ton and in the U.S. 6.3 tons. An even more unfortunate feature is that the output per man-shift has fallen, although economic and social position of mine workers has increased by virtue of the award of tribunals and various other developments. It is true that a decline in output is due, to a great extent, to the outmoded machinery and other equipment. But it is chiefly due to the apathy of workers. As wages and bonus are not linked to output, they do not care to exert themselves enough to increase their individual production. Further, the presence of too many workers naturally brings down the per capita output. So, the first things to be done before the question of wages can be tackled are to remove the surplus labour and to make the worker productivity-minded. These fundamental factors can be ignored only at the risk of imperilling the structure of the entire industry.

• • • •

If the report that the Government has changed its mind and dropped its proposal to refer the dispute to a Tribunal in favour of a Conciliation Board is correct, it deserves to be complimented. For the dispute is so complicated that it can be handled better by a Conciliation Board than by an Industrial Tribunal. A Tribunal might take a purely legalistic or a humane approach, ignoring the economic factors governing the coal industry. A Conciliation Board, however, will be in a position to take all the factores into consideration and hit at a solution that will be satisfactory to both workers and employers.



Sole Distributors for Lamps for Western India:

Messrs. PRECIOUS ELECTRIC CO.

Yusuf Building, Churchgate Street, BOMBAY

NEWS IN BRIEF

THE Government of India has agreed to the free licensing of import of cotton staple 1.1/16" and over from the U.S. against prior sales to mills.

The Shroff Committee, set up by the Reserve Bank of India to enquire into the problem of financing the private sector of Indian industry is expected to submit its report early in April. The final meeting of the Committee was held this week in Madras.

The Mysore State, which is deficit in food, will get Rs. 1 crore for the promotion of Grow-more-food scheme during 1954-55, according to a decision reached between representatives of the Central and State Governments who met in New Delhi last week.

The Planning Commission has recommended that a sum of Rs. 30 lakhs be spent during the remaining period of the Five-year Plan, for implementing the recommendations of the Expert Committee on quality jute, which have been accepted by the Government.

The U.P. Government proposes to form a Finance Corporation during the next financial year. The seven-men delegation of the Ford Foundation which has ended its survey of small-scale and cottage industries in U.P. has suggested the provision of more convenient and less expensive credit facilities.

Exports of cloth from India touched a record figure of 79.6 million yards, of which more than half was made up of medium cloth. The figure, however, does not include cloth passed for shipment from centres other than Bombay during the second fortnight of the month, which is said to account for another 2 million yards.

The Cotton Buyers' Association, Bombay, in a telegram to the Railway Board, has pointed out that the main reason for the repeated bottlenecks is that cotton meant for delivery inland and that intended for export to foreign countries are not treated alike, the former receiving priority over the other, being placed under category 'D' as against category 'C' for export cotton. The Association has, accordingly, requested the Railway Board to intervene immediately and remove the discrimination before the situation deteriorates any further.

About 1,000 tons of iron ore have been exported from Madhya Bharat following the grant of a mining lease covering about 80 acres last year. Over 3,000 tons of ore are now ready for export. The ore is said to contain about 60 per cent. of ferric oxide. A second mining lease for about 130 acres has also been granted by the State Government and mining work is expected to start soon. Arrangements have been made to work a 100-year old blast furnace which will be used to produce ferro-manganese. Good quality iron ore has been located in several places in Madhya Bharat.

Madhya Bharat now forms one of the principal suppliers of slate pencils in India, with an annual production of ten crores a year. The industry, which has developed on an extensive scale during the last five years, provides employment to about 2,000 persons. Besides making slates and slate pencils, the shale deposits are being used for the manufacture of stoneware pipes and cheaper types of crockery. A factory on a large scale, with a capacity for turning out 21,000 pipes per month, will start working in Ratlam within a month, using these shale deposits as raw material. A factory-cum-cottage industries centre is being located in Mandsaur by the Industries Department, with the object of giving employment to potters who will use the shale as raw material for pottery.

The Government of India is reported to have sanctioned the inclusion of the first stage of the Tungabhadra Hydro-Electric Project in the Five-year Plan on the recommendation of the Planning Commission. The first stage of the Project which will generate 19,000 kw. electricity, is estimated to cost Rs. 3.25 crores. The Tungabhadra Hydro-Electric Project, it may be noted, will be completed in three stages at an over-all cost of Rs. 14 crores which will generate electricity of 100,000 kw. In the second stage of the Project, hydro-electric energy will be obtained from the Sivapur Reservoir, eight miles downstream on the main canal from Tungabhadra. The final stage of the Project will consist in linking up the transmission line from Raichur to Hyderabad and taking over the remaining power schemes under the Tungabhadra Project.

The Government of India has fixed the ceiling prices (per ton) f.o.r. destinations for unpacked cement to be charged by different companies. They are: Rs. 75.8 for Digvijay Cement Co.; Rs. 75 for India Cement Ltd. and Orissa Cements Ltd.; Rs. 72 for Mysore Iron and Steel Works; Rs. 70 for Travancore Cement Ltd.; Rs. 67 for Sone Valley Portland Cement Co. which has not agreed to the condition regarding earmarking of Rs. 2 per ton for rehabilitation and expansion purposes; Rs. 71 for the following companies: Associated Cement Cos. Ltd., Rohtas Industries Ltd., Kalyanpur Lime and Cement Co., Ltd., Banjari (Bihar), Dalmia Dadri Cement Ltd. and Dalmia Cement Bharat Ltd., and Rs. 74-8 for Jaipur Udyog Ltd., Sawaimadhopur, pending further examination of their costs. These prices will take effect from 8th February, 1954. Packing charges for the current quarter, according to the recommendation of the Tariff Commission, work out to a flat rate of Rs. 11-9 per ton of cement. These charges are applicable for cement packed in new bags only. Charges for packing in old bags are subject to settlement between the buyer and the seller.

• • • •

From Abroad

Output of coal in the Netherlands in 1953 is estimated at 12,297,000 tons.

The Commonwealth Development Finance Company will shortly enter on its first overseas investment project.

The U.S. steel companies, which spent $1,000 million on plant improvement in 1953, have provided for a capital investment of $775 million this year.

Thailand and the U.K. have signed a rice agreement, which provides for British territories to buy between 226,000 and 400,000 tons this year at a reduced price.

World cotton production in 1953-54 is estimated by the U.S. Agricultural Department at 36,770,000 bales (of 500 lbs. gross), as compared with 35,730,000 bales in 1952-53.

The Federal Legislative Council of the Malayan Federation has authorised the Federation Government to request the U.K. to sign the Geneva tin agreement on Malaya's behalf.

Industrial production in the U.K. in 1953 was higher than in any year since the last world war. The total output was 5.3 per cent. higher than that in 1952 and 2.6 per cent. above that in 1951, the previous peak post-war year.

For the first time since January, 1951, there were more than 2 million unemployed in the U.S. during the week ended 9th January, 1954, and for the first time since March, 1952, the number of people employed fell below 60 million.

The United States scheduled airlines have increased their capacity by 42 per cent. in the last three years. The number of aircraft has increased by only 194 planes, but many of these aircraft are faster and larger than those in the 1950 fleet.

A one-year trade agreement was signed between Denmark and Indonesia on 28th January. Under the agreement, Denmark will export machinery, cement and other products to Indonesia in return for import of copra, tobacco, coffee, rubber and tin from Indonesia.

The Anglo-Japanese Sterling Payments Agreement signed on 29th January provides for an export of £210 million in 1954 from the sterling area to Japan, as compared with £240 million in 1953. This represents a decrease of £30 million. The agreement, however, provides for an increase in Japanese imports into sterling area by £80 million at £210 million in 1954.

A party of thirty-three British business men are in Moscow, exploring possibilities of promoting trade between the U.K. and the U.S.S.R. in non-strategic goods. The party has the approval of the British Board of Trade. It has, however, no power to conclude a trade agreement. Business resulting from this trip is expected to run into several million pounds. The U.K. will offer a wide range of engineering products, most of which are already vetted by the Government.

Australia's first overseas trade mission will fly to Africa on 15th February. The Mission, sponsored by the Commonwealth Department of Commerce, will be led by Mr. E. P. McLintock, Department's Director of Trade Promotion. It will spend about two months in South Africa, Mauritius, the Belgian Congo and the countries of the Central African Federation. Delegates from 16 Australian business organisations will seek markets for earthmoving machinery, industrial, agricultural, and radio equipment and machinery, silverware, wheat and other products.

The Anglo-Iranian Oil Company has resumed talks with major world oil companies, five of them being American, on the means of getting Iranian oil back into world markets. This follows the assurance by the U.S. Department of Justice that no anti-trust law proceedings would be taken against American oil companies joining an international "consortium" to market Iranian oil. The U.K. is understood to be prepared to recognise Iranian nationalisation of the Anglo-Iranian Company's Iranian assets, on condition that equitable compensation is paid.

PERSONAL

MR. C. F. Cobbold, Governor of the Bank of England, who is on a tour of courtesy visits to the Central Banks of Pakistan, India and Ceylon, has arrived in Bombay.

Mr. St. Bahroem Sjah, formerly First Secretary in the Indonesian Embassy at New Delhi, has assumed charge as Consul for Indonesia in Bombay.

Mr. K. M. Khalil, Assistant High Commissioner for Pakistan in Bombay, arrived in Bombay on Monday last. His office is housed at 249, Hornby Road, Fort, Bombay.

Mr. R. M. Lee, Chairman of the Calico Printers' Association Ltd., Manchester, and a Director of the Lancashire Cotton Corporation, arrived in Bombay last week.

Mr. A. K. Chanda, Secretary to the Central Ministry of Production, has been asked by the Prime Minister to examine the existing financial and administrative rules and procedure and suggest such modifications as are necessary for the expeditious conduct of official business.

Dr. H. L. Dey, Head of the Asian Department of the International Monetary Fund, who is on a tour of India, Burma, Ceylon and Thailand to exchange notes on the economic development in these countries and the future prospects of their progress, arrived in Bombay on Tuesday this week, and left for Colombo on Thursday.

Mr. A. B. Lloyd, Member of the Institute of British Foundrymen, and Mr. T. D. Scaife, Consultant Production Engineer, the two British experts on foundry operation and machine tool industry, respectively, are now in India. The services of these experts have been made available by Britain under the Technical Co-operation Scheme of the Colombo Plan.

Messrs. T. V. Baddeley, C.B.E., Dharamsey Mulraj Khatau, Krishnaraj M. D. Thackersey, J. C. Burns, G. D. Somani, M.P., Ramnath A. Podar, Radhakrishna Ramnarain Ruia, M. L. Tapuriah, S. P. Jain, E. D. Sheppard, Pratap Bhogilal, F. Edwards, Arvind N. Mafatlal, Naval H. Tata, B. L. Bubna, F. H. Kemple, R. L. Gohlan, and L. N. Birla, have been elected to serve on the Committee of the Millowners' Association, Bombay, for the year 1954.

Messrs. Jwala Prasad Tiwari, Rameshwardas Saboo, Kantilal Manilal, Vasudeo Somani, Visheshwar Chirwawala, Mohanlal Tejmal, Maganlal Trikamlal, Jamnadas Tulsidas, Behru Ratan Damani, Jamnadas Kalidas, Mangal Das Ranchhoddas, Vadilal Chhaganlal, Maganlal Damani, Sitaram Jogunuwala, Chandulal Dalsukhbhai and Nandlal More have been elected to the Board of Directors of the Bombay Bullion Association.

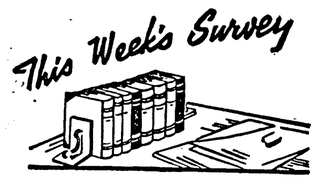
"COMMERCE" 1929

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *2nd February*

International Labour Conference

The next—the twelfth—session of the International Labour Conference will open at Geneva on May 30 next and the agenda includes certain items of vital importance to labour in general. As at present arranged the Conference will be called upon to discuss the (1) prevention of industrial accidents (final discussion); (2) protection against accidents of workers engaged in loading or unloading ships (final discussion); (3) forced labour (first discussion); (4) hours of work of salaried employees (first discussion). It will be remembered that the first two items went through the preliminary stage of the double-discussion procedure at the 1928 session of the Conference, which placed them on the agenda of the twelfth session for second discussion and the adoption of Draft Conventions or Recommendations. The questionnaire on these two items of the agenda, as agreed by the Conference at its 1928 session, were forwarded to the Governments in July last. The questions of forced labour and hours of work of salaried employees figure for the first time on the agenda of the Conference, and will, therefore, be the object of a preliminary discussion with a view to the drawing up of questionnaires. The International Labour Office is preparing, in accordance with its standing orders, a preliminary report on each of these questions, giving an account of law and practice in the different countries and finishing with a draft questionnaire. In addition to these four items a general report on unemployment may also be placed before the twelfth session, the Governing Body being of opinion that an examination of the present position with regard to unemployment and of the methods of improving the situation is necessary and will be of value. It should be noted here that in October, 1929, four months after the twelfth (general) session of the Conference, a thirteenth session will be held, to deal specially with the question of maritime labour.



DEVELOPMENT COUNCIL FOR BICYCLE INDUSTRY

THE inauguration of the Development Council for the bicycle industry on 29th January last at New Delhi marks another important phase of development in the sphere of promoting efficiency in industry through Development Councils as envisaged in the Industries (Development and Regulation) Act of 1951. This Council is one of the three so far constituted by the Government of India, the other two being the Councils for diesel engines and heavy chemicals. One more Council for the sugar industry yet remains to be constituted, though a decision to have a Council was taken some time ago. The idea of establishing Development Councils was borrowed from the U.K. where, according to the Minister for Commerce and Industry, Mr. T. T. Krishnamachari, who inaugurated the Council for bicycle industry, it had failed. He, however, seems to believe that, conditions in India being different from those in the U.K., it would succeed here. He thinks that the influence of the Government of India here, unlike that of the U.K. Government there, is sufficiently great to act as a stabilising factor and to use its influence to make the work of the Development Councils a success. How far this hope of Mr. Krishnamachari will materialise remains to be seen. However, the fact that some of the minor industries have been approaching the Government to establish similar Councils for them indicates that these bodies are becoming popular with the industries.

If the idea of the Development Council were to fail in India, such would not be for lack of interest on the Part of the Government. For, besides being the sponsorer of the idea, the Government has assured the availability of the services of its officials to the Councils. Reiterating this assurance again, the Minister, in his inaugural address referred to above, was keen on drawing the attention of the Council for the cycle industry to two factors which need to be borne in mind by it. One is that "the ultimate master in any industry is the consumer, the only god whom the industry must worship and placate and not the Government; and the only means to please this master is improvement, in quality of the goods that industry produces." The other is the Government's disinclination to ban imports completely of any and every product that is produced in the country. In other words, no industry in this country can hope to have for ever a closed market through both tariff protection and complete ban on imports. This is a wholesome principle to adopt in that it is only then that industries would be compelled to strive "to eliminate wastage, improve quality, reduce cost and obtain maximum production," as was stressed by the Minister for Commerce and Industry.

The cycle industry in India has its own complex problems. In finding correct solutions to these problems, the Development Council has a very difficult task before it. At present, there are six bicycle factories with an ultimate rated capacity of manufacturing 417,500 bicycles on a single-shift basis, while their actual production in 1953 was 264,169. The first need, therefore, is to fill up this gap between actual production and the rated capacity. Secondly, among these, some are smaller and weaker units, lacking both the technical and financial resources necessary for maintaining high standards of quality of their products. Thirdly, there are many small units engaged in the manufacture of cycle parts and accessories spread all over the country, though their main concentration is in East Punjab. These units, besides presenting the same factors as the weak units of whole bicycle producing sections, are badly in need of coordination not only among themselves but also with the bigger factories engaged in the manufacture of parts. Lastly, there is the question of enabling all the units to produce quality products at competitive prices.

That the Development Council is aware of these salient problems is evident from the remarks of its Chairman, Mr. P. L. Kumar. In the course of his address at the inaugural meeting of the Council, he called on the experts who serve on the Council not only to recommend targets of production but also suggest measures relating to provision of finance, technical assistance, raw materials, etc. He admitted that high standard of quality and lowering of price could be achieved only progressively. But there was the need for a constructive approach to be made by the industry to achieve this object, "by introducing strict stage inspection, provisioning of adequate testing and research facilities, by improving production methods, by eliminating waste and by proper co-ordination between various units, wherever there is scope for the same." It is in the success of this approach that the future of the Council lies.

PLANTATION LABOUR

The fifth session of the Industrial Committee on Plantations, which concluded its two-day session at Calcutta on 31st January, disclosed, once again, that the employers were prepared to go more than they can afford to in conceding the demands of labour, with a view to ensuring healthier industrial relations. The tripartite Committee adopted the recommendations of its sub-committee providing compensation for lay-off and enforcement of the Plantation Labour Act, 1951, both with effect from 1st April, 1954. Another significant feature of the conference was the compromise arrived at regarding the conversion of foodgrains' concession into cash concession.

That the planters have readily agreed to apply the provisions of the Industrial Disputes (Amendment) Act, 1953, relating to compensation for lay-off to their industry, despite the fact that they are not suitable to industries of a seasonal character, bespeaks of their magnanimity. It is common knowledge that plantations demonstrate more clearly than any other form of activity the extent to which conditions of workers depend largely on the elements as well as world market trends which are clearly beyond the control of employers. In the case of rubber plantations, for instance, there is practically no work to be done during the heavy monsoon. It is gratifying to find that employers of plantation labour have nevertheless been doing their utmost to provide work for their workers for as many days as possible even during this period.

There was also agreement among the various interests on major points relating to enforcement of the Plantation Labour Act. The Committee accepted the proposal that the Act should come into force on 1st April next. The main provision of the Act relate, among others, to the provision of drinking water, tokens and fitness certificates, and annual leave with wages. Exemption for one more year in regard to annual leave was, however, pleaded for on behalf of planters in the Cachar, Tripura and Darjeeling areas, on the ground that they had suffered a serious setback during the 1952 crisis. It remains to be seen whether the Government will heed to this plea.

The implementation of welfare measures depends upon the formulation of reasonable rules. Small wonder, therefore, the Committee requested that the Government should frame rules and submit it for scrutiny and approval by a tripartite committee at any early date. It was felt that a phased programme of implementation of welfare proposals, after finalisation of rules, would be desirable. The Committee felt that first priority in the programme should be given to the provision of (1) medical facilities, (2) creches, (3) recreational facilities, (4) housing, (5) protection from weather and (6) appointment of welfare officers. Educational facilities, conservancy and canteen amenities will form part of the programme to be implemented later.

The agreement arrived at the meeting on the conversion of foodgrain concession in the three zones of Assam Valley into cash concession seems to be quite realistic. The rate agreed upon was the one suggested by Mr. V. V. Giri, Union Labour Minister, at the last meeting held in Shillong. The conversion rates are As. 9 (with grains at Rs. 20 per maund) for zones 1 and 2 and As. 8 (with grains at Rs. 17-8 a maund) for zone 3. The conversion rate for children will be half the above rates. The cash concession at these rates will be added to basic wages.

The representatives of the coffee industry asked for an enquiry into the cost structure of the industry, before the Plantation Labour Act and lay-off provisions were enforced. The spokesmen of rubber plantations felt that the implementation of the Plantation Labour Act should follow a suitable increase in prices of the produce. These reservations by the planters concerned are understandable. In view of the fact that future production costs are difficult to estimate, especially with large arrears of maintenance, the need to build up reserves, and the refusal of the Commerce and Industry Ministry of a similar request from the coffee planters last month.

E.C.A.F.E. AT WORK

With the forthcoming annual session of the Economic Commission for Asia and the Far East due to commence at Kandy (Ceylon) on Monday next, the Commission will be entering its eighth year. Since its inception in 1947, serving as a forum for discussion, the Commission has identified itself with the studies relating to a few specific economic problems bearing on the economic development of the Asian and Far Eastern regions. These problems include flood control and water resources development, electric power, mineral resources, iron and steel, highways, railways and waterways, trade promotion, economic planning, and financing of development programmes. The results of these studies have been not only made available to the various countries but also assessed and evaluated from time to time. An idea of the work done by the Commission can be had from the following brief summary culled from its latest annual economic survey:

The E.C.A.F.E. Secretariat has given advisory services to Burma and Pakistan in regard to their monetary and budgetary problems, in setting up steel factories in Burma and Ceylon, in the planning of a large dam in Thailand, in equipment and operating methods in mowing river country-craft in Pakistan and India, and in reconstructing some mines in Thailand. The services rendered in modern methods of road construction and advice to Governments of countries ravaged by floods are also worthy of mention. Since 1951, with the co-operation and help of the U.N. Technical Assistance Programme, the Commission has been able to send experts drawn from the Asian countries to visit Europe, America and Japan to study particularly the problems relating to inland waterways, railway signalling methods, and iron and steel industry. Asian experts went to Australia to study the technique of exploiting and utilising lignite for fuel, and this year another group will go to Japan to study cottage and small-scale industries. As a result of constant meetings and activities of the organisation, no country in Asia today is unfamiliar with what is happening in another country in various economic fields. Secondly, at least some of the work of the E.C.A.F.E.'s is apparent in the establishment of more factories and installations and development of mines. It has also succeeded in fostering regional co-operation in various ways. The E.C.A.F.E. has promoted several training centres, too, the latest one being the proposed training centre for railway signal operating officials in Pakistan.

Thus, it will be seen that the functions of the E.C.A.F.E. have so far been confined to the study of the various problems, the tendering of advice to Governments and the provision of technical assistance in certain spheres, although the Secretariat claims a part of the credit for the establishment of certain factories and installations in some countries. It is possible to criticise this body on the ground that, although seven years have elapsed since its establishment, it has not planned for any regional integration, in the sense that some countries may produce for others by conscious planning. But this criticism ignores the practical difficulties inherent in the affairs of the region. The political situation in the region is still fluid and national sentiment is too strong to permit any such integrated development. Further, the level of economic development is at present so low that there is no danger of wasted effort, even if each country attempts to do what can be done better in other countries. All that this Commission can be expected to do, in the present economic and political state of affairs is to strive for regional co-operation wherever possible. It is, indeed, gratifying that the Commission is trying to bring about such co-operation. In the course of his recent review, Dr. P. S. Lokanathan, Executive Secretary of the E.C.A.F.E., for instance, observes:

"... the idea of regional co-operation is very much in the air. It is possible that, within a few years, common facilities and services might be provided on a joint basis for a group of countries with the assistance of Technical Assistance Programmes. It is also conceivable that the manufacturing facilities may be established for special products like D.D.T., penicillin and other drugs on a joint basis with capital and management supplied by more than a single country."

The pace of economic expansion in the E.C.A.F.E. countries has been very slow, thanks chiefly to paucity of finance, technical knowledge and preoccupation with political problems. In view of this and also of the rapid rate at which population is increasing, the efforts of the E.C.A.F.E. have not so far had any appreciable effect on the standard of living of the masses. Indeed, so long as these basic problems which are beyond the competence of this international body to tackle are solved, the E.C.A.F.E. can do nothing more than what it has been doing all along.

FIVE-YEAR PLAN FOR EGYPT

The new administration in Egypt, headed by General Neguib, the President, would appear to be concentrating its attention not only on such political issues as Sudan and the Suez Canal but also on economic problems. The present Government realises that sustained political stability cannot be had unless the economic development of the country is given the highest priority. As a first step in this direction, the Government of the Revolutionary Party introduced drastic land reforms aimed at eliminating huge landholdings and giving such land to landless tillers. But mere redistribution of land cannot bring about any increase in the real wealth of the country. That the present Government is aware of this elementary economic fact is evident from the drawing up of a Five-year Plan for agricultural and industrial development. The Plan, which includes several projects already under way, "is to come into force immediately."

The Plan lays considerable emphasis, and that very rightly, on quickening the pace of expansion in the agricultural sector. The Plan, for instance, covers projects which envisage (1) improvement in the quality of wheat, rice and maize seeds, in order to raise the per-acre yield, (2) intensification of the fight against plant pests and diseases, (3) reclamation of 350,000 acres, for which a credit of £E.12 million has already been approved, (4) provision of better storage space for cereals and erection of silos, and (5) construction of a fertiliser factory at Aswan. The chief consideration which has evidently weighed with the Revolution Command Council in according this special priority to agricultural development is the need for providing gainful employment to the agricultural labour class, which constitutes 70 to 80 per cent. of the total population (20 million in 1951) of Egypt. Although Egypt's population is small in relation to its physical size, it is big enough for the area available for cultivation. It must be remembered, in this connection, that, out of the total area of 240 million feddans (1 feddan=1.038 acres), only about 6 million acres are at present cultivable, which represents just 2½ per cent. of the total. Intensive and efficient cultivation of this limited area is, therefore, absolutely essential, if the masses are to derive any tangible benefit.

Next in importance to agriculture comes industry. That section of the Plan which relates to industrial development provides for two specific projects, one for the erection of an iron and steel mill and another for establishment of a paper factory. There are, besides these, several industrial schemes which are either under way or for the implementation of which steps are being taken. These include the establishment of a beet sugar mill and a factory for manufacturing tyre inner tubes, expansion of the national petroleum refinery at Suez, construction of a heavy furnace-oil pipeline from Suez to Cairo, erection of an electric power plant in South Cairo, setting up of factories for the manufacture of cables, electric wire, and bolts and nuts, and expansion of the production capacity of artificial silk, fine yarn, and tinned and preserved foodstuff industries.

The aggregate outlay of the Plan is not known. There are, however, indications to suggest that the implementation of the Plan entails expenditure of large sums of money over a relatively short period. The estimated expenditure for the building of the Aswan High Dam alone, for instance, amounts to as much as £E.200 million, of which actual building costs account for £E.60 million, indemnities for inhabitants who will be displaced for £E.10 million, hydro-electric power plants for £E.35 million, and fertiliser factory and other subsidiary works for £E.80 million. Since it is difficult to meet the huge capital outlay on the Plan by recourse to ordinary revenues—such would place an enormous strain on the annual budgets—the Government of Egypt is making efforts to exploit other sources of funds. It is proposed to meet the expenditure on the Aswan High Dam by means of an internal loan, while negotiating for loans from external sources (probably from the World Bank) and capital equipment which the West German firms are said to be willing to supply on comparatively favourable terms. Negotiations are also going on between the Egyptian and British Governments for a further release of £10 million of Egypt's sterling balances, in addition to the £5 million already released by Britain under the 1951 agreement.

OFF THE RECORD

(By "ROVER")

COUNTING of heads is a crude method of settling an important issue. There are heads and heads. Some look big but are merely swollen; many are half-empty; a few overflowing with grey matter. In this casual classification, I have not considered the case of those, whom their own fellow human beings delight in calling pig-headed. But democracy has done away with all these fine distinctions and for purposes of settling differences and for deciding what is right and what is wrong, it has ruled that a head is a head for a' that. At any rate, this machinery is ever so much more tidy than the old and messy method of settling issues with sabres and fisticuffs or, as we have been doing lately, with bombs.

I passed a very pleasant day last week in witnessing this simple process of counting heads at the office of the Indian Merchants' Chamber in Bombay. I was told that even this comparatively peaceful method of each member recording his preference for a team of twenty-four people to manage the affairs of the Chamber, could be, if not quite sanguinary, very noisy and undignified. Learning from past experience, things had been so well arranged this year that everything was extremely decorous and no battles were fought over the bodies of the voters or no attempt made to plague them into voting for X in preference to Y.

This election might have lacked colour and entertainment value but it had certainly gained in peace, dignity and leisureliness. I must say that, though long-drawn-out, it was an unusually pleasant affair, for all those who sought the suffrage of their fellow members, their agents and the voters. Even in the midst of keen rivalry, there was great good humour amongst them all. It was rendered still more pleasant for the first and the second of the above categories by the courtesy and helpfulness of the staff and the hospitality of the President of this august body. He provided a sumptuous buffet lunch and a gorgeous tea to break the monotony of wooing of hundreds of voters.

It is, however, not of the excellent cutlets and pastry served to scores of us who were present there, but of the decline which has overtaken this, the most important business organisation in Western India, that I propose to write today. In spite of the genuine atmosphere of friendliness and the complacent mood in which I was pushed for the rest of the afternoon by a pleasant meal in cheerful company, followed a few hours later by the cup with cheers but does not inebriate, I could not pretend to myself that the Indian Merchants' Chamber wielded the same influence and carried the same prestige as it did a decade or so ago. Try as I would, I could not get rid of this depressing reflection that the Chamber had been badly let down during late years, not so much by the authorities—Central and State—or its own rank and file, as by its great leaders.

The Chamber may have filled out. It might have increased its membership by hundreds. It might possibly be even more active today than it used to be in the less eventful past. But not even its best friends, amongst whom I count myself, can claim that it is as representative as it used to be or that its many memoranda and suggestions command the same attention or consideration of the Governments or the public. One of the main reasons for this unfortunate swing in its popularity and influence, according to some shrewd observers with whom I have discussed this point, is the element of extra-economic considerations which goes often to sway its general attitude and policy. When there was only one overriding issue before the country, prior to 1947, there was some justification for the strong political bias which coloured its day-to-day behaviour. But, with the emergence of a new pattern of economic thought and activity and a new political set-up in the country, a decided alignment with any political group in the country, especially with a group which has no economic principles, were bound to prove injurious to the inherent strength and integrity of any organisation, designed purely and exclusively for the development of economic activity on right lines.

Many weaknesses, which have crept into the structure of the Indian Merchants' Chamber in Bombay and which are responsible for the slow and as yet invisible disintegration which is there today, have flowed from its ill-concealed alignment with a powerful political organisation holding the reigns of power in the State and the country. Many who are dissatisfied but still remain in the body think that this close tie with the apron-strings of the massive matron has not even brought the few crumbs of favour, except, perhaps, individually to some more obstreperous and demonstrative leaders, either to the Chamber or to the interests which it is supposed to represent. They even point to some humiliating incidents in the recent past which certainly did not add to the lustre of this once powerful institution. On the contrary, as pointed out by this disgruntled group, this unofficial but nevertheless real affiliation to a political body has encouraged the State authorities, at times, to slight this organ of economic opinion, to mark their displeasure at its outspokenness in connection with some pet fad of theirs. Its critics maintain that the Government ignores its protests in the full confidence that, after having made enough noise to save its *amour propre*, the Chamber would allow itself to toe the line set by it. There may be an element of exaggeration in this criticism from within, but it must be admitted that there is an element of truth as well in it.

Such internal fissures cannot but lessen the strength of any organisation. But a greater weakness has assailed the Chamber from the secession of important people and business houses and the reported unwillingness on the part of many a mature and tried leader actively to take part in its affairs, though remaining nominally attached to it. Discipline and a certain degree of rigidity might be desirable characteristics of a political body. This is not true of loosely woven business organisations. Such bodies have few executive functions to perform or policies to enforce. Being mainly deliberative in character, a certain amount of fluidity of opinion from issue to issue and a changing group pattern from activity to activity make for greater endurance and stability in institutions of this nature.

Those in power in the Chamber, because this makes for smooth sailing for them, very possibly do not regret such non-intervention on the part of elders, but the loss in strength and maturity of judgment to the organisation as a whole is immense. I have no hesitation in admitting that, on most economic issues, what the Committee of the Chamber says is marked by wise thinking and deep study. What I want to convey is that, our State and national politics, and public opinion being what they are, it is not the opinion which is given that matters so much as who gives it. How is it that the Committee of the Indian Merchants' Chamber hardly includes any of the first six men who would invariably figure at the top of any list of most respected business men in the city?

As I have remarked, this is a deliberative and not an executive body. Certainly, there is room for younger and more energetic men on its committees, as there is on any other body. But there should be room for a few more tried and mature minds as well to guide its deliberations. When I put this question to some of these very elders, they are generous enough to plead either physical inability for the strain such participation involves or to take shelter behind the vague and amiable aphorism that older people must make room for the oncoming young. But I find most of these not only very actively engaged in their individual business or industry, but in the work of other bodies as well. I, therefore, cannot help questioning their sincerity when they put forth such excuses, when it comes to participate more actively only in the work of the Indian Merchants' Chamber. If they consider themselves, above occupying a position on this body, my accusation at the outset that they have let down and lowered the prestige of this important body, which they themselves had created and built up, stands. But few, if any, of these good people are so vain and so I fall back on my original plea that there is something in the ways and working of the Chamber itself which has kept some business leaders at a distance.

I should be failing in my very genuine friendliness for this once great institution, if I closed my evaluation of its present position, before lighting another red lamp of caution. The Chamber is and ought to remain a catholic and cosmopolitan body. There should be room and welcome in it for men engaged in commerce and industry in Bombay not only of every shade of political opinion but of every race, creed or language. Nothing in its constitution debars any business organisation or individual, but has not its political bias and the presence of a permanent and powerful group to uphold this not wrong but unnecessary and embarrassing association with active politics, resulted unconsciously and undesignedly in the Chamber itself being branded, most wrongly, as a predominantly racial and even linguistic institution?

It is no use pleading that its roll of membership includes business men belonging to all communities, races, creeds and languages. It is not enough that justice should be done but those seeking it and others should feel that it is being done. There are Parsis and Mahomedans, Maharashtrians and Rajasthanis, Hindus, Jains and Jews amongst its members and even on its Committee, but ere all these communities there in it in the same ratio as the stakes they hold in the business life of Bombay? Parsis may be a small community, but they figure very prominently in the business life of Bombay. Do they regard the Chamber as their own accredited mouthpiece? Or, again, why should Maharashtrians or Rajasthanis as business men have felt the need for separate bodies of their own in Bombay?

The business community which has an enviable record, despite the ignominy which a section of it has brought on its name during the last decade, has an even more constructive and creditable role to play in the builuing up of our country in the future. But, in a search for a scapegoat for things which have gone wrong, as much because of the weaknesses of other sections of society as of private enterprise, it has come very handy for being assailed from all sides. Even its professed political friends have not spared it from infamy or injury. It stands at the cross-roads today and its very future survival is at issue. A maligned and small community, its strength lies in its institutions and organisations, as well as the purity of their aims and behaviour.

In such matters, Bombay has to take a lead, being industrially and economically more advanced than the rest of the country. What it does today will be watched with eagerness elsewhere and copied tomorrow. It is, therefore, for the business community in Bombay to start putting its house in order. There could be no better beginning for this process of self-purification than the strengthening and consolidating of the Indian Merchants' Chamber on right lines during this year. Let those who have assumed charge of its affairs go out and persuade the best men in the community, wherever they be, to come back to the fold.—*All Rights Reserved.*

EXPORTS OF TEA REACH A RECORD TOTAL

KASHMIR DRAWS CLOSER TO INDIA

(From A Special Correspondent)

New Delhi, 2nd February

THE relations between India and Kashmir are expected to be placed on a more stable basis than hithertofore, especially when the State Constituent Assembly which meets at Jammu tomorrow, approves and ratifies finally the Indo-Kashmir Agreement of July, 1952. During the last week-end, the Kashmiri delegation which had been here, discussed the whole problem and decided to place the relations between the State and the Centre on a firmer footing.

DELHI LETTER

From the economic point of view, it is noteworthy that the State is stated to have agreed to relax the customs barrier against the Union gradually, so as to facilitate the increased flow of trade between Kashmir and the rest of India. As in the case of Rajasthan, Hyderabad, etc., the Indian Union will be compensating the State's loss of revenue in customs and income-tax by an immediate lump sum payment of about Rs. 2 crores which will be subject to the revision by a Finance Commission appointed for the purpose. The State authorities would appear to have been very reluctant to levy a sales tax, but were persuaded to do so with a modest beginning by taxing luxury articles. These apart, the fundamental rights of the Constitution will be made applicable with necessary adjustments to suit the abnormal conditions prevailing in the State at present. Further, the jurisdiction of the Supreme Court will be made applicable to Kashmir also. Although the State's accession to the Union will continue to be on the three subjects, namely, External Affairs, Defence and Communication, many of the gaps are stated to have been filled last week at the meeting between the leaders.

New Steel Plant

Although it may take some time for the Government of India to announce its decision on the location of the steel plant, it can now be taken for certain that the site will be Rourkela in Orissa. The German experts who had examined the various places for the location of the new steel plant are reported to have given their verdict in favour of Rourkela. In their decision they have been guided solely by economic considerations. Iron ore of very good quality is found at a distance of about 15 miles from this site, which can be transported by aerial ropeways. The place is also very near to other raw materials such as limestone. It has got good water facilities and will be in a position to secure abundant electric power from Hirakud. It is stated that coal could be imported from Bengal since the railway wagons which now carry limestone, dolomite, etc., from Orissa to the steel factories of Bengal are nowadays returning empty and these wagons could be utilised for getting coal to the Orissa factory. The Production Minister, who is now on tour of the competing sites, will be returning to the Capital shortly, after which a formal announcement will be made about the location of the new plant at Rourkela.

Tea Industry

The Indian tea industry has been doing quite well, particularly from the second half of 1953. The phenomenal recovery of the industry from the severe slump it experienced during the middle of 1952 may be seen from the following facts. The latest average export prices of North Indian tea in 1953-54 are now calculated at Re. 1-15-2 per lb., as compared with Re. 1-5-10 per lb. for the corresponding period in 1952-53. The improvement in prices may be better appreciated if one takes into account the latest weekly auction prices at Calcutta. For instance, in the auction sale No. 30 held on 18th January, the average export price of tea at Rs. 2-7-6 was nearly double that on the corresponding date a year ago.

The sharp rise in the price was attributable to a large extent to the impressive increase in the export demand, particularly from the U.K. During 1953, total exports of tea set up a new record in the history of this industry, the figure being placed slightly above 500 million lbs., as against 409.6 million lbs. in 1952 and 450.9 million lbs. in 1951. As per international agreement, India is not allowed to export this much quantity, the latest announced quota being limited to 427 million lbs. It is possible that from the current year onwards, Government might increase its quota to the maximum allowable extent. The higher export of 500 million lbs. last year was made possible by the carry forward from the export quotas of the previous years.

Not only from the point of view of quantity but also in regard to value, the year 1953 established a record for tea, the value being provisionally placed slightly above Rs. 100 crores. In the fiscal year 1952-53 and 1951-52, total tea exports amounted to Rs. 80.30 crores and Rs. 93.56 crores, respectively. As a result of this sharp rise in value, tea has begun to occupy the second place in the export trade of this country, being very close to jute manufactures whose exports in 1953 may now be estimated at less than Rs. 120 crores. Even the position of cloth has now been relegated to the third rank, despite the fact that exports of cloth showed a handsome recovery during the last quarter of 1953.

Some Problems

The improvement in prices as well as in exports of tea has brought to the forefront a few controversial problems to the industry and Government for solution. First of all, production of tea has to be increased and the restriction schemes that were introduced a year ago by North Indian gardens have to be shelved. The total production of tea in India in 1953 amounted to 612 million lbs. as against 621 million lbs. in the preceding year. If India were to maintain the present level of exports and to allocate about 200 million lbs. for internal consumption, it has to increase the output appreciably, now that it can expect to export a modest quantity of tea to the U.S.S.R. also.

Secondly, the industry has to ensure a contented labour force. The labour employed in this industry has become restive, being anxious to secure some welfare benefits, from the operations of which the industry had been exempt during the last two years, as per recommendations of the Rajaram Rao Committee. With the improvement in the fortunes of the industry, the Labour Ministry of the Government of India has been anxious to arrive at some decision about the enforcement of welfare schemes.

It is against this background that the conclusions of the Industrial Committee on Plantations which held its sessions in Calcutta should be judged. The decision that measures should be taken to apply the provisions of the Industrial Disputes (Amendment) Act of 1951 relating to lay-off to the plantations industry with effect from April next, will doubtless increase the cost of production of the plantation industries. Since the tea industry is largely dependent on the export markets for its prosperity, the lay-off compensation benefits cannot be rigorously enforced on this industry. It is a moot point as to whether the industry will be able to maintain the present prosperity. The latest reports from London suggest that a considerable resistance against the recent high prices has begun. Further, the Commerce and Industry Ministry has recently appointed Mr. P. M. Menon to go into the cost of production of the various plantation industries. Since the personnel of the Committee has not yet been decided, no progress has been made in this connection so far. In these circumstances, the time is not very opportune to enforce the welfare measures. It may be mentioned that many enlightened planters have already adopted welfare measures and in case Government is determined to go ahead with its labour welfare measures, it should proceed cautiously and methodically after taking into consideration the industry's ability to pay.

The other plantation industries such as coffee and rubber are not in a position to bear any extra cost at present. Even as it is, Indian rubber prices have been ruling somewhat higher than world prices. The higher prices have been fixed by Government partly in consideration of the fact that the industry should have to accelerate the progress of the rehabilitation and expansion programmes in order to satisfy a growing internal demand for this vital raw material. If the profits of the industry were to be reduced on account of higher production costs, the expansion plans will be curtailed and the scope for additional employment of labour will be restricted. The coffee industry has also been complaining about the rise in costs of production and hence its capacity to bear extra imposts will also have to be examined afresh. It is from this angle that the Government must approach the problem.

BANKING

(Concluded from page 206)

WORLD BANK

The net income of the International Bank for Reconstruction and Development for the six months ended 31st December, 1953, amounted to $10,122,649, as compared with $7,639,743 for the corresponding period in 1952. This income has been placed in the supplemental reserve, against losses on loans and guarantees, as a result of which the reserve has gone up to $86,636,160. Commissions on loans amounted to $5,563,593 and were credited to the Bank's special reserve, increasing that reserve to $42,800,010. Total reserves of the Bank as at 31st December, 1953, stood at the handsome level of $129,436,230.

Gross income, exclusive of loan commissions, was $23,930,935 as compared with $20,696,715 for the corresponding period in 1952. Expenses aggregated $13,808,266, including $2,926,679 of administrative expenses, $9,158,640 of bond interest, and $1,722,757 of bond issuance and other financial expenses.

During the six months under review, the Bank made 17 loans amounting to $190,392,000, the countries which received them being Brazil, Chile, Colombia, Iceland, Italy, Japan, Nicaragua, Panama, Turkey and the Union of South Africa. These loans increased the total loans signed by the Bank to $1,781,158,464. Disbursements on loans were $133,043,619, bringing total disbursements to $1,236,304,734.

Repayments of principal were received from borrowers as due. They aggregated $2,042,684 and brought the total principal repayments to $14,710,994 on 31st December, 1953. During the period, the Bank also sold or agreed to sell to private investors $14,038,384 principal amount of its loans. This included $8,965,687 without its guarantee and $5,072,697 with its guarantee. As at 31st December, 1953, these transactions brought total sales of effective loans to $84,053,038. Of these sales, $29,177,194 were made without the Bank's guarantee.

On 31st December, 1953, Czechoslovakia was suspended from membership in the Bank, because of failure to pay a balance of $625,000 due on its subscription to the Bank's capital.

INDIAN OVERSEAS BANK LTD.

The working of the Indian Overseas Bank Ltd., Madras, during the year ended 31st December, 1953, has resulted in a profit (subject to audit) of Rs. 13,24,875, as compared with Rs. 12,86,614 for the previous year. This is the fourth year in succession in which the Bank has maintained the upward trend in its profit. Thus from Rs. 5,34,764 for the year 1949 the profit has progressively expanded to the present level. It must, however, be stated that the pace of increase in profit has been slowing down. Thus, during the year under review, the rise in profit has been no more than Rs. 38,261, as compared with Rs. 1,40,471 in 1952, Rs. 4,43,158 in 1951 and Rs. 1,68,220 in 1950. With the undistributed surplus of Rs. 1,89,917 (Rs. 2,22,825) brought in from the previous year, the sum available for appropriation has gone up from Rs. 15,09,439 for 1952 to Rs. 15,14,793 for the year under review. The Directors have reduced the provision for taxation from Rs. 6,75,000 to Rs. 6,45,000 while the allocation to the reserve fund has been maintained at Rs. 3,50,000. The dividend is repeated at 6 per cent. per annum, free of tax, which requires, as in the previous year, Rs. 2,94,522, leaving to be carried forward a higher sum of Rs. 2,25,271, as compared with Rs. 1,89,917 brought in.

PUNJAB NATIONAL BANK LTD.

The Punjab National Bank Ltd. has earned a profit (subject to audit) of Rs. 39.86 lakhs in 1953, representing an increase of Rs. 5.74 lakhs over that in 1952. The profit for 1953 constitutes a record for the Bank since 1948. The sum brought in from the previous year is Rs. 1.93 lakhs, as compared with Rs. 5.34 lakhs a year ago, bringing the total amount available for appropriation to Rs. 41.79 lakhs, as against Rs. 39.46 lakhs. The total assets of the Bank, as on 31st December, 1953, exceed Rs. 79 crores, an increase of Rs. 5 crores over the year and of Rs. 27 crores over those at the end of 1949. Deposits as at the end of the year under review, at over Rs. 65 crores, are more than Rs. 6 crores above those at the close of 1952 and Rs. 3 crores over those as on 30th June, 1953. It may be recalled that, at the close of the half-year ended 30th June, 1953, the Bank had regained its former position of being the second largest amongst the Indian joint-stock banks, in the matter of total assets and deposits. It has not only retained that position but also surpassed the record figures touched at the close of the immediate pre-Partition year of 1946, when the total assets had stood at about Rs. 78 crores and deposits at Rs. 62 crores.

ANDHRA BANK LTD.

The net profit of the Andhra Bank Ltd., Masulipatam, for the year 1953 (subject to audit) amounts to Rs. 4,12,412, an increase of Rs. 44,159 over that of Rs. 3,68,253 for the previous year. The profit, as in the previous year, has been arrived at after payment of a month's salary as bonus to staff and making necessary provision for contingencies. The amount brought in from the previous year's account is Rs. 7,231 (as against Rs. 3,977). After taking this into account and after deducting the interim dividend at the rate of 6 per cent. per annum, free of tax, paid for the half-year ended 30th June, 1953, which had absorbed Rs. 75,000 (Rs. 75,000), the profit available for final appropriation stands at Rs. 3,44,643, as compared with Rs. 2,97,231.

AMERICAN LETTER

MILD RECESSION IN THE OFFING

NEW YORK STOCK EXCHANGE INTRODUCES NOVEL SCHEME FOR SMALL INVESTORS

(From Our Own Correspondent)

New York, 28th January

THE business curve is still declining, but, so far, the downturn is a mild one. Opinions differ widely as to the immediate future prospect for the economy. Chairmen and presidents of banks, presiding over the stockholder meetings in the first few weeks of the year, were optimistic. They said, in effect, that loan volume from industrial companies was going to hold up, according to all their projections. On the other hand, steel companies, which had calculated that they would operate at above 90 per cent. capacity in the first quarter, now figure that the figure may be nearer 80 per cent. This, however, applies to the new capacity which reached a new high figure as a result of the 1953 completion of the expansion programmes. Neither the Treasury nor the Federal Reserve authorities are concerned with the situation. The Federal Reserve Board still has not used the weapons of lower rediscount rates or the lowering of member-bank reserve requirements, but it may do so soon.

So far, the U.S. central banking system has probably done everything that was possible to accomplish in the field of monetary policy alone. This task in the U.S. is infinitely more complicated than, for example, in the United Kingdom, where credit policy makers have to reckon with only a dozen banks or so, against 14,000 and more in America. The Federal Reserve system's long-term calculations have been pretty accurate, but short-term guesses often go haywire. Recent bad weather, for example, disrupted air traffic, held up check and tax collections and led to a much higher float than expected.

At the moment, the situation is a bit confused. In order to provide greater stimulus to building, the Eisenhower Administration has come out with new plans for a long 40-years' Government guaranteed mortgage and lower down-payments. Most progressive people believe that encouragement of home ownership on more liberal terms is sound *per se*, but it remains to be seen what the Congress is going to legislate in this respect and what the administration of the new plan will be.

Randall Report

Foreign traders, as a whole, welcomed the report of the Randall Commission, although the American Tariff League assailed the paper as pulling "the rug from under American producers and workers faced with low-cost import competition." Mr. John S. Coleman, Chairman of the privately organised Committee for a National Foreign Trade Policy, however, suggested the breadth and the moderation of the Randall recommendation make possible the adoption of a programme that will provide a foundation for a U.S. foreign economic policy adequate to the needs of a growing American economy and of the United States role as leader in the free world. The report, he added, provides a programme in the national interest around which those concerned with an expanding international trade can unite.

Stock Exchange

Another interesting new development in the U.S. has been the beginning of the pay-as-you-go plan for investors on the New York Stock Exchange as from 25th January. On the first day the plan was in operation, odd-lot dealers—orders for less than 100 shares—received a total of 283 orders from 55 member-firms for 658 shares of 142 individual stocks. The dollar amount involved was $21,333. Monthly plans are topping quarterly plans three to one. Substantial orders were also taken for future execution. It must be remembered, however, that there are about 1,200 member-firms of the New York Stock Exchange. Thus, those actively participating are a very small percentage—so far. The pay-as-you-go plan for stocks involves no credit. Purchasers may pay as little as $40 every three months, or $1,000 every month towards a given amount of securities. Buyers pay only the regular Stock Exchange commissions for buying and selling.

Motor Industry

The American motor industry was in the news, too. At its recent exhibit of new automobiles, General Motors Corporation announced the largest private expansion programme ever undertaken. Mr. Harlow H. Curtis, President, said that General Motors will spend $1,000 million in the next two years for new production facilities. Mr. Alfred P. Sloan, Chairman, suggested the expansion programme may run to even $1,500 million. Just when and how these sums are going to be spent is not known, but the announcement in itself provided a psychological stimulus.

Meanwhile, steel companies which spent $1,000 million in 1953 in plant improvement, have scheduled a capital investment of $775 million this year. Government sources estimate at this point that outlays for capital and equipment will run about 5 per cent. higher in the first quarter of 1954 than in the first three months of 1953. Housing starts, an important indicator of construction activity, in 1953 were 2 per cent. under 1952, but it was still above the 1-million unit mark for the fifth consecutive year. The decline was less than seasonal in the closing months of the year.

President's Liberalism

As outlined in previous despatches, the Eisenhower Administration is now moving into a new phase. The erstwhile General has confounded the conservatives. He has come out for greater social security and for more liberalism than is palatable to the right-wing of the Republican Party. At the same time, he has retained the esteem and respect of the masses of the people. Meanwhile, Senator McCarthy's quizzes continue in search of Communists in Government and in other official positions. The tightly knit isolationist group in the country adores the Senator for his doings, while the great majority of the liberally-minded people in the United States take a very dim view of these proceedings because they remind them of Hitler and Mussolini.

The President, though, has now revealed his hand. He is on the side of liberalism, although he does not interfere with the constitutional processes which enable Senator McCarthy to continue with his investigations. This offhand attitude has probably made him many more friends than enemies. The development of the American economy will be the overriding question for the next few months to come. Eisenhower and his Cabinet will be judged, essentially, whether or not times are "good or bad." Except in some fringe areas, things are still satisfactory. Employment is high and personal income is also at levels which are just under the all-time peaks achieved during the inflationary period.

Therefore, while a downturn in the American economy cannot be denied—a slight downturn that is—present conditions are nothing to be alarmed about either by Americans or by any other nation in the world.—*All Rights Reserved.*

(Concluded from next column)

down cloth prices which have registered a sharp rise in recent months, thanks to the deterioration in the supply position consequent on the restrictive import policy. It was only recently that the Government of Pakistan had entered into arrangements with Japan for the purchase of £3 million worth of inferior quality cloth. As, however, the actual delivery will take place only after a few more weeks and with a view to arresting any further upward tendency in prices, the Government has, as already stated, brought the imported cloth under the purview of controls.

Cloth imported on private account and already lying with the importers or dealers has been exempted from the operation of the Control Order until the end of this month, on condition that the said lot should be distributed by the trade to consumers at reasonable prices. The indigenous cloth has also been exempted, because the textile millowners and traders of Pakistan have arrived at a Gentleman's Agreement with the Government, whereby they have undertaken to arrange distribution of mill-made cloth in various units at fair prices.

PAKISTAN NOTES

GOVERNOR-GENERAL OPTIMISTIC

COTTON EXPERT COMMITTEE SUPPORTS HEDGE TRADING

THE most striking feature of the address of Mr. Ghulam Mohammed, Governor-General of Pakistan, at the annual general meeting of the Associated Chambers of Commerce held at Karachi on Thursday last week, was the note of optimism over the future of Pakistan's economy. The economy, Mr. Ghulam Mohammed declared, had turned the corner, and the dawn of better and more stable economic conditions was already visible. In support of this claim, he mentioned the progress made in the spheres of agriculture, industry and transport. Alluding, in particular, to jute, Pakistan's most valuable earner of foreign exchange, he said: "Exports of jute to date have been up to expectations and no difficulty is likely to be experienced in the disposal of this year's crop, together with carry-over from the last two years."

The Governor-General referred to problems of industrial development. The discovery of natural gas at Sui in Baluchistan, he observed, would revolutionise power generation at a very cheap cost at least in Sind, Karachi and Baluchistan. An important pronouncement made by him was that, so long as foreign exchange earnings were restricted, the country should welcome offers made by some outside countries to supply machinery and capital goods on deferred payment basis. While on taxation, he revealed that proposals for entering into double taxation avoidance agreements with other countries were under consideration. Incidentally, it may be noted that Pakistan has already such an agreement with India.

In conclusion, Mr. Ghulam Mohammed called upon all Pakistan's business men and industrialists to maintain a high degree of integrity in their dealings. To quote him: "Pakistan is a new national entity and is yet in its infancy. We have to build traditions of trade and commerce and must lay such foundations as may command the respect and trust of the nations of the world."

Hedge Trading in Cotton

The Cotton Expert Committee has favoured reintroduction of futures trading in the Karachi market in the course of its report submitted to the Government of Pakistan a few days ago. This Committee was set up in June, 1953, with Dr. Nazir Ahmad as Chairman, to undertake a study of the cotton market and to examine the many issues relating to the cotton trade. The full details of the Committee's report are not yet available. From such information as is available, however, it is gathered that the report is quite a "comprehensive document," covering not merely the problems pertaining to the cotton trade but all issues relating to cotton economy in general.

While recommending the system of hedge contract in cotton trade, the Committee has urged the need for suitable legislation for the proper working of the system. It has also suggested measures for preventing sales of cotton on an unfixed basis.

As regards cotton cultivation, the Committee has opposed the idea of raising the acreage under cotton, since, in its opinion, such will adversely affect food production. It, however, emphasises that there should not be any further reduction in cotton acreage in future. If this recommendation were to be accepted and implemented by the Government, the area sown for cotton every year in Pakistan will continue to be 3.12 million acres (1953-54). The Committee has also suggested that all efforts should be made to raise the per-acre yield of cotton from 165 lbs. to 200 lbs. Referring to the subject of finance for cotton grower, the Committee feels that the State Bank of Pakistan should consider the desirability of providing larger credit to co-operative societies and agricultural credit banks directly or through commercial banks. Alluding to exports, it wants the quota to be increased to 2.2 million bales, as against the present 1.2 million bales.

Cloth Control

The Pakistan Government has imposed controls on prices and distribution of cotton piecegoods imported from abroad. The decision is in furtherance of the objective of bringing

(Continued in previous column)

CONVERTIBILITY OF STERLING STILL A DISTANT GOAL

VIEWS OF BRITISH BANK CHAIRMEN

BETWEEN the 10th and 17th inst., the annual meetings of the British "Big Five" banks are scheduled to take place. As preparatory to these meetings and according to customary practice, these banks, namely, Lloyds, Midland, Barclays, Westminster and National Provincial, have already circulated, along with their reports and accounts for the year ended 31st December, 1953, the annual statements of their respective chairmen among their shareholders. These statements are notable, as usual, for their critical analysis of the various banking trends, against the background of a comprehensive review of economic developments in the year under reference. They are, therefore, read avidly by the business community all over the world. In conformity with the general standards, this year's statements also make quite impressive and enlightened reading. The topics they have dealt with cover a wide range of subjects, such as banking trends, convertibility, reduction in the Bank rate, production trends, rising costs, crushing taxes, Government expenditure, savings, promotion of exports, etc. What is rather most striking about these statements is the similarity in the views of the bank chairmen on many of these topics.

To take the variations in banking trends first. The total bank deposits are higher in all cases. The expansion in deposits has been accompanied by an increase in the banks' holdings, of Government securities. As a good part of these Government obligations are of a short-term nature, banks have become highly 'liquid,' notwithstanding the large funding operations carried out during the year. In the result the liquidity ratio, that is, the percentage to deposits of cash, short loans to the money market, and short-term bills has risen to stand at about 38 to 39 per cent. Commercial advances, however, have declined. Referring to this feature, Lord Harlech, Chairman of the Midland Bank observes: "The demand for finance has been eased by the continued downward movement in prices of most basic raw materials. Further, as the post-war phase of irregularity of supplies of raw materials and components has come to an end, there has been less anxiety in industry to accumulate and carry stocks. Another factor contributing to the increased financial liquidity of business, as a whole, has been the considerable volume of new capital issues and other arrangements for augmenting the permanent resources of many undertakings."

Explaining the decline in bank advances further, Lord Harlech says that, in part, it results from an accidental factor, the irregular rise and fall of short-term borrowings by the nationalised gas and electricity undertakings to finance their capital expenditure in anticipation of periodical issues of stock to the public. In part too, it reflects the official policy of restraint in the provision of finance for personal and professional purposes. Even so, the fact is, he continues, that accommodation to industry and trade has, on balance, diminished over the year and that too at a time when the Government has been reducing controls and turning back to private hands the trade in a number of commodities.

Lord Harlech is not alone in criticising the British Government's policy of exercising restraint on non-Governmental borrowing from the banks. For Lord Aldenham of the Westminster Bank also is critical of this policy, as witness this remark of his: "The total of our advances, following the trend shown by bank advances as a whole, fell by £13 million, and the income from this item showed, therefore, a very substantial decrease as compared with 1952. The contraction in the assets may be attributed in part to the lower level of the prices of raw materials and to the more liquid position of the industry during the year. At the same time, it may be mentioned that the terms of the request made by the Chancellor of Exchequer to the banks to exercise restraint in their lending policy bears a little more hardly upon our Bank than upon some of the others because the proportion of our advances made to private and professional customers used normally to be larger than the average."

Economic Progress of Britain

Although there has been a fall in commercial advances, the general economic condition of Britain is healthier than before. This fact is recognised by most of the bank chairmen referred to above. Referring to this point, the Chairman of the National Provincial Bank, Mr. D. J. Robarts, says that, as months passed, one could sense a gradual change in the mentality of the country, and there was a revival of hope, and confidence, partly due to the Coronation of the Queen and partly due to relaxation in international tensions. There were, besides, other causes also. Thus, the alleviations in the 1953 budget were a welcome surprise, even though they left plenty to hope for in the future. The gradual demobilisation of wartime controls and of rationing and the better and more varied diet which became available have also helped. Lest there should be some in this country who do not understand the significance of freedom from official controls to economic development, we quote a couple of sentences from Mr. Robarts' statement:

"A love of freedom and a dislike of restrictions are in our blood and we look forward to the disappearance of the remaining controls. In every country, where this policy has been tried, it has been successful in providing incentives and stimulating enterprise. So it may be hoped that this year the nation will go forward in better heart to work together in the common task of rebuilding our prosperity by the only means by which it can be done, greater efficiency and higher productivity."

In the sphere of finance, too, there has been progress. An indication of this progress is seen in the strength of sterling which, according to Mr. Robarts, has become more and more a hard currency. He traces this progress to a number of factors among which he makes particular mention of the use of Bank rate as an instrument of financial management. He admits that, in the prevailing circumstances, it is difficult to make the Bank rate fully effective. "But even so," he adds, "the action taken has produced good results in tapering off some of the inflationary financing to which we have become accustomed and in enabling our economy to shed some superfluous fat. It has, therefore, helped to achieve what has been rightly described as a precarious balance." The Chairman of the National Provincial is neverthless not quite satisfied with the progress that has so far been made by Britain. He says that the country is consuming more and saving less. While recognising the increase that has taken place in the gold and dollar reserves of Britain, he feels that "there is still much to be done" before his country can reach a position of "financial security and independence." "If a chill wind should blow from overseas," he warns, "we might find ourselves again in grave difficulties."

Convertibility

After referring thus to the position of gold and dollar reserves, Mr. Robarts proceeds to consider the allied question of convertibility. His views on this subject are echoed practically in the statements of all other bank chairmen. He points out that the country is still indebted to the extent of £200 million to the E.P.U. It is also receiving substantial aid, both direct and indirect, from the U.S. The country is just paying its way and is very far from earning the target surplus of £300—£350 million. In this context, he draws attention to the efforts of Commonwealth countries towards achieving sterling convertibility. He says that, in the first six months, the colonies had a large surplus of £58 million with the dollar area, the rest of the sterling area had a surplus of £21 million; the U.K. had a surplus of £34 million but it had received £55 million from the U.S. on account of the U.S. defence aid. "At present, the strength of sterling seems to be due not so much to our efforts as to the efforts made by our partners in the Commonwealth." He, therefore, believes that sterling is not yet strong enough to face convertibility, and feels that it needs U.S. co-operation, especially in regard to lowering of tariffs.

The delay by the U.S. in dealing with the question of tariils and other barriers is viewed by all British bank chairmen with some disappointment. We may add here that since the release of these statements, the Randall Commission's Report has been published and from the Press version, its recommendations, as was pointed out in our last issue, go some way towards enlarging free trade but they do not go far enough. Nevertheless, even this limited approach is being strongly criticised by powerful vested interests in the U.S. and no one knows how long it will take for that country to implement the recommendations of the Randall Commission. Further, on the subject of convertibility, the Commission itself has advocated a policy of "hasten slowly." The only inference that one can draw from all this is that convertibility of sterling is a distant goal.

Export Drive

It is admitted by all that the achievement of convertibility is closely linked with export drive. This in turn depends on production costs and competitive ability, apart from tariff barriers and quota restrictions by importing countries. How crucial is this factor is evident by references made to it by all the chairmen including Mr. Robarts, Lord Balfour of Burleigh (Lloyds Bank), Lord Harlech (Midland) and Lord Aldenham (Westminster). It is generally held that delays in delivery and non-competitive prices are the two chief factors for the U.K. manufacturers' loss of export markets in favour of other countries. Mr. Robarts, particularly, points out that the loss is certainly not due to lack of credit facilities. For he says that the cost of credit in the continental countries, (and Japan, we may add) is higher than in the U.K. and believes that if their exporters can quote better terms, it is because their people are prepared to work harder for less wages than we are." Speaking in a similar vein, Lord Aldenham states: "All the reports that come to us from Western Germany tell of employers and employed there united in the most energetic drive for increasing exports, so that increasing competition is now no distant menace... It is most disturbing to find many instances of our having priced ourselves out of traditional markets. But almost as important as price is the ability to promise quick delivery, and the certainty of being able to keep those promises."

Some of the bank chairmen seem to agree that Governmental expenditure, over-taxation and inadequate savings are still responsible for undermining the British economy. Lord Balfour's remarks on this point are noteworthy. He says: "The important things are that over-taxation militates against all-out personal effort and extinguishes personal saving, while creeping inflation encourages excessive consumption and impedes the necessary expansion both of our capital goods industries and of exports. These are evils whose effects can only manifest themselves after a certain time but which in the long run, will be cumulative. They would be quite sufficient to account for the waning impetus of recovery and for the precarious state of our balance of payments, which are our major national problems."

Savings Inadequate

Lord Balfour says that there is ample evidence to show that the supply of savings in post-war Britain has been quite inadequate. Over the five-year period—1948-52—the U.K. devoted, on an average, just over one-eighth of its total output to the formation of capital in all forms, while in many countries of Europe the proportion of resources devoted to building up the national capital has been twice as much as in the U.K. During this period, in the U.K., persons, professional people and traders other than limited companies drew heavily on their past savings. The public corporations (nationalised industries) had a sizable current deficit for the period. This deficit as well as the large investment of over £1,000 million in these industries fell to be financed by others. Local self-governments had a small surplus, but only after receiving more than £1,500 million in grants from the Central Government which, in addition, financed most of the local authorities' net investment (in housing) of well over £1,500 million. Again, public and private companies, taken as a whole, had no doubt, a balance of savings left over for financing their own net investment. But this was possible on account of wide profit margins resulting from inflationary conditions and from dividend limitation and other restraints imposed on private investment. These considerations have led Lord Balfour to the conclusion that "there is no guarantee that expanding industry will get their share of the available savings or that new enterprise will be able to find capital at all." He further adds that no sufficient substitute has been found for the private investor as the source of the risk capital which is the life blood of enterprise. The private investor cannot provide, he remarks, risk capital, unless he has the income out of which to invest, and adds: "Maldistribution of company savings and a resultant slowing down of industrial progress is part of the concealed price that we pay for maintaining conditions in which dividend increase (or for that matter, tax concessions to the saving and investment classes) are inhibited by fears of aggravating the wage spiral."

In the circumstances noted above, Lord Balfour thinks that before the U.K. can face the future with confidence, it should pay attention to two factors both of which depend on adequate supply of savings. First is the great increase in the volume of productive investment at home. For it cannot hope to hold its own in world markets, unless the rate of modernisation of its industrial equipment at least keeps pace with that of its competitors. The second factor is the need for increasing its overseas earnings, so that they are sufficient not merely to pay for its imports of food and raw materials but to leave a substantial surplus throughtout the year. This, in effect, constitutes the crux of the problem of convertibility, for no country can have a freely convertible currency, unless it is economically solvent and strong.

TAX MUSINGS

SECTION 42 OF INCOME-TAX ACT

DOES IT APPLY TO BOTH RESIDENTS AND NON-RESIDENTS?

(By R. K. DALAL, B.Com., F.S.A.A., F.C.A.)

A CONTROVERSY is raging at present on the moot question whether section 42 of the Indian Income-tax Act applies both to resident and non-resident or does it apply only to non-resident. Section 42 has a history of its own. It was enacted in the following terms prior to the amendment of the Act:

"In the case of any person residing out of British India, all profits or gains accruing or arising, to such person, whether directly or indirectly, through or from any business connection or property in British India, shall be deemed to be income accruing or arising within British India, and shall be chargeable to income-tax in the name of the agent of any such person, and such agent shall be deemed to be, for all the purposes of this Act, the assessee in respect of such income-tax."

After the amendment in 1939 it ran as below:

"All income, profits or gains accruing or arising, whether directly or indirectly, through or from any business connection in British India, or through or from any property in British India, or through or from any asset or source of income in British India, or through or from any money lent at interest and brought into British India in cash or in kind, shall be deemed to be income accruing or arising within British India, and where the person entitled to the income, profits or gains is not resident in British India, shall be chargeable to income-tax either in his name or in the name of his agent, and, in the latter case, such agent shall be deemed to be, for all the purposes of this Act, the assessee in respect of such income-tax:

"Provided that, where the person entitled to the income, profits or gains is not resident in British India, the income-tax so chargeable may be recovered by deduction under any of the provisions of section 18 and that any arrears of tax may be recovered also in accordance with the provisions of this Act from any assets of the non-resident person which are, or may at any time come, within British India:

"Provided further that any such agent, or any person, who apprehends that he may be assessed as such an agent, may retain out of any money payable by him to such non-resident person a sum equal to his estimated liability under this sub-section, and, in the event of any disagreement between the non-resident person and such agent or person as to the amount to be so retained, such agent or person may secure from the Income-tax Officer a certificate stating the amount to be so retained pending final settlement of the liability, and the certificate so obtained shall be his warrant for retaining that amount:

"Provided further that the amount recoverable from such agent or person at the time of final settlement shall not exceed the amount specified in such certificate except to the extent to which such agent or person may at such time have in his hands additional assets of such non-resident person."

Sections 3 and 4 prior to the Amendment Act ran as follows:

3. "Where any Act of the Central Legislature enacts that income-tax shall be charged for any year at any rate or rates applicable to the total income of an assessee, tax at that rate or those rates shall be charged for that year in accordance with, and subject to the provisions of, this Act in respect of all income, profits and gains of the previous year of every individual, Hindu undivided family, company, firm and other association of individuals."

4. "Save as hereinafter provided, this Act shall apply to all income, profits or gains, as described or comprised in section 6, from whatever source derived, accruing or arising, or received in British India, or deemed under the provisions of this Act to accrue, or arise, or to be received in British India.

"Income, profits and gains accruing or arising without British India to a person resident in British India shall, if they are received in or brought into British India, be deemed to have accrued or arisen in British India and to be income, profits and gains of the year in which they are so received or brought notwithstanding the fact that they did not so accrue or arise in that year."

After the 1939 Amendment Act their frame was as follows:

3. "Where any Act of the Central Legislature enacts that income-tax shall be charged for any year at any rate or rates,... tax at that rate or those rates shall be charged for that year in accordance with, and subject to the provisions of, this Act in respect of the total income, of the previous year of every individual, Hindu undivided family, company and local authority, and of every firm and other association of persons or the partners of the firm or members of the association individually."

4. "Subject to the provisions of this Act, the total income of any previous year of any person includes all income, profits and gains from whatever source derived which—

(a) are received or are deemed to be received in British India in such year by or on behalf of such person, or

(b) if such person is resident in British India during such year—

(i) accrue or arise or are deemed to accrue or arise to him in British India during such year, or

(ii) accrue or arise to him without British India during such year, or

(iii) having accrued or arisen to him without British India before the beginning of such year and after the 1st day of April, 1933, are brought into or received in British India by him during such year; or

(c) if such person is not resident in British India during such year, accrue or arise or are deemed to accrue or arise to him in British India during such year."

Further, in 1941 section 14(2) (c) was enacted in the following terms:

"The tax shall not be payable by an assessee in respect of any income, profits, or gains accruing or arising to him within an Indian State, unless such income, profits or gains are received or deemed to be received in or are brought into British India in the previous year by or on behalf of the assessee, or are assessable under section 12B or section 42."

In order to appreciate these sections in the context of the scheme underlying, each one has to dig into the history of the Income-tax Legislation. Let us, therefore, refer to the charging sections 3 and 4 prior to their amendment in 1939. The basic principle of the charging section was to tax income with reference to income accruing or arising in British India—State being treated as outside the purview of the Income-tax Act. Since the *situs* of the source was the basis of the charge, the status of the assessee—whether resident or non-resident—did not matter. Emphasis was, therefore, on the source, rather than on the person. This being the fundamental of the scheme of taxation, naturally foreign income of a resident was not subjected to tax on the accrual basis. As the basis of taxation adopted was receipt or remittance into British India, such foreign income was subjected to tax, therefore, contingently on being received or brought into British India.

This basis was fundamentally altered in 1939. Foreign income, although outside the purview of territorial jurisdiction, was subjected to tax on accrual basis. Now to do so would necessarily entail transferring the emphasis from source to person. Assessees were, therefore, divided into "resident" and "non-resident" categories. In the case of the resident, the Government took the power to assess even his foreign income, even though not actually received; in the case of non-resident, owing to International law, foreign income, arising abroad under the auspices of another Government by reason of foreign allegiance, was not subjected to tax on accrual basis. The broad division between resident and non-resident had to be modified into *(a)* "ordinarily resident," that is, persons who habitually live in British India, *(b)* "not ordinarily resident," that is, persons who habitually live outside British India but who happen temporarily to acquire technical resident status, and *(c)* the "non-resident," that is, persons who habitually stay out and do not come within the purview of the Indian jurisdiction either ordinarily as "ordinary resident" or temporarily as "not ordinarily resident." Since a not-ordinarily-resident person acquires the status of a resident, he would have to pay tax on all his foreign income. In order to mitigate this hardship, section 4 limits his scope of liability.

Let me set out the respective liability of a "resident," "not ordinarily resident" and a "non-resident."

"Resident's" Liability.—Such a person is chargeable on:

(a) Income accruing or arising in British India;

(b) income accruing or arising outside British India;

(c) income received or deemed to be received in British India; and

(d) income brought into British India out of profits which accrued prior to 1938 but after 1933.

"Not Ordinarily Resident's" Liability.—Such a person is chargeable on:

(a) Income accruing or arising in British India;

(b) income received or deemed to be received in British India;

(c) income brought into British India; and

(d) income accruing or arising from a business controlled in India (including Indian States).

"Non-resident's" Liability.—Such a person is chargeable on:

(a) Income accruing or arising or deemed to accrue or arise in British India; and

(b) income received or deemed to be received in British India.

Having grasped the scope of the liability of each, let us now consider the alteration and the effect of the charging sections 3 and 4 *vis-a-vis* resident and non-resident.

Under these sections, a resident's liability was so enlarged that there was no income, either inland or foreign, that escaped the taxation net.

Section 42 has been enacted to catch the income under a fiction of law, income which otherwise would have been exempted under the charging section of the Act. Now, after the Amendment in 1939, if a resident's liability is such that nothing escapes tax under the charging sections, is it possible in the context to say that section 42 applied equally to resident and non-resident? It applied to non-resident, of course, for his foreign income was beyond the pale of the Income-tax Act. If it were so, then section 42 might throw the net wide to catch it, if it can, by a fiction of law. But, if the law catches the income normally, no fiction of law enacted under section 42 need be necessary to catch it. The position, therefore, is that "ordinarily resident" after 1939 was not contemplated under section 42 becomes clear. At least upto 1941, when section 14(2) (c) was enacted, non-residents were the only persons whose income could be hit by section 42.

But it will not be true to say that, because the liability of "ordinarily resident" is so large as to include all his foreign income, the same is also true of a "not-ordinarily resident." This person, as we said previously, pays tax on income accruing or arising in India. He does not pay tax on income accruing abroad. His foreign income could also be hit by section 42 on the ground of business connection. Thus, we come to this conclusion, that section 42, as amended after 1939, caught both "not ordinarily resident" and "non-resident," but not an "ordinary resident."

Support for this view is readily obtained from the internal evidence in section 42(2). If section 42 was intended to apply equally to all the three categories, why does sub-section (2) refer only to "non-resident" and "not ordinarily resident' and is silent as to resident? It is not an accidental omission but a deliberate enactment. Section 42(2), as we have explained before, can catch some incomes which are not caught under sections 3 and 4. Why should we, therefore, import the meaning by implication that section 42(1) applies to all the three categories?

The reason possibly advanced is the presence of section 42 in section 14(2) (c). This section exempts something which, but for it, would have been subjected to tax. Income of a resident under section 4(1) (b) (ii), i.e., income accruing or arising outside British India, would be taxed. This would include income accruing in the Indian State. To exempt what is caught under section 4 is the purpose of section 14(2) (c). Now the income of a resident accruing in Indian State was made liable under section 4, and that is sought to be exempted under section 14(2) (c) only if the two following conditions are fulfilled:

(a) Unless such income is received or deemed to be received in or brought into British India, or

(b) unless the income is assessable under section 42.

The genesis of this section was to avoid the Indian State Government also adopting for its residents a world income liability on accrual basis, so that, if a person is resident in Indian State by reason of his maintaining a dwelling house in the Indian State and visiting for short duration in the year, he would be resident there and also in British India, because he is trading and stays habitually in British India for most of the time. He will thus attract double resident status, once under the Indian Government and another under a State Government. The Government will collect tax from such a resident on world income basis both in British India and in Indian State, with the result that the Indian Government will have to part generally with half of its taxes in shape of double income-tax relief. In order to avoid such repayment, the basis was changed from accrual to remittance. If such persons are to be attacked under section 42 and their Indian State income subjected to tax under section 42, the whole purpose of the

(Continued on page 239)

PROGRESS OF SERICULTURE INDUSTRY

NEW SILK BOARD TAKING ACTIVE INTEREST

DESPITE tariff protection for a long period of two decades and active assistance from the Governments, the sericulture industry in India has failed to show any worthwhile progress. The production of raw silk continues to be at a low level, being not more than 2 million lbs. per annum, as against the country's present annual requirements of 3 million lbs. and the self-sufficiency target of 8 million lbs. The quality of silk, too, is still not up to expectations, being no higher than the International 'D' grade. What is worse, raw silk prices are ruling very high *viv-a-vis* those in other silk producing countries such as Japan and Italy. The chief factors responsible for this none too satisfactory position of the sericulture industry are absence of proper organisation, lack of adequate research and defective methods of production.

Viewed against this background, the statement of the Central Silk Board that it would be able "to lead the industry towards stability and ordered development" sounds too optimistic, if not heroic. Nevertheless, this statement is welcome as an indication of its earnestness to improve the affairs of the sericulture industry. In its latest annual report, that for the year 1953-54, the Board observes:

"The sericulture industry has been through a difficult time in the recent past, in the sense that either large imports from abroad or high prices within have prevented the stabilisation and orderly development of the industry. The Central Silk Board is addressing itself to the task of reducing the price of raw silk, increasing the offtake and increasing production. The Government of India has been good enough to place a considerable sum at the disposal of the Board for the first time during 1953-54 and the Board hopes, by promoting research, organisation of marketing and other means, to be able to lead the industry towards stability and ordered development."

Board's Activities

The Central Silk Board, it will be recalled, was created as early as in 1949. Until its reconstitution in September, 1952, the Board had not contributed anything substantial to the development of the sericulture industry. Barring the annual meetings—even those were not held regularly—the Board did not solve any of the long-term problems confronting the industry. With the reconstitution of the Board, the widening of the scope of its functions, and larger financial assistance made available by the Central Government, however, more vigour and drive would appear to have been infused into the Board. An indication of this is provided by the increase in the tempo of the Board's activities. The grants which the Board has made to the State Governments so far during the current (1953-54) financial year amount to Rs. 11.8 lakhs, as against Rs. 2.7 lakhs in 1952-53 and Rs. 1.46 lakhs in 1951-52. Before the close of the year, the Board is expected to provide another Rs. 2 to Rs. 3 lakhs. The aggregate grants for the whole of 1953-54 will thus amount to Rs. 14 to Rs. 15 lakhs which are over five times what were available during 1952-53.

The lines on which the Board has been assisting the development of the sericulture industry, as given in the latest annual report, may now be indicated. The real problem of the Indian silk industry is reduction in prices. One of the most effective ways of tackling it lies in the qualitative and quantitative improvement in raw silk production. This, in turn, is possible, if adequate and constant research is carried out towards increasing the yield and nutritive quality of the mulberry leaves. How important is this aspect will be evident from the fact that the cost of feeding the silk-worm on mulberry leaves alone accounts for as much as 60 per cent. of the cost of cocoon production. It is, indeed, gratifying to find that the Central Silk Board has been granting facilities in the form of supply of imported mulberry saplings and financial assistance to the State Governments for the establishment of mulberry nurseries for the preparation of improved grafts. Those facilities, it is said, have enabled the State Governments of Mysore, Madras and West Bengal to conduct trials with Japanese varieties on a large scale, in order to replace the existing poor yielding mulberry trees with improved and more nutritious varieties of mulberry grafts.

With a view to assisting the rearers to provide themselves with sufficient mountages on which the silk-worms spin cocoons, the Board has given financial assistance to the State Governments. It has also aided the setting up of foreign seed stations for the purpose of propagating foreign races of silk-worms crossed with indigenous races.

The production of good quality raw silk depends also on the improvement in the reeling of cocoons. The major part of this sector of the industry is still crude and primitive in its equipment and methods. The need for substituting the existing crude *charkhas* with improved appliances has, therefore, long been felt.

On the recommendation of the Technical Development Committee, the Standing Committee of the Board constituted a sub-committee of experts to put up concrete proposals for substituting the crude *charkhas* by domestic basins or other improved reeling appliances. This Sub-Committee has met twice and, after reviewing the comparative advantages of the three improved appliances, namely, the Mysore, Madras and West Bengal models, recommended that trials should be conducted at Channapatna (Mysore) and Malda (West Bengal) with these three types, in order to study their merits and deficiencies and to improvise a uniform type. Necessary funds have already been placed at the disposal of the State Governments of Mysore and West Bengal for the purpose of conducting these trials. The final report of the Committee is expected to be ready shortly when necessary steps will be taken by the Central Silk Board and the State Governments to arrange for the manufacture, on a large scale, of the model that is recommended by the Sub-Committee for introduction extensively in the rural areas. Necessary provision for assistance in this regard has been made in the budget estimates of the Board in the financial year 1954-55.

The question of affording increased facilities for the testing and conditioning of all raw silk before it is brought to the market has been engaging the attention of the Central Silk Board since its reconstitution in September, 1952. The Board, for instance, has granted financial assistance to the Government of Mysore for the construction of buildings for the silk conditioning and testing house at Bangalore. Efforts are also being made for the establishment of a similar house in Bombay with the help of the Silk and Art Silk Mills' Association. The Indian Standards Institution has finalised the standards for the testing of Indian silk.

Marketing of Raw Silk

Another field of activity which has engaged the attention of the Central Silk Board pertains to the marketing of raw silk. In the opinion of the Board, organisation of co-operatives comprising primary producers, rearers, reelers and sellers is the best method of stabilising the conditions in the silk industry. On the basis of the recommendations of one of its sub-committees, the Board has earmarked a sum of Rs. 2 lakhs for the establishment of such co-operative societies and also partly for the modernisation of reeling machinery. This sum is to be advanced to the States as loan carrying small interest.

The organisation of research is yet another important item of the Board's activities calling for intensive effort. The Board had appointed, in 1952, a Research Committee to draw up proposals for the delimitation of fields of work for the research institutions already existing and for the co-ordination of the work done by the various other agencies. The suggestions of this Committee have been accepted by the Board and are being implemented.

In view of the importance of deputing officers from the State Governments for training in the sericulture industry in Japan, the Board has been regularly subsidising the latter. So far, seven officers of the Sericulture Departments have been sent to Japan. Eight more officers will be sent in the near future.

Non-Mulberry Silk

The efforts of the Central Silk Board are not confined to the development of the mulberry raw silk industry alone. India produces about 800,000 lbs. of non-mulberry raw silk also —*Muga*, *Tassar* and *Eri* silk—and efforts have been made by the Board to assist the State Governments to develop this section also, especially with the improved type of indigenous reeling and spinning machines invented by Mr. Nidhi Ram Das of Gauhati. Demonstrations of experiments on these machines are at present being carried on with the co-operation of the State Governments concerned in Assam, Orissa, Madhya Pradesh, Bihar and West Bengal. The results achieved so far are encouraging and the *Eri* spinning machines are gaining popularity in the States of Orissa, Madhya Pradesh, Assam, Bihar and West Bengal. So far, the Central Silk Board has purchased 51 *Muga* reeling and *Eri* spinning machines at a cost of Rs. 3,200 for demonstration purposes. The question of getting these machines manufactured in a private workshop in Calcutta, as also the question of an outright grant to the inventor for his labour and the services rendered to the industry, is engaging the attention of the Board. The Board has also appointed five demonstrators, one each in the States of Assam, Orissa, Bihar, Madhya Pradesh and West Bengal, to carry on these demonstrations.

Stability of Raw Silk Prices

All these measures adopted by the Central Silk Board are, however, of long-term importance for the development of the sericulture industry. What is urgently required is stabilisation of raw silk prices. The Government of India's policy of linking imports of raw silk with an equal offtake of filature raw silk indigenously produced has, while seeking to protect the interest of the sericulture industry, overlooked the interests of weavers and consumers of raw silk who have been paying very high prices. It is common knowledge that, in the conditions of the purchasing power in the country, unless the price of raw silk is reduced, its offtake is bound to be lower. It is to be hoped that the special committee, recently constituted by the Board, to examine the question of ensuring stability of raw silk prices, will appreciate this point and suggest ways and means of bringing down the prices to a reasonable level. The Committee's report is expected to be submitted in the next few weeks.

EXPORT OF RAW WOOL

The latest decision of the Government of India to release, by 31st March, 1954, an additional quantity of wool equal to one-tenth of the allotments already held by established exporters is in keeping with the policy of liberalising exports. It was on 12th September, 1953, it will be recalled, that the Government announced that export of raw wool would be licensed to actual shippers up to 20 per cent. of the shipments effected by them during the first half of 1953. On representation, however, by the raw wool trade urging a further and more liberal quota for exports, on the score that the quota granted was too inadequate to prevent accumulation of heavy stocks and falling prices, the Government raised, on 24th November, 1953, the quota to 60 per cent. of the shipment during the January-June, 1953 period. Even this increase was considered by the trade as being not sufficient. A plea was accordingly put forward for a still liberal quota. The latest decision of the Government, referred to at the outset, is a sequel to this plea.

The above decision has been welcomed by the wool trade. But the Government's policy of broad-basing its export policy with a view to enabling a larger section of the trade to take part in export business has been criticised. Under the new policy, besides the actual shippers during the first half of last year, the following categories of firms will also be considered for granting licences for the export of a limited quantity of raw wool:

(a) Shippers who have not received any export allotment but who have exports to their credit during the period July-December, 1951 or July-December, 1952 or July-September, 1953;

(b) shippers who effected exports during any of the three calendar years 1951, 1952 or 1953 through an exporting house of a commission agent on consignment basis but who have not shipped the goods in their own names and hence are not eligible to claim any export quota; and

(c) internal traders not eligible to get any export allotment as a shipper but who have made outright sales of raw wool to established shippers or exporting houses or commission agents.

The raw wool traders feel that the foregoing procedure is rather complicated. In its opinion, the only equitable and practical way of distributing surplus wool for export is the "first come first served" principle "which affords an equal opportunity to all sections of the trade without calling for the existing complications." To quote the All-India Wool Trade Federation: "Had the Government seen their way to restore the aforesaid procedure of licensing followed by it since November, 1950, till September, 1953, which had worked generally satisfactorily and smoothly, the existing complications in the procedure of licensing and the dissatisfaction and confusion prevailing in the trade could have well been avoided without jeopardising the interests of any party."

The Federation goes even to the extent of saying that there is no need to control the export of raw wool, inasmuch as the exportable surplus is much larger than the average rate of export. If, however, the Government is not prepared to abolish all controls forthwith, it points out, it should at least release the entire surplus at a time based on a yearly policy on "first come first served" principle, instead of resorting to merely experimenting on various short-term policy announcements "which add confusion and uncertainty among trade circles, besides bringing in artificial fluctuations in prices."

TIME DRAWING NEARER FOR REOPENING LIVERPOOL COTTON MARKET

RENEWED FEARS REGARDING COTTON SUPPLIES

(From A Special Correspondent)

MANCHESTER, *26th January*

EXPORTS of cotton goods from Lancashire in 1953 showed little change as compared with the previous 12 months and remained substantially below the levels recorded in 1951. Earnings were £133,384,462, as against £148,039,772 in 1952 and the post-war peak of nearly £210,000,000 in the previous year. Lower price levels were the chief reason for this decline in earning power, as the quantity of cotton cloth shipped abroad was very similar to that exported in 1952, while sales of yarn showed an expansion in volume.

MANCHESTER LETTER

Cotton cloth shipments for the year amounted to 709,057,000 square yards, as against 710,813,000 square yards in 1952. The value was £87,928,460, an average of 29.76d. per square yard, as compared with £100,835,564 in the previous year, averaging 34.05d. per square yard. Yarn exports were 41,895,700 lbs., as against 35,721,600 lbs., earning £16,999,517 at an average price of 97.38d. per lb., as compared with £17,747,940, an average of 119.25d. per lb.

Volume of Exports

The following table shows the quarterly figures by volume in recent years:—

Cloth (in square yards)

	1951	1952	1953
1st quarter	211,961,000	211,646,000	173,106,000
2nd	240,390,000	162,220,000	169,604,000
3rd	213,995,000	151,540,000	182,020,000
4th	193,201,000	185,207,000	183,925,000
Total (adjusted to nearest million)	865,000,000	711,000,000	709,000,000

Yarn (in lbs.)

	1951	1952	1953
1st quarter	10,673,000	12,190,500	9,869,300
2nd	13,140,000	7,330,200	9,942,200
3rd	15,046,100	6,766,000	9,647,300
4th	12,754,900	9,359,200	12,388,400
Total (adjusted as above)	65,000,000	36,000,000	42,000,000

Although cloth shipments approximated to the 1952 level, there were some substantial changes in destinations. Whereas British West Africa remained the chief consumer, the total shipments to this area fell by 30,000,000 square yards to 145,050,000 square yards. The other main buyers were (in square yards, with 1952 comparisons): Australia 95,344,000 (72,940,000); South Africa 85,787,000 (59,421,000); British East Africa 31,074,000 (21,137,000); New Zealand 28,599,000 (30,518,000) and Malaya 26,466,000 (33,354,000).

Australia regained her place as the chief consumer of Lancashire-made yarn during the year, taking 5,968,900 lbs., against 2,942,800 lbs., with 1952 comparisons): Irish Republic 4,723,500 lbs. (3,199,100 lbs.); Canada 3,998,900 lbs. (2,132,700 lbs.); Western Germany 2,684,200 lbs. (1,207,100 lbs.); British West Africa 2,098,600 lbs. (2,175,900 lbs.) and South Africa 2,013,900 lbs. (1,486,000 lbs.).

Fall in Imports

As a result of the continued contraction in imports of grey cloth last year, it is estimated that the exports of cotton goods represented an extra 80,000,000 yards of Lancashire-made fabric as compared with 1952. The reduction in arrivals of foreign cloth amounted to about 70,000,000 square yards, the total being 76,069,000 yards, as against 144,256,000 yards in the previous year.

The system of buying unbleached material abroad, processing it in this country and re-shipping the finished product has been in operation for several years past, but the policy has been severely curtailed since the trade depression in 1952. Last year, the chief suppliers were again Japan and India, providing 38,319,000 sq. yards and 15,854,000 sq. yards, respectively. The total from Japan was little more than half the previous year, but there was an increase in shipments from India, mainly as a result of much bigger arrivals in the final two months of 1953.

The cost of all imported cotton goods last year at £13,569,789 was roughly one-third of the previous year. Finished cotton fabrics accounted for nearly £5,000,000 of the total, the main supplier being Belgium with 7,807,000 yards.

Sufficient Cotton Supplies

As the weeks go by, bringing the time nearer for the reopening of the Liverpool futures market, it would be idle to pretend either that the spinning trade or the raw cotton interests are fully at ease over the implications of the decision which has been taken. Recent developments have done little to create any feeling of security about the prospects. The attitude of the cotton trade unions has, of course, been uncompromisingly against the proposal. Their fears about possible shortages of raw cotton under the private buying system have culminated in an approach to the employers asking for a special wage agreement guaranteeing pay to any operatives whose earnings might be affected by a stoppage caused by a shortage of the raw material. The claim was rejected.

On the question of stocks, Mr. Alfred Roberts, Secretary of the Cardroom Workers' Amalgamation, says, in his latest quarterly report: "Before the war, Liverpool carried approximately one million bales of every variety of cotton. There appears little likelihood that former merchants and brokers will carry even a tenth of this amount." Raw cotton merchants have been complaining for some time past that the spinning trade is unable or unwilling to notify them of its future requirements. Whether a futures market can function adequately without substantial stocks being held in this country is open to question.

Meanwhile, some light has been thrown on future raw cotton trends as a result of the latest statement made by the Liverpool Cotton Association on the provision of a spot market. Merchants intend to charge more for spot cotton, arguing that they can only undertake to hold supplies where it would be a reasonable commercial proposition. The Association draws a contrast between the Raw Cotton Commission which has maintained large stocks of varied growths. This inevitably meant profits when world prices rose and a loss when values declined. The taxpayer has latterly been a loser in this venture. Merchants, on the other hand, have to compete in an open market and need to assess demand at the current high level of prices, which can easily lead to substantial losses in the event of supplies not being swiftly taken up by users. As a result, the price of spot stock must be considerably increased by handling and storage costs and wider profit margins charged to offset the risks involved.

Spinners with the necessary facilities are likely to obtain their raw material supplies direct from overseas sources, except in cases of emergency. The combines are, of course, well equipped to carry out this policy but smaller groups of mills may find the financial aspect of the problem beyond their powers.

Union "Blue-Print" For Industry

Mr. William Roberts, President of the United Textile Factory Workers' Association, said, after a meeting of the Association's legislative council in Manchester this week, that it was unlikely that the cotton unions' new policy document—the first for ten years—would be completed in time for submission to the unions' annual conference opening at Morecambe on 29th April. The policy document, running to more than 25,000 words, has been drafted by Mr. Harold Wilson, M.P., former Board of Trade President of the Labour Government, at the invitation of the U.T.F.W.A. Following joint discussions, certain sections of the document—which will cover every aspect of the industry from raw material to finished product—are now being revised.

"Learn Facts" Call

Allegations that Government spokesmen coming from London to speak in textile centres were inadequately briefed by the leading civil servants were made by Sir John Grey, Chairman of the Lancashire Cotton Corporation Ltd., in his final speech before retiring from the chairmanship. Sir John said at the annual meeting that permanent heads of departments in the Treasury and the Board of Trade should ensure that prominent Ministers, when they came to speak in Lancashire, were adequately supplied with the facts and did not have to be corrected in the following day's papers. He later declared that he was referring, in particular, to the speech made by Mr. R. A. Butler, Chancellor of the Exchequer, at Bolton in November, when he quoted export figures indicating that Lancashire was in danger of becoming a net loser of currency rather than an earner. Sir John also urged the Government to reduce taxation levels to enable industry to retain "a little more of its life's blood." The Government, he added, should "disentangle itself from G.A.T.T." and should fight "a little harder to support the interests of the cotton industry in any discussion."—*All Rights Reserved.*

LAND REFORMS IN INDIA

DANGERS OF IGNORING SOCIO-ECONOMIC BACKGROUND

(By Prof. T. R. SHARMA, B.R. College, Agra)

THE era of modern land reforms was, perhaps, first introduced in Russia by the Soviet Government just after the First World War and the new system of land management was introduced in all the countries which came under the influence of the Soviet Government as one of the earliest measures undertaken by Communist Governments. After the attainment of independence, most of the State Governments in India have taken steps to introduce land reforms. Upto this time, these reforms were mainly concerned with the elimination of intermediary interests standing between the State and the peasant farmer—the actual tiller of the soil.

After the abolition of the intermediary interests, it is being realised that changes in the titles of ownership of land are more or less useless, unless they are accompanied by other measures concerned with the actual management of agricultural land so that deficit subsistence farming may be replaced by efficient and progressive methods of agriculture, producing ever-increasing quantities of food and raw materials for providing a broad basis for the establishment of modern progressive economy.

On account of these considerations, the second instalment of land reforms seems to be imminent. Establishment of registered and co-operative farms, introduction of tractors and other types of farm machinery, fixation of a ceiling for individual holdings, breaking up of big landed estates, re-distribution of land for rehabilitating the landless rural worker, etc., are some of the problems engaging the attention of State and Central Governments. In order to be able to formulate a sound land policy, the Central Government has asked the State Governments to have a land census for collecting the necessary data. At this time, people hold different, often divergent, opinions about the form of land management to be adopted. While some people regard the Western type of farms or co-operative or collective farms as necessary adjuncts of increased production, another set of people place equally great emphasis on Japanese methods of cultivation. In these circumstances, it is essential that we understand clearly the social and economic background of all the three forms—Western, Indian, Chinese and Japanese—of agriculture and land management.

Different Types of Land Management

Let us take the Western type of agriculture as practised in America, Russia and Western Europe. In America and Russia land is plentiful and the population in relation to land is not large. Consequently, the farms are big. There is no dearth of capital in America and, therefore, the farms are mechanised on individualistic basis; in Russia, capital is not so plentiful and the mechanisation is carried out on co-operative or collective basis. Both of these regions are sufficiently rich in liquid fuel resources and, under these conditions, large-scale mechanised farming is, perhaps, most suited to their economic needs. In Western Europe, both land and capital are not so plentiful as in America but the pressure of population on land is much less in comparison to India and China.

From the social point of view, meat is the staple diet of the people and dairy produce forms a very important part of their food. The number of cattle is sufficiently large and they are maintained mainly for supplying meat and dairy produce. Female calves are reared up to replenish the stocks of milch cattle and the majority of male calves are killed for food, often as soon as they are six weeks old. Generally, a part of agricultural land is used for growing grass which is turned into hay for the cattle. The animals, thus, are mainly a source of food-supply and play almost no part in farming and agricultural operations.

In China and Japan, on the other hand, the pressure of population on land is very heavy and, consequently, farms are of a very small size. Capital is also scarce. The food habits of the people are also different; the main items of food are rice and fish; pigs and sheep are the main sources of supply of meat. There is almost a complete absence of bovine cattle. Rarely, a buffalo may be seen here and there. The result is that beef or dairy produce does not form part of the normal diet of most of the people and bullock labour and farmyard manure play almost no part in the working of the agricultural fields. Man has to depend upon himself; most of the agricultural operations are performed by him; often he himself draws the plough and works the water-lifting wheel; his wife acts as a beast of burden moving the crop from the field to the barn; and human excreta is carefully collected to provide manure to the fields. Man, unassisted by bovine cattle or machinery, carries on intensive agriculture on tiny holdings. There is no alternative or choice; agriculture has to be labour intensive.

The Indian System

India lies midway between the West and the Far East. Her agricultural practices are also of an intermediary type. The number of bovine cattle in India is, perhaps, the largest in the world, but the majority of people abhor beef-eating and for most of them cattle-killing is forbidden by their religion. Cereals, pulses and vegetables are the staple food of the people; dairy produce, though now available in small quantities, is the most relished item of diet. The pressure of population on land is heavier in comparison to the West but land is not so scarce as in the Far East.

Cattle assist man in most of the agricultural operations; they draw the plough, work the water lift, draw the cart and assist in threshing. In spite of the fact that the dung is burnt as fuel, cattle provide most of the farmyard manure. In these circumstances, a team of bullocks and one or two cows or buffaloes are most essential elements of the equipment of a peasant's farm unit. Generally dual purpose crops are grown to provide cereals for men and fodder for the cattle. Holdings are small, capital is not available for purchasing farm machinery and the country's resources are extremely poor in liquid fuel. Consequently, any appreciable departure from the existing man-cattle partnership does not seem to be feasible. If there is any serious deflection in favour of machinery or human labour to the exclusion of cattle labour, while dairy produce retains its place in the dietery, the problem of male calves renders the position untenable. So on account of our socio-economic set-up, we cannot afford to introduce American or Japanese methods of agriculture on any extensive scale; we shall have to solve our problem of increasing agricultural production within the framework of our own socio-economic conditions.

The Government of a democratic country cannot act against the sentiments of the people in any short period of time. Public opinion has to be educated slowly. During the last four or five years, public sentiment has been reacting very strongly against cattle slaughter, although most of the agriculturists know well that, as a result of this policy, roving herds of wild cattle, more dangerous to crops than the blue bulls, are likely to come into existence. In some areas of U.P., they are already there. This is the type of public opinion that has to be taken into consideration.

Man-Cattle Partnership

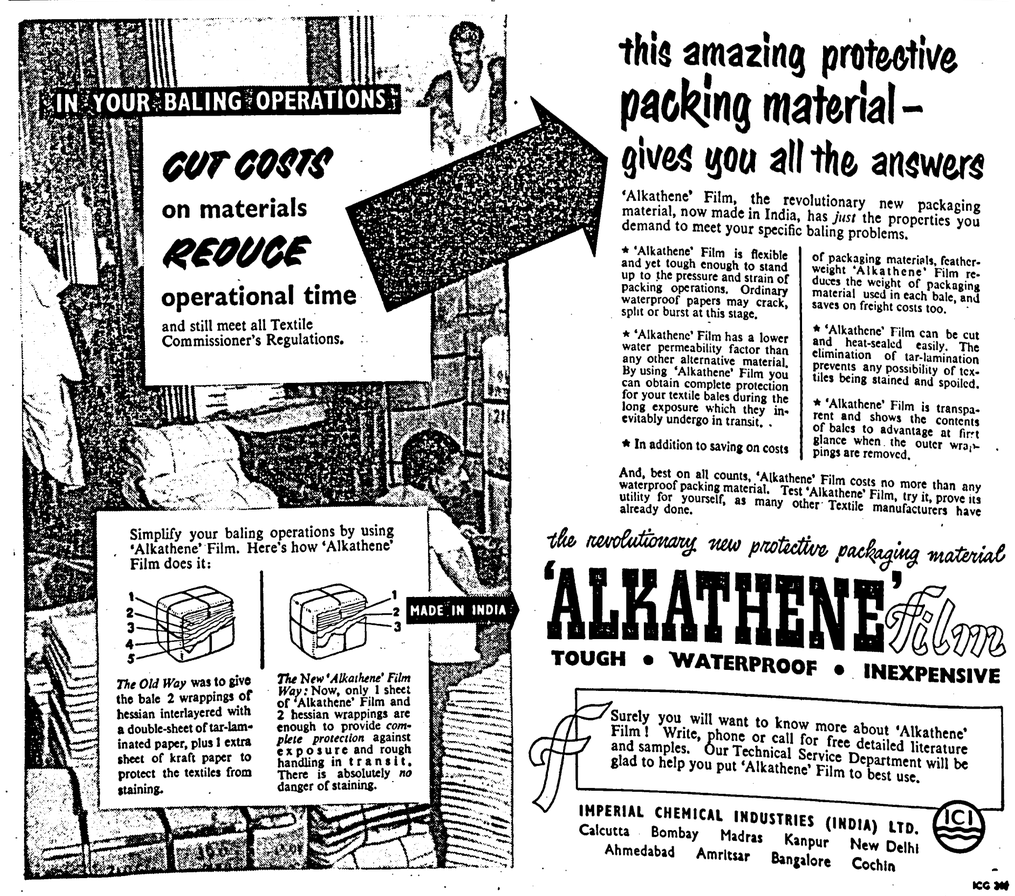
So before setting up regional ceilings to the size of holdings, the essential factor of man-cattle partnership should never be lost sight of. Whenever a farm-unit has to be considered, a team of bullocks and a milch cow or buffalo should be regarded as an essential part of the farm unit, besides the family of the peasant farmer. These holdings or farm-units can never be so small as they can be in Japan.

When fixing up the ceilings, perhaps some exception will have to be made in favour of well organised farms run on modern lines. They may be permitted to enclose more land than may be allowed to an average peasant cultivator. First of all, these farms give better yields per acre and, secondly, they are mostly owned by ex-proprietors of *zamindaris* and *jagirs* and to break up these farms would amount to disturbing the sources of livelihood of a section of population twice in one generation.

The size of holdings—minimum or maximum—will have to be determined in relation to the problems of farm management. In deciding the lower limit of an impartible holding, the minimum amount of land required for providing work and income to an average family possessing an average type of team of bullocks and a cow or buffalo should be the basic and most important consideration. Similarly, when we think of a regional ceiling to the size of holdings, to speak in terms of multiples of average family holding is entirely arbitrary. Really speaking, if we wish to have some modern farms at all, enough land will have to be permitted to be enclosed to form a suitable unit of farm management on a partially mechanised or fully mechanised basis.

In withdrawing land from larger holdings and farms for redistribution to landless workers, the Government and the people should make sure that they are not going to initiate a downward march by adopting the policy of least resistance on account of the clamour of certain interested or ill-informed groups of people. Some ordinary defects of an ill-considered and hasty policy of land re-distribution have been pointed out by many people. It is well known that the majority of landless labourers are likely to be inefficient and financially ill-equipped peasants. But the aim of this small article is to draw the attention of all thinking people to the basic social considerations underlying the very basis of the culture and civilisation of India. Man-cattle partnership in mainly vegetarian diet, in farm work and rural and urban transport, and in manuring and revitalising the soil is the bedrock of Indian society and culture. Any hasty and ill-considered decisions with regard to the re-distribution of land, leading to a progressive or steep fall in the size of holdings and pasture lands, are very likely to release the evil forces sure to undermine and eventually destroy the cherished age-old man-cattle partnership and, ultimately, to render man hopelessly lonely, as he is found in some of the regions of the Far East, to plough his own furrow with his own labour, to act as a beast of burden himself, to conserve every particle of his own excreta to manure the small patches of agricultural fields cultivated by him and to supplement his diet by eating lower forms of animals and insects.

In my opinion, it is the sacred duty of the people of India and their Government to resist the reduction in the size of holdings and pastures to save their cultural heritage for posterity. They must try to climb upwards by creating new fields of work and employment for the landless workers rather than choose the downward path of least resistance, of reducing the bigger holdings and re-distributing the land thus obtained in tiny fragments to landless workers—a path ultimately and surely likely to lead the people to a position worse than the one occupied by them socially, economically and culturally at present. Before taking a decision on the question of ceilings to land holdings, Government should have the patience at least to have before it the facts disclosed by the proposed land census.—*All Rights Reserved.*



this amazing protective packing material – gives you all the answers

'Alkathene' Film, the revolutionary new packaging material, now made in India, has *just* the properties you demand to meet your specific baling problems.

★ 'Alkathene' Film is flexible and yet tough enough to stand up to the pressure and strain of packing operations. Ordinary waterproof papers may crack, split or burst at this stage.

★ 'Alkathene' Film has a lower water permeability factor than any other alternative material. By using 'Alkathene' Film you can obtain complete protection for your textile bales during the long exposure which they inevitably undergo in transit.

★ In addition to saving on costs of packaging materials, featherweight 'Alkathene' Film reduces the weight of packaging material used in each bale, and saves on freight costs too.

★ 'Alkathene' Film can be cut and heat-sealed easily. The elimination of tar-lamination prevents any possibility of textiles being stained and spoiled.

★ 'Alkathene' Film is transparent and shows the contents of bales to advantage at first glance when the outer wrappings are removed.

And, best on all counts, 'Alkathene' Film costs no more than any waterproof packing material. Test 'Alkathene' Film, try it, prove its utility for yourself, as many other Textile manufacturers have already done.

the revolutionary new protective packaging material

'ALKATHENE' Film

TOUGH • WATERPROOF • INEXPENSIVE

Surely you will want to know more about 'Alkathene' Film! Write, phone or call for free detailed literature and samples. Our Technical Service Department will be glad to help you put 'Alkathene' Film to best use.

LLOYDS BANK LIMITED

LORD BALFOUR OF BURLEIGH'S REVIEW

THE Annual General Meeting of Lloyds Bank Limited will be held on 12th February at the head office, 71, Lombard Street, London, E.C.

In his statement accompanying the report and accounts for the year ended 31st December, 1953, the Chairman, the Rt. Hon. Lord Balfour of Burleigh, D.C.L., D.L., states:

"Our profit at £2,083,781 is £119,116 higher than last year, but should the steady decline in our loans and advances persist and the growth of our staff costs and running expenses continue, our future earnings may not be maintained at the present level.

"With regard to the increase of 2 per cent. in the dividend making 14 per cent. for the year, which members will be asked to approve, I emphasise what I have indicated on previous occasions, that it has been considerations of public policy which have been largely in your Directors' mind in recent years in refraining from altering our rate of distribution. But—and especially in our own case, as our reduction was more drastic than that of others—it has become at last a matter of simple justice to the shareholder that we should permit some alleviation of the restraint which we have so long imposed on ourselves and on him.

"It is considered desirable to strengthen our published reserves, and a sum of £500,000 has been added to general reserve, making the total of the reserve fund £16,500,000. An amount of £300,000 has been allocated to reserve for future contingencies.

"Current, deposit and other accounts, at £1,204 millions, show an increase of £35 millions. The principal changes in our assets are increases of £50 millions in our holding of Treasury Bills and £4 millions in our investments.

"In conformity with the general trend of bankers' advances, as a result of the restrictive lending policy, our loans and advances show a reduction of £21 millions, the largest falls being in the categories of public utilities and personal and professional borrowers.

India, Pakistan and Burma

"There was no pronounced improvement in trading conditions in India and Pakistan during the past year and import and export trade remained at a low level, with a consequent reduction in the activities of the British Exchange Banks. There are, however, some encouraging signs, including an improvement in the prices of certain of the primary products which bulk so large in the economy of both countries.

"Industrial development, too, both in India and Pakistan, is proceeding at an increasing pace which, in the long run, should increase the demand for British exports, which, it is essential, should be competitive both in price and delivery with those of other European countries; at the same time, these developments should give rise to an increase in the demand for banking services.

"Our branches in both countries have maintained their position and the high standard of service they have always shown in the past.

"My warm thanks go to the officials and staff of all our Eastern branches who continue to give of their best in very trying conditions."

Comparing the record of the post-war period with that after the 1914-18 war, Lord Balfour of Burleigh said: "Nobody would deny that we have in most respects done much better than after 1918. Taking the country as a whole and the period as a whole, the distinguishing feature has been the high level and stability of employment. Another striking contrast with the post-1918 period is to be found in the success of the post-war export drive; our exports at their peak have been raised some two-thirds above the 1938 volume.

Effects of New Policies

"There has, undoubtedly, been some improvement in the financial climate since the return to more orthodox monetary techniques two years ago. The cost of living has been steady for many months past. It has been possible to remove many important commodities from rationing or control without untoward effects. Externally, the balance of payments has been steadily on the credit side for eighteen months. Sterling holds firm in relation to the dollar and is no longer quoted in any market at more than a trifling discount.

"All this makes a heartening catalogue of improvement; nevertheless, the level of public expenditure and the deaoweight of taxation remain one of the chief obstacles to our future stability and progress. Moreover, it is a matter for regret that the new monetary policies introduced in November, 1951, have not, in fact, meant a reduction in bank deposits. I should be happier if we had been funding bank deposits over the past year, instead of creating some £200 millions of additional purchasing power, particularly as it is the official view that the general situation calls for the maintenance of the restrictions on bank lending.

Two Essentials

"I cannot escape the conclusion that our position must still occasion grave concern. It is true that the acute peril of two years ago has been surmounted. The immediate threat to the stability of the pound sterling has receded. We have a breathing space gained by our own efforts, with the help of some good fortune. But before we can face the future with confidence, two things are necessary, both of them dependent upon an adequate supply of savings.

"First, we need a great increase in the volume of productive investment at home, for we cannot hope to hold our position in world markets unless the rate of modernisation of our industrial equipment at least keeps pace with that of our competitors. Secondly, our overseas earnings must somehow be increased until these are sufficient not merely to pay for our food and raw materials in a good year but to leave a substantial surplus year in year out.

"In this context, I recall Mr. Butler's statement that an annual surplus of the order of £300 millions is needed, if we are to play our proper part in the development of the Commonwealth. Notwithstanding the progress made in checking inflation during the past two years, the continuance of the wages spiral is sufficient evidence that inflation persists. We have to ask ourselves whether the last two budgets have after all been sufficiently realistic. Moreover, it is clear that monetary policy in the sense of higher rates of interest alone cannot do everything. It is the inescapable duty of the Government to put a stop to inflation at its source, which is the additional supply of money derived from Government spending. The question which still awaits an answer is whether any Government can today hope to survive the unpopularity which effective disinflation would provoke.

"Without effective disinflation maximum production of the right things is not within our reach, though in addition it requires the fullest co-operation of capital and labour. To secure this co-operation is more than ever the essential task of management. Utterly dependent as we are on the sale of exports in a buyers' market, nothing will get us through but tremendous efficiency and the fullest competitive power."

SUGAR INDUSTRY UNDER FIVE-YEAR PLAN

PROGRESS DURING FIRST 2½ YEARS DISAPPOINTING

SO far as the sugar industry is concerned, the latest progress report of the Planning Commission on the Five-year Plan during the "first phase," covering the period April, 1951 to September, 1953, makes disappointing reading. This is so for more than one reason. The Report, for instance, does not give any precise information regarding the progress made in regard to the implementation of the development programme for the sugar industry mentioned in the Plan. Again, it fails to adduce reasons for the setback to sugar production and cane cultivation seen in recent years. Further, it has failed to indicate the lines on which the implementation of the Plan for the sugar industry will take place during the rest of the Plan period, barring a very vague statement to the effect that, if sufficient cane is available, the production of 1.5 million tons of sugar can be achieved "without difficulty." Nevertheless, the references to the sugar industry in the Report serve to emphasise at least one aspect, namely, that a greater part of the task remains to be accomplished and that more earnest measures have to be adopted for successfully implementing the development programme for the industry during the next two and a half years of the Plan period than those undertaken during the "first" phase.

From the little information furnished in the Progress Report, it is evident that there has been a small addition to the capacity of the sugar industry, as a result of three units, which were under construction in April, 1951, going into production. The annual installed capacity of the industry—based on 120 working days per season—in September, 1953, amounted to 1,550,000 tons, as against 1,540,000 tons at the commencement of the Plan (March, 1951), which equalled the target set for 1955-56. The whole of this increase of 10,000 tons in the installed capacity was registered in the first six months of 1953-54.

The following table shows the progress made in the implementation of the development programme for the sugar industry during the "first" phase of the Plan:

(In thousand tons)

Installed capacity	
March, 1951	1,540
September, 1953	1,550
Target for 1955-56	1,550
Actual production	
1950-51	1,116
1951-52	1,462
1952-53	1,316
April-September, 1953	1,500
Target for 1955-56	1,500

It will be seen from the above figures that the sugar industry had almost achieved, in 1951-52, the target of 1.5 million tons. This, however, was due to certain exceptional factors as, for example, high level of sugar prices and bumper cane crop. The Government's free market sales policy was another helpful factor. The financial assistance rendered by the Industrial Finance Corporation was yet another helpful factor. Out of the aggregate loans of Rs. 445.25 lakhs granted by the Corporation during the year ended June, 1952, the sugar industry alone accounted for Rs. 95 lakhs. The upward trend in sugar output registered in 1951-52 was, however, not maintained in the following season. In fact, the season witnessed an appreciable fall, the quantity actually produced being 1,316,000 tons. The output is expected to register a further fall during the current season, to about 1,200,000 tons.

What is this state of affairs due to? The inadequate supply of sugarcane to mills, consequent on diversion of supplies to *gur* manufacture, thanks to enlarged demand both for direct consumption and for the production of illicit liquor, was one of the reasons. Another reason was the heavy opening stocks in the 1952-53 season which disabled several mills from commencing their operations in time. A third reason is that a substantial part of the productive capacity of the industry is represented by old and worn-out plant, set up several years ago—about 20 years. Accordingly, the efficiency of this sector of the industry is low. The sugar industry has thus large arrears of replacement and modernisation which require considerable funds. The aggregate capital required for rehabilitating the industry is estimated at more than Rs. 25 crores.

It is unfortunate that the Planning Commission has not paid adequate attention to this important question. All that the Commission emphasises is only the need for shifting some of the sugar factories at present located in areas where sufficient cane supplies are not available to other areas in the same State or outside the State, depending on facilities for the supply of cane. Even here, the progress so far made is none too happy. The Progress Report merely says that, "in conformity with the recommendations of the Planning Commission, a few factories have been allowed to shift to more favourable areas in the country." It does not state anything about the Commission's suggestion for the setting up of an expert committee to examine carefully all the factories which are not working or which are working below capacity, due to paucity of cane supplies, with a view to determining which of the factories should be shifted from their existing location. If the Commission is under the impression that the Development Council proposed by the Government of India under the Industries (Development and Regulation) Act of 1951 will serve the purpose it had in view, then it is making a mistake.

The establishment of this Council cannot, by itself, be expected to ensure a smooth reorganisation of the sugar industry, inasmuch as it depends on the attitude of the State Governments concerned. In the first place, the Government of the State from where a factory has to be shifted must agree to give its consent. Secondly, the Governments of Bombay, Hyderabad, Andhra, Mysore and Madras States, all of which are in the tropical region and as such possess a more congenial climate for growing sugarcane, must revise their policies towards the sugar industry in such a way as to induce the factories in the sub-tropical regions to migrate to their jurisdiction.

Be that as it may, with regard to cane development also, the Progress Report furnishes little useful information. All that it has to say on this subject is: "Sugarcane recorded an increase of 450,000 tons in 1951-52, but, owing to a decline in prices, this improvement was not maintained in 1952-53. The latest reports for the current year indicate some increase over last year."

This is, indeed, a very vague statement; in fact, it is not even quite correct. The reduction in the minimum price of cane payable by the factories could not have adversely affected the sugarcane crop in the 1952-53 season, as the price was reduced only months after the crop had been planted. What happened was that this reduction led to diversion of a part of the cane crop to *gur* making, with the result that the factories received a smaller quantity of cane. Even as regards the 1953-54 season, the lower price for cane had no adverse effect on the crop planted, as will be seen from the following extract from the latest report of the Directors of the Cawnpore Sugar Mills, who ought to know better than the Planning Commission: "The reduction in the cane price did not adversely affect plantings materially for the next crop, but disastrous floods during the monsoon of 1953 have reduced the crop available for crushing for the season 1953-54 both in quality and quantity."

Further, the Commission does not seem to be aware that cane output in the Deccan for the 1953-54 season has been adversely affected by drought and poor supply of irrigation water. It is surprising that such an authoritative body as the Planning Commission should incorporate incorrect information in its Progress Report.

The Commission would have done well to examine the progress registered in cane development work, if only to see whether its expectations are being fulfilled. Such a study would have shown that, despite the stress laid on "improving quality and increasing the yield per acre, rather than extending the acreage," and the attempts made in this direction in the different States, nothing worthwhile has been achieved. In fact, the yield of cane has not only not increased but has actually declined. Thus, the average yield of cane per acre for the 1953-54 season, based on the second estimate of the crop, is expected to be just 12.4 tons, as against 13.3 tons in the base year of the Plan (1950-51). There has also been a setback in the recovery percentage of sugar. Thus, the all-India average recovery for 1952-53 was 9.98, as against 10.03 in 1950-51.

The figures below give the trend of cane cultivation during the "first" phase of the Plan period, as compared with the base year:

	1950-51	1955-56 *target*	1951-52	1952-53	1953-54 (Based on 2nd estimate)
Area (000 acres) ..	41,38	41,38*	47,92	43,76	41,01
Production (000 tons) ..	5,40,20	6,07,10	6,06,80	5,20,00	5,10,00
Yield per acre (tons) ..	13 2	14 6	12 6	12 0	12 4
Recovery percentage ..	10 3	..	9 57	9 98	..

* The Planning Commission emphasises concentration of attention on intensive cultivation. This estimate does not, therefore, provide for an expansion in acreage over the base year.

All these clearly bring out the imperative need for stepping up the yield of high sucrose content cane per acre, especially in areas like Uttar Pradesh and Bihar. After all, the fortunes of the sugar industry are closely linked to a healthy and prosperous sugarcane economy. It is to be hoped that the Planning Commission would impress upon the State Governments the necessity for taking vigorous measures in this direction at least in the rest of the Plan period.

THERMAL STATION FOR SOUTH ARCOT

MADRAS GOVERNMENT'S SCHEME

THE Government of Madras has proposed the erection of a thermal generating station at Neivaille (South Arcot). Reports from Madras indicate that the station, which is estimated to cost Rs. 17 crores, will generate 100,000 kilowatts of power per annum by utilising one million tons of lignite. As the erection of this station is dependent on the progress made in regard to recovery of lignite in South Arcot, it is stated that arrangements are being made, with a view to speeding up the work on the pilot scheme for the extraction of brown coal.

Already, one-third of excavation work has been completed and the rest is expected to be over in about six months, if the giant 'shovels' donated by the Technical Co-operation Administration were to arrive early enough. Each shovel, it is stated, can excavate about 2½ tons of earth at each turn. The Lignite Experts Committee, which met at Neiville on 21st January, decided to speed up excavation work with human power, utilising 'Euclids' for the removal of earth until the arrival of the 'shovels.' Each Euclid is capable of removing at a time about 9½ tons of earth. Ancillary plans are also to be speeded up, in order that everything might be got ready at the earliest possible time for the establishment of the thermal station. It is learned that Mr. Paul Eyrich, American mining expert and adviser to the Government, has submitted proposals for the utilisation of different kinds of lignite and other materials that can be extracted in South Arcot.

A gratifying result of the work that has been done so far is that the serious water percolation feared earlier has not materialised. The problem of sub-soil water has not been apparent even at a depth of 50 feet, upto which excavation has now reached. This circumstance, it is considered, will make it possible to have sharper slopes for the mining pits exposing a larger lignite area than otherwise—possibly about 400 sq. feet, where previously it was considered possible to expose only 100 sq. feet. This is also expected to reduce the cost of extraction of lignite substantially. Thus, conditions regarding extraction of lignite, to quote Mr. V. S. Hejmadi, I.C.S., Adviser to the Planning Commission, are "much more favourable than was at first believed to be."

The erection of the thermal station, as proposed, will bring immense prosperity to South India. It is common knowledge that the industrial backwardness of South India is due to lack of power, which in turn is the result of the high cost of transport of coal. This handicap will be removed to a considerable extent, when the exploitation of lignite in South Arcot becomes a practicable commercial proposition. All available reports indicate that commercial possibilities of mining have been fairly well established. Nevertheless, it is too early to say that no further difficulties will have to be faced in the course of actual mining.

ION EXCHANGERS FROM INDIAN COALS

A new method for the preparation of ion-exchange material from coal has recently been developed at the Fuel Research Institute, Digwadih.

The ion-exchange material prepared from coal finds extensive use in water-softening. The technique provides a cheap and readily available supply of soft water for various industrial purposes. The water so softened is used in boilers, laundries, textile mills, dyeing houses, breweries, etc. When regenerated with acid, these materials form part of the equipment used for the production of de-mineralised water for pharmaceutical purposes, aerated water and other beverage industries. The ion-exchange materials from coal in various forms can also find use in other industries, such as metal-concentration, sugar-refining, preparation and purification of solutions, refining of hydro-carbons, etc. In certain chemical processes, ion-exchangers are used as catalysts.

The water-softening capacity of the ion-exchanger, has been tested experimentally in a large-scale softening plant, in which water with a total dissolved solids equal to 440-480 parts per million was softened to zero hardness at an operating cost of As. 8 per 1,000 gallons. All the materials for the manufacture of the exchanger are easily available in India. The equipment required is simple and can be easily fabricated. The method is covered by patent, but the C.S.I.R.O. is offering it for commercial production.

A good book and . . .

a good cup of TEA are ideal companions

AND A GOOD CUP OF TEA IS MADE THIS WAY
• Boil fresh water • Rinse out teapot with boiled water • Put in one teaspoonful of tea for every person and one extra teaspoonful for the pot • Stand tea for four to six minutes before serving • Add milk and sugar after tea has been poured into cup

1,250,000 workers are employed in the Indian tea industry.
ISSUED BY CENTRAL TEA BOARD CTB-6-54

JUTE LOOMS IN THE WORLD

INDIA OWNS ONLY 56 PER CENT.

THAT India does not enjoy a monopoly in jute manufacture at present, as it did towards the end of the last century, is evident from the fact that, out of a world total of 122,510 jute looms, it had in 1952 only 68,557 looms or 56 per cent. The balance of 44 per cent. of the looms was in Europe and other continents. The next biggest holder of jute looms in the world is the U.K. which had in 1952 11,151 looms or 9.1 per cent. of the total. Then comes France with 7,698 looms representing 6.3 per cent. of the total, Germany with 6.349 (5.2 per cent.) and a large number of other countries with a very small percentage of looms. Pakistan had in 1952 only 1,000 looms but a further 2,000 looms were expected to function by the end of 1953.

These figures, as well as others relating to the position of jute looms in India, are contained in a neatly printed booklet entitled *Loom Statistics*, published by the Indian Jute Mills Association, Calcutta. The booklet gives details of distribution of hessian, sacking and other looms according to reed space and mills as they stood on 30th June, 1953. A similar booklet was published in 1952 and it contained figures corrected up to 30th June, 1951. The present publication covers statistics relating to the whole of the Indian Union and Nepal and gives separately for each individual mill the reed space of hessian, sacking and other looms. All looms of 40-inch reed space and over (unless they are "other looms") have been classified as hessian looms. It is, however, pointed out that this classification does not mean that mills do not use any looms above 40-inch reed space for sacking production.

Over the period since 30th June, 1951, when the last loom census was taken, upto 30th June, 1953, the date of the present census, no appreciable change has taken place, except an increase of 131 looms. Of this increase as many as 29 looms were on account of the expansion of Shree Ganesh Mills, the balance of 102 looms (other than hessian and sacking) being the addition to Hukumchand Mills. The net result of the change was that the total hessian and sacking loomage of the I.J.M.A. increased during the period from 65,720 to 65,749. The total recorded hessian sacking looms and mills outside the I.J.M.A. remained stationary at 3,225, there having been a transfer of 35 looms from hessian to sacking. On an all-India basis, the number of hessian and sacking looms rose, thus, to 68,974 by June, 1952. Including 3,728 looms other than hessian and sacking, the total loomage of mills, on an all-India basis, aggregated 72,702 as against 72,572 in 1951.

The table below gives the distribution of looms according to States as on 30th June, 1952:

1	2 Hessian	Sacking	4 Total (2+3)	5 Other looms	6 Grand total (4+5)
West Bengal	43,352	22,218	65,570	3,728	69,298
Madras	387	655	1,042	..	1,042
Bihar	131	869	1,000	..	1,000
U.P.	224	681	805	..	805
C.P.	25	195	220	..	220
Nepal	115	222	337	..	337
Total ..	44,234	24,740	68,974	3,728	72,702

Thus, it will be seen from the table above that, of the total of 68,974 hessian and sacking looms, West Bengal accounts for 95.1 per cent., Madras 1.5 per cent., Bihar 1.4 per cent., U.P. 1.2 per cent., and C.P. 0.3 per cent. Nepal's share of the total is 0.5 per cent.

The distribution of looms according to the I.J.M.A. mills and those outside is indicated in the table below:

	Hessian	Sacking	Total of hessian and sacking	Others	Total
I.J.M.A. mills	42,771	22,978	65,749	3,225	68,974
Mills outside I.J.M.A. ..	1,463	1,762	3,225	503	3,728
Total ..	44,234	24,740	68,974	3,728	72,702

It may be mentioned here that, over the two-year period, the total hessian and sacking loomage of the Association mills in West Bengal has increased from 63,939 to 63,968, while that of the mills which are not members of the Association has remained stationary at 1,602. The total hessian and sacking loomage of mills outside West Bengal has remained stationary at 3,404.

The census reveals the dominance of West Bengal in the location of hessian and sacking looms. The State accounts for as many as 43,352 hessian looms out of a total of 44,234. In the case of sacking looms, its share is 22.218 out of 24,740. Again, in West Bengal, hessian loomage is only a little less than double that of sacking; but, in all the other States, sacking looms exceed those of hessian. As for looms other than hessian or sacking, all the 3,728 are in West Bengal. Expressed in percentages, 66.1 of the West Bengal looms are hessian and 33.9 sacking, as against 25.9 hessian looms in mills outside West Bengal and 74.1 sacking. Further, West Bengal accounts for 98 per cent. of all the hessian looms and 89.8 per cent. of all sacking looms in India, leaving other States with 2 per cent. of all hessian looms and 10.2 per cent. of all sacking looms.

A noteworthy feature of this industry is that the number of steam-driven looms among Association mills declined during the period under review from 24,688 to 19,997, a fall of 4,691 looms which switched over to electric power. The number of electrically-driven looms within the Association rose from 41,032 to 45,752. The position outside the Association remained unchanged in respect of the use of both steam and electric power.

A perusal of the figures relating to the growth of looms within the Association discloses that the number of looms rose from 6,700 in 1885 to 15,336 in 1900. During the following decade the number doubled to 31,755; that was in 1910. Thereafter, the figure climbed up till it reached 65,762 in 1949. The year 1951 saw a fall to 65,720. With the addition of 29 looms, as stated at the outset, the total rose to 65,749 in 1953. The percentage of hessian looms to total rose from 27 in 1885 to 65 in 1944. It has remained at this figure ever since.

U.P. FORGES AHEAD WITH JUTE QUALITY DRIVE

The official drive to improve the quality of U.P. grown jute seems to have resulted in some success. The fibre arriving in the markets this season is gaining wide acceptance, because manufacturers find it, we are told, much better in colour and strength than any they bought on the home market during the last four years. The colour has improved as a result of intensive propaganda backed by village-to-village demonstrations of the correct retting processes conducted by the Jute Development Department of the State.

Jute mills in Uttar Pradesh are reported to have reacted favourably to the Government's "quality drive" by renewing their buying support for the locally grown fibre. To the end of November 1953, the three jute mills in the State together lifted 14,332 mds. as against 26,600 mds. purchased by Calcutta mills and 28,662 mds. by local merchants. Mill buying has enlivened the market and prices, as a result, have firmed up at levels which may be said to bear some relationship with the cost of production.

The co-operative jute trading movement in U.P., aimed ultimately at eliminating the middleman, is growing in strength and popularity. Nine jute co-operative credit sale societies have sprung up in Lakhimpur District, while 13 more are being set up. The State Government's target is 90 such societies.

BRAZIL'S JUTE CROP SWEPT AWAY BY FLOODS

Brazil's jute production in 1953 has, it is reported, suffered severe loss from floods. Owing to delay in financing the current crop, stocks piled along the river banks for transportation were swept away by floods on the Lower Amazon. Growers lost as much as 50 per cent. of their crop. The local dealers who had been financing them also suffered heavily. As a measure of relief to the distressed growers and traders, the Government is distributing large quantities of seeds free, extending the period for refunding loans and facilitating further advances until conditions become normal again. It is believed that there will be no need to import jute this year, the depleted crop notwithstanding. Banks have 8,000 tons on hand and the harvest should yield 12,000 tons of jute and 24,000 tons of *uacima* and similar fibres, while consumption is not likely to exceed 43,000 tons.

PRODUCTION WELL MAINTAINED IN FRANCE

A new burst of activity in the French market for jute goods has, according to the latest statistics recently made available, partly offset France's almost total loss of the U.S. burlap market, as well as enabling the industry to maintain production well during the months of July and August, 1953. During the two months under review production in the yarn section increased greatly to 7,078 tons and 4,984 tons, respectively, from a mere 7,256 tons during the same two months of the previous year.

Production of cloth, which was somewhat on a reduced scale from the normal monthly totals, amounted to 5,111 tons and 3,812 tons, respectively, compared with a total of only 6,500 tons during July and August, 1952. Compared with 1938, yarn and cloth production was up in the two months under review by 10 and 11 per cent., respectively.

FINANCE FOR PLANTING INDUSTRY

U.P.A.S.I.'S MEMORANDUM TO SHROFF COMMITTEE

THAT the plantation industry, particularly the tea and coffee sections, plays a very useful role in the economy of India is an undeniable fact. Unfortunately, this important section of free enterprise has been treated by the Government in such a manner during the last few years that it is no longer self-reliant. Its resources have considerably dwindled, due partly to the crisis through which it had to pass in 1952 and partly to the heavy burdens which it has been called upon to shoulder. It has, therefore, to look for external assistance to finance its expansion. This point was stressed last week by the United Planters' Association of South India (U.P.A.S.I.), in the course of its memorandum to the Shroff Committee, which is currently touring the country to enquire into the question of financing the private sector of industry. The Association pleaded for certain reliefs, which would help the industry to build up its own resources.

Referring to the tea industry, the U.P.A.S.I. pointed out that, in the past, the expansion of planted areas had been financed mainly out of accrued profits of established companies, which were conserved without being frittered away by way of dividends to shareholders. Conditions are entirely different now. Taxation and cost of production are at such high levels that there is practically little left out of the profits for financing new openings. Submitting how high the taxation applicable to tea estates was, the memorandum said that 40 per cent. of the profits was liable for ordinary taxation in Madras State, while estates in Travancore-Cochin were, in addition to being charged ordinary tax on 40 per cent. of the profits, liable to pay agricultural income-tax. An excise duty at the rate of one anna per lb. on packages of over 60 lbs. and at the rate of As. 4 per lb. on packages of 60 lbs. and under was levied on tea sold in India. There was also an export duty of As. 4 per lb. Referring to the last mentioned levy, the U.P.A.S.I. recalled that the industry was given an assurance, when the export duty was raised to As. 4, that should prices fall, the export duty would be reduced or abolished. But, when in 1952, tea prices fell sharply, there was no reduction in export duty, in spite of repeated representations made to the Government. The incidence of payment of duty fell on tea which was already selling at less than the cost of production.

Besides the above levies, the industry has been compelled to provide many labour welfare measures. Thus, tea producers, the memorandum pointed out, were squeezed between the Government on the one hand, and the workers on the other, both demanding more money to an extent which did not apply to industry in general. In these circumstances, it added, there was no possibility of tea producers finding enough money to maintain existing fixed assets in an efficient condition, let alone building up a reserve to enable them to open new acreage. "Should the Government feel that the acreage of tea in India should be expanded," the memorandum urged, "it is the responsibility of the Government to produce an atmosphere of incentive rather than that of disincentive which now prevails." It went on to warn that, if another slump were to occur and last longer than the one in 1952, estates, both large and small, would find it impossible to meet their wage bills and would have to close down.

Alluding to the coffee industry, the U.P.A.S.I.'s memorandum submitted that finance for coffee was required in the event of the crop being poor owing to adverse seasonal conditions. The industry was in need of short-term loans to finance immediate working expenditure to cover payment of wages, and purchase of stores, tools, spraying materials and fertilisers; medium-term loans for growers to carry on after one or two adverse seasons; and long-term loans for capital improvements and extensions, such as buildings, machinery and labour quarters. As in the case of the tea industry, heavy taxation and the additional cost of implementing the provisions of labour legislations, it is stated, left no margin for the industry to build up reserves for essential capital improvements. Whatever benefit that might have accrued to the industry out of the exports had been taken away by the Government by levying an export duty of Rs. 62-8 per cwt.

The need of the rubber industry was in the nature of assistance for rehabilitation of estates long overdue. In this connection, the memorandum drew the Shroff Committee's attention to the plans prepared and submitted by the Indian Rubber Board to the Government for capital assistance and expressed the hope that these would receive favourable attention at the hands of the Government.

Now that the Plantation Labour Act of 1951 and the Industrial Dispute (Amendment) Act relating to lay-off will be brought into force from 1st April, 1954, the burden on the industry will be higher than ever before. It is, therefore, to be hoped that the Shroff Committee would recommend suitable measures to place the industry on a sound footing and help it to expand.

South Indian tea production in 1953 is estimated at 122 million lbs., or 9 million lbs. more than in 1952, which was itself a record-making year. The net shortfall of total Indian output over 1952 production is 10 million lbs. Ceylon has advanced its output to a record of 330 million lbs., but Indonesian output has dropped further by 8 million lbs. and that of African colonies by 3 million lbs.

STAND SOLIDLY BY INDIAN MERCHANT MARINE

WORLD SHIPPING TONNAGE UP

MARKED EXPANSION IN TANKER FLEET

THE world's mercantile marine has been steadily expanding. According to the 1954 edition of the *Appendix to Lloyds Register Book*, just released, the total world tonnage of shipping, as at the end of June, 1953, was 93,352,000 gross registered tonnage (G.R.T.), which is higher by 3,171,000 G.R.T. over that on 30th June, 1952. A significant feature of this expansion was the marked growth in the output of oil tankers. The world total of tankers at 21,964,000 tons gross accounted for 24 per cent. of all steamships and motorships on 30th June, 1953, as against 19,989,000 tons gross representing 22 per cent. a year before. Another important feature was the sharp decline in the mercantile marine of the U.K., Canada and Greece. The U.S. fleet also declined but only slightly. The following table shows the principal merchant fleets of the world and the increase or decline over the previous year.

Country	*Thousand tons gross*	
Great Britain and N. Ireland ...	18,584	(—40)
Canada	1,652	(—40)
Total of Commonwealth	22,356	(+29)
*U.S.A.	27,237	(—8)
Norway	6,263	(+357)
Panama	3,907	(+166)
France	3,826	(+188)
Italy	3,456	(+167)
Netherlands	3,372	(+107)
Japan	3,250	(+463)
Sweden	2,575	(+244)
Russia (U.S.S.R.)	2,292	(+32)
Germany	1,750	(+352)
Denmark	1,529	(+139)
Liberia	1,434	(+536)
Spain	1,271	(+55)
Greece	1,222	(—52)
Argentina	1,057	(+24)

N.B.—Figures within brackets show increase (+) or decrease (—) from the previous year.

* Includes U.S. reserve fleet estimated at 13 million tons gross.

Of the ships built since the last war, by far the largest amount of tonnage falls in the size group of 10,000 to 15,000 tons. Nearly 78 per cent. of all ships of this size, under ten years of age, and 90 per cent. of all ships between 15,000 and 20,000 tons under five years of age is accounted for by oil tankers. Although nearly half the aggregate tonnage of all tankers comprises ships from 10,000 to 15,000 tons, recent trends are in the direction of construction of ships of much larger tonnage than these. The principal oil tanker fleets of the world on 30th June, 1953 and the amount of increase over the previous year were as follows:

Country	*Thousand tons gross*	
Great Britain and N. Ireland ...	4,656	(+124)
U.S.A.	4,461	(+51)
Norway	3,362	(+286)
Panama	2,151	(+308)
Liberia	1,029	(+421)
France	896	(+107)
Italy	834	(+112)

The *Lloyds Appendix* also discloses that motorships represented 31 per cent. of the steam and motor tonnage owned on 30th June, 1953, as compared with 23 per cent. a year before. An analysis of the position in the principal maritime countries discloses wide variations. In Norway, motorships accounted for 79 per cent. of tonnage owned, in Sweden and Denmark 76 per cent. each, in Greece 3.9 per cent. and in the U.S. 4.4 per cent. The figure for Great Britain and Northern Ireland was 40 per cent.

Oil was used as fuel in 87 per cent. of the total steam and motor tonnage. The rest depended on coal. In striking contrast with this, coal was used as fuel in 45 per cent. of total steam and motor tonnage in 1939 and 97 per cent. in 1914. Thus, oil is steadily replacing coal as fuel for shipping.

According to Mr. R. D. Ropner, a director of the Ropner Shipping Line, nearly 40 per cent. of dry cargo ships afloat today were built between 1940 and 1945. If we were to take the average economic age of these vessels at about 15 years, the whole of this block, representing 4 million tons, would have to be replaced and this is expected to cost something like £450 million to £500 million.

Activity in shipyards other than British increased substantially in 1953. Thus, the tonnage launched increased by 669,000 tons to 3,759,000 tons or 74 per cent. of the world total, as against 70 per cent. in the previous year. The tonnage completed also rose substantially by 740,000 tons to 3,687,000 tons or 75 per cent. of the world total, as against 70 per cent. in the previous year. But there was an indication that the peak of activity there had passed. In fact, the order books of shipyards were shrinking.

As against the rapid growth of activity in non-British shipyards, the U.K. shipyards presented a somewhat discouraging picture. The U.K. yards completed only one quarter of the total world tonnage in 1953, as compared with 30 per cent. in 1952 and over 50 per cent. in the immediate post-war period, that is, before there was any revival of shipbuilding abroad. About 28 per cent. of current work in the U.K. yards continues to be for export. But, in other countries, 34 per cent. of the tonnage under construction is for registration in countries other than the country in which they are built.

Oil tankers account for 53 per cent. of the tonnage now being built in the U.K. This represents 32 per cent. of tankers being built in the world, as compared with 37 per cent. at the end of 1952 and 53 per cent. at the end of 1951.

The outlook for shipbuilding is not quite bright, although not distinctly discouraging. It is true the sellers' market is no more there. The buyers' market has come in, because of the uncertainty about world trade and general fall in freight rates. But a buyers' market is "a long way short of a depression," as one of our London contemporaries puts it.

MANUFACTURE OF CYCLES

The progress of T. I. Cycles of India, Ltd., Ambattur, manufacturing "Hercules India" bicycles, in collaboration with Tube Investments in the U.K., has been encouraging. With the formal opening of the "B" factory to produce components on 29th January, 1954, by H. H. the Rajapramukh of Mysore, the factory has embarked, in a full-fledged manner, on its career to reach the target production of one lakh bicycles. The Company is hoping to reach 80 per cent. of the target this year. The full target is expected to be reached in a couple of years. The Hercules Bicycle Company of England has lent its experienced personnel to train Indian workers in specialised processes.

It will be recalled that T. I. Cycles of India Ltd. was registered in September, 1949. The factory was opened in October 1951. The Company started marketing its bicycles in January, 1952. The Company is now making serious efforts to manufacture as many parts as possible at its factory. Working on single shift, the factory, with its machinery valued at about Rs. 50 lakhs, is designed to reach a target of 100,000 bicycles a year. In the first year of production, 33 per cent. of the target was reached. In the second year, with components partly imported and partly manufactured locally, 50 per cent. of the target was reached.

Free-wheels, chains and bottom brackets necessary for cycles are the only components imported, because it is considered economical to get them from foreign manufacturers specialising in their production on a mass scale. There are prospects of bicycle chains being manufactured in India in the near future. The other components not manufactured in this factory but got from other factories within India are tyres and tubes, tyre rims, brake and pedal rubbers, reflectors and handle-bar grips.

MATHEW S. D'SOUZA, *General Manager.*

The Ambattur factory is designed to turn out, besides 100,000 complete cycles, 50,000 sets of spare parts for meeting the requirements of Hercules cycles in use in India. The annual saving in foreign exchange by the manufacture of spare parts and other components at the factory is estimated at about Rs. 40 lakhs.

All the steel required for the factory is now imported from the U.K. It is stated that Tatas have plans for the production of the required quality of steel in sufficient quantities in about three years. When Indian steel becomes available, the cost of production will also go down.

NEW STEEL PLANT

The Production Committee of the Central Cabinet will shortly announce its decision on the recommendation of the German Experts Committee with regard to the selection of the site for the proposed State-owned steel plant. The Experts Committee of the German Combine Krupps-Demag, which will erect the steel plant in partnership with the Government of India, has recommended Roerkela in Orissa as the best site for the location of the steel plant, in preference to other competing sites, namely, Durgapur in West Bengal, Sindri in Bihar and Bilhai in Madhya Pradesh.

The factors that are said to have influenced the German consultants to recommend Roerkela are that the place is very near the source of raw materials like iron ore, limestone and power supply, which would be available in plenty after the completion of the Hirakud Project. Although coal will have to be transported from Bengal, it has been felt that this would not prove an additional strain on transport. The wagons carrying iron ore and limestone to the factories in Bengal are stated to be returning practically empty to Orissa and these could be utilised to move the coal required for the steel plant. Further, the fact that there are already steel plants in West Bengal and Bihar to supply the requirements of Calcutta industrial area seems to have also weighed heavily against the location of the site for the steel plant in these States. The German consultants were, it is stated, guided entirely by considerations of economy and speed of construction, among others, in the selection of the site.

GIANT FIRESTONE "EARTHMOVER"

The Firestone Tyre and Rubber Company of India, Ltd., has commenced the manufacture of giant "earthmover" tyres. Speaking at the Taj Mahal Hotel, Bombay, (on the 23rd ultimo), where the unveiling ceremony of the first giant "earthmover" tyre, manufactured by the Company at its plant at Sewree, was held, Mr. A. D. Wenzel, Managing Director of the Company, described the earthmover tyre as "the newest and greatest achievement—our (the Company's) contribution to the success of the Five-year Plan." He forecast large savings in foreign exchange, as the Indian-made tyres were designed to replace the imported ones.

Few can dispute the claim that the services of Firestone to India by undertaking the manufacture of giant earthmover tyres, for the success of the Five-year Plan, are significant. For large-scale engineering projects under the Plan call for earthmoving machinery of gigantic proportions and, consequently, giant pneumatic tyres upon which they roll. So far, these massive tyres have been available only from abroad, resulting in a large expenditure of foreign currency. To the extent the Company helps the country to reduce its dependence on foreign sources, it will be making a solid contribution to the economic development of India, both by way of savings in foreign exchange and by providing additional employment for India's men and materials.

RESERVES OF IRON-ORE IN INDIA

The latest Issue (Vol. VII, No. 1) of *Indian Minerals*, published by the Geological Survey of India, gives the estimated reserves of high grade iron-ore containing 60 per cent. and over of metallic iron, in India. According to Dr. M. S. Krishnan, Director of the Geological Survey of India, the author of the article, the estimates are as follows:

(In million tons)

Hematite ores	
Bihar and Orissa	8,000
C.P. (Madhya Pradesh)	3,000
Mysore	1,000
Sandur	250
Magnetite ores	
Madras	1,000
Mysore	200
Limonitic and spathic ores	
West Bengal	500

BONE-DIGESTER

The Government of India has succeeded in evolving a new type of bone-digester and is now taking steps to popularise it. This newly designed digester, manufactured by a Bombay firm, has been experimented upon at the National Physical Laboratory during the last few months. These trials have led the Government to recommend this digester for commercial utilisation. The economic advantage of this digester over that tried in 1952 is mainly due to its being bigger.

Nearly 500,000 tons of animal bones, the meal of which can be utilised as manure, are available every year in India. Alive to the necessity of conserving the existing bone resources for manurial purpose to the maximum extent, the Government of India intends to establish small-scale village industries on a decentralised basis for preparing bone-meal and availing of all its by-products, such as glue and tallow.

"Five wonderful years! Time to build, time to create. For my child it will bring health, free schooling. For my family, security . . . may be, with hard work, a home to call our own!"

Nearly a quarter of the funds of the Five Year Plan will be used in increasing, improving and widening the scope of our Social Services.

Rs. 425 crores will go to raising the standard of living of the people, training 13,000 new doctors, 20,000 new nurses and midwives. By 1956, more than 60% of all children over six years of age will be in our 2,02,142 primary schools.

This long-range planning makes manifest our faith in the future. Here, indeed, is . . .

a pledge to posterity

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

FIRE INSURANCE IN AUSTRALIA

RATES OF PREMIUM RELATIVELY HIGH

IN India, fire insurance is still largely confined to urban areas, which constitute only a fraction of this vast country. The vastness in a way reflects the extent to which there is scope for expanding the fire business in this country. But the expansion is conditioned by several factors which one has to take into consideration while framing fire insurance policies and evolving the rates applicable to rural areas. Long distances, climatic differences, predominance of primary produce, existence of grass or wooden roofed houses, lack of good storage facilities, absence of fire-fighting equipment, ignorance among the general masses regarding the benefits of insurance and the generally low standard of living hinder the progress of fire insurance business in India. There is, therefore, a need for insurers in India to find a solution for overcoming these hurdles, and in this work of theirs, they stand to be benefited by the experience gained by their confreres in Australia and New Zealand. For, in many respects, the problems faced by the fire offices in these countries are similar to those facing the insurers here, although there can be no comparison between the two in respect of income and literacy of the people. Thus, in Australia, too, as in India, distances are great, the economy is based on primary production—industrial development there dates only from World War I—and risks are, excepting in the big cities, widely scattered. These have been largely overcome by Australian insurers over a period of years. In this context, the speech delivered by Mr. C. W. R. Little, Joint General Manager, General Accident, Fire and Life Assurance Corporation, Australia, at a recent meeting of the Insurance Institute, London, makes interesting reading.

Australia did not attract immigrants on a large scale until the end of the eighteenth century, while, in New Zealand, the first batch of Europeans arrived only in 1840. From the outset, the newcomers settled on land and, therefore, the economy in both the countries is largely based even today on primary production. It is particularly so in the case of New Zealand, as the country has not developed secondary industry to any appreciable extent. But Australia with its large mineral deposits has, in the last half century, entered the industrial field. Rapid development, however, dates back, as stated already, only from the First World War, for it was only the economic dislocation caused by the war that made it necessary for Australia to set about manufacturing many articles. And today there are some 45,000 factories employing nearly one million workers, who together earn wages of over £500 million a year, and whose output is valued at £2,500 million. In New Zealand, too, there are factories engaged in the lighter trades such as clothing, footwear, foodstuffs, furniture, woollen goods, glass, rubber goods and small items of machinery and plant for use in homes and farms.

In both the countries, the first assets seeking insurance are the homes of the people. There are two million of them for the combined populations of nearly eleven million, each with its own household furniture and personal effects. The average value of these possessions for each family is greater than in the U.K., because the standard of living is higher. There is, therefore, a larger volume of premium income available from insurance of private dwellings in Australia and New Zealand than in the U.K. The premium rates charged by Australian insurance companies are also higher, because the houses are below the British standards and the companies have to contribute heavily for the upkeep of fire brigades.

Wood-frame houses are in the majority. Over 90 per cent. of the houses in New Zealand are of this type, because of the earthquake hazard, and, in Australia also wooden houses abound. As the distances are great, many risks are situated in areas remote from close settlements and in places where fire-fighting equipment and public water-supply mains do not exist. The fire underwriter has, therefore, to take into consideration rather more factors than his counterpart in the U.K. His rates are, according to a combination of (a) trade, business or occupation of the common man and particular hazards appertaining thereto, (b) materials used in building construction, (c) nearness to fire-fighting services and water-supply mains and (d) exposure to contiguous hazards, the forces of nature and the menace of bush and grass fires. On the basis of these factors, towns and places have been divided into six classifications, each having a different structure of rates.

In Australia, people are highly civilised. They have plenty of leisure, time and good incomes. They have, therefore, created for themselves all the convenience and amenities of modern life. Immense values are represented by shops and warehouses, theatres and cinemas, hotels and restaurants, banks and mercantile offices, schools, colleges and universities, hospitals, museums, and art galleries, churches and meeting halls, exhibitions and newspaper offices, public garages, billiard saloons and the like. All these seek insurances and the rates charged are relatively high.

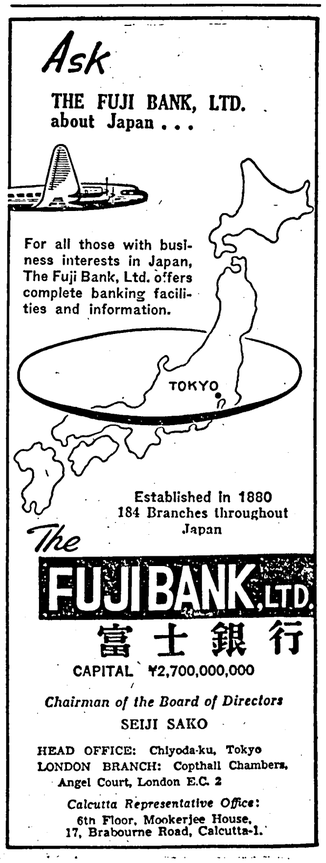
The 45,000 factories in Australia represent a capital investment in building, plant and machinery of nearly £700 million. The corresponding investment in New Zealand is about £100 million. A good volume of premium income accrues from covering these assets also.

Then there are insurances appertaining to primary production, its handling and transport. The Commonwealth of Australia produces 1,000 million lbs. of wool (or 30 per cent. of the world's total), 200 million bushels of wheat and other cereals, about 200,000 tons of butter, half a million tons of beef, 300,000 tons of mutton and lamb, 1,000,000 tons of cane sugar, and 1,500 million superficial feet of sawn timber. New Zealand, with a population (1.8 million) of less than one-fourth that of Australia, produces nearly 40 million pounds of wool, 20 million carcases of mutton and lamb, 750,000 carcases of beef, a similar number of slaughtered pigs, 150,000 tons of butter and 100,000 tons of cheese. Both the countries market their primary products in the U.K. Every capital city is adjacent to the sea or has large port facilities. Consequently, in order to store the produce, there are many wharves with storage buildings thereon. Enormous cold storage is necessary at the height of the meat killing and fruit harvest seasons. The arrivals exceed shipping space available. In like manner, wool clips have to be stored, and, in view of the continuing high values, the accumulation of risks on occasions assumes embarrassing proportions.

Between large centres such as Brisbane, Sydney, Melbourne, Adelaide and Perth, lie smaller communities varying from a few dozens to a few thousands who also require insurance service. It is uneconomic to get up branch offices in many of these settlements. So the insurance offices rely on agents for both production and service. Consequently, there has arisen an army of chief and second chief agents, local directors, sub-agents, brokers, listed persons, etc. This phenomenon has proved to be a thorny problem to Australian insurance offices; for if each of the 128 offices in the State of Victoria appoint, for instance, agents, chief agents and so on, the crowd receiving commmission and other remuneration would become unmanageable and make insurance an uneconomic proposition. Accordingly, attempts are being made to impose limits to the appointment of these agents.

Fire offices are also called upon to provide indemnities against loss caused by the forces of nature such as wind, storm, hailstorm and earthquake. The last mentioned is not a serious risk in Australia, but it is in New Zealand. Wooden buildings enjoy a lower rate of premium than buildings constructed out of bricks; for the former stand up to the stress of tremors, while the latter are liable to collapse like a house of cards. Prior to 1944, earthquake insurance in New Zealand was provided by private offices. But, since the beginning of 1945, all property insured against fire under any contract of indemnity has been deemed to be insured for the same amount against earthquake and war damage established under the provisions of the War Damage Act, 1941. Premium at the rate of 1s. per cent. per annum is collected by the offices and handed over to the Government. The offices are allowed 2½ per cent. commission towards expenses of collection. At the end of the fiscal year, 1952, the Earthquake and War Damage Fund stood at just under £9 million.

Figures relating to 1951 reveal that, in Australia, fire premiums amounted to £14,762,721, householders' comprehensive £2,347,044, sprinkler leakage £27,309, loss of profits £1,145,052 and hailstorm, £1,113,243, the total for the five classes normally handled by the fire department being thus a little short of £20 million. Income appears to have been rising in recent years at a rate of about 20 per cent., and therefore, it is assumed that the total for 1953 will be in excess of £25 million. Losses in 1951 amounted to £5.25 million, or approximately 27 per cent. of the premiums which is stated to be slightly higher than the ratio in each of the preceding five years. In New Zealand, net fire premiums in 1951 were £2,889,000, with a loss ratio of 30.7 per cent. On the basis of an increase of 10 per cent. per annum, the 1953 income may be £3.5 million or more than twice as much as that in 1946.



ISRAEL SOCIAL SECURITY SCHEME

On the 18th November the Knesset (Israel Parliament adopted the National Insurance Bill, the first instalment of a wider Social Security Plan for Israel. The full plan, inspired by the British "Beveridge Plan," was first introduced to the Constituent Assembly about four years ago, but the Bill was voided by the dissolution of the First Knesset.

The Bill now promulgated is limited only to old age pensions, workmen's compensation and maternity payments. Under the provisions of the law, a Social Insurance Institute has been created under the auspices of the Ministry of Labour to run the scheme. Residents of Israel will be entitled to old age pension at 65 years of age in the case of men, and 60 in the case of women. Non-salaried persons, however, will receive pension on reaching 70 and 65 years respectively. Every resident will enter the scheme on reaching the age of 18, and 3.3 per cent. of his earnings will be deducted for the Social Insurance Fund. Non-salaried persons will pay 2.9 per cent. of their earnings.

The contributions under the workmen's compensation section will vary from 0.5 per cent. to 3 per cent. of wages paid, according to the risk involved. This part of the scheme provides for coverage of the worker's hospital fees from two to 26 weeks of illness and for compensation in case of incapacity caused by accident.

The scheme is scheduled to start on the 1st April, 1954. It is expected that private insurers will continue to grant cover to employers in respect of their liability to workmen under the Civil Wrongs Ordinance, but a special committee at the Labour Department is studying the possibility of transferring this liability insurance to the State, in one form or another. Insurers, however, are convinced that this is entirely impracticable. At the same time, they doubt whether writing employers' liability under the Civil-Wrongs Ordinance only would continue to be a profitable class of business in future.

INDO-JAPANESE CO-OPERATION IN TRADE AND INDUSTRY

LARGE SCOPE IN BOTH SPHERES

(By P. B. ADVANI, M.Sc. Tech., M.I.E.)

AS is well known, Japan, as a result of the war, has lost its empire, that is, such territories as Korea, Monchukuo and Formosa, etc., which formed about 46 per cent. of its total pre-war area. It now comprises four major islands and numerous small islands surrounding them. It is situated in the centre of the temperate zone, with a climate which is, in many respects, much the same as that of Southern and Central Europe.

Its present population is about 85 million or about 3.6 per cent. of world's population and its area is about 0.28 per cent. of the world's total land area. Japan is a mountainous, volcanic country. The flat land constitutes about 20 per cent. of the total land area. It is a beautiful country. The Japanese are traditionally very hospitable and very courteous A traveller can spend a pleasant and enjoyable vacation in Japan in surroundings which are really picturesque and different from those in Europe or America. The best seasons for a visit are spring, that is, March to May, or again autumn, that is, September to November. There is plenty all over Japan which will interest a tourist. But it is not of tourism and sightseeing of which there is a great deal in Japan that this article is about. It is about that country's present industrial rehabilitation and possibilities of co-operation in trade and industries between it and India.

Japan is industrially the most developed country in Asia. Its industrial development is comprehensive. Going through their trade exhibitions and department stores, it is obvious at a glance that there is very little, whether of consumer articles or capital goods, that is not made in the country itself.

Post-war Development

World War II destroyed a sizable percentage of their industrial potential; where public electric supply is concerned, about 25 to 30 per cent. of the generating capacity is said to have been destroyed. Rehabilitation has taken place rapidly and is remarkable. It was specially facilitated by Korean war demands. Barring some special industries like cement, heavy chemical and coal, etc., which, in many cases, have their own power plants, most factories are run by electric power purchased from the public supply companies. The extent and rapidity of rehabilitation and extensions to manufacturing capacity will be appreciated from the fact that electrical energy generated by the various hydro and thermal plants of the public utility concerns in the year 1951 aggregated some 47.7 billion units and in 1952 some 52 billion units. The 1952 figure is about 130 per cent. of the pre-war all-time high. In other words, industrial activity is now appreciably higher than pre-war. The index of industrial production, which, when the Korean war started, stood at 80 per cent. of the pre-war level of 1934-36, rose in 1952 to 140 per cent.

The Japanese *per capita* income in 1952 in constant yens of 1934-36 basis was practically the same as in the pre-war year. It is stated to be about three times that in India. The common man in both urban and rural areas is on the whole comparatively well dressed, well shod and well nourished. This remarkable recovery has been made possible by co-operation between all the concerned authorities and the policies adopted by the Government of Japan and the Bank of Japan. The Japan Industrial Bank, a semi-Government organisation, Japan Development Bank, Long-term Credit Bank and the Export-Import Bank of Japan—these three are Government institutions—and private banks have all played their part and are still doing so in the sphere of industrial development of Japan. Private banks have advanced as much as 90 per cent. of their fixed deposits as loans to industries. Savings of people have been relatively small and hence their investment in industries has been very limited. The rates of interest have been relatively high. The industrial assets destroyed in the war could not have been so quickly recreated and extended without the bold steps taken and assistance given to industries by the Government and the aforesaid organisations.

One might consider Japan's industry under six major groups. Giving these groups the order of priority according to the number of persons employed, they are machine industry, spinning and weaving, foodstuff processing, chemical, metal, and metal products industries. The importance of the machinery industry will be appreciated from the fact that it is responsible for about 24 per cent. of all the persons employed in industry. The three allied groups, namely, machinery, metal and metal products industries account for no less than some 36 per cent. of all the persons employed in industry. In keeping with this, the productive capacity of steel is some 7 million tons, although the actual production in 1952 was about 4.6 million tons and that of aluminium was of the order of 50,000 tons.

Our own backwardness will be glaringly apparent when we note the fact that, with about four times the population of Japan, our present steel production is some 1 million tons and in 1956-57 or thereafter, when the projected extensions to the existing steel works are carried out and the new Government of India works goes into production, it will be about 1.6 million tons, against an estimated demand of 2.8 million tons in 1956-57. Electricity generated in our country in 1952 was 6.2 billion units, as against 52 billion units in Japan.

In Japan, before the war, industry and commerce were dominated and controlled by a very small number of big business houses like Mitsui Busban and Mitsubishi. In the post-war period, these were broken up by the occupation authorities into a large number of small units. One such organisation was broken up into as many as 250 concerns. Anti-monopoly law has now been relaxed and many such divided units are endeavouring to recombine and some have already succeeded in doing so. It is felt by them that this will lead to efficiency of organisation and reductions in cost of production, which latter is essential if export is to be developed. One of such recombined groups, the factories of which I visited, has some 17 factories, making electrical plant, appliances, equipment and apparatus and its President gave me to understand that their turnover, in the year ended in September, 1953, had been of the order of £30 million. This is by no means an isolated example of the strength of the new combines which are being formed.

Small-scale and Cottage Industries

In Japan, as is well known, small-scale and cottage industry has always co-existed and flourished along with very big manufacturing concerns. This continues to be so at present. Small-scale industries form a very important feature of Japan's industrial structure and contribute appreciably to the export trade in Japanese manufactures. This is illustrated by the fact that, even in the engineering industry, nearly 30 per cent. of the factories employ five to 49 persons, producing a little less than one-third of the total output. Many and varied are the articles made by the cottage and small-scale industry. I visited several. Some such concerns make even such highly specialised articles like X-ray apparatus. Many such concerns specialise in making individual parts required for an apparatus or article and these parts are assembled, and marketable articles are completed and finished in another factory. The output of many concerns, however, as may be expected, suffers from lack of uniformity in quality and high standard. To help the small-scale industry to improve its products and contribute further to foreign trade, the Japanese Chamber of Commerce and industry has recommendcd that Government should (1) create trade investigation machinery and encourage tours abroad; (2) encourage publicity; (3) bring about rationalisation of the small-scale industry and (4) stimulate promotion of co-operative system.

It is of special interest to note that, unlike our country, there is no objection on ideological or other grounds to power being used wherever it is available and it is possible to use it. While Government encourages and helps small-scale cottage industries, so far as I know, there are not any artificial restrictions imposed on large-scale industry for the specific benefit of small-scale and cottage industry.

From what has been stated above, it will be noted that the machinery industry is about the largest among the six groups mentioned. This was not so before the war. Japan now makes practically all the power plant, including very big units of 100,000 kw. each of both steam and hydro, extra high tension voltage equipment and more or less all the industrial and transportation machinery and equipment it requires for its needs.

Need for Developing Heavy Industry

The present-day development in the machinery and other industries is impressive and has been brought about, despite such adverse factors as lack of finance at reasonably low rate of interest (which may at present be as high as 11 per cent.), and lack of raw materials most of which have since the end of the war to be imported from the U.S.A., India and other non-Japanese territories.

Since the end of the war, Japan's machinery industry has become an important export industry. It has been exporting progressively large quantums of its products. In 1950, it exported machinery valued at some 70.5 million U.S. dollars, and, in 1951, the value of export orders received was some 177.5 million U.S. dollars.

All countries of Asia, including India, would be specially interested in Japan's machine and metal industries. Where India is concerned, this is specially so. We make more or less all the cloth and many other consumer goods for our needs and are looking for export markets for some of our manufactures. We want to industrialise our country rapidly and must for some time import machinery. Other Asian countries are also developing their textile and other industries. It is in the export of machinery and metal products that Japan can build up a useful export market to other Asian countries for some considerable time to come.

Japan depends at present for 87 per cent. of her essential industrial raw materials (coking coal, iron ore, crude oil, raw cotton, wool, rubber, zinc ore, industrial salt, phosphate, soya beans, bauxite, sugar). There is little prospect of lowering this percentage in future. It must also import large quantities of foodgrains as it can grow only about 80 per cent. of its needs and it is doubtful if its annual increment in production could cover the additional needs on account of increase in population each year.

Japan Must Export

It is estimated that, even if Japan does not engage in any export activities at all, there are certain minimum imports of raw materials and food which are essential for her people's sustenance. The cost of these materials, which are essential for its present population and present standard of living, is estimated at about 1.3 billion U.S. dollars. Japan must, therefore, earn at least this much of foreign exchange net, that is, after paying for raw materials needed for export industries. To be able to do this it is estimated that it must export goods at least of the value of 1,850 million U.S. dollars a year.

In 1952, the value of its exports was 1,272.9 million U.S. dollars. It is the opinion of some authorities that, for a healthy viable economy, Japan must export goods of the value of about twice this figure. In this connection, it must be borne in mind that Japan has lately enjoyed an extraordinary income of some 750 to 800 million U.S. dollars a year on account of the United Nations forces in Korea and the expenditure of U.S.A. soldiers stationed in Japan. This dollar income is a temporary one, it will start diminishing and will cease sooner or later. In 1953, for the first time since 1949, it was found that it did not cover the big export-import deficit.

Indo-Japanese trade statistics show that Japan imported from India in 1951 and 1952 goods of the value of £15.7 million and £22.96 million sterling, respectively, and exported to India in the same years goods of the value of £18 million and £14.2 million sterling. The most important items from the point of view of value exported to India were textiles, metal and metal products and machinery, and of imports from India, mostly raw materials such as iron ore, coal, cotton and salt. My visit to Japan and study of the various factors leads me to the conclusion that there is considerable scope for development in both export and import trade between India and Japan.

Since the Korean war, however, prices of many Japanese manufactures, specially several classes of machinery, have been higher than similar products of European manufacture. The Korean war boom experienced by Japan has now levelled off, freeing manufacturing capacity for exports. The Government of Japan and indus-

INDIAN SHEET GLASS INDUSTRY

CASE FOR CONTINUANCE OF PROTECTION BEING EXAMINED

NEARLY four years have elapsed since protection was granted to the Indian sheet glass industry. It was early in 1950 that the Government of India converted, on the recommendations of the Tariff Board, the then existing revenue duty of 45 per cent. *ad valorem* into an equivalent protective duty. And, thereafter, the rate of protective duty was actually raised to 47½ per cent. *ad valorem*, under the Finance Act of 1951. Protection was granted, in the first instance, only for two years ended 31st March, 1952. It was, however, subsequently extended for a further period of 21 months. As protection is due to expire at the end of the year, the industry has submitted its claim for continuance of protection and assistance. This claim was taken up by the Tariff Commission for examination early this week.

From a review of the existing position and problems of the Indian sheet glass industry, as made by Mr. M. D. Bhat, Chairman, Tariff Commission, in the course of his address while opening the public enquiry into the industry's claim, it looks as though the industry has a good case for continuance of protection. First of all, four years is not a period long enough for the stabilisation and expansion of a new and rather difficult industry like the sheet glass industry. Secondly, although opinions may vary on the question whether the industry has justified protection or not, there is no doubt that there has been some improvement in the product manufactured by the industry and, given protection for a further period, it may be in a position to raise the quality of its product. Thirdly, there is a big gap between production and installed capacity.

Installed Capacity

The estimates of installed capacity of the industry vary. The total capacity of the three factories under production, namely, the Sodepore Glass Works, Ltd., Sodepore; the Seraikella Glass Works Ltd., Kandra and the U.P. Glass Works Ltd., Bahjoi, was 15 million square feet per annum, at the time of the last enquiry by the Tariff Board. Since then, the Sodepore Glass Works have closed down their factory at Sodepore and have started another under the same name at Bhadaninagar, with an annual rated capacity of 29 million sq. feet. The other two factories have also raised their installed capacity sizably. The aggregate capacity of the three units is now estimated at 64.6 million sq. ft. per annum. There is also the new unit, the Hindustan Pilkinton Glass Works, with a capacity of 21 million sq. ft. set up at Asansol, which is expected to go into production shortly. The Development Wing of the Ministry of Commerce and Industry has, however, estimated the capacity of the four units at about 97 million sq. ft., a figure which is some 13 million square feet in excess of the aforesaid estimates. The actual output of the industry was 9.4 million sq. ft. in 1950, 11.1 million sq. ft. in 1951, 9.0 million sq. ft. in 1952 and 11.6 million sq. ft. during January-June, 1953. This discloses that only a small proportion of the installed capacity is being utilised at present.

The under-utilisation of the capacity is attributed to various reasons. They are, among others, lack of transport facilities for the movement of raw materials and finished products, shortage of coal due to allotment of inadequate quotas, supply of inferior quality coal, inadequate supplies of soda ash and heavy imports of sheet glass. The imports of sheet glass were 31.19 million sq. ft. valued at Rs. 91.27 lakhs in 1951, 15.04 million sq. ft. valued at Rs. 50.14 lakhs in 1952, and 4.31 million sq. ft. valued at Rs. 15.25 lakhs during the first eight months of 1953.

The main question before the Tariff Commission now is not whether protection should be continued but what should be the quantum of protection. This involves a comparison of the fair works prices of the indigenous product with the c.i.f. prices and the landed cost of the imported product. There is also the need to enquire into the quality of indigenous production, the selling prices and the selling arrangements made by the indigenous manufacturers of sheet glass.

On the question of quality, the consensus of opinion of importers and consumers, who have replied to the Commission's questionnaires seems to be that the indigenous sheet glass is defective and inferior to the imported one. The various defects mentioned by them are: the existence of bubbles, stones, waviness, blisters, scratches, uneven thickness, etc. It is also pointed out that there is absence of proper grading, and that, as packing is defective, there is heavy breakage in transit. These are serious complaints indeed. It is needless to emphasise that the quality of the glass manufactured is of vital importance to the future progress of the industry and it can be neglected by the industry only at its peril. Incidentally, the Commission must conduct a detailed investigation into the causes for the defects in the finished products of this industry and see whether all the factories have the right type of equipment. If the defects are the result of bad or lack of up-to-date machinery, there is, of course, no point in giving further protection to the industry.

Supply of Raw Materials

One more important question to be enquired into by the Tariff Commission relates to the supply of principal raw materials and consumable stores used by the industry. The principal raw materials required by the industry are sand, limestone, dolomite, soda ash, sodium sulphate and borax, all of which, with the exception of heavy soda ash and borax, are available in the country. Heavy soda ash is imported from British East Africa. The supply position of this ash is now stated to be easy. Meanwhile, the soda ash industry in India has planned to raise its capacity from 54,000 tons to 90,000 tons per annum by the end of 1955. As part of this expansion programme, the industry has planned to produce about 6,000 tons of heavy soda ash per year. Besides this expansion scheme, there are proposals for setting up new plants for the manufacture of soda ash, which, however, have not yet been finalised. When the various expansion schemes are implemented, the glass industry will be in a position to get all its requirements of soda ash from indigenous production. Meanwhile, it is worthwhile examining whether the industry cannot make use of the light soda ash produced in the country for at least a part of its requirements. So far as borax is concerned, it is imported principally from the U.S., although small quantities are also obtained from the U.S. and Bhutan. As its requirements of borax are very small, the industry may not perhaps have any difficulty in obtaining its full requirements of this material.

The supply position of stores has improved. A large number of refractory manufacturers have undertaken to meet the requirements of the glass industry. Recently, silliminite blocks made from raw Assam silliminite were offered to the glass industry and it is reported that they were found suitable after extensive tests carried out by Messrs. Steel Brothers, England. The views of producers regarding the suitability of these blocks based on their own experience should, however, be called for and examined.

(*Concluded from next column*)

The Textile Division Council dealt with physical characteristics of textiles, textile chemistry, cotton, yarn and cloth, jute, wool, rayon and its products, hosiery, handloom cloth, coir and coir products, textile sizing and finishing materials, textile stores and machinery and the National Flag of India.

The Building Division Council was concerned with cement, concrete, building limes, bricks and stones, flooring materials, timber and its products, builder's hardware, tar and bituminous products, application of building finishes and steel and test sieves.

The Chemical Division Council considered the problems relating to heavy chemicals, fine chemicals, coal and coke, plastics, paints and rubber, lubricants, essential oils, vegetable oils, soap, lac, paper, leather and glassware.

A notable feature relating to the establishment of standards for the items mentioned above is that all controversial or ambiguous points, arising out of the work of different committees and requiring further experimental, testing or research work, are referred to well-established and adequately equipped laboratories for investigation. The results of these investigations are incorporated before finalising the standards. It is gratifying to note that in this work, the I.S.I. has been receiving valuable help from the National Laboratories.

INDIAN STANDARDS INSTITUTION

ITS ROLE INCREASES IN IMPORTANCE

THE role of the Indian Standards Institution in providing assistance to Indian industries to ensure production of quality goods has been increasing in importance. The Institution started only six years ago. Since then, it has expanded its activities considerably. In 1947, only one Division Council was working. By the end of March, 1953, four fully constituted Councils and one section were functioning. The formation of the section referred to was almost the precursor of a new Agricultural and Food Products Division to be formed for dealing with the formulation of standards for foodgrain storage structures and a standard code of practice for the storage, handling and transport of grains. Two more sections to deal with steel and statistics were on the point of creation at the end of the fiscal year 1952-53. The Certification Marks Scheme, based on the I.S.I. (Certification Marks) Act, passed by Parliament in February, 1952 was also a new development which awaited the promulgation of the necessary Rules under the Act. The Scheme should prove a powerful instrument not only for maintaining but also improving the quality of the indigenous products and raising the general level of production in the country.

An index of the nature of the Institution's work and the increase in its activities is provided by the data given in its latest annual report covering the year 1952-53. There were, in the year, 350 active Committees and Councils working on different subjects. The membership of these bodies, selected from the various industries, consumer interests and technologists, consisted of 3,750 experts. The corresponding figures for the previous year were 300 Committees with a membership of 2,700 members. Again, during the year under review, 181 meetings of Committees and Sub-committees were held, as against 142 meetings in 1951-52. The I.S.I. published 81 new standards raising the total to 372. In addition, 19 standards were under print, and 93 draft standards had passed the committee stage of finalisation. The Institution received increased support from the various interests in the country, as witness the rise in its membership from 758 to 813. The income from subscriptions alone in 1952-53 was Rs. 2.19 lakhs which is nearly twice the figure in 1948.

Participation in Work of World Bodies

The I.S.I. participated actively in the administrative, as well as the technical, work of the International Standards Organisation and the International Electric Commission. The Director of tre I.S.I. was re-elected Vice-President of the I.S.O. for the second term of three years. The meetings of the I.S.O. Technical Committees on Lac and Mica were very helpful in arriving at decisions which would eventually lead to a final international agreement on the standards for these materials, and thus smoothen out the many difficulties in the Indian export of these commodities for which India holds almost a monopoly.

Good progress was made by the Engineering, Textile, Chemicals and Building Division Councils of the I.S.I. The standards set up by each of these Councils, being the result of the cooperative efforts of consumers, producers and technologists, should be acceptable to all concerned for voluntary adoption. Since the purchase specifications of the various Government departments are taken into consideration in the formulation of Indian standards, manufacturers should find these standards suitable for replacing their present specifications. The I.S.I. has taken up the matter of implementing Indian standards with the States and Union Governments. Its achievements in this direction, though notable, remain yet to be fully recognised by the Governments. Out of 372 published standards, the Central Government Departments have adopted only 192 and there is still a good deal of leeway to be made up with regard to the acceptance of these standards by the State Governments. The causes for the delay in the acceptance by the Governments of the standards are worth looking into by an impartial committee of private organisations.

The work of the Engineering Division Council covered a wide range of goods such as non-ferrous metals, manganese ore, electrical conductors, insulators, plant, switchgear and accessories, radio equipment, batteries, refractories, sports goods, bicycles, parts and accessories, internal combustion engines, oil-burning domestic appliances and hand tools.

W. H. BRADY AND COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE Forty-first Ordinary General Meeting of the Company will be held at the Registered Office of the Company, Royal Insurance Buildings, Veer Nariman Road, Bombay, on Monday the 1st day of March, 1954, at 11-30 a.m. (S.T.), to transact the following business:

1. To receive and adopt the Directors' Report and Audited Statements of Accounts for the year ended 31st December, 1953.
2. To sanction the payment of a Dividend.
3. Messrs. R. S. Smith and E. F. Morrey, Whole-time Service Directors and Technical Advisers, retire, and being eligible offer themselves for re-election.
4. To appoint Auditors for the ensuing year and to fix their remuneration.

The Transfer Books of the Company will be closed from Friday the 19th February to Thursday the 11th March, 1954, both days inclusive.

By Order of the Board,
JOSEPH KAY,
Managing Director.

BOMBAY, 5th *February*, 1954.

To the Shareholders of W. H. Brady & Company, Ltd., and in particular to:—

W. J. Pearce, F. W. Bennetts, Mrs. A. A. Dickinson, Mrs. O. M. Sharpe, T. W. Beneetts, Mrs. L. B. Postlethwaite, Mrs. I. C. Foxley, Mrs. J. A. Shelton, Warren H. Brady, Mrs. E. O. Cock, Mrs. M. M. Katgara, Sir A. G. Gray, A. V. Crowle, S. J. Crowle, Mrs. B. J. Peek, Mrs. Margaret Vernon, F. W. Reddaway.

THE EMPIRE DYEING AND MANUFACTURING CO., LTD.

NOTICE IS HEREBY GIVEN THAT THE Fifty-fourth Ordinary General Meeting of the Shareholders of THE EMPIRE DYEING AND MANUFACTURING COMPANY, LIMITED, will be held at the Registered Office of the Company, Royal Insurance Buildings, 12/14, Veer Nariman Road, Fort, Bombay, on Monday the 1st day of March, 1954, at 12-15 p.m. (S.T.), to transact the following business:—

(1) To receive and adopt the Directors' Report and Audited Accounts for the year ended 31st December, 1953.

(2) To sanction the declaration of a Dividend.

(3) To confirm the appointment of Mr. Maneklal Premchand as a Director of the Company.

(4) To appoint Directors in place of Mr. Tansukhrai M. Karundia and Mr. J. Symon, who retire by rotation in accordance with Article 135 of the Articles of Association, but are eligible for re-election.

(5) To appoint Auditors for the current year and fix their remuneration.

The Transfer Books of the Company will be closed from Friday the 19th February, to Thursday the 11th March, 1954, both days inclusive.

By Order of the Board,
W. H. BRADY & Co., LTD.,

THE PHALTAN SUGAR WORKS LTD. SAKHARWADI, DISTRICT SATARA NORTH

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the shareholders of the Company will be held at the Registered Office of the Company at Sakharwadi, District Satara North on Saturday, 27th February, 1954, at 3 p.m. (S.T.), when the undermentioned resolution will be proposed as a Special Resolution.

RESOLUTION

"That the Articles of Association be amended in the manner following:—

(1) Article 2. Definition of "The Indian Companies Act 1913" the portions "as applied in the Phaltan State and" and the words "British India" wherever they occur shall mean Phaltan State unless the context shows otherwise, be deleted.

(2) Add the following to the Article 30:

"No renewal fee shall be charged except when a certificate is torn through, defaced, destroyed or lost."

(3) Article 42, 1st line. For the word "befought" the word "brought" be substituted.

(4) Article 46, 2nd line. For the words "be applied the satisfaction of such towards in or debts" the words "shall be applied in or towards the satisfaction of the debts" be substituted.

(5) Article 48, 6th line. For the word "purchaser" the word "purchase" be substituted.

(6) Article 59, 1st line. The word "shall" be inserted between the words "share" and "be".

(7) Article 79, 5th line. For the word "adequate" the word "aliquot" be substituted.

(8) Article 101, 3rd line. For the word "or" the word "on" be substituted.

(9) Article 114. Delete words beginning with "if in the form" up to "by the letter (b)".

(10) Article 121, 3rd and 4th lines. Delete the portion "that any person . . . a Director of the Company".

(11) Article 127, 4th line. Delete words "either" and "otherwise."

5th line. Insert the word "in" between the words "either" and "addition".

7th line. Substitute word "incurred" for the word "occurred".

(12) Article 130, 6th line. After the word "but" the word "it" be inserted.

(13) Article 138, 3rd line. The word "and" be deleted.

(14) Article 146, 5th line. For the word "confirm" the word "conform" be substituted.

(15) Article 152, (16) 2nd line. After the words "Managing Agents" the word "by" be inserted.

(16) Article 156 (*a*), 6th line. For the word "convened" the word "concerned" be substituted.

(17) Article 172, 4th line. For the word "distributor" the word "distribution" be substituted.

30th line. The word "or" occurring after the word "partly" be deleted.

31st line. The word "or" be added after the word "paid".

32nd line. For the word "or" the words "and partly" be substituted.

33rd line. For the word "filled" the word "filed" be substituted.

(18) Article 179, 7th line. For the word "one" the word "are" be substituted.

(19) Article 183 (1). The words "Phaltan State" be omitted and the words "Government of Bombay" be inserted therefor.

(20) Article 185, 4th line. The word "and" occurring after the word "Company" be deleted.

(21) Article 188, 1st line. For the word "or" the word "of" be substituted.

(22) Article 196, 7th line. The word "in" be inserted after the word "him".

(23) Article 200, 3rd line. The word "as" occurring after the word "distributed" be deleted and the word "so" be substituted therefor.

(24) Article 201, 4th line para (2). The word "of" occurring after the word "case" be deleted."

By Order of the Board of Directors,
For MAFATLAL, APTE & KANTILAL LTD.,
L. V. APTE,
Managing Director,
Managing Agents.

Dated 1st February, 1954.

BURN AND COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the members of the abovenamed Company will be held at the Registered Office of the Company, 12, Mission Row, Calcutta, on Monday the 1st day of March, 1954, at 11 a.m., to consider and if thought fit to pass, with or without modification, the following resolutions, namely:—

1. (*As an Extraordinary Resolution.*)—That the Authorised Capital of the Company be increased from Rs. 70,00,000 to Rs. 1,20,00,000 by the creation of 50,000 Ordinary Shares of Rs. 100 each.

2. (*As a Special Resolution.*)—That the Articles of Association of the Company be altered in manner following:—

In Article 4, the words "at the date of adoption of these articles" shall be deleted and in the same article the figures "70,00,000" and "42,000" shall be deleted and the figures "1,20,00,000" and "92,000" substituted therefor respectively.

3. (*a*) That it is desirable to capitalise a sum of Rs. 42,00,000 being part of the undivided profits of the Company standing at the credit of the General Reserves and accordingly that the said sum of Rs. 42,00,000 be capitalised and that this amount be used as a capital bonus which shall be applied on behalf of the persons who are on the 1st day of March, 1954, holders of the 42,000 issued Ordinary Shares of Rs. 100 each in payment in full for 42,000 new Ordinary Shares of Rs. 100 each and that such 42,000 new Ordinary Shares credited as fully paid, shall be accordingly allotted to such persons respectively in the proportion of one new Ordinary Share for every issued Ordinary Share held on the 1st day of March, 1954, by such persons respectively and that the said new Ordinary Shares so distributed shall rank in all respects *pari passu* with the existing Ordinary Shares save and except that they will not participate in dividends declared in respect of any period ending on or before 30th April, 1953, and shall also be treated for all purposes as an increase of the nominal amount of the capital of the Company held by each such Ordinary Shareholder and not as income.

(*b*) That pursuant to the above resolution and in satisfaction of the said special capital bonus the Directors be and they are hereby directed to allot and distribute 42,000 new Ordinary Shares credited as fully paid up amongst the persons who are on the 1st day of March, 1954, holders of the 42,000 issued Ordinary Shares of the Company in proportion to the issued Ordinary Shares held by them.

(*c*) That the draft of the Agreement providing for the allotment of the said new Ordinary Shares in satisfaction of the said capital bonus submitted to this Meeting and signed in the margin by the Chairman thereof by way of identification be and the same is hereby approved and that the Directors be authorised to affix the Seal of the Company to duplicate engrossments of such Agreement as and when the same shall have been signed on behalf of the members holding Ordinary Shares in the Company on the 1st day of March, 1954, by some persons to be appointed by the Directors in that behalf under Article 168 of the Articles of Association of the Company.

The Share Registers of the Company will be closed from 19th February, 1954, to 1st March, 1954, inclusive.

By Order of the Board,
MARTIN BURN LTD.,
Managing Agents.

CALCUTTA, 30*th January*, 1954.

THE MYSORE SPINNING AND MANUFACTURING COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of The Mysore Spinning and Manufacturing Company, Ltd. will be held at the Registered Office of the Company, 70, Forbes Street, Fort, Bombay, on the Twenty-fifth day of February, 1954, at 4.00 p.m. (S.T.), when the subjoined resolutions will be proposed:—

(1) *As a Special Resolution* :—

That Article 102 of the Company's Articles of Association be altered by substituting the words "One Hundred" in place of the word "Fifty" in line 2 of that Article.

(2) *As an Ordinary Resolution* :—

That it is desirable to capitalise a sum of Rs. 4,96,700 being part of the undistributed profits of the Company standing to the credit of the Reserve Fund and accordingly that the said sum of Rs. 4,96,700 out of that Fund be capitalised and distributed amongst the holders of Ordinary Shares on the footing that they become entitled thereto as Capital in pursuance of Article 149 of the Articles of Association of the Company and that the said Capital sum be applied on behalf of the persons who on the 15th day of March, 1954, are the holders of 39,736 Ordinary Shares of the Company of Rs. 50 each in payment in full for 9,934 Ordinary Shares of the Company of Rs. 50 each and that such 9,934 Ordinary Shares credited as fully paid-up be accordingly allotted to such persons respectively in the proportion of one such new Ordinary Share for every four Ordinary Shares then held by such persons respectively and that the shares so distributed shall be treated for all purposes as an increase of the nominal Capital of the Company held by each shareholder and not as income and that such new shares shall rank *pari passu* with the existing shares of the Company and for all dividends declared after the 1st day of March 1954 and that the Company shall complete and have ready for delivery the certificates in respect of the said issue of 9,934 Ordinary Shares within six months from the allotment.

The Transfer Books of the Company will be closed from 4th February, 1954, to 13th February, 1954 (both days inclusive). If the abovementioned Ordinary Resolution for capitalisation of a part of the Reserve Fund is passed by the Company in General Meeting, the Transfer Books of the Company will again be closed from 11th March, 1954, to 15th March, 1954 (both days inclusive), for the purpose of giving effect to the scheme of capitalisation.

By Order of the Board,
N. SIRUR & COMPANY, LTD.,
Managing Agents,
V. N. CHANDAVARKAR,
Managing Director.

BOMBAY, 22*nd January*, 1954.

N.B.—The holders of 4½ per cent. Cumulative Preference Shares of the Company have no right to be present or to vote either in person or by proxy in respect of their holdings of such Preference Shares at the above Extraordinary General Meeting.

(The consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinion expressed with regard to them.)

SCINDIA STEAM NAVIGATION'S EARNINGS SLIGHTLY LOWER

DIVIDEND, HOWEVER, RAISED

THE welcome return to the dividend list by the Scindia Steam Navigation Company, Ltd., last year—after a break of three years—as a result of the striking improvement in its earnings during the year ended 30th June, 1952, has been followed up with an enhancement in the return to the shareholders from As. 8 to As. 12 per share (of Rs. 15 each) for the year ended 30th June, 1953. This does not mean that the year under review was more prosperous than the previous one in terms of earnings and profit. On the other hand, the gross profit for the year under review has recorded a slight fall. After providing a substantially higher sum for depreciation, at Rs. 93.64 lakhs (as against Rs. 72.68 lakhs), Rs. 10 lakhs (Rs. 10 lakhs) for debenture sinking fund and setting aside Rs. 60 lakhs (*nil*) for deferred taxation reserve, the net profit works out to no more than Rs. 58.08 lakhs, a drop of as much as Rs. 85.02 lakhs from the corresponding figure of Rs. 143.10 lakhs for 1951-52. It must, however, be said, in fairness, that the results of working during the year under review are not strictly comparable with those for the previous year, inasmuch as the previous year's results included those of the Vizag Shipyard for a period of eight months; this year, there has been no account about the Hindustan Shipyard. Again, while the results of the year under review include those of the Bombay Steam Navigation Company, Limited, those for 1951-52 did not, as it was only in the year under review that this latter Company was absorbed.

Nonetheless, an increase in the dividend this year has been possible, because there has been no loss to be written off from the year's profit, as in the previous year. Last year, it may be remembered, the Directors had to wipe out such a huge deficit as Rs. 89.05 lakhs brought in from the preceding year and, in addition, to write off a loss of Rs. 41.02 lakhs on the sale of the Company's shipyard at Vizag. However, to some extent, this had been offset by writing back a sum of Rs. 10.55 lakhs, being the provision for taxation no longer required. Whatever that may be, the net surplus for appropriation this year, at Rs. 59.66 lakhs, compares favourably with that of Rs. 23.58 lakhs last year.

The following comparative table presents the salient features of the year's results, as compared with those for the previous three years, from which an approximate idea of the Company's progress since 1949-50 can be had:

(In lakhs of rupees)

	For the year ended 30th June			
	1953	1952	1951	1950
Freight and passage money	1,141.74	934.07	756.00	607.44
Other income	107.81	130.88	185.18	72.93
Expenses	1,007.25	823.67	855.69	733.85
Gross profit	242.29	242.79	88.03	29.18
Agents' commission	20.57	17.01	8.80	2.38
Provision for depreciation	93.64	72.68	64.47	55.54
Deferred taxation reserve	60.00	..	..	..
Debenture sinking fund	10.00	10.00	10.00	10.00
Net profit (+) or loss (—)	+58.08	+143.10	+4.75	—38.73
Provision for taxation written back	..	10.55	..	..
Loss on sale of shipyard written off	..	41.02	..	..
Fleet replacement account	10.00	..	..	..
Dividend equalisation fund	..	..	..	..
Dividend	11.75 (6%)	.. (3½%)	..	..
Carry forward	35.18 +2.74	22.00 +1.58	—89.05	—93.80

N.B.—Expenses include the amounts transferred to capital account which are: *Nil*, Rs. 1.52 lakhs, Rs. 2.54 lakhs and Rs. 82.60 akhs for the years 1952-53, 1951-52, 1950-51 and 1949-50, respectively.

The rise of Rs. 207.67 lakhs in freight and passage money in the year under review has been due to the larger earnings of the B.S.N. Co., Ltd., from its workshop and increased passenger traffic due to the Exposition Pilgrimage to Mormugao. The earnings on cargo traffic, however, have been considerably lower, due to substantial decline in the freight rates on bulk cargo. The Company's fleet is stated to have been generally adequately employed during the year. If this is not reflected in the results of the year, it is mainly due to the decline in cargo rates referred to above. The comparative figures (excluding those of the B.S.N. Co.) for total cargo lifted and freight earned for the last two years are as follows:

		1952-53	1951-52
Cargo lifted	...	Tons 1,880,240	1,722,550
Freight earned	...	Rs. 8,92,85,841	8,73,81,562

The operating costs are reported to have been more or less steady, having regard to the voyaging done during the year, except for a small increase in the rates of fuel oil and wages for the floating staff.

Under the provisions of the Indian Income-tax Act, the Company is allowed additional depreciation, in the nature of initial and double normal depreciation, in respect of new ships purchased by it. The Company's liability for income-tax with regard to the profit is thereby deferred at present. However, the Directors have thought prudent to provide for this liability when the going is good. The liability so deferred in respect of the profit for the year under review is estimated at Rs. 60 lakhs and this sum has, accordingly, been transferred to the deferred taxation reserve. It must, however, be mentioned here that no such provision was made in respect of previous years.

In addition to the small increase in dividend for the year under review, the shareholders of the Company will soon be benefited by way of capital appreciation of their holdings, when the Directors' proposal to capitalise the sum of Rs. 2.35 crores, being part of the amount standing to the credit of the premium on shares account, is approved by the Government. If this move materialises, the paid-up value of the shares will be written up from Rs. 15 to Rs. 20 each. The Directors have decided upon this capitalisation, because, in their opinion, the paid-up capital of the Company is small *vis-a-vis* the total funds employed in the business and the time is opportune to "rearrange" the capital structure. An important point to be noted here is that the bonus scheme will not result in any increase in the number of the Company's shares.

The following synopsis of the Company's balance-sheet as on 30th June, 1953, reflects its financial position:

Liabilities	Rs.	Assets	Rs.
Capital	7,04,60,608	Gross block	17,21,48,094
Reserves and surplus	8,63,17,341	*Less*—Depreciation	3,71,00,000
Debentures	4,57,24,373	Net block	13,50,48,094
Deferred taxation reserve	82,00,000	Stores and spares	54,01,137
Liabilities	5,95,57,927	Work-in-progress	5,31,466
		Investments	6,09,86,600
		Debenture trustees' account	1,59,06,620
		Debts, deposits and advances	2,41,68,357
		Cash	2,62,56,288
		Debenture issue expenses	19,61,687
	Rs. 27,02,60,249		Rs. 27,02,60,249

The Company's capital is higher by Rs. 44.86 lakhs due to addition of 2,99,046 shares of Rs. 15 each issued to the shareholders of the B.S.N. Co., Ltd., pursuant to the scheme of amalgamation. The Company's reserves and surplus stand strengthened by Rs. 175.59 lakhs over the year, of which (1) capital reserve represents Rs. 137.64 lakhs being the difference between the cost of the assets of the B.S.N. Co. taken over and the cost of shares of the B.S.N. Co. held by the Company, (2) fleet replacement reserve accounts for an increase of Rs. 29.22 lakhs, made up of Rs. 19.17 lakhs being the income-tax refunds received during the year, Rs. 5,185 being the surplus on sale of the Company's property at Gopalpur and Rs. 10 lakhs being transfer from the profit for the year, (3) annual and special survey reserve for Rs. 3.43 lakhs being the amounted transferred to the debit of repairs account, (4) investment reserve fund for Rs. 1.88 lakhs being the difference between the cost and the redemption value of part of the Company's debentures representing the sinking fund investments redeemed during the year and the profit on other investments realised during the year and (5) staff amelioration fund for Rs. 1.25 lakhs being the amount transferred from the B.S.N. Co. under the scheme of amalgamation. There has been a decline of Rs. 50.49 lakhs in the debenture loans, on account of the redemption of debentures of the value of Rs. 49.65 lakhs. The current liabilities show an increase of Rs. 2.13 crores, mainly due to the taking over of the B.S.N. Company's debenture holders. There has been an addition of Rs. 4.73 crores to the value of the gross block, of which Rs. 2.41 crores represent assets taken over from the B.S.N. Co. Investments show a rise of Rs. 2.33 crores and debenture trustees' account Rs. 76.67 lakhs, while debts, deposits and advances account for a decline of Rs. 2.58 crores mainly due to the repayment of Rs. 2.72 crores being the dues from the Hindustan Shipyard.

KHARDAH JUTE CUTS DIVIDEND

PROFIT DROPS BY NEARLY 50 PER CENT.

AFTER staging an improvement during three successive half-years, the earnings of the Khardah Company, Ltd. (Managing Agents: Messrs. Anderson Wright Ltd., Calcutta), for the half-year ended 31st March, 1953, have suffered a setback. The gross profit, which had risen from Rs. 9.91 lakhs for the half-year ended 31st March, 1951, to Rs. 22.53 lakhs for the six months ended 30th September, 1952, has dropped to Rs. 11.56 lakhs for the half-year under review. As compared with the results for the previous half-year, the profit for the half-year under review represents a decline of 48.7 per cent. In fact, barring the earnings for the six months ended 31st March, 1951, it is the lowest in the last three years. In tune with the decline in profit, the dividend on the ordinary shares has been reduced to 20 per cent. per annum from 30 per cent. per annum paid for the previous half-year, to which level it had been raised from 12 per cent. per annum for the half-year ended 30th September, 1951.

The following comparative table, giving the salient features of the Company's results for the last four half-years, brings out clearly its progress in recent times:

(In lakhs of rupees)

	Half-year ended			
	31-3-1953	30-9-1952	31-3-1952	30-9-1951
Sale proceeds	137.31	192.42	261.45	232.78
Manufacturing expenses	84.08	124.48	196.93	181.84
Other expenses	42.93	43.45	46.91	37.90
Gross profit	11.56	22.53	17.87	13.59
Managing Agents' remuneration	1.35	2.47	2.00	1.87
Depreciation	1.50	1.50	1.50	1.50
Taxation	3.80	8.25	5.80	5.76
Net profit	4.91	10.31	8.58	4.41
E.P.T. refund	..	5.33	..	..
To reserves	0.18	5.33	3.00	2.32
Dividends—				
6% preference	0.27	0.27	0.27	0.27
Ordinary	5.40 (20% p.a.)	8.10 (30% p.a.)	5.40 (20% p.a.)	5.24 (12½% p.a.)
Carry forward	8.07	6.01	2.06	1.90

The foregoing table indicates that the period under review was not one of smooth sailing for the Company, as was the case with all other jute mills in India. Describing the trading conditions that prevailed during the half-year under review, the Directors observe, in their report to the shareholders, as follows:

"In the period under review, prices of both raw jute and manufactured goods advanced during the first two months, but subsequently there was a steep decline in both sections, with rates registering the lowest points. In consequence, it was difficult to maintain the previous half-year's working results. While stocks of hessian had diminished, those of sacking continued to increase substantially and mills had perforce to sell heavy goods at a loss. These adverse market conditions were mainly responsible for the low working profits during the half-year under review."

The Directors have welcomed the cut in export duty on hessian from Rs. 275 to Rs. 120 per ton, announced in September, 1953. They say that this concession has helped to promote a better demand from consuming markets and has imparted a fair degree of stability to local prices. This will be reflected in the Company's results for the half-year ending 31st March, 1954.

It will be noted from the foregoing table that the net profit, at Rs. 4.91 lakhs, shows a decline of Rs. 5.40 lakhs from that for the previous half-year. After transferring Rs. 18,000 to provision for doubtful debts, the profit available for distribution does not permit of paying a dividend at the rate of 20 per cent. per annum. However, the large surplus of Rs. 4.01 lakhs brought in from the previous half-year has come in handy and the Directors have proposed to utilise a part of this surplus to pay the above dividend.

The Company's financial position, as seen from its latest balance-sheet, is satisfactory. As against a paid-up capital of Rs. 63 lakhs, the reserves and surplus stand at Rs. 25.90 lakhs. The provisions for taxation amounts to Rs. 23.33 lakhs. The gross block of the value of Rs. 161.13 lakhs has been well written down to Rs. 51.60 lakhs. The current assets, at Rs. 90.37 lakhs, more than adequately cover the current liabilities, aggregating Rs. 55.74 lakhs, and the provision for taxation.

The Company's Rs. 100 paid-up ordinary shares are currently being quoted at Rs. 188, at which rate and on the basis of the latest dividend the yield works out to 10.6 per cent. per annum, free of tax.

Points From The Chair

Britain's Economy Still Cause for Concern

"SUMMARISING my analysis of the post-war period, I cannot escape the conclusion that our position must still occasion grave concern. It is true that the acute peril of two years ago has been surmounted. The immediate threat to the stability of the pound sterling has receded. We have a breathing space gained by our own efforts, with the help of some good fortune. But before we can face the future with confidence, two things are necessary, both of them dependent upon an adequate supply of savings. First, we need a great increase in the volume of productive investment at home, for we cannot hope to hold our position in world markets unless the rate of modernisation of our industrial equipment at least keeps pace with that of our competitors. Secondly, our overseas earnings must somehow be increased until these are sufficient not merely to pay for our food and raw materials in a good year but to leave a substantial surplus year in year out."

LORD BALFOUR OF BURLEIGH,
Lloyds Bank Ltd.

Government Should Economise

"An aspect of this question which is fundamentally unsatisfactory is that there is no inescapable pressure on any Government to economise, in the sense that a Board of Directors or a private individual has to economise. If it is prepared to forget that there will be a day of reckoning, there is in the last resort no limit to the amount of money that a Government can raise internally by taxation, or failing that by inflation. And every item of economy which may be proposed involves inconvenience, or perhaps even hardship to somebody; . . . A specious case can be made out for a reprieve in each separate instance, and there are always people with vested interests who will resist any divesting economy. No one likes, for example, to have the number of men under his command reduced. That applies even to bank managers, who have to find the salaries of their staff, if not out of their own pockets, at any rate out of their branch profits; how much more to Government servants, whose salaries fall like manna from heaven and who never have to sully their thoughts with base considerations of profit and loss."

ANTHONY WILLIAM TUKE,
Barclays Bank Ltd.

Domestic Finances Should be Set in Order

"The freeing of commodity markets promises once more to restore London's supremacy in this field, with the trading profits that result. The reopening of free markets enables the holder of sterling to acquire almost any commodity here at the lowest world price. As a result, there has been a satisfactory increase in the demand for sterling and a consequent improvement in the rate not only for free sterling but for the various categories of switch and securities sterling. All this is to the good and it may be hoped that we may soon see the abrogation of the remaining restrictions on sterling transferability, which only harm our credit and hamper our export trade. It should be borne in mind, however, that the freeing of the commodity markets entails most of the risks and strains on our exchange, without all of the advantages, that would follow the restoration of full convertibility; and accordingly, whichever course we adopt, it is necessary to set our domestic finances in good order."

DAVID JOHN ROBERTS,
National Provincial Bank Ltd.

Home Market Should be Revitalised

"For so highly industrialised a country as ours there should be no doubts about the need for expansion and development. The revitalised home market is but another step towards the desired end and a move which, with the re-created monetary and price mechanisms, should make our economy more flexible and, therefore, more efficient. The need for efficiency is a continuing one in industry and especially so just now when discovery and invention are proceeding rapidly in so many fields. Indeed, it is impossible to over-estimate the importance of efficiency at the present juncture when, in the interests of the nation at large, production has to cope with an active domestic trade and make a bid for exports at one and the same time—a time moreover when no day passes without reports of mounting competition in world markets."

SIR THOMAS D. BARLOW,
District Bank Ltd.

Acquisition of Modernised Plants

"Export of manufactured goods still remaining a vital question for our country, and with an obvious keen desire on the part of the Board of Trade to give all possible assistance to manufacturing exporters, I would suggest that one of the most effective ways of doing so would be to give more favourable consideration than our experience tells us to be the case to applications for the acquisition of modernised plant, even though payment for this be in dollar currency. 'Give us the tools and we will finish the job,' still rings in our ears and is equally as true in peace-time as in war."

DESMOND TUCK,
Raphael Tuck & Sons, Ltd.

COMPANY MEETINGS AND DIVIDENDS

GANGES MANUFACTURING CO., LTD. Half-yearly General Meeting, Calcutta, 10th February, 1954. Dividend: *Nil*. Transfer books remain closed from 4th to 10th February, 1954, both days inclusive.

NUDDEA MILLS CO., LTD. Half-yearly General Meeting, Calcutta, 10th February, 1954. Dividend: As. 8 per share. Transfer books remain closed from 28th January to 10th February, 1954, both days inclusive.

GOUREPORE CO., LTD. Half-yearly General Meeting, Calcutta, 10th February, 1954. Dividend: Rs. 3-12 per share. Transfer books remain closed from 28th January to 10th February, 1954, both days inclusive.

RALLIS INDIA LIMITED

NOTICE OF MEETING

NOTICE IS HEREBY GIVEN THAT THE Fifth Ordinary General Meeting of the Shareholders of the above Company will be held at the Registered Office, No. 16, Hare Street, Calcutta, on Tuesday the 23rd February, 1954, at 3.30 o'clock in the afternoon, for the following purposes:—

(1) To receive and adopt the Directors' Report and the Audited Accounts for the year ended 31st August, 1953, and the Balance Sheet as at that date.

(2) To elect Directors.

(3) To appoint Auditors and to fix their remuneration.

(4) To transact such other competent business as may be brought before the meeting.

The Share Transfer Books of the Company will be closed from 15th February, 1954, to 23rd February, 1954, both days inclusive.

By Order of the Board,
KENNETH SHEPPARD,
Secretary.

16, HARE STREET,
CALCUTTA, *28th January*, 1954.

THE PHALTAN SUGAR WORKS LIMITED
SAKHARWADI

NOTICE

Under Section 289-B of the Indian Companies Act, 1913.

To,

THE MEMBERS OF
THE PHALTAN SUGAR WORKS LIMITED

NOTICE IS HEREBY GIVEN IN PURsuance of Section 87-BB of the Indian Companies Act, application will be made to the Central Government for their approval to

A change in the constitution of Messrs. Mafatlal, Apte and Kantilal Ltd., Managing Agents of the Company, by reason of change in the registered ownership of shares in that Company as indicated below.

Out of the 80 shares of Messrs. Mafatlal, Apte and Kantilal Ltd., standing in the names of late V. S. Apte and late Sau. Yamunabai Apte, 40 shares are to be transferred to Mrs. Manoramabai Apte, 20 shares to Mr. Madhav Laxman Apte and 20 shares to Mr. Arvind Laxman Apte.

Dated, 1st February, 1954.

For THE PHALTAN SUGAR WORKS LTD.,
K. G. APTE,
General Manager.

HERCULES INSURANCE CO., LTD.
16, Hare Street, CALCUTTA

NOTICE

THE DIRECTORS AT THEIR MEETING held on the 25th January, 1954, decided to recommend to the Shareholders, subject to the approval of the Central Government, to capitalise Rs. 12,00,000 out of the amount standing to the credit of the General Reserve by issuing Bonus shares in the proportion of one share for each existing share with right to participate in any dividend that may be declared in respect of any year ending after 31st December, 1953.

By Order of the Board,
G. RAMABADRAN,
Secretary.

RESULTS OF SOME BIRD GROUP JUTE COMPANIES

PURTABPORE SUGAR REPEATS DIVIDEND

Dalhousie Jute Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. Bird & Co., Ltd., *Calcutta*) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 60,000 (*nil*) for reserve for taxation contingencies and Rs. 83,051 (Rs. 27,876) for depreciation, the profit and loss account shows a profit of Rs. 3,49,351 (loss of Rs. 2,00,498) to which is to be added the amount brought forward from previous half-year Rs. 8,357 (Rs. 80,807) making a total of Rs. 3,57,708 (loss of Rs. 1,19,691), from this the directors have transferred to general reserve Rs. 1,25,000 (*nil*) and to jute stock reserve Rs. 50,000 (*nil*) leaving an available balance of Rs. 1,82,708 (Rs. 1,05,309 after transferring Rs. 1,00,000 from dividend equalisation reserve and Rs. 1,25,000 from general reserve).

The directors propose to dispose of this in paying a dividend on the preference shares at the rate of 7 per cent. per annum, without any deduction for income-tax paid by the Company Rs. 52,500 (Rs. 52,500) in paying a dividend on the ordinary shares of Rs. 3 (Re. 1) per share, without any deduction for income-tax paid by the Company Rs. 94,374 (Rs. 31,453) and in carrying forward Rs. 33,834 (Rs.,21,356).

Stocks of jute have been valued at under cost and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act, 1946, and the Working Time Agreement of the Indian Jute Mills' Association, the Mill worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the Mill was maintained at full strength throughout the period under review.

The electrification of the Mill has now been fully completed. Plans for the modernisation of the Mill section of the Mill are at present under consideration and a final decision will be made in the near future after detailed proposals have been approved by the Directors.

During the period under review trading conditions continued to be difficult owing to the disparity between the prices of raw jute and those of manufactures, particularly sacking, the price of which remained unremunerative throughout the period due to overproduction and lack of demand. Hessians, however, remained in good demand mainly on account of substantial buying by the Argentine with moderate demand from other hessian consuming countries. The Government of India, reduced on 14th September, 1953, the duty on hessian goods from Rs. 275 per ton to Rs. 120 per ton.

Although the industry's output of sacking has now been adjusted to the lower demand and stocks have decreased during recent months, overseas interest remains disappointing and prices are still unremunerative.

A Jute Enquiry Commission has been set up by the Government to enquire into a wide range of subjects affecting the industry including speculation in both raw jute and jute goods.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	46,49,200	Block ...	67,09,185

		Cash ...	79,615
	Rs. 1,25,72,419		Rs. 1,25,72,419

Northbrook Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bird & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 39,000 (*nil*) for taxation, Rs. 67,000 (Rs. 67,000) for reserve for taxation contingencies and Rs. 1,84,332 (Rs. 2,08,794) for depreciation, the profit and loss account shows a profit of Rs. 2,34,509 (loss of Rs. 18,193) to which is to be added the amount brought forward from previous half-year Rs. 30,203 (Rs. 75,380) making a total of Rs. 2,64,712 (Rs. 57,187) from this sum, the directors have transferred to general reserve Rs. 1,00,000 (*nil*) leaving an available balance of Rs. 1,64,712 (Rs. 89,187 after writing back Rs. 32,000 being the provision against contingent loss on forward jute purchases no longer required).

The directors propose to dispose of this in paying a dividend on the preference shares at the rate of 5½ per cent. per annum, without any deduction for income-tax paid by the Company Rs. 41,250 (Rs. 41,250) in paying a dividend on the ordinary shares of As. 8 (As. 4) per share, without any deduction for income-tax paid by the Company Rs. 83,968 (Rs. 41,983) and in carrying forward Rs. 39,494 (Rs. 5,954).

Stocks of jute have been valued at under cost and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act 1946, and the Working Time Agreement of the Indian Jute Mills' Association, the Mill worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the Mill was maintained at full strength throughout the period under review.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	31,79,880	Block ...	66,93,415
Reserves ...	48,96,093	Stock-in-trade	27,40,742
Debentures ...	20,00,000	Stores, spares, etc. ...	7,76,574
Provision for taxation ...	39,000	Debts, deposits and advances ...	7,25,075
Liabilities ...	11,54,114	Investments	3,17,803
Profit and loss account ...	39,494	Cash ...	54,972
	Rs. 1,13,08,581		Rs. 1,13,08,581

Standard Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bird & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 31,565 (Rs. 20,915) for depreciation, the profit and loss account shows a loss of Rs. 4,593 (Rs. 1,84,766). The loss has been more than offset by the amount brought forward from previous half-year Rs. 10,963 (Rs. 1,24,587) and transfer from equalisation of dividend reserve Rs. 60,000 (Rs. 25,000 and Rs. 1,00,000 from reserve for roof repairs) leaving an available balance of Rs. 66,370 (Rs. 64,821) at the credit of the profit and loss account.

The directors propose to dispose of this in paying a dividend on the preference shares at the rate of 6 per cent. per annum, without any deduction for income-tax paid by the Company Rs. 27,000 (Rs. 27,000) in paying a dividend on the ordinary shares of Re. 1 (Re. 1) per share, without any deduction for income-tax paid by the Company Rs. 25,168 (Rs. 25,168) and in carrying forward Rs. 14,202 (Rs. 12,665).

Stocks of jute have been valued at market value and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act, 1946, and the Working Time Agreement of the Indian Jute Mills' Association the Company's mill worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the Mill was maintained at full strength throughout the period under review.

The directors state that the roof repairs to the Mill have now been fully completed, but results during the half-year have been adversely affected by the difficult working conditions which prevailed.

The majority of the Company's production is in the form of heavy goods, and but for the substantial stocks of jute held at relatively low prices, a considerable loss would have been shown on the half-year's working. The writing down of jute stocks to market values as at 31st March, 1953, favourably affected the results for this half-year, as early in the period, the price of jute increased appreciably and remained steady only to recede however at the close.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	34,19,600	Block ...	44,48,626
Reserves ...	48,76,263	Stock ...	26,25,299
Debentures ...	25,00,000	Stores ...	9,51,053
Provision for taxation ...	2,20,859	Debts, deposits and advances ...	10,09,574
Liabilities ...	12,14,461	Investments	6,36,828
Profit and loss account ...	14,202	Cash ...	25,74,005
	Rs. 1,22,45,385		Rs. 1,22,45,385

Union Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bird & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 45,000 (*nil*) for reserve for taxation contingencies and Rs. 65,300 (Rs. 54,641) for depreciation, the profit and loss account shows a profit of Rs. 3,69,977 (a loss of Rs. 2,24,607) to which is to be added the amount brought forward from previous half-year Rs. 21,038 (Rs. 34,682) making a total of Rs. 3,91,015 (loss of Rs. 1,89,925) from this, the directors have transferred to general reserve Rs. 75,000 (Rs. 1,00,000 and Rs. 1,50,000 from reserve for roof repairs and Rs. 12,000 from provision against contingent loss on forward jute purchases no longer required) and to jute stock reserve Rs. 1,00,000 (*nil*) leaving an available balance of Rs. 2,16,015 (Rs. 72,075).

The directors propose to dispose of this in paying a dividend on the preference shares at the rate of 7 per cent. per annum, without any deduction for income-tax paid by the Company Rs. 21,000 (Rs. 21,000) in paying a dividend on the ordinary shares of Rs. 4 (Re. 1) per share, without any deduction for income-tax paid by the Company Rs. 1,43,908 (Rs. 35,977) and in carrying forward Rs. 51,107 (Rs. 15,098).

Stocks of jute have been valued at market value and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act, 1946, and the Working Time Agreement of the Indian Jute Mills' Association, the Company's mills worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the mills was maintained at full strength throughout the period under review, but 25½ hours were lost at the North Mill in September when the management was forced to close the mill following a "go slow" policy adopted by the labour as a protest against the introduction of double shift working hours, which the Company considered essential for the satisfactory installation of the new machinery. 8½ hours were also lost at the South Mill in September when the labour demanded the payment of a *Puja* bonus.

The installation of the modern Mackie's Mill Machinery at the North Mill is proceeding satisfactorily and the switching of sacking looms to the manufacture of hessian is taking place gradually, the eventual target being a 100 per cent. hessian unit.

The majority of the Company's production is in the form of heavy goods, and but for the substantial stocks of jute held at relatively low prices, a loss would have been shown on the half-year's working. The writing down of jute stocks to market values as at 31st March, 1953, favourably affected the results for this half-year, as early in the period, the price of jute increased appreciably and remained steady only to recede, however, at the close.

Accounts in brief are as under:—

	Rs. 1,99,80,267		Rs. 1,99,80,267

Purtabpore Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Begg, Sutherland & Co., Ltd., Kanpur) submit the audited accounts of the Company for the year ended 31st October, 1953.

The results for the year, after making the usual charges, show a profit of Rs. 2,70,166 (Rs. 2,08,186), from which has been set aside for depreciation Rs. 65,000 (Rs. 65,000) for rehabilitation reserve Rs. 50,000 (*nil*) and for contingencies reserve Rs. 4,778 (*nil*) leaving a balance of Rs. 1,50,388 (Rs. 1,43,186). To this has to be added the carry forward from the previous year Rs. 19,435 (Rs. 25,249) leaving at credit of profit and loss account Rs. 1,69,823 (Rs. 1,69,823) this sum, the directors recommend, should be disposed of as follows:—

In payment of a dividend of 10 per cent. on the preference shares, free of income-tax, for the year ended 31st October, 1953 Rs. 60,000 (Rs. 60,000), in payment of a dividend of Re. 1·(Re. 1) per share, free of income-tax, on the ordinary shares for the year ended 31st October, 1953 Rs. 90,000 (Rs. 90,000) and in carrying forward Rs. 19,823 (Rs. 19,435).

The Company's factory commenced crushing operations on 8th December, 1952 and finished on 4th April, 1953. The quantity and quality of cane crushed was average, the relative figures being 19,39,270 maunds of cane with an extraction of 10.30 per cent.

Supplies of cane from the Company's estates again assisted materially in maintaining the quality and quantity of cane supplied to the Mill.

The cane price fixed by the Government of India was Re. 1-5 per maund at the Factory gate and Rs. 1-3 per maund at outstations, a reduction of As. 7 per maund, as compared with the season 1951-52. It was the Government of India's view that the reduction in the cane price would result in a basic price for sugar of Rs. 27 per maund. In the event, however, despite the large carryover of sugar stocks in India, the consumption of sugar in the country was in excess of the production, and the market price of sugar tended to rise. In order to stabilise prices, the Government of India imported considerable quantities of foreign sugar. The sugar produced at the Company's Factory realised prices slightly in excess of the basic rate of Rs. 27 per maund, in spite of the competition from imported sugar.

The lower cane price for the season 1952-53 has not affected to any great extent the cane plantings for the season 1953-54. Unfortunately, however, as a result of excessive drought followed by flood conditions, there will be a considerable reduction in the quantity and quality of cane available for the current season's crushing.

Accounts in brief are as under:—

MONEY RATES HARDEN

(From Our Own Correspondent)

BOMBAY, *3rd February*

Conditions in the short-term money market were extremely stringent during the week under review. While pressure for funds was heavier than in the previous weeks, the volume of floating funds was so small that borrowers remained unsatisfied. Large-scale drawings on the Reserve Bank and the Imperial Bank by all sections of the banks were the order of the day. The increased demand during the last few weeks for funds from traders in cotton, sugar and other commodities resulted in heavy withdrawal of funds from deposits and current accounts of banks. Some of the business houses of Calcutta, which had placed their funds at call in Bombay, are stated to have recalled their funds. Further, there were the usual month-end withdrawals for payment of wages and salaries. As a result, the available funds fell very much short of the day-to-day requirements. Consequently, turnover in the inter-bank call money sector dwindled considerably.

Inter-bank call money which had been quoted at 2½ per cent. among the Exchange banks and big Indian banks was bid at 3 per cent. But even at this higher rate funds were not available. The rate among the smaller Indian banks stood at 3 per cent. House money fetched 3 per cent. Almost all Exchange banks were reported to have raised their interest rates for term deposits. They were willing to pay 3 per cent. for one to three months and even upto six months. Deposits for 12 months were quoted at 2½ to 2¾ per cent.

The stringency is expected to become more acute in the coming weeks, when demand for funds will be greater for financing import of American cotton and payment of dividends by jute companies.

The Treasury Bill rate was, however, unchanged this week at Rs. 2-8 per cent. per annum. The amount offered, against the usual invitation for Re. 1 crore, was a little less at Rs. 1.14 crores than that of Rs. 1.31 crores in the previous week. Nevertheless, tenders for Rs. 1 crore of Bills have been invited for next week.

Minor variations in the portfolios of the Issue Department are disclosed by the statement of affairs of the Reserve Bank of India for the week ended 29th January, 1954, as compared with that for the previous week. Thus, notes in circulation show an increase of Rs. 1.16 crores, while notes held in the Banking Department are lower by Rs. 1.03 crores. In the Banking Department, the liabilities side reveals an increase of Rs. 2.75 crores in deposits of the Central Government and Rs. 1.40 crores in those of other Governments. Deposits of banks, on the other hand, have gone down by Rs. 3.60 crores. On the assets side, cash balances have shrunk by Rs. 1.02 crores, while balances held abroad have risen by Rs. 1.98 crores. Loans and advances other than to Governments show an increase of Rs. 2.36 crores. Government Treasury Bills purchased and discounted are lower by Rs. 1.44 crores.

A rise of Rs. 3.13 crores in demand deposits and of Rs. 93.15 lakhs in time deposits is disclosed by the consolidated statement of position of the Scheduled banks for the week ended 22nd January, 1954, as compared with that for the previous week. Inter-bank borrowings show little variation. Borrowings from the Reserve Bank have risen by Rs. 1.39 crores, while those from the Imperial Bank have declined by Rs. 49 lakhs. Advances and bills purchased and discounted have risen by Rs. 4.70 crores. Investments show a fall of Rs. 51.82 lakhs. Cash on hand and balances with the Reserve Bank have contracted by Rs. 1.93 crores, while balances with other banks in current account and money at call and short notice have gone up by Rs. 30.29 lakhs and Rs. 86.19 lakhs, respectively.

The Gilt-edged market displayed steadiness during the week under review. Although there was some demand, business put through was small and price variations were negligible. 3 per cent. Reserve Bank of India stopped today sale of 3 per cent. 1959-61 was unchanged at Rs. 96-2. 3 per cent. 1959-61 was unchanged at Rs. 96-2. 3 per cent. 1963-65, 3 per cent. 1964, 3 per cent. 1966-68 and 3 per cent. 1970-75 at quoted rates, at which rates there were buyers in the market. 3 per cent. 1986 Conversion Loan was put through at Rs. 82-11 and 3 per cent. 1961 was done at Rs. 98-14.

KIPS WEAK

(From Our Own Correspondent)

MADRAS, *1st February*

The kip market has ruled weak, due to paucity of shipment business. U.K. importers seem to be following a hand-to-mouth policy and are buying only against actual requirements. Enquiries were mostly for medium and heavy weights and demand for lights was poor. Prices in the raw centres have eased to a small extent, but not to the level of tanned parity. Tanners are not in a happy position, due to price resistance on the part of U.K. importers. There was steady demand for buff heavies and enquiries for cow calf and buff calf were patchy.

Arrivals of tanned goat and sheep skins have been restricted, and clearances have kept pace with arrivals. In the London public sales, prices of tanned skins—primes were unchanged at 3d. higher than December levels, and other tannages declined up to 6d. There were some enquiries from the U.S.A. for middle class goat skins.

GOLD FIRM

(From Our Own Correspondent)

BOMBAY, *3rd February*

The bullion market witnessed an irregular trend in prices of both silver and gold during the week under review. While silver closed on a quiet note, due to profit-taking attracted by the higher prices, gold displayed firmness with a gain of Re. 1-6 per tola over the week. Satisfactory offtake in gold, *vis-a-vis* the arrivals, and reports that the Central Government did not propose to sell the large stocks of confiscated smuggled gold (*no official confirmation of these reports has so far been forthcoming*) were said to be mainly responsible for the better tone in gold.

The market remained closed on Saturday (30th January) on account of Mahatma Gandhi Day and on Tuesday, the 2nd inst., on account of elections to the Board of the Bullion Association.

Silver for forward delivery (18th February settlement) opened on a steady note at Rs. 161-7 and hardened to Rs. 161-15. But profit-taking, due to diffidence of operators to follow up the advance, brought a reaction to Rs. 160-4 on Friday. A sharp upturn to Rs. 162-3 was, however, noted on Monday inspired by reports of good offtake, but this trend was not maintained today, due to selling by bull operators and the white metal finished at Rs. 160-15.

Ready silver (.996 Mint) opened at Rs. 161-11 and, after advancing to Rs. 162-9 on Monday, wound up the week at Rs. 161-3. The premium of ready rate over the forward widened from As. 4 early in the week to As. 8 at one time on Monday, but again narrowed down to As. 4 at the close. The floating stocks of silver are placed at 2,300 bars. The daily average offtake was 20 bars.

Opening at Rs. 84-8, forward gold (17th February settlement) moved up to Rs. 85-4 on better offtake, but shaded off to Rs. 84-10 following an increase in arrivals on Friday. However, an upward reaction soon set in and forward gold touched Rs. 86-2 today, before closing at Rs. 85-12.

Ready gold opened at Rs. 84-8 and closed at Rs. 86. The ready metal which was quoted at par with the forward at the opening of the week came to be done at a premium of As. 4 at the close. The floating stocks of gold are estimated at 25,000 tolas. The daily average arrivals and offtake were even at 5,000 tolas.

The following comparative table shows the trend of the market during the week under review:

	3-2-54	Highest	Lowest	27-1-54
Gold	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready (.99 fine Mint)	86 0	86 6	84 7	84 6

TEA PRICES DEARER

(Messrs. Forbes, Ewart & Figgis Ltd.)

COCHIN, *30th January*

The quantity on offer in Dust Sale 'B' which was held on Monday, 25th January, amounted to approximately 2,90,000 lbs. From the outset there was an excited general demand and prices for all types were As. 4 dearer. As the sale progressed the demand became even stronger and at the close, rates had advanced fully As. 4 to As. 6.

London Market—Sale of the 25th January.—"*Market half to one penny down.*"

Sale of the 27th January.—"Good tea fully firm. Commons occasionally half penny lower."

Colombo Market.—"Opened very quiet, became stronger, closed lower sorts down 25 cents, mediums 15, better sorts unchanged."

Calcutta Market—Export.—"58,000 packages. Market generally lower by As. 2 to As. 3, but fairly good demand at the drop."

Dust.—"21,000. Market As. 1½ to As. 2 easier."

Export Quota.—After a further decline in the early part of the week to 28-29 pies, the market re-acted strongly at the end of the week and returned to 45 pies, at which figure business has been done.

Forthcoming Auctions.—Dust Sale 'C' will be held on Tuesday, 9th February.

As we go to press, Messrs. Forbes Ewart and Figgis, Ltd., wire as follows:

"*Sale* 3.—8,10,000 lbs. Good general demand, but prices irregularly As. 2 to As. 3 lower for everything, except improved highgrown which are dearer. Weakest feature whole leaf grades."

LINSEED SUPPLIES SCARCE

(Messrs. A. Bradley & Co.)

CALCUTTA, *1st February*

Despite a general decline in the price of seeds, there have been very few enquiries in the local linseed market and the undertone continues to be easy. Supplies, however, are still very scarce, owing largely to transport restrictions. Although ready stocks are negligible, there are somewhat keener sellers for forward delivery. Interest from crushers has weakened and business has been reported on a very restricted scale. The oil section has been dull and, despite lower offerings from local sellers, the turnover has been very poor. Latest quotation is: Ready Rs. 21-4 per maund.

FORWARD COTTON RECEDES

(From Our Own Correspondent)

BOMBAY, *3rd February*

After touching a high of Rs. 734-8 early in the week, the February contract in the forward cotton market has receded, owing to technical reasons. The room rates and price differentials fixed for this week are, however, such as not to encourage deliveries by holders. These on the first day amounted only to 450 bales. Besides, the spot position is so bright that those who hold stocks find it more profitable to lift their hedge sales in February than to tender cotton. It is, therefore, likely that the total quantity tendered will be comparatively very small and most of the transactions in February will come to be squared up round about the *present* rates with occasional spurts and dips.

Interest, as pointed out last week, is centring itself on the May contract. Though this contract has reacted sharply this week, buyers are naturally very reserved, in view of the uncertainty in regard to the exact demand and supply position after a couple months.

In the spot section, activity is naturally progressively increasing and the Textile Commissioner's warning has proved of little avail, even though it has led the mills to divert their attention more and more to imported cotton for the time being. After the gradual disappearance of all staple varieties of domestic cotton, a situation leading to a deadlock may develop compelling the Government to reconsider its ceilings and allow certain relaxations to break this deadlock. The old demands for removing prices control, in view of cloth prices having been decontrolled, is bound to revive with greater insistence. Not only are the mills now allowed to sell cloth at uncontrolled prices, but actually, incentives are being demanded by way of reduction in excise duties to increase their margin. The cotton growers, therefore, naturally feel dissatisfied that they should be compelled to contribute to the prosperity of the mills by supplying them with cotton at controlled rates.

Be that as it may, in order to ease the situation, the Government is reported to have agreed to the free licensing of imports of U.S. cotton of 1.1/16" staple and over against prior sale to mills. Whether any conditions would be attached to this move, for which the trade had been agitating for some time, will not be known till the notification embodying this is issued.

Nothing of great interest to the trade has emerged from the meeting of the Indian Central Cotton Committee here this week. Most of the subjects dealt with by the Committee and the Sub-committees were of a technical nature. From the market point of view, however, the belief held by the Committee that the total production of cotton during this season was not likely to be very much below the target of 42 lakh bales might have a bearish effect on the market, perhaps, only temporarily.

In the forward section of the local cotton market, I.C.C. February opened the week at Rs. 728-8, as against Rs. 729 towards the close of last week. After improving to Rs. 734-8, it gradually receded to Rs. 699 today. At the close, however, it was slightly better at Rs. 699-8. I.C.C. May improved from Rs. 716-8 to Rs. 721. It moved down to Rs. 690-8 before closing at Rs. 692-8. The trend of prices in the forward section during the week under review was as follows:

	Opening	*High*	*Low*	*Closing*
I.C.C. Feb. ...	Rs. 728½	734½	699	699½
I.C.C. May ...	Rs. 715½	721	690½	692½

The following are the latest available prices from the spot market: Bengal *Deshi* Rs. 640; Berar *Jarilla* Rs. 800; Khandesh Rs. 820; Vijay Rs. 910; Oomra *Deshi* Rs. 735; Moglai Rs. 720.

As was to be expected, there has been an all-round advance in prices at Karachi during the week under review in *sympathy* with the world trend. The increase this week amounts to about Rs. 40 to Rs. 50 per candy on an average, as a result of expanded enquiries from the U.K., China, Continent and Australia. Japan, however, seems to be holding out. Exports from Karachi till 21st January amounted to 436,011 bales, as against 561,213 bales in 1952-53 for this period.

The following are the latest available quotations from the Karachi market: Punjab *Deshi* Rs. 75½; Sind *Deshi* Rs. 76; 4F Punjab R.G. Rs. 73½; S.G. Rs. 79½; N.T. R.G. Rs. 75½; S.G. Rs. 81½; L.S.S. Rs. 76½; S.G. Rs. 81½; 289F R.G. Rs. 81; S.G. Rs. 87.

Of all the cotton-growing countries in the world it is, perhaps, Egypt which has reaped the largest benefit from the supply situation, as it has developed from an expected plenty into one of regional scarcity. In spite of the general increase in the official selling differentials for all varieties being naturally followed by higher quotations by shippers to purchasers abroad, demand for medium grades of Karnak has in no way been affected, and the U.K., France and India continue to be deeply interested in this cotton, stocks of which with the Government have come down to 165,000 bales. The recent rise in prices has, however, affected, to a certain extent, enquiry for Ashmouni and Giza 20. As a result of the new trade agreement signed by the Egyptian Government with Poland and Rumania in Eastern Europe, which are likely to absorb sizable quantities of Egyptian cotton, the pressure on the market during coming weeks is expected to increase considerably. The Government has allowed an increase up to 25 per cent. in the acreage under Ashmouni, but it is feared that, due partly to the permission having come too late and partly to the shortage of good seed, the actual increase might be much smaller for the next season.

At New York, the week under review experienced a state of affairs not witnessed before since the commencement of the current cotton season. Spot prices in the American cotton markets were perceptibly higher than the average loan rate as applicable to these markets. If this difference widens sufficiently to make redemption of cotton already entered into the loan profitable after covering expenses, the supply position might ease to a certain extent. But, till prices reach this stage, the present indications are of supplies getting tighter in the spot markets, leading to large-scale short covering and a rise in the futures. In the U.S. also, the export prospects have improved out of all recognition and what appeared at one time to be an exaggerated claim that the exports from the U.S. will exceed the quantity sold abroad during the previous season by about 500,000 bales now appears to be fully justified, in view of the broadening export enquiry and the shippers making purchases to meet them. A recession does not seem likely, in spite of the continuous rise in the near deliveries at least till a position is reached when loan cotton begins to be redeemed.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	2-2-54	22-1-54	19-1-54
Spot	34.80	34.25	34.15
March	34.17	33.58	33.53
May	34.33	33.82	33.74
July	34.19	33.62	33.70
October	33.37	32.84	33.86

COTTON YARN RISES FURTHER

(From Our Own Correspondent)

BOMBAY, 3rd *February*

The cotton yarn market exhibited buoyant conditions this week too, although the extent of improvement in values was not as marked as it was a week ago. Renewed encouraging reports from cloth markets broadened the enquiries for cotton yarn. The volume of business transacted during the week under review was, therefore, large and prices continued their upward march. The rise would have been more pronounced but for the weak advices from the cotton market which experienced a setback to values on fears regarding the possibilities of importing American cotton.

Buying support was particularly in evidence for fine count yarns. Thus, among 60s, Coimbatore Spinning advanced by a rupee to Rs. 42-8 per bundle of 10 lbs. Pankaja gathered As. 12 to Rs. 39-12. Rajalakshmi was As. 8 higher at Rs. 43-12. Pioneer was fully steady at Rs. 45. Medium and low count yarns also recorded gains. Among 40s, Gokak and Meenakshi picked up As. 8 each to Rs. 26-8 and Rs. 26-6, respectively. Madura was steady at Rs. 27 and Modern at Rs. 26-8. A handsome improvement of As. 10 to Rs. 23-10 was the feature of trading in 30s. Among 20s, Madura improved from Rs. 18-8 to Rs. 18-12. Edward and Seksarias fared better, the former at Rs. 16-14, as against Rs. 16-11, and the latter at Rs. 16-14, as against Rs. 16-12. Among 10s, Elphinstone rose by As. 4 to Rs. 13-4. Modern and Podar put on As. 2 each to Rs. 13-8 and Rs. 13-6, respectively.

Latest reports have it that several mills have enhanced the prices of their yarns. They have also been quoting distant deliveries, which, in some cases, extend up to April-May, 1954. Some of the prominent mills, it is said, have arranged further sales of their popular varieties at higher prices. Even at higher prices, the dealers are reported to have shown inclination towards fresh purchases on expectation, evidently, of still better prices. Demand for yarn from handlooms and powerlooms have been steadily enlarging.

Aided by the upward trend in cotton yarn and by persistent good demand, art silk yarn also registered improvement in values. In the ready section, 120 Japan were picked up an anna and a half higher at Rs. 4-11½. 150 Japan and 120 Italy gained an anna each to Rs. 4-6 and Rs. 4-4, respectively. 150 Italy was a shade higher at Rs. 3-13½. In the forward section, trading in art silk yarn remained suspended, pending the amalgamation of the Yarn Merchants' Association and the Bombay Yarn Exchange. An extraordinary general meeting of these two bodies was held today. It was decided that both the bodies should go into voluntary liquidation. A new association is expected to be registered in about a week's time. Forward trading in art silk yarn will be resumed under the auspices of this new Association.

The table below gives the prices of art silk yarn quoted today, as compared with those on the 27th and 20th January, 1954:

	3-2-54	27-1-54	20-1-54
	Rs. a.	Rs. a.	Rs. a.
120 Japan (per lb.)	4 11½	4 10	4 10
150 Japan ,, ...	4 6	4 5	4 4
120 Italy ,, ...	4 4	4 3	4 1
150 Italy ,, ...	3 13½	3 14	3 13½

In contrast to the general upward trend, in other sections staple fibre yarn prices staged a retreat, owing to decline in offtake following unsatisfactory reports from consuming centres. Among foreign (40 x 2) yarns, Paramount fell by an anna to Rs. 4-8 per lb. S. Fuji and Aurora lost a like amount to finish both at Rs. 4-8½. Among Indian yarns, City dropped As. 2-9 to Rs. 4-3½. Hind shed an anna and a half to Rs. 3-12½. New Great slipped down from Rs. 4 to Rs. 3-15. Hindusthan was neglected at Rs. 3-11, as against Rs. 3-11½.

OILSEEDS EASY

(From Our Own Correspondent)

BOMBAY, 3rd *February*

The oilseeds market ruled easy during the week under review and there was an all-round decline in values. The easiness was chiefly due to a natural reaction after a steady rise for a long time. The easiness in the groundnut section was assisted by some nervous sales by weak holders, on renewed rumours that the Government may not allow export of groundnut oil. There was hesitancy in the castorseed section, in which operators were inclined to know the Government's policy regarding the trade's persistant demand for a reduction in export duty and the announcement of fresh export quotas. The linseed section had on inherent strength of its own. Consequently, it ruled easy in sympathy with the rest. *Kardi* and *niger* seeds proved no exception to the generally downward trend.

Groundnuts ruled easy, on fairly large arrivals in all the upcountry and other centres in the South, as also in the local market. The occasional support lent by *vanaspati* interests and crushers had, therefore, no effect on prices. Bold F.A.Q. declined from Rs. 35-10 to Rs. 34. February-March was lower by Re. 1-3 at Rs. 34-2, and April-May Re. 1-6 at Rs. 34-12. Khandesh quality ready eased from Rs. 36-12 to Rs. 35. Groundnut oil ex-mill and railway receipt disclosed a loss of Re. 1 and As. 14, respectively, at Rs. 17-10 each. February and March deliveries were done at Rs. 17-11 and Rs. 17-15, as against Rs. 18-9 and Rs. 18-12, respectively.

Groundnut oil at about Rs. 18 per quarter works out to about £124 per ton, including freight and other expenses. It is stated that buyers can be found for it at £162 per ton, provided exports are allowed immediately.

In the castorseed section, upcountry interests, who were long, were reported to be liquidating their holdings. May 1954, which opened at Rs. 115-4 as against Rs. 115-8, fluctuated between Rs. 116-10 and Rs. 111-8, before closing at Rs. 112. F.A.Q. was down by As. 12 at Rs. 24 and Madras by As. 8 at Rs. 24-8. Castoroil I Pressure and Commercial declined from Rs. 13-12 and Rs. 12-14 to Rs. 13-8 and Rs. 12-10, respectively. Export of castoroil from 1st to 28th January from Bombay was 482 tons.

The easiness witnessed last week in the linseed section gathered momentum this week. Bold ready fell from Rs. 29-4 to Rs. 26. February-March and April-May changed hands to-day at Rs. 23-10 and Rs. 23-2, as against Rs. 25-12 and Rs. 25, respectively. Linseed oil lost As. 12 to Rs. 15-6. Export of linseed oil from 1st to 28th January from Bombay was 34.4 tons.

Among others, *kardi* ready Bold sustained a loss of Re. 1-13 to Rs. 21-11 and February-March Re. 1-8 to Rs. 21-8. *Niger* F.A.Q. was lower by Re. 1-8 at Rs. 28-2 and Madras Re. 1-4 at Rs. 28-4. February-March eased from Rs. 29-4 to Rs. 28. In the U.K. and the Continent, *kardi* was quoted at about £40 per ton and *Niger* £53 per ton.

Arrivals of oilseeds and oils from 1st to 28th January, 1954, as compared with those in the corresponding period last year were as follows:

	1954	1953
Groundnuts	350,851	398,587
Linseed	5,128	4,397
Castorseed	2,291	49,871
Groundnut oil	106,239	32,618
Linseed oil	5,048	1,000
Castoroil	1,896	7,358

The following table shows the prices of oilseeds and oil on the 3rd inst., as compared with those at the end of the previous two weeks.

	3-2-54	27-1-54	20-1-54
	Rs. a.	Rs. a.	Rs. a.
Groundnuts—			
Khandesh Quality Ready (per cwt.) ..	35 0	36 12	37 0
Bold Feb.-March	34 2	35 5	36 3
Linseed—			
Bold Ready (per cwt.) ..	26 0	29 4	30 0
Feb.-March	23 10	25 12	26 6
Castorseeds—			
May 1954 (per candy) ..	112 0	115 8	117 0
Madras (per cwt.)	24 8	25 0	25 4
Groundnut oil—			
Ex-mill Ready (per quarter).	17 10	18 10	18 15
Castor Oil—			
Commercial (per quarter) ..	12 10	12 14	13 8

SUGAR EASY

(From Our Own Correspondent)

BOMBAY, 3rd *February*

The firm tendency that prevailed in the Bombay sugar market last week yielded place to a slightly easy trend during the week under review. This was due chiefly to the further release of 100,000 tons of sugar from the 1953-54 season's production for sale in the free market. The basis of this release is 70 to 75 per cent. of the total production upto 22nd January, 1954, less the total releases made up to date. The two other factors which imparted easiness were the allotments of imported Czechoslovakian beet sugar among tenderers and the Union Food Ministry's announcement that two more shiploads of sugar from Czechoslovakia, amounting to 6,600 tons, would arrive before the end of the month. Weak advices from Kanpur, following the withdrawal of the strike notice served by cane growers to stop supplies to sugar factories from the 1st inst., too, chilled the enthusiasm of operators. For want of support, therefore, sugar prices tended to decline.

The fall in prices was pronounced in the forward section. *Maha* delivery receded by Rs. 2 to Rs. 82-6 per maund, but recovered slightly to Rs. 82-8 at the close. *Fagan* delivery was quoted lower at Rs. 83-10, as against the opening rate of Rs. 83-12. In the spot section, foreign sugars suffered losses. Cuban sugar dropped As. 8 to Rs. 36-8 per 100 lbs. and Mexican sugar As. 4 to Rs. 40-8. British refined sugar was neglected at Rs. 85 per bag of 2 cwts. East German sugar is freely available at Rs. 82 per bag of 2 cwts. Last week's quotation was Rs. 83-8. Prices of indigenous sugar, however, were unaltered, small, medium and large grains being quoted at Rs. 92, Rs. 94 and Rs. 97-99 per bag, respectively.

There was a further reduction in the arrivals of sugar into the market this week, the quantity actually received being 6,500 bags, as against 7,300 bags last week, 11,300 bags two weeks before and 16,000 bags three weeks before.

As already stated, allotments for Czechoslovakian beet crystal sugar per s.s. *Maria* were announced by the Regional Director (Food), Bombay. Out of the total of 1,280 tenderers, only 722 have been allotted quotas, the quantity for each tenderer being 311 maunds. Tenders are available freely in the free market at a premium of Rs. 125 each. Two more shiploads carrying 4,000 tons and 2,600 tons of Czechoslovakian beet sugar, respectively, are scheduled to arrive within the next three weeks. The whole of this quantity will be distributed among the remaining 558 tenderers on a uniform basis, namely, 311 maunds per tenderer.

NARROW MOVEMENTS IN PEPPER

(Messrs. Parekh & Co.)

BOMBAY, 3rd *February*

The pepper market during the week remained quiet to steady, prices moving within a narrow range of Rs. 50, from Rs. 1,600 to Rs. 1,650, owing to continued enquiries by the New York dealers for shipments during early February and February at price between $0.80 and $0.81. Though the Indian exporters, who are bears and who have sold short a fairly good quality both in New York and in Bombay, are trying to bring down prices, the growers all over the coasts are reported showing resistance at round about the present prices. The coming two to three weeks will prove a testing period for the holding capacity of the growers for the arrivals in all the principal markets like Alleppey, Cochin and Calicut are likely to increase day by day. If both New York and Russia remained out of the market for some time, the prices would likely come down, but not without resistance from the growers at every subsequent decline. Most of the Indian growers fully know that the U.S.A. will need Malabar pepper for their consumption at least until the new crop of Sarawak and Lampong come into the market and also that the operators there are marking time and want to pick up a fair-sized quantity at reduced prices.

In the A.S.T.A. section, business in February was done at prices from $0.79½ to $0.81, while March was done at $0.79 to $0.81.

In the delivery section, prices improved from Rs. 1,510 to Rs. 1,545 for February and from Rs. 1,420 to Rs. 1,480 for March, mainly due to short covering operations.

Following are today's nominal quotations:—Ready delivery Rs. 220 per cwt., February delivery Rs. 1,440-60 and March delivery Rs. 1,480-1,500 per candy of 5½ cwts.

FRACTIONAL DECLINE IN JUTE GOODS PRICES

(From Our Own Correspondent)

CALCUTTA, 1st *February*

Moderate export business was put through in the jute goods market between Wednesday and Saturday last. In spite of this, prices were down fractionally, and this was due to the cautious attitude adopted by buyers. Stockists of raw jute are disappointed to find that prices of raw jute are not moving up, as they had expected earlier and increased their holdings. On the other hand, raw jute is closely following the jute goods market. Mills are not showing any anxiety about supplies of raw jute, and such an attitude on their part throws out the expectation of the stockists. Stocks with mills would see them through the end of April, and the supplies in the bazar are estimated to be sufficient for another two months. If these anticipations prove correct, then mills would have to look to East Bengal for finding the raw materials required between the end of June and the short period that would be necessary for the crop to move to the market after harvest.

Although the superior quality of raw jute of Indian origin is difficult to obtain, it is believed that a fair quantity of the better variety is available in the producing centres. This jute is evidently withheld from the market, on the expectation of higher prices. However, instances are not wanting where sales have been put through by holders, after being hardpressed for money. The present trend of the jute goods market completely dispels any possibility of an increase in prices. Therefore, the assumption that these holders, after waiting for some time, would release their stocks, can be entertained. It is also possible that these stocks would get exhausted, as a result of the small sales here and there for immediate needs of money. This week, business took place in Assam Bottoms at Rs. 27-8, as against Rs. 28 a week ago, and middles at Rs. 30-12 as against Rs. 31. Pakistani jat bottoms were priced at Rs. 30. *Bimlis* were quoted at Rs. 25-8. Other rates were: Indian N.C. cuttings Rs. 70 a bale, long group Dalsee Rs. 170 a bale, mill firsts Rs. 183 a bale, northern bottoms Rs. 28-8, tossa bottoms Rs. 29-8, and locally packed northern bottoms Rs. 28-8.

In the jute goods market, ready hessians 40" 10 oz. closed on Saturday at Rs. 45-15, representing a loss of As. 7 as compared to the rate on Wednesday. Forward positions were in fair demand. After giving way to Rs. 45 from Rs. 45-10, February-March goods recovered to Rs. 45-8. April-June goods were at one time raised to Rs. 45-10 from Rs. 45-4, but the closure on Saturday was at Rs. 44-12. B. twills ready fluctuated narrowly between Rs. 102-14 and Rs. 103-14, closing last Saturday at Rs. 103-13. Forward positions, however, made small additions. Thus April-June at Rs. 105-13 was better by As. 11, and the February-March position was taken to Rs. 104-9 from Rs. 104-6.

The report from Chittagong that 3,000 bales of gunny bags were shipped to South Africa last Tuesday as the first consignment to that country is a reminder to the Indian mills of the coming competition from Pakistan where mills are being established with the most up-to-date machinery. No doubt, India is not interested at present in the South African market in view of the trade sanctions but the Chittagong report should be able to bring into more light the need for Indian mills to re-equip themselves with more up-to-date plants. Certain mills have made a small beginning in this direction, but it is realised that without Government's help, no tangible results can be achieved. Meanwhile, valuable time is being lost. The Indian jute goods industry has paid considerable amounts of money to the exchequer in its heyday. This time can again be brought back if only Government desired to part with a portion of the money that it had taken from this industry.

FOODGRAINS RECEDE

(From Our Own Correspondent)

HAPUR, 2nd *February*

The downward trend in the foodgrains market witnessed last week was maintained during the week under review also. The difference in the price level between the surplus and deficit areas is fast disappearing, as considerable quantities of coarse grains are moving from surplus to deficit areas. The railway authorities have arranged to run special goods trains for transport of such grains. Following actual receipt of consignments and in anticipation of further arrivals, foodgrain prices eased in all importing areas. Not only coarse grains but wheat and rice have been affected.

It is reliably understood that the Government of India will withdraw all controls on wheat from the beginning of the next financial year. There is little apprehension of the prices going up and the Centre holds huge wheat stocks and will be willing to issue wheat to foodgrains licence holders at the rate of Rs. 15-8 per maund and, at the same time, ensuring that the retail price never goes up beyond the present level of Rs. 16-4 per maund.

As regards rice, the Union Food Minister has announced that, he will decontrol it, the moment the Government has a stock of one million tons of rice. What is needed for the decontrol of rice is, he says, the import of 700,000 tons of rice. He has reiterated his earlier declaration in the country now and that shortage of foodgrains in the country now and that imports are being made to create confidence among the people. According to him, because of procurement by the State Governments, foodgrain prices remained high. They will fall when procurement is stopped. The States should see that the economic level of prices of foodgrains does not fall to that level where cultivators suffer. They should also buy foodgrains at reasonable prices to protect farmers' interests.

It is understood that the Central Government has accepted the suggestion of the Delhi State to constitute Delhi and U.P. into one zone for purposes of supply of rice to the consumer. As a result of this, a reasonable quantity of rice will be allowed to be imported into Delhi from the free market in U.P. through normal trade channels, instead of on Government account as has been the case all these years since the imposition of the controls.

A final decision in respect of the disposal of imported wheat stock with the Uttar Pradesh Government has still not been taken. The flour millers in the State are not prepared to pay the high price of Rs. 17-11 per maund which the Government has asked for to avoid any financial loss on the wheat deal. The millers want the State Government is considering a proposal to dispose of this stock at the earliest in the free market at Rs. 16 per maund. It is understood that the State Government is considering a proposal to dispose of this stock at the earliest in the free market at Rs. 16 per maund. This stock has considerably deteriorated in quality and must be got rid of before the next wheat crop arrivals reach the market.

In the local market, prices of all grains, including wheat and pulses, have registered a fall this week, on account of arrivals of millers from Rajasthan and prospects of early wheat decontrol and bumper next crop yield. Pulses futures have also reacted very bearishly on speculative unloadings and bear pressure. Latest quotations (per maund) are: Wheat Rs. 16 to Rs. 18; gram Rs. 11-8; barley Rs. 10-8; *bejhar* Rs. 10-8; maize Rs. 8; *badam bajra* Rs. 11 to Rs. 12; *jowar*: red Rs. 29 to Rs. 19; Rs. 10 and white Rs. 11-8; rice Rs. 29 to Rs. 19; *guwar* Rs. 9-0; peas Rs. 10; *arhar* Rs. 10-8; *urd* Rs. 16; *moong* Rs. 16; *masoor* Rs. 10-2-3; *guwar maha jeth* Rs. 9-2-6; *arhar jeth* Rs. 15-4; futures peas Rs. 8-0-6 and *urd maha* Rs. 15.

SUGAR QUIET TO STEADY

(From Our Own Correspondent)

HAPUR, 2nd *February*

The crystal sugar markets remained quiet to steady. Kanpur steadied on active offtake, due to the threatened sugarcane supply strike and Bombay on improved mofussil demand. Calcutta complained of poor arrivals and small rise in ready and mill delivery prices. Madras eased slightly, due to pressure of clearance from the harbour and expected further shipments of imported sugar. In the upcountry markets, there was moderate demand and fairly good activity.

The situation with regard to the threatened strike of cane growers remained extremely fluid. The Union Food Minister stated that the Government was not prepared to increase the price of sugarcane, since the prices of all agricultural produce were going down. He said that the Government was trying to evolve a scheme which would entitle the cane growers to a share of the extra profits that the sugar factories might earn on account of the prevailing high price of sugar. The U.P. sugar industrialists had also taken a tentative decision disfavouring any increase in the price of cane.

The U.P. Chief Minister was later nominated as the mediator in the dispute and a high level Conference of States' officials was held to evolve a formula for the settlement of the dispute between the cane growers and sugar millowners over the price of sugarcane. According to latest reports, the U.P. Cane Growers Co-operative Federation has announced the postponement of the strike of the cane growers which was to have started on the 1st inst. Mr. Pant has proposed to call a tripartite conference which will be attended by representatives of the Government, the millowners and the sugarcane growers. The Central Government and the U.P. Government have accepted the principle that growers should share in the extra profits made by the mills during the current and last year's seasons.

Latest quotations (per maund) are: Sugar ready: retail Rs. 33-12; Mill delivery: Simbhauli Rs. 31, Jaswant Rs. 30-14, Daurala Rs. 32, Mansoorpur Rs. 32-4, Rampur Rs. 33-8, Sehora Rs. 30-14, Mawana Rs. 31 and Amroha Rs. 30-12.

The *gur* markets remained fairly active during the week under review, although prices moved within a narrow range. There were increased arrivals in both the North and South Indian markets and there was sustained demand from importing areas. Increased arrivals have induced some price fall not only in West U.P. markets but also at Akola and Ankapalli. *Gur* futures have also declined in sympathy.

Despatches by rail were on a moderate scale, due to the availability of only limited number of wagons. Rajasthan and Assam drew *gur* stocks from Hapur this week. There has been little stock accumulation in the local market, as despatches have been fairly regular. Meerut and Muzaffarnagar hold comparatively heavier stocks. Latest quotations (per maund) in the local *gur* market are: Ready *pansera* Rs. 15 and *balli* Rs. 15-8; future *fagan* Rs. 15-13.

HIDES IRREGULAR

(From Our Own Correspondent)

KANPUR, 31*st January*

During the week under review, the conditions in the hides and skins market were slightly indifferent. There was a slight fall in the demand for buff, while that for wet salted cow continued to be brisk. The main purchasers were the local tanners headed by Cooper Allens. The country tanners were concerned with lower grade cow and goat. Fresh arrivals were considerable.

Latest quotations are: Wet salted cow 1st grade Rs. 320 to Rs. 360 and 2nd grade Rs. 190 to Rs. 220 per score; wet salted buff heavy 1 lb. 8 ozs. to 1 lb. 11 ozs., medium 1 lb. 14 ozs. to 2 lbs. and light 2 lbs. 4 ozs. to 2 lbs. 8 ozs. per rupee; goat skins 1st grade Rs. 275 to Rs. 300 and 2nd grade Rs. 250 to Rs. 300 per 100 pieces; sheep skins Rs. 250 to Rs. 300 per 100 pieces.

TEA DUST DECLINES

(From Our Own Correspondent)

CALCUTTA, 2nd *February*

During last week's internal sale, prices receded as there was a fall in demand. Dusts offered amounted to 21,204 packages. The commonest varieties lost As. 1½, while all other sorts gave way by As. 2. The rates were: Good red Assam C.T.C. Rs. 2-2-6, medium Assam grainy dusts Re. 1-15-9 and medium Dooars Re. 1-15-3. The quantity of leaf offered was 11,496 packages. Here also dull conditions prevailed and prices were lower by As. 2 to As. 3 below brokers' valuations.

44,000 packages were offered in the export sales held on Monday this week. A fairly good demand at lower levels was in evidence except for flavoury Darjeelings and well-made whole leaf grades, as also the very best autumnal invoices which sold readily at dearer rates. B.O.Ps. with tip were well supported at about half to one anna below valuations. Fannings were irregularly As. 1 to As. 2 lower, while B.Ps., except for the best, were the weakest feature of the sale and were up to As. 3 lower. The following were the quotations: Clean black pekoe Rs. 2-9; clean common B.P. Rs. 2-2; medium Assam B.P. Rs. 2-3; best C.T.C. Assam B.P. Rs. 2-7 (nom.).

Offerings in this week's internal sale No. 32 held on the 2nd inst. amounted to 23,263 packages. Demand for dusts was again limited to a few buyers and there was less competition than last week. At first, prices were As. 2 to As. 3 lower, except for the best C.T.C. types which were As. 1½ to As. 2 below last week's level. Towards the close, however, demand fell off and many withdrawals were noted towards the close of the sale. Prices were As. 3 easier for all kinds. The following were the quotations: Medium Dooars dust Re. 1-12-6; medium Assam grainy dust Re. 1-3; best Assam C.T.C. dust Rs. 2.

Offerings of leaf grades aggregated 9,379 packages. There was comparatively little demand for internal leaf teas and only those lines of reasonable appearance came in for any competition. Others were As. 2 to As. 3 easier and a number of lots were withdrawn. Green teas met with an irregular demand.

Notice

THE BOMBAY DYEING AND MANUFACTURING CO., LTD.

Neville House, Ballard Estate
BOMBAY

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the Shareholders of The Bombay Dyeing and Manufacturing Company, Ltd., will be held at the Registered Office of the Company, Neville House, Ballard Estate, Bombay, on Thursday the 25th day of February, 1954, at 10-30 a.m., when the subjoined resolution will be submitted as an Ordinary Resolution.

"RESOLVED that the Company do become a member of The Bombay Textile Research Association and pay to the Association a sum of Rs. 3,68,925 as entrance fee and also such sum or sums as annual subscription or as contribution to the capital expenditure as may from time to time be determined by the said Association, and that Mr. Neville N. Wadia, a Director of the Company, be and is hereby authorised to sign the Memorandum of Association of the said Association for and on behalf of the Company."

Dated the 20th day of January, 1954.

By Order of the Board.
NOWROSJEE WADIA & SONS LIMITED,
NEVILLE N. WADIA.
Director,
Agents.

To,

The Shareholders of The Bombay Dyeing and Manufacturing Company, Ltd., and in particular to:—

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. ‡ Sales and amount written off. (k) Investments. ‡ For ten months ended 31st December 1951.

(j) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 196 in the debentures section:—

■ Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium.

(b) Bearer bonds of Rs. 1,000 each repayable par.

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1960.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

e Returnable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months' notice.

INDO-JAPANESE CO-OPERATION IN TRADE AND INDUSTRY

(*Concluded from page 219*)

trialists appreciate the fact that it is imperative for the Japanese economy that export trade must be developed very considerably and they are trying their best to devise means to make the prices of their products competitive. Meanwhile, they seem willing to take special steps to meet competition in individual transactions. Indian development calls for continued import of many types of machinery at present not made in the country. Obviously, however, no great expansion of export trade in this direction will be possible, unless prices become favourable. To this end, they are seriously endeavouring to get over the present political difficulties of importing some of their raw materials at lower cost than is the case at present from nearby China, instead of distant U.S.A., making fuller and better use of indigenous raw materials, including development and use of Hydro power and rationalisation and modernisation of their industry. Some other important steps being taken are that the Export-Import Bank of Japan is advancing loans to industries at low rates of interest for export orders and Government is permitting import of essential raw materials like copper in bond free of duty for export orders.

It is to be noted that, despite the great progress in industrialisation which Japan has achieved, it has found it necessary to conclude many Technical Assistance agreements with foreign countries. By the end of 1952, it had concluded 211 such agreements with foreign firms. The machinery manufacturing industry, especially its electrical power plant and equipment, automobiles and aircraft branches, leads in the number of these contracts. The chemical industry is the next. This is obviously due to the great strides recently made in both these fields in Europe and the U.S.A.

Emulate Japan

We must emulate Japan in the matter of machinery industry and take steps to ensure that we make at the earliest possible time all our key requirements like heavy power plant and industrial machinery of various categories and road, rail, water and air transport machinery, as well as various types of defence equipment. For this purpose, production of steel, aluminium, etc., must be stepped up quickly and new metals like titanium must be produced in the country. In the new projected steel works of the Government of India, we must make different and special kinds of steel to meet the needs of our various engineering industries. In order to hasten production of our essential requirements, we should, like Japan, enter, where necessary, into technical know-how arrangements with foreign manufacturers in various fields in Europe, U.S.A., as well as, where suitable, in Japan. After prolonged negotiations, Government has recently entered into an agreement with German interests for the establishment of a new steel works to produce 500,000 tons a year to begin with. This new production and extensions under way by the existing steel works will still leave us in appreciable short supply of steel.

According to newspaper reports, Government has just concluded a technical agreement with a foreign firm for the manufacture of heavy power plant in India at a capital cost of Rs. 7 crores. The proposals for a heavy power plant had been submitted to the Government some five or six years back and a committee was appointed by it to examine these proposals. As a result of this, two U.S. and one British firm sent out technical missions which made detailed surveys and each of them submitted an elaborate project report. On the basis of these, the Committee carried out negotiations with the concerned foreign firms and recommended, some three years back, a technical tie up with one of them. The investment was estimated to be of the order of Rs. 20 crores. No action was taken then, and, meanwhile, many crores worth of heavy plant which could have been made in India by the projected factory has had to be ordered from abroad.

Proposed Power Plant Scheme

The report that Government has reopened negotiations and has at last entered into an agreement for a Rs. 7-crore project with a German firm is heartening but one wonders as to what can be done these days with the relatively meagre capital of Rs. 7 crores. Japan has some six or more heavy power plant manufacturing works and supplies more or less all its own needs. Our reported seven-crore scheme, the first of its kind in India, cannot meet anything like our requirements of heavy power plant. We will unfortunately, therefore, still need to continue to import much of our heavy plant requirements even after the projected factory goes into production. We must lay much greater stress and attach much greater importance and urgency to engineering industries than is the case at present. For, we cannot industrialise our country rapidly or satisfactorily nor defend our independence, unless we have a flourishing engineering industry which is capable of supplying the bulk, if not all, of our needs of industrial machinery, as well as transportation and defence equipment.

As in Japan, Government and various financial institutions must make it possible for private enterprise to do its part in the great and important task of making India prosperous and strong. Japan has, as stated earlier, made sufficient progress in machinery industry to be able to meet practically all its own requirements. There are certain types of machinery and consumer goods in the manufacture of which it will, I believe, be advantageous for Indian industrialists to arrange for technical assistance contracts in Japan. Industrialists in that country are willing to co-operate with Indian industrialists in this direction.

Japanese Willing To Assist

Apart from providing the know-how, they seem willing, in some cases, to participate in financing the industries in question. The Export-Import Bank of Japan would appear to be willing to advance long-term loans, at reasonably low rates of interest to acceptable Japanese industrialists to enable them to do this.

Much interest is being taken, both in India and Japan, in Indo-Japanese trade and possible Japanese assistance in the development of certain classes of industries in India. A large number of Indians has been recently visiting Japan and likewise quite a number of Japanese business people and industrialists have paid visits to India. These personal contacts will, I am sure, lead to an understanding of each other's needs and difficulties and pave the way for development of export and import trade and co-operation in the matter of establishment of some new industries in India. My recent visit to Japan has convinced me that there is a large area in both spheres of trade and industry wherein Indo-Japanese co-operation will be mutually advantageous.

TAX MUSINGS

(*Concluded from page 207*)

enactment will be frustrated. It would almost neutralise the exemption given to a resident under section 14(2) (c) by taking it away under section 42(1). This will not achieve the purpose the Government had in view.

But the question is, if they so intended to exempt ordinarily resident, then nothing was simpler than deleting reference to section 42 in section 14(2) (c). This argument seems plausible, but the obvious reply is that they cannot do so, for we have seen that the resident status may be either that of "ordinarily resident" or "not ordinarily resident

I.M.F. EXPERTS ON FIVE-YEAR PLAN

A YEAR ago, when four experts of the International Monetary Fund under the leadership of Mr. E. M. Bernstein, a distinguished economist and Director of the Research Department of the Fund, visited this country on a fact-finding tour and were invited by the Government to express their views on the Five-year Plan, some were sceptical of the utility of such an examination. They felt that there was no need for it, because, in their opinion, the Plan had already been sufficiently examined by economic experts and any further analysis would be a waste of time. A few of them, in fact, felt offended, as they interpreted it to mean that it amounted to a lack of confidence on the part of the Government in the judgment of Indian economists, who had expressed themselves on the Plan in a forthright manner. The report of the Mission's findings, released early this week, conclusively proves that these critics were wrong. The Mission has, in our view, rendered a valuable service to the country, for which the latter ought to be grateful to the I.M.F. The Mission has, of course, not said anything sensational or anything new which others in this country had not observed before. Nevertheless, its report is far more forceful and convincing on a number of issues than any critic in this country has been. Of even greater value is the support it extends to that minority section in this country which has been pleading for a saner and practical approach to such issues as controls, deficit financing, foreign investment and incentives to production. The success of the present Five-year Plan, as well as the subsequent plans, depends on the correct approach to these vital questions. It is gratifying to find that the Mission has viewed them not on any doctrinaire lines but with a clear understanding of the aspirations, needs and capacity of this country today. Praise is also due to the Government of India for its thoughtfulness in inviting the I.M.F. experts to express their frank views on its Plan and for its readiness to make public the findings of these experts, even though they have exposed some of its cherished shibboleths.

Boardly speaking, the I.M.F. experts have approved of the fundamental objectives of the Five-year Plan, of the approach made in it, and of its priorities and basic assumptions. They sound even more emphatic than our planners on the imperative need for India to go ahead with the implementation of this Plan, so that the economy can be transformed from a stagnant to a progressive one. Such a transformation, it is needless to add, is absolutely essential, in view of its rising population. At the same time, the experts have sounded a note of warning against resorting to investment through inflationary methods. The keynote of their advice is "economic development with stability." In short, the Government's policy should be "bold, without being reckless."

After their preliminary remarks on general policies that should be adopted by an underdeveloped country such as India in planning for an improvement in its living standards, the experts have examined the question whether the present economic situation in India offers a suitable base on which a development programme of the magnitude of the Five-year Plan can be mounted without any serious adverse repercussions. This is no mere academic issue, for, although more than 2½ years of the period are over, the major portion of the investment contemplated in the Plan is yet to be made. Moreover, the first two years of the Plan had been relatively more easy than the remaining three would be, because, in these two years, the country had some sizable windfalls. The real difficulty of finding resources without generating inflation has commenced only now. Accordingly, the experts' views on this question are important. These are more or less similar to those which Mr. C. D. Deshmukh, our Finance Minister, has been expressing in recent months. The experts observe that the piled-up latent inflation of the past has at last disappeared, that Indian prices have been reasonably stable, and that the deficit in the balance of payments has been reduced to what can properly be met by the use of sterling balances. "With this restoration of economic stability," they remark, "the country is now in a position to undertake a larger volume of investment, without the risk of an inflation that could get out of hand." To those whose vision is blurred by the present level of prices which are four times the pre-war level, these remarks will no doubt come as a surprise. But, as the I.M.F. experts rightly argue, "the test of inflation is not whether prices are now higher than they formerly were, and certainly not whether they are higher than in the pre-war years. The test of inflation is whether aggregate demand exceeds the value of output at current prices. Inflation is indicated by prices that are rising in the present, not by prices that have risen in the past." They do not say that nothing should or could be done to redress the wrongs arising from inflation in the past, but they contend that it is not feasible to do this, as it will necessitate a serious deflation which will undoubtedly halt any progress in the country. The pre-war price levels have thus become of historic importance only and it is no use even to dream of their return. The proper base-year to be taken for judging the economic conditions in the country is 1948.

The experts' analysis of the financial estimates of the Plan has confirmed the widespread belief in this country that the investments contemplated in it are beyond the available resources of the country. The experts hold that domestic savings, private and public, cannot be expected to reach the estimates and that a large part of the foreign resources required is not assured. Active measures will, therefore, have to be taken to increase the total resources available to carry out the Plan. In the absence of additional resources, the implementation of the Plan will result in inflation. The alternative is to reduce the contemplated level of investment, but this is unthinkable, because failure to give a forward momentum to the economy of India will prove as disastrous as inflation itself. So, determined efforts must be made to secure the necessary resources, both domestic and foreign, and the problem should be attacked with renewed energy and ingenuity. "In view of the low income *per capita* prevailing in India and the modest increases that may occur, it is difficult to believe," say the experts, "that the desired savings will come about automatically." Accordingly, they urge that careful consideration must be given to policies that will stimulate saving by both business firms and individuals. They feel that, to make up a deficiency in voluntary saving, it may be necessary to rely on compulsory measures such as social security contributions, taxes, and higher prices for services of public enterprises. They have examined the feasibility of some of these measures and come to the conclusion that, given the will and political courage, there is scope for raising a sizable amount, a view which conforms to the stand taken by this journal. Considerations of space do not permit a detailed consideration of this important chapter of the experts' report, but suffice it to say that the Mission is not unrealistic in its suggestions. It is, however, regrettable that the Mission, which has been very frank in some of its criticisms of the Planning Commission's estimates, has not been equally frank enough to express its views on abolition of prohibition and reintroduction of salt duty, both of which will, in our opinion, bring a substantial revenue.

The major part of the experts' report is devoted to a discussion of deficit financing and physical controls, as opposed to controls through the monetary mechanism. Their views on these two subjects are well balanced, in refreshing contrast to the extreme opinions held by some sections in this country. The experts do not say that deficit financing is inconsistent with a sound credit policy. What they say is that it is only excessive deficit financing which is not consistent with a sound credit policy and can lead to inflation, even if it is for the purpose of undertaking development. The practical problem for the monetary authorities here is "to determine how much is proper and how much is excessive deficit financing within the framework of a sound credit policy." The experts have not clearly indicated the safe limit of deficit financing for this country, for they feel that it is not possible to fix any precise limit, as it will depend on a number of factors which vary from time to time. But, from the broad criteria mentioned by them, one can safely conclude that an annual developmental expenditure of the order of Rs. 600 crores, now contemplated by Mr. Deshmukh, will necessitate deficit financing of an order that will be inflationary, unless he succeeds in getting large foreign aid.

The chapter on "price controls, rationing and allocations" must be read and re-read not only by the whole of the Planning Commission but also by all those who blindly urge that a rigid system of physical controls is a prerequisite for the success of any planned economic development. It is impossible to summarise in a brief paragraph the impressive arguments that have been advanced by the I.M.F. experts, but their firm conclusion will be evident from the following extract:

"Price controls and rationing, in conjunction with credit expansion, do not offer a solution to the problem of inadequate resources. The controls are difficult and costly to administer. Their successful enforcement

on a comprehensive scale and for a long period of time cannot be taken for granted and might prove impossible. The controls involve economic costs in the form of rigidities, waste, and disrupted production. If long continued, they weaken incentives to work and to supply goods in exchange for money. In the long run, the resources for development—and development is a long-run problem—must come from taxes or savings out of the current income of the people, or they must come from resources provided from abroad. The problem of inadequate resources must be faced and met. It cannot be hidden by the excessive creation of credit reinforced by controls to avoid an obvious and active inflation."

India's experience of controls in the war and post-war years, and of decontrol in the last eighteen to twenty months, clearly confirms the correctness of the stand taken by the I.M.F. experts.

The conclusion that emerges from the I.M.F. Mission's study is that India cannot afford a cut in the investments planned in the five-year programme, but it has not adequate resources to carry out these investments. Inflationary financing is dangerous, as it will ultimately bring about a fall in the moral and material standards of the Indian people, thereby defeating the very object of the Plan. The only solution is to supplement its resources through aid from those countries which are fortunate to enjoy a high degree of prosperity and can spare a part of their savings. It is as much the responsibility of these countries as of India to make this solution feasible. India has yet to make conditions favourable for inducing foreign capital to come in, while the prosperous countries on both sides of the Atlantic must do something more effective than they are doing at present. But we admit that, in the present state of political conditions in the world, one can legitimately criticise this statement as being somewhat unrealistic.

NEW ERA IN INDUSTRIAL RELATIONS?

THE decision of the Joint Consultative Board of Industry and Labour, which concluded its two-day session on 5th February at New Delhi, to reconstitute itself into a purely non-official and bipartite body, is expected to usher in a new era of industrial relations. Whether or not it will actually do so remains to be seen, considering the setback suffered by the "Giri approach" in the not distant past. Before examining this question, it is necessary to state briefly the history of the body now sought to be reconstituted. It will be recalled that the present Joint Consultative Board was brought into existence in July, 1951, on the advice of the Development Committee on Industries which itself was formed in December, 1950, on the advice of the Planning Commission. The official notification regarding the constitution of this Board was, however, not announced till as late as on 6th February, 1952. But, as its life was fixed at two years from 18th July, 1951, by the Government, the Board became *functus officio* as early as 18th July, 1953. The Board, therefore, can be stated to have met in a defunct capacity. This is, indeed, something strange.

The main purpose of reconstituting the Board is to enable it to serve effectively the original purpose of creating it, namely, to tackle problems relating to retrenchment, as a result of rationalisation and any other matter mutually agreed upon between capital and labour. The Board is expected to establish healthy conventions and create conditions for the avoidance of disputes on a fair and rational basis. Further, it is expected to take effective steps to secure implementation of agreements and conventions and help the growth of bipartite machinery at all levels, that is, at the level of individual undertakings, industry and State, not to mention the country as a whole. Another function expected of it is to offer advice and co-operation to the Government in regard to all matters concerning industrial relations.

The Government's move to reform this defunct body in such a manner as to induce co-operation between workers and management through mutual discussion and understanding is a welcome one. It is also significant, in that it shows that the Government is still keen on pursuing the philosophy underlining the famous "Giri approach." It is gratifying to find that even Mr. Shantilal H. Shah, Bombay Minister for Labour, who was once strongly opposed to this approach, now admits that the right method of settling industrial disputes is conciliation and not running to industrial courts every now and then. Expressing this view in the course of a speech at Pachora (East Khandesh) last week, Mr. Shah declared that labourers and employers should sit round the table and settle their disputes by mutual discussion and that the help of industrial courts should be sought only in the last resort, after all means of amicable settlement had failed.

While this change in official attitude is commendable, it is advisable not to be too optimistic about the success of the new move. At the Conference referred to above, labour was opposed at the very outset to the constitution of the bipartite machinery, on the ground that it was a weaker party and, therefore, its bargaining power was not sufficient to make itself felt on the machinery. It, therefore, favoured the participation of the Government in the machinery. It was, however, only on the advice of Mr. Gulzarilal Nanda, Minister for Planning, who is the real author of the "Giri approach," that labour agreed to the reconstitution of the Board on a bipartite and non-official basis. Thus, labour has accepted this move only reluctantly. Nevertheless, the fact remains that it has agreed to come in and for this, considerable credit goes to Mr. Nanda. Apparently, he has succeeded where Mr. Giri had failed.

The success of the bipartite machinery depends not only on the sincerity of purpose of all those participating in it but also on the strict observance of neutrality by the Government. It should not intervene in employer-employee disputes, unless there is a national emergency or a serious threat to peace, or severe inconvenience to consumers. This is an essential prerequisite, because, so long as either party to the dispute is under the impression that it can get the scales tipped in its favour through the support of the Government, there will be no inclination on its part to settle disputes through mutual negotiations and voluntary conciliation.

Another basic condition for the success of a bipartite machinery is the realisation among workers and management that their interests are identical. They must remember that labour and capital are not irreconcilables, but part and parcel of a living organism and that the one without the other is like a horse without a chariot. There should be a spirit of give and take born of the realisation that maintenance of peaceful industrial relations is not a one-way street: the responsibility does not rest on the employer alone, but also on labour which must be as ready to give as it is ready to take. While employers must bear in mind that, if workers are to be efficient and devoted, they need to be assured of freedom from want, the employees must not forget that, if their share in the earnings of an undertaking is to be large, then they will have to help their employers to earn large profits and that "wealth can be created only by the sweat of one's brow and not by the strength of one's clamour." Failure to realise these fundamental requisites for a healthy employer-employee relationship will render the bipartite body a useless machinery and increase the dependence on the machinery of adjudication, which everybody admits is detrimental to such relationship.

AMERICA ON FREE TRADE AND FREE CURRENCIES

THE Randall Commission's Report to the U.S. President on liberalisation of trade and currencies, more details of which are now available, adds yet another to the list of documents advocating bringing America into a regime of free trade with other countries, which will assist them in turn to make their own currencies convertible. Unfortunately, the only material recommendation of the Commission which has secured unanimous approval by its members concerns the desirability of sterling convertibility and the cautious steps which the sterling area might make to that end. All the other recommendations of the Commission are hedged round with reservations or dissents of one or more members and look as if they are likely to have little chance of acceptance, if they are put before the House and Senate Committees which would have to approve any legislation embodying them. The Chairman of the Senate Finance Committee, for instance, dissents from all the provisions concerning liberalising American import policy and the Congress is likely to follow his lead. The only refreshing factor is the unexpected approval given by the Trade Unions' representative on the Commission towards a freer American import policy, since the American Trade Unions have traditionally been highly protectionist.

The Report contains a factual survey of the dollar problem which shows the illusory nature of the present surplus being earned by the non-dollar world. In 1953, American military and stock-piling expenditure provided the non-dollar world with $3,000 million, to which economic aid added a further $2,000 million, making a total of U.S. special expenditure of $5,000 million. Over the same year, the non-dollar world increased its gold and dollar resources by over $2,000 million, so that the normal deficit on trade account of the non-dollar world with the dollar world would appear to be somewhat less than $3,000 million. Yet there is no doubt that this special American expenditure will rapidly come to an end and the Commission recommends that it should. What then is to be put in its place, if the dollar and the non-dollar worlds are to trade in balance? The Commission's Chairman attempted to answer this question in a liberal manner—but, in deference to many of his colleagues, accepted less sweeping recommendations than he would otherwise put forward—however, without success, and he might as well have worded his report more forthrightly. Somehow or other, foreign nations must either receive or earn more dollars. They can receive them by increased American commercial investments overseas, and the Report suggests specially reduced taxation on income from overseas investments and, in appropriate cases, guarantees against capital losses. More dollars can only be earned by the rest of the world if they can sell more to the United States. Thus, the Report recommends a modification of the "Buy America" Act to enable foreign firms to compete for U.S. Government contracts on equal terms with American firms.

Import policy should also be as liberal as that of other countries, though with protection against low-wage production. The Report does not consider American tariffs unduly high, but wants the President to have powers to reduce current rates by 5 per cent. per annum for the next five years and to reduce all rates down to no more than 50 per cent. But, more important, the Report asks for a simplification of the commodity definitions and classifications which, in practice, are a more formidable barrier to exporters to the United States than the actual tariff rates themselves. On the other hand, it is proposed that America should retain the right to increase tariffs at any time; this perpetuates an ever-present danger to seekers after U.S. markets.

There is also a liberal recommendation that the European countries should strengthen their trade by importing and exporting more freely with Iron Curtain countries without suffering American disapproval, provided, of course, that non-strategic goods (to be more liberally interpreted than hitherto) only are involved. On the other hand, the Report condemns inter-Governmental agreements to stabilise the prices of raw materials, thus presumably putting an end to any scheme for stabilising American purchases of sterling rubber and tin. This is an example of the Chairman's devotion to the principle of the maximum freedom to trade, but it would be more readily acceptable, if the Report's general recommendations had any chance of being adopted. In an un-free trading world, it is a gain to make agreements covering even single commodities.

The Report will give no encouragement to those who wish to see sterling make a "dash for convertibility." It advocates a policy of gradualness, convertibility depending upon an expanding and strengthening of trade. The Commission agrees that the European Payments Union, which has worked very well, should not be destroyed until it is certain that something better can be put in its place and would be prepared to see what it calls "floating" exchange rates while currencies find their own levels. It would also like to see substantial support from the International Monetary Fund, and even from the Federal Reserve System, to assist countries to make their currencies freer. But, generally, the Report adheres to the school which says that right conditions must precede convertibility.

If the Report has done nothing else, it has served to show what, in the opinion of one more American Government Commission, are the conditions precedent to the full convertibility of currencies. The Congress may reject most of the recommendations, or water them down to an extent which renders them valueless, but it will then only have itself to thank if sterling, through which 40 per cent. of the world's foreign trade is done, continues to be a thing apart from the dollar.

SEASONAL DEMAND FOR MONEY STRONG

BANK RATE IN FRANCE AND U.S. CUT—PLIGHT OF TOBACCO PRODUCERS

THURSDAY, 5 P.M.

THE profit-taking by bulls in the Share Market witnessed last week has proved to be a short-lived affair. There has been enthusiastic buying again in most of the counters, more especially in textiles. The decision by the management of the Svadeshi and Central India Mills, both of which are under the management of Tatas, to issue bonus shares, has revived hopes of similar action by the managements of other mills which have sufficient resources and are in a position to issue bonus shares. Prominent among these are Gokak, Bombay Dyeing and Century. An increase of Rs. 2 in the final dividend by the Kohinoor Mill has also imparted some strength to textile shares. This increase had been fully anticipated by the market. Usually, when the market discounts in advance a particular development, the share concerned slips down. That such has not been the case with Kohinoors is significant, in that the market expects still better results for the current year. If the present trend of cloth market persists, this expectation will be justified. It looks as though for the textile mills, in general, and for well-managed ones, in particular, 1954 may turn out to be a better year than 1953. Among steels, Indian Irons took the lead on reports that the Tariff Commission has submitted its recommendations to the Government in regard to the retention prices for the products of the Company. There are reports that the Commission has proposed a liberal increase of Rs. 65 per ton in the price, but it remains to be seen whether the Government will accept it without making any downward adjustment. The firmness of Indian Irons has had a sympathetic effect on Tata Steel shares also. In the miscellaneous section, there has been selective buying in engineering shares, on reports that all leading engineering companies are doing well, with their order books full for a fairly long period, which, in some cases, is believed to be two years. The undertone of all sections is quite steady, if not firm.

MARKET GOSSIP

• • • •

Among the other markets, cotton has staged a recovery, thanks to covering by leading mills which had gone short and which were waiting for the market to react a little for fixing their call. The continued firmness of the ready section has also been a contributory factor. It is reported that quite a large turnover took place in the ready market, both in Indian and foreign cotton. There has been no appreciable variation in oilseeds, while in bullion, gold has staged a further rise for the fourth week in succession. This is due to an improvement in offtake in the face of lower arrivals. Silver, however, has been a shade quiet, which is not surprising, considering that there had been a fairly heavy rise in the past few weeks.

• • • •

Sometimes, Mr. T. T. Krishnamachari, Union Minister for Commerce and Industry, behaves like King Canute. The latest instance of this was his statement at Madras a few days ago that the prices of groundnuts and oil were standing at unduly high levels and that they should decline. He alleged that dealers were hoarding this commodity and pushing up its price in the expectation of Government allowing exports. He reiterated what he said in Bombay a few months ago when he remarked at Madras that, unless the price of groundnut oil declined below Rs. 1,000 per ton, he would not allow it to be exported. It is not known why he has chosen this limit of Rs. 1,000 per ton. But, in a free market, prices do not move according to the whims of ministers. They are determined by the law of supply and demand and by the view which merchants take of the future. It is not, therefore, surprising that Mr. Krishnamachari's statement has made no impression on the trend of the market. The ruling rate for groundnut oil in Bombay is over Rs. 1,300 per ton, which is only a shade lower than that prevailing before the Minister's threat. There was, of course, some selling, but that was offset by consisting buying by consumers. Arrivals of groundnut have broadened, but, at the same time, demand from crushers and *vanaspati* interests has been brisk. The fact reports that the Commission has proposed a liberal increase of Rs. 65 per ton in the price, but it remains to be seen whether the Government will accept it without making any downward adjustment. The firmness of Indian Irons has had a sympathetic effect on Tata Steel shares also. In the miscellaneous section, there has been selective buying in engineering shares, on reports that all leading engineering companies are doing well, with their order books full for a fairly long period, which, in some cases, is believed to be two years. The undertone of all sections is quite steady, if not firm.

Sometimes, Mr. T. T. Krishnamachari, Union Minister for Commerce and Industry, behaves like King Canute. The latest instance of this was his statement at Madras a few days ago that the prices of groundnuts and oil were standing at unduly high levels and that they should decline. He alleged that dealers were hoarding this commodity and pushing up its price in the expectation of Government allowing exports. He reiterated what he said in Bombay a few months ago when he remarked at Madras that, unless the price of groundnut oil declined below Rs. 1,000 per ton, he would not allow it to be exported. It is not known why he has chosen this limit of Rs. 1,000 per ton. But, in a free market, prices do not move according to the whims of ministers. They are determined by the law of supply and demand and by the view which merchants take of the future. It is not, therefore, surprising that Mr. Krishnamachari's statement has made no impression on the trend of the market. The ruling rate for groundnut oil in Bombay is over Rs. 1,300 per ton, which is only a shade lower than that prevailing before the Minister's threat. There was, of course, some selling, but that was offset by consisting buying by consumers. Arrivals of groundnut have broadened, but, at the same time, demand from crushers and *vanaspati* interests has been brisk. The fact that groundnuts is that the increase in production in the current season has been nearly neutralised by the deficit in the previous season, which left no surplus to be brought in. The statistical position of this seed is, therefore, strong and no appreciable fall in prices can be expected. If at all there is any reduction in prices, it may prove to be no more than a temporary phase. Consumers can expect real relief only after another season of normal crop. If Mr. Krishnamachari were to stick to his condition that he would allow exports only if groundnut oil declined below Rs. 1,000 per ton, then there might be no exports at all. For, at present, there is little evidence to suggest that a 30 per cent. fall in prices is a near possibility.

• • • •

Enquiries in market circles reveal that Mr. Krishnamachari's allegation that traders are hoarding in expectation of exports being allowed is, however, not without foundation. This is evident from the trouble in which some of the exporters have entangled themselves. It would appear that a number of shippers had already entered into firm commitments for export with overseas buyers. A sizable volume of business was booked at rates varying between £122-10 and £131 per ton, which compare with the ruling price of £118 per ton in the local market and £156 to £160 per ton on the Continent. As shippers are not able to honour their commitments, the Continential buyers are pressing them to pay heavy damages. They are not prepared, it is said, to square up this business at anything less than £146 per ton. If the shippers were to accept a settlement on this basis, they would have to forgo a part of their profits. It seems that they are refusing to pay the difference on the ground that their commitments were subject to the condition of export licences being granted by the Government.

• • • •

While traders in oils and oilseeds appreciate the Government's reluctance to permit exports of groundnuts in any form, they are at a loss to understand its continued silence over exports of castor oil, in which the country has a definite surplus of more than 30,000 tons in terms of oil. The traders are of the view that there is a good case not only for allowing exports of this oil but also for a reduction in the export duty on it. Some are offering to book export orders at low rates, subject to export licences, but buyers are not readily forthcoming. It is reported that some scattered business has been done at about £120 per ton for oil with the U.K. and the Continent. But even at the current price of Rs. 12 per quarter, Indian castoroil is out of parity with world prices. It works out to 13.5 cents per lb., as against 11.5 cents quoted by the U.S. buyers. It may be noted here that export duty at Rs. 300 per ton works out to 2.75 cents per lb. It will thus be seen that no business with the U.S., the main market for Indian castor oil, will be possible so long as the present rate of export duty continues.

• • • •

In the money market, the speed with which demand for funds has gathered momentum has exceeded earlier expectations. Till recently, the market was sluggish and market scribes were at considerable pains to explain it. Latest money market indices reveal that funds are in much greater demand than they were this time last year. Between 11th December, 1953 and 29th January, 1953, the Scheduled banks advances and bills discounted had gone up by no less than Rs. 56.09 crores, as against only Rs. 32.66 crores in the corresponding period of the previous year. The combined total of advances and bills stood at Rs. 505.57 crores, as against Rs. 488.96 crores a year before. Again, borrowings from the Reserve Bank were higher at Rs. 11.91 crores, as against only Rs. 1.70 crores. Similarly, borrowings from the Imperial Bank, too, were larger at Rs. 5.69 crores, as compared with only Rs. 2.58 crores. At the same time, balances with the Reserve Bank dropped by as much as Rs. 17.26 crores, as compared with only Rs. 2.28 crores in the same period of last year. In fact, the Scheduled banks cash balances at the end of January, this year, were lower at Rs. 38.50 crores, as compared with Rs. 45.08 crores a year before. If the call on banks for accommodation persists at this rate in the remaining months of this busy season, the stringency may be quite acute. There will not, however, be any further perceptible hardening of short-term money rates, inasmuch as the Reserve Bank is a willing supplier of credit at the rate of 3 per cent. per annum under the usance bill market scheme and at 3½ per cent. against Government securities.

• • • •

Soon after we went to press last week, two countries, namely, the U.S. and France announced a cut in their respective Bank rates. The U.S. discount rate was reduced from 2 per cent. to 1½ per cent. That was on the 5th inst. The last change in the U.S. Bank rate was in the middle of January, 1953, when it was increased from 1½ per cent. to 2 per cent. Thus, the present cut of ½ per cent. restores the rate to its former position a little over a year ago. Simultaneously, on the same day, a similar cut of ½ per cent. in the French Bank rate was announced. With this cut, the discount rate of the Bank of France now stands at 3½ per cent. instead of 3½ per cent., as hitherto since 17th September last when it was brought down from 4 per cent. to 3½ per cent. The reduction in the discount rate by both the countries by the same extent and at the same time is said to be for the same causes, namely, fall in industrial output and increase in unemployment. In other words, both have resorted to the Bank rate as a weapon to initiate changes in credit policy. Here, the similarity between the two countries ends.

• • • •

In the U.S., the cut in the discount rate is the continuation of the cheap money policy adopted by the Federal Reserve Bank system last year. Since May last year, American authorities have been providing as much credit as the commercial banks needed by means of purchasing Government securities in the open market. Money, therefore, became more plentiful with the commercial banks. But demand for advances from private business not only failed to expand but actually suffered a decline during the past few months. The result has been a drop in the Treasury Bill rate to as low as 1 per cent. followed by a corresponding fall in other short-term interest rates. It is with a view to bringing the discount rate into line with the short-term rates that the U.S. discount rate has now been cut. Commercial banks need not resort now to sales of Treasury Bills to obtain funds, for they can now borrow them straight from the Central Bank.

• • • •

In France, the decline in the discount rate is part of a development plan aiming at a 10 per cent. rise in industrial production. It is chiefly intended to make credit very cheap in the hope that it would stimulate investment, increase employment, and bring down internal price levels—which are higher than world prices—through higher production. This decision has been taken regardless of its effect on the country's balance of payments position which discloses a deficit on current account. This is possible, because dollars accruing to the French Treasury on account of the U.S. aid have been steadily expanding. Yet the French economy seems to derive very little benefit. In spite of severe import restrictions and heavy export subsidies, the commercial balance of payments remains critical. Commenting on the present French economy, the *Financial Times*, London, says:

"While nearly every country belonging to the O.E.E.C. registered a recovery in industrial production in 1953, France showed a drop of 4 per cent. below the 1952 level. Unemployment has increased, trade has gone slack, and yet there has been no sign of the benefit that might have expected to result from these deflationary conditions—a sharp downward adjustment in French prices towards world competitive levels. In these circumstances, Mr. Faure, the Finance Minister, seems to have decided that the only course open to him is to take the financial risks of a policy of pump-priming directed particularly at a higher level of industrial investment."

• • • •

This is a risky step, as the situation in France is already inflationary. Generally interest rates are given an upward twist to fight inflation. But the French Government is trying to control inflation through cheap money policy. This seems to be a shot in the dark.

• • • •

As already mentioned the Directors of the Svadeshi Mills sprang a pleasant surprise on the market this week by announcing their proposal to capitalise (subject to Government sanction) Rs. 25 lakhs out of the amount standing to the credit of the reserve fund and issue 25,000 ordinary shares Rs. 100 each to the existing ordinary shareholders, in the ratio of one share for every three shares held. The implementation of this proposal does not require any increase in the authorised capital of the Company, as there are still 35,000 unclassified shares of Rs. 100 each to be issued. The Directors propose to issue the aforesaid 25,000 shares out of this balance of authorised capital.

• • • •

The present paid-up ordinary capital of the Svadeshi Mills stands at Rs. 75 lakhs made up of 75,000 ordinary shares of Rs. 100 each; it is supplemented by a reserve fund of Rs. 50 lakhs. When the present move materialises, the paid-up ordinary capital will stand at Rs. 1 crore and the reserve fund at Rs. 25 lakhs. This is not, however, the first occasion that the Company is capitalising its reserves. It has already done so twice, both within the last seven years. The first occasion was in July, 1948, when it capitalised Rs. 30 lakhs and issued bonus shares to the then existing ordinary shareholders in the ratio of one share for each share held by them. Within an interval of 13 months from this, in August, 1949 to be precise, a sum of Rs. 15 lakhs was again capitalised and bonus ordinary shares were issued in the ratio 1 : 4. When the proposed capitalisation is carried out, the Company will earn the distinction of having increased its capital by way of capitalisation alone by as much as Rs. 70 lakhs. The total paid-up capital of the Company is at present Rs. 90 lakhs, as against a gross block (as on 31st December, 1952) of Rs. 129.98 lakhs. As the Company has a long-term plan for reorganisation and renovation of the mills, the Directors have thought it fit to have a more balanced capital structure.

• • • •

Close on the heels of the above proposal came the decision of the Directors of the Central India Spinning to increase its capital. But this is to be done partly by capitalisation of reserves and partly by the issue of new shares. The Directors propose to capitalise Rs. 15,62,500 out of the reserves (which stand at Rs. 47.56 lakhs) and issue 15,625 ordinary shares as bonus to the holders of the existing 46,875 ordinary shares in the ratio of one share for every three shares held by them. This will raise the ordinary capital to Rs. 62.50 lakhs, made up of 62,500 shares of Rs. 100 each. After this proposal is carried out, they propose to issue 37,500 new ordinary shares of Rs. 100 each. These shares will be offered for subscription at par to the holders of ordinary shares existing after the issue of the aforesaid bonus shares in the ratio of one new share for every two shares. As there will be only 62,500 ordinary shares, the new issue will absorb only 31,250 shares. The remaining 6,250 shares will be offered to these shareholders in addition to those issued in the aforesaid ratio of 1 : 2. If, however, the issue of 37,500 shares is not fully taken up by the ordinary shareholders, preference shareholders will be given the right to apply for the shares. In case the issue is not taken up by both the ordinary shareholders and the preference shareholders, the Directors will have the right to issue them at their discretion. In order to carry out these proposals, the existing authorised capital needs to be increased and the Directors propose to raise it to Rs. 2 crores. Perhaps this is the first time that this Company is issuing both bonus shares and new shares. So far as we can make out from the statistics available with us, it has not done so in the last two decades. The gross block of the Company (as on 30th June, 1953) stands at Rs. 221.33 lakhs, while the paid-up capital is no more than Rs. 96.87 lakhs. There is thus a good case for an increase in the capital structure of the Company.

• • • •

For some months now, the Indian tobacco producers have been passing through a crisis brought about by a depression in the market. The small growers who account for the bulk of tobacco grown in this country have been hard hit by the large accumulation of unsold tobacco stocks and heavy slump in prices. In Guntur, the country's major tobacco-producing district, for instance, about 32 million pounds of tobacco are reported to be lying in

(*Continued on page 287*)

IRREGULAR MOVEMENT IN EQUITIES

TEXTILES FIRM

(From Our Own Correspondents)

BOMBAY, 11*th February*

AN irregular movement in equities characterised trading on the Stock Exchange during the week under review under alternate spells of speculative support and profit-taking. The undertone was, however, steady. Values were sustained under the leadership of textile shares on account of favourable factors, such as announcement of bonus issues by two cotton mills, expectation of similar issues by a few more companies in the textile group and encouraging reports regarding continued demand for cloth from consuming centres. Besides, reports of a possible increase in retention prices of steel for the Indian Iron and Steel Co., Ltd., as a result of the Tariff Commission's recommendations and the big rise in notes in circulation were additional factors which sustained the sentiment. Nonetheless, equities failed to stage any big spurts, except in a handful of counters. The main reason for this was a general disinclination to enter into fresh commitments on account of the usual pre-budget cautiousness among operators. Though the Finance Minister had indicated that there would not be any major changes in the tax structure till the Taxation Enquiry Commission submits its report, the market seemed to entertain some misgivings regarding the probable effect on budget proposals of the reported heavy fall in Government revenues.

A notable development of the week was the announcement by two cotton textile mills of their proposal to issue bonus shares and the declaration of dividends by three mills. The Directors of the Svadeshi Mills Co., Ltd., have decided, subject to sanction by the Central Government, to capitalise Rs. 25 lakhs out of the reserve fund and issue 25,000 ordinary shares of Rs. 100 each to the existing shareholders as bonus shares in the ratio of one share to every three existing shares. The Directors of the Central India Spinning, Weaving and Manufacturing Co., Ltd., have also decided to capitalise Rs. 15.6 lakhs and issue bonus shares in the proportion of one share for every three held. They also propose to issue 37,500 new ordinary shares of Rs. 100 each at par and to offer them to the existing ordinary shareholders after the issue of bonus shares and, if necessary, to the preference shareholders.

The Directors of the two mills under the management of Messrs. Brady and Co., Ltd., namely, the New Great and the New City, have decided to maintain their dividends for 1953 at Rs. 10 per share. In the case of New Great, the dividend was beyond the expectations of the market. The Directors of Kohinoors propose to raise the final distribution for 1953 from Rs. 12 per share to Rs. 14 per share, by paying a bonus of Rs. 2 per share. This is in line with the market expectations.

In the steel section, Tata Deferreds opened on a quiet note at Rs. 2,087-8, as against the previous week's closing of Rs. 2,101-4 and moved in a narrow groove between Rs. 2,086-4 and Rs. 2,112-8 up to Tuesday this week. Yesterday, there was a fresh advance on emergence of buying support and Deferreds touched a high of Rs. 2,127-8. To-day, however, profit-taking intervened due, to end-of-account considerations and the scrips closed lower at Rs. 2,117-8. Tata Ordinaries came up to Rs. 361-4 before closing at Rs. 359, a gain of but Re. 1-4 over the week. After an initial dullness, Indian Irons brightened up on unconfirmed reports that the Tariff Commission had recommended an increase of Rs. 65 per ton in the retention price of steel to compensate higher costs. The shares, after being marked down from Rs. 28-3 to Rs. 28-0¼, looked up to Rs. 28-7, before settling down at Rs. 28-4.

The textile section was cheerful for reasons stated at the outset. Bombay Dyeings were prominent with a rise of Rs. 10-10 to Rs. 433-2 in view of the proximity of dividend announcement and rumours about bonus issue. The shares at one time during the week touched a high of Rs. 437-8. Kohinoors advanced from Rs. 316-8 to Rs. 321-8, but closed at Rs. 319-8. Central Indias were featureless early in the week, moving between Rs. 187 and Rs. 184-8 up to Monday. But following the announcement of the bonus issue, they spurted to Rs. 197-8. The buoyancy was short-lived in view of the proposal to increase the Company's capital by the issue of new shares after the bonus issue, and the shares came down to Rs. 187. Centurys came under the influence of rumours regarding bonus shares and closed with a gain of Rs. 9-8 at Rs. 318-8. For similar reasons, Gokaks staged a rise of Rs. 11-8 to Rs. 264-8. Morarjis advanced by Rs. 7-8 to Rs. 206-4. Mysore Spinnings were done at Rs. 160 *ex-div.* as against Rs. 165 *cum-div.* (dividend Rs. 3). Minervas gained Rs. 2-4 to Rs. 106. These two shares will be placed on the forward list of the Stock Exchange next week. New Greats, after being lower for a while, looked up to Rs. 167. Shrinivas appreciated by as much as Rs. 7-8 to Rs. 182-8. Simplex showed no gain at Rs. 154. Standards put on Rs. 6-4 to Rs. 329-12, Svadeshis Rs. 9-12 to Rs. 292, Swans Rs. 6-4 to Rs. 352-8 and Tata Mills Re. 1-8 to Rs. 53-8. Bradbury, which had been consistently going up for the past few weeks, received a check this week and came down by Rs. 30 to Rs. 925. Khataus dropped Rs. 8-12 to finish at Rs. 205-10.

Bank shares were featureless and price variations were small. Barodas were a fraction higher at Rs. 107-8, while Indias were a shade lower at Rs. 154. Centrals were unchanged at Rs. 58-8, while their new shares were better by As. 12, at Rs. 63. Imperial Fully Paids were marked down by Rs. 7-8 to Rs. 1,802-8, while Contributories were stagnant at Rs. 440. United Commercials were fractionally lower at Rs. 41.

There was a slight revival of investment demand in select electricity shares, but the volume of business was not large. Ahmedabad Electrics gained As. 10 to Rs. 115. Tata Hydros put on Re. 1 to Rs. 139 and Tata Powers Rs. 10 to Rs. 1,390. Andhra Valleys dropped Rs. 5 to Rs. 1,257-8. Bombay Suburbans were lower by As. 15 at Rs. 121-4 and Poona Electrics by As. 10 at Rs. 128-2.

Barring some activity in select counters, insurance shares, as a whole, were featureless. New Indias were done As. 4 better at Rs. 40-4. Industrial Prudentials were wanted Re. 1-8 higher at Rs. 31-8, as also Vulcans Re. 1 better at Rs. 12-12. Orientals were unchanged at Rs. 7,085, Empires at Rs. 640 and Jupiter at Rs. 7-4.

A marked rise of Rs. 18-12 to Rs. 360 in Alcock Ashdowns, due to scarcity of sellers, was the outstanding feature in the miscellaneous section. On reports that the Company would get a loan of Rs. 8 crores for its expansion programme, Scindias appreciated from Rs. 17-1½ to Rs. 17-10, but finished lower at Rs. 17-7½. A.C.C.s were featureless at Rs. 177. Belapurs picked up Rs. 2-8 and closed at Rs. 259. Bombay Burmahs moved between Rs. 387-8 and Rs. 382-8, before closing at Rs. 385. B.I.C.s were a little better at Rs. 9-4. Killicks gained Rs. 2-4 to Rs. 162-12. National Rayons evoked fresh interest owing to proximity of dividend announcement and advanced by Rs. 6 to Rs. 153-12. Phaltan Sugars were marked down by Rs. 6-12 at Rs. 103-4. Premier Constructions changed hands Rs. 4-4 higher at Rs. 118-12. Tata Chemicals hardened by As. 1¼ to Rs. 11-9½ and Tata Oils by As. 4 to Rs. 354. Wimcos were unchanged at Rs. 207-8. Digvijay Cements were a fraction better at Rs. 114-8. The shares will be placed on the forward list next week. Bhopal sugars, which also will be added to the forward list, came to be done at Rs. 12-6.

• • • •

Calcutta Stock Exchange

CALCUTTA, 10*th February*

The three-week old lively sentiment that prevailed on the Calcutta Stock Exchange gave way to an easy trend during the week under review. The easiness was occasioned by profit-taking and short selling, both being induced by fears regarding the outcome of the proposed colliery labour strike from 1st of March. There was, besides, extreme cautiousness among operators generally, a phenomenon usually associated with the weeks immediately preceding the Railway and the Central budgets. As some weak holders were inclined to reduce commitments in view of budget uncertainties, the market showed a tendency to drift downwards with most equities reporting losses on balance. Jute shares, however, proved an exception to the generally declining trend, as many of them registered smart gains.

The fall in prices was pronounced in the coal section. New Beerbhooms and Equitables receded by As. 4 each to Rs. 18-8 and Rs. 31-8, respectively. Central Indias receded from Rs. 6-3 to Rs. 6. Burrakurs were done an anna lower at Rs. 8-11.

Engineering scrips also met with selling pressure and suffered losses. Textile Machineries declined by As. 6 to Rs. 9-8. Jessop and Cos. dropped As. 4 to Rs. 26. Indian Irons declined by As. 2 to Rs. 28-6. Marshalls lost an anna to Rs. 6-11. Britannia Engineerings and Khumardhubis were dull at Rs. 27 and Rs. 8-11, respectively.

The sugar section too failed to evoke support. Among the former, Carew and Cos. slided down from Rs. 8-8 to Rs. 8. Ramnugger Canes eased by As. 7 to Rs. 22. Belsunds were lower by As. 2 at Rs. 8-15.

Among paper scrips, Titaghurs were marked down by Re. 1 to Rs. 38. Shree Gopals fell by As. 12 to Rs. 21.

Textile scrips were easy, New Victoria Ordinarys and Kesorams being quoted lower, the former at Rs. 1-11, as against Rs. 1-13, and the latter at Rs. 23-15, as against Rs. 24.

In the miscellaneous section, Rallis India were the worst sufferers, on reports of unsatisfactory results of working of the Company. The shares were marked down by Rs. 2-8 to Rs. 56-8. Dunlop Rubbers dropped As. 14 to Rs. 32-14 tor want of support. Jardine Hendersons shed As. 8 to Rs. 115 and Rohtas As. 3 to Rs. 11-13. India Coffees, Sone Valley Cements and India Steamships lost an anna each to Rs. 3-2, Rs. 7 and Rs. 7-9, respectively.

Tea scrips ruled dull with limited turnover and minor variations in prices. Dhelakhat declined by As. 3 to Rs. 13-5. New Terais were quoted at Rs. 13-12, Roopcherras at Rs. 8-10 and Jutlibais at Rs. 13-1. Patrakolas changed hands at Rs. 162-8.

In distinct contrast to the general trend, the jute section presented a fully steady trend. Deltas firmed up by Rs. 13 to Rs. 239. Fort Glosters advanced by Rs. 4 to Rs. 474. Indias spurted by Rs. 2 to Rs. 126-8. Nuddeas rose by a rupee to Rs. 47. Nationals improved by As. 8 to Rs. 24-14 and Presidencys by As. 7 to Rs. 3-13. Reliances were a shade better at Rs. 14-14. Howrahs were steady at Rs. 24-8.

• • • •

Madras Stock Exchange

MADRAS, 9*th February*

Except for textile and a few miscellaneous scrips, the Madras Stock Exchange ruled generally easy. The uptrend witnessed in the textile section last week persisted this week also for the same reason, namely, continued export enquiries for piecegoods and good offtake of cloth at various consuming centres in Madras. Prices of textile shares as a result shot up and recorded sizable gains. Selective buying on yield considerations caused some enlivened activity in the miscellaneous section this week. Plantings, however, put on a cheerless appearance, on profit-taking at the high levels touched towards the end of last week. The easiness was more pronounced in the tea section in which prices drifted downwards on selling pressure. There was, however, scattered enquiry in rubbers, while coffees remained generally neglected.

Textile shares put on a bright appearance, on continued buying support. Unusually smart gains were recorded in some of them. Thus, Bangalore Woollens gained Rs. 7-8 to Rs. 302-8, and Gnanambikai Rs. 6 to Rs. 82. Metturs were higher at Rs. 229, as against Rs. 223. Cannanores and Coimbatore Cottons put on Rs. 5 each to Rs. 91 and Rs. 190, respectively. Vasantas gathered Rs. 4 to Rs. 182. Premiers too were up by a similar amount at Rs. 99. Coimbatore Pioneers rallied Rs. 2-8 to Rs. 137-8 and Coimbatore Spinnings As. 8 to Rs. 46-8. But Lakshmis, (Rs. 50 paid-up) lost Rs. 4 to Rs. 107 *cum-div.* and 'A' (Rs. 25 paid-up) Re. 1 to Rs. 54-8 *cum-div.* Rajalakshmis eased from Rs. 100-8 to Rs. 97-8. Krishnarajendras were done at Rs. 56-4 *ex-div.*, as against Rs. 59 *cum-div.*

Teas, among Plantings, presented a mixed trend. Twyfords gained As. 14 to Rs. 14-4 and Udayagiris As. 7 to Rs. 8-14. Devon Teas rallied As. 2 to Rs. 16-2 and Alageswaar an anna and a half to Re. 1-15½. Peermades, however, lost As. 4 to Rs. 31. Nonsuch teas were also lower by a similar amount at Rs. 34-8. Highland Produces lost As. 2 to Rs. 13-4.

Among rubbers, Rajagiris lost As. 6 to Rs. 10-15. Cochin Malabars and Thamarapallys were lower by As. 2 each at Rs. 7-1 and Rs. 16-2, respectively. Midlands eased from Rs. 12-10 to Rs. 12-7½. Teekoy and Nilambur, however, put on As. 2 each to Rs. 7 and Rs. 8-8, respectively. Kailas were fractionally better at Rs. 3-14½.

In the coffee section Coffee Lands lost As. 4 to Rs. 8-13 and Consolidated Coffees an anna to Rs. 16-3. Nil. Neergundis were unchanged at Rs. 3-11, while Mysore Coffees were fractionally better at As. 12½.

Among miscellaneous scrips, Andhra Cements 'A' put on Rs. 4 to Rs. 105 and 'B' As. 4 to Rs. 10-8. India Cement (Rs. 25 paid-up) gained Re. 1-2 to Rs. 18-10. Travancore Cements rose up by As. 4 to Rs. 5-2. Mysore Paper rallied As. 8 to Rs. 17-8. Deccan Sugars, Rs. 10 paid-up, gathered As. 4 to Rs. 9-4 and, Rs. 25 paid-up, As. 10 to Rs. 23-2. Rallis, however, lost Rs. 5 to Rs. 56, against Rs. 15-14. The Directors have declared a final dividend of 10 per cent. on ordinary shares, thereby making a total dividend of 15 per cent. for the year ended 30th June, 1953 (the same as in the previous year).

TRAVANCORE CEMENT LTD.

The Government of India has fixed the ceiling price f.o.r. destination for unpacked cement, to be charged by the Travancore Cement Ltd., at Rs. 79 per ton and not Rs. 70 per ton as was stated in the News-in-brief columns of our last issue.

THE BANK OF BARODA

LIMITED

(Estd. 1908)

are glad to announce that two Branches of the Bank have been recently opened at:—

CROSS STREET, CALCUTTA

AND

BANGALORE

MATHEW S. D'SOUZA,

General Manager.

NEWS IN BRIEF

DURING the first two years of the Five-year Plan, 240 miles of national highways and 17 new bridges were constructed.

The President has given his assent to the Madras Indebted Agriculturists' Temporary Relief Bill which gives a moratorium on all debts of agriculturists for a period of one year.

More than 200 Australian sheep will shortly be received by the U.P. sheep wool station from Melbourne. The sheep are being consigned under the auspices of the F.A.O. for improving the Indian breeds.

A 13-man Japanese industrial delegation has arrived in Calcutta from Nagoya. The delegation will tour India and Pakistan to explore the possibility of increasing trade and securing economic and technical co-operation between the two countries.

The Bombay Rent Control Amendment Bill, which permits landlords to charge a graded increase in rents to their tenants from 5 to 50 per cent., will come into force on 1st April this year. The Bill provides for the increase in rent on premises which were let out on or before 1st September, 1940.

The Coir Industry Act of 1953, which empowers the Central Government to set up a statutory board to regulate coir production and exports and to impose a duty on exportable coir goods, has come into force with effect from the 9th inst. The personnel of the 40 member-board will shortly be announced.

The Central Government has turned down the Andhra Government's request for the reservation of coloured *saris* for the handloom industry. The extension of the existing principle of reserving bordered *dhotis* for the handloom industry will, it is felt, adversely affect the textile industry.

The fourteenth annual conference of the All-India Manufacturers' Organisation will be held in Calcutta on 27th and 28th March, 1954. Mr. M. Visvesvaraya will preside. Important subjects relating to the vital problems of the day affecting industry and trade of the country will be discussed at the Conference.

The Government of India will take a decision on the location of the Rs. 75-crore steel plant well before the middle of this month. This was announced by the Union Minister for Production in Nagpur last week. Mr. Reddy held discusslons with the State Cabinet on the Madhya Pradesh case for setting up the plant at Bhilai.

The Electricity Branch of the Punjab Public Works Department has introduced a new tariff for energy consumed from last month onward. The rates will now vary according to consumption. Five annas per unit will be charged up to 15 units, two annas per unit for the subsequent 25 units and one anna for each unit beyond 40 units. This change has been welcomed by consumers.

Work will begin immediately in the works of the Canadian Locomotive Company, Montreal, on the $20 million order for 120 steam locomotives for India. The Company will try to make initial deliveries in twelve months and complete the order by the end of 1955. A firm commitment was received from the Canadian Commercial Corporation, Crown agency of the Trade Department. The Crown Company placed the order as agent for the Government which is financing the job out of India's 1954-55 allocation of credits from Canada's $25 million-a-year contribution to the Colombo Plan.

The Government of India has constituted a Standing Committee of the Central Board of Forestry with Dr. Punjabrao Deshmukh, Union Minister for Agriculture, as Chairman. This is in pursuance of a resolution adopted by the Board at its meeting in Dehra Dun in June last. The main functions of this Committee will be to assess the progress in the implementation of the Planning Commission's recommendations regarding forestry and generally to assist the furtherance and fulfilment of the objects of the Forestry Board. For the purpose of representations on the Committee, the country has been divided into five regions.

The Union Ministry of Production is considering measures to raise the operational efficiency of the Sindri Fertiliser Factory, so that production might reach its full capacity of 1,000 tons of ammoniuum sulphate a day. The rate of production of the plant at present is 750 to 800 tons a day. Production at capacity, it is stated, will lead to a good reduction in the present pool price of fertilisers which is Rs. 290 a ton ex-Sindri. Another factor which is expected to help reduction in prices is the going into production of subsidiary industries at Sindri. The consumption of Sindri fertilisers by States is expected to increase by about 50,000 tons this year over last year's figure of a little less than 400,000 tons.

The Central Government is considering the request of Madras State for the grant of Rs. 1 crore towards furthering road and national highways development in the State. Disclosing this, Mr. H. P. Mathrani, Chief Engineer for Roads, Government of India, said in an interview that, under the second Five-year Plan, the Government proposed to build 1,000 miles of roads. Mysore State has also joined the National Highways System and henceforth there would be better co-ordination in inter-State road development programmes. The schemes sanctioned by the Central Government included a bridge over the Palar near Ranipet, another over the Pennar, near Villupuram, and a third over the Cauveri, near Tiruchirappalli. All these works had been taken up and would be completed. The construction of a bridge in Alwaye would be taken up during the next cold weather to be followed by another bridge at Aroor.

An Ordinance to amend the Air Corporations Act of 1953 has been issued by the President, seeking to amend sections 22 and 23 of the Act. Section 22 has been amended to extend, from 90 days to six months, the period, after the submission by the air companies of accounts relating to book debts, investments and agreements, within which the air corporations can notify the companies that specified debts and investments will not be considered as vested in the corporations. The amendment to section 23 provides for extension, from six months to one year of the period from the date of nationalisation, within which the air corporations can terminate any of the agreements entered into by the air companies without justification and in bad faith. The amendments have been necessitated because the examination of the books and other documents cannot be completed within time.

• • • •

From Abroad

Istanbul is shortly to have an underground railway. A French firm has been asked to prepare the plans required for the purpose.

Japan opened its first regular international air service since the war on the 2nd inst., by setting in flight a Douglas D.C.—6.B airliner between Tokyo and San Francisco.

The Eisenhower Administration has proposed to ask this session of the Congress $3,500 million for foreign aid. This amount is $1,000 million less than that voted by the Congress last year.

Norway's Student Bank, created by Act of Parliament after the war, has, in the last six years, lent £2,135,000 to students to help cover their living expenses while at college. The loans are repaid at a low rate of interest after the students have qualified.

Japan is expected to purchase surplus U.S. farm products using yen currency under the U.S. Mutual Security Aid. Under this plan, Japan may buy about $50 million worth of farm products, including large quantities of wheat and barley.

Work on a new dry dock is to begin at Marseilles (France) shortly. The new dry dock will be 250 metres long, 36 metres wide and 12 metres deep. The work will go on for four years and is estimated to cost three milliard francs. The cost will be borne by the State and the Marseilles Chamber of Commerce equally.

A new trade agreement signed in Oslo recently between Norway and the Soviet Union envisages an exchange of goods of the value of about £10 million in 1954. This is almost the same as last year. Norway will supply chiefly herrings and fats, and receive from Russia mostly grain, ores and phosphate. Russian cars will also be imported.

An economic depression in the U.S. more accentuated than in 1948-49, but less violent than in 1929-33 has been forecast by Dr. G. Haberler, Professor, Harward University. The cause of the depression, according to him, will be over-mechanisation and over-production, resulting in the saturation of the market with articles of consumption.

Asian countries, including the Philippines, Hongkong, Thailand, Indonesia, Burma, Malaya, Singapore, Ceylon and South Korea are expected to purchase a total of 675,000 tons of cement from Japan this year out of an estimated total export amount of 900,000 tons. Other countries expected to buy Japanese cement include Australia, New Zealand, and Okinawa.

The Ceylon House of Representatives passed on the 6th inst. a Bill empowering the Government to raise loans in foreign countries to the tune of Rs. 600 million to finance the Island's development project. The Government, according to the Bill, may raise loans either in the London money market or from the International Bank for Reconstruction and Development.

The U.K. Government has warned against purchase of too much dollar wheat by private British traders, as it is threatening to damage the sterling area's economic health. It proposes to re-enter trade for the import of wheat, if the traders fail to heed its warning. It will be recalled that, in May last, the Government stopped State purchase of wheat and handed over the trade to private merchants.

The population of France is estimated at 42,995,000. Of these, men account for 20,779,000 and women for 22,216,000, the latter outnumbering the former by 1,437,000. The division of the population by age groups discloses the following: up to 15 years, 10,134,000; 15 to 64, 27,950,000; over 64, 4,911,000. The difference in age of the two sexes over 65 shows that there are 1,887,000 men and 3,024,000 women.

PERSONAL

SARDAR Abdul Hussain Khan Aziz has been appointed Ambassador of Afghanistan to India.

Mr. Chimanlal B. Parikh of Messrs. C. Parikh & Co., Bombay, has been re-elected Vice-President of the Indian Central Cotton Committee.

Mr. C. C. Desai, High Commissioner for India in Ceylon, has been elected Chairman of the 10th Plenary Session of the U.N. Economic Commission for Asia and the Far East.

Mr. Loy W. Henderson, American Ambassador in Iran and formerly American Ambassador in India, paid a brief visit to Bombay this week *en route* to Colombo to attend a Conference of U.S. Ambassadors in Asia.

Mr. Richard M. Lyman, Director, I.L.O. Asian Field Office at Bangalore, has returned from five months' leave in the U.S. and assumed charge. On his way back from leave, Mr. Lyman visited the U.N. headquarters at New York and I.L.O. headquarters at Geneva for discussions on the operational activities of the I.L.O. under its expanded programme of technical assistance. He also held discussions with Government officials at Karachi and New Delhi on technical assistance matters.

Mr. Jwalaprasad Tiwari has been re-elected President of the Board of the Bombay Bullion Association for the current year and Mr. Kantilal Manilal Vice-President. The other members of the Board are: Messrs. Rameshwardas Sabu, Nandlal More, Jamnadas Tulsidas, Basudev Somani, Bishesharlal Chirawawalla, Mangaldas Ranchhoddas, Mohanlal Tejmal, Maganlal S. Damani, Chandulal Dalsukhbhai, Mangulal Trikamlal, Sitaram Jhunjhunwala, Vadilal Chhaganlal, Mangaldas Kalidas Chokshi and Bhewratan Damani.

Air Commodore Sir Frank Whittle, the British pioneer in the field of jet propulsion, has taken up an appointment with the Bataafsche Petroleum Maatschappij (B.P.M.), of The Hague, which is one of the principal operating companies of the Royal Dutch/Shell Group. In his present assignment, Sir Frank will give advice in the field of mechanical engineering relative to the development of techniques and equipment in the petroleum and chemicals-from-petroleum industries. He has already familiarised himself with the activities, including the work of the research laboratories, of the Royal Dutch/Shell Group.

Mr. D. S. Seth, Superintendent of the Soda Ash Plant, and Mr. C. B. Joshi, Superintendent of the Brine Evaporator and Marine Plants at the Tata Chemical Works, Mithapur, have been granted Economic Development In-Training Fellowships by the Technical Assistance Administration of the United Nations. Mr. D. S. Seth will undergo a training course in Chemical Engineering for one year, under the guidance and supervision of Mr. William Licht, Professor and acting Head of the Department of Chemical Engineering, University of Cincinnati, Ohio, U.S.A., while Mr. C. B. Joshi will undergo two months' practical training in Western Germany, learning the modern processes in the recovery and manufacture of marine chemicals under the guidance and supervision of Dr. Gerhardt at Frankfurt (Main).

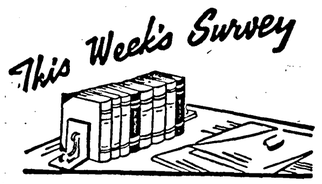
"COMMERCE" 1929

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, 9*th February*

Fire Insurance in Bombay

The Bombay Fire Insurance Association has rejected, by an overwhelming majority, a proposal for the suspension of tariff. The Bombay Fire Insurance Association held a general meeting on the 24th ultimo to consider the report of the Special Committee on Tariff Reform. After some discussion, someone moved a resolution which practically meant the suspension of tariff. Looking to the seriousness of the proposal and to the fact that it was sprung on the meeting at the last moment and without due notice, the meeting postponed its consideration till last week. In the course of last week's meeting, Mr. Price of the North British and Mercantile Insurance Company, far from having wished to see the fire tariff suspended, went so far as to put forward a specially prepared scheme "as a last effort to preserve the tariff control in Bombay." He proposed an amendment that, if the members wished to suspend rules controlling brokerage and commission, it would be advisable to suspend the tariff rules as well. Mr. F. E. Bharucha of the Central Insurance Company, Ltd., advocated keeping the tariff and observing all the rules and regulations, and he voted for the accepted resolution put forward by the representative of an Indian insurance company, whose cause he had warmly supported throughout. Withdrawal of the tariff would have meant on insurance rate-war, and a destructive blow to the infant Indian insurance companies struggling for existence. Fortunately, however, the Association threw out the resolution by a very large majority. This speaks volumes for the wisdom of those who took part in the meeting and the wise lead given by men like Sir Ness Wadia, Mr. C. N. Wadia, Sir Manmohandas Ramjee, Mr. F. E. Dinshaw and other leading merchants of Bombay, who warned non-Indian offices that, if they suspended tariff, it would be construed as a blow aimed at the Indian companies. All's well that ends well.



ANGLO-SOVIET TRADE TALKS

THE parleys at Moscow between the unofficial party of British business men and the Soviet interests for the promotion of Anglo-Soviet trade is stated to be progressing satisfactorily. The Soviet Union has offered to place orders worth about £400 million in the next three years (1955-57) with the U.K. According to Mr. I. Kabanov, the Soviet Minister for External Trade, these orders include the following:

(1) Shipping—1,500 million roubles (about £116 million);

(2) power equipment—600 million roubles (about £46 million);

(3) forging and pressing equipment and machine tools—400 million roubles (about £36 million);

(4) textile and tool industry machinery—375 million roubles (more than £33 million);

(5) miscellaneous equipment—125 million roubles (about £11 million); and

(6) raw materials, food and industrial consumer goods—about 1,300 million roubles (about £116 million).

The aforesaid Russian offer has been received with mixed feelings in the free world's important capitals and commercial centres. While the Board of Trade and other commercial circles in the U.K. have welcomed the offer, U.S. officials have viewed it with misgivings. They see in this offer a surreptitious, but major, move to ease the existing strict control on shipments of strategic goods to the Soviet bloc. There is a feeling that, although such items as tankers, cargo ships, electrical equipment are considered as civilian goods, they are as much strategic as any other material earmarked to be strategic, because they can be switched over to military purposes in times of emergency. Meanwhile, doubts have also been expressed in regard to the capacity of Russia to pay for the U.K. exports, as it may find it difficult to earn sterling currency needed to pay for them. Russia, however, is believed to have sufficient reserves of gold to pay for sterling imports, but there are some who feel that this requires to be checked up.

Typical of American reactions to the present trade talks is the opinion of the *New York Times* which, in the course of an editorial on Tuesday, observes as follows:

"The glittering possibility of Soviet orders averaging about $400 million annually during each of the three years 1955-57 has been held out to a group of British business men who have been visiting Moscow. The fact that the Soviet offer was made by the Minister of Foreign Trade seemingly gives it a more solid base than the unofficial talk about billions of dollars of Soviet trade with the West which marked the so-called World Economic Conference in Moscow two years ago. Talk at the latter meeting led to little of consequence in terms of real business subsequently. Is there reason to suppose that the present Moscow assertion is more serious? One factor leading to doubt is the obviously propagandistic setting and timing of the Soviet announcement. In so far as Russia may wish to buy non-strategic goods in Great Britain this can be done through normal trade channels and negotiation with the producers involved. Instead, the delegation of British business men was invited to come to Moscow; entertained there until a critical point had been reached in the Berlin Foreign Ministers' meeting; and then given this pleasant prospect of business at a time and in a manner to reap the greatest propaganda advantage. Secondly, there is yet no indication that firm, hard, specific bargaining about prices, delivery dates and specifications has taken place, and virtually none of the goods covered by this offer has yet been contracted for. Experience has shown that trade negotiations with the Russians often bog down precisely when discussions leave the cloudy realm of vague promises and enter the area of specific commitments. Finally, the Soviet Foreign Trade Minister seems to have been vague in explaining how the Kremlin would pay for such a vast volume of imports, vast as compared with last year's imports of less than $40 million from Great Britain. Does Russia intend to pay with gold, or does it maintain that it can find enough surplus grain, timber and other commodities so as to quadruple last year's sales of little more than $100 million to Great Britain? Or is the Kremlin looking for a large British credit?"

Although the *New York Times* says that no details are available, a Moscow report, dated lined 5th inst., claims that a deal for textile machinery of the value of £1.25 million has been concluded with British textile machinery makers and that delivery of this machinery would start in the second half of this year.

A significant feature of the present parleys in Moscow is that the British business men who have been negotiating trade orders have been doing so on their own initiative. It is, therefore, not a move for any trade agreement on a Government-to-Government level. The firm which has been taking the leading part in the organisation of this collective mission to Moscow is Crompton Parkinson, which has already established trading contacts with the Russians.

Although the present British Commercial Mission to Russia is thus of an unusual kind, it is reported to have the blessings of the U.K. Government. The latter, however, has warned the business men not to include strategic goods in their talks. In fact, all exports from the U.K. to Russia are generally vetted by the Government. There is thus no fear of the British business men selling strategic goods to Russia. If the mission were to succeed, it would have achieved, to quote a London contemporary, "The same kind of sounding of Russian intentions on trade at the highest level as Sir Winston Churchill has been seeking for so long in the political sphere." Unlike the Americans, the Britishers seem to feel that a real change has come to prevail over the Russians. In support of this view, they point out Russia's readiness to buy butter and sell iron and steel automobiles and oil, which are strategic goods, to all free countries. In fine, a strong section of British traders is of the view that there is sufficient ground for making some radical readjustments in the policy relating to trade with Russia.

• • • •

Reports received since the above account was written reveal that, excepting a few minor deals, no contracts have yet been placed in the heavy engineering field. Several of the British business men now in Moscow have been given a detailed breakdown of specific items on the Russian list and asked whether their firms can fulfil such contracts. Half of the goods sought by the Russians are believed to be on Britain's list of strategic exports and include tankers and machinery for textiles, oil and coal production, power stations and floating docks. Mr. Harry L. Dowsett, the Lowestoft shipbuilder, has already secured orders for a fleet of 20 trawlers worth £6 million. Some of the U.K. business men now in Moscow are also planning to visit Poland, with a view to exploring possibilities of trade expansion with that country.

The British business men feel that, since Russia has great trading possibilities, they should try to ensure a common basis in trade, if not in politics. They look to Russia as a long-term market for their goods. In the course of a talk broadcast from the Moscow radio station the other day, Mr. J. B. Scott, leader of the British trade group to Russia, stated: "With the local manufacture in many countries of the world, particularly the British Empire, of all kinds of products which were normally exported from the U.K., we must, as a nation, search for new markets. We are now turning to an expansion of East-West trade, in general, particularly with the U.S.S.R."

The move of the British and Russian business men to enter into trade contracts, however, has raised much opposition among traders in the U.S. Some describe the Russian offer of contracts worth £400 million as an "effective bait" which will hit the U.S. at the most vulnerable points in its relations with the non-Communist world. It is accordingly felt that the U.S. should adopt such measures as would enable British exporters to sell more goods in the U.S.

E.C.A.F.E. CONFERENCE ON TRADE AND INDUSTRY

The Industry and Trade Conference of the Economic Commission of Asia and the Far East, which met at Kandy (Ceylon) recently, provided an opportunity for full-scale discussions on some basic and urgent economic problems of the region. The discussions revealed certain important points on which the delegates were in general agreement. First, Asian countries should favour multilateral trade, as it was more conducive to an expansion in the volume of foreign trade than bilateral trade treaties. This is a significant point, in that it shows that Asiatic countries are opposed to any closed arrangement such as Imperial Preference. The need for a further increase in trade within the region, which is now 35 per cent. of the region's total foreign trade, was also strongly emphasised. Secondly, there was general recognition, among Asian countries, of the continued need for foreign capital and foreign technical assistance. It was pointed out by some that considerable increase in the flow of both foreign capital and technical assistance was not only desirable but also essential. Thirdly, while considerable emphasis was laid on the need for industrialisation, there was greater appreciation than in previous years of the imperative need for the improvement of agricultural productivity as an essential basis for economic development. Finally, in view of the sharp fluctuations in prices affecting Asian raw materials, the delegates were unanimously in favour of international commodity agreements, which would guarantee the producers a stable and equitable price.

The importance of recognition of these factors as an essential prerequisite for the development of the region as a whole is obvious. More so, when the impact of a recession in the major industrial countries of the West will be more pernicious on the economies of this region, as their living standards are dependent on the steady flow of their primary produce at a stable price. There is a need for increasing not only the extra-regional trade but also intra-regional trade. India, for instance, has a variety of manufactured goods to offer for export in return for scarce metals, oil and oleaginous produce, rice and the like.

The Conference did well in emphasising the need for favouring multilateral trade agreements. This is because bilateral agreements tend to perpetuate the colonial economy and barter agreements are restrictive and untenable with the objective of expanding world trade. A multilateral approach will reduce dependence on any particular country or group of countries and provide better bargaining opportunities, provided conditions are normal. It will also provide wider contacts with a large number of countries which in turn may be useful in obtaining help for economic development from a number of sources. The only snag here is the difficulty of reconciling this attitude with the demand for commodity agreements for stabilising prices.

Be that as it may, the Conference was right in emphasising that more attention should be paid to the export of processed articles. The suggestion made at the Conference that the possibilities of successfully exporting hydrogenated oil, instead of crude coconut oil, and blended tea, instead of unblended tea, should be carefully examined. Its implementation, however, will not be so easy as it may seem, for it requires considerable organising ability, expert handling and plenty of financial resources all of which are deficient in this region. In any case, it will require the whole-hearted co-operation of the Western countries, the principal consumers of these products.

The countries outside the E.C.A.F.E. region can help in a number of ways to accelerate the pace of development of the region by co-operating in promoting international price stabilisation schemes and providing the requisite capital and know-how. It is gratifying to note, in this connection, that the Western countries and, to some extent, Japan, announced at the Conference their intention to help in the development of the region. The Soviet Union, too, offered technical assistance by inviting Asian experts to the Soviet Union, on the basis of arrangements sponsored by the E.C.A.F.E. and the U.N. Technical Assistance Administration.

The future of this poverty-ridden region is of great importance to the whole world. For poverty anywhere constitutes danger to everywhere. The E.C.A.F.E. region, though it covers only a little over 20 per cent. of the world's surface, has half the world's population. The young democracies of this region have been striving hard to preserve their newly won political freedom and are engaged at the same time in an unequal battle against the evil giants of poverty, disease, idleness, ignorance and squalor. It is high time that the more fortunate members of the world, which are already rendering aid, realised the gravity of the situation and increased their quantum of assistance and guidance. It is also necessary to add, in this connection, that the Governments of countries in this region must create a favourable climate for the flow of foreign assistance. It will not do to express a need for foreign assistance in such conferences and then place all sorts of obstacles in the way of receiving such assistance. Further, these Governments must take assistance only from those foreign countries which are democratic and are prepared to respect democratic ways of life. To ignore this vital condition is to endanger their newly won political freedom.

TAX ON INTER-STATE SALES

(By J. S. MENON)

VARIOUS State Governments have recently issued Press Notes demanding payment of tax from non-resident dealers on their sales into State territory from 1st January onwards. There is no sufficient legal authority in support of these demands. Evidently, the Governments concerned have done so basing themselves on the Supreme Court's judgment in the Bombay appeal. It is true that, in the course of that judgment and at different paragraphs, the Supreme Court have stated that the delivery State has the power, right and freedom to tax inter-State sales or purchases. But all these statements have to be read and understood in the light of the passage on page 7 of the judgment which clearly and unequivocally discloses the true position so far as the taxing rights in this regard are concerned. The judgment lays down:

"The latter State (i.e., the State where goods are actually delivered as a direct result of a sale for consumption within the State) is left free to tax such sales or purchases which power it derives not by virtue of the Explanation but under Article 246(3) read with Entry 54 of List II."

The Supreme Court have thus laid down beyond a shadow of doubt that Article 286(1)A and the Explanation thereto do not confer any power of taxation on State Governments. That power is conferred by Article 246(3). Under Article 246(3), State Governments have, subject to the other provisions and restrictions contained in the Constitution, a right to tax sale or purchase of goods. The restrictions are contained in Article 286. One of these restrictions is that States cannot levy tax on inter-State sales or purchases. The Supreme Court held, in the same judgment, that all sales of purchases under which goods move from one State into another are inter-State sales irrespective of whether the sale is for purpose of resale or for manufacturing purposes or for own use and consumption.

A State's right to tax sales or purchases is thus circumscribed by this limitation, namely, a ban on taxation of inter-State sales or purchases. One class of cases is lifted out of this ban. That class is the group of inter-State transactions falling within the scope of Article 286(1)A read with the Explanation. The whole question, therefore boils down to the query: What transactions of sale or purchase come within the scope of Article 286(1)A read with the Explanation? The Supreme Court have given a clear-cut reply to this query. In para 3, page 6, the judgment states:

"Thus, all buyers within the State of delivery from out-of-State sellers, except those buying for re-export out of the State, would be within the scope of the Explanation and liable to be taxed by the State on their inter-State transactions."

In view of this clear-cut exposition of the whole position by the Supreme Court, the States will not be justified to assume that the judgment in the Bombay appeal confers on them any right to tax a non-resident seller in the case of an inter-State sale. The question whether, in the case of an inter-State sale, the delivery State has power to tax the non-resident seller or only the resident purchasing dealer was not a point at issue in the Bombay appeal. Nor was there any room for counsel to address any argument to the Court on this point. The whole concept of taxation, as envisaged in Article 286(1)A and the Explanation thereto, is a use tax or purchase tax or property tax and not a tax on sale. In spite of certain passages in the judgment where the Court may have indiscriminately used both the words, sale and purchase, when dealing with the rights of taxation by delivery States, the fact remains that all these remarks have to be read subject to the overriding observation made by them to the effect that the delivery State does not get any power of taxation by virtue of the Explanation to Article 286(1)A.

Until a further judgment of the Supreme Court is delivered in the appeal filed by the Bengal Immunity Company, Ltd., Calcutta, against the State of Bihar which will come up for hearing before the Court, in all probability during this month, I am of the opinion that the judgment in the Bombay appeal is not decisive on the point and there is, therefore, not sufficient legal authority on which the States now demanding tax on outside dealers can justify their demand. In my opinion, they would be well advised to wait for the next decision which would be available for them in a month or two, when the position will become clear to them. Today the State Governments concerned are after the non-resident dealers, but, if, by any chance, the next judgment throws a bombshell on the premises from which they have proceeded, it would be the turn of the non-resident merchants concerned to proceed against the

(Continued on page 287)

OFF THE RECORD

(By "ROVER")

AFTER six years of travail, tears and seeming frustration, an altogether new spirit is struggling to emerge in industrial India. I say struggling to emerge advisedly, because, to many in the other camps, this is not yet visible to the naked eye. The public, as such, has been so tragically and repeatedly exploited both by the captains of industry and labour, for short-term and selfish gains, that it has lost faith in any display of good intentions on the part of either. This is not to be surprised at in the atmosphere of demoralisation and disillusionment which followed first the technical end of world War II and then the sudden and almost despaired of independence of the country. Whatever social values were left, in spite of this spiritual frustration, were shattered by the starkly crude and nauseating scramble for power amongst those who professed to live for and serve the people, after the passing of Mahatma Gandhi.

But some of the poison in the body economic seems to have worked itself out, undoubtedly at great cost and injury to the organism itself. One of the reasons for this glimmer of a new spirit which though not divorced from the sole guiding principle of "profits at any cost," seeking re-entry and acceptance in the revised social and political set-up is the cruel and pariah-like isolation and ignominy to which the business man has been subjected during this period of strife and disintegration. I have always maintained that 'alone' is one of the most tragic words in the English language and he has felt, while he was minting money, the full intensity of this position of being alone and unfriended. Though there was as much an element of injustice as of social justice, possibly in the ratio of half to half, in his being pilloried during these fateful years, this rough mode of chastisement was necessary for his spiritual rebirth.

I do not mean to say that this new spirit of accommodation, if not of service, has touched all and sundry in the business world. The damage done by the orgy of moral destruction during the war years has been so great that it would be a miracle if the business community as a whole were to subscribe to this new doctrine. But the best amongst them have been set thinking seriously in terms of social and even moral rehabilitation. The search which was begun in more general terms by earnest minds like Mr. J. R. D. Tata and Mr. Homi Mody has been taken up by other enquiring and sensitive minds in the community and each one of these new band of thinkers is pushing it further in his own country, according to his innate bent and previous experience. A couple of weeks ago, *Commerce* editorially reviewed the thesis advanced by Mr. M. R. Masani in his address to the Rotary Club at Hyderabad. This, though constructive and positive in its contents, still preoccupied itself, albeit partly, with the defence of the private sector and pointing out the severe handicaps under which private enterprise had to function.

Unfortunately, it is true that the Governments, partly in their distrust born of sad past experience and partly in their overemphasis on securing rapid but grievously unplanned welfare in isolated and uncorrelated fields, have rendered it difficult even for basically good men in industry to contribute their best. Perhaps, the present lot of inexperienced but arrogant and know-all politicians will go on rendering this disservice both to industry and society in general, till they are either thrown out or re-educated. But it would ill serve the cause of private enterprise, if it were to keep on harping on the difficulties in the path of virtue which it now wishes to follow. The more sensible course for those who are earnest about rebuilding this sector on new and more enlightened lines is to accept the present conditions and to start about designing the new structure on the only site which is available today. Let them plan their edifice, knowing that the politicians would be constantly and mischievously pulling down a part of a wall here and of an arch there, if for nothing else, to give the merchant a feel of the power and authority they have usurped. A good workman does not waste his time and breath quarrelling with his tools: he uses them.

It is from this point of view that I welcome the advance copy of a speech with which I have been favoured by one of our most progressive industrial concerns, with its units spread all over the country. It is an address which would have been delivered by the time my piece appears in print at the end of this week. I consider this speech of Col. S. Sawhny of the Associated Cement Companies, Ltd., a very worthwhile and valuable piece of close thinking on one of the basic aspects of industry. It is remarkably free from rancour or ego, as all creative thinking is, and inspired with a spirit of humility and service to the worthy cause which Col. Sawhny has at heart—the cause of consolidating industry into an accepted place in the new society which mankind aims to achieve. It is not a spectacular cause but a solid and simple one, which today would help millions of our countrymen more in their life of want and distress, than so many of the empty slogans of the politicians roaming the countryside at election times.

Starting with this simple aim, Col. Sawhny attempts to achieve it with the help of what he calls "industrial statesmanship." This is a highly pregnant phrase to my mind and deserves to have its full implication developed in an independent paper devoted to this very purpose. In the meantime, one who has coined it, elaborates it as a concept of industry, which, apart from providing material goods and benefits, is rooted in the spiritual and psychological fabric of Indian life. Any industrial policy for this country, as, indeed, for any other, has, therefore, to be such as to set a purpose to which those engaged in industry can respond. This alone could inspire workers to a loyal and harmonious effort.

According to Col. Sawhny, unless this spiritual foundation forms the basis of whatever new policy our industrial statesmanship evolves, there will always be the danger of industry reverting once again to the purely materialistic profit motive, which has brought it to its present plight and which has been rejected once for all as having no place in the new India of enlightened values, which we are endeavouring to build up. No industry even in a mixed economy could keep going for long without adequate and material returns, but Col. Sawhny is quite right in taking it for granted that, if the revised policy of the private sector fulfils the fundamental human needs of both the individual and the working team, the material side will be automatically taken care of.

I do not want you to think from the high-brow stuff I have been perpetrating that what Col. Sawhny gave at Madras was some highly metaphysical discourse. As a matter of fact, after defining the basis of his belief as an industrialist, what this one-time soldier did was to get down to real brass tacks of the right type of business management, which he considered necessary for the implementation of this policy. You would be surprised to know that this responsible managing director of one of the country's greatest industries could be so frivolous as either to coin or quote the following limerick:

The young lady of the Niger,
Who went for a ride on a Tiger,
Came back from the ride
With the lady inside
And a smile on the face of the Tiger.

This was to illustrate the fear in the mind of petty-minded, old-time management, who took care to see that they selected a staff of the docile and submissive type and not able and independent-minded assistants, who might supplant them one day. This speech, which I am commenting on at some length, was perfectly suited to the occasion. Col. Sawhny was invited to preside at the All-India Council of Labour and Welfare Officers, over one of its sections dealing with the functions of management and management training. An employer is apt to think of his workers as a part of the plant. This outlook vitiates their relations from the outset and everything which follows naturally goes wrong on either side. He reminds the old stick-in-the-mud that the proper study of management is not machine or finance or markets but man. The days of "hiring and firing" or even of benevolent despots are gone. What is wanted is a new concept of leadership and a new basis of human and not purely economic relations between the two vital wings of industry.

I think it was the once famous but now sadly forgotten genial American philosopher and psychologist, Prof. William James, who first made the phrase "moral equivalents of war" popular and started thinkers on this quest. The idea is that, in spite of its frightfulness, destruction and cruelty, war is believed to have certain values in the evolution of human society, and, in banishing war or armed conflict between nations, we should try to preserve these values by searching for their equivalents in other more peaceful but equally adventurous pursuits of life and promoting them. The defence services are naturally regarded as representing the non-constructive activities of life, but they have, and more especially the army has, developed certain modes and techniques of organisation, training, and disciplined action, which get results. It is, therefore, on his experience of army life that Col. Sawhny draws upon, for borrowing this successful mechanism for use in the field of industrial management.

I have often noticed that, in the post-independence India, almost every institution has gone wrong at one time or another except its judiciary, the army and the Press. Apart from his intimate association, therefore, it is inevitable that he should want to bring the traditions and training he received in his earlier career to the field of industry. Going right back to the old Iron Duke, he quotes one of the famous sayings of this crusty old soldier that "there are no bad battalions; there are only bad officers." The implication of this is obvious. In industry, as in any military campaign, not only success or failure turns on leadership, but the responsibility for failure lies on it.

But what I have come to regard as the most valuable idea in this somewhat original thesis is his insistence on the absolute necessity for defining the aim of any joint enterprise, industrial or military. This has to be done carefully, because the new management must convey the purpose and the aims of the organisation to all who work for it. He puts it graphically, when he illustrates this rather startling demand in the opinion of some old diehards that "a man who is hewing limestone in a quarry" will work with better heart if he knows that he is doing this fatiguing job to satisfy ultimately the vital need of the country for cement than if all he knew was that "wielding a hammer and cracking rocks for eight hours a day is the sum and substance of his existence."

And even more important than this instruction to all workers in the aim of every activity is the need to fortify them with the knowledge, as in the defence forces, that they will be well cared for and well led in a united endeavour to reach this goal. The last on the list of Col. Sawhny's requirements for new and enlightened management is decentralisation. I have known industrialists and top executives who abhor any idea of sharing authority and initiative with those whom they regard as juniors. For them, however, I am afraid, Col. Sawhny's whole discourse is beyond the limited range of their imagination and mental grasp. It is only when the last of these ditchers has retired that private enterprise will come into its own.—*All Rights Reserved.*

AGENDA FOR BUDGET SESSION OF PARLIAMENT

SIGNIFICANCE OF BERNSTEIN REPORT

(From A Special Correspondent)

NEW DELHI, *9th February*

THE budget session of Parliament will begin on the 15th inst., with a customary address by the President. The President's speech will not reveal any fresh line of thought but will be a short replica of what he had stated in his Message on the eve of Republic Day. In addition, he will give a brief resume of the business before Parliament for the forthcoming session. The duration of the session will be about 100 days, extending up to the last week of May. Apart from the presentation and discussions on the Railway and the Central budgets and the passing of the budgetary grants of various Ministries, a few pending Bills will be taken up, especially during the last three to four weeks prior to the close of the session. So far as the Commerce and Industry Ministry is concerned, some of the pending Bills, such as the Rubber Marketing Board Amendment Bill, will be taken up. The Finance Ministry will take up the Companies Bill which will be referred to the Select Committee. In view of the gradual expansion of the ownership of commercial enterprises in the public sector, a new chapter will be added to the existing Bill dealing with this subject. The Shipping Control Act, which is due to expire shortly, will be extended for two years. Necessary amending legislation is expected to be undertaken during this session. The Motor Vehicles Amendment Bill, the Cinematograph Bill, etc., will also be brought before this session. Perhaps, the most important is the necessity for the Government to put through some suitable amendments to the existing provisions of the Constitution relating to the sanctity of private property following the Supreme Court's interpretation invalidating the Sholapur Mills Act.

DELHI LETTER

I.M.F. Experts' Report

The Report submitted by the International Monetary Fund Mission which visited India early last year under the leadership of Mr. E. M. Bernstein is of particular interest, especially from the timing of its release to the public. With barely two weeks for the presentation of the Central Budget, the suggestions contained in the Report in the sphere of taxation will doubtless receive more attention at the hands of the Finance Minister. In recent weeks, Mr. C. D. Deshmukh has categorically stated that there would not be any fresh impost pending the submission of the Taxation Enquiry Report. All the same, he will not be averse to collect a few crores of rupees not only by minor adjustments but also through levy of fresh taxation on some commodities and manufactured articles. During the last few years, the commercial community has been vociferous that it has not been able to bear the weight of heavy direct taxation and that the high level of taxation has been largely responsible for thwarting the proper development of private enterprises. The question of direct taxation must, therefore. be ruled out, but the Finance Minister may deeply consider why he should not collect some amount by resorting to indirect taxation. In the present position of the country, the latter will take the form of an excise duty. Another justification for this kind of tax is that, with the development of domestic industry, the Government's customs revenue has been showing some shrinkage due to a decline in imports of finished products. During the post-war period, an impressive development has taken place in certain spheres of industry which have not yet attracted the covetous eyes of the Finance Minister. Prominent mention may be made in this connection of cement, bicycles, paper, soap, etc. The levy of an excise duty on salt will doubtless secure handsome revenue to Government, without at the same time taking up the price of salt by any sizable extent. But Government will not touch this subject for historical and sentimental reasons, until, perhaps, it gets the backing of the Taxation Enquiry Commission.

In the sphere of taxation, the Report of the I.M.F. Mission points out that special attention should be given to the possibility of increasing (a) taxes that have not kept pace with rising prices and revenue requirements over the past 10 or 15 years, (b) taxes and charges that will claim a part of additional income directly attributable to the Five-year Plan, and (c) taxes that will restrain unnecessary consumption. From the point of view of State Governments, betterment levies and water charges which have been proposed by the Planning Commission in connection with multi-purpose irrigation projects are considered by the Mission as "amongst the most desirable means of capturing by the Government a part of the additional income directly attributable to the Five-year Plan." The I.M.F. Mission also points out that, so far, the progress of the States in achieving additional resources has been disappointing. It seems very doubtful at this stage that the States will be able to find their share of resources, unless they impose new taxes in the coming years and reduce their non-developmental expenditures.

It is from the above angle that the Finance Minister will approach the taxation problems. Even after making reasonable efforts to raise additional resources, it is, however, certain, the Report observes, that available home resources will fall short of the amount needed to proceed with the modest development programme laid down in the Five-year Plan and will have to be augmented from outside.

Sugar

If the Government of India has achieved a notable success on the food front under the leadership of Mr. Kidwai, it has failed miserably on the sugar front. It has recently been stated that the Government would be importing about three lakh tons of sugar within the next few months, but the latest reports suggest that there will be additional imports to the extent of about four lakh tons. The total costs of these imports will go up to the record figure of about Rs. 50 crores. This means that a sizable portion of savings effected through reduction in food imports will be spent on those of sugar. This state of affairs conclusively proves that, even after two decades and more of protection, the sugar industry has not been able to take deep root in U.P. and Bihar and offer sugar at competitive prices to the consumer. If the Government of India, which has been pampering the sugar industrialists and the cane growers of these two States, were to spend a modest portion of Rs. 50 crores in the improvement of irrigation, both large-scale and small-scale, in the Deccan and further South, this industry would have become not only strong but also be able to export a moderate quantity overseas. This aspect of the question will have to be examined afresh from all angles by the Planning Commission at the time of the preparation of the second Five-year Plan. If sugar is to be made available in plenty, the Planning Commission will have to double the current rate of production during the next plan period and this would be possible only if encouragement is given for this industry to spread itself in the Deccan, Hyderabad, Andhra and in parts of Madras.

Rationing in Delhi

The citizens of Delhi will practically be bidding good-bye next month to the food rationing system introduced some ten years ago. There will be some semblance of control in regard to wheat and rice, which is perhaps necessary before full decontrol is implemented. The State Government will continue to regulate the price of rice through fair price shops where rice will be made available to the people at fixed rates. In order to improve the supply of rice, the Government will be allowing private traders to import 10,000 tons of rice from U.P., under a system of licence. They will be permitted to sell this rice in the open market. In regard to wheat, the retail price of wheat under rationing will be fixed at Rs. 15-8 per maund, while the private trade will be allowed to sell it without any control in the retail market.

(Concluded from next column)

in its Customs and Tariff policy, and to provide the reserves without which such action would fail. The Chairman of Westminster, however, saw no advantage in present convertibility, since it would be bound to carry a further depreciation of sterling in terms of dollars and he lined up solidly with the conclusions of the Sydney Conference in putting the achievement of a healthy trade balance first.—*All Rights Reserved.*

BANKERS ON CONVERTIBILITY

NATIONAL PROVINCIAL WANTS IT NOW

(From Our Own Correspondent)

LONDON, *6th February*

THERE was a danger this year that the annual speeches of the "Big Five" Bank Chairmen would be dull—excusably so since the Chancellor of the Exchequer had recently had occasion to say nearly all that seemingly could be said on the country's external position. Instead, the bankers' individualism came out to attack soft domestic policies (the Chairman of Lloyds deplored the rise in bank deposits which were accompanying the wages spiral and evidenced an excessive circulation of money), with their excessive ratio of consumption to production and to urge the need for those more self-denying Continental policies which were raising up such severe competitors in our export fields. To cap it all, the Chairman of the National Provincial Bank demanded sterling convertibility *now*.

LONDON LETTER

The rise in the sterling area's gold reserves was noted with approval, but it was argued that the credit belonged mainly to the Commonwealth countries and the Colonies. This presupposes that the repayment of the U.S. and Canadian lines of credit, which are shown as charges against the U.K. balance of payments, is in no way an extra-U.K. liability; yet surely profligacy of dollar spending in 1946 and 1947 was a sin common to the whole sterling area. The bankers also noted that the U.K.'s sterling liabilities had increased to a much greater extent than the gold reserves and pointed out that the British balance of payments simply had no surplus of the order of £300 million per annum with which to finance Commonwealth development.

This circumstance called for less consumption at home, more exports and more investment. But, while one Chairman deplored the high level of taxation which prevented companies from financing their own expansion and drove them to the capital market to raise more funds, another put forward a thesis that has not come from the bankers' quarters before. It is that, in the national interest, it is more desirable that, after a company has put aside adequate reserves, it should pay out its remaining profits as dividends and then go out into the competitive capital market and take its chance on its own merits of raising new development capital. This argument, however, put forward by Lloyds, did not run counter to the general complaint of inadequate capital formation at home and it was pointed out that, whereas here gross capital formation takes one-eighth of the national income in a group of six Continental countries, the corresponding figure averages one-quarter, while net investment (after allowing for maintenance and depreciation) is 50 per cent. higher (as a proportion of the national income) than in this country.

A Danger

There was a danger of this country pricing itself out of its export markets (though North America appears an exception) and our exporters were urged to do better on delivery dates as well as on price—but the bankers stressed that credit to exporters was not a difficulty and that they were giving all the assistance needed. There was a great danger in assuming that, because the terms of trade were moving in the U.K.'s favour, all was well: they would move that way if our export prices were too high and we might find ourselves with no trade. To the National Provincial Chairman this argument led straight to the point that we needed to be able to quote firm prices (without escalator clauses for rising costs) and this could only be done if our prices moved in line with world prices, which in turn implied sterling convertibility. Here was nineteenth century economics with a vengeance and the speaker immediately faced the argument about the Welfare State being more important than the exchange rate, by declaring that nothing could be more to the long-term advantage of wage earners than stable prices, ensured employment and healthy exports. No one else had the temerity to suggest that sterling should be made convertible now, though some did deplore that facts made present convertibility impossible and put the next move with the United States, both

(Continued in previous column)

PAKISTAN NOTES

CENTRAL GOVERNMENT REVENUES LOWER

LOAN FROM COMMONWEALTH BANK—PROGRESS OF TEA INDUSTRY

PAKISTAN'S budget for 1954-55 will be presented to the Constituent Assembly in a few weeks' time. In view of this, the latest figures relating to the Pakistan Government's revenues will be of some interest. The total revenues of the Government during the seven months ended October, 1953, amounted to Rs. 87.30 crores, as compared with Rs. 103.80 crores in the corresponding period of 1952. The fall in revenues has been accounted for entirely by the decline in customs receipts from Rs. 42 crores to Rs. 23.86 crores. On the basis of these figures, the aggregate customs revenue for the whole of the fiscal year 1953-54 is estimated at Rs. 34 crores to Rs. 35 crores. It may be noted, in this connection, that customs duties contribute 50 to 60 per cent. to the Central Exchequer. This source had registered an appreciable rise during 1951-52, being Rs. 84 crores, as against Rs. 31 crores in 1948-49. Since the last two years, however, there has been a fall. Receipts from income-tax, on the other hand, have shown an improvement, the sum actually collected during the period April-October, 1953, being Rs. 10.86 crores, as against Rs. 9.13 crores. It is expected that the total for 1953-54 will amount to Rs. 17.5 crores to Rs. 18 crores.

With the announcement of the Commonwealth Development Finance Corporation's decision to grant a loan of £1 million to the Sui Gas Transmission Co., Ltd., Pakistan—this is the first commitment of the Corporation since its formation—the implementation of the scheme for tapping the vast resources of natural gas recently discovered in Sui (S.E. Baluchistan) has been carried a stage further. This loan forms part of the total capital cost of the project, estimated at about £9 million. The Company has also applied for a World Bank loan of £5 million. The remaining £3 million of the equity capital is to be provided equally by the Pakistan Industrial Development Corporation, the Burmah Oil Company and private investors. Under a long-term contract, the Burmah Oil Company will be responsible for the management of the Sui Gas Company.

The Sui Gas Company proposes to transmit the natural gas from the field by a pipeline over some 350 miles to Karachi through the lower valley of the river Indus. The exploitation of the natural gas resources will result in two distinct benefits to the economy of Pakistan. First, it will accelerate the development of the agricultural and industrial capacity of the country. Secondly, it will, by supplementing the indigenous fuel and power resources, enable Pakistan to save large sums of foreign exchange which are now being utilised for importing petroleum.

Foreign Capital Investment

Foreign capital investment in Pakistan during the past six years has been to the tune of Rs. 21.48 crores, as per details below:

Country	*No. of companies*	*Investment (Crores of Rs.)*
U.K.	51	12.28
India	14	3.31
U.S.A.	2	0.17
Others	38	5.72

From the above, it will be seen that the U.K. ranks first and that American interest is lagging very much behind in the trade and industry of Pakistan. Out of the 105 foreign companies registered in Pakistan, it is noteworthy that only 33 are industrial concerns involving Rs. 16.70 crores. The rest are trading and banking concerns.

Foreign investment in Pakistan is subjected to three important conditions: First, sugar, cloth mills, electricity, cement, hides and skins, coal mining, oil-refining, shipyard and ship building—all these industrial concerns can be floated only with 51 per cent. of Pakistani capital. Secondly, trading and other industrial concerns can be floated with at least 30 per cent. of Pakistani capital. Finally, all profits are permissible to be transferred subject to the usual tax payments.

Most of the capital flow from abroad has been during the past two years; thus, up to March, 1952, foreign capital investment in Pakistan was placed at only about Rs. 3.40 crores, of which Rs. 3 crores were accounted for by Britain.

The coal industry in West Pakistan is reported to be passing through difficult times, thanks to a fall in demand and non-availability of mining materials at a reasonable price. The mineowners in Baluchistan have complained that they have been adversely affected by the rise in the rates of royalty from As. 12 to Rs. 3 per ton and the increasing use of firewood, instead of coal, in some of the industrial concerns. Forced by circumstances thus, these mineowners have put forward a vigorous plea for Government protection. The three specific demands which they have made in this connection are: (1) Imports of foreign coal should be curtailed to the minimum; (2) import duty on coal should be raised to such a level as would remove chances of competition with domestic coal; and (3) use of indigenous coal should be made compulsory in West Pakistan by discouraging use of oil by factories.

Industrial Research

The Governing Body of the Pakistan Council of Scientific and Industrial Research has decided to set up four industrial research laboratories in the country, one each at Karachi, Lahore, Peshawar and Dacca. The budget estimates for these laboratories for the year 1954-55 have been approved. The capital expenditure during the first phase of planning, construction and equipment is estimated at Rs. 36.86 lakhs. A part of the equipment worth Rs. 10 lakhs is to be provided in the near future by the British Government under the Colombo Plan.

Recovery in Tea Industry

A note of relief at the recovery made by the Pakistani tea industry during the past year, after two years of successive crises, and of optimism at the prospect of return to better times was struck by both Mr. Goodchild, Chairman of the Chittagong Tea Association, and Mr. S. A. Salim, Minister for Commerce, Industry and Labour, East Pakistan, and Chairman of the Pakistani Tea Board, in their speeches at the annual general meeting of the Association held a few days ago in Chittagong. A noteworthy feature of the Association's annual meetings is that it is usually addressed by the Minister of Commerce and Industry also, presumably because of his position as Chairman of the Tea Board. Whatever that may be, it serves to emphasise the close liaison that exists between tea producers and the Government in Pakistan.

Efforts of Planters

A great deal of credit for the recovery of Pakistan's tea industry during 1953 goes to the planting community and the agency houses who faced the black years of 1951 and 1952 in a spirit of doggedness. The past year saw the industry well on the road to recovery and much of what had been gained could not have been achieved without the determined efforts of planters to solve the problems that stood in their way. This does not mean that the tea industry has completely overcome the ill effects of the previous two years. For, as Mr. Goodchild pointed out, it is still suffering from these.

The recovery which the tea industry has made is due in no small measure to the assistance which the Government of Pakistan has rendered to it during the period of crisis. The first step taken in this direction was the abolition of export duty on tea. Secondly, the Regional Office of the Pakistan Agricultural Development Finance Corporation at Dacca formulated plans for giving financial assistance by way of loans to tea estates. According to these plans, all "unencumbered" tea estates became eligible for receiving loans. Even those tea estates which, though mortgaged, had a margin for a further charge on their assets were granted loans. A sub-committee consisting of representatives of exporters, shippers and the State Bank of Pakistan was also constituted to examine how best the gardens could secure reasonable price for their produce. That the Government has not relaxed its efforts in rendering assistance to tea producers is evident from the words of appreciation spoken by Mr. Goodchild. He said: "It is encouraging, indeed, to feel that the Government realise their problems and are prepared to assist in resolving them, for in that lies the future prosperity of the tea industry, bound up as it is, not only with the welfare of this province, but with that of the State of Pakistan."

Not content with the assistance which it has so far rendered to the industry, the Pakistan Government has been actively co-operating with the producers in their efforts at expanding the industry. A few months back, the Government of Pakistan appointed a sub-committee to examine the question of augmenting the tea production from the present level of 53 million lbs. to 80 million lbs. in the course of the next ten years. The Minister for Commerce and Industry disclosed that the output would be stepped up by 10 million lbs. within the next two years, followed by an additional 20 million lbs. spread over another eight years. He also revealed that land of 18 acres has been obtained in Sylhet for establishing a tea research station, for which capital expenditure of Rs. 2.50 lakhs had been sanctioned.

Pakistan is stated to feel that there is a need for substantially increasing its output of tea for two main reasons, namely, (1) steady rise in domestic consumption, and (2) urgency of maintaining a high level of exports.

The aggregate quantity of tea exported by Pakistan tea producers during the period from 1st April to 31st December, 1953 was 16,204,315 lbs. as against 17,529,532 lbs. in the corresponding period of 1952-53. There has thus been a fall in tea exports recently. Referring to the question of Pakistan's foreign trade in tea, Mr. Salim pointed out that, although tea producers had built up a fair-sized export trade in relation to output, there was still room for expansion of exports to friendly, neighbouring countries. He alluded, at the same time, to the growing home market which, he said, should not be neglected. "The level of local consumption," to quote Mr. Salim, "is rising fast and is bound to go up further."

MAKE THE BEST OF *Living*

This man started out for himself many years ago, and soon established a successful one-man business. Then came the problem that after his death his widow might be obliged to sell the business at a loss. Sun Life of Canada Business Insurance solved this. Now the enterprise will be purchased from his widow by senior employees at a figure set during his lifetime.

PLANNED LIFE INSURANCE BRINGS PEACE OF MIND

Without obligation, let me tell you how the facilities of the SUN LIFE ASSURANCE COMPANY OF CANADA can best meet your particular needs in a way that will fit your pocketbook.

AUGMENTING FINANCE FOR INDUSTRIES

BANKS AND INVESTMENT IN EQUITIES

THE Shroff Committee appointed to suggest measures for augmenting bank finance for development in the private sector is understood to have completed examination of all the memoranda submitted to it by various bodies and oral evidence tendered by prominent persons and associations. Shortly after its return from South India last week, the Committee met in Bombay for two days and took some broad decisions on a number of issues. Thus, a general picture of what the Committee has to say would appear to have taken shape. Its draft report is now under preparation and final conclusions are expected to be drawn early next month. If the present rate of progress is maintained, it would not be surprising if the Committee's report were to be in the hands of the Reserve Bank Governor, Mr. B. Rama Rau, who is primarily responsible for the appointment of this Committee, before the end of March or early in April.

The rapidity with which the Committee has proceeded with its work is remarkable indeed, and is in keeping with the traditional character of speed and efficiency commonly associated with the enlightened section of private enterprise. The Committee, it will be remembered, was appointed by the Reserve Bank only four months ago, that is, in the first week of October, 1953. During these four months, it issued a simple but effective questionnaire, toured the length and breadth of this sub-continent, met individuals and representatives of State Governments, merchant bodies, stock exchanges and other business associations, recorded their oral evidence and has now reached the last stage of its work.

Voluminous Evidence

That the evidence tendered before the Committee is undoubtedly voluminous is further substantiated by the response it had in its tour of the southern peninsula. For copies sent to us of the memoranda submitted to the Committee, as also reports in the daily Press, reveal that some valuable suggestions have been put forward for the consideration of the Committee by such organisations as the Andhra Chamber of Commerce, Travancore-Cochin Bankers Association, the Southern India Chamber of Commerce, the Shikarpuri Banker (Shroffs) Association and the Madras Stock Exchange.

A perusal of the various memoranda submitted to the Committee discloses one chief underlying idea, namely, the hardships caused to trade and industry by an acute shortage of finance. This point has been brought out by the Southern India Chamber of Commerce, Madras. It points out that the proportion of bank finance to private lending in the financing of trade and commerce had never been correctly determined. The disparity between the actual lending rates of banks, on the one hand, and the bazar money rates, on the other, was a proper barometer of the inadequacy of bank finance for both trade and industry. Interest charges had become a significant item in industrial balance-sheets. Bank finance accounted for only a part of the finances of industry and this position had not been greatly altered by the war-time influx of new banks. Another cause for the inadequacy of bank finance, according to the Chamber, was the pressure put on banks by State Governments for buying large chunks of loans issued by them, while banks had every inducement to increase their holdings of Gilt-edged securities, as the yield on them were over 4 per cent.

Plans Given Up

As interest charges were thus high on account of lack of funds, many concerns started during the war had to give up their plans and programmes. The Andhra Chamber of Commerce says:

"Many of the concerns having completed their erection work, are now finding it difficult to carry on their business for want of working capital. Some of the concerns that have started working are not now able to pay satisfactory dividends on account of numerous restrictions and unforeseen difficulties It may also be noted that some of the concerns have not completed their original capital programme on account of inadequate capital and increased costs."

On the question whether commercial banks should provide long-term finance to any industry, the Travancore-Cochin Bankers Association is emphatic in its reply by stating that it is not advisable to provide long-term finance to any sort of industry and that such demand should be met by specialised industrial finance institutions. Holding more or less similar views, the Southern India Chamber of Commerce looks at this question from a different angle. It states that the nature of a bank's obligation—both demand and time liabilities—militate against their acting as an Industrial Finance Corporation. But it points out that though bank finance is seasonal for the most part, a portion of it is in the nature of long-range overdrafts and loans to certain well-established industrial ventures. Thus, in a sense, the banks are already acting as an Industrial Corporation. This is also a reason why banks are not able to call up the loans which became superannuated, though the company owing the money may have large assets. Such a position, the Chamber says, could not be described as over-trading; it is a symptom of a chronic state of under-capitalisation.

Should Banks Invest in Shares?

Another question on which there would appear to be considerable unanimity of opinion among private organisations is whether commercial banks should be allowed to invest in shares. The Travancore-Cochin Bankers Association, commenting on this issue, points out that investments of banks, as on 30th June, 1953, reveal that out of Rs. 385 crores, only Rs. 12 crores are invested in shares and debentures and these too must naturally be in leading industrial units only, as the investment by Non-scheduled banks is only Rs. 66 lakhs. Investments in shares and debentures of small and medium-sized industries should, therefore, be presumed, it considers, to be practically nil. The Association attributes this lack of interest to the fact that "such investments are not now approved under section 24 of the Indian Banking Companies Act (1949) for the purpose of 20 per cent. of eligible assets and also because such shares and debentures are not really marketable or realisable. The heavy burden of taxation on new industrial companies leaves precious little for profits and are, therefore, not yielding, and hence their shares and debentures are not attractive for investment; and successful individual concerns, again due to heavy taxation, are reluctant to seek incorporation under the Companies Act, and, therefore, they are unable to provide themselves with finance by the issue of shares or debentures for further development." The Association, in the circumstances, considers it desirable that, in order to make available increasing bank advances to industry, section 24 of the Banking Companies Act should be so modified as to encourage banks to invest in industrial securities by including them as eligible assets and by reducing the limit of 20 per cent. of eligible assets to a lower level. It is also suggested that rediscounting facilities by the Reserve Bank should be extended to these investments.

The Andhra Chamber of Commerce points out that the Reserve Bank of India looks with disfavour on any advance made by banks against industrial equities. This has not created a proper atmosphere for many investors to go in for industrial shares. If the Reserve Bank's control over such advances were more discriminating and liberal than at present, more finance would flow to finance industrial development. Like the Travancore-Cochin Bankers Association, this Chamber too advocates that advances made against shares or securities by joint-stock banks may be converted into the form of usance bills for a period of nine or 12 months and made eligible for rediscounting with the Reserve Bank. It, however, suggests that, in such cases, proper safeguards regarding fixation of limits to the maximum amounts eligible for such discount facilities may be adopted without mentioning the names of shares eligible for such discount.

Small and Medium-scale Industries

A pressing case has been put forward by the Travancore-Cochin Bankers Association for quick provision of bank finance to small and medium-scale industries of the State. So far as large-sized industries are concerned, there appears to be no difficulty for finance. For most of these are either quasi-Government concerns or those being financed by Exchange and leading banks. It is only the medium and small-scale industries which form the vast majority of industries that lack short- and medium-term finance. Even where such finance is offered by commercial banks to these small industries the supply is far short of demand. The peculiar economy of the State needs, it is stated, special consideration. Most of its agricultural produce such as tea, rubber, coconut, lemon grass, coir, jaggery, sugarcane, cashew nut, etc., have to be industrially processed for marketing. In this industrial processing are engaged many small and medium units which now need short-term finance. Whatever money these units require is now supplied against the security of stock-in-trade, machinery and plant, and often, to a considerable extent, against personal and real estate security of the industrialist concerned. But finances provided thus are too inadequate to meet their total requirements. What is needed, therefore, are advances on a larger basis than at present and this, the Association says, can be provided by the Reserve Bank by means of extending rediscounting facilities to medium-sized banks against their advances to industries also.

To sum up, in the opinion of the Association, the Reserve Bank could help industries by the adoption of the following measures:

(1) slight relaxation of the rigid control on the proportion of advances to deposits of commercial banks;

(2) extension of rediscounting facilities to smaller banks against their industrial investments and industrial accommodation;

(3) supply of industrial information to commercial banks and of the service of experts to help banks in the valuation of industrial assets through the Industrial Investment Corporation; and

(4) distribution of industrial credit by the Investment Corporation to small industry through commercial banks.

Co-operative Departments

The Andhra Chamber, however, for its part insists that medium and small industries should be started with the assistance of the Co-operative Departments of States "as they alone will be able to mobilise rural savings and divert them for purposes of developing small-scale and cottage industries." It adds: "The question of providing short-term credit to small-scale and cottage industries should be left to the co-operative societies, while other Scheduled banks should look to the needs of large-scale industries."

Both the Travancore-Cochin Bankers Association and the Andhra Chamber welcome the usance bill scheme of the Reserve Bank of India and plead for its extension to smaller banks. The latter body says that the facilities of the scheme should be extended to co-operative banks also.

U.S. ECONOMIC TRENDS

In his recent Economic Report to the U.S. Congress, President Eisenhower finds that the American economy is sound and flexible, and that it is heading for further growth. Pointing out that the urge to improve living standards, exercises a strong and continuous pressure on the society, the President notes many elements of strength in the American economic scene. Thus, for instance, today American purchasing power is greater than ever, with prices stable and income after taxes close to $250,000 million a year. Another $5,000 million in tax reductions will be added to this purchasing power in 1954. Liquid savings of Americans now total more than $200,000 million, and some two-thirds of American families have incomes of more than $3,000 a year. Business investments for new plant and equipment, which aggregated $27,800 million in 1953, are expected to reach an annual rate of $28,000 million in the first quarter of 1954. A continued rise is expected in spending by State and local Governments, apart from federal spending, to meet increasing needs for schools, roads and other public facilities. These expenditures, which amounted to less than $15,000 million in 1947, are now running at an annual rate of more than $26,000 million.

Also important to the American economy in this interdependent world are the improved economic conditions of other free nations. Their production reached new highs in 1953, and their gold and dollar reserves rose about $2,200 million.

The President acknowledges that the United States is in the midst of a "readjustment," marked by some declines from the record highs of 1953. But this readjustment, he believes, will be "brief and self-correcting." Principal cause of the recent downturn, according to the report, is a general inventory correction. What does this mean? At the end of the lengthy steel strike in 1952, many manufacturers who were left with depleted inventories began to build up their stocks—too rapidly in a number of cases. Cutbacks in the defence programme in 1953 led to a further piling up of inventories. Many manufacturers then began to cut back their production and to reduce their inventories to more realistic levels. The Report notes that "over the last two months of 1953 inventories declined while retail sales were generally sustained. Should this development continue, the moderate contraction now under way could come to a halt soon." It is noteworthy that so far in 1954, department store sales have been running 2 per cent. ahead of 1953.

This month's report of the Business Survey Committee of the National Association of Purchasing Agents—the men and women who buy and sell the products used by American business—says that inventory adjustments, while not completed, are making sufficient progress to foreshadow an "early end to the current business decline." The purchasing executives find that economic adjustments have been "orderly." Most of them believe that a "levelling-off may come this quarter, with a possible upward trend."

The employment situation is already showing signs of improvement. Within the past week, Government officials have noted a distinct slowing up in the rate of unemployment, which now amounts to about 2.3 million. Estimates are that this approximate level will hold for the year as a whole. If it does, the number of jobless—which includes unemployables or persons in the process of changing jobs in the free American economy—will come to no more than 4 per cent. of the entire civilian labour force. From 1946-50, before the outbreak of the Korean fighting, the ratio of unemployment averaged about 4.5 per cent. It is small wonder, then, that President Eisenhower's Economic Report was able to conclude: "There is every reason for confidence that our system of individual enterprise, which is one of the wonders of the world, will long continue to be a producer of ever-increasing wealth and widely diffused well-being."

INDIA'S STERLING BALANCES FIGURE IN U.K. COMMONS DEBATE

During the House of Commons' debate on the Chancellor of the Exchequer's report on the recent Commonwealth Conference at Sydney, concern at India's non-utilisation of its sterling balance was expressed by certain members. The discussion arose out of Mr. R. A. Butler's statement that India had a balanced budget and was, therefore, not drawing upon its sterling balances. Mr. Butler observed that, in India, there had been some remarkable recovery. During his visit to India, he said, he had seen something of the Five-year Plan and discussed it with India's "excellent Finance Minister." India had cured inflation and as a result, the country was to-day not using its usable reserve balances even for development. He quoted this instance of India to point out how the Commonwealth countries were tackling their internal payments problems.

Commenting on the statement of Mr. Butler, a Labour M.P., Mr. H. A. Marquand, said that he was concerned about the fact that India was not drawing on its sterling balances. He argued that non-utilisation of sterling balances was not in accordance with the expectations created by the Five-year Plan, which envisaged deficit financing and an import surplus to be met by withdrawal of sterling balances. Did the Chancellor's statement mean, he asked, that India had had to abandon its Plan. Replying to this poser, Mr. John Foster, Under-Secretary for Commonwealth Relations, simply stated that the Plan was progressing well.

Another member expressed concern at India's sterling balances in a different context. Opposing convertibility of sterling as aimed at at the Commonwealth Conferences. Mr. Hugh Gaitskell, a former Labour Chancellor of the Exchequer, feared that, if sterling was made freely convertible, all the holders of sterling would use that opportunity to convert them into dollars. Answering this criticism, Mr. Butler stated that sterling balances as a whole were controlled by release agreements and that India had not even drawn upon its usable balances. This explanation, however, did not satisfy Mr. Gaitskell; he pointed out that the release agreements were only gentlemen's agreements about not converting into dollars and that, if any member of the sterling area got into trouble, there was not the slightest doubt it would be forced to draw on those balances.

ARAB BANK OF ECONOMIC DEVELOPMENT PROPOSED

Proposals are under consideration for the establishment of an Arab Bank of Economic Development, with a capital of £E.200 million, divided into 2,000 shares of £E.100,000 each. Of these shares, Egypt would hold 800, Iraq 340, Saudi Arabia 320, Kuwait 240, Syria 80, Qalai 60, Lebanon 48, Sudan 40, Jordan 40, Libya 24, and Bahrein 8. Subscriptions are payable 2 per cent. in gold and the rest in the currencies in which the member-countries receive their incomes. One quarter would be payable within six months after the signing of the Bank's agreement by the member-countries and the balance later at the Bank's request. Apart from the paid-up capital, the Bank's funds would consist of its reserves, loans obtained through issuing bonds, or loans received from the International Bank for Reconstruction and Development.

The Arab Bank would grant loans to Governments of member-countries or to development institutions guaranteed by the Governments. Under certain conditions, it would make loans without guarantee to industrial or agricultural banks or share in regional development schemes carried out by companies on a commercial basis. Another feature of the proposed Bank is that it would grant loans to borrowers in any currency at its disposal, according to the needs of the project for which the loan was requested. The rate of interest charged, the date of maturity of loans and all other conditions would be left to the Bank's management.

The Bank would be run by a Board of Governors consisting of representatives of member-countries. It will be assisted by an Executive Board and a Board of Advisers. The former will consist of ten members and will be responsible for the management of the Bank. The Board of Advisers would consist of four members appointed for two years and chosen by the Board of Governors from a panel of eight experts nominated by the World Bank.

U.S. AID TO INDIA

Two more supplementary agreements providing for U.S. economic assistance to India were signed by the representatives of the Governments of the two countries in New Delhi on Saturday last. One of them provides for the extension of the engineering consultant services to the Damodar Valley Corporation up to the end of June, 1956, for which the U.S. Government will make available a sum of $632,000. The other relates to the supply of 5,000 long tons each of urea and ammonium sulphate-nitrate (worth $1.15 million) for the purpose of demonstrating, popularising and testing the chemical manures in India. Besides these two, another agreement covering the supply of 40,200 tons of steel is expected to be signed shortly. Preparatory to this agreement, the U.S. Foreign Operations Administration has already announced an allotment of $12.5 million for the purchase of steel. The steel is meant for such purposes as agricultural expansion, rural development, shipbuilding and repairs to industrial machinery, river valley projects and small-scale industries.

The aggregate U.S. outlay on the aforesaid three projects amounts to more than $14.28 million. The allocation is a part of the total authorisation of $77.1 million as assistance to India by the U.S. Government for the current financial year. It was only recently—on 24th December, 1953—that the first operation agreement between India and the U.S. under the Indo-U.S. Technical Co-operation Programme for 1953-54 was signed. The project financed under this agreement relates to the rehabilitation of Indian railways for which the U.S. Government has allocated $20 million.

The agreements under which the U.S. will supply India with fertilisers and steel are significant, in that they represent, just as the one relating to railway rehabilitation, direct economic aid, as distinct from technical aid, provided by the U.S. They should, therefore, be considered another landmark in Indo-U.S. economic co-operation.

The agreement covering fertilisers acquires special importance in the present context of the need for augmenting agricultural output in the country. The urea and ammonium sulphate-nitrate are new types of fertilisers which have not so far been tried in India. If the demonstration programme were to prove successful, it would, it is claimed, enable Indian farmers to obtain nitrogenous fertilisers at rates far cheaper than sulphate of ammonia. It may be mentioned here that there is a proposal to produce the new fertilisers at Sindri, in addition to the 300,000 tons of sulphate of ammonium now being produced every year.

HIND BANK RAISES DIVIDEND

The Directors of the Hind Bank Ltd., propose to raise the dividend for the year ended 31st December, 1953, to Re. 1-8 per share of Rs. 50 each, free of income-tax, from Re. 1 which they had paid for the previous two years. It may be noted here that the maiden dividend of the Bank was paid only in 1951. The stepping up of the dividend for 1953 is in tune with the encouraging results for the year. The profit of the Bank amounts to Rs. 7,91,038, which, as compared with that for 1952, shows an increase of Rs. 1,16,115. With the addition of Rs. 86,185 (Rs. 86,262) brought in from the previous year, the sum available for appropriation amounts to Rs. 8,77,223, as against Rs. 7,61,185 for the previous year. The provision for taxation has been raised from Rs. 2,90,000 to Rs. 3,86,000, while the addition to the reserve fund has been reduced from Rs. 2,50,000 to Rs. 2,00,000. The addition to the reserve fund brings it to Rs. 22,00,000. Bonus to staff absorbs Rs. 5,000 more at Rs. 40,000. The dividend payment at 3 per cent. per annum requires Rs. 50,000 more, that is, Rs. 1,50,000, leaving a sum of Rs. 1,01,223 to be carried forward to the next year's accounts.

The securities and investments of the Bank, as on 31st December, 1953, stand at or below market rate ruling on that date.

WEST EUROPE AND COMMONWEALTH MOVE TOWARDS CONVERTIBILITY

The four-day unofficial conference of more than 200 delegates from over 20 Commonwealth and West European countries held at London was over on the 1st inst. The delegates favoured the creation of a secondary preferences system between Western Europe and the Commonwealth within the framework of the G.A.T.T. They suggested that such preferences should be a reduction of tariffs accompanied by the gradual establishment of currency convertibility within the group. The Conference urged the Governments of the Commonwealth and the Western European countries to meet and discuss agricultural and industrial development of their dependent territories and draw plans for investment in the development schemes.

A resolution on trade made it clear that a European-Commonwealth link would not be aimed at building up tariffs against the rest of the world, but at promoting the fullest flow of trade between Europe, the overseas territories and other countries.

A special emergency resolution urged the closest possible association between Britain and the six-nation European coal and steel community in developing Europe's basic industries.

PRODUCTIVITY IN TEXTILE INDUSTRY

I.L.O. EXPERTS' SUGGESTIONS FOR IMPROVEMENT

AN important problem of the cotton mill industry in India which received the special consideration of the Joint Consultative Board of Industry and Labour at its fifth meeting held in New Delhi last week related to productivity. This is hardly surprising, considering the imperative need for raising the productivity of labour employed in cotton mills in order to make cloth cheaper for consumers in this country and to raise the competitive ability of Indian cotton goods in overseas markets. Although the need has been stressed time and again, the output in relation to the total effort expended has not shown any improvement at all. On the contrary, there has been a distinct setback. According to the Planning Commission, the productivity in the cotton industry has generally declined by 20 to 30 per cent. during the period following the Second World War. This has happened at a time when the productivity of workers in other cotton goods producing countries such as the U.S., the U.K., Japan and the European continent has gone up. India's backwardness in this respect is clearly borne out by the fact that an operative in the Indian cotton textile industry handles, on an average, 280 ring frame spindles, as against 800 spindles and 1,200 spindles handled by his confreres in the U.K. and the U.S. respectively. Similarly, an Indian operative handles an average of 2.5 ordinary looms, as against 5 ordinary looms in the U.K. and 32 automatic looms in the U.S.

The foregoing brief account serves to emphasise one aspect, namely, that, if India is to compete effectively in world cotton textile markets, it is of the utmost importance that productivity of labour should be increased. For, to the extent this is done, cost of production will be reduced and prices to consumers can be lowered. Indeed, it would be no exaggeration to say that the future of the Indian cotton textile industry hinges on the success of measures that are taken to increase productivity.

Viewed thus, the efforts of the International Labour Office (I.L.O.) in helping India to adopt measures for achieving higher productivity are certainly commendable. It will be recalled that, under the I.L.O.'s expanded programme of technical assistance, the Government of India has obtained the services of experts for organising productivity studies in selected industries. The experts who came to India in December, 1952, split themselves into two units to carry out studies in the textile industry and the engineering industry. The experts working in the cotton textile industry have, by means of pilot studies, already demonstrated how, even with a short course of training, results can be achieved quickly by training local staff in the fundamentals of work study and productivity techniques. They have also suggested that an experiment in the application of work study techniques and the introduction of a system of payments by results may be carried out in one complete unit or an independent section of a mill. This specific proposal made by the experts in this regard may be summarised as follows:

The productivity studies should cover all the sections, from the blow room to the winding and warping sections. Incentives or piece-work schemes should be introduced in all the departments, unless, of course, it is decided that there are overriding considerations, as, for example, the possibility of bad quality work. The mill or a section of a mill should consist of 50 to 100 cards and 20,000 to 40,000 spindles so that the results can be demonstrated in a reasonable time. The machinery in the selected plant must be in a reasonable state of repair; otherwise, time must be allowed for overall and maintenance. "Training Within Industry" facilities should be provided, so that training can be given to all grades of management and labour.

When the plant has been brought to a reasonable state of maintenance, it is proposed to install a Quality Control System, department by department, throughout the mill, so that the quality of the products, whether it be lap, sliver, roving or yarn, shall be maintained between agreed limits. This will avoid the wide variation in the product which now exists. It has been stated that the work will proceed as far as winding and warping. This is in the first instance only. If it is later agreed that weaving and finishing shall be included, this can be done. It is intended, however, to keep a close watch on weaving, while the experiment is being carried out in the spinning sections. The improvement in the quality of yarn should have a definite effect on the quality of cloth and on the weaver's work-load.

The management of the mill must be genuinely interested in increasing its production and the productivity of its plant and its employees; in improving the quality of the yarn and cloth produced in its mills; and in reducing costs to the consumer. Before the experiment commences, a spinning programme will be agreed to for six months or for the duration of the experiment, and the management must adhere to this programme.

The Mission realises and accepts the fact that in India there are more workers than there are jobs available. It will, therefore, require a guarantee from the management that there will be no retrenchment of workers from the selected mill as a result of work done by the Mission. At the same time, the Mission will require an undertaking from the trade unions that, subject to the guarantee above, there shall be redeployment of workers throughout the mill, if it is found that there is a surplus to requirements in any particular department. It shall be understood that the surplus workers who are redeployed shall suffer no reduction in wages as a result of the move.

The experiment shall continue for at least three months, or other mutually agreed period, after the completion of work study in order to allow the experiment to have a fair trial in all departments.

Although more than eight months have passed since these proposals were made, no worthwhile progress has been made in the direction of implementing them. In fact, the activity of the I.L.O. textile productivity experts has come to a standstill. This is due to the divergent attitudes taken by both employers and workers. A section of millowners has criticised, for instance, the recommendations of the experts in regard to maintenance of plant, working conditions and training of supervisory staff. In its opinion, the experts should not make any suggestion with regard to working conditions in the mills but should confine themselves only to their own field of work, namely, methods study with a view to suggesting measures for raising productivity. On the other hand, the workers point out that a mere study of methods and techniques will not be of much use, unless steps are taken to improve working conditions. Further, they state that any future experiments should be confined only to piece-rated occupations, so that increased productivity might automatically result in higher wages without interfering with the existing wage awards.

Owing to this divergence of opinion, as noted above, no final decisions could be arrived at at the recent meeting of the Joint Consultative Board of Industry and Labour. Now that the establishment of the National Productivity Centre has become a *fait accompli*, the existing deadlock in the textile industry must needs be resolved. There is sufficient reason to feel that the attitude taken by both the employer and the employed is of a retrograde nature. The employees' stand is at least understandable, in the light of fears of retrenchment. But it is difficult to appreciate the stand taken by employers. Commonsense suggests that they ought to welcome any sound proposal that is calculated to raise the productivity of workers. Will the millowners care to explain, in simple language, as to why they are afraid of carrying out the suggestion made by the I.L.O. experts?

HANDLOOM WEAVERS' CO-OPERATIVE YARN PRODUCING MILL

What is claimed to be the first of its kind in India is the establishment of a co-operative cotton yarn producing mill by the handloom weavers of Andhra at Guntakal, which was declared open on Monday this week by Mr. T. T. Krishnamachari, Union Minister for Commerce and Industry. The estimated capital cost of the mill is Rs. 37.5 lakhs. Of this, Rs. 22 lakhs were met by way of contribution to share capital from 500,000 handlooms of Andhra made through 500 primary weavers' co-operatives. The balance of Rs. 15.5 lakhs was taken up by the Andhra State Handloom Weavers' Co-operative Society, the federal body of primary societies. The number of spindles installed in the new mill is said to be 11,000.

Declaring open the mill, Mr. Krishnamachari said that the venture was a turning point in the history and fortunes of the handloom weavers of Andhra. "The Union Government," he observed, "was interested in the venture, because it was an experiment in a new direction—a great progress in the co-operative movement." To quote him: "The newly established mill is an acid test for the co-operative movement. Neither the Andhra nor the Union Government will allow the venture to fail." Proceeding, Mr. Krishnamachari stated that, in providing monetary assistance to the handloom weavers, the Centre had been keen that they should not be cheese-paring, because the money would be well spent with the machinery that was existing in the State.

In the course of his address, Mr. T. Prakasam, Chief Minister of Andhra, congratulated the weavers on their fruitful efforts at setting up the co-operative spinning mill. He assured them that his Government would give full assistance to weavers so that they could rehabilitate themselves. Mr. Prakasam revealed, in this connection, that the Andhra Government had represented to the Centre that the apportionment of the handloom cess fund between Andhra and residuary Madras was not equitable and that the Centre had agreed to revise the allotment.

BOMBAY YARN MERCHANTS' ASSOCIATION AND EXCHANGE LTD.

With the inauguration of the Bombay Yarn Merchants' Association and Exchange Ltd. by Mr. Purshotamdas Thakurdas, President of the East India Cotton Association, on Monday last, a new chapter has been opened in the history of the yarn trade in Bommay City. The existence hitherto of two separate bodies, namely, the Yarn Merchants' Association, Bombay, and the Bombay Yarn Exchange Ltd., had made it practically impossible to introduce unitary control over futures trading in yarn. Now that these two bodies have been merged into one single association and a new set of by-laws governs forward trading, one can expect that speculation in yarn trade will not degenerate into gambling, as it had invariably done in the past, and that crises which spoil the fair name of the trade will not recur. Mr. Gordhandas Jadavji, President of the new Association, did well to exhort the members, in the course of his address at the inauguration ceremony, to refrain from undue speculative activity and to bear in mind the fundamental principles of forward contract regulations. Mr. Gordhandas expressed the hope that the new Association would help foster the yarn trade on sound lines. Sentiments more or less similar to these were also expressed by Mr. Sankalchand G. Shah, the Vice-President, and Mr. M. R. Bharucha, the President of the erstwhile Yarn Merchants' Association, Bombay.

Inaugurating the new Association, Mr. Purshotamdas Thakurdas blessed the Association with a "bright and luminous future like the blooming flowers in the spring." He prayed that the Goddess of Wealth might bestow her favour and shower wealth on the yarn market.

TEXTILE CIRCLES' CONCERN OVER U.K.-JAPAN TRADE PACT

EXPORTS OF COTTON MACHINERY DECLINE

(By A Special Correspondent)

MANCHESTER, *2nd February*

SIGNING of the Anglo-Japanese trade agreement for 1954 has been the focal point of all interest in textile circles this week. As can be expected, the publication of the details has caused considerable alarm in Lancashire and many protests have already been made. In the House of Commons, an attempt to debate the subject was turned down by the Government, but there is considerable anxiety among Members of Parliament of all political parties on the effect which the pact will have on the cotton trade. In particular, attention has been drawn to the fact that the Government did not consult the industry in any official capacity before undertaking the negotiations and, from this point of view, there is intense dissatisfaction with the subsequent arrangements. Trade leaders in all sections have expressed their opposition to the agreement in outspoken comments over the week-end.

MANCHESTER LETTER

How the actual scheme will work out in practice is not quite clear from the initial reports. In some quarters, it is felt that the Treasury and Board of Trade have purposely kept the full facts quiet, hoping that the storm will die down.

Imports of up to £300,000 worth of cotton and rayon piecegoods and the same value of apparel are not in themselves large, but they represent a bridgehead for Japan, which the textile trades in Britain will watch very warily in the light of possible future developments. It must be remembered that this pact is for a year only—at the moment.

Controversy will again flare up in Lancashire over the quota of £3,000,000 for imports of cotton grey cloth for processing and re-export. The contrasted views of the finishers and manufacturers are by now well established. Lengthening delivery terms, caused by labour shortages in the mills, however, cannot be blamed on any one section. Confronted with a *fait accompli* in the shape of this new and unwanted burden, Lancashire traders can do little more than protest—and, in view of past experience, their pleas will be acknowledged and forgotten. Meanwhile, Japan last year went further ahead as the leading world exporter of cotton goods, and still goes marching on.

The Slump's Toll

It was a remarkable feature of the recent depression in the Lancashire textile industry that so few cases of actual failure took place. The strong financial reserves built up during the prosperous years undoubtedly helped traders to weather the storm when it came.

The total number of bankruptcies, deeds of arrangement, liquidations and receiverships during 1953, however, increased to 120, as compared with 68 in the previous year and 22 liquidations in 1951. The first post-war bankruptcies in the trade were experienced in 1952 and, again last year, there were three such failures, all affecting merchants and agents. In addition, four receivers were appointed, one each affecting spinning, manufacturing, finishing and merchant firms.

The number of compulsory company liquidations increased from four in 1952 to eight last year, all concerned with the merchanting section of the trade. Creditors' voluntary liquidations numbered 17, as against 12 in the previous year, in which three manufacturing firms were involved, 11 merchants and agents and three miscellaneous companies. Members' voluntary liquidations aggregated 88, as against 46 in 1952, there being 45 merchants firms affected, 14 spinners and 15 manufacturers.

There was a further increase in the number of new limited companies registered during the year, the total being 236, as against 197 in 1952. The nominal capital involved was also much larger, being £1,941,300, as against only £883,200 in the previous year, and £2,054,825 involving 164 firms in 1951. Again, the majority of companies registered comprised merchants and agents, numbering 173, while 21 miscellaneous textile traders were included in the list, along with 12 spinners and 12 manufacturers.

One Way To Reorganise?

In the second half of last year, the number of cotton mill deals which took place in Lancashire created a good deal of talk and, already, in 1954, there has been evidence that the trend has by no means ended. In fact, there are indications to show that another aspect of the phase may be taking shape.

Following swiftly upon the acquisition of the Maple Mill, Oldham, by the Fine Spinners and Doublers Ltd., the same combine has made a bid for the Asia Mill at Hollinwood. In addition, it is not long since the Lancashire Cotton Corporation bought the Briar Mill, Shaw. The interest displayed by these large groups in raising their productive capacity in this way has stimulated the belief that more deals of this kind are on the way and a number of mills have been mentioned as "takeover" possibilities. There are reasons also for the fact that single unit concerns are not altogether averse to throwing in their lot with a larger company. The directors have many problems before them at the moment, not the least being the provision of sufficient liquid assets to finance adequate stocks of raw material in the light of circumstances expected to prevail in the latter part of this year.

The bigger groups of mills, particularly in the spinning trade, have been favoured by circumstances in the past few years. They were assisted by the provisions of Government's modernisation plan, and the revival of private trading in raw cotton gives them certain advantages over their smaller colleagues. A gradual reorganisation programme, involving scrapping of uneconomic mills and their replacement by modernised redeployed units arranged within the orbit of the chief combines, would be of benefit to the trade as a whole and each group, in particular.

It is doubtful whether any voluntary scheme would receive sufficient support to carry it through without a great deal of discussion and argument. By quietly adapting their affairs to create greater efficiency, the big combines could be of immense value to the industry at this juncture.

Machinery Exports

Shipments of British textile plant last year continued the decline which was already becoming evident in 1952. Exports amounted to 1,687,340 cwts., a fall of more than 500,000 cwts. as compared with the previous year. Despite higher charges, the earnings from these sales were nearly £10,000,000 less than in 1952, aggregating £40,796,807. The average price obtained was £484 per ton, as against £448 in the previous twelve months. All the leading buyers of textile machinery took smaller quantities of plant during the year, India remaining the biggest consumer with 316,518 cwts. Pakistan received 193,661 cwts., Italy 150,750 cwts. and Brazil 118,975 cwts. There was also a general decline in the amount of each particular type of machinery which was shipped abroad. Spinning plant exported fell from 1,297,288 cwts. to 931,211 cwts. and weaving machinery from 358,475 cwts. to 307,259 cwts.

Imports of textile plant aggregated 113,946 cwts. last year, as against 133,851 cwts. in 1952. A large part of this machinery was for hosiery and knitting, which cost over £2,000,000 out of the total value of imports of £4,900,000. Chief suppliers of all types of textile plant were the United States, providing 43,922 cwts. and Germany 19,608 cwts.

Rayon Output Rises

Rayon was in the van of the revival in the textile trade which gathered momentum throughout 1953. Output of spun rayon yarn, in fact, reached record heights during the year and made up for the only partial recovery in purely cotton output. Average weekly production of cotton yarn at 13,080,000 lbs. during 1953 compared with 11,360,000 lbs. in the previous year, but with 16,630,000 lbs. in 1951. On the other hand, rayon and mixture yarns increased from a weekly average of 1,720,000 lbs. in 1952 to 2,800,000 lbs. weekly last year, which exceeded the previous best of 1,920,000 lbs. per week in 1951.

According to the latest figures issued by the International Cotton Federation, there was a sharp advance in the number of spindles in Lancashire spinning rayon staple fibre in the first half of last year. In January, the total was 1,831,000 spindles, rising by July to 2,522,000. An even more remarkable increase was evident in the same period in France, where spindleage on rayon jumped from 263,000 to 1,265,000. The only other countries with any pretentions to large spun rayon activity were Germany, with 1,350,000 spindles on this type of trade, and the United States, where 1,337,000 spindles were so employed.

Owing to the single shift in operation in Lancashire, however, the quantity of rayon staple consumed in cotton spinning mills in this country was only 33,300 metric tons in the six months ended July, 1953, as compared with 78,337 tons used in the United States and 39,090 tons in Western Germany.—*All Rights Reserved.*

RAISING PRODUCTION OF IMPROVED VARIETIES OF COTTON

MR. K. R. DAMLE'S EMPHASIS AT I.C.C.C. MEETING

REVIEWING the developments in the sphere of raw cotton in India during the year 1953, we observed in our *Annual Review Number*—*vide* page 128—that the chief problem before the cotton planners today was not only the quantitative improvement of cotton but also its qualitative improvement. It is gratifying to find that this was the main theme of the address of Mr. K. R. Damle, President of the Indian Central Cotton Committee, too, delivered at the Committee's sixty-ninth meeting held in Bombay last week. Mr. Damle said that a "more vigorous and systematic effort" in substituting the area under indigenous variety with improved medium and long-staple varieties would further increase the production of those types of cotton which the Indian cotton textile industry required. The question of accelerating production of long-staple cotton of 1-3/16" staple, Mr. Damle maintained, was of paramount importance from the point of view of national economy. In this connection, he drew particular attention to the following two specific recommendations of the Agricultural Research Sub-Committee:

(1) Schemes for the production of long-staple (1-3/16") cotton in the country should be invited from the principal cotton-growing States where experiments in that direction are already in progress. These States are the Punjab, Bombay and Madras.

(2) Production of long-staple cotton should qualify for special treatment and schemes should be financed in full, although the general policy of the Committee in regard to financial assistance to be given to the various States should be not to permit the full grant of the expenditure on research schemes beyond a period of 10 years and no grant after a further period of five years.

Pertinent Suggestions Indeed

These are, indeed, very pertinent suggestions and the Committee has done well in endorsing them. For whatever amount that is spent on such schemes will ultimately bring considerable benefit to the country as a whole in the form of higher returns to the grower and saving in foreign exchange. The Committee has done well in continuing to accord special attention to the problem of accelerating increased production of improved varieties of cotton. An indication of the progress already made in this direction will be evident from the rise of 1.2 million bales of cotton during the current (1953-54) season, as compared with the 1949-50 season, the year previous to the introduction of the Grow-more-cotton Scheme. Practically the whole of this increase is accounted for by long- and medium-staple cottons. Well could Mr. Damle claim: "We (the Committee) can look upon the current year's production with a certain amount of justifiable pride." Proceeding, he observed:

"An outstanding development which deserves special notice today is the fact that the consumption of Indian cotton by mills in India during the season ended 31st August, 1953, reached the record figure of 36 lakh bales, representing an increase of more than 6 lakh bales over the previous season's corresponding consumption figures. The consumption of foreign cotton, which was 8¼ lakh bales, showed a reduction of 2.3 lakh bales compared to the previous year's figures. Very little of the imported cotton was of Pakistan origin. The loss of supply of Pakistan cotton has been made good by increased supplies of corresponding varieties of Indian cotton. This achievement was possible on account of the efforts of this Committee in developing and extending improved varieties of cotton in the country in co-operation with the State Departments of Agriculture. Cotton extension schemes sponsored by the Government of India have also contributed, in a large measure, to accelerating the increased production of improved varieties of cotton. In assessing the value of the work done in this regard, it may not be out of place to refer here to the fact that the value of imported foreign cotton in India declined from Rs. 124.6 crores in the cotton year 1951-52 to Rs. 58.9 crores in 1952-53, resulting in a saving of over Rs. 65 crores in foreign exchange."

There is still great scope for further augmenting the output of medium- and long-staple varieties. This is evident from the recommendations made by the Committee for the consideration of the Central and State Governments concerned. Thus, the Committee has commended a scheme for the improvement of Tinnevelly and Karunganni cottons. Under this scheme, three new strains, namely, 6189-9, 6188-8 and 6874 have been evolved which are superior to the local strains K.2 and K.5 both in staple length and ginning outturn. Another strain, 6312-4, although yielding as much as the local strains, is superior to the latter in spinning performance, as it spins up to 42s. These four strains are now being tried out in the Tinnevelly-Karunganni tract with a view to determining as to which of these would be most suitable for general cultivation in the central and southern districts of the Madras State. Another suggestion made by the Committee covers the extension of schemes for the improvement of white Northerns and evolving white linted cotton for Cocanada tract in Andhra State. It will be interesting to note that new methods are being evolved with a view to producing long-staple cotton. At Indore, for instance, Karnak (*G. barbadense*), a leading Egyptian variety, has been successfully grafted with Jarilla (*G. arboreum*). The Committee has suggested that further grafting trial should be carried out at Indore on acre basis so as to obtain more definite results in respect of both the growth of cotton and its economics. It has also suggested that similar trials should be carried out at two or three other suitable centres in the country to confirm the results obtained at Indore.

Cotton Seed Distribution Schemes

The success of these steps will depend, to a large extent, on the attitude of the cotton growers. Now that the growers would appear to have come to realise the value of improved seed, the work of distributing such seed has been rendered less difficult than what it was some years ago. Now a question that has arisen is whether the responsibility for the work should continue to be shouldered by the Committee or be transferred to the respective State Governments. Alluding to this question, Mr. Damle felt that it should be possible for the States to undertake cotton seed distribution schemes in future without additional staff, since the staff of the Agricultural Departments in most of the States has been considerably expanded and strengthened in recent years. Another ground on which Mr. Damle justified his view was that the Committee was spending large sums of money on seed distribution schemes and any saving of funds would make available large amounts for important schemes of research. The State Governments, too, need not incur huge expenditure on this account, if only they pay heed to the advice of Mr. Damle that the State Governments should emulate the example of Bombay where the seed distribution schemes are being worked on the principle of making the growers themselves responsible for the expenditure on production and distribution.

This suggestion sounds good enough, but it is doubtful whether all the States will do this work as conscientiously as the Committee has been doing. In any case, if the responsibility for seed distribution is shoved on to the States, there must be some check on them to ensure that the work is being well done. Otherwise, all the good work that has been done so far in this direction would, in course of time, prove to have been in vain. Be that as it may, the Governments of Andhra, Mysore and Hyderabad have been asked to undertake multiplication and distribution of Laxmi cotton, a superior variety.

The President of the Indian Central Cotton Committee referred to the production plans for the years 1954-55 and 1955-56 and struck a note of optimism in regard to the prospects. He said:

"Given favourable weather conditions, no difficulty is likely to be experienced in attaining the target of cotton production which has been fixed by the Planning Commission for the country. These plans were discussed ... at an informal meeting of the Directors of Agriculture who have agreed with this view. The targets which have been prescribed for individual States seem capable of achievement and the State Directors have assured me that they will try to reach them."

Recent Progress

The optimism is not without foundation. This, in a way, is indicated by the satisfactory progress made in cotton production in recent years, a brief summary of which is given below:

While the total production of cotton in the country during 1952-53 was about 3.6 million bales —250,000 bales less than the figure for 1951-52— the target of total production for 1953-54 was fixed at 4.2 million bales. During the current season, several extension schemes sponsored by the Union Government were continued, for the fourth year in succession, in the States of Punjab, P.E.P.S.U., Rajasthan, Bhopal, Madhya Bharat, Madhya Pradesh, Saurashtra, Bombay, Uttar Pradesh, Hyderabad, Madras, Orissa, Mysore, Andhra and West Bengal. For this purpose, the Central Government made an outright grant of Rs. 10.1 lakhs for staff and other items of expenditure and a loan of Rs. 34.28 lakhs for the purchase of improved seed for distribution to growers. As a result of the implementation of these schemes, the final area under cotton is expected to be about 17 million acres, as against 15.7 million acres during the previous year.

From the all-India point of view, the current cotton season could be described as the most favourable in recent years. Almost all the States had fairly good and timely rains which helped the completion of sowing in time, and reports received from most of the States indicate that the yields are fair. However, in Madhya Pradesh and Hyderabad, two main cotton growing areas, weather conditions during the growth of the crop were not so favourable as originally anticipated, resulting in lower yields. Despite these and other conditions, the total production of cotton is not expected to be much below the target of 4.2 million bales.

For the 1954-55 season, the Planning Commission has fixed a target of 17¼ million as the acreage under cotton, the total cotton production target being about 4 million bales. The plans submitted by the cotton-growing States indicate that there would be no difficulty in achieving these targets.

Two other important aspects to which Mr. Damle alluded in the course of his address related to inter-specific hybridisation in cottons (at Surat) and supply of cotton baling hoops. While on the former, he pointed out that the hybrid type 170-CO.2, which had a staple length of 1⅛", was capable of spinning up to 48s counts. It had found favour with the cultivators in the Deccan canal tract and Gujrat. This variety was expected to cover, in a couple of years, over 100,000 acres in the areas to be served by the Khakrapara Project in the Surat District. As regards the supply of cotton baling hoops, Mr. Damle said that the position had been satisfactory and that he did not anticipate any difficulty in meeting the full requirements of cotton pressing factories. As regards fuel, he said that timely allotments of coal had been made by the Committee's office to cotton ginning and pressing factories. And the question of removing the difficulties in the actual despatch of adequate quantities of coal to some factories situated in Punjab and P.E.P.S.U. had been taken up with the Coal Commissioner.

Mr. Damle expressed satisfaction at the decision of the Madhya Pradesh Government to defer the imposition of sales tax on cotton up to 30th June, 1954 in respect of sales effected on or before that date. He even favoured the complete withdrawal of sales tax on cotton in all the States. This was also the unanimous view of the Committee as a whole. Thus, in a resolution adopted at the meeting, the Committee said:

"The Indian Central Cotton Committee desires to convey its thanks to the Madhya Pradesh Government for suspending the levy of the sales tax on cotton upto 30th June, 1954. In agreeing to this suspension, as the State Government has already accepted that the heaviest impact of the tax would be on the cotton grower, the Committee strongly urges the State Government in the interests of the cotton grower to see that cotton which is an essential commodity is permanently exempted from the sales tax in the State.

"The Committee also reiterates its previous recommendation that there should be no sales tax on cotton in any State, as that would tantamount to double taxation, as cloth and yarn are already subject to sales tax.

"The Committee also notes with concern the heavy incidence of the export tax on cotton levied in Hyderabad State which would ultimately fall on the cotton grower in the State and requests the State Government to withdraw the tax forthwith."

SUCCESS OF INDUSTRIAL MANAGEMENT—I

ON WHAT DOES IT DEPEND?

(By Col. L. SAWHNY, Managing Director, Associated Cement Companies Ltd.)

[The complexity of business administration has brought to the fore the imperative need for the attainment of a high degree of knowledge and experience. Further, in this age of enlightened democracy, the success or failure of a management depends on the extent to which it identifies itself with the ideals of a Welfare State. It was precisely these aspects which Col. L. Sawhny, Managing Director, Associated Cement Companies Ltd., emphasised, in the course of a lucid and thought-provoking presidential address delivered at the meeting of the section dealing with the functions of management and management training at the Second Annual Conference of the All-India Council of Labour and Welfare Officers held in Madras on Friday the 12th inst. In view of the importance of the subject, we reproduce below the address of Col. Sawhny—Ed.]

THE Duke of Wellington once remarked: "There are no bad battalions, there are only bad officers." Even though the constituents which go to make up the organisation of industry vary in detail from those which constitute fighting forces, yet the basic truth of this statement can, generally speaking, be applied to industrial management. For we may take it that the working class and the weapons of production in any individual country are of a fairly standard pattern, and, therefore, that the effectiveness or otherwise of the use which they are put to, will depend substantially on the quality of management which they receive.

In the same way as "the proper study of mankind is man," so I believe that a proper study of management is also man. Where some managements have failed in the industrial field in the past has been in their inability to achieve a proper balance between the rapidly advancing technical skills which science was continuously making available to them, and the higher skill which was needed to ensure human co-operation.

The days are past and gone when the "hiring and firing" type of management was able to achieve results by arbitrary means. Even the days of the "benevolent despot" are numbered, for that technique is no longer acceptable either. Everywhere today, men demand a new leadership, one that will fulfil the basic human needs of an individual. The balance-sheets of the past must now be rewritten in terms of human aspirations and individual values. The industrial pattern of today must be one in which the endeavours and ambitions of men are so co-ordinated as to produce a driving force that will consolidate industry in an accepted place in the new society which mankind aims to achieve. This will be only when management is able to guarantee an efficient and successful industrial community in which men may work willingly and live abundantly.

Measure of Success

In India today, our national goal, as expressed through the representatives of the people in Parliament, is the establishment, as speedily as possible, of a Welfare State. The success or failure of industrial management will be judged by the extent to which it is able to identify itself with this national aim and to prove, by its actions and its policies, that it can champion the hopes of those people who, in working for industry, are striving to achieve security and well-being.

In this connection, it is of interest to note the cleavage that has developed in the ranks of Britain's Labour Party, where the trade unionists have rejected the advocacy by the intellectual left wing of that party of more rigorous State control and speedier nationalisation of industry, as a means of achieving the idea of a Welfare State in England. They have apparently decided, as a result of the experience which they have gained in trying out the theories of public ownership, that the Welfare State will be more rapidly realised through vigorously directed free enterprise.

Industrial Policy

The Government of India has accepted the principle of a "mixed economy" so far as the future industrial development of the country is concerned. This concept envisages the co-existence of State control and private enterprise operating alongside each other within clearly defined spheres, and in accordance with the nationally accepted long-term plan. Within this overall national policy, that of the private sector must be based on certain sound and well-tried principles, it must satisfactorily fulfil certain conditions and it must guarantee to produce certain results. Apart from the provision of material goods and benefits, it should also be rooted in the spiritual and psychological fabric of Indian life.

In order that this link with spiritual values is maintained, an industrial policy must be ethical and accepted as being above suspicion. Moreover, such a policy must set a purpose to which men can respond with a high sense of duty and service to their fellow men. It should inspire its work-people to loyal and harmonious effort in the secure faith that their endeavours are contributing towards the betterment of society. Unless this spiritual foundation forms the basis of industrial policy, it is in danger of being dominated by the motive of materialism, and, when this occurs, industry finds itself back in a position which has been rejected as having no place in our new world of enlightened values.

Provided that the industrial policy fulfils these fundamental human needs of both the individual and the working team, it will automatically accomplish its material aims, and the entire picture of free enterprise will fall into place and be seen in its right perspective. Finally, it is of the utmost importance that an industrial policy should be positive, attainable, easily recognisable, and easily understood by the men and women who go to make up the society of industry. This, in its turn, means that it must be as sound in detail as it is in broad principle, and that it can be analysed, implemented and co-ordinated down to the lowest level necessary.

Responsibility of Management

It will be realised from the foregoing that one of the most significant factors in modern industrial development is the great emphasis which is now laid upon the responsibility of higher management. The complexity of business administration, when considered in the light of the national aim of establishing as early as possible a Welfare State, clearly shows that a very high degree of industrial statesmanship is called for. Let us now consider what are the responsibilities which face management today. These are:

1. A successful and efficient management must guarantee adequate rewards for the services rendered by its members, in addition to providing them with reasonable incentive. Further, it must not only give a fair return on invested capital but also provide the reserve funds which are necessary for the maintenance of the industry and for its future development. In achieving these aims, the management must shoulder the responsibility for holding an honest balance between the various interests reflected in its enterprise, that is, its work-people, its shareholders, and the consumers of its product.

2. Management is always responsible for technical efficiency in all its aspects, such as costs, quality, volume of production, etc. In the process of achieving this, however, it has a further responsibility, that of building up and maintaining a high morale and the proper attitude of mind and spirit among its work-people. This can be accomplished by sound leadership and effective organisation, and once it has been achieved, technical efficiency will normally and automatically result.

3. While management must be prepared to take advice from all those who are in a position to give it, it must, at the same time, be prepared to make, and to stand by, its own decisions. It is an inescapable function of management to face up to the making of such decisions as are necessary to ensure that the endeavours of its organisation are directed towards the attainment of its ultimate aim. A weak or vacillating management which attempts to pass on the responsibility for decision making to others stands immediately self-condemned. It will lose the respect and confidence of those who look to it to provide for their leadership and security.

4. Management is responsible for the selection of its staff, for a definition of their functions, and for training them to be able to undertake their responsibilities. Management must further ensure that it is prepared to delegate both responsibility and authority down to whichever level is necessary to achieve efficient working.

5. Finally, management is responsible to see that its actions and policies always further the nation's social and political aims, and are never in conflict with them.

Leadership

Having defined these responsibilities, let us next consider those attributes which management must seek to attain in order to fulfil them. The first attribute which a management must have is that of leadership, as on this will depend the effectiveness of its direction. Leadership no longer employs the power of imposing the will of any single individual upon those of others. Rather, it means the ability to organise the combined capacities of a group and to inspire them to a willing and enthusiastic participation in responsibility. It means the power to harness the human resources of industry towards co-operative and constructive endeavours for the achievement of an accepted end.

Such leadership can only be provided by men of ability. It is not only the qualities of character and personality that are the marks of a successful leader. There must also be the quality of intellect which permits the giving of reasoned counsel; the quality of sound judgment, arising from experience and knowledge, that provides a special aptitude for anticipating future situations. In addition to these qualities, a leader must be prepared at all times to set an example by his own behaviour and to live up to the theories and precepts which he advances. Once such leadership is provided, then the management concerned will be in the happy position of having people working with it and not for it. This spirit of leadership once established at the top level of management will certainly seep downwards to the lower level of middle management, and finally to the lowest level of the supervisor who should be regarded as the hard core around which industry is built.

It will be of interest to know that, in the Defence Services, in spite of the tremendous weapons of destruction which science has made available to modern armies, it is still considered that the maintenance of a high morale is the most important single factor in the successful prosecution of war. In order to achieve and maintain this morale among its soldiers, sailors and airmen, the Defence Services concentrate, at every stage of an officer's career, on leadership training. There is a mistaken conception that military leadership is based on military discipline and on a fear of punishment. In fact, military leadership implies the negation of punishment. Its basis is to provide a mutual confidence between the officer and the man by which the latter will automatically follow the former in the secure knowledge that to do so is in his best interests and that he will never be let down. I venture to suggest that, if the same high degree of morale prevailed among the workers in industry, as it does among the men of India's fighting services, the advancement of industrial progress would be readily assured.

Definition of an Aim

If people are to combine for a common purpose, they must be told what that purpose is. It is the responsibility of management to state with utmost clarity the purpose and aims of its organisation, and then to ensure that all its policy decisions assist in the implementation of the overall aim. It is a cardinal task of management to discern with accuracy those economic factors and trends which are likely to influence the future welfare of the enterprise and to ensure that, except for the occurrences of unforeseeable events and the projection of factors over which they have no control, that its resources will be at least as economically productive in the foreseeable future as they are today. It is for the management to take decisions today on the problems which will confront the enterprise tomorrow.

A proper discharge of this very vital function of management requires that it should constantly examine the main purposes of its existence and be ready, if changing circumstances warrant it, to redefine and reorientate that purpose. To put it briefly, it is the responsibility of management to decide what the business of the enterprise really is, and having done so, to make quite certain that every single man and woman employed by it understands clearly the ultimate objective towards which their efforts are directed.

Even though this definition of an aim for an industrial enterprise may appear to be an inevitable process and mere commonsense, I would like to give you an example to illustrate that this is not so. In the early days of the industrial development of the United States of America, two rail-road companies were operating with a similar object, that of transporting cattle from the farmland country of the mid-western States to the consuming markets in the East. In the course of time, competition between these two companies grew more and more intense and, eventually, a bitter and relentless rate-war was waged. As soon as one company reduced its charges, the other followed suit until a time came when the more powerful of the two decided to drive the other out of the business altogether by transporting cattle free of charge. After it had done this for some time and had practically ruined itself in the process, it woke up one day to find that the cattle which it had been

SOME PRESSING PROBLEMS OF INDIAN SUGAR INDUSTRY

CANE DEVELOPMENT SHOULD BE INTENSIFIED

CAN the sugar industry in India attain that high level of efficiency which has been attained by its confreres in other countries? This question was posed by Mr. S. Lal Singh, M.P., Vice-President of the Indian Central Sugarcane Committee, in the course of his presidential address at the Second Biennial Conference of Sugarcane Research and Development Workers in the Indian Union held at Jullundur on Sunday this week. Evidently, Mr. Lal Singh must have been provoked by the sad state of affairs prevailing in the sugar industry. Despite the long period of 18 years of protection granted by the Government, the efficiency of sugar making in India has not improved appreciably. If anything, conditions have deteriorated greatly, belying the expectation of the consumer getting his requirements of sugar at reasonable prices. Indeed, no other industry in India has been nursed so much by the consumers and for which they have made such a heavy sacrifice as the sugar industry. Certainly, Mr. Lal Singh was not at all exaggerating when he said:

"It is a sad commentary on, and hardly creditable to, us that, even after such detailed and prolonged control by the Government, the local production should again be considered inadequate and that India should have to import in this season (1952-53) alone about 250,000 tons of sugar; plans are afoot to import a large quantity of raw sugar for refining in this country, and we may have to import still larger quantities in the coming season, and this at a time when we are terribly faced with the problem of unemployment and when there is so much need to save foreign exchange."

What is the factor which has stood, and is still standing, in the way of a flourishing sugar industry? The answer to the poser is not far to seek. The most important factor is the inefficient growing of cane, especially in those States where the major portion of the sugar industry is situated. Ever since the grant of protection to the sugar industry in 1932, the manufacturing stage has received more attention than the primary stage, barring a couple of States as, for example, Bombay, so much so that the primary stage has been lagging far behind the manufacturing stage. As Mr. Lal Singh rightly pointed out, the overall picture of the sugar industry in regard to yield of cane per acre and recovery per cent. sugar in cane has remained more or less the same during the past two decades and, in some cases, has actually deteriorated, in spite of natural factors being favourable for its development. The statement at the bottom of this page admirably brings out the force of this contention.

Setback to Cane Cultivation

It will be seen from the statement that, while the area devoted to sugarcane has appreciably expanded in recent years, the yield per acre and the sucrose content have not only not improved but actually suffered a setback. How India compares unfavourably with the other sugar-producing countries of the world in this respect is clearly brought out by the following figures:

	Yield of cane per acre Tons	Recovery per cent. of sugar in cane
India	13.50	9.98
Cuba	17.12	12.25
Mauritius	19.63	12.08
Lousiana	19.84	8.06
Australia	21.34	14.33
Puerto Rico	24.16	12.23
Java	56.00	11.49
Hawaii	62.05	10.46

These figures show that both the per acre yield of cane and the sucrose content in India are the lowest in the world (with the exception of Lousiana in respect of sucrose content), the yield being not even one-fourth of that in Hawaii and recovery being just two-thirds of that in Australia. Referring to this aspect, Mr. Lal Singh said that there was a wide gap between the research institutes and the field which should be filled in if cane development were to be intensified. Any dispassionate observer of the sugar industry in India will fully appreciate the force of this contention. After all, as one of the leading sugar industrialists of India has very aptly remarked, sugar is made not in the factory but in the field.

It is, however, difficult to agree with Mr. Lal Singh when he says that the absence of remunerative prices for sugarcane growers has also been responsible for the slow pace of cane development. To quote him:

"The injustice to Indian cultivators reaches the limit when he neither gets a guarantee of minimum price for his produce, as done in most other civilised countries nor is he allowed, in full measure, the benefit of the 'law of supply and demand.' Ceiling price is fixed when he is likely to get high price but gets no protection when prices touch bottom level—the price of *gur* in 1952 at harvest time fell to Rs. 5 per maund, as against the control rate of Rs. 20 per maund. While the cane cultivator was groaning with pain, all other parties, including the Government, felt jubilant and expressed satisfaction in Press statements on the fall of prices, and mind it please, it was not the proverbial or hated capitalist, but two crores of petty cane cultivators, who were the victims. ... Cane growers in U.P. have acted rightly in demanding not only for this season's crop a price of Re. 1-12 per maund, but, in addition, a share in the abnormal profit made by sugar mills last year, as a result of higher price of sugar and reduced price of cane. They deserve support from all quarters believing in justice and fair play."

An Unjustified Demand

The anxiety of Mr. Lal Singh to better the lot of the sugarcane grower is commendable indeed. He is, however, not wholly correct in contending that the interests of sugarcane growers have been neglected. He would, of course, be correct, if he meant that the cane-growers had not been enabled to grow better varieties of cane and improve the yield per acre. But he is wrong when he says that the farmer is not being given a proper price for his cane. On the contrary, the farmer has been paid a much higher price for his cane than he deserved. As we have so often pointed out, the policy of the Central and State Governments has all along been the pampering of sugarcane growers. It is unnecessary to go into this question once again, since detailed editorial comment on this issue was made only two weeks ago. Suffice it to say that the demand of the grower for an increase in the price of cane and a share in the profit of factories must be firmly rejected.

Be that as it may, Mr. Lal Singh dwelt at length on the issue relating to sugar prices and emphasised the need for their reduction. The four suggestions which he put forward, in this connection, were: (1) Reduction in the cost of cane cultivation, (2) downward revision in Central and State Government taxes, (3) revision of policy in regard to molasses, and (4) utilisation of by-products. There is, of course, nothing new or novel in these suggestions, for these have been put forward for a considerable time ere now. But there is no gainsaying the fact that, despite repeated emphasis, they have not received the adequate attention of the powers-that-be. It is for this reason it is proposed to deal with them once again.

To take the question of reducing the cost of sugarcane cultivation first. Mr. Lal Singh rightly stressed the need for providing facilities to cultivators in the form of cheap and ready credit, supply of fertilisers, labour-saving appliances, etc., at subsidised rates, more economical and effective control measures for combating diseases and pests, and better transport facilities. Referring to taxes, he said that the various types of taxes imposed on the sugar industry amounted to as much as Rs. 8-4-6 per cwt., which represented about 17 per cent. of the total cost of sugar. He asked: "Cannot the Governments forgo a portion of this, in order to cheapen the sugar?" There is considerable force in these observations of Mr. Lal Singh, as also in his statement that the imposition of sugarcane cess was least justified. Here are his own words:

"Cess on cane, as imposed in India, is not known to be levied in any other cane-producing country. Further, even if levied, it is supposed to be utilised for cane development work only. During the period 1944-45 to 1950-51, cess collection on sugarcane supplied to the sugar factories and the expenditure therefrom for development purposes were as follows:

(In lakhs of Rs.)

	Cess collection	Expenditure on development
U.P.	13,25	1,55
Bihar	4,10	90
Bombay	1,80	6
Total ...	19,15	2,51

Thus, the balance of Rs. 16,64 lakhs were absorbed in general revenue. A tax on the raw material of an industry is hardly justifiable, but to absorb the bulk of it to general revenues is nothing short of misappropriation of funds."

On the question of molasses also, Mr. Lal Singh made a few interesting observations. Said he:

"The Government buys from the sugar mills, molasses at about As. 4 per maund or Rs. 6-12 a ton for use in distilleries for power and potable alcohol and Government derives tremendous income by way of excise duty on the same. The actual sugar content of a ton of molasses is valued at Rs. 150 to Rs. 200 at the present cost of sugar, i.e., Rs. 6 to Rs. 8 per maund, as against As. 4 allowed by the Government. The total amount of molasses in India was estimated at about 550,000 lakh tons in 1951-52, worth about Rs. 10 crores, for which the Government was to pay only Rs. 35 lakhs. It is noteworthy that the cost of manufacturing power alcohol in India is extremely low, as compared with that in other countries. In 1939, the Indian Tariff Board had calculated it at only As. 6 per gallon, as compared with Rs. 2-8 in Italy, Rs. 2-3 in Czechoslovakia, Rs. 2-3 in Germany, Re. 1-8 in Australia and As. 12 in the U.S., and the Government makes tremendous profit by excise duty. Why should not a reasonable price be allowed for molasses?"

Utilisation of By-products

The Vice-President of the Indian Central Sugarcane Committee alluded next to the problem of utilising the by-products of the sugar industry as a means of reducing the cost of sugar manufacture. He felt that there should be no unsurmountable difficulty either in the manufacture of power alcohol or in its economic disposal. For, according to him, 400,000 to 500,000 tons of molasses available in India can produce only 25 to 30 million gallons of power alcohol. The Government of India allows 15 to 20 per cent. of alcohol to be mixed with petrol, so that at least 40 million gallons of alcohol will be required for mixing in about 240 million gallons of petrol used in India at present, leaving apart the alcohol required for numerous other purposes. Likewise, there are excellent prospects of producing paper and cardboard, insulating material, etc., out of bagasse and wax out of press cake.

In conclusion, it must be said that, on the whole, Mr. Lal Singh made a constructive criticism of the Government's sugar policy. It has become a fashion with politicians in this country to uphold the cause of agriculturists, whether right or wrong. It is not surprising that Mr. Lal Singh is no exception to this. Nevertheless, his address was marked by one

EXPORTS OF INDIAN COAL

PROSPECTS FOR 1954 NOT BRIGHT

INDIA is strenuously trying to recover its export markets this year. Representatives of Indian coal producers are now in Japan negotiating contracts for export of Indian coal to Japan. According to a spokesman of the Coal Commissioner's Office, Japan is expected to renew its contract for about 700,000 tons. But trade circles are doubtful about this, their estimate of Japan's imports being no more than 200,000 tons. Japan is buying coal from the U.S., even though it is more expensive, not only because of shortage of sterling but also because the quality of American coal is better than Indian.

Burma, another important importer of Indian coal, is also expected to renew its orders for about 300,000 tons. But, in view of the possibility of a trade agreement between Burma and China shortly, it remains to be seen to what extent Burma will prefer Chinese to Indian coal. Reports from Rangoon disclose that, in the event of a successful conclusion of the trade agreement, Chinese coal may replace a good part of the 300,000 tons of Indian coal annually imported by the Burmese railways.

India is hoping to obtain a portion of South Korean orders for non-metallurgical coal, which is estimated at 200,000 tons. Negotiations are progressing in this direction. Even here, it is difficult to forecast success. If the present uneasy truce in Korea were to lead to permanent peace there, Korea may well satisfy a part of its needs from China itself.

The only hopeful feature so far is that Ceylon has already agreed to import 250,000 tons of coal, but this is, indeed, a very small quantity. Some exports to Hongkong and Singapore may be made, but those, again, depend on competition from Australian coal.

The picture thus is not encouraging. Unless the real causes for the downward trend in India's exports are spotted and eliminated, it may not be long before India loses its hold over the present markets, owing to emergence of keen competition from China, Australia and South Africa in the South and South-East Asian markets. There is need for relaxing restrictions on export of metallurgical and other high-grade coals. Again, proper attention should be given to the provision of storage and transport facilities, besides large-scale washing and blending centres, with a view to up-grading low-grade coals.

The cost of coal is already high and it is imperative that it should be brought down to reasonable levels by the introduction of rationalisation measures. Unfortunately, rationalisation which involves substantial retrenchment is prohibited. That apart, there is a fear of increase in costs, thanks to exorbitant demands of labour, which has threatened a nation-wide strike from 1st March, if no action were to be taken towards meeting its demands.

In view of all these, it is held that India must count itself lucky even if it were to manage to export as much coal as it did in 1953, which itself was alarmingly lower than in the previous year. It will be recalled that, last year, there was a decline of 50 per cent. in the volume of exports to countries other than Pakistan. Thus, India exported only 1,181,403 tons in 1953, as against 2,363,251 tons in 1952, a decline of 1,181,848 tons.

Exports to Pakistan also were lower by more than 32 per cent. They were 766,000 tons in 1953, as against 1,142,193 tons, a decline of 376,193 tons. It is stated that Pakistan, too, is trying to reduce its dependence on India for its coal, in view of the friction between the two countries over Kashmir and the proposed U.S. military aid to Pakistan.

The decline in exports in 1953, despite the abolition of surcharge on exports of coal to Pakistan and subsequently in May on exports to all other countries, is, indeed, alarming. It is high time the Government came to the rescue of the coal industry not only for arresting this down-trend but for recovering the lost markets.

LABOUR RELATIONS IN AUSTRALIAN COLLIERIES

Industrial relations in Australian coal mines should prove an eye-opener to Indian interests connected with the coal industry, as they are healthier than here. An interesting account of the position in that country was given by Mr. F. H. Cockerill, Vice-President of the Northern Branch of the Coal and Shale Employees' Federation, who visited this country recently. Addressing the National Mine Workers' Federation, a body affiliated to I.N.T.U.C., Mr. Cockerill said that the workers there had not to face such problems as the bonus system in India. This was because wage rates were fixed at reasonable levels.

A significant feature of the wage structure in Australia, however, according to Mr. Cockerill, is that it is adjustable, according to variations in coal prices. For instance, an upward rise in coal prices is automatically accompanied by an increase in the wages of workers and *vice versa*.

Unlike in India, no one in Australia can be an executive of any union, unless he is a working member of the industry. Labour unions are detached from political organisations. Although some of the office-bearers may be attached to some political party or other, they are so scrupulous that their political views do not influence the union decisions. In other words, decisions are taken industrially and not politically. Every member has to register himself compulsorily, as otherwise he will have to deal with his grievances individually.

There is a Central Council and various district councils which deal with settlement of disputes between management and labour. Disputes are sought to be settled without interference from the Government as far as possible, according to certain prescribed procedure. Minor disputes are decided in about two days.

Labourers have their own houses built by their co-operative societies. The labour unions maintain special funds for the benefit of their members, such as funeral fund. Pithead baths for coal miners are of a high standard in Australia, higher than in India. These and several other facilities are responsible for the healthier labour relations that exist in Australia.

According to the terms of the Award given by the Industrial Tribunal at Dhanbad, recently, in the dispute between the management of the South Bulliaree-Kendwadih Colliery and Bihar Colliery Mazdoor Sangh, all the workers in that Colliery will get dependent's ration and cash concessions irrespective of the fact whether they reside in the company's quarters or not. The retrenched employees of the Kendwadih Power House will get 15 days wages (total emoluments in cash and kind) for every year of service, as retrenchment compensation in addition to trainfare, proportionate bonus and leave pay. The machine loaders will get Re. 1-1, instead of As. 15 per tub, with retrospective effect from 28th October, 1952.

JUTE MILLS FARING BETTER

RAW JUTE SUPPLY COMFORTABLE

A STUDY of the latest available statistics relating to the jute industry reveals that the industry has been faring reasonably well in recent months. The position in regard to the supply of raw material has been comfortable; production has been tending to go up; despatches have been distinctly better; prices realised on both hessians and sackings have been higher on an average; and, finally, stocks of manufactured goods have been steadily declining since July last. An important conclusion that emerges from these trends is that the earnings of mills for the second half of 1953 must be better than those for either the first half of that year or the corresponding half-year of 1952. Details of these trends are given in the following paragraphs:

Imports of raw jute into Calcutta and other mill stations in December, 1953, the latest month for which figures have been released, amounted to 607,000 bales as against 637,000 bales in the same month a year ago. As compared with the arrivals in November, 1953, the receipts were, however, higher by 101,000 bales. Of the total imports during December, 1953, raw jute of Indian origin accounted for 479,000 bales and of Pakistan origin for 128,000 bales which correspond to 415,000 bales and 222,000 bales respectively, imported in December, 1952.

With the December receipts, the total jute imports into Calcutta and mill stations during the first half of the season 1953-54 aggregated 2,908,000 bales, as compared with 2,927,000 bales in the same period in 1952-53. Of this total, Pakistan's share was 866,000 bales, while India's was 2,042,000 bales, as against 830,000 bales and 2,097,000 bales respectively in the same period in the 1952-53 season. Thus, these figures indicate that, whereas the total offtake by mills remained more or less the same at 2.9 million bales in the half-year under review, receipts from Pakistan rose by 36,000 bales while those from India dropped by about 55,000 bales, as compared with those in the first half of the 1952-53 season. The improvement in the purchases of raw jute from Pakistan is due to the trade agreement signed in March, 1953, between the two countries, under which India offered to buy 1.8 million bales to 2.5 million bales from Pakistan.

Imports of Raw Jute

The table below gives imports of raw jute into Calcutta and mill stations during the first six months of the 1953-54 season from both India and Pakistan, as compared with those in the corresponding period of the preceding season:

Imports of Raw Jute into Calcutta and Mill Stations

(In bales, 000 omitted)

Months	Indian Jute		Pakistan Jute	
	1952-53	1953-54	1952-53	1953-54
July	2,69	2,57	22	1,02
August	2,37	2,63	58	1,05
September	3,31	2,73	46	1,76
October	4,07	3,41	2,20	93
November	4,38	4,24	2,62	82
December	4,15	4,70	2,22	1,28
Total ..	20,97	20,42	8,30	8,66

While total imports of raw jute into Calcutta and other mill areas were stationary at 2.9 million bales, consumption of raw jute during the first half of the season 1953-54 amounted to 2,525,600 bales which was 1,944,000 bales lower than the consumption in the corresponding period of 1952-53. Stocks of raw jute, partly due to low consumption and partly due to continued purchases, recorded a gradual rise as at the end of each month of the period under review. This is reflected in the table below giving stocks of raw jute at Calcutta with mills as also with press houses of the Calcutta Baled Jute Association during the period under review:

Stocks of Raw Jute at Calcutta

(In bales, 000 omitted)

End of the month	With I.J.M.A.		With Press Houses of C. Baled Jute Association		Total	
	1952	1953	1952	1953	1952	1953
July	6,60	11,04	44	41	7,04	11,45
August ..	5,40	11,40	29	36	5,78	11,76
September ..	5,22	11,47	32	42	5,54	11,89
October ..	6,88	12,00	22	55	7,10	12,56
November ..	9,59	12,77	50	49	10,09	13,26
December ...	11,10	13,75	63	51	11,87	14,26

It will be seen from the table above that the total stocks rose from 1,145,000 bales in July, 1953, gradually to 1,426,000 bales in December the same year. Of these, I.J.M.A. mills accounted for 1,375,000 bales, and press houses for 1,187,000 bales. Calculated on a consumption basis of about 415,000 bales per month, the mills had, at the end of December, stocks which would last them for approximately 3¼ months, working 42½ hours a week with 12½ per cent. of looms sealed. Mills may thus be said to have experienced a fairly comfortable supply position during the period under review.

A higher consumption of raw jute depends on the rate of offtake of jute goods by overseas countries, especially the U.S. The trend of offtake in recent months has been encouraging, with the result that production of jute goods has been tending to go up. Thus, after going down from 73,100 tons in September, 1953, to 66,800 tons in October, 1953, production was progressively higher in November and December, 1953, at 69,000 tons and 77,800 tons respectively. Some idea of the improvement in offtake can be had from the fact that gunny despatches in July to December, 1953, amounting to 469,000 tons, were 30,500 tons more than those in the same period of 1952. Of this total, internal consumption amounted to 61,300 tons and exports 407,700 tons, as compared with 87,700 tons and 350,800 tons, respectively, in the corresponding period of the previous year. Thus, while internal consumption declined by 26,400 tons, exports rose by 56,900 tons or 16 per cent. The increase in exports was chiefly reflected only in hessians, the despatches of which, during the six-month period, aggregated 215,500 tons, as compared with 159,400 tons. Exports of sackings, however, remained more or less stationary at 188,000 tons.

Burlap Consumption in U.S.

While exports have been better, the trend of burlap consumption in the U.S. since October, 1953, has not been favourable. The consumption which stood at 83 million yards in that month declined gradually to 74 million yards in November and to 71 million yards in December last year. The decline may be attributed to a slight recession in the U.S. economic conditions, coupled with the high level of price of hessians in this country. Thus, hessians 40" x 10 oz., which were quoted at Rs. 43 early in October, rose to Rs. 49-8 per 100 yards in the middle of November. Since then, however, owing to consumer resistance the rate has declined to Rs. 45-8, as on 6th February last. Stocks of burlap in the U.S. at 213 million yards at the end of December were the highest for any month in the whole of the calendar year, 1953.

The effect of higher despatches is perceptible on stocks of manufactured goods with the mills. These stood, at the end of December, 1953, at 98,800 tons, which represents a substantial drop as compared with those at the end of June, 1953, when they aggregated no less than 133,800 tons. The stocks at the close of 1952, too, were comparatively higher at 115,000 tons.

Now a line about the trend of prices. From the close of September, 1953 to the end of December, 1953, the prices of both hessians and sackings followed a generally upward trend, subject to minor setbacks. From Rs. 42-12 on 23th September, 1953, hessians (40" x 10 oz.) ready advanced to a high of Rs. 47-13 on 30th November, 1953 and after hovering between Rs. 47-3 and Rs. 45-12, finished at Rs. 46-14. Similarly, sackings B. twill ready marched forward from Rs. 91-8 to Rs. 104-14, and, after falling to Rs. 102-8 in mid-December, 1953, jumped up to finish the year at Rs. 107-4. A year before, hessians and sackings stood at Rs. 42-8 and Rs. 92-12, respectively.

(Concluded from next column)

of the delay in permitting exports of coffee was that most of the growers became heavily indebted to agents and others. In some cases, they were in debt to an extent more than the value of their crop. The Coffee Board's payment had been delayed and payments for new crop would be at half the rates.

The Convention also urged that coffee, being purely an agricultural crop, should be transferred from the Ministry of Commerce and Industry to the Ministry of Food and Agriculture, so that it might receive the sympathy and attention it deserved as an agricultural crop, in which the vast majority were small growers.

The Convention expressed its protest against the Commerce Minister's proposal to subsidise the small grower at the expense of the big grower and to make the return per acre equal, as, in its opinion, it was intended not to help the small producer, but to divide the ranks of the growers. The effect of this proposal was too serious to contemplate for the entire coffee industry, as no inducement would exist for raising the efficiency of production.

The Convention resolved that the export duty already levied be appropriated to create a special coffee development fund, so as to expand and improve coffee cultivation in the country. It also requested the Union Finance Ministry to examine the financial implications of a permanent levy of Rs. 62-8 on coffee exports before the proposal was incorporated in the Finance Bill for 1954-55.

By another resolution, the Convention requested the Government not to alter the present structure of the Indian Coffee Board and the present broad outlines of the Indian Coffee Market Expansion Act.

CEYLON TO ASK FOR HIGHER EXPORT QUOTA FOR TEA

The output of tea in Ceylon during 1953 was over 343 million lbs., a record in the history of the Island's tea industry. This country has already exported 335.5 million lbs. in the current tea year. In 1952, it exported 314.4 million lbs., out of its crop of 316.8 million lbs. In view of the record output on hand, Ceylon expects that its exports in the current year will far exceed the quota fixed by the International Tea Committee. Ceylon has been permitted to export 339.6 million lbs. of tea for the year ending 31st March, 1954. It is reported that Ceylon will shortly ask the International Tea Committee to raise its quota so as to enable it to market its increased output in the current year.

COFFEE GROWERS OPPOSE GOVERNMENT POLICY

IMPARTIAL ENQUIRY DEMANDED

THE Government of India's policy towards the coffee industry and the various pronouncements of official spokesmen, both in Parliament and outside, on coffee have caused so much concern and indignation among coffee planters that they have thought it fit to meet and discuss the Government's policy and its implications to their industry. Accordingly, a convention of coffee growers in South India was held at Kalpetta in Wynaad, on 30th January last, under the auspices of the Wynaad Coffee Growers' Association. The Convention, which was inaugurated by Mr. A. Karunakara Menon, a former M.P., and presided over by Mr. K. A. Damodara Menon, M.P., belonging to the K.M.P. Party, was attended by the representatives of as many as eleven planters' associations of Madras, Mysore and Coorg.

The coffee industry provides livelihood for over 100,000 families and it is as much the concern of the growers to protect the interests of these families as it is of the Government to protect the consumer from high prices. This does not mean that coffee growers are not alive to consumers' interests, as witness the open admission by the Convention that growers recognise that a high price for the consumer will adversely affect consumption and, consequently, the interests of growers. As has been pointed out in these columns ere now, the only effective way in which consumers' interest can be served is through higher output at an economic cost. This is essentially a long-term solution, but, if sustained results are to be achieved, there is no other alternative. The only thing that can be done is to expedite the implementation of this solution in such a way as to secure early results. The Convention, therefore, reiterated that a higher production was in the best interests of the consumers and the country, inasmuch as it would employ more labour, allow more coffee for the home market and export, a larger income to the Central and State Governments by way of sales tax, excise duty, etc., more money in the hands of the people of the coffee-growing region and a reduction in the price for consumers.

Scope For Increasing Output

The Convention pointed out that there is considerable area of suitable land in Wynaad, Coorg, Mysore and Nilgiri-Wynaad for further expansion of coffee acreage and, when fully utilised, this should add substantially to exports and national wealth. In Wynaad alone, it is stated that cultivation of coffee has increased by 13,000 acres to 33,000 acres during the last 15 years. This is claimed to be the highest rate of increase for any coffee district and when the whole area comes into bearing, Wynaad will produce no less than 6,000 tons.

The Government of India does not seem to have taken any steps to examine how far these potentialities can be utilised to the national advantage. The growers have been contending that the Government's present policy and action are not conducive to an expansion in coffee growing. The Convention held at Kalpetta confirmed this contention. It viewed with concern the attitude of the Commerce and Industry Ministry in the matter of fixing the price, marketing and export of coffee. The Central Government, the coffee growers' Convention said, had been directly controlling the distribution of coffee since December, 1952 and, in advance of the Government Cost Accountant's report, the Ministry of Commerce and Industry fixed arbitrarily a price of Rs. 2-4 as return to the grower. The inaccurate and misleading public statements made by the Ministry had helped to undermine the confidence of traders and large quantities of coffee offered at the auctions by the Board had not been taken up. In this connection, the Convention pointed out an anomaly in the sale of coffee. It is stated that, whereas over 19,000 tons were sold in 1952 when prices were admittedly higher, only 15,000 tons were sold throughout 1953 when coffee prices were about Rs. 50 per cwt. lower. The benefit of this reduction in price did not reach the consumers in areas not served by the Coffee Board as the Government's policy had disturbed the trade.

The Convention felt that, unless there was a free, unbiased and open examination of the whole coffee problem, a satisfactory settlement would be impossible. Accordingly, it suggested the appointment of a special committee, independent of the Ministry of Commerce and Industry, to conduct a comprehensive, impartial and open enquiry into all aspects of the industry and thereafter formulate the policy regarding coffee. Pending the report of that Committee, the Convention said, the Government of India should fix coffee prices at Rs. 2-7-1 per point, of which As. 3-1 per point might be allowed to be held by the Coffee Board and Rs. 2-4 be paid to the growers in the interim period.

Consequences of Delay in Export

The Coffee Board had requested the Government of India to allow the export of the surplus coffee above India's requirements, but the Government did not take any decision in regard to export of coffee until October, 1953, by which time a surplus of about 10,000 tons had accumulated, which, worth nearly Rs. 6 crores. The present surplus of coffee out of the last season's crop is 7,300 tons and this at least, the Convention urged, should be permitted to be exported immediately, as otherwise, there would be a further deterioration in quality and further storage charges. Another consequence

yes, it is my plan!

Lights will be switched on in a thousand villages. Handlooms, lathes will hum and spin. Every small community will become the hub of a growing village industry. There will be work for everyone. The Five Year Plan provides for Rs. 127 crores to be spent on developing and adding to our power resources. Multi-purpose hydro-electric schemes will supply cheap power to industry. Here is proof of a nation's determination to take its place amongst the leaders of the world.

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

AUTOMOBILE LEAF SPRING INDUSTRY

GAP BETWEEN INSTALLED CAPACITY AND OUTPUT WIDE

THE Tariff Commission is currently enquiring into the claim of the automobile leaf spring industry for protection and assistance. The indigenous producers have demanded levy of a protective duty of 60 per cent. on products of British manufacture and 66⅔ per cent. on those of non-British manufacture, imposition of restrictions on import of leaf springs, abolition or refund of import duty on raw materials used in the manufacture of leaf springs, liberal allocation of ordinary mild steel sections required for the manufacture of clamps, bushes, tools and accessories, etc., fixation of a uniform price for alloy spring steel needed by all indigenous producers of leaf springs, assistance for the development of the manufacture of spring steel within the country and grant of concessional railway freights for the transport of raw material and finished products. It must, however, be mentioned here that, in the individual claims made by the producers, there are variations in approach and emphasis, though they all include some of the forms of protection and assistance referred to.

The present enquiry into the industry's claim marks the commencement of the second phase of the question of protection and assistance to the automobile industry. It will be recalled that the first phase of this investigation came to a close after the Commission submitted its report on the automobile industry and the Government's resolution thereon issued in June, 1953.

The automobile leaf industry is an important ancillary industry and needs to be placed on a sound footing, if the manufacture of motor vehicles in India is to become an economic proposition. There is an imperative need to prevent haphazard and unregulated growth of ancillary industries, so that the number of units to be set up and the total capacity of each industry are correlated to the actual or potential demand for its production. Every possible method of collaboration between the automobile and components manufactures should be explored.

Installed Capacity

The brief review of the present position and prospects of the automobile leaf spring industry, as given by Mr. M. D. Bhat, Chairman of the Tariff Commission, while opening the public enquiry into this industry's claim for protection and assistance, reveals that there are, at present, three organised manufacturers of leaf spring in the country. They are the Metropolitan Springs Ltd., Bombay, the Premier Automobiles Ltd., Bombay, and the Canara Workshops Ltd., Mangalore. Of these, only the Premier Automobiles Ltd. has the benefit of foreign collaboration for the manufacture of automobiles and components required for them. As in the case of most of the industries seeking protection, estimates of the total installed capacity of this industry also vary. The Development Wing of the Ministry of Commerce and Industry has put it at 78,000 springs or about 975 tons on single-shift basis. But, according to producers, it is 142,000 leaf springs or about 1,775 tons per annum on single-shift basis. Shortly, Messrs. Simpson & Co., Ltd., Madras, will be erecting a factory with a capacity of 45,000 springs or about 562.5 tons on single-shift basis. There is no agreed estimate even in regard to the actual production of the existing three units. According to the Development Wing of the Ministry of Commerce, it was 55,000 springs or about 687.5 tons in 1952, while, according to producers, it was 52,000 springs or about 660.9 tons.

Be that as it may, that there is a large gap between installed capacity and actual production is beyond dispute. This, however, is not due to demand falling short of production. Actually, it is the other way about. Thus, the demand is estimated at between 187,000 and 262,000 springs, both for original equipment and replacement purposes. Estimates of future demand vary from 187,000 to 275,000 springs for 1955 and from 187,000 to 290,000 springs for 1956. It will be clear from this that there is great scope for the full utilisation of the installed capacity, if not for expanding it. Before deciding whether or not the industry requires protection, the Tariff Commission will have to reconcile the large difference in the demand estimates. Then, the total demand, current and future, for original equipment, separately for cars and commercial vehicles has to be estimated. The Commission will also have to examine whether, in view of the possibility of restriction on the types of vehicles to be manufactured or assembled in the country, the production of leaf springs too should be concentrated on particular specifications.

An assessment of the quantum of protection to the industry necessarily involves a comparison of the fair ex-works prices of the indigenous leaf springs with the c.i.f. prices and landed costs of the imported products. It has also to enquire into the question of selling prices of indigenous and imported leaf springs, as well as the selling arrangements made by the producers of indigenous springs.

Quality of Indigenous Springs

An important question to be considered by the Commission relates to the quality of indigenous springs. Some of the assemblers of automobiles are of the view that indigenous leaf springs are not as good as the imported ones, as the indigenous manufacturers are not able to give satisfactory heat treatment to springs. The view of some of the consumers is that spring leaves made out of imported material are as good as imported ones, but, when they are manufactured from mild steel, their quality is not satisfactory. The Indian Standards Institution has not formulated any standards for the automobile leaf springs so far. It is to be hoped that it would be done at an early date.

Of the three organised units, Metropolitan Springs Ltd. is manufacturing springs according to British Standard Specifications, and the Canara Workshops according to the A.S.T.M., that is, American standards. Premier Automobiles Ltd. is manufacturing according to the specifications laid down by their foreign associates, namely, the Chrysler Corporation, U.S.A., though they are also prepared to manufacture according to any given specification.

Yet another question to be considered relates to the availability of raw materials. The important basic raw material required by the industry is alloy spring steel of the silico-manganese or chrome vanadium or chrome silicon kind. The other materials required are mild steel flat bars or strips and plates, phosphor bronze bushes, tubes for bushes and centre bolts, clip bolts, nuts and rivets. It is reported that only one manufacturer of automobile leaf springs is using indigenous spring steel. It is, however, stated by other manufacturers that they are prepared to use indigenous spring steel, provided they can obtain it, according to their correct specifications. It is also stated that some of the steel and steel re-rollers would be able to manufacture the steel of certain specifications. Some of them do not, however, have the necessary facilities for rolling of sections. Consequently, the task before the Tariff Commission in this regard is to enquire into the available capacity for the manufacture of spring steel and the facilities available for rolling sections. It will also have to enquire into the market price of both imported and indigenous spring steel. Another important question relating to the supply of raw materials is the levy of import duty on alloy spring steel, for one of the proposed forms of assistance to the industry is a reduction in the import duty on alloy spring steels. The Commission will have to reconcile this demand with the need for encouraging manufacture of spring steel within the country.

INDIAN CABLES AND TABLES

The Indian Cable Co., Ltd., Calcutta, has brought out a small booklet entitled *Indian Cables and Tables*, which will be very useful to electrical engineers and architects. The booklet gives a variety of data on copper wires and strands, flexibles, carrying-capacity of cables, fuse wires, amperage of motors, capacity of conduits etc., besides extracts from the I.E.E. Regulations.

It may be noted that the Company was founded as early as in 1920. Being the first factory of its kind, it has been the pioneer in the manufacture of rubber cables from the humble house wiring cable of small diameter to the heavy duty trailing, colliery and mining type cables, as well as solid and stranded copper, A.C.S.R. and aluminium conductors. It has given India a cable in "Paramite," which, since it is manufactured for tropical conditions, has no equal in endurance and quality wherever tropical conditions are encountered. Its bare copper, A.C.S.R. and aluminium conductors known as "Cableco" conductors are manufactured under the strictest test conditions and are noted for their unvarying reliability. An expansion programme now in progress provides for an increase by 33 per cent. of its existing production, and new buildings and plant for the manufacture of P.I.L.C. power cables, synthetic enamel winding wires and plastics cables. In view of the Company's long experience in the manufacture of cables and of Indian conditions, the booklet is an authoritative and a highly valuable guide to electrical engineers.

STATE TRANSPORT IN PUNJAB

Now that the three-year "truce" period during which nationalisation had to be stayed in Punjab (I) has expired, the State Government proposes to go ahead with its plans for extending its activity in this sphere. Reports from Chandigarh disclose that a tentative agreement has been reached between the Governments of India and the East Punjab on the question of formation of a corporation for the running of the State's transport services. A significant feature of the Corporation, according to Press reports, is that, besides the State Government and the Railway Administration, private operators also will be permitted to become partners. Each of the first two will contribute 40 per cent. of the share capital, while the private operators will be allowed to provide the rest, that is, 20 per cent. If the private operators refuse to participate, the Railway Administration and the State Government will contribute the entire capital.

The Corporation will start with an initial investment of Rs. 1.5 crores, which will be increased to Rs. 3.5 crores in three years. It will take over routes from private operators in stages. At present, over 300 routes are being run by private operators and about 100 by the Government transport services. To begin with, those which are adjacent and contiguous to the existing nationalised routes will be acquired. In doing so, the question of effecting proper rail-road co-ordination is expected to be kept in view.

It will be recalled that, last year, the State Government had offered to private operators 49 per cent. share in the proposed Corporation, as against 20 per cent. now. But, as private operators wanted the day-to-day administration to be in their hands, the plan was shelved. There seems to be no indication of affording private operators, who would become partners of the Corporation, any hand in the day-to-day operations even in the present proposal and, consequently, no chance of their participation in the Corporation.

HIGH FREQUENCY WELDING APPARATUS FOR PROCESSING PLASTIC

In co-operation with plastic-processing concerns in the Netherlands, the Technical Apparatus Factory A. J. Versteege at Zandvoort, Netherlands, has developed two types of high-frequency welding apparatus. By applying electronic welding current limitation, the welding machine is automatically cut out after completion of the weld. The welding electrode cuts out the plastic material round the weld in such a way that superfluous material can easily be removed. The machine thus has a high productive capacity, without waste. These welding apparatuses are manufactured in two sizes. The large welding bench has a surface area of 800×450 m.m. (31½×17¾ ins.), with a maximum current consumption of 4 kw. The smaller machine has a welding bench of 750×400 m.m. (29½×15¾ ins.) with a useful weld face of 400×140 m.m. (15¾×5½ ins.) and a current consumption of 1.8 kw. These roomy welding benches makes it possible to use a wide variety of electrodes. The pressure of the electrodes on the welding benches is exerted by means of a pedal. The larger type is fitted with two guides with heavy ball joints to ensure even pressure distribution; the smaller type has one guide.

ANDHRA IRRIGATION PROJECTS

The Government of Andhra has submitted six major irrigation schemes to the Union Government for its approval. They are Nandikonda (Guntur District), Gandikota (Cuddapah District), Siddeshwaram (Kurnool), Pulichintla (Krishna), Somasila (Nellore) and Vamsadhara (Srikakulam).

The Chief Engineers of Hyderabad and Andhra will be meeting next week at Hyderabad to arrive at an understanding over the allocation of expenditure regarding the Nandikonda Project, which is now under dispute between the two States. This follows the Planning Commission's recent request to expedite an agreement over the outstanding issues involved. The Nandikonda Project, on the river Krishna, is estimated to cost about Rs. 35.3 crores.

PERAMBUR COACH FACTORY

Global tenders are stated to have been invited for the supply of plant and machinery to the Perambur Coach Factory. With easier market conditions in Europe, the authorities in India expect to procure the plant and other necessary equipment early in 1955. The factory, which is scheduled to go into production by the middle of 1955, will be the largest of such units in Asia and the second largest in the world. Its production capacity will be about 350 coaches a year. A batch of 20 technicians will shortly leave for Switzerland, where they will undergo advanced training in the construction of railway coaches.

POST-WAR INSURANCE IN JAPAN

RATIONALISATION HELPS REMARKABLE RECOVERY

FIGURES relating to progress of Japanese insurance in the post-war period make impressive reading. The latest year for which particulars are available is 1952. In life business the total value of policies sold by all offices during that year amounted to 996,200 million yen, yielding a total premium of 39,450 million yen, an increase of 36 per cent. over the figure for the previous year. New policies issued in 1952 amounted in value to 442,400 million yen, or an increase of 1.4 times over that of the previous year at 324,900 million yen. These figures eloquently show how Japan's life insurers made a remarkable stride in business promotion all through the year under review. Following this expansion, their total assets increased by 22,230 million yen to 75,230 million yen. Of these assets, 36 per cent. accounted for securities amounting to a total of 27,340 million yen, most of them stocks aggregating 23,360 million yen. Next to stocks come loans which are generally considered a good investment, and these rose by 9,930 million to 30,580 million yen or 4.1 per cent. of the total assets. Other assets included real estates and deposits, and the average rate of interest earned on them in 1952 was 15 per cent. as compared with only 4.4 per cent. five years before. Apart from the premium of 39,450 million yen, as stated already, income from other sources, interest and dividends amounted to 7,260 million yen. The total revenues stood at 49,410 million yen.

On the debit side, insurance money payments, including refunds, aggregated 7,690 million yen, and maintenance and tax amounted to 21,100 million yen. Taking these along with others, the combined expenditure ran to 36,020 million yen.

With revenues at 49,410 million yen and expenditure at 36,020 million yen, the accounts for the year 1952 showed a net gain of 3,390 million yen which was transferred to the reserve fund for dividends.

These figures, though quite encouraging, are stated to be still far from the pre-war business level in every respect. For, as compared with the previous 1934 level (as represented by the price index), the progress of business in 1952 was no further than 4.5 per cent. in total assets and 9.6 per cent. in policy sales. Again, the life insurance companies' share of the total assets credited to the country's financial institutions—which amounted to 4,456,400 million yen. was 79,800 million yen or 2 per cent. as against the pre-war share of 10 per cent. This low percentage is attributed to shrinkage of accumulated assets owing to post-war vicious inflation from which Japan suffered severely. Insurance circles in Japan seem to be confident that, by sustaining the recent rate of progress, the industry will recover its pre-war strength in a few years.

Premiums Reduced

The remarkable recovery of the life insurance business in Japan in the post-war period was not achieved without hard battles. In fact, it was the outcome of both the business and the Government making joint efforts to lift the industry from the morass into which it had sunk in the early post-war years. The fight was from both 'within' and 'without.' Internally, the insurance companies took bold measures to rehabilitate the business with extraordinary initiative, drive and energy. Thus, the business was rationalised, canvassing system was strengthened considerably, companies' services to policyholders including sale of new policies were greatly improved, and—what was more exemplary—with commendable courage, premiums were reduced, and payment of dividends, as well as grant of various tax concessions, was revived in 1949 after four years of interruption. This led to revival of confidence among the people which in turn yielded more business and premium income. When premiums were first reduced, life insurance circles were worried about the inevitable cuts in their revenues, but to their satisfaction, such never happened. On the contrary, the lower premium rates stimulated sales of life insurance policies.

These measures from within coincided with the stimulus provided by an external factor, namely, the Korean war which generated an upward trend in the national income of Japan. Increased national income naturally resulted in increased national savings, a part of which found its way into life insurance. Along with the rise in national income came also the unstinted and enlightened support from the Japanese Government. In 1951, the Government, in compliance with the earnest demand from life insurance offices, approved a 2,000 yen a year basic exemption in the individual income-tax and a 100,000 yen non-taxable limit on insurance money paid to beneficiaries. Again, in 1953, the Government granted the upward revision of the two tax exemption limits to 8,000 and 300,000 yen respectively. Now the industry is prevailing upon the Government to raise them further to 24,000 and 1,000,000 yen respectively. There is also another tax benefit, that is when employers or corporations earmarked the employees' retirement funds for life insurance premiums, they are entitled to cross out as 'loss' a certain amount of such premiums in relation to their obligations under the individual income and corporation tax laws. This benefit is not limited to life insurance premiums alone, but it has gone a long way towards helping the nation's life insurance companies to augment their business.

Non-life Insurance

Japan's non-life insurance business, which received a telling blow from the non-stop inflation during the first few years immediately after the end of the war, is also stated to be in good shape again. In the early post-war years, marine insurance companies saw their premium incomes tapering off due to the war-time losses of shipping and post-war interruption of foreign trade. Poor business also overtook the nation's fire offices, indicating the existence of social insecurity as well as the inadequate fire defence system which had resulted in increased fire hazards. In 1947, both fire and marine insurance companies increased their premium rates and embarked on a dual campaign, designed to promote fire prevention, on the one hand, and to strengthen whatever fire defence facilities were available, on the other. Further, they established the Fire and Marine Insurance Rating Association of Japan, with the object of drawing a new rate structure. These rates were exempted from the application of the Anti-Monopoly Law.

These measures greatly helped the general insurance companies to rebuild their business. A survey of the nation's 20 major non-life insurance concerns for 1952-53 revealed that their total capital amounted to 2,422 million yen, reserves to 2,794 million yen and profits to 2,001 million yen. Premiums earned aggregated 39,502 million yen. Total assets of these companies were of the order of 51,419 million yen.

Among the measures adopted by the companies to expand their business were the reduction of premiums relating to certain types of business and the reorganisation of agents into three categories in accordance with the premium involved. The latter was intended to enable the agents to get the right share of their commissions on an efficiency basis. A 10 per cent. cut was effected in the rates for cargoes of internal shipping services. The major import items such as grain, wool, cotton, salt and coal were under the reinsurance pool system enabling the companies to cede half of the amount originally insured. This arrangement would appear to have gone a long way towards eliminating unfair practices. Shipping insurance had registered a poor show prior to 1951, consequently, in 1952, premium rates were raised by 20 per cent. and this brought about smooth sailing in 1952.

Indian insurers will do well to take a leaf from the Japanese example noted above and improve their business, especially in the sphere of life insurance, on a rational basis. Insurance companies are bound to gain by effecting a reduction in their premiums which were increased during and immediately after the last war. The business can also be improved by strengthening their canvassing system as also by offering better services to the policyholders, as Japan has done.

NATIONAL INSURANCE CO., LTD.

The National Insurance Co. Ltd., Calcutta, has completed a new business of over Rs. 12 crores in 1953. This represents an increase of Rs. 2 crores over the new business written in 1952.

SOCIAL SECURITY IN U.S.

PRESIDENT EISENHOWER URGES EXPANSION

IN his recent State of the Union message presented to the U.S. Congress on 7th January last, President Eisenhower urged expansion of the U.S. social security system to cover more than ten million persons not included in the present system and to raise the benefits provided under the federal Old Age and Suvivors Insurance (O.A.S.I.) programme. The expanded programme would increase the number of jobs in which social insurance benefits can be earned to 93 per cent. of all paid civilian jobs in the country. The proportion of the aged population eligible for benefits would increase from 45 per cent. to 75 per cent. The U.S. social security system, established with the passage of the Social Security Act in 1935, is primarily a programme of insurance protection for the worker and his family against complete loss of income through old age or death, although other benefits were added later. Limited at first to workers in industry and commerce, the programme in 1950 was extended to cover farm and household employees and many persons—other than farmers—who work for themselves. Some 66,500,000 persons are insured under the programme today. At the end of 1953, about 5,970,000 persons were drawing benefits. That is almost a million more than in 1952, and nearly double the 1950 figure.

Under the present system an average worker who retires at the age of 65 receives about 35 per cent. of his previous average monthly wages. In addition his wife, if she is 65 years old, receives an amount equal to half her husband's benefit. Together the retired couple can receive as much as $127.50 a month for life. The widow, single surviving child, or parent of a deceased worker receives three-fourths of what he would have received at 65, while, if there is more than one surviving child, each receives one-half of the worker's monthly-benefit amount, up to a family maximum of $169 a month.

Benefits and the cost of administering the programme are paid wholly from the contributions of workers, employers and self-employed persons. The worker's contribution, which on 1st January increased from one and a half to two per cent. of his earnings up to $3,600 a year, is deducted from his wages or salary. The employer adds an equal amount and periodically sends the combined contributions to the Federal Government. Self-employed persons are now taxed at 3 per cent. of their net earnings up to $3,600 a year. These payments, or insurance premiums, go into a special trust fund. Benefits are paid by the Treasury Department after the Department of Health, Education and Public Welfare.

For many U.S. workers, the Federal programme is only a supplement to benefits received through labour-business agreements existing in major industries such as the automobile industry and coal mining. In addition, many workers join retirement plans operated by various private insurance companies. Certain other groups also are assisted under the Federal programme. Such persons as the needy aged, the blind, the totally disabled, and dependent children who have lost the care of a parent receive monthly cash allowances.

The Social Security Administration formerly also had responsibility for unemployment. This programme, which is administered by the individual States, now receives Federal assistance under the U.S. Department of Labour. The U.S. social security programme also helps the individual States carry on broad programmes of social services in behalf of children. These include maternity clinics, public-health nursing services, and health supervision of school-age children, including medical, nursing, dental and nutrition services. Crippled children are provided medical, surgical, corrective and prosthetic services. Child welfare workers are provided to give service to children with special needs which their families cannot meet unaided.

To broaden the present system the President, in a special message to Congress, recommended the following six steps:

(1) legislation to bring approximately ten million more persons under the O.A.S.I. system. These persons would include self-employed farmers, many more farm and domestic workers, doctors, dentists, lawyers and others now excluded from the retirement programme;

(2) liberalisation of the present O.A.S.I. provisions which now deprive a beneficiary of his benefit payment for any month in which he earns wages of more than $75;

PRIVATE INDUSTRY IN MIXED ECONOMY

BASIS OF STATE'S POLICY TOWARDS IT DEFINED

[The Government of India has adopted "mixed economy" as its policy. The implication here is that undertakings owned and operated by the State and private enterprise either in the same field or in different fields or in both will be in operation. What should be the details of this basic policy, if it is to succeed in bringing about an expanding economy? An answer to this question is attempted by the Tata Quarterly *in its January (1954) issue. If this country is to remain a virile democracy, this question must be tackled on right lines. The attempt made by the* Tata Quarterly *in this connection is a valuable contribution to correct policy-making. We are reproducing here its observations on this subject, in the hope that it will assist the public to make a diligent appraisal of Government's policies and to appreciate the kind of climate necessary for the effective and efficient functioning of the system of private enterprise.—*Ed.]

MIDWAY through the five years of the Plan, it might be helpful if, instead of examining a specific problem in detail, an attempt were made to draw attention to some of the basic issues in the operation of a private sector in a planned economy. The appropriateness of a policy towards private industry is dependent not merely on the objectives aimed at but also on the general economic situation which influences and circumscribes industrial activity. The present article seeks to discuss, in a general way, the major considerations in the light of which a consistent approach could be evolved.

India is trying to build up a "Welfare State," but, basically, this is not different from the direction in which every other country in the free world has been moving since the Great Depression of the 'thirties or, at any rate, since the end of World War II. The objective in India is not new or novel because there is now a Plan. With the end of *laissez faire*, it is universally agreed that the State must actively exercise its power or influence to secure, from the working of economic forces, the maximum possible contribution to social happiness. Differences lie only in the extent to which, from country to country, it is considered necessary for the Government to intervene in the working of private enterprise.

What is Mixed Economy?

The "mixed economy" which India has adopted for itself implies that, besides influencing the course of private enterprise, the Government will itself build up and operate several productive works—the so-called public sector—and thereby contribute directly to economic progress. Even so, it must be emphasised that, within the field allotted to it, private enterprise in a "mixed economy" cannot be different from private enterprise anywhere else. Everywhere, its paramount object would be the maximisation of profits. There is no way of harnessing it to social goals, except, in so far as, in the search for larger profits, it produces more goods, makes them more cheaply, expands the volume of employment and discovers new ways of satisfying consumer-wants. Private enterprise may be acceptable for these *incidental* advantages to the nation, but it cannot be had at all, unless it is itself allowed to operate for profit.

Industry is not, however, necessarily at its best during a period of good profits. Actually, for obvious psychological reasons, fear of loss may often be a greater spur to efficiency and reduction in waste than the hope of earning larger profits. Private industry could not be really efficient and vigorous, if, as a general rule, losing businesses were not allowed to lose. A dynamic economy requires constant shifts of capital and labour between one industry and another, and, although the State may take steps to minimise the social consequences of such shifts, the need for allowing shifts is implicitly accepted when private enterprise, which depends on the effective functioning of the market mechanism, has been allotted a field of its own.

Briefly, the concept of a mixed economy connotes the following ideas:

(i) There is an adequate and understandable basis on which industries and enterprises falling in the public sector are demarcated from the rest. As regards new developments, if there are lines to which private enterprise cannot be admitted, they are announced in advance.

(ii) Extensions of activity in the public sector are governed by an accepted order of priorities in relation to the available resources. The volume of public investment in any year is determined with reference to the prevailing situation regarding employment and the supply and prices of consumer goods.

(iii) While the fields of private and public enterprise may generally be complementary to each other, if there are areas over which the two are in direct competition with each other, such competition is on a basis of strict equality.

(iv) The behaviour of private enterprise is sought to be influenced by general measures in the sphere of monetary policy, taxation, labour legislation, etc.

(v) Priorities as between different industries in the private sector are made effective by adopting measures which apply to whole industries. As a general rule, no differentiation is made between an individual unit and another in an industry.

(vi) Official intervention in the affairs of an individual concern is limited to situations of an exceptional character and not for overcoming problems which arise in the ordinary course of business.

Programmes and Policies in the Five-year Plan

Besides the investment programmes of the Central and State Governments, the Five-year Plan also incorporated a schedule of approved investment in the private sector of industry with a corresponding schedule of production targets. These schedules were based on information about their plans supplied by the industries themselves, and, at that time, the provision of incentives for the attainment of those targets did not appear to be particularly necessary. In fact, owing to the underlying inflationary tendencies, which were then strong, it was possible to think of planning chiefly from the negative angle of controlling non-essential development. A general slackening of business activity and unemployment were not feared. There was no problem of *stimulating* private investment and, on the assumption of negative restraints, investment in desired channels could be predicted. The financial burdens which welfare legislation placed on industry were borne in the context of rising commodity prices. As regards consumers, price ceilings were the obvious step to be taken and there was no question of inducing consumers to buy more to keep up the demand for industrial products. Overseas expenditure was expected to conform to a specific pattern if only expenditure on certain classes of imports was restricted.

The situation today, 2½ years after the inauguration of the Plan, is different in many essential respects. Unemployment, which was not considered even a possibility, is here, suggesting, *prima facie*, that the investment programmes are not producing expected reactions. In the case of the State Governments, which have been unable to raise the required funds, investment is behind schedule. According to the information given in Parliament by the Finance Minister, the rate of new investment in private industry is not much at variance with that visualised in the Plan. Apparently, however, while some industries are expanding, there are others which are curtailing their activities owing to sluggishness of demand. In any event, the total volume of public and private investment has been unable to prevent the rise of unemployment. Foreign exchange, which was expected to be a bottleneck, has not been used rapidly enough. The volume of overseas trade has shrunk. Imports of plant and machinery are slack and imports of foodgrains are being sharply cut down.

One Possible Remedy

The emergence of unemployment notwithstanding the operation of the Plan suggests that some modification of the original strategy for development is required. Two alternative courses of action may be considered.

First, with a sudden and drastic expansion of public investment, financed by budget deficits, inflationary conditions resembling those in 1951 may be reproduced. Direct Government controls like investment control, licensing and price control may then be re-employed, partly to suppress the symptoms of inflation and partly to bring about the desired pattern of development in the private sector of industry. Inflation may encourage investment in essential industries while direct controls prevent investment in non-essential industries.

A solution of this kind is obviously unsatisfactory. It will set at naught the result obtained by the one policy (policy in the financial sphere) which the Government has consistently followed since the raising of the Bank rate in November 1951. While unemployment is eliminated, employment will be worth much less as prices rise and commodities in demand cease to be available in the market.

The alternative solution is to allow private industry to develop as fast as it can and to make that marginal addition to public investment which will help to maintain effective demand and prevent a worsening of the employment situation. The three assumptions on which the approach is based are: (i) that unemployment is the most serious problem today, (ii) that wider opportunities for employment should be provided with as little net inflation as possible, and (iii) that it would not matter if, as a price to be paid for this result, the pattern of development in the private sector differs from that visualised in the Plan.

Pattern of Development

It is generally considered desirable that private industry should expand and provide more work. It is even suggested that private enterprise should be "encouraged" to expand. Before the question of *encouragement* arises, however, logically there should be readiness to *accept* whatever the private sector can by itself do. The scope for the expansion of private enterprise is limited by restraints which are a legacy of the past and which, in the conditions of to-day, are inappropriate. Since the problem at present is not of conserving capital but of creating it, the *pattern* of development should not be an obsession, and investment in non-essential industry should be as much welcome as other investment so far as its favourable impact on the volume of employment is concerned.

If industry is to be allowed to expand, there would have to be the minimum of "licensing" in industrial policy. Control over capital issues, the licensing of capital goods imports and the licensing of industrial enterprises under the Industries (Regulation and Development) Act should be suspended and, if retained, should be no more than a formality, chiefly of statistical value. Secondly, although price control in respect of consumer goods would continue to be a necessary standby, price control in respect of investment goods should be re-examined. The availability of investment goods at cheap rates is obviously desirable but against this the handicaps involved in the dependence on the Government's scheme of distribution and the effect of price control on the further production of the goods concerned have also to be considered. Thirdly, the field for small-scale industry should be mapped out once for all. Certain lines of production may be reserved for them. But it should be made clear that, if small-scale units develop in other industries, they can survive only by their own competitive strength.

Retrenchment and Labour Legislation

It should be recognised that the general problem of unemployment is the responsibility of the State even if the solution is made easier by an expansion of private industry. It is the State's responsibility to create, chiefly by means of monetary, credit, fiscal, and investment policies, conditions in which persons retrenched by undertakings which can no longer afford to keep them find alternative employment either in industry or with Government in a reasonably short period. For safeguarding the interests of labour, the State may properly lay down the procedures to be adopted for retrenchment or re-employment and fix the scale of compensation payable to retrenched staff. At a suitable time, the introduction of unemployment insurance may also be considered. There can, however, be no general opposition to retrenchment, which must be accepted as the concomitant of the inevitable ups and downs of business. Generally speaking, a steady increase in the labour bill is both a cause and a product of an efficient and expanding industrial system. The State would have to see that the portion of the labour cost which, by legislation, it determines does not recoil on the volume of employment; but, once determined, it is the proper responsibility of private enterprise to meet the cost. In any case, State legislation involving a general increase in labour costs is a less serious question than intervention by the State or by Industrial Tribunals in the administration of individual undertakings aimed at placing an artificial barrier against retrenchment of workers. The former is, but the latter is not, a kind of State control which conforms with the principle of allowing private enterprise to carry out its normal functions.

Attitude Towards State Intervention

The present general attitude towards State intervention is born of a solicitude for increase of production "up to capacity" in each industry. As this required production in each unit to be up to its officially assessed productive capacity, it was felt that, in *some* way, the State was responsible for operations in every undertaking in each major industry. Superficially, it seemed logical that before the State *sanctioned* additional capacity in an industry it should see that the existing capacity was fully utilised. This quantitative-cum-licensing approach to the problem of industrial production could succeed, however, only if the State could undertake the marketing of the output of each undertaking at rates profitable to the owner. That was, of course, an impossible task. Policy-making, today, should recognise that, almost at all times, a portion of the productive capacity in an industry would remain unutilised even if investors rate highly creation of further capacity in that industry and are ready to put up money for it.

The foregoing is basically a plan for removing the artificial barriers in the way of industrial expansion and in the way of intra-industrial adjustments of resources. In the present atmosphere characterised by a general dependence on Government aids, subsidies, patronage and permits, a simple plan of this kind may not appear to carry us far. Actually, it should go much farther than is commonly supposed. Notwithstanding retrenchment by individual concerns, the total volume of employment should increase in the measure in which private industrial activity in the aggregate expands. There are two further considerations. First, an expansion of private industry which comes about in response to market conditions will serve the consumer better than an expansion of public investment undertaken chiefly for its impact on employment. Secondly, if the so-called "multiplier" principle is to come into play as a sequel to an increase in public investment, it would require a private sector which reacts promptly to the stimulus of increased purchasing power and adjusts itself readily to shifts in effective demand. With a given change in Government's investment programmes, even under a mixed economy, a private sector which is allowed to function in full recognition of the underlying dynamics of private enterprise will produce more favourable reactions on the volume of employment than a sector that is straddled with restraints imposed in deference to an assumed "order of priorities" and in fulfilment of a vague Governmental responsibility for the affairs of individual business units.

In any event, a policy for allowing business expansion in different directions has logically to precede consideration of general *assistance* to industry, through measures, like tax relief, which cost the State money, or measures, like a reduction in the Bank rate or a general tightening of import regulations, which do not. As regards "assistance" in the form of public disbursements on schemes of research, etc., this would, generally speaking, appear to be required more by small-scale and cottage industries than by the organised large-scale industries. Similarly, if State trading is to be extended, the State may try to market the products of small-scale industry (if necessary, at a loss) before it tries to solve the problem for large-scale industry. In regard to the provision of finance, too, the Government may contribute to meeting the requirements of small-scale industry (to the full extent to which it is administratively feasible) before lending funds to large-scale industry.

Reports from New Delhi indicate that the Government of India will institute an elaborate inquiry into agreements entered into by industrial and commercial concerns in India with foreigners, involving remittances on account of royalty or technical aid. This step is being taken under the Collection of Statistics Act, 1953. As a preliminary to the inquiry, all types of commercial firms, including those engaged in banking, insurance, shipping and navigation are stated to have been asked to submit before 1st March, 1954, accurate information on several items.

ECONOMICS OF THE ATOM

BIGGEST SINGLE SOURCE OF POWER

(By GRAHAM HUTTON)

IN all the international excitement about atomic bombs and hydrogen bombs, the peaceful uses of atomic energy have taken a back seat. Even more has the economics of peaceful atomic energy been overlooked. Yet there have been some remarkable announcements about the peaceful utilisation of nuclear energy as fuel for machines, and it is worth while trying to read between the lines of these statements in America and Britain so that we can get an idea of the cost involved and the economic effects.

One of the Atomic Energy Commissioners of the United States announced that a full-scale atomic electricity generating station was to be built by the Westinghouse Electric Corporation, a private enterprise which has been closely associated from the very beginning with the American Government monopoly of atomic energy. And the Deputy-Controller of Britain's atomic-energy production department, in a speech in New York announced that within a few years electric power made from nuclear energy would be flowing into Britain's electricity grid. He said that in three or four years' time the British atomic-energy organisation would be able to pass on to private enterprise the necessary knowledge for making the generating plant and other incidental apparatus. He also thought that Britain's nationalised Electricity Board ought then to build further reactors to produce electricity. In other words, instead of being anything from ten to twenty-five years away from the civilian use of nuclear energy as a source of power, we are within three to five years of it.

This alters our picture of the future considerably. It also alters the economics of the older-established sources of power for the machines of mankind, the rivers and lakes, coal and oil. True, the beginning of the peaceful use of atomic energy as a fuel will be small, even insignificant in comparison with the total output of energy from hydro-electric dams, furnaces producing steam fired by coal, coke, or oil and engines burning oil or gas to turn machinery. But big things from little causes spring and all beginnings are relatively small affairs.

New Era

Still, I am more concerned as an economist to try to assess the longer run effects and the costs of the civilian development of nuclear energy. What are these likely to be? Do we all stand on the threshold of a new era in which the so-called under-developed countries will be on as favourable a footing as those, like Britain or America, which already possess enormous equipment for producing energy in the familiar ways? Or, do we face a new era of energy which will only come in gradually and at great economic cost?

Britain began the whole world's Industrial Revolution with coal and steam. Today, Britain's main economic problem is the cost of getting its coal, which will last for 200 years more. It now lies deeper and farther underground, and it is costing the British people from £500,000 to £1,000,000 a week, on the average, in new capital equipment for their coal-mines, in order to help the miners to get out the coal. So the cost of that coal continually rises and that continually raises the cost of electricity, which in Britain is mainly produced from coal-fired furnaces.

On the other hand, according to the latest official statements, the initial cost of producing electricity from nuclear energy will probably be "competitive" with that of producing electricity in the old-fashioned ways, and, as with all new inventions after they are first put to work, that nuclear-energy cost is likely to fall steadily rather than to rise. Moreover, a strange aspect of atomic energy is that, in the future nuclear reactors envisaged for making electricity, the atomic material will breed new material which, in turn, can be further split in atomic operations. In other words, whereas all forms of making energy till now have been ways of transforming some fuel—coal or oil, for instance—into another fuel (electricity) at a consequent loss of material somewhere in the process, the new atomic fuel not only produces the electricity but also replaces itself to a considerable extent. This is, indeed, something unparalleled in economic development and it offsets a good deal of the cost of producing electricity from a nuclear reactor.

But there remain several problems to be overcome, before we all enter the atomic-energy era and throw away our coal-mines, hydro-electric stations, and oil refineries. First, there is the geological and geographical problem of finding and getting enough of the raw material for atom-splitting uranium. It is mainly found in the Belgian Congo, Canada, and Australia, and a few other places. Doubtless in time, we shall overcome this problem, and also develop machinery and methods for using lower-quality uranium ore; but it still costs a lot of money.

Secondly, there is the problem of safety for the human beings working on the nuclear reactors, or even those living within, perhaps, 100 or 200 miles of them. That is a problem for countries like Britain, France, Belgium, Italy, Germany, and most of Western Europe—or for Japan, for that matter—where towns are close together and people live densely. It is easier for newer countries with great open spaces like America, Australia, Canada, or old but sparsely settled big countries like China and Russia, where there are still vast uninhabited spaces. We do not yet know enough about the risks of civilian nuclear reactors. One accident alone would suffice to kill hundreds of thousands of people, and perhaps slowly destroy millions, if indeed an accident did not do worse.

Safeguarding Plant

This means that one big item alone in the cost of peaceful atomic energy will be that of safeguarding the plant against any and every risk of an accident, however, remote. This safety factor becomes much more important—and much more costly—when we progress from the simple nuclear reactors now being built to the more complex ones (called "fast reactors") which breed nuclear material as they produce energy and therefore become (as scientists hope) self-supporting. We in Britain are already looking for a remote isolated spot in the north of Scotland, where we can build our first "fast reactor," the breeder-reactor, the dangerous one.

So you can see that it is only the industrial countries—Russia, America, Britain, France, and so on—which are within measurable distance of the civilian atomic-energy era. What none of us yet really knows is how much it will all cost, in order to be perfectly safe. We are all in the hands of our scientists and they can only judge by the awful effects of the atom bombs already exploded. And merely on the production of such atomic bombs and other weapons the industrial nations of the world have already spent something like £6,000-million, enough to produce civilian atomic energy quite safely and on a scale sufficient to make Britain independent of coal, or to make Western Europe independent of imports of oil. We are still a very long way from cheap atomic energy for all.

The tragedy of atomic energy is, of course, the tragedy of mankind's two natures, namely, the evil nature making for war and the good nature making for prosperity, co-operation, and welfare. It has always appeared to me to be illogical to condemn men for using atomic bombs but not to condemn them for dropping just as destructive a quantity of ordinary explosive from 1,000 aeroplanes over an enemy city. Seven hundred years ago there was a unified Christendom which spoke with one voice. In the Lateran Council, it condemned the use of the artificial, mechanical bow instead of the ordinary bow and arrow. Gunpowder was condemned in its turn. So was poison gas, the machine-gun and everything else.

Today, in the atomic energy age we face on the one hand the penalties of being a divided mankind. On the one hand, there is the race in atomic armaments, the Iron Curtain of mistrust and enmity and, on the other, the Russians as much as the Americans or British are forging ahead with the application of nuclear energy for civilian and peaceful purposes. Indeed, the British have the biggest export trade of all in atomic isotopes for medical purposes.

Comparative Costs

What we all need to know—indeed, what we can perhaps get to know more easily and co-operatively than about armaments—is the comparative costs of producing energy in this new way, the best ways of securing the safety of human beings, the best methods of applying this new form of energy and the best ways of cushioning the social and economic shock of the new energy upon the old-fashioned forms and their industries, such as coal, oil, gas, and others.

Now, very fortunately for mankind, these really are peaceful and civilian questions of atomic energy. They are not so very different from, say, the international co-operation required to make the seas safe with lighthouses, or the air safe with radio beams, or to make the letter and parcel post work smoothly, or to control pests and plagues by the international brotherhood of medicine. I think it is a very good piece of news that the British and Americans are going rapidly ahead with their civilian, peaceful production of electricity from nuclear reactors, because it may bring nearer the day when true and full international co-operation can take place for the safeguarding of all humanity from both civil accidents and from warlike experiments, with this biggest single source of power available to the human race.

After all, it is no longer a case of fearing war with atomic weapons. It is perhaps only three or four years from our having to fear an accident to the peaceful, civilian electricity plant of a neighbouring country, which might kill us and our children. I may be a queer economist, but I take comfort from the fact that, when all the industrial lands have built their peaceful civilian atomic energy plants, the whole world will stand to lose from both a war and a civilian accident. We may then look on war itself as the deplorable human accident it has always been. If the discovery of atomic energy by the western world brings us all to that point, it will have been worth it.

U.S.-SOVIET ATOMIC TALKS

Discussions on the procedure for handling President Eisenhower's proposal for setting up an international agency for the peaceful development of atomic energy have been continuing between the U.S. and Soviet Governments in Berlin. These talks also cover the Soviet proposal for a ban on atomic weapons.

TECHNIQUES OF MATERIAL RESOURCES BUDGETTING

THEIR IMPORTANCE TO ASIA AND THE FAR EAST

ONE of the important papers which was presented for consideration at the sixth session of the Committee on Industry and Trade of the Economic Commission for Asia and the Far East, which concluded on 5th February at Kandy, Ceylon, describes the techniques of budgetting material resources. It is not clear as yet whether any discussion on this paper took place at the session or was deferred, as suggested earlier, for consideration by a working party, to be convened in course of time, in view of the need for a detailed study of the subject. The central aim of this paper is to survey the extent to which the assessment and analysis of the requirements of material resources have been carried out by the countries concerned and to bring to their consideration the basic concepts behind resources budgetting. Certain methods and techniques are described in the paper at some length. These are based on some fundamental principles of economic theory which, it has been found necessary, should also be explained in describing these methods. These methods and techniques, as studied in the U.S., the U.K., Denmark, the Netherlands, Israel and Australia, are described in an easily understandable form.

The importance of this paper to the underdeveloped countries of Asia and the Far East is obvious, for the resources budget is a new concept for the underdeveloped countries. In fact, even in more developed countries, resources budgetting is a very recent development and new techniques and methods are still being developed and tried to achieve the object in view. Although the countries of the E.C.A.F.E. region have started preparing resources budgets, the methods adopted are *ad hoc*. There is great scope for the application, with profit, to the conditions prevailing in the countries of this region some of the techniques being continuously developed elsewhere. It may, however, be noted that, as resources budgetting constitutes only one aspect of the problems and techniques confronting economic planning, it would be desirable if other aspects such as the determination of targets and priorities and the co-ordination of private and public investment, etc., could also be examined.

Need for Improvement

The gap between the approach of Asian countries in preparing resources budgets and the ultimate goal of a scientific method according to the paper, is too wide. It has been impossible to indicate whether there is any lack of balance between the material resources available or likely to be available and the requirements thereof, according to targets contemplated. Consequently, the paper attempts to bring out the stages by which the present approach of the Governments can be progressively improved.

A material resources budget is a counterpart of a financial budget of a development plan. It is true that the monetary yardstick is a valuable instrument of measurement of the broad magnitude of a plan, but it cannot adequately give an idea of the physical resources that should be devoted to the implementation of the plan. Investment of money will create demand for materials and services of personnel. A material resources budget is, therefore, an account of a requirement of materials that will be involved in the implementation of a plan.

As the material resources budget is a counterpart of a financial budget, it should be envisaged in the same way as the annual financial budget of a plan. Of course, the materials involved will be numerous and a list of all the requirements may mean an inventory of over thousands of items. For practical purposes, therefore, material resources can be confined to those essential and key commodities required for development. In the main, they are (1) construction materials, such as iron and steel, cement, timber and other building materials, (2) development commodities, such as electric power, coal, other fuels, fertilisers, etc. and (3) raw materials, such as mineral raw materials, agricultural and other raw materials which are constantly required in the manufacture of end-products.

A resources budget has multifarious uses. First of all, it will aid in the determination of correct targets of production. The targets can have no meaning, unless they are pitched in the context of the estimated requirements of these for development. Therefore, in judging whether a plan is balanced or not, it will be difficult to relate the estimates of requirements to the targets projected, without a resources budget. Similarly, it will be difficult to assess the gap between total requirements and domestic production which will call for expenditure of foreign exchange. Thus, even a foreign exchange budget will be unreliable, unless it is based upon the quantities of materials and goods which are considered to be important items of import during the implementation of a plan. In fact, in projecting targets of production for various commodities, more particularly, the developmental commodities and raw materials, the only reliable method will be first to assess the requirements of individual projects as well as of the entire economy. When the requirements are compared with targets, the deficiency in the plan will be automatically revealed.

This is not to convey that there should always be a balance between the requirements and targets of production. But the comparisons will make it possible to investigate further whether a plan can be so revised within its overall content as to make it easily workable and whether it will be possible to revise a target for a particular commodity which might become a crucial factor in the implementation of a plan. As is well known, in many countries in Asia and the Far East, several projects are often delayed because of scarcity of a particular material, which should have been anticipated.

Planning Import Programme

The budget of material resources will also indicate the deficiency that is likely to develop during the course of the plan in respect of a particular commodity. Such a forewarning could be most important in planning an import programme. The material resources budget will help not only the country concerned itself, but also other countries interested in the regular flow of exports of commodities required. Many of the key commodities are subject to international agreement. So the material resources budget will help planning international commodity agreements.

The material resources budget is a prerequisite for policy making. Without an entire picture of the requirements and availabilities of material resources, it is impossible to plan their use among alternative ends. The diversion of resources to desired uses can be done, for instance, through price policy or through a policy of regulation, allocation, restriction or rationing.

An estimate of material resources requirements reveals one of the important features of an economy, in the sense that it reveals interdependence of various industries. Further, the interdependence of the economies of any region can be gauged through a study of materials, their requirements and availabilities in the context of a development plan. Thus, it will provide basis for the study of regional planning and international aspects of planning. Again, it is a prerequisite to a programme of research and experimentation. Moreover, where a plan envisages a mixed economy in which many of the development commodities are partly provided by Government undertakings and partly by private enterprise, resources budgetting will help both the sectors to know the extent to which they will be called upon to supply the materials.

The main objective of material resources budgetting is to match available factors of production with the maximum rate of economic growth. A balance must be struck between the set targets and the resources that can be freed and mobilised to achieve them. There are two methods of framing a resources budget, namely, the aggregate method and the input-output table.

Even a cursory study of how this delicate task of striking a balance between set targets and the resources is being sought to be achieved in countries of Asia and the Far East disclose glaring anomalies. In most cases, for instance, the assessment of future requirements is confined to certain broad estimates of individual projects in respect of particular types of commodities. This method of analysing demand for, or supply of, particular commodities does not take into account the aggregate needs of the whole economy in respect of material resources. In other words, the method of adding up estimated material requirements of individual projects ignores the secondary demand for material resources. This is particularly so when the aim is to estimate the demand for raw materials and intermediate goods which are "versatile," that is to say, which can be used for a variety of uses. Empirical research has, therefore, to follow a different approach, which would enable the estimation of aggregate demands for resources in relation to changes in national income and its main components, namely, consumption and investment. Obviously, these major aggregates can be split into a series of end-products. The resulting estimates of growth in specific end-products can then be applied to current consumption of materials in the production of these specific end products to build up the estimates of demand for materials. This is the aggregate method which gives an overall view of demand for goods and services. This overall view is carried a step further by the use of national input-output table.

Input-Output Table

Such a table provides a comprehensive view of an economy in such a way that it has the merit of showing the points of contact between the various sectors in an economy and the amount of pressure exerted by each one on the others. The various flows become visible, showing the working of an economy. The planning authorities are provided with an overall detailed view and are thus made aware of the repercussions of their policy decisions spreading to the various inter-dependent units in the economy. This table helps in the formulation of mutually consistent development policies in the different sectors of an economy.

The success of the techniques referred to above depends on the awareness of the importance of inter-industry relations and the connection between the various sectors of the economy. For, without them, the whole process of development will not be clearly revealed. The fundamental question, however, is whether the vast amount of technical data required in adopting these techniques are available or can be collected in the countries of the region. It is, however, believed that, at least, some of the countries in the region might examine the availability of such data which in fact do exist but in various scattered ways. Furthermore, sample surveys might be profitably used in certain cases. Thus, for example, the data on consumption demands which are generally not available can be inferred from sample surveys or from the results of *ad hoc* market surveys of private enterprise. Thus, it will be possible for some countries, without undertaking any costly statistics-collecting work to combine their present techniques with the aggregative method. It should be remembered, however, that, in most of the underdeveloped countries, especially when there is an interruption due to war, projections into the future from the past is not sufficiently accurate for policy-making.

As regards the input-output technique, it is realised that, for the time being, it will be sufficient for the countries and particularly the officials in the planning agencies to become familiar with these concepts with the primary purpose of keeping in mind the inter-dependence of an economy. Whenever planning for the production of a certain commodity is framed, the repercussion on other commodities must always be kept in the forefront so that bottlenecks may not develop. It must be mentioned here that the input-output study of one country cannot be applied to other countries, however similar their economies might be. It would, therefore, be far more impossible to apply to countries of the region results of studies made for the United States or the United Kingdom economies in this regard. Every country will have to make its own individual study and the input-output table will have to be tailor-made. On the other hand, in many of the underdeveloped countries, industrial bases are thin and kinds of industries are few so that projections of resources requirements from the present input-output tables are not reliable. What is, however, immediately required and can be done is to perfect the production statistics, with a view to bringing about a clear understanding of the picture of the interdependence flow.

SWISS INDUSTRIES FAIR

The thirty-eighth Swiss Industries Fair will be held in Basle from 8th to 18th May, 1954. It offers an excellent display of the extremely varied production of Swiss industry, the goods of which have won for Switzerland a sound reputation throughout the world. On a total area of 1,300,000 sq. ft., some 2,500 factories will present their combined display, which is considered to be one of the finest of its kind in Europe. Prominent amongst the exhibits will be the traditional Swiss exports such as watches, textiles, textile machinery, electrical equipment, machinery, instruments, apparatus, chemicals, etc.

ECONOMIC SURVEY OF ASIAN REGION

"UNREALISTIC TO HOPE FOR RAPID PROGRESS," SAYS E.C.A.F.E.

DRAWING attention to the outstanding events in the Asian economic situation in 1953, the United Nations Economic Commission for Asia and the Far East observes, in its latest annual economic survey, that the most outstanding problem of the countries in its region during 1953 was an accentuation of the problem of finding the resources to fulfil the need and the desire for economic progress in the face of lower export earnings. This was so because the need for adjusting consumption to lower income levels and the paucity of finance had caused difficulties—these persist even today—in the way of implementing the development programmes in the countries of the region. The prominent features of economic developments in Asia during the year under review, as described in the Survey, were:

(1) The effects of the Korean "boom and bust" period had worked themselves out and there were indications that Asian export earnings had settled down since the second half of 1953 on a level slightly higher than that registered in the immediate pre-Korean war period (before June, 1950).

(2) The food situation since the second half of 1953 had changed from scarcity to surplus and, with the break in rice prices, the last vestiges of the sellers' market had disappeared.

(3) While export prices had, until recently, continued to decline, domestic prices in most Asian countries showed an upward tendency.

(4) The purchase of capital goods acquired a different aspect; whereas, until not too long ago, delivery difficulties on the part of foreign suppliers were a limiting factor, the volume of purchases was governed by considerations of available foreign exchange on the part of Asian importers.

(5) Asian countries were hit by the price "squeeze," resulting from Asian raw material prices having suffered a sharper drop than prices of imported capital goods.

(6) Lower revenues confronted all the Governments of Asian countries with the dilemma of either to curtail economic projects or to resort to controlled deficit financing in the interest of uninterrupted economic development.

Agricultural Production

The year 1953 witnessed a rise in food production in the countries of Asia and the Far East, which was the post-war record. Despite such a rise, however, the supplies available were insufficient to restore the pre-war level of consumption per head of the population. Rice production in 1952-53 increased by 7 per cent., the greatest improvement in any of the post-war years; it was well above the pre-war level. The rise in food output was due, in large measure, to good weather and better yields and also to widespread grow-more-food measures and improved security conditions in some countries. The other helpful factors were construction of irrigation works, distribution of agricultural requisites, and suitable incentives.

Examining the food prospects for 1954, the Commission observes:

"Present indications are that the 1953 crops may turn out to be larger in deficit countries than in 1952, with the exception of Japan, where the 1953 rice crop is down by about 20 per cent., as compared with 1952. Reduced import needs in other parts of the region are likely to offset the increase in Japan's rice requirements and rice surpluses available from Burma, Thailand, and Indo-China are expected to exceed last year's availabilities by approximately one million tons. Mainland China has announced its intention of exporting 270,000 tons of rice to Ceylon in fulfilment of a trade agreement.

"The 1954 picture of the food position would thus indicate a considerable increase in export availabilities in the region and only limited changes in effective demand at current prices, though price reduction could appreciably stimulate demand and shift consumption back to the pre-war import pattern, where rice was the largest import, wheat and other cereals being of minor importance."

In contrast to the general improvement in food output, the production of raw materials and other agricultural commodities showed divergent, but usually downward, trends. During 1953, the long persistent sellers' market for food finally broke and effective demand once again became a controlling factor for both food and raw materials. The sellers' market which had made room for a buyers' market for most materials by the end of 1951 and for industrial equipment in 1952, had, with the change in the food market, gone out of existence in the whole range of production. Price declines would appear to have been brought to a halt in 1953 or given way to small increases (except for tin and rubber where prices registered a sharp drop in the first half of the year). Despite this not unfavourable price development, production of a number of commodities declined or land had been diverted from industrial crops to food production.

Industrial Capacity

As deliveries of 1951 and 1952 orders were effected, industrial capacity in several Asian countries expanded during the year under review. The production of basic industries (coal, power, iron ore, and cement) throughout the region showed increases over 1952, and the same applied to textiles. The increases were widespread and appeared to reflect a fairly general expansion of production. Notable examples of this kind were the textile industry in Pakistan and cement and power production in Malaya. In India, a considerable expansion in production was achieved, as a result of the Five-year Plan. In Japan, investment continued on a high level.

Balance of Payments

The variations in the balance of payments position of the Asian countries during 1953 were much smaller than in previous years. The value of both imports and exports contracted, as a result of the general decline in the price level. Burma and Thailand provided an exception, since they could still obtain high prices for rice during the major part of the year, and the Philippines secured increased value for its exports. With the break, however, in rice prices of late, Burma and Thailand are expected to experience serious readjustment problems in the current year.

Export earnings of the region tended towards stability at a level somewhat higher than before the outbreak of the Korean War. The countries in the region exported in the first half of 1953 goods of approximately $3,300 million, as against $2,600 million in the first half of 1950, immediately before the outbreak of the Korean War. Part of this improvement was, however, due to the substantial increase in Japanese exports. If Japan is excluded, the picture was less favourable, for export values would show a somewhat less marked increase from $2,300 million to $2,700 million between the first half of 1950 and the first half of 1953.

Commodity Prices

Commodity prices and, to a lesser degree, changes in export volumes, determined the development of export earnings. The reduction in export earnings gradually tapered off. Whereas the decline was extremely rapid between the first and the second half of 1951, when it amounted to some $1,000 million, it gradually fell to about $270 million between the second half of 1952 and the first half of 1953. Figures for the 14 countries in the region for which data are available for the third quarter of 1953 show that the downward movement had at last come to an end.

Export Trade

The following statement gives the volume and value of exports from the E.C.A.F.E. countries.

*Value of Exports**

(Monthly Averages)
(In millions of $'s)

	Total†	Total
1950:

§ Length figures for India converted on basis of one yard width.

The intra-regional trade showed a substantial increase which is reflected in the total rise in export values. Leaving out intra-regional trade, the net exports of 13 countries in the region (excluding Japan) showed, in the first half of 1953, an increase of 25 per cent. over the corresponding period of 1952. Since, during the same period, import prices had risen slightly less (of goods from Britain by about 22 per cent., United States 15 per cent. and Continental Europe 29 per cent.), it might be assumed that countries of the region had slightly improved their ability to import manufactured goods from its main sources of supply.

The Commission emphasises the dependence of Asian countries on the export of their primary products and their sensitivity to export fluctuations. It is, however, observed that the degree of instability is not much less pronounced in those countries of the region which export mostly industrial products than in the predominantly agricultural countries. Thus, diversification of production is not likely to promise, by itself, a greater automatic resistance to external influences.

Balance Between Supply and Demand

In marked contrast to the decline in import and export prices, the trend in domestic wholesale prices and cost of living had been upward in most countries of the region, except in the Philippines and Malaya. Money wages, too, continued their upward movement and real wages appeared to be almost universally higher than they were before the outbreak of the Korean War. Nevertheless, inflationary pressure had generally lessened, if not completely disappeared. Domestic controls and rationing had been relaxed in many countries, though import controls had been preserved. Conditions had thus reappeared which were favourable for a restoration of the balance between supply and demand.

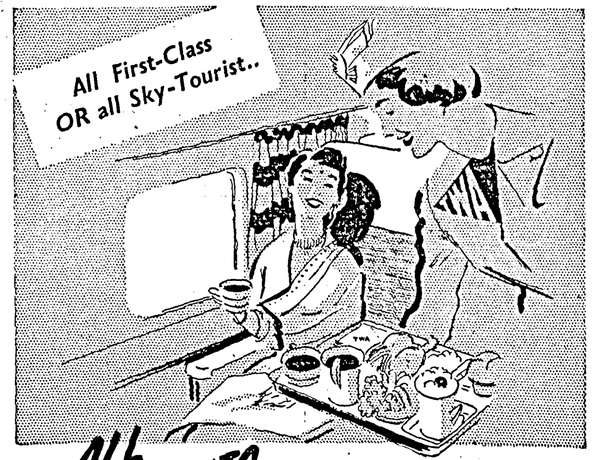
While spending in the private sector was generally reduced as a result of more stringent import or exchange restrictions, the Governments found, as a rule, their revenues declining more rapidly than they were prepared to reduce expenditure, although some efforts to curtail spending were made. In fact, with the exception of the Philippines, total expenditure had risen both in money and in real terms. More significantly, investment expenditure had risen more than total expenditure. This development has been most rapid in Mainland China, India, and Burma.

The Commission has drawn a rather pessimistic picture about the prospects for the economic development of the region during the current year (1954). In its opinion, the immediate problem in many countries of the region arises from the fact that levels of export earnings and of Government revenue are hardly likely to provide a sufficient and increasing amount of resources for economic development projects to which the Governments are committed.

An Acute Conflict

The Commission foresees that, in 1954, a conflict may develop in an even more acute form between the requirements of economic development growth and monetary stability. In addition, many countries of the region are committed to a policy of social welfare expenditure which it may be difficult and, perhaps, inadvisable to curtail. On the basis of present available financial resources and in view of the still low level of genuine savings for investment, the Commission is of the view that it would be unrealistic to hope for very rapid economic progress. The need for adjusting consumption to lower income levels and the problems of finance have caused difficulties for economic development programmes. The effects of the recession have become more widespread and imports of capital goods continue to decline in all countries, except Thailand, Burma, and the Philippines. On the other hand, the incentive to expand industrial capacity has been prodded by the continued increase in domestic consumption which, in many countries, more than offset the adverse effects of declining exports.

The present situation is characterised by the growing importance of Government expenditure for economic development in almost all countries of the region. At the same time, however, budget deficits are appearing or growing in several countries, as, despite lower export earnings, larger funds are used for basic developments which are essential to the increase of national output and higher productivity. Proceeding, the Commission remarks that several countries are already running close to the borderline at which the balance of payments deficits might lead to serious difficulties. Because of some overhang of purchasing power still remaining from the period of the 'boom,' the situation may, in some cases, even be worse than it was in 1950.



...ALL TWA FLIGHTS ARE ONE CLASS ONLY!

On all flights between Colombo and New York, TWA fly only world-proved Constellations. Complimentary meals. Sky-Tourists pay, at low charges, for their drinks, which are free to passengers by First-Class flights.

While First-Class flights seat four abreast, Sky-Tourists are five, but with plenty of room to stretch out, in the same, relaxable seats.

Fly your shipments by TWA. It will pay you on valuable and perishable goods, or on samples.

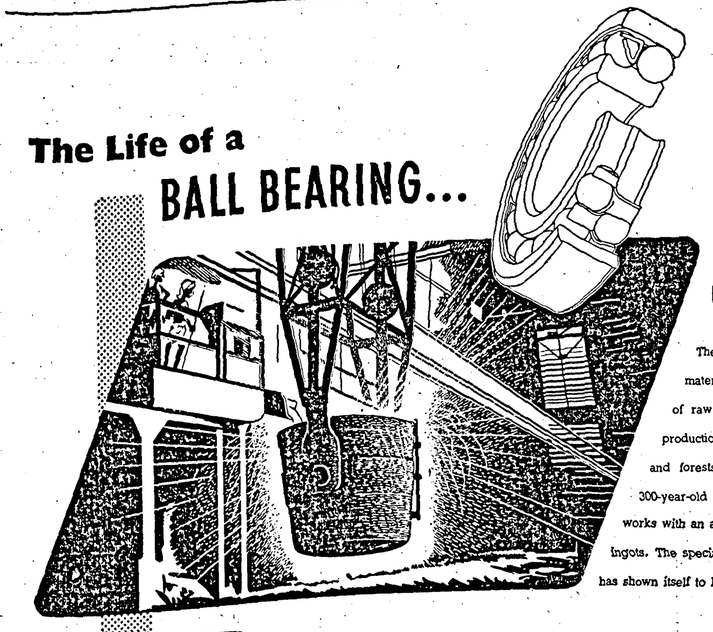
The Life of a BALL BEARING...



...and the material used

The life of a ball bearing depends mainly on the material from which it is made. To ensure the supply of raw material and obtain control over the steel production, SKF acquired Hofors Bruk with its mines and forests, in 1916. Under SKF's management this 300-year-old works has developed into a modern steel works with an annual output exceeding 150,000 tons of steel ingots. The special ball-bearing steel produced at Hofors Bruk has shown itself to be unequalled.

EARNINGS OF MACNEILL BARRY JUTE GROUP IMPROVE

GOUREPORE AND NUDDEA RETURN TO DIVIDEND LIST

THE financial results of the three jute mill companies under the management of Messrs. Macneill and Barry Ltd., Calcutta, namely, the Ganges Manufacturing Co., Ltd., the Gourepore Co., Ltd., and the Nuddea Mills Co., Ltd., for the half-year ended 30th September, 1953, are more favourable than those for the previous half-year and really quite impressive as compared with those for the corresponding half-year of 1952. Thus, the aggregate gross profit of the three Companies for the half-year under review amounts to Rs. 17.81 lakhs, as compared with that of Rs. 4.11 lakhs for the half-year ended 31st March, 1953, and a gross loss of Rs. 33.16 lakhs for the half-year ended 30th September, 1952. The aggregate net profit at Rs. 10.39 lakhs is in refreshing contrast to the loss of Rs. 2.24 lakhs and Rs. 37.51 lakhs in the previous two half-years under comparison.

The profits of individual Companies for the last three half-years are compared in the following table:

(In lakhs)

	Half-year ended		
	30-9-53	31-3-53	30-9-52
Gross Profit			
Ganges	+5.54	+4.58	−17.60
Gourepore	+8.24	+0.74	−11.76
Nuddea	+4.03	−1.21	−3.80
Net Profit			
Ganges	+4.10	+3.13	−19.05
Gourepore	+4.71	−2.71	−13.21
Nuddea	+1.58	−2.66	−5.25

The improvement in the profit of Gourepore and Nuddea is more encouraging than in that of Ganges. The first two Companies have been able to transfer a part of their net profits to the general reserve and return to the dividend list. After transferring a sum of Rs. 1 lakh to the general reserve and clearing off the arrears of preference dividend, the Directors of Gourepore have declared a dividend on the ordinary shares at the rate of 7½ per cent. per annum, thus resuming the ordinary dividend after a break of two half-years. The last half-year for which ordinary dividend had been paid by the Company was the one ended 31st March, 1952, at 2½ per cent. per annum, to which level it had been reduced from 20 per cent. per annum for the preceding six months. Nuddea, too, has returned to the dividend list, after a break of two half-years, with a payment of 2 per cent. per annum. This represents only half of what had been paid for the half-year ended 30th March, 1952. The dividend for the half-year under review has been declared after providing Rs. 50,000 to the general reserve which had not received anything in the previous four half-years. For the fourth half-year in succession, the ordinary shareholders of Ganges, however, have had to go without any return. In fact, the Company is in arrears of divided on the preference shares for the third half-year. This is because the Company has to wipe off a large accumulated deficit. The profit earned during the half-year under review has enabled the Company to reduce the loss of Rs. 8.53 lakhs brought in from the previous half-year to Rs. 4.62 lakhs.

The foregoing analysis shows that the working of the Companies is still far from very remunerative. The profit is not sufficient even to provide adequate amounts for plant rehabilitation and replacement, let alone distribute to the shareholders a handsome dividend. Alluding to the trading conditions that prevailed during the half-year under review, the Directors observe in their reports as follows:

"Trading conditions during the period under review continued to be difficult, both the hessian and heavy goods markets remaining depressed, as the result of the high level of stocks held in Calcutta godowns. Jute sowings were curtailed owing to the uneconomic prices ruling during the early part of the year and the current crops both in India and Pakistan have been much reduced from former levels. This resulted in an upward movement of prices for the raw material. Hessian prices improved on substantial purchases by the Argentine through ordinary trade channels, but the prices for heavy goods lagged far behind and were at no time in parity with the cost of raw jute. On 14th September, 1953, Government reduced the export duty on hessian from Rs. 275 per ton to Rs. 120 per ton which led to a further stimulation of hessian prices and a material improvement in the overall stock position.

"The reduction in labour costs effected in the previous year has been maintained. The management's relations with labour were satisfactory and a further improvement in production efficiency was achieved."

It may be noted here that the results of Gourepore include those of its oil mill. The working of the oil mill has been unremunerative. Consequently, the oil mill has ceased to be a good source of supplementary income. Referring to the working of the oil mill, the Directors of Gourepore say:

"Market conditions for linseed oil showed little improvement. In view of the capital involved and the unsatisfactory prospects for future trading, particularly in export markets, your Directors have decided to close down this section of the Company's operations."

The financial position of the Companies can be judged from the following synopsis of their latest balance-sheets:

	Ganges	Gourepore	Nuddea
LIABILITIES	Rs.	Rs.	Rs.
Capital	90,32,100	50,50,000	66,79,500
Reserves and surplus ..	2,81,602	31,34,253	33,93,042
Provision for taxation ..	....	....	....
Liabilities	74,44,769	1,22,11,155	40,83,659
ASSETS			
Gross block	2,10,72,458	2,19,25,904	2,18,29,378
Less—Depreciation	1,34,24,379	1,54,07,937	1,36,90,475
Net block	76,48,079	65,17,967	76,38,903
Stocks	85,60,993	33,99,339	25,07,097
Shares	12,43,435	14,89,759	13,22,488
Debts, deposits and advances	80,11,427	80,70,177	21,85,013
Investments	4,83,215	42,42,295	4,22,010
Cash	49,018	1,75,371	1,05,868
Profit and loss account ..	4,61,794	....	....
Total .. Rs.	1,67,58,561	2,03,95,408	1,41,61,201

The gross blocks of all the three Companies have been well written down. The current assets more than adequately cover the current liabilities. Stocks of raw materials have been valued at cost and those of manufactured goods at contract or market rates.

RALLIS IN ARREARS OF PREFERENCE DIVIDEND

The second complete year of trading since its conversion from a private limited company into a public one in April, 1951—that is the year ended 31st August, 1953—has also, unfortunately, proved to be a disappointing one for Messrs. Rallis India Ltd. (Chairman and Managing Director: Mr. T. A. Lykiardopulo, Calcutta). On account of the world slump of March-April, 1952, the Company had suffered a net loss of Rs. 2.75 lakhs for the year 1951-52, with the result that it had to skip over the dividend to the ordinary shareholders for that year. The year under review has been an even more disappointing one, in that the net loss amounts to as much as Rs. 12.87 lakhs, due to continued fall in commodity prices during the first half of the year. The result is that the Company has not been able to pay even the preference dividend. The Directors have decided to wipe off the deficit by drawing heavily from the reserves.

A more detailed picture of the Company's working results for the year under review, against the background of those for the previous years, is presented in the following comparative table, which gives an idea of the extent to which the fortunes of the Company have been affected during the last two years:

(In lakhs of rupees)

	Year ended 31st August			
	1953	1952	1951	1950
Sale proceeds	31,73.94	46,04.28	50,05.47	38,93.78
Stocks	4,09.76	5,83.06	6,18.88	6,23.91
Purchases and charges thereon	29,10.44	44,63.23	48,19.14	39,28.90
Trading profit	90.19	1,07.84	1,81.31	1,74.87
Other income	18.43	21.40	29.16	18.88
Establishment and other expenses	1,08.80	1,21.01	1,24.84	1,27.48
Bad debts	8.33	..	..	..
Provision for—				
Depreciation ..	10.35	10.78	10.09	8.90
Taxation	..	..	33.86	27.03

Ordinary	..	..	20.25 (9%)	19.12 (6½%)
Carry forward	0.18	0.25	4.62	1.95

Describing the conditions of trading and the causes that led to the loss during the year under review, the Directors observe thus:

"Trading conditions continued difficult throughout the year under review. The trend of falling commodity prices, keen competition and conditions of demand, referred to in our last report to you, continued during the first half of the year and, although there was a partial recovery in prices during the later months, trading conditions, particularly for those articles whose main market is overseas, remained unfavourable. These general trading conditions resulted in a sharp fall in the turnover of the Company (which amounted to over 30 per cent. in value from the previous year's level) and trading losses in some articles. In most of the articles in which the Company deals, the quantities handled were maintained and the reduction of turnover, especially in jute and gunnies, is attributable to the decline in prices to which reference has been made. In certain cases, however, there was a reduction in both quantities and value of the goods handled, the notable examples being oil and oilseeds, in which the reduction in quantity was the result of a poor crop of seeds throughout India, and lac, in which there was an overall reduction in the total exports from India as compared with the previous year. Despite the difficult conditions, the ratio of profit to turnover was well maintained.

"The burden of the permanent establishment expenses continued to weigh heavily on the Company. Important steps were taken during the year to effect economies, but the full benefit of such measures, as it has been possible to introduce, will only be reflected in the accounts of the current and future years."

The net loss of Rs. 12.87 lakhs has been arrived at after providing for full depreciation on fixed assets. To this loss has been added the sum of Rs. 1.20 lakhs transferred to the reserve for depreciation on investments, resulting in a total loss of Rs. 14.07 lakhs. This has been covered by transferring Rs. 3 lakhs from contingency reserve and Rs. 11 lakhs from general reserve and bringing in the undistributed surplus of Rs. 24,847 from the previous year, leaving a tiny sum of Rs. 17,649 to be carried forward.

The latest balance-sheet shows that the reserves and surplus stand at no more than Rs. 13.45 lakhs (including a profit of Rs. 2.09 lakhs on assets sold during the year), as against a paid-up capital of Rs. 3 crores, having been depleted to the extent of Rs. 14 lakhs for reasons stated above. Provision for taxation amounts to Rs. 11.99 lakhs. The current liabilities are down from Rs. 7.76 crores as at the end of the previous year to Rs. 4.55 crores. Of this decline, bank overdraft and short-term loan account for Rs. 2.78 crores. The gross block of the value of Rs. 1.66 crores has been written down to Rs. 1.20 crores. The current assets aggregate Rs. 6.60 crores, as against Rs. 9.83 crores as on 31st August, 1952, of which stocks (valued at cost or market price, whichever lower) have fallen from Rs. 5.83 crores to Rs. 4.10 crores, stores from Rs. 33.51 lakhs to Rs. 21.51 lakhs, debts, deposits and advances from Rs. 3.29 crores to Rs. 1.92 crores. The current assets, however, exceed the current liabilities and taxation by a margin of Rs. 1.93 crores.

BHOPAL SUGAR SUFFERS LOSS

A gross loss of Rs. 2.30 lakhs is disclosed by the audited accounts of the Bhopal Sugar Industries Ltd. [Managing Agents: Messrs. A. H. Bhiwandiwalla & Co. (Bombay) Ltd., Sehore, Bhopal] for the year ended 30th September, 1953, as compared with a gross profit of Rs. 4.71 lakhs for the previous year. The results of the Company's working during the two years under reference are, however, not strictly comparable, for there was no crushing of cane by the Company during the year under review due to non-availability of cane. The Company's earnings during 1952-53 are, therefore, entirely out of the sale of previous season's stocks of sugar and molasses. As the loss is not heavy, the Directors seem to have thought it fit not to deny the shareholders any return. They have, accordingly, drawn a sum of Rs. 1.72 lakhs from the dividend equalisation fund to pay the 5 per cent. preference dividend and the ordinary shareholders a modest dividend of 6¼ per cent., as against 10 per cent. paid for the previous year and 12½ per cent. for 1950-51.

The Company's factory had to remain idle during the year under review, as no cane was available for crushing owing to acute drought in Bhopal in the previous rainy season. Sale proceeds of the previous season's sugar and of molasses amounted to Rs. 13.59 lakhs. There was no stock of sugar at the end of the year under review. No provision for depreciation has been made. The Directors state that the Company has suffered the aforesaid loss, in spite of a subsidy of Rs. 2.22 lakhs sanctioned by the Government of India on old stock of sugar produced during the previous season. Needless to add that but for this subsidy, the loss for 1952-53 would have been much greater. After deducting from the loss of Rs. 2.30 lakhs the sum of Rs. 47,919 brought in from the previous year's account, a loss of Rs. 1.82 lakhs is proposed to be carried forward.

The following synopsis of the Company's latest balance-sheet will give an idea of the financial position:

Liabilities	Rs.	Assets	Rs.
Capital ...	30,00,000	Gross block ...	31,58,596
Reserves ...	13,25,000	*Less*—Depreciation ...	18,25,419
Provision for taxation ...	66,396	Net block ...	13,33,177
Liabilities ...	2,06,621	Crop-in-progress ...	10,45,377
		Stock-in-trade	4,493
		Stores, spares, etc. ...	7,82,333
		Debts, deposits and advances ...	1,26,823
		Investments ...	7,90,865
		Cash ...	3,33,056
		Profit and loss account ...	1,81,893
Rs.	45,98,017	Rs.	45,98,017

BURN AND CO. TO ISSUE BONUS SHARES

As announced in our last week's issue, the Directors of Messrs. Burn and Co., Ltd. (Managing Agents: Messrs. Martin Burn Ltd., Calcutta) propose to capitalise a sum of Rs. 42 lakhs out of the reserves and issue, as bonus, 42,000 ordinary

(*Continued on next page*)

Points From The Chair

Convertibility of the Pound Sterling

"IT does not seem likely that full convertibility between the pound and the dollar would help us much at present. Until our national shop window has become as attractive to the whole world as the shop window of the United States, convertibility would seem to imply either a lower price for the pound sterling measured in dollars, or an even more severe restriction of dollar imports than we suffer from now. The latter device would be highly unsatisfactory, since it would lessen the volume of our own trade, while any foreign holder or earner of sterling would be free to acquire with that sterling, dollar goods, unhampered by our own import restrictions."

LORD ALDENHAM,
Westminster Bank Ltd.

Dual Role of London Discount Market

"As I see the position of the London discount market today, it has a dual role to play in our national economy. The first is its traditional and primary role of buying and selling bills of exchange in their great variety. And the second, which through force of circumstances has of recent years fallen to its lot, is to provide a free market in short-dated Government securities. In fulfilling these functions, especially the latter, there is a serious element of risk, and it behoves your Board, with every consideration for you the shareholders, to maintain its policy of building up and maintaining our resources. It is by this policy, and this policy only, that we shall be able to face with confidence a future, which, not only in its domestic but also in its wider and international aspects, does not, for the British Commonwealth of Nations, yet rest on firm foundations."

SIR ERIC GORE BROWNE,
Alexanders Discount Co., Ltd.

Price of Wool

"Personally, I am of the opinion that a moderate fall in the price of wool would be in the best interests of the industry, and I certainly do not exclude the wool growers, who, in fact, have more to lose than anyone if a high price for wool should encourage the use of man-made fibres. Provided the price is reasonable, the characteristic qualities of wool are such that there will always be a demand for its products. An interesting development during the year under review has been the establishment of a futures market in wool tops. This is an innovation in this country—unlike cotton, in which there was an active futures market before the war. It has, however, I think, yet to be proved that a futures market in wool will be of the same value to the wool textile industry as the futures market for cotton has been to the cotton industry."

SIR JOHN KEELING,
West Riding Worsted and Woollen Mills Ltd.

Risk Taking—Essence of Progress

"No one has yet devised, and I do not believe anyone will ever devise, a substitute for the process which fertilises with capital the less well developed parts of the world, and by raising the standard of life of millions of people in those areas establishes a market for the goods made in industrialised countries such as our own. The financier's responsibility in this process is to place the capital he controls at the disposal of those who, by their integrity and ability, can contribute to the general well-being and as a consequence, will probably make a satisfactory profit commensurate with the risk involved. Risk taking is the very essence of progress, and we should be grateful to those who, in the past, took great risks financially and otherwise in developing the trade of this country. Present taxation, both here and overseas, makes the taking of such risks relatively unattractive financially, but that doesn't alter the fact that if we are to survive as a great nation the process must go on."

H. NUTCOMBE HUME,
Charterhouse Investment Trust

COMPANY AFFAIRS

(Concluded from previous page)

shares of Rs. 100 each to the holders of ordinary shares as on 1st March, 1954, in the ratio of one share for every share. The bonus shares will rank in all respects *pari passu* with the existing ordinary shares, except that they will not participate in dividends declared in respect of any period ended or before 30th April, 1953. In other words, the new shares will rank for dividend to be declared for the current year, that is, the one ending 30th April, 1954.

The present authorised and paid-up capital of the Company is Rs. 70 lakhs, made up of 13,000 7 per cent. cumulative preference shares of Rs. 100 each, 15,000 6 per cent. cumulative preference shares of Rs. 100 each and 42,000 ordinary shares of Rs. 100 each. The reserves stand at Rs. 106.90 lakhs. The proposed capitalisation will raise the paid-up capital to Rs. 112 lakhs. The authorised capital, therefore, requires to be raised and the Directors propose to increase it to Rs. 120 lakhs.

This is the third occasion the Company is capitalising a part of the reserves. The first occasion was as far back as in January, 1904, when it capitalised Rs. 9 lakhs and issued 9,000 ordinary shares of Rs. 100 each. The second was in April, 1923, when a sum of Rs. 21 lakhs was capitalised and 21,000 ordinary shares of Rs. 100 each were issued as bonus shares. If the present proposal materialises the Company will earn the distinction of having increased its paid-up ordinary capital from its original level of Rs. 12 lakhs to Rs. 84 lakhs, that is by Rs. 72 lakhs, all out of its earnings conserved year after year.

COMPANY MEETINGS AND DIVIDENDS

CHEMICAL, INDUSTRIAL AND PHARMACEUTICAL LABORATORIES LTD. Annual General Meeting, Bombay, 22nd February, 1954. Transfer books remain closed from 8th to 23rd February, 1954, both days inclusive.

Notices

THE CENTRAL INDIA SPINNING, WEAVING & MFG. CO., LTD.

NOTICE

THE DIRECTORS HAVE DECIDED, SUBJECT to the receipt of the Government of India's sanction thereto, to increase the capital of the Company as mentioned below:—

(*a*) To raise the authorised capital of the Company to Rs. 2,00,00,000, made up as under:—

	Rs.
Preference shares	50,00,000
Ordinary shares	1,00,00,000
Unclassified shares	50,00,000
Rs.	2,00,00,000

(*b*) Out of the authorised capital mentioned in (*a*), to issue 15,625 fully paid-up Ordinary shares of Rs. 100 each and to allot to the holders of existing Ordinary shares in the ratio of one new share to every three existing shares by capitalising Rs. 15,62,500 from Reserves.

(*c*) Issue of 37,500 Ordinary shares of Rs. 100 each to be offered for subscription at par to the holders of ordinary shares as existing after the issue of shares as provided for in paragraph (*b*) in the ratio of one new share to every two existing shares which will absorb 31,250 Ordinary shares. Holders of Ordinary shares may apply for the balance of 6,250 shares in addition to the shares to be issued in the ratio of one new share to every two existing shares mentioned above.

If the issue of 37,500 shares is not fully taken up by the Ordinary shareholders. Preference shareholders will be given the right to apply for the shares. In case all the shares are not taken up by Ordinary shareholders and Preference shareholders, the Directors are authorised to issue shares not taken up at their discretion.

An Extraordinary General Meeting of the Company will be convened in due course for the purpose of considering and if thought fit passing the necessary resolutions.

For and on behalf of
THE CENTRAL INDIA SPG., WVG. & MFG. CO., LTD.,
TATA INDUSTRIES LTD.,
Managing Agents,
A. D. SHROFF,
Director.

BOMBAY, *8th February*, 1954.

THE SVADESHI MILLS CO., LTD.

NOTICE

THE DIRECTORS HAVE DECIDED, SUBJECT to receipt of the Government of India's sanction thereto, to recommend to the shareholders the issue of 25,000 fully paid up Ordinary shares of Rs. 100 each, out of the unclassified share capital of the Company, by capitalising Rs. 25,00,000 from the Reserve Fund and their allotment to the holders of the existing Ordinary shares in the ratio of one new share to every three existing shares. An Extraordinary General Meeting of the Company will be convened for this purpose in due course.

For and on behalf of
THE SVADESHI MILLS CO., LTD.,
TATA INDUSTRIES, LTD.,
Managing Agents,
A. D. SHROFF,
Director.

BOMBAY, *8th February*, 1954.

THE GOKAK MILLS, LIMITED

The Dividend, if sanctioned, will be paid to those Shareholders whose names stand on the Register of the Company on the 25th March, 1954.

By Order of the Board,
FORBES FORBES CAMPBELL & CO., LTD.,
Agents.

BOMBAY, *8th February*, 1954.

BOWREAH AND DUNBAR SUFFER LOSS

FORT GLOSTER JUTE PASSES OVER DIVIDEND FOR THIRD HALF-YEAR

Bowreah Cotton Mills Co., Ltd.

THE directors of the above Company Managing Agents: Messrs. Kettlewell Bullen & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

The accounts show a loss of Rs. 3,41,307 (Rs. 40,441) to which has to be added the debit balance brought forward from the last account, namely Rs. 6,27,420 (credit balance of Rs. 12,017) giving a total debit balance of Rs. 9,68,728 (Rs. 28,432) which the directors recommend should be carried forward to the next account.

No reservation for depreciation has been considered necessary as in the opinion of the directors adequate provision has been made in previous accounting periods.

Trading conditions during the half-year continued to be most discouraging, and rising costs, coupled with the general shrinkage in demand experienced throughout the industry, rendered it impossible to dispose of productions on a profitable basis. The situation was aggravated by keen competition amongst mills throughout India to dispose of their accumulated stocks, and, although the Central Government removed all price controls, the restrictions still enforced, as regards the production of many popular varieties of cloth, rendered it very difficult for mills to operate on an economic basis. This was particularly so in the case of dhoties, for the manufacture of which a large part of the installed capacity of the Company is specifically designed. By an ordinance promulgated early in the period under review, however, for the purpose of assisting the handloom industry, mills were prohibited from manufacturing more than 60 per cent. of their 1952 outturn of these cloths and this has had a very detrimental effect upon the half-year's results. The restricted enquiry from overseas markets was most disappointing and keen foreign competition resulted in a further contraction of margins.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.

Dunbar Mills, Ltd.

The directors of the above Company (Managing Agents: Messrs. Kettlewell Bullen & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th June, 1953.

The accounts show a loss of Rs. 3,50,465 (Rs. 39,706) to which has been added the debit balance brought forward from the last account, namely, Rs. 1,73,620 (credit balance Rs. 11,912) giving a total debit balance of Rs. 5,24,085 (Rs. 27,794) which the directors recommend should be carried forward to the next account.

No reservation for depreciation has been considered necessary as in the opinion of the directors adequate provision has been made in previous accounting periods.

Accounts in brief are as under:—

Rs.	79,80,711	Rs.	79,80,711

Fort Gloster Jute Manufacturing Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Kettlewell Bullen & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

The accounts show a period of Rs. 3,34,840 (loss of Rs. 12,07,399) to which has been added the balance brought forward from the last account, namely, Rs. 3,971 (Rs. 25,700) resulting in a credit balance of Rs. 3,38,811 (Rs. 68,301 after transferring Rs. 12,50,000 from reserves). From this has been deducted the amount written off for depreciation Rs. 85,000 (*nil*) proportionate amount written off for debenture issue expenses Rs. 1,060 (*nil*), provision for taxation Rs. 6,200 (*nil*) and the amount transferred to debentures sinking fund Rs. 1,75,000 (*nil*) leaving a balance for disposal of Rs. 71,550 (Rs. 68,301) the directors recommend that this should be dealt with as follows:—

To pay a dividend on the 7 per cent. preference shares for the half-year ended 30th September, 1953 at Rs. 3-8 per share without any deduction for income-tax payable by the Company Rs. 49,000 (Rs. 49,000) to pay a dividend on the 2nd Preference shares for the half-year ended 30th September, 1953 at Rs. 2-8 per share without any deduction for income-tax payable by the Company Rs. 17,500 (Rs. 17,500) and to carry forward Rs. 5,050 (Rs. 1,801).

The additions to block account include the cost of a new fuel economiser plant, two more jute softeners and a water softening plant for the North Mill.

In compliance with the Working Time Agreement of the Indian Jute Mills' Association, the Company's mills continued to work throughout the period under review 42½ hours per week with 12½ per cent. of the total loomage sealed.

During most of the half-year, the markets for manufactured goods remained depressed as a result of the accumulation of stocks in Calcutta and a restricted volume of demand from overseas. On 14th September the Government of India announced a welcome reduction in the export duty of hessians from Rs. 275 to Rs. 120 per ton, and since the close of the half-year there has been a considerable improvement both in shipments and the level of values for these goods. Raw jute prices have, however, closely followed the trend of manufactured goods and trading on a simultaneous basis remains difficult and unremunerative.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	42,00,000	Block ...	90,70,286
Reserves ...	56,16,752	Stocks ...	69,15,294
Debentures ...	25,00,000	Stores and spares ...	23,86,577
Provision for taxation ...	14,818	Debts, deposits and advances ...	20,39,874
Liabilities ...	84,96,765	Investments	1,82,758
Profit and loss account ...	1,38,051	Cash ...	3,44,027
		Debenture issue expenses ...	27,570
	Rs. 2,09,66,386		Rs. 2,09,66,386

Naihati Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. F. W. Heilgers & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 1,31,136 (Rs. 1,45,587) for depreciation, the profit and loss account shows a profit of Rs. 99,593 (loss of Rs. 3,40,671) which reduces the loss brought forward from the previous half-year to Rs. 6,87,375 and this the directors recommended should be carried forward.

Stocks of jute have been valued at market value and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act, 1946, and the Working Time Agreement of the Indian Jute Mills' Association the Company's mill worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the mill was maintained at full strength throughout the period under review, but 6 hours were lost in September when the labour demanded the payment of a *Puja* bonus.

An improvement in both efficiency and costs has been achieved during the half-year, but the Mill will not become a fully economic unit until the electrification and modernisation schemes have been implemented, together with the conversion of a percentage of sacking looms to hessian. The directors inform that full electrification of the Mill is expected to be completed by July, 1954.

The trustees for the debenture holders have consented to the sale of plot No. 2 of the Company's land consisting of an area of approximately 238 cottahs to Messrs. India Paper Pulp Co., Ltd., at a price of Rs. 1,37,000 and to the utilisation of this sum for the purchase of modern machinery.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	47,48,900	Block ...	65,00,704

Debentures ...	25,00,000	Stores ...	12,66,833
Provision for taxation ...	4,17,766	Debts, deposits and advances ...	24,59,061
Liabilities ...	26,34,805	Investments	5,89,633
		Cash ...	87,385
		Profit and loss account ...	6,87,375
Rs.	1,44,09,054	Rs.	1,44,09,054

Lawrence Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bird & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 1,60,000 (Rs. 1,00,000) for taxation, Rs. 5,000 (*nil*) for reserve for taxation contingencies and Rs. 43,308 (Rs. 46,791) for depreciation, the profit and loss account shows a profit of Rs. 2,06,402 (Rs. 1,54,267) to which has been added the amount brought forward from previous half-year Rs. 7,757 (Rs. 32,655) making a total of Rs. 2,14,159 (Rs. 2,13,922 after writing back Rs. 27,000 being provision for contingent loss on forward jute purchases no longer required). From this the directors have transferred to jute stock reserve Rs. 50,000 (Rs. 50,000 for plant renovation reserve) leaving an available balance of Rs. 1,64,159 (Rs. 1,63,922).

The directors propose to dispose of this in paying a dividend on the "A" preference shares at the rate of 7 per cent. per annum, without any deduction for income-tax paid by the Company Rs. 17,500 (Rs. 17,500) in paying a dividend on the "B" preference shares at the rate of 5½ per cent. per annum, without any deduction for income-tax paid by the Company Rs. 27,500 (Rs. 27,500) in paying a dividend on the ordinary shares of Rs. 3 (Rs. 4) per share, without any deduction for income-tax paid by the Company Rs. 83,988 (Rs. 1,11,968) and in carrying forward Rs. 35,171 (Rs. 6,954).

Stocks of jute have been valued at market value and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act, 1946, and the Working Time Agreement of the Indian Jute Mills' Association, the Company's mill worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the Mill was maintained at full strength throughout the period under review, but 8½ hours were lost in September when the labour demanded the payment of a *Puja* bonus.

The directors state that they still await definite information regarding power being made available by the Damodar Valley Corporation through the Calcutta Electric Supply Corporation, but it now appears more likely that negotiations will be successfully concluded in the relatively near future.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	43,00,000	Block ...	51,61,161
Reserves ...	59,32,760	Stocks ...	29,26,274
Provision for taxation ...	1,25,699	Stores, spares, etc. ...	9,07,167
Liabilities ...	12,04,406	Debts, deposits and advances ...	16,55,897
Profit and loss account ...	35,171	Investments	8,57,990
		Cash ...	89,547
Rs.	1,15,98,036	Rs.	1,15,98,036

Kinnison Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. F. W. Heilgers & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 2,76,000 (Rs. 3,00,000) for taxation, Rs. 74,000 (Rs. 75,000) for reserve for taxation contingencies, Rs. 2,13,555 (Rs. 2,25,638) for depreciation and Rs. 2,975 (*nil*) for doubtful debts, the profit and loss account shows a profit of Rs. 4,60,214 (Rs. 4,50,317) to which has been added the amount brought forward from previous half-year Rs. 28,445 (Rs. 1,65,736) making a total of Rs. 4,88,659 (Rs. 6,55,053 after writing back Rs. 39,000 being the provision for contingent loss for forward jute purchases). From this the directors have transferred to general reserve Rs. 1,00,000 (Rs. 1,50,000) and to jute stock reserve Rs. 50,000 (*nil*) leaving an available balance of Rs. 3,38,659 (Rs. 5,05,053).

The directors propose to dispose of this in paying a dividend on the preference shares at the rate of 7 per cent. per annum, without any deduction for income-tax paid by the Company Rs. 52,500 (Rs. 52,500) in paying a dividend on the ordinary shares of Rs. 5 (Rs. 7) per share, without any deduction for income-tax paid by the Company Rs. 2,39,945 (Rs. 3,35,902) and in carrying forward Rs. 46,214 (Rs. 1,16,651.)

Stocks of jute have been valued at under cost and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act, 1946, and the Working Time Agreement of the Indian Jute Mills' Association, the Company's mills worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the Mills was maintained at full strength throughout the period under review, but 20 hours were lost during August on account of a strike due to a change in line of production.

The mill section of No. 1 Mill has now been fully electrified and it is expected that the electrification of the factory section will be completed by March, 1954.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.

PRONOUNCED STRINGENCY IN MONEY MARKET

(From Our Own Correspondent)

BOMBAY, 10*th February*

Stringency in the short-term money market noted during the past several weeks became more pronounced during the week under review, with a further broadening of demand and acute shortage of floating funds. The major sources of supply for most of the banks were the Reserve Bank and the Imperial Bank. Exchange banks were reported to have been meeting their requirements by drawing on their foreign offices through sales of sterling. There was, therefore, a dwindling of the turnover in the inter-bank call money sector. The call money rate among the Exchange banks and big Indian banks stood unchanged at 3 per cent. with no lenders. The corresponding rate among the smaller Indian banks was also 3 per cent. House money at call fetched 3 per cent. Short-term deposits were offered 3 per cent. for one to six months and 2½ to 2¾ per cent. for 12 months.

The three months' Government of India Treasury Bill rate, after having remained unchanged at Rs. 2-8 per cent. per annum in the previous three weeks, hardened this week to the record level of Rs. 2-9 per cent. per annum. The amount offered was no more than Rs. 1.01 crores, a decline of about Rs. 13 lakhs from last week. It is significant that neither the hardening of the interest rate nor the none-too-encouraging response has induced the authorities to withdraw the sale of these bills; they have invited tenders for another Rs. 1 crore for next week.

An expansion of Rs. 17.81 crores in notes in circulation is disclosed by the Reserve Bank's statement for the week ended 5th February, 1954, as compared with that for the previous week. Notes held in the Banking Department have declined by Rs. 8.94 crores, so that the total notes issued are higher by Rs. 8.88 crores only. This is covered by a rise of Rs. 10 crores in foreign securities and a fall of Rs. 1.12 crores in rupee coin. In the Banking Department, Central Government deposits have gone down by Rs. 8.32 crores, deposits of other Governments by Rs. 3.78 crores and those of banks by Rs. 41.87 lakhs. On the assets side, cash balances show a dwindling of Rs. 9.06 crores. Balances held abroad are also lower by Rs. 8.04 crores, evidently due to the transfer to the Issue Department. Loans and advances other than to Governments have risen by Rs. 4.42 crores, of which advances to Scheduled banks against usance bills account for Rs. 3.30 crores. There has been a fresh expansion of Rs. 7.30 crores in advances against usance bills during the week, as against which there has been repayment to the extent of Rs. 4 crores. Government Treasury Bills purchased and discounted account for a decline of Rs. 2.04 crores.

The consolidated statement of position of Scheduled banks for the week ended 29th January, 1954, discloses a fall of Rs. 1.86 crores in demand deposits and of Rs. 1.21 crores in time deposits. Inter-bank borrowings have also fallen by Rs. 1.03 crores. Borrowings from the Reserve Bank have increased by Rs. 2.29 crores and those from the Imperial Bank by Rs. 1.56 crores. A rise of Rs. 12.74 crores is noted in advances and of Rs. 71 lakhs in bills purchased and discounted. Investments have gone down by Rs. 1.44 crores. Cash on hand and balances with the Reserve Bank are together lower by Rs. 2.44 crores, balances with other banks in current account by Rs. 64 lakhs and money at call and short notice by Rs. 1.76 crores.

The Gilt-edged market continued to experience dull conditions during the week under review also. Business passing was of small nature, though the undertone remained steady. 3 per cent. 1947 was unchanged at Rs. 98-6, though there were buyers at that level. 3 per cent. 1958 and 3 per cent. 1959-61 were up by an anna at Rs. 98-3 and Rs. 96-3, respectively, having attracted attention due to proximity of interest payment. 3 per cent. 1966-68 and 1963-65, 3 per cent. 1964, 3 per cent. 1960-75 and 3 per cent. 1970-75 stood unchanged at previous week's levels. 3 per cent. 1986 Conversion Loan changed hands an anna lower at Rs. 82-10. A fair amount of business passed in 3½ per cent. 1961 N.P. Bonds at Rs. 98-14.

KIPS WEAK

(From Our Own Correspondent)

MADRAS, 8*th February*

The kip market ruled weak during the week under review, due to price resistance by U.K. dressers who did not book fresh orders for finished leather. There were enquiries for medium and heavy cow hides at one penny below last week levels and for lights at 1*d.* to 2*d.* less and some weak holders seemed to have accepted business.

Prices are likely to show declines in the local market shortly, except for inferior selections which are taken up for inland trade at 2*d.* to 3*d.* above U.K. levels. Demand for cow calf and buff calf has been patchy, while buff heavies are in good demand.

In the tanned skins section, there was good clearance of sheep at lower prices by exporters to Japan who anticipated allocation of licences shortly. Arrivals of goat skins continued to be meagre and the U.S. buyers showed some interest in medium goat.

In the London auction, prices of tanned sheep skins primes advanced up to 6*d.*, middle class were unchanged to 6*d.* down, and commons declined by 6*d.* to 12*d.* Lower selections suffered badly.

Shipments during the month of January were (in bales): To the U.K.: 3,397td. cow hides, 206td. cow calf, 200td. buff hides, 381td. buff calf, 749td. goat and 888td. sheep; to the Continent: 307td. goat, 63td. sheep and 12 drysalted goat; to the U.S.A.: 159td. cow hides, 4td. cow calf, 178td. buff hides, 43td. buff calf, 88td. goat, 294 drysalted goat and 3td. snake skins; to Japan: 90td. sheep skins.

BULLION FEATURELESS

(From Our Own Correspondent)

BOMBAY, 10*th February*

Trading on the Bullion Exchange during the week under review was featureless. Values moved in a narrow groove, but the undertone remained steady, in the absence of any adverse factors. After a minor recession in the earlier part of the week, due to lack of support and increased arrivals of gold, values tended to steady up, due to continued strength of the ready position, revival of moderate support from longs and scattered bear covering. The decline in arrivals of gold in the last three days and better offtake *vis-a-vis* the arrivals helped to keep the bullish sentiment intact.

Silver for forward delivery (18th February settlement) began at Rs. 161-9 and slipped down to *Rs. 159-10 on Friday.* After moving between that level and Rs. 160-6, values hardened to Rs. 161-5 on Monday and continued to make headway to Rs. 161-14 today before closing at Rs. 161-13.

Ready silver (.996 Mint) was quoted throughout the week at a premium of As. 4 over the forward rate, the opening and closing quotations being Rs. 161-13 and Rs. 162-1, respectively. The floating stocks of silver are placed at 2,300 bars. The daily average offtake was of the order of 10 to 15 bars.

Opening at Rs. 85-14, gold for forward delivery sagged a little to Rs. 85-1 under the weight of large arrivals in the initial days. But later there was a decline in arrivals and offtake by upcountry dealers looked up. Consequently, the forward rate slowly edged forward and saw a high of Rs. 86-2 today, before closing at Rs. 86-1.

Ready gold dropped from the opening rate of Rs. 86-2 to Rs. 85-4, picked up strength before the week passed to Rs. 86-6 and finally closed at Rs. 86-5.

The floating stocks of gold are estimated at 20,000 tolas. The daily average arrivals were 6,500 tolas; the offtake was also of the same order on an average.

The following comparative table shows the trend of the market during the week under review:

	10-2-54	Highest	Lowest	3-2-54
Gold	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Ready (.99 fine Mint) .. .	86 5	86 6	85 4	86 0

COMMON AND LOW MEDIUM TEAS DECLINE

(Messrs. Forbes, Ewart and Figgis Ltd.)

COCHIN, 6*th February*

Offerings in sale No. 3, which was held on Tuesday, 2nd February, amounted to approximately 8,10,000 lbs. Quality showed some improvement, particularly amongst the high grown teas. There was good general demand, but prices were irregularly As. 2 to As. 3 easier for all common and low medium teas. Good medium brokens and fannings with improved quality were slightly dearer, as were high grown teas with flavour. The weakest feature of the sale were whole leaf teas which declined by As. 2 to As. 4. The following were the quotations:—

	1954 Rs. a. p.	1953 Rs. a. p.
Low grown Travancore B.O.P.	2 4 6	1 6 0
Medium Travancore B.O.P. ...	2 6 0	1 13 0
Anaimallais B.O.P.	2 10 0	2 4 0
Best liquoring Nilgiri B.O.P.	3 6 0	4 1 0
Well made black leaf O.P. ...	2 10 0	2 2 0

London Market.—Sale held on 1st February. Market irregular, farthing to half penny dearer.

Sale held on 3rd February.—Market hardened. Commons advanced full farthing.

Colombo Market.—Strong general demand. Lowgrowns firm to dearer. Mediums advanced five cents. Highgrowns 10 cents dearer. Egyptian types lower.

Calcutta Market—Export.—Although prices generally declined by As. 2 to As. 2-6, except for whole leaf, there was good general demand.

Dust.—23,000 packages. Less demand. Market As. 2 to As. 3 down.

Export Quota.—At the beginning of the week the market again declined to 38 pies, but later strengthened to 43 pies. Today's quotation stands at 42 pies sellers.

Forthcoming Auctions.—Sale No. 4 will be held on Tuesday, 16th February.

As we go to press, Messrs. Forbes, Ewart and Figgis, Ltd., wire:

"*Dust Sale C.*—1,60,000 lbs. Less demand. Prices generally As. 3 lower."

READY COTTON FIRM

(From Our Own Correspondent)

BOMBAY, 10*th February*

With only a nominal quantity tendered on the second delivery day in the February contract, the difference between the two contracts has, again, almost doubled. In view of the obvious reluctance of shorts to tender cotton, it is expected that the February contract will have a further fillip before it finally expires this month. Sentiment in May delivery, however, has remained more or less unsteady, as a result of the large quantity of U.S. cotton expected in the country, as also of the more optimistic estimate with regard to the crop by the Indian Central Cotton Committee. While the trade is still inclined to place the crop for the season at 3.9 million bales, the Committee considers that, in the final calculations, it will not be found to be much short of the earlier estimate of 4.2 million bales. It is, however, a matter of time as to how long the operators will wait before making a fresh attempt to squeeze the market by collecting contracts in May, in view of the obvious preference of Indian mills for indigenous cotton. In cloth production, in spite of larger enquiries for the fine varieties, the emphasis is still on the medium and coarse grades, which means higher consumption of Indian cotton. The imported cotton may ease the supply and the carry-over position at the end of the season, but it cannot replace Indian cotton in any manner.

In the spot section, the position has remained almost unchanged. The demand for medium- and long-staple cotton has continued to be as active as before and that for short-staple varieties such as Bengal, Oomras and Mathias has also revived. This latter interest is a sequel to more enquiries from the Continent and the U.K. for short-staple cotton. Amongst imported styles, while the mills are still keen on medium grade Karnak, a good deal of business is believed to have been registered in U.S. cotton. The trade is nourishing a grievance in this respect, because the Government has allowed imports of U.S. cotton subject to prior sale to mills. Nothing is now being heard about paying for this cotton in Indian currency and it is being taken for granted that the payment will be in dollars. While mill interest continues in East African and Sudanese cotton, for which certain textile units have always shown a preference, both the supply position and the price trend for these are unreliable and it is uncertain as to how much more cotton from these sources India will be able to obtain during the rest of the season.

In the forward section of the cotton market, I.C.C. February opened the week on a steady note at Rs. 702½ and hardened to Rs. 705½ on the following day. But profit-taking brought a reaction to Rs. 699½ on the 6th inst. After recovering to Rs. 706 on Monday, it again slided down to Rs. 701 yesterday. A sharp upturn was, however, noted towards the close when the Contract finished at Rs. 710. Opening at Rs. 695, I.C.C. May moved up to Rs. 699½ on Friday, but shaded off to Rs. 692½ yesterday. But it finished higher at Rs. 696½ today. The trend of prices in the forward section during the week under review was as follows:

	Opening	High	Low	Closing
I.C.C. Feb. ...	Rs. 702½	713	694½	710½
I.C.C. May ...	Rs. 695	701	688½	696½

The latest available prices from the spot market are: Bengal *Deshi* Rs. 640-670; Berar Jarilla Rs. 845; Khandesh Rs. 832-845; Vijay Rs. 925-930; Oomra *Deshi* Rs. 740; Moglai Rs. 725.

The Karachi market has failed to maintain the advance registered last week. In fact, prices have slided back a little, though not to the previous week's levels, as enquiries from various sources both from the East and the West failed to materialise into actual business. One of the reasons for this back-sliding at Karachi was the arrest in the price improvement at New York, after a long spell of consistently bullish trend. Perhaps, the lowering of prices at Karachi will result in some business, especially as supplies from East Africa and Sudan are not forthcoming.

The latest available quotations from the Karachi market are: Punjab *Deshi* Rs. 71-72½; Sind *Deshi* Rs. 72-76; 4F Punjab R.G. Rs. 68-73½; S.G. Rs. 79½; N.T. R.G. Rs. 73½; S.G. Rs. 79½; L.S.S. Rs. 74½; S.G. Rs. 79½; 289F R.G. Rs. 77½; S.G. Rs. 83¾.

The Alexandria market continues to ride on the crest of a wave of prosperity. The spot premia over the price of the commission for Karnak, Giza 30 and Ashmouni have all increased. As usual, India has been the biggest buyer in the market during the week. As outside demand is mainly for Karnak, the stocks of this variety will soon be depleted. Even the internal demand for domestic textile industry has been fairly active and there is a tendency on the part of spinners to secure their supplies for the whole season, leading to a gradual improvement in prices. The only snag in the situation is that American prices have cried a halt and, when Sudan comes into the market later in this month, some of the interest in Egyptian cotton might be diverted. There is, therefore, just a possibility of a moderately downward trend at Alexandria next month and the Indian purchasers might do worse than wait for a technical reaction which is not unlikely.

At New York, after the big spurt in prices in the preceding week, a natural reaction had overtaken the market early in the week though there was no appreciable reduction in the quotations. The quantity of loan cotton continues steadily to increase. Towards the close, however, there was again a spirit, following mill buying and covering by shippers, with the result that closing rates were higher than even those a week ago.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	9-2-54	2-2-54	22-1-54
Spot	35.00	34.80	34.25
March	34.28	34.17	33.58
May	34.37	34.33	33.82
July	34.14	34.19	33.62
October	33.41	33.37	32.84

ART SILK YARN FIRM, STAPLE FIBRE YARN WEAK

(From Our Own Correspondent)

BOMBAY, *10th February*

The notable event of the week under review was the resumption of forward trading in art silk and staple fibre yarns on the 8th inst., under the auspices of the newly formed Bombay Yarn Merchants' Association and Exchange Ltd. Trading was permitted in 150D March delivery in art silk yarn, and was subject to the ceiling and floor prices at Rs. 850 and Rs. 700 respectively, fixed by the Association. 150D (March delivery) opened at Rs. 760 per case of 200 lbs. Scarcity of goods in the ready section and expectation of very poor imports lent much support to the market and the contract was lifted up to Rs. 776 today. Prices of yarn in the ready section were well maintained, today's closing rates being the same as those a week ago. 120 Japan was quoted at Rs. 4-11½. 150 Japan was done at Rs. 4-6. 120 Italy had buyers at Rs. 4-4 and 150 Italy at Rs. 3-13½.

The table below gives the prices of art silk yarn quoted today, as compared with those on the 3rd inst. and 27 January, 1954:

	10-2-54	3-2-54	27-1-54
	Rs. a.	Rs. a.	Rs. a.
120 Japan (per lb.)	4 11½	4 11½	4 10
150 Japan	4 6	4 6	4 5
120 Italy	4 4	4 4	4 3
150 Italy	3 13½	3 13½	3 14

In contrast to the trend in the art silk yarn section, the staple fibre yarn section ruled easy. Removal of restrictions on counts and taste of yarn to be included for forward trading, coupled with the increase in the number of mills (from 11 to 15) the yarn production of which was allowed to be traded, had a bearish effect. Consequently, there was a fall in values. Staple fibres yarn (40×2) March delivery contract which opened at Rs. 710 per case of 200 lbs. receded to Rs. 688 today. The ready section staged a retreat during the week under review. An idea of the extent of the fall in values (per lb.) of some of the foreign and indigenous varieties (40×2) can be had from the table below:

	10-2-54	2-2-54
Foreign	Rs. a.	Rs. a.
Suico	4 6½	4 9½
Shinco	4 5	4 7½
Paramount	4 5	4 8
S. Fuji	4 5½	4 8½
Aurora	4 5½	4 8½
Indian		
City	4 0	4 3½
New Great	3 12	3 15
Vasanta	3 11	3 13½
Hindustan	3 9	3 11

The buoyant conditions noticed in the cotton yarn market in the past few weeks gave way to a slightly easy trend during the week under review. The easiness was in sympathy with the cotton and other commodity markets where prices tended to decline. Demand from consuming centres also was rather reduced which greatly restricted the volume of business. Cotton yarn values, as a result, drifted downwards with quotations closing lower than those a week ago.

The fall in prices was more pronounced in fine and medium count yarns. Thus, among 60s, City receded by Rs. 2-4 to Rs. 47-8 per bundle of 10 lbs. Finlay dropped Re. 1-8 to Rs. 59 and Pioneer Re. 1-4 to Rs. 43-12. Rajalakshmi shed As. 4 to Rs. 43, Coimbatore Spinning, however, was fully steady at Rs. 42-8. Among 80s, Elphinstone, Sriram and Finlay lost a rupee each to Rs. 62-8, Rs. 64-8 and Rs. 68, respectively. 40 count yarns also suffered losses, Gokak and Modern being each quoted lower by As. 4 at Rs. 26-4. Meenakshi shed As. 8 to Rs. 25-14. Madura declined by As. 2 to Rs. 26-14. Among coarse varieties, 20s were the worst sufferers. Hind and Edward were lower, the former by As. 4 at Rs. 16-14 and the latter by As. 3 at Rs. 16-11. Seksaria and Madura lost As. 2 each to Rs. 11-12 and Rs. 18-10, respectively. 30 count yarns, however, proved an exception and their prices were generally well maintained. Indian advanced by As. 8 to Rs. 21. Madura shed As. 2 to Rs. 23-12.

GROUNDNUTS SLIGHTLY EASY

(From Our Own Correspondent)

BOMBAY, *10th February*

The oilseeds market presented a cheerless appearance this week. The groundnut section was slightly easy. This was chiefly due to the declaration made by the Commerce and Industry Minister in Madras, on the 5th inst., that the Government would not allow export of groundnut oil, unless its prices declined below Rs. 1,000 per ton from the present ruling rate of about Rs. 1,305 per ton. The castorseeds section ruled hesitant, in the absence of any possible indication of the Governments policy regarding export quotas and the demand for reduction of export duties. The linseed market had no strength of its own. It ruled quietly easy in sympathy with groundnuts and lack of export enquiries. Among others, *kardis* were steady, while *nigers* came in for some support.

Market circles expected heavy selling in groundnuts, following the warning of the Commerce and Industry Minister against cornering of groundnuts, as stated above. These expectations did not, however, materialise as, at every dip, there was some support on estimates of a short crop and enlarged demand from *vanaspati* interests. The decline in prices, therefore, was far less than what the market anticipated. Groundnuts Bold which opened the week at Rs. 34-6, as against Rs. 34, was placed at as high as Rs. 34-14 on the 5th inst. But, subsequently, it gradually declined to close at Rs. 33-10, on profit-taking. February-March and April-May deliveries were done lower at Rs. 33-10 and Rs. 34-10, as against Rs. 34-2 and Rs. 34-12, respectively. Khandesh quality eased from Rs. 35 to Rs. 34-2. Groundnut oil ex-mill and railway receipts lost As. 9 each to Rs. 17-1. March and April deliveries were down at Rs. 17-4 and Rs. 17-7, as against Rs. 17-15 and Rs. 18-4, respectively.

In the castorseed section, May delivery which opened at Rs. 113-4 as against Rs. 112, fluctuated between Rs. 115-4 and Rs. 112-10, before closing at Rs. 113-12. Madras quality was unchanged at Rs. 24-8 and F.A.Q. at Rs. 24. But castoroil I Pressure and Commercial declined from Rs. 13-8 and Rs. 12-10 to Rs. 12-6 and Rs. 11-2, respectively.

Except for some small enquiries from Australia, there have been no encouraging export enquiries. As a result, linseed Bold eased from Rs. 26 to Rs. 25-4. February-March and April-May disclosed a loss of As. 2 each to Rs. 23-8 and Rs. 23, respectively. Linseed oil was lower by Rs. 10 at Rs. 14-12.

Among others, *kardi* Bold ready and February-March were down by Re. 1-3 and Re. 1, respectively, at Rs. 20-8 each. *Niger* F.A.Q. however, gained As. 6 to Rs. 28-8 and Madras As. 12 to Rs. 29. February-March was higher by As. 8 at Rs. 28-8.

Arrivals of oilseeds and oils from 1st January to 14th February, 1954, as compared with those in the corresponding period previous year, were as follows:

(In cwts.)

	1954	1953
Groundnut	421,535	489,448
Linseed	7,451	7,030
Castorseed	3,373	67,504
Groundnut oil	141,284	43,511
Linseed oil	5,432	1,001
Castor oil	2,148	9,737

The following table shows the prices of oilseeds and oil on the 10th inst., as compared with those at the end of the previous two weeks.

	10-2-54	3-2-54	27-1-54
	Rs. a.	Rs. a.	Rs. a.
Groundnuts—			
Khandesh Quality Ready (per cwt.) ..	34 2	35 0	36 12
Bold Feb.-March	33 10	34 2	35 5

Ex-mill Ready (per quarter).	17 1	17 10	18 10
Castor Oil—			
Commercial (per quarter) ..	11 2	12 10	12 14

SUGAR BULLISH

(From Our Own Correspondent)

BOMBAY, *10th February*

The sentiment of the Bombay sugar market was generally bullish during the week under review. The chief factor responsible for the bullish undertone was the import ban barring imports of 6,600 tons of Czechoslovakian sugar for which tenders have already been invited, no other imports would be arriving before the end of next month. There were, besides, expectations of appreciably lower production in the current season based on disquieting sugarcane supply position in Uttar Pradesh and Bihar. The total production is estimated by one section at not more than 1 million to 1.1 million tons.

Despite the bullish sentiment as noted above, the market failed to make any impressive showing. Prices of sugar in the forward section registered only a minor improvement, *Maha* and *Fagan* deliveries being quoted at Rs. 85, and Rs. 83-4 per bag, as against Rs. 83-10 and Rs. 82-6, respectively, a week before. In the ready section, large grain sugar remained unaltered at Rs. 97-99 per bag, while small and medium grains suffered a loss of Re. 1 each to Rs. 91 and Rs. 93, respectively. Foreign sugars did not experience any change in prices. British refined sugar was quoted at Rs. 85 per bag of 2 cwts., East German sugar at Rs. 82 per bag of 2 cwts., and Mexican sugar at Rs. 40-8 per 100 lbs. Cuban sugar was higher by As. 4 at Rs. 36-12 per 100 lbs.

In contrast to the three preceding weeks, arrivals of sugar into the market this week were somewhat larger, the quantity actually received being 6,700 bags, as against 6,500 bags last week.

Among the imported sugar which has so far arrived in Bombay, the Czechoslovakian sugar is considered to be the best. The grain, lustre and purity of this sugar are said to be exceptionally good. The parcel of 8,500 tons of sugar which arrived in Bombay per *s.s Maria* on Sunday this week consists of different grains, small, medium and large. The respective quotations (per bag of 220 lbs.) for these different qualities are Rs. 83-4, Rs. 86-4 and Rs. 88-4.

Now that definite indications are available pointing to a lower output of sugar during the current season, a section of sugar traders has come forward with a vigorous plea for more liberal imports of sugar. The only prudent course opened to the Union Food Ministry, it is felt, is to permit imports of foreign sugar through private trade channels under an Open General Licence and regulate prices of sugar so imported by making suitable adjustments in the import tariff.

PEPPER STEADY

(Messrs. Parekh & Co.)

BOMBAY, *10th February*

During the major part of the week, the pepper market ruled steady in all primary centres, almost all the incoming arrivals from the interior having been taken up by exporters. Most of the shippers in the coastal markets who were bearish in the beginning of the year are now reported bullishly inclined. There also appears little anxiety on the part of the growers to press sales when the market reaches a level of Rs. 1,600 which price is considered by them as a bottom for some months to come. It is generally believed in trade circles that the greater resistance will be put up by growers, if the market, for one reason or the other, pierces through the level of Rs. 1,600. The growers are expecting better demand by the end of this month from the U.S. and the Continent, as soon as the traders there realise that no concession in the prices is coming forward even though the peak of the season is almost reached.

In the A.S.T.A. section, the speculators were free buyers whenever the price of $0.80 for shipment positions is reached. A fair quantity changed hands from $0.80 to $0.82 for February-March shipments.

In the delivery section, the lowest reached for February was Rs. 1,380 and Rs. 1,420 for March.

Following are today's nominal quotations:—Ready delivery Rs. 180-220 per cwt., and February Rs. 1,440-60 and March Rs. 1,470-90 per candy of 5¼ cwts.

JUTE GOODS DULL

(From Our Own Correspondent)

CALCUTTA, *9th February*

The jute goods market presented dull conditions during the week. There were, of course, a few enquiries from the U.K. while some negligible quantities of heavy goods were lifted by Australia and Burma. But these had only a temporary effect on prices, in that a mild rise was registered in the values of both hessians and B. Twills. That was on the 2nd inst. At the rise, demand dried up and with bears inclined to press down sales, the rates resumed a downward trend, and touched the week's lowest on the 5th inst. Mills, however, preferred to keep out of the market as they were not interested in the current rates. But some stray shipping enquiries caused some improvement in the tone, and as a result, a part of the earlier losses was recovered towards the end. The undertone remained quietly steady at close.

B.Twills opened the week at Rs. 103-12 per 100 bags. Following sporadic enquiries from shippers and others, bear-covering appeared, with the result that B.Twills rallied to Rs. 104-8. Subsequently, however, in the absence of any business, the quotation drifted down to Rs. 101. But later a slightly better tone prevailed and the rate improved to Rs. 102-8 today. Hessians 40 oz. x 10" moved in sympathy with B.Twills. At the commencement of the week they stood at Rs. 45-7 per 100 yards. On favourable foreign advices, they rallied to Rs. 45-11. But profit-taking coupled with short-selling brought down the quotation to Rs. 45 on the 5th inst. Later on, there was a slight improvement, following the upward trend in sackings, and hessians wound up the week better at Rs. 45-9.

Raw jute market was relatively better than the jute goods section, owing to restricted arrivals. Imports into Cossipore dwindled to about 40 to 50 wagons a day and consisted of inferior quality jute. In anticipation of a possible rise in prices, stockists were generally not inclined to reduce their rates. Mills for their part, having been well placed in respect of stocks, were not showing any anxiety to make purchases.

Assam bottoms which were normally quoted at about Rs. 28 per maund in the earlier sessions of the week lost As. 8 in the latter part, on sporadic selling by a few weak holders.

FOODGRAINS BEARISH

(From Our Own Correspondent)

HAPUR, *8th February*

The trend of the foodgrains markets was bearish and prices were coming down everywhere. There was increased movement of coarse grains stocks from the surplus to the deficit areas, while there was no panicky purchases by stockists and consumers. In fact, the traders who held stocks were anxious to reduce their commitments, in view of the excellent next crop prospects.

The Union Food Minister, Mr. Kidwai, has expressed the hope that, with the arrival of the new wheat after the harvesting season, the price of foodgrains would touch still lower levels. The downward trend this week was not confined to foodgrains alone but extended to *gur*, crystal sugar, edible oils and seeds as well. Futures remained as unsteady as ready. Shorts were reluctant to cover, while bulls preferred to lighten their commitments.

The position in regard to rice is fully confident. It is authoritatively stated that the Government of India desires to build up a rice stock of 1 to 1.5 million tons, nearly half of which would be from internal procurement and the rest from imports, presumably from Burma. The Union Food Minister has declared that he would not hesitate to decontrol rice the moment the contemplated reserve stocks are built. The Government has decided that all work connected with the promotion of the Japanese method of paddy cultivation in future form part of the Grow-more-food campaign. It is said that the results obtained from the adoption of this method, particularly in the form of higher yield and low seed rate, has made the Government to take this step towards large-scale application of this method.

There has been a general fall in foodgrains prices in the Uttar Pradesh markets. Millets and pulses gave the lead. Wheat and rice too were affected. Heavy quantities of maize, *jowar* and *guwar* are being received from the surplus areas, particularly from Rajasthan, and tightness of stocks has disappeared. Rice supplies also seem to be plentiful.

The U.P. Government has agreed to sell 30,000 tons of its stocks of imported and indigenous wheat by 31st May, 1954—15,000 tons at the rate of Rs. 18-8 per maund and the remaining at Rs. 15-8. Under the agreement, the mills will be allowed to extract unlimited quantity of flnes from wheat sold at Rs. 18-8 and the product will be allowed to be exported to other States. The mills will be allowed to produce only wholemeal *atta* out of the wheat sold at Rs. 15-8 to be sold in U.P. and exported to Bihar only. The Government of India will not make any wheat issues directly to the mills in U.P. There is a possibility of the State Government selling the remaining 20,000 tons of wheat with it in the free market. The State Government has agreed not to sell wheat at a rate lower than Rs. 15-8 to trade or any other agency in the State, except in areas covered by the hill provisioning and austerity provisioning schemes where the price is Rs. 14 per maund.

Prices of peas and *arhar* have declined sharply on lower advices from east U.P. and absence of enquiry from any quarter. Trade stockists were frantically trying to dispose of their stocks. Lower price advices from Madhya Pradesh induced an appreciable price decline in *urd*. Futures reacted in sympathy with the spot section. Good showers were received this week which benefited the crops immensely. The latest quotations (per maund) in the local market are: Rice *basmati* Rs. 29, *sela* Rs. 24 and coarse Rs. 19, wheat Rs. 15-14 to Rs. 18, gram Rs. 13-8, barley Rs. 10, *bejhar* Rs. 10, maize Rs. 11 to Rs. 11-8, *bajra* Rs. 10-12 to Rs. 11-8, *jowar* red Rs. 8, *badami* Rs. 9 and white Rs. 11-8, *guwar* Rs. 9, peas Rs. 9-8, *arhar* Rs. 10-8, *urd* Rs. 16, *moong* Rs. 16 and *masoor* Rs. 14-8.

In pursuance of its policy of gradual decontrol of foodgrains, the Delhi State Government is understood to have decided to introduce a system of partial decontrol of rice by allowing the import of 10,000 tons of rice from U.P. on trade account through its nominees who will be permitted to sell it in the free market. The system is likely to be given a trial early next month. Relaxation in the price control, quantitative restrictions, and sale and distribution of wheat within the State will be maintained. The Government has decided to reduce the retail price of wheat to Rs. 15-8 with effect from 7th March next, when there will be no price control on the sale of wheat on retail basis. The Inter-State restrictions on the movement of wheat and rice will, however, continue. To check the tendency of rise in prices, the Government will continue to maintain its reserve and storage of foodgrains.

CRYSTAL SUGAR UNSTEADY

(From Our Own Correspondent)

HAPUR, *8th February*

The crystal sugar markets remained unsteady during the week under review and there was a fall in the prices in most of the markets. Futures were first to react bearishly under the impact of heavy pressure from weak holders who were anxious to liquidate their commitments. The declining trend in all other markets—ready or forward—also had a very depressing affect. In the upcountry markets, unloadings were induced from reports indicating that the cane growers' strike threat had not materialised. Ready demand remained poor, owing to persistent drizzles and the *Kumbh* fair.

The ports continued to receive further consignments of imported sugar. There was increased demand for bold grain Indian sugar. Activity was on a reduced scale. The Government of India is likely to import 400,000 tons of sugar in order to maintain the price of sugar in the free market at a reasonable level. These imports will be in addition to the 300,000 tons of sugar already imported. The Indian Food Minister, Mr. R. A. Kidwai, claims that the policy of sugar imports has not only maintained a steady level of prices at Calcutta, Bombay and Madras, where it was actually released for sale, but also prevented a rise in prices in the States like the U.P. The Minister has expressed his determination to prevent any rise in prices, and, for the achievement of this end, he would not hesitate to import any quantity from abroad. The Government of India released a further quantity of 100,000 tons of sugar for sale in the free market out of the 1953-54 production.

The sugar industry in Uttar Pradesh is facing a rather difficult situation. The U.P. Cane Growers' Co-operative Federation had decided to postpone the sugarcane strike but the *Hind Kisan Panchayat* and the Praja Socialist Party are inducing the cane growers to press the strike. The spokesmen of these two bodies claim that 40 out of the 68 sugar mills in the State have been closed for want of supplies. Government circles have not contradicted this claim, although they assert that the situation will return to normal within the next few days.

The Central Government is reported to have asked for a detailed report from the U.P. Government regarding the reported closure of certain mills and other developments in the industry. Mr. Kidwai has also discussed with the U.P. Chief Minister the situation created by the stoppage of cane supplies to the mills by the growers. He is reported to have made it clear that there is no question of sharing the excess profits made last year by the sugar millowners in U.P.

The cane growers of Bihar have decided to stop the supply of sugarcane to all the 27 sugar mills in the State from the 15th inst., if the price of sugarcane is not raised to at least Re. 1-12 per maund. It is argued that the cost of cane production per acre is Rs. 1,037-8. The average yield per acre is 570 maunds. It is, therefore, not profitable for the *kisans* to supply sugarcane to the mills at the rate of even Re. 1-12 per maund. It is reported that there will be substantial reduction in the availability of cane for crushing by the sugar mills in Bihar this year as compared with last year.

Gur markets remained easy with a general fall in prices in both the ready and 'futures' sections. Arrivals were reduced, following cloudy weather and rains in some areas. Despatches were slow, due to availability of a limited number of wagons and reduced enquiries from importing areas. The Gujerat *gur* market was unsteady. The stockists are reported to be well equipped and totally disinclined to increase their weights. Besides, prices fell steeply in the South Indian markets of Kolhapur, Ankapalli and Belapur and some of the enquiry tended to turn that way. The downward trend in other commodity markets, including crystal sugar, reacted bearishly on *gur* futures and there were occasional unloadings. Meerut and Muzaffarnagar continued to present bearish conditions, as there had been large stock accumulations.

Recent rains have not only benefited the standing sugarcane crop but have improved next sowing prospects and, as sugarcane prices are comparatively steadier in face of the common fall in all other agricultural produce markets, there is a possibility of increased sowings. All these factors have combined to produce a reactionary tone in the *gur* section.

The latest *gur* quotations (per maund) in the different markets are: Bombay: *pansera* Rs. 18, *khurpapar* Rs. 18-4, *chaku* Rs. 19-8; Calcutta: *gur pansera* Rs. 17; Madras: dry Rs. 105 and wet Rs. 95; Muzaffarnagar: *pansera* Rs. 14-12, *khurpa* Rs. 14-12, *chaku* Rs. 15-10 to Rs. 15-14, *laddoo* Rs. 15-4; Akola: *gur* Rs. 16-4 to Rs. 17-4; Belapur: Rs. 17-8 and local Rs. 20 to Rs. 21; Ankapalli *gur* Rs. 19 to Rs. 19-8; Nadiad: *chaku* Rs. 18, *phatwa* Rs. 16-12, *napri* Rs. 17. Ankapalli: No. 1, Rs. 18, No. 1½ Rs. 17-8. No. 2 Rs. 17-6, No. 3 Rs. 16-12; Ahmedabad: *chaku* Rs. 18-1, *khurpapar* Rs. 17, *phatwa* Rs. 16-11; Delhi Rs. 16 to Rs. 16-4; Ghaziabad Rs. 14-4; Agra Rs. 15-12; Hapur Rs. 14-8 to Rs. 14-12; Bali Rs 15-12.

LINSEED FIRM

(Messrs. A. Bradley & Co.)

CALCUTTA, *9th February*

No appreciable change has been recorded during the week and generally firm conditions have prevailed throughout, whilst trading has taken place on a very small scale. Shortage of supplies still remains the chief feature; there have been fair enquiries from crushers for ready goods at higher prices, but sellers are very reserved, although they have made lower offerings for forward delivery. Little business has, however, resulted. Prices have been maintained in the oil section owing to the prevailing scarcity of stocks and a small local demand, but buyers are generally reserved and the market is dull. The latest quotation is as follows: Ready Rs. 21-4 per maund.

ARRIVALS OF HIDES LOWER

(From Our Own Correspondent)

KANPUR, *7th February*

During the week under review, conditions in the local hides and skins were more or less the same as those noted during the previous week. The new arrival was slightly less than the usual weekly average. The local tanners were the main purchasers. The Madrasi dealers and the country tanners were lukewarm. The latest quotations are as follows:—

Wet salted cow, 1st grade Rs. 400, 2nd grade Rs. 320 and 3rd grade Rs. 200 to Rs. 240 per score; wet salted buff. 1st grade 1 lb. 8 ozs., 2nd grade 1 lb. 14 ozs. to 2 lb. and 3rd grade 2 lb. 4 ozs. to 2 lb. 8 ozs. per rupee; goat 1st grade Rs 275 to Rs. 300 and 2nd grade Rs. 250 per 100 pieces; sheep, 1st grade Rs. 300 and 2nd grade Rs. 250 per 100 pieces.

THE RAYALASEEMA MILLS LIMITED ADONI

NOTICE TO SHAREHOLDERS

THE EIGHTH ORDINARY GENERAL MEETING of the Shareholders of the Company will be held at the Registered Office of the Company, Rayanagar, Adoni-Tungabhadra Road, Adoni, P.O., on the 7th March, 1954, at 2-00 p.m. (S.T.), to transact the following business:—

1. To receive, consider and adopt the Directors' Report and the Audited Statements of Account for the year ended 31st December, 1953.
2. To sanction the payment of Dividend.
3. To elect two Directors in the place of Sri M. Goolappa and Sri M. Narayanappa who retire by rotation but being eligible, offer themselves for re-election.
4. To elect two Directors in the place of Sri H. Sitarama Reddy and Sri M. Ramanna, who were co-opted as Directors on the 12th April, 1953, under Article 86 of the Articles of Association of the Company and who retire under the same Article but being eligible offer themselves for re-election.
5. To appoint Auditors for the current year and fix their remuneration. Messrs. Brahmayya & Co., the retiring Auditors, offer themselves for reappointment.

Notice is also given that the Transfer Books of the Company will be closed from 1st March, 1954 to 15th March, 1954, both days inclusive.

By Order of the Board of Directors,
For THE RAYALASEEMA DEVELOPMENT CO.,
M. SOMAPPA,
Senior Partner,
Managing Agents.

ADONI, *31st January*, 1954.

Note.—The Dividends, if sanctioned at the General Meeting, will be paid by Warrants to all those shareholders whose names stand on the Register of the Company on the 15th March, 1954.

HUMAYAN PROPERTIES LIMITED

NOTICE IS HEREBY GIVEN THAT THE Twenty-fifth Ordinary General Meeting of Humayan Properties Ltd. will be held at the New Empire Theatre, Calcutta, on Tuesday, 2nd March, 1954 at 11 a.m., for the following purposes:—

1. To receive the Directors' Report.
2. To pass the Audited Accounts.
3. To declare the Dividends on Ordinary and Deferred Shares recommended by the Directors.
4. To elect Directors under Article No. 123 in place of Mr. S. A. Basil and Mr. H. A. Fowler who retire by rotation (Mr. Basil and Mr. Fowler being eligible, offer themselves for re-election).
5. To appoint Auditors.

The Share Transfer Register of the Company will be closed from 23rd February, 1954, to 2nd March, 1954, both days inclusive.

By Order of the Board,
S. A. BASIL,
Director.

1, HUMAYAN PLACE,
CALCUTTA, *5th February*, 1954.

Notice

MADURA MILLS COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE Annual General Meeting of the Company will be held in Tuticorin on Thursday the 25th March, 1954, at 4 p.m. The Share Transfer Books will be closed from 5th to 25th March, 1954, both days inclusive. It is recommended that:

1. All persons holding shares on blank transfers should immediately arrange to have the shares registered in their own names as the Company will pay any dividend declared only to the person(s) in whose name the share stands on the date of declaration of dividend.
2. Shareholders desiring dividends to be paid to Banks or other Mandatees should register the mandates with the Company before 5th March, 1954.
3. Intimation of any change of address should be given to the Company immediately.

A. & F. HARVEY LIMITED,
Managers.

MADURAI, *2nd February*, 1954.

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published half-yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. I=Interim Dividend. F=Dividend for first half of the year.

Shares.—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share".

Accounts.—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and should be taken as the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. a Sales and amount written off. (b) Investments. ‡ For ten months ended 31st December 1951.

(i) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 288 in the debentures section:—

H Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(a) Option of repayment at any time at 3 per cent. premium.

(b) Bearer bonds of Rs. 1,000 each repayable at par

(c) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

e Returnable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months notice.

MARKET GOSSIP

(Concluded from page 243)

godowns. Although tobacco prices have collapsed from As. 6 a pound to as low as As. 1½ a pound, there have been no buyers. Consequently, widespread distress is prevailing among the growers.

• • • •

It is most unfortunate that the interests of the tobacco growers, who constitute an important sector of the Indian economy, have remained neglected, despite repeated cries for assistance. Although the attention of the State and Central Governments was drawn to the deteriorating position of the growers as far back as in December last, when the Indian Central Tobacco Committee was in session at Madras, no concrete measures would appear to have been taken so far to save the grower from the miserable plight in which he finds himself today.

• • • •

The causes for the present crisis in the tobacco industry are rather deep-rooted. The output last year, estimated at 219,000 tons, was higher by 6.8 per cent. than that in 1952. But the crop was affected by unfavourable weather conditions and, consequently, suffered adversely in respect of both yield and quality. The average yield of tobacco in Andhra is about 1,094 lbs. per acre which is less than half of the yield, say, for instance, in West Germany, in which it is as high as 2,352 lbs. per acre. In several parts of the State, which is the principal tobacco-producing area in the country, not only has the yield been lower than the average stated above, but the qualities grown have fallen, according to the Commerce and Industry Minister, Mr. T. T. Krishnamachari, under as many as 18 grades, most of them being inferior varieties. The presence of too many lower grades is attributed, according to Mr. Raghuramaiah, President, Andhra State Tobacco Growers' Conference, to a lack of application of results of agricultural research to the cultivation of tobacco. This complaint is significant, in that it underlines the lapses on the part of the Indian Central Tobacco Committee in its work of passing on some of the valuable results of research work carried on by the Tobacco Research Institute, Rajahmundry, to the actual field. This Institute has worked out manurial schedules, evolved better processes of cultivation and discovered economic methods of curing tobacco with less coal. But it is difficult to understand why the benefits of these results have not yet reached the grower.

• • • •

Lack of adequate finance would appear to be another great handicap of the tobacco growers in India. The present distribution of loans through *tacavi* and co-operative societies has fallen far short of the requirements of the cultivators. A suggestion has been made that a separate finance corporation with a capital of Rs. 2 crores should be started to cater to the needs of tobacco merchants. This is a strange demand and we wonder what made Mr. Krishnamachari give the assurance that he would consider this proposal. By doing so, he is giving rise to a false hope, because the suggestion is not workable. The best way of inducing finance to flow into this trade is to improve the marketing methods and to provide proper storage facilities.

• • • •

A part of the present crisis in the tobacco industry is traced to the existing method of excise levy on tobacco sales. The complaint of the President of the Andhra Tobacco Growers' Conference in this context is quite legitimate. The flat rate of excise duty on all Virginia tobacco, irrespective of quality, has forced manufacturers of cigarettes to pay the same rate of excise levy and go in for top varieties costing Rs. 3 a pound rather than purchase low grades costing As. 3 a pound. This indiscriminatory flat rate is in a large measure responsible for the accumulation of low grade tobacco stocks. The accumulation has been so heavy that the growers have perforce been compelled either to convert these grades of tobacco into manure or to export them on a consignment basis, without obtaining sufficient returns to meet even shipping freight, let alone a remunerative price.

• • • •

The trade in tobacco is governed by the Madras Commercial Crops Marketing Act. Under this Act, regulated markets have been established in only two districts, namely, Krishna and Guntur. In these markets, sales of tobacco through a compulsory system of auctions take place. Although this system is good in principle, it has not worked to the advantage of growers on account of the non-existence of organised markets in other parts of the country. It is stated that bulk buyers have often combined either to beat down prices at auctions or purchase at low rates in unorganised markets, with the result that the growers have had to submit to disturbingly low prices.

• • • •

This unsatisfactory state of affairs should not be allowed to continue in an important cash crop such as tobacco. Its role in the Indian economy is by no means an inconsiderable one. Next to the U.S. and China, India is the third biggest producer of tobacco in the world. As an earner of foreign exchange, its place stands high in the export list. In 1950-51, exports of tobacco earned for the country as much as Rs. 16.55 crores worth of foreign exchange. The earnings rose to Rs. 17.45 crores in 1951-52, but again dropped to Rs. 14.69 crores in the following year. In the first half of 1953-54, they amounted to only Rs. 8.07 crores as compared with Rs. 9.39 crores and Rs. 9.93 crores in the corresponding periods of the preceding two years respectively. The decline in exports is indeed a cause for concern and calls for immediate measures calculated to promote expansion of exports of tobacco.

• • • •

The Government has already sent two officers abroad to explore the possibilities of finding sales for Indian tobacco. It is now proposed to send a few more. Further, with a view to encouraging export of tobacco seed oil, the Government abolished the export duty on it in July last. These by themselves are not adequate to produce results. The Government should expedite the appointment of the Export Advisory Committee to be in charge of the promotion of tobacco exports as promised by Mr. Krishnamachari at the last Export Advisory Council meeting. It has to reduce excise duty on low grades of flue-cured Virginia tobacco and to abolish the *ad valorem* export duty on Indian cigars. It is also necessary to extend the market yard system to the entire tobacco-producing area, to install tobacco redrying plant and to revise tobacco grades on a more scientific basis than at present. Possibilities of expanding the internal market for low grade tobacco should also be explored as a long-term measure.

SUCCESS OF INDUSTRIAL MANAGEMENT—I

(Concluded from page 255)

transporting free belonged to its rival company, which, having foreseen the result of the rate-war, had decided to abandon its rail-road business and had instead gone into the cattle trade.

William Blake

VOL. LXXXVIII. No. 2244 BOMBAY, 20 FEBRUARY, 1954 PRICE Rs. 1/8

MORE ABOUT SUGARCANE PRICE

THREE weeks have passed since we last commented on the U.P. sugarcane growers' demand for a higher minimum price for their produce. Some important developments have taken place in the interval and it is worthwhile assessing their significance, if only to see whether the handling of the situation by the authorities has been on sound lines. The strike, sponsored by the Praja Socialist Party and a couple of other leftist parties, did materialise, as was scheduled, on the 1st inst., but it did not go very far. It is actually fizzling out at the time of writing. Only a few factories have been affected and that too for a short period. All available indications go to show that the cane growers did not show much enthusiasm for the strike. They were concerned at the prospect of their cane drying up and of losing the chance of selling their crop and raising much needed cash, for which they had toiled for well-nigh a year. Their stake was something substantial and real, whereas the politicians who were instigating them to go on strike had hardly any, except their reputation. It would have been a great tragedy for the U.P. farmers, if these politicians had succeeded. The cane growers, [illegible] deserve to be congratulated on the [illegible]ing they displayed by them. Congratu[illegible]high due to the Central and Uttar [illegible]sants for the firmness with [illegible]as strike threat. Undoubtedly, [illegible]ds Kidwai, the Union Food [illegible] Govind Ballabh Pant, [illegible]ear fr Uttar Pradesh, did their best [illegible]eme One prime growers from following the [illegible]rity shared given by the Praja Socialist [illegible]e mediat, unfortunately, they have, in their decided to appease the cane growers, committed is lee themselves to a course of action which is fraught with serious consequences to the economy of the country. We wish they had heeded the warning sounded in these columns against such a course and firmly resisted the temptation to give a little more to cane growers.

The Governments were right in turning down the cane growers' demand, inspired by the socialists and other left-wingers, for a straight increase in the so-called minimum price for cane from Re. 1-7 to Re. 1-12 per maund. But they were wrong in deciding to give the growers "a legitimate share of the additional profits made by factories during the current season." As was pointed out by us three weeks ago, the present minimum price itself assures the grower a far more handsome return than he could hope to get by growing other crops. It is a misnomer to call it a minimum price. It is, really speaking, more than a fair price; in fact, it is unduly high considering the poor quality of cane grown in U.P. and Bihar, where the average sugar recovery is no more than 9.5 per cent., as compared with 11 to 12 per cent. obtained from the cane grown in the Deccan. Now, to pay something more for this cane is surely absurd, as it tantamounts to giving a reward for inefficiency. In agreeing to do so, the authorities have, in a way, capitulated to the growers' threat. Mr. Kidwai himself is reported to have stated at Ramkola, where he addressed the Northern India Sugarcane Growers' Conference last week, that he could not appreciate the clamour for enhancement of sugarcane price when the prices of foodstuffs and other commodities were falling. Why then has he agreed to secure for the cane growers an extra price for them through a scheme of profit-sharing with the sugar mills? The answer to this question is politics. He must somehow keep the cane growers contented, lest the Congress should lose their support.

As readers are aware, the cane growers' demand for a higher price has arisen, because the sugar mills have been realising on the sale of their sugar a price higher than the so-called fair price of Rs. 27 per maund. That logically this line of argument is correct has already been conceded by us. But, then, the best solution for it is to remove the cane growers' jealousy of the mills making a little extra profit, by completely decontrolling the price of cane and by allowing, at the same time, larger imports of foreign sugar which is now cheaper than Indian. The Government of India, it is true, has now decided to allow imports of 5 lakh tons of sugar for about a year from 1st February, 1954 to 13th March, 1955, but it has chosen to retain the control on sugarcane price. Even in regard to imports, the Government has not dropped its present policy which has been largely responsible for defeating the very object for which imports were decided upon. The policy of controlled distribution of imported sugar at a uniform price, fixed at a level which provides an effective floor of Rs. 30 per maund to domestic producers in U.P., Bihar and other centres situated far away from the ports, has failed to bring down the price of sugar as was envisaged when the price of cane was fixed in September, 1953. If this state of affairs is not to be perpetuated, the Government should revise its policy in regard to disposal of imported sugar.

This can be done in two ways. One way is to allow imports of sugar freely, subject to one safeguard. It is necessary to see that both the domestic industry and cane growers are not allowed to suffer unduly through competition from cheap foreign sugar. This can be ensured by raising the import duty to the required level. It has been decided, rightly or wrongly, that Rs. 27 per maund, ex-factory, represents a fair price for the current season, on the basis of Re. 1-7 per maund for cane. The import duty, which is rather low at present, should be so adjusted as to see that the sale of imported sugar in the consuming centres below that price would be uneconomical. In making such adjustment, the authorities should take into consideration the fact that domestic sugar has been fetching a premium over imported sugar, as the former is said to be sweeter than the latter by about 10 per cent. If this point is ignored, then all calculations will go wrong as they have done ere now. Such an adjustment, however, will have to be fairly frequent, if prices of sugar in foreign countries fluctuate widely and frequently. Whether frequent adjustments in import duty will be feasible is a question that needs to be examined.

The other way is to continue the present system of imports, but the Government should be ready to vary the price at which it is selling imported sugar to the trade from time to time to keep down the price of domestic sugar at a reasonable level. This would mean a reduction in the profit which the Government is now making on imported sugar. The advantage which this method has over the former is that the import duty need not be altered from time to time. But it suffers from three defects. One is that purchases of sugar are not being made as efficiently as would be done by private enterprise—under the present system, the Government's agents buy sugar in foreign markets and the sugar thus bought is sold to the trade in this country through tenders. Secondly, all foreign sugars are sold at a uniform price, irrespective of difference in their quality. Thirdly, this is most important, the Government is usually very reluctant to give up its share of profit by reducing the price at which it accepts tenders. Consequently, adjustments in prices may not be made in good time. In short, both the methods have some advantages as well as disadvantages. It is for experienced business men and officials to put their heads together and decide which one of the methods would be more suitable.

So much for the Government's policy in regard to imports of sugar. The next issue that needs to be discussed is the proposed profit-sharing scheme. Now that the Government has definitely committed itself to this system, its implications and practicability deserve to be carefully studied. In the ultimate analysis, the Government's move amounts to increasing the favouritism it has already been showing to cane growers. It is economically inexplicable why the Government should show so much bias in favour of those who grow sugarcane. If the system of profit-sharing is introduced for sugarcane, the question that naturally arises is: Why not for other crops too? Cloth has been decontrolled, but cotton is subject to control, as a result of which the grower of cotton is being compelled to sell his crop at appreciably below world prices. The cotton grower will, therefore, be induced to ask for a share in the profits of textile mills. Indeed, the cotton grower has a greater justification for making this demand than the cane grower, because, whereas he is being paid well below world prices for his cotton, the cane grower gets a price which is higher than the world price. It is quite conceivable that producers of other agricultural crops also may ask for a similar arrangement with the processors of their produce. It will thus be seen that a profit-sharing scheme for sugarcane will be a bad example for the whole country. The fact that it is in force in one or two centres in the country is no argument in favour of its extension throughout the country. A wrong practice cannot become a right one by wider adoption.

Just as profit-sharing with workers unrelated to productivity is bad, so is profit-sharing with cane growers which has no relation to the quality of cane. It will only accentuate the evils of the present system of fixing a high level of minimum price on the basis of weight, with no consideration whatever for the quality of cane. Under such a system, farmers will be keen on growing only heavy-weight cane and not cane with high sucrose content. The country has had enough of this defective price policy, a policy

which has not helped it to produce sugar at a price which suits the pockets of consumers. It would be most regrettable if this defect were to be magnified, as it would certainly be, by the introduction of the profit-sharing system. As the public has learned through bitter experience, a concession once shown to sugarcane growers always remains, for it becomes politically difficult to withdraw even when everyone realises that it will be in the larger interests of the country to do so. The Government of India, therefore, must think a thousand times before introducing the profit-sharing scheme it has in mind now.

In actual practice, no proposition is, perhaps, more complicated than a profit-sharing scheme. The Government's efforts to try this scheme for industrial workers had to be abandoned, because it was not practicable. Details of the Government's move for sugarcane growers have not been made available yet. It is still only a vague idea. Mr. Kidwai is believed to have told Press men at Lucknow that his aim was to let the cane growers have 60 or 62 per cent. of the excess profit, leaving the balance for the mill-owners. It is not known what would be the basis for determining the excess profit. According to some, the fair price of Rs. 27 per maund of sugar should be taken as the basis, while there are some who say that the current price should be regarded as the basis. Whatever that may be, one of the reasons why the Praja Socialist Party had turned down this proposition was that it would, in actual practice, mean a benefit of no more than one anna. Whether this conclusion is right or wrong only Mr. Kidwai knows. It is quite probable that even he does not know, for everything will depend upon the prices realised by the factories on all their production. That means the exact benefit to cane growers will not be known until the current season is over.

A detailed criticism of the profit-sharing scheme will be possible only when all the particulars about it are known. It remains to be seen whether it will be on unitwise basis, or regional basis or the whole State-industrywise basis. Whatever the method adopted, the outcome will not be perfect; it will suffer from many inequities, for profit is the outcome of several factors, of which raw material is only one. The most iniquitous feature will be to penalise the efficient producer of both cane and sugar in favour of the inefficient. Inequities apart, introduction of profit-sharing system will not be conducive to smooth relationship between the factories and the cane growers, for the latter is bound to demand a say in, or at least an enquiry into, the working of factories, so that they may satisfy for themselves that the factories are being efficiently managed. This may lead to a fresh series of litigation analogous to the present industrial labour disputes. Considering all these possibilities, it is, indeed, surprising that, so far, not a word of criticism of the proposed move has emanated from the spokesmen of the sugar industry in Uttar Pradesh. What does this silence on their part mean? Does it mean that they do not mind all this bother, so long as they are allowed to work in peace and keep their factories going? If the answer is in the affirmative, it will mean that they do not care for either principles or consumers but only for profits. In fact, a Lucknow paper, which can be relied upon to know the mind of sugar millowners, observes that the industry is ready to meet the growers half-way and that it has assured the Government of its co-operation in this direction. It is high time the U.P. sugar industry came out with a statement explaining its stand on this vital issue.

There is also another aspect to this issue. If the profit-sharing scheme is introduced, it will mean a decline in the industry's profit assessable to income taxation. In other words, the Centre and all the States will get less tax revenue. Thus, the consumer will suffer in two ways; as a consumer of sugar (because he will have to pay a higher price) and as a taxpayer. The question, therefore, is one which concerns not only the Centre and Uttar Pradesh but also other States. It will be interesting to know whether the Food Ministry consulted the Finance Ministry before deciding to pursue the course it has decided upon.

HOME FOR STATE-SPONSORED STEEL PROJECT

AT long last, the Government of India has decided on the selection of the site for the location of the Rs. 72-crore new State-sponsored steel project. According to a Press note issued on the 16th inst., Orissa will have the honour of housing this new project in a place called Rourkela. A gratifying feature of this decision is that it has been arrived at by the Centre entirely on economic considerations. The heavy political pressure that was sought to be used on the Central Government was firmly resisted. What is even more encouraging to find is that every one of the rival claimants, namely, West Bengal, Bihar and Madhya Pradesh, appears to have been convinced of the justness of the Centre's decision. Even Mr. Ravi Shanker Shukla, Chief Minister of Madhya Pradesh, who had sometime back threatened to "expose the Centre," if the claims of Bilhai were to be ignored, has quietly reconciled to the decision and taken it in the right spirit. He has consoled himself by saying that it is "inevitable in the existing circumstances." The fact that the Government of India's final choice has left no trace of bitterness in the minds of the Chief Ministers of the competing States is a tribute to their spirit of tolerance and respect for the rules of federal Government.

In taking its decision, the Centre has accepted the recommendation of the technical experts of Krupps and Demag, the German participants in the project, that Rourkela is preferable to Durgapur in West Bengal, Bilhai in Madhya Pradesh and Sindri in Bihar. Few can dispute the impartiality of the recommendation of the German experts. They have nothing to gain by supporting any particular State. On the contrary, they will have everything to lose by not recommending the best of the four sites, for they have not only their reputation at stake but also a sizable risk capital which they are investing in this venture. The main factor that influenced the German experts to decide in favour of Rourkela is its proximity to the developed and successfully workable sources of raw materials, such as iron ore and limestone, and electric power, the supply of which would be available in plenty after the completion of the Hirakud project. There are also other factors in favour of this site. The supply of labour, for instance, is quite adequate. The presence of a cement factory and a large equipped repair shop, including a foundry at Hirakud, is expected to be of advantage to the erection of the steel works. Water-supply from the river Brahmani appears to be reliable, although further investigations are necessary to determine the character of the measures necessary to ensure adequate and continuous water-supply throughout the year to the steel plant. It is true that coal will have to be transported from West Bengal, but this, it is felt, will not prove an additional strain on transport. The wagons carrying iron ore and limestone to the factories in West Bengal are now returning practically empty to Orissa and these can be utilised to move the coal requirements of the new steel plant.

The fact that there are already steel plants in West Bengal and Bihar to supply the requirements of the Calcutta industrial area seems to have weighed heavily against the location of the new plant in any of these States. As regards the claims of Madhya Pradesh, it is pointed out that the iron ore and coal reserves at Bilhai are yet to be explored. Further, transport facilities are woefully inadequate. It is stated that, if this site were to be chosen, the necessary railway extension and/or improvement would cost about Rs. 11.5 crores in case coal were to come from Jharia and Rs. 17 crores if it were to be transported from Jhimili. The corresponding cost in the case of Rourkela would, however, be only Rs. 1.9 crores and Durgapur Rs. 3.3 crores. It will thus be seen that Rourkela has a distinct advantage over Bilhai, even though both belong to areas which are relatively underdeveloped as compared with other parts of India.

There is, however, no doubt that Madhya Pradesh's desire to have a steel plant must also be fulfilled as early as possible. Since India's steel needs will not be fully met even after the proposed plant at Rourkela comes into full operation; there is room for another steel plant. This plant may be located at Bilhai in Madhya Pradesh. But, before a final decision in this regard is taken, this area must be fully surveyed and the type of resources available investigated. The Centre has already recognised this need, as witness its decision to undertake forthwith a further intensive survey, examination and analysis of the mineral resources of this State, with particular reference to iron ore and coal. This decision must have doubtless gone a long way towards tempering the emotions of Pandit Shukla and securing his consent to the Centre's decision in favour of Orissa.

Now that the question of selecting the site has been amicably settled, it is to be hoped that the execution of the project will go forward smoothly and quickly and that it will be completed within four years, as has been promised, to the dismay of critics who are almost cock-sure that it will not be over even within twice that period. The completion of the project within the time limit will undoubtedly bring credit to the Government, disproving the general assumption that, in planning and executing big industrial enterprises, the State cannot be as efficient as private entrepreneurs.

PRODUCTIVITY IN WEST EUROPE

THE Organisation for European Economic Co-operation (O.E.E.C.) has called upon its 14 member-nations to reinforce the campaign for increased productivity. It has warned that failure to do so is fraught with dire consequences to West Europe, inasmuch as it would jeopardise even the maintenance of the present position of member-countries in world markets in general, and the dollar markets, in particular. Elucidating the position through its fifth annual report entitled *Progress and Problems of European Economy*, just published, the O.E.E.C. has pointed out that productivity does not mean mere increase in the quantum of output, but also an improvement in the quality of the product manufactured, both simultaneously, at a cost which would make their products easily marketable in world markets. It has contended that, in the absence of specific policies to foster output, production in West Europe will rise only slightly and that too on the assumption that world economic conditions will remain unchanged.

The O.E.E.C. has told its members that increased productivity is not easily realisable, especially in the face of possible economic fluctuations. It requires, in the long run, major adjustments in balance of payments between the member-nations and the U.S. Such adjustments, which include those in the field of tariff, import restrictions and foreign investments, have to be made on both sides and that too before the present extraordinary dollar outlays are reduced, so that the economic expansion o Europe may proceed on a durable basis.

The report admits that, even in the sh run, greater economic exp ansion would ad affect the balance of trad by incr into home markets. Bu this says, be offset, to a co siderable d greater flow of overseas manufactures. Increased create greater demand fo the agricultural countries of East, among others, which, in i for greater flow of European manu these countries. Larger European d dollar goods would, it is however, state almost a negligible effect on the economy o North America, inasmuch as it is unlikely to lead to any appreciable import of European goods by North American countries. The expansion of European output in the immediate future would mean a slower build up in the Continent's exchange reserves than if production remained stagnant. This would, therefore, constitute a real problem for those countries, the reserves of which are seriously inadequate at present.

Expressing concern at the slow expansion of European output, the O.E.E.C. says that what little improvement in balance of payments has been achieved is, to a certain extent, of a precarious nature. First of all, the dollar problem has not yet been solved once and for all, the existing disequilibrium being concealed by heavy extraordinary military expenditure by the U.S. Government and continued restrictions on imports from the dollar area. The low rate of expansion on industrial production in Europe stands in significant contrast to that in the U.S. But there is a heartening feature, namely, the sizable increase in agricultural production, which, in 1952-53, reached the highest level since the end of the war.

In view of all these, the call for increased productivity in West Europe is most appropriate. Although this call is confined to the nations belonging to the O.E.E.C., it applies with equal force to most of the countries in other parts of the world as well. Unless production is increased, there can be no expanding economy. Conversely, it is only in an expanding economy in which the flow of goods and services increase that productivity can secure a high and stable level of employment. In order to obtain increased productivity, there is a need for greater mobility of manpower, so that labour can take advantage of the opportunities offered by new and expanding sectors of activity. Increased productivity after all is a social, if not moral, responsibility, and in the last resort, an attitude of the mind which alone can make the wheels whirl as fast and as smooth as is needed.

BULLISH TREND IN SHARES PERSISTS

SIR JEREMY RAISMAN ON DEFICIT FINANCING AND GOVERNMENT'S LABOUR POLICY

MARKET GOSSIP

THURSDAY, 5 P.M.

SHARE Markets are still dominated by a strong bullish fervour. Even the customary pre-budget caution, which was there for a while a fortnight ago, has disappeared, although the Central budget is only 10 days ahead. The absence of any fresh taxation in the Bihar and Bengal State budgets presented this week, in spite of heavy deficits, has evidently encouraged operators to take an optimistic view of the contents of the Central budget, too. This impression will be confirmed tomorrow by the Railway budget. Advices from the bullion, jute, jute goods, tea, cotton and oilseeds markets also have been favourable to the bulls. The publication of the Directors' report and statement of accounts of the Kohinoor Mills has also infused confidence among them. This report, as we shall presently show, makes impressive reading and has raised hopes that other first class mills also will show similar results. There has been a revival of expectation of Bombay Dyeing and Century paying higher dividends for 1953. At one time, the shares of the former were depressed a little following the report that Australia, where the goods of Bombay Dyeing are popular, has raised the tariff rates on imports of cotton sheetings used in bedding and pillow cases. But this was only a momentary phase, for the market soon took the view that the effect of this development on this Company would not be appreciable. On the whole, textile shares have ended the week on a cheerful note.

• • • •

All the steel shares also were active, but Indian Irons were, and are still, specially fancied. Speculators are confident that, in fixing the retention prices, the Government will give a better deal to this iron and steel company than it did to the A.C.C. and other cement companies. Strong efforts are being made in New Delhi by the spokesmen of the Company, according to reports from the capital, to convince the Government that the Tariff Commission's recommendations are by no means liberal and that they are the absolute minimum that should be accorded to the Company. An early announcement of the Government's decision in this issue is expected. It is on this basis that T.I.S.Co. shares have jumped up by nearly Rs. 10 during the week under review to stand at Rs. 71-12, the highest level for the past two years. This good buying in T.I.S.Co. shares has led to a handsome gain of Rs. 166-4; a year ago, this scrip was quoted at Rs. 71-12. This means that the shares are now commanding a premium of 66.25 per cent. over their paid-up value, a remarkable performance for a share yet to be included in the dividend list and belongs to a Company which has no reserves to its credit. This appreciation is based on the expectation that, in 1953, the Company fared so well that it can now easily afford to pay a dividend of Rs. 10 per share. Late on Monday next one will know to what extent this expectation is justified, for it is on that day the Directors are scheduled to meet and decide the malden dividend. Meanwhile, it is pertinent to recall here that the Company has borrowed from the Industrial Finance Corporation Rs. 30 lakhs and that no company which is indebted to the I.F.C. can pay an ordinary dividend higher than 6 per cent. on the paid-up capital, unless it has the special permission of the Corporation. If the market's expectation is correct, the Company must have either obtained this permission or already repaid the loan. Another point to be noted is that to pay a maiden dividend of Rs. 10 per share, the Company should have a minimum distributable profit of Rs. 24.76 lakhs, including Rs. 8.73 lakhs to meet the 5 per cent. preference dividend. Considering that, in the previous year, the Company was able to distribute Rs. 26.20 lakhs towards preference dividend (for three years), such cannot be beyond the ability of the Company, especially as it is believed to have fared quite well, in the past year. The only other question that has to be considered is whether it will be prudent for a new company to start with such a high maiden dividend as 10 per cent. There will, of course, be nothing wrong in doing so, provided the profits are large enough to pay such a dividend and also to set aside, at the same time, a sizable amount to the reserve fund. If the Company is able to fulfil this criterion, it can truly be said to have achieved phenomenal success.

• • • •

The performance of the Kohinoor Mills Co., Ltd., in 1953 has been excellent. Its gross profit has nearly trebled, as compared with that for 1952, being as much as Rs. 65.22 lakhs, as against Rs. 23.22 lakhs. The net profit for 1952 was scarcely half a lakh, but for the year under review it is no less than Rs. 25.88 lakhs. Last year, the Company could pay a dividend of 18 per cent. per annum without drawing on its reserves, simply because it had a post-war refund of Rs. 18 lakhs, which represented accumulated fruits of war-time profits. This year, the enhanced distribution of 20 per cent. to shareholders (of which 2 per cent. represents bonus) has been fully earned. Besides this higher dividend to shareholders, the Company has also been able to strengthen its reserves by Rs. 6 lakhs, an increase of Rs. 5 lakhs over the provision made a year ago. An outstanding feature of the Company's results for 1953 is that its expenses have dropped from Rs. 703.64 lakhs to Rs. 642.02 lakhs, a fall of Rs. 61.62 lakhs, although sales have declined by only Rs. 18.53 lakhs. This saving in expenses has been almost solely due to the decline in the cost of cotton and raw materials consumed, from Rs. 4.32 crores to Rs. 3.38 crores. If the whole of this decline is not fully reflected in profit, it is mainly because of a sharp increase of about Rs. 33 lakhs in salaries and wages. In fine, the encouraging results of the Company seem to have been due chiefly to the skill displayed by its management in buying raw materials.

• • • •

A reader wants to know as to what has happened to the proposal for converting the Oriental Life Assurance into a mutual company. Since this is an old move and nothing at all has been heard about it in recent months, he wants to know whether he can take it for granted that the scheme has been dropped. Our enquiries reveal that such a presumption is unwarranted and that the scheme is still alive. It looks as though the Directors of the Company have more or less decided that the Company should be converted into a mutual society, by paying compensation to the shareholders. The precise reasons for the delay are, however, not known. Nor does one know what will be the rate of compensation per share. According to a reliable source, however, it may be anything between Rs. 8,000 and Rs. 9,000 per share, which compares with the ruling market rate of Rs. 7,085. One thing, however, is certain and that is, if and when the scheme is put through, the shareholders will get payment not in cash but only in the form of short-term bonds or debentures. It is believed that the bonds will be for a period of five years, freely negotiable, and carry interest at the rate of 4½ per cent. per annum.

• • • •

Sir Jeremy Raisman, who distinguished himself as India's able war-time Finance Member and is now one of the two Deputy Chairmen of Lloyds Bank Ltd., returned to the U.K. last week-end after a brief visit of about four weeks to this country. Just before his departure, we had the opportunity of meeting him and obtaining an idea of his impressions about India as it is today. Even while he was the Finance Member, Sir Jeremy was not very communicative to the Press. Being a banker now, he was even more reserved in expressing his views. Nevertheless, he was good enough to give his thoughts on a few of the burning topics of the day. One of these was deficit financing. On this subject, he was in full agreement with what the I.M.F. has said—the views of the Mission are published elsewhere in this issue. He was generally of the opinion that deficit financing was not harmful in a period of depression. But, he added, "in a country like India, too much inflation is really serious. It is the most regressive method of raising resources. It is something like clipping the coinage in the old days. It is extremely unjust in its incidence and has disastrous effects on incentives and savings." These words, coming from a person who resorted to the heaviest inflation in the history of this country in order to finance the war, may sound strange. Apparently anticipating this criticism, he added: "In times of war, inflation may be inevitable, because we have to develop and utilise resources so rapidly that we cannot erect the machinery necessary to distribute the burden equitably, but, in times of peace and when we are planning in a leisurely way, we really ought not to rely on inflation at all, especially in a country with a very low standard of living. It will result in everybody's standard being imperceptibly reduced, though that may become palpable only over a period."

• • • •

We then discussed with Sir Jeremy the subject of commercial banks providing long-term finance for industries. He said he was strongly opposed to this idea, as it was too risky a business for banks in India to undertake. "India," he remarked, "has suffered in the past from excessive venture-someness. Several banks which tried it have failed. India has still to acquire absolutely sound banking traditions. In my opinion, the need has to be met by some special type of institutions. The way the problem has been solved in England is by the banks participating in the institution specially set up for the purpose of providing long-term financing to industry. Moreover, mere provision of finance will not ensure development. You can't make a man fat, as they say, by giving him a bigger belt. Further, rapid advance for the sake of advance is no good. It is no good unless it is also sound advance. I don't think we can advance by these means. Presumably being a conservative in these matters, I am rather doubtful."

• • • •

Asked whether he was in favour of this country resorting to the system of depositors' insurance as in the U.S. for enabling banks to attract more deposits and spreading the banking habit speedily, the Vice-Chairman of Lloyds Bank said that he was not very much enthusiastic over it. He remarked that it was the function of a central bank to ensure sound banking system. The insurance system would penalise the sound banks, inasmuch as it would mean that these banks should make a contribution to guarantee the depositors of smaller and unsound banks. He was afraid that well established sound banks might not readily agree to work such a proposition.

• • • •

Another subject on which Sir Jeremy commented was the labour policy of the Government. Describing the existing employer-employee relations as "almost anarchical," he observed that, "unless something can be done to cure this deep-seated evil, I am very pessimistic about the future of industrial enterprise in India. Explaining this point, he said: "I am entirely in favour of a square deal for the worker, but I see a great danger that the people who happen to be in jobs at a particular time become a privileged class and that a very large part of the resources of industry is mortgaged to preserving and extending the amenities of that particular section of the community, regardless of the effect of the power of industry to adapt itself to changing conditions to provide further opportunities of employment. In fact, the rigidity which legislation and awards relating to industrial labour is introducing into the economy is fatal to the prospect of reducing unemployment. Unless industry can remain flexible and able to meet changing factors in the economic situation, it will soon become incapable of supporting the existing establishments and will shrink from commitments in regard to new and larger establishments. In this way, the intervention of the State is capable of militating against the cure of the very evil which it is seeking to prevent, namely, unemployment. The best chance for the worker is when industry is free to expand wherever it sees opportunities. But, if the engagement of a hand means a perpetual liability, the employer will think a thousand times before he embarks on any expansion or new venture. Thus, the interests of the working population as a whole and the economic future of the State are subordinated to the sole object of protecting the position of those who happen to be in jobs at a particular moment."

• • • •

Sir Jeremy did not at all approve of the idea of the Government trying to interfere too much with the working of private enterprise even if it was with the best of intentions. When we drew his attention to the Central Government's recent decision to obtain control over the rehabilitation reserves of cement companies such as the A.C.C., he remarked, with his characteristic frankness thus:

"All attempts to impose models of conduct will throttle private enterprise. No doubt, there may be some owners of industry who do not use the reserves in the best way for the development of the industry which is also the best way for the development of the economy. But, if the State comes in too deeply, it will remove all initiative from the private sector and that is dangerous. In any case, I do not believe that, if a private Industrialist is not running his business in the best way, anything that the State can do can improve matters."

• • • •

It is understood that the question of renewal of the current International Tea Agreement which expires on 31st March, 1955, is already engaging the attention of the participating countries as well as of the International Tea Committee in London. The signatories to the present Agreement are India, Ceylon, Pakistan and Indonesia, and, despite all efforts, it has not been possible to bring East Africa into the scheme. Nevertheless, it seems to be the general feeling in the producing countries that the Agreement should be renewed for a further term, in view of the harm that would be caused to the tea industry of the world by unrestricted exports.

• • • •

The attitude of the Government of India in this matter is yet to be known. There is a feeling that the Government of India may not look upon restriction of production or exports as desirable so long as there are countries outside the International Agreement like East Africa which are free to produce or to export as much as they like. It is, however, believed that East African production has not reached a level at which it can materially alter the equilibrium between world production and world demand either at the present time or

BRISK BUYING IN SHARES

ELECTRICS WELL FAVOURED

(From Our Own Correspondents)

BOMBAY, 18*th February*

TRADING on the Stock Exchange assumed fresh vigour during the week under review. Under a spell of brisk buying orders and frantic short covering, prices were lifted up all round to new high levels. However, the rise in prices was not uninterrupted; for, at every bulge, operators hastened to book profits. But values again moved up following revival of additional support. The cheerfulness in the prebudget week was something unusual. For, usually, at this time of the year, the market would be in an expectant mood on account of budget uncertainties. However, the departure from this behaviour this year only reflected the market's faith in the Finance Minister's assurance held out in December last that there would not be any change in tax structure until the Taxation Enquiry Commission submitted its report. Besides, bulls appeared to have been encouraged by other helpful factors also. Thus, the strength of the commodity, cotton and bullion markets, firm advices from Calcutta indicating a move to approach the Government of India to announce its decision on the Tariff Commission's recommendations in respect of the retention price for steel manufactured by the Indian Iron and Steel Co., Ltd., and expectations of good corporate results from the textile section—this was confirmed by the excellent results disclosed by the Kohinoor Mills—were cumulatively responsible for fanning the revival of bullish enthusiasm at every decline. The undertone at the close was, therefore, firm.

The steel section brightened up on strong speculative support, and fresh high levels, for several months, were recorded this week. Tata Deferreds, for instance, opened on a buoyant note, with a jump from the previous closing of Rs. 2,117-8 to Rs. 2,140, owing mainly to higher Calcutta advices; but end-of-account consideration brought some realising, as a result of which the scrips moved down to Rs. 2,115. At this level appeared renewed buying and frantic short-covering, lifting the rate again to Rs. 2,152-8. After being marked down once again to Rs. 2,137-8, the shares came up today to Rs. 2,157-8 which was only Rs. 10 short of 1951 peak. The closing was, however, only a shade lower at Rs. 2,150-12. Tata Ordinaries appreciated from Rs. 359 to Rs. 367, the highest since September, 1951, and closed at Rs. 366. Indian Irons were well favoured and were taken up from Rs. 28-4 to Rs. 29-3, a level not seen since January, 1952.

The textile section was again the cynosure of attention and almost the entire body of shares was sought after keenly. Some of the scrips which had lagged behind all this time came in for particular attention. Bombay Dyeings advanced on unabated demand from Rs. 433-2 to Rs. 441-4. After a sharp reaction to Rs. 431-4, they once again forged ahead to Rs. 437-8. Kohinoors hardened from Rs. 319-8 to Rs. 323. After drifting lower to Rs. 316, they moved up to Rs. 322 at the close. Century was conspicuous with a rise of Rs. 10 to Rs. 318-8, while Central Indias lost Rs. 2-8 to Rs. 184-8. Finlays gained Rs. 3 to Rs. 278 and Gokaks Rs. 8-8 to Rs. 273. Indore Malwas, which had remained in the background all these days, attracted attention and bagged as much as Rs. 12-8 to Rs. 111-4. Khataus added Rs. 6-14 before closing at Rs. 212-8. Minervas were taken up Rs. 3-6 higher to Rs. 109-6, following the transfer of the scrip to the forward list. A similar promotion was greeted by Mysore Spinnings with a gain of Rs. 2-8 to Rs. 162-8. Podars were wanted Rs. 7-8 higher at Rs. 143-12. Sholapurs were put through Rs. 25 higher at Rs. 1,755. Simplex was popular and gained Rs. 6 to Rs. 160. Standards put on no more than Re. 1-4 to Rs. 330. Svadeshis had buyers Rs. 3 better at Rs. 295 and Swans Rs. 3-12 more at Rs. 356-4. Elphinstones rose by Rs. 2 to Rs. 44. Models came in for enquiries and advanced by Re. 1-14 to Rs. 143-2. Morarjis hardened by Rs. 3-12 to Rs. 202-8. Hindustans were done up to Rs. 3,810 *ex-div.* as against Rs. 3,600 *cum-div.* (dividend Rs. 40 interim), Indian Manufacturing up to Rs. 3,500 *ex-div.*, as against Rs. 3,400 *cum-div.* (dividend Rs. 40), and Western India up to Rs. 3,500 *ex-div.*, as against Rs. 3,370 *cum-div.* (dividend Rs. 40).

A quiet tendency was in evidence in the bank section, in distinct contrast to the general trend of the market, and values were marked down a little. Barodas, after being done at Rs. 108, closed at Rs. 107-8, Centrals were lower by As. 8 at Rs. 58 and their new shares by Rs. 2 at Rs. 61. Imperial Fully Paids were down by Rs. 7-8 at Rs. 1,795 as also the Contributories at Rs. 432-8. Indias shed a rupee to Rs. 153 and United Commercials As. 4 to Rs. 40-12.

Electric shares moved into the limelight on good demand and scarcity of sellers, in expectation that the Electricity Act would be shortly amended to provide a higher return to electrical undertakings. Thus, Ahmedabad Electrics cheered up from Rs. 115 to Rs. 118-2 and their new shares from Rs. 110 to Rs. 112-8. Bombay Suburbans put on Rs. 2-8 to Rs. 123-12. Tata Hydros were in keen demand and were, therefore, put up by Rs. 2 to Rs. 141, Tata Powers by Rs. 50 to Rs. 1,440, and Andhra Valleys by Rs. 35 to Rs. 1,292-8.

Insurance shares were steady and values were marked up in select scrips. After a long time, New Indias came in for favour and gained Rs. 2 to Rs. 42-4. Industrial Prudentials were placed Re. 1 higher at Rs. 32-8 and Indian Mercantiles As. 8 better at Rs. 38-8. Vulcans, which had spurted by a rupee last week on enquiries influenced by reports of a higher dividend, rose by As. 2 to Rs. 12-14 this week. Orientals were stagnant at Rs. 7,085, as also Empires at Rs. 640.

Among sugar shares, Belapurs were prominent with a rise of Rs. 2-4 to Rs. 261-4. Bhopal Sugars closed As. 10 higher at Rs. 13, following the transfer of the shares to the forward list. Phaltans were, however, quiet with a loss of Re. 1-4 at Rs. 102.

The miscellaneous section provided several features on yield considerations, prominent among them being Scindias, Bombay Burmahs, B.B. Petrols, National Rayons, Premier Constructions, Tata Chemicals, Tata Oils, Wimcos and Digvijay Cements. The undertone in this section was firm. Associated Cements which were listed *ex-right* on Monday this week at Rs. 150, as against last week's closing of Rs. 177 *cum-right*, closed at Rs. 154-8. Digvijay made a fine debut on its inclusion in the forward list and forged ahead from Rs. 114-8 to Rs. 123-8. Scindias were in brisk demand and forged ahead from Rs. 17-7½ to Rs. 17-15. At one time during the week, the shares touched a high of Rs. 18-0½. Alcocks covered fresh ground to Rs. 362-8, as against Rs. 360. Bombay Burmahs revived on good support from Rs. 385. B.B. Petrols picked up As. 4½ to Rs. 3-6½. B.I.Cs continued to be in demand on expectation of favourable dividend and rose by As. 5½ to Rs. 9-9½. Indian Coppers were steady at Rs. 3-2½. Killick Industries rose by Re. 1-4 to Rs. 164, on good results announced by Kohinoor Mills and expectations of favourable results from other managed concerns. National Rayons staged a sharp rise of Rs. 11-12 to Rs. 165-8 due to proximity of dividend announcement. Premiers shaped well with a rise of Rs. 6-12 to Rs. 125-8. Shivrajpurs firmed up from Rs. 71-8 to Rs. 76 on expectations of favourable results. Tata Chemicals made a smart jump of Rs. 2-1½ to Rs. 13-11 on expectations of favourable recommendations by the Tariff Commission. Anticipation of higher dividend pushed up Tata Oils by Rs. 5-4 to Rs. 40-8. Wimcos gained Rs. 2-8 due to scarcity of sellers. Tata Locomotives were done at par, on reports that the Company would commence manufacture of cars in conjunction with a German firm.

• • • •

Calcutta Stock Exchange

CALCUTTA, 17*th February*

The Calcutta Stock Exchange put on a steady note during the week under review, in contrast to the easy trend it displayed last week. The sentiment of operators was well sustained by a series of several favourable factors. Trading was enlivened by expectation of early and fair increase in steel retention prices. Added to this was the firmness in the jute goods section. Besides, prospects of higher dividend payments by several companies and bullish advices from commodity markets too imparted strength to the market. Equity values, particularly in the jute, engineering and coal sections, recorded sizable gains, while they were generally maintained in other sections, in spite of hesitancy among operators on account of pre-budget uncertainty.

Jute shares were particularly in the limelight. There was enlarged buying support induced by hopes of better trading conditions in jute goods markets in the coming weeks and expectations of a possible reduction in, or even abolition of, export duty on jute goods. This was fully reflected in the handsome improvement in some of the leading counters. Fort Glosters forged ahead from Rs. 474 to Rs. 495. Alliances and Deltas rallied Rs. 6 each to Rs. 172 and Rs. 245, respectively. Indias moved up by Rs. 4-8 to Rs. 131. Howrahs advanced by As. 10 to Rs. 25-2, Nationals by As. 9 to Rs. 25-7 and Nuddeas by As. 8 to Rs. 47-8. Aucklands were fully steady at Rs. 118 and Reliances at Rs. 14-14.

The coal section also evoked special attention of operators, following reports of a notable rise in coal output during the month of December, 1953. Talchars were specially favoured at Rs. 4, as against Rs. 3-4. Central Indias and Burrakurs rose by As. 3 each to Rs. 6-3 and Rs. 8-14, respectively. Unions and Equitables were better by As. 2 each, the former at Rs. 22-12 and the latter at Rs. 31-10.

Expectation of higher steel retention prices for Indian Irons lent active support generally to engineering scrips. Indian Irons scored a gain of As. 10 to Rs. 29. Burn and Cos. firmed up from Rs. 338 to Rs. 350 and Bhartia Electric Steels from Rs 11-8 to Rs. 13-5 yesterday. Textile Machinerys improved by As. 9 to Rs. 10-1. Jessop & Cos. and Indian Standard Wagons were in good demand, their respective quotations yesterday being As. 11 and As. 8 higher at Rs. 26-7 and Rs. 63-12.

Selective buying enquiry was in evidence in the miscellaneous section. F. and C. Oslers were specially supported at Rs. 11-2, a rise of Re. 1-14 as compared with the previous week. Indian Cables advanced by As. 8 to Rs. 56. Rallis Indias which had dropped Rs. 2-8 last week recovered As. 8 to Rs. 56. B.B. Petrols and National Insulated Cables hardened by As. 6 each to Rs. 3-7 and Rs. 15-14, respectively. Martin Burns and British India Corporations gained As. 3 each to Rs. 21-5 and Rs. 9-9.

The textile section provided an exception to the general trend and continued to be easy, on account of persistent profit-taking. Kesoramos receded by As. 5 to Rs. 23-10. Elgin Mills shed an anna to Rs. 15-15. New Victoria Ordinarys lost a like amount to Rs. 1-10. Bengal Nagpurs, however, met with support and were lifted up from Rs. 13-5 to Rs. 14.

Activity in tea scrips was subdued, ing bearish advices from tea auctions, slackness in demand, values tende Nagri Farms were pushed down Rs. 22-10. Ethelbarls suffered a Rs. 7-12. Dibrugarhs fell by an

Madras Stock Exchang

MADRAS, 17*th Fe*

Although the Madras Share Market did no expect any surprises in the proposals to be made by the Finance Minister next Saturday, it was not completely free from the influence of budget uncertainties. Consequently, it depicted a somewhat hesitant tone. Textiles and tea scrips came in for selective enquiry, as a result of which prices of some shares looked generally upward, while others witnessed minor losses. The enquiry in textiles was induced by continued export advices for piecegoods, and in tea it was due to U.K. and Continental enquiries for better grade teas. Rubbers fared slightly well, but coffee and miscellaneous scrips ruled generally easy and disclosed fractional losses over the week. The undertone, however, remained quietly steady.

In the textile section, Bangalore Woollens shot up from Rs. 302-8 to Rs. 307-8 and Vasantas from Rs. 182 to Rs. 185. Metturs and Radhakrishnas gained Re. 1 each to Rs. 230 and Rs. 166, respectively. Kotharis were higher by As. 12 at Rs. 11-12 and Venkateshas As. 8 to Rs. 63 *ex-right*. Premiers, however, lost Rs. 5 at Rs. 94 and Vijayalakshmis Rs. 2-8 at Rs. 77-8. Krishna Rajendras were down by Re. 1-4 at Rs. 55. Lakshmis, Rs. 50 paid-up, by Re. 1 at Rs. 100 *cum-div.* and Rs. 25 paid-up by Re. 1-12 at Rs. 52-12. Travancore Rayons were lower by an anna at Rs. 7-10.

Among plantings, tea scrips presented a mixed trend. Devasholas put on Re. 1-4 to Rs. 21-4 and Twyfords Re. 1-2 to Rs. 15-6. Udayagiris and Peermades gathered As. 4 each to Rs. 9-2 and Rs. 31-4, respectively. Highland Producers, however, lost As. 4 to Rs. 13 and Kalasas As. 2 to Rs. 13-4.

Rubbers were generally bright. Malankaras gained As. 8 to Rs. 37. Travancore Rubbers rallied As. 6 to Rs. 15-8. Nenmenys also put on a similar amount to Rs. 16-6. Thirumbadis advanced by As. 5 to Rs. 3-9 and Teekoys by As. 2 to Rs. 7-2.

In the coffee section, Consolidated Coffee eased from Rs. 16-3 to Rs. 16. Puthuthottam were slightly lower at Rs. 3-4. But Nilgiri Neerugundis gained an anna to Rs. 3-12. Shevroys also were up by a similar amount at Re 1-7. Coffee Lands were unchanged at Rs. 8-13.

Miscellaneous scrips came in for selective enquiry. Andhra Cement 'A' shot up by Rs. 3 to Rs. 110. Andhra Cements 'B' were higher by As. 8 at Rs. 11. Bruntons gathered As. 10 to As. 12 at Rs. 5-14 and Mysore Papers by As. 8 at Rs. 18.

ASP VC-1/54

NEWS IN BRIEF

THE annual general meeting of the Bombay Chamber of Commerce will be held on Wednesday, 17th March, 1954, at 11-30 a.m.

The three-member Prohibition Enquiry Committee appointed by the Government of Andhra has submitted its report to the State Government.

The National Income Committee signed its final report in New Delhi on Sunday last. The report is expected to be submitted to the Government of India shortly.

An Indo-West German trade agreement was signed at Bonn on Tuesday this week by the representatives of the Governments of the two countries. The agreement covers a period of one year, from 1st February, 1954 to 31st January, 1955.

The Government of India has sanctioned a loan of Rs. 10 lakhs to the Madras Handloom Weavers' Co-operative Society for starting a spinning mill on co-operative basis at Tinnevelly. The mill is intended to provide relief to the drought-stricken areas.

A vegetable milk plant to produce milk from groundnuts has been set up at Trichur by the Central Food Research Institute, Mysore. Each pound of groundnut kernels yields seven to eight lbs. of milk. It is said to be cheap, the price being one-third the cost of cow's milk.

A proposal to declare a moratorium to low-income groups among non-agriculturists is under the consideration of the Andhra Government. A Cabinet Sub-Committee has already been set up to enquire into the extent and nature of indebtedness of the non-agricultural classes in the rural and urban areas of the State.

The registration of export sales of *kardi* seed and *niger* seed has been stopped with effect from the 15th inst. Shipment against sales registered prior to the 15th inst. will, however, be allowed. Exports of *kardi* and *niger* oil will continue to be licensed freely to all permissible destinations up to the end of June, 1954.

A donation of Rs. 14 lakhs to establish an agricultural college and hostel in West Bengal has been offered to the Chief Minister by Mr. G. D. Birla, the noted industrialist of India. The Chief Minister has accepted the offer and the proposed college will, it is learned, be located in Haringhata, where the State Government already has a dairy and agricultural farm.

The Punjab Government is reported to have decided to organise a number of cottage industries in the State on a co-operative basis to place them on a strong footing. The industries that will be taken up at the initial stage are leather and tanning, handloom, with emphasis on durrie, curtain and upholstery, dairy farming, with emphasis on milk and poultry, rope-making, sports goods, low-cost furniture, smithy and lock-making.

According to Sardar Ujjal Singh, Minister for Industries and Finance, Punjab (I), the State is now producing cycle parts of fine quality which can compete with those of foreign manufacture. Government offices, police and military departments will extend patronage to Indian-made cycle parts. The State Government has decided to advance to the industry loans, carrying interest at 5 per cent, and recoverable in easy instalments over a period of seven years, in order to help it to tide over its financial troubles.

Raisings and despatches of coal from Indian collieries during 1953 declined by approximately 400,000 tons, as compared with 1952, according to latest figures. Raising and despatches last year were nearly 35.8 million and 36 million tons, respectively. The fall in despatches is attributed mostly to the fall in overseas export which was not fully balanced by despatches within the country. India's coal export last year amounted to 1,246,000 tons, Japan being the main consumer importing nearly 425,000 tons.

The Railway Testing Research Centre at Lucknow was inaugurated by Pandit G. B. Pant, Chief Minister, U.P., on the 12th inst. The range of research at this Centre will relate to many aspects of railway working, including operational problems and improvement of amenities for railway passengers. Safety measures, prevention of accidents and steps to achieve economy will also receive the highest priority. The trials, tests and research at this Centre will be co-ordinated with the design and development wings of the railways and there will always be close and constant liaison between this Centre and the railway chief design engineers.

The Government of India has decided to extend the term of the Trade Marks Enquiry Committee. The Committee, appointed by the Government on 18th November, 1953, to review the laws in India bearing upon trade marks, etc., had issued a questionnaire to the various chambers of commerce and associations asking for their views by the end of January, 1954. As replies from all organisations have not been received and as the expectation that the Committee would submit its report by the end of February is not likely to materialise, the Government of India has decided to extend the term of the Committee upto the end of April, 1954.

A small plant to manufacture about two tons of synthetic rice per day is proposed to be erected in the Central Food Technological Research Institute at Mysore in a month or two. This quantity, though small, would correspond to the production of rice from about four acres of land and will help to meet the rice requirement of nearly 10,000 persons. It is proposed to distribute the grain in selected areas with a view to assessing the reaction of consumers and observing the effect on their health. The nutritive value of synthetic rice was improved recently by treating it with a thin coating of calcium caseinate. Recent experiments have shown that the final product has about two and a half times the nutritive value of the natural grain. Synthetic rice is chiefly manufactured from tapioca and groundnut flour.

In reply to a letter from the Andhra Chamber of Commerce seeking clarification in regard to inter-State sales tax in respect of automobile and electrical goods, etc., the Revenue Board, Government of Madras, has stated that, if a Bombay dealer sells electrical goods or motor vehicles to a Madras dealer and if delivery and consumption take place in the Madras State, this State will levy tax on the Bombay dealer under Article 286(i)(*a*) of the Constitution read with the explanation. The communication further states that the tax will be levied at the higher rate under section 3(2) of the Madras General Sales Tax Act. If the tax has been collected from the Bombay dealer at the higher rate, additional tax cannot be levied again on the first dealer residing in this State, as the higher rate of tax under section 3(2) can be levied at a single point only. Further, under rule 4(b) of the Turnover and Assessment Rules, tax under section 3(2) can be levied on a person, who in the Madras State, is the first dealer in the goods specified. In the above case, the Bombay dealer becomes the first dealer, as his sales take place in this State under section 3(2) and the tax under section 3(2) will be levied only on him.

From Abroad

The British Government has decided to return the trade in jute to the private sector "as soon as it can be arranged."

Canada's population stood at 15,005,000 on 1st December, 1953, showing a rise of 112,000 in three months since 1st September last.

The British trade mission to Soviet Russia has signed £16 million worth of orders. Orders for £48 million more are under negotiation.

The third session of the Advisory Committee on Salaried Employees and Professional Workers of the International Labour Organisation will be held from 10th to 22nd May, 1954, instead of from 29th March to 10th April, 1954, as had been announced earlier.

The British Overseas Airways Corporation has placed orders for 5 Comet III Aircraft, deliveries of which are expected to begin in 1956. The Comet III will carry 58 passengers in first class accommodation, on stage lengths of 2,500 miles, and will cruise at more than 500 m.p.h.

The United States has given the United Nations nearly $4 million for providing technical assistance to the less developed countries. This is the first payment on a United States pledge of nearly $14 million for the expanded technical assistance programme for 1954.

The Japanese Government has borrowed £500,000 from London banks, against the security of a deposit of an equivalent amount in dollars in New York to the credit of the banks. At the end of three months, London will pay back the dollars and Japan the sterling.

Output of cars in Japan during 1953 reached a post-war record, with the manufacture of 46,167 chassis of all cars, trucks and buses, as against 38,964 in 1952. Export of Japanese cars also reached a post-war high. Japan shipped 1,089 ordinary cars and nine small cars, as against 849 and six, respectively, in 1952.

Two senior executives of a British electrical engineering firm, Metropolitan Vickers Ltd., have gone to Moscow to examine trade prospects there. The firm had a long pre-war history of trade with Russia and much of its machinery is still in service there. The firm is expected to seek orders for heavy electrical generating equipment.

An "Atoms for Peace" conference is scheduled to commence at the University of Michigan on 20th June, 1954, under the auspices of the American Institute of Chemical Engineers. The conference is expected to attract more than 1,000 experts, including nuclear scientists. Besides the U.S. and India, countries which will be represented are Argentina, Belgium, Canada, England, France, Italy, Mexico, the Netherlands, Norway, Spain, Sweden and Yugoslavia.

The Australian Government has enhanced the tariffs on a number of imported goods ranging from sheeting to motor vehicle parts. The major changes proposed affect cotton sheetings, paper and paper products, and motor vehicle gear box and differential assemblies. In the case of cotton sheetings used in bed and pillow cases, the duty has been increased to four pence (Australian) per pound weight plus a further 15 per cent. according to the value of the vehicle where this is admissible under British preferential tariffs.

A Bill seeking to set up a new non-departmental authority to control atomic energy research and development in Britain was introduced in the House of Commons last week. The proposed atomic energy authority will take over from the Ministry of Supply the nuclear side of schemes ranging from Britain's proposed atom-driven electric power station in Scotland to the production of hundreds of species of industrial isotopes. The authority will develop and produce atomic weapons, but only under arrangements with the Ministry of Supply. It will be free to carry out experiments leading to improved types of warheads for such weapons.

The United States Government's Bureau of Labour Statistics has reported a drop of two million people employed by industry, transport, Government and trade between December, 1953, and January, 1954. The non-farm total of employment last month—47,700,000—was 646,000 smaller than a year ago because of factory lay-offs. But, in non-manufacturing industries, January employment was the highest on record. Factory employment declined by 380,000 between mid-December and mid-January. The decline is appreciably larger than usual and is described as the sharpest reduction for the season since the recession year 1949. Seasonal trends accounted for the reductions in the lumber, food and miscellaneous manufacturing industries.

Establishment of a new joint shipping service under the name of American Mideast Line, providing regular monthly sailings from the U.S. Gulf and Atlantic ports to the Red Sea, Gulf of Aden, Persian Gulf, Pakistan and India, has been announced in New York. The Lines participating in the service include Alexandria Navigation Co. and Societe Misr Navigation Maritime S.A.E. of Alexandria, British Steamship Co. of London, and Fisser, Schiffahrt G.M.B.H. of Emden, of Germany. All the ships planned to maintain the service are modern 15-knot motor ships, of which some provide accommodation for 40 passengers. The first to commence sailing will be the Egyptian vessel *Port Said*, which will begin loading at Gulf of Mexico ports by about 20th March. This Line has already submitted applications to join the various shipping conferences serving the area.

PERSONAL

MR. Louis St. Laurent, Prime Minister of Canada, will arrive in New Delhi tomorrow.

Mr. Dharam Vira, India's Minister-designate to Czechoslovakia, left for London *en route* to Prague.

Mr. C. F. Cobbold, Governor of the Bank of England, who was on a brief courtesy visit to India, left Madras for Colombo on Tuesday last.

Mr. P. C. Bhattacharya, Financial Commissioner for Railways, who was recently nominated as a member of the Industrial Finance Corporation of India, is likely to be appointed its Chairman, *vice* Lala Sri Ram who has resigned.

Sir Alfred Egerton, Professor of Chemical Technology, University of London, has arrived in India at the invitation of the Central Government to help the special committee to be appointed to review the working of the various laboratories established in the country during the last five years by the Council of Industrial and Scientific Research.

Mr. H. P. Mathrani, Consulting Engineer, Road Development, and Joint Secretary, Ministry of Transport, Government of India, has been elected President of the Council of the Indian Roads Congress for next year. Mr. C. M. Bennett, Chief Engineer of Orissa, Mr. U. N. Mahida, Chief Engineer of Bombay, and Dr. F. P. Antia of the Cement Marketing Co. of India were elected Vice-Presidents.

"COMMERCE" 1929

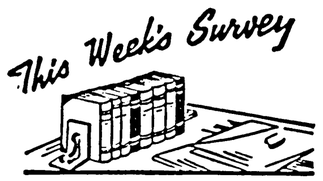
FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, 16*th February*

Indian Railways

The report by the Railway Board on Indian railways for 1927-28, issued last week, affords nothing sensational. The local advisory committees have more than justified their *raison d'etre*; considerable advance has been made in the publicity activities of the different railways. But we have not yet been offered any opportunity of judging the merits or otherwise of the central and individual railway efforts at amateurish journalism. We do not get any of their "journals" or "magazines"—whatever these might be called. Besides the formation of a central bureau and the appointment of a Chief Publicity Officer, a publicity office has been opened in London since July, 1927. The enterprise of the department is employed in cinema film production and display, poster production and display, pamphlet production and display, publication of an Indian State Railway Magazine, demonstration trains, upper and lower class excursion trains, Press propaganda in India, Europe, America and other parts of the world, and reciprocal publicity with the leading railways of the world.

We are, naturally, watching with considerable interest the development of these activities, as they, to no inconsiderable extent, encroach upon the precious preserve of professional journalism. The monsoon during the year was normal and trade on the mend. The result was that taken all round the year was a most profitable one for railways, the gross earnings of State-owned lines reaching the record figure of Rs. 104 crores, or an increase of Rs. 5¾ crores as compared with 1926-27. Goods traffic was responsible for most of the increase in gross receipts, the earnings from goods carried on all railways amounting to Rs. 69¼ crores, as compared with Rs. 65 crores in 1926-27.



ANGLO-JAPANESE TRADE AND PAYMENTS AGREEMENT

FEW recent events have evoked such keen controversy in the U.K. as the Anglo-Japanese trade and payments agreement concluded towards the close of last month. It unleashed so much emotion that the present Government in Britain has had to face a storm of protests both inside and outside Parliament. The Government was assailed by both the Opposition and some of its party members when the matter was raised in Parliament. In the debate that took place last week on this agreement, there was more politics than economics. It was, indeed, ununderstandable how the Labour Party pressed for a division, albeit unsuccessfully, in spite of the fact that the agreement was only a renewal of an arrangement concluded by itself when it was in office.

A dispassionate study of the terms of the agreement discloses that all this heat over the agreement was unwarranted. The agreement is designed to facilitate a two-way trade between Japan and the sterling area to the extent of £420 million. The implication here is that, while the agreement will help the maintenance of the level of sterling area exports, the sterling area should be prepared to buy more goods from Japan. It is expected that the agreement will enable Japan to export more of cotton and rayon piecegoods, toys, buttons and studs, electric lamps, bulbs and shades, paper manufactures, brooms and brushes, lacquerware and ivory fancy goods than it has been able to do all along. In return, Japan has undertaken to provide sterling sufficient to maintain U.K. exports to Japan in 1954 at the current level. It has, in particular, agreed to provide sterling quotas upto a value of £2 million for the import of wool and worsted yarn and manufactures, for which no provision was made in the previous year. Japan has also guaranteed payment in sterling for sales of sterling oil and facilities for remittance of earnings of British firms in Japan.

This agreement with Japan has become inevitable. For Japan has been having a severe deficit in its trade with the sterling area which is based on payments agreements, the first of which was signed in August, 1951. Under this type of agreement, all payments by Japan are to be made in sterling. Any serious disequilibrium in trade should be adjusted by mutual consultations between the two countries. The provision for consultation, however, is a one-sided affair, in that it comes into effect only when Japan accumulates large quantities of sterling. When the situation is otherwise, that is, when Japan runs short of sterling, the remedy lies in drawing upon its working balances in London or in borrowing in the open market in London or in resorting to forward exchange operations. The balance sought to be achieved by resorting to such stop-gap measures last year proved to be extremely unsatisfactory. It meant that Japan was not in a position to pay for its imports from the sterling area by exports to that area. In other words, it meant a one-way traffic, which is not conducive to expanding trade between any two areas. It is obvious that, unless Japan were enabled to pay for its imports from the sterling area, the latter's trade with Japan would shrink. Hitherto, Japan could settle its adverse balance with the sterling area through its U.S. dollar holdings, but its position in this respect, too, is not as comfortable as it used to be when the Korean war was at its peak. It is this state of affairs that necessitated the conclusion of a new payments agreement, an agreement designed to strike a balance in trade between Japan and the sterling area.

The agreement is criticised on the ground that Japan has been gratuitously admitted into third markets in which the U.K. exporters are interested. As Japanese goods are and will be cheap, they will, so argue the critics, slowly but steadily price the British manufactures out of the many sterling markets. The opposition, especially from the Lancashire textile interests, is great, as they fear that the biggest battle in sterling markets will be between the Japanese and the British textiles. The fear has been accentuated by the U.K. Government notification to the colonial Governments that they may import from Japan in 1954 "up to their estimated requirements for consumption and *entrepot* trade." They further fear the revival of pre-war Japanese dumping and other unfair practices.

There may be some justification for the opposition fears, considering that, in pre-war years, Japan indulged in all sorts of unfair practices to gain markets for its goods, but that is not the whole truth. Most of the opposition is born of either selfish or other political motives. Small wonder, therefore, that leading newspapers in the U.K., the concern of which for the larger interests of the nation cannot be questioned, have supported the British Government on this issue. To quote, for instance, the *News Chronicle*:

> "Japan has a black record of treachery and brutality. But the idea of this pact is not to fatten up the perfidious Japanese, but to help our own hard-pressed exporters. Last year, our exporters sold goods worth nearly £15,500,000 to Japan. They will sell next to nothing this year, unless the pact goes through and gives Japan enough sterling to go on buying British goods. Our exporters have been struggling hard for months past to get a market in the Far East. The individual items are impressive. Are we now going to tell the motor, engineering, chemical and other industries, who are making a brave fight in the Far East, to surrender to subsidised German competition? Millions of pounds are at stake. We find it frankly funny that this newspaper should be applauding the Conservative Chancellor of the Exchequer and the President of the Board of Trade for their efforts to liberate trade. But Mr. Butler and Mr. Thorneycroft are right on this issue. They have courage."

It is admitted by a section of British public opinion that the fear of Japanese competition is being overplayed. The quota of £3,000,000 for imports of Japanese cotton and rayon cloth into the U.K., for instance, is no concession to Japan and involves no hardship to the British textile industry, especially because the whole of it is to be re-exported after processing. The quotas in regard to many other commodities also is sizably small and mosly smaller than pre-war imports. It is further pointed out that Japan's manufacturing costs are on the ascent, due chiefly to high inflation. Again, Japan's exports are being maintained by a system of dual prices and export subsidies, the continuance of which are subject to serious limitations in the present-day Japan. There is already a proposal to cut Governmental expenditure by reducing export subsidies. Moreover, in an effort to curb inflation, interest rates in Japan have been pushed up and credit is severely restricted. There are no such handicaps to exporters in Britain or in other sterling area countries.

The opposition of Lancashire cotton textile interests, in particular, has been subjected to strong criticism in the British Press itself. While it is admitted that Japanese competition in this field cannot be underestimated, the imports into the sterling area as a whole are not, however, expected to be more than that attained in 1951. In any case, Lancashire goods cannot seek a protected market in the sterling area. Those days were over long, long, ago. It is inexplicable why the sterling area countries should be denied the cheap Japanese cloth and be forced to buy the high-priced Lancashire goods. What economic justification is there for the underdeveloped countries in the sterling area to pay for the maintenance of the high standard of living of the Lancashire workers and that, too, at the cost of their own living standards? Even our conservative contemporary, the *Economist*, London, has aired similar views. It says, for instance:

> "It is in these markets that the export industries in Britain, and the textile industry in particular, may feel the draught of competition, for they have hitherto been preserved for British imports by the quantitative restrictions of import licensing. But this prospect hardly warrants the shouts of angry dismay that have come this week from Lancashire. Is it seriously contended—in the home of free trade—that the Malays and the Africans whose labour produces so many of the dollars with which the British people indulge their taste for both essentials and luxuries should be thanked and rewarded for their efforts by an indefinite continuance of the embargoes which compel them to buy their cloth in Lancashire, whether they like to or not, and exclude the competition of, perhaps, cheaper manufactures from Japan? If so, it would be difficult to conceive of a shorter cut to losing the colonial empire."

It is too early to forecast whether or not the object of the agreement, namely, a neatly balanced trade between Japan and the sterling area, will be realised. There are many imponderables. To mention only two. First, much will depend on the policy of the South African and Australian Governments. Will these Governments allow liberal imports of Japanese goods? Secondly, it will depend on the maintenance of at least the current level of export prices in Japan, which in turn depend on the measures taken or to be taken to arrest the inflationary spiral in that country.

As a member of the sterling area, India, too, is interested in this trade and payments agreement. It will also be affected more or less in the same manner as Britain. Its exports of cotton goods, for instance, will no longer have the same sheltered markets in British territories as hitherto. But that is no reason why India should oppose this agreement. The very fact that no notice of this development has at all been taken in this country shows that the Indian Government and businessmen fully realise that foreign trade is a two-way traffic. While Indian goods may have to face somewhat stiffer competition from Japan, it may also be in a position to improve its exports (of coal, iron ore, cotton, etc.) to Japan, as a result of this agreement.

Be that as it may, if the payments agreement had not been signed, the Japanese would have probably concluded separate bilateral agreements with the Dominions. In that event, it is likely that Japan would have tried to force on the Dominion markets larger quantities of its goods. Such a course would have doubtless proved worse than the present agreement to Britain and other members of the sterling area.

DEFICIT BUDGET FOR BIHAR

The daily Press version of the Bihar Government's budget estimates for 1954-55, presented to the State Assembly on Monday last by Dr. A. N. Sinha, Finance Minister, reveals certain peculiar features. Thus, while the capital account for the ensuing year discloses a surplus of Rs. 2.05 crores, the revenue account shows a sizable deficit of Rs. 10.48 crores, so that the overall deficit amounts to Rs. 8.43 crores. Again, the deficit is to be covered largely by setting off the opening balance of Rs. 8.12 crores. The remaining Rs. 31 lakhs, together with what is called the ordinary specified balance of Rs. 43 lakhs, have been left uncovered. It is noteworthy that the Bihar budget does not contain any new tax proposals or alterations in the existing rates. Evidently, Dr. Sinha must have realised that, as it is, taxes have been loaded up to the last straw. As he himself remarked, "raising the level of existing taxes is no more a solution to the State's financial problems," although he took care to add that the Government might adopt expedients later in the year, if necessary, as, for example, recourse to taxes for specific services rendered to particular sections of the community and fresh taxes or duties on the more well-to-do sections.

The deficit of Rs. 10.48 crores on revenue account estimated for 1954-55 compares very unfavourably with the estimated deficit of Rs. 34 lakhs for the current year. This widening of the deficit is the result of a fall of Rs. 3.75 crores in revenue estimates, on the one hand, and an appreciable rise of Rs. 6.39 crores in expenditure, on the other. The estimates of revenue and expenditure for 1954-55 are placed at Rs. 29.25 crores and Rs. 39.73 crores, as against Rs. 33.00 crores and Rs. 33.34 crores, respectively, for 1953-54. The fall in revenues is expected mainly under receipts from sales tax, agricultural income-tax, sale of text books, sugarcane cess and stamp duties. Electricity and land revenue, however, are expected to register improvement. The estimate of expenditure is placed higher, despite the reduction of Rs. 1.17 crores (as compared with revised estimates for 1953-54) in outlay on famine relief, thanks to a good harvest. This is chiefly due to the rise (as compared with revised estimates for 1953-54) of Rs. 2.78 crores in civil expenditure, of Rs. 1.75 crores under education and of Rs. 16 lakhs under general administration. Incidentally, it is stated that the Post-war Fund will be completely liquidated in the course of next year.

An idea of the financial position (budget estimates only) of the State Government during 1954-55 can be had from the following statement:

(In crores of rupees)

Revenue Account		
Revenue		29.25
Expenditure		39.73
Surplus (+) or deficit (—)		—10.48
Capital Account		
Receipts—		
Grants-in-aid		2.86
Loans		10.78
	Total	15.64
Disbursements—		
Capital expenditure		10.59
Grant of loans		2.29
Repayment of debts		0.71
	Total	13.59
Surplus (+) or deficit (—)		+2.05
Opening balance		—8.43
		+8.12
Uncovered deficit		—0.31

It will be seen from the above figures that, in framing the capital budget for the ensuing year, the Finance Minister of Bihar has taken for granted a sum of Rs. 10.78 crores as loans and another sum of Rs. 2.86 crores as grants-in-aid. It is, however, not known how the loan of Rs. 10.78 crores is to be raised. Does the Finance Minister propose to enter the capital market for a public loan or does he depend entirely on the Central Government? In the absence of full details, these posers cannot be answered. This much, however, can be said. In the present state of the capital market, the Finance Minister cannot hope to raise even half the target of Rs. 10.78 crores from the public. He will, therefore, have to fall back upon the Centre for loans. The Centre's finances, unfortunately, are none too comfortable. It can meet the large capital needs of States only by exercising its right to issue notes.

SOME PROBLEMS OF IMPORTERS

Among the points raised by Mr. Shantilal M. Shah in his presidential address at the annual meeting of the All-India Importers' Association held at Bombay on the 16th inst., the one relating to his complaints against the attitude of manufacturers towards the established import trade merits every consideration. He says: "Even before an industry is established, there is a hue and cry for protection by banning imports. And once protection has been obtained from the Government and the field of competition is reduced or eliminated altogether, they prefer to distribute their goods through either their own created agencies or organisations controlled by them." This exclusive tendency on the part of manufacturers is desirable neither in their own interests nor in the interests of the import trade, nor, for that matter, those of the consumer. The exclusion of established trade channels deprives the manufacturers themselves of the benefit of sound marketing experience developed over a long period, causes unemployment among these classes and leads to bitterness between the two important sections of the economy. The established import trade, therefore, plead for a change in the attitude on the part of manufacturers.

This plea has been strengthened by the fact that the import traders have, to quote Mr. Shah, "agreed, in principle, to protection being granted to our industries, either through the import trade control or by imposing high tariffs, and, although this means gradual restrictions on our field of business, we are ready to make a sacrifice in the national interests."

This important admission under the principle "Indians first and importers next," as was pointed out by Mr. R. G. Saraiya, President of the Federation of Indian Chambers of Commerce and Industry, in his inaugural address at the meeting, represents a welcome change in the attitude of the import traders towards Indian industry. Thus, the domestic manufacturers have a good climate in which they can work in co-operation with established and experienced middlemen to the mutual benefit of both. Mr. Shah, however, desires that the Government should compel manufacturers to sell their products through normal trade channels. This is hardly a wholesome procedure to follow; for, through compulsion, one can only lead the horse to water but cannot make it drink. Nor is such a demand for Government intervention in keeping with the demand for freedom for private enterprise.

But Mr. Shah is right in criticising the Government's policy of giving double protection to an industry, that is, by means of imposing a ban on imports, as also by levying high tariff duties. When there is a Tariff Commission with wide powers to examine the claims of industries for protection, it is not understandable how the Government can ignore, as Mr. Shah has emphasised, its recommendations and place restrictions on imports under the advice of its Development Wing. While prescribing import quotas, Mr. Shah is of the opinion that the quotas should cover the gap between demand and internal supplies for the commodity concerned. Although this principle appears sound at first sight, even that is not calculated to serve the consumer, for, the demand and supply being equal, there will scarcely be scope for competition. Consequently, the quantum of quotas fixed should be such as would leave enough room for healthy competition so essential for the establishment of reasonable price levels. Granting that such a principle is accepted, there is the difficulty of arriving at accurate estimates of demand and supply. This difficulty is being solved by the Federation by inviting the producers and importers to sit together and arrive at agreed figures on the basis of data before them. According to Mr. Saraiya, this practice would appear to have met with some success, as the Government has accepted the estimates thus arrived at by the Federation.

OFF THE RECORD

(By "ROVER")

I WONDER if the time is far ahead when the advocates of handlooms and other cottage industries, being in power, will compel us all by law to use only articles produced by these industries. From the day the Congress Governments came into power some seven years ago, they have been undisguisedly devising ways and means to bolster up what is almost a lost cause. It began only with modest State patronage for handloom cloth and hand-made paper. It was soon found that this spoon-feeding on a token scale neither helped this section of industry, which because of natural causes had been wasting away like a tuberculous patient, nor advanced the cause in any manner with the indifferent public. After all, it is only the free and voluntary preference of the masses and not official patronage, that can keep any industry in commission for long. And the masses refused to be moved.

Exasperated at this failure, those amongst the Governments, who are not much troubled with the political niceties of democracy or much concerned about respecting the wishes of the people, began to think of more drastic means of inveigling the public into buying the products of cottage industries. All this was to be done, of course, with the taxpayers' money. If the people, as such, had the slightest regard or soft corner for hand-made goods, they would have shown their preference in the one and unmistakable way of purchasing these articles even at a higher cost. But subsidies and other financial aids failed to create a big enough market for these products to enable the handloom and other cottage industries to keep their heads above water. It takes an expert swimmer with a fund of stamina to make his way against a strong current and even he cannot just go on doing it indefinitely.

Any sensible Government would have been put on its guard by these initial failures. Such a Government would have gauged the true capacity of these industries about the number of persons or families they could keep profitably in employment and they would then have started looking about for ways and means of finding work for those in excess. Even the most mechanised country offers some scope for specialised and artistic products and, with every rise in the standard of living of its people, this scope is automatically increased. A poor people with low living standard like us cannot afford the luxury of maintaining a huge handicraft industry.

It is not as if these votaries of the mediæval age in economic evolution, who are in authority today, are not aware of the implications of their outmoded policy. They are not so unintelligent or out of touch with the times in which they live as not to realise the incongruity of their schemes with the economy of the country or of the rest of the world. But almost unlimited political power has an unfortunate tendency to cloud and confuse reason and the capacity to take a balanced and unbiased view of things. And, in this particular instance, as in that of prohibition, it is not merely a case of power going to the head of certain party leaders and Ministers. With most of them, *khadi*, hand-pounded rice, *ghani* oil and similar other things have assumed the sacredness of religious symbolism.

These things are no longer primary, physical necessities of life and as such merely matters of economic adjustments. When religious emotions came to be combined with political power, the resulting product, most frequently, by some strange spiritual alchemy is not chastened and tolerant exercise of authority, but unbridled fanaticism. When so moved, these potentates are apt to throw all the wise and wholesome limitations with which power in a democracy is hedged in and to use the last dram of it in cramming what they rever as great spiritual truths down the unwilling throats of poor, misguided unbelievers. Failure only drives them into greater desperation and, as in the case of prohibition in some of the States, into progressively more and more savage forms of punishment for transgressors. Things have not yet come to this pass in the case of cottage industries in general and handlooms in particular. However, those who have followed the course of this movement with any care, could not have helped noticing that, when modest measures fail, more arbitrary and powerful weapons are drawn from the political armoury and used without any scruples or without counting the cost.

When positive aid failed to bolster up these decayed and dying industries, these priests of the temple turned their eyes to rival creeds. If these could be put into heavy chains and weakened, a greater field might be opened for their gods. From unfair discrimination in favour of hand-made goods in the matter of taxation and official purchases, it was an easy, though not a short, step to the levy of special financial burdens on mechanised industries and directing these funds towards granting further monetary aid to the unfortunate products of handlooms, which few outside the Government offices wanted to purchase. Even oxygen and forced feeding failed to put them back on their feet which, the worshippers in their devotion failed to notice, were of clay. The public continued to be perverse and refused to accept the lead from its rulers.

This unhelpful attitude of the public towards their pet fads virtually infuriated some of our satraps. To overcome their chagrin and virtually to compel people to buy goods of the Government's and not of their own choice, they cut down the field of operation of the cotton industry, by restricting their production of the articles most in demand. Like all desperate and ill-conceived measures, this one misfired. It did not have the desired effect, unless it was to punish the obdurate public. The handlooms failed to benefit from this partial reservation in their favour. Even the increased price they received for their bordered *dhotis* and coloured *saris* did not help them to be self-supporting. All it did was to make the people pay more for these articles to the mills. Even an unsophisticated villager knows that he can take his bullocks to the trough; he cannot force them to drink. Perhaps, our wiseacres in New Delhi, Madras, Calcutta and Bombay take the masses to be less self-willed than horses and bullocks. They hold that the people can be made to drink from a *Sarvodaya* trough by an overriding ordinance.

It was at this stage of near despair that a crisis came to the help of the determined priests of this temple, which was fast losing its following. Unemployment, which had always been there, took a menacing form. It threatened not only the political stability of the party in power but of the country as a whole. Not being sufficiently schooled in the operation of economic forces, these priests of the temple almost welcomed this new development. When knowledge is made to wait outside, superstition gets hold of the mind and many a religion has found a good ally in superstition. It was put forth with the confidence of a quack, in spite of all evidence to the contrary, that cottage industries alone could supply the required exent of scope for employment. It was forgotten that, for fifty years or more, this wing of industry had failed to find gainful employment even for those who were traditionally born within its sphere.

Cottage industries had failed to maintain, even in comparative penury and poor living standards, those few who found themselves unable to abandon them for various reasons. This failure was all the more remarkable, in view of the powerful impetus given to them by Mahatma Gandhi, with the full force of his great personality and influence with the masses of the country. It was all the more significant, because the use of these products was raised to the status of a political cult for winning independence from foreign rule. It was promoted and practised and it is still being practised, rightly, as a symbol of culture and refinement. If handicrafts could not rise beyond a symbol of cultured and protected life of a few even with this tremendous backing, if they failed to wield a mass appeal even with the aid of the organisation which Gandhiji built up for popularising them, when all the social forces worked in their favour, there is little hope of their expanding to a scale large enough to solve, within any reasonable period of time, the widespread unemployment of today, merely as a result of the futile and puny efforts of the few fanatics, who have been left in the country with their blind faith in cottage industries.

When the Prime Minister and the Union Minister for Industries, after paying a sentimental and token tribute to cottage industries, and mentioning them merely as a testimony of their faith, are talking of rapid industrialisation of the country and when they are busy launching great schemes for mechanised production of steel, fertilisers, locomotives, machine tools, aircrafts and ships as a part of Government's own programme for the public sector, the Rip van Winkle of Mr. Gulzarilal Nanda, who unfortunately has been put, at least nominally, in charge of planning, is still thinking exclusively and piously in terms of cottage industries as the economic panacea for the country. Having lavished funds and political influence and prestige on the All-India *Khadi* and Village Industries Board and found it still ineffective and barren, he now proposes, as he gave out at Ahmedabad the other day at a Press interview, to turn this into a statutory organisation.

This could only mean that persuasion and propaganda by the Board having failed to advance its sacred cause, it should now be invested with some sort of authority to coerce large-scale and mechanised industry and the people into worshipping his gods and making compulsory offerings to them. I frankly see in this innocent-looking announcement of the still more innocent-looking Minister, a great threat and menace to the economy of the country. I want the industrialists in the country to underscore his words that Government would effect some control on large-scale industries, so that selected small-scale industries could not be subjected to unfair competition. Any competition which adversely affects one's pet institutions is bound to be taken as unfair and so, of course, rightly to be exterminated, provided one has the power to do so.

It was kind of Mr. Nanda to discountenance the proposal for organising picketing against the use of machine-made goods, but the fact that the advocates of cottage industries are contemplating such measures not only shows to what length they are prepared to go, but also exposes, as nothing else could, that the people in the mass are at any rate indifferent, if not against, cottage industries. For any Government to go persistently against the wishes of the sovereign people and to tax them for a purpose in which they have no faith is anything but democratic. Even if such a political attitude be right, it is more in keeping with Hitler's Germany and Stalin's Russia than Nehru's India.—*All Rights Reserved.*

PRESIDENT'S ADDRESS TO PARLIAMENT

PURCHASE TAX TO REPLACE SALES TAX

(From A Special Correspondent)

NEW DELHI, 16*th February*

DELHI LETTER

THE President's address at the opening of the budget session of Parliament yesterday was a somewhat dull and disappointing affair. His speech did not reveal any new lines of Government's policy. Nor did it indicate the policy that the Union Government would be pursuing in the coming months. The general tenor of his speech was insipid, inasmuch as the public already knew the various developments both in the political and economic spheres. When such is the case, it is ununderstandable as to why Parliament should spend two to three days in discussing his address, especially as it will have a good deal of opportunity to offer constructive criticisms at the passing of grants to the various Ministries in the next month.

On the economic front Dr. Rajendra Prasad was full of praise for the community projects and the National Extension Service, particularly for the encouraging contribution of the people. He expressed satisfaction at the continued improvement in the general economic situation. Production of foodgrains which recorded a substantial improvement of five million tons in 1952-53 is expected to show a further handsome increase during the current year and the goal of self-sufficiency in food is now very near reach. The President stated that industrial production was standing at the highest level since the war, but showed great concern at the existence of a considerable volume of unemployment.

The President's partiality to cottage industries is well known and on this subject, he observed: "My Government attach special importance to the development of cottage industries. I regret, however, that progress in this respect has not been very satisfactory. It is hoped that the efforts of the All-India Khadi and Village Industries Board as well as the All-India Handloom Board and the All-India Handicrafts Board will yield substantial results in the near future." In regard to river valley projects, he pointed out that five new projects, namely, the Kosi, the Koyna, the Krishna, the Rihand and the Chambal had been included in the first Five-year Plan. According to the President, the present budget session has a vast legislative programme. There are 28 Bills pending and among these, he mentioned specially the Bills dealing with the reform of the Hindu law and also that relating to judicial procedure with a view to expediting these processes and lessening the expenditure involved in them.

Purchase Tax

The possibility of the purchase tax substituting the existing sales tax in certain directions is becoming brighter in the near future. The Officials Committee which discussed the whole question in October last, following the situation created by the recent Supreme Court judgment relating to the tax on inter-State sales, is reported to hold the view that "a permanent solution in respect of sales tax on inter-State trade (where a State desires to levy such tax) must be sought on the lines of a purchase tax to be levied on its own residents by the taxing State, so as to avoid the vexations and complications of taxing non-resident dealers." In other words, for internal transactions, the sales tax will continue to stay, while for inter-State transactions, the purchase tax is likely to be enforced. Although there is a section of the public which holds the view that the sales tax should be made a Central subject and that the proceeds thereof could be distributed by the Centre to the States on a certain basis, many State Finance Ministers have been opposing this development on the ground that each State differs from the other in respect of social and economic conditions and that a uniform all-India sales tax cannot be a workable proposition. In the States also, the sales tax has now become more or less a purchase tax in the sense that it is the purchaser who has been asked to pay the tax, thus shifting the incidence of the tax on the purchaser.

In many foreign countries, the sales tax has either taken the form of a purchase tax or turnover tax. In the U.K., for instance, since there is no question of inter-State transaction this tax is called purchase tax. In April, 1946, the then Chancellor of the Exchequer said: "I do not regard this as a temporary tax or as a wartime aberration . . . to be hastily swept away. On the contrary, my view is that the purchase tax has got to stay, and must yield an increasing revenue over the next few years to help pay the bill for social betterment. Its yield will rise as the production of taxable goods increases. This tax, in present conditions, not only raises revenue but also . . . 'mops up' . . . purchasing power, and also helps to prevent inflation." Thus in the post-war period, the tax has remained, not only as a device for combating inflationary tendencies, but also as an important source of revenue. In 1951-52, the total yield from this tax amounted to an impressive amount of £338 million. This tax is not a turnover tax since this tax is being levied in that country largely on luxuries and some other consumption goods such as tooth brushes, razor blades, knives and forks, electric light bulbs, clocks, pens, pencils, writing paper, etc. In India also the amount from the sales tax and the proposed purchase tax is likely to go in an upward direction with the improvement in the living standards of the people.

The Government of India is stated to have come to a definite agreement with the Burma Government regarding the bulk purchase of rice. As per this agreement, India will be importing about six lakh tons of rice during this year from that country. The price settled is stated to be high at £50 per ton and inclusive of transport and incidental charges, it will work out at well above Rs. 800 per ton. As compared with the current prevailing prices in the producing centres, the rate for Burma rice may be considered somewhat high, especially if the quality of rice to be imported is taken into consideration. This rice deal costs India Rs. 40 crores and it is suggested that a part of the above sum will be adjusted against the debt which Burma has to pay to India under the Separation Agreement of 1935. The outstanding amount is now computed at about Rs. 48.15 crores. This sort of agreement will be helpful to India from two angles. First, India will be able to build up its reserve of rice appreciably and may be able to pursue its policy of progressive decontrol at an accelerated pace. Secondly, to the extent that India is able to set off a portion of the purchase money against the debt due from Burma, it will have a disinflationary effect on the Indian economy.

Steel Plant

At long last the Government of India has been able to arrive at a definite decision regarding the location of the steel plant after prolonged discussion and consultation. This prolongation has largely been the result of the Government's anxiety to avoid unnecessary and unedifying controversy during the coming weeks on this subject. In coming to the decision to establish the plant at Rourkela (Orissa), the Government is mainly motivated by economical and technical considerations in accordance with the recommendations of the German combine which will be associated with its execution. The Production Minister, Mr. K. C. Reddy, will be making a statement on this subject today in Parliament when he will narrate the reasons that guided the Government of India to prefer Rourkela to Bilhai or Durgapur. According to the German collaborators, the proposed plant in Orissa will produce steel at relatively attractive rates as compared with those prevailing in the world. This apart, Government has favoured the site at Rourkela from a strategic point of view as against the claims advanced by West Bengal for Durgapur where there is already a concentration of a number of industries. Further, if the Madhya Pradesh site were to be selected, the problem of electrical supply will arise and additional expenditure will have to be incurred for erecting a thermal plant which will again take some time. The location of the new steel plant in Orissa will build up the economy of this backward State, since Orissa is stated to possess vast mineral resources of varied nature. Now that the Government of India proposes to establish another steel plant during the second Five-year Plan, it is expected that it will choose Bilhai for its location at that time.

DOMESTIC BUDGET PROSPECTS

NO RELIEF IN PURCHASE TAX

(From Our Own Correspondent)

LONDON, 13*th February*

LONDON LETTER

WITH less than two months to go before the end of the financial year, the annual exercises on the part of Government and industry are taking place to patch up the wrong estimates of the past budget and to provide for the future. This coming week, Parliament will be asked to vote additional expenditure of about £80 million partly for Service needs but largely also for the Home Departments, of which the Ministry of Food is the principal in this case —the additional money being required to sustain the agricultural guarantees to the farmers in the face of falling world prices. Up to date the Government have already exceeded the expenditure estimates by £150 million, so the grand total of unbudgetted-for expenditure will be £230 million. Of this total, nearly two-thirds is accounted for by the Ministry of Food—again for the same general purpose of sustaining the guaranteed farm incomes.

Up to date, revenue has been coming in above expectations and the current surplus covers a substantial part of the excess expenditure. It is also possible that hidden economies have been made which will further offset some of the additional spending. A year ago, the Chancellor reckoned to end his budget with a surplus of some £100 million, and, although the indications are that this will not be achieved, neither will the possible shortfall be as great as the new expenditure estimates presented to Parliament might suggest.

Need for Tax Reductions

Industry has begun making representations to the Chancellor about the need for tax reductions in various directions and insistent pressure has come from the trades which have to pay substantial purchase tax varying from 25 to 75 per cent. of cost prices. This tax brings in £260 million a year and, although it was first introduced as a means both of contributing to the revenue during the war and of reducing consumption, it was regarded as a temporary expedient. It now appears to be suffering the same fate as Mr. Gladstone's income-tax and looks likely to go on for ever. The trouble with it is that it brings in too useful a revenue to be lightly disposed of.

Unlike income-tax, the tendency since the war has been to reduce it and, although on some occasions in the past there were increases, a Chancellor who increased the purchase tax under other than crisis conditions could hardly now hope to get his budget through the House. But since reductions in tax mean losses for traders holding the goods concerned, and whenever rumours of possible tax reductions are about the public hold off buying, the tax has become a considerable nuisance to trade. Ever since Christmas, retailers have been pressing the Government to make their intentions about the tax clear, the more so since the Chancellor has the right to alter the rate of tax at any time in the course of a financial year. Mr. Butler has now ended the uncertainties and told the country that the realities of budgetting make it impossible to reduce purchase tax either before or in the Budget. However unpalatable this news is—and it bears especially hard on the textile trades, the least prosperous section of British industry—there is some compensation in the ending of uncertainty. It is apparently the first time that a Chancellor of the Exchequer has revealed a major Budget decision well in advance of the Budget.

An important implication of the decision not to reduce the tax is that the Budget prospects for the coming year are not particularly favourable. No doubt if the Chancellor is able to make any remissions in taxation it will be principally through changes in personal taxation. But, undoubtedly, Mr. Butler's Budget has been made more difficult by the constantly rising tide of expenditure. He had been hoping by now to have eliminated the food subsidies, instead of which he finds that, as fast as he gets the consumer subsidies down, the producer subsidies to the farmers have to go up. It is no longer the consumer who is getting the benefits of cheap food through the incidence of taxation, but the consumer who has to pay the producer through taxation for maintaining the level of British agriculture!—*All Rights Reserved.*

AMERICAN LETTER

ECONOMIC READJUSTMENT WILL BE COMPLETED SOON

BIG INDUSTRIES PLAN FOR MORE INVESTMENT

(From Our Own Correspondent)

NEW YORK, 11*th February*

AMONG the outstanding events influencing business in the last two weeks were the successful U.S. Treasury $21,000 million refunding financing, the lowering of the Federal Reserve re-discount rate from 2 to 1¾ per cent., the easing of money rates in other segments of the markets as well as the issuance of the report by the President's Randall Commission which proposed a more liberal foreign trade policy.

Easiness of money is a deliberate policy of the monetary and credit authorities, while there is no sign that the business adjustment has come to an end, in order to provide an ample flow of funds to satisfy the necessary needs of the Treasury, States, Municipalities and private business.

The markets reacted splendidly. Bond prices rose further in response and the average yield for general obligations dropped below 2.4 per cent. in the first week of February. It was 3.06 per cent. last June and prices for tax-exempt bonds have been rising 13 per cent. since that time.

Lower financing costs will enable the various turnpike and thoroughfare authorities to finance their vast construction programme cheaper and it should help stimulate business activity in all industries contributing their materials, including machinery, heavy construction and building.

The Treasury securities markets have been all on new highs. And one of America's leading corporations, General Motors, announced it would spend between $1,000 and $1,500 million for expansion within the next two years. Confidence is the by-word in most segments of the economy.

The General Motors statement was followed by reports from the steel industry that it would spend about $750 million this year for expansion, against about $1,000 million last year.

Statements by bank chairman and presidents at their annual stockholders' meetings in January were of the same buoyant note. Most of them thought that demand for loans would be high in the first half of the year, although obviously depending on immediate money market conditions. None ruled out the possibility that interest rates would turn down further and that the prime lending rate may be cut as well, following that for commercial paper and other instruments.

Commodity Prices

Commodity prices have continued fairly steady, with the exception of coffee and cocoa which have continued to rise. One somewhat disturbing element which remains to be solved is that of farm surpluses, price supports and international distribution. The deadline is now past for getting 1953 wheat under Federal loan. Estimates are that the Government currently controls some 899 million bushels, of which more than 460 million bushels come from the 1953 crop and 439 million bushels from previous harvests. It is a new record.

A similar situation prevails in cheese. The seasonal output rise is now under way and indications are that the volume which will come in for price support will be very large. In the early part of January, cheese production was up 20 per cent. over 1953 and 15 million pounds of cheddar cheese sought official support on top of the 219 million pounds in the last nine months of 1953.

These are two glaring examples of farm surpluses. Both the Department of Agriculture and Congressional quarters are debating what to do about them.

Consumer credit rose to a new high in December, but the rate of increase slowed sharply, as compared with 1953. Consumer short-term credit climbed up by $644 million that month. It brought total outstandings in that category to $28,800 million on 31st December last, or more than $3,000 million above the figure reported twelve months previously. The significant element was, however, that the increase of last December was only about one half as much as the $1,200 million addition in December, 1952. Instalment loans, in fact, dropped to a level more than $500 million below that of 31st December, 1952. Smaller instalment purchases accounted for some of the retail-sales slow-down, especially in such goods as appliances and automobiles.

Meanwhile, deposits of the more than 14,500 commercial banks in the U.S. exceeded the $200,000 million mark for the first time at the year-end. The rise was about $6,000 million for the year.

There is also very little to complain about income receipts for individuals which ran at the rate of $285,000 million annually during December. This was $1,000 million below the November pace because of factory payroll reductions, but these were mostly overtime and not necessarily layoffs.

Thoughtful observers report that industrial business picked up momentum towards the end of January. Production and orders declined somewhat, but at a lower rate than in December, so that the predictions by President Eisenhower and others to the effect the American economic adjustment will be completed fairly soon, sound plausible.

Construction activity continued extremely strong in January. The total value was placed at $2,425 million, off 9 per cent. from December which is seasonal, but still 3 per cent. higher than in January, 1953.

Foreign Scene

On the foreign scene, the quasi-deadlocks in Korea and Berlin proved no particular surprise to the American public, although the Indo-Chinese situation is causing some serious concern to insiders.

American exports in 1953 were estimated at more than $15,500 million, but, if military exports are excluded, this means commercial exports were probably 8 per cent. below the 1952 aggregate. Imports to the United States totalled an estimated $10,877 million, just about the same as in the preceding two years.

This development, coupled with the growing loss of gold by the U.S.—to the tune of more than $1,000 million last year—continues to contribute to the increasing economic health in the Western world's international trade.

The recommendations of the President's Randall Commission aim in the same direction. They suggest for the President to reduce duties gradually and to have price supports changed, so that U.S. crops could be sold overseas.

The report criticised international pacts to regulate trade in raw materials, but it did advocate measures to foster more trade for "peaceful goods" between Eastern and Western Europe. It suggested to keep the embargo on exports to Red China and the continuation of regulations for shipments of strategic items to the Soviet bloc, generally.

Politically, it is a sound report which will no doubt be backed by President Eisenhower who enjoys as much popular confidence today as when he took office early last year.—*All Rights Reserved.*

(Concluded from next column)

order to enable Pakistan to tide over the critical food situation, about 550,000 tons have already been delivered. Another consideration which seems to have weighed with the Pakistan Government in its latest move is the highly encouraging wheat crop due to be harvested in April next. The crop, it is said, may turn out to be quite sufficient to meet the country's needs in full and even to leave a small surplus.

Pakistan had a favourable balance of trade with the U.K. to the extent of over £2 million during the first two months of 1953. The value of Pakistan's exports to the U.K. was £24.68 million, while that of imports was £22.54 million.

It is understood that the Indo-Pakistan rail conference, which was to have been held at Karachi this week, has been postponed. No new date has been fixed, but indications are that the conference will be held towards the end of the month.

PAKISTAN NOTES

STATE TRADING IN COTTON

GOVERNMENT TO INSTITUTE ENQUIRY

THE reported decision of the Government of Pakistan to institute an enquiry into State trading in cotton (and also jute) during 1952-53 has come not a day too soon. The decision is a sequel to the bitter criticisms that have all along been expressed by cotton circles in Pakistan against the bulk handling of cotton by Government through the Pakistan Cotton Board. These criticisms are on the score that the system of bulk purchases and bulk sales adopted by the Government is defective in several respects. It is pointed out, for instance, that a disquieting effect of the official interference with the cotton market has been the distortion of the cotton price pattern. Again, the price support scheme followed by the Board during 1952-53 resulted in considerable loss to the Exchequer, amounting to as much as Rs. 4.5 crores, thanks to the world-wide recession in cotton prices. It may be noted here that the price support scheme was withdrawn on 1st September, 1953. Incidentally, the Government lost no less than Rs. 9.5 crores on its jute price support scheme.

The proposed enquiry into State trading in cotton is expected to cover two important issues: (1) Whether the purchase and sales of cotton during 1952-53 were effected by the Cotton Board in the appropriate manner; and (2) whether the heavy loss sustained by the Government could have been reduced. The findings of the enquiry will be awaited with much interest, not merely by cotton traders in Pakistan but also by the overseas importers of Pakistan cotton. The enquiry, it is to be hoped, will result in the adoption, by the Government, of such measures as would enable the cotton market to function effectively without the need for official interference in its day-to-day affairs.

Industrial Development

The implementation of the several projects undertaken by the Pakistan Industrial Development Corporation is expected to be in full swing during the current calendar year. Thus, according to Mr. Gulam Faruque, the Corporation's Chairman, ten factories will commence operation before the end of the year. These include four jute mills in East Pakistan, one sugar factory at Jauharabad, a caustic soda factory, a D.D.T. plant and a paper board mill at Nowshera, a cotton mill in East Pakistan, and a strawboard mill at Rehwali.

The successful completion of these projects is expected to be rendered possible by adequate Government assistance to the tune of Rs. 17 crores. Assuming that this sum will be advanced, the aggregate capital outlay incurred by the Corporation up to the end of the year will amount to nearly Rs. 60 crores. The major portion of this sum, Rs. 35 crores to be precise, is accounted for by advances from Government, the remaining being contribution from the public.

Further U.S. Aid

One more operational agreement providing for U.S. economic aid to Pakistan has been signed by the Governments of the two countries. Under this agreement, the U.S. Government will make available $750,000 towards meeting the expenses for the engineering services for the Karnafulli multipurpose project. A reputable U.S. firm will visit Pakistan shortly to help the Government in drawing up detailed designs and specifications of the project. The firm is also ready to prepare a schedule of construction and to assist in inviting tenders. Four other operational U.S. Pakistan agreements were signed a few days earlier and these relate to fertiliser factory, timber-extracting project, supply of chemical fertilisers and plant protection project.

Supply of U.S. Wheat

It is learned that the Pakistan Government is contemplating to cancel the request for the 300,000-ton free emergency wheat supply from the U.S. This move is said to be a sequel to the difficult conditions with regard to storage. The shipments of U.S. wheat have been so rapid in recent months that the Government is said to be faced with the problem of finding storage accommodation. Out of the free wheat aid of 700,000 tons (this excludes the emergency allocation of 300,000 tons referred to above) granted by the U.S. Government last spring, in

(Continued in previous column)

ROLE OF BANK CREDIT IN FINANCING THE PLAN

I.M.F. MISSION ENVISAGES ONLY LIMITED SCOPE

THE Mission of the International Monetary Fund, headed by Mr. E. M. Bernstein, has in its report on the economic and financial situation in India, entered into an intelligent discussion on the effect of the expansion of bank credit (by which is meant not only the credit provided by commercial banks but also by the central bank of a country) to finance development projects under the Five-year Plan. This discussion evidently originates from the controversy in this country on the issue of deficit financing. One section holds the view that, with the widespread under-employment of labour, no great impetus to inflation would result from the expansion of bank credit for productive investment. As opposed to this, another school of thought has expressed apprehension at the dangers of inflation, since it would be difficult to judge as to when and to what extent bank credit could be safely resorted to finance the Plan. In view of this controversy, the I.M.F. Mission has done well in addressing itself to this and making certain well-considered observations, which merit the close and careful attention not only of our policy-makers and administrators but also of our economists and students of economics.

At the outset, the Mission examines the assumption that deficit financing in underdeveloped countries where a considerable part of the labour force is employed in low output work in agriculture, will not be inflationary. The contention of this school of thought is that the contribution of such marginal workers to output is exceptionally small in India, because of the limited supply of land. If such marginal workers are transferred to the construction of dams, roads and other investments, it will result in little or no reduction in the output of food. And, in time, the investment which is undertaken with their labour will increase the output of food and other consumer goods. The conclusion is then reached that for these reasons the expansion of bank credit to finance development would not be inflationary. The Mission says that this assumption is wrong, because when the workers are transferred from agriculture to other works, they must be paid. The result will be that their wages will add to the income arising from agriculture. Thus, the aggregate incomes will be increased as a result of investment and prices will rise because there will be no automatic increase in the supply of consumption goods. Thus the argument that investment results in increased production in future is no guarantee that the creation of bank credit to finance such investment will not give rise to inflation *now*. In other words, the time lag between current demand and future supply is bound to create inflationary tendencies in an underdeveloped country.

The Mission then proceeds to consider another question which arises from the above, namely, whether, at a later stage, when the investment results in a larger output of consumer goods, the same level of investment will be inflationary. Suppose that, after an interval of two years, the effect of the new investment is to increase agricultural production annually by an amount equivalent to the additional investment financed by bank credit. Even then, it observes, the maintenance of the same level of investment would generate inflation. Explaining this point further, it states that the increase in output accrues as income to some part of the economy, except when it results in additional tax revenue, or is set aside as reserves for depreciation. While some of the increase in income will be saved, most of it will be spent. Thus, the larger part of the increased output is matched by increased expenditure. Only that part which remains as savings, taxes or depreciation reserve is available to finance the new higher level of investment.

Positive Role of Bank Credit

On the strength of reasoning noted above, the Mission does not rule out entirely the method of resorting to bank credit for financing development. It says that "it must not be assumed that because the creation of bank credit to finance development may lead to inflation, there is no positive or constructive role for an appropriate credit policy. On the contrary, because there is a deficiency of real resources, credit policy must be alert to ensure that a deficiency of money, as distinguished from a deficiency of real resources, does not further impede development. And it must be alert to ensure that whatever credit is made available through the banking system has the greatest possible effect by increasing production." Thus, the Mission points out that, because there is a gap between money supply and material resources, there is scope for using bank credit. For as the Indian economy develops, a gradual increase in money supply will be needed. The increase in money supply that will be necessary is likely to be not less than in proportion to the increase in production, and it may have to be somewhat more if industry and commerce and even agricultural production for market gain in importance relative to agricultural production for the village community. Such an increase in the money supply is clearly not inflation, and a smaller increase may prove to be inadequate for the needs of a stable economy.

Two Ways of Increase

How to increase the money supply when it is needed? This is the poser which the Mission sets out to explain after establishing the need for increasing the money supply as stated above. It points out that there are only two ways in which money supply can be increased, namely, (*a*) by strengthening monetary reserves, which is possible by the acquisition of foreign exchange assets, and (*b*) by the creation of bank credit. For India, says the I.M.F. Mission, it would not be desirable, in the next few years, to link the growth of the money supply with the accumulation of additional reserves for the development programme. For only for a time it can draw on its sterling balances. But soon a time will come when the reserves will have to be brought into appropriate relation with India's needs. It may become necessary to begin a gradual process of building up reserves to keep pace with the expansion of India's international trade and payments. The time when such a change in policy will be necessary is, we are told, beyond the period covered by the Five-year Plan. For the present development programme, growth in the money supply will not be accompanied by any increase in monetary reserves; on the contrary, it will have to be brought about, it is stated, in the face of a decrease in monetary reserves.

After pointing out how there are limitations for increasing money supply by building up reserves, the Mission next proceeds to examine

SATISFACTORY RESULTS OF HABIB BANK

LIQUIDITY RATIO STILL HIGH

THE monetary and banking trends of a country are inevitably linked to the state of its overall economic activity. Any change, either for the better or for the worse in the economic conditions of the country will, therefore, be reflected in the working results of its banks. The past year witnessed a contraction in the economic activity in Pakistan, particularly in the field of foreign trade. Commodity prices were lower than in the previous year and there was a fall in money income in the agricultural sector. All these factors, therefore, cast a greater responsibility on the part of banks to follow a cautious policy in their activities, even if it meant a decline in their earnings.

Judged in the light of the foregoing factors, the performance of the Habib Bank Ltd. (General Manager: Mr. Razak H. Mahomed, Karachi), one of the leading commercial banks of Pakistan, in 1953, as testified by its audited accounts for that year, can be said to be satisfactory. The gross profit (before providing for taxation) amounts to Rs. 56.66 lakhs, a drop of nearly Rs. 11 lakhs as compared with the record profit for the previous year. The provision for taxation has been reduced from Rs. 40 lakhs to Rs. 28 lakhs, so that the profit available for other appropriations is actually higher by more than Rs. 1 lakh. The Directors have not chosen to strengthen the reserve funds this year also. But this does not matter, because the Bank has already a large reserve fund. Further, the undistributed surplus is higher than a year before, being as much as Rs. 26.77 lakhs as compared with Rs. 18.11 lakhs brought in. The dividend has been maintained at the liberal rate of 20 per cent. per annum, a rate which had been paid for the preceding two years.

The following comparative table provides an idea of the Bank's progress during the last three years:

(In lakhs of Pak. rupees)

	For the year ended 31st December			
	1953	1952	1951	1950
Gross income	134.80	139.23	137.02	125.44
Interest paid	20.80	16.66	17.12	17.76
Expenses	55.11	52.67	50.82	49.64
Depreciation	2.22	2.23	8.31	8.76
Profit	56.66	67.63	67.37	54.29
Appropriations—				
To taxation ..	28.00	40.00	28.00	21.00
To reserve	..	..	15.00	17.50
Dividend	20.00	20.00	20.00	10.00
	(20%)	(20%)	(20%)	(10%)
Carry forward ..	26.77	18.11	10.48	6.11

	As on 31st December			
	1953	1952	1951	1950
Capital	1,00.00	1,00.00	1,00.00	1,00.00
Reserve funds ..	1,00.00	1,00.00	1,00.00	50.00
Deposits	87,27.06	84,57.84	43,82.81	35,13.05
Advances and bills discounted and purchased ..	7,74.84	7,72.56	11,45.20	8,99.65
Investments	24,03.45	20,24.89	23,11.41	22,81.81
Cash	7,09.74	9,82.81	13,38.76	6,95.90
Balance-sheet total ..	47,69.02	43,81.51	62,01.01	45,72.77
Ratio to deposits of—	%	%	%	%
Advances	20.8	22.8	26.1	25.6
Investments ..	66.9	58.5	52.7	63.8
Cash	21.4	28.4	30.4	19.6

It will be seen that there has been a drop of Rs. 4.93 lakhs in the gross income. In the absence of the break-up figures, it is not possible to say whether the decline is due to a fall in interest and discount earned or in commission and exchange or in both. Accompanying this shrinkage in earnings is the rise of Rs. 3.64 lakhs in interest paid and of Rs. 2.44 lakhs in expenses. These variations account for a contraction of Rs. 10.97 lakhs in the gross profit.

As will be noted from the latter half of the table above, there has been an increase of Rs. 3.88 crores in the balance-sheet total. This does not mean that there has been an increase in the Bank's turnover. Of this increase, deposits account for Rs. 2.69 crores. This is in consonance with the general trend of bank deposits in Pakistan, which is said to be due to increase in idle balances, consequent on the slackness in economic activity, sizable Government disbursements inside the country and a favourable turn in the balance of payments on private account. There has practically been no increase in the Bank's advances and bills purchased and discounted, with the result that the ratio of bank credit to deposits has fallen from 22.3 per cent. at the end of 1952 to 20.8 per cent. at the close of 1953. Investments have been strengthened by Rs. 4.68 crores, while cash balances are lower by Rs. 1.83 crores. However, the total liquidity ratio stands at a very comfortable level of 88.3 per cent., as compared with 86.9 per cent. at the end of 1952. Investments are shown at cost or market value, whichever is lower. A break-up of investments shows that Government, municipal and trustee securities have been increased by Rs. 4.49 crores, shares in joint-stock companies by Rs. 9.33 lakhs and bullion by Rs. 10.28 lakhs.

EARNINGS OF LLOYDS BANK RISE FOR SEVENTH YEAR IN SUCCESSION

DIVIDEND RAISED AFTER OVER TWO DECADES

THE financial results of Lloyds Bank Ltd. (Chairman: Lord Balfour of Burleigh, London) for the year ended 31st December, 1953, show no deviation from the general pattern of earnings of British banks to which reference was made in an earlier issue of this journal. They disclose that, despite the fall in credit portfolio for the second year in succession, in common with most others, the Bank's profit has gone up, but only by an extent less than that noted in the previous year. The improvement in profit may have been due partly to higher interest rates on advances and bills and partly to the steady trend of Gilt-edged values during 1953 which did not call for any large-scale drawings from the earnings to cover the capital losses as in the previous year. It cannot, however, be presumed that no provision has been made for any diminution in value of assets, for the published profit has been arrived at only after making transfers to the contingency accounts, out of which full provision is usually made for any such depreciation.

The profit, after providing for taxation and after making transfers to contingency accounts as stated above, amounts to £2,083,781, an increase of £119,116 over that earned in 1952. Thus, the upward trend in earnings that started in 1946 has been maintained. This increase, however, slightly falls short of that of £148,807 witnessed in the profit for 1952. The profit would have been much higher but for the decline in advances and the continued increase in administrative expenses. Nonetheless, the Directors have thought it fit to raise the dividend level, which had been maintained from 1932 onwards at 12 per cent., to 14 per cent. for the year under review. A notable feature of the Directors' decision to raise the dividend level is that it has been done at a time when the outlook for profit on (*sic*) no means promising. In saying this, we do not mean that the ability of the Bank to repeat the higher dividend in the coming years is in doubt. The dividend is so well covered by the present level of profits that, even if the latter were to decline a little in the coming years, it should be possible for the Bank to maintain this dividend. But, generally, no board of directors will recommend a higher dividend when there is a likelihood of reversal of the trend of profit. The Bank's Chairman himself is not sure that the future earnings will be maintained at the present level, if the steady decline in loans and advances persist and the growth of the staff costs and running expenses continue. Why then did the Directors of Lloyds Bank decide to pay a higher dividend? The answer is the need for doing justice to shareholders. Explaining this point, the Chairman remarked:

". . . It has been considerations of public policy which have been largely in your Directors' minds in recent years in refraining from altering our rate of distribution. But—and especially in our own case, as our reduction was more drastic than that of others—it has become at last a matter of simple justice to the shareholder that we should permit some alleviation of the restraint which we have so long imposed on ourselves and on him."

It is necessary to add here that readers should also peruse the further elucidation given by the Chairman which is published on page 319 of this issue.

The dividend level has been raised by stepping up the final distribution from 6 per cent. to 8 per cent., the interim one having been kept unchanged at 6 per cent. The higher distribution has, however, been made only after allocating a sum of £500,000 to the general reserve and £300,000 to the reserve for future contingencies. Last year, it may be recalled, the general reserve was strengthened by the addition of £1.2 million, while the inner reserve did not receive anything from the published profit. The undistributed surplus left to be carried over is higher, at £555,780, than that of £418,242 brought in from the previous year.

The decline in the balance-sheet total noted at the end of 1952 was partially restored at the end of the year under review, as will be seen from the table in the adjacent column, thanks mainly to a rise in deposits. In refreshing contrast to the small contraction in 1952, the Bank's deposits have risen by as much as £35 million to stand at a record level of £1,203 million. For the second year in succession, the Bank's liability for acceptances, endorsements, guarantees and other obligations (contra item) has declined, the drop in 1952 being, however, of a smaller degree than in 1952. On the assets side, loans and advances show a fall of £21 million; in 1952 too, this item suffered a decline, of £32 million to be precise. This is not a feature in the case of Lloyds Bank alone; it is in conformity with the general trend of bankers' advances which is the result of the Government's policy of restricted credit. The largest decline in advances is said to have been in the categories of public utilities and personal and professional borrowers. The Bank's holdings of British bills of exchange have gone down by £2 million. These, together with the decline of £27 million in acceptances, endorsements, etc., have brought down the Bank's main forms of advancing to the private sector by as much as £50 million, as against £93 million in 1952. This has been offset by expansion in Government obligations, both short-term and long-term. Thus, British Treasury Bills have risen by £50 million and Dominion, Colonial and foreign Bills by over £2 million. The Bank's investments in Gilt-edged securities continue to constitute the largest individual class of assets and these show a rise of £4 million, though their relative position has suffered a slight recession, as witness the drop in their ratio to deposits from 34.8 per cent. to 34.1 per cent. Cash balances with banks abroad and money at call have not shown any worthwhile change, but the rise in deposits has brought down the cash coverage from 21.6 per cent. to 20.9 per cent.

The Bank's investments in British Government securities, amounting to £374.7 million are all redeemable at fixed dates, the majority maturing within 10 years, and are taken at or under cost and below redemption price. The market value of these and other quoted investments as on 31st December, 1953 was greater than that shown in the balance-sheet.

The following comparative table brings out the salient features of the Bank's balance-sheet as at the close of the last four years:

(In thousands of £'s sterling)

	As on 31st December			
	1953	1952	1951	1950
Capital	15,810	15,810	15,810	15,810
Reserve fund ..	16,500	16,000	14,800	14,800
Undistributed surplus	556	418	597	624
Deposits	1,203,039	1,168,011	1,169,647	1,147,720
Acceptances, endorsements, and guarantees (contra Item) ..	94,784	121,770	164,524	96,153
Cash, money at call and balances with other banks ..	252,049	252,165	254,524	264,317
Bills	247,156	195,664	188,580	236,104
T.D.R.'s ..	..	..	15,500	54,000

Gilt-edged	410,055	406,019	360,189	273,749
Trade	8,119	8,184	8,020	7,413
Loans and advances ..	288,976	309,779	341,904	288,953
Bank premises ..	8,515	7,956	7,537	7,350
Balance-sheet total ..	1,332,702	1,323,908	1,367,211	1,276,445
Ratio to deposits of—	%	%	%	%
Cash	20.9	21.6	21.7	23.0
Gilt-edged investments	34.1	34.8	30.8	23.8
Loans and advances.	24.0	26.5	29.0	25.0

(*Concluded from next column*)

overdrafts account for Rs. 58.35 lakhs and bills purchased and discounted for Rs. 57.91 lakhs. As the increase in advances has been sharper than that in deposits, the advances ratio has jumped up from 38.5 per cent. to 50.4 per cent. which, however, is much lower than that of over 55 per cent., the average for all Scheduled banks. Investments have risen by Rs. 63.16 lakhs, in contrast to the decline of Rs. 23.47 lakhs in the previous year. We are told 91 per cent. of the total investments represents Government securities maturing within the next ten years. The market value of the investments in Government securities is higher than their book value by Rs. 2.04 lakhs. Cash balances have shrunk by Rs. 1.23 crores, but the cash coverage to deposits is still at a very comfortable level of 25.4 per cent. which is double the all-India average. It will thus be seen that the Bank continues to maintain a high liquidity in the disposition of its assets.

The year under review has seen impressive progress in other directions also. The most outstanding of these is the opening of foreign department. The Bank is stated to have concluded agency arrangements with other banks in all important countries of the world and is now in a position to give world-wide banking service to its customers. The scheme of advanced foreign training for its officers, started in 1952, has now been completed with the return of the third batch of two officers from the U.K. During the year under review the Bank opened two more branch offices, bringing their total number to date to 46.

CANARA BANK MAKES STRIDENT PROGRESS

RECORD TURNOVER IN 1953

THE distinction of being the first among the Scheduled Banks in India to publish the full text of the Directors' report and the audited accounts for the year ended 31st December, 1953, and that too within such a short period as four weeks of the close of the year, goes to the Canara Bank Ltd. (General Manager: Mr. P. S. Nayak, Mangalore). The Bank has also earned the credit of being one of the very few banks to register an increase in their profits for the past year, in refreshing contrast to the decline in profits generally experienced by banks. In fine, the year under review is a notable one for the Bank, in that there has been a substantial increase in its turnover. The balance-sheet total stands at a record level, reflecting a sizable rise in its resources.

The Bank's profit for 1953, at Rs. 8.67 lakhs, is a fresh record in its history and represents an increase of Rs. 1.13 lakhs over that for 1952. With this increase, the Bank has kept up an unbroken upward trend—barring, of course, a break in 1949—in its profit since 1940. It is gratifying to find that the increase of Rs. 1.13 lakhs in its profit for 1953 compares favourably with that of Rs. 0.15 lakh witnessed in 1952 and of Rs. 0.41 lakh in 1951.

The dividend to ordinary shareholders has been well maintained at 9 per cent. per annum, a return which the Bank has been paying for over a decade now. It must, however, be mentioned here that, from 1941 to 1947, the distribution was made up of a dividend of 8 per cent. and a bonus of 1 per cent. and that this was consolidated in 1948 into a dividend of 9 per cent. The dividend has been maintained only after making larger provisions for taxation, reserves and bonus to staff.

The progress which the Bank has made during recent years can be seen from the following comparative table giving the salient features of its profit and loss account and balance-sheet for the last four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1953	1952	1951	1950
Interest and discount earned	28.17	24.89	21.27	21.84
Commission and exchange	9.19	8.25	8.74	6.43
Gross income	39.84	34.80	32.65	29.68
Interest paid	10.10	8.86	8.80	8.14
Expenses	20.30	17.78	15.91	13.54
Depreciation	0.77	0.66	0.55	0.40
Profit	8.67	7.54	7.39	6.98
Provision for—				
Taxation	3.40	3.10	3.40	3.10
Reserves	2.50	2.06	1.50	1.50
Bonus to staff ..	0.85	0.75	0.65	0.49
Dividends—				
5% preference ..	0.52	0.52	0.52	0.52
Ordinary	1.35	1.35	1.35	1.35
	(9%)	(9%)	(9%)	(9%)
Carry forward ..	0.14	0.09	0.33	0.37

	As on 31st December			
	1953	1952	1951	1950
Capital	29.00	29.00	29.00	29.00
Reserves	21.00	16.50	15.00	13.50
Deposits	7,89.89	7,31.85	7,48.07	7,49.58
Advances	3,98.45	2,82.18	3,20.88	3,46.57
Investments	2,60.62	1,97.46	2,20.93	2,20.97
Cash	2,00.86	3,23.99	2,74.05	2,15.58
Balance-sheet total ..	10,45.63	9,19.31	9,57.19	9,15.68
Ratio to deposits of—	%	%	%	%
Advances	50.4	38.5	42.9	46.2
Investments	33.0	27.0	29.5	29.5
Cash	25.4	44.3	36.6	28.8

It will be observed that the marked rise in earnings by way of interest and discount noted in the previous year was more than maintained in 1953, thanks to the sharp rise in the advances and investment portfolios. Commission and exchange earned has gone up by nearly a lakh of rupees, in refreshing contrast to the small drop noted in the previous year. This again is the result of an enlargement in the Bank's bills business, which it has been strenuously trying to build up with the assistance of two foreign banking experts. The rise in interest paid by the Bank is accounted for by the increase in deposits. The expansion in the Bank's business during the year, brought about by the opening of a foreign exchange department and the extension in the number of branches coupled with the general increase in administrative costs of banks, explains the rise in the Bank's expenses during the year under review. Out of the profit, the allocation to the general reserve has been stepped up from Rs. 1.50 lakhs provided last year to Rs. 2.50 lakhs. No contribution to the contingency reserve has been made, whereas a year ago, a sum of Rs. 56,000 was provided for this purpose.

In addition to the sum of Rs. 2.50 lakhs provided out of the profit for the year under review, the Directors have transferred from the inner reserves (now no longer required) a sum of Rs. 2 lakhs to external reserves, thus bringing the latter to the handsome total of Rs. 21 lakhs. The rise in deposits from Rs. 7.32 crores to Rs. 7.90 crores is in tune with the general trend of bank deposits. A break up of the Bank's deposits shows that fixed deposits have gone up by Rs. 31.72 lakhs, saving bank deposits by Rs. 11.86 lakhs and current accounts and other accounts by Rs. 14.45 lakhs over the year. As in the case of deposits, the decline in advances noted in the previous year has been more than offset by the sharp rise in 1953. Of this rise in advances, loans, cash credits and

(*Continued in previous column*)

INTERNATIONAL COTTON SPINDLE STATISTICS

FALL IN MULE SPINDLES

A SLIGHT fall in world cotton spindleage is disclosed by the latest issue of *International Cotton Statistics*, published by the International Federation of Master Cotton Spinners' and Manufacturers' Associations, Manchester. According to this publication, the aggregate number of spindles in the world as at 31st July, 1953, was lower at 129,318,000, as against 129,330,000 on 31st January, 1953, a reduction of 12,000 spindles. This fall is in distinct contrast to the rise of 186,000 spindles, 1.39 million spindles and 1.87 million spindles registered in the three preceding half-years, respectively. If, however, the year ended 31st July, 1953, is taken as a whole, the world cotton spinning capacity shows expansion. But the number of additions to spindles installed in the course of the year was a bare 258,000, as compared with as much as 1.2 million in the previous year.

The foregoing analysis shows that the upward trend in spindles installed was definitely arrested in the first half of 1953. That is the broad conclusion. But a closer analysis of the statistics reveals that the fall has been due chiefly to the scrapping of the outmoded mule spindles. The ring spindles installed were actually higher, as we shall presently show. The significance of this change in the character of spindles is that the world today has more modern spindles than before.

The drop in cotton spindles during the six months under review has taken place entirely in the countries of Europe and North America, the actual decline in the spindles installed in these countries being from 72.28 million and 25.51 million to 72.21 million and 25.27 million, respectively. On the other hand, the countries of Asia (and Oceania), South America and Africa accounted for an upward trend in spindleage, the number of spindles as at the end of July, 1953, being 25.75 million, 5.16 million and 935,000 as against 25.63 million, 5.03 million and 885,000, respectively, six months before. The expansion in the cotton spindleage in these countries indicates the efforts on their part to develop the cotton textile industry with the twin object of providing more employment opportunities to people and of reducing dependence on foreign textiles.

An idea of the changes in the spindleage in the world's leading cotton producing countries during the half-year under review as compared with the two preceding half-years can be had from the following statement:

(In millions)

	Feb., 1952 to July, 1952	Aug., 1952 to Jan., 1953	Feb., 1953 to July, 1953
U.K.	27.98	27.23	27.26
U.S.A.	23.23	23.08	22.83
India	11.24	11.43	11.44
U.S.S.R.	9.90	9.90	9.90
France	8.06	7.96	7.81
W. Germany	6.24	6.28	6.31
Japan	6.95	7.46	7.50
Italy	5.72	5.78	5.78
China	4.10	4.10	4.10
Brazil	3.25	3.33	3.37
Czechoslovakia	2.38	2.38	2.41
Spain	2.23	2.23	2.23
Belgium	1.85	1.93	1.94
Pakistan	0.43	0.63	0.68
Other countries	15.50	15.63	15.87
Total	129.06	129.25	129.32

It will be seen from the foregoing figures that the U.S. and France witnessed a fall in the number of spindles installed, which indicates that the spindles which had been worn out were not replaced but scrapped, following slackness in the export demand for cloth and downward trend in prices. The pace of expansion in the cotton spinning capacity was retarded in Japan also, where the number of spindles added during the six months under review was only 42,000 as against 49,000 in the previous half-year. From this, one should not, however, rush to the conclusion that the *tempo* of activity in the Japanese textile industry has declined. For, according to recent reports, the Japanese cotton spinners have been concentrating their attention not so much on the expansion in the size of the industry as on modernisation of equipment, with a view to improving the technical efficiency and quality of textile output. The number of spindles in Japan at the end of July, 1953, was 7,502,000 which is equal to about 61.09 per cent. of that country's pre-war capacity of 12.28 million spindles. The increase in the number of spindles installed in the U.K. too was negligible, being only 25,000, which no doubt compares favourably with the fall of 750,000 spindles in the preceding half-year. India did not witness any addition to the spindleage; in the previous half-year, it may be noted, there was an addition of 190,000 spindles.

The contraction in the world cotton spindleage during the half-year ended July, 1953, as noted above, has been solely in mule spindles, the number of which declined from 20.87 million to 20.45 million. Ring spindles, however, accounted for a rise from 108.46 million to 108.87 million. The number of spindles spinning Egyptian cotton and rayon staple fibre was also higher, the former at 20.69 million, as against 20.40 million, and the latter at 7.84 million, as against 6.33 million. The table below shows the distribution of the different kinds of spindles in different countries as at the end of July, 1953:

(In thousands)

	Ring spindles	Mule spindles	Spindles spinning Egyptian cotton	Spindles spinning rayon staple
U.K.	10,548	16,709	11,150	2,522
U.S.A.	22,830	13	1,321	1,337
India	11,182	245	1,580	171
U.S.S.R.	8,700	1,200	155	..
France	6,945	862	1,300	1,265
W. Germany	6,103	202	590	1,350
Japan	7,502	..	107	4
Italy	5,735	44	1,500	400
China	4,100	..	250	..
Brazil	3,369	..	..	12
Czechoslovakia	2,010	400	450	..
Spain	2,081	145	350	150
Belgium	1,793	46	..	..
Pakistan	674	5	..	..

The above table reveals that ring spindles constitute the major portion of the spindleage of most of the countries. Mule spindles occupy a predominant place only in one country, that is the U.K. As the efficiency of ring spindles is greater than that of mule spindles, the spinners in the U.K. are making efforts to replace the latter by the former.

COMPENSATION FOR MADRAS TEXTILE LABOUR

Those workers of the cotton mills in Madras State who were denied employment by reason of the cut in power supply in 1952-53 will have to be given compensation by the managements. This is the result of the award of the Special Tribunal appointed by the Government of Madras to adjudicate the dispute between the cotton textile workers and managements in the State. It will be recalled that, owing to the failure of the monsoon and the consequent shortage in the output of electric energy during the years 1952 and 1953, the Madras Government effected a cut in the electric power supplied to the textile mills. The managements of the mills were, therefore, not able to give full employment to workers and the workers were paid only for the days they worked. The workers claimed compensation for involuntary unemployment due to power cut but the managements denied their liability to pay such compensation, on the ground that the unemployment was due to causes beyond their control. As there was no possibility of a settlement, the Government of Madras referred the dispute to a Special Tribunal for adjudication.

After conducting the enquiry, the Tribunal has submitted the award, as stated at the outset. Under the award, the workers who have been denied employment by reason of the cut in the supply of power by the Government are entitled to compensation for such involuntary unemployment. Such compensation shall be limited to a total period of 45 days in each of the calendar years 1952 and 1953, when the total period of unemployment is 45 days or in excess thereof, and in other cases, to the actual number of days of unemployment. It shall apply only to employees who have been permanent employees on the rolls of the mills, that is persons who have been employed for one year or more. The number of days of such unemployment would be gathered from the registers of the connected mills. The quantum of such relief shall be 50 per cent. of the total of basic wage and dearness allowance. The Tribunal has also ordered that 68 of the 74 textile mills involved in the dispute should pay Rs. 30 each towards the costs of the workers and that the amounts should be remitted to it for distribution to the representatives of the workers' unions or workers' unions concerned.

LANCASHIRE STILL AGITATED OVER TRADE AGREEMENT WITH JAPAN

"A CHALLENGE TO COTTON INDUSTRY," SAYS MANCHESTER CHAMBER PRESIDENT

(By A Special Correspondent)

MANCHESTER LETTER

MANCHESTER, 9th *February*

THERE has been no sign of any slackening in the protests made in Lancashire against the trade agreement with Japan, negotiated by the British Government. Although soothing voices have been trying to allay the fears, so widely expressed in the textile industries that the new pact will have important repercussions on future trade, the industry has been roused by a subject on which it invariably speaks with one voice.

As the agreement has actually been signed and accepted, it must be regarded as an accomplished fact and the inevitability of some reduction in Lancashire's export trade in cotton goods, particularly to Colonial markets, is taken for granted. On the other side of the picture, it has been stated that British exports of all types of goods to Japan were valued at around £17,500,000 last year. Main shipments were woollen yarn and cloth, aircraft, cars and various types of machinery. Traders in Lancashire are astonished to read of the possible loss of export business in motor cycles worth £70,000 or shipments of whisky of the value of £160,000, when they take into consideration the threat to their own orders which amount to millions of pounds.

More Pact Deputations

As more Jap pact protest meetings were held in Manchester this week, Mr. Peter Thorneycroft, Board of Trade President, agreed to meet a deputation representing owners of 1,500 cotton spinning and weaving mills in London.

Following a special meeting of union leaders of 280,000 cotton operatives, telegrams were sent to Mr. Butler, Chancellor of the Exchequer, and Mr. Thorneycroft, calling on them to receive a deputation from the trade unions to hear protests about opening up Commonwealth markets to Japanese mills. If the Ministers agree, all the 24 members of the Legislative Council of the United Textile Factory Workers' Association will travel to London. At the end of the union meeting, Mr. Harold Bradley, the Secretary, said: "We are taking a very serious view of the matter. Whatever anybody might say about the agreement, our main interest is to look after the welfare of the Lancashire textile worker irrespective of the Government in power."

Meanwhile, in the course of a speech at Manchester, Lord Woolton, Minister of Materials, said: "This agreement will create profitable trade and employment in this country and I appeal to my friends in Lancashire on two issues. I beg them to look at this problem from a national standpoint and I beg them to have faith in their own capacity. In the past, they have overcome competition vastly more extensive in volume and much keener in price than anything they are likely to have to face as a result of this recent agreement." Added Lord Woolton: "We need to trade with Japan and we have made an agreement by which we in this country shall sell to Japan more than we shall buy. That seems to me to be good business."

Chamber of Commerce View

The new pact with Japan was described as "a challenge" to the Lancashire cotton industry by Mr. Benjamin Pickup, retiring President of the Manchester Chamber of Commerce, at the annual meeting. "The full implications of this loosening up of trade, not only in the Colonial markets, but in our own home market," Mr. Pickup declared, "have to be faced with realism and are indeed a new challenge. We shall certainly tell the Government of the considered views of our members directly affected, but, meanwhile, there must be no slackening of effort in the trade itself to ensure that our volume of exports is kept up to its largest possible figure." According to him, the problems created by the agreement are to be critically examined by the Chamber's committees and trade sections. To quote him: "We shall then get from them the best possible advice as to how we are to go about the tasks which are now before us. We all know from past experience that the impact of trade from the East can quickly bring chaos in many markets, with resultant grave disturbance to our exports and with its consequent effect on productive output and employment."

Mr. Pickup warned against relaxing efforts or slowing down of the rate of modernisation, development and scientific advancement in cotton mills. He perceived a mounting strength and a realisation throughout Lancashire that the textile trade must be kept at concert pitch in all its methods of manufacture and craftsmanship. Proceeding, he observed: "I am not a pessimist about its future. I have seen enough of its new developments, in colour, design and production generally, to say without hesitation that, given a fair deal in world markets, it will hold its own for good workmanship, presentation and merchanting."

Fair Criticised

Unanimous agreement that the British Industries Fair has "outlived its purpose so far as textiles are concerned" has been expressed by interested members of the Cotton and Rayon Merchants' Association. According to a survey undertaken by the Association, textile exhibitors have declined from 412 in 1947 to 192 last year, and, in each case, merchant converters have been in a minority as compared with garment manufacturers.

Principal objection to the Fair is its cost under present conditions. "For the same expenditure, trade representatives would visit several important markets and secure business," the Association declares. "Little export business in textiles resulted from the Fair that could not be secured by normal methods. Overseas textile buyers would not continue to visit at considerable cost to themselves an exhibition so unrepresentative of the British textile industry."

Trade promotion by exhibitions run by private enterprise might be favoured by groups of traders, either at home or in overseas markets, but there is no strong urge at the moment for a grand exhibition representing the whole industry on the scale of the British Industries Fair.

Cloth Output Up

Over 340,000,000 more yards of cotton and rayon cloth came off the looms in Lancashire's 1,000 weaving mills last year than in 1952. This measure of the way the cotton industry has climbed out of the slump is given in production returns issued by the Cotton Board.

Output of cloth from the mills in the 53 weeks ended 2nd January, 1954, was 2,632,210,000 yards, as compared with 2,291,740,000 yards in the 52 weeks of the previous year. But production is still running well below the level of the pre-slump period. Compared with 1951—the industry's peak post-war production year—output in 1953 was down by 328,000,000 yards. A bigger labour force is helping the mills to turn out more cloth. During 1953, manpower in the weaving section of the cotton industry rose by over 6,000 to 140,960, and the labour force in the industry as a whole increased from 272,230 to 288,130.

Case for an Egyptian Contract

In view of the anxiety which has prevailed in various sections of the spinning trade over the conditions likely to be encountered when the Raw Cotton Commission's cover scheme comes to an end, further representations have been made to the appropriate Government departments. There is particular concern as to the position of producers of fine yarns in the Egyptian section who feel that their interests will not be fully served by the provision of merely an American contract in Liverpool.

These spinners are calling for the introduction of an Egyptian futures contract at any early date to enable them to be equally well placed as users of American cotton. In some quarters, it has even been suggested that the operation of the Commission's merchanting section should be extended for a further year beyond the end of August to assist this branch of the industry through the transitional period. It is contended that such a move would take considerable weight off the American futures contract when the Liverpool market opens and help it to function more smoothly.

At the same time, there is still a body of opinion, even among spinners of Egyptian cotton, who contend that freedom is the most important objective to be sought and that the trade must be ready to stand on its own feet. While admitting that dangers exist as regards the cover position for raw cotton not balanced by orders, they feel that, by prolonging the activities of the Commission, the full establishment of a free market is correspondingly hindered.

WORLD RAW COTTON SUPPLY POSITION

CURRENT SEASON OUTPUT ESTIMATED AT 29.5 MILLION BALES

IF the latest estimates of the International Cotton Advisory Committee (I.C.A.C.) were to materialise, the free world output of raw cotton in the 1953-54 season, that is, the current season, would touch a new post-war record of 29.5 million bales (of 478 lbs. net weight), which surpasses the previous record of 28.8 million bales established in the 1952-53 season by 700,000 bales. Of this increase, the U.S. is expected to contribute the major portion. The latest estimate of U.S. cotton crop for the current year is placed at 16.3 million bales (running bales of 500 lbs. each), as against 15.1 million bales in 1952-53. India is another country which is expected to show an increase of 675,000 bales in its crop for the current season as compared with the previous season. The remarkable improvement of 1.9 million bales in cotton output in these two countries has been offset, to a considerable extent, by the fall in output in some of the leading countries on the world cotton map, such as Egypt, Brazil and Pakistan. In Egypt, for instance, raw cotton output is assessed at no more than 1.27 million bales, as against 2.06 million bales. Similarly, production in Brazil and Pakistan is expected to decline from 1.60 million bales and 1.54 million bales in 1952-53 to 1.40 million bales and 1.27 million bales, respectively, in 1953-54.

The following figures culled from the Quarterly Statistical Bulletin of the I.C.A.C. shows the production trends in the several countries of the free world during the season under review, as compared with the 1952-53, 1951-52 and 1938-39 seasons:

† Included with India.

Prospects in the Southern Hemisphere now appear to be somewhat more promising than earlier in the season, particularly in South Brazil. After a slow start, plantings in this country in November were reported to have been very heavy and any reduction in acreage may now be more moderate. One unofficial report mentions an acreage decline of 15 to 20 per cent. Satisfactory progress in new crop plantings is reported from Argentina and present indications, based on seed distribution, are for a possibly larger acreage, particularly in Formosa Province. Rainfall and growing conditions are described as satisfactory in most areas. Increased acreages planted to cotton in Paraguay and Nicaragua may result in larger crops this season, but, in El Salvador, some reduction is expected.

Thanks to the rise of 700,000 bales in production and an increase in the carry-over from 13.3 million bales to 15.4 million bales, the raw cotton supply position in the free world during the season under review is quite comfortable. The aggregate supplies amount to 44.9 million bales which compares very favourably with 42.1 million bales in 1952-53.

The comfortable raw cotton supply position, as noted above, has tended to limit the world trade in this commodity to immediate requirements. The underlying factor here is unquestionably price—the keen competition which makes buyers selective and the continuing uncertainty with regard to future price movements in the main cotton exporting markets, especially in the U.S. The second influence, operating in the opposite direction, is the expanding consumption of raw cotton in strictly net-importing countries, which must, in the long run, encourage trade. The demand for non-dollar cotton in the past few months has been very active, leading to a perceptible, though irregular, upward trend of prices in these markets, particularly for the higher grades. In contrast, raw cotton prices in the U.S. have remained consistently at the loan level, so that U.S. cotton today is the cheapest in the world, barring, of course, the Indian cotton for domestic consumption which is held down appreciably below world prices through controls.

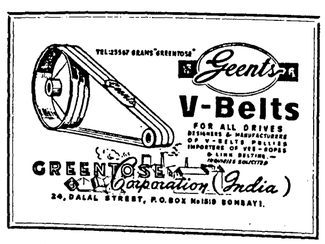
Since the U.S. plays a significant role in the world trade in raw cotton, whatever changes that occur in that country have wide repercussions on the latter. Referring to some of these changes in recent months, the I.C.A.C. makes the following interesting observations:

Several new or additions to existing procurement authorisations for purchases of cotton from the U.S. have recently been made available by the Foreign Operations Administration (formerly M.S.A.). These include $20 million to the United Kingdom which, up to the end of October, 1953, had not received any dollar aid in respect to raw cotton and a further $5.4 million to Formosa supplementing the $8.1 million already granted to this country. Up to date, therefore, authorisations for cotton purchases in monetary terms are virtually equal to the total for the entire 1952-53 season, but, in view of the lower price of raw cotton, they represent a significantly greater purchasing power.

Arrangements for the granting of a 60 million dollar credit to Japan by the Export-Import Bank were finalised at the beginning of December last; it is estimated that this amount would finance imports of approximately 330,000 bales at present prices. According to an American source, these funds will soon be allocated. The same source estimates that 860,000 bales of the total Japanese import programme of 1,350,000 bales for the October 1953-March, 1954 period will be dollar cotton—dollar in this context means Mexican, Brazilian, Argentinian and Egyptian, as well as cotton of U.S. origin. The volume of raw cotton imports from the U.S. will, it is reported, be influenced by developments under the Japanese agreement with Pakistan.

United States exports this season could conceivably be favourably affected by the recent decision in the United Kingdom to liberalise completely the cotton import trade and to reopen the Liverpool futures market at the earliest possible date in the new year. Futures contracts will be based on U.S. middling 15/16" cotton and only this growth will be tenderable. This presupposes the carrying of substantial stocks of U.S. cotton by this market.

A further factor in U.S. cotton trade to which I.C.A.C. draws attention relates to the introduction of insurance cover for exporters against the risk of loss from war or expropriation of cotton shipped on consignment to foreign countries. Again, the importance of the U.S. even in the capacity of a residual cotton exporter, the I.C.A.C. says, must not be underestimated for quality reasons; supplies outside this country are more limited this season and, in particular, in the better quality cottons. Finally, it is said that the pressure of demand in certain markets outside this country has narrowed the differential between prices there and in the U.S. and, in some cases, non-dollar cotton has reportedly risen above international parity.



HIGHER TARGET FOR COTTON OUTPUT

ADVISORY BOARD'S RECOMMENDATIONS

AT a meeting held in Bombay on Friday last week, the Central Cotton Advisory Committee is reported to have urged the Government of India to effect an upward revision in the Planning Commission's target of cotton production for the 1954-55 season from 4.2 million bales to 4.5 million bales. In doing so, the Committee was only endorsing the recommendations made by the Indian Central Cotton Committee early this month. The need for this upward revision of the target has arisen because the present target of 4.2 million bales, which is the same as that for the current (1953-54) season, is not sufficient to cope with the increase in demand for cotton, especially of medium- and long-staple varieties, from the mills. From the trend of cloth production in recent months and the strong statistical position of Indian cotton, it can be stated that a crop of 4.5 million bales is the minimum which this country should aim at, if the current rate of cloth output is to be maintained.

In recommending the aforesaid target, the Cotton Advisory Committee is said to have drawn "special and immediate" attention to the need for increasing the supply, within the country, of medium- and long-staple cottons and continuing the efforts at producing extra long-staple cotton. This is also the endorsement of the view expressed by the I.C.C.C., as witness its remarks: " ... the Committee's recommendations for accelerating the production of long-staple cotton 1⅛" and above should not result in any reduction of the output of coarse and medium staple varieties which are mainly the types required by the textile industry." As regards the means of achieving the target, the Cotton Advisory Committee laid stress on intensive cultivation, since, in its opinion, the area target of 17.5 million acres fixed for the ensuing (1954-55) season was quite adequate to secure this yield, provided, of course, climatic conditions were favourable. Some of the members of the Committee are, however, said to have favoured an expansion in the area devoted to cotton by 1.5 million acres.

Another important suggestion which the Committee has made to the Central Government relates to allocations of quotas to mills. In the Committee's view, no further quotas of Indian cotton can be allotted to the mills this season "in any circumstances." This view of the Committee may seem strange, considering the increase in the latest estimate of the outturn of cotton in 1953-54, at 4.1 million bales, as against the previous estimate of 4.02 million bales and the actual production of 3.6 million bales in 1952-53. But the Committee is understood to have based its view on the necessity to maintain a "safe" carry-over into the 1954-55 season. The estimated balance-sheet of cotton, for 1953-54, as drawn up by the Committee, are as follows:

(In thousand bales of 400 lbs. each)

Supply:		
Carry-over—		
Indian		1,478
Foreign		318
		1,796
Production		4,100
Imports		600
Total		6,496
Distribution:		
Mills' consumption—		
Indian		3,900
Foreign		700
		4,600
Exports		200
Total		4,800
Carry-over (on 31st August, 1954):		
Indian		1,478
Foreign		218
Total		1,696

These figures reveal that the stocks at the end of the current season are expected to be lower by 100,000 bales at 1,696,000 bales, as compared with the position in the previous season. The figures also reveal that imports for 1953-54 are estimated at 600,000 bales. Examining the question of imports, the Committee would appear to have felt that the raw cotton supply in the sterling area, particularly in Egypt, is short and as such imports from the U.S. would have to be larger. This decision seems to have been approved by the Government of India.

TWELFTH REPORT OF DIRECTORS FOR THE YEAR ENDED 31st DECEMBER, 1953

TO THE SHAREHOLDERS,

The Directors have pleasure in submitting herewith the Twelfth Balance Sheet and Profit and Loss Account of the Bank for the year ended 31st December, 1953, together with the Auditors' Report.

	Pak Rs.	a.	p.
Net profit for the year 1953	28,66,323	10	11
Amount brought forward from last year's account	18,10,824	12	9
Total .. Pak Rs.	46,77,148	7	8
Appropriations made during the year :—			
Interim Dividend paid at Rs. 3·0 per share on 5,00,000 shares	15,00,000	0	0
The Directors now propose :—			
Payment of final dividend for the year ended 31st December, 1953, at Rs. 1·0 per share on 5,00,000 shares	5,00,000	0	0
To carry forward to next year's account	26,77,148	7	8
Total .. Pak Rs.	46,77,148	7	8

By the Grace of God the Bank has shown good progress during the year.

In accordance with Article 91 of the Articles of Association, Mr. Ali Akbar H. Ebrahim, Mr. Huseinali A. Jumani and Mr. Rashid D. Habib, Directors of the Bank, retire by rotation and, being eligible, offer themselves for re-election.

You are requested to appoint Auditors for the year 1954 and fix their remuneration.

The Directors place on record their appreciation of the enthusiasm, loyalty and devotion to duty of the officers and other members of the staff.

By Order of the Board,
MAHOMEDALI HABIB,
Managing Director.

KARACHI, *dated 21st January*, 1954.

FINANCE FOR REHABILITATION OF SUGAR INDUSTRY

TOTAL REQUIREMENTS FOR NEXT SEVEN YEARS ESTIMATED AT RS. 28 CRORES

ONE of the most important factors responsible for the low level of efficiency in the Indian sugar industry *vis-a-vis* that in other sugar-producing countries is the heavy backlog of replacement and modernisation. As readers are aware, a large part of the productive capacity of the industry is represented by old and worn-out plant. When protection was first granted the sugar industry in 1932, a number of second-hand units imported from other countries were installed and several of these units have been in operation continuously all these years. During the war and the period following it, even the normal replacements could not be carried out, as machinery parts were not easily available. If, therefore, the efficiency of the sugar industry is to be raised, it is necessary to replace the worn-out machinery with up-to-date plants, incorporating all the latest developments in sugar technology. This issue has been ably brought out by the Indian Sugar Mills' Association, Calcutta, in the course of a memorandum submitted to the Shroff Committee now examining the question of finance for the private industrial sector.

The aggregate capital outlay required by the sugar industry for carrying out the rehabilitation programme is estimated by the Association at Rs. 28 crores. Of this, the investment necessary to keep the existing assets in efficient condition accounts for Rs. 8 crores; the additional funds required for the modernisation of plants and introduction of schemes such as fuel economy, etc., is placed at Rs. 10 crores; and capital expenditure for organising better transport of cane by laying down tramway lines is expected to absorb Rs. 10 crores. Assuming that this total outlay of Rs. 28 crores is spread over a period of seven years, the annual investment required will be of the order of Rs. 4 crores.

This investment of Rs. 4 crores per annum is considered by the Association to be too heavy to be met out of the sugar industry's own resources; at best, it can find no more than Rs. 2 crores. In support of this view, the Association observes:

". . . . the gross profit allowed to an average factory is only 10 per cent. on the block which is taken to be Rs. 18 lakhs. Therefore, the gross profit allowed is only Rs. 1,80,000. The 1937 Tariff Board had also recommended that the profit to sugar factories should be allowed on the above basis. While there could be some justification for allowing this profit margin during the pre-war years when taxation accounted for only 20 per cent. of the gross profit and the balance was available to factories for reserves and dividends to shareholders, there can be no justification for continuing the same basis, in spite of sharp increase in the tax rate. Now taxation alone absorbs about 40 per cent. of the gross profit. Further, about 20 to 25 per cent. of profits are absorbed in payment of bonus to labour which was not paid in pre-war years. What is actually left is not sufficient even to pay a small return to the shareholders. As a result of the above policy, the factories have not been able to build up reserves to carry out renovation and modernisation of plants. Moreover, much of the earnings of the factories in recent years have been utilised for providing the additional working capital required. . . . Some of the factories might get some funds through refund of E.P.T. deposits, but it cannot be of any material assistance, in view of the size of the expenditure involved. It will also not be propitious to float new issues in the existing conditions of the money market."

In view of this position, the sugar industry has been forced to depend on sources other than its own. One such source is commercial banks. But these banks, it is common knowledge, are not making advances for undertaking capital expenditure. The only other source on which the industry has to fall back upon is, therefore, the Industrial Finance Corporation. The Association wants the Corporation to treat the financial requirements of the sugar industry for purposes of renovation and modernisation on the same footing as that of other industries, such as cotton textiles.

The Association refers next to the industry's needs of working capital. The working capital of an average factory is at present estimated at Rs. 50-60 lakhs. It would be 25 per cent. more, if the production of sugar were to reach the Planning Commission's target of 1.5 million tons. It urges the Reserve Bank of India to facilitate provision of increased working capital to the industry as and when the output registers a rise.

Explaining its case fully, the Association observes:

"Factories are at present able to raise the required working capital from banks through hypothecation of the stocks and movable assets and through personal guarantees of the managing agents or directors. It may, however, be stated that factories had considerable difficulty in raising their working capital during the season 1951-52 when the requirements on this account increased considerably, due to the production reaching almost the target figure of 1,500,000 tons. The banks, however, did not agree to increase the cash credit limits of the factories, in spite of the Government's guarantee to ensure deliveries of controlled stocks at controlled rates. It is, therefore, essential that, in the event of any difficulty, the Reserve Bank of India should facilitate increased working capital being made available to the industry with the increase in its output."

The Indian Sugar Mills' Association has also examined the question of dispersal of sugar factories from congested areas where sufficient cane supplies are not available to more favourable areas. It fully appreciates the urgency of such dispersal as witness its remarks that "it is a national loss that these factories should continue to operate at their existing sites with only limited cane supplies, while the country has to import sugar from outside." But, at the same time, it points out that it is beyond the resources of the factories, which have been working only partially, to undertake the huge expenditure involved in the dispersal; the cost of shifting a factory is estimated at Rs. 15 lakhs. In view of this and with a view to encouraging the shifting of such factories, the Association pleads for the assistance of Governments—Central and State. In its opinion, the Government of India and the Governments of Uttar Pradesh and Bihar should contribute 50 per cent. towards the cost of shifting. For the remaining half, the Central Government should arrange for a loan to the factories through the Industrial Finance Corporation or any other institution at a low rate of interest, say, 3 per cent.

Few would dispute the reasoning behind this suggestion. Even the Planning Commission has fully conceded the need for financial assistance to the sugar industry for this purpose. Here are its own words: "It is necessary to work out and finalise such arrangements (in the form of financial help, railway facilities and issue of import licences for new machinery) *as soon as possible* (italics ours) for helping the industry to shift the necessary factories to new locations and achieve full production."

Although nearly three years have elapsed since the Five-year Plan began, no efforts have been made by either the Central or the State Governments in the implementation of this suggestion. This is due to no other factor than the opposition of the State Governments of Bihar and Uttar Pradesh. It was only the other day that Mr. Deep Narain Sinha, Development Minister of Bihar, declared, in the course of his address at the Northern India Sugarcane Growers' Conference held at Ramkola (Deoria), that the shifting of sugar factories from the north to the south would seriously disturb the economic equilibrium of the north and that, therefore, the question should be given up for all time to come.

The argument of Mr. Sinha is least convincing. Considering the fact that the Bihar Government—one may as well include the U.P. Government too—has done scarcely anything to enable the sugar factories to get sufficient supply of good quality cane at economic price, one could surely ask: "What moral justification has Mr. Sinha got to oppose the shifting of a factory to areas best suited for growing sugarcane and closer to consuming centres?" As the Indian Sugar Mills' Association rightly remarked, the refusal of the State Governments to permit the shifting of factories to other States is not in the national interest.

STOWING IN COLLIERIES

PROPOSAL FOR LOW INTEREST LOANS

PRESS reports from Calcutta indicate that the Coal Board is considering the question of granting loans at concessional rates of interest to collieries producing coking coal, which undertake stowing as a measure of conservation of metallurgical coal. It is stated that the Board has proposed grant of loans for the installation of plant and equipment necessary for conservation of coking coal, at a rate of interest considerably lower than the current 4½ per cent. There is also a proposal for payment of subsidies to collieries undertaking stowing as a measure of conservation. So far, subsidy has been granted only to those which have taken up stowing for safety. We are told that 67 collieries have been sanctioned assistance for voluntary stowing for safety in collieries during 1953-54. It is expected that production in these collieries will be about 3.5 million tons.

The proposals referred to above are a step in the right direction. For stowing is a costly but necessary process. It is necessary not only as a means of conservation, but also for prevention of losses (of both men and coal) arising from collapses, a common feature in collieries. Many of the collieries, however, do not possess the wherewithal to undertake stowing measures. Conditions in the capital market are such that it is not easy to raise a loan at low rates of interest, which is necessary inasmuch as stowing is not an investment that is immediately productive and profitable. At the same time, the Technical Advisory Committee of the Coal Board has brought to the notice of the Board a number of cases where it is considered necessary to take immediate steps for stowing, with a view to conserving coal and preventing accidents.

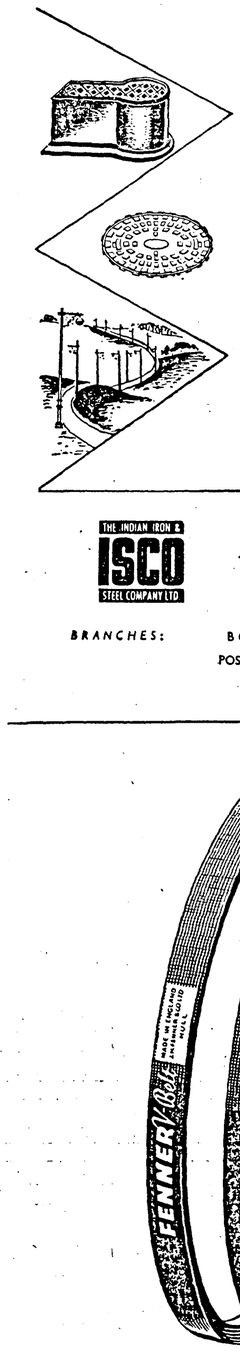
Long-run Benefits

The progresss of stowing in coal mines has been poor, as compared with other countries. Stowing in coal mines in this country started only some four decades ago, though collieries have been in existence much earlier than that. To be precise, it was first introduced in Ballarpur collieries in Chanda District of Madhya Pradesh in 1914. Five years later, it came to be practised in the Jharia coalfields. Till recently, it was practised only as a measure of safety. Latterly, however, a number of mines has been resorting to it for purposes of maximum extraction also. It is true that stowing adds to the cost of extraction, but mining interests have come to realise that, without stowing, only a small fraction of available coal resources in any mine can be extracted and that, as such, stowing is a profitable proposition in the long run.

The most successful technique developed so far is hydraulic sand stowing. But stowing in coal mines with materials other than sand is of greater importance, because stowing is very costly. Sand has to be transported over long distances. At times, the distances are so vast that the use of sand for stowing becomes uneconomic. In fact, the cost of transport of sand to areas where it is needed most for stowing is a formidable obstacle to the widespread adoption of stowing, despite improvement in the methods of transport, as, for instance, the aerial ropeway system. Again, although the availability of sand is for the present considerable, it is not unlimited. The sand that is removed from river beds for stowing is replaceable only by floods. The rate at which it can be replaced is a factor which is entirely beyond human control. This factor, as well as the high cost of transport, clearly points to the need for suitable, cheap and readily available materials to replace, wholly or partially, sand. It is only when suitable substitutes for this purpose are discovered that stowing can be popularised.

It is, however, gratifying to note that the question of stowing in coal mines, with materials other than sand, for safety and conservation, has been engaging the attention of the Coal Board for some time past. We are told that stowing can be practised successfully with a mixture of reasonable amount of sand, ash, clinker and colliery rejections. Even the presence of small quantities of combustible material in ash or clinker will not, it is stated, render the materials unsuitable to stowing. At present, hydraulic stowing with crushed stones is being effectively practised in Angarpthra colliery. This colliery is utilising stone and debris of the goafed areas for stowing purposes. The process is said to have helped the colliery in recovering lost coal from the goafs. There are certain other collieries which are stowing with a mixture of sand and ash on a fifty-fifty basis.

Castings of Infinite variety



Among the wide range of cast iron products which a civil engineer requires are pressure pipes for water works, lamp posts, surface boxes, manhole frames & covers, drain gratings, water tanks—to name only a few. With years of experience behind them, ISCO manufacture cast iron products of high quality and undertake to supply them according to any design or specification.

TRENDS IN TEA TRADE

FUTURE RESTS WITH PRODUCERS

THE latest advices from Calcutta and Cochin indicate that the break in tea prices during the past few weeks, after a spell of continuous advance lasting over several months, was only a temporary feature, for prices are once again steady to firm though no perceptible increase in them has taken place. In the export sale held last week in Calcutta, for example, a fairly good general demand was once again in evidence with exporters buying a larger quantity than they did in recent weeks. Whole leaf grades and more stylish types were dearer and there was a good demand for best liquoring sorts with autumnal character at firm rates. According to one source, the recent break in prices appears to be only a "trade device to check the upward pressure, but the supply position is too strongly against any such check."

The following table gives the trend of prices of the different varieties of tea since the beginning of January:

	9-2-1954	1-2-1954	11-1-1954	21-12-1953
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
Clean black pekoe ..	2 9 6	2 9 0	2 10 0 to 2 11 0	2 5 0
Clean common B.P. ..	2 3 0	2 2 0	2 7 0	2 1 0
Medium Assam B.P. ..	2 3 0	2 3 0	2 8 0 to 2 9 0	2 1 6 to 2 2 0
Good Assam B.P. ..	2 7 0	2 7 0	2 9 0	2 4 6
Medium Dooars dust ..	..	1 12 6	2 1 6	1 13 0 to 1 13 6
Medium Assam grainy dust ..	..	1 13 0	2 2 0	1 14 0
Best Assam (T.C. dust) ..	..	2 0 0	2 5 0	2 1 0

The sharp rises witnessed during the December sales were carried further in the first export sale of the new year held on 11th January and in the first two sales for internal consumption held on 5th and 12th January, due to an exceptionally strong and general demand. As will be seen from the foregoing table, the prices of the first four varieties, which are generally for export, on 11th January, were As. 6 higher than those in the last sale for 1953 held on 21st December. The strongest feature was broken orange pekoes, suitable for Eire, which were As. 8 to As. 10 dearer. Alluding to this sharp rise in prices, Messrs. J. Thomas and Co., Ltd., Calcutta, in their monthly review for January, 1954, say that this rise was caused by operators for all markets buying, it would appear, without limits. It seemed to be universally thought, according to this firm, that there was an acute shortage of "spot" teas and that there would be every likelihood of a tea "famine" during the next eight months. It is true that prices in London also soared during that week, but the rise there was not so sharp as in Calcutta, where the buyers for Indian consumption placed our market to about a level of As. 2 to As. 3 above London, due to a shortage of tea for consumption in this country. Following the increase in the retail price for tea in the U.K. on 4th January, there was an increase in auction sale prices by a further 4d. per lb. It looked as though prices—both retail and wholesale—would continue to rise until the price of tea would become so costly to the public that consumption would decline and an unhealthy situation would develop.

But this upward trend did not last long. As was only to be expected, after the limitless bidding and "long-at-best" orders, a reaction took place and prices during the next two sales fell, first by one anna and then by a further As. 2 for all mediums and commons, which formed the bulk of the sale. Broken orange pekoes, which had displayed the sharpest rise in the first sale, suffered the heaviest fall. All out-markets in general, and Eire, in particular, limited or withheld their orders. However, local operators continued to be active and, consequently, the closing sale of January saw the market standing As. 2 above London and As. 3½ above the last sale of December.

More tea other than dusts was offered for local consumption, as a result of the sudden rise in the price of export rights by nearly As. 3 per lb. These teas sold readily throughout the four internal sales held in January, reflecting the strength of the local demand.

Summing up the present position of tea and the prospects, Messrs. Thomas and Co., Ltd., observe, in their review referred to above, thus:

"(i) There is likely to be for some time to come—perhaps for the next 6 to 8 months—a serious shortage of tea at the consuming centres, the chief of which are the U.K. and India. (ii) The reason for this shortage is *not* that the world crops have shown a short-fall—actually, it is estimated that they are about 2½ million lbs. above the previous year. (iii) It is, therefore, only reasonable to surmise that world consumption has increased—and increased much more than the crop increase of 2½ million lbs. (iv) As we pointed out in our last issue, deliveries from the U.K. bonded warehouses, especially during the last 6 months, have shown a big increase and may be this shows that there has been an increase in consumption in that country. Perhaps, in the future, when this mere surmise can be more firmly established, there may be shown an increase of consumption of between 20 and 30 million lbs. (v) The future of the industry largely rests with the producers. They have one clear policy to go by, which is to regulate their crops in quality as well as quantity to the requirements of the consumers. They see Indonesia falling back in supply to the outside world—possibly only temporarily—and they feel, therefore, that they are entitled to produce as large a crop as possible on the standard of quality of the past year. In this way, the consumer's taste will be retained and the price they pay will have to depend on its retail cost, as compared to other beverages which, even with the recent rise, is still comparatively low."

The following table shows the progress of exports of North Indian tea from 1st April to 30th January during the last three seasons:

(In million lbs.)

	1953-54	1952-53	1951-52
U.K.	202.33	192.50	200.74
Canada	13.03	12.44	9.94
U.S.	15.62	17.03	13.45
Eire	20.03	9.82	20.45
Kenya	7.84	6.57	2.01
Red Sea ports ..	6.07	7.76	2.23
Amsterdam and Rotterdam ..	3.62	5.13	3.25
Hamburg and Bremen	3.59	1.92	1.74
Istanbul	3.24	4.04	3.63
Persian Gulf	3.87	7.31	7.06
Australia	1.43	6.03	3.54
New Zealand	1.02	0.74	0.21
Other places	9.08	11.32	20.49
Total ..	350.67	281.61	288.82

It will be observed that exports in the first 10 months of the 1953-54 season have gone up as compared with the previous season, by about 25 per cent., the U.K. and Ireland being mainly responsible for this improvement.

WORLD OUTPUT OF RUBBER

The world output of natural rubber during December, 1953 amounted to 167,500 tons, bringing the total for the year to 1,717,500 tons. Consumption during the month was of the order of 122,500 tons, such for the whole year being 1,565,000 tons. There was an apparent surplus of about 152,500 tons of natural rubber, but much of it was absorbed in stockpiles. Commercial stocks as on 31st December, 1953, amounted to 860,000 tons, made up of 245,000 tons in producing areas, 392,500 tons (excluding Government-held rubber) in consuming areas and 222,500 tons afloat.

Synthetic rubber production in December amounted to 65,000 tons bringing the world total for 1953 to 935,000 tons. Consumption in December was 57,500 tons and during the whole year 867,500 tons. Stocks at the close of the year were estimated 197,500 tons.

CEYLON RUBBER OUTPUT

Official estimates place Ceylon's production of rubber during the current year at 95,000 tons, as against 90,000 tons last year. The increase is expected to be largely in sheet rubber, on account of the favourable world prices. Last year's production of sheet rubber amounted to 60,000 tons, of which 59,500 tons were exported, China's share alone constituting 59,000 tons. The prospects for crepe rubber is considered dull and prices are not expected to show any improvement, as the London market is stocked heavily.

JUTE CROP ESTIMATE IN WEST BENGAL

The final estimate of the area under jute, (excluding *mesta*) in West Bengal in 1953-54, published this week by the State Government, places the area at 534,700 acres yielding 1,498,400 bales (of 400 lbs. each) as compared with 819,800 acres and 2,363,100 bales in 1952-53. The figures for the year 1953-54 thus show a decrease of 285,100 acres or 34.8 per cent. in area and of 867,700 bales or 36.6 per cent. in production. This decrease in acreage is due to unfavourable weather conditions and to low price of jute prevailing at the sowing time last year. The average yield in the last season was 2.88 bales per acre, whereas this season it was slightly lower at 2.80 bales per acre.

JUTE STOCKS DECLINE IN JANUARY

OUTPUT DROPS BY 14 PER CENT.

THE latest monthly statistical returns of the jute industry, namely, those relating to January, 1954, show a slight improvement in the industry's position. Stocks at the end of the month were lower; this was particularly so in regard to hessians. It is true that production, too, was down by a sizable amount, but the major part of this fall was the result of two additional holidays in the month. Stocks of jute manufactures held by the jute mills reporting to the I.J.M.A. at the end of January, 1954, reveal a further fall. At 96,087 tons, they are 2,500 tons lower than those at the end of December, 1953, and 3,300 tons lower than the stocks in the same month of the previous year. The January-end stocks were, in fact, the lowest since October, 1953, when they stood at 102,871 tons.

To a large extent this reduction in stocks may be attributed to the cut in export duties on hessians effected in two instalments in the last two years, once in May, 1952, from Rs. 750 to Rs. 275 per ton, and again in September, 1953, from Rs. 275 to Rs. 120 per ton, the rate at which it still continues. The effect of the reduction is fully reflected in the downward trend in hessian stocks. These stocks amounted to 36,684 tons at the end of September, 1953. Thereafter they gradually declined to 30,508 tons in October, 24,550 tons in November, 24,176 tons in December and to 21,357 tons in January, which constitute 22.2 per cent. of the total for the month.

The trend of sacking stocks during the period under reference, however, was not so encouraging. Thus they rose from 70,166 tons in October, 1953 to stand at 73,087 tons in January, 1954. This quantity is equal to about 2½ months' output. The deterioration in the position of sacking stocks is certainly a cause for concern. In order to stimulate despatches from the mills, the Government will do well to examine the question of effecting a reduction in the export duty on sackings which now stands at Rs. 80 per ton. The industry has been demanding the total abolition of the duty.

The table below gives the position of stocks of various types of jute goods as at the end of January, 1954, as compared with those at the end of the preceding two months as also in the same month a year ago:

(In tons)

	As on			
	31-1-1954	31-12-1953	30-11-1953	31-1-1953
Civil—				
Hessian	21,126	23,734	24,138	26,439
Sacking	72,448	72,163	70,793	85,389
Others	1,643	1,630	2,290	2,544
Total ..	95,217	97,527	97,221	1,24,372
Government—				
Hessian	231	442	412	838
Sacking	639	619	719	3,052
Others	..	4	14	156
Total ..	870	1,065	1,145	4,046
Grand total ..	96,087	98,592	98,336	1,28,418

The output of jute goods during January, 1954, staged a fall of 14.2 per cent., that is, from 77,849 tons in December, 1953 to 67,327 tons in the month under review. Consumption of raw jute during the month, calculated on the basis of production, may be placed at 390,496 bales, as compared with 423,371 bales in the same month a year ago. With the output of jute goods for January, the total for the seven months of the season, 1953-54, amounts to 500,511 tons which compares with 528,925 tons in the same period of the preceding season, namely, 1952-53. Consumption of jute during the period, based on the output of jute goods, may be put at 2,902,963 bales, as compared with 3,067,765 bales in the seven months of the 1952-53 season.

Of the total output of 67,327 tons during January, hessians accounted for 31,468 tons and sackings for 33,349 tons, other varieties making up the balance of 2,510 tons. The corresponding figures in the previous month were, in all cases, higher at 36,981 tons, 38,010 tons and 2,858 tons respectively. Thus, the fall in output has been shared by all the three varieties. The table below gives a summary of the position of the various types of jute goods produced in each of

PGC LIME KILNS

for the Calcination of Limestone, Dolomite & Magnesite

PGC design and manufacture complete process plants for the calcination of Limestone, Dolomite and Magnesite in vertical shaft kilns.

Over 30 years world-wide specialised experience has developed the following two types of shaft kilns :

1. MIXED FEED TYPE—Coke or coal is charged direct to the kiln with the stone to make a general purpose product.
2. GAS FIRED TYPE—The Fuel is gasified separately and the gas burnt at the kilns to make a high grade product suitable for the chemical industries.

Capacities are available ranging from 7 tons to 60 tons of burnt product per 24 hours per unit. Kilns are normally equipped for automatic discharge for large capacities of 40 tons and over.

THE ELLERNAN CALCINER—This new design of kiln is specifically made to burn small sized limestone with an output of 5, 10 or 22 tons of burnt product per 24 hours per unit.

The 5-ton capacity kiln utilizes stone sizes of ¼" to ¾" and the 22-ton capacity ½" to 1½", while the 10-ton kiln can use either size of stone.

The Ellernan Calciner is available in either oil or gas fired types.

INDIAN MACHINE TOOL INDUSTRY

PRODUCERS' PLEA FOR PREFERENTIAL TREATMENT

READ together, the Annual Report of the Indian Machine Tool Manufacturers' Association, Bombay, and the presidential address of Mr. M. B. Jambhekar to the seventh annual general meeting of the Association, held in Bombay last week, highlight the nature and magnitude of the problems facing the development of the Indian machine tool industry. Mr. Jambhekar strongly criticised the Government's policy of placing tenders for the machine tool requirements of the factories built and being built under State ownership, in foreign countries, instead of in India, without consulting Indian manufacturers. He characterised this policy as "niggardly" and highly detrimental to the progress of the industry. As an instance, he quoted the issue of a large number of tenders on a global basis by the Government of India for the supply of nearly 800 machine tools comprising lathes, drilling, shaping and milling machines, hacksaws, power presses and a variety of other equipment required by the proposed factory to manufacture electronics equipment in Bangalore.

It is not the mere issue of tenders in outside countries that is criticised but also the manner in which the specifications for the manufacture of tools required by the electronics equipment factory were fixed by technical consultants. Characterising the manner in which they were fixed as "ridiculous," Mr. Jambhekar observed:

"Before the tenders were issued, the consultants called, from some Indian manufacturers, specifications and details of machine tools being produced by them and then they issued tenders laying down specifications which slightly differed from those supplied by the Indian manufacturers. Anyone conversant with engineering would be able to say that slight differences in specifications do not materially matter for production and even for precision jobs. But this move was deliberately taken to obviate the necessity of buying machine tools available in India and justify purchases from French and other producers on grounds of exact suitability of specifications."

Tenders for Machine Tools

Mr. Jambhekar did not mean that the Indian manufacturers should be given merely the opportunity to quote, even which has so far been denied to them, but that the Government should actually issue instructions for according preferential treatment to Indian manufacturers at the time of consideration of quotations of foreign and Indian tenders. To quote him:

"This is the least that we could expect of our Government to do for an industry which is in the throes of difficulties through lack of demand and is of such paramount importance for the defence of the nation. There is nothing new in our claim that we should be given this preferential treatment, for it is the practice followed by even the most advanced industrial nations of the world. In my opinion, mere leaving Indian tenders to stand in competition with well established foreign producers of vast resources, who could underquote with disastrous effects, would be most illogical and unjust. We rightfully expect our Government to show preference to items manufactured in India when they are required for projects to be established with the Indian taxpayers' money. In conclusion, I should like to reiterate, with all the emphasis at my command, that, in future, all such tenders should be first issued in India and not through any foreign capital city, that the specifications fixed for requirements should not ignore specifications available from Indian production, and lastly utmost preferential treatment should be given to tenders from Indian suppliers."

Mr. Jambhekar also criticised the Government for failing to have on the Board of Directors of the Hindustan Machine Tools Ltd. at least one representative of the Association who is technically conversant with the development of the machine tool industry and whose counsel and guidance would be of immense assistance in the formulation of policy of the factory and its execution. He remarked:

"Running a huge machine tool establishment is no mean job and it once again shows, in a clear light, how things are managed when it is realised that, apart from the technical consultants whose representatives will be on the Board, there will be perhaps no one amongst the Indian Directors, who can even claim having had a bare association with the development of the machine tools industry. Government have, with their eyes open, disregarded the co-operation of the Association, the responsibility for which lies squarely at their door."

The Association has expressed grave fears of overproduction of lathes in India once the first stage of the State-owned Hindustan Machine Tools Ltd. is fully implemented. It may be noted that this factory will manufacture only 400 lathes of 8½" size in the first stage of production of the factory. The manufacture of the following types and sizes will be left to private enterprise during the first stage:

(1) High-speed geared head lathes (7" centre entirely and 8½" centre to the extent produced at the end of 1952);

(2) High-speed shaping machines (20" stroke entirely and 24" if produced by 1951 end);

(3) High-speed drilling machines below 1½"; and

(4) Universal horizontal and vertical milling machines, unit-milling heads and horizontal boring machines of the type already produced.

The industry has been ceaselessly demanding the imposition of a restriction on the manufacture of certain sizes of lathes in the State factory, as the private sector of the industry has already developed them and is actually manufacturing these sizes. It is stated that, in spite of repeated protests that the production of the private sector and that of the State-owned factory would be far too large for the estimated demand for these lathes, the Government had not thought it fit to revise its plan for the production of 8½" centre lathes in the first stage of its production programme.

Rationalisation

Another problem facing the industry is rationalisation; this has been defying solution for a long time. One reason for this is the differences of opinion amongst the members in the demarcation of manufacturing operations and lack of an adequately remunerative field for the manufacture of any one type of machine tool by one producer, which would be the basis of rationalisation. It is felt that it is necessary to have a joint selling organisation of all manufacturers without which the working of any rationalised scheme of production would be unsuccessful. But the question of setting up such an organisation has been held up because of the varying commitments already entered into by producers with the consumers, some of which have still a few years to run.

The production of machine tools in India is somewhat on the uptrend. It was valued at Rs. 33.15 lakhs during January-September 1953, as against Rs. 44.37 lakhs during January-December, 1953. It is gratifying to note that the manufacturers have been progressing in their attempt to manufacture new types of machine tools. The following summary gives a brief picture of the progress made by the members of the Association in this direction during 1952-53:

Cooper Engineering Ltd: The 24" fully electric heavy duty centrally lubricated shaping machine went into production. The development work on the 20" type shaping machine was well under way.

India Machinery Co., Ltd: The SKD-25 heavy duty all-geared-head motorised lathe was undergoing trials. The 18" and 24" all-geared heavy duty power feed shaping machines and cone drive horizontal boring machine were successfully marketed. A new range introduced during the year was the Universal No. 3 milling machine, which was undergoing trials. The Company has also commenced manufacture of 4-jaw lathe chucks from 10" to 18" sizes.

Investa Machine Tools & Engineering Co., Ltd.: The Company reported further progress on the production of various types of drilling machines. The 1¼" capacity auto-feed pillar drill with 6 speeds and fully-geared direct motor-drive and also the 1.5/8" capacity fully-geared pillar drill went into production. Machine tools under development were 2" capacity radial drill with 12 speed 6 automatic spindle feeds and a 1¼" capacity radial drill with 9 speeds.

Mysore Kirloskar Ltd.: Its development on all-geared-head motorised lathes continued at a rapid pace. The 7", 8", 8½" and 9½" all-geared-head motorised lathes were well under production and successfully marketed, mostly in Government factories and railway workshops. Its 10½" all-geared-head motorised lathe reached the prototype stage. They are now developing a new 12½" heavy duty geared-head lathe.

Praga Tools Corporation Ltd.: Its 18" hydraulic shaping machine and 1.1/8" capacity ball-bearing auto-feed drilling machine reached the prototype stage. It had under development a Universal No. 2 milling machine. Its Universal No. 1 milling machine with attachments and 1/2" and 3/4" single and multi-head drills were in production and successfully marketed. It was also producing a complete range of drill chucks from 1/4" to 3/4" and lathe chucks (scroll type 3-jaw) from 4" to 12".

Shree Ram Mills Ltd.: It was producing 4-jaw independent lathe chucks upto 24" size.

STEEL IN INDIA

Inaugurating the first meeting of the Structural Steel Sectional Committee of the Indian Standards Institution, held in Calcutta last week, Mr. T. T. Krishnamachari, Union Minister for Commerce and Industry, forecast that the annual output of finished steel would reach 2 million tons by 1958. Briefly elucidating this statement, he stated that the steel industry in India reached the peak production of 1,360,000 tons in 1941-42. But, owing to the intensive use of steel plants during the war period without proper facilities for repair and replacement, this rate of production could not be maintained thereafter. The annual production, therefore, had declined to as low as 854,000 tons in 1948. In subsequent years, it could be increased through repairs and renewals to about one million tons only by 1952. The expansion and modernisation programmes, which were already in the process of implementation, were expected to increase the annual outturn by 600,000 tons. The new steel plant, the proposal for which had recently been almost finalised by the Government, would have, to begin with, a capacity of 350,000 tons.

Emphasising the need for economic use of steel, the Commerce and Industry Minister said that, in the opinion of experts, more than 25 per cent. steel now used in structural engineering in India might be considered as wasted. This waste resulted from the use of uneconomic sections and the adoption of wasteful and outmoded designs and building practices. Even with the present restricted use of steel, the cost of this wastage was estimated at over Rs. 9 crores. It was against this background, said the Minister, that the revision of the present standards for production of heavy sections, standardisation of lightweight sections, popularisation of the use of welding and the preparation of rational codes for the use of steel should be taken up expeditiously.

Addressing the meeting, Mr. Jehangir Ghandy, Chairman of the Committee, supported the plea for maximum economy in the use of steel and urged the Government, the single largest consumer of steel today, to lead the rest by adoption of new designs and techniques to achieve the object in view. In his view, rationalisation and standardisation of structural steel sections, side by side with new lightweight sections, would not only economise production, but also would reduce the cost of transportation and erection. It would further ensure convenience in handling. He pointed out that structural engineers at present had large-range sections and a large quantity of steel was being wasted on this account. Merely to provide a wide range of supply was of little use. To balance the interests of the consumer and producer, it was, he said, necessary to standardise quality and designs. Performance specifications also kept the standard under constant review and helped to improve the standard, in the light of new technological developments. Another way of conserving steel, Mr. Ghandy said, was to use low-alloy high-strength steel. This would be particularly useful in the construction of long-span bridges, ships and railway wagons.

MYSORE IRON AND STEEL WORKS

The Government of India has approved of the plan of the Mysore Iron and Steel Works to install a spun-cast iron pipe plant. It is stated that, when this plant goes into production, the output of small-size pipes, which is 9,000 tons per year at present, will increase to 22,000 tons per year. The Government of India is also reported to have sanctioned a loan of Rs. 35.8 lakhs for the installation of a sintering plant at the lower terminus of the ropeway at Kemmangudi iron ore mines. The estimated cost of the sintering plant scheme is Rs. 43 lakhs. When this plant is implemented, the Mysore Iron and Steel Works will not only be utilising the large quantities of iron ore which are at present thrown away as waste, but will also be able to reduce the cost of production of pig iron. It may be noted, in this connection, that the erection of the second electric furnace at Bhadravati and the fixation of the new bi-cable ropeway at the Kemmangundi mines have been completed and power supply arranged. Both units will be in regular operation shortly. Trial operations on the new bi-cable ropeway have been found to be satisfactory.

INSULATOR PLANT FOR MYSORE

Reports from Tokyo indicate that the Government of India has approved of a 295 million yen contract (about £840,000) between a Japanese firm and the Mysore State Government for the establishment of an insulator plant at Bangalore (Mysore State). Officials of the Japanese firm will leave Tokyo shortly for Bangalore to make an on-the-spot survey for installing the equipment, as soon as the advance money, equivalent to 20 per cent. of the contract amount, is received. The plant will have a production capacity of 300 tons per month. The shipment of the equipment is expected to start late this year.

Every village within reach of a main road

In well-developed agricultural areas there should be a main road within five miles of every village — that is one of the objectives of the Five-Year Plan, India's design for better living.

The task is enormous. It will mean building 13,400 miles of national highways; thousands of bridges; and 2,987 State Roads, increasing their total length to more than 20,582 miles.

These great projects will ensure a better life for everyone. They will call for vast quantities of cement; and the A.C.C. is helping to achieve National Targets by producing more and more quality cement.

For technical assistance on any problem of concrete construction, please write to The Concrete Association of India, 1 Queen's Road, Bombay.

TAXATION ON GENERAL INSURANCE

PLEA FOR MODIFICATION OF PRESENT METHODS

AVAILING itself of the questionnaire issued by the Taxation Enquiry Commission, the Indian Insurance Companies' Association, Bombay, is understood to have put forward a strong case for getting certain existing methods of taxation of general insurance companies so modified as to enable them to play a more significant role in building up Indian economy than has been possible hitherto. Some of the grievances relating to the present system of taxation of these companies have remained unredressed for a long time by the income-tax authorities, despite repeated appeals, and general insurance business circles now fervently hope that the justification of their cause will be admitted by the Taxation Enquiry Commission.

It is common knowledge that Indian insurance will be required to play an important part in the economic development of the country under the Five-year Plan. In order to enable them to perform their obligations in the coming years satisfactorily, they have been pressing the Government to permit them to build up adequate reserves against unexpired risks and catastrophes. They have been stressing all along the fact that, in the matter of reserves, they have been placed at a disadvantage *vis-a-vis* the non-Indian companies operating in India. These latter, having entered the field earlier when there was little competition from indigenous concerns and when reserves were outside the scope of taxation, have consolidated their position with large reserves. With this strong reserve position making for greater underwriting capacity, these companies even today enjoy a substantial participation in general insurance business in this country. If Indian companies were to compete with them, it would be essential, it is stated, that these companies too should be enabled to attain a sound financial position by affording them necessary facilities to build up reserves.

Apart from the point of view of enabling the insurance companies to improve their competitive capacity, there are also other grounds which emphasise the need for strengthening their reserves. The problems of underwriting capacity and reserve building are so interlinked that the strength of reserves is of paramount importance for their progress not only in the home market but also in the international market. Indian insurance companies have been taking increasing interest in recent years in developing their business abroad and, with improved financial pisition, it will be easier for them to extend the field of their operations in foreign countries also, where ample opportunities exist to expand their business profitably. A strong reserve position will certainly go a long way towards inspiring confidence amongst foreign clientele.

Reserves for Unexpired Risks

At present, the companies are allowed to set aside as reserve up to 50 per cent. of their premium income free of income-tax for fire and miscellaneous insurance and 100 per cent. for marine. This percentage is considered to be not adequate to stabilise their financial position. In fact, reserve for unexpired risks really consists of premiums paid in advance for which there are liabilities that continue in the subsequent year. The reserves are built up in the basis of normal trading conditions, that is, on the normal expectation of losses. It is, therefore considered not practicable to assess the profits of general insurance in terms of a single year. Besides, as far as possible they have to keep these reserves in hand so that, in the event of big losses, they can be met without any serious adverse effect on the finances of the companies concerned and on the investment market. Accordingly, they have to provide for this contingency by strengthening their reserves year after year. Their demand, therefore, is that they should be allowed to add every year to the unexpired and additional reserves at the rate of 5 per cent. of their annual premium income till the reserves reach a total of 100 per cent. of their premium income in respect of fire and miscellaneous insurance, 150 per cent. in respect of marine cargo business, and 200 per cent. in respect of marine and aviation hull business.

Another development which is causing considerable anxiety to general insurers is the proposed move by the income-tax authorities to levy income-tax on reinsurance payments made outside the country on business of Indian and foreign insurers operating in India. If this proposal is given effect to, it is needless to say that it would not only check the progress of Indian insurance but retard its development. This point needs to be elaborated here in order to emphasise how harmful the effects of the proposal would be on the industry.

An insurer underwrites risks of unequal amounts and of varying hazards. In order to establish a balance in his portfolio, the insurer fixed his own retention, according to capacity to underwrite the risk, and reinsures the excess with other companies in India or abroad. If it is reinsured overseas, the reinsurance assumes an international character. Such reinsurance dealings represent trading between two different parties, the company placing reinsurance becomes the insured and the foreign company, with its head office abroad, underwriting the reinsurance cover becomes the insurer. The relationship between the two is none other than that of a buyer and seller and, therefore, is not such as to warrant it being considered an internal dealing by the company in respect of whose assessment, tax could be levied on reinsurance profits payable outside the country. Reinsurance with overseas concerns is, in fact, foreign trade, and is also a two-way trade. For insurance companies generally get reciprocity against the business ceded by them to their reinsurers. The insurers reinsuring abroad, under a reinsurance contract given by the reinsurer and signed by him at his head office, are considered to have purchased a reinsurance cover from the reinsurer the same way as the reinsured buys his insurance cover from the insurer. This transaction has not been subjected to tax so far, because (1) the transaction of reinsurance is as between principal and principal and (ii) the reinsurer selling the reinsurance cover from his head office is not considered as "trading in India." The Indian Insurance Companies' Association says—and in our opinion rightly—that "the practice so far followed in this country is sound and is almost universally followed, based, as it is, on the fundamental principles on which taxation laws are generally framed in all countries."

Tax on Reinsurance

An attempt to tax the profits earned by foreign reinsurers would seriously jeopardise the cause of Indian insurance in the international insurance market for the reasons given below:

(1) It would restrict facilities of reinsurance available to Indian insurers in foreign markets.

(2) If treaty reinsurance facilities are hampered or withdrawn, there would be a crisis in the market, causing great hardship to smaller insurers in the country who might be forced to curtail their activities.

(3) The reinsurers who are subject to a double tax would find it less attractive to have reinsurance dealings with Indian companies, and would divert their attention to companies of other countries.

(4) Indian insurers who would be able to build up good reciprocal relationship over a period of years would suffer a substantial shrinkage of business.

(5) Premium income and profits of Indian insurers from reinsurance would be reduced, and this, in turn, would adversely affect the tax payable by them to the income-tax authorities.

(6) Any retaliatory tax measures adopted by foreign countries would affect the reinsurance business of Indian insurers abroad.

In view of these considerations, it is submitted that the Government should desist from imposing taxes on reinsurance payments made outside the country in respect of Indian business.

Stamp Duty

The Indian Insurance Companies' Association has also claimed certain concessions in regard to the incidence of stamp duty on insurance policies. In recent years, insurance policies have become so complex that it is very difficult to decide under which item or items of the present schedule of the Indian Stamp Act, 1899, they should be classified. The schedule prescribing the various stamp duties was drawn at a time when insurance was in its infancy in India and was confined to the basic forms of policies dealing with risks of fire and marine and a small amount of accident insurance. It has now become archaic and is generally out of step with modern insurance developments.

Again, with the growth of air travel, more and more persons are taking out policies for substantial amounts for which the rate of premium is very reasonable and stamp duty based on the sum insured makes a heavy additional burden on the insured.

In the circumstances, it is felt that a single uniform rate of duty for all types of insurance, other than life, based on the present rate for fire insurance, is desirable. Alternatively it is suggested that, where the rate of stamp duty is directly related to the sum insured under the policy, there should also be a provision that the amount should not exceed a certain percentage of the premium chargeable. This method is considered specially helpful in respect of two specific types of policies, namely, personal accident and marine time policies.

Another concession asked is in respect of sea insurance for time. This type of insurance generally applies to the insurance of steamer hulls, the values of which in recent times have reached very high figures. The stamp duty of As. 4 for every Rs. 1,000 charged is stated to be a heavy burden on the shipping industry.

There are occasions when composite offices, in order to restore the solvent position of the life section, transfer funds from profits of the general departments. Such transfers reduce the profits of the companies, and in such cases the transfers should be allowed, the Association says, as an expense, and should not be taxed. It, however, concedes that when the amount so transferred is returned to the general department from the life section, the same should be treated as income.

PROVINCIAL INSURANCE CO., LTD., U.K.

History has innumerable examples of how business concerns started in humble, unpretentious and unostentatious circumstances have grown into great international institutions. One can see the instance of such development in the career of the Provincial Insurance Company, Ltd. (Chief Office: London and Kendal: Indian Branch, Bombay), during a period of 50 years from 1903-53. A perusal of the booklet entitled *Personal Account*, published by the Company, discloses that in the making of big institutions such as the "Provincial," it is the character and personality of men who build them that count most. This publication is a short personal memoir written by two brothers, Sir Samuel Scott, who was the second Chairman of the Company, and Mr. F. C. Scott, its present Chairman.

Started in 1903 in the town of Bolton, North England, by Sir James Scott, Bart., with the purpose of giving the opportunity of a career for his younger son, the "Provincial" was purely a private venture. The whole of the subscribed capital of £150,000, with £75,000 paid-up, was, in fact, provided by Sir James himself, and the Company was, therefore, a one-man company. There were, consequently, no shareholders looking for a return on investment. Even today, the Company is a family concern, its holders being limited to the family of Sir James Scott. "The Provincial escaped," writes *Personal Account*, "the dilemma of the newly-founded insurance Company which is charged with heavy initial expenses and saddled with demands for dividends, and is forced to expand rapidly to meet them. The business of the Provincial was a selected business from the start, and its policy was to expand gradually. The small Company's balance-sheet was not charged with an item for organisation expenses and there was no lavish appointment of a directorate or officials." Being a non-tariff company, the Provincial has done useful service to the public by quoting competitive rates which have hardly interfered with its good and friendly relationship with the tariff companies. It is here one sees the strong foundations on which the Company was laid. From £5,107 in 1925, the premium income has grown to over a million and a half pounds. Its reserves now exceed a million pounds. Started as a purely domestic insurer, it has a network of world-wide business at present. Today this Company has branches overseas not only in India but also in South Africa, Canada, etc. It has braved the stormy weather under two world wars and several minor, and one of the worst depressions, and several minor, and one of the worst depressions, It can look forward to a great future and may well be proud of its past record.

Writes Mr. F. C. Scott, the second son of the founder and the present Chairman of the Company: "With some justice, we might, perhaps, claim that there have been few companies which have shown underwriting profits so consistently good or have never made any draft on interest earnings for the benefit of the shareholders. The fact that the building up of a reserve fund of over a million pounds has taken place over a period when the average rate of tax was the highest this country ever had to endure is further proof of the sound lines of the Company's progress."

Few will grudge these claims, especially when it is noted that the staff found in the management the most generous provisions made from time to time to safeguard its interests against rising living costs. The pension fund stood in 1953 at as high a level as £900,000. This Company has had the unique distinction of having on its Board of Directors the brilliant economist, Lord Maynard Keynes. He served as the Chairman of the Finance and Investment Committee of the Company for some 23 years.

Personal Account, containing as it does some recollections of Sir S. H. Scott and Mr. F. C. Scott, provides an insight into the nature of qualities one should possess to build up a lucrative industry. Those who choose insurance for their career have much to profit by a perusal of this neat little book.

THE BANK OF BHOPAL LIMITED, BHOPAL

(INCORPORATED IN BHOPAL IN 1944.) (LIABILITY OF MEMBERS IS LIMITED.)

NINTH REPORT OF THE BOARD OF DIRECTORS

The Directors beg to submit to the Shareholders the Audited Balance Sheet of the Bank as on, and Profit and Loss Account, for the year ended 31st December, 1953.

The Bank's working during the year, including Rs. 4,017-5-3 brought forward from the previous year's account, yielded a net profit of Rs. 84,785-13-1.

The Directors propose to make the following appropriations out of the net profit:—

		Rs.	a.	p.
(1)	To be transferred to Reserve Fund under section 17 of the Banking Companies Act, 1949	17,500	0	0
(2)	To provide for taxation	25,000	0	0
(3)	To bonus to Staff	5,000	0	0
(4)	To pay a dividend at the rate of two per cent. free of tax, i.e., Re. 5 per share on 5,000 shares (Rs. 500 each, Rs. 250 paid up) for the year ended 31-12-1953	25,000	0	0
(5)	To be carried forward to next year's account	12,285	13	1
	Rs.	84,785	13	1

The Bank continues to make satisfactory progress. The dividend paid last year at the rate of two per cent. free of tax, i.e., Re. 5 per share is being maintained.

The Directors are thankful to the shareholders and clients of the Bank for their continued support.

The Directors express their warm appreciation of the work done by the Chairman and all officers and other members of the staff for their able and efficient services to the Bank.

Seth Rajmal Phoolchand Agrawal and Shri Syed Akhtar Abbas due to their preoccupations regretted their inability to continue as Directors of the Bank and resigned from the Board during last year. Shah Hiralal Chhaganlal and K. H. Sahibzada Dewan Anjur Rahim Khan, retiring Directors under the provisions of Articles 105 and 107 of the Articles of Association of the Bank, being eligible, offer themselves for re-election.

The shareholders are requested to appoint Auditors for the year ending 1954 and to fix their remuneration.

By Order of the Board,
B. M. VENCOBA RAO,
Chairman.

BHOPAL, 6th February, 1954.

BALANCE SHEET AS AT 31st DECEMBER, 1953.

REPORT OF THE AUDITORS.

We have audited the annexed Balance Sheet of the Bank of Bhopal Limited, as at 31st December, 1953, and also the annexed Profit and Loss Account of the Bank for the year ended 31st December, 1953, in which are incorporated certified Returns from Sehore Branch in India, but the Returns from Karachi Branch have not been incorporated as the Returns have not been received from the State Bank of the Pakistan which has taken possession of that Branch, and report that:—

(a) We have obtained all the information and explanations that we have required and have found them to be satisfactory;
(b) The transactions of the Bank which have come to our notice have been within the powers of the Bank;
(c) That returns received from Sehore Branch of the Bank in India have been found adequate for the purposes of the audit;
(d) In our opinion the annexed Balance Sheet and Profit and Loss Account are drawn up in conformity with the Law;
(e) Such Profit and Loss Account shows a true Balance of Profit for the year;
(f) Such Balance Sheet exhibits a true and correct view of the state of the affairs of the Bank according to the best of our information and explanations given to us and as shown by the Books of the Bank; and
(g) In our opinion Books of Account have been kept by the Bank as required by Section 130 of the Indian Companies Act, 1913.

EFFECTS OF INDUSTRIAL AWARDS ON INDIAN BANKING SYSTEM

PROFITS WILL FAIL TO KEEP PACE WITH INCREASE IN EXPENSES

(Contributed)

SINCE independence, Industrial Tribunals have made a number of awards conferring considerable benefits on workers in various industries in India. The immediate effect of these awards has been to improve the economic conditions of workers in the industries concerned. But it is necessary to consider their effect upon the capacity of the industries to maintain their scale of operations and to expand it. If it is found that the awards have produced adverse effects upon the capacity of industries to maintain the scale, it will have to be admitted that the awards have adversely affected the interests of the existing workers by compelling the industries to retrench some of them. Even if the awards have not produced this effect upon any industry, but if they have adversely affected its capacity to expand, the awards must be said to have adversely affected the interests of those who are in search of work, because such persons cannot secure any employment in the industry concerned. The number of such persons is already large in India and is increasing rapidly every year, on account of the rapid growth of population in the country. In this note, it is proposed to consider briefly the effect of industrial awards on the Indian banking system, on the above lines.

History of Awards

Until 1947, there were no industrial awards for the Indian banking system and banks were free to give salaries and other emoluments to their employees according to their capacity to pay. Moreover, they were not obliged to give annual increments in pay to their employees, if they could not afford to do so. This enabled banks to take advantage of the favourable economic conditions, which were brought into existence by the Second World War, by expanding their operations with a fair degree of rapidity. This is seen from the fact that the total number of offices of Scheduled banks increased from 1,128 in 1938 to 1,888 in 1943 and to 3,469 in 1946. The total number of offices of non-Scheduled banks with capital and reserves of Rs. 1 lakh and over increased from 1,161 in 1943 to 2,688 in 1946. Then came the industrial awards.

Mr. Justice Divatia made an award, covering 30 banks in Bombay, on 8th April, 1947. Subsequently, he made a similar award with regard to certain banks at Ahmedabad. Mr. V. B. Singh, Labour Commissioner of the United Provinces, made an award in respect of 40 banks in the said Province on 11th March, 1947. Mr. R. Gupta made an award regarding the Imperial Bank in West Bengal on 4th August, 1947. In December, 1947, Mr. S. K. Sen made an award regarding the Calcutta branches of the Central Bank of India Ltd. In 1948, Mr. S. C. Chakravarty made another award regarding the Imperial Bank of India in Calcutta. In the same year, Mr. P. R. Mukherjee made an award in regard to the Hindustan Commercial Bank in Calcutta. The All-India Industrial Tribunal (Bank Disputes), consisting of Mr. Justice K. C. Sen, Mr. Justice J. N. Majumdar and Mr. Justice N. Chandrasekhara Aiyar, made an award on 30th March, 1950 covering all banks as defined in section 5 of the Banking Companies Act, 1949, having branches in more than one State and the Imperial Bank of India. Although this award was declared void *ab initio* by the Supreme Court in 1951, the Industrial Disputes (Amendment and Temporary Provisions) Act, passed by Parliament immediately afterwards, prohibited banks from altering to the prejudice of their employees, the scales of pay or rates of dearness allowance, which they had begun to pay in terms of the above award save in accordance with the terms of any award that might be made afterwards. Another All-India Industrial Tribunal (Bank Disputes), consisting of Mr. Justice Panchapagesa Sastry, Mr. M. L. Tannan and Prof. V. L. D'Souza, made an award on 20th March, 1953, for the same banks for which the Sen Tribunal had made an award. Appeals against this award, made by the All-India Bank Employees Association and some banks, have been heard by the Labour Appellate Tribunal, which will publish its award shortly.

These awards have increased considerably the establishment expenses of banks. In 1947, the total earnings of Indian Scheduled banks were Rs. 29.83 crores and their establishment expenses amounted to Rs. 9.61 crores. By 1952, they had increased to Rs. 34.38 crores and Rs. 13.91 crores, respectively. This shows that the percentage of their establishment expenses to earnings increased from 32.2 in 1947 to 40.5 in 1952. While the awards have increased the remuneration of bank employees, labour legislation has paid no heed to the necessity of employees turning out adequate work per man-hour. On the contrary, indiscipline and disloyalty have increased among the employees of banks, because labour legislation has provided an elaborate and lengthy procedure for dealing with cases of indiscipline and even fraud. These difficulties have been one of the chief causes for a sharp fall in the number of offices of banks in India. The fall in the number of offices of Scheduled banks from 3,469 to 2,961 and of non-Scheduled banks, with capital and reserves of Rs. 1 lakh and over, from 2,688 to 1,833 between 1946 and 1947 must be attributed chiefly to the partitioning of the country. But the progressive fall in the number of offices from 1948 onwards must be attributed mainly to the burden imposed by the tribunals' awards upon banks. The total number of offices of Scheduled banks fell to 2,913, 2,864, 2,766 and 2,647 and of non-scheduled banks to 1,767, 1,572, 1,545 and 1,504 in 1948, 1949, 1950 and 1951, respectively.

Effect on Employment

The fall in the number of offices of banks, as noted above, has not yet produced any appreciable effect upon the volume of employment in them, because, in many cases, banks have been prevented from discharging surplus staff, resulting from the closing of unremunerative branches, by the orders of Labour Commissioners or Tribunals. This means that banks have been prevented, to a large extent, from benefiting from the closing of unremunerative branches. There is no doubt, however, that the awards and the labour legislation have made banks unwilling to add to their liabilities by opening new offices, particularly in undeveloped areas. This unwillingness to expand activities, even where there is scope for doing so, has not only checked the growth of banking in India, but has prevented the Indian banking system from providing additional employment, which it would have otherwise been able to do. The unemployed would welcome, even on somewhat lower remuneration, additional employment that would be provided by new branches of banks, in the confidence that, with good work, they would be able to secure better terms, with the progress of the new banking offices. Banks, however, would be prepared to open new banking offices only if they are allowed to remunerate their employees according to their capacity to pay. To enable them to do so, it is suggested that a section may be added to the Banking Companies Act, empowering the Reserve Bank to regulate relations between banks and their employees. The Reserve Bank has already powers of supervision over banks and they can be expanded so as to include regulation of employer-employee relations. With its intimate knowledge of the peculiarities and needs of banking and with a free hand, the Reserve Bank can lay down conditions of service either for banks generally or in particular banks, according to their capacity, and can encourage opening of new branches of banks by keeping terms of employment rather elastic. The Reserve Bank may have to set up a new department for doing this work.

The Minimum That Should Be Done

If for any reason the above suggestion is regarded as impracticable, the least that should be done is to carry out the recommendation made by the Rural Banking Enquiry Committee in 1950 on page 60 of its report, namely, that awards of industrial tribunals should not be made applicable to the offices of banks situated in towns having a population of less than 50,000. The Committee stated that the opening of new branches by banks in semi-urban or rural centres was found to be difficult, because of the high operating costs in relation to the earning capacity of such branches; that the enforcement of awards of industrial tribunals was likely to result in salary scales, fixed largely with reference to conditions obtaining in large urban centres, being made applicable to the smaller branches and would thus make the maintenance of such branches unremunerative for banks; that costs of living in the smaller towns would be lower than in the larger cities, particularly for locally recruited staff; and that, in any case, it would have to be recognised that the salaries which banks could pay to their staff would have to be related to the paying capacity of the areas concerned, as no bank could be expected to maintain indefinitely branches which were uneconomic, simply because overall profits were good or its income at other offices was considerable.

Impediment To Rural Banking

The check imposed upon the growth of the banking system by the awards is doing considerable harm to the economy of the country in another respect also. On account of the compulsion imposed upon the banks to pay the scales of emoluments laid down by the awards to their employees working in their branches located even in rural areas and townships, banks find that establishing their offices in such localities would involve them in a loss. Thereby they are prevented from mobilising the savings of the people living in those areas and making them available for the economic development of the country. They would have been very willing to mobilise these savings for the good of the country by establishing offices in such areas, if the awards had not prevented them from paying their employees in such areas according to their capacity to earn there. Commercial banks are the best agency for mobilising the savings of such areas on account of their ability to establish personal, friendly contacts with the people and to give them quick services much more effectively than any other agencies.

It is to be feared that these harmful results of the awards will increase in the near future, as they compel banks to give increments on a graded scale to their employees, regardless of the ability of the banks to pay and of the productivity or willingness to work on the part of their employees. This will impose on banks a cumulative burden, the worst effect of which may be felt by the country after a few years. Looking to the present trend, it seems safe to say that, in the near future, it will be impossible for banks to increase their income in the same proportion as the increase in their expenses that will surely follow consequent on the awards.—*All Rights Reserved.*

WORLD BANK'S LOAN FOR ECUADOR

A loan of $8.5 million was sanctioned to Ecuador by the International Bank of Reconstruction and Development on the 10th inst. It is intended for the execution of a highway construction programme designed to stimulate the development of agricultural production in the Province of Guayas and neighbouring parts of the coastal region.

This is the World Bank's first loan to Ecuador and is made to an autonomous local authority charged with the responsibility for developing the road system. Under the highway construction programme, eight of the existing roads radiating from Guayaquil, Ecuador's largest city and its most important port, will be converted to all-weather highways. The individual roads to be built under the programme will have a total length of about 365 miles.

The programme includes three other items namely, (a) the construction of a central maintenance shop for the repair and overhaul of construction equipment; (b) the building of a suspension bridge over the Daule River and (c) the acquisition of car ferries for use between Guayaquil and Duran. The programme is expected to take about four years to complete. It will cost 179 million sucres ($11.8 million) including the foreign exchange being financed by the Bank. The Bank's loan will pay for the import of road-building equipment and materials, ferryboats repair shop and maintenance equipment.

The loan is for a term of 10 years and the rate of interest is 4½ per cent. per annum, including the 1 per cent. commission allocated to the special reserve. Amortisation will begin on 1st March, 1956. The loan is guaranteed by the Government of Ecuador.

WINNING THE BATTLE AGAINST FUEL-FORMED DEPOSITS

SALIENT FEATURES OF MOBILGAS WITH S-54 DESCRIBED

THE recognition that fuel contributes to the formation of deposits and that they have an important bearing on the operation of the automobile gasoline engine opened up a new field of research investigation into the means of their amelioration. Fuel-formed deposits may be found in combustion chambers, on other parts of the intake system and the exhaust passages. These deposits make themselves felt in plug malfunctioning, pre-ignition, knocking, and engine stalling, with the result that the engine does not develop its full power.

In the research laboratories, studies were made extending over many years on the deposition tendencies of fuels in different makes of engines and for evaluating the ability of a new gasoline to ensure proper acceptance. Extensive improvements in refinery practices were made to provide a high quality gasoline, but, with the advent of high compression engines and the use of TEL (tetra-ethyl-lead) as an anti-knock agent, the problems of building into the gasoline properties to meet the more severe requirements became more complex and difficult.

This article is devoted to a description of the factors that contribute to fuel-formed deposits, their influence on engine operation and how Mobilgas with S-54, developed by Standard-Vacuum's Principals in one of the world's largest laboratories and proven by road performance in America and Europe, overcomes the problems associated with them.

Sources of Deposits

The carburettor is designed to supply the engine with the proper mixture of air and gasoline over a wide range of speeds and loads. However, under certain conditions of driving, combustion of the gasoline air mixture in the cylinders is often incomplete, with the result that various parts are likely to become more or less covered with fine carbon, as, for example, the plugs, combustion chambers, piston tops, exhaust passages and pipes. This carbon by itself would not be so objectionable as it is of a sooty nature. However, other factors such as gum and Tel in the gasoline contribute to deposit formation and, in combination with the carbon may foster relatively hard deposits of a troublesome nature.

Tel is now almost universally used in gasoline to suppress 'knocking.' If used alone in gasoline it forms lead oxide on cumbustion, which tends to accumulate on the spark plugs and exhaust valve seats. In order to overcome this, a product is incorporated to assist in the evacuation by the exhaust gases of the Tel-formed deposit. However, some amount of this deposit will be left in the combustion chamber, the extent of which will be influenced, to a great extent, by the amount of gum in the gasoline, by the nature of the carbon left by the burning of the lubricating oil and by engine operating conditions.

Small Amount of Gum

A small amount of gum exists in dissolved form in all gasoline. When, however, gasoline is stored for long periods, it absorbs oxygen from the air to form additional gum. This gum can form residues that can cause more trouble than other gasoline deposits. When gum goes into the engine, it does not evaporate along with the rest of the gasoline and some is deposited wherever the gasoline evaporates, as on carburettor jets, in the intake manifold or on inlet valve stems and it may also be carried into the combustion chamber. At first, the deposited material is sticky like varnish. It combines, however, with other deposits, absorbs more oxygen from the air and, under the drying action of heat, it may assume a form ranging from molasses to a hard flint-like deposit.

It will be seen, therefore, that, if the structure of the gum can be altered to prevent it from sticking on the parts of the intake system and from promoting the formation of hard deposits in the combustion chambers and on exhaust valves, deposit accumulation can be overcome to a great extent. This is what Mobilgas with S-54 does in a gasoline engine. It prevents the gum from being deposited in a sticky state when the gasoline is vaporised; instead, the gum-forming material is modified so that it is in a non-adherent state.

What Mobilgas With S-54 Does

The power output of a gasoline engine can be seriously impaired by fuel-formed deposits. Mobilgas with S-54 not only assists in minimising the deposits in the combustion chamber but it improves the functioning of the separate parts of the intake or breathing system, with the result that the power output is maintained at a peak. Let us consider how Mobilgas with S-54 improves the functioning of the engine, beginning with the throttle valve in the carburettor and continuing to the exhaust valves.

The throttle valve in a carburettor consists of a pivoted disc located in the venturi tube, which the driver operates by means of an accelerator pedal. The gasoline-air mixture from the carburettor is drawn by the suction of the engine via the manifold and the supply is controlled by the throttle valve. When the throttle valve is "closed," the engine is said to be idling. Actually, however, in the "closed" position, the throttle valve allows a small quantity of gasoline mixture to be drawn into the engine. This is done by providing an annular space between the periphery of the disc and the walls of the venturi tube. However, the annular space is very restricted and, if the rim of the disc gets gummy or sticky, the passageway may actually be sealed, thus stopping the flow of the intake charge of the air-gasoline mixture and causing the engine to stall.

Mobilgas with S-54 prevents the "gum" from being deposited on the throttle valve.

In modern gasolines, there are incorporated several components like inhibitors and anti-knock agents, which contain much non-volatile material. These added materials do contribute somewhat to the deposition of residues in the engine manifold, particularly if the interior surfaces are coated with gum. Mobilgas with S-54 prevents this material from being deposited and clogging the passages.

Prevention of Formation of Harmful Deposits

Near the intake ports of the combustion chamber, all the while that the engine is running, there is a constant pulsation of gases, including the fresh air-gasoline mixture about to enter the ports and a mixture of products of combustion tending to get past the intake ports, owing to the designed overlapping action of the intake and exhaust valves. In course of time, the products of incomplete combustion tend to deposit a coating of varnish-like substance on the walls of the passages at the intake ports.

Sometimes, the gumming on the underside of the inlet valve head may be so severe as to reduce considerably the power output of the engine. The valves must also effectively seal the gases in the combustion chamber at pressures up to or possibly exceeding 600 pounds per square inch. If gummy deposits collect on the underside of the valve heads, power is lost and the valves and valve seats may also suffer damage.

Mobilgas with S-54 serves to prevent the formation of these harmful deposits.

Lungs of Gasoline Engine

It may be said, therefore, that the inlet valves and manifold are the lungs of a gasoline engine and, like mortals, when affected with congestion of the respiratory system, cannot breathe freely, if the passages are clogged with deposits. In the automotive engine, such deposits will result in the cylinders not receiving the right amount of air-fuel mixture and, therefore, the engine cannot develop its full power.

The stems of the intake valves are fitted into cylindrical guides and are normally lubricated by a thin film of lubricating oil supplied from the engine sump. The valves are required to operate at lightning-like speed and open and close in a fraction of a second. However, when the engine is overloaded, it is likely to run "hot" and there is a tendency for the oxidised lubricant to combine with the gum in the fuel and accumulate in a sticky film in the clearance space near the top of the valve guides. When this happens, the valves stems stick and the valves operate sluggishly. Mobilgas with S-54 assists in free movement of the inlet valves.

The intake valve, being constantly cooled by the incoming charge of the gasoline-air mixture, operates at a comparatively cool temperature. The exhaust valve, on the other hand, is subjected to a very high temperature, sometimes high enough to cause it to operate at red heat. If deposits find their way on the valve seat, it ultimately results in burnt out or broken valves.

Mobilgas with S-54 alters the characteristics of the deposits in the combustion chamber resulting from gum or material incorporated in the gasoline, making them non-adherent, with the result that combustion chamber deposits are minimised.

Effectiveness Established

Proof of the effectiveness of Mobilgas with S-54 in minimising deposit formation has been established in actual use in America and Europe. Summarising, therefore, its use helps to (1) create better engine breathing and hence more efficient utilisation of fuel resulting in greater power and lower fuel consumption, (2) reduce the knocking tendency due to better breathing and minimum deposit formation (3) provide easier starting and warm up as valves move freely and the carburettor does not stick, (4) greatly reduce valve and hence engine maintenance.

A Modern Motor Oil

So far, we have dealt with fuel-formed deposits. However, cleanliness of the moving parts in the crankcase and of the pistons is also equally important, since deposits on these parts can be a great source of trouble. Mobiloil, a modern motor oil, developed by Standard-Vacuum, is a highly detergent oil. This powerful property enables Mobiloil to hold in suspension in a finely divided state contaminants such as fuel soot and any oxidation products resulting from the fuel and lubricant that find their way into the engine sump. When the oil is changed, the impurities are drained out of the sump with the oil and permanently removed. To coin a phrase, Mobiloil keeps engine crankcases and pistons "Mobiloil clean."

The best advice that can be given for keeping down to a minimum the formation of deposits in the automotive engine is, first, to use only the best gasoline and, second to use a selected motor oil. Mobilgas with S-54 and Mobiloil, when used together in the gasoline tank and engine sump, respectively, will provide complete engine cleanliness.—*Advt.*

ARE PRICE CONTROLS, RATIONING AND ALLOCATIONS NECESSARY?

VIEWS OF I.M.F. EXPERTS

[Alluding to the views of the experts of the International Monetary Fund on price controls, rationing and allocations, in the course of an editorial last week, we observed that they should be duly taken note of not only by the whole of the Planning Commission but also by all those who blindly argue that a rigid system of physical controls is a prerequisite for the success of any planned economic development. For considerations of space, however, we could not refer in detail to the impressive arguments advanced by the I.M.F. experts in support of their conclusion that a system of controls that is terminated by a burst of inflation or by confiscation of savings cannot be regarded as an acceptable means of securing resources for development in a democratic country in which the Government is concerned with the well-being of the people. We, therefore, reproduce in these pages the relevant chapter from the Mission's report. This is, of course, somewhat lengthy, but, as it is necessary to educate public opinion on the harmful effects of these controls, we have thought it worthwhile to publish the views of the experts in full. It will be seen from what follows that the experts have questioned the very assumption of the Planning Commission that controls "are an integral and integrated part of the Plan." It is true that there are not many price controls, rationing and quotas now. Nevertheless, there are still some controls such as those on cotton, sugarcane, cement and steel. A perusal of the views of the experts will show that there is no need for continuing even these.—Ed.]

WHERE credit policy is used actively to provide the country with no more than the appropriate money supply that can finance a growing output at stable prices, there can be no inflation arising from deficit financing and credit creation by the banks. At the same time, such a credit policy does not increase the real resources available for development. It merely allocates the real resources represented by the drawing down of exchange reserves and the savings of the public in the form of cash balances. Credit policy could be used to expand the money supply beyond the appropriate amount. Under such circumstances, additional real resources would become available for development, if the response of the economy to the inflation were not of a sort to diminish the availability of resources arising in other ways.

The inflation resulting from the excessive creation of credit transfers real income to profit receivers. It would be a mistake to assume, however, that all of the inflation profits become available for development. The savings of other groups in the community are reduced in an attempt to protect the level of consumption. The consumption of profit receivers is also increased, as their real incomes rise. Thus, only a fraction, perhaps only one-half or one-third of the inflation profits, emerge as an addition of real resources for development. And even this is accomplished only at the cost of severe disruption in the economy and grave injustice to large numbers of the people. It has been argued in India, as elsewhere, that the disruption and the injustice caused by inflation can be avoided by controls, while credit creation is used to secure real resources for development.

Controls and Real Resources

It should be made clear what controls can and cannot do under circumstances where credit has been expanded excessively, because real resources for development are inadequate. As resources cannot be transferred to investment without taking them away from consumption, there must be some reduction in consumption below the scale that would otherwise prevail at the new level of income. No system of controls can avoid that. What controls can accomplish, if they are successful, is to prevent a sharp rise in the real incomes of profit receivers and a sharp fall in the real incomes of other groups in the community. And controls can prevent, if they are successful, the concentration of the ownership of the newly saved wealth in the hands of the profit receivers, instead of the consumers whose consumption is reduced to provide real resources for development.

The inflationary pressures arise from the excessive demand which cannot be met by output. The rise in prices is the response to the excessive demand, and the effect of the higher prices is to restrict the demand to the available output. Although the rise of prices is a symptom and not the cause of inflation, it is the mechanism by which the transfers of income take place. If prices could be prevented from rising, the public would be unable to spend as much of its income as it would wish. The unspent part of the income would remain as the savings of consumers; it would not be dissipated in bidding up prices and transferring real income to profit receivers.

Price controls in one form or another were used in practically all countries during and immediately after World War II. Their effectiveness varied from country to country, and everywhere, they were much less effective in holding down prices in the later than in the earlier years. For example, in the United Kingdom, the cost of living rose by nearly 15 per cent. between 1941 and 1945; it rose by more than 20 per cent. between 1945 and 1949. Wholesale prices of all goods rose by 10 per cent. between 1941 and 1945; they rose by 40 per cent. between 1945 and 1949. Over the whole period, from the beginning of the war to the end of 1949, the rise in prices was larger in the European countries that maintained price controls throughout these years than in the United States and Canada where price controls were abandoned about one year after the war. Obviously, the important factor was that inflationary pressures were not as great in North America as in Europe.

Problem of Allocations

If prices are successfully controlled, the supply of consumer goods cannot satisfy the demand at prevailing prices. If the excess of demand is moderate, there may be no great harm in permitting consumption to be reduced haphazardly by the exclusion of those buyers who come when supply is exhausted. Where the excess of demand is considerable, however, great injustice would be done by this procedure. To assure a tolerably equitable distribution of the available supply of consumption goods, it would be necessary to resort to rationing. As shortages would also appear in the supply of production goods, allocations to business firms would be equally necessary. It should be pointed out that the problem of allocation is far more complex than consumer rationing. Fairly equal access for all consumers to the supplies of scarce goods is socially just and administratively simple. No such rule can be applied to producers competing for limited materials and equipment to produce an almost infinite variety of goods.

Price controls, rationing, and allocations involve significant real costs of their own. A comprehensive system requires a large and elaborate Government organisation for its administration. Where trained people are scarce, as in India, the necessary staff can be assembled only at the expense of handicapping other Government or private activities. Furthermore, the efforts required to ensure compliance by business men and consumers are costly and time-consuming. Experience in many countries indicates that, even with a well-organised and efficient administration, it may prove impossible to enforce the controls in a reasonably effective and equitable manner. The problems increase with the severity and duration of the controls. If the public loses sympathy with the policy and attempts to evade the controls on a large scale, a breakdown in their administration becomes almost inevitable. Since incompletely enforced controls are both unjust and ineffective, these hazards cannot be lightly dismissed.

It should be emphasised again that price controls, rationing, and allocations do not obviate the need to sacrifice consumption in order to secure real resources for development. They serve, rather, as a method of apportioning the compulsory reduction in consumption more or less equitably throughout the community. If successful, the controls would prevent the injustice inherent in the redistribution of income originating in a rise in prices. The creation of credit would provide borrowers with the means of securing real resources; the corresponding savings would be accumulated by those whose consumption is curtailed. The accumulation of such savings is a partial offset to the sacrifice entailed in restricting consumption.

Broadening Area of Controls

The philosophy underlying controls is that a rise in prices would be followed by a demand for a rise in wages in order to restore the level of consumption, while stable prices with controls would be accepted without insisting on an unrestricted level of consumption. The key element in this philosophy is the necessity of avoiding a rise in the cost of living. Some of the advocates of the view that inflation can be suppressed in this way seem to believe that price controls and rationing will be necessary only for foodgrains, cloth, and perhaps a few other goods of special importance. The experience with controls in most countries, however, shows that in order to assure the effectiveness of the basic controls, it becomes necessary to extend the regulatory system more and more widely.

Effective price controls and rationing of necessities leave the public free to try to buy other things with a part of the income that otherwise would be spent for necessities. This spill-over of purchasing power, if not checked, causes prices of other goods to rise, makes their production more profitable, and induces producers to shift production from necessities to non-necessities. Producers of controlled goods cannot afford to pay as much as other producers for scarce materials or labour. To stop this diversion, it is necessary to put price ceilings on more and more commodities and attempt to check the production of non-essentials by limitation orders, allocation of materials and the like. Thus, the network of controls becomes very wide, even though the original purpose may have been only to assure an equitable distribution of necessities.

If there are any parts of the economy in which there are enough unused resources to permit an increase in production without diverting labour, materials or equipment from other activities, a spill-over of spending into these areas will be harmless and even desirable. Although there may be some possibilities of this nature, especially as regards services, they cannot be of great importance in India.

In general, controls must be operated in an environment of scarcity. Where real incomes are low, the demand for the particular types of consumption on which income would be spent is likely to be very inelastic. There is thus extraordinary pressure to offer illegal prices for supplies outside the official ration, and these higher prices become an inducement to divert supplies from official channels into black markets. It becomes necessary to extend control over supply as well as demand.

As controls continue in force and become broader in coverage, they make for inflexibility in cost-price relations. For example, the prices of industrial raw materials, if rigidly controlled, cease to reflect the influence of relative scarcity or abundance. The process of development always requires important shifts in the use of economic resources. One of the functions of the price system is to facilitate this shift by making the new uses comparatively more attractive than the old—a simple case of a functional price adjustment. The most skilful administration cannot hope to anticipate all these shifts and to achieve, by regulation, a close approximation to the operation of a free price system. The usual course is to attempt to hold prices rigidly, making changes only as they become obviously inescapable.

Wasteful Use of Materials

Price controls may lead to wasteful use of materials. For example, steel, being in short supply, is subjected to price control. By keeping down the price of steel, the community foregoes the opportunity of employing a powerful incentive for careful use of the material. At the controlled price, it will become necessary to allocate steel, just as rationing must accompany price control for basic foods. If the price of steel were allowed to rise, every business man would be given an economic inducement to shift to another material the relative supply of which is greater than that of steel. The pattern of relative prices of raw materials is a powerful force to induce successive substitutions of less expensive materials which are more plentiful for more expensive materials which are scarcer.

Controls also result in a domestic cost-price structure that is out of line with world prices and production costs. Imports and exports, therefore, become less responsive to changes in the outside world and greater reliance must be placed on import and export controls and exchange restrictions. These problems are familiar ones in India and need not be elaborated. It is only necessary to mention that, if internal prices of grain, for example, are kept below the world level, it will be necessary to restrict exports and to subsidise imports. If, to take a different example, the price of raw cotton is held down at home, while the price of commercial fertiliser is equal to the world price, Indian growers will have less incentive to apply fertiliser than will growers in other countries and India's relative output is likely to suffer.

The establishment of controls to deal with excessive demand requires comprehensive regulation to restrict consumption and use of goods of all kinds and to assure the flow of supplies to those authorised to buy such goods in specified amounts at regulated prices. In a country like India, large in area, where production is undertaken by innumerable small producing units, with small incomes, and with supplies of the most essential goods barely adequate for needs under ordinary conditions, such comprehensive regulation presents a formidable administrative problem. These difficulties are certain to be enhanced, if the controls are retained for an extended period. For, after a time, controls affect the incentive to produce and the willingness of producers to supply output for controlled markets.

Where production is organised on a price-cost basis, the ability of producers to maintain and expand output depends upon their receiving a remunerative price. The complexity of the pricing process compels the authorities to depend primarily on the maintenance of the price relationships existing at the time the controls are imposed. As these prices are not all equally remunerative, there is a tendency for producers to concentrate output on those goods the price-cost relationship of which is most favourable. These are likely to be, although not necessarily, the higher priced goods of each type. To assure low-income consumers a proper proportion of the output, it becomes necessary to regulate the types of goods produced, as under the utility goods schemes in various countries.

An effective system of price controls inevitably requires the control of costs, including wages, materials and equipment. Where costs cannot be controlled, or cannot be prevented from rising even with controls, there will be a need for repeated adjustment of prices to assure a proper relationship with costs. As costing necessarily lacks precision, particularly when output cannot be maintained at levels for which capacity is installed, there is great risk that the proper relationship of price to cost will not be established. Business firms may be induced to reduce or to limit output, because regulated prices are regarded as too low to cover costs, including reasonable profits. Acute shortages of particular goods may develop for this reason.

Restrictions on Consumption

Even if prices and production are successfully controlled, the restrictions on consumption may affect the willingness to work or to sell output. Restrictions on consumption provide resources by preventing the public from spending a part of its income. The resulting forced savings, by definition, appeal less to the income recipients than the goods they would buy if they were allowed to do so. If controls continue, the accumulation of money which cannot be spent will in time become less and less attractive. Workers may not be motivated to put in extra effort to earn money to add to unwanted savings. Cultivators will almost certainly prefer to consume more of their foodgrains, if they are forced to save money that they would prefer to spend, or, if they are able, to spend money only for goods that appeal to them less than more food.

The principle is the obvious one that income encourages work, because it can be used to buy goods. For a time, people may pile up money claims which they confidently expect to be able to redeem in the near future. But, as rationing persists, the motivating power of unspendable money begins to weaken. That is why absenteeism becomes a serious problem in countries in which consumption is rigidly restricted by rationing, and that is why the most thoroughly controlled economies are ultimately compelled to devise consumption incentives to maintain work standards.

Quite apart from the discouraging effect on production, comprehensive controls are likely to hamper the flow of supplies. Because goods have a premium over money, consumers are induced to buy goods whenever they can get them and to hoard goods in preference to holding money. This is the familiar experience that people will take up a ration in full even when it is more than they would buy under free conditions. For business men, inventories in all stages of production tend to be held in larger amount than necessary. As prices always creep up, and may ultimately burst upward even with the best system of price controls, speculation in inventories is certain to prove profitable. That is why inventory control becomes a common feature of every comprehensive system of price fixing, rationing and allocations.

In agriculture and in small industrial units, particularly cottage industries, the difficulty of securing goods induces producers to circumvent the restrictions by marketing their output outside the usual commercial channels. In small and relatively self-sufficient communities, this can be done by trading agricultural products for cloth and other consumer goods. For larger producers and for higher income consumers, black markets, with their higher prices and their availability of supplies outside the ration, become important alternatives to the fixed-price rationed market. In time, such markets acquire a tinge of respectability and even legality as parallel markets or free markets.

If controls are successful in preventing an active inflation, their incentive effects and welfare implications, with the passing of time, come closer and closer to those of an especially severe form of taxation. Comprehensive rationing in practice comes to resemble a tax imposed at extremely high rates on all money income in excess of that required to buy the rations at controlled prices. An individual cannot hope to increase his family's present consumption of rationed goods to any significant extent by working harder or bringing more produce to the market. Of course, it would be possible to relate the size of the ration to the amount of work done or the quantity of agricultural products marketed, but this would conflict with the egalitarian philosophy which is usually urged as the justification of rationing. In contrast, the ordinary tax system, which allows some increase in consumption with a larger money income, may actually impel the worker to try to earn more or the farmer to sell a larger part of his crop. When the people begin to respond to these implications of rationing, and they will not be long in doing so, its psychological and political advantages over outright taxation also tend to disappear.

Controls and Inflation

Any general expectation that prices can be kept from rising by any system of controls, however comprehensive, when there are persistent inflationary pressure, is certain to be disappointed. In one form or another, these pressures gradually act on prices. No country that has had extensive experience with controls has been able to avoid at least a gradual rise in prices. That has been the experience of India in the war and post-war periods; it has been the experience of countries more plentifully supplied with goods and in which the administrative difficulties were far less formidable than they would be in India. The most successful experience with war-time price controls involved a war-time rise in the cost of living of about 20 per cent. (somewhat less for Canada, somewhat more for Australia). This was for high-income countries which are normally very large exporters of foodstuffs. India could not hope to do as well.

Few people would argue that controls should be expected to do more than slow down the rate at which prices rise in response to inflationary pressures. Even a modest rise of 5 per cent. per annum in prices—and that would indicate very successful use of controls—would, after a few years, bring considerable distortion in the Indian economy and result in grave injustice to large numbers of people. After eight years, covering the completion of the present Plan and another Five-year Plan, the cost of living would be nearly 50 per cent. higher than at present. To superimpose such a rise in prices on the large rise that took place between 1940 and 1950 would be to compound the injury that has already been suffered by many people whose income cannot respond to inflation. Nor is there any way of making certain, through the use of controls, that the rise in prices will not be considerably greater than 5 per cent. per annum.

The Task of Development

The task of development with which the people of India are confronted is not one of providing an extraordinary amount of real resources for a relatively short period of time. Development requires a larger flow of resources into investment for a generation or more, if India is to escape from poverty and stagnation. The people cannot be expected to pile up forced savings which they will hold in more or less liquid form, but for which there can be no use in consumption over so long a period. In one way or another, these savings, in the form of money or money claims in excess of what people wish to hold in preference to current consumption, will have to be removed, if the economy is to continue to function efficiently.

There are only two ways in which this can be done. One would be to allow the forced savings gradually to be used for consumption expenditure. As the output of consumer goods in the future will at best be only enough to meet expenditure out of current income, this will involve activating the latent inflation represented by these accumulated savings. Even if controls are continued indefinitely, these savings, as they rise higher and higher, will at last break through the controls, and the money savings will be dissipated in open inflation. In practically no country could the public be induced to continue to hold the unwanted war-time savings resulting from price control and rationing. In the end, by allowing prices to rise, the savings gradually disappeared, until they no longer exerted pressure on the economy.

Monetary Reform

The other way to remove the unwanted savings that impede the operation of the economy is to confiscate them through a monetary "reform." Even in the most thoroughly controlled economies of Eastern Europe, it was impossible to make the price and rationing systems work under the pressure of these piled-up and unusable savings. That is why these countries have had to resort to monetary reforms which wiped out a large part of past savings in the form of currency, deposits, and even Government bonds. The resentment created by such reforms, in which the Government confiscates the savings accumulated by consumers as a result of restrictions imposed on their consumption, is even greater than that caused by inflation.

A system of controls that is terminated by a burst of inflation or by confiscation of savings cannot be regarded as an acceptable means of securing resources for development in a democratic country in which the Government is concerned with the well-being of the people. Either course means that the promises implicit in rationing would then turn out to be equivalent to a form of taxation in practice as well as in theory. Moral questions aside, a Government should recognise that either open inflation or monetary reform weakens the urge to accumulate money savings in the future and thereby complicates a financial programme relying on either voluntary or forced saving.

Price controls and rationing, in conjunction with credit expansion, do not offer a solution of the problem of inadequate resources. The controls are difficult and costly to administer. Their successful enforcement on a comprehensive scale and for a long period of time cannot be taken for granted and might prove impossible. The controls involve economic costs in the form of rigidities, waste, and disrupted production. If long continued, they weaken incentives to work and to supply goods in exchange for money. In the long run, the resources for development—and development is a long-run problem—must come from taxes or savings out of the current income of the people, or they must come from resources provided from abroad. The problem of inadequate resources must be faced and met. It cannot be hidden by the excessive creation of credit reinforced by controls to avoid an obvious and active inflation.

GENERAL AGREEMENT ON TARIFFS AND TRADE

A NEW PROPOSAL FOR REDUCTION OF CUSTOMS TARIFFS

AT the eighth session of the G.A.T.T. held at Geneva in October, 1953, the plan of the French Government for a new method of reducing tariffs was presented as a technically feasible scheme and was submitted to Governments for study, so that they can give their views in the course of this year. The main features of this proposal are explained in a small pamphlet entitled "A New Proposal for the Reduction of Customs Tariffs." Published by the G.A.T.T., the pamphlet sets out in simple language what the plan is and how it would work. It also includes the rules of the plan, in which the commitments are set out and an annex in which some of the technical regulations and definitions are formulated.

The first section of the pamphlet—Origin and Development of the Plan—refers briefly to the technique for tariff reduction which, in the three post-war Tariff Conferences—Geneva in 1947, Annecy in 1949 and Torquay in 1950-51—led to remarkable results: in all, some 58,000 concessions were negotiated among countries that conduct four-fifths of world trade. It states that "although this method of negotiation was responsible for the fruitful results of the post-war conferences, there was some feeling at Torquay . . . that the time had come to search for new methods."

Reasons for New Approach

After explaining the technique of product by product bargaining on which the Geneva, Annecy and Torquay negotiations were based, the pamphlet states that "one of the principal reasons for the need to find a new approach to tariff reduction lay in the weak negotiating position of the countries with relatively low tariffs. . . . At Torquay, these countries considered that the renewed binding of their tariffs should be accepted as a concession equivalent to further reductions in the higher tariffs of other countries. But, when they came to negotiate, they found that the high tariff countries were not prepared to make further reductions merely in return for a rebinding of low rates. . . . Therefore, in their opinion (i.e., the opinion of the low tariff countries) it was essential that the negotiating technique should be reconsidered if further progress was to be achieved in the process of tariff reduction. For this and other reasons, efforts have been made since the close of the Torquay Conference to find new methods of reducing tariffs by collective action under the General Agreement."

The pamphlet then reviews the history of the new plan. The first proposal was put forward by the Benelux Governments. Their scheme was directed mainly towards the reduction of the disparity in the tariff levels within Europe. But this would have involved the unilateral reduction of duties by high-tariff countries—reductions which would have had to be extended to non-European countries under the most-favoured-nation provisions of the General Agreement. As an alternative, the French Government suggested a plan of broader scope which, it was thought, would meet the difficulties of the Benelux Governments and which would, at the same time, require of non-European countries the same kind of reductions as would be required of European countries. This French plan called for an agreement among Governments to reduce their tariff levels by 30 per cent. in three years.

In brief, what are the main characteristics of the new approach to tariff reduction? "In place of bilateral negotiations between countries on a product-by-product basis aimed at a strict balance of concessions, there would be an obligation on all participating Governments to reduce the protective incidence of their tariffs in accordance with a common standard. . . . The balance for any particular country is measured not by setting off specific concessions obtained against specific concessions granted, but by setting off overall reductions made by it under the common standard against overall reductions made by others under the same standard. Another feature of the plan is that it requires efforts proportionate to each country's tariff level. And, finally, it provides an additional obligation to reduce individual rates of duty that exceed given levels."

The Governments of Belgium, Denmark, France, the Federal Republic of Germany and the Netherlands have indicated their support of this plan in principle, but clearly, states the pamphlet, it cannot be brought into operation unless it is accepted by all the main trading countries in Europe and North America.

How the Plan Would Work

(a) *30 per cent. reduction in stages of 10 per cent*: Each Government participating in the plan would undertake to reduce the average incidence of its customs tariff in a base year by 30 per cent. in stages of 10 per cent. in each of three successive years. Governments would not be required to reduce every tariff rate by this amount, for, within certain limits, they would be free to choose the items on which to make reductions. The reductions would, however, have to be distributed throughout the tariff and not concentrated in any one part of it, thus ensuring that the benefits would accrue to all supplying countries, even to one whose interest might be limited to products of a certain class. In order to achieve that object, the tariff would be divided into sectors covering broad categories of related products, such as primary foods, products of the chemical industry, etc., and the 30 per cent. reduction would be applied to each sector.

An example: The average incidence of the tariff in each sector is taken to be the percentage of the value of imports collected by the customs. If, for example, the value of the imports of the items in a certain sector of the tariff is 1 million francs and the duties on those items are 100,000 francs, the average incidence for that sector would be 10 per cent. In this example, assuming no change in the total value of imports in the sector, the plan would require reductions of duties sufficient to bring the duty collections down to 90,000 francs in the first year, to 80,000 francs in the second and, finally, to 70,000 francs in the third year.

(b) *How the plan would work for low tariff countries*: Reduction by 30 per cent. is the general rule, but less than that is required of countries having comparatively low duties. This would be accomplished by the establishment of a demarcation line and, below that, a floor for each sector. A country whose average duty incidence in any sector was below the demarcation line would be required to make less than the 30 per cent. reduction, and, if the incidence was below the floor rate, no reduction at all would be required.

(c) *Special obligation to reduce all very high duties*: Each participating Government would undertake the further obligation to reduce all duties which exceed certain upper limits. If a country has some very high duties in a given sector, it will have to reduce those duties to the level of the ceilings during the first three years. These reductions can be counted in the reduction of the average incidence for that sector, but will have to be carried out even if no reduction is required under the 30 per cent. rule.

Ceiling Rates to be Fixed

It is proposed that a ceiling rate should be fixed for each of the four categories of imports, namely, industrial raw materials, semi-finished goods, manufactured articles and agricultural products. The authors of the plan feel that, if this additional obligation were not included in the plan, there would be no guarantee that the high duties which are the greatest obstacles to trade would be reduced.

Freedom to Select Items for Reduction in each Sector

Apart from their obligation to observe the ceiling rates, and to achieve a definite quantum of reductions in the course of each of the three years, Governments would be free to select the items in each sector on which to make reductions and to determine the degree of reduction for each item. Moreover, the method by which the reductions would be effected would be left to the discretion of each Government. In some cases, reductions would be brought about unilaterally, while, in others, they might result from bilateral negotiations on the basis of reciprocity; in other cases, again, they might be made under regional plans for economic co-operation. No Government would be obliged to make reductions on the same items in each of the three years; that is, a rate of duty which is reduced in the first year would not need to be further reduced.

Special Arrangements for Less Advanced Countries

The Governments of countries recognised as being in the process of economic development and which elect to be governed by special rules would not be required to make duty reductions on products included in their development programmes. The right to exclude any particular product from the operation of the plan would be granted for a fixed period of time. These exclusions would be limited to products covered by a country's programme of economic development on which production had started before the plan entered into operation or was expected to start soon after the exclusion was approved. Further, for these countries, the average incidence of duties would be computed on the tariff as a whole, instead of by sectors, so that they would have ample freedom in the selection of items for the application of the percentage reduction. The same advantages would be available to overseas customs territories of industrialised countries which are recognised as being in the process of economic development.

Exclusion of Fiscal Duties and Other Items

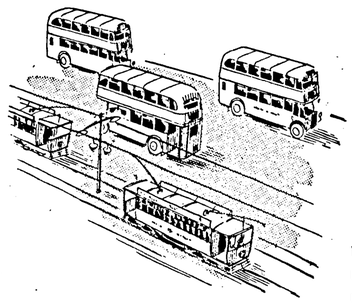
The plan also provides for the exclusion of certain items from the operation of the plan, that is, Governments could omit the value of imports of these items and the duty collections from the calculation of the average incidence and also omit those items from the obligations to reduce rates of duty. In the first place, Governments would be permitted to exclude fiscal duties, that is, duties which are imposed for the purpose of raising revenue rather than to afford protection to domestic production. Secondly, they could exclude duties on goods imported mainly from countries which do not participate in the plan. This exclusion is provided for, because Governments would probably not wish to extend the benefits to countries outside the General Agreement and because the plan is based on the principle that every reduction of duty would have to be extended to all the contracting parties to the General Agreement, whether they participate in the scheme or not.

Length and Conditions of Operation

It is proposed that the plan should operate in the first instance for a period of five years. The reduced rates of duty and the reduced average incidences in the various sectors would remain bound until the end of that period. There is, however, an escape clause, under which exceptions to this rule could be allowed. A Government could ask for authority to modify a duty which had been reduced on the ground that the maintenance of the bound rate would involve serious economic or social dangers. In addition, a Government could be authorised, in exceptional circumstances, to maintain a particular rate above the ceiling fixed for goods of its category.

Administration of the Plan

Once in operation, the plan would be administered by a permanent board composed of all participating countries. For administrative purposes, the board would be considered as a subsidiary body of the contracting parties. Unless all contracting parties should decide to participate, the plan would be embodied in a separate instrument governed by its own provisions, but, in order to safeguard the benefits to be derived from the duty reductions, this instrument would incorporate some of the provisions of the General Agreement such as those relating to margins of preference and the imposition of other duties or charges. The plan would not affect the obligations of contracting parties under the General Agreement, it would merely impose additional commitments.



Keeping 'tabs' on 12,05,000 daily journeys

Every day, Bombay's *260* trams and *350* buses carry an average of *12,05,000* passengers. Every day, Bombay's Electric Supply and Transport Undertaking receives — through its Hollerith installation — closely analysed returns of this vast traffic: a contribution of inestimable value to the economy of a great Corporation serving a great community. SUCCESS OF INDUSTRIAL MANAGEMENT—II

PROPER SELECTION AND TRAINING OF STAFF IMPERATIVE

(By Col. L. SAWHNY, Managing Director, Associated Cement Companies Ltd.)

[The following is the second and final instalmnt of the author's address at the Second Annual Conference of the All-India Council of Labour and Welfare Officers held in Madras on the 12th inst. The first instalment of this address was published on page 255 of our last issue.—Ed.]

MANAGEMENT must be the co-ordinator of the policies and functions of its enterprise. It is vital that management always keeps before its eyes the broader picture and combines the various parts of the organisation into a harmonious and consistent whole. Unless this is done, there will be an inevitable waste of effort which may result in a serious slowing down process, and possibly in disintegration. Co-ordination is not only necessary at the top level of management but must be exercised at every organisational level of industrial administration. In order to provide for this, authority and responsibility must be delegated down as far as is necessary to achieve the best results. A man must have as much responsibility as goes with the function of his task, and he must be given as much authority as is necessary to undertake this responsibility.

Co-ordination does not mean a rigid acceptance of conformity. Wherever possible; executives should be allowed to run their respective departments in their own way and with the least possible interference from headquarters. Also, they should be encouraged to use their own initiative in taking decisions. Management must, however, be particularly careful of individually brilliant executives and more so of those of the "technical" variety. In the same way as a brilliant soloist often makes a poor member of an orchestra, so a brilliant specialist may create disharmony in an industrial organisation. An industrial team, like an orchestra, depends upon the blending, timing, and harmonising of all performances. However good individual performances may be, it is the general performance that counts.

Co-ordination implies an ability on the part of management to look ahead and to effect such changes and adjustments in the existing structure of an organisation as may be dictated by the future requirements of its development. Proper co-ordination will promote in the individual executive and supervisor a sense of intelligent participation in the management function. It will also instil in the individual worker a feeling that he is managing his own job, and thus provoke a sense of responsibility. By thus sharing control and leadership, management will bring about well organised departments and a full acceptance of the principle of decentralisation. Senior executives will be relieved of unnecessary administrative detail, and top-level management will be given an opportunity to think ahead as to how best to stimulate the morale and the effectiveness of the whole organisation.

Selection of Staff

A vital factor in the success of any business is the right selection of its administrative staff. In this matter, management has the inescapable function not only of making the right selection, but, after having made it, also of providing the fullest scope for legitimate ambition and individual advancement. A management which is so petty as to be jealous of its powers and authority will naturally select staff of the submissive type, docile men who are accustomed to obey without question. It would not take the risk of engaging able and independently-minded employees for the fear that it may one day be supplanted by them. In fact, they would be scared that they might suffer the same fate as:

"The young lady of the Niger,
Who went for a ride on a Tiger,
They came back from the ride,
With the lady inside,
And a smile on the face of the Tiger."

A really go-ahead management which understands the mood of the present times will do the direct opposite. It will seek out men capable of evolving policies within their own sphere, and will train them to rise to the highest position.

Management Training

In common with most administrative bodies, management is self-perpetuating and is responsible for providing for its own succession. Even the ablest management cannot foresee the future with certainty, its decisions for the future are at best intelligent guesses. What, however, it can and must do is to make available to the enterprise men who will be capable of taking the decisions of the future and who are qualified trained, and tested during the present to do so. No management can rely upon a constant supply of geniuses. It must so train its staff that, during normal times at any rate, the enterprise is capable of being run effectively by men of not much more than average ability and with a robust sense of purpose.

The best method of providing this training is, in my opinion, a combination of practical experience and formal instruction. So far as formal instruction is concerned, no one would seriously suggest that the education of a future manager should end with the attainment of a University degree. Yet, in our country, there are as yet no institutions which are designed to impart instruction in management training. The young business executive is left "to train himself," to "learn as he goes along." This haphazard and unplanned education of the managers of the future is a very serious national shortcoming and one which requires to be remedied as quickly as possible.

A Lesson from the Military

Here, again, if I may draw upon my experiences with the Indian Army, I think that industry can learn something from the manner in which the education of the army officer is organised. Throughout an officer's career, he is perpetually sent to school. At every stage of his advancement he is taken away from the cares and responsibilities of carrying out his day-to-day duties and is sent to do a course of instruction which teaches him the technical knowledge that is necessary to carry out the future task which has been assigned to him.

At the most junior levels the army officer is sent to schools of instruction where he is taught the proper handling of small arms weapons; the functions of a leader concerned with the tactical handling of a minor infantry unit; or, again, of the technical duties involved in the maintenance of sub-unit inter-communications. At the peak of their careers, the future Generals, Admirals, and Air Marshals of the Defence Services, upon whom the responsibility for the defence of their country devolves, are sent to institutions like the Imperial Defence College, where they are taught the integrated use of all weapons and organisations of war, as also the functions of the various civil administrations and of the industrial organisations which go to make up a nation's war effort. When it is appreciated how, from a comparatively small number of professional soldiers, such a rich harvest in ability and national leadership has been achieved, then it will be realised that this careful system of training at all levels of a military career pays the most handsome dividends.

If business will face up to this problem of training its leaders of tomorrow, it will find, as the fighting services have found, that formal instruction and practical experience must be planned and provided for throughout an executive's career. The practical experience is provided by means of an orderly progression of jobs, each of which calls for a larger measure of intellectual capacity and moral responsibility from the individual.

Academic and Technical Instruction

The academic and technical instruction should, I suggest, be planned to provide training at two periods of a business career. The first at a stage when the young executive has, after, say, eight or ten years, assimilated experience of direct practical management at a comparatively low level, and requires the teaching which is necessary to enable him to bridge the gap between this type of management and the higher, more indirect, role of co-ordination that his future assignments will necessitate. The second should be at a stage just before a manager, who has proved himself worthy of promotion, is required to function at a really high level of responsibility involving the integrated problems of various industries, as also their relation to governmental policy. At such a time, he must be permitted to lay aside the cares of his daily work and spend six months or a year in an atmosphere of intellectual stimulation where a deep study can be made of the science of high level management. During this time, he will also be given the opportunity of exchanging ideas and experiences with his fellow students, drawn as they will be from the various official and non-official organisations that represent a nation's industrial effort.

At the moment in India, there are no such courses available for the education of future managers. Recently, however, I was very pleased to read that the Minister for Commerce and Industry has taken the initiative in calling for the formation and early establishment of an Administrative Staff College. The object of the instruction to be given at this College will be much the same as its military counterpart, namely, a study of the higher technique of the executive's profession after he has assimilated 8 to 12 years of practical experience. I understand, however, that the average age of business men going to this course will be between 35 and 40, and also that the duration of the course itself will be for a period of approximately three months. I feel that there is some danger that the course will suffer from the disadvantages of being "too little and too late." "Too little," because I doubt whether a period of three months is sufficient to achieve the education which I have described as being needed, and "too late," because of the average age of student entry. Nevertheless, it is definitely a step in the right direction and as such is most welcome.

Training Within Industry

Training within industry has a significant role to play in teaching leadership to the supervisory staff in industry which has been described earlier in this talk as the "hard core" of its organisation. At present, the supervisory staff, namely, the foremen, the shift engineers, the charge hands, etc., of Indian industry are concerned with the idea that their task is to carry out the mechanical operations of their departments during an eight-hour shift. Having done this, they feel that they have completed their job for the day and have discharged their responsibilities to the company. It is vital that this attitude should change and that each member of the supervisory staff should realise that the carrying out of the actual technical operations of their departments is only half their work. The other half is to be welfare officers and the true leaders of the men who are placed in their charge. Unless this attitude exists in the supervisor, it is impossible to create in the individual worker a sense of purpose in the job which he is doing and to imbue him with a team spirit.

Though T.W.I. functions through the technical application of the methods which it has evolved to perfect job relations, job instructions, and job methods, the final impact of this science, if properly introduced, will achieve the result of making each member of the supervisory staff function as his own welfare officer and his own efficiency officer. T.W.I. really adds up to the promotion of human relations at the all-important level of the actual working man so as to give him a sense of purpose and pride in the job he is doing. Its goal is to make the worker's life more joyful by making his work more meaningful and to increase efficiency of output through the development of the best qualities inherent in man.

Conclusion

Management is, therefore, concerned with the attainment of the aim of the organisation through a maximum co-ordination of work and the voluntary co-operation of those it employs. It is concerned with the delegation of authority and responsibility right down the lines. It must lay down a clear definition of duties and be responsible for the proper selection and training of all its staff. It is concerned with the flexibility of its structure and with intelligent future planning. It must ensure the economy and efficiency of all operations. It must see that its human resources are utilised to the greatest advantage through justice and decency and all that is compatible with the rights and dignity of man.

LLOYDS BANK LIMITED

FACTS ABOUT DIVIDENDS AND WAGES

LORD BALFOUR OF BURLEIGH'S STATEMENT

THE Annual General Meeting of Lloyds Bank Limited was held on the 12th February, 1954, at the Head Office, 71, Lombard Street, London, E.C.

The Right Hon. Lord Balfour of Burleigh, D.C.I., D.L., the Chairman presided.

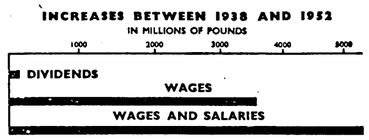
With the concurrence of the members present the Report and Accounts and the Statement by the Chairman, all of which had been previously circulated, were taken as read.

In moving the adoption of the Report and Accounts, the Chairman said:

"As I notice a tendency in some quarters to make the small increase in dividends recommended by some bank boards, including our own, an excuse for still further pressing wage claims, I want as an addendum to my statement already in your hands to try to bring into proper perspective the relative importance of wages and dividends in relation to inflationary pressure.

"The additional dividends declared for 1953 by the clearing and other banks were considerably less than £1 million gross: to be precise, £853,000. In the calendar year 1953 wage increases amounted to £125 millions. And remember that the present series of increases in bank dividends are the first changes since the drastic reductions of more than twenty years ago, whereas the £125 millions of wage increases are simply the continuance of a process that has been going on since 1939.

"Our present dividend of 14 per cent. nominal actually represents a smaller money payment to a holder liable to tax at the standard rate than the 12 per cent. dividend paid in 1938. In 1938 a holder of 100 'A' shares received £12 less tax at 5s. 6d., i.e., £8 14s. Today he receives £14 less tax at 9s., i.e., £7 14s. So he is down £1 even in money terms, and the real purchasing power of his present dividend is only two-fifths that of the 1938 dividend. The yield on an investment in our shares, with the 14 per cent. dividend, at a price of 60s. is 4⅔ per cent., or in actual cash after deduction of tax at 9s. just over 2½ per cent.



Wage Inflation

"May I now put the relationship of wages and dividends in a wider setting? What we are concerned with is the weight of money as spending power in causing inflation, and the facts can surely leave no doubt that any contribution of higher dividends is quite negligible compared with that of wages and salaries.

"The amount of money received as wages in 1952 was £5,460 millions, and in wages and salaries taken together £8,215 millions, compared with £472 millions in ordinary dividends. This means that in 1952 dividends on all ordinary shares were something less than 50 per cent. higher than in 1938; on the other hand, salary incomes were about two and a half times as great as in 1938 and wages had more than trebled. In actual money, the increase since 1938 in wages alone was nearly twenty-five times as great as the increase in ordinary dividends. The increase in wages and salaries taken together was thirty-five times as great. (*See diagram above.*)

"It is also a fact that industrial production in 1952 was no higher than in 1950, yet during those two years wage incomes in the relevant industries increased by £542 millions, and salaries by £153 millions. To adapt a familiar advertisement: that's inflation, that is.

"And while I am unlikely to be asked in this company what service the ordinary shareholder performs in return for his dividend, it is perhaps worth reminding ourselves that he is the source of the life-blood of industry, the risk capital without which labour could not have been set to work in the first instance. And without a constant supply of fresh risk capital, industry cannot work properly or continue to provide full employment. Moreover, of the millions of equity shareholders a large proportion are people of quite small incomes. The average individual holding of the 60,000 shareholders in our Bank is in the 'A' shares 248 and in the 'B' stock £56.

"What seems to me so regrettable is that attempts are being made in certain quarters to engender class bitterness by statements about wages and dividends which represent the dividend receiver as a profiteer, whereas in sober fact it is the wage earner who has been the real beneficiary of the inflationary process.

"The *Daily Herald* has in fact taken pride in pointing out in its advertising that the real purchasing power of wage earners in 1952 was about one-third higher than before the war. And that is true even after payment of taxes and before making allowance for social security benefits. I think it is undeniable that this change has been brought about largely at the expense of other, and not only the wealthier, sections of the population.

"We, British, are a magnanimous lot and no one, I believe, grudges the redistribution brought about by progressive taxation and designed expressly to help the poorest. But superimposed upon this process there is continuing a further redistribution due purely to inflation and benefiting all wage earners as such, regardless of the scale of their earnings.

"The wage earner is at heart as magnanimous as anyone else, and I believe that if these facts could be brought home to him he would hesitate before pressing a claim to a still larger share of the national income. For that is what is involved by any increase in wages without a corresponding increase in productivity; for example, if wages are raised to meet every rise in the cost of living—itself often engendered by increased wages—other sections of the population have to meet the bill.

Unemployment Danger

"It is, I think, beyond doubt that, if the wage earners exert their full power, they can under present conditions, and in the short run, secure for themselves a still greater share of the national cake. In the light of the facts and figures I have just given you that would not seem to be a generous course, but in suggesting to the wage earner that it would be unwise, I am thinking less of magnanimity than of his own self-interest. For it is the stark truth that in our present economic position higher costs will, in a period quite short in terms of years, price us out of our export markets to an extent which, in my opinion at least, will create grave unemployment in this country—unemployment which no atempt to whip up internal purchasing power by cheap money or other expedients of the kind could conjure away.

"What a wonderful thing it would be if we could wake up one morning to find each pound buying more; cost of living falling; real wages rising automatically. Yet this miracle could be brought about quite simply by higher productivity without higher costs. No one has more to contribute to, or more to gain by, that process than the earner of weekly wages. Moreover, he can nowadays rely with certainty on his bargaining power to secure for himself his full share of any increase in the national cake. My point is that—as things are now—he cannot safely take more until there is firmly and solidly a larger cake to divide, and a stable pound in which to draw his weekly wage.

"It is a simple recipe; could we not try it?"

The Report and Accounts were adopted and the other ordinary business transacted.

Votes of thanks were passed to the Chairman and Directors and to the staff.

CAUSTIC SODA AND BLEACHING POWDER INDUSTRY

HIGH COST OF PRODUCTION IMPEDES PROGRESS

THE Tariff Commission is now enquiring into the claim of the caustic soda and bleaching powder industry for protection and assistance. This is the third such tariff enquiry. It will be recalled that the first enquiry was conducted in 1945-46 by the Tariff Board, which recommended that the Mettur Chemical and Industrial Corporation Ltd., the only applicant for protection, should be granted a subsidy at specified rates, on the basis of actual sales of caustic soda and bleaching powder. Although the Government accepted this recommendation, the subsidy was not paid, as the conditions attached to the grant of subsidy were not satisfied. The second enquiry was conducted by the Board in 1949-50. The Board recommended levy of protective duties at specified rates on caustic soda, bleaching powder and liquid chlorine until 31st March, 1954. But the Government, in its resolution of 18th May, 1951, declared that there was no need to levy such protective duties, as the landed costs of imported caustic soda had increased considerably since the Board's enquiry and the sales of indigenous caustic soda had been allowed at the higher selling price fixed for imported caustic soda. But, in May, 1952, the industry complained that increase in its cost of production and heavy imports were undermining the stability of the industry and its future progress. The present enquiry is a sequel to this complaint.

The various units in the industry have asked for varying measures of protection. One unit, for instance, has asked for abolition of the preferential rate of duty on imports of caustic soda from the U.K. or a British Colony. Another unit has suggested that a protective duty, which would equate the cost of imported caustic soda at Indian ports, with the fair ex-works price of indigenous caustic soda, should be levied and that a protective duty of 30 per cent. should be imposed on imports of bleaching powder. Yet another suggestion is that the import duty on caustic soda should be fixed at such a level as to ensure a minimum price of Rs. 40 per cwt. to the indigenous manufacturers.

Measures of Assistance

About measures of assistance, however, the views of the manufacturers are generally in agreement. They have asked for the exemption of the manufacturers of caustic soda from the cess payable on salt, concessional freight rates on salt, coke, caustic soda, hydrochloric acid, liquid chlorine, etc., supply of tank wagons for the transport of liquid caustic soda and hydrochloric acid, supply of good quality salt and coal and of electricity at cheaper rates, and the abolition of duty on barium chloride and of freight on chlorine containers. They have also asked for restrictions on imports of caustic soda.

Even a cursory glance at the working of the industry discloses that the industry is passing through bad days. There is a big gap between installed capacity and actual output. The industry is suffering not only from the high cost of manufacture, but also competition from imported products. There is, therefore, an immediate need for improving the quality of its products so that they may stand a favourable comparison with imported goods.

There are eight units manufacturing caustic soda in India. At the time of the first Tariff Board enquiry in 1945, there were only four units in production, namely, the Mettur Chemicals, the Tata Chemicals, the Alkali and Chemical Corporation of India and the Rohtas Industries. By the time of the second enquiry in 1950, there were two more units, namely, the Calico Mills' Chemical Division and D.C.M. Chemicals. Since then, two more units, namely, the Travancore and Mettur Chemicals, Alwaye, and the Hindusthan Heavy Chemicals, Calcutta, have come into being; both of them are producing caustic soda at present. All the eight units are manufacturing caustic soda by the electrolytic process, but Tata Chemicals produce by the causticisation process also.

The estimates of installed capacity, actual output and demand vary. Consequently, the first task of the Commission is to enquire into the estimates and arrive at a reasonable figure. The annual productive capacity of caustic soda of these units is estimated by the Development Wing of the Ministry of Commerce and Industry at 30,618 tons, on the basis of 330 days' working, while, according to the manufacturers, it is 31,871 tons. There is no correct estimate of the installed capacity of caustic soda not only of the industry but also of each individual unit. Actual output according, to the manufacturers was 7,221 tons in January-June 1953, as against 12,944 tons during January-December, 1952, 12,563 tons during January-December, 1951, and 10,657 tons during January-December, 1950. The output as estimated by the Development Wing of the Ministry of Commerce and Industry is somewhat different. The demand also is estimated variously. According to the Planning Commission, the demand for caustic soda in 1952-53 was 58,000 tons and this is expected to rise to 87,000 tons by 1955-56. The Development Wing of the Ministry of Commerce and Industry has estimated the current demand at 60,000 tons and that in 1956 at 90,000 tons. The current estimates of demand given by indigenous producers vary from 50,000 tons to 58,000 tons and those of future demand from 62,000 to 75,000 tons.

Liquid Chlorine

The installed capacity of liquid chlorine is estimated by the producers at 15,124 tons, while the Development Wing of the Ministry of Commerce and Industry has put it somewhat higher, at 15,741 tons. Production, according to the manufacturers, was 3,348 tons in January-June, 1953, as against 6,124 tons in the year 1952, 5,156 tons in 1951 and 3,670 tons in 1950. These figures exclude the rated capacity and actual production of different manufacturers in respect of other chlorine products.

Three units, namely, Mettur Chemicals, Tata Chemicals and Rohtas Industries, are engaged in the manufacture of bleaching powder. The manufacturers have estimated the annual rated capacity at 8,170 tons, while the Development Wing has put it at 7,755 tons on the basis of 330 days' working. Actual output, according to the producers, in January-June, 1953, was only 735 tons, as against 791 tons in the year 1952, 3,581 tons in 1951 and 3,247 tons in 1950.

As regards chlorine products, the Tariff Board in 1950 estimated chlorine requirements of the country at 12,000 tons, irrespective of the form in which it was utilised, i.e., whether as bleaching powder, bleach liquor, liquid chlorine or chlorine gas. It was envisaged by the Board that the demand for chlorine would go up to 15,000 tons per annum by the end of 1953, on the basis of an increase of 25 per cent. in the then existing demand. In connection with the present enquiry, the Development Wing of the Ministry of Commerce and Industry has placed the estimate of demand for chlorine at 14,200 tons for 1954 and 19,200 tons for 1956. Other estimates of demand vary between 7,500 tons and 14,000 tons for the present requirements, while it is estimated to increase to 26,700 tons in 1955-56.

Assessment of Quantum of Protection

After arriving at a fairly accurate estimate of installed capacity, actual output and demand, the Tariff Commission will have to determine whether protection should be granted and, if so, the most suitable form, and the appropriate quantum and duration of protection. The assessment of the quantum of protection will necessarily involve a comparison of the c.i.f. prices and landed cost of the imported products with the fair ex-works price of the indigenous products. It should also enquire into the question of selling prices with special reference to ceiling prices fixed by the Government, both for imported and indigenous caustic soda. Another matter which should be examined in this connection is whether the selling arrangements made by indigenous manufacturers of caustic soda and bleaching powder are adequate and of a nature to stimulate demand for their products.

One important question that has to be enquired into by the Tariff Commission is the quality of the product. The information gathered by the Tariff Commission on this point has brought out certain defects. These defects, to quote the Chairman of the Tariff Commission, Mr. M. D. Bhat, are as follows:

"The general trend of opinion appears to be that, while there has been some improvement in the quality of caustic soda, it is still inferior to that of the imported product. The quality of bleaching powder is stated to be unsatisfactory and most of the consumers complain about its instability and low chlorine content. Since both caustic soda and bleaching powder are used by a number of industries, it may, perhaps, be desirable to ascertain the opinion of each individual consumer industry. Some of the soap manufacturers have pointed out that the salt content of the indigenous caustic soda is higher and NaOH content lower than that of the imported product and that, therefore, the consumption of caustic soda in saponification is greater, resulting in higher cost per ton of soap. It has also been stated that the indigenous caustic soda has certain action on the tank wagon and, if the wagon is in transit for a considerable time, the resultant liquor is very dark in colour. Regarding solid caustic soda, it is mentioned that the quality varies according to the quality of the drums in which it is packed. A drum which is rusty inside results in brownish coloured caustic soda, which cannot be used, as the iron content has an effect on the colour of the soap produced. Excess of salt in caustic soda is also said to lead to sweating of soaps, particularly during monsoon. Some of the textile manufacturers have pointed out that the Na_2O content of indigenous caustic soda is lower than that of the imported product and the colour is also greenish due to the presence of iron impurities. It is also stated that there is iron contamination caused by the use of inferior containers which affects the whiteness and finish of the cotton textiles.

"In respect of the quality of the indigenous bleaching powder, it is stated that its strength is lower than that of the imported product and goes on diminishing while in transit or in storage, leading to increased consumption. It is also complained that the strength is not uniform from package to package, packing is of inferior quality and the high content of free lime results in heavy deposits of lime on textiles. The paper manufacturers have stated that the purity of the indigenous caustic soda varies from consignment to consignment and is generally not more than 93 per cent., as against the guaranteed 98 per cent. of the imported products. The paper manufacturers further complain that chlorine content of bleaching powder is not guaranteed by the indigenous producers and the quality deteriorates rapidly in storage. Some units manufacturing vegetable ghee and refining oil have also stated that there is scope for improvement in the quality of the indigenous caustic soda, particularly in respect of strength and salt content."

Raw Materials

Related to the question of quality of indigenous products is that of availability and quality of raw materials required by the industry. The principal raw material required in the electrolytic process of manufacture of caustic soda is common salt. The supplies of this material in this country are ample, but the salt generally obtained is not pure, as it contains impurities of calcium, magnesium and sulphates. Besides salt, coal or furnace oil is required for the evaporation and final fusion of caustic soda solution obtained by electrolysis into caustic soda. The electrolytic process of manufacture also involves the consumption of large quantities of electricity. In the other process of manufacture of caustic soda, namely, the causticisation process, the principal raw materials required are soda ash and Lime. The Tariff Commission has to enquire into the availability, quality and price aspects of each of the principal raw materials and find out what assistance the industry requires in regard to improving the quality of caustic soda and reducing the cost of production.

The two materials required for the manufacture of bleaching powder are limestone and dry chlorine. The supplies of limestone are plentiful, but its quality, it is stated, is not up to the requisite standard. Chlorine is also available in plenty as a co-product in the manufacture of caustic soda by the electrolytic process. "Indeed, it is to be examined," says Mr. Bhat, "whether apart from the trend towards the replacement of bleaching powder by chlorine, the non-availability of good quality limestone in India would exclude for all time the possibility of manufacturing good quality bleaching powder."

Finally, the Tariff Commission has to enquire into the question of import control policy and import duties. Imports of caustic soda were 21,993 tons valued at Rs. 1 crore in 1950-51, 61,713 tons valued at Rs. 3.79 crores in 1951-52, 25,552 tons valued at Rs. 1.46 crores in 1952-53 and 17,041 tons valued at 0.99 crore in the first six months (April-September) of 1953-54. Imports of bleaching powder were 5,633 tons valued at Rs. 20.8 lakhs in 1950-51, 8,810 tons valued at Rs. 14.4 lakhs in 1951-52, 2,749 tons valued at Rs. 14.0 lakhs in 1952-53 and 2,114 tons valued at Rs. 11.0 lakhs in the first six months (April-September) of 1953-54. There have been practically no imports of liquid chlorine into India since 1940-41.

The imports of caustic soda and bleaching powder are based on the quota system. Caustic soda and liquid chlorine are subject to a standard rate of 37.8 per cent. and a preferential rate of 27.3 per cent. In the case of caustic soda, these duties are assessed on a tariff value of Rs. 28 per cwt. Bleaching powder is allowed free of duty from all sources.

TRANSMISSION OF RESEARCH RESULTS TO FARM LANDS

I.C.A.R. ASKED TO REVIEW POSITION

PROBLEMS concerning development of agriculture came up for review and discussion last week at the meetings of the Standing Committee of the Indian Council of Agricultural Research (I.C.A.R.), the Governing Body of the I.C.A.R. and the sixth annual convocation for the award of certificates, etc., to students in agricultural statistics who passed in the examinations conducted by the I.C.A.R. Dr. Punjabrao S. Deshmukh, Minister for Agriculture, addressed the first two meetings held on the 9th and 10th inst., respectively, while the convocation address at the last mentioned function was delivered by the Vice-President of India, Dr. S. Radhakrishnan.

In the deliberations of the meetings, the chief problem which did rightly receive due attention was the question of filling the gap between the research and knowledge available in the agricultural research institutions and the Indian farmer. The Vice-President's address too dealt at length with this urgent problem. He did well in impressing upon the recipients of diplomas the place of agriculture in the economy of the country and the task before them, namely, of improving agriculture by conveying the knowledge of research and information to the worker in the field. Agriculture, the Vice-President said, was a major national issue and the Five-year Plan had recognised its importance. It was because culture had its roots in agriculture, that great civilisations developed round large rivers which made the surrounding soil fertile and offered easy communications. These civilisations centred round, he said, the Yangtse, the Ganges, the Nile, the Tigres and the Euphrates. "If one looks into history, one finds that there is no civilisation which does not have a legend about floods. Wherever one may go, one may find something lingering in people's minds about floods which tried to destroy civilisation." Continuing, Dr. Radhakrishnan said that there was a time when, in India, they had built dams and canals to overcome, or at least mitigate, their dependence on rains and meet the threats of destruction by flood. According to Greek books, the dams built by Chandragupta Maurya functioned till A.D. 150. Even today in the country could be found, he observed, remains of canals and dams built in earlier ages. But some circumstances intervened and their society had become stationary. But now there was all-round renaissance in the country, and the Council of Agricultural Research and the Statistical Institute attached to it were one of the ways in which the renaissance was expressing itself.

Modern Techniques

Then referring to agricultural practice in India, Dr. Radhakrishnan said that, if only the people were taught how to utilise modern techniques, they would not lag behind in utilising them. He admitted that the Indian farmer was illiterate, but he was quite certain that he was not lacking in intelligence. What was necessary was that information gathered in research should be brought home to the farmer through visual education, radio, bulletins, micro-film services and other means. This fact was pronouncedly visible to him when, as Chairman of the University Education Commission, he visited agricultural colleges and schools. These visits revealed the gap between these institutions and the farms. He remarked: "This gap has to be bridged. Even where the cultivator is willing to improve his technique, debts and lack of resources stand in his way. We are bringing about an agrarian revolution by legislation. But some of us feel that a bolder and more imaginative treatment of this land problem is necessary in some parts of our country." He then called upon the students to undertake the work and said that it was their duty to spread knowledge of advanced agricultural techniques among the people.

Presiding over the meeting of the Standing Committee of the I.C.A.R., Dr. Punjabrao Deshmukh called upon the members to take stock of the overall position in respect of the various research schemes completed or continued by the I.C.A.R. during the last 25 years of its existence. The revision was necessary because the agricultural authorities were making serious efforts to carry the results of research to the cultivator. In this context, it was but natural and inevitable that there should be proper arrangements for research from which the cultivator might benefit. The same point was reiterated by Dr. Deshmukh in his speech at the Governing Body of the I.C.A.R. too. Here he stated that the Council had done useful work. In the course of 25 years, many developments had taken place and several research institutions had been set up both under the Central and State Governments. A large amount of research work had already been done and a national plan of development was under way. The national extension organisation had been reorganised, with a view to forging an instrument to carry to the tiller the results of research in laboratories and on experimental farms. But, if the research organisations had not developed in consonance with the requirements of the country or was inadequate, what would the extension staff, the Doctor asked, take to the farmers? He, therefore, requested the Governing Body also, as he had done in the case of the Standing Committee on the previous day, to review the research work done so far by the I.C.A.R. both at the Centre and in States and to examine carefully whether the arrangements for agricultural research were adequate or not. He suggested that the Governing Body should find a solution for eliminating delays in starting and financing schemes of research approved by the technical experts.

The Governing Body examined the schemes and proposals as recommended and approved by the Finance and Standing Committees of the I.C.A.R.

It may be mentioned here that the Standing Committee at its meeting on the 9th inst., considered the report of the Secretary of the I.C.A.R. The latter explained the salient features of the budget estimates for 1954-55 and the financial position of the Council. The Committee approved of all the current and new agricultural and animal husbandry schemes, with the exception, among others, of two schemes relating to the supply of milk to Patna and Chandigarh towns. These two schemes were not approved, as no research was involved and they were of a commercial nature to be financed entirely by the State Governments concerned.

The Committee also approved of the formation of two new scientific committees, namely, the Agricultural Engineering and Soil Conservation Committee and the Agricultural Economics Committee. Previously, the number of schemes relating to agricultural implements and soil conservation was very small and they used to be scrutinised by the Agronomy Committee.

Economics Committee

Similarly, in order to intensify investigations into agro-economic problems and to coordinate the research activities undertaken by the various institutions in the country, it was thought advisable to have a separate Economics Committee.

An account of the research schemes carried out by the I.C.A.R. in 1952-53 makes interesting reading. A summary of this is given below for purposes of record.

By 31st December, 1953, the 34 Extension Training Centres, organised by the Indian Council of Agricultural Research all over the country, had turned out 3,492 key personnel, comprising 549 supervisory staff and 2,943 multi-purpose village-level workers, for community development work. These Training Centres, set up with financial assistance from the Ford Foundation and the U.S. Technical Co-operation Administration, are situated in different States. They have at present 1,877 personnel, including 1,678 village-level workers, under training. By their own example and manual labour, the village-level workers have been demonstrating the results of research in agriculture, health, education and social organisation and assisting the village population in the adoption of improved farm practices. In order to establish closer contact between research stations and extension workers, the Council has proposed that a number of refresher courses should be arranged at these institutions for them on agricultural matters and cultural practices. In addition, certain selected agricultural colleges were helped during the year to set up extension wings to impart practical training to graduates in agricultural methods under village conditions.

In view of the high yields obtained by the adoption of the Japanese method of paddy cultivation, the Government of India decided to launch a country-wide campaign during the *kharif* season of 1953 for stepping up rice production. Crop-cutting surveys of cereals and non-food crops (jute and oilseeds) were continued, as also the assessment of the results of the grow-more-food campaign.

A five-year scheme for the improvement of statistics relating to livestock and fisheries was sanctioned by the Government of India, and it is expected that at the end of the period definite sampling techniques will have been evolved. A critical statistical study of the data collected at the Indian Dairy Research Institute, Bangalore, and the Livestock Research Farm, Hissar, was made for an appraisal of the cattle-breeding programmes. Fellowships were awarded for research work in agriculture and animal husbandry statistics.

Agricultural Research

During the year under review, a series of manurial and agronomic trials were conducted and tests carried out in connection with the eradication of weeds by the use of chemicals.

As a result of rice-breeding experiments, a number of varieties were produced suitable for varying environmental conditions, resistant to attack of various pests and diseases and giving high yields. In the Central Rice Research Institute, Cuttack, 112 cross combinations were completed in this scheme for hybridisation between *japonica* and *indica* rices. These trials have been undertaken for stepping up yield.

As the rust disease is a serious menace, limiting production of wheat in the country, the Council concentrated its attention during the period on the investigation of wheat-rust. Five hundred and seventy-two cultures of wheat received from the U.S.A. were artificially infected in the adult stage with a mixture of all the races of the three rusts at the I.A.R.I. Of these, 82 were found to be resistant to all the three rusts simultaneously. The Council has since sanctioned a new scheme for studies on the chemical composition and nutritive value of wheat at the I.A.R.I.

As regards millets, promising results were obtained in the scheme for the breeding of *jowar* varieties resistant to the parasitic weed *striga*. Some short-duration strains of *bajra* were also evolved giving higher yields. In respect of maize, experiments revealed that seeds treated with fungicides gave significantly higher yields than the untreated seeds. In view of the nutritive value of pulses, a co-ordinated scheme of research has been in progress in the country. In addition to the breeding experiments, the value of pulses in rotation and mixed-cropping was investigated. Experiments on gram-wilt in the Punjab indicated that sub-soiling is very effective in controlling the disease.

Animal Husbandry

On the animal husbandry side, the scheme for putting milk cows to work was continued at the Indian Dairy Research Institute, Bangalore, but it is yet premature to draw any definite conclusion from the experiments. Proposals for research on artificial insemination of cattle in the country and selection of places for the location of regional centres were finalised. A scheme was sanctioned for investigation of pregnancy diagnosis tests in animals. The various sheep and goat breeding schemes financed by the Council showed steady progress.

In the pilot scheme on the control of rinderpest, about 14,000 animals, including cattle, buffaloes, sheep and goats were vaccinated, using lapinised virus and lapinised goat-reactor virus in different parts of the country, and the immunity given by them under different conditions were studied. Various strains of viruses causing the foot and mouth disease and suitable methods of vaccination for its control were studied at the Indian Veterinary Research Institute, Izatnagar.

A new method of manufacture of ghee prestratification in newly-designed ghee boilers proved more economic and hygienic and produced ghee of a better taste. Experiments were conducted for better preservation of raw butter. Phytosteryl acetete was found most sensitive and reliable for detecting the presence of vanaspati in ghee.

Paints are his Province

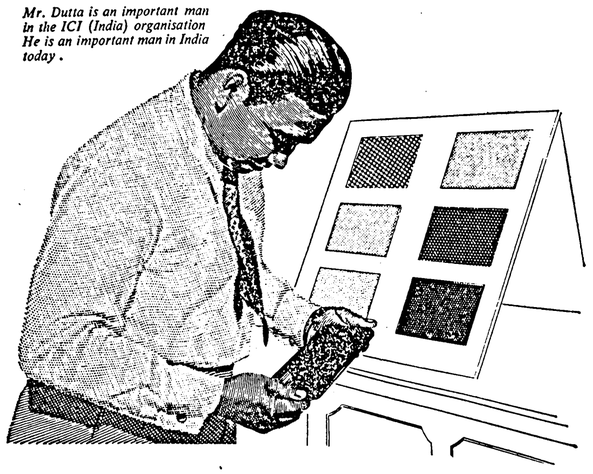
Mr. J. Dutta, whom you see here, is a specialist on paints.

Paints, for both decorative and protective use, are essential to many industries today. Their wide and varied application in many new directions gives rise to a number of allied problems. Which paint would suit a specific purpose? How can a paint be made to do a better job? Why is a particular paint behaving in an unsatisfactory manner?

These are the types of queries, vital to industrial efficiency, that demand the attention of our Technical Experts. Mr. Dutta, as Plant Superintendent of the modern paint factory at the Alkali & Chemical Corporation of India, Rishra, near Calcutta — a subsidiary of ICI (India) — plays an important part in solving these problems.

His work results in many benefits to our industries . . . in indicating more effective paint-defence against rust and corrosion . . . in giving a better finish to the wide range of products now made in India.

Mr. Dutta is an important man in the ICI (India) organisation He is an important man in India today.



. . . contributing to India's progress and prosperity

Notices

THE ALKALI AND CHEMICAL CORPORATION OF INDIA, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Seventeenth Ordinary General Meeting of the Members of the Company will be held on Friday, 12th March, 1954, at 3-30 p.m. at the Registered Office, 18, Strand Road, Calcutta, to transact the following business:

(1) To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 30th September, 1953.
(2) To declare Dividends on Ordinary Shares.
(3) To elect Directors.
(4) To appoint Auditors for the current year and to fix their remuneration.

The Ordinary Share Registers of the Company will be closed from the 26th February, 1954 to the 12th March, 1954, both days inclusive.

By Order of the Board,
IMPERIAL CHEMICAL INDUSTRIES (INDIA) LIMITED,
Secretaries.

CALCUTTA, *5th February*, 1954.

To

The Shareholders of The Alkali and Chemical Corporation of India, Limited, and in particular to:

Mr. J. V. A. e Brito, Mr. W. A. Bell, Mrs. A. L. Baxendale, Mr. H. M. Cox, Her Highness Bada Maharani Deela Kumari Devi, Mrs. M. Duncan, Mrs. H. C. D'Cruz, Mrs. E. M. Fanthome, Mrs. J. Guest, Mr. P. H. Guest, Mr. W. A. T. Hollingbery and Mrs. E. M. Hollingbery, Commdg. Genl. Mohun S. S. Jung B.R., and Major Genl. Bijaya S. S. Jung B.R., Genl. Sir Baber S. S. Jung B.R., and Major Genl. Mrigendra S. S. Jung, B.R., Mrs. M. A. Edney, Mr. A. Y. Kadwa, Mr. F. J. C. Melhuish, Mrs. N. M. McCann, Major Sirdar K. M. Panikkar, Mrs. C. V. Pandit, Mr. B. R. Goodfellow, Mr. A. R. Sahasranam, Mr. S. P. Upadhya, Mr. C. R. Witcher, Mr. K. W. Young.

CALCITE DEPOSITS OF SAURASHTRA

A recent investigation by the Geological Survey of India has shown that the calcite deposits in the Saurashtra peninsula are unique in their kind, not only in India but also among the world deposits. Similar deposits of a large magnitude have not been reported in the Deccan traps in other parts of India. Although there are many instances of calcite occurring in big cavities in basic rocks and plateau basalts in many parts of the world, nowhere the deposits assume such an extent as in Saurashtra. In Iceland, the source of the world's best optical materials, calcite is found in a large cavity in basalt, 75 feet long, 25 feet wide and 60 feet deep. In Saurashtra the calcite veins occur in the plateau basalts and run over considerable distances. The bigger ones are up to 5 feet wide and 2 miles or more in length, persisting down to 30-50 feet or even more in depth. The reserves appear to be large but detailed geological mapping and exploratory works will, it is stated, be necessary before a correct estimate can be obtained.

The important calcite deposits are found in Nawanagar, Porbandar, Junagadh and Amreli. Minor occurrences are seen in many parts of Saurashtra. In recent years, a good trade has developed with the material from Nawanagar and Porbandar, where it is ground to fine powder and marketed to Calcutta, Bombay and elsewhere, for use in rubber, textiles, paper mills, glass works, tanneries, etc. This industry, once very prosperous in war-time due to scarcity of certain mineral powders, is at present facing keen competition from cheap fine mineral products. This is due to increasingly higher mining and production costs.

The Geological Survey has recommended that efforts should be made to encourage the existing industry, as otherwise it may not survive for a long period and that prospects for the manufacture of chemicals with the calcite should be explored. Analyses of Nawanagar calcite have shown that it is exceptionally pure and may be used for manufacture of calcium carbide, bleaching powder, as a flux in metallurgical operations, for making glaze in pottery and in making industrial lime for a variety of purposes. The ground calcite is suitable for use as whiting in rubber, textiles, paper mills, glass works, tanneries, sugar factories, etc. It can also be employed as a non-scratch metal polish. The calcite crystals are generally too opaque to be suitable for optical purposes, but the Survey has recommended that attempts should be made to isolate transparent and suitable crystals for the preparation of nicols prisms, as a high price is paid for the requisite varieties.

Prior to the integration of the Princely States, the leases of fields containing calcite deposits were held by a few parties holding monopoly rights over extensive areas in various parts of Saurashtra. This practice was not conducive to proper development of the deposits and led to considerable waste. The new Mineral Concession Rules eliminate this danger and can go a long way towards the proper development of the calcite industry.

THE BANK OF BHOPAL LIMITED
CHOWK, BHOPAL

NOTICE

NOTICE IS HEREBY GIVEN THAT THE NINTH ORDINARY GENERAL MEETING of the Shareholders of THE BANK OF BHOPAL LIMITED will be held at the Registered Office of the Bank at Chowk Bhopal, on Saturday the 27th February, 1954, at 4 p.m., to transact the following business:—

1. To receive the report of the Directors and the Audited Balance Sheet, as at, and Profit and Loss Account for, the year ended 31st December, 1953.
2. To sanction the declaration of a Dividend.
3. To elect Directors in place of those who have been longest in office and who retire under Articles 102 and 103 of the Articles of Association of the Bank.
4. To appoint Auditors for the current year and to fix their remuneration.
5. To transact such other business as the Directors may place in the Meeting.

By Order of the Board,
V. S. MANI,
General Manager.

BHOPAL, *6th February*, 1954.

N.B.—The Transfer Books of the Bank will be closed from the 15th February to the 27th February, 1954, both days inclusive.

THE CHAMPDANY JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE SIXTY-FIRST ORDINARY GENERAL MEETING OF THE CHAMPDANY JUTE COMPANY, LIMITED, will be held at the Registered Office of the Company, No. 2, Netaji Subhas Road, Calcutta, on 11th March, 1954, at 12 noon, for the following purposes:—

1. To receive and pass the Directors' Report and Audited Accounts for the half-year ended 30th September, 1953.
2. To declare a Dividend.
3. To transact any other competent business that may be brought forward.

The Share Register of the Company will be closed from 24th February to 11th March, 1954, both days inclusive.

Dividend Warrants will be issued and posted to Registered Shareholders only. Persons holding shares on blank transfer are advised to effect registration of scrip in their names before 24th February, 1954.

By Order of the Board,
JAMES FINLAY & CO., LIMITED,
Managing Agents.

2, NETAJI SUBHAS ROAD,
CALCUTTA, *15th February*, 1954.

THE INDIAN IRON AND STEEL COMPANY LIMITED

NOTICE

THE ADJOURNED THIRTY-SIXTH ORDINARY General Meeting of the Shareholders of The Indian Iron and Steel Company Limited, will be held on Wednesday, the 10th March, 1954, at 11-0 a.m., at the Registered Office of the Company, 12, Mission Row, Calcutta, to transact the following business:—

(1) To receive the Directors' Report and pass the Audited Accounts for the year ended 31st March, 1953.
(2) To confirm the Interim Dividend declared on the Ordinary Share Capital.
(3) To elect Directors.
(4) To appoint Auditors and fix their remuneration.

The Share Registers of the Company will be closed from the 4th to the 10th March, 1954, both days inclusive.

By Order of the Board,
MARTIN BURN LIMITED,
Managing Agents.

CALCUTTA, *19th February*, 1954.

RESULTS OF BRADY GROUP MILLS SHOW SLIGHT IMPROVEMENT

DIVIDENDS MAINTAINED—FINANCES SOUND

THE financial results of the two cotton textile mills under the management of Messrs. W. H. Brady & Co., Ltd., Bombay—the New Great Eastern Spinning and Weaving Co., Ltd., and the New City of Bombay Manufacturing Co., Ltd.—for the year ended 31st December, 1953, are in line with the general expectation that the past year was a little more favourable for textile mills than the previous one. The gross profits of both the mills for 1953 are slightly higher than those for 1952; the New Great has recorded an increase from Rs. 2.68 lakhs to Rs. 4.32 lakhs and the New City from Rs. 0.97 lakh to Rs. 6.97 lakhs. The profits for the past year, however, fall very much short of those for 1951 and are less than those for any of the preceding years in the post-war period. To this extent the results of the two mills for 1953 are disappointing, particularly in view of the fact that the year was a record one so far as production was concerned.

The rise in the profit of the New City is more encouraging than that of the New Great, as will be seen from the foregoing figures. This has enabled that Company to add Rs. 2 lakhs, a sum equal to about a third of the gross profit, to the reserves. No such addition, however, has been possible in the case of the New Great. Nevertheless, both the Companies propose to pay the same rate of dividend, namely, 10 per cent. per annum for the second year in succession.

If the two mills have not been able to show a greater improvement in their profits than they have done, it was due to the difficult trading conditions that prevailed during the year. Alluding to these, the Directors observe in their reports to the shareholders as follows:

"The year under review was subject to varied trading conditions, notable for a falling away of consumer interest in the latter part of the year, which led to a general decline of prices of both cloth and yarn and some degree of accumulation of stocks. The Government of India's decision to abandon control on price and distribution of textiles was also announced during July.

"As forecast at the close of 1952, increased manufacturing charges had to be met during 1953 arising principally from the increased quantum of dear food allowance paid to operatives and the first full year of employers' contribution to the Workmen's Provident Fund Scheme."

Evidently, the removal of price and distribution controls in July, 1953, and the measures taken to improve the marketability of cloth in the last quarter of 1953 have not had any markedly favourable effect on the Company's results for the year under review.

New Great Eastern

The following comparative table, giving the salient features of the results of the New Great, clearly brings out the Company's progress in recent years:

(In lakhs of rupees)

	Year ended 31st December			
	1953	1952	1951	1950
Sale proceeds (net)	221.13	192.40	230.04	169.10
Expenses	217.06	190.28	214.09	160.55
Gross profit	4.32	2.68	15.29	8.77
E.P.T. refund (less tax) ..	0.09	3.90	..	..
To Secretaries' and Agents' commission	0.54	1.11	1.83	1.05
Provision for—				
Taxation	..	..	5.50	2.25
Depreciation	1.12	1.77	1.62	1.30
To reserves	..	0.25	1.70	0.75
To dividends—				
5½% preference	0.44	0.44	0.44	0.44
Ordinary	3.00	3.00	3.75	3.00
	(10%)	(10%)	(12½%)	(10%)
Carry forward	0.01	0.70	0.68	0.24

It will be noted that the increase in sale proceeds since 1950 is as much Rs. 52 lakhs, attributable partly to increased production and partly to the rise in cloth prices over these years, while the gross profit has dwindled by over 50 per cent. This is clearly due to the rise in expenses on account of the increase in the cost of raw material, wages and other manufacturing costs. Of the rise of Rs. 26.80 lakhs in expenses in 1953 over those in 1952, cotton and stores, fuel, etc., consumed account for Rs. 10.08 lakhs, dyeing and bleaching charges for Rs. 4.36 lakhs, wages for Rs. 2.96 lakhs, dear food allowance for Rs. 5.03 lakhs, contribution to provident fund for Rs. 2.13 lakhs and other expenses for Rs. 2.23 lakhs. Except for the sum of Rs. 25,000 added to the pension and gratuity and welfare fund in the previous year, the Company has not strengthened its reserves for the last two years.

It will be noted from the above table that the Company has made no provision for taxation for the second year in succession. That may probably be due either to depreciation allowance exceeding the profit available or to the existence of adequate taxation reserves or to both.

The Company's financial position, as seen from its latest balance-sheet, is, however, quite satisfactory. The reserves and surplus at Rs. 21.63 lakhs are nearly equal to 57 per cent. of the paid-up capital of Rs. 38 lakhs. Provision for taxation stands at Rs. 8.38 lakhs. Current liabilities aggregate Rs. 32.09 lakhs. The gross block of the value of Rs. 88.89 lakhs has been written down to Rs. 27.92 lakhs. The current assets amount to Rs. 72.20 lakhs (of which stock-in-trade amounts to Rs. 44.41 lakhs, stores, spares, etc., Rs. 10.72 lakhs, debts, deposits and advances Rs. 5.16 lakhs, investments Rs. 10,000 and cash balances Rs. 11.81 lakhs) and exceed current liabilities and provision for taxation by a wide margin of Rs. 31.73 lakhs.

The Rs. 100 paid-up ordinary shares are being currently quoted at Rs. 168 *cum-div.* At this rate, the proposed dividend gives a yield of about 6 per cent. per annum.

New City of Bombay

The progress of the New City of Bombay Manufacturing Co., Ltd., during the past three years is reflected in the following comparative table:

(In lakhs of rupees)

	Year ended 31st December			
	1953	1952	1951	1950
Sale proceeds	154.06	149.24	182.52	131.88
Expenses	147.24	148.74	161.67	120.74
Gross profit	6.97	0.97	20.94	11.23
E.P.T. refund (less tax) ..	0.12	4.40	..	..
To Managing Agents' commission	0.70	0.10	2.09	1.12
Provision for—				
Taxation	..	..	8.60	4.00
Depreciation	2.26	2.52	2.72	1.80
To reserves	2.00	0.75	3.95	1.50
To dividend	2.40	2.40	3.60	3.00
	(10%)	(10%)	(15%)	(12½%)
Carry forward	0.16	0.42	0.82	0.23

Unlike in the case of the New Great, the expenses of the New City, as compared with 1952, are lower by Rs. 1.50 lakhs. There has been a drop in the value of cotton, stores, spares, etc., consumed by Rs. 10.01 lakhs, but this has been nearly offset by increases in other items of expenditure. Thus, dyeing charges have gone up by Rs. 1.29 lakhs, wages by Rs. 1.71 lakhs, dear food allowance by Rs. 2.80 lakhs, provident fund contributions by Rs. 1.47 lakhs and other expenses by Rs. 1.24 lakhs. A sum of Rs. 75,000 had been added to the reserve for rehabilitation of plant and machinery in the previous year, which has received another Rs. 50,000 from the profit for 1953. The reserve fund has been strengthened by Rs. 1 lakh, reserve for contingencies by Rs. 25,000, and pension, gratuity and welfare fund by Rs. 25,000, none of which had been provided with anything a year ago.

The latest balance-sheet of the Company reveals that the reserves and surplus, aggregating Rs. 28.61 lakhs, exceed the paid-up capital of Rs. 24 lakhs by a sizable amount. The provision for taxation stands at Rs. 3.80 lakhs and current liabilities at Rs. 26.58 lakhs. The gross block of the value of Rs. 73.05 lakhs has been written down by Rs. 44.46 lakhs to a net value of Rs. 28.59 lakhs. The current assets amount to Rs. 54.55 lakhs (made up of stock-in-trade Rs. 20.23 lakhs, stores and spares Rs. 7.52 lakhs, debts, deposits and advances Rs. 4.93 lakhs, investments Rs. 7,500 and cash balances Rs. 21.80 lakhs) and exceed current liabilities and provision for taxation by Rs. 24.17 lakhs.

The Rs. 100 paid-up shares of the Company are being currently quoted at Rs. 180-8, at which rate and on the basis of the latest dividend, the yield works out to 5.54 per cent. per annum.

KHATAU MILLS TO CAPITALISE RESERVES

To the rank and file of companies which have proposed to capitalise a part of the amount standing to the credit of their reserves, must be added the Khatau Makanji Spinning and Weaving Co., Ltd. The Company has received the consent of the Controller of Capital Issues to increase its authorised capital and issue thereafter ordinary shares as capital bonus to the existing shareholders, by capitalising a part of its reserves.

The present authorised capital of the Company is Rs. 70 lakhs, made up of 40,000 ordinary shares of Rs. 100 each and 30,000 4 per cent. (tax-free) cumulative preference shares of Rs. 100 each. This is sought to be raised to Rs. 90 lakhs by increasing the ordinary shares to 60,000 shares of Rs. 100 each. A sum of Rs. 29,92,500 is proposed to be capitalised out of the reserve fund which stands at Rs. 35.32 lakhs and issued in the form of 29,925 ordinary shares of Rs. 100 each as bonus to the holders of the existing 29,925 ordinary shares, in the ratio of one share for every existing share, thus raising the paid-up ordinary capital from Rs. 29,92,500 to Rs. 59,85,000. The new shares will rank *pari passu* in all respects with the holders of the existing ordinary shares as on 13th March, 1954. This means that the bonus shares will be entitled to dividend that may be declared for the year ending 30th June, 1954.

This is the third occasion in its history when the Company is capitalising its reserves. The first was in 1944, when a sum of Rs. 9,97,500 was capitalised and issued in the form of 9,975 ordinary shares of Rs. 100 each to the then existing ordinary shareholders in the ratio of one share for every two shares held. The second occasion was in 1947, when the Company issued 29,925 4 per cent. (tax-free) cumulative preference shares of Rs. 100 each as bonus shares to the then existing ordinary shareholders in the ratio of one preference share for one ordinary share.

The present paid-up capital of the Company is Rs. 59.87 lakhs. The gross value of the block is Rs. 207.51 lakhs, the book value of which is Rs. 50.33 lakhs. The Company had paid a dividend of Rs. 10 per share for each of the years 1951-52 and 1952-53, to which level it had been reduced from Rs. 14 paid for 1950-51. The payment of dividend at the rate of Rs. 10 per share had taken up only Rs. 2.99 lakhs. Judged from the performance of textile mills in recent months, it can reasonably be expected that the Company's results for the year ended 30th June, 1954, will be more favourable than those for the past year. One can, therefore, easily expect the Company to be in a position to pay the same dividend on the enhanced capital, if not a somewhat higher one. A dividend of Rs. 10 per share on the enhanced capital will require only a sum of Rs. 5.98 lakhs. This is not too high a figure for a mill which has 77,404 spindles and 1,517 looms. Further, the Company's 6 per cent. cumulative preference shares having been repaid, the Company has a saving of Rs. 60,000 per annum being the dividend on these shares. This amount itself is sufficient to cover an increase of Re. 1 per share on the enhanced capital.

RAYALASEEMA MILLS

The 12 months ended 31st December, 1953, was the third full year of working of the Rayalaseema Mills Ltd. (Managing Agents: The Rayalaseema Development Co., Adoni), since it commenced production on 22nd May, 1950. The year under review, however, proved to be less favourable than the previous one, in that the gross profit, which had gone up from Rs. 6.79 lakhs for 1951 to Rs. 13.80 lakhs for 1952, has dropped to Rs. 7.69 lakhs for 1953. The provision for depreciation has been more than maintained at Rs. 3.15 lakhs and that for taxation at Rs. 50,000. The Directors, who had transferred as much as Rs. 7.50 lakhs to the reserves in the previous year, have had to reduce the same to Rs. 2 lakhs. But the dividend is proposed to be maintained at 6 per cent. per annum, which is the same as that for the previous two years.

The following comparative table gives the salient features of the Company's financial results for the last three years:

(In lakhs of rupees)

	For the year ended 31st December		
	1953	1952	1951
Sale proceeds	40.50	45.17	46.02
Stocks	0.87	5.82	3.04
Expenses	37.03	33.30	42.89
Gross profit	7.69	13.80	6.79
Managing Agents' remuneration ..	0.84	0.85	..
Depreciation	3.15	5.12	3.10
Taxation	0.50	0.50	..
Net profit	3.40	9.33	3.69
To reserves	2.00	7.50	2.10
To bonus to employees ..	0.18	0.36	..
Dividend	1.34	1.34	1.32
	(6%)	(6%)	(6%)
Carry forward	0.42	0.44	0.35

Founded in 1945, as the first cotton spinning mill project in the Ceded Districts at Adoni, the Company, as already stated, commenced production on 22nd May, 1950, with 7,696 spindles. A further addition of 2,800 spindles was made during the year under review and production on these spindles commenced during the year. Unfortunately, the Company could not get the benefit of the increased spindleage during the year under review, on account of the high cost of cotton and unfavourable market for yarn. Referring to the trading conditions during the year, the Directors observe thus:

"The control over price and distribution of yarn was removed by the Government of India on 10th July, 1953, up to which date the Company was allowed to levy the retail margin for sales through the Company's own retail depots. With the removal of the above control, prices fell sharply. The Company had to close the retail depots and sell yarn through appointed agents. In common with all post-war mills, the fall in prices during the year affected your Company also severely. The two half-yearly quotas of export allowed by the Government of India in 1953 were fully utilised."

However, the carry-over of stocks of cotton from the previous year at lower costs helped the Company achieve the results mentioned at the outset.

The financial position of the Company, as seen from its balance-sheet on 31st December, 1953, is satisfactory. The paid-up capital of Rs. 22.14 lakhs is supplemented by reserves and surplus amounting to Rs. 12.02 lakhs, of which general re-

(Continued on page 325)

Points From The Chair

A Serious Misconception

"IT seems to me, therefore, to indicate a serious misconception of the realities of our economic position that at this time a general movement should be afoot to raise further our industrial costs. I can only ascribe this policy to the fact that wage increases have been more or less regularly secured year by year, and that manufacturers' order books are still on the whole comfortably filled. Full order books, like full employment, carry their own dangers for the future, if they result in constantly rising costs. If our prices are not competitive, a time will certainly come when replacement orders cannot be secured. That time, I suggest, is ominously near and in some cases has actually arrived. It is, then, surely unwise, to say the least, to speed its approach by our own deliberate action. The level of wages should by this time have regard to the need to secure orders in the future rather than being based on existing orders which are, in fact, being steadily worked off. It is, perhaps, unfortunate that the nationalised industries do not have to face foreign competition, as they are apt to set the pace for wage increases affecting those industries which do not enjoy a sheltered market."

SIR HAROLD E. YARROW,
Clydesdale & North of Scotland Bank Ltd.

Development of Rubber Estates

"... we will await Government orders on the scheme for assisted development of rubber estates which the Indian Rubber Board prepared and which the Tariff Commission commended. The small allowance of 6 cts. included in the controlled price, as provision for rehabilitation, is ludicrously insufficient to rescue large acreages of old seedling rubber, the economic life of which is now numbered. It is, therefore, a case for special subsidy, if these old rubber areas are to be resuscitated and fresh lands opened up. With the fresh slant given to Government planning, viewing schemes from their potentialities as employers of labour, one would expect a scheme for development of rubber plantations to receive high priority. Possibly only the textile industry exceeds plantations as employers of labour, but there must be few textile mills which, in addition to employing their labour also house them and minister to their health, recreation and welfare as plantations do."

W. W. KILGOUR,
Thirumbadi Rubber Co., Ltd.

Higher Productivity—A Simple Recipe

"What a wonderful thing it would be if we could wake up one morning to find each pound buying more; cost of living falling; real wages rising automatically. Yet this miracle could be brought about quite simply by higher productivity without higher costs. No one has more to contribute to, or more to gain by, that process than the earner of weekly wages. Moreover, he can nowadays rely with certainty on his bargaining power to secure for himself his full share of any increase in the national cake. My point is that—as things are now—he cannot safely take more until there is firmly and solidly a larger cake to divide, and a stable pound in which to draw his weekly wage. It is a simple recipe; could we not try it?"

LORD BALFOUR OF BURLEIGH,
Lloyds Bank Ltd.

New Zealand's Economy

"The overall picture of New Zealand economy shows an undoubted state of prosperity. Business is buoyant and this has been helped considerably by the fact that Britain had, in 1953, her best post-war year, and that in the U.S.A. business activities were well maintained. On the other hand, although during the year under review there has been some halt to the spiral of rising costs, the recent general increase of 10 per cent. in award wages throughout New Zealand will, undoubtedly, result in further inflationary pressure. A rise in the charges for all public and private services has followed quickly, and any benefits derived by the wage-earner have already been partly absorbed by the increased cost of living."

LORD GLENCONNER,
National Mortgage and Agency Co. of New Zealand, Ltd.

(Concluded from page 324)

serve is Rs. 7.50 lakhs, plant replacement reserve Rs. 2.50 lakhs, dividend equalisation reserve Rs. 1.50 lakhs and employees' benefit reserve Rs. 10,000. Provision for taxation stands at Rs. 1 lakh and current liabilities at Rs. 10.21 lakhs. The gross block of the value of Rs. 37.50 lakhs, including additions of the value of Rs. 6.68 lakhs made during the year, has been written down to Rs. 27.08 lakhs. The current assets amount to Rs. 18.29 lakhs (of which cash balances alone account for Rs. 8.55 lakhs) and more than adequately cover current liabilities and provision for taxation.

During the year under review, in addition to raising the spindleage, a new hall was added to house the preparatory machines. The entire cost of the machinery and the new building has been met from the Company's own resources. Regarding the Company's outlook for the current year, the Directors report as follows:

"The general improvement in the seasonal conditions of the country and the consequent increased demand for handloom cloth and the efforts of the State Government and the Government of India in improving the export trade of the handloom goods give the spinning industry hope of a steady and regular market in future. In these circumstances, your Directors expect satisfactory results during the present year."

COMPANY MEETINGS AND DIVIDENDS

FORT GLOSTER JUTE MANUFACTURING CO., LTD. Half-yearly General Meeting, Calcutta, 23rd February, 1954. Dividend: *Nil.* Transfer books remain closed from 12th to 23rd February, 1954, both days inclusive.

ANGELO BROTHERS LTD. Annual General Meeting, Calcutta, 24th February, 1954. Dividend: Re. 1-4 per share. Transfer books remain closed from 13th to 26th February, 1954, both days inclusive.

NORTH WEST COAL CO., LTD. Half-yearly General Meeting, Calcutta, 25th February, 1954. Dividend: *Nil.* Transfer books remain closed from 17th to 25th February, 1954, both days inclusive.

KUMERGODE ESTATES LTD. Annual General Meeting, Kozhikode, 27th February, 1954. Dividend: *Nil.* Transfer books remain closed from 20th to 27th February, 1954, both days inclusive.

KIL KOTAGIRI TEA AND COFFEE ESTATES LTD. Annual General Meeting, Kozhikode, 27th February, 1954. Dividend: As. 9-3/5 per share. Transfer books remain closed from 15th February to 1st March, 1954, both days inclusive.

HUMAYAN PROPERTIES LTD. Annual General Meeting, Calcutta, 2nd March, 1954. Transfer books remain closed from 23rd February to 2nd March, 1954, both days inclusive.

NATIONAL COMPANY LTD. Half-yearly General Meeting, Calcutta, 5th March, 1954. Dividend: Re. 1 per share. Transfer books remain closed from 20th February, to 5th March, 1954, both days inclusive.

BUDGE-BUDGE JUTE MILLS CO., LTD. Half-yearly General Meeting, Calcutta, 5th March, 1954. Dividend: Rs. 4 per share. Transfer books remain closed from 20th February to 5th March, 1954, both days inclusive.

RAYALASEEMA MILLS LTD. Annual General Meeting, Rayanagar, Adoni-Tungabhadra Road, Adoni, 7th March, 1954. Dividend: Rs. 6 per share. Transfer books will remain closed from 1st to 15th March, 1954, both days inclusive.

CHAMPDANY JUTE CO., LTD. Half-yearly General Meeting, Calcutta, 11th March, 1954. Dividend: Rs. 3 per share.

ALKALI AND CHEMICAL CORPORATION OF INDIA LTD. Annual General Meeting, Calcutta, 12th March, 1954. Transfer books will remain closed from 26th February to 12th March, 1954, both days inclusive.

ASSOCIATED STONE INDUSTRIES (KOTAH) LTD. Annual General Meeting, Ramganj Mandi, 14th March, 1954. Transfer books will remain closed from 7th to 13th March, 1954, both days inclusive.

UNITED NILGIRI TEA ESTATES CO., LTD. Interim dividend of Rs. 8 per share, for the year ending 31st March, 1954.

UNITED COFFEE SUPPLY CO., LTD. Interim dividend of 2½ per cent. for the year ending 30th June, 1954.

UNITED BREWERIES LTD. Interim dividend of Rs. 7-8 per ordinary share, free of income-tax, for the year ending 31st March, 1954.

BENGAL ASSAM STEAMSHIP CO., LTD. Dividend of Rs. 10 per ordinary share, for the year ended 31st October, 1953.

COMPANY REGISTRATIONS

YERROWADA INVESTMENTS LTD. (First Director: Mrs. Tarabai Maneklal Premchand.) Business: Purchase, Lease, Exchange or otherwise Land, Buildings and Hereditaments of any Tenure, etc. Authorised capital: Rs. 5,00,000. Private company. Address: 7, Narayan Dabholkar Road, Bombay 6.

FOUNTAIN INVESTMENTS LTD. (First Director: Mrs. Tarabai Maneklal Premchand.) Business: Purchase for Investment, Land and House and Other Properties of any Tenure, etc. Authorised capital: Rs. 5,00,000. Private company. Address: 7, Narayan Dabholkar Road, Bombay 6.

CELESTIAL PICTURES LTD. (First Director: Mr. D. B. Patel.) Business: Cinematograph Trade and Industry and all its Allied Trades. Authorised capital: Rs. 5,00,000. Private company. Address: 6A, "Ivanhoe," Back Bay, Bombay 1.

QUESTION HOUR IN PARLIAMENT

Textile Enquiry Committee Report

THE Kanungo Committee's report on the textile industry is likely to be submitted to the Government before the middle of this year.

• • • •

Tea Production

The estimated production of tea in India in 1953 was 608 million lbs., as compared with 629 million lbs. in 1951 and 620 million lbs. in 1952. The fall in production was due to selective plucking. The Government endeavours to bridge the gap between fall in production and increased export by increased internal consumption. So far as India is concerned, its internal consumption is estimated at 170 million lbs. a year.

• • • •

Sholapur Mill Management

The decision of the Supreme Court declaring as *ultra vires* the law under which the Government of India has taken over the management of the Sholapur Mills has not involved the Government in any monetary loss, but its implications may. The present management continues to be the management for the time being. The Press reports that there has been some settlement between the Government and the shareholders of the Sholapur Mills by which the Centre will hand over the Mills to the former Board of Directors are, unfortunately, ahead of events and are not even half-truths. The position cannot be remedied by amending the law, but be remedied by amending the Constitution.

—Minister for Commerce and Industry

G.A.T.T. Schedules

All contracting parties to the G.A.T.T. except Australia, Brazil and Peru, have signed the declaration extending the life of the G.A.T.T. schedules till 1st July, 1955. According to the G.A.T.T. Secretariat, the Government of Australia has decided to sign the declaration. The contracting parties are now considering the question of extending the time limit to sign the declaration up to 30th April, 1954. It is not our understanding that, by declining to sign the declaration, Brazil and Peru have gone out of G.A.T.T. These two countries have signed the protocol of provisional application of the G.A.T.T. and have not given any notice of withdrawal. So far as the Government of India are concerned, they have no reason to believe that either Brazil or Peru is anxious to withdraw the tariff concessions granted to India.

—Minister for Commerce

Second Five-year Plan

The Planning Commission has not yet considered the projects for the second Five-year Plan. The Central Government has asked for lists for inclusion in the schemes which are intended to be incorporated in the first Five-year Plan itself when certain readjustments are contemplated. The Planning Commission is considering the whole question of the second Five-year Plan and steps will be taken very shortly. In regard to irrigation and power schemes, the States have been asked to submit their proposals which will be considered by a special committee.

Nandikonda Project

Reports about the Nandikonda Project are expected to be submitted by the Andhra and Hyderabad Governments by the end of this month. Reference is made to the Krishna-Pennar scheme, which is one of the five schemes mentioned by the Planning Commission. As regards the question whether the Krishna-Pennar Project is preferred now, in spite of the fact that the Khosla Committee has categorically recommended the Nandikonda Project, it is not at all the intention. The Report made by Mr. Khosla suggested certain further investigations being undertaken by various participating Governments. Those investigations are nearly complete. There is no going behind any earlier decision. Reports of the Hyderabad and Andhra Governments will be considered by the Government of India. They are not final or binding.

—Minister for Planning

Smuggling of Goods

With the partition of India creating wide land frontiers and with import controls being tightened up, smuggling was naturally apprehended to increase, but indications are that, of late, it is on the decline. Concerted measures have been taken to check smuggling. Searches of passengers and vehicles have been intensified. The intelligence system has been improved and informers are rewarded more liberally. Vessels suspected of carrying smuggled goods are watched throughout their stay in port and are searched whenever considered necessary. Patrols by land and sea have been intensified by the sanction of additional staff, jeeps and launches; a barbed wire fence has been put up at a vulnerable land frontier. Prosecutions are being launched in suitable cases and heavy penalties are imposed under the Sea Customs Act in deliberate cases of smuggling, in addition to confiscation of the goods attempted to be smuggled.

—Deputy Minister for Finance

SPENCER MAINTAINS DIVIDEND LEVEL

EARNINGS OF NATIONAL COMPANY HIGHER

Spencer and Co., Ltd.

THE directors of the above Company (Secretary: Mr. C. W. Stephenson, Madras) submit the audited accounts of the Company for the year ended 30th June, 1953.

The net profit for the year after charging all expenses other than depreciation and taxation is Rs. 24,03,773 (Rs. 23,45,166) from which must be deducted depreciation Rs. 4,32,303 (Rs. 5,21,288) and provision for taxation Rs. 9,00,000 (Rs. 10,50,000) leaving a balance of Rs. 10,71,470 (Rs. 7,73,878). To this sum is added the amount brought forward from the last account of Rs. 5,36,552 (Rs. 6,61,628) making a total of Rs. 16,08,022 (Rs. 18,35,530). From this amount falls to be deducted, the dividends already paid on "A" and "B" preference shares Rs. 3,41,905 (Rs. 3,23,409) and *ad-interim* on ordinary shares at 5 (5) per cent. free of income-tax Rs. 2,00,000 (Rs. 2,00,000) leaving available for further distribution a sum of Rs. 10,66,117 (Rs. 13,12,121). The directors recommend that the dividends already paid be confirmed and that the above amount be dealt with as follows:—

In payment of a final dividend for the year of 10 (10) per cent. (free of income-tax) on ordinary shares Rs. 4,00,000 (Rs. 4,00,000), transfer to pension and gratuities reserve Rs. 1,00,000 (*nil*), transfer to exchange reserve Rs. 19,050 (*nil*) and carry forward Rs. 5,47,067 (Rs. 5,36,552).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	1,00,00,000	Block ...	46,37,599
Reserves ...	94,66,946	Stock-in-trade ...	67,09,523
Provision for taxation ...	5,66,642	Stores and spare gear etc. ...	7,20,831
Liabilities ...	41,65,205	Debts, deposits and advances ...	46,20,436
Profit and loss account ...	5,47,067	Investments	23,58,550
		Cash ...	56,98,921
Rs.	2,47,45,860	Rs.	2,47,45,860

National Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st October, 1953.

After providing Rs. 3,15,000 (Rs. 3,60,000) for taxation, there is a balance of Rs. 5,08,818 (Rs. 4,17,233) at the credit of profit and loss account from which the directors recommend payment as follows:—

Dividends on preference shares at Rs. 3-8 (Rs. 3-8) per share Rs. 17,500 (Rs. 17,500) and on ordinary shares at Re. 1 (Re. 1) per share Rs. 3,50,000 (Rs. 3,50,000) leaving Rs. 1,41,118 (Rs. 49,733) to be carried forward.

In accordance with the working time agreement of the Indian Jute Mills' Association, the mills worked 42½ hours per week with 12½ per cent. of the total looms sealed.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	40,00,000	Block ...	18,53,389
Reserves ...	44,27,437	Stocks ...	29,23,265

		Cash ...	35,78,080
Rs.	1,01,23,162	Rs.	1,01,23,162

North-West Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half year ended 30th September, 1953.

After providing Rs. 18,500 (Rs. 15,000) for depreciation and Rs. 4,500 for cesses and bringing in Rs. 90,000 (*nil*) from general reserve and Rs. 8,000 (*nil*) surplus in cesses provision, there is a balance of Rs. 552 (Rs. 12,237 after paying dividend of 2½ per cent. absorbing Rs. 6,813) at the credit of profit and loss account which is being carried forward.

Raisings during the half year were 44,065 tons as compared with 42,196 tons and despatches 34,818 tons as compared with 46,842 tons during the last half year. During the period under review the Company has been successful in concluding agreements with contractors for the raising and selling of coal mined at Ena Colliery.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	2,72,500	Block ...	5,00,805
Reserves ...	2,46,004	Stock of coal	4,26,472
Provision for taxation ...	22,969	Stores ...	1,16,152
Liabilities ...	8,68,011	Debts, deposits and advances ...	3,63,732
Profit and loss account ...	552	Cash ...	2,875
Rs.	14,10,036	Rs.	14,10,036

Empire Dyeing and Manufacturing Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. W. H. Brady & Co., Ltd., Bombay) submit the audited accounts of the Company for the year ended 31st December, 1953.

The accounts show a net profit on the year's working after writing off depreciation of Rs. 41,811 (Rs. 44,617) on machinery and plant, etc., setting aside Rs. 2,00,000 (Rs. 90,000) for taxation; and charging the managing agents' commission amounting to Rs. 76,920 (Rs. 31,991), of Rs. 4,42,101 (Rs. 1,50,587) which together with the balance brought forward from last year's account of Rs. 9,446 (Rs. 3,859) gives an amount for disposal of Rs. 4,51,548 (Rs. 1,54,446). This sum the directors propose to dispose of as follows:—

Dividend of Rs. 4 (Rs. 3) per share on 30,000 shares of the Company, free of income-tax to those shareholders on the register of the Company as at the 11th March, 1954, Rs. 1,20,000 (Rs. 90,000), to general reserve Rs. 1,50,000 (*nil*), to transfer to reserve for rehabilitation of machinery and plant Rs. 50,000 (Rs. 20,000), to staff gratuity fund Rs. 40,000 (Rs. 25,000) and to contingencies Rs. 50,000 (*nil*) leaving a balance to carry forward to next year's account of Rs. 41,548 (Rs. 9,446).

An increase in output over the immediate preceding year's workings was registered in all departments, and which increase is reflected in the figures shown.

The Company's property, including buildings, machinery and stock has been insured against fire and riot for Rs. 65,57,200. The profit and standing charges of the Company have been insured for Rs. 3,00,000; such insurance to run from 31st March, 1953 to 31st March, 1954.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,50,000	Block ...	5,61,171
Reserves ...	10,62,212	Stock-in-trade	47,821
Provision for taxation ...	3,74,928	Stores and spare gear	1,54,489
Liabilities ...	5,10,893	Debts, deposits and advances ...	2,03,274
Cash ...	4,51,547	Investments	3,19,133
		Cash ...	15,63,672
Rs.	28,49,580	Rs.	28,49,580

G. Claridge and Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. W. H. Brady & Co., Ltd., Bombay) submit the audited accounts of the Company for the year ended 31st December, 1953.

The accounts after charging Rs. 55,682 (Rs. 64,188) for depreciation and providing Rs. 1,00,000 (Rs. 3,00,000) for taxation shows a net profit of Rs. 1,57,778 (Rs. 1,50,283), which together with the balance of Rs. 5,799 (Rs 5,516) brought forward from last year's profit and loss account, gives Rs. 1,63,577 (Rs. 1,55,799) and this the directors propose to dispose of as follows:—

To pay a dividend of Rs. 12-8 (Rs. 12-8) per share on 8,000 shares of the Company, free of income-tax, to those shareholders on the register of the Company as at 11th March, 1954 Rs. 1,00,000 (Rs. 1,00,000), to transfer to general reserve Rs. 25,000 (Rs. 25,000), and to transfer to rehabilitation of plant fund Rs. 25,000 (Rs. 25,000), leaving a balance to be carried forward to next year's account of Rs. 13,577 (Rs. 5,799).

During the year costings have increased considerably as a result of Industrial Court Awards on Wages, etc., and although turn-over has been fairly well maintained, the profit margins have been much lower.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3,00,000	Block ...	3,80,187
Reserves ...	8,94,346	Stock-in-trade	13,48,017
Provision for taxation ...	5,89,188	Debts, deposits and advances ...	8,75,323
Liabilities ...	4,81,513	Investments	2,716
Profit and loss account ...	1,63,577	Cash ...	3,22,381
Rs.	29,28,624	Rs.	29,28,624

Brady Engineering Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. W. H. Brady & Co., Ltd., Bombay) submit the audited accounts of the Company for the year ended 31st December, 1953.

The accounts after charging the managing agents' commission amounting to Rs. 9,861 (*nil*) shows a profit of Rs. 1,59,779 (Rs. 1,74,893) which together with the balance brought forward from last year's account of Rs. 33,319 (Rs. 47,626), gives an amount of Rs. 1,93,099 (Rs. 2,22,520). Out of this amount the directors have written off depreciation on machinery and plant, etc., of Rs. 75,387 (Rs. 64,201) leaving a balance of Rs. 1,17,711 (Rs. 1,58,319), which the directors propose to dispose of as follows:—

Dividend at Rs. 3 (*nil*) per share on 25,000 shares of the Company, to those shareholders on the register of the Company as at 11th March, 1954 Rs. 75,000 (*nil*) and transfer to reserve fund Rs. 25,000 (Rs. 1,25,000) leaving a balance to carry forward to next year's account of Rs. 17,711 (Rs. 33,319).

The directors again have to report that the Company has not been able to obtain sanction to erect an additional cupola and that, to some extent, retarded development of the business. It is hoped, however, that there will be a relaxation of the restriction shortly.

The Company entered into an agreement for a period of five years commencing from 1st January, 1954, with the Polygram Casting Co., Ltd., of England, for securing the right to the Company for the manufacture of casting by their patented process on payment of a royalty of £500 per year.

Capital expenditure amounting to Rs. 5,869 (Rs. 7,681) was incurred in purchasing machinery and plant. The Company's property, including building, machinery and stock has been insured against fire and riot for Rs. 18,20,000.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	14,99,960	Block ...	10,82,533
Reserves ...	1,25,000	Stock-in-trade and work-in-progress ...	1,18,549
Liabilities ...	40,221	Stores ...	72,504
Profit and loss account ...	1,17,711	Debts, deposits and advances ...	60,723
		Cash ...	4,48,583
Rs.	17,82,892	Rs.	17,82,892

Auckland Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bird & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1953.

After providing Rs. 1,60,000 (Rs. 3,10,000) for taxation, Rs. 14,000 (*nil*) for reserve for taxation contingencies and Rs. 70,771 (Rs. 66,464) for depreciation, the profit and loss account shows a profit of Rs. 1,66,058 (Rs. 2,81,850) to which has been added the amount brought forward from previous half-year Rs. 42,740 (Rs. 61,145) making a total of Rs. 2,08,798 (Rs. 3,42,995). From this, the directors have transferred to jute stock reserve Rs. 25,000 (*nil*) leaving an available balance of Rs. 1,83,798 for general reserve). The directors propose to dispose of this in paying a dividend on the preference shares at the rate of 5½ per cent. per annum, without any deduction for income-tax paid by the Company Rs. 27,500 (Rs. 27,500), in paying a dividend on the redeemable preference shares at the rate of 4½ per cent. per annum, without any deduction for income-tax paid by the Company Rs. 33,750 (Rs. 33,750), in paying a dividend on the ordinary shares of Rs. 2 (Rs. 4) per share, without any deduction for income-tax paid by the Company Rs. 80,000 (Rs. 1,60,000) and in carrying forward Rs. 42,548 (Rs. 71,745).

Stocks of jute have been valued at market value and manufactured goods at contract or market rates.

In accordance with the Factories (Amendment) Act, 1946, and the Working Time Agreement of the Indian Jute Mills Association the Company's mill worked 42½ hours a week with 12½ per cent. of total looms sealed during the period under review.

The labour complement at the Mill was maintained at full strength throughout the period under review.

The directors inform that delivery of the modern Mackie's mill machinery for the hessian section of the Mill is expected during March, 1954.

During the period under review trading conditions continued to be difficult owing to the disparity between the prices of raw jute and those of manufactures, particularly sacking, the price of which remained unremunerative throughout the period due to overproduction and lack of demand. Hessians, however, remained in good demand mainly on account of substantial buying by the Argentine with moderate demand from other hessian consuming countries. Government on 14th September, 1953, reduced the duty on hessian goods from Rs. 275 per ton to Rs. 120 per ton. Although the industry's output of sacking has now been adjusted to the lower demand and stocks have decreased during recent months overseas interest remains disappointing and prices are still unremunerative.

The majority of the Company's production is in the form of heavy goods and but for the substantial stocks of jute held at relatively low prices, a loss would have been shown on the half-year's working.

The writing down of jute stocks to market values as at 31st March, 1953, favourably affected the results for this half-year as early in the period the price of jute increased appreciably and remained steady only to recede however at the close.

A Jute Enquiry Commission has been set up by Government to enquire into a wide range of subjects affecting the industry including speculation in both raw jute and jute goods.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	65,00,000	Block ...	32,39,386

CALL MONEY RATE UNCHANGED

(From Our Own Correspondent)

BOMBAY, *17th February*

The extreme stringency in the short-term money market, witnessed during the past several weeks, almost reached the climax during the week under review. Following the heavy drawings on their foreign offices and borrowings from the Reserve Bank and the Imperial Bank, the foreign banks were able to meet fully the demand for funds from their clients and are now reported to have withdrawn completely from the inter-bank call money sector. It appears that these banks do not expect such a keen demand for funds as ere now. Some of them are even reported to have turned lenders, albeit on a small scale. Indian banks, however, were still very keen borrowers. With supplies remaining scanty, they had to seek accommodation from the Reserve Bank and the Imperial Bank. Consequently, the inter-bank call money continued to be bid at 3 per cent.

The present famine-like conditions in the money market are expected to improve a little from now and remain so for some time, unless shipments of American cotton and sugar arrive much earlier than expected. However, with the much earlier than expected. prospects of the demand reviving once again on account of these imports, banks continue to bid short-term deposits at the high rate of 3 per cent. for one to six months and 2½ to 2¾ per cent. for longer periods.

The only change in the money rates this week was the sharp rise in the Government's borrowing rate against Treasury Bills from Rs. 2-9 per cent. to a fresh record of Rs. 2-9-11 per cent. per annum. The amount offered was only Rs. 8.5 lakhs more than that invited (Rs. 1 crore), but this is a little better than that offered last week, the authorities have invited tenders for another Rs. 1 crore next week.

A further expansion of Rs. 5.74 crores in notes in circulation is disclosed by the statement of affairs of the Reserve Bank of India for the week ended 12th February, 1954, following the rise of Rs. 17.81 crores noted in the previous week. Notes held in the Banking Department also have gone up by Rs. 3.95 crores, so that the rise in total notes issued is of the order of Rs. 9.69 crores. This rise has been offset by the increase of Rs. 10 crores in foreign securities and a decline of about Rs. 4 lakhs in rupee securities and of Rs. 27 lakhs in rupee coin. In the Banking Department, for the second week in succession deposits of Governments show a contraction, the decline in Central Government deposits being of the order of Rs. 1.73 crores and that in other Government deposits of Rs. 2.51 crores. Deposits of banks have, on the other hand, risen by Rs. 2.22 crores and those of others by Rs. 3.61 crores. On the assets side, cash balances have enlarged by Rs. 4 crores, while balances held abroad have shrunk by Rs. 6.71 crores. Ways and means advances to Governments are higher by Rs. 47 lakhs and other loans and advances by Rs. 5.44 crores. There has been a fresh rise of Rs. 6.83 crores in advances against usance bills, against which repayments during the week amounted to Rs. 37 lakhs.

The Scheduled banks' statement for the week ended 5th February, 1954, discloses, as compared with that for the previous week, a contraction of Rs. 2.37 crores in demand deposits and an expansion of Rs. 1.58 crores in time deposits. Inter-bank borrowings are lower by Rs. 1.26 crores. A rise of Rs. 4.23 crores is noted in borrowings from the Reserve Bank and of Rs. 1.31 crores in those from the Imperial Bank. Advances have recorded an increase of Rs. 4.86 crores and bills purchased and discounted of Rs. 82 lakhs. Investments have declined by Rs. 52 lakhs. Cash on hand and balances with the Reserve Bank have shrunk by Rs. 72 lakhs and balances with other banks and money at call by Rs. 1.90 crores.

Dull conditions prevailed in the Gilt-edged market during the week under review, with very little business passing now and then. The undertone, however, was steady. 3 per cent. 1957 was quoted at Rs. 98-7, though there were willing buyers at Rs. 98-6½. 3 per cent. 1958 had business at Rs. 98-0½ *ex-voucher*, half anna less than the quoted rate. 3 per cent. 1959-61 was done at Rs. 96-1 *ex-voucher*. 3 per cent. 1963-65 and 3 per cent. 1964 were each placed at Rs. 92-8. 3 per cent. 1966-68 was unchanged at Rs. 90-4 and 3 per cent. 1970-75 at Rs. 86-8.

The Bombay State Transport Corporation will shortly approach the long-term capital market with an offer of Rs. 1 crore. The loan will have a maturity of 11 years and will carry interest at the rate of 4 per cent. per annum. The issue price will be Rs. 99 per cent. Both the principal and interest will be guaranteed by the Bombay Government.

LINSEED ADVANCES

(Messrs. A. Bradley & Co.)

CALCUTTA, *15th February*

A somewhat firmer tendency has developed in the linseed market during the past week and an appreciable advance in prices has been recorded. The availability of ready goods locally is very poor. Sellers are, therefore, extremely reserved, despite keener enquiries for near positions from local crushers. Business, however, has been reported on a small scale for new crop forward delivery. Following the report of some export business to Australia, oil prices have advanced appreciably. The local demand has improved, but ready goods are very scarce. Latest quotation is: Ready Rs. 21-12 per maund.

MARGINS ENFORCED IN BULLION

(From Our Own Correspondent)

BOMBAY, *17th February*

Brisk trading and sharp rise in prices were the notable features of trading on the Bullion Exchange during the week under review. While silver became active only in the latter half of the week, gold was in the limelight almost from the beginning. Nevertheless, as the week advanced, both the metals moved up so high that they attracted enforcement of automatic margins.

Gold gave the lead this week. Following fresh bull support and frantic covering by short-sellers, there was a good spurt in rates. Heavy purchases in the ready position by both local and upcountry dealers, especially from Calcutta, coupled with reports of bull squeeze in Calcutta fanned the bullish fervour. Other factors that accentuated it were a fresh attempt to squeeze by a leading operator in the new settlement, a shrinkage in the floating stocks of gold due to despatches to Calcutta and encouraging advices from other markets. Forward gold, therefore, touched a high of Rs. 89-7 today, the highest since the end of June, 1953. However, just before the close, there was a sharp reaction, due to profit-taking.

After a spell of idleness in the initial days of the week, silver also followed suit and brisk advances were registered as the week progressed. Heavy purchases by a leading bull operator, fairly good offtake in the ready position and upward trend in other markets, all combined together and lifted the price to high levels not seen for several months now. Towards the close, the bulls themselves made frantic efforts to bring down the prices by booking profits, in order to avoid payment of margin. But short-sellers were successful in resisting the efforts of the bulls and forced them to pay margin yesterday on their outstanding purchases. The enforcement of margin, however, did not have any effect on the bullish sentiment. On the other hand, the battle was carried to a further stage today, when there was a further rise in silver prices. In this tug-of-war, the bears would appear to have overdone their part, with the result that the *budla* charges, which were till this morning in their favour, turned against them at the close.

Gold for forward delivery (17th February settlement) began at Rs. 86-1 and soared to Rs. 87-15 on Monday. As the closing rate on that day stood at Rs. 87-13, that is, above the margin levels, the bulls were obliged to pay the margin. Despite this, forward gold continued its upward trend and touched today a high of Rs. 89-7 before closing at Rs. 88-8. The next settlement began at Rs. 85-14 and registered a high of Rs. 89-2 today, but was lower at Rs. 88-4 at the close.

Ready gold opened at Rs. 86-6 and closed at Rs. 88-12, after being marked up to Rs. 89-12. The floating stocks of gold are estimated at 20,000 tolas. The daily average arrivals were 10,000 tolas. The daily average offtake was of the order of 9,000 tolas.

Forward silver (18th February settlement) began at Rs. 161-14 and, after a drop to Rs. 161-7 early on Saturday, appreciated to Rs. 164-2 yesterday. The closing level on that day having stood at Rs. 164-1, that is nearly a rupee more than the margin levels, the bulls were obliged to pay the margin. However, the upward trend continued further today, when a high of Rs. 166-5, a record since the middle of May, 1953, was touched. The closing was, however, a shade lower at Rs. 166-2. Forward trading in the next settlement opened the week at Rs. 162-5 and advanced to Rs. 165-11 at the close today.

Ready silver (.996 Mint) was done at a premium of As. 4 over the forward rate for the first settlement. The floating stocks of silver are placed at 2,250 bars. The daily average offtake was 25 bars.

The following comparative table shows the trend of the market during the week under review:

	17-2-54	Highest	Lowest	10-2-54

HIDES IN GOOD DEMAND

(From Our Own Correspondent)

KANPUR, *14th February*

During the week under review, the hides end skins market put on a confident note. There was strong and persistent demand for wet salted buff which registered a substantial rise in prices. The fresh supply of both wet salted cow and buff was considerable. The local tanners and the Madras dealers were the main purchasers. The country dealers effected considerable business in second grade cow.

Latest quotations are: Wet salted cow, 1st grade Rs. 400 to Rs. 320, and 2nd grade Rs. 260 to Rs. 240 per score; wet salted buff, 1st grade 1 lb. 8 ozs. and 2nd grade 1 lb. 14 ozs. to 2 lbs. per rupee; goat, 1st grade Rs. 300 and 2nd grade Rs. 250 per 100 pieces; sheep, 1st grade Rs. 300 and 2nd grade Rs. 250 per 100 pieces.

SPOT COTTON FIRM

(From Our Own Correspondent)

BOMBAY, *17th February*

...owly but steadily, the world supply position with regard to cotton seems to have changed from a fear of plenty to apprehensions of paucity. At the beginning of the season, every cotton-producing country, except Egypt, was worried about the disposal of its crop. There was a slump in cotton markets everywhere, including the U.S.A. and India. The world production has not dwindled. If it has gone down a little at some places, as in Egypt, it has gone up elsewhere, as in India, China, Russia and the U.S. What has possibly happened is that consumption has increased imperceptibly but steadily and the demand on the supplies has grown, with the result that prices have been pushed up. Sudan and East Africa, together with Egypt, are today almost in a position to dictate their terms. The U.S.A. is now fully assured of over-stepping last year's figure for exports which at one time looked absolutely unlikely.

In this context, the increasing firmness in the spot market in Bombay and upcountry is nothing to be surprised at. All available staple varieties are being clamoured for and high premia are being paid for these. As Indian mills are not likely to get any further quotas of indigenous cotton, they have started looking for supplies abroad. As stocks at Alexandria are depleted and East Africa and Sudan can give us only limited quantities, their attention is centred on the U.S. and quite a considerable amount of business is believed to have been put through during the week in Californian cotton, after it was known that the auctions of 30,000 bales of Sudan cotton realised what amounted to almost boom prices. Even the short-staple varieties are in better demand than at any other time in the season, because of a fresh interest displayed by the Continent, Japan and the U.K. in these styles.

It is this situation which has led the Central Cotton Advisory Board, to recommend to the Government that the target of cotton production in the country for the coming season be revised from 42 to 45 lakh bales. A similar recommendation had been made by the Indian Central Cotton Committee only a week before. The Board has also concurred with another recommendation of the Indian Central Cotton Committee, namely, that special and immediate attention should be paid to increasing the production in the country of coarse and medium counts cotton alongside the present efforts made for producing more of extra long-staple cotton.

In spite of all these, the forward market appears to be worried. Heavy bouts of buying and selling are a sign of nervousness, which characterises the attitude of the operators. They are worried, because they fear that hedging pressure will be the heaviest during the interval between the February and May contracts. The forward market has got itself into a stage where it cannot work on long-term views and has to be swayed frantically by temporary developments. It is also worried because there is no escape contract at present after May. Strong pressure is, therefore, being brought on the Government to allow trading in the August contract.

The authorities do not seem to be in any hurry to oblige the operators. But once this permission is given—it is bound to be given sooner or later—there will be a tremendous buying pressure on the market, with August standing at a heavy premium over May. In the meantime, the market developed a slight diffidence early this week and the longs in both February and May contracts considered it wiser to pocket gains. This gave an opportunity to those who had hedged cotton to lift these hedges at rates much lower than they expected to pay for squaring up their commitments. This is the one forward market which is not troubled with any apprehensions about unforeseen burdens in the coming budget and, to that extent, it is free from this complicating factor.

In the forward section of the cotton market, I.C.C. February opened the week firm at Rs. 712-8, as against Rs. 710-4, the closing rate of last week. Under the impetus of persistent call-fixing by mills and bear-covering, the contract gradually moved up to Rs. 747 on the 13th inst. At higher levels, profit-taking set in and the contract staged a retreat, today's closing quotation being Rs. 713-8. The net gain over the week was thus reduced to only Re. 1. I.C.C. May was higher at Rs. 697-8 on the opening day, as against Rs. 696-4 last week. After advancing to Rs. 718 on Saturday, the contract slided down to Rs. 699-8 today, the net gain over the week being no more than Rs. 2. The trend of prices in the forward section during the week under review was as follows:

	Opening	*High*	*Low*	*Closing*
I.C.C. Feb. ...	Rs. 712½	747	711½	713½
I.C.C. May ...	Rs. 697½	718	697½	699½

The latest available prices from the spot market are:

Bengal *Deshi* Rs. 660-670; Berar *Jarillas* Rs. 840; Khandesh Rs. 850-860; Vijay Rs. 935-945; Oomra *Deshi* Rs. 730; Moglai Rs. 725.

Karachi has failed to profit by the recent rise in the New York prices. All its habitual customers are still finding prices of Pakistan cotton above the U.S. parity and there is, therefore, little inclination on their part to patronise it. In fact, the U.K. and the Continent are more interested in the short-staple *Deshi* varieties at Karachi than those styles for which the Karachi market is famous. Some business in *Deshi* cotton and N.T., however, seems to have materialised with the U.K. China, France and Pondicherry at a fairly attractive price and, if Karachi has more Sind or Punjabi *Deshi* cotton to offer, there may be buyers from the Continent at good prices. For the rest, it looks doubtful that substantial business can result at present prices, as they are higher than those for the comparable varieties in the other cotton markets of the world.

Karachi is, however, contemplating to send a delegation to the U.K. for the purpose of creating a Pak-Lancashire Cotton Committee.

The latest available quotations from the Karachi market are: Sind *Deshi* Rs. 74-12 to Rs. 75-4; Punjab *Deshi* Rs. 72-4 to Rs. 73-12; 4F Punjab R.G. Rs. 70-12; S.G. Rs. 76-12; L.S.S. Punjab R.G. Rs. 75-12; S.G. Rs. 80-12; N.T. R.G. Rs. 74-12 to Rs. 75-4; S.G. Rs. 79-12 to Rs. 80-4; 289F Punjab R.G. Rs. 79-12; S.G. Rs. 85-12.

At Alexandria, with every day, demand on its depleted supplies is growing from India and several countries on the Continent. The U.K. too has been a persistent buyer and Spain has also entered this ring. The shippers, therefore, are offering only small lots which are snapped up immediately. Internal consumption has also accounted for a good deal of Ashmouni cotton. Curiously enough, Egyptian cotton interests were keen bidders at the auction held at Khartoom in Sudan. The Cotton Commission is expected to put up its prices some time this week for all varieties.

After a long stretch of rising prices, New York has shown a very small recession for the first time during the last two days from the 34.50 cent level. This may be only a technical reaction and Indian mills would do well to take advantage of any such setbacks. The price situation is getting technically very complicated in the American markets, because of the basis of calculations on which the loan rate is based and the possibilities of withdrawals from the loan at certain price levels. Any further rise in spot prices, induced by tight supplies, might result in large-scale withdrawals, which are sure to be hedged in the forward markets. In spite of all these conflicting factors, the export demand at New York continues to be fairly brisk and no falling off from this is feared in view of the world supply position.

The following are the latest available quotations from New York, as compared with those a week and a fortnight before:

(In cents per lb.)

	16-2-54	9-2-54	2-2-54
Spot	35.05	35.00	34.80
March	34.33	34.28	34.17
May	34.38	34.37	34.33
July	34.25	34.14	34.19
October	33.58	33.41	33.37

ART SILK YARN SHOOTS UP

(From Our Own Correspondent)

BOMBAY, 17th *February*

Hectic buying by bulls, induced by scarcity of stocks and expectation of very poor imports, imparted a firm tone to the art silk yarn market in the initial sessions of the week under review. There was a swift and steady advance in prices of art silk yarn. The upward trend was, however, somewhat halted on Monday, when, on account of profit-taking, values staged a retreat. This persisted on the following day too erasing thereby a part of the earlier gains. But today, again, the market picked up strength on good demand in the spot section and values registered strident advances. The closing quotations were substantially higher than those at the end of last week.

In the forward section, 150D March contract rallied 30 points to Rs. 806 on Saturday. After receding to Rs. 791 yesterday, it recovered to Rs. 798 today. The net gain over the week was Rs. 22. Spot prices of yarn also registered handsome improvement. 120 Japan was specially favoured and hardened by As. 4 to Rs. 4-14. 120 Italy evoked enquiries and rose by As. 4 to Rs. 4-8. 150 Japan and 150 Italy were transacted each As. 2 higher at Rs. 4-8 and Rs. 3-15½, respectively.

Traders in art silk yarn feel that there is no possibility of any further bulk arrivals of yarn imported under the confirmed licences of last year. They also expect very negligible arrivals of tenderable qualities in 150 denier brights, owing to the severely restricted import policy. Under this policy, the Government has allowed only 5 per cent. of 150 denier bright yarns of the total licence value. This expected low arrivals, however, do not seem to have been based on the actual imports in recent weeks which show a rise. Thus, the quantity of art silk yarn actually imported into Bombay during the month of January, 1954, amounted to over 2.68 million lbs., as against 2.25 million lbs. in the previous month and 2.05 million lbs. two months before.

Firmness in the art silk yarn section and announcement of Government's decision not to entertain applications from established importers for importing staple fibre imparted strength to the staple fibre yarn section early this week and values tended to move upwards. Staple fibre yarn (40 x 2) March contract spurted from Rs. 693 to Rs. 721 on Saturday, due to increased buying enquiries from consuming centres. On Monday, however, a reaction set in, following pressure of sales by local and upcountry mills. There was also a rumour that a few Bombay mills were eager to sell considerable part of their output for forward delivery. Consequently, the contract slided down to Rs. 704 today. The net gain over the week was only Rs. 11. Prices of 40 x 2 staple fibre yarn—foreign and indigenous—were well maintained at about last week's levels. Among foreign yarns, Suico was quoted at Rs. 4-6, Shinco at Rs. 4-5-6, Paramount at Rs. 4-5, S. Fuji at Rs. 4-5-6 and Aurora at Rs. 4-5-6 per lb. Among Indian yarns, New City was steady at Rs. 4, New Great at Rs. 3-12-3, Vasanta at Rs. 3-12 and Hindustan at Rs. 3-9-6.

Turnover in the cotton yarn section was greatly restricted this week, and values moved within a narrow range. Superior variety yarns met with special buying support and registered handsome improvement in prices. Among 60s, Rajalakshmi advanced by a rupee to Rs. 44 per bundle of 10 lbs. Finlay and Pioneer put on As. 12 each to Rs. 59-12 and Rs. 44-8, respectively. City was higher by As. 8 at Rs. 48. Among 80s, Finlay rose by Rs. 2 to Rs. 70 and Sri Ram by As. 8 to Rs. 65. Prices of 40 count yarns also were better, Meenakshi, Madura and Gokak being quoted at Rs. 26-10, Rs. 27-4, Rs. 26-6 as against Rs. 25-14, Rs. 26-14 and Rs. 26-4, respectively. Values of 10s, 20s, and 30s were fully steady.

The table below gives the prices of art silk, staple fibre and cotton yarns quoted today, as compared with the previous week:—

	17-2-1954	10-7-1954
	Rs. a.	Rs. a.
Art silk yarn—		
150 March (per case of 200 lbs.)	798 0	776 0
120 Japan (per lb.)	4 14	4 11½
150 Japan (per lb.)	4 8	4 6
120 Italy (per lb.)	4 8	4 4
150 Italy (per lb.)	3 15½	3 13½
Staple fibre yarn—		
40 x 2 March (per case of 200 lbs.)	704 0	693 0
Suico (per lb.)	4 6	4 6½
New Great (per lb.)	4 5½	4 5½
Cotton yarn (per bundle of 10 lbs.)—		
10s Modern	13 8	13 8
20s Hind	16 14	16 14
30s Madura	23 14	23 12
40s Gokak	26 6	26 4
60s Raguvanshi	53 4	..
80s Finlay	70 0	68 0

GROUNDNUTS DECLINE AT CLOSE

(From Our Own Correspondent)

BOMBAY, 17th *February*

The notable development during the week under review was the announcement by the Joint Controller of Exports, Bombay, on the 16th inst., that registration of export sales, *kardi* and *niger* seeds had been stopped with effect from 15th February, 1954. It was, however, simultaneously announced that export of *kardi* and *niger* oils would continue to be licensed freely to all permissible destinations upto the end of June, 1954. It will be recalled that it was announced on 12th January, 1954, that export of *kardi* and *niger* seeds would be allowed only against prior sales to buyers abroad. These sales were required to be registered with the export control authorities, before shipment was effected.

This development had a bearish effect on the market. The groundnut and linseed sections which ruled almost firm, prior to the announcement on Tuesday, staged a mild recession thereafter. The initial firm trend in groundnuts was due to bull support on reports of small arrivals. In the linseed section, prices were marked up, on news of an export business of about 300 tons of oil having been put through with Australia at £109 c. & f. per ton; it was also rumoured that crop prospects this year were not as bright as expected earlier. The castorseeds section, however, ruled slightly easy, in the absence of any indication of announcement of export quotas in the shortrun.

In the groundnut section Bold ready, which was done early in the week at Rs. 34-8, as against Rs. 33-10, shot up to Rs. 35 on the 15th inst., and thereafter declined to Rs. 34-8. February-March gained As. 9 to Rs. 34-3 and April-May As. 6 to Rs. 34-6. Khandesh quality was higher by As. 14 at Rs. 35. Groundnut *ex*-mill and railway receipt each improved by As. 5 to Rs. 17-6. March and April deliveries were done at Rs. 17-9 and Rs. 17-12, as against Rs. 17-4 and Rs. 17-7, respectively.

The linseed section came in for considerable enquiry. Bold ready which changed hands at Rs. 26-10 on the 11th inst., as against Rs. 25-4, shot up to Rs. 27-8, before gradually declining to close at Rs. 26-8. February-March improved from Rs. 23-8 to 24-8 and April-May Rs. 23 to Rs. 24. Linseed oil rallied As. 4 to Rs. 15.

Operators in the castorseeds section were hesitant to commit themselves, in the absence of any possible insight into the export policy likely to be adopted by the Government. May delivery which opened steady at Rs. 113-12, fluctuated between Rs. 114-14 and Rs. 113-2, before closing at Rs. 114-4. Madras quality lost As. 4 to Rs. 24-4. Castor oil B.S.S. was done at Rs. 13-10 as against Rs. 12-10, I Pressures at Rs. 12-14 as against Rs. 12-6 and Commercials at Rs. 11-14 as against Rs. 11-2.

Among others, *kardi* bold, which improved from Rs. 20-8 on the 11th inst. to Rs. 21 on the 13th inst., declined gradually to close at Rs. 19-8. *Niger* F.A.Q., which was steady at Rs. 28-8 on the 11th inst., advanced to Rs. 29 before closing at Rs. 28-6. Madras quality lost As. 10 to Rs. 29.

Arrivals of oilseeds and oils from 1st January to 11th February, 1954, as compared with those in the corresponding period last year, were as follows:

(In cwts.)

	1954	1953
Groundnut	470,656	602,575
Linseed	8,095	7,171
Castorseed	3,594	94,856
Groundnut oil	166,582	155,892
Linseed oil	6,148	2,763
Castor oil	2,610	21,408

The following table shows the prices of oilseeds and oil on the 17th inst., as compared with those at the end of the previous two weeks.

	17-2-54	10-2-54	3-2-54
	Rs. a.	Rs. a.	aR. a.
Groundnuts—			
Khandesh Quality Ready (per cwt.)	35 0	34 2	35 0
Bold February-March	34 3	33 10	34 2
April-May	34 6	34 0	34 12
Linseed—

Castor Oil—			
Commercial (per quarter) ..	11 14	11 2	12 10

SUGAR FULLY STEADY

(From Our Own Correspondent)

BOMBAY, 17th *February*

Barring slightly easy conditions today, the Bombay sugar market ruled fully steady during the week under review. The chief factor which imparted steadiness to the market during the major part of the week was the firm advice from the London sugar market where the price of British refined sugar has spurted by 10s. to £39-10 per ton c.i.f. Bombay, following the Government of India's decision to import larger quantities of foreign sugar. The bullish feeling was also sustained by renewed expectation of appreciably lower sugar output in the current season and reports that fresh imports of sugar would not be arriving earlier than two months. On top of these, there were firmness in *gur* prices and strong advices from U.P. sugar markets. The buying support that ensured as a consequence lifted up the prices of sugar. But the improvement was halted today, when, on announcement of the Government's decision to effect immediate shipments of sugar to meet the internal shortage, prices staged a retreat. Over the week, however, sugar values were more or less maintained at last week's levels.

In the ready section, small, medium and large grain sugars were quoted today at Rs. 91, Rs. 93 and Rs. 97-99 per bag, respectively, same as last week. Among foreign sugars, British refined was steady at Rs. 85 per bag of 2 cwts., Cuban at Rs. 36-12 per 100 lbs. and Czechoslovakian at Rs. 83-88 per bag of 220 lbs. Mexican sugar was higher by As. 4 at Rs. 40-12 per 100 lbs. German sugar hardened by As. 12 to Rs. 82-12 per bag of 2 cwts.

In the forward section, *Fagan* delivery firmed up from Rs. 83-4 to Rs. 85-6, but reacted to Rs. 84-8 today. *Maha* delivery was quoted at Rs. 82-12, as against Rs. 83 a week before.

Arrivals of sugar in the market were larger this week too, the quantity actually received being 7,100 bags, as against 6,700 bags last week and 6,500 bags two weeks before.

A notable development during the week under review was the Central Food Ministry's announcement of the decision to import 500,000 tons of foreign sugar with a view to meeting a part of the country's demand, estimated at 1,700,000 tons. The present time being the fag end of the season on the Continent, the sugar markets there are ruling firm. British refined sugar is now being quoted at £39-10 per ton c.i.f. Indian ports. Since the offers are invited on c. & f. basis for immediate shipment, it is understood that important offers are currently being negotiated in New Delhi for shipments during the next month.

UPWARD TREND IN PEPPER

(Messrs. Parekh & Co.)

BOMBAY, 17th *February*

The pepper market during the week showed a slow but steady rising tendency under pressure of buying by the exporters against their sale to Russia and the U.S. New York, after waiting in vain for a lower price, is also reported in the market and has been a continuous buyer for February shipment at prices ranging from $0.81 to $0.84½. Once again, Indian growers have showed their holding power and forced the bears, both in India and in New York, to cover at sellers' price. Selling pressure from pepper growers in Alleppey area is now reported to be on the wane, the small holders in need of money having already liquidated a major part of their harvest. Arrivals in Tellicherry are reported on an increase, but the steadiness on the part of Alleppey growers has its sympathetic reflection on their counterparts in Tellicherry, who are revising their price idea from time to time in parity with the quotations from Alleppey.

Representatives of a couple of New York dealers are now on a visit to Bombay. Their constructive views on the immediate future of pepper are also responsible for the present reserved attitude of the Indian exporters. Russia is reported to have bought about 1,250 tons, and it is possible that the country may take a few hundred tons more for shipment during February.

The Indian exporters' present policy of shipping pepper on consignment basis to New York has also had a steadying effect on the prices in the Indian market though such consignments may weaken at times the technical structure of the New York market. As long as the spot price in New York is quoted at a premium, the shipping of consignments in most cases has so far proved a paying proposition, particularly, in view of the policy of the New York dealers of keeping their market half-starved.

Some exporters are reported to have paid Rs. 1,850 for ungarbled at Alleppey.

In the A.S.T.A. section, February was done from $0.81 to $0.84½, while March found buyers up to $0.85 April-May-June shipments also were in demand at $0.84½.

In the delivery section, a sympathetic rise in the prices was recorded and February and March delivery were done at Rs. 1,520 and Rs. 1,545 respectively.

Following are today's nominal quotations:—Ready delivery Rs. 190-240 per B.m. February Rs. 1,500-1,520, March Rs. 1,530-50 and April Rs. 1,550-70 per candy of 5¼ cwts.

JUTE GOODS MOVE UP

(From Our Own Correspondent)

CALCUTTA, 16th *February*

The jute goods market continued to present steady conditions during the week under report. Excepting a small rise in the value of goods, the market was devoid of any development worth reporting. The rise was more due to short-covering than to any actual business activity in the market. Factors such as lower stocks with mills, as indicated by the figures released for January, the prospects of lower production in February which is always a short-working month and revival of purchasing demand after the ensuing Central budget, all indicated the possibility of a bear-squeeze in the coming weeks. Consequently, bears preferred to cover their sales and prices, as a result, staged minor advances. Overseas enquiries were few and far between, and activity remained restricted.

On reported low stocks of hessians sentiment of the market changed with quotations for 40 oz. 10" recording gradual improvement. Opening the week at Rs. 45-9 per 100 yards, the rate rose steadily and slowly to Rs. 45-12 on the 12th inst., Rs. 46-6 on the 15th inst., and to Rs. 46-12 today. B. twills moved in sympathy with hessians from Rs. 102-8 to Rs. 105-10.

Raw jute market remains dull. In the absence of any enquiries for jute goods, mills were not showing any anxiety to make purchases. Quotations, therefore, remained unchanged. Assam bottoms were quoted nominally at Rs. 27-8 per maund throughout the week.

TEA DUSTS RECEDE

(Messrs. Forbes, Ewart and Figgis Ltd.)

COCHIN, 13th *February*

1,60,000 lbs. were offered in dust sale "C" which was held on Tuesday, 9th February. There was less demand this week after the steep rise in prices in dust sale "B" and the market declined fully As. 3.

London Market—Sale of 8th February.—Half to one penny dearer.

Sale of 10th February.—Half penny dearer.

Colombo Market.—Dearer, particularly lower sorts, and all leaf. Good B.O.Ps. opened dearer and closed at last rates.

Calcutta Market—Export.—Opening little disappointing, but in general rates remained steady with stronger tendency towards the close.

Dust.—No sale this week.

Export Quota.—The market strengthened during the beginning of the week and business was done at 46 pies, which remains today's quotation.

Forthcoming Auctions.—Dust sale "D" will be held on Tuesday, 23rd February.

As we go to press, Messrs. Forbes, Ewart and Figgis Ltd., wire:—

"Sale 4.—8,44,000 lbs. Good general demand. Low and low medium irregularly As. 1 to As. 2 dearer. Medium fully firm. Best liquoring irregular and sometimes easier. Whole leaf weakest feature."

CEREAL PRICES RECOVER

(From Our Own Correspondent)

HAPUR, 15th *February*

Foodgrain markets have been quiet to steady during the week under review and prices in the open market have tended to get stabilised after the recent post decontrol fall in coarse grains. In some of the markets, there has been slight recovery in cereal prices, while in others the downward march has been arrested. Movements of coarse grains from surplus to the needy areas have been well maintained. Rice and wheat movements continue to be controlled and it is thought very probable that the Union Government will prefer to wait at least till the end of June this year by which time the *kharif* crop prospects may be assessed with some confidence. The State Governments are free to relax such restrictions, as there may be on distribution and consumption of rice within their States. Such restrictions in respect of wheat are already withdrawn.

The overall food position in the country continues to be very satisfactory. Mr. Kidwai says that prices have been declining everywhere. The policy of the Government of India to sell imported wheat at Rs. 15-8 per maund in the market, according to him, has greatly helped to maintain a low trend in the prices of foodgrains. Mr. Kidwai has expressed the hope that, with the arrival of new wheat after the harvesting season, the prices of food will touch still lower levels. The Government of India has reduced by Re. 1 per maund the price of imported wheat to be supplied to flour mills for the manufacture of fines. The new price of imported wheat to be so supplied to the mills will be Rs. 18-1 per maund. Owners of flour mills are prohibited from manufacturing fines from indigenous or imported wheat not specifically issued to them by the Central or State Governments.

It is now authoritatively stated that the Government of India will import 600,000 tons of rice from Burma this year for the purpose of building a reserve stock. Negotiations for the purchase of rice have been conducted on a Government-to-Government basis. No immediate major changes in the food policy are likely to follow this rice agreement. The Government will continue to meet the needs of the deficit States from internal procurement by other States, the declared surplus of which is stated to be quite comfortable for the purpose. It is reliably learned that the Burma rice may cost about Rs. 25 per maund, whereas the bulk of internal procurement falls within the range of Rs. 15 to Rs. 20 per maund. Thus, the internal price structure in respect of rice may not be affected by the imported stocks. It is learned further that shops may be started in Calcutta from where people would be enabled to purchase the rice imported from Burma at the controlled price in any quantity.

During the week ended 3rd February, 1954, India received 15,600 tons of foodgrains from abroad. The total arrivals since 1st January are: wheat 2,400 tons, rice 13,200 tons and milo 8,100 tons.

In the local market, foodgrains and pulses remained depressed for most of the period. The decline in the price of peas recently gave a stimulus to the speculators to indulge in heavy short coverings. Futures rallied after a sharp fall and the volume of business increased. The latest local market quotations (per maund) are: Ready wheat Rs. 16-4 to Rs. 18-8; gram Rs. 13 to Rs. 13-8, barley Rs. 10, *bejhar* Rs. 10; maize Rs. 11 to Rs. 11-8; *bajra* Rs. 11 to Rs. 11-12, *jowar* Rs. 9 to Rs. 11-8, *guwar* Rs. 9 to Rs. 9-6, *rice: basmati* Rs. 29, *sela* Rs. 22 to Rs. 24 and coarse Rs. 19; peas ready Rs. 9-8 and *jeth* Rs. 9-5-6, *arhar* Rs. 10-8, *jeth* Rs. 10-5-6, *urd* ready Rs. 16, *baishak* Rs. 14-12 and *guwar maha* Rs. 8-3.

SUGAR STEADY

(From Our Own Correspondent)

HAPUR, 15th *February*

Crystal sugar markets ruled generally steady. There was considerable speculative activity in the bigger centres like Kanpur. Troubled conditions continued in the sugar industry in Uttar Pradesh this week also. Mr. Kidwai's efforts to bring about a settlement between the cane growers and the industrialists failed and eyes are now set towards the tripartite conference which the U.P. Government propose to convene this week on the advice of Pandit Pant. The U.P. Hind Kisan *Panchayat* which has sponsored the cane strike in U.P. rejected Mr. Kidwai's formula for the sharing of the excess profits, since the Committee's view was that the formula would bring only an extra anna per maund to the sugarcane producers.

The Bihar cane growers who were scheduled to stop supplies to sugar mills from today have postponed their strike. Mr. M. P. Sinha, Chairman of the State branch of the P.S.P., said that the decision to postpone was taken as the crushing season in most of the mills was about to close. The position is very much different in U.P. According to the Kanpur office of the *Amrit Bazar Patrika*, sugarcane worth Rs. 10 crores is estimated to be standing in the fields in U.P. and, if the strike move succeeds, a large number of the *kisans* will be involved in it. The total estimated sugar produce in U.P. is about 7 lakh tons and the 66 sugar mills consume 70 lakh tons of sugarcane every year. By this time, about 40 lakh tons of sugarcane must have been consumed. If the rural cane crushing industry's usual consumption is to be taken into account, about Rs. 4 crores worth of cane requires to be diverted to that channel.

Pointed atention was drawn to the present short supply of home sugar, its high cost and mounting consumption which necessitated the import of 240,000 tons at a cost of over Rs. 17 crores, by Mr. K. L. Khanna, Director, Sugarcane Research and Development Section, at the Research and Development Workers Conference held at Jullundur this week. For augmenting the existing sugar production, he suggested strict demarcation of "white sugar" areas for factories save for manufacture of *gur* for bona fide domestic use, rapid rail and road transport, harvest control and mist spraying of cane in transit at 2 gallons per 10 ton wagon.

The Union Food Minister has stated that the Government of India is likely to import 4 lakh tons of sugar in order to prevent any undue rise in sugar prices. It would be in addition to the 3 lakh tons already imported. Mr. Kidwai is satisfied that sugar imports have not only maintained a steady level of prices in Calcutta, Madras and Bombay markets where it was actually released for sale, but they have also prevented a rise in the States, like the U.P. which produce sugar, by not taking away sugar from them to other parts of the country.

The latest mill delivery quotations in the Hapur markets are: *Jaswant* Rs. 30-13, *Simbhauli* Rs. 30-15, *Amroha* Rs. 30-8, *Bijnor* Rs. 30-9, *Dautala* Rs. 31-12, *Mansoorpur* Rs. 31-12, *Rampur* Rs. 33, *Sakoti* Rs. 30-14, and *Sehora* Rs. 30-11 and retail Rs. 33.

Gur markets remained quiet to steady. There was reduced offtake due to small arrivals and only restricted railway loading except on one or two days of the week. Receipts were unexpectedly low and there were fears that the overall production of *gur* might record a shortfall this year. Besides, the weather remained overcast and peasants have suspended *gur* manufacture in preference to preparing for next crop sowings. There was not much encouraging enquiry from the importing areas, particularly from Gujerat. *Gur* stockists in the South are inclined to hoard at current prices, while their counterparts in the North do not favour that. There has been some stock accumulations now in Hapur, Meerut and Muzaffarnagar markets, but this has not been by choice. Railway clearance being restricted, stocks went on piling. The continued fall in other agricultural produce prices and Mr. Kidwai's repeated declarations that his Government would keep sugar prices quite low were the strong incentives not to hoard at the prevailing high prices. Prices in the futures section moved low for some time, but towards the close of the week growing uncertainties about the sugarcane strike in U.P. and a spectacular rise in cotton futures induced heavy speculative activity in *gur* futures also, with the result that prices staged a good recovery. In the ready section *Pansera gur* at Hapur was quoted today at Rs. 15-2, while *Fagan* future was quoted at Rs. 15-6. *Low* during the week had touched Rs. 14-6.

Ankapalli in the south has yet to receive over 60 per cent. of the seasonal *gur* arrivals. There was good enquiry from Gujerat. Biltlicut was quoted at Rs. 16 to Rs. 18-8. Kolhapur quoted Rs. 17-8 to Rs. 25, and had already received nearly 13 lakh lumps and was expected to get another 6 or 7 lakhs. Karnatak and Gujerat met with sustained enquiry. Baramati was getting 3 to 3½ thousand maunds of *gur* daily. There, the trader stockists were hoarding at these prices. Yellow was quoted at Rs. 20 to Rs. 20-4, and red Rs. 17.

KIPS CLEARANCE SLOW

(From Our Own Correspondent)

MADRAS, 15th *February*

Arrivals of kips were as usual and clearance slow. Inferior fifths were in good demand lowly at one to two pence over U.K. levels. Enquiries from the U.K. have been at a penny below Madras prices for selected grades and weights and trading has been restricted and the tone is bearish especially for light weights. Buff heavies were firm but calf skins were neglected. There were some enquiries from U.S. for buff calf and buff lights at low prices which however resulted in business, more for financial reasons.

In the tanned skins section, clearances of stocks in the local market were good and prices ruled unchanged.

The Government of India wish to introduce the *agmark* scheme to control the quality of tanned hides and skins exported from Madras and have asked the trade to give their reactions before the end of the month. The Government want to enforce it at the port of export; the shippers desire to have it at the place of origin viz., tanneries, and the local tanners do not want any control as they are able to find a market for anything produced. At a meeting of the shippers held last week, it was decided to suggest to the Government of India to call a joint meeting of the tanners and shippers with the Government to arrive at a workable scheme.

MANCHESTER LETTER

(*Concluded from page* 301)

It is generally agreed that Egyptian spinners will either be forced to purchase supplies only when they book orders or speculate by securing quantities of cotton ahead without being able to obtain any satisfactory cover. In both directions, they stand to lose, whether by lack of continuity of suitable qualities, or financially when the market moves against them.

It is highly unlikely that merchants under the proposed conditions will build up a reasonable stock of Egyptian type cotton for spot purposes. The Government has been warned that there is no chance that a strategic stock of suitable cotton of such qualities will be available, if the need should arise.—*All Rights Reserved.*

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published half-yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotation. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends:—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus. ‡ Sales and amount written off. (k) Investments. † For ten months ended 31st December 1951.

(j) Made up of an interim dividend of Re. 1-12 per share on 1,20,000 shares and final dividend of Re. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

* The following explanatory notes relate to the abbreviations and marks shown on page 340 in the debentures section:—

(a) Option to repay on six months' notice, on any interest date after 31st December, 1951, at 102 per cent. Also redeemable out of a cumulative sinking fund of 1½ per cent. per annum (commencing in 1938) by drawings at 102 per cent. or by purchase at or 102 per cent.

(c) Option of repayment at any time subject to one month's notice.

(d) Bearer bonds of Rs. 1,000 each with option of redemption in whole or in part at par on 30th June, 1952 or on any subsequent interest date at one month's notice.

e Redeemable on or after 31st July, 1950, at Rs. 102-8 or at par after 31st July, 1955 on six months' notice in each case.

(f) Bearer bonds of Rs. 1,000 each with option of redeeming on 3 months' notice at ½ per cent. premium after 1st March, 1954, but before 1st March, 1957, and 1 per cent. premium on or after 1st March 1957.

(g) Option of redemption on or after 1st July, 1949, at par.

(h) Option of repayment at any time at par at any time on or after 30th June 1947 on six months notice

(b) Bearer bonds of Rs. 1,000 each repayable at par.

(e) Bearer bonds of Rs. 1,000 each repayable on 31st July, 1959.

MARKET GOSSIP

(Concluded from page 291)

during the next two or three years. One might, therefore, hope that India would be willing for a renewal of the Agreement for a limited number of years, if not a full five-year term, as is the case with the present Agreement.

• • • •

Assuming that this will be so, it is more than likely that India and the other participating countries will ask for some important changes in the terms of the Agreement. One of them would be with regard to the calculation of the figure of "standard exports" of the participating countries. The existing figures of standard exports were arrived at on the basis of the maximum exports of tea by each of the producing countries during the three years 1929, 1930 and 1931. It is felt that this basis of calculation is too much out-of-date and unreal. It would be much more preferable for all the countries concerned to calculate their respective figures of standard exports on the basis of the actual exports during the past three or four years, say 1951, 1952 and 1953.

• • • •

The second major question would be with regard to the fixation of permissible extensions or replacements of tea. Under the present Agreement, it is possible for plantations in the signatory countries to carry out extensions up to 5 per cent. of their acreage as at 31st March, 1950, and to undertake replacements upto 10 per cent. of the same acreage. These percentages appear to be adequate, taking into account the fact that they represent about 70,000 acres of new plantings and 140,000 acres of replacements for all the participating countries taken together. It is believed that new plantings and extensions already granted under the current agreement have not be fully utilised and are not likely to be so utilised before 31st March, 1955. On the other hand, it is also thought that both in India and in other producing countries, there has been a large number of cases of violation of the regulations relating to extensions and replacements, the culprits having undertaken these works either without licences or in excess of the limits authorised by the licences. A correct assessment of the actual areas planted in the last five years against the licences already issued by the Licensing Committee and the extent to which unauthorised plantings have been carried out would be of value at this juncture.

BANKING

(Concluded from page 298)

th[illegible] question of increasing by bank credit. It sa[illegible]s that, in India, the effective force in the growth of the money supply is the action of the Reserve Bank of India in creating central bank credit and of the commercial banks in creating commercial credit. Of course, changes in cash balances of the Central Government also serve to increase or decrease the supply of money, but the scope here for any appreciable increase over a long period is limited. So it is to bank credit that the Government should turn for undertaking a considerable part of its investment in development, because bank credit can fill up a considerable portion of the gap between its revenues, and proceeds of loans from the public, on the one hand, and its huge expenditure under the Plan, on the other. Accordingly, the Mission says: "The Government will find it necessary to draw down its cash balances and borrow from the Reserve Bank of India. The financing of the uncovered deficit in this way is called 'deficit financing' in India; and this is the sense in which this term is used in the Report." The poser whether such deficit financing could be resorted to or not is answered by the Mission thus: "If deficit financing is undertaken without any regard to its effect on the money supply and the availability of resources, it will inevitably lead to inflation and hamper the achievement of the Plan. Whether deficit financing is desirable or not depends fundamentally on the amount, the environment in which it is undertaken and the policies that go along with it." In other words, it is ultimately a matter of judgment. For, there is, the Report says, no formula by which one may determine the amount of deficit financing that may properly be undertaken in the near future.

Deficit Financing

Assuming that the present supply of money in India is approximately suited to its needs, a further contraction in the money supply, the Mission observes, is not called for, unless there is a very sharp change in the payments position in India: The carrying out of the Plan will result in the drawing down of sterling balance. The process by which monetary reserves are used involves in the diminution in the money supply equal to the decline in reserves, unless other measures are taken to offset it. As a minimum, the use of cash balances by the Government, and the creation of Reserve Bank credit and commercial bank credit should, therefore, be undertaken equivalent to the further use of sterling reserves. How this use of bank credit could be made use of without creating inflationary conditions in the country has been clearly described by the Mission in its Report. The relevant extracts are given below:

"Clearly, some deficit financing is consistent with a sound credit policy designed to avoid inflation and to facilitate economic development with stability. Clearly, too, excessive deficit financing is not consistent with a sound credit policy and can lead to inflation, even if it is for the purpose of undertaking development. Deficit financing is but one aspect of credit policy, and it is only on the whole range of credit policy that a judgment can be made. The practical problem for the monetary authorities is to determine how much is proper and how much is excessive deficit financing within the framework of a sound credit policy.

"One magnitude of which rough estimates can be made is the aggregate amount of credit creation that may reasonably be undertaken without risking a serious inflation. The money supply at the end of March, 1953, was Rs. 18.5 billion. Disregarding adventitious factors, it is probable that, if the economy develops, as foreseen by the Five-year Plan, an appropriate money supply for India by March, 1956 (the close of the Plan) would be close to Rs. 19.5 billion. If the drawing down of sterling balances in this three-year period should

Who else must sweat and toil and gain but scanty fare."
William Blake

VOL LXXXVIII. No. 2245 BOMBAY, 27 FEBRUARY, 1954 PRICE Rs. 1/8

RAILWAY TRANSPORT NEEDS LARGER EXPANSION THAN ENVISAGED

THE contents of the Railway Budget, presented to Parliament last week by Mr. Lal Bahadur Shastri, Minister for Railways and Transport, provide cause for only negative satisfaction, in that the revenue estimates indicate a measure of stability and the curve of working expenses, which had been steadily rising, has flattened out. There is, however, no cause for positive satisfaction, for the traffic receipts have ceased to be buoyant, as they should be in an expanding economy. Industrial production in India in 1953 had gone up by about 12 per cent., as compared with that in 1952. There had been an equally substantial improvement in agricultural output also. These trends are anticipated to continue in the coming year, too. It is true that there has been a fall in imports of foodgrains and a few other items. But this has been nearly offset by increases in others and the prospects for 1954-55 are that the volume of India's foreign trade will expand. Despite all this, the gross traffic receipts of railways have shown hardly any improvement in the year (1953-54) now drawing to a close; nor are they expected to expand in coming year.

What are the causes for this state of affairs? There seem to be at least two important ones. In the first place, the railways are not in a position to handle all the traffic that is available. This is evident from the fact that the railways are still rationing the facilities and that complaints of inadequate supply of wagons are being heard from almost all industries and trade. Secondly, their existing capacity is not being utilised efficiently, as is borne out by the delays in movement of traffic and the annual reports of auditors. The only gratifying feature is that the Railway Administration is conscious of these shortcomings and is taking steps to meet them.

In order to overcome the first handicap, the Administration has decided to step up the expenditure on development of railway services in the next two years. Thus, in 1954-55, a sum of Rs. 95 crores, an increase of Rs. 17 crores over the revised estimates for the current year, is proposed to be spent on works, machinery and rolling stock. A similar or slightly larger amount will be expended in the following year. Details of how the sum of Rs. 95 crores is going to be expended in 1954-55 are published elsewhere in this issue. It will be seen therefrom that arrangements have been made to get a larger supply of locomotives from abroad, to expedite and expand manufacture of locomotives in the Chittaranjan and Tata Locomotive Works in this country, to increase the indigenous production of wagons, to secure more passenger coaches from abroad, and to speed up the construction of the Integral Coach Factory at Perambur. The other steps that are being taken to enhance the carrying capacity of the railways relate to augmentation of line capacity. Certain sections have, during recent years, become so congested that they are unable to cope with the current and anticipated traffic. The line capacity of these sections can be improved by doubling the lines, building more cross stations, extending loops, improving the standard of signalling and interlocking, and creating additional facilities in marshalling and transhipment yards. Accordingly, a larger sum of Rs. 3.3 crores, as against Rs. 2.1 crores, is proposed to be spent in this direction. It is expected that, when these physical bottlenecks are removed, the existing carrying capacity of railways can be more profitably employed.

The second drawback in our railway system referred to above, namely, poor efficiency of railways, is sought to be tackled through the establishment of an Efficiency Bureau in the Railway Board and the association of railway users' representatives with the Railway Administration in advisory capacities. The Efficiency Bureau will study carefully the operation, workshop, marshalling yard and other statistics with the object of improving progressively efficiency and economy on Indian railways. It will investigate and eliminate outmoded and costly practices and evolve suitable techniques for efficient measurements in diverse fields of railway operation and management. It will particularly enquire into the causes for the delay at various changing and transhipment points and make recommendations for reducing these delays to the minimum. Given freedom of action and proper incentive for drive and initiative, this Bureau can do quite useful service, provided the Administration makes sincere endeavours to implement its suggestions.

There is no clear indication, either in the Minister's speech or in the report on the progress of the Five-year Plan, of the extent to which the railways will be able to carry passengers and goods at the end of the Plan period. From what little information that is given in these documents, it is, however, apparent that its present plans to improve the capacity of railways, even assuming they will be fully implemented, will not help the railways to an extent fully to meet the transport needs of the country. The Administration proposes to spend no more than the originally planned amount of Rs. 400 crores for the rehabilitation and expansion of railways. By the end of the current year, it will have spent more than half this amount, Rs. 208.99 crores to be precise. By the close of next year, this will go up to Rs. 303.99 crores, leaving about Rs. 96 crores to be expended on development in the final year of the Plan. The Planning Commission itself has admitted that, even after all this investment, the railways will not be able to meet the entire transport requirements of the country. The number of overaged locomotives to be replaced will be almost as large as in the beginning of the Plan. The portion of tracks to be renewed will still be quite sizable. There will not have been any notable net increase in route mileage. It is, therefore, a misnomer to [illegible] to carry out the development programme in the Plan considering the needs of the country. [illegible] the first two years, the pace of the implementation of the proposals for rehabilitation and expansion of railways was being retarded by non-availability of materials. Now, the limiting factor is lack of adequate finance. As railway transport is a basic necessity, lack of finance cannot be regarded as a sufficient ground to hold back its expansion. From the point of view of increasing employment opportunities also, development of railways is eminently desirable. If the required funds cannot be found by the railways themselves, then they must be provided by the Government by a rearrangement of priorities in the general Five-year Plan. Efforts must also be made to secure more foreign assistance for this specific purpose. In the present world economic situation showing indications of surplus engineering capacity, the chances of getting such help seem to be more favourable than in the immediate past. This, however, does not mean that the Railway Administration should not endeavour to increase its income through economy in expenditure and efficiency in its operations. There is, doubtless, considerable scope for doing so. Anyone who goes through the audit reports of this greatest State commercial undertaking in India will agree with this view. But the saving that can be made in this direction will not, by itself, be sufficient to meet the development needs of railways. Nor is there much room for raising their traffic receipts by stepping up fares and freights. So far as fares are concerned, the present rates are so high that the law of diminishing returns seems to have come into operation already. There may be some scope for enhancing freights on some goods, but that will not be much. In any case, all possibilities in this direction must be carefully explored, if possible, in consultation with representative bodies of the mercantile community. The latter must readily concede that, when the country is engaged in eradicating the evils of poverty and illiteracy, wherever freight rates are such as to amount to an unwarranted subsidy to producers, the railways would be justified in effecting an increase. There can, therefore, be no objection to the Railway Ministry's decision to re-examine the question of rationalisation of freight rates, especially as it proposes to do this after discussion with such commercial bodies as the Federation of Indian Chambers of Commerce and Industry.

While on this subject, a reference may be made to Mr. Shastri's proposal for finding finance for development. This is best done by quoting the relevant passage:

"There is the need for maintaining and, if possible, accelerating the pace of construction of new lines. The present high levels of cost of material and labour involve unremunerative investment, at least for some time to come. The balances in the Development Fund are rapidly dwindling. How are these new constructions going to be financed? The only way in which such construction seems to be possible is to provide for a recovery of charges on the basis of inflated mileage for a limited period, so that the projects may not be financially burdensome. This device may also profitably be adopted in cases where a shorter route is provided reducing the cost of trans-

portation substantially, the whole of which need not be passed on to the consumer."

The foregoing quotation means that those who directly benefit from the new constructions must pay for it. On the face of it, this principle may appear to be unobjectionable. But, on closer examination, it will be found that it is not so sound as it seems. Most of the new constructions will have to be in the under-developed parts of the country. To expect the people in these areas to bear the cost of this development will not be quite fair. Really speaking, that cost, or at least the major portion thereof, must be borne by the developed areas of the country. Further, the rates on the new sections will have to be very high if the object which the Minister has in mind is to be served. In that case, they may be so high as to render the use of new lines uneconomical. Moreover, when an existing commercial undertaking expands, it does not pass on the cost of such expansion by raising the selling prices of only a few products. It is generally reflected in the prices of all the products made by it, unless market conditions are favourable to follow the former course. The best thing to do would be to spread the cost of new constructions over the entire system to the maximum extent possible.

In his budget speech, Mr. Shastri claims that a substantial improvement has been brought about in travelling conditions on the Indian railways. This claim, we must say, is not totally unjustified, especially when viewed against the chaotic conditions that prevailed in the war years and in the subsequent four or five years. The number of train services has been increased. Accommodation for third class passengers has been enlarged in almost all the ...ns, in addition to running exclusively third ... special trains, popularly known as the ...a Express. Better types of third class com... ...s and, in a few cases, of upper class ... nts also, have been introduced. The ... of trains has improved perceptibly. ... y officials, if not the entire staff, are ... ous to passengers, willing to attend ... nts promptly and receptive to ideas. ...nities to passengers are also a little ... But still a lot remains to be done. The ...ard of comforts and conveniences provided ...y our railways is far below that provided in advanced countries. Overcrowding, especially in the long-distance mail trains—India is a country of long distances—and in the suburban trains, is yet to be eliminated. The percentage of improved types of coaches to the total on the rails is very small. The service that is provided to upper class passengers is not worth the fare that is being collected from them. So long as these deficiences persist, the railways will continue to be the target of criticism. The earlier they are removed, the better. The authorities will do well to realise that one of the best ways of building up public opinion in favour of the Government is to improve the facilities offered by the railways.

PLANNING AND EMPLOYMENT

THERE is no denying the fact that the problem of unemployment continues to be a potential menace to the security of this country. It is common knowledge that this problem assumed such serious proportions in the months which followed the slump in March, 1952, that it compelled a revision of the Five-year Plan. The outcome of this revision was the announcement of an eleven-point programme, emphasising the need, among others, for increasing output and creating more employment opportunities in the country to cope with the increase in the number of job-seekers. Ever since this programme was announced in August last, public interest in the Plan has increased. There is scarcely any public meeting of importance in which a discussion on the Five-year Plan does not take place. The latest instance of this interest is provided by the appraisal of the Plan by Mr. Ambalal Kilachand, the retiring President of the Indian Merchants' Chamber, Bombay, in his address at the forty-sixth annual meeting of that body held in the city on the 24th inst.

Mr. Ambalal assessed the progress of the Plan in terms of employment opportunities provided by it. His study reveals that, in many respects, the position is disappointing. In regard to food production and irrigation schemes, there has, no doubt, been considerable improvement. But, in other directions, there has been no significant progress, chiefly because State Governments have not made available adequate finances for implementing the Plan. In several respects, they have been behind the targets set in the Plan. Some of these Governments have not only indulged in development schemes not provided for in the Plan, but spent on these schemes funds granted from the Centre for development purposes. What is more, in respect of the Plan as a whole, after taking the various available resources into consideration, there will yet remain a gap of Rs. 750 crores between the targeted expenditure and the finance required for its implementation. This will have to be covered "by additional taxation and borrowing, further external assistance, and in the last resort, by still further deficit financing." But the prospects for covering such a gap are, according to Mr. Ambalal, bleak. For the level of taxation and other burdens having remained high, much resources cannot be raised through additional taxation. As regards borrowing, the results of State loans reveal that there is some scope for increasing the amount, especially under the small savings campaign, provided the necessary climate is created and proper techniques are adopted. Even after making allowance for all these, there will be need for resorting to deficit financing which, as Mr. Ambalal rightly observes, "is not without its dangerous spots." In the circumstances, if Mr. Ambalal is asked to choose between the two alternatives, namely, additional burdens in the shape of new taxes and deficit financing, on the one side, and the spreading over of the period of the Plan, on the other, he will have no hesitation at all to express his choice in favour of the latter. In other words, he is for hastening slowly.

Is this a desirable choice? There is an authoritative reply to this question. In its report on *Economic Development with Stability*, submitted to the Government last year, the I.M.F. Mission has made it plain that there is no choice but to implement the Plan. It says: "So far as can be foreseen at this time, the resources available to the Government of India are not adequate for carrying out the Five-year Plan. It would be tragic, if this essential development programme, designed to give momentum to the economy of India, had to be pared down for lack of resources."

It is, however, encouraging to note that Mr. V. T. Krishnamachari, Deputy Chairman, Planning Commission, thinks that no need will arise for the nation to choose between the two alternatives mentioned above. Thus, in his inaugural address at the annual meeting of the I.M.C., he stated: "If prices continue to be steady and production shows a continuous increase, the financing of the Plan need not present insuperable difficulties." This robust optimism of the Deputy Chairman of the Planning Commission is, no doubt, welcome, but, unfortunately, the grounds on which he seems to base his optimism do not carry conviction to us. He is, of course, realistic enough to admit that there are limitations to both new taxation and deficit financing. He, however, relies for additional funds on the mobilisation of small savings by methods adopted in Madras in raising the State loan last year. There may be savings in rural areas. But we are not sure that they can be garnered in the manner in which the Madras Government attempted to do last year. For though this loan was apparently successful, it amounted, in reality, to not mobilisation of rural savings but drawing upon the funds in the organised money market. Perhaps, Mr. Krishnamachari is not aware that most of the subscribers in rural areas soon cashed their investments in the Madras loan, even though it involved some sacrifice on their part. Again, he seems to be optimistic about the prospects of the States raising funds through enhancement of water rates and land assessments and levy of betterment contributions. This optimism, too, is not justified. It is common knowledge that no State Government has so far implemented any of these proposals to any worthwhile extent, as they are afraid of becoming unpopular with the masses in rural areas.

In the circumstances noted above, if the Five-year Plan is to provide an effective answer to the problem of unemployment, such would be possible only by a modification in the Plan. The emphasis should not be on the State doing everything, but on the State helping the people to help themselves. We do not say that the State should curtail its plans for expanding the basic services and resources. That should go on as planned. What we wish to say here is that the Government's economic policies should be so designed as to encourage entrepreneurs to come forward and start new enterprises which will provide greater opportunities for employment. As readers are aware, private industry in India has been appealing to the Government to refrain from placing obstacles in the way of business and enterprise. Factors such as heavy taxes, high and inflexible labour costs, restrictions on managerial discretions, excessive restraints and regulations on business, all foisted without proper consideration of their effects, have all inhibited attempts at opening up new channels of employment. These appeals should be considered sympathetically, with a view to allowing private enterprise to play its role effectively in the task of raising the living standards of the people.

COFFEE GROWERS AND CENTRAL INCOME-TAX

IT is now definitely known that Income-tax Officers in some districts of Madras and Mysore have issued notices to coffee growers, asking them to submit returns of their income for 1953-54—in some cases even for the previous two or three years—and to state why a portion of the income should not be taxed on the ground that it is derived by industrial processing. This attempt on the part of income-tax authorities to levy tax on coffee income has produced consternation among growers who regard the proposal as wrong, unsound and inequitable.

Ever since the Indian Income-tax Act was passed, coffee has enjoyed complete exemption from income-tax, on the ground that the income is purely agricultural. This finds support from a study of what happens to coffee beans before they are put on the market. The coffee bean has two coverings, the pulp and the parchment skin. The grower usually removes the outer cover, the pulp, either by hand or by a simple machine, and then sends the coffee beans with the thin parchment skin to the curing works. Here, the parchment skin is removed and the coffee graded into different sorts. No other operation takes place either at the estate or at the curing works. The bean does not undergo any sort of physical change during the processes above described. The entire process is carried out merely to make the coffee fit for the market, since the ripe bean without removing the husk and skin has no market as such.

Under section 2 of the Indian Income-tax Act, any process ordinarily employed by a cultivator to render a commodity fit for the market cannot be deemed to be an industrial process and as such cannot attract income-tax. In the case of tea, however, there is clearly a manufacturing process involved in the conversion of green tea leaves into black tea, and the final shape has no resemblance whatever to the raw product. In consequence, the Government of India decided, many years ago, by means of rule 24 of the Income-tax Rules, to regard 40 per cent. of the profits of a tea garden as comprising manufacturing profits and liable to income-tax. Surely, there can be no justification to levy an income-tax on coffee on similar grounds. This is apart from the fact that coffee income has, in one or two High Court decisions, been specifically regarded as agricultural income and none other.

It would seem worthwhile to know from what source the proposal to levy income-tax on coffee has emanated. If it is the Board of Revenue, one does not appear to have seen any Press Note or statement or rule in this connection. Is it to be presumed that the notices have been issued by the Income-tax Officers in the different States of their own accord in their anxiety to find new pastures? It is learned that one or two officers have already made their assessments, on the basis of about 30 per cent. of the total income from coffee being liable to assessment. How they arrived at this figure passes one's comprehension.

The implications of this levy are likely to prove to be quite serious. There are likely to be some anomalies, particularly with respect to the liability to agricultural income-tax. In some States, the whole of the income from coffee pays agricultural income-tax, on the score that the income is agricultural. Will a portion of the same income be now held to be liable to Central income-tax as well? Besides, what is going to be the case with other agricultural crops such as paddy? Will the de-husking of paddy and making it into rice attract income-tax on the same grounds as coffee? The position, to say the least, is highly intriguing.

It seems unfortunate that, at a time when coffee growers are bitterly complaining about the Government's interference in their affairs, including the fixation of an arbitrary basic price and the scaling down of profits, they should be told by Government that they would have to pay income-tax as well on a portion of the profits. In our view, the Government should lose no time in considering the grave implications of the Income-tax Department's proposal stated above.

BULLS RUSH TO BOOK THEIR PROFITS

ORIENTAL LIFE—I.C.I.—IMPORTED SUGAR—WORLD WHEAT AGREEMENT

THURSDAY, 5 P.M.

THE city markets which were presenting a steady to firm trend till this morning suddenly got the jitters in the afternoon. Bulls in all the markets rushed to book their profits and get out as early as possible. Unfavourable rumours about the Central Budget, due to be presented to Parliament this week-end, were responsible for this. These rumours claimed that the Finance Minister would freely resort to some excise duties to raise the funds needed for economic development. There was one report which said that there would be an increase in the excise duty on cloth. There was another which mentioned an excise duty on *vanaspati* and cement. Although a few newspaper correspondents had forecast this possibility some two weeks ago, the markets had taken no notice of them. It is inexplicable how they fell a victim to them just this afternoon. It is probable that somebody might have given an authoritative colour to it, just to play upon the frayed nerves of the bulls, many of whom have undoubtedly bitten much more than they can chew.

MARKET GOSSIP

• • • •

Some idea of the extent to which rumourmongers have played havoc in the markets can be had from the fact that, in the share market, Bombay Dyeings dropped 17 points within a few minutes this afternoon, Kohinoors 7 points and Centurys 6 points. Even the steel shares were adversely affected, although there were no bearish reports about them. Thus, Tata Deferreds lost 15 points, Tata Ordinaries Rs. 3 and Indian Irons As. 4, all within twinkling of an eye as it were. Similarly, in cotton, I.C.C. May shrunk from Rs. 682 to Rs. 673. The drop in oilseeds was even more sharp, with groundnuts and castorseeds being the worst sufferers. In bullion, gold lost nearly a rupee and silver more than a rupee. Over the week, the fall in the value of equities, bullion and commodities is quite substantial.

• • •

While we know nothing of what the Finance Minister has in his mind regarding the budget proposals, the rumour that the excise duty on cloth will be increased sounds incredible to us. This may be just wishful thinking on our part, but considering the heavy burden of taxation that has already been imposed on the textile industry and consumers of cloth, we wonder if any fair-minded Finance Minister—Mr. C. D. Deshmukh is certainly a fair-minded person—will choose to add to the burden further. Be that as it may, the technical position of the share market seems to have become rather unhealthy. Much of the buying that has taken place in shares is on account of persons who long to get rich quick. Well-informed brokers tell us that some big parties are behind the recent impressive rise in Indian Irons. That may be so; nevertheless, the fact remains that this scrip is now standing at a level at which the yield is scarcely 3 per cent. per annum and that these operators have bought it in large numbers with the object of booking their profit within a short period. The working of the Company is doubtless smooth and production is running at a high level. All the same, the current market value is higher than its intrinsic merits.

• • •

An indication of the unhealthy position of the equity market is provided by the short but swift shake-out it had today. It is also evident from the fact that a scrip, which remains almost neglected so long as it is in the cash section, becomes quite popular immediately after it is listed in the forward section. This tendency has now become so strong that the mere mention of the possibility of a share being included in the forward section attracts speculative buying. All this shows that the market is being frequented more by people who want to make money without making any immediate outlay than by those who wish to invest their hard-earned savings in shares in the hope of earning a decent steady return.

• • • •

As was anticipated in these columns last week, National Rayon was placed on the dividend list this week, the Directors having decided to recommend a dividend of Rs. 9 per share. It is reported that the Company has received the permission of the Industrial Finance Corporation for doing so. The proposed dividend is, of course, a rupee less than the optimistic expectation of Rs. 10 per share; nevertheless, it is a handsome one. Preliminary reports of the profits of the Company reveal that the dividend has been well earned. It is not, however, fair to comment on the appropriation policy followed by the Board of Directors until the full statement of accounts is available. The reaction of the market to the dividend announcement was not quite favourable, in that the value of the shares declined from Rs. 170-8 to Rs. 162. This is not surprising, for those who had bought earlier must have decided to book their profit. Even at the ruling rate, the yield works out to a little over 5.5 per cent. only, which is not very high for a new share. For big investors, whose incomes are large, the net yield will be still less, because, as the Company is not paying tax owing to the benefit of extra and initial depreciation allowances, one cannot claim refund of tax on its dividend. The impression given in certain sections of the Press yesterday that this is not so is incorrect.

• • •

A subdued optimism about the outlook for the Scindia Steam Navigation Co. Ltd., is discernible in the speech of Mr. Dharamsey M. Khatau, Chairman, delivered at the annual meeting of the Company held on Wednesday. His remarks about the current year's earnings suggest that a slight fall in profit is quite likely. They also reveal that much will depend upon a satisfactory arrangement being arrived at with the other indigenous shipping companies in regard to the coastal trade. But these are only short-term factors. For the long-term, the outlook appears to be promising. The Company has rid itself of the costly undertakings, such as the shipbuilding yard, the overseas passenger trade and the civil aviation subsidiary, on all of which it was losing heavily. The Government is taking keen interest in the progress of mercantile marine and is prepared to render substantial financial assistance on easy terms. The Scindia Company, as the largest unit in Indian shipping, will be the chief beneficiary of this recent development. The Company has decided to carry out a bold plan of expansion of its fleet, involving a capital investment of Rs. 12.30 crores. Two-thirds of this amount will be provided by the Government as a long-term loan at low rates of interest—believed to be 2½ per cent. per annum—while the balance of one-third will be found by the Company from out of its own present and prospective resources. The Chairman has promised to provide the shareholders full details of this ambitious programme later and take their consent before going ahead with its implementation. The whole scheme will be placed before the Parliament [illegible] meeting, which would be called for the purpose, so that there would be opportunity to consider [illegible] This [illegible] doubt [illegible] democratic principles [illegible] system.

• • • •

At a time when conjectures and assertions of an economic recession are in the air both in America and in the U.K., it may sound strange to some in this country to hear that big industrial enterprises in those two countries are planning to make large capital investments in order to improve the efficiency of their plants and to expand their production. But it reflects the confidence of those who are in charge of these enterprises in the future. Evidently, they are looking ahead. As readers will have noted from the despatch of our New York correspondent published in our last issue, General Motors of America have announced that it would spend some $1,000 to $1,500 million for expansion within the next two years. Steel companies in the U.S. have planned an investment of $750 million this year for expansion. The American chemical companies also propose to invest large amounts to improve their efficiency and to reduce their costs through higher production. There are similar moves in the U.K. also. The latest instance of such large-scale investment in that country comes from Imperial Chemical Industries.

• • • •

I.C.I. has just announced the biggest financing operation ever proposed by an industrial company in Britain. It proposes to issue unsecured loan stocks to the tune of £30 million, in order to provide money for the further expansion of the undertaking for some considerable time. The loan stocks will bear interest at the rate of 4½ per cent. per annum and are redeemable in 1972-74. These stocks will be issued at par to the existing preference and ordinary stockholders of the Company. We are told that it has still to spend £60 million on projects already sanctioned and that it is expected to sanction projects costing another £70 million within the next three years. The Company also proposes to capitalise £80 million from its reserves and issue a scrip-for-scrip bonus to ordinary holders and a two-for-five scrip preference stock bonus to the preference stockholders.

• • • •

The proposed £30 million I.C.I. loan is not meant for any particular project, but for the expansion programme as a whole. Some of the projects included in the programme are: extension of production of soda ash, caustic soda and chlorine, and substantial expansion of nylon and Terylene production. It is not known whether the expansion programme will be confined to the Company's factories in the U.K. only or it will include those of its foreign affiliated concerns, including I.C.I. (India) Ltd. However, Dr. Alexander Fleck, Chairman of I.C.I., who was on a tour of India recently, said that the Company proposed to take up the building of a factory for the production of industrial explosives in Bihar at a cost of Rs. 4 crores. There are also reports that Tata Industries Ltd. are seeking the collaboration of I.C.I. for starting a new venture for the manufacture of dyes in India.

• • • •

An impressive rise is noted in the new life assurance business written by the Oriental Government Security Life Assurance Co., Ltd., during the year ended 31st December, 1953. The number of policies issued during the year was 78,292, assuring a sum of Rs. 23,42,17,204, representing an increase of 6,933 policies covering a value of Rs. 2,19,72,627 over the corresponding figures for 1952. The figures for 1953 are, however, subject to a slight adjustment. With this expansion in new business in the past year, the Company has not only more than made good the decline in the business suffered in the preceding year, but has established a record for the post-Partition period. In 1952, it may be recalled, there was a decline in the Company's new business from 73,459 policies for Rs. 22.22 crores (for 1951) to 71,359 policies for Rs. 21.22 crores. In 1946, the Company wrote a record business in its history, issuing 1,08,700 policies for Rs. 28.62 crores. In the Partition year, the business dwindled to 76,297 policies for Rs. 20.03 crores and in the subsequent year to 66,884 policies for Rs. 18.58 crores, the lowest in the last decade. Another interesting feature of the Oriental's new business in 1953 is that the average sum assured per policy, at about Rs. 3,000, is higher than that in the peak year, that is 1946, when it was only a little over Rs. 2,600. The news of the Company's encouraging results for 1953 was greeted today by the share market with a rise of Rs. 40 to Rs. 7,125 in its share value.

• • • •

Apropos the reference in these columns last week to the Oriental's move to convert itself into a mutual company, we understand that the delay is due to the Government sitting tight over the Directors' scheme. The latest reports are that the Government has decided to give its consent and that the Company will soon be informed of it. The rate of compensation is believed to have been fixed at about Rs. 8,800, which is approximately Rs. 200 less than the figure suggested by the Directors.

• • • •

The Government of India has decided to change the system of distributing the imported sugar to the trade in Bombay. Under the present system, imported sugar is distributed on the basis of tenders at a fixed price of Rs. 29-8 per maund. Tenders are accepted from all and sundry before each shipload reaches this city and quotas are allotted *pro rata*. This has given rise to an evil. As there is a good margin of profit on the sale of this sugar to the retailer, there has been a great rush for getting as large a quota as possible. The established sugar trade complained that they were losing their business to outsiders and that they had to buy the sugar from them by paying a premium for the quota. The Government too, has been finding it difficult to handle a large mass of applications. [illegible] Government has decided to import [illegible] tons of sugar in the next year and the [illegible] for securing quotas of imported sugar is increasing, these difficulties will become great and cause considerable inconvenience to both the Government and the trade. It is not, therefore, surprising that the authorities have decided to scrap this system in favour of the one obtaining in Calcutta.

• • • •

In order to bring about this change, Mr. P. Gopalakrishnan, I.C.S., Joint Secretary of the Department of Food and Agriculture, was appointment yesterday. He, along with the Regional Controller of Food, Bombay, talked to the sugar trade always and has secured their consent for funds candistribution of imported sugar and the price. Under this scheme, a syndicate of the Government by blished *bona fide* wholesale traders will to which all the foreign sugar in the general Bombay will be sold by the Government made to fixed price, believed to be Rs. 28-12 per specific The share of each member of the syndicate situadetermined on the basis of a formula related to turnover in a basic period yet to be determined by the Government. The members of the syndicate will sell this sugar wholesale at Rs. 30 per maund, subject to local taxes, for retail distribution. It is stated that, on this basis, the imported sugar will be available to consumers in Bombay City at about As. 12-9 per seer of 2 lbs.; it may, however, cost a little more in the interior. The members of the syndicate will have to give an assurance to the Government that they will not allow any increase in prices to take place, whenever there is some delay in the arrival of shipments. They must also get suitable guarantee from the retail dealers that they will not sell sugar to consumers at prices higher than those fixed by the syndicate. The implementation of the scheme will be under the supervision of the Regional Director of Food, Bombay. This scheme is now awaiting the sanction of the Central Government.

• • • • • •

As the aforesaid scheme offers an assured handsome margin of profit, it is quite a lucrative proposition to the sugar merchants. It was first feared that the whole scheme will be entrusted to the care of the Bombay Sugar Merchants' Association Ltd. The control of this Association is in the hands of only a few merchants who belong to the "A" class. The other sugar dealers in Bombay are either "B" class members of this Association or non-members. The latter feared that, in case the Government were to favour this Association with the privilege of distributing the entire sugar imports into Bombay, they might not get their due share. This led to dissensions among the members of the Association, and the "B" class members and non-members formed themselves into a new association overnight and claimed a share in the right for distributing the imported sugar. It must, however, be said to the credit of Mr. Gopalakrishnan and the Regional Director of Food, Bombay, that they understood the real cause of this dissension and prevented it from spreading further by deciding that the right of distribution will be given to all *bona fide* sugar dealers on the basis of their turnover in a particular period.

• • • •

So far as consumers are concerned, the new scheme seems to have no particular advantage over the existing one. If anything, it may mean an increase in the cost of their sugar, for the dealer who buys from the syndicate will have to pay the Bombay State purchase tax, amounting to about a rupee per maund which he has not to pay now, as he gets it direct from the Government. The Centre, however, will continue to make its usual profit, both by way of import duty and the difference between the landed cost and the selling price to dealers. It is estimated that, on an import of 500,000 tons of sugar, the Government will make in all a gain of about Rs. 18 crores, Rs. 10 crores by way of import duty and Rs. 8 crores by way of profit on the deal. On the domestic sugar of about 12 lakh tons—the estimated production in the 1953-54 season—the Central and State Governments will raise by way of excise, cane cess and sales tax about Rs. 13 crores. Thus, consumers of sugar will pay approximately Rs. 31 crores by way of taxes which work out to

(*Continued on page* 391)

EQUITIES REACT AT CLOSE

HEAVY SELLING IN TEXTILES

(From Our Own Correspondents)

BOMBAY, *25th February*

THE Stock Exchange was in the grip of pre-Budget uncertainties during the week under review. Trading during the major part of the week was characterised by a general desire to lighten existing commitments rather than enter into fresh ones. Though the Railway Budget was well received, the Railway Minister's indication about the possibility of a rise in freight rates induced caution among operators. However, sentiment was more or less intact, having been favourably influenced by revival of speculative support to Indian Irons and persistent demand for a few select counters in the miscellaneous group of industrials. However, on the closing day, that is today, rumours regarding the possibility of an additional levy of excise duty on cloth coupled with expectations of heavy *budla* charges in the next settlement, brought about a wave of liquidation in the textile group and values tumbled. This affected adversely the sentiment in other sections of the list.

In the steel section, Tata Deferreds opened the week on a bright note with a jump from Rs. 2,153-12 to Rs. 2,162-8, but soon succumbed to pressure which brought them down to Rs. 2,130 on Monday. After recovering temporarily to Rs. 2,158-12 yesterday, due to the strength of Indian Irons, they drifted again lower to Rs. 2,142-8 at the close today, on selling attributed to the weakness of textile shares and expectations of heavy *budla* rates. Tata Ordinaries came down from Rs. 366 to Rs. 360-8 on Tuesday. After a mild spurt to Rs. 364 yesterday, they finished today at Rs. 361-8. The Company's transfer books will be closed from 15th to 29th March, 1954 for the purpose of conversion of deferred shares into ordinaries and issue of bonus ordinary shares. In early dealings, Indian Irons were marked up from Rs. 29-2½ to Rs. 29-12½, but subsequently there was a recession to Rs. 29-3. Yesterday, however, there was a spirited rise to Rs. 30-6 on consistent Calcutta support. Today, they shaded off to Rs. 30-2 at the close.

The textile section was depressed owing to a wave of heavy selling pressure induced by budget rumours, as stated at the outset. Leading counters disclosed losses over the week, while some of the other counters managed to score small gains. After an initial rise from Rs. 437-8 to Rs. 440, Bombay Dyeings came down to Rs. 431-14, but a temporary spurt lifted them up to Rs. 436-4 yesterday. This rise was short-lived and today the shares crumbled to Rs. 418-12, before closing at Rs. 420. Kohinoors closed with a loss of Rs. 7 at Rs. 315. Century was lower by Rs. 4 at Rs. 314-8, Finlays by Rs. 6 at Rs. 272, Gokaks by Rs. 3 at Rs. 270, and Simplex by Rs. 5 at Rs. 155. A drop of Rs. 5 was noted in Standards at Rs. 325 and Rs. 4-8 in Svadeshis at Rs. 290-8. Bradburys had a loss of Rs. 30 at Rs. 890. Central Indias were, however, unchanged at Rs. 184-8, while Khataus disclosed a gain of Rs. 5 at Rs. 217-8, Minervas Re. 1-4 at Rs. 110-10 and Morarjis Rs. 2-8 at Rs. 205. Srinivas spurted by Rs. 37-8 to Rs. 220, following the promotion of the shares to the forward list.

Bank shares were steady with moderate rises in values. Barodas put on Re. 1-8 to Rs. 109, Centrals As. 12 to Rs. 58-12, and their New shares As. 4 to Rs. 61-4. Imperial Fully Paids gained Rs. 10 and Contributories Rs. 6-4 to Rs. 438-12. Indias were maintained at Rs. 153, while United Commercials advanced by Re. 1-12 to Rs. 42-8.

In the insurance section, the highlight was provided by New Indias which, on expectations of higher dividend, rose by Rs. 5-12 to Rs. 48. Orientals appreciated by Rs. 40 to Rs. 7,125. British India Generals dropped As. 5½ to Rs. 13.

A few bright spots were noted in an otherwise featureless trading in the miscellaneous section. A.C.C. stood Re. 1-8 lower at Rs. 133 and Belapurs Rs. 2-12 down at Rs. 258-8. Bombay Burmahs (Old) were, however, better, but by no more than Re. 1-14 at Rs. 397-8. B.I.Cs, after being marked up to Rs. 10, closed a shade lower at Rs. 9-9. Disappointment over dividend declared at Rs. 9 per share, as against the market's expectation of Rs. 10, caused a decline of Rs. 3-8 to Rs. 162 in National Rayons. Scindias were well favoured during most part of the week and this lifted them from Rs. 17-15 to Rs. 18-13. But the Chairman's remarks about the not very bright outlook for the current year at the annual general meeting yesterday pushed them back to Rs. 18-3½. Tata Chemicals were supported up to Rs. 14-14, but they drifted today to Rs. 13-15. Tata Oils were marked down by As. 8 at Rs. 40. Shivrajpurs lost Rs. 2-12 to Rs. 73-4 and Premier Constructions Re. 1-4 to Rs. 124-4.

* * * *

Calcutta Stock Exchange

CALCUTTA, *24th February*

Strong bullish fervour dominated the Calcutta Stock Exchange during the week under review. It was generated by several inspiring factors, such as absence of any fresh taxation in the West Bengal budget despite heavy deficit, larger dose of deficit financing in coming years, prospects of better financial assistance to industries and the generally encouraging trend in production. There were, besides, renewed hopes of an early increase in retention prices of steel produced by the Indian Iron and Steel Co., Ltd. Encouraging advices from jute goods and bullion markets also helped to brighten the sentiment of the market. Absence of jitters in the Railway budget induced operators generally to take an optimistic view of the forthcoming Central Budget. Under the stimulus of these factors, equity values forged ahead, with gains spreading to almost all counters.

Buoyant conditions were in marked evidence in the jute section. Following good overseas business in jute goods, the British Government's decision to decontrol jute and the reported removal of restrictions on import trade in jute goods by the Government of Australia, operators evinced keen interest in jute shares. Gourepores assumed the leadership with their quotation advancing by 30 points to Rs. 320. Kamarhattys rallied Rs. 26 to Rs. 202. Belvederes and Deltas firmed up by Rs. 11 each to Rs. 221 and Rs. 256, respectively. Champadanys picked up Rs. 9 to Rs. 154, Lansdownes Rs. 8 to Rs. 143 and Indias Rs. 7 to Rs. 138.

Coal shares evoked good buying enquiries on prospects of strike notice being withdrawn, following the appointment of a tribunal to adjudicate the colliery labour dispute. Equitables moved up by Rs. 2-12 to Rs. 31-4. Central Indias and New Manbhooms hardened by As. 11 each to Rs. 6-14 and Rs. 11-11 (yesterday), respectively. South Karanpuras gathered As. 7 to Rs. 10-5 and Burrakurs As. 4 to Rs. 9-2. East Indias steadied up from Rs. 25-10 to Rs. 25-12.

Among engineering shares, Indian Standard Wagons provided the bright spot with a rise of Rs. 5-4 to Rs. 69. The highly speculative counter, Indian Irons, strengthened by Re. 1-8 to Rs. 30-8. Textile Machineries improved by As. 14 to Rs. 10-15, Bhartia Electric Steels by As. 12 to Rs. 14-1, Jessop and Cos. by As. 11 to Rs. 27-2 and Marshalls by As. 9 to Rs. 7-3. Indian Galvanisings were As. 3 higher at Rs. 16-10.

Handsome improvement in values was also recorded in the miscellaneous section primarily on yield considerations. Indian Aluminiums were specially favoured and firmed up by Rs. 20-8 to Rs. 129. Rallis Indias appreciated by Rs. 4 to Rs. 60 and Midnapore *Zamindaris* by Rs. 2-4 to Rs. 38. India Steamships were up at Rs. 9-4, as against Rs. 8-9. F. & C. Oslers were taken Re. 1-1 higher at Rs. 12-4. Rohtas and Assam Saws shaped well with a rise of As. 8 each to Rs. 12-6 and Rs. 7-15, respectively. Indian Cables hardened by As. 8 to Rs. 21-2. Sone Valley Cements gained a like amount to Rs. 7-10.

* * * *

Madras Stock Exchange

MADRAS, *23rd February*

The Madras Stock Exchange ruled generally steady this week. Although operators did not expect any prospective surprises in the Central budget proposals to be announced on Saturday next, they generally preferred to remain cautious. But in the few transactions which were put through, prices tended to look up on buying support. Textiles particularly persisted to rule steady on continued encouraging export and domestic demand for cloth. Teas came in for some selective support, on demand for better grade tea leaves from the U.K. and the Continent. Rubber and miscellaneous scrips also fared better in sympathy with the improvement noted in other sections.

In the textile section P. Andavar 'A' shot up from Rs. 68 to Rs. 72-8 and 'B' from Rs. 93 to Rs. 110. Radhakrishnas and Rajalakshmis gained Rs. 3 each to Rs. 169 and Rs. 100, respectively. Vasantas were done higher at Rs. 188, as against Rs. 185. Janardanas rallied Rs. 2-4 to Rs. 72-4 and Balasubramanias 'B' Rs. 2 to Rs. 72. Metturs changed hands at Rs. 232, as against Rs. 230. Coimbatore Cottons were done at Rs. 210 *cum-div.*, as against Rs. 190 *ex-div.* The Directors have declared a dividend of 20 per cent. for the year ended 31st December, 1953, as against 9 per cent. in the previous year. Premiers, however, lost Re. 1 to Rs. 93.

As stated at the outset, some favourite tea scrips came in for special enquiry. Nilgiri Tea improved by As. 3 to Rs. 13-14 and Twyfords by As. 2 to Rs. 15-8. Talyars and Udayagiris gained an anna each to Rs. 9-11 and Rs. 9-3, respectively.

Among rubbers, Nelmenys advanced from Rs. 10-6 to Rs. 10-8 and Rajagiris from Rs. 10-14 to Rs. 11. Anandams gathered As. 3 to Rs. 8-13. Malankaras and Travancore Rubbers however, lost Rs. 2 each to Rs. 96-14 and Rs. 15-4, respectively. Thirumbadis were lower by an anna and a half at Rs. 3-7½ and Ouchterlonys by an anna at Rs. 4-6.

Coffee scrips were mostly steady. Coffee Lands and Consolidated Coffees were down by an anna each at Rs. 8-12 and Rs. 15-15, respectively. Nilgiri Neerugundis were also higher by a similar amount at Rs. 3-13. Puthutotams were fractionally better at Rs. 3-4½. Periakaramalais (tea and coffee) were done at Rs. 8 *cum-div.* The Directors have declared an *interim* dividend of 15 per cent. for the year 1953-54. The aggregate dividend for 1952-53 was 40 per cent.

(*Concluded from next column*)

those in Government and trustee securities amount to Rs. 2.91 crores, the market value of which is Rs. 2.82 crores, and those in equities Rs. 1.81 lakhs, the market value of the same being Rs. 2.08 lakhs. The difference between market value and the cost of the investments is fully covered by provision for depreciation amounting to Rs. 9.64 lakhs. Cash balances have shrunk by over Rs. 66 lakhs to Rs. 87.14 lakhs which provides a coverage of 9.8 per cent. to deposits, as against 17.5 per cent. at the end of 1952. The low ratio of cash and the high percentage of advances to deposits clearly show that the Bank has been employing its resources to the maximum extent possible.

MYSORE BANK'S PROFIT BETTER

RESOURCES WELL EMPLOYED

THE year ended 31st December, 1953, was an important landmark in the history of the Bank of Mysore Ltd. (General Manager: Mr. B. V. Narayana Reddy, Bangalore), for the privileged position which it had been enjoying all these years as bankers to the State Government was taken over by the Reserve Bank of India on 1st January, 1953. With this change, the management of the funds and public debt of the State was handed over to the Reserve Bank. However, an arrangement between the Reserve Bank and the Mysore Bank was agreed upon under which the latter was appointed agent of the Reserve Bank and as such continued to handle Government funds. Referring to this arrangement in his address to the shareholders at the last annual general meeting, the Chairman of the Bank assured them that it would be beneficial. The audited accounts of the Bank for the past year reveal no effect of this change on its financial results.

The profit of the Bank for the year under review amounts to Rs. 17.91 lakhs, representing a small, but welcome, increase from that of Rs. 17.30 lakhs for the previous year. No provision for depreciation on investments has been found necessary; it may be noted here that in the previous year, a sum of Rs. 2.81 lakhs had to be set apart for this purpose. The saving on this account has enabled the Directors to maintain the dividend comfortably at 16 per cent. per annum, including a bonus of 4 per cent., which they have consistently been paying from 1947 onwards. Last year, a sum of Rs. 1 lakh had to be drawn from the dividend equalisation fund in order to supplement the profit available for distribution before the dividend could be maintained. No addition to the reserves has, however, been made. But the undistributed surplus left to be carried over is higher at Rs. 2.27 lakhs, as against Rs. 0.86 lakh brought in.

The salient features of the Bank's profit and loss account for the past four years and balance-sheet at the close of these years are compared in the following table:

(In lakhs of rupees)

	For the year ended 31st December			
	1953	1952	1951	1950
Interest and discount	47.35	43.18	43.42	32.06
Commission and exchange	5.69	5.79	6.48	5.49
Gross income	53.24	49.18	50.09	37.79
Interest paid	19.47	19.13	19.49	8.80
Expenses	15.10	18.04	17.15	14.80
Depreciation on and repairs to property	0.76	0.71	0.59	0.53
Profit	17.91	17.30*	21.85*	14.16
Appropriations for—Taxation	6.00	6.00	5.10	4.50
Depreciation on investments	..	2.81	5.41	..
Reserves	..	..	1.50	1.00
Bonus to staff	2.50	2.25	2.20	1.78
Dividend†	8.00‡ (16%)	8.00‡ (16%)	8.00 (16%)	8.00 (16%)
Carry forward	2.27	0.86	1.59	1.06

	As on 31st December			
	1953	1952	1951	1950
Capital	50.00	50.00	50.00	50.00
Reserve fund	94.00	92.00	85.00	83.50
Deposits	8,88.90	8,77.93	9,92.08	9,31.78
Advances (including bills purchased and discounted)	6,67.78	6,03.20	7,22.61	6,21.84
Investments	2,02.51	2,00.34	2,85.15	3,04.06
Cash	87.14	1,53.86	1,44.81	1,59 18
Balance-sheet total	11,58.26	11,84.23	12,19.57	11,40.97
Ratio to deposits of—Advances	% 77.4	% 68.8	% 72.8	% 66.6
Investments	22.9	22.8	23.7	32.6
Cash	9.8	17.5	14.6	17.1

* Before providing for depreciation on investments.
† Includes a bonus of 4 per cent. per annum.
‡ Includes Rs. 1 lakh drawn from dividend equalisation fund.

The gross income of the Bank for 1953 at Rs. 53.24 lakhs is the highest in its history and represents an increase of Rs. 4.06 lakhs over that for 1952 and of Rs. 3.15 lakhs over the previous highest for 1951. This increase in gross income mainly reflects the rise of Rs. 4.17 lakhs in interest and discount earned. Commission and exchange earned are only a shade lower. The increase in earnings has been largely offset by the rise of Rs. 2.34 lakhs in interest paid and of Rs. 1.06 lakhs in expenses. The rise in interest paid is accounted for by the expansion in fixed, thrift and savings bank deposits. Though the profit is only Rs. 0.61 lakh better than that for 1952, it is pleasing to find that it constitutes the second highest in the history of the Bank.

An increase of about Rs. 11 lakhs is noted in deposits, but this is not shared by all classes of deposits. For, while fixed deposits have gone up by about Rs. 81 lakhs to Rs. 3.40 crores and thrift and savings bank deposits by Rs. 14 lakhs to Rs. 1.81 crores, current accounts, contingency accounts, etc., have gone down by nearly Rs. 84 lakhs to Rs. 3.68 crores. Of the rise of Rs. 83 lakhs in advances, loans, cash credits and overdrafts account for Rs. 77 lakhs (to Rs. 6.02 crores) and bills purchased and discounted for Rs. 8 lakhs (to Rs. 86 lakhs). As the rise in advances is larger than that in deposits, the advance ratio has gone up to as high as 77.4 per cent. Investments (at or below cost) are lower by only Rs. 7 lakhs. Of these investments,

NEWS IN BRIEF

AN experimental unit for the more efficient extraction of starch from tapioca has been developed by the National Chemical Laboratory of India, Poona.

During the first three years of the Five-year Plan, the total Central assistance to State Governments in the form of loans and grants has amounted to Rs. 289 crores.

The Government of Madras has filed an appeal in the Madras High Court against the order of Mr. Justice Balakrishna Aiyar, directing the winding-up of the Madras Electric Tramway Co., Ltd.

The Bombay Sales Tax (Amendment) Bill, 1953 has received the assent of the President. The date from which the amended Act will come into force and the procedure regarding registration, etc., will be announced shortly.

The report of the Ford Foundation team of international experts on small-scale and cottage industries in India will be ready early next month. The team may also make an interim report on the development of certain industries.

The West Bengal Assembly has passed the West Bengal Estates Acquisition Amendment Bill giving the Government powers to check *mala fide* transfers of land by landlords seeking to evade the provisions of the *Zamindari* Abolition Act.

The all-India second estimate of rice for 1953-54 puts the current year's area at 71,198,000 acres, as against the corresponding adjusted estimate of 69,591,000 acres for 1952-53, thereby showing an increase of 1,607,000 acres or 2.3 per cent. in area.

The sales tax relief given to non-resident dealers in Mysore in respect of inter-State transactions has been extended from 1st April, 1953 to 1st January, 1954. This will not, however, apply to those non-resident dealers who have already collected sales tax from their customers or charged sales tax in the accounts of customers.

The President of India has given his assent to the West Bengal Estates Acquisition Bill, 1953, popularly known as the *Zamindari* Abolition Bill. The Bill has now become an Act and the Government of West Bengal is now free to proceed with the abolition of *zamindari* without let or hindrance. Thus, the last legislative barrier to bring to an end the Permanent Settlement of Lord Cornwallis has been removed.

The date for the proposed tripartite conference in U.P. to evolve a formula for a share to the canegrowers in excess sugar profits, has not yet been fixed. Disclosing this in the State Assembly last week, the State Minister for Industries said that the Government wanted the Conference to be held in a "peaceful atmosphere." The Deputy Minister for Industries added that the principle of profit-sharing would apply not only to excess profits in the current season, but also in the future.

The Government of India has abolished the import duty on raw pearls (other than cultured) with effect from 23rd February, 1954, following the representations made to the Government that, with the levy of duty of 20 per cent. *ad valorem* last year, the artisans skilled in the special processes of drilling, bleaching and polishing raw pearls are suffering for lack of adequate raw material and are also facing difficulties in the export markets. Being in the nature of a cottage industry, processing in bond or export under claim for drawback is not easy.

A process for the extraction of starch from the stems of the banana plant has been worked out at the Central Food Technological Institute, Mysore. The annual Indian requirement of starch is in the vicinity of 2 lakh tons. The quantity has never so far been manufactured inside the country. During the last few years, the production of starch has considerably gone down due to the non-availability of maize, which was used as raw material for its extraction. It is estimated that about ten thousand tons of starch are being manufactured in the country at present. Investigations to find out a suitable substitute for maize revealed the possibility of the use of banana stems.

Tenders received from all over the world for the supply of plant and machinery for the Integral Coach Factory at Perambur are now being examined by the Central Government. Meanwhile, construction work is under progress at the site of the Factory and the erection of the assembly shop is expected to be started shortly. The erection programme is scheduled to be completed by the end of this year. Proposals for the construction of three additional shops have also been finalised, it is stated. A batch of technicians has already left for Switzerland to receive advanced training in the construction of railway coaches. A school for training trade apprentices is likely to be opened in March this year. The course of instruction is expected to last 18 months.

The Rajasthan Labour Advisory Board, which met recently at Lakheri, has, among other things, decided that a three-man committee, consisting of a representative each from labour and employers and an independent person as chairman, be constituted for standardisation of wages in the cement, cotton and metal industries. The Board has also recommended that survey should be conducted in the wool cleaning and pressing industry, cotton ginning and pressing industry and printing presses for finding out whether there was any scope for fixing minimum wages. The Board has further suggested that the Rajasthan Government should approach the Union Government for acquiring the services of I.L.O. experts for introducing certain schemes for training among the various industries.

Six scholarships, types 'A', 'B' and 'C', intended for industrial training of Indian nationals in the U.K., have been offered by the Federation of British Industries. Applicants must be graduates from an approved university or technical college and undertake to follow their profession after the training. Applicants for types 'A' and 'B' should not be more than 30 years old and should have at least one year's practical industrial experience since graduation. Applicants for type 'C' should not be more than 35 years old and should have at least three years' practical experience since graduation. The application forms and further necessary particulars can be had from the Ministry of Education (Scholarships and Information Division). The last date for the receipt of applications is 31st March, 1954.

A Bill to impose on the Barsi Light Railway Company an obligation to make certain payments to the Central Government following its purchase by the latter on 1st January, 1954, has been introduced in the House of the People. The Bill seeks to replace an Ordinance promulgated on 31st December, 1953. The statement of objects and reasons of the Bill says that, on the purchase of the undertaking of the Barsi Light Railway Company, the staff of the Company was also taken over by the Government of India. In order to secure continuity of service of such staff, it is necessary that the Company should pay to the Government suitable sums to cover the liability of the Company in regard to gratuity, special contribution to the provident fund, and leave salary of the staff in respect of the period of service of such staff under the Company. It was to remove any legal incompetency on the part of the Company to make such payments that the said Ordinance was promulgated.

From Abroad

Britain proposes to spend £163.9 million on defence in 1954-55 which is just over £3 million more than was planned for the current year.

A Japanese shipbuilding company has signed a provisional contract with Soviet Russia to build seven small ships worth about 1,000 million yen (about £1 million).

A £8 million pulp and paper mill has been opened near Auckland in New Zealand. The mill will produce 45,000 tons of pulp and 25,000 tons of paper annually.

The final step in the "dismantling" of the war-time food rationing system in the U.K. will be taken during the first half of July this year, when rationing of meat and bacon will end.

Fourteen employees of Bernecchia Brothers, Inc., a New York bus line, are now owners of the concern. Fifty-one per cent. of the controlling interest of the firm were sold last week to the employees who already held the balance of the stock.

The Ford Motor Company of America is engaged in atomic research to develop metals and other materials that might be used in manufacturing automobiles. According to Mr. Andrew A. Kucher, Director of the Company's laboratory, engineers are trying to develop metals that will withstand the extreme heat produced by atomic energy.

The U.S. Patent Office has granted to a Californian inventor a patent for a sound-producing device designed to increase the output of oil in wells. The device delivers high-powered sound waves into the well and generates heat in the rock. The heat creates gas pressure and causes more oil to flow from the oil-bearing formation.

The U.K. export prices of re-rolled steel products have been reduced so as to bring them in line with the prices ruling in the domestic market. The basic untested price for angles has been cut from £35 per long ton f.o.b. to £31-14½ and for flats and rounds from £35 per long ton f.o.b. to £32-4½.

The French Ministerial Council has fixed a new general price ceiling, under which it will be illegal to raise prices above the level existing on 8th February last. The measure is designed to prevent any rise in prices which might originate from the increase made in the first week of February in the wages of the lowest paid workers and thus offset the concessions made to these workers.

Egypt has signed a £4.1 million-barter agreement with Russia and Rumania for the exchange of cotton for petroleum. Russia and Rumania will supply Egypt with 350,000 tons of petroleum products at prices 16 per cent. below those in the world market. They will use the proceeds to buy Egyptian cotton in the free market. The first consignment of petroleum is due at Alexandria on the 28th inst.

More than 400 classes of goods will be permitted to be freely imported into Australia from 1st April this year, under the relaxation of import restrictions. Under the new relaxation importers from British and other sterling areas will be able to bring in any quantity of unassembled motor cars, carpets, linoleums, yarns, canned fish and numerous other goods, provided they can be got there within a year from 1st April, 1954.

Sweden proposes to import coffee from Colombia to a value of $6 million, at least $3 million of which in direct purchases and the remainder via Britain against payment in sterling. An agreement to this effect was concluded in Bogota on 8th February and will remain valid until 27th January, 1955. Colombia on its part is to permit imports of certain Swedish goods—primarily radio sets, glass, pottery and automobiles—which are subject to conditional import restrictions in Colombia.

Hungary has planned to exhibit goods in 15 big world cities this year. This is a considerable increase on last year when Hungarian goods were on show at nine exhibitions. The first exhibition this year was opened in Cairo on 29th January. Others will be in Casablanca, Milan, Frankfurt, Sao Paulo, Montevideo, Leipzig, Helsinki, Vienna, Stockholm, Toronto, Teheran, Djakarta, and in Pakistan. Syria has asked for an exhibition in Damascus.

PERSONAL

MR. Louis St. Laurent, Prime Minister of Canada, has arrived in India.

Mr. R. J. Rebello, B.A. (Cantab), I.A.S., has been appointed Vice-Chairman of the Bombay State Road Transport Corporation.

Mr. K. Shamsuddin Khan, former Director of Sericulture, Mysore, and a member of the Central Silk Board, has been appointed Vice-President of the Central Silk Board.

Nawab Ali Yavar Jung Bahadur, erstwhile Ambassador of India in Argentina and Ambassador-designate to Egypt, has arrived in India from Buenos Aires for consultations with the External Affairs Ministry prior to his taking up office in Cairo.

Mr. I. C. Alspach, Manager of the Industrial Products Department of the Goodyear Tyre and Rubber Export Co., U.S.A., has arrived in India to render technical advice in connection with Goodyear's expansion programme for industrial products in India.

Mr. S. S. Iyengar, General Technical Manager of the Hindustan Machine Tools Factory, Bangalore, has returned from a six-week stay abroad, where he recruited 85 European technicians for the Factory. He also obtained the services of 15 Indian technicians who are now under training in Europe.

Mr. J. D. Choksi, Director, Tata Industries Ltd., and Mr. S. T. Modgaokar, Director, Tata Locomotive and Engineering Co., Ltd., have left for Geneva en route to Stuttgart (Germany) to examine the possibility of manufacturing motor buses and trucks in India in co-operation with a German automobile firm.

Messrs. A. [illegible], B. J. Christie, A. E. Cooke, M. Heeramaneck, Dharamsi and P. K. Sahgal have been elected members of the Committee of the Upper India Chamber of Commerce for the year 1954. The election of Mr. Herbert Hill as President of the Chamber for the current year has already been announced in these columns.

Dr. Punjabrao S. Deshmukh, Union Minister for Agriculture, left for Colombo early this week to attend the Technical Meeting on Co-operatives in Asia and the Far East, jointly sponsored by the F.A.O. and the I.L.O., which began on the 23rd inst., at Kandy. Dr. Deshmukh is the leader of the Indian delegation to the meeting. The other members of the Indian delegation are: Mr. Deep Narain Sinha, Minister for Co-operation, Bihar, and Mr. M. S. Menon, Assistant Economic and Statistical Adviser, Union Ministry of Food and Agriculture.

"COMMERCE" 1929

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *23rd February*

The Railway Budget

In the railway estimates presented by the Railway Member, the Hon'ble Sir George Rainy, in the Legislative Assembly on Tuesday, an important feature is the considerable increase of traffic receipts expected in 1928-29 over the high-water mark of last year, in spite of the failure of the monsoon rains in parts of the United Provinces and the Punjab and the strikes at Tatanagar and Bombay. The goods traffic is anticipated to bring nearly Rs. 2 crores more, in spite of the reductions made in the freight rates on certain commodities. The passenger earnings are practically the same notwithstanding the considerable reductions in the third-class passengers' fare on seven important lines, given effect to during the year. The total traffic receipts from the commercial lines are over Rs. 104 crores, an increase of Rs. 1¼ crore over last year's figure. All the principal commodities share in the increased traffic, except coal and coke. Except in the single case of kerosene oil, there has been generally a marked increase in traffic in commodities on which reductions were effected during the year. The opening of new lines and the larger traffic carried by the railways have increased the working expenses, generally, and as a result the total administration and operation costs combined is about a crore higher. To the extent of Rs. 35 lakhs this is due to the exceptional non-recurring expenditure on gratuities to workmen at Negapatam on the South Indian Railway and at Parel on the B.B. and C.I. Railway not transferred when the workshops were transferred to Trichinopoly and Dohad.

THREAT TO TOBACCO INDUSTRY

PUBLICITY given to supposed harms arising from the use of certain articles of daily consumption sometimes does more harm to the economy than the harm itself rightly or wrongly attributed to the article. India has had a bitter taste of such publicity twice in recent years. Once it was when news gained currency that wrist-watch straps made of plastic tied round the wrist continuously would result in damaging the skin. The news created such consternation among the public that plastic straps were flung off the streets and their sales suddenly dropped. The currency given to this belief played such havoc that the trade in plastic straps has not so far recovered from the impact of that blow. Another instance, which must be still green in the minds of the public, was the bitter experience of the *vanaspati* industry. This industry was, for some years past, in the throes of total extinction on account of prejudice which gave currency to the view that the eyesight of the third generation of a family consuming *vanaspati* would be adversely affected. The matter went so far as to encourage some to seek a statutory ban on the manufacture of the vegetable oil in which the country had invested several crores of rupees. It took quite a good few years for the industry as well as the Government to fight their way towards the total elimination of the ill-founded belief and not without expending enormous money, time and energy. Now it looks as though it is the turn of the tobacco industry to fall a victim to publicity abroad which has linked cigarette smoking with cancer of the lung. This publicity has adversely affected tobacco shares on the Stock Exchanges in both New York and London. Imperial Tobaccos (ordinary), for instance, which were quoted in London at £2.29/32 before the news was flashed declined to £2.3/4 before recovering to £2.27/32. The subsequent rally was occasioned by a statement from a group of tobacco companies casting doubts on the evidence adduced to link cancer with smoking.

The events leading to the development above deserve to be noted here. The suggestion that there is relationship between smoking and cancer of the lung was first made in the British Parliament by the Minister of Health on the 12th inst. He stated that the Standing Advisory Committee on Cancer and Radiotherapy, after having considered for three years, all the statistical evidence, had given the following opinion: "(1) it must be regarded as established that there is relationship between smoking and cancer of the lung; and (2) though there is a strong presumption that the relationship is casual, there is evident that the relationship is not a simple one, since: (a) the evidence in support of the presence in tobacco of a carcinogenic agent causing cancer of the lung is not yet certain; (b) the statistical evidence indicates that it is unlikely that the increase in the incidence of cancer of the lung is due entirely to increases in smoking, and (c) the difference in incidence between urban and rural areas and between different towns suggests that other factors may be operating—for example, atmospheric pollution, occupational risks, etc." The Committee felt, therefore, the need for cautioning young people against the dangers of excessive smoking.

The Minister's statement naturally caused concern in British tobacco industrial circles. A group of companies soon after came forward with an offer of £250,000 for research into the causes of cancer. Issuing a statement at the same time, they raised certain doubts regarding the findings of the Committee. These are: "The disease occurs in those who have never smoked; the number who smoke and contract the disease is a very small proportion of those who smoke and do not contract it; the disease is much more common in towns than in country districts, yet there is no corresponding difference in the average amount smoked by people living in towns and people living in the country; and there are medical authorities here and in other countries who are laying increasing emphasis on atmospheric pollution as a possible cause of the disease." The force of these remarks can hardly be disregarded. In view of the difference of opinion even among experts, it is difficult to prove or disprove the theory that smoking might be a contributory cause of cancer of the lung. It is, however, for medical scientists to make vigorous research and give its final verdict.

GOVERNMENT AND INDUSTRIES

If India is to forge ahead in the industrial field, the Centre and the States Governments should take such steps as will dispel the fear complex in the investing sector. This, in brief, was the substance of the presidential address of Mr. G. E. Longdin, to the sixty-sixth annual general meeting of the Upper India Chamber of Commerce, held at Kanpur on 19th February. Evidently, Mr. Longdin had been provoked by the series of hasty legislations passed by the authorities partly in their anxiety to better the lot of labour, partly to have control over the irresponsible section of business men, and partly to gather as much revenue as possible in utter disregard of their ill effects on the growth of industries. At the outset, Mr. Longdin cited the adverse consequences to industries of the extension of lay-off compensation in excess of 45 days in a year and of the provision for referring to conciliation or adjudication in matters relating to lay-off or retrenchment, even where compensation had been made. He deplored the Government's failure to amend or expunge sect a 33 of the Industries Disputes Act which has been encouraging indiscipline in the factories among workers. He referred to a special disability from which many employers in Uttar Pradesh have been suffering. This was the anomalous situation created by the fact that the aged and infirm employees could not be retrenched even with gratuity without the risk of being challenged in the courts. Mr. Longdin also criticised the Industries (Development and Regulation) Amendment Act, 1953, on the ground that it tended to restrict the initiative of private entrepreneurs. Further, while accepting the basic principles underlying the Companies Bill, 1953, he feared that a number of clauses of the Bill might tend to restrict the legitimate business activity of many concerns. Finally, he dwelt on the piquant situation created by the judgment of the Supreme Court in regard to sales tax on goods in the course of inter-State trade.

These are only a few glaring instances of the way in which the Central and State Governments have been consciously or unconsciously inflicting hardship after hardship on the industries at a time when profits are declining, with the return of the consumers' market. It is true that these measures are aimed at converting the country into a Welfare State. Taken individually, they may inflict only a small burden on the industries, but their cumulative effect is crushing and not conducive to ensuring an expanding economy.

The picture, however, is not altogether gloomy. For, latterly, there appears to be a growing awareness on the part of the Government of the adverse consequences of its ill-considered and hasty measures. The appointment of the Taxation Enquiry Commission with a level-headed economist-cum-business administrator, such as Dr. Matthai, as Chairman, to enquire into the structure of taxation, and of the Shroff Committee to enquire into the finances available for the private sector, the keen interest taken in the move sponsored by the World Bank and American financiers to start an investment bank with a view to providing risk capital to industries in the private sector and the attempt to get some relief to the branches of banks in small towns from the heavy burdens imposed by the awards given by the various tribunals, are instances that confirm this impression.

WELFARE STATE OR SOCIETY?

Addressing a meeting in Delhi University, Prof. T. H. Marshall of the London School of Economics questioned the appropriateness of the term Welfare State to depict the state of social development that had taken place or had to take place. For Welfare State might connote, according to him, some kind of an imposed "benevolent totalitarianism," which is not what it is intended to mean. He, therefore, preferred to use the expression "Welfare Society" in place of "Welfare State" which is being widely used now. Welfare Society, he remarked, presumed the attainment of a sense of dignity by its members which they did not possess before.

Explaining the principles and problems of the Welfare State in Britain, Prof. Marshall stated that the nineteenth century *laissez faire* individual, who was a "disintegrated" entity, was being sought to be "reintegrated" under the Welfare State in Britain. He pointed out how the impact of industrial revolution in Britain had produced a sense of being "uprooted" among the common man. The latter was torn amidst a host of social, cultural and economic problems which he could not cope with. The idea of a Welfare State in the twentieth century meant for him the fulfilment of a new right, namely, "the social right of citizenship," a right which enables the individual to claim equality of opportunity in regard to education, maintenance, culture and health, because this social right was being expressed in terms of economic value. The British idea of a Welfare State, in the opinion of Prof. Marshall, also meant that the difference between higher and lower classes in society should be substantially reduced, so that the average man might become the dominant type. He was, however, careful to add that it did not mean the total elimination of the difference. A significant feature of the Welfare State in Britain, to which Prof. Marshall drew pointed attention, was that it was not run entirely by the Central Government, as a very large sector of the State was run by voluntary agencies.

TRAINING IN MANAGEMENT

One of the striking features of the second annual conference of the All-India Council of Labour Welfare Officers, which concluded its three-day session at Madras on the 14th inst., was the recognition of the need for management training. Col. L. Sawhny, who was the Chairman of the section relating to management training, pointed out that it was high time that industrial executives were trained in modern business administration. His section recommended that colleges and universities should include in their curriculum a course in business training and that theoretical instruction in the approach to human relations should form a part of the course. It was suggested further that theoretical instruction should later be reinforced and sustained by practical experience.

The recognition of the need for training business executives has come none too soon. For the success of modern business enterprises depends entirely on the efficiency of management. In fact, it is the management which makes the wheels go round. The managers have to take basic decisions and co-ordinate the efforts of all company employees into an effective organisation, with a view to ensuring successful operation of the enterprise concerned. He must be in close touch with not only the needs and desires of consumers but also with the policies of the Government affecting the fortunes of the company. As David Lilienthal, a prominent American with experience in both Government and industry recently described, the manager should essentially be "a man with a strong and practical sense of responsibility to the public" and should have "an awareness of the ethics of present-day business competition."

The greatest function of management lies in ushering in and maintaining healthy labour relations, a function more easily defined than realised. As this involves dealings with human elements and not with statistical data, the problem should be approached from a psychological angle. This requires on the part of management an understanding of the difficulties and aspirations of the employees and their tactful handling. It is, for instance, rarely realised that there is only a short step from an ignored suggestion to a grievance. But, it is common knowledge that once the suggestion of an employee is accepted and credit is given to him for the idea, it helps him to sustain his ego and thereby his warmer feelings towards the management. Again, recognition for a job well done costs little, but it is often a means of earning the co-operation and productiveness of the employees. Further, praise in the presence of others is effective as long as one worker is not compared with another. More than all, there is the need to recognise that to err is human and that one is seldom wrong or right all the time.

The management has yet another function and that is planning of jobs ahead of time. This planning has much to do in improving labour relations and also efficiency. For planning often saves many needless steps and false starts.

It will be evident from what has been stated above that the functions of management constitute a complicated business. This explains why management has become a profession. Professional managers are hired because of their training, their judgment and ability to work with others. It is true that some people advance to managerial responsibility by demonstrating their capabilities in subordinate positions. But they are only very few. In the industrialised West, most of the managers are often selected from among those who have been trained for that profession.

Most of the industrialised nations have some form of management training. The foremost among them is the U.S., which realised the importance of management training decades ago. As far back as in 1900, for instance, the Harvard University introduced its Graduate School of Business Administration. Now this successful School has been joined by similar departments in most of the leading American universities. Scores of companies enrol their most promising executives in advanced management courses.

In India, however, management, be it in the private or the public sector, is far below Western standards. Corruption, nepotism, callous disregard to feelings of the employees and greed for immediate profit are generally so rampant that it has made the successful working of the organisation concerned a doubtful proposition. That explains why there is a marked preference among ambitious young men to seek a career in concerns managed by Europeans or in Indian concerns which are known to be following Western standards. That again explains why firms managed by Europeans are making steady progress year by year, as compared with the slow and often halting, if not haphazard, growth of Indian-managed companies. Management is both an art and a science. Unless private enterprise in India realises this and improves its managerial efficiency, its future will be at stake.

BOOSTING OUTPUT OF FISH PONDS

The possibility of using hormones to stimulate the spawning of fish was examined by the Indo-Pacific Fisheries Council, a 16-nation body sponsored by the Food and Agriculture Organisation of the United Nations, at its recent session in Bangkok. One of the difficulties in the pond fish culture, a programme being encouraged by the F.A.O. in a number of countries as a means of boosting the supply of protein-rich-food, is the fact that certain species of carp from India and China will not spawn in confined waters. In Brazil, it is reported, fisheries experts have achieved some success in using sex hormones on other species of fish with the same characteristics. Experiments along the same line are going forward, but it is still too early to draw any conclusion from the results.

The Council also discussed a paper by Dr. S. Y. Lin, F.A.O. expert working in Haiti, on compatible combinations of different species to make the best use of fish ponds. Some fish feed on the surface, others at the bottom, some on vegetation and others on animal matter. If a proper combination of fish with these varying characteristics can be worked out, the resources of a pond, it is stated, can be utilised to the fullest extent.

A popular fish in South-East Asia is the amazing tilapia. Under good conditions, one pair of matured tilapia may produce as many as 10,000 fish in one year. Moreover, it takes only about four months for the young fingerlings to grow to a good size for the table. Dr. Ling says that tilapia live well in many kinds of water, require no particular feed and that their flesh is "firm and delicious with few bones, also excellent for fresh consumption." Another interesting fish experiment reported by the F.A.O. recently from the South-East Asia region is in Indonesia. There, it is thought, ponds can be freed of malarial parasites by combining two species of fish, and that production will be increased by two million kilograms a year.

(Concluded from third column)

outside the usual run of day-to-day administration at great cost to the country, and relegating them, for some unknown and unspecified reasons, to purely routine posts such as that of Collectors or Deputy Commissioners in distant backwaters.

While it is true that the district administration needs to be strengthened, in view of our concentrated efforts for rural uplift, it is not necessary to waste talents and training, painfully and laboriously imparted and acquired, in important subjects like defence, road transport, shipping, etc. Even if a change is considered necessary and it is thought advisable to train additional personnel in these out-of-the-common-run activities, it will be more economical and more to the advantage of the country as a whole, in which administrative standards, by all accounts, are still very poor, if such persons, of whom there must be possibly a dozen in the whole of the Union, are fitted into more responsible posts in the administration.—*All Rights Reserved.*

OFF THE RECORD

(By "ROVER")

IF it was a body constituted for the spiritual uplift of our countrymen, there would be nothing wrong or incongruous in the highly negative and serenely contemplative attitude of the Forward Markets Commission. I wonder if this on the whole placid and inactive Commission is perchance labouring under some misapprehension about its functions, though the fact that its headquarters has been purposely located in the market place at Bombay, and not on the heights of Hardwar, should have been enough to remove any such misunderstanding on its part. Being only a babe in arms, nobody expects it to be up and kicking, but no six-month-old child, when it is not asleep, sits as if in a trance engaged in the eternal verities of the universe, as Dr. B. V. Narayanaswamy Naidu and his colleagues seem to have been doing.

From what I have been able to gather so far, the Forward Markets Commission, and especially its Chairman, have been leisurely touring the country, visiting important centres of forward trading in commodities and bullion and unhurriedly studying the working of these markets. Apart from this, Dr. Naidu, who, perhaps because of official discipline, is the only vocal member of the high-powered body, has been making tolerably amiable and somewhat reassuring speeches to the vested-in-the-wool and tough members of the governing bodies of the various exchanges and associations sponsoring and conducting large speculative activities in futures trading, on somewhat goody-goody lines. I earnestly hope that the good-natured Chairman of the Commission is not taken in by the flattering words of the many addresses of welcome which have been showered on him, wherever he has gone, and by the high and lofty sentiments expressed regarding the great services to the public these philanthropic bodies are rendering, by their selfless activities in the trading rings.

In any case, the time for these mutual compliments, exchange of pleasantries and welcome addresses is over and the Commission has got to come down to brass tacks. One would naturally have thought that the head and other members of this important body were selected for their close and intimate acquaintance with the working of forward markets in the country and knowledge of the clever manipulations and machinations for the exploitation of every new situation which it covers. They certainly could not have been so innocent of this necessary knowledge as to need almost a year of peripatetic study at the taxpayers' expense, of an activity which they are paid to control and regulate.

There were certainly men knowing the subject from A to Z and steeped deep in it, like the late Mr. T. B. Dalal, within the official cadre, and many outside it in the actual commercial, academic and journalistic world, available to the authorities for manning this body at the outset, if the Government were serious about their intention of introducing some discipline in these dens. But it is not the first time that officials have helped in smothering a good idea at the very start, by regarding such newly created bodies as aids to some people's careers. They are looked upon either as a dumping ground for getting some of the unwanteds out of the way or of finding safe and comfortable billets for some not very competent favourites, or, again, of side-tracking certain stumbling blocks in the cadre, preventing the rapid rise of some V.I.P.'s more fortunate than capable protegees.

Why I have all of a sudden thought of the Forward Markets Commission at this time, though I have been closely watching its activity, or, more properly speaking, a lack of it, is the way in which some of the forward markets have been behaving of late. Nobody expects these markets to sail along a set course; they are bound to be swayed somewhat exaggeratedly and jerked out of their path violently, from time to time, by every passing gale and current. They are, in a sense, shock absorbers for more regular and sedate forms of economic activity, and, to that extent, liable to steep ups and downs. But, when these threaten the welfare of the community and its ordered life, not as a result of the play of unforeseen forces, but as a direct outcome of sheer over-trading and frenzied buying or selling, it is time the authority specially created for regulating unwholesome economic activities stepped in and took some drastic action, at least to jusify its costly existence.

Textiles still constitute the country's biggest industry. Cloth is our biggest item of exchange-earning exports. Cotton not only forms the raw material for this industry, but is one of the most important crops of our agriculture. To hundreds of thousands of families it is a means of physical existence. We, therefore, cannot afford to let it be a plaything of reckless and dare-devil speculators. I am neither enamoured of official controls, nor do I, by any means, regard forward trading in cotton as more desperately cynical than in any other commodity. In fact, there are worse culprits going loose in this field. Why I have mentioned cotton is just because, at the moment, it happens to be behaving in a bewildering criss-cross manner, like a reveller returning home late after hectic hours of glorious life in a night club or possibly a series of them. All the markets are quite capable of behaving and do often behave in a similar irresponsible manner or worse. And it is the business of the Commission, if it be worth its salt, to get tough with them and pull them up both *in* their own interest and that of the community at large.

In a matter of a week or so, the whirling and howling crowd at Kalbadevi has pushed cotton up by thirty rupees and then down by as many or more. If even a microscopic quantity of cotton bales tendered against deliberate purchases and sales pushed up prices for the part of the delivery period, in the hope that no seller would be delivered, could inflate or depress values to such an extent as witnessed recently, it should be obvious even to the meanest intelligence that most of those who operate and who are allowed to operate unchecked on a large scale in this market could not be men of substance. For ought I know, speculation in forward markets may be an honourable calling, it possibly is; but I should think that so distinguished a calling as dealing in futures on an impressionable scale would demand certain attainments and resources, as in the case of most other professions. A system of margins or deposits for all transactions would soon eliminate much of the undesirable element from these markets and reduce trading to reasonable dimensions. If the Forward Markets Commission is still busy studying things, I would willingly make a gift of this idea to Dr. Naidu, if he would promise to enforce it in the various forward markets, as his Commission's first contribution to the economic health of the country.

There is another very valid reason for my so rudely awakening this body from its comfortable slumber. The country has really never been free from the harassing effects of inflation at any time during the last fifteen years, since World War II shook the world and played havoc with its currencies. We are once again embarking, on a large scale, on the painful, but, perhaps necessary, adventure of deliberately reducing the purchasing power of our rupee. In such times, forward markets tend to inflate inflation itself and make life a greater misery for millions than that brought forth inevitably by pumping of extra currency in circulation by the Government as a part of its chosen plan and policy. This is the time for the Forward Markets Commission to watch every trend in the markets suspiciously and to get busy before things get out of hand. Let us hope that the addition of one more member, Mr. W. R. Natu, fresh from the super-active atmosphere of New York, will add vim, if not lasting vigour, to the work of this somewhat complacent body.

Wasted Talents and Training

It has been freely admitted often in the past that the Government of India and the State Governments have undertaken many unusual activities, for which the administrative machinery was neither well trained nor well geared, with the result that there were frequent breakdowns, delays and general loss of efficiency. In fact, whenever anything has gone wrong with any of the major industrial or irrigation-cum-power projects, or again, when controls have been administered in a wooden and unimaginative manner creating avoidable difficulties both for commerce and industry, the plea put forward, when driven to bay, has been the dearth of administrative officers with necessary training and experience of these subjects. It is therefore, all the more surprising that, during recent months, there should have been several instances both at the Centre and in the States of removing key-men, who have been trained in activities

(Continued on first column)

MOVE TO REFORM INDEX NUMBER OF PRICES

PARLIAMENT DISPOSES OF NUMBER OF BILLS

(From A Special Correspondent)

NEW DELHI, *23rd February*

DISCUSSIONS on the question of reconstruction of the index numbers of wholesale prices on a more reliable and dependable basis have been going on in Government circles for the past few months. The present index is considered somewhat unreliable, since it does not interpret the true state of the economic health of the country. In fact, the credit for focussing the Government's attention on the undependability of the index numbers of wholesale prices, as also on the urgency for their reform, must, doubtless, go to the I.M.F. Mission, particularly to Mr. E. M. Bernstein. According to this international financial expert, the wholesale prices index is defective in several respects. First of all, it has been constructed on the basis of the pre-war year when prices were generally at a low level, and, in consequence, this base has been unduly magnifying the rise in the commodity prices during the war and post-war periods. Again, it has for its basis undivided India for the purpose of weightage, etc. For instance, in regard to raw jute, raw cotton, wheat, raw wool, raw hides and skins, the area now constituting Pakistan was the major producer in pre-independence days. As a result of Partition, the share of the Indian Union in the production of some of these commodities has dwindled considerably. Consequently, any index number which does not take the change into consideration should be unreliable. Thirdly, India was not then as integrated as it is now, because of the prevalence of a large number of Indian States in the Pre-partition days. Further, greater weightage has been given to raw jute, manganese ore, mica, jute goods, tea, etc. According to informed statisticians, nearly 40 per cent. of the base could be computed as belonging to exportable commodities and goods which play an insignificant part in the determination of the internal price structure in the country. For instance, the increase in the wholesale prices during the last few months has been largely the result of the rise in the prices of many export goods such as tea, shellac, etc.

DELHI LETTER

In this connection, the Report of the I.M.F. makes interesting observations: "As the wholesale price index is weighed heavily with goods that enter into international trade, it did show a sharp rise and fall, characteristic of all raw materials since the beginning of the Korean War. A price index which reflects the operation of internal monetary and fiscal forces would show greater stability from year to year as well. Such an index can be constructed by taking into account only those goods that are both consumed and produced almost entirely at home. In view of the constant necessity of judging the effectiveness of internal fiscal and monetary policies in maintaining economic stability, it would be extremely useful for the Government of India to publish regularly an index of prices of goods produced and consumed domestically and which would be free, as far as possible, from the direct effects of external fluctuations."

The proposed new index now under construction will have 1948-49 as its base year. The weightage to each commodity has been given in such a way as to represent its true place in the national economy of this country. In order to assess weekly fluctuations in the price level, prices of commodities in different places are being taken into consideration. It is stated that as the Government of India has to resort to deficit financing to some extent with a view to implementing the Five-year Plan, during the next two years, this reform of the wholesale prices index might enable the Finance Ministry to assess more correctly the impact of deficit financing on the general economy of the country. This new index is expected to be computed from the beginning of the next fiscal year and when published, it will substantiate the statement made by the I.M.F. Report, namely: "There are many people to whom the conclusion that inflation has been eliminated in India and economic stability restored will come as a surprise."

The presentation of the Railway Budget this week did not provide any thrill to both the Houses of Parliament, especially when members were more or less sure that the Budget would not contain any surprises. However, as Mr. Lal Bahadur Shastri, the Railway Minister, began reading his speech slowly, the feeling became uppermost in their minds that the Railway Administration had been doing creditable work these years in the matter of speedy rehabilitation and construction of the main arteries of transport in the country. That the Administration has been spending vast sums during the last few years in regard to development, rolling stock, etc., could be appreciated only when the present rate of expenditure is compared with that prevailing before World War II. The average expenditure per annum during the five-year period before the war hardly worked out to Rs. 8 crores, while for the forthcoming fiscal year, it is budgetted at the high figure of Rs. 95 crores. During this period, the allocation to the depreciation reserve fund was about Rs. 13 crores per annum, as against nearly Rs. 34 crores at present. The latter is exclusive of the allocations to the Development Fund which is being enriched to a moderate extent from time to time. From the point of view of capital expenditure, the progress must be considered satisfactory. The capital-at-charge of the Indian railways in 1948-49 (the post-Partition year) amounted to Rs. 701.89 crores as compared with Rs. 807.76 crores for undivided India in 1946-47. When the ex-Indian States railways were amalgamated with those of the Union railways, this figure was marked up to Rs. 827.04 crores in 1950-51. Since then, there has been a progressive increase in the capital-at-charge as a result of new constructions and by the end of 1954-55, the cost is likely to go up to Rs. 909.09 crores.

The debate on the President's Address to the joint session of both the Houses of Parliament was not impressive. It was for the most part desultory in character, with the exception perhaps of a notable speech from the Prime Minister. There was, however, considerable anxiety in his face when he referred to the proposed U.S. military aid to Pakistan, following the Turco-Pakistan Pact. He was emphatic when he stated that this aid would add to the uncertainty, fears and apprehensions of the various Asian States instead of adding to the security of this part of the world. According to him, it would be a reversal of history since the symbol of Asia's struggle for freedom had been the withdrawal of foreign troops. In regard to Kashmir, he observed that, while India's international commitments continued to remain, the U.S. military aid to Pakistan had somewhat changed the context of events. The financial effect of this military aid was not referred to by him, but this aspect of the question is expected to be dealt at length by the Finance Minister in his forthcoming Budget speech this week. Although India cannot afford to have an armament race, it will be compelled to spend more money on defence forces, equipment and also in the building up of defence industries at an accelerated pace in the coming years.

A number of minor Bills was disposed of during this week in Parliament. The Council of States passed the Health Minister's Bill to control the advertisement of drugs in certain cases and to prohibit certain types of advertisements in regard to remedies alleged to have been advertised by these druggists. During the debate, the Minister disclosed that she proposed to bring forward, as early as possible, an amendment to the Drugs Act with a view to preventing manufacture and sale of spurious drugs. The House also disposed of four Bills in brisk succession yesterday. These Bills were the Absorbed Areas (Laws) Bills, 1953, the Control of Shipping (Amendment) Bill, 1954, the Indian Railways (Second Amendment) Bill, 1953 and the Lushai Hills District (Change of Name) Bill, 1954. The Deputy Minister of Transport who piloted the Shipping Bill stated that a consolidated Bill on shipping was already under preparation. The present Bill only intended to continue the existing arrangements till March, 1956, by which time he hoped that a comprehensive legislation on the subject would have been passed by the House.

WAGES AND EXPORTS

CHANCELLOR TO ENCOURAGE HIGHER PRODUCTIVITY

(From Our Own Correspondent)

LONDON, *20th February*

MR. Butler, Chancellor of the Exchequer, was talking to a sympathetic audience of the Conservative Party in Glasgow, when he told his listeners that wages had risen more than prices since the Government took office. He could say with truth (though he did not use the figures) that wage *rates* had gone up by 14 per cent. since 1951, while retail prices had risen by only 12 per cent. Moreover, earnings had probably increased more than rates.

LONDON LETTER

But, in these comparisons, a great deal depends upon the exact basis taken. If January, 1952, is compared with January, 1954, Mr. Butler is still right, for the indices show that wage rates have gone up by 7 per cent. and retail prices by only 5.6 per cent. His political opponents, however, say that a proper comparison cannot be made on the basis of the most convenient date for the purpose of a particular argument and the Trade Unions add that they are not concerned with the movements of wage rates under a Labour or a Conservative Government; they want wages to keep up with prices over a long-term and, over the post-war years as a whole, wages have, in fact, barely held their ground with prices. Since 1947, the wage rate index has gone up by 38 per cent., but the price index by 140 per cent. and the narrowing of the gap in recent years has been due, the unions declare, to their efforts on behalf of their members, efforts which they are still making to close the gap completely.

The price index has been very stable this year—it has only gone up by two points, or little over 1 per cent., and this only because of an increase in the general level of rents, as more and more of the new, but higher rented, houses have come into occupation. For the wage earner who has gone on living in the same house at the same rent, the cost of living has not really increased.

Dividend Payments

But the Chancellor was making the point that this country was now coming up against really serious German competition and that productivity and productive investment must be increased. He wants to see no increase in national consumption, except as the result of higher output, and he does not consider that wage rates for the same work should be raised. It was up to everyone concerned to increase their income only by increasing their output. Mr. Butler wanted to defend the industry against the charge of increasing dividends, while resisting the pressure for wage increases. "In the four years to 1952," he said, "earnings went up by 30 per cent. and dividends by 23.5 per cent."—But a more recent comparison, since most companies abandoned dividend limitation, would not have shown such a gap. He was on much firmer ground with a pre-war comparison, where he pointed out that, in terms of real income, shareholders are only drawing 65 per cent. of their pre-war income, while the wage-earner is drawing 128 per cent. Moreover, the *rate* of dividend paid on capital has tended to decline, accompanying, of course, the general decline in money rates.

There is a pointer in all this for the coming fiscal year. "It is my policy," said Mr. Butler, "to encourage all in industry with the hope of a greater reward from higher and more efficient output." But how can he translate this into action through taxation policy? He can reduce the rate of tax on overtime earnings (though this sometimes leads to workers scamping on normal hours in order to earn more on overtime rates), and he can reduce the tax on earned income, though he wants to encourage investment, which means not unduly penalising the unearned income which results. He can also reduce the rate of tax on the higher ranges of income, thus removing the present disincentive to increasing output. Otherwise, he must use his influence on the Trade Unions to encourage methods of pay depending on output and to remove the brakes which unions put on individual workers increasing their output for fear of leading to rate-cutting or unemployment. Industry and the workers must get together on these problems and Mr. Butler is right to concentrate attention on the encouragement of higher productivity. But he has a lot of educational work to do on both sides before any success can result. Perhaps, however, his Budget will produce some further devices.—*All Rights Reserved.*

PAKISTAN NOTES

FURTHER U.S. AID TO PAKISTAN

STATE BANK FIXES EXCHANGE LIMITS FOR VISITORS TO INDIA

YET another agreement providing for U.S. economic aid to Pakistan was signed in Karachi this week by the Governments of the two countries. The agreement, which is an amendment to, and an expansion of, the one signed in 1953, covers the financing of the agricultural research programme for the current year. The U.S. Government will make available to Pakistan a sum of $290,000—an equal sum will be contributed by the Pakistan Government—towards meeting the expenditure in connection with the establishment of research centres in universities and experimental stations throughout the country. U.S. assistance in the form of services of technical advisers and research equipment, technical books, etc., is also envisaged.

The above agreement is one more indication of the U.S. Government's desire to help Pakistan in the development of its economy. It was only recently that several operational agreements providing for U.S. economic aid in the sphere of agriculture were signed. Mention, for instance, may be made of those relating to (1) the Ganges-Kobadak Irrigation project in East Bengal and (2) soil and water conservation project in West Punjab. For the former project, the U.S. Government is contributing a sum of $1.9 million. The project envisages provision of adequate water-supply during the dry season by perennial pump irrigation and removal of surplus water during the monsoon by an open drainage system, with a view to raising agricultural output. Towards the pilot project for soil and water conservation, the U.S. Government will contribute $850,000. The project envisages a programme of practical demonstration of soil and water conservation and application of conservation methods best suitable for local conditions and most effective for preventing soil erosion. The other agricultural fields in which U.S. economic aid is being used cover supply of chemical fertilisers and plant protection service.

Exchange Limits for Visitors to India

Pakistan is still suffering from keen shortage of foreign exchange. This is evident from the State Bank of Pakistan's announcement this week fixing exchange limits for Pakistan visitors to India. The limit is Rs. 100 (India) per person who travels by air, provided he possesses a valid *visa*. Those who visit India by land route are allowed exchange upto Rs. 50 per head; children below 16 years will be allowed half the amount only. Banks authorised to deal in foreign exchange will extend the facility to travellers, the releases in excess of Rs. 50 being made in the form of travellers' cheques valid for encashment in India only.

Provision of these exchange facilities will be available only once in each calendar year to all persons domiciled in Pakistan. Nationals of the countries, except India, who have resided in Pakistan for at least six months will also be eligible.

Indo-Pakistan Electricity Agreement

West Pakistan will continue to get supply of electric power from the Punjab(I) for one more year. This is the result of a decision arrived at by the Chief Engineers of the two Punjabs at a conference held in Chandigarh last week. Under the revised agreement, the quantum of power supply, however, has been reduced from 5,000 kw. to 4,000 kw. The reduction is a sequel to the growing demand of the Punjab(I).

At the Conference, the Chief Engineers also discussed the terms of a long-term agreement for supply of power from the Nangal Project, but no decisions could be reached. The question is expected to be examined again at a meeting of electricity officials in Lahore some time next week, when the metering arrangements at the Pakistan receiving grid station at Shalimar Gardens in Lahore too will be discussed.

Trade Pacts

Pakistan seems to be busy entering into bilateral trade pacts with a number of countries. An indication of this is provided by the conclusion of a trade agreement with West Germany and negotiations for trade pacts with France and Japan. The Pakistan-West German pact covers the calendar year 1954 and provides for the exports of cotton, jute, hides and skins, wool and sports goods, in exchange for machinery, photographic equipment, optical instruments, vehicles, dyestuffs and plastics. Trade talks are currently being held between the French trade mission and the Pakistan Government. The talks are designed to pave the way for a fresh trade agreement between the two countries replacing the one which expired in December last. A thirteen-member Japanese mission arrived in Karachi recently to study the possibilities of improving trade relations.

• • • •

The Government of Pakistan is "actively considering" measures for bringing about a downward revision in the prices of consumer goods throughout the country. Reduction of coal and oil prices is also being examined and announcement is expected to be made shortly. In the meantime, the Government has reduced the prices of steel, bringing approximately a saving of Rs. 50 lakhs to consumers.

• • •

A recent Press report from Hyderabad (Sind) avers that the Sind Government proposes to introduce prohibition in the Province.

(Concluded from next column)

Prof. Lawrence Witt of Michigan State College feels that dollars to pay for imports are a major problem for countries which would like to expand purchases from the U.S. According to him, if a substantial percentage of America's farm crop is to be sold abroad, it will, be necessary for the U.S. to increase imports from other countries. An active foreign trade and an expanding domestic economy are essential, if agriculture is to remain fairly prosperous in the next few years. Mr. Louis H. Bean, former U.S. Agriculture Department Economic Analyst, has suggested grants of surplus food to hungry persons. "The main point is," to quote him, "that grants of surplus food destined for needy people whose poverty isolates them from regular commerce should not be checked by requirements that the goods be sold for local currencies. Grants to them are not, and indeed should not, be a threat to normal commerce." Mr. C. Claude Mitchel, Chairman of the University of Nebraska's Agricultural Economics Department, opines that American foodstuffs can be employed in foreign aid and development programmes in such a way that the population dilemma of the underdeveloped nations can be solved. He observes: "Whenever America's food is directed specifically towards students and vocational trainees in such countries, the ultimate effect will be greater agricultural and industrial productivity, higher levels of living, greater urbanisation to the point where a proper balance between people and resources can be achieved."

AMERICAN NOTES

U.S. BUSINESS FACES GREAT CHALLENGE

FOREIGN TRADE EXPANSION URGED

THE American business man today is facing a great challenge—and a great opportunity. He must bear, in large measure, the responsibility for completing the successful transition from a war-time to a peace-time economy. The extent of this responsibility was indicated by President Eisenhower in his recent economic report to the U.S. Congress. Said the President: "The best service the Government can render to our economy, besides helping to maintain stability and insuring a floor of protection for the population, is to create an environment in which men are eager to make new jobs, create new products and develop new markets, increase efficiency all around, and thus be able and willing to pay higher wages and provide better working conditions."

The U.S. Government has been creating that environment. It has, for instance, provided tax reductions for the American public and it has scheduled tax relief later in the year for American business. These tax revisions will help boost up mass purchasing power through the stimulation of business expansion leading to more and better job opportunities. This is in line with the President's belief that the prosperity of the U.S. lies in the prosperity of all the people, not merely of a few corporations. The U.S. Federal Reserve System recently reduced its rediscount rate, that is, the rate of interest at which member-banks can borrow money. This, it is anticipated, will stimulate banks to seek out profitable business investments and loans, thereby encouraging new construction and new production.

In addition to these and similar measures, the President has signified the readiness of his Administration to intervene more directly in the economy through such "bold steps" as public works and large-scale credit expansion, if a serious economic decline should threaten and business is unable to take up the slack.

The attitudes and actions of the business man, then, are matters of vital concern. How is he meeting his responsibilities? One significant measure of business intentions and capabilities lies in plans for capital investment. Business expenditures for the expansion and modernisation of the nation's productive plant, which hit a record of $27,800 million last year, are estimated at an annual rate of $28,000 million for the first quarter of this year.

Foreign Trade

Increased U.S. exports and imports have been urged as steps towards easing problems of food surpluses and distribution, by witnesses before the Congressional Joint Committee on the Economic Report, which is studying U.S. economic conditions. Greater imports by the U.S., it is pointed out, will help those nations acquire the means of obtaining goods which are surplus in the U.S.

RURAL BANKING IN TRAVANCORE-COCHIN

RELAXATION OF LEGAL PROVISIONS URGED

EVER since the Indian Banking Companies Act, 1949, came into force, the banking community in Travancore-Cochin has been stressing the unsuitability of the legislation to the conditions prevailing in the State. In fact, the passing of this legislation created such a stir that a number of joint stock banks in the State recognised at once the need for starting an association of their own to safeguard their interests against any common danger. The result was the coming into existence of an association, at Kottayam, now known as the Travancore-Cochin Bankers Association. That was in 1951. Its membership then was 26, whereas today there are 60 members on the role out of a total of about 150 banks operating in the State.

The third annual conference of this Association, held under the presidentship of Mr. M. Ct. M. Chidambaram Chettiyar, a well-known South Indian banker and industrialist, once again provided a venue, just as it did last year, for focussing the attention of the Central authorities on problems facing the bankers. These problems were explained effectively and forcefully by Mr. Chidambaram Chettiyar as well as by the Chairman of the Association, Mr. George Thomas in their respective presidential and welcome addresses. Those two speeches, together with that of Mr. A. J. John, Chief Minister, Travancore-Cochin, who inaugurated the conference, form a comprehensive survey of the banking problems in the State and the lines of action which, according to them, are necessary for overcoming the difficulties facing the bankers there.
