The influence of personal considerations is further evident from the transfer of all subjects relating to village industries and handicrafts from the Commerce and Industry Ministry to the Production Ministry, a ministry in charge of heavy industries owned by the State. This is a curious combination, indeed. The village industries have been in charge of a Deputy Minister under the Commerce and Industry Ministry, thereby receiving the sole attention of a member. It is not clear whether they will now receive such attention under the Production Ministry. Further, Mr. T. T. Krishnamachari has been trying to place these industries on a sound footing by evolving practical measures, though some of these have not been to the liking of the *Sarvodaya* group which dominates the All-India *Khadi* and Village Industries Board and All-India Handicrafts Board. In Mr. Reddy this group may find a more agreeable Minister, but, if Mr. Reddy were to allow these sentimentalists to dominate his policies, his practical achievements in this sphere would be next to nothing.

It is not clear from the President's order whether village industries include all small industries too. If it does, it will mean that the handlo

Government of India is fully alive to this need, as witness the setting up of a Cabinet Committee of heavy industries, immediately after the constitution of the Ministry of Iron and Steel. The function of this Committee is to bring about co-ordination at all levels in heavy industry in the public sector. The Commerce and Industry Ministry has already under its control all the principal consumers of steel. There is thus full scope for co-ordination of production and consumption of steel.

The task facing Mr. Krishnamachari is heavy. The responsibility for making India self-sufficient in steel as early as possible is now largely his. It is true that he is inheriting two projects for State-owned steel factories which are not perfect in every way. The German project at Rourkela is expected to cost more than necessary. The Russian scheme for putting up a factory at Bhilai has all the disadvantages of a package deal. It may be too late now to set right the basic defects which are going to result in needless inflation of the capital cost of these factories. But, to some extent, their effects can be mitigated by avoidance of waste in the construction of factories, by fabricating as much plant and machinery as possible within the country, by expeditious completion of the projects, and by taking proper care to see that the mistakes made in the other two projects are not repeated in the third project proposed to be implemented with the assistance of British manufacturers.

It is common knowledge that India is well endowed with all the natural resources required for manufacturing steel. It has first class iron ore, enough coking coals, and plenty of manganese, limestone and dolomite deposits. Some of these can be had near the factory site and others not very far from it, so that, if wisely managed, India can produce the cheapest steel in the whole world. Despite this advantage, the growth of steel industry has been slow. One thought that, after independence at least, the steel industry would grow fast and pave the way for establishment of other heavy industries. But, until very recently, the position was no better and expansion was lamentably slow. Steel production in 1952—five years after independence and the peak post-war year—was only 12 per cent. above the 1941 figure, while the production of pig iron was actually below that in 1941. The present Government is largely responsible for this state of affairs. Its threat of nationalisation and parsimonious policy of fixing the return on capital at the unduly low level of 3.5 per cent. net provided no chance for the existing producers to expand their capacity. If proper encouragement had been given, the existing companies could have easily raised the production of steel to 2 million tons by now and that at a much smaller capital cost than what the Government has to incur at present. This is not the only loss to the country. It is something very much more; just think of the avoidable loss of employment caused by inadequate supply of steel and the heavy sums that have already been spent on importing costly foreign steel. All this has been mainly due to the dog-in-the-manger policy of the Government.

There has of late been some realisation among the Government of the folly of its policy and, a few months ago, it decided to allow the Tata Iron and Steel Co., Ltd., and later the Indian Iron and Steel Co., Ltd. also, to expand further. A few weeks ago, it revised its policy of fixing the prices in favour of producers. These are welcome changes in policy, but they are not enough, because their favourable effects have been neutralised by the threat of nationalisation. This threat, coupled with the arbitrary powers vested in Parliament in regard to payment of compensation by the latest amendment to the Constitution, has made it extremely difficult for these Companies to raise the capital they require for expanding their productive capacity. By 1958, when the assurance of "non-nationalisation" to the existing producers expires, the Government will have neither the finance nor the managerial capacity to nationalise the existing iron and steel units. It will still be busy with the job of implementing the projects on hand. Moreover, the Prime Minister himself stated in Madras early this year that it would be a waste of capital to take over the existing factories. Then, why toy with the idea of nationalisation and unnecessarily handicap the progress of the units in the private sector, units which have none of the blemishes usually attributed to private enterprise and the record of which has been creditable all round?

It is argued by those who claim to know the mind of Mr. Nehru and his colleagues that this demand is not reasonable, inasmuch as it requires the present Government to tie the hands of future Parliaments. It is also argued by them that there is not much value in any such assurance, because subsequent Governments may repudiate it. These arguments are not convincing. The assurance can certainly be given by the Congress Party, that is, the party which is in power today and which hopes —a very reasonable hope indeed—to be in power for several decades to come. If this party (which is the Government for all practical purposes) gives the assurance that it would not nationalise the iron and steel units in the private sector, the investors will know where they will stand in future and will, perhaps, strive to keep that party in power. In a democracy, the issues of nationalisation and other broad features of economic policy are the legitimate spheres of political parties and not that of the Government of the day. There will, therefore, be nothing wrong in the Congress Party making its stand clear on this vital issue. It has certainly no obligation to protect the policies and philosophy of its political opponents. It is to be hoped that Mr. Krishnamachari, whom we regard as a man of sturdy common sense, will realise the value of our suggestion and persuade the Prime Minister and his other colleagues in the Congress Party to give up their unrealistic policy towards the steel industry. If he succeeds in this attempt, he will have won half the battle for making the country self-sufficient in steel in less than half a decade.

MR. DESHMUKH ON TAXATION

CERTAIN interesting observations on taxation in the context of the second Five-year Plan now in the making were made by Mr. Deshmukh at a Press Conference held by him in Madras shortly after we went to press last week. They show how his mind is working and what sort of budget he may present in February next. Before proceeding to analyse his remarks, it must be stated that he did not make any dogmatic pronouncements. It is necessary to bear this point in mind, if one is not to get scared by his remarks. He was only saying as to what should be done if certain objectives were to be achieved. Whether the line indicated by him would be followed or not is a question for which no definite answer can be given even by Mr. Deshmukh. Much would depend upon the domestic political, let alone economic, climate. If Parliament thinks like him and if all the State Governments are prepared to follow his directions, then, of course, his ideas will prevail. But, at the moment it looks as though he will not be able to command such all-round support for them. The share market, therefore, need not get unduly panicky over what he said at Bangalore or Madras, though it will be perfectly right if it chooses to remain cautious and play for safety.

The next budgets of the Central and the State Governments will have to be framed in such a way as to implement the second Five-year Plan, because they will cover the first year of that Plan. This will be possible only if the Plan itself is finalised before the end of this year. There is already a note of determination in the speeches of the Prime Minister and others connected with the Plan that it will be done. There is, of course, no reason why it should not be, because the Government has, fortunately for us, no other pressing problems. Nevertheless, it is better not to be so sanguine about it. The States Reorganisation Commission's report will be out just at the time when the Planning Commission is about to finalise its plans. If the Commission puts forward any far-reaching proposals, as it well may, any plan drawn without due regard for its recommendations will be no better than a tentative one, especially from the point of view of raising resources and the fixation of State-wise targets. It is obvious that the Governments of the States that are affected by the Commission's recommendations will not have the heart either to impose additional taxation or to implement the Plan seriously, until the fate of these recommendations is known. Mr. Nehru, of course, can, in view of his universal popularity, postpone giving effect to the Commission's suggestions, but it is extremely doubtful whether even he will be able to succeed in having his way, if Andhra is any indication.

But assuming that the miracle happens and that the States Reorganisation Commission's findings do not disturb the Plan. What then? Mr. Deshmukh says that, after taking into account the available resources for the second Five-year Plan, as it has been framed so far, the Governments—Central and State—will have to raise about Rs. 100 crores per annum through taxation and profits of State-owned enterprises. As profits of the latter are not sizable, practically the whole of this amount will have to be obtained by way of taxation. Can such a large amount of additional taxation be raised? We think that it will be possible to do so, provided (a) the duty on salt is reimposed, (b) prohibition held over for a decade or at least drastically modified to confine the objective of this reform to avoid drunkenness, (c) all further nationalisation, especially of road transport is stopped, and (d) collection of the existing taxes, especially income-tax and sales tax, in both of which there is an enormous amount of evasion is vigorously enforced. To the Congress Party, however, the first three suggestions will not appeal and, to that extent, the realisation of additional taxation, as proposed by Mr. Deshmukh, will not be possible. Most of the methods suggested by the Taxation Enquiry Commission, on which the Union Finance Minister is pinning his hopes, will not work, as they are not politically feasible. A warning to that effect has already been sounded by Dr. B. C. Roy, Chief Minister of Bengal and a veteran Congressman. They can, perhaps, be tried after the next general elections, but by that time two years of the second Five-year Plan will have gone.

Mr. Deshmukh is both right and wrong when he says that the capacity of the country to yield more taxes has not yet been reached. But whether he is right or wrong depends on how he approaches the problem. If the economy is allowed to expand through the vigorous actions of the private sector and if the tax collecting machinery is kept in good order, he and his colleagues in the States will be able to net in a much larger amount than they hope to get now, at the existing rates of taxation. But, if he were to step up the rates of taxation to penal levels, he would kill all incentive to work and more production; the outcome might well be less tax revenue and more tax evasion. Excessive taxation on the private sector, especially at a time when inflation is generated through development expenditure by the public sector, would amount to adding fuel to fire, for it is an economic fact that high level of taxation itself will have an inflationary effect on the economy. It must, however, be conceded that there are, as Mr. Deshmukh pointed out in Madras, several areas in India where sales tax is not being levied or levied at only nominal rates. It should be possible to collect more tax revenue in these areas through sales tax, provided political conditions permit the enforcement of such a levy.

One of the sensible questions put to Mr. Deshmukh at Madras was as to how he hoped to raise additional taxation of the order of Rs. 100 crores per annum when he had to give up many of the proposed levies in the last budget. The reply given by him makes interesting, though not convincing, reading, as will be noted from the following summary of his remarks, as published in the *Hindu* of Madras:

"Mr. Deshmukh said that budgets were related to the implementation of plans in force for the time being and so also was this year's budget related to plans for the current year, which was the closing year of the first Plan. That involved certain responsibilities in the way of raising revenue. The scheme of taxation he introduced was intended to secure those revenues. It was also based on certain assumptions in regard to economic conditions. One of the assumptions was that they would have gone some way towards implementing policy decisions that they had already taken in regard to agricultural prices and that, therefore, the level of agricultural prices would remain more or less stable. Actually, by the time the budget proposals came up for discussion, it was found that implementation of the policy had not gone very far on account of organisational difficulties and that agricultural price levels showed a declining trend. In such circumstances, he thought it was permissible to review the budget proposals for taxation. If agricultural prices were falling, that might be regarded as a sign of some kind of deflationary trend, and, in such conditions, he said, it was permissible to vary one's taxation proposals. One of the recognised steps in meeting such a situation was to give some relief in taxation."

We wonder as to how many of our readers will be impressed by this explanation. It is, to say the least, a very naive one. Agricultural prices had started coming down very much earlier and, even by the time Mr. Deshmukh finalised his proposals, it was evident that the measures he talks of for arresting the downward trend of prices had not succeeded. Mr. Deshmukh would be deluding himself were he to think that he could reintroduce all his original budget proposals if agricultural prices looked up again.

OUTLOOK FOR ROHTAS BRIGHT

PAKISTAN JUTE—WORLD WHEAT POSITION—U.S. TARIFF ON CYCLES—COTTON SUBSIDY

THURSDAY, 5 P.M.

THE share markets are still in a subdued mood, with equities moving within a narrow range. The downward trend noted in the previous weeks has, of course, not proceeded further, and at current levels, there is good resistance to selling pressure. The earlier selling in Tata Ordinaries by some big individual investors has been absorbed, but it remains to be seen whether the market will be able to take delivery of these scrips, if and when they are tendered, without suffering any further fall in value. It is reported that some leading speculators are still having a fairly large oversold position in both iron and steel scrips. If this is true, the technical position of the market is in favour of buyers. This, however, by itself cannot help the market to move forward, unless some fresh favourable factors appear on the scene. Psychologically, both professional speculators and investors are in a depressed mood. They are, therefore, paying little attention to news of the progress of various industries. The textile mills, for instance, especially the leading ones such as Kohinoors and Bombay Dyeings, are doing well. Cloth markets are steady, prices have been well maintained and stocks are not heavy with either the mills or the trade. Further, the cotton textile industry is not one of those earmarked for nationalisation. In view of all these, cotton mill shares should be firm. On the contrary, they have remained quiet throughout the week. The same is true of many other industrial scrips such as engineering, paper, cement and sugar. Nevertheless, investors, instead of going in for these shares, prefer to place their savings in first class preference shares and debentures. Quite a number of them are eagerly waiting for the preference and/or debenture issues of the Stanvac and Burmah-Shell Refinery Companies. But they are unlikely to be offered, until the Government of India completes its borrowing programme.

MARKET GOSSIP

• • • •

The storm raised last week by the Commerce and Industry Minister, Port Trust Chairmen and Dock Workers' unions over the foreign shipping companies' notice for levying, with effect from 1st June, 1955, a surcharge of 25 to 35 per cent. on all cargoes imported and exported through Bombay, Madras and Calcutta ports, has affected the domestic shipping companies, too. These companies had decided to raise their rates for coastal trade by 10 per cent. from this month. But they have had to postpone this decision as the Government is not in favour of it. The considerations which had impelled the coastal shipping services to raise their freights were entirely different from those that had induced the overseas companies to propose a surcharge. Besides, what the former had decided to do had already been done by the latter in December last. The contemplated increase in coastal freights was not solely on account of delays in ports, which is the main reason for the surcharge proposed by the foreign companies, but the result of an all-round increase in the cost of their operation. It is a pity that the Government should have chosen to bring pressure on them to defer the notified rise in coastal freights. It is true that all foreign conference lines have now kept in abeyance their threat to impose a surcharge for a fortnight, pending discussions with the Government of India. But they had a good reason for doing so, because, by the deadline given by them for an improvement in port conditions, the congestion in docks had been cleared and no ships were waiting unduly long for unloading or loading their cargo. In the case of coastal services, there was no such ground. It is no wonder that, in the light of these developments, the shares of Scindia Company, the largest operator on the coast, have lost further ground during the week to stand at as low a level as Rs. 14-10, as against Rs. 15-2 a week ago and Rs. 15-12 a month ago.

• • • •

The shareholders of the Rohtas Industries Ltd. have every reason to feel happy over the note of confidence which their Chairman, Mr. Shanti Prasad Jain, struck about the outlook for their Company, in his speech at its annual general meeting held the other day, the full text of which is published elsewhere in this issue. Readers will have already noted from our review of the Company's working during the past year (ended 31st October, 1954)—*vide Commerce* dated 14th May, page 944—that the Company has made strident progress, the production in the various units having touched record levels, thanks to the modernisation and extension programmes going ahead at a good pace. The output of cement rose by 17 per cent. to a record level. Paper and board production went up by 30 per cent. and the output of asbestos cement improved by 48 per cent. The *vanaspati* factory was restarted during the year. Only the sugar factory lagged behind, for no fault of the management; supply of cane was not adequate, in spite of the arrangements made for transport by rail. As will be seen from the figures of production for the first five months of the current year given in our aforesaid issue, the trend of production in all the departments of the Company is encouraging.

• • • •

The Company's cement factory is claimed to be one of the most economical in the country, barring lime-stone cost. Mr. Jain assured the shareholders that, even in respect of lime-stone cost, efforts were being made to improve the position. He disclosed that extension of transport facilities to new lime-stone quarries had already been undertaken and that the working of the new quarries would be more economical. Notwithstanding the longer transport, the lime-stone is expected to be cheaper. Further, the old kiln has been renovated completely with the result that it is now said to be on par with the new kiln in respect of both clinker production and economy in coal consumption.

• • • •

A sum of about Rs. 3 crores is expected to be spent on the extensions to the Company's paper factory. It is gratifying to note from Mr. Jain's speech that when the present extensions are completed, the Rohtas paper factory will rank as the largest modern paper factory in the country. A very wide variety of paper will be produced. It is proposed to manufacture several kinds of fine paper, like bank paper, bond paper, etc., as would match in quality with any of the similar imported varieties, in addition to enlarging the existing production and improving the qualities of boards, poster paper, kraft paper, etc. The present rate of production of the Company's paper factory is about 2,000 tons per month, and it is expected to be increased further. The increased production of paper will naturally call for larger consumption of caustic soda and chlorine. The Company's caustic soda plant is, therefore, being extended to yield a production of 5,000 tons of caustic soda and about 4,500 tons of chlorine. There will, however, be a surplus of over 3,000 tons of caustic soda. Since the Company's caustic soda will be of rayon quality, it will find a ready market at remunerative price. The entire output of chlorine will be consumed by the Company's paper factory itself.

• • • •

Mr. Jain feels gratified that, despite certain handicaps regarding transport, lack of adequate assistance in obtaining economic supply of raw materials, the Company has made steady progress. He is optimistic that, given proper facilities, this industrial centre at Dalmianagar would offer a vast scope for further development. With all the measures taken for modernisation and expansion, the prospects for the Company are indeed good and there is every reason to hope that its earnings during the next few years would improve substantially. The Rs. 10 paid-up ordinary shares of the Company are being currently quoted at Rs. 23-9 *ex-div.* On the basis of the dividend (Re. 1-8) paid for the past year, the shares give an attractive yield of 6.4 per cent. per annum, free of tax.

• • • •

Keen anxiety is being felt in Calcutta over East Pakistan Government's policy of issuing licences to jute shippers for the new season, 1955-56. Of the hundreds of applications received by the Government for renewal of licences, only 101 applications are reported to have been accepted, whereas rejections so far amount to as many as 154. Although all the applications have not been dealt with, the long list of rejections keeps out a large section of Indian jute traders. The firms to which licences have been denied are accused of having indulged, last year, in certain malpractices such as under-invoicing, undergrading, registration of bogus contracts, etc. It will be recalled, in this connection, that the value of the jute involved in this action taken last year was estimated at £5.4 million and most of the jute was for Britain and the Continent. As the alleged malpractices contravened the provisions of the East Bengal Jute Dealers Registration Act, the Government was justified in cancelling licences, as it did, in December last. This sudden action had the effect of alerting, for the first time, the trade in which irregularity and infringement of rules had almost been universal for decades past. But all this is past history and the majority of the trade has since recognised the grave consequences which would follow any infringement of rules. There is, therefore, no need for the Government to adopt, as it is doing now, a very stiff attitude in granting licences to shippers for the new season.

• • • •

The exclusion of a large section of the established jute trade will undoubtedly have adverse repercussions on Pakistan's own economy. It is conducive to the interests of neither the jute grower nor the State. Every year Pakistan exports about 5 million bales of jute. The handling of this huge quantity needs enormous warehousing and baling facilities. Besides, its movement requires a substantial amount of finance. Such of these facilities as were being provided by shippers now prohibited from trading, are by no means inconsiderable. They command considerable finance and own jute godowns and baling presses. These latter are now lost to the trade, unless the Government goes another ill-advised step forward in requisitioning and handing them over to licensed shippers. Even in that event, it is doubtful whether the relatively few licensed shippers will have enough resources—financial and otherwise—to deal with a large jute crop. Again, what guarantee is there against the recurrence of infringement of rules? When only a small section of shippers is entrusted with handling a large volume of jute which is beyond its resources and ability, malpractices are bound to reappear again in different forms. The Pakistan Government will, therefore, do well to take a lenient attitude towards disposing of applications for renewal of licences. This is all the more necessary, because the next crop, from all indications, appears to be a bumper one, being estimated tentatively at between 5.6 and 6 million bales.

• • • •

With the approaching end of the current wheat season on 31st July next, it is becoming increasingly clear that the outlook for wheat in world markets is getting rather gloomy. In spite of considerable recovery in world exports of wheat this season, thanks to relatively lower stocks with importing countries, the surplus with the exporting countries has not been reduced to any extent. The carry-over of wheat with the five leading exporting countries alone, for instance, is expected to be of the order of 205.3 million quarters (of 480 lbs. each). Although this quantity is 10.1 million quarters less than the carry-over in 1953-54 it is still about twice the normal requirements of importers which are something like 90 to 100 million quarters. It is thus evident that this very large quantity of export surplus would be sufficient to provide for the next season's normal export requirements without any call on the new crops and still leave a carry-over of 100 million quarters at the end of next season. On top of this, production in exporting countries during the next season also is expected to be heavy. In the circumstances, there seems to be a growing concern among these countries over the problem of selling the next season's crops. The prospects for any appreciable increase in the demand for wheat appear to be dim, for the simple reason that the output of both wheat and other foodgrains is expected to reveal increases in a number of countries and, what is more, some of these have built up stocks and, consequently, do not feel any need for buying more wheat. India, for instance, is looking for another bumper wheat crop and, therefore, may not purchase much wheat this year. Many European countries and Turkey are also expected to have very good crops.

• • • •

Among the exporting countries the outlook for the U.S. appears to be very bleak, as the current year is likely to end with a huge surplus of 122 million quarters, or 9 million quarters more than the carry-over a year before. This quantity is so huge that, unless production in the coming years is drastically cut, there is little likelihood of any solution to the problem of surplus wheat. The U.S. authorities have already a definite programme for achieving a greater degree of flexibility in farm production and trade. Support prices are being reduced and made less rigid. For the 1955 harvest, wheat is to be supported at 82½ per cent. of parity, but, if farmers do not agree to marketing quotas, the support price could be reduced to 50 per cent. of parity. Within these two limits, it is considered possible that an increased wheat acreage might be allowed, in return for farmers accepting a price support somewhere between 50 per cent. and 82½ per cent. Besides, the U.S. authorities are also endeavouring to liquidate official stocks by export sales. One of the ways in which the stocks are being reduced is to barter with other countries surplus agricultural commodities in return for strategic materials such as raw silk, mined ores and fertilisers. Thus, in the first ten months of the year ending 30th June, 1955, they contracted sales abroad for surplus commodities worth $211.5 million. Of this, wheat valued at $75 million was exported upto 30th April. This, however, is just a flea-bite, considering the enormous stocks awaiting disposal. At this rate, the U.S. cannot get rid of much of its stocks. It will be interesting to see what they will do there, as all available storage space has been filled up.

• • • •

The outlook for rice, however, appears to be somewhat better than that for wheat. According to the Commonwealth Economic Committee's *Rice Bulletin*, the rice crop in 1954-55 is slightly smaller than the record figure of 1953-54. In the first two months of this year, exports from South-East Asia continued to increase, but those from the U.S. and Italy declined. Rice shipments from Burma, Thailand and Indo-China aggregated nearly 440,000 tons, as against 381,000 tons in the corresponding period of 1954 and 317,000 tons in 1953. Imports of rice into the main importing countries in 1954 were slightly better than in 1953, with larger offtake by Japan and India more than offsetting a reduction in that of other countries. Japanese imports reached in that year 1.49 million tons, and was the peak level for the post-war period. India was the second biggest importer, on account of its decision to build up reserves for emergencies. About 1.3 million tons of home-grown rice plus 900,000 tons purchased from Burma were expected to enable the country to have adequate stocks to meet any emergency. At present, India's rice reserve is placed at 1.5 million tons and this permits it to abstain from all purchases of foreign rice this year, even if its rice crop were to be somewhat less than the last year's record outturn. According to the latest reports, the entire stock of Burmese rice purchased by the Government of India under an agreement with the Burmese Government has arrived and the authorities at New Delhi would appear to have decided against importing any more rice during the current year.

• • • •

Among other importing countries, the U.K. appears to have purchased 25,400 tons in the first quarter of this year, as compared with 16,300 tons in the same period last year. Indonesia was the world's third biggest importer in 1952. Since then, its imports have fallen drastically, thanks to implementation of plans for attaining self-sufficiency in this cereal. It is, however, expected to buy some foreign rice this year. Malaya, Ceylon, Hongkong and Cuba are the only other countries interested in importing rice.

SHARE MARKET DULL

UNDERTONE STEADY

(From Our Own Correspondents)

BOMBAY, 2nd June

DULL and featureless conditions marked trading on the Stock Exchange during the week under review shortened by a day due to closure of the market today on account of a Jain festival. During this short working week, activity continued to be on a restricted scale and fluctuations in prices were confined to a narrow range. Early in the week, trading was of a squaring-up nature due to settlement considerations. The new account opened on a steady note, as operators were encouraged by the news of setting up a new Ministry for Iron and Steel under the charge of the Commerce and Industry Minister. Equities made some headway, despite the tendency to book profit at every rise. On Tuesday, however, a sagging trend was in evidence on nervous liquidation by bulls and lack of support. This was attributed to a speech in Bombay by Dr. John Matthai, suggesting the placing of a ceiling on income under the present circumstances and the gearing up of the taxation structure to cover all risks. Indian Irons bore the brunt of this pressure, assisted by discouraging advices from Calcutta. Scattered covering, however, checked a sharp recession. Yesterday, again, the market turned steady on revival of some support induced by second thoughts on Dr. Matthai's suggestions which were construed to contain nothing new. The closing prices were, therefore, above the worst levels of the week. The undertone was slightly steadier than in the last week.

Tata Ordinaries were marked down from Rs. 228-4 to Rs. 227-8, but they revived to Rs. 229 on Monday. After a reaction to Rs. 226-8, they closed better at Rs. 228 on bear covering. Fresh support for this counter was not forthcoming to any marked extent, due to fears of heavy carry-forward charges on account of the closure of the Company's share transfer books from 1st to 29th July, both days inclusive. Indian Irons were depressed, moving down from Rs. 33-3¼ to Rs. 32-7, the lowest level since 15th February last. There was, however, a revival to Rs. 32-11¼ at the close.

Barring a few selected counters, textiles were generally steady. Bombay Dyeings gained ground from Rs. 455 to Rs. 458-12 on Monday. After a dip to Rs. 452-8, they finished at Rs. 455. Kohinoors moved narrowly and gained on balance Re. 1-4 at Rs. 312-4. Centurys put on at the close no more than As. 12 at Rs. 377-8, although the highest level touched during the week was Rs. 379-8. Central Indias were subjected to heavy unloading on unfavourable rumours about the current working of the Company; the shares lost on balance Rs. 5 to Rs. 118. Finlays held their own at Rs. 245-8 and Gokaks at Rs. 211-8. Indu Ordinaries were a shade quiet at Rs. 10-9, while Indore Malwas gained Rs. 2-8 to Rs. 95. Khataus held ground at Rs. 167-8, Lakshmis at Rs. 507-8 and Minervas at Rs. 98-8. Morarjis appreciated by Rs. 3-12 to Rs. 222-8, while New Citys gave way from Rs. 140-12 to Rs. 138-12 and New Greats from Rs. 171 to Rs. 170. Podars lost Re. 1-4 to Rs. 158-12 and Phoenix Rs. 2-8 to Rs. 112-8. Shree Niwas was better at Rs. 223-2 *ex-div.* (div.: Rs. 14), as against Rs. 235 *cum-div.* a week ago. Simplex were unchanged at Rs. 154. Standards moved down by Rs. 5 to Rs. 353-12. Svadeshis were up by Rs. 2-8 at Rs. 187, whereas Tatas were lower by Re. 1-12 at Rs. 46-4. Vishnus changed hands Re. 1-8 higher at Rs. 135.

In the banking section, the outstanding development of the week was the removal of the shares of the Imperial Bank of India from the Stock Exchange list. The shares, which had been on the list for over 33 years, that is, since the formation of the Bank in January, 1921, by the amalgamation of the three Presidency Banks, went off the list on 28th May. The share transfer books of the Bank will remain closed from 16th to 30th June. Prior to the removal from the list, Fully Paid shares were dealt in at Rs. 1,700 and the Partly Paids Rs. 3-12 higher at Rs. 420. The other shares in this section were quiet with fractional losses over the week. Barodas were done As. 12 lower at Rs. 99-4, while Bank of Indias gained As. 8 at Rs. 146-8. Central Banks shed As. 4 to Rs. 47, as also their 'A' shares to Rs. 48-12. Punjab Nationals were a fraction lower at Rs. 42, and United Commercials at Rs. 44.

The insurance section displayed an easy tone with losses in leading counters. Orientals changed hands at Rs. 100 lower at Rs. 7,100. New Indias were picked up Re. 1-8 lower at Rs. 47-8. Indian Mercantiles lost Re. 1-4 to Rs. 44-8.

In the electricity section, most of the counters disclosed a reactionary trend. Ahmedabad Electrics were, however, steady with a fractional gain at Rs. 105-5. Bombay Suburbans were taken up As. 10 lower at Rs. 123-2 and Surat Electrics Re. 1-4 down at Rs. 134-6. Andhra Valleys (old) stood Rs. 3-12 better at Rs. 1,380, while their New shares lost Rs. 3-12 to Rs. 1,062-8. Tata Hydros lost Re. 1-8 to Rs. 141-8 and their New shares Rs. 2 to Rs. 107. Tata Powers were unchanged at Rs. 1,445 while their New shares gained Rs. 17-8 to Rs. 1,140. The Tata Hydro-electric Companies have made the final call on their new shares.

The miscellaneous section was quiet, with select counters showing fair-sized losses. In the sugar group, Belapurs moved in a narrow groove, closing a fraction lower at Rs. 300, as also Bhopal Sugars at Rs. 12-10. Phaltans gained As. 8 to Rs. 120, while Walchandnagar Industries reacted from Rs. 203-12 to Rs. 200. Among cement shares, A.C.C's shed a fraction to Rs. 174-12 and Digvijays Rs. 2 to Rs. 182-4. In the engineering and mining group, Alcocks shed a part of the previous week's gain and closed Rs. 2-8 lower at Rs. 271-4. Jost Engineerings had business Re. 1-8 lower at Rs. 94-8. Larsen and Toubros eased by As. 9 to Rs. 13-4. Premier Constructions lost further ground from Rs. 146 to Rs. 142-8. B.B. Petrols were done at Rs. 3-3 *ex-div.* (div.: As. 2-1½), as against Rs. 3-5 *cum-div.* last week. Indian Coppers were dull at Rs. 3-10. Shivrajpurs held ground at Rs. 65-8. In the shipping and transport group, Scindias slipped from Rs. 15-2½ to Rs. 14-8, before recovering to Rs. 14-10½. Great Eastern Shippings were wanted As. 6 lower at Rs. 15-9. India Steamships were unchanged at Rs. 7-5. Hindustan Motors were As. 2 down at Rs. 8-8. Among other miscellaneous industrials, Bombay Burmahs (old) were steady at Rs. 456-4, while their new shares were taken Rs. 2-8 lower at Rs. 168-12. On abatement of buying, B.I.C's shed As. 4½ to Rs. 8-12. National Rayons attracted attention and jumped up by Rs. 5-12 to Rs. 209 on reports that the Company had sold its production up to December, 1955, at a price slightly higher than market quotations and that the current working was good. Tata Chemicals changed hands As. 1½ lower at Rs. 13-7, while Tata Oils were unchanged at Rs. 39. Wimcos were brought down from Rs. 185 to Rs. 181-4.

Calcutta Stock Exchange

CALCUTTA, 1st June

Barring tea company scrips which encountered fresh support, the Calcutta Stock Exchange displayed a distinctly easy tendency during the week under review. Traders were greatly disappointed at the Union Finance Minister's statement that there was still scope for additional taxation—direct and indirect—as, for example, inclusion of essential commodities for the levy of sales tax. Besides, fears of nationalisation at low rates of compensation stifled activity in the market. Lack of encouraging reports with regard to the Tata Iron and Steel Company securing a loan from U.S. private investors for further expansion was another unhelpful factor. The cumulative effect of all thess influences was that the longs were somewhat eager to reduce their commitments, while bears were inclined to lose no opportunity to press sales. Equity values, as a consequence, generally tended to look down. As stated at the outset, tea shares evoked good buying enquiries on reports of revival of demand in tea auctions and expectation of still better sales in the coming weeks.

Selling was particularly more pronounced in the engineering section. Indian Irons moved down by As. 13 to Rs. 32-10. Richardson and Cruddas dropped As. 9 to Rs. 17-8. Martin Burns fell by As. 8 to Rs. 22-15. Textile Machinerys suffered a loss of As. 4 to Rs. 17-15. Kumardhubis were neglected at Rs. 12-1.

Jute shares also staged a retreat for want of support even at declines. Budge Budges receded by Rs. 3 to Rs. 172. Nuddeas slipped from Rs. 55-4 to Rs. 54-8 and Nationals from Rs. 33-3 to Rs. 32-11. Chitavalsahs lost As. 8 to Rs. 13-10. Presidencys were done As. 4 lower at Rs. 6-9. Lansdownes changed hands at Rs. 136-8 on Tuesday, as against Rs. 137 on 26th May. New Centrals, on the other hard, came in for special enquiries and rallied Rs. 4 to Rs. 162. There were some buyers today for Agarparas at Rs. 13-8 and Burrakurs at Rs. 12-7. Champdanys were transacted at Rs. 154-8 and Aucklands at Rs. 135.

Coal shares too failed to elicit attention of operators. Bengals eased by a rupee to Rs. 496. Equitables decreased by As. 6 to Rs. 29-6. Burrakurs and Western Bengals were sold As. 3 lower in each case at Rs. 12-7 and Rs. 7-1, respectively. Central Indias lost As. 2 to Rs. 7-6. Sendras were quiet at Rs. 10. New Beerbhooms, however, improved by As. 5 to Rs. 19-6 on buying support. Deals in New Manbhooms were put through at Rs. 8.

Quotations for most of the miscellaneous scrips were easy. Rallis Indias were subjected to heavy selling and slumped by Rs. 2-12 to Rs. 36-12. Calcutta Electrics dropped As. 9 to Rs. 14-13. Rohtas slipped by As. 8 to Rs. 23-9. British India Corporations declined by As. 7 to Rs. 8-12. Among paper mill shares, Shree Gopals and Orient Papers moved down by As. 6 each to Rs. 16-14 and Rs. 26-12, respectively. Titaghurs shed As. 8 to Rs. 43-8. India Paper Pulps, however, met with good investment support and firmed up by Rs. 11 to Rs. 259. India General Navigations retreated by Re. 1-8 to Rs. 91-8. British Burma Petrols lost an anna to Rs. 3-3. Indo-Burma Petrols were quiet at Rs. 133. India Steams gave way from Rs. 7-5 to Rs. 7-3. National Tobaccos were a shade easy at Rs. 9-4. Indian National Airways were quiet at Rs. 4-13. Among sugar shares, Carew & Cos. were done As. 8 lower at Rs. 11-10. Sree Krishna Gyanodayas declined by As. 7 to Rs. 17-2.

Fairly large business was put through in tea shares, with prices recording improvement. Hantaparas elicited special support and advanced by Rs. 5 to Rs. 323. Dhunseris were also well favoured, their quotation rising by Rs. 3-8 to Rs. 27. Bishnauths picked up Rs. 2-2 to Rs. 46. Tezpore hardened by Re. 1-5 to Rs. 31-9 and Hasimaras by Re. 1-12 to Rs. 45. Methonis gathered As. 14 to Rs. 24-8, Brooke Bonds and Jaybirparas rose by As. 6 each to Rs. 15-10 and Rs. 38-10 respectively. Baghmaris were quoted today at Rs. 27, as against Rs. 27-8 on 27th May.

Madras Stock Exchange

MADRAS, 1st June

Favourites in the Madras Stock Exchange came in generally for some good support during the week under review. This was in evidence particularly in the textile section due to overseas demand for select quality piecegoods. The upward tendency noted last week in the tea section persisted this week also, on prospect of renewed demand for tea leaves from the U.K. Select scrips among rubbers and coffees too met with sustained support. The miscellaneous section also witnessed scattered enquiries. On balance, business done in the market remained restricted and price gains turned out to be moderate. The undertone, however, remained steady.

There were a few notable dividend announcements during the week under report. Of them, mention may be made of the Mettur Industries, which declared a dividend of 35 per cent. for the year ended 31st March, 1955, as against 22½ per cent. for the previous year. Vijayamohini has maintained the dividend of 7½ per cent. for the year ended 31st December, 1954. The Directors of Gokul Rubber and Tea Plantations declared a dividend of 9 per cent. for the year ended 31st December, 1954, as against 6½ per cent. for the previous year.

Among textiles, Anglo-French put on Rs. 2 to Rs. 98 ex-div. and Buckinghams Re. 1-8 to Rs. 153. Bangalore Woollens improved by Re. 1 to Rs. 426. Balasubramanias (Rs. 40 paid up) were higher by Rs. 2 at Rs. 57 *cum-div.* and Lakshmis Rs. 50 paid put by Re. 1 at Rs. 142. Palani Andavar 'A' and 'B' were better by Re. 1-8 each at Rs. 112-8 and Rs. 158-8, respectively. Vijayamohinis were quiet at Rs. 94 *cum-div.* Mettur Industries changed hands at Rs. 350 *cum-div.*, as against Rs. 330.

In the tea section, Coonoor Teas rallied Re. 1 to Rs. 32-8 and Devoshalas As. 12 to Rs. 25. United Nilgiri Teas gathered Rs. 4 to Rs. 279. Highlands, however, lost As. 12 to Rs. 16-4 *cum-div.*, while Nonsuch Teas were quiet at Rs. 31 and Blue Mountains at Rs. 3-9½.

Vaikundams, among rubbers, advanced by Re. 1 to Rs. 23-4 and Rajagiris by As. 4 to Rs. 16-10. Kailas were better by an anna at Rs. 5-4. But Teekays lost As. 3 to Rs. 8-9 and Waterfalls an anna to Rs. 3-12. Malankaras were dull at Rs. 27 and Pullangodes at Rs. 3-12. Gokul Tea and Rubber Plantations were done at Rs. 2 *cum-div.*, as against Re. 1-12.

In the coffee section, Coffee Lands were up by As. 6 at Rs. 17-2, while Consolidated Coffees were unchanged at Rs. 19. Puthuthotams were fractionally better at Rs. 4-3½. Kadur Coffees were, however, colourless at Re. 1-10½.

Among miscellaneous scrips, Bruntons rallied As. 4 to Rs. 8 and Mettur Chemicals an anna to Rs. 8-9. India Cements gained As. 2 at Rs. 23-10. Travancore Cements were also better by a similar amount at Rs. 8-5. But Rallis lost Rs. 2 to finish at Rs. 38.

The structure and the extent of deposits of manganese ore in Madhya Pradesh (M.P.) are being studied under the Point Four Programme. According to the latest available information, M.P. has a belt of manganese deposits extending over 128 miles in length and 20 miles in width. The deposits are located in Bhandeara, Balaghat, Nagpur and Chhindwara districts. It is estimated that M.P. has 100 million tons of manganese ore, as against a total of only 2.5 million tons in Madras and Mysore and 5 million tons in Bombay. With the completion of the two ferro-manganese plants, one at Tumsar and the other at Ramtek, proposed to be erected under the second Five-year Plan, there will be a sharp fall in the export of raw ore.

NEWS IN BRIEF

A THREE-MAN delegation, representing Japanese leather trade, has arrived in Madras to explore ways and means of developing Indo-Japanese trade in tanned goat and sheep skins.

The Government of India has decided to place next year Rs. 20 crores at the disposal of the State Governments for the development of highways. This is twice the sum provided last year.

A team of the Geological Survey of India which is conducting digging operations in Khairal Patti of Almora District has traced one-mile long lead belt between Chhepani and Belaun Sera. The belt is 600 feet wide and 1,200 feet deep. The percentage of lead in the newly struck belt will be from 6 to 14.

Plans are afoot to increase the sugar output in Madhya Bharat from the present level of 3 lakh maunds to 8 lakh maunds. The Chief Minister of the State has suggested the appointment of a committee consisting of officials and representatives of sugar millowners to recommend measures for achieving the target.

The Railway Ministry has decided to make the railway line between Nagpur and Rourkela a double line, in order to cater to the needs of the Bhilai steel factory. With this, the entire highway from Bombay to Calcutta will be a double line and all the steel factories, Jamshedpur, Rourkela and Bhilai, will be on this Bombay-Calcutta line.

American ghee amounting to 6 million lbs. is among the food gifts to be sent by charitable associations in the U.S. to India for distribution among the poor and the needy in the country. Negotiations are still going on between the U.S. and the Indian Governments, as regards the import of American ghee for commercial purposes.

The Government of India has fixed the price of tea for the purpose of determining the export duty during the month of June at Rs. 2-7-3 per lb., as against Rs. 3-5-6 per lb. for the previous month. At this rate, the export duty on tea, under the sliding scale of duty, will be As. 4 per lb. and represents a 50 per cent. reduction from that in force during May.

The Saurashtra Government has formed a 15-member committee to examine the possibilities of developing the industries in the State through the private sector. The Government has decided to set up two corporations with a capital of Rs. 10 crores each for East Saurashtra and West Saurashtra for the above purpose. The Government also proposes to nationalise the passenger bus transport and for this purpose an experimental scheme with a capital expenditure of Rs. 1.65 crores is under consideration.

The Madhya Bharat Government has announced certain concessions in sales tax with effect from 28th May, with a view to reducing the burden of tax on persons having low income, reducing the impact of tax on goods on which income-tax is paid and removing sales tax difficulties of retailers of general goods. Thus, sales tax will not be charged on shoes, the cost of which does not exceed Rs. 10 per pair. Footwear prepared by the producer himself without using power at any stage of their production, if sold by the producer himself, will be free from sales tax. The rate of sales tax has been halved from Rs. 6-4 to Rs. 3-2 per Rs. 100 on sewing and knitting machines. Such goods on which Madhya Bharat income-tax is paid and on which sales tax is charged on or after 1st April, 1955, if sold during the current financial year, will be free from sales tax.

From Abroad

A number of Australian industries has been given protection or increased protection under the amended tariff schedule approved by the House of Representatives last week.

Steel producers and consumers in West Germany have reached an agreement for increasing the price of steel by an average of 2.3 per cent. The increase is effective from the beginning of June.

The licences of 21 jute shippers, most of whom are Indian business men, have not been renewed by the Pakistan Government for the new season. These business men are alleged to have engaged in irregular practices.

The Australian Government's Commonwealth Shipping Line is now the largest shipowner on the Australian coast, with a fleet of 41 ships and another 19 on order, of which 16 will be built in Australia.

The discount rates of South African Treasury bills have been raised with effect from 1st June. The new discount rates are: 3 months: 2½ per cent. and six months: 2⅝ per cent. These compare with the previous rates of 2-7/16 per cent. and 2½ per cent., respectively.

Six Latin American nations have approved the creation of the International Finance Corporation, according to an announcement by the International Bank for Reconstruction and Development. The nations are: Mexico, Cuba, Panama, Costa Rica, the Dominican Republic, Paraguay and Honduras.

The tea subsidy scheme introduced by the Ceylon Government is reported to have cost the Government Rs. 15 lakhs at last week's auction when the scheme first came into operation. Of this amount, subsidy payments accounted for Rs. 11 lakhs and purchase of unsaleable teas for Rs. 4 lakhs.

The Italian Chamber of Deputies has approved of a measure exempting transactions in unwrought gold from payment of turnover tax. Gold and silver coins imported into Italian territory have also been exempted from the tax. Imports of gold have still to be handled through the Italian exchange control office.

The Iron and Steel Board, U.K., has changed the prices, both upwards and downwards, of certain non-alloy steel wire rods. Though most of the changes are relatively small, they are said to represent the Board's policy of rationalising the price structure. The net effect of these changes on the general level of steel prices will not be significant. The new prices have come into effect from 30th May last.

Tea traders of Ceylon are stated to have decided to limit the weekly catalogues for the Colombo tea auctions of the next three weeks to 6 million lbs. The object of this step is to prevent a surfeit of teas being offered for sale at the auctions and thereby depress prices further. When the export subsidy scheme was announced two weeks ago, it may, however, be noted, the Government said that no limits would be placed on the quantities of tea to be auctioned each week.

An agreement has been reached between the U.S. railway companies and railway conductors (ticket collectors), through the intervention of the American National Mediation Board, thus averting a possible nation-wide strike of railway conductors. The agreement ends a six-year old dispute over the demand of the conductors to be paid on a graduated scale according to the pulling power of locomotives, in place of the existing daily basis. The settlement calls for payments to conductors based on the length of trains, in addition to their regular daily wage.

PERSONAL

MR. Mirza Ismail, a former Dewan of Mysore, left Bombay on Monday this week for Frankfurt, Germany.

Mr. B. N. Banerji, Collector of Customs, Bombay, has been appointed member of the Central Board of Revenue, Delhi. He has been succeeded by Mr. A. V. Venkateswaran, Collector of Central Excise, Bombay.

Prof. B. P. Adarkar, until recently *Charge d' Affaires*, Indian Embassy, Bonn, West Germany, has arrived in India from London. Prof. Adarkar will leave for Hong Kong on 20th June to take up his new appointment as Indian Commissioner in Hong Kong.

Mr. A. D. Wenzel, Managing Director, Firestone Tyre and Rubber Co. of India Ltd., left last week on an extensive overseas tour. Mr. Wenzel will spend some time at Akron, the head office of the Firestone organisation. Before returning to India, he will visit Firestone factories in the U.S. and Europe.

Mr. P. M. Chinai, President of the Indian Merchants' Chamber, and Mr. P. Chentsal Rao, Secretary of the Federation of Indian Chambers of Commerce and Industry, left for Paris last week to make arrangements for the International Industrial Exhibition to be held at Delhi in October this year. Mr. Chinai later on proceeded to Geneva to attend the annual session of the I.L.O. which commenced there on 1st June.

The West German firm, Diemag Civil Engineering Works, has secured a contract valued at about £17 million for a steel plant near Heliean, Egypt, with a capacity of 264,000 tons of crude steel and a rolling mill for 200,000 tons per year. Preparatory construction work has already started. The West German Company will accept shares of the Egyptian steel works for 20 per cent. of the f.o.b. value of machinery and installations. The disposal of these shares within a few years after the plant has started production has been guaranteed.

The Pakistan International Airlines Corporation has just announced new services and developments in its operation. First it has replaced, with effect from the 4th inst., the Dakotas on the Karachi-Delhi route by the more comfortable and faster Convair aircraft. The rates, however, have not been changed. Secondly with effect from the 5th inst., it proposes to increase the Convair services between Karachi and Bombay from three to five times a week. Finally, it proposes to introduce with effect from the 8th inst., three new coach services through Multan. Two of these will operate between Karachi and Lahore and the third between Karachi, Rawalpindi and Peshawar. A special feature of these new services is the reduction in fares.

World oil-refining capacity at the end of 1954 amounted to about 820 million metric tons, thus showing an increase of 53 million metric tons or about 7 per cent. The total refining capacity of the Commonwealth oil refineries as a whole last year was 77 million tons—12 million tons more than in 1953. By far the most important individual countries within the Commonwealth oil refining area are the United Kingdom and Canada, each with just over 29 million tons capacity last year. Other new refineries are now being constructed in India, Australia and elsewhere. Outside the U.S., Western Europe has become the leading area and now has a capacity of 100 million tons, if the U.K. plant is included. The chief refining country is still the U.S., which accounts for over half of the world total at 419 million tons.

TEXMACO
Boiler & Heavy Engineering Division ◎ Ring Spinning and Drawing Frames
TEXMACO
is dedicated to sharing and solving your production problems.
By supplying exactly the right machine for your job, Texmaco secures for you incredible economies in time and cost plus higher quality production all along the line.
can meet your requirements in Smoke Tube, Marine, Water Tube and Locomotive Boilers, Flues, Mechanical Stokers, Economisers, Chemical and Pressure Vessels, Coal Handling Plant, Chimneys, Ductings, Cranes, Wagons and Rolling Stock, Penstock Pipes, Sluice and Spillway Gates for Hydraulic Dam Projects, etc.
are the products of extensive research and designed for improved yarn production in point of quality and quantity under varying mill conditions.
In addition to complete units a wide variety of spare parts and conversion material can be manufactured to required specifications.

DEVELOPMENT OF MALNAD

IT is but natural that the second All-India Malnad Conference, which met in Mercara last week, should have pleaded for the appointment of a planning committee for the all-round development of the entire Malnad region. For one of the chief reasons why the development of the region has suffered so far is that it is under the rule of more than one State Government. The region referred to stretches from Belgaum in Bombay State to Malabar in Madras State, cutting across at least four States, namely, Bombay, Mysore, Coorg and Madras. But really speaking, it covers the whole area stretching from the mountainous spine of the Western Ghats commencing from Bombay through Wynaad to South Travancore, including spurs, such as the Nilgiris, the Palnis and the Annamalais. Be that as it may, since it is the duty of every State through which the Malnad area stretches to develop the region, no State is willing to carry the baby. The result is that this lovely stretch of territory, full of potentialities for agricultural and industrial development, persists to be a backward area. The natural resources of the region, which include timber, sandalwood, pepper, cardamom, coffee, rubber, tea and cashewnuts, have been producers of foreign exchange. Consequently, if the region were to play its part in the economic development of India as a whole, it should be developed as one integrated unit to the extent possible. The Planning Committee should, as suggested by the Conference, be under the chairmanship of a member of the Planning Commission and include representatives of Coorg, Travancore-Cochin, Madras, Mysore and Bombay as members. It is to be hoped that the Government of India will constitute such a body at an early date.

It is no wonder that the Conference expressed concern at the lack of transport facilities and urged the Union Government to undertake the construction of a number of important railway lines, a network of roads and a major port between Goa and Cochin. Provision of adequate transport facilities is the first requisite for the development of Malnad. Without road and rail transport, little can be done to exploit the natural advantages offered by this area for the benefit of the country as a whole. It is high time that the demand for linking Mysore with Coorg and Tellicherry, Shorannur with Nilambur through Wynaad and Hubli with Dharwar by rail were fulfilled. So also the construction of a network of roads connecting outlying areas with the Malnad region and the hinterland with the coast. The construction of a major port between Bombay and Goa will only add to quicken the pace of development of the region. The constitution of marketing boards will also help marketing of the plantation products in such a way as would benefit not only the producer but also the consumer.

An important factor obstructing the development of Malnad is the lack of requisite power supply. Consequently, the Conference dealt with this aspect also. Ironically enough, although many rivers originate and flow through Malnad and are favourable for developing large quantities of hydel power, the Malnad can boast of very few of such power projects. Despite this, the Conference has put forth only a modest demand that the Barapoie Hydro-electric Project which would generate 18,000 kw. of power, besides irrigating 30,000 acres, should be included in the second Five-year Plan.

The Conference requested the Union Government not to levy the proposed income-tax on any portion of income from coffee and to popularise drinking of Indian coffee in India and abroad by setting up suitable agencies. This stress on coffee shows how important the produce is to the economy of Malnad. The employment potential of coffee and other plantations is quite high and, as such, the development of these crops in this area should be accorded the highest priority.

RAILWAY FREIGHT RATES

Mr. Shanti Prasad Jain pleaded, in the course of his address to the twenty-second ordinary general meeting of the Rohtas Industries Ltd., held at Dalmianagar recently, for a revision of the railway freight structure. He held that the present freight structure, evolved as far back as in October, 1948, had a number of glaring defects, which restricted the growth of industries in general. The recent 10 per cent. increase in freight on movement of goods within the first 300 miles had, he asserted, "apart from pushing up transportation cost of raw materials and finished goods, cut at the root of regional development." Besides, he averred that the present classification of goods for freight purposes was not based on scientific foundations. Speaking on the effect of the present freight structure on the development of the chemical industry, he remarked:

"With the present high freight structure of salt in comparison with coal, the alkali industry, wherein coal, lime-stone and salt are important raw materials, is proposed to be established largely near salt centres, and not near coal areas. With a comparable freight structure for coal and salt, the industry would have developed in both the areas. Natural advantages possessed by Bihar and Bengal have been set at naught by the Railway Ministry by their inequitous freight structure, putting other raw materials, howsoever basic for industries, generally at a disadvantage with coal. It is very desirable that freight rate on salt and coal should be comparable. If a rational freight is fixed for salt, coal empties could be conveniently utilised for this movement."

That there is need for the revision of the railway freight structure is hardly disputable, but whether it should be on lines suggested by Mr. Jain is a matter to be decided by experts. Even the Government of India is convinced of the need for a revision of rates, as witness its decision to constitute a special committee to enquire into the present freight structure and suggest measures needed to alter it. The freight charged by railways for bulk carriage of goods, such as coal, for instance, is far lower than that charged by coastal ships, with the result that it is practically impossible for shippers to compete with rail. The Government of India has decided to constitute a shipping committee also to enquire into the problem of rail-ship competition. It is to be hoped that the two committees scheduled to be constituted shortly, will work in co-operation with each other. The revision of the freight structure is all the more urgent now, because the success of the second Five-year Plan, with a large degree of emphasis on industrial development, will depend not only on the availability of adequate transport facilities but also on the existence of a proper structure of freight rates.

DR. B. C. ROY ON SECOND PLAN

An important pronouncement which Mr. Nehru made at a Press conference in New Delhi on Tuesday last was that the National Development Council had generally approved the approach to planning as contained in the Plan-frame prepared by Prof. P. C. Mahalanobis and others and endorsed the views of the Economists' Panel. This pronouncement should not, however, be taken as the final indication of the shape of the second Five-year Plan. For the Planning Commission will have to consider in detail, besides the three papers submitted by the Statistical Institute, the Economics Divisions of the Finance Ministry and Planning Commission, and the Panel of Economists, the several ideas and suggestions offered by individuals and associations of industry and trade. Dr. B. C. Roy, Chief Minister of West Bengal, has already aired his views on the second Plan in the daily Press.

The daily Press version of Dr. Roy's formula reveals that it differs from the aforesaid three papers even in the matter of approach. At the very outset, Dr. Roy dubs the whole statistical-mechanical approach as being basically unwise, unsuitable and, perhaps, dangerous. He lays particular stress on the assessment of (1) our current available surplus resources—material and human—which can be straightaway utilised for further growth, and (2) our current capacity for the organisational effort required for promoting such growth. "What matters is," to quote him, "not what are potential reserves but what is the extent of the existing resources and our ability to utilise them within the period of the second Five-year Plan." Dr. Roy also dismisses the common production programme enunciated in the Plan-frame—under this programme, the surplus production from agriculture and small-scale consumer goods will be controlled and rationed to meet the increased demand of consumer goods by wage earners—as being hardly feasible in this country. He gives three reasons for holding this view. First, the excess from small-scale and hand industries will be poor in quality and small in quantity. Secondly, they will not satisfy the demands of wage earners. Thirdly, the agricultural surplus will have to meet the increased demand of the villagers and they will not offer them for sale, unless they get something in return which they value; heavy capital or producers goods will not satisfy them. Dr. Roy, therefore, opines that we should plan for the needs of villagers for their village enterprises, the need for raw materials, improved tools, equipment, cheap power, etc. It is only then we can, he argues, estimate the supplies which will be needed of coal, iron and steel, yarn, machinery for making tools, irrigation facilities and so on. Such supplies will have an assured market. We can then calculate our targets for heavy industries. In other words, Dr. Roy's formula boils down to this:

We should plan for (1) increased production in agriculture and small-scale industries, (2) increased consumer goods for the use of larger number of workers engaged in making capital goods, construction work, transport, electricity, etc., and (3) fuller use of the present installed capacity for consumer goods; the scheme may be expanded to put in new installations in due course.

A specific issue on which Dr. Roy does not agree with planners, including Mr. C. D. Deshmukh, India's Finance Minister, relates to taxation. The Economists' Panel, it may be noted, has endorsed the recommendation of the Taxation Enquiry Commission to the effect that Article 286(3) of the Constitution will have to be amended in order to remove the present exemption of articles "essential to the life of the community" from the scope of State sales tax. It also considers that measures designed to secure a practical ceiling on income through a steepening of taxes on income and wealth (including estate duties) as an imperative necessity. Speaking in Madras the other day, Mr. Deshmukh stated that there was still scope for additional taxation—direct or indirect—as, for example, inclusion of essential commodities for the levy of sales tax. This view has, however, been stoutly opposed by Dr. Roy who categorically maintains that there is no room whatever for further taxation, much less to attempt taxing essential supplies like food products. Significantly enough, he remarks: "So far as State subjects are concerned, it is almost impossible to increase the sources of taxation much less to attempt tax on essential supplies like food products. The level of our standard of living left after meeting the essential requirements is very narrow. If we take away a part of them for investment in schemes which will only bear fruit for direct consumption after some interval, the present standard of living will be further depressed. Therefore, there cannot be a curtailment of present consumption which is already very low. It may be possible to get increased receipts of taxation, if we can tap the higher income groups. But our present structure of taxation of these groups leaves little scope for them to bear any further burden."

Dr. Roy has a few interesting observations to make on what is called "consumable wealth." Alluding to the increase in national income from Rs. 9,190 crores in 1950-51 to Rs. 10,800 crores in 1955-56, he points out that it cannot be overlooked that this increase is not in the form of directly consumable wealth, for a considerable portion has been in the shape of dams, factories and other capital investments which will have time to express themselves in a rise in the standard of living. According to him, a part has to be set aside for maintenance of capital previously installed and a part for the consumption requirements of increased population. Only the remaining portion will represent the net addition to wealth available for direct consumption.

BHILAI STEEL PLANT

The preliminary work for the execution of the Bhilai Steel Project (Madhya Pradesh) seems to be in full swing. The Geological Survey of India has carried out a contour survey of approximately 25 sq. miles of land around the proposed factory site. The State Government has organised boring and trenching operations to provide the necessary geological data. The Engineering College at Jabalpur and the Central Laboratory at Poona have been carrying out the necessary tests. The sampling and analysis of the essential raw materials are nearing completion. The site for the steel plant is very near the Shivnath and Kharun Rivers, both tributaries of the Mahanadi. The plant alone will cover some 26 square miles, this, together with the township of 20,000 modern houses, may occupy an area of about 100 square miles.

It would appear that the Russians want to execute the project as quickly and efficiently as possible and show to the world that the communist countries could deliver goods better and at a cheaper rate than their democratic counterparts. Thus, they seem to be determined to challenge the supremacy of industrial democracy. It remains to be seen how the German counterparts who are to erect the Rourkela steel plant and the British who propose to erect another steel plant for the Government of India will emerge from the competition.

The Bhilai steel plant is expected to go into full production in December, 1959; a considerable part of it, including the two blast furnaces, will be ready a year earlier. The plant will have an initial capacity of one million tons of ingots to be rolled into about 750,000 tons of rolled products. The plant will be designed with a view to eventual expansion up to a capacity of one million tons of rolled products. Construction work of the plant will commence after the approval of the detailed project report by the Government of India, which is expected to be submitted by the Russian experts by December this year.

U. S. INVESTMENTS IN PAKISTAN

The pace of economic development in Pakistan will be greatly accelerated in the coming years, following the provision of U.S. Government guarantees for American private investments in business enterprises in Pakistan. An agreement to provide this guarantee was signed between the Governments of the two countries in Washington on Thursday the 26th ultimo. The agreement was effected by an exchange of notes between Mr. George V. Allen, Assistant Secretary of State for Near Eastern, South Asian and African Affairs, and Syed Amjad Ali, Pakistan's Ambassador in the U.S. Pakistan thus becomes the first country in the Asian region, bordered by Turkey on one side and Thailand on the other, to sign such a pact with the U.S., and the twenty-fifth country to co-operate in the programme for facilitating the flow of U.S. private capital to foreign countries, first established in 1948.

The agreement provides for guarantees to American investors against loss from inconvertibility of foreign currency earnings into dollars or from expropriation. The guarantees are administered by the U.S. Foreign Operations Administration, but all guaranteed investments must be approved of by both the U.S. and Pakistan Governments. There will, however, be no interference in the operation of the business involved. Announcing these details, the U.S. State Department observes: "The United States plans to draw the attention of U.S. business to opportunities for investment and development in Pakistan and is prepared to consider making guarantees to any person of new investments for the establishment, expansion, modernisation or development of enterprises in that country (Pakistan)."

The aforesaid agreement is of great importance in view of the need for large capital investment in Pakistan. An assessment of the extent of foreign capital invested in Pakistan, recently made by the U.S. Department of Commerce, revealed that there was little U.S. private investment in the country, thanks largely to the disturbing trends in Pakistan's economy and political system. Now that the U.S. Government has assured guarantees for American private investments, U.S. business and industrial leaders may be expected to evince much interest in participating in Pakistan's industrial development.

The extent to which these expectations will be fulfilled will depend, of course, on the economic and fiscal policies of the powers-that-be in Pakistan. Indications are that Pakistan is taking all possible measures to encourage foreign investments in the country. Mention, for instance, may be made of guarantees covering equitable compensation to foreign investment in the event of nationalisation and permission for foreign capital to hold up to 60 per cent. of the total investment in enterprises other than public utilities.

I. L. O. CONFERENCE

The most important subject scheduled for discussion by the thirty-eighth session of the International Labour Organisation (I.L.O.), which began at Geneva on the 1st inst., is the all familiar one of labour-management relations. Mr. David A. Morse, Director General of the I.L.O., has, in his annual report, called on the representatives of Governments, employers and workers "to formulate a programme of work for the I.L.O., which would assist countries in all degrees of industrial development to solve problems of industrial and human relations." He is of the view that good industrial relations cannot be attained through legislation but will depend in the long run on the efforts of the two most interested parties, namely, the employers and the workers. Proceeding, he says:

"Widening recognition that rising productivity is essential for raising standards of material prosperity has been responsible for a perceptible shift of emphasis in labour-management relations 'towards collective thinking rather than conflicting bargaining.' For, in the last analysis, efforts to develop higher productivity depend very largely on improved co-operation within industry between management and the various categories of workers concerned and their organisations. This is, perhaps, the most urgent and important single area requiring joint endeavour in the years to come."

One thing that clearly emerges from the above quotation is that the promotion of healthy industrial relations depends on a number of factors. It is true that adequate wages and satisfactory conditions of work are essential for good industrial relations, but they alone are not enough. Similarly, the mere fact that employers and workers agree to bargain collectively is not sufficient to ensure better industrial relations. Everything depends on the attitude of both the employers and employees towards the problems in dispute. This involves a psychological approach to the problems concerned. That depends again on the growth of a healthy trade union movement free from political influences.

The Conference will also discuss new international standards relating to vocational rehabilitation of disabled workers. The proposed recommendation seeks to cover all disabled persons, irrespective of their origin and nature of their disability, so long as they can be prepared for, and have reasonable prospects of, securing and retaining suitable employment. The main object of the development of vocational rehabilitation, according to the draft resolution, should be:

(1) to demonstrate and develop the working qualities of disabled persons;

(2) to promote in the fullest measure possible suitable employment opportunities for them; and

(3) to overcome, in respect of training or employment, discrimination against disabled persons not related to their working capacity.

Another subject scheduled for discussion is protection of migrant workers in underdeveloped countries. The proposed recommendation lays down, as a general policy, the principle that "every effort should be made to assure the migrant workers the same or as favourable working and living conditions as those provided by law or in practice to other workers engaged in the same employment." It also provides for a standard of protection as regards housing, wages, admission to skilled jobs, trade union activities, social security, etc.

NEW MINISTRY FOR STEEL INDUSTRY

IMPLICATIONS ANALYSED

From A Special Correspondent

NEW DELHI, 31st May

AT long last, Mr. T. T. Krishnamachari, Minister for Commerce and Industry has been able to succeed in the stand he had taken in January last regarding the control and development of iron and steel industry. His success has come in the form of a Government announcement this week, which states that "in view of the importance of developing and expanding the iron and steel industry, the Government of India have decided to constitute a new Ministry of Iron and Steel." This new Ministry will be under the additional charge of Mr. Krishnamachari who will hereafter administer the working of the Hindustan Steel Factory, Rourkela, the Bilhai Steel Factory, Madhya Pradesh, and the proposed Durgapur Steel Factory, West Bengal.

DELHI LETTER

Besides, the Minister will also look after the development of the steel industry in the private sector. The Tatas have, for the past few days, been in New York, negotiating with the U.S. Export-Import Bank for a sizable loan for financing their proposed expansion scheme under which they are to produce about 2 million tons steel ingots. The Indian Iron and Steel Company, Ltd., Calcutta, has also been gradually increasing its production of pig iron and steel and, after the completion of the present plan, it might embark on a further programme of expansion to about one million tons of steel. The Mysore Iron and Steel Company, Ltd., Bhadravati, has also got approved from the Planning Commission a proposal to expand its production at a cost of Rs. 12 crores. This concern is expected to step up its steel production to about one lakh tons, concentrating its attention on the manufacture of special steel, stainless steel, etc.

Expansion Plans

As matters stand at present, all the expansion plans are expected to be completed before the expiration of the second Five-year Plan. It is possible that both Rourkela and Bilhai plants might come into full production before the end of 1959, that is, in another four years' time. The progress of work in regard to both these factories has been going on smoothly. The township in Rourkela is now under construction. Arrangements are being made for the regular supply of iron ore and its transport to the plant site. Within a few months' time, tenders will be called for the requisite plant and machinery to be installed at the factory. In regard to the Bilhai Steel Plant, the Russian Chief Engineer, along with some six technical experts, will be shortly arriving in New Delhi. It is stated that important units of the steel plant like blast furnaces, open hearths and coke ovens are expected to be completed by the end of 1958. Although the agreement with Russia provides for the erection of two blast furnaces, the Bilhai Plant may eventually have three furnaces since the Russian experts now feel that three blast furnaces would be more economical for operation.

The creation of a new Ministry for stepping up steel production in the country will have some definite advantages. The unity of purpose and control will enable the country to accelerate the pace of expansion and to hit the target earlier. Again, the concentration of administrative functions under a single Ministry will enable Government to have a close supervision in regard to cost of erection and other charges of the various factories. Further, this step will enable the Government to pool its resources, particularly in undertaking the manufacture of such types of tools and machinery within the country itself and thereby effect some savings in foreign exchange. The Government can also establish a close liaison between the steel industry and the possible consumers of this metal, namely, the railways, heavy and light engineering industries, machinery manufacturers, the automobile, shipbuilding and other industries. In other words, the Industry sector of the Commerce and Industry Ministry will have to plan carefully in such a manner as to enable the different heavy industries to absorb the various end products turned out from the old and new steel factories. There should not be any accumulation of stocks of steel due to the inability of heavy industries to absorb them. It is, therefore, necessary that there should be a simultaneous development of a number of heavy engineering industries which would be ready to absorb the additional steel produced in the country. It is possible that, during the next one or two years, there will be more imports of steel.

In order to co-ordinate the development of heavy industries at all levels, the Government of India has now constituted a Cabinet Committee for heavy industries. A Committee of Secretaries to deal with this co-ordination is also being constituted to keep in close touch with all developments in the field of heavy industry and report progress to the Cabinet Committee of heavy industry. In view of the constitution of these two committees, the Steel and the Production Committee of the Cabinet will hereafter be discontinued.

Speedy Development

That the Government is very anxious to bring about a speedy development of the iron and steel industry, as also heavy industries, is evident from the fact that, besides creating a new Ministry for Iron and Steel, the chairmanship of the Heavy Industry Committee will be held by the Prime Minister himself. Likewise, the Co-ordination Committee at the Secretary level will be held by that veteran administrator, Mr. N. R. Pillai. The total investment in iron and steel industry during the second Plan period is now computed at Rs. 425 crores. A similar sum is expected to be spent on the development of heavy industries in the public and private sectors.

It is expected that the Government will be following a specific line of policy in regard to the development of heavy industries. According to the pamphlet on *The Second Five-year Plan—A Tentative Framework*, the development of heavy capital goods industries has followed in the wake of a rapid advance in consumer goods industries in most countries. But it is not an uneconomic proposition to give priority to the development of heavy industries and to try and reverse the historical process, within limits. It is also suggested that the major effort in the development of basic capital goods industries must come from the public sector. That is necessary, if the State is to have command over means of production in strategic sectors. Also, private enterprise is not likely to be able to provide the large capital requirements of such industries. The pamphlet in question visualises that, in the next 10 or 15 years, India may have to step up its capacity of steel production to 10 to 20 million tons. Since a large part of the profits in organised industries is made in consumer goods industries, steps must be taken, says the pamphlet, to direct a larger flow of private investment into basic industries by suitable tax and credit measures and by making a stricter use of the powers to control capital issues and imports and by licensing of new enterprises.

The development of heavy industries would require fuller exploitation of our mineral resources, extension of transport facilities and a rapid expansion in the number of trained personnel in the country. The pamphlet adds that the basic strategy in the second Plan must be to invest large sums in the development of basic industries, transport and mining at one end and to economise as much as possible in the capital requirements for other sectors without restricting the supply of consumer goods.

In this connection, it may be of interest to note the opinion of Prof. Mahalanobis. He says: "In order to make available large capital resources for investment and national development and to facilitate the implementation of the Plan, Government will be prepared to enter into such activities as banking, insurance, foreign trade or internal trade in selected commodities. Government would also promote enterprises in partnership with the private sector, so that, although Government would hold a controlling share, initiative can be left to private management subject to policy decisions by Government."

These extracts from the pamphlet will show how the trend of thought is moving in high circles of Government. Since Mr. Krishnamachari is a realist and has considerable insight into business management and administration, it is likely that he will try to strike a *via media*, particularly in the establishment of a number of heavy industries through the use of his pet National Industrial Development Corporation. In the coming months, this institution is expected to adorn the mantle of entrepreneurship by starting a number of big industries in co-operation with the private sector.

VOICE OF DEMOCRACY

MORE FREEDOM FOR PRIVATE ENTERPRISE

From Our Own Correspondent

LONDON, 27th May

YESTERDAY was one of those days, when, about once in five years, democracy in this country ticks. On that day, one was conscious that Government was in suspense: right up to that day, the outgoing Government remained the Government, Ministers attended their offices, and policy continued as before, but that was the day when the electorate were deciding whether they should carry on or whether men with different ideas should be called in.

LONDON LETTER

And yesterday, when the electorate had the choice, it spoke with certainty. It is true that only three out of four voters bothered to go to the polls, but it is a good election when four out of five go and exceptional when any larger number attend. The fact that only three out of four went was, in itself eloquent. It meant that many of the so-called floating voters whom politicians have been trying so hard to attract decided that they did not sufficiently dislike the present Government to vote against it and they were not sufficiently attracted by the Labour Party to want to vote for them. They were prepared to let the others decide, and the nature of the British balance of voting power is such that a lower poll usually means a lower poll of the Left, of those who are attracted by radical ideas when radical ideas seem to be what the country needs.

So the swing of about 2 per cent. of the electorate in favour of the Government's policy which is going to give the Government a substantially increased majority indicates that the general temper of people is that things are going well enough, there is every chance of their continuing to do so under the guidance of the present Government, and that they do not really feel that the Opposition have enough to offer to make the excitement and risk of change worthwhile.

Election Campaign on Television

A good deal has been said in this country about the conducting of the election campaign on television. This is probably the only campaign which will be conducted in quite the same way since there is a monopoly organisation. By the time the next election comes round, commercial television is likely to be in full swing and we are more likely then to get the typical election meeting reproduced on viewers' screens right through the country with local as well as national candidates appearing. But, at this election, the Conservatives certainly made a better job of the new medium and it may well have helped them substantially by confirming in the minds of millions of viewers that they were better off in the hands of the present Government than by risking the uncertainties of a new one whose prospective members showed up so indifferently on the screens.

The other interesting point is that foreign policy failed to become an election issue. There were no stunts of any kind and the Government conveyed the impression that they were doing all that was possible for peace and that their opponents had nothing to add on this issue.

With a substantially increased Conservative majority (incidentally, it is only the second time in the history of democratic elections in this country that the pendulum has swung three moves the same way—the elections of 1950, 1951 and 1955) and the likelihood of a return to power in five years' time being very remote—unless all the laws governing voters' behaviour are to be broken—the Government will now go firmly ahead for the next five years on its policy of controlling the country's economy internally and externally on as light a rein as possible. Their testing time will come only if there is an external, followed by an internal, economic crisis and, since they will not have the fear of imminent election in front of them, they will be able to go ahead boldly on their own brand of freedom for private enterprise.—*All Rights Reserved.*

FUTURES TRADING IN COTTON

MONOPOLY BY ONE CENTRE DISCOURAGED BY FORWARD MARKETS COMMISSION

A BRIEF reference to the report of the Forward Markets Commission on the recognition of associations in respect of forward contracts in cotton and the Government of India's decision thereon was made in this journal two weeks ago—*vide* page 972. The report, the full text of which was released to the Press only towards the close of last week, was submitted to the Government early in March last—it is dated 3rd March, 1955—and, within two months, on 12th May, 1955, to be precise, the latter announced its decision. Thus, the Government has been fairly quick in making up its mind on this subject.

The Commission has prefaced its report by indicating the three types of contracts through which the forward market functions, *namely*, non-transferable specific delivery contract, transferable specific delivery contract, and hedge or futures contract. These contracts differ from one another in regard to conditions of delivery and mode of payment. Explaining these differences, the Commission says:

"In non-transferable specific delivery contracts, delivery is a common feature. The goods have to be of a specified quality and have to be delivered in a specified quantity at a specified destination for a specified price. This type of contract resembles the ready contract, except that the delivery takes place after a longer period. In the case of transferable specific delivery contracts, delivery takes place between the first seller and the last buyer, and it has to conform to the same detailed specifications as in the case of the non-transferable contracts. Hedge or futures contracts, on the other hand, do not visualise actual delivery at all, except in a residual sense, and are entered into in terms of a 'basis' quality.

"The settlement in the non-transferable specific delivery contracts takes place through the payment of the actual value of the goods by the buyer to the seller. The futures contracts and the transferable specific delivery contracts in so far as the intermediate buyers and sellers are concerned are, however, settled by the payment of differences between the buyer and seller.

"The transferable specific delivery contract thus occupies a position intermediate between the non-transferable specific delivery contract and the futures contract. It has points of resemblance to both. It is, however, treated on a par with the futures contract under the Forward Contracts (Regulation) Act."

Centres for Futures Trading

The Commission proceeds next to a brief study of the technique of futures trading, role of speculator, payment of differences, basis of contract, tenderable varieties, days and points of delivery, sellers' option, spot and futures prices and dangers of futures trading. It then addresses itself to the controversy as to whether there should be only one centre for futures trading in any commodity or a number of different centres. The most important conclusion arrived at by the Commission is that facilities for futures trading should be provided at a number of different centres located in the principal regions of the country. For it considers that a single centre is not likely to serve adequately the needs of different areas and of different varieties of a product. In support of this view, the Commission gives the following reasons:

(1) The facilities of transport and means of communication, such as telephone and the radio, are not yet properly developed in different parts of the country and have not yet achieved the necessary degree of efficiency; movement of stocks from centres of production to those of consumption in the same region, or from the surplus region to the deficit region, is generally slow and sluggish;

(2) the collection of economic intelligence and its dissemination throughout the countryside through various agencies is not yet organised on satisfactory lines and much of the relevant information has yet to be collected;

(3) the credit, insurance and warehousing facilities leave much to be desired and are often non-existent;

(4) the proportion of illiteracy is high, the producers are not vigilant and the small traders are inadequately organised; and

(5) the spirit of co-operation among different interests has yet to develop and a sense of responsibility still remains to be fostered.

In view of all these handicaps, the Commission points out that it would be unwise to leave the fortunes of the countryside spread over distant regions entirely into the hands of a single centre of hedge trading, howsoever well it is regulated. For, according to it, a single centre is likely to arrogate to itself too much authority by the very fact of its singleness and prove less responsive to regulation. It is prone to brush aside too lightly the complaints of weaker interests and distant areas. The Commission, therefore, favours the establishment of a number of judiciously located centres in the more important producing and consuming areas. Such a system has, in its opinion, five distinct advantages. First, the system will, apart from providing hedging facilities near at hand, educate the mofussil areas in the technique of hedging and the forecasting of price variations. Secondly, it will encourage local interests to co-operate with each other in safeguarding the interests of their locality. Thirdly, the new centres will be more responsive to advice and submit willingly and even cheerfully to regulation, although it is true that they have to be carefully nursed by the regulating authorities. Fourthly, the transactions at such centres will be in small quantities and are less liable to produce violent jerks and jolts. Finally, the existence of many centres will assist the regulating authority in experimenting with different techniques of regulation and evolve suitable techniques for individual centres.

The Commission imposes a vital obligation on a centre which is selected for the establishment of futures market, namely, that every effort must be made to look to the convenience of the other competing centres in the region and provide them with all facilities. Delivery against the contract should be permitted at all important producing centres and facilities for survey and arbitration of disputes should also be provided on the spot. The entire crop grown in the region must be made tenderable at the centre and the tendering differences should be fixed in a manner which would cause no hardships and involve no discrimination.

Selection of Associations

The Commission refers next to the selection of associations for recognition to conduct the futures market. It emphasises that the successful working of a futures market depends mainly on the existence of a representative association possessing the necessary experience and resources and capable of discharging its duties in an impartial and responsible manner. The suitability of an association, it further emphasises, has to be judged in the light of various factors such as the basis of its incorporation, the size and composition of its membership, the terms and conditions of the contracts conducted by it, the procedures laid down by it for trading, the length of its experience, and the reputation that it has built up. The associations should be incorporated, as far as possible, under the Registration of Societies Act or section 26 of the Indian Companies Act. The membership of the association should be open to all persons genuinely interested in trading in the commodity and having the financial resources necessary for engaging therein. The method of selection to the board of directors should be so devised as to secure a fair representation for the different interests reflected in the membership.

This brings us to the procedure of trading as indicated by the Commission. "The procedure," according to the report, "should be adjusted to the nature of the commodity, the local environment and the requirements of the market. The basis of the contract should be laid down in such a way that it would represent fairly the production of the neighbourhood and the varieties traded in the market. The varieties tenderable should include, as far as possible, all the indigenous varieties produced, so that no stockists remain without the protection of hedging facilities. The unit of contract should be so fixed as would be within the means of the operators. The number and duration of contracts should be adjusted to the seasonal character of the production of the commodity, so that hedging facilities might be available continuously throughout the year. The opening of the contracts should be so timed as to provide an indication of the prospective prices before, during and after the sowing and harvesting operations. The closing of the contracts should be timed to coincide with the movement of the crop, so that delivery can be given, if required. The duration of the contracts should not be unduly long lest speculative forces should distort the trend of prices. The different contracts should be spread evenly over the year and the duration of each should be timed on the basis of the marketable supplies likely to be available at the delivery period. The contracts should be negotiated in a spacious, well-designed ring, equipped with cabins and telephone facilities for the members. The transactions should be restricted to specified hours of business and stringent action taken to prevent business being transacted outside the official hours. The contracts should invariably be reduced to writing. The settlement of contracts should be effected through a clearing house, administered by an independent agency, preferably a bank. The settlement should be effected every week and, in special cases, at more frequent intervals. The facilities for survey should be organised, preferably through expert and independent surveyors on the permanent staff of the association. The machinery for arbitration of disputes should be so devised as would give a full and fair hearing to the parties, bring to bear an expert and disinterested judgment on the issues and result in a speedy award."

Futures Trading in Cotton

It is in the light of these general principles that the Forward Markets Commission has examined the issue relating to the futures trading in cotton. At the outset, the Commission opines that futures trading is essential for cotton. Enumerating the factors which render cotton quite suitable for futures trading, it observes:

"The supply of cotton and the demand for it are adequate to support a futures market. The crop is large and stocks also have, therefore, to be stored in large quanties by the dealers. The textile mills, which are the principal consumers, constitute the largest single industry in the country. The production is spread over a number of regions. The mills are, to some extent, concentrated in the Bombay State, but are also to be found in other regions. The exports of raw cotton and finished goods are substantial and have an important place in the foreign trade of the country. There are a large number of experienced persons familiar with the technique of hedging and they are anxious to make use of the facilities offered."

The Commission received 30 applications from all the important cotton-growing States, except Madras which produces about 260,000 bales of cotton annually, representing about 6.6 per cent. of the total production. The applications have been grouped under four regions: (1) *Northern Region* (12 applications)—States of Punjab, P.E.P.S.U., Rajasthan, U.P., Ajmer, Delhi, Vindhya Pradesh, Himachal Pradesh and Bilaspur; (2) *Central Region* (9 applications)—Madhya Pradesh, Madhya Bharat, Bhopal, West and East Khandesh, Ahmednagar, Sholapur, Poona and Satara North districts of Bombay State, and the Aurangabad, Bhir, Parbhani, Nanded, Adilabad, Osmanabad, Bidar, Karimnagar, and Medak districts of Hyderabad State; (3) *Southern Region* (8 applications)—Kolhapur, Satara South, Belgaum, Bijapur and Dharwar districts of Bombay State, the Gulbarga and Raichur districts of Hyderabad State, and the States of Mysore, Travancore-Cochin, Madras and Andhra; (4) *Bombay City* (1 application).

The Commission has found it difficult to choose for recognition any of the centres in the Northern Region for the opening of futures market. It is said that there is no centre which is located in the midst of the main producing area and which satisfies the other requirements for the location of a futures market. The question of selection of a centre is also rendered difficult until the precise pattern of cotton production, following the construction of the Bhakra-Nangal Project, unfolds itself. The benefits of irrigation resulting from the Project will accrue mainly to the southern parts of the States of Punjab and P.E.P.S.U. and to the Ganganagar District of Rajasthan. The relative importance of the different districts in the

ALL-ROUND EXPANSION IN BANKING

DOWNWARD TREND IN DEPOSITS REVERSED

THE progress of banking in India during 1954 was characterised by all-round improvement. A large turnover, resulting from expanding resources and greater economic activity in the country was, in fact, the outstanding feature of this development. The expansion in overall economic activity is common knowledge by now. Production, both agricultural and industrial, touched record levels. The index of agricultural production rose from 102 for 1952-53 to 113.5 for 1953-54, the chief factor responsible for the rise being foodgrains, the production of which exceeded the Five-year Plan target by about 4.4 million tons. In industry also the rising trend in production, witnessed in the last three years, was maintained, a rise of 81 per cent. being registered in 1954 over the level of 1953. The average index number of industrial production for 1954 stood at 146.3 as against 135.3 for 1953. The expansion in production was accompanied by a larger level of foreign trade. There was, besides, increased activity in the inland trade, too, thanks to the resumption of private trading in foodgrains, following the complete withdrawal of controls on these. The effects of the increasing tempo of economic development during 1954 on the banking system and credit trends are lucidly explained in the latest *Annual Report on the Trend and Progress of Banking in India*, just released by the Reserve Bank of India. As readers are aware, this annual survey by the Reserve Bank is a statutory obligation under section 36(2) of the Banking Companies Act, 1949. The Bank describes the past year as one of orderly economic expansion, with credit policy remaining broadly unchanged.

Money Supply

Thanks to the overall economic expansion as noted above, there was a rise in money supply. During 1954, the volume of money supply rose, according to the *Report*, by Rs. 129 crores, as compared with a smaller rise of Rs. 33 crores in 1953 and a decline in 1952. This increase was made up of a rise of Rs. 66 crores in currency in circulation and Rs. 63 crores in deposit money. Two factors accounted for the total increase in the money supply, namely, (*a*) the budgetary deficits, and (*b*) increase in the level of bank credit. A point to be noted is that, despite the increase in money supply, prices of commodities registered a downward trend. Thus, the general index of wholesale prices went down by 6.5 per cent. during the year, whereas, in the previous year, it had risen by 4.8 per cent.

The external payments position in 1954 showed a nominal surplus of Rs. 3.7 crores, as compared with a large surplus of Rs. 58.7 crores in 1953. The decline in the surplus relatively to that in 1953 was due to liberalisation of imports in the year under review. The export situation, however, registered an improvement over the year and the level of foreign trade, as stated earlier, was generally above that in 1953.

Bank Credit

The higher level of economic activity witnessed in 1954 was reflected in bank credit trends. Bank credit recorded an expansion of Rs. 57 crores in 1954, as against a fall of Rs. 66 crores in 1952 and Rs. 10 crores in 1953. The expansion of bank credit in the busy season of 1953-54 was larger, at Rs. 112 crores, than in the busy season of 1952-53 at Rs. 86 crores. Further, in the slack season of 1954, which was relatively short, the contraction in bank credit was less than two-thirds of the preceding seasonal outgo and was indicative of the continuance of a measure of demand for bank credit in the slack season. Commenting on these trends, the *Report* says: "Though the credit demands were at a higher level in 1954 and though the credit contraction in the slack season was not commensurate with the seasonal expansion in 1953-54, there was no reason to believe that speculative influences were significantly at work, the expansion in bank credit is to be related to the sustained increase in production and business activity, though with a generally declining wholesale price levels." These remarks mean that the health of the overall economy was generally good.

Borrowings

In order to meet the increased credit needs of the country, the banking system had to find additional resources during the year. Although there was an impressive rise in deposits, the banks had to supplement their resources by borrowing from the Reserve Bank to a much greater extent than in previous years. Their total borrowing [under sections 17(4a) and 17(4c)] of the Reserve Bank rose from Rs. 195.42 crores in 1953 to Rs. 336.22 crores in 1954. Of this increase of Rs. 130.8 crores, borrowings under the Bill Market Scheme [section 17(4c)] accounted for Rs. 81.68 crores and those against Government securities under section 17(4a) for Rs. 59.12 crores, as indicated by the table below:

(In crores of rupees)

Year	Section 17(4a) (against Government securities)	Section 17(4c) (against usance bills)	Total
1952	164.25	81.45	245.70
1953	129.58	65.84	195.42
1954	188.70	147.52	336.22
1955 (1st January to 15th April) ...	67.70	60.64	128.34

The most striking feature disclosed by the above figures is the sharp increase in borrowings under the Bill Market Scheme. At about Rs. 148 crores, the borrowings in 1954 were more than double the amount borrowed under the Scheme in 1953. This rise is partly due to the extension, in mid-1953, of these facilities to banks with deposit liabilities of Rs. 5 crores each or more. It may be noted that the Shroff Committee had recommended in May, 1954, the extension of the Scheme to all Scheduled banks with deposits of Rs. 1 crore and above. The Reserve Bank, however, went a step further and extended it in July, 1954, to all Scheduled banks in possession of a licence granted by it irrespective of the size of their deposits. In addition, the minimum limit of advances under the Scheme was lowered from Rs. 25 lakhs to Rs. 10 lakhs and the minimum amount of each individual bill was also fixed lower at Rs. 50,000. The effect of this liberalisation on the Reserve Bank's advances to the banking system was not felt during the year under review, as it took place in the slack season. There is, however, no doubt that the Scheme has become quite popular with banks.

In addition to financial accommodation under these two sections mentioned above, the Reserve Bank discounted Treasury Bills held by Scheduled banks to the tune of Rs. 19 crores.

Deposits

Deposits continued, as stated early, to be the main source of funds with banks to meet their increasing credit requirements. The total deposits of all Scheduled banks rose from Rs. 832 crores as at the end of 1953 to Rs. 923 crores a year later, a rise of Rs. 91 crores. Nearly two-thirds of the increase occurred under demand deposits which rose over the year by Rs. 56 crores, the balance Rs. 35 crores being accounted for by time deposits. The exact amount of time and demand deposits at the end of 1954 was Rs. 464.6 crores and Rs. 298.8 crores, as against Rs. 417.6 crores and Rs. 266.7 crores, respectively, a year before. Saving deposits amounting to Rs. 146.5 crores, as against Rs. 138.8 crores, accounted for about the same proportion of total deposits, as they did in 1953, and nearly three-fifths of savings deposits were in the nature of demand liabilities.

A class-wise analysis of deposits shows that Rs. 80 crores of the total increase of Rs. 91 crores was the share of Indian Scheduled banks, Rs. 11 crores being that of Exchange banks. Even this expansion was due mainly to a spurt of Rs. 7 crores in their deposits during November, 1954. These figures show that Exchange banks have not succeeded, to any significant extent, in getting deposits in India.

In the case of Non-scheduled banks, the deposit liabilities showed a small rise of Rs. 5 crores to Rs. 65 crores, though the number of reporting banks was less.

Commenting on the increase in deposit liabilities, the *Report* makes certain interesting remarks which need to be underlined. "The rising trend in deposits confirms," it says, "the observation made in the *Report* for 1953 that the post-Partition decline in deposits has been arrested; in fact, a phase of deposit expansion related, in the main, to the rising tempo of Government outlay under the Five-year Plan seems to have begun."

Investments

Another notable trend of banking in India was that banks were in a position to invest a greater volume of their resources in earning assets. Both advances and investments went up over the year. Advances rose from Rs. 517 crores to Rs. 573 crores. The increase is noteworthy following, as it does, declines in the previous two years. The ratio of advances to deposits of banks as a whole, however, was almost unchanged over the year. The generally comfortable position in which the banks were placed was also reflected in the large increase in their excess balances with the Reserve Bank. The average cash ratio of Scheduled banks was higher at 9.4 per cent. as against 9.1 per cent. in 1953. The increased borrowing facilities offered by the Reserve Bank enabled banks to work on lower cash ratios than might have been otherwise necessary.

Data collected by the Reserve Bank disclose that commercial advances rose by 11.2 per cent. and industrial advances by 14.7 per cent. These totals conceal significant variations in the behaviour of advances to individual industries. Cotton, other textiles, sugar and engineering were the main industries which contributed to the expansion in industrial advances, while iron and steel industries registered a decline. The main increase in commercial advances is accounted for by wholesalers in agricultural commodities.

The trends of investments in securities also indicate greater utilisation of resources in the earning assets. Over the year, the rise in investments in Government securities of all banks amounted to Rs. 14 crores, the increase in the case of Indian Scheduled banks alone being Rs. 12 crores. From April upto November, 1954, the rise in investments was steady, the largest increases taking place during July to September, reflecting, perhaps, the subscription by Indian Scheduled banks to the issue of the National Plan Loan. Other investments fluctuated within a narrow range of Rs. 23-25 crores and over the year, registered a small increase of Rs. 1.6 crores.

Profits

The profit and loss accounts of 18 large Indian Scheduled banks reveal that, during 1954, their gross earnings rose by Rs. 2.6 crores to Rs. 31.2 crores, over two-thirds of the rise being accounted for by the rise in interest and discount earned. The rise in total expenses was somewhat lower at Rs. 2.2 crores, more than half of which was made up by an increase in interest paid on deposits and borrowings. Consequently, net profits went up by Rs. 40 lakhs to Rs. 5.3 crores, in contrast to a fall in the preceding two years. During the year, the number of offices of banks recorded a further decline of one as compared with a fall of 19 in 1953. This decline was made up of a net *increase* of 73 offices in the case of Indian Scheduled banks and of a *fall* of 74 offices in the case of Non-scheduled banks. The number of offices of Exchange banks remained unchanged at 65.

A review of the administrative measures taken by the Reserve Bank of India reveals that the Bank inspected 227 banks in the year, of which 26 were Scheduled banks. By the end of the year, the first round of inspections of practically all reporting banks was completed. A little over half of the inspections carried out during the year was for the purpose of considering the eligibility of banks for the grant of a licence to carry on banking business in India. All the inspections carried out during the year of Scheduled banks and 72 of those in respect of Non-scheduled banks were re-inspections conducted mainly for the purpose of reviewing the financial position of these banks and the progress made by them in improving their affairs. In this connection, says the *Report*: "It would be difficult to exaggerate the value of these inspections which have enabled the Reserve Bank to watch closely the working and practices of all banking companies and to apply, where necessary, timely and effective remedial measures. They have certainly been the most important factor that has contributed to the greater stability of the banking system." The *Report* also explains the procedure in connection with licensing of banks and mentions that the slow progress in this regard is due to the Reserve Bank's anxiety to safeguard the interests of the depositors and to give as many banks as possible a fair chance to qualify for a licence.

A brief mention is also made to the steps taken by the Reserve Bank to assist co-operative credit institutions and augmenting industrial credit facilities. Drawing attention to the role of banking in the process of development, it observes that, while credit expansion to meet the growing needs of the economy would be permitted and encouraged, the Reserve Bank would necessarily have to keep the situation under observation to prevent undue credit inflation to ensure the goal of development with stability.

SOME PROBLEMS OF STATE FINANCIAL CORPORATIONS

Such of the State Financial Corporations as have come into existence are still in their earlier stage. Some of them were started last year, while others have been working for only a little over a year. The experience gained by these Corporations in this short period and the data available with them are hardly sufficient to assess their usefulness to the different types of industries in the land. But an idea of the difficulties facing them is provided by the speeches of the Chairmen of the Financial Corporations of three States, namely, Bombay, Hyderabad and West Bengal. It would appear from these speeches that thanks to these difficulties, the Corporations have not been in a position to help industries as much as they could, in spite of their eagerness to do so.

One chief reason why the Corporations have not been able to make much headway in granting loans, according to Mr. B. M. Birla, Chairman of the State Financial Corporation of West Bengal, is the unhelpful tax structure in the country which does not enable the man who borrows to pay back the loan. Speaking at the annual meeting of the Corporation held at Calcutta recently, he said: "If with the best of intentions, the borrower is not able to repay the loan, there must be something wrong somewhere. At present, as the borrower is not certain that he will be able to earn enough to repay the loan, he is not anxious to come forward and to take the risk." He added that, during the year under review, very few people, considering the vast needs of the State, came forward for loans from the Corporation. And those who came forward did not have any resources to fulfil the conditions of the grant of loans by the Corporation. Apart from poverty and lack of resources to venture and to take risks in starting industrial undertakings, there was, he said, a growing unwillingness to take risks due to the expectation of inadequate return. He doubted if borrowers belonging to proprietorship and partnership firms would be able to repay the loan, even with the best of intentions, within a reasonable time, out of their profits after meeting the taxation liabilities at the existing levels. He pointed out that both the Government and public leaders who emphasised that small and medium industries should be encouraged through State Financial Corporations, overlooked the fundamental fact that the Corporations could help only if there were borrowers who were willing to take risk. Mr. Birla urged those responsible to consider carefully this vital aspect of the problem of industrial finance, namely, without suitable conditions for the people to venture and take risks, the Financial Corporations were left without much scope to function.

The problems of small and medium-sized industries figured prominently also in the address delivered by Mr. Purushottam Kanji, Chairman, the Bombay State Financial Corporation, at the annual meeting of this body held last week. He opined that there was an urgent need for enquiring into the existing conditions of the various groups of industries in this sector. Some industries, he said, were working below their installed capacity, some were engaged in fierce competition in their struggle for survival and some others were in need of rehabilitation. He wanted the agencies set up by the Government to look after the welfare of these industries, to devise practical measures for removing the difficulties facing them. This would create, he said, confidence among all *entrepreneurs* and provide a congenial atmosphere for developing new enterprises. He took care to add that co-ordination in their programmes of production in order to avoid wasteful competition was absolutely necessary.

It is interesting to note from Mr. Kanji's speech that, with a view to giving information regarding the working of the Corporation, as widely as possible, among industrialists, the Bombay State Financial Corporation is preparing brochures in English and in regional languages for distribution. It has also sent full particulars regarding its terms and conditions for loans to the Director of Industries, Bombay, so that he may circulate them among those industrialists who have been granted licences for expansion of existing units or for the development of new ones in the Bombay State. This should enable the intending borrowers to comply with the requirements of the Corporation and prevent unnecessary correspondence and delays.

Explaining the circumstances in which the Bombay State Financial Corporation has had to provide working capital to some of the borrowers, Mr. Kanji said:

"Some industrial concerns have asked for accommodation partly for financing their programme of expansion and partly for financing their current requirements. The last of these requirements is perhaps due to conditions which have arisen of late and especially during the past two years. During the war and thereafter, the margin of profit for manufacturing concerns was sufficiently high to enable medium and small-scale concerns to finance purchase of raw materials and goods in process and, with the sellers' market, they obtained payment for their finished products on delivery. After the recession in 1952, many of these concerns suffered losses because the prices of their finished goods fell faster than their costs of production which included high prices of raw materials. Thus their own resources for working capital were considerably diminished. These concerns were, therefore, in need of working capital with which to buy raw materials and to finance goods in process as well as stock-in-trade. It seems that this type of financial requirement has gradually grown acute during the past two years because, with the return of the buyers' market, small industrial concerns have not only to compete on the price factor but are required to sell their goods on credit which sometimes extends from three to six months. In these circumstances, it is natural that medium and small-scale concerns require much larger amount of working capital in order to maintain stocks of raw materials, finance goods in process and meet other obligations.

"Therefore, in response to requests from industrial concerns, especially of the small-scale type, the Board, with the approval of Government, decided to advance loans for working capital. But I should like to make it clear that there is an essential difference between the loans given by the Corporation for working capital and those given as short-term credit or cash-credit arrangement by commercial banks. The Corporation advances loans on the security of fixed assets, while commercial banks usually advance loans on the pledge or hypothecation of raw materials and in some cases against finished products. The Corporation, therefore, avoids overlapping of security with commercial banks and permits a borrowing concern to pledge its goods to banks in order to obtain finance in addition to the loan taken from the Corporation. You will see that the Corporation has tried to meet the two types of financial requirements of medium and small-scale industrial concerns in the State."

It will be noted from the above extract that the Corporation claims to provide working capital without making any inroads on the sphere of commercial banks.

Another problem which seems to be causing concern to the various State Financial Corporations is the heavy burden of taxation on their finances. Both Mr. Kanji and Mr. Pannalal Pitti, Chairman of the Hyderabad State Financial Corporation, have dwelt on this subject at considerable length. The observations of Mr. Pitti on this subject are particularly noteworthy. He advocated that the Central Government should exempt the State Financial Corporations from payment of income-tax and corporation tax for the initial period of five years. It may be noted that the Corporations have to pay a minimum guaranteed dividend at the rate of 3½ per cent. per annum, free of tax, to their shareholders, whereas most of them charge about 6 to 6½ per cent. or slightly more on their loans and advances. There is, therefore, only a very small margin between the amount of interest earned and the amount of guaranteed dividend payable to shareholders. Since they have to pay seven annas in the rupee by way of income-tax on their net profit, they have to approach the State Governments for subvention every year until both the capital and the volume of their business increase sufficiently to yield revenue to pay the full amount of dividend, and what is more, all advances made by

TEXTILE INDUSTRIES IN ITALY

ROLE OF ARTIFICIAL AND SYNTHETIC FIBRES

TEXTILE industries play a vital role in the economy of Italy. Besides meeting the major part of the clothing requirements of the country's population and providing employment to as many as 650,000 workers, these industries earn for the country a considerable amount of foreign exchange. Out of the total value of Italian exports amounting to 930 million lire during the calendar year 1953, nearly 20 per cent. was accounted for by textile products, the actual value being 185.5 million lire.

The cotton textile industry is the largest in the textile group and gives employment to about a quarter of a million workers. Italy accounts for 4.5 per cent. of the world's aggregate spindleage of nearly 130 million. The actual productive potential of the spinning section is estimated at 5.8 million spinning spindles and 1.1 million doubling spindles, the number of firms engaged in spinning being 161. The spindles are represented almost wholly by the ring system. The share of Italy in the world's total loomage is larger than that of spindles, being 5.5 per cent.—138,000 looms out of the total of 2,730,000 looms.

Italy is one of the countries which have been most adversely affected by the growing competition in international cotton textile trade. An indication of this is provided by the slump in exports of cotton cloth and yarn in recent years. During the calendar year 1954, for instance, Italy exported not more than 10,828 tons (metric) of piecegoods, as against 14,902 tons in 1953, 17,208 tons in 1952 and 37,164 tons in 1951. Similarly, exports of cotton yarn were lower at 13,422 tons, as compared with 13,503 tons, 21,534 tons and 33,831 tons, in the three preceding years, respectively. The performance on the production front has also been none too happy, although the output during 1954 was somewhat higher than in 1953. The quantity of yarn actually produced declined from 191,236 tons in 1951 to 173,266 tons in 1952 and 163,740 tons in 1953, but recovered slightly to 166,876 tons in 1954. Similarly, piecegoods output receded from 123,399 tons in 1951 to 111,452 tons and 107,860 tons in the following two years, respectively, but rose to 115,063 tons in 1954.

Artificial Fibres

Manufacture of artificial fibres has now come to play a prominent role in the home and export markets of Italy. The industry has up-to-date equipment and is developing its own indigenous raw materials. During 1954, rayon output amounted to 139 million lbs., representing about 7 per cent. of the world total of 1,991 million lbs. Staple fibre production in the same year reached 145 million lbs., or 6 per cent. of the aggregate world production of 2,372 million lbs. Besides cellulose fibres, Italy produces non-cellulose fibres, that is, fibres derived from casein, polyamides and polyvinyls. The total output of all these during 1954 was 18 million lbs., or 4 per cent. of the world total of 441 million lbs.

The artificial fibres industry of Italy is said to be continuously alive to the importance of its export trade. As much as half of the production of artificial fibres is being exported. During the year under review, Italy exported 77 million lbs. (56 per cent. of production) of rayon yarn and piecegoods and 71 million lbs. (48 per cent.) of staple fibre and manufactured goods. The high proportion of fibres exported, it is said, has left its mark on the economic conditions in the industry, inasmuch as the prices in the home market are usually higher than export prices in the various producer countries. This policy of adopting prices to the market at home or abroad is shaped by a number of factors. In the course of an article contributed to *Italy—A Financial Times Survey*, Prof. Libero Lenti of the Pavia University, for instance, alludes to the following factors: "In the first place, the cost of production is always taken into account, particularly the cost of the raw materials used. Secondly, in view of the high degree of competition within the industry, attention is also paid to the prices of natural fibres. Thirdly, price discriminations also occur as a result of Government concessions, designed to improve the national balance of payments. Indeed, this particular problem of the balance of payments has led to the adoption in some countries of measures restricting the import of natural fibres, with a view to creating economic conditions more favourable to the use of artificial fibres."

According to Prof. Libero Lenti, the technical progress in the field of cellulose production has been accompanied by an improvement in the output of staple fibre and yarn. Italy is the first country in Europe to build up plants with a continuous production cycle enabling the fibre to be produced in one operation. Progress has also been made with regard to the final shape in which these yarns are supplied, so as to make them more attractive, both technically and economically, to consumers. The production of rayon cake with a minium number of knots and better handling qualities has arisen. Cones have been made heavier, and both viscose rayon and acetate rayon are now supplied on weavers' or knitters' beams so as to make them suitable for either weaving or knitting purposes. Finally, there has been considerable progress in the manufacture of spun-dyed staple fibre yarns. As regards the intrinsic qualities of the fibres, the continuous improvement in the tenacity of rayon and staple, both moist and dry, the increasing fineness of gauge, and other advances must be borne in mind. This has made it possible to extend the use of these fibres into fields where natural fibres previously held sway.

Non-cellulose Fibres

Similarly, progress has been made with non-cellulose fibres. Outstanding among these is the casein fibre, Merinova, which can be used either on its own or mixed with wool. If mixed with very harsh and rough types of wool, it reduces those deficiencies and produces materials which have lost most of their initial harshness. This fibre can be spun-dyed. Polyamide fibres, such as nylon and lilion, have also shown both quantitative and qualitative improvement.

In addition, another polyamide fibre known as Rilsan, whose polymer is extracted from castor oil, is about to be produced commercially. This fibre, because of its special characteristics, can well take its place among the large number of synthetic fibres now in existence. It is a filament of very low specific weight, with a particularly pleasant feel and a silky appearance which distinguish it clearly from other polyamide fibres.

Silk Industry

Thanks to the progress in the artificial and synthetic textile industry in Italy, as in the rest of the world, the silk industry has been adversely effected. This is indicated by the marked decline in the output of raw silk. The annual rate of output, which at times in the inter-war period, amounted to 10 million lbs., has dropped to 3.3 million lbs. now. Cocoons, the raw material, are scarce, since the changes that have taken place in Italian agriculture has made it less easy to breed silkworms now. Apart from these difficulties, consumption generally has shifted to other fibres. As a result, silk is being used only for luxury purposes today. Since the development of the rayon industry has adversely affected the natural silk industry even in countries like Italy which enjoy natural facilities and considerable skill for producing cocoon silk, it is not surprising that the natural silk industry in India, where it has not been so well developed, has been languishing for some years now. It remains to be seen whether, one of these days this industry, too, will share the fate of the indigo industry which has completely ceased to exist, owing to the development of chemical dyes.

Developments in Wool

The woollen sector of the Italian textile industry which experienced a slump in 1952 has since staged a recovery, the chief contributory factor being the stability in prices. The year 1953 witnessed a normal level of production. In addition to woollen yarns and tissues, Italy produces knitted goods, including socks and underwear, jerseys and dress materials. Generally speaking, wool textile exports from Italy consist mainly of articles in the medium and low-priced ranges which are made up largely from shoddy, wool wastes and new fibres. Exports of fine woollens and worsteds meet with keen competition from other European countries.

During 1954, exports of pure and mixed wool cloth were substantially higher at 18,633 tons, which compare favourably with 15,684 tons in the previous year. The whole of this rise was accounted for by larger offtake by European markets. Shipments to Asia and Africa remained more or less at the level of 1953, while those to North America suffered a marked setback. Among the buyers of Italian wool textiles, Western Germany took about a third of the total (6,152 tons). The U.K. purchased 2,830 tons, India 1,174 tons and South Africa 1,170 tons.

CLOTH EXPORTS

The Cotton Textiles Export Promotion Council proposes to send, in the near future, a delegation to Burma, Siam, Indonesia, Malaya and Ceylon with a view to exploring the possibilities of augmenting exports of cloth from India to these countries. This was disclosed by Mr. Neville N. Wadia, Chairman of the Council, when he addressed the Council's first annual general meeting held in Bombay on Thursday last week. This is a wise decision for two reasons. First, the area which will be covered by the delegation consists of countries with large populations which have not developed their textile industries sufficiently to meet all their needs. Secondly, the area offers a natural market for India's low-priced varieties of cloth, because their standards of living are comparatively low. It will be worthwhile making a determined attempt to develop India's export trade in cloth with these countries.

Besides the aforesaid move, the Council, we are told, has drawn up a programme for establishing offices in overseas countries and the staff for this purpose is now being selected. According to Mr. Wadia, the Council proposes to open offices immediately in the U.K., Indonesia, and West Africa and later in Iran, Iraq and other Persian Gulf countries, Burma, East Africa, Rhodesia, Aden, Abyssinia, Sudan, Saudi Arabia, Singapore, Malaya, Hongkong, Ceylon, Australia, New Zealand, Canada and Pakistan. It also proposes to partake in some exhibitions abroad and the Indian Industries Fair in New Delhi, besides drawing up a programme for publicity overseas. Indeed, "every endeavour," to quote Mr. Wadia, "will be made to publicise our activities, as well as the ITEX scheme, throughout the world."

The review of the recent trends in cloth exports from India, made by Mr. Wadia, reveals that there was a substantial decline in exports during the first quarter of 1955. But this setback was shared by India's main competitors also, particularly Japan and the U.K., as the following figures show:

(In million yards)

	First quarter		Percentage fall
	1954	1955	
India	232.92	190.22	18
Japan	334.05	251.75	25
U.K.	176.75	165.23	7

Mr. Wadia attributed the decline in the trade of all major textile exporting countries to a general slackening of demand in overseas markets. He, however, felt that the downward trend in exports from India had come to a halt; shipments of cloth during April, 1955, were equal to the monthly average for 1954. Nevertheless, Mr. Wadia, rightly warned against any tendency to sit back complacently. He observed: "The work that this Council can do becomes all the more important and all of us must strive to stem the tide and to do everything possible to reach the target of 1,000 million yards."

U.K. WOOL STOCKS INCREASE

Stocks of wool in the United Kingdom at the end of March are estimated at 255,800,000 lbs. (clean weight) by the Wool Industry Bureau of Statistics. This represents an increase of 12,000,000 lbs. on the position a year earlier. Although the March figure was only 500,000 lbs. above that at the end of February, commercial stocks were higher, because stocks of British wool in the hands of the British Wool Marketing Board showed a decrease of 5,000,000 lbs. The increase of 12,000,000 lbs in 12 months was accounted for by 7,000,000 lbs. of merino wool and 5,000,000 lbs. of other varieties. Stocks of tops in the United Kingdom as on 31st March were 50,000,000 lbs., an increase of some 1,400,000 lbs. on the previous month's figure.

Orders have been received from Sweden for the first Dutch-made cotton spinning machine which, it is stated, costs about half the price of its Swiss counterpart and considerably less than German machines.

LABOUR LOSSES IN MILLS SUBSTANTIAL

COTTON PIECEGOODS EXPORTS SLUMP

From A Special Correspondent

MANCHESTER, 24th *May*

MANCHESTER LETTER

NO surprise has been caused within the Lancashire cotton industry at the substantial labour losses which have been suffered in spinning and weaving during the last few weeks. In view of the adverse circumstances surrounding employment, the operatives cannot be blamed for seeking jobs elsewhere or deciding to leave the industry for the time being. So far, the drain of manpower has not reached the magnitude encountered three years ago, when net losses of more than 1,000 a week were being experienced in the spinning section alone. The average fall in available labour, however, is in excess of 1,000 in spinning and weaving combined each week and may yet become substantially worse. Nothing has happened to halt the drift, and immediate prospects do not give any indication of improvement.

Labour losses over the producing end of the industry show that manpower has declined by over 10,000 as compared with the position 12 months ago, but the major part of this setback has occurred in the first quarter of this year, following the extended short-time which came into operation at the Christmas holiday period. Employers are faced with very awkward problems when deciding what action to take when output exceeds demand by such a substantial margin. A point is reached when accumulation of stocks is no longer economic, and yet, when machinery is stopped, wastage of operatives must be expected.

Recruitment of Juveniles

In addition to the dwindling numbers of workers employed in cotton and rayon mills, the high average age of the remaining operatives causes a good deal of concern. Recruitment of juveniles, which was a favourable feature of the trade in the years up to 1952, suffered a sharp setback during the recession which then occurred. Slowly, the proportion of school-leavers in the Lancashire towns joining the cotton trade had been re-established until at the end of last year when it was little below the 1951 figure. Now, however, conditions are such that a further disturbance in this rate of recruitment must be faced, with its consequent effect on the future of the trade.

Lancashire's cotton industry has an unfortunate record for providing continuity of employment over the past 40 years. The ups and downs of trade have deterred many parents from encouraging their children to take up careers in the industry. Recruitment after the last war was stimulated by higher wages, better conditions and the keen demand for goods which lasted for nearly a decade. Unhappily, existing prospects are so obscure that there is no longer the same confidence among entrants, who are apt to pass the mills by when looking out for new jobs.

Terms of trade again moved against Britain's cotton industry in April when earnings were down and imports continued their rising trend. Over the first four months of the year, shipments of cotton goods earned £37,000,000 but raw material supplies entering the country alone cost over £40,000,000 and imports of cotton goods were valued at a further £9,461,000.

Excluding November last year, when the dock strike affected shipments, exports of cotton piecegoods last month were the lowest since August, 1952. The volume sent abroad was only 45,842,000 square yards, their value being less than £6,000,000. This brought the total for the first four months of the year to 211,289,000 square yards, as compared with 236,117,000 square yards 12 months ago.

Nor can any comfort be obtained from the extent of yarn sales abroad. Shipments in April at 3,129,358 lbs., worth £1,325,368, were more than 400,000 lbs. below the average in the first quarter of the year. For the four months, aggregate exports of yarn were 13,862,902 lbs., as compared with 15,098,041 lbs. in the corresponding period in 1954.

Merchants and Eastern Trade

Increased opportunities for exports of Lancashire textiles to the Middle East are referred to in the Annual Report of the Cotton and Rayon Merchants' Association. The new-found prosperity of these areas, due to the expansion of the oil business, was expected to result in an increased demand for imported goods. The influx of more and more employees of the oil companies and of associated concerns in itself should create some demand for higher class goods of Western manufacture.

The report says that, in view of the potentialitles of these markets, the Executive of the Association has appointed a representative to a panel set up by the Federation of British Industries to study the situation and to endeavour to establish the conditions required for export enterprise. Referring to the operation of the Anglo-Japanese Sterling Payments Agreement, the report says that the increase in Japanese textile shipments to vulnerable Commonwealth and Empire countries has been serious from Lancashire's viewpoint. Last year, Japanese exports of cotton cloth rose to 1,278 million square yards, as compared with 914 million square yards in the previous year. Of this increase, 30 per cent. found its way into the United Kingdom, Australia, British West Africa, Singapore and Aden.

Changes Wanted

"Remarkable and revolutionary" changes are urgently needed in Lancashire mills, if the industry is to survive, Mr. John Buckley, President of the Textile Officials' Association, told the annual conference. There must be changes in the field of leadership, personal relations, productivity and automatic machinery. Mr. Buckley said: "Unless we evolve new techniques and new markets, the position of the Lancashire textile industry seems bleak. We must ask ourselves if we can put our house in order. We cannot expect the Government of the day to do this, whatever its convictions." But the Government could obviously assist in the development of new overseas markets at present starved of textiles.

"There must be a new approach made in our industry on similar lines to other industries which show improvement. There is no need to be afraid of production committees where healthy criticisms can be made to the benefit of the industry. Many mills, if they are to continue producing, must have changes in plant and equipment."

Cotton Complaints

Whereas the British cotton manufacturing industry built up its reputation for the production of quality goods which could be trusted, American cotton growers established a similar reputation for the high grade of the fibre they produced. In the light of present-day trends, however, both are having to look to their laurels.

An indication of the attitude of Lancashire spinners towards supplies of cotton from the United States has been given by Mr. Fred Napper, a Vice-president of the Master Spinners' Federation, in an article assessing the viewpoint of local millowners. In contrast with the situation before the war when American supplies were supreme, the mills in Lancashire have latterly been forced to use outside growths due to wartime exigencies and subsequent exchange difficulties. Spinners, Mr. Napper says, have had to use their ingenuity by blending different cottons and it is now probably true to say that there is hardly a local mill producing yarns purely from American cotton.

Countries which formerly contributed only minor quantities of the raw material to consumers were quick to recognise the new situation and it is noticeable that many have concentrated on improved modern packing methods. These, Mr. Napper alleges, have been neglected by many American shippers. Proceeding, he observes: "The artificial umbrella of the American support price system has enabled growers in other countries to undersell the United States shipper. Spinners producing yarns to meet the requirements of their customers are not willing to switch to more costly American cotton, particularly in these days of acute and specialised competition."

Referring to the dangers of mechanical harvesting, Mr. Napper says that this may bring additional trash in the bales or uneven distribution of trash throughout a single bale. A recent survey undertaken by the Spinners' Federation among users of American cotton has shown that there were serious complaints about bad bale covers, which showed up in striking contrast to those used for some outside growths. Several mills reported receiving shipments containing not merely an occasional false packed bale but quite a high proportion of them. Another complaint, he adds, is that some shippers have not observed strict adherence to the shipping dates given in their contracts. This is liable to cause the mills considerable embarrassment, as the large spot stocks formerly available for the trade are no longer in existence.—*All Rights Reserved.*

ANNUAL MEETING OF ROHTAS INDUSTRIES LIMITED

MR. S. P. JAIN ON IMPEDIMENTS TO INDUSTRIAL PROGRESS

FAITH IN NATION'S PROSPERITY EXPRESSED

THE Twenty-second Annual General Meeting of Rohtas Industries Ltd. was held at Dalmianagar, Bihar, on 18th May, 1955. Addressing the shareholders of the Company, Mr. Shanti Prasad Jain, Chairman, referred in brief to the steady progress achieved by the various units of the Company, despite many handicaps. He also added that, with proper facilities, this industrial centre at Dalmianagar promised a vast scope for further development. Mr. Shanti Prasad next dealt with the general problems relating to the industrial development of India and drew attention to the various impediments, such as increase in freight rates, amendment to section 23A of the Income-tax Act, rising wage structure, etc. Notwithstanding the impediments, the nation, he said, had set its pace firmly on the road to progress and prosperity and he had no doubt that our future was brighter and our destinies surer.

The following is the full text of Mr. Shanti Prasad's address:

"GENTLEMEN,

"I have pleasure in welcoming you to the twenty-second ordinary general meeting. The audited accounts of your Company for the year ended 31st October, 1954, together with the Directors' report are already in your hands. With your permission, I shall take them as read.

"I am sure you will all share with me the confident feeling that the Company is making steady improvement year by year. The total sales proceeds during the year have increased by Rs. 1.3 crores over the previous year and production of the various units is the highest on record and greater efficiency has been registered. Cement output has increased by about 17 per cent. Paper and board production has gone up by 30 per cent. The asbestos cement output has improved by 48 per cent. The *Vanaspati* factory was restarted. Only the sugar factory working declined, because adequate supply of cane was not available, in spite of the arrangement made for rail transport by the construction of a 16-mile railway line from Dalmianagar to Nasriganj. The factory, however, refined imported raw sugar and results in this direction were satisfactory.

Expansion of Paper Factory

"The estimated expenditure on the paper factory extensions would be about Rs. 3 crores. The number of new paper machines that have been ordered is now three; and from information so far available regarding expansion programmes of other paper factories, it appears that, after completion of present extensions, your factory will emerge as the largest modern paper factory in the country. We shall be producing a very wide variety of paper. Besides continuing to produce larger quantities and better qualities of boards—duplex, triplex, art and other quality boards—poster paper, kraft paper and pressings, etc., we shall be producing several such varieties of fine paper like bank paper, bond paper, etc., as would match in quality with any of similar imported varieties. Emphasis will continue to be kept on quality of all varieties of our paper. The benefits of extension are already in evidence. The rate of production of your paper factory is now about 2,000 tons per month and it is hoped that very shortly there will be further improvement in this direction. To meet the increased demands of pulp-bleaching for enhanced production, your caustic soda plant is also being extended to yield a production of 5,000 tons of caustic soda and about 4,500 tons of chlorine. More than 3,000 tons of caustic soda will be surplus and will be available for sale. Since our caustic soda will be of rayon quality, it will find a ready market at remunerative price. All the chlorine will be consumed by the paper factory.

Cement Factory

"The shareholders are aware that except in the matter of lime-stone cost, our cement factory at Dalmianagar is one of the most economical in the country. Efforts are being made to improve the position in this direction. Extension of transport facilities to new lime-stone quarries has already been undertaken. Working of the new quarries will be more economical. In spite of longer transport of lime-stone from new quarries, it is hoped that because of the quarrying advantages, lime-stone delivered to the cement factory will, on the whole, work out cheaper. Of the two cement kilns at Dalmianagar, the old one has been producing 500 tons of clinker per day as against 550 tons produced by the new kiln with less coal consumption. Renovations to the old kiln recently completed place it at par with the new kiln both in the matter of clinker production and economy in coal consumption.

"It is a matter for gratification to me that, notwithstanding certain handicaps regarding transport and lack of adequate assistance in obtaining economic supply of raw materials, the various units at Dalmianagar have achieved steady progress. It is clear that, with proper facilities, this industrial centre promises a vast scope for further development.

Railway Transport and Freight Rate

"A very important question is that of railway transport and freight rate. With industrial and economic development in the country the need grows for greater transport facilities; and railways have not only to provide additional transport by construction of new lines in areas which are not accessible but also to make movement of raw materials and finished products economical to the industry and trade. The rate-structure has, of course, to be framed in such a manner as to be paying for the railways to carry the traffic; but what is equally important is to see that the freight structure enables regional and broadbased development of industries. Unfortunately, the Indian railways have not shown adequate appreciation of this aspect of the problem. The freight structure was revised as a result of a departmental study on 1st October, 1948. The rates were steepened so much that industry and trade were very adversely affected. The classification of goods has also not been made on appropriate scientific basis. It has been found in many cases that it is anomalous and the description of goods is complicated and even overlapping. The Railway Minister in his budget speech has agreed to appoint a special committee to look into this question of freight. At the same time, he announced certain increases in the freight rates. I do not follow why this precipitate increase in freight rates should have been made while announcing the constitution of a committee to examine the very subject. The upward revision could have certainly awaited the committee's findings. The 10 per cent. increase of freight for movement within the first 300 miles will, apart from pushing up the transportation cost of raw materials and finished goods, cut at the root of plans for regional development.

"I am sure the railways will not have to lose their income by adopting a reclassification of the goods and adjusting the freight rates in a manner as to assist national development. On the contrary, I feel that by a scientific reclassification of goods and appropriate freight rate, the railways will be able to earn larger revenues through increased volume of traffic and will achieve further gain through the resulting development in the country.

Chemical Industry

"The chemical industry is one which has vast scope for development and an appropriate freight structure will undoubtedly help. For our caustic soda plant, at present the railway freight for salt works out to Rs. 30 per ton against the cost of Sambhar Lake salt at Rs. 17 per ton. With the present high freight structure of salt in comparison to coal, alkali industry, wherein coal, lime-stone and salt are important raw materials, is proposed to be established largely near salt centres and not near coal areas. With comparable freight structure of coal and salt, the industry would have developed in both the areas. Natural advantages possessed by Bihar and Bengal have been set at naught by the Railway Ministry by its inequitous freight structure, putting other raw materials, howsoever basic for industries, generally at a disadvantage with coal. It is very desirable that freight rate on salt and coal should be comparable. If a rational freight is fixed for salt, coal empties could be conveniently utilised for this movement.

"Further, caustic soda industry by the electrolysis process is not being developed in the country because of the difficulty of disposal of chlorine and its products. With improved consumption of chlorine products, such as hydrochloric acid, liquid chlorine, etc., it will be possible to manufacture caustic soda by the electrolysis process. In India, we have yet to develop fullest use of chlorine products for manufacture of disinfectants, insecticides, etc., and for purification purposes. For increase in agricultural production, use of insecticides is almost as important as use of fertilisers. As such, chlorine and its products, particularly insecticides etc., along with their raw materials should be given the same freight classification as fertilisers. Again, sulphuric acid is an essential raw material for manufacture of superphosphates, another important fertiliser. A large number of small units are manufacturing sulphuric acid with imported sulphur. It is possible to manufacture sulphuric acid at a few centres in the country with indigenous raw materials like pyrites and from the process of smelting ores of copper, zinc, etc. This process of manufacturing sulphuric acid will save the country from depending upon foreign imports of sulphur. It will, however, entail long-distance transport of sulphuric acid. The very heavy freight that is levied on sulphuric acid is deterrent to large-scale development of the sulphuric acid industry based on indigenous raw materials. The movement of a commodity that is a raw material must understandably be allowed in a lower class than the finished product.

"Since the question of railway freight is of vital importance, especially in the present context of big-scale developments in the country, it requires urgent attention. The Planning Commission is making a study of the transport requirements and of the co-ordination of rail and road transport, etc. I would urge that in combination with the committee for freight structure appointed by the Railway Ministry, the Planning Commission should make an expeditious examination of the freight rate and also of the development of new lines to link undeveloped areas and permit exploitation of the vast mineral and forest wealth for industrial purposes.

Extension of Railway Lines

"In the last few months, the Railway Minister has made several pronouncements regarding expansion of new railway lines. His estimates started with a figure of 1,500 miles of new railway lines and, it appears now, they have come up to about 5,000 miles. From the way these figures are being worked out or announced, it would seem that the figure of 5,000 miles of new railway lines is considered quite a stupendous one. The limiting factor must be physical considerations and not financial resources that the Railway Ministry can have at its command. When considered in the light of the development achieved during the period when the railways were privately managed and were much smaller in stature, this figure of 5,000 miles contemplated for the second Five-year Plan appears a very tame affair. The extension of railway mileage during the ten-year periods of 1873 to 1883, 1883 to 1893, and 1893 to 1903 was to the extent of 83.4 per cent., 76.7 per cent. and 46 per cent.—the respective mileage expansion being 4,750, 8,000 and 8,500 miles. Between 1903 and 1913 too the expansion was of the order of 8,000 miles. With larger resources and increased number of technical personnel, it should be possible for the Railway Ministry to do a job in 1956-61 which should be comparable with former achievements when neither there was freedom nor any National Plan as such. In this connection, I would like to refer to the construction of the Barwadih-Chirmuri line which was undertaken immediately after the cessation of hostilities, but was abandoned subsequently. This line will open up large inaccessible forests in the old Sirguja and Rewa State areas and will place within reach large quantities of raw materials for our expanding paper industry. From the revenue point of view too, it will be an economic line for the railways. Extensive earthwork already done will be useful in completing the construction earlier. I request the Railway Ministry and the Planning Commission to give this matter their early consideration.

"In the working of companies there are certain wider issues which may be pertinently referred to in this speech. The second Five-year Plan is being put to shape and it is acknowledged that development has to be in a big way. The private industrial sector can and will play its effective part in this development, provided its health is not impaired by a liberal nature of ill-advised injections, as happens to be the case now. It is most important that the private industrial sector be left with resources to play its part. Recent trends in Government policy are, however, such as to divert resources from the private industrial sector to the public sector, while all the time the role of this sector in national economic development is acknowledged. The amendment made to section 23A of the Income-tax Act by the Finance Act, 1955, is a measure of serious import. The modification has the effect of bringing within the scope of the section many of the public limited industrial concerns and compel frittering away of their resources.

"It will be of interest in this connection to examine an analysis of dividends and reserves of companies. An analysis of the results of important industrial undertakings clearly shows that there has always been an attempt to plough back as much as possible into the various businesses concerned and utilise the available sums for rehabilitation and further development as the case may be. A study of the working of 90 companies conducted by the Employers' Association, Calcutta, shows that for five years in succession the percentage of profits ploughed back worked out to more than 40, while the average for the whole of 1948-53 is high at 49.3. In 1949-50, nearly 61 per cent. of the disposable profits were ploughed back, in 1948-49, 55 per cent. and in 1951-52, 51 per cent. The private industrial sector has been endeavouring its best to conserve its funds for expansion and development so as to be able to play its part in the national scheme. The Shroff Committee and its offshoot, the Handoo Committee, made certain recommendations regarding development of resources of the private sector. These recommendations are still under consideration of the Government and the Reserve Bank of India. They must do something positive and substantial enough to help the private sector to do the job which will be assigned to it in the next Five-year Plan.

The Coming Plan

"Development of industrial centres and greater attention to industries are declared to be the objectives of our second Five-year Plan. The language in which this second Five-year Plan is being talked over and the epithets of 'big', 'mighty' and 'bold', etc., that are being used for it, show that something really big is coming up. Whether this coming plan would really be large enough and of a pattern that would accommodate legitimate industrial aspirations of the country or not is, to me, still a moot question. My request to the Planning Commission is that they should assess the results of the first Five-year Plan, not so much by higher increases in industrial and agricultural production that have taken place, but by the actual fruits reaped by the society and by the precise jobs and additional channels released by the Plan. Far from minimising the achievements of the first Five-year Plan, my intention is to focus attention of the Planning Commission on certain realities of the situation which, if taken into account, will bring within the field of the second Five-year Plan a much wider arena of highly beneficial national activity and will obviate pin-pricks unnecessarily and indiscreetly being taken recourse to through various enactments, proposals and public pronouncements which go contrary to national interests or which are not in conformity with the objectives set forth. It needs be seen by those who ought to, that the progress which the nation has made is not due to the swash-buckling of certain theorists who demand credit for achievements not of their making. Actually their restraint and refraining would have brought better results. Their bravado reminds one of the ant which finding itself in the company of an elephant crossing a bridge, spoke to the elephant: 'Did you see, brother, how tremendous is our weight? Sure, we did shake the bridge.'

True Meaning of Socialistic Pattern

"Our planners sometimes forget that 'money' is just a form of accumulated physical labour usefully employed by human intelligence, technique and organising ability. I am purposely using these two words—'technique' and 'organising ability'—because we see in this world that the same amount of human labour and effort do not produce the same amount of wealth in each case. It is the technique and organising ability of a few who are leaders and pioneers in society that produce wealth in geometrical progression. We find that in various countries living standard is not so much dependent on physical labour and effort as on technical efficiency and organising ability. It is, in fact, immaterial to what particular type of socio-political pattern an independent country subscribed so long as it retains its initiative and lets the technical efficiency and organising abilities possessed by its leaders in the economic field to have thier full play for greater and greater good of larger and larger number of persons. Socialistic pattern envisages, first of all, that there will be no person in society who will not have at least the minimum required for a normal healthy living. It does not, and should not, mean that there will be no scope for persons with a better technical knowledge, higher organising ability and more vigorous initiative in various fields to attain a higher level of aspirations and living. Endowed with human qualities and capabilities not inferior to any in the world, why should not our people generally have the best in life as may be obtaining or be obtainable? Why must we necessarily think of patterns pertaining to particular countries where there is equalisation of negations rather than social distribution of fruits of achievements acquired by the best initiative of individual geniuses. Romantic platitudes do not constitute practical politics. Even in Russia there exist levels of living, more pronounced than in democratic countries, which were conceded to by Stalin but not thought of by Marx and Engles. Let us have a socialistic pattern by all means, but let us fill this concept with a meaning suited to our own genius and capable of leading the country to a glorious future bereft of ills obvious in others' ideologies.

Small Industries

"It is desirable and necessary that we should develop our small-scale and cottage industries as one line of industrial advancement. There we can utilise the accumulated ability and dexterity of our craftsmen and artisans acquired through generations. But to think that such development can be had only through Governmental agency or through workers' co-operatives alone without the guidance of persons who possess marketing and organising skill is erroneous. All such organising and technical leadership, of course, has to be co-ordinated to serve social ends. That is important. But if the people who carry on this vitally important job of co-ordination at industrial levels are called 'bloodsuckers,' as is the wont in some quarters to call them, then surely it means that neither we have proper appreciation of our objectives nor do we understand the role of various elements in a functional dynamic economy.

"For some time now we have had the experience of working of co-operatives in this country. So far as the idea and ideals are concerned, it is a good venture. But in the absence of persons with proper vision and spirit, co-operatives like the cane co-operative societies do not carry us far. The executives of the cane co-operative societies are such paid men as work in a set-up and atmosphere and with motives not congenial to the prosperity of the sugar industry. Working of co-operatives has to be reviewed and revitalised.

Price-support for Agricultural Produce

"A demand has been voiced that the Government should undertake a policy of price support for agricultural produce, based probably on the American pattern. Such a policy is outside the present resources of the Government. Total resources of the Government are a fraction of the total agricultural produce of the country. The losses that the Government will suffer will be heavy and will ultimately fall on society. The Government can only help smoothening the process by providing increased credit, better storage and transport facilities.

"The country's economy has, of late, been adjusting itself from higher price levels of the war and post-war periods to lower price levels. In this process of adjustment there appear certain surpluses at one time and shortages at the other, which is bound to happen in any process of such a change-over. Yet, on the whole, our economy remains expanding, progressive and healthy. Not only do the increased agricultural and industrial productions find markets, need for further increase continues to be felt. We should continue our efforts towards increased production which should be taken due care of by increased consumption. Of course, in the matter of consumption we have to strive for conditions where the producers of the very commodities—rural population, artisans and craftsmen—also become consumers of such produce or products. Increased employment must let loose increasing purchasing power for consumption of increased production. Our production targets have to be realistic and our production selective. We have to concentrate on production of such consumer goods as have a ready demand and as are within the reach of general consumers. This is an important lesson for those responsible for developing cottage industries. Strangulation of certain economic activities in order to fetch high prices for certain other products is not only unhealthy from the economic point of view but defeats the very purpose of raising the living standard when such products, because of their high prices, remain beyond the reach of those at the lowest economic level in society. Palliatives can only be short-lived. They cannot take the place of lasting remedies. Cottage industries and small-scale industries have to be given greater attention, but success in that sphere is not to be achieved at the sacrifice of other useful economic activities having a direct bearing on peoples' speedier or earlier betterment. The disequilibrium between the agricultural and industrial prices that has exhibited itself in the process of change-over from high-price economy to low-price economy needs careful study and examination. A large number of industrial products, like cotton textiles, jute textiles, sugar, *vanaspati*, etc., depend greatly on agricultural raw material. Prices of these products will adjust according to agricultural price-level.

Wage Factor

"In the industrial sector, where production is based purely on mineral and forest resources, the wage factor is the most important element in the price structure. It is because of the rising wage structure that the prices in such sectors are resisting a downward trend. In fact, in some cases, as in the case of steel which is the basic material for such a large number of engineering industries, there is an upward tendency. It is very doubtful, looks almost impossible, if the wage structure as it obtains in these industries, at present, will allow the prices of industrial production to come down to any appreciable extent. At least one thing is apparently urgently called for. With the lower agricultural prices, demand for higher wages in the industrial sector should cease, because the benefit of lower agricultural prices does mean a higher real wage to the worker. I congratulate our Central Labour Minister, Mr. Khandubhai Desai, on his recent speech to the Indian National Textile Workers Federation advising the industrial worker to wait for further increases in his income until his counterpart, the agricultural worker, comes somewhere near his level.

"Normally, with larger industrial plants and better technical efficiency in the utilisation of raw materials, industrial prices should have, in due course, adjusted themselves at lower levels, if the wage structure would have been allowed to adjust itself to the cost of living index. The Government too wants to have its additional imposts on the industry by way of cesses, excise duties, larger royalties on minerals and forests resources, extensive sales tax and other taxes in one form or another. These factors, naturally, tend to increase industrial prices and hopes of reduction recede.

Nation on Road to Progress

"Whatever the impediments, a virile nation like India, which has survived through hundreds of years of adversities and dependence, has now set its pace firmly on the road to progress and prosperity. It is bound to occupy its front position among the nations of the world. The great strides that our country has taken during these seven years of independence in the direction of political stability, international prestige and economic advancement furnish clear indications that our future is brighter and our destinies surer. That is not a small thing for a nation to be proud of.

"Whether it is in the matter of big development or heavy industries or small-scale and cottage industries or rural credits, the Directors and the executive personnel of your company will continue to render their best co-operation, because they feel that all these activities are in line with their objectives and it is in the fulfilment of these that their own success and prosperity lie.

"I convey your thanks to the executives, the staff and the workers for their efforts in maintaining the progressive trends of your Company."

HANDLING BULK CARGOES OF SUGAR

ADVANTAGES AND SAVING IN COST

HANDLING of sugar cargo on a bulk basis is largely a development of recent origin. It gained considerable momentum during the war and the immediate post-war years, when there was a shortage of jute bags. Another factor that gave stimulus to this movement was shortage of manpower and high level of wages in Western countries, as well as in Australia. Although the supply position of jute goods has eased considerably, movement of sugar in bulk seems to have come to stay. Nevertheless, India must continue to strive for a revival of the extensive use of jute bags in moving sugar from the producer to the consumer, because in the jute industry it has a large stake. In this context, it would not be out of place to refer in these columns to an interesting article "Handling Sugar in Bulk" contributed to a recent issue of the *Financial Times*, London, by one of its correspondents, as it shows the magnitude of the problem facing the jute industry.

Prior to the Second World War, it will be recalled, the major portion of the world's raw sugar supplies was being stored and carried in sacks or other containers. The capacity of each of these varied between 200 and 300 lbs. of sugar; this quantity had to be manhandled at various stages of loading and unloading before being finally sent to the refinery. The aggregate world supply of jute bags has not been sufficient to meet the growing demands for the same since the war, so much so that the bulk handling of sugar, without any form of outer package, has tended to become common. The Americans were the first in this field and the Hawaiian Sugar Producers' Association pioneered the setting up of bulk storage facilities, in order to make easy shipment overseas possible. Out of the total annual sugar output of about one million tons in Hawaii, as much as 75 per cent. is shipped in bulk. The lead of Hawaii has been followed by the sugar industry in the West Indies. During 1954, for instance, arrangements had been made by which about two-thirds of the raw sugar supplies in this island were lifted by Messrs. Tate and Lyle Ltd. in bulk.

Unloading of bulk sugar at a British port dates back to 1949 only. The method then adopted was to bring small single-deck and some larger vessels with two decks to unloading berths at Dagenham and to discharge their cargo, in the same way as coal, into lighters by means of grabs. The lighters carried the sugar to the Plaistow and Thamas refineries where there are special facilities permitting direct unloading. Special equipment for bulk discharge is now in operation at Liverpool at the Huskisson Dock which was built for Messrs. Tate and Lyle Ltd. at an estimated cost of £800,000 (a little under Rs. 1.07 crores).

A More Recent Development

A more recent development in the handling is the design, by Captain F. H. Formby, A.I.N.A., Technical Director of the Athel Line, of a special type of ship for carrying raw sugar in bulk. The ship has only a single deck with large centre holds like smooth boxes to prevent fouling of the grabs and allowing the latter to reach any part of the hold. Another special feature of this new type of ship is its pretty big size—9,500 tons (deadweight)—while the single-deck vessels used previously were all much smaller. The design of the ship is such that it can equally well be used for carrying in bulk other commodities such as grain or iron ore, as also timber, with deck cargoes.

Two ships of this type were launched some time in March last and it is planned to have a fleet of six vessels in all, three of which will come into commission this year and three in the coming year. The capital cost of the scheme is estimated at £4.8 million (Rs. 6.4 crores).

The aforesaid type of ships marks a distinct improvement over some of the ships which are currently being utilised as bulk sugar carriers and which are said to have not proved particularly suitable. There is, for instance, no need for employing in the new carriers, as in the case of 'tween deck ships used, special machinery for bringing sugar from the wings of the hold within the reach of the grabs. For these new carriers have, as already stated, only one deck with large centre holds like smooth boxes to prevent fouling of grabs and allowing the latter to reach any part of the hold.

The capital costs involved in the organisation of bulk handling of sugar are no doubt high, but there are many advantages in it, such as saving in recurring expenditure. Although no exact estimate is made of the likely savings—this, it is said, is not possible until efficient equipment is used throughout the operation—the *Financial Times* correspondent has given a rough idea of the probable saving that would result if sugar were handled in bulk. According to the correspondent, first of all, there will be a saving on containers. The cost of a 2-cwt. sack in February this year was 2s. 3d. (Re. 1-8); but the price of sacks fluctuates and they have been known to cost as much as 5s. 4d. (about Rs. 3-9) each in recent years. To put a cargo of raw sugar in sacks will, in the case of one of the new vessels, cost approximately £11,000 (Rs. 1,46,667), although this will not be a dead loss, for sacks have a residual value once they are finished with at unloading end.

The saving in cost, if handled in bulk, will, it is claimed, be fairly large. At the loading end, perhaps only half of the labour used for stowing sacks will be required. What is more, the rate of discharge from the specially designed ships will be at least 2,000 tons—rising up to 4,000 tons—a day, as against 700-1,000 tons of bagged sugar. It is thus evident that the ships will have a far quicker turnround and make more voyages each year.

The handling of sugar in bulk in every stage has been found so valuable and useful that it is now being extended even to refined sugar. Many consumers in several places, it is said, are receiving sugar in bulk from road tankers.

CANE DEVELOPMENT IN P.E.P.S.U.

The Central Sugarcane Board is reported to have approved of a comprehensive scheme of cane development for P.E.P.S.U. under the second Five-year Plan. The capital outlay of the scheme is estimated at Rs. 4.5 lakhs, of which 50 per cent. will be contributed by the Central Board. Details regarding the actual implementation of the scheme are not available. From the reports appearing in the daily Press, it is gathered that the scheme envisages, besides an increase in the area sown to sugarcane, replacement of old varieties by new improved ones and intensification of manuring through compost-making.

The need for intensifying cane development in this State will be clear from the fact that the progress made so far in the field of cane culture has been none too satisfactory. Not only is the yield of cane per acre very low but the sucrose content also is considerably poor. Indeed, both these fall short of even the all-India averages. Thus, the per-acre yield of sugarcane grown in P.E.P.S.U.—on the basis of the All-India second estimate of sugarcane crop, 1954-55—comes to not more than 12.3 tons, as against the average of 13.1 tons for the whole of India. The area actually sown to cane is 69,000 acres and the output anticipated is 848,000 tons. Similarly, the percentage recovery from P.E.P.S.U. cane may be placed at 8.66 (1953-54), which compares unfavourably with the all-India average of 10.08.

The importance of intensifying cane development in P.E.P.S.U. also arises from the need to ensure adequate supplies of quality cane to both the sugar mills already in existence and the two new ones proposed to be established at Sirhind under the second Five-year Plan. There are at present two sugar mills in P.E.P.S.U.—the Jagatjit Sugar Mills Co., Ltd., Phagwara, and the Malwa Sugar Mills Co., Ltd., Dhuri—with a daily cane-crushing capacity of 850 tons and 1,000-1,200 tons, respectively.

"INDIAN SUGAR" ANNUAL NUMBER

With the publication of the *Annual* (Editor: Mr. J. S. Mehta, Indian Sugar Mills' Association, 23-B, Netaji Subhas Road, Calcutta. Price: Rs. 3), *Indian Sugar* has completed four years of useful existence, since the Association took it over. Like the previous volumes in the series, the *Annual* under review is an authoritative compendium of the developments on the Indian sugar front. It covers a wide range of subjects connected with both primary stage—cultivation of cane—and the secondary stage—manufacture of sugar—of the sugar industry. It also covers subjects dealing with confectionery and other subsidiary industries such as power alcohol and food yeast production.

All these subjects have been examined and discussed by persons who are experts in the line and who can speak with authority. Mention, for instance, may be made of two articles—one on the financial structure of the sugar mill industry by Mr. A. K. Sur, Economist, Calcutta Stock Exchange, and the other on stiffening of filter press cloth by Prof. J. M. Saha, Director of the Indian Institute of Sugar Technology, Kanpur. There is another interesting article on clarification of cane juice with a new flocculating agent. Mist spraying of cane—a simple and effective means for minimising sugar losses between harvest and milling—forms the subject matter of yet another interesting article.

The utility of the *Annual* has been further enhanced by the reproduction of the review of the world sugar position in the past four years by the F. O. Licht's Sugar Information Service and an analysis of the trend in world sugar market during 1954 by Messrs. C. Czarnikow Ltd. Also incorporated in the *Annual* are the revised statistical tables relating to the different aspects of sugar industry.

WASHING HIGH-GRADE COAL

GOVERNMENT TO SUBSIDISE?

WASHING and blending of high-grade coal received prominent attention at a recent meeting of the representatives of collieries producing coking coal and the Planning Commission. It would appear that the consensus of opinion at the Conference was that the demand for coking coal for metallurgical and other essential purposes at the end of the second Five-year Plan would be of the order of 14 million tons and that this should be secured by washing and blending high-grade coal. The Planning Commission is also reported to have conveyed the Centre's desire to subsidise washing of coal for coking purposes on a no-profit-no-loss basis.

All grades of coal below grade II and all seams below No. 10 are considered as non-coking coal, while selected grades A and B and grade I and II are regarded as coking coal. The aggregate output of A and B grades in 1954 was 7.21 million tons, grade I coal 3.66 million tons and grade II coal 2.75 million tons, the total of all these four varieties being 13.62 million tons. Although grade I and grade II are not at present used for metallurgical purposes because of their higher ash-content, they are considered as capable of being converted into superior grades through beneficiation and blending with the superior grades. They can themselves be used for making hard coke for metallurgical purposes but are not so used because it would be uneconomical and because sizable reserves of high-grade coal are still available. Grade I and grade II coking coals are, therefore, bound to assume more importance and will, perhaps, be the main source of supplies, to the iron and steel industry after beneficiation, as the reserves of higher grades of metallurgical coal gradually get depleted.

Assuming that correct methods of mining are employed and waste is eliminated, India has, according to official estimates, reserves of 2,000 million tons of high-grade and coking coal which should last, if consumption were restricted to use in iron and steel and other metal manufacturing industries alone, for a period of about 650 years. But India is using coking coal today for ordinary furnace and railway purposes, for domestic fuel and also for some industrial uses to the extent of 10 to 12 million tons per annum. Consumption of coking coal for purely metallurgical coal purposes is, however, only about 3 million tons. If the high-grade reserves are used for non-metallurgical purposes also at the present rate, they will get depleted in about 160 years.

Recent Experiments

Recent experiments conducted at the Fuel Research Institute and private industrial concerns like Tatas show that India's second grade coal is capable of improvement to first grade of coal through washing and blending. It is expected that the percentage of recovery by washing may be roughly 80 per cent. in the case of selected B and about 65 per cent. in the case of grade I and II, but the actual recovery will depend upon the ash content of the coal washed.

The Central Government's readiness to subsidise washing of the extent of the loss incurred by washeries is, indeed, welcome. It is, however, not clear whether it would encourage the setting up of central washeries by groups of collieries. It will be recalled that the Washeries Committee recommended coal preparation under a central authority in a centrally situated plant, as it felt that only a centrally situated plant, designed to wash large tonnages of different varieties of coal, would be economical. All indications are that the Government is reluctant to undertake the construction of any central washeries at its own cost.

It is expected that, on beneficiation, the output of coking coal suitable for metallurgical and other essential purposes from the present rate of production will be about 11 million tons, as against an estimated demand of about 14 million tons. Consequently, even the output of coking coal, which was 13.65 million tons in 1954, will have to be increased. The cost of developing coking coal mines and setting up washeries is estimated at as much as Rs. 30 crores. How is this large sum to be raised, especially when the investment market is dry, is the question. Moreover, in view of the Government's undecided policy regarding nationalisation of coal and the uncertainty about the quantum of compensation caused by the further amendment to the Constitution, private enterprise has hardly any incentive to invest in this vital industry.

FUTURE OF TEA INDUSTRY

QUALITY TEA HAS GOOD PROSPECTS OF FETCHING SATISFACTORY PRICES

THE tea markets both in India and in London have lately shown some signs of steadiness. In fact, when sales were re-opened in London last week, Indian teas were in demand and slightly higher prices were fetched by quality teas. This improvement in the markets seems to be the cumulative result of the various measures adopted by the producing countries to arrest the distressing fall in prices. Restricted offerings for sale, a call for regulation of crop by the tea planters' associations of North India, the closure of the London market for a few weeks, the Ceylon Government's entry into the market as a buyer, its offer of price-subsidy in case the price of tea were to fall below Rs. 1.50 per lb. and the removal of quantitative restrictions on the export of quality teas to the London market were among the important steps taken to check the downward trend. The intervening period gave the growers and blenders an opportunity to reduce their stocks; for the recent decline in prices is traced more to the loss of confidence of retailers who had bought at high prices than to consumer resistance.

Any assessment of the future trend of tea prices based on the latest improvement in market trend is impossible. However, producers of quality tea will have no cause for anxiety and they can command a fair price at a premium over that which producers of common tea can get. This aspect was stressed by Mr. W. S. S. Mackay, Chairman of the Kannan Devan Planters' Association, in the course of his address at the annual meeting of the Association held last week at Munnar, Travancore-Cochin State. Referring to tea prices and their future, Mr. Mackay said that the bewildering oscillations of the market presented a situation unique in the tea trade. From record prices of 8s. per lb. for the best marks sold on the London auctions a few months ago, values wavered and fell rapidly to levels even below the cost of production. Again prices rose and hopes of stability revived. "Today, we are again faced with dropping prices," he observed, "and only really satisfactory prices are being paid for well made quality tea. We cannot influence prices, but we believe that much harm was done by the unrealistic rise in prices, followed by a rapid and even more alarming decline." Mr. Mackay added that there was, however, one gratifying probability of the producers of quality tea continuing to get a fair price or, at any rate, a premium over the manufacturers of common tea. "Speaking in general terms," he continued, "we have no great cause for anxiety, provided we keep on producing the teas for which the hills of Travancore became famous many years ago."

The fall in tea prices has brought to the fore other problems to planters. The export duty on tea is one of them. Though the present sliding scale system of export duty is welcomed by the planters as an improvement, in principle, over the past method of arbitrary fixation, the incidence of the duty is considered heavy in a falling market. Referring to this, Mr. Mackay observed in his speech:

"The export duty for this month (May) is fixed at As. 8 on the basis of a price for April of Rs. 3-3-6, as compared with the first duty rate on the new system of As. 10, on the basis of a price of Rs. 4-3 as announced on 1st March.

"If we were to obtain Rs. 3-8 or more per lb. for our teas, we should have few grounds for complaint about the rates fixed, but it is very evident that we are not to continue to obtain the inflated prices which obtained at the beginning of this year. Should the London auction average be Rs. 2-8-6, the expense of payment of duty at the 6-anna rate, plus charges for shipping, marine insurance, London brokerage and sale charges, is approximately As. 10.

"This only leaves Re. 1-14-6 to cover ex-warehouse costs, which will entail many estates in working at a loss once the expenses imposed by the Plantation Labour Act are taken into account."

Another problem which has assumed great significance in the light of fall in prices is the implementation of the Plantation Labour Act. Mr. Mackay availed himself of the opportunity provided by the annual meeting of the Kannan Devan Planters' Association to utter a note of warning about the crippling effect of the legislation. "A short time ago, the prosperity of the tea industry was such that some felt that the implementation of the Plantation Labour Act would not be so bad as first predicted," Mr. Mackay pointed out, "yet today many estates are selling tea at below cost of production and some may be threatened with acute financial difficulties." He feared that the implementation of this Act without mutual understanding and real co-operation between Government and employers could present a crippling blow to a large section of the industry.

Describing the Plantation Labour Act as the biggest single step taken by legislation to deal with the conditions of service of workers, for which it was necessary for the Government to prepare draft model rules for the guidance of States, Mr. Mackay complained that employers in South India were almost entirely ignored, or denied the right to explain local conditions and difficulties and put forward their case for amendments or alterations where these appeared absolutely necessary. It is stated that, in earlier discussions between the Government and the employers, it seemed clear that, in respect of major points, reasonable time would be given for the implementation of the requirements of the Act. Mr. Mackay, however, expressed surprise that, without due consultation with those bodies which represent employers in Travancore-Cochin State, the Government should have submitted draft rules for that State without study of the peculiar circumstances in the State. A sub-committee of the U.P.A.S.I. would appear to have been set up to study this matter and this committee has appealed for suitable modifications, agreeable to both sides. Mr. Mackay was not opposed to the implementation of the Plantation Labour Act. What he said was that, to be sound and truly beneficial, an Act of this nature should be imposed slowly, steadily and at a pace amenable to proper consolidation.

TEA INDUSTRY AND EXPORT DUTY

Writing from Coonoor, our Plantation Correspondent says:

"'A burdensome duty on tea means the destruction of the goose that lays the golden egg,' says a contemporary writer. The course of events in the tea industry over the past few months may justify this statement in the near future. The rapid recession in prices that has occurred in the principal markets of the world shows that, sooner or later, the tea industry will have to begin to think of various reliefs in order that its economic position may not be too seriously affected. When a crisis overtook the industry in 1952, there was a widespread demand for some reduction in the prevailing rates of export duty, but no such reduction was granted by Government. Nevertheless, due to a favourable turn in demand the industry's economic position slowly started to improve, and by the end of 1953, the industry had recovered the position that it had lost for two years.

"This improvement continued for several months of 1954, but, in October of that year, the Government decided to raise the export duty by 3 annas a lb. The increase, however, was easily absorbed, owing to the strong demand for tea in the overseas markets. Early in 1955, the Government ordered a further increase of 3 annas in the duty, making it amount to 10 annas a lb. Contrary to previous experience, however, this increase was not easily absorbed in spite of the prevailing high price of tea, and, in fact, the effect of the increase was to reduce the market price of tea by an equivalent amount. That was a sure indication of resistance from buyers. The continued downward trend of tea prices since March this year clearly shows that the incidence of export duty should be examined carefully. The fixation of the new slab rates of duty, with 12 annas as the maximum rate, since 1st March, 1955, has not improved the situation by any means.

"As has been pointed out ere now, the main defect of the slab system of levy is that it does not permit of prompt adjustments when the market for tea is falling. As against this, however, we are told that the system might benefit the industry when tea prices start recovering. It is unnecessary to discuss the merits of this argument for the present. But, in the present falling market, the main question is whether the floor rate of 4 annas a lb. will have to be levied if tea prices go down to 1952 levels. Supposing the price went down to, say, Re. 1 a lb., should the 4 anna duty still be paid? This is a matter which requires attention since the new slab system presupposes that the tea industry should at all times be subject to a minimum levy of 4 annas by export duty."

JUTE CULTIVATION IN U.P.

EMPHASIS LAID ON QUALITY

THE Government of Uttar Pradesh appears to be making a determined bid to place the State on the jute map of India, by encouraging cultivation of jute on scientific lines. According to the Jute Development Officer of U.P., sowing of jute in the State, which began in last March-April, was completed on 34,400 acres. In this area, as many as 695 acres were brought under the system of line-sowing. Thus, the target of 500 acres fixed for line-sowing this season has been exceeded by 195 acres.

Considerable progress is also reported to have been made in experiments relating to quality cultivation of jute. Out of 10 *Capsularis* subvention trials, nine are stated to be progressing well. Besides, out of 13 manurial trials of the *Capsularis* variety, as many as 11 were sown till April last. Under the double-cropping experiments, jute and paddy were sown in accordance with the instructions of the Jute Agricultural Research Institute and the germination of jute crop is reported to be good. The other experiment with jute and wheat is expected to be launched with the first shower next month. These experiments in double-cropping are being conducted at Tamkohi Road, Deoria District.

Work, however, has not commenced on the construction of new retting tanks. The programme drawn for the current year to boost jute cultivation in the State provides for constructing 150 such tanks. Selection of sites for these tanks has yet to be made.

Meanwhile, the pilot survey scheme launched some time ago to investigate the economics of jute growing is, it is learned, progressing rapidly. Under this scheme, work is being done in 35 select jute centres. During the last three months, the jute grading party worked in 54 villages and completed grading of about 203 maunds of jute and 19 maunds of *mesta* fibre.

The area sown to jute and the total output of raw jute in U.P. have varied considerably during the last four or five years. This is evident from the table below:

Year	Area Acres	Yield Bales
1951-52	67,900	102,900
1952-53	80,000	164,600
1953-54	27,000	56,000
1954-55	34,000	70,000
1955-56*	34,400	—

*Estimated.

It will be seen from the table above that the acreage registered a fall of 66 per cent. in 1953-54. This fall is in line with the general downward trend in acreage under the crop in the country as a whole. In 1952-53, the area devoted to jute in the whole of India was 1.83 million acres. But in 1953-54 the area dropped to 1.19 million acres. This drop was in the main due to a heavy decline in the prices of raw jute, following the cessation of Korean hostilities. It will be interesting to recall here the observations made on this decline by the Jute Enquiry Commission. It said: "When prices began falling in 1952, it was mainly after the sowing season, so that the acreage was not materially affected and the yield also proved to be even higher than in the year previous. Since then the raw jute market has felt the jute impact of the slump in the jute goods market. The latter affected seriously prices of hessians as well as sackings, and not even the drastic reductions in the export duty from time to time could suffice to boost the prices. During the period of decline, prices of raw jute fell to the lowest levels, touching in the beginning of the 1952 season, Rs. 10 to Rs. 15 in the interior of U.P., Rs. 13 in Orissa and even lower figures for *bimli* and *mesta*. Though the prices began to recover before the end of the 1952-53 jute season, the psychological effect of the earlier fall was accentuated to the same degree, as in the converse experience of the boom at the beginning of the 1951-52 season."

Since 1954-55, there has been an increase in the area under jute in U.P. It is, however, still premature to say whether the improvement will persist in the coming season. For the Centre has been insisting on the States to limit the expansion in acreage to areas which are only best suited to the cultivation of jute. This principle is being followed in all the States. It is, therefore, unlikely that the area under jute in U.P. would go up to as high as 80,000 acres sown in 1952-53, as a large part of this area is not suitable for growing jute economically.

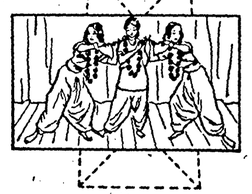
it's a GREAT job...
keeping thousands of workers fit and happy
Over 8,000 people are on the payroll of the Assam Oil Company—a great community, drillers and doctors, truckdrivers and typists, whose lives are centred round the winning, refining and distributing of oil. Helping to keep contented minds in healthy bodies—both in their leisure and their working hours—is indeed a formidable task.

Taking physical well-being first, Digboi Hospital is one of the most modern and best equipped in India. There are maternity centres and clinics readily accessible and a fully staffed Welfare Office. Malaria, which at one time affected three out of five workers, has been virtually stamped out.

More than 4,300 children attend the company's nine schools, which have a high record of Matriculation successes. Social clubs, sports clubs and playing fields cater for every kind of sport. Vegetable and flower shows, arts and crafts, stage plays, concerts—every form of hobby and recreation is encouraged.


In these ways the Assam Oil Company is glad to acknowledge the loyal service of its family of workers, engaged as they all are in a great national effort to satisfy India's oil needs from her own resources.

EUROPEAN COAL AND STEEL COMMUNITY

ENCOURAGING DEVELOPMENTS IN 1954-55

THE year 1954-55 (12th April, 1954, to 10th April, 1955) was one of outstanding developments to the European Coal and Steel Community. The most important of them was the establishment of the common market for special steels. As a result, the common market came to cover all the products that are within the Community's jurisdiction. The next important event was the agreement among all the Community's six member-States, namely, Belgium, France, Germany, Luxembourg, Italy and the Netherlands to set up in three stages from 1st May, 1955, to 1st May, 1957, "international through rates" ending all extra charges on Community freight crossing frontiers in the six-nation area.

Further, the High Authority fixed its policy on the future of the Ruhr coal-selling agency early in 1955 and informed the interested parties of the reforms which would be necessary if anti-cartel prosecution by the Authority were to be avoided. Besides this, the High Authority provided help for workers in all cases where problems of labour resettlement arose from modernisation programmes hastened or caused by the opening of the common market. Workers' resettlement programmes are under way in mines and in steel plants in the centre and south of France and have been approved in principle for workers in the Italian steel industries and in the mines of Borinage coalfield of southern Belgium. Another important development was the Agreement of Association signed between the U.K. and the Community on 21st December, 1954. This agreement is regarded as a model for future relations between the U.K. and future European integrated communities.

The common European market developed steadily throughout the year as a new and distinct unit. The existence of the common market free from customs duties, quotas, exchange controls and transport discriminations, which helped to maintain production during the recession of 1953, restrained prices in the boom of 1954. Evidently, this was due to the greater stability provided by a large market. In part, it was due to rules of fair trading, requiring the publication of prices and forbidding discriminations, the system being backed by a mechanism of inspection of books with fines for violation of the rules. According to the third general report on the activities of the Community, the year 1954 was the first normal year of functioning of the common market and the institutions of the Community.

The importance of the common market is evident from the fact that it serves an area of 449,000 sq. miles covered by the Community (including the Saar). It has a population of 160,000,000, as many as there are in the United States. The active working population of 74,000,000 is greater than that of the United States. The Community produced in 1954 a record of 43.8 million metric tons of steel and the post-war peak of 241.7 million metric tons of coal. It shares with Russia the world's second place in the output of these products. There are 914 enterprises, of which 447 are colliery companies. As many as 204 plants produce pig iron and steel and 107 are iron ore mining concerns. The following tables give the output of coal and steel of the Community in 1954, as compared with a number of other important producing States of the world and the percentage of 1954 in comparison with the previous maximum:

Production of Coal and Steel

(In millions of tons)

COAL

	1952	1953	1954	Percentage of 1954 in comparison with previous maximum
Community	238.9	237	241.7	— 0.3 (1938)
United Kingdom ..	280.1	227.8	228.1	—22.1 (1913)
United States ..	458.1	438.2	378.2	—39.2 (1947)
Soviet Union	250	248	267	+ 7.7 (1953)
Eastern Europe ..	110.4	115	119.3	+ 3.7 (1953)
Other Countries ..	228.4	236.5	250	..

STEEL

	1952	1953	1954	Percentage of 1954 in comparison with previous maximum
Community	41.8	39.7	43.8	+ 4.7 (1952)
United Kingdom ..	16.7	17.9	18.8	+ 5.2 (1953)
United States ..	84.5	101.3	80.1	—20.9 (1953)
Soviet Union	34.4	37.9	41	+ 8.2 (1953)
Eastern Europe ..	10.3	12	13.3	+10.8 (1953)
Japan	7	7.7	7.8	+ 1.3 (1953)
Other Countries ..	16.8	18.5	18.2	— 1.6 (1953)

The reality of the common market, still in its initial stages, is shown by the growth of trade between the countries of the Community. As compared with 1952, steel trade in 1954 doubled and coal trade was up by 26 per cent. These proportions apply not to marginal quantities but to exchanges amounting to a quarter of total trade between the six countries. The trade across the frontiers in 1954, as compared with that in 1953 and 1952, was as follows:—

(In million tons)

	1952	1953	1954
Steel	2.1	2.8	4.2
Coal	24.3	27.0	30.6

Internal growth in trade was not obtained at the expense of trade with third countries. The imports and exports of steel and coal in 1954, as compared with those in 1953 and 1952, were as follows:

(In million tons)

	1952	1953	1954
Steel:			
Imports	0.8	0.9	1.0
Exports	6.6	6.6	6.7
Coal:			
Imports	22.3	13.8	13.9
Exports	9.6	10.2	13.4

In order to cope with shortages of scrap experienced by the common market, the High Authority, in agreement with the Council of Ministers, decided on 28th March to tighten control over the distribution of imported scrap. By directing to places where demand most required them, the High Authority has been able to refrain from imposing new controls on scrap within the common market. The policy of the High Authority is to overcome scrap shortages in the long run by encouraging the use, wherever practicable, of pig iron.

In 1954, the High Authority began discussions with member-States to whittle away administrative obstacles, which subsisted, despite the ending of customs duties, quotas, current restrictions, etc. As a result, licences in most countries have been replaced by simple declaration forms for the benefit of national statistical and exchange bureaus. Similarly, only a few of the administrative costs which had to be reimbursed to Government agencies by producers shipping goods across a frontier still subsist. The High Authority now aims at persuading member-countries to agree on a single customs declaration valid throughout the common market, instead of the multiple forms still required to establish that Community goods can pass duty-free over all frontiers.

The object of setting up of "international through rates" by stages from 1st May, 1955, to 1st May, 1957, is to end all extra charges levied on freight carried across frontiers. These charges add, on the average, 25 per cent. to the total cost of freight. They have been handicapping across-frontier traffic in the common market. The total of excess charges to be ended amounts to about £6 million.

The High Authority agreed during the year under review to five minor joint selling agreements, which were too small to enable the firms involved to determine prices or restrict competition. The aim of High Authority policy is to eliminate simultaneously the cartel obstacles to the common market in coal in Belgium, France and Germany.

The High Authority has authorised seven concentrations scattered through most of the Community and none of which results in a merger of over 2 million tons production a year —considerably less than that of the largest firm existing in the Community when the common market was established. The High Authority's policy is to encourage concentrations which lead to a lowering in production costs as long as the companies to which they give rise cannot restrict competition or establish themselves in an artificially privileged position.

The loans already made to Community firms by the High Authority, out of the $100 million U.S. loan, amount to $64,400,000 for the following purposes:

	$
Modernisation of coal mines and collieries	23,310,000
Power stations	26,890,000
Iron ore mines	14,200,000

In addition, $10,000,000 have been earmarked for thermal power stations in Belgium.

The participation of the High Authority in projects has varied between 20 and 30 per cent., the average being 22 per cent. The High Authority received requests for loans amounting to $157,000,000, much more than its available funds. The High Authority loans were made for the most part at 4.1 per cent. interest repayable in 25 years, terms which are much more favourable than at present usual on the European capital market.

The High Authority had earmarked $25,000,000 of the American loan to help stimulate miners' housing programmes. But financial complications have led it to seek equivalent funds in the Community countries. The balance of the American loan will shortly be lent out to Community firms for industrial investment.

The social aim of the Community is to equalise living standards upwards in an expanding European economy, and some steps were taken in this direction during the year under review. The High Authority initiated two workers' resettlement schemes in France, started miners' housing projects and brought about an agreement between member-countries in order to enable skilled workers to obtain jobs anywhere on the common market free from all national restrictions.

ISOCYANATE CHEMISTRY

About 15 years ago, a German chemist, Professor Otto Bayer, surprised the chemical world with the announcement that he had succeeded in finding a new way of using the simple products of the chemistry of coal to make new types of materials with many different and interesting properties. At that time two fundamental roads towards the same goal were already known. One of these had already been found before the First World War by Leo Henrik Baekeland and had led to the synthetic resin "bakelite" which has become known all over the world and which, for almost 20 years, was the shining example of the plastics. The second was found at the end of the 1920's and had presented us with the multitude of vinyl plastics. The new road found by Prof. Bayer was fundamentally different from the two older ones. This was in so far an advantage that it opened up entirely new possibilities. But it also had a disadvantage, because it made it necessary to carry out extensive development work, and even to work out entirely new processing methods, all of which required a great deal of time. The war and post-war years delayed this work considerably, but the development work was resumed again a few years ago. The so-called isocyanate chemistry has grown bigger and bigger and it is surprising to see how many new technical possibilities have been found in this chemical reaction which was found in painstaking laboratory work and extended through the years.

One of the most interesting products of this development work is a material which is, on the one hand, as elastic as rubber but, on the other hand, is completely resistant to oils and petrol, resistant to aging in the highest degree and characterised by excellent mechanical qualities. Gear and friction wheels which run without making any noise and work with practically no wear are among the products made therefrom. Large high-pressure packings can be made of this material without the use of any fabric whatever. A cup sleeve for a heavy forging press with a wall thickness of 0.313" and a diameter of almost 27½" may be taken as an example. Pulleys, sheaves, rollers, bumpers, clutch sets and discs are now being made of this new material in all applications where a long service life is desired. An interesting new development is a flat belt with teeth which is made of this material and is intended mainly for sewing machines, where the tension is taken up by a steel braid which is embedded. In the production work, tolerances in length of up to 0.004" can be maintained without effort, and an angle accuracy of 15 minutes is achieved in practical work. Gear couplings in which the individual tooth flanks have been covered with the new plastic by a coating

(Continued on page 1099)

NEW PRODUCTS AND PROCESSES

Storage Battery

A STORAGE battery no larger than a postage stamp and about ¼ inch thick has been developed by Yardney Electric Corporation of New York. Believed to be the smallest rechargeable battery in the world, the tiny cell weighs one-sixth of an ounce. Zinc and silver electrodes are used in the battery, which has one-fourth the ampere-hour capacity of a regular battery that is 16 times bigger. It is expected that the battery will be used in portable communications equipment and electric wrist watches, and may "revolutionise" some photography and model airplane equipment. The battery could, it is stated, operate an electric-powered watch for more than a year without recharging.

Plastic Foam

A plastic foam which promises to reduce the cost of constructing some parts of boats and airplanes by as much as 50 per cent. has been developed by the Bakelite Company of New York, a U.S. chemical concern. The new lightweight material is produced by bonding together thousands of tiny hollow spheres made of phenolic resin. A phenolic, epoxy or polyester resin is used as the bonding material. The finished product has a cellular structure similar to that of wood and, like wood, the plastic foam can be drilled, sawed or machined. Designed to be used in structures, such as boat hulls and airplane wings as a filler or reinforcer, the plastic foam also has properties that make it useful as an insulating material in air conditioners and refrigerators.

Electronic Camera Photographs Planets

Scientists at Johns Hopkins University in Baltimore, Maryland, have perfected a new electronic camera which virtually "sees in the dark" and promises to revolutionise the study of planets. The camera has already photographed Mars under poor atmospheric conditions and has made some of the best pictures so far obtained of the planet. The electronic camera takes a picture like an ordinary camera and translates the picture into electrical impulses or signals. Before changing the impulses back to a picture, the camera greatly amplifies the impulses. This means that a picture can be seen several thousand times brighter than an ordinary camera picture. It is expected that the new camera will soon take pictures of details on Mars that have never before been observed.

Atom Product Used in New Stomach Test

Vitamin B-12, made radioactive by using a peaceful product of atomic energy, is being used in the United States in a new test to determine the presence or absence of acidity in the stomach. The vitamin is irradiated by Cobalt 60, produced in a nuclear reactor. The test is used primarily to determine if patients have pernicious anemia. Pernicious anemia patients do not have normal acid in their stomach and in addition they do not produce a substance, called "intrinsic factor," which is needed to absorb Vitamin B-12. When normal persons are given the radioactive vitamin, it can be detected in their system, but this is not the case with pernicious anemia patients. Thus, the test may show whether patients have pernicious anemia or some other condition, such perhaps as stomach cancer. The test was developed and is being used by Dr. Lloyd D. MacLean of the University of Minnesota Medical School at Minneapolis, Minnesota.

Sewage Pump

The first electric motor-driven raw sewage pump was recently installed at Newark Bay Pumping Station of the Passaic Valley Sewerage Commissioners, U.S. The new pump, manufactured by Worthington Corporation, is handling 135 to 150 million gallons of sewage daily under the plant's present head conditions. A similar pump is being manufactured at Worthington's Harrison, N.J. Works and will be installed in the near future. Prior to the installation of the new electric motor-driven pump, all of the plant's pumps were of the steam engine-driven type. The new pump, along with the similar unit under construction, are the first two pumps in the plant's programme of renovation and electrification. The Newark Bay Pumping Station, located on the outskirts of Newark, N.J., handles sewage from 26 surrounding municipalities with its total pumping capacity of approximately 400 million gallons a day. Work on the plant's new programme is under direction of Chief Engineer Seymour A. Lubetkin and the consulting engineering firm of Bogert and Childs.

Building Crane With Unusual Hoisting Speed

A novel crane for building purposes, the first all-Swedish unit of its kind, has recently been put on the market by AB Malcus Holmquist, of Halmstad. Having a hoisting speed of 40 metres (131 ft.) per minute for loads up to 1.1 tons at a radius of 17 metres (56 ft.) and an elevation of 16.75 metres (55 ft.), it is claimed to be one of the speediest-working cranes ever to be built. The designing of the new crane was preceded by large-scale market research among Swedish contractors in order to find out what properties were required for a unit of this type. The sturdy welded steel structure has a low centre of gravity and high dynamic stability, thanks to 16-ton cast-iron counterweights. It is equipped with two hoisting blocks, the inner block working on a radius of 10 metres for a load of 2 tons and a hoisting speed of 20 metres per minute. For easy revolving, the hooks are provided with cased-in SKF axial bearings. The bogie platform, which has wheels of cast steel, is dimensioned for 2.8-metre tracks. Both hoisting and revolving machinery have elastic coupling with brake disk. The lower bars of the crane beam serve as rails for the hoisting carriage, which makes it possible to pick up and dump the load at any point within the crane's working area. The operator's cabin is electrically heated. The new 30-ton crane, which can be mounted on the working site in one day, is shortly to come into series production at the Malcus Holmquist factories. It has undergone a series of exhaustive tests and has been found to work satisfactorily even in severe snowstorms.

Coloured Aluminium Skyscrapers

Coloured, aluminium-clad skyscrapers are in prospect for America. The Aluminium Company of America (Alcoa) is going to cover Pittsburgh's newest skyscraper in blue aluminium. Last year, the Company used coloured sheets for the first time on its own sales office building in Cincinnati, a combination of blue and gold, Alcoa hopes that the new Pittsburgh structure, the 16-storey Pennsylvania State Office Building, will set a style. The rainbow-hued metal is suitable for churches, schools and even homes, the company says. Ordinary silver-appearing structural aluminium is in wide use. Last year, in a demonstration of the economy in labour costs which structural aluminium offers, the bare beams of an entire New York skyscraper were clad with exterior aluminium walls in just nine and one-half hours. The coloured sheets are slightly more expensive than the glistening silver ones, but Alcoa believes the added beauty offsets any price difference. As to the tinting process, the Company reveals only that "oxidised metal is impregnated with colour," the colour is not coated on the aluminium.

Tetracycline

Tetracycline, the newest addition to the family of broad spectrum antibiotics, is fulfilling the promise of its early clinical trials. Widespread experience with the new drug confirms its high safety and effectiveness; these factors, combined with tetracycline's ability to diffuse readily through body tissues, indicate that its recent discovery marks a significant milestone in the conquest of infectious disease. The antibiotic, also known as polycycline and bristacycline, has shown itself effective against a wide variety of disease-causing organisms. North American physicians, for example, report striking results with bristacycline in eradicating the diverse bacteria responsible for acne and other troublesome types of skin disease.

INDIAN INSURANCE INSTITUTE

SILVER JUBILEE CELEBRATED

THE celebration of the silver jubilee of the Insurance Institute, Calcutta, on the 14th ultimo, is undoubtedly an event of significance in the history of Indian insurance. Started 25 years ago by Mr. Surendranath Tagore, founder President, the Institute has had the distinction of having had some of the eminent insurers, such as Sir Nilaratna Sircar, Mr. Nalini Ranjan Sarker, Mr. A. C. Sen, Mr. J. C. Ghosh Dastidar, Mr. S. P. Bose and Mr. S. C. Roy as its Presidents. It was founded at a time when Indian insurers were struggling hard to find a place for themselves in the insurance market which was itself limited in scope, with foreign insurers dominating this limited field. Insurance legislation as it existed then left much to be desired. The legitimate claims of the indigenous insurers did not find favour with the administration. The insurers were generally inexperienced and had to contend with the ignorance of the public regarding insurance and its significance. It was in such circumstances, that the Institute was formed in order to provide, to quote Mr. S. C. Roy, President of the Institute, who presided over the silver jubilee celebrations, "a forum where all those interested in insurance could gather, discuss its problems, and devise and implement measures to foster its development on sound lines. The Indian Insurance Institute was the pioneer of the institute movement in our country and its activities cover a wide field."

Mr. S. C. Roy gave, in the course of his address, certain figures to show how the Indian insurance industry has grown since the inception of the Institute in 1930. The new life insurance sold by all insurers in that year was Rs. 27.5 crores. Of this, Indian insurers wrote just Rs. 15.75 crores. The total amount of life insurance in force was Rs. 154.5 crores, of which Rs. 84.75 crores, comprising 513,955 policies, were insured with Indian companies. In 1953, the latest year for which official figures are available, the total amount of life insurance in force amounted to Rs. 961.89 crores, of which assurances for Rs. 829.29 crores were with Indian insurers. During the same year, Indian companies wrote a life business of Rs. 137.46 crores and non-Indian offices of Rs. 17.03 crores. During the last quarter of a century, the life business transacted by Indian insurers, had, according Mr. Roy, increased more than tenfold.

A similar change has occurred in the field of general insurance also. In 1930, Indian insurers were just entering the field. But, in 1953, their global net premium income from non-life business was Rs. 15.06 crores. Of this sum, premiums written in India accounted for Rs. 6.77 crores which was about 50 per cent. of the total general premiums written in India. Said Mr. Roy: "Many factors have contributed to the change in the fortunes of Indian insurance. Among these must be counted the services rendered by the Institute, through publicity and propaganda and its educational activities—creating conditions for the growth of indigenous industry." Few would dispute this claim of Mr. Roy for the Institute. It certainly has to its credit 25 years of useful service to the industry. The activities covered a varied field. Thus the active part it assumed in shaping the insurance legislation in India, organisation of publicity for spreading the gospel of insurance, educating the public in regard to principles of insurance through lectures and special courses for students appearing for examination of the Indian Life Assurance Offices Association, formation of field workers' organisations under the auspices and publication of authoritative pamphlets on insurance problems are some of the principal activities of the Institute.

Commenting on the role of insurance in achieving the objective of establishing a socialistic pattern of society in India, Mr. Roy seemed to be convinced that insurance offered "the safest and surest means of establishing socialistic pattern, perhaps not without a lot of sweat, but certainly without blood and tears." If this idea was understood properly by the people, there would, Mr. Roy observed, not be "any need for expropriation, class war and the regimentation of bodies and souls" or for "the State to embark on economic enterprises of dubious value." He drew attention to the fact that the existence of a number of companies ensured progressive efficiency and expansion of the service of insurance. He, therefore, saw little reason to think that nationalisation of existing companies, either wholesale or piecemeal, would make for either economic efficiency or expansion of the service. He emphasised that the socialistic pattern did not consist of merely taking away extra money in the hands of the people or transferring undertakings from the private to the public sector. It involved the much harder work of ensuring equal amenities for all along with a rising standard of living. There was quite a lot that Government could do, he stressed, in this respect without laying hands on the insurance industry.

NATIONALISATION OF INSURANCE WILL BE INOPPORTUNE

Speaking as the chief guest at the annual conference of the Insurance Club of Patna, held in that city a fortnight ago, Mr. B. K. Setalvad, General Manager of "The Ruby General," commented on a number of live-wire topics engaging the minds of insurers today. Although Mr. Setalvad prefaced his speech by saying that the views expressed by him were his own, they deserve to be noted, as they have a close bearing on the future development of insurance in India.

Of the topics dealt with by Mr. Setalvad the contemplated nationalisation of insurance figured prominently. It could not have been otherwise, in view of the fact that persons in high positions, both in Government and in the Congress Party, seem to be of the view that insurance is a fit subject for nationalisation. The Prime Minister himself stated recently that he was for acquiring, at the right time, banks, insurance companies and mines. It is, therefore, not at all surprising that this subject should be the burning topic of the day, compelling every insurer to think whether it would be in the ultimate interests of the nation to bring insurance under the State ownership and management. Mr. Setalvad for his part, and rightly in our opinion, feels that, with the controls and restrictions placed on insurers, there is no need for nationalisation at all. He says that, when the Insurance Act was amended, he thought that that was the end of Government interference with the industry's day-to-day activities. For the amendments, including as they do, (a) restrictions on the investment of insurance funds, (b) prohibition of interlocking of funds of insurance and banking companies, (c) limitations of expenses, and (d) prevention of cornering of control over insurance companies, were so harsh that there was nothing left for further control. But now it seemed to him that the Government was not satisfied with all these blanket controls, as it was keen on nationalising insurance. He said: "As it is, with the introduction of further rules and regulations, limitation of acquisition cost, limitation of expense ratio, submission of various statements relating to appointments, outstanding premiums, bad debts, investments, etc., we are already governed 90 per cent. by the Controller of Insurance, Government of India. Besides, in the balance of 10 per cent. whipsnade freedom allowed to us, we are left with practically no authority in matters of general interest to the insurance industry as a whole."

Mr. Setalvad then referred to the working of the National Health Insurance Act in Great Britain. This was, he said, the most ambitious piece of social insurance legislation ever carried through in any country. No previous measure had directly affected so large a number of persons, involved so great a cost and made such demands upon the British administration. With all this, it was a conspicuous failure, according to the Report of the Fabian Society. The observation in the Report quoted by Mr. Setalvad reads thus: "By insurance premium, the State is abstracting from each, out of their cupboards, one loaf of bread every week, thereby starving them still further into illness. In order to pay for their doctoring and sickness benefit during their illness which the State has thus helped to create." In Germany also, the system of sickness insurance was, Mr. Setalvad added, a failure even in the direction in which it had not been anticipated. He, therefore, remarked: "If we learn any lesson from the experience of other countries, it is this that economic planning and full employment should precede any scheme of social security to make it a success." Consequently, the only alternative was, according to him, co-existence of the private and the public sectors. If, however, the Government felt that the country's interests would be served better through nationalisation, it should be done at a later date and "not now." With due humility, I submit," he said, "the time to nationalise insurance is not now—the time to nationalise insurance will not be for quite some time to come. The heavens will not fall, if we wait till such time comes."

Availing himself of the opportunity afforded by the Conference, Mr. Setalvad referred to the dangers facing small and medium-sized insurance companies as a result of staff insurance schemes. He thought that the schemes would hasten the closure of a large number of small and medium-sized companies, at a time when they were just beginning to stand on their feet. He thought that this type of underwriting was no "insurance" at all in any sense of the word and was a complete misnomer. He considered that it was an attempt to reduce life premiums to make it impossible for small business to enter the field. Besides, it hit the life insurance agent who was responsible for enabling the companies to underwrite large business every year, by denying him the commission that was his. He appealed to the leaders of Indian insurance to reconsider their step in the matter of staff insurance scheme and remedy the harm already done by not allowing it to spread any further.

CROP INSURANCE FOR INDIA?

Apropos the reference to the crop insurance scheme last week in these columns, it is understood that the Government of India is considering a proposal for the introduction of a crop insurance scheme in the country to safeguard the interests of cultivators against the vagaries of nature. Information to this effect was, in fact, given by Dr. R. Ahmed, Minister for Agriculture, West Bengal, while speaking at the silver jubilee celebrations of the Indian Insurance Institute, to which reference is made on this page. Dr. Ahmed opined that insurance business had a bright future in India, but insurers should also pay attention to agriculturists who formed the bulk of the country's population. He advised them to make arrangements for having crops on fields insured against all sorts of the vagaries of nature. Such a step would not only be progressive and conducive to the greater interest of the country but would also prove, he said, to be remunerative in future.

It is, however, doubtful whether private insurers could undertake the stupendous work of underwriting crops on fields. For one thing, it requires enormous resources which private insurers do not have. For another, it needs a well trained technical staff, the maintenance of which they cannot afford. Any scheme of crop insurance should, therefore, be the sphere of the State which already maintains a department connected with the development of agriculture. This department, with its personnel trained in methods of scientific agriculture and with the assistance of staff having special training abroad in actuarial science relating to crop insurance, can take up the work of organising such schemes in India under a carefully evolved phased programme. It is to be hoped that this subject will receive the attention of our planners who are now considering a draft scheme for the development of agriculture in the second Five-year Plan.

NEW PUBLICATIONS

British Public Finances. By Ursula K. Hicks. Published by Oxford University Press, London. Price : 6s. net.

NO better teacher of Public Finance than Ursula K. Hicks could be found to deal with the various stages of growth of Government finance in Britain during the last three-quarters of a century in a popular and intelligent way. The author traces, in six well marked out chapters, the origin and establishment of the Welfare State and the impact of world wars on the social and economic development of the British economy.

In the first two chapters, the author deals with the expenditure side, special reference being made to the development of education, social security, and capital investment by public authorities, particularly on housing. The third chapter deals with the methods of adapting the tax structure to the needs of expenditure and the effects of high income taxes on personal incentive and savings and on the ability of industry to develop. The story of the 2d. temporary tax on incomes is, indeed, interesting. Dealing with the redistribution of income through taxation (positive and negative) and social service expenditure, the whole of which accrues to the poor, the author states that "whatever the exact balance in the average of the lower income groups may be, we can be pretty certain that they make no net contribution to the enormously increased tax bill of recent years." The redistribution of income through public finance is described as the leading characteristic of the Welfare State.

A whole chapter has been devoted to a discussion on budget balance and national balance. What strikes one is the development of budget as an instrument of control in the modern economy; this is related to the machinery of planning and social accounting as they have been developed since 1940. The author concludes that "the justification of these rather detailed reforms is the predominant role which public finance must henceforward play as an instrument of policy. Even if it should prove both practicable and desirable to restore credit policy to something of its former importance as an instrument of stability, the size which public sectors have attained in modern economies and the subtleties of the fiscal instrument which modern economic analysis has revealed, alike assure that fiscal policy must in future be the senior partner."

The last chapter examines the impact of debt management on the economy, in the light of the control over money and capital markets which a £26,000 million national debt implies. The Dalton experiment in cheap money and the causes for its failure are discussed at length. The causes listed are, mainly, the pressure of external events such as fuel crisis and convertibility and the political uneasiness to which they gave rise, and the substantial gap between the short-term (controlled) rates and the long-term rates. The Dalton experiment in its later stages was, in the opinion of the author, unique as a sustained attempt to force markets in the opposite direction to that in which they were naturally tending and to do so by the use of debt management alone. The story of British finances as revealed here is that it has passed from a phase, in which the aim was to achieve national stability entirely by credit control, through one in which an attempt was made to throw the whole responsibility on public finance and finally to one in which the way is open for a proper use of both instruments in an informed and integrated policy.

Company Direction. By John Seymour. Published by *Macdonald & Evans, Ltd.*, 8 John Street, Bedford Row, London, W.C. 1. Price : 25s. net.

In this book, Mr. John Seymour has departed from the usual textbook style on company law and accountancy and concentrated on the dynamic and practical parts of a director's duties. His central theme is that direction and management of a company are complementary processes and that successful management is largely dependent on its effective direction. The author has, therefore, endeavoured to examine what is unique in the function of directing and industrial enterprise and to consider how direction interacts with management.

The present edition is the result of the author's close contacts with manufacturing industry, which has he says, provided him with firsthand knowledge of many companies and sufficient acquaintance with the main details of each to suggest the reasons for the measure of success they have attained. Proceeding, he observes:

"This work has been mainly in concerns which, though of medium size, are still large enough to throw up a rich variety of problems of direction and administration. Such companies together form an important sector of our industrial economy, and the value of this book will in all probability lie in connection with this class of enterprise. There are in Great Britain a relatively small number of very large businesses which have peculiar and very difficult problems of both direction and management. I cannot speak with any great experience of such corporations, and it is possible that what is said here may not be immediately applicable to them."

The book contains many references to practical situations in company management. Although it is concerned with the direction of manufacturing concerns primarily, much of Mr. Seymour's advice is applicable generally to the duties of directors of all types of trading companies.

This book is valuable chiefly to numbers of young men who are coming forward to sit for the first time on a board of directors. It is true, as Mr. Seymour says, that some of the work of directors can, by means of technique, be reduced to a matter of routine. But most of the problems which the directors have to handle are definitely those which do not fit into routine. In fact, it is difficult questions that go to the directors for decision. No business can be created without courage and it is the board which must maintain the "series of acts of courage which are needed to continue the enterprise." Mr. Seymour's book will help the new directors to grasp the nature of their duties more quickly. Even experienced directors, who wish to re-evaluate their functions, will find the book quite useful. Considering that the Companies Bill, awaiting consideration by the Indian Parliament, imposes many restrictions on the management of joint-stock enterprises, there is certainly need for training many men to take up the direction of such enterprise. In this context, this book is bound to prove a valuable guide.

Ceylon—Overseas Economic Survey. By C. E. Thorogood, U. K. Trade Commissioner in Ceylon. Publishers : Her Majesty's Stationery Office, London. Price : 4s. net.

Opportunities for exporters to take an increasing share in supplying Ceylon's needs of more imported manufactures and equipment for its secondary industries are outlined in the volume on Ceylon, the latest addition to the series of Overseas Economic Surveys published by Her Majesty's Stationery Office for the Board of Trade.

Mr. C. E. Thorogood, United Kingdom Trade Commissioner in Ceylon, the author of the Survey, who looks back over three and a half years of varying conditions in Ceylon, says that the Government are "exploring every possible means of diversifying the island's economy." The main problem is to provide the growing population with a higher standard of living with a sufficiency of nutritious food, clothing, and various consumer goods which the country does not at present manufacture, as well as capital goods for development purposes.

A statement by Sir John Kotelawala of his Government's policy for the attraction of foreign capital and enterprise is quoted at length by the author of the Survey, who adds that the attractiveness of Ceylon as a field for investment may well be conditioned by another of the Government's objectives, the "Ceylonisation" of trade—the greater employment of Ceylon nationals in existing concerns and the reservation of certain sections of import/export trade to Ceylon firms. Rules defining the conditions that must be satisfied by individuals, partnerships and companies if they are to qualify for recognition as Ceylonese firms are reproduced in the Survey.

Ceylon, Mr. Thorogood writes, still has to look abroad for the bulk of her consumer and capital goods, and for much of her food. Imports of lighter consumer goods have inclined downwards lately, but imports of machinery, electrical apparatus, vehicles and iron and steel manufactures have remained high or increased. Cotton yarns and manufactures still constitute the biggest single item, in spite of a fall since 1951. The United Kingdom is still the principal source of overseas purchases in the aggregate. Its share of Ceylon's import trade rose steadily in 1948-52 and remains encouraging "in view of the threat of increased competition from European countries and Japan."

Mr. Thorogood reviews the various irrigation projects that in one way or another invite the constructive attention of British industry. He also examines comprehensively Ceylon's own resources, legislation and administration, communication, and communal and social problems.

The Structure of the British Electricity Supply Industry. By Dr. V. V. Ramanadham. Published by Kamath & Co., Ltd., Management Consultants, Mangalore-1. Price : Rs. 10.

This is an abridged version of Dr. V. V. Ramanadham's thesis on the structure of British Electricity Supply Industry before and after nationalisation, approved for the Ph.D. degree by the University of London, in 1951. Dr. Ramanadham has examined the economic aspects of this important nationalised industry. He has analysed the available cost and supply data and weighed the considerations which, from the standpoint of production cost, determine the optimum scale and location of generating stations, taking into account the improved opportunities for mutual help provided by the development of the national transmission grid. He has first dealt with the policies and plans of the Central Authority. He has then marshalled the statistical evidence concerning the demands to be met by the system of distribution operated by the Area Boards. Finally, he has considered the meaning and significance of co-ordination of fuel and power policy of the Minister of Fuel and Power.

Dr. Ramanadham has surveyed this vast and complicated field in a manner which has won the admiration of Prof. Sir Arnold Plant of the London School of Economics and Political Science. In his foreword to the report, the latter observes:

"His book displays his skill in marshalling masses of statistical material, the subtlety of his analysis of the economic factors relevant in the making of policy, and his powers of lucid exposition in a field in which technology too frequently obscures understanding. In my view, this study establishes his position as an authoritative economic guide in a highly technical field. His book provides a valuable introduction to the informative annual reports of the British Electricity Authority and of the Area Boards, which have now completed six years of activity."

The book is of great value to those interested in the study of economics of electricity supply industry. Present-day conditions in the sphere of electricity industry give this book a new significance. As in the U.K., electricity industry is being nationalised in many States in India. From this point of view, the author's study of the U.K's nationalised electricity industry should prove useful to those connected with the management of State-owned electricity enterprises in India.

INDIA'S TRADE IN TOBACCO

COMPETITION AFFECTS EXPORTS

TOBACCO occupies a fairly prominent place in the Indian economy. Its contribution to the upkeep of the economy is remarkable indeed. Being the largest earner of excise revenues, it heads the list of excisable commodities that contribute to the country's exchequers. Among the exportable commodities, it holds eighth rank. As a producer of tobacco, India is the third biggest country, next to the U.S. and China. In spite of such important position which it holds, no comprehensive statistical data on the various aspects of the trade in tobacco have so far been made available in a compact form. This void has now been filled by the *Statistical Monograph on Tobacco Trade in India* (1950-54), compiled by the Indian Central Tobacco Committee, Madras. This monograph is divided into two parts, namely, (1) a review of the tobacco trade in India and (2) a series of statistical tables, giving trade figures. Besides, the review gives an account of the world tobacco trade with special reference to India's foreign trade in unmanufactured tobacco and also of Indian shipments to the various trade belts of Africa, Asia, British Isles, Europe and Oceania. To those engaged in tobacco cultivation and trade, the monograph gives a fund of valuable and useful information.

The output of tobacco in India averages 550 million lbs. per annum. The area sown to this crop forms only 0.34 per cent. of the total cultivated areas and the annual output constitutes about 0.24 per cent. of India's total annual agricultural production. In terms of actual value, the annual realisation from tobacco to the cultivators is estimated at about Rs. 32 crores. About 15 per cent. of the total produce of Indian tobacco is exported annually and the earnings in different foreign currencies amount to the equivalent of Rs. 16 crores. About 60 countries in the world either import Indian tobacco directly or consume it indirectly.

The products manufactured in India out of tobacco are mainly cigarettes, cigars, cheroots, *bidis*, snuff, chewing and *hookah* tobaccos. Excepting cigarettes, which are manufactured in factories, other products are produced mostly on a cottage basis. The cigarette industry is consuming about 54 million lbs. of raw tobacco and is concentrated in West Bengal, Bombay and Hyderabad. The number of units engaged in the manufacture of cigarettes is 18 and they account for 20,000 million cigarettes. Besides, there is a large-scale factory producing cigars and cheroots in Dindigal, Madras.

The cigar and cheroot and snuff industry is concentrated mainly in Madras and Andhra States, while the *bidi* industry is found not only in these States but also in Bombay, Madhya Pradesh and Bihar. The chewing industry is confined mostly to Bombay and U.P. The entire tobacco industry employs, directly and indirectly, about 10 million persons.

World Tobacco Exports

The world production of tobacco is estimated at 7,500 million lbs. Only about a fifth of this enters world trade. The greater part of the crop is consumed by the major producing countries themselves, namely, the U.S., China and India, etc. The table below gives the trend of tobacco (unmanufactured) exports from important tobacco trading countries in the four years ended 1953:

(In million lbs.)

	1950	1951	1952	1953
U. S.	478	522	396	516
Turkey	111	127	126	148
Greece	57	60	91	106
S. Rhodesia	69	67	88	81
India	104	116	85	72
Brazil	81	66	67	50
Cuba	32	48	46	37
Indonesia	23	28	23	33
Dominican Republic	32	35	34	33
Canada	23	29	33	28
Algeria	24	30	24	26
Philippines	8	13	26	26
Nyasaland	24	27	21	26
Italy	21	17	17	24
Others	60	115	83	82
Total	1,172	1,304	1,170	1,290

From the table above, it is evident that the U.S. is the largest tobacco exporter. Since the Second World War, Turkey has been the second biggest exporter. India ranked third in 1950 and 1951, but, during the years 1952 and 1953, Greece and Southern Rhodesia excelled India. In the later year, India held the fifth rank. Prior to 1950, tobacco exports from Brazil were quite substantial; subsequently, owing to competition from other countries and to foreign exchange difficulties, the exports declined. Exports of unmanufactured tobacco were maintained at more or less a steady level by the Dominican Republic, Cuba, Algeria and Canada. There was, however, a marked improvement in the exports from the Philippines from 13 million lbs. in 1951 to 26 million lbs. in 1952 and 1953. In the Far East, exports from Indonesia which were steady at 28 million lbs. rose to 33 million lbs. in 1953.

Flue-cured virginia tobacco used in the cigarette manufacturing industry is the principal variety in the international tobacco trade. The U.S., India, S. Rhodesia and Canada are the leading exporters of this type of tobacco, as will be seen from the following table.

(In million lbs.)

	1950	1951	1952	1953
U. S.	384	434	319	442
India	53	58	60	60
S. Rhodesia	89	68	85	84
Canada	20	28	37	27
Nyasaland	2	3	2	2

More than one half of the production of 100 million lbs. of Indian virginia tobacco is exported annually to the U.K., the U.S.S.R., Sweden, Pakistan, the Netherlands, Kenya, Japan, Irish Republic, Indonesia, Hongkong, W. Germany, China, Ceylon. The U.K. is the largest buyer of this variety of tobacco. Of the total imports into the U.K., about 50 per cent. is of U.S. origin, 20 per cent. is from the Federation of Rhodesia and Nyasaland, 15 per cent. from India and 10 per cent. from Canada.

Another variety of tobacco which enters world trade is turkish or oriental tobacco. The U.S. offers the largest market for this variety. West Germany and the U.K. buy the bulk of the remainder. Exports of this tobacco from Greece to the U.S. and W. Germany vacillated considerably in the post-war period.

Sales to African Belt

The total quantity of Indian tobacco purchased by the African belt during 1954 amounted to 3.8 million lbs. valued at Rs. 48 lakhs, as compared with 2.4 million lbs. valued at Rs. 45 lakhs in 1953, and 3.9 million lbs. worth Rs. 62 lakhs in 1952. This belt—consisting of Algeria, Egypt, Anglo-Egyptian Sudan, Somaliland, Kenya, Tanganyika, Nyasaland, Rhodesia, Mozambique, South West Africa, Nigeria, Malta, and Gozo, Mauritius and Dependencies—is interested mostly in cheap flue-cured virginia tobacco and *hookah* tobacco. Of late, Egypt has shown considerable interest in high and medium grades of Indian flue-cured virginia variety. It is stated that, on account of competition from S. Rhodesia and Tanganyika, it would be difficult to make much headway into this belt. But the problems of the area are worth being studied by the Central Tobacco Committee in order to meet the competition effectively.

In the pre-war period, Afghanistan, and Aden and Dependencies used to import Indian *bidi* tobacco and *hookah* tobacco. The peak imports were in the year 1954, when 6.5 million lbs. valued at Rs. 35 lakhs were purchased by these countries. At present, they are interested in flue-cured virginia tobacco, if available economically. The possibility of larger intake of Indian *bidi* and *hookah* tobaccos by these countries also deserves further study.

China's Offtake

China and Japan, among other Asian countries, account for most of the increase in India's exports of tobacco in recent years. Till recently, China occasionally purchased Indian tobacco through Hongkong. In 1954, however, thanks to the efforts of the delegation sent by the Government of India to China, a deal for the sale of 4.5 million lbs. of tobacco to China was put through. That country purchased a further 9 million lbs. of flue-cured tobacco from India. The revival of trade between India and Japan, after World War II, brightened the prospects for selling Indian sun-cured country tobacco to Japan. The country is evincing interest in flue-cured variety also. In 1954, 5.8 million lbs. of tobacco were purchased by Japan, as against 10 million lbs. in 1953 and 14.6 million lbs. in 1952.

Pakistan usually imports *bidi* tobacco but there has been a decline in the volume of offtake, Ceylon, Malaya and Singapore purchase Indian *bidis*.

Indian exports of tobacco to Australia and New Zealand are negligible. They amounted to 5 lakh lbs. valued at Rs. 14 lakhs in 1954.

As already mentioned, in Europe, the British Isles and Ireland play an important part in the Indian tobacco exports. The bulk of Indian exports to the U.K. consists of flue-cured virginia tobacco. India is facing competition in the U.K. market mainly from the U.S., S. Rhodesia, Canada, and Nyasaland. The U.S. occupies the foremost rank as the supplier of leaf tobacco to the U.K., Rhodesia and India come next.

About 23 per cent. of the total Indian tobacco exports went to the Continental countries of Europe in 1950. The percentage rose to 26 in 1951. However, it dropped to 15 in 1952, 10 in 1953 and 9 in 1954. Efforts are at present being made, it is stated, to recover the lost ground in the region.

Exports of Indian tobacco to foreign countries are chiefly made through the ports of Madras, including Kakinada and Vishakapatnam, these ports accounting for about 89 per cent. of the total.

In 1954, as many as 3.8 million lbs. of manufactured tobacco valued at Rs. 114 lakhs were exported abroad from India, as against 3.0 million lbs. worth Rs. 107 lakhs in the preceding year. The main customers were Pakistan, Ceylon, Singapore and Malaya. The varieties of manufactured products included cigarettes, cigars and *bidis*.

Inland Trade

Of the total output of 550 million lbs. of tobacco, about 80 to 90 million lbs. are exported every year. The balance enters the home trade, since the bulk of it is consumed locally. During 1953-54, 237 million lbs. of tobacco were traded inter-State by rail and river.

Although India is practically self-sufficient in tobacco, it imports some small quantities of virginia tobacco from America for blending purposes, so as to cater to the taste of those who are used to such. Cigar wrapper tobacco is also imported in limited quantities. Unmanufactured tobacco imported in 1954, amounted to 2.07 million lbs. as compared with 2.9 million lbs. in 1953 and 5.2 million lbs. in 1952.

Besides unmanufactured tobacco, India imports manufactured tobacco products to a limited extent. Such imports aggregated 156,000 lbs. in 1954, as compared with 180,000 lbs. in 1953 and 93,000 lbs. in 1952. Out of the total tobacco products imported into India, cigarettes occupy a prominent place.

Tobacco in India is subject to excise duty as it is in other countries. The total excise collections on this commodity in 1953-54 come to Rs. 32.7 crores. In addition, it contributes about Rs. 6 lakhs by way of cess at the rate of ¼ per cent. *ad valorem*.

SHELLAC INDUSTRY IN BIHAR

A concrete instance of how slowly bureaucracy *moves is provided* by the unduly long time taken by the Bihar Government to implement the recommendations of the Bihar Shellac Enquiry Committee. This Committee, it will be recalled, was appointed as far back as 1952 by the State Government, following the severe slump which hit the shellac industry in the State that year. It completed its deliberations and submitted its report in October, 1953. It is more than a year and a half now, and we are told that the State Government has just taken up for consideration the Committee's recommendations.

In the meantime, the industry has pulled on and, fortunately, nothing untoward has taken place. Prices of T. N. Pure Shellac are today standing at about Rs. 134 a maund. This compares with Rs. 194 a maund on the eve of the slump in March, 1952. During the slump that year, it dropped to as low as Rs. 68 per maund. That was in December, 1952. It was to rescue the industry from the effects of the slump that the Committee referred to above was appointed and as its recommendations have been dealt with in detail in *Commerce* dated 24th October, 1953, there is no need to recall them here. But suffice it to say that the recommendations included, among others, (1) ban on export of stick lac, (2) creation of a separate division in the State Forest Department to be in charge of lac development, (3) grant of substantial loan to lac growers, (4) organisation of lac growers' co-operatives, (5) formation of a syndicate by manufacturing units, (6) introduction of licensing of manufactures, (7) establishment of industries such as micanite, oil-cloth, moulding powders, etc., for encouraging domestic consumption of shellac, (8) application of Forward Contract Regulation Act, (9) fixation of minimum and maximum prices of shellac, and (10) the reconstitution of the Central Lac Cess Committee into a central Regulation Board with the States of Bihar, Madhya Pradesh, and West Bengal having direct representation on it.

It is reported that the State Government has consulted the Government of India regarding the various recommendations. It is expected that, with the assistance of the Centre, the Bihar Government will initiate some major steps for the rehabilitation of the shellac industry in the State.

By Order of the Directors,
TATA INDUSTRIES LTD.,
Managing Agents,
J. J. GHANDY,
Director.

BOMBAY, 27*th May*, 1955.

RESULTS OF SOME McLEOD GROUP JUTE COMPANIES IMPRESSIVE

ALEXANDRA AND PRESIDENCY EARN RECORD PROFITS

THE six months ended 31st December, 1954, witnessed somewhat better trading conditions in jute goods than those in some of the previous half-years, with the result that the working hours of jute mills were increased. Many jute mills were able to take good advantage of the prevailing conditions and reap substantially higher profits than those earned in some of the previous half-years. Normal labour conditions also contributed to the successful operations. Nevertheless, the operational success of the mills, as seen from their profits, was not equally encouraging in all cases. This is evidently due to the fact that trading conditions were still difficult. *The audited accounts of four of the* companies (namely, the Alexandra Jute Mills Ltd., the Chitavalsah Jute Mills Co., Ltd., the Nellimarla Jute Mills Co., Ltd., and the Presidency Jute Mills Co., Ltd.) under the management of Messrs. McLeod & Co., Ltd., for the half-year ended 31st December, 1954, bear ample witness to this state of affairs.

The most encouraging performance is provided by the Alexandra Jute, the gross profit of which has advanced to Rs. 9.34 lakhs from Rs. 1.81 lakhs for the previous half-year and Rs. 5.83 lakhs for the corresponding six months of 1953. This profit is probably a record in the history of the Company. The Chitavalsah Jute reports a gross profit of Rs. 8.24 lakhs for the half-year under review, as compared with that of Rs. 4.33 lakhs for the previous six months and Rs. 5.40 lakhs for the half-year ended 31st December, 1953. The Nellimarla Jute has earned a gross profit of Rs. 3.84 lakhs, which is only fractionally better than that (Rs. 3.56 lakhs) for the previous half-year. As compared with that for the corresponding six months of 1953, the profit for the half-year under review actually represents a decline of Rs. 2.63 lakhs. The gross profit of the Presidency Jute amounts to a record of Rs. 7.19 lakhs, *as against* Rs. 1.28 lakhs and Rs. 5.11 lakhs for the previous two half-years under comparison, respectively.

The net profit (after providing for depreciation and taxation) of the Alexandra Jute amounts to Rs. 5.60 lakhs, as compared with Rs. 0.26 lakh and Rs. 3.52 lakhs for the six months ended 30th June, 1954 and the half-year ended 31st December, 1953, respectively. The Chitavalsah has earned a net profit of Rs. 3.22 lakhs, as against Rs. 1.30 lakhs and Rs. 1.29 lakhs for the previous two half-years, respectively. The net profit of the Nellimarla has risen slightly to Rs. 1.21 lakhs from Rs. 1.10 lakhs for the immediately previous six months, but it represents a drop of Rs. 1.47 lakhs from that for the half-year ended 31st December, 1953. The Presidency Jute's net profit, at Rs. 3.17 lakhs, compares very favourably with that of Rs. 0.29 lakh for the previous six months, though it is a shade less than that of Rs. 3.32 lakhs for the corresponding half-year of 1953. It may, however, be noted that both Alexandra and Presidency had not provided anything for taxation in the previous two half-years.

All of them, except the Nellimarla Jute, have been able to set aside something to the reserves. The Alexandra has transferred Rs. 4.40 lakhs to the reserve for machinery renewals and the Chitavalsah Rs. 50,000 for a similar purpose. The Presidency has, in addition to putting by Rs. 1 lakh to the above reserve, *strengthened the general* reserve by Rs. 25,000, while none of the four companies had added anything to any of the reserves six months ago.

Dividend Record

The dividend on ordinary shares of the Alexandra Jute, after being maintained for the previous two half-years at 5 per cent. per annum, has been doubled to 10 per cent. per annum; the Directors have thus restored it to the level paid for the half-year ended 30th June, 1951, after which the Company had remained off the dividend list for four half-years. The dividend on the Chitavalsah shares has been raised to 12½ per cent. per annum from 10 per cent. per annum paid for the previous two half-years. The dividend of the Nellimarla has been maintained at 7½ per cent. per annum for the third half-year in succession. The Presidency Jute has raised the dividend to 7½ per cent. per annum from 5 per cent. per annum paid for the previous two half-years, after remaining off the dividend list for three successive half-years.

It may be noted, in this connection, that Chitavalsah has thus earned the distinction of having maintained an unbroken dividend record for twenty-six half years, that is from the half-year ended 30th June, 1952. The Nellimarla Jute has established a longer record; it has consistently paid a dividend from the half-year ended 30th June, 1941. During the long period of enviable record, the Chitavalsah had distributed the highest dividend of 90 per cent. per annum for the half-year ended 31st December, 1951, followed by a free scrip issue of two shares for one in December, 1953. The performance of the Nellimarla, in this respect, has been even more impressive; for it paid a record dividend of 100 per cent. per annum for the six months ended 31st December, 1951, and distributed a capital bonus of five shares for every two shares in December, 1953.

The salient features of the Companies' profit and loss accounts for the past four half-years are compared in the table appended at the foot of this page, which, studied against the following observations of the Directors in their reports, will give a clear idea of the Companies' progress. The Directors say:

"During the period under review the labour relations were normal. Somewhat better, though still difficult trading conditions obtained throughout the period. Raw jute prices increased steadily at the close of the half-year, because of the anticipated shortage resultant from the flooding and damage previously reported. There was an improvement in heavy goods prices, but this was largely offset by the marked increase in the price of cuttings."

In accordance with the Main and Supplementary Working Time Agreements of the Indian Jute Mills Association, the working hours were 45 per week as from 12th July, 1954, and 48 per week as from 18th October, 1954. However, due to a re-allocation of loom hours on a group basis and the purchase of loom hours, the Alexandra Jute and the Presidency Jute worked 48 hours per week with 12½ per cent. of their total looms sealed up from 12th July, 1954 and 27th September, 1954, respectively. Thereafter, the Alexandra Jute worked 96 hours per week on a double-shift basis, working 250 looms each shift, increasing to 350 looms per shift on 18th October, 1954. The Presidency Jute also commenced working 96 hours per week on a double-shift basis from 27th September, working 230 looms each shift increasing to 300 looms per shift on 18th October, 1954.

Balance-sheets

The latest balance-sheet of the Alexandra Jute shows that, as against a paid-up capital of Rs. 15 lakhs, the reserves and surplus aggregate Rs. 10.44 lakhs. The debenture liability amounts to Rs. 6 lakhs. The current liabilities and provision for taxation aggregate Rs. 33.72 lakhs. The gross block of the value of Rs. 51.49 lakhs has been written down to Rs. 16.17 lakhs. *The current assets amount* to Rs. 48.99 lakhs and exceed the current liabilities and provision for taxation by Rs. 15.27 lakhs.

The reserves and surplus of the Chitavalsah Jute amount to Rs. 29.77 lakhs, as against a paid-up capital of Rs. 35.15 lakhs. The debenture liability stands at Rs. 10.69 lakhs. The current liabilities and provision for taxation aggregate Rs. 19.93 lakhs. The value of the gross block is Rs. 60.73 lakhs, the book value of the same being Rs. 14.72 lakhs. The current assets amounting to Rs. 80.82 lakhs exceed the current liabilities and taxation by a huge margin.

The paid-up capital of the Nellimarla Jute is Rs. 31.25 lakhs, while reserves and surplus aggregate Rs. 24.06 lakhs. There is a mortgage liability of Rs. 5 lakhs. The current liabilities and taxation amount to Rs. 12.72 lakhs. The gross block of the value of Rs. 26.83 lakhs stands written down to Rs. 7.18 lakhs. The current assets amount to Rs. 65.85 lakhs, of which cash balance alone, at Rs. 19.84 lakhs, more than adequately cover the current liabilities and taxation.

The reserves and surplus of the Presidency Jute amount to Rs. 7.27 lakhs against a paid-up capital of Rs. 25 lakhs. The mortgage liability amounts to Rs. 8 lakhs. The current liabilities and provision for taxation stand at Rs. 17.41 lakhs. The gross block of the value of Rs. 80.73 lakhs has been written down to Rs. 16.95 lakhs. The current assets aggregate Rs. 40.74 lakhs and exceed the current liabilities and provision for taxation by Rs. 23.33 lakhs.

The Alexandra and the Presidency Jute Mills propose to modernise a section of the mills. Orders have been placed for the modernisation of sacking weft department and partial modernisation of the sacking warp department of the Alexandra Mill with *sliver spinning machinery at a cost of about* Rs. 9.5 lakhs and for the modernisation of the sacking weft department of the Presidency Jute Mill with *sliver spinning machinery* at a cost of about Rs. 4.5 lakhs. The installation of the machinery is likely to be completed early in 1956.

The Rs. 100 paid-up ordinary shares of the Alexandra are being currently quoted at Rs. 235 *ex-div.*, the Rs. 10 paid-up shares of the Chitavalsah and Nellimarla at Rs. 13-12 *ex-div.* and Rs. 11-14 *ex-div.*, respectively, and Rs. 5 paid-up shares of the Presidency at Rs. 6-13 *ex-div.* At these rates and on the basis of the latest dividends, the yields on the shares are 4.25 per cent. per annum, 9.1 per cent. per annum, 6.3 per cent. per annum and 5.5 per cent. per annum, respectively.

I.C.I. (INDIA) LTD.

A more liberal import policy improved the opportunities of trade with India and, in spite of intense competition, sales of Imperial Chemical Industries' products showed an increase over those for 1953, states the Company's annual report for 1954, just issued in London. The total turnover of Imperial Chemical Industries (India) Ltd. was only a little below the record figure for 1952, and there were particularly satisfactory increases in sales of alkalis, dyestuffs, pharmaceuticals, and plastic products.

The report says that the Company *has always* taken a keen interest in the industrial development of India, and, through frequent visits of technical staff, it keeps under constant review the possibilities of economic local manufacture.

Apart from the operations of Imperial Chemical Industries (India) Ltd. in the mixing and processing of dyestuffs and in the manufacture of "Alkathene" film from imported granules, the Company's subsidiary—the Alkali and Chemical Corporation of India Ltd.—has, for some years, operated successfully near Calcutta, and its products now include chlorine, caustic soda, benzene hexachloride and "Gammexane" formulations, and paints.

According to the report, mention was made last year of the agreement reached in 1953 with the Government of India for the formation of a new company, Indian Explosives Ltd., to manufacture commercial blasting explosives in India. "Much progress was made," says the report, "in the preparatory work for this project, and it is hoped that negotiations over the site with the Government of Bihar will shortly be concluded, so that building can begin."

Proceeding, the report says: "Agreement was reached between the Company and Atul Products Ltd., an Indian company already engaged in the manufacture of certain dyestuffs, for the establishment of a joint company to manufacture jade greens on a portion of the Atul factory site at Bulsar, Bombay State. The Company will provide technical information and advice, and the factory is expected to be in production by the end of 1955."

Turning to Pakistan, the report notes that the continuing restrictions on imports imposed by the Pakistani Government made it a rather difficult year for traders. In the circumstances, it is particularly satisfactory that I.C.I. (Pakistan) Ltd. increased its sales turnover to a figure which almost equalled the record sales of 1952.

The Khewra Soda Company Ltd., in which I.C.I. holds a 70 per cent. interest, had another successful year and achieved a record level of production of soda ash, which met the entire requirements of West Pakistan and part of those of East Pakistan. The question of extending this plant in order to meet the growing demand is under consideration.

MINERVA MILL SUFFERS LOSS

EFFECT OF LABOUR AWARD

THE working of the Minerva Mills Ltd. (Managing Agents: Messrs. N. Sirur & Co., Ltd., Bombay) during the year ended 31st December, 1954, has resulted in a loss of Rs. 1.55 lakhs, in distinct contrast to the gross profit of Rs. 6.39 lakhs for the previous year, to which level it had risen from Rs. 0.85 lakh for 1952. The aforesaid loss has swelled to Rs. 3.96 lakhs by the provision of Rs. 2.41 lakhs for depreciation, which has, however, been more than made good by drawing a sum of Rs. 5.45 lakhs from the reserve fund. The Directors have not passed over the dividend either. They propose to distribute a dividend of 5 per cent., as against a distribution of 7 per cent., made up of a dividend of 6 per cent. and a bonus of 1 per cent., for 1953. It may be recalled that the distribution to shareholders was raised last year from a dividend of 5 per cent. paid for 1952 by enhancing the dividend part of it by 1 per cent. and paying a bonus of 1 per cent. This additional dividend and bonus have now been withheld for the year under review, thus restoring the dividend to the 1952 level.

This is the first time in many years that the Company has suffered a loss and even this is not the result of the year's trading. It is due to the payment of an extra sum of Rs. 8.25 lakhs on account of wages and dearness allowance in respect of the two years from last January, 1953, to 31st December, 1954, in terms of the Consent Award of the Industrial Tribunal, Bangalore. But for this additional burden, therefore, the year's trading would have actually shown a profit of Rs. 6.70 lakhs, which would have been the highest since 1949.

The following comparative table provides an idea of the Company's progress in recent years:

(In lakhs of rupees)

	For the year ended 31st December

* Includes Rs. 8.25 lakhs being the wages and extra dearness allowance for the period from 1st January, 1953 to 31st December, 1954, in terms of the Consent Award of the Industrial Tribunal, Bangalore.

It will be noted from the foregoing table that the Company's profit trend has been irregular, evidently due to the uncertain marketing conditions, as indicated by the wavering nature of sale proceeds. Wages and expenses other than consumption of cotton and stores have, on the other hand, been mounting up, with the result that the Company has not been able to plough back anything, let alone assure a steady return to shareholders. As a matter of fact, the Company has not strengthened its reserve fund since 1949. On the other hand, it has withdrawn a sum of Rs. 7.45 lakhs from the reserve fund in the course of the last three years; the last occasion when it did so was two years ago when it nearly suffered a loss.

The Company's paid-up capital remains unchanged at Rs. 29.81 lakhs, of which Rs. 4.93 lakhs represent the sum capitalised out of the reserve fund in 1948. The reserves and surplus aggregate Rs. 19.57 lakhs, of which reserve fund accounts for Rs. 17.08 lakhs, investment reserve for Rs. 90,000 and labour colony fund for Rs. 1.46 lakhs. The current liabilities and provision for taxation aggregate Rs. 98.65 lakhs, of which secured loans from banks constitute Rs. 45.15 lakhs, having risen from Rs. 25.38 lakhs, and unsecured loans Rs. 17.69 lakhs, a decline of Rs. 1.57 lakhs. A substantial part of the unsecured loans—Rs. 13.49 lakhs to be precise—represents fixed deposits. The gross block of the value of Rs. 84.14 lakhs, including an addition of Rs. 8.40 lakhs during the year, has been written down to Rs. 37.31 lakhs. The current assets aggregate Rs. 110.72 lakhs.

The Rs. 100 paid-up shares of the Company are being currently quoted at Rs. 98-8 *cum-div.* On an *ex-div.* basis, the latest dividend provides a yield of 5.34 per cent. per annum, free of tax.

Points From The Chair

Technique and Organising Ability

"OUR planners sometimes forget that 'money' is just a form of accumulated physical labour usefully employed by human intelligence, technique and organising ability. I am purposely using these two words—'technique' and 'organising ability'—because we see in this world that the same amount of human labour and effort do not produce the same amount of wealth in each case. It is the technique and organising ability of a few who are leaders and pioneers in society that produce wealth in geometrial progression. We find that in various countries *living standard is not so much* dependent on physical labour and effort as on technical efficiency and organising ability. It is, in *fact, immaterial to what particular type of socio-*political pattern an independent country subscribed, so long as it retains its initiative and lets the technical efficiency and organising abilities possessed by its leaders in economic field to have their full play for greater and greater good of larger and larger number of persons."

SHANTI PRASAD JAIN,
Rhotas Industries Ltd.

Japanese Shipping

"In my address last year I referred to the increasing participation of Japanese shipping in world trades. I regret to have to report that the rapid expansion of Japanese shipping continues to be a source of concern. It is apparent that the policy of the Japanese Government has been to use its shipping as an instrument of commercial policy. Japanese lines have entered specific trades and, by their competition and conduct, have brought down the rates of freight in those trades to uneconomic levels. I am aware that this is a matter of concern to certain established Japanese shipping companies, with whom we have had friendly relations dating back for many years. I appreciate that Japan, like this country, needs—and has the right to expect—to operate a *mercantile marine. I do not feel, how*ever, that the extensive aid being given by the Japanese Government to their shipping, without *regard to the need for shipping to pay its way,* is in the best commercial interests of Japan. I sincerely trust that those in authority in Japan will come to appreciate that a commercial and shipping policy based on orderly progress and friendship will prove of more lasting benefit than a policy of hasty and aggressive expansion."

SIR WILLIAM C. CURRIE, G.B.E.,
Peninsular & Oriental Steam Navigation Co.

Price of Copper

"It is generally accepted that wide fluctuations in the price of copper are not in the interests of anyone—producers, fabricators or final consumers—and the problem exercising the minds of many people recently has been how to introduce a greater degree of stability into the copper market. It is not an easy question, but some points are clear. The first is that the price at present being obtained by copper producers is an unhealthy one and can only lead in time to an ever-increasing substitution of copper by other materials. The second point is that it is wholly unfair that fabricators, like ourselves, should have to bear so much of the risk of fluctuation in prices, for, whilst fabricators must always have enough metal to keep their factories running, customers naturally tend to hold off when prices are high and to buy when prices are lower. The position is equally unsatisfactory from the customers' aspect in the difficulty they must have in planning any major scheme involving a substantial amount of copper when they have little, if any, idea of the prices they may have to pay ultimately for the metal."

W. H. MCFADZEAN, C.A.,
British Insulated Callender's Cables Ltd.

Competition from Synthetic Rubber

"The Government-owned synthetic plants in the U.S.A. have recently been sold to leading rubber, chemical, and oil companies. The new owners of the plants are so far offering their products for sale at about the price level ruling before the transfer. We must expect to see private enterprise improve the synthetics and to some extent probably cheapen them. The plantations can produce cheaply too; this Company has shown in the last few years how keenly we can compete. It must be our business by well-directed research to put ourselves in a position also to offer our rubber in forms more attractive to special users."

SIR ERIC MACFADYEN,
Lanadron Rubber Estates, Ltd.

Marine Insurance in the U.K.

"In the shipbuilding industry in 1954, British yards have launched the highest tonnage since 1930, and no less than eight ships of 20,000 tons and upwards have gone down the slipways. However, in spite of the considerable number of new ships that are going into service, many obsolete vessels still remain in commission, which are a potentially heavier risk to the underwriter, and more firmness by the market in agreeing to insure these vessels on restricted conditions only would lead to a healthier state all round. The cargo business rates have been further reduced during the past year, owing to intense competition. Claims arising from extraneous risks continue to absorb a large proportion of the premium, with the result that, at the low levels now prevailing, the amount left is inadequate to meet losses arising from fire and perils of the sea."

LT.-COL. JOHN LESLIE,
Commercial Union Assurance Co., Ltd.

COMPANY MEETINGS AND DIVIDENDS

KYANG TEA SEED CO., LTD. Annual General Meeting, Calcutta 8th June, 1955. Transfer books remain closed from 2nd to 8th June, 1955, both days inclusive.

HIGHLAND PRODUCE DOUBLES DIVIDEND

MYSORE CHEMICALS' PROFIT HIGHER

Highland Produce Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. A. V. Thomas and Co., Ltd., Alleppey) submit the audited accounts of the Company for the year ended 31st December, 1954.

The tea crop secured during the year amounted to 10,13,270 (9,11,800) pounds, of which Pasuparal Estate accounted for 4,16,270 (4,02,700) pounds and Carady Goody Estate 5,97,000 (5,09,100) pounds. Thus the tea crop harvested was quite satisfactory.

Cardamom.—The cardamom crop harvested during the year was 10,700 (6,385) lbs.

Cost of Production.—The f.o.b. cost for the year was Rs. 1-0-5 against an estimate of Rs. 1-1-6 per lb. and the all-in cost was Rs. 1-12-4 per lb. as against last year's figure of Rs. 1-9-9. The net average price realised was Rs. 2-3-8 as against Rs. 1-12-3 for 1953.

The net profit for the year amounted to Rs. 6,64,629 (Rs. 3,19,494) after providing for depreciation on buildings, machinery, etc., and after reserving a sum of Rs. 4,75,000 (Rs. 1,90,000) for taxation. This profit together with the previous year's carry forward of Rs. 57,291 (Rs. 80,796) makes a total of Rs. 7,21,920 (Rs. 4,00,291). Out of this, Rs. 18,000 (Rs. 18,000) towards preference dividend for the year and Rs. 1,12,500 (Rs. 90,000) as interim dividend of 6¼ (5) per cent. on the ordinary shares on account of 1954 amounting in all to Rs. 1,30,500 (Rs. 1,08,000) have already been paid, leaving a balance of Rs. 5,91,420 (Rs. 2,92,291) available for distribution which the directors recommend be disposed of as under:—

By payment of 18¾ (7½) per cent. final dividend on ordinary shares (making 25 (12½) per cent. for the year), Rs. 3,37,500 (Rs. 1,35,000), by transfer to dividend equalisation fund (making in all Rs. 2,50,000) Rs. 1,00,000 (*nil*), employees welfare fund Rs. 50,000 (*nil*), by transfer to general reserve fund (making in all Rs. 4,80,542-8-0) Rs. 50,000 (Rs. 1,00,000) and carry forward Rs. 53,920 (Rs. 57,291).

Crop estimate for 1955:—

	Tea. lbs.	Cardamom. lbs.
Pasuparai	3,75,000	—
Carady Goody	5,50,000	10,000
Total	9,25,000	10,000

The tea prices appear to have reached the peak in 1954, but in 1955 there has been a steady and serious drop in the prices obtained at the auctions generally.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	21,00,000	Block ...	18,20,518
Reserves ...	7,95,543	Stock-in-trade ...	3,30,381

Mysore Chemical Manufactures, Ltd.

The directors of the above Company (Managing Agents: Messrs. Krishna and Co., Ltd., Bangalore) submit the audited accounts of the Company for the year ended 31st March, 1955.

After providing a sum of Rs. 47,174 (Rs. 32,680) for depreciation and Rs. 98,264 (Rs. 48,898) for taxes (Rs. 92,000 (Rs. 43,000) for income-tax and Rs. 6,264 (Rs. 5,898) for sales tax) and writing off Rs. 28,781 (*nil*) being the loss on the sale of investments out of the current year's profits, the net profit of the Company amounts to Rs. 83,086 (Rs. 64,626) which, together with the balance of Rs. 57,514 (Rs. 42,388) brought forward from last year's account makes up a total of Rs. 1,40,600 (Rs. 1,07,014) which the directors propose to dispose of as follows:—

In payment of a dividend of 6 per cent. per annum for the year under report on 20,000, 4 per cent. cumulative preference shares free of income-tax Rs. 12,000 (Rs. 12,000), in payment of a dividend of 20 (12½) per cent. per annum for the year under report on 30,000 ordinary shares, free of income-tax Rs. 60,000 (Rs. 37,500) and in carrying forward to next year's account Rs. 68,600 (Rs. 57,514).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,00,000	Block ...	1,96,461
Reserves ...	4,00,000	Stock-in-trade ...	81,494

		Cash ...	5,88,735
Rs.	12,60,147	Rs.	12,60,147

Thamarapally Rubber Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. A. V. George and Co., Ltd., Kottayam) submit the audited accounts of the Company for the year ended 31st December, 1954.

The area under mature rubber is 467.00 acres and coconut, cashew, etc., is 67.78 acres. Both Thamarapally and Maliyakal Estates are reported to be in good condition.

Crop and prices.—The rubber crop secured during the year was 2,29,775 (2,39,123) lbs. at 51.99 (52.96) cents against an estimate of 2,25,000 lbs. at 60 cents per pound. The crop estimated for 1955 is 2,28,000 lbs. at 62.94 cents per pound. The rubber crop was sold at an average price of 127.37 (124.70) cents per pound.

The net profit, after providing for depreciation, taxes, managing agents' remuneration, etc., is Rs. 82,288 (Rs. 91,040). To this has to be added the balance from last year of Rs. 13,303 (Rs. 41,669) making a total of Rs. 95,590 (Rs. 1,32,709) from which is deducted dividend on preference shares for 1954, paid in February, 1955 Rs. 4,875 (Rs. 6,906). The directors now recommend the payment of a dividend of 30 (30) per cent. on the ordinary shares Rs. 75,000 (Rs. 75,000) leaving a balance of Rs. 15,715 (Rs. 13,303 after setting apart Rs. 37,500 to dividend equalisation fund) to be carried forward.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3,25,000	Block ...	5,01,692
Reserves ...	2,37,500	Stock-in-trade ...	45,747
Provision for taxation ...	55,405	Stores and spare parts	4,366
Liabilities ...	17,481	Other assets	160
Profit and loss account ...	95,590	Advances ...	1,495
		Cash ...	1,77,516
Rs.	7,30,976	Rs.	7,30,976

Nenmeny Rubber and Produce Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. A. V. George and Co., Ltd., Kottayam) submit the audited accounts of the Company for the year ended 31st December, 1954.

The area under mature rubber is 1,316.35 acres, immature rubber 50.00 acres, tea 11.00 acres and coconut 25.50 acres. 86.55 acres of immature rubber in Eldorado Estate was brought under tapping in 1954.

Crop and prices.—The rubber crop secured during the year was 5,18,364 (5,36,211) lbs. at 78.78 (75.45) cents against an estimate of 5,60,000 lbs. at 89.95 cents per pound. The shortfall in crop is due to the unfavourable weather conditions and the complete stoppage of tapping on Sundays. The crop estimated for 1955 is 5,60,000 lbs. at 89.77 cents per pound. The average price realised was 134.84 (125.25) cents per pound. A portion of the crop was sold as sole crepe.

The net profit after providing for taxes, managing agents' remuneration, etc., is Rs. 1,16,915 (Rs. 1,07,227) to this has to be added the balance from last year of Rs. 42,480 (Rs. 31,378), making a total of Rs. 1,59,396 (Rs. 1,38,605) from which is deducted preference dividend for 1954 paid in February 1955, Rs. 21,000 (Rs. 21,000), leaving a sum of Rs. 1,38,396 (Rs. 1,17,605). The directors now recommend 15 (7½) per cent. dividend on the ordinary shares Rs. 50,250 (Rs. 25,125) and transfer to debenture redemption reserve Rs. 75,000 (Rs. 50,000), leaving a balance of Rs. 13,146 (Rs. 42,480) to be carried forward.

Accounts in brief are as under:—

THE INDIAN

OVERSEAS BANK LTD.

MADRAS

We have pleasure in announcing that a Branch of the Bank will be opened in Hong Kong on 9th June 1955.

C. P. DORAIKANNU,

General Manager.

Sendra Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. F. W. Heilgers and Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st December, 1954.

Coal raised and sold.—Raisings for the period 1st July, 1954 to 6th October, 1954 inclusive (i.e., prior to the transfer of the colliery) totalled 33,927 (67,480) tons. By arrangement with the purchasers the Company continued to dispose of their remaining coal stocks throughout the period under review, and 66,748 tons of coal were sold, compared with 61,059 tons during the preceding half-year.

Colliery.—As approved by the resolution passed at the extraordinary general meeting held on 30th November, 1954, the Company's colliery has been sold to Messrs. Hind Shippers, Ltd. The directors report that the transfer of the property, particularly as regards the labour force, proceeded smoothly. It is expected that completion of the deed of sale—at present awaiting the formal approval of the authorities—will be effected shortly.

Karanpura Mining Syndicate.—During the half-year ended 31st December, 1954, 66,571 (74,888) tons were raised and 65,780 (68,186) tons were despatched.

The secretaries report that rail movement has become somewhat easier recently but wagon supplies are not yet on a par with the output capacity of the mine.

The profit and loss account, after providing Rs. 15,008 (Rs. 14,089) for taxation and including the debit balance of Rs. 1,22,722 (Rs. 1,59,849) brought forward from last half-year, shows an available balance of Rs. 48,443 (debit of balance of Rs. 2,06,478) which it is proposed to dispose of as follows:—

In paying a dividend on the ordinary shares at the rate of 2½ (*nil*) per cent. per annum without any deduction for income-tax paid by the Company Rs. 10,000 (*nil*) and in carrying forward Rs. 38,443 (debit of Rs. 2,06,478).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	8,00,000	Block ...	23,624
Debentures	2,00,000	Coal stock	81,611
Reserves ...	5,60,754	Stores ...	4,765
Provision for taxation ...	15,000	Debts and advances ...	17,64,933
Liabilities ...	4,48,523	Investments	1,77,074
Profit and loss account ...	38,443	Cash ...	10,713
Rs.	20,62,720	Rs.	20,62,720

Futwah-Islampur Light Railway Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Martin Burn Ltd., Calcutta) submitted the audited accounts of the Company for the half-year ended 31st March, 1954.

The gross earnings for the half-year were Rs. 2,33,409 (Rs. 2,04,350) which is Rs. 29,059 (Rs. 13,511 less) more than the earnings of the corresponding period ended 31st March, 1953. There are increases of Rs. 18,168 (decrease of Rs. 24,513) under coaching and Rs. 10,805 (Rs. 10,714) under goods. The working expenses for the half-year were Rs. 3,44,590 (Rs. 3,45,785) which is Rs. 1,195 (Rs. 91,210 more) less than the figure for the corresponding period ended 31st March, 1953. There was a deficit of Rs. 1,11,181 (Rs. 1,41,435) in net earnings.

The net profit for the year was Rs. 11,456 (Rs. 11,442) to which was added the balance brought forward of Rs. 4,231 (Rs. 4,090), making a total of Rs. 15,687 (Rs. 15,532).

The directors paid Re. 0-15-9.6 (Re. 0-15-9) per share representing a dividend at the rate of 3½ (3¼) per cent. per annum for the half-year less tax Rs. 11,353 (Rs. 11,318) and carried forward Rs. 4,334 (Rs. 4,214).

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	11,49,900	Block ...	15,83,943
Reserves ...	1,67,842	Stores ...	17,885
Provision for taxation ...	17,570	Other assets	4,24,900
Liabilities ...	11,70,153	Debts, deposits and advances ...	3,29,773
Net revenue account ...	15,687	Investments	84,205
		Cash ...	78,446
Rs.	25,21,152	Rs.	25,21,152

N.B.—Figures within brackets relate to the corresponding period of the previous year.

MONEY STEADY

(From Our Own Correspondent)

BOMBAY, 1st *June*

Conditions in the short-term money market remained steady during the week under review, with no further appreciable improvement in the supply of funds. There was no keen demand for money either; however, the available funds were fully usable. Consequently, the money rates remained largely unchanged at the previous week's levels. Inter-bank call money was done at 2½ per cent. among the Exchange banks and big Indian banks, though stray transactions were reported at 2¼ per cent. also after clearing hours. Business among the smaller Indian banks was put through at 2½ per cent. House money continued to fetch 3 per cent., as also short-term deposits for 1 to 6 months.

Offers to this week's sale of Government of India three months' Treasury Bills disclosed a notable rise at Rs. 229.50 lakhs, as against Rs. 155 lakhs in the previous week. The average rate of accepted tenders, which had gone up by one pie to Rs. 2-9-1 per cent. per annum last week, declined to Rs. 2-9 per cent. per annum this week.

The Reserve Bank of India's statement for the week ended 27th May, 1955, discloses no notable features. The notes in circulation have contracted by Rs. 6.32 crores and this is the second week in succession for which there has been a decline in this portfolio, the aggregate fall for the two weeks being Rs. 15 crores. Notes held in the Banking Department are up by Rs. 6.58 crores, the net rise in total notes issued (Rs. 26 lakhs) being covered on the assets side by a similar increase in rupee coin. In the Banking Department, the deposits of the Central Government show a small decline of Rs. 60 lakhs and those of other Governments Rs. 83 lakhs. There has been a fall of Rs. 1.41 crores in deposits of banks. On the assets side, balances held abroad are down by Rs. 5.12 crores. Loans and advances are unchanged, but other loans and advances have gone down by Rs. 4.69 crores, of which advances to Scheduled banks against usance bills account for Rs. 4.48 crores. Though there have been fresh borrowings by banks against usance bills to the extent of Rs. 4.38 crores during the week, the outstanding borrowings have been reduced by Rs. 4.48 crores.

A further improvement in the deposits of Scheduled banks is shown by the statement for the week ended 20th May, 1955. Demand deposits account for an increase of Rs. 4.74 crores and time deposits for Rs. 1.44 crores. Inter-bank borrowings also have risen by Rs. 1.97 crores. Borrowings from the Reserve Bank and the Imperial Bank have, on the other hand, declined by Rs. 3.84 crores and Rs. 67 lakhs, respectively.' A drop of Rs. 4.18 crores is noted in advances and of Rs. 85 lakhs in inland bills purchased and discounted. Foreign bills purchased and discounted have, however, gone up by Rs. 1.38 crores. Investments are almost unchanged. Cash on hand and balances with the Reserve Bank are together higher by Rs. 2.12 crores. Balances with other banks in current account have declined by Rs. 68 lakhs, while money at call and short notice have risen by Rs. 2.67 crores.

The Gilt-edged market appeared to be well groomed during the week under review, to receive the new Government of India loan, an announcement regarding which is expected at any time now. There was a further rise in the official selling price of two securities during the week. Thus, the Reserve Bank put up its rate for 3 per cent. 1966-68 by As. 2 to Rs. 91, and for 3 per cent. 1970-75 by an anna to Rs. 87-2. There were buyers for most of the securities, but, due to paucity of sellers, the volume of business was small. 3 per cent. 1957 had business at Rs. 99-8¼. 3 per cent. 1958 had buyers at Rs. 99-7. 3 per cent. 1959-61 picked up As. 2 to Rs. 97-14. 3 per cent. 1963-65 was quoted today at Rs. 94-1 *ex-voucher*, as against Rs. 94-3 a week ago. 3 per cent. 1964 was wanted an anna better at Rs. 94-1 due to proximity of interest payment. 3 per cent. 1966-68 was in request at Rs. 90-15½, though the official price was Rs. 91. 3 per cent. 1970-75 was in demand at Rs. 87-1½. 3 per cent. 1986 Conversion Loan was depressed, with sellers predominating. It was on offer at Rs. 80-8, as against Rs. 80-11 a week ago. 3½ per cent. 1961 National Plan Bond was quoted at Rs. 99-14 *ex-voucher*. 3½ per cent. National Plan Loan 1964 was unchanged at Rs. 98-12.

In the foreign exchange section, the most outstanding development of the week was the reported decision of the Reserve Bank to allow free trading in all currencies, with the exception of the pound sterling, the U.S. and Canadian dollars and the Pakistani rupee, with effect from the 15th inst. No official announcement has, however, been made. There was no change in the rupee-U.S. dollar exchange rate. Sterling, however, ruled weak in terms of the dollar with a further drop in values. Thus, in New York, spot sterling moved down from $2.79 11/32-2.79 13/32 to $2.79 3/16-2.79 5/16, forward sterling (three months) from $2.78 1/16-2.78 3/16 to $2.77¼-2.78 and transferable sterling from $2.77 1/8-2.77½ to $2.77 1/16-2.77 3/16.

HIDES QUIET

(From Our Own Correspondent)

MADRAS, 30th *May*

Due to *Ramzan* holidays, the hides market in Madras remained quiet during the week. Arrivals were small and offtake meagre. U.K. buyers were testing the market with lower prices, but shippers did not fall in with importers' idea of prices. Tanners are of the view that there is no need to take lower prices in view of the strength in the raw section.

In the tanned skins section also, the market was quiet. There were a few enquiries from Japan for lining sheep and from the Continent for superior tanned goat at last prices.

FORWARD BULLION DULL

(From Our Own Correspondent)

BOMBAY, 1st *June*

The forward section of the bullion market ruled dull during the week under review, with price fluctuations confined to a narrow range. The undertone, however, remained steady. The notable development of the week was a slight weakening of the ready section in both the metals. The waning demand due to approaching end of the busy season and the heavy arrivals of unrefined silver were the main factors responsible for the weakness of this section. Thus, the premium which ready silver (Mint) commanded over the forward (*Jeth* settlement) narrowed from Rs. 4-8 at the close of last week to Rs. 1-4 today and that of ready gold from Rs. 3 to Rs. 2-2.

Silver for forward delivery in *Jeth* settlement reacted early in the week from Rs. 161-2 to Rs. 159-12, due to slackening of bullish enthusiasm on reports of heavy arrivals of *kutcha* silver and the widening backwardation charges. There was, however, a slow recovery to Rs. 160-12 on Monday this week on rumours of the formation of bull syndicate. After receding to Rs. 160-5 yesterday, forward silver revived to close at Rs. 161-3, today. *Ashad* silver moved down from Rs. 155-2 to Rs. 153-8, before coming up to close at Rs. 154-12. *Shravan* silver reacted from Rs. 152 to Rs. 151-3, but recovered to Rs. 152-9 at the close.

Ready silver (.996 Mint) slumped from Rs. 165-10 to Rs. 161-12, but gathered strength at the close to Rs. 162-7. The floating stocks of silver are estimated at 700 bars. The daily average offtake was 15 bars.

Gold for forward delivery in *Jeth* settlement lost ground in the earlier part of the week from Rs. 92-8 to Rs. 90-12, sentiment having been affected by the decline in offtake in the ready section and by rumours that gold on behalf of a former princely State might be offered through official sources. These rumours having proved false later on, it improved to Rs. 92-2 today, the shortage of Kolar gold stocks further assisting the trend. *Ashad* gold declined from Rs. 89-14 to Rs. 88-7, but improved to Rs. 89-2 at the close. After a reaction from Rs. 88-6 to Rs. 87, *Shravan* gold gathered strength to Rs. 87-9 at the close today.

Ready gold opened at Rs. 95-7, but fell back to Rs. 92-12 on slackening demand and larger arrivals. Thereafter, there was a good recovery to Rs. 94-4 today, before closing at Rs. 93-15. The floating stocks of gold are reported to be 10,000 tolas. The daily average arrivals were 3,000 tolas, while the offtake was 2,500 tolas on an average.

In London, silver prices were unchanged at 78¼d. for spot and 78¼d. for forward. Gold reacted from £12 10s. 11d. to £12 10s. 9½d., but the loss was more than made good when it closed yesterday at £12 10s. 11½d. In New York, the price of silver was raised from 90½c. to 90¾c. the highest level in the last thirty-five years.

The following comparative table shows the trend of the market during the week under review:

	1-6-55	Highest	Lowest	25-5-55
	Rs. a.	Rs. a.	Rs. a.	Rs. a.
GOLD				
Ready (.99 fine Mint) ..	93 15	95 8	92 12	94 14

TEAS ACTIVE

(Messrs. Forbes, Ewart & Figgis Ltd.)

COCHIN, 26th *May*

There has been no sale in Cochin this week, sale 11 having been postponed until 31st May. The market has been rather more active during the week with unsold teas from sales 8, 9 and 10 moving steadily at market rates. Heavy rains during the past 10 days will affect crops in all districts, unless a period of sunny days is experienced.

London Market:—Sale of 23rd May—Better tone. Good tea considerably dearer. Commons about 1d. up.

Sale of 24th May—Good demand. Best sorts 3d. to 4d. dearer. Mediums irregular. Commons firmer.

Colombo Market:—Good demand. Middle East and best quality teas fannings firm, except tip brokens with poor leaf and liquor declined 20 cents. Fewer withdrawals.

Calcutta Market:—No sale this week.

Export Quota:—1955-56 quota stands at 60 pies buyers with sellers scarce. Transactions have practically concluded in special licence as they expire on 31st May.

As we go to press, Messrs. Forbes, Ewart and Figgis Ltd. wire:

"*Sale* 11:—Approximately 1,600,000 lbs. Strong general demand all grades, particularly from internal buyers. Prices have advanced irregularly As. 2. Well made black leaf very strong and considerably dearer. Poor and stalky descriptions about one anna dearer."

COTTON LOSES EARLY GAINS

(From Our Own Correspondent)

BOMBAY, 1st *June*

With the I.C.C. May Contract having gone off the boards of the East India Cotton Association on Wednesday last, trading in the cotton futures market this week was confined only to August delivery. A notable feature of the trading was that the sentiment of operators was somewhat bright till two days ago on expectations of a steady trend in cotton prices in the ensuing weeks, thanks to three important considerations. First, the operators felt that there would be a broadening of enquiries among overseas interests in Indian cotton, owing to liberalisation in the Government of India's export policy announced last week. There were already indications of Liverpool enquiring about certain varieties of Indian cotton. Cotton circles also envisaged better prospects of business from Hong Kong, Shanghai, Spain, Italy and Australia. Secondly, it was rumoured that the Union Government had already made up its mind with regard to reduction in export duty on cotton and an announcement to that effect was considered imminent. Thirdly, there were possibilities of the grant of a further export quota for cotton yarn.

After exhibiting a firm trend during the first three sessions of the week under review, the cotton futures market staged a setback on Monday which persisted practically till the close today. The initial firmness was aided by reports of very good offtake in the piecegoods market and encouraging advices from the spot section. In addition, reports of bullish fervour in upcountry cotton markets, particularly in Punjab, and hopes of a reduction in export duty on cotton also influenced the sentiment of the market favourably. Buying support ensued, as a consequence, and prices registered a distinct improvement. The upward trend was, however, halted on Monday when, on account of disappointment over the delayed announcement regarding the export duty, the market experienced a reaction. The reaction became more pronounced today, following nervous liquidation and short selling, and prices continued their downward march. Much of the earlier gains was lost, but the closing quotation today was higher than that at the end of last week.

I.C.C. August opened the week at Rs. 577, as against Rs. 573-4 last week-end. It gradually improved to Rs. 584-8 on Saturday, but receded to Rs. 573-3 today before finishing at Rs. 577-8.

In the spot section, there was revival of mill and trade demand. Jarillas, Surtis, Vijays, Morvis and Wagads were particularly sought after. Among exportable styles, Zoda cotton and old lots of Bengals met with enquiries. C.P. 1 and 11 varieties were also favoured. There were rumours that some business in Vijays had been done with Hong Kong. The samples of this variety are understood to have been approved by the *ad hoc* Committee. Traders are now awaiting response from abroad. In the foreign section, ready Africans were in moderate demand. Jinja cotton evoked some mill interest. Sudan "S" cotton attracted a few buyers. Egyptians and Americans were practically neglected.

The latest available quotations from the Sewri market are: Bengal *deshi* Rs. 540; Berar Jarillas Rs. 605; Khandesh Rs. 390; Vijay Rs. 765; Oomra *deshi* Rs. 540; Moglai Rs. 520.

At Alexandria, there was moderate spot demand for all varieties of cotton. Medium grades of Karnak for May-June delivery also evoked buying enquiries. Spain is reported to have purchased 2,600 bales of Karnak. Entitlement premiums have eased slightly, with U.S. dollars fetching 13½ per cent., sterling 10 per cent. and Deutschemarks 12 per cent. The new crop Egyptian cotton has been making satisfactory progress. Sowings, it is said, are 10 to 15 days earlier than those last year and the area under cotton cultivation is larger by 10 to 15 per cent.

With a view to making cotton readily available to "potential" buyers, the Sudan Gezira Board has decided to hold auctions for all unsold lots, each day from Tuesday to Saturday, instead of once every week. The bid can be for a minimum of 100 bales and at a price not below the reserve price. All the better grades of "S" cottons having been sold out, the grades now available are G2S and lower. At the auctions held on the 20th and 21st inst., 750 bales G2S, 300 bales XG3S, 1,479 bales G3S, 1,500 bales XG4S, 1,550 bales G4S, 900 bales XG5S, and 2,100 bales G5S were sold. Among "L" cottons, only 200 bales G3L were sold.

The Liverpool cotton futures market ruled quiet during the week under review also. The volume of transactions was very much limited, as operators preferred to await the announcement of the U.S. official policy for cotton exports in the ensuing season. There was, however, some selling in evidence against trade purchase of Nigerian cotton. Prices tended to look down, light hedge selling offsetting purchases on account of mill fixing. The fall would have been more marked but for American buying and trade fixing on Friday last, in which there were only light offerings. The latest available quotations from the Liverpool futures market are: July-August 31.23d; October-November 30.34d; December-January 30.20d.

The easy trend depicted by the New York cotton futures market last week gathered further momentum this week. There were liquidation and offerings by New Orleans, reflecting improved cotton crop outlook, following recent rains, together with continued uncertainty over U.S. cotton export policy for the next season. Values eased in late dealings under scattered liquidation, coupled with selling in May credited partly to foreign interests.

The U.S. Department of Agriculture has set up an eight-man committee consisting of 5 shippers and 3 producers to advise the Department on the ways and means of making effective the cotton

export programme which the Department is to submit to the Committee. Available indications are that direct subsidies or sales at world prices may not form a part of the proposed plan designed to liquidate the U.S. cotton surplus. Speaking at Mississippi last week, the Assistant Secretary of State, Mr. Samuel Waugh, made it abundantly clear that the Administration's policy was to protect the economies of the friendly nations which depended chiefly on cotton and other agricultural products for export income. Notwithstanding this assurance, opinion among informed quarters persists that there may be indirect subsidies through extension of the scope of Public Law 480 which will have provided for export of some 500,000 bales of cotton by the end of this season. Multiple country deals, such as those recently concluded between Pakistan and Japan, may also become a regular feature. The long-term plan may include lower farm prices and efforts at expanding the present scope of Public Law 480.

The Board of Directors of the New York Cotton Exchange (N.Y.C.E.) has adopted several changes in its contract for the future delivery of cotton. The changes proposed are: (1) New contract will provide for basis staple of 1", whereas the current contracts are basis 15/16" staple; (2) cotton upto minimum 29/32" staple will be tenderable; this will eliminate delivery of 7/8" cotton, which is permissible at present; (3) premium for 1 1/32" cotton will be increased to 100 per cent. of the commercial differences over 1" quoted at the designated markets, while in the case of 1 1/16" and longer staple cotton, the full premium for 1 1/32"+75 per cent. of the difference between 1 1/32" and 1 1/16" will be allowed; (4) micronaire test reading of 3.5 will be required. The changes, if approved by the members of the N.Y.C.E., will become effective beginning with the October 1956 contract. The Board of Directors of the New Orleans and Memphis Cotton Exchanges have approved a new futures contract on similar lines.

The final estimate of the American cotton crop for 1954-55 has just been issued by the U.S. Department of Agriculture. The area sown to cotton is placed at 19.79 million acres and production at 13.68 million bales (500 lbs. each) from a harvested acreage of 19.25 million acres. These figures compare with a production of 16.47 million bales from a harvested acreage of 24.34 million acres in the previous season. The yield per acre is estimated at 341 lbs.—a record—as against the previous record of 324 lbs. in 1953-54.

The following are the latest available quotations from the New York market, as compared with those a week and a fortnight before:

(In cents per lb.)

	31-5-55	24-5-55	17-5-55
Spot	34.65	34.80	34.75
July	33.86	34.04	34.11
October	34.02	34.20	34.25
December	34.08	34.22	34.33
March	33.95	34.15	34.28

SUGAR RISES SLIGHTLY

(From Our Own Correspondent)

BOMBAY, 1st June

Paucity of indigenous sugar stocks, thanks to reduced arrivals following booking restrictions to Wadi Bunder, imparted much steadiness to the sugar market during the week under review. There was a fair amount of buying enquiry and prices of sugar were fully maintained. Arrivals of indigenous sugar during the week aggregated only 3,100 bags, as against 4,400 bags a week before and 9,600 bags two weeks before.

In the spot section, medium grain indigenous sugar hardened by As. 8 to Rs. 89½-Rs. 93½. Large grain was fully steady at Rs. 93½-Rs. 101. The values of foreign sugars were throughout maintained at the last week's levels. British refined sugar being quoted at Rs. 84-4 (2 cwts.), French sugar at Rs. 82-Rs. 84 (224 lbs.) and German sugar at Rs. 80 (224 lbs.). There was no business in Czechoslovakian sugar, as stocks had been practically exhausted.

Sugar for *Jeth* delivery met with buying support and improved by As. 3 to Rs. 83-7. *Shravan* delivery was also favoured As. 2 higher at Rs. 88-4.

It is reported that the Regional Directorate (Food), Bombay, is still having an unsold stock of 50,000 tons of imported sugar. Two more shiploads of British refined sugar—amounting to 16,000 tons—are being discharged in Bombay harbour.

N.B.—The rates for Indian sugars are inclusive of sales tax, while those for foreign sugars are exclusive of the tax.

COTTON YARN BEARISH

(From Our Own Correspondent)

BOMBAY, 1st June

A distinctly bearish trend was in evidence in the cotton yarn market during the week under review. Traders were greatly intrigued by the imposition of excise duty on weaving units having more than four cotton powerlooms, in addition to the composite units. The incidence of the duty was considered to be unduly heavy—Rs. 18 per shift per loom on looms exceeding four but not nine, Rs. 20 in respect of looms exceeding nine but not 24, and Rs. 22-8 on looms exceeding 24. In fact, there were reports that several powerlooms had already curtailed production and some had even closed down, since they were unable to bear the incidence. These reports, coupled with the expectation that resumption of non-dollar cotton imports would result in higher output of finer count yarns, let loose a wave of selling and cotton yarn prices suffered a recession. Even hopes of early grant of an additional export quota for cotton yarn failed to provide a fillip to the market. The market was closed today on account of *Ekadashi*.

Coarse count yarns were the worst to suffer in the recession. Thus, among 10s, Moderns dropped As. 4 to Rs. 12-12. Podars lost an anna to Rs. 12-12. Elphinstones were neglected at Rs. 12-8. Among 20s, Moderns and Raghuvamshis declined by As. 2 each to Rs. 16 and Rs. 16-4, respectively. Maduras shed an anna to Rs. 17-3. A fall of As. 2 to Rs 21 in the quotation for Moderns was the feature of trading in 30s. Deals in 40 counts were put through at lower levels, Gokaks being marked down by As. 12 to Rs. 24-4 and Seksarias by As. 2 to Rs. 22-4. Finer counts were no exception. Among 60s, Moderns gave way from Rs. 61-8 to Rs. 61-4. Elphinstones lost As. 2 to Rs. 48-8. Yarns of 80 counts were quiet, Finlays being quoted at Rs. 68-8 and Moderns at Rs. 62-8.

Listless conditions prevailed in the rayon yarn market this week. Despite better offtake in fabrics market, operators were extremely cautious in their dealings, as they preferred to watch the trend of demand for yarn in the coming weeks, as also the import policy for the second half of this year. Turnover was, therefore, greatly restricted and, over the week, rayon yarn prices were a shade easy. In the forward section, 150D May contract terminated at Rs. 730, as against Rs. 731, last week-end. Among spot imported yarns, 120 Italy declined by an anna to Rs. 4. 120 Japan and 150 Italy lost half an anna each to Rs. 3-13-6 and Rs. 3-10-6, respectively. 150 Japan was quiet at Rs. 3-15. Following the reported booking of orders by National Rayon Corporation for delivery in October-November-December, yarns produced by this Company suffered losses. 150 Bt. cones I and II grade fell by 15 pies each to Rs. 3-7-3 and Rs. 3-6-9, respectively. 120 Bt. cones I grade lost an anna to Rs. 4-3-6 and IL grade eased by six pies to Rs. 4-2.

In sympathy with the general trend and following reduced offtake by consuming centres, the staple fibre yarn section ruled easy. Some selling was in evidence and values generally drifted lower. An exception to the general trend was provided by imported yarns (40×2) which recorded handsome improvement on good buying support. Staple fibre yarn (40×2) for May delivery terminated yesterday at Rs. 587-8, that is, Rs. 3-4 lower than a week ago. June contract receded by As. 12 to Rs. 587. In the spot section (40×2), New Greats and Citys lost three pies each to Rs. 3-3-3 and Rs. 3-1-6, respectively. Sitarams also lost a like amount to Rs. 3-1-9. As already stated, foreign yarns (40×2) found supporters. Suicos picked up As. 2-6 to Rs. 4-12. Shincos strengthened by As. 2 to Rs. 4-9.

The table below gives the prices of art silk staple fibre and cotton yarns quoted yesterday, as compared with those six days before:

	31-5-1955	25-5-1955
	Rs. a.	Rs. a.
Art silk yarn—		
150 D. May	730 0	731 0
120 Japan (per lb.) ..	3 13½	3 14
150 Japan (per lb.) ..	3 15	3 15
120 Italy (per lb.) ..	4 0	4 1
150 Italy (per lb.) ..	3 10½	3 11
Staple fibre yarn—

80s Finlay ..	68 8	68 8

OILSEEDS EASY

(From Our Own Correspondent)

BOMBAY, 1st June

The oilseeds market ruled distinctly easy during the week under review. In fact, there was a general wave of selling pressure, which gathered momentum as the week advanced. Consequently, prices declined and substantial losses were recorded during the week. The easiness in the groundnut section was due to exhaustion of quotas in groundnut oil and in the linseed section to fears of the imposition of an export duty of Rs. 50 per ton on linseed oil. The approaching maturity of June-July contracts in both these sections further induced some selling pressure. The castorseed section also ruled easy, despite some encouraging overseas advices from the Continent, the U.K., and the U.S. This was presumably due to lack of shipping space for export. As a result, business done in the market was limited to a narrow level. The undertone, however, was steady.

Fresh arrivals of groundnut summer crop have already commenced in parts of South Arcot in Madras and heavy arrivals are expected by the end of this month. This factor had a restraining influence on operators in the groundnut section. As a result, groundnut Bold ready declined from Rs. 20-14 to Rs. 19-14. August-September delivery receded from Rs. 21-12 to Rs. 20-13. Khandesh quality disclosed a loss of As. 12 at Rs. 20-10. Groundnut oil ready eased from Rs. 11-6 to Rs. 11-1. June delivery changed hands at Rs. 11-1, as against Rs. 11-7 and July delivery at Rs. 11-2, as against Rs. 11-9.

In the linseed section, Bold ready declined from Rs. 23-5 to Rs. 22-8. June-July delivery receded from Rs. 23-3 to Rs. 22-6 and August-September from Rs. 23-2 to Rs. 22-7. Small Sutna disclosed a loss of As. 10 at Rs. 21-4. Linseed oil was virtually dull at Rs. 14. The oil was quoted in the U.K. and the Continent quiet at £98.

In the castorseed section, September delivery opened the week at Rs. 75-11, as against Rs. 75-3. After fluctuating between Rs. 75-12 and Rs. 73-10, it closed at Rs. 73-14. The due rate for May, 1955, delivery was Rs. 70. About 2,300 candies were tendered for delivery against this contract which went off the board on 31st May. Among spots Madras quality suffered a loss of As. 9 to Rs. 13-14, and Kanpur As. 8 to Rs. 13. Castoroil, Commercial quality, eased from Rs. 8-8 to Rs. 8-4 and First Pressure from Rs. 9-8 to Rs. 9-5.

The margin system, recently approved by the Forward Markets Commission came into effect in respect of September, 1955 contract as from the 1st inst.

Among others, *kardi* Bold ready ruled colourless at Rs. 11-8 and *niger* Madras quality at Rs. 19-4.

Advices for oilcake from the U.K. and the Continent continue to be encouraging. Shippers welcomed the release of a further quota of 25,000 tons of groundnut oilcake (expeller variety) for export by eligible shippers up to the end of June, 1955, announced by the Joint Chief Controller of Exports, Bombay, on 26th May. The licensing procedure will remain as hitherto. It may be noted that the initial ceiling of 25,000 tons released for export some time back has already been exhausted.

The following table shows the price of oilseeds and oil today, as compared with those at the end of the previous two weeks.

	1-6-1955	24-5-1955	18-5-1955

PEPPER QUIET

(Messrs. Parekh & Co.)

BOMBAY, 1st June

Influenced by the reactionary fall in the spot pepper at New York from $0.54 to $0.50, Malabar black during the week, after touching new high levels of Rs. 1,250 in recent months, went down to Rs. 1,187½ at Alleppey. But the fall proved short-lived and prices steadied up between Rs. 1,225 and Rs. 1,250 with undertone firm on enquiries from exporters who were constantly buying. With thinning down of arrivals there was absence of selling pressure from growers. Spot in New York went up from the lowest of $0.39 to $0.54. Named steamers sailing during May and June were placed at as high as $0.52½ to $0.52. Sarawak and Lampong also showed sympathetic sharp rise and improved from $0.43 to $0.49 and $0.46 to $0.52, respectively, under pressure of New York buying and short covering. Shortage of contracts in Bombay proved a sustaining factor for Malabar pepper at all primary markets, though there was absence of enquiry from New York, where working week days were shortened owing to Memorial Holiday. News of Sarawak underselling Malabar has so far failed to affect our market as most of the exporters are bullishly inclined. They think that New York shall have to buy Malabar pepper for their fall requirements as shipments from Singapore, Sarawak and Lampong during May and June will not be enough for replacement by the dealers in view of the approaching autumn season. With such healthy statistical position of pepper, as it is today, a section of the trade anticipates some kind of bull manipulation in New York either by dealers or by speculators some time in July or August, as has happened during the past years. If so, prices of Malabar are likely to go still higher.

At the time of writing, the market is a little quiet, and June shipment is quoted at $0.50½, July at $0.50 and August/Sept/October all at the self same rate of $0.49. Garbled at Cochin, after touching the highest at Rs. 217, is now quoted at Rs. 205. Ungarbled is nominally quoted at Rs. 1,200 to Rs. 1,212½.

Following are today's nominal quotations:—Ready delivery Rs. 157 (as against Rs. 155-60) per Bengal maund, June Rs. 1,080-90 (Rs. 1,095-1,105), July Rs. 1,090-1,100 (Rs. 1,110-20) and August Rs. 1,080-90 (Rs. 1,105-1,115) per candy of 5¼ cwts.

RAW JUTE WEAK

(From Our Own Correspondent)

CALCUTTA, 31st May

Conditions in the raw jute market remained depressed throughout the week. On continued selling pressure, prices drifted downwards and, on balance, revealed substantial losses. Assam bottoms, for instance, which stood at Rs. 30-8 per maund on 25th May, came down to Rs. 27-8 today. The decline is attributed to the prospects of a very large jute crop both in India and Pakistan in the coming season. Trade circles pitch the crop at 6 million bales for Pakistan and 4 million bales for India. Those dealers who had gone long in recent weeks in anticipation of realising higher prices were, as a result, reported to be liquidating their stocks, while mills, fairly well-stocked, evinced no interest in making purchases of raw jute even at lower levels. Part of this hesitancy on their part was also due to lack of buying support in the jute goods section.

In the jute goods market, uninteresting conditions prevailed till yesterday. Buying interest subsided, following lack of orders from abroad. Prices of both hessians and B. twills declined on selling pressure by weak holders as well as by speculators. As a result, 40"×10 oz. hessians which were ruling at about Rs. 42-9 on the 25th inst. receded to Rs. 42 per 100 yards yesterday. Similarly, B. twills staged a descent from Rs. 110-4 per 100 bags to Rs. 109-2. At the low levels, some buying by shippers attracted short-covering. As a consequence, hessians gained As. 10 to Rs. 42-10 and B. twills Re. 1-14 to Rs. 111 today. The undertone of the market remained steady on expectation of an improvement in the position of jute goods stocks with mills.

It is reported that the East Pakistan Government has started issuing licences to jute shippers for the new season. Although all the applications have not been disposed off, so far only 101 licences have been renewed, while as many as 154 have been cancelled. It is expected that these heavy cancellations would affect adversely the handling of the coming crop in East Bengal.

HIDES STEADY

(From Our Own Correspondent)

KANPUR, 29th May

Conditions in the hides and skins market were fully steady during the week under review too. Arrivals from local butcheries were less, because, this being the period of intense heat of summer, less meat is consumed. Fresh arrivals of dead cow were quite up to expectations. The main purchasers were the local tanners and some Madras dealers.

The latest available quotations are: Wet salted cow 1st grade Rs. 380 to Rs. 400, 2nd grade Rs. 280 to Rs. 320 and 3rd grade Rs. 140 per score; wet salted buff 1st grade 1 lb. 9 ozs., 2nd grade 1 lb. 12 ozs. and 3rd grade 1 lb. 14 ozs. per rupee; goat 1st grade Rs. 300 and 2nd grade Rs. 250 to Rs. 275 per 100 pieces; sheep 1st grade Rs. 250 and 2nd grade Rs. 200 to Rs. 225 per 100 pieces.

LINSEED FIRM

(Messrs. A. Bradley & Co.)

CALCUTTA, 30th May

A further advance in prices of linseed has been recorded during the past week, owing to an improved demand for linseed oil. Upcountry markets are steady and, although goods have been reaching this centre on a fair scale, supply has been short of the demand from crushers. A fair turnover has been recorded, chiefly for forward positions. In the oil section, prices have firmed up as a result of an acute shortage of goods; in addition, enquiries from shippers are brisk. The latest quotations are as follows:—Ready June Rs. 16 and June/July Rs. 16-4 per maund.

WHEAT PRICES DECLINE

(From Our Own Correspondent)

HAPUR, 30th May

Foodgrain prices continued an uncertain tone during the week. After a temporary improvement, wheat prices again declined. Opening at Rs. 9-14 for *dara* quality on Monday last, the price of wheat improved to Rs. 10-2 per maund in mid-session on resumption of Government purchases at the price fixed, namely, Rs. 10 per maund, but on account of pressure of arrivals averaging 5,000 maunds daily and slack outside demand, the prices eased to Rs. 9-10 for *dara* quality quoted today. The Government's agents are purchasing wheat, but the quantity offered to them for sale by the producers is not very heavy. In order to tone up wheat prices in the country, the Government of India has decided to license freely for export wheat products, whether manufactured out of imported wheat or indigenous wheat. The daily arrivals here average 4,000 to 5,000 maunds of wheat and the local stock has swelled to 48 *khaties*. The rice prices, on the other hand, recorded an all-round improvement in all the sections, due to shortage of local stocks and good demand for the marriage season. The fine quality was quoted at Rs. 27 per maund and coarse quality Rs. 13 per maund.

The coarse grain prices recorded a steady tone during the week. Gram was transacted at last week's level at Rs. 6-4 for local quality and Rs. 6-10 for Punjab quality. Barley and *bejhar* improved by As. 4 to Rs. 5-8 and Rs. 5-6 per maund, respectively quoted today. The *bejhar* stock is estimated at 8 *khaties*. Peas prices continued unchanged at Rs. 5-8 for green quality and Rs. 6-8 for white quality. With moderate demand and want of loading facilities and arrivals averaging 1,200 maunds, the peas stock here has increased to 38 *khaties*. *Arhar* prices improved by As. 2 to Rs. 6-8, with stocks estimated at 18 *khaties*. Pulses futures recorded an appreciable fall in prices, due to bear pressure from east U.P. Peas *jeth* and *bhadon* were quoted at Rs. 5-4 and Rs. 5-6, as against Rs. 5-11 and Rs. 5-13 quoted last week. *Arhar* futures also declined by about As. 4. *Jeth* and *bhadon* being quoted today at Rs. 6-5 and Rs. 6-7, respectively.

SUGAR DULL

(From Our Own Correspondent)

HAPUR, 30th May

The sugar prices ruled dull and featureless during the week under review although there was some improved demand from Saurashtra and Madras side. Prices are not likely to improve substantially, because the total availability of sugar is now expected to be higher than the total requirements of the country. Output of the sugar factories is reported to have reached 15 lakh tons by the end of the last month and, with the pace of production on the increase, the earlier anticipations that the current season's total production would be over 16 lakh tons have been strengthened. The latest mill delivery rates here are: Jaswant Rs. 29-2, Simbhauli Rs. 29-4, Mowana Rs. 29-4, Daurala Rs. 30, Amroha Rs. 28-8, Bijnore Rs. 28-8, Mansoorpur Rs. 31 and Rampur Rs. 32, retail Rs. 31 and *khandsari* Rs. 21 to Rs. 27 per maund.

Ready *gur* prices further drifted to lower levels on slack outside demand and abnormal daily arrivals of about 400 maunds. The daily offtake is from Rajasthan and Gujerat side. The current prices are Rs. 9-8 for dry quality and Rs. 9 for koths quality and the stock here is estimated at 85,000 maunds.

The forward section of *gur* also recorded a slight fall during the week under report, in consonance with the ready section, as also on account of bear pressure following reports of increased sowings for the next season. *Gur Asar* and *Phagun* are today quoted at Rs. 8-10 and Rs. 8-1 respectively, as against Rs. 8-12-9 and Rs. 8-9-6 quoted last week.

Notices

THE NEW INDIA ASSURANCE COMPANY, LIMITED

BOMBAY

NOTICE TO THE SHAREHOLDERS

NOTICE IS HEREBY GIVEN THAT THE Thirty-sixth Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company, New India Assurance Building, Mahatma Gandhi Road, Fort, Bombay, on Wednesday the 29th June, 1955, at 4-30 p.m. (S.T.).

(1) To receive and adopt the Directors' Report and the Audited Accounts for the year ended 31st December, 1954.
(2) To declare a Dividend.
(3) To elect three Directors in place of Mr. A. D. Shroff, Mr. Ramniwas Ramnarain and Mr. Kasturbhai Lalbhai who retire by rotation but are eligible for re-election and offer themselves accordingly.
(4) To appoint Auditors for the current year and to fix their remuneration.

The Transfer Books of the Company are closed from 23rd day of May, 1955, to 21st day of June, 1955 (both days inclusive).

By Order of the Board,
B. K. SHAH,
General Manager.

BOMBAY, 26th May, 1955.

N.B.—The Dividend when sanctioned at the General Meeting will be payable to those Shareholders whose names stand registered on the Company's Registers on the 21st May, 1955. It will be payable at the Central Bank of India Limited, Bombay, for six months on and after the 1st July, 1955, and thereafter at the Registered Office of the Company.

CHANGE OF ADDRESS should be notified without delay.

IMPERIAL BANK OF INDIA

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Principal Register and the Branch Registers of the Imperial Bank of India will be closed for transfer of shares from Thursday the 16th June, 1955, to Thursday the 30th June, 1955, both days inclusive.

In terms of Section 6(1)(a) of the State Bank of India Act, 1955, all shares in the capital of the Imperial Bank of India shall be transferred to, and shall vest in, the Reserve Bank of India, free of all trusts, liabilities and encumbrances on the "appointed day" which has been fixed for the 1st July, 1955, by the Government of India Notification No. F.8(8)-F.I./55, dated the 14th May, 1955. Section 9(1) ibid provides that every person who immediately before the 1st July, 1955, is registered as a holder of shares in the Imperial Bank of India shall be entitled to compensation in accordance with the provisions contained in the First Schedule.

All purchasers of Imperial Bank of India shares are therefore advised to lodge with the Bank for registration the instruments of transfer in their favour along with the relative share certificates, *not later than the 15th June, 1955.*

S. K. HANDOO,
Managing Director.

BOMBAY, 17th May, 1955.

FUTURE TRADING IN COTTON

(Concluded from page 1065)

region in the production of cotton will, therefore, undergo considerable change as a consequence of the completion of the Project. The relative importance of the centres from which applications for recognition have been received will also change correspondingly. It is likely that, in the context of the new situation, a centre different from the centres visualised at present might appear to be most suitable for the region. In view of all these considerations, the Commission feels that the choice of a centre for the region has to be postponed until the new set-up of economic forces becomes clear and an association, more representative of the different concerned interests, comes forward to take up the responsibilities of running a futures market.

With regard to the Central Region, the Committee has favoured the establishment of two cotton futures markets at Indore in the northern part, at Akola in the central part, at Ahmedabad in the western part. The markets at these centres may be opened by about August, 1955, so as to provide hedge facilities for the February-March 1956 delivery. It has, however, deferred the question of opening a futures market in the southern part. The Commission considers the applicant association at Akola, namely, the Madhya Pradesh Commercial Exchange Ltd., to be suitable for recognition but would like to await, in respect of Indore, an application from the new association proposed to be constituted jointly by the applicant associations from Indore and Ujjain. The West India Cotton Association, Ahmedabad, is also considered suitable for the purpose of recognition under the Forward Contracts (Regulation) Act, 1952.

In regard to the Southern Region, the Commission observes that the volume of production and consumption of cotton fully justifies the location of a futures market in the region. But it has not received any application for recognition from the concerned associations from this region, nor does there appear to have been any local tradition, of futures trading in cotton. The Commission has, therefore, come to the conclusion that, while there is need for developing a futures market in the region in due course, it has to await the development of public opinion and the establishment of representative associations which can be entrusted with the task.

Futures Market in Bombay City

As regards Bombay City, the Commission considers it necessary to have a futures market, taking into account the importance of the City as a consuming centre and a terminal market and the long experience and tradition of futures trading. Even after the establishment of futures markets in cotton at other centres, the importance of the market in Bombay City is expected to be maintained undiminished. To quote the Commission: "In view of the considerable experience of Bombay in the field, the large volume of transactions that take place there and the extensive resources of the local dealers, the Bombay market would guide and influence the behaviour of the other futures markets in the country." The Commission wants recognition for the East India Cotton Association (E.I.C.A.), Bombay. The E.I.C.A. is a non-profit-making public limited company. It has been conducting trading in cotton, including futures trading, since its establishment in 1922. The Association was recognised by the Government of Bombay under the Bombay Cotton Contracts Acts of 1922 and 1932 and the Bombay Forward Contracts Control Act, 1947. The application of section 15 of the Forward Contracts (Regulation) Act, 1952 to cotton repealed the provisions of the Bombay Forward Contracts Control Act, 1947, in so far as they related to cotton, but the recognition of the East India Cotton Association has been temporarily saved under section 29 of the Act. The Association has recently effected certain amendments to its constitution and bylaws at the instance of the Commission.

In addition to the futures markets at Bombay, Akola, Indore and Ahmedabad, the Commission feels that it may be desirable to establish cotton futures market in due course at two or three more centres. According to it, the first centre should be in the Northern Region, the second in the Southern Region and the third in the area consisting of the northern and central districts of Hyderabad State and the adjoining districts of Bombay State. The precise location of the centres may be decided later. The opening of the centres may be timed in the light of the experience of the working of the four centres being established immediately and the use made of the facilities provided by them.

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. F=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotations. x.d.=Ex-Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share.'

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and All value items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the amounts are closed half-yearly, dividends are shown separately for the respective half-years

MARKET GOSSIP

(*Concluded from page 1059*)

creditor nation and with its oft-repeated desire for liberalisation of restrictions on world trade. The final outcome of this move is, therefore, awaited with interest all over the world. The latest reports from Washington reveal the interesting fact that the U.S. Tariff Commission's recommendations for higher tariffs, which have not yet been accepted by the President, are not unanimous. Only three out of five members of the Commission are in favour of higher tariffs, as they found, as a result of enquiry, evidence of injury to the cycle industry from excessive imports. They have, accordingly, recommended that the duty on all imported cycles should be increased to 22½ per cent., as against the present rate of 7½ per cent. on most British machines. This opinion has not, however, been shared by the two other Commissioners who hold entirely different views. One of them thinks that the injury which the U.S. cycle industry has suffered to some extent is due mainly to imports of heavy balloon tyre American type bicycles which Britain does not manufacture. He, therefore, considers an increase in duty on balloon tyre machines and lightweight English type machines to 22½ per cent. and 15 per cent., respectively, as quite sufficient. The other member of the Commission does not want any modification at all in the present tariff policy covering cycle imports. "No sufficient reason," he observes, "exists for the recommendation to the President that concessions on cycles be modified or withdrawn. The deterioration in the position of the domestic bicycle industry is not to be measured by the extent of the increase in imports." This Commissioner goes even to the extent of saying that the escape clause in the Trade Agreements Act has never been intended to protect domestic producers from the consequences of being less astute than importers in judging the preference of American consumers.

• • • •

While the U.S. cycle industry's application for higher protection is thus hanging fire, another industry is likely to receive a certain measure of protection against foreign exports. Thus, a New York message claims that the U.S. Department of Agriculture has almost decided to extend the Sugar Act in such a way as to provide for an increased quota to indigenous industry and that an official announcement is expected shortly. This move, we are told, is a sequel to the plea that has persistently been put forward by domestic sugar interests. The move, it is said, will adversely affect all the countries which supply sugar to the U.S., particularly Cuba, which accounts for more than a third of the sugar consumed in the U.S. It would appear that the Agricultural Department's move is contrary to the policy of the State Department which has all along been urging the undesirability of interfering with the U.S. outlets for Cuba and other countries.

• • • •

The fog of uncertainty over the U.S. cotton export policy for the ensuing (1955-56) season is likely to be cleared in the next four week's time—by 1st July next to be precise—when Mr. Benson, U.S. Secretary of Agriculture, is expected to make an announcement. In the meantime, Mr. Benson has set up an eight-man cotton export advisory committee, comprising producers, exporters and textile makers, to help him decide whether to subsidise cotton sales abroad in the marketing year beginning from 1st August, 1955. Pending the recommendations of this Committee and the U.S. Government's decision thereon, speculation is once again rife as to whether the U.S. would accelerate sales of surplus stock of cotton on world markets by offering them at competitive prices. Although the U.S. Agriculture Secretary seems to be personally not in favour of subsidising cotton exports, he will, cotton circles feel, be compelled by the cotton producing interests to agree to

WANTED—A NEW APPROACH BY EMPLOYERS

FOR some time now, the Congress Party in India has been propagating a new economic philosophy. Vague though this philosophy is, despite the torrent of words that has flowed from many leading Congress men by way of explanation, one thing is clear. The State will, under this philosophy, dominate over all forms of economic activity. Private enterprise and initiative will be at a discount. The State will determine how much one should earn, save and hold as property. It will tell the people what type of education they should have, what type of industries they should start, how much land they can keep, with whom they can insure and bank and at what cost, what type of cloth they should wear (mill-made, handloom, or *khadi*), what type of oil they should use for cooking (village *ghani* oil or factory pressed oil), whether they should get their paddy pounded in a rice mill or by hand, and whether they should get their wheat ground into flour in a flour mill or by hand in the ordinary household grinding stones, as used to be done during the days of our great-grandmothers. This may or may not be consistent with democracy. That is a question about which one can go on arguing endlessly. But all this is inherent in an economy planned for bringing about a socialistic pattern of society.

What is the attitude of our business men towards this new philosophy? Some of them have, of course, loudly protested against it. They have argued that a socialist Welfare State is not practicable for an underdeveloped country severely lacking in capital and managerial talent. Some, however, are taking it stoically, for they feel that the change in the offing is inevitable and cannot be stopped. They admit that many of the things which the Congress Party has been saying as necessary, such, for instance, as nationalisation of banking and insurance, socialisation of co-operative movement and fixation of ceiling on land, are not necessary for raising the living standards of the people and that, on the contrary, they may do more harm than good to the country. Yet, they are doing nothing to avert this trend.

If private enterprise in industry, trade and finance, as distinct from private enterprise in agriculture and cottage industries, is to survive the onslaught of neo-socialists in this country, it must not only preach but actually practise a philosophy which will appeal to the public now under the spell of the propaganda for a socialistic pattern of society. It must prove that it exists not merely for itself but for the welfare of the people as a whole. It must lay down a code of conduct for all business men, ensure a high degree of managerial efficiency, and maintain happy and friendly relations with its employees. All these three prerequisites are, of course, of equal importance. But we propose to confine ourselves in this issue to the last one, for it is more important than the rest. In a democratic economy, where workers in factories and offices are highly organised, or rapidly organising themselves by forming trade unions, and are getting conscious of their rights, failure to maintain satisfactory employee relations will jeopardise the position of private enterprise, since discontented employees will, sooner or later, allow themselves to be brought under the influence of professional politicians who will, of necessity, be left-wingers. Even those whose leanings are not towards the left will be inclined to move more and more towards the left, in order to keep themselves in power, because the factory and office workers are more vocal than agricultural workers and a force to be reckoned with. This is precisely what has been happening in India during the past few years.

Unfortunately, employers in India, barring a few exceptions, have not been following a progressive policy in keeping with the changing times. It is a fact that almost every one of the amenities which industrial workers are now enjoying—reduced working hours, overtime payment, holidays with pay, provident fund, sickness benefits, cash bonuses, etc.—have had to be forced on them through legislation and adjudicators' awards. Although it is the employers who are footing the cost of these amenities, the credit for securing all these has invariably gone to professional politicians and union leaders, with employers being labelled as diehards and exploiters. In other words, though employers pay, they are not able to call the tune. Is it not high time then that they changed their attitude towards their employees and followed a more forward-looking policy which will earn for them the goodwill of their employees and eliminate politicians from trade unions? They should draw a lesson from what is being done by employers in other democratic countries for fighting the philosophy of socialists. Recently, when the Labour Party in Britain advocated nationalisation of the chemical industry, the Chairman of I.C.I., Dr. Alexander Fleck, gave six main reasons why nationalisation was not desirable. One of these was satisfactory relations with employees. He pointed out with justifiable pride that, since 1926, his company has been free from any serious industrial dispute. Some of the other reasons given by him were: (a) fair dealing with customers, (b) efficiency in production, (c) conservative financial policy which enabled the company to bring about great expansion of productive capacity, and (d) significant contribution to export trade and human happiness.

It is true that amenities to workers and a decent wage will largely be governed by the general level of national income. An employer cannot pay more than what the market for his products can bear. But, subject to this rule, he should honestly endeavour to keep his workers well content. It should be his aim to follow such modes of production and marketing as will enable him to pay a decent wage to his workers. Further, in an economy where the public sector threatens to dominate, he should follow a standard which will make his workers feel convinced that the private sector is far superior to the public sector. In this context, it is necessary to draw his attention to a new revolution in company ownership which is steadily gaining ground in the U.K. and the U.S. We mean the employee-shareholding schemes. Employers in India should seriously consider whether they, too, should not make a beginning in this direction. In one of our earlier issues, we drew attention to the fact that, in most of the State-owned undertakings in India, the Government has given representation to workers on the boards of these undertakings by nominating trade union leaders and that, sooner or later, labour leaders would make a demand for similar representation on the directorates of joint-stock companies in the private sector, too. Indeed, some of them have already started voicing this demand. A few economists also have extended their support to it. Dr. B. N. Ganguli, of the Delhi School of Economics, for instance, says, in a paper on planning, that "workers' participation in industrial management is essential, if only because centralisation of power and responsibility is an inherent evil of large-scale industrial organisation." It will be wise on the part of employers to forestall such a demand by judicious action. They must think of a workable scheme which will effectively meet this ambition of workers and, at the same time, scotch the move for nationalisation of private undertakings. In fine, employers in India must carry their workers with them, if the Government's pressure for nationalisation and more stringent controls is to be successfully resisted. The policy of giving an opportunity to employees to become shareholders may prove useful for this purpose.

The idea of worker-shareholdings is not new. It is fairly well established in the U.S. and is being fostered in the U.K. In both the countries, various types of employee-investment schemes are in vogue and have the approval of the Governments. It is very interesting to find that, in the U.K., where the idea has come into practice only recently, the Conservative Government has been more sympathetic to it than the Labour Government. Apparently, the Conservative Party, which has expressed itself in favour of a property-owning democracy, finds in this idea a means whereby workers can be encouraged to save and become partners of industrial and financial undertakings where they work. It is heartening to find that the shareholders of even those British companies which have introduced schemes for workers' participation in equity capital have reconciled themselves to this idea in good spirit. Evidently, they have the common sense to appreciate that the alternative to it may be dispossession of their holdings by a Socialist Government.

It will not be out of place here if we briefly describe some of the employee-shareholding schemes in Britain, inasmuch as joint-stock companies in India are modelled on the British system. Our task in this direction is facilitated by a recent article in the *Investors' Chronicle*, London, which has itself warmly commended these schemes. It seems that there are three ways in which workers' participation in ownership of undertakings is being encouraged in Britain. First, there is participation in equity capital by giving a part of the rights issue to workers. The second is the creation of a special class of worker-share. And the third is purchases of existing ordinary shares at market price through the Stock Exchange and their allocation

to workers. The last mentioned method, however, has two disadvantages, in that (a) brokerage and other expenses have to be incurred and (b) persistent purchases year after year may artificially inflate the market value of shares. But these defects could be overcome if purchases were made judiciously over a period and accumulated in a special trust formed on behalf of employees. In all cases, the cost of shares is met by workers themselves either from their bonuses or from their regular savings.

Quite a number of the companies in Britain trying these schemes are well-known giants. They include Associated Electrical Industries, Colvilles Steel, Rugby Portland Cement, Imperial Chemical Industries, Joseph Lucas, Barclays Bank, the famous Yorkshire woollen manufacturers, J. T. and J. Taylor, and the large department store, the John Lewis Partnership. The Associated Electrical Industries' scheme is an example of direct investment method. A part of its new issue of £10.3 million, all in ordinary shares, was offered to the employees on the same bonus terms as those offered to shareholders. The Company even gave financial facilities to its workers to take up their share of the offer, as well as any portion not taken up by shareholders. One of the conditions made by the Company was that employees must hold their shares for at least three years.

When Colvilles Steel was denationalised in January last, its employees were given a chance to subscribe to the capital at the same rate at which the scrip was offered to the public and in multiples of 50, 100, 150 or 200 shares. The Company arranged for special loan facilities for its employees to subscribe to these shares. Repayment terms were easy. They were threepence weekly per share deducted from wages or salary over 104 weeks. While no interest was charged on the loan, dividends would be regularly credited to the workers' account. Thus, for a weekly deduction from earnings of 26s. over two years, a worker could buy 100 shares at 26s. each, with full right to dividends. The balance of the loan is repayable in cash or by sale of the shares at any time or immediately a subscriber leaves the Colville Group. It is true that, under this scheme, the workers got shares at the same price at which they were offered to the general public. But they received interest-free financial assistance and almost full allotment in the face of heavy oversubscription.

The aforesaid two schemes are of this year. Last year, two leading companies hit the headlines by announcing novel schemes which were the talk of the world. These were the Rugby Portland Cement and Imperial Chemical Industries. The I.C.I. scheme, as described by our London correspondent in our issue of 29th May, 1954, is as follows:

"The exact form of the proposal to share profits is to issue bonus shares to the employees in the ratio of one per cent. of their annual earnings less tax for every one per cent. by which the dividend exceeds five per cent.; the payment to be made after deduction of tax in the same way as if the bonus were wages. Where the sum provided is not enough to purchase a minimum of 25 £1 shares, then it is put aside in a fund until it is sufficient for this purpose. The shares will be provided by the Company by creating new issues but these will be offered to the employers' trustees at market prices. After allotment, the employee is left free to do whatever he wishes with them, that is, to sell them and spend the proceeds, if he wants. For its part, the Company expects to have the payments rank as allowable expenses for income-tax in exactly the same way as if they were wages. That is why the scheme is essentially one for paying additional wages *pro rata* to the increase in profits, but paying these wages initially in the form of shares. If an employee is not particularly interested in remaining a shareholder in I.C.I., he can sell the shares and the test of whether or not the scheme is achieving its purpose can only be judged by the percentage of retention of shares by the employees."

The chief merit of the I.C.I. proposal is that the employees are given shares without any strings attached. It is a straightforward increase in income to match a given level of profits. Since I.C.I. is a company from which one can expect relatively stable dividends, there is not the danger from which other schemes suffer, namely, a loss in the income of the employee in case there are not sufficient profits to maintain the dividend. Another feature of the scheme is that I.C.I. will be steadily increasing its equity capital while the scheme operates. The only condition attached for allotting these shares to workers is that they must be adults and have at least 2½ years' service to their credit. It is said that there are 112,000 employees, the number of eligible workers being placed at about 100,000.

Under the Rugby Portland scheme, announced in October last, employees and shareholders, as groups, were each offered *at par* 500,000 "A" 1s. ordinary shares. But these were non-voting and without right to surplus assets in a winding-up. About 1,200 employees were given the right to apply and allotments were made according to status and salary, with a minimum of 250 shares each. Although all employees were entitled to shares, discretion was exercised in allotment to Directors who are all paid. Out of 500,000 shares, the Directors received only 30,000 and the Chairman gave up his right in favour of the workers. A notable feature of this scheme is the worker-incentive element in it. Thus, the "A" shares do not share in profits until the group net is at least £900,000 and the gross dividend paid on the ordinary capital is £300,000. But, once the conditions for "A" profit-sharing are fulfilled, the shares rank for £70,000 *plus* 20 per cent. of the excess over £900,000, with a maximum of 12½ per cent. of net profit.

An underlying feature of all these schemes is that they constitute a form of employees' participation in the prosperity of companies. As mentioned earlier, the schemes are not confined only to giant industrial and trading concerns. Barclays Bank has also encouraged employee shareholding for a number of years. We shall examine, in our next issue, the feasibility and desirability of applying these schemes to joint-stock companies in this country.

EUROPEAN ECONOMY

IT is a matter of considerable interest to this country that European economy, more particularly Western European economy, should be in a state of good health, for this region constitutes an important market for India as well as a supplier of a wide range of goods. The post-war economic recovery of this region, aided though it was by generous American aid, has been an encouraging factor from the Indian point of view. Progress has not, of course, been uniform. Nor is it to be expected. Comprising as it does countries the economies of which were damaged in varying degrees by the war, and the internal momentum for growth and expansion differed in strength from country to country, it is hardly surprising that some countries should have made more rapid headway than the rest.

In the last two or three years, however, progress has been commendably rapid. But a matter for concern is that this might have been accomplished or could be maintained only through a sacrifice of monetary stability. In other words, the risk of inflation is a potential danger even in these highly developed countries no less than it is in underdeveloped countries with ambitious plans for development. How real is this danger in Europe? In what country is it a more imminent danger? To these questions, as well as to the wider question of the trends in European economy, the latest issue of the *Economic Bulletin for Europe*, prepared by the Research and Planning Division of the Economic Commission for Europe (E.C.E.), has addressed itself.

The E.C.E. *Bulletin* observes that, in the early months of 1955, the economic upswing continued unabated in virtually all countries of Western Europe. A "pronounced" investment boom gave a further stimulus to the production of industrial equipment after the slackening in the coal and steel industries in the beginning of 1954. A factor that must have lent some strength to this general upswing (the only exception being the textile sector) is the revival of activity in the U.S. from October, 1954. European production recorded sizable improvement in 1954. This seems to have been accompanied, according to the *Bulletin*, by a considerable rise in profits, even though prices remained fairly stable, "because of the better utilisation of capacity and because the upswing had not yet been reflected in major wage increases." Of late, however, the boom in durable consumer goods, which was noticed in 1954, is beginning to level off. The *Bulletin* adds: "Sales of durable goods do not any longer seem to be advancing faster than sales of textiles and, in some countries, sales of motor vehicles showed a rather unfavourable development in January and February, as compared with those of previous years." Although the export trade in textiles suffered a setback, it did not prevent a continuation of the general expansion of the trade of continental European countries towards the end of 1954 and in the first months of 1955. Britain, however, was at a double disadvantage *vis-a-vis* Continental Europe. It faced a dock strike in 1954. Also, its import prices commenced rising in the autumn of 1954 and the volume of imports increased faster than exports. This factor, coupled with the deterioration in the payments position of some of the other sterling area countries and some capital transactions, led to a setback in the balance of payments position of the sterling area towards the end of 1954.

Summing up the position of the European economy in the winter of 1954-55, the *Bulletin* characterises it as one of "quantity boom." Explaining this phrase, it says that it is derived from the German concept of *Mengenkonjunktur* and is used to describe the phase of an upswing during which supply elasticities are sufficient to permit an expansion of the volume of production, without appreciable effect on prices and wages. Apart from some rise in freight rates and in prices of certain basic materials, mainly in the investment goods sector, there is nothing in the price situation to warrant the concern about inflationary trends that is being felt in certain countries. This concern is partly traced to the price situation in the U.K. which has been somewhat less stable than that of most other countries. It is also due to a general feeling that price stability cannot last for much longer, in view of the consideration that improved employment situation and high profits have made labour less and less inclined to show restraint in wage demands.

That it is difficult for labour in the context of full employment, to resist the temptation to ask for more and more wages, irrespective of the relation of that demand to man-hour productivity, is evident from the latest railway and dock strikes in the U.K., which are, at least ostensibly, designed to secure higher wages. In the U.K., prices have been rising of late; in April, 1955, the index number of prices of all articles (base: 1938=100) was 332.3, as against 325.3 in 1954 (average) and 323.5 in 1953 (average). The railway and dock strikes will certainly affect adversely the course of industrial production and would consequently have an inflationary effect on prices. Indeed, the *Bulletin* warns against such a contingency. It emphasises that the very high level of employment in the U.K. has resulted in a "considerable pressure on wages and it may prove increasingly difficult to maintain stable selling prices, the more so since many firms have probably passed the optimum level of utilisation of capacity and increasing expenditure on overtime also adds to industrial costs." It then goes on to point out that the recent measures taken to reduce imports into some of the traditional British markets underline the need for the U.K. to strengthen its export position in other and more competitive markets. The continuing dock and railway strikes are certainly not calculated to serve this purpose. If they are persisted in, they are bound to inflict a serious damage on the British economy.

Discussing the wider question of maintaining a high level of economic activity in Europe, the *Bulletin* has stressed the vital need for commercial policies to be oriented towards raising imports or towards granting credits to some countries both in and outside Europe which have been attempting to reduce their imports. It warns: "Otherwise, there is the danger that a continued accumulation of currency reserves in some countries, accompanied by further expansion of economic activity in others, will stop the expansion of intra-European trade and thereby weaken, or even interrupt, the economic upswing in Western Europe."

The *Bulletin's* exposition of the importance of intra-European trade deserves notice. This trade, it is pointed out, is the more "crucial," since the prospects of relief in the form of increased exports to overseas countries are uncertain. Normally, the continuation of an American upswing might be expected to swell the export earnings of the raw-material-producing countries and thereby pave the way for increased exports from Europe to these countries. But such repercussions on European trade are felt only after a long time. Also, some of these countries have adopted import restrictions. These restrictions, experience shows, are never promptly lifted even when economic conditions in the importing countries improve. It is for this reason that the *Bulletin* emphasises the need for improving and extending the volume and area of intra-European trade.

SHARE MARKETS START LOOKING UP

INDIA REFUSES TO GUARANTEE AMERICAN INVESTMENTS—FAVOURITISM IN CIVIL AVIATION

THURSDAY, 5 P.M.

THERE has been a slight improvement in the trend of all share markets. In Bombay, the downward trend in Tata Steel shares seems to have been checked. The closing rate for this scrip is about Rs. 3 higher than the lowest level touched earlier in the week, though, over the week, there is no net gain. In contrast to this, Indian Irons have actually gained a fraction of a rupee, owing to short-covering and some fresh buying. The main reason for Tata Steels not having made a sizable recovery is the prospect of heavy *badli* rate which the bulls would have to pay in the next settlement owing to closure of share transfer books. This prospect has been acting as a deterrent to bulls. As regards the other section, textiles have staged a handsome rise, due chiefly to bear covering in Bombay Dyeings and Kohinoors. It looks as though the operators are now inclined to view the outlook for textiles rather optimistically. Among miscellaneous shares, there have been quiet a few bright spots. Of these, mention may be made of Bombay Burmahs, Belapurs, National Rayons, Indian Coppers and A.C.Cs. In the Calcutta and Madras markets, too, activity has broadened, tea, textiles, engineering, cements and a number of miscellaneous scrips evoking a fair amount of buying support.

MARKET GOSSIP

• • • •

The aforesaid improvement is based on (a) encouraging reports about the results of working of industries so far during the current year and chances of satisfactory progress in the coming months, and (b) good dividend announcements and expectations. The spurt in textile shares, in particular, has stemmed from the former factor. In the case of Bombay Dyeing, there is an additional reason, namely, renewed rumours that the Company has received, or is about to receive, the Government's permission for introducing automatic looms and working an extra shift. Tea shares have gone up, because of the feeling that the worst is over in the world tea markets. This feeling has been engendered by (1) the satisfactory prices realised in the first export auction of the new season at Calcutta, (2) the cut in export duty on tea, (3) the arrest of further fall in prices of tea in the London market, (4) the measures now being taken by tea gardens to pluck only quality tea, and (5) the growing realisation that, though stocks of tea in London may be large, the statistical position, taking the world as a whole, is sound, and that the fall in tea shares in recent months had been overdone. The sudden jump of Rs. 15 per share by Bombay Burmahs (old) in a couple of days is in tune with this revised view of the outlook for tea shares. But operators attribute it to another ground also. They say that the Company, coming under section 23A of the Income-tax Act, will choose to pay a higher dividend for 1954-55, as has been done by the Mettur Industries, Madras.

• • • •

The handsome rise in sugar scrips is not surprising to us, because there was no reason at all for their fall during the past few days. We have always maintained that, though the prices realised by the Deccan factories in the current season are lower than those in the preceding season, their profits will be satisfactory in view of higher production. Some said that the downward drift in Belapurs was a reflection of the market's disappointment caused by the Government's procrastination over the Company's application for the issue of bonus shares. If that were so, a rise of over Rs. 11 since Saturday when a low of Rs. 299 was touched, should mean that the Company must have received the Government's permission for offering a bonus scrip to its shareholders. But we understand that till this evening no communication has been received by the Company. It is true that, at times, the market receives advance information. Whether that is so in this case is, however, beyond our ken. The absence of a similar spurt in the case of scrips of other companies such as Calico Mills and Bangalore Woollen Mills, which have also applied to the Government for permission to issue bonus shares, indicates that the Government has not yet made up its mind. This is just a surmise.

• • • •

Indian Coppers have staged, during the week, an impressive rise from Rs. 3-10 to Rs. 4-6-6; at one time, yesterday they stood at a higher level of Rs. 4-7-3, a level not witnessed for some years past. The chief reason for this improvement is the Company's decision to step up the return to shareholders for 1954 to as high as 25 per cent. from a mere 10 per cent. for 1953. The proposed distribution is made up of a dividend of 15 per cent. and a bonus of 10 per cent. and, at the ex-dividend rate of Rs. 4-2, gives a yield of 8 per cent., free of income-tax. A subsidiary reason for the improvement in the value of this share is the possibility of the scrip being included in the list for forward trading on the Calcutta Stock Exchange. According to knowledgeable circles, the Company's financial results for 1954 and the short-range outlook for it are bright. For several months now, this scrip has been a favourite among both investors and speculators on expectations of higher dividend. But the distribution of 25 per cent. exceeds even the most optimistic expectation. It will be interesting to note, in this connection, that, after touching a high of Rs. 7-2 in the early post-war boom (1946), these shares had touched a low of Re. 1-10 in 1949. If those who had bought these during the boom had the patience to wait and averaged their holdings even at about Rs. 2-8, they would have more than recouped their losses. Here is an instance to show that, over a period, investors in first class equities do not generally suffer a capital loss.

• • • •

A note of optimism characterises the speech delivered by Mr. Kasturbhai Lalbhai at the annual meeting of the National Rayon Corporation Ltd. held today, in his capacity as its chairman. The full text of his speech is published elsewhere in this issue. It will be seen therefrom that, although the practice of bulk sale of the Company's production to the Association of Silk and Art Silk Mills could not be continued this year, it has had no difficulty in disposing of its products. Indeed, it has been successful in making forward sale of its production upto the end of the year. The Company is following an enterprising policy of expanding its production for which there is plenty of scope in the country. It is endeavouring to reduce its dependency on foreign countries for raw materials. For a long time to come, of course, it will have to depend on foreign sources for the supply of the main raw material, namely, wood-pulp. But it can achieve self-sufficiency in regard to chemicals within a few years. The postponement of the proposed increase in shipping freights for an indefinite period has averted the danger of a significant increase in the cost of the Company's raw material. There are, however, two adverse factors, but neither of them is serious. One is the unfair competition by some of the Continental manufacturers and the other the tight power supply position. The Government is aware of both the issues and can be trusted to come to the rescue of the Company in the event of its getting into trouble.

• • • •

Although there is every prospect of the National Rayon making better profits in the coming years, the Board of Directors has decided to follow a cautious policy in regard to payment of dividend. The Directors have candidly told the shareholders that it is not their intention to pay a dividend of more than 10 per cent. for a few years to come. They have also given good reasons for pursuing this wise policy. There is no doubt that a certain amount of self-restraint in this respect in the initial years of a company is admittedly in the long-term interest of shareholders themselves. At the meeting, some shareholders took objection to this part of the Chairman's speech and pleaded for its deletion. The Chairman was, however, firm and turned down the suggestion. Those who objected to this particular passage contended that there was no necessity for the Chairman to make a categorical announcement that there would be no increase in the dividend for a few more years. But what is wrong in the Chairman taking the shareholders into his confidence? This may not have suited the convenience of some speculators on the Stock Exchange who may have gone long. The Chairman is not concerned with them. His obligation is to his genuine shareholders. Mr. Kasturbhai was perfectly right in revealing to the public the Board's mind on this important question, for he has thereby provided a check to the unhealthy speculation that had revived, once again, in the Company's ordinary shares, a few weeks ago.

• • • •

In the course of the debate in Parliament on the Air Corporation Act, 1953, under which the private air transport services of India were nationalised, an assurance was sought from the Government on behalf of the small shareholders of the air companies that the compensation received by the companies would not be utilised by the management for any other business, risky or otherwise. This assurance was sought, because it was feared that the managements with large controlling interests might, without distributing the same to the shareholders, use it for other businesses, as had happened in some cases of nationalisation of public utility companies in the past. The Minister for Communications, it would appear, gave the above assurance and said that the interests of the small shareholders would be protected. It is, however, now reported that Airways (India) Ltd., a Calcutta company taken over by the Government of India, has been given a licence to operate a regular transport service between Calcutta and the Andaman Islands. While the other air companies which have received compensation have already taken steps to distribute the same to the shareholders, or are about to do so, it is surprising that Airways (India) Ltd. alone should have been permitted to operate the above service, contrary to the assurance given by the Communications Minister. That apart, how is it that, when the entire civil aviation, both internal and external, has been nationalised, a private operator has been allowed to carry on this trade? Strange, indeed, are the ways of our Government!

• • • •

A decision that may have considerable influence on the course of foreign investments in this country is the reported rejection by the Government of India of the U.S. proposal for a treaty guaranteeing American investments in India. The proposal envisaged arbitration to determine the quantum of compensation for American undertakings in the event of their nationalisation. Had this arrangement been accepted, it would have meant a powerful stimulus for the inflow of foreign capital. After all, foreign investors would naturally like to be assured that no unilateral decision on compensation would be taken by the Government in this country. It would have allayed possible fears lurking in the minds of potential investors that the Government in this country might fix an unduly low rate of compensation for foreign-owned properties which might be taken over by the State. It is true that Mr. Nehru has repeatedly given the assurance that reasonable compensation would be paid, and that, so far as foreign assets were concerned, there could be no question of their acquisition by the State without payment of compensation. These, as far as they go, ought to be reassuring to foreign investors. But such reassurances cannot possibly go very far. For, as Sir Kenneth B. Harper, Chairman of the Burmah Oil Company, Ltd., pointed out, in the course of his statement to the shareholders, the Government of India "have been as good as their word but Governments change." Indeed, this is a view which we have expressed often enough. Although the present Government could be relied upon to act in good faith, one cannot say that of its possible successors. This is the reason why the Government should be really chary of claiming powers which are open to grave abuse by succeeding Governments. To this category of powers belongs the recent amendment of the Constitution, which abolishes the citizens' right to take the question of compensation to the courts and vests the powers for deciding the issue in the legislature.

• • • •

Technically, the Government's rejection of the U.S. proposal for arbitration to decide compensation issue may be correct. For it would be too much to expect the Government to grant to foreign investors a right which is denied to the nationals of this country. Indeed, this is the ground on which the Government of India is reported to have rejected the proposal. But there is something to be said for the consideration that, since the inflow of foreign capital is to India's advantage, there is nothing inherently wrong about making special arrangements with a few foreign countries for deciding the issue of compensation. After all, the Government's intention is to be fair and just in payment of compensation. Why, then, need it fear arbitration? In this respect, Pakistan, as we pointed out last week (*vide* page 1063), has acted wisely in concluding such arrangements with the U.S. Incidentally, the fact that the Government has been compelled to reject arbitration proposal made by the U.S. on the ground that such facilities are not available to Indians shows that its prior denial of these facilities to Indians is itself wrong. The Government, in fact, ought to grant such facilities to Indian nationals, too, if it wants them to save and invest in concerns floated by the private sector.

• • • •

The stage is being set for the resumption of trading in the Alexandria futures market with effect from 1st August next. It would appear that the system of trading will be modelled on that in the Liverpool Cotton Exchange. If so, the market would incorporate the same safeguards as the Liverpool Cotton Exchange, especially in regard to exchange control, clearing system, security in contracts and measures to prevent undesirable speculation. The Alexandria market, it is stated, will have two contracts, long and medium-stapled contracts, based on Karnak and Ashmouni, respectively. Revealing this, the Egyptian Finance Minister, Mr. A. K. Kaisunny, is reported to have said that the Government, which would continue the existing arrangements to buy and sell cotton for the current season, had already disposed of some 4 million kantars out of the estimated crop of 7.7 million kantars. He also revealed that the Government was studying the question of straddling operations between Alexandria and Liverpool in readiness for the opening of the forward market.

• • • •

Although the Egyptian Government is thus contemplating the grant of facilities for straddling operations between the Alexandria cotton market and the Liverpool cotton market, the authorities in this country have turned down the request of Indian cotton and textile interests for facilities to participate in the Liverpool Cotton Exchange. The main ground on which it has been rejected is stated to be the danger of abuse of that facility for clandestine transfer of funds from India. This suggests that the Government has no faith in its own people. Apart from this fact, it may be noted that the problem is not peculiar to this country. In the U.K., the Bank of England has created the machinery of the "Market Executive" to keep a watch over transactions involving transfer of foreign exchange. Surely, it should be possible to set up similar machinery in India. Again, it must be remembered that an unscrupulous Indian trader could not possibly indulge in unauthorised transfer of funds without the assistance of his counterpart in the U.K. And it is extremely unlikely that the British trader would agree to such an arrangement when the detection of the crime involves a fine of £2,000 and also carries the risk of expulsion from the trade altogether. It remains to be seen whether the imminent reopening of the Alexandria market, the institution of facilities for straddling operations between Liverpool and Alexandria and the world-wide trend towards the restoration of free marketing facilities will induce the Government later on to review more favourably the question of linking Bombay's cotton trade with the British and Egyptian futures markets in cotton.

• • • •

The decline in foodgrain prices which, not very long ago, caused considerable concern to the Government and the agriculturists, appears to have been arrested. Most foodgrain markets report a steady trend. The Government's decision to appoint purchasing agents for purposes of buying wheat in the event of its price reaching the floor of Rs. 10 per maund has had a salutary effect. The agents have not had much work to do for the

EQUITIES RULE BETTER

SPURT IN SUGAR SHARES

(From Our Own Correspondents)

BOMBAY, *9th June*

AFTER remaining subdued during the early part of the week under review, the Stock Exchange displayed some steadiness, with modest gains spread over almost the entire list. The early quietness was attributed to the weakness of steels which encountered sizable liquidation. Support was utterly lacking and activity was much restricted. Subsequently, however, values forged ahead on replacement buying at low levels and consequent emergence of heavy short-covering. As the week progressed, there was a further improvement in sentiment. Press messages from the U.S. that the negotiations between the Directors of the Tata Iron and Steel Company and the Export-Import Bank and others for a loan to the Company for its expansion programme were proceeding satisfactorily restored confidence. Other helpful factors, such as reports of good offtake of cloth in the domestic market, anticipations of favourable results of sugar companies, particularly in the Deccan area, on account of expected bumper output for the current year, encouraging corporate news from some miscellaneous companies and higher advices from Calcutta were all cumulatively responsible for sustaining the sentiment till the close. Quotations though below the best were higher than those at the end of last week.

In the steel section, Tata Ordinaries were marked down early in the week from Rs. 228 to Rs. 225-12 on sizable liquidation. Later on, values gained ground to touch a high of Rs. 229-4 before profit-taking pruned top gains, on fears of heavy carry-forward charges in tomorrow's settlement, due to closing of transfer books, and the shares closed at Rs. 228. Indian Irons crept up from Rs. 32-11½ to Rs. 33-4, but finished at Rs. 33-1½.

Activity in the textiles section was highlighted by the smart rise in Bombay Dyeings on favourable rumours regarding rationalisation. After an early setback from Rs. 455 to Rs. 452-8, the shares jumped to Rs. 466-4; at the close they were done at Rs. 465. Kohinoors gathered strength from Rs. 312-4 to Rs. 317. Centurys moved up from Rs. 377-8 to Rs. 380-4, but the closing was lower at Rs. 378-8. Central Indias gained over the week Rs. 2 at Rs. 120, Gokaks Rs. 2½ at Rs. 214 and Indu Ordinaries As. 2½ to Rs. 10-11½. New Greats advanced by Rs. 2 to Rs. 172. Shree Niwas, however, lost Rs. 3-2 to Rs. 220. Simplex moved within very narrow range and gained a fraction to Rs. 154-8. Standards hardened by Rs. 6-4 to Rs. 360. Svadeshis picked up Rs. 6 to Rs. 193 and Tata Mills Rs. 4-4 to Rs. 50-8. Bradburys had business, Rs. 16-14 higher at Rs. 182-8, while Phœnix remained unchanged at Rs. 112-8.

Barring Central Banks, which were firm, bank shares ruled dull and quiet. Centrals gathered Re. 1-4 to Rs. 48-4 and their new shares Re. 1 to Rs. 49-8. Barodas declined by Re. 1-8 to Rs. 97-12. Bank of Indias were quietly steady at Rs. 146-4.

Insurance shares were steady, with New Indias returning to favour on encouraging results. The shares were in request and rose by Rs. 2-8 to Rs. 50. Orientals were done Rs. 10 higher at Rs. 7,110. Indian Mercantiles were picked up As. 4 better at Rs. 44-12. British India Generals gained an anna to Rs. 13-11.

Electricity shares presented a mixed pattern. Selective issues received moderate support and gained small ground. Ahmedabad Electrics continued to be in favour and rose by Re. 1-4 to Rs. 106-9 and their new shares Re. 1 to Rs. 52-4. Amalgamated Electrics were a fraction better at Rs. 10-14. Bombay Suburbans, after rising from Rs. 123-2 to Rs. 124-1, shed the earlier gain to close at Rs. 123-2, while their new shares shed As. 10 to Rs. 118-2. Surat Electrics disclosed no change at Rs. 134-6. Tata Hydros gained As. 8 to Rs. 142. Tata Powers were lower by Rs. 5 at Rs. 1,440 and their new shares by Rs. 10 at Rs. 1,130. Andhra Valleys eased from Rs. 1,380 to Rs. 1,362-8, before closing better at Rs. 1,366-4.

Activity in the miscellaneous section was marked by several outstanding features. Sugars, Bombay Burmahs and Indian Coppers were prominent among the counters which attracted a good deal of attention. In the sugar group, Belapurs spurted from Rs. 300 to Rs. 310, Walchandnagars by Rs. 8-2 to Rs. 208-2, and Phaltans Rs. 4-4 to Rs. 724-4. Bhopal Sugars put on an anna to Rs. 12-11. Cement shares were very steady, A.C.C. improving from Rs. 174-12 to Rs. 177 before closing at Rs. 176-4. Digvijays were quoted at Rs. 176 *ex-div.*, as against Rs. 182-4 *cum div.* (dividend: Rs. 8-8). Shipping and transport shares were unimpressive, though the undertone was fairly steady. Scindias moved between Rs. 14-7 and Rs. 14-13½ and closed at Rs. 14-11. Great Easterns were unchanged at Rs. 15-9. India Steamships were dull at Rs. 7-4. Hindustan Motors were done an anna better at Rs. 8-9. Engineering and mining shares shaped well. Alcocks gathered Re. 1-14 to Rs. 273-2. Premier Constructions moved up by Rs. 2-8 to Rs. 145. Larsen and Toubros added As. 2 to Rs. 13-6. Shivrajpurs gained Re. 1 to Rs. 66-8. Indian Coppers were in the limelight with a sharp jump from Rs. 3-10 to Rs. 4-6½, following the declaration of a higher dividend of 15 per cent. for 1954 (as against 10 per cent. for 1953) and a bonus of 10 per cent., and the enlistment of the shares in the forward list on the Calcutta Stock Exchange. B.B. Petrols looked up from Rs. 3-3 to Rs. 3-4½. Among miscellaneous industrials, Bombay Burmahs received speculative attention in expectation of higher dividend and rose from Rs. 456-4 to Rs. 471-14. National Rayons advanced from Rs. 239 to Rs. 214 but, on profit-taking, fell to Rs. 210-4.

• • • •

Calcutta Stock Exchange

CALCUTTA, *8th June*

Although trading on the Calcutta Stock Exchange continued on a cautious note, the recent decline in values of favourite counters induced some support, and prices registered fractional gains. The cut in export duty on tea and prospects of higher dividends of a number of jute and engineering companies contributed to the improvement. Reports that Mr. J. R. D. Tata, who is now negotiating a loan in Washington for the expansion of the Tata Iron and Steel Company, Ltd., may succeed in his efforts was also considered as a helpful factor. The volume of business done, however, remained restricted, as operators were generally not inclined to enter into fresh commitments owing to fears of higher taxes on industries for meeting the enlarged outlay on the second Five-year Plan.

A steadier trend was in evidence in jutes on expectations of better working results for the current accounting period, on account of decline in prices of raw jute, thanks to a bumper crop next season. Kinnisons spurted to Rs. 191 from Rs. 177, and Nationals recovered to Rs. 33-1 from Rs. 32-11. Champdanys at Rs. 161 were stronger by Rs. 6-8, Anglo-Indias being steady at Rs. 212. At Rs. 13-10 Agarparas received moderate attention, and at Rs. 14-11 Reliances were fractionally better. Megnas at Rs. 96 improved by Re. 1. Naihattis recovered to Rs. 116 from Rs. 111, Lawrences to Rs. 158 from Rs. 146, and Dalhousies to Rs. 144 from Rs. 137. Alliances were put through at the higher rate of Rs. 171 and Kamarhatties at Rs. 204. Howrahs were firm at Rs. 30-3.

The export drive that the Government is shortly to launch in an attempt to improve the country's foreign exchange position, it was felt, would improve working results of cotton mills. Accordingly, cotton mill shares evoked interest and values moved up a bit. Thus Elgin Mills were taken to Rs. 19-10 from Rs. 19-1. Dunbars were steady at Rs. 206 as were Bowreahs at Rs. 343. From Rs. 13-2 Kesorams rose to Rs. 13-7.

Coal shares were shown more than ordinary attention, and Burrakurs improved to Rs. 13-3 from Rs. 12-7. From Rs. 51, Khatra Jherriahs picked up to Rs. 54-11, while equitables at Rs. 29-10 were better by As. 4. Standards were raised to Rs. 18-6 from Rs. 17-12. Raneegunges came to business at Rs. 10-10 and East Indians at Rs. 28-7.

In the engineering section also, there were features. Texmacos, which will shortly be included in the forward list, were dealt with at Rs. 18-8 *cum. div.* and at Rs. 17-9 *ex-div.* Strong support was forthcoming to Richardson Cruddas which were taken to Rs. 18 from Rs. 17-10. Jessop & Cos., with which the Government has placed an order for more wagons, were steady at Rs. 36-8. Indian Irons opened at Rs. 32-12 and steadily rose to close today at Rs. 33-2. The higher level was well maintained. On the other hand, shares that gave way on profit-taking included Braithwaites at Rs. 24-4 and Burns at Rs. 267.

One of the strong features among miscellaneous industrials was provided in the steady rise to Rs. 4-8 from Rs. 3-10 in Indian Coppers following highly satisfactory working results enabling the directors to raise the dividend for the year ended December, 1954, to 15 per cent. and payment of a bonus of 10 per cent. Rohtas Industries, which are also likely to be included in the forward list, hardened to Rs. 25 from Rs. 23-9. Indian Cables improved from Rs. 26-12 to Rs. 27-13, and Metal Boxes from Rs. 20-13 to Rs. 21-1.

• • • •

Madras Stock Exchange

MADRAS, *8th June*

Cheerful conditions prevailed on the Madras Stock Exchange during the week under review. The operators were somewhat inclined to be optimistic, thanks to a number of favourable influences. Thus, reports of encouraging performance of several textile and planting companies hardened their sentiment. Textile scrips were specially in the limelight, owing to reports of good offtake of piecegoods in the domestic markets. Tea shares evoked good buying enquiries on news of revival of demand in tea auctions and expectation of still better sales in the coming weeks. Coffee shares also elicited support, induced by higher prices for coffee following the release of an additional quota of 200 tons for export. Miscellaneous company scrips, too, attracted buying enquiries. The sugar section was fully steady. There was, therefore, a broadening of activity in the market and equity values moved upwards, with popular counters recording sizable gains. The undertone of the market was firm.

In the textile section, Dhanalakshmis and Radhakrishnas rallied Rs. 7-8 each to Rs. 275 and Rs. 215, respectively. Coimbatore Cottons advanced by Rs. 5 to Rs. 280. Lakshmis gained a like amount to Rs. 154. Rajalakshmis spurted by Rs. 4 to Rs. 135, Buckinghams by Rs. 3-8 to Rs. 161 and Metturs by Rs. 2-8 to Rs. 362-8 *cum-div.* Rangavilas rose by a rupee to Rs. 72. Coimbatore Spinnings were better by As. 8 at Rs. 70-8. Cambodias were fully maintained at Rs. 12-2, Maduras at Rs. 45-6, and Vasantas at Rs. 213.

The volume of transactions in the planting section was quite considerable. Among tea shares, United Nilgiris picked up Rs. 6 to Rs. 287. Peermades were done Rs. 2 higher at Rs. 39. Peninsulars increased by Re. 1-6 to Rs. 17. Devasholas and Nonsuch Teas hardened by a rupee each to Rs. 26 *cum-div.* and Rs. 32-12, respectively. Parksides and Twyfords finished As. 12 higher, the former at Rs. 22, and the latter at Rs. 24-4. Coorg Teas improved by As. 7-6 to Rs. 8-10. Highland Produce were done at Rs. 15-6 *ex-div.*, as against Rs. 16-8 *cum-div.* Among rubber shares, Vaikundams were on special request and hardened by a rupee to Rs. 24-4. Rajagiri's were up by As. 13 at Rs. 17-7. Be Bes advanced by As. 11-6 to Rs. 8-6, Malankaras by As. 8 to Rs. 27-8, Kailas by As. 6 to Rs. 5-10, Cochin Malabars by As. 5-6 to Rs. 8 and Teekoys by As. 3 to Rs. 8-12. Among coffee shares, Consolidated Coffees rose by As. 5 to Rs. 19-5. Coffee Lands went up by As. 4 to Rs. 12-6. Shevaroys were higher by 18 pies at Re. 1-10.

In the miscellaneous section, F.A.C.T. attracted good buyers and changed hands As. 14 higher at Rs. 5-13. Andhra Cements moved up by As. 8 to Rs. 130-8 *ex-div.*

STOCK EXCHANGE REFORM

It was a pertinent and wholesome point that Mr. Chunilal B. Mehta, President of the Indian Stock Exchange Ltd., emphasised when he said, in the course of his speech at the annual meeting of the Exchange held in Bombay last week-end, that stock exchanges, under proper supervision and control, should be allowed to function freely on the lines of similar institutions in foreign countries. By doing so, the common man would, Mr. Mehta observed, be induced and encouraged to participate in fresh capital formation "which is a dire need of the country at present." In this connection, he commended the Securities Contracts (Regulation) Bill, 1954, as one which would open a new chapter in the history of stock exchange trading in India. In his opinion, the Bill was sufficiently comprehensive and was by far an improvement over the Bombay Securities Contracts Control Act, 1925, in that it contained several additional clauses which seemed necessary. Several clauses of the Bill had been framed on right lines on the basis of past experience and on lines of laws prevailing in other markets. In particular, Mr. Mehta welcomed four important features of the Bill, namely, (1) appointment of Government nominees on the governing body of stock exchanges, (2) enforcement of rules for adoption by stock exchanges, (3) licensing of dealers who are not members of any stock exchange, and (4) imposition of a limit on the life of a blank transfer by denying rights of dividend, bonus, etc., to non-registered shareholders.

Mr. Mehta would appear to feel that the future of the private sector in India is quite bright. He said that the Government fully appreciated that the future of private investments in India would depend on the confidence which the private sector enjoyed with the Government and the useful contribution which the sector made towards the objective of the plan. Indeed, he observed that the recent pronouncements of the Prime Minister were in "keeping with the spirit to foster and encourage the private sector and make it more effectively serve the national interests." It is true that Mr. Nehru's recent speeches are somewhat reassuring. Nevertheless, it is difficult to share Mr. Mehta's views that the Government fully appreciates the role of private enterprise. For, as we observed only two weeks ago in the course of an editorial on Mr. Nehru's views on socialism and nationalisation, there has, with singular exceptions, so far been no evidence that Mr. Nehru's lieutenants, at both the Central and State Government levels, have borne the basic policy in mind while framing and administering economic controls and fiscal measures. On the contrary, there are more curbs on the private sector today than a year before.

Notice

NEW INDIA INVESTMENT CORPORATION LIMITED

NOTICE IS HEREBY GIVEN THAT THE Eighteenth Ordinary General Meeting of the shareholders of New India Investment Corporation Ltd. will be held at the Registered office of the Company at 9, Brabourne Road, Calcutta, at 4 p.m. on Tuesday the 28th June, 1955, for the purpose of receiving the Directors' Report, passing the Audited Accounts for the year ended 31st December, 1954, declaring dividends recommended by the Directors, electing Directors, appointing Auditors and for transacting any other ordinary business of the Company.

The Share Transfer Register of the Company will be closed from 20th June to 28th June, 1955, both days inclusive.

By Order of the Board,

RAMDUTT RAMKISSENDASS,
Secretaries.

9, BRABOURNE ROAD,
CALCUTTA, *2nd June*, 1955.

(Please note that dividends will be posted to Registered shareholders and no claim will be entertained on shares held on blank transfer.)

NEWS IN BRIEF

THE Government of India has made a gift of 5,000 tons of rice to Cambodia to help that country tide over its rice deficit. The whole of this quantity will be delivered at Bombay, from where the Cambodian Government will arrange to have it transported to Cambodia.

A modern factory to manufacture baby food in India will shortly be set up by the Kaira District Milk Supply Association at Anand, near Bombay, at a cost of about Rs. 40 lakhs. This venture will receive assistance from F.A.O., W.H.O., and U.N.I.C.E.F.

The postponed trade talks between India and Pakistan are expected to be held in Karachi in the middle of July. The objects of the talks is probably to make a fresh trade agreement between the two countries. The present trade agreement between the two in respect of coal and jute is valid till August, 1956.

The Government of Madras has proposed to investigate the possibilities of organising co-operative farming societies of different types in the State. A special Deputy Registrar will undertake a tour of select districts of the State and also visit Bombay and U.P. to study the working of co-operative farming societies in these States.

Successful investigations carried out at the Central Glass and Ceramic Research Institute have rendered possible the production of artificial teeth from dental porcelain in India. The dental porcelain is made from washed china-clay, felspar, quartz and nepheline syenitex. The invention is expected to have good commercial prospects.

A proposal to construct a 7,000-mile long super-international roadway between the East and Europe has been put forward to the United Nations Organisation by Alliance International of Tourism, the parent body of all automobile associations. The Governments of all countries through which the road will pass have agreed to bear the cost of its construction within their respective boundaries.

The U.P. State Government proposes to open warehouses, attached to the co-operative seed stores, to store agricultural produce, so that farmers can have the bargaining capacity. Under this scheme, the Government will pay 60 to 70 per cent. of the market value of stored produce to the peasants and the balance will be paid after realisation. The scheme which was tried in Naini Tal District of the State is said to have been successful.

The Union Government has exempted red lead, white lead, zinc oxide and lead-zinc oxide from the whole of the excise duty leviable thereon under the Central Excise and Salt Act, provided the Collector of Central Excise is satisfied that such goods are intended for use in the manufacture of plates of electric storage batteries and the usual procedure is followed in the matter of obtaining remission of duty leviable on such goods.

Researches conducted by agricultural scientists in India have proved that all vines can be made to yield sweet grapes and that the sugar content can be raised from the normal low level of 9 bruggs to 25 bruggs by improved methods of cultivation. They have produced on an experimental basis a record yield of 30 tons of grapes per acre each time twice a year in the Bhari variety, in contrast to the normal yield of 3 to 6 tons per acre in one annual crop in other parts of the world.

The nineteenth annual session of the Indian Roads Congress will be held at Srinagar from 18th to 25th June, 1955. Besides discussion of papers relating to improvement of roads, there will be inspection of works and roads in the State, particularly of the Banihal Tunnel. A technical engineering exhibition, in which various engineering firms and public works departments of States are expected to participate, would be arranged at the time of the session.

The All-India Tobacco Employees' Federation, at its second annual conference held in Hyderabad last week, adopted a resolution opposing the employers' move to introduce rationalisation in the tobacco industry. It expressed itself against any form of rationalisation, including introduction of labour-saving devices, as such steps, it was feared, would result in retrenchment and closure of avenues of employment. It suggested, on the other hand, the setting up of additional units of production and sale and creation of more avenues of employment.

The question of developing the flax industry in Periyapatna taluk, Mysore, has been seriously taken up by the State Government. The task of developing the industry had been entrusted to a private company, but the progress does not appear to be satisfactory. The Government proposes, therefore, to examine, with the help of experts, the possibility of running the industry on an economic basis, should the Company fail to proceed with the scheme. Later on, the Government will consider the question of entrusting it to the private sector or undertake it itself. The Company, it is stated, has approached the Government with a request for the liberalisation of the conditions of its contract with the Government.

The West Coast-India-Pakistan-United States Shipping Conference and the India-Pakistan-Ceylon-Burma Outward Freight Conference, the two organisations which were to have levied a 35 per cent. surcharge on freight exported at Bombay and the freight imported at Bombay, Calcutta, and Madras, respectively, with effect from 1st June, have decided to defer the levy until 15th June. The decision to impose the surcharge was taken on account of the "delay in loading cargo at Bombay, Calcutta and Madras." The Conferences deferred the levy at the request of Indian officials at the Indian Consulate in New York. Other Conference lines participating in India's foreign trade have also done so.

The Mysore Government has decided to call for information from the public in regard to decentralisation of industries in the State, so as to make the people feel that they had a hand in the shaping of the Government industrial policy. The proposals from the public will be examined by the Industries Department and its experts and such of them as are feasible will be included in the second Five-year Plan. The information to be asked for from the public are: (1) possibilities of development of industries, small, medium and big; (2) raw materials for such industries available in their area; (3) whether the private sector would undertake it and, if so, what help they expected from the Government and, if it was by the public sector, what help the people proposed to give the Government.

The Integral Coach Factory at Perambur will commence production early in October next. The factory is expected to go into full production by 1960 with an annual output of 350 coaches. It is expected to assemble 20 coaches in the first year, 100 in the second, 200 in the third and 300 in the fourth, beginning from October this year. In the first year, apart from assembly work, the factory will start manufacture of parts and components for attaining the target of 100 coaches in the second year. By the time the final target is reached the parts and components will all be almost indigenous. With the attainment of full production, there will be a saving of the foreign exchange to the tune of about Rs. 4 to Rs. 5 crores per annum. When completed, the factory, costing over Rs. 7.3 crores, will be the largest in Asia and one of the largest in the world, providing employment to over 4,000 workers.

From Abroad

The U.S. consumption of petroleum products is expected to reach about 9.1 million barrels per day by 1959, as compared with the present rate of 7.7 million barrels a day.

An international wool textile research conference will be held in Australia from 22nd August to 9th September this year to discuss techniques and recent developments in the wool textile industry.

The Government of Japan signed on the 7th inst. the protocol of terms of accession to the General Agreement on Tariffs and Trade after conducting negotiations with seventeen countries for a period of nine weeks.

The Norwegian Government proposes to ask Parliament to approve proposals for raising the maximum dividend payable by companies on shares from 5 to 6 per cent. The Government proposes that the new maximum dividend rate should be effective from 1st July, 1955.

Over 500 delegates from 35 nations are participating in the two-week long Congress of International Standardisation Organisation (I.S.O.) which opened in Stockholm on the 6th inst. This is the third general assembly of the nine-year-old I.S.O., the two previous ones have been held in Paris and New York.

Australia has accepted the revised G.A.T.T. which Britain has also approved. Though Australia does not like G.A.T.T., it does not wish to withdraw from it, as it will mean "introducing unknown and unpredictable factors" in its relations with nations with which it conducts most of its trade.

The Norwegian Government is considering ways of reducing domestic paper consumption so as to meet the heavy demand for paper abroad. Consumption of paper and cardboard in Norway has more than doubled since before the war—210,000 tons in May, 1954, as compared with less than 100,000 tons in 1939.

A two-day conference of 100 representatives of the U.K., Pakistan and Indian shipping conference lines began in London on the 7th inst. to discuss the future of freight rates to and from the Indian continent. The main agenda of the meeting was the earlier proposal to raise the freight rates by 35 per cent. to cover the "additional expenses incidental to shipping delays in Indian ports."

The Swedish Match Company reports that the decline in match exports which was noticeable in 1952 and 1953 continued in 1954, when the volume of exports dropped by 8 per cent., while prices remained fairly stable. The decrease is attributable to both competition from other exporters and import restrictions, and also to the establishment of local match factories in different countries.

The Canadian Government is likely to approve of a scheme of subsidy to the Canadian deep-sea merchant fleet before the end of this year. The subsidy may be in the form of a flat sum per annum for the operation of each modern and efficient ship on the Canadian registry. The subsidy may not be given to more than 30 or 35 ships and the cost may be about $3 million per annum. The Government is also not likely to require the ships to be built in Canada.

A new Constellation service will be introduced by the B.O.A.C. between London and Singapore on the 16th June. The service, operating once weekly in each direction, will be 15 per cent. faster than previous schedules, including stops at Frankfurt, Damascus, Basra, Karachi, Delhi and Bangkok. Under this service, Delhi to Bangkok will be one big hop. The B.O.A.C. Constellations will provide first class service only. They will leave Delhi for Singapore on Thursdays and for London on Fridays.

The Oslo City Council has agreed to the proposals for raising old age pensions, whereby single persons from 1st July will receive £145 a year and couples £234 a year. Minimum old age pensions are laid down by Parliament, but local authorities can supplement these in their own districts. In Oslo, old age pensions are the highest in Norway. The minimum old age pensions laid down by Parliament in April and applicable from 1st July this year are £84 for single persons and £126 for couples.

The Pan American World Airways has decided to go ahead with its plan to reduce transatlantic air cargo rates by an average of 30 per cent. with effect from 1st July. The plan was approved by the International Air Transport Association last March. Under the new rate structure, reductions on some commodities will be as much as 47 per cent. in monetary terms. In addition, the airline is reducing the hundreds of specific cargo categories between the U.S., Europe and the Middle East to only 32 categories.

Under a project agreement signed between Pakistan and the U.S., the latter has agreed to make available during the calendar year 1955, a sum of Rs. 24 lakhs ($725,000) to the Pakistan International Airlines Corporation for launching a broad training programme for P.I.A.C. personnel. The P.I.A.C. will contribute about Rs. 4 lakhs ($121,212). The U.S. assistance forms part of the overall plan envisaging a total expenditure of Rs. 83 lakhs ($2.5 million) by the U.S. over the three-year period. The assistance is provided under the Foreign Specification Administration's aid programme.

PERSONAL

MR. Jawaharlal Nehru, Prime Minister of India, left for Prague on the 5th inst., *en route* to Moscow on a goodwill tour of Russia, Eastern Europe and the Middle East.

Mr. R. S. Mani, I.C.S., at present Joint Secretary, Union Ministry of External Affairs, has been appointed Ambassador of India to Iraq.

Mr. M. D. Bhatt, I.C.S., until recently Chairman of the Tariff Commission, has been appointed Chairman of the Film Censor Board.

Mr. Said Hasan, Secretary, Pakistan's Ministry of Economic Affairs, has been elected Chairman of the U.N. Technical Assistance Committee for the year 1955-56.

Dr. John Matthai, Vice-Chancellor, University of Bombay and former Finance Minister of India, has been appointed Chairman of the State Bank of India. Mr. Valkunth Lal Mehta, former Minister for Finance, Bombay, has been appointed Vice-Chairman of the Bank.

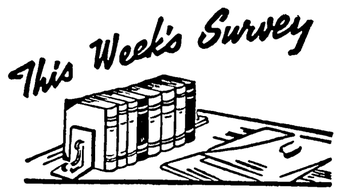
"COMMERCE" 1930

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *14th June*

World's Gold Output

The estimated gold production of the world during the last few years has shown but a comparatively small increase. This slow rate of progression, which amounts to an average of £500,000 per annum, is the more regrettable in view of the present abnormal economic position of the world. It has been estimated that in 1924 gold production totalled £81,000,000, against £83,500,000 for 1929. Of this total, the British Empire was responsible last year for 71.4 per cent., according to a calculation made by Mr. Joseph Kitchin, Assistant Managing Director of the Union Corporation, Limited, whereas in 1924 the British proportion was 69.1 per cent. The only countries which appeared to be making a substantial contribution to the world's increase during the last few years are the Transvaal and the Dominion of Canada, and more particularly the Province of Ontario. West Africa is slowly expanding its gold output and the time should not be far distant when Australia should regain some of the ground lost in past years. In view of the world's present needs, surely further production of the precious metal is of paramount importance. Here is a metal, unlike tin, copper, lead and zinc, where no untoward consequences will follow overproduction. Hence, all the more reason why prospecting for gold should be uppermost in the thought of mining engineers.



AGRICULTURAL CROPS

INDIA'S agricultural sector has not lagged behind the industrial in its contribution to the improvement in national economy. Rather, it can show an even brighter record than industry. It is true that it owes much of its progress to the past two good monsoons. Even so, credit is due to India's agricultural administration no less than to this country's sturdy peasantry that, both in extending the land under cultivation and in adopting superior cultural practices, they have displayed commendable enthusiasm. The *Krishi Pandits*, indeed, deserve special praise, for, by their untiring labour, they have established new record yields for many agricultural crops. The result is that, in not a few commodities—rice, for instance—India is not merely self-sufficient, in contrast to its state of deplorable dependence on imports only a few years ago, but in the happy position of possessing a surplus even for export.

At a recent Press Conference in New Delhi early this week, the Union Minister for Agriculture, Dr. Punjabrao Deshmukh, reviewed briefly the impressive record of India's progress on the agricultural front. The story is well worth telling. And Dr. Deshmukh told it well indeed, though he carefully refrained from adorning it. Among India's foodcrops, wheat has recorded, as compared with last year, a 12 per cent. rise in output to 7.9 million tons in 1954-55, the target for 1955-56 being 8.1 million tons. Between 1953-54 and 1954-55, rice output, however, fell from 27.2 million tons to 24.2 million tons. But this is mainly due to the decline in area from 77.0 million acres to 74.4 million acres. The target for 1955-56 for rice is 27.2 million tons on 80 million acres. The Japanese method of paddy cultivation, which was adopted in 1953 on 400,100 acres, resulted in an additional production of 197,000 tons of paddy at the rate of 13.35 maunds per acre. In 1954, about 1.2 million acres were brought under this method of cultivation. About 75,000 demonstration plots were laid on the Government farms and on cultivators' fields. The success of this method provided an incentive for extending it to other crops like *jowar*, *bajra*, wheat and cotton. Specific campaigns for increasing production of coconut and arecanut have been initiated. The output of groundnut has already recorded a rise. In 1954-55, it was 3,823,000 tons from an area of 12.6 million acres, as against 3,573,000 tons from an area of 10.8 million acres in 1953-54.

The record of sugarcane crop and sugar output has been even more encouraging. The production of sugarcane this year was 56 million tons, as against 46 million tons last year. The per-acre yield has gone up by 20 per cent. The output of sugarcane, as Dr. Deshmukh pointed out, would have been still higher but for the damage caused by floods in Bihar and East U.P. While the normal development work carried on in factory areas was there, much of the "revolutionary" progress was attributable to the drive for larger output launched last year for intensive manuring of sugarcane crop during the monsoon period. The campaign is being repeated this year and is intended to cover 0.7 million acres. Although sugarcane acreage is likely to remain the same as last year, namely, 3.6 million, the yield is expected to go up by 20 per cent. to 60 million tons. The target set for sugarcane under the first Plan would thus be reached. If this progress were maintained, it might not be difficult to reach the target of 77 million tons, provisionally set for the second Plan.

The output of sugar in the current (1954-55) season is expected to establish a record this year. The industry is likely to produce about 1.6 million tons, the largest ever produced in India; the previous record was 1.5 million tons registered in 1951-52. Already, that is, up to 31st May, India has produced 1,567,000 tons, that is, about 600,000 tons or 60 per cent. more than last year. This, together with imports, is expected to result in a large surplus of 800,000 tons by end of the sugar year, that is, the year ending 31st October next. Dr. Deshmukh revealed that two more sugar factories would go into production next year, each with a productive capacity varying from 800 to 1,000 tons per day. The target set for sugar under the first Plan (about 1.50 million tons) is thus being exceeded. If this rate were maintained it should not be difficult to reach the combined target of 6.7 million tons for sugar, *gur* and *khandsari* set under the second Plan.

CEMENT INDUSTRY

Among Indian industries, the cement industry has established a record of which any industry could be proud. In the immediate post-Partition year, the output was no more than 1.6 million tons. It is now over 4.35 million tons. Creditable as this record undoubtedly is, the industry will be called upon to make further progress in the next few years, for the provisional target set for it in the second Five-year Plan is 10 million tons. Mr. G. D. Somani, one of the leading spokesmen of the industry, is convinced that the target is not beyond the reach of the cement industry. At the annual meeting of the Shree Digvijay Cement Company, Ltd., held this week, Mr. Somani averred that the industry is "capable of achieving this ambitious target."

Only, he rightly emphasised that the Government, on its part, should realise the "imperative need for allowing the industry to plough back adequate resources required for expansion of its productive capacity." Citing the example of the steel industry which had been granted an increase in prices in order to help it build funds for expansion purposes, Mr. Somani expressed the hope that similar facilities would be made available to the cement industry too. This seems a perfectly valid request. After all, if the Government chooses to control the fortunes of an industry through regulation on the prices of its products, it is certainly reasonable that the Government should also bear a certain share of the responsibility for the expansion of that industry.

Finance is, however, only one aspect of the problem of reaching the target for cement output. There are certain physical handicaps, of which the lack of prompt and adequate supply of transport facilities is the most irksome. The economics of cement production demands that the raw materials of the industry, including fuel, coal, should reach the site of the cement factory regularly and that the finished products are transported equally regularly. Transport is thus particularly vital to the economic operation of a cement factory. And recent experience of industries has been that the railways are unequal to the task of efficient, speedy and prompt transport. The Digvijay Cement has had more than its share of transport difficulties. Despite some improvement in the situation during recent months, the factory, it would appear, has to operate under transport conditions that are "far from satisfactory." If this is the position now, it should be much more difficult in the near future when the management implements its plans for doubling the output.

Yet another handicap for this factory is that, while the recent relief in freight granted for long-distance traffic avails it little since it has to market its products in its own neighbourhood, the increase in freight on short-distance (150 to 300 miles) traffic involves an additional burden. It is to be hoped that this problem will receive the attention of the authorities. In this connection, Mr. Somani welcomed the decision of the Railway Minister to appoint a committee to examine the present freight structure. As regards the wider problem of providing more adequate transport facilities for industries, it is becoming increasingly clear that it cannot be solved, unless the Government implements a bold and imaginative policy for expansion of railway transport.

EXCISE ON POWERLOOMS

Much anxiety is expressed by owners of cotton powerlooms with regard to the future prospects for their industry, following the imposition, with effect from 18th May, 1955, of an excise duty on weaving units having more than four looms, in addition to that imposed on composite units. The incidence of the duty is considered to be unduly heavy—Rs. 18 per shift per loom on looms exceeding four but not nine, Rs. 20 in respect of looms exceeding nine but not 24, and Rs. 22-8 on looms exceeding 24. In fact, there have been reports that several powerlooms have already curtailed production and some have even closed down, since they are unable to bear the incidence of the duty. In the State of Mysore alone, for instance, nearly 800 powerlooms out of the 2,471 in existence, it is stated, have closed down completely. Vigorous representations have accordingly been made by powerloom owners all over India to the Union Government urging the latter to withdraw the excise levy. The Government of Mysore also is believed to have decided to recommend to the Centre at least to raise the exemption limit for purposes of excise levy from 4 to 24 looms, as in the case of silk powerlooms.

The plea for the revision of excise duty on the powerloom sector of the cotton textile industry seems to be justified. For the powerloom sector (having more than five looms) does not enjoy, unlike the handloom sector, any special treatment in the form of reservation of production, exemption of octroi duty and the like. Nor are they in a position to compete with composite mills, thanks to the smallness of their size, lack of marketing facilities, inadequate capital and high cost of production. That there is no exaggeration in this statement will be evident from the following extract of the Textile Enquiry Committee's report:

"The larger powerloom units often come under the provisions of the Factory Act and, in some cases, as, for example, Ichalkaranji, are subject to even a statutory minimum wage. Despite these handicaps, whereby the non-domestic powerloom units are placed on the same or similar footing as the organised large-scale industry, there is still a predominance of units having between 6 and 20 looms. On this scale of operation, the benefits of large-scale organisation are not available to these units. For instance, the preparatory processes of winding, warping and sizing are still done in the case of these units, which might be called medium-sized, on near-primitive equipment at a very much higher cost, both in wages and in efficiency, than would be the case in the larger unit with, say, 50 looms or more. These medium-sized units, obviously, have to concentrate on the production of varieties which do not need elaborate finishing or they would have to sell their product at a lower price than they would get, if the product were properly finished. In the alternative, these units would have to depend on outside agencies at considerable expense for the finishing of their product for sale."

Drawing attention to all these aspects, the powerloom owners point out that their production costs are higher than those of the mills. The average cost of manufacturing one yard of *dhoti* (80s warp, 60s weft, 64 reeds, 50 picks and 50" width) is estimated at Re. 1-3-4, as against Re. 1-3-1 for composite mills (and Re. 1-4-9 for duty-free handlooms). In view of all this, it is feared that the excise levy will ultimately spell the ruin of powerlooms. Next to composite mills, the powerlooms are capable of playing a vital and efficient role in the country's textile economy. It is bad enough that composite mills should be prevented from expanding their capacity. But it is worse that the powerlooms should be made to bear a burden that allows them no choice but to close down.

CAPITAL ISSUES

During the 10 months from April 1954 to January 1955, 988 companies with a total authorised capital of Rs. 192 crores, were registered in India, as compared with 984 companies with a total authorised capital of Rs. 39 crores during 1953-54. The largest single company floated during 1954-55 was the Industrial Credit and Investment Corporation of India, with its authorised capital of Rs. 25 crores.

The net increase in the paid-up capital of companies during the 10 months, under reference was Rs. 37.91 crores, as compared with Rs. 23.25 crores in the preceding year.

While, on the one hand, there is an increase in the number of limited companies, as many as 426 companies with a paid-up capital of Rs. 3.52 crores went into liquidation in the past fiscal year, as compared with the 452 with a paid-up capital of Rs. 2.35 crores in 1953-54.

AMERICAN LETTER

ROBUST OPTIMISM ABOUT FUTURE

SIGNIFICANCE OF THE DEMAND FOR GUARANTEED WAGE

From Our Special Correspondent

NEW YORK, *3rd June*

THE business outlook for the rest of the year is still excellent. Leading banks and economists predict that 1955 may turn out to be the best year in American business history. These suggestions are based on high personal income, greater corporate profits, steady savings which provide the wherewithal of capital expansion, better dividends and confidence in the future.

Even the tension between the East and the West shows signs of dissolving. Russia's apparent willingness to consider a four-power conference has given a big lift to business and financial psychology, although it still remains to be seen if the Kremlin goes through with these plans and if anything is going to be accomplished in the end. The optimists in America seem to see a better than 50-50 chance in this respect. Some recent events support this belief.

Germany became sovereign and a full-fledged member of the North Atlantic Treaty Organisation and Moscow did not do very much about it. The Kremlin is now courting Marshal Tito of Yugoslavia, its former enemy, and both political and trade negotiations are under way. It adds to the general impression that enmity rather than hostility is the byword of the Soviets these days. The turbulent Far Eastern situation has quietened down as well, although Indo-China and Formosa still remain question marks.

Domestic and foreign business is doing better every day under these conditions. Operations in the steel industry have reached 97 per cent. of capacity, for example. Automobile output and sales have likewise been at record levels.

Guaranteed Wage

Under such favourable conditions, it is very difficult to see what could be gained in the long run by either the unions or by management in forcing the annual guaranteed wage issue to a point where a really prolonged strike may ensue. The same question will be faced later this year by the steel industry and auto and steel are, of course, interrelated.

At stake are millions of individuals' pocket books, corporate earnings and dividends and, indeed, the overall economic health of the nation. All indications are that both sides in the annual guaranteed wage controversy are fully aware of the implications.

The guaranteed wage is a national challenge. There are those who insist that it would wreck business and industry since nobody can guarantee the future or consumer buying habits on which production depends.

On the other side are those who say that a semblance of a guaranteed wage in whatever diluted form may add stability to the American economy, just as Federal Deposit Insurance of bank deposits, old age pensions as well as corporation retirement plans have created some sense of security, besides assuring the means of paying rents, grocery bills and insurance policies. In a wider sense, the so-called guaranteed annual wage, apparently, would be an adaptation for the blue collar worker of the less formalised arrangements in the white collar industries where a guaranteed annual wage has been a near reality for several years.

The stock market has reflected the stability of the U.S. economy. Speculative excesses seem to have diminished and price changes have been relatively moderate, but on the firm side. The market is supported by excellent earnings and dividends by corporations and by very good prospects, unless prolonged strikes may mar the outlook.

Monetary Policy

Monetary policy here and abroad has contributed a good deal to this overall stability. It has endeavoured to anticipate economic development. Sometimes this has been very successful. In fact, in the last 18 months, it has been quite successful, although misjudgment, because of lagging information, cannot be ruled out.

The victory of the British Conservative Party in its decisiveness brings up the question of convertibility of currencies. It was generally held that the Churchill-Eden Government was unwilling to move in this direction before the general elections showed the temper of the people. Many European countries are anxious to go ahead in steps toward greater convertibility and there may be some indications in the near future that Whitehall intends to act.

Loan to Italy

The International Bank for Reconstruction and Development has authorised a $70 million loan to Italy for development of the poverty-stricken south of the country. The loan is unusual in that it is designed to furnish the major part of the money in lira and other currencies and only a small part in dollars. The Bank of America, San Francisco, is participating in the deal to the extent of $5 million. The loan was authorised for various projects which had been investigated beforehand by the World Bank because of the limited amount of capital accumulation in Italy.

Another loan was made to Spain by a group of New York banks and the World Commerce Corporation for $30 million to stabilise the Peseta and get that country back on a more efficient operating basis.

In most of these transactions and in the thinking behind it, American banking has taken a decisive lead and support, backed by the far-sighted policy that a healthy economy, in whatever part of the world, is an antidote to Communism.

All this emphasises the relative status of well-being and health in the U.S. and the confidence which is held for the future. Even the pessimists concede there is very little to worry about.—*All Rights Reserved.*

AGREEMENT WITH FORD WORKERS

The C.I.O. United Auto Workers Union (U.A.W.) and the Ford Motor Company reached on the 7th inst., agreement on a new three-year contract containing a company guarantee of pay for periods workers are laid off.

The contract also grants the workers higher pay, higher pensions and better hospitalisation insurance. It was expected to bring an immediate end to a strike of 70,000 of Ford's 140,500 employees.

The U.A.W. President, Mr. Walter Reuther, said the agreement is "one of the most historic and largest contracts" ever negotiated by the U.A.W. and noted that it "marks the first time in the history of the industry that a company ever has taken steps to protect laid off workers from the industry's seasonal layoffs by supplementing their unemployment compensation with company paid benefits." Mr. Reuther said the contract contains the principle of the Guaranteed Annual Wage. The Company official, Mr. John S. Bugas, called the supplemental benefit plan an "important road to improved security of our employees." The contract grants workers a package increase amounting to 20 cents an hour. The automobile industry worker in the U.S. earns an average of about $2.10 an hour.

New HAS A NEW MEANING IN THE
PLYMOUTH '55
The car with the Forward Look

There is nothing like it. There has never been anything like it. Your 1955 Plymouth has undergone a complete change in its appearance and performance.

It's long, low and elegant—at least 10 inches longer front to back, at least 2 inches lower—to give the look you have always wanted in your car. The 1955 Plymouth's new FORWARD LOOK makes it appear it is in motion even when it is standing still.

And then the swept-back, wrap around "new horizon" windshield—you'll be amazed at the wide, wide view it gives of the road. *For the tubeless tyres, fitted to your new Plymouth as standard equipment, you pay no extra charge.*

Seeing is believing. Go see the unbelievably new 1955 Plymouth at your dealer's.

DIRECTIVE TO STATE GOVERNMENTS

MORE TAXES INEVITABLE IF SECOND PLAN IS TO SUCCEED

From A Special Correspondent

NEW DELHI, *7th June*

THE Planning Commission is now busy collecting comprehensive data before finalising the draft of the second Plan. Since finance happens to be the crux of the whole Plan, the Commission has sent a circular to the Chief Ministers of States to undertake a review of the recommendations of the Taxation Enquiry Commission on the States' and local finances and send memoranda, showing the possibilities of raising additional resources for financing the second Five-year Plan. It has also asked the Chief Ministers to make suggestions for augmentation of Central revenues, as also for the intensification of savings, including schemes for compulsory savings, if necessary.

DELHI LETTER

The plan-frame of the second Plan is being estimated at Rs. 5,600 crores being made up of Rs. 3,400 crores for the public sector and Rs. 2,200 crores for the private sector. This sum excludes Rs. 900 crores being the cost of carry-over of many of the schemes that are now being implemented and which will be completed during the early part of the second Plan. It is assumed that the public sectors outlay on the Plan will increase from Rs. 600 crores or so in 1955-56 (the latest estimated figure according to the Vice-Chairman, Mr. V. T. Krishnamachari, is Rs. 710 crores) to Rs. 1,100 crores in 1960-61, that is, by about 80 per cent., in order to make up a total of Rs. 4,300 crores over the Plan period.

Prof. Mahalanobis has estimated the total Government expenditure for the second Plan at Rs. 8,800 crores, which is split thus: development expenditure under the Plan Rs. 4,300 crores; development expenditure outside the Plan Rs. 1,100 crores; and non-development expenditure (defence and civil administration) Rs. 3,400 crores. The question is how a total Government outlay of Rs. 8,800 crores (Rs. 4,500 crores outside the Plan and Rs. 4,300 crores within the Plan) is to be financed. Assuming that the Government takes some 8.5 per cent. of national income in taxes and in non-tax revenue as has been the case on an average over the past four or five years (7 per cent. in taxes and about 1.5 per cent. in non-tax revenue), the total revenue receipts would amount to about Rs. 5,200 crores. Borrowing from the public may possibly yield (net) another Rs. 1,000 crores (about Rs. 600 crores from loans and Rs. 400 crores from small savings). Contribution from railways may be put at Rs. 200 crores over five years. The budgetary position of the Government over the second Plan will, therefore, reveal a deficit of Rs. 2,400 crores. A credit of Rs. 400 crores has been taken for foreign assistance, excluding Rs. 100 crores of foreign assistance envisaged for the private sector.

Of the remaining gap of Rs. 2,000 crores, it is assumed that created money can be resorted to to the extent of Rs. 1,000 to Rs. 1,200 crores by the Government. Allowance can also be made for credit creation by banks for the needs of the private sector, say, Rs. 400 crores or so, bringing total credit creation to Rs. 1,400 to Rs. 1,600 crores. A part of this credit would be withdrawn from the system as the accumulated sterling balances are used up, say, to the extent of Rs. 150 crores. Even then, the total money supply in the economy might increase by about Rs. 1,300 crores during the second Plan. It is suggested that a large money supply in this country will be needed as the monetised sector expands relatively to the non-monetised sector. Even then, with a 25 to 27 per cent. increase in national income, an increase in money sipply by some Rs. 1,300 crores on a base of some Rs. 2,000 crores is regarded as a sort of outside limit, as the maximum limit to which it can be carried.

The planners are, therefore, of the opinion that deficit financing by Government must be restricted to some Rs. 1,000 to Rs. 1,200 crores and that efforts should be made to raise at least Rs. 800 crores by higher taxation or compulsory borrowings or through increased profit on Government enterprises. In fact, a combination of all these will be called for. In this connection, the pamphlet on the *Second Five Year Plan—A Tentative Framework*, observes: "If additional Government profits are to be raised, it might be necessary for the State to enter into the field of trading or production of consumer goods. The scope for such expansion of State activity into profit-making ventures will have to be carefully examined. Alternatively, taxation in the country will have to be raised from 7 per cent. of national income to 9 or 10 per cent. of national income by 1960-61. An increase in taxation from 7 to 9 per cent. or even 10 per cent. of national income cannot be regarded as excessive if our aim is to have a bolder plan which requires an increase in the savings of the community from 6 to 10 per cent. of national income. But it should be borne in mind that some tax adjustments will be necessary even to maintain the existing level of tax receipts at 7 per cent. of national income."

It may, therefore, be taken for granted that both the Central and State Governments will embark on additional taxation in order to finance the second Five-year Plan. What forms this additional tax burden will take will be decided in the coming months. So far as the Centre is concerned, there is restricted scope for raising additional taxation. In the sphere of direct taxation, income-tax, super-tax, surcharges, etc., are sufficiently high and steep, so that they cannot be increased further. The customs revenue is not likely to increase substantially, in view of the fact that most of the imported manufactured goods will be gradually replaced by indigenous manufactured goods. The only scope for the Centre is the imposition of more excise duties, although the higher level of industrial production will augment the total yield of income and corporation taxes to a sizable extent. In the case of Central excise duties, Government cannot go on expanding the sphere and range without first creating conditions conducive to increased consumption of indigenous manufactured goods within the country. That the Central Government had to retrace its steps by reducing or even abolishing some of the new imposts in this sphere during the latest budget session goes to prove that it has to adopt a cautious and go-slow policy in the coming years. In other words, it has recognised the principle that the imposition of new excise duties should not retard the consumption of products on which the duties are levied.

In these circumstances, it is the State Governments that have to bear the brunt of raising increased taxation in the coming years for purposes of financing the second Five-year Plan. During the first Plan period, the record of the States in this respect is not satisfactory. It will be recalled that, under the first Plan, the States were required to raise Rs. 232 crores by way of additional taxation—and some economies in non-development expenditure. In the first three years, the estimated yield from additional taxation worked out to Rs. 29 crores. About two-thirds of this amount was raised by five States, namely, Bombay, U.P., Madras, Madhya Bharat and Travancore-Cochin. For 1954-55, the yield from additional taxes imposed in the preceding three years and the new ones added in that year was placed at about Rs. 27 crores. For 1955-56 a sum of Rs. 30 crores may be estimated in this connection, the total being Rs. 86 crores for the Five-year period. It may be mentioned that the transfer of some Rs. 80 crores over the Plan period from the Centre to the States has correspondingly relieved the States of raising the amount of funds on their own. In addition, the loan receipts of States are expected to bring in about Rs. 50 crores more than the total envisaged in the Plan and, in consequence, the financing of the Plan by the States has not been difficult, especially during the later stages of the Plan period.

During the past one or two years, some State Governments have, of course, been making efforts to broadbase their tax structure. In their budgets for 1953-56, a number of States introduced many new taxes. Madras, for instance, proposed a surcharge of two annas in a rupee on land revenue, while Mysore announced the introduction of agricultural income-tax on plantations and some lucrative commercial crops. P.E.P.S.U. proposed a tax on passengers and goods carried on road in motor vehicles, higher sales tax on luxury goods and a betterment tax on urban lands. Himachel Pradesh announced a few new taxes such as a single point sales tax, betterment levy on irrigated lands, road cess, etc. A notable feature in regard to the imposition of new taxes has been the recognition by many States that people who benefit from development schemes should pay back to the State a part of that benefit by way of taxes and services. States like Orissa, Hyderabad, Travancore-Cochin introduced betterment taxes. Hyderabad also imposed a development cess and lowered the agricultural income-tax exemption limit.

TRADE UNIONS AT WAR

HOW LONG WILL IT LAST?

From Our Own Correspondent

LONDON, *4th June*

SO the dreaded rail-strike has come at last and, if the temper of the strikers is anything to go by, they could stay out for the six weeks their financial reserves are estimated to last. But the trade union movement as a whole is too conscious of the way it is being called into question by the community to accept the inevitability of a long-drawn-out battle. The dockers, striking 20,000 strong in seven ports, are joined by a majority of the engine drivers and firemen in the second great inter-union war of this year. The Trades Unions Congress is desperately trying to make the four unions see sense—but, in each case, the smaller union will not give way on its principles. In the docks, the issue is the right of a new union of dockers and stevedores to contract with the port employers, resisted by the older Transport and General Workers' Union. On the railways, the issue is the right of the skilled drivers and firemen to negotiate higher rates of pay with the employers, resisted by the National Union of Railwaymen which maintains that both Unions must negotiate together. The employers are helpless—if they concede higher pay to the skilled men, the N.U.R. will demand increases for all their members and if these are not granted they will strike. So one Union or the other will strike anyway (as in the docks) and the entire economy of the country will suffer grievous injury.

LONDON LETTER

Your Correspondent has just visited the great industrial regions of Tyneside and the Clyde to judge just what that injury is amounting to. In the first place, the strike is not complete since a proportion of the drivers do not belong to the striking union. The milk trains and the mails and a skeleton passenger and goods service is maintained. The most obvious impact of the strike has been on the daily passenger traffic in and out of the big cities, notably, London. Around London, every available vehicle has been pressed into service and a fearful congestion caused in the City. Elsewhere, the position is not so difficult as people live near their work. On Tyneside, a high proportion of the drivers are working and there has been very litle dislocation. In Scotland, few trains are running but the local passenger services in the Glasgow area are less affected.

But it is in the impact on the heavy industries that the seriousness of the strike is gradually making itself felt. First—coal: nearly four million tons move every week, and move by rail. The stoppage of this movement is congesting the mines and they are just starting to cut down production. The gas, electricity, iron and steel and engineering industries carry from three to four weeks' stocks of fuel and they will not be affected from this cause for some time. But the iron and steel industry moves its bulk production by rail, and, without transport, congestion at the works will also force a halt. At some plants in the Glasgow region, workers are being laid off already and, after the end of this week, the position will be generally serious.

Tyneside and the Clyde are the chief shipbuilding areas and the shipyards are already feeling the shortage of steel deliveries. It is generally expected that shipyard work will slow down substantially within a week, by which time many yards will close altogether except for minor repairs where material can be brought by road. Engineering, building and other steel-using industries are going to find themselves in a similar plight.

The Government have, ever since the strike threat earlier this year, been prepared with the necessary legislation—now put into force—giving them emergency powers to maintain essential supplies and services. Food supplies will be maintained, but more than powers will be necessary if the heavy industries are to be kept moving. Nothing short of the use of troops to run the trains will serve and that would be regarded as strike breaking. The Government might be incurring a risk of having the N.U.R. strike against the use of troops! Yet it will be salutary to have this *reductio ad absurdum* brought to the notice of the unions. Are the latter to say that, because *they* (the unions) cannot agree either about pay differentials or about the conduct of pay negotiations, that workers in all sorts of other industries are to be made idle, that the national economy is to be brought to a standstill? Clearly this inter-union war cannot be carried so far—but can a Conservative Government get the co-operation of the Labour opposition and of the T.U.C. to stop it? Will the trades unions-members of the T.U.C. accept action military or legislative that curbs the power of unions to withhold their labour? What is really lacking is a wage policy of Labour and the Unions: both shirked the issue under a Labour Government—are they prepared to accept it now?—*All Rights Reserved.*

THE SECOND FIVE-YEAR PLAN

MAIN OBJECTIVES OUTLINED

THE final draft of the second Five-year Plan is expected to be published by the Planning Commission by November next. This draft plan will be circulated for public opinion and the final plan will be drawn up some time before the end of March, 1956. This was disclosed by Mr. C. D. Deshmukh, Union Finance Minister, in the course of his opening speech at the meeting of the Economists' Panel held in New Delhi on Friday last week. At this meeting, the Panel discussed the list of papers drawn up by Dr. D. R. Gadgil for allocation to the members for the preparation of working papers. The list included about 30 subjects covering practically all the aspects of the second Plan—taxation and fiscal policy, employment, land reforms, agricultural development, irrigation and power, deficit financing, etc. It was decided that all the working papers should be ready before 15th September, 1955. At the end of these studies and discussions, the Economists' Panel will prepare a memorandum embodying its conclusions on the various questions dealt with by it. The Panel is scheduled to meet early in October.

While brisk activity is thus going on in regard to the preparation of the draft of the second Plan, an outline of it, setting out the broad objectives and tentative targets, was released last month after it was considered by the Standing Committee of the National Development Council. This outline, entitled *The Second Five-Year Plan—a Tentative Framework*, was prepared by the Economic Divisions of the Finance Ministry and Planning Commission, in consultation with the Central Statistical Organisation and the Indian Statistical Institute. Inasmuch as the targets for achievement in the second Plan period have to be worked out in the light of the main objectives in view, we reproduce below the relevant extracts from the aforesaid publication for the benefit of those readers who may not have access to it.

Basic Industries

The main objectives of the second Plan may be set down in general terms as (1) a sizable increase in national income so as to raise the level of living in the country, (2) rapid industrialisation, with particular emphasis on the development of basic industries, (3) fuller employment, and (4) social justice. These objectives are interrelated. The level of living in the country cannot be raised without a sustained increase in production and investment. In order to facilitate greater capital formation in the country, it is necessary to develop the basic industries producing steel, coal, electricity, heavy chemicals and machinery. But, in a poor country where consumption standards are already too low, higher investment and development of basic industries cannot be made to depend on a curtailment of consumption even in the initial stages. An attempt must, therefore, be made to increase both consumption and investment simultaneously by harnessing such resources as are unemployed or unutilised at present.

The economic development of the country must conform to the broad social objectives in hand. The development of a socialistic pattern of society has already been enunciated as a basic objective before the country. In formulating the second Plan, emphasis must be placed on extension of public ownership or control over the strategic means of production, greater equality of opportunities, bridging of the gap between the haves and the have-nots, and protection and enhancement of the well-being of the weak and unorganised sections of society. Men do not give of their best in the absence of a secure and fair share in the fruits of their labour; and achievement of social justice is a necessary condition for releasing the productive energies of the people.

The objectives outlined above cannot be achieved fully in a matter of five or ten years. In the short run, it may not be possible to reconcile fully the claims of greater production, fuller employment, and a wider capital and industrial base for further progress. Such conflict as arises between different objectives in the short run must be resolved in keeping with the dictates of social justice and the need for raising standards of life at the lower levels. In planning for a given period ahead, the basic task is to define as precisely as possible the advance to be made in each desirable line and to ensure an optimum fulfilment of all the objectives.

National Income and Standard of Living

The first Five-year Plan contained an illustrative model of development over a period of some 27 years. According to that model, India's national income could be doubled in some 22 years, per *capita* income doubled in about 27 years, and per *capita* consumption increased by roughly 70 per cent. in a little more than five Plan periods (that is, between 1950-51 and 1977). The increase in national income by the end of the first Plan is likely to be greater than was anticipated and may amount to about 15 per cent. over the five years. The national income of India increased by some 15 per cent. in real terms during the five years 1948-49 to 1953-54. During the first three years of the first Plan, the increase was of the order of 12.5 per cent. Even when allowance is made for the provisional character of the estimate for 1953-54 and for favourable monsoons, it is reasonable to expect a 15 per cent. increase in national income over the first Plan period. For the second Plan, therefore, we may well aspire to an increase in national income higher than 15 per cent., say, 25 to 27 per cent. in five years or 5 per cent. per annum as a first approximation.

An increase in national income of about 5 per cent. every year in the second Plan is by no means unrealistic or ambitious. A rate of increase in national income of 3 per cent. per annum has been achieved over a period of years without any attempt at planning in countries already advanced industrially. In recent years, the socialist countries in Eastern Europe have achieved a rate of increase of some 12 to 16 per cent. in national income every year, as will be seen from the table below:

Growth in National Income in Selected Countries

Country	Period	Rate of growth (Annual Average in per cent.)
U. S. A.	1869-78-1904-13	4.5
	1869-78-1929	4.0
	1899-1906-1929	3.2
	1929-1950	3.0
Canada	1903-29	2.6
Switzerland	1890-1929	2.7
Germany	1876-1913	2.8
Japan	1887-1913	3.0
	1914-1930	6.7
	1914-1937	6.7
Australia	1901-03-1928-29	3.2
	1901-03-1947-48	2.5
Soviet Union	1928-37 (Official)	16
	1949-53 ,,	15
Poland	1947-53 ,,	14.5
Czechoslovakia	1948-53 ,,	12
Hungary	1952-53 ,,	12
Bulgaria	1952-53 ,,	16

In the light of this experience, the target of a 5 per cent. per annum increase in national income for the second Five-year Plan must be regarded as a minimum to aim at. With effort and organisation, it can probably be improved upon. On this basis, it should be possible to advance the long-term targets outlined in the first Plan by some four to five years, or even more. An increase in national income of 5 per cent. per annum would permit both a sizable improvement in the level of living in the country and an increase in the rate of investment. If investment is stepped up from roughly 7 per cent. of national income at present to about 11 per cent. of national income by the end of the second Plan, total consumption should increase roughly by 20 per cent. and *per capita* consumption by 12 to 13 per cent. by the end of the second Plan.

The first Five-year Plan aimed, as a first step, at restoring the pre-war levels of consumption of the basic necessaries of life in the country. There has been a significant increase in the consumption of foodgrains, cloth and other items in recent years and the damage done by war and the Partition is all but repaired. However, the standards of nutrition, clothing, health, housing and education in the country are still inadequate.

Level of Living

The minimum requirements of cereals in a balanced diet are estimated by the Nutrition Advisory Committee as 14 oz. per adult per day. The average consumption of cereals in the country has increased from less than 13 oz. per adult per day in 1950-51 to nearly 15 oz. in 1953-54. The availability of pulses and grams still falls short of minimum nutritional requirements—2.5 oz., as against 3 oz. per adult per day. The consumption of a large number of people, however, is below the average level in the country; and the demand for foodgrains is certain to increase if purchasing power is increased at the lower levels. Thus, quite apart from the requirements of a growing population, the production of foodgrains needs to be increased in the second Plan. In the case of other foods such as milk, ghee, meat, fish, eggs, fats, fruits, vegetables and sugar, the present level of consumption falls far short of minimum requirements. In planning for a higher standard of living, special attention must be devoted in the second Plan to animal husbandry, fisheries, poultry-farming, vegetable gardening and other branches of food production. How much advance in these directions can be secured within the next five years is a matter for detailed examination. The average consumption of cotton cloth in India is now back to the pre-war standard of 15 yards per person. The Textile Enquiry Committee has recommended an increase in consumption of cotton cloth to 18 yards per person by 1960. This modest objective must be achieved in the second Plan.

The supply of houses in the urban areas would increase from some 10.2 million in 1950-51 to 11.5 to 12.0 million by the end of the first Plan. Broadly, provision has to be made in the second Plan for the construction of an additional 3.0 million houses in the urban areas. The housing problem in rural areas is not as acute as in urban areas. But an effort must be made through the National Extension Service and similar agencies to improve housing conditions in rural areas as well. As regards education, of the total population of children between 6 and 14, only 23 per cent. went to school in 1939-40 and some 32 per cent. in 1950-51. It is expected that this proportion would increase to 40 per cent. by the end of the first Plan. A considerable expansion to a proportion of, say, 60 per cent. in primary education facilities must, therefore, be achieved in the second Plan. Similarly, the provision of hospitals, doctors, nurses and sanitation facilities in the country is far from adequate and a substantial increase in health and medical facilities during the second Plan must be assured. An increase in national product by some 25 per cent. would be required to ensure the increase in the level of living as envisaged above.

Industrialisation is a means, not an end. But, considering the need for initiating the process of sustained and more rapid progress in subsequent Plans, it becomes almost an objective in itself. From the long-term point of view, it is necessary to make a rapid advance in those sectors where the potentialities for further growth and the indirect benefits to other sectors are the greatest. It was with this end in view that the first Plan laid great emphasis on the development of irrigation and power in the country. In the second Plan, a high priority must be accorded to the development of basic industries such as those producing iron and steel, machinery, electrical equipment and heavy chemicals. The development of these industries in the first Plan has not come up, by and large, to expectations. This deficiency must be made good in the second Plan. It is only by developing basic industries that a secure foundation for capital formation can be laid and the country made more and more independent of imports of vitally needed plant and equipment.

Careful Planning

A country which seeks rapid development cannot rely on the export of food and raw materials for satisfying the major part of its increasing requirements of capital goods. Nor can a comparative late comer in the field of industrialisation hope for a sizable expansion in the exports of manufactured consumer goods. The hinterland of countries with an industrial vacuum is disappearing day by day and countries placed in more or less the same position as we are naturally anxious to develop industries themselves. Our natural resources put us at no serious disadvantage in the development of basic industries; and such deficiencies of capital or skill as we have can be removed by careful planning. In both these respects, assistance from more developed countries would be welcome. The emphasis on the development of basic industries, therefore, is not in disregard of the possibilities of international exchange.

The major effort in the development of basic capital goods industries must come from the public sector. This is necessary if the State is to have command over means of production in strategic sectors. Also, private enterprise is not likely to be able to provide the large capital requirements of such industries. Schemes for setting up iron and steel plants and an electrical equipment plant in the public sector are already under way, and the possibility of taking up new schemes in this field must be further explored. Special attention needs to be given to the production of machinery to be employed in other producer goods industries and to the production of synthetic petrol. Presumably, it would be necessary to expand steel capacity to 10 or 20 million tons in the next 10 or 15 years. It would be desirable, therefore, to try and fabricate as much of the steel-making machinery as possible at home. Similarly, the development of synthetic petrol in the country would reduce imports and serve as nucleus for the development of several other industries.

The private sector must also be encouraged to invest predominantly in the producer goods industries. A number of such industries, such as cement, chemicals and iron and steel is at present largely in private hands. However, a large part of the profits in organised industries is made in consumer goods industries. Steps must, therefore, be taken to direct a larger flow of private investment into basic industries by suitable tax and credit measures, by making a stricter use of the powers to control capital issues and imports, and by licensing of new enterprises.

The development of heavy industries would require fuller exploitation of our mineral resources, extension of transport facilities and a rapid expansion in the number of trained personnel in the country. Concrete schemes for scientific training, mineral development and transport must, therefore, be worked out in advance of the projects for heavy industries. The need for extensive surveys to discover additional mineral resources in the country can be hardly exaggerated. At the same time, steps must be taken to conserve such scarce resources as high-grade coal and to develop domestic substitutes for minerals such as copper in which we are deficient. Where necessary, arrangements can be made with foreign countries to make up the gap in skilled personnel in the country by practical training abroad.

The Basic Strategy

The basic strategy in the second Plan must, therefore, be to invest large sums in the development of basic industries, transport and mining at one end and to economise as much as possible in the capital requirements for other sectors without restricting the supply of consumer goods. This strategy requires all-out efforts for the maximum utilisation of capacity in existing industries and for the development of additional production in the capital-light or small-scale sector of industries. Since a large part of the additional demand for consumer goods would be directed against food, attention must be paid to the adoption of schemes which would increase productivity in agriculture quickly and at less capital cost.

A great deal of unused capacity exists at present in organised industries. This should be drawn upon as fully as possible. It is also possible to expand production on the basis of existing equipment by working additional shifts. A detailed survey of unused capacity in different industries should, therefore, be undertaken as soon as possible and steps should be taken to ensure the fullest use of existing capacity before setting up new units.

The extensive development of small-scale industries in the second Plan is essential for a number of reasons. Apart from releasing scarce capital resources for the basic industries, they would provide greater employment and incomes for a

U.S. FOREIGN ECONOMIC AID

DEMOCRATS SUPPORT PRESIDENT

THE three-day debate held last week on President Eisenhower's Foreign Aid Bill in the United States Senate has ended in victory for the Administration. The Bill provides for a global aid programme of $3,408 million. Approved by 59 votes to 18, its passage is a notable instance of a proposal sponsored by a Republican President receiving preponderant Democratic support. Although a number of cuts were proposed by several senators including Republicans, they were defeated by Democratic supporters who argued that any substantial cuts in the total funds would weaken President Eisenhower's position in the projected four-power conference to be held somewhere in Europe next month.

The Bill is principally designed to check communist aggression and subversion by strengthening the armies and internal economies of the allies and friends of the U.S. The funds for aid-items included in the Bill are (1) $1,278 million worth of military material such as tanks and planes for U.S. allies, (2) $317.2 million for the armed forces mostly in Korea, Formosa, Indo-China and Pakistan, (3) $1,000 million for defence support to enable U.S. allies to maintain their military forces necessary in the cold war, (4) $165 million for long-range economic assistance, (5) $172 million for technical co-operation between the U.S. and individual allies and the U.N. Technical Co-operation fund and (6) $475 million for other purposes.

Out of the $3,530 million asked by President Eisenhower, the Senate Foreign Relations Committee, which scrutinised the programme before being sent to the Senate, voted for only $3,408 million but stated that the previous authorisations of $122 million would, in total, add up to the President's request of $3,530 million.

Of particular interest to underdeveloped countries is the provision included in the Bill for a special $200 million fund for regional economic development in Asia. The use of this fund is subject to certain restrictions recommended by the Senate Foreign Relations Committee. Thus, it would have to be "pledged not necessarily spent" within the next three years. Secondly, half of it would have to be in the form of loans, and thirdly, not more than one quarter of it should go to any one country. Besides this, a sum of $85 million has been requested for economic development and technical co-operation in India.

Two days after the Senate had given its approval to the President's Bill came the report of the Hoover Commission set up by Congress to study ways of saving foreign aid funds and to recommend reorganisation where necessary. This Commission seems to be even more critical of the Administration's programme and policy than some of the individual Republicans. In its report to the Congress, the Commission has urged that no funds be made available for manufacturing or for establishing large industrial development in Africa and Asia, "with the possible exception of Japan." It has further advocated the end of economic aid to the ten original European Charter members of the North Atlantic Treaty Organisation including Britain and France, but not Greece, Turkey or West Germany. It has recommended that no economic aid should be given for projects where private capital is available and that all economic aid should be contingent on good faith efforts of the receiving country to improve the climate for private investment. In cases where countries are not able to repay loans granted to them, it is said that outright grants should be made to such countries.

Commenting on the aid to Asian-African countries, the Commission observes: "The fundamental need of many of the countries in the Asian-African area is increased food supplies. Therefore, sound irrigation projects and introduction of improved agricultural methods are justification for U.S. Aid Programmes." It remains to be seen to what extent these recommendations will influence U.S. foreign economic policy in future.

Meanwhile, the proposed assistance to India has been warmly supported by officials and several senators. Senator Hubert Humphrey, Democrat member of the Foreign Relations Committee, for instance, said that it was vitally important that India's ambitious Five-year Plan to raise living standards of people should succeed. He told his colleagues that India's democratic efforts to raise itself economically were being watched and compared by their Asian countries with those of Chinese communists and that a U.S. University study showed India was ahead of China in economic development. He advised them not to let their feelings be influenced by their differences of opinion over India's foreign policy but to remember the fact that U.S. money invested in India was producing constructive results. Speaking on an earlier occasion, Mr. John Foster Dulles, U.S. Secretary of State, said, in the course of his defence of the aid to India before the Senate Foreign Relations Committee, thus: "It is important that India be helped in making its Five-year Plan succeed, as India is attempting to demonstrate that its people's economic conditions can be improved by means other than communism." He added that it would be short-sighted not to help in the development of the Indian plan to demonstrate an ability of a free society against that of the neighbouring society of Communist China. He was convinced that the Indian Prime Minister had been waging a very bitter and successful campaign, against the communist within his own country.

While the proposed $85 million aid is for the U.S. fiscal year 1955-56, India has just concluded another four agreements with the U.S. Government for receiving financial assistance to implement certain specified projects. These agreements cover a total assistance of $7.7 million (or over Rs. 3.6 crores). The Government of India's share of expenditure on these four projects will be Rs. 55.4 lakhs. One of the four projects relates to the purchase of steel from abroad of 38,145 tons. The steel may be used for industrial purposes and for railroad replacements, rehabilitation and expansion programmes, as well as for development projects. The U.S. Government will contribute $6.8 million, India's share being Rs. 30 lakhs. For another project, the U.S. will contribute $465,000. This project covers survey of water resources and minor irrigation works. India's contribution to this project amounts to Rs. 25 lakhs. Under another scheme of assistance in home science, education and research, a sum of $100,000 has been provided, India's share being Rs. 40,000. The fourth subject is intended for aid to technical educational institutions. The U.S. assistance for this purpose is $300,000 and will be used for procuring the services of specialists to the Indian Institute of Science and the Bengal Engineering Colleges.

PILOT SCHEMES FOR RURAL CREDIT

Brisk action is being initiated by several State Governments for reorganising rural credit on an integrated institutional basis, as envisaged by the Rural Credit Survey Committee of the Reserve Bank of India. For the present it is confined to certain pilot co-operative credit schemes to be introduced in selected areas, where co-operation has made considerable progress. These schemes are based on a tentative overall national plan on co-operation drawn by the Centre. This plan is stated to have laid down that the membership in the agricultural credit societies should be increased from the existing five million to 15 million during the second Five-year Plan. It envisages an increase in the long-term loans to agriculturists through land mortgage credit societies from Rs. 3 crores to Rs. 25 crores and in the short-term credit from the present Rs. 30 crores to Rs. 150 crores by the end of 1960-61. According to it, co-operatives should provide 50 per cent. of rural credit in 15 years' time. The State Governments have been requested to draw up their respective programmes on those targets, having regard to their resources, their administrative machinery and the relative progress of the co-operative movement. It is in pursuance of this directive that the States of Bombay, Madras and Andhra have drawn up pilot schemes, as stated at the outset.

In the Bombay State, the pilot scheme will be introduced from 1st July next in three districts, namely, Broach, East Khandesh and Dharwar. These districts have made considerable progress in co-operative credit and have been selected as the proving ground for the new schemes. In these districts, about 35 per cent. of the credit needs are now being met by co-operative societies, as against the Bombay State average of 16 per cent. and the country's average of 3 per cent. A feature of the scheme is that all small credit co-operatives in the three districts will be asked to amalgamate into "economic societies." This is evidently intended to make them financially strong enough to employ adequately paid and trained staff, a prerequisite for improving the efficiency of co-operation. Each society will have a share capital of Rs. 25,000. Of this the Bombay Government will subscribe Rs. 11,000 repayable in five years. The State Government will not, however, claim controlling interest. This should set at rest the fears expressed earlier by leading co-operators in the States that participation by the State Government by way of contribution to share capital would result in the movement becoming a purely bureaucratic agency.

The quantum of credit to the farmer will be based not on his capacity to repay or on the value of his land, but on crop values. It is expected to cover not only the estimated expenses for raising the crop but also his personal maintenance costs. It is, in effect, designed to save the grower from going to the moneylender or to the bank, or even to the Government for getting a *taccavi* loan. The farmer will be asked to deliver the entire crop he produces to the society which will market the crop. But it is doubtful whether compulsion to hand over the crop will help retain the loyalty of the farmer to the society. Where he is in a position to market his crop at a price higher than that assured by the society, he should have the liberty to do so after consultation with his society.

Under the scheme, the State Government will lend to rural societies to enable them build godowns to stock the crop.

The pilot scheme, with modifications if any in the light of experience gained in the three districts, will be introduced all over the State next year.

The Madras Government also has drawn up a scheme for dispensing rural credit modelled on the recommendations of the Rural Credit Survey Committee. Since an outline of this has been given in *Commerce* dated 28th May, 1955, there is no need to describe the scheme once again here. But a further decision since taken by the Government must be mentioned in this context. According to Mr. A. B. Shetty, Minister for Co-operation, the State Government has approved of a scheme for the organisation of 25 rural banks. Of these, sanction has already been granted for opening 19 banks; four of these have, in fact, started functioning in South Canara, Coimbatore, Tirunelveli and Madurai Districts. All the 25 banks, we are told, will be started by the end of June this year. It is stated that the establishment of these banks is in addition to the extension of co-operative societies.

The State will participate in the rural credit service of co-operatives both in regard to marketing and warehousing, but the extent of such participation is yet to be decided. From Press reports it is gathered that the State prefers to have a "direct voice in the management of the co-operatives." It is believed that, as a result of such State participation, there would be greater supervision of these bodies and that the people would have greater confidence in them. This view is completely opposed to the attitude of the Bombay Government (which, as stated already, does not propose to have a controlling voice in the management of societies) and all accepted principles of co-operation.

As regards Andhra, the State Government's present scheme is confined to the constitution of two funds: (a) the State Co-operative Development Fund and (b) the State Agricultural (Guarantee and Relief) Fund in connection with its scheme for co-operative agricultural credit under the second Five-year Plan. It is expected that the finance will be provided from these funds up to 25 per cent. by way of contribution towards the share capital of marketing societies and grant of loans for construction of godowns, etc. The Government of India and the Reserve Bank are considering, it is learned, the possibility of providing funds to meet the balances of 75 per cent. of the cost of the programmes. It may be noted that similar funds have recently been created by the Reserve Bank of India.

STERLING AREA GOLD RESERVES

The sterling area gold and dollar reserves at the end of May last stood at $2,686 million, the same as those at the end of the previous month. In April, they had improved by $19 million, after falling by $14 million in March and $82 million in February, this year.

During May, receipts from the U.S. under defence aid amounted to $18 million. Besides, the area received a total of $31 million in gold or dollars from the European Payments Union in settlement of the April surplus, with the Union. But Britain had to pay off $2 million towards old debts to the creditors of the Union. Consequently, the net inflow from the E.P.U. to the U.K. during May was $29 million.

Trade and currency movements, other than the two factors above, however, involved an outflow of $47 million in May, thus resulting in no change in the total gold and dollar reserves of the sterling area at the end of May.

On the provisional figures for May, the U.K. had a surplus of $8 million with the E.P.U., the U.K. has now reached a stage where it had almost no unfunded debt with the E.P.U. countries. It might be mentioned, in this connection, that from the start of the E.P.U. to the end of April, 1955, there was a total accounting deficit, including the gold which had been paid, of $563.5 million. Half of that amount was paid in gold, so that the remaining "book debt" stood at $282 million or £100 million. Of this, payment of £90 million was settled last year under the new arrangement. The unfunded debt stood, as a result, at £10 million. As the E.P.U. is to receive this month £4 million, out of the April surplus of £8 million, the unfunded debt of £10 million will be brought down to £6 million. If this debt is wiped out by continuing monthly surpluses, Britain will then have to extend credit to the E.P.U. Having freed itself from this debt, the U.K. will then be in a relatively better position to build up reserves more rapidly than at present.

The heavy outflow of $47 million from the U.K. on trade and currency movements, outside those under U.S. defence aid and E.P.U. transactions, is in part attributed to operations of a capital nature stimulated by general elections uncertainties and labour troubles in May. It is believed that a temporary fall in confidence in sterling due to these uncertainties resulted in a tendency (a) for foreign countries to delay purchases of sterling during most part of May and (b) for short-term funds to move away from London, even though interest rates in that centre were higher than those in many other parts of the free world.

FINANCE FOR SMALL-SCALE INDUSTRY*

PROBLEM CAN BE MORE EASILY SOLVED IF INDUSTRIES ARE PROPERLY ORGANISED

By R. S. Bhatt

MANAGING DIRECTOR, BOMBAY STATE FINANCIAL CORPORATION

FOR a long time, the sector of small-scale industries was in comparative obscurity. Public attention on its importance in our economy was focussed when the Committee on Finance for the Private Sector pointed out that, according to the broad estimates made by the National Income Committee, "the value of net output of small enterprises in 1951 was of the order of Rs. 910 crores, while that of the factory establishments was around Rs. 550 crores. The number of workers in small enterprises was about 11.5 million, as against 3 million workers in factory establishments." This category, of course, included cottage industries. But, assuming that small industries that are not village or cottage industries constitute one-third of the total, their contribution to output and employment appears to be substantial. Further, a number of small units which come under the Factories Act are probably included in the National Income Committee's definition of "factory establishments." On the whole, therefore, it would be safe to assume that the net value of output of small industries was of the order of Rs. 350 crores in 1950-51.

On the one hand, demarcating its sphere from the medium and large-scale industry, the small-scale unit is defined as an undertaking having assets upto Rs. 5 lakhs and employing labour upto 50 persons with power or 100 persons without power. On the other hand, the borderline between the small-scale and cottage industry is vague. Geographically, small industrial units are located all over the country, though it would appear that they are fairly well concentrated in industrial centres like Bombay, Calcutta, Ahmedabad, Kanpur, etc. Small industries are engaged in three types of activities:

(1) Those producing goods in competition with larger units;

(2) those supplying spare parts or semi-manufactured and intermediary materials to large units; and

(3) those producing goods mainly in competition with imported goods.

Ownership

The ownership of small industry usually vests in a few shareholders, or partners or even a single proprietor. Sometimes, the owner is a technical man or financier or both. The small-scale industry, therefore, is largely dependent upon the initiative and enterprise of the individual *entrepreneur*.

The growth of small industries in India in pre-war days was largely governed by market conditions. Quite a good number of these small undertakings came into existence during the war and post-war period, when there were shortages of consumer goods and spare parts and intermediate materials. There was a sellers' market and the small producers were able to dispose of their products at a fair margin of profit. After the war, some of them have been given tariff protection and some have already consolidated their position. But, with the return of the buyers' market, many of them have been experiencing difficulties and recent investigations have shown that one of the principal difficulties is the lack of finance.

Capital Requirements

Usually, the capital requirements of small-scale industry consist of (a) equity capital, (b) loan capital, and (c) working capital. The proportion between these three types of capital would depend upon the size and the nature of manufacturing activity of an individual unit. Equity capital, which is risk capital, is usually provided by promoters. In some cases, the promoters supplement their own resources by taking short- or medium-term deposits from their relations and friends. A major portion of this initial capital is utilised for buying equipment and the balance for working capital. But it is found from experience that a large number of small-scale units are undercapitalised, and it is extremely difficult to raise equity capital from the market because Indian investors are not generally interested in small enterprises. There is at present no financial agency which provides equity capital for small concerns. The risk capital has, therefore, to be provided by promoters themselves.

Small-scale industries need medium- and long-term capital to acquire fixed assets for purposes of expansion, renovation or modernisation. If there is adequate security, an industrial unit may ordinarily be in a position to raise loan capital from financial institutions. Indian commercial banks, however, are generally not interested in giving medium- and long-term credit to small industries. This policy is in keeping with the requirements of commercial banks which do not make long-term advances. Further, the official policy has also been to discourage commercial banks from going into this type of business. Under the State Aid to Industries Rules, Governments in various States grant loans to small concerns. But assistance from this source has been of a limited nature. In Bombay State, there are industrial co-operative banks which render assistance to their members but this does not go very far. There has, therefore, been a need to establish institutions which would meet the requirements of long-term and medium-term finance to medium- and small-scale units. The first institution to be set up for financing industrial expansion and development in the country immediately after the war was the Industrial Finance Corporation of India. The Industrial Finance Corporation of India was meant largely to cater to the requirements of large-scale industries and its activities were restricted only to public limited companies and registered co-operative societies. For financing small-scale industries under all forms of management, including partnership firms and individual proprietors, there were long-standing suggestions for establishing industrial banks with a network of branches. The Bombay Provincial Industries Committee in 1947 had recommended the establishment of State Financial Corporations. Accordingly the State Financial Corporations Act was enacted in 1951. There are already eight State Financial Corporations in India, functioning for over a year now and two more have come into being recently.

Main Object

The main object of these institutions is to provide medium- and long-term credit for purposes of expansion of the existing units and development of new ones. In the past two years, there have been signs of an increase in the tempo of industrial development. In 1954, 110 licences were issued by the Central Government for the establishment of new undertakings, while 226 licences were granted for the expansion of existing undertakings and taking up of new lines of manufacture. Many small- and medium-scale units have already approached these Corporations and the demand is likely to increase as the pace of industrial development is accelerated.

There is a third type of requirement of medium and small-scale industries, namely, working capital. This type of finance is usually provided by commercial banks, because the advances are for a short-term and are made against the security of raw materials, stores and stock-in-trade which are realisable assets. Enquiries have shown that, with few exceptions, commercial banks do not favour advances, even of a short-term nature, to medium- and small-scale concerns. There are various reasons for this attitude which we need not go into at present, but the fact remains that small-scale and medium-scale concerns are not in a position to avail themselves of the facilities offered by commercial banks. Many of these units, therefore, have to turn to alternative sources of finance and this is mainly provided by shroffs and private

moneylenders. This finance is in the form of *hundies*, renewable at stated periods and carrying rates of interest ranging from 6 per cent. to 12 per cent. and in some cases even higher. The needs of small business for working capital have increased during the past two years. After the recession in 1952, many of these concerns suffered losses, because the prices of their finished goods fell faster than their costs of production which included high prices of raw materials. Thus, their own resources for working capital were considerably diminished. These concerns were, therefore, in need of working capital with which to buy raw materials and to finance goods in process as well as stock-in-trade. It seems that this type of financial requirement has gradually grown acute during the past two years, because with the return of the buyer's market, small industrial concerns have not only to compete on the price factor but are required to sell their goods on credit which sometimes extends from three to six months. In these circumstances, it seems natural that small-scale concerns require a considerably large amount of working capital, in order to maintain stocks of raw materials, finance goods in process and meet other obligations.

No Overlapping With Commercial Banks

In response to the request from small- and medium-scale concerns, the Bombay State Financial Corporation has modified its policy and is now giving accommodation for working capital. But it should be made clear that there is an essential difference between the loans given by the Corporation for working capital and those given as short-term credit or cash-credit arrangement by commercial banks. The Corporation advances loans on the security of fixed assets, while commercial banks usually advance loans on the pledge or hypothecation of raw materials and in some cases against finished products, though they secure a negative lien on fixed assets of the borrower. The Corporation, therefore, avoids overlapping of security with commercial banks and permits a borrowing concern to pledge its goods to banks in order to obtain finance in addition to the loan taken from the Corporation. It will be seen that the Corporation thus tries to meet two types of financial requirements of small-scale industrial concerns in Bombay State.

Under the Act, the State Financial Corporations are authorised to grant loans to and subscribe to debentures of industrial concerns on sufficient security. Further, they may guarantee loans floated in the public market; and they may underwrite issue of shares, stocks and debentures for a period not exceeding 20 years. The maximum amount of an advance to a single industrial concern is fixed at 10 per cent. of its capital, not exceeding Rs. 10 lakhs. As regards the terms of advance, the Bombay State Financial Corporation grants loans at 6 per cent. per annum, for periods which are determined according to specific requirements in each case but not exceeding 10 years. The amount of loan is about 50 per cent. of the net value of the fixed assets offered in security. I may add that the Corporation is liable to pay income-tax and super-tax like any joint-stock company. The dividend on the shares of the Corporation having been guaranteed at 3½ per cent. by the State Government, it has to be paid free of income-tax to the shareholders.

Considerations for Granting Loans

The Corporation takes into account the overall position of a borrowing concern as well as of the industry to which it belongs and if, after assessing the financial soundness and earning prospects of the unit, it is convinced that the financial assistance given would be employed fruitfully, it grants the accommodation. As the recent report of the Bombay State Financial Corporation shows, it has sanctioned loans over Rs. 68 lakhs in the past year and has assisted existing units for expansion as well as for the establishment of new ones.

Besides the facilities provided by the Corporation, the Government of Bombay has now formulated a new scheme, under which loans are given to small industries upto Rs. 75,000 and in exceptional cases upto Rs. 1 lakh on more liberal terms under the State Aid to Industries Rules and a provision of Rs. 50 lakhs has been made in the current year's budget for this purpose.

I may now show the other side of the medal. On the borrower's side, a unit is required to offer adequate security. It should show that the net value of assets given as security is properly determined and there is a consistent record of earnings and prospect of improving it. A lending institution would, in the first instance, require to study the financial position of a borrowing concern from its accounts during the past four or five years. Now, the peculiarity of small industrial concerns is that their accounts are not audited and some of them do not follow the generally accepted accounting practices. In a partnership or proprietary concern, for instance, the partners or proprietors do not keep their personal accounts separate from their business accounts. When the prices are high, they earn a good margin of profit, but, before distributing it, they make no provision by way of reserve which they can resort to in lean times. Some concerns do not even make provision for depreciation of their fixed assets like plant and machinery. Now a lending institution, the resources of which are derived from public or private savings and is thus responsible to its investors or depositors, must satisfy itself that the net value of security offered is adequate, a concern has prospect of utilising it fruitfully and the borrowing party is creditworthy. Without such an assessment and without applying usual criteria for lending, a credit institution would not be in a position to consider a request for financial accommodation.

The problems of credit and finance for small industries, if they are to be solved, should be tackled, as the Ford Foundation Team of international experts pointed out, as a part of the whole programme. They are a part of the vast complex in which the problems of material production, quality control, finance, marketing, etc., are vitally inter-related. Lack of finance is not always the cause, but in many cases the result of difficulties in other respects. I may be permitted to touch briefly upon a few of them.

Haphazard Growth

In the past, the growth of small-scale units was somewhat haphazard and it is no exaggeration to say that many of the present difficulties are attributable to the mushroom growth of small units. For instance, in the pharmaceutical industry, which is of comparatively recent growth, out of the total number of 1,643 manufacturers, 1,563 were small-scale manufacturers. Of these, 261 covered almost all the important small-scale manufacturers, the remaining factories being mostly very small. As the Pharmaceutical Inquiry Committee pointed out, the small units were working at a very small margin of profit due to the existing cut-throat competition. Very few of them had any resources to equip themselves better or buy raw materials of standard quality. It would, therefore, appear that there are far too many small units producing all types of pharmaceutical preparations some of which are not of standard quality. Consequently, there has developed a strong consumer's resistance against Indian products. Secondly, it is imperative to bring about adjustment in the production programme between large-scale, small-scale and cottage-scale units within an industry, as, for instance, in the cotton textile and engineering industries. Generally, for a large country like India it would be a sound policy to organise our industries on a decentralised basis in order to provide employment, reduce cost of production and eliminate unnecessary use of transport. In this process, in the initial stages, the cost of production among small units may be high and consumers may not resist slightly higher prices for a temporary period for goods which are necessities of life, like cloth. But as the Textile Inquiry Committee pointed out, "low income consumer cannot for any length of time go on paying a high price for a product manufactured on a tool of production which could be made more efficient." Ultimately, the price factor must prevail and disparities in costs for the same type of goods between the large-scale, small-scale and cottage-scale type of units should be eliminated as far as possible. Thirdly, many small units in the engineering and chemical groups of industries are working below their installed capacity.

Taking the small-scale units engaged in producing spare parts or semi-manufactured or intermediate materials utilised by large-scale units, there are, for instance, in Bombay and Ahmedabad a large number of engineering workshops of various sizes, producing goods required by the cotton textile and other industries. There is no doubt great scope for these ancillary industries which can be systematically developed in the mechanical and allied industries to cater to the requirements of large-scale industries on a profitable basis. Thus, a horizontal structure of large groups of industries can be built up. But this would require a great deal of co-ordination in production programmes, technical efficiency and business integrity between large and small units.

As a result of the recommendations of the International Team of Experts sponsored by the Ford Foundation, the Central Government have established special institutions to assist small industries. Four Small Industries Service Institutes have been set up of which one is located in Bombay, for assisting small industries in improving their technique of production and management, in securing proper raw materials, in marketing their goods and in promoting patterns of development calculated to make small-scale industries ancilliary to large-scale industries by bringing about co-ordination of production programmes. A Small Industries Corporation has been set up for the servicing of small industry in the field of Government indents for all its purchases from industry. A marketing service corporation will be established soon.

In addition, the Central Government have already set up institutions for the development of *khadi* and village industries as well as handloom industry and given assistance for the development of handicrafts and specific small-scale industries.

Future Development

With regard to future development, the policy of the Central Government is to "diversify the pattern of industry and to develop as much as possible medium and small-scale industry." There is no doubt that, for a balanced industrial development, these second and third line industries should be strengthened. In the tentative framework for the second Five-year Plan, which is under discussion, rapid industrial development is envisaged. The broad aims appear to be that high priority should be given to the development of basic industries and that, for meeting additional demand for consumer goods, efforts should be made for maximum utilisation of capacity in existing industries and for the development of additional production in the small-scale sector of industries. Thus, in the next plan, the development of small industries assumes a special importance. On the one hand, this policy releases scarce capital resources for setting up basic industries and, on the other, it provides greater employment and incomes for a large number of persons employed in small enterprises. In the tentative estimates for investment in industries and mining in the second Five-year Plan, there is a provision of Rs. 100 crores for factory consumer goods industries and Rs. 200 crores for small-scale and village industries. These are substantial outlays. In order to absorb them, it will be necessary to prepare a broad programme of industrial development, indicating specially the categories of industries which may be developed on small- and cottage-scale basis. Then a list of small and cottage-scale industries should be prepared region-wise, having regard to the availability of raw materials, technical skill, managerial and business ability, capital resources and marketing. If this material is made available, the small *entrepreneurs* would be in a position to know the special advantages which particular industries enjoy for development in different regions. This would guide and assist them in pursuing specific projects of industrial development.

Swadeshi Spirit Needed

The problem of starting a small industry is fraught with many difficulties. With small resources, the individual *entrepreneur* is not in a position to purchase land and buildings of his own. If, therefore, trading estates with necessary services are created they would go a long way to provide suitable locations for development of these industries. For the growth of the small-scale industry, however, a dynamic approach is required. On the one hand, the spirit of *swadeshi* should be revived and, on the other, an all-out effort should be made to promote the growth of small units by providing suitable incentives and facilities. It poses a challenge for organising our efforts on a nation-wide scale for providing necessary raw materials, efficient equipment, technical training, managerial personnel, finance and marketing arrangements. It is not known how the resources under the second Plan will be channelled and what pattern of organisation and management the small-scale industries would adopt. There is no doubt that the small-scale industry will remain in what is known as the "private sector" and there is immense scope for an individual *entrepreneur* with sufficient initiative and drive. Perhaps, the future form of organisation may be on co-operative lines and financial resources may be channelled through State-sponsored agencies. But, as I have mentioned at the outset, the small-scale industry depends on the initiative and enterprise of individual *enterpreneurs*. We hope that people with these qualities will come forward to assist the development of small industries in the next Five-year Plan.

SLIGHT REVIVAL IN DEMAND FOR COTTON GOODS

RE-EQUIPMENT PLANS OF MILLS

From A Special Correspondent

MANCHESTER, 31st *May*

MANCHESTER LETTER

WHILE the holidays in the mill towns comprising the Lancashire cotton industry are still some weeks away, most of the larger distributing centres around the Manchester area are having their usual Whitsunside break which lasts for most of the current week. This year, it comes at a time when trade has noticeably slackened and prospects for the industry are by no means encouraging. For nearly twelve months, business has been relatively poor, in view of the unwillingness of buyers to operate at all freely. So much uncertainty has arisen over the future of cotton prices, as well as the disconcerting factors surrounding imports of foreign cloth and the effect of purchase tax on textiles at home, that the order books held by spinners and manufacturers have steadily declined and labour has been leaving the mills in large numbers.

At the time of writing, however, there have been signs of a very slight revival in demand. The tariff concessions granted by the Indian Government have stimulated more interest in Lancashire goods, while, at the same time, home trade sales have tended to broaden, in view of the better weather conditions encountered. Many distributors had allowed supplies to run down during this slack trading period and they have now reached a point where replenishments are needed. As a result, a fair general enquiry has been recorded covering many different styles of cloth from light summer dresswear to heavy goods for industrial purposes.

While immediate prospects cannot be regarded as entirely satisfactory, the trade has the opportunity of quick revival, as goods can be offered on very short delivery terms. An announcement as to American cotton price policy in the near future would go a long way towards removing obstacles to freer trading.

Weavers' Views

With Government help and the application of new ideas and determination, the future for the Lancashire cotton industry need not be bleak, the Amalgamated Weavers' Association, the largest of the cotton trade unions, says in its annual report. "Given a fair chance, the industry," the Association observes, "need not contract as much as some thing to be inevitable. Quality still counts for something and there are still markets to be won, if the will and determination exists to win them." According to it, the North American market is not an easy one, but it is there, open to attack. Now that it is as difficult to sell in the sterling market as in the dollar, perhaps a new incentive would arise. "Our designers and stylists, packers and publicists, all have a part to play. Given the abolition of purchase tax we have not got a bad hand and it should be played strongly. Government assistance is needed but should not be taken as an invitation to sit happily upon the home market." The Association points to the need for increased efficiency in most mills and the scope for re-equipment. Financial reserves are high and should be used in the right way.

East African Trade

Lancashire should command "a good business" in the export of better quality printed cotton goods to the East African territories because of the steadily growing purchasing power of the natives. This was the view which Mr. G. T. Dow-Smith, the United Kingdom Senior Trade Commissioner in East Africa, expressed during a visit to Manchester. Provided Lancashire prices remained competitive with those of Continental countries and Japan, he saw no reason why her exports should lose ground.

Mr. Dow-Smith was beginning a three-day visit to the Manchester Chamber of Commerce for talks with exporters to the East African territories. He said that big capital development schemes, including railways, harbours and roads, were under way in the territories. British engineering firms had already succeeded in obtaining a large share of the work undertaken by the Government, and there was possibly export scope for such goods as excavating equipment, road-making machinery and vehicles.

Spinners and Raw Cotton

Changes in the financial arrangements of Crosses and Heatons Ltd., the Bolton spinning combine, as a result of the liquidation of the Raw Cotton Commission and the revival of free trading in raw cotton, are referred to in the annual report of the Chairman, Colonel B. W. Heaton. A sum of £100,000 has been transferred to stock and contingencies reserve, he tells stockholders, making this reserve £300,000. "Since the cover scheme facilities of the Raw Cotton Commission have been withdrawn," he adds, "we have been exposed to risks which are beyond our control, as futures contracts based on American cotton either on Liverpool or New York are not an adequate hedge for long-stapled cottons. It is to cover this contingency that this reserve has been created."

Stock in trade at the end of March, according to Col. Heaton, was £335,822 greater, due to carrying of more raw cotton and finished yarn stocks. To quote him: "Since the closure of the Commission's cover scheme and the reversion to free buying, we have been compelled to carry sufficient raw cotton stocks to ensure our qualities. Whereas these stocks were previously carried and financed by the Commission, we now have to bear the cost ourselves."

Commenting on trade conditions, Col. Heaton says that, during the last eight months of the year under review, trade was restricted and customers only bought from hand to mouth. Order books had been much reduced and competition in all export markets had been very severe.

Fabrics Display

An important future for woven cotton fabrics in what he termed "the highest fashion field" has been forecast by Sir Raymond Streat, Chairman of the Cotton Board. Speaking at the opening of a new exhibition at the Board's Colour, Design and Style Centre devoted to woven cotton dress fabrics, Sir Raymond said that the public was frequently being reminded at the present time of the basic problems facing the cotton industry; this publicity tended to mask progress being made in other directions of which the new exhibition was a significant token. The exhibition typified the creative forces which were more virile today in Lancashire than ever before.

Fabrics designed by students of the Royal College of Art are a feature of the exhibition which also includes a collection of woven cottons from France, Switzerland and Italy. Sir Raymond said that the exhibition showed that there was much liveliness in the Continental textile industries in the field of woven designs, but it also showed a very lively creative sense in the coming generation in this country and proved that the Royal College of Art was doing something really significant.

Modernisation Setback

Some concern is being felt in the Lancashire cotton trade that the slack conditions which have prevailed for a year past may hamper the trend of re-equipment of the mills. Mr. Lewis Wright, Secretary of the Weavers' Amalgamation, recently asserted that dwindling orders and growing unemployment had compelled some Lancashire mills to scrap their modernisation plans. "Short-time working is increasing and weaving firms who were contemplating fairly large reorganisation have now dropped these programmes," he said after a meeting of the United Textile Factory Workers' Association.

This view was confirmed in a statement made by Mr. Joseph Hollas, Chairman of a large Bolton group of weaving mills. He said that the Company's mill developments consisted mainly of the installation of automatic looms, adding: "The present lull in the trade is causing us to go more cautiously with ordering new machinery." Turning to competition from imported Indian cloth, Mr. Hollas stated that this had continued during the past year on an even more marked degree. Duty-free supplies of cloth from India in the first quarter of this year amounted to over 72,000,000 square yards. "This," he commented, "is sufficient to keep 100 weaving mills of average size in Lancashire running."—*All Rights Reserved.*

RAW WOOL EXPORT FROM INDIA

The Government of India has decided to release a further quantity of raw wool for export up to the end of September, 1955. Details of the licensing procedure are being notified by the export trade controllers at the ports concerned.

The Pakistani Government has decided to permit export against licences of a portion of cotton yarn manufactured by Pakistani textile mills in order to enable cotton textiles to explore and develop foreign markets, it is officially disclosed. It has already permitted export of a portion of production of all textile mills in the country.

TREND OF TEXTILE OUTPUT UPWARDS

SETBACK TO MILL CLOTH EXPORTS

THE distinct improvement in the production of cotton mill piecegoods witnessed during 1954 has been well maintained so far in the current calendar year. The quantity of cloth actually produced during the first four months of 1955, for instance, amounted to 1,686 million yards, which compares very favourably with 1,661 million yards in the previous four months and 1,647 million yards in the corresponding period of 1954. In other words, the average monthly rate of output comes to more than 421 million yards, as against 416 million yards for 1954. If this rate of production is maintained during the rest of the year, the aggregate mill output of cloth for the whole of 1955 will be as high as 5,052 million yards—an all-time record—exceeding the actual production in the previous year by 59 million yards. The estimated output will surpass the production target of 4,779 million yards fixed by the Planning Commission for 1955-56 by 273 million yards. It will also exceed the rated capacity of 4,922 million yards by 130 million yards. It is said that the improvement in cloth output would be greater still if the production control, particularly the restriction on the manufacture of *dhotis*, were removed.

The assumption that production in the remaining months of the current year will be maintained has, however, to be qualified. The mills in Kanpur which account for 5 per cent. of the total output have remained closed, practically completely, for the past forty-five days on account of workers' strike. It remains to be seen whether this loss of output can be made up in the coming months.

Yarn Output

The encouraging trend of cloth output during the four months ended April, 1955 followed a sizable increase in yarn output, the quantity actually produced being 525 million lbs., as against 508 million lbs. a year before. It was, however, lower by 6 million lbs., as compared with the total for the period September-December, 1954. The average monthly rate of output is 131 million lbs., as against 130 million lbs. in 1954. Assuming that this trend will be maintained in the subsequent months, the total output for the entire year may be estimated at 1,572 million lbs., which represents a rise of 10 million lbs. over the quantity produced in 1954. This figure falls short of the Planning Commission's target of 1,640 million lbs. and the actual installed capacity of 1,775 million lbs. by 68 million lbs. and 203 million lbs., respectively.

Thanks to the improvement in yarn output, the supply of yarn available to the handloom and powerloom sectors is quite comfortable. During the first four months of this year, the surplus yarn available for sale to the handloom and powerloom sectors (as also for export) with the mills amounted to 173 million lbs., as against 168 million lbs. in the same period last year. This figure is arrived at on the basis that the mills consume on an average 67 per cent. of the yarn produced by them for weaving cloth. Reflecting such a position, the production of handloom cloth in 1955 is expected to be maintained at the previous year's level of 1,330 million yards. Incidentally, the target for this sector for 1955-56 is 1,700 million yards.

The trend of cloth and yarn output—month by month—during the period under review, as compared with the corresponding period of 1954, is indicated below:

(Cloth in million yards; yarn in million lbs.)

	Cloth		Yarn	
	1954	1955	1954	1955
January	418	437	132	135
February	398	402	122	125
March	405	429	125	135
April	426	418	129	130
Total ..	1,647	1,686	508	525

In contrast with the impressive performance on the production front, India's export trade in cotton piecegoods would appear to have received a setback. During the first four months of 1955, about 282.4 million yards were passed for shipment, as against 312.5 million yards in the corresponding period of last year. Actual exports in the first quarter of the current year amounted to 190.22 million yards, as compared with 212.00 million yards in the previous quarter and 232.92 million yards a year before. The setback to cloth exports has gathered further momentum in the past few weeks. The quantity of piecegoods passed for shipment from the port of Bombay in the first fortnight of May is placed at 34.00 million yards, as against 37.6 million yards and 35.3 million yards in the two previous fortnights, respectively.

Variety-wise Exports

The decline in exports of cloth piecegoods during the period January-April, 1955, as noted above, was accounted for entirely by coarse and fine varieties. The quantity of coarse cloth passed for shipment in that period was not more than 49.0 million yards, which compares unfavourably with 77.4 million yards a year before. It must, however, be noted, in this connection, that, since the reduction in the export duty on coarse cloth (from 10 per cent. to 6¼ per cent.) announced on 28th February last by the Union Finance Minister in his budget statement for 1955-56, exports of this category of cloth seem to have recovered. During the month of April, 1955, about 16.4 million yards were passed for shipment, as against 7.8 million yards in February, 1955. But the quantity is very much lower than the 21.7 million yards passed for shipment in January, 1954. Fine varieties alone accounted for a fall in exports, the quantity passed for shipment during the first four months of the current year being 11.3 million yards, as against 34.6 million yards in the same period last year. There was practically no change in shipments of superfine counts which aggregated 7.8 million yards, as against 7.6 million yards. Exports of medium cloth, on the other hand, continued their upward march, the quantity passed for shipment advancing from 192.9 million yards to 215.0 million yards.

A comparative statement relating to exports of different categories of cloth in the first four months of the current and previous calendar years is furnished below:

(In million yards)

	Total	Coarse	Medium	Fine	Superfine
1954					
January	81.0	21.7	49.3	8.4	1.6
February	82.8	18.6	52.3	10.2	1.7
March	78.7	19.5	47.7	9.3	2.1
April	70.0	17.5	43.6	6.7	2.2
Total ..	312.5	77.4	192.9	34.6	7.6
1955					
January	63.9	9.5	51.2	2.3	0.9
February	69.5	7.8	59.0	1.4	1.3
March	72.8*	14.6	53.0	2.8	2.4
April	76.2	16.4	51.8	4.8	3.2
Total ..	282.4	48.3	215.0	11.3	7.8

A recent review of the conditions in some of the export markets for Indian cloth reveals that only meagre business is possible with Hong Kong, owing to difficulty experienced in securing ocean freight. Demand from Ceylon and Persian Gulf ports has been only moderate. No deals have been put through recently with Burma on account of non-issue of import licences in that country. Similarly, Australia has not evinced any interest in purchasing Indian cloth of late. Demand from West Africa is reported to have tapered off, except for negligible bookings for immediate needs in grey bafts, domestic cloth, coatings and dyed poplin. There are also no active enquiries from Iraq. Business with Iran too is limited. The only countries which are at present somewhat interested in buying Indian cotton piecegoods are said to be Singapore, Indonesia, the U.K., Saudi Arabia, East Africa, Sudan and Aden.

Outlook for Exports

It is against this background that one should assess the outlook for cloth exports in the coming months. The biggest obstacle to the expanding export trade in cloth is the growing competition from other textile exporting countries, especially Japan. The latest reports from Japan indicate that, consequent on decline in prices, there has been a rush of orders for cloth from various countries, including the U.K. and the Middle East, while the South-East Asian countries are holding off due either to import restrictions or slack conditions of market in these countries. Japan is expected to augment the export trade promotion budget considerably from 310 million yen (£305,000) to 1,000 million yen (£986,000) in the fiscal year 1955-56. Much larger sums, it is said, will thus be spent on overseas publicity, subsidies for international fair, travel agencies, the Overseas Trade Promotion Association and for improving export designs and encouraging exports of textile goods. To quote one report: "In particular Japan will try to develop new markets and to expand sales in existing markets for better quality textiles." From all this, it looks as though India's exports of mill cloth during the current year will be lower than those (898 million yards) in 1954, unless fresh steps are taken without any further delay to increase the competitive capacity of Indian textiles.

General Manager.

WORLD TRADE IN WOOL TOPS

The most striking feature of the world trade in wool tops during the last three years is that not only has the downward trend in trade which persisted throughout the period 1928 to 1951 been reversed but there has actually been a marked improvement. World exports of wool tops, which had steadily dropped from 127 million lbs. in 1928 to an average of 120 million lbs. in 1934-38 and to 106 million lbs. in 1946-51, spurted to an average of 158 million lbs. for the years 1952 to 1954, representing a rise of 25 per cent. as compared with 1928, according to a special article published in the International Wool Secretariat's *Wool Digest*.

According to the article, today, as before the war, three countries together account for more than 80 per cent. of the total world exports of wool tops. But these countries have not been the same throughout the period. The position of the third largest exporter has shifted from Germany to Belgium and then to Uruguay, while France, the largest pre-war exporter, has changed places with the U.K. Nor have these changes occurred as a result of only minor shift in trade. Germany exported 18 per cent. of the total in 1928 but only 2 per cent. in 1934-38 and 3 per cent. after the war. Uruguay was not an exporter of wool tops before the war and its present trade involves a differential exchange trade which, in effect, subsidises wool top exports. Exports from France fell from nearly half the total before the war to about a quarter, in contrast to the U.K., the percentage share of which increased from 27 in 1928 to 37 in 1934-38 and 41 in 1954. They have, however, recovered since 1951 and this may foreshadow a further alteration in the relative position of wool tops, yarn and cloth exported from France. Australia and South Africa together accounted for 5 per cent. of the wool top exports during 1954.

Several interesting changes have also occurred in the markets for wool tops. In this respect, the decline in importance of the market in Europe is especially notable. In 1928, Europe took 73 per cent. of the total world wool top exports, but, in 1938, the share had fallen to 56 per cent. and since the war it has remained at roughly the figure it was last year, namely, 47 per cent.

COMFORT OF SUMMER CLOTHING

The scientists working at the Technical Development Establishment, Kanpur, have evolved an index which will enable the comfort of summer clothing to be evaluated. The index is assessed on the basis of skin temperature and calculated by measuring the average drop in skin temperature of the human body (but not the arms and legs) in terms of degrees after exposure for six minutes at a high air temperature to a streamlined flow of air travelling at 300 ft. per minute. The index, it is claimed, is more efficient than previous indices based on factors such as the measurement of the effect of strikingly different types of clothing on body comfort. In experiments with subjects wearing muslin *kurtas*, cellular bush shirts, and gaberdine bush shirts, a fall of 4.0°F., 2.3°F. and 1.8°F. was recorded, respectively, thus showing that muslin is the most comfortable and effective form of clothing under hot weather conditions.

The Union Government has decided to license freely for export hand-printed cotton *saris* meant for domestic consumption till the end of December, 1955.

NATIONAL RAYON CORPORATION LIMITED

PRODUCTION SOLD UPTO THE YEAR-END

CHAIRMAN, MR. KASTURBHAI LALBHAI'S SPEECH AT ANNUAL GENERAL MEETING

THE Eighth Annual General Meeting of the National Rayon Corporation Ltd. was held at Bombay on 9th June, 1955. Addressing the shareholders, Mr. Kasturbhai Lalbhai, Chairman of the Company, referred to the proposed expansion programme, with a view to duplicating the present productive capacity by stages, for which the necessary licence had been obtained from the Central Government. In this context, Mr. Kasturbhai expressed his concern over the serious handicap experienced by all industrial concerns, as a result of power shortage and inadequate transport facilities. Adequate power supply and transport facilities were, he said, essential pre-requisites to industrial expansion and should be provided quite ahead of the industrialisation. He also viewed with concern the possibility of an increase in manufacturing cost, if the threatened increase in freight rates by shipping companies materialised.

The following is the full text of Mr. Kasturbhai Lalbhai's speech:

"I have pleasure in welcoming you to this eighth annual general meeting of the Company and present to you for adoption the Directors' report and the audited statement of accounts for the year ended 31st December, 1954, which, with your permission, may be taken as read.

"Sir Purshotamdas Thakurdas, Chairman of our Company from its inception, resigned on 11th April, 1955, and the Board accepted his resignation with deep regret as already reported. I am glad, however, to inform the shareholders that, though he has resigned from the Company, he has assured us that he would be readily available for advice and guidance whenever needed. I take this opportunity of wishing him many more years of useful and happy life. I may also inform you that the Directors have decided to place his portrait in the board room in appreciation of his contribution to the progress of this Company.

"I also regret to inform you that Mr. F. W. Mattinson, the Company's Consultant and former Vice-President of Messrs. Skenandoa Rayon Corporation, died in Utica, New York, on 27th April, 1955. You may be aware that the Company used to invite Mr. Mattinson for routine consultation and expert advice almost every year right from the day we started manufacturing rayon yarn at the plant. This year also he was expected to be here in January, but, as ill-luck would have it, when the invitation reached him, he was hospitalised and he was destined not to return. The success that the Company obtained in manufacturing rayon yarn of good quality right from the start is mainly due to his efforts. He assisted in training the Company's technical personnel in America and imparting to them the 'know-how' of manufacturing rayon yarn. In him the Company has lost a sincere friend and a competent technician. I trust you will all join me in paying our tribute to his services.

Gross Profit

"Coming to the working results of the year, you may have noticed that the year's working has resulted in a gross profit of Rs. 1,08,69,604. Better results during the year were due to higher production consequent upon the working of additional spinning frames and slightly better prices for its finished products, while the raw materials were obtained at about the same price as last year.

"You may be aware that, till the end of last year, a major portion of the Company's output used to be sold by way of bulk sales to the Associations of the Silk and Art Silk Mills. This arrangement could not be continued since last year. The Company has been able, however, to dispose of its entire production for forward deliveries ahead of the actual manufacturing periods and, as on date, the Company's products have been sold upto the end of the year without experiencing any difficulty.

"The Government of India continues to follow the policy of permitting imports only to the extent of deficit requirements of the country. I cannot help, however, making a reference to the very unhealthy competition that most of the manufacturers on the Continent have resorted to since last year. While maintaining fairly high prices in their home market, they are offering rayon yarn in the export markets in standard qualities like 150 and 120 deniers at 18 to 40 pence per lb. less. This policy is likely to harm the indigenous manufacturers. It is to be hoped that our Government will keep a watchful eye on this development.

Expansion Programme

"As already referred to in the Directors' report, the expansion of the Company's rayon plant is progressing according to schedule and the new machines purchased are expected to go into production shortly to increase the productive capacity of the rayon plant by about 30 per cent. The Company proposes to embark upon further expansion programmes of its rayon plant, with the object of duplicating its present productive capacity by stages. Towards this end, the Company has already obtained licences from the Central Government under the Industries Development and Regulations Act. Orders for the proposed caustic soda chlorine plant are being placed. This plant is expected to go into production early in 1957. With the establishment of a caustic soda plant, the Company will be manufacturing one more important raw material for which uptil now we had to depend upon imports from foreign countries.

"In this context, I cannot but express concern regarding the serious handicap that all industrial establishments have been experiencing due to shortage of power and inadequate transport facilities. There is still considerable backlog of power demand to be met in Bombay over and above the power required to remove the staggering arrangements in vogue in the textile mills. This situation, therefore, needs radical improvement at the hands of the appropriate Government departments.

Supply of Wagons

"The other bottleneck from which industries are suffering is the unsatisfactory supply of wagons by the railways for carrying of coal, important raw materials and finished products. As regards wagons allocated for coal alone, the Company has been losing about 30 per cent. of its quota in view of the inability of the railways to supply the necessary wagons. Though in this matter, the Commissioners of Coal both of the State and at the Centre have been helping us out by granting special *ad hoc* quotas and allowing us to build up reasonable stocks, we cannot help expressing our concern at the transport situation as it is developing in this country. I am afraid, unless some drastic steps are taken to improve the transport problem, the country will come to a standstill as far as industrial expansion programme is concerned.

"Guaranteed and adequate supply of power and transport arrangements are essential prerequisites before anyone can think of industrial expansions. I am afraid, failing provision of these facilities quite ahead of industrialisation, the country will witness a phenomenon where an industrial plant would be lying idle for want of either power or transport facilities.

Freight Rates

"The proposed increase in freight rates announced by the principal shipping companies is also a matter of concern. It is a known fact that, at present, the Company depends largely on the imported raw materials for operating its plant. Additional freight that the Company would be called upon to pay if the threatened increase of 35 per cent. is imposed, would be considerably adding to the manufacturing cost. What is a matter for concern is that the threatened increase is stated to be due to the difficulties experienced by steamer companies in getting timely turnover of their steamers at the principal docks where sometimes delays of discharging or loading of cargoes are very great. This state of affairs is really very regrettable. It is, however, gratifying that, following this threat, the Port Trust authorities have endeavoured to clear the docks and the Government have also intervened and are endeavouring their utmost to persuade the steamer companies to refrain from imposing any such surcharge which, if done, is bound to disrupt the import and export trade of this country.

Dividend

"Your Board of Directors, after very careful consideration, have come to the conclusion that, both in the interest of the shareholders, and the Company, it is desirable to maintain dividend at one rate and alter it only when a higher rate is justified and the Company's profits permit. As you are aware, the Company has a large programme to fulfil and naturally it is desirable to finance a part of the programme from the profits of the Company rather than from the borrowings. Besides, the Company will be called upon to pay large amount of taxes in the years to come. Taking all these factors into consideration, we have decided to recommend Rs. 10 as dividend on ordinary shares and maintain it for a few years to come. I hope this policy of the Board will meet with your approval.

"It is gratifying that the Government has accepted the recommendations of the Taxation Enquiry Commission in the matter of giving development rebate to new industries which I am sure will help to accelerate industrial expansion. The recent announcement exempting rayon grade wood-pulp from payment of import duty will help expansion of rayon manufacturing and staple fibre industries. With reference to the relief to be given to the shareholders in respect of their investment in new industries, I suppose Government will take steps in the next year's budget. The relief given under the present section 15C(4) has remained a dead letter for reasons already explained in the Chairman's speech last year. I trust the Government will accept the recommendations of the Taxation Commission in this behalf and effect the necessary amendment so as to make the concession really effective.

Debentures Oversubscribed

"I have already referred in the Directors' report to the Company's decision to issue 5½ per cent. debentures for a total sum of Rs. 1,50,00,000, with a view to meeting a part of the expenses of the proposed expansion of the rayon plant and the establishment of the caustic soda chlorine plant. I am glad to inform you that the issue which was offered to the public was oversubscribed by about 100 per cent. necessitating closing of the subscription list on the opening day. I take this opportunity to thank the investing public for the confidence shown by them in this Company.

"It is gratifying to report that the relations between the management and labour have remained cordial and it has been possible for the Company to settle all the matters in dispute amicably by way of bipartite negotiations with representative union of workers resulting in a series of agreements. Even matters pending before the Labour Appellate Tribunal for the last two years have been settled amicably. The union in return has promised to maintain industrial peace for a minimum period of three years.

Rayon Plant to be Fabricated

"We have already reported to you that the new sulphuric acid plant was engineered entirely by our own technical staff and barring such standard equipments as motors, control equipments, pipes and fittings, etc., a major portion of the remaining part was fabricated locally. We are now in the process of expanding our rayon plant and increasing the capacities of the carbon-bi-sulphide plant, water works, etc., and we are also in the process of putting up a new caustic soda chlorine plant. I am glad to inform you that the engineering of all these plants will be done by our own technical staff at the factory and it is our ambition that gradually we should be able to fabricate almost the complete rayon yarn plant excepting for standard equipments which may be either procured locally or imported from abroad.

"I am sure I am voicing the feelings of every one of you when I say that the results obtained for the working of this year as also the progress made by the Company uptil now have been largely due to the loyalty of the workers and the ability of our technical and administrative staff."

RAISING EFFICIENCY OF SUGAR MILLS

KANPUR INSTITUTE OF TECHNOLOGY TO BE EXPANDED

THE latest move of Mr. Ajit Prasad Jain, Union Minister for Food and Agriculture, to impart more vigour and impetus to the implementation of schemes of sugar technology is highly commendable. Speaking on the occasion of his first official visit to the Indian Institute of Sugar Technology, Kanpur, last week, Mr. Jain stated that the Government of India had made good provision for setting up a new building for the Institute. He further revealed that there were also certain matters under consideration for making allocations for equipment, etc., and for enlarging the staff. Indeed, he said that the future of the Institute was in the melting pot, not in the sense that it was going to be dissolved, but in the sense that its shortcomings and weaknesses would be examined and it would be strengthened and reoriented so as to play a useful role in the country's economy.

These observations of Mr. Jain are certainly very reassuring. In the present context of the supreme need for enhancing the technical efficiency of the sugar industry, the part played by the Kanpur Institute of Sugar Technology is of great importance. It is this Institute which is primarily responsible for ensuring progress on the technological side of the sugar industry. Since its inception in 1936, the Institute has been doing valuable work by way of undertaking technological research, training of technical personnel, and doing advisory work in regard to statistical and technical matters pertaining to the industry. It has also conducted experiments relating to sugar chemistry, sugar technology and sugar engineering. In all this work, the methods of overcoming practical difficulties faced by factories in processing have been studied and experimented upon. Wherever means are found to overcome such difficulties, they are publicised for the benefit of factories. The Institute has also done valuable research work for the economic utilisation of the by-products, namely, molasses, press mud and bagasse. In order to examine the actual working of the factories and investigate their difficulties on the spot and render suitable technical assistance the staff of the Institute is deputed to the factories. The Institute has paid attention to the *khandsari* sector of the sugar industry too. Crushers and furnaces used in the manufacture of this type of sugar have been improved and the process of production modified so as to increase the efficiency of extraction of juice, resulting in higher recovery.

More Intensive Research Needed

Thanks largely to all this research work, the efficiency of the sugar industry has gone up considerably. In fact, it is claimed by sugar technologists that, on the whole, the efficiency of the Indian factories compares favourably with that of factories in the more advanced sugar producing countries. This is no doubt a very creditable achievement. But it should not lead to complacency, for there is still a vast field which needs further and more intensive research. In view of the importance of sugar to the country as its second largest industry, and also in view of the continuous need for progress in the technological field, the research and development wing of the Institute should be strengthened. It is also imperative to ensure that the results of research undertaken actually reach the manufacturers at the factory without delay.

All these aspects were duly stressed by the Food and Agriculture Minister last week. High quality research, the Minister said, was going to play an important part in the development of the sugar industry—indeed, of any other industry—inasmuch as the foundation of all progress was based on the formulation of new methods—technological, mechanical and administrative. He did not think that any industry or set of industries could do without high quality of research. At the same time, Mr. Jain did well to warn against research scholars and specialists "creating a sort of shell round them and living in a world of their own." Indicating that his interest lay in how he could make results of research available to the industry and thereby benefit the nation, Mr. Jain told the technologists of Kanpur Institute. "I have formed some idea, I am going to examine it in Delhi, of course, in consultation with your Director and certain other sections of the sugar and *gur* industry, and I would like to work out a scheme whereby the contract between you (sugar technologists) and the industry is made more intimate; you will benefit from the practical experience of the industry and the industry will benefit from your advice."

This approach of Mr. Jain is undoubtedly correct. After all, fundamental research into the problems of sugar industry, it must be admitted, would lose much of its importance if it were confined mainly to the laboratory. There must be free and speedy flow of knowledge from the laboratories to the factories. It is only then that one can expect a high level of efficiency in the industry and a reduction in the cost of sugar to suit the pocket of the common man.

RENTS FOR LANDS LEASED TO SUGAR MILLS

Of much interest to the sugar industry in the Bombay Deccan is the award of the Collector of Ahmednagar with regard to the rent of lands leased out to the Maharashtra Sugar Mills in the Tilak Nagar for growing sugarcane. The salient features of the award are: (1) Since the present rentals are inadequate, they must be raised to Rs. 50 per acre in the case of flow irrigation and Rs. 35 per acre in respect of lift irrigation of "caneable" lands; (2) all the lands leased out to the Company are not "caneable" and the rent for the land not used for growing cane should be Rs. 25 per acre; (3) the Company should give back lands to such of those lessors as have no land for personal cultivation, the unit per lessor being 3 acres; (4) the period of the lease should be 30 years.

The above award followed the agitation by the landlords (lessors) for an increase in the agreed rent of the lands leased out to the Maharashtra Sugar Mills and for restoration of lands on the expiration of the present duration of the leases. As the attempts to settle the matter amicably were unsuccessful, the Government of Bombay appointed the Collector of Ahmednagar as an arbitrator to mediate between the parties and to settle the main issues involved.

The contention of the landlords was that the lands leased out to the Company should be restored after their expiration or, in the alternative, three classes of lands should be restored, namely, landowners who are left without any lands for cultivation, poor and middle class landowners, and self-cultivator landlords. The Company should, it was argued, continue only the leases of absentee landlords and of those who had sufficient lands of their own for self-cultivation with due rise in the rent. On the other hand, the management of the Company stated that the Company's existing land position was very critical, as the land at its disposal for sugarcane plantation was only 50 per cent. of its requirements. In brief, the Company's points of view were: (1) to keep sufficient caneable lands with it, (2) fixation of reasonable rent for land under flow and lift irrigation, (3) fixation of the lease period for a sufficiently long time and (4) fixation of land rentals in accordance with the quality of the soil with reference to the land revenue. Incidentally, the Company is at present holding an area of 10,480 acres of land on lease, of which, 8,197 acres are caneable lands.

CO-OPERATIVE SUGAR MILL AT BARDOLI

The implementation of schemes for establishing co-operative mills in Bombay State is reported to be progressing fairly well. It is expected that several factories will commence production of sugar by the end of next year. One of them is the factory proposed to be erected at Bardoli. The capital outlay of this factory is estimated at Rs. 65 lakhs. The Industrial Finance Corporation of India is understood to have agreed to grant a loan of Rs. 40 lakhs. The Bombay Government has agreed to invest Rs. 10 lakhs in the venture. About 1,140 farmers, presently growing plantains on their lands, have already subscribed over Rs. 8 lakhs by way of share capital and another sum of Rs. 7 lakhs is to be collected shortly.

The Bardoli sugar factory will have a daily cane crushing capacity of 800 tons. Machinery and equipment worth Rs. 55 lakhs are to be imported from Germany and Czechoslovakia. Nearly 3,000 acres of land spread over an area of 20 miles will be brought under sugarcane cultivation. The aggregate value of the cane output is estimated at Rs. 45 lakhs per annum.

At a meeting held in Lucknow recently, the General Council of the Indian National Sugar Mills Workers' Federation urged the Central Government to extend the Employees' Provident Fund Act, 1952 to the sugar industry. This Act, it will be recalled, is now applied only to six industries—cement, cigarette, engineering, iron and steel, paper and textiles. Under the Act, the contribution of employers and employees to the Provident Fund is fixed at 6¼ per cent. of the basic wages and dearness allowance payable to employees. The Council also urged the U.P. Government to refer to adjudication issues relating to retaining allowances, sick leave, casual leave and bonus for the sugar season 1954-55.

The scheme for the manufacture of confectionery and other *gur* products from *neera*, evolved by one Mr. N. Venkatayya, has met with the approval of the Andhra Cabinet Sub-committee. The Committee has recommended the implementation of the scheme as an experimental measure in some places in the State and throughout the State later, if found essential. It has also favoured extension of the State Government's *neera* scheme and establishment of a few more ex-tapper co-operative societies.

The sugarcane growers of North Arcot District (Madras) are now busy promoting a sugar mill on co-operative basis. They have already collected some funds for the purpose. As there has arisen some difficulty in securing the requisite share capital of Rs. 10 lakhs, the cane growers have suggested to the State Government that the co-operative societies in the district be permitted to contribute their surplus fund towards the share capital of the proposed sugar mill. This suggestion is, at present, under the consideration of the Registrar of Co-operative Societies.

DURGAPUR COKE OVEN PLANT

CENTRE ACCEPTS SCHEME

WITH the acceptance by the Government of India of the West Bengal Government's proposal for setting up a coke oven plant, the country may be said to have marched a step forward towards achieving self-sufficiency in hard coke. The acceptance is a sequel to the recommendations made by the Coke Oven Projects Enquiry Committee appointed by the Planning Commission in November last to assess the economic prospects for setting up another coke oven plant in the country. The terms of reference to the Committee (*vide Commerce* dated 4th December, 1954, page 1099) included, among others, the assessment of demand for and supply of coke in the next five years, the examination of plans of existing producers of coke, the indication of the size of a new coke oven plant if there was scope for its establishment, and of the prospects for by-products recovery from such an oven, the investigation into the scope for a thermal plant as an adjunct to the coke oven plant, if set up at Durgapur, and the possibilities of ultilising coke oven gas for improving the economics of operation of the coke oven plant, etc. Having examined all these issues, the Committee, which was presided over by Mr. D. C. Driver, President of the Coal Consumers' Association, Calcutta, submitted its interim report in March, 1955, and the final report on 7th May last. The recommendations of the Committee, just released, throw interesting light on the prospects for setting up the plant at Durgapur as proposed by the West Bengal Government.

The Coke Oven Projects Enquiry Committee estimates the demand for hard coke by 1960, exclusive of the requirements of the steel works and other subsidiaries, as well as of the Sindri Fertiliser Factory, at 875,000 tons. Of this, the demand for sized coke would be 831,000 tons. The increase in demand is expected to arise mainly from foundries, the Mysore Iron and Steel Works, Bhadravati, and soda ash, sugar, calcium carbide and ferro-manganese industries. Of the total demand, 100,000 to 110,000 tons of the hard sized coke should contain phosphorus not exceeding 0.05 per cent. and ash below 20 per cent. for the manufacture of ferro-manganese and ferro-alloys production. Another 15,000 to 20,000 tons of coke should possess phosphorus not exceeding 0.03 per cent. and ash below 12 per cent. for the production of calcium carbide, sodium sulphide and special castings.

On the supply side, the Committee does not expect any supplies to the market from the Sindri Fertiliser Factory and the Steel Works at Jamshedpur. But the Indian Iron and Steel Company is expected to supply sized coke in quantities varying between 66,000 tons in 1955 and 44,000 tons in 1960 but nothing in 1959.

The Committee's investigation into the renovation programmes of existing foundries reveals that the four private cokeries will be raising their capacity to 307,000 tons of hard coke. The share of sized coke in this total is estimated at 269,500 tons. To this is added the supplies of about 27,600 tons by the Giridih Coke Ovens. Thus, the total availability of sized coke, from all the existing sources, is expected to be 341,100 tons. Including supplies of sized bee-hive coke, estimated at 105,000 tons in 1960, the total domestic supplies of sized coke would be 446,000 tons, as against the total demand, as estimated at the outset, of 831,000 tons. The deficit in supplies of sized coke would thus amount to 384,900 tons. Of this deficit, 250,000 to 270,000 tons are sized coal of normal grade, the rest being of special grades.

After thus establishing the need for additional production of sized coal, the Committee proceeds to consider the question of locating the site for setting up a plant at Durgapur. In examining this issue, the Committee has precluded itself from studying several aspects of the different coalfields and their coal and making comparative merits and demerits of each location in these fields. This is because the volume of work and the investigation that would be involved would take a considerably longer period than at the disposal of the Committee. It has, therefore, confined its enquiry to the issue of locating the plant at Durgapur. Its examination of the several aspects relating to Durgapur reveals the existence of (a) facilities for quick transport towards Calcutta side from a four-track railway system soon to be electrified, (b) cheaper railway freight for coke as compared with freight from Jharia, etc., (c) future availability of water transport through Durgapur canal towards Calcutta and places in between, (d) cheap land, (e) water supplies, and (f) a developed colony. It further shows that Durgapur is also favourably situated in respect of availability of coal and power and the market. The Committee is, therefore, of the opinion that,

More cement means better living for all; and the ACC continues to produce more and more quality cement

CEYLON REDUCES EXPORT DUTY ON TEA

EXPORT SUBSIDY SCHEME GIVEN UP

THE Government of Ceylon is reported to have decided to effect a 50 per cent. cut in export duty on tea from Re. 1 to 50 cents per lb. Though no official announcement has been made at the time of writing (Tuesday, the 7th inst.), it is stated that the reduction will be operative from the 8th inst. Consequent on the aforesaid cut in export duty, the Government's earlier scheme to subsidise export of tea has been withdrawn. This scheme of subsidy, it may be recalled, was introduced only as recently as on 23rd May, under which all teas which were catalogued and sold at auction as first-hand tea at a price below Re. 1.50 per lb. would receive, as an export subsidy, the difference between Re. 1.50 and the price realised, subject to a maximum of 50 cents.

The scheme of subsidising export of tea did not find favour with a section of the tea industry of Ceylon. It may be recalled that Mr. S. Pathmanathan, former Chairman of the Low-country Products Association, expressed the view that the subsidy scheme would lead to many abuses. He also foresaw that, within two months, the tea markets would be flooded with Indian teas bearing lower export duty than Ceylon teas and that consumers of Ceylon tea, mainly Australia, would switch over to Indian teas. That apart, as we ourselves pointed out ere now, the idea of subsidising exports, while subjecting the same to a stiff export duty of Re. 1 per lb. is ridiculous. What the Government has now decided to do was inevitable.

In giving up the scheme of subsidy within two weeks of its introduction, the Ceylon Government must have found it very costly. For it was reported last week that, even on the first day of the operation of the scheme, it cost the Government Rs. 15 lakhs. Of this amount, payment of subsidy accounted for Rs. 11 lakhs and cost of purchasing unsaleable teas for Rs. 4 lakhs. The Prime Minister had expected that, in view of the improvement in tea market of late, the expenditure on the subsidy would not be much and that it would not have to buy up lots of tea. He assured that should the need arise, the Government would certainly go all out to meet its commitments under the scheme. The aforesaid expenditure from the public Exchequer on the scheme in the first auction itself clearly showed that the scheme was not a little costly and that the Prime Minister's expectation would be belied. At the time of introducing the subsidy scheme, the Government must have thought that it could more than make good the cost of subsidising export and purchasing unsold teas by the levy of high export duty on larger exports consequent on the removal of export restrictions for a period of three months from 27th April. In fact, the Tea Controller of Ceylon issued export licences to the tune of 9 million lbs. between 1st and 18th May; this quantity compared with the total quantity of 21.3 million lbs. for which export licences were issued during the first four months of 1955. The heavy cost of subsidy involved at the very first auction might have shown that ultimately the Government was suffering a heavy loss. Otherwise, there was no reason for withdrawing the subsidy. For there has been no such sharp improvement in prices as to render subsidising by the Government unnecessary. Anyway, it is gratifying to note that the Government has realised its folly before it was too late.

The reduction in export duty by the Ceylon Government closely follows the Government of India's action last week reducing the export duty on Indian tea from As. 8 to As. 4 per lb. with effect from 1st June. The last occasion on which the Ceylon Government reduced the export duty was on 22nd April, when the duty was cut from Re. 1.30 to Re. 1 per lb., thus restoring it to the level which had prevailed before 21st January when it had been raised to Re. 1.30 per lb. The export duty on Ceylon tea had for some time past remained well above that on Indian tea. Early in January last, when India raised the export duty from As. 7 to As. 10 per lb. with effect from 7th January, the export duty on Ceylon tea had stood at Re. 1 per lb., thus commanding a premium of As. 6. This difference widened further when the Ceylon Government raised it to Re. 1.30 per lb. on 21st January. When the Ceylon duty was reduced to Re. 1 per lb. on 22nd April, the Indian duty was As. 8 The reduction from 1st June to As. 4 of the Indian duty again accentuated the difference. It is, therefore, not surprising that Ceylon finally decided to reduce the wide gap, if not close it altogether. Notwithstanding the latest reduction, the export duty on Ceylon tea is still higher by a quarter of a rupee. With this 50 per cent. cut in export duty, the Government certainly cannot afford to continue the costly subsidy scheme also.

The reduction in export duty by India and Ceylon may not have any direct effect on improving prices at auction. It may, however, help the producers who bear the burden of export duty, to realise a larger proportion of the auction price actually received by them. (The export duty is paid by producers and the difference between the auction price and the export duty is retained by them). To the extent the duty is reduced, therefore, the hardship on producers as a result of the fall in tea prices is alleviated.

Nothwithstanding the cut in export duty by the two main producing countries, much attention is being paid to avert the repetition of the 1952 depression in the tea market. One of the leading firms of tea brokers, Messrs. A. W. Figgis of Calcutta, has urged the producers in North India to keep ready the machinery for speedy restriction of output. It is of the view that the best form of restricting crop is to concentrate on better quality production. In order to ensure that only the best quality is turned out, the firm has suggested the adoption of a scheme for compulsory destruction of some residual teas. This would lead to a loss of 10 to 15 million lbs. of completely unwanted tea. The firm urges that producers should try to restore confidence to tea markets by the end of July at the latest. The flow of tea should be so phased as to eliminate undue market fluctuations. A similar suggestion was recently made by Messrs. Carritt Moran and Co., Ltd., another leading firm of tea brokers. This firm said that, if production in India were restricted by more careful plucking and manufacture, buyers would obtain the confidence they required that stocks were not to be permitted to become unduly large. To this end, it would seem, the firm added, that crops from India and Ceylon this year should be no larger and preferably rather smaller than last year.

FINANCING ASSAM TEA INDUSTRY

Tea is the most important industry of the Assam State and is also well organised. Its contribution to the country's foreign exchange earnings makes it occupy a unique place in the national economy. It is, therefore, not surprising that this industry accounted for the largest number of enquiries for accommodation from the Assam Financial Corporation during the period ended 31st March, 1955. Out of the 59 enquiries for loans from industrial concerns received by the Corporation, 14 were from the tea industry. The actual number of applications for accommodation received from the tea industry was, however, only four and the amount of loan applied for was Rs. 3.15 lakhs. Though the tea industry accounted for the largest number of applications, the total amount applied for by it was not the highest. But none of the loan applications from tea companies was sanctioned during the period under review. Of the four applications, two (for a total sum of Rs. 1.85 lakhs) were deferred for fulfilment of certain conditions and two others (for Rs. 1.30 lakhs) were held up for want of information or pending enquiry.

Despite the leading place it occupies in the industrial field of Assam, the number of applications for loans was small and the amount sought for is low. One reason for this, according to the latest Directors' report of the Corporation, is that, because tea prices were at peak levels during the period under review, there was not much urge on the part of even the smaller units in the industry to seek medium and long-term advances for capital expenditure. Another reason for this state of affairs is: "most of the tea gardens obtain their working capital from commercial banks against hypothecation of their tea crop and export rights and some of the banks insist on the deposit of title deeds or an undertaking not to encumber the fixed assets while granting accommodation against the hypothecation of tea crop. Even though some of the gardens may like to avail of accommodation from the Corporation for their requirements of block capital, they are apprehensive of their bankers restricting or altogether stopping the seasonal accommodation against hypothecation of tea crop for their requirements of working capital." The Board has, however, since decided to provide, in deserving cases, working capital in addition to block capital.

Out of the total quantity of 4,000 tons of coffee originally permitted by the India Government for export to places outside India during the current year, 2,650 tons had been sold by the Indian Coffee Board to registered dealers by means of closed auctions and most of this quantity has been exported. A further quantity of 200 tons has been released this week for sale to the registered dealers to enable them to export outside.

GUNNY DESPATCHES

INTERNAL OFFTAKE IMPROVES

GUNNY despatches from jute mills in India during April, 1955—the latest month for which official figures have just been released—amounted to 76,000 tons. Although this quantity is the same as that in April, 1954, it is about 700 tons lower than the despatches in March, 1955. This small setback is accounted for by minor declines in both exports and internal consumption. With the despatches in the month under review, the total for the first 10 months of the current season aggregated 814,500 tons, representing a rise of 7.1 per cent. over the total despatches in the corresponding period of 1953-54, at 759,700 tons. The improvement in the total mill despatches was shared by exports as well as by internal consumption. The exports rose from 657,400 tons in the 10-month period of 1953-54 to 709,100 tons in the corresponding period of the current season. Similarly, the offtake for internal consumption improved from 102,300 tons to 105,400 tons in the period under review. The table below shows at a glance, the trends of despatches for exports and internal consumption during each of the 10 months of 1954-55, as compared with the corresponding months of 1953-54.

Despatches of Gunnies

(In 000 tons)

	1954-55			1953-54		
	Exports	Internal con-sumption	Total	Exports	Internal con-sumption	Total
July ..	80.2	7.1	87.4	67.0	9.7	76.7
August ..	80.9	7.8	88.7	63.1	8.7	71.8
September ..	71.3	9.4	80.7	80.6	9.3	89.9
October ..	64.8	7.4	72.2	72.0	9.8	81.8
November ..	79.6	9.9	89.5	62.6	10.7	73.3
December ..	79.4	12.5	91.9	63.3	13.2	75.5
January ..	64.5	12.1	76.6	68.0	10.5	83.5
February ..	62.2	12.5	74.8	59.6	8.5	68.1
March ..	63.2	13.5	76.7	67.2	10.9	78.1
April ..	62.8	13.2	76.0	65.0	11.0	76.0
Total ..	709.1	105.4	814.5	657.4	102.3	759.7

A striking feature disclosed by the table above is that, since January, 1954, there has been a marked decline in exports of gunnies from India. The main reason for this is the lack of interest of U.S. buyers in the Indian market owing to high prices of jute goods. Reluctance to support jute goods at high prices is reflected in the figures of the U.S. hessian stocks and consumption. Thus, during the first ten months of 1954-55, U.S. consumption of burlap was only 665,000 million yards which is 35 million yards lower than that in the period of 1953-54. U.S. stocks of hessians, on the other hand, rose from 183 million yards to 258 million yards.

Home Demand

The table above further reveals considerable improvement in the offtake of jute goods for internal consumption. The monthly offtake which used to be of the order of 10,000 yards has, during each of the five months ended April, 1955, been above the 12,000-ton mark. A part of this increase may be attributed to the demand for gunnies arising out of the significant increase in both industrial and agricultural output in the country during the last three years.

Full details of despatches for May, 1955, will be available only after some time. But, according to press reports, it would appear that shipments of jute goods in the month were better than those in the preceding two months. Hessian shipments amounted to 30,659 tons in May, as against 23,695 tons in April and 25,944 tons in March this year. The performance of sackings would appear to be far better than that of hessians. Sacking shipments in May are reported to be 45,266 tons, which compare with 32,047 tons and 25,944 tons in the two preceding months, respectively. This improvement in exports should bring considerable relief to the mills. For it should have gone a long way towards reducing the stocks of finished goods with them at the end of May. It may be noted, in this connection, that, at the end of April, 1955, the stocks had gone up to as high as 103,300 tons. The heavy accumulation of unsold stocks had created anxiety among the mills and for a while there was even talk that the mills were contemplating reduction in their weekly working hours. This possibility should, for the present, recede to the background, now that the stocks with the mills are expected to be lower than in April. But this may prove to be only a passing phase. It is just likely that the increase in shipments last month merely reflects the improvement in the labour situation in the docks at Calcutta.

INDIA'S IRON AND STEEL INDUSTRY—I

POST-WAR PROBLEMS AND PLANS FOR EXPANSION

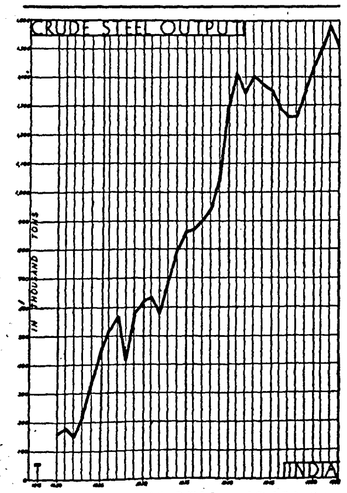
[India's plans for raising production of steel are receiving world-wide attention. Several countries have come forward with proposals for assisting this country in the implementation of its ambitious projects. These include not only the major steel producers such as the U.S., the U.K., W. Germany and Russia, but also minor producers such as Austria and France. All these countries must have obviously studied the potentialities of making steel in India. That the British iron and steel industry has made such a study is evident from a detailed article published by the British Iron and Steel Federation in the last February issue of its Monthly Statistical Bulletin. A brief reference to this study was made in our issue of 2nd April, 1955, vide page 628. We are now publishing, with due acknowledgment to the Federation, the full text of the article in two instalments, as it gives a connected account of all the basic facts of the industry and as such will serve as a useful source of reference. The first instalment appears on these pages, while the second will figure in our next issue.

*The Survey is up to date and comprehensive, in the preparation of which the British Federation must have spent considerable time and energy. It describes India's existing iron and steel industry, its plans and problems and summarises the various proposals for new capacity to bring steel production eventually upto 6 million tons a year.—*ED.]

THE foundation of India's present iron and steel industry was not laid until 1872, since when development has been steady, although slow judged by Western standards. Characteristic of the Indian industry is the fact that pig iron output has always surpassed that of steel. This is mainly due to the relatively large iron foundry industry, and also to the conventional use of a low scrap ratio in the open hearth charge—this being necessitated by the scarcity of scrap which is usual in underdeveloped countries. Another characteristic of the Indian industry has been a surplus of pig iron for export, although in the last two or three years this has almost disappeared.

The Indian Government of the immediate post-war years had high hopes of rapidly expanding the country's economy. However, by the time the Planning Commission had made its report in 1951, the first optimism had subsided, for the overwhelming difficulty—lack of capital—had become all too obvious. The Commission's report emphasised the importance of steel production, pointing out that nothing was holding up India's industrial development more than the acute shortage of steel. The report stressed that, with ore resources* of such high Fe content and situated so near to coking coal supplies, no country was more suited to steel-making; but it concluded nevertheless that financial obstacles would prevent any large immediate expansion.

A Five-year Plan was eventually formulated having regard to the resources at India's disposal, and based on the Planning Commission's suggestion that steel output should reach 1,650,000 tons by 1957-58. Since then a second Five-year Plan has been formulated, envisaging an ingot production of 6 million tons by 1962. More recently, Mr. K. C. Reddy, Minister of Production, has declared that there is no reason why India should not think in terms of 10 million tons for its third Five-year Plan.



By Courtesy of the British Iron and Steel Federation

*India's raw material resources are reviewed in Appendix I, which will be published in our next issue.—ED.

In the years immediately following World War II, demand for steel was greater than supply, this being further aggravated by the Korean war. India, a country which has habitually relied upon some imports of steel, suffered acutely from this shortage. With no steel-exporting nations as her near neighbours, India has always had to import from distant countries, involving transport over thousands of miles. In the post-war years of high freight rates and scarce foreign exchange, India has used this adverse situation to support the argument for self-sufficiency in steelmaking.

With home demand over the past nine years far in excess of supply, the Indian Government found it necessary to operate an allocation scheme,† together with price controls. Consequently, it is difficult to give any accurate estimate of what current demand would be in a free market. Various estimates have been made since 1946 by a number of different bodies, both Indian and international; the best is probably that of the Indian Government itself, which estimated that 1957 finished steel requirements in a free market would be in the region of 2.7 million tons. The capacity of the main producers of finished steel is at present just over 1 million tons, whilst the actual production trend in the post-war years is shown in the graph on the opposite page.

Finished Steel Available

It must be mentioned that the 1953 decline was largely due to labour troubles at the Burnpur works of the Indian Iron and Steel Company. The otherwise steady increase is what might be expected in a country where steel consumption per head of population is low and where, for both economic and nationalistic reasons, production is being fostered. To supplement home production, India has made efforts in recent years to increase her imports, but with little success, owing to world shortage and her lack of foreign exchange. As steel exports are negligible, the graph also gives an idea of total steel availabilities in India.

†As there are no statistics of consumption by industry, the Government allocations may be of interest; they are given in the following table:

(Thousand tons)

	1952	1953
Government—

Policy of Nationalisation

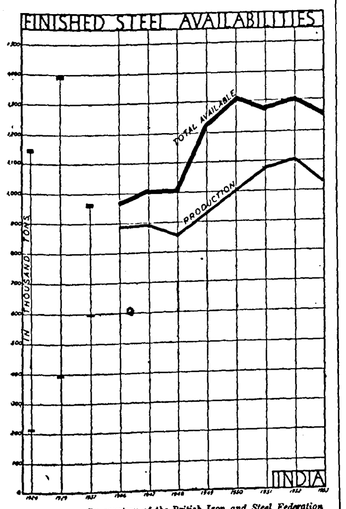
In 1948, the Government declared that their ultimate intention was to nationalise the iron and steel industry, but that no immediate action was to be taken and the position would be next reviewed in 1958. The immediate effect of such a statement was obviously to add to the industry's difficulty in obtaining further capital from either the home market or overseas.

Nevertheless, in 1950, a panel of Government experts compiled a list of industries which they advised the Government to make State monopolies. This list, whilst it included the railways and manufacture of arms and ammunition, mentioned only *new* undertakings as far as iron and steel was concerned. Reference to this subject in the first Indian Five-year Plan (1951-56) published in 1952, was, however, vague—stating that "in planning, the role that the State will have to play will be a crucial one. While his need not involve complete nationalisation of the means of production or elimination of private agencies in agriculture, business and industry, it does mean a progressive widening of the public sector and a reorientation of the private sector to the needs of a planned economy." The steel industry is therefore officially regarded as one for whose further development "the State is responsible, except to the extent that the co-operation of private enterprise is from time to time considered necessary."

Capital Shortage

It may be said that much of the equipment in the existing industry needs modernising. The strain of war-time demand certainly subjected plant and equipment to abnormal wear and tear, but the companies are reproached with not having kept pace with technological progress in pre-war years. In any case, these firms after the war had insufficient capital for the required large-scale modernisation and expansion.

The Indian Government has been faced with the same difficulty—and India's tardiness in establishing a State steelworks has been largely due to lack of finance. The financial aspect, however, represents only one side of the problem. Another difficulty in the years up to 1952 has been to find plant makers who were in a position to supply new equipment and to modernise older plant. Since the war, plant makers have been so occupied in replacing and renewing equipment in their own countries, and in those able to pay promptly, that markets



By courtesy of the British Iron and Steel Federation

such as India have had very little attention. Today, however, the whole situation has changed, for not only has India found the necessary finance, but plant makers are now seeking orders in a very competitive market.

Financial Aid

Part of the finance required for expansion in the private sector has been made available by the Government, both directly through loans, and indirectly by raising retention prices (explained later) and also by insisting that special depreciation allowances be set apart and used for implementing a programme of plant renewal, replacement and extension.

The steel companies themselves, from their current rate of operation, could allow no more than £22.4 million for expansion and replacements over the five-year period, yet it is estimated that a further £31.4 million was necessary. "This amount is so large," reported the Planning Commission, "that it will have to be mobilised from more than one source by and with the assistance of the State." The Government has come to the aid of the companies, and in the case of Tatas has granted a loan of £7.5 million for raising finished steel capacity from the present annual level of 780,000 tons of 931,000 tons by 1957-58. The Indian Iron and Steel Company, besides a large increase in pig iron capacity, is to increase annual finished steel potential from 350,000 tons to about 700,000 tons by the end of 1957, and has received from the Government a repayable advance of £7.5 million and an ordinary loan of £2.15 million. This is in addition to the £3.75 million previously granted and to the £11.25 million from the World Bank, which is being guaranteed by the Government. The Mysore Iron and Steel Company, has received a loan of £300,000, whilst other Government commitments for loans to steel development schemes amount to some £3 million.

Changes in Company Structure

Government financial assistance has not been granted without these companies agreeing to some fundamental changes in their structure. It was Government pressure which brought about the amalgamation of the Steel Corporation of Bengal with the Indian Iron and Steel Company on 1st January, 1953, a step which was certainly desirable on the grounds of efficiency. The Government has also secured participation in the direction of the companies by having its own nominees functioning as directors. Tata's long-standing proposal to convert its deferred shares into ordinary units was also supported by the Government and this resulted in shareholders accepting the scheme.

Whilst the expansion and modernisation programmes of the existing steel companies were being agreed, the possibilities of the long-discussed new State plant were also under discussion. An offer from a Japanese group suggesting Indo-Japanese co-operation in setting up a new steel plant was seriously considered, but negotiations broke down on Indian insistence that all control and management should remain in their hands. Nevertheless, the Japanese negotiations served one useful purpose, for they led to offers of assistance in establishing a new steel plant being received from various plant-making firms in several parts of the world.

German Plant

The Indian Government finally came to an agreement with the German concern Krupp-Demag A.G. (with whom they signed an agreement in Bonn in August 1953) to plan a steelworks at Rourkela in Orissa. Originally, the plant was to have an initial annual ingot capacity of 500,000 tons with provision for doubling that potential within three or four years, but it has now been made clear that the project is to be revised immediately to 1 million tons. Contracts, however, will not necessarily go to Germany, but will depend upon what offers are received from other countries. The Germans expected that the initial 500,000-ton capacity would be working within a period of four years, provided the ancilliary facilities, such as railways, water and electricity were available.

A company—The Hindustan Steel Company—has been formed with an authorised capital of £75 million to implement the agreement. The total capital cost of the initial project is estimated at £53.3 million, of which Krupp-Demag is to supply as a loan about £7 million. The balance of the share capital will be found by the Government of India. The German investment will be for a definite period of 10 years with the possibility of an extension. In this connection the Krupp concern has secured a credit of £4.3 million for a total of eight years—Frankfurt Export Credit Institute covering the first four years, whilst the Federal Government has agreed to step in and cover the period 1957-61.

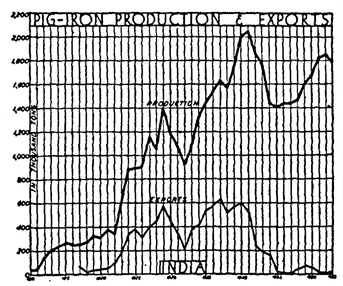
Russian Plant

Recently the Indian Government has signed an agreement with the Soviet Union to build a plant with a capacity of a million tons at Bhilai in Madhya Pradesh; this is, however, subject to ratification. Full cost of the project is estimated at £75 million, which will include the development of the site and building of the township. Of this amount, the Soviet Union will supply about £33 million of plant, machinery and equipment (excluding a sinter plant), all f.o.b. Black Sea or Baltic port, the amount to be repayable in rupees in 12 annual instalments at the very low rate of 2½ per cent. interest. If the agreement goes through, the works will from the outset be entirely controlled by the Indian Government. Whilst this will be the second steel plant established in India with foreign assistance, it will be the first major project outside the Communist bloc to be financially aided and constructed by the Soviet Union.

British Proposals

The Indian Government's policy of insisting that new undertakings in the iron and steel industry must be predominantly State-owned recently led to the failure of negotiations between the Metallurgical Equipment Export Company (M.E.E.Co.) of London and a group of Indian industrialists for building and operating a privately-owned steelworks at Durgapur in West Bengal. The British proposals, however, were then submitted direct to the Indian Government for consideration, backed by an indication from the British Government that financial assistance on a long-term credit basis would be available through the Export Credit Guarantee Department for a State-sponsored development exactly as it would be for a privately-owned enterprise. The offer has been "accepted in principle," and in view of Mr. Nehru's statement that both the Russian and the British offer may finally be taken up, it is likely to constitute the fifth large steelworks in the India of tomorrow.

(To be continued)



N.B.—Exports for years after 1924 are for 12 months to 31st March.

NEW PRODUCTS AND PROCESSES

Portable Irrigation

AN irrigation system, based upon the use of plastic piping and which can be moved to any part of a farm or orchard is a new agricultural development in Australia. The units comprise two tubes of heavy gauge, unbreakable, heat-resisting plastic, which have jet sprays incorporated at regular intervals throughout their lengths. In the same manner as a fireman's hose is used, the plastic tubing is wound round a specially constructed reel. This can be hooked on to the back of a tractor. After being attached directly to the water main, the tubing turns out freely from the reel behind the tractor, and is laid down the centre of the area to be irrigated. When water is turned on, the jet sprays distribute it over considerable areas, the tubing being supplied in 400 feet lengths. After use, the tubing can be re-wound automatically, so that the tractor need not be driven over the soaked sections. The tubing, which is made by the Victorian company, Mobile Industrial Equipment Pty. Ltd., of Whitehorse Road, Nunawading (Australia), has the jet sprays at 20 feet intervals, and 400 feet will irrigate one acre of orchard.

Brown Coal Used for Cement Making

Manufacture of cement with the use of brown coal by the vertical kiln method has been successfully pioneered in Traralgon, Victoria (Australia). The low-grade fuel has been very much cheaper than that required for the rotary kiln technique, which uses black coal from New South Wales. Ground limestone, clay and fuel are formed together into small pellets or nodules, which are then burnt in a vertical kiln. The economy is based on the fact that the wet-process rotary kiln requires twice as much heat as a modern vertical kiln. Tests carried out in Government laboratories indicate that the strength of the cement from the Traralgon plant is well above that required by the Australian Bureau of Standards. Traralgon is 100 miles south-east of Melbourne, and the plant was built in ten months at a cost of just over £A300,000.

New Passenger Train

A new lightweight, high-speed passenger train being built for two American railroads is on display in New York. The train comes in three car units which are completely reversible. The cars are reported to be 50 per cent. lighter than conventional passenger coaches, and can seat 84 to 96 passengers. They are cheaper than standard coaches and the builders predict maintenance costs may be only one-fourth as much as with standard cars.

Ultrasonic Waves Prevent Honey Crystallation

Crystallation of honey, which causes large losses, can be prevented with ultrasonic waves, according to Dr. Socrates A. Kaloyereas of Louisiana State University's agricultural experiment station. Dr. Kaloyereas reports that honey treated with ultrasonic waves and stored for one to four weeks at temperatures from 40 degrees below zero Fahrenheit to plus 102 degrees Fahrenheit showed no signs of crystallising. Untreated samples of honey similarly exposed showed signs of crystallising and spoiling.

Seeing Through Steel

U.S. scientists and engineers have developed an inspection tool, which can "see" through steel seven inches thick, thus making available another use of atomic energy. The unit, which uses radio-active cobalt 60, has been named "Isoscope." The "Isoscope" requires only one-third the exposure time of a million volt X-ray unit used for inspection purposes. The unit was developed by the Babcock and Wilcox Company in Barberton, Ohio.

New Plastic for Tropic Packing

The Imperial Chemical Industries of Australia and New Zealand Ltd. (I.C.I.A.N.Z.) is now producing a transparent plastic film known as the "Visqueen" brand of polythene, and which in the United States is used extensively for packaging. The film is transparent, tough, durable and waterproof, with a soft waxy appearance, which makes it ideal for all methods of packaging. During World War II, the Visking Corporation of Chicago (U.S.) developed from polythene this special packaging material to protect arms and equipment against tropical humidity. By agreement, the Australian company is using the Visking patents and processes. The film can be made into packages to hold practically any type of liquid. In addition, it also "breathes" because of a special property of selective gas transmission which allows oxygen in and carbon dioxide out. Its water vapour transmission rate is extremely low.

Radio-equipped Lawnmowers

Grasscutting at London Airport has been planned like a military operation. Six giant tractor-drawn lawnmowers, each able to cut a swath 16 ft. wide, are to be fitted with two-way wireless to solve the problem of keeping the 1,100 acres of grass evenly cut, while aircraft from all over the world come and go at the rate of 400 a day. The manufacturers of the lawnmowers believe that by using wireless they have eliminated the possibility of accidents. "The tractors," they say, "work at a speed of 6 m.p.h., and that gives them plenty of time to get out of the way after a warning." What happens to the tons of grass cut every day? Most of it is processed and used as cattle food.

TAXATION ON GENERAL INSURANCE

GOVERNMENT URGED TO IMPLEMENT MATTHAI COMMISSION'S RECOMMENDATIONS

SOME concern is expressed by general insurers over the continued uncertainty in regard to the Government's decision relating to the Taxation Enquiry Commission's recommendations on the subject of taxation of general insurance offices. Naturally enough, the Commission's suggestions for the reform of the law relating to such taxation were widely welcomed by general insurers at the time they were published. It was then believed that the Government would not long delay their implementation. But it now looks as though the Government has not fully made up its mind to implement them. In any case, the delay is sufficiently long to justify the concern that is felt by the insurers.

Indeed, the delay is the more surprising because the Government has readily accepted certain other important recommendations of the Commission. Thus, it has implemented the Commission's recommendation for raising the maximum amount for abatement in respect of insurance premium and provident fund contribution to one-fifth of the total income subject to a maximum of Rs. 16,000 for Hindu undivided families and Rs. 8,000 for other assessees. It is not clear why the Government has found it necessary to delay the announcement of its decisions on the Commission's recommendations in respect of taxation of profits of general offices. It would appear that the Indian Insurance Companies Association has represented to the Government requesting early action on the Commission's suggestions for tax relief.

From the point of view of general insurers, the Commission's chief recommendation, it may be recalled, relates to the provision of reserves for unexpired risks. The companies are now allowed to set aside as reserves for unexpired risks upto 50 per cent. of the current year's premium income in respect of fire and miscellaneous insurance and 100 per cent. for marine insurance. Representations were made to the Taxation Enquiry Commission suggesting that Indian insurance companies should be enabled to attain a sound financial position by affording them necessary facilities to build up adequate reserves which would improve their competitive capacity and help them play their proper role in the future economy of the country. The Commission was impressed by these arguments. It agreed that general insurance in India was still in an "early stage" of development and needed "encouragement" for building up reserves. It accordingly recommended that the companies should be allowed to add 5 per cent. of their annual premium to the reserve every year, free of tax, until they reach 75 per cent. of annual premiums in respect of fire and miscellaneous business and 150 per cent. in respect of marine and aviation bulk business.

General insurers will appreciate an early announcement by the Government of its decision accepting the Commission's recommendations. In this connection, it is pointed out that the balance-sheets of insurance companies for 1954 are in the course of preparation at present. Many of these companies would like to provide for reserves in their revenue account on the revised basis recommended by the Taxation Enquiry Commission. They will be encouraged to do so if the Government specifically accepts the Commission's recommendations and the Central Board of Revenue issues necessary instructions to the income-tax authorities directing them to permit insurers to provide for reserves in accordance with the Commission's suggestions.

Yet another aspect of the Commission's recommendations, on which insurers would appreciate early action by the Government, relates to the question of taxation of treaties and other reinsurances placed outside India. General insurers have already represented to the Government how reinsurance is indispensable to the day-to-day operations of insurance companies and that any attempt at taxing the profits earned by foreign offices under reinsurance arrangements with Indian companies would seriously jeopardise the cause of Indian insurers in the international insurance market. Examining this problem, the Commission said that it was "impressed" by the consideration that such taxation would make foreign reinsurance companies reluctant to accept reinsurance from India. It added: "In the interests of general insurance business being built up in India, we would suggest that the best policy would be not to apply the interpretation that a business connection arises in such transactions." It, however, felt that no amendment of the law was necessary to bring about the result which could be secured by the issue of suitable executive instructions. This issue is of vital concern to the future of general insurance in India. For, if the Government's tax policy is so designed as to discourage the co-operation of well-established foreign insurers with Indian insurers, it is the latter, not the former, that will be the losers thereby. The continued uncertainty about the taxation of profits arising from reinsurance contracts is bound to curtail the freedom and initiative of Indian general insurers in placing, as well as obtaining, reinsurance contracts in the world's leading insurance markets. It is, therefore, to be hoped that the Government will clarify the position, specifically accepting the Commission's recommendations on the subject.

HERCULES INSURANCE

The report and accounts of the Hercules Insurance Company, Ltd. (Manager and Underwriter: Mr. E. K. Srinivasan, Calcutta), disclose that the Company has had another year of satisfactory working. Although premium income of this general insurance office in 1954 at Rs. 46 lakhs shows a slight fall as compared with the previous year when it was Rs. 49.24 lakhs, the underwriting profit for 1954 was actually higher at Rs. 8.87 lakhs, as against Rs. 8.51 lakhs in 1953. The Directors have recommended an increased dividend of Rs. 2 per share on the Rs. 10 paid-up share of the Company, as against Re. 1-8 paid last year. The increase in dividend is particularly noteworthy, because it is paid on the new capital which, through the capitalisation of reserves, stands at Rs. 24 lakhs, as against Rs. 12 lakhs at the end of 1953.

The fall in premium income, to which a reference was made at the outset, is due to a setback in the Company's Indian business. Thus, the premium income from the business done in India declined from Rs. 22.41 lakhs in 1953 to Rs. 19.10 lakhs in 1954, whereas the income from the Company's foreign portfolio has shown a small increase from Rs. 26.82 lakhs to Rs. 26.89 lakhs. The fall in premium income has been shared by the fire and accident departments. In the fire department, the premium income declined from Rs. 34.98 lakhs to Rs. 33.17 lakhs, while in the accident department it was lower at Rs. 6.30 lakhs, as against Rs. 8.06 lakhs. In the marine department, however, it was somewhat higher at Rs. 6.52 lakhs.

The mainstay of the Company is its fire department which yielded an underwriting profit of Rs. 6.87 lakhs, as against Rs. 6.05 lakhs in 1953. The accident department yielded Rs. 1.31 lakhs, as compared with Rs. 1.85 lakhs and the marine department Rs. 69,946, as against Rs. 61,420. In 1954, the income derived from interest and dividend aggregated Rs. 3.14 lakhs, as against Rs. 3.03 lakhs in the previous year. The underwriting profit in the three departments, together with interest and dividends and income from other sources, makes in all Rs. 12.21 lakhs. After providing Rs. 5.20 lakhs for taxation, the disposable balance of the year, including the amount brought forward from last year, is Rs. 10.15 lakhs. The Directors have transferred Rs. 2 lakhs to general reserve, as against Rs. 4 lakhs last year. The payment of the recommended dividend of Rs. 2 per share absorbs Rs. 4.80 lakhs, leaving a balance of Rs. 3.35 lakhs to be carried forward.

The financial position of the Company continues to be very strong. Besides a capital of Rs. 24 lakhs, the Company has reserves and funds aggregating Rs. 51.82 lakhs, inclusive of fire fund Rs. 16.59 lakhs, accident fund Rs. 3.15 lakhs and marine fund Rs. 6.52 lakhs.

FIRE LOSSES IN COTTON FACTORIES

The losses due to fires in cotton ginning and pressing factories, it is stated, are assuming serious proportions in certain centres. Since cotton in these factories is generally insured against fire, the insurers have had to pay, in recent years, large claims running into several lakhs of rupees. What is more regrettable about these losses is that many of them can be traced to avoidable causes. A serious and frequent cause of fire is stated to be sparks from railway engines. Because many of the factories are situated in the vicinity of railway stations and cotton is stocked in the compounds of the factories, even a single spark from a steam engine, it is stated, is sufficient to set ablaze the unprotected cotton stocks.

It would appear that, if the railway authorities installed spark arresters in these engines, there would be less chance of occurrence of such fire losses. On a former occasion, when the insurers took up this matter with the railway authorities, they were informed that, as there was a proposal to replace all steam engines by diesel engines, it was unnecessary to consider the question of installation of spark arresters. Since then, the proposal is stated to have been dropped. In any case, it seems clear that, since railway engines are a source of sparks, which either cause, or might conceivably cause, fires in the cotton pressing and ginning factories situated in the neighbourhood of railway stations, the authorities would do well to reconsider the question of installation of spark arresters. Such arresters, we are told, are an inexpensive and simple device. If this is correct, the authorities should be particularly sympathetic to the suggestion for adopting such devices. They will do well to appreciate the fact that these losses, irrespective of whether they are paid for or not, are a national waste.

INTEREST YIELD IN U.S.

The net rate of interest earned on invested funds of U.S. life companies, according to the American Institute of Life Insurance, rose in 1954 to the highest level in the last 15 years. The net rate earned by the companies in 1954 was 3.46 per cent. before Federal income-taxes and 3.24 per cent. after such taxes, as against 3.36 per cent. and 3.15 per cent., respectively, in 1953. The before-tax rate, it is stated, was higher than in any year since 1939 when it was 3.54 per cent.; and after-tax rate was higher than in any year since 1942 when it was 3.36 per cent.

In 1954, the U.S. life companies had a gross investment income of $2,750 million. The increased investment earnings, resulting from the higher yields and increase in the total volume of investments, have been a factor in recent advances in policy bonuses, last year's bonuses to policyholders being $396.6 million greater than in 1947.

"ACT OF GOD"

The position of an insurer *vis-a-vis* losses arising from an act of God was explained by Mr. R. Olaf Hambro, Governor of the London Assurance, in the course of his annual statement to shareholders, circulated along with the report and accounts for 1954. He said:

"It is often said, ignorantly, that, since loss or damage has occurred through an act of God, no claim will fall on the insurer. This misconception probably originated in connection with liability claims where a man accused by his neighbour of negligence may sometimes plead both on his own behalf and on behalf of his insurance company that, since the event which led to loss or damage was an act of God, the accusation of negligence cannot lie against him. Should he succeed in this defence, his insurer also would be relieved of all responsibility. Outside the field of third party liability, however, where it is a question of the sufferer claiming compensation from his own insurance company, the defence of 'act of God' would be quite irrelevant and there are many events properly described as acts of God which can be covered by insurance, and for which the insurer must pay."

MR. RAVIKANT D. SHAH'S SPEECH AT THE SEVENTEENTH ANNUAL MEETING

PRODUCTION CAPACITY TO BE EXPANDED

ADDRESSING the Seventeenth Annual General Meeting of the shareholders of the Andhra Cement Company, Ltd., held at Madras on 28th May, 1955, Mr. Ravikant D. Shah, Chairman of the Meeting disclosed that the Directors had decided to expand the Company's capacity from 300 to 500 tons and a licence had already been obtained for that purpose. This decision had been taken not only in view of the growing demand for cement but also with a view to bringing the cost of production and solving the problem of surplus labour. Speaking in general, Mr. Shah emphasised the need for close collaboration between the public and the private sectors of industry. A wholehearted co-operation of free enterprise, he submitted, would play a decisive part in the enrichment of the national economy. This required a favourable climate, but he found a discouraging atmosphere.

The following is the full text of Mr. Shah's speech:

"GENTLEMEN,

"I have great pleasure in extending to you a hearty welcome to this seventeenth annual general meeting of our Company.

"The Directors' report and the audited accounts of the Company for the year ended 31st December, 1954, have already been circulated to you and with your kind permission, I will take them as read.

"We are all happy to note a slight, yet distinct, improvement in the international situation. The progress towards easing of tension is slow, but promising. Ever since the Bandung Conference hopes for world peace have brightened and there are reasonably promising indications for constructive achievements resulting from efforts by peace-loving leaders who have been often misunderstood. The part played by our country, or rather our Prime Minister, Sri Nehru, in those efforts is highly appreciated and heartily blessed by peace-loving peoples throughout the world. To us his efforts are particularly important, inasmuch as world peace is very essential for planned and speedy development of underdeveloped countries like ours.

"Nearer home, the recent Nehru-Ali talks at Delhi, though indecisive, have given hopes for better neighbourly relations and indications are not wanting to suggest that both India and Pakistan have realised the need to create better climate for peaceful co-existence, greater co-operation in matters of trade, travel and minority affairs and above all friendly relations aimed at co-prosperity. With full faith in our leaders, we can look to the future with hope.

Economic Progress

"On the economic front we are slowly, but steadily, advancing. The first Plan has taken the country a big step forward towards its economic objectives. The great river valley and irrigation projects have made a substantial contribution to the solution of the food problem. There has been steady increase in industrial production. The fact that there is no decrease in incidence of unemployment or of noticeable upturn in standard of living does not mean that there is no improvement. The real cause for this position is the fast increasing population. The greatest achievement of the first Plan has been that the people have become planning conscious and are realising more and more the advantages of co-operative effort, and we are encouraged to embark upon a more ambitious second Plan. Lessons learnt through mistakes, and information and experience gained during the first Plan will be availed of in framing and executing the second Plan.

"Our Government has adopted a policy to bring about socialistic pattern of society and there is no wonder, therefore, that Government would undertake major projects for the speedy development of the country's resources. It is also recognised that there would be a strategic control on private enterprise for planned and co-ordinated development. All the same, the need for close collaboration between the public and private sectors cannot be ignored. Wholehearted co-operation of free enterprise, I submit, will play a decisive part in the enrichment of the national economy.

"But this requires a favourable climate, whereas what we find is a discouraging climate. Unnecessary, vague and inconsistent references to the Avadi resolution, regarding socialistic pattern of society, by several leaders, the Fourth Amendment to the Constitution, making the issue of compensation unjusticiable, the Company Law Amendment Bill, the debate in the Lok Sabha on the State Bank Bill, the uncertainties regarding nationalisation, the labour opposition to rationalisation, etc., certainly create disturbing effect on the psychology of the investing public and adversely affect capital formation. Sometimes an impression is created as if the private sector is on probation and the risk capital has no chances of reasonable award.

Future of Private Sector

"I have said this just to show how imperative it is to avoid creating a discouraging climate. At the same time, I am not inclined to believe that Government is deliberately planning the destruction of private enterprise. I would refer to the Government-backed Industrial Finance Corporation and Industrial Credit and Investment Corporation for credit facilities to the private sector and the development rebate amounting to 25 per cent. of the cost of all new plant and machinery installed for business purpose, which is a very important concession. Our Prime Minister has also very often said that the Government desires the continued existence of the private sector. At the same time, it should not be forgotten that the private sector has few chances of survival, if it fails to fulfil public needs.

"I would now briefly refer to the affairs of our Company. The year under review has shown further small improvement both in production and sales. One of our two plants is fairly old, yet the production has been maintained at full capacity. You would naturally like to know why the profits are lower. As already indicated in the Directors' report, the cost has gone up. You may be aware that, whereas our selling price is fixed, several items of cost are beyond our control. As a small unit we have certain disadvantages in buying our packing materials at favourable rates. Coal was dearer, due to poor quality, and electricity was dearer, due to surcharge by the Government thermal station. Labour bill compared to output has also gone up. We have some surplus labour and we have to manage with it for the sake of industrial peace.

Capacity to be Raised

"Since the selling price is controlled, the only field where we can do something to earn better profits is cost of production. But we have now reached a stage where cheaper cost through higher production is not possible unless we expand our capacity. There is good demand for cement and it would grow further. The target for cement in the second Plan has been fixed at 10 million tons. Taking all these into consideration, your Directors have decided to expand the capacity of your Company. We have already obtained a licence for expanding our daily capacity from 300 to 500 tons. We are now planning to have the expansion completed as early as possible. Expansion of the sidings at factory is already undertaken; better lifting at quarries is being provided for and it is hoped that railways would meet our additional requirements for moving in raw materials and moving out cement. We have already arranged for higher capacity crushing and packing. The proposed expansion would also help us solve the problem of surplus labour.

Adequate Depreciation

"There has been a big cut in the provision for depreciation compared with last year. In this connection, I would draw your attention to the provision made for rehabilitation and expansion fund amounting to Rs. 2,15,798. When you take this into consideration, I assure you that depreciation is adequately looked after.

"Labour-management relations have been satisfactory during the year, but at some cost. We have been always tackling labour demands in a spirit of accommodation, of course, within our limitations. We have during the year met some of their demands. With lower profits we have recommended the same percentage of bonus (25 per cent. of basic earnings). I am sure our labour friends would appreciate the spirit and work with greater co-operation and higher efficiency leading to industrial peace and increased output so essential for co-prosperity for themselves and the shareholders.

"Our subsidiary, Andhra Cement Construction Co., Ltd., has made a small beginning and in due course it would have its due share in major works planned in the State of Andhra. It is moving very cautiously and I hope the current year would show satisfactory results.

Outlook

"I know you would like me to say something about the future. Well, so far as production is concerned it is being maintained at last year's level. We are trying to economise our cost where possible. I can assure you that your Directors are devoting sufficient care for the balanced development of your Company, keeping in mind always the welfare and well-being of the workers and the interests of the shareholders. Our objective is more cement, better cement, cheaper cement. When I say cheaper cement, I mean lower cost of production through higher efficiency on the part of labour and on our part too.

"With these words, gentlemen, I now beg to move this resolution:

"'Resolved that the following statement, pursuant to section 132-A of the Indian Companies Act, may be treated as forming part of the balance-sheet:

'Andhra Cement Construction Company, Limited, Vijayawada, is a subsidiary Company of this Company registered in Indian Union. Andhra Cement Construction Company, Limited has earned profits for the period ended 31st December, 1954. The profits of the subsidiary Company have been carried forward in the accounts of that Company and such profits have not been taken into account of the Holding Company in arriving at the profits of this Company'

and that the audited balance-sheet and profit and loss account for the year ended 31st December, 1954, together with the Directors' report and the statement pursuant to section 132 (A) of the Indian Companies Act, be and are hereby adopted.'"

The Government of India has set up an *ad hoc* committee to consider the working conditions of labour in the building and construction industry in the country. The Committee, which will be tripartite in character, will also consider the working of the fair wage clause and labour regulations in contracts of construction work of the Central and State Governments, special amenities for women workers and the adoption of an advisory guide. Besides, the Committee will examine the question of the enforcement of labour standards in the industry.

MR. G. D. SOMANI'S SPEECH AT TENTH ANNUAL GENERAL MEETING

PROMPT MEASURES FOR EXPANDING RAILWAY TRANSPORT FACILITIES URGED

THE inadequacy of railway transport facilities to meet the growing needs of the expanding industrial sector of Saurashtra was brought to the notice of the Railway Board by Mr. G. D. Somani, M.P., Chairman of Shree Digvijay Cement Company, Ltd., in the course of his address to the shareholders of the Company at their Tenth Annual General Meeting held at Sika (Jamnagar) on 6th June, 1955. Mr. Somani made a reference to the above problem in view of the Company's ambitious expansion programme. He doubted whether the Company's requirements of additional railway wagons, when its second plant goes into production next year, would be met, because even its present needs were yet to be satisfied. Mr. Somani also stressed the urgency for introducing a scientific and rational freight rate structure.

The following is the full text of Mr. Somani's speech:

"GENTLEMEN,

"I have great pleasure in welcoming you all to the tenth annual general meeting of the shareholders of the Company and placing before you for adoption the audited balance-sheet and profit and loss account of the Company for the period ended 31st December, 1954. The Directors' report and the accounts have been in your hands for some time and I propose with your consent to take the same as read.

"The profits for the year under review have been Rs. 23,71,008-2, after making a provision of Rs. 18,00,000 for depreciation. Your Company has still arrears of approximately Rs. 18,70,000 for depreciation and thus, if provision is made to cover this outstanding amount, there is a net surplus of only Rs. 5,00,000.

"Last year's production of clinker and cement was 211,015 tons and 236,268 tons, respectively, while the despatches during the period were 240,767 tons. I hope the results shown in the face of transport difficulties which the Company had to face will be regarded as fully satisfactory.

Extension Plans

"As you must have seen from the Directors' report, an order for the second extension plant of an additional annual capacity of about 2 lakh tons has been placed during the period. You will please appreciate that within five years of the period of starting the factory, it has been possible for your Company to complete its first extension plant to double the original capacity and then embark upon its second extension to double the extended capacity. It should be realised that the Company, ever since its inception, has been working under tremendous handicaps and, therefore, its progress under the difficult circumstances may be regarded as remarkable.

"The financial obligations which the ambitious extension plans have imposed upon the Company are really heavy. The second extension plant will entail much higher capital outlay as compared with the first one, due to higher capacity. Moreover, this tremendous increase in capacity will involve much larger handling of raw materials and finished product. It has, therefore, become unavoidably necessary to arrange the handling and transport by mechanisation, so that this heavy daily turnover could be handled expeditiously and economically and, accordingly, besides the order for the actual second extension plant, the Company has either placed or has under active negotiation various other orders for working its limestone quarries and the sea-sand deposits. This ambitious programme of additional new plant and machinery will involve a huge capital outlay and hence your Directors have been following a conservative policy in distributing dividend, so that the Company's liquid resources could be utilised in implementing the vast programme of expansion. This policy of expansion and modernisation will place the Company in a much better position in the long run and I have, therefore, no doubt this programme will have your full support.

"I would like to draw the attention of the Railway Board to the difficulties that your Company still continues to face in the matter of securing adequate railway wagons for the transport of raw materials, coal and cement. I must acknowledge that the position has shown gradual improvement throughout, but the fact remains that the railway transport facilities are still far from satisfactory. We accepted some time ago, on the initiative of the Railway Board, an arrangement to store our coal stocks at Viramgam dump, but even this arrangement has not worked satisfactorily.

"Apart from the present tight position of the supply of railway wagons, I am more worried about the future, when, with the second extension plant expected to go into production some time during the middle of next year, our requirements of railway wagons will be almost doubled. When we have to struggle so hard even for meeting our present requirements, we are naturally apprehensive of the tremendous difficulties that we may have to face when our second extension plant goes into production. We are continuously making representations and I hope the Railway Board will take suitable measures promptly to improve railway facilities in Saurashtra region, so that the increasing needs of the expanding industrial sector of Saurashtra may be adequately met. In this connection, I would strongly urge upon the Railway Board to link this area with the broad-gauge system, so that there may be permanent improvement.

Railway Freight Rates

"The question of introducing a scientific and rational freight rate structure is of vital importance to the industrial development of the country. Railway freight charges have, unfortunately been going up year by year and no attention has so far been paid by the Railway Board to the series of representations made by various industrial organisations from time to time in the matter. Indeed, the last increase in freight rates between 150 and 300 miles have further imposed heavy additional burden on the cement industry.

"Cement distribution is controlled by Government and factories are required generally to sell their product within their own economic zone which mostly lies within 300 miles from the factory. Therefore, while the small relief given to the long-distance traffic will not in any way benefit the cement industry, it has to bear the additional burden imposed on the traffic moving between 150 and 300 miles. I, however, welcome the decision of the Railway Minister to appoint a Committee to examine the present freight rate structure and I hope the whole structure will be carefully examined, so that the same may be scientifically revised to suit the developmental needs of your expanding Company.

"The production of cement has been steadily increasing year by year. The remarkable progress made by the industry will be evident from the fact, that, while the total production was only 1,591,098 tons in 1948, the same has gone upto 4,367,871 tons in 1954. Still more ambitious expansion of the industry is envisaged under the second Five-year Plan and a target of 10 million tons has been already set for the industry. The country is embarking upon a dynamic programme of development in the second Five-year Plan and the consumption of cement is bound to increase further progressively year by year.

"The industry is capable of achieving this ambitious target, as it has already shown by its remarkable progress during the first Five-year Plan period. I would like to draw the attention of the Government to the imperative need for allowing the industry to plough back adequate resources required for expansion of its productive capacity. The Government have recently allowed the steel industry an increase in prices to build funds for expansion purposes. It is to be hoped that the Government will allow the cement industry also to build up adequate resources to enable various units to carry out their expansion and development programmes.

Favourable Conditions Needed

"If the primary objective of raising the standard of living of our people substantially and eliminating the serious menace of growing unemployment is to be achieved within a reasonably short period, then favourable conditions will have to be created under which the talent, experience and resources of all sections of our people will be fully utilised for completing this gigantic task of building a new India. We have, as a matter of fact, to fight poverty and unemployment on a war-time basis and as in cases of war or national emergency, all our resources, human and material, must be harnessed for achieving our national goal as quickly as possible. When such gigantic task lies ahead, there is no room for any controversy and the widest possible scope should be given for peoples' creative energies and resources to be utilised in constructive and productive channels. It is, therefore, regrettable that at such a historical period, we are engaged in frittering our energies in fruitless controversies and in creating conditions which might come in the way of accelerating the pace of economic development. Plans are being made to extend the public sector even beyond its capacity and its present limitations and deficiencies, due to lack of adequate administrative and technical personnel of the right calibre and various other factors, are being ignored. On the other hand, conditions are being created under which it will be extremely difficult for the private industrial sector to play its due and proper role in expanding the productive capacity of the country. The private industrial sector is really capable of doing much more than the place that is being assigned to it in the second Five-year Plan now under formulation and, given the necessary scope and incentive, private enterprise can play a very vital role in promoting economic development of the country."

INDUSTRIAL FINANCE CORPORATION OF INDIA

(Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948))

Authorised Capital	Rs. 10,00,00,000/-
Paid-up Capital	Rs. 5,00,00,000/-
Loans Sanctioned	Rs. 25,21,25,000/-

The Corporation has been established to grant medium and long-term loans to industrial concerns registered in India. Only public limited companies or co-operative societies engaged in (i) manufacture or processing of goods; (ii) mining; (iii) generation or distribution of electricity or any other form of power; and (iv) shipping, are eligible for financial assistance.

Industrial concerns requiring medium and long-term advances over Rs. 10 lakhs for new schemes of expansion or modernisation are requested to get in touch with the Head Office of the Corporation or its Branches, as soon as they have prepared their schemes.

WORLD INDUSTRIAL PRODUCTION MAINTAINED

INCREASE IN OUTPUT OF RAW MATERIALS

WORLD industrial production during 1954 was precisely the same as in 1953, the relative index figure remaining unchanged at 137. The high level of output from mines and factories of the world, excluding the U.S.S.R., China and Eastern Europe, was maintained, despite a fall in output to the tune of 7 per cent. in the U.S. and 2 per cent. in Canada. The marked decline in these two countries was, however, offset by increases in output in Western Europe and Latin America. The table below giving the percentage of increase in production over that of the preceding year and the index figures for 1953 and 1952, reveals, at a glance, the trends of production in the world and in the different countries during each of the three years ended 1954:

*Growth of Industrial Production**

(Mining and manufacturing only)

	Percentage of increase over the previous year			Index 1948=100	
	1952	1953	1954	1953	1954
World	2	7	..	137	137
Western Europe ..	..	6	9	148	161
Austria	1	2	14	185	211
Belgium	—3	..	8	113	122
Canada	3	6	—2	126	123
Denmark	—4	4	5	119	126
France	4	—8	9	126	138
W. Germany	7	7	12	258	289
India	10	5	6	124	132
Italy	8	10	9	163	178
Japan	10	23	6	264	300
Netherlands	—1	12	8	143	154
Norway	1	4	6	139	147
Sweden	—2	..	3	111	115
U.K.	—4	6	7	122	130
U.S.	3	8	—7	129	120

* Figures exclude U.S.S.R., China and Eastern Europe.

The most important gains in production, as revealed in the table above, are stated to be, according to the *U.N. Monthly Bulletin of Statistics* (April 1955), in those countries whose economies were capable of turning out substantial quantities of durable consumer goods, such as passenger cars, household appliances and other metal consuming products. Production of chemicals rose rather prominently not only in Western Europe, but also in the rest of the world. As production began to accelerate in North America towards the end of the year, the index of world production reached the highest point which had not been attained earlier.

North America

In the U.S., mining and manufacturing output declined, as stated at the outset, by 7 per cent. in 1954, as compared with that of the previous year. The 1954 index would have been lower still, had there not been a marked increase in the output in the last quarter of the year. This was able to make up, to a certain extent, the fall of 9 per cent. witnessed during the first nine months of the year, as compared with that during the same period of 1953. Activity in the last quarter was particularly strong in the chemical industry which reached a new record in the period. In the other spheres of manufacture, transportation equipment, though higher than in any year, except in 1953, declined from 185 per cent. in 1948 to 171 per cent. in 1954. Production of trucks was 25 per cent. lower than in 1953. The output in textile mills declined by 9 per cent., the fall being marked in woollen goods. There was, however, no change in the output of food and beverages.

Another feature of U.S. industrial production was the decline in the number of workers employed in manufacturing industries. Although the index of employment in manufacturing showed that there were no more production workers in 1954 than in 1948, the output was 23 per cent. higher in 1954 than in 1948. The last quarter of 1954 had the highest production of manufactures while the first quarter had the highest level of employment in manufacturing.

Mining activity in the U.S. in 1954 was 4 per cent. lower than in 1953. This was due to a decline of 14 per cent. and 20 per cent. in coal and metal mining, respectively.

In Canada, the total output declined by 2 per cent. in 1954, as compared with that in the preceding year. But marked increases were seen in mining activity, nickel and petroleum being the chief contributors. In manufacturing, output was slightly higher despite a fall of 15 per cent. in textiles. Moderate gains were recorded by food and paper industries. Durable manufactures, however, reported a decrease of 8 per cent. But only a small increase was seen in production of electricity and gas.

Every country in Western Europe reported substantial increases in output in 1954 over the corresponding figures for the previous year. The tempo of production was high in the second and third quarters. In the U.K., however, factory output in the last quarter was 6 per cent. more than in the same period of 1953 and 39 per cent. greater than in 1948. This was due principally to increases in motor vehicles, chemicals and paper and printing industries. Among those industries in which the output did not increase as much as the total were textiles, ferrous metals and food and beverages. There was also a record level of employment in manufacturing in 1954. Mining in the U.K. did not expand as greatly as manufacturing. Coal production in the last quarter of 1954 was a million metric tons lower than in the corresponding period of 1953.

In France, the output in 1954 was 9 per cent. larger than in 1953. French factories increased their output more than did mines and quarries. Chemicals rose by 16 per cent., metal products, machinery and transport equipment by 7 per cent., motor cars by 19 per cent. and commercial vehicles by 26 per cent. over the corresponding figures for 1953.

West Germany

In West Germany, the volume of production during 1954 rose at an increasing rate, reaching a level of 12 per cent. greater than during the previous year. Employment also rose 6 per cent. higher in plants and factories than in 1953. The rate of increase was higher in export industries such as machinery, transport equipment, electrical goods, etc. Production of passenger cars, for instance, was 40 per cent. higher than in 1953. Striking gains were witnessed in steel and chemical industries. As a result of increased production, exports rose by 25 per cent. in 1954.

Among the other countries of Europe, the output in Italian factories was 9 per cent. higher than that in 1953. In Austria it was 10 per cent. above the 1953 figure, and a similar increase was seen in the factories of the Netherlands. In Belgium, Denmark, Norway and Sweden, the increases were, however, below the regional average. The Scandinavian economies did not gain as rapidly as their Southern neighbours.

Japan

In Japan, the output for the year was 7 per cent. above that of 1953, which had, in turn, been 21 per cent. above the output of 1952. The decline began in the second quarter of 1954 and continued till production in the last quarter was no higher than that of the same period of 1953. The textile industry was the first of the major sectors to weaken, but this was overcome by the end of 1954. Metal and metal production also was lower in 1954.

In India, industrial enterprises produced approximately 6 per cent. more in 1954 than in 1953. Gains were greater in the production of iron, steel and machinery than in the production of cotton textiles, which was only slightly above 1953 levels for the first ten months of the year.

There was also considerable increases in the production of important industrial raw materials in 1954. The table below shows the trend of production of these in each of the five years ended 1954:

World Production of Raw Materials and Electricity

(In million metric tons)

	1950	1951	1952	1953	1954
Coal	1,816	1,876	1,844	1,852	1,987
Crude petroleum ..	484.5	550	575.7	605.2	627.2
Cement	122.1	136.2	144.2	158.3	169.0
Pig-iron	112.9	126.3	125.3	138.4	136.1
Crude steel	161.0	178.1	175.0	194.2	180.1
Copper	2,285	2,387	2,410	2,474	2,485
Zinc	1,827	1,939	2,003	2,083	2,113
Lead	1,544	1,492	1,627	1,646	1,726
Tin	176	170	171	184	185
Aluminium	1,311	1,600	1,809	2,138	2,456
Rubber (Natural) ..	1,890	1,916	1,819	1,753	1,832
Electricity	858	954	1,022	1,115	1,197

It will be seen from the above figures that there was a rise of 12 per cent. over the figure for 1953 in the output of aluminium. This metal ranked fourth behind copper, lead and zinc in 1948. In 1954, production had increased by 118 per cent. over that of 1948. In view of the relative lightness of the metal when compared with other non-ferrous metals, it is estimated that, in terms of actual usage, the volume of aluminium produced in the world has exceeded the combined volume of copper, lead and zinc in each of the last two years. Owing to U.S. output, the 1954 world production of iron and steel was down by 9 per cent. and 7 per cent. respectively, from the 1953 levels. The production of crude petroleum, however, rose by 4 per cent., despite a fall of 2 per cent. in the U.S. output.

CALCIUM CHLORIDE INDUSTRY

FALL IN COSTS RENDERS PROTECTION UNNECESSARY

THANKS to eight years of continued tariff protection, the calcium chloride industry has reached a stage of development where continuance of further protection is considered not necessary. According to the Tariff Commission, the fair ex-works price of indigenous calcium chloride is less than the landed costs, without duty, of imported calcium chloride. The Commission which investigated the claims of this industry for protection in September last has, therefore, recommended that protection to it should not be continued beyond 31st December, 1955. The Government has accepted this recommendation.

There are at present two units manufacturing calcium chloride in India. One of them, the Pioneer Magnesia Works Ltd., produces calcium chloride from bitterns, obtained from the Government salt works at Kharaghoda. The other one, the Dhrangadhra Chemical Works Ltd., uses the effluent of its soda ash plant in the manufacture of calcium chloride. The Pioneer Magnesia Works has been granted by the Government a fresh lease for 25 years from January, 1954, to use all the bitterns remaining after the extraction of salt from the brine in the salt pans at the Government salt works at Kharaghoda. The Company has to pay a royalty at the rate of 2½ per cent. on the ex-works selling price of magnesium chloride and magnesium sulphate and 1 per cent. on the price of other products of the Company. The Company is manufacturing magnesium chloride and calcium chloride and is investigating the possibility of producing Epsom salt from magnesium hydroxide recovered in the process of manufacturing calcium chloride. The present rated capacity of this factory is about 1,000 tons, but its actual production in 1954 was 359 tons, as compared with 369 tons in 1953 and 193 tons in 1952.

About 120 tons of calcium chloride in the form of effluent are available daily with the Dhrangadhra Chemical Works. Most of this effluent is at present allowed to go waste. Only a part of this is being utilised in the manufacture of calcium chloride. The Company's rated capacity of this chemical is 1,125 tons per annum. But its actual production in 1954 was 165 tons, as against 364 tons in the preceding year.

The demand for calcium chloride in the country is estimated at 950 tons. This is likely to increase to 1,100 tons per year in the course of the next three years. As against this, the rated capacity of the two units is 2,125 tons per annum. The country can, therefore, be self-sufficient in this chemical.

As regards the quality of the indigenous calcium chloride, the information supplied to the Commission reveals that such is generally satisfactory. It is admitted, however, that the colour of calcium chloride manufactured by the Pioneer Magnesia Works was blackish, but the producer has, according to the Commission, given the assurance that precautions would be taken to avoid deterioration in colour in future. The Indian Standards Institution has not yet evolved standard specifications for calcium chloride produced in the country. The Commission has, therefore, recommended that steps should be taken by the Institution to formulate standard specifications for the indigenous calcium chloride in consultation with the industry as early as possible.

The cost data, as compiled by the Commission, reveal that the actual cost of production amounted to Rs. 14.86 per cwt. in the case of Pioneer Magnesia Works, and at Rs. 9.54 per cwt. in the case of Dhrangadhra Chemical Works. The fair ex-works price, calculated on the basis of these costs, remains unchanged in the case of the former at Rs. 14.86 per cwt. while it is slightly lower at Rs. 8.66 per cwt. of calcium chloride produced by the Dhrangadhra Chemical Works. For sale of the chemical to port towns, the Commission has estimated the disadvantage on account of railway freight at Rs. 2 per cwt. and this sum has been added to the fair ex-works price of the indigenous calcium chloride. For the purpose of comparison with the c.i.f. price of imported calcium chloride, the Commission has adopted the fair ex-works price of the Dhrangadhra Chemical Works Ltd. Several reasons are given in support of this choice. First, the cost of production of this unit is much lower than that of the Pioneer Magnesia Works Ltd. Secondly, this latter firm is expected to be in a position to effect a reduction in its costs, following the implementation of plans for reorganis-

IMPERIAL BANK OF INDIA

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Principal Register and the Branch Registers of the Imperial Bank of India will be closed for transfer of shares from Thursday the 16th June, 1955, to Thursday the 30th June, 1955, both days inclusive.

In terms of Section 6(1)(*a*) of the State Bank of India Act, 1955, all shares in the capital of the Imperial Bank of India shall be transferred to, and shall vest in, the Reserve Bank of India, free of all trusts, liabilities and encumbrances on the "appointed day" which has been fixed for the 1st July, 1955, by the Government of India Notification No. F.8(8)-F.I./55, dated the 14th May, 1955. Section 9(1) *ibid* provides that every person who immediately before the 1st July, 1955, is registered as a holder of shares in the Imperial Bank of India shall be entitled to compensation in accordance with the provisions contained in the First Schedule.

All purchasers of Imperial Bank of India shares are therefore advised to lodge with the Bank for registration the instruments of transfer in their favour along with the relative share certificates, *not later than the 15th June, 1955.*

S. K. HANDOO,
Managing Director.

BOMBAY, *17th May*, 1955.

5. To appoint Auditors for the current year and fix their remuneration.

By Order of the Board,
For RAMNARAIN SONS LIMITED,
RAMNIWAS RAMNARAIN,
Director,
Agents.

BOMBAY, 23rd *May*, 1955.

N.B.—The Dividend, if sanctioned, will be made payable at the Company's Registered Office, Imperial Bank Building, Bank Street, Bombay, on and after Tuesday the 28th June, 1955, to those Shareholders whose names stand on the Register on Wednesday the 27th April, 1955, to whom Dividend Warrants will be posted at their registered addresses. Intimation of any change of address should be given to the Company immediately.

SMALL DROP IN PROFIT OF BHARAT LINE

INCOME SUBSTANTIALLY HIGHER, DESPITE REDUCTIONS IN FREIGHT RATES

THE downward trend in the earnings of the Bharat Line Ltd. (Managing Agents: Messrs. Dinshaw Ltd., Bhavnagar), witnessed in 1953 for the first time in the history of the Company, continued in the following year also, namely, the year ended 31st December, 1954. Thus, the Company's gross profit, which had been marked down from the record level of Rs. 53.99 lakhs for 1952 to Rs. 42.71 lakhs for 1953, has shrunk further to Rs. 37.28 lakhs for the year under review. This decline in 1954 was not unexpected, for the Directors had already indicated in their report for the previous year that, "in view of the persistent demand for further reductions in freight rates and in the absence of any counterbalancing factors," a further fall in earnings and profits in the coming year was to be expected. It is, however, comforting to note that the shrinkage in profit for 1954 is less than half of that which occurred in the previous year, so that the distribution to the shareholders has not been affected. The dividend is proposed to be maintained at 5 per cent.; this is the third year in succession for which the dividend is being repeated, after it had been raised from 4 per cent. paid for 1951.

The following comparative table shows the Company's progress since 1951:

(In lakhs of rupees)

	For the year ended 31st December			
	1954	1953	1952	1951
Freight earnings	256.64	214.97	205.95	162.24
Charter hire and other income..	6.19	8.00	7.11	7.21
Expenses	225.55	180.26	158.86	120.70
Gross profit	37.28	42.71	53.99	43.75
Managing Agents' remuneration.	2.03	2.09	4.40	2.59
Depreciation	30.05	34.51	45.17	35.86
Provision for taxation	..	..	..	1.00
Net profit	5.20	5.11	4.42	3.80
Dividend	5.00 (5%)	5.00 (5%)	5.00 (5%)	4.00 (4%)
Carry forward	0.20	0.69	0.59	1.17

Despite the reductions in rates, the earnings by way of freight have gone up by Rs. 41.67 lakhs, thus maintaining the upward trend in this item since the inception of the Company. This is mainly due to the operation of additional ships—the Company, it may be noted here, acquired three cargo ships during the year. This sharp rise in freight earnings has been more than offset by the increase of Rs. 45.29 lakhs in expenses, of which coal, fuel, oil, stores and victualling account for Rs. 7.81 lakhs, marine dues, light dues and customs charges for Rs. 5.38 lakhs, stevedoring charges, etc., for Rs. 11.46 lakhs, hire of chartered steamers for Rs. 9.97 lakhs, repairs, survey expenses and dry dock charges for Rs. 3.74 lakhs, agency fees, brokerage and commission for Rs. 2.27 lakhs and establishment charges for Rs. 1.14 lakhs. Thus, there has been an increase in expenses in almost all directions. The Directors report that the great delays at loading and discharging ports and high maintenance costs, noted in the previous year, continued unabated in the year under review also. It will thus be seen that, had it not been for the operation of three additional cargo ships, the Company's profit would have been affected considerably.

The Company entered, during the year under review, the Persian Gulf-India-Burma trade, having arranged to acquire four ships for this purpose. It acquired, as already stated, three cargo ships during the year. The fourth ship, which will be arranged for during the current year, will not, however, be a purely cargo ship. The Directors consider it necessary to have a passenger-*cum*-cargo ship to meet the requirements of this trade. It is gratifying to note from the Directors' latest report that the Company has succeeded in attracting a fair measure of support from the shippers in this trade, under conditions of competition. The Directors are happy that their efforts at securing an undertaking with the principal interests concerned have met with sympathetic response and are hopeful that they will be able to report satisfactory results at the next opportunity.

The latest balance-sheet of the Company shows that the paid-up capital remains unchanged at Rs. 1 crore. There are no reserves, except a fleet replacement reserve of Rs. 16.68 lakhs. This reserve was created last year by providing Rs. 11.18 lakhs (subject to tax), being the profit on sale of a ship. The Company's assessment for the year 1953 was finalised during 1954 and income-tax amounting to Rs. 4.50 lakhs was paid. After debiting this to the fleet replacement reserve, there was a balance of Rs. 6.68 lakhs to the credit of this account. An addition of Rs. 10 lakhs was made to this account during the year under review, being the amount received from the underwriters in respect of the loss of a ship. The current liabilities and provision for taxation account for Rs. 246.95 lakhs, of which borrowings from the Government of India secured by mortgage of seven ships amount to Rs. 152.87 lakhs. The gross block stands at Rs. 463.15 lakhs, of which fleet represents Rs. 452.69 lakhs. There has been an addition of Rs. 154.95 lakhs, after deducting the cost (Rs. 10.89 lakhs) of one ship grounded during the year. A sum of Rs. 180.07 lakhs has been built up in the depreciation account, after adjustment of Rs. 10.89 lakhs for the loss of the ship grounded. The current assets (excluding deferred revenue expenditure amounting to Rs. 5.31 lakhs) aggregate Rs. 74.13 lakhs.

A redeeming feature of the otherwise difficult operating conditions to which the Directors make a reference in their latest report, is the end of the downward trend in freight rates. The Directors observe that there are indications that the freight rates will now see an upward trend and hope that they will reach a satisfactory level in the coming years. The Directors are obviously referring to the decision of the Indian Coastal Conference reached early in the year to raise the freight rates on general cargo by 10 per cent. from 1st June. The Conference has, however, since decided to postpone the increase indefinitely, in view of the controversy between the overseas shipping companies and the Government over the former's decision to impose a surcharge of 35 per cent. on freight rates.

ANDHRA CEMENT'S PROFIT LOWER

After three years of successive rise to a record level of Rs. 21.89 lakhs, the gross profit of the Andhra Cement Company, Ltd. (Managing Agents: The Andhra Engineering Company, Ltd., Madras), for the year ended 31st December, 1954, has suffered a decline of Rs. 3.56 lakhs to Rs. 18.33 lakhs. This recession has very nearly wiped out the improvement noted in 1953, so that the profit for the year under review is no better than that for 1952. The net profit (after providing for Managing Agents' remuneration, depreciation and taxation) is, however, higher by Rs. 2.56 lakhs at Rs. 7.66 lakhs, mainly due to a substantial cut in the provision for depreciation. The bulk of this increase—Rs. 2.16 lakhs to be precise—has been transferred to the rehabilitation and expansion fund. The distribution to ordinary shareholders has been maintained at 10 per cent.—made up of a dividend of 7½ per cent. and a bonus of 2½ per cent.—to which level it had been raised last year from 7½ per cent. paid for 1951 and 1952 by paying a bonus of 2½ per cent. The distribution has been maintained because, in the opinion of the Directors, the average returns to the shareholders in the past had been inadequate.

The Company's progress in recent years can be judged from the salient features of its profit and loss accounts for the past four years given in the following table:

(In lakhs of rupees)

	For the year ended 31st December			
	1954	1953	1952	1951
Sale proceeds	99.23	94.01	71.50	51.08
Stocks	5.84	7.40	14.82	8.51
Expenses	75.39	72.27	58.27	37.56
Gross profit	18.88	21.89	18.31	18.99
Managing Agents' remuneration.	1.17	1.34	1.49	1.09

6 per cent. Preference ..	0.15	0.15	0.15	0.15
Ordinary	5.12 (D. 7½% + B. 2½%)	5.12 (D. 7½% + B. 2½%)	4.68 (D. 7½%)	3.85 (D. 7½%)
Carry forward	0.37	0.03	0.20	0.25

The Directors report that production and despatches during the year under review were higher than those in the previous year. The gross profit is lower, mainly due to increased labour charges, higher cost of raw materials and reduction in packing allowance, permitted by the Government, even though the cost of these packing materials continued to be high. The addition of Rs. 2.16 lakhs to the rehabilitation and expansion fund is in pursuance of the directive of the Government of India, whereby out of the price of Rs. 71 per ton for neat cement fixed by the Government, a sum of Rs. 2 per ton of cement sold should be set aside for the purpose of rehabilitation and expansion. This scheme came into force on 8th February, 1954, and the amount so contributed having been completely spent on expansion programme, has since been withdrawn from the fund.

In view of the considerable demand for cement and with a view to bringing down the cost of production, the Directors have decided to increase the production, by raising the capacity of the factory from 300 to 500 tons a day. The necessary permission and licence having been obtained, steps are being taken to install the machinery as early as possible. The area in which the Company's factory is situated contains adequate deposits of the essential raw material, limestone, and the Directors expect that adequate supplies of other materials also would be assured, with the co-operation of the Union and State Governments and the railways.

The latest balance-sheet of the Company shows that the reserves and surplus aggregate Rs. 11.12 lakhs, as against a paid-up capital of Rs. 53.76 lakhs. The gross block of the value of Rs. 79.90 lakhs has been written down to Rs. 40.58 lakhs. The current assets amount to Rs. 54.03 lakhs, exceeding the current liabilities and provision for taxation, at Rs. 29.73 lakhs, by a wide margin of Rs. 24.30 lakhs.

PAN AMERICAN AIRWAYS

The Directors of the Pan American World Airways Inc., have declared a dividend of 20 cents per share payable 17th June, 1955, to stockholders of record at the close of business on 27th May, 1955. This is the forty-second dividend paid by Pan American. Dividend payments have been made each year since 1941.

LARSEN AND TOUBRO'S PROFIT EXPANDS

OUTLOOK PROMISING

THE year ended 31st March, 1955, has turned out to be another period of successful activity for Messrs. Larsen and Toubro Ltd. (Managing Agents: L. & T. Management Ltd., Bombay). The Company has recorded an all-round improvement in its results. Its turnover for the year constitutes a fresh record in its history. Its direct sales rose from Rs. 192.16 lakhs to Rs. 209.44 lakhs, thus maintaining the upward trend in this respect since its inception; indirect sales also increased from Rs. 60 lakhs to Rs. 105 lakhs. The gross profit amounts to Rs. 16.01 lakhs and represents a rise of Rs. 0.95 lakh over the year, thus more than making good the decline of Rs. 0.43 lakh noted in the previous year. The gross profit for the year under review also constitutes a record, exceeding its previous best of Rs. 15.49 lakhs earned for 1952-53 by a comfortable margin.

The net profit (after providing for depreciation and taxation) shows an increase from Rs. 6.84 lakhs to Rs. 7.09 lakhs, a fresh record. The dividend on ordinary shares is proposed to be maintained at 10 per cent. for the sixth consecutive year, after making a welcome addition of Rs. 2.75 lakhs to the general reserve, which had received Rs. 2.25 lakhs a year ago.

The following comparative table provides a good idea of the Company's progress in recent years:

(In lakhs of rupees)

	For the year ended 31st March			
	1955	1954	1953	1952
Sale proceeds	209.44	192.16	162.80	139.65

Ordinary	3.50 (10%)	3.20 (10%)	3.20 (10%)	2.99 (10%)
Carry forward	0.25	0.16	0.12	0.26

The successful results obtained for the year under review are due to the substantial increase in sales of "caterpillar" earthmoving machinery and allied equipment, as also the tube-well drilling equipment. The extensive service and spare parts organisation of the Company and prompt deliveries are stated to have been helpful factors in promoting sales. The Company has also obtained a contract from the Bombay Government for drilling tube-wells in North Gujerat, with its own staff and equipment. This contract is at present under execution.

The Company's balance-sheet as on 31st March, 1955, shows that the paid-up capital is unchanged at Rs. 50 lakhs. The reserves and surplus aggregate Rs. 6.25 lakhs. The provision for taxation amounts to Rs. 21.40 lakhs and current liabilities aggregate Rs. 109.17 lakhs. The gross block of the value of Rs. 25.88 lakhs has been written down to a book value of Rs. 12.42 lakhs. The current assets amount to Rs. 174.40 lakhs and cover the current liabilities and provision for taxation by a large margin of Rs. 43.83 lakhs. Of the current assets, stocks and work-in-progress account for Rs. 76.28 lakhs and book debts (unsecured) for Rs. 70.81 lakhs.

The outlook for the current year is good and the Directors continue to view the future with confidence, as will be seen from the following extract from their latest report:

"Though competition is keen, there was a noticeable tendency, during the last months of the past year, for prices to become firmer and overseas deliveries more protracted. The Company enters 1955-56 with a well-balanced stock, both of machines and spare parts, and is thus well equipped to meet the situation should it further develop. The growing confidence of industrialists and contractors has resulted in large orders now under execution, and important enquiries. This, seen together with an unprecedented activity in the public sector, during the tail end of the first Five-year Plan, and the bold planning for the next five years, indicates that the Company's sales will continue to grow and its services being required on an increasing scale. The Directors consequently continue to view the future with confidence."

The Company's ordinary shares are being currently quoted at Rs. 13-4 *cum-div.* On an *ex-div.* basis, the shares give a yield of 8.2 per cent. per annum, free of tax.

PROFIT OF INDORE MALWA DOWN

DIVIDEND, HOWEVER, MAINTAINED

A SUBSTANTIAL decline in the earnings of the Indore Malwa United Mills, Ltd. [Managing Agents: Messrs. Govindram Seksaria (Indore), Indore] is disclosed by the Company's audited accounts for the year ended 31st December, 1954. The gross profit, for instance, which had gone up from Rs. 11.20 lakhs for 1952 to Rs. 16.82 lakhs for 1953, has suffered a recession to Rs. 6.78 lakhs for the year under review. Thus, the improvement in profit noted in the previous year has been more than wiped out, so that the profit for 1954 is the lowest for the past three years. After providing for Managing Agents' commission and reducing substantially the provision for depreciation from Rs. 12.01 lakhs to Rs. 3.16 lakhs, the net profit amounts to Rs. 2.94 lakhs, which is a shade lower than that (Rs. 3.10 lakhs) for 1953.

The aforesaid provision for depreciation represents the amount written off the accrued depreciation for 1953. In other words, the Company has still arrears of depreciation to be provided for. No provision for taxation has, therefore, been made. No allocation to reserves has also been possible on account of the low level of profit. In fact, the Company has had no occasion to strengthen its reserves at all since 1945, consequent on the series of poor results. The dividend is, however, proposed to be maintained at 6 per cent. and this is the third consecutive year for which this dividend is being repeated, after it was raised from 5 per cent. paid for 1951.

Commenting on the trading conditions which prevailed during the year under review and the factors responsible for the reduction in profit, the Directors observe:

"During the year under report, cloth production in the country registered a further improvement, as compared with that in the previous year, exceeding the target set in the first Five-year Plan two years before time. This impressive performance is all the more remarkable, because the industry had to fight growing competition in world trade in textiles, on the one hand, and a series of handicaps, such as production control, heavy tax imposts and vagaries of Government policy, on the other. This achievement was mainly possible due to comfortable raw cotton position, absence of any labour strike of magnitude, some improvement in the transport situation, and the removal of all controls on prices and distribution of all varieties of cloth. As a result of the availability of plentiful supplies of cloth, however, the trade conditions remained slack during the year, more especially in the first half and that too for coarse and medium styles. There was a tendency for the demand for traditional lines to shrink in the domestic market. Exports of cloth, though increased, due to free licensing, the prices had to be reduced to meet overseas competition. Owing to a large output of cotton, the supply position during the year was more satisfactory than during the previous year, but, on account of depleted stock position, the prices of good varieties hardened during the early part of the season. The mills had also low stock of cotton in hand, and had to purchase at the then prevailing higher prices. The above adverse factors, coupled with increased cost of production on account of surplus labour and increased labour welfare expenses, are mainly responsible for lower profits."

The following table compares the salient features of the profit and loss accounts for the past four years, from which an idea of the Company's progress can be had.

(In lakhs of rupees)

	For the year ended 31st December			
	1954	1953	1952	1951
Sale proceeds (net) ..	261.98	253.59	262.58	277.01
Cotton, stores, etc., consumed..	158.93	137.87	160.59	182.90

Carry forward	0.06	0.12	0.08	0.07

The Company's paid-up capital amounts to Rs. 50 lakhs, of which Rs. 30 lakhs represent the amount capitalised out of the reserve fund in September, 1948. This transfer from the reserves has not been replaced at all. On the other hand, a further sum of Rs. 4.50 lakhs was drawn from the dividend legislation fund to supplement the profit for 1947 and to pay the dividend for 1948. The reserves and surplus, therefore, stand depleted at Rs. 3.16 lakhs. The provision for taxation amounts to Rs. 16.37 lakhs. The current liabilities aggregate Rs. 107.45 lakhs. The gross block of the value of Rs. 129.36 lakhs has been written down to Rs. 26.33 lakhs. The current assets amount to Rs. 134.37 lakhs and more than adequately cover the current liabilities and provision for taxation.

COMPANY MEETINGS AND DIVIDENDS

DEVKARAN NANJEE INVESTMENT CO., LTD. Annual General Meeting, Bombay, 16th June, 1955. Dividend: As. 12 per share. Transfer books remain closed from 2nd to 16th June, 1955, both days inclusive.

BHARAT LINE LTD. Annual General Meeting, Bhavnagar, 16th June, 1955. Dividend: Rs. 5 per share. Transfer books remain closed from 16th May to 14th June, 1955, both days inclusive.

ALBION JUTE MILLS CO., LTD. Half-yearly General Meeting, Calcutta, 17th June, 1955. Dividend: Rs. 6 per share. Transfer books remain closed from 10th to 17th June, 1955, both days inclusive.

EMPIRE JUTE CO., LTD. Half-yearly General Meeting, Calcutta, 21st June, 1955. Dividend: As. 12 per share. Transfer books remain closed from 7th to 21st June, 1955, both days inclusive.

SIRSILK LTD. Annual General Meeting, Hyderabad-Dn., 21st June, 1955. Dividend: *Nil*. Transfer books remain closed from 1st to 20th June, 1955, both days inclusive.

BENGAL-NAGPUR COAL CO., LTD. Half-yearly General Meeting, Calcutta, 23rd June, 1955. Dividend: *Nil*. Transfer books will remain closed from 15th to 23rd June, 1955, both days inclusive.

CALCUTTA ELECTRIC SUPPLY CORPORATION LTD. Annual General Meeting, London, 23rd June, 1955. Dividend: 6 per cent. for the year (includes interim dividend of 3 per cent. already paid).

AHMADPUR-KATWA RAILWAY CO., LTD. Annual General Meeting, Calcutta, 24th June, 1955. Dividend: Rs. 2-11 per share, less income-tax, payable on 8th July, 1955. Transfer books will remain closed from 15th to 24th June, 1955, both days inclusive.

KALIGHAT-FALTA RAILWAY CO., LTD. Annual General Meeting, Calcutta, 24th June, 1955. Dividend: Rs. 2-11 per share, less income-tax payable on 8th July, 1955. Transfer books will remain closed from 15th to 24th June, 1955, both days inclusive.

TEXTILE MACHINERY CORPORATION LTD. Annual General Meeting, Calcutta, 24th June, 1955. Dividend: Re. 1 per share. Transfer books remain closed from 11th to 24th June, 1955, both days inclusive.

INDORE MALWA UNITED MILLS LTD. Annual General Meeting, Indore, 25th June, 1955. Dividend: Rs. 6 per share, payable on 11th July, 1955. Transfer books remain closed from 3rd June to 2nd July, 1955, both days inclusive.

SRI KRISHNARAJENDRA MILLS LTD. Annual General Meeting, Bangalore Road, Mysore, 25th June, 1955. Dividend: Rs. 3 per share (final), payable on and after 11th July, 1955. Transfer books will remain closed from 14th to 26th June, 1955, both days inclusive.

RAMPOORIA COTTON MILLS LTD. Annual General Meeting, Calcutta, 27th June, 1955. Transfer books will remain closed from 14th to 27th June, 1955, both days inclusive.

SIMPLEX MILLS CO., LTD. Annual General Meeting, Bombay, 5th July, 1955. Dividend: Rs. 6 per share (final), payable on 12th July, 1955. Transfer books will remain closed from 17th June to 1st July, 1955, both days inclusive.

EDWARD TEXTILES LTD. Annual General Meeting, Bombay, 9th July, 1955. Transfer books remain closed from 11th June to 9th July, 1955, both days inclusive.

UNITED PROVINCES SUGAR CO., LTD. Dividend of Re. 1-4 per share, for the year ended 30th September, 1954.

COMPANY REGISTRATIONS

GOPAL CHANDRA PAUL AND BROTHERS LTD. (First Director: Mr. K. Paul.) Business: Wholesale and retail dealers in all sorts of umbrellas, etc. Authorised capital: Rs. 10,00,000. Private company. Address: 6, Khongrapatty Street, Calcutta-7.

PAUL BROTHERS (UMBRELLA) LTD. (First Director: Mr. K. Paul.) Business: Manufacturers of umbrellas. Authorised capital: Rs. 10,00,000. Private company. Address: 6, Khongrapatty Street, Calcutta-7.

MOHANLAL GOUTAM LTD. (First Director: Mr. M. L. Mukerjee.) Business: Sellers, importers, exporters and dealers in merchandise, etc. Authorised capital: Rs. 3,00,000. Private company. Address: 14, Gurusadaya Road, Calcutta.

KANKARTOLA COLLIERIES LTD. (First Director: Mr. Satkari Banerjee.) Business: Colliery proprietors, etc. Authorised capital: Rs. 5,00,000. Private company. Address: Nandi, P.O. Nandi, Burdwan.

GOOD LUCK LTD. (First Director: Mr. M. L. Jhunjhunwala.) Business: General merchants Authorised capital Rs. 20,00,000. Public company. Address: 12, Syed Sally Lane, Calcutta.

HOWRAH WOOD AND GENERAL INDUSTRIES LTD. (First Director: Mr. A. N. Khan.) Business: Manufacturers and dealers in furniture, etc. Authorised capital: Rs. 5,00,000. Private company. Address: 93, Deshpran Sashmal Road, Howrah.

COAL

(*Concluded from page 1117*)

taking the deficit into account, the Durgapur site is suitable for the location of the plant proposed by the West Bengal Government with a capacity of 292,950 tons of sized coke over 1" per annum.

The Durgapur Scheme consists of the setting up of (*a*) coke oven plant capable of handling 1,300 tons of coal and coke breeze per day (1,235 tons of coal and 65 tons of coke breeze), (*b*) auxiliary plants for the recovery of by-products from coke oven gas (ammonia sulphuric acid, coal-tar, crude benzol and its rectified products) and (*c*) a coal-tar distillation plant with a daily input of 50 tons of coal-tar.

The fixed capital investment on the three sections is estimated at Rs. 5.25 crores. The requirements of working capital are placed at Rs. 35 lakhs. The total credits from the sale of different products mentioned above are expected to be Rs. 193.61 lakhs, as against the manufacturing expenses and provisions for depreciation and interest on working capital estimated at Rs. 157.9 lakhs. The operating results are expected to show a return of 6.8 per cent. over the capital investment of Rs. 525 lakhs. The above return, however, excludes interest on fixed capital.

In view of the proposed establishment of a 30,000 kw. thermal power plant by the Damodar Valley Corporation, the Committee feels that the contemplated new coke oven plant would not lead to any growth of load in the Bengal Bihar power grid area. It considers that it would be difficult now to say whether there would be any surplus gas to be transported to either Chittaranjan or to Calcutta, as the future prospects of demand for gas in the Durgapur area itself are considered to be bright. The question of deciding the form of organisation and management for the project has been left to the State Government itself.

COAL OUTPUT IN APRIL, 1955

The output of coal in collieries in India during the month of April, 1955, was lower at 3,233,135 tons, as against 3,305,967 tons in the previous month, according to official statistics released by the Chief Inspector of Mines. Despatches of coal also were lower at 2,693,664 tons, as against 2,765,120 tons. Coal stocks at pitheads thus increased from 3,960,697 tons at the beginning of the month to 4,062,157 tons towards the close.

During the month under review, 841 collieries were reported to be working with an average daily employment of 344,559 workers. Output per man-shift is estimated at 1.08 tons for miners and loaders, 0.59 ton for all workers underground and in open workings and 0.37 ton for all persons employed including surface workers. The percentage of absenteeism was of the order of 14.24.

COMMERCE & INDUSTRY

(*Concluded from page 1128*)

ing its works, including the installation of a new plant for using magnesium hydroxide, in the manufacture of Epsom salt. Thirdly, the Commission thinks—quite rightly in our opinion—that, as already there is a unit manufacturing calcium chloride at a much lower cost and as it has a capacity to meet the entire requirements of this country, it would not be fair to consumers that they should be required to bear the burden of protection based on the higher cost of production of another unit. Lastly, it rightly believes that the demand for calcium chloride will be stimulated, if the selling price is based on the lower cost of production. It is needless to add that this stimulus to demand will provide added fillip to the Magnesia Works for raising its production and thus also to effect reduction in costs. On these considerations, the Commission has estimated the fair ex-works price at (Rs. 8-10-6+ Rs. 2) Rs. 10-10-6 per cwt.

Owing to the ban imposed on imports, it was not possible to obtain c.i.f. prices of recent consignments of calcium chloride imported into the country. The Commission, therefore, obtained the c.i.f. prices based on the latest f.o.b. quotations in the U.K. from the Imperial Chemical Industries (India) Ltd. and the High Commission of India in the U.K. Calculated on the basis, the c.i.f. price of calcium chloride (solid-fused grade 72-75 per cent.) works out to Rs. 13-3-10 per cwt. Adding clearing charges of As. 8 per cwt. the landed costs, without duty, amount to Rs. 13-11-10 per cwt. or Rs. 3-1-4 per cwt. higher than the estimated fair ex-works price of Rs. 10-10-6 per cwt. Consequently, the Commission has, as stated at the outset, felt that there was no case for further continuance of protection to the calcium chloride industry beyond 31st December, 1955, when the present period of protection to the industry is due to expire.

METTUR INDUSTRIES RAISE DIVIDEND UNDER SECTION 23-A

BRIDGE AND ROOF TO EXPAND PRODUCTION

Mettur Industries Ltd.

THE directors of the above Company (Managing Agents: Messrs. W. A. Beardsell & Co. Ltd., Madras) submit the audited accounts of the Company for the year ended 31st March, 1955.

The net profit available for distribution after providing for depreciation and reserving for taxation Rs. 13,50,000 (Rs. 9,20,000) and taking into account the amount of Rs. 50,153 (Rs. 77,484) brought forward from 1954, amounts to Rs. 22,43,408 (Rs. 20,50,153 including Rs. 6,81,214 being excess profits tax refund). The directors recommend the payment of a dividend of 35 per cent. (22½ per cent. including a special bonus of 10 per cent.) free of tax amounting to Rs. 21,00,000 (Rs. 13,50,000) leaving a balance to be carried forward of Rs. 1,43,408 (Rs. 50,153 after setting aside Rs. 6,00,000 to fixed assets replacement reserve and Rs. 50,000 to dividend equalisation reserve).

With the passing of the Finance Act of 1955 certain amendments have been made to Section 23-A of the Income-tax Act. As a result, the Company, at present, is obliged to distribute as dividend the whole of its assessable income after providing for taxation. The directors, therefore, have no alternative but to recommend a dividend of 35 (22½) per cent, free of income-tax.

For the first time in recent years, the Mill's working has not been affected by power cuts and the fact that the Mill has been able to work full-time during the year is reflected in the improved turnover and higher net profit.

The distribution organisation of wholesalers and retailers has again functioned smoothly. The retail prices of the Company's cloths have remained unchanged during the year and the keen demand has continued throughout South India.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	60,00,000	Block ...	20,81,211
Reserves ...	69,00,000	Stock-in-trade	16,91,451
Provision for taxation ...	5,03,099	Stores and spare parts	13,56,252
Liabilities ...	36,13,655	Loose tools, etc. ...	53,603
Profit and loss account ...	1,43,408	Debts, deposits and advances ...	8,48,503
		Investments	72,12,637
		Cash ...	39,16,505
Rs.	1,71,60,162	Rs.	1,71,60,162

Bridge & Roof Co. (India) Ltd.

The directors of the above Company (Managing Agents: Messrs. Balmer Lawrie & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the half-year ended 31st December, 1954.

The profit for the half-year, after providing for debenture interest, depreciation and taxation, was Rs. 1,87,448 (Rs. 1,89,926) to which was added the balance brought forward of Rs. 1,09,624 (Rs. 91,661), making a total of Rs. 2,97,072 (Rs. 3,36,195 including a sum of Rs. 54,608 relating to preceding half-years). Out of the above sum the directors have set aside Rs. 1,00,000 (Rs. 1,50,000) to general reserve. This leaves a balance of Rs. 1,97,072 (Rs. 1,86,195), at the credit of profit and loss account, which the directors disposed off as follows:—

Paid a dividend at the rate of 15 (15) per cent. per annum absorbing Rs. 90,000 (Rs. 90,000) and carried forward Rs. 1,07,072 (Rs. 96,195).

The value of work completed during the half-year was the highest ever achieved, severely taxing the Company's capital, reserves and finances, which had to be supplemented from time to time by bank loans.

To assist in meeting the heavy demand for Structurals created by the second Five-year Plan the Company will have to expand production still further. This expansion will require expenditure on capital account and the financing of additional stocks, work in progress and debtors. The directors have accordingly recommended no increase in the dividend as it is in their view essential to build up the resources of the Company.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	12,00,000	Block ...	10,43,300
Debentures ...	2,00,000	Stock ...	12,24,994
Reserves ...	14,80,000	Work-in-progress ...	21,75,893
Provision for taxation ...	3,97,469	Goods-in-transit ...	53,880
Liabilities ...	42,27,868	Debts, deposits and advances ...	28,62,886
Profit and loss account ...	1,07,072	Investments ...	93,092
		Cash ...	1,58,364
Rs.	76,12,409	Rs.	76,12,409

Empire Jute Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod and Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st December, 1954.

The profit for the half-year, after providing for depreciation Rs. 1,22,000 (Rs. 1,00,000) and taxation Rs. 1,83,000 (Rs. 1,35,000) amounts to Rs. 2,49,245 (Rs. 1,64,573 after providing Rs. 25,000 for doubtful debts) to which must be added the credit balance brought forward from the previous half-year of Rs. 56,215 (Rs. 57,631) and provision for doubtful debts written back Rs. 25,000 (*nil*) making a total of Rs. 3,30,460 (Rs. 2,22,204). From this amount the directors have transferred to general reserve account Rs. 50,000 (Rs. 50,000), leaving an available balance of Rs. 2,80,460 (Rs. 1,72,204) out of which the directors recommend dividend on 10,000 preference shares at 7 per cent. per annum for the half-year ended 31st December, 1954, or Rs. 3-8 per share Rs. 35,000 (Rs. 35,000) and a dividend on 1,50,000 ordinary shares at 15 (10) per cent. per annum for the half-year ended 31st December, 1954, or As. 12 (As. 8) per share Rs. 1,12,500 (Rs. 75,000), leaving to be carried forward Rs. 1,32,960 (Rs. 62,204).

Jute stocks are shown at cost. Sold stocks of goods have been calculated at contract sale price and goods unsold on 31st December, 1954, have been valued at market rates.

In accordance with the main and supplementary working time agreements of the Indian Jute Mills' Association, working hours were 45 per week as from 12th July, 1954 and 48 hours per week as from 18th October, 1954. Due to a reallocation of loom hours on a group basis and the purchase of loom hours, your mills worked 48 hours per week with 12½ per cent. of their total looms sealed.

Orders have been placed for the partial modernisation of the mill with sliver spinning machinery and at present the sacking weft sliver spinning machinery is under installation.

Somewhat better though still difficult trading conditions obtained throughout the period. Raw jute prices increased steadily at the close of the half-year because of the anticipated shortage resultant from the flooding and damage previously reported. There was an improvement in heavy goods prices but this was largely offset by the marked increase in the price of cuttings.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	25,00,000	Block ...	20,41,589
Debentures ...	8,86,000	Stocks ...	23,28,117
Reserves ...	33,50,000	Stores ...	8,76,132
Provision for taxation ...	6,72,742	Debts, deposits and advances ...	15,03,024
Liabilities ...	9,50,423	Investments	9,17,206
Profit and loss account ...	1,32,960	Cash ...	8,26,037
Rs.	84,92,125	Rs.	84,92,125

Albion Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Sahu Jain Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th November, 1954.

The half-year's working after writing off depreciation shows a profit of Rs. 5,54,631 (Rs. 5,80,976). The following appropriations have been made:—Provision for taxation Rs. 2,40,000 (Rs. 1,70,000) and transfer to general reserve Rs. 1,00,000 (Rs. 5,96,609). After adding the balance brought forward from the last account of Rs. 54,874 (Rs. 4,42,186) there is an available sum of Rs. 2,69,504 (Rs. 2,56,553). The directors recommend payment of dividends (free of income-tax) for the half-year ended November, 1954 to the shareholders as on 17th June, 1955, on 9,000 preference shares at Rs. 3-8 each Rs. 31,500 (Rs. 31,500) and on 24,000 ordinary shares at Rs. 6 (Rs. 12) each Rs. 1,44,000 (Rs. 1,44,000), leaving a balance to be carried forward of Rs. 94,004 (Rs. 81,053).

Shipments of modern sliver spinning machinery have already commenced. Installation would be in full swing in the ensuing half-year, and modernisation programme and electrification of the mills are expected to be completed early next year.

The mills worked 42½ hours per week upto 10th July, 1954. Working hours were increased to 45 hours a week from 12th July, 1954, and again to 48 hours per week from 18th October, 1954.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	33,00,000	Block ...	13,70,169
Reserves ...	16,00,000	Stocks ...	47,51,253

Profit and loss account ...	2,69,504	Investments	50,780
		Cash ...	5,29,470
Rs.	92,45,728	Rs.	92,45,728

Bengal-Nagpur Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st December, 1954.

After providing Rs. 16,025 (Rs. 10,164) for depreciation there remains a balance of Rs. 24,518 (Rs. 27,128 after transferring Rs. 4,284 to capital reserve, to the debit of profit and loss account. Rs. 15,750 (*nil*) has been transferred from the general reserve and the directors recommend that preference dividend for the half-years ending 30th June, 1953, 31st December, 1953, 30th June, 1954, and 31st December, 1954, be paid out of it.

During the half-year the raising contractor gave notice of withdrawal from the contract and raisings ceased on 3rd December, 1954, when the contractors' notice expired. Approximately 20,000 tons remained to be worked in the Colliery's 3 pit and arrangements are being made for the extraction of this remaining coal. A plan for future mining operations at the colliery is at present under consideration by the Board.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3,37,500	Block ...	2,77,282
Reserves* ...	4,96,231	Stock of coal	31,903
Provision for taxation ...	11,935	Stores ...	243
Liabilities ...	1,09,050	Debts, deposits and advances ...	6,38,637
		Cash ...	6,651
Rs.	9,54,716	Rs.	9,54,716

*Reserves are shown after deducting Rs. 24,518 being profit and loss account debit balance.

Standard Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. F. W. Heligers and Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st December, 1954.

Labour.—The appeals by the Company and the workmen against the award of the Industrial Tribunal in connection with the closing of the colliery in 1951 have not yet been taken up by the Appellate Tribunal.

The profit and loss account, after providing Rs. 1,000 (Rs. 1,00,000) for depreciation, Rs. 49,992 (Rs. 94,168) for taxation, transferring Rs. 12,000 (*nil*) from taxation reserve and including the sum of Rs. 59,039 (Rs. 87,018) brought forward from last half-year, shows an available balance of Rs. 1,27,358 (Rs. 1,64,141) which the directors propose to dispose of as follows:—

In paying a dividend at the rate of 15 (20) per cent. per annum without any deduction for income-tax paid by the Company Rs. 60,000 (Rs. 80,000) and in carrying forward Rs. 67,358 (Rs. 84,141).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	8,00,000	Block ...	1,45,060
Reserves ...	14,72,339	Investments	18,29,312
Provision for taxation ...	1,14,684	Debts, deposits and advances ...	6,90,004
Liabilities ...	2,20,388	Cash ...	10,393
Profit and loss account ...	67,358		
Rs.	26,74,769	Rs.	26,74,769

TATA HYDRO-ELECTRIC COMPANIES MAKE FINAL CALL

The Tata Hydro-Electric Power Supply Company, Ltd., The Tata Power Company, Ltd., and The Andhra Valley Power Supply Company, Ltd. (Managing Agents: Tata Hydro-Electric Agencies Ltd., Bombay), have made the final calls of Rs. 25, Rs. 250 and Rs. 250 per share, respectively, on their new ordinary shares. It may be recalled that, in August, 1953, all the three Companies raised fresh capital by the issue of new shares for the purpose of providing a part of the funds required for installing the thermal plants at Trombay. The total cost of the project was then estimated at Rs. 13 crores, of which the three Companies among themselves were to contribute Rs. 3 crores by the issue of new shares. The final call on the shares will bring in Rs. 75 lakhs, the balance of Rs. 2.25 crores having been received by the earlier calls.

TREASURY BILL RATE DECLINES

(From Our Own Correspondent)

BOMBAY, 8th June

The short-term money market remained featureless during the week under review, with both supply and demand being of a limited nature. There was, however, no change in the money rates. Activity in the inter-bank call money section was smaller and the rate was stagnant at 2½ per cent. There were some enquiries at 2¼ per cent., but lenders were not eager to do business at that rate. Short-term deposits were still keenly bid at 3 per cent. for 1 to 6 months.

There was a further improvement in the offerings to the three months' Government of India Treasury Bill sales this week. The amount offered against an invitation for Rs. 100 lakhs was Rs. 273.75 lakhs, as against Rs. 229.50 lakhs in the previous week and Rs. 155 lakhs two weeks ago. The average rate of accepted tenders which had declined from Rs. 2-9-1 per cent. to Rs. 2-9-0 per cent. per annum last week, dropped a little further to Rs. 2-8-8 per cent. per annum this week.

After two weeks of successive decline to the extent of Rs. 15 crores in the aggregate, notes in circulation have gone up by Rs. 8.86 crores during the week ended 3rd June, 1955. Disclosing this, the Reserve Bank statement for that week shows a fall of Rs. 9.73 crores in notes held in the Banking Department. Total notes issued have gone down by Rs. 87 lakhs, and this decline is covered by a similar fall in rupee coin. There has been a contraction of Rs. 9.93 crores in foreign securities and a similar rise in rupee securities. In the Banking Department, deposits of the Central Government have declined by Rs. 2.43 crores, while those of other Governments have gone up by Rs. 58 lakhs. Deposits of banks show a fall of Rs. 2.74 crores. Balances held abroad are higher by Rs. 11.57 crores. Loans and advances other than to Governments have recorded a fall of Rs. 6.38 crores, mainly accounted for by the repayments to the extent of Rs. 6.43 crores by Scheduled banks of advances against usance bills. There have been fresh borrowings to the tune of Rs. 6.85 crores during the week by the banks against these bills. Investments are lower by Rs. 1.04 crores.

A further rise of Rs. 5.28 crores in demand deposits of Scheduled banks is disclosed by the statement for the week ended 27th May, 1955. Time deposits show a negligible rise. No notable variation is seen in inter-bank borrowings, while a decline of Rs. 4.78 crores is noted in borrowings from the Reserve Bank and of Rs. 39 lakhs in those from the Imperial Bank. Advances, which had dropped by Rs. 4.18 crores in the previous week, have gone down further by Rs. 3.20 crores during the week under review. Inland bills purchased and discounted are up by Rs. 73 lakhs, while foreign bills are lower by Rs. 28 lakhs. Investments are almost unchanged, as also total cash. Balances with other banks in current account are higher by Rs. 20 lakhs, while no notable change is seen in money at call.

The Gilt-edged market remained steady during the week under review with buyers in almost all securities. There was no change in the official selling price of securities during the week. 3 per cent. 1957 was wanted at Rs. 99-8, but there was no change in the rate. 3 per cent. 1958 had enquiries change in the rate. 3 per cent. 1959-61 was in demand an at Rs. 99-7. 3 per cent. 1959-61 was in demand an anna better at Rs. 97-15. 3 per cent. 1963-65 was marked down by an anna to Rs. 94 and there were buyers at that level. 3 per cent. 1964 was wanted at Rs. 94-1, while 3 per cent. 1966-68 was stagnant at Rs. 91. 3 per cent. 1970-75 was, however, an offer at Rs. 87-2. 3 per cent. 1986 Conversion Loan changed hands an anna better at Rs. 80-9. 3½ per cent. 1961 shed an anna to Rs. 99-13, but attracted buyers at that level. 3½ per cent. 1964 was unchanged at Rs. 88-12. There was very keen demand for 4 per cent. loans of State Governments at higher levels. 4 per cent. 1963 and 1964 Bombay were both in demand at Rs. 101-5, as against Rs. 101 and Rs. 101-1, respectively, a week ago. 4 per cent. 1963 and 1964 Madras were in request As. 4 higher at Rs. 101-2.

In the foreign exchange section, there was no change, on balance, in the rupee-U.S. dollar exchange rates, the banks selling rate for ready dollars being Rs. 479½ per $100 and the buying rate Rs. 475½ per $100. However, the selling rate moved between Rs. 479 and Rs. 480 per $100 and the buying rate between Rs. 475 and Rs. 475¾ per $100. Sterling, on the other hand, disclosed a fractional gain in terms of the dollar. Thus, the New York spot sterling was marked up from $2.79-3/16-2.79-5/16 to $78-3/8-2.79⅛, three months forward from $2.77-7/8-2.78 to $2.77-15/16-2.78-1/16 and transferable sterling from $2.77-1/16-2.77-3/16 to $2.77-1/8-2.77-1/4.

HIDES FULLY STEADY

(From Our Own Correspondent)

KANPUR, 5th June

During the week under review, conditions in the hides and skins markets were in major respects, similar to those prevailing in the previous week. New arrivals during the week, though a bit smaller than the general average, were quite according to the expectations of the summer season. The main purchasers were the local tanners. Madras dealers were lukewarm. There was particularly strong demand for wet salted buff and cow. The undertone of the market was fully steady.

The latest available quotations are: Wet salted cow, 1st grade Rs. 360 to Rs. 400, 2nd grade Rs. 260 to Rs. 280 and 3rd grade Rs. 120 to Rs. 140 per score; wet salted buff, 1st grade 1 lb. 9 ozs., 2nd grade 1 lb. 12 ozs. and 3rd grade 2 lbs. per rupee; goat, 1st grade Rs. 275 to Rs. 300 and 2nd grade Rs. 200 per 100 pieces; sheep, 1st grade Rs. 250 and 2nd grade Rs. 200 per 100 pieces.

SELLERS PAY HEAVY CARRY FORWARD CHARGES IN BULLION

(From Our Own Correspondent)

BOMBAY, 8th June

Trading on the Bullion Exchange during the week under review was marked by aggressive bullishness in *Jeth* settlement of the forward section which matured during the week. As the settlement drew nearer, prices advanced briskly on firm bull grip and frantic short covering. Notwithstanding the enforcement of a margin of Rs. 2,500 per bar of silver, under section 33 D(1)(a) (i), on their outstanding purchases in *Jeth* settlement, the bulls were able to tighten their grip over the market. With virtually all the floating stocks of silver in their hands and with an upper hand in gold also, the bulls began to squeeze the sellers by exacting heavy backwardation charges. The backwardation charge (*Jeth* to *Ashad* settlement) in silver widened from Rs. 6-8 to as much as Rs. 9-2 and in gold from Rs. 2-12 to Rs. 3-2.

The heavy backwardation charges exacted by the bulls caused a stir in the market and a requisition signed by more than 50 members was sent to the Board of the Bullion Association urging the postponement of the *Jeth* delivery by 5 days. The members also asked the Board to take effective measures to check the recurrent squeezes. A meeting of the Board was held yesterday, but before it could take any decision, a mutual understanding was reached between the members of the opposite camps, under which the bulls agreed not to ask for a backwardation of more than Rs. 9 in silver. Following this understanding, the suggestion for extension of the *Jeth* settlement was withdrawn. The settlement also passed off smoothly.

After remaining dull, early in the week, forward silver in *Jeth* settlement firmed up to Rs. 162 on Saturday, as against last week's closing of Rs. 161-3, on keen buying by bulls, despite heavy arrivals of *kutcha* silver attracted by heavy backwardation charges. As this rate, at the close of that day, stood above the official starting rate (Rs. 161-9) for that settlement and as the closing rate for the next succeeding contract on that day was more than Rs. 3 below this, the bulls were obliged to pay a margin of Rs. 2,500 per bar on their outstanding purchases in *Jeth* settlement. Despite this, forward silver for this settlement forged ahead to Rs. 164-3 before the settlement ran out at Rs. 164 on the 7th inst. *Ashad* and *Shravan* silver ruled steady with narrow movements, the former closing at Rs. 154-13 and the latter at Rs. 152-4, as against last week's closing of Rs. 154-10 and Rs. 152-4, respectively.

Ready silver (.996 Mint) opened at Rs. 162-7 and advanced to Rs. 164-15, before closing at Rs. 157-13. The floating stocks of silver are reported to be 700 bars. The daily average offtake was 15 bars.

Gold for forward delivery in *Jeth* settlement advanced from Rs. 91-13 to Rs. 93-3, before the settlement ran out at Rs. 93-1. *Ashad* gold hardened from Rs. 89-2 to Rs. 90-12 and closed at Rs. 90-9. *Shravan* ready gold moved up from Rs. 87-14 to Rs. 88-12. The floating stocks of gold are estimated at 10,000 tolas. The daily average arrivals were 4,000 tolas and the offtake was 3,500 tolas on an average.

In London, silver price was unchanged at 78¼d. for spot and 78¼d. for forward. After an initial decline from £12 10s. 11½d. to £12 10s. 10d., gold firmed up to £12 11s. In New York, the price of silver was marked down from 90½c. to 90¼c. per fine ounce.

The following comparative table shows the trend of the market during the week under review:

	8-6-55	Highest	Lowest	1-6-55

BASE METALS MOVE NARROWLY

(From Our Own Correspondent)

CALCUTTA, 7th June

Prices of base metals fluctuated within narrow limits during the week under review. Consumers were interested in fair tonnages, but were reluctant to purchase when prices got moving up. This kept prices down. Higher advices were received from London and New York, but locally electrolytic copper was better only by two points at Rs. 250. On the other hand, the price for the ready metal on the London Metal Exchange went up by as much as £10 per ton mainly encouraged by the Railwaymen's and dock labourers' strikes. The higher level was thought here as a temporary phase, but it would persist if the labour trouble facing Britain was not ended. Electrolytic zinc was in moderate demand, and improved from Rs. 64-8 to Rs. 65. Tin opened at Rs. 483, and moved down to Rs. 476-8, which is much below the replacement cost. Such a recession was due to expectations of imminent arrivals. Offerings were less. Stockists expected return of steadier conditions in the near future, in view of higher advices from the Far Eastern markets. Lead closed at Rs. 73-8, as against an opening of Rs. 74-8. The weakness reflected supply in abundance.

COTTON MOVES UP

(From Our Own Correspondent)

BOMBAY, 8th June

Although narrow fluctuations characterised the trading in the forward section of the local cotton market during the earlier part of the week under review, there was a slight improvement in values towards the close. The change in sentiment is attributed to moderate demand in the ready market and more particularly to renewed rumours about the possibility of a cut in export duty on cotton. Mill demand for ready cotton in such styles as Vijay, Jarilla and Surti has been encouraging. So has been the offtake in the piece-goods market where moderate demand for popular varieties has been reported. The two large uncertainties that still remain are: the Government's decision on export duty and the imminent monsoon. It is only when they are cleared that any definite trend is likely to be established.

Opening the week at Rs. 577½, the same rate as the one at which it closed in the previous week, I.C.C. August fluctuated, in the first three days of the week, between Rs. 577½ and Rs. 571½ before it closed at Rs. 574¾ on the 4th inst. The second half of the week witnessed a steady trend, the contract moving up to Rs. 579½ on 7th inst. and still further to Rs. 580¾ today (the highest level reached during the week). Profit-taking at this level depressed prices so that the contract finished weak at Rs. 578¾, showing a meagre gain of Re. 1-4 per candy over the week.

The following is the trend of prices during the week under review:

	Opening	High	Low	Closing
I.C.C. August ...	Rs. 577½	580¾	571½	578¾

In the spot section, there was good enquiry from mill interests for Vijay and Jarillas. Sporadic export demand was reported in Vijay and Zoda cotton. The following are the latest available quotations from the Sewri market: Bengal *deshi* Rs. 560; Berar Jarillas Rs. 605; Khandesh Rs. 590-600; Vijay Rs. 765; Oomra *deshi* Rs. 550; Moglai Rs. 520.

The members of the Hedge Contract Committee, set up by the East India Cotton Association to examine the question of amending the current contract, are understood to favour a change in the present basis of the contract, namely, 23/32" staple. They are stated to be generally in favour of a basis of 13/16". Such revision, it is held, would benefit producers and traders of medium and long-staple cotton. The question of evolving two hedge contracts will probably not find general support, in view of the reported disinclination of the Forward Markets Commission to permit trading in more than one hedge contract.

The Reserve Bank of India, it is learnt, has rejected the plea of the Bombay Millowners' Association for exchange facilities to mills in order to enable them to participate in the Liverpool futures market. The authorities of the Bank, it is stated, are of the view that such facilities are likely to be misused for unlawful transfer of funds from India to overseas countries.

Despite the absence of any keen demand from overseas buyers, the Pakistan cotton market witnessed a firm trend in prices. This is attributed to the bull grip over the market. N.T. July contract improved over the week from Rs. 67-5 to Rs. 70-2 and N.T. January from Rs. 65-5 to Rs. 66. The following is the list of latest available quotations from the Karachi market: Sind *deshi* Rs. 58; Punjab *deshi* Rs. 53; Punjab R.G. Rs. 69-2; S.G. Rs. 74-2; N.T.R.G. Rs. 73-2; 289F R.G. Rs. 73-2.

In the Alexandria market, enquiries for Karnak from the U.S. and India were reported. The U.K. is said to have evinced some interest in Ashmouni. In order to facilitate trade with Eastern Europe, the Egyptian Government has decided to guarantee, within the limits of £E.10 million, the collection of payment for cotton exported to Russia, East Germany, Czechoslovakia, Hungary and Poland.

The final official estimate for Egyptian cotton for the 1954-55 season places the crop at 7,746,260 kantars against 7,081,869 kantars in the previous season. The estimate points out that long-staple varieties (above 1⅜ inches) accounted for 2,563,243 kantars, other long-staple varieties (above 1½" and below 1⅜") including Giza 30 and Dandara, for 1,979,313 kantars, medium-staple varieties, including Ashmouni, for 3,024,592 kantars and cotton waste for 179,112 kantars.

The Sudan Gizira Board sold in all 17,346 bales of cotton during the auctions held on 25th, 26th, 27th and 28th May, 1955. The Board has notified reserve prices (per 100 lbs. ex-Port Sudan) for D.G. 62, 3B and 3C at 1,000 piastres, 955 piastres and 890 piastres respectively.

Trade fixing was mainly responsible for the steady trend in the Liverpool cotton market this week. Business, however, remained restricted. The latest available quotations are: July-August 31.12; October-November 30.20; December-January 30.05; March-April 29.94.

The members of the New York Cotton Exchange, it is stated, have approved of the new contract with basis Middling 1" tenderable up to 3/32" off and 1/16" on for staple. The "on" allowance for 1/32" and "off" allowance for 1/32", 1/16" and 3/32" have been fixed at full premium over and full discount under 1". Trading in the October, 1956 contract under new conditions of trading commenced on 1st June.

The American Department of Agriculture has estimated the supply of raw cotton in the U.S. at 23.5 million bales of 478 lbs. each, in the 1954-55 season, as against 22.1 million bales in the 1953-54 season. The offtake in the current season is placed at 12.8 million bales, including domestic mill consumption of 8.8 million bales and exports of 4 million bales. The carryover on 1st August, 1955, is placed at 10.7 million bales.

The firm trend which was witnessed in the New York cotton market during the earlier part of the week, gave way towards the close of the

week. The market eased under pressure of liquidation by commission houses and New Orleans operators. Thus, the July contract which was quoted at 33.86 cents on 31st May, moved up to 33.98 cents on 3rd inst. but reacted subsequently, so that it came to be quoted at 33.83 cents on 7th inst.

The following are the latest available quotations from the New York market as compared with those a week and a fortnight before:

(In cents per lb.)

	7-6-55	31-5-55	24-5-55
Spot	34.65	34.65	34.80
July	33.83	33.86	34.04
October	33.98	34.02	34.20
December	34.02	34.08	34.22
March	33.95	33.95	34.15
May	34.01	—	—
July	33.21	—	—
October	32.75	—	—

SUGAR FULLY STEADY

(From Our Own Correspondent)

BOMBAY, 8th June

The upward trend in prices witnessed in the sugar market last week gathered further momentum during the week under review, thanks to good buying support in the face of paucity of indigenous sugar stocks, occasioned by transport bottleneck. Stocks of French and Czechoslovakia sugars also had been practically exhausted. Even the statement of the Minister for Agriculture to the effect that sugar production during 1954-55 would be an all-time record of 1.6 million tons and that there would be a carryover of as much as 800,000 tons at the end of the season failed to have an adverse effect on the sentiment of the market.

In the spot section, large grain indigenous sugar strengthened from Rs. 93½—Rs. 101 to Rs. 97—Rs. 102 per bag. Medium grain spurted by As. 8 to Rs. 90—Rs. 94. Among imported sugars, British refined sugar was fully maintained at Rs. 84-4 per bag of 2 cwts. and German sugar at Rs. 80 per 224 lbs.

In the forward section, *Shravan* delivery hardened by As. 8 to Rs. 88-12 per bag. *Jeth* delivery was squared up at Rs. 83-8, as against Rs. 83-7 last week end.

An inexplicable feature of the market is that, while the profit margin available to dealers on sales of imported sugar in sound bags is exceptionally slim, the Union Food Ministry is getting good prices at the auctions for sugar even if it is in slack, torn and damaged bags. At the auction held today, for instance, damaged British refined sugar was bid at Rs. 29-8, and slack and torn German sugar at Rs. 29 per maund, as against the Government issue price of Rs. 30-8 and Rs. 29-8, respectively.

Sugar traders are somewhat surprised at the Union Agriculture Minister's statement about the heavy carryover of sugar at the end of the season. They do not understand as to how the Minister arrived at the figure of 800,000 tons. It may be that the Government has not re-sold the undelivered portion of the foreign sugar bought by it and that the whole of it will arrive in India after the monsoon. But the present trend of offtake is good and consumption may not be as low as was reckoned a few months ago.

N.B.—The rates for Indian sugars are inclusive of sales tax, while those for foreign sugars are exclusive of the tax.

RAYON YARN EASY

(From Our Own Correspondent)

BOMBAY, 8th June

There was practically no business in the forward section of the rayon yarn market during the week under review, thanks to scarcity of supplies of 150 deniers tenderable quality yarns and fears of sellers being squeezed. June delivery was nominally quoted at Rs. 730. The spot section presented an easy trend owing to three bearish factors. First, increased supplies of yarn are made available by indigenous manufacturers. Secondly, arrivals of imported yarns have been larger in recent weeks; the quantity that actually arrived in the port of Bombay during the month of May is estimated at 2.67 million lbs., as against 2.32 million lbs. in the previous month. Thirdly, inward clearance of goods at the docks have improved considerably. All these factors induced some selling and rayon yarn prices tended to come down. 120 Italy was subjected to considerable selling pressure and dropped As. 5-6 to Rs. 3-11-6 on Monday, but recovered to Rs. 3-13, following support at lower levels. 150 Italy shed 18 pies to Rs. 3-9-0. 150 Japan lost an anna to Rs. 3-14. 120 Japan was quiet at Rs. 3-13-6. Among indigenous yarns, National Rayons 120 Bt. Cone I and II grades declined by half an anna each to Rs. 4-3-6 and Rs. 4-2, respectively. 150 Bt. Cone I grade was lower by three pies at Rs. 3-7-3.

In contrast with rayon yarns, the staple fibre yarn section exhibited fully steady conditions, owing to good enquiries from consuming centres and, as a consequence, prices recorded a rise. Staple fibre yarn (40×2) for June delivery moved up from Rs. 587 to Rs. 591-8 today before finishing at Rs. 590-8. In the spot section, Kohinoors increased by half an anna to Rs. 3-5. Sitarams gained 3 pies to Rs. 3-1-9. Citys were fully steady at Rs. 3-3-4, New Greats at Rs. 3-1-6 and Seksarias at Rs. 3-0-7½. Among foreign yarns, Suicos spurted by an anna to Rs. 4-13. Shincos were throughout maintained at last week's level of Rs. 4-9.

Activity in the cotton yarn market was very much restricted this week. Enquiries from consuming interests, particularly from the powerloom sector, continued to be slack. Traders showed little interest in fresh business, as they preferred to watch the trend of powerloom goods market in the context of the imposition of excise duty on weaving units having more than four cotton powerlooms. Consequently, prices moved narrowly, the general tendency being downwards. Among 10s, Podars eased by an anna to Rs. 12-11. Moderns were quiet at Rs. 12-12 and Elphinstones at Rs. 12-8. Deals in 39 count yarns were put through at lower rates, Maduras declining by As. 4 to Rs. 20-12 and Moderns by As. 2 to Rs. 20-14. Among 40s, Seksarias dropped As. 12 to Rs. 21-8. Moderns retreated from Rs. 25-4 to Rs. 25. Among 60s, Finlays receded by Re. 1 to Rs. 61. Moderns lost As. 4 to Rs. 61. Cotton yarns of 20 and 80 counts, on the other hand, were steady. Among the former, Seksarias were done at Rs. 15, Raghuvamshis at Rs. 16-4 and Maduras at Rs. 17-3. Among 80s, Finlays were unaltered at Rs. 68-8, as also Moderns at Rs. 62-8.

The table below gives the prices of art silk staple fibre and cotton yarns quoted today, as compared with those eight days before:

	8-6-1955	31-5-1955
	Rs. a.	Rs. a.

OILSEEDS FIRM

(From Our Own Correspondent)

BOMBAY, 8th June

After a prolonged spell of dull and easy conditions, the oilseeds market sprang into activity during the week under review, with brisk business in the oil section. The chief factor which provided impetus to the market was the extension of the free licensing policy for export of castorseed and linseed oils up to the end of December next. This measure has been widely welcomed by traders. It will be recalled that, despite keen overseas enquiries for the oils, shippers were hitherto extremely cautious to enlarge their commitments, thanks to difficulty in obtaining freight space for quick delivery. Now that shipment period has been extended, deals for export purposes are expected to register improvement. There are already reports of sizable business—amounting to 2,200 tons of castor oil, for July-August—having been done recently with the U.S. by some shippers at As. 7-3 per lb. (c.i.f.) for commercial quality and at As. 7-10 per lb. for 1st quality. The firmness in oil prices attracted widespread buying enquiries for castorseed and linseed, resulting in a marked improvement in prices. In sympathy with these, groundnuts, kardiseeds and nigerseeds ruled strong, their quotations today being higher than those at the end of last week.

After remaining dull in the earlier part of the week, castorseed for September delivery came into the limelight in the latter half. The delivery opened the week easy at Rs. 73-2, as against Rs. 74-2 on Wednesday last. After receding to Rs. 72-10 on the 3rd inst., it staged an impressive rise thereafter, following bull support and short covering, to touch a high of Rs. 77-8 before finishing at Rs. 76-12. The net gain over the week was Rs. 3-10. In the ready section, F.A.Q. was favoured most, its price advancing by Re. 1-14 to Rs. 14-8. Madras quality also met with buying support and hardened by As. 12 to Rs. 14-10. Kanpur improved from Rs. 13 to Rs. 13-8. Castor oil 1st Pressure strengthened by As. 5 to Rs. 9, commercial quality by As. 4 to Rs. 8-8 and B.S.S. by As. 3 to Rs. 9-8.

As already stated, the Government of India has extended the free licensing of exports of castor oil up to the end of December next. Export licences will be granted on presentation of shipping bills by two categories of shippers, namely, (1) established shippers who have already established their basic year exports of castor oil, effected by them during any of the calendar years 1951, 1952, or 1953 and (2) non-established shippers dealing in the trade of vegetable oils and oilseeds and having a minimum turnover of over Rs. 25,000 in any of the three years 1951, 1952 or 1953. Exports of castor oil by "others," however, will not be allowed.

In the linseed section, August-September registered a handsome rise of Re. 1-6 to Rs. 23-12. June-July rallied Re. 1-3 to Rs. 23-11. Indore quality were higher by Re. 1-5 at Rs. 23-12 and Bold ready by Re. 1 at Rs. 23-8. Kanpur quality was better at Rs. 22-4, as against Rs. 21-4, although, at the time of writing this report, this variety was somewhat neglected. Linseed oil ready moved up by As. 8 to Rs. 14-8.

It is reported that overseas demand for linseed oil, especially from the U.K., is excellent. Buyers are prepared to purchase oil at £103 per ton. To what extent will the extension of the shipping period help exporters to do further business in linseed oil will depend on the supply position which is said to be scarce at present. Incidentally, about 25,000 to 26,000 tons of oil—which, in terms of linseed, amount to 70,000 tons—are reported to have been exported so far in the current season.

The groundnut section ruled strong, following covering in oil by shippers against previous commitments as a result of improved freight position. The improvement in prices of groundnut in the U.K. from £100 per ton to £105 per ton in the past few days also strengthened the sentiment. Prices, however, could not move up appreciably, owing to exhaustion of most of the export quotas for groundnut oil. Bold F.A.Q. gathered As. 8 to Rs. 20-6. June-July picked up As. 10 to Rs. 20-6 and August-September As. 9 to Rs. 21-6. Coromandel ready and Khandesh rose by As. 10 each to Rs. 21-2 and Rs. 21-4, respectively. Groundnut oil *ex*-mill increased by As. 6 to Rs. 11-7 on Monday, but receded to Rs. 11-5 today. Railway receipt was better by As. 3 at Rs. 11-5. June improved from Rs. 11-1 to Rs. 11-5-6 and July from Rs. 11-2 to Rs. 11-5-6. August was quoted today at Rs. 11-7-6, as against Rs. 11-4 on Thursday last.

Kardiseeds evoked good buying enquiries, Bold ready advancing by Re. 1 to Rs. 12-8 and June-July by As. 12 to Rs. 12-8. Nigerseeds, however, were quiet. F.A.Q. and Madras were quoted each As. 4 lower at Rs. 18-8 and Rs. 19, respectively.

Export business in oilcakes continued to be quite brisk. The U.K. and Continental interests recently purchased a sizable quantity of groundnut oilcake at about Rs. 507 per ton (c.i.f.). There are overseas buyers for kardiseed oilcake at Rs. 227 and for nigerseed oilcake at Rs. 331 per ton (c.i.f.).

The following table shows the price of oilseeds and oil today, as compared with those at the end of the previous two weeks.

	8-6-1955	1-6-1955	24-5-1955
	Rs. a.	Rs. a.	Rs. a.

PEPPER MOVES UP

(Messrs. Parekh & Co.)

BOMBAY, 8th June

During the earlier part of the week, the sentiment in Malabar black pepper appeared depressed in view of the absence of enquiries from New York for more than a week and under pressure of sales by bears. Prices at primary centres slipped back to as low as Rs. 1,125. But these rates proved nominal, for immediately on the appearance of buyers, growers put up their prices and refused to sell anything below Rs. 1,175. After a small sale at the rate, they again raised their price to Rs. 1,187½-1,200. In view of the tight statistical position of Malabar black, growers are getting stiffer day by day, in spite of exporters trying to bear the market and absence of large enquiries.

Locally there was a scarcity of contracts and a small buying was enough to scare away sellers who seemed to be trying to depress the market, simply for making purchases at a later date in a declining market.

New York after touching $0.54 for spot, reacted to $0.49, and is now reported to have improved to $0.52 with buyers for shipment during the first half of June at $0.51.

It is learned that the Reserve Bank of India has decided to allow from 15th June free trading in some currencies like those of Australia, New Zealand, Belgium, Denmark, France, Holland, Norway, Sweden, Portugal, West Germany, Hongkong, Singapore, etc. with the exception of the pound sterling, the U.S.A. and Canadian dollars and Pakistan rupee. The pepper trade has so far not fully grasped all the implications of this measure. Some among the trade think that this might afford an opening in the near future for some international trading houses to do "commodity shunting," thus giving them an opportunity to make profit both in the exchange business and in the commodity.

June shipment after having gone down to $0.49 improved to $0.51 and July from $0.48½ to $0.50½. At the time of writing there is a scarcity of sellers both in the A.S.T.A. and delivery. In the delivery section, July improved from Rs. 1,045 to Rs. 1,105 and August from Rs. 1,040 to Rs. 1,100.

Following are today's nominal quotations: Ready delivery Rs. 155 (as against Rs. 157 a week ago) per Bengal maund, July Rs. 1,100-10 (Rs. 1,090-1,100), and August Rs. 1,095-1,105 (Rs. 1,080-90), per candy of 5¾ cwts.

TEA PRICES IMPROVE

(Messrs. Forbes, Ewart and Figgis Ltd.)

COCHIN, 2nd June

Following the three-week gap in export auctions in Cochin, Sale No. 11 was held on Tuesday 31st May. Some 1,600,000 lbs. were on offer and quality was well maintained, in view of the season of production. There were still some useful highgrown teas on offer. The sale opened to a strong general demand for all grades. However, the activity was mainly confined to internal buyers and exporters were fairly quiet. Poorer sorts and stalky teas were sold at rates which were about one anna dearer, but medium and good medium teas were well supported and were irregularly As. 2 dearer. Best liquoring highgrowns met with some competition and were As. 2 to As. 3 dearer. Whole leaf grades were very well supported. Black leaf Middle East types were in strong demand and

must be quoted considerably dearer. The following were the quotations:—

	1955	1954
	Rs. a. p.	Rs. a. p.
Low-grown Travancore B.O.P.	1 10 6	2 7 6
Medium Travancore B.O.P. ...	1 11 6	2 8 0
Anamallais B.O.P.	2 1 0	2 10 0
Best liquoring Nilgiri B.O.P.	2 6 0	2 14 0
Well made black leaf O.P. ...	2 13 6	2 12 6

London Market.—No sale this week.

Colombo Market—Sale of 30th May.—More general interest at dearer rates. Liquoring broken teas and fannings 20 cents dearer. Plain sorts and stalks 10 cents dearer. Good dusts active. Poor sorts weak.

Sale of 31st May.—Middle East sorts considerably lower, owing to shipping difficulties. Stalky sorts easier. Poorer mediums steady. Good mediums and best quality strong enquiry and much dearer.

Calcutta Market.—No sale this week.

Export Quota.—At the end of last week, there was a stronger demand and business was done at 34 pies. The market has now eased and there are buyers at 66 pies with sellers at 72 pies.

Export Duty.—The Government of India has announced a reduction in export duty from the present level of As. 8 per lb. to As. 4 per lb.

Forthcoming Auctions.—Sale No. 12 will be held on Tuesday, 14th June.

As we go to press, Messrs. Forbes, Ewart and Figgis Ltd. wire:—

"*Dust Sale K.*—4,30,000 lbs. Excited general demand. Prices have advanced for low and low medium As. 6 to As. 8, medium and best As. 4 to As. 6."

RAW JUTE EASY

(From Our Own Correspondent)

CALCUTTA, 7th June

Foreign buyers of jute goods preferred to sit tight without entering into commitments. This was naturally reflected in prices giving way and in weak holders turning out as nervous sellers during the week under report. However, the industry was not at all alarmed by the lack of buying by foreign consumers. After the recent purchases of hessians for export to Argentina, no substantial business with overseas buyers has been done. However, if the quantities bought for internal consumption and those taken by shippers and speculators driblets are added, they should compare well with the rate of production. What should be noted is that ever since the completion of the deals for export to the Argentina, there had been no heavy purchases which could reduce stocks further.

However, business is anticipated. The time of the year is fast approaching when the United States should commence purchasing for replenishing its stocks. In view of the satisfactory shipments of both hessians and heavy goods during the month of May, it is expected that the month-end stock figures would reveal sizable declines. During May, jute goods amounting to 69,455 tons were licensed for export, and utilising unexpired licences actual exports were more than 76,000 tons. Sacking goods exported reached the highly satisfactory figure of 45,266 tons, which was higher by 13,219 tons compared to the previous month. Hessian exported were as much as 30,659 tons as against 23,695 tons in April and 25,944 tons in March.

Ready B. twills were being quoted last Tuesday at Rs. 109-4, and July-September goods at Rs. 107-8. No genuine business was forthcoming even at these lower levels, and nervous speculators began to unload. This pushed down the price to Rs. 107 and to Rs. 105-12 respectively. There were clear indications in the market that overseas buyers desired to see how far prices were being taken down. Unfortunately, there had been no comparative decline in the prices of raw jute. The mills, therefore, could not do simultaneous business in the raw material as well as the finished products at a profit. Considering the very favourable reports of the jute crop in both Pakistan and India and the definite anticipations of the crops surpassing all estimates, raw jute should have declined unhesitatingly. However, this had not been so.

After reaching the lower levels earlier mentioned, B. twills made an attempt at partial recovery which was assisted by local short-covering. The ready position improved to Rs. 107-12 from Rs. 107 and the forward to Rs. 106-12 from Rs. 105-12. At this stage, a fight between bulls and bears developed, and there were more sellers at higher levels. This coupled with anticipations of early business for export forced a recovery, with ready B. twills improving to Rs. 108-8 by the week-end and the July-September goods to Rs. 107-12. An easier trend was in evidence yesterday, and the ready goods were lower at Rs. 108-4. In the hessian section, the movement in both directions was limited to fractions. Ready hessians 40" 10 oz. at first gave way to Rs. 42-3 from Rs. 42-7 but soon recovered to Rs. 42-9. By the week-end, the price touched Rs. 42-12 which, however, should not be considered a higher level in view of the higher prices for raw jute. Reports from the United States indicated that burlap manufacturers there were in no hurry to purchase hessians and that, with the expectation of a bumper jute crop in India and Pakistan, they naturally desired to enter into commitments only to the extent of their immediate requirements. Yesterday, in sympathy with an easier heavy goods section, 40" 10 oz. hessians also was lower at Rs. 42-10, with the eight oz. quoting at Rs. 34-2 f.a.s. and Rs. 37-6 f.o.b.

Raw jute was also easy. However, judging from the nature of bumper crop expected in East Bengal, the declines should have been more pronounced. This was not so because the difficulties in getting East Bengal jute have growingly increased during recent months, and it is highly necessary that these should be removed. It is expected that the forthcoming Indo-Pakistani trade talks would deal with this matter, and the market is eagerly looking forward to these talks. The latest quotations of raw jute are appended below:

	Old Crop Mid. Bottoms		New Crop Mid. Bottoms	
	Rs. a.	Rs. a.	Rs. a.	Rs. a.
Pakistani:				
Northern	31 8	27 8	31 8	27 8

Assam Lower	30 8	27 8	29 0	26 0

DEMAND FOR TEA STRONG

(From Our Own Correspondent)

CALCUTTA, 7th June

The 1955-56 season's first tea export auction was held yesterday. There was a strong demand, and, in spite of this, prices were held at levels, considered fair to both buyers and sellers. If prices remain at these levels, then the British housewife would remain content. Offerings yesterday aggregated 19,000 packages. Many of the lots on offer were taken by buyers for internal consumption, as quotations were considered attractive to the internal market in view of the current price for the export quota, viz., As. 5¼. The strongest feature was well-made black B.P. teas and whole leaf grades, prices of which were raised As. 2 above brokers' valuations. Stylish Dooar teas were firm, and, among Darjeelings, superior teas were sold at above valuations. A number of plainer lots of Darjeelings had to be withdrawn, as they did not attract buyers' attention. Fannings were easy and lost by 1 to 2 annas. The rates were: plain B.P. Re. 1-14, and plain pekoe Rs. 2-8 to Rs. 2-10.

KIPS DECLINE

(From Our Own Correspondent)

MADRAS, 6th June

Trading in kips with the U.K. was sporadic due to Whitsun holidays and dock and railway strike in the U.K. Arrivals of kips were on the usual scale and clearance moderate. Prices in the local bazaar were easier by six pies per lb. for ordinary qualities of cow hides and three pies for buff hides. Tanned cow calf and buff calf ruled steady. The U.S.A. showed some interest in buff calf skins.

COTTON PRODUCTION PROSPECTS

RECORD CARRYOVER STOCKS PREDICTED

AN analysis of the free world cotton statistics for the 1954-55 season brings out the very significant fact that the overall decline in output has in no way affected adversely the supply of cotton. Rather, the supply is now placed higher at 47.1 million bales of 478 lbs. each, as against 45.8 million bales in the 1953-54 season, although production is estimated to have fallen from 30.3 million bales to 28.7 million bales in the current season. The reason for this increase in supply must be sought in the heavy carryover stocks brought into the current season—some 18.4 million bales on 1st August, 1954, as compared with 15.5 million bales on the same date in 1953.

A further probe into the statistics reveals that the cotton producing countries outside the U.S. are beginning to play an important part in world cotton economy. Between 1953-54 and 1954-55, the U.S. cotton crop was reduced by 2.8 million bales. But the overall output declined only by 1.6 million bales. This is because the countries, outside the U.S., increased their production by over one million bales. The following table gives the acreage under cotton, yield and output of cotton in the U.S. and in the major and minor cotton producing countries in 1949-50 to 1953-54 (average), 1953-54 and 1954-55:

Cotton Statistics

	1949-50 to 1953-54 Av.	1953-54	1954-55(a)
	(In millions of acres)		
ACREAGE.			
U. S.	24.5	24.3	19.2
Other Countries	38.0	39.8	42.0
Major (b)	33.0	34.1	35.9
Minor	5.0	5.7	6.1
Free World Total	62.5	64.1	61.2
	(Pounds per acre)		
YIELD.			
U. S.	233	324	339
Other Countries	161	167	171
Major (b)	165	170	174
Minor	134	149	158
Free World Total	209	226	224
	(In million bales)*		
PRODUCTION			
U. S.	14.5	16.4	13.6
Other Countries	12.8	15.9	15.1
Major (b)	11.4	12.1	13.1
Minor	1.4	1.8	2.0
Free World Total	27.3	30.3	28.7

(a) Estimated. (b) Mexico, India, Pakistan, Turkey, Syria, Egypt, Sudan, Uganda, Belgian Congo, Brazil, Argentina, and Peru.
* Bales of 478 lbs. each.

Free world production, this season, as the table above shows, is placed at 28.7 million bales. This is likely to be in excess of offtake—that is, consumption, net trade with communist countries and cotton destroyed—by some 800,000 bales. Taking into account cotton afloat, the free world carryover on 1st August, 1955, it is predicted, should rise to over 19 million bales as against 18.4 million bales on 1st August, 1954 and 15.5 million bales on 1st August, 1953. The volume of carryover stocks at the end of the current season, it is stated, is likely to be the largest, since 1946. Stocks in the U.S. are expected to rise to over 10.5 million bales while aggregate stocks in other countries may decline slightly from last season.

Prospects for 1955-56

The prospects for cotton production in 1955-56 are still uncertain. Discussing them, the International Cotton Advisory Committee, Washington, observes, in its May issue of *Cotton*, that, so far as the U.S. is concerned, the farmers are likely to "plant near to their allotment"—namely, 18.1 million acres. For production the determining factor in this country will be the yield. Farmers are expected to concentrate production on the best land and plant and fertiliser intensively. Using minimum and maximum yields by States obtained in the past ten years, the possible range of production in the U.S., it is stated, extends all the way from 8.3 to 11.6 million bales. Using average yields, production would be 10.3 million bales; a "workable" figure would be about 10.5 million bales.

In almost all countries outside the U.S., cotton production will be unrestricted. This fact, it is stated, makes it "more difficult to arrive at any estimate of total acreage." Prospects, however, are for a further net increase in planted acreage. During the 1954-55 season, major increases in acreage occurred in India, Brazil and Egypt. Land under cotton in these countries increased by 1.7 million acres out of a total increase of 2.2 millions outside the U.S. In India, the incentive to increase acreage next season, it is felt, may be "affected by the steep fall in cotton prices in recent months and the emphasis may now shift towards quality and more intensive cultivation." In Egypt, it is expected that there will be some relaxation in 1955-56 of the acreage controls. Preliminary indications are that acreage could rise to over 1.8 million acres for the coming crop.

Acreage was reduced in 1954-55 in the major cotton producing countries—Pakistan, Turkey and Mexico. Reports indicate that this trend may be reversed. The Committee says that there is "almost certain to be some increase in acreage in Mexico with more cotton grown under irrigation." Efforts are continually being made in Pakistan to increase cotton production. Again, everything seems set for a significant increase in acreage in Turkey. Among other cotton producing countries, Sudan and Uganda have steadily increased the land under cotton. This is true of Africa too. Acreage in Peru has been on significantly higher level in recent years, though it is doubtful if acreage could be expanded at the same rates as in past seasons. Summing up the position in major producing countries, the Committee observes: "Given normal weather conditions, therefore, the possibility is that there could be a further net increase in cotton acreage in the major producing countries next season."

Minor Countries

As regards minor cotton producing countries, the total acreage under cotton has increased by nearly 50 per cent. over the last six years and in 1954-55, it is estimated to have been in excess of 6 million acres. In many of these countries, according to the Committee, cotton is a "firmly entrenched, well established, industry." Thus, in the Central American countries—Nicargua, Guatemala, and El Salvador—this season's production of nearly 300,000 bales represents a five-fold increase over the 1950-51 season. Smaller increases in acreage and production have taken place in the minor cotton producing countries of Asia and Africa.

Discussing the influence of yield on cotton output, the Committee notes that net increases in yield per acre outside the U.S. have contributed in only a small way to the increase in overall production in the last four years though, of course, fluctuations in yield in several of the individual countries were far more significant. The net increase in yield in the major producing countries in 1954-55 amounted to only 4 pounds per acre and in the minor countries, 9 pounds per acre. Among the major countries, Mexico recorded a "phenomenal" rise in production by over half a million bales which was entirely a function of higher yield arising mainly out of increased production in irrigated areas. In Pakistan, too, yield increased and was above the average of recent years. In Egypt, Uganda, Brazil and Argentina yields declined in 1954-55 and were under the recent average. In India, however, it was above the average. Apart from Mexico, fluctuations in yield caused a net decrease in aggregate production in the major countries this season. Among minor cotton producing countries, yields in the smaller North American countries were at or near record levels this season. In view of the fact that aggregate production in these countries represents only some 7 to 8 per cent. of the free world total, variations in production will have only a relatively minor effect on the overall supply position.

To sum up, available information foreshadows the possibility of some further increase in aggregate free world production outside the U.S. next season but this might only partly offset the expected reduction in the U.S. Assuming a 10.5 million bale crop in the U.S. and combining acreage potential and average yields in other countries, the chances are there would be a "significant" reduction in free world production next season, with a somewhat smaller decline in total supply as a result of the expected increase in the carryover stocks at the end of the current season. This estimate, the Committee has taken care to emphasise, is purely tentative, for much will depend upon weather and other unpredictable factors of nature.

STOCK & SHARE QUOTATIONS

Abbreviations:—D=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N—Nominal quotations. x.d.=Ex-Dividend. x.c.=Cum. Dividend. I=Interim Dividend. f=Dividend for first half of the year

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and All other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years

MARKET GOSSIP

(*Concluded from page 1103*)

simple reason that, in all but a few isolated markets, wheat price has been held at above the floor level. It would appear that even in those few centres, where prices were found to have pierced the floor, the main reason for the decline in prices was the absence of transport facilities. Some traditional low-price areas are to be found in Part B States. In these areas, the Government, according to the Union Minister for Food and Agriculture, Mr. Ajit Prasad Jain, has decided to inject more purchasing power by undertaking developmental works such as roads, transport and minor irrigation. He, however, added that any abrupt and artificial rise in prices in these areas would disrupt the region's economy, for people in these areas are accustomed to only a low level of prices for almost all necessaries of life. Also, the Government was expediting the implementation of the Rural Credit Survey Committee's recommendations for setting up co-operative processing plants, warehouses, and for encouraging co-operative marketing and extension of rural credit. The Government, he further revealed, was considering the question of extending price support policy to rice and other agricultural crops as well and had already extended it to gram which would be supported at a level of Rs. 6 per maund.

* * * *

In this context, the outcome of the labours of the Committee (Chairman Mr. M. V. Krishnappa, the Deputy Minister for Food and Agriculture) set up by the Government yesterday to investigate the variation in prices of agricultural commodities will be awaited with interest. It will examine the causes of inter-State and inter-regional disparities in prices, study price trends and suggest measures for achieving stability in prices. It is not clear whether the Committee will consider the question of disparity in the price trends of agricultural commodities and manufactured goods also. This subject aroused considerable interest in Parliament recently. There is a growing volume of public opinion that, while prices of manufactured goods remain at a high level, thanks to the rigidity of the cost structure, agricultural commodities have tended to decline. It is argued that while the fall in agricultural price reduces the income of the farmer, he has had no relief in so far as his expenditure on the goods he buys is concerned. There is, in our opinion, considerable confused thinking on this subject. The argument referred to, for instance, is based on comparison of price levels, with only one or two previous years. If a longer period is taken into account, it will be seen that the disparity between the prices of agricultural commodities and those of manufactured goods is not so wide as is being made out. Further, it must not be forgotten that a major portion of rural population consists of landless labourers who have received considerable relief as a result of fall in prices of food and other edible products. The savings of the labourer is now able to make in his food bill has enabled him to buy other necessaries of life, as, for instance, cloth. The fact that there has been no perceptible accumulation of consumer manufactured goods even in the face of higher production seems to support this contention. In any case, this Committee will do well to examine this aspect of the problem too, so that there may be no mis-leading presentation of the trend and pattern of price structure in the country.

THE SECOND FIVE-YEAR PLAN

(*Concluded from page 1109*)

large number of persons organised in small enterprises. Measures to encourage and protect small-scale and village industries should, therefore, be an integral part of the second Plan. But one must not lose sight of the fact that, with increasing income, the pattern of consumption is liable to change fairly quickly and the output of consumer goods must be adapted to this changing pattern. Cottage and small-scale industries must not be thought of in terms merely of traditional techniques and traditional types of products.

Needless to say that, a great deal of effort and organisation will be required for resuscitating small-scale industries. Should these not be forthcoming, the emphasis on capital-saving methods may well land us between two stools—the large-scale capital-using methods may get discouraged without other methods filling in the gap. We may thus have the worst of both the worlds. The consequence of this would be inflation or non-fulfilment of the investment planned.

It should also be borne in mind that, with

EMPLOYEE-SHAREHOLDERS

THE attention of readers was drawn in these columns last week to a revolution in company ownership that is steadily gaining ground in the U.K. and the U.S. It was shown that this was a part of the move by enlightened employers in these democratic countries to preserve democracy and that it had the support of the respective Governments. By enabling the employees to become shareholders of companies, the employers achieve the twin objectives of instilling among workers greater sense of responsibility for rendering efficient service and spreading the ownership of companies over a large number of people, thereby meeting the criticism that the country's productive machinery is owned by a handful of individuals. We stated in our last issue that employers in India, too, should emulate the example of their confreres in Britain, and proposed to discuss this week the feasibility and desirability of applying employee-shareholding schemes to joint-stock companies in this country. Hence the reference to that subject again.

But before we proceed to discuss the issues raised by us, we should like to refer to two latest developments in Britain since we wrote last week. One is the statement made by Sir Anthony Eden, Prime Minister of Britain, and the other is the introduction of employee-shareholding scheme by Rolls Royce, the world-famous manufacturers of motor cars, aero-engines, etc., whose assistance the Government of India has been seeking for making aircraft in this country. To take the latter first. Rolls Royce has been having a limited form of employee-shares since 1920. But the Directors of the Company have now decided to terminate this scheme and replace it by a larger and more flexible one. Under the present scheme, less than 2.5 per cent. of the capital is held by the employees. It is now proposed to enable employees to hold 10 per cent. of the Company's issued capital. With this end in view, the Directors have decided to create £600,000 worth of workers' shares of 10s. each to be converted, when fully paid, into Ordinary stock. The shares will be issued at par. They will rank *pari passu* with the Ordinary stock for dividends and on voting. They will share in any capitalisation of reserves through the issue of more employees' shares; in this respect, the scheme differs from the earlier one, under which employee-shares received bonus issues in Ordinary stock. On liquidation, they will have *pari passu* rights with Ordinary stock. They will, however, have only restricted transfer rights, in that they may not be sold except to trustees of employees, who will buy them at par, and they will revert to the trustees on the employee leaving the firm. This restriction on sale will, of course, prevent the employees getting the benefit of the market value of the Company's share. But this disadvantage is offset by the advantage an employee gets by paying only par value for a scrip commanding a high premium. Further, he will receive the same rate of dividend as the holders of Ordinary stock. This means that he will get a higher return than an investor who buys the Ordinary scrip of his Company on the Stock Exchange. Another important point is that the holders of the present employees' stocks receive, in market terms, if not in income, a big windfall.

A couple of days before Rolls Royce announced its new scheme of workers' ownership, Sir Anthony Eden made a significant observation in his first main speech made in the new Parliament, so that it formed an important policy statement. As a keynote of Government's policy for an ever-rising prosperity, Sir Anthony stressed its intention to encourage all forms of profit-sharing and co-partnership and to pursue the aim of property-owning democracy. It was the Government's desire, said Sir Anthony, that all those working in industry should have an increasing share, directly or indirectly, in the rising prosperity of their own industry. The British Prime Minister hoped and believed that profit-sharing in its various forms had come to stay. This remark of Sir Anthony, as the head of a Conservative Government, is a striking evidence of the welcome transformation in the outlook of a party generally regarded as representing the diehards and capitalist exploiters.

To revert to the idea of applying employee-shareholding schemes to companies in India. The first question to be answered is whether there is need for it. We have already answered the question in a way in our last issue. The implementation of such schemes in all the big joint-stock companies will serve to answer the criticism that industries in India are owned and dominated by a few capitalists. Indeed, by encouraging employees to become shareholders, private enterprise will definitely strengthen the chances of its existence now being threatened by the communists and socialists. The number of people having investments in industrial and commercial concerns will register a substantial increase. In other words, it will mean an expansion in the ranks of property-owners, without which democracy cannot subsist. Only when people have some stake will they be interested in saving and safeguarding the right to hold property which is now being vehemently attacked by a section of politicians.

There are also other considerations which go to show that the idea advocated by us is eminently desirable. From the employees' angle, it will help promote friendly relations between workers and employers. If the former are admitted to the ranks of shareholders, they may shed many of the suspicions they have about management, because one or two of their own representatives will be on the Board or be actively associated with management and these representatives can ensure that no waste or inefficiency takes place on the management side. Again, the presence of employee-shareholders will itself act as a check on managements that are prone to indulge in unsound or undesirable trading practices. It may thus lead to an improvement in the character of joint-stock company management. Another advantage will be a rise in the efficiency of workers themselves. Once they become shareholders with an investment of a size which is substantial as compared with their earnings, they will have at least the psychological urge to do their best for the welfare of their company. All this, of course, presupposes that employees get a decent real wage. If any employer were to think that, by making his employees shareholders in his company, he could pay lower wages, he would be wrong. An attempt of that sort would defeat the fundamental object of such schemes.

The greatest advantage in introducing employee-shareholding schemes is that they will serve as an effective antidote to the cry for nationalisation and the demand for restrictions on dividends emanating from workers' representatives. The workers will then realise better that, if they supported State-ownership, they would become the vassals of a vast bureaucracy, instead of remaining as free workers with rights of co-partnership in their concerns. The introduction of such schemes may help managements to get the workers' approval even for modernisation of their plant and machinery, because it will be easy to convince the workers that they will also share in the prosperity of their industry.

The second question to be answered is whether employees would be willing to accept the schemes referred to. It may be argued that, with most of the workers not being sufficiently educated, it will be difficult to convince them of the advantages of the schemes. There may be some force in this contention, but the difficulty posed is not unsurmountable. With the help of trade unions, it should be possible to bring round the workers. Some may say that trade union leaders, most of whom are left-wingers, themselves will not give their consent. In all countries which introduced profit-sharing schemes, there was always a certain amount of opposition from trade union leaders, because they feared that such schemes were a clever device by employers to reduce their influence over workers. These fears, however, turned out to be baseless. Similarly, it would not be surprising if trade union leaders in this country, too, were to give a cold reception to employee-share schemes in the initial stages. But it should be possible to overcome their opposition by assuring them that these schemes are not meant to divide the ranks of workers or to prevent the growth of trade unions on healthy lines and by inviting their attention to the active support being given by trade union leaders in other countries to similar schemes.

The third question is: from where will the employees find the necessary money for subscribing to the shares of companies in which they work? Almost every one of the successful concerns, whether big or small, has been paying substantial sums to its workers by way of annual or bi-annual bonuses. This is in addition to fairly decent wages, social security benefits, provident fund and gratuity contributions. Surely, it should be possible for the employees to devote a part of these bonus payments for investing in the shares of companies created on the lines followed by Colville Steel, I.C.I. or Rolls Royce. If these sums are found inadequate, the companies can give financial assistance on easy terms, as has been done by some of the British companies.

It may be interesting to note, in this connection, that, for 1953-54, the Tata Iron and Steel Company, Ltd., distributed no less than Rs. 103

lakhs by way of bonus to their workers. Similarly, the Indian Iron and Steel Company, Ltd., distributed Rs. 69 lakhs and the Associated Cement Companies, Ltd., Rs. 37.54 lakhs. Early this year, all the profit-making Bombay mills put together paid out about Rs. 3 crores by way of additional dearness allowance and bonus for 1952. One mill alone—the Bombay Dyeing, we believe—gave away something like a quarter of a crore of rupees. These rough statistics will give one a broad idea of the large sums which are annually distributed to workers. It is common knowledge that, invariably, a large part of these lump-sum cash payments is squandered away by the recipients. The workers will suffer no great hardship, especially in view of the fall in prices of goods during recent months, if they set apart, for a few years, the major portion of these cash receipts for investment in the shares of their corporations. By doing so, they will be helping not only themselves but also the nation as a whole which is in need of savings for rapid industrialisation. The return on these investments, they will do well to note, will be substantially larger than that on national savings certificates. The latter are, of course, more safe, but it should not be difficult to evolve a scheme for workers' shares the capital value of which can be maintained. Moreover, in an expanding economy, investments in equities of established companies are most unlikely to suffer capital depreciation.

There are several categories of companies which can introduce employee-shares with profit to themselves. Companies facing the threat of nationalisation, companies requiring additional capital for expansion, companies that fall under Section 23A of the Income-tax Act and have, therefore, to pay either penal tax to the Government or high dividends to its shareholders, and companies with large reserves which are thinking of issuing bonus shares—these are a few categories that occur to our mind as quite suitable for taking their employees as shareholders. Banking and insurance companies, which are earmarked for nationalisation at some future date, can proceed with the implementation of the scheme straightaway. Most of their employees are highly educated and belong to the middle class which knows the value of savings and investment. A very large number of banks is undercapitalised, in the sense that their capital bases are relatively small as compared with their deposit liabilities, which have once again started rising, and can bear a fair-sized expansion. The same is true of insurance companies also.

Quite a number of companies paying large sums by way of bonus falls under the category which requires additional capital for expansion and some of which have taken, or intend taking big amounts, by way of loan, from the Government. These include such well-known companies as the T.I.S.Co., I.I.S.Co., A.C.C., National Rayons, and several electricity undertakings, the shares of which are considered as blue chips by investors. Also belonging to this category are the shipping companies and several engineering ventures. All these companies can get a part of their capital needs by issuing employee-shares. The companies taking loan capital from the Government will, in our opinion, be well advised to make their employees shareholders and utilise the subscriptions received from them for reducing their indebtedness to the Government. Managements of Section 23A companies can broad-base the list of shareholders by trusting their workers and allocating to them a part of their holdings on favourable terms, instead of declaring high dividends, the result of which will be to evoke the envy of workers. The companies that wish to issue bonus shares should also seriously consider the advisability of issuing additional capital to their employees on favourable terms; they can use the additional capital, together with their surplus resources, either for expanding or modernising their works or for starting side lines which will provide additional employment.

It is to be hoped that the Government will not view the idea advocated in these columns in a hostile spirit. On the contrary, it should welcome the idea and extend its support by actively canvassing for its adoption, inasmuch as it is fully in keeping with the socialistic pattern of society which it wants to see firmly established in the country. There may be certain legal impediments to the implementation of this idea; these should be removed by making suitable provisions in the Company Law, now being revised by Parliament. We suggest that the few business men who have been fortunate enough to get elected to the present Parliament should themselves take the initiative in this matter by moving necessary amendments to the relevant sections of the Company Law Bill, when it comes up for discussion in the forthcoming session of the Lok Sabha and thereby bring credit to their community as the authors of a desirable reform.

DOCK LABOUR

THE Bombay dock labour has been weighed in the scales and found wanting. It was placed in the dock before the one-man Industrial Tribunal (Mr. M. N. Meher, President of the Bombay Industrial Court), appointed by the Government of India to adjudicate disputes relating to the Bombay docks. And the Tribunal's impartial verdict has gone against dock labour in some respects. It has held that there is strong evidence to show that the Bombay dock workers have been going "slow" and that they have sometimes resorted to an "intensified" go-slow policy. The verdict was not, of course, unexpected. But it does not, on that account, lessen the gravity of the problem. The plain fact is that dock labour, in Bombay and in many other Indian ports, has been shockingly irresponsible. The Tribunal's verdict is important, not so much for its revelations—for they are hardly revelations—as for the fact that even so impartial a body as the Tribunal has not been able to find any justification for the dock labour's deplorable attitude towards its work.

The unrest in the docks has been a depressing theme in the speeches of the chairmen of Indian shipping companies. Dr. A. Ramaswami Mudaliar, Chairman of the Indian Steamship Co., Ltd., described the "go-slow" tactics of Indian dock labour as the "most distressing" aspect of the labour situation in the ports. After recalling the Prime Minister's famous and stirring phrase "aram haram hai"—"idleness is sacrilegious"—Dr. Mudaliar averred that, if his attention were drawn to the situation at the major ports, he would be "shocked at the extent to which this evil practice of idleness is prevalent." The mild Mr. Dharamsey M. Khatau, Chairman of the Scindia Steam Navigation Co., Ltd., pointed to the fact that the output of dock labour "has been deteriorating continuously."

The facts of the dock labour output speak so loudly for themselves that no vivid description is necessary. The Chairman of the Bharat Line Ltd., Mr. C. R. Srinivasan, whose speech at the annual meeting of the Company held this week appears elsewhere in this issue, has brought together some revealing statistics on dock labour output. A reference to these figures will show that, whereas, in 1951, for handling 1,000 tons of cargo, 20.79 gangs were employed at a cost of Rs. 52 per gang and the work was completed in 3.01 days, in 1954, the same workload required 31.74 gangs, costing Rs. 72 per gang, and it took 4.88 days to complete the work. Other studies have confirmed these findings. Even conservative estimates place the output of dock labour at 30 per cent. below the 1951 levels.

The fall in dock labour output, a sad trend in itself, is particularly deplorable, because it has occurred in the face of improvement in the wages and other amenities for dock workers. It all started with the decasualisation of dock labour—introduced in Bombay in 1952, in Calcutta in October, 1953, and in Madras in 1954—and the assurance of minimum wages and grant of other facilities, such as attendance fees and leave. Dock labour's response to improvement in their working conditions is a sad commentary on labour discipline in this country, and serves only to curb the enthusiasm of those who are anxious to improve workers' conditions.

A fall in dock labour's output, more than a similar fall in the output of any other section of labour, has a special national significance. Dock labour holds the keys to a nation's trade doors. If it plays foul, the country may well lose its position in the world economic map. This is the ultimate damage. But the more immediate sufferers are the shipping companies and the shippers. The "slowness of labour," as Mr. Srinivasan points out, causes "needless" detention to ships. The maintenance cost of a medium-size ship is about Rs. 4,000-Rs. 5,000 per day. The Bharat Line alone has suffered a detention cost of Rs. 8 to Rs. 9 lakhs, which is sufficient to keep in operation an 8,000-d.w.t. ship for a period of nearly six months. There is invisible loss, too, for immobilisation of a ship means the loss of its earning power.

For shippers, a ship in "forced" detention means endless difficulties. A shipper who is committed to fulfil a contract at a particular time, may not be able to send his goods promptly enough. An importer is handicapped, for he is unable to get, promptly enough, the goods he needs. But this does not exhaust the list of shippers' difficulties. There is always the threat of an increase in freight rates. The shipping companies, when they are faced with the increase in the costs of operations, are compelled to pass on the increase to their customers. The recent "surcharge" controversy owes its origin directly to labour troubles in docks. Shipping companies felt that they would be justified in raising the freights by 30 to 35 per cent. Fortunately, they have held their hand, thanks to the firm attitude adopted by the Commerce and Industry Minister, Mr. T. T. Krishnamachari. But even he admitted that the position in the Calcutta and Bombay ports was not happy; he added: "Sooner or later, we must see that the goods are landed and cleared quickly." Mr. Krishnamachari's protest against the proposal for a rise in freight rates was based on the ground that the companies were applying it only to India, and not to all countries where there was dock labour trouble. But the fact that the threat of an increase in freight rates has not been carried out does not minimise the gravity of the dock labour situation. Rather, this fact should inspire better and more determined efforts at finding a remedy for the malady.

The need for finding the right solution for the problem—and finding it, promptly enough—arises from the consideration that, if the situation persists, it might mean additional investments on ports and ships, that is, over and above those now contemplated. If ships are idle, or slow in turn-round, it may mean that the target for shipping will have to be revised upwards. Clearly, a shipping target is fixed on the basis that all the shipping space will be economically used. If space were "wasted"—to keep a ship idle is equivalent to waste of space—it would mean that more ships would be needed. Again, if there were congestion in ports, it would mean that port facilities would have to be augmented. In either case, it would be an avoidable expenditure of capital—and that, at a time when the country cannot afford to waste its capital resources. For this reason, the report of the high-powered Dock Labour Enquiry Committee, which has been appointed to go into the labour situation in the docks, is being awaited with great interest.

But no solution is likely to be found which does not undo the mischief that has been wrought by decasualisation. This is not to suggest that labour is not entitled to security of employment, or to a decent wage. Only, dock labour, like any other section of labour, must be prepared to accept responsibility for carrying out a certain volume of work. In other words, wages, as Mr. Srinivasan insists, must be related to productivity. In fact, workers' own interests, as he rightly points out, stand to be "better served with an incentive bonus for extra work." Since it is the time-rate system that has led to such trouble in the docks, it seems clearly necessary to replace it by the piece-rate system, or some variation of the system that will relate wages to work.

The Tribunal, to which a reference has been made at the outset, agrees with the Bombay Port Trust that the time-rate system of payment has resulted in slowing down work. Accordingly, it has processed piece-rates on the basis of an increased time-rate and has fixed piece-rates for various categories of workers. Adequate safeguards have, however, been laid down for the benefit of workers. Thus, payment would be made at the time-rate, if labour were rendered idle on account of circumstances beyond their control. Workers reaching 90 per cent. of the datum-line would be entitled to payment at not less than the time-rate. For production in excess of the datum-line, payment would be at double the usual rates. There is thus scope for the workers to earn additional income by stepping up their output. The Tribunal has directed the appointment of a committee, consisting of an equal number of representatives of employers and employees and an independent chairman to administer the piece-rate system.

The award is, on the whole, an eminently satisfactory document. Its approach is severely practical. Its suggestions are inspired by the desire to see that, while the workers earn more wages, the dock situation readily improves. It is, therefore, surprising—or is it not?—that the workers should resent it and want to appeal against it. Whether they win the appeal or not, it is a different issue. But one thing seems clear: It is hard to imagine, much less to devise, a more workable scheme for resolving the deadlock in the docks than the one evolved by the Tribunal.

T.E.L.CO. SHARES TO BE LISTED ON THE STOCK EXCHANGE

CALTEX—OILSEEDS—E. COTTON—WORLD SUGAR

THURSDAY, 5 P.M.

THE shares of the Tata Locomotive and Engineering Company, Ltd., were very much in the limelight this week. They jumped up to Rs. 142 from Rs. 128 a week ago and Rs. 125 two weeks back, though they are currently being quoted at Rs. 136-8. The sudden spurt in these shares is attributed to expectations of a maiden dividend for the year ended 31st March, 1955. Though there are no reliable indications of that possibility as yet, it is confidently expected that the Company's results for the past year would make encouraging reading. It is also averred by knowledgeable sources that the Company's prospects for the next few years at least are bright. For, in addition to the heavy orders which the Company has already undertaken in respect of the motor truck and foundry projects which will keep it busy for the next three or four years, the orders for 100 locomotives which the Government of India has decided to place with the Company will certainly improve its earning capacity, though the net return on the locomotive business is not attractive enough.

MARKET GOSSIP

• • • •

In this context, one may wonder why the shares of such an important and growing industrial concern have not yet found a place on the Stock Exchange list. There is, of course, an explanation for it, but what many of our readers will be interested to know is that the prospects for this scrip being listed on the Exchange in the near future are distinctly bright. According to well-informed sources, all the preliminaries required to be done before placing the shares on the official list are being attended to expeditiously. It may be recalled, in this connection, that the question was raised by some shareholders at the last annual general meeting of the Company and the Chairman told them that an application had already been made to the Stock Exchange in this regard, that negotiations were being carried on with the Stock Exchange authorities for this purpose and that, as soon as the talks concluded successfully, steps would be taken to have them included in the list. It would appear that the difficulty in getting the shares listed then was that certain conditions under the Stock Exchange rules and regulations could not be fulfilled. This difficulty has now been overcome and the Stock Exchange authorities have agreed to have the shares listed. But what is holding this up is the necessity for making certain changes in the Articles of Association of the Company. This requires the shareholders' approval. To call a special meeting of shareholders for this purpose alone would mean considerable expenditure to the Company. Probably, the opportunity provided by the forthcoming annual general meeting of the Company may be availed of by the Directors to complete the necessary formalities. It may, however, be noted that, although the shares are not officially listed, they are already enjoying a wide market. The advantage of having the shares on the list will be that reliable and authoritative quotations for the shares can be had and investors can operate on this counter with more freedom and security. Since this scrip is getting popular, there is every justification for its inclusion in the forward list. It is to be hoped that the Stock Exchange authorities will do the needful in this direction.

The Caltex Oil Refining (India), Ltd., which will own and run the third oil refinery at Visakhapatnam on the east coast of India, proposes to raise capital in India by the issue of debentures to the tune of Rs. 2 crores for financing its refinery project. The terms of the issue will be the same as those offered by Burmah-Shell and Standard-Vacuum. Thus, the debentures will carry interest at the rate of 5½ per cent. per annum (taxable). Out of the above sum, Rs. 1 crore will be placed in the Bombay market and Rs. 1 crore in Calcutta. The issue is expected to be offered to the public some time in August, after the Central Government puts through its borrowing programme.

• • • •

Now that the Forward Markets Commission has completed the task of reorganising futures trading in raw cotton, the biggest of all cash crops in India, it is busy tackling the problem of futures trading in oils and oilseeds, another important commercial crop. It held valuable discussions this week with the local traders interested in these commodities. The issues facing the Commission are no less complex than those it had to solve in cotton. As compared with the king of textile fibres, it may have received fewer claims from associations for recognition to conduct forward trading in oilseeds. But that does not render its task any the easier, for, unlike cotton—a single commodity—there are more than half a dozen different oilseeds and as many oils to boot. It can, of course, very conveniently eliminate some of the minor oils and oilseeds such as nigerseed and kardiseed and their oils. It is, however, doubtful whether the Commission can so lightly treat rapeseed and mustard-seed, though it can do so with the oils extracted from these seeds. The claims of Calcutta for futures trading in these seeds, if any, will be hard to resist. Bombay, of course, has no claim for these two seeds, for they do not come under its province. We do not think that any of the Bombay associations will have advanced a claim for them, though they are by no means strangers to these seeds. Bombay has a reputation for speculating successfully even in commodities not known to it from Adam.

• • • •

If the minor oilseeds and oils are left out, there are four major seeds and oils eligible for futures trading. These are, in the order of their importance, groundnut, cottonseed, linseed and castorseed and the respective oils. At present, futures trading is allowed in castorseed and that, too, only in Bombay. Having permitted this greasy oilseed to enjoy the facility of hedge trading even when other seeds were denied it, there can be no question of the Commission disqualifying it for this privilege now. As regards the others, the Commission will have to decide whether futures trading should be allowed in all of them. It will also have to decide whether such trading should be allowed in only one centre or in more than one and whether one exchange will do for all the oilseeds chosen to have the facility of hedge trading or whether there should be separate exchanges even in one centre for each one of them. The most important consideration that will have to be taken into account for deciding the latter question is whether there will be sufficient number of operators specialising in only one oilseed and whether they will be in a position to run an association economically. The next important issue to be decided is whether there should be a separate futures market in Bombay devoted solely to oils. A significant section of oilseed crushers and consumers has been urging the need for such a market, while another section has been opposing it. The latter feels that the only oil which needs hedging facility is groundnut oil, that for the sake of this one commodity it is not worthwhile having a separate association, and that it could very well be entrusted to the care of the Bombay Oilseeds Exchange Ltd.

• • • •

As regards futures trading outside Bombay City, the Commission will find it difficult to resist the claims of Saurashtra and the Southern States. It may find it easy to concede the demand of Saurashtra for having a futures ring in Rajkot, for there may be no serious competitors in the neighbourhood. But so far as the Southern States are concerned, there must be at least three rivals, Hyderabad, Adoni and Madras, with very little to choose between them. It is just likely that, on investigation, none of these places will disclose the existence of rich experience and strongly rooted tradition in hedge trading, one of the important criteria applied by the Commission for judging the claim for conducting a futures market successfully. Nevertheless, for more than one reason, the Southern region will, we believe, have to be granted a hedge market, at least for groundnuts. Since Hyderabad and Adoni are not very far from Bombay, the obvious choice seems to be Madras City.

• • • •

The era of shortages in oils and fats was, as readers are aware, over several months ago. This does not mean that there is no scope for improvement in world consumption of oils and fats, for, if living standards in the underdeveloped countries improve, it would lead to larger consumption. Be that as it may, it is encouraging to note that, in 1954, world production of oils and fats rose by 1.2 million tons to 25.6 million tons. An analysis of world trends in output and export availabilities of oils and fats was made by Mr. J. C. A. Faure of Unilever in his address at the recent annual meeting of the International Association of Seed Crushers. He said that the largest increases in oils and fats output occurred in Western Europe which accounted for an increase of 420,000 tons, and India and Pakistan which together accounted for an increase of 240,000 tons. To the increase in world output of oils and fats, liquid edible oils contributed the largest share; there was an increase of 680,000 tons in their production. The output of coconut, palm and palm kernel oil increased by 230,000 tons, of mineral fats, including butter, by 180,000 tons. World exports improved by 750,000 tons to a new peak of 6.3 million tons. This rise was made possible largely by the shipment of cottonseed oil and linseed oil from the accumulated stocks in the U.S. and Argentina. Only rough estimates of world consumption are available. World consumption, according to Mr. Faure, rose by about 800,000 tons, of which Western Europe accounted for 200,000 tons and the U.S. and India for 100,000 tons each. On this basis, the increase in world production exceeded world consumption by roughly 400,000 tons.

• • • •

The rise in world production of oils and fats this year is again expected to match the increase in world demand for these commodities. Thus, production is expected to go up by 370,000 tons. The increase in world demand, arising from growth in population, is placed at 300,000 tons of oils and fats each year. This year, the higher output of soyabeans, coconut oil, butter and lard is expected to offset the fall in cottonseed oil and olive oil. The supplies available for export are expected to be somewhat smaller at 100,000 tons, since accumulated stocks in exporting countries have been largely liquidated. But, even at this slightly lower level, supplies, it is stated, are sufficient to meet world import requirements. The U.S. is sure to emerge as a bigger exporter of cottonseed oil this year. An important development from the point of view of world markets for oils and fats is that the artificial distinction between dollar and non-dollar markets has disappeared. This is attributed to the willingness of the American Government to offer its surplus of liquid oils competitively in world markets and to the relaxation of restrictions on dollar oils in importing countries. The disappearance of the division between the dollar and non-dollar markets, according to Mr. Faure, has led to a better balance in world supplies of oils and fats and should serve to stabilise world prices of these commodities.

• • • •

The Egyptian Government's decision to reopen, with effect from the beginning of next cotton season, the Alexandria futures market, to which a reference was made in these columns last week, has been welcomed in many quarters, both in Egypt and in overseas countries. It may be recalled that forward trading in Alexandria was suspended in May 1940, and was resumed only in May 1948. But the market did not function satisfactorily, subject as it was to manipulations from interested quarters. Even some high Government officials, it was alleged, were involved in the corrupt practices which finally undermined the morale of the market. Perhaps, more than any other factor, the main cause for the failure was its isolation. The price-trend in the market could have no relation with the New York market, for currency considerations prevented any such link-up. Nor could it be related to Liverpool where the cotton exchange still remained closed. There was no extensive domestic market for cotton, either. Under these conditions, it is hardly surprising that the market did not function well enough. Government intervention too was not always helpful. Rather it was more irksome than constructive. The market was eventually closed in November, 1952.

• • • •

The prospects for the successful functioning of the Alexandria futures market are now perhaps brighter than formerly. The fact that it is proposed to link the market with the Liverpool cotton market will help minimise the chances of excessive speculation in Alexandria. The Egyptian Government, as we stated last week, is at present studying details of straddling between Liverpool and Alexandria. In Liverpool, the reopening of the Alexandria cotton market has been hailed as a "constructive and welcome development." This is because it will pave the way for introducing a long-staple cotton contract in that market. When the Liverpool futures market was reopened in May, 1954, only an American cotton contract was permitted. Indeed, it was criticised on the ground that a broader basis had not been permitted. But, in the absence of the futures market at Alexandria, the Liverpool authorities could not reinstate an Egyptian cotton contract of the kind that functioned in pre-war years. It was, however, made clear that such a contract would be restored as soon as possible. In August, 1954, the Liverpool Cotton Association issued a statement to the effect that a Liverpool long-staple contract would begin operating this spring. It is now believed that the Association will initiate an Egyptian cotton contract simultaneously with the reopening of the Alexandria market.

• • • •

A delegation of officials from Egypt, it is stated, will shortly go to the U.K. to study the methods of control on exchange operations, connected with hedge trading in cotton, evolved by that country. The futures market authorities, it is further stated, are preparing new regulations whereby brokers' capital will be increased from £10,000 to £15,000 each and capital per member from £30,000 to £50,000. Dealers will have to pay a deposit of 15 per cent. of the value of contract as previously. Again, clearing arrangements will take place daily, instead of weekly, in order to facilitate prompt payment of price differences.

• • • •

For some days past, the world sugar market has been ruling rather weak, in striking contrast to the firm trend witnessed towards the close of April and early May last. Raw sugar (Spot No. 4 World Contract) is now quoted in New York at 3.30 cents per lb., as against 3.41 cents a month before. The present quiet trend is the outcome of two factors. First, Brazil has been a persistent seller of sugar in the world market, thanks to the acute shortage of foreign exchange it is experiencing. This country has already sold about 450,000 tons of sugar—a quantity which is nearly three times its effective quota of 157,000 tons under the International Sugar Agreement—at rather less than the world price. Secondly, supplies of "free" sugar in the market have improved considerably, following the decisions taken by the International Sugar Council at its recent meeting held in London. Thus, the Council has redistributed export quotas amounting to 372,000 tons, of which the additional allocations to Cuba alone account for 193,000 tons. The Council has also released the participating countries with a basic export tonnage of over 75,000 from the obligation (under the Agreement) not to export more than 80 per cent. of their initial export quotas before the end of August next. By taking these decisions, the Council has, it must be noted, avoided the possibility of restoring the remaining 10 per cent.—444,500 tons—of the total quotas.

• • • •

Close on the heels of export quota readjustments, the Cuban Sugar Stabilisation Institute has approved of the sale of 120,000 tons of refined sugar to Russia at 4.20 cents per lb. (f.o.b.). Russia, it will be recalled, had been negotiating with Cuba for some time for a bulk supply of sugar. The price which Cuba has now accepted is considered to be rather low in relation to current raw sugar market values. Nevertheless, there is no gainsaying the fact that, but for the Cuban-Russian deal, the fall in world sugar prices would have been more pronounced than now. It is reported that France is on the point of concluding a novel barter deal with Cuba, under which it will build a tunnel under

(Continued on page 1199)

STOCK EXCHANGES RULE FIRM

VOLUME OF BUSINESS EXPANDS

(From Our Own Correspondents)

BOMBAY, 16*th June*

BUOYANT conditions were witnessed on the Stock Exchange during the week under review. The upward trend noted in the previous week gathered sizable momentum this week, on keen buying enquiries and heavy short-covering under the lead of steels and textiles. At higher levels there was a hesitancy to follow the rise, and closing quotations were, therefore, a shade below the week's highest levels. Nevertheless, the undertone remained firm. The volume of business also disclosed a notable enlargement. A feature of the week's trading was the recovery in the cash section, which was taken as a sign of return of confidence among investors.

The return to India this week of Mr. J. R. D. Tata, Chairman, the Tata Iron and Steel Co., Ltd., and his statement to the Press that he was hopeful of getting the required loan were construed as favourable indicators. The serious efforts made to promote exports of Indian cloth and the decision taken by the Cotton Textiles Export Promotion Council to send a trade delegation to South-East Asia for this purpose were duly noted. Further, expectations of favourable corporate results from industrial companies in the miscellaneous section, such as Bombay Burmah, Tata Chemical, Tata Locomotive, Premier Automobile, Hindustan Motors, etc., stimulated buying interest in the market.

In the steel section, Tata Ordinaries gained good ground, advancing from Rs. 228 to Rs. 234-12, the highest level touched since 20th May, but dropped a rupee to Rs. 233-12 at the close. Indian Irons gathered strength to move up from Rs. 33-1½ to Rs. 33-15, the best level seen in the last six weeks. After reacting to Rs. 33-10, they closed at Rs. 33-14.

Trading in textile shares was dominated by Bombay Dyeings and Kohinoors. The former rallied from Rs. 465 to Rs. 473-12, but finished at Rs. 470-10. The latter appreciated from Rs. 317 to Rs. 325 and wound-up at Rs. 324-8. Centurys advanced from Rs. 378-8 to Rs. 384-8, but profit-taking erased a part of the gain and the closing was, therefore, lower at Rs. 381-12. Central Indias provided a contrary trend with a decline of Rs. 4 to Rs. 116. Finlays picked up Rs. 5 to Rs. 250, Gokaks Rs. 5 to Rs. 219 and Indore Malwas Rs. 3-12 to Rs. 98-12. Indu Ordinaries were lower by As. 2½ at Rs. 10-9. New Greats moved up by Rs. 3 to Rs. 175, Phœnix by Rs. 5 to Rs. 117-8 and Shree Niwas by Rs. 3-12 to Rs. 223-12. Simplex were taken up from Rs 154-8 to Rs. 158-8, but the closing was lower at Rs. 156-8 on account of disappointing results. Standards appreciated by Rs. 7½ to Rs. 367-8 and Svadeshis by Rs. 7 to Rs. 200. Swans gained Re. 1-4 to Rs. 316-4. Tata Mills Re. 1-4 to Rs. 51-12 and Vishnus Rs. 2-8 to Rs. 140.

Banks were featureless and the tendency was quiet. Barodas continued to be on offer and lost Rs. 2-4 to Rs. 95-8. Centrals gained a fraction to Rs. 48-12 and their New shares to Rs. 50-4. Bank of Indias were steady at Rs. 146-4. Punjab Nationals changed hands at Rs. 42-8 and Union Banks at Rs. 6-6. United Commercials were unchanged at Rs. 43-8.

Insurance shares were active and transactions were done even at higher rates. Orientals gained Rs. 100 to Rs. 7,210. New Indias were, however, a fraction down at Rs. 49-4. But British India Generals were done a rupee higher at Rs. 14-10, following the stepping up of the dividend from Re. 1 to Re. 1-2 per share. Indian Mercantiles changed hands As. 4 higher at Rs. 45. Vulcans were in demand and put on Re. 1-1 to Rs. 16-5. Jupiters were lower by As. 6 at Rs. 8-4.

Electricity shares were generally steady, with an improvement in many counters, particularly in Tata Hydro group shares. Ahmedabad Electrics, after moving up to Rs. 106-14, closed at last week's price of Rs. 106-9. Amalgamated Electrics were steady at Rs. 10-15½. Bombay Suburbans improved by Rs. 2-3 to Rs. 125-5. Surat Electrics, on the other hand, shed Rs. 3-2 to Rs. 131-4. Tata Hydros rose from Rs. 142 to Rs. 145-8 and their New shares from Rs. 107 to Rs. 110, Tata Powers from Rs. 1,440 to Rs. 1,480 and their New shares from Rs. 1,130 to Rs. 1,165. Andhra Valley gained Rs. 18-12 to Rs. 1,385 and Andhra Valleys (New) Rs. 7-8 to Rs. 1,070.

In the miscellaneous section, sugar shares were steady. Belapurs recorded a rise from Rs. 310 to Rs. 315-8, but reacted to close at Rs. 311. Phaltans gained Re. 1-12 to Rs. 126. Walchandnagars disclosed no change at Rs. 208-2. Cement shares were cheerful, A.C.C. firming up from Rs. 176-4 to Rs. 181, before closing at Rs. 178-12. Digvijays were taken up Rs. 3 higher at Rs. 179. In the shipping and transport group, Scindias rose from Rs. 14-11 to Rs. 15-4½, but closed at Rs. 14-14. India Steamships moved up from Rs. 7-4 to Rs. 7-7½ and Bharat Lines from Rs. 82 to Rs. 84. Hindustan Motors were done up to Rs. 9-1, as against Rs. 8-9½. Premier Automobiles were better at Rs. 81, as against Rs. 79. Tata Locomotives shot up from Rs. 128 to Rs. 142, before closing at Rs. 136-8. Among engineering and mining shares, Alcocks were lower at Rs. 255 *ex-div.*, as against Rs. 273-2 *cum-div.* (div. Rs. 12-8). Premier Constructions showed a rise of Re. 1-8 to Rs. 146-8. Josts' Engineerings gained Re. 1-8 to Rs. 96. Shivrajpurs picked up Rs. 2-8 to Rs. 69, Indian Coppers As. 2½ to Rs. 4-9 and B.B. Petrols as much as As. 7 to Rs. 3-11½.

In the miscellaneous Industrial group, Bombay Burmahs continued to be influenced by rumours about higher interim dividend, their old shares rising from Rs 471-14 to Rs. 483-2, before finishing at Rs. 479-6. Their New shares gained on balance Rs. 3-12 to Rs. 177-8. National Rayons closed at Rs. 198-8 *ex-div.*, after touching Rs. 204-4 *ex-div.*, as against Rs. 210-4 *cum-div.* (div. Rs. 10). Killick Industries added Re. 1-8 to Rs. 161, Tata Chemicals As. 6 to Rs. 13-15, Tata Oils Re. 1-12 to Rs. 42 and Wimcos Rs. 3-2 to Rs. 184-6.

Calcutta Stock Exchange

CALCUTTA, 15*th June*

The Calcutta Stock Exchange witnessed active trading with an increase in the volume of transactions, during the week under review. Tea shares registered attractive gains, and reports of a reduced crop as at the end of May and of the possibility of an improvement in quality were noted with enthusiasm. Jutes also encountered moderate support, as, with the definite possibility of a higher jute crop and the consequent expectation of a fall in prices of raw jute, the outlook for mills has improved. Shares of sugar mills were steady, as the likely increase in output this season, despite lower prices, would improve the working results of mills. As usual, engineerings and miscellaneous industrials claimed a good portion of the activity and in conformity with the general trend, added gains. A good deal of speculative attention was paid to shares which were considered as probables for inclusion in the forward list, a decision on which will be taken by the Stock Exchange authorities before the end of this week. Generally, the improved prospects for industries, the products of which will receive more widespread attention during the Indian Industries Fair this cold weather and may result in opening up of new markets, gave strength to both investors and operators.

Among cotton textiles, Muir Mills were taken from Rs. 112 to Rs. 113-8, and Kesorams spurted from Rs. 13-7 to Rs. 14-11. Cawnpores were unchanged at Rs. 8-9, but Elgin Mills receded from Rs. 19-9 to Rs. 19-4.

In the coal section, interest was at a low ebb, in view of the uncertain prospects for the industry, but New Beerbhooms were a specially attractive feature for the rise from Rs. 19-12 to Rs. 20-14. Burrakurs continued to be in moderate demand and were done at Rs. 13-4. Equitables were raised from Rs. 29-10 to Rs. 30.

Enquiries for jute shares widened, and several rises were recorded. Howrahs were a feature and, on expectations of being included in the forward list, were taken from Rs. 30-6 to Rs. 32-3, before quoting today at Rs. 31-12. Nationals rose from Rs. 33 to Rs. 33-8, and Birlas gained strength from Rs. 19-4 to Rs. 20-4. Barnagores firmed up from Rs. 172 to Rs. 177-8, while Lansdownes receded from Rs. 142 to Rs. 139. Ganges had buyers at Rs. 101-8. Anglo-Indias hardened from Rs. 212 to Rs. 223, Alliances, which receive a dividend of 6 per cent. (same) for the six months ended December last, from Rs. 171 to Rs. 173. Fort Williams were quiet at Rs. 373 *ex-div.* (div. Rs. 10).

Engineering shares recorded moderate gains. Indian Irons were taken from Rs. 33-1 to Rs. 33-15. Texmacos registered a further improvement from Rs. 18-6 to Rs. 19-4. Richardson and Cruddas were maintained at Rs. 18, and Kumardhubis were sought at Rs. 12-4.

Selected miscellaneous industrials gained further strength. Indian Coppers continued to be in good demand and rose to Rs. 4-11, before receding today to Rs. 4-9. Rohtas Industries changed hands and, with the support of enthusiastic buyers, improved from Rs. 24-14 to Rs. 26-6. Dunlop Rubbers, at Rs. 37, disclose a gain of one point, while F. & C. Oslers were unchanged at Rs. 16-2. British Burma Petroleums were pushed up from Rs. 3-3 to Rs. 3-11. At Rs. 274, India Pulps were better by Rs. 9. Titaghur Papers hardened from Rs. 43-12 to Rs. 44-7.

Tea shares added attractive gains for reasons already stated. Gungarams were higher by as much as Rs. 42 at Rs. 442. Ledos hardened from Rs. 26 to Rs. 30-4. Brooke Bonds from Rs. 15-12 to Rs. 17-7, and East Indias from Rs. 28-2 to Rs. 30-2. Dhelakhats were steady at Rs. 20-4.

Madras Stock Exchange

MADRAS, 15*th June*

The Madras Stock Exchange displayed a cheerful note this week too, thanks to reports of encouraging performance of several companies. Demand broadened on prospects of higher dividends already announced, as well as expected. Renewed buying enquiries were in evidence in the textile section on hopes of enlarged export orders for piecegoods from overseas countries, especially from South-East Asia. These hopes are likely to materialise, in view of the latest move of the Textiles Export Promotion Council to send a textile mission to the latter region. Tea shares also continued to be in the limelight, the sentiment of traders being influenced favourably by higher auction prices for tea in Colombo, Cochin and Calcutta. The flurry of buying in these shares was attributed to calculations about corporate profits for 1954 in the case of established exporters. Tea and coffee company scrips also met with good buying support. Bank, insurance, electric and sugar shares were all fully steady. The miscellaneous section ruled strong, the attention of traders being focussed on popular counters.

Bangalore Woollens led the textile section this week, their quotations firming up by an impressive amount of Rs. 25 to Rs. 465. Krishnarajendras elicited considerable support and rallied Rs. 8 to Rs. 95 *cum-div.* Metturs spurted by Rs. 2-8 to Rs. 365 *cum-div.* Coimbatore Cottons and Dhanalakshmis recorded a rise of Rs. 2 each to Rs. 282 and Rs. 277, respectively. Rajapalayams hardened by Re. 1 to Rs. 81. Loyals gathered As. 12 to Rs. 31 and Cambodias As. 7 to Rs. 12-9. Balasubramanias were done at Rs. 51 *ex-div.*, as against Rs. 57 *cum-div.* Buckinghams were fully steady at Rs. 161, Janardhanas at Rs. 75, Kotharis at Rs. 12-4, Pankajas at Rs. 53 and Radhakrishnas at Rs. 216. Despite a higher dividend of 12 per cent. for 1954 (as against 7½ per cent. for 1953), Ranga Vilas, however, failed to elicit support and receded by a rupee to Rs. 71. Lakshmis also dropped Rs. 3 to Rs. 151 and Rajalakshmis Rs. 2 to Rs. 133.

In the planting section, tea shares came in for good business and handsome gains were recorded. United Nilgiris picked up Rs. 3 to Rs. 290. Devasholas strengthened by Rs. 2-8 to Rs. 28-8 *cum-div.* Nonsuch Teas increased by Re. 1-12 to Rs. 34-8 and Parksides by Re. 1-4 to Rs. 23-4. Peninsulars finished As. 14 higher at Rs. 17-14. Peermades rose by As. 12 to Rs. 39-4. Among rubber shares, Malankaras were in special request, their quotation advancing by As. 12 to Rs. 28-4. Vaikundams moved up by As. 8 to Rs. 24-12 and Rajagiris by As. 7 to Rs. 17-6. Midlands improved by As. 6 to Rs. 17-12. Cochin Malabars gained As. 5½ to Rs. 8-5½. Thirumbadis, Be Bes and Teekoys changed hands each As. 2 higher at Rs. 2-0½, Rs. 4-7 and Rs. 8-14, respectively. The improvement in Thirumbadis followed announcement of an increased dividend (17½ per cent.) for the year ended March, 1955, as against 15 per cent. for the previous year. Among coffee shares, Consolidated Coffees registered a gain of As. 9 to Rs. 19-14.

Buying in the miscellaneous section was of a selective nature. Mysore Tobaccos were sought at Rs. 11-12, as against Rs. 11-4. India Cements advanced by As. 4 to Rs. 23-14. Mysore Papers gained a like amount to Rs. 17-14. Travancore Cements, Mettur Chemicals and Aluminium Industries gathered As. 2 each to Rs. 8-8, Rs. 8-13 and Rs. 19, respectively. Spencers were steady at last week's level of Rs. 17-4 *cum-div.* Mysore Chem. Fers, were done at Rs. 18-9 *ex-div.*, as against Rs. 20-8 *cum-div.* Announcement of a higher dividend of 7½ per cent. for 1954 (as against 5½ per cent. for the previous year) by the Directors of the Indian Steel Rolling Mills Ltd. failed to induce support for the shares of this Company which were unaltered at Rs. 13.

Notices

THE TWYFORD TEA COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE Fortieth Annual General Meeting of the Shareholders will be held at the Registered Office of the Company at Kottayam, on Thursday the Fourteenth July, 1955, at 11 a.m., to receive the Directors' Report and Accounts for the year ended 31st December, 1954, to declare a Dividend, to elect Directors, to elect Auditors and to fix their remuneration, and to transact any other ordinary business of the Company.

The Transfer Books of the Company will be closed from 9th July to 21st July, 1955, both days inclusive.

By Order of the Board,
PARKINS LIMITED,
Managing Agents.

KOTTAYAM, 13*th June*, 1955.

THE HAILEYBURIA TEA ESTATES LIMITED

NOTICE IS HEREBY GIVEN THAT THE Thirty-second Annual General Meeting of the Shareholders will be held at the Registered Office of the Company at Kottayam, on Friday the Fifteenth July, 1955, at 11 a.m., to receive the Directors' Report and Accounts for the year ended 31st December, 1954, to declare a Dividend, to elect a Director, to elect Auditors and to fix their remuneration, and to transact any other ordinary business of the Company.

The Transfer Books of the Company will be closed from 9th July to 22nd July, 1955, both days inclusive.

By Order of the Board,
PARKINS LIMITED,
Managing Agents.

KOTTAYAM, 13*th June*, 1955.

NEWS IN BRIEF

A FERTILISER factory will be set up at Itarsi to improve the economic condition of the area.

The area under tobacco during 1954-55 was over 838,000 acres, as against 818,000 acres during 1953-54, showing an increase of about 2.4 per cent.

India has today telephones at 0.7 telephone per thousand of population, as against 0.2 in 1939, while the aim is to raise the figure to 1.25 by the end of 1961.

A sugar mill will soon be set up in Assam at a cost of Rs. 2 crores. It will be the biggest industrial enterprise in the State and will be run on co-operative basis.

The Government of India has decided to continue free licensing for export of tapioca flour and starch to all permissible destinations till the end of December, 1955.

The Prohibition Enquiry Commission set up by the Planning Commission to study the various aspects of Prohibition is expected to submit its report to the Commission by the end of July.

The Government of India has raised the maximum individual quota for export of square mesh mosquito nets/nettings during the current half-year from 30,000 yards to 50,000 yards. The other conditions and terms of licensing will remain the same.

The number of new co-operative societies started under the Community Projects, Community Development and N.E.S. schemes up to September, 1954, was 4,747. The number of new members enrolled in co-operative societies during the same period was 184,254.

The Madras Cabinet has agreed to the general principles relating to land reforms recommended by the four-man Cabinet Sub-committee. The proposals of the Madras Government in this regard will be finalised after consulting the Planning Commission.

Members of the Employees' Provident Fund will be allowed interest at 3½ per cent. on their accumulations in the Fund for the year 1955-56. A recommendation made to this effect by the Central Board of Trustees of the Employees' Provident Fund has been accepted by the Government of India.

The estimated total output of iron ore mines in India increased to 380,702 tons in April, from 369,584 tons in March, 1955. Returns received from 66 mines during the month show despatches amounting to 251,626 tons to the iron and steel plants and 41,353 tons to the export market. The reported stocks at the end of the month amounted to 1,064,599 tons.

According to the revised estimates issued by the Indian Lac Cess Committee, the *Baisakhi* lac crop in India for the year 1955 is expected to be 794,000 maunds, as against the preliminary estimates of 749,000 maunds and the previous year's final estimates of 600,000 maunds. The normal yield for this crop, based on the average of ten years preceding 1955, is 710,000 maunds.

The Government of Mysore is making a representation to the Government of India, urging the claims of Bangalore for the location of the proposed State-owned heavy electrical equipment factory. Five foreign firms, one each from the U.S., the U.K., Belgium, Czechoslovakia and West Germany, have offered to co-operate with India in the establishment of the above factory. The offers are being studied by a committee of eleven experts, who may hold discussions with the foreign firms before arriving at a decision.

The Madhya Pradesh Government has under consideration a proposal to send a team of officials and non-officials to study the working of cottage industries in Japan, in view of the fact that a prominent place has been given to cottage industries in the second Five-year Plan. The State Government proposes to start a number of polytechnics for training of artisans. It has also a proposal to start industrial colonies, pioneer units of production in village industries, and industrial estates to facilitate the growth of groups of industries.

In pursuance of the Government of India's decision to purchase gram at railhead *mandis* at Rs. 6 per maund, if prices pierce that level, about 64,300 tons of gram are expected to be purchased on Government account during the current season. The same machinery as at present exists for implementing the price support policy in regard to wheat, the quantity of wheat purchased on Government account will be utilised and the same procedure will be followed. Under the price support scheme for wheat last was about 43,000 tons.

The second Five-year Plan is expected to allocate Rs. 80 crores for the development of shipping. An increase of tonnage from 600,000 to one million, including additions and replacements, is anticipated during the second Plan period. The Government is trying to secure the participation of some private companies in the establishment of a second Shipping Corporation with headquarters in Calcutta. The formation of this Corporation will give an impetus both to the expansion of tonnage as well as overseas trade in Indian bottoms. An outlay of Rs. 26 crores had been provided for shipping under the first Five-year Plan. It is expected that the planned target of expansion of a little over 2 lakh tons to 6 lakh tons will be realised by the end of the current year.

The eight-member committee appointed by the Government of India to enquire into the diamond industry started its deliberations at Panna in Vindhya Pradesh last week. The Chairman of the Committee, Dr. C. S. Pichamuthu, together with other members visited some of the more important diamond mining areas, as well as cutting and polishing establishments, and interviewed several officials and non-officials who are connected with the industry. A few sub-committees were set up to go into the details of some of the aspects of the industry like security measures, marketing, the present system of mining procedure and the setting up of co-operative mining. The Committee has invited information and views from the public on any aspects of the industry which would assist it in its work.

An agreement has been reached between the 70,000-strong Ahmedabad Textile Labour Association and the Commercial Mill, Ahmedabad, for the grant of bonus to its workers for the year 1953. The mill has agreed to pay 15 per cent. of the pay drawn by every worker, clerk, watchman and technician in 1953 as bonus. The Ahmedabad Textile Labour Association had originally negotiated with the Ahmedabad Millowners' Association for the grant of bonus to the workers for the year 1953. But, when the negotiations failed, the Association served notices individually on the mills and later the matter was referred to the Conciliation Officer. But the management of the Commercial Mill subsequently negotiated with the Association and reached a settlement. The cases relating to other mills are pending before the Conciliation Officer.

The Ministry of Iron and Steel has come into being with effect from the 15th inst., in terms of the Presidential order promulgated on 2nd May, 1955. Mr. T. T. Krishnamachari, Minister for Commerce and Industry, is also the Minister for Iron and Steel. Mr. S. Bhoothalingam, I.C.S., has been appointed Secretary of the Ministry. He will also continue to be the Secretary of the Ministry of Commerce and Industry until Mr. H. V. R. Iengar, I.C.S., returns from leave. The new Ministry is in charge of Government industrial undertakings for the production of iron and steel and Government-owned foundries. The iron and steel projects in the public sector at present are the Rourkela Steel Project in Orissa and the Bhilai Steel Project in Madhya Pradesh. The Government-owned foundry is at Nahan in Himachal Pradesh. With effect from the 15th inst., village industries (including the All-India Khadi and Village Industries Board), handicrafts (including the All-India Handicrafts Board) and the All-India Silk Board have come under the Ministry of Production.

From Abroad

The Pakistan Jute Board has decided to maintain the minimum price for jute next season at £80 per ton as the basis for export firsts.

The Iraq Government Development Board will engage 50 British engineers to enable it to proceed with its £59 million full-scale programme for highways and bridges within the next five years.

The Colombian Coffee Federation has contracted with Japanese shipyards a deal worth $12 million for the construction of four 10,000-ton freighters. Payment will be made with coffee in 1956.

The Australian Government's decision to accept the revised G.A.T.T. and the proposed agreement on the Organisation for Trade Co-operation has been approved by both Houses of the Australian Parliament.

The U.S. Agricultural Department has forecast a wheat crop of 845 million bushels for 1955. It is the smallest crop since 1943 and is 13 per cent. lower than last year's production of 970 million bushels.

The shipping lines in the U.K. and Continent-Bombay and Calcutta Conference which met in London last week have decided to defer the question of imposing a surcharge of 35 per cent. on freights to Bombay and Calcutta, in view of the improvement noted in the above two ports.

The Pan-American World Airways has concluded a $60-million financing arrangement with 18 insurance companies for its development plans. The Company has on order $110 million of new flight equipment. Repayments by the Company will begin in 1966 and will be completed by 1980.

The Senate Banking Committee of the U.S. has approved of the Bill authorising the participation of the U.S. in the new International Finance Corporation which is being established by the World Bank under United Nations' auspices. The Bill authorises the payment of $35,168,000 as the U.S. subscription to the I.F.C.

The production of raw sugar in Australia during 1955 would be limited to about 1.17 million tons, according to the Chairman of the Colonial Sugar Refining Company, as the present home market, together with Australia's share of overseas markets under the Agreements, is not capable of absorbing continued unrestricted production.

An agreement has recently been concluded in Kabul, under which Czechoslovakia has undertaken to erect a cement works near Kabul. The cement plant will be entirely equipped with Czechoslovak machinery. As soon as the plants begin production, they will be handed over to the Afghanistan cement corporations. The Czechoslovak experts will also train Afghans to run the plants.

PERSONAL

MR. M. K. Kidwai, *Charge d'Affaires*, Legation of India, Jedda, has been appointed Minister of India to Saudi Arabia.

Mr. Naval H. Tata, Member of the Governing Body of the I.L.O., arrived from Geneva last week.

Mr. V. K. R. Menon, Director of the Indian branch of the I.L.O., New Delhi, left for Geneva last week to attend the thirty-eighth annual general conference of the I.L.O.

Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Co., Ltd., who had been to the U.S. for negotiating a loan for the Company's expansion programme, returned to Bombay on Tuesday this week.

Mr. M. M. Philips, Director-General of Posts and Telegraphs, returned to New Delhi last week after attending a meeting of the Executive and Liaison Committee of the Universal Postal Union at Lugano.

Mr. Allen Myra, General Superintendent, Standard-Vacuum Refining Company, has assumed charge as Managing Director of the Company, in place of Mr. William A. Williams, who is proceeding to the U.K. for re-assignment.

Mr. A. F. Dubash, Planning Manager (Traffic), Air-India International Corporation, left for Palma (Spain) last week-end to attend a meeting of the Rates, Charges and Schedules Committee of the International Air Transport Association.

Mr. N. K. Misra, Chairman of the Railway Service Commission, whose services have been placed by the Union Railway Ministry at the disposal of the Sudan Government, has been appointed General Manager of the Sudanese Railways for one year.

M. Rene Mayer, former French Prime Minister, has been appointed President of the European Coal and Steel Pool's High Authority, in succession to M. Jean Monnet, who was the High Authority's first President and who had resigned his post.

"COMMERCE" 1930

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, 21*st June*

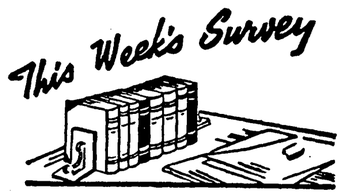
Rubber's New Low Level

The week opened with plantation rubber quoted at a fraction less than 6d. per pound. The declension—a repetition of the experience of 1922 prior to the introduction of restriction—emphasises anew the hard lot of shareholders of rubber producing companies. They produce a commodity, of which the consumption, subject from time to time to temporary checks, is on the whole expanding steadily. Yet they are fortunate, if their companies are able to remain solvent, for it is estimated that a large number cannot sell at under 8d. per pound, except at a loss. To some extent, the existing situation must tend to effect its own cure, for it renders any deliberate expansion of production unlikely. Indeed, estimates for the present year put the output below the 1929 figure and, in view of the very large measure of agreement to the suggested Sunday tapping holiday, there is likely to be a substantial reduction. This view is borne out so far by experience, shipments having shown a steadily declining tendency since the beginning of the year, while the total for the first four months (partly dependent upon estimates) is put some 10,000 tons below that of last year. The time has been long looked forward to when consumption would overtake production, and it was hoped by some authorities that so desirable a point will be reached this year.

The U.S. Government has suffered a loss of over $563.96 million in supporting farm prices during the first ten months of the current fiscal year ending 30th June. This compares with a loss of $419.45 million in the corresponding period of the previous fiscal year. The U.S. Agricultural Department's investment in price support loans and farm products has gone up to more than $1,000 million in a year.

The President of the U.S. has offered financial aid and technical facilities to all free nations of the world for developing atomic energy for the benefit of mankind. He will ask the Congress to agree to meet half the cost of providing atomic reactors for research to friendly countries and to furnish the nuclear material needed to fuel them. Countries taking advantage of this project will also, within the limits of security, be given training in the technological processes of construction and operation of the reactors for peaceful purposes.

A supplementary agreement between the U.S. and Switzerland has been signed in Geneva, giving the Swiss new tariff concessions under the U.S.-Swiss trade agreement of 1936, as compensation for the increase in the tariff rate on watches made last year. Under the agreement, tariffs on some 18 products, the yearly import of which by the U.S. is estimated at 50 million Swiss Francs, have been reduced on an average by 44 per cent. This is the first time that the U.S. has agreed to grant tariff concessions as compensation for the application of escape clause. The concessions would be continued, even if the watch tariff is reduced in the future, but the Swiss will have to grant in turn new concessions to the U.S.



RAIL-SHIP CO-ORDINATION

THE Government has now implemented the promise made by the Minister for Transport and Railways, in the course of the Parliamentary debate on the Railway Budget, that a committee would be set up to go into the question of co-ordination of railways and coastal shipping. The Committee, the formation of which was announced this week, will consist of: Mr. N. S. Lokur, Chairman, Railway Rates Tribunal, as Chairman, and Mr. B. R. Patel, Director-General of Shipping, Mr. S. R. Kalyanaraman, Director of Traffic, Ministry of Railways, Mr. P. Das, M.P., and Mr. M. Govinda Reddy, M.P., as members. It will examine the reasonableness of freight charged by coastal shipping with reference to its costs of operation and the existing pattern of trade movements within the country of commodities which could suitably move by sea. It will suggest measures to ensure effective co-ordination between railways and coastal shipping with a view to promoting movement of such goods by sea with particular reference to (a) the need for promoting coastal shipping on sound lines, (b) the need for avoiding overlapping between the two forms of transport, and (c) the possibility of extending through booking arrangements between railways and shipping for movements by combined rail-sea route, wherever possible. It will also advise whether any standing machinery should be set up for considering all problems concerning rail-shipping co-ordination or allocation of traffic between the two forms of transport. It is expected to submit its report in six months.

Announcing the formation of the Committee, the official resolution says that the Government has had under consideration for some time the question of co-ordinating the development of railways and coastal shipping so as to ensure harmonious development of the two forms of transport and the avoidance of all wasteful competition between them. A study group, which was constituted in December, 1953, to go into the wider question of planning the transport industry as a whole, has, it is stated, also studied this aspect of transport and made certain tentative suggestions. Another study group, namely, the *ad hoc* sub-committee of the Consultative Committee of shipowners, which was appointed to examine the shipping target for the second Five-year Plan, has also emphasised the importance of promoting the necessary co-ordination of rail and sea transport. The Government Resolution reiterates that the Government, on its part, has already accepted, as a matter of policy, that there should be an adequate and efficient coastal fleet capable of fully catering to the needs of the country. The Government, it is further stated, feels that it is necessary and desirable that the question of rationalisation and co-ordination of cargo movement by railways and coastal shipping should be examined urgently both in view of the large increase in the demand for transport facilities which is anticipated as a result of the various development schemes and also in view of the large investments proposed by the railways, ports and the shipping industry under the second Five-year Plan.

The appointment of the Committee will, therefore, be widely welcomed. Surely, it is to the advantage of national economy that both the railways and the ships should be enabled to operate economically, so that the two sectors may have no reason to regard each other as rivals in the carriage of traffic. A factor which underlines the need for co-ordination is the inability of the railways to absorb at present all the traffic that is offered to it. If co-ordination can result in some relief to the railways it is all to the good. Only, the means of achieving it in a way that is satisfactory to all the interests concerned are not easy to discover or to implement. The carriage of coal is a typical instance. Coal is being carried by the railways, it is alleged, at a rate that is below their costs of operation. If the railways were to charge what they ought to charge for carrying it, the ships would be able to quote competitive rates for transporting coal. This would enable ships to participate profitably in the carriage of coal, thereby releasing more wagons for transporting other commodities. But, then, the question will also have to be considered from the point of view of consumers of coal who cannot afford an abrupt upward revision of coal freights which would throw their production costs out of gear.

LAC INDUSTRY

The deliberations of the two-day session of the Lac Conference, which concluded at Simla on Saturday last, the speeches made on the occasion and the decisions taken there have all served to emphasise the valuable role which lac plays in the country's economy. Lac—a complex product which results from the biological interaction between the sap of trees and the lac insect—is a source of subsidiary income to a large number of cultivators in Bihar, Madhya Pradesh, Orissa, Vindhya Pradesh and Assam. In many areas, cultivation of lac is an important source of income to the backward tribes. What is more, lac is one of the major earners of foreign exchange for India, the average annual value of exports during the last nine years being nearly Rs. 10 crores. The story of lac's material contribution to the progress of science and industry was lucidly analysed by Dr. Punjabrao Deshmukh, Union Minister for Agriculture, who presided over the Conference. Gramophone records, Dr. Deshmukh said, became possible as early as 1897 because of lac. Before the advent of synthetic dyes, lac was a very important source of natural dye, which, along with lac itself, brightened many a home. The electrical industry owed a debt to this natural insulating material. The beauty of furniture was dependent, to a large extent, on a coating of shellac. Thus, lac and its processed goods—seedlac and shellac—Dr. Deshmukh stated, were still the most valuable resin, judging from the multifarious uses to which they are put.

It is, indeed, deplorable that the production of so important a commodity as lac, especially Kusum lac which is the best commercial variety, should have suffered a severe setback in recent years. The total quantity of lac actually produced during 1953-54 was only 654,000 maunds, which compares very unfavourably with 1,152,500 maunds in 1952-53 and 1,296,000 maunds in 1951-52. The estimate of the Bysakhi lac crop for the year 1955 is, however, placed higher at 794,000 maunds. The setback to lac production is attributed mainly to reckless speculative activity resulting in violent fluctuations in prices, the other reasons being failure of crops due to seasonal factors and shortage of sticklac.

The rise in prices has affected adversely the quantum of exports. Thus, exports during 1954-55 were lower at 726,300 maunds, as against 732,000 maunds in the previous year, though the value was substantially higher at Rs. 10.5 crores, as against Rs. 6.7 crores. If the violent fluctuations in prices were to persist, India is bound to lose a considerable share in the world lac market, what with increasing competition from some countries and stiff competition from synthetic substitutes. The imposition of a complete ban on speculation in lac under the Forward Markets Regulation Act was, therefore, a step in the right direction. An equally welcome move on the part of the Government is to set up an Export Promotion Council for shellac.

Simultaneously with the implementation of a workable scheme for promoting exports of shellac, measures should be devised to step up internal consumption which, at present, is at a very low level, being only 5 to 8 per cent. of the aggregate output. The Simla Conference did well, therefore, to discuss this problem. From the details of the discusssions made available, it is gathered that gramophone records, paint and varnishes, oil-cloth, sealing wax, rubber mixing, adhesive and cement are some of the industrial products which offer opportunities for larger utilisation of lac. The use of shellac as a coating for pottery has great potentialities. Incidentally, the All-India Khadi and Village Industries Board is already giving training in this direction at its village pottery training centre near Belgaum.

It is in conformity with the export trade and expanded internal consumption that measures should, as Dr. Deshmukh rightly stressed, be devised to stabilise lac production. Keeping this aspect in view, the Government of India has provisionally fixed the production target for lac under the second Five-year Plan at 1.7 million maunds, which represents a rise of 42 per cent. as compared with the anticipated output of 1.2 million maunds at the end of the first Plan period. In other words, the scheme envisages an increase of 100,000 maunds of lac per year during the second Plan period.

The several proposals which the Union Food and Agriculture Ministry has drawn up for achieving the aforesaid target were considered at the Simla Conference. The decisions taken at the Conference include (1) establishment of 50 new brood farms in the lac-producing States in order to ensure a steady supply of brood lac to all parts of the country, (2) imparting of technical knowledge of lac cultivation to villagers, and (3) organisation of a lac extension service in the producing States. Bihar, which normally accounts for nearly 60 per cent. of the total lac production, will have 20 brood farms and Madhya Pradesh 10 farms and the remaining 10 farms will be in U.P., Vindhya Pradesh, Orissa, Assam and West Bengal. The lac-producing States have been asked to carry out a survey of the idle host plants in different areas, with a view to bringing them under cultivation. The total expenditure proposed to be provided for lac work in the second Plan is Rs. 50 lakhs. The other notable decisions taken at the Conference relate to the (a) establishment of warehouses and of a few air-conditioned godowns for the storage of lac and organisation of co-operative societies of lac-growers; (b) enforcement of quality control at manufacturing and export stages; (c) organisation of separate forest divisions for stepping up lac cultivation; and (d) provision of marketing facilities for lac growers. These decisions, it is to be hoped, will be translated into action without delay, for on their implementation depends the prosperity of lac industry.

ROAD DEVELOPMENT

The pace of road development during the second Five-year Plan period would be greatly accelerated, if the schemes now being scrutinised by the Union Government were approved by the Planning Commission. The estimated total capital outlay for the development of the country's arteries, the national highways and the important link roads between States is placed at as high as Rs. 93 crores, which represents a rise of more than 72 per cent., as compared with the provision of Rs. 54 crores made in the first Five-year plan. The increase in outlay would be even more impressive—244 per cent., to be precise—if the amount expected to be actually spent in the first Plan period, namely, Rs. 27 crores, were taken as the basis of comparison. Nevertheless, it must be admitted that road development has suffered a great deal through past neglect. Accordingly, the Government can never be too generous in its expenditure on such development.

With the estimated outlay of Rs. 93 crores, roads account for about 1.7 per cent. of the aggregate net investment of Rs. 5,600 crores, as contemplated in the Plan-frame prepared jointly by the Economic Divisions of the Finance Ministry and the Planning Commission in consultation with the Central Statistical Organisation and the Indian Statistical Institute. The provision for road development represents over 10.3 per cent. of the sum of Rs. 900 crores earmarked for transport and communications as a whole. The targets for road development fixed in the Plan-frame are given below:

(Thousands of miles)

	1950-51	1953-54	1955-56*	1960-61*
National highways ...	11.9	12.2	12.5	17.5
State roads	17.6	—	20.0	35.0

*Estimate.

It will be seen from these figures that the Plan-frame envisages an expansion of 5,000 miles of national highways and 15,000 miles of State roads during the second Plan period. The importance of roads needs no special emphasis, for they are, as is well known, labour intensive and facilitate development of trade and industry. It is common knowledge that development of roads is one of the essential pre-conditions for rapid industrial and agricultural progress. Indeed, road development forms a crucial link in the scheme not only for bringing about a balanced development of the country's economy but also for endowing it with the capacity for self-propelling and accelerated growth.

It will be worthwhile to review here the progress so far achieved in the implementation of the schemes already prepared for road development. The programme for road development in the first Five-year Plan provides for construction of 1,250 miles of missing links in national highways, improvement of 6,000 miles of sections of existing highways and erection of 75 new major bridges. It is claimed that the progress made in respect of works taken in hand has been satisfactory and that the target in respect of improved works has been exceeded. This is attributed to three important factors, namely, expansion of programmes, economy in the execution of works and

implementation of certain types of improvement works out of maintenance grant. During the first four years of the Plan, about Rs. 18 crores were spent on road development. An important feature of the road programme is that, in order to assist the balanced development of all classes of roads, the Centre has recently agreed to give grants to States for the development of roads other than national highways which are of inter-State or economic importance. Grants are also given by the Centre from the Road Fund Reserve for the development of village roads. The approved programme for bridges provides for the construction of about 200 bridges (big and small) at a total estimated cost of Rs. 22 crores. But so far only about 25 major bridges costing Rs. 3 crores have already been completed. Ten new bridges costing Rs. 1 crore are said to be in advanced stages of construction.

EXCISE DUTY ON POWERLOOMS

The President of the Maharatta Chamber of Commerce, Poona, Mr. R. G. Vijayakar, put forward a convincing case for the withdrawal of excise duty on cloth produced by units having more than four powerlooms, in the course of his speech at the annual meeting of the Chamber held on Tuesday this week. He contended, in support of his plea, that the cost of production of cloth woven in powerloom factories was about 22 to 25 per cent. higher than that produced by composite mills and only about 7 per cent. less than that of handlooms. Even before the introduction of the excise levy, the powerlooms were finding it difficult to sell their cloth in competition with the handlooms which with the rebate of As. 1¼ in a rupee given on the sale of their products, over and above the exemption from octroi duty and sales and general tax and concession in railway transport charges, were in a definitely advantageous position. Further, the powerlooms were dependent for supply of yarn on outside sources and were not able to get yarn in the form in which it could be woven straight on the loom. And what is more, they did not get yarn of the quality used by composite mills, and hence were not able always to produce cloth of a quality comparable to that of cloth manufactured by composite mills. And, even where it was comparable, consumers' prejudice adversely affected the sale of these fabrics. Mr. Vijayakar, therefore, pointed out that the new Central excise duty made it even more difficult for powerloom units to compete with either the handlooms or the composite mills.

The arguments thus put forward by Mr. Vijayakar seem to have made no marked impression on Mr. A. C. Guha, Union Minister for Revenue and Defence Expenditure, who inaugurated the meeting of the Chamber. For, he said that Mr. Vijayakar's apprehensions regarding powerloom units were not quite justifiable. He mentioned that the duty leviable on powerloom products was about 15 to 30 per cent. lower than that on textile mills. Further, there was a restriction on production of *dhotis* and *saris* by composite mills, whereas no such restriction was placed on powerlooms. The stocks lying on 18th May had been exempted from the excise. These were, he said, significant concessions to the powerlooms and he opined that powerloom units were even now in a good competitive position with the products of composite mills. Besides, the Government's concern was, he averred, to give protection to handlooms which were weaker units as compared with the powerloom units and, as such, it would not be fair, he said, to put these two on the same level. He stated that, in reimposing this duty on powerlooms, the Government had really treated the powerlooms as an intermediary step between the handloom and the composite mills.

It is, however, gratifying to note that the Government has since decided, according to Mr. Guha, to reduce substantially the present licence fee of Rs. 100 per year for powerlooms. Mr. Guha revealed that the Government proposed to levy only a nominal licence fee of Re. 1 for units with less than 10 looms, of Rs. 5 for units having looms between 10 and 24 and Rs. 10 for units with 25 and 99 looms. Those who had already paid the full amount of Rs. 100 would, he said, be entitled to get a refund. This gesture of goodwill certainly reflects the anxiety of the Government to help the powerlooms. But, with all this goodwill, it is doubtful whether the powerlooms, which suffer from the disadvantages of both the handlooms and the composite mills, will be able to hold their own in competition with them. The fact that a number of powerloom units in Bombay and Mysore States have suspended operations indicate their inability to withstand such competition.

LAND REFORMS FOR EAST AFRICA

For two important reasons, the report of the Royal Commission on Land and Population in East Africa, just published in London, will evoke more than ordinary interest in India. First, the conditions obtaining in the agricultural sector of East Africa's economy resemble, to some extent, those in this country, so that there is something that India can learn from the report. Secondly, the three East African territories—Kenya, Tanganyika and Uganda—account for a good share of India's foreign trade, the average annual turnover being of the order of Rs. 34 crores.

In its report, the Royal Commission—the Commission was set up in 1953 with Sir Hugh Dow as Chairman—has examined the question of the increase in population in East Africa, with particular reference to the congestion of population on land in certain localities. On the basis of such a study, the Commission has recommended adoption of several measures necessary to achieve an improved standard of living, including introduction of capital to enable peasant farming to expand. The chief conclusion which the Commission has arrived at and which is of special significance to India in the present context of the greater and greater incursion of the State into the economic activity is that a free economy is invaluable for the development of East Africa. This emphasis on free economy, according to the Commission, is "not because of political prejudice but because East Africa needs—and a free economy can create—fresh capital and expanding credit." It does not, of course, suggest that the Government should cease to exert a guiding influence. What it does suggest is that the Government should now deliberately subject the economy to the operation of the market. Indeed, the Commission maintains that it is only through the resort to such policy that the land can be properly used and the market can be expanded in one of the poorest regions in the Commonwealth.

The land reforms for Africa proposed by the Dow Commission, it is claimed, are widespread and radical. The Commission believes that the hope for the future lies in the bringing down of the barriers which preserve a past attempt at equilibrium. The two specific and far-reaching proposals put forward by it are: (1) Abandonment of the old tribal and family tenures in favour of individual ownership of land, and (2) a general sweeping away of vested interests, controls and fiscal measures which stand in the way of economic change. In this connection, it advocates the establishment in each territory of Land Development Boards which should be divorced from sectional and interested controls; these Boards must act as the main agents of agricultural development. While carrying out the aforesaid reforms, the existing rights should, the Dow Commission emphasises—the planners in India will do well to take note of this—not be arbitrarily disturbed and that land should be disposed of by the Government only by the established legal process and after adjudication and registration.

Besides considering the basic problems of land tenure and settlement, economic conditions and population problems, the Commission has also reviewed health and education, water-supplies, transport, urban development, immigration, and the whole history and function of agrarian administration. In the considered opinion of the Commission, the various trade regulations and restrictions should be removed. Access to external capital, it is stated, will be necessary for some years to come.

DEVELOPMENT OF SMALL INDUSTRIES

CENTRE MAKING EARNEST ATTEMPTS

From A Special Correspondent

NEW DELHI, 14th June

CONSIDERABLE emphasis is now being laid on the development of cottage and small-scale industries, with a view to providing greater employment during the second Five-year Plan. Since the main objective of the planners is to create employment opportunities to about 10 to 12 million people in the next five years, it is their hope that the small-scale and other labour-intensive industries would absorb more than six million people. Although there is general agreement from the self-styled political-cum-economic experts to the ordinary citizen about the potentialities of these industries for absorbing the idle manpower and educated classes, the difficulty until now, from the point of view of Government, is the lack of proper organisation to bring about quick results. The Commerce and Industry Ministry has been trying to rectify this lacunæ, but the progress at the beginning can only be gradual.

DELHI LETTER

There has been a notion among many that the present Minister for Commerce and Industry, Mr. T. T. Krishnamachari, is a friend of capitalists and supporter of large-scale industries, but few know that, ever since his assumption of office, the expenditure on cottage and small-scale industries has gone up enormously mainly because of his efforts. In the four years ended 1952-53, for instance, the total expenditure on these industries hardly amounted to Rs. 50 lakhs. But, in 1953-54, a year after this gentleman became the Minister, it was marked up to Rs. 5.8 crores; and, in 1954-55, the sanctioned expenditure was as high as Rs. 11 crores. Apart from direct grants, loans and technical help to these industries, the Government has also resorted to other forms of encouragement, among which mention may be made of reservation of production spheres between the handloom and mills, regulation and restriction in regard to the installation of new looms, establishment of large tanneries or footwear units, relief to small-scale units in regard to excise duties, etc.

All these have doubtless helped stabilisation of cottage and small-scale industries during the last one or two years, but it is now being realised that something more concrete should be done, in order to stimulate the expansion of these industries in the coming years. It is against this background that one should view the constitution of a separate committee by the Planning Commission to draft a suitable plan for the expansion of the village and small-scale industries as an integral part of the second Five-year Plan. The draft plan should have the following objective:

The bulk of the increased production during the Plan period of consumer goods in common demand has to be provided by the village and small-scale industries. Employment provided by these industries should progressively increase. Production and marketing should be organised, in the main, on co-operative lines. This committee is being manned by five people, namely, Professors D. G. Karve and D. R. Gadgil, Mr. V. L. Mehta, a former Finance Minister of Bombay, Mr. V. Nanjappa, I.C.S., Textile Commissioner, and Dr. Malhotra, Deputy Secretary, Planning. In the plan-frame, a sum of Rs. 200 crores has been allocated towards the village and small-scale industries. When it was brought to the attention of the Prime Minister that this sum was totally inadequate to tackle the problem, the Prime Minister replied that more money would be allocated in case it was found necessary.

The plan-frame pamphlet on the second Five-year Plan says that, if employment is to be maximised, labour-intensive methods of production have to be preferred. Further, a poor country as a whole cannot be run on the basis of up-to-date capital-intensive methods for the simple reason that there is not that much surplus of savings for investment to go around. Since one of the main objectives is to develop basic industries in the second Plan, the protection and encouragement of small-scale industries assumes greater importance as a means of preserving a balance between the supply and demand for consumer goods, quite apart from their employment potential. Granted the need for encouraging and protecting small-scale and village industries, how far should this process be carried? The protection of small-scale industries also implies a redistribution of income within the community. The limit to such protection and encouragement—apart from considerations of export and the feasibility of the requisite organisational effort—must be prescribed in the light of the broad social objective of protecting and promoting the level of living at lower levels in preference to raising of standards at a higher level.

In the first week of July, the Small-scale Industries Board will be meeting at Bangalore. When it met in New Delhi mid-April last, the plan-frame was not before the public and, hence, it could not discuss the place of small-scale industries in the second Five-year Plan. Again, on account of the recent changes in the allotment of portfolios, the village industries sector is being shifted to the Production Ministry, while the small-scale industries section will continue to be administered by the Commerce and Industry Ministry. This will necessitate a re-allocation of funds earmarked for small and cottage industries between the two sections.

When the Small-scale Industries Board was first constituted in January last, it was proposed to set up four Regional Institutes and also a Small-scale Industries Corporation, primarily for arranging the production of goods against Government contracts. The Minister at that time characterised the Regional Institutes as thinking cells. It was then decided to approach the development of small-scale industries from different angles. The decisions were as follows:

In regard to widely dispersed industries such as carpentry, blacksmithy, pottery, etc., better tools and equipment are to be provided. Model workshops are also to be established for imparting to workmen better technique in respect of these industries. Further, central workshops are to be set up for undertaking operations that cannot be done by individual small units economically. New industries are to be started in groups through Government assistance. Industrial estates where a number of inter-dependent small-scale units, are to be established in several parts of the country, so that goods and services of one unit may be used by other units, thereby keeping the cost of production down to the minimum.

Although the four Regional Institutes have been set up, the difficulty of manning them has now become a serious bottleneck. The President of the Small-scale Industries Board is now touring foreign countries, in order to select some personnel and equipment for these Institutes. Even the construction of building for housing them has yet to be undertaken and this means that it will be another two years before these Institutes are able to commence their work. Meanwhile, the Central Government has directed all the State Governments to prepare detailed schemes for the establishment of a number of small-scale industries in their respective territories.

Some States have already submitted a few schemes to the Central Government on the following lines:

(i) service schemes such as for establishment and continuance of training, demonstration, model workshops, etc. (ii) schemes for establishment of common facility workshops, industrial groups, pilot plants which may be run departmentally in the initial stages and transferred to co-operative management later, (iii) schemes for assisting industrial co-operatives of small artisans and workers, (iv) proposals for establishment of industrial estates and (v) schemes for assisting individual units through loans, etc.

The Central Government, on its part, has already commenced the preparation of detailed draft schemes for a number of industries. The drafts include, for instance, a list of machines and tools that could be used by individual carpenters' units, a demonstration and training workshop, etc. In the case of blacksmithy, for example, the scheme gives indications of the lines on which the blacksmith could develop such things as repair machine shops, fitting shops and sheet metal work, etc.

Similar schemes are being prepared for a model pottery unit, leather tanning, leather footwear, etc. In regard to the leather footwear industry, a model scheme is being prepared in consultation with a German expert who has come to India to advise Government on the development of footwear industry. Similarly, a Swiss expert has come to advise the Government for encouraging the growth of small glassware manufacturing units at different centres. There is also a proposal to send some intelligent workers on deputation to foreign countries abroad for training in small factories. Again, a scheme may be introduced to train technical officers and place their services at the disposal of State Governments. Under this scheme, about 200 fresh graduates from technical colleges and institutions may be recruited by the Development Commissioner for training for one year.

The implementation of all these schemes will take time and, perhaps, the momentum will be felt only after two or three years. It is suggested that model workshops, pilot plants, industrial groups and industrial estates should be established in those places where there are power facilities and also in areas where the people have become more conscious on account of the operation of community projects and National Extension Service schemes. Some of these schemes can be started immediately, so that the Government may gain experience and learn from initial mistakes.

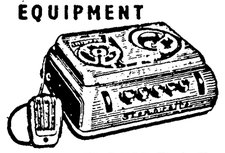
TEXTILE DELEGATION TO S.-E. ASIA

A trade delegation, consisting of leading representatives of the Indian cotton mill industry and the textile export trade, will make a study tour of Burma, Thailand, Malaya, Indonesia and Ceylon. This delegation is sponsored by the Cotton Textiles Export Promotion Council and will leave India by the third week of June. The members of the delegation consist of Mr. Chinoobhai C. Javeri (leader), President of the All India Exporters' Association, Bombay; Mr. Arvind Narottam, Director, Ashok Mills, Ahmedabad, nominated by the Ahmedabad Millowners' Association; Mr. M. N. Savani, Vice-President of the Africa and Overseas Exporters' Chamber; Mr. T. P. Barat, Director, Bombay Dyeing and Manufacturing Co., Ltd., and ex-Textile Commissioner to the Government of India, nominated by the Millowners' Association, Bombay; and Mr. P. K. Nagersheth, Secretary, Cotton Textiles Export Promotion Council, Bombay.

The delegation will make an on-the-spot study of these markets, assess the extent of their requirements of cotton textiles, study consumer preferences in the wake of changing dress habits and investigate other incidental problems vital to the promotion of export of Indian cotton textiles. The members will meet leading chambers of commerce, visit local textile markets and have discussions with Government officials.

The delegation will leave Bombay on the 25th June, 1955, and cover the five countries of the South-East Asia in a period of four weeks. The itinerary includes 7 days' stay in Rangoon, 4 days in Bangkok, 9 days in Indonesia, 5 days in Singapore and 4 days in Ceylon.

AND NOW
THE MOST PAYING & THRILLING OFFICE EQUIPMENT



THE GRUNDIG
Stenorette
DICTATING MACHINE

This incredible machine enables you to dictate in short or long bursts at your convenience at any time of the day. It makes life easier and simpler. It increases output per person (yours and your secretary's) by 40% or more. In stenographer's time alone it saves you money equal to a dividend on its cost of 420% per annum.

It is the cheapest Dictating Machine available and so every business house must own.

Well-known GRUNDIG Tape Recorders also available.

Sole Distributors for the Republic of India:
MAHOMED EBRAHIM & CO., LTD.
Head Office: "Victory House", 7/8, Mount Road, MADRAS-2.

Sub-Distributors for Western India:
LAKHANPAL LTD.
29, New Queen's Road, BOMBAY-4.

CONVERTIBILITY PROSPECTS

MR. BUTLER HOLDS THE KEY

From Our Own Correspondent

LONDON, 11th June

WHILE this country was in the throes of electioneering, the O.E.E.C. Secretariat was busily continuing work on its bule-print for convertibility. And now that Mr. Butler has a much stronger backing in the House, there is little doubt that he will be considering how soon he can support a move to take Western-European currencies a further stage to "looking the dollar in the face."

LONDON LETTER

There is now general agreement that the European Payments Union will have to be wound-up and its part taken by the European Fund, equivalent, on a local scale, to the International Monetary Fund. But the policy-making body will be the Organisation for European Economic Co-operation, which looks like enjoying an indefinite lease of life.

As for the "Fund" it will (like its international counterpart) discuss the effects of exchange rate policies on the trade of the member countries and make recommendations as necessary. Obviously, it will also form the immediate ground for discussions between Finance Ministers of the problems that will show themselves after convertibility. There is a very proper appreciation that what is at stake in the move towards convertibility is the *trade* of the member countries; hence the care taken to ensure that the effects of convertibility on trade can be appreciated rapidly and steps taken to counter adverse developments.

But what can such steps be? Not a move *back* to inconvertibility, for the West European countries, once having agreed *together* to make their currencies convertible, will not *together* move back—exchange control will become a matter for individual countries. Therefore, if convertible currencies dislocate trade, the remedy will be to move exchange rates. This conclusion is the more inescapable, in that the countries concerned have agreed that trade liberalisation must be their main objective. Quotas are to go on being whittled away (a drive is beginning now to free entirely all foodstuffs and agricultural produce) and it is not apparently intended that members should clap on quotas or raise their G.A.T.T. tariff levels the moment they find their currencies under pressure.

But there will be a half-way house towards moving exchange rates. Countries will be able to draw on the European Fund *provided* they can show they are in a balance of payments difficulty. The I.M.F. has shown, however, how rigid are the limits of drawing on a central Fund (because, of course, the "debtor" country is drawing on the reserves provided by the "creditors") and it must follow that any heavy adverse balances will need to be met by other means.

It is still questionable, however, whether member countries will in practice accept a regime of fluctuating exchanges. Within the sterling area, the traditional remedy for an adverse balance is import restriction, and, in spite of the lip-service paid to liberalisation, it would not be surprising if liberalisation proved an earlier casualty than the rate of exchange.

Thus, convertibility can easily become a hindrance rather than a help to trade, in spite of all the theoretical work being done in Paris on intra-European co-operation. But the strong countries (which include the United Kingdom) are all bent on moving towards dollar-freedom and Mr. Butler is as anxious as anyone to achieve this, provided he can be sure that this country's balance of payments at the time of the change is strong enough to avoid any fiasco.

As soon as Mr. Butler feels he can take the plunge, we are likely to have convertibility (in concert with—it is hoped—all the O.E.E.C. countries) but *not* freedom to buy dollar goods, *not* freedom for all capital movements. But it will look like convertibility and, gradually, the restrictions on dollar purchases will no doubt be lifted. There is really no reason, indeed, why the first stage should not be entered on very soon.—*All Rights Reserved.*

AMERICAN NOTES

PROFIT-SHARING IN U.S. INDUSTRY

TREND SHOWS EXPANSION

AMERICAN workers, to an increasing degree, are acquiring a direct stake in the prosperity of many of the nation's industrial enterprises through the growth of profit-sharing plans. Last year, nearly 8,000 corporate profit-sharing plans were reported on file with the U.S. Treasury Department, as compared with 6,000 in 1953 and only 549 a decade ago. Today, there are more than 100 firms which do nothing but offer advice to companies setting up profit-sharing programmes. It is estimated that about 1,875,000 American workers are now covered by such programmes. For many of them, the benefits of profit sharing have proved substantial. A survey by the *Wall Street Journal* in 1954 listed the following examples:

At De Luxe Check Printers of Chicago, Illinois, some of the workers due to retire in the next 10 years will draw pensions from profit-sharing funds greater than their last annual pay while working.

Employees of E. G. Shinner and Company, operating a chain of meat markets in the mid-west, accumulated so much under profit-sharing schemes that they bought out the company in 1953. Since then, the employee-owners report they have "built up a very sizable reserve, paid a $1-per-share dividend, at the same time paying the highest rate of wages in the history of the industry."

The Reader's Digest, a publishing firm, paid out $1,200,000 in cash bonuses last year to 1,200 employees, in payments ranging from $548 per worker to $25,000.

And Sears, Roebuck and Company, prominent mail-order house and retail-store chain, has contributed since 1916 more than $500,000,000 into a profit-sharing fund for its 120,000 employees.

Profit-sharing plans take many forms. Company distributions range all the way from 5 to 50 per cent. of profits. For the employees, the shares amount to anywhere from 5 to 100 per cent. of annual pay, with a representative share around 10 to 12 per cent.

Methods of distribution vary. Some payments are made in cash. Others are put into trust funds, payable when the employee retires or leaves the company, either in periodic payments or in a lump sum. Some plans combine both forms—cash and deferred payments.

Employers who favour profit sharing report that it results in high employee morale, increased productivity and reduced labour turnover. They say that it gives the workers a sense of partnership in the company, prompting them to take better care of the equipment, avoid waste and initiate new ways of improving operations and reducing costs.

Others oppose it on the ground that profit-sharing plans provide for a sharing of profits but make no provision for sharing losses. They also cite the fact that, since all workers receive an equal percentage of the profits, the efficient worker receives no greater reward than the inefficient worker.

Historically, unions have been lukewarm toward profit sharing, because they believed that, originally, it was designed to discourage union organisation, and because they suspected that it might be used by employers as a substitute for higher wages. However, the trend appears to be changing, as more and more plans are set up through labour-management negotiation and co-operation.

The growth of profit sharing has been most pronounced among successful companies in highly competitive industries. The roster of corporations with active profit-sharing plans includes such industrial leaders as Procter and Gamble, Sears, Roebuck and Company, the Bank of America, Eastman Kodak Company, Jewel Tea Company, R. H. Macy and Company, Time, Inc., Container Corporation of America, Bell and Howell Company, Zenith Radio Corporation, Motorola, Inc., and Rand McNally and Company.

One of the reasons frequently cited for the growth of profit-sharing plans in the last two decades was the adoption by the U.S. Congress of tax legislation permitting corporations to treat as a business expense payments into a profit-sharing fund, provided such payments were within specified limits and the trust was set up to meet certain specifications.

An equally important reason, according to John W. Leslie, Chicago industrialist and advocate of profit sharing, is the changing concept of the responsibilities of management which now views the modern corporation "as a trusteeship with balanced duties and obligations to owners, employees, customers and the public."

Simultaneously, says Mr. Leslie, there has been a change in the relationship between managers and employees—a trend in management "from centralised to decentralised authority, from paternalism to team leadership, and from the treatment of the employee as an automaton to treatment as a fellow creature."

PAKISTAN NOTES

BALANCE OF PAYMENTS

SWEDISH TECHNICAL AID

THE fourth quarter of 1954 witnessed a distinct improvement in Pakistan's balance of payments position. In that quarter, Pakistan enjoyed a surplus balance of Rs. 2.7 crores, as against a wide deficit of Rs. 10.8 crores in the previous quarter. The improvement was due mainly to a marked rise in earnings from exports, particularly jute, and partly to a fall in payments for imports. Thus, the total receipts during the quarter under review amounted to Rs. 35 crores, which are Rs. 12.28 crores more than what were derived three months before. The aggregated payments, on the other hand, were lower at Rs. 32.30 crores, as against Rs. 33.52 crores, of which private imports accounted for Rs. 19.40 crores, showing a fall of Rs. 1.63 crores over the previous quarter. Out of the rise of Rs. 12.25 crores in export earnings, jute alone contributed as much as Rs. 9.84 crores. Receipts on account of cotton, however, dropped from Rs. 6.81 crores to Rs. 5.11 crores.

The figures relating to the area-wise trade reveal that the payments position with the dollar area during the three months ended December, 1954, was appreciably better, thanks to enlarged exports to the United States. In contrast to the deficit of Rs. 30 lakhs during July-September, 1954, Pakistan had a surplus of Rs. 1.05 crores with that country in the quarter under review. There was also improvement in the payments position with the U.K. and India, the deficit declining from Rs. 8.75 crores and Rs. 1.05 crores to Rs. 7.10 crores and Rs. 30 lakhs, respectively.

Reflecting the improvement in the balance of payments position, the foreign assets of Pakistan as at 31st December, 1954, stood substantially higher at Rs. 91.64 crores, which compare very favourably with Rs. 79.08 crores on 1st October, 1954. But, as compared with the high level of Rs. 150.52 crores at the beginning of 1952, the foreign assets were still lower by nearly Rs. 60 crores. Be that as it may, the improvement in the Pakistan balance of payments position, it would appear, has not been maintained in the current calendar year, as witness the decline, albeit small, in foreign assets to Rs. 91.52 crores as at 27th May, 1955. It will be interesting to note, in this connection, what the Commercial Correspondent of the *Pakistan Economist* says in the course of an article on the "Vagaries of Karachi Stock Exchange." The correspondent observes: "As regards the export of manufactured goods from Pakistan, its prospects are not bright, unless we are able to improve the quality and design of our products and offer them at competitive prices in the world market... with the present rate of Pakistan rupee, we are at a disadvantage as compared to India and other advanced countries."

An agreement providing for technical assistance by Sweden to Pakistan on a bilateral basis was signed in Karachi on the 4th inst. by the Swedish Minister to Pakistan and the Secretary to the Pakistan Ministry of Economic Affairs. The agreement provides for the establishment of a Swedish-Pakistani Institute of Technology in the Landhi area outside Karachi. The Institute will train foremen, instructors and small-scale *entrepreneurs* in selected fields and thereby contribute to the development of small-scale industries. It will simultaneously impart to the trainees some knowledge of production economics, so that, at the end of the training, the trainees may be able to set up small manufacturing units of their own.

The above agreement is the outcome of the visit of a mission of Swedish experts to Pakistan some time ago, in order to explore the scope and extent of Swedish technical assistance to Pakistan. The Government of Sweden had set aside 649,000 kronors (about Rs. 4 lakhs) in each of the two years 1953-54 and 1954-55. Further provisions of similar amounts are expected to be made in the next three years.

O.E.E.C. REVIEWS PLANS FOR CONVERTIBILITY

FUTURE OF E.P.U. ALMOST DECIDED

THE meetings of the Ministerial Council of the Organisation for European Economic Co-operation (O.E.E.C.) held last week at Paris have once again given rise to talks on the possibility of establishing convertibility of currencies in Western Europe. It will be recalled that about this time last year, it looked as though Britain, West Germany, Holland and Belgium were on the point of taking a final decision on convertibility. It was reported that final touches to the contemplated scheme of convertibility were to be given at the annual meeting of the International Monetary Fund held in the autumn of last year. Nothing of the kind, however, happened; for Britain was reticent to take up the question at the meeting, as by that time sterling had tended to weaken. In the absence of Britain's lead, other European countries which favoured early convertibility were helpless and the whole question receded to the background.

Although so far no information on the decisions reached at the Paris meeting of the O.E.E.C. Council is available, from reports in the international Press it is gathered that the Council had to deal with a number of problems on which there were a wide variety of differing viewpoints. The future of the European Payments Union, the establishment of a European Fund, the type of clearing system to be adopted in the event of convertibility coming to fruition, and the rates of exchange at which currencies should be converted were the principal issues on which opinions appeared to be sharply divided.

Britain's views on the future of the E.P.U. seem to have not found favour with a number of Continental countries, including France and Italy. Britain desires the complete elimination of the E.P.U., once convertibility is established. It may be noted that the agreement on the E.P.U., extended a year ago, is due to expire at the end of this month. It was, therefore, found necessary to reach an understanding on the future of the E.P.U. or on the organisation that should take its place. During the discussions at the meeting attention was concentrated on the "termination clause" in the proposed agreement which provided for closing down the E.P.U. after the currencies were made convertible. Britain argued that, as the place of the E.P.U. would be taken by a European Fund, the E.P.U. would have no further task to perform. It pointed out that this Fund would assume the responsibility for providing short-term credit to the needy countries—a function at present being carried on by the E.P.U. As regards the other important function of the Union, namely, facilitating automatic clearing payments in a number of European currencies once a month, it was stated that this could be performed just as well, if not better, by the central banks. Since the major part of the task of providing multilateral clearing of payments would have to be done by sterling, the retention of the E.P.U., it was stated, would serve no purpose.

Plea for E.P.U.

Some of the Continental countries, especially those which are not in a position to embark on currency convertibility, however, seemed to feel that the E.P.U.'s compensation role should continue in some form, so as to preserve the principle of European co-operation which under the E.P.U. had worked so well. They feared that the channels of trade would become distorted if the compensation system were discontinued. They appeared to doubt whether sterling was capable of doing the work of the E.P.U., while the proposed European Fund, on the constitution of which the Council of Ministers were still undecided, was too ill-defined to warrant their confidence.

A reconcilation between these two opposing sets of opinions is, however, considered not impossible. It is felt that the temporary prolongation of the E.P.U. will certainly be voted, possibly for a year, but on the condition that it may be terminated at any date by a majority vote of the members in favour of the new clearing system and the Fund.

There were also different shades of opinion on the various aspects of the European Fund. According to the recommendations of the Managing Board of the E.P.U., the Fund is to have a capital of about $550 million. This is intended to support the weaker currencies. Under the scheme, the international clearing function of the Union, as stated already, would revert, when currencies were convertible, to the mechanism of international banking. Member-countries are required to make an initial contribution of $148 million (followed later by another $123 million) to the Fund. It is expected that the U.S. would not object to the transfer of its $271 million from the E.P.U. funds to the new European Fund. As to the constitution of the Board of the Fund, a major divergence of opinion between creditor and debtor countries is considered possible. It is expected that some debtor countries may raise objections to some of the features of the Fund, for the simple reason of striking certain bargains. The countries, however, seem to agree that two-year credits should be the maximum and that the Fund should be set up for three years with the option to renew it for a further period at the end of the first year.

Clearing Mechanism

Another issue on which considerable controversy took place at the Paris meeting was the technique of a clearing mechanism after the exit of the E.P.U. The U.K. Government is opposed to both the multilateral clearing system and the introduction of fixed rates of exchange. It considers that the multilateral clearing system will impede trade and is unlikely to be workable in practice. It favours direct settlements of trade account between central banks. Several European countries, including Germany, however, advocate the multilateral clearing scheme. According to this scheme, the E.P.U. should not vanish completely with the day of convertibility, but should live on in a reduced form, engaged in arranging short-term clearances once or twice a month, technically through the Bank for International Settlements in Basle—even after 100 per cent. payment in gold or dollars is introduced. In this context, attention is drawn to the agreement reached within the O.E.E.C. countries to the effect that the O.E.E.C. trade rules should be fully maintained even after convertibility. German financial experts believe that this agreement has cleared one obstacle to convertibility to be achieved "some time within 30th June, 1955 to 30th June, 1956." The German view on convertibility is that, in its initial phase, it would be restricted to current payments. The free movement of capital would be excluded. Controls over both inflow and outflow of capital would be maintained at least in the beginning, both for reasons of balance of payments situation and for fear of sudden rush movements at times of high political tension. For this purpose, the fixed rates of exchange are, in the opinion of German experts, the best.

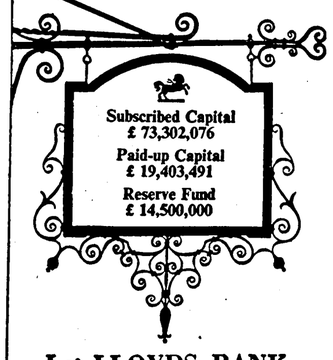
Britain, however, attaches great importance to the principle of fluctuating exchange rates within an agreed range. It is of the view that it would be extremely difficult to embark on convertibility for a currency, so exposed to international strains as sterling, without some widening of the present narrow margin for movement allowed on either side of the parity of $2.80 to the £. This view has found the support of a few other countries. These latter believe that a 6 per cent. margin (3 per cent. above and 3 per cent. below parity) would be helpful. Some commercial banks prefer the operating margin to be at 5 per cent. instead of 6 per cent. But this is considered to be too broad by European creditor countries who point out that such wide margin of fluctuation would need the permission of the I.M.F. The Bank Deutscher Lander, for instance, objects to broad margins as a device which, in the long run, would be self-defeating.

With a view to bringing a reconciliation between the divergent views, the Paris meeting is reported to have accepted the Dutch proposal to set up a European "watch-dog" committee of top Government officials as a safeguard against fluctuating rates and to co-ordinate various financial policies. The Council decided, it is reported, to entrust the task of developing the Dutch proposal to the Secretariat of the Council. It is considered possible that the E.P.U. Managing Board will, as a result, be instructed to complete the details of the Dutch proposal by the end of July next at the latest.

Is Convertibility Imminent?

The move towards convertibility as indicated by the proceedings of the Council above raises an important question: Is convertibility of European currencies imminent? According to Herr Blucher, West German Vice-Chancellor, who represents Germany at the O.E.E.C. meetings, a final decision on the date of convertibility may be taken in October next. He said that the decision rested, in the final analysis, with Mr. Butler. He insisted that no steps should be taken without the consent of Britain. He imagined the prospect of a decision by about 1st or 15th October, when the balance of payments situation of Britain during the crucial autumn months would be fairly clear. Mr. Butler is, however, very cautious in his remarks on convertibility. He stated at Paris last week that "very considerable progress" towards wider free trade had been made in recent months. He told the Press that there was no question of rushing into convertibility but the prospects ahead were good. Convertibility was approaching, he said, but no definite move had been made, "because the time was not opportune." He pointed out that the immediate aim was to furnish the machinery to meet the situation that would arise when certain member-countries decided on convertibility. It may be added here that the countries keen on convertibility today are Britain, West Germany, Scandinavia, Belgium, the Netherlands, Luxemburg and, possibly, Austria and Portugal.

LLOYDS BANK LIMITED



Let LLOYDS BANK look after *your* interests

LLOYDS BANK LIMITED INCORPORATED IN ENGLAND

LB 3042

T.-C. FINANCIAL CORPORATION

The Travancore-Cochin Financial Corporation received during the year ended 31st March, 1955, 37 applications for a total loan of Rs. 57.37 lakhs. Of these, 22 applications for Rs. 37.15 lakhs were sanctioned. Actual disbursements of the loans sanctioned amounted to Rs. 22.90 lakhs. As the first loan was disbursed in May, 1954, repayments would only start from this year. At the end of the year, 14 applications were pending consideration, while one was rejected.

Industry-wise distribution of applications for loans was as follows:

Industries	No. of units	Loans granted
		(Rs. lakhs)
Textile mills	2	10.10
Cashewnut	5	12.34
Rubber	5	18.20
Tile works and saw mills	6	4.28
Oil mills	6	4.49
Coir industry	4	3.45
Vegetable oil mills	1	2.50
Fertiliser	2	2.74
Jewellery	1	0.50
Tyre retreading	1	0.18
Confectionery	2	0.50
Plastics	1	0.99
Match	1	0.10
Total	37	57.37

The profit earned by the Corporation during the year under review amounted to Rs. 3.70 lakhs. After payment of taxes and making provision for reserves, there remained a balance of Rs. 2.01 crores. It was proposed to utilise this sum for payment of guaranteed dividend to shareholders. The State Government was requested to give subvention of Rs. 1.48 lakhs to make up the guaranteed dividend at 3¼ per cent. per annum.

SWEDEN'S NEW MONETARY POLICY

INTEREST RATES STEPPED UP

ON 19th April, 1955, the official bank rate in Sweden was raised from 2¾ to 3¾ per cent. —the highest level since 1932. At the same time, the issue of a long-term Government loan was announced at 4½ per cent., that is, at a rate 0.6-0.7 per cent. above the current market rate for gilt-edged securities. Since then, the banks and savings banks have also raised their interest rates by, generally, 1 per cent., so that an all-round rise in interest rates has become a fact.

This far-reaching use of the interest rate as a weapon of economic policy came as a surprise to most people. The Swedish price level had remained virtually stable since the middle of 1952, showing only a slight tendency to rise in recent months. At the end of March, the Riksbank's and the commercial banks' foreign exchange reserves totalled Kr. 2,430 million, or Kr. 28 million more than in March last year. As in Great Britain, the raising of interest rates has, therefore, been a preventive measure intended to counteract the threatening inflationary tendencies, resulting mainly from considerable wage increases.

Pressure for Wage Increases

The risk of a new wave of wage increases had already become apparent when the negotiations for the 1955 contracts were opened last autumn. The year 1954 had been a favourable one for Swedish industry. Generally speaking, the marketing conditions had been good, production was again rising after the slow-down in 1953 and industrial investment continued on an extensive scale. The demand for labour was keen and in some fields exceeded the supply. The result was strong pressure exerted by workers for higher wages, while, at the same time, employers were both willing and able to grant increases.

At this stage, the Government sought to put a brake on economic activities by measures to curtail the supply of funds on the capital market. A Government loan was issued in October at an interest rate of 4 per cent., i.e., ½ per cent. higher than the current rate on the market. This loan was very heavily subscribed and substantial sums were thus withdrawn from the market. The budget for 1955-56 also foreshadowed greater stringency. At the beginning of this year, a 12 per cent. duty was imposed on industrial investments in buildings and machinery and also a 10 per cent. levy on car purchases. Nevertheless, these measures had no appreciable effect on the course of the wage negotiations, which are by now concluded in most sectors. As a result, the general level of income is expected to go up this year by about 10 per cent. At the beginning of April, when a substantial rise in wages had already become a fact, the Minister of Finance presented a proposal to introduce compulsory saving. This was to be effected by a 10 per cent. addition to the income-tax, repayable in 1958. It was believed that by this means Kr. 1,300 million could be withdrawn in the course of 18 months. However, the proposal aroused strong opposition and had to be abandoned.

Rise in Bank Credit

Thus it had proved impossible to tackle the problem of inflation from the consumer's end by directly absorbing a part of the surplus purchasing power. The idea of compulsory saving had been rejected, and both a general purchase tax and a higher rate of personal income-tax were considered to be politically impracticable. In this situation, the Government decided to try to check the expansion with the aid of credit policy. Hitherto, it had sought to bring about stringent credit conditions mainly by voluntary restrictions on the part of the banks. In spite of these restrictions, however, bank credit continued to rise. During 1954, the commercial banks' advances rose by 12 per cent. and they continued to increase during the first quarter of this year.

There is no doubt that the new policy may be capable of putting a brake on the expansion of credit. When borrowers have to pay 6 per cent. or even more for their bank credits, part of the demand for credit is bound to fall off. At the same time, the banks have to count upon greater strains on the deposits side. The new Government loan, with its 4½ per cent. interest, is an attractive investment not only for institutional investors but also for the general public, who will in all probability use some of their bank balances for buying these bonds. The banks' deposits have already shown a slower rise than their advances—the increase between March, 1954 and March, 1955, was only 5 per cent. as against 9 per cent. in the case of the advances—and the liquidity position has gradually deteriorated. Within the framework of the current voluntary credit restrictions, every bank has undertaken to maintain a certain liquidity quota, that is, specific ratio between its liquid assets (cash, Government securities and claims on other banks) and its deposits. In spite of the restraint imposed on their credit accommodation, the majority of banks have had difficulty in maintaining these ratios.

The Riksbank has announced that, if the banks fail to reach the agreed liquidity quotas before the 1st August, the so-called emergency law governing the banks' cash reserves will come into operation. This law empowers the Riksbank whenever necessary to prescribe that up to 50 per cent. of the banks' deposits must be kept in the form of liquid assets. The banks, which are anxious to avoid any such development, may be expected to apply a highly restrictive credit policy within the next few months.

Other Measures

The Government, however, will probably not stop at this tightening-up credit policy but are expected to propose certain supplementary measures in other sectors. Thus, it is proposed to encourage voluntary saving by paying certain premiums. It has also been hinted in official quarters that the national tax on corporations will be raised from 40 to 50 per cent., implying that the combined national and municipal taxation of profits will rise from about 47 to about 56 per cent. Finally, the possibility of higher taxes on tobacco and spirits has been mentioned in this connection.

The new economic policy would have had a more powerful effect had it been introduced earlier. Now the wage increases are already an accomplished fact, as are also certain price increases, that is, the higher food prices. However, the measures now taken will undoubtedly limit any supplementary increase in wages over and above the contractual level and keep the inevitable rise in prices within as narrow limits as possible. A cumulative inflationary process may thus be avoided and a more balanced situation reached in face of next autumn's wage negotiations.—*Index*—the Monthly Economic Review of Svenska Handelsbanken.

WORLD BANK'S LOAN TO ITALY

The International Bank for Reconstruction and Development (World Bank) has approved of a loan in various currencies equivalent to $70 million to Italy. The loan is intended to finance projects for increasing agricultural production, industrial output and electric power in Southern Italy. The borrowing concern is a Government agency which, since 1950, has been charged with the administration of a comprehensive programme for raising depressed standards of living.

The main feature of the loan is the participation by the Bank of America, without the World Bank's guarantee, to the extent of $5 million. This amount represents the first five maturities falling due semi-annually from 15th July, 1958, to 15th July, 1960.

The loan is for a term of 20 years and carries interest at 4¾ per cent. including the 1 per cent. statutory commission charged by the Bank. It is guaranteed by the Government of Italy.

This is the largest development loan the World Bank has made in Europe. The Bank has also granted two other loans to Italy, each amounting to $10 million.

HONGKONG AND SHANGHAI BANKING CORPORATION

The Hongkong and Shanghai Banking Corporation, Hong Kong, has filed an application with the State Banking Department, San Francisco, California, for permission to establish its subsidiary, The Hongkong and Shanghai Banking Corporation (California), as a State Bank incorporated under the laws of California. It is expected that the necessary permission will shortly be forthcoming, and that the newly incorporated bank will be opened in the near future.

INDIA'S FOREIGN TRADE IN RAW WOOL

EXPORTS DURING 1954 AGGREGATE 29 MILLION LBS.

As an earner of foreign exchange, raw wool plays quite an important role in India's export trade. The average annual value of raw wool exported from India comes to about Rs. 8 to Rs. 9 crores. In the list of raw materials and produce and articles mainly unmanufactured, raw wool occupies the sixth place, the value of its exports (excluding re-exports) representing more than 7 per cent. of the aggregate exports of such merchandise. During 1954, the quantity of wool actually shipped amounted to as much as 29 million lbs. (actual weight), as against 23 million lbs. in the previous year, a rise of over 26 per cent. The bulk of the improvement in exports was accounted for by the U.S., the off-take of which during the year under review was 9.57 million lbs., which compares favourably with 4.71 million lbs. in 1953. Similarly, the U.K. bought a larger quantity, namely, 17.43 million lbs., as against 10.57 million lbs. Purchases by West Germany, the Netherlands and France were also higher at 580,000 lbs., 185,000 lbs. and 309,000 lbs., respectively. Australia took 622,000 lbs., Belgium 210,000 lbs. and Canada 156,000 lbs.

The upward trend in exports of raw wool has been well maintained in the current calendar year also. During the first quarter of the year, exports aggregated 8.78 million lbs., as against 6.38 million lbs. in the preceding quarter and 4.72 million lbs. in the corresponding quarter of 1954. On this basis, the total exports for the whole of 1955 may be estimated at about 35 million lbs. Incidentally, it may be noted that the Government of India has decided to release a further quantity of raw wool for export up to the end of September, 1955. Details of the licensing procedure are being notified by the Export Trade Controllers at the ports concerned.

Re-exports of raw wool from India, however, received a setback during 1954, despite a marked increase of 50 per cent. in the intake of the U.K. The quantity actually re-exported amounted to 5.1 million lbs., as against 5.36 million lbs. in 1953 or a drop of about 5 per cent. This may be the result of China taking away a large part of the Tibetean wool, the exportable surplus of which was being exported through India before Tibet came under the occupation of Communist China. It is significant that the fall in re-exports was mainly accounted for by Czechoslovakia, a communist State which took only 689,241 lbs. in 1954, as compared with 1.39 million lbs. in 1953. As already stated, the quantity going to the U.K. improved considerably, from 1.27 million lbs. to nearly 2 million lbs. A large part of the raw wool re-exported from India went to Belgium (1.1 million lbs.), Hungary (735,000 lbs.) and the Netherlands (397,000 lbs.).

Raw Wool Imports Fall

While the export trade in home-grown raw wool was quite encouraging, imports of wool registered a decline. During 1954, sea-borne imports of raw wool into India aggregated 3.0 million lbs., as against 4.5 million lbs. in 1953. The fall would appear to have been somewhat halted during 1955, the total imports in the first quarter of the year being 661,847 lbs., as against 553,316 lbs. in the preceding quarter. But, as compared with the imports a year before, the figure is lower by 349,355 lbs. The fall in imports of raw wool during the year under review was more pronounced in the case of Australia, one of the chief supplying countries. India took from this country only 1.13 million lbs., as against 1.84 million lbs. Receipts from New Zealand were lower at 848,000 lbs., as against 1.10 million lbs., as also from the U.K. which receded from 1.40 million lbs. to 1.02 million lbs.

Imports of wool tops into India, on the other hand, were larger, the quantity that actually arrived in 1954 being 11.01 million lbs., which compares favourably with 9.36 million lbs. in 1953, or a rise of 17 per cent. Of this quantity, the share of the U.K. was 10.25 million lbs. (8.97 million lbs. in 1953), the balance being accounted for by Australia and France. Imports of wool yarn also were larger, being 4.0 million lbs., as against 1.88 million lbs. The main increases were in supplies from Italy which more than trebled, from 824,000 lbs. to 2.87 million lbs. Japan, too, sent a little more, from 360,000 lbs. to 580,000 lbs. The offtake of U.K. yarn by India, however, was slightly smaller at 436,000 lbs., as against 456,000 lbs. The increase of 2.1 million lbs. in wool yarn imports during 1954 was accounted for mainly by worsted yarn for weaving, the imports of which advanced from 1.34 million lbs. to 3.29 million lbs. Imports of other yarns were also a little higher at 497,000 lbs., as against 277,000 lbs., while those of knitting yarn declined from 264,000 lbs. to 214,000 lbs.

Imports of Tissues

Despite a rise of 171,000 linear yards to 1.37 million yards in the import of mixed wool piecegoods, the total import of tissues during 1954 were lower at 2.57 million yards, as against 2.61 million yards (excluding wool shoddy cloth imports during January-March, 1953, the figures of which are not available for the previous year). The decline was due to a reduction in imports of woollen and worsted piecegoods, from 807,000 yards to 416,000 yards. Imports of shoddy cloth amounted to 783,000 yards. The fall in wool tissue imports would have been more marked but for the grant of enlarged import quotas for the fourth quarter of 1954. During the quarter, India imported 1.28 million yards of tissues, as against 583,000 yards three months before. Italy was the largest supplier of woollen tissues to India during 1954, the quantity that this country actually exported to India being 1.95 million yards, followed by the U.K. with 495,000 yards.

In the case of carpets and floor rugs, the quantity improved during 1954 was less, being 18,000 lbs., as against 36,000 lbs. in 1953. By contrast, imports of blankets and rugs improved from 404,000 lbs. to 735,000 lbs., representing a rise of 80 per cent.

CLOTH EXPORTS TO PERSIAN GULF PORTS

The past few months have witnessed a distinct setback in India's exports of cotton textiles to the Persian Gulf markets. During the three months ended March, 1955, exports of cloth to these markets amounted to a bare 3.46 million yards, as against 9.42 million yards in the corresponding period of 1954. What is this setback due to? Is there any scope for expanding India's export trade in the Persian Gulf markets? If so, what are the measures that should be adopted? For answers to these posers, one has only to peruse the interesting survey made by the Cotton Textiles Export Promotion Council in the course of an article published in the latest issue of the *Texprocil Bulletin*.

At the very outset, the Council points to the growing competition in the cotton textile markets of the Persian Gulf. Japan, Poland, Mexico, Hong Kong, Italy, the U.K., etc., it says, vie with one another for an increased share of the markets. Analysing some of the factors that have been acting against India and in favour of Japan and other competitors, the Council points to the efficient sales technique of the latter. According to it, high pressure sales promotion is the essence of Japan and other European countries' success. In the case of Japan, for instance, the manufacturers and exporters have prepared a comprehensive shop list of cotton textiles. Customers are merely to cable a certain number from the list to get quotations and specifications. Another sales secret to which India's competitors attach great importance is the ultimate satisfaction and appeal to the consumer. It is not enough to see that goods reach destinations, but "brand" appeal must be created so that the importer will find it easy to move the goods. It is also felt that Indian exporters and mills should help create appeal for their goods in these markets through more attractive sample booklets, folders, etc., as the Japanese manufacturers do. At present, very little attention, it is said, is being paid to these aspects.

The other handicaps in the way of an expanding export trade in the Persian Gulf markets to which the Council has drawn attention are:

(1) There are no "on-the-spot" studies made by Indian mills and exporters with a view to studying local needs, tastes, etc.;

(2) Indian mills do not accept export orders for less than 20,000 to 25,000 yards, unlike their confreres in Japan which book orders even for small lots of 3,000 to 5,000 yards;

(3) the designs and colours of Indian piecegoods are unimaginative and do not meet with the local consumers' likes;

(4) Indian goods are not so highly finished and do not bear such attractive appearance as those supplied by Japan and other competitors;

(5) packing of Indian textiles is deplored by most overseas importers;

(6) complaints have been made that, when it comes to delays, the exporters blame the mills and controversies are created, with the result that importers get tired of such dealings;

(7) there is great difficulty in securing shipping space easily and shipments are thereby delayed and freight rates exorbitant;

(8) sometimes, goods damaged at production point are despatched which greatly annoys buyers; and

(9) there is no system of "in-transit" consignments.

If the foregoing defects are remedied, India can, the Council feels, bid for a much higher share—amounting to about 45 million yards—in the textile markets of the Persian Gulf. "What is needed is," to quote it, "improvement in sales technique and quality of supplies."

As a means of studying the comparable qualities and competitive prices of textiles reaching the Persian Gulf markets from other sources, the Council has secured a number of shipment samples manufactured by Japan and Poland which are available for inspection by mills and exporters. The scrutiny of these samples and the comments on the same received from the importers there reveal that Japan offers more varieties of bed-ticking and these are of better finish. Japanese longcloth is of comparatively superior finish. The monopoly that India had in this variety is being lost rapidly, because Japan is able to offer better variety and wide assortment at competitive prices. The position is the same in respect of voiles. Japan is offering improved designs and good colours at more competitive prices. The samples of Polish cloth received by the Council also reveal the same trend. Although the qualities of these are the same as good Indian flannelettes, the range of colours and designs offered by Poland is superior and prices competitive. Among the other Polish varieties received are printed chintz (sateen finish), which are superior to Indian stuff, in both design and finish; at the same time, prices are competitive. The British blanket cloth sold in the Persian Gulf markets is finer than Indian qualities. The demand for such qualities is increasing.

WORLD WOOL CONSUMPTION

World wool consumption in the first quarter of 1955 was about 3 per cent. higher than in the previous three months, according to the Commonwealth Economic Committee. The outstanding feature was the sharp improvement in consumption in the United States, which rose by 13 per cent. to reach the highest level for the past 18 months. The quantity of wool used in Canada rose by about 16 per cent. and was more than 30 per cent. higher than in the corresponding period of last year. The United Kingdom consumption also rose—by 7 per cent.—and was the largest for two years. In Belgium and the Netherlands, there was a slight increase. In a number of the important West European countries, particularly Germany and Italy, however, there were substantial declines. Japanese consumption also showed a fall of 2 per cent. and was 7 per cent. lower than a year earlier. Australia, too, used about 4 per cent. less wool, the lowest for 12 months. Aggregate consumption in the 11 major consuming countries amounted to 427 million lbs. (clean), as compared with 416 million lbs. in October—December, 1954.

NOTICE

THE HONGKONG AND SHANGHAI BANKING CORPORATION

The Board of Directors of The Hongkong and Shanghai Banking Corporation, Hong Kong, has pleasure in announcing that an application has been filed with the State Banking Department, San Francisco, California, for permission to establish its subsidiary, The Hongkong and Shanghai Banking Corporation (California), as a State Bank incorporated under the laws of California. It is anticipated that the necessary permission will shortly be forthcoming and the newly incorporated bank opened in the near future.

EFFECT OF RAIL AND DOCK STRIKES ON COTTON INDUSTRY

VIGOROUS DRIVE TO INCREASE EXPORTS TO AUSTRALIA

From Our Special Correspondent

MANCHESTER, *7th June*

MANCHESTER LETTER

Attention throughout Britain has been centred on the drastic effect of the labour disturbances on the railways and in the docks. There is much speculation as to the length of the strikes and how the industrial life of the nation will suffer as a result of the transport hold-ups.

From the local angle it was perhaps fortunate that the rail strike, if it had to come, should have been called to coincide with the traditional Whitsun holiday, which curtails the distribution of goods in Lancashire textile centres. Yet the long-term effect of the worst outbreak of industrial strife for nearly thirty years will clearly bring trouble in its train for cotton as well as every other trade in Britain.

Ultimate Damage

Whatever the rights or wrongs of the grievances involved both on the railways and the docks, there can be no question about the ultimate damage caused to the nation's economy by such disastrous interference with the flow of output and services. Much of the movement of supplies within the cotton industry is nowadays carried out by road transport, but such a widespread dislocation of distribution is bound to have its repercussions in numerous directions.

The cotton industry's record for industrial disturbance is one which can be envied by many another trade. It is well over twenty years since there was a dispute which even threatened a large stoppage of output from the mills due to labour unrest. Unfortunately, the distribution of cotton goods has been indirectly hampered on more than one occasion in recent years by the action of other workers, especially in the docks.

Export progress achieved by Lancashire mills has been unsatisfactory for several months. The industry can ill afford any further interference with the flow of shipments abroad at such a critical stage in its history. Echoing the Prime Minister's words on the resumption of negotiations: "The quicker, the better."

Now that the Government has been returned to power with an increased majority it is possible to assess the outlook so far as British industry is concerned with at least one of the obscurities removed. For those engaged in the cotton trade the election provided some interesting contrasts. Whereas the mill towns had been expected to play an important part in deciding the contest, there was no strong movement to substantiate the Government's policy or to reject it.

It is now the turn of trade leaders to carry out their announced intention of returning to the fray. Both on the vexed topic of purchase tax on textiles and the even more controversial matter of foreign cloth imports, the main organisations of the industry have declared their intention to approach the new Government, whatever its political shade.

In view of the mandate which has been given by the country, the Chancellor of the Exchequer and the President of the Board of Trade will be on firm ground if they refuse to reverse their policy decisions, leaving the industry to fend for itself. In any event, constant changes in purchase tax will only persist in creating uncertainty, although its complete abolition would be universally agreeable.

No fresh arguments can be put forward on the need to curb arrivals of foreign cloth. The situation is already well established and the damage has been done. To introduce certain restrictive measures would cause this country to transgress the terms of the General Agreement on Tariffs and Trade and in some quarters moves are afoot to try and obtain some revision of the Ottawa Agreement to assist Lancashire's cause. Lack of confidence over the future trend of raw material rates is still the main cause of the industry's present troubles. If the result of the election had brought a complete change in political power there would have been further uncertainties to be overcome. It must now be assumed that the existing position will persist for some time to come.

Australian Trade Drive

A vigorous drive to boost exports of Lancashire textiles to Australia—leading overseas market of the United Kingdom cotton industry with a £15,000,000-pounds-a-year "shopping bill"—is planned by the Cotton Board.

Under the banner "Always Buy British Cottons," the Board this year aims to widen the campaign initiated last year with the addition of sales drives in Tasmania and New Zealand.

Nearly 130 key stores in metropolitan areas and an estimated 1,500 shops and stores throughout the Commonwealth will join in the campaign this year. British "Cotton Weeks" will be held in all five States of Australia and in Tasmania between August and October.

Suggestions that the time is opportune for scrapping some of the older Lancashire mills and concentrating production in the most modern units were described as "quite impracticable" in the quarterly report of the Operative Spinners' Amalgamation.

In support of this policy it had been suggested that technicians and operatives would not suffer as they would be found employment at other mills which would be able to run double shifts as a result of the reduction in running units. The Secretary, Mr. Schofield, states that this would mean redundancy among considerable numbers of mule spinners and their assistants, the majority of whom had spent the whole of their working lives in this branch of spinning. Surely it was not expected, he said, that men should accept employment in another department at a wage of two-thirds or less than they normally earned.

Manpower in Lancashire mills has dropped by 15,000 in 12 months, figures given by the Cotton Board have revealed. At the end of April, the Board stated, the cotton labour force stood at 275,740 compared with a figure a year ago of 290,620. In the month to 30th April, the weaving sheds alone lost 1,360 full-time and 120 part-time operatives.

The cotton labour force is now made up in this way—weaving 137,070 (compared with 141,870 12 months ago), spinning 107,630 (114,490), doubling 23,950 (27,060), waste spinning 7,090 (7,200).

In the four weeks to the end of April, the Cotton Board states, production of cotton, rayon and mixture cloth averaged 48,320,000 yards weekly. Easter holidays restricted the yield. Production in the previous month averaged 54,520,000 yards weekly and in the same week last year the weekly average was 53,510,000 yards.

Import Position

Although imports of cotton grey cloth into the United Kingdom in April were slightly lower than in the first quarter, they remained distinctly higher than the average monthly figure recorded last year. In the first four months of 1955 nearly 112,000,000 square yards of foreign cloth has arrived in this country, including 51,000,000 yards from India and almost 33,000,000 yards from Japan. Comparative figures for 1954 were 38,000,000 yards from India and less than 3,000,000 yards from Japan.

Another significant development has been the continued rise in shipments from Hong Kong, which amounted to some 5,500,000 square yards in April, bringing the four-monthly total to over 18,500,000 square yards—slightly more than was received from that Colony in the whole of 1954.

The proportion of foreign grey cloth reaching Britain last year represented a little more than one-third of total exports of cotton fabric from this country. By the end of April the ratio had exceeded one half of corresponding shipments abroad.

Even the merchanting community, which stands to gain from trading in such goods, cannot stand idly by and observe such a development without protest. The annual report of the Cotton and Rayon Merchants' Association refers to the problem in realistic terms. The grey cloth sectional report, while recognising that imported cloth makes a contribution to Lancashire's export trade in the form of re-exports, expresses anxiety that there is no machinery available by which the flow of imported piecegoods into the home market can be regulated.

Despite the sharp increase in imports of grey cloth, foreign goods of other types have not shown an equally rising trend. At the end of April imports of finished cotton cloth were slightly lower than at the same time a year previously, being 11,731,000 square yards against 11,868,000 yards. Yarn shipments from abroad have increased from 3,627,000 lbs. to 4,886,000 lbs.

FUTURES TRADING IN COTTON

FORWARD MARKETS COMMISSION'S VIEWS ON CLAIMS OF CENTRES ANALYSED

IN our issue, dated 4th June, 1955, we summarised the main recommendations of the report of the Forward Markets Commission on the recognition of associations in respect of forward contracts in cotton. Considerations of space, however, prevented a fuller presentation of the Commission's assessment of the importance of the different cotton-growing regions to the country's cotton economy and its discussion of the validity of the claims made by different towns for recognition as centres for forward trading in cotton. This part of the Commission's Report, which is summarised in this article, will show that the Commission has been guided in its choice of centres by certain very relevant considerations.

Assuming that there is need for more than one centre for forward trading in cotton, the Commission is certainly right in insisting that the centre, chosen for this purpose, should possess rail and road connections with different producing markets and consuming centres and command a large proportion of the crop grown in the region. Other pertinent considerations are: (1) pressure of important consuming interests, such as processors, manufacturers and exporters, (2) availability of credit, warehousing and insurance facilities, and (3) tradition and experience in forward trading. In assessing the importance of each cotton-growing region, the Commission has taken into account such factors as area under cotton, production of cotton in general, and tenderable varieties, in particular, and consumption of cotton. From this point of view, the Commission has, as we pointed out in our previous issue, divided the country into four regions—Northern, Central, Southern and Bombay City.

The Northern region consists of the States of Punjab, P.E.P.S.U., Rajasthan, Uttar Pradesh, Ajmer, Delhi, Vindhya Pradesh, Himachal Pradesh and Bilaspur. With about 15 lakh acres under cotton, the region's acreage accounts for 9 per cent. of the total area under cotton in the country. In 1953-54, it produced 7.9 lakh bales, amounting to about 20 per cent. of the total output of cotton in the country. The prospect for cotton cultivation in the region is held bright due to the construction of the Bhakra-Nangal Dam. It is estimated that, after the completion of the dam, cotton production in the region may eventually increase to about 16 lakh bales. At present, the Punjab and P.E.P.S.U. account for about 70 per cent. of the region's production. Short-staple varieties account for about 55 per cent., medium-staple Rajasthan American and U.P. American varieties for about 5 per cent. and long-staple Punjab American variety for about 40 per cent. of the production of this region. The entire production of American varieties is tenderable against the Indian Cotton Contract of the East India Cotton Association (E.I.C.A.), Bombay. The region is also important from the point of view of cotton consumption. It has 40 textile mills, which, in 1953-54, consumed 6.3 lakh bales (or about 13.7 per cent. of total consumption in the country), of which the region's varieties accounted for 43 per cent. Considering the present production and consumption of cotton in the region and the prospect of a substantial rise in production, the Commission is of the view that there is a case for the location of a futures market in the region.

The Commission had received 12 applications from ten centres for recognition for purposes of forward trading in cotton from this region. The centres are: Abhor, Amritsar and Ludhiana (Punjab); Barnala and Dhuri (P.E.P.S.U.); Ganjanagar, Gulabpura and Jaipur (Rajasthan); Bewar (Ajmer State) and Delhi. In discussing the rival claims of the centres, the Commission points to some deficiency or other in each centre. Further, the pattern of production, which would follow the construction of the Bhakra-Nangal Dam, is stated to be uncertain. In these circumstances, the Commission has come to the conclusion that the "choice of a centre for this region has to be postponed, until the new set-up of economic forces becomes clear, and an association, more representative of the different concerned interests in the region comes forward to take up the responsibilities of running a futures market."

The Central region consists of Madhya Pradesh, Madhya Bharat and Bhopal, West Khandesh, East Khandesh, Ahmednagar, Sholapur, Poona and Satara, North Districts of Bombay State and the Aurangabad, Bhir, Parbhani, Nanded, Adilabad, Osmanabad, Bidar, Karimnagar, and Medak districts of Hyderabad State. It is the biggest cotton-producing region in India. The total area under cotton in the region in 1953-54 was about 86.5 lakh acres constituting about 49 per cent. of the total area under cotton in the country. The output of cotton was 16 lakh bales or about 40 per cent. of the total production of cotton in India. The short-staple Oomra variety accounted for about 26 per cent. of the total production of cotton in the region. The medium-staple varieties of Jarilla and Malvi are the principal varieties grown in the region, accounting for about 50 per cent. of the total production in the region. The long-staple Buri American, Parbhani American and Gaorani varieties form about 24 per cent. of the total production. Of the varieties grown in the Central region, Oomras and Malvi with a staple length less than 24/32" are not tenderable against the Indian Cotton Contract at the East India Cotton Association, Bombay. Thus, approximately 31 per cent. of the production in the region is not tenderable at the E.I.C.A. The rest of the production is tenderable.

As compared with production, the consumption of cotton in the region is small. In 1953-54 there were about 44 cotton textile mills in the region, which consumed about 6.6 lakh bales of cotton or about 14 per cent. of the total mill consumption in the country. The consumption included indigenously grown varieties of the region to the extent of about 75 per cent.

From this region, the Commission received nine applications from seven centres, namely, Ujjain, and Indore in Madhya Bharat; Khamgaon, Akola and Amravati in Madhya Pradesh; and Jalna and Nanded in Hyderabad. Two applications were received from Ujjain and Jalna each. The Commission felt that two futures markets for cotton should be opened for the present in the Central region, one in the central part of the region, at Akola, and the other in the northern part of the region, at Indore. In the southern part of the region, no futures market for cotton need be opened at present, but the question may be reconsidered later.

The Western region covers the Gujarat districts of Bombay State, Saurashtra and Kutch. During 1953-54, the area under cotton in this region was about 30 lakh acres. In the all-India acreage under cotton, the share of the region is about 17 per cent. The production of cotton in the region during the year 1953-54 was of the order of 874,000 bales or about 22 per cent. of the overall production in the country. The production of cotton in the region has been increasing in keeping with the increase in the production in the country.

The short-staple variety of Mathia accounts for only about 5 per cent. of the cotton production in the region, the medium-staple varieties of Dholleras, Kalyan and Broach Vijay account for about 75 per cent. and the long-staple variety of Surti accounts for about 20 per cent. The varieties of Vijay, Surti and Kalyan, representing about 75 per cent. of the production in the region, are tenderable against the Indian Cotton Contract at the East India Cotton Association, Bombay. The other two varieties, that is, Dholleras and Mathia, grown in Saurashtra and Kutch, are not so tenderable. These together constitute nearly 25 per cent. of the total production of the region.

In 1953-54, the 106 mills of this region consumed about 850,000 bales or about 19 per cent. of the all-India consumption. Out of the total consumption in the region, while the mills in the Gujarat districts accounted for about 785,000 bales, the mills in Saurashtra absorbed about 65,000 bales only. A little more than 35 per cent. of the consumption in the region comprised foreign cotton, most of which is consumed by mills in Ahmedabad. The indigenous varieties account for about 40 per cent. of the consumption of cotton in the region.

The eight applications for recognition received from this region were from associations situated in seven different centres, namely, Ahmedabad, Botad, Dhrangadhra, Manavdar, Morvi, Surendranagar and Veraval. Two applications have been received from Dhrangadhra. The Commission came to the conclusion that the most suitable location for a centre for futures trading in the Western region would be at Ahmedabad.

The Southern region consists of the Kolhapur, Satara South, Belgaum, Bijapur and Dharwar districts of the Bombay State, the Gulbarga and Raichur districts of the Hyderabad State and the States of Mysore, Travancore-Cochin, Madras and Andhra. During 1953-54, the area under cotton in this region was about 38 lakh acres, representing about 22 per cent. of the all-India area under

NEW IN EVERY SENSE OF THE WORD

DODGE '55 KINGSWAY CUSTOM 4-DOOR SEDAN

The car with the Forward Look

LONGER—LOWER—WIDER

A car that is unrecognisably new—that's the 1955 Dodge. You dreamed of it, you expected it, here it is.

The newest thing about the new Dodge is its FORWARD LOOK. It's been made at least 10 inches longer, at least 2 inches lower to give it the appearance of a car that is in motion even when it is stationary.

Extended-vision windshield wraps around at top and bottom like the cockpit of an aeroplane to give you a bigger, wider view all round. *Every Dodge car is fitted with tubeless tyres—which come as standard equipment, without any extra charge.*

Take a look at the new 1955 Dodge at your dealer's. You'll fall in love with it.

It's a BIG job.... running an oilfield

Many special kinds of skill are required to keep India supplied with oil, from the study of fossils to the operation of complicated plant in refineries—and not excluding the care of elephants.

Consider the complexity of the Assam Oil Company's operations at Digboi, in north-east India. Here, at India's first and hitherto only oilfield, nearly a thousand wells have been drilled into the earth's rocks—a total of over 300 miles of hole. More than 600 of these wells still yield oil regularly, modern production techniques ensuring that the maximum amount of crude is recovered from the field. Science and engineering skills guide every phase of the company's work, nowhere less than in Digboi refinery which in a single day supplies the Indian market with over 250,000 gallons of high-quality petroleum products. In all branches of this full-scale industry the Assam Oil Company employs nearly 9,000 persons, while many hundreds more are engaged in serving the consumer.

Yes, the day-to-day running of the oil industry is a big job. To keep it running the Assam Oil Company has to spend crores of rupees just in "looking ahead". For no oilfield lasts for ever, and in order that India's vital flow of oil may be supplied to an increasing extent from India's own resources, the company is constantly exploring for new sources of petroleum.

ASSAM OIL COMPANY does it all

DEVELOPMENT WORK IN SUGAR INDUSTRY

STRESS LAID ON SELF-HELP AMONG MILLS

IT was only last week that we referred in these columns to the welcome move of Mr. Ajit Prasad Jain, Union Minister for Food and Agriculture, to impart more vigour and impetus to the implementation of schemes of sugar technology. We stated then that, although the efficiency of the Indian sugar mills compared favourably with that of mills in the more advanced sugar-producing countries, it should not lead to complacency, for there was still a vast field which needed further and more intensive research. This point has been stressed by no less a person than Mr. R. C. Srivastava, a well-known sugar expert of India and a former Director of the Indian Institute of Sugar Technology, Kanpur. In the course of his note on improving Indian sugar industry, submitted to the Development Council for Sugar Industry some time ago—his suggestions relating to cane development as contained in this note have been analysed in our issue dated 28th May, 1955—Mr. Srivastava, for instance, observes that, despite drawbacks such as high price of machinery and uncertain and long periods of delivery, every effort should be made to increase efficiency of our factories.

In the considered opinion of Mr. Srivastava, there is still a large trade in spare parts for sugar machinery and also in complete units of machinery for additions and alterations. In order to meet this demand, it will be desirable to encourage manufacture of sugar machinery in India. There are no doubt a few concerns engaged in this work, but their work is spasmodic. Nearly ten years have elapsed since the Technical Committee, which scrutinises and reports on all applications for extension to plants of sugar factories, passed a resolution on recommending to the Government that all factories be allowed to extend their milling plants to 17 or 18 rollers, preceded by two sets of cane-cutting knives, and to make additions to their boiling house plants to balance with this. If this recommendation had been accepted and implemented, the efficiency of the Indian sugar factories, it is said, would have risen considerably.

Quality of Sugar

Mr. Srivastava also emphasises the need for improving the quality of sugar manufactured in India. He urges that special attention should be paid to the clarification of cane juice and the pan boiling and curing processes. According to him, the new process evolved by Prof. J. M. Saha, Director of the Indian Institute of Sugar Technology, Kanpur, deserves wider publicity and must be tried in as many sugar factories as possible. The process is economically sound and gives sugar of a very good quality. Even for factories following the ordinary processes, it will be very helpful if the Technical Officers of the Kanpur Institute make a rule of visiting sugar factories without waiting for being called or being paid their fees. The objects of their visits should be not to scrutinise the work of the factory staff but to give them advice and make suggestions for improvement. Mr. Srivastava has not gone into wider technical details concerning improvement of the quality of sugar. He has, however, made particular mention of the rise in quality which results from a properly regulated scale of price differentials for different qualities of sugar.

In order to guide and co-ordinate the working of the aforesaid schemes, as also those relating to cane development, Mr. Srivastava suggests that there should be a senior Development Officer possessing considerable experience of the sugar industry. He may be a whole-time officer or part-time officer as a consultant, and may be imported if necessary. It will be of advantage if he is stationed at the Kanpur Institute and is given full help and co-operation by the Institute. But the Institute has itself been a truncated body, a large part of its staff having been removed. As a result, its work has lost much of its value. Alluding to this aspect, Mr. Srivastava points out that, for properly helping in the development work, most of the staff will have to be restored; in fact, a little additional staff may have to be provided. The advantages which the Institute provides for their work are not likely to be available elsewhere, because the Institute can accord very good laboratory and library facilities, besides making available services of Technical Officers who have had long experience of visiting and advising the sugar factories all over India. Important statistical work will also have to be done for the development section such as that pertaining to raising the yield of cane, lowering the cost of production of sugar, and compiling and tabulating the technical data on the working of sugar factories.

In this connection, Mr. Srivastava lays particular stress on the fact that the machinery set up for the development work must be of an elastic nature and not too much bound up by rigid rules and regulations. For it should be realised that, as work of improvement progresses, more defects and difficulties are likely to come to light, and remedies will have to be found for these also.

Expenditure

The completion of the development work indicated above is expected to take about five years. The overall expenditure during the period is not considered large as compared with the foreign exchange spent on imports of sugar, the losses suffered by cane growers and labourers, and the expenditure incurred in shifting sugar factories from areas which are at present not having enough supplies of sugarcane to areas where supplies are abundant.

In conclusion, Mr. Srivastava calls upon the sugar industry to try to help itself to a greater extent, instead of depending on Government assistance for everything. He commends to all the industrialists the book entitled *Can Industry Govern Itself?* which, he says, describes how the sugar industries of a large number of countries have organised themselves for self-help. Countries, we are told, have experimental stations run by the industry which help both the factories and the cane growers. To quote Mr. Srivastava: "We must remember that the sugar industry has to see to the interests not only of its capitalists and shareholders but also of the cane grower, the labourer and the consumer of sugar."

NEW GIANT SUGAR MILL FOR WEST INDIES

Central Palma, on the eastern end of Cuba, will soon have a huge new sugar mill in operation. The mill is expected to set new standards for grinding efficiency in this greatest of sugar-producing areas. The new 18-roll tandem mill, built by Farrel-Birmingham Company, was purchased by Cuban Dominican Sales Corporation, subsidiary of West Indies Sugar Corporation; which specified Worthington steam turbines and remote centralised controls for driving and controlling the mills. Each of the six three-roll mills has its own turbine drive, capable of developing up to 900 horsepower. Individual mill speeds can be collectively or separately controlled by push-button from a master panel, permitting instantaneous variations in mill speeds for most efficient performance under varying conditions. Mills may be stopped and started by push-button from this remote control panel. Power transmitted from the steam turbines to the mill rolls has four steps of speed reduction. The new mill contains two sets of cane knives and a unique magnet arrangement, designed and developed by Farrel-Birmingham. The sugarcane after passing through the second knife set, is considerably thinned out and, at this point, the magnet removes any metal scrap which could damage the cane crushing rolls. This latest mill, it is claimed, reflects the positive trend toward the modern method of utilising steam turbines for driving mills over the older steam engine method.

MOLASSES DISPOSAL IN U.P.

The Government of Uttar Pradesh has relaxed the restrictions on the distribution of molasses. Accordingly, sugar factories are now free to dispose of molasses which remains with them after other purposes have been met but at the rate fixed by the Government, namely, As. 3-6 per maund. Any price realised in excess of this rate must be deposited with the Government. The mills are also required to give preference to co-operative institutions.

The above decision, it is said, is a sequel to the record production of sugar in the current season, resulting in the accumulation of heavy stocks of molasses with the mills. Hitherto, the Government used to invite tenders for the purchase of molasses left over after supplies to distilleries for the manufacture of alcohol, including power alcohol. Even during normal years, this system proved cumbersome and there were difficulties in obtaining the requisite supplies of molasses from the sugar factories. This handicap has since been removed with the restoration of freedom to sugar mills for disposing of molasses.

1954
a year of outstanding success for UNITED INDIA!

Policyholders number	1,25,000
Life Assurance in Force	Rs. 30,56,26,000
Total Assets	,, 9,73,00,000
Total Income	,, 1,68,00,000
Life Assurance Fund	,, 8,77,00,000
Total Claims Paid in 1954	,, 52,00,000

NEW BUSINESS SECURED Rs.5,30,00,000

This success reflects the faith and the confidence of the people in United India policies and service. The Company's sound management, efficient field force and prompt payment of claims has made it a name to reckon with today. In the future, the same ideals will guide it towards greater benefits for its policyholders.

Trade with Australia and New Zealand

Business men trading with Australia and New Zealand are invited to use the complete banking service of the Bank of New South Wales.

The oldest and largest joint-stock bank operating in Australia and New Zealand, the Bank of New South Wales keeps in close touch with local conditions through over 850 branches and agencies (sub-branches) in Australia, New Zealand, Fiji, Papua and New Guinea. It is thus particularly well equipped to provide enquirers overseas with a full picture of the local business and rural scene.

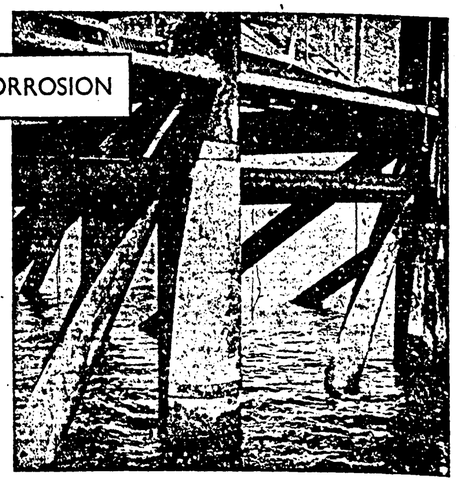
MONEL CONQUERS CORROSION



Waves and biting spray threatened this steel derrick in the Gulf of Mexico with corrosive disintegration. Built miles from land in warm sea water, the area of the piling that caught the spray and wash was rapidly losing the ceaseless battle against the corrosive sea. Then Monel sheathing was used to cover the exposed areas. For three years these Monel sheaths have been subjected constantly to attack by the Southern seas, but both the sheaths and the piles they protect are still undamaged.
If you are faced with a problem involving exposure of metals to corrosion or high temperatures, consider the Wiggin Nickel Alloys.

OUTLOOK FOR NATURAL RUBBER

RUSSIA ENTERS LONDON RUBBER MARKET

IN recent weeks, there has been a notable recovery in the world price of natural rubber. On the London Rubber Exchange, for instance, the price of spot rubber touched last week 31½d. per lb., having risen from 25d. at the end of April last, and was only a fraction less than the peak level of 31⅝d. per lb. for the current year so far touched in January. The strength of the rubber price, as reflected in the above quotation, is attributed to a good demand for near supplies of the commodity, following the labour unrest in the U.K. and Singapore. The main contributing influence has, however, been the re-entry of Russia and Poland in the market. Russia has entered the London rubber market after a lapse of 2½ years. It has been buying mostly in London and some quantities have been bought in Amsterdam also.

Russia is stated to be buying spot and near supplies of only top grade rubber which is not easily available and stocks of which are low. Another feature of Russia's buying policy has been that it is flexible and does not follow sharp rise in prices. The Russians are also reported to have rejected damp and mouldy bales at the appropriate discount. This selective buying of the best grade rubber by Russia is interpreted in some quarters to mean that the purchases are for replacing the country's strategic stock, the old rubber from which is being released for consumption. Another explanation offered for the Russian buying is that the country has once again diverted its attention to the development of heavy industry from the emphasis on consumer goods. This has led to an increase in consumption of rubber by that country. The larger attention paid to the development of consumer goods in recent years is said to be responsible for the decline in imports by Russia and the Iron Curtain countries during the last two years. In 1954, the imports by these countries dropped to 120,000 tons, the lowest level for six years, as compared with 143,000 tons in 1953 and 197,000 tons in 1952.

Offtake by Russia

The re-entry of Russia into the London market has, therefore, given rise to optimistic hopes about the future of natural rubber. It is expected that Russia and other Iron Curtain countries would buy this year about 170,000 tons, the average offtake per annum for the six years prior to 1954. The increase in offtake by Russia will more than wipe out the small surplus of 15,000 tons of natural rubber forecast for this year by the International Rubber Study Group, provided that the consumption by the United States remains at the present level. In fact, the two main uncertain factors, in the assessment of the prospects for natural rubber during 1955, were the extent of American consumption and buying by Russia and China. Even otherwise, it was expected that the consumption of natural rubber would more or less balance the production and this expectation has since been confirmed by the figures of estimates released by the International Rubber Study Group, which places the world production at 1,845,000 tons and consumption at 1,830,000 tons. The position has now been rendered more clear with the entry of Russia in the rubber market. Moreover, the rapid recovery of the European economy, which had mainly contributed to the strength of natural rubber during 1954, does not show any sign of slackening and the consumption by the European countries is expected to keep pace with the tempo of their industrial recovery.

So far as American consumption of natural rubber during the current year is concerned, there is no reason to believe that it would fall below that of 1954, because the strikes that resulted in the closure of rubber factories in America during the past year are not expected to intervene as a serious factor. So far this year, the consumption of natural rubber has been well maintained, despite the fact that the price of natural rubber is rising and synthetic rubber has a price advantage over the natural. An explanation for this may be the reported technical difficulties which have impeded manufacturers of tubeless tyres from switching over wholly from natural rubber to synthetic. Further, there are also reports that the new marketing structure for synthetic rubber manufactured by private enterprise has not yet been evolved. These two factors may check increased consumption of synthetic rubber, but these difficulties can be expected to be removed eventually and natural rubber will once again face the challenge of synthetic rubber, unless technical developments in the production of natural rubber give it a definite advantage over synthetic in terms of quality.

The main producers of natural rubber seem to have already realised this, as witnessed the experiments which are now being carried on in Malaya and Indonesia not only to increase the yield per acre of natural rubber substantially, so as to reduce the cost of production, but also to incorporate certain physical features in natural rubber which would enable it to meet the advances in synthetic rubber. The Malayan Government has also announced its own new scheme of rehabilitation, in preference to those submitted by the Rubber Producers' Council and the Mudie Mission. Under the Government scheme, direct assistance to estates would be given by paying half the assumed average cost of replanting ($800 per acre) for a period of eleven years from 1st January, 1953. These grants would also be available for approved new planting or for replanting with alternative crops. Small holders will also get assistance, for the total funds set aside by the Government for the eleven-year scheme (estimated at a minimum of $280 million) would be shared between estates and small holders in the ratio of their production, namely, 3 to 2. This assistance would supplement the existing scheme for replanting among small holders, which is financed by a replanting cess of 4½ cents per lb. and which provides grants that have been raised from $400 to $500 per acre. The variable replanting cess paid by both estates and small holders would be abolished, because it is found to be too small to be of any real use.

TEA CONSUMPTION IN U.S.

During the year 1954, the U.S. imported 115.7 million lbs. of tea, as compared with 105 million lbs. in 1953, or a rise of 10.2 per cent. Retail sales moved up by 7.7 per cent. to 83.4 million lbs. and total sales rose by 8.4 per cent. to 112 million lbs. Disclosing this, the Annual Report of the Tea Council of the U.S.A. Inc., for 1954, says that this was the third successive year to show a substantial gain in home consumption. The report adds: "It is now clear that a definite trend towards tea has been established. Our joint campaign has finally scored a breakthrough." It, however, points out that it is important to remember that the unfavourable publicity attending the rapidly rising coffee prices in the spring of 1954 undoubtedly brought about some conversions to tea—either temporary or, as is likely in a substantial number of cases, permanent.

In January, 1954, when the public outcry against high prices of coffee occurred, sensing that the situation might offer special opportunities, the Tea Council took speedy steps to accelerate the already established trend in consumption of tea. It, however, decided that it should not use the high price of coffee, nor the comparative economy of tea, as the main thrust of its effort, but should continue, on the whole, to put forward tea's merits along the same lines as before. The report observes that the Council did not believe that economy in itself was the primary motive in the choice of tea as a beverage. It did not also think it was sound selling to try to make capital out of coffee's plight.

The Tea Council's report also contains a note on what the future holds for tea. Though the year 1954 ended with an increase of 9 million lbs. to a record high of 112 million lbs. in consumption, the Council points out that "it will be harder to achieve gains" in 1955 for two reasons. First, it will not "get the same 'assist' from high coffee prices," because coffee prices are coming down and tea prices have risen. Secondly, competition for the beverage market is growing at a fast rate. Giving a few examples of this growing competition, the report says that the U.S. coffee trade is making increasing efforts to recapture and expand its market. The Pan American Coffee Bureau proposes to launch a $4.25-million annual campaign. The milk industry has increased the budget for its campaign by 12 per cent. to $4.5 million and the soft drink industry, which had never before been organised nor had carried on a campaign, proposes to launch one, costing $3 to $4 million per annum, to meet the competition of other beverages, such as tea, coffee, beer and fruit juices. Though these campaigns will have an influence on tea, the Council says that the potential for future growth is great and that this potential can be converted into a reality only by very hard work in continuing the joint effort of tea trade and producing countries.

The North Indian tea crop up to the end of May was almost 3 million lbs. below last year's and 5.3 million lbs. below the average of the last three years. The Indian Tea Association estimates the crop at the end of May at 51.8 million lbs. against 54.8 million lbs. last year—a decline of 5.4 per cent. Thus the excess of 25 per cent. reported at the end of April has been wiped out, and this year's crop promises to be adjusted nearer to likely demand. It is expected that similar restriction is being effected in South India and Ceylon.

JUTE MANUFACTURES IN MAY

OUTPUT AND STOCKS LOWER

THE stocks of jute goods held by mills at the end of May last aggregated 94,895 tons. They represent a fall of 7.7 per cent., as compared with those at the end of the preceding month. The fall was not unexpected, in view of the improvement in the shipments of these goods from the Calcutta port in the month under review. Apart from increased offtake during the month, the decline in stocks is also due, to some extent, to a fall in production, as we shall presently show. A noteworthy feature of the fall in stocks is that it is mainly due to a sharp drop in the stocks of sackings from 62,879 tons to 53,114 tons or nearly 16 per cent. Stocks of hessians, on the other hand, rose from 39,021 tons in April to 40,596 tons in the month under review, reflecting thereby relatively lower despatches in hessians.

The table below shows at a glance the stock position of the three varieties of jute goods, as at the end of May, 1955, as compared with those at the end of the two preceding months as also at the close of May, 1954:

Jute Goods Stock

(In tons)

	As on 31st May, 1955	As on 30th April, 1955	As on 31st Mar., 1955	As on 31st May, 1954
CIVIL:				
Hessian	40,429	38,776	33,762	34,455
Sacking	52,708	62,559	58,853	49 698
Others	1,185	1,488	1,565	1,601
Total	94,322	1,02,823	94,179	85,754
GOVERNMENT:				
Hessian	167	245	237	392
Sacking	406	320	209	299
Others	Nil	Nil	Nil	1
Total	573	565	446	692
Grand total	94,895	1,03,388	94,625	86,446

It is seen that hessian stocks account for as much as 43 per cent. of the total stocks of jute goods held by mills. This high percentage, however, should cause no concern, as upward trend of stocks has been checked and demand is once again picking up. As regards sackings, the stocks at 53,114 tons represent nearly 55 per cent. of the total and from the trend of orders that are being received from overseas buyers for small quantities now and then, during the last few weeks, one can expect a further decline in them. The improvement in shipping position should enable the mills to accelerate the pace of despatches this month.

The downward trend in output witnessed in April last continued during the month under review also, even though it was longer by a day. In March, 1955, the production of jute manufactures aggregated 89,258 tons. It declined to 85,691 tons in April and still further to 81,768 tons in May, despite the fact that the mills worked 48 hours a week. The decline may be explained by the fact that the conditions prevailing in both raw jute and jute goods were not conducive to increased production.

The table below shows the output of the various types of jute goods during each of the three months ended May, 1955, as also during May, 1954:

Jute Production

(In tons)

	May, 1955	April, 1955	Mar., 1955	May, 1954
CIVIL:				
Hessian	32,075	33,777	34,766	25,861
Sacking	46,108	49,185	50,834	39,483
Others	3,448	3,576	3,638	2 877
Total	81,631	85,686	89,238	71,176
GOVERNMENT:				
Hessian	14	8	10	124
Sacking	133	152	10	24
Others	Nil	Nil	Nil	9
Total	147	155	20	157
Grand total	81,768	85,691	89,258	71,333

The output of hessians in the month under review was 700 tons lower at 32,089 tons, and that in sackings, at 46,236 tons, was lower by as much as 3,100 tons. Other varieties declined from 3,576 tons in April to 3,443 tons in May.

With production in May, the total quantity of goods manufactured in the first eleven months of the jute season, 1954-55, amounted to 917,926 tons, as against 790,679 tons in the same period of the preceding season. Consumption of raw jute during the period, calculated on the basis of production, may be put at 5.3 million bales, as compared with 4.6 million bales in the first eleven months of the 1953-54 season. Availability of more jute, increase in the working hours per week, and a relatively better offtake of jute goods for export as well as for internal consumption were principally responsible for the improvement in the output of jute goods in the current season.

INDIA'S IRON AND STEEL INDUSTRY—II

EXPANSION PROPOSALS ANALYSED—RAW MATERIAL RESOURCES REVIEWED

THE following is the second and final instalment of the article on India's iron and steel industry, published in the British Iron and Steel Federation's *Monthly Statistical Bulletin*. In this instalment, the authors have outlined the expansion plans of the three existing producers, namely, the Tata Iron and Steel Company, Ltd., the Indian Iron and Steel Company, Ltd., and the Mysore Iron and Steel Works, besides giving a brief account of India's raw material resources required by the industry. The first instalment was published on pages 1120-21 of our last issue:

The Tata Iron and Steel Company at present dominates the Indian iron and steel industry, and produces over 65 per cent. of the country's output of pig iron and over 70 per cent. of the output of crude steel. The foundation of this company in 1907 marked the turning point in the development of the industry, for, while there had been numerous small-scale attempts to install iron and steel plants, lack of capital and the use of poor quality ores had prevented their successful operation, the sole exception being the Bengal Iron Company.

The site chosen for Tata's plant was Jamshedpur (then called Sakchi), 157 miles west of Calcutta, near the confluence of two rivers and not far from the iron-ore deposits of Mayurbhanj (which had just been discovered) and the coking coals of Jharia.

Mining Concession

At the time of its inception, Tata took a mining concession in Mayurbhanj State and established the Gorumahisani mine (61 per cent. Fe), whilst in 1923 the Badampahar (57 per cent. Fe) and Sulaipat (68 per cent. Fe) mines were opened. In 1917, the deposits at Noamundi (60/67 per cent. Fe) in Singhbhum and in the Keonjhar State were discovered and construction of a railway from Chaibasa to the main line made the use of these ores a practical proposition.

The first pig iron was produced by Tata in 1911, the steel furnaces commencing production in the following year. Today, the company has a share capital of over £13 million with provision for depreciation of about twice that amount, the gross fixed capital expenditure being over £38 million. It is a fully integrated steelworks, owning coal mines, iron and manganese ore mines, limestone quarries and dolomite deposits, as well as other raw material properties. The company is one of the five firms outside North America, Europe and the U.S.S.R. having a capacity of over one million tons of pig iron as well as over a million tons of crude steel.

Use of Fuel

Since the early years, efficiency in the use of fuel in the blast furnaces has greatly increased, and in this respect the following figures are of interest:

Consumption of Raw Material per ton of Pig Iron Produced

(Tons)

	1914-15	1924-25	1944-45	1953-54
Ore	1.597	1.645	1.657	1.669
Coke	1.125	1.208	0.952	0.813
Flux	0.493	0.618	0.456	0 360

It is difficult to compare labour productivity over the years, but figures supplied by the company comparing the year 1939-40 with 1953-54 reveal that, while the average annual income of employees at Jamshedpur rose by 187 per cent., the average labour cost per ton of finished steel increased by as much as 253 per cent., whilst the average output per employee of finished products at Jamshedpur decreased by 20 per cent. Output of finished products in the years in question was roughly the same. The present size and extent of the plant can be gauged from Table I which gives details of capacity and production.

As India's steel production was insufficient to meet her needs, Tata was already considering the possibility of expansion in the 1930s. Outbreak of the second World War, however, made any major expansion impossible, whilst war-time demand necessitated all plant being worked to full capacity, which inevitably resulted in heavy wear and tear of equipment. With the end of hostilities, lack of capital prevented immediate large-scale modernisation and expansion. By 1951, however, the company had drawn up a programme for the period 1951-52 to 1957-58 involving a total expenditure of nearly £32 million, of which approximately £9 million goes to increase steel capacity from the present 780,000 tons to 931,000 tons. The following are the main points of the plan:

(*a*) The first project to be completed was the replacing of the old 1923 Wilputte battery of coke ovens by a fourth battery of Simon Carves ovens.

(*b*) Rebuilding of the 850 tons-per-day "D" blast furnace has also been completed, increasing its capacity to 1,000 tons per day.

(*c*) To increase finished steel capacity to 931,000 tons per annum, ingot capacity is to be stepped up to 1,344,000 tons. This is to be achieved by remodelling No. 3 melting shop, which, when completed, will consist of five basic open-hearth furnaces each of 165 tons capacity, two Bessemer converters and two hot metal mixers, giving an annual production of 564,000 ingot tons. The five smaller furnaces in No. 1 melting shop are to be dismantled, whilst the three 130-ton open hearths are to be retained for producing bottom-poured steel (for the wheel, tyre and axle plant) also high silicon steel, etc.

(*d*) In the rolling department, the blooming mill is to be modernised by putting in new roller tables, and installing new electrical equipment and controls. The annual capacity of the plate mill is to be increased from 70,000 to 100,000 tons by introducing a new roughing stand with tilting tables, and other improvements. The 28-in. billet mill is to be improved to enable it to roll slabs suitable for a new skelp mill which is to be installed. The skelp mill will supply a Fretz-Moon tube mill of the Indian Tube Company—a firm jointly owned by Tata and Stewarts and Lloyds (Tata and associates having 60 per cent. of the share capital). The equipment will produce welded tubes of ½-in. to 3-in. nominal bore and have an annual capacity of 80,030 tons, which is expected to meet the country's entire demand for these sizes and types of tube. The mill is scheduled to come into operation at the beginning of 1956.

Latest reports indicate that the Government has authorised further expansion of the order of 750,000 ingot tons, which will add some 500,000 tons to the firm's production of heavy structurals and heavy rails.

Indian Iron and Steel

The history of the Indian Iron and Steel Company, Ltd., the second largest producer in the country, is somewhat complex, resulting from a number of amalgamations. It starts with the Bengal Iron Company, which, towards the end of the last century, was the first concern to make a success of pig iron production in India. The company's works was at Kulti (142 miles west of Calcutta), and whilst its production of pig iron steadily increased, it also produced considerable tonnages of ferro-manganese for export. A new concern—the Indian Iron and Steel Company—entered the industry in 1922 with a plant (Hirapur Works) at Burnpur (120 miles from Calcutta); blast furnace capacity was 350,000 tons per annum, and the

* Saleable products. † Products despatched.

plant confined itself to the production of pig iron, the bulk of which was exported. In 1936, after a long period of negotiations, the Bengal Iron Company and the Indian Iron and Steel Company were amalgamated under the name of the latter.

In 1939, another company, the Steel Corporation of Bengal, was established and built a steelworks at Burnpur (Napuria Works), adjacent to the works of the Indian Iron and Steel Company, with which it had close connections and from which it obtained the necessary pig iron. As already stated elsewhere, these two companies—the Indian Iron and Steel Company and the Steel Corporation of Bengal—were amalgamated on 1st January, 1953, again under the title of the Indian Iron and Steel Company. The company therefore has three works, two of which adjoin at Burnpur and together are now known as the Burnpur Works; the other plant is at Kulti. Details of capacities and production of the company are given in Table II.

The company also owns ore mines in Gua and Manoharpur, and three collieries in the Jharia and Raniganj coalfield which feed both the blast furnace plants. At present, Burnpur blast furnaces supply the main pig iron requirements of the steelworks, whilst the foundry pig produced at the Kulti works supplies material for the 70,000/80,000 tons of iron castings produced annually at this works, the bulk of the balance being sold locally.

It is proposed to increase the firm's annual iron-making capacity from the present 750,000 tons to 1,400,000/1,600,000 tons, thus making the company the largest iron producer in the country. Annual finished steel capacity will be stepped up to 650,000/750,000 tons from the present 350,000 tons. The expansion naturally involves many changes to existing facilities, the major ones being as follows:

(a) The increased pig iron output will require some 8,000 tons of ore daily and, to meet this need, large-scale mechanisation of extraction, handling, etc., will be carried out at the Gua and Manoharpur mines.

(b) Daily coal throughput of the coke ovens is to be increased to 6,000 tons by adding two 72-oven batteries of Simon Carves ovens at Burnpur.

(c) The blast furnace section at Burnpur is to be expanded by addition of two 1,200 ton-per-day furnaces, together with the necessary ancillary equipment. The furnaces at Kulti are to be rebuilt and modernised.

(d) A second melting shop is to be built consisting of two 200-ton basic open hearths, and the Duplex process will be adopted, whilst the existing shop will concentrate on normal open-hearth practice. The combined annual capacity will then be approximately 870,000 tons.

(e) The existing rolling mills are capable of processing the increased steel production, though it will be necessary to provide additional re-heating and finishing facilities. Present generating capacity will also be expanded.

Mysore Iron and Steel

The Mysore Iron and Steel Company is situated at Bhadravati in the south of India, on the banks of the River Bhadra. Before World War I, the Mysore Government, anxious to utilise the mineral and timber resources of the State, decided to establish an iron industry; construction of the works began in 1918, and production commenced in 1923. The ore, with a 60 per cent. iron content, is obtained from Kemmangundi Hill, some twenty-four miles away, while charcoal is used as a fuel. In 1936, a small steel plant was added to ensure the more economic operation of the concern, whilst since the war the plant has expanded and electric pig-iron furnaces have been added. Details of the plant are given in Table III.

TABLE: III

Mysore Iron and Steel Company

Ironmaking Facilities

1 × 80-ton per day charcoal furnace built in 1923
The furnace was originally built with a daily capacity of 60 tons but was enlarged in 1928. Hearth diameter 8 ft.

2 × 100-ton per day electric furnaces (Tyland Hole) built in 1951-52

Steel Melting Shops

2 × 25-ton open hearth furnaces (Basic)
1 electric arc furnace

Rolling Mills

20-in. roughing mill consisting of 3 × 2-high stands
12-in. light section mill consisting of 5 × 2-high stands

Statistics

Annual Capacities:	
Charcoal pig iron	28,000 tons
Electric pig iron	75,000 tons
Crude steel	34,500 tons
Rolling mills (both mills)	130,000 tons

Production	1951	1952
Charcoal pig iron	24,516	26,109
Crude steel	26,403	24,337
Rolled products	27,000	

At present, the addition of the two new electric pig-iron furnaces means that the company is producing more pig than it can use, and difficulties in disposing of the surplus result in considerable stockpiles. It is hoped that this position will be rectified, however, with the installation of a Bessemer-electric duplex plant and a light structural mill. A new centrifugal cast iron pipe plant costing £340,000 is also to be installed, which will enable an annual production of 17,000 tons of 3-12-inch pipes and 5,500 tons of larger pipes up to 30 inches diameter as against current output of only 9,000 tons. Two 20-25-ton are furnaces will be put in for electric steel production, whilst in the more distant future a third electric pig-iron furnace is envisaged.

For the second Five-year Plan, the Indian Government is at present considering Mysore's £4.9 million scheme for the production of stainless steels, wire and wire products. The plan would necessitate a further Government loan, but if authorised, which is very possible, it would be the first plant of its kind in the country.

Tinplate Production

The only tinplate producer in the country—the Tinplate Company of India Ltd.—is owned jointly by Tata and the Burma Oil Company. Founded in 1920, it has its works at Golmuri some three miles east of Jamshedpur. The plant comprises six mills, each having a roughing and finishing stand arranged on either side of a 1,000-h.p. motor, and fifteen Abercarn-type (double sweep) tinning machines, whilst the works has its own sulphuric acid plant. Tinplate production rose from about 20,000 tons in 1924 to 46,633 tons in 1938, and by 1954 it exceeded 65,000 tons.

At present, finishing facilities are larger than rolling capacity, so that some 12,000 tons of sheets, together with all tin bar requirements, have to be obtained annually from Jamshedpur. In order to balance the equipment, a further rolling mill is in process of installation, but will not come into operation until the last quarter of 1955; this will increase annual sheet output by 10,000 tons.

An official Government Commission has estimated the present Indian annual demand for tinplate at 75,000 tons, made up as follows:

	Tons
Oil Companies	34,000
Metal Box Co.	14,000
Tea Industry	1,000
Vegetable fat (ghee) manufacturers	12,500
Miscellaneous	13,500
Total ...	75,000

The Re-rollers

The re-rolling industry was founded in the 1920s, when several enterprising scrap merchants decided that re-rolling would be more profitable than merely selling scrap abroad. The development of the industry in its early stages owes much to the encouragement it received from the Government acting upon the advice of the Indian Tariff Board's report of 1934. Unfortunately, the growth of the industry was unplanned and the number of plants increased out of all proportion to the scrap availabilities. In 1942 the Government decided that it would be expedient to control further entrants into the industry, and required all re-rollers established before September 1941, to join the existing Steel Re-Rolling Mills Association of India. Membership of the Association suddenly leaped from forty to about one hundred and has since increased to 143, mainly as a result of the merger of the princely States.

The capacity of these re-rollers is believed to be as high as 700,000 tons per annum, but production (excluding four works classed as A1 re-rollers) is only around 100,000 tons per annum. Of the 143 re-rollers, as many as 120 rely almost exclusively upon scrap materials, the chronic shortage of which has always presented a serious problem. At present, no works is able to obtain more than 50 per cent. of the raw materials required for one-shift working. Re-rollers based on billets or semis were also, until very recently, faced with similar problems of supply of raw materials, but their position has greatly eased and will further improve now the steelmaking expansion plan is under way. Only a very few of the re-rollers have electric furnaces of their own.

An Important Part

The Tariff Commission reported in 1952 that "the re-rolling industry occupies an important place in the economy of the country" and that it should be encouraged, and efforts made to supply the mills with sufficient raw materials for a two-shift basis. The Commission also reported, however, that it did not consider efficiency was possible with such a large number of units.

Nevertheless, despite the tendency in India to emphasise the need of integrated steelworks, there are now indications that the Government are beginning to realise that re-rollers can make a very real contribution to the national economy without requiring large additions to their capital or large purchases of foreign equipment.

Foundries in India are small and number some two thousand, drawing their supplies from various sources, but mainly from the Kulti furnaces of the Indian Iron and Steel Company. At present the foundries are suffering from a shortage of iron supplies, but it is hoped that the proposed expansion of the Indian Iron and Steel Company will greatly improve the position.

Whilst the final plans for construction of the first State-owned plant—the Rourkela Plant of the Hindustan Steel Company—are by no means settled, it was decided at the very beginning that the works should specialise in flat products and thereby give an impetus to a number of engineering industries, such as wagon construction and shipbuilding. As already mentioned, the plant will be situated at Rourkela in Orissa on the banks of the River Brahmani, so there will be no water problem. As yet, nothing is known of the details of the ultimate extension of the plant to 1 million ingot tons, but, in the initial stage, the works was to have only a small standby power station of 7,800 kW for emergency purposes, and would normally rely on power supplied from Hirakud.

A team of geologists from the Bureau of Mines is at present preparing a report on the ore deposits of Taldih, from which it is hoped the new plant will be supplied. Coal is to come from the Kargali and Jharia fields, probably in the proportion of 75 per cent. and 25 per cent. respectively, the Fuel Research Institute having already ascertained that such a mixture would be suitable for metallurgical coking purposes. The coal will, however, have to be washed before coking, and the Government is examining the question of establishing a washery at Kargali.

Bhilai Plant

Full details of this plant will not become available until September/October of this year, when, under the agreement, the Soviet Union are to present the final project report for acceptance or rejection—for the Indian Government retain the right to reject the scheme. Nevertheless—as mentioned above—it is known that the plant is planned to have a capacity of a million ingot tons, producing some 750,000 tons of rolled products, and that it is hoped eventually to expand it to a million tons of finished steel. The plant is to be in operation by the end of 1959, although certain departments, including three batteries of coke ovens, two blast furnaces and two open hearths, are to be ready by December 1958. According to the current agreement, the annual capacities of rolled products will eventually be:

100,000 tons rails
175,000 tons heavy structurals
90,000 tons sleeper bars and crossing sleepers
235,000 tons merchant bars
150,000 tons billets

and between 100,000 and 300,000 tons of foundry pig.

Durgapur Plant

The British proposals, which the Indian Government have accepted in principle, are for the construction of an integrated steelworks with an annual capacity of 920,000 ingot tons, representing some 700,000 tons of rolled products. The plant is expected to produce medium and light structurals, medium and light rails, sections, flats and wire rod. Whilst no final decision has yet been made by the Indian Government on the actual site, current reports indicate that it is almost certain to be Durgapur, near Calcutta. Apart from the advantage of a location conveniently near to one of its principal markets, a plant at Durgapur would have easy rail access to the ore and coal deposits of Bihar and Orissa, whilst the nearby River Hooghly would ensure adequate water supply and also cheap transport by sea-going vessels to Southern India.

A fourth State steel plant has recently been mentioned by Mr. K. C. Reddy, Minister of Production. He suggested that a pilot plant should first be installed in Southern India based upon the use of lignite, large deposits of which have recently been discovered at Neivell in Madras State; and that, if successful, a large plant should be built. No mention, however, has been made of any foreign technical or financial aid for such a project, although both French and Czechoslovak interests have recently indicated that they would be interested in building a steel plant in India.

Costs and Prices

It has been shown that India is well situated for the production of iron and steel. From reports available, it would appear that the Jamshedpur works is the most efficient in the country. The Company owns its own raw material sources, which are relatively near the works. The ore used is high grade (well over 50 per cent. Fe), and coke consumption per ton of iron produced is in the region of 16-17 cwts.* With these advantages, pig iron production costs are probably the lowest in the world. The steelworks thus begin with a good cost advantage over competitors, whether at home or abroad.

The average annual income of an Indian steelworker—around £150-£180—is very low in comparison with that of European steelworkers, but living costs are also much lower. Whilst it might be true to say that real wages are relatively below those in Europe, it is also probably equally true that the total wage costs represent about the same percentage of total costs as in Europe, owing to the much higher labour force employed.

Under the steel pricing system, each of the main Indian producers (Tata, I.I. & S.C. and Mysore†) receives *retention prices* for the products. The Government fixes these prices periodically, being guided by reports of the Tariff Commission; the prices fixed are ex-works and are based upon costs—which for this purpose include gross return on fixed capital, depreciation, etc. *Selling prices*, on the other hand, are the prices at which home or foreign steel can be purchased in India. The Government are also responsible for fixing these prices, which are computed on the basis of the retention prices plus a surcharge which is adjusted from time to time. The surcharge is paid into an Equalisation Fund used by the Government to offset the higher cost of imported steel. In other words, the Equalisation Fund is, as its name suggests, a fund to level up home and imported prices and thereby create standard steel prices for the whole country. Most of these selling prices are quoted f.o.r. Calcutta, Bombay or Madras, and consumers have to pay the freight charge from these ports even though Indian steel is delivered from Indian works. The accompanying table shows the differences between the selling prices and the retention prices allotted to Tata.

Schedule of Prices for Indian Steel Products (Tested)

(Per ton)

	July 1st, 1949		July 1st, 1952		July 1st, 1954	
	Tata's retention prices Ex-works	Selling prices f.o.r. port	Tata's retention prices Ex-works	Selling prices f.o.r. port	Tata's retention prices Ex-works	Selling prices f.o.r. port
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Basic pig iron	6 6 0	7 8 6	8 8 0	9 10 6	8 8 0	11 0 6
Steel products:						
Billets	14 5 0	18 7 6	17 2 0	19 10 0	17 12 6	22 19 0
Structurals	18 0 0	26 12 6	23 2 0	28 2 6	24 1 6	33 0 0
Heavy rails	17 5 0	24 1 6	21 7 6	25 11 6	22 7 0	30 16 6
Bars	18 13 6	27 4 6	22 5 6	28 14 6	23 3 6	33 7 6
Plates	20 9 6	29 0 6	24 7 6	30 10 6	25 13 0	38 0 6
Hot-rolled sheets	22 13 0	31 5 6	27 0 0	32 15 6	28 5 6	39 3 0
Galvanized corrugated sheets	31 11 6	35 11 6	49 1 0	44 12 6	42 9 0	49 17 6

Whilst the Equalisation Fund was intended to level up imported and home prices, in practice imports have been small in comparison with domestic production. Hence only a small part of the fund has been used for subsidising imports, so that there is a large accumulated surplus in the fund. Despite much criticism, it has been announced that the Government intend to use this surplus as a loan to the steel industry.

Conclusions

The foregoing analysis shows that India's main problem in the post-war period has been financial, resulting to some extent from political changes. Not only have the capital needs of the steel industry been overshadowed by the Government's large demand on the very limited internal capital market, but the industry has been further harassed by the threat of nationalisation and, as pointed out recently by the chairman of Tata's, also by the Government policy restricting steel retention prices to a level calculated to yield a net return of only 3½ per cent. on new capital expenditure.

The result of this policy can be seen from production statistics. Steel production in 1952—the peak post-war year—was only 12 per cent. above the 1941 figure, whilst pig iron output is still below that recorded in 1941. This compares very unfavourably with other under-developed steelmaking countries such as Brazil, Mexico and China. Nevertheless, the vast projects put forward in the past year have shown that the Government is now alive to India's urgent need for steel. If all goes according to plan—and there is no reason to believe otherwise—then by 1960-65 India will have made very definite progress in the industrial field, with the possibility of a further advance in the more distant future. It will, however, be another three or four years before any large-scale increase in India's steel production can materialise.

APPENDIX

Raw Materials

Iron Ore

India's present-day problems in developing her steel industry do not spring from any lack of raw materials, for she has some of the richest iron ore deposits in the world, many of which have not, as yet been surveyed. As long ago as 1920, it was estimated‡ that, within a rectangle 400 miles (east to west) by 200 miles, having Calcutta at its north-east corner, there would be some 20,000 million tons of high grade ore available. Even today, after repeated surveying, no complete statement can be given of ore reserves, although the table A, recording ore of over 60 per cent. Fe, does give some idea of the vastness of even the high-grade deposits.

The largest known deposits are in the Bihar and Orissa districts, although reserves in other parts may yet prove to be of equal magnitude. As coal is also found in Bihar and Orissa, it is not surprising that the major steel industry is situated in this region. This in turn accounts for the fact that more geological surveying has been carried out in this vicinity than in any other part of India.

The relative importance of the various deposits according to output can be seen from the following production statistics:

Iron-ore Output

(Thousand tons)

	1951	1952	1953
Singhbhum (Bihar)	1,765	1,958	1,918
Mayurbhanj (Orissa)	1,060	1,084	1,666
Keonjhar (Orissa)	778	618	
Bellary	31	142	77
Other	38	124	184
Total ..	3,657	3,926	3,845

1952 production was the highest ever recorded, and exports reached 811,600 tons, rising to more than a million tons in the following year. Iron-ore exports are being encouraged by the Government, and trade agreements including this material have recently been concluded with Austria, Norway, Poland and Rumania. It remains to be seen, however, whether these markets will be of a permanent nature, since transport costs are very high.

Coal

Whilst probable reserves of coal have been put at upwards of 35,000 million tons, the proved reserves are estimated at 4,520 million tons, of which just over 1,000 million tons are of good coking quality. In 1952, the Indian Production Minister reported that, at the present rate of output, known reserves of metallurgical coal would last for only 80 years, if no measures were taken to conserve them and if no new reserves were discovered. Nevertheless, developments in both washing and blending of Indian coals for coking purposes may well result in extending this period to over 150 years. The good coking coals are found in the Jharia, Raniganj, Bokaro and Giridih fields, all of which are in Bihar and Bengal. It is in the vicinity of the Raniganj deposits that the Burnpur and Kulti furnaces of the Indian Iron and Steel Co. have been built, the Tata plant at Jamshedpur being situated between the Mayurbhanj (50 miles) and the Jharia coking coal field (100 miles).

Coke	3,337.7	3,396.1	3,535.4

Other Minerals

Whilst U.S.S.R. is the world's largest producer of *manganese* ore, India is the principal exporter. Indian production is almost entirely determined by foreign demand, since the country's own requirements usually amount to no more than 100,000 tons annually, whilst the current export rate is over a million and a quarter tons per annum. The Central Provinces account for more than 75 per cent. of total output, whilst other producing areas are Bombay, Bihar, Orissa and Madras. Mining operations are easy and cheap due to open-cast working, but rail hauls to Bombay and Calcutta are long and expensive. Although most of the Bihar deposits are of no economic value, it is interesting to note that deposits are found in the Singhbhum iron-ore district and also at Chaibasa, which is very near Jamshedpur. The district of Singhbhum is also of particular interest, for it is here that some of the most important *chrome* ore deposits in India are to be found, whilst there are also occurrences of *wolfram* in the area, although, at present, they are not considered to be of any economic significance. *Chromite* is also found in Keonjhar in Orissa and in Mysore.

NEW U.K. ATOMIC REACTOR WILL SPEED TESTING OF FUELS

Work has started in Britain on the construction of a new type of nuclear reactor that will reduce from one year to 10 days the time needed to test fuels and materials for the U.K.'s atomic power programme. This was revealed by Sir John Cockcroft, Director of the U.K. Atomic Energy Research Establishment at Harwell, in a London lecture to the Institution of Civil Engineers.

Speaking of the experimental high-power "fast breeder" reactor which is being built in the North of Scotland, Sir John said that, while it was a "nuclear physicist's dream," it was also, to some extent, an "engineer's nightmare," since the required rate of extraction of heat from a very small core of material was perhaps a hundred times as great as in the most highly rated boiler.

It was possible that the new water-moderated reactors would give the heat equivalent of 100,000 tons of coal from one ton of uranium, and he looked forward to the time when the same amount of uranium would give the heat equivalent of 1,000,000 tons of coal.

Sir John gave detailed statistics of the cost of generating electricity at the first atomic power station to be built for the Central Electricity Authority, and estimated that it would be as low as 0.6d. per unit, even if the uranium remaining in the "ash" was not reused. It was believed possible, however, to use the fuel several times in a nuclear power station. A *Financial Times* editorial says that "at this stage the cost of electricity produced by nuclear power would be far below that of electricity produced by coal-burning generating stations."

*Comparative figure for the Indian Iron and Steel Company would be over 20 cwts.

†Retention prices for Mysore are the highest, and those for Tata the lowest, among the three producers.

‡C. P. Perin, *Recent Developments in the Iron and Steel Industry of India*. Trans-American Iron and Steel Institute, 1920, p. 12.

NEW INDIA'S LIFE BUSINESS IN 1954 AGGREGATES RS. 43.42 CRORES

IMPRESSIVE RISE IN GENERAL PREMIUM INCOME

LAST year, the New India Assurance Company, Ltd. (General Manager: Mr. B. K. Shah, Bombay), hit the headlines in the financial Press by its sudden decision to reduce life premium rates which led to not a little controversy. Since then, most life offices have, grudgingly maybe, followed the lead of the New India. As far as the originator of the premium controversy is concerned, there is no doubt that the policy has been fully justified by the trend of its new business. It has established for 1954 a record level of new life business which is undoubtedly one of the most impressive of its kind in the history of Indian insurance. The New India is in a position to offer facilities for all types of life and general insurance and figures quoted later in the review will provide ample proof of the statement that the facilities provided by the Company are gaining ever-increasing recognition. This has further strengthened the Company's financial position and also enabled the management to recommend a higher dividend of Rs. 2-8 per share on the Rs. 15 paid-up shares, as against Rs. 2 paid last year.

In 1954, the New India's new life business reached a record total of Rs. 43.42 crores, having risen from Rs. 19.90 crores in 1953. The increase in new life business is thus of the order of Rs. 23.52 crores. A part of this high level of new life business must, however, have been of the replacement variety induced by the reduction in premium rates. In this connection, it is significant that, while new business in 1954 aggregated as much as Rs. 43.42 crores, total business in force increased from Rs. 95.17 crores at the end of 1953 to Rs. 125.29 crores at the end of 1954—or by only Rs. 30.12 crores. Having established record levels of new life business, the management should now aim at consolidation, in order that impressive gains are not lost through lapses or other causes. We have no doubt that this aspect of the problem is being kept under constant scrutiny by the management.

Life Department

Net premium income in the life department improved from Rs. 4.74 crores in 1953 to Rs. 5.62 crores in 1954. Last year, claims aggregated Rs. 84.82 lakhs and commission and expenses Rs. 1.78 crores as against Rs. 79.55 lakhs and Rs. 1.32 crores in 1953. The growing operations of the Company are reflected in the slight increase in expense ratio which has risen from 28.1 per cent. to 31.9 per cent. It is, however, noteworthy that the renewal expense ratio, calculated after allowing for lower expenses on special plans and staff insurance scheme business, has gone down from 14.2 per cent. to 12.2 per cent. The life assurance fund at the end of 1954 rose, again, by more than Rs. 3 crores, to Rs. 23.92 crores.

There has been an all-round increase in the premium income of the fire, miscellaneous and marine departments. The total premium income from the three departments rose by Rs. 46.9 lakhs to Rs. 4.37 crores in 1954. This increase has been shared by all the three departments. Thus, in 1954, the premium income of the fire department improved by Rs. 16.99 lakhs to Rs. 2.50 crores, that of the miscellaneous department by Rs. 13.18 lakhs to Rs. 85.52 lakhs and that of the marine department by Rs. 16.73 lakhs to Rs. 1.01 crore. Again, the increase in the premium income is shared by the Company's Indian as well as foreign business, the former having gone up from Rs. 86.57 lakhs in 1953 to Rs. 91.23 lakhs in 1954 and the latter from Rs. 3.03 crores in 1953 to Rs. 3.45 crores in 1954.

The claims experience in each of the three departments is more favourable than in the year 1953. Thus, in the fire department, it was 36.1 per cent. in 1954 as against 43.1 per cent. in 1953, in the miscellaneous department 49.8 per cent. as against 51.2 per cent. and in the marine department 74.1 per cent. as against 88.4 per

It will be seen from the table below that, in all the three departments, additional reserves —that is, reserves over and above the customary levels of around 40 per cent. in the fire and miscellaneous departments and 100 per cent. in the marine department—have been maintained at substantially high levels. The underwriting profit in the fire department has risen from Rs. 26.93 lakhs in 1953 to Rs. 35.36 lakhs in 1954, while that in the miscellaneous department has declined from Rs. 12.68 lakhs to Rs. 9.36 lakhs. The marine department shows a deficit of Rs. 14.12 lakhs. But it must be remembered that the Directors have not only maintained the reserves for unexpired risks at 100 per cent. of premium income, but also created an additional reserve of Rs. 41 lakhs.

After taking credit for Rs. 30.61 lakhs from the general department accounts, Rs. 3.88 lakhs from the shareholders' life profit account and bringing forward Rs. 92,926 from the previous year's accounts and making certain other sundry adjustments, there remains a sum of Rs. 44.51 lakhs. Out of this, the Directors have transferred Rs. 13 lakhs to reserve for taxation, Rs. 10 lakhs to general reserve and Rs. 3 lakhs to dividend equalisation fund. The payment of the recommended dividend of Rs. 2-8 per share will absorb Rs. 17.80 lakhs, leaving a balance of Rs. 71,250 to be carried forward to the current year's accounts.

As a result of the year's operations, the total funds of the Company have increased by Rs. 3.94 crores. The financial position of the Company continues to remain strong. Apart from the capital of Rs. 1.07 crores, the Company's reserves and funds aggregate Rs. 29.32 crores, inclusive of fire fund of Rs. 1.68 crores, miscellaneous fund of Rs. 62 lakhs, marine fund of Rs. 1.42 crores and life fund of Rs. 23.92 crores.

The following table will demonstrate the remarkable progress achieved by the Company, in its general departments, during the last three years:

(Rs. in lakhs)

	1954	1953	1952
Fire Department.			
Net premiums	250.81	233.82	229.23
Net claims	90.36	100.50	88.30

(*Concluded from next column*)

present national difficulties serve to remind us that the country's economy must inevitably have its ups and downs and dividends on ordinary shares must also be expected to fluctuate. To suggest, therefore, that any of the appreciation existing at a point of time might be distributed would clearly be imprudent. Such a course would be tantamount to taking credit for future income which may not in fact be received. The only sound procedure is to take credit for such dividends as are in fact received year by year. In this way the distributions made to policyholders and shareholders will benefit from our profitable investment in ordinary shares."

These words bring out, briefly and yet succinctly and clearly the essential elements of a sound investment policy for insurers.

ROLE OF INSURANCE IN NATIONAL LIFE

A BRITISH CHAIRMAN'S VIEWS

AMONG the many organisations which owe their continued prosperity to the British genius for hard work and perseverance, mention deserves to be made of the leading insurance office, the Prudential Assurance Company Ltd. The immense progress which the office has made is reflected in the fact that the sums assured and bonuses in force, at the end of 1954, in the Company's ordinary and industrial life branches, exceed £2,000 million, while its life premium income amount to over £90 millions. In 1954, the general branch premium income exceeded £12 million. The Chairman of the Company, Sir Frank Morgan, made, in the course of his address at the annual meeting of the Company, a few interesting observations, worthy of notice, on the role of assurances and on the objectives of a sound investment policy.

After referring to the progress of the life business of the Prudential, Sir Frank Morgan said:

"These figures are a measure of the extent to which our policyholders, here and overseas, have made voluntary provision for the future—provision which is not only to the advantage of their families and themselves but to the undoubted benefit of the communities in which they live. At the same time, our business strengthens the national economy by the diversion of many millions of pounds from current consumption to savings, the importance of which has perhaps never been greater than it is today.... When it is borne in mind that all these savings through life assurances are an aggregate of a vast number of individual payments, that in many cases their saving would not have been effected in any other way and that it regularly provides very large sums for investment, to the benefit of the policyholders and the nation, we can fairly claim that our business performs unique functions and is an indispensable factor in our national life."

After referring to the fact that, with a view to strengthening the Company's valuation bases, the management had written up ordinary shares by £8 million and freehold properties and ground rents by £3 million, Sir Frank pointed out that the real growth in the Company's funds during 1954 was £51 million and the main items in which this increase had been invested were: £7 million in British Government securities, £14½ million in debenture-stocks, £5½ million in preference shares and £18½ million in ordinary shares. He said that, as compared with the previous year, they had invested substantially greater amounts in the three latter groups and considerably less in British Government securities. He added: "This changed pattern of our investment is a reflection of the increasing demands made by industry on the capital market during 1954, particularly in the latter half of the year, and the indications are that this trend will continue during the current year."

The gross rates of interest earned by the Company's Life funds during 1954 were £5 1s. 8d. per cent. in the ordinary branch and £5 1s. 5d. per cent. in the industrial branch, showing, as compared with 1953, increase of 4s. 10d. per cent. and 3s. 6d. per cent., respectively. Had it not been for the writing up of assets the increases in these yields over the year would have been greater, namely, 5s. 10d. per cent. in the ordinary branch and 5s. 8d. per cent. in the industrial branch.

By writing up its assets by £11 million, the Company has in no sense distributed this amount. What has really been done is to increase the value placed upon the assets in the balance-sheet in order to match a corresponding increase in the figures at which the life assurance funds are stated on the liabilities side of the balance-sheet. It might be asked why some part of this appreciation could not be treated as a surplus and distributed. Discussing this question, in relation to the wider issues of a sound investment policy for insurers, Sir Frank said:

"The primary aim of our investment policy must be to secure interest income and not to seek capital profits as such. Premiums are calculated on the basis that they can be invested to earn an assumed rate of interest throughout the duration of the policies and the contracts cannot be met unless this is achieved. In the case of fixed interest securities carrying contractual interest payments, and in many instances contractual capital payments, it should be clear that so long as we receive these sums the investments are fulfilling the purpose for which they were bought and that we are very little concerned with intervening fluctuations in market values.

"With ordinary shares the dividends receivable are subject to the economic and industrial risks inherent in the businesses concerned. During 1954, with the rise in national prosperity, dividends on ordinary shares generally have been increasing, and the extra income accruing in this way will have a beneficial effect on the Company. The

DEVELOPMENT OF AGRICULTURE

PHYSICAL AND FINANCIAL TARGETS

THE three-day conference of State Secretaries for Agriculture and officials of the Union Food and Agriculture Ministry, held at New Delhi at the end of last month, had by no means an easy task before it. Apart from fixing physical and financial targets for each State, it had to scrutinise as many as 34 proposals for the development of agriculture during the second Plan period. These proposals included schemes for forestry, dairying, animal husbandry, minor irrigation, tube-wells, soil conservation, rural credit, co-operation, agricultural extension and reclamation of new land, tenancy reform, settlement of landless labourers, etc. While these schemes needed enormous sums for their effective implementation, the resources available, as envisaged in the plan-frame, were no more than Rs. 650 crores. In determining the break-up targets for individual States, the Conference had to bear in mind the extent of resources at the disposal of each State, the administrative machinery and the trained personnel available with each of them and the relative progress of each State economically. Judged from its various decisions, it may be said that the Conference has tried to tackle the issues in a realistic manner.

The financial targets for the second Five-year Plan for the whole country has been fixed at Rs. 650 crores. Of these, the Centre is expected to assume responsibility for schemes costing Rs. 43 crores. Both the Centre and the State Governments are jointly to participate in projects involving an expenditure of Rs. 515 crores. The balance of Rs. 92 crores is to be spent by the State Governments themselves on schemes to be carried out by them on their own initiative and with their own resources. The break-up figures for each State are yet to be decided.

Targets Raised

In fixing the physical targets under the first Five-year Plan, the planners had to take into consideration the need for achieving self-sufficiency in a number of agricultural commodities such as foodgrains, cotton, oils, sugar, etc., in order to eliminate dependence on foreign countries for their supply. Thanks to the increase in the output of most of these commodities during the past two years, the targets were reached far ahead of time. Consequently, under the second Plan, the targets are related not to cover deficits as in the first but to enhance physical output with a view to raising the standard of living of the people. The fixation of higher output is necessitated by such factors as (a) the growing population, (b) rising incomes resulting in more consumption of food, (c) low nutrition standards among the bulk of the people, (d) limited cultivable area, (e) uncertain monsoons and (f) additional demand for raw materials from growing industries as well as from exporters. The additional targets for the various agricultural commodities approved by the Conference are given in the table below:—

	Targets under first Plan	*Targets to be reached by 1960-61*
Cereals (in million tons) ...	55.0	63.5
Pulses (in million tons) ...	10.0	11.5
Sugarcane (in million tons) ...	6.1	7.7
Jute (in million bales)	4.0	5.0
Cotton (in million bales) ...	4.2	5.5
Oil seeds (in million tons) ...	5.5	7.0
Pepper (in 000 tons)	22.0	36.0
Cashewnuts (in 000 tons) ...	60.0	80.0
Lac (in million maunds) ...	1.2	1.7

On the basis of the targets in the table above, the Central Ministry had drawn up a tentative State-wise break-up for each State according to its performance, in the first Plan period, but the State representatives preferred to examine the figures and to inform the Centre later about their final decision. The overall additional targets are within reasonable limits and could be reached, provided the States follow realistic agricultural policies. Provision of adequate finance, for instance, is a fundamental prerequisite for establishing research stations, seed-breeding farms and soil conservation programmes. The Secretaries' Conference was, however, of the opinion that finances for some of the proposals were not as much as was needed.

It is gratifying to note that the Conference was fully alive to the pressing need for having trained personnel for agricultural Extension Service. It is stated that aproximately 38,000 village level workers will be needed to meet the requirements of National Extension Blocks by 1960-61. The 48 Extension Training Centres started under the first Plan have a capacity to train only 25,000 of such workers. The gap is proposed to be filled up by starting additional centres as well as by expanding existing ones. The States have agreed to take up a part of the programme a year ahead, in order to make available, in time, the quantum of personnel needed for Extension Service.

Milk Production

Since milk is imperative in building up human health, the stress laid at the Conference on starting co-operative milk unions, milk creameries, milk drying plants and cattle colonies was quite appropriate. So also the various schemes of the States and the Centre for development of fisheries approved by the Conference.

The provision of Rs. 50 crores in the plan-frame for the rehabilitation of landless agricultural labourers was also discussed by the Conference. It was felt that the information regarding the total number of families to be resettled and the total area available for the purpose was essential before the scheme could be finalised. Further consideration of the question was, therefore, deferred. It could be tackled effectively after the results of the land census now undertaken by the various State Governments are published.

Quite essential is the recommendation of the Secretaries that compulsory quality control should be instituted on agricultural commodities exported from the country. For only then it is possible to maintain a high reputation for supplying quality goods. The commodities to which quality control, has to be applied are hemp, tobacco, wool, bristles and goat hair, raw goat skins, lac plantation and forest produce, leather, vegetable oils and oilseeds, hand-picked groundnuts, fruits, vegetable products and *jeera*.

It must, however, be stated that no permanent results can be achieved unless State Governments effect consolidation of holdings quickly. For the advantages of large-scale farming which would result therefrom will certainly help achieve the proposed physical targets. Closely connected with this question is the issue relating to tenancy reforms. This latter question also must be tackled without delay in order to derive beneficial results on the agricultural front.

THE SECOND FIVE-YEAR PLAN—II

DETAILS OF TENTATIVE TARGETS

IN our last issue—*vide* page 1109—we outlined the main objectives of the second Five-year Plan, as enunciated by the Economic Divisions of the Finance Ministry and the Planning Commission in their working paper entitled *The Second Five-Year Plan—A Tentative Framework.* With a view to achieving these main objectives, the authors of this paper have fixed tentative targets to be reached during the second Plan period. We reproduce below the relevant extracts from the said paper:

The development of the economy envisaged for a given period ahead must satisfy three requirements. First, it must conform to the basic objectives of social policy. Secondly, the growth of different sectors of the economy must be balanced in the sense that the requirements of each sector in terms of men, machines and materials must be forthcoming in right quantities at the right time, and the products and services of each sector must be promptly and fully utilised so as to promote the growth of other sectors of the economy. Thirdly, the particular pattern of development envisaged must represent an optimum or an economically efficient choice from among the various alternatives available.

If the criteria just outlined are to be satisfied in formulating a plan, we have to take into account the socially desirable norms of consumption in certain specified fields such as health and education, the pattern of consumer demand; the scope for international exchange, the interdependence of different industries, alternative methods of production available in different sectors, and the feasibility of mobilising certain intangible factors such as inventiveness and enterprise. In addition, we must proceed from a proper assessment of such resources of manpower, capacity or minerals and land as are un-utilised or under-utilised to begin with. It is clear that the formulation of a plan in detail requires supplementing of existing statistical knowledge on a number of points, and such knowledge will grow if the preparation of the plan is taken in hand in terms of a frame tentatively thought out with the help of existing information and of broad judgments.

Order of Magnitudes

The tentative targets for the second Plan as outlined in this paper are fixed, as far as possible, with reference to available data and in the light of our experience in recent years. In some cases, policy pronouncements already made have been accepted as a starting point. Complete consistency cannot be claimed for them at this stage. The purpose of the tentative framework given here is not to present a set of targets or a statement of the material or monetary requirements which must be treated as given, but to present the broad order of magnitudes involved in reaching defined objectives and thereby to initiate the process which would culminate in the formulation of the Plan. Planning is a continuous process of reviewing and revising the tasks to be performed in the light of experience gained and after consultation at various levels. Initial assumptions can be modified in the light of further experience, as the Plan comes into operation. Meanwhile, a tentative outline of the tasks to be performed in the next Plan may throw some light on the decisions to be made by giving a rough measure of the effort involved in various directions for arriving at a desired set of results.

It is not possible at this stage to indicate the phasing of the Plan annually over the five-year period. Targets are set for the final year of the Plan (1960-61) and these are compared with our performance over the first Plan. It would be necessary in the next few months to work out the annual phasing of the Plan. If the Plan falls to gather momentum in the early stages, or is thrown out of gear as a result of bottlenecks, the tempo of development in later years is also likely to be retarded. Considering the falling price trends and the unemployment situation, a fresh momentum must be given to the development effort at the very start.

Outline in Real Terms

The outline of the second Plan given in this chapter is essentially in real terms, inasmuch as targets are expressed in quantities and magnitudes such as investment and national income are expressed at constant prices. In a money economy, the financial aspect of the Plan is inseparable from the physical aspect. Incomes are generated in the process of production and supplies are utilised through market operations. Balanced development requires that supply and demand are balanced in money and real terms. Thus, aggregate incomes must equal aggregate expenditure, savings must match investment, and the supply and demand for individual goods and services must equal in terms of money so as to avoid any inflationary rise in prices or an undesirable shift in relative prices. The gap in the requirements of technical and managerial personnel for the fulfilment of the targets outlined must be filled early and the Plan itself must provide for creating such resources of skilled personnel and administrative cadres as are needed for its fulfilment. Administrative and financial arrangements also must come for review in this connection.

The provisional targets for production of important commodities and services are given in the following table:

	1950-51	1953-54	1955-56 (Estimates)	1960-61
Agriculture—				
Foodgrains (m. tons)	50.0	65.7	66.0	76.0
Other food items (index)	—	—	100	125
Cotton (m. bales)	2.9	3.9	4.2	5.8
Sugarcane (m. tons raw gur)	5.6	4.6	5.0	7.5
Oilseeds (m. tons)	5.1	5.6	5.6	7.0
Tobacco (th. tons)	258	256	250	300
Tea (m. lbs.)	607	675	675	750
Irrigation (m. acres)	50	58	70	100
N.E.S. and Community projects (blocks)	—	479	1,200	5,600
Industries—				
Pig iron (for foundries m. tons)	—	—	0.35	1.8
Finished steel (m. tons)	1.1	1.1	1.3	5.0
Cement (m. tons)	2.7	4.0	4.8	10.0
Aluminium (th. tons)	3.7	3.8	4.0	40.0
Fertilisers (index)	—	—	100	400
Heavy chemicals (index)	—	—	100	800
Synthetic petrol (m. tons)	nil	nil	nil	0.30
Cotton textiles (m. yds.) mill.	3,718	4,908	5,000	5,500
Handloom and powerloom	742	1,200	1,600	3,200
Woollen manufactures (m. lbs.)	13	19.6	20	25
Sugar (m. tons)	1.1	1.1	1.4	2.1
Soap (th. tons)—				
Large-scale	106	76	85	120
Small-scale	—	—	28	40
Footwear (m. pairs)—				
Large-scale	5.2	5.7	6.0	7.0
Small-scale	—	—	80.0	100.0
Vegetable oil (m. tons)	1.2	1.4	1.5	3.0
Electrical goods (index)	—	—	100	166
Bicycles (thousands)	101	290	500	1,000
Sewing machines (thousands)	33	68	90	150
Metalware (small-scale; index)	—	—	100	133
Minerals—				
Coal (m. tons)	32	36	37	60
Iron ore (m. tons)	3	4	4	13
Mica (cwts.)	162	—	150	200
Manganese (m. tons)	1	2	2	3.5
Transport and Power—				
Shipping (tonnage th.)	391	525	610	—
Railway (mileage)	—	—	34,500	37,500
Roads (th. miles):				
National highways	11.9	12.2	12.5	17.5
State roads	17.6	—	20.0	35.0
Electricity (m. kw.h. capacity)	2.3	2.8	3.5	6.0
Social Services—				
Hospital beds (thousands)	107	112	125	250
Doctors (registered)—thousands	—	65	70	90
Urban houses (lakhs)	101	—	120	150
Education (% of total children 6—14 going to school).	32	—	40	60

Despite the general emphasis on industries in the second Plan, we cannot afford to relax in our efforts to increase agricultural productivity, in view of our increasing population, growing incomes, limited area, uncertain monsoons and low nutritional standards. It would also be necessary to provide for the raw materials needed in industries and for exports (or replacement of imports).

With a 20-per cent. increase in total consumption over the second Plan, the consumption of *foodgrains* may well increase by some 15 per cent. It would also be reasonable to expect a shift in favour of superior foodgrains such as pulses and wheat, as against millets, and, to some extent, from grains to other nutritional or protective foods. In terms of quantity, the consumption of foodgrains is likely to increase less rapidly than the consumption of other commodities. On this basis, an increase in the production of foodgrains from 66 to 76 million tons or so should ensure the maintenance of self-sufficiency on an average at slightly higher standards of consumption. In the case of other foods such as milk, ghee, meat, fish, eggs and vegetables, demand is likely to be more income-elastic, and a provision of a 25 per cent. increase in production is, therefore, made. In the case of milk, meat and eggs, however, detailed schemes will have to be worked out if production is to increase on the scale indicated. If this is not feasible, a more liberal provision must be made for the supply of additional foodgrains.

The increase in the output of *cotton* from 4.2 million bales to 5.8 million bales is related to the production of cotton textiles and it is assumed that the country would reduce its net imports of cotton substantially by 1960-61. The total yield of *sugarcane* would increase from some 5 million tons (raw *gur*) to 7.5 million tons. The demand for sugar is highly income-elastic; and we are currently importing large amounts of sugar. We have been self-sufficient in the supply of sugar in the past, and it is not unreasonable to expect that we would revert to that position in the second Plan. The production of *oilseeds* is expected to increase from 5.6 to 7 million tons largely in response to domestic demand. In the case of important export items such as *tea* and *tobacco*, exports must be maintained and increased as far as possible, in spite of greater consumption at home. The increase in the production of tobacco from 250 to 300 thousand tons and of tea from 675 to 750 million lbs. is postulated on this basis.

Apart from the important commercial crops like cotton and tobacco, attention must also be paid to others which have been hitherto of only marginal significance. Some of the marginal items like wool are bound to increase in demand at home and have good export prospects. Wool also has special significance from the point of view of providing employment in some of the poorer areas such as Rajasthan, Saurashtra and Jammu and Kashmir.

The lines on which efforts must be made to raise agricultural production are already clearly established. In order to achieve the targets outlined above, the total *irrigated area* in the country must be increased from 70 to 100 million acres. Special attention must be given to flood-control. The extension of *N.E.S. Blocks and Community Projects* to cover the entire country by the end of the second Plan is already contemplated; and the Rural Credit Survey has indicated the role of credit, marketing and warehousing facilities as the spearhead of rural uplift. Apart from this, the policy of ensuring an adequate return to agriculturists and the speedy implementation of a well-defined scheme of land reforms have already been emphasised.

Industrial and Mineral Development

The development of basic industries in the country has been emphasised as one of the major objectives of the second Plan. The targets set in this field are somewhat generous in the sense that provision is made for a number of possibilities which remain to be explored fully. Since our endeavour in this field is to develop in new lines, it is necessary to indicate, however tentatively, some concrete possibilities which are desirable in themselves. Detailed projects must be worked out before any of these possibilities are taken up for implementation.

The production of *steel* in the country can be raised to five million tons and steel capacity to six million tons by the end of the Plan by expanding the capacity of existing plants and by setting up three new steel plants in the public sector. It may be necessary, however, to prepare the market for this steel by developing other industries on the basis of imported steel in the early stages. If steel production is to expand further in subsequent plans, it would be desirable to set up a number of plants for producing the machine-tools required for fabricating the equipment in steel plants and in other producer goods industries.

Similarly, the production of *heavy electrical equipment* such as generators and turbines must be started in order to make the country self-sufficient in the growing requirements arising from rapid electrification of the country. We have already made a beginning with the production of *railway rolling stock* in the country, and the railways have a big plan for expansion and re-equipment. The production of locomotives, wagons and coaches in the country can be increased by working existing equipment to full capacity on a multi-shift basis. In view of these considerations, it is not unreasonable to plan for a sizable increase in the production of railway equipment in the country.

There is considerable unutilised capacity in the existing units producing agricultural implements, diesel engines, light engineering goods, and machinery for textile, sugar and other consumer goods. The scope for import substitution is also great in this field; and doubling of output, therefore, may be appropriate.

The *fertiliser* target assumes "three more Sindris." On an average, a threefold increase in the output of *heavy chemicals* is envisaged. Plans for the production of 300,000 tons of *synthetic petrol* have been on the anvil; and this target is included, in view of the need for economising on imports and for the development of associated chemical industries. The increase in the production of *aluminium* is envisaged in order to make up for the shortage of copper in the country and to meet the requirements of electrification. The output of 40,000 tons proposed represents a doubling of the target (capacity) proposed in the first Plan. Since production of aluminium has lagged far behind the Plan so far, a considerable effort would be needed to realise the target set here.

The production of *coal* and *iron-ore* is related to the needs of other sectors. In the case of *mica* and *manganese*, allowance is made for increased consumption at home and for somewhat higher exports.

The targets for manufactured consumer goods are fixed with reference to the increase in demand resulting from a 25 to 27 per cent. increase in national income or a 20 per cent. increase in total consumption. Some allowance is made for increased exports, and production by cottage and village industries is expected to increase substantially.

The production of mill-made *cotton cloth* is expected to increase from 5,000 million yards to 5,500 million yards, and that of handlooms and small power looms from 1,600 million yards to 3,200 million yards. This would provide for a domestic consumption of 18 yards per person per year, while allowing for additional exports of some 500 million yards by the end of the Plan. In the case of *sugar*, an increase in production from 1.4 to 2.1 million tons will make the country self-sufficient while allowing for a sizable increase in total consumption. The targets for *vegetable oils* and *footwear* are based on similar considerations.

In the case of the newer industries producing *electrical goods, bicycles, sewing machines* and *glassware*, where there is some excess capacity and where export prospects are good, increases in production ranging from 60 to 100 per cent. and even more can be expected.

Transport and Power

Development of power and transport are essential preconditions for rapid industrial progress. The first Five-year Plan outlined a long-term programme for the development of power resources in the country over a period of 15 to 20 years. It was expected that installed capacity for the generation of *electricity* would increase from 2.3 to 3.5 million kw.h. over the first Plan. In view of the programme for rapid industrialisation envisaged here, this capacity must be increased to 6 million kw.h. by the end of the second Plan.

In the case of *railways* there is a considerable lag in the development of both goods and passenger traffic. However, the railways already have a tentative plan of expansion and re-equipment of some Rs. 800 crores. This plan, which calls for an addition of 3,000 miles of railway lines, among other things, may be accepted as the first approximation to the task in the second Plan.

The long-term development of *roads* in the country has already been outlined in the Nagpur Plan. An expansion of road building in the second Plan is desirable from the point of view of providing both employment and the basic amenities of life in the rural areas. It is reasonable, therefore,

to plan for an expansion of national highways from about 12.5 to 17.5 thousand miles and of State roads from about 20 to 35 thousand miles.

Social Services

The provision of basic services and amenities such as schools, hospitals, housing, water-works, drainage and parks must respond primarily to the expression of popular needs. It is in this sphere that "planning from below" has real significance. The district plans under preparation now should give a fair measure of popular aspirations in this field. The extent to which social services can be expanded in the second Plan is primarily a function of such local initiative and popular participation as we are able to elicit by leadership and organisation. The extension of social services must also keep step with the increase in the productive power of the community. Considering the prevailing low standards of health, education, housing, etc., to which attention has been drawn earlier, the targets set here appear to be a sort of minimum to be aimed at. It has also been emphasised that, apart from increasing the basic amenities and services of life, steps must be taken to make them available to a large proportion of the people irrespective of their means.

Investment and Priorities in the Plan

In the first Five-year Plan, two concepts were used to denote the size of the Plan, namely, net investment and developmental expenditure. Thus, the net investment in the public sector was expected to be of the order of Rs. 1,600 to Rs. 1,700 crores, whereas the developmental expenditure which includes outlay of a capital as well as current nature was initially estimated at Rs. 2,069 crores. Since outlay on the Plan included only a portion of the outlay on certain developmental heads such as health and education, an additional concept of total developmental outlay (as distinguished from that included in the Plan) has also been used at times to indicate the size of the Plan. In the case of 42 organised industries in the private and the public sector, the first Plan considered the requirements of gross rather than net investment, inasmuch as allowance was made for part of depreciation, replacement and modernisation. Similarly, the requirements of working capital were taken account of in the case of industries, but not for other sectors.

For the purposes of this paper, we speak of 'net investment' when referring to the economy as a whole. If our idea in assessing the 'investment cost' of a plan of certain size and character is to measure the effort of saving that is involved, it is more logical to consider gross income and gross investment. The entire gross product of the economy is, strictly speaking, available for consumption or investment. The allowance to be made for depreciation is in many cases notional, in the sense that, except in the case of repairs, maintenance or replacements, no real resources are, in fact, required currently against the estimated amount of depreciation. Replacement itself is seldom a mere substitution of one machine or building by another of the same type. Nonetheless, since our national income statistics are expressed in net output terms, it may be convenient to relate them to net investment.

Non-monetised Investment

Non-monetised investment is not included in investment. In a predominantly rural community of self-supporting persons, a significant amount of investment must be done by the application of personal labour and by using locally available materials. With the efforts to mobilise voluntary labour for various nation-building activities such as flood-control, investment in non-money terms must play an important part. It is also illogical not to include such investment when the income generating from it is included in national output. In view, however, of the highly conjectural nature of the imputed value of such investment, it is proposed to disregard it at this stage.

As regards investment in working capital, that is, in stocks of goods and services waiting to be consumed or to be utilised in production, it is clear that any additional requirements here are indistinguishable from the requirements of the fixed capital. Both require "savings" in real and financial terms. As the Rural Credit Survey amply points out, provision of short-term capital has as much relevance to production as that of long-term capital. Indeed, unless increments in stocks of all goods are included in investment, it would be difficult to justify the inclusion of residential houses in investment. Construction of a house is investment not because it resembles a producer good more than a consumer good but because it represents a net addition to the stock of houses.

Although it is more meaningful to speak of net investment when referring to the economy as a whole, it is useful to retain the concept of developmental expenditure in speaking of the public sector. As long as we use more than one concept to indicate the size of the Plan in the public sector, it would be essential to recast Government budgets in a manner which would make explicit the magnitudes of all these concepts. Thus, net capital formation through the budget, total developmental outlay and the outlay on the Plan must be all readily ascertainable from the budget statements.

The total amount of net investments required for achieving the targets outlined above may be estimated at about Rs. 5,600 crores. This estimate is made up by aggregating, wherever possible, the capital requirements of the individual targets. However, this procedure cannot be adopted uniformly for two reasons. The targets do not cover all the items of production. And in several important sectors, particularly in agriculture, investment is multi-purpose in the sense that only a complex of products can be related to a complex of investment.

Again, it is not as if all the investment in the community is strictly required for the achievement of the targets set. Residential construction, stockpiling and investment in gold and precious metals can take place irrespective of the requirements of the targets sought to be achieved. It is as well, therefore, to be clear in our minds as to how much allowance we make for such investment.

A tentative breakdown of the net investment of Rs. 5,600 crores may be given as follows:

	(In crores of rupees)	Percentage of total
Agriculture and community development (including irrigation and flood control)	950	17.1
Power	500	8.9
Transport and communications	900	16.1
Industries and mining (incl. small-scale)	1,400	25.0
Construction (houses, shops, schools, hospitals, etc.)	1,350	24.0
Stocks and miscellaneous	500	8.9
Total	5,600	100.0

Strictly comparable figures for the economy as a whole are not available for the first Five-year Plan. But total net investment in the first Plan was originally envisaged to be of the order of Rs. 3,500 to Rs. 3,600 crores. The provision made for aggregate investment in the second Plan, therefore, is about 55 per cent. higher than that in the first Plan. As regards the pattern of investment, the major emphasis is on industries and mining. A detailed breakdown of the investment of Rs. 1,400 crores in industries and mining (public and private) is given below:

	(In crores of rupees)	Percentage
Iron and steel	423	30.4
Synthetic petrol	80	5.7
Heavy machinery to fabricate plants for steel and producer goods	150	10.7
Heavy electrical equipment	40	2.9
Machinery for agriculture and consumer goods industries	50	3.6
Existing State enterprises (expansion)	50	3.6
Cement	50	3.6
Chemicals and drugs	50	3.6
Fertilisers	100	7.1
Aluminium	30	2.1
Minerals and prospecting	75	5.4
Factory consumer goods	100	7.1
Small-scale and village industries	200	14.3
Total	1,400	100.0

The provision made for industries and mining here corresponds to the targets outlined earlier. The major part of investment is devoted to basic industries and it is assumed that existing enterprises would work to full capacity on a multi-shift basis wherever possible. A generous provision of Rs. 200 crores is made for small-scale and village industries, in view of the considerations outlined earlier.

It may be useful to relate these magnitudes to developmental outlay as conceived in the first Plan. For this purpose, we may assume that, out of the total net investment of Rs. 5,600 crores, some Rs. 3,400 crores would be organised through Government's budgetary and other operations and the remaining Rs. 2,200 crores or so would represent private investment from private sources. Needless to say, this is only a tentative breakdown.

The developmental expenditure under the Plan in the public sector, corresponding to the net investment of Rs. 3,400 crores, might amount to roughly Rs. 4,300 crores. This figure is roughly comparable to the outlay of Rs. 2,069 crores initially proposed for the first Plan. In addition to capital formation proper, a part of the current expenditure on nation-building activities, such as health, and education, has also to be included in the Plan in the public sector.

Outlay in Public Sector

A tentative breakdown of the Plan outlay of Rs. 4,300 crores in the public sector might be as follows:

(In crores of rupees)

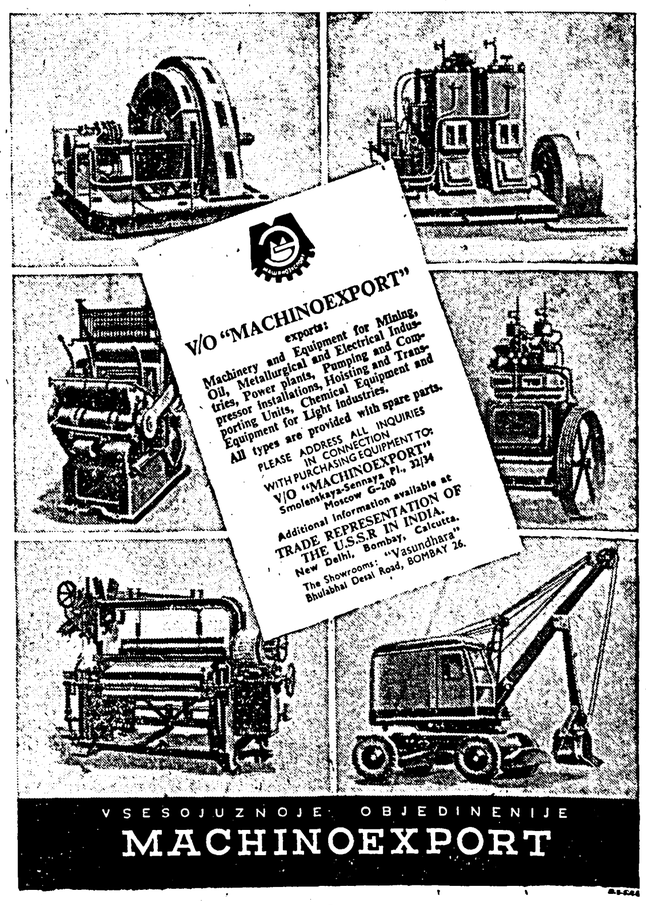
	Second Plan				First Plan	
	Investment outlay	Current outlay	Total outlay	Percentage	Percentage	Total outlay
Agriculture, irrigation and community development	750	200	950	22		
Power	450	..	450	10.5		
			1,400	32	44	990
Transport and communications	850	100	950	22	24	536
Industry and minerals	1,000	100	1,100	26	8	178
Construction and social services	250	500	750	17	24	544
Stocks	100	..	100	2	..	..
Total	3,400	900	4,300	100	100	2,248

A considerable shift in favour of industries and mining is thus envisaged in the Plan for the public sector. Nonetheless, the actual expenditure on all other sectors, such as social services, agriculture and transport, in the second Plan, as proposed here, is significantly greater than in the first Plan. The total Plan outlay in the public sector (Rs. 4,300 crores) is roughly double the outlay envisaged in the first Plan (Rs. 2,248 crores).

The total net investment of Rs. 2,200 crores in the private sector might be distributed roughly as follows:

(In crores of rupees)

Construction	1,100
Industry, mining, power and transport	500
Agriculture and allied pursuits	200
Working capital in trade and industry and miscellaneous	400
Total	2,200



Agents for Printing and Polygraphic Machinery: MANUBHAI SONS & CO., BOMBAY.
Agents for Agricultural Machinery and Earthmoving Machinery: AMINCHAND PYARELAL, CALCUTTA, BOMBAY, MADRAS, NEW DELHI AND JULLUNDUR.

FINANCIAL RESOURCES FOR SECOND FIVE-YEAR PLAN

RISE OF RS. 1,300 CRORES IN MONEY SUPPLY ENVISAGED

ON the previous pages of this issue, we have published the provisional targets fixed for the second Five-year Plan. The financial resources needed for hitting these targets, the manner in which they can be mobilised and the foreign exchange requirements of the Plan are indicated in the following extracts from the outline of the Plan prepared by the Economic Divisions of the Finance Ministry and the Planning Commission.

There are two distinct aspects to the question of raising financial resources needed for the Plan. First, the savings needed for the capital formation envisaged must be available in the aggregate. Secondly, the financial resources must be available and utilised by each sector and for each purpose in accordance with the priorities set in the Plan. This second aspect requires a policy of directioning investment.

If net investment of the order of Rs. 5,600 crores is to be realised over the next Plan period, savings of the same order must be forthcoming. With increased incomes, the volume of savings is bound to increase. For initiating a process of higher investment and higher incomes by fuller utilisation of unemployed and underutilised resources, it is not necessary that savings come first and only these are invested later. Credit has to be taken in advance for the additional savings that are likely to arise, as incomes and investment increase. Some initial credit creation, therefore, is an essential part of a development programme. Nonetheless, if planned investments are to be realised without generating serious inflationary pressures, the initial credit creation must be limited with reference to what savings are likely to be available, or can be created by suitable policy measures.

An investment programme of Rs. 5,600 crores for the second Plan cannot be carried through without a considerable increase in the rate of savings in the community. Assuming that sterling balances can be drawn down by some Rs. 100 to Rs. 150 crores and foreign assistance of the order of Rs. 500 crores is available during the second Plan, domestic savings of the order of Rs. 5,000 crores must be available. The Taxation Enquiry Commission (T.E.C.) has estimated that total savings in India in 1953-54 and total net investment (at home and abroad) amounted to some 7 per cent. of national income. Their concept of net investment is not strictly comparable to the one used here in arriving at the net investment of Rs. 5,600 crores for the second Plan. Thus, unlike the T.E.C., we have excluded non-monetised investment. At the same time, we have made some allowance for investment in stocks and in small enterprises which have been disregarded by the T.E.C. Again, a sizable increase in public investment is expected for the last two years of the first Plan. On the other hand, the T.E.C's estimate of net investment abroad of Rs. 70 crores in 1953-54 must be regarded as rather exceptional. Normally, we should expect a deficit in our current balance of payments (not taking credit for donations), with the result that the total investment in the country must be higher than domestic savings. Taking these considerations into account, it is reasonable to expect that, comparable to the figure of Rs. 5,600 crores for the second Plan, net investment in the country in 1955-56 would be of the order of 6.75 per cent. of national income and corresponding domestic savings of some 6 per cent. of national income. On this basis, the growth in investment and savings over the second Plan would have to be somewhat as follows:

(In crores of rupees)

	1955-56	1956-57	1957-58	1958-59	1959-60	1960-61	2nd Plan 1956-57 to 1960-61
National income	10,800	11,800	11,825	12,875	13,000	13,700	62,200
Net investment	730	810	930	1,060	1,300	1,600	5,600
Domestic savings	650	680	800	930	1,170	1,370	4,950
Foreign resources	80	130	130	130	130	130	650

The phasing over the five years of savings and investments given above is intended to be illustrative. The essential point is that, in order to achieve a total investment of Rs. 5,600 crores, the rate of investment must increase from 6.75 per cent. of national income in 1955-56 to 11 per cent. of national income in 1960-61, and domestic savings from 6 to 10 per cent. over the same period. If foreign resources are not available on the scale envisaged, the savings effort at home would have to be correspondingly greater.

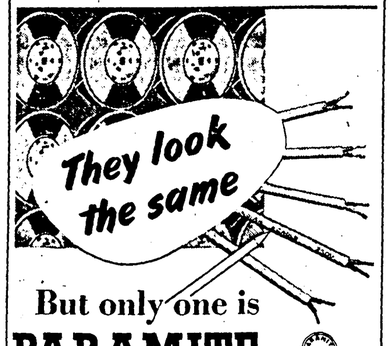
Whether an increase in the rate of domestic savings from 6 per cent. in the beginning of the next Plan period to 10 per cent. by 1960-61 is likely to take place in response to a voluntary increase in savings resulting from additional incomes cannot be judged in advance. The increase in savings envisaged here is not very large in relation to the rates achieved in other countries. But, considering the current low rate of saving and the large margin of unsatisfied needs, it may be assumed that savings of the order required would not be forthcoming without special and persistent effort at restricting consumption through fiscal and other devices.

In an underdeveloped economy, where there are idle resources, increased investment need not imply a reduction in current consumption. It would, however, imply austerity, that is, preparedness to hold down consumption, especially of luxuries, in the face of rising incomes. A check on the consumption of non-essential commodities, domestic as well as imported, is necessary in order to release additional resources for the production of essential goods. Shortages of essential goods are dealt with better in this way than by direct limitation of consumption. However, if resources released through restriction of luxury consumption are not of much use for increasing the supplies of essential goods, controls over consumption of essentials would become unavoidable. The question of controls must, in other words, be judged in terms of the particular real resources, which are in short supply. Foreign exchange resources have to be conserved with particular care, in that they can be converted into whatever commodities became scarce within the country. In the present world situation in regard to food and cotton, one can hope that a plan of the magnitude contemplated can be seen through without having to impose controls on necessaries like food and cloth.

Up to a point, the emergence of some inflationary pressures or a sellers' market is necessary, since our objective is to push ahead as far as possible in the direction of utilising our resources. Essentially, inflationary pressures—or insufficiency of savings—arise as a result of inelastic supplies of goods against which people direct their demand. The elasticity of supply is not equally great in the case of all commodities. With effort and organisation, it can be altered favourably at least in selected sectors. If we are to stop at the first bottleneck in supplies for fear of a rise in prices in that sector, even though supplies in other sectors are elastic to some extent, we are likely to stop short of the full potential for expansion of the economy. We have to be prepared to "tackle" short supplies in some commodities. Whether in doing so, we would be able to prevent a general and cumulative rise in prices depends, obviously, upon the measure of shortage and the organisational efficiency in dealing with it. In an expanding economy, the sufficiency of savings cannot be predicted in advance, but, since the overall effort suggested is not excessive and is required for making an impact on employment, the practical problem is one of watching overall economic trends and of correcting, through fiscal and other measures, any shortages in resources in particular sectors as they rise.

Resources For The Public Sector

From the standpoint of finding resources for the public sector, it is necessary to consider not only the outlay on the Plan but total outlay. Expenditure outside the Plan has an obvious significance to the realistic appraisal of the financing of the Plan. The outlay on the Plan in the public sector includes, first of all, all expenditure which results in the creation of new capital assets (directly in the public or indirectly in the private sector). In addition, it should include that part of the current expenditure on specific developmental heads which represents an increase over the level reached at the end of the first Plan. This would give a clear idea of the "lift" we are giving to the developmental effort during the next Plan. This is the concept which has been kept in mind in this paper in arriving at the Plan outlay of Rs. 4,300 crores.



But only one is
PARAMITE
the reliable
Cable

Selling Agents: GILLANDERS ARBUTHNOT & CO., LTD
BOMBAY — NEW DELHI — KANPUR

An alternative would be to include all expenditure under specified developmental heads in the Plan, leaving out only expenditure on non-developmental items like Defence and Civil Administration. Although this would inflate the Plan figures, it would facilitate a more realistic appraisal of the Plan and its financing by ruling out the possibility of shifting of expenditure as from one sub-category to the other within the broad category of developmental heads. It would also enable a quicker review of the progress under the Plan from the budget itself. On the other hand, by confining the scope of the Plan to the schemes deemed more essential to further effort, we are better able to scrutinise them. The best course in the circumstances would, therefore, be to highlight both the total expenditure under specified developmental heads and the outlay on the Plan. As a rough approximation, the budgetary position of the Centre and the States combined may be outlined as follows:

(In crores of rupees—estimates)

	1955-56	1960-61	Over second Plan 1956-57 to 1960-61
Outside the Plan—			
Non-developmental	825	725	3,400
Developmental	200	225	1,100
Sub-total	825	950	4,500
On the Plan	600	1,100	4,300
Total ..	1,425	2,050	8,800

The estimated outlay of the Centre and the State Governments combined for 1955-56 is based on the budget proposals for the year, as far as possible, and on the revised budget figures for 1954-55. However, in view of the difficulties in combining the figures for the Centre and the States and in apportioning the development outlay, within and outside the Plan, the estimates must be taken only as roughly indicative of the magnitudes involved.

It is assumed that public outlay on the Plan will increase from Rs. 600 crores or so in 1955-56 to Rs. 1,100 crores in 1960-61, that is, by about 80 per cent., in order to make up a total of Rs. 4,300 crores over the Plan period. Expenditure outside the Plan is assumed to increase by 15 per cent. over the five years or by Rs. 25 crores every year. The total outlay on developmental heads is envisaged to be of the order of Rs. 5,400 crores—Rs. 4,300 crores in the Plan and Rs. 1,100 crores outside the Plan.

The question is how a total Government outlay of Rs. 8,800 crores (Rs. 4,500 crores outside the Plan and Rs. 4,300 crores on the Plan) is to be financed. Assuming that the Government takes some 8.5 per cent. of national income in taxes and in non-tax revenue as has been the case on an average over the past four or five years (7 per cent. in taxes and about 1.5 per cent. in non-tax revenue) the total revenue receipts would amount to about Rs. 5,200 crores. Borrowing from the public may possibly yield (net) another Rs. 1,000 crores (about Rs. 600 crores from loans and Rs. 400 crores from small savings). Contribution from railways may be put at Rs. 200 crores over five years. The budgetary position of the Government over the second Plan might, therefore, look somewhat as follows:

	(In crores of rupees)
Expenditure:	
On the Plan	4,300
Outside the Plan	4,500
	8,800
Receipts:	
On revenue account	
From railways	5,200
Loans from the people	200
	1,000
Deficit	6,400
	2,400

As against the gap or deficit of Rs. 2,400 crores, we may take credit for some Rs. 400 crores of foreign assistance. (In addition, foreign assistance of Rs. 100 crores is envisaged for the private sector.) Over the first Plan, foreign assistance utilised in the public sector is likely to be of the order of Rs. 250 crores. Thus, we are assuming a 60 per cent. increase in the amount of external assistance utilised by the public sector. The remaining gap of Rs. 2,000 crores cannot be filled up by deficit financing or creation of money. As a first approximation, we may assume that such money creation can be resorted to to the extent of Rs. 1,000 to Rs. 1,200 crores by the Government. Allowance must also be made for credit creation by banks for the needs of the private sector, say, Rs. 400 crores or so, bringing total credit creation to Rs. 1,400 to Rs. 1,600 crores. A part of this credit would be withdrawn from the system, as we use up our accumulated sterling balances. We have made an allowance earlier for a decline in our foreign exchange reserves by some Rs. 150 crores. Even then, total money supply in the economy might increase by some Rs. 1,300 crores during the second Plan. We have argued earlier that credit creation is essential to development and that some price rises may well occur in an economy trying to reach to the full limit of its resources. In India, a larger money supply will be needed as the monetised sector expands relatively to the non-monetised sector. Even then, with a 25 to 27 per cent. increase in national income, an increase in money supply by some Rs. 1,300 crores on a base of some Rs. 2,000 crores must be regarded as a sort of outside limit.

If, then, for the reasons just stated deficit financing by the Government must be restricted to some Rs. 1,000 to Rs. 1,200 crores, it would be necessary to raise at least Rs. 800 crores by increased taxation, or by compulsory borrowings, or through increased profit of Government enterprises. In fact, a combination of all these will be called for. If additional Government profits are to be raised, it might be necessary for the State to enter into the field of trading or production of consumer goods. The scope for such expansion of State activity into profit-making ventures will have to be carefully examined. Alternatively, taxation in the country will have to be raised from some 7 per cent. of national income to 9 or 10 per cent. of national income by 1960-61. An increase in taxation from 7 to 9 or even 10 per cent. of national income cannot be regarded as excessive, if our aim is to have a bolder Plan which requires an increase in the savings of the community from 6 to 10 per cent. of national income. But it should be borne in mind that some tax adjustments will be necessary even to maintain the existing level of tax receipts at 7 per cent. of national income.

The foregoing discussion of the resources for the public sector has been in terms of the receipts and expenditures of the Centre and the States combined. A survey of the financial position of individual States during the second Plan will have to be prepared separately.

Resources For The Private Sector

Of the total investment of Rs. 2,200 crores in the private sector, Rs. 1,100 crores are envisaged in construction, Rs. 500 crores in industry, mining and transport, Rs. 200 crores in agriculture, and, Rs. 400 crores in working capital in trade and industry and in residual items. The Taxation Enquiry Commission has estimated that net investment in organised enterprises (public limited and private limited companies) and in private transport amounted to Rs. 75 crores in 1953-54. Correspondingly, corporate savings and new subscription to capital of companies together have also been put at Rs. 75 crores for that year. This investment is roughly comparable to the provision made here for an investment of Rs. 500 crores in industries, mining and transport in the private sector for the next Plan period. An increase in the rate of such investment from Rs. 75 crores in 1953-54 to an average of Rs. 100 crores over the next Plan may be regarded as feasible, particularly in view of the larger profits that are likely to arise in organised industries if unutilised capacity is put to full use. The more important problem would be to ensure a proper allocation of the investment in the private organised sector of industries. Apart from capital issues control and export and import controls, a differential tax policy might be needed in this context. Where necessary, arrangements may be made for loans or planned increases in prices for realising important investments in this sector.

The requirements of working capital for industry and trade can be met without much difficulty through bank accommodation. We have made allowance for an increase of some Rs. 400 crores in bank credit earlier in arriving at total credit creation in the economy. Indeed, with deficit financing of Rs. 1,000 to Rs. 1,200 crores in the public sector, the problem may well be one of preventing excessive bank accommodation.

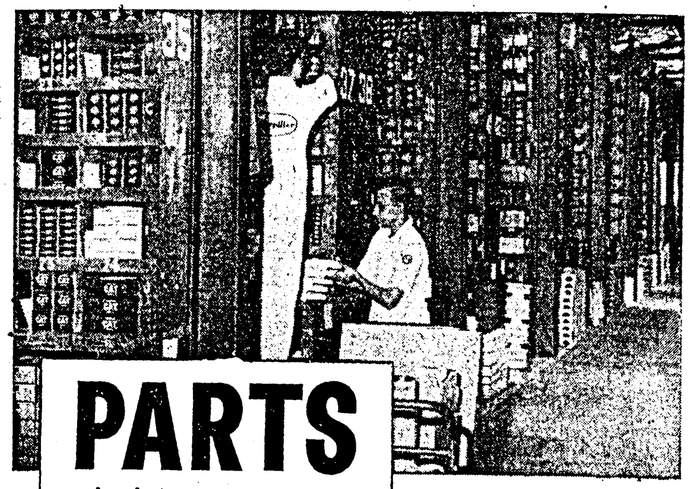
Of the net investment in the private sector of Rs. 2,200 crores, about one-half is envisaged to be in construction. This implies private construction activity of the order of Rs. 220 crores per year on an average in the next Plan period. Private monetised construction at present may be estimated at about Rs. 150 to Rs. 160 crores per year. The source of savings for construction activity cannot be indicated. Nor can it be asserted that the increase in construction activity envisaged would, in fact, be realised. If aggregate savings are inadequate, there is no knowing where this shortage would impinge. As long as investment in the high priority part of the private sector is assured, any shortfall in the availability of resources for other purposes would not seriously retard the tempo of development.

Balance Of Payments

A close analysis of the balance of payments position for the second Plan period has yet to be made. Considering the type and structure of our exports, it is doubtful if a large increase in earnings can be secured, at least in the earlier years of the Plan. In the targets indicated, provision has been made for larger exports of cotton textiles, tea, mica, manganese and some of the newer products like sewing machines, electrical goods, etc. However, in view of the increasing competition in some export items, it might be safe not to assume any significant increase in export earnings. The balance would turn mainly on imports.

Of the total investment of Rs. 5,600 crores, about Rs. 2,500 crores will be of a kind that makes little demand on foreign exchange. For the rest, that is, about Rs. 3,000 crores of investment in irrigation and power, communications, industries, railways, etc., if we assume the imported component at 33 to 40 per cent. (as a very rough average), the import requirements would work out at between Rs. 1,000 and Rs. 1,200 crores. To this, we may add Rs. 400 crores or so as imports needed for replacement.

Total imports of capital goods over the second Plan period may thus amount to Rs. 1,400 to Rs. 1,600 crores. At present, these imports are of the order of Rs. 100 crores a year. Since the overall external account is more or less in balance, it may be assumed that we could finance Rs. 500 crores worth of machinery and equipment imports from current earnings. The problem then would be to find foreign exchange resources of the order of Rs. 1,000 crores. Allowing for a saving of foreign exchange of some Rs. 200 crores on petrol, raw cotton, sugar and similar items where domestic production is expected to increase, there would still be a problem of finding Rs. 800 crores of foreign exchange. The foreign exchange assets held by the Reserve Bank can, perhaps, be drawn down by Rs. 100 to Rs. 150 crores during the next Plan period (that is, from the present level of Rs. 730 crores to Rs. 550 or Rs. 600 crores, after making an allowance of a decline of Rs. 30 crores or so in the last year of the first Plan). This leaves a balance of Rs. 650-700 crores. If Rs. 500 crores of this could be met by way of external assistance, there will still be need for economising on imports and for promotion of exports. Since the reducible element in our imports is small, there is a correspondingly greater need for increasing exports.



PARTS
..Insist on Genuine
CATERPILLAR
Spare Parts

Every part in your machine was built with a precision that few manufacturers can equal ... materials were the finest available ... workmanship was that which comes with long experience and training. These features paid off in long-life, low-cost performance, efficient operation.

When any part needs replacement, make sure the new part has this same background ... order only genuine Caterpillar parts!

Call us in for fast, efficient on-the-job service—or for complete rebuilding of your CATERPILLAR equipment.

Rely on us for quick supply of genuine CAT-built replacement parts from our ample stocks—and get your CATERPILLAR equipment back at work with the minimum "down time".

BE 100% SURE WITH 100% CAT PARTS

ANNUAL MEETING OF THE BHARAT LINE LIMITED

DAMAGE CAUSED BY DOCK LABOUR UNREST TO COMMUNITY

MR. C. R. SRINIVASAN ON FINANCE FOR SHIPPING

ADDRESSING the Ninth Ordinary General Meeting of the shareholders of the Bharat Line Ltd., held on Thursday the 16th June, 1955, at Bhavnagar, the Chairman of the Company, Mr. C. R. Srinivasan, deplored the introduction of labour decasualisation scheme in ports and adduced statistical evidence to show how productivity per worker had declined. He urged that wages of the workers should be related to output of work and pointed out that labour's interests would be better served by an incentive bonus for extra work. He suggested that, if shipping had to make more rapid progress, it was necessary for the Government to be more realistic in its loan and aid policy towards Indian shipping and also to adopt such measures as were calculated to secure for the country's shipping industry an increasingly larger share of overseas trade.

The following is the text of Mr. Srinivasan's speech:

"GENTLEMEN,

"It gives me great pleasure to welcome you to the ninth ordinary general meeting of the Company. The Directors' report and the audited balance-sheet and profit and loss statement have been in your hands for some time now. I trust I have your permission to take them as read.

Company's Fleet

"A complete list of the ships owned by the Company with their gross registered and dead-weight tonnage has been appended to the Directors' report for your information. The 14 ships listed amount to a gross registered tonnage of 64,516 tons and a dead-weight tonnage of 98,595 tons. Shareholders are aware of the loss of the s.s. *Bharatbala* in the Gulf of Cambay last year. The ship has not been replaced yet, though the insured value has been collected in due course and credited to the fleet replacement account. You will be glad to hear that the ship, s.s. *Bharatkhand*, has after all been transferred to the Indian Registry. The ship s.s. *Bharatratna*, built for us at the Vizag Shipyard, was delivered to us in July last. Three ships, s.s. *Bharatbhushan*, s.s. *Bharatkesari*, and s.s. *Bharatdeepak*, were acquired last year to meet, in part, the requirements of the Persian Gulf trade and a fourth ship, a passenger-*cum*-cargo one, we expect to acquire if possible, or charter if necessary, to complete our initial requirements for this trade. The second oldest ship in our fleet, the s.s. *Bharatmata*, has been sold for scrap value as it had become uneconomical in running and a new ship will replace it in due course. Following the policy initiated last year, insurance cover for our entire fleet has been placed with Indian interests and we are glad to learn that a progressively higher percentage is being retained in Indian hands.

Company's Finance

"The investment cost of the ships owned by the Company amounts to Rs. 4,52,69,369-15, as you will see from the balance-sheet. The issued, subscribed and paid-up capital of the Company being only one crore of rupees, you will naturally be interested to learn how finance for the additional investment has been found. The accounts will show that we have accumulated a sum of Rs. 1,80,06,587 in our depreciation fund, besides a sum of Rs. 16,67,690-7-10, to the credit our fleet replacement account. We have also borrowed from the Government of India a sum of Rs. 1,52,78,333, under the ship loan scheme. It is from these sources that necessary finance has been found. The question of broadening the capital structure of the Company has engaged our attention from time to time, but in the present condition of the share market, any sober appraisal of large-scale equity issues, on merit, is not to be expected and, until the climate is recovered, the wiser course would be to meet our needs from alternative sources. Fortunately, our Government, equally aware of these conditions and at the same time anxious that progress should not be halted on this account, has made loan funds readily available on reasonable terms. Welcome as it is, it can only serve to a limited extent and for a limited period. In its own interests and in the service of national economy the industry must stand on its own legs. The Government may perhaps render more help indirectly than even directly, if doubts and misgivings, induced in the private sector by recent developments, are authoritatively set at rest.

Company's Earnings

"The Company earned as freight and charter hire Rs. 2,61,80,933-6-5, during the year under report. In 1953, it amounted to Rs. 2,22,27,900-15-4 and in 1952, Rs. 2,12,79,907-7-6. This progressive increase in our earnings is largely due to the increase in our tonnage and the increasing share in the volume of business we handle. Heartening as this fact is, what is depressing to record is a progressive fall in our gross profits. In 1952, these amounted to Rs. 49,59,304-8-11; in 1953, it was Rs. 39,61,844-15-3; in 1954, it has come down to Rs. 35,25,403-8-9. Partly this is accounted for by fall in freight rates; largely, however, it is attributable to rising operation costs; and in this the main contributory is labour.

Labour Problems

"In the new economy that Free India is seeking to build up, labour is assured of its proper share in the fruits of endeavour and enterprise. A spate of labour legislation has been placed on the Statute Book to evidence this sympathy and goodwill and though its administration has often been irritating and vexatious, the desire to better the lot of labour has been widely and willingly accepted. It is unfortunate, however, that some, at any rate, of those who claim to speak for labour have shown no appreciation of the broader implications of the claims they advance. A short-sighted attempt to hold industry to ransom is not in the interests of either labour or the community as a whole. They forget that in the last analysis it is the community that pays for goods and services, and the assertion of rights without acceptance of obligations will progressively deplete the goodwill of the community. Discerning leaders of labour cannot have missed signs of the revulsion of feeling that is setting in. In the preparation of the second Five-year Plan, with emphasis on the industrial sector, a new concept is being canvassed, that of creating a national labour force. Presumably, it is not lack of labour that has germinated this idea, but the lack of discipline and responsibility that marks organised industrial labour today. Labour would be wise to see the writing on the wall and fall into step to protect free enterprise. No employer is interested these days in sweated labour, nor in denying labour proper working conditions, fair wages and reasonable amenities of service. But the pseudo-leaders of labour are not content to leave well alone; and in the conditions they have brought about today, it is not so much labour as capital that calls aloud for protection at the hands of Government.

"With your permission I should like to deal a little more fully with the situation as it has developed in the labour sector in so far as it concerns the shipping industry. Apart from labour legislation of a general character, which affects the shipping industry also, the recent introduction of labour decasualisation scheme, involving payment without work to dockyard labour, not merely imposes a direct burden on the industry but indirectly has exposed it to a vicious train of reactions of infinite consequence to the community. If pay can be had without work, it acts as a provocation to ask for more and more pay for less and less work: the go-slow movement has gathered a new momentum in consequence. The incidence of this new force that has invaded labour ranks may be gathered from the comparative figures for the years 1951 to 1954 for the Port of Bombay that I place before you:

Statistics of Cargo Handled at Bombay

Year	Cargo handled	Gangs employed	No. of days
1951	1,24,296	2,584	3.40
1952	96,338	2,193	3.84
1953	82,134	2,619	4.05
1954	90,519	2,874	4.42

"Proportionately for handling 1,000 tons, the statistics would be:

Year	Gangs employed	No. of days	Cost per gang Rs. a. p.
1951	20.79	3.01	52 0 0
1952	22.76	3.98	57 10 0
1953	31.88	4.93	72 0 0
1954	31.74	4.88	72 0 0

"Taking 1951 as 100, the above figures work out to:

	Gangs employed	No. of days
1951	100.00	100.00
1952	109.47	132.22
1953	153.34	163.78
1954	152.67	162.12

"It will be seen that whereas for handling 1,000 tons of cargo 20.79 gangs were employed at a cost of Rs. 52 per gang and the work was completed in 3.01 days in 1951, the same work load required 31.74 gangs costing Rs. 72 per gang and the work was completed in 4.88 days in 1954!

"And that is only part of the penalty that the shipping industry is called upon to bear in the service of labour interests. The greater loss comes from the needless detention of ships at ports due to slackness of labour. The standing charges of a medium size ship comprehending wages, fuel, maintenance, insurance, etc., average to between 4 and 5 thousand rupees per day, and every day's detention not merely adds to expenses but denies also opportunities for further earnings. I have had statements prepared to estimate the loss sustained by us on our fleet on this account and you will be amazed to hear that the total detention cost equals in value the full-time operation of an 8,000 d.w.t. ship for a period of 179 days, or nearly six months. The maintenance cost of the ship for this period would be between Rs. 8 and Rs. 9 lakhs. This represents the direct loss. The indirect loss is that during this period what might normally have been earned on freight is also lost. Does labour stand to gain anything by imposing this loss on the shipping company? It does not, and that is the tragedy of it!

"And that is not all: detention of ships at ports leads in turn to congestion, with ships waiting outside for berths. The gravity of the situation as it has developed in the major ports of India may be gathered from the fact that foreign shipping interests had notified shippers that a surcharge of 35 per cent. would be levied with effect from 1st June, if conditions did not substantially improve. Naturally, this has provoked a storm of protest from the interests affected and the Government's hands have geen forced to meet a threat with a counter-threat. However the position finally resolves itself, the point I desire to stress in this context is the price that the community may be called upon to pay for pampering a small section of labour, unconscious and unmindful of their own long-term interests. It is time that Government realises its larger responsibility to the country and by legislation or otherwise takes proper and necessary steps to correct the mischief before it places our economy beyond repair. Wages of labour must be related to output of work and labour's interests stand to be better served with an incentive bonus for extra work. With labour costs rising and stevedoring charges keeping pace with them, the outlook before the shipping industry is bleak indeed. I wish Government, anxious as they are, I know, to help the shipping industry, will take serious notice of the position and act quickly.

Company's Progress

"It is to the credit of the Board and even more to the watch and ward kept by the management that the progress of the Company has been steady and sustained. We have an acknowledged place in the coastal trade and, as I indicated last year, we have entered the adjacent trade by opening a regular service to the Persian Gulf. A growing volume of business is being attracted to our service and the fact that the Government of India is behind us in this adventure has helped to create the climate for fruitful negotiations with the interests which had established a virtual monopoly of this trade. In all probability, we shall reach an understanding with them presently and the element of competition implicit in the situation may resolve itself into one of co-operation, ensuring a firm footing for the Company in this trade. We have already acquired and put into this service three cargo ships, s.s. *Bharatbhushan*, s.s. *Bharatdeepak* and s.s. *Bharatkesari*, and, if the understanding we seek with the established interests comes off, it may be possible for us to charter one of their passenger-*cum*-cargo ships until we are able to acquire a ship of our own to fill the gap. We would have been happy to have this ship built for us at the Vizag Shipyard, but their existing commitments, we are afraid, would make it impossible for them to build and deliver a ship to our specifications within a reasonable time. Once we consolidate our position in the Persian Gulf trade, it may be possible, perhaps even necessary, for us to explore the possibilities of further adventure in the adjacent trades. Beyond stating that this matter is engaging our serious attention it is not possible at the moment to state in what direction our attention is turning. It is not our intention to expand too rapidly either and find ourselves in Queer Street amidst the many uncertainties that prevail today. These uncertainties are bound to resolve themselves in time, and by way of a pointer I may say that the fall in freight rates has been arrested and a heartening improvement in the position has begun to assert itself.

State Aid to Shipping

"In assessing the prospects of further progress and future expansion it would be just as well to stress that the pivotal point on which the whole thing turns is the extent to which our Government is consciously and continuously prepared to help Indian shipping. Their interest and concern have been demonstrably established in the past when they proceeded to reserve coastal trade to Indian ships. That passed without raising a ripple from competitive shipping interests because it is now widely recognised that coastal trade is the preserve of the nationals of the country. Increasing participation of Indian shipping in the adjacent and ocean trades, however, is not so easily achieved as the way is blocked by multi-conference arrangements designed to maintain the hold of the 'haves' against the encroachments of the 'have-nots.' The way can only be opened by the Government asserting itself to protect the interests of our flag. It can be done in a variety of ways, and the history of shipping development elsewhere provides illuminating examples of how it was done. Whatever is attempted by way of flag protection will no doubt be interpreted by established interests as flag discrimination. The controversy that raged in the Victorian period between free trade and protection may be cited by way of illustration. But it did not prevent any country from establishing its trade interests against competitive interests.

"The speeches made in the course of budget debate in both Houses of Parliament provide ample indication of popular expectations on the subject and the Government should feel reassured in pursuing a forward and fruitful policy. This is not merely a matter of fixing a tonnage target for the second Five-year Plan and estimating the funds necessary to finance additional tonnage. The first Five-year Plan set the target at 600,000 tons g.r.t. The second Five-year Plan takes the target to 1,055,000 tons g.r.t. Indian shipping interests were also consulted in fixing this target and finding ways and means. Obviously, the additional tonnage is not intended to cover only our coastal needs. Beyond the existing tonnage earmarked for the purpose, coastal trade can only absorb a fraction of the additional tonnage to cover our expanding needs; the greater part is intended progressively to cater to adjacent trades and ocean trades. That is necessary if a balanced economy is to be achieved. The time has arrived, therefore, when the Government must bestow serious thought on the ways and means to secure a fair share in these trades and they would be wise to consult informed Indian interests on the subject. In the second Five-year Plan it is expected that our imports from foreign countries for capital goods, etc., would be of the order of Rs. 300 crores per year and, on the scale of industrial development that we contemplate during the second planning period, a sizable export market will have to be built up. Both ways, therefore, we have sufficient bargaining counters in our hands for promoting the interests of our flag in these two trades.

"I have indicated earlier some of the steps which the Government may straightaway take to reassure shipping interests in the country and recharge them with enthusiasm. I have laid particular stress on the need to rationalise labour charges. A great deal more remains to be done. As our economy expands under intensive planning, transport may easily develop into a bottleneck. Congestion on road and railway transport must be relieved by diversion of heavy traffic to water transport. The limited facilities now available for shipbuilding in the country should also expand with our needs and require-

(Continued on page 1199)

INDIAN TRADE AND GENERAL INSURANCE COMPANY, LIMITED

FRESH RECORD IN NET PREMIUM INCOME

THE Eleventh Annual General Meeting of the Indian Trade and General Insurance Company, Ltd., will be held at Calcutta on 25th June, 1955. In a statement accompanying the report, accounts and balance-sheet of the Indian Trade and General Insurance Co., Ltd., for the year ended 31st December, 1954, to be submitted at the above meeting, the Managing Director, Lala Karam Chand Thapar, reports that the net premium income of the Company has reached a fresh record of Rs. 57,19,597, an increase of Rs. 5,52,451 over the figure for the previous year.

The fire department had a very good year, the net premiums totalling Rs. 27,67,331, as against Rs. 25,97,027 in the previous year, and the claims ratio showing a reduction from 46.4 per cent. to 39.5 per cent. Commissions and expenses of management, at 45.6 per cent., compare favourably with the average expense ratio of the British Tariff Offices conducting world-wide business. After increasing the reserve for unexpired risks by Rs. 1,10,667 to Rs. 13,58,015, a sum of Rs. 3,25,415 has been transferred to the profit and loss account.

The marine department came through a difficult year creditably, the net premiums amounting to Rs. 18,80,133, as compared to Rs. 16,57,458 in the previous year. An exceptionally large number of total losses and general average losses resulted in an increase in the claims ratio from 53.6 per cent. in 1953 to 60.1 per cent. in 1954, but commissions and expenses of management came down from 29.4 per cent. to 26.9 per cent. The reserve for unexpired risks has been further strengthened by Rs. 3,66,153 and now stands at Rs. 16,92,120, more than double the reserve maintained two years ago.

In the miscellaneous department, although the net premiums went up from Rs. 9,03,662 in 1953 to Rs. 10,63,133 in 1954, the claims ratio rose from 45.3 per cent. to 63.9 per cent., mainly due to heavy motor claims in certain overseas territories, where the Company had started writing direct business. On the other hand, commissions and expenses of management, at 39.9 per cent., show a reduction compared to the figure of 42.8 per cent. in the previous year. The reserve for unexpired risks has been increased by Rs. 79,736 to Rs. 5,31,567.

The balance-sheet position has again been strengthened, the reserve for unexpired liabilities now amounting to Rs. 35,81,702 and the book value of investments totalling Rs. 43,79,139, an increase of Rs. 2,69,875 over the figure for the previous year. The funds of the Company now stand at Rs. 66,37,298 and the total assets at Rs. 87,18,937. The Company has, therefore, emerged from a year, which has not been without its difficulties, with strengthened resources, and has definitely established itself in the very forefront of the leading Indian companies.

It is proposed to maintain the dividend, as in the previous year, at Re. 1-8 per share and the amount provided for this purpose is more than doubly covered by the investment income of the Company.

Abridged Balance-sheet as at 31st December, 1954

LIABILITIES	Rs.	ASSETS	Rs.

MARKETING OF HAND-MADE PRODUCTS

PROBLEM OF HIGH COSTS AND LOW PROFITS

THE second Five-year Plan proposes to increase employment opportunities for about 12 million persons. This is sought to be achieved by developing, in the main, small-scale and cottage industries. For this purpose a Small-scale Industries Board and a Small-scale Industries Corporation have already been established. Four multi-purpose regional service institutions and their branches are in the process of organisation. The Central Government has placed a sum of Rs. 17 crores for giving loans and grants-in-aid to the industries for the current year. Among others, it is proposed to lay strong foundations for expanding industries such as—to mention a few—carpentry, smithy, shoe-making, utensil manufacture, *bidi*-making, etc. Plans are being evolved for organising production and distribution of these products on a scientific basis. This work will be facilitated, to a large extent, by having precise information on the nature of markets for these products, their quality, prices, etc. Such a market surely will enable the administration in charge of the development work to get production adjusted to the needs and the tastes of the consumer. Knowledge of market requirements is obtained by large-scale industrial houses by conducting marketing surveys. For small industries and cottage products, however, there has so far been no comprehensive market surveys. A beginning in this direction has, however, been made by the Bureau of Industrial Statistics, Calcutta. The Bureau has, under the directorship of Mr. T. Ghose and at the instance of the Union Ministry of Commerce and Industry, conducted a market survey of about 80 products in West Bengal. A brochure, entitled *Survey of Retail Markets: West Bengal*, published by the Bureau recently, furnishes very valuable information. This study is only of a limited nature, in that it covers a limited area and a limited number of manufactured goods. But it can be taken as a good model for similar studies in other parts of India.

The Bureau's *Survey* covers both seller and buyer surveys conducted concurrently in each market, in respect of 80 products, of which as many as 78 are hand-made and 2 factory-made. These products are grouped under ten heads, namely, agricultural tools, cutlery and fishing hooks, brass and bell-metal utensils, galvanised iron buckets, pottery and jugs, ropes and cords, fibre mats and baskets, leather sandals and shoes, dolls and toys and jewellery. The area covered by the *Survey* comprises (1) Calcutta, (2) certain urban centres other than Calcutta, and (3) certain selected rural centres in the Damodar Valley Zone of West Bengal.

The object of the *Survey* was to estimate the market position of the various hand-made products both from the point of view of sellers and buyers and to utilise the data for taking a decision on the extent to which technical help was necessary for small and village industries.

The *Survey* confirms that the buyer's market has definitely set in and that the supply of goods exceeds the demand, the sale being greatly influenced by the buyer's choice. A point of note revealed by its findings is that the buyer's market is more prominent in the outstation urban centres than in Calcutta. It is stated that price-cutting competition has already started in spades, cutlery products, galvanised iron buckets, brass and bell-metal utensils and dolls and toys. As for others such as fishing hooks, cord mats and jewellery, the position is normal.

Another significant finding of the *Survey* that confirms the existing public belief is that the production costs of hand-made articles are generally higher, the profit-margin is very low and that transport and other charges enhance their cost, as they are generally located in local areas. This is stated to be the reason why hand-made products do not usually reach distant markets, excepting a few items which have special demands in special markets. The *Survey* emphasises, in this context, that, for better and wider markets, standardised hand-made articles must be produced at a reasonably low cost. This is, however, not possible without mechanisation of cottage units and provision of modern know-how as well as finance.

The *Survey* discloses another notable feature relevant to marketing, namely, most of the hand-made products are supplied by individual producers and not by middlemen who play an important part in the distribution of manufactured articles. The *Survey*, therefore, lays stress on the need for marketing organisations to operate on the basis of "earn as you produce."

The major portion of articles for sale is procured through direct purchases by dealers. But these dealers have to invest a considerable amount of money for procuring the goods, though in many cases, "payment after sale" is also in vogue.

Lower prices of articles, higher purchasing power of buyers, improvement in quality, new design and better finish, protection against substitutes, additional capital for dealers to increase their holding capacity, free trade with Pakistan, etc., have been suggested as possible means to boost sales of hand-made products. Pottery dealers want protection against substitutes. Dealers in wooden and earthen dolls and toys complain about competition from plastic toys and want protection. Again, brass and bell-metal industries have a grouse against aluminium and enamelware substitutes. It is evident that these demands for protection against substitutes are a serious problem which needs to be tackled first. The *Survey* says that it is not possible to give protection against substitutes. What is most important is, according to it, the reorientation of quality design, finish, etc., of products which are too old and too obsolete to stand modern innovations. Producers of hand-made articles must keep pace, it avers, with the oft-changing consumers' choice.

A study of wholesale and retail prices of different articles reveals that the price of a factory-made spade is definitely cheaper than the one made by hand. The price of a hand-made spade is dearer in Calcutta than in outstation markets. A sickle is cheaper in the outstation market than in Calcutta. Higher cost of production seems to be the explanation for the difference in prices, besides the cost of transport. Most of the cutlery products are dearer in Calcutta than in outstations. This is due to size, quality and higher transport charges of the product for sale in Calcutta. But the retail price of a razor blade is the same both in Calcutta and in outstation markets.

Most of the buyers are stated to be satisfied with the quality, durability, etc., of hand-made products. Almost all of them, however, want a reduction in prices ranging from 24 per cent. to 38 per cent. Buyers' ability to pay being limited, current prices of hand-made products pinch the majority of them. The *Survey*, therefore, observes that, in order to maintain the economic health of the country, the demand for lower prices should be met through lowering the cost of production. This is possible, according to it, by reorganisation and provision of technical assistance at the producers' end. It suggests that, before taking such a step, it is essential to have a thorough survey of small and village industries, on the one hand, and a country-wide demand survey, on the other. "It is futile to equip small producers with modern equipments and technical know-how without *a priori* knowledge of their real difficulties as also the demand of their products." This is a piece of valuable advice which merits the prompt attention of the Small-scale Industries Board.

PLANNING FOR COTTAGE INDUSTRIES

The Planning Commission has set up a small committee of five persons for preparing a draft plan for the development of small-scale and village industries for inclusion in the second Five-year Plan. The Committee consists of: Prof. D. G. Karve (Chairman), Prof. D. R. Gadgil, Mr. V. L. Mehta and Mr. V. Nanjappa, Textile Commissioner, Bombay (members), and Dr. D. K. Malhotra, Deputy Secretary, Planning Commission (Secretary).

The terms of reference to the Committee are to prepare, in the light of the provision made in the draft plan-frame for village and small-scale industries and in the light of recommendations on the same subject made in the memorandum submitted by the panel of economists, a scheme of industry-wise and wherever possible, State-wise utilisation of resources to be earmarked for the purpose of development of these industries, as an integral part of the second Five-year Plan. The scheme should be prepared with particular reference to the following objectives:

(i) The bulk of the increased production during the plan period of consumer goods in common demand has to be provided by the village and small-scale industries;

(ii) employment provided by these industries should progressively increase; and

(iii) production and marketing in these industries are organised, in the main, on co-operative lines.

The Committee has by no means an easy task before it. Its scheme should be confined to the limits set by the plan-frame. It may be noted that the plan-frame has earmarked Rs. 200 crores for the development of small-scale and cottage industries. This is intended to enable the industry to provide greater employment and incomes for a large number of persons. The draft plan suggests that measures to encourage and protect these industries should be an integral part of the second Plan. The planners are conscious that a great deal of effort and organisation will be required for resuscitating small-scale industries.

The attempts so far made at developing cottage industries have brought in their wake a conflict between small and large-scale industries, as consumption goods are produced in both factories and cottages. In the case of cloth, for instance, handlooms are assigned by a system of excises and subsidies and by reservation of fields of production. A bitter controversy has centred round this kind of artificial stimulus to small units. The Economists who dealt with this problem, have stated that the principles of reservation may not be so easily applicable to all industries, but have felt that a comparatively stable relation between prices of hand and machine products could be maintained only through excises and subsidies. If the efficacy of these fiscal measures is found to be doubtful, they say that other measures may be adopted to implement a common production programme. In any case, the organisation of increased production through hand industry will, they aver, require considerable effort in distribution of supplies, of technical and financial assistance to the dispersed producers and the collection and sale of their products. They have laid stress on organisational effort in the Plan period in order to bring about increased production through cottage industries.

In view of the importance attached to the problem of increasing production through cottage industries, the five-man committee now appointed by the Planning Commission will have to devise measures calculated to enable village and small industries to produce the bulk of the consumer goods in common demand. It should also enumerate the category of goods covered by the term "consumer goods in common demand." Wherever such goods are produced in both factories and cottages, the Committee should examine how far the latter could be made not only to produce more goods but also to increase the number of persons that can be employed by them. In doing so, the Committee will have to bear in mind the capacity of consumers to pay for the products of cottage industries. In this connection, the Committee would do well to take note of the findings of a survey conducted by the Bureau of Industrial Statistics, Calcutta, briefly reviewed on this page.

INDIA'S NEGLECT OF EAST AFRICAN MARKETS

Despite a number of advantages India enjoys in the East African markets, its share in the total trade of this area appears to be almost negligible. Indian population in the area comprising Tanganyika, Kenya, and Uganda is about 170,000, and this small section controls nearly 70 to 80 per cent. of the total trade there. The wholesale and retail trades are mainly in the hands of Indians. But the share of Indian merchandise in the trade is hardly 6 to 7 per cent., with the exception of Uganda where export of cotton forms 29 per cent. of the total trade and is in the hands of Indians. This negligible share of India in the total trade of East African countries is attributed to many factors. For long, it has been the complaints of Indian settlers in East Africa that Indian exporters and industrialists have been indifferent to the need for developing the immense trading opportunities in the area and even now there seems to be no change in the position there. This is the gist of a comprehensive note prepared by Mr. M. P. Shah, Editor, *The Indian Exporter and Indian Importer*, Bombay, setting out the impressions of his tour of the area, early this year, with the object of studying the market conditions there. The causes mentioned by him for the failure of Indian trade to make headway in the region merit the attention of the Minister in charge of Export Promotion, Mr. D. P. Karmarkar, as also other organisations and industries interested in the trade.

Mr. Shah's study reveals that East Africa holds enormous scope for the sale of Indian leather goods. Many Calcutta firms are stated to be exporting these goods, but the manner in which these firms are executing the orders does not seem to enhance the reputation of Indian goods. The length of the leather pieces, for instance, does not tally with the invoiced measurement and, invariably falls short of the stipulated specification. Again, even where the goods are graded, the pieces sent are usually a grade lower than that mentioned in the invoice. Packing is always defective. Leather suit-cases are found with nail scratches, and locks neither open nor close easily. Screws are not tight. More or less the same complaints are made in respect of footwear.

There is also a good market for cement and sanitary hardware. India can deliver the goods earlier than Continental countries and in many cases, the articles are competitive. Yet, owing to lack of information and publicity, the market remains unexploited. In the case of cement, the steamer companies have, we are told, stipulated that they would not lift cement cargo, if it is less than 1,400 tons and that on their return journey they must be assured of cargo. This stipulation is stated to be a great deterrent to the development of cement trade in the region.

Steel furniture, office equipment, and other manufactures seems to have suffered owing to lack of publicity and distribution of catalogues. A great difficulty in the development of this trade is stated to be inadequate shipping facilities. These difficulties are also responsible for the negligible share in the East African trade of Indian motor cars and spares, electrical goods and equipment, pharmaceutical products and other preparations and sundry consumer goods. Most of this trade is in the hands of Japanese and British traders who have established their organisations to study the conditions of the market and supply goods according to the needs of consumers.

GOOD PERFORMANCE BY CALCUTTA ELECTRIC SUPPLY CORPORATION

SHARP RISE IN SALES AND REVENUE

THE 12 months ended 31st December, 1954, proved to be another year of substantial progress for the Calcutta Electric Supply Corporation Ltd. (Agent in India: Mr. I. A. Macpherson, Calcutta). In fact, the operations during the year resulted in record results in the history of the Company, barring, of course, the four years 1941-44, the reports for which were not published due to war-time restriction. Thus, the sales of energy, which had crossed the 1,000 million unit-mark in 1953 (to 1,013 million units), grew to touch a new peak of 1,099.4 million units in the year under review, thus keeping up the upward trend since 1947. The gross revenue, which had been steadily rising since 1946 and touched about £5 million in 1953, improved further to £5.29 million in 1954. It will be interesting to note that the gross revenue of the Company has more than doubled in the course of the past one decade, from £2.46 million in 1945 to £5.29 million in 1954.

The gross profit of the Company for the year under review amounts to £1.9 million, as compared with £1.6 million for 1953, thus establising a new high level. The provision for depreciation on the scale provided under the Electricity (Supply) Act, 1948, has been raised from £710,984 to £748,485. A provision of £95,000 for taxation has also been made, as against *nil* in the previous year. For several years past, the Company had been relieved of a taxation charge on account of the initial depreciation allowances arising from large post-war capital expenditure. The U.K. allowances that had been carried forward from the previous years have now been fully absorbed and have been taken into account in the computation of the taxation charge for 1954. Out of the net profit of £1,056,748 (as against £906,517), the allocation to debenture sinking fund absorbs £112,702, as compared with £106,903 in the previous year, retiring gratuity fund gets £35,000 (same as last year), and contingency reserve fund £70,978 (as against £68,918). A sum of £192,223, representing one-fifth of the total of the special appropriations permitted by the Government of West Bengal during the four years 1949 to 1952, has been set aside to a special reserve in implementation of the Company's arrangement with the State Government. This reserve is for the purpose of meeting any deficiency in future reasonable returns allowed under the Electricity (Supply) Act, or, if not required for that purpose, for the benefit of consumers in such manner as the Government may direct. This is the second of the five annual appropriations of this nature which fall to be made from the net revenue. Incidentally, the Directors point out that the clear profit of the Company for 1954 does not exceed the reasonable return. In view of the considerable capital expenditure on distribution which will have to be incurred during the next two years for augmenting the Company's supply within its licensed area with current from the Damodar Valley Corporation, the Directors have deemed it advisable to allocate a sum of £300,000 to the "net-revenue special appropriation" account. The dividend on the 5 per cent. preference stock absorbs £95,000 and that on the ordinary stock, maintained at 6 per cent. (actual), £255,758, leaving a surplus of £152,818 to be carried forward, as against £157,731 brought in.

The following comparative table shows the progress of the Company during the last three years:

(In thousands of £'s sterling)

	For the year ended 31st December			
	1954	1953	1952	1951
Sale proceeds of current	5,212	4,919	4,705	4,288
Other income	79	77	69	62
Cost of fuel, wages and other expenses of generation, distribution, etc.	2,648	2,458	2,390	2,140
Other expenses	743	925	704	592
Gross profit	1,900	1,617	1,680	1,618
Depreciation	748	711	698	519
Taxation	95			1
Net profit	1,057	906	982	1,098
To reserves	806	559	640	640
Dividends—				
5 per cent. preference	95	95	95	95
Ordinary	256	256	256	256
	(6%)	(6%)	(6%)	(6%)
Carry forward	152	158	161	170

The sharp rise of 86.4 million units in sales of energy during 1954 is attributed to the all-round demand for more power. The growth of residential houses in the suburbs of Calcutta City, due to congestion in the City, and the increasing popularity of electricity appliances among the middle class, accounted for an expansion in demand for domestic and commercial load. The increase in working hours of jute mills and the larger industrial production in textile mills, steel works, engineering and aluminium works and chemical works accounted for a larger demand for industrial high tension power. Public lighting also called for an increase in consumption, following the opening of many new roads in Calcutta City and developments in adjoining municipalities. A marked improvement in demand in the field of traction was also noted, because there was no suspension of tram services during the year, as in 1953, the frequency of service was raised on some of the routes and the number of cars in commission was also increased. Further, there was more demand for power in bulk supplies, mainly from the North Calcutta grid of the West Bengal Government which has been expanding its area of supply.

The increase in cost of fuel, wages and other expenses of generation, distribution, etc., is due to the larger consumption of fuel, increases in rates of overtime paid to non-factory workers during the latter part of the year and greater expansion in the Company's operations. The fall in "other expenses" is accounted for by the decline in interest charges and absence of any provision similar to that made last year for employees' bonuses in respect of former years.

The balance-sheet of the Company, as on 31st December, 1954, shows a very satisfactory financial position. The paid-up capital of £6.16 million is supplemented by reserves and surplus aggregating £6.78 million. The outstanding liability on account of the 5 per cent. debenture stock (1970) is £4.44 million. The provision for taxation stands at £89,000. The current liabilities aggregate £3.20 million. The expenditure on capital account during the year amounted to £907,700 (almost the whole of which represents extensions and improvements to distribution system) bringing the gross value of the block account to £27.99 million. This has been written down to a book value of £18.83 million. The current assets amount to £1.60 million and the cost of issue of debentures still to be written off is £250,057.

The £1 paid-up ordinary stocks are being currently quoted on the Calcutta Stock Exchange at Rs. 15, at which rate and on the basis of the latest dividend, the yield works out to 5.3 per cent. per annum.

SIRSILK LTD.

The working of Sirsilk Ltd. (Managing Agents: Messrs. Birla Brothers Ltd., Hyderabad-Deccan), during the year ended 30th September, 1954, has resulted in a loss of Rs. 16.22 lakhs, without providing for depreciation. This is the first year in which regular production of acetate yarn commenced after the inception of the Company, in 1946. The construction and erection work of the factory was completed upto the spinning section during the year under review and the cellulose acetate plant, including acetic acid plant, acetone plant and spinning sections went into regular production towards the close of the year. But before a continuous production could be achieved, according to the Directors, many machines had to be re-erected, damaged and rusted parts had to be replaced and processes modified, which contributed to the aforesaid loss.

The Company would appear to have faced some initial difficulty in selling its production of acetate yarn. The acetate yarn is being manufactured, for the first time, in India by Sirsilk Ltd. "Its consumption in the past being negligible," the Directors point out in their report, "the manufacturers of fabrics were neither acquainted with the methods of processing the yarn for manufacture of varied types of cloth nor conversant with uses of the acetate for producing elegant designs." It would appear that considerable difficulties had to be faced in popularising it, as the consumers were in the beginning "very slow and reluctant to take it." The Directors, however, add that the initial difficulties have since been overcome and that the market has recognised the finer qualities of the yarn and fabrics made therefrom. They, therefore, expect the demand for acetate yarn to increase gradually.

The Company's accounts show that the expenses during construction from 1st October, 1953 to 30th April, 1954, amounting to Rs. 15.93 lakhs, have been capitalised. Besides, there have been fresh additions to the block account to the extent of Rs. 14.73 lakhs bringing the total cost of the gross block to Rs. 498.57 lakhs. During the year under review, the Company repaid a loan of Rs. 62.49 lakhs to the Government of Hyderabad and the balance still payable to the State Government as on 30th September, 1954, is Rs. 288.08 lakhs, besides the accrued interest of Rs. 50.17 lakhs thereon. Unsecured loans under clean cash credit account with the Hyderabad State Bank amount to Rs. 44.32 lakhs.

The Company entered into a new agreement on 10th July, 1954 with Messrs. Lansil Ltd. of Lancaster, England, cancelling all other agreements in force on that date. Under the old agreements, the Company had earmarked 15,555 fully paid-up ordinary shares of O.S. Rs. 100 each for allotment and had also agreed, in principle, to allot further an equal number of fully paid-up shares to Messrs. Lansil Ltd., besides other payments. In view of the new agreement, however, the Company has been absolved from the above liabilities and has to pay only a sum of £50,000 in instalments to Messrs. Lansil Ltd., subject to the approval of the Reserve Bank of India, for which an application has already been made.

SRI KRISHNARAJENDRA MILL EARNS HIGHER PROFIT

Encouraging results are disclosed by the audited accounts of the Sri Krishnarajendra Mills Ltd. (Managing Director and Chairman: Mr. H. N. Pallegar, I.A.S. Mysore) for the year ended 31st March, 1955. Not only has the upward trend in profit noted in the previous two years been maintained but the profit has nearly doubled itself. Thus, the gross profit, which has risen from Rs. 6.66 lakhs for 1951-52 to Rs. 9.20 lakhs for 1953-54, has advanced to as much as Rs. 17.78 lakhs for the year under review. It must, however, be mentioned here that the major portion of this improvement is the result of revaluation of stocks of cotton, yarn, cloth, hosiery and socks. We find that a sum of Rs. 5.60 lakhs held as margin for valuation of stocks in previous years has been utilised to inflate the value of closing stocks. After making allowance for this adjustment, it is seen that the gross profit has risen by Rs. 2.98 lakhs on account of trading operations. Even this performance must be regarded as creditable in view of the "acute competition in the buyers' market." It may be recalled that, at the last annual general meeting of the Company, the Chairman struck a cautious note saying that "of late, buyers have become very discriminating and really selective regarding price and quality, and it is becoming more and more difficult to sell the Mills' products at attractive prices in the increasingly competitive trading conditions that are obtaining at present."

Following the encouraging performance, the Directors have stepped up the dividend by 1 per cent. to 10 per cent. per annum. This is the third consecutive year for which the distribution to shareholders has been raised. A good part of the expansion in profit has been utilised to strengthen the reserves. This they have done by creating a cotton price fluctuation reserve, with an initial credit of Rs. 2.35 lakhs from the year's profit. They have also enriched the dividend equalisation reserve by Rs. 30,000, to which a sum of Rs. 20,000 had been added last year. The former allocation is only as it should be, because the improvement in net profit is largely the result of revaluation of stock-in-trade, as already indicated.

The following comparative table shows the Company's progress during the past three years:

(In lakhs of rupees)

	For the year ended 31st March			
	1955	1954	1953	1952
Sale proceeds	97.52	88.05	85.39	78.31
Stocks	34.71	23.11	22.65	26.21
Expenses*	80.74	80.63	80.45	72.34
Profit	17.78	9.20	6.75	6.66
Provision for—				
Depreciation	6.00	4.32	3.10	1.80
Taxation	5.44	1.12	1.00	2.00
Net profit	6.34	3.76	2.65	2.86
To reserves	2.65	0.48	0.74	0.81
Dividend	3.67	3.30	2.94	2.20
	(D. 10%)	(D. 9%)	(D. 8% + B.3%)	(D. 4½% + B.1½%)
Carry forward	0.28	0.26	0.25	0.27

* Approximate.

The stocks as at the end of the year under review include Rs. 5.60 lakhs held as margin for valuation in stock in previous years. Of the provision of Rs. 5.44 lakhs for taxation, provision for the year under review accounts for only Rs. 2.12 lakhs and the balance represents extra provision for previous years.

The balance-sheet of the Company as on 31st March, 1955, shows that the paid-up capital of Rs. 36.70 lakhs is supplemented by reserves and surplus aggregating Rs. 16.92 lakhs. Provision for taxation stands at Rs. 2.12 lakhs. Current liabilities amount to Rs. 23.73 lakhs. The gross block of the value of Rs. 71.76 lakhs has been written down to Rs. 20.40 lakhs. The current assets amounting to Rs. 59.07 lakhs exceed the current liabilities and provision for taxation by a handsome margin of Rs. 33.22 lakhs.

The Rs. 50 fully paid-up shares of the Company are being currently quoted on the Madras Stock Exchange at Rs. 69 *cum-div.* On an *ex-div.* annum free of tax.

A joint-stock company with an authorised capital of Rs. 10 lakhs is proposed to be established by the Mysore State Government to start a fruit canning industry in the State.

The paid-up capital of the Company will be Rs. 4.5 lakhs, of which the Government investment will be Rs. 2 lakhs. A committee has been set up to select a suitable site for the industry which will be located outside Bangalore.

VICTORIA MILL SHOWS SATISFACTORY RESULTS

DIVIDEND WELL MAINTAINED

THE audited accounts of the Victoria Mills Ltd., Bombay (Secretaries, Treasurers and Agents: Messrs. Mangaldas Mehta & Co., Ltd., Bombay) for the year ended 31st December, 1954, show that the trading results for the year have been satisfactory. The gross profit (before providing for Agents' commission, depreciation and taxation) amounts to Rs. 16.45 lakhs, which, as compared with that for the previous year, represents a small decline of Rs. 1.79 lakhs. Though the fall in profit is in consonance with the general trend of profits of textile mills in Bombay, it must be noted that, in the case of the Victoria Mills, it is comparatively very much smaller than in those of many other mills. Even this recession is not the result of actual trading, but is on account of the additional bonus for 1952 and extra dearness allowance for the years 1953 and 1954 which the Company, along with other mills, had to pay under the award of the Labour Appellate Tribunal. The dividend on ordinary shares has, however, been maintained at 15 per cent. and this is the fourth year in succession for which this dividend is being paid, after it had been raised from 12½ per cent. paid for 1949 and 1950.

The salient features of the Company's working results for the year under review are presented against the background of those for the previous three years in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st December			
	1954	1953	1952	1951
Sale proceeds (net)	205.03	205.78	195.20	209.02

It will be noted that the net sale proceeds of cloth, yarn and waste for the year under review have been nearly maintained at the previous year's level, despite the fall in prices of cloth. Though the downward trend in the cost of cotton consumed by the Company during the previous two years continued in the year under review also, the extent of decline was almost negligible. The increase in other expenses was much less than that noted in previous years. Whatever increase there was, was mainly accounted for by the rise of Rs. 3.49 lakhs in salaries and wages, which, in turn, was due to the extra payment of Rs. 5.50 lakhs on account of additional bonus for 1952 and dear food allowance for 1953 and 1954 as per the award of the Labour Appellate Tribunal. The actual profit on account of trading would, therefore, have been much higher than that for 1953 but for this additional expense.

The provision for depreciation has been increased by Rs. 1.50 lakhs to Rs. 6 lakhs, consequent on the substantial addition to the block account during the year. The allocation to taxation has also been raised by Rs. 1 lakh. As a result of these increases, the net profit is lower by nearly Rs. 4 lakhs, at Rs. 2.54 lakhs. The Directors, therefore, have not been able to strengthen the reserve fund, which had received last year a sum of Rs. 1 lakh out of the profit for 1953. This, however, does not matter much, because the Company's reserves are already at an impressive level.

The reserves and surplus of the Company as on 31st December, 1954, aggregate Rs. 32.22 lakhs, as against a paid-up capital of Rs. 24 lakhs. The provision for taxation stands at Rs. 15.54 lakhs and current liabilities amount to Rs. 32.62 lakhs. There has been an addition of Rs. 15.03 lakhs to the gross block during the year, bringing the total value up to the end of the year to Rs. 61.35 lakhs. Of this addition, machinery accounts for Rs. 13.24 lakhs and land and buildings for Rs. 1.77 lakhs. This is in keeping with the policy of the management to renovate and replace the old machinery. As against the gross value of block, the depreciation fund built up amounts to Rs. 37.76 lakhs. The current assets aggregate Rs. 80.79 lakhs (of which cash balances alone account for Rs. 20.48 lakhs) and cover the current liabilities and provision for taxation by a wide margin of Rs. 32.63 lakhs.

The Directors have a desire to capitalise a part of the Company's reserves and to issue bonus shares. They are, however, awaiting the results of applications submitted to the Government of India by other companies. As soon as the Government gives consent to other companies to augment their capital, the Directors of the Victoria Mills propose to take up the matter. It may be noted, in this connection, that the Company had capitalised as much as Rs. 20 lakhs out of its reserves during the years 1942 to 1949. Of this, Rs. 12 lakhs were distributed to ordinary shareholders in the form of ordinary shares and Rs. 8 lakhs in the form of preference shares. In fact, the entire preference capital had been raised by capitalisation of reserves.

Points From The Chair

No Room for Controversy

"IF the primary objective of raising the standard of living of our people substantially and eliminating the serious menace of growing unemployment is to be achieved within a reasonably short period, then favourable conditions will have to be created under which the talent, experience and resources of all sections of our people will be fully utilised for completing this gigantic task of building of a new India. We have, as a matter of fact, to fight poverty and unemployment on a war-time basis and, as in cases of war or national emergency, all our resources, human and material, must be harnessed for achieving our national goal as quickly as possible. When such gigantic task lies ahead, there is no room for any controversy and widest possible scope should be given for peoples' creative energies and resources to be utilised in constructive and productive channels. It is, therefore, regrettable that, at such a historical period, we are engaged in frittering our energies in fruitless controversies and in creating conditions which might come in the way of accelerating the pace of economic development."

G. D. SOMANI, M.P.,
Shree Digvijay Cement Co., Ltd.

Discouraging Climate for Private Sector

"Unnecessary, vague and inconsistent references to the Avadi resolution, regarding socialistic pattern of society, by several leaders, the Fourth Amendment to the Constitution, making the issue of compensation unjusticiable, the Company Law Amendment Bill, the debate in the Lok Sabha on the State Bank Bill, the uncertainties regarding nationalisation, the labour opposition to rationalisation, etc., certainly create disturbing effect on the psychology of the investing public and adversely affect capital formation. Sometimes, an impression is created as if the private sector is on probation and the risk capital has no chances of reasonable award. I have said this just to show how imperative it is to avoid creating a discouraging climate. At the same time, I am not inclined to believe that Government is deliberately planning the destruction of private enterprise. I would refer to the Government-backed Industrial Finance Corporation and Industrial Credit and Investment Corporation for credit facilities to the private sector and the development rebate amounting to 25 per cent. of the cost of all new plant and machinery installed for business purpose, which is a very important concession. Our Prime Minister has also very often said that the Government desires the continued existence of the private sector. At the same time, it should not be forgotten that the private sector has few chances of survival, if it fails to fulfil public needs."

RAVIKANT D. SHAH,
Andhra Cement Co., Ltd.

Handicap to Industries

"I cannot but express concern regarding the serious handicap that all industrial establishments have been experiencing due to shortage of power and inadequate transport facilities. There is still considerable backlog of power demand to be met in Bombay over and above the power required to remove the staggering arrangements in vogue in the textile mills. This situation, therefore, needs improvement at the hands of the appropriate Government departments. The other bottleneck from which industries are suffering is the unsatisfactory supply of wagons by the railways for carrying of coal, important raw materials and finished products. As regards wagons allocated for coal alone, the Company has been losing about 30 per cent. of its quota, in view of the inability of the railways to supply the necessary wagons. Though in this matter the Commissioners of Coal, both of the State and at the Centre, have been helping us out by granting special *ad hoc* quotas and allowing us to build up reasonable stocks, we cannot help expressing our concern at the transport situation as it is developing in this country."

KASTURBHAI LALBHAI,
National Rayon Corporation Ltd.

Home Service Insurance in the U.K.

"The 'home service' insurance industry continues to play an important part in the economic life of the country. Some £150 millions a year in premiums are being collected, and policyholders' funds are increasing at a rate of over £40 millions a year. These are real savings and are an important factor in the nation's effort to keep a check on inflation. In addition, some part of the £30 odd millions paid out on maturing endowment claims each year to policyholders, whose thrift has reaped these returns, will no doubt be retained by them in some form of savings."

J. A. JEFFERSON,
Britannic Assurance Co., Ltd.

COMPANY MEETINGS AND DIVIDENDS

NEW CINNATOLLIAH TEA CO., LTD. Annual General Meeting, Calcutta, 21st June, 1955. Dividend: Rs. 10 per share. Transfer books remain closed from 13th to 21st June, 1955, both days inclusive.

UPPER GANGES VALLEY ELECTRICITY SUPPLY CO., LTD. Half-yearly General Meeting, Calcutta, 23rd June, 1955. Dividend: As. 7 per share. Transfer books remain closed from 17th to 23rd June, 1955, both days inclusive.

BAREILLY ELECTRICITY SUPPLY CO., LTD. Half-yearly General Meeting, Calcutta, 23rd June, 1955. Dividend: As. 8 per share. Transfer books remain closed from 17th to 23rd June, 1955, both days inclusive.

SAUGOR ELECTRICITY SUPPLY CO., LTD. Half-yearly General Meeting, Calcutta, 23rd June, 1955. Dividend: As. 4 per share. Transfer books remain closed from 17th to 23rd June, 1955, both days inclusive.

WAGON SHORTAGE AFFECTS REWA COAL

DUNCAN BROTHERS TEA GROUP REPORTS BETTER RESULTS

Rewa Coalfields Ltd.

THE directors of the above Company (Managing Agents: Messrs. Shaw Wallace & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st December, 1954.

The Company's profit for the half-year after the inclusion of Rs. 25,293 (Rs. 26,964) brought forward is Rs. 1,52,350 (Rs. 3,56,232). And after making provision for taxation Rs. 45,000 (Rs. 1,43,384) there remains a sum of Rs. 1,07,350 (Rs. 2,12,848). Out of this amount the directors have recommended payment of a dividend at the rate of 12½ (20) per cent. per annum free of income-tax, absorbing Rs. 84,375 (Rs. 1,35,000) leaving to be carried forward Rs. 22,975 (Rs. 27,848).

Output and despatches of steam and other grades of coal for the last three half-years are as follows:—

Half-year ended.	*Raisings.* Tons.	*Despatches.* Tons.
31st December, 1954 ...	1,58,272	1,52,840
30th June, 1954 ...	1,61,005	1,60,064
31st December, 1953 ...	1,59,034	1,57,021

Wagons continued to be in short supply throughout the period under review and in consequence both Burhar and Umaria Collieries operated on restricted production. There has been no improvement in the transport position since the close of the half-year and heavy stocks particularly of small coal have accumulated at both collieries.

Good progress has been made in the development and fitting out of the new mine at Amlai, but the construction of the siding by the Railway Authorities is still awaited. A start in production must necessarily await the installation of the new siding.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	13,50,000	Block ...	7,99,000
Reserves ...	8,03,385	Stock of coal	1,47,060
Provision for taxation ...	3,95,000	Stores ...	4,65,410
Liabilities ...	16,26,470	Debts, deposits and advances ...	16,25,720
Profit and loss account ...	22,975	Investments ...	2,83,415
		Cash ...	8,77,225
Rs.	41,97,830	Rs.	41,97,830

Seeyok Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submit the audited accounts for the year ended 31st December, 1954.

The accounts disclose a profit of Rs. 2,00,084 (Rs. 48,216). On transfer of this sum to profit and loss account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 1,81,697 (Rs. 56,071), of which the directors have transferred Rs. 82,500 (Rs. 20,000) to revenue reserve and Rs. 35,000 (Rs. 10,000) to buildings and machinery reserve. The directors recommend a dividend of 15 (2½) per cent. leaving Rs. 19,197 (Rs. 18,571) to be carried forward.

The tea crop was 2,221 maunds as compared with 2,056 maunds in 1953. The average selling price was Rs. 3-5-3 per lb. against Rs. 2-7-1 per lb. in the previous year. Planted area remains at 389.32 acres.

Estimates for 1955 provide for a crop of 2,000 maunds at an outlay of Rs. 3,95,300, including inland freight and sale charges.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3,00,000	Block ...	2,60,000
Reserves ...	1,96,302	Stores and supplies ...	13,741
Provision for taxation ...	48,397	Tea sales receivable ...	1,89,056
Liabilities ...	1,02,173	Advances and deposits ...	20,685
Profit and loss account ...	19,197	Cash ...	1,82,587
Rs.	6,66,069	Rs.	6,66,069

Poobong Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers and Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1954.

The accounts disclose a profit of Rs. 1,80,965 (Rs. 22,051). On transfer of this sum to profit and loss account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 1,32,089 (Rs. 30,328), of which the directors have transferred Rs. 32,000 (Rs. 10,000) to revenue reserve and Rs. 45,000 (Rs. 5,000) to buildings and machinery reserve. The directors recommend a dividend of 15 (2½) per cent. leaving Rs. 10,089 (Rs. 7,828) to be carried forward.

The tea crop weighed out at 2,109 maunds as compared with 1,845 maunds in 1953 and the average selling price was Rs. 3-6-5 per lb. as against Rs. 2-3-9 per lb. in the previous year. Planted area remains at 500.43 acres.

Estimates for 1955 provide for a crop of 2,200 maunds at an outlay of Rs. 4,06,930 including inland freight and sale charges.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3,00,000	Block ...	2,85,000
Reserves ...	3,73,387	Stores and supplies ...	21,906
Provision for taxation ...	71,548	Tea sales receivable ...	1,47,140
Liabilities ...	86,605	Advances and deposits ...	19,176
Profit and loss account ...	10,089	Investments	1,30,276
		Cash ...	2,38,131
Rs.	8,41,629	Rs.	8,41,629

New Cinnatolliah Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1954.

The accounts disclose a profit of Rs. 3,97,483 (Rs. 2,00,667). On transfer of this sum to profit and loss account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 3,17,913 (Rs. 1,61,164), of which the directors have transferred Rs. 1,00,000 (Rs. 75,000) to revenue reserve, Rs. 1,30,000 (Rs. 40,000) to buildings and machinery reserve and Rs. 15,000 (*nil*) to hall reserve. The directors recommend a dividend of 10 (5) per cent. leaving Rs. 22,913 (Rs. 21,164) to be carried forward.

The tea crop weighed out at 4,807 maunds as compared with 4,707 maunds in 1953. The average selling price was Rs. 3-1-8 per lb. compared with Rs. 2-3-3 per lb. in the previous year. Planted area is now 937 acres.

Estimates for 1955 provide for a crop of 5,300 maunds at an outlay of Rs. 8,27,200 including inland freight and sale charges.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,00,000	Block ...	4,00,000
Reserves ...	3,60,000	Stores and supplies	40,864
Provision for taxation ...	1,10,383	Tea sales receivable ...	6,71,707
Liabilities ...	2,17,706	Advances and deposits ...	18,487
Profit and loss account ...	22,913	Cash ...	79,944
Rs.	12,11,002	Rs.	12,11,002

Pussimbing Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Davenport & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1954.

Although hail damage was not experienced, weather conditions were adverse, with drought early in the season and practically continuous rain throughout the monsoon, causing widespread blister blight. A crop of 1,58,740 (1,03,418) pounds of tea was made.

The total net average sale price including cost of export rights sold, was As. 58.67 (As. 38.44) and the total working cost per pound of tea produced was As. 35.98 (As. 39.78).

The gross profit for the year is Rs. 2,16,234 (Rs. 32,156), out of which the directors have provided Rs. 33,037 (*nil*) for taxation, Rs. 14,339 (Rs. 10,000) for depreciation and replacements, Rs. 10,000 (*nil*) for renewals and additions reserve and Rs. 17,200 (Rs. 6,303) for reserve for staff expenses. Allowing for these and the other expenses, there is a net profit for the year of Rs. 1,42,391 (Rs. 17,703) and a final balance on this account of Rs. 1,39,169 (debit of Rs. 33,222), out of which the cumulative preference dividends for the years 1951, 1952, 1953 and 1954 and an interim dividend of 5 (*nil*) per cent. on the ordinary shares, absorbing in all Rs. 67,650 (*nil*) were paid on the 18th April, 1954. The directors propose to deal with the remaining balance of Rs. 41,519 (debit of Rs. 33,222) as follows:—

Pay a final dividend of 5 (5) per cent. on the ordinary shares (making 10 (5) per cent. for the year) Rs. 10,250 (*nil*) and carry forward to 1955 Rs. 31,269 (debit of Rs. 33,222).

Estimates for 1955 are based on a crop of 2,000 maunds of tea at a cost of Rs. 3,66,512. In addition capital expenditure of Rs. 24,000 will be incurred on two tea sifters and a land rover.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,10,000	Block ...	4,20,500
Reserves ...	2,24,733	Stores and supplies ...	44,961
Provision for taxation ...	43,694	Stock of 1954 crop ...	57,185
Liabilities ...	34,959	Deposits and advances ...	67,692
Profit and loss account ...	1,09,169	Investments	1,928
		Cash ...	2,30,289
Rs.	8,22,555	Rs.	8,22,555

Balanoor Tea and Rubber Co., Ltd.

The directors of the above Company (Managing Agents: Young India Agencies Ltd., Madras) submit the audited accounts of the Company for the year ended 31st March, 1955.

The Company's working for the period under review shows a profit of Rs. 5,58,184 (Rs. 2,54,420) to which is added the balance brought forward from last year of Rs. 9,199 (Rs. 32,070), making a total of Rs. 5,67,383 (Rs. 2,86,489). After deducting dividend on preference shares at 7½ per cent. per annum paid Rs. 18,750 (Rs. 18,750), interim dividend at 10 (*nil*) per cent. on ordinary shares paid Rs. 82,491 (*nil*) and 10 (10) per cent. of the net profit to managing agents Rs. 55,618 (Rs. 25,441), there is a balance of Rs. 4,10,324 (Rs. 2,42,298). From this amount, the directors recommend to pay a final dividend of 10 (12½) per cent. plus bonus of 5 (6¼) per cent. on ordinary shares absorbing Rs. 1,23,741 (Rs. 1,03,125), to transfer to taxation reserve Rs. 2,26,110 (Rs. 30,000), to transfer to reserve fund Rs. 25,000 (Rs. 1,00,000) and to carry forward to next year Rs. 35,473 (Rs. 9,173).

The acreage of the estates is tea mature 579.00 acres, coffee immature 27.00 acres, coffee mature 645.00 acres, rubber 179.40 acres and reserve and minor crops 480.10 acres.

Crop and Estimate.—Tea crop during the year was 4,21,344 lbs. as against previous year's crop of 3,79,245 lbs. All in cost of tea was 112 (125.5) cts. per lb. and the average sale price realised 218 (177.4) cts. Estimate for the next year is 3,90,000 lbs. Coffee crop was 783 cwts. against previous year's crop of 1,432½ cwts. Estimate for next year is placed at 2,240 cwts. Rubber crop was 32,312 lbs. against previous year's crop of 34,615 lbs. Estimate for the next year is placed at 34,000 lbs. The Company's estates are well maintained.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	10,74,910	Block ...	11,04,535
Reserves ...	5,85,090	Stock on hand	1,58,179

Devon Tea and Produce Co., Ltd.

The directors of the above Company (Managing Agents: Young India Agencies Ltd., Madras) submit the audited accounts of the Company for the year ended 31st March, 1955.

The Company's working for the period under review shows a profit of Rs. 3,19,329 (Rs. 1,48,194) to which is added the balance brought forward from last year of Rs. 22,821 (Rs. 26,935), making a total of Rs. 3,42,150 (Rs. 1,75,129). From this amount is deducted dividend on preference shares at 7½ per cent. per annum paid Rs. 15,000 (Rs. 15,000), interim dividend of 10 (*nil*) per cent. on ordinary shares paid Rs. 29,996 (*nil*) and 10 (10) per cent. of the net profit to managing agents Rs. 31,932 (Rs. 14,819), leaving a balance of Rs. 2,65,221 (Rs. 1,45,310). The directors recommend to pay a final dividend of 10 (12½) per cent. plus a bonus of 5 (*nil*) per cent. on ordinary shares Rs. 44,996 (Rs. 37,500), to transfer to taxation reserve Rs. 1,11,983 (*nil*), to transfer to reserve fund Rs. 50,000 (Rs. 50,000), leaving a balance of Rs. 58,242 (Rs. 22,810) which the directors recommend be carried forward to next year.

The acreage of the estates is tea mature 450.00 acres, tea immature 15.00 acres, coffee 511.54 acres and reserve and minor crops 911.40 acres.

Crop and Estimate.—Tea crop during the year was 2,53,177 lbs. as against previous year's crop of 2,22,243 lbs. All in cost of tea was 112 (128.2) cts. per lb. and the average sale price realised 216 (175.0) cts. Estimate for the next year is 2,30,000 lbs. Coffee crop was 343 cwts. against previous year's crop of 929 cwts. Estimate for the next year is placed at 1,300 cwts. The Company's estates are well maintained.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital	4,99,960	Block ...	5,79,823
Reserves ...	3,55,040	Stock of tea and coffee	1,29,457
Provision for taxation ...	38,017	Stores on hand	64,016
Liabilities ...	71,147	Debts, deposits and advances ...	1,02,966
Profit and loss account ...	3,12,154	Investments	13,258
		Cash ...	3,86,796
Rs.	12,76,318	Rs.	12,76,318

Raneegunge Coal Association Ltd.

The directors of the above Company (Managing Agents: Messrs. B. N. Elias & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September, 1954.

Coal raisings, despatches and stocks

	Half-year ended 30-9-53 Tons.	*Half-year ended* 31-3-54 Tons.	*Half-year ended* 30-9-54 Tons.
Raisings ...	1,43,490	1,85,944	1,72,761
Despatches ...	1,55,592	1,58,323	1,70,086
Stocks ...	9,691	37,282	39,956

Raisings for the half-year showed a decrease of 13,183 tons as compared to the previous half-year. The drop in raisings was due to the Company having to bring its output in line with the target set by Government under the Conservation Act. Despatches increased by 11,763 tons over the previous half-year, but we were unable to dispose

of the entire output or to reduce the carryover of stocks. Stocks therefore increased slightly over the previous half-year.

Coke Manufacture.—The Company manufactured during the half-year under review 2,662 tons of beehive hard coke. This is a slight increase over the previous half-year. 3,640 tons were despatched and 238 tons remain in stock. Precautions taken to protect the collieries during the Monsoon were quite satisfactory.

Labour.—Relationship with labour has been satisfactory during the period under review. However, most Coal Companies are now under Tribunal to consider demands from workers for higher wages and added amenities. The Company is also a party to this dispute. Government's decision in this matter will not be known for some time. It is, therefore, not possible to assess the effects of any award that may be issued by Government at this stage.

The Company's profit for the half-year after inclusion of Rs. 72,002 (debit of Rs. 97,825) brought forward is Rs. 3,07,197 (Rs. 27,432) and after making provision for taxation Rs. 1,00,000 (*nil*) there remains a balance of Rs. 2,07,197 (Rs. 27,432) from this balance the directors have placed machinery replacement and development reserve Rs. 1,00,000 (*nil*) and recommend the payment of a dividend of As. 4 (*nil*) per share absorbing Rs. 59,988 (*nil*) leaving a balance to be carried forward Rs. 47,209 (Rs. 27,432).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	23,99,500	Block ...	35,89,718
Reserves ...	18,17,105	Stock of coal	5,15,457
Provision for taxation ...	2,00,000	Stores ...	6,11,341
Liabilities ...	21,59,837	Debts and advances ...	18,72,420
Profit and loss account ...	47,209	Investments	8,158
		Cash ...	26,557
Rs.	66,23,651	Rs.	66,23,651

Vijaya Mills Co., Ltd., Ahmedabad

The directors of the above Company (Agents: Messrs. Haridas Achratlal and Co., Ltd., Ahmedabad) submit the audited accounts of the Company for the year ended 31st December, 1954.

During the year, the Company made a profit of Rs. 8,65,562 (Rs. 8,37,853) to which is added the last year's balance of Rs. 31,806 (Rs. 16,259), making a total of Rs. 8,97,368 (Rs. 8,54,112). After deducting donations made to the public charitable institutions amounting to Rs. 4,604 (Rs. 5,306), there is an available sum of Rs. 8,92,764 (Rs. 8,48,806) from which the directors recommend the following allocations:—

To machinery and building depreciation fund account Rs. 8,00,000 (Rs. 8,00,000), to dividend equalisation fund account Rs. 50,000 (*nil*), to charity fund account Rs. 10,000 (Rs. 10,000) and to carry forward to next year's account Rs. 32,764 (Rs. 31,806). The directors recommend to transfer a sum of Rs. 2,71,600 (Rs. 2,71,600) from the reserve fund of the Company for the payment of dividend as under:—

To payment of income-tax free, interest on 3,500 second cumulative preference shares of Rs. 100 each at 4 per cent. for the year 1954 Rs. 14,000 (Rs. 14,000), to payment of subject to income-tax, interest on 2,800 third cumulative preference shares of Rs. 100 each at 4½ per cent. for the year 1954 Rs. 12,600 (Rs. 12,600) and to payment of dividend at Rs. 22 (Rs. 22) and bonus at Rs. 13 (Rs. 13), making the total of Rs. 35 (Rs. 35) per share, both income-tax free on 7,000 ordinary shares of Rs. 400 each for the year 1954 Rs. 2,45,000 (Rs. 2,45,000).

During the year under report there was no marked change in the cost of production. Cotton prices were almost steady. But the cloth prices especially in the last six months of the year showed a downward tendency, because the buying capacity of the public was reduced. Taking the above factors into account, the working of the Company will be found satisfactory.

Company's machinery, buildings, cotton, cloth, stores, etc., have been insured against fire. Profit and standing charges insurances have been covered. Only a small risk has been carried by the Company.

The mill has worked for two shifts during the year. There are 36,176 ring spindles and 780 looms along with the necessary processing plants.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	34,30,000	Block ...	1,03,76,340
Reserves ...	29,08,088	Stock-in-trade	44,65,796
Depreciation fund ...	60,35,291	Stores ...	9,28,024
Provision for taxation ...	6,40,917	Debts and advances ...	30,74,042
Liabilities ...	59,18,793	Investments	8,13,834
Profit and loss account ...	8,92,764	Cash ...	1,67,817
Rs.	1,98,25,853	Rs.	1,98,25,853

Mysore Glass and Enamel Works Ltd.

The directors of the above Company (Managing Agents: The Ogale Glass Works Ltd., Bangalore) submit the audited accounts of the Company for the year ended 31st March, 1955.

The profit and loss account discloses a net working loss of Rs. 83,797 (profit of Rs. 871) without provision for depreciation on the fixed assets of the Company.

The saleable production of glass in tons and the value realised therefor, during the past three years, was as follows:—

Year	*Tons*	*Value realised* Rs.
1952-53 (15 months)	457	7,79,500
1953-54	464	6,37,500
1954-55	447	5,45,000

This shows how steep is the fall in the prices, while raw materials, labour and other charges are rising, besides the unhelpful attitude of the labour in improving the production and bringing down wastages. In the total cost of production, raw materials, fuel and packing charges form about 45 per cent. and labour about 45 per cent. and there is hardly any scope for economy even as a last resort.

There is a possibility of filling the present gap between monthly production and expenses by withdrawing all the *ex-gratia* payments and amenities so far liberally given to workers (without touching their basic wages and dearness allowance) and the management and staff also making similar sacrifices. Negotiations with the Labour Association are going on for the past 2 months without any tangible results. The works, shall, therefore be closed taking all the consequences thereon, if the workers persist in their present attitude. This step should have been taken much earlier, but the managing agents made a last effort to increase production and bring down the wastages by negotiating with the workers and having failed in their attempt, apprised the Board of the situation rather late in the year.

The industry, as a whole, has been caught in a vicious circle created by rising costs and unhealthy internal competition and unless the manufacturers and the Government make an all-out effort to break this vicious circle, the fate of the industry will be doomed.

The progress of the ampoule making section has been blocked for various reasons, the chief amongst them being lower production capacity of the machine imported and the heavy customs duty at 66⅔ per cent. charged on the imported glass tubing. With this sad experience in mind and taking into consideration the falling prices of articles like glass syringes, thermometers, glass-shells, and other adverse circumstances, the directors have come to the conclusion that the manufacture of any new articles should not be undertaken and the Company involved in further financial risks, at present.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	6,33,255	Block ...	5,20,462
Reserves ...	1,53,858	Stock-in-trade and goods-in-process	68,456
Liabilities ...	3,78,504	Live-stock, tools, etc. ...	5,477
		Raw materials	75,046
		Stores ...	57,928
		Other assets	24,292
		Debts and advances ...	43,317
		Investments	1,83,713
		Cash ...	33,687
		Profit and loss account ...	1,55,239
Rs.	11,67,617	Rs.	11,67,617

Pullangode Rubber and Produce Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Aspinwall and Co., Ltd., Calvetty, Fort, Cochin) submit the audited accounts of the Company for the year ended 31st March, 1955.

The net profit for the year amounted to Rs. 1,84,471 as compared with Rs. 1,87,689 for the previous year. The necessary provisions for depreciation on buildings and machinery have been made, while unsold rubber on the date of closing has been valued on the basis of control rates. The provision of Rs. 86,850 for agricultural income-tax, which the directors made in the previous year's accounts has been written back and in consequence the profit and loss account carry forward from the previous year of Rs. 63,253 has been increased to Rs. 1,50,103. The Madras Plantations Agricultural Income-tax Act, 1955, came into force with effect from 1st April, 1955 and therefore the agricultural income liable to be taxed will be the income for the season 1954-55. The directors have, therefore, in order to provide for this liability, made a provision in the accounts of Rs. 98,395. The profit earned by the Company was Rs. 1,84,471 as against Rs. 1,87,689 in the previous year, and Rs. 3,05,313 for the year ended 31st March, 1953.

Crops and Costs.—Against an estimate of 6,00,000 lbs., the crop harvested amounted to 6,23,000 (6,05,000) lbs., which is a record crop, in spite of very adverse conditions experienced during the latter part of the year. Estate expenditure worked out at 77.69 (73.19) cents per lb.

The visiting agent reports that the Company's property is in good order and under careful management. It is estimated that the crop for 1955-56 will be 6,00,000 lbs. at an estate expenditure of 87.23 cents per lb.

With the addition of Rs. 1,50,103 carried forward in profit and loss account and after deduction of preference dividend paid, the balance in profit and loss account amounts to Rs. 3,25,574 (Rs. 1,87,689) which the directors recommend be disposed of as follows:—

By payment of a first and final dividend of 17½ (15) per cent. on ordinary share capital Rs. 1,92,500 (Rs. 1,65,000), by transfer to rubber rehabilitation reserve Rs. 42,500 (Rs. 42,500) and by carry forward in profit and loss account Rs. 90,574 (Rs. 1,50,103).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	12,50,000	Block ...	13,77,672
Reserves ...	2,36,176	Stock-in-trade	1,02,472
Provision for taxation ...	1,08,727	Stores and spare parts	22,536
Liabilities ...	97,963	Rubber nursery ...	3,400
Profit and loss account ...	3,25,574	Debts and advances ...	30,021
		Investments	2,03,101
		Cash ...	2,79,238
Rs.	20,18,440	Rs.	20,18,440

Ahmadpur-Katwa Railway Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod and Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st March, 1954.

The total capital outlay on final heads remains the same as at the close of the previous year, viz., Rs. 20,77,071.

The capital subscribed by shareholders, amounts to Rs. 17,24,000 and the gross capital outlay, inclusive of suspense heads to Rs. 20,87,698, the balance being met by means of temporary loans from the Government of India and also from revenue account. The Government of India granted a temporary loan of Rs. 3,00,000 from the revenue reserve fund to repay the 3½ per cent. debentures of the same amount which were redeemed on 28th October, 1952. Claim for Rs. 1,00,000 only was received and paid upto 31st March, 1954.

The gross earnings for the year amounted to Rs. 5,36,733 while the working expenses totalled Rs. 5,09,220 as compared with Rs. 4,99,621 and Rs. 4,54,015 respectively, for the previous year. The net earnings of Rs. 27,533 (Rs. 45,606) have been carried to net revenue account. Under this account, after including share transfer fees and meeting the interest payable on loan from Government and other charges there is a surplus of Rs. 16,800 (Rs. 35,116) which to make up the amount required for the guaranteed interest at 3½ per cent. on share capital of Rs. 17,24,000 calls for a total subsidy of Rs. 43,540 (Rs. 25,224) to be recovered from the Government of India in terms of the agreement. As, however, super tax is not allowed as an item of working expenses and the reserve fund has been depleted, the directors are able to recommend payment of a dividend at the rate of Rs. 2-11 (Rs. 2-11) only per share (less income-tax) for the year ended 31st March, 1954, the deficit of Rs. 40 (*nil*) only being met from reserve. Additional income-tax aggregating Rs. 50 on revised assessments for the years 1948-49 to 1950-51 and 1952-53 is payable and is being debited to reserve.

Working Expenses.—Compared with the previous year the total working expenses show a net increase of Rs. 55,205 (decrease of Rs. 1,996) which is mainly due to unavoidable urgent work and includes heavy repairs to carriages and renewal of sleepers.

Coaching.—The receipts under this head amounted to Rs. 4,27,027 for the carriage of 897,534 passengers as compared with Rs. 4,16,052 and 852,926 pasengers for the previous year. The feeder bus service from Ganutia helped as before in contributing to the traffic earnings.

Goods—Earnings from this source totalled Rs. 99,257 for 792,085 maunds of goods as against Rs. 64,283 for 538,864 maunds for the previous year, the increase being mainly due to movements of greater quantity of Government programmed traffic.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	17,24,000	Block ...	20,68,816
Debentures	2,00,000	Stores ...	10,627

		Cash ...	2,86,850
Rs.	25,74,687	Rs.	25,74,687

Bengal Bhatdee Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule and Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 31st December, 1954.

After providing Rs. 3,500 (Rs. 3,500) for depreciation, and Rs. 8,400 (Rs. 4,000) for taxation, there is a balance of Rs. 10,568 (Rs. 9,172) at the credit of profit and loss account from which the directors recommend payment of a dividend of As. 2 (As. 2) per share absorbing Rs. 5,617 (Rs. 5,617), leaving to be carried forward Rs. 4,951 (Rs. 3,555).

Raisings for the half-year were Rs. 39,979 (Rs. 39,910) tons as compared with 42,417 tons in the previous half-year and despatches were 43,693 (39,837) tons as against 36,251 tons.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,49,350	Block ...	3,08,193
Reserves ...	70,000	Debts, deposits and advances ...	1,88,677
Provision for taxation ...	24,017	Cash ...	2,24,303
Liabilities ...	1,72,855

21, NETAJI SUBHAS ROAD,
CALCUTTA, *7th June*, 1955.

INDIAN COPPER CORPORATION LIMITED

(Incorporated in England)

DIVIDEND No. 27.

NOTICE IS HEREBY GIVEN THAT AT THE Thirty-first Ordinary General Meeting to be held at the Royal Exchange Hall, Royal Exchange, Calcutta, on Wednesday the 17th August, 1955, at 11-30 a.m., the Directors will recommend payment of a Dividend (No. 27) for the year ended 31st December, 1954, of 15 per cent. and Bonus of 10 per cent. (6 pence, i.e., annas 5 pies 4 per unit of stock) free of Income-tax payable by the Company. Subject to confirmation of Members, the Dividend will be paid on the 31st August, 1955, to all Members registered in the books of the Company at close of business on the 1st July, 1955.

The Transfer Books will be closed from the 2nd July to the 21st July, 1955, both days inclusive.

The nett profit for the year ended 31st December, 1954, was £263,987 (against £74,600 for previous year), after providing £100,000 for Depreciation (£90,000 last year), £264,395 for Taxation (against £171,382), £150,000 for General Reserve (against £75,000) and £120,000 on other accounts (against nil). With £76,278 brought in from 1953, there is an available balance of £340,265 (against £167,698). After providing £228,550 for proposed Dividend of 15 per cent. and Bonus of 10 per cent. free of Income-tax payable by the Company (10 per cent. free of tax last year—£91,420), the balance carried forward is £111,715 (against £76,278 brought in from previous year).

By Order of the Board,
G. A. CARVER,
Secretary.

CLIVE BUILDINGS,
NETAJI SUBHAS ROAD,
CALCUTTA, *8th June*, 1955.

THE HOOGHLY FLOUR MILLS COMPANY, LIMITED

MONEY EASY

(From Our Own Correspondent)

BOMBAY, *15th June*

A slackening of demand for money and an inflow of funds brought about distinctly easy conditions in the money market during the week under review. With the relaxation of the seasonal pressure for funds banks were not keen borrowers of call money, with the result that there was a drop in the inter-bank rate among the Exchange banks and big Indian banks from 2¾ per cent. to 2½ per cent. and that among the smaller Indian banks from 3 per cent. to 2¾ per cent. Short-term deposits were taken at 3 per cent. for one to six months, though banks were a little hesitant to pay that rate for one month.

In consonance with the trend described above, there was a further decline in the Government of India Treasury Bill rate during the week, the average rate of accepted tenders being Rs. 2-8-5 per cent. per annum, as against Rs. 2-8-8 per cent. per annum last week. This is the third consecutive week when the rate has shown a drop. The rising trend in offerings noted in the previous two weeks, was not, however, maintained this week, the amount tendered recording a fall from Rs. 273.75 lakhs last week to Rs. 248.75 lakhs.

An expansion of Rs. 6.33 crores in notes in circulation is disclosed by the Reserve Bank's statement for the week ended 10th June, 1955. This rise follows an increase of Rs. 8.86 crores in the previous week. Notes held in the Banking Department show a decline of Rs. 6.07 crores and the consequent small rise in total notes issued is covered by a similar increase in rupee coin. In the Banking Department, the Central Government's deposits have gone up by Rs. 3.15 crores, while those of other Governments have dropped by Rs. 3.17 crores. Deposits of banks are higher by Rs. 2.22 crores. On the assets side, balances held abroad have risen by Rs. 6.07 crores. Loans and advances to Governments show a small increase of Rs. 56 lakhs and other loans and advances Rs. 23 lakhs. The rise in the latter is mainly accounted for by the increase of Rs. 43 lakhs in advances to Scheduled banks against usance bills. French borrowings by banks against these bills during the week amounted to Rs. 5.20 crores. Government Treasury Bills purchased and discounted disclose an increase of Rs. 1.91 crores.

The Scheduled banks' statement for the week ended 3rd June, 1955, shows a decline of Rs. 2.43 crores in demand deposits and a rise of Rs. 2.79 crores in time deposits. Inter-bank borrowings are also higher by Rs. 1.19 crores, while borrowings from the Reserve Bank have declined by Rs. 6.56 crores. Borrowings from the Imperial Bank are almost unchanged. A small rise of Rs. 59 lakhs is noted in advances, after two weeks of successive fall. Inland bills purchased and discounted have declined by Rs. 1.11 crores, while foreign bills have gone up by Rs. 95 lakhs. Cash on hand and balances with the Reserve Bank have together risen by Rs. 1.40 crores, balances with other banks in current account by Rs. 12 lakhs and money at call and short notice by Rs. 63 lakhs.

The Gilt-edged market presented firm conditions during the week under review, with keen buying enquiries and all-round rise in prices. The Reserve Bank of India stepped up on Friday last its selling price of 3 per cent. 1966-68 and 3½ per cent. 1964 by As. 2 to Rs. 91-2 and Rs. 98-14, respectively, and this action gave additional strength to the market. By a notification dated 10th June, 1955, the Government of India announced its decision to repay at par the whole of the 4½ per cent. 1955-60 loan on 15th September, 1955, with all interest due up to date. Interest will not accrue on the loan from and after 15th September, 1955. This loan was issued in 1928 at Rs. 94 per cent. and the outstanding amount is Rs. 9,05,64,000. It is currently being quoted at Rs. 100-12. The Government of India has not yet announced the terms and date of issue of its new loan. Presumably it is awaiting the closing of half-yearly accounts of banks, lest it should inconvenience the banks.

To revert to the trend of prices. 3 per cent. 1957 had buyers at Rs. 99-9½. 3 per cent. 1958 changed hands an anna higher at Rs. 99-8. 3 per cent. 1959-61 was in demand an anna better at Rs. 98. 3 per cent. 1963-65 rose sharply by As. 4 to Rs. 94-4 with persistent enquiries at the higher level. 3 per cent. 1964 attracted attention and gathered an anna to Rs. 94-3 due to proximity of voucher. 3 per cent. 1966-68 was wanted at the official selling price of Rs. 91-2. 3 per cent. 1970-75 was unchanged at Rs. 87-2, but was in demand. After the good support received in the previous week, 3 per cent. 1986 Conversion Loan was a shade easy, dropping an anna to Rs. 80-8. 3½ per cent. 1961 gained an anna to Rs. 99-14 and was on offer at that rate. 3½ per cent. 1964 was better at Rs. 98-14 due to the raising of the official selling price. 4 per cent. State Government and Bombay Municipal loans were in keen demand.

In the foreign exchange section, there was no change in the rupee-U.S. dollar rate, the banks selling rate being Rs. 479½ per $100 and buying rate Rs. 475½ per $100. Sterling, however, suffered a slight recession in terms of the U.S. dollar early in the week, but made headway later on. Thus, in New York, spot sterling, after being marked down from $2.79⅜—2.79½ to $2.79¼—2.79½, gathered strength to $2.79⅝—2.79¾ yesterday. Three months forward dropped from $2.77-5/16—2.78-1/16 to $2.77-11/16—2.77-13/16, before recouping to $2.77½—2.78. Transferable sterling closed yesterday at $2.77-3/16—2.77-5/16, as against $2.77½—2.77¾ a week ago.

BULLS PAY MARGIN IN GOLD

(From Our Own Correspondent)

BOMBAY, *15th June*

The bullion market ruled steady during the week under review, with an improvement in the prices of both the metals. Early in the week, there was an initial reactionary trend on reports that the leading bull had transferred a substantial part of his purchases in silver from *Ashad* to *Shravan* settlement at a backwardation charge of Rs. 3. This news, coupled with the expectation that the demand would slacken with the onset of the monsoon, caused a sharp drop in silver. Gold also declined in sympathy, but a sharp fall was averted by good demand in the ready section.

As the week progressed, signs of renewed strength were visible on bull manipulations, following good demand in the ready section. Frantic covering by bears also paved the way for a smart recovery. While the upward trend in gold was sustained by persistent offtake by Madras and Delhi, silver attracted profit-taking at the higher level. The closing rate for silver was, therefore, below the best level, while the yellow metal finished at the highest level for the week.

As the closing rate today in forward gold for *Ashad* settlement was above the official starting rate of Rs. 91-4 for that settlement and as it was more than Re. 1-8 above the closing rate for the next forward contract, the bulls were obliged to pay a margin of Rs. 35 per tola on their purchases in gold in *Ashad* settlement.

Silver for forward delivery in *Ashad* opened at Rs. 154-10 and suddenly dropped to Rs. 153-5. A smart recovery, however, set in and a high of Rs. 156-5 was touched yesterday. Realising pressure at the bulge brought it down to Rs. 155-8 at the close today. *Shravan* silver, after dropping from Rs. 152-4 to Rs. 151-1, came up to Rs. 155-9, but ended at Rs. 154-10.

Ready silver (.996 Mint) advanced from Rs. 157-13 to Rs. 158-13 and finished a shade lower at Rs. 158-8. The floating stocks of silver are placed at 1,400 bars. The daily average offtake was 25 to 30 bars.

Gold for forward delivery in *Ashad* settlement reacted early in the week from Rs. 90-9 to Rs. 89-10, but gained good ground before closing at Rs. 91-11. *Shravan* gold hardened from Rs. 88-12 to Rs. 89-11, although it had touched a low of Rs. 88 early in the week.

Ready gold moved up from Rs. 93-8 to Rs. 95, the premium over the forward rate for *Ashad* settlement being well maintained at Rs. 3-6. The floating stocks of gold are reported to be 10,000 tolas. The daily average arrivals and offtake balanced each other at 3,500 tolas.

In London, the price of silver and gold declined during the week. Spot silver was marked down from 78¼d. to 77⅞d. and forward from 78¼d. to 77⅞d. per fine ounce. Gold weakened from £12 11s. to £12 10s. 10½d. New York also witnessed a recession in silver. Messrs. Handy Harman reducing their official buying price twice during the week from 90½c. to 89½c. and again to 89¼c. per fine ounce.

The following comparative table shows the trend of the market during the week under review:

	15-6-55	Highest	Lowest	8-6-55
	Rs. a.	Rs. a.	Rs. a.	Rs. a.
GOLD				
Ready (.99 fine Mint) ..	95 0	95 1	92 14	94 1

BASE METALS ADVANCE

(From Our Own Correspondent)

CALCUTTA, *14th June*

An improvement in prices of base metals was a feature of the trading in the metal market during the week under review. Consumers were not inclined to support the higher prices, and business was limited to meet immediate needs. From Rs. 248, electrolytic copper gained to Rs. 250. The price was maintained at the higher level, despite the wide fluctuations either way reported on the London Metal Exchange. This was due to the local tightness in supply. There was some demand for scrap. Clean wire scrap improved from Rs. 192 to Rs. 195, mixed scrap being unchanged at Rs. 182. Tin recovered from Rs. 476 to Rs. 486, and thus reached the replacement cost. There were reports of fresh arrivals, despite which the price regained to the replacement level. Some quantity changed hands, but stockists, encouraged by the higher advices from both London and Singapore, were reserved. Electrolytic zinc closed at Rs. 64-8 which was also the opening rate. During mid-week, the rate touched a high of Rs. 65. However, the quantity that changed hands was insignificant, as consumers were expecting prices to fall following fresh arrivals during the week. Lead was quiet at Rs. 72. Consumers kept away from buying, as supplies in the market had increased in view of recent arrivals.

COTTON MOVES DOWN

(From Our Own Correspondent)

BOMBAY, *15th June*

In the absence of any encouraging factor, the forward section of the cotton market witnessed a distinctly easier trend during the major part of the week under review. Initially, the market remained steady, thanks to good spot advices. But this proved short-lived. Among the factors responsible for the easier trend, mention deserves to be made of the fact that expectations of a cut in export duty, held for some time now, did not materialise. The offtake in the cloth market was not very encouraging either. The only helpful factor was the appearance of China on the market as a buyer of Indian cotton. It would, however, appear that the Chinese demand for cotton has been somewhat less than what it had been expected to be. The cumulative effect of these factors was liquidation by tired bulls, resulting in a fall in values.

Little is yet known about the magnitude of the Chinese demand for cotton. Chinese representatives, it is stated, are negotiating with the Indian authorities at New Delhi for a quota of about 25,000 bales. But they are reported to insist on certain special terms. Thus, the quality and weight of Indian cotton bought by China will be decided by the Chinese Commodity Testing Bureau, the decision of which will have to be accepted as final. It remains to be seen whether a quota will be granted to China on these terms.

A welcome report from Tokyo avers that the Government of Japan has released sterling exchange to certain non-spinning mills for purchase of 50,000 bales of Indian cotton. Since the allocation has been made only to non-spinning mills, it is considered that Japan will buy only short-staple varieties.

Apart from the activity connected with the offer of Indian cotton to China, the demand for cotton for export purposes was somewhat limited. There were, however, some inquiries by shippers for Vijay, lower Jarillas, *Deshi* varieties and Zoda cotton. Some export business with the U.K., Continent and Hongkong has been reported.

I.C.C. August opened the week at Rs. 579 and moved up to Rs. 582½ on the following day. Liquidation by nervous bulls and selling pressure depressed prices, so that, on the 11th inst., it declined to Rs. 580. Since then, the downward movement has gained momentum. Today the contract touched the lowest level for the week at Rs. 571 and closed a shade higher at Rs. 571½. The following is the trend of prices in the forward section of the cotton market during the week under review:

	Opening	High	Low	Closing
I.C.C. August ...	Rs. 579	582½	571	571½

The ready section of the cotton market was also somewhat easier. Mill demand was restricted to Vijay, Punjab staple style and Jayadhar. The following are the latest available quotations from the Sewri cotton market:

Bengal *deshi* Rs. 530—Rs. 540; Berar Jarillas Rs. 600; Khandesh Rs. 575; Vijay Rs. 750; Oomra *deshi* Rs. 560; Moglai Rs. 500.

The Saurashtra Cotton Control Bill has received the assent of the President. It regulates cultivation of cotton, and prohibits mixing of prohibited varieties and of possession or use of, or trade in, the prohibited variety of cotton in any part of the State.

Steady conditions were witnessed in the Karachi cotton market during the week under review. On some mill demand and export enquiries, prices tended to look up. N.T.R.G. July improved to Rs. 71-4, as against Rs. 70 last week and N.T.R.G. January to Rs. 67-12, as compared with Rs. 66. In pursuance of the Pakistan-U.S. agreement, concluded in March this year, for sale of about 31 million dollars worth of surplus agricultural produce, the U.S. Agricultural Department is reported to have issued authorisation to Pakistan to buy 5,000 bales of cotton valued at one million dollars.

The following are the latest available quotations from the Karachi cotton market:

Sind *deshi* Rs. 58; Punjab *deshi* Rs. 53; 4F. roller Rs. 66-2; 4F. S.G. Rs. 71-2; Punjab roller Rs. 70-2; S.G. Rs. 75-2; 289F. N.T. roller Rs. 74-2; Sind S.G. Rs. 79-2; 289F. Punjab roller Rs. 75-2; S.G. Rs. 80-2.

The Sudan Gezira Board has in all sold about 24,326 bales in its auctions held from 31st May to 4th June. The approximate quantity of cotton harvested this season is stated to consist of 118,813 bales of 'S' cotton and 136,574 bales of 'L' cotton.

The final estimate of the Uganda crop for the current season is placed at 295,000 bales. The Lint Marketing Board, it is stated, has successfully marketed this entire quantity.

Good demand from the U.S., India, Poland and certain other countries of the Continent for Egyptian cotton has been reported from the Alexandria cotton market. Fully good and good Karnak and Gezira 30 were in demand. Entitlement premiums have remained practically unchanged. The Egyptian Government has decided to permit the reopening of the Alexandria futures market at the end of the current season. In this connection, it is learned that the first contract to be traded in will be for December delivery.

Some buying on U.S. private account and trade support at lower levels were the two principal factors that were responsible for a steady trend in the Liverpool Cotton Exchange. Operators were inclined to interpret the U.S. buying as indicating less likelihood of export subsidy in that country. Turnover was, however, reported to be somewhat limited. The following are the latest available quotations from the Liverpool cotton market:

July-August 31.17d.; October-November 30.33d.; December-January 30.16d. and March-April 30.04d.

Weather reports from the U.S. aver that weather conditions in the cotton-growing regions are excellent. Light insect infestation has, however, been reported. But control measures have been applied. The new crop in the U.S. appears to have made a favourable start, but, with the planted acreage estimated to be only round 17.3 million acres, any adverse development in the critical growing period will have more than normal significance.

The latest estimate of the supply of cotton in the U.S. places it at 23,528,000 bales of 500 lbs. each, made up of carryover stocks of 9,728,000 bales, crop of 13,650,000 bales and imports of 150,000 bales. Included in this supply are the stocks held by the Commodity Credit Corporation which, as on 27th May, 1955, held about 8.32 million bales. Thus, "free" supplies are of the order of 15.2 million bales. Distribution prospects, it is stated, appear around 12.5 million bales, made up of domestic consumption of 8.8 million bales and exports of 3.7 million bales. On the basis of this estimate, the end-season carry-over would be 2.9 million bales of "free" cotton or a total of 11 million bales.

The New York cotton market advanced on trade buying, mostly for mill account, together with commission house and local demand. Some buying in new crops was based on price considerations, but traders were generally inclined to await Washington developments. The July 1956 contract, which is the last contract where 7/8" cotton can be tendered, has been showing weakness and is quoting 50 points below the July contract. The October 1956 contract, which was 43 points above July at the commencement of trading on 1st June, is now about 60 points below July.

The following are the latest available quotations from the New York market as compared with those a week and a fortnight before:

(In cents per lb.)

	14-6-55	7-6-55	31-5-55
Spot	34.65	34.65	34.65
July	34.00	33.83	33.86

SUGAR EASY

(*From Our Own Correspondent*)

BOMBAY, 15th *June*

The sugar market depicted an easy trend during the week under review, in distinct contrast to the fully steady note witnessed in the previous two weeks. There was some selling induced by expectations of heavy arrivals of indigenous sugar during the coming weeks, following resumption of booking to Wadi Bunder and anticipation of the usual monthly release of sugar for sale in the free market early next week. There was slackness in demand also, the pre-monsoon buying having come to an end. Consequently, prices of sugar tended to look down. Arrivals of indigenous sugar into the market during the week aggregated 8,600 bags.

In the *spot section*, large grain indigenous sugar was done at rates varying from Rs. 93-Rs. 100 per bag, as against Rs. 97-Rs. 102 a week before. Medium grain was easy at Rs. 91; last week, it was quoted at Rs. 90-Rs. 94. Among foreign sugar, British refined sugar receded by As. 4 to Rs. 84 per 2 cwts. German sugar lost As. 4 to Rs. 79-14 per 2 cwts.

In the *forward section*, *Shravan* delivery declined by As. 4 to Rs. 88-8.

N.B.—The rates for Indian sugars are inclusive of sales tax, while those for foreign sugars are exclusive of the tax.

STAPLE FIBRE YARN FIRM

(*From Our Own Correspondent*)

BOMBAY, 15th *June*

A notable event of the week under review in the rayon yarn market was the decision taken by the Bombay Yarn Merchants Association and Exchange Ltd. to resume, with effect from the 24th inst., trading by way of fixed delivery contract in 120 dull cones Snia rayon yarn. Trading will be for August and October 1955 fixed delivery and onwards. After the settlement for August delivery is over, contracts for December delivery may be entered into. Yarns of 120 denier dull cones of Snia mark 1st and 2nd qualities will be tenderable at par, while the goods of 3rd quality will be tenderable at a discount of an anna per lb. A case having a packing of 180 to 220 lbs. shall be made tenderable. The unit in the transactions shall be of 5 cases. The transactions will be quoted at the Exchange per case of 200 lbs. The members who have to take delivery of the goods will have to make payment in the Association at the rate of 200 lbs. a case. The seller and the buyer shall have to adjust their accounts amongst themselves of the difference in weights. The brokerage will be allowed at the rate of As. 10 per case. The by-laws pertaining to the transactions of fixed delivery contracts of 150D rayon yarn and 40/2 staple fibre yarn shall be made applicable to the above transactions with regard to the clearing system, delivery of goods, survey of goods, margin system, slips of statement, time of business, etc.

The forward section of the rayon yarn market which was inactive last week came in for some business this week. Following reports of better offtake in consuming centres, operators were somewhat inclined towards enlarging their buying commitments and, prices, as a result, registered a rise. 150D June contract was today quoted at Rs. 733, a rise of Rs. 2 as compared with the quotation in the previous week. Spot prices of foreign rayon yarn were fully maintained throughout the week. 120 Japan was done at Rs. 3-13-6, 150 Japan at Rs. 3-14, 120 Italy at Rs. 3-13 and 150 Italy at Rs. 3-9. Among indigenous yarns, National Rayons 150 Bt. cones 1st and 2nd grades rallied 18 pies each to Rs. 3-9 and Rs. 3-8-3, respectively. 120 Bt. cones 1st grade were maintained at last week's level of Rs. 4-4.

Thanks to persistent enquiries from consuming centres, the staple fibre yarn section exhibited a firm trend during the week under review, and prices, therefore, rose further. Staple fibre yarn (40×2) for June delivery rallied Rs. 5-8 to Rs. 596 today, before closing at Rs. 595-8. July delivery was quoted today at Rs. 593-8. Among foreign yarns (40×2) in the ready section, Shincos moved up by As. 2-8 to Rs. 4-11-6. Suikos gathered half an anna to Rs. 4-13-6. Among indigenous yarns, Kohinoors gained six pies to Rs. 3-5. New Greats were better by 3 pies at Rs. 3-1-9.

The cotton yarn market presented a distinctly bearish trend this week. Owing to pressure of sales at lower rates by some mills, shrinkage in offtake and in consuming centres and easy advices from cotton market, traders were busy lightening their commitments. Consequently, cotton yarn prices staged a retreat. Among 10s, Elphinstones were subjected to considerable selling pressure and were hammered down by As. 8 to Rs. 12. Moderns dropped As. 4 to Rs. 12-8. Podars lost an anna to Rs. 12-10. Among 20s, Moderns slipped by As. 4 to Rs. 15-12. Raghuvamshis and Seksarias were each an anna lower at Rs. 16-3 and Rs. 14-15, respectively. Among 30s Moderns receded by As. 6 to Rs. 20-8. Maduras were quiet at Rs. 20-12. Deals in 40 count yarns were put through at lower prices, Gokaks losing Re. 1 to Rs. 23-4 and Seksarias As. 4 to Rs. 21-4. Among 60s, Elphinstones declined by As. 4 to Rs. 48-4. Finlays and Moderns were quiet at Rs. 61. Among 80s, Moderns eased by As. 4 to Rs. 62-4. Finlays were unaltered at Rs. 68-8.

The table below gives the prices of art silk staple fibre and cotton yarns quoted today, as compared with those a week before:

	15-6-1955	8-6-1955
	Rs. a.	Rs. a.
Art silk yarn—		
150 D. June	733 0	730 0

80s Finlay	68 8	68 8

OILSEEDS RISE FURTHER

(*From Our Own Correspondent*)

BOMBAY, 15th *June*

Before these lines appear in print, the Forward Markets Commission will have received the views of the oilseeds and oil interests on the question of establishing a regulated market in Bombay. This question was discussed by the Commission yesterday with the representatives of six trade bodies which had applied for recognition of their respective associations for forward trading in either oilseeds or oils. The opinions expressed by the representatives, it is reported, were wide and varied. Thus, some thought that it was necessary to recognise only one association, while a few others favoured separate associations for each type of oilseeds. Opinions also differed as to whether there should be only one association for both oilseeds and oils or a separate body for each. In view of these conflicting claims, the Commission urged the representatives to approach the problem realistically in the general interests of the trade and submit their views on the 16th inst.

The oilseeds market was relatively more active during the week under review. The improved trend witnessed last week gathered further strength and values continued their upward march. Groundnuts met with renewed buying support, under the stimulus of a number of favourable factors such as good enquiries for oil from overseas buyers and *vanaspati* manufacturers, paucity of arrivals owing to shortage of wagon supplies and firm advices from interior markets. The expectation of an early grant of an additional export quota for groundnut oil also influenced the sentiment favourably. Castor seeds also ruled strong, on reports that two tankers had already been chartered for the export of an aggregate quantity of 5,000 tons of oil. The U.S. interests were prepared to buy Indian castor oil even at higher prices, the latest rate offered for commercial quality being about As. 7-4 per lb., as against As. 7-3 a week before. The linseed section, too, provided a bright spot, thanks to covering by shippers against their previous commitments in oil. The overseas demand for oil was excellent, the latest rate offered being Rs. 1,373 per ton (£103). *Niger* seed also was well favoured. *Kardi* seed, however, proved an exception and was a shade easy, due to lack of follow-up support.

As stated already, groundnuts evoked good attention of operators and prices recorded an improvement. Coromandal ready and Khandesh quality were on special request and their quotations, as a result, rose by As. 6 each to Rs. 21-6 and Rs. 21-10, respectively. Bold F.A.Q. hardened by As. 4 to Rs. 20-10. June-July was fully maintained at Rs. 20-8, as also August-September at Rs. 21-6. Groundnut oil July rose by an anna and a half to Rs. 11-7. August improved by an anna to Rs. 11-8-6. June was better by six pies at Rs. 11-5-6. Railway receipt was fully steady at Rs. 11-5.

In the linseed section, Bold ready spurted by As. 8 to Rs. 24. June-July hardened from Rs. 23-11 to Rs. 23-15 and August-September from Rs. 23-12 to Rs. 23-15. Indore quality gathered As. 9 to Rs. 24-4. Linseed oil ready strengthened by As. 4 to Rs. 14-12.

In the castor seeds section, September delivery, which had gone down from Rs. 77-8 last week-end to Rs. 75-14 on Friday on account of covering by shippers at lower levels, recovered to Rs. 77-2 on the 11th inst. before finishing the week at Rs. 76-4. Deals in Kanpur quality were put through at Rs. 13-12, as against Rs. 13-8. F.A.Q. was fully steady throughout the week at Rs. 13-12, as against Rs. 14-8 last week, but spurted to Rs. 14-8 today. Madras quality was done at Rs. 14-10, same as last week. Castor oil B.S.S. picked up As. 2 to Rs. 9-10. First Pressure and Commercial were steady at Rs. 9 and Rs. 8-8, respectively.

Niger seed F.A.Q. were demanded by several traders and their price advanced by a rupee to Rs. 19-8. Madras quality also had buyers As. 8 higher at Rs. 19-8. *Kardi* seeds were somewhat quiet, ready bold and June-July being both quoted at Rs. 12-4, as against Rs. 12-8.

The following table shows the price of oilseeds and oil today, as compared with those at the end of the previous two weeks.

	15-6-1955	8-6-1955	1-6-1955

PEPPER HARDENS AT ALLEPPEY

(*Messrs. Parekh & Co.*)

BOMBAY, 15th *June*

After a spell of narrow movements, Malabar black pepper during the week tended to harden induced by the general strike in Singapore. At Alleppey, the rate, after touching Rs. 1,145, improved to Rs. 1,175, while garbled at Cochin went up from Rs. 195 to Rs. 202½. If the Singapore situation deteriorates it is felt that the U.S. will have to switch over to India for meeting her immediate requirements, as shipments from sources like Kuching and Djakarta take longer time to reach New York. The U.S. is said to have paid $0.50 per lb. for June shipment from India. At the time of writing, however, market is quiet in sympathy with New York where buyers are reported offering for June shipment at $0.47½ per lb. Alleppey is down to Rs. 1,156½ and Cochin to Rs. 197½.

It is believed here that though Continental countries can afford to wait, the U.S. cannot wait longer in view of its approaching autumn and small stock position. The present U.S. purchases are patchy and selective. New York dealers buy for a day and then withdraw asking concession in price. Then again, after waiting for some time when they feel that sellers are stiff, they come in as buyers. They play thus a game of hide and seek. This they can do during the present dull season, but from July onwards, they cannot wait any longer, as otherwise there will be shortage of spot goods.

Growers in India are stiff sellers. When there is no buying for a couple of days, they reduce their price in order to attract buyers. But, immediately on their appearance, growers push up their quotations. Indian exporters, therefore, fear to go short. The talk of convertibility of sterling is also one of long long forward sales, as in case of convertibility, they do not know the level of cross rate to be fixed.

Following are today's nominal quotations: Ready delivery Rs. 150 (as against Rs. 155 a week ago) per Bengal maund, July Rs. 1,070-80 (Rs. 1,100-10) and August Rs. 1,060-70 (Rs. 1,095-1,105) per candy of 5¼ cwts.

DEMAND FOR DUSTS BROADENS

(*Messrs. Forbes, Ewart and Figgis Ltd.*)

COCHIN, 9th *June*

Approximately 430,000 lbs. were on offer in dust sale "K" which was held on Tuesday, 7th June. From the outset there was an excited general demand for all types of dust. The demand increased as the sale progressed and buyers competed keenly. Major advances were registered in the prices of low and low medium dusts including milled descriptions, and Medium types and best liquoring dusts were well supported and advanced by As. 4 to As. 8 per lb.

London Market—Sale of 6th June.—Irregular market. Best ½d. to 3½d. dearer. Stalky kinds easier.

Sale of 7th June.—Irregular market. Better sorts dearer.

Colombo Market—Sale of Monday, 6th June.—Good demand. Rates unchanged.

Tuesday's sale.—The export sale due to be held on Tuesday, 7th June, was postponed pending official notification of a reduction in the export duty to 50 cents from the present level of Re. 1. The reduction was due to take effect from midnight 7th June, but no official notification has been received.

Calcutta Market—Export.—The first sale of the season got off to a promising start. Brokens sold at about valuations. Fannings were rather neglected, owing to absence of U.K. support, but whole leaf grades were very strong.

Internal.—Dust 6,000 new 2,350 old. Fair demand. Strongest feature C.T.C. and Darjeelings. Leaf 400 new 400 old. Fair demand, mainly non-exportable.

Export Quota.—There has been an easier tendency and business has been done at 60 piles. There are still buyers at this figure.

Forthcoming Auctions.—Dust sale "L" will be held on Tuesday, 21st June.

As we go to press, Messrs. Forbes, Ewart and Figgis Ltd. wire:

"*Sale* 12.—1,950,000 lbs. Good demand at about last rates, but mediums occasionally easier. Whole leaf very strong and dearer. Internal operators predominate."

NARROW FLUCTUATIONS IN JUTE GOODS

(*From Our Own Correspondent*)

CALCUTTA, 14th *June*

There was moderate activity in the jute goods market during the week under review, but most of this was the result of covering on expectations of demand from overseas buyers, as well as speculative buying. The announcement on Tuesday last of the stock figures of mills as at the end of May evidently pleased all sections of the market, and prices recovered very satisfactorily. According to these figures, there was more than a satisfactory decline in heavy goods, which took the stock down to 53,100 tons from 62,900 tons. On the other hand, hessians increased by 1,600 tons to 40,600 tons. The overall decline was of the order of 8,500 tons. There is no anxiety in the increase in hessian stocks, as plenty of hessians is required for the Argentine order for shipment between July and September. Irrespective of the increase in hessian stocks, it is stated that shipment of hessians during May had improved to 129.8 million yards from 111.3 million yards. The increase was shared by the United States, Canada, Australia, and Argentina and Montevideo.

On Tuesday last, ready B. twills gained to Rs. 109 from Rs. 108-8 following the good statistical position of heavy goods revealed on that day. The next day, there was a further improvement to Rs. 109-2, and mills were sellers. The higher prices were not supported by foreign buyers, and when covering demand was satisfied prices dropped. The ready position lost to Re. 107-12, and at Rs. 106-12 the July-September goods were lower by Re. 1-8. The decline continued on Friday also, and took the prices to Rs. 105-8 and to Rs. 105 respectively. Over the week-end, some business was done, and ready goods were steady at Rs. 106-10. Yesterday, there was a further improvement to Rs. 107. Indications were available that more quantities would be shipped to certain Far Eastern countries. Foreign buyers refrained from entering into any large commitments, as they expected that as and when the new crop commenced reaching mills, there would be a further drop in prices of both the raw material and finished products.

In contrast with the trend in heavy goods, the fluctuations in the prices of hessians were narrow. Demand was at a low ebb. But stockists were confident that good demand was in the offing. From Rs. 43-5, hessian 40" 10 oz. improved to Rs. 43-12. There was a fall to Rs. 42-4 on account of selling pressure but when this subsided there was a recovery to Rs. 42-11. Forward goods were priced one to two annas lower than ready goods. With the improvement in B. twills yesterday, the 10 oz. hessians were also one anna better at Rs. 42-12. The 8 oz. hessians were priced at Rs. 34-6.

Mills showed interest in offers of the old crop and, at firm prices, bought some quantity. Assam bottoms old crop was nominally quoted at Rs. 27-8. The firm tendency in quotations was due to the fall in stocks of jute goods, and the expectation that mills would require more raw jute. Mills were, however, reluctant to enter into fresh forward deals in new crop. As higher crop became a reality, prices would drop further to the benefit of the industry. The following are the latest quotations and are almost unchanged compared to those of a week ago:

	Middles	Bottoms
	Rs. a.	Rs. a.
Pakistani:		
Northern	31 0	27 0
District	31 8	27 8
Indian:		
Northern	30 0	27 0
Assam Upper ...	29 8	26 8
Assam Lower ...	30 0	27 0
Dalsee	31 0	28 0
Murshidabad ...	29 0	26 0
Western	28 8	25 8

Uttar Pradesh ...	28 8	25 8
Orissa	30 8	27 8
Dalsee mesta ...	28 0	25 0
Bimli f.a.q.	25 8	

Pucca bales first marks ready Rs. 172-8 per bale.

TEA ACTIVE

(*From Our Own Correspondent*)

CALCUTTA, 14th *June*

Internal buyers were again active during yesday's export auctions. Offerings aggregated 18,500 chests. There was strong demand, and prices gained fractionally. Well-made Darjeelings possessing quality were paid keen attention, while the plainer liquoring teas eased to quote below valuations. Whole-leaf grades were in good demand, with stylish B.P.Es. being pushed to the forefront. Prices of clean black brokens gained by half to one anna, and those of fannings by As. 1½. The quotations were: clean pekoe Rs. 2-8 to Rs. 2-10, and clean B.P. Re. 1-14-6.

There was fair demand at lower levels during last week's internal sale. Dusts offered amounted to 6,350 packages, of which 2,350 packages were the old season's tea. The feature was provided by the prices for C.T.C. Assams and Darjeelings rising above brokers' valuations, following keen competition. All other teas were below valuations.

Quotations were nominal and were: best Assam C.T.C. Rs. 2-10, and medium Dooars Re. 1-12 to Re. 1-13.

Offerings of dusts consisted of 400 packages each of the old and the new seasons' teas. Demand was fair.

LINSEED FIRM

(*Messrs. A. Bradley and Co.*)

CALCUTTA, 13th *June*

The linseed market remained firm during the week and activity was scarce. Sellers were very reserved, owing to poor arrivals and scanty offerings from the centres. There were keen offerings from crushers for both ready and forward delivery, but the daily turnover was small. The oil market was firm with good enquiries from both local and overseas buyers. Sellers were rather reserved.

Latest quotations are: June Rs. 16-3 and July-August Rs. 16-8 per maund.

PRICE SUPPORT FOR GRAM

(*From Our Own Correspondent*)

HAPUR, 13th *June*

The foodgrain market ruled quiet to firm during the week and it appears that the scheme of price support to wheat by the Union Government (at Rs. 10 per maund in markets where prices tend to fall below that level) has resulted in stabilising wheat prices in the country. The overall food position in the country has been described by Mr. Ajit Prasad Jain, Union Food Minister, as "very very comfortable," having achieved self-sufficiency in wheat and with large stock of surplus rice. There is now no question of importing foodgrains; in fact, efforts are being made to export rice.

At Hapur, wheat prices have improved to Rs. 10 per maund for average quality and fine farm quality was transacted at Rs. 11-4 per maund. Daily arrivals average 3,000-4,000 maunds and, as outside demand was slack, the local stock has swelled to 90 *khaties* of 800 maunds each.

The Government of India has decided to give price support for gram also and the Government will enter the market as buyer, as and when necessary, if gram prices tend to fall below Rs. 6 per maund. About 64,300 tons of gram are expected to be purchased on Government account under the scheme. The Union Food Minister has declared that the Government of India, if need arises, would extend its price support policy to rice also at the next harvest, "on the basis of parity price of wheat."

Gram prices recorded some gains, following the aforesaid announcement. Gram for local quality is now transacted at Rs. 6-4 and Punjab quality at Rs. 6-14 per maund. The stock position of gram continues unchanged, being 6 *khaties*. Prices of other coarse grains also recorded fractional gains to Rs. 5-8 per maund for barley and Rs. 5-7 for *bejhar*, and the *bejhar* stock has now increased to 11 *khaties*. Despite loading restrictions and increasing stocks, ready peas prices recorded sizable gains during the week and peas *dara* quality is now quoted at Rs. 5-12 and white quality at Rs. 6-12 per maund. Daily arrivals now average upto 2,000 maunds and the stock is 60 *khaties*. *Arhar* prices also advanced in sympathy with peas and are now quoted at Rs. 6-14 per maund and stocks have gone upto 30 *khaties*. Other pulses also ruled quietly steady.

The pulses future section, too, advanced in consonance with the ready section and peas and *arhar bhadon* are today quoted at Rs. 5-12-6 and Rs. 7-2-3, as against Rs. 5-11-3 and Rs. 6-14-6, respectively, on the 6th inst.

SUGAR DULL

(*From Our Own Correspondent*)

HAPUR, 13th *June*

Stagnant conditions prevailed in the sugar market during the week under review. Trading was on a small scale, in spite of increased demand from Saurashtra, Rajasthan and Madhya Bharat. Price movements were within fractional limits. Dr. Punjabrao Deshmukh, Union Agriculture Minister, has informed that the total sugar production this year will reach an all-time record of over 1.6 million tons, representing an increase of over 60 per cent. over last year's production of 1.0 million tons and, at the beginning of the next sugar season on 1st November, the carryover of sugar was expected to be over 800,000 tons. The all-India consumption of sugar is estimated at 1.6 to 1.7 million tons, as against 1.8 million tons last year. The *khandsari* production is also expected to go up to about 250,000 tons. The prevailing rates for mill delivery sugar are: Jaswant Rs. 29, Simbhaull Rs. 29-3, Mowana Rs. 29-4, Daurala Rs. 30, Amroha and Bijnore Rs. 28-6, Mensoorpur Rs. 30-4, Rampur Rs. 31, retail Rs. 31-4 and *khandsari* Rs. 22 to Rs. 27 per maund.

Ready *gur* prices recorded an appreciable fall during the week to Rs. 9-6 per maund for dry quality and to Rs. 9 per maund for *kotha* quality. Arrivals this year have been abnormally high, at an average of 1,000 maunds and were even 3,000 maunds today. As the offtake too is very substantial mainly to Gujerat and Rajasthan, the local stock has gone down to 70,000 maunds. There have been reports of heavy stocks in nearby small markets and this alone is a very depressing factor.

Gur future, on the other hand, moved within very narrow limits. Opening at Rs. 8-13-9 and Rs. 8-4-3 *ascr* and *phagun* deliveries are today quoted at Rs. 9-0-9 and Rs. 8-3-9, respectively.

MYSORE CHEMICAL MANUFACTURERS LTD.

SEVENTEENTH ANNUAL MEETING

THE Seventeenth Annual General Meeting of the shareholders of the Mysore Chemical Manufacturers Ltd. was held at Bangalore on 11th June, 1955. Addressing the shareholders, Mr. H. F. Marker, Chairman of the Company, referred to the Company's successful working during the year ended 31st March, 1955, and indicated that new lines of production had been developed.

The following are extracts from Mr. Marker's speech:

"GENTLEMEN,

"Before asking you to adopt the report and the accounts, I wish to review briefly the working of the Company during the year under report. During the year, the total sales of our products amounted to nearly Rs. 17 lakhs, resulting in a net profit of Rs. 1,11,867-0-7, the loss of Rs. 28,780-15-6 incurred by selling our 4 per cent. Mysore Government Bonds shown in the profit and loss account having been provided for in the carried forward amount of the previous year. The higher sales and profits have been possible because of the larger production of copper sulphate which was carried on without any break at our Chikbanavar Works. It is also due to the quality of our material being appreciated by the actual users and it is expected that the demand would be even higher during the coming year.

"I am glad to report that we have successfully prepared a new copper fungicide in our works, similar to Cupravit and Cuprokylt, which is mainly copper oxychloride and contains nearly double the copper content of copper sulphate and can be used for spraying and dusting without addition of lime and other fixatives. We hope to make this new material available in large quantities during the next spraying season.

"Another new development during the year has been the successful introduction of iron-free sulphate of alumina which is used mainly for dyeing purposes. Our product is of the requisite standard of purity and the sales are expected to reach a high level during the current year. Another of our products, crystal alum, is also proving very popular and is manufactured on a large scale at our Belagula Works."

STRONG DEMAND FOR GOAT HIDES

(*From Our Own Correspondent*)

KANPUR, 11th *June*

During the week under review, the conditions of the hides and skins market were rather indifferent. Fresh arrivals and overall offtake were less than the weekly averages usual for this period of the year. Smaller volume of fresh arrivals was specially noteworthy in reference to fresh goat, buff or sheep from the butcheries, local or otherwise. The local tanners were the main purchasers. The Madras dealers were responsible for heavy purchases of goats of all categories.

The latest quotations are: Wet salted cow, 1st grade Rs. 360, 2nd grade Rs. 280 and 3rd grade Rs. 120 per score; wet salted buff, 1st grade 1 lb. 10 ozs., 2nd grade 1 lb. 12 ozs. and 3rd grade 1 lb. 9 ozs. per rupee; goat, 1st grade Rs. 275 and 2nd grade Rs. 250 per 100 pieces; sheep, Rs. 200 to Rs. 250 per 100 pieces.

KIPS DECLINE SLIGHTLY

(*From Our Own Correspondent*)

MADRAS, 14th *June*

Arrivals of kips have been on the usual scale and clearance of shippers moderate. Prices are a shade easy, due to shippers' inability to sell to U.K. factors at last prices. The U.K. dressers, in their turn, do not find it profitable to buy kips at current levels for their trade, nor E.I. tanners are able to buy raw stocks at U.K. tanned parity. Demand for superior tannages has continued for light weight cow hides and 1½/2 and 2/2½ lbs. cow calf. Tanned buff hides market has declined by six pies per lb.

In the tanned skins section, prices of ordinary sheep skins have advanced slightly, due to good clearance by shippers probably for shipment to Japan. Tanned goat skins market is steady.

STOCK & SHARE QUOTATIONS

Abbreviations:—D.=Deferred shares. P.O.=Preferred Ordinary shares. Y.=Accounts published yearly. H.=Accounts published half-yearly. P.=Company has Preference shares. T.=Company has Debentures. N.=No quotations. x.d.=Ex-Dividend. c.d.=Cum. Dividend. I=Interim Dividend. f=Dividend for first half of the year.

Shares:—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts:—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, (in All other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends.—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years

(L) Investments.

(A) For seven months ended 31st March, 1954.

MARKET GOSSIP

(*Concluded from page 1151*)

Havana Bay and take 400,000 tons of raw sugar in payment over the next two years.

• • • •

To revert to the Council's decision to re-allocate export quotas. Commenting on this decision, the London *Economist* points out that the quantity re-allocated may prove to be no more than the actual shortfall, ignoring the defection of Brazil, and several exporters may be unable to take advantage of the withdrawal of restrictions on shipments before 31st August next. The *Economist* is rather inclined to believe that, with six months of the year still to run, the Council cannot hope to strike more than a rough balance between supply and demand. The prospects of success will, according to it, turn largely on the size of the European beet crop and on whether any further extraordinary demands are made on the market. According to the latest review of E. D. and F. Man, London, due to the late start and continued cold weather in most European countries, conditions do not augur well for a large beet crop. It is, however, impossible to forecast at this stage, with any degree of accuracy, the beet sugar output, as much depends upon weather conditions during the coming months.

• • • •

Meanwhile, the future of the International Sugar Agreement has, once again, become obscure. Brazil is reported to have threatened to withdraw from the Agreement. Britain, too, is said to be contemplating to introduce free trading in sugar. It is stated that the present Government is not in favour of continuing the existing agreements when they expire. According to one source, the British Government might return sugar to the trade, freeing it completely from all controls by 1st January next.

COTTON

(*Concluded from page 1162*)

cotton. The production of cotton in the region in that year was about seven lakh bales, or about 17 per cent. of the overall production of cotton in the country.

Many varieties with different staple lengths are produced in the region. The short-staple variety of Mungari accounts for only about 6 per cent. of the total production in the region. The medium-staple varieties of Westerns, Northerns, Warrangals, Coconadas, Comptas ordinary and Tinnevellis account for about 20 per cent. and the long-staple varieties of Jayadhar, Laxmi, Parbhani American, Madras American and Mysore American account for about 74 per cent. of the production. All major varieties in the region, except the Mungari, Warrangal, Coconadas and Nadam varieties which constitute only about 8 per cent. of the total production of the region, are tenderable against the Indian Cotton Contract of the E.I.C.A., Bombay.

The region is important from the point of view of the consumption of cotton also. There are in all 112 cotton textile mills in the region. In 1953-54, the mills consumed 896,000 bales of cotton, that is, about 19.5 per cent. of the all-India consumption by mills during that year.

The volume of production and consumption of cotton in the region fully justify the location of a futures market in cotton in this region. The Commission, however, did not receive any application for recognition from the concerned associations from this region, nor does there appear to have been any local tradition of futures trading in cotton. The Commission, therefore, came to the conclusion that, while there was need for developing a futures market in the region in due course, it had to await the development of public opinion and the establishment of representative associations which could be entrusted with the task.

Bombay City is the biggest cotton consuming centre in the country. There are in all 65 textile mills in the City, which, in 1953-54, consumed about 12.5 lakh bales of cotton or 27 per cent. of the total cotton consumed by the mills in India. Out of this, the varieties imported from foreign countries amounted to about 2.6 lakh bales or 20 per cent. of the total, the remainder being made up of Indian cotton. The Indian cotton consumed consisted of short-staple varieties to the extent of about 5 per cent., medium-staple varieties to the extent of about 70 per cent. and long-staple varieties to the extent of about 23 per cent. The varieties of Jarilla and Broach Vijay accounted for about 50 per cent. and 12 per cent., respectively, of the Indian cotton consumed. Jarilla is imported from Madhya Pradesh and the Deccan districts of the Bombay State, while Vijay is imported from the Gujarat districts of

ASSISTANCE TO SHIPPING

A FACT that clearly emerges from the speeches delivered at the annual general meeting of the Indian National Steamship Owners' Association, held on Tuesday this week, by its President, Mr. Pratapsingh Shoorji Vallabhdas, and its distinguished guest, Mr. Lal Bahadur Shastri, Minister for Railways and Transport, is that expansion of Indian shipping is virtually dependent upon the assistance of Government. The cost of ships is so high, the labour in the ports is so difficult to handle, the competition for cargo from well-established foreign shipping companies is so keen, the leeway to make up is so large, thanks to decades of neglect, and the period within which such has to be done is so short that, without Government co-operation, sympathy and active help, the private sector, in the realm of which shipping still resides, can do precious little for bringing about a rapid growth of our infant shipping. If all the forms of assistance which Mr. Vallabhdas listed in his speech were to be given by the State, the role of the Government in shipping will be that of a father in a typical Indian household, the role of the private sector being that of a mother. The Government has to provide the bulk of capital, cargo and even ships; it has to enforce discipline among the workers in ports; and it has to fight with the foreign shipping giants in order to get a place for our shipping in world trade. With all this provided, the private sector, for its part, will select and train the personnel to man the ships and handle the complicated task of employing the ships economically. For the present, there is, to carry our metaphor further, complete agreement between father and mother, and the entire household is working in harmony, born of perfect understanding. It is to be hoped that this happy state of affairs will continue for many years to come, so that the growth of infant shipping to the stage of strong and sound manhood may not be impeded. One cannot, however, blindly shut one's eyes to the risk of separation, for there are persons in the party-in-power who are bent upon bringing about estrangement by demanding nationalisation, especially in fields where the State has already developed a stake.

The dependence of shipowners on the Government for developing their business seems pathetic, indeed. Some idea of this was given by Mr. Vallabhdas in his speech. Even to fulfil the modest target of a net addition of 445,000 tons gross in the second Five-year Plan, the capital required is estimated at Rs. 80 crores. Of this, the private sector can provide, according to the Study Group (composed of representatives of shipowners) which suggested the target, only Rs. 10 crores. The balance, we are told, has to be provided by the Government by way of loans. The Government has already been advancing money to shipowners, besides contributing to the capital of the Eastern Shipping Corporation owned by it jointly with the Scindia Company in the proportion of 3:1. Out of Rs. 23.3 crores which it agreed to lend in 1953, actual disbursements and firm commitments up to date amount to Rs. 20 crores and the balance of Rs. 3.3 crores is expected to be taken up before long. These loans have been made on fairly easy terms, in regard to both period of repayment and rate of interest. Thus, the rate of interest charged is 4.5 per cent. on loans for developing coastal trade and 2.5 per cent. on those for expanding overseas trade. The period of repayment varies between 10 and 12 years. The basis of loan is related to the cost of ships; at present, it is about 75 per cent. While gratefully acknowledging this form of assistance, all shipowners are of the view that the terms and conditions of loan are still onerous and require further liberalisation, if the pace of development is to be quickened. They want (a) the amount of loan to be raised to 90 per cent. of the cost of the vessel, (b) the existing rates of interest to be halved, and (c) the repayment of capital to commence from the sixth year of the loan and to be completed within 15 years therefrom or three-fourths of the normal age of the ship. They also want the Government to purchase suitable ships and charter them to shipping companies on bare boat terms. Besides, they want the Government to reserve all its cargo, as well as cargo under its influence, for Indian ships to the extent they can carry. The Government, they say, should also use its influence and good offices to enable the companies to get admission to the various overseas shipping conferences.

This overwhelming dependence on Government is, of course, not the seeking of shipowners. It is the outcome of circumstances almost all of which are beyond their control. In the first place, the capital market is not in a position to provide equity capital for Indian shipping. Its inability is due to two causes: (1) The quantum of risk capital available is itself of a very limited nature. And (2) the little capital that is available is chary of finding a haven in shipping business, because shipping has not proved to be a profitable proposition in recent years. Secondly, the expansion envisaged requires so large an amount of capital that the whole of it cannot be found by existing shipping companies. The Government has, therefore, to provide a good part of it. Thirdly, the competition offered by the advanced maritime countries on the high seas is so strong that it cannot be met except with the protection given by the State. Finally, the productivity of port labour has gone down to such an extent that Indian shipping is at a definite disadvantage as compared with its competitors.

While shipping has undoubtedly a strong case for Government assistance in various forms, the wisdom of depending on the Government to such a large extent as indicated above at a time when private enterprise is at a discount is open to question. To the credit of Mr. Lal Bahadur Shastri, however, it must be said that he has been quite sympathetic to the needs and aspirations of Indian shipping and that he is quite prepared to assist this industry to the maximum extent he can. He has promised to consider all their suggestions and, if his performance during the past one or two years is any indication, there is no doubt that he will keep his promise. But the question is whether it is advisable to strain his spirit of accommodation to an extent that may be embarrassing to him in his party or Parliament. A more prudent course for the industry would be to put forward proposals which will enable it to stand on its own feet.

It is not suggested here that all the forms of assistance advocated by Mr. Vallabhdas are not justifiable. The demand for Government-financed and/or Government-controlled cargoes and the plea for Government help to enter the various conferences are legitimate and have been conceded by the Transport Minister. But whether the same can be said of the demand for the Government buying ships and leasing them to the companies, or of the one for loans up to 90 per cent. of the cost of ships, is open to question. It sounds rather ridiculous for private enterprise to confront the Government with such demands. In such a case, one may turn round and ask the private sector: "If the State is to give you practically all the capital you need, buy ships and give cargo and, in some cases, even personnel to manage your business, why should you be there at all? Why should not the State itself run the whole show?" In posing this question, we do not wish to be misunderstood by shipowners. Such questions are bound to be raised by the critics of the private sector of whom there are many in the Government itself. Our object in drawing the attention of shipowners to this aspect is to warn them that they are treading on dangerous grounds. Apart from political considerations, over-dependence on Government is not in the interest of either the shipowners themselves or the taxpayer. If the Government were to give 90 per cent. of capital as loan at very low rates of interest, it might not be conducive to efficiency and economy among the shipping companies.

What is the alternative? A healthy alternative, in our opinion, will be for shipowners to insist on the Government to create conditions that will enable them to raise their own capital both in the domestic and in foreign markets.

This means, in short, that the Government must make it possible for shipping companies to operate profitably and to pay decent dividends. It also means that the shipping companies must not place sentiment before business, as some of them do in regard to tramp shipping, for instance. They must resort to all legitimate means of enhancing their profit. In all the maritime democratic countries, shipping is given special tax concessions. It is a fiscal practice universally followed and endorsed even by the Royal Taxation Commission in Britain which submitted its final report only a fortnight ago. After the war Germany, Japan and Italy gave liberal tax concessions to shipping companies and the result has been an impressive rise in the size of their mercantile marine. One advantage of helping shipping through tax concessions will be that they will encourage and enable new *entrepreneurs* to enter the field and boost expansion. This will not happen freely, if loans on easy terms are given to shipowners, because, while tax concessions operate automatically, loans can be had only through negotiation and persuasion, a method that may lead to corruption and favouritism in the Government. Entry of new *entrepreneurs* or even the possibility of such a development will keep the existing shipowners on their toes. It is significant that, even though there is need and scope for more shipping and the Government has been offering loans on fairly liberal terms, no new big shipping company has come into being in recent years.

Tax concessions alone are, of course, not sufficient. Almost every shipping company will need loan capital of varying degree and extent. This the companies should be enabled to obtain from the market, instead of being directly provided by the Government. If the shipping companies function profitably, pay a reasonable rate of dividend and are well managed, the traditional institutional investors will be willing to provide loan capital. A ship is a floating asset which usually earns from the day it is put on stream. It is, therefore, a first class collateral for any lending institution. If the needs of loan capital are more than the capacity of the domestic market, they can be satisfied by borrowing from either the World Bank or the proposed International Finance Corporation or from some of the well-known foreign capital markets. It is the duty of the Government to help the shipping companies to obtain finance from such sources. It is only when the companies know and feel the cost of borrowed money will they have the incentive to operate efficiently and enterprisingly.

The profitability of a ship depends on its turnround. If it lies idle, it loses heavily. In this context, the Government can render valuable assistance. It is primarily the responsibility of the Government to ensure a high level of productivity in ports. This will be possible only if the labour employed in the docks are hard-working and disciplined. The equipments in ports must also be up to date. The handling facilities at the docks, including the installation of mechanical appliances for loading and unloading bulk cargo, must be improved.

The profitability of shipping can also be improved by giving it protection against competition from the world's leading maritime countries. Nascent shipping has a right to expect such protection from the Government on the same ground on which such land-based industries as steel, textile and sugar are given protection in their early stages. As shipping is a floating industry, it cannot, of course, be given protection through the traditional tariff walls of varying heights, as is being done in the case of other industries. The only practical way of extending protection to it is through State subsidy. Where such subsidy has to be given, it will be better to do so through an impartial body like the Tariff Commission. Further, in order to safeguard the interests of the taxpayer, it will be necessary for the State to keep a periodical check over the operations of shipping corporations so long as subsidies are continued.

KOLAR GOLD MINES

THE relations between the Mysore State Government and the Kolar Gold Field Mining Companies in the State are not as happy as either party would desire. Both the Government and the Companies have, in the recent past, indulged in a controversy, the most technical of its kind known in this country. After all, the gold mines at Kolar are the only rich and substantial mines in India, so that there are no standards or models from which one could judge the validity either of the allegations that have been made by the Government or of the defence by the Companies. Even so, it is certainly regrettable that the Government of Mysore should have felt that the only alternative to prolongation of controversy is the nationalisation of gold mining industry in the State. The Chief Minister of Mysore, Mr. K. Hanumanthaiya, revealed that the State Government was inclined in favour of nationalisation of the gold mining industry. The Government of India, too, he claimed, had been "very helpful and sympathetic in the matter of implementing the opinion of the Government and the people of Mysore."

The Kolar gold mining companies are not only one of the oldest of their kind but also technically one of the most efficient. They work what is described as the world's deepest gold mines. After 60 years of sporadic exploration by Europeans, the first successful prospecting for gold in the State was made in 1871 by one M. F. Lavelle. The present operating companies, Messrs. John Taylor and Sons, Ltd., London, took over the management of the mines in the beginning of the present century. In 1935, an agreement was reached between the Government of Mysore and the four mining companies to renew their lease for a further period of 30 years from March, 1940 on certain conditions. According to this agreement, the companies have the right to work the mines up to 1970. At present, only three gold mines are operating, namely, the Mysore mine, the Nandydroog mine and the Champion Reef mine; the fourth mine, the Oorgaum mine, was closed in October, 1953. In 1940, the gold duty was imposed. The duty was removed in 1949, after protracted negotiations and an agreement was concluded between the Government and the Companies, whereby 75 per cent. of the net surplus has to be paid to the Mysore Government, in addition to royalty and additional royalty.

The present dispute between the Government and the Companies has arisen out of the implementation of the Agreement. The Government's contention has been that the Companies have not abided by the terms of the Agreement and that they have violated some of its terms. A committee (Chairman: Mr. H. Siddaveerappa, Minister for Home and Industries, Government of Mysore) was appointed in 1954 to review the working of the Agreement. This Committee, the report of which was published in February, 1955, virtually endorsed the views of the Government spokesmen which had been expressed prior to the appointment of the Committee. It charged the Companies with having honoured the Agreement "more in the breach than in the observance." Some of its specific criticisms were: (1) Working costs had been unduly inflated; (2) Indianisation of staff had not been satisfactorily carried out; (3) the Companies had failed, even when funds were available, to contribute to the depreciation development expenditure upto 15 per cent. of working costs in terms of the Agreement; (4) the over-valuation of assets, coupled with the transfer of disproportionate and unwarranted liabilities to rupee companies at the time of their formation (in December, 1950), had handicapped the new companies at the very start and had affected adversely their resources. The Committee deplored that, whereas the State Government's total income from royalty, gold duty and contributions (exclusive of income-tax) from 1881 to 1953 was Rs. 16.43 crores, the shareholders had earned by way of dividends Rs. 34.50 crores during this period. The Committee recommended that the royalty, computed as a percentage of the sale proceeds, should be increased from 5 per cent. (in terms of the 1949 Agreement) to 10 per cent.

The Companies' contention, by way of reply to the foregoing charges, is that it is wrong for the Government to get the Agreement reviewed by a Committee wholly of officials. They flatly deny the allegations of avoidable increase in working costs and of tardy progress in Indianisation. Their contention is that nearly 90 per cent. of the increase in costs between 1945 and 1952 was due to reasons over which the Companies had no control and the remaining 10 per cent. was due to the grant of allowances to staff. They argue that the Committee's admission that the increases in output far outweighed the rate of increases in expenditure between the years 1949-52 is proof of the technical progress and increased efficiency achieved by the management. As regards Indianisation, the Companies point out that, out of 229 convenanted posts, Indians now hold about 137 posts (93 technical posts and 44 non-technical posts). Of the 29 key posts listed, 8 are held by Indians and the remaining non-Indians are "highly technical men of long service, ranging from 20 years and upwards." As regards the Committee's allegation that considerations of seniority had been overlooked, the Companies contend that, in the interests of efficiency and discipline, they cannot accept seniority as the sole criterion for promotion. They point out that "suppression of senior men with long service is not unknown in Government service."

The chief grievance of the Government is that, whereas its annual income from the mines was about Rs. 20.6 lakhs in the pre-war years, the average income received in the years 1952 and 1953 increased by a mere 12½ per cent. to Rs. 23.2 lakhs. The Government had expected to derive a much larger income at the time the Agreement was negotiated. The Companies point out in reply that, if the Government's expectations have not been fulfilled, it is because gold prices have declined. If the price had remained at Rs. 300 per ounce, the level at which it remained at the time of the negotiation of the Agreement, the Government would have received in 1952 a total of Rs. 74 lakhs. But the prices declined until they fell to Rs. 228 per ounce in 1953. Again, income-tax is now payable to the Government of India, whereas, at the time of the repeal of the gold duty, it was payable to the Mysore Government. The State Government, it may be noted, receives compensation for this loss from the Central Government. The management of the gold mining companies regret that the Committee has not taken these factors into account. Nor has the Committee realised that the Government has benefited through the sale of power, water, timber, etc., and through the indirect benefit derived from the revenue of the industry circulating in the State, to say nothing of the employment it provides and the income the Government derives through direct and indirect taxation of the employees of the Companies.

The impression seems inescapable that the Committee, in its understandable anxiety to recommend measures that would augment the revenues of the State, has either ignored or accorded insufficient recognition to the fall in gold prices and the indirect benefit that should accrue to the State through the continuance, as well as possible expansion, of the Companies' activities. In any case, it is certainly unfair that the Agreement between the Companies and the Government should have been peremptorily reviewed by a Committee consisting wholly of Government spokesmen, especially because the Agreement specifically provides for arbitration in case of disputes. What is even more surprising is that the Government should now think that even the revision of the Agreement, on the lines recommended by the Committee, is not a sufficient remedy for the situation, and that nothing less than wholesale nationalisation is the only solution. This attitude gives rise to the impression that the *ex-parte* enquiry was just a show and a prelude to implement the Government's pre-conceived decision to nationalise the mines. The recent amendment to Article 31 of the Constitution has evidently encouraged it to go ahead.

Before snapping the connections with one of the oldest of gold mining experts in the country and the only gold mining company, that is, before taking the irrevocable step of nationalisation, the State Government, as well as the Central Government, will, perhaps, do well to examine whether some workable alternative to State ownership cannot be found. It should not be difficult to increase the Indian ownership of the companies, if it is in a minority as it seems to be. The State Government, the workers of mines and Indian investors could together hold the majority of shares, the foreign interests retaining a fair proportion. The present management could be retained as Secretaries and Treasurers. If this were done, it would serve a double purpose. In the first place, Indian interests would have larger control over the working of the industry. Incidentally, it would enable the Companies to get the capital they need for expansion. Secondly, the services of the present management, which has guided the fortunes of this highly technical industry for close upon half a century, would be retained for the benefit of the industry. So far as the Mysore Government is concerned, it has a creditable record of successful working of joint-stock companies in partnership with private investors. For the foreign gold mining experts, such a solution would mean the continuation of profitable association with this country. Only, it would require some psychological readjustments, as well as some organisational changes. But they would be in keeping with the spirit of the times and, at any rate not beyond the British genius for adjustment.

NATIONALISATION OF INSURANCE BEFORE NEXT ELECTIONS?

STATE BANK SHARES—MR. SHROFF'S SPEECH —U.S. COTTON—I.M.F. ON CONVERTIBILITY

THURSDAY, 5 P.M.

TRADING in the share market is colourless; the trend is quietly steady and the turnover is mostly of a jobbing nature. After looking up during the past fortnight, the market is somewhat hesitant. Here and there, however, some bright spots are seen, thanks to encouraging reports about individual companies. Particular mention may be made of Bombay Burmahs, A.C.C., and automobile shares. Some of the big industrialists say that there is no cause for pessimism. They argue that all existing industries are faring well, with a few exceptions, as, for instance, coal. Banks and insurance companies, too, have been working satisfactorily. They further point out that almost every one of the big Indian business houses are either starting new ventures or expanding the existing ones. Tatas, for instance, are expanding their iron and steel factory and enthusiastically going ahead with the T.E.L.Co. Birlas are expanding their paper mills and going in for chemicals, rayons, and heavy engineering on a big scale. Dalmia-Jains, too, are expanding their paper, cement and chemical works. Somanis propose to put up a big paper mill somewhere in Karnatak. Kilachands have concluded a deal with Dow-Chemicals for producing an important raw material for plastics. Kasturbhais are expanding their Atul factory. Khataus also are said to have a plan for establishing a large-scale industry. Several other schemes relating to sugar, printing, engineering and a number of miscellaneous industries are also daily reported from the various parts of the country. If prospects for business are bad or highly uncertain, why are these projects coming up?, ask these industrialists.

MARKET GOSSIP

• • • •

While all this is true, the fact remains that investors are still shy and those who want fresh capital think in terms of not equity capital but preference shares or debentures. This is because of the uncertain economic policy of the Government and the frightening statements that are being made by politicians in power. That the Government is actively assisting several industries in the private sector cannot be denied. But, at the same time, it must be conceded that it is following policies which threaten to restrict the activities of large-scale industries in the not distant future. Look at the fate of the W.I.M.Co. The encouragement given to cottage match factories has reduced the market for this Company and its shares once considered to be a blue chip, are standing at such a low level that they are giving a yield of 6 per cent. This may be the fate of many other consumer goods industries during the second Five-year Plan period, when they may be subjected to heavy handicaps, in order to boost cottage and small industries. High discriminating excise duties are being proposed for many of them. One will know more on this subject when the various committees, which have been appointed to suggest ways and means of improving the employment potential of these industries, submit their plans. It is significant that there are hardly any practical business men on any of these Committees, whereas they include quite a few faddists, with pronounced bias in favour of cottage industries. The strong canvassing now going on in favour of *Amber Charka* (hand-operated spindle) may ultimately affect the purely spinning mills which have hitherto been free from the deleterious effects of reservation of markets for handlooms. For a time, the scarcity of yarn created by any such restriction in favour of *charka* may lead to a boom in the yarn market, but the Government may not let the spinning mills get away with it.

• • • •

There are reasons to feel that the Congress Party is quite serious about its desire for nationalisation of insurance. This may figure as its trump card for the next General Elections, due to be held early in 1957. In other words, the right time to nationalise insurance, referred to by Mr. Nehru, will be the last quarter of 1956. So, the threat of nationalising insurance is not an empty one. Many, including this journal, have been wondering as to what is there for the Government to gain by nationalising such a closely controlled activity as insurance. This curiosity drove us to seek an explanation from quarters that ought to know. The rationale given by this source sounds quite plausible. It is this: Insurance is a business which provides opportunities for employing thousands of free-lancers as field workers who can do many other jobs also. The Government, it is said, would like to utilise these field workers to work as its agents in every nook and corner of the country. They can be employed, for instance, to sell small-saving bonds, to do propaganda for the Government Five-year Plan, to look after the co-operatives, etc. An uncharitable critic remarked, when he heard this news, that, if insurance is nationalised, it will provide a first class avenue for finding jobs for the Congress Party men and for building up a volunteer force that will come quite handy for the party-in-power at the time of elections. When asked, as to what made him jump to this conclusion, he promptly replied that it was based on his recent study of the way in which co-operatives were now being run in certain districts of Gujarat.

Although there is only a week more for the Imperial Bank of India to be taken over by the State Bank of India, details of compensation payable to shareholders of the former bank have not been made public up to the time of writing. An announcement, however, is expected any moment now. The compensation will be in cash up to Rs. 10,000 and the balance will be either in Government bonds or shares of the State Bank of India. Those who do not wish to exercise their right to receive payment in cash up to the specified limit may take the compensation in shares or bonds. It is not known whether the Government bonds will be in 3½ per cent. 1964 National Plan Loan, of which the Reserve Bank has plenty, or in the proposed new loan. It is, however, reliably learned that the shares of the State Bank will be offered at par in units of Rs. 100 each and not at a high premium, as was being speculated in certain quarters. This means that it is not the intention of the State Bank authorities to pay any high dividend on the share capital, at any rate not in the initial years. Since no premium is proposed to be collected on the shares, it is obvious that they will not declare big dividends. On the basis of current market ideas for first class scrips, one can venture to forecast that the dividend may be anything between 4 and 5 per cent. per annum, tax-free. In so far as we can make out, the promoters of the State Bank of India, namely, the Reserve Bank, do not propose to give any idea of the probable dividend. Shrewd finance brokers are of the view that it will be advantageous to take compensation in the shares of the State Bank rather than in Government bonds, for even on the basis of 4 per cent. tax-free, the shares, which have been declared as a trustee security and which are a degree higher than a blue chip, form a more remunerative investment than the 3½ per cent. Government loan. Further, they are of the opinion that, after a few years, the State Bank may declare higher dividends.

• • • •

The president of a stock exchange, more than of any other body or organisation, has unusual opportunities for a close study of the market mechanism. Since stock exchange represents the barometer of the markets, it is small surprise that the observations of the president of that exchange merit attention. And when he happens to be at once so painstaking an analyst and so persuasive a speaker as Mr. K. R. P. Shroff, the President of the Bombay Stock Exchange—or to give this body its quaint, old-fashioned name, the Native Share and Stock Brokers' Association—his views acquire an additional significance. In his customary address, at the annual meeting of the Exchange, this week, Mr. Shroff was again at his best and showed that he was, as he always is, worth listening to.

• • • •

Mr. Shroff prefaced his address with a review of the market trends—the rise in economic activity and in money supply, the success of the Government's borrowing programme and of the new issues market, and the generally satisfactory trends in different sections of the stock market. He declared that the unbroken decline in stock market prices, which characterised an earlier period, had now ended. The imbalance caused by inflation had corrected itself. He added: "This process of adjustment is one of the major factors in the remarkable improvement observed during the years in the conditions ruling in the stock market and its present resistance to any headlong fall." He forecast that, in the context of a strong and healthy economy, the favourable trend could be maintained and reinforced. But he rightly insisted that the forecast depended for its fulfilment on the adoption of "reasonable" economic policies and of a system of taxation of personal incomes, particularly those of the middle class, that would leave a margin for savings and investment.

• • • •

It is heartening to see Mr. Shroff taking up the cause of the long neglected, fast disappearing middle class. But he had special reasons for emphasising the importance of this class. Despite all the shocks to which the class has been subject in the recent inflationary era, it is still an important factor as a source of investment. He quoted from the study covering 54 representative companies, made by the Indian Chamber of Commerce, which showed that 97 per cent. of the shareholding population individually held shares of the aggregate value of less than Rs. 10,000 each. The Reserve Bank study of the subject, based on data collected from income-tax assessment records, shows that 59.5 per cent. of the shareholders are people having incomes below Rs. 8,000 annually. These studies, he recognised, were admittedly tentative. But they pointed to one central fact, namely, that it is the middle class which saves and invests its savings in stocks and shares. And yet, it is this investor who is the target of a three-pronged attack—through heavy taxation, unjustifiable labour awards and threats of nationalisation of industries.

• • • •

The subsequent portions of Mr. Shroff's illuminating address were devoted to a critical evaluation of this "three-pronged" attack. Referring to the "attack" made on the investor by tax authorities, he deprecated the facile view, held in many quarters and recently emphasised by the Taxation Enquiry Commission, that consumption should be restrained, if not actually restricted, in order that savings might be increased. Mr. Shroff admitted that, at a given point of time, "income is equal to consumption *plus* saving." But, there were dangers in excessive curtailment of consumption. Such restriction did not always lead to saving and larger investment. In this connection, he pointed out that "rice, wheat and cloth, which are not consumed, are not transformed by some miracle into capital goods." On the contrary, reduced consumption, by slowing down the production process, might reduce real national income, and lead to decline in the rate and quantum of savings and investment. He pointed out that it was not an accident that the "rate of savings as well as investment activity in the stock market should have shown such visible signs of improvement in the period under review, of which the most outstanding characteristics were rising production, plentiful supplies and freedom of consumption from shackles of control."

• • • •

Proceeding, Mr. Shroff quoted from the Reserve Bank study which revealed that the corporate enterprises are making a genuine effort at savings. The study, based on an analysis of 757 joint-stock companies, shows that, of the total gross profits, taxation absorbs 30 per cent., retained savings account for 46 per cent., leaving a balance of 24 per cent. for distribution as dividend. He regretted that this "very act of moderation" in the distribution of profits among shareholders had been made the subject of tax. He cited, in this connection, the recent amendment to section 2(6A) of the Indian Income-tax Act, whereby, on the liquidation of a company, all its retained earnings would be chargeable to tax in the hands of the shareholders, as if that were dividend earned by them in that single year. He said that this amounted to a tax on capital, since retained profits, spread on plant and machinery over a number of years, are capital. He remarked that it was all the more surprising that such "injustice should be perpetuated when the Taxation Enquiry Commission itself declares, and rightly, that bonus shares should not be taxed as dividend."

• • • •

After referring to labour awards which sometimes expressed views contrary to equity and common sense—he particularly cited the recent award of the Madhya Pradesh Industrial Court in the dispute involving the cotton mills and their workers (subsequently set aside by the Appellate Tribunal) —Mr. Shroff examined the problem of exercise of so-called "police" or "regulatory" powers of the State. He referred to the amendment to Article 31 of the Constitution which now clearly provides that, when property is acquired by the State, Parliament alone will fix the compensation and such compensation cannot be called into question in any court of law. He deplored that in order not to fall a prey to a totalitarian way of life, we should resort to totalitarian methods of confiscation and abridgment of guarantees in the "national" interest, thereby subverting the rule of law. Examining the dangers implicit in the unrestricted expansion of the State into the economic sphere, Mr. Shroff said:

"Power, whether political or economic, corrupts. Absolute power, implicit in the combination of political and economic authority, will corrupt absolutely. Those who urge the obliteration of the private sector and laud the enlargement of the public sector scarcely seem aware of this new peril. It has been suggested that, in contrast to the private sector, the policy and administration in the public sector will be entrusted to disinterested public servants on whose activities will 'beat the light of publicity far fiercer than any that has ever beat on a throne.' But there is little doubt that the protection and choice available to the man-in-the-street under a system of competitive prices, such as a private proprietor or business concern might charge under competitive conditions for the use of property or supply of goods and services, will in time fade away. In practice—as has been the experience of most Western countries where the gilt has worn off the gingerbread of socialism—the plea of public service and public interest will be used to cover a multitude of sins and the power to charge what the traffic will bear will be wielded in the same manner as the taxing authority of the State itself—without, however, any of the checks resembling parliamentary and ministerial responsibility to the elected representatives of the people. The arbitrariness of Government organisations and the unsuitability and inefficiency of Government machinery, operating under the cover of monopoly rates and charges and indifferent to consumers' preferences, will lead to concealed waste of public funds amounting to the imposition of a heavy fine on the community. The facile assumption that, because an industry is in the public sector, it is run in the interest of the country, is wholly unwarranted. We cannot forget that controls, rationing and regulations in the economic sphere have in the recent past produced results exactly the opposite of those intended. We have all heard the familiar charges that the private sector means exploitation, a direct giveaway to predatory interests, robbing the people of their heritage and the like—as if the private sector were free to do as it liked and what it liked, fastening its tentacles on the property of the people and milking the public with exorbitant rates and charges, with the sole object of piling up huge profits and distributing large returns. One could hardly get from all this the impression that the companies are, in fact, subject to the strictest kind of regulation in almost everything they do, and that through its multiple tax demands, the Government is the principal partner in whatever profits that are earned but not in the losses that also accrue. As the Planning Commission has recognised, 'there is no such thing under present conditions as completely unregulated and free private enterprise.' Companies in the private sector are not 'private' in the sense of being free from public taxation, regulation and control, as are those

(Continued on page 1241)

TRADING IN SHARES DULL

PRICE MOVEMENTS NARROW

(From Our Own Correspondents)

BOMBAY, *23rd June*

BARRING some sustained support to selective scrips, which covered fresh ground, trading on the Stock Exchange as a whole this week was a dull affair. Fresh buying interest was at a low ebb and price fluctuations were confined to a narrow range. Lack of follow-up support and mild realising pressure brought down prices to a modest extent; but at lower levels buying enquiries and short-covering emerged and acted as a check on further recession. The undertone was, however, fairly steady, in the absence of any discouraging factors, and better advices from Calcutta contributed to the steadiness. The uninteresting performance of the market during the week under review, after two weeks of sustained bullish activity, showed that operators were very cautious in enlarging their commitments at higher levels. Further, end-of-account considerations also restricted activity.

In the steel section, Tata Ordinaries, after an initial mild hardening from Rs. 233-12 to Rs. 234-12, reacted to Rs. 231-8, but renewed support restored them to Rs. 232-8. Indian Irons gave way from Rs. 33-14 to Rs. 33-6, but recouped to Rs. 33-10½ on keen Calcutta buying.

Textiles were featureless and most of the counters disclosed small losses over the week. Bombay Dyeings were marked down from Rs. 470-10 to Rs. 465, but revival of rumours about commencement of third shift in the mills brought fresh support to lift the shares to Rs. 470 at the close. Similarly, Kohinoors moved down in the earlier part of the week from Rs. 324-8 to Rs. 321-8, but came up to Rs. 325-12 before finishing at Rs. 324-4. Century's lost ground from Rs. 381-12 to Rs. 379-4. Ahmedabad Advances shed Rs. 3-2 to Rs. 127-8. Central Indias lost a rupee to Rs. 115. Finlays declined from Rs. 250 to Rs. 248-8. Gokaks finished a rupee lower at Rs. 217-8, while Indu Ordinaries attracted attention and added As. 9½ to Rs. 11-2½. Indore Malwas had transactions Re. 1-14 lower at Rs. 96-14. Khataus were held at Rs. 165-10, Morarjees reacted sharply from Rs. 223-12 to Rs. 215. Buying enquiries were noted in New Citys which pushed up the shares from Rs. 138-7 to Rs. 141-14. New Greats were depressed from Rs. 175 to Rs. 170, but spurted at the close to Rs. 174. Phœnix were done a shade better at Rs. 118-2. Shree Niwas were unchanged at Rs. 223-12. After going down from Rs. 156-8 to Rs. 154, Simplex recovered to Rs. 156. Standards changed hands at the close at Rs. 367-8, showing no change over the week. Svadeshis lost Re. 1-4 to Rs. 198-12, Tatas were done a fraction lower at Rs. 51-8, while Vishnus were taken up at the self-same rate of Rs. 140.

Bank shares were quiet with sellers in most counters. Barodas were a fraction lower at Rs. 95-4. Centrals were on offer and shed Re. 1-8 to Rs. 47-4 and their New shares Re. 1-4 to Rs. 49. Bank of Indias shaded off to Rs. 146. Punjab Nationals were, however, a rupee better at Rs. 43-8, while United Commercials disclosed no variation at Rs. 43-8.

Electricity shares were unimpressive with the tendency quiet. Ahmedabad Electrics were maintained at Rs. 106-9, while Amalgamated Electrics were a fraction higher at Rs. 11-1. Bombay Suburbans shed As. 5 to Rs. 125. Surat Electrics were done at Rs. 127-8 *ex-div.*, as against Rs. 131-4 *cum-div.* (div. Rs. 4-8) Tata Hydros changed hands a rupee lower at Rs. 144-8, while their New shares were held at Rs. 110. Tata Powers (Old) declined by Rs. 5 to Rs. 1,475, whereas Tata Powers (New) were maintained at Rs. 1,165. Andhra Valleys had transactions Rs. 10 lower at Rs. 1,375, but their New shares gained Rs. 2-8 to Rs. 1,072-8.

Insurance shares were featureless and business passing was very small. New Indias were dull at Rs. 49. Orientals were unchanged at Rs. 7,210. British India Generals, however, picked up As. 6 to Rs. 15 and Indian Mercantiles As. 8 to Rs. 45-8. Industrial and Prudentials stayed at Rs. 44 and Vulcans at Rs. 16-5.

In the miscellaneous section, the sugar group was steady. Belapurs met with heavy profit-taking earlier in the week, dropping from Rs. 311 to Rs. 306, but renewed support lifted them up to Rs. 312 at the close. Phaltans gained As. 8 to Rs. 126-8 and Walchandnagars As. 10 to Rs. 208-12. Cement shares also displayed a steady tone with prices well held around last week's closing rates. A.C.C. finished at Rs. 179-4 and Digvijays at Rs. 179. Among shipping and transport shares, Scindias slipped from Rs. 14-14 to Rs. 14-8½, but gained ground to Rs. 14-12. Great Easterns stood unchanged at Rs. 15-9, while India Steamships stood on balance As. 2 better at Rs. 7-10. Bharat Lines were marked down from Rs. 84 to Rs. 81. Hindustan Motors were steady at Rs. 9-1. Premier Automobiles were quoted at Rs. 81. Tata Locomotives had buyers at Rs. 136.

Among engineering and mining shares, Alcocks were marked up by Re. 1-4 to Rs. 256-4. Larsen and Toubros were done at Rs. 12-10 *ex-div.*, as against Rs. 13-6 *cum-div.* a week ago. Jost's Engineerings were unchanged at Rs. 96. Premier Constructions were quiet at Rs. 146. Shivrajpurs were a shade lower at Rs. 68-12. Indian Coppers continued to be in demand and gathered As. 1½ to Rs. 4-10½. B.B. Petrols gained an anna to Rs. 3-12½. Among miscellaneous industrials, Bombay Burmahs staged a jump from Rs. 479-6 to Rs. 489-6 early in the week, but reacted to Rs. 484-6 at the close. B.I.Cs picked up As. 3 to Rs. 9-0½. National Rayons moved down from Rs. 198-8 to Rs. 195-12, but gathered strength to Rs. 197-4. Killick Industries were steady at Rs. 160-8. Polsons rebounded from Rs. 137-8 to Rs. 141-4. Tata Chemicals were steady at Rs. 13-15½ and Tata Oils at Rs. 42. Wimcos closed with a fractional gain at Rs. 185.

• • • •

Calcutta Stock Exchange

CALCUTTA, *22nd June*

The Calcutta Stock Exchange was again active this week, and buyers concentrated their attention on several counters, which were found to be attractive on yield considerations. Naturally, transactions showed an increase. This improvement is likely to receive a temporary setback, if the anticipated loan of the Centre is floated. For, in the event of subscriptions to the new loan market funds usually get diverted, and the Stock markets will be left with relatively limited resources. In the meantime, the late improvement in quotations has been mainly due to industrial progress, as reflected in the improved working results of several companies, recently published. It was also due to the inclusion of scrips of Texmaco and Indian Copper in the forward list of the Stock Exchange, and these two shares attracted considerable attention. With this, the forward list now covers six scrips. The other four are Burrakurs, Howrahs, Orient Papers and Indian Irons. There was no session on Monday on account of the solar eclipse.

Sectionwise, coal shares pulled their weight in conformity with the general trend, although the prospects for the coal industry are far from cheerful in the face of higher output costs and nationalisation possibility. Burrakurs were steady at Rs. 13-4 and today gained to Rs. 13-6. New Beerbhooms were higher at Rs. 21-1, but today receded to Rs. 20-14. Central Indias were raised to Rs. 8 from Rs. 7-9. Pench Valleys at Rs. 23-1 put on As. 5, while East Indias were quiet at Rs. 28-10.

Jutes attracted more attention and prices gained. Birlas were one of the favourites of buyers, and were better at Rs. 20-10, as against Rs. 20-2 earlier. At Rs. 102 Ganges were raised by Rs. 2, while Barnagores recovered to Rs. 177 from Rs. 172. Kinnisons were unchanged at Rs. 191-8, but Nuddeas hardened from Rs. 54-12 to Rs. 56. Belvederes were, on the other hand, pushed back from Rs. 203 to Rs. 200. Chitavalsahs staged a recovery from Rs. 14 to Rs. 14-7. Howrahs were transacted at Rs. 31-8 and Nationals were quoted at Rs. 33-13.

In the engineering section, Texmacos were a special favourite and were raised to Rs. 20-14 from Rs. 19-2. Indian Irons were steady, and at one time, were higher at Rs. 34 as against Rs. 33-10 earlier. Subsequently, the rate gave way to close yesterday at Rs. 33-6, today regaining to Rs. 33-10. Marshalls met with good support this week, and spurted to Rs. 7 from Rs. 6-11. From Rs. 12-5, Kumardhubis improved to Rs. 12-8, while Indian Galvanizings were bought at Rs. 23-2 as against Rs. 23 earlier.

There were several features in teas, and the more prominent ones are indicated below:

QUOTATION

	As on 15th June		Latest		Gain	
	Rs.	a.	Rs.	a.	Rs.	a.
Hantapara	350	0	366	0	16	0
Banarhat	573	0	585	0	12	0
Teloijan	32	0	33	10	1	10
Dhunseri	30	6	34	8	4	2
Jutlibari	25	8	28	10	3	2
Tukvar	15	0	18	8	3	8
Gairhatta	325	0	385	0	55	0
Roopcherra	21	6	23	8	2	2
Tezpore	34	4	37	12	3	8
Bishnauth	47	2	48	8	1	6
Dhelakhat	21	2	22	0	0	14
Bormahjan	21	12	24	0	2	4
Betjan	50	12	53	0	2	4

Miscellaneous industrials were sought at higher levels. Indo-Burma Petroleums were very active, and were taken to Rs. 146 from Rs. 134-8. Dunlop Rubbers were another feature for the rise to Rs. 38 from Rs. 37. Indian Coppers were held steady at Rs. 4-10. The earlier report that Rohtas Industries were also likely to be included in the forward list had made these shares very active. But, when these rumours did not materialise, a downtrend set in, and took the rate to Rs. 25-10 from Rs. 27-2. Indian Cables eased to Rs. 27-2 from Rs. 27-9, while B.I. Corporations were unchanged at Rs. 8-13.

Among sugars, Carew & Cos. were in good demand, and moved to Rs. 11-13 from Rs. 10. Ramnugger Canes improved to Rs. 24-13 from Rs. 23-12.

• • • •

Madras Stock Exchange

MADRAS, *22nd June*

The firm trend on the Madras Stock Exchange persisted for the third week in succession. Induced by continued keen buying enquiries, most scrips recorded handsome gains. Conditions were particularly buoyant in the planting section, with tea shares in good favour. This was due to persistent firmness in tea prices following excellent demand and reports of highly encouraging performance of some tea companies. There was also sustained demand for rubber shares. Coffee shares, too, were well sought after. Although activity in the textile section was relatively subdued, values generally tended to look up. Sugar shares were steady, as also bank, insurance and electric shares. Transactions put through in the miscellaneous section were lower than those a week before, but prices of most of the shares were fully maintained.

There were a few notable dividend announcements this week. The Directors of the Chandramalai Estates Ltd. have recommended an interim dividend of 20 per cent. on the ordinary shares for the year 1955-56, which compares very favourably with a total of 20 per cent. for the previous year. The other dividend announcements are: Emerald Valley Estates Ltd.—final dividend of 17½ per cent. on ordinary shares for the year 1954, bringing the total to 35 per cent., as against 30 per cent. for 1953; Mlamallay Tea Estates Ltd.—75 per cent. on ordinary shares for the year ended 31st March, 1955, as against 20 per cent. for the previous year; Haileyburia Tea Estates Ltd. and Twyford Tea Co. Ltd.—final dividend of 15 per cent. on ordinary shares for the year 1954, bringing the total dividend to 30 per cent., as against 25 per cent. for 1953; Indian Steel Rolling Mills Ltd.—7½ per cent. (as against 5½ per cent.) for 1953 on ordinary shares for the year 1954; Ranga Vilas Mills Ltd.—12 per cent. on ordinary shares for 1954, same as for the previous year.

Rubber shares in the planting section evoked good buying enquiries and registered handsome gains. Malankaras spurted by Re. 1-4 to Rs. 29-8. Vaikundams and Rajagiris put on As. 12 each to Rs. 25-8 and Rs. 18-2, respectively. Midlands changed hands As. 8 higher at Rs. 18-4. Cochin Malabars gathered As. 6-6 to Rs. 8-12. Travancore Rubbers rose by As. 4 to Rs. 19-2 and Pullangodes by As. 3 to Rs. 3-14 *cum-div.* Among tea shares, Nelliampattys received special buying support and strengthened by As. 11-6 to Rs. 3-14. Parksides increased by As. 4 to Rs. 23-8. Peninsulars gained a like amount to Rs. 18-2. Nilgiri Teas were up by As. 2 at Rs. 13-4. Among coffee shares, Blue Mountains hardened by As. 3 to Rs. 3-15. Consolidated Coffees were steady at Rs. 19-4.

The shares of Vasanta Mills Ltd. led the textile section this week, their quotation firming up by Rs. 9 to Rs. 222. Coimbatore Spinnings, Pankajas and Radhakrishnas recorded a rise of Rs. 2 each to close at Rs. 72, Rs. 55 and Rs. 218, respectively. Cambodias picked up As. 4 to Rs. 12-13. Janardhanas were fully maintained at Rs. 75, Rajalakshmis at Rs. 133, Trichinopolys at Rs. 12, Bangalore Woollens at Rs. 465 and Buckinghams at Rs. 161. Ranga Vilas, however, lacked support and fell by Rs. 2 to Rs. 69. Lakshmis were also neglected at Rs. 149-8, as against Rs. 151.

In the miscellaneous section, cement shares evoked good attention. Andhra Cements rallied As. 8 to Rs. 131. India Cements moved up by As. 2 to Rs. 24. Dalmias were firm, though the closing quotation was the same as in the last week at Rs. 13-14. Among other shares, India Steel Rollings were done at Rs. 13 *cum-div.* Mettur Chemicals gained an anna to Rs. 18-14. Mysore Chemicals and Fertilisers, Parrys and Ralis were all maintained at the last week's levels of Rs. 10-7, Rs. 4-14 and Rs. 38, respectively.

Notice

THE BENGAL POTTERIES LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Forty-third Ordinary General Meeting of the Bengal Potteries Limited, will be held at the Registered Office of the Company, 45, Tangra Road, Calcutta, on Friday the 8th July, 1955, at 4 p.m., to transact the following items of business:—

(1) To receive and adopt the Directors' Report, the audited Balance Sheet and the Profit and Loss Account for the year ended 31st December, 1954.

(2) To declare Dividend.

(3) To elect Directors.

(4) To appoint Auditors for the current year.

The Share Transfer Register of the Company will be closed from 2nd July, 1955, to 27th July, 1955, both days inclusive.

By Order of the Board of Directors,

S. LALL BHAGAT & CO.,
Managing Agents.

45, TANGRA ROAD,
CALCUTTA, *20th June, 1955.*

NEWS IN BRIEF

THE Government of India has decided to continue free licensing of export of kyanite ore till the end of this year.

The Union Railway Ministry has signed an agreement with a Czechoslovakian firm for supply of 2,050 goods wagons. The delivery of the wagons is expected to commence towards the end of 1956.

Final touches are being given to the scheme for the expansion of steel output from 25,000 tons to 100,000 tons at the Mysore Iron and Steel Works, Bhadravati, at a cost of Rs. 12 crores, in the light of the American experts' report to the Government of India.

The revenue to the Government of India from estate duty since October, 1953, when it came into effect, till the end of 1954 amounted to only Rs. 4.56 crores, as against the estimated income of Rs. 8 crores per year. The above revenue, however, is in respect of non-agricultural property. The yield from agricultural property is not yet known.

The object of the proposed land reform in Madras, according to the State Minister for Public Health, is broadly to put a ceiling on landholdings and ensure a fair share of produce for tenants. There would be, in due course, a ceiling on all personal incomes, so that the owners of land might not feel that they had been singled out for this reform.

The Major Liners' Conference, London, has raised the freight charges for Indian iron and manganese ores by 5s. per ton with effect from the 17th inst. With this increase, the total increase in freight rates for iron and manganese ores during the past six months comes to 35s. bringing the rate to 95s. per ton on iron ore and 100s. per ton on manganese ore.

The Government of India has relaxed certain conditions regarding export of iron and manganese ore in transit through the Portuguese Port of Marmugoa. The condition of production of sales contract as a prerequisite for grant of export licences will not be insisted for the movement of iron and manganese ore to Marmugoa for export to overseas destinations.

The Government of India has decided to release a quota of 20,000 tons of kardiseed and nigerseed (combined) for export outside India upto the end of December, 1955, subject to a maximum of 250 tons of kardiseed and nigerseed together to any one shipper from all the ports. Export of nigerseed oil and kardiseed oil will continue to be licensed freely up to the end of December, 1955.

At a meeting of the Chairman of the Coal Board with the representatives of the Indian Mining Association and Federation and the Colliery-owners' Association held last week at Calcutta, the amalgamation of small collieries into up-to-date ones, capable of fulfilling the standards of the second Five-year Plan, was agreed in principle. A committee will soon be set up to study the position in Raniganje and Jharia and work out definite proposals in this connection.

The Panna diamond mines in Rajasthan, said to be one of the richest in the world, will be developed with the help of Russian experts. A private firm has secured the services of Russians to exploit the mines. They are setting up a plant capable of processing 10,000 tons of diamond-bearing rock per day. The present plant has a capacity of processing only 500 tons. The estimated value of the yield is over Rs. 1 crore per annum and the mines are said to be rich enough to be exploited for at least 50 years.

The Ninth Congress of the International Society of Sugarcane Technologists will be held in New Delhi from 27th January to 4th February, 1956. The Union Minister for Food and Agriculture, Mr. Ajit Prasad Jain, is likely to inaugurate the Congress. Dr. D. R. Narang has been elected Chairman of the Congress, Mr. N. J. King (Australia) as Vice-Chairman and Mr. T. Prasad as Secretary and Treasurer. About 1,000 delegates, including 500 from India, are expected to attend the session.

The Government of Travancore-Cochin has published a notification in the State *Gazette*, giving a list of employers of 736 estates and their workmen represented by 34 labour unions as parties to the disputes which have been referred to a Special Industrial Tribunal for adjudication. The Tribunal consists of Mr. P. K. Subramania Iyer, retired Judge of the High Court of Travancore-Cochin. There are 23 issues referred for adjudication to the Tribunal, dealing with wages, bonus, conditions of service, amenities, etc.

The Central Board of Revenue is reported to be examining the question whether any revision of Rule 8 of the Indian Income-tax Rules relating to depreciation allowance on buildings, machinery, etc., is necessary, particularly in regard to the enumeration and classification of the various types of assets eligible for such allowances and also the rates of allowance prescribed for each type of asset. The Board is stated to be collecting statistics with regard to the effect of the latest technical improvements in the manufacture of plant, machinery, etc., on the life of the respective type of assets. It is also gathering information on the effect of the latest technical and other developments in the running of business, in general, on the life of the assets used in particular businesses, professions, etc. The Board has also called for the views of business men on these points.

A four-man committee will be set up by the Union Transport Ministry, in consultation with the Planning Commission, to examine a scheme to deepen the sea between India and Ceylon, so as to permit the passage of ocean-going vessels from the Arabian Sea to the Bay of Bengal. The scheme, called the *Sethusamudram* scheme, is expected to cost Rs. 4 crores. At present, only boats and other small craft can cross the sea between India and Ceylon and large ships have to go round the island of Ceylon. If the scheme is put through, the coastal ships coming from the Arabian Sea to Madras, Visakhapatnam or Calcutta will save an ocean journey of 300 miles. Incidental advantages of the scheme are: (1) the problem of sea erosion at Dhanushkodi will be solved to a large extent, because, as part of the scheme, certain protection measures will have to be taken, (2) the port of Tuticorin will be developed, and (3) work for the displaced persons from Ceylon will be found.

From Abroad

Italy requires investments aggregating 2,000 milliard lire (£1,142 million) during the next 10 years for the development of the country's oil resources to meet its demand for oil.

The U.K. Government has introduced in Parliament a Bill seeking to authorise Britain to take part in the International Finance Corporation. The British Government's subscription to the Corporation's capital will be $14.4 million.

A British firm of shipbuilders has secured a £1-million contract for a powerful dredger from the Calcutta Port Commissioners. The contract has been secured in the face of keen competition from Japanese and European shipbuilders.

Prices of pig iron have been raised in Germany by 2.3 per cent., with effect from the 15th inst. This follows the recent increase in the price of rolling mill products. A similar rise is expected for open-cast steel and cast iron.

Civil servants in China will be paid their salaries in the form of food, clothing, housing and other daily necessities, instead of in cash, from 1st July next. Government employees who may suffer from the change will be given subsidies of money from welfare funds.

The supply of tea in Britain is to be referred to the Monopolies Commission, which investigates allegations of monopoly in industries. This follows the comments made inside and outside Parliament, as a result of the rapid rise in prices of tea early this year. The Opposition complained that huge profits were being made at the expense of the public. The price of tea has, however, since fallen.

A newsprint famine within ten years is envisaged by the British Vice-President of the International Federation of Newspaper Publishers, unless other means of supply are devised. Addressing the final session of the three-day Congress of the Federation held at Berne last week, he said that the demand would increase to an alarming extent because of the rapid increase in education in the backward countries of Asia.

The World Bank has approved a 25-year loan of $15.9 million to the Colombian National Railroads. The loan is for the purpose of financing a 190-mile extension of the Magdalena Valley railroad. The Bank of America National Trust and Savings Association is also participating in the loan, without the World Bank's guarantee, to the extent of $866,000. The World Bank has so far granted loans to Colombia to the extent of $94.7 million.

The Government of India has agreed to grant the Assam Oil Company, a subsidiary of Burmah-Shell, a prospecting licence for a period of 20 years. The licence will be renewable for a further period of 20 years at the option of the Indian rupee company, which is to be incorporated in India. All unworked licences at present held by the Assam Oil Company will be transferred to the rupee company. The Government of India will hold one-third of the equity capital of the Company.

Locomotive drivers and motormen in Britain, whose claim for pay increase was the cause of the recent nation-wide railway strike, have been awarded a rise of between 1s. and 3s. a week, by Lord Justice Morris, the referee appointed in the dispute after the strike was called. The British Transport Commission and the Railwaymen's Union, the parties to the dispute, agreed in advance to accept the referee's findings immediately and without question. Railway firemen, who also participated in the strike, were not given any increase.

Complete mechanical equipment for an iron-ore crusher installation will be delivered to the Indian Iron and Steel Co., Ltd., India, by a firm of Swedish specialists in this field. The order is worth about Kr. 4 million (£276,000). The delivery will include two jaw-crushers of the largest type built by the firm and provided with huge S.K.F. roller bearings. The plant will have a crushing capacity of 3,300,000 tons of iron ore per annum and can crush lumps of ore measuring about one cubic metre, into pieces of 75-100 millimetres suitable for the blast-furnace process.

An agreement has been signed between the Foreign Operations Administration, U.S., the Pan-American Airways and Turkish State Airlines for the development of the airline industry of Turkey. Under the agreement, Pan-American Airways will provide technical assistance for three years and train Turkish aviation personnel to operate the airline with the most modern techniques both in the air and on the ground. The F.O.A. will finance 70 per cent. of the cost of the project, the balance of 30 per cent. being borne by the Turkish Government.

PERSONAL

MR. R. S. Mani, I.C.S., Ambassador-designate of India to Iraq, has been concurrently appointed Minister of India to Jordan.

Mrs. Alva Myrdal, Head of the Department for Social Questions of the U.N.E.S.C.O., has been appointed Minister of Sweden in India.

Dr. Gianfrance Farinelli, the erstwhile Italian Vice-Consul in Buenos Aires, has been appointed Italian Consul in Bombay, *vice* Dr. V. Bolasco.

Prof. P. C. Mahalanobis, Statistical Adviser to the Government of India, left last week for Rio de Janeiro to attend the twenty-ninth session of the International Statistical Institute.

Dr. A. Ramaswami Mudaliar, Chairman of the India Steamship Co., Ltd., Calcutta, has been appointed Chairman of the Committee set up by the Government of India to examine the freight structure on railways.

Dr. Punjabrao S. Deshmukh, Union Minister for Agriculture, left last week on a four-week tour of the Scandinavian countries, to study advanced methods of mechanired deep-sea fishing and co-operative canning and marketing.

Mr. John Baker Hollister, a partner of the law firm of Taft, Stettinius and Hollister, has been appointed Director of the International Co-operation Administration, U.S., which has been formed to take over most of the functions of the Foreign Operations Administration and is scheduled to commence operations on 1st July.

"COMMERCE" 1930

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *28th June*

The Insurance Year

Detailed review of insurance matters during the past year will be found in the "Insurance Supplement" published in conjunction with this week's issue. The year has been undeniably one of considerable difficulty for the British insurance companies, for while life insurance, in its endeavour to obtain new business, was severely handicapped by the reduced prosperity of all classes of the insuring and investing public, the low level of security values involved appreciable depreciations in assets; and, since the commencement of the current year, the Chancellor of the Exchequer has altered the rebate of income-tax permitted on premiums in a manner inimical to the interests of policyholders. He has, moreover, introduced legislation against single-premium policyholders; he has increased the income-tax rate, thus reducing net interest earnings and by so doing has played havoc with valuation surpluses. Exceptionally heavy claims against fire insurance in the United Kingdom—the estimated losses from fire being something like 36 per cent. higher in 1929 than in 1928—were duplicated to some extent in America and on the Continent of Europe; and, in accident insurance, the amazing increase in the number of motor-car claims has been conspicuous as a disturbing feature. In the marine section, underwriters have been almost overwhelmed by a succession of storm disasters.

The Pakistan Government has decided to issue licences for the full quota of 1.6 million acres under jute cultivation. The decision has been taken after reviewing the position of jute cultivation during the season. Last season closed, according to official sources, without any carry-over stocks of jute and it is decided that the quota for this year will be of the order of 5.5 million bales. Licences issued so far cover nearly 1.1 million acres corresponding to a crop of about 3.9 million bales. It is estimated that the crop available at the end of the season will be approximately 5.5 million bales.

The U.S. Senate approved last week President Eisenhower's reciprocal trade programme extending the President's powers to negotiate trade treaties for a period of three years. The measure gives the President the power, until 30th June, 1958, to reduce tariffs up to a total of 15 per cent. at the rate of five per cent. a year, subject only to the qualification that such reductions shall not result in substantial injury to American industry. President Eisenhower had asked for the legislation as a major policy measure designed to expand international trade and strengthen the economies of both the United States and other free nations.

More than 300 delegates from 22 countries on five continents have already registered for the International Advertising Conference to be held in Zurich, Switzerland, on 28th, 29th and 30th July this year. The Conference, sponsored by the International Advertising Association, in co-operation with the Swiss Advertising Association, will hold talks and panel discussions covering new developments in "Advertising in World Markets." Agency operations, market and media research and the planning and budgeting of overseas advertising campaigns are among the topics to be covered by the U.S., European and other authorities on advertising abroad.

RAILWAY FREIGHTS

As a target of criticism, the railway freight structure is next only to the shortage of wagons. The business community in this country has criticised the structure as being unfair to certain categories of goods, and the procedure for rectifying the anomalies in the structure as being painfully slow. In the last railway budget, the Minister for Transport and Railways had to bow to public opinion and modify some of his original proposals for a revision of freight structure. In the course of the debate, he, however, promised that he would consider the question of appointing a committee to examine the structure of railway freights.

Such a committee has now been appointed. The Chairman of the Committee will be Dr. A. Ramaswami Mudaliar, and the other members are: Mr. T. N. Singh, M.P., Mr. D. K. Barooach, M.P., Mr. I. S. Puri, ex-Financial Commissioner for Railways, Mr. V. P. Bhandarkar, ex-Member, Transportation, Railway Board, Mr. L. K. Jha, Joint Secretary, Ministry of Commerce and Industry, and Mr. A. K. Basu, General Manager, Eastern Railway. The Committee will review the present railway freight rate structure and suggest modifications therein, bearing in mind the needs of developmental economy and the necessity for maintaining the financial stability of the railways. It will examine whether the statutory provisions dealing with the responsibility of railways as carriers need any modification, and if such modification is needed, whether any adjustment in freight rates is warranted. It will also consider what changes, if any, are needed in the existing constitution, jurisdiction and rules of procedure of the Railway Rates Tribunal, so that the Tribunal might be a more effective and expeditious instrument for adjudication of railway freight matters at a reasonable cost to the litigant. The Committee, it is stated, is not expeced to undertake the cumbersome task of going into the classification of individual items unless the interests concerned allege anomalies and ask for adjustment. The Committee will, however, be expected to review the principles of classification and suggest changes in the overall structure in the light of the changes that have taken place or that are likely to take place in the field of trade, commerce and industry.

Trade and industrial interests have now an opportunity to place their views, suggestions and demands before the Committee. The previous revision of freight structure, which was effected in October, 1948, followed detailed investigations conducted by a departmental committee during the years 1945 to 1948. Since then, many changes have taken place. Adjustments have had to be made as a result of Partition. Many industries have expanded production, and are expected to expand further. Again, many new industries are bound to be started in the next few years. Above all, there is the restoration of normal trading conditions, which has followed the decontrol of certain commodities, notably foodgrains. These changes underline the need for a fresh examination of the freight structure. Already, the task of examining the freight structure in coastal shipping has been entrusted to the Rail-Ship Co-ordination Committee. The two Committees will thus together cover two important sectors of transport—railways and shipping.

ONE MORE RAILWAY ZONE

There will be, with effect from 1st August next, seven railway zones, instead of the present six. This increase in the number of zones is the result of the Government of India's decision to divide the Eastern Railway into two separate zones—the Eastern Railway comprising the old E.B. Railway section up to Moghalserai, including the Sealdah Division, and the South-Eastern Railway comprising the old B.N. Railway section. The headquarters of both the proposed zones will be at Calcutta. An announcement to this effect was made by Mr. Lal Bahadur Shastri, Union Railway Minister, at a Press Conference in New Delhi on Thursday last week.

The aforesaid move of the Government is a sequel to the impact of the vast developments envisaged in the second Five-year Plan. During this Plan period, goods traffic is expected to increase by 50 per cent. and passenger train-miles by 30 per cent., as against the normal rise of 12-15 per cent. and 7-10 per cent., respectively, over a five-year period. Three new steel factories, each producing about one million tons of steel per annum, will be set up, besides the expansion of the two existing ones. A number of ancillary industries will inevitably follow these projects. All these will naturally require considerable expansion in rail facilities.

The main brunt of the developments will fall on the Eastern Railway which serves an area rich in mineral resources. The development of heavy industries is, therefore, mainly concentrated in its jurisdiction. As an indication of the extent of the expected growth of traffic, it will be interesting to mention the anticipated increase in the output of certain key industries under the second Plan. Coal despatches will rise from 37 million to 58 million tons, iron ores from 5 million to 22 million tons, and iron and steel (excluding imports) from 1.8 million to 6.8 million tons. The net increase in traffic on the Eastern Railway, as compared with the tonnage currently handled, is estimated at 75 per cent. As it is, the administrative machinery on this Railway is considerably strained; this Railway has the heaviest work-load amounting to 215—assuming the old G.I.P. Railway figure as 100—as against 98 on the Western Railway, 109 on the North-Eastern Railway, 118 each on the Northern and Central Railways, and 127 on the Southern Railway. It accounts for 48 per cent. of the aggregate originating tonnage and over 33 per cent. of the wagons loaded, as well as ton-miles, on Indian railways. The passenger train-miles and passenger-miles are also the heaviest, being 23.1 per cent. and 19.3 per cent., respectively, of the total. With the prospective developments, the work-load will, according to Mr. Lal Bahadur Shastri, become unmanageable. Considering this, as also the need for executing the development programmes with speed, economy and efficiency and without any setback to the day-to-day operational output, the proposed division of the Eastern Railway into two workable units is, indeed, a rearrangement carried out with considerable foresight.

The impact of the second Plan on other zonal railways will be felt to a varying degree. Experience indicated, Mr. Shastri revealed, the necessity for certain adjustments within the existing organisational set-up of some of these zones. Such changes, we are told, will be carried out as and when they are required. Meanwhile, it is proposed immediately to post a Regional Superintendent in overall charge of the Pandu region of the N.E. Railway with fairly wide powers to settle on the spot many of the local problems which now have to be referred to Gorakhpur. It is also proposed to transfer to Gorakhpur the work of some of the N.E. Railway offices which, as a matter of expediency, have been functioning in Calcutta.

The latter proposal has, however, been stoutly opposed by a section of Calcutta's commercial circles, on the score that the proposal will cause great inconvenience to trade and industry in Calcutta which are vitally interested in the movement of traffic over the N.E. Railway. The Railway Minister had sought to justify the proposal by stating that the location of two headquarters in Calcutta will facilitate the absorption of the staff and accommodation released by the N.E. Railway. Alluding to this, Mr. G. Basu, President of the Bengal Chamber of Commerce, points out that the consideration, though important, is not the only point which the Minister has to take into account. According to Mr. Basu, he has also to look to the convenience of the trading public which, in the absence of the liasion offices, would have to suffer tremendous handicaps in their relations with the N.E. Railway.

PLAN FOR ROADS

"There is grave danger that, while we produce goods, we cannot transport them easily." These words of Mr. Nehru, contained in his message to the nineteenth session of the Indian Roads Congress held at Srinagar on Sunday last, admirably sum up the crux of the problem of road development. Roads and road transport constitute one of the essential pre-conditions for economic progress. Indeed, road development, as was stated in this journal only last week, forms a crucial link in any system of economic planning not merely for bringing about a balanced development of the country's economy but also for endowing it with the capacity for self-propelling and accelerated growth.

Viewed thus, the Planning Commission has, indeed, done well to approve—albeit tentatively—of a much bolder scheme of road development during the second Five-year Plan period than what was incorporated in the first Plan. An idea of the magnitude of the scheme was furnished by Mr. H. P. Mathrani, Joint Secretary to the Union Ministry of Transport and Consulting Engineer (Road Development), Government of India, who presided over the Congress. The proposed scheme, we are told, is likely to provide for a total central expenditure of Rs. 125 crores on road development—the figure cited by Mr. O. V. Alagesan, Deputy Minister for Railways and Transport, in Madras recently was Rs. 93 crores—as against Rs. 60 crores earmarked in the first Plan. Of this amount, (1) national highways account for Rs. 60 crores, (2) roads like the West Coast road for the development of which the Centre has agreed to give financial assistance and other roads of special economic and inter-State importance for Rs. 44 crores, and (3) roads for which grants from the Central Road Fund will be given for Rs. 22 crores. In addition to Central expenditure, the State Governments are expected to incur Rs. 225 crores on roads, which represents a rise of Rs. 135 crores as compared with the first Plan.

The aggregate capital outlay on development of roads in the second Plan—Central and States—thus comes to as much as Rs. 350 crores, as against Rs. 150 crores in the first Plan, or a rise of over 233 per cent. The outlay is no doubt quite substantial and indicates the anxiety of the authorities to intensify the tempo of road-building activity. But one wonders if the whole of this expenditure will, in fact, be incurred. For the progress in the implementation of the road development programme in the first Plan period is none too happy. The provision amounted to Rs. 60 crores. But now it looks as though a sum less than one-half of the amount provided—Rs. 27 crores, to be precise—is all that may actually be spent by the end of 1955-56. This is certainly disquieting and the road engineers will do well to take due note of it while formulating proposals for road development in the second Plan period.

It is certainly encouraging to be told that the Nagpur Plan targets are likely to be reached at least before the end of the second Five-year Plan. It is true that, if road development had received all the attention it deserved, it should have been possible to reach those targets earlier. But even delayed fulfilment is better than non-fulfilment. The Nagpur Plan provided for increasing the length of hard surfaced roads from 88,000 miles to about 123,000 miles and the earthen roads from 132,000 miles to 208,000 miles. At the commencement of the first Five-year Plan, the country had 97,000 miles of hard surfaced roads and 147,000 miles of unsurfaced roads. The Plan provides for an additional of 10,000 miles of hard surfaced roads and 20,000 miles of unsurfaced roads. Thus, at the end of the Plan period, it is expected that there will be 107,000 miles of hard surfaced roads and 167,000 miles of unsurfaced roads. Referring to the prospects in the second Plan, Mr. Mathrani said:

"Possibly, at the rate now envisaged, the Nagpur Plan targets in respect of length of roads, metalled and unmetalled, will be nearly reached in the second Five-year Plan. Targets in respects of bridges may, however, take one more Plan to attain. The stage will then be set for bolder planning and greater achievement in the years to follow."

Another important aspect which deserves the most careful attention of road engineers is the need to ensure that the country gets the best out of the enormous money proposed to be spent on roads. This, as Mr. Mathrani rightly stressed, can be done by improving standards and specifications, so that the construction cost is lowered and the life of structures increased. To quote him: "These improvements have to be based on research—research inside the laboratory, followed by experiments on models and then by trials on the field scale."

While the need for the construction of more and better roads is imperative, it is equally important that roads built should remain free from haphazard growth of buildings (called "ribbon development") and from encroachments. This aspect was ably stressed by Mr. Mathrani. Urging the revision of the present highway laws and enactment of new highway laws, he observed:

"A beginning has been made in respect of the latter in some States, but we must step up the progress, as, otherwise, there is risk of our beautiful new roads being ruined, particularly near towns and cities, by the unregulated growth of buildings along them. At present, road engineers have no powers to get encroachments within highway limits removed. All that they can do is to request the local revenue authorities to do so. In this respect, our experience is sad, with the result that encroachments are increasing and the highways being built at tremendous cost are being spoiled. Indeed, the present system is working so adversely against road interests that new legislation giving necessary powers to the road authorities to remove encroachments should have preceded our embarking on large road development programmes."

Coming as they do from an expert road engineer, these observations acquire considerable force. Surely, the need for enacting appropriate highway laws cannot be stressed too strongly, if we wish to derive the maximum benefit from the roads.

DEVELOPMENT OF MINERAL WEALTH

The Union Government seems to be keen on making amends for its lapses in mineral development policy during the first Plan period. The low priority given to minerals and prospecting in the first Five-year Plan indicated neither a sense of urgency nor of foresight on the part of the planners. Not only did the first Plan lack a vigorous programme for exploring new hidden wealth, but the sum allotted to the work was as low as Rs. 1 crore only. It is, therefore, very encouraging to hear from Mr. K. D. Malaviya, Minister for Natural Resources, that the Government proposes to spend another Rs. 3 crores during the remaining period of the first Plan. In addition, a bold bid is made by earmarking a sum of Rs. 75 crores in the second Five-year Plan for mining and prospecting. The breakdown of this amount is not yet available. It is, therefore, difficult to say whether the sum of Rs. 75 crores in the second Plan is strictly comparable with Rs. 4 crores in the first Plan.

Explaining the reason for setting apart such a large sum, Mr. Malaviya said at a Press conference in New Delhi that the need for a greater assessment of the natural resources of the country was being strongly felt with the shift in emphasis on industrialisation in the second Five-year Plan. He added that, while the knowledge of the mineral wealth of the country was limited, the development of mineral resources was the very basis of national development. It was, therefore, felt that vigorous attempts at the exploration of oil and other mineral wealth was necessary.

Mr. Malaviya's analysis of the lines on which development will be pursued by the Government makes interesting reading. They will be a projection, in certain cases, of what is being done already. The Ministry has already started geophysical exploration work for oil in Rajasthan and Saurashtra. Although the results achieved so far have not been encouraging, vigorous efforts at oil search there will be continued. A scheme for search for oil in the submontanous regions, extending from Assam in the east to Srinagar in the West, is being planned. Co-operation is being received from international agencies like the Technical Co-operative Administration. A new scheme involving about Rs. 6 crores is ready for work on oil exploration in about half a dozen new areas. In order to ensure development of mining on systematic and scientific lines, the Indian Bureau of Mines and Geological Survey of India will be strengthened by way of both adequate financial resources and technical equipment. It is also proposed to expand the Indian School of Mines at Dhanbad, with a view to meeting the additional requirements of technical personnel. The Natural Resources Ministry will set up shortly a suitable organisation for the exploitation or prospecting of oil as well as other minerals in as wide a range as possible. For this purpose, the Ministry is examining the possibility of obtaining technical experts, equipment and know-how from all available sources inside and outside the country.

The Government appears to be willing to consider schemes from any private party for exploiting mineral resources other than oil. If past experience is any guide, few schemes will be placed before the Government by private parties. Because the Government's mining policy is hardly conducive to encourage private enterprise. For the period of mining leases fixed at 20 years is inadequate, in that it will not be sufficient to enable the parties to obtain a fair return on the capital invested in this risky business. In other parts of the free world, the period of licence is usually for as many as 100 years. Again, under the recent amendment to the Constitution, the Government has the right to cancel any mineral right at short notice albeit on payment of compensation; but for the quantum of compensation, the holder of licence is entirely at the mercy of the Legislature, with no recourse to a court of law. Further, the royalties charged are exorbitant. Income-tax structure is unsuited. The risks involved in mining operations being heavy, they do not permit taking up new exploration schemes. Unless, therefore, proper safeguards are provided and a long tenure is assured, the chances of private enterprise venturing in this field are bleak.

The Government's move to reserve for itself the prospecting of new oilfields is devoid of realism. As everyone knows, the Government is lacking in know-how and in technical personnel. For this it seems to be relying on Russian experts, although there are already three oil refineries in the country, equipped with money, personnel, resources and vast experience in oil prospecting. They are well suited to undertake work on oil exploration over a wide area and can be expected to take up the work, provided the necessary encouragement is given them. It is stated that an agreement is being finalised with the Assam Oil Co. for exploiting the oilfield discovered near Naharkatya in Assam. It is further reported that an agreement has been reached with Stanvac for a joint exploration for petroleum in the West Bengal basin. Details of these agreements are not known. Nevertheless, they are quite welcome, for oil prospecting is a field in which friendly foreign co-operation is necessary to augment the country's meagre resources and technical know-how. And it is prudent to have such agreements with companies belong to democratic countries rather than with Governments of countries subject to authoritarian rule.

BURMA WELCOMES FOREIGN CAPITAL

From an attitude of suspicion and distrust of foreign capital, one country after another in the South-East Asian region is beginning slowly to recognise the need for an inflow of such capital. Nearly all countries in this region have one common political factor. They have all been freed from foreign domination only a few years ago. Perhaps this explains their suspicion of all things foreign, including capital. They have also one common economic feature, shortage of domestic capital. Apparently, the desire to achieve economic progress and the fear that extremist political forces will gain ascendancy in the event of any failure to make rapid progress are getting the better of the earlier suspicion of foreign capital. In any case, it is significant that, for some time past, both Pakistan and Ceylon have been proclaiming from the house-tops that foreign capital is welcome. And surprisingly enough, Burma, with a strong socialist Government, has announced its policy welcoming foreign capital. An official statement on the subject says that every field is open to private interest, whether foreign or domestic, excepting major public utilities and munitions manufacture. Enterprises for extraction of natural resources may be conducted by private foreign concerns in partnership or under contract with the Government. The statement affirms that the Government recognises the contribution which private enterprise, foreign or domestic, can make to the economic and social progress of the country.

The Government of Burma, according to the statement, will offer guarantees against nationalisation for an agreed period which normally will not be less than ten years. Further, the Government will pay fair and equitable compensation in the event of nationalisation and make foreign exchange available for import of necessary raw material, repairs and replacement of equipment. The Government will render protection and support to industry by tariff or other means and, in case of foreign investments, permit remittances of current earnings or dividends and allow repatriation of capital itself over a reasonable period. It, however, expects from foreign investments maximum employment opportunities to Burmese citizens.

It remains to be seen whether this shift in the Government's attitude towards private enterprise and foreign capital will induce overseas countries to invest more freely in Burma. But there is no doubt that Burma offers an excellent field for investment, for it has many untapped natural resources. Further, law and order have been restored over wide areas and the present Government is firmly settled in office. Whether the Burma Government's statement of policy induces the flow of foreign capital or not, the change itself is symptomatic of what may well be called a world-wide swing to the right. Such a swing seems particularly necessary in the South-East Asian region. For this region lacks capital resources which it cannot obtain without giving reasonable guarantees for capital, domestic as well as foreign.

FOREIGN EXCHANGE NEEDS FOR SECOND FIVE-YEAR PLAN

EXPORT PROMOTION REQUIRES CAREFUL PREPARATION

From A Special Correspondent

NEW DELHI, 21st *June*

DELHI LETTER

WHILE the Prime Minister is busy in Soviet Russia touring important industrial centres and seeing personally the tremendous progress achieved by that country during the post-war period in the expansion of many key industries, the Planning Commission and some important Ministries are greatly occupied in discussing and formulating broad details of the second Plan. It is being conceded that the kingpin of the Plan is the ability of the country to procure adequate foreign exchange resources, in order to import essential capital goods and industrial raw materials in furtherance of the Plan. The pamphlet on the *Second Five-year Plan* prepared by Government has estimated that the total imports of capital goods would amount to Rs. 1,400 to Rs. 1,600 crores. The framers have not taken into account the necessity for increased imports of certain industrial raw materials such as non-ferrous metals and iron and steel, particularly during the initial years of the Plan. While imports of machinery during the first Plan are estimated at about Rs. 500 crores, those of iron and steel and non-ferrous metals are placed at about Rs. 250 crores.

The Planning Commission's present estimate is that, even after making an allowance of Rs. 500 crores by way of external assistance, there will still be need for economising on imports and for promotion of exports. Since the reducible element in India's imports is small, there is a correspondingly greater need for increasing exports. Export promotion should, therefore, form an important item in augmenting the exchange resources of the country with a view to financing the second Plan.

Liberal Export Policy

The Commerce and Industry Ministry has already begun to follow a liberal policy in regard to exports. Only during this week, it has announced liberalisation in respect of a number of commodities such as pulses other than gram, wheat bran, cane jaggery and jaggery powder, gram and gram flour, kardi seed and niger seed cakes, groundnut oilcake expeller variety, etc. There are few restrictions on exports at present. Again, exports are being encouraged through the organisation of Export Promotion Councils, introduction of quality control, sending out trade delegations to foreign countries, participation in exhibitions, etc.

Despite these, there is still an absence of taking a long-term view of the country's export trade and shaping its economy in such a way as to expand its trade in a number of directions. Generally speaking, the pattern of India's trade in the coming years will be more or less similar to that of the U.S.A. Although some Government spokesmen have been reiterating from time to time that India should export more manufactured goods in preference to raw materials or semi-processed goods, they have failed to take into account the fact that a fully developed India will be in a position to export both manufactured goods and a substantial quantity of raw materials or processed goods. The possibility of increased exports of some food articles and industrial raw materials will become greater following higher production of these goods as a result of improved irrigation facilities and better agricultural practices. The Government should from now on concentrate its attention on the production of such goods and industrial raw materials as will have a good export demand in the coming years.

Trade Deficit

In the pre-war period, India generally used to experience a favourable trade balance, whereas, during the last few years, it has been incurring a moderate deficit both in its sea- and air-borne trade and land-frontier trade. The average imports have been varying between Rs. 600 and Rs. 700 crores a year, while its exports have been standing below Rs. 600 crores. The deficit in its external trade is being made good as a result of receipts from abroad through World Bank Loans, external aid from the U.S.A. and other countries, etc. Granting that India will be able to stabilise its export trade at a higher level during the coming years, it will be possible for it to shape the pattern of import trade in such a way as to secure more capital goods and important industrial raw materials.

Imports

For the entire first Plan period, imports of foodgrains may be put at Rs. 540 crores, the figure for the first four years alone being Rs. 516 crores. In case the Government makes a determined effort not to import foodgrains during the second Plan period, offsetting the surplus production in a favourable monsoon year against the deficit caused by failure of rains in some other year or years, it can save nearly Rs. 500 crores of the valuable foreign exchange resources. Another item in which India can effect some savings in its exchange resources is mineral oils, the average annual imports of which amount to around four million tons. In case India were to install expeditiously synthetic petrol plant or plants, it can hope to save about Rs. 20 to Rs. 25 crores of foreign exchange. Yet another item is long-staple cotton. Here also India can reduce its imports by about 200,000 bales by intensifying the cultivation of better staple cotton within the country itself. Small amounts of foreign exchange can be saved through reduced imports of a number of manufactured goods such as chemicals, drugs and medicines, dyes and colours, paper and pasteboard, vehicles, staple yarn, etc., through increased indigenous output. In all these, a saving of about Rs. 15 crores can be effected. Apart from foodgrains, total savings from other items may be estimated at Rs. 50 crores which could be diverted to the purchase of much needed capital goods and machinery, as also steel and non-ferrous metals. In other words, a sum of Rs. 150 crores per annum will be available for diversion, which means that about Rs. 750 crores could be utilised for purchases of essential goods during the second Plan. If this sum were to be supplemented by about Rs. 500 crores by way of external help through loans, grants, etc., India may have sufficient foreign exchange resources to finance industrial expansion programme, provided its export trade is stabilised at least at the present high level. Due allowance is made here for the higher imports of steel and non-ferrous metals which might go up to Rs. 500 crores during the entire second Plan period as against Rs. 250 crores during the first Plan.

There should be room, however, for adjustability or manœuvrability in the financing of of the Plan and for this purpose, there should be careful thinking and planning in regard to the country's export trade. First of all, the Government should take note of items which could figure prominently in the export trade in the coming years and try to augment their production within the country, so that a greater quantum may be made available to the export markets. The three big exchange earners at present are tea, jute goods and cotton cloth. These apart, other important items of export are raw cotton, pepper, cashew kernels, manganese, vegetable oils, lac, mica, raw and semi-tanned hides and skins.

Exports

In regard to exports, the Government must, first of all, protect and stabilise the trade in the major items of export, namely, jute goods, cotton cloth and tea. While every effort should be made to meet the possible competition from Pakistan in jute goods, the Government should encourage the production of quality cotton goods at competitive prices. As regards tea, India appears to be losing the race compared with Ceylon. While India has been able to augment its exports from 337 million lbs. in 1939 to 440 million lbs. in 1954—an increase of about 23 per cent.—Ceylon has been able to step up its exports from 228 million lbs. to 356 million lbs. during this period—a rise of about 55 per cent. It is, therefore, extremely urgent that India should be able to compete with Ceylon in the coming years.

There are a number of commodities with possibilities for increased exports. India has already been trying to recover its lost trade in res-

BALANCE OF PAYMENTS

CONCERN OVER LONG-TERM PROSPECTS

From Our Own Correspondent

LONDON, 18*th June*

LONDON LETTER

WHEN this week the Opposition attacked the Government on the Queen's Speech for failing to protect the country's economy—failing to "achieve full employment, stable prices, peace in industry, and an adequate surplus in our overseas payments"—they drew from Mr. Butler, the Chancellor of the Exchequer, more than a political rejoinder. They drew a confession that the Chancellor was worried about the long-term prospects for the balance of payments, that he held that the greatest responsibility lay with organised labour, but that he saw no clear way out of the coming problem. Mr. Butler was, in fact, attempting an honest economic analysis and it will be a pity, if the dangers which he sees are buried in the rough and tumble of political debate.

It was easy to show that the Government's economic policy was giving good results at present—unemployment as low as 1 per cent. of the working population, a high Bank Rate and credit restriction apparently checking the rate of increase in imports without affecting exports or finance to essential industry, sterling strong and so forth. The Chancellor could say that as regards the present balance of payments he was satisfied and considered that the 4½ per cent. Bank Rate of February had justified itself. But there satisfaction stopped. In 1953 there was an overall payments surplus of over £200 million (including defence aid), in 1954 of £160 million, but it would be very difficult to achieve a similar surplus this year.

The rail strike, now over, had not proved as great a danger as previously feared. The credit for this went (though the Government hardly admitted as much) to the nationalised British Railways organisation, which was able by rapid redistribution of loco-men from the non-striking union, to keep far more heavy goods moving than had been generally expected. Thus no industries had been shut down because of the strike, coal production had been maintained and supplies had been delivered to users. The dock strike, which still affects 40 per cent. of employees, is a different matter. Mr. Butler saw in this not the transient effects of export goods held up at the ports, but the permanent effects of reduced production for export and the inflationary effect of maintained money incomes with less goods on which to spend them. The economic reasoning behind this is more abstruse than is normally permissible in a Government spokesman, but Mr. Butler is an unrepentant intellectual and never afraid of involved reasoning! He considers that industry has, as a result of the dock strike, been living partly on stocks and so piling up cash balances (though, on the other hand, total bankers' deposits have fallen 2 per cent. in the three months since the raising of the Bank Rate). But is this more than a transient effect too? Presumably the stocks will be replaced. But Mr. Butler seemed to imply that production for the internal market had dropped and fewer goods would be available against unchanged money incomes—though against this net earnings of industry must have been less, so it is doubtful how much strength there is in this point.

Looking further ahead, the Chancellor saw higher overseas defence expenditure, a higher import bill for feeding stuffs (consequent on the success of the Government's agricultural expansion programme), a loss of coal exports (due to strikes) and, on the other side, nothing making for higher exports. The recipe is an old one, but nonetheless true for that. Money incomes could not go on being increased, unless productivity increased as well and costs were reduced.

The Opposition could only look askance at this conclusion of the Chancellor. It sounded like a call to action against labour. But was not his basic contention true? The unions were excessively concerned with earnings—not with costs. But the Opposition has no answer to the problem either. They can only accuse the Government of being too tender to investors (refusing to tax capital gains, for instance). In practice, of course, things may not turn out as gloomily as the Chancellor fears and we must hope this will be the case, for, though he points out the weakness of this country's overseas balance in prospect, he cannot suggest how the remedy can be achieved.—*All Rights Reserved.*

LABOUR RELATIONS IN NATIONALISED INDUSTRY

LESSONS TO BE DRAWN FROM BRITAIN

By "Rudderbar"

WITH the exception of Russia and China, from whom little authentic information regarding management-labour relations and allied problems reaches the outside world, Great Britain provides the best, if not the only, shop window in which can be viewed the fruits, now perhaps a trifle fly-blown, of socialist planning and policy. It is not proposed here to deal with socialism or a socialistic pattern of society in its broader aspects. That is a highly controversial topic and, quite obviously, outside the scope of a short article. It is proposed only to discuss some of the problems which have arisen, the repercussions of which are continually affecting the community as a whole, of labour in nationalised industry.

There can be no doubt that the persistent recurrence of strikes, threats of strikes, go-slows and stoppages in the nationalised industries in Britain pose, both for politicians and trade unions, problems of a very serious nature. There is no doubt either that these events have materially shaken the faith of the general public in the much vaunted benefits of nationalisation as a policy. It was, of course, the fond belief of the Socialist Party that nationalisation would, *ipso facto*, lead to an era of good labour relations and maximum output. It was argued that the worker, relieved of exploitation by the "bosses" and imbued with a sense of pride in his capacity as an employee of the State, would work as never before.

Labour Becomes Less Responsible

These beliefs, rooted as they were in poor psychology, have, so far as the public is concerned, long been shattered, though doubtless they are still tenets of faith amongst the more woolly-minded. This is not, however, necessarily to say that nationalisation *per se* tends to lower efficiency. The British railways would seem, possibly, to support such a view, but, on the other hand, the efficiency of British Overseas Airways, to name one of many nationalised undertakings, has never seriously been called in question, save, of course, from the point of view of the economics of operation. What is clearly lacking, however, and this is very curious in view of socialist theory, is that sense of responsibility which the average worker in private enterprise feels towards his firm and his co-employees and, not to put it too high, the salutary sense of fear that failure of the enterprise will see him out of a job.

In these circumstances, his attitude towards a stoppage of work, either official or unofficial, but particularly the latter, is entirely different to that of a man employed in private industry. In theory, of course, strike action is the result of a decision of a union or a majority of workers in an industry, irrespective of the numbers of firms or employers concerned. It makes no difference in theory, therefore, whether the employer is a single nationalised monopoly or a number of independent firms. In practice, however, the unofficial strike, that is to say one contrary to the wishes of the management of the union, is far more easily engineered and far more common in the nationalised industries than in those operated by private enterprise. Whilst the nationalised worker, then, feels he has little to fear from the consequences of an unofficial strike, union leaders, on the other hand, are far less inclined to support strikes in nationalised units. Such strikes, as they are well aware, tend to undermine the labour theory that nationalisation creates efficiency in the industry and contentment amongst the workers. It is in this peculiar atmosphere that the unofficial strike naturally thrives.

A Curious Feature

It is a curious feature of the post-war era and the ever-growing number of unofficial strikes which have occurred that, whereas formerly labour unrest had always been associated with periods of unemployment, these have flourished during one of the most prosperous periods of labour's history, both from the point of view of full employment as well as of high wages. One of the conclusions which must inevitably be drawn from this phenomena is that powerful nationalised industries and particularly where those command, as they do, the basic resources on which all other industry depends, have, in constantly exercising their respective labour demands to the full, acted as a permanent incentive to wage demands in all other industries.

The Skilled vs. the Unskilled

Another feature of nationalisation under the Socialist Government of 1945, was the deliberate policy of levelling up the unskilled workers' wages in relation to those of the skilled, and of countenancing the employment of large numbers of redundant and, in many cases, workshy, men. British Railways is, perhaps, the best example of this state of affairs. As I write, Britain is in the grip of a railway strike of unprecedented magnitude which, however short it may eventually prove to be, is bound to inflict very grave damage on the economy of the country, impose heavy losses on industry of every description and entail great hardship for the public in general. This strike, however ill-conceived, however irresponsible and however disastrous, is the direct and logical outcome of the policy to which I have above referred.

Seventy thousand footplate men have at long last vented their sense of grievance at the lack of recognition of their skill and the heavy responsibility which they carry in the performance of their duty. That the present Government, when faced with the threat of a national transport stoppage in January last, struck a disastrous bargain with the N.U.R. and, not to put too fine a point on it, surrendered to the demands then made in a most pusillanimous manner, doubtless aggravates the position today. It does not, however, alter the basic cause of the trouble; it merely underlines the difficulty of resisting the demands of a strong nationalised monopoly industry, which, at the dictates of an infinitesimal minority, can virtually hold the nation to ransom.

That the footplate men have a genuine case, the following example will serve to illustrate: before the recent settlement to which I have referred above, the wages of a porter were £6 10*s.* per week. This means that a great many of them earn, with tips, as much as an engine driver. After the settlement demanded by the N.U.R., in which wholesale wage increases were sanctioned, the porter will presumably be even better off *vis-a-vis* the skilled worker than before.

Whatever be the rights and wrongs of the present strike, it is a clear example of the calamity which organised labour can bring upon the State, for which the general public has not only to pay but which it is powerless to avert. It can be argued that private industry, as in 1926, is equally capable of holding the country to ransom. Although such an argument cannot be entirely refuted, in the circumstances of Britain today, as I have endeavoured to show in the course of this article, it is the basic nationalised industries which are acting as an incentive to all other industries in the matter of wage demands.

Dangers Obvious

The extent of nationalisation in India is, at present, comparatively small. Nor is labour, either in State-owned or private industry, yet organised to the extent of labour in Great Britain. The policy of the Government of India, however, is towards a socialistic pattern of society, with the accent heavily on the public sector of industry. Recently, air transport was nationalised. For nearly 18 months, labour relations in the domestic corporation were soured by the somewhat bureaucratic methods employed by the management in its dealings with the union. At length, after much futile negotiation, which did nothing to smooth ruffled feathers, the Minister himself intervened, gave the union a hearing and, in fact, conceded a large number of the demands made. This was, naturally, all to the good, and it is perhaps ungracious to voice any doubts. Nevertheless, when we read in the Press that I.A.C. is reported to be planning health resorts for its employees (*vide* the *Indian Express* of 14th April, 1955) and has introduced certain other features not enjoyed by workers elsewhere, some doubts inevitably creep in.

There is, of course, nothing wrong with health resorts, tubercular clinics and other amenities for workers. Indeed, these are highly desirable objectives which, it is hoped, the Welfare State will be able to provide for all, in course of time but to create conditions of employment (I do not refer to scales of wages which must always rule higher in specialised and highly technical walks of life, such as aviation) in one branch of nationalised industry which cannot for financial or other reasons be extended to other branches, will create widespread dissatisfaction and eventually unfulfillable and embarrassing demands. The dangers of this are all too obvious and require no emphasis. The particular case to which I have referred may or may not be based on fact, and, in any event, is not of great importance. What does seem to be of importance, however, is that advantage should be taken of the lessons so painfully acquired by Britain in this vital aspect of nationalisation, and that those same lessons should not have to be learnt here the hard way. There is already an appreciable public sector. Railways, air transport, shipbuilding, road transport and many other activities employ a very considerable number of men. It is not too soon to give this problem very serious consideration and, even if it is, better too soon than too late.—*All Rights Reserved.*

WHAT EXTRA FOR SKILL?

Writing under the above heading in a recent issue of the *News Chronicle*, London, Mr. Oscar R. Hobson, City Editor of this daily, observes as follows:

"A very interesting article in the current *Economist* examines the highly topical question of wage "differentials" in the wider setting of history. It yields some lessons which are worth pondering on even amid the turmoil of industrial strife to which the age-old conflict between "skilled" and "unskilled" workers has now given rise. The *Economist* quotes figures giving time wage rates of skilled workers in building, shipbuilding, engineering and railways as percentages of those earned by unskilled workers in 1885 and subsequent years up to and including 1954 (April). These show very clearly that, over the past 70 years, there has been a persistent trend against the skilled and in favour of the unskilled worker.

"In the building trade, for example, skilled workers received in 1885 more than half as much again (57 per cent. more) as unskilled and on the railways nearly twice (that is, 198 per cent.) as much. Now, however, the "differential" in favour of the skilled man has fallen to only 14 per cent. in the building trade and 28 per cent. on the railways—with intermediate figures for engineering and shipbuilding workers.

"Clearly some strong and persistent force or forces have been at work depressing the premiums earnable by skill. One may suppose that the main such force is the advance of mechanisation and mass production techniques which have reduced the scope for craftsmanship.

"The records show, however, that the decline in the differentials has not been evenly paced and has been interrupted by one recovery. From 1885 to 1914 the retreat of the skilled was very gradual—in the building trade his differential fell only from 57 to 50 per cent., and on the railways from 98 to 84. Then came World War I, with a plunge to 20 per cent. in building and 35 per cent. in railways. Then from 1919 the recovery—to 34 per cent. for building by 1922 and 40 per cent. for railways. Then again the slow retreat, till 1939 (with the exception that railway skilled workers made a further recovery between 1930 and 1939). Then World War II and an acceleration of the decline to the figures already quoted.

"War in both cases dealt a grievous blow to the skilled man. After the first war, he made a partial come-back. This time, so far, he has made none. Some wonder that he is now tempted to fight back! He has failed so far, because inflation and its concomitant over-full employment, have remained with us.

"Yet, is it basically true that skill is worth less than it was? We need it as much or more than ever at the highest level. Industry cries out daily for more trained scientists. Is it not needed at levels below the summit? It is impossible to believe that it is not. And if so, skill must have its reasonable reward or it will surely not be forthcoming.

"One is tempted to wonder whether history will not regard these disputes over differentials, infuriating though they are for those who watch and suffer on the side lines, as in the nature of a crusade. Or perhaps, from another aspect, history will regard what is now happening as a nemesis for our persistence, long after there was any plausible excuse for it, in the folly and fraud of inflation.

"Are we face to face with an exposure of the perpetual motion delusion—the delusion that a nicely graded rate of monetary inflation can give perpetual boom and full employment? Well, history will, in due course, deliver its judgment."

RURAL CREDIT STRUCTURE IN INDIA

DIFFERENT ASPECTS ANALYSED

THOSE engaged in the administration of the institutional system of integrated rural credit to be introduced shortly all over the country can put to good use the conclusions of the Committee of Direction, All-India Rural Credit Survey, embodied in a *Summary of the Survey Report* just released by the Reserve Bank of India. The *Summary* gives an analytical insight into the present rural credit structure in India. It covers data relating to a number of aspects of farm credit. These include the debt position of rural families, nature of their borrowings and expenditure, capital formation, utilisation of savings, current farm business, credit requirements of farms, creditworthiness and the role of various credit agencies in rural finance.

The *Survey, Report* mentioned above is Volume I of the three volumes comprising the Report on All-India Rural Credit Survey to which numerous references were made in these columns ere now. Volume II, known as *The General Report*, contains the recommendations of the Committee of Direction appointed by the Reserve Bank of India. This was published in December last. Volume III is the *Technical Report* which gives a description of the technique of the survey and the various statistical statements prepared from the data collected in the course of the rural credit survey. Volumes I and II are yet to be published.

The information provided in the *Summary of the Survey Report* relates to rural families in 600 villages of the 75 districts covered by the rural credit survey conducted in 1951-53. The data pertain to the position as existed in that year.

The *Survey Report* reveals that the level of rural debt was higher among cultivators than among non-cultivators. The level of debt at the beginning of the survey year was, in many districts, quite low, but it rose considerably during the year. This was partly due to the fall in prices during the latter half of the survey year and partly to the relatively large incidence of drought, famine and inclement seasonal conditions in the survey region.

A study of the measure of outstanding debt shows considerable variation in the debt from Rs. 29 per family in Koraput to about Rs. 1,200 per family in Bhatinda. The district averages show some concentration in the range of Rs. 100 to Rs. 300 per family. For non-cultivators, the measure of outstanding debt varied from Rs. 4 per family in Koraput to over Rs. 800 per family in Bhatinda, whereas for cultivators the variation was from about Rs. 60 per family in Sitapur to more than Rs. 1,300 per family in Bhatinda. The district data show that average debt of less than Rs. 300 per family was recorded in about 51 per cent. of the districts in the case of cultivators and in about 93 per cent. of the districts in the case of non-cultivators. Again, the debt per indebted cultivating family varied from Rs. 140 in Hazaribag to Rs. 2,100 in Bhatinda, the corresponding figures in the case of non-cultivating family being Rs. 31 in Koraput and Rs. 1,200 in Sirohi. As compared with the level of debt which prevailed when investigations by the Provincial Banking Enquiry Committees were made, the real burden of debt during the year covered by the Rural Credit Survey was generally found to be less.

Borrowing was resorted to by a larger proportion of families among cultivators than among non-cultivators. Again, the level of borrowing was higher among the former group than among the latter. For all the 75 districts put together, about 50 per cent. of the total borrowings was for family expenditure, slightly more than 25 per cent. for capital expenditure on farms and the balance of about 25 per cent. for current expenditure on farms, non-farm business, and others. Less than one-fifth of the total borrowings among a selected sample of cultivators was repaid. Borrowings-in-kind by cultivators were resorted to in about 20 districts, to a significant extent. Repayments were generally small in size as compared with the level of borrowings. They were particularly poor in certain districts.

Expenditure on "family account" included items such as construction and repairs of residential houses, clothing, shoes, utensils, etc., death, marriage and other ceremonies, and medical, educational and litigation expenses, but excluded expenditure on current consumption. A part of the expenditure was met out of current income, past savings and borrowings. About one-fourth of the recorded expenditure on family account was financed from borrowings.

A notable feature revealed by the *Survey* is that investments in the Government of India's small savings schemes such as National Savings Certificates, etc., accounted for only a very small proportion of the total expenditure of the cultivator on capital investment account. Purchase of land and livestock was the most important items for which capital investment expenditure in agriculture was incurred.

Data relating to expenditure on gross capital formation reveal that such expenditure by rural families was about Rs. 420 crores in the survey year for the whole country. Of this, about Rs. 250 crores were on items of capital expenditure in agriculture, excluding purchase of land and livestock, and Rs. 170 crores on construction and repairs of houses and other structures. Gross savings were probably channelled in four main directions, namely, capital expenditure in agriculture, excluding land and livestock purchase, repayment of old debts, construction and repairs of houses and lending funds to others.

Information relating to farm business operations, based on data from some selected cultivators, shows that the value of gross produce was about Rs. 600 or less per year per family for nearly half the cultivators in the country. Cash expenditure on farms accounted for more than 60 per cent. of the total farm expenditure in the cash crop regions. Cash receipts from sale of crops and fodder and cash wages constituted the most important items in the total cash farm receipts of the cultivators.

A study of operations of different credit agencies reveals that 3 per cent. of the total borrowing by cultivating families was from Government and another 3 per cent. from co-operative agencies. The balance of 94 per cent. was provided by professional and agricultural moneylenders. A similar pattern is revealed by figures relating to total outstandings. Slightly less than 4 per cent. of the debt of cultivators was due to the Government, an equal amount to co-operatives and commercial banks jointly. The remainder was owed to private credit agencies. Co-operatives supplied about 11 per cent. of the total borrowings for short-time agricultural purposes and about 9 per cent. of the borrowings for repayment of debt. For all non-agricultural and consumption purposes, more than 95 per cent. of the total borrowings were from private credit agencies. The Government supplied about 6 per cent. of the total borrowings for long-term agricultural purposes. Relatively larger proportions of the borrowings of the large cultivators were from institutional agencies as compared to the borrowings of the smaller cultivators. "Relatives" accounted for 14 per cent. of the total amount borrowed by cultivators.

Particulars are also given regarding the nature of loans to cultivators by the various credit agencies. Government loans were generally of small size in most districts. They were either for land reclamation or for rehabilitation on the security of immovable property. Larger cultivators appeared to be in a better position to take advantage of Government finance. Co-operative societies advanced loans mostly for two common purposes, namely, (a) current farm expenditure and (b) purchase of livestock. The low proportion of co-operative credit to poor farmers is a notable feature of lending by these agencies. And this is attributed to the same reasons as in the case of Government. Co-operatives and Governments in most States demand security of immovable property. Loans are restricted to specific purposes, whereas poor farmers need finance for current consumption. In a few instances, however, co-operative effort is stated to have been quite successful, as in the crop loan scheme in Bombay, sugarcane supply unions in U.P. and the cotton sales by co-operatives in Gujerat. The private credit agencies consisted of professional moneylenders, indigenous bankers, agriculturist moneylenders, landlords, relatives and commercial banks. The data collected in respect of these agencies show that legislation has been powerless to control operations of these agencies. There is clear evidence, it is stated, of a general disregard by these agencies throughout the country of legal regulations relating to rates of interest chargeable by them.

INDIAN MERCANTILE INSURANCE COMPANY Ltd.
BOMBAY

ASSAM FINANCIAL CORPORATION

The Assam Financial Corporation received during the period ended 31st March, 1955, 14 applications from various concerns for a total loan of Rs. 23.35 lakhs. Of these, eight applications, involving a sum of Rs. 8.85 lakhs, were examined by the Board of Directors of the Corporation. The Board sanctioned only three (of the eight) applications, amounting to Rs. 3.15 lakhs. Of these three, one electric supply company received a loan of Rs. 2.5 lakhs, one saw mill was granted Rs. 50,000 and a furniture-making firm got Rs. 15,000.

The number of applications rejected was two, one from a furniture-making firm for Rs. 2 lakhs and another from an oil mill requesting a loan of Rs. 80,000. Besides, three applications were kept in abeyance till fulfilment of certain conditions.

Soon after the Corporation was established some Indian-owned tea gardens approached it for financial accommodation. Doubts having arisen whether the Corporation could lend to tea gardens, the question was referred to the Industrial Financial Corporation of India. The latter obtained the opinion of the Ministry of Law of the Union Government. On the basis of this opinion, it was decided that tea gardens having processing and manufacturing equipment would be eligible for accommodation from the State Corporation, irrespective of the purpose for which the amount of loan was to be utilised.

The rate of interest charged by the Corporation is stated to be not less than 6½ per cent. per annum with a rebate of ½ per cent. for prompt payment of interest and instalments on loans.

The working of the Corporation during the period ended 31st March, 1955, resulted in a net profit of Rs. 38,545. After transferring Rs. 5,000 to the reserve fund and Rs. 15,000 for taxes, the balance of Rs. 18,545 was proposed to be utilised for payment of the guaranteed dividend at 3½ per cent. per annum to its shareholders. As the sum payable on this account amounted to Rs. 1.04 lakhs, the State Government was requested to give subvention for the balance of Rs. 85,612.

REDEMPTION OF WORLD BANK BOND ISSUE IN CANADA

The International Bank for Reconstruction and Development will redeem Can. $13,600,000 outstanding of its 4 per cent. 10-year Canadian Dollar Bonds of 1952 on 1st August, 1955, at 101½ and accrued interest. The bonds—these are a part of an original issue of Can. $15,000,000 sold in February 1952—have a stated maturity date of 1st February, 1962. Payment on redemption will be made at any agency of the Bank of Canada in Canada. Commenting on the redemption, Mr. Eugene R. Black, President of the Bank, points out that the 4 per cent. 10-year Bonds, though favourably regarded in Canada, have not fully reflected the improvement in the market there, because of the ceiling imposed on their market price by the call price of the issue. Consequently, the Bank has decided to call the bonds for redemption.

Three World Bank bond issues aggregating Can. $53,600,000 are currently outstanding in Canadian dollars. The 4 per cent. 10-year Bonds to be redeemed were the first to be offered in the Canadian market. Subsequently, an issue of Can. $25,000,000 3¾ per cent. 15-year Bonds was offered at 99½ on 17th June, 1954. More recently, an offering of Can. $15,000,000 3¾ per cent. 10-year Bonds was made at 99 on 21st March, 1955.

Discussing the market for the Bank's bonds in Canada, Mr. Black says that "World Bank bonds have won rapidly increasing acceptance among Canadian institutions and private investors based on a growing recognition of their strength and of the Bank's record of successful operations. All of the Bank's Canadian issues are currently selling above par." Referring to the Bank's record for the current fiscal year ending 30th June, 1955, Mr. Black discloses that "the Bank will have made loans of more than $400,000,000—a new high—and earnings will have reached a new peak of about $24,000,000 for the period." Total loans made by the Bank since it began operations in 1946 aggregate about $2,300,000,000. In addition to Canada, the Bank has sold its issues in Great Britain, the United States, Switzerland and the Netherlands. The total of its bonds now outstanding amounts to the equivalent of $851,590,000.

RURAL BANKING IN INDONESIA

TRAVELLING BANKS—A UNIQUE FEATURE

By Peter Diebold

SENIOR AGRICULTURAL ADVISER, NATIONAL PLANNING BUREAU OF INDONESIA, DJAKARTA

WITHOUT ever leaving his village, an Indonesian farmer living in a remote rural area has easy access to banking facilities—something that most farmers in East and West Asia do not have. Available in the village are a rice bank that lends rice to tide him over until his new harvest and a village (*desa*) bank that makes small short-term cash loans. And each month a travelling bank (*rombongan*) that handles larger, long-term cash loans is sent around by the nearest branch of the People's Bank, or Bank Rakjat Indonesia (B.I.R.).

The idea of rural credit institutions is firmly established in Indonesia. The first such institutions date back to the turn of the century, when a Dutch official named De Wolff promoted the founding of savings banks and rice banks. The savings banks were located in small towns out of reach to most villagers.

But the rice banks did serve the small villages; and several years later came the village banks themselves, which dealt in cash. The number of rice banks, 250 at the start, had swollen to 12,424 by 1913, but shrank to half that by 1926, and to 3,635 by November, 1954. While half the rice banks were closing, 3,418 new village banks were opening, and by November, 1954, there were 4,567.

The B.I.R. is responsible for almost all this far-flung system of farm credit. It controls and administers the local institutions—the village banks, the rice banks, and the credit co-operatives (where there is no co-operative bank of a higher order)—that extend small credits to the village people. And its 112 local branches make larger loans to individuals and organisations—generally for amounts of not less than 250 rupiah (about $20) (one U.S. dollar=11.40 rupiah) and for periods of not less than two months. Of the total loans of about 40 million dollars granted by the B.I.R. in 1953, 21 per cent. was lent in rural areas. People living in the regency capital or nearby get their loans direct from the branch bank. Most of the rural areas, however, are serviced by the travelling banks, which function as departments of the branch banks.

Travelling Bank

The average travelling bank has a cashier, a book-keeper, and two clerks, and its equipment consists of a station wagon and a cash register. Once a month, it visits the various villages on its route. The bank is parked at some central point of the village, and banking takes place often in the mayor's house, sometimes in a store, and occasionally at a stand in the central market place. Before the war, a specially equipped truck with a cash register and counter was used, and banking took place inside the truck itself.

The travelling bank is not a substitute for the village banks; it does not extend small short-term credits, but, like the B.I.R. branch bank itself, concentrates on larger, longer-term loans, usually from about $90 to about $260, and sometimes as much as $900 to one person. Loans are on a 10-month or seasonal—that is, six-month—basis, at 12 per cent. interest per annum. Each month the borrower repays one-tenth of the loan *plus* one-tenth of the interest rate calculated on a system of compounded rates. The B.I.R. officials estimate that only about two-fifths of the loans made by the travelling banks are for agricultural purposes such as farm-building construction or the purchase of livestock, fertiliser, and the like. The rest go not to agriculturists but to traders of craftsmen setting up buildings or godowns.

In order to observe the functioning of a travelling bank, I visited the one that calls at Leuviliang, one of the larger villages in Bogor Regency. Leuviliang is the capital of a sub-district and the seat of a *tjamat* (township officer). The travelling bank was operated at the *tjamat's* office, where the bank staff worked at tables set up on a covered porch. From 8 a.m. till 1 p.m., they collected payments on loans, and from 1 to 4 p.m. they made new loans. At the time of my visit, Leuviliang had 223 borrowers with seasonal loans amounting to 66,524 rupiah (nearly $6,000). More than half the borrowers were traders and craftsmen, although this is one of the most prosperous agricultural districts, having year-round irrigation with two wet rice crops and one dry *poloowidjo* non-rice crop).

Village banks are set up to serve a different sort of need—that for smaller credits on a short-term basis. Under the rules of the B.I.R., no village bank can lend more than 250 rupiah (about $20) to an individual. Loans are made for 10 weeks. During this period, the borrower pays back weekly instalments of one-tenth of the loan, and after having repaid the tenth instalment, pays an eleventh as interest. In some banks a twelfth instalment is required from the borrower; this is considered a forced loan, and the bank returns it without interest after a year. To be able to borrow from the village bank, a villager must be investigated and approved by the Commissie Bank Desa, a committee of five villagers elected by the community. The Commissie must be present on the day when loans are issued and repaid. Each of its members receives for his services 2½ per cent. of the loans repaid, but not more than 120 rupiah a month (about $10).

In 1953, the village banks lent over 13 million dollars, as compared with 2½ million dollars in 1951 and 12.4 million dollars in 1938. However, in terms of the present purchasing power of money, the 1938 total is considerably above that for 1953.

In order to observe the functioning of a village bank, I visited the one in Simplak, a town of a little more than 3,000 people near Boro. This bank can be considered typical of those in Java's more prosperous areas, where a village contains a high percentage of so-called small traders.

In the Simplak bank, loans are made and repaid on one day each week, from 8 a.m. to about 1 p.m. For the first half of the banking day, loans are repaid; for the second half, new loans are made. The operations I observed took place at the house of the village head. Around a large table on the open porch were seated five members of the Commissie, the book-keeper, the village head, and, on this occasion, the supervisor of the B.I.R. As each borrower repaid one-tenth of his loan, the credit slip he carried was stamped and an entry made by the book-keeper in the books of the bank. Shortly before the end of the repayment period, $197 had been collected; by the end of the banking day, $178 of this had been given out in new loans. Of the 213 borrowers in the village, only three absented themselves; these were small traders who had to be out of the village for business reasons.

Rate of Interest High

The Simplak bank was founded in December, 1951, with a loan of 3,000 rupiah ($263) from the B.I.R. Considering the high rate of interest charged, it is not surprising that, within two and a half years, the Bank has been able to repay this initial fund. In addition, it now has outstanding loans amounting to 16,500 rupiah (about $1,450), which means a total earning of over $1,700. On the basis of these observations, the village banks are operating on a sound financial basis. Their earnings, however, are going to the communities rather than to individuals; and the communities' use of these earnings may be on a less sound financial basis. For example, the village head of Simplak wanted to invest bank earnings in a bank building which did not appear really necessary, and which would divert from more productive investments the money earned by the bank.

Most borrowers from the village bank do not seem discouraged by the high interest rate charged—104 per cent. in terms of annual interest. Their nonchalance may be due partly to long experience with usurers' interest rates, which are usually from 260 to 520 per cent. a year. Even the usurers' rates, since they are always expressed in weekly terms (i.e., from 5 to

COTTON TEXTILE INDUSTRY IN SECOND FIVE-YEAR PLAN

NEED FOR HIGHER TARGET FOR MILLS

By A Special Correspondent

THE draft second Five-year Plan will be placed before the public within the next few months to elicit suggestions for its improvement. It is proposed to discuss here what place should be assigned in the Plan to the cotton textile industry which, after agriculture, holds a position of very great importance in the national economy. Inevitably, any blue-print for this industry must give prominence to production and consumption.

The prospects for the cotton textile industry are, indeed, bright. The nation is engaged in the great task of overcoming poverty and unemployment which have so long darkened the lives of our people. Though the first Five-year Plan has yielded no spectacular results, it has certainly contributed to the solution of the intractable food problem. There has also been a slight improvement in the clothing standards of the community. The present *per capita* consumption of 15 yards of cloth, though still below the pre-war level of 16 yards, marks an improvement over that of previous years.

It is reasonable to expect that, as the nation's economic progress gathers greater momentum under the second Plan, there will be an appreciable improvement both in the living and consumption standards of the community. But it is difficult to say what portion of the increased income will be spent on cloth. Experts have differed widely in assessing the potential demand for this commodity.

Per Capita Consumption

With its penchant for ambitious projects, the Bombay Plan envisaged a *per capita* consumption of 32 yards, while the Post-war Planning Committee, Textiles, was more modest with 18 yards. Suggestions were made to the Working Party for the Cotton Textile Industry, which reported in 1952, that cloth consumption should "really be 25 yards *per capita*" and that "any estimate below 20 yards by the year 1955-56 would really be inadequate and unreasonable."

The Textile Enquiry Committee, 1954, otherwise known as the Kanungo Committee, is of the opinion that the rate of cloth consumption will rise to 18 yards per head by 1960. The Union Minister for Commerce and Industry gives an extra two yards to the consumer on the ground that the solution of the food problem has contributed to the greater material well-being of the comman man. The Federation of Indian Chambers of Commerce and Industry has arrived at the figure of 22 yards.

Howsoever divergent these estimates might be, they establish the fact that the consumer is well on the road to the attainment of higher clothing standards. But is the proposed allocation of the increased demand for textiles between the mill and non-mill sectors of the industry just and practicable? The draft outline of the second Five-year Plan has assigned production targets of 5,500 million yards to the mill industry and 3,200 million yards to the non-mill sector, while the targets recommended by the Kanungo Committee are 5,000 million yards and 3,200 million yards, respectively.

The arguments put forward by the Kanungo Committee in support of these figures call for careful examination. On the assumption that the population of India will be 400 million by 1960 and that the *per capita* consumption of cloth will increase to 18 yards, the Committee estimates that the total cloth requirements by the end of that period will be 7,200 million yards. The industry will have to produce another 1,000 million yards for export. Thus, the total output of cotton textiles will be 8,200 million yards a year.

Will It Be Able To Deliver The Goods?

According to the Committee, handloom and powerloom production amounts to 1,400 million yards and 200 million yards respectively. The present output, including the 5,000 million yards of mill cloth, thus amounts to 6,600 million yards. The Committee rightly feels that the bulk of exports should come from the mill sector, but this results in only 4,000 million yards of mill cloth becoming available for domestic use. With mill output sealed off at the present level of about 5,000 million yards, the entire additional demand is recommended to be annexed by the handlooms and cottage powerlooms.

The questions that arise in this connection are: (a) Will the non-mill sector be able to double its present production of 1,600 million yards to 3,200 million yards within five years? (b) Are the various measures suggested by the Committee for realising this objective feasible? and (c) Will the goal of higher consumption be attained by depriving the mill industry of the advantages of mass production?

The Committee believes that it will be possible for the non-mill sector to raise its output to 3,200 million yards by converting the handlooms into efficient instruments of production. The *modus operandi* suggested by it may be briefly described here. The Committee feels that the handloom industry can well turn out 1,600 million yards of cloth a year with only 9 lakhs of ordinary handlooms by working for 300 days a year. This will mean that, out of 12 lakh active handlooms, 3 lakhs will be rendered idle.

In order to produce the extra 1,600 million yards of cloth, the Committee recommends thus:

> "An improved type of the so-called semi-automatic handloom will produce 20 to 24 yards a day (of 8 hours) and a powerloom will produce 30 or more yards per shift. An extra 2.13 lakh improved handlooms/powerlooms working one shift a day (and producing an average of 25 yards a day) for 300 days a year will be required to manufacture the extra 1,600 million yards."

The conversion plan involves an estimated expenditure of Rs. 12.00 crores or Rs. 2 crores a year.

The Committee is, in fact, anxious that the handloom sector should be rid of the incubus of inefficient and useless machines and that it should go over to improved types. It, therefore, suggests that the remaining 9 lakh active handlooms should be brought within the scope of the conversion scheme, the whole process being completed within a period of 15 to 20 years. Some 50,000 old type looms should, however, be retained in order to manufacture "special fabrics with an intricate body design."

Man Behind The Loom Important

Large sums of money are involved in this scheme, but finance is not the chief consideration as the Government is determined to give maximum help to all labour-intensive small and cottage industries. In fact, the whole edifice of the Kanungo Committee's proposals rests on how smoothly and effectively its conversion project is carried out. To quote its Report:

> "After very careful consideration, the Committee has come to what, in its opinion, is an irresistible conclusion, namely, that at a pace at which there will not be too drastic a disturbance of the economic and social fabric, the handloom industry has to be made technically more efficient by converting the handloom either into a semi-automatic loom and/or into a powerloom, as power becomes available more generally in the areas where the handloom industry is widely prevalent."

Evidently, this view has the support of the Union Minister for Commerce and Industry. Addressing the reconstituted All-India Handloom Board at its first meeting in November 1954, Mr. Krishnamachari urged that it was wrong to regard the handloom as more important than the weaver. "I want you," he declared, "to think of the human being behind the handloom—not merely the machine by itself. We do not want to maintain inefficient and useless machines irrespective of the men behind them."

Indeed, it is the considered opinion of all forward-looking persons that sentimental attachment to outdated modes of production is misguided. The Report on Small Industries in India by the International Planning Team of the Ford Foundation contains this candid observation:

> "Without modernisation, Indian industries which cling to obsolete equipment are condemned to mediocrity and eventual elimination. Only by adopting efficient methods of production, as soon and as widely as possible, can small and village industry take advantage of the good opportunity it now has to lay a basis for a promising long-term development."

What Progress?

It will be most useful if detailed information can be made available about the progress, if any, that has been made in the direction of modernising the handloom sector. The latest brochure entitled *Indian Handloom Development Schemes*, 1953-55, issued by the All-India Handloom Board, does not throw much light on this important subject. It says that, on the recommendation of the Handloom Board, the Government has sanctioned schemes for converting 32,632 throw-shuttle looms into fly-shuttle looms during 1953-54 and 1954-55 at a cost of Rs. 8.6 lakhs and for providing take-up motion attachments for 29,625 looms at a cost of Rs. 14.8 lakhs.

Unfortunately, the booklet does not say how many of these sanctioned schemes have already been implemented and whether any organised attempts are being made to ensure that the Kanungo Committee's recommendation for converting 3 lakhs of old type handlooms into improved varieties within the prescribed period is duly carried out. It is quite possible that the Government itself is not enthusiastic about the conversion scheme, as it involves unemployment which is against its policy. Probably, this is one of the reasons why the Government's reactions to the Committee's proposals have been withheld from the public.

What is more certain, however, is the lack of enthusiasm among the spokesmen of the handloom industry for the modernisation scheme. One such leader, who is also a member of the All-India Handloom Board, has called in question some of the basic statistics contained in the Kanungo Committee's Report. For instance, he claims that each handloom provides employment for a minimum of 2.5 workers and not to 1.25 persons, as "wrongly" stated by the Committee.

Stating that the "entire range of calculations made by the Committee is vitiated by such glaring fallacies," he attacks the conversion scheme in these trenchant words:

> "In the name of improvements to the handloom and increase in production, the Committee suggests its radical conversion into powerloom—as ruthless in nature as a religious conversion."

If, as a result of the likely failure of the conversion scheme, the production target assigned to the non-mill sector does not materialise, it will be extremely difficult to cater to the increased demand for cloth. Such a situation will arise because the Kanungo Committee wants mill output to be "stabilised" at the level of 5,000 million yards. Cloth shortage in the country will inevitably boost prices, thereby causing undeserved hardship to the consumer. It may also adversely affect exports, as any serious shortfall in domestic supplies may necessitate the imposition of stringent restrictions on exports. Should this happen, it will be a serious blow to our export trade in textiles, built up after years of ceaseless effort. A setback to exports will involve loss of foreign exchange which the nation wants so badly for importing capital equipment.

Handicaps on Mills

There is absolutely no reason why such a situation should be created when the country has a well-established and competently organised industry capable of fully meeting the nation's clothing requirements and its export commitments. But this premier national industry is being prevented from playing its role effectively by imposing a series of restrictions and burdens on it. These disabilities are best summed up in the words of an official document issued on 16th December, 1954. To quote this Memorandum, published by the Government of India:

> "In the beginning, certain lines such as coloured *saris*, *lungis*, *sarongs*, etc., were reserved for the handloom industry, and production of *dhotis* by mills was restricted to a percentage of their previous production by way of a penal excise duty. Installation of new looms in the mill industry is not allowed. The Textile Enquiry Committee, whose work has been completed recently, has recommended that all further expansion of cloth production should be reserved for small-scale industries. No licences are being given for the expansion by the mill industry of garment-making and printing of cloth."

The list is by no means exhaustive. Since 1952 an additional excise duty on mill cloth is being collected to rehabilitate the handloom and *khadi* industries. The yield from this source will be approximately Rs. 7½ crores in the current year. The Centre has also given the States a sum of Rs. 95 lakhs to be used as rebate on sales of handloom fabrics. These are large concessions, the aim of which is not only to put these small-scale industries on their feet, but also to establish an artificial price parity for the goods of the two sectors.

In fact, the planners have made no bones about it. To quote the "plan-frame" of the second Five-year Plan, as reported in the Press:

> "It is recognised that the price of hand-made goods would be often higher than the price of factory-made goods of comparable quality. Appropriate excise duties (which would be selective) would be imposed on factory products to maintain desired price parities with hand-made goods in such cases."

The mill industry does not grudge making legitimate sacrifices for the revival of handlooms. Such sacrifices are made with the full realisation that, in an over-populated country like India, there is a great need for small and cottage industries which are ideally suited for giving employment to a larger number of people than factories can afford. But it is necessary to strike a judicious balance between the two sectors so that both might live and prosper together.

Vexed Question

Dealing with this vexed question, the Union Minister for Commerce and Industry made the following useful observations, while addressing the fifth meeting of the Central Advisory Council of Industries last August:

> "A mere sentimental emphasis on the importance of cottage and small-scale industries without an economic appraisal of their social cost and their contribution to the future well-being of the people of this country is, I think, wrong."

It is clear from this discussion that the crux of the problem is how to stimulate higher consumption. Whether or not the non-mill sector will be able to achieve one hundred per cent. increase in its present production within the short period of five years, it is almost certain that the policy of reserving to it the entire additional demand for textiles will make it extremely difficult to reduce cloth prices.

Today, the *per capita* consumption of cloth in the country is 15 yards, of which about 11 yards come from mills and the balance from the non-mill sector. That is to say, over 70 per cent. of the total demand for cotton fabrics in the country is met by the mill industry. If the Kanungo Committee's recommendations are accepted and if its anticipations regarding the *per capita* consumption in 1960 come true, the position will be that the consumer will have to buy 10 yards of mill cloth and 8 yards of handloom cloth. This means that the share of the latter in clothing the nation will rise to about 45 per cent., while that of mills will decline to about 55 per cent. There will be a slight variation in the percentage—60 per cent. for the mills and 40 per cent. for the handlooms—if we place the *per capita* consumption at 20 yards on the basis of the production targets laid down in the draft second Five-year Plan.

By freezing mill production at a level very much below the country's need, by establishing an artificial price parity for the products of the two sectors, and by making the issue of modernisation and rationalisation dependent on labour's volition, the mill industry is being deprived of the advantages of efficient and economical production. In consequence, it is unable to make any substantial changes in its cost structure. These handicaps of the mill industry are, however, advantageous to the handloom sector. With mill cloth regulating the market price, there is no need to offer handloom fabrics at economic prices. Nor need there be any apprehension about their disposal, for the simple reason that only a limited quantity of mill cloth will be made available to the consumer.

Consumer Neglected

Unfortunately, in this scheme of things the consumer's interests, which, after all, are paramount, are apt to be forgotten. Only three years ago the Union Minister for Commerce and Industry made these observations:

> "It seems that consumers all over India want mill cloth which is cheaper. We cannot ignore the consumer's interest, which is the primary one with which we are concerned. We cannot ignore it, particularly at a time when he wants more cloth, and we cannot reject this aspect of the question and accept a narrower view."

What then should be done to eliminate the conflict of interests between the two sectors and to promote the good of the industry as a whole? First, there should be no "stabilisation" of mill production at any arbitrary level. In the years to come, there is bound to be an increase in the demand for cloth due to the growth of the population at the rate of 4½ millions a year and to a steady rise in the community's standard of living. Cheapening of cloth prices by adopting rationalised methods of production, for which a plea will be presently made, will further broaden the demand for this article of necessity.

It would, therefore, be wise to keep the production targets flexible as a safeguard against any shortage of cloth supplies in the country. If this is not done, we are likely to revert to the era of controls and of siege economy. Since, however, targets have got to be indicated in the second Plan, the present ratio of 3 to 1 in regard to mill and handloom production should be retained. The draft Plan envisages an output of 8,700 million yards of cloth from the two sectors. Twenty-five per cent. of this production, namely, some 2,200 million yards, may be earmarked for handlooms. This would mean that the present output of 1,600 million yards by the non-mill sector should be increased by 600 million yards by the end of the second Plan period. This allocation appears to be far more realistic than the Kanungo Committee's recommendation for a hundred per cent. increase in handloom production in five years.

Handlooms Must Be Modernised

Secondly, energetic steps should be taken to modernise the handloom industry on the lines of the conversion scheme recommended by the Kanungo Committee. As the Committee has rightly pointed out, "the pure and simple handloom is and must be a relatively inefficient tool of production" for the manufacture of ordinary fabrics, as distinct from cloths of elaborate design. The wages of the thousands of workers engaged in this backward industry are low and will remain so, thus condemning a large section of the community to a permanently depressed life. In modernisation alone lies the salvation of the weaver.

Modernisation of Mills

Lastly, the rehabilitation and modernisation of the mill industry must be undertaken by shedding all hesitations and prejudices against this healthy and essential reform. There has been a lamentable lack of realism in the approach of the policy-makers to this question, as the following quotations will make it abundantly clear. In the first Five-year Plan, the Planning Commission says thus:

> "The progress of rationalisation should at the same time be facilitated so as to reduce costs. Musters should be standardised and workloads fixed to this end. Side by side, working conditions should be made uniform. Fresh recruitment should be stopped and vacancies caused by death and retirement should not be filled."

In other words, the Planning Commission has no objection to the reduction of redundant labour force through natural wastage.

The resolution on rationalisation, passed by Parliament in September 1954, makes no advance whatsoever on this unnecessarily cautious policy. The resolution reads thus:

> "The House is of opinion that rationalisation of the textile and jute industries, where it is necessary in the country's interests, must be encouraged, but the implementation of such schemes should be so regulated as to cause the least amount of displacement of labour in those industries, providing reasonable facilities for the employment of such displaced labour."

The Kanungo Committee, which studied the rationalisation issue, was impressed by its need, particularly for the purpose of imparting greater competitive power to Indian cloth in foreign markets. It accordingly recommended the replacement of plain looms with automatic looms at the rate of 5,000 looms a year "so that one half of the existing loomage may be converted into automatic looms over a period of 20 years."

The Committee, however cancelled out its own recommendation by saving that rationalisation should be undertaken "in consultation and agreement with labour, or at least according to principles which Government after a full consideration of the matter may lay down." This lukewarm support of the Committee for rationalisation is hardly surprising if it is remembered that even on the question of converting uneconomic mills into viable units by putting up more looms, its attitude was most unhelpful.

Thus, the absence of a firm policy on rationalisation has turned the issue into a deadlock. Having secured the right of veto, labour is loth to surrender this weapon. It has no great interest in the method of natural wastage, even though its spokesmen are pledged to its implementation. In fact, "rationalisation without tears" has become a meaningless slogan, because the very principle of rationalisation is being bitterly assailed. The prolonged strike at Kanpur provides conclusive proof of the determination on the part of at least one section of labour leadership to fight rationalisation tooth and nail.

No Enemy of Labour

And yet if a long-range view is taken, rationalisation will not be found to be the enemy of labour. Much of the machinery now in use in many of the mills is old and worn out. The Working Party for the Cotton Textile Industry has furnished some useful information regarding the state of the industry's productive equipment. A survey of 111 mills, situated in different parts of the country, has revealed that 45,393 looms were installed prior to 1910, 23,375 looms during 1910-25 and 23,130 looms after 1925.

The following comparison of the productivity of Indian textile workers with that of their counterparts in other textile producing countries will be found instructive.

Countries	No. of spindles handled by one operative	No. of looms handled by one operative
United States	1,500—2,100	60 automatic
Japan	1,600—2,000	{30-40 automatic 14-15 ordinary
Britain	800	6 ordinary
India	350*	2* ordinary

* Average.

The issue is simple. With such a debilitated equipment and with such low standards of work, would it be possible to maintain a high degree of efficiency in the industry? Can India expect to export 1,000 million yards of cloth annually and maintain shipments at that level in the face of growing competition in a steadily shrinking world market? Lastly, will not employment opportunities decline if the industry is not in good health?

Rationalisation should, therefore, be looked upon as a beneficent instrument for reducing costs and prices when alone it will be possible to stimulate higher production, consumption and employment. By minding new and more machines, the worker will earn higher wages and thus raise his standard of living. With the probable increase in the demand for cloth in the coming years, the industry may have to expand production. In that event, it may become possible to adopt improved methods of production without having recourse to retrenchment. It is only in such favourable circumstances that the volume of employment in the industry can be maintained at the present high level.

Benefits To Others

Lastly, a vigorous policy of machinery modernisation will give a great fillip to the textile machinery manufacturing industry in the country. Thanks to the Government's solicitude, the machinery manufacturing industry is gradually coming into its own. The estimated rehabilitation requirements of the cotton textile mill industry, in the shape of renewals and new equipment, are valued at Rs. 300 crores. With a steady flow of orders for plant and machinery, the textile machinery industry, which has at present a capital investment of Rs. 5 crores, will receive the necessary incentive to expand its activities. The development of such an important industry will be a national asset.

The conclusions that emerge from this survey may be briefly set down here:

(1) There is no inherent conflict of interests between the mill and the non-mill sectors of the cotton textile industry and so all measures taken on the basis of this assumption should be reconsidered.

(2) The production targets for the two sectors should be flexible and should be determined strictly in terms of the ability of each sector to fulfil its assignment.

(3) All oppressive restrictions on the mill industry should be removed so that it may continue to serve the nation by producing cheap and durable cloth and by earning valuable foreign exchange through exports.

(4) Reforms like rationalisation and modernisation should be boldly undertaken by recognising their abiding value to the nation.

(5) Lastly, it must be remembered that, being second in importance only to agriculture, a healthy and vigorous textile industry becomes a tower of strength to the national economy.

The following quotation from the Report on Small Industries in India by the International Planning Team of the Ford Foundation makes a fitting conclusion to the present discussion:

> "The Indian market is one of the largest potential domestic markets in the world. If this market is fully developed in both the cities and the villages, it can stimulate perhaps the greatest industrial revolution ever seen, and make India one of the foremost producing and consuming areas in the world."

All our energies must be bent on realising this glorious objective.

WORLD COTTON TEXTILE POSITION

PRODUCTION AND EXPORTS RECEDE

THE international trade in cotton textiles is expected to suffer a recession during the current calendar year, according to a forecast of the Japan Cotton Spinners' Association (J.C.S.A.), made in the course of an interesting article published in its latest quarterly report. After surveying the developments in the domestic and foreign cotton textile scene, the Association observes that the world cotton yarn and piecegoods trade (and production), which had continued to keep up high levels during last year, has, since the start of 1955, been showing a strong tendency to decline. Indeed, it points out that the world cotton textile trade, which had followed an upward path since 1953, "has struck the ceiling for the time being and even started to drop." The aggregate exports of cotton piecegoods from the nine principal producing countries—Japan, the U.K., the U.S., India, France, Italy, Belgium, Western Germany and the Netherlands—during the first quarter of 1955, for instance, are estimated at less than 1,100 million square yards, which compare unfavourably with 1,240 million square yards in the previous quarter (that is, October-December, 1954), or a drop of more than 11 per cent. On this basis, the total exports for the whole of 1955 may be estimated at 4,400 million square yards, as against nearly 5,000 million square yards in 1954. The fall in piecegoods exports from India during the quarter under review as compared with the previous quarter was of the order of 22 million yards, the quantity shipped being 190.22 million yards, as against 212.00 million yards.

The setback to the cotton goods trade is attributed to slackness in both domestic demand and export business of Japan and the West European countries. The downward tendency is expected to become further pronounced and export rivalry intensified in the coming months. This view is based on three factors, namely, (1) stricter import restrictions in various countries, (2) efforts on the part of leading cotton goods producing countries to sustain their export levels, and (3) the entry of minor textile producing countries into the world export business.

In view of the aforesaid disquieting trend in the world cotton textile trade, the J.C.S.A. asserts that the Japanese cotton spinners and weavers should direct "energetic efforts" to promote export trade in cotton products, while adjusting the demand-supply situation by means of the mill operation curtailment. At the same time, it urges the Government to adopt "effective measures for boosting exports of cotton piecegoods." These words of the Japanese Cotton Spinners' Association apply with equal force to cotton textile interests and the powers-that-be in our own country. It was only two weeks ago that it was pointed out in these columns that India's exports of mill cloth during the current year would be lower than those (898 million yards) in 1954, unless fresh steps were taken without any further delay to increase the competitive capacity of Indian textiles. Viewed thus, the forthcoming visit of the Indian textile trade delegation to Burma, Thailand, Malaya, Indonesia and Ceylon—these are some of the most important adjacent markets for Indian cotton piecegoods—will be quite timely. The delegation which is leaving Bombay today will make an on-the-spot study of the market, assess the extent of their requirements of cotton textiles, study consumer preferences in the wake of changing dress habits and investigate other incidental problems vital to the promotion of exports.

To revert to the J.C.S.A.'s survey of the world cotton yarn and piecegoods market during the three months ended March, 1955. There are two outstanding developments of this period to which the J.C.S.A. has made particular reference. First, the prices of British cotton yarns registered a decline. Secondly, the dual prices of Japanese yarns for export and domestic trade disappeared.

Thanks to reduction in offtake—domestic and foreign—the production of cotton textiles in the aforesaid nine countries began to slide downwards with the advent of the new year (1955). During the first quarter of the year, not more than 6,830 million square yards of cloth came off the looms in those countries, a drop of almost 100 million square yards as compared with the October-December quarter of 1954. It is recalled that total cotton goods output in the nine countries during 1954 amounted approximately to 27,000 million square yards, setting a new high record in the entire history of the world's cotton industry. In India, however, the performance on the production front during the quarter under review was quite encouraging, the quantity of mill cloth actually produced being 1,268 million yards, as against 1,245 million yards three months before. But the upward trend has been checked in the last two months, the estimated production of cloth declining from 429 million yards in March, 1955 to 418 million yards in April and 401 million yards in May.

It will be interesting to note, in this connection, that production of cotton textiles in Japan recorded a distinct improvement during the month of April, 1955. The output of fabrics in that month is estimated by the Ministry of International Trade and Industry at 341.63 million square yards, which represents a rise of 6 per cent. over the previous month. The rise in cloth production followed an increase of 7 per cent. to 206,600 bales in the output of yarn, the number of spindles that worked being 7,838,000. As compared with March, the operation rate advanced from 90.8 per cent. to 97.7 per cent. The market for yarn, however, was depressed and trading was inactive, raising the stocks as at the end of April by 5 per cent. to about 62,000 bales. Owing to depressed market, stocks of fabrics were also higher by 10 per cent. at 146.50 million square yards.

WORLD TEXTILE TALKS

A six-day conference of 80 delegates from the textile industries of 15 countries will commence at Ostend in Belgium on Friday next week. An announcement to this effect has been made by the International Federation of Cotton and Allied Textile Industries. The conference is at the invitation of the Belgian Cotton Spinners' and Weavers' Association and the Ghent Cotton Exchange. Observers from the U.S. are expected to attend the conference. Besides the meeting of the Committee of Management, meetings will also be held of the Federation's joint Egyptian cotton, raw cotton merchants, European affairs and international liaison committees. Considerable trade interest, it is said, attaches to the discussions among raw cotton interests, in view of the Egyptian Government's decision to reopen the Alexandria futures market with effect from the beginning of the ensuing cotton season.

(Concluded from next column)

FUTURE OF COTTON

CAN IT FACE COMPETITION FROM MAN-MADE FIBRES?

THE increase in the production and consumption of man-made apparel fibres has underlined the need for the producers of cotton, the natural fibre, to become more than merely academically conscious of the importance of promoting the uses of cotton. The consumption of cotton has no doubt increased in recent years. So has that of synthetic apparel fibres. Indeed, the consumption of synthetic fibres has advanced far more rapidly than that of cotton. But it is heartening to note that cotton men in the U.S. are not greatly perturbed by this trend, and that they believe that the natural fibre will be able to hold its own against the the synthetics. At the recent annual session of the American Cotton Congress, Mr. Burris C. Jackson, Chairman, declared that a "magic valley of opportunity" lay before the cotton industry.

Although cotton's position as a apparel fibre has not been seriously threatened, there is no doubt that its consumption has risen less rapidly than the increase in world population. Between 1938-39 and 1953-54, the consumption of cotton increased from 6,370,000 tons to 7,250,000 tons, whereas that of man-made fibres increased from 632,000 tons to 2,054,000 tons. The average *per capita* consumption of natural fibres in the 1934-38 period was 8.5 kg. (average) but it declined to 8.4 kg. in 1953; over the same period, the *per capita* consumption of man-made fibres rose from 0.3 kg. to 0.8 kg. Again, in the 1934-38 period, cotton accounted for 80 per cent. of apparel fibre consumption, wool for 12 per cent. and man-made fibres for 8 per cent.; in 1953, the consumption of cotton and wool declined to 69 per cent. and 11 per cent., respectively, whereas that of man-made fibres increased to 20 per cent.

These facts suggest that there is a tendency for synthetic fibres, particularly rayon, to invade the realm of cotton. In the ultimate analysis, the determining factors are, of course, price and quality. So far as price is concerned, cotton is at a disadvantage. Since its production cannot be as neatly planned as that of rayon and other synthetics to match the size of the market, its prices are subject to wider fluctuations than those of rayon. As regards quality, cotton does enjoy certain unique features which give it a pre-eminent position as a textile fibre.

The superior characteristics of cotton include, as Mr. Jackson himself pointed out, launderability, absorbency, strength, durability, resistance to heat and adaptability to dyes. Its versatility, he added, is so great that it can be made into fabrics with great warmth or into others which cannot be matched for coolness and comfort. He pointed out that with special finishes, one kind of cotton print cloth can be transferred into one of 20 different kinds of effects, pique, taffeta, crepe and many others.

But the quality of man-made fibres too is being improved through research. Mr. Jackson said, referring to the U.S., "today, cotton, besides rayon, faces its major competitors—orlon, nylon, dacron, dynel, acrilan, saran, vicara, fibreglass and paper. The research and promotion programmes of the synthetic producers are many times greater than those which disturbed us back in the thirties." He, however, noted that, in the face of all this competition, cotton's total domestic market (that is, in the U.S.) had expanded by 50 per cent. in the last 15 years. He added: "We have an unswerving faith in our product and are working intelligently and unceasingly to improve and promote it."

Since it is research that has enabled the man-made fibres to replace cotton in certain spheres, it is again research and promotional programme that can help cotton hold its own against its rivals. Attention to this aspect of the cotton problem was called by Mr. W. R. Blake, Vice-President of the U.S. National Cotton Council, at the Cotton Congress. He said:

"In 1953, I reported to you that a single development in rayon research had cost us our biggest market—500,000 bales a year for tyre cord.... We were researched out of a market which, over the last three years, would have amounted to a million and a half bales. If cotton could have held this single market, the present surplus would be less by almost a fourth and growers would not be facing nearly so bad a problem in present and prospective acreage controls."

Mr. Blake revealed that the Council would shortly establish market research and sales promotion programmes abroad. He emphasised that cotton had to meet competition on three big fronts—quality, promotion and price—and that research had an all-important bearing on each one. Research had to be used to develop new

(Continued in previous column)

CONTROVERSY OVER FUTURE SIZE OF TEXTILE INDUSTRY

TRADING IN LONG-STAPLE COTTON CONTRACT LIKELY TO BE RESUMED

By A Special Correspondent

MANCHESTER, 14th June

SPECULATION over the future size of the cotton industry in the U.K. has been a constant subject for controversy in recent years no less than in the past. It is generally accepted that the time has come when a contraction in the purely physical size of the trade is inevitable, yet without necessarily involving further curtailment of productive capacity.

MANCHESTER LETTER

Commenting on the imported cloth problem, Mr. J. F. Simpson, Chairman of the Cotton and Rayon Merchants' Association, said at the annual meeting: "It is quite impossible to develop a profitable export trade when the home market is being undermined. Merchants have no confidence to produce, not knowing how much greater the volume of importation may become as a result of unrestricted entry of goods from the low-cost producing countries. As a result, we have entered into a further period of contraction in the industry, which is already reaching a point that will cause it to be too small a size to provide the strategic needs of the country in the event of war or increased international tension."

Export Markets

More and more, prominent figures in the trade are linking this need for the maintenance of a stable industry at home with the ability to compete in export markets. Mr. A. N. de Thier, Chairman of Balstone, Cooke and Rayonese, Ltd., the manufacturing and merchant business, declared in his annual statement that purchase tax had ruined Lancashire's world-wide export reputation for quality goods. European and American competitors were taking its place in export markets, while at the same time India and Japan were killing trade in the coarser and cheaper lines.

On the assumption that Lancashire would have to face a shrinking overseas market and high tariff walls, Mr. de Thier said he felt with other trade leaders that more mergers of important firms and a contraction in the number of small mills and merchanting houses was a practical suggestion.

The union attitude, however, is so far antagonistic. Mr. Charles Schofield, for the Operative Spinners' Amalgamation, has described the scrapping of older mills and the concentration of production in the most modern units as "quite impracticable." He contends that a considerable number of mule spinners and their assistants would suffer redundancy in consequence, despite assurances that technicians and operatives would be found employment at other mills.

Shortening order books and the prevailing uncertainty are affecting recruitment of young workers to the Lancashire cotton industry. Only 11.1 per cent. of all the Easter school-leavers in the principal Lancashire mill towns entered the cotton industry. The comparable figure for last year was 14.5 per cent. and the highest Easter intake in post-war years was 16.9 per cent., recorded in 1951.

A Cotton Board spokesman said that the smaller recruitment figures were almost certainly due to present conditions in the industry. "Recruitment seems to react quickly to the state of trade but, happily, it appears to pick up quite quickly when trade improves."

Long-staple Cotton Contract

Raw cotton traders in Liverpool and Manchester have welcomed the decision of the Egyptian Government to reopen cotton futures trading in Alexandria in September. The development was regarded as a favourable move which should assist the fine spinning trade in Lancashire to obtain greater protection against price fluctuations.

Ever since the reopening of the Liverpool cotton futures market in May, 1954, there have been complaints from users of the finer types of cotton that the reliance on a single American contract placed them at a disadvantage when endeavouring to secure cover against price movements. According to a statement made by the Liverpool Cotton Association it will now be possible to reopen futures trading in long-staple cotton simultaneously with the re-establishment of the Alexandria futures market.

Describing the decision of the Egyptian Government as "a most constructive and welcome development," the Liverpool Cotton Association said it would provide Lancashire and other consumers with much needed hedging facilities for Egyptian type cotton. The Directors of the Association are shortly to decide their course of action. A draft long-staple futures contract has already been prepared but, the Association pointed out, many technical details will have to be quickly settled if a simultaneous reopening of the two markets in September is to be achieved.

It has also been announced that a delegation from Egypt would arrive in Liverpool towards the end of the month to discuss further details. This follows the visit paid to Egypt last November by leading representatives of the Liverpool Cotton Association who urged the reopening of the Alexandria market. At that time the difficulty of starting futures trading in a long-staple contract in Liverpool without a reasonably free marketing system in Egypt was pointed out.

Raw cotton traders in Liverpool are very gratified that their arguments in favour of reviving futures operations in Alexandria have been accepted and that the same trading safeguards as Liverpool are to be introduced.

On behalf of the spinning trade, Mr. C. Henniker Heaton, Director of the Master Spinners' Federation, described the action of the Egyptian Government as a welcome development which should create more favourable trading opportunities for Lancashire spinners of high quality yarns.

Hopes that the Lancashire textile industry will now be able to expand its exports to India as a result of the cut in tariffs were expressed by Mr. E. A. Midgley, United Kingdom Trade Commissioner at New Delhi, when he began a three-day visit this week for discussions with exporting firms in the Lancashire area.

"This pretty substantial reduction in duty should create opportunities for Lancashire," he said. The British textile team which recently visited India did a very good job and it was to be hoped that their efforts would bear fruit in better sales of Lancashire textiles in the Indian market.

Speaking at the Manchester Chamber of Commerce, Mr. Midgley said India was determined to industrialise and her second Five-year Plan, now about to be launched, would put the emphasis on industrial expansion.

Considerable success had already attended India's industrialisation efforts and developments in this field included the production of textile machinery, including spinning frames, carding machines, looms and textile accessories. "India is now starting to make a fair amount of textile machinery," added Mr. Midgley.

But Britain was holding its position as the predominant exporter to India with sales running at more than £100 million a year. India's economy was now changing from the production of consumer goods to producer goods and if British firms could adapt themselves to this gradual change there was no reason at all why they should not retain their position in the Indian market.

Group Buys Towel Mills

Further expansion in activities of Fine Spinners and Doublers Ltd., the Lancashire textile combine, is foreshadowed by the acquisition of W. M. Christy and Sons, Ltd., the old-established Manchester towel manufacturing firm.

An offer to purchase the whole of the £115,000 issued capital of Christys has been accepted by over 90 per cent. of the holders. The Fine Spinners group plan to continue production of high quality towels on the machinery owned by W. M. Christy and Sons, the mills of which contain 20,000 ring spindles, 1,800 doubling spindles and 540 looms. The firm was constituted in 1874 and has for many years been noted for quality towel manufacture.—*All Rights Reserved.*

A reference to export trade and the U.S. cotton policy has been made by Mr. W. H. Marr, Chairman of James Finlay & Co., Ltd. in the course of his statement, accompanying the report and accounts of the Company for the year 1954. Referring to the Company's mills in the U.K., he says:

"Our sales have been mainly in the home market. Competition from other manufacturing countries is making export business very difficult, and the uncertainty that exists as to what America may do with her huge surplus cotton stocks has a dampening effect on consuming markets and causes more or less hand-to-mouth purchasing both of cotton and of cotton fabrics. To date this year our sales, except for towels, have been reasonably satisfactory and, in the absence of any unforeseen events and with the abolition of Purchase Tax, I am hopeful that a year hence I may be able to report favourably on the working for the current year."

SUGAR INDUSTRY IN MADHYA BHARAT

STEPPING UP OF CANE SUPPLIES URGED

DESPITE the repeated stress laid on the need for the maximum utilisation of the sugar industry's installed capacity, the progress actually achieved by the sugar mills in Madhya Bharat is none too encouraging. An indication of this is provided by the wide gap that still persists between installed capacity and actual output. The production of sugar in the current (1954-55) season, for instance, is estimated at not more than 280,000 maunds, as against the capacity amounting to 800,000 maunds. Such a low level of output is the result of poor crushing operations following inadequate supply of cane. Thus, during the season under review, the five sugar mills of Madhya Bharat together crushed about 310 million maunds of cane, which represent a bare 37 per cent. of the annual installed crushing capacity of 8.2 million maunds. The duration of the crushing season was very short, being only 50 days.

An explanation for this poor performance is provided by the Madhya Bharat Sugar Mills' Association in a communication addressed to the Chief Minister of the State. The chief factor responsible for the low level of crushing operations by factories is the inadequate supplies of cane. This, in turn, is due to frequent droughts, lack of irrigation facilities to cane growers and paucity of necessary roads for moving cane from fields to factories. The Association has, therefore, urged the State Government to launch a scheme for both intensive and extensive cultivation of sugarcane and to ensure adequate facilities for transport of cane. Otherwise, the sugar mills and the cane growers will, it warns, ever remain at stake. Emphasising our well-known slogan that sugar is produced in the fields and not in the factories, it points out that cultivation of good quality cane to the extent required by the factories, namely, 8.2 million maunds, would mean a payment of about Rs. 1.25 crores to farmers and production of 800,000 maunds of sugar which would make the State self-sufficient, not to speak of the contributions to the State exchequer by way of excise duty, sales tax, etc.

Irrigation Facilities

The Association has drawn the special attention of the authorities to the need for better irrigation facilities and makes the following observations:

" . . . the maximum crush by all the factories together achieved was only 5.50 million maunds of cane in 1948-49, while the total crushing figure is down at 2.17 million maunds in 1952-53 for the five factories, which means that, when the supplies were at the lowest, all the factories crushed only one-fourth of the total installed capacity of 8.22 million maunds. Sugarcane is a crop which needs water all the year round and, to provide adequate supplies of cane to the factories to keep them working, like the sugar factories in U.P., Bihar and other States for at least 120 days, increased irrigation facilities are most imperative. No good will come out of any fertiliser scheme, Community Project, seed improvement scheme, model farms, etc., if the cane grower cannot be assured of water for his crop, especially in the dry summers. Irrigation schemes are already before the Government since long, but we regret to say that, under the Five-year Plan, when by now 75 per cent. of the money which ought to have been spent on them, only 32 per cent. has been spent so far and very little, indeed, in the sugarcane zones. Existing irrigation schemes should be improved and new ones provided for where necessary."

In this connection, the Association has put forward three specific suggestions. First, bunds should be built along small rivers and *nalas*. Such bunds will keep in storage huge quantities of water which will be available to the farmers for growing sugarcane (as also other crops). Secondly, existing wells should be repaired and deepened and new ones constructed. The sugar mills have been informed that the sinking of tube-wells is not possible, because the soil is strong. This difficulty can, however, be got over, if power-boring machines which cut through rocks are acquired. Tube-wells can irrigate very large areas and do not dry up in summer. They have proved a great success in Uttar Pradesh and other parts. Some trial bores can be made in factory areas. Thirdly, pumping sets must be supplied to the cane growers who have no canal irrigation and who grow more than 4/5 *bighas* of cane every year.

The plea of the Madhya Bharat Sugar Mills' Association for provision of increased irrigation facilities is fully justified, considering that irrigation is the most important problem in the hot and dry areas such as Madhya Bharat. Good standing crops of cane, we are told, wither away in hundreds of acres from hot sun and dry wind. This state of affairs is likely to kill the sugarcane crop and with it the sugar industry as well. As the Agriculture Commissioner to the Government of India has rightly stated, in a letter written to the Director of Agriculture, Madhya Bharat, in the agricultural development plans for the State, highest priority should be given to increasing supplies of water in the sugar factory zones. The existing supply of water must also be raised by tapping catchment areas in other *nalas* to store water to the maximum extent during monsoon months for utilisation in the *rabi* and sugarcane seasons.

"Takavi" Loans

The Madhya Bharat Sugar Mills' Association also wants the Government to advance *takavi* loans for purchase of tractor implements, seed-cane, bullocks, and fertilisers and manures. According to it, the present rules and procedure for granting these loans are very rigid and there is a great deal of red-tapism. The delay, it is suggested, can be avoided, if loans are given to cultivators through the sugar mills. This suggestion is based on three considerations. First, the cane growers will get the loans in time and not have to run from official to official. Secondly, the factories are in a better position to see that loans given to cultivators are utilised for the purpose and are repaid in time. And thirdly, because of delays and the urgent need of cultivators, the co-operatives are exploiting the situation; they are advancing loans at exorbitantly high rates of interest—as much as 9 per cent. in some cases.

Besides irrigation facilities and *takavi* loans, the Association urges the necessity for the construction of *pucca* roads from fields to the factories. As regards the provision of improved and good variety seeds, it considers that the cultivator being ignorant to make the right choice, the distribution by the Government on loan basis is desirable. It is suggested that this distribution, too, should be through the factories to selected farmers. Along with seed, a liberal supply of fertilisers and manures is equally important for raising cane yields and improving quality. The Association further suggests introduction of Community Projects in the areas round about the sugar factories and reduction of areas devoted to opium cultivation which lie near to the factories. Another important suggestion put forward relates to the reduction in railway freight on cane. In support of this plea, it observes:

"Rail-borne cane is very costly to the sugar factories in Madhya Bharat, as the same has got to be transported from long distances and dries up in transit. The existing freight charges on sugar-cane traffic are nearly 300 times those prevailing in 1947-48. The transport charges, in some cases, come to as much as As. 10 per maund, as against which a rebate of only As. 2 per maund is allowed by the Government in rail cane price and the rest has to be borne by the factories. It is, therefore, most imperative that the other railway authorities should be requested to reduce the freight rates for Madhya Bharat as a special case or the Central Government should allow more rebate on rail cane, so that the production cost of sugar in Madhya Bharat may not be very high and uneconomic."

Tax Relief

Turning to the manufacturing side of the sugar industry, the Association points to the heavy incidence of sales tax on sugar, which in Madhya Bharat is 12 pies per rupee, as against six pies in U.P. and no sales tax at all on sugar in the neighbouring States of Rajasthan and Bhopal. This, it is said, encourages smuggling of sugar into Madhya Bharat, resulting in loss of revenue to the Government and creating difficulties for the sale of sugar by the mills. It is accordingly urged that the sales tax on sugar be reduced to six pies per rupee. Another important suggestion made by the Association relates to the imposition of a ban on manufacture of *gur* by power-crushers in the factory areas.

Proceeding, the Association requests the State Government to recommend to the Centre that the factories in the State be allowed to sell the 25 per cent. stock of sugar in the free market. Now that stocks of imported sugar lying with the Government are heavy, reservation of 25 per cent. of output is considered to be unnecessary and will only result in loss to factories on account of blocking up of capital and downward trend in prices. The Association also appeals to the State Government not to implement its proposal of establishing a new factory in the Morena area until supplies of cane become more than what are actually required by the existing factories.

Considering the useful role which the sugar industry plays in the economy of Madhya Bharat, the Government should carefully examine all the proposals put forward by the Association and implement them in right earnest. The sugar industry is the second largest industry in the State with the interests of a vast number of agriculturists inextricably involved in it and providing gainful employment to as many as 5,000 workers. The industry also contributes substantially to the Governments—Central and State—in the form of sales tax, cane cess, income-tax, land revenue and excise duty.

CO-OPERATIVE SUGAR MILL AT DEODALI

Of the 12 co-operative sugar mills proposed to be set up in Bombay State in the next few years, one has taken concrete shape. The foundation-stone of the *Rahuri Sahkari Sakhar Karkhana* at Deodali in the Ahmednagar District was laid on Saturday last by Mr. B. S. Hiray, Minister for Revenue and Agriculture, Government of Bombay. This factory has been sponsored by the agriculturists of Rahuri who have already collected Rs. 7.5 lakhs and are trying to collect another Rs. 2.5 lakhs. The State Government will invest Rs. 10 lakhs and the Bombay State Financial Corporation will lend Rs. 40,000. The factory, it is said, commands 3,000 acres of sugarcane plantation from 40 villages. It is expected to go into production next year. The rate of sugar output is estimated at 1,100 bags per day.

In the course of his speech on the occasion, Mr. Hiray stated that the agriculturists had accepted the challenge to start industries on a co-operative basis and the Government had also full faith in the ability of agriculturists. He pointed out that the proposed factory would repay the agriculturists' share amount "within a couple of years." Characterising the co-operative sugar mills as a definite step towards the goal of the socialistic pattern of society, Mr. Hiray said that the profits of the 12 co-operative sugar factories to be started in Bombay would go to 2,400 peasants, instead of to 12 capitalists.

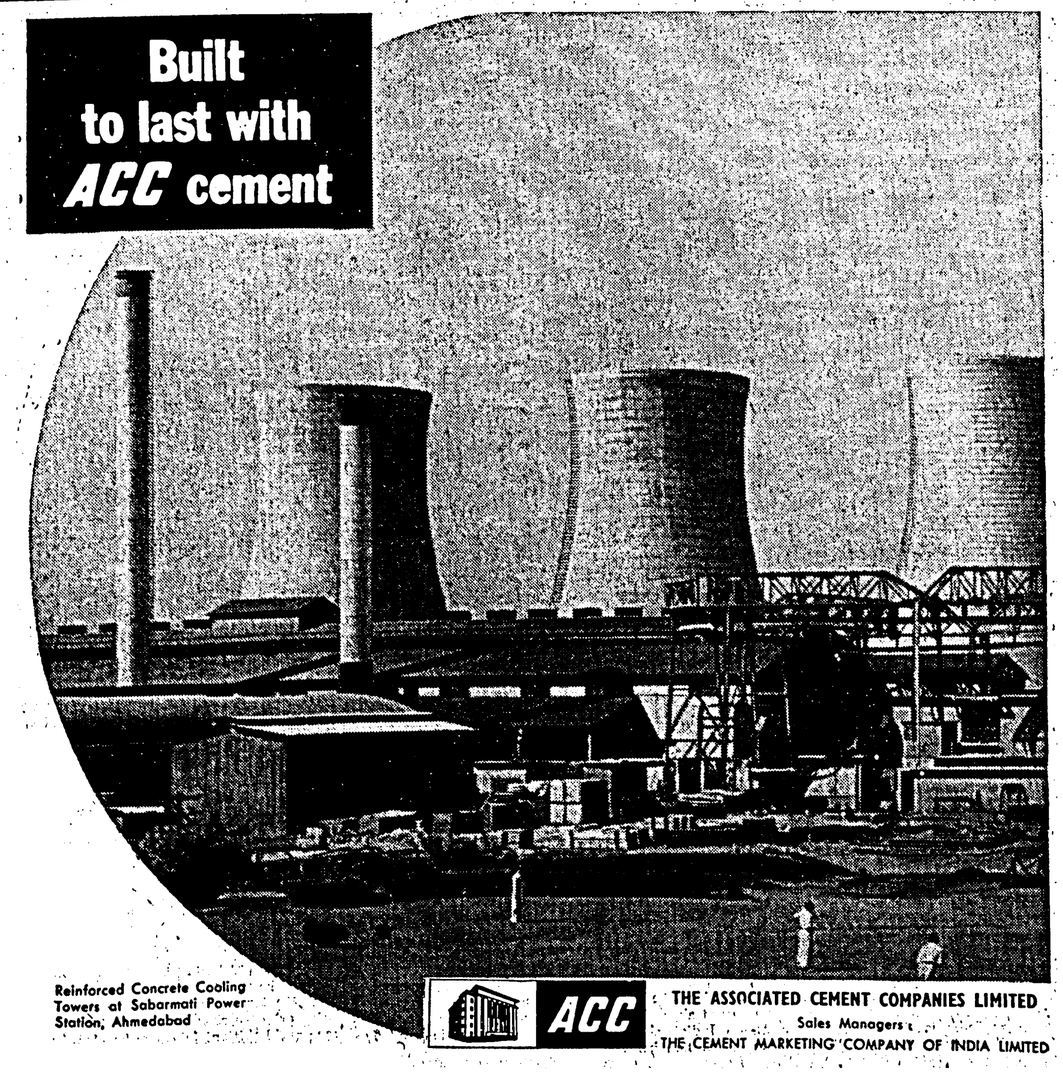
RED ROT OF SUGARCANE

A careful examination of sugarcane setts before planting helps to keep down red rot, according to the Indian Council of Agricultural Research. Cane should be taken from plots specially raised and from where diseased clumps have been removed and destroyed, as a first step towards raising a disease-free crop. Before planting, the cut ends of the cane should be examined, and those showing even a trace of reddening should be rejected.

The field in which cane is planted should also be free of red rot infection. In order to ensure this, agricultural experts recommend that all trash and cane stubbles of the previous crop should be carefully removed and a rotation followed in which cane is not grown for two years subsequent to any serious red rot infection. If some canes are still found infected with the disease, the entire clumps containing the diseased canes should be removed and burnt. If infection is heavy and occurs early, then the field should be ploughed up and the setts and stubbles burnt. The field must be either kept fallow or sown with some other crop. If, however, infection comes late in the season, the crop should be cut and crushed as early as possible. In both the cases, the field should not be planted with cane for some time.

The reservation of a well-drained piece of land for growing sugarcane for seed material is being recommended, largely as a means of getting disease-free crops, by the Indian Council of Agricultural Research. On such a plot, carefully selected seed material should be planted and observed frequently for the appearance of diseases like red rot, smut and other diseases of cane. Whenever a disease is noticed, the affected clump should be removed and destroyed. The quality of seed can also be improved by giving the seed nursery special manurial and cultural treatment. Experience has shown that seed material from such nurseries is superior to that from ordinary fields, and gives a better germination and an even stand of the crop.

The five-man sugar delegation deputed by the Central Government to Australia and Indonesia will be leaving India this week. The delegation is expected to spend about five weeks in all in these countries studying the various steps taken for the proper development of the sugar industry and seeing how far these measures can be applied to India for tackling the problem confronting its sugar industry. The delegation is led by Mr. P. A. Gopalkrishnan, Joint Secretary to the Union Ministry of Food and Agriculture and Chairman of the Development Council for Sugar Industry. The other members of the delegation are: Sardar Lal Singh, M.P., Mr. Madhav Lal N. Pittie and Mr. S. S. Kanoria. Mr. K. P. Jain, Deputy Director (Sugar), is the Secretary of the delegation.



MARKETING OF WORLD COFFEE

LATIN-AMERICAN PRODUCERS' MOVE TO STABILISE PRICES

AT a meeting held in New York recently, the coffee producers of Latin America are reported to have reached an agreement, subject to the approval of their respective Governments, on a scheme for regulating coffee export quotas of producing countries. The object of the scheme is to stabilise the world market in this commodity. According to the scheme, Brazil would be allowed to export 15.35 million bags during the year 1955-56 (beginning on 1st July) and Colombia 5.65 million bags, while fourteen other countries would share the export of 5.25 million bags. The surplus coffee remaining in these countries, it is stated, will be held in reserve until world demand increases. Among these countries, Brazil and Colombia, with their substantial reserve stocks, will have priority in meeting the new demand. It is expected that the Governments of Latin-American countries would approve of the scheme by the end of this month.

According to the June issue of the *Comercio Exteriro de Mexico*, a monthly publication of the Banco Nacional de Commercio Exterior, S.A., the eighth regular general assembly of the Central American-Mexican Coffee Federation (FEDECAME) which met in San Juan, Puerto Rico, in April last adopted unanimously a draft resolution, by which all the fourteen member-countries of the FEDECAME bound themselves to recommend to their Governments the establishment of an agency devoted to stabilise the prices of coffee and prevent violent fluctuations, which upset their production programmes and their economies in general. Besides regulating the surplus stocks, the assembly also assigned the International Coffee Bureau with the task of promoting coffee consumption, making studies of an economic-agricultural character, giving technical assistance and granting financial assistance.

It is not known whether the meeting of the Latin-American coffee producers in New York was independent of the meeting of the FEDECAME at San Juan or a sequel to it. Be that as it may, it is clear that the main coffee producing countries of the world are now taking steps to stabilise the world coffee market. The move on the part of these countries has been spurred by the substantial increase in world production and the steep fall in prices during the latter half of 1954. Further, fears are held that there would be a plentiful world supply of coffee during 1955-56. Brazil's crop is estimated at 17 million bags. The new plantings of the past years are now yielding good crop and the frost affected plants of last year have recovered. This crop, together with the present stock of 5 million bags, may bring about a decline in prices of grave consequence to the economic and political life of the countries for which coffee is the main source of dollar income. For example, coffee accounted for, in terms of value, 95 per cent. of Colombia's exports during 1953, 86 per cent. for El Salvador, 77 per cent. for Guatemala, 68 per cent. for Brazil and 66 per cent. for Haiti. In the case of Mexico, coffee represented only 16 per cent. of its total exports, but it is the second item on the list of its general exports. Any decline in coffee prices will, therefore, affect a very large sector of Mexico's economy as well. For the Latin-American countries as a whole, coffee accounts for 25 per cent. of the value of their total exports. In 1954, it formed 42 per cent. of the U.S. imports from all the Latin-American countries. It thus represents the main source of dollar income for many countries. The earnest attempts that are being made by these countries to stabilise coffee prices is, therefore, quite understandable.

If the scheme is officially accepted, it is likely to be extended and elaborated. The success of the scheme will depend on the effectiveness of the measures envisaged to encourage world consumption. It will also depend on the attitude of other producing countries in Africa and Asia and that of consuming countries, mainly the U.S. It would appear that the Latin-American producers expect some degree of support and co-operation from these quarters. A large measure of co-operation and support is sought from the U.S. which buys more than 60 per cent. of the coffee exported by the world.

So far as India is concerned, it is a relatively small producer, but it still enjoys an important and advantageous position in the world coffee trade on account of the excellent flavour and quality of its coffee. During 1954, it produced a record quantity of 29,500 tons. This, together with carry-over of 7,600 tons from the previous season, made a total supply of over 37,000 tons, the highest quantity in any one year in the history of the Indian coffee industry. The Government permitted a total export of over 10,000 tons during the year which earned over Rs. 7.5 crores, an amount more than the value realised on the sales of 21,450 tons in the internal market. The low price realised on internal sales is due to Government control over distribution and prices. Coffee is the only agricultural commodity to be marketed in India through a statutory board. The Government fixes the prices and the Board arranges marketing within the country at these prices. The quantity and the channels through which the distribution is to be made are also fixed by the Government. The quantum of export is also regulated so as to make available ample supplies to consumers in India at the lowest price possible. A good part of the difference between the world price and the controlled price for domestic consumption is skimmed off by the Government by levying a stiff export duty. India had a large surplus of over 15,000 tons above the home requirement during 1954, which was a year when world price of coffee advanced to over 3½ times the price fixed by the Government of India for internal consumption. The large crop, coupled with the profit made on exports, enabled the producers to more than make good the loss arising from the subsidy to internal consumers.

The prosperous year enjoyed by Indian coffee growers is not expected to be repeated. The current year's output is estimated at no more than 24,000 tons, with the result that the cost of production per ton will be higher, because there has been no fall in expenses. On the contrary, expenses have remained on the high side owing to the increase in wage bill. Taxation, too, has gone up. There has been a precipitous fall in the world price of coffee, the latest quotation from New York for Santos No. 2 being 60 cents per lb. as against 90 cents a year ago and an average of 110.3 cents for 1954. In keeping with this fall, the Government of India has, of course, reduced the export duty on coffee from Rs. 1,250 to Rs. 420 per ton. The subsidy to internal consumers payable by the producer has also been reduced to As. 2. Nevertheless, the profit-margin on exports has gone down to such an extent that the aggregate profits of producers in 1955 will be appreciably down. Viewed against this background, the move made by Latin-American countries to stabilise the price of coffee appears to be a beneficial one for this country.

WORLD CONSUMPTION OF RUBBER

The output of natural rubber in the world during April, 1955 amounted to 132,500 tons, bringing the total for the first four months of the current year to 570,000 tons, according to figures released by the International Rubber Study Group. Consumption in April was 155,000 tons and for the first four months 620,000 tons. Thus, during the first four months of 1955, consumption of natural rubber exceeded production by 50,000 tons. Stocks on 30th April aggregated 775,000 tons, which represented a decline of 65,000 tons from those at the beginning of the year, and were made up of 230,000 tons in producing areas, 370,000 tons (excluding Government-held stocks) in consuming areas and 175,000 tons afloat.

World production and consumption of synthetic rubber during the period January-April, 1955, balanced each other at 327,500 tons. Stocks as on 30th April, were 167,500 tons, a drop of 7,500 tons since 1st January.

(Concluded from next column)

1.5 million bales. But it remains to be seen how far Pakistan will be in a position to increase its exports to other countries. That depends on several factors such as the prices of jute goods in world markets, competition from substitutes such as cotton and paper bags and the ability of jute manufacture outside India to absorb Pakistan jute. At present, the world consumption of raw jute, including India, is estimated at about 9.5 million to 10 million bales. Of this, India's share varies between 5.5 million and 6 million bales.

JUTE ARRIVALS

MILLS USE MORE DOMESTIC FIBRE

FOR the past seven or eight weeks, there has been a growing feeling of optimism that till the arrival of the new jute crop, Indian jute mills need have no anxiety about the supply of raw material. This feeling has been borne out by arrivals of raw jute in Calcutta and mill stations during May, 1955. The arrival aggregated 311,000 bales of which 209,000 bales were of Indian origin and 102,000 bales of Pakistani jute. The total arrivals for the eleven months ended May, 1955, amounted to 5,300,000 bales, as compared with 4,896,000 bales in the same period of the preceding season, namely, 1953-54. The table below gives the trend of raw jute arrivals from Indian, as well as Pakistan sources during the first eleven months of the four seasons ended 1954-55:

Imports of Raw Jute into Calcutta and Mill Stations
(In 000's bales)

July to May	India	Pakistan	Total
1951-52	3,046	1,776	4,820
1952-53	3,805	1,213	5,018
1953-54	3,517	1,379	4,896
1954-55	4,262	1,138	5,300

Two broad trends in the arrival of raw jute into Calcutta and mill stations are revealed by the figures in the table above. First, raw jute supplies from Indian sources have registered a steady increase from 3.0 million bales in 1951-52 to 4.2 million bales in 1954-55, the setback witnessed in 1953-54 being an exception. Secondly, the reverse has been the case with the supplies of raw jute from Pakistan. Thus, arrivals from that country have slowly declined from 1.7 million bales in 1951-52 to 1.1 million bales in 1954-55, though there was a slight improvement in 1953-54. These distinctly opposite trends are due to the different raw jute policies followed by the Governments of the two countries during the past few years. Thus, the desire to be independent of raw jute supplies from Pakistan to the extent practicable made the Government of India encourage cultivation of raw jute in the States suitable for growing this crop on a scientific basis. The first Five-year Plan fixed a target of 4.0 million bales to be reached by 1955-56. Although this target was exceeded in 1952-53 when the crop amounted to 4.62 million bales, it was purely on account of the inducement provided to the grower by the abnormally high prices of raw jute. Accordingly, the performance in that year cannot be taken as normal and must be left out of account. Taking the subsequent years for study, it is seen that the progress made is not unsatisfactory and that the target is likely to be very nearly hit in 1955-56. The crop in 1953-54 was 3.12 million bales; it improved to 3.5 million bales in 1954-55. Current forecasts of the crop in 1955-56 are optimistic and envisage a substantially bigger output than in the season now drawing to a close. It must be mentioned, in passing, that, in laying stress on the need for increased production of jute, India is not unmindful of the fact that it will have to depend upon Pakistan for a sizable supply of superior quality fine jute. India's aim is not to attain self-sufficiency at any cost but only self-reliance.

While thus India followed a policy of expanding production of raw jute, Pakistan took strong measures for curtailing production mainly with a view to boosting the price of raw jute. Further, it wanted to reduce its dependence on India. It, therefore, adjusted its export policy for raw jute in such a way as to increase its exports to the U.K., the Continent and other parts of the world. In the result, the quantities despatched to India gradually declined while those sent to other areas registered a marked improvement as will be evident from the table below:

(In million bales)

	Exports from Pakistan to India	Exports from Pakistan to World
1948-49	3.9	1.7
1949-50	1.6	1.7
1950-51	2.5	4.2
1951-52	1.6	3.2
1952-53	1.5	3.7
1953-54	1.3	3.7

The trends disclosed by the table above are likely to be maintained in the coming years also. With the target for raw jute fixed at 5 million bales to be reached by 1960-61, India's requirements of Pakistani jute may be placed at about

BRITISH INSULATED CALLENDER'S CABLES LIMITED

GROUP TURNOVER MAINTAINED TRADING PROFIT LOWER

MR. W. H. MCFADZEAN'S STATEMENT

THE Tenth Annual General Meeting of British Insulated Callender's Cables Limited was held on 14th June in London, England.

The following is an extract from the statement by the Chairman and Managing Director, Mr. W. H. McFadzean, C.A.

"Immediately after our annual meeting last June, Sir Alexander Roger, at his own request, relinquished the chairmanship and was unanimously appointed our first Honorary President.

"On Sir Alexander's retirement, the Board did me the great honour of electing me Chairman, and it will certainly be my constant endeavour, with the assured loyalty and support of all my colleagues, to justify the confidence placed in me.

"Following my appointment as Chairman, Mr. D. W. Aldridge was elected Deputy Chairman and, at the request of my colleagues, I accepted the position of Managing Director.

"Although the turnover of the Group has been maintained in total, profit on trading has fallen by £981,494 to £7,362,580, almost wholly due to lower profit rates. Many factors have contributed, but the two most important have been the uneven load and intensified competition.

"The falling off in demand in the first part of 1954 largely applied to home business, but the competition thus engendered was even more intensive throughout the whole year in export markets.

"Following the fall in trading profit one would have expected a decreased charge for taxation. This charge is, however, little altered at the immense sum of £2,736,162, as the benefit of the decreased tax payable this year following the lower profits, has, from a comparative point of view, been offset by the special credits brought into the 1953 accounts from (a) excess profits levy refund, and (b) the release of taxation provisions made in earlier years following settlement on several major outstanding points.

"Total assets now amount to almost £65,000,000 with reserves of one and one-half times the issued capital.

Copper

"As one of the largest fabricators of copper in the world the B.I.C.C. Group are vitally concerned with the supply and price of that metal. The supply position in this country during 1954 was normal, but the price increased substantially over the year and there were many wide fluctuations from day to day.

"The problem of introducing greater stability into the copper market is continuing to receive the active consideration of many parties. I hope in the interests of the country and the industry an early solution will be found.

"At home, we have fully maintained the overall level of business done with the various nationalised industries and the numerous industrial concerns and individuals who have all been our good customers for so many years.

"Conditions in the export field are certainly difficult, for in addition to competition, import into many countries is restricted through shortage of finance and/or the development of local manufacture. We are, however, making every endeavour to overcome all difficulties and more and more are attacking overseas markets by a Group effort.

"As stockholders know, our interest in overseas markets is a dual one, as, in addition to exports from this country, we have many substantial investments in manufacturing companies abroad.

"In Australia, all the companies in which we are interested, with one exception, showed improved results for 1954 and we are now starting to obtain the benefits of establishing B.I.C.C. (Australia) Pty. Ltd. to co-ordinate many of our activities there.

"Our new Canadian company, Phillips Electrical Company (1953) Ltd., had an extremely difficult year, for although turnover was maintained, competition was even fiercer than is usual in that country.

"The Indian Cable Company had another successful year, although profits were lower, mainly due to difficulties regarding copper supplies and lower profit rates.

"Although smaller than the three investments just mentioned, our holdings in manufacturing companies in New Zealand and South Africa—both of which had successful years—are of importance to us. In Pakistan, we look forward to the early start of operations in the factory in which we and certain other companies in this country are interested together with Pakistan nationals.

"During 1954, we made an important new investment overseas when we undertook to subscribe one-third (£1,000,000) of the ordinary capital of Ndola Copper Refineries Limited, the remaining two-thirds being subscribed by Roan Antelope Copper Mines Ltd.

"More and more products previously manufactured in Britain are being manufactured overseas and your Board are convinced that their policy is right in taking substantial financial and other interests in such overseas companies, and operating in growing partnership with the nationals of the countries concerned. But it must be emphasised that this is essentially a long-term policy, the full benefits of which will only accrue gradually.

Some Interesting Orders

"From Australia the Electricity Commission of New South Wales have ordered a further 17 miles of 132,000-volt 3-core impregnated gas pressure cable, a gratifying follow-on to the recently commissioned Rozelle-Homebush 132,000-volt contract which we carried out last year. In Queensland, we are supplying some 31 miles of aluminium sheathed I.P. cable to Brisbane City Council. This extensive development of their 33,000-volt network represents a bold engineering use of the technical and economic advantages to be obtained with our latest high-voltage cable techniques.

"In India, we have received an order for the supply and installation of some 9½ miles of 3-core 110,000-volt I.P. cable for the Tata Power Company in Bombay—the first pressure cable and highest voltage cable ever to be installed underground in India.

"We are supplying Portugal with their first 33,000-volt I.P. cables, and an 8-mile feeder is being laid for the Lisbon Tramways.

"In Porto Alegre, Brazil, we have just completed the first I.P. cable system to be laid in South America, while in Canada the Hydro Electric Power Commission of Ontario awarded us a contract for 115,000-volt oil-filled cables. A repeat order has since been received from this Canadian Authority.

"From New Zealand we received a contract for the supply and supervision of installation of 82½ miles of 4-tube coaxial cable.

Railway Electrification

"The B.I.C.C. Group, and in particular the Parent Company and our Construction Company, has played a leading part in the electrification of the world's railways.

"Electrification of many more of the railways of the world is only a matter of time. Increasing loads and traffic, public demand for clean, fast transport, together with the necessity for economy in operation and conservation of fuel supplies, all point to this conclusion.

"As a Group engaged in a field which is becoming more and more technical, we place tremendous importance on research and development. 1954 has witnessed a further expansion of our activities under both these heads.

"Intensive research work has continued into the basic properties of some of our most important raw materials with promising results.

"Further progress has been made in the direct extrusion of aluminium.

"One of the most interesting series of techniques on which marked progress has been made is that resulting from the establishment of a laboratory for radio activity studies. Some of the revolutionary developments achieved in this sphere have already been introduced with advantage into our production processes.

"We have made a good start to 1955 and, in the absence of exceptional happenings, I feel we can look forward to a satisfactory year."

NEW PRODUCTS AND PROCESSES

Preparation for Asphalt Road Construction

A CHEMICAL works (Chemische Fabriek F. Bloemink, Abeelenlaan 12, Bennebroek, Holland), has developed a preparation which opens up the possibility of working up bituminous binders in road construction also during wet weather and with wet stone chippings. Moreover, this agent retains its preventive effect against the influence of water when the road carpet is in use. The preparation can be applied undiluted or in a solution of, preferably, creosote oil. If undiluted, 1.5 to 2 per cent. of the preparation is added to the binder within six hours before spraying takes place. In the other case, two procedures can be distinguished: pretreatment of the mineral aggregate with a 5 per cent. solution or vaporisation of such a solution over the freshly laid tar or bitumen coat. In the pre-treatment about 4 litres (0.9 gal.) of the solution is mixed with 1 ton of chippings; in the case of vaporisation, 3.6 litres (0.8 gal.) is sufficient for treating a surface area of 100 sq. metres (1,075 sq. ft.). In both cases very good adhesion is obtained with various types of aggregate. The preparation has been tested by the Road Research Laboratory at Harmondsworth, Middlesex, and, on the strength of the results, has been included in the list of *surface active-agents for use in surface dressing.*

Welding Lamps

An incandescent lamp factory (Philips' Gloeilampenfabrieken N.V., Eindhoven, Holland) produces a lamp which is specially suitable for use in welding, during which process it frequently happens that glowing metal particles flying about hit the glass wall of a lamp, causing breakage. The globe of this special welding lamp is provided with a transparent silicon lacquer, which, so to speak, smothers the welding sparks in the surface coat and prevents them from touching the glass wall. It is, therefore, possible to install adequate, local lighting also close to the welding site. The lamps are supplied in capacities of 60 and 100 watts, in reinforced designs. For welding operations in boilers and the like, for which special specifications apply as regards the maximum voltage for portable lamps, welding lamps are made in the same capacities, but for 24 volts.

Ultra High-speed Photography

While the use of image converter tubes as shutters for ultra high-speed cameras is now an established practice, circuit limitations have in the past fixed the lower limit of exposure at about 30×10^{-9} seconds. In this type of system, the image of the object to be photographed is focused on the sensitive photo-cathode of the tube. A duplicate image can then be made to appear at the opposite end of the tube when an electric current is applied. To photograph fast transient phenomena, the tube is switched on by voltage pulses synchronised with the phenomena, the actual photographic record being made by an ordinary camera at the viewing end of the tube. A co-axial pulsing system developed by Mullard Ltd., (Century House, Shaftesbury Avenue, London, W.C. 2) is said to enable the exposure time to be reduced ten times, that is, to 3×10^{-9} seconds.

Oil Refining Catalyst

A new, cheaper and more efficient catalyst for oil refining has been developed out of kaolin by its researchers, claims the Minerals and Chemicals Corporation of America. The catalyst has already been placed on the market by the Company. The Company has set on foot a programme of developing from plentiful natural resources low-cost substitutes for often costly synthetic chemicals. It owns substantial deposits of kaolin in Georgia, and envisages that catalysts from the material can replace silica gell, which sells for about $300 a ton. Two developments were neqessary before the step could be taken. A method of purifying the kaolin had to be worked out, and then of converting it into pellet form. The pelletised kaolin has now been used in refineries incorporating the so-called Houdry process. Houdry owns patents on kaolin as well as other types of catalysts, and Minerals and Chemicals has taken out licences in connection with its new application. Capacity for the new catalyst is now being completed, with the construction of a $5 million factory. This should be finished by the autumn. The Company is building a new research centre, at a cost of about $1 million. Previously the Company was developing its kaolin resources for paper coating processes.

Synthetic Diamonds

Following the recent announcement by the General Electric Company of a process for the making of synthetic diamonds, a Swiss biophysicist and a Puerto Rican chemist are now reported by a leading New York newspaper to have had similar success. The biophysicist is Dr. Leandro Tomarkin, and the chemist is Mr. Mario Vilella. Their experiments have been conducted over the past five years in a barn at Spring Valley, N.Y. Their company, the Vitron Research Corporation, has one patent approved and five pending. The patent is for a mobile furnace used in the production process with a 300-ton hydraulic press, it is reported. The furnace consists of a cylindrical aluminium tube, in which carbon for treatment is placed. It is lined with heat-resisting powder. There is a terminal for the introduction of electricity that provides the heat. Pressure is applied of 250,000 lbs. per square inch, while temperatures of 6,000 degrees are also applied. Diamonds produced are said to range from one-hundredth to one-three hundredth of a carat. The producers of them hope to be able to sell industrial diamonds within two years for between $1 and $1.75 a carat, compared with a current U.S. price for natural industrial diamonds of $2.75 to $3.75 a carat.

UNITED INDIA LIFE ASSURANCE COMPANY, LIMITED

MR. N. RAMA RAO ON THREAT OF NATIONALISATION

IN moving the adoption of the accounts for 1954 of the United India Life Assurance Company, Ltd., the Chairman, Mr. N. Rama Rao, B.A., B.L., referred to the phenomenal increase in the prosperity of the Company on all fronts during the year with new policies issued amounting to Rs. 5.30 crores as against Rs. 3.80 crores in the previous year, the first year's premium income to Rs. 27.75 lakhs as against Rs. 21.48 lakhs, renewal premium to Rs. 1.13 crores as against Rs. 1.01 crores. Income from interest amounted to Rs. 31.89 lakhs as against Rs. 23.73 lakhs, the life assurance fund to Rs. 8.77 crores as against Rs. 6.49 crores and the expense ratio decreased to 14.75 per cent. as against 15.51 per cent. in the previous year.

Reduction in Premium

The great increase in new business was in the main responsible for such gratifying results and this increase in new business was due to the reduction in premium rates brought out by the Company along with others in March, 1954. Expansion of new business and its spread to additional sector of the public has more than silenced the critics who were sceptical of the wisdom of the reduction. To some extent, the phenomenal increase in new business of Indian insurers was due to the re-entry of old business at new rates of premium. But so far as the United India was concerned, such increase was a genuine one, not the result of any artificial process of rewriting old business.

Staff Insurance Scheme

Along with the reduction in premium, vigorous pursuit of what has come to be known as staff insurance scheme has made substantial contribution to the increase of new business by bringing in persons who would not have otherwise been persuaded to effect the protection to their dependants which they did. Controversy over the wisdom of staff insurance is still active and it has been objected to on the grounds: (1) it cuts the agents; (2) it discriminates between policyholders; and (3) smaller insurers are placed at a disadvantage in competition for such business. The Executive Committee of the Life Insurance Council is still considering the matter but Mr. Rama Rao saw no objection to the same. Not only that but it was bound to enlarge the scope of life assurance among office and industrial workers.

Future of Life Assurance—Rural Uplift

With the rapid development of the economy of the country under the successive Plans, Mr. Rama Rao said, the scope for the spread of life assurance in the country was very great, with improvement not only in quantity but also in quality. In extending the market and in extending the services and increasing the urge to save for the future, trained life assurance men could and must play a worthy part. The need for their services would be particularly great in rural areas where life assurance had not yet spread. The Five-year Plans with the Community Projects and National Extension Board were also directed to give a new orientation to village life, the backbone of our country for ages. It is necessary, Mr. Rama Rao felt, that life assurance companies should have a plan to cope with this new need and new opportunities that will arise as the rural areas regain their prosperity.

Group Insurance and Group Pension

With the rapid development of industrialisation there will be demand in urban areas for what is known as group insurance under which employers effect policies on the lives of all their employees for the benefit of the employees with or without contribution from the employees. In the United Kingdom and more so in the United States quite a big share of new business underwritten in villages is of such type. Without going into further details, Mr. Rama Rao was of opinion that here was a field which promised great scope for expansion.

Nationalisation

It was impossible, Mr. Rama Rao felt, to conclude any survey of the present trend of life assurance in India, without referring to the threat of nationalisation which was being freely discussed. It was known that this matter was being considered at the departmental level and the Prime Minister recently announced that the nationalisation of banks, mines and insurance would be considered at the proper time. Mr. Rama Rao wondered what could be the purpose of nationalisation. The efficiency of insurance service depends on the keenness of healthy competition and its success depends on the initiative and drive in its day-to-day working. Could a Government department under its official institution, its standardised methods and its inseparable nexus with red tape, ever be expected to do this satisfactorily? So long as there was no complaint that could be urged against private enterprise, it would be inexpedient to nationalise the insurance industry in the country.

Satisfactory Results of Latest Valuation

Before concluding, Mr. Rama Rao referred to the valuation that was done as at 31st December, 1954, the results of which were just then available. The report would soon be circulated to the shareholders but it was permissible for him to say that the results were so satisfactory that the Actuary recommended grant of bonus at the following rates:

Rs. 17 per thousand per annum on whole life policies and Rs. 15 per thousand per annum on endowment policies.

These rates of bonus were substantially higher than those declared within the recent past and it was a matter of gratification for him that these results were possible with strict adherence to all the considerations which characterised their previous valuations specially with regard to the maintenance of the rate of bonus in future valuations.

CONVERSION OF "ORIENTAL" INTO A MUTUAL OFFICE

SHAREHOLDERS APPROVE SCHEME

As readers of *Commerce* are no doubt aware, the management of the "Oriental"—or to give the Company its full name, the Oriental Government Security Life Assurance Company, Ltd.—the pioneer insurance office in the country, has been making strenuous efforts to convert the Company into a mutual office. The Scheme for mutualisation of the Company was approved at the extraordinary general meeting of shareholders of the Company, held on 15th June, 1955. The next step in the evolution of the Company into a mutual office is to obtain, as provided in section 6C of the Insurance Act, 1938, the consent of the Central Government for the Scheme. When such approval is obtained, the Scheme will come into effect. The section, however, provides that an aggrieved person, who may be either a policyholder or a shareholder, may, within 90 days of the sanction of the Scheme, prefer an appeal to the High Court, the decision of which will be final and binding on all the persons concerned. It remains to be seen whether the Scheme will be challenged by any person. When the Scheme was in a formative stage, some policyholders had protested to the Union Finance Minister informally against it. They had even formed themselves into an action committee, but not much has been heard from these quarters in recent months. Whether they are lying low pending the Government's formal sanction of the Scheme or have given up the fight as being useless is a question for which time alone can provide the answer.

Briefly, the Scheme provides that the Mutual Company should issue to the holders of 3,000 shares of the face value of Rs. 200 each of the present Company, 3,000 debentures of the face value of Rs. 8,800 each with interest at the rate of 4 per cent. per annum. Thus, every shareholder of the Company will receive one debenture in the Mutual Company for every one share held by him. The face value of Rs. 8,800 fixed for each debenture, according to the Directors, represents a "proper and equitable" figure as between the shareholders, on the one hand, and the policyholders, on the other. This figure, it has been stated, has been arrived at by capitalising at a fair rate of interest the approximate dividend which the shares would earn in future out of the 7½ per cent. of the annual surpluses which are likely to be disclosed from time to time at future triennial valuations of the Company. Further, in arriving at the figure, the Directors have taken into account the business written by the Company at present, "its future likely prospects" and all other relevant factors.

Limited by Guarantee

Since a mutual company is one in which only and all the policyholders have to be members, the Scheme provides that all the policyholders of the present Company, as well as the policyholders of the Mutual Company, will become members of the latter Company. Again, as a mutual company is one that is limited by guarantee, the policyholders of the Oriental Mutual will give a guarantee to the extent of a nominal figure of one rupee. The Scheme further provides that, until the debentures have been redeemed, the debenture-holders will have the right to elect debenture-holders' directors to the Board of the Mutual Company. The number of such directors will, at the outset, be five out of a board of 12 directors, but will go on dwindling until all the debentures are paid off.

Commending the resolution for conversion of the Oriental from a shareholders' concern into a mutual office to the acceptance of the shareholders at their extraordinary meeting, Sir Cowasjee Jehangir, Bart., Chairman of the Company, averred that it was but "appropriate" that a purely life insurance company should, at some appropriate point of time, belong to the policyholders only and be solely managed by them. He added that he did not, however, suggest that the share capital did not perform any function. Such capital was necessary in some stages of the company's life, for, "if anything untoward happens to the company before a sufficiently large number of persons have effected policies with the Company and contributed to the funds of the Company, it is the share capital that provides the guarantee for solvency and creates the confidence in the institution for the incoming new policyholders as also the existing ones."

The importance of the share capital of an insurance company generally diminishes in proportion to its growth. Explaining this aspect of the financial structure of a company, Sir Cowasjee said:

"As and when a life insurance company grows in size, the functions performed by the share capital, although very important and indispensable, gradually diminish. For instance, in the case of your own Company, going back to the figures disclosed by the valuation as at 31st December, 1951, as the latest figures relating to the valuation as at 31st December, 1954, are not yet in hand, the policy liabilities amounted to the figure of approximately Rs. 60 crores, whereas the value of the assets of the life assurance fund amounted to approximately Rs. 63 crores, providing a comfortable margin of Rs. 3 crores. This shows the very large cushion provided by the life assurance fund itself against any chance of the shareholders being called upon to defray any amount to put the Company in a position of solvency."

Proceeding, Sir Cowasjee observed that, in economically advanced countries, institutions comparable to the Oriental took similar steps, in accordance with the laws of their respective countries, and converted themselves into mutual companies. He added that the Directors felt that a stage had been reached when the share capital of the Company should be paid off and the Company converted into one which the policyholders alone managed. He reiterated that, in arriving at the value of each share, "strict equity" between the claims of policyholders and those of the shareholders had been maintained. He further stated that the policyholders' directors, who had given "very great" consideration to the Scheme, were satisfied that it was fair both to the policyholders and the shareholders.

Cynics May Not Agree

The argument advanced by Sir Cowasjee for justifying the conversion of the Company into a mutual office sounds novel to us but very convincing nonetheless. This is a unique example of the shareholders of a very successful concern, with bright prospects ahead, voluntarily giving up their right of ownership in favour of those who were being served by them. In making this comment, we are quite conscious of the reception it will have at the hands of a cynic. And, in this case, there are quite a few cynics. The cynics will no doubt jeer at our remark. For they consider the whole move as a clever device on the part of the Directors and the influential shareholders of the Company to safeguard their interests in view of the serious threat of nationalisation of insurance companies. A cynic, of course, can never be convinced, but, unfortunately for us and the Directors of the Company, the present circumstances are such that to a layman the cynic's explanation may sound more convincing than the one offered by Sir Cowasjee.

When the Scheme comes into effect, the ranks of mutual insurers in India will have been greatly strengthened, because of the large magnitude of the Oriental's business. It may be noted, in this connection, that, out of the total life business in force of Rs. 962 crores at the end of 1953, the share of the Oriental was as much as Rs. 207 crores or 21 per cent. If the business in force belonging to Indian life offices alone is taken into account, the share of the Oriental is as much as 25 per cent. Incidentally, the Oriental's conversion might inspire many other insurance companies also to join the ranks of mutual companies. It remains to be seen whether such a trend will induce the Government and certain political groups to refrain from harping upon the advantages of State-ownership of insurance.

BRITISH INDIA GENERAL

An increase of Rs. 3.43 lakhs in the net premium income of the general departments in 1954, as compared with the previous year, is disclosed by the report and accounts of the British India General Insurance Co., Ltd. (General Manager: Mr. M. S. Dastur, Bombay) for the year ended 31st December, 1954. A noteworthy feature of the Company's working is that all the three departments, namely, the fire, the marine and the accident and general, participated in the increase in net premium income. The new life business increased from Rs. 72.01 lakhs in 1953 to Rs. 97.82 lakhs in 1954. The improvement in the activities of the Company has encouraged the Directors to recommend a slightly higher dividend of Re. 1-2 per share or 11¼ per cent. as against Re. 1 per share or 10 per cent. paid last year.

The British India General is a composite office, transacting life as well as general business. Its branches are located in all principal towns in India and Pakistan and it has either branches or representatives in Malaya, Burma, Ceylon, Egypt, East Africa, France and the U.K. It has a growing foreign business which, in 1954, brought Rs. 29.53 lakhs of net premium income to its general departments, as against Rs. 26.04 lakhs in the previous year.

The fire section continues to be the mainstay of the general department. The net premium income in this section amounted to Rs. 33.56 lakhs, as against Rs. 32.77 lakhs in 1953, while net losses amounted to Rs. 10.60 lakhs (31.59 per cent.) as against Rs. 11.04 lakhs (30.70 per cent.) in 1953. Besides the customary allocation of 40 per cent. of the net premium income, an additional reserve of Rs. 4.20 lakhs, as against Rs. 4.10 lakhs last year, has been provided. The underwriting profit in the fire department amounted to Rs. 3.71 lakhs, as against Rs. 3.79 lakhs in 1954.

In the marine section, the net premium income improved from Rs. 6.14 lakhs to Rs. 6.87 lakhs. Claims paid and outstanding, were slightly higher at Rs. 3.90 lakhs, as compared with Rs. 3.30 lakhs disbursed in 1953. Reserves for unexpired risks have been provided at 40 per cent. of net premium income. Additional reserve accounts for Rs. 4.46 lakhs, as compared with Rs. 3.99 lakhs in 1953.

The net premium income in the accident and general departments moved up from Rs. 18.97 lakhs in 1953 to Rs. 20.88 lakhs in 1954. Claims, paid and outstanding, increased by Rs. 1.17 lakhs to Rs. 8.57 lakhs. Besides the 40 per cent. reserve for unexpired risks, an additional reserve to the tune of Rs. 2.92 lakhs has been created.

New life business, as already stated, advanced from Rs. 72.01 lakhs to Rs. 97.82 lakhs. The total life business in force, at the end of 1954, was Rs. 2.51 crores which brought a net premium income of Rs. 12.24 lakhs. The net interest yield improved from 3.33 per cent. to 3.43 per cent. The total business in force at the end of 1954 in the Company's closed life account was Rs. 53.08 lakhs.

The underwriting profits in the Company's general department, together with income from interest and dividends (Rs. 1.76 lakhs) and other sources, yielded a total of Rs. 6.58 lakhs. After providing for certain expenses (not applicable to any particular account) and certain other sundry expenses, the balance available for appropriation is Rs. 6.06 lakhs, which together with Rs. 1.24 lakhs brought in, amounts to Rs. 7.30 lakhs. Provision has been made for taxation (Rs. 2.15 lakhs), reserve for bad and doubtful debts (Rs. 40,000), life assurance current revenue account (Rs. 25,000), general reserve (Rs. 50,000), exchange reserve (Rs. 5,000), reserve for equalisation of dividend (Rs. 25,000) and contingencies reserve (Rs. 62,500). The payment of the dividend at Re. 1-2 per share (11¼ per cent.) will absorb Rs. 2.25 lakhs, leaving Rs. 82,590 to be carried forward.

The Company's financial position is strong. Besides a capital of Rs. 20 lakhs, it has reserves and funds aggregating Rs. 1.11 crore, of which fire fund accounts for Rs. 17.62 lakhs, marine fund for Rs. 7.21 lakhs, accident fund for Rs. 11.28 lakhs, life fund (closed account) for Rs. 30.37 lakhs and life fund (current account) for Rs. 24.92 lakhs.

INDIAN TRADE AND GENERAL

By adopting a policy of conservative underwriting and building up of reserves, the Indian Trade and General Insurance Company, Ltd. (General Manager: Mr. T. M. Sturgess, Calcutta), has been able to show a creditable record of progress over the 11-year period since its inception in 1944. During the year ended 31st December, 1954, the net premium income of this general insurance office advanced to Rs. 57.11 lakhs, from Rs. 51.58 lakhs in the previous year. The Directors have recommended the maintenance of the return to shareholders at 3¾ per cent.

The Company has been consistently strengthening its reserves and funds year by year as the following table, setting forth its progress over the 1944-54 period, will show:

(Rs. in lakhs)

	Net Premiums	Reserves	Funds	Total assets
1944	2.81	1.47	25.45	26.60
1945	4.60	2.72	28.26	28.82
1946	8.18	4.02	29.59	33.87
1947	12.07	7.47	31.59	38.70
1948	15.55	10.43	34.55	45.47
1949	21.12	14.04	38.15	50.75
1950	24.66	15.50	39.58	56.58
1951	29.50	19.81	43.02	68.03
1952	40.53	28.12	53.13	77.92
1953	51.58	35.22	60.22	82.33
1954	57	45.30	66.37	87.19

In the fire department, the net premium income advanced from Rs. 25.97 lakhs to Rs. 27.67 lakhs. Net claims, paid and outstanding, amounted to Rs. 10.92 lakhs or 39.5 per cent. of the premium income as against 46.4 per cent. in 1953. This welcome reduction in the loss ratio, it is stated, was entirely accounted for by the greatly improved experience of the Company's Indian business. The Chairman of the Company, Mr. Karam Chand Thapar, observes, in the course of his statement accompanying the report and accounts, that, in view of the number of fires reported in the first few months of the current year, it is unlikely that the favourable experience, witnessed in 1954, will be repeated in 1955. Commission and expenses amounted to Rs. 12.63 lakhs. The reserves for unexpired risks has been maintained at 50 per cent. level. The underwriting profit amounted to Rs. 3.25 lakhs as against Rs. 2.47 lakhs in the previous year.

The net premium income in the marine department moved up from Rs. 16.57 lakhs in 1953 to Rs. 18.80 lakhs in 1954. The loss ratio in this department was higher at 60.1 per cent., as against 53.6 per cent. in 1953. Commission and expenses, at Rs. 5.06 lakhs (26.9 per cent.), were, however, lower than in 1953 when they amounted to Rs. 4.87 lakhs (29.4 per cent.). The reserve in this department has been maintained at 90 per cent. level. It

THE KOYNA PROJECT

The commencement of work on the Koyna Project is fulfilling a cherished dream of Industrial Maharashtra. Erection of the grand Koyna Dam and the Electric Power House will irrigate thousands of acres of land and supply cheap power to mills and factories.

The Koyna Project is one of the important undertakings in the Five-Year Plan and Crores of Rupees will be spent on it. It is for the people to economise and create capital to finance such Projects and Industries. THE BANK OF MAHARASHTRA LTD. is always ready to help you to utilise your savings properly, benefiting yourselves and the nation.

PRIVATE LIMITED COMPANIES

A CASE FOR THEIR ENCOURAGEMENT

By R. A. P. Misra, M.I.Prod.E. (London), A.F.R.Ae.S.

MANAGING DIRECTOR, INDIAN WILD-BARFIELD CO., LTD.

IN a relatively undeveloped country like India, the financial resources of the Governments, both Union and States, must be greatly increased if they are to provide a decent standard of such primary necessities as good roads, education, communications, irrigation, power, canals, etc. The welfare State will cost even more and that not merely in terms of finance as this will have to be backed by goods and services if an inflationary situation is to be avoided. Amongst thoughtful people, whatever their polico-economic views, there is no divergence of opinion about the objective of greater economic development, which will lead to greater employment and an improved standard of life for the people.

From here onwards, there is a divergence of opinion as to the best and quickest method of achieving this desirable state of affairs. The protagonists of private enterprise maintain that a rapid rate of economic progress would follow, if the State were to create conditions in which private enterprise could develop with confidence in its future and not be regarded as a nuisance to be tolerated until it can be conveniently absorbed by the State. The advocates of the public sector maintain (and they are often more vocal) that private enterprise has been tried and found wanting and at least in this country it cannot by itself achieve the rate of economic progress that is desirable. Whether this criticism is justified or not, or whether the rate of economic progress aimed at is practical are matters of opinion. It is, however, a fact that there has been an increase of approximately 40 per cent. in the industrial production during the last five years and most of it has come from the private sector. The rate of economic progress envisaged in the first Five-year Plan by the Planning Commission also aimed at a fairly modest target and this has been substantially met.

The Taxation Enquiry Commission's report is now published. There can be no doubt that this monumental work which will form the basis of Indian taxation policy during the years to come is the result of much conscientious labour by the eminent members of this Commission. Whatever opinions one may hold about the various recommendations made by the Commission, all who are interested in the economic progress of this country owe the members and staff a debt of gratitude for a fine job of work done. The planning, the execution of the enquiry and the logical clarity with which the report is presented, with a summary of the conclusions reached and recommendations made, deserve high praise. In fact, we can all justifiably feel proud that a job of this magnitude was done with such efficiency and speed with an all-Indian personnel without any outside help.

Incentive Aspect

One cannot, however, help feeling, after studying the section dealing with the taxation of private limited companies (section XI, Vol. II), that the Commission's recommendations appear to be influenced more by the desirability of reducing the disposable income of wealthy shareholders, than by the need for encouraging the formation of small and medium size industrial and commercial units for which this form of organisation is particularly suited. Although, in fairness to the Commission, it must be stated that they have tried to encourage the formation of small public companies, it will be difficult to do this for reasons stated later. The Finance Minister has also lost no time in giving effect to some of the recommendations made for tightening up section 23A provisions governing these companies and other companies in which the public are not substantially interested. In some respects, Mr. C. D. Deshmukh has gone even beyond the recommendations of the Commission. This has been undoubtedly done with the idea of catching the big fish in the net of super-tax, which in the past cleverly escaped by retaining the profits in the company. It would not be true to say that the private limited company system has not been used, in a few cases, by wealthy individuals as a device for reducing their super-tax liability. But at the same time it would be true to say that, in guarding against one possibility which might arise only in a few cases, the law has now been altered in such a manner as to adversely effect the growth of a large number of small and medium genuine enterprises. In other words, the net cast out to catch the big fish has also caught within its meshes a lot of small fry. It will be idle to deny that a great gulf does not exist between the rich and the poor in this country but this is a feature of all industrially undeveloped economies and is not something peculiar to India. As industrial and economic development takes place this gap will tend to narrow, as it has in other industrially advanced countries like the U.S.A. and the U.K. It is not that our rich are so rich, as compared with other countries with a free economy, but that our poor are so miserably poor which makes for this striking contrast. It would surely be a more laudable objective to improve the living standards of the poorest section of our population than to liquidate the rich by subjecting them to extremely severe taxation.

According to 1952-53 income-tax returns, there were only 550 assessees in India in the top super-tax group, with net incomes over Rs. 5,000 *per month*. The total tax demanded from them amounted to approximately Rs. 11 crores, assuming an effective rate of taxation of about 70 per cent. of their income. This only gives them a net income of about Rs. 4.25 crores. Those who enthusiastically talk about eliminating the rich altogether should realise that this income, equally distributed amongst our population of about 36 crores, will mean an increase of about two annas per head per year, which will not materially benefit even the poorest of our citizens. This, of course, leaves out the super-tax payers in the lower brackets, but even if this income is completely expropriated, and distributed amongst the population, it would not make a material difference to the *per capita* income. It may, perhaps, mean an addition of another five to six annas per year. So much for the alleged advantages of eliminating the rich by taxation. Whatever other advantages and disadvantages this may bring, it would certainly not materially help the industrial or economic development of this country; the opposite is more likely.

The Private Limited Company

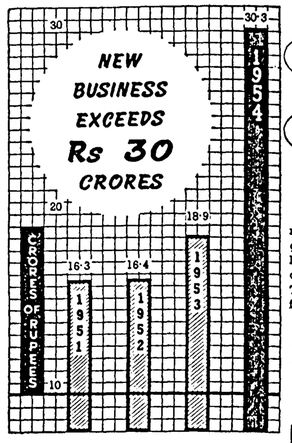
What it is or should be?

(1) It is a device to be used for the systematic pursuits of a small or medium-scale industrial or commercial enterprise.

(2) It is often used by a man with initiative, a new idea or an invention, to develop it. If, as often happens, he does not have the necessary financial resources to commercially exploit it himself, he may approach friends or acquaintances with resources who may be willing to back him up by investments of amounts which limit their liability to the amount of their investment.

(3) Such ventures would otherwise be conducted as partnerships or proprietary concerns, but both these forms of business organisations have certain features which act as a disincentive to investment and enterprise. Proprietary concerns require a good deal of capital and credit is not easily available, unless complete security can be provided to the creditor, and that too sometimes at uneconomic rates of interest. Partnerships are even worse, as, unless they are entered into between persons who can always amicably work together during a lifetime, there is the added risk of the partners falling out, often leading to the ruination of the business. It sometimes happens that the working partner who has provided the idea and the technical know-how is elbowed out by an unscrupulous financial partner or *vice versa*. All this leads to a great deal of instability in Indian business which is not a desirable state of affairs.

There are many industrial and commercial enterprises, which are too small to warrant their conversion into public limited companies, as their capital requirements and scale of operations are comparatively small, and can be met without public subscription. By extending the principle of limited liability to such undertakings, the formation and systematic running of relatively small units is considerably facilitated. A public limited company has to comply with a large number of legal requirements which are necessary to protect the interest of the investing public. In order to conform to all these requirements, and to deal with the share transfers, which are always taking place when the shares of a company are quoted on the stock exchanges, it will be necessary to have a staff which a small company cannot easily afford. It is, therefore, only right that the business of running a private limited company should not be made unneces-



RECORD RETURNS FOR 1954

sarily complicated. There are already enough complications by way of sales tax, inter-State sales tax, labour legislation, local regulations, etc., to make the job of running a company almost a nightmare with the limited staff which such a business can afford to employ. The Government should not add to their difficulties by following an unrealistic tax policy.

Many Real Benefits

There are many real benefits which will accrue not only to the country's economy but also to the Union and State Governments by encouraging the private limited form of business organisation. Apart from increased business stability due to the perpetual life of a company, the legal requirements ensure that accounts are properly kept and audited and all taxes are more easily realised by the authorities than from individuals and partnerships. Comparative figures show that income and corporation taxes paid by *limited companies increased in a much* higher proportion over the war years than from the non-incorporated section of business and industry. Since rates on personal incomes increased much more steeply during these years than on corporate incomes, it is obvious that evasion in the unincorporated sector must have been on a much larger scale. In making this statement, it is assumed that prosperity in terms of money incomes induced by the inflationary conditions of the war and its aftermath was evenly distributed over the two sectors, a not unreasonable assumption.

Our Income-tax Department is now undoubtedly much more energetic and efficient than it ever was in the past but it is recognised that there is considerable room for improvement in many directions. Encouragement of the corporate sector will enable substantial revenues to be collected without increasing the cost of collection unduly.

The treatment of the private limited company in India should be on the same lines as in the U.K., where there is no equivalent of our section 23A, and these companies are allowed to adjust their dividends according to the profits and, generally, to follow a stable conservative policy. They are encouraged to build up reserves of undistributed profits which are ploughed back in the business. In order to encourage this, tax reductions are provided on retained profits. There is no limit on reserves which may be built up to the legitimate needs of each business. In practice, this amounts to the directors deciding the amount of the reserves as they are the only people who are supposed to know the legitimate needs of the business and the I.T.O. has little say in the matter.

View of an Australian Economist

It is the opinion of at least one eminent Australian economist that incentive for investment in productive enterprise begins to suffer if the rates of personal taxation increases beyond 25 per cent. of the gross income even in the highest income groups. He is of the opinion that general rate of income- and super-tax should not go beyond 15 per cent. even for the relatively well-to-do section of the taxpayers, say, those having a gross income of Rs. 1 lakh per year. The present rates in India are much higher than these.

There is no doubt that our Union Government are anxious to step up the pace of economic development of this country, and are willing to explore all avenues of development. That is why they are trying to develop a mixed economy, with a public and a private sector. They should, however, realise that, in order to make the donkey walk, you can either use a stick or dangle a carrot in front of its nose. In the case of private enterprise at any rate, the carrot in the shape of tax inducements is much more effective in encouraging progress in a forward direction, than the stick of penal taxation or dire threats of nationalisation.

It is a truism that the only way to make anybody do anything well is to make them want to do it, by offering various forms of inducements. In the private enterprise system, the inducement of monetary rewards is used, and its language is more universally understood, as recent reports of black marketing even in Russia would seem to indicate. This is not to say that other incentives for work and service do not exist such as the ideal of service to the community, but, in order to be effective, this needs some form of constant recognition. It is also unwise to carry the appeal to idealism too far, as one cannot buy food or pay the house rent with it, no matter how desirable it may be.

Since constructive suggestions are always considered desirable, the following steps, if implemented within a reasonable period of time, will initiate such a rapid progress in the private sector that our Government will be more than satisfied with the investment in this sector during the second Five-year Plan.

(1) The present high rates of income and super-taxes on personal incomes which appear to be a war-time legacy, should be gradually reduced, at the rate of about 5 per cent. per year. The 5 per cent. surcharge should be abolished forthwith. This process should be continued till the effective rates for gross incomes of Rs. 1 lakh per year is reduced to about 25 per cent. and on the highest income to about 50 per cent. The present high rates which are the highest in the world, with the exception of the U.K., encourage evasion on a large scale and, with more reasonable rates, the assessees will have less inducement to conceal income. These high rates not only tend to discourage investment in corporate productive enterprises, but encourage speculation, gambling, hoarding of bullion and other less desirable forms of economic activity where profits can be more easily hidden.

(2) Rates of corporate taxes should also be gradually brought down in line with personal rates, so that this form of business organisation does not become unattractive as an investment.

(3) The present discriminatory treatment of private and public limited companies in the matter of corporation tax and section 23A must be partly removed. If section 23A cannot be dropped altogether its provisions should be altered to allow 60 per cent. of the taxed profits to be put to reserve and only insist on the declaration of 40 per cent. as dividends. Incidentally, this section does serve one purpose, which was probably never intended by its framers, and that is that it protects the minority shareholders against the tyranny of the majority shareholders, who, for their own reasons, may not wish to declare any dividends or insufficient dividends even when profits justify it.

(4) To help the small private limited company, the corporation tax rebate recommended in paragraph 55, page 169 of the Taxation Commission Report, Volume II, should be extended to them also which is at present restricted to public companies. The new recommendations, if accepted, will reduce corporation tax to one anna per rupee on the first Rs. 25,000 of the total income and two annas nine pies on the balance. The only companies to which this concession could have been of material benefit are the small private limited companies, and these have been left out of its purview at present.

Abuse to be Prevented

(5) In order to avoid flagrant abuse of the facilities granted to the private limited companies, there should be a limit on its size, and no company of this type should be allowed to be registered with an authorised capital of more than Rs. 5 lakhs. Reserves up to a maximum of 200 per cent. of the paid-up capital may be allowed. When the private limited company's capital and reserves reach Rs. 15 lakhs it should be compulsorily converted into a public limited company but this should only be done after giving the company a free opportunity to capitalise its reserve through a bonus issue of shares.

The author realises that these suggestions will be regarded by some as practically revolutionary, particularly in view of the recommendations of the Taxation Enquiry Commission. Although these recommendations contain some small incentives to the private sector, they are, on the whole, designed to increase the share of the State in the total national income. In a democracy, however, every citizen is free to say his piece and try to persuade public and legislative opinion. Fortunately, democratic legislation is a matter of trial and error and policies can always be reversed if they do not produce the desired result. May we long retain this freedom to make a free choice of our policies! So, it is up to private enterprise to present its case where it has a case. It should also conduct itself in accordance with a code of commercial and moral ethics, so that in time it will come to be looked upon as a beneficial factor in the life of the country.

MANUFACTURE OF AMMONIUM CHLORIDE

F.A.C.T. SETS UP NEW PLANT

THE new ammonium chloride plant of the Fertilisers and Chemicals Travancore, Ltd. (F.A.C.T.), which went into production on the 4th inst., has taken the country a step forward in the direction of achieving self-sufficiency in this important chemical. The plant is the first of its kind to be erected in India. With a capacity of 8,000 tons a year, it will be able to meet not only all the country's current requirements of ammonium chloride but also its potential future demand. India is importing, at present, all its needs of ammonium chloride amounting to about 4,000 to 5,000 tons a year from abroad. By the addition of a new plant for the manufacture of this chemical, the F.A.C.T. has undoubtedly—as was emphasised by Mr. Panampally Govinda Menon, Chief Minister, Travancore-Cochin, who inaugurated the plant—enhanced its utility to the national economy.

Ammonium chloride is one of the oldest chemicals discovered by man. It was known to the Egyptians in the fourth century B.C. They recovered it from the burning of animal refuse. In the eighteenth century, Joseph Pristly isolated ammonia by heating a mixture of "sal ammoniac" and lime. Different processes are adopted for the manufacture of ammonium chloride. In some countries, large quantities are also recovered as a by-product in the ammonia soda process followed in the manufacture of soda ash. Direct neutralisation of synthetic ammonia with synthetic hydrochloride acid is the process adopted by the F.A.C.T. The availability of synthetic ammonia from the factory and of hydrochloric acid from the neighbouring plant of the Travancore-Cochin Chemicals Ltd. has rendered it possible for the F.A.C.T. to produce ammonium chloride of the highest purity. The two gases are continuously fed into saturators where they react to form ammonium chloride. The saturators are operated under vacuum, and the heat of reaction is utilised for evaporation, causing the crystals to separate themselves. The crystals are centrifuged and bagged, the mother liquor being returned to the insulators.

In appearance, ammonium chloride is a white crystalline salt which sublimes at high temperatures. Marketed as crystals, compressed bars or pellets, it finds widespread application, making its way even to remote villages as a flux for tinning domestic utensils.

Uses of Ammonium Chloride

Ammonium chloride is put to a number of uses. It is an important constituent in the manufacture of dry cells, accounting for a consumption of 1,500 tons a year in India. At present, three major units are engaged in the manufacture of dry cells. Ammonium chloride is used as a cleaning agent and a flux in the galvanising of steel sheets and structures. With the expansion of steel industry in the country, consumption of this chemical is bound to increase substantially. The chemical is also used as a fertiliser, since it supplies 26 per cent. of nitrogen to rejuvenate the soil. It can be used for all crops, barring those that are susceptible to the presence of chloride. It finds useful application in textile printing, leather tanning, fermentation, ice manufacture, urea formaldehyde resins and water purification carried on by municipal bodies.

The ammonium chloride plant of the F.A.C.T. has been erected at a cost of Rs. 10 lakhs. It was designed and supplied by Krebs & Co., Zurich, Switzerland, a well-known firm of chemical engineers and designers. Equipped with the most modern machinery, this new plant incorporates in itself, it is stated, all the latest developments in this field. The erection and commissioning, including some minor design changes, were made by the F.A.C.T. personnel.

The manufacture of ammonium chloride by the F.A.C.T. adds another important chemical to the already impressive list of products turned out by this second largest fertiliser factory next to Sindri. The factory is located at Eloor, Alwaye, on the banks of the river Periyar. It is 20 miles by water from the port of Cochin and a similar distance from the Malayattur forests which supply the principal raw material, firewood. Planned primarily as a unit for the manufacture of ammonium sulphate, the factory has since diversified its activity far beyond its original concept. Along with other neighbours, namely, Travancore-Cochins Ltd., Travancore Titanium Products Ltd. and Travancore Rayons Ltd., the factory constitutes "an industrial complex of national importance." A brief account here of the products manufactured by this unit will not, therefore, be out of place.

The F.A.C.T. came into being at a time when there was acute food shortage in the country. The factory was planned, erected and commissioned during 1944-47. Ammonium sulphate was the first fertiliser produced by it. A later product was superphosphate and this was followed by a host of others. Commercial production of ammonium sulphate commenced in August, 1948. Since then, well over 2.5 lakh tons of fertilisers have been manufactured and distributed to improve the food position of the country. As the second Five-year Plan envisages a 200 per cent. increase in nitrogenous fertiliser production, it can be confidently asserted that the F.A.C.T. will have a more vital role to play in the years ahead. The planning and execution of this project was rendered possible by the active assistance of the State Governments of Travancore-Cochin and Madras and the facilities provided by the Central Government. A little over 75 per cent. of the paid-up capital of the company is State-held, the balance being owned by private interests.

Ammonia

Ammonia is one of the chemicals manufactured by the F.A.C.T. It is a chemical compound, containing the elements of nitrogen and hydrogen in the ratio of 1 : 3. At atmospheric temperature, it is a colourless gas with a sharp odour. It is used in the manufacture of ammonium sulphate, ammonium chloride, ammonium phosphate, ammonium nitrate and other ammonium compounds. It is also widely used in refrigeration, preservation of rubber latex and rayon manufacture. The plant capacity is 40 tons a day.

Ammonium sulphate is another product of the F.A.C.T. It is a crystalline salt containing about 21 per cent. nitrogen, and the most widely used fertiliser in the world and is particularly suited to conditions in India. Its increased consumption has resulted in increased production of food in the country. The plant set up by the F.A.C.T. has a rated capacity of 150 tons a day. Sulphuric acid is another basic chemical manufactured by the F.A.C.T. The plant has a capacity of 150 tons a day. Although erected for the manufacture of ammonium sulphate and superphosphate, the plant supplies large quantities of the acid to Travancore Rayons Ltd. and Titanium Products Ltd.

The superphosphate plant of the F.A.C.T. has a rated capacity of 100 tons a day. Superphosphate is a free flowing powdery material containing 16 to 18 per cent. water-soluble phosphoric acid.

Carbon-di-oxide is another chemical recovered in this factory, primarily as an intermediate product for the manufacture of ammonium sulphate by the Merseberg process. It is also marketed for the aerated water and cashewnut canning industries. Another possible large-scale use is in the manufacture of 'dry ice' to be used as a portable refrigerant.

It is stated that the central laboratories attached to each plant keep a strict watch over the purity of the various constituents going into the process, as well that of the final products. The factory had at its inception about a dozen foreign technicians. They have been since replaced by Indian personnel. There are on its rolls about 1,500 employees of all categories.

TOWARDS SELF-SUFFICIENCY IN ARECANUT

Areca is an article of daily consumption in India. Its use has both religious and social significance, but, unfortunately, little attempt has been made to collect reliable data regarding consumption, production and distribution of this commodity. Even the Indian Central Arecanut Committee would appear to have no reliable statistics. This is evident from the remarks of Mr. P. A. Gopalakrishnan, Joint Secretary, Ministry of Agriculture and Food, Government of India, in his address at the meeting of the Committee held at Bangalore a fortnight ago. He said that internal production of areca at present was estimated at 2.2 million maunds and the deficit at about 1 million maunds. But he candidly admitted that these were not based upon any scientific statistical data but merely represented rough estimates based on the average yield of areca trees in the different regions of the country. As regards imports of arecanut, the position is, however, clear, for statistics are available through customs figures. In 1954-55, the volume of imports amounted to 794,000 maunds, as against 900,000 maunds in the previous year. The principal countries from such arecanuts were imported are Ceylon, East Pakistan and Singapore. The decline in imports in Imports in 1954-55 is attributed to increased domestic production and higher import duty on arecanuts from As. 9 to Re. 1 per lb. in 1954-55. It is, however, difficult to assess the relative shares of these factors in the fall in imports. The Government has since reduced the import duty to As. 12 per lb. Owing to the general fall in agricultural prices it remains to be seen whether imports of arecanuts would go up to the previous year's level. But India, according to Mr. Gopalakrishnan, has got to import a large quantity from outside, till improved methods of cultivation of arecanuts make the country self-sufficient.

It is the responsibility of the Central Arecanut Committee to initiate measures for achieving self-sufficiency. Some of the decisions taken at its last meeting at Bangalore indicate that the Committee is alive to the need for making the country self-sufficient. The Committee decided to request all State Governments to draw up comprehensive schemes for bringing more area under arecanut and to increase production in the existing areas. In order to formulate a co-ordinated scheme for experimentation in ryots' gardens to determine the manurial and cultural requirements of arecanut crop, it was decided to set up a sub-committee. It sanctioned schemes for a crop-cutting survey of arecanut in Travancore-Cochin and for research on better utilisation of the by-products of arecanut in the laboratories of the Forest Research Institute, Dehra Dun, the Leather Research Institute, Madras, and the Universities of Travancore-Cochin, besides sanctioning a pilot scheme to estimate the cost of cultivation of arecanut in a few representative tracts and a scheme for marketing survey. It was also agreed that by systematic propaganda for better cultivation, manuring, prevention of diseases and by giving the requisite help for irrigation of the crop, the yield should be increased by about a third of the present production. This responsibility was entrusted to the Areca Development Officers in each State who should devote their exclusive attention to the improvement work. The Committee further decided to request all State Governments to exempt the first sale of arecanuts from sales tax.

INDO-BRITISH TRADE IN JAN-APRIL, 1955

The upward trend in the total volume of trade between India and the U.K. witnessed in the first three months of the current calendar year continued to prevail till the end of April. During the four months, the overall trade aggregated £110.9 million, as compared with £89.4 million in the same period last year. These figures include the total volume of exports, re-exports and imports between the two countries.

During the four-month period, shipments of Indian merchandise to the U.K. aggregated £66.8 million, as against £50.3 million in the same period last year. Britain sent, in turn, goods worth £43.8 million as against £39.0 million. The table below gives at a glance the trade between India and the U.K. during the year 1954 as also during the four months of January to April, 1955, and the corresponding period of 1954.

Principal Exports and Imports

(In £000's)

	Year 1954	4 months January-April 1954	4 months January-April 1955
Total All Exports	**114,907**	**39,015**	**43,856**
Of which :—			
Machinery other than electric.	23,151	9,860	10,391
Electric machinery, apparatus and appliances	14,836	5,207	5,510
Chemicals	15,152	4,872	5,504
Road vehicles and aircraft	9,863	3,987	8,405
Total All Imports	**148,595**	**50,316**	**66,871**
Of which :—			
Tea	70,963	24,961	44,114
Leather and manufactures and dressed furs	13,271	5,088	4,305
Cotton yarns and woven fabrics	6,355	2,079	2,053
Miscellaneous textile manufactures	16,444	7,136	6,465

Out of the total imports into the U.K. from India of £66.8 million, as much as £40.1 million or 60 per cent. were on account of tea, the quantity of the commodity shipped being 1.17 million cwts. Britain's total tea imports during the period amounted to 1.9 million cwts., of which 133,380 cwts. came from non-Commonwealth countries.

Textile manufactures were the next biggest item after tea imported by the U.K. from India. During the four months, India despatched textiles worth £6.5 million. This included jute piecegoods also. This was followed by leather manufactures and dressed furs worth £4.3 million.

India sent to the U.K. £2.6 million worth of cotton yarns and woven fabrics and 13.8 million lbs. of raw cotton at £1.1 million.

Among the goods which India imported from the U.K., non-electric machinery headed the list. During the four months, January-April, 1955, such imports reached a total of 532,999 cwts. valued at £10.4 million. This included 93,082 cwts. of textile machinery valued at £2.2 million, 83,409 cwts. of power producing boiler house plant, steam engine and internal combustion engines.

Imports of electrical machinery, apparatus and appliances into India reached a total value of £5.5 million. These included 24,903 cwts. of generating plant (£857,000), 54,108 cwts. of converting and switching gear (£1.4 million).

Among vehicles imported from the U.K., 5,910 tons of railway stock were worth £3.5 million. Among these were 1,814 tons of locomotives valued at £709,000. Road vehicles and aircraft of the value of £3.5 millions were also purchased by India. Of this, 645 road chassis were worth (£710,000).

The next largest group of Britain's exports to India during the four-month period was chemicals valued at £5.5 million.

In the field of textiles, Britain's exports to India of wool products aggregated £2.09 million including 4.05 million lbs. of tops. Cotton yarns and woven fabrics amounted to £610,000.

LAND REFORMS IN INDIA

BOMBAY AND MADRAS SCHEMES

ALTHOUGH the first step towards land reforms was initiated some years ago with the abolition of *zamindaris*, no positive progress has since been made in evolving and implementing a practical land policy. Here and there, of course, certain laws, as, for instance, the one relating to ceiling on land holdings in Hyderabad, have been passed, but there is yet to be a co-ordinated policy for the country as a whole. There are still serious differences of opinion among the leaders of the Congress Party on certain vital issues, more especially on ceiling on land holdings. The confusion that exists in the ruling party is evident from the appointment of more and more committees by the Planning Commission, even though five long-years have passed since the draft of the first Five-year Plan was drawn up. It was only recently that the Planning Commission set up a panel for tackling the problem of land reform. This Panel, which met for the first time early this month, has constituted four sub-committees to make recommendations on (*a*) tenancy reform, (*b*) size of holdings, (*c*) problems of reorganisation and (*b*) *bhoodan*.

While thus a firm policy has yet to be laid down by the Planning Commission and the Government of India, certain State Governments are going ahead with their preparations for introducing far-reaching land reforms. The Bombay Government, for instance, has published a draft Bill seeking to amend the Bombay Tenancy and Agricultural Lands Act, 1948, for eliciting public opinion. The Madras Government, too, has made certain moves, though they are not as firm as the step taken by the Bombay Government. The Cabinet Sub-Committee of the Madras Government, appointed to go into the recommendations of the proposals put forward by the Land Reforms Sub-Committee of the Tamilnad Congress Working Committee and suggest a draft scheme, has submitted its report to the Cabinet. This report is still confidential and nothing is known about its contents, though it was considered at a meeting of the Madras Cabinet last week. Meanwhile, the report of the Tamilnad Congress Sub-Committee has been released to the public.

The difference between the steps taken in Madras and Bombay is that, whereas the Government of the latter State has made up its mind in regard to the details of its land reform, that of the former State has not. The Bombay Government is trying to elicit public opinion on what it wants to do. The fact that a draft Bill has been published shows that the Bombay Cabinet has reached definite conclusions. In the case of Madras, what is published is the report of the State Congress Party. It is not known to what extent the Madras Government itself is in agreement with this report. Nevertheless, an analysis of both the schemes will be useful.

Ceilings on Landholdings

A ceiling on landholdings is envisaged in both the schemes. The Bombay Bill stipulates that no person, in future, whether as occupant or tenant, would be allowed to hold land in excess of 48 acres of *jirayat* land or 24 acres of seasonally Irrigated or paddy or rice land or 12 acres of perennially irrigated land. This ceiling does not, however, affect the existing holdings. While thus in Bombay ceiling is specified on three types of land, namely, *jirayat*, seasonally irrigated and perennially irrigated, the Madras measure proposes ceilings in respect only two types of lands, namely, wet and dry. A "resident landowner" in Madras can, under this proposal, cultivate personally, if he wants to, a holding of 25 wet standard acres or 75 dry standard acres or an appropriate holding of wet and dry lands computed on the basis of one wet standard acre for every three dry standard acres. The ceilings will be double in the case of a resident landowner of an undivided family.

The limits specified in the Madras Congress Land Reform Committee report apply only to landowners whose personally cultivated holdings in the concerned village or villages in the agricultural year 1954-55 exceeded them. They do not apply also to holdings which happen to be a well-knit compact and integrated farm, involving large capital investment or farm buildings, mechanical appliances, improved cattle breeds, mixed farming, advanced techniques of cultivation, etc. Whether a particular farm answers this description or not would be decided by a specially constituted Board. The ceilings are not also applicable to grazing lands for cattle, as well as to holdings of topes (groves) growing coconut, casuarina, mango or other fruit-bearing trees. But if these topes are irrigated by seasonal or perennial water resources, they are covered by separate proposals. Similar provisions exist in the Bombay scheme too. Thus leases of land granted for the benefit of any industrial or commercial undertaking other than a co-operative society or granted to any body of persons otherwise specified are exempt from the provisions of certain sections. But the Government will have powers to regulate them.

In will be interesting to refer, in this context, to some of the observations made in the course of a minute of dissent appended by Mr. K. G. Sivaswamy to the T.N.C.C. main report. He says the term "resident landowner" should include residents in an area beyond a village, as distances shrink with greater facilities of communication. Regarding ceilings, he says that they should not be applicable to large-scale farmers. This suggestion is sound, in that it is conducive to increasing agricultural output through intensive and modern methods of cultivation. However, he is opposed to marking out, once and for all, big estates. There should be, he says, a provision for exempting big farms whenever they come into existence at a future date. This suggestion provides for making the scheme more flexible, instead of being rigid.

Minimum Wages

Under the Madras Congress Committee's Scheme, if the area under personal cultivation of a landholder—owning more than the maximum holding—was less than the limit proposed, he would not be able to resume land from his tenant for the purpose of reaching the ceiling for personal cultivation, except under certain conditions. "Personal cultivation" has been defined as cultivation by the "resident landowner" himself with the assistance of one or more members of his family or cultivation by labour hired for daily or monthly wages and not for any share in the crop. The schedule attached to the report fixes the minimum wages payable by the landowner. Here, the Sub-committee appears to be rather very ambitious. The monthly wages is fixed at Rs. 30 for a farm servant employed during an agricultural year. Part of this is payable in kind. Grain worth Rs. 20 is to be paid every month. Of the balance of Rs. 10, Rs. 5 are to be paid every month, the balance should be credited to a fund which is to be used for payment in two instalments of Rs. 30 each, once on *Divali* and again on *Pongal*. Where a servant and his landowner agree to continue the contract for a minimum period of 15 years, the owner has to take out a 15-year endowment insurance policy in his servant's name for an appropriate amount involving the payment of an annual premium not exceeding Rs. 20. For casual workers the minimum wage is fixed at Rs. 1-4 per day for males and at As. 12 for women.

The wage levels proposed by the Sub-committee are no doubt reasonable from the point of view of the worker. Nor are they higher than those prevailing in many parts of Tamil Nad at present. Indeed, as a minimum to be aimed at, the rates prescribed are fair indeed. But the question is whether such statutory levels can be enforced during periods when prices of agricultural commodities decline owing to a slump or when drought or other adverse conditions due to nature affects the fortunes of farmers. The vagaries of agricultural income are well known. It will not, therefore, be logically correct to lay down statutory minimum wages for agricultural workers, however desirable they may be from the social point of view, unless the farm-owners are guaranteed a minimum price for the crops they raise and protection against crop failures.

Where a landowner in Madras has all or a part of his lands cultivated by tenants, he shall have, according to the Congress Sub-committee, the right to resume the land only under certain conditions. Thus, he cannot exercise the use of this right during 1955-58. If after 1st April, 1958, he wishes to use the right of resumption, he should do so within three years. At the end of this period, if he fails to do so, his rights would automatically lapse. On the other hand, if he exercises his right, then the total of the resumed land plus the holdings which he is cultivating should not exceed the limit. The land resumed should be used for *bona fide* personal cultivation. These provisions are applicable to absentee landlords also.

In the Bombay scheme provision has been made for consolidation of holdings by means of fixing a minimum for holdings which is also considered to be an economic holding. The minima proposed are 16 acres for *jirayat* land, 8 acres for seasonally irrigated or paddy or rice land, and 4 acres for perennially irrigated land. A man who holds land below this specified area would be allowed to acquire enough land to make up the economic holding and would also be protected from eviction by the landlord in the event of his acquiring the land for his own cultivation or for a non-agricultural purpose.

Again, the Bombay Bill seeks automatically to give the tiller the right to own the land he is tilling. Thus, on and with effect from 1st April, 1957, to be known as "Tiller's Day," every tenant, whether permanent, protected or otherwise, shall be deemed to have purchased from the landlord the land held by him as a tenant, provided he cultivates the land personally and his total holding does not exceed the ceiling. The purchase price in the case of a permanent tenant shall not be less than 30 times or exceed 100 times the assessment. In the case of other tenants, the limits would be 50 and 100 times the assessment, respectively. Disputes would be referred to tribunals but the Government itself would be an appellate authority in the settlement of disputes. Purchase price can be paid in a lump sum or in instalments not exceeding ten with simple interest at the rate of 4½ per cent. to be spread over a maximum period of 12 years. If the tenant is unwilling to purchase the land, the Collector can evict him and surrender the land to the landlord, if he holds less than the ceiling area. Failing that, the land may be given to another landlord or a landless person. All lands purchased by tenants shall be non-transferable during a period of five years from the date of purchase.

Grounds for Eviction

While thus in Bombay the ownership is proposed to be vested in the cultivating tenant, in Madras the proposal seeks to deprive the landholder of his rights to evict the tenant. This is done by specifying the grounds on which a tenant can be evicted. These are: (*a*) Failure to pay the rent in full before 30th April every year, (*b*) use of land for a non-agricultural purpose, (*c*) sub-letting it to another person, (*d*) partitioning or alienating his cultivation rights or mortgaging his rights and (*e*) obstructing the division of produce at the thrashing floor. The tenant, however, has the right to purchase the landowner's interest in the concerned holding whenever the latter decides to sell it, at prices agreed upon between the parties concerned. If the tenant fails to purchase it within six months of the owner's notice, the landowner shall be free to sell it to any other person. The Sub-committee has left it to the State Government to examine the possibilities of transferring the landowner's interests in their holdings to the concerned tenants under a suitably evolved tenant purchasing programme financed by a tenant purchase fund. In Bombay, on the contrary, the price and the methods of payment for the land are, as stated already, fixed by Government. No financial arrangement is proposed for assisting the tenant to make the purchase.

The Madras proposals, however, contain two detailed schedules fixing the fair-rent rates for the *waram* and fixed tenancies respectively. They also envisage the establishment of a Land Management Corporation with two divisions, namely, one for the management of all lands belonging to temples, *mutts*, mosques, etc., and the other for the management of such lands as are left uncultivated by their owners.

It is evident from the foregoing that both the schemes have their own advantages and drawbacks. For instance, the Madras Congress Party's proposal is fair to the landowner in that it does not seek to deprive him of his right on the ownership of land as the Bombay scheme does. The landowner, however, loses his right to evict the tenant. Further, the scheme fixes the proportion of the share in the produce each should get. This imparts rigidity; instead, it would be better for the State to fix a maximum and a minimum, allowing the parties to bargain the shares of each in the produce. Again, the automatic conferment of ownership rights on the tenant, irrespective of the tenant's wish, is tantamount to expropriation and thus does injustice to the landowner. The Madras scheme, on the contrary, is reasonable in that the rights are not alienated till the tenant purchases the land. There is, however, one desirable feature in the Bombay proposal, namely, the fixation of floors to holdings. This is a step in the right direction.

WESTERN INDIA LIFE INSURANCE COMPANY, LIMITED

DR. M. N. AGASHE ON CUT IN PREMIUM RATES

ADDRESSING the Forty-first Annual Meeting of the shareholders of the Western India Life Insurance Company, Ltd., held at Satara on Sunday, 19th June, 1955, Dr. M. N. Agashe, Chairman of the Company, referred to the impressive increase in the Company's new life business from Rs. 2.76 crores in 1953 to Rs. 4.7 crores in 1954. This "splendid achievement," he said, was made possible not only by the untiring efforts of the Western India's field staff but by certain other factors. Among the latter, he called attention to the reduction in premium rates, increase in bonus and introduction of staff insurance schemes by some leading insurers. He stressed that the Western India had effected only a nominal cut in premium rates and that this factor guaranteed comparatively higher bonus to its policyholders. He declared that the Western India was not in the least disturbed by these "events and storms"—he was referring to the "rate war" in insurance—and could remain "cool and quiet" and carry on its business in its "usual way."

The following are extracts from Dr. Agashe's speech:

"I feel great pleasure in welcoming you all to this annual general meeting of the shareholders. The audited accounts and the report of your Directors for the year 1954 are already with you and I take it that you have acquainted yourself with their salient features and have noted the progress made by our Company during the last year.

"I must make mention of one of the saddest events that occurred not only in the life of this institution but in the history of Satara and Maharashtra. Our revered R. G. Alias Bhausaheb Soman, who was elected as the President of our Company after the sad demise of Mr. Annasaheb Chirmule in 1951, passed away in the month of February this year. His sudden departure from amongst us has created a void in our midst and we are deprived of his valuable advice, which it was our privilege to have from time to time. Mr. Bhausaheb was one of our founder-Directors and a golden link between the old and new generations. He was an astute politician, an eminent lawyer and a good social reformer. He was the President of the Legislative Council, Bombay, where he made a name for himself. He will be remembered by us all for a very long time.

New Business

"When we met last time a year ago, I had taken a review of the conditions, then prevailing in the country and had referred to the question of general unemployment and the sad plight of the middle class which is generally the backbone of our business. Though there does not appear to be any marked improvement in that quarter, I am glad to say that the new business of our Company has gone up, from Rs. 2 crores and 76 lakhs for 1953 to nearly Rs. 4 crores and 7 lakhs for 1954. This is a splendid achievement of which every one of us should be proud. It is also a matter of further satisfaction that we could achieve all this at a moderate cost.

"Now the point that is before us is what is this rise in business due to?

"These were mainly three in number: (1) reduction in premium rates, (2) increase in bonus, and (3) introduction of staff insurance schemes by some leading insurance offices in India.

"Now the point before us is how far we are affected by these storms and whether the rate reduction in our premiums is in any way likely to affect our Company's stability. I am going to give here the same answer which I have given on many occasions when a question was asked whether the new amendments to the Insurance Act affected us in any way. I am glad to declare that not only we were not in the least disturbed by these events and storms but we could remain cool and quiet and carry on our business in our usual way. We had, of course, to adjust ourselves according to the situation but it did not disturb us in any way.

"If you just take a comparative survey of the reduction in rates made by various companies, you will observe that whereas some companies in some cases reduced their rates considerably, our reduction was nominal. You can thus consider how little the Western India's renewal premium income is likely to suffer in comparison and realise that this factor alone can guarantee comparatively higher bonus to our policyholders in future. Those who can consider the question from this angle can immediately see a bright future for the Western. To say anything beyond this, would amount to self-praise.

Business Prospects

"Having thus said what I had to say about the business of last year, a question naturally arises whether we would be able to maintain the level of business that we have reached last year and whether we could show any appreciable increase in business in the current as well as in the succeeding years. Though there are no temptations like those of last year and though business under the Estate Duty Plan may not be so lucrative as like last year, I have every hope that we shall strive our utmost to fight against the odds and try to maintain our tradition of booking increasing business from year to year.

"On going through the figures of our annual report, it will be seen that, as a result of the year's working, a sum of over Rs. 64 lakhs has been added to our life insurance fund which now stands at more than Rs. 6 crores and 96 lakhs.

"It is satisfactory to note that our net interest yield leaves sufficient margin over the rate assumed in the valuation. Similarly, our gross expense ratio of 25.48 per cent. for 1954 is also satisfactory in comparison to the average expense ratio of all companies together for the year 1953. These features only confirm that we have maintained our great tradition of the past.

"During the year 1954, payments over Rs. 32 lakhs were made by us by way of death and maturity claims. It is a gratifying feature that our experience in respect of death claims was satisfactory during the year under review which speaks eloquently of the great care exercised by the Directors in the selection of business.

Twelfth Valuation

"You are already aware of the results of our twelfth valuation as at the end of 1953. I am proud to state that though stringent conditions prevailed in the country during the last three years, we have been able to show quite satisfactory results in the twelfth valuation. The rate of interest assumed in the valuation is at 3 per cent. although the actual average net yield of interest during the intervaluation period was 4.41 per cent. Ample provision has been made to allow for future expenses for the current business. It is also gratifying to note that we have been able to declare a reversionary bonus of Rs. 15 per thousand per annum for whole life with profits and Rs. 12 per thousand per annum for endowment with profits policies. This shows that the Company's financial position is well maintained and it is most sound.

"The net interest yield for 1954 is 3.72 per cent. against 4.43 per cent. in 1953. While the gross interest yield for 1954 is 4.69 per cent. against 4.50 per cent. in 1953. This apparently anomalous position is entirely due to the incidence of the item of income-tax.

"The net interest yield will not show such fluctuations if the refunds were obtained from the Government at more regular intervals than at present.

Our Buildings

"In my last speech, I had made a special mention of our new magnificent building at Poona, the opening ceremony of which took place at the hands of the Vice-President, Dr. Radhakrishnan. In addition to this new building at Poona, we have now our own new buildings at Kolhapur and Delhi. We have purchased a new building at Delhi just adjacent to our present building. Now we have a magnificent building in the capital of India and it is hoped that this will give new impetus to our new business from that part.

"I pray God to have his blessings on us and lead our Company from prosperity to prosperity."

Notices

THE INDIAN GALVANIZING COMPANY (1926) LIMITED

THE BOARD OF DIRECTORS HAS DECIDED to recommend to the forthcoming General Meeting of the Shareholders of the Company dividends in respect of the year ended 31st December, 1954, as follows:—

(*a*) Dividend on Cumulative Preference Shares at 6 per cent. (subject to deduction of Indian Income-tax).

(*b*) Dividend on Ordinary Shares at 4 per cent. free of Income-tax.

By Order of the Board,
BALMER LAWRIE & CO., LTD.,
Managing Agents.

21, NETAJI SUBHAS ROAD,
CALCUTTA.

THE GANESH FLOUR MILLS COMPANY, LIMITED, DELHI

NOTICE

NOTICE IS HEREBY GIVEN THAT THE 63RD ORDINARY GENERAL MEETING of the Shareholders of the Company will be held at the Registered Office of the Company at Subzimandi, Delhi, on Friday the 15th July, 1955, at 6 p.m., to transact the following business:—

(A) To receive Directors' Report and pass Audited Accounts for the year ended 30th September, 1954.

(B) To elect Directors in place of L. Rang Behari Lall and L. Satya Narain Gupta who retire by rotation and offer themselves for re-election.

(C) To appoint Auditors and fix their remuneration.

The Transfer Register of the Company will remain closed from 2nd July to 15th July, 1955 (both days inclusive).

By Order of Directors,
KIRPA NARAIN,
Manager.

DELHI, 13*th June*, 1955.

MINERVA MILLS, LIMITED

NOTICE OF 20th DIVIDEND

NOTICE IS HEREBY GIVEN THAT A DIVIdend of Rs. 5 per share of Rs. 100 for the year ended 31st December, 1954, sanctioned by the shareholders at the Thirty-fifth Ordinary General Meeting held on the 15th June, 1955, is made payable at the Imperial Bank of India, Bombay, on and after Wednesday the 22nd June, 1955, to those Shareholders whose names stood on the Register of Members on the 20th May, 1955, and who have paid all dues to the Company whether in respect of calls on their shares, interest thereon or otherwise.

By Order of the Board,
N. SIRUR & Co., LTD.,
Managing Agents,
V. N. CHANDAVARKAR,
Managing Director.

CALCUTTA, 14*th June*, 1955.

TEXMACO MAKES STRIDENT PROGRESS

PROFIT MORE THAN DOUBLES IN THREE YEARS

THE impressive rise in the market value of the ordinary shares of the Textile Machinery Corporation (Managing Agents: Messrs. Birla Brothers, Ltd., Calcutta) on the Calcutta Stock Exchange during the past two weeks—from Rs. 17-15 at the beginning of the month to Rs. 19-10 *ex-div.* at present (17th inst.)—is attributed partly to the excellent results achieved by the Company during the year ended 31st December, 1954, and partly to the expectation that the shares would be placed on the forward list of the Exchange. This expectation has since become an accomplished fact with the decision of the authorities to promote the shares to the forward list. The audited accounts of the Company for the past year reveal that the appreciation in the value of its shares was not unjustified. For the gross profit has jumped up by Rs. 6.47 lakhs to Rs. 26.62 lakhs, a fresh record in the history of the Company. With this rise, the upward trend in profit noted since 1950 has been maintained. What is more, the profit has more than doubled itself during the past three years (in 1951, the gross profit was Rs. 12.76 lakhs).

In consonance with the aforesaid trend in profit, the Directors have stepped up the dividend on ordinary shares from 7½ per cent. paid for 1953 to 10 per cent. for the year under review. This is the third consecutive year when the dividend has been raised. After the lapse of a year in 1950, the distribution to ordinary shareholders was resumed with a dividend of 2½ per cent. for 1951 and for each of the following three years it has been stepped up by 2½ per cent. The distribution for 1954 is thus four times that made for 1951. It must, however, be noted that the higher disbursement to shareholders is being made without being accompanied by any allocation to reserves. In fact, it is several years now since the Company set apart something for the rainy day. It is to be hoped that, having stepped up the dividend now to a very decent level, the Directors would follow a steady dividend policy and build up reserves.

The following comparative table clearly brings out the good progress in the working of the Company during the past three years:

(In lakhs of rupees)

	For the year ended 31st December			
	1954	1953	1952	1951
	£	£	£	£

Carry forward	1.48	0.36	0.15	1.96

* Net value.

† Provision for bad and doubtful debts.

The Directors report that there was a substantial improvement in sales. A notable feature of the sales in the textile machinery division was the booking of certain bulk orders from some of the foremost textile mills in India; this reflects their confidence in the Company's capacity for supplying quality goods.

In the boiler and heavy engineering division, the production of industrial boilers is said to have been maintained at a satisfactory level during the year. Last year, the Company undertook the manufacture of railway wagons for the Government of India and soon established itself as one of the regular suppliers of wagons for the Indian railways. The Railway Board has placed repeat orders with the Company for wagons. The Board has also placed orders for locomotive boilers; work on this, taken in hand during the latter half of the year, is said to be progressing satisfactorily. In 1953, the Company secured orders for the welded type of fabricated sluice gates for the Rupar Dam and penstock liners for the Hirakud Project. These works are now nearing completion. The work done by the Company on the Sindri coke oven by-products plant is said to have received commendation from the authorities concerned. The steel foundry equipment ordered by the Company from Germany has arrived and its erection is in progress.

The Company's balance-sheet as on 31st December, 1954, shows that the reserves and surplus aggregate no more than Rs. 6.16 lakhs, as against a paid-up capital of Rs. 100 lakhs. The debenture capital, together with accrued interest thereon, amounts to Rs. 40.04 lakhs. There is no provision for taxation, the small amount of Rs. 10,292 standing to the credit of this account at the close of 1953 has been adjusted partially towards payment of tax for the assessment year 1949-50, the balance being provided out of the profit for 1954. The current liabilities aggregate Rs. 67.05 lakhs. There has been an addition of Rs. 11.27 lakhs to the gross block during the year, bringing the total value of the block account to Rs. 155.63 lakhs. As against this, the provision for depreciation built up is Rs. 70.12 lakhs. The current assets amount to Rs. 167.74 lakhs, exceeding the current liabilities by a large margin.

The Rs. 10 fully paid-up shares are being currently quoted at Rs. 19-10 *ex-div.* On the basis of the latest dividend, the shares give a yield of 5.1 per cent. per annum, free of tax.

SHAW WALLACE EARNS BUMPER PROFIT

The prosperity of the tea industry during 1954 and the securing of the agency for procurement of rice and paddy for the West Bengal Government have been mainly responsible for the bumper profit earned by Messrs. Shaw Wallace & Co., Ltd. (Chairman and Managing Director: Mr. R. H. D. Campbell, Calcutta), during the year ended 31st December, 1954. The gross profit (before providing for Directors' remuneration) amounts to Rs. 50.97 lakhs, representing an increase of Rs. 22.93 lakhs over that for 1953. The profit for the year under review is a record in the history of the Company and exceeds the previous best of Rs. 40.92 lakhs earned in 1948, the second year of its working after it was converted into a public limited concern. (The Company was incorporated only in 1946 as a private concern and in the following year the shares were offered to the public.)

After providing for Directors' remuneration, depreciation and taxation, the net profit amounts to Rs. 19.15 lakhs, an increase of Rs. 4.72 lakhs over that for 1953. The net profit is not, however, a record one, on account of the substantial increase in the provision for taxation from Rs. 7.60 lakhs to Rs. 20.18 lakhs. After setting aside Rs. 4 lakhs for contingencies, which had received nothing in the previous year, the Directors have strengthened the general reserve by Rs. 4 lakhs, thus doubling the allocation made a year ago, and the investment reserve by Rs. 2.50 lakhs, as against Rs. 1.50 lakhs. The dividend on ordinary shares has been stepped up to 12½ per cent. from 10 per cent. paid for the previous seven years.

The following comparative table, presenting the salient features of the Company's profit and loss account for the past four years, gives an idea of its progress.

(In lakhs of rupees)

	For the year ended 31st December			
	1954	1953	1952	1951
Sale proceeds	48.92	38.81	40.15	49.81
Agency and other commissions and allowances	62.87	45.54	45.07	43.72
Other income	12.34	7.48	6.77	17.97
Stocks	8.50	7.89	10.12	6.61
Expenses	73.29	61.57	73.10	72.33
Gross profit	50.97	28.04	28.39	39.48
Directors' remuneration ..	6.61	4.94	4.93	5.40
Provision for—				
Depreciation	1.03	1.08	1.13	1.01
Taxation	20.18	7.60	6.92	12.84
Net profit	19.15	14.43	15.41	20.18
To contingencies	4.00	..	..	..
To reserves	6.50	3.50	4.50	8.50
Dividends—				
6% preference	3.32	3.32	3.32	3.32
Ordinary	9.37 (12½%)	7.50 (10%)	7.50 (10%)	7.50 (10%)
Carry forward	3.64	3.93	3.57	3.48

The latest balance-sheet of the Company shows that the reserves and surplus aggregate Rs. 52.64 lakhs (including the provision for contingencies set aside from the year's profit), as against a paid-up capital of Rs. 150 lakhs, of which 6 per cent. taxable cumulative preference shares account for Rs. 75 lakhs and ordinary shares for Rs. 75 lakhs. The provision for taxation amounts to Rs. 16 lakhs and the current liabilities aggregate Rs. 98.24 lakhs. The gross block of the value of Rs. 9.78 lakhs has been written down to Rs. 6.31 lakhs. The Company's investment in the firm of Shaw Wallace & Co. (including Rs. 39.63 lakhs paid for goodwill), together with the amount due from it on current account, aggregates Rs. 179.96 lakhs. Investments (at cost) in joint-stock companies amount to Rs. 29.83 lakhs and current assets Rs. 97.37 lakhs.

As regards the outlook for the current year, the Directors point out that, in view of the improved food position, the procurement agency for the West Bengal Government is not likely to be repeated in 1955. "Since the close of the year to date," they add, "business continues at a satisfactory level, although it is anticipated that the final 1955 profits will not be as high as 1954."

The Rs. 10 paid-up shares are being currently quoted at Rs. 14-2 *ex-div.* At this rate and on the basis of the latest dividend, the yield on the shares works out to 8.85 per cent. per annum, free of tax.

EQUITABLE COAL'S PROFIT LOWER

DIVIDEND MAINTAINED

A SETBACK in earnings is disclosed by the audited accounts of the Equitable Coal Company, Ltd. (Managing Agents: Messrs. Macneill and Barry Ltd., Calcutta) for the half-year ended 31st December, 1954. The gross profit has declined from Rs. 9.23 lakhs for the six months ended 30th June, 1954, to Rs. 6.87 lakhs for the half-year under review. It, however, compares favourably with that of Rs. 5.27 lakhs earned in the corresponding half-year of 1953. With the above-noted drop in profit, the improvement noted in the previous half-year has to a large extent been offset and the downward trend in the Company's earnings since the half-year ended 30th June, 1952, has almost reasserted itself. Thus, the gross profit has dwindled from no less than Rs. 37.92 lakhs to Rs. 6.87 lakhs, all in the short period of five half-years.

No provision for depreciation has been made, for which a sum of Rs. 5 lakhs had been set aside in the previous half-year. The Directors are satisfied that the provision so far made for this purpose in the Company's accounts is adequate. No provision for taxation also has been made, as in the previous three half-years. The net profit, after making provision for Managing Agents' remuneration, amounts to Rs. 3.51 lakhs, which is better than that for either of the previous two half-years, namely, Rs. 1.07 lakhs for the half-year ended 30th June, 1954, and Rs. 1.87 lakhs for the corresponding six months of 1953. Out of this net profit, a sum of Rs. 1.18 lakh has been utilised to write off debenture issue expenses. While a sum of Rs. 20,000 had been provided for cesses, no such provision has been made out of the profit for the half-year under review. The dividend on ordinary shares has been maintained at 15 per cent. per annum, to which level it had been reduced successively, from 30 per cent. per annum paid for the six months ended 31st December, 1952, to 20 per cent. per annum for the next half-year and 17½ per cent. per annum for the following six months. It may be noted here that, in the previous half-year, the Directors supplemented the net profit with Rs. 1.66 lakhs, being the provision for taxation and reserve for doubtful debts no longer required, before paying a dividend of 15 per cent. per annum.

The following comparative table brings out clearly the progress of the Company's working during the past three half-years:

(In lakhs of rupees)

	For the half-year ended			
	31-12-54	30-6-54	31-12-53	30-6-53
Sale proceeds of coal	158.11	163.89	164.21	196.00
Other income	1.36	1.84	2.02	2.88
Stocks	15.89	21.49	10.02	27.99
Expenses (including coal purchased)	147.01	158.08	156.00	193.94
Gross profit	6.87	9.23	5.27	10.29
Managing Agents' remuneration	3.36	3.16	3.40	3.21
Provision for—				
Depreciation	..	5.00	..	5.00
Taxation	..	..	..	..
Net profit	3.51	1.07	1.87	2.08
Debenture issue expenses written off	1.18	..	..	..
Provision for cesses	..	0.20	..	..
To reserves	..	..	0.61	0.11
Reserves and provisions written back	..	1.00	0.60	2.00
Dividends—				
6 per cent. preference ..	0.12	0.12	0.12	0.12
Ordinary	2.22 (15% p.a.)	2.22 (15% p.a.)	2.50 (17½% p.a.)	2.96 (20% p.a.)
Directors' commission on dividends	0.14	0.14	0.16	0.18
Carry forward	1.70	1.80	1.81	2.82
Raisings .. .. .. (tons)	802,218	819,882	805,211	836,000
Despatches .. .. .. (tons)	861,241	790,922	848,104	781,800
Stocks .. .. .. (tons)	105,357	152,108	128,859	171,782

The decline in raisings of coal during the half-year under review is seasonal and is always noticeable during the second half of each year. The Directors, however, observe that full advantage was taken of the better wagon supplies experienced during this period and stocks were reduced considerably.

Commenting on the general conditions which prevailed during the half-year under review, the Directors observe as follows:

"Good relations between labour and management continued throughout the period. The All-India Industrial Tribunal (Colliery Disputes) appointed by Government to deal with certain disputes which have arisen with the industry's labour reached no conclusions during the half-year. The small margin between production costs, which continues to rise, and the controlled selling prices, fixed by Government, makes it imperative that, if increased emoluments are to be given to labour, the price of coal should also be increased. Coal prices, indeed, already require revision, in the light of existing costs."

Though the Company has not been able to make any worthwhile contribution to the reserves during the last four half-years, the

reserves and surplus as on 31st December, 1954, stand at the impressive level of Rs. 73.52 lakhs (as against a paid-up capital of Rs. 33.64 lakhs), thanks to the allocations made during the days of prosperity. The debenture liability, together with interest accrued thereon, amounts to Rs. 51.38 lakhs. The provision for taxation and cesses stands at Rs. 14.50 lakhs and the current liabilities aggregate Rs. 145.97 lakhs. There has been an addition of Rs. 11.82 lakhs to the gross block, bringing the total value to Rs. 377.77 lakhs. This has been well written down to Rs. 96.63 lakhs. The current assets (including investments in joint-stock companies and subsidiary) amount to Rs. 222.38 lakhs, exceeding the current liabilities and provision for taxation and cesses by Rs. 61.91 lakhs.

During the half-year under review, a new sand-gathering plant and aerial ropeway were put into operation at Ranipur colliery. This will enable raisings of the Dishergarh seam to be increased. The Directors point out that further expenditure will be required to lay a new siding to handle this expected increased output.

The Rs. 10 paid-up ordinary shares of the Company are being currently quoted at Rs. 30-4 *cum-div.* On an *ex-div.* basis, the shares offer a yield of 5.1 per cent. per annum.

NEW COMPANIES REGISTERED

Eighty-eight new companies limited by shares with a total authorised capital of Rs. 15.36 crores have been registered during the month of February, 1955. This brings the total number of companies registered during the period of 11 months in the fiscal year 1954-55 to 1,076, with an authorised capital of Rs. 207.48 crores. During the corresponding period last year, 1,087 companies with a total authorised capital of Rs. 43.65 crores were registered.

The largest flotation during February, 1955, was the Caltex Oil Refinery of India Ltd. (Bombay) with an authorised capital of Rs. 6 crores. This company ranks as the fifth largest flotation during the first 11 months of the fiscal year 1954-55.

Forty-six companies limited by shares with a total paid-up capital of Rs. 28 lakhs have either gone into liquidation, finally dissolved or become defunct, during the month of February, 1955. During the corresponding period last year 41 companies with a capital of Rs. 9 lakhs went into liquidation or became defunct. During the period of 11 months, i.e., from April, 1954 to February, 1955, 472 companies with a total paid-up capital of Rs. 3.8 crores ceased to work, while during the corresponding period in the fiscal year 1953-54, 493 companies with a total paid-up capital of Rs. 2.44 crores went into liquidation.

Net increase in the paid-up capital of the companies reported during the month of February, 1955, has been of the order of Rs. 1.83 crores, as against Rs. 1.43 crores during the corresponding period last year. The cumulative net increase in the paid-up capital of companies during the first 11 months of 1954-55 is Rs. 39.75 crores, as against Rs. 33.68 crores during the corresponding period of the fiscal year 1953-54.

Individual Americans continue predominant among holders of stocks in American corporations. Furthermore, although individual stockholders constitute a relatively small fraction of the population of the United States, most Americans have an indirect stake in the stock market through investments by insurance companies, savings banks, investment trusts, and pension and personal funds. This is reported in a study of the dynamic role of the stock market in the expanding U.S. economy, issued by the Senate Banking and Currency Committee.

The report estimates the market value of the outstanding capital stocks of all American business corporations at about $318,000 million at the end of 1954. Of this, individuals held total stocks estimated at $196,400 million. Other countries held an estimated $5,000 million of stocks in U.S. businesses.

INSURANCE

(*Concluded from page 1222*)

may be noted, in this connection, that the Company's marine reserves have been increased by as much as Rs. 8.70 lakhs in the last two years. The working of the department, however, resulted in a loss of Rs. 1.13 lakhs.

In the miscellaneous department, the net premium income advanced from Rs. 9.04 lakhs to Rs. 10.63 lakhs in 1954. Net claims also rose, somewhat sharply, from Rs. 4.09 lakhs (45.3 per cent.) to Rs. 6.80 lakhs (63.9 per cent.). The increase in loss ratio, it is stated, is largely due to heavy motor claims in certain foreign territories where the Company operates. It is gratifying to note that steps have been taken to correct this position. After maintaining the reserve for unexpired liabilities, the working of the department has shown a loss of Rs. 1.44 lakhs.

The profit from the fire department (Rs. 3.25 lakhs), together with income from interest and other sources, make in all Rs. 4.02 lakhs. After meeting the losses in the marine and miscellaneous sections and other expenses, the balance available for appropriation is Rs. 1.32 lakhs, which, together with Rs. 9.747 brought forward from the 1953 accounts, makes Rs. 1.41 lakhs. The provision for taxation absorbs Rs. 34,169 and payment of the recommended dividend Rs. 90,000, leaving a balance of Rs. 17,211 to be carried forward to the current year's accounts.

Apart from the capital of Rs. 24 lakhs, the Company has reserves and funds aggregating Rs. 41.30 lakhs, inclusive of fire fund Rs. 13.58 lakhs), marine fund (Rs. 16.92 lakhs) and miscellaneous fund (Rs. 5.32 lakhs).

Points From The Chair

Business Prospects

"HAVING thus said what I had to say about the business of last year, a question naturally arises whether we would be able to maintain the level of business that we have reached last year and whether we could show any appreciable increase in business in the current as well as in the succeeding years. Though there are no temptations like those of last year and though business under the Estate Duty Plan may not be so lucrative as like the last year, I have every hope that we shall strive our utmost to fight against the odds and try to maintain our tradition of booking increasing business from year to year."

DR. M. N. AGASHE,
Western India Life Insurance Co., Ltd.

Prospects for Manganese

"There is at present a good demand for our ore, but at prices lower than those obtainable in 1952 and 1953, when market conditions were exceptionally advantageous. Another factor which has to be taken into account, when one considers the future, is the opening up of other manganese areas in various parts of the world, which will no doubt compete in course of time with ore supplies from existing sources. But, on the other hand, it has to be borne in mind that the steel production in the world is continually expanding. So far as I can see at the moment, and provided that nothing unforeseen arises, I think that the prospects for the current year's trading are not unsatisfactory."

H. R. HOLMES,
Central Provinces Manganese Ore Co., Ltd.

General Outlook for Tea Fair

"At the time of writing this statement, I feel it would be unwise to attempt to forecast the trend of the market for the current season, because the North India season has scarcely commenced and the quantities of exports which may be released by producing countries are still unknown. I think, however, that the general outlook for tea is fair, provided always that growers maintain a good standard of production. The high prices ruling last year resulted in some coarse plucking towards the end of the season and it is to be hoped the lessons of the reception that these teas are receiving now from buyers and the recent crisis of 1952 will not be forgotten. I think there is no doubt that world consumption of tea is increasing and there is every evidence of increased demand in India, but the future of the industry must depend largely on the steps taken to produce good sound teas or, in other words, not to push up yields at the expense of quality."

W. H. MARR,
Consolidated Tea and Lands Co., Ltd.

New Zealand's Economy

"Secondary industries continue to expand under the stimulus of a high demand for almost all types of goods. The general picture is one of prosperity, but it cannot be too often emphasised that with its high volume of overseas trade and its high and rigid internal cost structure, New Zealand is very vulnerable to changes in the value of its exports upon which the standard of living depends. The Reserve Bank has recently emphasised that the Dominion must concentrate increasingly on improving its competitive position, which entails research into new methods of efficient production, more attention to quality, packaging and advertising, adaptability in production to meet any changes in market conditions and consumers' preferences, but it is also vital that the country's competitive position should not be undermined by inflation. Unfortunately, signs of inflation are still present, one indication of an overloaded economy being the continued shortage of labour, to which my predecessor referred last year. Moreover, retail prices have continued to rise in the absence of any rise in the price index for imported goods, and the pressure on the Dominion's overseas reserves is considerable."

ARTHUR H. ENSOR,
National Bank of New Zealand.

State Aid to Shipping

"In assessing the prospects of further progress and future expansion it would be just as well to stress that the pivotal point on which the whole thing turns is the extent to which our Government is consciously and continuously prepared to help Indian shipping. Their interest and concern have been demonstrably established in the past when they proceeded to reserve coastal trade to Indian ships. That passed without raising a ripple from competitive shipping interests because it is now widely recognised that coastal trade is the preserve of the nationals of the country. Increasing participation of Indian shipping in the adjacent and ocean trades, however, is not so easily achieved as the way is blocked by multi-conference arrangements designed to maintain the hold of the 'haves' against the encroachments of the 'have-nots.' The way can only be opened by the Government asserting itself to protect the interests of our flag. It can be done in a variety of ways, and the history of shipping development elsewhere provides illuminating examples of how it was done. Whatever is attempted by way of flag protection will no doubt be interpreted by established interests as flag discrimination. The controversy that raged in the Victorian period between free trade and protection may be cited by way of illustration. But it did not prevent any country from establishing its trade interests against competitive interests."

C. R. SRINIVASAN,
Bharat Line Ltd.

U.P. SUGAR SHOWS BETTER RESULTS

GIELLE TEA RETURNS TO DIVIDEND LIST AFTER A LAPSE OF THREE YEARS

United Provinces Sugar Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. James Finlay and Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 30th September, 1954.

The profit on sugar account amounts to Rs. 4,22,423 (Rs. 1,60,370) and sale proceeds of motor car and scrap Rs. 6,826 (Rs. 8,521), making a total of Rs. 4,29,249 (Rs. 2,01,927). After deducting the loss on estates account of Rs. 5,369 (Rs. 1,93,250), the profit for the year amounts to Rs. 423,880 (loss of Rs. 8,677). From this sum has been deducted provision for Central and State taxation Rs. 1,90,000 (Rs. 80,000), leaving a balance of Rs. 2,33,880 (debit of Rs. 1,04,358). To which falls to be added the credit balance brought forward from last year of Rs. 5,181 (credit of Rs. 36,665), leaving a balance available for distribution of Rs. 2,39,061 (Rs. 85,181 including Rs. 85,000 transferred from reserve for E.P.T. deposit and Rs. 67,875 transferred from general reserve). Out of this the directors recommend payment of a dividend of 12½ (5) per cent. for the year to 30th September, 1954, absorbing Rs. 2,00,000 (Rs. 80,000), leaving a balance to be carried forward to credit of profit and loss account of Rs. 39,061 (Rs. 5,181). Depreciation provided at the usual rates absorbed Rs. 71,194, while expenditure during the year on new batteries and wiring amounting to Rs. 9,959 was written off in accordance with the usual practice. Full provision has been made in the accounts for Central and State taxation.

Crushing operations commenced on 7th December, 1953, and concluded on 24th March, 1954. The cane crushed and sugar produced was 18,96,330 maunds and 1,90,573 maunds respectively as compared with 25,24,444 maunds and 2,44,069 maunds in 1953. The yield percentage was 10.05 (9.67). The results for the year can be considered as quite satisfactory when compared with those of the previous season and this in spite of the difficulties encountered in regard to flooding and price agitation by cane growers to which reference was made in last year's report.

The minimum cane price, cane cess and cane co-operative societies' commission remained the same as in the previous year. Government control over the sale of sugar continued throughout the year, but satisfactory prices were obtained for the stocks released for free sale.

A bonus at the rate of 2½ annas per maund of sugar produced and amounting to Rs. 29,777 was paid to workers under the terms of the Government of Uttar Pradesh, Labour (A) Department Order, dated 10th January, 1955.

A new steel chimney accounted for the major portion of the expenditure. The small loss resulting from the Company's farming operations during the year was partly attributable to floods. A new tractor was purchased during the year in replacement of a worn out machine.

Season 1954-55 *Prospects.*—This season's crush at 24,83,996 maunds has been satisfactory and the recovery at 10.16 per cent. slightly better than that in season 1953-54. The results, should, therefore, be satisfactory unless the position is materially affected by the recent 50 per cent. increase in the excise duty, the surplus sugar stocks in the country and the fall in sugar consumption. Prospects for the season from the Company's farming operations seem fairly good.

Accounts in brief are as under:—

Gielle Tea Co., Ltd.

The directors of the above Company (Secretaries: Messrs. Davenport and Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1954.

Despite a severe drought early in the season a crop of 2,84,204 (2,45,013) pounds of tea was made and this was sold in the auctions at favourable rates. The net average sale price was As. 49.13 (As. 37.02) and the total working cost per pound of tea produced was As. 28.64 (As. 27.07).

The gross profit for the year is Rs. 3,48,539 (Rs. 1,48,725) out of which the directors have allowed Rs. 62,015 (*nil*) for taxation and Rs. 28,564 (Rs. 25,713) for depreciation, and they have allocated Rs. 90,000 (Rs. 10,000) to renewals and additions reserve. Allowing for these and the other adjustments shown there is a net profit of Rs. 1,65,758 (Rs. 1,01,668). The preference dividends for the years 1952, 1953 and 1954 and an interim dividend of 10 (*nil*) per cent. on the ordinary shares were paid on the 2nd May, 1955, absorbing in all Rs. 56,000 and there remains a final balance on this account of Rs. 1,29,350 (Rs. 36,592) which the directors propose to deal with as follows:—

Transfer to staff reserve Rs. 12,500 (Rs. 5,000), transfer to general reserve Rs. 50,000 (*nil*), pay a final dividend of 15 (*nil*) per cent. on the ordinary shares absorbing Rs. 30,000 (*nil*) and to carry forward to 1955 Rs. 36,850 (Rs. 19,592).

Estimates for 1955 are based on a crop of 3,350 maunds at a total cost of Rs. 5,32,264 equal to As. 31.78 per pound of tea. In addition some Rs. 32,250 will be spent on improvement to factory buildings, labour houses and a tractor and trailer.

Accounts in brief are as under:—

Nagaisuree Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers and Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1954.

The accounts disclose a profit of Rs. 13,50,639 (Rs. 9,04,843). On transfer of this sum to profit and loss account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 10,39,227 (Rs. 6,99,278), of which the directors have transferred Rs. 3,25,000 (Rs. 1,79,000) to revenue reserve and Rs. 2,50,000 (Rs. 2,00,000) to buildings and machinery reserve. An interim dividend of 5 (*nil*) per cent. was paid on 23rd November, 1954 leaving Rs. 4,16,227 now to be dealt with. It is proposed to pay a final dividend of 35 (25) per cent. and to carry forward Rs. 80,227 (Rs. 80,278).

Tea crop was 14,619 maunds as compared with 13,169 maunds in 1953. The average selling price was Rs. 2-12-5 per lb. as against Rs. 2-1-10 per lb. in the previous year. Planted area remained at 1,124.90 acres.

Estimates for 1955 provide for a crop of 12,000 maunds at an outlay of Rs. 16,02,860, including inland freight and sale charges.

Accounts in brief are as under:—

Okayti Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1954.

The accounts disclose a profit on the season's working of Rs. 1,95,358 (Rs. 45,994). On transfer of this sum to profit and loss account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 1,51,018 (Rs. 23,948) of which the directors have transferred Rs. 40,000 (Rs. 5,000) to revenue reserve, Rs. 45,000 (Rs. 5,000) to buildings and machinery reserve, and Rs. 10,000 (Rs. 2,500) to hail reserve. Dividends on the preference shares for seasons 1953 and 1954 and an interim dividend of 5 (*nil*) per cent. on the ordinary shares were paid on 28th March, 1955, leaving Rs. 44,018 (Rs. 4,448) now to be dealt with. It is proposed to pay a final dividend of 32½ (*nil*) per cent. on the ordinary shares and to carry forward Rs. 11,518 (Rs. 4,448).

Tea crop weighed out at 2,264 maunds as compared with 2,250 maunds estimated and 2,045 maunds in 1953. The average selling price was Rs. 3-7-3 per lb. as against Rs. 2-8-2 per lb. in the previous year. Planted area remains at 505 acres.

Estimates for 1955 provide for a crop of 2,250 maunds at an outlay of Rs. 4,68,670, including inland freight and sale charges.

Accounts in brief are as under:—

LIABILITIES	Rs.	ASSETS	Rs.

Rs.	4,15,091	Rs.	4,15,091

Phaskowa Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December, 1954.

The accounts disclose a profit of Rs. 2,61,189 (Rs. 1,72,835). On transfer of this sum to profit and loss account and after sundry adjustments, there is a balance at credit of that account amounting to Rs. 2,45,127 (Rs. 1,81,356), of which the directors have transferred Rs. 75,000 (Rs. 1,00,000) to revenue reserve and Rs. 65,000 (Rs. 25,000) to buildings and machinery reserve. The directors recommend that a dividend of 30 (10) per cent. be declared at the annual meeting, leaving Rs. 30,127 (Rs. 31,356) to be carried forward.

Tea crop was 3,201 maunds as compared with 3,150 maunds in 1953. The average selling price was Rs. 2-10-0 per lb. as against Rs. 2-0-4 per lb. in the previous year. Planted area remains at 347.62 acres.

Estimates for 1955 provide for a crop of 3,000 maunds at an outlay of approximately Rs. 4,28,910, including inland freight and sale charges.

Accounts in brief are as under:—

LIABILITIES	Rs	ASSETS	Rs.
Capital ...	2,50,000	Block ..	2,30,000

Rs.	7,85,657	Rs.	7,85,657

Walford Transport Ltd.

The directors of the above Company (Manager: Mr. R. R. Aiyer, Calcutta) submit the annual accounts of the Company for the year ended December, 1954.

After writing off Rs. 55,020 (Rs. 37,957) for depreciation, and setting aside Rs. 1,15,703 (*nil*) for taxes, the available profit for the year is Rs. 3,58,141 (Rs. 2,15,622) including Rs. 1,38,899 (Rs. 1,96,536) carried forward from the last account. It is recommended that this sum be dealt with as follows:—

By payment of a dividend of 11 (8½) per cent. per annum on 2,10,200 preferred ordinary shares, absorbing Rs. 23,122 (Rs. 17,867), payment of a dividend of 12 (7) per cent. per annum on 8,40,800 ordinary shares, absorbing Rs. 1,00,896 (Rs. 58,856), transfer to contingency reserve of Rs. 1,00,000 (*nil*), thereby bringing it to Rs. 6,00,000 Rs. 1,00,000 (*nil*) and to carry forward Rs. 1,34,123 (Rs. 1,38,899).

With the revised policy of the Government of India as it related to the manufacture of automobiles in the country, major changes previously forecast took shape during the year. Many automobile dealers were left without franchises and this Company was one which was partially affected. During the year under review, General Motors (India), Ltd. whose franchise was valuable, ceased operations. It was, however, possible to maintain a reasonable volume on account of bulk Chevrolet vehicle releases as a result of closing down of the plant. This source has since completely dried up and the Company, foreseeing what would happen, took up additional franchises for Studebaker trucks and station wagons for West Bengal and DeSoto and Fiat vehicles for the State of Assam. However, with the limited supplies the Company gets, it is anticipated that the earning capacity during 1955 will be restricted. It would thus appear prudent to provide for as large a reserve and carry forward balance as possible to the 1955 accounts.

Accounts in brief are as under:—

Alcock, Ashdown & Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Turner Morrison and Co., Ltd., Bombay) submitted the audited accounts of the Company for the year ended 31st December, 1954.

Adequate provision has been made in the profit and loss account for depreciation, employees' gratuities, income-tax and super-tax. After giving effect to the above provisions and transfer, the profit and loss account show a profit of Rs. 4,71,218 (Rs. 3,33,802) to which must be added the carry forward from last year of Rs. 82,377 (Rs. 82,796), making a total of Rs. 5,53,596 (Rs. 4,16,597) available for disposal. The directors paid a dividend at the rate of 12½ (10) per cent. per annum (free of income-tax) Rs. 4,17,775 (Rs. 3,34,220) and carried forward to next account Rs. 1,35,821 (Rs. 82,377).

Accounts in brief were as under:—

MONEY COMFORTABLE

(From Our Own Correspondent)

BOMBAY, 22nd June

The short-term money market continued to experience easy conditions during the week under review also. Though a few banks continued to be good borrowers, the available supplies were more than adequate to meet their requirements. As in the past week, inter-bank call money fetched no more than 2½ per cent. among Exchange banks and big Indian banks; indeed occasional business was put through even at 2¼ per cent. for overnight funds. The rate among the smaller Indian banks remained unchanged 2¾ per cent. Short-term deposits were taken up at 3 per cent. for one to six months.

The aforesaid comfortable conditions were duly reflected in the results of this week's sale of three months' Government of India Treasury Bills. The total amount offered was higher than in the previous week and the rate declined further. Thus, the offerings aggregated Rs. 277 lakhs, as compared with Rs. 248.75 lakhs in the preceding week. The average rate of accepted tenders declined from Rs. 2-8-5 to Rs. 2-8-2 per cent. per annum.

After two weeks of successive expansion by an aggregate amount of Rs. 15.19 crores, notes in circulation contracted by Rs. 10.05 crores during the week ended 17th June, 1955. Disclosing this, the Reserve Bank's statement for that week shows a rise of Rs. 10.82 crores in notes held in the Banking Department. The resultant increase of Rs. 77 lakhs in the total notes is covered by a similar rise in rupee coin. In the Banking Department, an increase of Rs. 1.79 crores is noted in deposits of the Central Government, Rs. 21 lakhs in those of other Governments and Rs. 93 lakhs in those of banks. On the assets side, there has been a drop of Rs. 1.51 crores in balances held abroad. Loans and advances to Governments show a decline of Rs. 31 lakhs and other loans and advances Rs. 1.02 crores. The fall in the latter is mainly due to a decrease of Rs. 1.18 crores in advances to Scheduled banks against usance bills. Fresh borrowings against usance bills during the week amount to Rs. 3.70 crores. Investments disclose a fall of Rs. 1.47 crores.

No notable variations are disclosed by the consolidated statement of position of Scheduled banks for the week ended 10th June, 1955, as compared with that for the previous week. Demand deposits are higher by no more than Rs. 82 lakhs and time deposits by Rs. 1.51 crores. Inter-bank borrowings are also higher by Rs. 31 lakhs. Borrowings from the Reserve Bank show a small drop of Rs. 22 lakhs and those from the Imperial Bank Rs. 56 lakhs. An increase of Rs. 36 lakhs is seen in advances, while inland bills purchased and discounted have gone down by Rs. 2.95 crores. Foreign bills are, however, up by Rs. 19 lakhs. Investments have gone up by only Rs. 38 lakhs. Cash on hand and balances with the Reserve Bank are together lower by Rs. 99 lakhs and balances with other banks in current account by Rs. 10 lakhs. Money at call and short notice shows an increase of Rs. 76 lakhs.

The Gilt-edged market continued to rule firm during the week under review, with buyers over in most of the short and medium-dated securities. In the absence of sellers, turnover, however, was restricted. Up to the time of writing, no indication is available of the terms of the forthcoming loan of the Central Government. The general expectation of the market now is that it will be a 12-year loan at an issue price of Rs. 98 per cent. Earlier expectations were that it will be a 10-year loan having an issue price of Rs. 98-8.

3 per cent. 1957 hardened by As. 2 to Rs. 99-11 and there were buyers even at that level. 3 per cent. 1958 was unchanged at Rs. 99-8, but was in good request. 3 per cent. 1959-61 was wanted at Rs. 98. 3 per cent. 1963-65 dropped to Rs. 94-2. 3 per cent. 1964 was in demand at Rs. 94-2 *ex-voucher*. 3 per cent. 1966-68 gained an anna to Rs. 91-3. 3 per cent. 1970-75 had buyers at Rs. 87-2. 3 per cent. 1986 Conversion Loan gathered an anna to Rs. 89-9, at which level there were sellers. 3½ per cent. 1961 was maintained at Rs. 99-14. 3½ per cent. 1964 had transactions at Rs. 98-14.

In the foreign exchange section, the rupee disclosed some weakness in terms of the U.S. dollar, the banks' selling rate for ready dollar having gone up from Rs. 479¾ to Rs. 480¼ per $100 and the buying rate from Rs. 475¼ to Rs. 476 per $100. This in tune with a similar trend displayed by sterling in terms of the U.S. dollar. Thus, in New York, spot sterling gave way from $2.79¾-2.79½ to $2.78¾. Three months forward also dropped from $2.77¼-2.78 to $2.77.5/16-2.77.7/16 and transferable sterling from $2.77.3/16-2.77.5-16 to $2.77½-2.77¼.

DEMAND FOR HIDES BRISK

(From Our Own Correspondent)

KANPUR, 19th June

During the week under review, the hides and skins market ruled steady, although supply position was slightly easier. There was brisk demand for high grade cow and buff. Madras dealers were lukewarm. Messrs. Cooper Allens headed the local tanners who were the main purchasers. Fresh arrivals were quite considerable.

The latest quotations are: Wet salted cow 1st grade Rs. 360, 2nd grade Rs. 280 and 3rd grade Rs. 120 per score; wet salted buff 1st grade 1 lb. 12 ozs. and 2nd grade 1 lb. 14 ozs. per rupee; goat 1st grade Rs. 250 to Rs. 275 and 2nd grade Rs. 200 to Rs. 225 per 100 pieces; sheep Rs. 200 per 100 pieces.

SPURT IN BULLION

(From Our Own Correspondent)

BOMBAY, 22nd June

A sudden spurt in prices of both silver and gold in the last two days was the outstanding feature of trading in the bullion market during the week under review. The flare-up in prices was due to a large demand for gold from Madras, Calcutta and Delhi and good offtake in silver, which in turn encouraged bull manipulations and heavy bear covering. During the earlier part of the week, the market ruled quiet with a slight fall in prices, thanks to waning demand in the ready section and easier advices from upcountry centres.

The clause under which bulls had to deposit margin on their outstanding purchases in gold in the *Ashad* settlement on Wednesday last week (15th inst.) became inoperative the following day, as the closing price fell below the starting rate (Rs. 91-4) for that settlement, although it was more than Re. 1-8 above the closing rate for the next settlement. However, when *Ashad* gold stood at Rs. 92 at the close of business yesterday and was over Re. 1-8 above the closing rate for *Shravan* settlement, the bulls were once again obliged to deposit a margin of Rs. 25 per tola on their outstanding purchases in *Ashad* settlement.

Silver for forward delivery in *Ashad* settlement opened at Rs. 155-14 and dropped to Rs. 155-1 on Saturday. A smart recovery, however, set in after mid-week and a high of Rs. 157-4 was touched before closing at Rs. 156-13. *Shravan* silver declined from Rs. 155-1 to Rs. 154-1, but gained ground to Rs. 155-14.

Ready silver (.996 Mint) closed a shade lower at Rs. 158-0, after touching a low of Rs. 156-5 during the week. The floating stocks of silver are estimated at 900 bars. The daily average offtake was 25 bars.

Gold for forward delivery in *Ashad* settlement declined from last week's closing of Rs. 91-11 to Rs. 90-10, but recovered to Rs. 92-9 today, before closing at Rs. 92-4. *Shravan* gold was marked up from Rs. 89-11 to Rs. 90-5.

Ready gold, after slipping down from Rs. 95 to Rs. 92-14, made good the fall and closed at Rs. 94-10. The floating stocks of gold are reported to be 15,000 tolas. The daily average arrivals were 3,000 tolas; the offtake also was of that order, on an average.

In London, there was a further decline in the price of silver during the week. Spot silver moved down from 77¾d. to 77¼d. and forward from 77¾d. to 76¾d. per fine ounce. Gold, on the other hand, hardened, from £12 10s. 10½d. to £12 11s. 3½d., thus more than making good the recession in the previous week. This is the highest level to be seen since 7th March last. In New York, silver was unchanged at 89½c. per fine ounce.

The following comparative table shows the trend of the market during the week under review:

	22-6-55	Highest	Lowest	15-6-55
	Rs. a.	Rs. a.	Rs. a.	Rs. a.

EXPORT TEA IN STRONG DEMAND

(From Our Own Correspondent)

CALCUTTA, 21st June

Strong and active demand pushed up sizably the prices of tea that was offered for export sale during yesterday's auctions. Offerings aggregated 19,500 chests. Good support was given to the few plain liquoring Assams, the tippy B.O.Ps. of which were raised to sell As. 4 to As. 8 above brokers' valuations. However, Dooars tea with inferior leaf appearance was easy. Darjeelings received a good demand, and prices rose above valuations. Prices of well-made whole-leaf grades regained by As. 2 to As. 4. The quotations were: Plain B.P. Rs. 2, plain black pekoe Rs. 2-11, to Rs. 2-12 (nominal), medium Assam B.P. Rs. 2-1 to Rs. 2-2, best C.T.C. Assam B.P. Rs. 2-6 to Rs. 2-7. (Nominal).

With the above strong conditions in the export market, the price of export quotas also rose. Rights changed hands at As. 6½ to As. 6¾ but sellers were asking As. 7 a lb.

There was no dust sale last week, as the quantity was not sufficient. Leaf grades offered for internal consumption amounted to 1,449 packages and 178 packages of old and new seasons' teas, respectively. Conditions were firmer and prices were lower. There were withdrawals.

LINSEED FIRM

(Messrs. A. Bradley & Co.)

CALCUTTA, 20th June

The linseed market ruled firm during the week and trading was small. Sellers were very reserved, owing to poor arrivals and absence of selling orders from upcountry. There were fairly keen enquiries from crushers for ready and forward delivery, but only small lots changed hands. The oil market was very firm; sellers were reserved despite better prices offered by shippers.

Latest quotations are: June-July Rs. 16-8 and August Rs. 16-12 per maund.

COTTON STEADY

(From Our Own Correspondent)

BOMBAY, 22nd June

Although there was a distinct improvement in sentiment in the forward section of the local cotton market, towards the close of the week under review, the general trend in the earlier part of the week was downward. Many factors contributed to the earlier weakness. In the first place, the expectations of an announcement regarding the reduction in export duty did not materialise. Secondly, the reports from the interior, especially from the Saurashtra region, and from the spot market continued to be bearish. Thirdly, the market was rocked by rumours that the Government would reduce the floor prices for the 1955-56 crop by Rs. 50. The net effect of these factors was to depress the price of futures. Towards the close of the week, however, the contract gathered some strength, thanks to good speculation support at lower levels, induced by mill demand for spot cotton.

In view of the more encouraging reports of the current crop outturn from certain regions, some trade quarters are now inclined to revise upwards the total crop estimate for the current season. It is now placed at 49½ lakh bales (commercial crop) or 52.2 lakh bales of total crop. Mill consumption of Indian cotton in the first seven months of the 1954-55 season aggregated 23.7 lakhs bales. Assuming that this rate is maintained during the rest of the season and also allowing for some reduced consumption in Kanpur arising out of the strike situation in the mills in this region, some trade estimates place the mill consumption this season at 41 lakh bales. Allowing for exports of 2½ lakh bales till the end of August, the total disappearance is estimated at 43½ lakh bales. This should leave a surplus of about 6 lakh bales in the current crop. This surplus, however, according to some trade circles, will consist mostly of inferior cotton. If this calculation turns out to be correct, the prices of good quality stocks are expected to improve as the season draws to a close.

I.C.C. August opened the week at Rs. 568½ or Rs. 3 lower than the previous close of Rs. 571½ and moved up, on the following day, to Rs. 574¼, the highest level of the week. Speculative selling depressed prices, so that the contract moved down to a low of Rs. 566½ on 20th inst. This trend gained further momentum on the following day when the contract touched Rs. 566, the lowest level for the week. Although the lowest level was repeated today there was good support just before the close, bringing about a smart recovery in value. The earlier losses were wiped out and the contract closed steady at Rs. 573, that is, with a gain of Rs. 4-8 over the week.

The following is the trend of prices in the forward section during the week under review:

	Up	High	Low	Closing
I.C.C. August ..	Rs. 568½	574¼	566	573

Moderate activity was witnessed in the spot market where good business was reported in Vijay, Surti, Kalyan, Hubli and Jayadhar. The foreign section was dull since import licensing has been stopped for the time being. The following are the latest available quotations from the Sewri market:

Bengal Deshi Rs. 530-40; Berar Jarillas Rs. 600; Khandesh Rs. 575; Vijay Rs. 750; Oomra *Deshi* Rs. 525; Moglai Rs. 460.

Steady conditions were witnessed in the Karachi cotton market during the week under review. In the forward market, profit-taking at higher levels led to fractional losses, though the undertone remained firm. N.T. July was quoted at Rs. 70-5 as against Rs. 71-4 last week and N.T. January Rs. 67-5 as against Rs. 67-12. The latest available quotations from the Karachi market are:

Sind *deshi* Rs. 58; Punjab *deshi* Rs. 53; 4F. Punjab R.G. Rs. 66-11; S.G. Rs. 71-11 to Rs. 73-11; L.S.S. Punjab R.G. Rs. 70-11; S.G. Rs. 75-11; N.T. R.G. Rs. 75-11; S.G. Rs. 80-11; 289 Punjab R. G. Rs. 76-3; S.G. Rs. 81-3.

In Africa, the Sudan Gezira Board sold 8,903 bales in the auction held on four different days during the week ended 11th June. In recent weeks, certain communist countries have evinced keen interest in Sudan cotton. Czechoslovakia is reported to have bought 10,000 bales, almost entirely of 'L' cotton, under a trade agreement involving sugar and cotton. Similar deals are expected to be concluded with Sudan by a few other communist countries.

Forward trading in Alexandria, as already stated in these columns, is expected to commence with effect from 1st September. The Egyptian Cotton Commission, it is stated, will take over all unsold stocks as on 31st August at 1954-55 buying prices. Exports from 1st September to 8th June (1954-55) aggregated 554,513 bales (or 4,047,945 cantars), as against 834,703 bales (or 6,093,332 cantars) during the same period last year. These included 264,799 bales Karnak, 151,347 bales Giza 30, 123,539 bales Ashmouni and 14,065 bales Menoufi.

In the Alexandria cotton market, there was good demand for certain grades of Karnak reported to be in short supply. Prices for these grades, therefore, advanced sharply. Enquiry for Giza 30 was moderate, and Ashmounis were generally neglected.

In the Liverpool cotton market there was a steady improvement in prices, thanks to a fair volume of American buying and some trade fixing. The latest available quotations from Liverpool are: July-August, 31.46d.; October-November 30.68d.; December-January 30.42d. and March-April 30.21d.

The New York Cotton Exchange reported modest gains over this week. This is attributed to less favourable weather reports. Cool weather in the main cotton belt and rains in certain sections, it is stated, have delayed chopping operations and promoted insect activity. The upward trend in prices

was assisted by commission house buying and short-covering.

Mills' consumption of cotton from 1st August to 28th May, 1954-55, aggregated 7.4 million bales or 145,000 bales higher than in the corresponding period in 1953-54.

The uncertainty over the cotton export policy of the U.S. Government still continues. The chief question, of course, is that of the grant of a subsidy. The members of the Cotton Export Advisory Committee, which has been appointed by the Government to examine the export position and suggest measures for improving export trade, are said to be divided on proposals to increase exports.

The following are the latest available quotations from the New York market as compared with those a week and fortnight before:

(In cents per lb.)

	21-6-55	14-6-55	7-6-55
Spot	35.00	34.85	34.65
July	34.25	34.00	33.83
October	34.22	34.17	33.98
December	34.26	34.26	34.02
March	34.23	34.19	33.95
May	34.28	34.29	34.01
July	33.63	33.50	33.21
October	33.05	33.02	32.75

COTTON YARN EASY

(From Our Own Correspondent)

BOMBAY, 22nd June

The staple fibre yarn market presented a firm trend during the week under review. Enquiries from consuming centres continued to be quite encouraging. There was, therefore, an all-round improvement in values. Staple fibre yarn (40×2) for June delivery, for instance, gradually moved up from Rs. 595-8 to Rs. 598 before finishing at Rs. 597-8. July delivery was higher at Rs. 595-8 today, as against Rs. 593-8. Both indigenous and foreign yarns (40×2) in the spot section recorded a rise in prices. Among the former, Citys advanced by As. 2 to Rs. 3-5-3. New Greats spurted by nine pies to Rs. 3-2-6. Kohinoors and Seksarias gathered half an anna each to Rs. 3-5-6 and Rs. 3-1, respectively. Among foreign yarns, Suicos gained six pies to Rs. 4-14. Shincos rose by a like amount to Rs. 4-12.

Thanks to scarcity of stocks, the spot prices of rayon yarn ruled strong. 120 Japan picked up 15 pies to Rs. 3-14-9. 120 Italy was sought an anna higher at Rs. 3-12. 150 Japan increased by six pies to Rs. 3-14-6. 150 Italy was fully steady at Rs. 3-9. Among indigenous yarns, National Rayons 120 Bt. cones 2nd grade rose by three pies to Rs. 4-0-6. 150 Bt. cones 1st and 2nd grades were fully maintained at last week's levels of Rs. 3-9 and Rs. 3-8-3, respectively. In the forward section, 150 June which had gone up by Rs. 3 last week receded to Rs. 732 for want of follow-up support.

Conditions in the cotton yarn market were easy. The easiness was due to rumours regarding imposition of excise duty on hosiery goods and of closure of several powerloom factories, notwithstanding reduction in the licence fee. There was, therefore, some selling and prices drifted lower. Among 10s, Podars and Elphinstones receded by As. 2 each to Rs. 12-8 and Rs. 11-14, respectively. Among 20s, Centurys declined from Rs. 15-4 to Rs. 15-2. Raghuvamshis lost an anna to Rs. 16-2. Deals in 40 count yarns were put through at reduced rates, Moderns, Gokaks and Seksarias losing As. 4 each to Rs. 24-12, Rs. 23 and Rs. 21, respectively. Among 60s, Finlays fell by a rupee to Rs. 60. Raghuvamshis decreased by As. 4 to Rs. 55. Elphinstones were easy at Rs. 48-3, as against Rs. 48-4. Among 80s, Finlays went down by a rupee to Rs. 67-8. Yarns of 30 counts, however, were fully steady, Maduras being quoted at Rs. 20-12 and Moderns at Rs. 20-8.

The table below gives the prices of art silk staple fibre and cotton yarns quoted today, as compared with those a week before:

	22-6-1955	15-6-1955
	Rs. a.	Rs. a.
Art silk yarn—		
150 D. June	732 0	733 0

OILSEEDS FORCE AHEAD

(From Our Own Correspondent)

BOMBAY, 22nd June

Last week's firm trend in the oilseeds market persisted this week also. The firmness emerged as a result of fresh support and renewed short covering. The castorseeds section was particularly active, thanks to considerable buying enquiries inspired by reports that the U.S. was eager to secure supplies of Indian castor oil even by chartering tankers, in view of the uncertainty regarding levy of 35 per cent. surcharge on freight. The volume of transactions put through in the linseed section was quite large, the chief driving force being the rush of shippers who had booked freight heavily by chartering tankers to fill with linseed oil in the absence of fresh export quota for groundnut oil. The sentiment was also influenced favourably by reduced arrivals from growing centres in the face of keen demand from crushers. In sympathy with castorseeds and linseed, coupled with withdrawal of selling pressure due to firm advices from upcountry centres, the groundnut section also ruled buoyant. Trading in *kardi* seeds and *niger* seeds was very brisk, the interest of operators having been whipped up by (a) the release of an overall export quota of 20,000 tons of these seeds (combined) which would be licensed freely but subject to a maximum of 250 tons per shipper, and (b) the decision to continue the free licensing of exports of *niger* seed oil and *kardi* seed oil up to the end of December next. The undertone of the market was fully firm and prices forged ahead, touching new high levels in the recent upward trend.

Under the impetus of considerable bull support, castorseeds September delivery moved up to touch a high of Rs. 81-14 today, as against Rs. 76-4 last week-end. Madras quality rallied As. 12 to Rs. 15-6. Kanpur advanced by As. 10 to Rs. 14-6. The firmness in seeds prices followed a swift rise in the quotations for castor oil. Induced by reports of business with the U.K. at £88 per ton, B.S.S. recorded a rise of As. 11 to Rs. 10-5. First pressure and commercial hardened by a rupee each to Rs. 10 and Rs. 9-8, respectively.

In the groundnut section, June-July was in special request, its quotation increasing by Re. 1-4 to Rs. 21-10. Bold F.A.Q. rose by a rupee to Rs. 21-10. Coromandal ready and Khandesh quality picked up As. 12 each to Rs. 22 and Rs. 22-6, respectively. August-September was bid at Rs. 22, as against Rs. 21-6 a week before. Groundnut oil ex-mill strengthened from Rs. 11-7 to Rs. 11-14. Railway receipt put on As. 8 to Rs. 11-13. June delivery rose by As. 7-6 to Rs. 11-13. July and August deliveries finished As. 7 higher, the former at Rs. 11-14 and the latter at Rs. 12.

Traders are somewhat intrigued at the delay in the release of a fresh export quota for groundnut oil. It is reported that there are no unutilised quotas, while the U.K. and Continental interests have been keen buyers of Indian groundnut oil. The Bombay Oilseeds Exchange Ltd. has sent a telegram to the Chief Controller of Exports urging the Government to announce its export policy for groundnut oil at the earliest.

Linseed Bold ready evoked good attention of operators and strengthened by As. 8 to Rs. 24-8. June-July and August-September were both higher at Rs. 24-8, as against Rs. 23-15. Indore quality improved by As. 3 to Rs. 24-8. Linseed oil ready was done As. 8 higher at Rs. 15-4.

Among other oilseeds, *kardi* seed June-July delivery met with special buying support and advanced by Re. 1-2 to Rs. 13-6. Ready Bold gained a rupee to Rs. 13-4. *Niger* seed Madras quality gathered Re. 1-2 to Rs. 20-10 and F.A.Q. Re. 1 to Rs. 20-8.

The following table shows the prices of oilseeds and oil today, as compared with those at the end of the previous two weeks.

	22-6-1955	15-6-1955	8-6-1955
	Rs. a.	Rs. a.	Rs. a.

SUGAR QUIET

(From Our Own Correspondent)

BOMBAY, 22nd June

Quiet conditions prevailed in the sugar market during the week under review. There was a fall in the ex-mill quotations for sugar in Kanpur and Bombay Deccan area, following further release of sugar for sale in the free market. The sentiment of operators was also affected by larger arrivals of indigenous sugar into the market, aggregating 17,700 bags, as against 8,600 bags in the previous week.

In the forward section, *Shravan* delivery declined by As. 2 to Rs. 88-6 per bag. In the spot section, medium grain sugar was quoted at Rs. 90-91, as against Rs. 91 last week. Large grain remained unaltered at Rs. 93-Rs. 100. Deals in small grain sugar were put through at Rs. 88. Among foreign sugars, British refined sugar and German sugar were quiet at Rs. 84 and Rs. 79-14, per 2 cwts., respectively.

The Union Food Ministry has announced a further release of sugar for sale in the free market, bringing the total release from the current season's production to about 65 per cent. The share of Bombay Deccan mills in the additional release is estimated at 8,000 tons. The offtake of sugar from the Deccan area has so far been fairly good. The unsold released stocks in this area are not considered to be substantial enough to meet the local demand, as also the demand from the interior, Gujerat, Madhya Pradesh and Hyderabad sides. Transport bottleneck continues to be a problem and movement of sugar is still very slow. The stocks of imported sugar lying with the Regional Directorate (Food), Bombay, it is reported, have been depleted; these are now estimated at 4,000 tons.

N.B.—The rates for Indian sugars are inclusive of sales tax, while those for foreign sugars are exclusive of the tax.

PEPPER STEADY

(Messrs. Parekh & Co.)

BOMBAY, 22nd June

Despite slow demand from the U.S. during the week, all primary markets were steadily held, the highest and the lowest at Alleppey being Rs. 1,175 and Rs. 1,150 respectively. There appears no anxiety on the part of the growers to press sales on an unwilling market as they think that the present restricted buying by New York dealers is likely to create some shortage of spot in the coming months which fact may ultimately induce aggressive buying from the U.S. for covering its autumn requirements.

In spite of new crop arrivals, Sarawak is reported to be very steady. The Continent which was out of the market for some time seems now to have entered the market, though enquiries are slow. If such enquiries are enlarged, Sarawak may show improvement and such improvements are likely to have their reflections on other supplying markets. At the time of writing, however, there is some liquidation of tired longs in Bombay and there are sellers for June and July shipments at $0.49 and $0.48½ respectively. At Alleppey there are sellers at Rs. 1,137½.

In the delivery section there is a marked fall in prices owing to liquidation by weak holders and pressure of sales by bears. July and August deliveries are quoted at Rs. 1,035-45.

New York after paying for afloat at $0.50½ is now reported asking $0.49. Selling pressure of unsold consignments is reported to be responsible for the present fall of 2 cents in spot.

Following are today's nominal quotations:—Ready delivery Rs. 150 (as against Rs. 150 a week ago) per Bengal maund. July Rs. 1,035-45 (Rs. 1,070-80), August Rs. 1,035-45 (Rs. 1,060-70) and September Rs. 1,020-30 per candy of 5½ cwts.

QUALITY OF TEA ON OFFER FALLS

(Messrs. Forbes, Ewart and Figgis Ltd.)

COCHIN, 16th June

Approximately 1,950,000 lbs. were on offer in sale No. 12 which was held on Tuesday, 14th June. Quality showed a falling away from the previous auction and there were a number of "rush" teas on offer of poor leaf appearance. These types do not find ready buyers and we cannot stress too strongly the necessity for making clean teas of good appearance. There was a good demand which originated mainly from internal buyers. However, low medium teas and those of poor leaf appearance were irregularly one anna easier. Medium teas of good leaf appearance, suitable for the Middle East, sold well at rates which were often dearer. Best liquoring teas were irregularly easier with buyers following quality. Fannings of all types met with a good demand and there was keen competition for whole leaf grades and prices for these types advanced. The following are the quotations:—

	1955	1954
	Rs. a. p.	Rs. a. p.
Low grown Travancore B.O.P.	1 9 6	2 9 0
Medium Travancore B.O.P. ...	1 11 0	2 10 0
Anamallais B.O.P.	2 0 0	2 13 6
Best liquoring Nilgiri B.O.P. ...	2 3 0	3 6 0
Well made black leaf O.P. ...	2 14 6	2 12 6

London Market—*Sale of 13th June.*—Best sorts 2d. dearer. Mediums and clean plain ½d. dearer. Stalky fibrous teas poor demand, barely steady.

Sale of 14th June.—Tuesday's Ceylon and South Indian market irregular. Fannings and best liquoring strong to dearer with broken grades and low medium descriptions generally rather easier.

Colombo Market.—*Sale of 13th June.*—Good general demand. Firm rates. Best liquoring sorts dearer, particularly fannings.

Sale of 14th June.—Active. Generally dearer, particularly Gulf and fannings.

Calcutta Market.—*Export.*—18,400 packages. Fairly general demand. Prices mostly firm to slightly dearer.

Internal.—Leaf 1,449 new season and 178 old season. Fair but irregular demand. Some withdrawals.

Export Quota.—The market has hardened slightly and there are buyers in Calcutta at 66 pies. Business has been done at 63 pies.

Forthcoming Auctions.—Sale No. 13 will be held on Tuesday, 28th June.

As we go to press, Messrs. Forbes, Ewart and Figgis Ltd. wire:

"*Dust Sale L*:—460,000 lbs. Less demand. Very irregular. Prices approximately As. 6 easier."

RAW JUTE FIRM

(From Our Own Correspondent)

CALCUTTA, 21st June

Bear-covering was a feature in the jute goods market during the week under review. Prices recovered slightly on moderate support from foreign buyers. Heavy goods led the market. The recovery in heavy goods was relating more pronounced than in hessians. This trend, of course, reflected the current statistical position of the respective sections. Foreign buyers were in the market and purchased moderate quantities at lower levels. Trade circles learned with satisfaction that the Indian Jute Mills' Association was considering the question of sending delegations to Australia and New Zealand, and China and other Far Eastern countries, in order to find out the possibility of exploring new markets for Indian jute goods. The countries mentioned have been good markets for heavy goods, but excepting perhaps in the case of Australia and New Zealand, no information is at present available about the packing problems facing the other countries. When once direct contact is made by the jute industry with importers and consumers in other countries, it is felt that the goodwill thus created would result in an increase in the offtake by these countries. What the jute mills require now is an increase in consumption of their production.

Mr. M. P. Birla, who announced last Friday that the question of despatching the delegations was under consideration, stated that at the request of the Government of India a sub-committee of all those directly concerned was preparing a constitution for a well-regulated futures market for jute goods. As and when the draft was ready, it would be forwarded, he said, to the Forward Markets Commission and the Government of India for their acceptance.

During the month of May, there is reason to believe that shipping will be satisfactory; but as in April, heavy goods are on the lead. Their stock as at the end of the current month will record a further reduction. In hessians, on the other hand, shipments are not so much as to reduce stocks, although buyers for export to the United States had been active during this week and took fair quantities. It is expected that in the coming weeks, as shipping to Argentina commences, hessians will regain their liveliness. Mills are looking forward for the new jute crop, which is bound to reduce prices.

Ready B. twills opened steady at Rs. 107-8, and stockists made good use of the reports coming from Assam, which anticipated that floods are likely to damage the jute crop there. At this time, bears intervened and managed to take the rate down to Rs. 105-4. July-September, delivery at Rs. 104-12, was lower by Re. 1-12. At lower levels, covering took place, and the price for the ready position soon gained to close at Rs. 108-8 for the week-end. Yesterday, there was profit-taking and the rate lost to Rs. 108. Ready hessians 40" 10 oz. fluctuated between Rs. 42-11 and Rs. 42-7 and closed yesterday at Rs. 42-8.

Firm conditions were in evidence in the raw jute market. There was only little of the old crop offers, although it is believed that a moderate quantity is held back. Old crop Assam bottoms rose to Rs. 28 from Rs. 27-8.

METALS FIRM

(From Our Own Correspondent)

CALCUTTA, 21st June

Although business transacted in the metal market during the week under review was extremely limited, prices remained firm. This was so because advices from overseas markets indicated confidence among stock-holders. The railway strike in the United Kingdom ended, but consumers of base metals all over the world cannot but be concerned with the threatened strikes in some of the units of the copper industry in the United States. For this reason, consumers in the U.S. were interested in more quantities than actually required by them. This caused prices to rise, and, in conformity, the price in Calcutta for electrolytic copper was higher at Rs. 250, as compared with the opening quotation of Rs. 248. The report that Bombay was quoting a lower price following fresh imports was not reflected on the local quotation, in view of the international trend. Another firm spot was provided in tin, which gained from Rs. 484-8 to Rs. 488. This was in line with higher advices from Singapore where support was given by heavy buying for European countries. This has resulted in Calcutta rates being below the replacement level. Electrolytic zinc was transacted at Rs. 65. Lead at one time declined to Rs. 72 from Rs. 71, but was able to close yesterday at Rs. 72.

KIPS FULLY STEADY

(From Our Own Correspondent)

MADRAS, 20th June

The kip market was remarkably steady this week, despite U.K. buyers' resistance to prices at origin. Arrivals met with good clearance and Madras prices ruled 1d. to 2d. above U.K. importers' level of prices. If this trend were to persist, prices locally would ease to some extent. Shipment business was patchy. Arrivals of cow calf were small and prices ruled very firm in consequence. The buff hides market was slightly easy, while bull calf was steady.

In the tanned skins section, prices of goat and sheep were unchanged. Arrivals were moderate and clearances fair.

GRAM MOVES UP

(From Our Own Correspondent)

HAPUR, 20th June

Foodgrain prices ruled steady to firm during the week. While prices for average quality wheat advanced by As. 4 to Rs. 10-4 per maund, fine farm quality was transacted as high as Rs. 12 per maund at Hapur. Government purchases in markets where wheat average quality was quoted below Rs. 10 were continued and it is estimated that purchases on Government account so far aggregated about 50,000 tons—mostly in the States of U.P. and Punjab. Daily arrivals here averaged for most part of the week at 3,000 to 4,000 maunds and fine quality wheat was in request from Gujerat. Arrivals today were hardly 1,000 maunds, due to solar eclipse, and the wheat stock here is now about 107 *khaties* of 800 maunds each. Prices for red quality wheat are far below the Government purchase price of Rs. 10 per maund in Bundelkhand, being quoted at about Rs. 6-8 per maund, and the Union Government has been urged to extend its price support policy to red wheat also.

The Government of India's decision to give price support to gram prices also coupled with the State Government having arranged to purchase gram at Rs. 6 per maund in 51 *mandis* situated at railheads, has resulted in recording a steady outlook in gram prices which are now quoted at Rs. 6-8 for local quality and at Rs. 7 per maund for Punjab quality and gram stock here is estimated at 8 *khaties*. Prices of barley and *bejhar* also advanced fractionally during the week to Rs. 5-12 and Rs. 5-8 per maund, respectively, today. Ready peas prices continued steady at Rs. 5-12 for green quality and Rs. 6-12 for white quality and, with poor offtake during the week, the peas stock has swelled to 75 *khaties*, the average daily arrivals being 1,000 maunds. *Arhar* prices found support from Madhya Pradesh operators on continued dry weather and advanced by As. 10 per maund to Rs. 7-8 per maund with stocks estimated at 35 *khaties*. Other pulses also recorded fractional gains all round in line with peas and *arhar*.

Pulses futures also ruled firm during last week in line with the ready section and, although future markets were closed today due to solar eclipse, Saturday's closing quotations were: Peas *bhadon* Rs. 5-15-9, *arhar bhadon* Rs. 7-9-9, as against Rs. 5-12-4½ and Rs. 7-2-3 quoted last week-end.

SUGAR RULES DULL

(From Our Own Correspondent)

HAPUR, 20th June

Stagnant conditions prevailed in the sugar market during the week under review and prices remained unchanged at last week's levels. Booking by railways was restricted and Madhya Bharat and Saurashtra were the only purchasers with negligible quantities. Traders were not willing to go in for long commitments, in view of an expected fall in prices, as the supply position is reported to be very easy on account of heavy increase in indigenous sugar production of the season. The latest prevailing rates for mill delivery prices were: Jaswant Rs. 29-2, Simbhauli Rs. 29-3, Mowana Rs. 29-4, Daurala Rs. 30, Amroha Rs. 28-8, Bijnore Rs. 28-8, Daurala Rs. 31, Mansoorpur Rs. 31-4, Rampur Rs. 31-8, retail Rs. 31-8, *khandsari* Rs. 22 to Rs. 27 per maund.

Despite good outside demand and heavy offtake averaging 8 to 10 wagons a day, ready *gur* prices were a shade easy, due to heavy stock position estimated at 65,000 maunds here. The latest Government of India's decision to license export of cane *jaggery* and cane *jaggery* powder freely without any quantitative restrictions up to the end of the year failed to cheer up the market, as exports in the last few months have been poor. *Gur* dry is now quoted at Rs. 9-8 per maund and *kotha* quality at Rs. 9 per maund. The *gur* markets in the South also ruled dull last week. At Baramati (Poona), the season has come to a close. Daily arrivals average 25 to 30 cart-loads and offtake 3,000 to 4,000 *behalas* and stock is estimated at 3½ *behalas*. Prices range between Rs. 9 and Rs. 11-8. In Akloze (Sholapur), the stock is 80,000 *behalas* and prices range between Rs. 8 and Rs. 10-8. In Ankapalli, daily arrivals average 15,000 *behalas* and the rates are Bilticut Rs. 8 to Rs. 10. The demand is from Assam, Calcutta and Madras sides, but the wagons supply position is not satisfactory. In Kolhapur, there are also loading restrictions and the demand is from Bombay and Gujerat sides.

The future markets at Hapur ruled uneven during the week. While prices for *asar* delivery declined in line with weak position in the ready section, prices for *phagun* delivery advanced due to continued want of rains. Opening at Rs. 9-0-9 and Rs. 8-5-9 for *asar* and *phagun* delivery on Monday last, the respective quotations on Saturday were Rs. 8-14-6 and Rs. 8-8-9.

BANKING

(Concluded from page 1211)

10 per cent. per week), do not look so high to the unsophisticated borrower as they really are. However, although the village bank's interest rates appear to be no burden to the small trader, they are much too high for the farmer, and make it difficult for him to accumulate savings for the improvement of his farm. This disadvantage to the functioning of the village bank is recognised by the Government, which is encouraging the transformation of village banks into credit co-operatives.

Rice Bank

The rice bank, unlike the travelling bank and the village bank, makes few loans in cash. Its chief function is to lend rice to the rural population during the critical period before the new harvest, when stocks of food have been exhausted. Because the rice bank needs storage buildings and godowns, which have to be maintained and inspected, it requires a larger investment than the village bank, and its administration is much more difficult and costly. Nevertheless, its importance as a source of credit to the rural people and especially the farmer, although decreasing, is still considerable.

The B.I.R. and the local institutions under its control are still the major components of Indonesia's farm credit system. However, it is the policy of the Indonesian Government, as well as of the farmers' associations, to make a shift in emphasis, from Government control to co-operative control. At the end of 1953, there were 8,108 co-operatives in Indonesia; most of them were founded as credit institutions that later took on other activities such as co-operative marketing, co-operative buying, and the like. Of the total, only 2,390 were co-operatives handling credit only. Membership in 1953 numbered 1,409,735; personal savings amounted to nearly 7.9 million dollars, less than 1 per cent. of it from non-members.

Co-operatives

The credit operations of the co-operative bank closely resemble those of the village bank. Interest rates are the same, and loans are paid back in weekly instalments of 10 per cent. with one additional instalment as interest and another as forced savings. Seasonal credit is granted to farmers at 2 per cent. a month, repayment of the loan in full being required at the end of the period. What chiefly distinguishes the credit co-operative from the village bank is the fact that most of the profits go back to the borrowers.

On the institutional side, judging from the number and broad distribution of banks and co-operatives, Indonesian farmers appear well served, especially when compared with farmers of other Asian countries. But on the basis of the type and quality of service rendered, the picture is much darker. High interest rates make long-term loans for productive purposes such as farm improvement or purchase of equipment and fertiliser too costly to be remunerative to the farmer. Consequently, loans are mainly either short-term loans for consumption purposes, to tide the borrower over financial difficulties, or, more often, commodity loans to small traders and peddlers of village products. The Indonesian Government is at present considering proposals to encourage farm loans that will lead to improved agricultural practices. Fortunately, there are thousands of rural banks that will be able, with relatively few adjustments, to finance effectively any forthcoming programme for agricultural credit.

DELHI LETTER

(Concluded from page 1208)

pect of fine rice, pulses and other food articles. About Rs. 25 to Rs. 30 crores can be expected from export of these items. Coffee is another item which was able to make a valuable contribution to India's foreign exchange during the last two years. With increased area and intensive cultivation, a target of about 25,000 tons per annum should be fixed for coffee in the next Plan. Similarly, it is possible to increase considerably the quantum of export trade in vegetable oils, tobacco, leather goods, pepper, cashew kernels, coir goods, etc. In the pre-war period, India was able to send about 500,000 tons (in terms of oil) of groundnut, linseed and castorseed. With increased irrigation facilities, particularly minor irrigation works, it is likely that, in the coming years, production of oilseeds in the country will increase. Making due allowance for higher consumption, the Government should have a target of about 2.5 lakh tons. There is great scope for the expansion of trade in cashew kernels, pepper and other West Coast products.

Wherever there are possibilities of increasing export trade in agricultural produce or semi-processed goods out of such produce, the Commerce and Industry Ministry should work closely with the Agricultural Ministry and see to it that the production of such goods as are in demand in the export markets is stepped up appreciably. In raw cotton, the demand for short-staple cotton has been remaining somewhat subdued during the last three or four years and the Government will have to allow slightly higher staples for export purposes. It has already done so a few weeks ago. During the second Plan, an export target of about five lakh bales should be fixed for raw cotton. Efforts are being made to set up ferro-manganese plant which will enable the country to send ferro-manganese instead of manganese ore at present.

In the years immediately following the termination of the war and also after the outbreak of the Korean War, the Government was following a fairly rigid export policy, with a view to preventing the inflationary trend and making available as large supplies as possible for internal consumption. But the position has changed and is changing fast. Substantial surpluses are disclosed by a number of commodities and they should be disposed of when the going is good. The administrative section of the Commerce Ministry, dealing with export promotion, should be active and strengthen India's export trade in such a manner as to earn sufficient foreign resources for facilitating the orderly implementation of the second Plan. It can do this only if it formulates a trade plan and invites suggestions from the commercial community concerned.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H=Accounts published half-yearly. P=Company has Preference shares. T=Company has Debentures. N=Nominal quotations x.d.=Ex.Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery, and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year, they represent the proportionate dividend for that period. In the case of those companies which class their accounts yearly, dividends shown are for their financial year. Where, however, the accounts are closed half-yearly, dividends are shown separately for the respective half-years.

* Including bonus.

(a) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Rs. 1-12 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares.

(k) Investments.

(c) For seven months ended 31st March, 1954.

MARKET GOSSIP

(*Concluded from page 1203*)

which are financed directly from the public fisc. About the only thing which is 'private' about the private sector is that it is financed from the earnings and savings of the private citizens and it is these earnings and savings of the middle-class investors that are now under ruthless attack."

This is an admirable exposition of the relative worth of private and public enterprise. If Mr. Shroff is suspicious of the signs of the growing might of the State and of those who advocate such growth and development, he is at least in good company. For, Gandhiji, whom he approvingly quoted, held a similar view. Gandhiji said:

"I look upon an increase in the power of the State with the greatest fear, because, while apparently doing good by minimising exploitation, it does the greatest harm to mankind by destroying individuality which lies at the root of all progress."

• • • •

Although Indian cotton markets are insulated from the world centres for the marketing of cotton, they cannot be altogether oblivious to things happening around them. For one thing, India is a net importer of cotton. Secondly, it is an exporter of cotton goods. As an exporting country, India has enjoyed for the past several years the advantage of comparatively low-priced cotton. But this advantage must gradually disappear, if and when the margin between world cotton prices and Indian cotton prices becomes reduced. World cotton markets are, at present, cautious, thanks to the uncertainty of the U.S. export policy. Many remedies continue to be suggested for the disposal of the U.S. cotton surplus. The Cotton Export Advisory Committee, set up by the U.S. Secretary of Agriculture, Mr. Ezra T. Benson, has not, however, been able to formulate a new export programme. Some reports from the U.S. suggest the possibility of the Government-owned surplus cotton being sold to foreign buyers below the domestic support price. No definite announcement has been made so far. Mr. James A. McConnel, Assistant Secretary, confirmed that the Government was convinced that something must be done promptly to restore American cotton exports. He explained, however, that the Government did not intend to dump huge amounts of surplus cotton on world markets which would inevitably lead to retaliatory measures by other cotton-producing nations. Nevertheless, the objective was to step up exports to about five million bales a year, or about a million and a quarter more than those now anticipated for the current crop year ending 31st July next.

• • • •

Meanwhile, a concrete long-term plan for stimulating exports of cotton and cotton goods from the U.S. has been announced by the Department of Agriculture and the National Cotton Council. It calls for U.S. research and marketing specialists from the Cotton Council to be permanently stationed abroad, in countries yet to be decided, so that they can work with national textile industry groups in the various countries. These specialists will advise the local textile industries on American mass-production methods, with the aim of reducing production costs. Also, they will train personnel in market research. The Plan also envisages the sending of European textile experts to the U.S. Thus, there will be mutual exchange of ideas. It is emphasised, in this connection, that, if the quantity of cotton used in Britain, the Netherlands, France, Italy and Germany could be increased by only 10 per cent., it would increase the demand by about 500,000 bales and "increase the opportunity for U.S. cotton exports."

• • • •

Some financial experts in Europe strongly believe that convertibility of currencies would be achieved some time in 1956. But all indications go to show that the return to convertibility will still remain a distant goal. In the case of Britain, at any rate, there is no reason to expect that the move towards convertibility is imminent. This is evident from the cautious optimism of the British Chancellor of the Exchequer, Mr. R. A. Butler. He said a fortnight ago that there was no question of rushing into convertibility, though in his view, the prospects ahead were good. More or less similar views are expressed by the International Monetary Fund. The Fund's sixth annual report on exchange restrictions, released early this week, says that the progress towards convertibility has so far been gradual and "mainly by means of numerous relatively small measures of relaxation" of exchange restrictions. These relaxations have generally taken the form of greater freedom granted to residents in making payments to non-dollar countries. Non-residents have been provided with facilities not only to transfer funds between non-dollar countries but also to convert inconvertible currencies into dollars. This conversion has, however, not generally been possible at rates within 1 per cent. of parity, but only at rates involving a higher discount from the official exchange rate. But a relieving feature is that in providing these facilities for increased convertibility, the countries have relied more on monetary and fiscal measures than on restrictions on foreign trade and payments—restrictions which would hamper progress towards convertibility. The Fund avers that the momentum towards convertibility exists today in many leading trading countries and that there is a marked trend towards multilateralism and freedom from restrictions.

• • • •

The steady movement towards convertibility as noted above has been rendered possible by the underlying improvement in the economic situation of the free world. Higher levels of income and output, improvement in efficiency of export industries in the main trading countries and an expanded volume of international trade are cited as factors

FINANCE CORPORATIONS IN U.K.

THE PUNJAB NATIONAL BANK

★ ★ ★ DIAMOND JUBILEE ★ ★ ★

SECRETARIAT LIBRARY 25 JUN

SIXTY YEARS OF DEVOTED SERVICE TO INDIA

History of Punjab National Bank Limited

ONE of India's foremost and the oldest banking institutions, the Punjab National Bank Ltd., celebrated its Diamond Jubilee on 12th April, 1955, on the completion of 60 years of existence. The steady growth in its organisational and financial strength, on the one hand, and progressive expansion over the large sub-continent, on the other, testify to the vision, integrity and courage of its early founders. From a modest beginning at Lahore, with a total capital investment of no more than Rs. 20,000, the Punjab National Bank today has 313 branches scattered all over the sub-continent, employs 6,356 persons, accounting for a monthly establishment expenditure of Rs. 11 lakhs. Its deposits and working capital today exceed Rs. 80 and Rs. 100 crores, respectively, and one out of every five of the 28 lakhs constituents of all banks in India belongs to it. The history of the Punjab National Bank, the first among the Indian banks to celebrate its successful completion of 60 years, proves beyond doubt that, given the right type of operative conditions and the right personnel, an Indian bank can function as effectively as any other in the world.

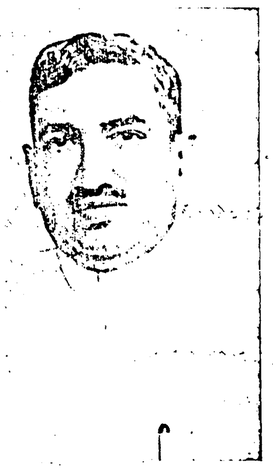
The Background

With foreign interests dominating the economic and the political life of the people towards the close of the last century, there was a growing awareness that the prosperity of the country depended on the successful creation of reliable, efficient and progressive economic and political institutions. The desire to have a purely Indian banking institution organised on Western lines stemmed from a strong desire to participate in the rising tempo of economic and commercial activities. The growth of the canal colonies in the Punjab, on the one hand, and the rapidly expanding economic activity, on the other, led to many attempts to set up credit institutions. But, owing to a number of difficulties and also a desire for quick profits, many of the early ventures failed. The success of the Punjab National Bank is due wholly to the foresight and integrity of its early founders. Associated closely with practically every important contemporary movement in the Province, Sardar Dyal Singh Majithia, the first Chairman of the Punjab National Bank (1895-1900), set the example of indefatigable industry, selfless service and cautious investment for his successors to emulate. Much of the success of the Bank must be attributed to the qualities of the men who guided its activities during the early period.

The history of the Punjab National Bank is best studied against the broader background of India's banking history. The flotation of the Bank synchronised with widespread social and political awakening among the people. Soon after its establishment, the Bank came under the influence of the *swadeshi* movement, which began during the early years of the present century. Under the zealous and selfless industry of its first Chairman, the Bank progressively became popular in the Province and steadily grew in strength from its early beginnings, its paid-up capital rising from the humble Rs. 20,090 to Rs. 62,590 by the end of June, 1896, and deposits with the Bank amounting to Rs. 3,46,046. Fortified by this support and confident that their zealous care of the depositor and solicitude for the economy would ensure their success, the Directors observed in one of their reports that: "We may look forward to a day when the Punjab National Bank will be regarded as a first-class bank and a useful institution for the trade and prosperity of the country."

From the day the Bank commenced its operations, that is, on 12th April, 1895, up to the end of 1900, the Bank followed a cautious policy, with a view to creating the maximum confidence among the depositors. It was during the chairmanship of Lala Lal Chand, a Judge of the Punjab Chief Court and the first President the Hindu Mahasabha, that the Bank opened its first branch at Rawalpindi. The integrity, judgment and zeal of the Chairman, on the one hand, and the dynamic enthusiasm of Lala Har Krishen Lal, Secretary of the Bank, on the other, enabled the Bank to move progressively from strength to strength. The *swadeshi* movement initiated around this period not only called into existence many of the present leading banks in India but enabled the Punjab National Bank to consolidate its position and expand further.

The period 1900-13 may be described as the first expansionist phase of the Bank. It raised its paid-up capital from Rs. 1,60,000 to Rs. 10,00,000, its total reserve increasing during the period from Rs. 25,000 to Rs. 10,00,000. Its deposits in June, 1913, amounted to Rs. 1,63,71,733, as against Rs. 12,91,341 in 1900. In 1906, the Bank opened a branch in Bombay, the first Indian bank to do so. With the expansion of India's internal and external trade in the wake of commercialisation of agriculture, development of transport, etc., the Punjab National Bank opened branches at the important trading centres, having, by the end of 1913, 22 in all.



SHRI SHANTI PRASAD JAIN
Chairman of the Board of Directors

The expansionist phase of the Punjab National Bank which coincided with the establishment of a large number of small banks was followed by one of India's worst banking crises. The period 1914-18 was one of anxiety and tribulations to most of the banking institutions in the country. A number of small banks, which had mushroomed during the period, failed one after another, threatening older and better managed institutions. Large-scale failure of small banks, involving large sums of paid-up capital and deposits, affected the working of most of the institutions. But the judicious policy of the Punjab National during the earlier periods, as well as the confidence with which it met the crisis, won for it a tribute from the Punjab Provincial Industrial Committee. "Survival of the Punjab National Bank", said this Committee, "showed that the purely Indian directorate and staff were capable of steering a bank through circumstances as trying as ever any financial institution had to face." The Financial Commissioner of the Punjab commented that the survival of the Bank was due to its having chosen its investments wisely. Although the deposits with the Bank declined during the period by about Rs. 30 lakhs, the confidence of the investing public in the Bank continued unshaken and the issue of 5,000 shares of the nominal value of Rs. 5,00,000 issued at par in February, 1914, was oversubscribed to the extent of Rs. 11 lakhs.

The outbreak of World War I, soon after the banking crisis, imposed a heavy burden on the Bank. The steep fall in the value of Government securities necessitated the creation of a special reserve fund to offset such losses. It was only after 1917 that conditions returned to normal and the Bank resumed its steady upward progress. After 1917, the deposits with the Bank increased rapidly from Rs. 1.10 crores in 1917 to Rs. 3.09 crores in 1920. Over the first 25 years of its life, the Bank paid an average dividend of 9 per cent., a convincing index of its financial success.

Period of Prosperity

The period from 1917-26 was a period of unprecedented prosperity for the Bank. Dr. Hiralal, a distinguished representative of the medical profession and a worthy successor to the earlier distinguished chairmen, initiated a policy of expansion to provide larger banking facilities to the growing urban areas. A man of unusual skill and foresight, Dr. Hiralal saw not only the scope available for such expansion but also the right means to consolidate the expansion so initiated. At the time of its Silver Jubilee in 1920, the Bank decided to open additional branches all over the country, establish agency connections with the U.K. as a part of its foreign exchange business and also raise its authorised capital from Rs. 50 lakhs to Rs. 1 crore. It was in 1920 that the Bank acquired the imposing building at the Mall, Lahore, for its headquarters.

The change in the Bank's policy synchronised with the period of increasing industrial activity. The recommendation of the Fiscal Commission to grant discriminating protection, as well as that of the Industrial Commission suggesting changes in Government's economic policy, led to the expansion of existing industries.

This change in Government's policy enabled the Bank to play an ever-increasing role in the economic development of the country. This period was also distinguished for the men who guided the activities of the Bank. Succeeding Dr. Hiralal, Lala Dhanpat Rai, a leading lawyer of Lahore, took over the chairmanship of the Bank and obtained for the Bank the services of Shri Purushottamdas Tandon, who later became the President of the Indian National Congress, as Secretary and Chief Manager at the head office. Again it was during this period that Lala Lajpat Rai, the "Lion of the Punjab," was associated with the Bank and added not only lustre to the institution but was a great asset in times of stress. The period 1920-24 was important not

only to the history of the Bank but to the development of Indian banking as well. The amalgamation of the Presidency Banks into the Imperial Bank was followed by rapid expansion of banks in the country. Following its Silver Jubilee in 1920, the Bank went from strength to strength. The deposits with the Bank more than doubled from Rs. 3.09 crores in 1920 to Rs. 7.85 crores in 1926 and the number of its branches increased to 41 by 1926.

Of greater significance to the assessment of the Bank's importance in the country was the rise in the percentage share of the Punjab National Bank in the total bank deposits. In 1926, the deposits with the Punjab National Bank accounted for 13.1 per cent. of the entire deposits of the country. The sound organisation, prudent policy, cautious investment and above all its efficient management were the main causes for this impressive performance. The increased volume of business and judicious investments enabled the Bank to declare, in 1921, a dividend of 15 per cent.

Great Depression

The period of prosperity, however, was followed by the Great Depression of 1929-31. With the steep fall in exports, growing weakness of exchange, political instability, the marked decline in the values of Government securities and the prices of all commodities, the banking institutions in the country faced a progressive increase in their daily difficulties, and the Punjab National Bank also found its business fast shrinking. As a result of bank failures one after another during the period of 1926-36, involving a total loss of Rs. 2 crores in paid-up capital alone, and the steep decline in the value of Government securities, necessitating the Government to borrow at 7 per cent. per annum, there was little scope for any large banking business. Following these difficulties, the Bank did not declare any dividend in 1931 but utilised its profits to write off bad and doubtful debts. The Bank weathered the economic storm under the able guidance of Lala Mulk Raj Bhalla, a genius in banking finance. In addition to his courage and vigour, Lala Bhalla had the ability to undertake a realistic policy to cut down expenditure in all directions and to initiate policies that would build up the Bank's strength. Dr. Maharaj Krishna Kapur, who took over the chairmanship of the Bank during 1931-37, guided the Bank to consolidate its position step by step during the following period. The establishment of the Reserve Bank in 1934 was an additional cause for further expansion. On the eve of the world war in 1939, the Bank had not only completely recovered from the effects of the depression but had acquired considerable strength, increasing the number of its branches to 69 and its deposits to Rs. 7.15 crores. With a view to acquiring further strength, it did not, however, raise its dividend beyond the modest level of 6 per cent.

The rapid expansion of money supply during the period of the war, on the one hand, and the enormous increase in the movement of commodities within and without owing to the establishment of a large number of industries that were set up in the country on the other, the period 1939-46 saw the phenomenal expansion in the assets as well as the business of most banks in the country. During this period, the deposits with the Punjab National Bank increased from Rs. 7.15 crores in 1939 to Rs. 62 crores in 1946. Its advances increased to Rs. 26 crores from a relatively negligible figure of Rs. 4.34 crores in 1939, and its investment in gilt-edged stood at Rs. 34.52 crores in 1946, as against Rs. 1.55 crores in 1939.

During the period of the war the Punjab National Bank embarked upon a tremendous territorial expansion, having in 1946 not less than 281 branches scattered all over the country. This tremendous increase in activities was presided over by Rao Bahadur Dewan Badri Das during 1939-42 and by Lala Yodh Raj in 1943. Lala

SHRI B. N. PURI
General Manager

Yodh Raj, who joined the Bank in its ranks in 1926, rose to this honoured position by his ability, industry and capacity. For over ten years, he worked for the consolidation of the Bank, ably smoothening the difficulties presented by the Partition, and retired in 1953 from the chairmanship after seeing it rise to its present stature.

Partition and After

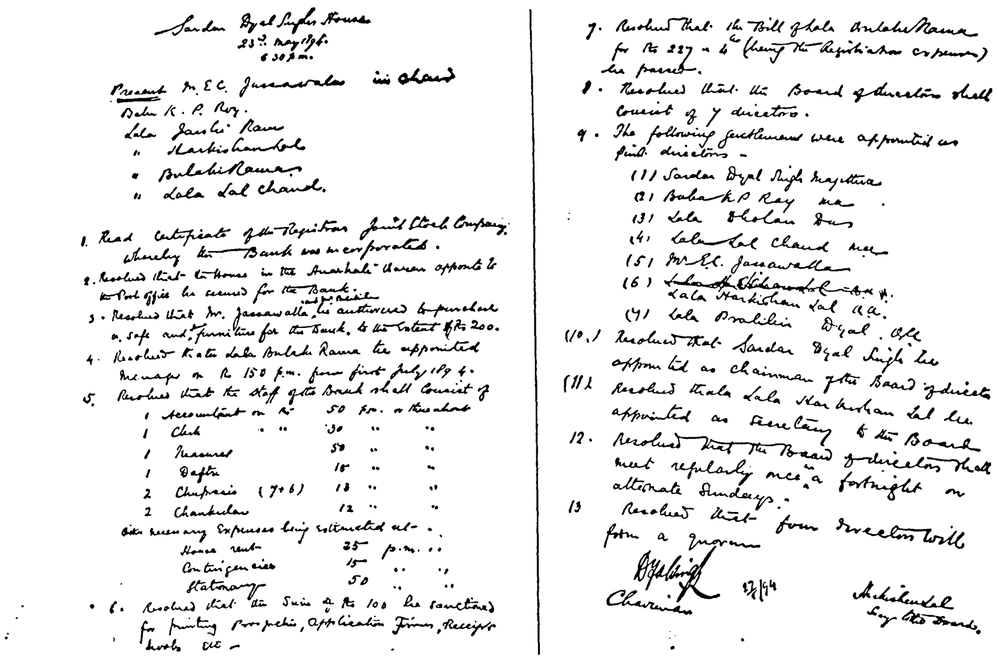
The partition of the country exposed the Bank to enormous difficulties due partly to the location of its headquarters at Lahore and partly to having 91 of its best developed branches in the area now comprising Pakistan. The Bank had decided to shift its headquarters to Delhi just before the Partition to be able to serve the country better from a central place and had already shifted many of its valuable documents, Government securities and jewellery to Delhi along with the necessary staff. Still the compulsory closure of many of its branches in Pakistan necessitated by the Partition, the burden of payments to the staff marooned in the branches in Pakistan, the need to meet the continous withdrawal of refugees in India in addition to the indirect effects of a series of bank failures in 1949 singly and collectively imposed on the Bank an enormous burden. As a result, the deposits with the Bank declined from Rs. 62 crores in 1946 to Rs. 42 crores in 1949, and the volume of business had also declined with the closure of its best branches in Pakistan, affecting the earning capacity of the Bank.

After surmounting the aforesaid difficult period, the Punjab National Bank took over the assets and liabilities of the Bharat Bank, Ltd., in 1951 which had a large network of branches. The Directorate of the Bank was strengthened by taking in Shri Shriyans Prasad Jain, Shri Kamalnayan Bajaj and Shri Chiranjilal Bajoria, three distinguished industrialists from the developed urban areas of the country. The deposits with the Bank steadily increased to Rs. 58 crores in 1952. Shri Shriyans Prasad Jain took over the chairmanship in 1953 and, with Shri B. N. Puri, who had by then risen to the position of Secretary from an unpaid apprentice in 1926, as the General Manager, launched on another phase of expansion. In about a year's time, both of them had infused into the organisation a new spirit and had completely altered the management-employee relations to one of mutual trust. In 1954, with the Bank on the ascending wave, Shri Shriyans Prasad Jain handed over the reins to Shri Shanti Prasad Jain, the present Chairman.

The present General Board consists of:—

Shri Shanti Prasad Jain,
Dr. Maharaj Krishna Kapur,
Shri Chiranjilal Bajoria,
Shri Kamalnayan Bajaj,
Lala Jaswant Rai Churamani,
Pandit J. N. Bhan,
Shri Keshab Chandar and
Shri Shital Prasad Jain.

Proceedings of the First Meeting of Board of Directors



Sardar Dyal Singh House
23rd May 1894
6.30 p.m.

Present Mr. E. C. Jassawalla in chair
Babu K. P. Roy.
Lala Jaishi Ram
" Harkishen Lal
" Bulaki Rama
" Lala Lal Chand.

1. Read certificate of the Registrar Joint Stock Company whereby the Bank was incorporated.
2. Resolved that two rooms in the Anarkali Unreserved apply to the Post Office be secured for the Bank.
3. Resolved that Mr. Jassawalla be authorised to purchase a safe and furniture for the Bank, to the extent of Rs. 200.
4. Resolved that Lala Bulaki Rama be appointed Manager on Rs 150 p.m. from first July 1894.
5. Resolved that the staff of the Board shall consist of

1 Accountant on Rs	50	p.m.	in the start
1 Clerk " "	30	"	"
1 Messenger	20	"	"
1 Daftri	15	"	"
2 Chaprasis (7+6)	13	"	"
2 Chankidars	12	"	"

Other necessary expenses being estimated at—

House rent	25	p.m.	"
Contingencies	15	"	"
Stationery	50	"	"

6. Resolved that the sum of Rs 100 be sanctioned for printing prospectus, Application forms, Receipt books etc —
7. Resolved that the bill of Lala Anlaki Rama for Rs 227-4-6 (being the registration expenses) be passed.
8. Resolved that the Board of Directors shall consist of 7 directors.
9. The following gentlemen were appointed as first directors —
   (1) Sardar Dyal Singh Majithia
   (2) Babu K P Roy
   (3) Lala Dhokan Das
   (4) Lala Lal Chand
   (5) Mr E. C. Jassawalla
   (6) ~~Lala Jaishi Ram~~ Lala Harkishan Lal
   (7) Lala Bhalchin Dyal.
10. Resolved that Sardar Dyal Singh be appointed as chairman of the Board of Directors
11. Resolved that Lala Harkishan Lal be appointed as secretary of the Board
12. Resolved that the Board of Directors shall meet regularly once in a fortnight on alternate Sundays.
13. Resolved that four Directors will form a quorum

Chairman 23/5/94 Secretary to the Board.

All are men distinguished in their respective fields. Shri S. P. Jain has already made his impress on the Bank's policy, gearing it to play its part in the national scheme. His chairmanship of the Bank synchronises with a new dynamic phase in the country's economic development and with his abundant experience in matters relating to industry and finance, the Bank is admirably set for a vital and inspiring role. The ripe experience and able guidance of Dr. Maharaj Krishna Kapur, who has been connected with the Bank from 1917, are of inestimable value to the Board. Shri Chiranjilal Bajoria, partner of Messrs. Soorajmal Nagarmal and head of Messrs. McLeod & Co., Ltd., Calcutta, is connected with jute, tea and engineering industries. Shri Kamalnayan Bajaj, in keeping with the traditions of his family, has undergone imprisonment as a political fighter. He takes keen interest in social and political movements in the country and is connected with the sugar and electrical industries and the cotton trade. Shri Jaswant Rai was an educationist, who turned to business and made a success of it. He has a philosophical bent of mind and devotes himself to cultural and welfare activities. He has a thorough grasp of the intricacies of business. Shri J. N. Bhan is a shrewd business man, with an intimate knowledge of the shipping, non-ferrous and other industries; he was President of the Non-ferrous Metals Manufacturers Association, Calcutta. Shri Keshab Chandar has wide experience in foreign trade and is a prominent figure in commercial, social and political circles in the Punjab. He is keenly interested in sports. Shri Shital Prasad is the Financial Director of the Sahu-Jain Group. He is an invaluable asset to the Board because of his grasp of finance and his knowledge in the working of various industries. The Bank's administration is inspired by the team-spirit of these eight Directors, who are all imbued with the single-minded purpose of improving the service of the Bank to the community and fostering the Bank's strength, popularity and prestige. In this, the General Board is very ably supported by the various Local Boards and Advisory Committees which consist of influential and respected personalities. The General Manager, Shri B. N. Puri, is undoubtedly a live-wire. It is his drive and tact that make effective fulfilment of the Bank's policy possible. In him, the staff at the head office and in the branch offices find a vigorous and understanding head. Shri Puri's geniality and accessibility have contributed to the building up of a tradition of happy co-ordination and well-disciplined work at all levels in the Bank's administration. The General Manager has able adjutants in the trio of Assistant Secretaries, Shri R. L. Tuli, Shri P. R. Mehta and Shri A. S. Puri; Shri S. L. Varma, Superintendent, Central Office, and the District Managers, Shri Harkishen Lal Bedi, Shri Ram Pratap Chopra and Shri Somesh Chandra Trikha, as also Shri Sita Ram Mohindroo, who co-ordinate the work between the head office and the vast network of branches.

Outlook

Former President of the Federation of Indian Chambers of Commerce and Industry, associate of the leading chambers of commerce and industrial organisations, and Chairman of the Sahu-Jain Industries, the present Chairman of the Punjab National Bank, Shri Shanti Prasad Jain, is a man of extensive experience in finance, industry and commerce. Under his dynamic leadership tempered by his extensive knowledge, the Bank is at present considering a number of development schemes to enable it to participate increasingly in internal trade, and foreign exchange business. Schemes of expansion in overseas areas are also under active consideration. To keep the Bank supplied with the right type of personnel, the Bank today has a Staff Training School was a comprehensive syllabus. In spite of contrary trends in the labour world, it redounds to the credit of the Bank management that the employer-employee relations are cordial and that every effort is being made by the management to relieve the staff of the drudgery involved in complicated calculations, additions and multiplications inevitable in the working of a bank by introducing modern electric machines.

Solidly founded, ably stewarded, and manned by a contented and zealous staff, the Punjab National Bank continues its service to the nation, acquiring in growing measure the support and confidence of the public. On this memorable occasion, we wish it all success.

DIAMOND JUBILEE

First Swadeshi Bank celebrates completion of

SIXTY YEARS OF SERVICE

Pledged to the service of the motherland, we started in 1895 with a humble capital of Rs. 20, 090.

Born out of the patriotism, determination and ambition of enterprising sons of the soil, the Bank, backed up by the people's unshaken faith and confidence has grown in strength, stability and prestige. Dominated since its inception with the urge to contribute to the economic and industrial development of the country, the Bank has a proud record of achievement.

Today, after sixty years of fruitful service we have a working capital of Rs. 100, 00, 00, 000.

Through its network of 313 branch offices the Bank is today linked with the country's industrial progress and trade expansion, playing its rightful part in the building up of New India. On the proud and historic occasion of its Diamond Jubilee, the management pledges the Bank's continued service in keeping with its traditions, to constituents and the country.

"MANNED BY 6500 DEVOTED WORKERS, THE PUNJAB NATIONAL BANK CONTINUES TO MARCH FORWARD IN THE SERVICE OF THE NATION"

THE PUNJAB NATIONAL BANK LTD.

HEAD OFFICE : DELHI

EVERY MAN'S BANK

RURAL CREDIT AND COMMERCIAL BANKS

FINANCING OF AGRICULTURAL PRODUCTION NOT WITHIN THEIR SCOPE

By Prof. R. N. Chopra, D. A. V. College, Jullundur City

"INDIA lives in villages" is not merely a platitude; it is a realism and agriculture is the backbone of her economic life. Any attempt to raise the living standards of the people without affecting considerable improvements in rural economy will be futile. But the historical analysis of agricultural development in all advanced countries shows that an integrated system of credit is the very foundation of agricultural development and prosperity. Hence the importance that is being attached to rural credit in India.

India is essentially rural and rural India is virtually the cultivator. "Credit," says an old French proverb, "supports the cultivator as the hangman's rope supports the hanged." It is, therefore, to his needs that we have to cater. It becomes a problem when it can not be obtained, or when it can be had, it must be in such a form that or the whole, it does more harm than good. It is the twofold problem of "inadequacy and unsuitability" that is perenially presented by agricultural credit in India.

Rural credit is a vast complex jigsaw puzzle. It is fundamentally different from industrial finance. While industries have shown a marked tendency towards increasing concentration and large-scale production, agriculture has continued to be "small-scale, scattered, isolated, individualistic and relatively unorganised." Operations are longer in their cycle, results are dependent on the vagaries of nature and the produce are perishable. The farmer cannot modify or diversify his production in case of variation in prices once the main step of sowing has been taken. The price of his produce is not fixed by him but imposed on him. Yield on capital is, therefore, uncertain. A low rate of interest—lower than the one usually charged—is the essential condition of a satisfactory scheme of rural credit. It is because of these special characteristics that the normal channels of finance do not serve the agricultural needs.

Sources of Need

The cultivator's need for credit arises in a number of different ways. In the course of his business, he requires short-term finances to meet current production needs—such as seeds, manures, expenses of transplantation, payment of land revenue, etc. This should be available to him at short notice, spread over nine months or so and repayable only after the harvest is sold. Medium-term loan is needed for purchase of live stock, agricultural implements, etc., for a period of one to three years. He may have to borrow long-term for permanent investments in land or costly equipment. The same gradation may arise in connection with family expenditure—current consumption needs, emergencies such as sickness or special occasions like marriage, etc. Credit for these diverse purposes for varying lengths of time has to be made available to the farmer at reasonable rates of interest. Total annual credit needs have been estimated at about Rs. 800 crores.

These credit needs are satisfied from different sources. According to the *Rural Credit Survey*, made by the Gorwala Committee, private credit agencies (excluding commercial banks)—professional moneylenders, agriculturists moneylenders, the *zamindars*, friends and relatives—account for 93 per cent. of the total borrowed by the cultivators. The private moneylender, in spite of his various drawbacks, is still the main supplier of rural finance—70 per cent. of the total. Government and co-operatives account for only 6 per cent., this being equally divided between the two. Commercial bank credit to the cultivators direct and indirect probably does not exceed one per cent. It is only with the last that we are concerned for the present.

Two Aspects

There are two aspects of this problem. Credit for agricultural production and financing of the marketing of agricultural commodities. This distinction is particularly important in a discussion of the role of commercial banks in rural credit and it will be convenient to treat them separately.

The Banking Enquiry Committee's remarks made in 1931 that "the banks do not look upon agricultural finance as part of their general business and play little direct part in the supply of credit to the agriculturist," still hold true. Statistical data reveals that advances of banks for agricultural production constitute less than 4 per cent. of their total advances. The figures as on 30th June, 1951, for all reporting banks were Rs. 18.3 crores for agricultural production as against a total of Rs. 627.6 crores. On the borrower's side, the credit obtained by the cultivator was less than one per cent. of his total borrowings. Even this small assistance was not uniformally distributed. It was confined only to a few districts. In four out of every five districts, covered by the *Survey*, it was practically non-existent. Moreover, it was only the bigger agriculturist who was able to secure loans from the banks; the medium and the small cultivators did not enter the picture at all. Nor are the commercial banks of any significance as lenders to co-operatives. In 1951-52, in the co-operatives' total working capital of Rs. 36.72 crores, the share of the commercial banks amounted to Rs. 2.51 crores only—that is, less than 7 per cent. of the total. Lest even this small figure may give a misleading impression, it is relevant to disclose that the bulk of this accommodation was provided to one State co-operative bank for the procurement of foodgrains more or less under the directions of the Government.

It is amply clear from what has been stated above that the commercial banks contribute little, either directly or indirectly, towards the credit needs of the farmer *in regard to production*. This non-participation in rural financing in any considerable measure or this lack of interest can largely be attributed to two factors.

Reasons for not Financing Production

The commercial banks usually grant short-term credit. The period ranges from one week to three months, while the shortest agricultural needs are for a period longer than this. Even the short-term loans taken for current agricultural production cannot be paid before the harvesting and the sale of the crop. This normally takes twelve or fifteen months. The banks find that they cannot provide funds for this long period and the proposition, therefore, is uninteresting to them.

from perseverance and industry come prosperity and progress

In any field of activity, the success or failure of an enterprise depends on human endeavour — the perseverance and industry that man devotes to the execution of a given task.

In the field of industry, the vast and extensive activities of Sahu Jain Ltd., are the result of years of planned endeavour and demonstrate that the efforts of man combined with money and materials build up the economic strength and prosperity of the country.

Secondly, the security that the farmer can offer is not acceptable to the bank. Land is the principal security they can offer. Banks have generally a preference for personal security and for security in the shape of goods in their custody as against immovable property. Further, land cannot be readily sold, price is uncertain and there is always the danger of title being in dispute. The movable and the liquid assets are also unsuitable. Crop is subject to risk of flood, drought, fire, etc. Price fluctuations are too frequent and often considerable. The livestock as a security involves too much botheration.

Besides these two specific factors, it may be remembered that the commercial banking system in India is organised on the English pattern to do a strictly commercial banking business. It is not designed for agricultural finance, whether long-term or short-term. This is the experience not only in India but in several other countries also, where agriculture predominates. The Department of Economic Affairs of the United Nations has reported, "the banking system is adjusted to meet the credit needs of large industrial concerns and commercial enterprises, and of agricultural production in so far as it is organised in large estates or plantations. The greater part of agricultural production, however, is in the hands of individuals or families conducting relatively small independent enterprises with very limited capital."

Not Much Hope

From this it may safely be concluded that there is not much hope for a broader participation by commercial banks in agricultural production in the near future. Chances become all the more bleak once we consider that an acceleration in the pace of industrialisation is bound to increase commercial activity, probably enough to absorb all the loanable funds the banks will be able to provide. It does not mean that nothing can be done. Persuasion by the Reserve Bank of India may possibly lead to some of them into the farm-loan field. It will, of course, take time to demonstrate that they are safe loans. Mr. Chester C. Davis, Consultant to the Ford Foundation, has suggested "that a start might be made by encouraging banks which have or will establish branches at market centres where real progress in increasing production has been made to use local deposits for productive loans in the community." Scheduled banks, however, do not seem to be interested in establishing more branches. The Rural Credit Survey Committee is also not very optimistic when it says "that the claims put forward by commercial banking interest in the context of agricultural credit trend to be greatly exaggerated.

Coming to the second aspect of the problem, that is, financing agricultural commodities, we find that the commercial banks have played "a less insignificant, even an appreciable," part. During 1950-51, the banks advanced Rs. 105.7 crores for wholesale trade in agricultural commodities. This accounted for 16.8 per cent. of their total advances. This is the field in which there is plenty of scope for the banks to expand their activities and acquire considerably greater importance. Their potentialities have, unfortunately, not been fully exploited. The main hinderances have been lack of good and adequate storage and absence of co-ordinated marketing agencies. It is obvious that the private financing of commodity movement from the farm to the processor and the seller can hardly become general without these facilities. The banking practice also justifies it. A large portion of the credit given was in respect of four commodities—cotton, jute, oilseeds and sugar—as these are of major commercial importance and relatively well stored and their marketing, better organised.

Crux of the Problem

The State Governments have, no doubt, from time to time, enacted legislation to encourage the construction of warehouses but these have only remained on paper. Nothing concrete has come out of them. The Government have to play an active part. Their sponsorship and at least partial financing will be needed to get the development under way. The Rural Credit Survey Committee seems conscious of the magnitude and the urgency of the problem. They have recommended the constitution of a National Co-operative Development and Warehousing Board, with the Minister for Food and Agriculture as its Chairman, and an All-India Warehousing Corporation. The latter is required to have an authorised share capital of Rs. 20 crores—the issued and paid-up share capital being Rs. 10 crores, out of which Rs. 4 crores will be subscribed by the Government of India. Its main functions will be to acquire and build godowns and warehouuses, run licensed warehouses and manage regulated markets at important centres.

With a well-organised system of sale storage and orderly marketing as indicated above, there is no reason why commercial banks should not participate in this sphere of rural credit to a much greater extent than they are doing at present. This is, in fact, the credit operation to which they are accustomed. It is not only in the interest of the banks but also their duty to expand their activities in the rural areas. They have to counteract the criticism of the Survey Report that the commercial banks' interest in the rural area is only for the purpose of getting deposits from those areas through branches, mobile banks, etc., and not for financing either agriculture or cottage industry.

To sum up, the interest of commercial banks in agriculture lies not so much in production as in marketing. As things stand, it is quite improbable that the banks will play any significant part in relieving the credit needs of the actual farmer or the cultivator, but they can contribute more liberally towards the marketing of agricultural produce, if the necessary facilities are provided to them and they show some initiative and enterprise.

A Well Deserved Tribute

Warmly congratulating the Punjab National Bank on the completion of 60 years of useful service to India, Dr. B. Pattabhi Sitaramayya, Governor, Madhya Pradesh, says:

"Little do the public understand today what difficulties the founders of this Bank had to encounter in starting it 60 years ago. The three Presidency Banks of Bombay, Madras and Bengal held the field in those days as a monopoly and to add to these there were the National Bank, the Mercantile Bank of India, Lloyds Bank and, later, the Chartered Bank of India, Australia and China. In Madras, there was a bank called Arbuthnott Ltd. which broke about 1908. The three Presidency Banks as they were called—the Bank of Madras, Bombay and Calcutta (Bengal)—were incorporated each under its own special Act. These were later reconstituted into one bank called the Imperial Bank of India—with the Madras, Bombay and Bengal branches—some time in 1919. Other branches came later. The old shareholders were given highly favourable terms for having their shares transferred to the Imperial Bank of India.

"Sixty years ago, when the Punjab National Bank was founded, I was a lad of 15. But 34 years ago, that is, in 1923, I started the Andhra Bank Ltd., and I know fully the attitude of the Imperial Bank towards any little banking institution that was raising its head. Indeed, my first attempt to start a bank was made in 1915 when I founded the Kistna District Co-operative Bank, but, as it was a co-operative concern, I did not personally and directly come into conflict with the Imperial Bank, though, in the matter of an overdraft for the whole co-operative movement in Madras Presidency, the Imperial Bank and we co-operators came to grips in 1926. In presiding over the Provincial Co-operative Conference that year, I criticised the hesitation of the Imperial Bank in giving an overdraft of a few lakhs—about 50—to the 26 district co-operative banks in the Province on the security of the unlimited liability of as many crores of rupees worth of property belonging to the rural societies.

"I started the Andhra Bank in Masulipatam in 1923. The Imperial Bank had in that town advanced a loan of Rs. 1,25,000 to a *sowcar* who very nearly failed; I helped him to clear his debts and pay off his creditor cent per cent with interest by acting as trustee to his estate. The local Agent, who was thus helped by me to get out of a bad scrape, promised to help me if I ever needed any. I wanted an overdraft for my Andhra Bank of just Rs. 50,000 on the additional individual security of the 16 Directors of the Bank who possessed property easily worth as many (50) lakhs. The head office in Madras turned it down, it was said. When I saw the head office myself, I was asked whether I was not a non-co-operator and, if so, how the Imperial Bank could allow me an overdraft. If that was the only objection, I said, I would resign my Managing Directorship and handed him my quarter sheet of resignation paper. 'I am the only sinner, now the way is clear,' I said. 'Oh, no. Don't say that,' he replied. 'You have said it,' I rejoined.

Progress of Joint-Stock Banking in India

PUNJAB NATIONAL KEEPS STEP WITH IT

By Dr. V. Sundara Rajan

SENIOR LECTURER IN ECONOMICS, THE M.B. UNIVERSITY, BARODA

BANKING on modern lines began in India with the foundation of the Agency Houses at Calcutta and Bombay in the eighteenth century. They combined trading with banking, they also issued notes. Most of them failed during the crisis of 1829-32.

The Presidency Banks of Bengal (1806), Bombay (1840) and Madras (1843) were "destined to play a great part in the history of Indian banking." The three Banks had a close connection with the Government which not only subscribed part of the capital but also had a share in the management. They were allowed the privilege of note issue, but, between 1839 and 1862, the maximum amount of note issue was fixed by law.

After the crisis of 1832, when the Agency Houses and their associated banks failed, banking activity proceeded with moderate zeal. Out of 12 banks launched between 1833 and 1860, half the number failed. Every one of them was a European enterprise. Some of them were mere frauds made possible largely by the laxity of the law. The Exchange Banks came into existence during this period. The Oriental Banking Corporation was established in 1842; others followed—the Chartered Bank of India, Australia and China, the Mercantile Bank of India, etc., were established between 1845 and 1853.

Prior to 1860, there was no law giving legal sanction to limited liability. In the absence of this privilege, the banks were forced by the logic of facts, to act with an extra amount of caution and hesitation when making advances or investments. Act VII of 1860 conferred this privilege on banks and opened a new chapter in the history of banking in India.

Until 1861, banks in India enjoyed, with or without restriction, powers of note issue. The Paper Currency Act of 1861 vested the right of note issue in the Government. This acted as a brake on the growth of banking in the country. In the early stages of banking development, the currency note rather than the cheque proved the most powerful factor in accelerating the growth of banking and banking habits. The growth of our banking system without any prolonged experience or historical stimulus of competitive note issues is, indeed, a distinguishing mark of banking in India as compared with other countries.

Indian joint-stock banks are of relatively recent origin. The earliest bank of this description was the Bank of Upper India, founded in 1863. The Allahabad Bank was established in 1865 and the Alliance Bank of Simla in 1874. These banks, however, could hardly be classed as exclusively Indian, since they were under European management. The Oudh Commercial Bank, founded in 1881, and *The Punjab National Bank in 1895, were the outcome of Indian enterprise and were under Indian management. The latter—the Punjab National Bank, started with a capital of Rs. 20,000, has come to occupy the second position among the joint-stock banks of the country.* By 1900, the number of Indian joint-stock banks with capital and reserves of five lakhs and over had increased to nine.

The slow progress of banking in India, as Dr. Muranjan observes, was but a reflection of the almost stationary conditions in the latter half of the nineteenth century. The fluctuations in the exchange rate and the course of prices were obviously ill-suited to stimulate the growth of banking in a backward country like India.

The picture of Indian banking in 1900 was as follows:

	Number	Paid-up capital and reserves (In crores of Rs.)	Deposits (In crores of Rs.)
Presidency banks	3	5.5	15.68
Exchange banks ..	8	1.57	10.50
Indian joint-stock banks (A Class)	9	1.27	8.00

1900-1913

Till 1906, the Presidency and Exchange banks maintained their accustomed lead in general growth. Between 1900 and 1906, the Presidency and Exchange banks added Rs. 15 and Rs. 8 crores, respectively, to their deposits, while the Indian joint-stock banks added Rs. 3½ crores only. The growth of the national movement with its slogan of "Swadeshi" gave a fillip to Indian banking. Thanks to it, the number of Indian joint-stock banks with capital and reserve of Rs. 5 lakhs and over was nearly doubled during the period 1906 to 1913 and they added to their deposits Rs. 11 crores, as against Rs. 9 crores of the Presidency Banks and Rs. 13 crores of the Exchange Banks. The number of smaller banks which sprang up during this period was much larger. It is to this period that some of the existing important joint-stock banks belong, namely, the Bank of India (1906), the Indian Bank (1907), the Bank of Baroda (1908), the Central Bank of India (1911) and the Bank of Mysore (1913). The Exchange Banks had increased to 12 in number with capital and reserve of £37.8 million.

Bank Failures 1913-17

Unfortunately, the business of many of these banks was so unsafe and speculative in character and their cash holdings low in proportion to their liabilities that a banking crisis seemed inevitable. The failure of the People's Bank in 1913 saw the beginning of the crash and, in the course of one year, 1913-14, as many as 55 banks went into liquidation.

The financial crisis of 1913-14 shook the Indian banks to their roots and a large number of them which were started as a result of the Swadeshi movement had to close. But The Punjab National Bank, one of the "Big Five" today, remained unaffected and emerged out of the crisis as strong as ever. The bank failures did considerable harm to the banking business, in particular, and to the industrial and commercial development of the country, in general. But there were certain good effects as well. They removed the weak spots in Indian banking and emphasised the need for a reform of the banking system in the country.

After the setback in 1913-14, the deposits of joint-stock banks increased greatly until it reached the record figure of Rs. 80 crores in 1921, after which there was a sharp decline, especially marked in the year 1923, when the deposits of all Indian joint-stock banks declined to Rs. 48 crores. This by itself was a sign of the weakness of the banking system in the face of difficulties. Banks with capital and reserve of less than Rs. 5 lakhs had also begun to operate in the present century and their number had increased from 23 in 1913 to 38 in 1921. During the period of banking crisis, the position and progress of Indian joint-stock banks of this class appear very remarkable. Between 1913 and 1921 their gain in deposits was Rs. 175 lakhs.

After the war period and by 1922, it was felt necessary to increase the authorised capital of the Punjab National Bank to the present figure of Rs. 1 crore. The idea was to inspire greater confidence in the depositing public and, consequently, to provide further funds for loans and advances.

The period 1913-24 was a critical period for joint-stock banking in India. Within five years, 1913-17, as many as 87 banks with a paid-up capital of Rs. 178 lakhs went into liquidation. The bank failures during 1918 to 1925 do not compare with the seriousness of those of 1913 to 1917, but the fact that they numbered 91 and involved a paid-up capital of Rs. 5.13 crores was serious enough. Of the bank failures in this period, the failure of the Alliance Bank of Simla was the most serious.

The Imperial Bank of India

An important development in banking was the amalgamation in 1921 of the three Presidency Banks into one bank, known as the Imperial Bank of India. The Bank started with an authorised capital of Rs. 11,25 lakhs divided into 225,000 shares of Rs. 500 each, all of which were subscribed but of which 75,000 shares were fully paid up and 150,000 shares were partly paid up at the rate of Rs. 125 each. The Bank had an initial reserve fund of Rs. 3,75 lakhs. The Imperial Bank became a semi-central bank, being charged with certain functions admittedly appropriate to a central bank, such as being the banker's bank and acting as the Government banker.

The Imperial Bank of India fulfilled its obligation to open 100 branches by 1926. With the coming into existence of the Imperial Bank, there was keen competition between the Imperial Bank and the Indian joint-stock banks. In 1926, after the creation of its 100 statutory branches, the Imperial Bank had 169 branches. Between 1916 and 1926, the branches of Indian joint-stock banks increased from 228 to 484. In the next decade, the Indian joint-stock banks embarked on a vigorous policy of creation of new branches, which accounted for 502 out of 512 new branches which appeared in the years 1930-36. The total number of branches of Indian joint-stock banks had grown to 1,185. The Exchange Banks, which had been powerful rivals before, steadily lost their position. Only 45 in 1916, the branches of those banks increased to 77 in 1926 and to 99 in 1936.

In 1930, there were 84 joint-stock banks of which 30 had a paid-up capital and reserve of Rs. 5 lakhs and over; and 54 had a paid-up capital and reserve of from Rs. 1 lakh to Rs. 5 lakhs. The deposits of the bigger banks showed a tendency to rise. The gain of the smaller banks was Rs. 2 crores in the decade between 1920 and 1930.

Bank failures, however, though on the decline, were not yet things of the past. The world-wide depression in trade and industry which began in the autumn of 1929 could not but affect the position of banks in the country. During the period 1926-30, 66 banks failed with a paid-up capital of Rs. 79 lakhs or about 7 per cent. of the total paid-up capital and reserve of all banks. *The Punjab National Bank, thanks to the foresight and sound policy pursued by its management, faced the crisis with confidence and courage.*

The Central Banking Enquiry Committee, in its report published in 1931, made important recommendations to ensure the sound and orderly growth of banking in India.

The establishment of the Reserve Bank in 1935 was an event of great importance and heralded a new era in the history of Indian banking. The Bank was organised as a shareholders' bank having a fully paid up share capital of Rs. 5,00,00,000 divided into shares of Rs. 100 each. Under the provisions of the Reserve Bank of India (Transfer to Public Ownership) Act of 1948, the Bank was nationalised, the Government of India acquiring the entire share capital of the Bank against compensation to shareholders.

The Reserve Bank of India was constituted as a Central Bank to regulate the issue of bank notes and the keeping of reserves, with a view to securing monetary stability and generally to "operate the currency and credit system of the country to its advantage." The Reserve Bank has thus the sole right to issue bank notes in India, the assets of which, consisting of gold coin, gold bullion, foreign securities, rupee coin and rupee securities, are kept distinct from those of the banking department. The Bank has, in fact, maintained a higher rate of reserve than that prescribed by law, that is, 40 per cent. consisting of gold coin, gold bullion and foreign securities. The Reserve Bank's next important function is to regulate the banking and credit system of the country. Every Scheduled Bank has to maintain with the Reserve Bank a minimum balance equal to 5 per cent. of its demand liabilities and 2 per cent. of its time liabilities. "The accumulation of these balances with the Reserve Bank places it in a position to use them freely in emergencies to support the Scheduled Banks whenever they seek its assistance as a lender of the last resort." The Bank extends credit to Scheduled Banks and State Co-operative Banks through the grant of short-term accommodation against eligible securities and rediscount of eligible bills. The Bank extends the benefit of its advice and guidance to non-Scheduled Banks and in times of emergency the Bank is authorised to grant financial assistance to them. The Reserve Bank is required by the Act to provide assistance to agriculture on the usual central banking principles.

As the central bank of India, the Bank carries on the banking transactions of the Government and other operations including the provision of ways and means advances to the Central and State Governments and the management of their public debt.

The total deposits of all banks in India amounted to Rs. 257 crores in 1936. The share of Indian joint-stock banks was 40 per cent., as compared with 30 per cent. in the case of the Imperial Bank of India and 29 per cent. in the case of the Exchange Banks. A noteworthy feature is the large concentration of resources in the hands of a few banks. Till very recently, the Imperial Bank of India, 18 Exchange Banks and the "Big Five" Indian joint stock banks (namely, the Bank of India, the Central Bank of India, the Allahabad Bank, the Bank of Baroda and the *Punjab National Bank*) held among them 90 per cent. of the deposit resources of the country. Taking into consideration the deposits of Indian joint-stock banks (A and B classes only), the

share of the "Big Five" was 75 per cent. in 1930 but declined to 69 per cent. in 1939.

During the period of the Second World War, the number of Scheduled Banks increased. Their number rose from 54 in 1937-38 to 96 in 1946-47. Between 1938 and 1946 banks with capital and reserves exceeding Rs. 1 lakh rose from 120 to 198. Banks having paid-up capital and reserves between Rs. 50,000 and Rs. 1 lakh increased from 112 to 135 and those with less than Rs. 50,000 fell from 400 to 216 during the same period.

In 1938, there were only 1,471 banking offices in India. Their number increased to 5,266 in 1946. But the development of banking facilities was mainly confined to the larger towns and cities. The total demand and time liabilities of the Scheduled banks in India rose from Rs. 245.68 crores in 1939 to Rs. 1,020.34 crores in 1946.

A few large commercial banks like the Bharat Bank, the Bank of Jaipur and the United Commercial Bank were floated in 1943. In addition to the newly-started large banks, some of the non-scheduled old ones became scheduled by an increase of capital and/or reserves.

The first setback to the war-time expansion came with the partition of India. There was a severe strain on the banking structure in the country. The working of banks in the Punjab and Bengal was greatly affected. *The Punjab National Bank transferred the head office of the Bank from Lahore to Delhi. It had to leave about 100 branches in West Punjab, N.W.F.P., and Sind out of a total of over 280. The Bank opened new branches in other parts of the country and continued its activities in spite of the losses it had to suffer.*

The second blow dealt to Indian banking was in West Bengal. This led to suspension of payment by three Scheduled banks in 1950—the Nath Bank, the Bank of Hindusthan and the Pioneer Bank. This created a feeling of insecurity and led to heavy withdrawals of funds from other banks too. These failures would have resulted in a much worse crisis, perhaps a major crisis, if the Reserve Bank had not rendered timely assistance. An outcome of such developments was the amalgamation of weak banks. The banking edifice was, however, essentially sound and on the whole stood the strain well enough but, in order to fill the gaps, which had been a source of weakness, long contemplated legislation was at last enacted.

Banking in India had been regulated through stray pieces of legislation before the Banking Companies Act of 1949. The Central Banking Enquiry Committee (1931) proposed a comprehensive Bank Act and the Indian Companies Act (1913) was amended in 1936 with a separate chapter on banking. In 1946, ordinances were issued to control branch expansion and to allow inspection of banks by the Reserve Bank. It was not till 1949, however, that a comprehensive law to regulate banking activities was passed. Banks are now required to secure a license from the Reserve Bank of India for carrying on banking business. The powers given to the Reserve Bank under the Act have ensured the growth of banking enterprise under its fostering care and guidance. In 1950, the Banking Companies Act was amended to correct faults which came to light in its working.

The position of Scheduled banks is shown below:

(In crores of rupees)

Year	Number	Number of branches	Time liabilities	Demand liabilities	Cash and balances with the Reserve Bank	Advances
1938-39 ..	53	1,123	108	130	23	121
1945-46 ..	91	4,115	260	655	125	301
1953-54 ..	89	2,701 (1952-53)	328	527	77	494

The progress of non-Scheduled banks is shown in the following table:

(In lakhs of rupees)

Year	No. of reporting banks	Total deposits	Cash in hand and with Reserve Bank	Percentage of 4 to 3
1	2	3	4	5
1939	669	16	1.1	6.9
1949	858	40	4	9.0
1953	896	52	4	7.7

The expectation that the establishment of the Reserve Bank will stimulate banking enterprise as much as it is in the power of a central bank to do so, has not been entirely unfulfilled. The growth of organised banking was regarded as gratifying by the foreign experts in 1931 and at the end of two more decades since then, can still be regarded as gratifying.

The last two decades on the whole have witnessed steady progress in banking, though this has not been without some setbacks. An impetus to rapid development came during World War II, when inflation increased money incomes in the hands of the people. In the post-war period, there has been a reaction, but this is rather in the nature of an inevitable corrective to the earlier expansion, which in some respects was indiscriminate. The adjustments now being accomplished, partly through the recent legislation governing banking companies and the supervisory powers given to the Reserve Bank, should enable the banking system to strengthen itself to play a larger role than in the past in the country's economic progress, without undue disturbance of economic stability.

(*Concluded from page v*)

To make a long story short, on my renewal of my application as advised by him, I got the same old reply that the business would not suit the Bank. We remained where we were.

"When I started this (Andhra) Bank in 1923, the local Agent of the Imperial Bank would not allow the local merchants to take shares, much less to become Directors, still less to become the Managing Director or the Secretary, and least of all, to have transactions with the new Bank. Shortly afterwards the Imperial Bank's dues were repaid by loans taken from my Bank. We had to fight our way every step and every inch.

"The Englishman, always a shrewd businessman, saw 'the moon in the candle and the sun in the hurricane lamp.' He would not take the smallest risk in business. He takes time by the forelock. It was in the midst of such conditions that the Punjab National Bank was started with a capital of Rs. 20,000 that it grew, prospered, met with its own trials in the Partition, survived them all and is today in the van of progress of banking institutions and is the second biggest joint-stock banking institution serving the country with 312 offices. The Punjab has all along been noted for its banking and insurance companies and produced men like Har Kishen Lal, Lala Lajpat Rai, Sardar Dayal Singh Majithia, Shri Meherchand Mahajan and Purushottamdas Tandon. This Bank is one of the biggest subscribers to the National Plan Loan and has contributed liberally to the various Development loans floated by the Madhya Pradesh Government. Its deposits have reached Rs. 75 crores on 31st December, 1954. Its total assets exceed Rs. 90 crores. It publishes a pretty little monthly which attracts readers from all grades of society and all professions and callings by its sparkling wit and its original notes and comments. The Bank ranks second amongst the Big Five banks of India.

"Public institutions have only a beginning and no end. They are *nithyajeevis*—not merely *Chiranjeevis*. May the Bank aspire to be the Bankers' Bank, taking under its wings the young institutions that must spring into existence with the march of time in *Swaraj* India."

NEW PRODUCTS AND PROCESSES—

Air Conditioner Supplies Heat and Cold ... 367
Akulon Coated Steel Wire Ropes 733
All-purpose Footwear 265
Antimycin 313
Anti-T.B. Drug 1029
Apparatus for Paper Electrophoresis of Serum Albumins 629
Architectural Lighting System 21
Artificial Food Creation 73
Artificial Photosynthesis 883
"Atomic Clocks" Seek Time of Earth's Origin 217
Atom in Dental Research 785
Atom Product Used in New Stomach Test 1077
Atom Used to Gauge Snowfall 169
Atoms to Test Washing Machines ... 73
Aureomycin Helps X-Ray in Treating Cancer 785
Automatic Blind Flying System for Link Trainers 833
Automatic Milling and Grinding Machine 981
Battery Process 265
Blood Cells Magnified to Baseball Size ... 677
Blood Pressure Gauge 121
Brakes Slow Jet Planes in Flight 1029
Building Crane with Unusual Hoisting Speed 1077
Chainomatic Balance For Determining Specific Gravity of Liquids 517
Chicken Feed in Crumbs 883
Coffee Filter Pot 121
Collapsible "Ajax" Awning 566
Coloured Aluminium Skyscrapers 1077
Colour-printing on Leather 417
Combating Fouling of Ships Due to Controlling Pest Damage to Grain in Storage ... 677
Compact Device Makes and Seals Bottle Caps 785
Cycloserine 417
Dehydrating Potatoes 1029
Desalting of Sea Water 629
Detection of Metal Objects in Saw Timber 833
Device for Making Oilcan Obsolete ... 73
Diamond Tipped Drills and Grinding Wheels for Dentists 629
Dyes From Grapefruit 169
Electrical Resistance Heating 883
