What is necessary is that the insurers should observe, and the authorities should enforce, the spirit of the code, rather than merely its letter. The authorities should not be lenient in taking disciplinary action against those insurers who fail to follow the code. All the insurers should be on the alert and see to it that no black sheep are harboured in their midst. Further, it takes two to establish malpractices, the insurer and the insured. The vast majority of those who take protection under general insurance belongs to the business community, the most important section of free enterprise. This community is as much responsible for the prevalence of malpractices in general insurance as the insurers themselves. If free enterprise is to be protected from the intervention of the State and saved from ultimate extinction, those who seek general insurance cover should neither ask for rebates, etc., nor take them even if offered by the insurer. Business men should realise that, if general insurance also is nationalised on the ground of corruption and other malpractices, it would seriously hurt the cause of free enterprise and reduce the field of their activity. If all this is done, it should not be long before the industry's house is set in order.

INSURANCE OF AIRCRAFT

Discussing the problems of insurance of aircraft, the Estimates Committee, in its recent report on the Air-India International Corporation, has made a number of observations. Referring to third party claims, which arise mainly from accidents resulting in injuries from aircraft and motor vehicles to persons or damages to property of those not travelling in the Corporation's aircraft or motor vehicles, the Committee says that such claims are generally covered by a comprehensive insurance policy. There are certain cases, however, in which third party claims are not strictly covered by the terms and conditions of insurance relating to liability. In such cases, the Corporation is not able to recover the claims from the insurance companies, though it may have paid compensation to such parties. In order to meet such liabilities, the corporation has proposed that a sum of Rs. 5 lakhs should be earmarked annually for establishing a fund pursuant to the rules made under section 44(2) (c) of the Air Corporations Act.

Prior to nationalisation, A.I.I. Ltd. used to insure their aircraft comprehensively with outside insurers. This question was reviewed after nationalisation, and the Government decided that the Corporation should continue the same policy as the one the Company followed before nationalisation. An insurance fund is, however, being built up from the surplus which remains after meeting the expenditure on operations and also by crediting to the fund any rebate that may be received from the insurer in the shape of difference between the standard rate premium paid for insurance of aircraft and minimum rate chargeable in those areas in which the claims position is satisfactory. Miscellaneous insurance covers are being progressively effected from this fund. The Committee says that it understands that, when the fund is sufficiently built up, a portion of aircraft risks may also be covered by this fund. The effect of this policy is to increase the risks which the Corporation has to carry on itself, for the Corporation cannot, unlike a general insurer, reinsure the risks it carries. The Committee has, therefore, recommended that a "cautious policy should be followed in this matter." It adds: "The question of laying down a policy in respect of insurance of properties belonging to all State-controlled undertakings is stated to be under consideration of the Government. The Committee recommends that the policy should be made applicable uniformly for State-controlled undertakings under all the Ministries of the Government."

PENSION LAW IN U.S.S.R.

Under the recently introduced changes in the pensions law in the U.S.S.R., higher scales for old age pensions, disability benefits and benefits for families in the event of the death of the breadwinner are provided. As a result of these changes, the budget allocation for pensions has been increased from 13,000 million roubles to 25,100 million roubles. Under the new law, the range of people qualifying for pensions has been greatly extended. In the past, students who study in colleges, specialised secondary schools, junior technical schools and in special courses for training skilled workers did not qualify for pension rights. Today, however, they come within the scope of the Act. In addition to the husband or wife, parents, children, brothers or sisters of a deceased breadwinner, grandchildren, grandfather and grandmother qualify for benefits; adoptive parents and adopted children enjoy equal rights with parents and children. The gap between higher pensions and the ordinary ones has been narrowed considerably. The lower category pensions have been doubled or trebled. All factory and office workers without exception will, upon retiring, receive from 50 (for skilled workers) to 100 per cent. (low-paid workers) of their last earnings.

Old-age pensions range from 300 to 1,200 roubles monthly, and depend on previous earnings, length of service, conditions of work and number of dependents. Pensions are computed on the basis of the actual average monthly earnings for the 12 past months of work, or at the wishes of the claimants for pension, for any five years in succession of the 10 years before applying for pension. This provision is important in cases where earnings fluctuated during the last decade. The applicant is entitled to choose the years when his earnings were highest. Factory and office workers are entitled to old age pensions: men upon reaching the age of 60, women upon reaching 55. Factory and office workers on underground jobs, on jobs with harmful or arduous conditions of labour or in hot shops are entitled to old age pensions at an earlier age.

steel brings you the news

Yes, that paper you are reading owes its existence to steel. It is steel that helped to manufacture the paper, did the printing and even helped to collect the news that it carries. There is hardly any facet of life where steel does not play a part in one way or another.

TATA STEEL

SERVES THE NATION

Steel, today, is very much to the fore in the nation's thinking. India's steel-making capacity is being rapidly enlarged to provide a sure and solid basis for the country's advancement.

MACHINERY MANUFACTURE IN INDIA

GOVERNMENT GIVING PRIDE OF PLACE TO IT IN THE DEVELOPMENT PLAN

By Manubhai Shah

UNION MINISTER FOR HEAVY INDUSTRIES

THE basic feature of the second Five-year Plan is the emphasis on the development of heavy industries. The first Five-year Plan had laid the foundation for this by stimulating agricultural production, and it is now possible to lay the basis for large-scale industrial development.

The foundation of such development is the expansion of the steel industry, through establishment of three new units in the public sector and the expansion of existing units, which will raise production to six million tons (crude) by the end of the Plan period. Only some time ago, there was much discussion as to whether the targets for steel and cement were not too ambitious; it was argued that the country would not be able to absorb six million tons of steel by 1961. It is now clear that, if anything, we should have planned in a more ambitious way even earlier. Meanwhile, development is being fostered by imports of steel, so that the steel processing industry will be in existence when the new plants come into production. During 1956, the production of steel within the country was about 1.33 million tons, and, in addition, imports amounted to about 1.8 million tons of iron and steel. We are thus in a position to more than fully utilise the steel that will become available to us as a result of our planning. In order to accelerate the tempo of development, we will have to plan soon for 10 to 15 million tons or more of steel per annum in the third Plan period and onward.

Striking Feature

Indeed, the most striking feature of our industrial development during the last three years has been the progress of the engineering industry. The output of this set of industries is now running at well above twice the level of 1951. Since the beginning of 1956, the index has risen from 179.3 in January 1956 to 226.8 in August 1956, as compared to 100 in 1951. In some lines, the increase even over the past nine months or so has been very large. Thus, between January-September 1956, the index for complete ring spinning frames has risen from 282.3 to 437.6, for wood screws from 850.7 to 1,080.0, for electric motors from 170.3 to 263.1, for power transformers from 313.3 to 471.5 and for electric lamps from 151.4 to 207.6.

These are merely illustrations; there has been increased demand and production over the whole range of engineering industry, and, in many cases, the available capacity is fully booked for many months. Contrary to the common assumption, the engineering industries also save foreign exchange in a big way. By and large, the investment of foreign exchange in machinery for an engineering works is recouped in terms of lower imports within a year or 18 months. Experience reveals that, with more electric power and skilled personnel becoming available, the engineering industry would be able to forge ahead faster. We have already begun to develop an export trade in engineering products, and hope to develop this trade much more. In this respect, we have natural advantages, in view of the relatively lower cost of steel manufacture in our country.

Not Complacent

We are not, however, complacent about the capacity available in the engineering industry. While much progress has been made in the lighter steel-using industries, there are certain key developments which have not so far taken place. We do not as yet have the capacity for the heavier types of structurals. Nor is there capacity in the country for casting heavy pieces of machinery and for large forged components. To these, the National Industrial Development Corporation has directed its attention. Again, an adequate supply of machine tools of the right kinds is essential for industrial expansion. Estimated annual demand at the end of the second Plan period for machine tools has been worked out at Rs. 17.5 crores per annum, as against the current year's production of machine tools in the country of Rs. 80 lakhs only and Rs. 7 to Rs. 8 crores of imports of machine tools in the current year.

Past experience in India shows that manufacture of machinery usually follows but does not precede the establishment of any industry. This results in two handicaps. First of all, in the initial stages, a large amount of foreign exchange is needed to import the machines. Secondly, the country remains dependent upon continuous supplies of spare parts from abroad.

This leads us to the consideration of the basic needs of an industrialised nation. There should be a sufficient number of designers and technicians to help the industries. They should, from experience, build up a store of "know-how," which can be utilised in any desired direction. India does not have enough of them today. We are laying special emphasis in all our industrial programmes on this aspect of the problem. And we welcome the help given by other countries by way of collaboration and extension of "know-how." Even after this, it would not always be economic to make all the specialised items of equipment, which an advanced industrial country requires. The leading industrial countries invariably specialise in certain lines of equipment which they export to one another. For certain small requirements of specialised machinery and equipment, we may have to depend on imports. Also, it is better to have our demands running fast ahead of our rapidly increasing production. This would, therefore, mean some imports. But, at the same time, continuous efforts should be made at increasing the volume of exports in lines which we can profitably manufacture in excess of our requirements.

Heavy Machinery

In the field of machinery manufacture proper, we have established some capacity for the manufacture of modern machinery for the jute and cotton textile industries. We have planned to manufacture textile machinery (cotton textiles, jute, rayon, silks, woollens, etc.) worth Rs. 19.5 crores by 1960-61, as compared to Rs. 4.7 crores worth of production of this machinery in 1956. The demand for sugar mill machinery has been increasing significantly, in view of the increased demand for sugar within the country, and several sugar mills have been licensed. In order to provide the machinery for these sugar mills, a number of schemes for manufacture of sugar mill machinery has been approved. When these are completed, it should be possible for the country to produce 14 to 15 complete sugar mills every year. Progress is also being made with the manufacture of machinery for the cement industry in a big way. One scheme has been already approved, with a capacity to manufacture complete cement plants capable of manufacturing one million tons of cement per annum. There is, however, yet considerable scope for expansion; this field is very promising, in view of the steadily rising demand for cement within the country. We have made some progress also with machinery manufacture for the paper industry.

On present indications, we should be able, by the end of the second Plan period, to make within the country about Rs. 83 to Rs. 100 crores worth of machinery per annum, as against about Rs. 23 crores per annum at present. The following table indicates the tentative break-up of this programme:

(In lakhs of rupees)

	Estimated production in 1960-61	Production in 1956
Textile machinery	17,00	4,50
Jute machinery	2,50	21
Sugar machinery	2,50	22
Printing machinery	2,00	(a)
Machine tools	5,00	80
Electric motors	7,50	4,16
Transformers	8,20	5,59
Tea machinery	1,50	70
Diesel engines	15,00	4,10
Pumps	7,00	1,70
Rice and flour mills machinery	50	13
Oil mill machinery	40	9
Paper mill machinery	4,00	(a)
Compressors	4,00	Nil
Exhaust fans and blowers	1,00	3
Other machineries	5,00	50
Total	83,00	22,73

(a) = Negligible.

The establishment of machinery manufacture is necessarily a long-term process and any target adopted must take cognisance of our probable demands in years subsequent to the second Plan as well. Some tentative calculations have been made and the annual demand for machinery by 1960-61 is expected to be at about Rs. 200 to Rs. 250 crores, as against the actual demand at the end of the first Plan of about Rs. 126 crores, of which imports of machinery alone in 1955 accounted for about Rs. 106 crores. Our current rate of imports of machinery, on the basis of figures for 1956, is much higher. Studies in perspective planning are also being undertaken, in order to estimate and plan the requirements and the demands of the country for machinery and machine tools in the third Plan period.

Foreign Help

We have already had valuable discussions with technical missions from the United Kingdom and the U.S.S.R. on comprehensive lines. One of the ideas that are being considered is the establishment of an integrated heavy machine building plant to produce machinery of use to

various big industries. We would need machinery not merely for the replacement requirements of the existing industries, but also for the growing industries such as steel, mining, heavy machine tools, heavy engineering and heavy chemicals and other industries. Perhaps, our present estimates may themselves prove low by later experience. In any case, it would be, in keeping with the practice of advanced nations, necessary to depend upon specialised foreign sources for certain items rather than to approach the problem from the view of self-sufficiency in every item.

We may now consider certain other aspects of heavy industries. For many industrial purposes, aluminium is displacing steel, because of its physical and chemical properties. India has abundant supplies of bauxite and reserve sources of electric power. There is no doubt that we should exploit our natural resources in this regard. Expansion schemes raising the present annual production of 7,500 tons of aluminium to 20,000 tons have already been sanctioned, and we hope to establish additional capacity of 10,000 tons of aluminium per year in the public sector during the second Plan period. Our annual demand for aluminium by 1960-61 is estimated at 35,000 to 40,000 tons.

Chemical

Chemical industries are also essential for a developing economy. The manufacture of certain basic chemicals, such as caustic soda and soda ash, has already been undertaken in the country and big expansions are contemplated during the next few years. In the dyestuffs industry, notable progress has been made in the finishing operations. There is scope for further expansion and for the development of capacity for the more basic intermediates and chemicals required by the dyes industry as also others such as drugs, plastics and explosives. In heavy chemicals, the country will be more than self-sufficient, during the second Plan. It is hoped to produce 60 to 70 per cent. of our requirements of dyes, drugs and their intermediates by 1960 61. The National Industrial Development Corporation is also helping in this task. For the last years of the second Plan and for the period of the third Plan, very big expansions in the production of pharmaceuticals and drugs are to be undertaken and, for this purpose, we have been conducting discussions with the U.S.S.R., West Germany, the U.S.A., the U.K., Italy and other countries.

Cement

The programme for the expansion of cement manufacture is well known. In this field also, our estimates of demand have proved too low and we have had to arrange for imports of cement in order to meet even essential needs under the second Plan. I am glad to say that internal production capacity is now at the rate of 5.8 million tons per annum and is being rapidly expanded to enable us to produce 16 to 17 million tons of cement per year by 1960-61. By the third Plan period, this may have to rise to 30 million tons or more per annum.

Textiles

Regarding cotton cloth, our target of 8,400 million yards (18.5 yards *per capita*) which may have to be raised to 9,000 million yards (20 yards *per capita* plus 1,000 million yards for exports) in due course is a modest and satisfactory one. As a matter of fact, our programme for manufacture of textile machinery is being already geared up, so as to manufacture almost all the textile machinery in the country for reaching the production target of 20 yards of cloth *per capita*, in addition to meeting the needs of replacement and renovation. The demand for artificial silk cloth has risen rapidly and the handlooms have been able to make a significant contribution towards meeting the demand of this variety of cloth. We have at the moment to import a large part of the staple fibre and the filament yarn required by the art silk looms. However, in this field also, there are plans for expansion, with a view to meeting the growing demand. Very shortly, we will have approved production capacity upto 100 million lbs. per annum in the country.

In sugar, our production has risen from 11.16 lakh tons in 1950-51 to 18.62 lakh tons in 1955-56. Over and above the existing 143 factories, 57 new factories have been licensed, besides allowing for expansion of several existing factories, raising the target of production to 25 lakh tons annually by 1960-61.

The railway programme plays a vital part in the second Five-year Plan in the field of transport. Here again, the Railway Equipment Committee had made useful recommendations. We have already over the past few months sanctioned expansion in the capacity available for wagon manufacture, and, on the basis of the Committee's recommendation, more schemes are under consideration.

Automobiles

The automobile industry has special importance in the context of industrialisation. This industry has been steadily increasing its production and also the percentage of indigenous components in the finished vehicle is going up. There can be no doubt that a substantial increase in the output of trucks and other commercial vehicles must take place to supplement the efforts of the railways. We are hoping to produce 65,000 or more automobile vehicles of all kinds, including 40,000 trucks per annum, by the end of the second Plan, as against 21,000 units in 1955. The growing demand for transport, especially of the lower income groups, is being met by the increased output of scooters and bicycles. In the field of bicycles and indeed of components for all vehicles, the small-scale industries have been able to play a notable part.

I have referred here only to some selected aspects of our industrial programme. Obviously, it would not be possible to describe in a small compass, even cursorily, the many important developments that are taking place. The Industrial Policy Resolution has cleared the ground for rapid development of industry. I am glad to say that, within this framework, both public and private industrial developments are taking place on an impressive scale. Over the last few months, applications to the Licensing Committee established under the Industries (Development and Regulation) Act have increased considerably in volume, and there is greater willingness to take up the manufacture of producer goods even when complicated techniques are involved.

It is important that the industrial development of the future should result in a balanced regional structure. Naturally, all parts of the country are anxious to share in the industrial progress that lies ahead. In order to ensure that the hitherto industrially underdeveloped areas secure their fair share of development, the prices of steel and cement throughout the country have been equalised. This will help in the establishment of engineering works and other steel processing industries, and especially the dispersal of small-scale industries which are basic to them.

The Central and State Governments have been assisting industrial development through the provision of finance and also by directly undertaking major projects. The Small-scale Industries Loans, the State Financial Corporations, the Industrial Finance Corporation of India, the Industrial Credit and Investment Corporation and some other industrial credit agencies and institutions are helping to provide credit finance for the development of industries in the country. In the National Industrial Development Corporation is available a flexible and useful instrument for establishing key industries in the public sector. As mentioned earlier, the Corporation proposes to establish the basic heavy plants for manufacture of machinery and equipment on modern lines and plants in the fields of dyes, drugs and many other chemical, engineering and metallurgical industries. The N.I.D.C. is also financing the modernisation of jute and cotton spinning industries. We are thus laying the true foundations for a big edifice in the realm of industrial production.—*All Rights Reserved.*

British atomic scientists are working on nuclear reactors capable of propelling a large high-speed oil tanker designed for the Cape route. This was announced in Paris early this week by Sir John Cockcroft, Director of the British Atomic Energy Research Establishment at Harwell. Sir John was addressing a group of European industrialists at the inaugural dinner here of an atomic energy course for management. The advantages of such oil tankers—as big as the *Queen Mary* and capable of speeds of 25 to 30 knots—were obvious at the present moment, Sir John said, but he warned that they were still far from discovering whether atomic propulsion of tankers was a paying proposition.

THE ALUMINIUM INDUSTRIES LIMITED
KUNDARA

ANNOUNCEMENT

The Company is proposing to establish an Aluminium Rod Mill and an Aluminium Cable Mill at Hirakud in accordance with the licence issued by the Government of India.

For financing the above project the Company is issuing 4,00,000 ordinary shares of Rs. 10/- each at par, to the existing shareholders whose names stand registered in the books of the Company as on 1st February 1957. The necessary sanction has been received from the Central Government for this issue.

The shareholders are entitled to apply for shares in the above issue at the rate of one share in respect of every share held by them as on 1st February 1957.

It is proposed to collect only Rs. 5/- per share on application and give shareholders time to pay this sum on or before 1st April 1957. The balance of Rs. 5/- per share is made payable in one instalment on or before 1st October 1957. Those shareholders who prefer to make an earlier payment of the second instalment of Rs. 5/- per share will be entitled to interest at 6 per cent. per annum on such advance remitted, for the period of advance payment beyond 1st April 1957.

The new shares will rank for dividend from 1st April 1957.

The share transfer books of the Company will be closed from 1st February 1957 to 7th February 1957, both days inclusive.

MAKING ALL OF INDIA YOUR NEIGHBOUR !

When an economy develops rapidly, the pressure on its communications systems increases greatly.

During the Second Five Year Plan 1609 locomotives, 66,610 wagons and coaches will be built, 60 major bridges will be constructed. The capacity of our ports will increase by 30%. 20,000 new post offices will ease the task of our overburdened postal system.

In this expansion, paper will play an important role as an essential and indispensable means of communication.

PRODUCTION OF PAPER AND NEWSPRINT

SELF-SUFFICIENCY ENVISAGED

A SIGNIFICANT fact about the paper industry is that most of the raw materials necessary for it are available indigenously. Yet, if the production of paper and paper products, including newsprint, has been lagging behind demand, it is primarily because of (1) inadequate knowledge about the sources of raw materials, (2) inadequate transport facilities, and (3) the non-availability of machinery within the country. It is true that, during the first Plan period, the paper industry witnessed a substantial expansion, and a newsprint factory at "Nepa" came into existence. But the demand for paper has outpaced production. The difficulties facing the industries, however, are being increasingly realised and a concerted and determined effort is being made to attain self-sufficiency in paper and its products, including newsprint. This is reflected in the speech of Mr. Manubhai Shah, Union Minister for Heavy Industries, at the first meeting of the Panel for Paper and Pulp Industries. The Minister disclosed at this meeting that under the second Plan, the Government had given permission for setting up 22 new paper mills and a substantial expansion in the capacity of 21 existing paper factories. This is a major step by the Government in the direction of increasing paper production. It is expected that these new units, together with the expansion of existing ones, would raise the country's capacity for paper production from 210,000 tons per year in 1955-56 to 540,000 tons in 1960-61. It is also proposed to establish at Shakarnagar, near Hyderabad, a new newsprint factory in the public sector through the National Industrial Development Corporation. The annual capacity of this factory is put at 30,000 tons and the raw material will be bagasse, that is, sugarcane trash. The Minister pointed out that there was still scope for two more newsprint factories with a capacity of 30,000 tons each, as India's newsprint needs by 1960-61 were placed at 120,000 tons.

The actual production of paper and paperboard and newsprint together in 1955-56 was 227,000 tons as against 114,000 tons in 1950-51. As against this, the consumption rose during the same period from 209,000 tons to 317,000 tons. In consequence, the country has been importing annually 40,000 tons of paper, 80,000 tons of newsprint and 12,000 tons of rayon grade pulp, together valued at Rs. 15 crores, to meet the growing demand.

In his address to the Panel, Mr. Shah pointed out that the *per capita* consumption of paper in India was among the lowest in the world, averaging about two lbs. per year, as compared with no less than 400 lbs. in the U.S., about 100 to 200 lbs. in almost all the European countries and more than 50 lbs. in Japan. It was clear, therefore, that, with literacy and education in India rapidly increasing, the consumption of paper would increase considerably. According to present estimates, the Minister pointed out, the country's annual consumption would rise by 1960-61, to 350,000 tons of paper, 120,000 tons of newsprint, and 50,000 tons of rayon grade pulp. In terms of value, the consumption by 1960-61 would be to the tune of Rs. 69 crores, as against the present value of Rs. 29 crores. The country would thus require an additional production per annum of the value of Rs. 40 crores by 1960-61, and, as Mr. Shah rightly stressed, this is a formidable challenge to the industry and the Government.

Since the manufacture of wood-pulp belongs to the family of paper industry, Mr. Shah's reference to the production of this raw material at the Panel's meeting was appropriate. Wood-pulp, it may be noted, is a raw material common to both paper and rayon industries. The Minister disclosed that the Government had approved of a scheme, submitted by an industrial concern, for setting up a plant in Assam to manufacture chemical pulp, required for the production of paper, at the rate of 100 tons per day, that is, 30,000 tons per annum. In addition, two proposals for the establishment of rayon grade pulp plants, with a total capacity of 50,000 tons a year, were also under consideration. If these projects materialised, the requirements of the country for rayon grade pulp would be satisfactorily met.

An important suggestion was made by the Minister for Heavy Industries in regard to raw material for paper industry. It was that the industry should explore the prospects of converting bamboo, *sabai* grass and other cellulose raw materials into pulp near the site of their availability by establishing more pulp plants in these areas. The pulp would then be conveniently utilised by paper factories at their location. The merit of this suggestion lies in the fact that it would considerably save haulage and transport of bulky raw materials for paper manufacture over long distances.

Supply of Raw Materials

The primary difficulty facing the industry relates to the supply of raw materials such as bamboo, *sabai* grass and other basic materials. Inadequate information about the availability of raw materials in different regions, lack of sufficient transport facilities, restrictive policies adopted by some of the State Governments and absence of any planned programme for replacing the supply of these raw materials through afforestation have been found to be the main cause of these difficulties. An important measure recently taken by the Government to overcome these obstacles was the appointment of an *ad hoc* committee, under the chairmanship of the Inspector-General of Forests, Government of India. This Committee has been asked to examine the cellulose raw material resources of the country, such as bamboo, fir, spruce, bagasse, *sabai* and other grasses. The Minister expressed the hope that the report of the Committee would be soon available to this Panel for its consideration. The Minister also stressed that, since the present consumption of bamboo was going to be doubled in the next five years, there was need for doubling the cultivation of bamboo—the present resources of which are estimated at 1.8 million tons on a felling cycle of four years—and other woods like eucalyptus and wattle.

The Minister made a fervent plea for the utilisation of bagasse for the manufacture of paper. He pointed out that the old and the proposed new sugar mills would produce 3.75 million tons of bagasse on dry basis, which could easily yield one to two million tons of paper. It would be very wrong, he contended, to burn away as fuel such an important cellulosic raw material as bagasse, when it was far more profitable and suitable to convert it into paper and paper-boards. He thought that it should not be difficult to organise the replacement of bagasse by coal as fuel. But, having regard to the transport situation, there is reason to feel that the Minister is underestimating the difficulty in switching over to coal as fuel by sugar factories. The problem may be relatively less difficult to factories in U.P., Bihar and Bengal, but it is a very serious handicap to those in the Deccan, Mysore, Andhra, Kerala and Madras. If Mr. Shah could solve it without adversely affecting the cost and quantum of sugar production in these areas, it would be a feather in his cap.

Assuming that the aforesaid difficulty could be solved, Mr. Shah's suggestion that small paper factories of one to five tons could be established for producing inferior grades of paper, 50 per cent. of which was being imported, is worthy of special consideration. For, as the Minister himself has pointed out, the small units could utilise the small quantities of available cellulosic raw materials in the different regions of the country. Moreover, a unit of this nature would cost between Rs. 5 lakhs and Rs. 15 lakhs and would be as economic as big plants in cost of production. Machinery for such plants could be manufactured conveniently in the country itself. He urged the Panel to consider this aspect and draw up a programme for the setting up of small and medium-sized units. There are, however, two points to be borne in mind in this connection. One is the possibility of world prices of such paper going down; if they do, the Government should be prepared to give sufficient tariff protection. The other is whether the *Sarvodayists*, for whom the Government has great sympathy, will not come down on such manufacturers as competing unfairly with hand-made paper. Will Mr. Shah be able to assure the small paper manufacturers that the Government would protect them against pressure tactics from the faddists of cottage industry?

The Minister estimated the value of the need for machinery of various types for paper, newsprint and pulp plants at Rs. 30 to Rs. 40 crores. He described the present position of supply of machinery as being unsatisfactory. The target fixed for 1960-61 for the production of machinery in the country was fixed at only Rs. 4 crores. He, therefore, called upon the industrialists running engineering units and making paper to come forward and establish units for the manufacture of machinery required by the paper industry. It is easy to make a suggestion of this nature, but extremely difficult to fulfil. In the first place, manufacture of paper machinery, as the Minister himself recognised, is a complicated business, requiring great skill and experience. These requisites cannot be developed in time for turning out the machines urgently needed by the paper industry under the second Plan. And, secondly, there is not enough capital in the country to produce all the capital goods required by the various consumer goods industries. If, therefore, the paper industry is to reach the targets placed before it within the specified time, it has to buy the machinery from abroad. But this does not mean that the scope for establishing this machinery industry should not be explored, so that, at least in the third Plan period, India could meet most of its requirements.

PROBLEM OF OVERCOMING SHORTAGE OF OILS AND FATS

COTTONSEED OIL FOR EDIBLE USES SHOULD BE POPULARISED

ONE of the indices of the rise in the standards of nutrition of people is provided, in a large measure, by the extent to which the *per capita* consumption of oils and fats is stepped up. In the first Plan period, the *per capita* consumption went up by only one lb. to 11.5 lbs. It is likely to increase much faster in the second Plan period, because of the higher rate of expected increase in the national and, consequently, *per capita* income. Apart from the increase in consumption for edible purposes, the industrial demand for vegetable oils, as, for instance, for soap, paints and varnishes and pharmaceuticals, all of which use substantial quantities of those oils, is also expected to go up considerably. Again, the need for augmenting exports of oils, oilseeds and oilcakes cannot be overemphasised, in view of the pressing need for foreign exchange. The target fixed in the second Plan for stepping up the production of oilseeds from 5.6 million tons in 1955-56 to 7.6 million tons in 1960-61, implying an increase of 2 million tons, is not, therefore, high.

Viewed in this context, the views expressed by Dr. J. C. Ghosh, Member, Planning Commission, at the special session of the Oil Technologists Association held at Calcutta on the 15th inst., are of special importance. Dr. Ghosh rightly stressed that the attainment of the targets fixed for the second Plan for oilseeds would require an organised effort on the part of the agricultural and community project extension staff and spontaneous co-operations of the agriculturists. He pertinently pointed out that, if the yield per acre of groundnuts in other parts of India than Madras could be raised to the level obtaining in Madras—where it is 1.5 times the all-India average—the increase in groundnut alone would be 1.3 million tons. Dr. Ghosh also pleaded that the problem of surplus labour in rural areas especially underlined the need for adoption of labour-intensive methods. He, therefore, advised oil technologists to pay attention to the task of improving labour-intensive processes for the extraction of oil from the seeds. It will be recalled that the Oilseeds Crushing Industry Inquiry Committee also recommended, in its report, that *ghani* oil should be encouraged, not only because it is more palatable and nutritious than mill oil, but also for the reason that, in the conditions prevailing in India where malnutrition of the animals is common, it is important to ensure that the cake remains in the villages and is utilised for feeding the cattle.

But, according to Dr. Ghosh, the percentage of oil that is left in the oilcake as it comes out from the village presses is very high and needs to be reduced, in order to increase the quantity of oil for domestic consumption. The cake does not benefit by this large residue of oil; on the contrary, it is a liability to the animal as it leads to extra accumulation of fat which in turn reduces the utility of the animal. Thus, this residue of oil becomes a double waste which a poor country like India cannot afford. One solution to this problem is the widespread adoption of solvent extraction process. But, as Dr. Ghosh pointed out, though plant capacity for the solvent extraction of oilcakes of the order of 340,000 tons in terms of oilcakes has been permitted up to the end of March 1956, the progress in this direction has been poor. It would appear that inadequate supply of fresh oilcake has been primarily responsible for this slow progress, for, as is well-known, the *ghani*-pressed oilcake undergoes quick spoilation. Accordingly, it is highly desirable that methods should be found to overcome these difficulties and to attain the target fixed in the second Plan, namely, 64,000 tons of oil by 1961 through the solvent extraction of 800,000 tons of oilcakes.

Cottonseed Oil

In order to overcome the shortage of edible oil in India, Dr. Ghosh urged the increasing use of cottonseed oil for cooking purposes. The stumbling block in the way of making any progress here is the people's reluctance to use this oil as cooking medium; they have no taste for it. Dr. Ghosh, therefore, advocated constant efforts for getting rid of people's prejudice against this oil.

World production of cottonseed oil, he said, was 1.5 million metric tons, as against 1.8 million tons of groundnut oil. In India, the production of cottonseed oil was no more than 9,000 tons in 1955-56 and is expected to be a mere 30,000 tons by 1960-61. This would require only 250,000 tons or 11 per cent. of the cottonseed that would be available by 1960-61. A chief advantage arising from the production of this oil, according to the speaker, was that modern cottonseed oil mills would be equipped with de-linting machinery, and there would be simultaneous production of 20 million lbs. of cotton linters for meeting the requirements of cellulose acetate and nitro-cellulose industries. Another handicap to the rapid growth of cottonseed oil industry is the opposition of many who advocate the use of whole cottonseed as cattle-feed. Dr. Ghosh was quite right when he said that these persons would not believe even when told by eminent experts that cattle could obtain their energy requirements from cellulose and could also synthesise fat in their system from cellulosic materials. What is worse, quite a large number of popular leaders belong to this class of persons. A few years ago, Rajaji decried in public the extraction of oil from cottonseed purely on the basis of this popular prejudice. Unfortunately, the common man believes these ignorant political leaders rather than the scientist who has done enough research to prove his theory. The oil technicians have, therefore, a hard task to perform in overcoming the resistance to the use of cottonseed oil from ill-informed people. But it is worth doing, considering that the output of cottonseed is of the order of 2.5 million tons and that this seed can form a valuable basic raw material for a flourishing edible oil industry.

Non-edible Oilseeds

Closely allied to this suggestion is another pertinent point raised by Dr. Ghosh. He urged the utilisation of non-edible oil-bearing seeds of trees such as *karanj*, *neem*, *kusum* and *punsi*, for the purpose of producing oils to meet the needs of soap manufacture, hair-dressing, massaging the skin and the like. A switch-over to these raw materials will release larger quantities —as much as 300,000 tons—of edible oils for home consumption. Incidentally, the collection of the non-edible seeds would also help relieve unemployment in rural areas.

Dr. Ghosh made yet another valuable suggestion when he said that, in order to meet the requirements of people suffering from chronic intestinal infection, lower melting-point fat should be produced. He felt that harder fats were not easily melted, and were apt to become lumpy, and, therefore, less liable for penetration and emulsification by digestive juices. They thus took longer to digest. Accordingly, Dr. Ghosh suggested the manufacture of a special brand of vegetable fat with pretty low melting-point and suitably fortified by vitamins, for the use of people with weak digestive systems. "There is no reason," he went on to add, "why refined vegetable oil, without any hardening whatever but fortified with vitamins and flavouring materials, should not be packed as such and popularised for consumption in India." Here is a question for the oil technicians to answer. But, according to some, it is difficult to say how far this suggestion is practicable. For it would appear that the vegetable oil fortified by vitamins but without hardening undergoes oxidization quickly.

Needs of Foreign Exchange

Turning to the role of oilseeds and oil exports in augmenting foreign exchange, the speaker rightly emphasised that the need for developing export trade was obvious. The export trade in oils fluctuated between 63,000 tons in 1953 and 340,000 tons in 1955. It is noteworthy that these violent fluctuations were, according to Dr. Ghosh, not due to lack of demand, but due to the country's inability to meet that demand, and, in the nature of things, subjected business relations with foreign buyers to too much strain. He voiced the view that is commonly held that it would be a boon to the industry if some economic method of carryover could be devised, which would minimise the fluctuations in export trade. The only effective solution to this problem, in our opinion, is to step up domestic production of oilseeds at a rate faster than that at which domestic consumption expands, coupled with a scientific programme for creating buffer stocks built out of surpluses in those years when the demand is slack or when the crop turns out to be a bumper one.

Another solution that would help increase foreign exchange, to which the speaker referred, is augmenting domestic coconut production. In this connection, the Plan aims at stopping imports of coconut oil and copra by 1961. It is proposed to increase the production of coconuts from 130,000 tons in terms of oil to 210,000 tons by 1961. Much has to be done if this target is to be achieved. Special steps will have to be taken for increasing the production of coconuts in Malabar, parts of Madras and Andhra, which are ideally suited for this purpose.

Needs of Foreign Exchange

Turning to the role of oilseeds and oil exports in augmenting foreign exchange, the speaker rightly emphasised that the need for developing export trade was obvious. The export trade in oils fluctuated between 63,000 tons in 1953 and 340,000 tons in 1955. It is noteworthy that these violent fluctuations were, according to Dr. Ghosh, not due to lack of demand, but due to the country's inability to meet that demand, and, in the nature of things, subjected business relations with foreign buyers to too much strain. He voiced the view that is commonly held that it would be a boon to the industry if some economic method of carryover could be devised, which would minimise the fluctuations in export trade. The only effective solution to this problem, in our opinion, is to step up domestic production of oilseeds at a rate faster than that at which domestic consumption expands, coupled with a scientific programme for creating buffer stocks built out of surpluses in those years when the demand is slack or when the crop turns out to be a bumper one.

Another solution that would help increase foreign exchange, to which the speaker referred, is augmenting domestic coconut production. In this connection, the Plan aims at stopping imports of coconut oil and copra by 1961. It is proposed to increase the production of coconuts from 130,000 tons in terms of oil to 210,000 tons by 1961. Much has to be done if this target is to be achieved. Special steps will have to be taken for increasing the production of coconuts in Malabar, parts of Madras and Andhra, which are ideally suited for this purpose.

Dr. Ghosh made yet another valuable suggestion when he said that, in order to meet the requirements of people suffering from chronic intestinal infection, lower melting-point fat should be produced. He felt that harder fats were not easily melted, and were apt to become lumpy, and, therefore, less liable for penetration and emulsification by digestive juices. They thus took longer to digest. Accordingly, Dr. Ghosh suggested the manufacture of a special brand of vegetable fat with pretty low melting-point and suitably fortified by vitamins, for the use of people with weak digestive systems. "There is no reason," he went on to add, "why refined vegetable oil, without any hardening whatever but fortified with vitamins and flavouring materials, should not be packed as such and popularised for consumption in India." Here is a question for the oil technicians to answer. But, according to some, it is difficult to say how far this suggestion is practicable. For it would appear that the vegetable oil fortified by vitamins but without hardening undergoes oxidization quickly.

The Rs. 10 fully paid-up ordinary shares of the Company are currently quoted on the Calcutta Stock Exchange at Rs. 21-4 *ex-div.* On the basis of 6¼ per cent. dividend per annum, the yield works out to 3 per cent. per annum.

	For the half-year ended			
	June 30, 1956	Dec. 31, 1955	June 30 1955	Dec. 31, 1954

Of coal	517,428	526,106	506,281	530,960
Of coke	48,266	40,491	36,722	36,767

As compared with the previous half-year, the Company's sale proceeds dropped from Rs. 95.99 lakhs to Rs. 95.05 lakhs but by-products and other sales improved from Rs. 11.79 lakhs to Rs. 15.03 lakhs. Its raisings of coal fell from 516,165 tons to 500,931 tons, accompanied by a fall in despatches from 526,106 tons to 517,428 tons. Sand got and transported by the Loyabad Ropeway System was 321,819 tons, as compared with 389,558 tons for the previous six months. The Loyabad coke plant manufactured a larger quantity of metallurgical coke at 48,416 tons as compared with 40,712 tons in the six months to December 1955. The relative despatch figures were 48,266 tons and 40,491 tons respectively. The Directors state that repairs to the ovens had almost been completed and that the plant went into full production by October 1956, at an output of 8,000 tons per month. As regards the plans for expansion of coal production, they observe that they have still had no direct reply from the Government in connection with the expansion programme submitted to them. Until, therefore, the Directors are given definite instructions regarding the part they will be permitted to play, orders for the equipment required to increase the output in accordance with the expansion programme, cannot be placed. The first year of the second Plan is drawing to a close and it is surprising that the Government has not yet taken a decision on this question. It has to be borne in mind that orders for machinery take time to be fulfilled, more so because the public sector also is competing in the world markets for colliery plant and machinery.

(Concluded from next column)

at economic levels. Yet another major problem confronting the industry is the wide and rapid fluctuations in the prices of both the raw material and the finished goods occasioned by the unrestrained activities of local speculators which continue to be a feature. In these days with the buyers' market very much still in evidence, the instability in prices thus created acts as a deterrent to the use of jute goods and tends to intensify the use of substitutes which have already made deep inroads. A well regulated futures market is, therefore, an imperative necessity and, in this regard, it is hoped that such a market, which is expected to function shortly, will curb some of the evils which are the direct consequences of unrestricted trading and impair the industry's progress.

"The modernisation programme of the mills referred to in the last report is going ahead according to schedule. Your Directors are glad to report that the National Industrial Development Corporation has sanctioned a loan of Rs. 29 lakhs, which sum covers the first two stages of the scheme which will completely modernise the sacking section. The machinery comprising the first stage has already arrived and is in the course of being erected; in fact some units have already gone into production."

The Company's mill is situated on the left bank of the river Hooghly, at Khardah, which is about 12 miles north of Calcutta. Its total loomage of 1,530 is divided into hessian 914 and sacking 616. The mill is driven by electricity.

The Company's balance-sheet, as at 31st March 1956, shows its paid-up capital at Rs. 63 lakhs, divided into 9,000 six per cent. cumulative preference shares of Rs. 100 each and 54,000 ordinary shares of Rs. 100 each; of which 45,000 shares represent bonus issues. The reserves and surplus aggregate Rs. 24.40 lakhs. Loans from bank amount to Rs. 66.67 lakhs. The provision for taxation stands at Rs. 45,499 and including this, the current liabilities total Rs. 28.29 lakhs. The gross block of Rs. 172.57 lakhs stands depreciated at Rs. 53.97 lakhs. Additions to the gross block during the half-year were of the order of Rs. 1.11 lakhs. The current assets aggregate Rs. 128.40 lakhs. Of these, the main items are, stores at Rs. 18.40 lakhs, stocks of jute, cloth and bags Rs. 83.38 lakhs, book debts Rs. 24.99 lakhs and investments Rs. 1.40 lakhs. The current assets cover the current liabilities by a wide margin of Rs. 100.11 lakhs.

The Rs. 100 fully paid-up ordinary shares of the Company are currently quoted on the Calcutta Stock Exchange at Rs. 119 *ex-div.* On the basis of a dividend of 10 per cent. per annum, the yield works out to 8.4 per cent. per annum. Such a high yield, even in the case of a financially sound scrip such as this, reflects the investor's lack of confidence in the future of the jute industry.

RESULTS OF KHARDAH JUTE POOR

RISE IN PRODUCTION COST

nutrition of the animals is common, it is important to ensure that the cake remains in the villages and is utilised for feeding the cattle.

But, according to Dr. Ghosh, the percentage of oil that is left in the oilcake as it comes out from the village presses is very high and needs to be reduced, in order to increase the quantity of oil for domestic consumption. The cake does not benefit by this large residue of oil; on the contrary, it is a liability to the animal as it leads to extra accumulation of fat which in turn reduces the utility of the animal. Thus, this residue of oil becomes a double waste which a poor country like India cannot afford. One solution to this problem is the widespread adoption of solvent extraction process. But, as Dr. Ghosh pointed out, though plant capacity for the solvent extraction of oilcakes of the order of 340,000 tons in terms of oilcakes has been permitted up to the end of March 1956, the progress in this direction has been poor. It would appear that inadequate supply of fresh oilcake has been primarily responsible for this slow progress, for, as is well-known, the *ghani*-pressed oilcake undergoes quick spoilation. Accordingly, it is highly desirable that methods should be found to overcome these difficulties and to attain the target fixed in the second Plan, namely, 64,000 tons of oil by 1961 through the solvent extraction of 800,000 tons of oilcakes.

The dividend, however, has been maintained at 10 per cent. per annum to which level it was cut six months ago from 12 per cent. per annum declared for the half-year ended 31st March 1955. No allocation to reserves has been made since the latter half of 1954 for which period an amount of Rs. 1 lakh was transferred to general reserve.

The following table brings out the salient features of the Company's working during the past four half-years:

(In lakhs of rupees)

	For the half-year ended			
	Mar. 31, 1956	Sept. 30, 1955	Mar. 31, 1955	Sept. 30, 1954
Sales of cloth and bags ..	150.66	140.09	158.88	132.56
Other income	0.17	0.30	0.16	0.18
Stock of cloth and bags ..	23.22	21.31	8.39	N.A.
Expenses	146.20	144.85	139.63	123.46
Of which:				
Manufacturing expenses ..	98.84	80.50	87.22	79.15
Salaries and wages ..	39.25	33.23	33.53	33.56
Gunny purchases ..	4.58	18.83	14.48	7.64
Gross profit	6.55	8.65	7.22	9.28
Managing Agents' remuneration	0.83	1.03	0.89	1.10
Depreciation	1.68	1.60	1.00	2.00
Taxation	1.52	2.70	1.60	2.00
Net profit	2.52	3.42	3.73	3.38
Transfer to reserves ..	..	..	..	1.00
Dividend—				
Preference	0.27	0.27	0.27	0.27
Ordinary	2.70 (6%)	2.70 (6%)	2.24 (5%)	2.70 (6%)
Carry forward	0.27 Rs. (56,929)	1.02	0.67	0.36

N.A.—Not available.

It will be seen from the table that, although the Company's sales of cloth and bags improved, as compared with the half-year ended 30th September 1954, there has been a progressive rise in manufacturing expenses, salaries and wages, with a corresponding fall in the profit-margin of the Company.

Commenting on the Company's working, its modernisation programme and the present position of the jute industry in general, the Directors observe thus:

"In compliance with the working time agreement of the Indian Jute Mills Association, the mills continued working 48 hours per week with 12½ per cent. of the total complement of looms sealed until the 7th January 1956, and with 10 per cent. of the total looms sealed from 9th January to 18th February 1956 and with 5 per cent. of the total looms sealed from 20th February until 16th July 1956, when permission was given for 2½ per cent. of the total looms to be resealed. A further 5 per cent. of the total looms were resealed on 17th September 1956, thus reverting to the original position whereby 12½ per cent. of the total complement of looms remain sealed. It was thus evident that the earlier decision to increase production by unsealing 5 per cent. of the looms was premature and that, while stocks of jute goods increased with the corresponding depression in prices, fibre prices which remained high constantly, rendered simultaneous business unremunerative.

"Although our country has made rapid strides towards increased production of raw jute, we have still to attain self-sufficiency, this being the only solution for the procurement of supplies by mills

(Continued in previous column)

Points From The Chair

Restrictions on Imports

"THE effect of varying forms of restriction on imports in many overseas markets, together with the growing tendency towards the encouragement of secondary production in such markets, coupled with the fact that, as markets for political or economic reasons close, the competition in the remaining ones left open becomes more intense, makes it essential that nationally and individually we 'cut our coat according to our cloth.' It will be obvious that the nation must limit the burden of taxation, and the burden of the continual rises in the charges of our nationalised industries, if the inflationary repercussions resulting therefrom are to be kept within reasonable bounds. Only by the increased effort of every firm and individual can we, as a nation, continue to face the ever-increasing foreign competition and retain that share of the export trade which, above all else, is so essential to the well-being of our people."

SIR PERCY LISTER,
R. A. Lister & Co., Ltd.

Expenditure of Public Sector

"So long as depressive action is still required, the enforced artificial contraction in bank advances, known as the credit squeeze, is one factor which can bring it about; but a much more potent factor, for better or worse, in influencing the supply of money is the volume of Government expenditure which has to be financed by borrowing from the banks on Treasury Bills, because it is not covered by revenue or savings. If the expenditure of the public sector is excessive, the efforts which the Government make to press down bank advances, and thereby to reduce the deposits in the banking system, will be negatived by the creation of additional credit in the form of Treasury Bills, which will provide the banks with abundant liquidity and have their counterpart in increased deposits. It is very discouraging, in fact infuriating, when one is labouriously pulling in rope, to find that someone else is incontinently paying it out. There is said to be virtue in not letting your left hand know what your right hand is doing; but I doubt its application to this particular set of circumstances. Perhaps it is not for me, as a banker, to complain of this when it makes life easier for me. But I know that this is not the time for an easy life, and I would much rather see the country's credit improving more rapidly, both at home and abroad."

A. W. TUKE,
Barclays Bank Ltd.

Economic Strength

"Whilst we have eased the burden for other countries, some of which as a consequence enjoy comparative freedom from economic anxieties, we have deflected materials and manpower to defence in such quantity as to accelerate the upward movement of prices and wages and so aggravate our inflation. This relatively heavy outlay has meant that we have the lowest rate of internal investment in Europe: in other words that we have relatively less of our national income available for the development of our essential productive industries. Plainly, inflation and the lack of capital for these industries are serious embarrassments for a country which has to live by its foreign trade, and it seems to me more than time that we took steps to restore, and, thereafter, greatly strengthen, their competitive power. Urgent as may be these internal investment needs, the capital requirements for our nuclear energy programme are even more pressing, since imported coal and oil form an unrealistic basis for this country's economic growth. This is not to suggest a complete reversal of policy but rather that we should bring our commitments into line with our existing resources. After all, it is becoming increasingly apparent, that real strength is economic strength, and we shall serve ourselves and others best by making sure that we have a margin over and above our obligations sufficient to enable us to expand our economy and build up our gold and dollar reserves."

SIR THOMAS D. BARLOW,
District Bank Ltd.

Effect of Rising Interest Rates

"In a market where interest rates are rising and are expected to rise still further, some borrowers float capital issues to provide cash balances which they may need later. In other words, there is a growing tendency for some, who have future but undefined and as yet unplanned expansion in mind, to go into the capital market unduly far in advance of their actual needs. With high short-term rates for the temporary use of these funds, the net additional cost may not be great; and the general deterrent effect of high rates is weakened by the expectation that rates are going even higher. What we have is a sort of panic: a panic to get money now for fear it will not be available later. This is an unexpected cousin of the typical inflation—it is inflation of the capital funds market. As a result, corporate securities may be sold to non-bank investors, who presumably either have surplus funds or divest themselves of other assets, such as Government Securities, to those who have these funds. Thus, otherwise idle money may be put into the hands of spenders."

JAMES MUIR,
Royal Bank of Canada.

Measure of Economic Activity

"Ever since power-driven machinery was pressed into service in aid of manual labour, generation and consumption of electricity have verily become the measure of economic activity in a country. Man-hour output has increased at incredible rates in every country that has placed more and more of electric power in the hands of workers, as a supplement to their own muscular effort. When it is remembered that eight hours' labour of an adult can hardly turn out useful work of a ½ kilowat-hour, it is no wonder that productivity levels and living standards based thereon have soared to enviable heights in countries like America which have been able to place 20 units or more of electric power (equal to 40 human slaves) behind the elbow of each worker. Producers of electrical machinery like this concern must, therefore, do everything possible in their own humble spheres for the success of the Government of India's plans to step up the production and consumption of electric energy from 11,000 million kw. h. to 22,000 million kw. h. in the second Five-year period."

K. NARAYANASWAMY,
Radio and Electricals Manufacturing Co., Ltd.

COMPANY MEETINGS AND DIVIDENDS

INVESTMENT TRUST OF INDIA LTD. Annual General Meeting, Calcutta, 30th January 1957. Dividend: Rs. 4-8 per share, payable on and after 31st January 1957. Transfer books remain closed from 21st to 30th January 1957, both days inclusive.

SOUTH BEHAR SUGAR MILLS LTD. Annual General Meeting, Bihta, Patna, 31st January 1957. Dividend: *Nil.* Transfer books remain closed from 11th to 31st January 1957, both days inclusive.

BELVEDERE JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 31st January 1957. Dividend: *Nil.* Transfer books remain closed from 18th to 31st January 1957, both days inclusive.

CALEDONIAN JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 31st January 1957. Dividend: *Nil.* Transfer books remain closed from 18th to 31st January 1957, both days inclusive.

CHEVIOT JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 31st January 1957. Dividend: *Nil.* Transfer books remain closed from 18th to 31st January 1957, both days inclusive.

DELTA JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 31st January 1957. Dividend: *Nil.* Transfer books remain closed from 18th to 31st January 1957, both days inclusive.

ORIENT JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 31st January 1957. Dividend: Re. 1 per share. Transfer books remain closed from 18th to 31st January 1957, both days inclusive.

BURRAKUR COAL CO., LTD. Annual General Meeting, Calcutta, 1st February 1957. Dividend: As. 5 (6¼ per cent. per annum) for the half-year ended 30th June 1956. Transfer books remain closed from 18th January to 1st February 1957, both days inclusive.

A. V. THOMAS AND CO. (INDIA) LTD. Annual General Meeting, Madras, 1st February 1957. Dividend: *Nil.* Transfer books remain closed from 25th January to 1st February 1957, both days inclusive.

CALCUTTA LANDING AND SHIPPING CO., LTD. Half-yearly General Meeting, Calcutta, 8th February 1957. Transfer books will remain closed from 30th January to 8th February 1957, both days inclusive.

ANDHRA SUGARS LTD. Annual General Meeting, Tanuku, Andhra Pradesh, 15th February 1957. Transfer books will remain closed from 1st to 15th February 1957, both days inclusive.

SAMASTIPUR CENTRAL SUGAR CO., LTD. Annual General Meeting, Kanpur, U.P., 16th February 1957. Dividend: *Nil.* Transfer books remain closed from 9th to 16th February 1957, both days inclusive.

BOMBAY BURMAH TRADING CORPORATION LTD. Final dividend of Rs. 28-12 per share on fully paid-up shares of Rs. 125 each and Rs. 11-8 per share on partly paid-up shares of Rs. 50 each, payable on 4th March 1957. Transfer books will remain closed from 9th February to 2nd March 1957, both days inclusive.

SHREE KRISHNA GYANODAY SUGAR LTD. Dividend of Re. 1 per ordinary share (10 per cent.), for the year ended 31st July 1956.

JAM SHRI RANJITSINGHJI SPINNING AND WEAVING MILLS CO., LTD. Dividend of Rs. 60 per share, for the year ended 30th June 1956.

HOOGHLY FLOUR MILLS CO., LTD. Interim dividend of As. 12 per ordinary share, for the half-year ended 30th June 1956. Transfer books will remain closed from 28th January to 6th February 1957, both days inclusive.

SOOM TEA CO., LTD. Interim dividend of Re. 1-8 per ordinary share, for the year ended 31st December 1956, payable on or after 28th January 1957. Transfer books remain closed from 21st to 26th January 1957, both days inclusive.

LINGIA TEA CO., LTD. Interim dividend of Re. 1-8 per ordinary share for the year ended 31st December 1956, payable on or after 28th January 1957. Transfer books remain closed from 21st to 26th January 1957 both days inclusive.

UNITED FLOUR MILLS CO., LTD. Interim dividend of Re. 1-8 per ordinary share, for the year 1956. Transfer books will remain closed from 28th January to 6th February 1957, both days inclusive.

COMPANY REGISTRATIONS

ANIL HARDBOARDS LTD. (First Director: Mr. R. L. Khanna). Business: Manufacture of hardboards. Authorised capital: Rs. 1,00,00,000. Public company. Address: Laxmi Buildings, Sir Phirozeshah Mehta Road, Fort, Bombay.

MAHARASHTRA PAPERS LTD. (First Director: Mr. P. K. Atre.) Business: Printers and publishers. Authorised capital: Rs. 10,00,000. Public company. Address: Lakshmi Building, Sir Phirozeshah Mehta Road, Fort, Bombay.

HAZARAT ELECTRONICS PRIVATE LTD. (First Director: Mr. P. V. Hazarat). Business: Manufacture of textile machinery. Authorised capital: Rs. 5,00,000. Private company. Address People's Building, Sir Phirozeshah Mehta Road, Fort, Bombay.

ASHOK PICTURES (BOMBAY 1956) PRIVATE LTD. (First Director: Mr. Ashok Kumar Gangoly). Business: Producers and exhibitors of motion pictures. Authorised capital: Rs. 5,00,000. Private company. Address: 28, Rampart Row, Fort, Bombay.

ENGINEERING

(Concluded from page 176)

employed in industry, amounted only to Rs. 23.03 crores. The balance, namely, Rs. 8.93 crores, had to be met, as already stated, from external sources. The parent company did not take out of this country any money by way of dividend on the capital invested here. On the contrary, it exported to India additional capital of the order of nearly Rs. 9 crores. This serves to show the important role played by foreign capital in supplementing the capital resources needed by this country. Another important point to be noted here is that, if the entire job is carried out by Indian capital, the price of oil would necessarily have to be higher than it is now, because it will have to include a sufficiently large margin for covering the cost of additional capital required for meeting the increasing demand for this commodity.

A notable contribution made by Burmah-Shell is in respect of training Indians to take positions of responsibility. The main administrative organisation of the Company operates through four main branch areas, based on Bombay, Calcutta, Madras and Delhi, and a network of 22 divisional offices. In 1955, the Company had on its pay-roll 15,364 personnel, made up of administrative and technical 463, supervisory 1,217, clerical 3,024 and labour 10,660. Every branch office has well-equipped facilities for the regular training of staff at all levels and at Juhu, near Bombay, the Company maintains a residential training centre. Besides, the Company has established two scholarships (of the value of £450 per year) to be awarded annually and tenable at the Loughborough College of Technology, England.

These activities, as well as the policy of conservation of resources adopted by the oil industry on a large scale, show that the industry, far from being a symbol of capitalistic greed as it is often represented to be, is in fact a fine example of private joint-stock enterprise imbued with a commendable sense of social responsibility.

RESEARCH ON INDIAN RAILWAYS

Among the important investigations carried out at the Railway Testing and Research Centre at Lucknow during the year 1955-56, according to the Centre's Annual Report for the year, were trials in connection with the running of high speed vestibuled air-conditioned train services on some trunk routes development of cycle trolleys, use of loco coal ash as building material, performance of different types of sleepers in the track, investigation into compounds for prevention of corrosion of rails, design and construction of better instruments for measuring forces exerted by locomotives, riding quality and comfort of coaches, pressure exerted by soils and development of paints and varnishes. Successful designs of broad-gauge and metre-gauge trolleys capable of being pedalled without fatigue by one man at a time at a speed of eight miles per hour when carrying a load of about 1,200 lbs. were finalised. Only two trolleymen would be required in place of four for running these trolleys, which are light enough to be removed off the track by two men without any difficulty.

Nearly 1·5 million tons of loco coal ash are annually produced by the railways, and a large quantity out of this goes waste. This material has been successfully used by the Centre in building materials and attempts are now being made to pulverise it, when it can replace a portion of cement in concrete work without affecting strength. The economics of pulverisation are being studied. Research is also being carried out on bridges and structures as well as on the effect of wind pressure on platform shelters. The report says: "Our investigations have convinced us that there is a wide field of study in railway engineering, whether in the track work or in the design of locomotives and rolling stock. Indeed, almost the whole problem of track, in relation to the vehicle remains unsolved."

S.A.S. TO OPEN POLAR ROUTE

A new air route between Europe and Asia across the top of the world will be opened on 14th February by Scandinavian Airlines System, pioneer of the historic Los Angeles-Copenhagen transpolar service. With the start of regularly scheduled Copenhagen-Tokyo flights, S.A.S. routes will circle the world according to Globe Press Service. The new polar route will cut travel distance between the two cities to about 7,800 miles. Flights over the present route—across Europe and Asia—cover nearly 10,300 miles. Global Express DC-7C airliners will make the one-stop flight between Copenhagen and Tokyo in about 30 hours. The one stop, for refuelling will be made in Anchorage, Alaska. Present plans call for two combination (tourist and first-class) flights a week in each direction. They will take off from Copenhagen on Tuesdays and Saturdays, from Tokyo on Tuesdays and Fridays.

The world's first transpolar service was inaugurated by S.A.S. just two years ago, linking the West Coast of the United States and Europe. The Los Angeles-Copenhagen service—over what was called the "first new commercial route in 1,000 years"—began with two flights weekly in each direction. Today there are five round trips a week. During last summer's peak travel season, east-bound and west-bound flights covered the route each day.

FLOODS AFFECT SAMASTIPUR SUGAR

STANDARD BATTERIES REPEAT DIVIDEND

Samastipur Central Sugar Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. Begg, Sutnerland & Co. Private Ltd., Kanpur, U.P.) submit the audited accounts of the Company for the year ended 30th June 1956.

It will be observed that the accounts are presented in the new form required by the Companies Act, 1956.

The results for the year, after making the usual provisions, charging depreciation, and adjustments, show a profit of Rs. 95,077 (loss Rs. 18,061 before depreciation). To this sum has been added the carry forward from the previous year of Rs. 8,477 (Rs. 13,455) making a total of Rs. 1,03,554. After placing to contingencies reserve on stock realisation Rs. 25,000 (Rs. 60,000) and rehabilitation reserve Rs. 75,000 (*nil*) there is a balance to be carried forward to the next account of Rs. 3,554 (Rs. 8,477 after adjustment).

Floods again affected the areas supplying cane to the Factory but as it later appeared these floods did not affect the quantity of cane to the extent that was originally anticipated and the crop taken off was one of the highest on record, amounting to 28,35,276 (16,97,490) maunds. The longer crushing season to take off the larger crop together with the effects of the floods reduced the sugar recovery to the low figure of 9.32 (9.93) per cent.

The cane price remained at the high rate of Rs. 1-7 per maund at the Factory gate and Rs. 1-5 per maund at outstations, and these relatively high prices encouraged farmers to grow more cane. This was a general experience throughout the Sugar Industry with the result that the sugar production in the country rose to an all-time record of 18.5 lakh tons. The result of this high production of sugar in India tended to reduce the market prices for sugar, particularly in Bihar and U.P. where factories have to compete with sugar factories nearer the port towns. This disadvantage, aggravated by a shortage of railway wagons on the N. E. Railway in the early part of the selling season, also tended to depress prices. The stocks of sugar remaining unsold on the 30th June were considerable, particularly stocks of sugar which had been sold but could not be delivered due to the shortage of railway wagons. Since the 30th of June, sugar prices have fallen considerably and on that account the directors have considered it prudent to create a contingency reserve.

The efficiency of factory operations continued at a high level although labour difficulties continued, which adversely affected production.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	1,99,000	Block ...	21,07,973
Reserves ...	19,38,520	Stock-in-trade	46,95,017
Liabilities ...	60,34,295	Stores, spare parts and tools ...	8,10,421
Profit and loss account ...	3,554	Goods-in-transit ...	1,856
		Debts, deposits and advances ...	15,19,530
		Investments	600
		Cash ...	39,972
Rs.	91,75,369	Rs.	91,75,369

Standard Batteries Ltd.

The directors of the above Company (Managing Agents: The Industrial Enterprises Private Ltd., Bombay, submit the audited accounts of the Company for the year ended 30th June 1956.

The profits after providing for all expenses and depreciation amounted to Rs. 5,14,322 (Rs. 5,26,800) after adding the amount brought forward from last year's accounts of Rs. 1,485 (Rs. 2,785) there is a total of Rs. 5,15,807 (Rs. 5,29,585). The directors recommend this amount to be utilised as under:—

To payment of dividend on 20,000 ordinary shares at Rs. 8 (Rs. 8) per share, tax free Rs. 1,60,000 (Rs. 1,60,000), to provision for taxation Rs. 1,17,000 (Rs. 1,93,100), to payment of bonus to staff and operatives equivalent to one fourth of their basic earnings for the year ended 30th June 1956 exclusive of dearness allowance and other allowances Rs. 98,000 (Rs. 85,000), to provision for repayment of loan instalments on two loans availed from the Industrial Finance Corporation of India Rs. 75,000 (Rs. 90,000), to gratuities reserve Rs. 63,500 (*nil*) and to carry forward Rs. 1,807 (Rs. 1,485).

In the financial year under report some of the latest type of equipments ordered with a view to supplementing and modernising the plant, arrived and the same were being erected.

The lead refining plant has gone into production. The plant for the manufacture of microporous latex separators was received during the year and erection work is being taken up in the current financial year. In terms of the agreement with the technical collaborators, Messrs. A. B. Tudor of Sweden, one of their Technicians has been deputed to work in the Factory.

Considerable improvement in the process control and tests have been effected. The laboratory—the heart of this industry is being reorganised and installed with the latest equipment for testing, control and development. This has resulted in very marked improvement in the life and performance of our batteries and has rationalised production.

The demand for aircraft and special batteries for defence services to accepted standards are being met on a regular basis. Special "STANDARD" RPG patented train lighting batteries are in regular production and have been supplied to all the railway systems in the country. The factory is developing batteries for electric traction, telegraph and telephone departments, using the patented process under technical advice from Messrs. A. B. Tudor of Sweden.

During the year under report, the directors took possession of about 6,260 square yards of adjoining land acquired on the company's behalf through the good office of the Government of Bombay and they have constructed a compound wall on the southern boundary of the Factory. With the construction of this compound wall the properties of the Factory have been fully secured on all the four sides of the factory premises. The building for location of the plant for the manufacture of microporous latex saparators was completed during the year under report. As reported last year, the directors have acquired about 43,000 square yards of land near the Factory for location of a housing colony for the Employees of the Company.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	20,00,000	Block ...	24,50,589

Berar Manufacturing Co., Ltd.

The directors of the above Company (Agents: Messrs: Maneckji Bhimjibhai and Co., Bombay) submitted the audited accounts of the Company for the year ended 30th June 1956.

The directors inform that during the year under report, the Company made a loss of Rs. 2,13,587 (Rs. 4,01,846) subject to depreciation which, along with the previous loss of Rs. 8,68,776 after writing off Rs. 11,995 from the reserve fund and Rs. 16,208 business profits tax refund amounted to Rs. 10,54,160 (Rs. 8,68,776) which the directors carried forward to the next year's account.

The main reasons for the loss incurred by the Company during the year are as under:—

Thinking that for several years the prices of cotton were low in the months of March and April, the company did not buy much cotton in the months of November and December but unfortunately the prices went up very high and this placed it in a very awkward position and had to buy cotton at very high prices. This is mainly responsible for the loss incurred.

The electrification of the mill which was taken in hand as reported by the directors in their last report was not completed before the end of August and full working of the weaving department with electricity started only in the middle of September. However they had to keep all the boilers working in the month of September and as the consumption of coal was not reduced proportionately inspite of the electrical energy used. Due to these reasons during the first three months working was not satisfactory as a number of machines had to be kept idle. During this period as the company had not been taking the full load of electricity from the grid for power and had to take the full load for lighting purposes, it had to pay very heavy charges for electrical energy consumed for lighting as according to the agreement a certain percentage only of the energy taken for motive power is allowed at the bulk rate and the extra energy used for lighting purposes had to be paid at the small consumers' rate. The directors represented the matter to the Electricity Board a number of times but without any result. Further, electrical duty both on energy consumed for motive power and for lighting were also saddled on the consumers by the Government. This also took up a large amount.

The freight on coal also was increased and the coal supplied was not up to the mark inspite of the representations to the authorities and the suppliers.

Absenteeism among the workers was rampant and this has affected the working of the machines and the Company had to keep a large number of machines idle for want of workers.

State Insurance Premium is to be paid by the Company even though no benefit is given to it. The Company has to make provision for its workers under the Workmen's Compensation Act and the Maternity Benefit Act. Thus even though the company has to bear the medical expenses, the maternity benefit and all the other claims for accidents etc. under the Workmen's Compensation Act it has to pay a large sum to the Government without receiving any benefit. The State Insurance Scheme of the Government is made applicable to Nagpur, Bombay, Burhanpur and Akola but the directors still do not know when it is going to be applied to Badnera and until then the company will have to pay the State Insurance charges without any corresponding advantage.

During the year under report workers agitated for higher salary and so the Millowners' Association had to agree to an increment of about 12½ per cent. to all the workers in the mechanical and engineering departments. This has also put the company to a further expense every month and also to a payment for certain months previous to the award as it was made retrospective. Similar is the case with the clerical staff. When they were employed after the reorganisation they were employed at different scales but now they have agitated and asked for re-instatement of their original pay before the closure and that too with retrospective effect. Somehow or other the directors managed to effect a compromise, still they had to pay a large sum under this head also.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,50,000	Block ...	8,26,329

Teliapara Tea Co., Ltd.

The directors of the above Company (Secretaries: Messrs. Duncan Brothers & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The accounts disclosed a profit of Rs. 7,11,533 (Rs. 21,13,275). On transfer of this sum to profit and loss account and after sundry adjustments, there was a balance at credit of that account amounting to Rs. 13,81,706 (Rs. 5,51,058); of which the directors have transferred Rs. 8,00,000 (Rs. 2,00,000) to revenue reserve. A special dividend of 30 per cent. for season 1954 was paid on 28th March 1956, while Rs. 2,25,000 (Rs. 1,35,000) have been provided against a dividend distribution at the rate of 25 per cent. payable at a later date, leaving Rs. 86,706 (Rs. 66,058) to be carried forward.

The directors inform that the State Bank of Pakistan have recently sanctioned the remittance to this country of Rs. 7,75,789, representing the Pakistani trading profits of the Company for season 1954, and the amount has now been received.

The Indian Finance Act, 1956 has given retrospective exemption from taxation in India of agricultural income arising in Pakistan and taxable in that country and accordingly a sum of Rs. 11,50,000 has been credited to profit and loss account, being a reserve for taxation no longer required.

It will be observed from the accounts that a sum of Rs. 1,86,079 representing a net loss on exchange resulting from the devaluation of Pakistani currency has been charged to profit and loss account.

The accounts of the Company have been prepared in accordance with the provisions of the Companies Act, 1956. Thus the fixed assets which had been written off up to 31st December 1954 have been brought back into account and a depreciation reserve account representing the present written down value of these assets has been opened.

Crop.—The outturns produced and the average selling prices realised compare with those of the previous year as follows:—

Crop	1955	1954
	Mds.	Mds.
Teliapara	6,196	7,866
Satchurie	4,820	5,468

Average selling prices per lb. in Pakistani currency:—

	1955	1954
	Rs. a. p.	Rs. a. p.
Teliapara	2 4 1	2 7 4
Satchurie	2 3 2	2 7 2

Estimates for 1956 provide for a total crop of 13,000 maunds at an outlay of Rs 12,37,110, including inland freight and sale charges.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.

Bengal Luxmi Cotton Mills Ltd.

The directors of the above Company (Managing Agents: The Bengal Textile Agency Private Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st March 1956.

The Company made a net profit of Rs. 7,12,912 (Rs. 3,60,576) during the year. Adding to this the sums of Rs. 98,783 (Rs. 49,818) brought forward from the previous year's account and Rs. 9,814 (*nil*) transferred from reserve for bad and doubtful debts no longer required and providing the sums of Rs. 2,65,991 (Rs. 60,000) for taxation and Rs. 4,25,000 (Rs. 1,25,000) for general reserve there remains a balance of Rs. 1,30,518 (Rs. 1,69,911) to the credit of profit and loss account, which the directors recommend, be dealt with as under:

Dividend on old 17,782 ordinary shares at Rs. 4 (Rs. 4) per share free of income-tax Rs. 71,128 (Rs. 71,128) and balance to be carried forward Rs. 59,390 (Rs. 98,783).

The year under review was a year of satisfactory progress as compared to the past few years. The net profit for the year has been Rs. 7,12,912 as against Rs. 3,60,576 in the previous year. The main reasons for this higher profit are increase in production and decrease in the cost of production owing to comparatively lower prices of cotton during the year under report.

The directors report that 77 new looms have been installed in replacement of 78 wornout looms at a cost of Rs. 1,07,800 and spinning and other preparatory machines valuing to the extent of Rs. 3,95,231 have been added during the year under review. Further, with a view to economise the cost of production by installing up-to-date machinery, orders have been placed for drawing and speed frames from the United Kingdom to the value of Rs. 5,50,000 approximately as first instalment. The total value of the machinery required for the said purpose will be about Rs. 16,00,000.

The directors regret to note the poor response from the shareholders in the matter of subscribing to the shares offered to them out of the New Issue of Capital during the year under review. The directors are, however, quite alive to the situation and are doing everything in their power to raise the required capital.

Accounts in brief are as under:—

Bhagalpur Electric Supply Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Octavius Steel and Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December 1955.

The revenue account shows a profit on the year's working of Rs. 1,61,614 (Rs. 1,65,679). Adding to this the profit on sale of investments Rs. 86 (*nil*), there is a total of Rs. 1,61,700 (Rs. 1,65,679). From this amount is deducted arrears of depreciation Rs. 1,759 (Rs. 3,620), gratuity to retired employees Rs. 959 (Rs. 8,606), bonus to staff Rs. 9,835 (Rs. 9,315), expenses relating to loan from the Government of Bihar—written off Rs. 440 (*nil*), reserve for deferred taxation Rs. 14,700 (Rs. 13,000), provision for redemption of Government loan Rs. 30,000 (*nil*) and appropriations—under the Electricity (Supply) Act, 1948 Rs. 46,654 (Rs. 3,900) leaving a net profit for the year of Rs. 57,353 (Rs. 79,238 after providing Rs. 48,000 for taxation). After adding to this Rs. 41,818 (Rs. 35,103), the adjusted balance brought forward from the previous year, Rs. 603 (Rs. 685) on account of forfeited dividends (net) and Rs. 957 (*nil*), being over-provision for taxation for 1955-56 and deducting therefrom Rs. 419 (Rs. 113) for sundry adjustments, there is a credit balance of Rs. 1,00,312 (Rs. 1,08,778) out of which the directors have decided to transfer Rs. 30,000 (Rs. 30,000) to general reserve leaving a balance bf Rs. 70,312 (Rs. 78,778) which they recommend be disposed of as follows:—

Payment of a dividend of As. 8 (As. 8) per share for 1955 without any deduction for income-tax payable by the Company Rs. 36,960 (Rs. 36,960) and carry forward Rs. 33,352 (Rs. 41,818).

Referring to the qualifications in the auditors' report the directors have to explain, that as these accounts relate to a period prior to the commencement of the Companies Act, 1956, they have been prepared in accordance with the provisions of the Indian Companies Act, 1913, which was in force for that year. The figures in the accounts have been taken to the nearest rupee for purposes of convenience.

The registered office of the Company has been transferred from Bhagalpur to No. 14, Old Court House Street, Calcutta, by passing of a special resolution on 25th May 1956, in respect of which confirmation by the Court was obtained in September 1956.

A continuous supply of electricity was maintained throughout the year and as compared with the previous year an increase of 7 per cent. in the number of units sold has been recorded. During the year the number of units of electricity sold was 39,72,312 as compared with 37,28,657 units in the year 1954. The total number of consumers connected to the Company's system as on 31st December 1955 was 3,544 (3,343) and the total connected in kw. was 4,011 (3,843).

Prospects.—The new 720 kw. diesel engine alternator set was brought into commission on the 29th June 1955. The cost of this set was met from the loan of Rs. 6,00,000 made by the Government of Bihar, and the balance of the amount is being utilised on the re-organisation of mains and services. The Company's business continues to expand and future prospects are considered good.

Accounts in brief are as under:—

Kotamullai Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Duncan Brothers & Co., Ltd., Calcutta, submitted the audited accounts of the Company for the year ended 31st December 1955.

The accounts disclosed a net loss of Rs. 36,724 (profit Rs. 73,171). On transfer of this sum to profit and loss account and after sundry adjustments, there was a balance at credit of that account amounting to Rs. 16,331 (Rs. 73,171), which the directors carried forward. In January 1956 an agreement was entered into between the representatives of the industry and employees on an industry-wise basis by which bonuses became payable to labourers for the years 1953 to 1956 inclusive. As the Company made a loss for season 1955 no provision has been made for the bonus for that year but the bonus payable by Rampore and Jiajuri Tea Estates in respect of the previous period appears in the accounts. The accounts of the Company have been prepared in accordance with the provisions of the Companies Act, 1956.

Crop.—The following are particulars of the quantities of tea made and the prices realised:—

	Crop	0955 Average selling price per lb.	Crop	0954 Average selling price per lb.
	Mds.	Rs. a. p.	Mds.	Rs. a. p.
Jiajuri	5,725	1 15 2	5,344	2 12 0
Rampore	3,789	1 10 7	4,173	3 0 0
Kotamullai	6,601	1 11 2	7,512	2 9 4

Planted area is 1,955·57 acres. Estimates for 1956 provide for a total crop of 17,075 maunds at a cost of Rs. 24,41,595, including inland freight and sale charges.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3,93,275	Block ...	18,37,905

Rs.	35,22,371	Rs.	35,22,371

Duffla ghur Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Williamson Magor and Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The season's working resulted in a profit on revenue account of Rs. 6,58,504 (Rs. 10,91,847) (after providing for depreciation amounting to Rs. 20,404 (Rs. 2,04,134). After transferring the above profit, making various adjustments, charging labour bonus for 1953-54 and making a provision for labour bonus for 1955 and setting aside Rs. 1,95,000 (Rs 4,90,000), for taxation and transferring to dividend equalisation account Rs. 75,000 (*nil*) and paying an interim dividend of 10 (10) per cent. for season 1955 absorbing Rs. 50,050 (Rs. 56,050), the profit and loss account showed a balance at credit of Rs. 3,50,790 (Rs. 3,88,560) from which was paid a final dividend of 30 (40) per cent. for season 1955 (making a total of 40 (50) per cent. for the year) absorbing Rs. 1,68,150 (Rs. 2,24,200) and carried forward Rs. 1,82,640 (Rs. 1,64,360).

The following are comparative statistics of sales for the past three years:—

	Lbs.	Average price per lb.
		Rs.
1953	863,496	2 4 1¾
1954	951,149	3 0 6
1955	891,538	2 7 8½

The estimates for 1956 provide for a crop of 960,000 lbs. of tea at a cost of Re. 1-8-5¾ per lb.

Accounts in brief were as under:—

Liabilities	Rs	Assets	Rs
Capital ...	5,60,000	Block ...	6,97,119
Reserves ...	8,82,000	Stock-in-trade	11,01,393

Profit and loss account ...	3,50,790	Investments	2,04,750
		Cash ...	9,26,826
Rs.	31,29,203	Rs.	31,29,203

Rajendra Coffees Ltd.

The directors of the above Company (Managing Agents: The Associated Planters Private Ltd., Madras, submitted the audited accounts of the Company for the year ended 31st March 1956.

The result of the Company's working for the period under review showed a profit of Rs. 1,47,572 (Rs. 36,781) and after making provisions for depreciation written off Rs. 5,191 (Rs. 6,015), Company's contribution to provident fund Rs. 986 (Rs. 1,950) and debenture interest and income-tax payable thereon Rs. 7,068 (Rs. 7,068), the net profit left was Rs. 1,34,327 (Rs. 22,648). To this amount was added a sum of Rs. 16,463 (Rs. 35,315) being the last year's balance brought forward, making a total of Rs. 1,50,790 (Rs. 57,963). Transfer to agricultural income-tax reserve absorbed Rs. 65,000 (*nil*) and transfer to debenture redemption reserve absorbed Rs. 10,000 (*nil*) leaving for appropriation a sum of Rs. 75,790 (Rs. 57,963). The directors have paid dividend at 6 per cent. tax-free on 10,000 preference shares absorbing Rs. 6,000 (Rs. 6,000), dividend at 5½ per cent. tax-free on 10,000 redeemable preference shares Rs. 5,500 (Rs. 5,500) and dividend at 20 (15) per cent. tax-free on 40,000 ordinary shares Rs. 40,000 (Rs. 30,000), leaving a balance of Rs. 24,290 (Rs. 16,463) to be carried forward.

The estimated agricultural income-tax for 1954-55 is Rs. 20,000 and for 1955-56 Rs. 45,000 and the directors have transferred a sum of Rs. 65,000 to agricultural income-tax reserve to meet this contingency liability.

Working.—The directors feel that the working results for the year ended 31st March 1956 have been quite satisfactory. The coffee crop as well as the profits earned for the period are a record for the Company. As may be noted from the estimated crop for the year 1956-57, the next year's coffee crop also is very encouraging. The systematic manuring programme and intensive cultivation have improved the estates of the Company. The eel worm attack on the coffee bushes of the Horikhan Estate of the Company has not yet abated and the crop is very poor.

Crop.—The coffee crop realised for the year under review was 136 (48 tons *robusta* and 4 (7) tons *arabica* against the estimate of 75½ tons *robusta* and 4 tons *arabica*. The cardamom crop was 37 (16½) maunds against the estimate of 15 maunds.

The coffee crop estimate for the year 1956-57 is about 126 tons *robusta* and 4 tons *arabica* and the cardamom crop is estimated at 50 maunds against the previous year's estimate of 15 maunds.

The average cost of coffee per cwt. stood at Rs. 51-3-0 as against Rs. 101-15-0 during the previous period. The increase in crop has substantially reduced the cost per cwt. of coffee, though the per acre cost was high during the year.

General.—The estates of the Company have been maintained well and the labour position is quite satisfactory. The supply of food materials to the estate labourers are also quite satisfactory. The Rules of the Mysore Agricultural Income-tax Act were framed only very recently and hence the assessment of the agricultural income-tax is not yet over. The results of the enquiry about the cost of production of coffee conducted by the Government of India has not yet been published.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	4,00,000	Block ...	4,44,550
Debentures ...	1,00,000	Stock-in-trade	2,75,055

Provision for agricultural income-tax	65,000	Loans and advances ...	1,58,213
Liabilities ...	2,37,050	Investments	1,00,220
		Cash ...	16,076
Rs.	9,84,050	Rs.	9,84,050

N.B.—Figures within brackets relate to the corresponding period of the previous year.

MANCHESTER LETTER

(*Concluded from page 171*)

to secure tariff increases on imports of velveteens and cotton ginghams into the U.S. While these steps were aimed at curbing large-scale imports of Japanese fabrics into America, they were also a serious threat to Lancashire's trade with the market. The "gravest possible view" was taken of an application for greater protection made by U.S. manufacturers of cotton ginghams and related cloths, because 27 per cent. of Lancashire's exports to the U.S. could be affected.

Australian Trade

The serious effects of Australian import restrictions on exports of Lancashire textiles were discussed at the annual meeting of the Commonwealth Section of the Manchester Chamber of Commerce. The report to the meeting said Australia remained the Lancashire industry's biggest overseas customer, but, in the first ten months of 1956, shipments of cotton cloth fell to 67,000,000 square yards, as compared with more than 88,000,000 in the previous year and rayon cloth to 13,800,000 yards, as against 21,000,000 yards.

Towards the end of last year, Australia's payments position showed some improvement, and, if this trend continued, it should influence the Australian Government in making relaxations. "The Executive hopes," to quote the report, "that the Australian Government will not maintain the severity of the existing restrictions longer than is absolutely necessary."—*All Rights Reserved.*

NEW PUBLICATIONS

Agricultural Marketing in India—Vol. I. By Prof. K. R. Kulkarni. Published by The Co-operator's Book Depot, 9, Bakehouse Lane, Bombay 1. Pages : 501. Price : Rs. 20.

THE link between production and consumption is marketing. It is important both in the case of industrial as well as agricultural products. This technique might be said to have advanced considerably during the last few decades in respect of industrial products. But, at least as far as this country is concerned, the poverty of the rural area is largely attributed to the inefficient marketing arrangements in respect of agricultural produce. Indian agriculture is largely a subsistence one, but where surplus production exists, owing to the malpractice adopted by the intermediaries, the gap between the producer's price and the consumer's price is very large. This gap might be said to be greater in the case of foodgrains than in the case of cash crops. It is in this context that agricultural marketing becomes very important for the economy of this country. Central and State Governments have taken various steps from time to time, such as introduction of regulated markets, but they are yet to yield tangible results.

With the growing emphasis on co-operative organisation, considerable reliance has been placed on co-operative marketing. The two factors that contribute to the poverty of the Indian peasant may be grouped as lack of credit facilities and proper marketing arrangements. The Rural Credit Survey Report has emphasised the inter-linking of credit and marketing ; without the one, the other cannot be there. That has been the history of agricultural production in all countries. In this connection, it has underlined the need for simultaneously promoting economic activities like warehousing, grading, processing and marketing. The new policy of the Government, as is well known, envisages a larger expansion of the co-operative movement. National and State warehousing corporations are to be established to build and manage warehouses throughout the country ; financial assistance will be given to co-operative societies.

The literature on the subject of agricultural marketing is limited. A book on the subject is, therefore, to be welcomed. Five years ago Prof. Kulkarni published his book on Agricultural Marketing. The years since the first publication have witnessed many important developments. The fact that the author has found it necessary now to publish the book in two volumes, instead of two parts, indicates the growing importance of the subject. For dealing with this subject, Prof. Kulkarni is eminently suited on account both of his previous background and of his present responsibility as a professor at the Co-operative Training College, Poona.

He has devoted the present volume to the principles and functions of marketing ; the second volume will cover the practical aspects of co-operative and agricultural marketing in India. The 17 chapters in the present volume cover wide ground. The theoretical aspect of the subject is exhaustively dealt with and the economic background is properly presented. As Dr. T. G. Shirname, Agricultural Marketing Adviser, Government of India, points out in his "Note of Observations," the "aim of studying marketing is not necessarily one of defending existing practices or institutions, nor of advocacy of other or new practices or institutions ; but either may be justified under certain conditions." Perfection in marketing systems depends on the attainment of the best possible relationships between the functions and the value of services rendered by the various agencies, along with the development of dependable and adequate market information. Appropriately enough, in the second chapter of the book, the importance of marketing research has been emphasised. It is indicated that the improvement in the technique of marketing witnessed in the last few years has been brought about largely as a result of marketing research which is now being undertaken by the various agencies such as private firms, trade associations, governmental agencies, universities and the like. A chapter has been devoted to advertising. Though this might be a little premature for Indian agriculture, its importance for marketing cannot be minimised. In this context, the free flow of market news or information is important. The farmer now depends for information very largely on reports received from friends or neighbours who go to the market or from itinerant dealers or the local *banias*. The sixth chapter dealing with the financial aspect of marketing is, however, disappointing even in regard to India.

A whole chapter has been devoted for the discussion of transportation since any measures towards marketing presupposes facilities for transport. Again, in a market economy, produce exchanges and the facilities for futures trading and hedging are important. In this connection, the experience of other countries such as the U.S.A. and Canada are valuable. In marketing, the technique of selling is as important as any other factor. This subject has also been dealt with adequately. The last chapter is devoted to a discussion of agricultural prices. The welfare of the agriculturists depends largely on the stability of the market prices for their produce and as the Prices Sub-Committee of the Government of India wrote, when a general expansion of agricultural production is aimed at, in the present circumstances of the country a guarantee of minimum price is an effective measure to adopt and forms, therefore, an essential part of the policy of agricultural development. In this connection, the observation of the F.A.O., is pertinent: "Marketing is the crux of the whole food and agricultural problem. It would be useless to increase the output of food and it would be equally futile to set up optimum standards of nutrition unless means could be found to move food from the producer to the consumer at a price which represents a fair remuneration to the producer and is within the consumer's ability to pay."

The book can be recommended to all students as a compact study, particularly to students of commerce and at the various co-operative training institutions.

Recent Developments in Certain Aspects of Indian Economy—III. Published by the International Labour Office, India Branch, New Delhi. Pages : 176. Price : Re. 1-8.

This moderately priced book, like the earlier volumes, contains four articles giving an objective review of recent Indian developments in such spheres as industry, industrial wages, collective bargaining and co-operative marketing societies. The article "Industry in India" briefly traces the history of industrial development in the nineteenth century and early twentieth century till the outbreak of the First Great War. It then analyses in some detail the progress of industrial production till the attainment of freedom. Special attention is given to the post-independence period, particularly to the progress under the first Five-year Plan, and the rise of the public sector and the anticipated progress in the second Five-year Plan.

The article "Industrial Wages in India" reviews mainly the wage trends of industrial workers. Besides tracing the wage fluctuations, questions of wage policy are also briefly touched upon. An attempt has been made to cover the developments from the rise of industrial working class in the early decades of this century, but more attention has been devoted, as in the case of articles in this series, to the post-Second World War period.

A number of collective agreements have been concluded in India recently. This new development in the labour field is considered in detail in the article entitled "Collective Bargaining in India." The article reviews all important collective agreements and information has been drawn from original texts of agreements wherever possible. Like the earlier article on "Co-operative Housing Societies" which appeared in the second volume, the present article on "Co-operative Marketing Societies in India" has been prepared on the basis of replies to a questionnaire from State Governments. It reviews in detail the activities and progress of co-operative marketing societies in India with particular reference to their organisation and work, financing, storage and warehousing facilities and education and training programmes.

Problems in Indian Economics. By Dr. P. C. Jain. Published by Chaitanya Publishing House, Allahabad. Pages : 688. Price : Rs. 11-8.

The rapid changes in the economy of this country render any textbook on Indian Economics out of date within a short period. It is, therefore, gratifying to note that Dr. Jain has brought out three rapid editions of his book within the space of three years. The book has already been reviewed in the columns of this journal. In this edition, the author has added new chapters on important topics such as decimal coinage, deficit financing, the Taxation Enquiry Commission's Report and the second Five-year Plan. A significant improvement is that the facts and figures in the various other chapters have been brought up to date. While attempting to give a faithful version of the various topics, the author has also taken pains to attempt their critical assessment. For example, he has stated that the suggestion of the Taxation Enquiry Commission to reduce consumption, if accepted, would make investment impossible and any developmental expenditure financed by reducing consumption will defeat its own purpose. Similarly, it is pointed out that several of the suggestions such as including the value of any benefits granted to an employee in the taxable income or surcharge for compulsory deposit scheme, will have an adverse effect on the economy of an underdeveloped country where it is not possible to impose such burdens on the *entrepreneurs* without producing harmful effects. The chapter on the second Five-year Plan gives a critical appraisal of the Plan. This book undoubtedly sets a standard for textbooks to the college student as well as the general reader.

Trade and Finance in the Bengal Presidency (1793-1833). By Amales Tripathi. Published by Orient Longmans Private Ltd., 17, Chittaranjan Avenue, Calcutta 13. Pages : 209. Price : Rs. 20.

The book analyses the inter-connection between the private British traders and capitalists, on the one hand, and the East India Company's Bengal Government, on the other, during a period of transition from monopoly to free trade and of rapid growth of the British Empire in India.

The book contains important financial statistics and private papers, hitherto unpublished, of the Governors-General and the Agency Houses, which throw light on the first phase of British Capitalism in India. It also discusses the effects of industrial revolution on Indian economy. A successful attempt is made in presenting Indian economic history in its proper perspective in the context of world economy and of Indo-British relations as a whole. The book will be specially useful to students of economic history. The get-up of the book is good.

Our Second Five-Year Plan. Published by the Publications Division, Ministry of Information and Broadcasting, New Delhi. Pages : 72. Price : As. 6 ; 9d. ; 10 cents.

Although much is seen and read in the daily papers about India's progress and achievement towards self-sufficiency under its Five-year Plans, a clear insight into the aims and objectives envisaged under the Plans cannot be had from such scattered material. The book under review is, therefore, useful in that it brings together in a concise form the various phases of the Plan, how it is to be administered and what are the developments contemplated. Priced very low, the book contains 12 chapters of interesting and useful information.

About India. Revised and Enlarged Edition. Issued by the Publications Division, Ministry of Information and Broadcasting, Old Secretariat, Delhi 8. Pages: 128. Inland Price: Rs. 3-8. Foreign Price: 7s. 6d. ; $1.00.

The Publication Division of the Government of India has brought out a handy volume, entitled *About India*. The book, though small, covers a wide ground, and deals with India, its land and people, its history, culture, industries, Five-year Plans, mineral resources, scientific research, foreign trade and Community Development Projects. The book, besides, is copious with pictures and photographs depicting India's art and culture as well as its agricultural and industrial progress.

Report of the Bombay Chamber of Commerce and Industry for the year 1955. Published by the Secretary, Bombay Chamber of Commerce, Ballard Estate, Bombay 1. Pages: 271.

The report under review covers briefly the developments in the year 1955 in the fields of agriculture, trade, finance, banking, etc., including the new legislation in these fields, besides extracts from the memoranda on different subjects submitted by the Chamber during the year.

Annual Report of the Indian Merchants' Chamber for the year 1955. Published by A. C. Ramalingam, Secretary, Indian Merchants' Chamber, Back Bay Reclamation, Fort, Bombay. Pages : 535.

The report under review gives in detail the activities of the Chamber during 1955, including the report of the Committee of the Chamber for the year 1955 and statement of accounts. The appendices give the important communications on topics of commercial interest addressed by the Chamber to the Government of India and other authorities.

GILT-EDGED CHEERFUL

(From Our Own Correspondent)

BOMBAY, 23rd *January*

The short-term money market continued to experience acute stringency this week also. With the pressure of demand for bank credit on an increased scale, banks had to bid for house money and short-term deposits at higher rates. The money placed by the Insurance Corporation and one or two industrial houses last week would appear to have provided only a temporary relief to a few banks, with the result that the demand for funds was very keen.

Inter-bank call money was placed at 3¼ per cent., but the volume of business was very thin. There was keen bidding in house money, the common rate being 3⅞ to 4 per cent., as against 3¾ to 3⅞ per cent. last week, the higher rate being offered for large amounts. There was a hardening of deposit rates also, one to six months' money fetching 3⅞ to 4 per cent., as against 3¾ to 3⅞ per cent.

A decline of Rs. 4.32 crores in notes in circulation is disclosed by the Reserve Bank of India statement for the week ended 18th January 1957. As notes held in the Banking Department have gone up by Rs. 4.49 crores, the total notes issued are up by Rs. 17 lakhs. This rise is covered on the assets side by a similar increase in rupee coin. There has been a drop of Rs. 4.97 crores in foreign securities offset by a corresponding rise in rupee securities. In the Banking Department, a drop of Rs. 3.29 crores is noted in Central Government deposits and a rise of Rs. 2.09 crores in other Government deposits. Deposits of banks have dwindled by Rs. 3.26 crores. On the assets side, there has been an increase of Rs. 93 lakhs in balances held abroad, while loans and advances other than to banks were lower by Rs. 3.99 crores, of which outstanding advances to Scheduled banks against usance bills accounted for only Rs. 16 lakhs. Fresh advances to banks against usance bills during the week were of the order of Rs. 11.05 crores, but repayments have been larger at Rs. 11.21 crores.

The Scheduled banks' statement for the week ended 11th January 1957 discloses a sharp rise of Rs. 8.72 crores in demand deposits of banks, while time deposits are slightly lower by Rs. 68 lakhs. Inter-bank borrowings have also declined by Rs. 2.63 crores, while borrowings from the Reserve Bank have gone up by Rs. 5.91 crores, following the rise in borrowings against usance bills to the extent of Rs. 8.04 crores. A further increase of Rs. 9.56 crores is noted in advances, whereas bills purchased and discounted have fallen by Rs. 2.83 crores. The total of advances and bills now stands at Rs. 808.43 crores, as against Rs. 663.05 crores a year before. Investments have fallen by Rs. 2.04 crores. No notable variation has taken place in cash balances, while balances with other banks and money at call have declined by Rs. 1.13 crores and Rs. 2.14 crores, respectively.

Cheerful conditions prevailed in the Gilt-edged market. There was an all-round marking up in prices. The absence of selling pressure and scattered enquiries contributed to the general improvement in the tone of the market. The volume of business did not, however, show any marked expansion. 3 per cent. 1986 Conversion Loan rose for the second week in succession from Rs. 73-3 to Rs. 73-7; a fortnight before it stood at Rs. 73. This spurt was chiefly due to covering by speculators who had sold short in expectation of a rise in the Bank rate. 3 per cent. 1970-75 had buyers an anna higher at Rs. 87. 3 per cent. 1966-68 gathered an anna to Rs. 92-5, while 3 per cent. 1964 was maintained at Rs. 94-6. 3 per cent. 1963-65 and 1959-61 were in request an anna higher each at Rs. 94-3 and Rs. 97-11, respectively. 3½ per cent. 1962 had sellers at Rs. 97-14, while 3½ per cent. 1961 hardened by As. 2 to Rs. 99-6 and 3½ per cent. 1964 by As. 3 to Rs. 98-6. 3½ per cent. 1965 improved by As. 2 to Rs. 98-4 and 3½ per cent. 1967 by an anna to Rs. 98-8.

State loans were neglected, but prices were well maintained at quoted rates.

In the foreign exchange section, there was a further slight hardening of the rupee in terms of the U.S. dollar, in consonance with the persistent strength displayed by sterling abroad. Banks' selling rate for ready dollars was marked down from Rs. 478¾ to Rs. 478 per $100 and their buying rate from Rs. 475 to Rs. 474½ per $100. In terms of the Canadian dollar, the rupee ruled steady, banks' selling rate being maintained at Rs. 499¼ per $100 and buying rate declining from Rs. 493¾ to Rs. 493¼ per $100. In New York, spot sterling, after declining from $2.79.13-16-2.79.15/16 to $2.79.11/16-2.79.13/16, rallied to $2.79.15/16-2.80.1/16.

DEMAND FOR LINSEED POOR

(Messrs. A. Bradley & Co.)

CALCUTTA, 21st *January*

Prices have displayed a slight decline, owing to a slackening in the demand from buyers; ready stocks are still scarce and sellers have been fairly reserved. Trading during the week has been poor. In the oil section, shippers have been rather less active, owing to a small decline in overseas prices. Sellers are, however, pausing in expectation of a further rise in prices.

Latest quotations are as follows: January Rs. 25-4 and April-May Rs. 22-6 per maund.

HIDES STEADY

(From Our Own Correspondent)

MADRAS, 21st *January*

Arrivals of kips have been smaller than usual and clearance by shippers brisk. Importers have increased their limits by one penny, but as the local market is firm, shipment business has been difficult to conclude. Prices of cow calf, buff calf and buff hides are steady in the local market and out of line with the buyers' ideas.

Tanned goat and sheep skins are steady, but sales overseas have been patchy. There has been good clearance of market goat and sheep skins by shippers.

BULLS PAY MARGIN IN SILVER

(From Our Own Correspondent)

BOMBAY, 23rd *January*

The boom in the bullion market made further headway during the week under review, as the bulls tightened their grip over both the metals. Frantic covering on account of a leading bear operator, who had substantial commitments in the market, was another cause for the advance in prices. It is alleged that the loss suffered by this operator was so large that he was unable (some say he was unwilling) to meet it. The default by the prominent bear is said to have resulted in heavy loss to his constituents.

The growing Indo-Pak political tension, the substantial fall in the arrival of Tibetan coins and unauthorised gold and the strong advices from other commodity markets were the main factors which sustained the bulls for another week. The floating stocks in both the metals, which were small, would appear to have been cornered by the more resourceful operators, resulting in a scarcity of ready metals. This was particularly the case in silver, as indicated by the change from a discount of As. 7 to a premium of As. 8 at which ready was quoted over the forward. The rise in silver was so sharp that the bulls had to pay a margin of Rs. 500 per bar yesterday, under by-law 33C, as the closing price in February settlement stood over Rs. 182-12, that is, Rs. 7 more than the starting rate for the settlement.

Silver for forward delivery (16th February settlement) advanced from Rs. 181-15 to Rs. 182-8, but profit-taking at the higher level brought it down to Rs. 181-5. Renewed support and frantic short-covering lifted the price once again yesterday to a high of Rs. 185, a level not seen since 1951. The sharp jump, however, brought a technical correction and the closing today was slightly lower at Rs. 184-6, which showed a rise of Rs. 2-7 over the week.

Ready silver (.996 Mint) rallied from Rs. 181-8 to a high of Rs. 185-8 before closing at Rs. 184-14. The floating stocks of silver are reported to be 1,400 bars. The daily average offtake was of the order of 12 bars.

Forward gold (15th February settlement) shaded off early in the week from Rs. 107-14 to Rs. 106-15, but soon gathered strength to touch a high of Rs. 108-15, which is also a peak for the past five years. On profit-taking, due to slackening of demand at higher levels, there was a slight recession to Rs. 108-6 at the close.

Ready gold moved up from Rs. 107-11 to Rs. 108-15 before finishing at Rs. 108-4 today. The floating stocks in gold are placed at 30,000 tolas. The daily average arrivals were 3,000 tolas, and the offtake was also of the same order.

In New York, silver was kept unchanged at 91⅛c., as also in London at 80½d. for spot and 80¼d. for forward. Gold recorded a further recession from 249s. 4½d. to 248s. 11d.

The following comparative table shows the trend of market during the week under review:

	23-1-1957	Highest	Lowest	16-1-57

SUGAR STEADY

(From Our Own Correspondent)

HAPUR, 21st *January*

Sugar prices remained steady, due to export prospects. According to the Government's view, sugar production is likely to exceed last year's figure at 1,862,000 tons. Production of indigenous sugar amounted to 451,000 tons up to 31st December 1956, as against 358,000 tons during the corresponding period of 1955 and the stocks with the factories on this date stood at 660,000 tons, as compared with 526,000 tons a year ago. Loadings from this station have very much improved and the offtake during the week was mostly for Saurashtra. Latest mill delivery prices were:

Jaswant Rs. 28-10 ; Simbhauli Rs. 28-14 ; Mawana Rs. 28-12 ; Daurala Rs. 29-14 ; Amroha Rs. 28-2 ; Bijnore Rs. 28-2 ; Mansoorpur Rs. 28-12 to Rs. 30 and Rampur Rs. 31-8 ; retail price Rs. 30-15 per maund. The *khandsari* market too ruled steady, but demand was negligible. Inferior grade was quoted at Rs. 20 to Rs. 23 per maund, while fine quality was transacted at Rs. 24 to Rs. 27 per maund.

Ready *gur* prices, after an improvement to Rs. 10-14 per maund in mid-week, following continued cloudy weather and occasional rains, declined at the week-end to Rs. 10-8 per maund as the weather cleared up and arrivals increased to 1,500 maunds today. Outside buying inquiry was slack and, although easy loading facilities were available, prices tended to go down. About half of the total produce for the season is reported to have reached the market.

Gur for forward delivery which had also recorded strident advance in line with ready prices and had touched the highest at Rs. 11-3-4½ for *Fagun* delivery in the mid-week, as against the week's opening level of Rs. 10-5, declined at the week-end and was quoted today at Rs. 10-13-3.

COTTON FUTURES FIRM

(From Our Own Correspondent)

BOMBAY, 23rd *January*

A firm trend was depicted by the cotton futures market during the week under review. The firmness was due mainly to the decision of the Board of the East India Cotton Association (E.I.C.A.) to reconsider its earlier decision to keep by-law 61, relating to invoicing back, unaltered. This was interpreted bullishly in some trade quarters as they expected that the Board may decide to amend the by-law. But this expectation proved baseless, for the Board, at its meeting yesterday, resolved to maintain the *status quo* in respect of the said by-law. Other helpful factors were the fears of the scarcity of cotton tenderable against the maturing contracts and reports of cold wave and rains in Punjab and Saurashtra. The consequent mill and spot house support pushed the contracts higher. But the rates were held in check by the profit-realising sales induced by the high prices and the dampening of enthusiasm by the delay in the anticipated announcement of a fresh export quota. The forward section remained closed today.

M. G. Jarilla (March delivery) opened the week at Rs. 662-8, as against the previous close of Rs. 665, and advanced to Rs. 665; but it later eased, on profit-realising sales, to Rs. 658-4. On buying support induced by the reported decision of the E.I.C.A. to reconsider the question of altering by-law 61, the contract firmed up to Rs. 668 the next day and the trend was maintained the following two days also. Opening yesterday at Rs. 662-8, the contract rose to Rs. 672 before closing at Rs. 669.

M. G. Vijay (April) followed more or less the same course. After having opened at Rs. 775, the contract made a gain of two or three points before facing liquidation which brought it down to Rs. 767. It again received fresh support which raised the contract to Rs. 774-8 on the 21st inst. Opening yesterday at Rs. 767, and advancing to Rs 780, the contract met with selling pressure, shedding most of the earlier gains. It wound up the session lower at Rs. 777.

The following table gives the trend of prices of the two contracts for the week:

(In rupees per candy of 784 lbs.)

	22-1-57	*High*	*Low*	16-1-57
Jarilla (March) ...	669½	668½	656½	665
Vijay (April) ...	777	780	762	778

The spot section ruled quiet. Mill demand was slack. Some interest was noted in Jarilla, Berar and Khandesh. In the export section, moderate inquiry was evident in Bengals, Oomra, Dholleral and C.P. II. Small business was put through in these styles. Japan's interest in Bengals is reported to have fallen off. In the foreign section, U.S. growths continued to be popular. It is believed in market circles that the monetary ceiling for U.S. aid cotton will soon be reached and the grant of an additional quota of about 50,000 bales is regarded as likely. Egyptians and Sudans were entirely neglected due, probably, to their high prices. The delivery contracts also were easy. The latest available spot rates—in rupees per candy of 784 lbs.—are given below:

Bengal *Deshi* 720; Berar Jarilla 758; Khandesh 780; Vijay 890; Oomra *Deshi* 770; Moglai 720. *Delivery Contracts*: Khandesh 197-3, 135, Berar 110, Moglai 72 'ON' Jarilla ; 320F 95 ; Vijay 13/16 February 115 'ON' Vijay.

The Karachi market depicted an easy trend during the week. The good buying support, noted last week, was not forthcoming due mainly to the accumulation of city stocks. Activity in the futures section was also affected by the weakness of the spot market. The total Pakistani cotton crop in the current season is estimated at round 1.5 million bales which is 200,000 bales less than last year's output. N.T.R.G. January which had closed at Rs. 85-10 improved slightly to Rs. 85-13 while the March position eased from Rs. 85-11 to Rs. 85-3. The spot section also was quiet. The latest available rates—in rupees per 82 lbs.—for a few popular varieties of Pakistan, prevailing at Karachi, are given below:

Sind *Deshi* 93-8; Punjab *Deshi* 85-12; 4F Roller 90-13; S.G. 94-13; Punjab Roller 92-1; S.G. 96-9; 289F N.T. Roller 90-5; 289F N.T. Sind S.G. 96-1; 289F Punjab Roller 95-5; S.G. 105-5.

The firm trend noted in the Alexandria futures market continued unabated during the week under review also. The main influencing factor appears to have been the reported decision of Japan to purchase, on barter basis, half a million dollars worth of Egyptian cotton, in exchange for fertilisers. Medium-staple Ashmouni registered fair advances. Karnak contracts also improved but not to the same extent. The following are the latest available rates —in tallaris per lb.—from Alexandria:

Karnak: January 123.20; March 119.30; May 118.60. *Ashmouni*: February 84.30; April 84.35; June 84.25.

The Sudan Gezira Board has announced that the sales policy for 1957 is to offer the cotton crops of the Gezira, Alternative Livelihood Scheme, Gash and Nuba mountains for sale by free and frequent public auctions which will be open to all buyers without discrimination. Auctions will be held every day with the exception of Sundays, Mondays and public holidays and the procedure will be the same as in 1956. Sample types of all cotton will be shown in Port Sudan as early in the season as possible. While the Board has reserved the right to change its system of sales at any time, it has no intention of doing so unless there is an appreciable change in circumstances. The Board has stated that this policy has the full support of the Government of the Sudan. It has not yet indicated any reserve prices but prominent shippers believe that they will do so early in March when auctions are likely to commence. There is some anxiety regarding finding early freight space but if the clearance of the Suez Canal is expedited, it is hoped, freight opportunities will increase considerably.

Trading in the Liverpool futures market was easy throughout the week. Inter-month switching was a notable feature. There were some scattered hedge selling in the American contract a portion of which was absorbed by local short-covering. The Egyptian contract was idle and the Sudan Sakel inactive while Sudan Lambert evoked some inquiries and registered fair gains. Mill demand for both ready and shipment cotton was slack. What little interest evinced was confined to U.S. growths. A consignment of 10,000 to 12,000 bales of Turkish cotton, which had recently arrived in Liverpool, was very popular with spinners and is reported to be taking the place of Pakistani American seed cotton. Small business was put through in Indian Oomras but the high prices and the limitation of offerings restricted business. The latest available quotations—in pence per lb.—from Liverpool are given below:

American Cotton One Inch Staple Contract: March-April 26.47; May-June 26.15; July-August 25.60; October-November 25.27. *American Cotton Mixed Growth Contract*: March-April 26.82; May-June 26.37; July-August 25.86; October-November 25.54. *Egyptian Karnak Cotton*: January-February 60; March-April 60. *Sudan Sakel*: January-February 61.30. *Sudan Lambert Seed Contract*: May-June 46.50; July-August 45.50.

Fair gains were recorded by the New York cotton market. There was good demand from textile mills and exporting houses and the contracts improved as a result. But further rise was prevented by reports of Government plans to cut the 1957 support price below the present rate of 82½ per cent. of parity.

Total purchases in the 14 spot cotton markets for the week ended the 10th inst. were 250,100 bales, as against 136,900 bales during the previous week. In spite of considerable demand from abroad shippers are reported to be reluctant to enter into large forward commitments. Among the factors restraining them are the congested condition at ports and limited cargo space. Exports during the week ended the 10th inst. were 192,235 bales which raised the aggregate exports for the season till then to 3,885,022 bales. The corresponding figure for last season was only 710,121 bales. The Commodity Credit Corporation has sold a further quantity of 43,030 bales under the new export sales programme, raising the aggregate sold thus far to 6,273,192 bales. The average price for basis Middling 1 inch accepted by the C.C.C. was 26.87 cents gross weights average location and the minimum price for basis Middling 15/16" 25.55 cents.

The following are the latest available quotations from New York, as compared with those of a week and a fortnight before:

(In cents per lb.)

	22-1-57	15-1-57	8-1-57
Spot	34.95	34.70	34.65
March	34.45	34.43	34.32
May	34.48	34.45	34.31
July	34.22	34.02	—

GROUNDNUT ACTIVE

(From Our Own Correspondent)

BOMBAY, 23rd *January*

Barring castorseed the local oilseeds market displayed a cheerful trend during the week under review. The most impressive advance was witnessed in the cottonseed futures section. The market opened easy on the first day of the week on fears regarding Government's intervention to check the rising trend of prices. It received further setback following the announcement of introduction of margin system on 18th inst. On the 19th, the market remained almost featureless with irregular movements, except in linseed which remained steady on scattered fresh support. On the following three days, however, the market advanced steadily, weak interests having been eliminated on account of margin requirements and the consequent domination by the buyers. The upcountry advices were also firm. Moreover, subsidence of liquidation and stop-loss buying from bears who had sold previously on expectations of bearish trend on the enforcement of the new margin in castor and groundnut futures caused substantial rise in values. Castorseed futures, however, suffered a technical setback on profit-taking and closed today at a level much lower than a week ago, while groundnut closed firm. Linseed and cottonseed were firm in sympathy with groundnut.

In the groundnut section, February contract opened at Rs. 164-8, and after fluctuating between that level and Rs. 161-12 touched on 18th, for the first three days, moved up on the 21st inst. to Rs. 167-2. Subsequently, it further went up to Rs. 176-10 today before finishing at Rs. 168-8. Over the week it put on Rs. 2-12. The May (futures) contract witnessed a similar trend. Opening easy at Rs. 168 it declined to Rs. 162-12 on the following day but moved up to Rs. 169 on 21st and Rs. 170 on 22nd and Rs. 171 today. It, however, was quoted at Rs. 169-12 at the close. In the spot section, Bold F.A.Q. rose by Re. 1-8 to Rs 35. Groundnut oil ex-mill was done at Rs. 19-3, that is, As. 7 higher than last week.

Linseed May contract, opening at Rs. 31-12, touched the lowest level of the week at Rs. 30-12 on the following day and reached the peak on 22nd at Rs. 32. At the close today it was done at Rs. 31-12, that is, As. 9 higher than a week ago. In the spot section Bold ready rose by Re. 1-8 to Rs. 36-4. Linseed oil ready was unchanged at Rs. 19-10.

In the castor futures section, however, the May contract reflected a downtrend over the week. Commencing at Rs. 176-8 it slided down to Rs. 167-12 on the 18th before closing the same day at Rs. 173-4. After irregular movements on the two days that followed, it moved up to Rs. 176-12 on 22nd, but declined at the close to Rs. 171-8 on profit-taking. Today again it advanced to Rs. 176-4 before retreating at the close to Rs. 173-8. Over the week it lost Rs. 5-8. In the spot section, however, a steadier trend was in evidence. Castor Bold put on Re. 1-8 to Rs. 59-8. Oil B.S.S. was nominally lower.

The most impressive trend was found in the cotton-seed section. The two contracts, February and May displayed steadily upward trend. February contract commenced at Rs. 98-8 and touched today the peak of the week at Rs. 106 before closing at Rs. 103. So also, the May contract opened at Rs. 98-12 and reached the same peak level today before finishing at Rs. 104. Over the week they respectively put on Rs. 3-8 and Rs. 4-12.

Among the other seeds, kardi Bold was higher at Rs. 22-6, and nigerseed Madras was quoted at Rs. 30-12.

An important development of the week was that the Bombay Oilseeds Association brought into effect from Tuesday a more rigorous system of margins, designed to arrest the upward tendency in castorseed and groundnut futures prices. The Association's Board imposed margins at the rate of Rs. 15 per candy against open "long" positions if the closing rate for both castorseed and groundnut is above Rs. 165 per candy on a trading day. The decision, it is stated, followed a recent meeting between the Forward Markets Commission and the Association's President, Mr. Ramdas Kilachand, at which the Commission is reported to have expressed its anxiety over the rise in castorseed and groundnut prices. The Association had tightened margin regulations once before in June last year to meet a similar situation.

During the week, an announcement of a simplified procedure for the export of vegetable oils was made. With effect from 1st February 1957, a simplified procedure for export by sea of excisable goods under claim for rebate of duty or under bond will come into force. It will apply to exports of all excisable goods through the ports of Bombay, Madras and Calcutta, except tea and vegetable non-essential oils. As regards tea, the existing procedure will remain unchanged. As for non-essential vegetable oils, a somewhat different simplified procedure will be brought into effect from the same day. Under the revised procedure, the payment of refund will be made directly by the maritime Collector of Central Excise concerned on production by the exporter of proof of shipment.

The main advantage of this procedure is said to lie in the fact that the existing time lag in the payment of refunds in case of exports under claim for refund, and in discharging the bond in case of exports under bond, involving correspondence with the Collectorates from which the goods were originally despatched, will be largely eliminated. A further reduction in the time taken is expected because payment will be made by the maritime Collectors of Central Excise concerned themselves by cheques and not by an order on various treasuries and sub-treasuries as at present.

For exports of vegetable non-essential oils also, the simplified procedure now being introduced will do away with the system of strict identification of oil exported with the duty-paying documents at the time of shipment.

The Joint Chief Controller of Exports has issued a notification to the effect that it has been decided that the validity of the unutilised export quotas of linseed oilcake granted in July 1956 will be further extended up to the end of March 1957.

The following table shows the prices of oilseeds and oils at close as compared with those at the close of the previous two weeks:

	23-1-1957	16-1-1957	9-1-1957
	Rs. a.	Rs. a.	Rs. a.

ART SILK YARN EASY

(From Our Own Correspondent)

BOMBAY, 23rd *January*

There was no change in conditions in the yarn market during the week under review. Dull trading was in evidence and the market was generally weak. Due to lack of buying enquiries, quotations tended to look down and business was restricted in practically all the varieties. The easy trend was most probably due to increasing supplies of both staple and rayon yarns. It was, however, reported that, taking advantage of the Suez Canal deadlock, Japan has booked a large rayon yarn business during the past three months. Cotton yarn did not show any improvement in spite of spurt in raw cotton.

Staple fibre yarn (40x2) for February delivery encountered selling and declined by Rs. 2 to Rs. 640. Spot Kohinoors advanced by 3 pies to Rs. 3-8-6. Citys lost 3 pies to Rs. 3-6-6 and likewise New Greats to Rs. 3-6. Centurys receded by 3 pies to Rs. 3-7-3. Among foreign yarns (80x2), Paramounts and Fujis both shed As. 2 to Rs. 5-7 and Rs. 5-9, respectively.

In the cotton yarn section, among the forty counts, Mnaxis and Gokaks eased by As. 2 to Rs. 27-6 and Rs. 27-10, respectively. Moderns remained quiet at Rs. 23-12. Thirty counts Centurys were quoted at Rs. 22-8. Among 20s, Maduras were quoted one anna down to Rs. 19-7. Moderns were dull at Rs. 19-8. Ten counts Moderns and Podars both remained unchanged at Rs. 15-8. Among sixty counts, Raghuvamshis witnessed some support and gathered As. 6 to Rs. 57-6. Finlays were done As. 12 lower at Rs. 61-4. Among 80s, Moderns hardened by Rs. 3 to Rs. 78.

Staple rayon yarn (120 dull cones) for February delivery improved by a rupee to Rs. 824. Spot 120 Japan shed 21 pies to Rs. 4-4. 150 Japan lost an anna to Rs. 4-7, 120 Italy 6 pies to Rs. 4-2-6 and 150 Italy one anna to Rs. 3-13.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	23-1-1957	16-1-1957
	Rs. a.	Rs. a.
***Art silk yarn* (per case of 200 lbs.)—**		
120 Dull Cone Spun February	824 0	823 0
120 Japan (per lb.)	4 4	4 5½
150 Japan (per lb.)	4 7	4 8
120 Italy (per lb.)	4 2½	4 3
150 Italy (per lb.)	3 13	3 14
***Staple fiber yarn* (per case of 200 lbs.)—**		
40 s 2 February	640 0	642 0
40 s 2 New Great (per lb.)	3 6	3 6½
40 s 2 Century (per lb.)	3 7½	3 7½
40 s 2 City (per lb.)	3 6½	3 6½
Cotton yarn (per bundle of 10 lbs.)—		
Tin Podar	15 8	15 8
20s Madura	19 7	19 8
30s Madura		24 0
40s Gokak	27 10	27 12
60s Finlay	61 4	62 0
80s Modern	78 0	75 0

SUGAR LISTLESS

(From Our Own Correspondent)

BOMBAY, 23rd *January*

The sugar market was devoid of any outstanding developments during the week under review. The spot section was listless due to poor offtake. In the forward section, the tone was a shade quiet towards the close, after remaining firm in the beginning of the week. There was no change in the ex-mill quotations. Although stock position is substantially heavy, the overall tone of the market is one of steadiness due to better prospects for exports.

In the spot section, there was scarcely any change in the rates. Small grains were quoted at Rs. 88 per bag, medium at Rs. 89 to Rs. 90 and large at Rs. 92 to Rs. 101. These rates include sales tax. British refined sugar improved by a rupee to Rs. 96 per bag (excluding sales tax), owing to extremely poor stocks of this variety. Damaged and torn British refined sugar fetched Rs. 90 per bag (excluding sales tax).

In the forward section, *Fagan* delivery contract for 'C' grade sugar touched a high of Rs. 93 early in the week, but receded to finish at Rs. 92-10. The trend at the time of writing is quietly steady.

Rumours of additional excise duty on sugar are still thick and the delay in the usual monthly release is bullishly interpreted by some. The new season's production, it is expected, may be released at the end of this month with an additional burden of excise duty. Knowledgeable trade circles rule out any upward movement in the price of sugar, at least for the time being, owing to the fact that the much talked of shipment of indigenous sugar to Persian Gulf ports will not take place before the middle of February and mills would not be in a mood to bargain for better prices in the midst of a heavy crushing season.

PEPPER ARRIVALS POOR

(Messrs. Parekh & Co.)

BOMBAY, 23rd *January*

After a pause, Malabar black steepper during the week showed improving tendency, following news from all the terminal centres that new arrivals are slowly tapering off. Usually arrivals during the last week of January and the first two weeks of February are the heaviest. Analysts are, therefore, posing a question whether the present comparatively smaller arrivals are a passing phase or it denotes smaller crop in Alleppey and Travancore areas as well. The coming three weeks are, therefore, likely to give a clearer picture as to the final turnout of Malabar crop. Growers in jungle areas appear to be reserved sellers. Continuous and scattered inquiries from Russia, China and other East European countries have made exporters cautious. A couple of hundred tons are reported to have been booked by Poland, Czechoslovakia and China during the week.

New York is reported to have revised its buying price from $0.24½ to $0.25. The dealers there are offering firm at $0.25 for January shipment but little business is reported to have been done. By repeatedly offering the same price for days together New York dealers seem to be testing the intrinsic strength of the market. When they are unable to buy at their price they come out ultimately to pay sellers' price. The present behaviour of New York market appears deceptive in so far as the dealers there want to buy but without showing any anxiety. Grinders appear to be slow to follow through but with the steadiness at the origins they will be forced to come out, possibly in large numbers.

Alleppey is reported quoting Rs. 587½ to Rs. 612½ according to quality while garbled at Cochin is changing hands at Rs. 99¼ for ready, Rs. 100 for February and Rs. 105 for March.

January shipment for Malabar black to all foreign destinations is estimated to be between 2,200 and 2,300 tons while February export to all countries including Russia, China and other East European countries is tentatively placed at round about 3,000 tons. If this figure turns out to be correct the statistical position of Malabar will be quite healthy. There are chances of the market improving in the long run, if Sarawak crop turns out to be 20 to 25 per cent. less, as some informed sources predict, though it is too early to say anything definitely.

Investment buying in pepper in March delivery seems to have begun and at every drop new parties are coming in. *January is done at* $0.25 while February-March at $0.25½ and April-May-June at $0.26½ with reserved sellers. At the time of writing, however, the market is a shade quiet thanks to profit-taking.

Following are today's nominal quotations: Ready delivery Rs. 83 per Bengal maund; February delivery Rs. 581-86 and March delivery Rs. 593-98 per candy of 5½ cwts.

GOOD DEMAND FOR TEA

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 18th *January*

Approximately 650,000 pounds of tea were offered in dust sale "B" held on 15th inst. There was a good general demand and prices ruled fully firm to dearer for all types. Best liquoring teas, were, however, occasionally easier. Black leaf Middle East types continues to be in poor demand.

The combined average price realised in dust sale "B" was Re. 1-15-7 per lb., as compared with Re. 1-9-8 per lb. in the corresponding sale of 1956.

London Market—Sale of 14th January 1957.—Very best steady. Others 3d. to 5d. easier.

Sale of 15th January 1957.—Plain 2d., good 3d. easier.

Colombo Market—Sale of 15th January 1957.—Good demand. High-grown brokens irregular, following quality. Medium brokens declined five to ten cents. Low-growns, including Gulf types, down five to ten cents. All fannings dearer.

Calcutta Market—Export.—After firm opening market weakened generally one anna to As 1½ lower, except brighter liquoring sorts.

Internal.—26,000 chests. Dust met with good demand. Best liquoring C.T.C. and black export types were firm, but prices for the remaining offerings tended generally easier. Commons were, however, fairly steady. Assam orthodox were easier by one anna to As. 1½. The poorer C.T.Cs were As. 2 easier. 3,000 leaf. Good general demand, particularly clean leaf teas.

Export Quota.—The market for export quota fluctuated between 38 pies and 42 pies during the week and, at the time of writing, there are buyers reported in Calcutta at 40 pies.

Forthcoming Auctions.—Dust sale "C" is due to be held on 29th January 1957.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Sale* 2.—2,200,000 lbs. Good general demand from exporters, but internal buyers very quiet. Low and low medium declined irregularly As. 2, Medium one anna to As. 2 lower and better sorts mediums one anna to As. 2 lower and better sorts As. 4 to As. 6 easier. Whole leaf generally As. 2 to As. 3 down."

JUTE GOODS QUIET

(From Our Own Correspondent)

CALCUTTA, 21st *January*

Although business put through for export during the week under review was limited, prices of jute goods were well maintained at lower levels, on speculative manipulations. The New York report that burlap consumption in the United States in December was as low as 71.6 million yards, as compared with 81 million yards in the previous month and 74 million yards in December 1955, was read with alarm in the first instance. However, it was realised that this was usually the time of the year when consumption begins to fall. Consumption figure for the year as a whole was more than satisfactory. It was 878 million yards, an increase of 52 million yards over 1955. Such an increase as this was interpreted here as being due to the cheapness of burlap as compared with the substitutes. No doubt, economic activity in America in 1956 was also considerably higher. As on 31st December last, burlap stocks, at 267.4 million yards, were higher, and represented consumption of 9 to 10 weeks. In view of the easing of the international tension, there is no doubt that foreign buyers have slowed down their purchases. Stocks that were increased during recent months would now be utilised partly towards consumption.

It was earlier announced that production in mills during the last month was 84,900 tons, which was higher by 1,100 tons as compared with November. During December, the total number of hours worked was only 206, as against 209 in the previous month, and the increase in output was due to the resumption of work in mills that had stopped working in the previous month. Adding stocks to production, the total availability of goods during December was 186,600 tons and stocks at the end of December being 96,600 tons, demand both for export and internal consumption during December was of the order of 90,000 tons. This was considered satisfactory, as it was higher than production for the month.

On Tuesday last, ready B. twills improved to Rs. 119-14 from Rs. 119-12 and 40" 10 oz. hessian to Rs. 45-10 from Rs. 45-8 following speculative activity. Business took place at these levels. At this stage, the report of higher stocks of burlap in the United States induced caution in speculative transactions. However, an analysis of the American consumption figures for 1956 as a whole encouraged sentiment, and on renewed speculative buying 40" 10 oz. hessian gained to Rs. 45-14 on Wednesday. B. twills rose to Rs. 120-10. Profit-taking, however, soon followed, and genuine business was meagre. These caused rates to sag by the week-end. Thus, ready 40" 10 oz. hessian were quoted at Rs. 45-2 and B. twills at Rs. 119-6.

During the week, raw jute prices eased by As. 8 per maund for most constructions. This followed an increase in offers and mills' need to depress prices. However, good quality jute was difficult to obtain. Arrivals were small. Indian northern bottoms were priced at Rs. 33, as against Rs. 33-8 earlier in the week, and local daissee bottoms at Rs. 34, as against Rs. 34-8. Reports from Pakistan indicated reluctance on behalf of overseas buyers to pay higher prices. With the result, rates eased slightly.

TEA PRICES DROP

(From Our Own Correspondent)

CALCUTTA, 22nd *January*

Although there was steady demand during the export sales held yesterday, when offerings amounted to 76,000 chests, prices eased noticeably. All lots, excepting tippy teas which were well supported and bright liquoring teas, prices of which gained, recorded a rise of As. 2 to As. 3. At the lower level, fannings were in good demand. Whole leaf grades provided the market's weakest spot which eased by As. 3. Darjeelings were also quiet, although a few lots were steady. Withdrawals were heavy. The quotations were: Best C.T.C. Assam B.P. Rs. 2-9 to Rs. 2-10, medium Assam B.P. Rs. 2-2 to Rs. 2-3, plain B.P. Rs. 2-1, and clean black pekoe Rs. 2-3.

Export quotas changed hands at 34 pies. The rise to 35 pies was for a while only, as buyers were not prepared to pay more than 33 pies.

Dusts offered during the internal sales held on Wednesday last aggregated 26,298 packages. General demand was good, but most prices were easy. Dooars and Commons were sold well at firm prices, and a similar trend was reported in black leafy teas suitable for export and in the best liquoring C.T.C. Assams. Good buying was registered in the very best liquoring and non-fibrous C.T.C. Assams, but all other C.T.C. Assams gave way further by As. 2. Prices of orthodox Assams, with the exception of those lots in which Middle East buyers showed interest, eased by As. 1½. Among Darjeelings, a few selected lines were steady, but the rest of the offerings declined by an anna to As. 2. The quotations were: Best Assam C.T.C. Rs. 2-9 to Rs. 2-11, medium Assam C.T.C. Rs. 2-4-6, medium Assam grainy dust Rs. 2-1 to Rs. 2-2, and medium Dooars Rs. 2-1.

Leaf grades on offer amounted to 2,852 chests. Demand was good. Unlike the dusts market, prices improved. C.T.C. Assams represented the general trend, orthodox clean leaf teas being firm.

METALS ADVANCE

(From Our Own Correspondent)

CALCUTTA, 21st *January*

Prices of base metals were better during the week under review. Consumer demand, however, continued to be small. The report of the formation of a Development Council for the non-ferrous metals industry, in order to co-ordinate the production programme, was noted, and it was thought that the Council would ensure the achievement of output. The Council is composed of prominent men in the industry and would inspire confidence. Calcutta has adequate representation in the Council.

Tin continued to wield considerable strength and hardened further from Rs. 555 to Rs. 560. New arrivals were reported, but these were insufficient to meet commitments. More ships with tin were anticipated, and only after these arrived the price would decline to the replacement cost level. Electrolytic copper opened at Rs. 193 and, after advancing to Rs. 195, closed at Rs. 194-8. Demand by fabricators was small. Stocks with them were believed fair. It was reported that demand in the United States was not expanding and that the increase in production was resulting in imbalance, although Japan had been increasing its purchases at 34.5 cents per lb. Virgin lead was unchanged at Rs. 82-8. Electrolytic zinc jumped to Rs. 75 from Rs. 73-8. Supplies were comfortable and demand was small. However, the price improvement was due to the possibility of further arrivals being delayed.

TRADE WITH *Japan* THROUGH

BANK OF TOKYO LTD.

(FORMER YOKOHAMA SPECIE BANK)

The only foreign exchange bank in Japan licensed under the Foreign Exchange Bank Law, offering complete banking service through its branches all over Japan and overseas, and well equipped to give full and accurate business information.

KEEN DEMAND FOR BUFF

(From Our Own Correspondent)

KANPUR, 20th *January*

Conditions in the local hides and skins market were rather steady during the week under review. The demand for buff was keener than in the previous week. The supply of wet salted cow was not as plentiful as it was some time back. The Madras dealers were hesitant buyers. The main purchases were effected by Cooper Allens who have been entrusted with further orders of footwear for Soviet Russia. The latest quotations over the main categories of goods are as follows:—

Wet salted cow 1st grade Rs. 320 to Rs. 360 and 2nd grade Rs. 140 to Rs. 150 per score; wet salted buff 1st grade 1 lb. 14 ozs. and 2nd grade 2 lbs. per rupee; goat 1st grade Rs. 320 and 2nd grade Rs. 300 per 100 pieces; sheep 1st grade Rs. 300 and 2nd grade Rs. 225 per 100 pieces.

GRAINS QUIETLY STEADY

(From Our Own Correspondent)

HAPUR, 21st *January*

Quietly steady conditions prevailed in foodgrain markets during the past week. The price of wheat average quality was unchanged at Rs. 16-4 per maund, while barley quality at Rs. 13-8. The sale of wheat through fair-price shops continues and demand on such shops is daily increasing. Diversion of wheat from these shops to the black market has been checked many times, thanks to the vigilance of the marketing staff. Outside buying inquiry of wheat at the prevailing rates is slack and the stock figure ran down by one *khati* only during the week to 53 *khaties*. Although local supply position continues satisfactory, due to the arrivals of the new crop in the market, rice prices recorded slight gains during the week in line with steady trend of wheat and coarse grain prices. Prevailing prices on Monday were: Basmati Rs. 23 to Rs. 26, Mainpuri Rs. 19-8, coarse quality Rs. 15-8 per maund.

Gram continued to be very much in demand during the week and, although reports of fairly good crop prospects were being received following rains last week, gram prices remained steady at Rs. 13-6 per maund for local quality and Rs. 13-14 for Punjab produce. Stock figure ran down by 12 *khaties* during the week to 36 *khaties*. *Bajra* and maize were still in good demand for seasonal consumption and prices stayed at previous week's levels. Poor local stocks accounted for hardening trend in the prices of barley and *bejhar* and the week-end prices were: Barley Rs. 13-4; *bejhar* Rs. 13; maize Rs. 13-6; *bajra* Rs. 13-12; *jowar* Rs. 12 to Rs. 13 and *guwar* Rs. 10-14 per maund.

Fast dwindling stocks due to good outside buying inquiry accounted for steady conditions in the prices of peas during the week, although latest rains have very much brightened the prospects of standing crops. Peas *dara* is quoted at Rs. 13-8 and white quality at Rs. 14-10 per maund and local stock is put at 6 *khaties*. *Arhar* prices, however, ruled quiet around Rs. 13 per maund and the stock here is put at 16 *khaties*. Prices of other pulses moved narrowly during the week and were quoted at: *Urd* Rs. 18 to Rs. 20-8, *moong* Rs. 14-8 to Rs. 16 and *masoor* Rs. 17 per maund.

After early gains on bull support, pulses futures declined to be quoted near the opening level of the week and latest quotations on Monday were: Peas *Jeth* Rs. 10, peas farm *Maha* Rs. 12-15, *Jeth* Rs. 10-6-3, *arhar Maha* Rs. 12-2, *Jeth* Rs. 10-10 and urd *Maha* Rs. 18-7-6.

U.K. TRADE WITH INDIA AND CEYLON

Britain's trade outlook is "particularly good" with Ceylon, and "good" with India. This assessment is made in the January issue of the General Electric Company's export guide, which has just been published. The guide assesses the United Kingdom's overall opportunities for 36 groups of manufactured goods in 34 of the most important oversea markets. It considers that in 14 of them the outlook is "good", in nine the prospects are "improving," in 10 they are "deteriorating", and in only one—Egypt—are the prospects "bad."

Markets with continuing good, or particularly good, prospects are—in addition to Ceylon and India—Canada, Rhodesia, Switzerland, the United States, Venezuela, Western Germany, the Gold Coast, Nigeria, Kenya, New Zealand, Sweden, and South Africa. Since the publication of the last guide in October, the outlook for British trade has improved in Argentina, Australia, Belgium, Norway, and Spain, and further improvement is noted for the Irish Republic, Italy, Malaya, and Trinidad.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H.=Accounts published half-yearly. P.=Company has Preference shares. T.=Company has Debentures. N.=Nominal quotations. x.d.=Ex. Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up Def share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and Dece respectively. Reserves include general and other reserves and all other funds, which a company may i excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual c land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and s for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where qu for portion of a year they represent the proportionate dividend for that period. In the case of those comp which close their accounts yearly, dividends shown are for their financial year.

M—Managed by the Board of Directors. ‡ Less income-tax. z) Clive Mills have paid dividend at As. 10½ on bonus shares, for the year, 1955. * Including bonus. (k) Investments.
(i) Made up of an interim dividend of Re. 1-12 per share on 1,20,000 shares and final dividend of Re. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares. (c) For seven months ended 31st March 1954.
† New Central Jute Mills—Dividend for 1955 is on shares of Rs. 10 each. The Albion and Lothian Jute companies have been amalgamated with New Central Jute Co., with effect from 1st December 1954.
‡—Fort William Jute Co. has sub-divided ordinary shares of Rs. 100 into shares of Rs. 10 each.

HIGHER DEFENCE SPENDING—CRUX OF U.K.'S PROBLEM

BANK CHAIRMEN URGE CUTTING COAT ACCORDING TO CLOTH

IT is no exaggeration to say that the economic situation now facing Britain is the severest, if not disturbing, witnessed in recent years. This view is shared in public by a number of eminent practical economists and bankers; for it is no more possible to hide the underlying weakness of the economy. No less a man than Mr. Thomas D. Barlow, Chairman of the District Bank Ltd., has forthrightly voiced the opinion in his annual statement to the shareholders that, though the country has muddled through the recurrent troubles of recent years because the difficulties with which it had to contend were not formidable enough to reveal the hidden deficiencies in the economy, the present situation is of so stern a character that it has ruthlessly exposed the accumulated internal weaknesses as well as external dangers. Thus, the impact of the Suez trouble, which has laid bare the most serious weaknesses of the economy, was reflected in the catastrophic fall in the gold and dollar reserves which more than wiped out in one month the painful gains of the first ten months of the year. As a consequence, the economy has received a grave setback. Inflationary forces have gained further momentum with imported food and raw materials becoming dearer, and freight and transport charges growing higher, forcing, in turn, a rise in the cost of living and wages. Moreover, profits of industries have begun to decline, affecting adversely the attitude towards development plans. The Bank Rate continues to be high, accompanied by credit squeeze, and also, paradoxically, by high Government spending. In the external field, sterling has been subjected to unprecedented pressure at a time when the world's faith in it was being gradually restored after the 1949 devaluation, calling for the repetition of the extraordinary measures resorted to during the war in order to fortify the pound sterling. But is it possible, in

PROTECTION FOR AUTOMOBILES—I

THE Tariff Commission has done full justice to the problem of improving the economics of the automobile industry, though its findings and recommendations have brought little relief to consumers. After some unsuccessful attempts to tackle it, the Commerce and Industry Ministry thought it better to transfer the task to the Commission. This was done on 6th August 1955, twenty-six months after an entirely new policy had been announced by the Government on the basis of a comprehensive inquiry conducted by the Commission into the affairs of the industry in 1952-53. It will be recalled that it was under this policy that the two foreign assemblers, Fords and General Motors, had to cease their operations in this country and that opportunity was given only to those concerns that were prepared to undertake progressive manufacture of motor vehicles. That it was found necessary to order a fresh inquiry within so short an interval was the result of Government's exaggerated hope that the domestic producers-*cum*-assemblers would be able to sell their cars at lower prices. The hope did not materialise and consumers were naturally disappointed. At the same time, at least one of the manufacturers—Hindustan Motors—bitterly complained that the selling price of its car was uneconomic and that it should be permitted to raise it. Confronted with this demand, which was not unreasonable as events have shown, and disappointed at the failure of its expectation, the Government remitted the case to the care of the Commission. The latter was asked to fix fair prices for manufacturers and consumers, as well as to make a comprehensive review of the industry again. The Commission has handled this twofold task in a commendable manner, with the assistance, albeit for a short period, of a British automobile expert, whose services were secured under the Colombo Plan.

The Commission's appraisal of the industry's affairs has been thorough and painstaking. It has reported its findings in a candid manner. It has not hesitated either to criticise or to commend where such was due. It has endeavoured to protect the interests of consumers from their long-range and national points of view. That is the consolation consumers can have for not getting any relief in the price of cars or for having to pay a slightly higher price for one of the light cars, namely, the Hindustan Landmaster. On the whole, the Commission's report gives the impression that the job has been done in as impartial a manner as is humanly possible in the prevailing circumstances. The Government, too, it must be said to its credit, has done well in accepting the Commission's findings and suggestions, except in one or two important respects. On the last occasion, that is, in 1953, however, it modified the Commission's proposals in good many respects. Subsequent events have not borne out the Government's wisdom in full. It is gratifying to find that the Government has been wiser this time.

The Commission's findings on the main question of prices show that, though consumers have been paying for automobiles prices higher than those in advanced Western countries, no manufacturer has exploited them, taking advantage of the protected market. The margins between the current net dealer prices and the ex-works costs of the vehicles produced by the approved manufacturers have not been unreasonable, in the case of any model of car or truck, except diesel trucks produced by the Premier Automobiles, to some extent. The latter has already been directed to reduce the price of these trucks. In the case of Hindustan Landmaster, the ex-works (or net dealer) price per car has actually been Rs. 833 less than the ex-works costs. The Commission, however, found that the dealers' margins were higher than necessary and, therefore, recommended a reduction in them. It proposed that the dealers' commission should be Rs. 1,000 per vehicle or 10 per cent. of the ex-factory price, whichever is lower, for passenger cars and jeeps and Rs. 1,000 per vehicle or 7½ per cent. of the ex-factory price, whichever is lower, for trucks, buses and other commercial vehicles. The dealers, however, complained that this reduction would tell on their capacity to render efficient service facilities. The Government, as a compromise, has decided that the dealers' commission should be fixed at the percentages mentioned by the Commission, but without the monetary ceiling of Rs. 1,000 per vehicle. This decision may give some relief to consumers, but, as manufacturers have been given the freedom to vary their prices, subject to Government's previous consent, not much benefit will accrue to them. On the contrary, Hindustan Landmasters will cost a thousand more per car, as a rise of that order is justified by the Commission's inquiry into their cost of production.

On the last point, namely, manufacturers' freedom to fix a reasonable price, the Government has needlessly modified the Commission's recommendation. After a careful study of the problem, the Commission came to the conclusion that a rigid system of price control was likely to have adverse repercussions on the development of the industry. It, therefore, recommended that the interests of consumers could be adequately safeguarded by replacing the present system of price control by a more flexible system. Under this system, no maximum prices are to be fixed

could on the basis of its findings. This is not surprising, because no bureaucracy ever wishes to surrender its rights and this is much more so in a socialist State.

In another important respect also the Government has modified the Commission's recommendation. After examining the working of protection to the industry through import duties as evolved in 1953, the Commission came to the conclusion that it did not provide adequate incentive to manufacturers to proceed with their manufacturing programmes. On the contrary, it penalised the manufacturer who took the trouble of making in this country as many components as possible and conferred a bigger margin of profit on the one who went slow with the programme of progressive manufacture and continued to stay mainly as an assembler. The Commission has given enough data to prove this point. The Hindustan Motors Ltd., for instance, has been making a smaller profit than the Premier Automobiles Ltd. mainly because it has made much greater advance than the latter in implementing the manufacturing programme. It will be recalled that, in 1953, the Commission recommended, and the Government accepted the suggestion with some modification, that the import duties on components should be brought down in order to lower the cost of vehicles in the building of which a very large number of imported parts was used. Of course, while recommending this system of protection, the Commission was aware of the possibility that progressive manufacture of components might result in higher cost of vehicles and, therefore, lower profits, but it took the view that this adverse factor might be neutralised by the larger volume of demand which was expected to result from its recommendations regarding import arrangements and heavy burden of taxation and other measures that are having an inhibiting effect on the offtake of motor vehicles. Actual events, however, have not fully justified its expectations. Although the offtake of cars has increased in the past five years, the cost of manufacture too has gone up very appreciably.

The State Governments have done nothing to reduce the burden of taxation on motor vehicles and the Central Government also has taken no effective steps in this direction. Some gain has been made in reducing the rigour of the other measures that are restraining the demand for cars, but it is not appreciable. The import control, too, has not been administered in such a manner as to provide adequate incentive to manufacturing activity. Again, the Central Government itself departed from the policy indicated by the Commission and gave licences to two more manufacturers, thereby increasing the number of those who are predominantly assemblers. Three of the other manufacturers, who were already in the field, have also been defaulting in their manufacturing programme for some reason or other. All this has aggravated the trend under which it is more profitable to import automobile components than to manufacture them. In order to arrest this unfortunate trend and to encourage the manufacture of components, the Commission recommended a judicious readjustment of import duties. It proposed a higher level of duties on the import of those components which should have a higher order of priority in the manufacturing programme as, for instance, the engine, transmission and axle, and a lower level for those components which are on a lower order of priority. This sensible rearrangement of duties, designed to speed up the manufacture of cars and commercial vehicles in the country, has failed to evoke the Government's consent. Giving its reasons for not implementing this proposal of the Commission, the Government says:

"Government recognise the force of the point made by the Commission that the existing rates of duty are inadequate for protecting the industry. They feel, however, that a change in tariffs as recommended by the Commission is not particularly necessary at this stage, having regard to the fact that the domestic industry is sheltered to a very considerable extent by restrictions on imports. It is Government's intention, and the Tariff Commission also has recommended such a course, that, in the grant of import licences for components, special weightage should be given to firms, which show the maximum progress in indigenous manufacture, while firms that lag behind the programmes, which they have given to Government, should be penalised. Government, therefore, propose, instead of making any changes in the tariff at this stage, to convert the existing revenue duties into protective duties and this will enable them to change the tariffs on these components, if at any time such a course appears to be essential."

The aforesaid line of reasoning is not convincing, for the administration of import controls hitherto has not been such as to inspire confidence that it will work any better in future. It is, however, gratifying to be told that the Government appreciates the force of the Commission's contention and would follow the course advocated if the situation warranted it.

Excepting on the two issues discussed above, the Government has concurred with all other recommendations of the Commission. The most valuable of these are: protection for the industry to continue for a period of ten years and no more new manufacturers to be allowed to enter this industry, so that all future expansion in the demand for automobiles may be met by existing manufacturers. By accepting these important suggestions, the Government has demonstrated its desire to see established in this country a strong automobile industry. This should sustain the hope of automobile manufacturers, whose lot is by no means enviable today, that better days are bound to come.

SHIPBUILDING

INDIA is in the unenviable position of having to pay a heavy penalty for its past neglect of shipping and shipbuilding. The scope for progress in both operating and building ships is immense, but it now finds that, while ships are not easy to obtain from the world's shipyards, which are booked for a long time ahead—almost till April 1961—its only shipyard, owned by the Hindusthan Shipyard Private Ltd., Visakhapatnam, is still unable to meet even its modest needs for ships. Lack of steel and cement, difficulties of obtaining imported equipment which goes into the building of ships and paucity of trained personnel are factors which still dog the progress of the Visakhapatnam shipyard. The sooner these impediments are removed, the quicker will be the pace of progress of the Shipyard, and brighter will be the prospects of establishing the contemplated second shipyard.

Although the Shipyard is thus unable to meet the country's shipping needs, it is gratifying to note that some notable progress has been achieved in recent years. Reviewing the progress of the Shipyard, at its recent annual general meeting, held at New Delhi, its Chairman, Mr. N. R. Pillai, pointed out that the year 1955-56 witnessed the completion of the first two of the new series of modern diesel ships which the Shipyard was building. The third ship of the same design was delivered in May 1956. The *State of Kutch*, built for the Eastern Shipping Corporation and delivered in November 1956, is the largest the Shipyard has built so far. The first passenger-*cum*-cargo ship, the *Andaman*, to be built at the Shipyard, is now being fitted out. The Shipyard has also started work on a mooring vessel, the first naval craft to be built by it for the Indian Navy. The total value of production in 1955-56 was Rs. 247.92 lakhs, as compared with Rs. 210.84 lakhs in the previous year. In the absence of the text of the annual report and accounts, it is difficult to offer any comment on the results of the Shipyard's working. It may, however, be mentioned here that the total paid-up capital of the Company is Rs. 4.53 crores, of which the Union Government's share is Rs. 3.49 crores and that of Scindia Steam Rs. 1.04 crores.

The Shipyard's shipbuilding as well as development programme would have been more expeditiously carried out if the supply position of steel and cement had been more favourable. Arrangements have, however, been made to import steel from abroad. The total quantity of steel now ordered is expected to meet the requirements for shipbuilding upto the middle of next year. The importation of ships' equipment, according to the Chairman, Mr. Pillai, continues to present difficulties, as the order books of foreign firms are already full and as there is a paucity of freight space. Another impediment to speedy progress is shortage of trained personnel. It is gratifying to note that the authorities have decided to set up a training school which will train skilled workmen and junior supervisory staff to meet their own requirements and also to provide a nucleus of trained technical personnel for the second shipyard. The French firm, the agreement with which has been extended by a period of one year, to 15th July 1958, has agreed to make available the services of skilled French workers from their shipyards to work along with the Indian workers for purposes of instructing the latter in the use of modern tools and methods.

For development works in the Shipyard, the Government of India has sanctioned a sum of Rs. 30 lakhs, bringing the total amount of advances made to Rs. 140 lakhs; expenditure upto 1st September 1956 was Rs. 122 lakhs. The progress of the work, according to the report of the Board of Directors, has been retarded by the difficulty in obtaining necessary materials. The project is likely to be completed only in the third quarter of 1957, though it was originally expected to be completed by the end of 1956. The important works completed so far include berths 4 and 5, installation of travelling cranes, certain cutting and bending machines and air compressor, and blacksmith, welding, electrical and joiners' shops. Satisfactory progress has been made in connection with the preparatory work of the Rs. 2.15-crore Dry Dock project which is expected to be completed by the end of 1959. When all the major works are completed, the production capacity of the Shipyard, it is stated, will increase from 2½ ships (equal to four ships of the old type) of the modern type in 1956 to about four ships (equal to six ships of the old type) of modern type.

The situation which faces the Shipyard is that, though we are only in the first year of the second Five-year Plan, it is unable to take any more orders for delivery during the period of the Plan. The Indian Shipyard is, however, in good company, in that no shipyard in the world is in any better position to undertake construction of ships for quick delivery. Only, the Indian Shipyard is in a somewhat worse plight, because some of the machinery and equipment it needs for the ships it builds have to be imported from abroad. No foreign manufacturer, it is stated, is in a position to offer delivery within less than 24 months, while 36 months is the normal period. After referring to these facts, the Chairman said: "In the circumstances, it seems clear to me that the plans for expansion of the shipping industry should be made some years in advance. I would go further and suggest that the proposals for the expansion of shipping during the third Five-year Plan should be finalised now." In the interests of both the shipping and the shipbuilding industry, we commend this advice to the attention of the Government and shipowners alike.

A closely related problem is that of the price of ships. The present practice is to fix the price payable by the buyer on the basis of the cost of a similar ship in the U.K. This practice, as Mr. Pillai pointed out, has its limitations. Since ships are not bought across the counter and no two ships are alike, it is extremely difficult to arrive at the correct U.K. parity price. It would, of course, be even more difficult to determine the "world parity" price which some shipowners are said to be demanding. Mr. Pillai said: "Unless foreign shipyards know that there is a reasonable chance of securing an order, they will not be willing to spend time, labour and money in computing and giving a realistic estimate of cost. The estimates given by them would further be subject to 'extras' and escalator clauses. In other words, the actual cost can be ascertained only after the ship has been completed."

In order to avoid the difficulties met with in implementing the U.K. price parity formula and those that would be raised by any attempt to determine the world parity price, the authorities have submitted a proposal to the Government under which the price of the ships built in the Shipyard would be fixed on the basis either of a percentage of the total cost of the ship or varying percentages of the different elements of cost. Commending this proposal to the shipowners, the Chairman said: "This has the advantage of avoiding uncertainty and of relating the amount payable by the shipowners to the actual costs, not to hypothetical estimates. It gives the shipowners an opportunity to keep their requirements to the minimum and thus bring down the price." The chief merit of the proposal seems to lie in the fact that it would insulate Indian shipbuilding costs from world currents and also eliminate the metaphysical difficulties of estimating the costs of ships that have never been built. But the implementation of the proposal implies that the Shipyard, on its part, is capable of giving a fairly accurate estimate of costs of the ships it undertakes to build. Further, it should be remembered that, as shipowners have to compete on the high seas, they must have some reasonable certainty that the prices which they pay for the ships built in India are fairly competitive. The existing practice, though it may not be mathematically accurate in arriving at the U.K. parity price, offers that certainty, besides setting a "costing" standard for the Shipyard. The question which remains to be examined is whether the proposal can give these benefits in addition to its obvious advantages.

CONFUSION OVER BANK RATE

SILVER—GOLD—FREIGHT RATES—COAL AWARD

THURSDAY, 5 P.M.

MARKET GOSSIP

WILL the Bank rate go up? This question was being raised in the share markets for well over a month. Even the Finance Minister's statement in Parliament and elsewhere to the effect that he was not in favour of raising the Bank rate did not satisfy the curiosity of the market. Some of the operators continued to assert that an increase in it was a certainty and that it was only a question of time. Every Wednesday, the fear of that event materialising used to subdue the trend of equities. The firmness of the Gilt-edged market during the last three weeks, and the resumption of buying Government loans by the Life Insurance Corporation, however, gave rise to the impression that an increase in the Bank rate was most unlikely. It is possible that even those who were almost certain of a rise a few days ago must have given up their hopes. Anyway, after being distinctly easy on Tuesday and yesterday, the share market opened firm today and staged a smart rally from the lowest levels touched twenty-four hours earlier. But, after the close, the Reserve Bank sprang a surprise on the market; not a pleasant one, of course. It took the unprecedented step of by-passing the Bank rate. We do not think that even the few that were expecting a higher Bank rate would have anticipated this step.

The Reserve Bank announced this afternoon that "as from Friday the 1st inst., its rate of interest on advances to Scheduled banks against Government and other eligible securities has been raised to 4 per cent. per annum." Earlier in the day it had announced that the Bank rate remained unchanged. This means that, for the first time, the Bank rate in India is not what it always used to be.

Unlike in Britain and other Western countries where the Bank rate represents "discount rate," that is, the rate at which the central banking authority rediscounts fine bills in order to enable the banks to borrow money from it, in India, the Bank rate is an "advances rate," that is, the rate at which the Reserve Bank lends money to member banks against Government securities and other eligible Gilt-edged securities. It is true that a new method, called the Bill Market Scheme, was introduced in 1952, in order to provide the banks with an alternative method of getting central banking credit. Under this scheme, the so-called usance bill—in other parts of the world it is called a finance bill—was evolved and banks have been utilising this instrument on a fairly large scale since 1955, when the pace of demand for bank credit began to exceed that of expansion of deposits. But the rate at which banks borrow from the Reserve Bank against these bills has been having a distinctly separate name for itself, namely, usance bill rate. Though we often used to describe this rate as the *de facto* Bank rate, none has so far mistook it to be the Bank rate as is commonly known.

We are now suddenly told by the Reserve Bank—that at any rate what this afternoon's announcement means—that the interest rate at which it lends money to member banks against Government securities is different from the Bank rate. If that is so, what is Bank rate? Has the Reserve Bank changed the generally understood meaning of the Bank rate? Does it mean that, from tomorrow onwards, there will be three rates—the Bank rate (the meaning of which is not clear now), the advances rate to Scheduled banks against Government securities, and the usance bill rate? Again, can the member banks borrow from the Reserve Bank at the Bank rate, which now remains unchanged at 3½ per cent., and, if so, against what collateral? We are not having in mind here the usance bill rate which is also standing at 3½ per cent. But the effective rate is higher, in that the banks have to pay the stamp duty on the bills. Since from tomorrow this duty will be at ¼ per cent., the actual usance rate will be 4 per cent. It looks as though some explanation is called for from the authorities to clear these doubts.

* * * *

Meanwhile, it is not difficult to see why the Reserve Bank has pushed up the rate of interest on advances against Government securities, leaving, at the same time, the Bank rate unchanged at 3½ per cent. Since the cost of borrowing against usance bills has already been raised to 4 per cent. by enhancing the stamp duty with effect from tomorrow, it became clear that all those banks which are in need of accommodation from the Reserve Bank would first borrow against Government securities to the extent possible if the rate of interest on such advances were left unchanged at 3½ per cent. If this were to happen, the Reserve Bank would be faced with the risk being loaded with large blocks of Government securities as had actually happened in 1951-52. In order to avoid this risk, it must have decided to bring the cost of advances against such securities also on par with that of raising credit against usance bills.

Whatever the cause, the effect of this unusual step is to push up the cost of bank credit to trade and industry further. It is almost similar to that of putting up the Bank rate. The only difference is that it may not adversely affect the Gilt-edged market to any perceptible extent. But we wonder as to how long the Bank rate, if there is anything like that now, can remain divorced from the other short-term interest rates. It is bound to be pulled up by the *de facto* bank rates sooner or later, at least before the Government comes to borrow from the open market this year, assuming that the *de facto* rates will be allowed to remain at the enhanced levels till then.

By thus by-passing the Bank rate, the Reserve Bank and the Government have undermined the understanding with the electricity companies the standard rate of return of which is related to the Bank rate. Similarly, they have prevented an automatic increase in the rates of interest on bankers' advances to trade and industry which are also usually related to the Bank rate. This amounts to breaking faith with the banking system. Now the banks will have to negotiate separately with each of their parties before putting up their lending rates. If the Government's real intention in asking the Reserve Bank to raise the rate of interest on advances to banks was to tighten the credit squeeze further, the proper thing to do would be to raise the Bank rate itself. It now looks as though the authorities are willing to wound but afraid to strike. This may appear to be a clever move on their part, but it is unfair to those who have contractual obligations based on the Bank rate.

Following the Reserve Bank's announcement this afternoon, the short-term interest rates have already hardened further. The house money on call is fetching 4 per cent., as against 3¾ to 3⅞ per cent. before. The banks have raised their *hundi* rate from 5½ to 6 per cent. The State Bank, too, has raised its hundi rate from 5¼ per cent. to 5½ per cent. The firm tone in the share market earlier in the day has yielded place to an easier tone, while the sagging tendency in commodities and bullion, which had begun as a natural reaction to the bullish phase at its peak last week, has received some impetus.

* * * *

Financial circles in the U.K. have been disappointed again this week by the fact that their expectations of a reduction in Bank rate have not materialised. The optimism about the reduction in Bank rate from 5½ per cent. to at least 5 per cent. has been mainly responsible for the rise in Gilt-edged and other securities and for a generally upward trend in the Stock Exchange. The main grounds on which a reduction in Bank rate is expected are: (1) a reduction in Bank rate would reduce the interest payable on the externally-owned sterling balances; (2) it would facilitate the funding of Floating Debt and enable the authorities to exert monetary control more effectively in the future, and (3) it would offset the disinflationary trend caused by the closing of the Suez Canal and the rationing of petrol.

Further, since the discount rate for bills has fallen to about 1 per cent. below the Bank rate, it was argued that the authorities would be compelled to correct this anomalous position by reducing the Bank rate. Finally, it was pointed out that, if the authorities did not avail themselves of this opportunity to reduce fairly safely the Bank rate, they would leave themselves without adequate room for raising the rate to meet any new deterioration in the country's economic situation in the future.

Apparently, these considerations have not yet carried conviction to the Government. Presumably, the authorities feel that the danger of inflation has not so far receded as to justify a reduction in Bank rate. Or, it may be, that they would like to wait till they have stronger evidence to show that their disinflationary policy has reached a stage at which its continuance would mean a painful setback to the economy.

* * * *

Over the year ended today, silver has risen by about Rs. 10 to Rs. 184-10 per 100 tolas. This increase in price reflects the general upward trend in commodities as also the traditional Indian demand for silver for marriage and other purposes. In a way, it also reflects world conditions of shortage of silver—that is, the inadequacy of supplies in relation to the demand for the white metal. World offtake of silver (for coinage and commercial purposes) in 1956, according to the well-known U.S. silver traders, the firm of Messrs. Handy and Harman, aggregated 260 million ozs., or 17 per cent. heavier than in 1955. On the other hand, world output of silver in 1956 continued to remain at the previous year's level of 204 million ozs.

It should thus be clear that there was a sizable gap of nearly 54 million ozs. representing the excess of offtake over production. How was the gap generally filled? Broadly speaking, there used to be one important source which could meet the excess demand. It is the Governments of those countries which demonetised silver and were therefore in a position to release the silver withdrawn from circulation. This source, it is now stated, has practically dried up. An important source in recent years has been the U.S. which has found it possible to release silver from its "free" stocks—ed as reserves against its currency. These "free" stocks have been continuously fed by receipts of silver from countries to which the U.S. had lent silver under its lend-lease schemes. Nevertheless, its releases (estimated at 30 million ozs. in 1956, as against 35 million ozs. in 1955) have been modest as compared with the inflow which aggregated 95 million ozs. last year. Towards the close of 1956, the U.S.'s "free" stocks of silver amounted to 87 million ozs. These stocks are in no danger of any immediate depletion, considering that, in the first quarter of the current year, the U.S. is expected to receive from the U.K., India and Pakistan about 150 million ozs. and about 105 million ozs. in the next two years, being return of lend-lease silver.

So long as releases from the U.S.'s "free" stocks continue, there is no likelihood of any shortage in silver, and, therefore, of any rise above the U.S. official selling price of 92c. per oz. At any rate, no shortage, it is predicted, is likely to develop before 1960, provided, of course, the U.S. continues to adhere to its present policy of releases from its free stocks. What of the future beyond that date? In discussing this question, it is well to remember that the demand for silver for industrial and commercial purposes is growing at a faster pace than the basic demand for the production of new coinage is contracting. Against the background provided by the increase in the demand for silver, the failure of supply to meet the demand and the likelihood of exhaustion of "free" stocks in the U.S., it is easy to see a situation in which a steep rise in the world price of silver may well take place in the not too distant future. A deterrent to such a rise would be the possibility of development of substitutes for silver. Another such deterrent is a possible change in the U.S. official policy designed to sell silver from its monetary reserves. These reserves, as is well known, are sufficiently large to enable the U.S. Government to sell silver without endangering in any way the stability of its currency.

* * * *

An interesting suggestion has been made in the U.K. to the effect that the British Government should mint sovereigns—a practice discontinued for some years now—and sell them in order to take advantage of the premium which these coins command over bar gold. The word "sovereign," though it is now perhaps used in many countries to denote coined gold, owes its origin to the good (or is it, golden?) old days when gold coins carrying the imprint of British kings and queens freely circulated in many countries. In India, itself, these coins were preferred to bar gold; so great was the popular belief in the purity of the gold in the coin. Indeed, in many parts of the country, people still rate the weight of a given article of jewellery as so many sovereigns, instead of using the traders' weight—the tola. Some families are proud to own Queen Victoria's coin, the popular superstition in the rural areas being that these old coins contain better gold than the best of the gold bars. It is also interesting to note that these coins have different market prices, the oldest among them quoting somewhat less than the later coins; this represents the market's assessment of wear and tear.

Nor is this preference for gold sovereigns confined only to India. It would appear that, in many countries, this preference persists. This is attributed to the fact that coins could be purchased for smaller amounts than gold bars, they are easier to hoard and are more readily marketable. In some markets, the premium for these coins, it is stated, is as high as 27½ per cent. over their value as metal. This has led to illicit minting of gold sovereigns in certain markets. Although the British Government has tried to put down this evil through threats of legal action, it is still said to flourish in isolated centres. The suggestion now made is that the British Government should itself revive the minting of sovereigns and derive what benefit it can from the premium they command. Though in the past this suggestion has been turned down by the Treasury, it remains to be seen whether the change in Government will make any difference. The new Government, it may be noted, is anxious to strengthen the foreign exchange reserve by all possible means and the suggestion may appeal to it, as it adds to the opportunities for augmenting foreign exchange at a higher rate. It will be recalled, in this connection, that ever since the gold market in London was opened in 1954, the bullion dealers have been permitted to sell gold bullion for dollars and to replenish their stocks from official reserves. If bullion could thus be sold for a profit, why not coins?

* * * *

The much-feared, though long-expected, increase in freight rates has taken place. The freight rates on all shipments between ports in India and Pakistan and those in the U.K. and the Continent will be increased by 10 per cent. with effect from 15th March, 1957 and the existing surcharge of 15 per cent. raised by 2½ per cent. with effect from 1st February 1957. The Karmohan Conference, which made this announcement, stated that the decision to raise the freight rates and the surcharge was taken in order to meet "to some extent the continuing increases in operating costs, including higher prices of fuel oil."

The increase in freight rates, now announced, is part of a world-wide movement towards higher freight rates which can be traced to the closure of the Suez Canal and the large increase in ship operating costs in the past year. Many conferences have now announced an increase in freight rates, though the dates from which they will come into effect seem to vary. The North Atlantic Freight Conference has stated that cargo freight rates from the U.K. and Eire to the east coasts of the U.S. and Canada are to be increased by about 10 per cent. with effect from 1st April 1957. The Australian Outward Conference Lines have decided to increase the freight rates to Australia by about 14 per cent. with effect from 1st March. The Far Eastern Passenger Conference has announced increase in passenger fares, which will come into effect from 1st March 1957. The Conference includes such well-known lines as the American President Lines, British India Steam Navigation, the N.Y.K. and the P. and O. Four conferences, operating from certain South American countries, including Brazil and Argentina, have also decided to increase freight rates by about 10 per cent., the increase to come into effect from 1st April 1957. In nearly all cases, the Lines have pointed out that their decision stems from the continuing heavy increases in costs.

There is no doubt that the increase in freight rates, perfectly justified though it is, is a factor which must adversely affect the export capacities of different countries and also their import costs. To India, in particular, which finds that its foreign exchange reserves are falling and the scope for reduction in imports is strictly limited because they are made up of the much-needed plant and machinery and essential raw materials, the increase in freight rates is an additional source of economic difficulty.

EQUITIES REACT

SLIGHT RECOVERY AT CLOSE

(From Our Own Correspondents)

BOMBAY, 31*st January*

EQUITIES on the Stock Exchange experienced a mild shake-out during the week under review, which wiped out a substantial part of the previous week's gains. Towards the close, however, there was a mild recovery, but on balance equities stood to suffer moderate losses over a wide front. The sudden change in sentiment, after two weeks of sustained bullish trend, was due to a fresh wave of selling in Indian Irons on fears of heavy carry forward charges which buyers would have to pay in tomorrow's settlement on account of the closure of the Company's transfer books from 21st February to 11th March for the issue of right shares. The Company proposes to issue 5,183,708 new ordinary shares of Rs. 10 each at a premium of Rs. 3-8 per share in the ratio of one share for every ordinary share held to those shareholders who are on the books of the Company on 11th March. Besides the prospect of heavy *budla* charges, another dampening factor was the report that the shareholders would be called upon to pay the entire sum of Rs. 13-8 per share in one instalment.

The other factors which induced selling pressure were apprehensions of heavy deliveries in the coming settlement, the anxiety over the Kashmir issue, following the U.N. Security Council's decision to maintain *status quo* in Kashmir till the fate of the State was decided by a plebiscite, and weaker advices from commodity and bullion markets. Renewed rumours about rise in Bank rate also chilled the enthusiasm of operators. Notwithstanding the slight recovery today, the market's undertone was not quite encouraging.

In the steel section, Tata Ordinaries were a little erratic early in the week, moving between Rs. 182 and Rs. 179-12, before reacting to Rs. 177 on Tuesday. Today, however, they improved to Rs. 180-12 before winding up at Rs. 179-12. Indian Irons gave way from Rs. 29-15 to Rs. 29-0½, but gained strength to Rs. 29-5½ at the close.

Modest losses were common in the textiles section. The expectation that the excise duties on cloth would be reduced from 1st February was the main factor which checked widespread recession. Bombay Dyeings dropped from Rs. 578-2 to Rs. 562-8, but staged a recovery to Rs. 570. Centurys moved down from Rs. 512 to Rs. 499-8 before gaining to Rs. 507-8. Kohinoors shed Rs. 4-8 to Rs. 326-8, the lowest touched being Rs. 323-8. Central India's were lower by Rs. 2-8 at Rs. 124 and Finlays by Rs. 2 at Rs. 312. Gokaks were fairly steady at Rs. 226-8 and Indu Ordinaries at Rs. 11. A sharp fall of Rs. 31-4 to Rs. 230 was noted in Morarjee Goculdas. New Citys kept their own at Rs. 147-8. New Greats were steady at Rs. 241-8. New Kaiser-I-Hinds had business Re. 1-4 higher at Rs. 113-12 and Podars Re. 1-4 better at Rs. 170. Shree Niwas Cottons declined by Rs. 3-12 to Rs. 190 and Simplex by Re. 1-4 to Rs. 183-8. Standards moved down by Rs. 5 to Rs. 440, Svadeshis by Rs. 4-4 to Rs. 230 and Swans by Rs. 3-12 to Rs. 415. Tata Mills were a fraction lower at Rs. 50-12.

Bank shares presented a mixed pattern and business was limited. Barodas were unchanged at Rs. 103-8, while Centrals gave way by Re. 1-12 to Rs. 54-8 and their new shares by As. 8 to Rs. 59. Bank of Indias were maintained at Rs. 141, but their new shares hardened by Re. 1 to Rs. 142. Punjab Nationals were down by Rs. 2 at Rs. 56. United Commercials were a shade quiet at Rs. 58-4. Bank of Jaipurs were better at Rs. 40. Union Banks had business a fraction higher at Rs. 7-9.

Insurance shares were steady, but transactions were very few. New Indias changed hands As. 4 lower at Rs. 43-12. Vulcans were done As. 2 better at Rs. 13-10.

A small reactionary trend was noted in electricity shares. Ahmedabad Electrics dropped As. 15 to Rs. 96-9. Bombay Suburbans were, however, unchanged at Rs. 109-6 and Surats at Rs. 112-8. Tata Hydros recorded a decline of Rs. 2-8 to Rs. 124 and their new shares a drop of Rs. 2 to Rs. 112. Tata Powers were marked down by Rs. 13-12 to Rs. 1,235 and Andhra Valleys by Rs. 5 to Rs. 1,227-8.

The miscellaneous section showed a mixed trend and except in a few counters the variations were not marked. Sugar shares were quiet, Belapurs shedding Rs. 3 to Rs. 231. Phaltans receded by Rs. 2 to Rs. 148 and Walchandnagars by Re. 1-4 to Rs. 267-8. In the cement group, A.C.Cs. were affected by the Chairman's announcement at the annual general meeting on Friday last that there was no prospect of an increase in dividend and that it would be very difficult even to maintain the present level. The shares dipped from Rs. 185-8 to Rs. 181-4, but recovered at the close to Rs. 183. Ashoka Cements were done As. 2 better at Rs. 11-2 and Jaipur Udyogs As. 2 higher at Rs. 12-4. Digvijay Cements were quiet at Rs. 152-4. In the engineering group, Alcocks were the worst affected with a decline of Rs. 11-4 to Rs. 265. Tata Locomotives drifted down from Rs. 155-4 to Rs. 153-8. Premier Constructions gave way from Rs. 187 to Rs. 181-8. Larsen and Toubros changed hands As. 4 lower at Rs. 16-14, but Kamani Engineerings were steady at Rs. 6-11. Texmacos improved by As. 6 to Rs. 20-14. Among mining shares, Shivrajpurs displayed a firm tone gaining over the week Rs. 3 to Rs. 93-8. Indian Coppers dropped As. 2 to Rs. 3-10, despite the announcement of an interim dividend of 6¼ per cent. or As. 1-5 per unit stock on the increased capital of £1,371,300 in respect of the year ended 31st December 1956, as against an interim of 10 per cent. paid on the old capital of £914,200 paid for the previous year. B.B. Petrols were quiet at Rs. 2-13.

Automobile shares were quiet. Premier Automobiles being a fraction lower at Rs. 105-8. Hindustan Motors shed As. 2½ to Rs. 8-3. Shipping shares were affected by the general sentiment. Scindias were marked down from Rs. 19-3 to Rs. 18-12, before they gained to Rs. 18-15½. Great Easterns were down by an anna to Rs. 19-1.

In the miscellaneous section, Bombay Burmahs reacted from Rs. 725 to Rs. 714-6, but the loss was more than made good today when the shares closed at Rs. 727-8. Their new shares recorded a rise of Rs. 3-12 at Rs. 276-4. British India Corporations shed As. 4 to Rs. 8-8, while Killick Industries gained Re. 1 to Rs. 169. National Rayons moved between Rs. 248-8 and Rs. 244, before finishing at Rs. 246-4. Tata Chemicals dropped As. 5 to Rs. 16-6 and Tata Oils Re. 1-4 to Rs. 45-12. Wimcos gathered Re. 1-4 to Rs. 172-8. Hindustan Levers were quiet at Rs. 19-6, while Gwalior Rayons were marked up by As. 12 to Rs. 15-12. Bombay Potteries were done Rs. 4-4 higher at Rs. 47 and Industrial Credit and Investment Corporations at Rs. 75.

* * * *

Calcutta Stock Exchange

CALCUTTA, 30*th January*

Trading on the Calcutta Stock Exchange was cheerful up to Monday this week and not only were earlier gains well maintained and transactions widespread in most sections but selected counters recorded a further improvement. However, on bull liquidation yesterday, a part of the gains was lost, although the undertone remained steady. Earlier in the week, for a time, the Security Council's resolution on Kashmir restrained activity, but this proved purely a temporary phase, as it was realised that Indian official views did not show any alarm to the changed situation. The Bombay report of a mutually beneficial understanding in the recent Indo-British textile talks was noted with satisfaction, and it was thought that Great Britain would not place official restriction on imports of Indian cloth. The possibility of an American loan of $600 to $700 million, in addition to the existing American aids and grants, was another cheerful news. For, if this materialised, import restrictions on capital goods would be liberalised; otherwise, the difficult foreign exchange resources situation, it was thought, would hamper progress at least in the private sector.

The call for public subscription for a portion of the 5 per cent. convertible loan stock by the Indian Aluminium Company, Ltd., was received by the share market with enthusiasm. The Governor, Miss Padmaja Naidu's address to the joint session of the West Bengal Legislative Assembly and Council, in which she foresaw better economic conditions for the State during 1957, was noted as a long-term factor favourable to the widening of investment activity. The ban on cement imports in the light of indigenous production being inadequate to meet demand should have normally invited •buoyancy to cement shares; however, the prospect of cement companies making larger profits was ruled out, in view of the control on manufacturers' prices as well as increased production costs. If any reminder was needed that industrial profits were increasing and the country's economy was expanding, this was provided by the latest banking results. There was more activity in jute shares following the fall in raw jute prices and the extreme improbability of any actual fibre shortage during the current season.

Selected counters in the coal section were involved in cheerful trading. Khatras Jherriahs were buoyant at the higher rate of Rs. 63-2, and Bengals, at Rs. 456, showed a gain of six points. From Rs. 21-8, Burrakurs receded to Rs. 21, as did Equitables to Rs. 26-6 from Rs. 27-3. Central Indias, at Rs. 6-12, were fractionally better.

More shares changed hands in the jute sections; first, because the lower levels attracted support and, secondly, there was the prospect that jute mills' working results for the current accounting period would be more satisfactory. Cheviots hardened to Rs. 145 from Rs. 142. Anglo-Indias were at one time as high as Rs. 141, as against Rs. 136 previously. At Rs. 57-8, Ganges were higher by Re. 1-8, but Howrahs were quiet at Rs. 19-7. Fort Glosters were lower at Rs. 309, but Deltas had buyers at the higher rate of Rs. 140.

Engineering shares responded well to fair investment support. In unsatisfied demand Guest Keens rose to Rs. 24-15 from Rs. 23-12. Indian Irons, on short-covering, improved to quote as high as Rs. 30-2, but were soon subjected to profit-taking, which brought them down to Rs. 29-3. After realising Rs. 21-5, Texmacos sagged to Rs. 20-12. On the other hand, Kumardhubis, at Rs. 9-13, maintained the improvement on investment support. After realising Rs. 29-8, Jessop & Cos. closed lower at Rs. 29, while Braithwaite & Cos. recorded a steady improvement to Rs. 27-8 from Rs. 26-4. Indian Galvanisings, at Rs. 19-11, were up by Re. 1-4, and National Irons were bought at Rs. 7-10, as against Rs. 7-8 previously.

Among shippings, India Steamships, on profit-taking, receded to Rs 10-4 from Rs. 10-10, while India General Navigations recorded a gain from Rs. 73 to Rs. 78. In view of the proximity of the Tariff inquiry into the cement industry, cement shares were shown less attention, and representative of the general sentiment in the section, Sone Valley Cements declined to Rs. 7-12 from Rs. 8-2. Among minings, Indian Coppers were fractionally lower at Rs. 3-10 on profit-taking, and in view of the expansion plans, which among others envisage the installation of an electrolytic copper refinery, the counter is looked at with great interest in investment circles.

Tea shares were steady, but transactions were lower, in view of the poor reports from the auctions. Bishnauths were one point higher at Rs. 21, Tezpores were steady at Rs. 21-4.

In accord with the general trend, profit-taking also invaded miscellaneous industrials yesterday. Indian Cables sagged to Rs. 32-14 from Rs. 33-3, but National Carbons were steady at Rs. 26-12. Angelo Bros. were put through at the improved rate of Rs. 24-4, while Orient Papers, after being higher at Rs. 34-8, finished lower at Rs. 34-1.

* * * *

Madras Stock Exchange

MADRAS, 31*st January*

The Madras Stock Exchange witnessed a firm trend during the week under review. There were buyers for most of the shares and the turnover was large. The chief contributory factor which helped to enliven sentiment was the firmer conditions which prevailed in Bombay. At the close of the week under review, however, a few shares reacted due to profit-taking.

In the textile section, Lakshmis were in the limelight and there was strong buying, with the result that the price jumped by Rs. 11 to Rs. 265 and their "A" shares by Rs. 5-8 to Rs. 132-8. Metturs were active and spurted by Rs. 7-8 to Rs. 440. Maduras, however, displayed a reactionary trend, with a drop of Re. 1-12 to Rs. 47, following the cut in dividend from 20 per cent. to 17½ per cent. for the year ended 31st December 1956. Bangalore Woollens advanced by Rs. 12-8 to Rs. 555 and Cannanores by Rs. 10 to Rs. 178. Cauvery Spinnings gathered As. 8 to Rs. 12-4, while Coimbatore Spinnings dropped Rs. 3-8 to Rs. 89, Dhanalakshmis were better by Rs. 4 at Rs. 374, Pankajas by Rs. 2 at Rs. 77 and Radhakrishnas by Rs. 5 at Rs. 330. Buckinghams eased by Rs. 5 to Rs. 133, Rajalakshmis by As. 8 to Rs. 183-8, Ranga Villas by Rs. 2 to Rs. 90 and Travancore Rayons by As. 2 to Rs. 14-5. Malabar Spinnings, Rajapalayams and R. C. Ambikais remained quiet at Rs. 108, Rs. 154 and Rs. 262, respectively. Sri Krishnarajendras declined by Re. 1 to Rs. 108.

There was a lively turnover in the planting section. Coffee shares were highlighted during the week. These were closely followed by tea and rubber. Among coffee shares, Consolidated Coffees put on As. 2 to Rs. 19-4 and Coffee Lands and Mysore Coffees each by an anna to Rs. 24-1 and Rs. 2-10, respectively. Among teas, Kalasas were As. 12 better at Rs. 14-4. Coorg Teas gathered As. 4 to Rs. 11-8, Talayar Teas As. 6 to Rs. 12-2 and United Nilgiris As. 4 to Rs. 18-14. Coonoor Teas remained firm at Rs. 25-4. Chandramalais at Rs. 4-7 and Waterfalls at Rs. 5-6. Periakaramalais were a shade quiet at Rs. 7-12, but Peermades rose by Re. 1-4 to Rs. 29-4. Haileyburias gained As. 4 to Rs. 23. Among rubber shares, Kalpettas improved by As. 12 to Rs. 24-4. Midlands picked up an anna to Rs. 17-15, Mercaras As. 2 to Rs. 9-4 and Rajagiris As. 4 to Rs. 21-12. Travancore Rubbers remained quietly steady at Rs. 21-8, Thirumbadis at Rs. 2-2 and Malankaras at Rs. 28-12. Travancore Rubber and Teas were lower by As. 3 at Rs. 10-1.

Activity in the miscellaneous section was again restricted during this week also. Indian Aluminiums declined by As. 2 to Rs. 14-6. Aluminium Industries were neglected at Rs. 19-12, Binnys at Rs. 180, Textools at Rs. 266 and Singarenis at Rs. 10-8. F.A.C.Ts. were an anna down at Rs. 6-7. Ranes were quoted at Rs. 7-5 *cum-right*. The Company announced an issue of 91,920 ordinary shares of Rs. 5 each at par at the rate of one new share for every ordinary share held.

Among sugar shares, E.I.Ds. witnessed support and gained As. 2 to Rs. 28-12. Deccans were unchanged at Rs. 11-6, Mysores at Rs. 44-12 *cum-div.* and Jeypores at Rs. 13-8. Cauverys were done As. 8 lower at Rs. 45 and Travancores As. 3 at Rs. 11-12. K.C.P. Ordinaries were unchanged at Rs. 127-8, despite the announcement of an interim dividend of 7½ per cent. for the year ended 30th June 1956.

The banking section was active and there was business in several scrips. Prices, however, remained unchanged. Andhras remained firm at Rs. 120, Indian Overseas at Rs. 159, Canara Bankings at Rs. 80-8 and Travancore Forwards at Rs. 4-15. Indian Banks eased by Rs. 2 to Rs. 207.

NEWS IN BRIEF

A NEW factory for the manufacture of raw films and other photographic materials will be set up by the Government of India at Ootacamund.

Exports of Pashmina wool from the State of Jammu and Kashmir against the quota of 315 maunds announced on 19th November 1956 will be allowed up to 15th February 1957.

Established shippers or mine-owners will be granted export allotments of manganesediozide or peroxide for 1957 equal to the quotas allotted to them during 1956. The allotment of quotas will be valid for shipment till 31st December 1957.

The Cashew and Pepper Export Promotion Council, Cochin, has recommended to the Union Government the enactment of legislation for the levy of a cess on the exports of pepper and cashew kernels in order to promote the activities of the Council.

The Railway Board has sanctioned a scheme, estimated to cost over Rs. 40 lakhs, for remodelling the railway yard at Godhra on the Western Railway. The remodelling has become necessary to enable the yard to cope with the expected increase in traffic during the second Plan period.

A coke oven plant, with an initial production capacity of 300 tons per day, will shortly be installed at Rajkot. The estimated cost of the plant is Rs. 2.6 crores. The State Government is also considering the establishment of two plants in Rajkot, one for the manufacture of elemental sulphur and the other for the production of aluminium.

The validity of the Indo-Czechoslovak Trade Agreement has been extended upto 31st March 1957, pending further negotiations between the two countries. The Agreement was signed on 17th November 1953, and was initially valid up to 31st December 1954. It was extended thereafter from time to time and was valid upto the end of 1956.

The Union Government has decided to continue to allow for export limited quantities of cotton yarn during the period January-June 1957 to all permissible destinations, excluding Portuguese Possessions in India. Allotments for export will be made to mills for the period January-March and April-June 1957 on the same basis as was done during the same quarters of 1956.

The Kashmir Government has placed orders for heavy electrical equipment worth Rs. 29 lakhs with the Hungarian Government's Ganz Factory. Generators and turbines, forming part of the equipment, will be used to expand the new Sindh Valley Hydro-Electric Project in Kashmir. Others who competed for the contract were British, American and Japanese firms.

An agreement, effective from 1st January, has been reached between the management of the Indian Copper Corporation Ltd., on the one hand, and two labour units, separately for mines and works, on the other, on issues of wage structure, bonuses, retiring gratuities, housing, etc. The agreement is for a period of two years and will benefit about 2,500 workers in the Corporation's factory at Moubhandar and about 5,000 miners at Mosabani.

The Government of India has decided to set up a seven-member wage board for the cotton textile industry. The Board will consist of an independent chairman and six members—two each for employers and workers and two independent members. The Board is being set up in pursuance of the recommendations in the second Five-year Plan for the establishment of tripartite wage boards for individual industries.

Problems, such as competition from road transport, facing the 550 miles of light railways in the country, are being studied by a group of Union Government officials. The study group, set up by the Planning Commission, has already inspected some light railways in and around Calcutta and is inspecting light railways in Bihar. It will submit its recommendations after inquiries in other parts of the country.

Rebate at a rate not exceeding As. 2 in the rupee has been allowed by the Government of Bombay on the cash sales of all varieties of coir goods produced and sold through industrial co-operative societies, coir institutions and co-operative coir societies conducted by it. The rebate, tenable for a period of three months from 1st January, in the first instance, is admissible in respect of wholesale as well as retail transactions, provided the retail sales exceed Rs. 3 at a time.

A milk conservation project, costing about Rs. 28 lakhs, is to be installed at Rajkot as part of an ambitious scheme to provide more and better milk to the people of Saurashtra region. Machinery worth Rs. 12 lakhs is to be supplied for the project by the U.N.I.C.E.F. Dairies involving a capital outlay of Rs. 5 lakhs each have been established at Jamnagar, Bhavnagar, Surendranagar and Junagadh. The State Government owns 60 per cent. of the shares in the dairies which will distribute 10,000 lbs. of pasteurised milk to the public daily.

The Railway Board has sanctioned a Rs. 22-lakh scheme for improving signalling facilities at the eight stations situated between Wardha and Balharshah on the Delhi-Madras section of the Central Railway. These stations will be provided with modern interlocked signalling. At present, they have a signalling system worked by hand levers which severely restricts section capacity, besides perpetuating hazards inherent in non-interlocked working. The interlocking of stations will ensure greater safety and speed in the operation of trains, and also help in stepping up line capacity.

The Ministry of Finance had, in a notification, fixed 5th January 1957 as the date on which the provisions of the Central Sales Tax Act 1956, except section 15, shall come into force. This has caused some misapprehension about the date from which the liability of dealers to pay tax under the provisions of the Act on inter-State sales arises. In order to remove this misapprehension, the Ministry has further notified the public that the liability of dealers to pay tax under the said Act on inter-State sales can arise only on and from the date which may hereafter be appointed by the Central Government in a notification. The notification has not yet been issued and therefore no tax is payable for the time being on inter-State sales.

India's overall trade balance disclosed a deficit of Rs. 151.79 crores during April-November 1956, as compared with Rs. 26.28 crores in the corresponding period of the previous year. While total exports of merchandise by sea, air and land during the said period declined in value to Rs. 383.19 crores from Rs. 391.81 crores in April-November 1955, imports rose sharply to Rs. 534.93 crores from Rs. 418.35 crores. The increase in imports was wholly due to larger imports by sea and air, which rose by more than Rs. 120 crores to Rs. 521.9 crores. Imports by land, on the other hand, declined in value from Rs. 16.68 crores in April-November 1955 to Rs. 12.93 crores in the period under reference.

A 10 per cent. increase in the existing rates of freight to Canadian-Atlantic ports has been announced by the Malabar Coast-Canadian (Atlantic) ports shipping lines. The *ad valorem* rates in this respect remain unchanged. The present increase in freight rates has been necessitated by the steadily increasing operating costs. The new rates will come into force from 15th February and will apply to all shipments made on vessels commencing to load at each individual Malabar Coast port from that date. The Karmahon Conference has also announced that the freight rates on all shipments between ports in India and Pakistan and those in the U.K. and the Continent will be increased by 10 per cent. and the existing surcharge by 2½ per cent. with effect from 15th March.

* * * *

From Abroad

The British House of Commons has approved of the Government's Anti-dumping Bill. It seeks to give the Board of Trade power to place a duty on goods dumped into Britain or sent with the aid of subsidy.

Holland's two leading shipping companies, the Royal Rotterdam Lloyd and the Nederland, have decided to increase passenger fares on the Cape route by about 15 per cent. with effect from 1st March.

Output of coke in the European Coal and Steel Community in 1956 reached a new record level of 74.8 million metric lbs. This represented an increase of 9 per cent. over the 1955 figure of 68.6 million metric lbs.

The National Foreign Trade Council of the U.S. has forecast that foreign nations will increase their combined gold-dollar reserves by $600 million in 1957. Earnings of foreign nations from U.S. imports in 1957 will, according to the Council, be increased by $300 million.

Japan, for the first time, overtook Britain as the world's largest shipbuilding nation in peacetime last year by more than doubling its production in 15 months. According to Lloyd's Register of shipbuilding, Japan's total tonnage commenced, launched and completed last year was 4,311,000, as compared with Britain's 4,179,000.

Aluminium producers of the United States set a new all-time output record during 1956 when they produced 3,358.8 million lbs. of aluminium, about 227 million above the 1955 record. The highest monthly figure on record was set in July last, when 303.1 million lbs. were produced. The output in December was of the order of 297.1 million lbs.

A joint hearing by two Senate sub-committees on the operation of the emergency programme to provide oil for Europe will start on 5th February. The sub-committees would seek to determine why oil prices to consumers have advanced in the United States, while oil deliveries to Western Europe, to offset the shortage from Middle East sources, have fallen off.

The Nippon Yuseh Kaisha Shipping Company of Japan has announced that nine Japanese shipping firms have decided to increase their freight rate on the Japan-New York liner service by 10 per cent. The Company gave increased costs and higher freights on other routes as reasons for the rise. Foreign shipping companies would also be asked to raise the rates.

The Egyptian Government has issued a decree deleting the names of 64 insurance companies, including Lloyds of London, owned by "enemy countries", from the register of insurance companies. The Government had announced earlier that foreign banks and insurance companies would be Egyptianised and capital transferred to Egyptian nationals.

Exports of British-made footwear touched a new high in 1956. According to the estimates of the Footwear Manufacturers' Federation, total exports of footwear, wholly or mainly made of leather, during the year amounted to 8 million pairs, valued at £10 million—an increase of 25 per cent. over the past four years. This success in the export front is mainly attributed to intensive market research undertaken by the Federation.

Japan-India Industrial Co-operation Council, formed to act as a go-between the Indian Government and private traders and Japanese industry, held its inaugural meeting in Tokyo recently. The Council will assist the Indian Government in placing orders with Japanese industrialists for machinery and other goods. The Council will hold monthly meetings to discuss Indo-Japanese trade problems.

Chinese geological teams, who have been surveying the eastern part of Tibet, reported discovery of rich mineral deposits in Eastern Tibet. Two iron mines, with high "quality deposits" in concentrated seams, have been located in the Tangla range on the north-eastern border of Tibet. Rich crystal deposits, several oil and coalfields and deposits of lead, zinc and manganese are also reported to have been found by the team.

PERSONAL

MR. Shukri Al-Kuwatly, President of the Syrian Republic, left Bombay for Damascus on Sunday after a ten-day stay in India.

Mr. Frank A. Lytton, a senior executive of Messrs. J. J. Saville & Co., Ltd., Triumph Works, Sheffield, arrived in India from London on 15th January on a two-month visit to India.

Mr. Inche Abdul Aziz Bin Ishak, Minister for Agriculture, Federation of Malaya, arrived in New Delhi on 24th January, along with two other senior officials of the Malayan Government.

Mr. Boon Charoenchai, Legal Adviser in the Thai Foreign Office, has been named as Thailand's new Ambassador to India. The present Thai Ambassador in New Delhi, Mr. Phra Vibhuddha Nukara, is due to return home soon.

Mr. Karnail Singh, at present General Manager, Chittaranjan Locomotive Works, has been appointed Member (Engineering), Railway Board. He succeeds Mr. P. C. Mukerjee, who was appointed Chairman, Railway Board, on 31st December 1956.

Mr. R. K. Gupta, former Chief Engineer of the Punjab, has been appointed Managing Director of the recently-constituted National Projects Construction Corporation. Mr. T. Sivasanker, I.C.S., Secretary, Ministry of Irrigation and Power, will be the Chairman of the Board.

Sir Charles Goodeve, Director of the British Iron and Steel Research Association, will arrive in New Delhi at the end of this month in the course of a round-the-world tour. After spending a few days in the Capital, he will go to Calcutta, where he is to advise the Tata Iron and Steel Company, Ltd.

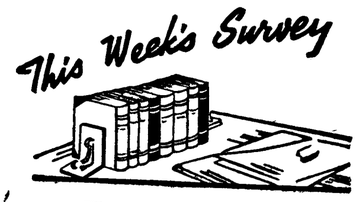
"COMMERCE" 1932

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, 6*th February*

Bamboo Paper Industry

The Tariff Board has issued its report on the question of the continuance of protection to the bamboo paper industry. Under the Bamboo Paper Industry (Protection) Act of 1925, protective duties were imposed on certain kinds of paper in order to develop the manufacture in India of paper from bamboo. These duties are due to expire on 31st March next. The Government of India in the Commerce Department, therefore, requested the Tariff Board in March last year to enquire and report as to how far these duties have achieved their object and what measure of protection, if any, should be continued after 31st March next. The total consumption of paper of all kinds in India (including pasteboard) increased from 111,963 tons in 1924-25 to 175,627 tons in 1929-30. In 1930-31, the figure fell to 154,277 tons. Of this total consumption, the Indian mills have steadily supplied from 22 to 25 per cent. The consumption of protected classes of paper increased from 43,331 tons in 1924-25 to 53,584 tons in 1929-30. In 1930-31, the figure fell to 49,046 tons. Of these classes of paper, the Indian mills have supplied from 53 to 71 per cent. There are now nine paper mills working in India, of which two belong to the Titaghur Paper Mills Company and two to the Deccan Paper Mills Company. The total capacity of the Indian mills in 1930-31 was about 45,000 tons of paper and the total output nearly 40,000 tons. There has also been a considerable increase in the use of indigenous auxiliary materials. Most auxiliary materials can now be obtained in India at economical prices.



FINANCIAL CONTROL

THE long-awaited reform of governmental administration which envisages the appointment of internal finance officers in each department, has now been announced. It is the culmination of a series of examinations of the problem of evolving a technique of expenditure control which would be both effective and expeditious. The search for a solution of this problem has been carried on ever since it became evident that the old and leisurely forms of financial control were not so well suited to the needs of the present day, marked as it is by growing economic activity of the Government. Examination of the problem by several authorities, including the American expert, Dr. Appleby, the Estimates Committee and the Comptroller and Auditor-General, has indicated the need for some reform of the procedure of financial control in the interests of the speedy execution of the Government's economic programmes.

Since the reform now proposed seems to stem from the note appended by Mr. A. K. Chanda, the Comptroller and Auditor-General, to the Audit Report of 1955, it may be appropriate to recall the essence of the changes in administrative procedure which he advocated. Overall financial control, with reference to financial policy and principles, he said, should continue to vest in the Finance Ministry but detailed scrutiny of proposals at expert level should vest in the administrative Ministry by installing "balancing personnel" within the Ministry. He pointed out that external financial advisers could not become familiar with the peculiar difficulties which arise in the formulation and execution of schemes. He added: "Without a full realisation of these difficulties, external advice tends to become unreal and detached." He felt that the "unnatural divorce of authority from responsibility is the *malaise* of our administration." He, therefore, suggested that the administrative Ministries should be provided with "internal financial advisers." Commending this reform to the attention of the Government, he said that it would lead to the growth of "financial consciousness" at all levels in the spending Ministries.

The reform now introduced by the Union Finance Minister, Mr. T. T. Krishnamachari, is conceived on the lines suggested by the Comptroller and Auditor-General. The scheme envisages the appointment of an Attached Financial Adviser (A.F.A.) to each Ministry to assist it from the very inception of a proposal. Apart from the A.F.As there would be two or three senior joint secretaries of the Finance Ministry who would deal with the major items of expenditure like multi-purpose projects and public enterprises. The Government would also nominate representatives of the Finance Ministry on industrial undertakings in the public sector. Explaining the merits of the scheme, Mr. Krishnamachari, in the course of his speech made at a conference of the Secretaries of the Administration Ministries of the Government of India, stated that the Attached Financial Adviser would be able to advise the Ministry concerned on financial aspects of administration. The Adviser would exercise functional control over the budget cell in each Ministry, particularly in the preparation of the Budget, in receiving and reviewing reports of the progress of expenditure and in ensuring that expenditure did not outrun allotment. The Minister also emphasised the need to transfer increasingly the administrative responsibility for expenditure to secretaries and to give them a certain latitude in regard to expenditure, provided it has already been budgeted for.

The working of the new procedure will be watched with interest. Since much thought has gone into the evolution of this procedure, it is reasonable to expect that it will result in a marked diminution in official delays and an improvement in accuracy of budgeting. The Comptroller, in his note commending the scheme of internal financial advisers, pointed out, it may be recalled, that it would reduce appreciably the "time-consuming vertical movement, up and down, of files dealing with projects and sanctions." The Attached Financial Advisers should also be able to advise the spending Ministries in the preparation of budgets in a way that would avoid the twin evils of overestimating and underestimating, the former leading to lapse of grants and the latter to the necessity of obtaining supplementary grants. In fine, the revised procedure ought to result in more realistic budgeting. It is, however, necessary to emphasise that, at least in the initial stages of the working of the reform, only men with some financial experience, sufficient imagination and ability to co-operate with others, should be chosen to work as Attached Financial Advisers. The success of the new scheme would, therefore, depend on the careful choice of personnel. In the absence of sufficient care in this respect, the new officers, instead of being healthy connecting links between the Finance Ministry and the spending Ministry concerned, could easily become additional bottlenecks to administration.

IMPORTANCE OF SAVINGS

As a result of the economic crisis that developed in the U.K. in the wake of the Suez hostilities, there has been in evidence a certain measure of serious re-thinking on economic policies. It has been difficult even for experts to foresee clearly the future course of events, for the simple reason that events are still in a nebulous stage. There are, however, certain trends in recent thinking which are becoming prominent as the situation crystallises. One important school of thought holds the view that the Government should cut its spending, especially defence spending. The realisation of the value of such a step has already resulted in certain far-reaching steps taken by the Government to effect economies in defence expenditure. There is another school which vehemently emphasises that Britain, as a nation, depending for its sustenance on its exports, ought to take measures for encouraging investment and productivity.

In this context, the observations made in the annual statement, circulated with the report and accounts of Lloyds Bank Ltd., for the year ended 31st December 1956, by the Bank's Chairman, Sir Oliver Franks, make interesting reading. He is of the view that the credit squeeze was achieving its aim prior to the Suez crisis. For there was a substantial improvement in the balance of payments position in the first half of 1956, as compared with the second half of 1955. Moreover, unemployment had remained low at 1 per cent. and the level of capital investment was high. In the light of this experience, he says, there should be no more of the cry that any measure of disinflation, however gently applied, can result in wholesale slump and unemployment.

Answering, in this connection, the argument that even a temporary check to production is too high a price to pay for the achievement of monetary stability, Sir Oliver points out that it is not the corrective measures taken to check the investment boom that constitute the limiting factor to investment and production. He concedes that the country has to step up the rate of investment and thereby the rise in productivity, if it is to keep pace with other industrial nations of the world and to keep up its status. "We have to put," he says, "more horse-power and better machinery behind the efforts of every member of the labour force." At the same time, he warns that one should not suppose that, in the absence of corrective measures, domestic production could have gone on rising without limit. He adds:

> "It cannot be sufficiently emphasised that the limiting factor is the supply of savings; it is this which sets an upper limit to the amount of investment that can be sustained. For a time, no doubt, the amount of voluntary saving which is forthcoming can be supplemented by the forced savings imposed by inflation. Even so, there comes a point at which any further increase in domestic capital formation tends to be offset by a deterioration in the external balance of payments: the resources needed to finance the extra investment at home are provided not by the savings of the domestic population—even forced savings—but by means of borrowing from the outside world or running down our gold reserves or other external assets."

According to Sir Oliver, this period has already been, reached and further rise in domestic capital formation alone will make no net addition to the national wealth, for every factory built will have to be paid for by gold. The real need, therefore, is not to press ahead with domestic capital formation regardless of what is happening to the balance of payments, but the creation of conditions, in which "a revival of savings will make it possible to press on more rapidly, at one and the same time, with additions to our domestic wealth and with the rebuilding of our overseas capital." Explaining the manifold streams which go to make the broad river of national savings, he says: "Savings, however, take many forms. The undistributed profits of companies, the current surpluses of local authorities and the public corporations, the surplus on the budget, as well as the unspent income of private persons—all these are the tributary streams which combine to make up the flow of savings as a whole. It is this combined flow of savings in the aggregate that we have to augment."

The Chairman welcomes the disinflationary measures adopted by the Government for the favourable results they have produced on the level of personal savings. Commenting on the taxation measures taken by the Chancellor last April to effect a budget surplus, he agrees with the Chancellor that they may be necessary in an emergency but cannot be erected into a permanent system. He rightly warns—this warning is as much applicable to this or any country as to the U.K.—that high rates of taxation needed to produce a sizable surplus will not only react adversely upon other forms of saving but in time stifle the very well-springs of enterprise.

U.S. ECONOMY

The assessment of the state of U.S. economy and its prospects in 1957 contained in President Eisenhower's economic message to Congress is couched in very cautious terms. For the U.S. economy, running at the rate of $412,000 million a year with full employment and rising incomes, is passing through a very critical period which calls for utmost care in economic management. Business activity has almost touched the limit set by the available resources and the problem is to prevent it from bumping against the ceiling and taking a downward course. The crucial task, therefore, lies in devising appropriate measures to sustain the rate of growth without at the same time provoking inflationary tendencies which might precipitate the very thing that is sought to be avoided—that is, a business depression.

Since the conflict is between economic expansion and a stable level of prices and costs, the Administration's main problem is to seek a compromise between the two. The Federal Reserve Board and the Council of Economic Advisers appear to be most sensitive to the dangers of inflation, as it is considered that the present prosperity is most likely to continue in the coming year also. The upward pressure of prices and costs is, therefore, the principal source of danger. This view found itself reflected in the President's message to the Congress. Mr. Eisenhower observed that, though there were grounds for confidence about the economy's prosperity in 1957, uncertainty was always present in the scene, especially the international situation and the upward pressure on costs and prices. But he was equally aware of the opposite danger—namely, a depression. Last year, business investment expenditure was the main motive force which helped the upswing of the economy. But indications are that this will suffer a slight setback in 1957. So also, building expenditure may fall at a more rapid rate. If this happens, it is likely that the tempo of activity may ease or even be reversed. But any such tendency is sure to be countered by the Government through appropriate measures. The level of consumer expenditure, due to the unpredictability of spending habits, continues to be the most uncertain element in the situation.

Of more direct interest to the world outside and the underdeveloped countries, in particular, is the growing realisation of America's responsibility for the well-being of the free world and the feeling that U.S. prosperity is closely bound up with economic development abroad. This conviction finds itself echoed throughout the entire economic report of the President to the Congress. The prosperity of the rest of the world deserves to be fostered even in the U.S's own interest. The Administration has fully realised this as witness the observation in the report that, if trade is conducted on a non-discriminatory, multilateral basis, the prosperity elsewhere will be reflected in increased demand for U.S. products. The sharpest expansion in U.S. exports, for instance, has been in shipments to industrialised countries with high *per capita* income, which are often competitive with America, and to certain less developed countries in which the rate of economic expansion has of late been high. To facilitate and increase international flow of goods and capital on a non-discriminatory basis, therefore, continues to be the major objective of the U.S. Since the volume of imports and the amount of private funds available for foreign investment depend mainly on domestic prosperity, the President's message stressed the need for a stable and growing economy as an essential foundation for a sound structure of world trade. But it particularly emphasised that positive measures are needed to help other nations to participate in the prosperity of the free world. The President therefore called on the Congress to authorise U.S. membership in new organisations for trade co-operation, to support new programmes of economic aid to underdeveloped areas abroad, to encourage the growth of private U.S. investment abroad and extend beyond June 1958 the authority of the Government's Export-Import Bank to encourage U.S. exports through loans to foreign Governments and to private business within the country. It is to be hoped that the U.S. Congress will extend its full support to a programme inspired by real concern for the economic health of the entire community of free nations.

PRODUCTION OF POWER

The importance of electricity to the economic advancement and prosperity of a country is well known. In fact, electric power has now come to be regarded as the *sine qua non* of a nation's industrial progress. In the words of Mr. Jaishuklal Hathi, Union Deputy Minister for Irrigation and Power, "it is actually the consumption of electricity which determines the progress and development of a country." Measured by this yardstick, the position, so far as this country is concerned, is far from satisfactory. The *per capita* generation of electricity in India in 1953 was only 18.51 units—now it is 25 units—while it is 88 times this level in the U.K., 162 times in the U.S. and 360 times in Norway. Against this background, the deliberations of the second All-India Power Engineers' Conference, held in Bangalore last week under the ægis of the Union Ministry of Irrigation and Power, acquire a national significance. The Conference, which was attended, among others, by several power engineers from all over the country, concluded its seven-day session after passing a number of resolutions on important aspects of the power supply industry.

The Conference urged the need for commencing detailed investigations of hydro-electric projects in each State in sufficient numbers to enable appropriate selections being made for inclusion in the third Five-year Plan. The need for early commencement and intensive work in this field by a special organisational set-up headed by a superintending engineer in each State was stressed. The Conference appointed a committee to go into the question of procuring equipment and materials for implementation of the power projects and evolve a procedure acceptable to the power supply industry and to the relevant departments of the Government. The need to accelerate rural electrification was particularly stressed. The Conference expressed the view that, unless the Central Government granted the required subsidy in some form or other, progress in the field of rural electrification was bound to be limited. The assembled engineers were also urged to devise ways and means of reducing the cost of rural electrification to the absolute minimum. Other resolutions related in some cases to appointing committees to go into the technical problems facing the industry and evolving such procedures as would secure the expeditious implementation of the second Plan.

Inaugurating the Conference, Mr. Gulzarilal Nanda, Union Minister for Irrigation and Power, stressed in his speech the importance of electricity as the symbol of civilisation and a measure of our material progress. He pointed out that, even though the *per capita* generation in this country had doubled itself over the last eight years or so, still, in respect of actual magnitude of the *per capita* generation, India stood very low in the scale of development. Again, even though the number of villages served by electricity had doubled under the first Plan, and the Government was planning to carry electricity to about 10,000 more villages and small towns during the second Plan period, the number of villages electrified by 1960-61 would form hardly three per cent. of the total in the country. There was also much to be done in the interest of "regional justice." To illustrate this, he compared backward regions like Orissa and Assam with advanced States like Mysore and Bombay. It was, therefore, their endeavour to even out these disparities in development in the various regions progressively.

Reviewing the progress of power generation in India, Mr. Nanda stated that a total generating capacity of one million kilowatts was added during the first Plan period, bringing the total installed capacity in hydro, steam and power plants to 2.7 million kilowatts. The projects taken up under the first Plan and expected to yield substantial benefits in the second Plan include the Bhakra-Nangal, in which 450,000 kw. of generating capacity will be installed, the Ghandisagar Power Station under the Chambal Scheme and the Rihand Project. The commissioning of the Hirakud Power Station on 13th January, the Minister stated, marked an important milestone in the progress of power development. A more ambitious programme of power development, he said, had been included in the second Plan. Forty-four hydro-electric and steam generating schemes are to be undertaken in this Plan. Of these, 25 would be hydro-electric stations and 19 thermal power stations. With the successful completion of these projects, an additional generating capacity of 3.5 million kilowatts will have been added. This represents a marked advance over the first Five-year Plan in which a generating capacity of one million kw. was added. The total outlay on power projects in the public sector during the second Plan will be about Rs. 427 crores, as compared with Rs. 160 crores in the first Five-year Plan. These projects, commendable in themselves, may not prove sufficient to meet the country's growing power requirements. It is this factor that points to the need for further exploration of hydro-electric resources and setting up of thermal stations, and emphasises the importance of early preparation for the establishment of nuclear power stations.

WORLD FOOD RESERVE

One of the most serious difficulties that affect the pace of economic development in the underdeveloped areas is insufficiency of food supplies. Efforts directed towards, and expenditure incurred in the cause of, economic development almost invariably increase the pressure on the supplies of numerous essential items of consumption, especially food. Thus, if the supplies of essential articles are not increased commensurate with the growing needs, a chain of reactions, starting with higher prices, and affecting wages and costs of production, are set in motion which ultimately jeopardise the implementation of the Plan. Hence an essential part of the programmes of economic development should be the creation of buffer stocks of essential food supplies to meet the contingencies that may arise either from failure of crops or from the increasing demand or both.

The world food reserve plan, which was under discussion last week at the U.N. Economic and Social Committee, will, therefore, be widely welcomed. The essential function of any such organisation should be not one of providing after-care emergency relief, but one of protective action. This is necessary if the clock of economic development is not to be put back. Speaking on this subject in the U.N. Economic and Social Committee, Mr. B. R. Sen, Director-General of the Food and Agricultural Organisation, emphasised this essential aspect. He advanced certain very important but workable suggestions in regard to the proposed world food reserve. He suggested the establishment of a high-powered combined operations committee for international relief of food shortages. According to him, this group should be made up of one high level officer from each of the interested international agencies. Moreover, these members would form a focal point of joint responsibility for the better organisation of international assistance in the speedy detection and relief and a world-wide detection system, which would strengthen the effectiveness of all the aid that other existing programmes could provide. Mr. Sen also visualised that such a body would be eventually given some resources of its own in earmarked reserves of funds.

The body envisaged by Mr. Sen thus can fulfil an important function. The part that can be played by countries having farm surpluses in not only building up a pool of food stocks but also in strengthening the national reserves is great indeed. Mr. Sen informed the Committee, in this connection, that the F.A.O. was trying to explore new ways of using surplus stocks on special terms for such purposes as financing of crop insurances in some of the underdeveloped countries. It had also tried, according to him, to explore the possible functions of an international pool of food stocks which would mainly provide a channel for the use of surplus stocks in aid of additional investment in underdeveloped countries.

The usefulness of any such pool, however, depends on the terms on which the surpluses are made available to the needy countries. The problem of scarcity of food supplies in certain parts of the world is not always one of the inability of the exporting countries to meet the demand. It is also one of inadequacy of purchasing power in these food-deficit regions. The issues, therefore, centre on the terms of providing the surpluses as development capital, whether on a grant basis or on the basis of low-interest long-term loans. An important aim of the national policies in this regard should be, as Mr. Sen rightly pointed out, to prevent the danger of relapse into anything like a disastrous depression of the early thirties.

FREE ENTERPRISE

India is known to the world as the land of thought and spirit; and its contribution to this sphere is one of which we may legitimately be proud. Through the ages, values governing the thoughts and actions of people have been constantly changing, and today it is generally accepted that the welfare of every citizen is the responsibility of every other citizen of the country. Indeed, in course of time, the system of values obtaining today may well be replaced by more expansive values, and the individual in one country may actively extend his sympathies and concern to individuals in other parts of the world. But, throughout the ages, the individual remained as the fountain-head of all new thought and values. In short, the *raison d'etre* of planning in India is the acceptance of the values of the day. So far there can be no dispute, and such acceptance vindicates the country's pragmatic outlook. However, the question arises, whether the acceptance of the new values should mean the complete disavowal of the individuality of man. Obviously, the essential virtues of man, that is, his inexhaustible creative powers and adventurous spirit, are the qualities which have made for his survival through the ages. There is, therefore, need for preserving these qualities. Planning in democracy implies a synthesis of social and individual values. It should not mean undue regimentation and regulation of individual freedom.

The Prime Minister, Mr. Nehru, is fully aware of these dangers as his statement at the Indore session of the Congress clearly reveals. After referring to the tragic consequences of unbalanced planning in totalitarian countries, he said: "We attach great value to individual freedom, because, in the final analysis, we want the creative and adventurous spirit of man to grow. It is not enough for him merely to produce the material goods of the world." Mr. Nehru also said: "We want to produce the material goods of the world and to have a high standard of living, but not at the expense of the spirit of man, not at the expense of his creative energy, not at the expense of his adventurous spirit, not at the expense of all those fine things of life which have ennobled man throughout the ages."

Appropriately enough, the Forum of Free Enterprise, in a Press statement, has welcomed these observations of Mr. Nehru. The Forum says that it is reassuring to learn that the Prime Minister has underlined the dangers of unbalanced planning resulting from undue emphasis on heavy industry at the cost of agriculture and consumer goods industries.

The Forum rightly believes that enlightened free enterprise, working within the framework of planning, is an indispensable part of the democratic set-up. There is a close interrelationship, it affirms, between socially regulated free enterprise and democracy. Free enterprise is indispensable to the democratic way of life. It is not to be accepted merely on sufferance and to be tolerated on grounds of political expediency. It adds: "Free Enterprise has a legitimate and vital function to perform in democratic planning." The Forum has assured the Prime Minister and the country that free enterprise is prepared to accept its full share of responsibility as a partner in the great national adventure which democratic planning implies.

WORLD RICE PRODUCTION

Indications are that world rice production in 1956-57 may exceed the high level of last season as a result of larger acreages and favourable conditions in many producing areas, states the Commonwealth Economic Committee *Rice Bulletin*, just published in London. First estimate of acreage under rice in India shows an increase of 4.8 per cent. over the previous year, while "some increase" in production is expected in Pakistan. Ceylon also is growing more rice.

In Burma, the harvested area is reported to have reached a post-war peak of over 10,000,000 acres. In Formosa, the second rice crop was also large—a record total of nearly 950,000 tons of brown rice (the equivalent of 1,239,000 tons of paddy) being forecast, of which 70 per cent. had been harvested by the end of November.

In the Middle East, rice harvests are reported to be good, those in Iran and Iraq being well above the average, and possibly equalling peak figures of two years ago. Other countries reporting good yields are China and the Philippines.

AMERICAN LETTER

PRESIDENT OPTIMISTIC ABOUT FUTURE

POPULATION REACHING 170-MILLION MARK

From Our Special Correspondent

NEW YORK, 23rd *January*

PRESIDENT Eisenhower's inauguration for his second and last term as head of the United States and his economic message to Congress were two important events in recent days and weeks.

The inauguration ceremonies were very tactfully handled and no rift between Democrats and Republicans were in evidence. There was also no vindictiveness apparent so far as persons were concerned who had taken issue with Administration policy.

Former Governor Stassen, for example, who lead a campaign against re-election of vice-President Nixon, had a seat in a governmental box, although he is no longer an official member of the Government.

George M. Humphrey, Secretary of the Treasury, who has vigorously opposed the Administration's new record peace-time budget of more than $71,000 million, was very much in evidence.

The economic message to Congress was generally applauded. The President took cognizance of Mr. Humphrey's remarks that, if the spending is not stopped or curtailed, expenditures by a chain of events might drive this country into a depression.

But Mr. Eisenhower was optimistic about the future and predicted continuation of the present prosperity and boom conditions, generally. He made it clear, however, that, if activity should fall, no stone would be left unturned and all necessary measures would be taken by the Government to correct such conditions.

Both the securities and commodities markets reacted favourably to the economic message. The President said he would recommend to Congress at an early date improved acreage allotments and price support for maize.

Disposal of Government surplus commodities, overseas and private exports are important features of the markets these days. The potential for future export business is also large and the Commodity Credit Corporation has been selling large amounts of corn to exporters.

Middle East

The next few weeks will see the visit to this country of Arabian dignitaries who will present their views on the Middle East situation to the Washington Government. They will be guests of President Eisenhoweer.

Their presence here is eagerly awaited, since it may have an important influence on passage of the Eisenhower defence plan for the Middle East on which hearings have been held by Congress. It may be interesting to note that the best legal brains maintain that the President already has the powers he seeks and merely wants a double confirmation from the legislative branch of the Government.

The original reception of the Eisenhower doctrine had a lukewarm reception in the Arab world. Since that time, both the Kremlin and China, in a joint statement, also pledged their intention to "defend the Middle East." Even if it had been planned that way deliberately, the Soviets could not have rendered a greater service to the United States. The Eisenhower proposals are almost certain to pass, despite all the wranglings over details which have made the headlines.

Oil and Ocean Freights

Factors affecting U.S. foreign trade and domestic trade are several. Freight rate increases, previously scheduled for the Middle East, have been cancelled, but ocean shipping rates of cargoes from Brazil, Argentina and Uruguay to East Coast ports of the U.S., Canada and U.S. Gulf Coast harbours, will be raised by about 10 per cent., effective 1st April 1957.

An increase of about the same proportions is scheduled to go into effect on south-bound shipments between the same areas on 18th March. Rates on these routes were last increased in August 1956. The latest boost was due to increased cost of operations and it will certainly boost the cost of the merchandise involved.

Extremely active demand for oil arising out of the Middle Eastern crisis, has led to another boost in prices. Canadian producers have boosted their prices between seven-tenths of a cent to one cent a gallon of gasoline and light fuel oils on a wholesale basis.

Sterling

Another factor is the unexpected strength of sterling, due to active support by the Bank of England and negotiations for a standby dollar credit from the International Monetary Fund. In fact, since the appointment of Sir Harold MacMillan as Prime Minister, sterling has shown remarkable strength and, for the first time since last June, it broke through the $2.80 parity level on the upside the other day.

The overall economic situation remains in quasi-balance. Steel has shown some weakness in recent weeks. Close to the year-end the industry operated at above rated capacity. It is now down to about 92 per cent.

Steel plates for shipbuilding and structural steel are still in extremely tight supply. Some manufacturers have backlogs of orders of about three years. Both the shipping shortage and the enormous demand of the national and State highway programmes are the principal reasons for it. Other categories of steel, however, are quite easy to get. Moreover, the industry is continually increasing its capacity and by the end of this year this may reach 150 million tons annually.

Population

One of the underlying factors for the constant pressure for more supplies in certain sections of the economy is the population growth here. The most recent statistics show that 1956 broke all previous yearly records.

The increase in population last year is authoritatively estimated at 2.9 million, bringing the total, including the armed forces overseas, to 169,670,000 at the year-end. In the eleven and one-third years since the close of the last war, almost 29.5 million people have been added to the population.

This is more than the total gain during the 23 years between the two world conflicts. The number of births exceeded deaths by an unprecedented margin and infant mortality dropped to a new low. Owing to advances in medical sciences, the proportion of older people in relation to the total population has also been growing. It may be noted, in passing, that, last year, there was a further rise in accidental deaths. Accidents in the U.S. continue to outrank every other cause of death, except the cardiovascularrenal diseases and cancer. The population growth is the biggest prop under the U.S. economy.—*All Rights Reserved.*

MR. MACMILLAN'S EUROPEAN DREAM

From Our Own Correspondent

LONDON, 25th *January*

LONDON LETTER

IN Press Conferences and speeches, Mr. Macmillan conveyed the impression immediately after assuming the Premiership that his principal constructive policy in foreign affairs was the setting up of the European Common Market. There is no question at all that Britain's Premier is bent on creating that impression and his efforts have been so far successful that they have drawn the maximum reaction from those who are fearful that a European Common Market will spell the end of the Commonwealth ties and of some of Britain's "infant industries," i.e., industries that have been infants since the Ottawa Agreement of 1932.

But, in conveying these indications of his policy, the Premier has had to spell out what he really envisages by the Common Market and it is now becoming clear that what he envisages is nothing very revolutionary after all! The Common Market is not, of course, to be confused with the Customs Union which is being mooted by a much narrower group of the O.E.E.C. Companies.

Moreover, the stage has now been reached of putting into draft a treaty ultimately to be signed by the O.E.E.C. countries adhering to the Common Market and that treaty will have to be laid before Parliament. Its details are not yet available other than in Mr. Macmillan's speeches. It is, of course, common knowledge that agricultural products are to be ruled out by this country. It is less well known that certain raw materials and a specific range of industrial articles will also be exempt from the general provisions.

Free to What Extent?

In brief, Mr. Macmillan, for all his enthusiasm as a good European, is not going to sacrifice any vital British interests or any Commonwealth preferences. What is left? Certainly not a large free trade area. Instead, we shall have an extension of the O.E.E.C. quota-free arrangements with the aim of guaranteeing the exchange of commodities at equalised tariff rates. The tariffs themselves will still be there, unlike in the European Customs Union. In the latter, there will be no tariff between the members of the Union and a Common Tariff by all the members to the outside world; but, in the Common Market, countries will maintain their tariffs against each other, the aim being to bring them into line. It is furthermore intended to permit the free movement of capital for investment between the adhering countries. But no positive proposals have so far emerged. Nor are they likely to do so, given Mr. Macmillan's general philosophy—for positive measures mean planning to increase production and exchange.

Mr. Macmillan's idea is that, by putting a number of commodities on the same tariff basis, putting a number of countries on the same footing regarding the exchange of these commodities, he will achieve the liberal ideal of maximising production and minimising cost under the theory of comparative costs. This theory is valid in a true Common Market such as the United States but, when applied to a number of independent European countries with their different conditions of employment, different rates of investment, different standards of taxation and welfare, there are in practice likely to be set up enormous hindrances to the realisation of the economic ideal. What we may get instead is the protectionists' nightmare of foreign competition killing home industries without equivalent expansion in the export industries to absorb the labour and capital. In brief, the policy, instead of being expansive, could be deflationary.

But this is not to say that there is sound reason for opposing Mr. Macmillan's plans, it is rather that, one must point out, in themselves they do not go very far, that they have some undesired consequences, and that, if one is really concerned about expanding trade, one has to take more positive steps. The O.E.E.C. countries should be considering the giving of encouragement, industry by industry, regardless of country, to the most efficient and the potentially most efficient producers. It is clear, however, that nothing positive of this kind is envisaged; there is no real stimulus, so far as can be seen, to be given to European production as a whole.—*All Rights Reserved.*

ECONOMIC SYSTEMS ARE INDIVIDUAL TO EACH NATION

IDEAS ARE, HOWEVER, ADAPTABLE

By Dr. Marcus Nadler

[The author of this article is widely known in the field of international economics. In addition to his post as Professor of Economics, Graduate School of Business Administration at New York University, he is Consultant to the Hanover Bank and Trust Company, New York, and Associate Editor of the Journal of Commerce. His published works include "Foreign Securities," 1929, "International Money Markets," 1955 (both with J. T. Madden), "The Money Market Primes," 1948 (with J. T. Madden and S. Heller), as well as numerous articles and brochures on various phases of economics.—ED.]

THE economic system of each individual country is the result of historical, social and political developments and these differ from country to country. However, while economic institutions and practices have served one nation well, they would not necessarily lead to the same results in another country. Each country, however, has a great deal to learn from the others and the United States certainly has learned a great deal from the institutions established in the older countries.

The economic system of the United States has served the people well and provided them with a very high standard of living. In part, this is due to the favourable geographic position of the United States and to the vast natural resources which exist in the country. The climate is varied, permitting the growing of a wide variety of crops, from cotton and citrus fruits in the south to spring wheat in the north. It is, on the whole, moderate and healthful.

The composition of the population differs in many respects from that which prevails in other countries in the Western Hemisphere. It embraces a great many peoples and cultures, all of which have contributed to the American culture and the American way of thinking. All Americans, with the exception of the native Indians, are immigrants or descendants of immigrants.

The geographic position of the United States, the character of the frontier, and the background of the population have had a marked impact on political and economic developments. The need for co-operation in conquering the wilderness led to the establishment of democratic institutions which had a pronounced effect on later political developments. The self-reliance required of the new settlers developed a feeling of equality, which was further strengthened by the absence of the institution of nobility. From the earliest days, there was usually a shortage of labour, with the result that wages in the United States were generally higher than in most countries. This situation, together with the rapidly expanding market, led to the creation of labour-saving devices and the emphasis on increased productivity which have had such an important impact on economic development in the United States.

In all these years of growth and expansion, the United States has learned a great deal from foreign countries. In fact, up to the outbreak of World War I, thousands of American students studied at the institutions of higher learning throughout the world in order to acquaint themselves with the institutions and practices of other countries. While many of the ideas and concepts were adopted by the United States, however, based on different historic, social and economic developments, important differences in the economic system of the United States were developed. Some of these differences may be mentioned as follows:

(1) Competition in the United States is, perhaps, keener than in most other countries. To meet this competition, business concerns are forced to spend large sums on new machinery and equipment, in order to reduce labour costs and to maintain their competitive position. Some foreign observers believe that this severe competition is harmful to the American economy, that it leads to a large number of failures and too rapid obsolescence of productive facilities. Yet this policy has served the American people well; it has resulted in increased productivity, higher wages, and relatively low prices of manufactured goods.

(2) The American economy is one of mass production, mass consumption and mass financing. The domestic market is the largest that has ever existed thus far, in the world, and in order to meet the demand of this huge market, mass production is essential. Many foreign observers are concerned over the widespread use of instalment sales and the huge volume of consumer indebtedness in the United States. At the end of September 1956, consumer credit outstanding amounted to $40,000 million, or 17 per cent. of annual disposable personal income. In many other countries, this would not only be considered unwise financing but also dangerous to the economy. In the United States, consumer financing is part and parcel of the way of life. The average individual thinks nothing of buying an automobile or other types of consumer goods on the "pay-as-you-use-it" plan. The experience with consumer loans, on the whole, has been satisfactory and the loss ratio has been exceedingly small. Without such mass financing, mass distribution and mass production would have been impossible.

(3) The banking system in the United States is unique, in that it is a dual banking system. While in other countries the banks operate under only one set of laws, in the United States banks may be chartered either under national laws or under 48 separate codes of State laws. In other countries, nation-wide branch banking is usually permitted. In the United States, there is State-wide branch banking in some States, while, in others, branches are not permitted at all or only over a limited area. Strange as it may seem to some foreign students of banking, this system has served the United States well and has contributed materially to the economic growth of the country.

(4) The savings of the people are enormous, and, to a considerable extent, they are contractual in character, such as those made in the form of insurance premiums. The life insurance companies, as well as other major savings agencies, such as savings banks and savings and loan associations, are largely private and mutual in character, that is, they are not owned by stockholders but by the policyholders or depositors. The total resources of American life insurance companies at the end of June 1956 amounted to $93,000 million. Savings of individuals in savings and loan associations and mutual savings banks amounted to $64,000 million on that date. Private pension funds are also playing an increasingly important role in the economy. Usually, these are managed by the companies, sometimes with the participation of the beneficiaries.

This system has served the American economy well. It has made available to industry and Government huge sums of money at relatively low rates of interest and, at the same time, has given the people a degree of economic security which few countries can rival.

(5) In the United States, with certain notable exceptions in the field of power, the utilities and transportation, facilities are largely privately owned and managed. All railroads in the United States are privately owned. The telephone and telegraph system is in the hands of private enterprise, as is the bulk of the power and gas facilities. And yet even the severest critics of private enterprise admit that the service rendered to the users of these facilities is excellent and probably not surpassed anywhere. The American people are satisfied to leave these facilities, which are monopolistic in character, in the hands of private enterprise, subject to Government regulation, particularly as to rates and service.

The above examples were taken at random and were cited not to prove that these institutions are superior, but merely to indicate that each country develops its own economic system, its own institutions, its own methods of doing business, based on its requirements and needs. Some are typically American, as, for example, the banking system. Others are adaptations of principles which have been adopted from other countries.

Many other examples of the pecularities and uniqueness of the American economic system could be cited. This system, as was previously stated, is the product of deep-rooted, historical, geographic and political developments. It is not static and it is in a constant state of flux, changing itself to meet changed economic and social conditions. Although the means of production, transportation and distribution are largely in the hands of private enterprise, it could be said that the American economy is rapidly becoming a "people's capitalism," in the sense that the means of production, while managed by industrial executives, are, to a large extent, owned by the people themselves, either directly, in the form of stock ownership, or indirectly, through their interest in such mutual institutions as insurance companies and pension funds.

While Americans do not advocate wholesale adoption of their economic system, the system does have features which could properly be adapted to the needs of other countries. Similarly, as has been shown before, the United States has learned and seeks to learn from the systems in operation in other lands and from the experiences of other nations. Each nation is endowed with a special creative genius from which all other nations can learn. It is, however, fallacious to believe that, because an economic system has served one nation well, its adoption by other countries would lead to the same results. An economic system that is not deeply rooted in the character of the people nor based on its history and traditions, whether adopted voluntarily or imposed by force, is bound to fail.

PAYMENTS UNDER STANDING ORDERS

BANKS IN INDIA SHOULD POPULARISE THE SYSTEM

ONE of the main worries of commercial banks in India at present is to find adequate resources to meet the growing demand for bank credit and to maintain a fair level of liquidity ratio. The increase in interest rates offered by them on time deposits and savings bank accounts has not yet yielded sufficient deposits to meet the situation. As was pointed out in our last issue, while notes in circulation have gone up by nearly Rs. 325 crores over the past five years, the net deposits of Scheduled banks have risen by only Rs. 256 crores. This means that a substantial part of the increase in currency has found its way into non-productive channels, being held mostly by those among whom the banking habit has not spread. Banks in India should, therefore, strive to raise their resources.

This can be done by infusing the banking habit among the population by intensive efforts. One of the ways in which this can be done among the urban population is to offer services other than mere keeping of deposits and paying interest on them. Banks can, for instance, undertake to do almost all monetary transactions of their customers, such, for instance, as payment of insurance premia, rents, subscriptions to societies, associations, clubs, etc., amortisation of debts by instalments, and all other remittances which are to be made at regular intervals. This service, known as Standing Order System, is very common in Western countries and can be conveniently adopted and popularised in India. It is true that many leading banks in this country offer some of these services, but the system is neither widespread nor popular for two reasons. In the first instance, the public at large does not know that such facilities are available to them; a wider publicity of these services may, therefore, yield better results. Secondly, the cost of these services is rather high, with the result that customers have no incentive to avail themselves of these services. The banks should render them at charges lower than those made for other forms of remittances. In this context, the system prevalent in the U.K. can be usefully followed by banks in this country.

The Standing Order System is gaining popular favour in Britain. Under this system, customers entrust the work of making a series of periodical payments to their bankers. This is done by completing a single form, in which are mentioned the amounts to be paid, to whom they are to be paid and the dates on which the transfers are to be effected. Such a system is particularly suited for transactions which involve payments at fixed regular intervals, namely, insurance premiums, rents, etc. All commercial banks provide these facilities to their customers. Trustee savings banks also offer them, though in some cases in a limited form. Even post office savings banks render these services to their customers, albeit on condition that the payments under a Standing Order are not more frequent than once a month and that a reasonable balance is maintained in the account, that is, a sum sufficient to ensure that the amount involved can be transferred without the necessity of the bank having to intimate the customer that his account must be brought up to an adequate level.

The main attraction of this system is that the customer is saved the bother of keeping note of the due dates, and issuing a cheque for each payment or sending each remittance by money order or postal order. The second attraction is that the cost is not materially more than the total cost of all remittances by other methods. It also saves the stamp duty on every cheque issued. (In India there is no stamp duty on cheques.) It is stated that commercial banks do not make any special charge at all, if an annual payment is to be made under a Standing Order. Where frequent regular payments are to be made, some additional charges are levied, which, however, vary from account to account. For instance, the charges are much less in the case of those who keep large balances in their account and do not utilise them for other transactions than in the case of those who maintain small balances. Generally, the charges do not exceed a few pence more than those ordinarily charged for clearing cheques. Post office savings banks charge 8d. a time for transfers under Standing Orders. But even this cost is less than that involved in postal remittances. Trustee savings banks which provide Standing Order facilities levy charges varying from 8d. to 1s. per payment.

The Standing Order System generally operates only in respect of regular payments of even amounts. Savings banks do not usually offer such facility where irregular payments are involved, while in the case of commercial banks, the arrangements for irregular payments and payments of uneven amounts are previously discussed and fixed with the branches concerned. Some commercial banks have been accepting instructions from customers to make a number of payments set out on a slip in exchange for a single cheque reimbursing the bank for the total amount involved. Thus, some commercial concerns have been in the habit of disbursing salaries to their staff in this way, while some private customers have been availing of this facility for making household payments. This practice is, however, being discouraged, on account of the extensive work which it entails for bank staff. The banks also levy sometimes very heavy charges for such payments in order to discourage this practice.

The Standing Order System can also be adopted in cases where dues are to be collected at regular intervals, but in such cases powers-of-attorney may have to be executed in favour of banks by the customers. The system can very conveniently be adopted in cases where the person who has to make the payment and the one who has to receive happen to be customers of the same bank, because the transactions involve only a book entry.

STATE BANK OF INDIA

In line with the general trend of bank profits for 1956, the State Bank of India has made an impressive performance. The net profit of the Bank for the year under review amounts to Rs. 156.18 lakhs, which compares very favourably with the combined profit of Rs. 135 93 lakhs made by the former Imperial Bank of India during the first half of 1955 and by the State Bank in the latter half. It also exceeds by Rs. 19.27 lakhs the record profit of Rs. 136.91 lakhs made by the Imperial Bank of India in 1954, before it was nationalised. With the sum of Rs. 34.37 lakhs brought in from 1955, the total sum available for appropriation is Rs. 190 55 lakhs (as against Rs. 170.12 lakhs), out of which the Directors have set aside Rs. 2.50 lakhs to the reserve fund, as against *nil* a year ago, Rs. 6.14 lakhs to the pension funds, which had received Rs. 5.75 lakhs last year, and bonus to staff Rs. 40 lakhs, same as in the previous year. In addition, the Directors have transferred Rs. 10 lakhs to the staff amenities fund, for which no allocation had been made last year. The dividend has been maintained at 16 per cent. per annum, a rate which the former Imperial Bank of India had been paying from 1950 onwards after raising it from 14 per cent. This requires Rs. 90 lakhs, leaving to be carried forward Rs. 41.91 lakhs to the next year.

INTERNATIONAL FINANCE CORPORATION

The membership of the I.F.C. has now risen to 47 countries with capital subscriptions aggregating $90.396,000. It will be recalled that the I.F.C. came into existence on 24th July last with 31 member countries. The purpose of the I.F.C. is to further economic development by promoting the spread of private enterprise in the less developed countries of the world.

(*Concluded from next column*)

The information collected by the Committee for Invisible Transactions, in the course of its examination of the various reservations, has shown that, in certain cases, it should be possible to extend liberalisation. Consequently, the Council of the O.E.E.C. adopted a unanimous Recommendation to the effect that the countries concerned should withdraw 16 reservations entirely and two partially and should modify five others. With regard to 16 other reservations, the Council made no formal recommendation for withdrawal to the member-countries concerned, but considered it desirable that they should envisage the possibility of removing or reducing, according to circumstances, the restrictions which they still maintain. The Council also approved of the programme of work of the Committee for Invisible Transactions. This Committee will continue, at regular intervals, to examine the reservations maintained by the member-countries, and will submit to the Council appropriate suggestions to assist such countries in withdrawing their reservations. It will also explore the possibility of widening the general obligations of liberalisation laid down in the Code and will make thorough studies of problems arising with regard to transport, films, insurance and personal capital movements.

EXCHANGE CONTROL IN WESTERN EUROPE

MORE FREEDOM FOR INVISIBLES

FURTHER steps have been taken by the Council of the O.E.E.C. towards the gradual overcoming of those obstacles to so-called "invisible" transactions and transfers which still remain at international level. The Council has sent a Recommendation to member-countries for abolishing some of the restrictions which they still impose on such transactions and given its approval to the programme of work to be undertaken by its Committee for Invisible Transactions. The terms of reference of this Committee, which was established in 1955, are to consider by what means it is possible to extend the liberalisation of invisible transactions, i.e., services rendered by persons residing in one of the member-countries to persons residing in another member-country, such as operations concerned with freights, insurance, advertising, use of patents, etc.; its task is also to facilitate the liberalisation of transfers on current account arising out of such transactions, as well as financial transfers relating, for instance, to dividends, interest, rents, tourist allowances, inheritances, etc.

When codifying previous decisions of the Organisation on invisible transactions in June 1955, the Council of the O.E.E.C. approved a list of transactions and transfers, annexed to the Code of Liberalisation, for which the principle of liberalisation had been affirmed. In other words, all the items in this list—designed to be an exhaustive list of all invisible transactions and transfers on current account—were to be freed, subject to certain limitations regarding some of them; it was provided, however, that, if, in the case of any given item not freed hitherto, a country was unable to authorise the transaction and corresponding transfer, that country had the right to make a reservation, which had to be brought to the notice of the Organisation. The latter has the task of carrying out a periodic examination of such reservations, in order to determine whether the reasons invoked are justified and to define the action which might be taken to bring about their elimination.

In recent months, the Committee for Invisible Transactions, in conjunction with the experts of member-countries, examined the various reservations notified to the O.E.E.C., and submitted to the Council a report, analysing the present state of the liberalisation of invisible transactions in Europe, and proposing suitable measures to extend such liberalisation by means of a Recommendation to member-countries.

Great progress has been made in recent years and exchange control restrictions on invisibles have largely disappeared. Thus, in most of the O.E.E.C. area, a business man can avail himself of all services offered as freely in other member-countries as in his own. He can ship and insure his goods through foreign companies and warehouse them in the country of his choice. He can travel and advertise abroad; commissions and expenses relating to foreign trade can be freely transferred; foreign experts and technicians can be consulted. The investor can receive his foreign dividends, interest or other capital earnings. Similarly, the foreign worker can, generally speaking, transfer earnings and maintain social security payments. Royalties can be paid to foreign authors under copyright and licence fees to foreign owners of patents. The private person can obtain substantial allowances in foreign currencies for travel in member-countries, for pleasure, health or study. Inheritances and dowries are transferable.

The list of invisible transactions given in the O.E.E.C. Code of Liberalisation covers 47 items, only 18 of which have given rise to reservations by certain member-countries, and in some cases only one or two reservations were made. It may, therefore, be said that, for a large number of transactions and transfers, there is a common market in Europe. It should also be pointed out that the mere fact of a country making a reservation against an item does not necessarily mean that the transaction or transfer in question is not free in practice; it often happens that a country, without accepting a formal undertaking to liberalise, follows a very liberal policy.

Certain items in the Code of Liberalisation which have given rise to reservations are, in fact, of great economic importance. For example, important restrictions are maintained by several countries on inland transport, insurance and films.

(*Continued in previous column*)

ROLE OF CO-OPERATION IN SOCIAL ADVANCE

SOME RECENT TRENDS

By G. D. H. Cole

CHICHELE PROFESSOR OF SOCIAL AND POLITICAL THEORY AT OXFORD UNIVERSITY

THE Co-operative Movement, in its long history of development in many countries, has shown itself remarkably adaptable to a wide variety of social and economic conditions.

In Britain, ever since the foundation of the Rochdale Pioneers' Society in 1844, it has developed mainly as a movement of consumers for the collective sale and production of everyday household supplies—above all, of foodstuffs, but with a growing tendency to invade other forms of retail and wholesale trading and of manufacture in establishments collectively owned and managed by consumers' societies.

It has developed in largely similar ways in a number of other Western countries—for example, in Scandinavia, in Germany, and in Switzerland. On the other hand, in many of the less developed countries it has taken root, in the first instance, mainly as a means for the supply of credit to small farmers or other small-scale producers; and in certain advanced agricultural areas, such as the prairie provinces of Canada, it has grown up chiefly as a producers' movement among farmers, large and small, for the collective purchase of farm requisites such as seeds and machinery.

In yet other countries, industrial co-operation among producers has played an important part, through productive societies largely owned by the workers employed—for example, in France and Italy and also, on a smaller scale, in Britain. In the United States, one of the most successful co-operative ventures has been in the sale of petrol, chiefly to farmers, and there have also been interesting adventures in co-operative credit to university students and in co-operative home-making.

Wide Diversity

In almost every country, some form of co-operative enterprise seems to be adaptable to the local conditions. In recent years, some of the most interesting developments in many branches of co-operation have occurred in colonial areas—for example, in West Africa and in Malaya, including both consumers' societies for collective supply and producers' societies for marketing of rural products.

This almost unlimited adaptability of the co-operative method indicates the enormous scope that is open for its further development, especially in the countries that are economically less advanced. Forms of agricultural development range from the complete co-operative socialisation that exists in some, but not by any means all, of the *kibbutsim* in Israel to single-purpose marketing societies for particular products among farmers who cultivate their land or breed stock as individual *entrepreneurs*, as in Denmark or Canada.

Given this wide diversity both of methods and of social composition, it is not always easy to see what binds all the varying groups of co-operatives together into a common movement; for there are obviously great differences between bodies of consumers who are banded together in order to secure supplies of unadulterated goods at fair prices on a non-profit basis and societies of farmers or industrial producers who are seeking to market their products, whether individually or co-operatively produced, on favourable terms. There are, however, certain principles which all co-operative societies that can claim to belong to the great international Co-operative Movement are required to accept as the basis of their work.

Democratic Basis

First and foremost among these principles is the democratic basis of membership, which assures to each member an equal voting right regardless of the amount of capital he has invested in his society or of the amount of his transactions with it. This sharply marks off co-operative from all forms of capitalist enterprise; for, in capitalist companies, voting is weighted by the amount of risk-bearing capital held by the investor, and a few wealthy shareholders can outvote a large majority of small investors, so that the latter usually have no effective control at all.

Secondly, all real co-operative societies work on the basis of a limited return on invested capital, in the form of fixed interest and not of a variable dividend on capital depending on the amount of profit or surplus. This interest cannot, indeed, be fixed absolutely for all time: it has to be varied in accordance with the rates of interest prevailing for other forms of borrowed money in the country in question, but is kept as low as the conditions allow. Thirdly, wherever possible co-operative societies work on a basis of open membership—which means that anyone who wishes can join a society on an equal footing with the existing members.

This principle can be fully applied to the consumers' societies which dominate the movement in Western Europe: it cannot be applied in the same way to the producers' societies, which must limit their working numbers to the members they are in a position to employ with the capital resources they possess and with the markets open to them. But here too the principles of equal membership and democratic control are applicable, and mark co-operative sharply off from capitalist enterprise.

Relations with State

In most countries, it is a matter of pride to co-operators to keep their movement fully independent of control by the State or by any outside body. But this is not always possible. In the totalitarian countries, the Co-operative Movement is inevitably subjected to different forms of State control, which co-operators in advanced Western countries would decisively reject; and, in the less developed countries, it is often necessary for the State to maintain some control, especially over the provision of credit through central agencies for co-operative banking—whereas, in the more advanced countries, the Co-operative Movement usually develops its own banking arrangements independently both of the State and of the capitalist banks.

Despite these differences, it is a remarkable fact that, whereas both the trade unions and the labour and socialist parties have become divided into rival Communist and non-Communist Internationals, the International Co-operative Alliance has continued to include the Co-operative Movements of the Soviet Union as well as of the Western countries—though not without a good deal of friction arising out of differences of view concerning the proper relations between the co-operative societies and the State.

CORRESPONDENTS ALL OVER THE WORLD

In Britain and in other Western countries, the predominant consumers' co-operative movement continues steadily to add to its membership and to increase the volume of its trade, but is subject to increasing challenge from private traders, and especially from large capitalist multiple concerns. Rising standards of living in many of these countries have been greatly altering the typical patterns of consumers' expenditure and have been reducing the proportion of total income spent on goods and services which the co-operative societies have equipped themselves to supply: so that, despite rising membership, a smaller percentage of members' total incomes has been spent at the co-operative stores.

It has also become less easy to raise co-operative capital as more alternative openings for the investment of small savings have become available—especially in loans to the State or other public bodies. This has slowed down the rate of expansion, especially of productive enterprises under co-operative control; and a good many friends of co-operation are wondering whether it may not become necessary, as the range of social enterprise grows wider, for Governments, as an alternative to nationalisation, to give aid to the co-operative movements to expand their activities into new fields of production and service. In general, however, co-operators are reluctant to contemplate anything that would involve any sort of State control over their movement and tend to prefer a slower rate of expansion that can be financed out of their own resources.

Dividend on Purchases

In Britain, one effect of the keener competition of private with co-operative trade has been a tendency for the rate of "dividend on purchases"—a characteristic co-operative device since Rochdale days—to fall off, so that the average rate of dividend is now not much above one shilling in the £1. In the past, the co-operative dividend has been of great help to the housewife in meeting expenses that arise, not day by day, but at longer intervals. It still is so, but no longer to the same extent as when most wage-earnings left no margin above bare subsistence; and the fall in "dividends" is not altogether a bad thing when it is used for maintaining reserves at a level adequate to cover current and prospective needs for capital replacement.

The "dividend," however important it has been in attracting and holding members, has always been a matter of expediency rather than of co-operative principle. Some societies, though few in Britain, have never used this device, and have preferred to devote their surpluses to the provision of collective services, especially in countries in which the public social services are inadequate, or even almost non-existent. Whether "dividend" on purchases should or should not be paid depends on the social environment in which each particular movement is operating. It is an error to regard it as a matter of essential principle.

Political Activities

Finally, there is the question of co-operative participation in, or abstention from, political activities. Abstention has sometimes been regarded as a matter of principle, whereas, in other cases—for example, in Belgium—co-operative societies have grown up in close alliance both with the trade unions and with the labour or socialist parties. In Britain, the co-operative societies for a long time held aloof from politics, until, in 1917, they formed a Co-operative Party of their own—a party which has since worked in close alliance with the Labour Party, but has not in fact prevented the co-operative societies from enrolling members of widely differing political views.

Whether the Co-operative Movement should or should not enter politics surely depends on the situation it has to face in each country at any particular time. The very successful Swedish movement is non-political: the no less successful British movement has been in politics for nearly 40 years with no adverse effects on its trading activities. There is room in the world for many kinds of co-operation and for many different policies corresponding to varying local needs. What seems certain is that, over the world as a whole, a period of great co-operative expansion lies ahead of us, and that the movement can, above all, make a great contribution to raising standards of living and of productivity in the less developed countries in which it has been spreading fast in recent years.

FINANCE (NO. 3) ACT, 1956

REVIEWED, ANALYSED AND COMMENTED

By R. K. Dalal, B.Com., F.S.A.A., F.C.A.

ON 30th November 1956 the Finance Minister introduced interim budget proposals involving far-reaching changes in the structure and level of taxation at the fag end. It came as a veritable bolt from the blue. The markets reacted to these proposals sharply and registered a steep decline in equity values. It is proposed to review, in this article, the new taxation proposals in some detail, so as to give a clear idea of the underlying intentions inspiring these proposals.

Capital Gains

The first and foremost measure is the revival of Capital Gains Tax from the financial year 1957-58.

The Finance (No. 3) Act, 1956, revives with some modification the scheme of capital gains tax which was in existence during the period 1st April 1946 to 31st March 1948.

The new scheme applies to capital gains arising on or after 1st April 1956, irrespective of the year of account of the assessee. The present provisions regarding capital gains tax have some characteristic features, as compared with the capital gains tax of 1946.

The old capital gains tax was levied on profits arising on sale, exchange or transfer of capital assets. This let a loophole, for relinquishment of an asset attracted no tax. In order to plug this loophole, the new section provides that "the tax shall be levied under the head of capital gains in respect of any profits or gains arising from sale, exchange, *relinquishment* or transfer of capital asset after 31st March 1956."

The Bombay High Court in *Provident Investment Co. Ltd.*, vs. *C.I.T.* 1953 (24) I.T.R. 33, held that section 12B does not subject to tax capital gains arising to an assessee by reason of relinquishment of property belonging to him or some rights vested in him. It is with a view to providing against such "relinquishment" of rights escaping capital gains tax that the additional word "relinquishment" is added in the section.

Further, in computing capital gains, the assessee is given the option to adopt, instead of the actual cost of the asset, its fair market value on 1st January 1954. This is a valuable option, for any capital gains arising out of the rise in price of capital asset prior to 1st January 1954 is made ineligible.

Important Departure

There is an important departure as regards the rate of tax. Under the old section, in case of non-company assessee, only the excess of capital gains over Rs. 15,000 was subjected to tax. In the new provision, it is provided that there will be no levy of capital gains tax, if the capital gains do not exceed Rs. 5,000 or if the total income, including capital gains, does not exceed Rs. 10,000.

Further, in the old section, the rates of tax were not related, in the case of non-company assessee, to the total income of the assessee. It is now decided to link up capital gains liability to the total income thus: one-third of the capital gains will be added to the other income and the income-tax rate applicable to the sum so arrived at will be the rate at which the whole of the capital gains will be charged to tax.

Thus, capital gains liability is based on a man's total income. Accordingly, two persons having equal capital gains, but unequal total incomes, will now pay different capital gains tax based on their total incomes and not based only on the amount of total capital gains made.

What is not clear, however, is whether, when the total income shows a *nil* income or a loss—large enough to absorb the one-third capital gains—capital gains would earn an exemption on the ground that there is no rate applicable to the total income, and *a fortiori*, therefore, to the capital gains. If the intention is to ignore the loss of total income, it would, indeed, be very unfair and inequitable, for it would tantamount to saying that, while positive income will set up the rate of capital gains tax, negative loss will not correspondingly reduce the charge. They say income-tax and equity are strangers; but, if this logic is to prevail, one must be driven to the conclusion that income-tax and common sense are positive enemies.

Under the old scheme, companies were not charged capital gains if the amount was less than Rs. 15,000. Under the new section, the full amount of capital gains without any exemption limit is chargeable. The rate of capital gains on companies will be the ordinary income-tax rate applicable to the company.

There is no super-tax chargeable on the capital gains.

Coming to exemptions, the Finance Act has deleted the following exemptions expressly given under the old section 12B dealing with capital gains:

(1) The gains arising on the transfer of property on compulsory acquisition for public purpose.

(2) The gains arising on the distribution of assets on the dissolution of the firm or an association of persons or on liquidation of a company.

The latter exemption was based, it seems, on the strict meaning attached to sale, exchange and transfer. It applied to a case where a property passed by sale, etc., from one person, who was an owner, to another, who was a purchaser; but it did not apply to the case where the transfer was between one owner as an entity and another owner as an individual. This was clearly a weakness. If a firm sold a property and made a capital gain, it would be chargeable to tax. Why not, when the partner on dissolution took over the asset of the firm in satisfaction of his claim at a valuation? Thus, the deletion of exemption may be justified. But, if this argument is true as regards entities like a firm, association and company, it should, logically speaking, apply to H.U.F. (Hindu undivided families) also. But the Act retains the exemption in case of H.U.F.

(3) Gains arising on the sale of residential property possessed by the assessee or his parent for seven years or more are now made exigible to tax, though exempted under the old Act.

Gains from Property

Gains arising from sale, exchange, relinquishment or transfer of property, the income of which is chargeable under section 9 and which was used by the assessee or his parent for residence in the two years before the date of sale, etc., and the assessee has, within a period of one year before or after that date, purchased a new property for his own residence, are charged as under:

(a) if the capital gain is greater than the cost of new asset, the difference will be charged as income of the previous year;

(b) if the capital gain is equal to or less than the cost, capital gain shall not be charged.

(4) Gains arising on the sale of building, plant and machinery belonging to a business invested in the purchase of a new building, plant and machinery within a specified period is made subject to the tax, though it was previously exempted.

(5) Gains on the transfer of asset to an irrevocable trust have been similarly made liable to the tax, though exempted previously.

Exemptions, however, are retained in the following cases:—

(i) Gains arising on the distribution of assets on the total or partial partition of an H.U.F.

(ii) Gains arising on the transfer of assets by will, bequest or deed of gift.

(iii) Gains arising on the transfer by a parent company of its assets to a 100 per cent. Indian subsidiary.

Exemption to H.U.F. does not seem to be logical when similar exemption is not granted to entities like a firm, association and a company.

Exemption from capital gains tax of gifts and bequests is due to the fact that they do not strictly fall within the ambit of sale, exchange and transfer in the sense of a property being transferred from one to another for value. In order that there may be no doubt, the Amendment Act clearly provides an exemption. Gifts may soon come to be taxed—who knows?—under Prof. Nicholas Kaldor's scheme of gift tax. Exemption of a sale, transfer or exchange of capital asset with a 100 per cent. Indian subsidiary seems to be actuated by the principle that, factually, the seller and the purchaser are the same, though legally constituted into two separate entities.

With regard to capital losses, it is provided that such losses as cannot wholly be wiped off by capital gains of the year in which they are made may be carried forward *indefinitely* for set off against future capital gains. In order to permit of such carry forward, the capital loss sustained in "any previous year" must exceed Rs. 5,000 in the case of non-company assessee. Companies would be allowed to carry forward any loss without regard to the amount, for they are taxed on capital gains without any minimum exemption of Rs. 5,000, as in case of non-company assessee.

The provision for carry forward of loss to be set off against capital gains seems to be eyewash, for, unlike revenue sources, capital gains is not a recurring source, which can yield gain or loss with any manner of continuity or regularity. The only consolation is that, over a period of years, when you dispose of capital assets, the gains on some may be set off against loss on the other—so that the net gains come under the taxation charge. Here also there is a snag. If you first made a capital gain in one year and capital loss in the next, the relief of net gain is not available as it would be, if a person first made a capital loss and then a capital gain. The loss provisions, unfortunately, do not operate backwards.

Deposits Out of Profits

The next feature of the new Finance Act, 1956, lies in its provisions for deposit to be made with the Central Government by companies which are allowed in their assessment depreciation allowance and development rebate.

It is provided that, in the case of companies, the depreciation allowances and development rebates allowed should be added as an item of income, unless the Company deposits with the Central Government before 30th June of the relevant assessment year a prescribed amount depending on its undistributed profits and reserves.

The amount deposited will consist of two parts. The first part is a prescribed percentage of so much of the accumulated profits and reserves as are not represented by fixed assets in the business.

The second part is a prescribed percentage of the amount by which available profits of the year, i.e., profits before deduction of depreciation or development rebate less taxes payable less dividends, exceed Rs. 1,00,000.

The formula seems to be based on the following line of reasoning:

What are profits available for distribution in order that Government may claim a compulsory deposit of 75 per cent.? The criterion taken is the Company's assessable profits. Out of these profits, taxes represent an outgo and, therefore, must be deducted. The dividend declared in the previous year also represents an outgo. Then, since the Government wants to control depreciation and development rebates, the formula requires the company to add back these sums, for, in computing the total income, they have been deducted. Next, allowance must be made for outgo in shape of expenditure actually incurred, but disallowed as admissible for purpose of computation of total income. This cannot be adequately measured; so, it is best to provide an overall figure of Rs. 1,00,000 to cover such outgoings. The balance thus left is clearly available for distribution or deposit and Government claims a compulsory segregation of at least 75 per cent. thereof in deposit.

Fifty Per Cent. to be Deposited

The exact percentages referred to above will be prescribed by the Central Government and notified from year to year; but will not exceed 25 per cent. for the first and 75 per cent. for the second part of the deposit. As regards the latter, the Finance Minister stated in Parliament that, at present, the Government's intention is to demand a deposit of only 50 per cent.

The deposit will carry such rate of interest as prescribed by Government and it is refundable wholly or in part where the Government is satisfied that the amount refunded will be used in the business for purpose approved by the Government. Rules for these matters will be issued by the Central Government.

These proposals are startlingly new and novel, having for its object, it seems, to take away from the company's resources, surplus finance for the Government's second Five-year Plan, thereby severely restricting the company's dividend policies. There has been a two-pronged attack on companies: one, by taxing excess dividend over 6 per cent. of the capital of the company; another, by taking away by compulsory deposits as much surplus finance represented by reserves not represented by fixed

(*Continued on page 251*)

EFFECTS OF ENHANCED EXCISE DUTIES ON SMALL MILLS OF GUJERAT

WRONG BASES LEAD TO INCORRECT CONCLUSIONS

By Bipinchandra M. Mehta, B.Sc. (Tech.), B.S. (Michigan), A.M.I.E.T.

[The author of this article is more a technician than a writer. His business is to produce cloth, but he has been provoked to write by the heavy incidence of excise duty, because he must have realised that he will be in the business only if the cloth that he makes is sold and a profit is made. The recently enhanced excise duty on cloth has made serious inroads into the earnings of small, yet not necessarily inefficient, mills and their existence has been rendered difficult. The author belongs to one such mill. He knows where the shoe pinches. So, he has taken a lot of trouble to gather data about a group of mills in the Baroda area of Gujerat to show that the bases chosen for levying the excise duty have ignored the economics of these mills, besides being defective in many other respects. Since he is very keen that his data should receive the attention of the Government, we have published his analysis in detail, though parts of it make disjointed reading and do not perhaps apply to most of the big mills in the country.—ED.]

A steep increase in excise duties on cloth was announced on 1st September 1956. The Government introduced a Bill in Parliament, Bill No. 60 of 1956, fixing the maximum limits of excise duties at 4 annas per sq. yard on coarse and medium cloth and 6 annas per sq. yard on fine and superfine cloth. The incidence of the excise duties as announced on mill-made cloth during 1956 are as follows:—

(Per square yard)

Category	Jan., 1956	March, 1956	Sept., 1956	Increase between March and Sept.
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
Coarse ..	0 0 6	0 1 0	0 1 6	0 0 6
Medium ..	0 0 6	0 1 0	0 2 0	0 1 0
Fine ..	0 1 3	0 1 9	0 3 0	0 1 3
Superfine ..	0 2 0	0 2 6	0 4 0	0 1 6

(Handloom cess at 3 pies per square yard extra)

The declared aims of the Government in increasing the excise duties were: to arrest the rising spiral of prices of cotton textiles, to mop up the extra profits as an indirect source of revenue, and to restrict the consumption of mill-made textiles with a consequent fillip to the handloom industry and the export trade. It was anticipated that the new rates of the duties will fetch Rs. 17.5 crores in seven months and will raise the overall figure of revenue from excise duties on cloth to Rs. 61.5 crores, thus making cloth the most heavily taxed material in the country.

In the "statement of objects and reasons" (hereinafter referred to as the "Statement") appended to the Bill and in a note (hereinafter referred to as the "Note") submitted by the Union Finance Ministry to the members of Parliament at the time of the introduction of the Bill, it was stated that, even though production of cloth had increased, production had not kept pace with the increase in demand. A sellers' market had prevailed, and prices of cotton piecegoods soared high and, therefore, the necessity arose to arrest this rising trend. The following is an abstract from the note referred to above:

"From January 1956, the rise in prices has been particularly steep:

(In annas per lb. of yarn woven)

	Coarse	Medium	Fine	Superfine
January, 1956 ..	30.60	46.13	65.60	142.37
April, 1956 ..	45.50	58.88	75.67	158.50
August, 1956 ..	47.06	66.95	83.00	166.00
Increase since January, 1956 ..	7.46	20.82	17.4	23.63"

The comments which are made in this article refer more particularly to coarse and medium varieties of cloth, and to the case of medium-sized mills situated in the mofussil area such as mills in the Gujerat districts of Bombay State.

On the basis of authoritative data available, it can be definitely stated that the quantum of rise in the prices given in the note does not apply to most of the sorts manufactured by the mills in coarse and medium varieties, and gives an exaggerated picture which is not in consonance with the material facts.

Table I appended to this article shows the price trends in the respective groups 13s/14s, 18s/18s, 18s/24s and 28s/38s for the months of January 1956, April 1956 and August 1956 and also realisation per lb. of yarn woven for the respective months in grey and in finished state of the majority of the mills coming under the Federation of Gujarat Mills and Industries, Baroda. Simultaneously, the wholesale realisation per lb. in the finished state is arrived at by adding excise duty prevalent to the ex-mill uncontrolled price *plus* 3 per cent. commission of the wholesale merchants which is normally allowed to the trade, e.g., the realisation in column 12 of the table equals price in column 3 *plus* excise duty *plus* 3 per cent. wholesalers' margin (excluding items such as transport cost, sales tax, etc.). Since comparison in the note and in the statement are of wholesale prices which are inclusive of excise duty, an attempt has been made to compile the wholesale prices which are arrived at from the ruling prices from the mills and a comparison, a difficult task, is made with the wholesale realisation shown in the note.

To what extent the wholesale prices prevalent in the market are higher than the contracted prices of the mills during the same period is a difficult proposition, as such will vary from mill to mill, sort to sort and from market to market. The wholesale prices depend upon so many factors such as excise duty, the popularity of the sorts, and competitive and similar sorts of other manufacturers. The realisation per lb. will increase as the number of processes increases. Bleached realisation will be more than grey and the dyed realisation will be more than the bleached realisation per lb. and so on.

The realisation per lb. is, however, increased to a considerable extent by the inclusion of excise duty, and, after all, excise being revenue, should be deleted for a fair comparison, more so because of the prevalence of different rates of excise duty such as in January 1956 and during the period March to August 1956.

Apropos the coarse group in Table I, the price of grey drill sort indicates an increase in price, while grey realisation per lb., on ex-mill price basis, moves up from Rs. 2 to Rs. 2-4-5, that is, a rise of Re. 0-4-5 per lb. If the processed material is also considered, more or less a similar rise may be there, and, due to inclusion of excise duty, the difference per lb. is inflated. If the wholesale price for grey drill is also considered, it shows a rise of Re. 0-5-8 per lb., as shown below:

Count 13s/14s	January 1956	August 1956	Difference
	Rs. a. p.	Rs. a. p.	Rs. a. p.
Grey realisation ..	2 0 0 (col. 4)	2 4 5 (col. 8)	0 4 5
Wholesale realisation.	2 2 11 (col. 10)	2 8 7 (col. 12)	0 5 8

It will be observed from the two sample calculations shown above that the quantum of excise duty determines the increase in the realisation per lb. of yarn woven. The quantitative rise in the realisation per lb. from sort to sort for the months of January and August could be observed as the quantum of excise duty, say, for medium group was Re. 0-0-9 per sq. yard in January and Re. 0-1-3 per sq. yard during March-August, that is, a difference of Re. 0-0-6 per sq. yard, and, on a rough approximation of six yards to a pound in the medium group, this very increase of Re. 0-0-6 per sq. yard would increase the realisation multiplier by Re. 0-3-0 per lb.

Similarly, observations could be confined to other sorts in 18s/24s group and 28s/38s group also, belonging to the medium category. It may not be out of place to mention that the price increase in the 28s/38s group has not been so very predominant because of the bulk manufacture among the mills as compared with the other counts, and in this group the price fluctuation is not very significant.

Now, on focussing one's attention on the wholesale price realisation per lb. in column 12 of the table, one will note that the same moves up from Rs. 2-8-7 in the coarse category to Rs. 2-14-5 in 18s/18s, Rs. 214-10 to Rs. 3-15-3 in 18s/24s group and Rs. 4-5-11 to Rs. 5-6-4 in 28s/38s group. Similar observations could be made for the wholesale realisation for the month of January 1956 as per column 10. The pertinent observation follows from this that, for groups 13s/14s, 18s/18s, 18s/24s, 28s/38s and other similar count groups, the realisation per lb. moves distinctly in certain groups as shown above and, if all these wholesale realisations per lb. were grouped together by any suitable statistical method, it does not convey as to the precise price fluctuation among the groups concerned but presents an overall picture which may be far from the truth.

Table I, it may be mentioned here, is the compilation of authoritative data available due to the courtesy of the Federation of Gujarat Mills and Industries, Baroda.

It is difficult to gauge to what extent the wholesale price should be above the free ex-mill price. As already mentioned, the rise above the free ex-mill price may be different for different sorts and will be a variable factor from market to market. With these limitations to arrive at a fair approximation and possible comparison. 3 per cent. wholesalers' margin is considered fair.

The trend of cloth prices presented in the official note suffers from inflated realisation because of the inclusion of different rates of excise duties prevalent at different times. The data presented in the note depicts an overall picture. It is not very effective in giving a dissected picture in various count groups in the same category, such as coarse, medium, etc. One fails to understand such a presentation in its proper perspective.

During the control period upto June 1953, the destiny of the textile mills was governed by the schedule of realisation multipliers of cotton cloth for certain count groups on the basis of the Tariff Board formula which was arrived at after a painstaking review of the cost structure of the mills at that time. An actual reproduction in barest details of the schedule is given in Table II appended herewith.

From this it will be seen that, for group No. IV count 14s/14s, in June 1952 the realisation multiplier was As. 28.5. Similarly, for group No. V, count 20s/20s, it was As. 35.00, group VII, count 30s/30s, As. 45.5, group VIII, count 30s/40s, As. 50.5. If the same original sequence were to be followed, it would have been fair to the industry and trade had the data been presented in the note in different count groups for various sorts. This would not have been an easy task, but would have been very commendable as it would project a correct picture in all its dimensions in the minds of the industry and trade.

The following data are reproduced from the statement of the indices giving the trend of prices of both cotton cloth and cotton (coarse and medium categories only):

Month	Coarse		Medium	
	Cloth price	Cotton mix price	Cloth price	Cotton mix price
1956				
January ..	39.60	14.35	46.13	18.12
February ..	39.60	14.35	47.25	18.12
March ..	41.37	14.35	50.56	18.12
April	45.50	15.01	58.88	18.16
May	47.57	15.01	64.90	18.16
June	46.78	15.01	64.92	18.16

As indicated in the note submitted to the members of Parliament, the difference beween the cloth price and the cotton mix price will represent the manufacturing cost of cloth and profits of the mill and the wholesaler.

Confining ourselves to the medium category only the difference between cloth price and cotton mix price for the month of January 1956 is as follows:

As. 46.13 — 18.12 = As. 28.01

Similarly, for June 1956:

As. 64.92 — 18.16 = As. 46.76

The difference indicates the manufacturing cost *plus* the profit of the mill and the wholesaler.

If the difference between As. 46.76 and As. 28.01 is taken, the result is As. 18.75 which measures the rise in profit per lb. for the mill and the wholesaler.

Without any consideration of the cotton mix price, if the difference between June and January cloth prices were to be considered, which is As. 18.79, the difference represents the profit of the mill and the wholesaler. The quantum of difference in the excise duty between January and June 1956 of Re. 0-0-6 per sq. yard and considering as a fair average for medium category six yards per lb., this increase in excise duty has added to the extent of As. 3 per lb. Hence, if a correction factor for the increase in excise duty were to be applied to arrive at the same base, the figure of As. 18.75 per lb. which represents the profit of the wholesaler and the mills, should be reduced by As. 3 per lb. and comes to As. 15.75 per lb.

Applying the same analogy for coarse category, the results are as under:

January 1956 As./lb.	June 1956 As./lb.	
39.60	46.78	
— 14.35	—15.01	
25.25	31.77	— Manufacturing cost *plus* profit of mill and wholesaler.

As./lb.	
31.77	
— 25.25	
6.52	— Profit of the mill and the wholesaler only.

If the cotton mix price is not taken into consideration as is done in the note, the following would be the result:

As./lb.	
46.78	January 1956
— 39.60	June 1956
7.18	Difference

Applying the excise duty at Re. 0-0-6 per sq. yd. and considering as fair approximation four yards to a lb., As. 2 should be subtracted from the profit of the mill and the wholesaler, that is,

As. 6.52— As. 2 = As. 4.52.

Thus, As. 4.52 is the correct profit made by the mill and the wholesaler and not As. 7.18 as alleged in the note.

It will thus be evident that, while there was a moderate increase in the prices of several varieties of cotton textiles, the increase is not to the extent as assumed by the Government. So the new excise duty for coarse category of Re. 0-1-6 per sq. yard and for medium category of Re. 0-2-0 per sq. yard *plus* handloom cess of 3 pies extra, does not represent the correct levy. There is thus a clear justification for a revision of the rate of excise duty in a downward direction.

Further, measures taken in quick succession by the Government for putting down the prices of cotton textiles, have shocked the industry and the trade. While the new excise duties came into force from 1st September 1956, in the second week of September, credit control was announced whereby banks were directed to decrease their advances against cotton textiles to merchants from 75 per cent. to 65 per cent. This led to the liquidation of stocks by merchants, as money supply was already inadequate. At about the same time, fair prices of cloth were announced in Calcutta for the *Puja* festival, and the prices were arrived at on the basis of the old Tariff Board formula. The expected demand did not materialise and the markets were glutted and prices moved downwards. At the fag end of September came the announcement on the restriction of stocks with the mills and wholesalers which had to be subsequently amended and relaxed as regards mills' stocks were concerned and did away with restrictions on stocks with the merchants.

The increased excise duties have hard hit all the mills, and, in particular, the medium-sized mills situated in the mofussil which manufacture coarse and medium varieties. The coarse and medium varieties of cloth account for about 80 per cent. of the total consumption of the country. In most cases, it was the mills who have had to bear the major portion of the increased duties, and the ruling prices are back to the December 1955/January 1956 level.

Of the 13 cotton mills which are members of the Federation of Gujarat Mills and Industries, Baroda, the percentage of gross profit (before tax and depreciation) to total sales was less than 5 in the case of five mills, less than 7 in the case of two mills, 10 in the case of one mill, 12 in the case of four mills and 15 in the case of one mill. There were no mills that reported more than 15 per cent. It will be seen that no mills have earned more than 15 per cent. of the total sales as gross profit, and the majority of the mills have earned less than 10 per cent. This is no profiteering.

The incidence of excise duty at the increased level cannot be borne by all the mills alike, and many of the mills who have earned meagre profits ranging between Rs. 5 to Rs. 7 lakhs in 1955 will be in the minus group so far as 1956 is concerned. Mopping up of excess profits is justifiable but it should be dependent upon the profit-earning capacity of the mills. Mills in the mofussil, and mills in the coarse and medium groups do not have the same earning capacity as the urban mills which are well established and which do not have to incur heavy overheads.

An element of injustice is introduced in the incidence of excise duty which all the mills have to bear without distinction whatsoever between the groups of mills in the higher earning and the lower earning categories. After all, the lower earning group of mills also do contribute to the production of the industry and their existence also has to be preserved. Just as the uneconomic handloom industry merits consideration and all the help—fiscal and technical—so also the uneconomic or marginal units in the mill industry deserve a part of the same consideration, if not the whole. Excise duty is an indirect tax which falls on all the units alike, and it would be more considerate and there would be more justice, if the surplus profits which the Government wants to mop up is taxed by way of direct taxes.

The Finance Minister had declared that he would consider making necessary adjustments in the excise duty if prices indicated a downward trend. The prices have already receded and have gone back to the pre-January 1956 level, and the case for the revision of the duty seems evident.

DIVERGENT VIEWS EXPRESSED OVER FREE TRADE AREA SCHEME

FAILURES IN TEXTILE TRADE LAST YEAR

From Our Special Correspondent

Manchester, 22nd January

MANCHESTER LETTER

THOSE Lancashire traders who attended the Cotton Board conference a few months ago came away under no illusions as to the Government's attitude towards the proposed free trade area linking European and British economic interests. Mr. Low, the spokesman on that occasion, clearly favoured the plan and nothing has subsequently transpired to alter the opinions which were then expressed. The latest indications point to the new administration being even more disposed to commit British industry to this important decision.

Among textile traders divergent views must be expected on so controversial an issue. Certain prominent leaders of the Lancashire trade have already given their views on the subject, some of which have been favourable and others equally distrustful of the scheme. The main point at issue appears to be whether Continental textile products will make wider gains in our home market than Lancashire will achieve in Europe. Many observers contend that the cotton and rayon industries will lose on balance, but that other British trades will derive benefit and thereby assist the economic position of the country as a whole.

Among those who take the opportunity each year to assess the trend of events during the past 12 months are the chairmen of the various banks, some of which are closely connected with the textile areas by reason of their geographical locality. In particular, the heads of the District Bank and Williams Deacon's Bank are both themselves directly interested in the cotton trade and, as such, their comments are widely read in Lancashire.

The banking chiefs cannot avoid reference to the vexed question of the European common market, which seems likely to be primary economic topic of 1957. Sir Thomas Barlow, for the District Bank, says: "It seems to me that we cannot ignore the European free market which is now under discussion, even though it may present severe problems to particular industries."

On the same important theme, Sir Eric Carpenter, Chairman of Williams Deacon's Bank, also admits the project is not without its difficulties. "At the same time, we can hardly remain aloof from a scheme which covers one-fifth of both our imports and our exports," he adds. "It seems to me we would be well advised to participate in the framing of the scheme."

The Lancashire textile industry must be prepared to revise its policies to meet changing circumstances, according to the Annual Report of the Board of Directors of the Manchester Chamber of Commerce.

"The cotton and rayon industry is entering a critical phase in its history," said the report. "There will need to be the utmost alertness to the quickly changing pattern of events and a willingness to face adjustments of policies."

Building Hold-up

The credit squeeze has been responsible for a hold-up in building operations on the new mill at Barrow being erected by Sir Elkanah Armitage and Sons, the Manchester textile group.

Mr. P. Gordon Armitage, Chairman, said the Board has been unable to make satisfactory arrangements for financing the main phase of the building project. Treasury consent to borrowing had been received and, in November, it was announced that negotiations were proceeding for a mortgage not exceeding £150,000 on the new building and plant.

"The Directors are greatly concerned by this unforseen delay in carrying into effect the new factory plans which they regard as most important for the future successful conduct of the firm's business," said Mr. Armitage. He added: "It is hoped that present credit restrictions will be relaxed soon and meanwhile the Board will watch the position closely with a view to proceeding with this project as soon as financial conditions are favourable."

Failures in 1956

Cases of financial difficulty encountered by cotton textile firms in Lancashire during the past year have not shown any startling change compared with recent similar periods. The total number of bankruptcies, deeds of arrangement, liquidations and receiverships during 1956 was 99, as compared with 90 in the previous year and 101 in 1954.

Bankruptcies notified numbered six, as compared with none in the previous year, and involved one manufacturing firm and five merchants and agents. One deed of arrangement was drawn up by a doubling firm, there being no similar transaction in 1955. The number of cases of receivers being appointed, however, was only five last year, comprising one manufacturer, one spinning and weaving firm and three merchants and agents, compared with ten in 1955.

For the third year in succession, the number of compulsory company liquidations was six, the 1956 cases involving one manufacturing unit, four merchants and agents and one miscellaneous textile trader. Creditors' voluntary liquidations affected 12 firms, including five manufacturers, one finisher and six merchants. Members' voluntary liquidations rose from 60 to 69, foreshadowing reconstruction, amalgamation or a decision to give up business. Decisions were taken on behalf of 22 manufacturing firms, 29 merchants, seven spinners, five finishers, three weavers, one doubling firm and two miscellaneous traders.

There was a further decline in 1956 in registrations of new limited companies in the industry. The reduction has been most marked since the peak of 236 in 1953 and last year, only 85 new companies were registered, as against 96 in 1955, the nominal capital involved dropping from £642,300 to £498,900. Merchants and agents continued to account for the majority of registrations, numbering 67, as against 69. Seven manufacturing firms, three finishers, one doubling unit and seven miscellaneous traders were also included in the list.

Australian Quota

Any change in the circumstances affecting trade with Australia—still Lancashire's largest single outlet for cotton yarn and cloth—must cause local traders to watch the position closely. Variations in import quotas during the past few years have caused considerable dislocation of output and resulted in shippers being left with frustrated exports.

A shortage of cloth for making-up purposes in Australia has now brought a relaxation in the restrictions which has been welcomed in Lancashire as giving merchants the opportunity to regain some lost ground. Manufacturers' quotas of textiles are being increased by 60 per cent. over the allocations of July last year and other traders' textile quotas are being increased by 20 per cent.

Such a move at a time when Lancashire's export trade remains so unmistakably in the doldrums must cause optimism but there are other factors in the situation which are not entirely favourable. The more promising outlook may well be outweighed by the adverse possibilities inherent in the recently-concluded trade agreement between the United Kingdom and Australia which threatens to undermine Lancashire's important textile trade in cotton yarn.

Under the terms of this pact, Australia can reduce the preferential tariff enjoyed by this country over a large number of manufactured goods. Although there is no sign of any immediate action, the possibility exists that in the future British products may have to face very considerable competition from Eastern yarns, especially those made in Japan.

Production Census

Preliminary details of the latest census of production, now issued by the British Board of Trade, indicate that textiles as a whole, and the cotton industry in particular, lost further ground between 1951 and 1955. Gross output of textiles, representing the total value of goods made and work done for customers, declined from £2,460 million in 1951 to £2,056 million in 1955. On this basis textiles, as a group, took fifth place in 1955, whereas four years previously they were second only to the food, drink and tobacco trades. In the interim, the value of output of engineering, shipbuilding and electrical products, metal manufacture and building and contracting overtook textile production.

Considering the state of the textile trades during the period, the survey shows that capital expenditure had not decreased. The amount spent on plant, machinery and vehicles was £51,000 000 in 1955, as against £46,600,000 in 1951. In addition, new building work accounted for £13,800,000 in 1955, as against £9,600,000.—*All Rights Reserved.*

RAISING OILSEEDS PRODUCTION

STRESS LAID ON INTENSIVE CULTIVATION

IT is but appropriate that the question of achieving the targets fixed for oilseeds in the second Plan period should have figured prominently in the deliberations of the tenth annual general and the eighteenth ordinary meeting of the Indian Central Oilseeds Committee, held at Hyderabad on 25th January. It is well known that oilseeds play a vital role in the economy of India adding, as they do, to the foreign exchange resources of the country at the rate of about Rs. 25 crores every year. The estimated value of the produce from the five major oilseed crops in India during 1955-56 was Rs. 343.4 crores; and the value of oil from these oilseeds amounted to Rs. 184.9 crores in the same year. India is also the largest producer of groundnuts in the world, accounting for no less than 3.4 million tons, or nearly one-third of the total production. One depressing factor, however, is the yield per acre, which is only 639 lbs., as compared with 1,519 lbs. in China, and 887 lbs. in the U.S.A.

Viewed in this light, there is not only special force but also significance in its timing in the view expressed by Dr. Randhawa, Chairman, Indian Central Oilseeds Committee, in the course of his address, that targets fixed for the second Plan, namely, 7.6 million tons by 1960-61 —an increase of 2 million tons over the 1955-56 level—should be achieved only through intensive methods of cultivation and scientific practices similar to the Japanese method of paddy cultivation. Apart from the fact that the yield per acre of oilseeds in India is one of the lowest in the world and can be improved substantially through better and more scientific methods of cultivation, there is also the inescapable situation that the area under cultivation cannot be increased indefinitely when the demands for production of other crops, especially food, are so pressing. It should be noted that the area under cultivation of oilseeds has increased in the first Plan period itself by 3 million acres, from 26.5 million acres to 29.5 million acres, and accounts for about 9 per cent. of the total area under agricultural crops in India. Although the area under cultivation has gone up during the first Plan period by 11.3 per cent. the production has increased from 5.076 million tons to 5.596 million tons, or about 10 per cent. This reveals that the yield per acre has not increased at all. There is thus wide scope for increasing the yield per acre and it is not merely desirable that it should be exploited, but it is also inevitable, if the targets fixed for the ensuing five years are to be achieved.

New Schemes

The deliberations and some of the decisions taken at the meeting of the Indian Central Oilseeds Committee are of particular relevance in this context. Worthy of special mention in this regard is the sanctioning of seven new schemes which include the intensive breeding of sesamum in Madras State, research on sesamum in Kerala State and trial of improved groundnut and sesamum varieties in the same State. The scheme for crop competitions in West Bengal and Rajasthan, designed to provide certain measure of incentive for higher production, was also approved. In addition, a scheme for research on anatomical and morphological studies of fruits and seeds of some crucifers at Meerut College and another for production of hybrid castor and for evolving short-duration high-yield castor strains in Madras were also approved.

Yet another important outcome was the sanctioning of new extension schemes in different States. These are in addition to 11 schemes on agricultural research. But it should be noted that no amount of research is likely to be useful, if it is not coupled with extension work. A notable step taken by the Committee towards promoting research was the decision to meet all the recurring expenditure in respect of new agricultural research schemes, hitherto met by the State Governments. The Committee also approved the establishment of 17 composite Regional Research Stations for cotton, oilseeds and millets. Of these stations, research work on oilseeds will be taken up in five main stations and four sub-stations.

The cultivation of castor also figured prominently at the meeting. The Committee noted that castor stems could be advantageously used in the manufacture of wrapping paper and has done well to emphasise the need for cultivating castor along irrigational channels, and as border crop in the Community Project areas. Much, however, rests with the State Governments which are as a rule slow in propagating new practices among farmers.

Fruits of Research

Of particular importance to the dissemination of the fruits of research and of new techniques is the recommendation of the Committee for the compilation of information regarding improved strains of seed, with particular reference to their morphological and economic character. To the same class also belongs the decision to produce documentary films on groundnuts and castor. The emphasis laid by the Committee on promoting intensive cultivation of groundnut on lines similar to the Japanese method of paddy cultivation should be welcome, for the reason that the method has already proved successful in the country.

Certain notable decisions related to the technological side also. The Committee approved nine research schemes, besides the extension of certain schemes, for the study of new anti-oxidants related to plant pigments at the Chemistry Department of the Delhi University. The new projects include a scheme for pilot plant studies of the optimum conditions for groundnut milling at the Oil Technological Institute, Anantapur; for preparation of useful chemical from castoroil at the National Chemical Laboratory, Poona; for research on storage of seed and cake of groundnut in Madras State; for the manufacture of edible proteins from commercial oilcakes at the Central Food Technological Institute, Mysore; and for the preparation of activated carbon for bleaching purposes from shells of *neem* and *mahua* at the Harcourt Butler Technological Institute, Kanpur.

It is needless to add that the success of the Plan for stepping up production of oilseeds hinges on the progress that will be made by these research and extension schemes in the months ahead. It is likely that substantial improvements may not be felt immediately for, in the nature of things, the process of research, extension and propagation of the results of research takes a long time. It is from this angle that the need for quick action on the part of the States and Extension Departments must be underlined, especially as the targets fixed for oilseeds are to be attained through intensive methods of cultivation and not through allocation of additional land.

GROUNDNUT CROP

The All-India second estimate of groundnut, 1956-57, puts the current year's area and production at 11,299,000 acres and 3,559,000 tons (of nuts in shell) as against 10,968,000 acres and 3,372,000 tons for 1955-56. This shows an increase of 331,000 acres or 3.0 per cent. in area and 187,000 tons or 5.5 per cent. in production during the current year, as compared with last year. The increase in acreage during the current year is reported to have occurred mainly in Bombay, Mysore and Andhra Pradesh and, to a smaller extent, by Madhya Pradesh, Madras, the Punjab and Uttar Pradesh and is attributed generally to favourable climatic conditions at sowing time.

The increase in production is stated to have been shared mainly by Bombay, Andhra Pradesh and Mysore and, to a lesser extent, by Madras, Madhya Pradesh and the Punjab. The increase in production is attributed partly to increase in acreage and partly to timely rains during the growing period of the crop.

This estimate covers the period generally up to the end of September or the beginning of October 1956. Till then, the condition of the crop was reported to be, on the whole, satisfactory except in parts of Andhra Pradesh, Bombay, Rajasthan and Madhya Pradesh where it was affected by heavy and continuous rains during July-August 1956. In parts of Kurnool district of Andhra Pradesh, the crop was reported to have been attacked by pests. The estimate, however, does not cover the entire area sown to the crop during 1956-57. Past experience has shown that the area at the second estimate stage forms roughly about 84 per cent. of the area under the crop finally reported.

It will be noted that the information given in this estimate relates to the set-up of States after their reorganisation on 1st November 1956.

Britain's textile industry will stage its biggest trade show of the year—and the biggest of its type in the world—from 4th to 8th March. The British Textile Show will embrace four separate trade fairs—the National Men's and Boys' Trade Fair; the British Cloth Fair; the National Household Textiles and Soft Furnishings Fair; and the National Carpet and Floor-coverings Trade Fair. More than 500 firms will take part in the show, exhibiting a cross-section of everything that is new in British textiles. The show is being sponsored by six national trade organisations.

The Japanese Government's decision not to conclude a third agreement with the U.S. to re-receive surplus American farm products has now opened the way for resumption of trade talks with Australia. Earlier, Australia had offered to remove discriminatory import barriers against Japanese goods in return for most-favoured-nation treatment by Japan in the purchase of wheat. The former Japanese Minister for Agriculture had vetoed the proposal on the ground that it would interfere with the import of American farm surplus. The recent increase in the foreign exchange position, coupled with two excellent harvests in the past two years, has enabled Japan to dispense with the importation of agricultural commodities on long-term interest-bearing credit, and it is now in a position to purchase food products in cash or on short-term credit.

RUBBER PRODUCTION AT RECORD LEVEL

CONSUMPTION, HOWEVER, HIGHER

THE production of rubber in India during December 1956 amounted to 2,914 tons, as compared with 2,800 tons in the previous month and 2,787 tons in the corresponding period of 1955. It also represented the highest monthly output so far. This brings the total production for the past year to 23,444 tons, an increase of only 926 tons over that for 1955, at 22,482 tons. With this rise during 1956, the rubber production in the country has shown a consistent upward trend since 1953, when it amounted to 21,136 tons, and has reached a record level. What is more, the production has gone up by more than 50 per cent. since 1950.

The consumption during the month under review amounted to 2,647 tons, as against 2,547 tons in the previous month and 2,721 tons in December 1955. The total consumption by manufacturers during the past year was 28,996 tons, having gone up from 27,543 tons in 1955, thus maintaining the upward trend for the fourth year in succession from 21,061 tons in 1952. The gap between consumption and production during the past year was, accordingly, 5,552 tons, such having widened from 1,237 tons in 1953. As against this, the total quantity of rubber imported during the year amounted to 6,463 tons, while the imports during the previous year aggregated no more than 3,839 tons. It, however, fell short of 6,921 tons imported in 1951.

The stocks with estates, dealers and manufacturers as on 31st December 1956 amounted to 8,311 tons, having risen from 7,454 tons at the end of 1955, thus reversing the downward trend noted since 1952, when the closing stocks were as high as 10,351 tons.

The following table shows, at a glance, the progress of raw rubber production since 1950 and how far it has been able to meet the internal requirements:

(In tons)

	Production	*Imports*	*Consumption*	*Stocks*
1950 ...	15,599	1,082	17,735	6,281
1951 ...	17,148	6,921	22,427	7,779
1952 ...	21,863	3,851	21,061	10,351
1953 ...	21,136	272	22,373	9,221
1954 ...	21,493	3,371	25,487	8,687
1955 ...	22,482	3,839	27,543	7,454
1956 ...	23,444	6,463	28,996	8,311

The widening gap between production and consumption, consequent on the quickening pace of consumption, is expected to increase progressively. The target of consumption at the end of the second Plan period is estimated at 40,000 tons. This quantity, of course, includes reclaimed and synthetic rubber also. Nevertheless, the shortfall in production as compared with consumption will continue for some years to come, as the replanting scheme sanctioned by the Government of India, covering 70,000 acres, will be spread over a period of ten years, commencing from 1957. The production of rubber, as a result of this programme, is expected to go up to 36,600 tons by 1974. Further expansion in production is also expected by the extension of cultivation to new areas. In all, about 40,000 tons of raw rubber are expected to be produced by 1974, whereas consumption is expected to reach that level, as indicated above, thirteen years earlier, that is, in 1960-61. It is, therefore, clear that, for many years to come, India has to depend on imported rubber, unless the proposed synthetic rubber plant, with a capacity of 15,000 to 20,000 tons, fills the gap.

The Rubber Board is seized of the problem of meeting the shortage, but it has, curiously enough, not made any specific recommendation to the Government of India on the quantity of rubber to be imported in 1957. It has, however, decided to place before the Government facts and figures about production and consumption and leave it to the latter to decide the quantum of imports. According to the Board, the quantity of rubber (including synthetic imported) that is expected to be available in 1957 is 39,713 tons and reclaimed rubber will be of the order of 782 tons. The production of raw rubber is expected to go up to a record level of 27,000 tons during the current year. The Board's estimate of total consumption and carry forward of natural and synthetic rubber is 53,444 tons and of reclaimed rubber 6,640 tons. Whatever be the quantity of natural and synthetic rubber that the Government permits to be imported, the Board has recommended, it may be divided between the first and second half of 1957 in the ratio of 65:35, because, during the first six months, usually the tapping of rubber is very much less. It has further recommended that manufacturers may be allowed to import on *pro-rata* basis of their consumption during 1956. The Board is in favour of import against D.R.C. of exported goods. It wants the manufacturers to continue to pay the difference between the landed cost of imported natural rubber and that of indigenous rubber to the Board's pool fund, this condition being imposed while granting import licences. This is no new condition; it was introduced in the latter half of 1956 and the Board is said to have received so far about Rs. 2 lakhs on this account. It is, however, doubtful whether any worthwhile sum can be collected on this account during the current half-year, on account of the recent rise in prices abroad.

The Rubber Board has requested the Government of India to expedite its decision on the Board's proposal to grant loan for new planting. The scheme for replanting sponsored by the Board is said to have received very good response from the growers, applications having been received for replanting 8,500 acres during the current year, as against the targeted area of 7,000 acres.

The Board is of the view that the minimum wages having been in force for nearly five years, the time has now come for re-examining the position, with a view to assessing the fair wages for rubber estate workers.

WORLD RUBBER

The world rubber market is faced with an uncertain outlook for consumption of natural rubber, although at present prices rule somewhat steady, the latest spot quotation in London being 2s. 3¼d. per lb., as against 2s. 2¾d. a week before, to which level it had declined from 2s. 8d. early in January. The present steady tone is said to be due to a relatively tight position for R.S.S. 1 for January shipment in Singapore, where a number of dealers have oversold, as also due to covering by Dutch dealers against sales to Russian buyers.

Consumption in Europe is expected to decline in the next two months and the strength of the market is, therefore, mainly dependent on the support from America and Russia. Trading in New York has, however, been far from active, as dealers are inclined to scale down their earlier estimates, with the accumulation of unsold new cars at the end of 1956 to the extent of 550,000, an increase of 300,000 in the last two months. It is, therefore, considered more prudent to revise the estimate of car production to 6.2 to 6.5 million, as against the previous figure of 6.5 to 7 million.

Russia, on the other hand, is said to be active lately, with an estimated purchase of 1,000 tons per week, but this business is not being done in London, as the Liverpool dockers are refusing to handle the rubber meant to be shipped to Russia and about 10,000 tons out of the earlier purchases are stated to be held up at Liverpool. The general expectation, therefore, is that rubber prices will react soon unless American or Russian buying picks up.

Consumption of rubber in the U.S. during 1956 amounted to 1,437,762 tons, having dwindled from 1,529,700 tons in the previous year, the share of natural rubber being 562,249 tons, as compared with 634,800 tons in 1955, and that of synthetic 875,513 tons, as against 894,899 tons.

Exports of rubber latex from Malaya during the past year showed a decline of 14.5 per cent., at 92,181 tons, the lowest since 1953. This recession reflected the reduced output of the American automobile industry and the consequent fall in demand for foam rubber. Among the other factors which were responsible for the decline in exports was the 10 per cent. premium which latex commanded over sheet rubber, thus rendering the former less attractive. The U.S. purchased 27,605 tons, a drop of about 39 per cent. The U.K.'s imports fell from 31,127 tons to 26,282 tons, owing to credit squeeze and the tightening of hire-purchase regulations. West Germany's purchases, however, rose from 7,103 tons to 9,320 tons, France's from 4,965 tons to 6,027 tons and Japan's from 3,230 tons to 5,428 tons.

FOREIGN TEA ESTATES IN CEYLON

The Minister for Food and Agriculture, Ceylon, is reported to have recommended to the Cabinet the nationalisation of all foreign-owned tea estates in Ceylon, paying a compensation at the rate of Rs. 925 per acre. On this basis, the amount required to pay compensation is estimated at Rs. 24 crores. He is also said to have suggested that the payment of compensation should be spread over a period of four years. The report claims that foreigners have made a profit of Rs. 6 crores from tea estates in the Island during the past ten years. The Minister has further suggested, it is said, that a special tax of 5½ cents per lb. should be levied on every pound of tea exported to finance payment of compensation to the owners.

RAW JUTE SUPPLIES

PAKISTAN'S CROP FALLS SHORT

JUDGED from the latest statistics of raw jute and mesta, the jute mills in India do not seem to be assured of a very comfortable supply position in respect of its raw materials, though the prospect cannot be said to be discouraging. As already mentioned in these columns, the all-India final estimate of jute crop for 1956-57 is 4.22 million bales, as against 4.14 million bales for 1955-56. The second estimate of mesta crop for the current season places the production at 1.43 million bales, as against the adjusted second estimate of 1.10 million bales for 1955-56, thus showing an increase of 329,000 bales or 29.9 per cent. over last year.

Accordingly, the total supplies of raw materials from India alone will be of the order of 5.65 million bales. In addition to this, there will be import of jute from Pakistan under the recent trade agreement. Up to the end of December arrivals of raw jute from East Pakistan amounted to 375,000 bales. The mills had at the beginning of the season stocks amounting to 1.02 million bales. As against these supplies, the consumption by mills at the current rate of operation is estimated at 6.2 million bales. it must, however, be noted that a large quantity of mesta crop is not available to the mills, as it is consumed locally. The total domestic consumption of jute and mesta by manufacturers other than mills during the current season is estimated at 200,000 bales while the stocks (other than those held by mills) brought forward from the previous season aggregated 247,000 bales.

Consumption

The consumption of raw jute by mills reporting to the I.J.M.A. during the half-year ended 31st December 1956 amounted to 3.02 million bales, as compared with 3.03 million bales in the corresponding period of 1955 and 6.34 million bales in the whole of 1955-56. Receipts by mills during the six months aggregated 3.31 million bales, as against 3.17 million bales in the corresponding period of 1955. Arrivals of Indian jute in July-December 1956 were of the order of 2.94 million bales (as against 2.39 million bales) and those from Pakistan 371,300 bales, as compared with 774,500 bales in July-December 1955. In the earlier months of the season, arrivals fell very much short of consumption, but it was only from October onwards that they tended to exceed consumption, with an increase in arrivals and a decline in consumption following the re-sealing of the looms in September. Over the six months to December, the arrivals exceeded consumption by 292,000 bales.

The fairly comfortable supply position depends, to a large extent, on further imports from Pakistan, but the prospect does not seem to be very assuring. For the third and final official estimate of jute crop for the 1956-57 season places the Pakistan crop at only 5.51 million bales, as against the earlier estimate of 5.5 to 6 million bales. It appears that flood caused more damage to crop this season than was anticipated earlier. This will mean that production in Pakistan will be less than that (5.59 million bales) yielded in 1955-56. Past experience shows that the Pakistan official estimate of jute crop must be taken with a pinch of salt, for, in order to boost the price of the commodity, the authorities of the country are prone to underestimate the size of the crop. It will not, therefore, be surprising if the actual crop happens to be higher than the official estimate.

It will be recalled that Pakistan supplied to India during 1955-56 1.47 million bales. If imports are maintained at this level during the current season, the mills can enjoy a fairly comfortable supply position. But this means that Pakistan will have to step up its exports of raw jute to India very considerably during the current half-year, as its despatches in the first half declined by over 50 per cent. Since this is too large a leeway to be made up, it seems that the prospects of supply position of raw jute getting tight in the coming months of the current season cannot be completely ruled out. It is true that, at the time of writing, the trend of the raw jute market is a shade easy, but this is due mainly to a similar trend in the manufactures section induced by lack of fresh orders.

ROLE OF NON-FERROUS METALS IN INDIAN ECONOMY

MR. M. M. SHAH REVIEWS POSITION AND PROSPECTS

ALTHOUGH India is endowed with large reserves of iron and steel, it is somewhat deficient in the supply of non-ferrous metals, except ores bearing aluminium. There is no need to be surprised at this position nor is there any reason to deplore it, for there are few countries in the world which are naturally endowed with reserves of all metals. All that the position calls for is that efforts should not be relaxed in the sphere of prospecting for fresh deposits of non-ferrous metals and that, simultaneously with continuing these efforts, imports of ores should be liberally permitted, so as to enable the non-ferrous fabricating industry to get the raw material it needs. These considerations were succinctly brought out by Mr. M. M. Shah, the Union Minister of Heavy Industries, in the course of his speech at the recent meeting of the Development Council for Non-ferrous Metals which he inaugurated.

Theoretically, all metals, other than iron and steel, are classified as non-ferrous metals. In practice, however, the non-ferrous metals group chiefly includes copper, lead, tin and zinc (also called major base metals), aluminium, magnesium and titanium (called light metals) and such "minor" metals as manganese, chromium, nickel, antimony, tungsten, cobalt, molybdenum, and vanadium. From the foreign trade figures of five principal non-ferrous metals (in all forms), namely, aluminium, copper, lead, tin and zinc, it would appear that India has been importing these metals to the value of Rs. 20 crores to Rs. 25 crores every year. With the development in engineering, chemical and other consuming industries, contemplated in the second Plan period, India's consumption of non-ferrous metals is expected to increase substantially. It is thus estimated that, in 1960-61, India would need imports of the value of Rs. 41 crores. The wide gap that exists between domestic supply and demand will be evident from the fact that, in 1955-56, Indian production of non-ferrous metals was of the order of only Rs. 6 crores.

In the two following tables, the first gives the imports of the principal non-ferrous metals in 1953-54, 1954-55 and 1955-56, while the second gives the trend in domestic production of these metals:

Imports

(Quantity in tons. Value in crores of Rs.)

Metal in all forms	1953-54		1954-55		1955-56	
	Quantity	Value	Quantity	Value	Quantity	Value
Aluminium ..	5,455	1.81	12,380	3.60	15,805	4.77
Copper ..	8,532	2.71	28,979	8.74	18,122	8.71
Lead ..	7,422	0.98	10,177	1.42	13,274	2.07
Tin ..	3,147	2.90	3,935	3.82	3,923	3.58
Zinc ..	29,778	3.59	44,493	5.29	29,071	4.15
Total ..	54,334	11.97	97,964	22.87	80,195	23.28

N.B.—Imports of antimony in 1953, 1954 and 1955 were 4.2 tons, 54.7 tons and 30.15 tons, respectively.

Production

(In tons)

Metal	1953-54	1954-55	1955-56
Aluminium	3,647	5,476	7,333
Copper	5,640	7,181	7,455
Lead	1,845	1,881	2,143
Zinc			12,000*
Tin	*Nil*	*Nil*	*Nil*
Antimony	130†	508†	504†

* Estimated output in 1957.
† Production refers to earlier calendar year.

India, as stated at the outset, is well endowed only with reserves of aluminium ore, whereas its known reserves of other non-ferrous metals are somewhat limited. The following gives an account of known reserves of different non-ferrous metals in India.

Deposits of Non-ferrous Metal Ores

Bauxite

Bauxite deposits are known to occur in Bihar, Orissa, Madhya Pradesh, Bombay, Madras, Mysore and Kashmir. The total reserves of bauxite of all grades from all the deposits in the various parts of the country are roughly estimated at about 250 million tons.

Bihar: The most important deposits in this State are situated in Ranchi and Palamau districts of Bihar. The reserves of high grade ore containing about 50 per cent. Al_2O_3 in this area are estimated at about 10 million tons.

Orissa: Although some bauxite deposits occur in Kalahandi and Sambalpur districts of the State, the total reserves of quality suitable for aluminium manufacture are estimated at less than 4 lakh tons.

Madhya Pradesh: Next to Bihar, Madhya Pradesh contains the most extensive deposits of bauxite in Surguja, Raigarh and Bilaspur region, Balaghat and Katni areas in Jabalpur district. The total reserves of bauxite of grades suitable for manufacture of aluminium metal in this State are estimated at about 7 million tons.

Bombay: The most important deposits of bauxite in this State are in Kolhapur and Halar district in Saurashtra. It was reported that reserves in these areas may be more than 10 million tons, although no detailed prospecting and proving of these deposits appear to have been carried out as yet.

Madras: The important deposit of bauxite in this State is situated in Shevaroy hills in the Salem district. The total reserves of all grades of bauxite in this region are estimated at 7 million tons while the grade suitable for manufacture of aluminium are estimated at about 2 million tons.

Mysore: Some minor deposits of bauxite occur in Baba Budan hills in the State. Bauxite deposit in the Belgaum region, which now is in this State, is estimated to contain about 7 lakh tons.

Kashmir: It has been estimated that about 2 million tons of bauxite are available in Poonch and Riasi areas of Kashmir State. However, these deposits are entirely diasporic in nature and are very refractory and not easily soluble in caustic soda. It may therefore be difficult to process this bauxite by Bayer process to manufacture alumina.

Copper Ore

The most important ore of copper is chalkopyrite which occurs in the copper belt of Singhbhum district in Bihar. The proved reserves of copper ore of the area which is worked by the Indian Copper Corporation is estimated at 3.3 million tons with an average copper content of 2 per cent. The company is engaged in more development work and it is hoped that more reserves of ore will be proved in the near future. Other important regions where occurrence of copper ore has been reported are Sikkim, Garhwal, Rajasthan and Andhra Pradesh.

Sikkim: Best known deposit in this region is Bhotang near Rangpo; some 16 miles from the nearest railway. At the Bhotang mine there is lode of 10' to 15' thick containing ore on an average tenor of 3 to 4 per cent. copper. Several other prospective regions exist, namely, Dikchu, Rhotok, Sirbong, Sisni, Jugdum, etc. As these areas have not been systematically prospected no reliable estimate of the ore reserve is available. In the Garhwal district of U.P. there are ore workings at Dhanpur and Pokhri. Little information is, however, available about the reserves as no prospecting in a systematic manner has been done so far.

Rajasthan: The Khetri deposits in Jaipur State, Rajasthan, are marked by numerous workings which are about 10 centuries old. No estimate of the reserves are available as systematic test-drilling has not been carried out so far. A recent examination by the Geological Survey indicated that ancient mining was extensive and has reached in places at a depth of 300 feet from the outcrops. There are indications that there are some rich lodes which, however, require detailed investigation by diamond drilling, to prove the extent of the deposit. Another deposit of some importance in this State is found at Dariba in Alwar State, about 20 miles from Rajgarh station. Here also there are extensive old workings. But no estimate of reserves is available as detailed prospecting and drilling has still to be carried out.

Andhra Pradesh: There are two prospective areas in this State which require systematic prospecting. These are Agmigundala, 9 miles north of Vinukonda in Guntur district and Gani in the Kurnool district. Here also, no estimate of reserves is available; detailed test drilling has still to be carried out.

Lead and Zinc Ore

The only important ore deposit for lead and zinc is Zawar mines near Udaipur in Rajasthan. There are five hills in this area where the occurrence of ore deposit has been reported. At present, deposit in the one hill is being exploited by the Metal Corporation of India Ltd. According to the recent estimate of the above firm, the total lead-zinc ore is at least 3.2 million tons. As the development work is carried out in the remaining hills, it is likely that more reserves will be proved.

Occurrence of Galina, which is the ore for lead, has been recorded in Hazaribagh in Bihar, Durg, Datia and Gwalior in Madhya Pradesh. However, no detailed prospecting has been carried out and therefore no estimates of reserves are available.

Tin

Small deposits of tin have come to light in the State of Bihar at a few places in Gaya and Hazaribagh districts. Pits were sunk several decades ago at Narungo to a depth of 600 feet but the tin values are stated to have decreased with depth and the deposits were not considered an economic proposition. Small amounts of cassiterite (tin ore) are found associated with granite and pegmatite at Chapatand, Simratal and Chakkar-Bandha. Some work was done a few years ago on this deposit but the operations were not profitable. It may be stated that the deposits known so far have not yielded sufficiently encouraging results.

India's known reserves of bauxite ores are, as noted above, estimated at 250 million tons. Out of these, it is estimated that about 27 million tons are of high grade. With the aid of modern technological processes, it may be possible to work even low-grade ores in course of time. The known estimates of 250 million tons of bauxite would then enable a production of 40 to 50 million tons of aluminium metal. The installed capacity for aluminium is at present sufficient to produce only 7,500 tons a year. The quantum of demand for the metal has been increasing. In 1954-55 it was 17,856 tons and in 1955-56 it was 23,138 tons and, by the end of the second Plan, it is expected to go up to 35,000-40,000 tons. Referring to these estimates, Mr. Shah said:

"From these figures, it will be observed that there is a large gap between the installed capacity and the demand and, therefore, as you are already aware, a target of production of 30,000 tons has been fixed to be achieved by the end of the second Plan period. I would, however, mention that this is the minimum and may be suitably revised in the light of increasing demand which may develop during these years. To achieve the production capacity of 30,000 tons per year, two licences have already been issued, one for installation of a new unit of 10,000 tons at Hirakud and another for expansion of existing unit to 5,000 tons per annum. This will bring the capacity to 20,000 tons. Further, in order to establish on modern scientific lines, the balance of the target, a committee of experts for aluminium industry was constituted for advising the Government, *inter alia*, on the suitable site or sites of new aluminium smelters and the minimum economic size of such smelters. The committee has recommended that two smelters of 10,000 tons capacity each should be established at suitable sites, provided with facilities for expansion to 20,000 tons in due course as soon as possible and has indicated that Mettur and Rihand dam area appear to be very suitable sites. It is expected that one of the 10,000 smelters will come into operation during the second Plan period while the other might come into production during the early stage of the third Plan period."

As regards copper, one of the oldest known metals, the gap between demand (25,000 to 30,000 tons) and domestic production (about 7,200 tons) is also a wide one. The demand for copper is made up of: electrical cable and wire 12,000 to 15,000 tons; utensils 8,000 tons; and defence, and railways and miscellaneous requirements 5,000 to 7,000 tons. Electrical industries are thus the major consumer of copper. The demand of this industry for high conductivity electrolytic copper has to be met from imports, as copper produced in the country is of fire-refined variety and does not conform to specifications laid down for high conductivity copper. The Indian Copper Corporation which is the only producer of copper in India, has a scheme for the installation of an electrolytic copper refinery. The Government has also received a few other schemes of a similar character. The main problem facing the copper industry, according to Mr. Shah, is the "proving of existing deposits and/or locating of new workable ores." If sufficient reserves are available, there will be scope for setting up a plant with a capacity of 10,000 tons per annum. From all available information, the most promising site is near Khetri deposits in Rajasthan.

Lead

The present production of lead in the country is about 2,400 tons per year. The major producer is the Metal Corporation of India Ltd. But demand is now running at the annual rate of 10,000 to 12,000 tons; it is expected to go up to 20,000 tons per annum at the end of the second Five-year Plan. Steps are being taken by the existing producer to expand the mining and ore dressing facilities. It is expected that, by the end of 1957, they will be operating their lead smelter at an annual capacity of 6,000 tons of lead. The allied non-ferrous metal ore, the zinc ore—zinc and lead occur as mixed ores—is also being worked by the Metal Corporation of India Ltd. No zinc is being produced in the country. Zinc concentrates are being exported and recovered zinc imported. India's annual production of zinc concentrates containing about 50 to 54 per cent. zinc is of the order of 6,800 tons. The Corporation is, however, installing more equipment and is expected to treat about 500 tons of ore per day. The production of zinc concentrate during the current year is likely to be some 12,000 tons. India's present demand for zinc is of the order of 35,000 to 40,000 tons. By 1960-61, it is likely to go up to 50,000 tons.

In view of the increasing importance of zinc metal, a committee of experts, known as Zinc Committee, was constituted to go into the question of establishment of a zinc smelter based on the supply of zinc ores from Zawar deposits. The committee has reported that India should have proved reserves of ores to mine continuously upto the extent of 1,000 tons per day for a reasonable number of years in order to be able to establish and feed the smelter of an economic size. The Metal Corporation of India Ltd. are

NEW PRODUCTS AND PROCESSES

Electric Watch

THE Hamilton Watch Company claims to be the first to market an electric wrist-watch, powered by a 1½-volt battery which releases energy through a coil of fine wire fixed on a balance wheel. Two magnets are placed on either side of the wheel. The interaction of the battery energy with the magnetic field causes the balance wheel to oscillate, controlling the movement of the hands within 99.995 per cent. of accuracy, according to the watch manufacturer. Hamilton says it has been working for ten years on the perfection of the electric watch, which has now been brought to the commercial stage. It has been put on sale on a test basis in a number of cities at a retail price of $175. In a few weeks, an $89.50 model is expected to be on the market. The electric wrist-watch is being offered with a 12-month guarantee on the battery, although an anticipated life of about 18 months is suggested by Hamilton. The batteries are being made by Union Carbide and Carbon, and will be on sale at jewellers and other outlets for $2. One advantage of an electric watch is said to be that it does not run down when removed from the wrist, as a standard watch tends to do. Although Hamilton Watch is the first in the field with an electric watch, several other U.S. manufacturers, and the Swiss watch industry, are also developing them. The Elgin National Watch Company and Bulova Watch Company are known to be experimenting with "electronic" watches. While the electric watch does away with the mainspring, an electronic watch would eliminate such standard features as the balance wheel.

Traffic Control

Helicopters are the latest device to be called into service in an attempt to solve traffic congestion in New York City. Officials of the city's Transit Authority recently took to helicopters to carry out an aerial survey of bus operations in the five boroughs of New York. During the flight, the officials maintained constant two-way radio contact with cruising patrol cars, to whom they relayed details of traffic congestion. After the flight, they said that from a helicopter it was easy to spot traffic jams and their causes. The General Manager of the Transit Authority, Mr. Thomas J. McLernon, afterwards discussed how a fleet of six helicopters might be used to help ease traffic congestion. He suggested that these might each patrol an aerial "beat," and maintain constant contact with the 2,200 city buses through a closed circuit radio communications system. The buses could carry luminous numerals painted on their roofs to permit identification. Mr. McLernon said he believed that such a system of inspection could be set up within about a year, involving the purchase of six helicopters at a cost of $65,000 each. The helicopters would be able to re-route buses, or cut short their trips, when congested traffic areas were spotted. Now the Transit Authority plans to carry out a number of other experimental aerial surveys before deciding whether or not to put such an inspection system into effect on a regular basis.

Novel Doors and Pavings

An all-steel entrance door, first on the market in the U.S., has the advantages of resisting shrinking, swelling and warping. It is also completely insulated. Available with it in a kit: a steel frame with factory-applied bronze weather-stripping plus extruded aluminium threshold with built-in vinyl seal. It is being made by Steelcraft Manufacturing Company, Rossmoyne, Ohio, in many styles, trims and colours at prices competitive with doors of other materials. A new cold paving material is being offered to home-owners who would like to pave, or repave, their own driveways, walks, garden paths, etc. Available in 50 and 100 pound bags, the material can be raked over any area, or hole and tamped down with a shovel. Immediately thereafter it is ready for use, and is said to wear like a government-built highway. The manufacturer is Sicilian Asphalt Paving Company, New York. A new process for curved rolling of thin-gauge, channel-ridged, metal sheets without use of cross corrugating or other weakening devices has been developed by the Behlen Manufacturing Company of Columbus, Nebraska U.S.A. Shaped sections for curved industrial roof buildings and other applications are being produced, with costs expected to be considerably reduced.

Molybdenum Greases

Molybdenum disulphide and a modified form of bentonite clay are the base materials of a new series of greases which have been developed for high temperature operation. The greases which are said to be capable of giving efficient lubrication at working pressures of the order of 100,000 lbs. per square inch can, it is claimed, be used in machinery which is operating continuously at temperatures as high as 450 degrees Fahrenheit. Since the molybdenum greases, as they are called, also possess water repellent properties, their lubricating efficiency is not impaired when they are used under wet conditions, or in the presence of high pressure steam. The composition can also be varied to meet special operating conditions, such as exceptionally high temperatures, or applications where petroleum compounds must be avoided, as for example, where engineering requirements entail the greasing of rubber parts.

Quieter Helicopters

Quieter helicopter travel can be expected to result from research that has been carried out recently into methods of reducing the noise inside helicopters. Although the soundproofing of helicopters presents special difficulties owing to the necessarily light weight construction of these aircraft and the restrictions which are imposed on the use of sound deadening materials owing to weight restrictions, considerable success has been achieved by combining a number of special sound reducing techniques. Measurement of the amount of sound heard inside experimental helicopter units has shown, for example, that large reductions in noise can be achieved by altering the design of the fuselage in such a manner that the sound is transmitted along it, and away into the air, exceptionally rapidly. Other experiments have shown that similar significant improvements can be achieved by modifying the engine design. These modifications can, it is claimed, be undertaken without affecting in any way, the performance of the engines.

LLOYDS BANK LIMITED

INCESSANT DEMAND FOR ACCOMMODATION: SIR OLIVER FRANKS'S STATEMENT

THE Annual General Meeting of Lloyds Bank Limited will be held on 15th February 1957 in London.

The following are extracts from the statement by the Chairman, The Rt. Hon. Sir Oliver Franks, G.C.M.G., K.C.B., C.B.E., circulated with the report and accounts for the year 1956:—

"The profit for the year, at £2,541,793, is £219,354 higher than last year and, in conformity with the intention announced in the circular letter to the shareholders dealing with the scheme of capital reorganisation, since carried into effect, we propose a dividend of 13 per cent. per annum, an increase of 1 per cent. compared with 1955. Our business in general continues to expand year by year, as evidenced, for example, by the growth in the number of accounts.

The Credit Squeeze

"Throughout the year, our lending operations have been governed by the principles of the so-called 'credit squeeze' initiated by the Chancellor's appeal for credit restraint originally made in July 1955 and reaffirmed, among other occasions, as recently as November last.

"We continue to give effect to the Chancellor's wishes. In June 1955, our normal advances to domestic customers, falling within the purview of the Chancellor's directives, amounted to £298.5 million. By December last, their total had been reduced to £278.4 million. This contraction masks a substantial increase in our lendings to customers in a group of industries—engineering, iron and steel, shipping and chemicals—whose contribution to exports and to the strength of the economy in general has justified larger borrowings from the banking system.

"These figures, of course, relate only to part of our total business. At each of the dates mentioned, the aggregate figure of loans and overdrafts appearing in our published statements was about £50 million higher than those I have just quoted.

"The margin of £50 million was made up of three special categories of lendings falling outside the scope of the directives. One of these is advances to the nationalised industries. As is well known, finance for these industries is being provided as a temporary measure by the Treasury. Our own lendings have thus fallen substantially and in November last amounted only to about £10 million. For the rest, the margin is accounted for by two other categories of lending, both of which have been expanding during the period of the squeeze.

Eastern Branches

"First, it happens that, alone among the clearing banks, we have a number of branches in three overseas countries, whose figures are included among our balance-sheet totals. These are our 20 offices in India, Pakistan and Burma. The lendings of these Eastern branches naturally fall outside the ambit of the United Kingdom credit squeeze, since these are rupee advances made against rupee deposits. In India especially, with an economy expanding so rapidly, there is an incessant demand for bank accommodation which, owing to tightness of funds, banks do not always find easy to meet to the full. This demand is reflected in our own advances, which show material expansion.

"The increasing business is being handled in a most satisfactory manner by our staff in the East, both European and Asian, and to them I would express our appreciation of their good work.

"The second special category of lendings consists of a relatively new form of accommodation, namely, medium-term credits extended to overseas buyers to enable them to purchase capital equipment manufactured in this country.

"We have made facilities available in this form to assist the export of capital equipment for such projects as power stations, railways, steelworks and hydro-electric schemes overseas, and in some cases this has enabled British manufacturers to secure valuable contracts that would otherwise have gone elsewhere. Among the more important transactions of the kind have been medium-term credits to finance the export of large numbers of civilian jet airliners to dollar markets.

Approach to Monetary Stability

"The 'credit squeeze' is, of course, only one strand in a far wider programme of disinflationary measures. Prior to the crisis in the Middle East, these seemed steadily to be achieving their aim. Indeed, in one most important respect they had already brought satisfactory results, namely, in swinging our balance of payments back from a deficit of £107 million in the second half of 1955 to a surplus of £144 million in the first half of 1956.

"This movement is one more convincing demonstration of the truth that our recurring overseas crises since the war had their origin in an excess of demand at home. The favourable turn in the balance of payments could not have come about but for the disinflationary measures.

The New Phase

"It is clear that the events in the Middle East have opened a completely new phase in our economic affairs. Our long-term problems are unchanged; we still have to maintain the value of sterling and to speed up the rate of accumulation. What has gone is the prospect of a smooth transition to a state of monetary equilibrium in the course of the next few months.

"A new chapter has been opened. At best, we must reckon with an interruption of some months in the advance towards our long-term objectives. Fortunately, American co-operation has been forthcoming in the measures taken to avert some of the more serious possibilities that were at one time feared. We can now count upon a sizable flow of oil across the Atlantic and also upon dollar facilities to help in paying for it. Moreover, the danger to sterling arising out of speculative attacks has been dispelled by the action of the International Monetary Fund, under the leadership of Dr. Per Jacobsson, in making available for use if necessary the whole of our quota.

"The situation we face is a complex one, calling above all for flexibility and resolution. One overriding principle alone is certain: it is that we must seek to emerge from this temporary period of difficulty with our ability to achieve our long-term objectives unimpaired.

"We have to maintain the position of sterling as a world currency, fully viable on the basis of existing rates of exchange. This in turn means that we must maintain and improve our position in export markets. We must also be prepared during the emergency to draw upon the reserves to pay for necessary food and raw materials. Only so can we hope to achieve our second and parallel objective, which is to maintain a high level of production and employment. We must be thankful that the reserves now seem large enough to permit these two objectives to be reconciled—but also resolute to use the respite given to produce a lasting consolidation of the position.

"A great task of reconstruction lies ahead of us. To a very large extent, this task is a political one. We have to restore relationships that have been gravely damaged with many of our overseas friends and allies, above all our relationships with the other members of the Commonwealth and with the United States. These are not subjects which the annual statement of a bank chairman can properly discuss at length. But success in these endeavours so conditions the speed with which we can hope to solve our economic problems that it would be equally inappropriate to end without stressing their paramount importance."

TOWARDS INDUSTRIAL DEMOCRACY

SHOULD WORKERS BE MADE DIRECTORS?

IN recent months, the concept of participation of workers in management has gained more and more adherents and received particular emphasis in discussions on matters of labour policy. Inaugurating the Labour Ministers' Conference, held recently at New Delhi, the Union Labour Minister, Mr. Khandubhai Desai, declared that they had to evolve what he called "industrial democracy" by making the workers "feel the sensation of participation in the management of industry." He stressed that workers must have the feeling that they were not mere wage earners but were part and parcel of industrial production and that they were as important in stature and status as the management itself.

The Planning Commission, on its part, has already emphasised that, for the successful implementation of the Plan, increased association of labour with management is necessary. Such a measure, it has suggested, will help in (a) promoting increased productivity for the general benefit of the enterprise, the employees and the community, (b) giving employees a better understanding of their role in the working of industry and of the process of production, and (c) satisfying the workers' urge for self-expression, thus leading to industrial peace, better relations and increased co-operation. The Industrial Policy Resolution has also stressed that "workers and technicians should, wherever possible, be associated progressively with management."

Since the concept of workers' participation in management has thus received considerable emphasis, the question arises whether such participation should take the form of representation of workers—strictly speaking, their representatives—in the board of directors of the companies in which the workers are employed. In other words, should workers be made directors of the companies with which they are associated? Such a measure would clearly involve fundamental changes in proprietorial rights, blur the distinction between employer and employee and thereby raise certain difficult legal and constitutional issues. Apart from this consideration, there is reason to believe that a section of the workers is itself opposed to representation on the board of directors. This section seems to hold the view that such a change in the workers' status would make a person at once an employer and a worker and thereby reduce labour's bargaining capacity. Further, it does not want to identify itself with the possible faults and imperfections of the management. Again, the method of selecting workers for appointment on the board would cause a great deal of controversy. If the method of selection is adopted, workers may get the feeling that their representatives are being bought by the management. On the other hand, if the method of election is adopted, it might easily become the prelude to the introduction of party politics into the boards of directors, thereby converting the placid board room into a political cock-pit.

Discussing some of the issues arising out of proposals for inclusion of workers' representatives in boards of companies where they are employed, Mr. C. A. R. Crosland, a former labour M.P. in the U.K., in a recent book entitled *The Future of Socialism*, observes:

"We are then left with the proposals relating to the legal position of the workers. First, it is suggested that the workers in a firm should become, if they so choose (and after a minimum length of service), legal members of the company, with the same rights as shareholders to receive financial information, and with some fixed proportion of total voting rights at annual general meetings. This could be achieved by the issue of a special class of non-interest-bearing shares. Secondly, the workers should have the right to elect a proportion of the board. The workers' moral (and logical) claim to such representation is incontrovertible. The trouble is first that they seem to have little desire to exercise it, and, secondly, that such a reform, besides being subject to severe practical difficulties, cannot be guaranteed to produce any real benefit.

"On the first point, the trade unions would be indifferent, if not actually hostile, to the change. They fear the creation of a parallel hierarchy of workers' representatives, neither chosen by nor responsible to themselves, possible rivals for the loyalty of their members, and dangerously likely to interfere in the proper union function of negotiation. These fears may or may not be irrational, but they exist; and it is not easy to press a reform on behalf of the workers which their chosen leaders show no sign of wanting. Nor is there any sign that the rank and file very much want the change. Most of them probably prefer to be left in peace, and not to take on added responsibilities.

"The technical difficulties are manifest enough: the shortage of potential worker-directors of the right calibre—men combining a strong personality, some financial and technical knowledge, and ability in committee work; the danger of divided counsels on the board and a consequent loss of entrepreneurial initiative; the ambivalent relationship of the worker-directors to the unions, especially when wages come to be discussed; the risk that a large number of communists may be elected, bent solely on disruption: and so on.

"The economic effects are harder to assess. There are two issues: the effect on managerial efficiency, and on the supply of capital. The first would depend simply on the quality of the worker-directors, and the way in which they interpreted their duties on the board. The effects on the supply of equity capital can no doubt be exaggerated. The role of the shareholder as a source of new capital is consistently overrated. But we should exert a much more adverse influence on the supply of new capital by causing complete uncertainty such as these changes would create, than by any definite measures of taxation or dividend limitation. Investors would never know what policy a board so constituted, and with a membership possibly changing every year, was likely to pursue.

"There is little reason to expect a gain in contentment or industrial morale. These seem to depend on the quality of local management and supervision, the degree of effective consultation at the point of production, the nature of the wage-bargain, and wider considerations of social equality. None of these will be much affected by the presence of a minority of worker-directors on the central board of large public companies; and the instinctive indifference of the workers to the suggested change is thus perhaps well justified. Indeed, the election of worker-directors might easily become a source of resentment of its own."

It would be difficult to improve upon Mr. Crosland's discussion of the basic issues arising out of proposals for participation of workers in the boards of directors of the companies concerned. It serves to bring into bold relief the many difficulties in the way of implementing such proposals. In this connection, it is well to recall that the Planning Commission itself did not go beyond suggesting the setting up of councils of management, consisting of representatives of management, technicians and workers. It stressed that it should be the responsibility of management to supply such a council of management fair and correct statements of all relevant information which would enable the council to function effectively. The Commission's suggestion is both sensible and practicable. And it reflects no small credit on certain enlightened units of the private sector—notably, the T.I.S.Co. and the Indian Aluminium Co., Ltd.—that they have already translated the spirit of these suggestions into action by setting up suitable consultative machinery. Such procedures deserve to be emulated by other large units in the private sector and also by the enterprises in the public sector.

PRODUCTIVITY OF LABOUR IN THE U.S.S.R.

The growth of the productivity of labour, according to Mr. Y. Ioffe, of the Economic Institute of the State Planning Committee of the U.S.S.R., is the decisive source of increase of production in Russia. The growth of the productivity of labour was responsible for a 51 per cent. increase of industrial output in the first Five-year Plan period and 79 per cent. increase in the second Five-year Plan period. The plan for the development of national economy for the coming five-year period (1956-60) provides for no less than four-fifths of the overall increase of industrial output due to the growth of the productivity of labour and only one-fifth due to the increase of the number of workers. The productivity of labour is expected to go up by 50 per cent. as a result primarily of technical improvement in production.

There are, according to Mr. Ioffe, no barriers for the development of technique in Soviet society. The elimination of manual labour and introduction of machinery, application of the more advanced and perfected technical equipment, of most progressive methods of production, and implementation of the latest technical achievements attained by man—these are the most important and decisive methods of raising the productivity of labour in the U.S.S.R. Mr. Ioffe emphasises that machines not only save much of the workers' labour, but also make it much easier. Arduous manual labour, causing great strain and exhaustion, is now being substituted by the work of the machine. Thus, powerful suction dredges are now used on the Soviet hydro-construction jobs. These are serviced by 10 workers. Each dredge does the work of 35,000 men and 15,000 horses. Hence, each worker's productivity increases several thousand times. Eighteen to 24 working days, depending on the skill and strength of the labourer, are necessary for reaping one hectare of wheat with a sickle and threshing it with a flail. Each combine—and there are hundreds of thousands of them working on the fields of the U.S.S.R.—reaps and threshes one hectare of wheat in 30 minutes.

Experience in the development of Soviet economy shows that the improvement of technical and cultural standards of the workers and peasants is also of great significance for the growth of the productivity of labour. Modern technical equipment is very complicated and becomes more complicated with every year. Only those who know the elements of modern science can master this equipment.

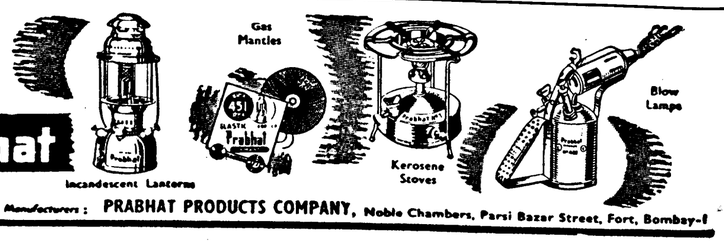
A broad network of various schools, courses, and correspondence, educational system, training scores of millions of persons, is spread all over the country. The people are an eternal source of talents. Over 8,000,000 inventions, technical innovations and production-improving suggestions it is stated, have been made by industry, construction and transport workers only in the last five years. Four and a half million of these have been put into practice. These inventions were a priceless contribution in the matter of raising the productivity of labour.

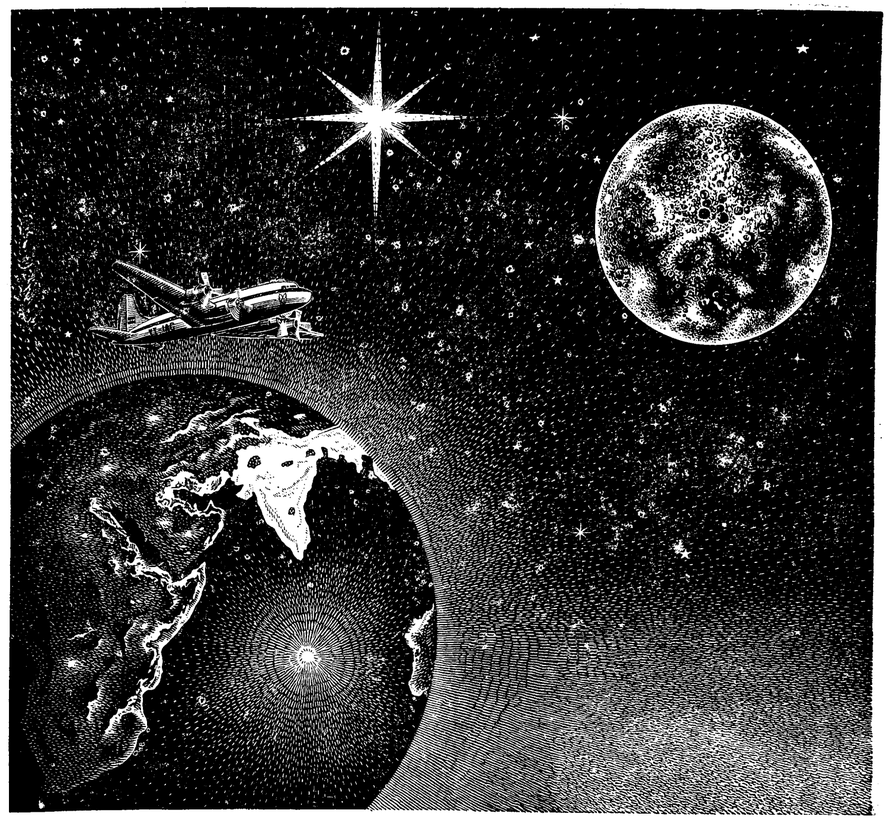
INDUSTRIAL RELATIONS

The index of industrial relations (Base 1939=100) for the manufacturing industry group for November 1956 was 149.8, as compared with 143.3 for the previous month. This index, it may be mentioned here, is computed by taking as 100 the quotient obtained as a result of dividing the estimated number of man-days actually worked by the man-days lost due to industrial disputes in the base year (1939). Only those disputes which result in work stoppage are taken into account in the statistics of industrial disputes. Even here, only disputes involving 10 or more workers are included.

The total time-loss during the month under review was 4¼ lakh man-days, which was lower by about 47.5 per cent. than the figure during October. This was also lower than the monthly average time-loss during 1955 by about 9.0 per cent. Following the reorganisation of States with effect from 1st November 1956, the statistics of industrial disputes for the month relate to the reconstituted States. Among the States, West Bengal recorded the highest time-loss during the month. Next in order came Bombay, Andhra Pradesh and Madras. As compared with the previous month, the time-loss increased in Andhra Pradesh, Assam, Bihar and Punjab whereas it decreased in other States.

The number of fresh disputes arising during November 1956 was 77 and these involved 27,862 workers. The corresponding figures during the previous month were 76 and 49,007 respectively. One hundred and four disputes were current at any time during the month. These involved about 46,000 workers. In the previous month, the number of disputes was 145 and these involved about 112,000 workers. The average duration of disputes current at any time during the month was 9.4 days as against 7.4 days during the previous month. Fourteen of the disputes resulted in lockouts. These involved about 16,000 workers and accounted for a time-loss of nearly 3½ lakhs of man-days. The number of lockouts was highest in West Bengal, namely, 11. Uttar Pradesh and Madras came next with two and one lockout respectively. Eighty-one disputes terminated during November, 1956. Of these, 53 lasted for not more than five days each and only eight lasted for more than 30 days each. The workers achieved complete or partial success in 36 cases. In 24 cases they were unsuccessful. The results were indefinite in 13 and not known in eight cases. The major reasons for these disputes were "wages and allowances" and "personnel." Among the industry groups, the time-loss increased in "electricity, gas, water and sanitary services," and decreased in all other industry groups.





40 round trips to the moon!

In one year IAC flies over 20 million miles—equivalent to 40 round trips to the moon.

LARGEST internal airline in the East, Indian Airlines Corporation links the cities and towns of India — its 132 daily flights covering more than 20 million miles every year, its staff of over nine thousand ever at your service.

The modern world is a world of flight ... and Indian Airlines Corporation is proud of the role it plays in transporting goods and mail, in bringing the people of India ever closer together ... building a stronger, united nation!

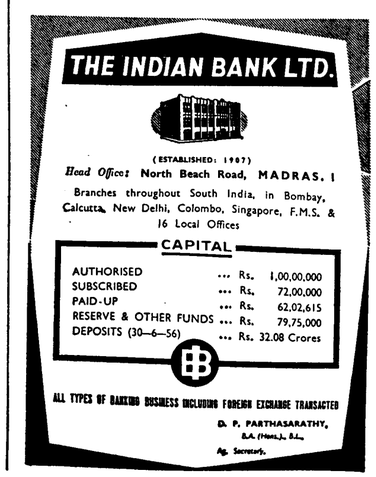
IAC. 3908



This is an advertisement and not a Prospectus. A formal Prospectus dated 20th December, 1956 has been prepared and filed with the Registrar of Companies, West Bengal.

Consent of the Central Government has been obtained to this issue by an Order, of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed in regard to them.

A licence has been obtained from the Central Government for the establishment of the new industrial undertaking described in the Prospectus and a copy of the licence is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this licence the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

THE SUBSCRIPTION LIST WILL OPEN ON THE 4th OF FEBRUARY, 1957, AND WILL CLOSE ON 15th FEBRUARY, 1957, OR EARLIER OR LATER AT THE DISCRETION OF THE DIRECTORS.

SHAREHOLDERS, DIRECTORS AND FRIENDS HAVE ALREADY SUBSCRIBED TO Rs. 212 LAKHS OF THIS ISSUE.

INDIAN ALUMINIUM COMPANY, LIMITED

(INCORPORATED UNDER THE INDIAN COMPANIES ACT, 1913)

SHARE CAPITAL

Authorised		Issued, Subscribed and Paid Up
Rs. 5,60,00,000	in Ordinary Shares of Rs. 10 each ...	Rs. 2,01,10,000
Rs. 40,00,000	in 5 per cent Cumulative Redeemable Preference Shares of Rs. 100 each ...	Rs. 40,00,000
Rs. 6,00,00,000		Rs. 2,41,10,000

LOAN CAPITAL

Authorised		Now being Issued
Rs. 2,68,13,200	5 per cent Convertible Loan Stock ...	Rs. 2,68,13,200

Out of this issue, the existing Ordinary shareholders of the Company, Directors and friends have subscribed to Rs. 212 lakhs Convertible Loan Stock. (Aluminium Limited, the Company's majority shareholder, has subscribed to 50 per cent of the issue and in order to permit increased Indian participation, has renounced, with the approbation of the Government of India its right to subscribe in excess of 50 per cent) The remaining Rs. 56 lakhs Convertible Loan Stock is available for allotment to the public.

AVAILABLE FOR PUBLIC SUBCRIPTION Rs. 56 LAKHS

5% CONVERTIBLE LOAN STOCK 1971-81 AT PAR

PAYABLE IN FULL ON APPLICATION

Applications must be for multiples of Rs. 200 with a minimum of Rs. 200.

The Convertible Loan Stock now offered for subscription was created by a Resolution passed at an Extraordinary General Meeting of Shareholders held on the twelfth day of November 1956 and is constituted by a Deed Poll as an unsecured obligation of the Company. Interest at the rate of 5 per cent per annum (less tax) will be payable on the 1st January each year for the year ending on the preceding 31st December, except that the first payment to be made on the 1st January, 1958, shall be nine rupees and four annas (less tax) for each unit of Stock of Rs. 200 outstanding on 31st December, 1957.

The following is a summary of the principal terms and conditions upon and subject to which the Rs. 2,68,13,200 Convertible Loan Stock is being issued:

CONVERSION RIGHTS

Stockholders will be entitled on the terms and conditions mentioned in the Deed Poll, by giving written notice to the Company, to convert every Rs. 200 nominal amount of Stock held by them into fifteen fully paid Ordinary Shares of the Company up to 15th December, 1957, and into fourteen such Ordinary Shares during the period from 1st January, 1958, to 30th June, 1960, inclusive, and into twelve such Ordinary Shares during the period from 1st July, 1960 to 15th December, 1970, inclusive, after which date the conversion rights shall cease to be exercisable. After the 15th December, 1970, the Stockholders will be subject to and entitled to the benefit of all the conditions endorsed on the Stock Certificates except the option to convert. The Ordinary Shares into which the Stock is converted will rank *pari passu* in all respects with the then existing Ordinary Shares of the Company and will be entitled to participate in any dividend that may be declared after receipt by the Company of notice of intention to convert.

REDEMPTION

On the 2nd January, 1971, and on the same date in each succeeding year the Company will redeem at par Stock amounting to Rs. 25,00,000 until all the Stock has been redeemed. The Stock to be redeemed will be selected by drawings. In addition, the Company may redeem at par all or any of the Stock outstanding at any time after 31st December, 1970, upon giving three months' notice in writing and if the Company elects to redeem part only of the Stock, the part to be redeemed will be selected by drawings. The Company will redeem at par any Stock, which remains outstanding on the 2nd January, 1981.

DIRECTORS

KAILASH CHANDRA MAHINDRA, "Mont Blanc," Dadyseth Hill, Bombay, 26, Industrialist and Chairman of the Company.

ERIK SPENCER GREENWOOD, 7, Mayfair Road, Calcutta, Managing Director of the Company.

LAWSON GREENE BASH, Apt. 19D, Hotel Ten Park Avenue, New York, 16, U.S.A. Merchant.

JAKOB BOETSCHI, *Alternate for Mr. Bash*, 9, Dover Park, Calcutta, Merchant.

JAMES WILLIAM CAMERON, 146, Easton Avenue, Montreal West, P.Q. Canada, Engineer.

MUTHIAH ANNAMALAI CHIDAMBARAM, Chettinad House, Raja Annamalaipuram, Madras, 28, Industrialist.

JAMES ATWOOD DULLEA, Dogwood Lane, Westport, Connecticut, U.S.A., Senior Vice-President, Aluminium Limited, Canada.

SIR UDAY CHAND MAHATAB, K.C.I.E., *Maharajadhiraja Bahadur of Burdwan*, "Aftab Ville." 14/1, Burdwan Road, Alipore, Calcutta, Landlord.

DR. PARAMESWAR VELAYUDHAN NAIR, "Saraswathi Sadan," Cotton Hill Road, Trivandrum, Additional Director of Industries and Commerce, Kerala State.

WILLIAM ARCHIBALD RUSSELL, M.C., 1, Minto Park, Calcutta, 27, Stockbroker.

MANU SUBEDAR, Lotus House, Marine Lines, Bombay, Businessman.

HISTORY AND BUSINESS

The Company was incorporated in Bengal on the 17th December, 1938, under the name Aluminium Production Company of India Limited as a private limited company. On the 21st June, 1944, the name of the Company was changed to Indian Aluminium Company, Limited, and on the 28th March, 1945, the Company was converted into a public limited company.

The Company undertook the construction of a rolling mill at Belur, Calcutta, in 1939 for the fabrication of aluminium and its alloys and operations commenced mid-1941 with an initial capacity of 2,500 tons per annum which has since been increased to 7,000 tons per annum. This rolling mill was at first entirely dependent upon the importation of aluminium ingot. However, by 1943, an aluminium smelter to produce 2,500 tons of ingot per annum was constructed and completed at Alupuram, near Alwaye, Travancore. When this smelter commenced operations in 1943 it was dependent on imported alumina but by 1946 the Company was operating its own bauxite mines at Lohardaga, Bihar, and producing alumina at Muri also in Bihar and about 80 miles from the bauxite mines. The capacity of these mining, alumina and aluminium smelting facilities was subsequently increased to produce 5,000 tons of aluminium ingot per annum at which level the smelter is now operating. However, due to recent improvements in operating techniques and the installation of additional furnace pots, it is expected that the smelter will operate at approximately 5,600 tons per annum commencing 1957.

In addition to the above smelting and fabricating facilities, in 1951 an aluminium powder and paste plant was completed at Kalwa, near Bombay, with an annual capacity to produce 600 tons of aluminium powder and 250 tons of aluminium paste, in respect of which India was formerly dependent upon imported supplies. During 1955 the Company completed the installation of a modern extrusion press capable of producing 1,000 tons of extrusions per annum. This extrusion press is located adjacent to the smelter at Alupuram, Travancore.

DEVELOPMENT PLANS

With the evidence that India is becoming increasingly dependent upon the importation of aluminium ingot, and since technological developments in the industry are creating greater demands for aluminium, the Company has decided to construct at the Hirakud power project site an aluminium smelter with an initial capacity to produce 10,000 tons of aluminium ingot capable of easy expansion to 20,000 tons or more per annum in the future. The necessary licence has been granted by the Government of India under the Industries (Development and Regulation) Act of 1951.

Simultaneous with the construction of the new smelter at Hirakud, the Company's bauxite mining and alumina producing facilities will be suitably expanded and subsequent further expansion will provide sufficient bauxite and alumina for all the Company's expanded smelting operations. Pending completion of the necessary bauxite and alumina producing facilities, arrangements are being made, with Government approval, to import alumina to ensure full use of the new smelter.

Negotiations with the Government of Orissa for the supply from the Hirakud Power Project of sufficient electric power to enable the new smelter to produce 10,000 tons of aluminium ingot per annum and for a lease of the necessary land at Hirakud for the establishment of the smelter have reached an advanced stage and it is expected that such negotiations will be successfully concluded in the very near future.

MARKET POSSIBILITIES

The Tariff Commission enquiry into the aluminium industry held in 1955 determined that the then prevailing demand for aluminium was about 20,000 tons per annum and it was expected to increase at the rate of approximately 5,000 tons per annum so that by the end of 1958 it would reach about 35,000 tons as follows: Utensils 10,000 tons; electrical conductors 14,000 tons; transportation 5,000 tons; foil, canning and packaging 3,000 tons; engineering, building construction and other uses 3,000 tons.

However, consumption of aluminium in India in 1955 was about 27,000 tons of which approximately 10,000 tons of semi-fabricated products and 4,100 tons of ingot were imported. Since India's present capacity to produce primary aluminium ingot only approximates 7,200 tons there is an obvious and urgent need to expand ingot producing facilities and when the proposed new smelter is in operation it is expected that the new production will be promptly absorbed. Furthermore, since the Tariff Commission estimates that the demand for aluminium will increase at the rate of 5,000 tons per annum the need for smelting facilities in addition to those now planned is evident and it is already envisaged that the capacity of the proposed Hirakud smelter may eventually be doubled from 10,000 to 20,000 tons per annum.

TECHNICAL AND RESEARCH FACILITIES

The highly complicated operations of smelting and fabricating aluminium in this relatively new industry, must necessarily be supported by extensive and unceasing efforts in exploration, engineering and research. Fortunately, due to close affiliation with its principal Shareholder, Aluminium Limited, Montreal, Canada, this Company is, by agreement, able to use and benefit from the research and technical facilities of Aluminium Laboratories Limited, which is a fully owned subsidiary of Aluminium Limited, and is thereby provided with technical information, engineering services and advice regarding all developments in the aluminium industry and guidance on operational problems and the development of new products.

The research facilities of Aluminium Laboratories Limited are located in Canada and the United Kingdom and are probably the most extensive of their kind. Aluminium Laboratories Limited's annual budget for research and development exceeds 4 million dollars.

FINANCING

The amount required for the expansion programme and for additional working capital is estimated to be Rs. 8.65 crores, part of which will be financed by the proceeds of the recent new and fully subscribed issue of 4,11,000 Ordinary Shares and this issue of Convertible Loan Stock; the balance will be financed by bank loans, depreciation reserves and undistributed earnings. Part of the proceeds of this issue will be utilised for the purpose of repaying the sum of Rs. 50 lakhs which the Company has borrowed from Aluminium Limited.

The financial information included herein reflects the effect of the increased aluminium ingot capacity which commenced in the second quarter of 1955 when the capacity of the Alupuram smelter was increased from 2,500 tons to 5,000 tons per annum. The increased ingot production was most rewarding and it will be noted that profits of Rs. 20,44,011 in 1955 and Rs. 23,57,567 for the nine months ended 30th September, 1956, were recorded, compared with Rs. 2,69,243 in 1954.

The new ingot capacity of 10,000 tons per annum now envisaged by this Company together with India's existing capacity of approximately 7,200 tons per annum is, as previously indicated, substantially below the Tariff Commission's estimate of an overall demand of 35,000 tons per annum by 1958. Consequently, it is expected that production from the new smelter will be marketed at profitable levels and will provide a reasonable return on the new capital invested as well as sufficient funds to service and repay loans which will become necessary during the construction period.

FINANCIAL INFORMATION

The following is a condensation of the accounts of the Company which have been audited by the Company's Auditors, Price, Waterhouse, Peat & Co.

	Sales	Net Profits before Depreciation and Taxation	Net Profits after Depreciation and Taxation*
	Rs.	Rs.	Rs.

DIVIDENDS ON PAID-UP CAPITAL

Dividends paid on Ordinary shares were 3½ per cent for the year ended September 1950, 5 per cent for the year ended September 1951, Rs. 5 per share for the 15 months ended December 1952, 9 per cent for the year ended December 1955 and an interim dividend of 5 per cent was paid in respect of the year 1956. Dividends on the 5 per cent Cumulative Preference Shares have been paid regularly.

GENERAL INFORMATION

Management: The Management of the Company is vested in and exercised by the Directors. The Company has no Managing Agents.

Interest of Directors: Mr. K. C. Mahindra is the Financial and Technical Adviser of the Company and receives remuneration for his services as such.

Mr. E. S. Greenwood is the Managing Director of the Company and receives remuneration for his services as such.

Mr. W. A. Russell is a partner in the firm of Place, Siddons and Gough, Stock and Share Brokers, brokers to this issue.

Mr. J. A. Dullea is a Director of Aluminium Laboratories Limited which Company is a party to contracts for the supply of engineering and technical services at cost to this Company.

Save as above no Director has any financial or other interest in any property acquired or proposed to be acquired by the Company.

Underwriting: The Convertible Loan Stock now being issued is not underwritten.

Brokerage: A brokerage of one half of one per cent will be paid on allotment of Stock made in respect of applications bearing the stamp of a recognised Stockbroker.

APPLICATIONS FOR STOCK

Applications for the stock, which must be for Rs. 200 or multiples thereof, must be made on the official forms issued by the Company, and sent together with a remittance for the full amount payable on application to one of the undermentioned Brokers, or a branch of Lloyds Bank Ltd., in India, or a branch of The First National City Bank of New York, in India. Copies of the official application forms and of the formal prospectus may be obtained from the Registered Office of the Company at 31, Chowringhee Road, Calcutta 16, the Company's Bankers and the following Brokers.

THE ASSOCIATED CEMENT COMPANIES LIMITED

SHRI DHARAMSEY M. KHATAU'S SPEECH AT ANNUAL MEETING

STATE TRADING IN CEMENT UNWARRANTED

THE following is an abstract of the speech delivered by Shri Dharamsey M. Khatau at the Twentieth Annual General Meeting of the Associated Cement Companies Limited held in Bombay on 25th January 1957:

"Following upon drastic amendments to the Constitution enabling outright nationalisation, or the assumption by the Government of complete managerial control over private property upon such terms as to compensation as the Government of the day might think proper, there have been enacted a series of laws of the most far-reaching character. Taken together with the previously existing restrictive laws and the voluminous labour legislation already on the statute book, they furnish such a complete range of weapons in the Government's armoury that it seems pointless to talk any longer of freedom for the private sector. The issue must be joined hereafter on the broader base of preservation of freedom and democratic institutions, because what is now in danger of being smothered is not just the private sector in the industrial field, but free enterprise generally."

State Capitalism

Shri Khatau mentioned the nationalisation of life insurance and the resort to State trading in cement as the two most outstanding recent examples of the suppression of free enterprise and the onward march of State capitalism. He referred to the notable contribution of these two industries and their achievements over the last 20 years and observed that in the case of life insurance, the grounds on which that vast and growing industry was nationalised, did not bear dispassionate scrutiny. Nor had the results been conspicuously successful or demonstrably in the larger public interest. In fact, there had been an alarming drop in the volume of new business since nationalisation.

State Trading in Cement

"As for State trading in cement," the Chairman continued, "the Government's reason for resorting to this remain a mystery to this day. The Government's decision is all the more inexplicable, because the conditions obtaining in the cement industry did not warrant any such measure. The cement industry had on the basis of its performance and record, honourably justified its stewardship."

Referring to the "cement gap" which existed in the country, despite the industry's impressive production efforts and performance, Shri Khatau pointed out that the A.C.C. was the first to foresee the gap which was likely to develop due to the requirements of the second Five-year Plan. The A.C.C. brought this to the notice of the Government as far back as September 1955 and offered to import cement and to distribute it to the consuming public *without profit*. "After taking little or no notice of this suggestion for some months," the Chairman continued, "the Government seemed suddenly to feel the urgency to resort to State trading in cement and sought to justify this step on the following grounds:

(a) the need to import substantial quantities of foreign cement to meet the current 'cement gap';

(b) the need to sell both indigenous cement and imported cement (which would cost about Rs. 40 to Rs. 45 per ton more than indigenous cement) at an equalised price; and

(c) the need to rationalise all rail-borne cement movements, so as to impose the minimum strain on the transport system in the country."

The Chairman met these points by stating: "We had already recognised the existence of the 'cement gap' and had offered to import foreign cement and to sell it to the consumer at cost. We suggested that price equalisation should be done *without profit*, by raising the price of Indian cement by just so much as would be necessary to meet losses on the sale of imported cement at a common delivered price applicable to both. We suggested that this could be done either through the medium of enhanced excise duty, or by imposing a 'price equalisation pool' or 'trust fund,' either voluntary or statutory. We also offered to evolve a pattern of distribution which would involve only the minimum rail movement. But the disappointing outcome of all this was that, while the Government accepted our main proposals, it rejected all the alternative price equalisation mechanism we had suggested. And so the country was launched upon State trading in cement."

Mechanism of State Trading

The Chairman then examined the mechanism of State trading in cement. The entire production is sold to the State Trading Corporation of India and the Corporation pays to the producers of cement the old ex-works price which, in the case of the A.C.C., is Rs. 54-8 per ton for naked cement, *plus* packing charges (varying from Rs. 13-8 to Rs. 14-8 per ton) to be determined by the Government each quarter. "But the State Trading Corporation in turn sells the cement to the public at the new equalised price of Rs. 102-8 per ton f.o.r. destination, inclusive of excise duty, selling expenses, freight and other handling charges, all of which are borne by the Corporation. As against this, our selling price f.o.r. destination before the advent of State trading was approximately Rs. 90 per ton. The purchase and sale of cement is arranged by the State Trading Corporation through the existing selling agencies of the cement manufacturers, who were appointed as agents of the State Trading Corporation for this purpose. The agents' remuneration for their services comes out of the ex-factory prices originally fixed for the manufacturers. The Cement Marketing Company of India Private Ltd. is accordingly the agent of the State Trading Corporation since 1st July 1956 for the sale and distribution of A.C.C. cement at a commission of Re. 1-8 per ton."

Free Enterprise and the Freedom to Trade

Stating that the cement industry's *objection to State trading was fundamental*, the Chairman stated: "We believe that all forms of State trading constitute a serious infringement of the right of freedom of trade in a democratic society. The mere fact that State trading *can* resolve a given problem in terms of agreed objectives is not, by itself, a sufficient justification for its adoption, if other solutions of equal, or superior or even slightly inferior validity, are available, which do not involve State interference. Moreover, State trading lops off the essential sales function from a basic productive industry—a function laboriously built over the years by free enterprise, thereby causing grave injury to it. I would also emphasise that State trading in cement runs counter to the declared policies of the Government itself as enunciated in the Industrial Policy Resolution early last year and in which an attempt was made to strike an admirable balance between State and free enterprise. The continual maintenance of such a balance is of the very essence of a socialistic pattern of society, *if it is to be built on the foundations of a democratic constitution.*

"In this context, the recent assurances of the Prime Minister in respect of the urgent need for India's adherence to democratic processes in planning and of evolving a balanced approach between State and free enterprise are indeed welcome. Experience has shown that the concentration of economic power in the hands of the Government, backed by monolithic majorities in the legislatures and operated through a well organised bureaucracy must, in course of time, result in whittling down both individual freedom and liberty. It is with this larger objective in view that one must repeatedly warn the Government against adopting a doctrinaire and unrealistic approach to problems of planning and in the techniques for achieving industrial development. Issues like nationalisation and State trading should be conceived only as the means to an end, and not as ends in themselves.

"Enlightened free enterprise working within the framework of planned development is an indispensable part of the democratic set-up, for there is a close interrelationship between socially regulated free enterprise and democracy. Free enterprise should, therefore, be positively encouraged to thrive by appropriate incentives and reliefs whenever needed, because it had a legitimate and vital function to perform in national planning and development so long as democracy is the foundation upon which our Constitution rests."

Production and Sales

Turning to the affairs of the Company, the Chairman reported another year of successful working for the A.C.C. Both production and sales of cement were satisfactory. Yet the results were less profitable than for the preceding year, due to repeated increases in freight rates, the price of coal, imported stores and spares, royalty on limestone, etc. The Chairman felt that this trend of rising costs was likely to continue, and that the Company would have to face up to a substantially higher cost of production in the future. This would be further aggravated by the irresponsible demands for wage increases which were being sponsored by the I.N.T.U.C., and the threat of hasty legislation to enhance the rates of provident fund contribution which was being pressed for by the Government.

Plant Rehabilitation and Expansion

Reviewing the Company's programme of modernisation and expansion, Shri Khatau reported that it was progressing according to schedule and that the Company had formulated plans to expand its installed capacity over the next five years to a total of 5·2 million tons per annum as its contribution to the national target of 12.5 million tons of cement under the second Five-year Plan. During the year, the modernisation and expansion of the Company's Bhupendra, Kistna, Chaibasa and Kymore factories continued satisfactorily. The Chairman also announced the Company's intention to install a third unit at the Sindri Works, "provided that a satisfactory price for the additional raw material (calcium carbonate sludge from the Sindri Fertiliser Factory) required can be negotiated with the Fertiliser Factory."

New Projects

The Chairman stated that satisfactory progress had been made in the construction of the Company's new cement factories at Mancherial and at Porbandar and that work on the construction of a new plant at Drug would be started in the near future. All these three factories would operate the dry process, instead of the wet process employed at other A.C.C. factories. The Company's newly constructed refractory plant at Katni was functioning satisfactorily and its output would steadily be stepped up to its rated capacity.

Finance for Expansion Projects

Speaking about the very heavy capital outlay entailed by the expansion programme, Shri Khatau stated that the projects would be financed partly out of the proceeds of the recent issue of new shares and partly by borrowing against the Company's cash-credit arrangements with the State Bank of India up to the full limit of Rs. 4 crores. He continued: "Despite this, however, substantial additional funds will obviously be needed. By far the largest portion of this extra finance will have to come out of the internal resources of the Company, consisting of depreciation allocation and undistributed profits retained to the credit of various reserves. This process of ploughing back as large a portion of the profits as was possible is in serious danger of being prejudiced in the years to come by recent trends in bonus awards and in the taxation policies of the Government. As for the former, there appears to exist no appreciation whatsoever of the need to plough back into industry an adequate volume of profits not merely for rehabilitation and modernisation of existing plant but also for expansion of capacity; with the result that these needs are virtually ignored and a substantial portion, if not the whole, of the so-called "surplus" is cheerfully awarded as bonus. The time has come for some realistic thinking in this matter, with a view to evolving a fair and workable formula for the award of bonus, so that the industry may not be deprived of that steady volume of annual accretions to internal resources so essential for financing both expansion and modernisation. If there must be a curb on industrial dividends, then there must also be one on bonus to industrial workers."

Dealing next with the effects of the recent Finance Act upon industrial development, the Chairman observed: "The Act directly impinges upon industrial development in two ways. In the first place, there can be no doubt that with the existing confiscatory level of personal taxation, the capital gains tax and the heavy additional corporation tax on dividends in excess of 6 per cent. can only act as decisive disincentives to new investment and to ploughing back profits into industry. On the other hand, the deposit scheme for canalising in approved directions the utilisation of corporate funds represented by undistributed profits and the tax saved on depreciation and other allowances need not, in itself, give cause for anxiety. But the effect of the whole scheme will depend entirely upon the flexibility and consideration with which it is operated in practice. In particular, companies such as ours which may have already used their funds for approved purposes should not be required to make any deposits; and 'approved purposes' should include not merely the full range of fixed capital and working capital requirements of a company but also the repayment of moneys borrowed and utilised for those purposes. There is every reason to hope that the rules, which are now being framed, will fulfil these expectations. And if the deposit scheme is so operated, it need cause no undue concern; but otherwise, it may precipitate a major crisis in the money market and bring all significant industrial development to a grinding halt."

The A.C.C.-Vickers-Babcock and Wilcox Project

The Chairman reported that satisfactory progress had been made in the Company's negotiations with Messrs. Vickers Ltd. and Messrs. Babcock and Wilcox Ltd. for the establishment of an up-to-date heavy engineering plant, which within a few years, would make India largely self-sufficient in the whole range of cement-making machinery. The new project would also provide a substantial proportion of the country's requirements of water tube boilers and mining machinery.

Pakistan

The Chairman stated that the A.C.C.'s two factories in Pakistan were operating satisfactorily. As anticipated, prices of coal, stores and other materials had risen sharply in that country, with the devaluation of the Pakistan rupee. But the price increase granted by the Government of Pakistan covered only a portion of the actual increase in costs and, unless production costs declined, Shri Khatau felt that the Company would have to approach the Government there for an upward revision again. Shri Khatau also reported that, as a result of the representation by the Company, the Pakistan Government had since rescinded certain restrictive clauses in the Cement Control Order which were not warranted, in view of the supply position there.

Labour-Management Relations

Turning to labour-management relations the Chairman observed: "I am very glad to report that the present year has been one of distinct improvement in our relations with our employees. I am heartened to think that the enlightened and progressive policy which your Company has always followed in promoting the welfare and well-being of its employees is not without its due response from them. And I would like to congratulate my labour friends and officials of the trade unions at the various factories for the generally realistic attitude which they have adopted in solving problems of common interest and for showing an increasing awareness of their responsibilities in our common endeavour. Unlike in past years, there was no strike or stoppage of work to mar the growing accord and understanding based on good faith and goodwill.

"In my report last year I had referred to the unanimous decision of the Industrial Committee on Cement to abolish the contract system wherever possible in the normal working of our factories. With the co-operation of the unions we were able to implement this decision during the year under review. This provides an excellent example of the Company's workmen and management striving together with singleness of purpose to achieve satisfactory results in solving important issues."

Bonus and Appreciation

The Chairman announced that the Board had recommended this year the payment of a bonus equivalent to three months' basic earnings to all employees at the head office, the works and branch offices, including those employed in the Cement Marketing Company, and concluded by recording the Company's warm appreciation of the unstinted co-operation and unremitting hard work put in by all members of the Company's staff during the year.

Note.—This does not purport to be a record of the proceedings of the Annual General Meeting which will be sent separately to the shareholders.

EVOLUTION OF UNIFORM STANDARDS

THIRD COMMONWEALTH CONFERENCE

THE advantages of standardisation lie in the simplification of production and distribution by the elimination of unnecessary types, sizes and qualities of articles produced for the same purpose. When rapid strides are being made in various fields of human activity, as, for instance, sciences, technology, industry, both productive and consumer, and commerce, and the number of varieties of articles that come into vogue is being multiplied, the importance of standardisation cannot be overemphasised. Attempts are being made constantly to standardise the products of industries. To take one example, certain countries have standardised the components of the motor industry. They include tyres, safety glass, plugs, screws, bolts, bearings, lamp bulbs and so on which are, as a result, replaceable. In the aircraft industry, to take another example, between 5,000 and 6,000 parts, varying from rivets and washers to complete pilots' seats, rudder bars and the components for wiring system are standardised.

Standards, in fact, affect almost every aspect of household and everyday life. To mention only a few, they affect clocks, refrigerators, clothes, line posts, electric fittings, basins, taps and milk bottles. It is noteworthy that the British Standards Institution (B.S.I.) has now established the standard measurement for the "spoonful," so common in cookery recipes. The exact capacity of a teaspoon is to be 60 minims in dispensing medicine, and 100 minims in measuring ingredients for cookery. Further, size and workmanship of children's and women's garments are standardised. In the field of medicines and drugs, the Medical Act of 1858 of Britain prescribes the standard for the substances and the preparations concerned for the whole of the Commonwealth.

A pioneer in the evolution of standards is the B.S.I. The embryo of this huge organisation was the Engineering Standards Committee formed in 1901 following a vigorous movement started by Mr. H. J. Skelton, a London iron and steel merchant, and Sir John Wolfe Barry, then President of the Institute of Civil Engineers. Today the constitution and the scope of the B.S.I. serves four main industrial groups—engineering, chemical, building and textiles—with sectional committees to cover such fields. The work of standardisation is carried out mainly by Industry Standards Committees, each one representative of the manufacturers, distributors, users and professional bodies, associated with that particular industry. At present there are 60 such committees and nearly 2,000 technical and sub-committees. A noteworthy feature is that the institution is an entirely voluntary body, formed and maintained by industry with the co-operation and support of the Government.

Role of N.P.L.

The National Physical Laboratory in the U.K. plays a vital role in the field of standards. It works out and maintains the accepted standards of measurement without which scientists today would have had no foundation upon which to base advanced theories. It has also fostered several offshoots now doing work in highly specialised subjects such as radio, radar, aviation research and other fields. What is all-important in the work of the laboratory is accuracy—whether it is in measuring 1,000,000 volts of electricity or a millionth part of an inch. In short, its job is to check the gauges which check the precision tools which make the precision instruments. In the last half century, the laboratory has made countless contributions to the progress of standards. Work in the study of fluid flow, perhaps, has been the most important. Originally, its only direct relation was to the movement of water past a ship's hull. Now, with travel revolutionised and with the theories propounded by men like Lord Raleigh to broaden the scope, "fluid flow has just as much to do with the design of the latest aircraft, buildings, concert halls and radio techniques as with things seemingly so unrelated as the latest ships, and the ventilation of the House of Commons." Today, British standards, promoted, established and maintained by the British Standards Institution are known and used all over the world. The story of the evolution of standards in Britain can be traced to many years back. In early modern times, navigational standards and those based on astronomical data, such as longitude, marine chronometer and nautical almanac, were largely initiated by Britain. By far the largest number of standards, however, are industrial and have been evolved in more recent times. Some of the notable instances are the "horse-power," "block system" of working passenger lines, the gauge of 4 ft. 8½ inches, etc., in the field of railways. Britain has also adopted international standards in such matters as metric ball bearings and 16mm. film. It is noteworthy that the cause of the success and prestige of British standards is stated to be the principle of procedure, which ensures that only standardisation demand by both producers and users is carried out and that standards are prepared by agreement and accepted by all the interests concerned and are, therefore, assured of general adoption.

Developments in Commonwealth

An important feature of the development of standardisation in the Commonwealth which started about 45 years ago is that, while the different standard bodies are organised on similar lines as the B.S.I., and closely related with it and British industry, they are independent standard bodies closely identified with the industrial progress of their respective countries. In India, till 1946, the use of British standards was fostered by a local committee established in 1919 by the Institution of Engineers (India). In 1946, however, the Indian Standards Institution was constituted on the lines similar to the B.S.I.

The third Commonwealth Standards Conference, which opened in New Delhi on 21st January and is in session as these lines are written, is a landmark in the evolution of standards in the Commonwealth. The first conference, held in London in 1946, revealed that standardisation is a dynamic activity, that those that collaborate must do so on a free and voluntary basis. Bearing these in mind, the first conference made 34 recommendations relating to general policy and procedures of standardisation and also on some technical issues like screw threads, universal decimal classification and glossary terms. The second conference, also in London, was held in 1951 with the object of furthering the collaboration between the national standards organisations of the Commonwealth and to secure agreement on common objectives and principles of operation in the interests of Commonwealth relations and trade. A notable feature of the progress made since the first conference was that the national standards bodies in the Commonwealth had implemented, to a very satisfactory degree, the recommendations of the first Conference and that the intra-Commonwealth agreement in standards had been fostered, without conflict with the needs for international agreement under the International Standards Organisation. The last conference, moreover, helped to establish the fact that the consultation and co-operation that had developed between the Commonwealth countries had led to a commendable degree of practical alignment of the standards issued in the various Commonwealth countries.

The programme for the present session includes, besides the general session of the type held in 1946 and 1951, four technical sessions relating to electrical equipment for machine tools, cables, safety requirements for domestic electrical appliances and steel.

Technical Sessions Welcomed

Inaugurating the Conference, Mr. Morarji Desai, Union Minister for Commerce and Industry, welcomed the inclusion of technical sessions in the Conference. He pointed out that such inclusion would provide the necessary incentive for busy people to participate in the Conference. Especially, it would also enable the technical personnel of Indian Committees to benefit by the exchange of views with their compeers and peers from other countries. Referring to the India Government's decision to "go metric," Mr. Desai expressed the view that it provided ample proof of the fact that there was no thought of regimentation of standards within the Commonwealth and that national standards bodies were perfectly free to adopt measures suited to the needs of their countries. Nevertheless, an important hurdle that had to be crossed in the path of international standardisation was, according to him, the question of conversion from the inch-pound system to the metric system. The protagonists of the two systems, he pointed out, were naturally apt to take a partisan view, making agreement on conversion somewhat difficult. He, however, hoped that the Conference would not only streamline the Commonwealth point of view but also provide a basis for compromise that might lead to a world agreement.

Welcoming particularly the inclusion of a technical session on steel on the agenda of the Conference, the Minister pertinently observed:

"Unlike most other Commonwealth countries, India is very deficient in steel production. In our bid for self-sufficiency, we have not only to aim at greater production but better utilisation of our resources. One may suppose that, in the competitive world of today, such economies are always of interest to any country, but, in the case of India, which has to plan for a several-fold increase in its production at heavy capital cost in the next five years, the need is paramount for the most economical utilisation of what we produce by a proper reassessment of the improvements in the quality of steel which have been made during the past decades as also by encouraging the newer techniques of welding and improvement in design."

The Conference is attended by over a hundred experts from different Commonwealth countries. It is to be hoped that the deliberations of the Conference will pave the way for greater uniformity of standards throughout the Commonwealth and especially succeed in ensuring that India's decision to "go metric" will not hamper Commonwealth trade. Indeed, with Britain's latest decision to join the free trade area in Western Europe where the metric system is in vogue, there can scarcely be any conflict. If anything, India can claim to be ahead of the leader of the Commonwealth. It is only a question of time before Britain, too, follows suit.

JAPAN'S EXPORTS TO CHINA

The value of Japan's exports to mainland China during the first eleven months of 1956 amounted to $53 million, as against $29 million in 1955. As against this, Japan's imports from that country during the same period remained at about the same level as in the previous year.

Some of the items that figured prominently in the exports from Japan were light machinery, particularly textile machinery, farm equipment, three-wheeled trucks and office equipment. The value of these exports increased nearly fourfold in 1956 over that of the previous year. Sales of chemical products also advanced substantially.

With a view to accelerating Japan's exports to China, the Japanese Government is reported to be taking measures for encouraging greater utilisation of the exceptions incorporated in the Chincom embargo regulations (regulations governing exports of strategic goods). The Japanese Government, it is further stated, is well aware, that any violation of the ban on strategic exports would give rise to serious repercussions in U.S.-Japan relations.

Japan is also said to be preparing to offer a wide range of technical assistance to China, as a method of circumventing the embargo without violating it. The technical assistance will serve two purposes, it is stated. First, it will pay for some Japanese imports from China. Secondly, it prepares the ground for selling industrial equipment when the ban is finally lifted.

PROCEEDINGS OF THE A.C.C. MEETING

PROSPECTS OF HIGHER DIVIDEND REMOTE

THE annual general meeting of the Associated Cement Companies Ltd. was held on Friday, 25th January 1957. It was well attended. But only a small number of them—less than a dozen—spoke. While some of these were rather critical of the growing cost of administration, most of them criticised the Government's policy relating to the cement industry. The approach of the latter was identical to that of the Chairman. The highlight of the speech of the Chairman, Mr. Dharamsey M. Khatau, was his detailed reference to the growing restrictions on the freedom of the private sector by the State through such measures as nationalisation of life insurance and the extension of State trading even to internal trade, as, for instance, the distribution of cement. He said that, in the range and scope of their achievements over the last 20 years, life insurance and the cement industry and trade had made a significant contribution to the well-being and development of the country. The grounds on which life insurance was nationalised, did not, he asserted, bear dispassionate scrutiny. Similarly, he observed, the Government's reasons for resorting to State trading in cement remained "a mystery even to this day." Appropriately enough, he dwelt at some length on the latter subject, as it concerned the industry most. He said that the cement industry objected to State trading not because it involved any financial loss—it really did not—but because it raised *fundamental* issues. Amplifying this point, he stated that State trading lopped off the essential sales function from a basic productive industry, thereby causing grave injury to it. Besides, it also ran counter to the declared policies of the Government itself as enunciated in the Industrial Policy Resolution early last year.

Alluding to the Company's programme of modernisation and expansion, Mr. Khatau explained the plans for expanding its installed capacity over the next five years to a total of 5.2 million tons per annum as its contribution to the national target of 12.5 million tons of cement under the second Plan. He reported that satisfactory progress had been made in the Company's negotiations with Messrs. Vickers Ltd. and Messrs. Babcock and Wilcox Ltd. for the establishment of an up-to-date heavy engineering plant, which, within a few years, would make India largely self-sufficient in the whole range of cement-making machinery. The new project was also expected to provide a substantial proportion of the country's requirements of water tube boilers and mining machinery.

Expansion

Explaining the ways and means of financing the very heavy capital outlay entailed by the expansion programme, Mr. Khatau stated that funds would be found partly out of the proceeds of the recent issue of new shares and partly by borrowing against the Company's cash-credit arrangements with the State Bank of India up to the full limit of Rs. 4 crores. He hastened to add that, despite this, substantial additional funds would obviously be needed. By far the largest portion of this additional finance would have to come out of the internal resources of the Company consisting of depreciation allocation and undistributed profits retained to the credit of various reserves. He, however, warned, and that rightly, that this process of ploughing back as large a portion of the profits as possible was in serious danger of being prejudiced in the years to come by the recent trends in bonus awards to workers and in the taxation policies of the Government. Surprisingly enough, he did not view the compulsory deposit scheme introduced as part of the tax proposals on 30th November last in the alarmistic fashion, as has been done by many other business men. He felt that this scheme need not give cause for anxiety, though he agreed that the effect of the whole scheme would depend on how it was operated in practice.

The Directors' report and the audited balance-sheet were adopted by the shareholders of the Company present at the meeting. There was all-round satisfaction over the financial results for 1955-56. Doubts were, however, raised by a few with regard to the necessity for certain items of expenses and allocations. Besides, there was the usual demand for a higher dividend, at least for the current year. One shareholder (Mr. Dhirajlal Maganlal) referred, in particular, to the proposed Tariff Commission inquiry into cement prices and suggested that the Directors of the Company should demand a substantial increase in prices in order to cover the cost of expansion, a practice adopted by the Commission for determining the ex-factory prices of steel. He said that the Company, as a producer of about 50 per cent. of India's total output of cement, had to spend about Rs. 30 crores to Rs. 35 crores to achieve the target. He thought that the internal resources of the Company would help to the extent of about Rs. 12½ crores and capital resources would meet about Rs. 7½ crores. There was still a leeway of Rs. 10 crores to Rs. 15 crores to be made up. There was, therefore, a strong case for a vigorous plea for a suitable increase in price, as in the case of steel, for purposes of expansion. This rise, he suggested, could be of the order of Rs. 5 or Rs. 10 per ton. Appreciating this valuable suggestion, Mr. Khatau assured the shareholders that suitable representation would be made to the Tariff Commission for an upward revision in prices.

Dividend

Mr. Dhirajlal Maganlal also recalled his demand made three years ago, when a dividend of 9.5 per cent. was declared for the year 1952-53, and said that the then return of 6.3 per cent. should be maintained. The Chairman, he pointed out, had assured the shareholders that it would be done, but actually the return to the shareholders had gone down since then to 5.8 per cent. He pleaded that the return should be maintained at over 6 per cent. In his reply, Mr. Khatau said that the question of raising the dividend level did not arise, as the maintenance of the existing level itself was difficult. He added that the Directors would see whether the dividend could be maintained in the years to come. With sales of cement controlled, the costs going up and prices fixed, it all depended on how far the Company was able to cut down its costs, as well as on the recommendations of the Tariff Commission, which was about to conduct an inquiry into the industry.

Referring to the suggestion of a shareholder that the Company should build up a dividend equalisation fund, from which such amount as would be needed for maintaining the dividend could be drawn, Mr. Khatau said that the idea of having such a fund was a good one, but sufficient funds must be available for building it up. "Our problem is to fulfil our expansion programme. We want to do it without any more borrowings or further issue of capital," he added. There would be no issue of further capital, if it could be helped. It all depended on exigencies of the situation. Nothing could, however, be said categorically on the subject at present.

A pleasant surprise at the meeting was the support to labour extended by a lone shareholder. While every shareholder spoke in favour of increasing his own returns in the shape of dividend, there was at least one shareholder to champion the cause of workers and staff of the Company. He pointed out that the success of the Five-year Plan, in general, and that of the Company, in particular, depended on a staff who were adequately paid and well contented and that, therefore, their bonus for the year should be increased from three to four months.

Joint Venture

As regards the joint venture with Messrs. Vickers Ltd., Mr. Khatau said that it would be carried out by a separate company. There was a suggestion that in case the shares of this Company were offered to the public, the A.C.C. shareholders should be given the right to subscribe in the first instance. To this, the Chairman answered that this question was not likely to arise, as Vickers might not be in favour of a public issue at all.

The reference, in the Directors' report, to the acquisition of a further 18,000 shares of Asbestos Cement (Private) Ltd. out of the entitlement of "another" shareholder (in addition to the 5,075 shares to which the A.C.C. itself was entitled out of the 35,000 additional ordinary shares of Rs. 100 each at par which the Company proposed to issue) provoked the inquisitiveness of some shareholders who wanted to know who that "another" shareholder was and why the Company should acquire the 18,000 shares at a premium of Rs. 40, when the Asbestos Cement was issuing the shares at par. In his reply, Mr. Dharamsey M. Khatau said that the Asbestos Cement Company was started many years ago and that the A.C.C. had an interest in it right from the beginning. Cement formed a large part in the manufacture of asbestos products and the cement used by the Company was entirely A.C.C. cement. The Company was increasing its share capital and the A.C.C. as a shareholder, got its allotment of 5,075 shares. One of the main shareholders, Messrs. Turner Newall of England, wanted to part with a part of their holdings and the A.C.C. was approached. The financial position of the A.C.C. did not permit it to take up the entire lot of shares offered by this British firm, though purely as an investment, it was a good proposition. Mr. Khatau did not consider the premium of Rs. 40 per share as high. The products of Asbestos Cement were of a very high quality and enjoyed a very good market. With the acquisition of the 18,000 shares, the A.C.C. would hold 24 per cent. of the entire share capital of Asbestos Cement and it was also represented on the Board of Directors of the latter.

Directors' Age

The resolutions calling for the re-election of Directors who were due to retire and who were over 65 years of age gave rise to a heated debate. One of the shareholders wanted that those directors who were above 65 should not be re-elected and that they should "quietly vacate" their offices. He added that, however experienced they were and however valuable their services had been so far, nobody was indispensable and they should be replaced by younger blood, because the services of the older people would not be available for all time. The reappointment of Mr. Purshotamdas Thakurdas (who is now 77), in particular, was objected to by a shareholder, on the ground that he was not in good health and had not attended a single board meeting in the past one year. Another shareholder suggested, as a compromise, that, while retaining the services of the aged Directors and getting the benefit of their sage counsel, some younger people should be elected to the Board and trained.

Replying to the debate, Mr. Khatau said that the remarks about the age of the Directors and their utility were based on wrong appreciation of facts. He said that the Board of the A.C.C. was one of the best. It was not the age that should be considered but the immense knowledge and experience that counted. The amount of responsibility and importance of their suggestions were valuable to the Company in various ways. It might be that the aged Directors were not attending all the meetings of the Board, but what the Company was in need of was direction on general policy and conduct of the Company's affairs and these were available to the Company on the few occasions when they attend the Board meeting. Mr. Khatau added that it was not they who wanted to continue in office but it was the Company which wanted their services.

State Trading

In reply to a question whether the cement industry would be nationalised, Mr. Khatau said that it was very difficult to say anything on this question. So far as the existing industries were concerned, the Government might not nationalise, but would go in for new ventures. Nevertheless, he said that he could not say what the Government had in mind. Strangely enough, there was one shareholder who felt that nationalisation of life insurance was justified and did not see why the cement industry, too, should not be nationalised.

Speaking on the State Trading Corporation, Mr. Khatau said that it was a Government body and its profit depended on what it undertook. It was making a profit on cement produced in India, thus more than making good the loss on import of foreign cement. It looked as though the Corporation was making a substantial profit.

The suggestion made by one of the shareholders that the Company should start a factory of its own to manufacture gunny or paper bags, so that it could save a good lot of the cost on bags, did not find favour with the Chairman. He said that the Company was fully occupied with development of cement production, manufacture of machinery, etc. It was, therefore, not possible to start a bag manufacturing unit. The bags supplied by others were good, he said.

The other main points of Mr. Khatau's replies to various questions are: (1) The repatriation of such portion of the profit made in Pakistan and the cash balances held there is being allowed by the Pakistan Government as it thinks fit. Last year, a sum of Rs. 15 lakhs was received by the Company out of its cash balances in Pakistan and has still to receive Rs. 80 lakhs from that country. No progress has been made regarding the taking over of the Company's factories in Pakistan by the Government. (2) The latest restriction on import of machinery will

(*Continued on page 237*)

INDIAN ALUMINIUM'S NEW ISSUE

AN ATTRACTIVE INVESTMENT

THE Directors of the Indian Aluminium Company, Ltd., have, as readers are already aware, decided to issue 5 per cent. convertible loan stock of the value of over Rs. 2.68 crores, the full details of which are published elsewhere in this issue. The list will open for subscription on 4th February 1957 and will close on 15th February or earlier or later at the discretion of the Directors.

The convertible loan stock has been offered in the first place to the existing shareholders of the Company, of which Aluminium Ltd. of Montreal, Canada, the Company's majority shareholder, has agreed to subscribe to 50 per cent. of the issue. In order to permit increased Indian participation in the Company's capital, Aluminium Ltd. has renounced, with the approbation of the Government of India, its right to subscribe in excess of 50 per cent. The response to the issue is already encouraging, the shareholders, the Directors and their friends having already subscribed to the extent of Rs. 2.12 crores. The small balance of only Rs. 56 lakhs, now available to the non-shareholder public, assures the Company of the success of this novel form of issue.

The convertible loan stock is constituted by a Deed Poll as an unsecured obligation of the Company and carries the right of conversion into ordinary shares. Interest at the rate of 5 per cent. per annum (less tax) will be payable on 1st January each year for the year ended 31st December preceding. The first payment of interest, which will be made on 1st January 1958, will amount to Rs. 9-4 (less tax) for each unit of stock of Rs. 200 outstanding on 31st December 1957.

The proceeds of this issue, together with the recent issue of Rs. 41.1 lakhs of ordinary capital, will be utilised for financing a part of the expansion programme and providing additional working capital, estimated to aggregate Rs. 8.65 crores. The balance will be financed by bank loans, depreciation reserves and undistributed earnings. A part of the issue will be utilised for repaying the sum of Rs. 50 lakhs which the company has borrowed from Aluminium Ltd.

Remunerative

The new ingot capacity of 10,000 tons per annum, together with India's existing capacity of about 7,200 tons per annum, is substantially below the Tariff Commission's estimate of an overall demand of 35,000 tons per annum by 1958. Consequently, the Company expects to market its production from the new smelter at profitable prices, which will provide a reasonable return on the new capital invested, as well as make available sufficient funds to service and repay loans which will become necessary during the construction period. It will be interesting to note that the increased aluminium ingot capacity of the Company, which commenced in the second quarter of 1955, when the capacity of Alupuram smelter was doubled from 2 500 tons to 5,000 tons per annum, has proved to be most rewarding. Thus, the net profit, which was only Rs. 2.69 lakhs in 1954, rose to Rs. 20.44 lakhs in 1955 and, for the nine months ended 30th September 1956, it had risen further to Rs. 23.58 lakhs.

The Company had, no doubt, a difficult period since 1951 and, for the two years 1953 and 1954, it had to skip over the ordinary dividend. Since then, the prospects have considerably improved, following the increase in the ingot capacity of the Alupuram smelter, as is evident from the figures of net profit quoted above and the return of the ordinary shares to the dividend list with the distribution of 9 per cent. for the year 1955. For 1956, the Company has paid an interim dividend of 5 per cent. which, apart from being an increase of 1 per cent. on the corresponding distribution for 1955, is on the increased ordinary capital of Rs. 2.01 crores. The Company comes within the purview of section 23A of the Income-tax Act.

The Rs. 10 ordinary shares are being currently quoted at Rs. 14-10. On the basis of the conversion terms, that is, 15 ordinary shares for every Rs. 200 stock unit during the current year, the price per share works out to Rs. 13-5-4, so that the issue is quite attractive. Even if the conversion facility is not availed of, the stockholders are assured of a decent return of 5 per cent. per annum (taxable).

Points From The Chair

State Trading in Cement

"WE had already recognised the existence of the 'cement gap' and had offered to import foreign cement and to sell it to the consumer at cost. We suggested that price equalisation should be done *without profit*, i.e., that the price of Indian cement should be raised by just so much as would be necessary to meet losses on the sale of imported cement at a common delivered price applicable to both. We suggested that this could be done either through the medium of enhanced excise duty, or by imposing a 'price equalisation cess' on indigenous cement or through the mechanism of a 'price equalisation pool' or 'trust fund,' either voluntary or statutory. We also offered to evolve a pattern of distribution which would involve only the minimum rail movement. But the disappointing outcome of all this was that, while the Government accepted our main proposals, they rejected all the alternative price equalisation mechanisms we had suggested. And so the country was launched upon State trading in cement."

DHARAMSEY M. KHATAU,
Associated Cement Companies, Ltd.

Credit Squeeze Intensified

"The credit squeeze by the banks had to be maintained and even intensified during the year, and has at last been reinforced by a somewhat similar squeeze in the sector of public finance; though I still feel that, by contrast with the Central Government and with Local Authorities, the banks have been asked to carry more than their fair share of the task of exercising monetary restriction. The published figures of the movements in the different categories of advances show clearly that the squeeze has been selective, in that advances to farmers have been but little reduced while advances to some of our chief exporting industries have actually shown increases—but these increases have been much more than offset by the decreases to those industries which are deemed to be less essential to the maintenance of the balance of payments. This selective nature of advances policy has already gone a little way towards enabling the most essential industries to attract more labour. It is sincerely to be hoped that, in the relatively near future, we shall be enabled to judge all applications for assistance purely on their merits from a banking standpoint and not with the spectre of 'directives' looking over our shoulders. It is natural for employers to wish to retain their best workpeople by working short time when markets are poor, but it is clearly very wasteful of the nation's resources at a time like the present, when many jobs are left unfilled; and it is, therefore, a good thing that some steps towards making notices of redundancy less painful have been achieved in recent months."

THE RT. HON. LORD ALDENHAM,
Westminster Bank, Ltd.

Concentration on Exports

"Any forecast of economic conditions in 1957 would be a rash venture at this time. Our economy is so intimately bound up with oil that any doubt about the supply of oil must dominate consideration of our trading prospects. One thing, however, seems clear. We must keep consumer demand at home in check and concentrate on production for export, and we must do our utmost to prevent an increase in the costs of production which will price us out of the export markets. Only by earning a substantial balance of export proceeds over import costs, can we hope to rebuild the gold and dollar reserves we have lost, and to make these reserves adequate in relation to the liabilities of this country as the banker to the sterling area. It should be borne in mind that half of the world's trade is still conducted in sterling."

DAVID JOHN ROBARTS,
National Provincial Bank Ltd.

Results of Disinflationary Measures

"Fortunately, one of the most encouraging results of the disinflationary measures has been the indication of a substantial increase in personal savings, a revival most strikingly manifest in the recent figures of the National Savings Movement. Nothing could be more welcome. There have been other signs of progress. For example, the overburden on the economy has been reflected in a great excess in the number of vacancies on offer, compared with the numbers seeking work. Throughout most of 1956, the gap was narrowing rapidly, and by the end of the year, had disappeared. Up to November, too, the index of retail prices showed no further rise on balance after April, notwithstanding the round of wage increases in the early months of the year."

THE RT. HON. SIR OLIVER FRANKS,
Lloyds Bank Ltd.

Getting Rid of Faulty Thinking

"No one can take out of the common pot more than he puts into it and each of us must in fact take out less, for from what is left in the pot come the resources to bring about the development to which I have referred. The compulsory cutting back of personal spending by controls, credit squeezes and so on will not solve this problem. People themselves must be able to save and invest, and, to do so, the burden of taxation must be lightened. In America, the man who can earn a high salary is highly regarded, and the fact that he is allowed to keep a large part of his earnings, does not excite the feelings of jealousy or attract the odium to which he is subjected in this country. Profits are rightly regarded as a safeguard for employment and are not constantly denigrated as not quite respectable. No political party seeks support by suggesting that levelling down is a worthy object of policy. I am quite sure that we, in this country, must get rid of much faulty thinking on this subject as an essential step in maintaining our position and influence in the world."

SIR NUTCOMBE HUME,
The Charterhouse Investment Trust Ltd.

COMPANY MEETINGS AND DIVIDENDS

PENCH VALLEY COAL CO., LTD. Half-yearly General Meeting, Calcutta, 6th February 1957. Dividend: As. 11-1/5 per share. Transfer books remain closed from 29th January to 6th February 1957, both days inclusive.

AMALGAMATED COALFIELDS LTD. Half-yearly General Meeting, Calcutta, 7th February 1957. Dividend: As. 8 per share. Transfer books remain closed from 29th January to 7th February 1957, both days inclusive.

CALCUTTA LANDING AND SHIPPING CO., LTD. Half-yearly General Meeting, Calcutta, 8th February 1957. Dividend: As. 11-1/5 per share. Transfer books remain closed from 30th January to 8th February 1957, both days inclusive.

BIRDS INVESTMENTS LTD. Annual General Meeting, Calcutta, 15th February 1957. Dividend: Re. 1 per share. Transfer books remain closed from 1st to 15th February 1957, both days inclusive.

ANDHRA SUGARS LTD. Annual General Meeting, Tanuku, Andhra Pradesh, 15th February 1957. Dividend: Re. 1 per share. Transfer books remain closed from 1st to 15th February 1957, both days inclusive.

SAMASTIPUR CENTRAL SUGAR CO., LTD. Annual General Meeting, Kanpur, U.P., 16th February 1957. Dividend: *Nil*. Transfer books will remain closed from 9th to 16th February 1957, both days inclusive.

BALRAMPUR SUGAR CO., LTD. Annual General Meeting, Kanpur, U.P., 20th February 1957. Dividend: *Nil*. Transfer books will remain closed from 11th to 20th February 1957, both days inclusive

INDIAN COPPER CORPORATION LTD. Interim dividend of 1.6d. (6⅔ per cent.) per unit of stock, payable on 15th April 1957. Transfer books will remain closed from 23rd February to 2nd March 1957, both days inclusive.

BOMBAY BURMAH TRADING CORPORATION LTD. Final dividend of Rs. 28-12 per share on fully paid-up shares of Rs. 125 each and Rs. 11-8 per share on partly paid-up shares of Rs. 50 each, payable on 4th March 1957. Transfer books will remain closed from 9th February to 2nd March 1957, both days inclusive.

SHREE KRISHNA GYANODAY SUGAR LTD. Dividend of Re. 1 per ordinary share (10 per cent.), for the year ended 31st July 1956.

UNITED FLOUR MILLS CO., LTD. Interim dividend of Re. 1-8 per ordinary share, for the year 1956. Transfer books remain closed from 28th January to 6th February 1957, both days inclusive.

HOOGHLY FLOUR MILLS CO., LTD. Interim dividend of As. 12 per ordinary share for the half-year ended 30th June 1956. Transfer books remain closed from 28th January to 6th February 1957, both days inclusive.

COMPANY REGISTRATIONS

CAMBATA FERRO-MANGANESE PRIVATE LTD. (First Director: Mr. K. S. Cambata.) Business: Manufacture of ferro-alloys, steels and other by-products. Authorised capital: Rs. 1,50,000. Private company. Address: 42, Queen's Road, Bombay.

COLOUR-CHEM LTD. (First Director: Mr. R. R. Ruia.) Business: Manufacture of dyes, etc. Authorised capital: Rs. 1,00,00,000. Public company. Address: 143, Mahatma Gandhi Road, Bombay 1.

SHREE SAYYAJI PRAKASHAN LTD. (First Director: Mr. Fatesinhrao P. Gaikwad.) Business: Printers and publishers. Authorised capital: Rs. 10,00,000. Public company. Address: Modi Khana Road, Near Sardar Bhavan, Baroda.

JOLLY INDUSTRIAL AGENCIES PRIVATE LTD. (First Director: Mr. G. R. Jolly.) Business: Managing agents. Authorised capital: Rs. 5,00,000. Private company. Address: Lakshmi Building, Sir Pherozeshah Mehta Road, Fort, Bombay 1.

BALRAMPUR SUGAR SUSTAINS LOSS

RESULTS OF ROOPACHERRA TEA BETTER

Balrampur Sugar Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. Begg, Sutherland & Co., Ltd., Kanpur, U.P.) submit the audited accounts of the Company for the year ended 30th June 1956.

It will be observed that the accounts are presented in the new form required by the Companies Act, 1956. The results for the year, after making the usual provisions, charging depreciation, and adjustments, and after providing a contingencies reserve for stock realisation of Rs. 70,000 show a loss of Rs. 69,251 (profit of Rs. 3,14,853). From this amount has been deducted the carry forward from the previous year of Rs. 20,880 (Rs. 23,527) leaving a debit balance to be carried forward of Rs. 48,371. Credit balance of Rs. 3,38,380 from the directors allocated Rs. 1,20,000 for depreciation; Rs. 1,00,000 to rehabilitation reserve; Rs. 80,000 to contingency reserve and paid a dividend of one anna per share, absorbing Rs. 17,500, leaving a balance of Rs. 20,880 to be carried forward.

The crops taken off by the Factories in the crushing season covered by this report are disappointing as compared with other factories in the U.P. and Bihar. Balrampur crushed 18,65,905 (21,49,154) maunds of cane with an extraction of 9.57 (9.75) per cent., while Tulsipur crushed 22,00,961 (24,42,946) maunds of cane with an extraction of 9.97 (9.46) per cent. There was an improvement in the quality of the cane supplied to the Tulsipur Factory, but at the Balrampur Factory there was a deterioration in the quality of cane supplied. Balrampur Factory started crushing on the 12th December 1955 and finished on 16th March 1956. Tulsipur Factory started crushing on 1st December 1955 and finished on the 6th April 1956.

The cane price remained at the high rate of Re. 1-7 per maund at the Factory gate and Re. 1-5 per maund at outstations, and these relatively high prices encouraged farmers to grow more cane. This was a general experience throughout the Sugar Industry with the result that the sugar production in the country rose to an all-time record of 18.5 lakh tons. The result of this high production of sugar in India tended to reduce the market prices for sugar, particularly in Bihar and U.P. where factories have to compete with sugar factories nearer the port towns. This disadvantage, aggravated by a shortage of railway wagons on the N. E. Railway in the early part of the selling season, also tended to depress prices. The stocks of sugar remaining unsold on the 30th June were considerable, particularly stocks of sugar which had been sold but could not be delivered due to the shortage of railway wagons. Since the 30th June, sugar prices have fallen considerably and on that account the directors have considered it prudent to create a contingency reserve.

There was a high standard of efficiency at both factories. Shortage of wagons delayed the delivery of sugar during the selling season. The utilisation of (Rs. 2,00,000) out of the rehabilitation reserve is included in the accounts.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	17,30.000	Block ...	12,16,880
Reserves ...	12,32,202	Stock-in-trade ...	59,72,548

Liabilities ...	67,29,236	Goods-in-transit ...	23,037
		Debts, deposits & advances ...	14.62,649
		Cash ...	1,10,458
Rs.	98,08,853	Rs.	98,08,853

Roopacherra Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The season's working resulted in a profit, before providing for depreciation, of Rs. 1,86,020 (Rs. 4,55,805) to which was added the profit on sale of machinery Rs. 1,533 (*nil*) and balance of profit brought forward from 1954 of Rs. 22,603 (loss of Rs. 3,71,177) making a total of Rs. 2,10,156 (Rs. 48,603 after providing for taxation and depreciation). Provision for taxation absorbed Rs. 45,977 (Rs. 14,000), adjustment account Rs. 37,553 (Rs. 2,030) and depreciation on fixed assets Rs. 33,001 (Rs. 27,730) leaving a balance of Rs. 93,625 (Rs. 48,603). From this amount the directors transferred to buildings and machinery reserve Rs. 40,000 (*nil*) and paid a dividend of 15 (10) per cent. for the year ended 31st December 1955, on 26,000 ordinary shares of Rs. 10 each, absorbing Rs. 39,000 (Rs. 26,000) leaving to be carried forward Rs. 14,625 (Rs. 22,603).

Crop.—The saleable crop weighed out at 8,453 (6,309) maunds against an estimate of 7,300 maunds, and was disposed of at an average price of As. 25.97 (As. 36.37) per lb.

Estimate 1956.—The estimate for season 1956 provides for a saleable crop of 8,000 maunds at a total revenue expenditure of Rs. 9,80,977.

The results may be regarded as satisfactory, considering the general recession in tea prices during the period under review.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	2.60,000	Block ...	4,24,515
Reserves ...	3,56,592	Stock of tea ...	3,93,524

Liabilities ...	3,30,166	Debts and advances ...	49.984
Profit and loss account ...	14,625	Investments ...	1,110
		Cash ...	1,885
Rs.	10.21,351	Rs.	10,21,351

Nelliampathy Tea and Produce Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. A. V. Thomas & Co., Ltd., Alleppey) submitted the audited accounts of the Company for the year ended 30th June 1956.

The tea crop harvested was 7,60,720 lbs. costing 120.82 cents per lb. against an estimate of 7,50,000 lbs. to cost 115.03 cents per lb. The crop harvested was 10,720 lbs. more than the estimate. Owing to enhanced bonus for 1953 and 1954 paid to the labourers during the year, as per the decision of a Tripartite Conference in T.-C. State, the cost of production per lb. exceeded the estimated figure of 115.03 cents by 5.79 cents. The average sale price realised during the year was 195 cents per pound as against 233 cents per pound for the previous year. There was a phenomenal drop in tea prices during the year and this has affected adversely the profit for the year under report, in comparison with the previous year.

Rubber crop harvested was 75,200 lbs. at a cost of 64.45 cents per lb. The rubber crop harvested was satisfactory being 10,200 lbs. more than the estimate. The yield per acre worked out at 601.6 lbs. per acre. Coffee crop harvested was 88 50 (113.33) cwts. against an estimate of 100 cwts. Cardamom crop harvested was 13,554 (12,911) lbs. against an estimate of 10,000 lbs.

After providing for depreciation and income-tax amounting to Rs. 2,29,769 and payment of 6 per cent. preference dividend for 1955-56 amounting to Rs. 27,000, the net profit including the previous year's carry forward of Rs. 43,289 amounted to Rs. 1,49,623 available for distribution which the directors disposed of as under:—

Payment of a dividend of 10 per cent. for the year 1955-56 on equity shares Rs. 1,20,000, transfer to rehabilitation reserve Rs. 25,000 and carry over to next year Rs. 4,623.

Estimate for 1956-57

	Crop Lbs.	*Cost of production* Cents per lb.
Tea ..	7,50,000	114.39
Rubber ..	65,000	75.19
Cardamom .	12,000	Rs. 5.42 per lb.
Coffee ...	100 cwts.	Rs. 691.58 per cwt.
Tea seed ..	40 mds.	Rs. 119.95 per md.

Rs.	29,97.163	Rs.	29,97.163

Hooghly Mills Co., Ltd.

The directors of the above Company (Chairman: Mr. Baijnath Bajoria, Calcutta) submitted the audited accounts of the Company for the year ended 31st March 1956.

During the year 1955-56 the Company was managed by the then managing agents Messrs. Gillanders Arbuthnot & Co., Ltd., who resigned with effect from 11th August 1956. Since then the Company is managed by the board of directors.

In accordance with the Indian Jute Mills Association's agreements the Mill worked 48 hours per week from 1st April 1955 to 31st March 1956 with 12½ per cent. looms sealed from week ending 5-4-55 to 10-1-56, 10 per cent. from week ending 17-1-56 to 21-2-56 and 5 per cent. during the remaining part of the year.

During the period under review, a threatened shortage of raw jute caused prices to reach uneconomic levels.

The result of the year's working was a loss of Rs. 3,65,329 (profit of Rs. 5,74,972) deducting rebate on foodstuffs purchased in previous year Rs. 4,252 (Rs. 2,843). Refund of income-tax on investment income Rs. 616 (*nil*) and provision made in previous year against contingent loss on forward jute purchase written back Rs. 39,030 (*nil*) there was Rs. 3,21,431 (Rs. 6,30,315). Adding to this income-tax and super-tax short provided in previous year Rs. 9,027 (Rs. 1,51,388), provisions against contingent loss on forward jute purchase Rs. 9,343 (Rs. 39,030) there was a balance of Rs. 3,39,801 (Rs. 3,39,747). Deducting the credit balance brought forward from previous year of Rs. 44,548 (Rs. 32,401) there was a net loss of Rs. 2,95,253 (Rs. 44,548 after paying a dividend of 12½ per cent. on ordinary shares) and this the directors carried forward Rs. 2,95,253.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	28,56.000	Block ...	18,76,815
Reserves ...	18,51,969	Stock of jute	18.03.885
Provision for taxation ...	1,90,785	Stores ...	9,89,885
Liabilities ...	20,81,561	Deots, deposits & advances ...	18,63,654
		Investments	83,603
		Cash ...	17,220
		Profit & loss account ...	2,95,253
Rs.	69,90,315	Rs.	69,90,315

Investment Trust of India, Ltd.

The directors of the above Company (Managing Agents: Messrs. Kothari Mehta and Co., Private Ltd., Madras) submitted the audited accounts of the Company for the year ended 30th September 1956.

The result of the Company's working for the year under review is a profit of Rs. 63,485 (Rs. 1,27,826) after adding the balance brought forward from last year of Rs. 4,531 there was a total of Rs. 68,016. Provision for taxes absorbed Rs. 5,000 and transfer to general reserve Rs. 10,000. Leaving a balance of Rs. 53,016. The directors disposed of this balance as under:—

Paid a dividend at 4½ per cent. on the ordinary shares (free of tax) Rs. 45,000 and carried forward to next year Rs. 8,016.

The share market was active during the year under review and there has been an all-round increase in the value of the shares held by this company. The total market value of the investments held by the Company as on 30th September 1956 was about 47 per cent. higher than the book value. Since closing our account, the award of the Special Tribunal on Plantations has increased the financial burden on the industry to an enormous extent and has lowered the market prices of shares of planting companies. A further fall in the market prices of shares in general has been brought about by the recent budget announcement of the Finance Minister levying capital gains tax as well as increased taxes on dividends.

In spite of such fall in share values, the total market value of the investments held by the company is substantially higher than the book value.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	10,00,000	Investments	9,61,240
Reserves ...	1,39,782	Loans and advances ...	1,72.478
Provision for taxation ...	27.274	Cash	1,06,651
Liabilities ...	65.297		
Profit and loss account ...	8,016		
Rs.	12,40,369	Rs.	12,40,369

Woodland Estates Ltd.

The directors of the above Company (Managing Director: Mr. M. K. Thomas, Trivandrum) submitted the audited accounts of the Company for the year ended 31st March 1956.

Capital.—It will be recalled that the Company's authorised capital was increased during the year under review from Rs. 3,50,000 to Rs. 20,00,000 by the creation of 1,25,000 ordinary shares of Rs. 10 each and 40,000 6½ per cent. tax-free redeemable *cum*-preference shares of Rs. 10 each, on 12th September 1956.

The Company purchased from the Poonmudi Tea and Rubber Company Limited, London, the Braemore Estate measuring 765.06 acres for a consideration of Rs. 10,50,000.

To finance the purchase, the directors issued during the year 53,000 ordinary shares of Rs. 10 each at par, ranking *pari passu* with the old ordinary shares in all respects except as to dividends and 13,250 6½ per cent. tax-free redeemable-*cum*-preference shares of Rs. 10 each at par ranking *pari passu* with the old preference shares in all respects, except as to redemption, along with an issue of 1,000 6 per cent. income-tax free first mortgage debentures of Rs. 500 each secured by a first mortgage on the immovable properties of the Company including the new estate with a floating charge on the Company's business on the terms of a trust mortgage deed executed in favour of Mr. Thomas Vellapally, Barrister-at-Law, Kottayam—the trustee for the debenture holders. Of this issue 52,001 ordinary shares, 9,350 6½ per cent. tax-free redeemable-*cum*-preference shares and 923 debentures have been subscribed for, till date of this account and the balance subsequently.

The Ackal Estate was sold during the year for a consideration of Rs. 90,000 on 14th September 1955.

The Braemore Estate was taken possession of on 28th February 1956 and the conveyance was registered subsequently on 5th July 1956. The Braemore and Marigold Estates were amalgamated together for all working purposes from 1st March 1956. With the addition of Braemore Estate, the Company's total acreage under various cultivation, at present, is as follows:

Tea in bearing 329.04 acres, tea immature 26.45 acres, abandoned tea 4.00 acres, rubber tapped area 567.63 acres, rubber untapped area 49.50 acres and sundry produce and wasteland 199 34 acres.

Rubber.—The crop harvested during the year was 1,16,845 (89,972) lbs. (Lekshmi Estate—61,714 (56,554) lbs.; Marigold Estate—29,211 (23,710) lbs.; Ackal Estate (till the date of sale—7,170 (9,708) lbs.; Braemore Estate—150 (*nil*) lbs.) at a cost of 60.53 (59.22) cents per lb. which includes a sum of Rs. 8,620 spent on the rubber area of Braemore Estate during March 1956. Sales during the year including the opening stock of 18,600 (7,628) lbs. and 160 lbs. taken over from Braemore Estate on 28th February 1956, was 39,977 (46,804) lbs. sheet at 146.2 (132.99) cents per lb., 15,084 (17,551) lbs. scrap at 101.3 (87.00) cents per lb. and 44,043 (14,645) lbs. latex at 143.1 (130.00) cents per lb. There is a balance of 12,831 (13,726) lbs. sheet and 5,070 (4,874) lbs. scrap which have since been sold.

Tea.—Consequent on the taking over of Braemore Estate on 28th February 1956, the Company stopped manufacture of tea in Marigold Tea Factory from 1st March 1956 onwards, and the green leaf of Marigold Estate too was taken over to Braemore Factory for manufacture thereby eliminating the cost of running the Marigold Factory as a separate unit.

The crop harvested during the year was 47,788 lbs. (37,510 lbs. from Marigold Estate and 10,278 lbs., from Braemore Estate from the date of taking over) at a cost of 148.7 cents per lb. as against 36,002 lbs. from Marigold Estate at a cost of 148.58 cents in the previous year. Sales during the year including the opening stock of 6,112 (6,053) lbs. and 1,601 (*nil*) lbs. taken over from the Braemore Estate on 28th February 1956, was 29,399 (34,943) lbs. at an average price of 154.00 (210.59) cents per lb. Due to the slump in the tea market, the quantity sold and the prices realised were comparatively low. There is a closing stock of 26,102 lbs. which has since been sold.

Minor Produce.—The income for the year was Rs. 18,263 as against Rs. 15,434 in the previous year. Capital expenditure during the year amounted to Rs. 8,531 (Rs. 9,405).

The net profit after providing for depreciation and other expenses; Rs. 2,579 for accrued interest on debentures and Rs. 30,000 (Rs. 30,000) for taxation, was Rs. 37,706 (Rs. 47,086). After adding the amount brought forward from the previous year of Rs. 5,524 (Rs. 1,063) there was a total of Rs. 43,230 (Rs. 48,148). After deducting 6½ per cent. *cum* preference shares (old) dividend declared for 1955-56 Rs. 6,500 (Rs. 6,500) there was left a balance of Rs. 36,730 (Rs. 41,648). Out of this the directors paid a dividend at 12½ (20) per cent. on the ordinary shares (old) Rs. 20,625 (Rs. 33,000), paid bonus equivalent to three months emoluments to staff Rs. 3,859 (Rs. 3,125), transferred to general reserve Rs. 10,000 (*nil*) and carried forward to next year's accounts Rs. 2,245 (Rs. 5,524).

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	8,78,510	Block ...	13,15,370
Debentures	4,61,500	Stock-in-trade	65,633
Reserves ...	87,259	Estate stores	33,031
Provision for taxation ...	42,921	Other assets	17,963
Liabilities ...	50,574	Debts, deposits and advances ...	1,01,914
Profit and loss account ...	43,229	Cash ...	30,082
Rs.	15,63,993	Rs.	15,63,993

N.B.—Figures within brackets relate to the corresponding period of the previous year.

ENGINEERING

(*Concluded from page 224*)

now implementing their programme to develop these mines so as to raise 1,000 tons of ore a day which will be sufficient to feed a zinc refinery of 10,000-12,000 tons per annum. It is expected that this zinc refinery will come into operation by 1960-61 to coincide with the availability of electric power from the Chambal hydro-electric scheme. In this connection, Mr. Shah said: "Even after the establishment of this refinery, there would still remain a large gap between the demand and projected capacity. However, the establishment of further units of zinc refinery will depend upon proving of ore reserves in different hills of the Zawar mines area and/or discovery of new workable deposits."

India is not producing any tin at present, for no workable deposits have been located so far. Sporadic occurrences have, however, been reported in Bihar. The main consumers of tin are the tin plates industry and the alloy-making industry. The demand for tin is of the order of 3,000-4,000 tons, all of which is now met by imports. It is expected to go up to 7,000 tons by 1960-61 due to increased production of tin plates and copper-tin base alloys.

There is sufficient capacity in the country for the smelting of antimony ore. The installed capacity of the unit engaged in smelting operations is 1,000 tons per year which is more than sufficient to meet the present demand, estimated at 600 tons and the projected demand of 800-1,000 tons by 1960-61. The main consumers of antimony metal are storage battery, printing and type metals, the anti-friction bearing metals, railways and ordnance factories. The consumption of antimony by these industries will increase as a result of their expansion during the second Plan period. Although there is requisite ore smelting capacity to meet the demand, in order to ensure the uninterrupted working of this industry there is urgent necessity of locating workable deposits inside the country or making some long-term arrangement for importing the ores from other countries, such as China, which has the largest deposit of antimony. Mr. Shah, therefore, felt that it may be useful to explore the possibilities of supplies of ores from this source.

Non-ferrous Semis

In the sphere of non-ferrous metal semis, the country has capacity for the production of plates, sheets—strips, foils, circles, bars and sections, pipes and tubes and wires of aluminium, copper, brass, zinc and lead. There is also a large capacity for the manufacture of various types of copper-base strong alloys and soft alloys of lead, tin and antimony. The installed capacity of the alloy-making industry is more than sufficient to meet the demand of the country. However, the position of copper and brass sheet rolling industry is not very healthy as there is substantial idle capacity in this industry. This state of affairs has arisen due to the fact that many units which came into existence just after the Second World War, are capable of producing only commercial quality sheets suitable for utensils and hollow-ware industry. Demand for this type of product has gone down since the war. Thus, the demand for brass and copper utensils has decreased due to high prices and the inroads made by substitutes such as aluminium and stainless steel utensils. Mr. Shah, therefore, felt that it was necessary to rationalise the production of existing units and to diversify their products through installation of suitable balancing machinery so that industrial types of sheets conforming to rigid standard specifications are manufactured. These are used by the industries such as automobiles, electrical accessories and appliances, industrial machinery, flashlight torch, etc. Mr. Shah urged the Council to investigate the existing state of affairs in this sector of the industry and suggest ways and means to rationalise production and place it on a sound footing.

Finally, Mr. Shah did well to draw the attention of the Council to the twin problems of active prospecting for fresh sources of metals and of importing ores to feed the metal industries. He said that, while, on the one hand, they must concentrate intensively on efforts at rapid surveys and provings of different ores in order to have the availability of indigenous ores, they must, on the other, remember that many industrially advanced countries have gone ahead with the production of metals and alloys from imported ores. The Council, as Mr. Shah himself suggested, should, therefore, consider the question of facilitating the establishment—wherever it was profitable, economic and essential to do so —of smelting and metal-producing units in the country dependent even on imported ores.

COMPANY AFFAIRS

(*Concluded from page 234*)

affect the Company to some extent, but it will not affect it to such an extent as others, since the Company is using a large portion of the machinery manufactured in India. (3) The Company is supplying 46 per cent. of its cement production to the Government and 54 per cent. to the public. (4) Interest at 9 per cent. has to be charged on the amount of calls received after the due date, in fairness to those who have paid the calls in advance and on due date. The interest so charged is roughly equivalent to the dividend paid. (5) The travelling expenses spent by the Company's officials were justified, as periodical inspection of factories spread over the various parts of the country is very essential in the interests of the Company. The shareholders should, in fact, encourage more visits by officials to the factories. The Directors are convinced that such visits should be more frequent and hence the proposal to buy an aeroplane for the use of officials. Anyway, it is very difficult to get the Government's permission to purchase an aeroplane and the question of luxury does not, therefore, arise now. (6) It is not possible to reduce the managing agency commission. With the heavy personal taxation, it is not worthwhile for anybody to continue as managing agent. Any reduction in the commission will, therefore, tantamount to adding insult to injury. (7) The Company's income-tax has been settled up to 1953-54 in India and up to 1952-53 in Pakistan. (8) The import duty on cement is Rs. 5 per ton. (9) With 30,000 shareholders on the books of the Company, it takes two months for the preparation and the posting of dividend warrants to the shareholders. (10) Despatch of dividend warrants by registered post will mean delay and will cost Rs. 20,000 more. The loss in transit is, however, very small.

Notices

THE BOMBAY BURMAH TRADING CORPORATION, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Ninety-third Ordinary General Meeting of the Shareholders of the Corporation will be held at the Indian Merchants' Chamber Hall, Lalji Naranji Memorial Building, 76, Veer Nariman Road, Bombay 1, on Monday, 25th February 1957, at 3 p.m. (S.T.), for the purpose of transacting the following business:—

1. To receive and adopt the Directors' Report and Audited Accounts for the year ended 31st May 1956.
2. To sanction the declaration of a Dividend.
3. To confirm the appointment of Mr. R. E. Forrester as Director.
4. To elect a Director in the place of Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., who retires by rotation and is eligible for re-election, by passing the following resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Corporation.

   "Resolved that Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., who has attained the age of 77 years, and who retires by rotation, be and is hereby re-elected a Director of the Corporation and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."
5. To elect a Director in the place of Mr. M. G. R. Aitken, who retires by rotation and is eligible for re-election.
6. To appoint Auditors for the current year and to fix their remuneration.

By Order of the Board,
R. E. FORRESTER,
Chairman.

N.B.—A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself, and a proxy need not be a member of the Corporation.

The Transfer books of the Corporation will be closed from 9th February 1957 to 2nd March 1957, both days inclusive.

BOMBAY, *9th January* 1957.

EXPLANATORY STATEMENT AS REQUIRED BY SECTION 173 OF THE COMPANIES ACT, 1956.

The Special Resolution set out under item 4 is required as Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., has attained the age of 77 years and hence cannot be re-appointed a Director except by a resolution in respect of which special notice has been given in accordance with Sections 190 and 281 of the Companies Act, 1956. Notice has been received that this Special Resolution will be proposed.

Sir Cowasjee Jehangir, Bart., G.B.E., K.C.I.E., has been on the Board of the Corporation for over 25 years. In view of his wide and varied experience in the business life of the country and the valuable services he has rendered to the Corporation, it is most desirable that the Board should continue to receive the benefit of his services.

BURMAH-SHELL REFINERIES LIMITED

NOTICE IS HEREBY GIVEN THAT THE Register of the Company's 5½ per cent. Debentures 1965-69 will be closed for transfers from 15th February 1957 to 28th February 1957, both days inclusive.

P. A. ENGINEER,
Secretary and Treasurer, State Bank of India, Agents for Burmah-Shell Refineries Ltd., for the management of the Debentures.

STATE BANK OF INDIA,
MUNICIPAL LOANS SECTION,
APOLLO STREET, FORT,
BOMBAY, 1, *1st February* 1957.

Notices

RESERVE BANK OF INDIA

APPLICATIONS ARE INVITED FOR THE following posts in the Reserve Bank of India:

(A) Posts and Scales of Pay:

1. Probationary Assistants, Department of Research and Statistics/Legal Division—Rs. 250-25-450 E.B. 25-650.
2. Economic/Statistical Assistants, Department of Research and Statistics—Rs. 175-12½-300 E.B. 20-440.
3. Field Inspectors—Rs. 175-12½-300 E.B. 20-440.
4. Field Investigators—Rs. 90-5-100-8-140 E.B. 10-250 E.B. 12½-300.

Note:—Candidates possessing exceptionally good qualifications and experience of value to the Bank and those having experience of field investigation work, may be given a higher starting pay in the prescribed scale.

In addition to pay, the selected candidates will be eligible to draw local pay, house rent allowance and dearness allowance at the rates prescribed by the Bank from time to time.

(B) Age Limits as on 1st January 1957:

1. Probationary Assistants, Department of Research and Statistics/Legal Division—Not less than 21 years and not ordinarily over 24 years.
2. Economic/Statistical Assistants—Between 18 and 24 years.
3. Field Inspectors—Between 18 and 24 years.
4. Field Investigators.
   (a) *Undergraduates*—Between 18 and 22 years.
   (b) *Graduates*—Between 18 and 24 years.

The maximum age limit is relaxable but not beyond 30 years, in the case of—

(1) Probationary Assistants in the Department of Research and Statistics possessing special qualifications and experience of value to the Bank;

(2) Probationary Assistant in the Legal Division;

(3) Candidates having extensive field experience;

(4) Candidates with approved war service;

(5) Ex-employees of Banking Institutions whose services had to be terminated for reasons of economy or as a result of the Banks going into liquidation;

(6) Personnel retrenched from Government offices after at least one year's service, applying through Employment Exchanges and

(7) Candidates belonging to the Scheduled Castes or Scheduled Tribes.

(C) Qualifications:

1. Probationary Assistants, Department of Research and Statistics.
   Essential: A brilliant academic record with a first or high second class Master's degree in Economics or Agricultural Economics or Commerce or Statistics/Mathematics.
   Desirable: 1. A period of research work in
   (a) Agricultural Economics
   (b) Co-operation
   (c) Rural Sociology, or
   (d) Sampling Theory.
   2. Experience gained in a responsible position in a Co-operative Institution/Department.
   3. Experience of field investigation work.
2. Probationary Assistant, Legal Division.
   Essential: Applicants should be Advocates or Solicitors and must possess high academic qualifications in law and practical experience of work in an Advocate's or Solicitor's office or experience of independent practice, *for a minimum period of four years.*
3. Economic/Statistical Assistants.
   Essential: A first or high second class M.A. or M.Com. degree in Economics or Statistics of a recognised University.
   Desirable: Practical experience of research in Economics or Statistics.
4. Field Inspectors.
   Essential: At least a second class Bachelor's degree in Economics, Commerce, Agriculture, Mathematics or Statistics of a recognised University.
   Desirable: (1) Practical experience of the working of Co-operative Credit Institutions or Agricultural Marketing and Processing Societies or Industrial Co-operatives.
   (2) Experience of field investigation work.
   (3) Special study of Agricultural Economics or Rural Sociology.
6. Field Investigators.
   Essential: Matriculation or equivalent examination of a recognised University or Board in first or second class with *at least* 50 per cent. marks in English, Mathematics and Geography.
   Desirable: (1) A Bachelor's degree of a recognised University.
   (2) Experience of field investigation work or of work in Co-operative Institutions.
   (3) Knowledge of two or more vernacular languages.

Note:—Field Investigators and Field Inspectors should be able to *speak and write* one or more of the following vernacular languages:

(1) Bengali, (2) Gujarathi, (3) Hindi, (4) Kannada, (5) Punjabi, (6) Tamil, (7) Telugu.

The selected candidates for the posts of Probationary Assistants, Department of Research and Statistics/Legal Division will ordinarily be on probation for a period of three years.

The selected candidates for the posts of Probationary Assistants in the Department of Research and Statistics should be prepared to work in Districts selected for Rural Surveys and should be able to conduct the field work, if required.

The selected candidates for the posts of Field Inspectors and Field Investigators will be appointed on a temporary basis for a period of one year in the first instance but are likely to be made permanent and they will be stationed in Districts selected for Rural Surveys and will be required to carry on investigations in selected Villages in such Districts.

The selected candidates for the posts of Economic/Statistical Assistants will be required to appear for a written test.

Candidates who wish to apply for more than one category of posts must submit *separate* applications accompanied by *separate* application fees and *they should also mention prominently on their applications the other posts applied for by them.*

Applicants for the posts of Probationary Assistants must remit application fee of Rs. 7-8 by Postal Order, Cheque or Bank Draft on a *Scheduled Bank payable at Bombay* along with the application. Applicants for the posts of Economic/Statistical Assistants and Field Inspectors must remit an application fee of Rs. 2 in a similar manner. The application fee is in no case refundable. *Bona fide* Refugee candidates who are NOT IN EMPLOYMENT applying through any of the Government Employment Exchanges are exempted from payment of application fees while in the case of candidates belonging to Scheduled Castes/Scheduled Tribes the fee will be reduced to 1/4th.

Applications should be in the candidate's own handwriting. Applications for the posts of Probationary Assistants, Department of Research and Statistics/Legal Division, Economic/Statistical Assistants should be in the prescribed form obtainable from any office of the Reserve Bank. Applications for the posts of Field Inspectors and Field Investigators should be on plain paper and must contain the following information:

Name in full; educational qualifications—Examinations passed with subjects, distinctions, classes and marks obtained; Schools, Colleges and Universities attended; date of birth; age; address; place of birth and domicile; community; details of previous office/research experience, if any; period of approved war service, if any; *number of languages able to speak and write;* father's name; father's occupation; extra curricular activities; proficiency in games, etc.

All the applications should be accompanied by copies of two testimonials (originals should not be sent; the Bank does NOT accept responsibility for returning the originals if sent through oversight) and forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1, so as to reach him on or before the 18th February 1957. *Candidates already in service must submit their applications through their employers.* Candidates belonging to Scheduled Castes or Scheduled Tribes should mention this fact prominently on their applications and also enclose a copy of certificate to that effect from a competent authority.

Appointments will be subject to candidates being found medically fit for service in the Bank. If any candidate desires to have his application acknowledged he should send it by "Registered Post Acknowledgment due." Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into any correspondence with them.

Canvassing in any form will be regarded a disqualification.

THE INDIAN CABLE COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT A General Meeting of the Shareholders of The Indian Cable Company, Ltd., will be held at the Registered Office of the Company, 9, Hare Street, Calcutta, on Friday the 22nd February 1957, at 11.00 a.m., to consider and if thought fit to pass, with or without modification, the following resolutions, namely:—

1. (*As a Special Resolution*) That the capital of the Company be increased to Rs. 4,00,00,000 by the creation of 20,00,000 additional Ordinary Shares of Rs. 10 each.
2. (*As a Special Resolution*) That the regulations contained in the printed document submitted to the meeting, and for the purpose of identification subscribed by the Chairman thereof, be approved and adopted as the Articles of Association of the Company, in substitution for, and to the exclusion of, all the existing Articles thereof.

By Order of the Board,
S. N. MUKERJEE,
Chairman.

9, HARE STREET,
CALCUTTA, *21st December* 1956.

N.B.—A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

STATE BANK OF INDIA

NOTICE

THE SECOND ANNUAL GENERAL MEETING of the Shareholders of the State Bank of India will be held at the Local Head Office of the Bank, Apollo Street, Bombay, on Thursday the 28th February 1957, at 4 p.m., (Standard Time), for the transaction of the following business:—

To receive the Central Board's Report, the Balance Sheet and Profit and Loss Account of the Bank made up to the 31st December 1956 and the Auditors' Report on the Balance Sheet and Accounts.

H. V. R. IENGAR,
Chairman.

BOMBAY, *25th January* 1957.

MONEY RATES FIRM

(From Our Own Correspondent)

BOMBAY, *30th January*

There was hardly any change in the trend of the short-term money market; it continued to experience stringency during the week under review also. In the face of acute scarcity of funds, the demand for bank credit showed no signs of abatement, with the result that banks had to seek temporary accommodation from the Reserve Bank of India or the State Bank. Interest rates were, therefore, firmly held at the previous week's levels.

The inter-bank call section was dull in the absence of lenders. The rate was, however, unchanged at 3½ per cent. among all sections of banks. House money at call was in keen demand at 3¾ to 4 per cent. Short-term deposits also were sought at 3¾ to 4 per cent.

For the second week in succession, there has been a small contraction in notes in circulation. The Reserve Bank of India statement for the week ended 25th January 1957 shows a fall of Rs. 5.37 crores in this portfolio, following the decline of Rs. 4.32 crores in the previous week. Notes held in the Banking Department have, on the other hand, gone up by Rs. 5.91 crores; the consequent rise of Rs. 54 lakhs in total notes is covered by a similar increase in rupee coin. There has been a further fall of Rs. 14.91 crores in foreign securities, which is offset by a corresponding expansion in rupee securities. In the Banking Department, a fractional rise of Rs. 75 lakhs is noted in deposits of the Central Government and an increase of Rs. 6.30 crores in deposits of other Governments. Deposits of banks are lower by Rs. 1.23 crores. On the assets side, balances held abroad have risen by Rs. 1.94 crores, while loans and advances to Governments have dropped by Rs. 94 lakhs and other loans and advances by Rs. 42 lakhs. Outstanding borrowings of Scheduled banks against usance bills are also lower by Rs. 1.39 crores. Fresh borrowings by banks against usance bills during the week were of the order of Rs. 11.21 crores, but the decline in outstanding borrowings noted above indicates that repayments must have been Rs. 12.60 crores.

A rise of Rs. 11.71 crores in demand deposits is disclosed by the Scheduled banks' statement for the week ended 18th January 1957. This brings the aggregate increase for the two weeks ended 18th January to Rs. 20.43 crores. Time deposits have also risen by Rs. 1.67 crores during the week under review. Inter-bank borrowings are also up by Rs. 1.91 crores, while borrowings from the Reserve Bank stand reduced by Rs. 3.97 crores. Borrowings from the State Bank of India have, on the other hand, risen by Rs. 1.28 crores. On the assets side, advances show an increase of Rs. 4.21 crores and bills purchased and discounted Rs. 3.23 crores. Cash balances are lower by Rs. 1.13 crores, while money at call and short notice are up by Rs. 2.12 crores.

The Gilt-edged market maintained a steady tone during the week under review, with a further small rise in some of the securities. The scarcity of stocks, paucity of offerings and demand from the Life Insurance Corporation for some of the long-dated issues were all responsible for the improvement in the undertone. The volume of business also showed a slight improvement. 3 per cent. 1986 Conversion Loan staged a further rise of As. 2 to Rs. 73-9. 3 per cent. 1970-75 gained an anna to Rs. 87-1. 3 per cent. 1966-68 was unchanged at Rs. 92-5. 3 per cent. 1964 at Rs. 94-6 and 3 per cent. 1963-65 at Rs. 94-3. 3 per cent. 1959-61 held its own at Rs. 97-11. 3½ per cent. 1962 was on offer at Rs. 97-14. 3¾ per cent. 1961 was maintained at Rs. 99-6, while 3¾ per cent. 1964 hardened by an anna to Rs. 98-7. 3½ per cent. 1965 was marked up by As. 2 to Rs. 98-6. 3½ per cent. 1967 had sellers at Rs. 98-7½ and 3¾ per cent. 1974 at Rs. 98-8.

In the State loan section, some of the 4 per cent. Bombay, Hyderabad and Saurashtra loans attracted some attention at quoted rates, while others were neglected.

In the foreign exchange section, the rupee was a little erratic in terms of the U.S. dollar, but, on balance, showed a slight weakening, in consonance with a similar trend displayed by sterling abroad. Thus, banks' selling rate for ready dollars, after rising from Rs. 478 to Rs. 478¼, dropped to Rs. 478¾ per $100. The buying rate improved from Rs. 474¼ to Rs. 475. The selling and buying rates for Canadian dollars were Rs. 500¼ and Rs. 494¼, as against Rs. 489¼ and Rs. 493¼, respectively, a week ago. In New York, spot sterling reacted from $2.79.15/16-2.80.1/16 to $2.79.11/16-2.79.13/16, but towards the close gained to $2.79¾-2.79¾. Three months' forward showed a drop from $2.78¾-2.79 to $2.78¾-2.78¾. Transferable sterling was, however, a shade better at 276.65-276.75 cents, as against 276.55-276.65 cents a week ago.

HIDES STEADY

(From Our Own Correspondent)

MADRAS, *28th January*

The Madras tanned cow hides market has remained steady, due to brisk clearance of stocks by shippers. Though for shipment business U.K. importers have been offering prices which are As. 2 to As. 3 lower than Madras market, shippers who have earlier high-priced orders to cover have been in the market and this has prevented prices at origin to come into line with U.K. current asking levels. It is likely that the market will decrease during the middle of February at this end, once shippers have completed their old orders.

Shippers to the U.S. have been slowly buying buff hides at Re. 1-7 to Re. 1-7-3 per lb. Sales of buff calf and cow calf have been slow.

In the tanned skins section, arrivals of market qualities have met with ready clearance and prices rule firm. Superior tannages also have been in good demand. The stocks available for sale in the London public auctions which commence today are 400,000 goat skins and 200,000 sheep skins.

BULLION DRIFTS LOWER

(From Our Own Correspondent)

BOMBAY, *30th January*

An erratically lower trend was witnessed in the bullion market during the week under review, which was a short one on account of two holidays. The market remained closed on Saturday and today, being Republic Day and Mahatma Gandhi death anniversary, respectively.

The bullish fervour witnessed in the previous three weeks abated a little. There was nervous unloading by bulls on fears of Government intervention and reports of fresh arrivals of Tibetan silver coins. The expectation that there would not be any more arrivals of coins from Kalimpong did not prove correct, as a fresh consignment of coins, equivalent to 300 bars, was reported to have been received. Even though this quantity was not large, it sapped the enthusiasm of the bulls. The increase in arrivals of gold, with no corresponding improvement in offtake, also affected sentiment. The bears availed of the opportunity to hammer down the prices. There was a sizable recovery on Monday this week, but this proved shortlived; for there was again a setback yesterday which brought the prices below the previous week's closing levels. The undertone was by no means weak, as the closing levels were still well above those two weeks ago.

Forward silver (16th February settlement) reacted from Rs. 184-6 to Rs. 182-14 on Friday last. After improving to Rs. 184-15 on Monday, there was a recession to Rs. 182-14 yesterday. The closing was done at Rs. 183-6.

Ready silver (.996 Mint) was marked down from Rs. 184-14 to Rs. 183-6 and, after gaining to Rs. 185-11, finished lower at Rs. 184-2. The floating stocks of silver are reported to be 1,400 bars. The daily average offtake was 15 bars. The scarcity of ready stocks and the slight improvement in offtake was reflected in the widening of the premium of ready over forward from As. 8 to Re. 1, before narrowing down to As. 12 at the close.

Gold for forward delivery (15th February settlement) moved down from Rs. 108-6 to Rs. 107-8. After hardening again to Rs. 108-9, forward gold dipped to Rs. 107-8 at the close.

Ready gold fluctuated between Rs. 107-5 and Rs. 108-6, before finishing at Rs. 107-5, as against the previous week's closing of Rs. 108-4. The floating stocks of gold are estimated at 30,000 tolas. The daily average arrivals were 4,000 tolas, while the offtake was 3,000 tolas per day on an average.

In New York, silver was unchanged at 91⅛c. In London, spot silver weakened from 80½d. to 79⅞d. and forward from 80½d. to 79⅞d. Gold, however, gained strength from 248s. 11d. to 249s. 1⅜d., reflecting the weakening of the pound sterling.

The following comparative table shows the trend of market during the week under review:

	29-1-57	Highest	Lowest	23-1-1957

METALS QUIET

(From Our Own Correspondent)

CALCUTTA, *29th January*

Quiet conditions visited the metal market during the week under review. Prices were, however, maintained at about previous levels, despite the inclination on the part of consumers to cover for day-to-day requirements only. The British Government's decision to reduce the defence expenditure was reflected in advices from the London market. On the other hand, reports from the United States indicated increased purchases of copper, and this was reflected in fractional improvement in price in New York. Japanese purchase of copper and copper scrap continued in greater measure, and, according to a London report, by April, Japan would have imported 12,000 tons of copper scrap and 20,000 tons of electrolytic copper. It would, therefore, appear that Japanese activity would keep copper prices steady in the coming weeks. That Indian demand for copper has been increasing, following the impetus to industrial development, as against 14,962 tons only in 1955. However, consumers here strongly felt that world supplies were plentiful and that caution was necessary in replenishing supplies. That was why the quantity of copper that changed hands during the week was meagre and the price for the electrolytic material was throughout at Rs. 193 per cwt.

Fair activity was in evidence in tin, but that the tightness in the supply situation eased slightly was evident from the fall in the price from Rs. 558 to Rs. 542; the lower level was several points higher than the replacement cost. In lead also, a fair quantity changed hands, but the supply position continued to cause no anxiety whatsoever. The price was maintained firm at Rs. 82. Electrolytic zinc was steady at Rs. 75-8 and reports of good activity in London were noted by stockists with satisfaction.

COTTON FUTURES SHED EARLIER GAINS

(From Our Own Correspondent)

BOMBAY, *30th January*

The cotton futures market had a limited trading period during the week, as it was closed on the 26th inst., it being Republic Day. The market was officially closed today also because of the death anniversary of Mahatma Gandhi. During this short period, the forward market witnessed a continuation of the firm trend noted in the last few weeks. In fact, both the contracts scaled new heights, Jarilla touching a high of Rs. 681 and Vijay rising to Rs. 793. After hovering round this level for a brief period both the contracts dipped, towards the close of the week, on heavy liquidation. Operators appeared to have been extremely cautious to ensure that a situation was not created which would provoke Government intervention. The general feeling was that the Forward Markets Commission (F.M.C.) will not brook any speculative spurt in prices and the recent experience of the Oilseeds Exchange was fresh in their minds. Further, the uncertainty regarding the exact stand of the F.M.C. in respect of By-laws 55 and 61 and the cotton policy of the Government of India prevented traders from taking an unduly bullish view of the market trends. As a result of the selling, based on these considerations, most of the earlier gains were wiped out in yesterday's session.

M.G. Jarilla (March delivery) opened the week at Rs. 666-8, as against the previous close of Rs. 669, and improved, on brisk demand, to Rs. 670 the same day before closing lower at Rs. 668. Extended spot house support pushed the contract higher the next day to Rs. 675. On profit-realising sales forthcoming at this stage, the contract eased to Rs. 671-4. The upward march continued, bringing the contract up to Rs. 681 on the 28th inst. The heavy liquidation, promoted by the abovementioned factors, resulted in a sharp break in values yesterday and the session was wound up at Rs. 667½.

M.G. Vijay (April delivery) followed more or less the same pattern. After having opened at Rs. 773, it steadily firmed up to Rs. 793 on the 28th inst., due to heavy buying support. The earlier gains were, however, wiped out in yesterday's trading, and the contract closed at Rs. 779¼.

The following table gives the trend of prices of the two contracts during the week:

(In rupees per candy of 784 lbs.)

	30-1-57	*High*	*Low*	22-1-57
Jarilla (March) ...	667½	681	665	669½
Vijay (April) ...	779¼	793	772	777

The spot market at Sewri ruled steady. Although, at the opening of the week, mill demand was slack, it revived subsequently. Vijay and Khandesh 197/3 attracted attention. Jaydhar and Khamgaon also came in for business. In the export section, inquiries were noted for Jarilla, Oomra *Deshi* and Bengals. Zodas were also on offer. The foreign section was featureless. It was reported that the ceiling fixed for the import of American cotton under P.L. 480 had been reached and no further applications for American cotton would be immediately entertained. It is expected in trade circles that the Government would enlarge the ceiling. The following are the latest available spot rates—in rupees per candy of 784 lbs.—from Sewri:

Bengal *Deshi* 720; Berar Jarilla 755; Khandesh 775; Vijay 910; Oomra *Deshi* 770; Moglai 720. *Delivery Contracts*: Khandesh 135, Berar 117, Moglai 82 'ON' Jarilla; 320F 95, Vijay 13/16" 122 'ON' Vijay.

The Karachi market dipicted a bearish trend during the week. Speculative selling and slack overseas demand resulted in a sharp dip in prices. N.T.R.G. January which had closed at Rs. 85-13 last week declined to Rs. 82-6, while the March position shed, over the week, Rs. 2-13 to Rs. 82-7. The spot section also was depressed. The latest available rates—in rupees per 82 lbs.—for a few popular varieties of Pakistan cotton, prevailing at Karachi, are given below:—

Sind *Deshi* 90; Punjab *Deshi* 82-8; 4F Roller 87; Punjab Roller 88-12; F.N.T. Sind S.G. 92-8; F.N.T. Punjab Roller 91-8; 289F Punjab S.G. 103-8.

The Alexandria futures market ruled easy during the week as a natural reaction to the sharp rise witnessed in the preceding two weeks. Premiums of Karnak and Ashmouni have eased a little. Karnak January went off the board at around 122 tallaries per lb. Towards the close, however, a revival was in evidence. This was due to reports that Egypt had concluded an "enormous" cotton deal with the U.S.S.R. involving £E12 million. Payments, it is understood, would be made partly in certain foreign currencies required by Egypt. It may be recalled that last April, the two countries signed a £E1 million barter trade agreement which was followed by further agreements for the supply of 400,000 tons of wheat by Russia during the 1956-57 season to be paid for in Egyptian currency which would be used to purchase Egyptian cotton.

Export sales of Egyptian cotton to the free world have of late been small. Exports from the commencement of the current season till the 2nd inst. were 137,798 bales (of 730 lbs.), as against 324,605 bales shipped during the same period of the 1955-56 season. The Egyptian Cotton Commission has announced that it will sell, by public auctions, in the near future all their old crop steampressed stocks. The sales are meant only for export against payment within two months in American dollars, Deutsche Marks and Swiss Francs. This means that India cannot participate in these auctions. The latest available quotation—in tallaris per lb.—from Alexandria are given below:

Karnak: March 119.00; May 117.70; July 117.00.
Ashmouni: February 84.50; April 84.15; June 84.15.

Reports indicate that the Sudan cotton crop is likely to be late. The Gezira Board will announce the reserve prices only in March. But shippers have already begun to make limited offers mostly for shipment in April-May and after.

Cotton values in Liverpool received a setback during the week, and quiet conditions prevailed in the market. The quietness was influenced by the recent large arrivals of U.S. cotton. The turnover was small, confined mainly to medium and lower U.S. styles. Some business was also reported in Turkish, East African and Peruvian cotton. Interest in Indian cotton continued to be low because of high prices and further export quota was awaited. Both the American and American type contracts declined on hedge pressure. The limited amount of trade buying and local short-covering were inadequate to absorb the offerings. Activity was affected by reports of the likelihood of a resumption of U.S. dock workers' strike. A majority of traders were inclined to wait and watch before entering into fresh commitments. The Egyptian Karnak contracts were neglected and nominally unchanged. Sudan Sakel remained steady, while Lambert seed eased. The following are the latest available rates—in pence per lb.—from Liverpool:

American 1-inch Staple Contract: March-April 26.40; May-June 26.05; July-August 25.60; October-November 25.25. *American Cotton Mixed Growth Contract*: March-April 26.64; May-June 26.24; July-August 25.79; October-November 25.43. *Egyptian Karnak*: January-February 60; March-April 60. *Sudan Sakel*: January-February 61.30. *Sudan Lambert Seed*: May-June 46.00; July-August 45.00.

The New York cotton market ruled generally firm, due to domestic mill buying and fair export demand based on tightening free market supply as a result of the loan programme. Commission houses purchased new crop positions. Part of the demand was attributed to the prolonged drought in the south-west and expectations of a higher mid-February parity price. Spot values also registered a marked increase.

The C.C.C. sales, against bids received on 22nd January, were 43,502 bales. This brings the total cotton sold so far under the new export programme to 6,316,694 bales. The minimum price for basis middling 15/16", average location, continued unchanged at 25.35 cents, while the average price for Middling 1" cotton was 27.21 cents, as compared with 26.87 cents at the previous sale. Exports for the week ended 17th inst. were 285,894 bales, making and aggregate for the season till then of 3,170,916 bales, as against only 731,975 bales during the corresponding period of the previous season.

The following are the latest available quotations from New York, as compared with those of a week and a fortnight before:

(In cents per lb.)

	30-1-57	22-1-57	15-1-57
Spot	35.15	34.95	34.70
March	34.83	34.45	34.43
May	34.81	34.48	34.45
July	34.32	34.22	34.02

ART SILK YARN DULL

(From Our Own Correspondent)

BOMBAY, 30*th January*

The decision of the Government of India to continue to allow for export limited quantities of cotton yarn during January-June 1957 has not been received with much optimism by shippers. In view of the keen competition prevailing in world markets, it is stated, prospects of exports of Indian yarn are not very encouraging. During the week under review, the yarn market witnessed somewhat dull conditions. The demand for coarse cotton yarn was limited, whereas finer counts evoked good support. There were good enquiries for staple yarn. Art silk yarn, however, remained dull and the offtake was rather restricted.

Staple fibre yarn (40×2) for February delivery, on good support, spurted from Rs. 640 to Rs. 652. Spot Citys advanced by 6 pies to Rs. 3-7, New Greats by 3 pies to Rs. 3-6-3 and Centurys by a like amount to Rs. 3-7-6. Among foreign yarns, (80×2) Paramounts shed 6 pies to Rs. 5-6-6, while Fujis remained quiet at Rs. 3-9.

In the cotton yarn section, among the forty counts, Minaxis picked up an anna to Rs. 27-7, and Moderns As. 4 to Rs. 29. Gokaks eased by As. 2 to Rs. 27-8. Among 20s, Maduras were As. 5 better at Rs. 19-12 and Gokaks As. 15 at Rs. 19-11. Moderns remained unchanged at Rs. 19-8. Ten counts Moderns declined by As. 2 to Rs. 15-6 and Podars were quietly steady at Rs. 15-8. Among sixty counts, Raghuvamshis gathered As. 6 to Rs. 57-12 and Finlays As. 4 to Rs. 61-8. Among eightys, Moderns remained firm at Rs. 78.

Snia rayon yarn (120 dull cones) for February delivery declined by Rs. 4 to Rs. 820. Spot 120 Japan improved by As. 1½ to Rs. 4-5-6; so also 150 Japan by the same amount to Rs. 4-8-6. 120 Italy were 6 pies down at Rs. 4-2 and 150 Italy an anna lower at Rs. 3-12.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	30-1-1957	23-1-1957
Art silk yarn (per case of 200 lbs.)—		
120 Dull Cone Snia February	Rs. a.	Rs. a.
120 Japan (per lb.)	820 0	824 0
150 Japan (per lb.)	4 5½	4 4
120 Italy (per lb.)	4 8½	4 7
150 Italy (per lb.)	4 2	4 2½
	3 12	3 15
Staple fibre yarn (per case of 200 lbs.)—		
40 × 2 February	652 0	640 0
40 × 2 New Great (per lb.)	3 6½	3 6
40 × 2 Century (per lb.)	3 7½	3 7½
40 × 2 City (per lb.)	3 7	3 6½
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	15 8	15 8
20s Madura	19 12	19 7
30s Madura	—	—
40s Gokak	27 8	27 10
60s Finlay	61 8	61 4
80s Modern	78 0	78 0

OILSEEDS EASY

(From Our Own Correspondent)

BOMBAY, 30*th January*

The local oilseeds market remained weak, on balance, during the week under review. No trading was done in the futures sections of the market on 24th and 25th as a mark of protest against the introduction of the margins system last week.

The market opened steady on 24th January, but while groundnut improved slightly on demand from crushers in the following two days, castorseed reacted as a result of lack of support, discouraging overseas advices and further increases in freight rates by 10 per cent. and increase in surcharge by 2½ per cent. to 17½ per cent. between India, the U.K. and Continent. Following demand, cottonseed, too, hit new levels on 28th January. On the next two days, namely, 29th and today, groundnut remained somewhat easy. Castorseed, however, sagged on professional selling and unloading. Cottonseeds and linseed moved in sympathy with groundnut.

In the groundnut section, the February contract in which trading was resumed on 28th January, opened at Rs. 171 and touched the level of Rs. 173-8, before closing at Rs. 170-12. On 29th the peak level touched was only Rs. 171-12, while today it touched a low of Rs. 168-2, before finishing up As. 6 higher. Over the week there was no change in the contract. May contract commenced at Rs. 172-4 and moved up to Rs. 174-12 on the same day, that is, 28th, before finishing at Rs. 171-12. While on the following day it moved between Rs. 170-8 and Rs. 172-4, today it moved down from Rs. 172 to Rs. 169-8. Over the week it lost only As 2. In the spot section, Bold F.A.Q. was a shade lower at Rs. 34-14. Groundnut oil ex-mill, however, was nominally higher at Rs 19-4.

Linseed futures (May), having opened on 28th at Rs. 31-14, gradually moved down to Rs. 30-10 today, before finishing up at Rs. 30-12. It lost during the week Re. 1. In the spot section, Bold ready was quoted Rs. 2-4 less at Rs. 34 than a week ago. Linseed oil ready was, again, done at Rs. 19, that is, As. 10 lower than last week.

Castorseed May contract, however, lost heavily. Having commenced at Rs. 174-8 on 28th, it moved down the same day to Rs. 171 and further to Rs. 165-12 on 29th and still further to Rs. 163 today. It closed As. 8 higher. Over the week the loss was no less than Rs. 10. In the spot, Bold shed Rs. 3-8 at Rs. 36. Kanpur lost Rs. 3-12 at Rs. 34-8. Oil B.S.S. was Re. 1-8 lower.

Cottonseed futures section was only nominally lower over the week. While the February contract moved down slowly but steadily from Rs. 107 on 28th to Rs. 103 at the close today, the May contract came down during the same period from Rs. 105 to Rs. 103. The latter, however, finished As. 12 higher.

Among other seeds, *kardi* seed Bold was done at Rs. 21-2 while *niger* seed Madras maintained the level of Rs. 30-12 of last week.

The following table shows the prices of oilseeds and oils at close as compared with those at the close of the previous two weeks:

	30-1-1957	23-1-1957	16-1-1957
Groundnuts—	Rs. a.	Rs. a.	Rs. a.
February 1957	168 8	168 8	165 12
Khandesh Quality Ready (per cwt.)	35 4	35 6	33 14
Dec.-Jan.	—	—	—
Linseed—			
May 1957	30 12	31 12	31 8
Bold Ready (per cwt.)	34 0	35 4	34 12
Feb.-Mar.	32 4	33 12	33 0
Castorseeds—			
May 1957	163 8	173 8	179 0
Madras (per cwt.)	36 0	39 8	39 4

Commercial (per quarter)	20 14	23 14	22 10
Linseed oil—			
Ready	19 0	19 10	19 10

PEPPER QUIET

(Messrs. Parekh & Co.)

BOMBAY, 30*th January*

Malabar black pepper, during the week under review, ruled quiet, following the pressure of sales by a Singapore house. They are reported to have sold locally rather heavily both in delivery and in A.S.T.A. Sarawak pepper in Singapore remained weak to quiet in sympathy with rubber and owing to liquidation by weak holders in view of the approaching Chinese New year. White and black pepper, at Singapore, showed a break from Str.$113 and Str.$81 to Str.$103 and Str.$76 respectively. The break in white was more severe as the stock thereof was rather heavy.

New York is said to be firm buyers for Malabar black at $0.25 for January shipment. But only small business is reported since growers and exporters are sellers, nearly 37½ per cent. of the crop having already been marketed.

Alleppey, after going down to Rs. 575, improved to Rs. 587½ and garbled from Rs. 97½ to Rs. 99½. January is done at $0.25 while February-March are nominally quoted at $0.25½. February delivery, after receding to Rs. 574, is moving between Rs. 579 and Rs. 584 for want of fresh incentive.

The sentiment among the growers and exporters is bullish but lack of constructive buying from the U.S. and want of short sales in the markets are responsible for the present narrow fluctuations.

Sarawak offers being cheaper, Europe is said to be taking little interest in Malabar. The freight rate is increased by 10 per cent. as from 15th February 1957 both for U.S. and European ports.

Following are today's nominal quotations: Ready delivery Rs. 82 per Bengal maund; February Rs. 578-83 and March Rs. 590-94 per candy of 5¼ cwts.

SUGAR QUIETLY STEADY

(From Our Own Correspondent)

BOMBAY, 30*th January*

In spite of a release of 155,000 tons of new season's production, the sugar market displayed no perceptible change in the quietly steady trend that had come to prevail a week ago. While the upcountry markets appeared to be steady, the local market continued to be dull in the face of substantial stock position. Arrivals of indigenous sugar during the week under review amounted to about 10,600 bags. The closing prices for small, medium and large grain sizes were: Rs. 88, Rs. 89-91 and Rs. 94-100 per bag, respectively, including sales tax. Stocks of good British refined sugar are now nearly exhausted and it is pointless to quote for this variety.

In the forward section, Fagan delivery contract for 'C' grade sugar, which had moved up Rs. 92-5 at one time, receded to Rs. 92 per bag today under sustained bearish outlook. Ex-mill quotations were more or less unchanged.

TEAS MARKED DOWN

[Messrs. Forbes Ewart and Figgis (Private) Ltd.]

COCHIN, 25*th January*

Approximately 2.2 million lbs. were offered in Sale No. 2 held on Tuesday, 22nd January. The quality of offerings registered a definite improvement, particularly amongst the medium and good medium sorts. A good general demand prevailed throughout the auction. Most of the enquiry emanated from exporters and internal operators were very quiet. Low and Low medium teas declined irregularly As. 2 to As. 3, whilst mediums were an anna to As. 2 lower. There has been a better demand for fannings grades, than of late, at the drop in price. Better sorts again found an easier market and prices were marked down As. 4 to As. 6. Whole leaf grades generally sold well at As. 2 to As. 3 down. The following are the quotations:—

1957	Rs.	a.	p.	
Plain B.P.	2	0	0	nominal
Low medium B.O.P. ...	2	2	6	
Medium B.O.P.	2	4	6	
Good B.O.P.	2	8	0	
Well made black leaf O.P.	2	7	0	

The combined average price fetched in sale No. 2 was Rs. 2-6-6 per lb., as against Rs. 2-0-3 in the corresponding sale of 1956.

London Market.—Sale of 21st January 1957.—20 per cent. withdrawn, due dock strike. Generally half penny to two pence dearer.

Sale of 22nd January 1957.—Coloury teas steady. Others very irregular and generally one penny to two pence lower.

Colombo Market.—Sale of 21st January 1957.—Strong demand. Black grainy dusts and good liquoring fannings dearer. Other sorts firm.

Sale of 22nd January 1957.—Quieter demand. Twenty to thirty cents lower, except fannings and good brokens with improved quality.

Calcutta Market—Export.—Generally As. 2 to As. 3 lower.

Internal.—Fair general demand for the 25,400 chests of dust on offer. Prices were generally As. 2 easier at the commencement of sale and at the close were a full As. 3 down. There were a fair number of withdrawals. The few lines of bright liquoring C.T.C. teas were sold at valuation, but the more ordinary varieties were often As. 2½ easier. There was limited middle east demand for black exportable types and these were all sold at easier rates. Commons dooars and orthodox Assams opened As. 2 easier and closed As. 3 easier. There was good general demand for the 2,300 chests of leaf on offer and any clean leafed types sold well at slightly easier rates. The more fibrous residue varieties were firmer.

Export Quota.—During the beginning of the week, export quota changed hands at 35 pies, but the price fell away sharpy and business has been done as low as 33 pies. Buyers have, however, reappeared at this level.

Forthcoming Auctions.—Sale No. 3 will be held on Tuesday, 5th February and Dust Sale 'C' on 29th January 1957.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Dust Sale C.*—400,000 lbs. Strong demand. Market irregularly dearer for everything, except best liquoring sorts, which are rather easier."

JUTE PRICES FALL

(From Our Own Correspondent)

CALCUTTA, 29*th January*

A feature of the trading in jute markets during the week under review was a fall in the prices in both jute goods and fibre. While covering demand forced a recovery in jute goods, raw jute met with demand at lower levels only. This has been a good development from the point of view of the jute goods industry, as it is time that the raw material price should be economical to mills. This trend was due to the strong feeling in mill circles that there was sufficient raw material within the country and that, even if no further supplies from Pakistan were forthcoming, there was no need to apprehend any shortage. Consumption of raw jute by mills in the current season to June next has been estimated at about 5,800,000 bales, assuming that mills maintain the present basis of working. As against this, availability is estimated at 7,126,000 bales, made up as follows: 375,000 bales being imports from East Pakistan up to the end of December, 4,221,000 bales being the 1956-57 jute crop in India, 1,430,000 bales being the indigenous mesta crop, 1,100,000 bales being the carry-over stocks with mills from the last season. The second all-India estimate of the mesta crop places the output at 1,430,000 bales, representing an increase of 329,000 bales compared to the first estimate. Huge stocks are believed to be in the possession of dealers, and cultivators have also sufficient jute yet to be disposed off. Pakistani prices have not so far shown signs of falling, and unless they fall, further imports in the current season would be negligible.

The possibility of mills increasing working hours or unsealing looms, either in part or in full, now remaining idle is out of question, past experience in this regard being what it was. As such, no shortage in raw jute is expected, and mills may be able to carry over about 1,000,000 bales for the next season. It is this changed position in the light of the revised mesta crop which made raw jute prices fall during the week. Indian northern bottoms declined to Rs. 31-8 from Rs. 32-8, and local daissee bottoms to Rs. 33 from Rs. 34. During the week, the reserved tendency on the part of sellers gradually gave way and took the place of anxiety to book business.

The market was closed on Wednesday last on account of Netaji's birthday, and on Saturday, being Republic Day. The conclusion of the Indo-Pakistani trade agreement was noted, and it was thought that India would be able to get any quantity of jute from Pakistan. The only condition is that Pakistan must be let known before sowing time an idea of the quantity that India would require in the season following, in order to enable Pakistan to plan for a crop taking into consideration probable Indian needs. Such a condition is thought to be a clever move on the part of the Pakistani negotiators for the trade agreement, since, even if prices increased subsequent to sowing and by the time the crop was ready, Pakistan would be able to impress on India the latter's obligation to lift the quantity earlier agreed to. However, with the difficulties Indian importers have felt in the past in getting the E.P.C. forms by the State Bank of Pakistan and the abnormal delay in movement, Indian mills would be inclined to do with as little Pakistani jute as possible, and with the efforts now being made by the State and Central Governments, it is expected that the indigenous crop for the 1957-58 season would more or less be able to meet the needs of mills in full. If this situation can be achieved, Pakistani prices may as well fall. In which event, India can import some of the better varieties from Pakistan, and, if need be, export any excess from the domestic crop. It was noted that the third and final estimate of the 1956-57 Pakistani crop reduces the crop to 5,500,000 bales from 6,000,000 bales forecast earlier. The reason given for this revision is more damages on account of floods.

On Tuesday last, there was considerable activity on the part of speculators. In the liquidation that followed, ready B. twills fell from Rs. 119-6 to Rs. 117-4 and hessian 40" 10 oz. from Rs. 43-2 to Rs. 44-6. At the lower levels, mills kept off the market, as sales could be put through only at a loss. As stated earlier, Wednesday was a holiday. On Thursday, weak holders continued to lessen their commitments and B. twills lost further to Rs. 115-8 and 40" 10 oz. hessian to Rs. 43-12. Bear-covering and shippers' demand induced some recovery, and on Friday B. twills were better at Rs. 116-10 and 40" 10 oz. hessian at Rs. 44-4. Yesterday, prices were further lower at Rs. 116-6 and Rs. 43-14, respectively, but the firmer tendency was attributed to activity in *fatka* and expected Government orders.

TEA QUIET

(From Our Own Correspondent)

CALCUTTA, 29*th January*

Conditions during the tea export internal sales held last week were easy with prices ruling quiet. This was in striking contrast with the trend in London auctions held last week. Prices there were dearer because of the dock strike which resulted in withdrawals from original catalogues. It was noted that in the Mincing Lane auctions there was better demand for low medium, good plain and coloury Assam teas.

The difficulties facing the tea gardens which can only grow common and medium teas due to soil and climatic conditions were highlighted in Mr. J. P. Shaw's recent address to the annual meeting of the Dooars Branch of the India Tea Association. He said that taxation and the provision for increased labour amenities were causing serious headaches to the small gardens, as well as the marginal units. Fine plucking in gardens producing medium teas had no doubt given better results, but the majority of production being common and medium teas, the fine plucking could not be reflected in working results. He, therefore, pleaded for relief in export duty for common teas by taking into consideration the price-disparity between quality and plain teas. This deserves sympathy in New Delhi, as also the need for implementing the Plantation Inquiry Commission's recommendation for doing away with the Assam road and waterway tax and the West Bengal entry tax. The pleadings of Mr. Shaw should be read in the light of the marked fall in prices in the internal sales held in recent weeks.

In the sale for domestic consumption held on Thursday last, dusts offered amounted to 25,139 packages. Demand was poor, and prices fell, the decline in some cases being as much as As. 3. In view of this, withdrawals were marked. Orthdox Assams, commons and Dooars opened lower by As. 2½ and by closing time the drop was as much as As. 3. There was, however, fair support for a few lots of bright liquoring C.T.C.'s, but the ordinary teas in this category fell by As. 2½. Although black teas suitable for export were in good demand, prices represented the general decline. The quotations were: best Assam C.T.C. Rs. 2-9 (nominal), medium Assam C.T.C. Rs. 2-2 to Rs. 2-3, medium Assam grainy dust Re 1-15, and medium Dooars Re. 1-14-6.

In contrast to the above trend, leaf offerings, amounting to 4,088 packages, met a steady market. Prices of residue teas rose above valuations. Green teas were readily absorbed. Although there was good demand for clean leaf teas, prices were easier.

LINSEED FAIRLY STEADY

(Messrs. A. Bradley and Co.)

CALCUTTA, 28*th January*

Fairly steady conditions have been maintained throughout the week, although buyers are less keen to pay higher rates, owing to a poorer offtake of oil; the weekly turnover has been small. Activity in the oil section has been on a smaller scale, as a result of lower advices from overseas buyers. The latest quotations are as follows: January-February Rs. 25-6 and April-May Rs. 22-12 per maund.

WHEAT PRICES DECLINE

(From Our Own Correspondent)

HAPUR, 28*th January*

Quiet conditions prevailed in foodgrain market during the past week. The supplies of wheat in the market have improved, following the Government of India's decision to rush special trains carrying wheat from Bombay to Uttar Pradesh to meet the urgent requirements of the State. About 73,000 tons of wheat is being distributed in U.P. during the current month. Sales of wheat through fair-price shops, which were irregular for some weeks past, due to paucity of Government stocks, continued with increased quantity during the week under review and, as a result, wheat prices registered a decline of As. 4 per maund. Wheat dara was quoted at Rs. 16 and farm produce at Rs. 17-4 per maund. Outside buying inquiry at prevailing rates is dormant and wheat stocks here is unchanged at 53 *khaties*, as against 43 at this time last year when average wheat was quoted at Rs. 14-11 per maund.

Rice prices, on the other hand, recorded an improvement both here and in other centres. Following heavy purchases from Assam in Bengal markets, rice prices there went up by about Re. 1 to Re. 1-4 per maund and prices here also advanced in sympathy. Prevailing prices on Monday were: Basmati Rs. 23 to Rs. 26-4, Manipuri Rs. 20-4 and coarse Rs. 15-12 per maund. Although demand for gram continued unabated and the local stock position was tight when compared to previous years, superior quality gram prices here registered a fall of a few annas per maund on lower Punjab advices where standing crop is progressing very satisfactorily. Gram stock here ran down by 8 *khaties* during the week to 33 *khaties*, as against 12 only last year. Local gram is quoted at Rs. 13-6 and Punjab produce at Rs. 13-12, as against Rs. 10-6 last year. Prices of other coarse grains also ruled quiet on good crop prospects and prevailing prices were: barley Rs. 13-2, *bejhar* Rs. 12-12, maize Rs. 13-6, *bajra* Rs. 13-14, *jowar* Rs. 11-12 to Rs. 13, and *guwar* Rs. 11 per maund.

Firm conditions prevailed in the prices of peas, despite reports that standing crop was excellent. This was due to fast dwindling stocks, which are now put at one *khati* only and there is still about one and a half months for the arrival of the new crop in the markets. Prices of *arhar*, however, ruled quiet and local stock ran down by 5 *khaties* during the week to 13 *khaties*. Prices of other pulses eased slightly due to better supply position and prices on Monday were: Peas *dara* green Rs. 14-8, white Rs. 15-10, *arhar* Rs. 13, *urd* Rs. 18-8 to Rs. 21, *moong* Rs. 14-8 to Rs. 16 and *masoor* Rs. 16-10 per maund.

Pulses futures ruled firm during the week and the latest quotations on Monday were:—Peas *jeth* Rs. 10-3 (Rs. 10), peas farm *maha* Rs. 12-15 (Rs. 12-15), *jeth* Rs. 10-10 (Rs. 10-6-3), arhar *maha* Rs. 12-7 (Rs. 12-2), *jeth* Rs. 10-15-9 (Rs. 10-10), *urd maha* Rs. 18-11 (Rs. 18-7-6), *basaikh* Rs. 18-15 (Rs. 18-13). The figures within brackets represent the quotations a week ago.

SUGAR STEADY

(From Our Own Correspondent)

HAPUR, 28*th January*

Sugar prices continued steady during the week under review and new quality prices were quoted As. 2 to As. 4 per maund higher. Sugar being one of the commodities to be exported to Pakistan under the recent agreement, prices recorded modest gains on that account. But due to growing political tension between the two countries on the Kashmir issue, export prospects at an early date were discounted in trade circles. The production and despatches of sugar from indigenous factories amounted to 620,000 tons and 382,000 tons, respectively, up to 15th January 1957 in the current season, as against 528,000 tons and 303,000 tons, respectively, in the corresponding period last year. The stocks with the factories on this date stood at 765,000 tons, as against 637,000 tons last year. Prevailing mill delivery prices were: Jaswant Rs. 28-15, Simbhauli Rs. 28-12, Mowana Rs. 29, Daurala Rs. 30, Amroha Rs. 28-5, Bijnore Rs. 28-5, Mansoorpur Rs. 29 to Rs. 30, Rampur Rs. 31-8; retail Rs. 31 per maund.

The *khandsari* market also ruled steady and the U.P. Government's decision to reduce the sales tax from 6 ps. to 3 ps. on *khandsari* has been welcomed in trade circles. Prevailing prices are: Rs. 23 to Rs. 27 per maund.

Ready *gur* prices which improved in the mid-session to Rs. 10-13 per maund, declined and were today quoted at Rs. 10-10 per maund, following increased arrivals estimated at 5,000 maunds today. Outside demand at higher rates was slack. Total arrivals were put at about 310,000 maunds from the beginning of the season, which were nearly half of the total produce expected in the market by the end of the season. Future gur prices, after having touched a high of Rs. 11-6-6 for *fagan* delivery, declined towards the close and were quoted at Rs. 11-1 today. Week's opening quotations were Rs. 10-13-3.

The concentration of British Commonwealth's industrial strength in the British Isles has been severely criticised by Mr. Harold Holt, Australian Cabinet Minister. The Suez crisis had demonstrated how dangerously placed was the Commonwealth. Good sense and national survival, Mr. Holt said, dictated a very much greater movement of people and resources from the heart of the Commonwealth to its outlying parts. Too big a proportion of British manpower and industry was concentrated in a small and highly vulnerable island. Canada, Australia, Rhodesia, Kenya, etc., he observed, would welcome the kind of development which increased British migration and additional capital investments would provide. He also suggested the formation of a Commonwealth Plan for developing the resources of the region.

THE
CHARTERED BANK
(Incorporated in England by Royal Charter, 1853)
(Liability of Stockholders Limited)
Capital (Paid-up) - £3,500,000
Reserve Fund - - £5,000,000
Branches throughout India, Pakistan and the East
AFFILIATED BANK IN INDIA
THE ALLAHABAD BANK LTD., with over 70 offices in India
The Bank offers a complete Overseas Banking Service and provides exceptional facilities for financing every description of trade with the East.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.= Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H.=Accounts published half-yearly. F.=Company has Preference shares. T.=Company has Debentures. N.=Nominal quotations. x.d.=Ex. Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and gross for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year.

M—Managed by the Board of Directors. ‡ Less income-tax. s) Clive Mills have paid dividend at As. 10½ on bonus shares, for the year, 1955. * Including bonus. (k) Investments.
(l) Made up of an interim dividend of Re. 1-12 per share on 1 20,000 shares and final dividend of Re. 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares. (c) For seven months ended 31st March 1956.
† New Central Jute Mills—Dividend for 1955 is on shares of Rs. 10 each. The Albion and Lothlian jute companies have been amalgamated with New Central Jute Co., with effect from 1st December 1954.
K—Fort William Jute Co. has sub-divided ordinary shares of Rs. 100 into shares of Rs. 10 each.

MARKET GOSSIP

(*Concluded from page 207*)

It will be some time before the precise effect on the fortunes of the coal industry of the recent award by the Special Bench of the Labour Appellate Tribunal in respect of wages and emoluments of the colliery workers, announced this week, can be fully assessed. Considering that it serves to increase the emoluments of coal labour by making certain important changes in the award given by the Lower Tribunal, namely, the All-India Industrial Tribunal (

EQUAL WAGES FOR MEN AND WOMEN?

A MAJOR decision involving the principle of equal wages for men and women was taken by the Special Bench of the Labour Appellate Tribunal in its award for colliery labour. Reversing the lower Tribunal's award, which fixed women colliery workers' wages at 75 per cent. of the wages for men workers, the Special Bench eliminated this element of inequality in wages. It held that the payment of lower wages for women was a matter of tradition and that the "tradition had to go with the upsurge of social conscience." It seems necessary to examine the repercussions of this aspect of the Special Bench's award, for it may conceivably lead to a wave of fresh demands for equality in wages of men and women, thereby creating new controversies in the sphere of industrial relations.

It may be found useful to review briefly the arguments by which the demand for equality in wages, irrespective of sex, was supported and opposed at the time of the inquiry by the lower Tribunal which finally decided in favour of lower wages for women. The representatives of labour unions contended that it was now a well-recognised principle, also embodied in the Constitution, that "there should be no difference between the wages of a male and female worker for the same amount of work." The demand for equal wages for both men and women, it was further contended, was the latest landmark in the women's struggle for social, economic and political equality. A labour union declared: "It is the fundamental right of women to be on par with men sharing the fruit of her labour and to deny this right to women is to deny a fundamental right guaranteed to them by the Constitution of India. We claim this reactionary system to be abolished once for all."

Since the subject has thus already aroused considerable emotional ferment, it will be somewhat difficult to make the labour unions see the other point of view. But it is noteworthy that the employers urged the Tribunal to take into account some relevant considerations in deciding the issue. The Indian Mining Association contended that the wages paid to a man were supposed to be sufficient to permit him to support a family, whereas a woman employee usually belonged to a family, in which her father or husband was employed, and, in the majority of cases in which the woman did not belong to such a family, she had only herself to support. The Indian Mining Federation stated that, for the same amount of work, more women had to be employed, and that they also enjoyed special amenities. It is noteworthy that the State-owned collieries also argued that there was no denying the fact that, on account of certain legal and physical limitations, women could not provide the employer with the same "flexibility or value" of service as their male counterpart. Convinced by these arguments, the lower Tribunal held that a woman worker's wage should be calculated on the basis of 2.25 consumption units per family, as against the basis of 3 units for a man's wage. Accordingly, it recommended the fixation of minimum wages for women at 75 per cent. of the wages for men. It further averred that this was a fair arrangement, if it was remembered that (1) the female worker generally belonged to a family group with at least one male earner as its head and (2) special amenities enjoyed by women like maternity benefits, provision of creches, etc., should make up for the deficiency in the wages of women workers. It is this decision which the Special Bench of the Appellate Tribunal, as stated at the outset, has reversed.

The immediate impact of the Special Bench's decision will be clearly to reduce the scope for employment of women in the coal industry. Considering that employers have consistently held that women workers cannot do the same amount of work as men workers and that special amenities have to be provided for women, the only conceivable result of equalising the wages of men and women could be a definite disinclination on the part of colliery owners to take women workers. The Indian Mining Federation, in fact, had warned that a decision in favour of equality in wages would "act as a deterrent to the future employment of women labour in coal mines." Already, the number of women employed in coal mines is going down. From 1950 to 1954, the total labour force (men and women) in the industry, with figures in brackets representing the numbers of women workers, were: 1950: 350,204 (57,290); 1951: 351,975 (55,226); 1952: 348,663 (51,468); 1953: 341,193 (48,812); 1954: 340,964 (47,876). Commenting on these figures, the lower Tribunal pointed out that the fall in the women labour force was greater than that in the total labour force. This trend will, if anything, gather fresh momentum, as a result of the Special Bench's decision to equalise the wages of men and women. So much for the effect of the award on the coal industry.

To look at the question in its wider context. It is well known that the principle of "equal wages for equal work," irrespective of sex considerations, is one of the important conventions adopted by the International Labour Organisation. Although the value and significance of this convention have never been disputed, it has been found extremely difficult to implement it in practice. So far as India is concerned, although it has not ratified the convention, the principle forms one of the directive principles of the Constitution (Article 39d). It was accepted by the Central Pay Commission and approved by the Fair Wages Committee. Nevertheless, distinctions persist in the wages of men and women in diverse occupations. The Government's view is that, in the absence of an objective study, it is not possible to determine to what extent, if any, the existing disparities in wages between men and women workers constitute a violation of the principle of equal remuneration. By and large, this is a correct view. For the I.L.O. convention cannot be interpreted to mean that there should be equal pay, irrespective of the differences in work turned out by men and women. All that the conventfon emphasises is that, given proof of equal work, there should be no difference in wages. So long as there is no scientific evaluation of the work turned out by men and women workers in an industry or occupation, it will be difficult to enforce the principle of equal remuneration. If, despite this consideration, equal remuneration were enforced, the only result would be a certain decline in the opportunities of employment for women.

The persistence of lower wages for women, as compared with those for men, is attributed to five factors: (*a*) habit and customs, (*b*) biological factors which make it difficult for women to do strenuous and heavy work continuously, (*c*) limited obligations and responsibilities for financing home expenditure, (*d*) lack of the same urge to stick to employment and improve their economic position as in the case of men, and (*e*) lack of education and specialised training. There are, however, certain jobs in which women are actually preferred. Generally speaking, such jobs are those that require dexterity, lightness of touch, deftness and speed. Thus, in the cashewnut industry, in the packaging sections of industrial units and in the winding and reeling sections in mills, employers prefer women workers. Furthed, women are found suitable in certain professions, like nursing and teaching. In these sectors of industry or profession, women workers should actually be paid more than men.

Where the piece-rate system is followed, as, for instance, in *bidi*, cashewnut and plantation industries in which the percentage of women workers to the total labour force is 20, 82 and

supplement men's earnings. Again, because there is practically an unlimited labour force, any forced regulation of wages designed to bring about an artificial equality between men's and women's wages is bound to result in the displacement of women by men. This could mean considerable hardship to women who are single, widowed, or divorced or separated from their husbands, or who have, out of economic necessity, to supplement men's incomes. A solution that is only fair to employers is that minimum wages should be fixed, leaving it to them to choose men or women for the work. But this solution will not, however, enlarge the employment opportunities for women. These considerations point to the need for hastening slowly in the direction of enforcing equality of wages for men and women, especially in those fields where the output by women has not been proved to be as good—quantitatively and qualitatively—as that of men.

PROTECTION FOR AUTOMOBILES—II

THE Tariff Commission's report on the automobile industry makes sad reading. It clearly shows that the industry is not in good health and that it has to go a long way yet before it can become a strong link in our industrial chain. There is little prospect of consumers getting cars at reasonable prices for several years. The progress made by the industry in the manufacture of automobiles is disappointing. Despite the high level of prices of cars, the financial position of the automobile companies is far from sound. And they still require large sums of capital for becoming economic units. The problem of raising additional finance is, therefore, a tough one and a test to the ingenuity of *entrepreneurs*. The lack of sensible planning in the industry and at Government level is surprising to a degree, especially because we are supposed to be living in an era of planned development. There is hardly any co-operation among the various manufacturers even in regard to matters of common interest, with the result that there has been a lot of duplication of effort and waste of resources. If, despite all this, the Tariff Commission has favoured strong protection for the industry for a decade through import duties, import control and regulated internal competition, it is because the industry is essential for the economic well-being of a vast country like India with a population of over 370 million as well as for its defence. It is unthinkable that India can attain economic prosperity and retain its political freedom and solidarity without a healthy and efficiently managed automobile industry. No sacrifice is too much for this purpose.

Yet we wonder whether this point is adequately realised by both the Government and the manufacturers. The history of the industry during the past three or four years offers enough room for raising this doubt. One has only to go through chapters 15 to 23 of the Commission's report to appreciate the veracity of this point. Here is an industry in which there ought to have been, in the interests of the country's defence and speedy economic progress, careful planning, co-ordination of effort and close co-operation between the Government and manufacturers, on the one hand, and manufacturers *inter se*, on the other. But none of these requisites was fulfilled to the extent necessary. The result is that the industry's survival and growth have become a more complicated problem than it need be. Perhaps, the position would have been very much better had the Government not departed from the Tariff Commission's 1953 recommendations to the extent it did.

The first major defect is that there are too many manufacturers in the industry in relation to the size of the market for cars. This was there even before the 1953 Tariff enquiry, but it has been aggravated since then by allowing more manufacturers to enter the field. At the time the Government accepted the recommendations of the Tariff Commission, it recognised five companies as manufacturers. These were: the Hindustan Motors, the Premier Automobiles, the Standard Motors, the Automobile Products of India and the Ashok Motors. Besides these, it allowed Messrs. Mahindra and Mahindra Ltd. and Dewar's Garage and Engineering Works as assemblers of jeeps and Land Rovers, respectively. But now there are eight approved manufacturers. It is true that the demand for all types of vehicles has risen from about 13,100 per annum in 1954 to 31,090 in 1956 and that, similarly, the production of approved manufacturers has also advanced from 12,146 to a little over 31,000. While the final figures of sales and output for 1956 are not yet available, those relating to 1955 show that sales were 25,048 and production 22,153. Further, it is estimated that, by 1961, the total demand for all vehicles will be of the order of 65,000. Even assuming that this estimate will turn out to be correct, there are too many producers in the field to enable manufacture of cars at an economic price.

The hope in 1953 was that at least two companies recognised as manufacturers would go out of the field, for want of resources, if not for anything else, and thereby pave the way for the speedy growth of the remaining three companies. This hope was about to materialise, but the Government, instead of cancelling their licences, gave them a fresh lease of life. In addition, it permitted Messrs. Mahindra and Mahindra to assume the role of manufacturers of jeep, instead of that of assemblers, as was originally intended, and gave licences to two new manufacturers, the T.E.L.Co. and Messrs. Simpson & Co., Ltd. Before taking these steps, the Government did not consult either the existing manufacturers or the Tariff Commission. If the Government had thought that diesel cars and trucks required to be manufactured in the country, it could have asked the then existing manufacturers to undertake that task. Even granting for argument's sake that the Government had good reasons for allowing two new manufacturers for making diesel vehicles and engines, was it necessary for it to go to the rescue of two of the permitted manufacturers who were about to close their show?

It may be argued that, in licensing more manufacturers, the Government had in mind the desire to maintain internal competition as a safeguard against undue increases in cost or deterioration in quality. But, as the Tariff Commission has rightly pointed out, this approach is wholly unsound. What are the reasons for taking this view? This question is best answered in the words of the Commission:

> "If planned development is the objective, it would be an admission of failure if, for the purpose of keeping costs and prices under control, it was found necessary to promote internal competition at the expense of economic volume, since this would involve a waste or uneconomic use of resources which it is the very object of planning to avoid. ... Besides assuring all units of an economic volume, it is also desirable in some cases to see that the approved units obtain a large enough volume to achieve the economies of mass production. This, however, is a consideration which may reasonably be weighed against the desirability of maintaining internal competition." But "the claims of internal competition could be considered only after an economic volume is assured to all the units."

The second major defect of the industry is that too many types of vehicles are being manufactured, with the result that it has become difficult to achieve the economies of mass production. This defect is probably the offshoot of the first one. The grounds on which it has been allowed to develop are also the same as those relating to the first defect. Of course, the advantages of diesel vehicles over petrol vehicles must have induced the Government to license the manufacture of these types. But this consideration should have weighed with the authorities only to a limited extent. While one can appreciate the importance of diesel engines for commercial vehicles, such is not easy so far as passenger cars are concerned. It is not necessary, for instance, to place in the market a diesel car as a competitor to either a Fiat 1100 or Hindustan Landmaster; nor is it necessary to allow a Land Rover to be pitted against a jeep. In view of the extremely limited size of the market for automobiles and the necessity for ensuring an economic volume, India cannot afford to have the luxury of producing too many types and ranges of cars and trucks. It must wait for some more years to enjoy this luxury, that is, until the market for automobiles expands to a size comparable with that of some of the Western countries. The need for bringing down the cost of vehicles and achieving self-sufficiency in manufacture at an early date must have priority over this luxury.

It can be argued that, in allowing a larger number of manufacturers and types of automobiles, the Government had in mind the necessity to create a large enough capacity to meet India's future needs of road transport which are immense. It will be interesting to note here that the Indian Roads and Transport Development Association, Bombay, has expressed the view that about 300,000 additional commercial vehicles alone will be needed during the decade from 1950-51 to 1960-61. A similar estimate of passenger cars that will be required in the next four years is 80,000. But the Tariff Commission regards that these estimates are valid to a limited extent only, as they are subject to the assumption that various obstacles to transport development will be substantially removed or eliminated in the near future—an assumption not fully justified by experience during the past five years. Some, however, may not agree with this view and may refer, in support of it, to the increase in the demand for steel and cement which has exceeded even the most optimistic expectations. Even granting that there is some force in this argument, the fact cannot be denied that, unless the existing units are made economic and enabled to work at a reasonable profit, it will not be possible for the industry to grow to a size necessary to meet that demand. Thus, whichever way the question is looked at, it is clear that there has been serious bungling in planning the growth of this vital industry.

It will not be fair to say that the entire blame for the defective growth of the automobile industry must be laid at the doors of the Government. Some of the manufacturers, too, have erred in planning and assessing the needs of the country. In this respect, the pioneers—the Hindustan Motors and the Premier Automobiles—have sinned more than the others, apparently because they have been in the field for a longer period. In saying this, we do not underestimate either their difficulties or their achievements so far. In fact, the Tariff Commission has paid high compliments to the Hindustan Motors for having achieved "notable" progress in the manufacture of cars and to the Premier Automobiles for the "satisfactory" progress it has made, especially in the manufacture of trucks. But, with all that, their judgment of the market has evoked certain criticisms at the hands of the Tariff Commission. They have, for instance, paid more attention to passenger cars than to commercial vehicles, which should have received first priority from the point of view of both economic development and strategic importance. There are also many economic advantages in giving priority to commercial vehicles. They have a high value per unit—a material consideration in a country where the total demand for vehicles is relatively small—changes in their design are far less frequent, self-sufficiency could be achieved sooner than in the case of cars, and capital expenditure would be relatively less. Again, despite the growing demand for diesel vehicles and the uncertain outlook for petrol engines for use in trucks, the Hindustan Motors has not moved with the times.

Another criticism of the Tariff Commission which applies mainly to the two pioneers, as also to the Standard Motors, is that they have developed the automobile industry in a direction opposite to the one favoured by public opinion. It would have been more appropriate, in the opinion of the Commission, if they had paid attention to the manufacture of baby cars rather than to light, medium or big cars. In that case, they would have had a bigger market and served the socially more desirable purpose of producing a car for the common man. This initial mistake, which has led to firm commitments and locking up of large capital in the manufacture of light and medium cars, "precludes," according to the Commission, "any prospect of a baby car being produced in the near future at the low production cost desired by the consumer."

Yet another weakness of all manufacturers, not necessarily confined to the two pioneers only, has been the tendency constantly to ask for permission to take up new projects, even before fully consolidating progress in those already undertaken. Thus, "manufacturers have," to quote the Commission, "tended to under-rate the difficulties involved in implementing manufacturing programmes in respect of several vehicles simultaneously. Although the Hindustan Motors, the Premier Automobiles and the Standard Motors had each undertaken to carry out more than one project, none of them was able to show appreciable progress in respect of more than one project during the last three years. Except in the case of Hindustan Landmaster, all other manufacturing programmes undertaken by these firms are in arrears. And yet every one of them has asked for permission to take up new projects and is promising to carry out the old and the new projects simultaneously." There has thus been an unhealthy tendency among the manufacturers to bite more than they could chew and digest in time. The result has been delay in the implementation of the manufacturing programme.

RESERVE BANK TO PROVIDE MORE FUNDS TO THE BANKING SYSTEM

KALDOR'S PROPOSALS—SPATE OF NEW ISSUES

THURSDAY, 5 P.M.

MARKET GOSSIP

THE share markets are, once again, chary of taking a bullish view of the future. It is being assailed by doubts and fears, which are partly political and partly economic. There is a fear that India's stand on Kashmir may lead to hostilities between India and Pakistan. The economic fears are many. The continued delay by the Controller of Capital Issues in giving permission to applications from companies for issuing bonus shares has given rise to the fear that the tax on bonus issues will be raised either in the forthcoming budget or the one that will be presented after the General Elections. Secondly, it is apprehended that the Government might close the futures trading in commodities and bullion, in view of the pronounced bullish fervour that prevails in these markets. It is noteworthy that the rise in short-term interest rates and the bankers' lending rates following the ½ per cent. increase in the *de facto* Bank rates has made no perceptible impression on these markets. On the contrary, cotton, foodgrains and bullion are now quoting higher than they did a week or ten days ago. Thirdly, the deteriorating balance of payments position and the dimmer prospects of getting more foreign aid have strengthened the possibility of further substantial doses of new taxation.

Some persons, however, are setting great store by the meeting that took place yesterday at New Delhi between the top leaders of the business community and the Finance and Commerce and Industry Ministers. They are hoping against hope that the outcome of this meeting will impart a bullish fervour to the share markets. It is expected that, following this meeting, there will be some relaxation in the burden of taxation on cloth, that the compulsory deposit scheme will be so simplified as not to hurt the companies which are using their reserves for purposes in consonance with the requirements of the development plan, that the rigours of the dividend tax will be modified in favour of investors, that more bank credit will be made available to trade and industry, that no further incursions will be made by the State into the sphere of private enterprise and that there will be better appreciation of the merits of free enterprise than now. It remains to be seen whether all this is mere wishful thinking or at least some of them will materialise.

It seems that big operators are still optimistic and are holding large blocks of shares. In other words, the market is believed to be long, with most of the short-sales that were effected before and after the November-end tax proposals having been covered. Some say that these operators have no other go but to stick to their holdings, as it is not easy to get rid of them without suffering serious losses and that it is in their interest to nurse the market. How far this is true is not an easy question to answer. The occasional upward pull of the market and the absence of any marked buying at higher levels are said to be the outcome of the aforesaid situation.

* * * *

The share market is inclined to think that the Bank rate has not gone up, for, in its opinion, the ½ per cent. increase in the Reserve Bank's lending rate to banks last week does not amount to that. It is just deluding itself in thinking thus. For all practical purposes, the Bank rate has gone up. The trends in the money market have already begun to support this conclusion. The short-term deposit rates of banks have risen by ½ per cent. This is only the beginning and this journal would not be surprised if a further rise in these rates were to materialise. There is reason to believe that the Reserve Bank has no intention of using its good offices for bringing about an understanding among the banks for keeping the rates of interest on deposits pegged at agreed levels. With the exit of Mr. Benegal Rama Rau, who had been persuaded by some of the bankers to extend his sympathy and support to such a proposal, what little chances there were for its implementation have now completely disappeared. The new regime, under the leadership of Mr. T. T. Krishnamachari, does not want to interfere in this matter. It seems to believe in the theory that higher interest rates on deposits will attract more savings. And, in any case, now that banks are making good profits, as is evident from their financial results for 1956, the official circles are said to hold the view that banks can afford to pay higher rates on deposits.

Several banks have raised the rate of interest on some of their advances to trade and industry. This is also only a beginning. In their anxiety to better their margin of profit and to provide for the possibility of a fall in the value of Gilt-edged securities in the coming months, the banks are bound to apply higher rates of interest to all advances. It is only a question of time. Business men will, of course, grumble in the beginning, but since they need more credit and do not find any difficulty in passing on the additional burden to consumers, they will ultimately agree to the change. Indeed, many of them will not mind paying more for bank credit if they can get their requirements in full. It is significant that no section of the business community has so far protested against the rise in the Reserve Bank's advances rate to member banks, though all sections must be fully aware of the significance of this step. Incidentally, the State Bank of India, too, has raised its rate of interest on advances to banks against Government securities from 4 to 4½ per cent.

* * * *

Enquiries made in official circles reveal that the authorities were prompted to take the unprecedented step of divorcing the Reserve Bank's rate of interest on advances to member banks against Government securities from the Bank rate for three main reasons. These, in their order of importance, are: (1) The need for keeping the usance bill rate and this rate at par, lest there should be a pronounced tendency on the part of banks to borrow against Government securities to the maximum extent possible and to reduce the use of usance bills; (2) the increase in the profit-margin of banks and the consequent desire of the Government to charge a little more on the money that is lent by the Reserve Bank to them; and (3) the presence of inflationary pressures in the economy and the necessity for keeping them under control. The last mentioned factor implies that the Scheduled banks must pass on the increase in the cost of their deposits and borrowings from the Reserve Bank to their customers. There is thus no question of the Reserve Bank frowning at the banks putting up the rates of interest on their advances so long as the increase is within reasonable limits.

This attitude may seem to be in conflict with the relaxation of restriction on bank credits to cloth trade. But one should not mix these two issues. Bank credits to cloth trade are on a different footing now. This restriction has already served its purpose. The boom in cloth trade, noted in the second and third quarters of 1956, has been successfully killed. Instead of a boom, there are now prospects of a recession in cloth trade. Stocks of cloth with mills have accumulated to uncomfortable levels. Several mills are holding stocks in excess of the limit prescribed under the Textile Control Order, because they cannot be sold at remunerative levels. It is in order to ease this situation that the Government directed the Reserve Bank to lift the restriction on bank credits to cloth traders. The Reserve Bank gave the necessary orders to the banks on the 1st inst., but news about it appeared in the daily Press only on Wednesday.

SUGAR EXPORTS

Since our reference to export of sugar by India in these columns a fortnight ago, we understand that orders for 30,000 tons have been booked, bringing the total firm sales to 40,000 tons, as compared with the initial target of 50,000 tons. The buyers include, besides the Persian Gulf countries, Pakistan, Ceylon and Africa. There has, however, been a fall in the price realised on such sales, from £62 per ton, f.o.b. to £60 per ton f.o.b. The demand for Indian sugar at the latter level is said to be good and further business is likely.

Despatches of sugar from the factories in Uttar Pradesh which have sold for export have already begun and the first shipment to the Middle East is scheduled to begin on the 15th inst.

Indeed, now that interest rates have been pushed upwards, it will not be surprising if the authorities are prepared to make available more credit to the market. The Reserve Bank is already reported to have bought Government securities from the open market and some of the credit institutions to the tune of Rs. 16 crores since the commencement of 1957. This incidentally explains the recent spurt in the value of Gilt-edged securities and their current steadiness in the face of higher *de facto* Bank rates. It is also reliably understood that the Reserve Bank has enhanced the limit for discounting usance bills (outstanding at any time) to as much as Rs. 145 crores, as against which the banks have so far availed of only Rs. 56 crores. If this limit were to be exceeded on account of heavy demand for bank credit and if the authorities were satisfied that such demand was for genuine trade purposes and not for speculation, they would be prepared to raise it by Rs. 25 crores to Rs. 30 crores. It would accordingly appear that the business community need not be unduly perturbed by prospects of a famine in bank credit in the coming months, though it is now certain that they will have to pay a little more for such credit.

* * * *

Assuming that the Union Finance Minister is the best astrologer of the country's fiscal future, the forthcoming budget is bound to be a "lame duck." This does not, however, rule out the possibility of the succeeding budgets turning out to be more menacing centipedes, armed with a multitude of fiscal fangs. There is a widespread impression that the Government will derive its inspiration for fiscal reform from the British economist, Dr. Kaldor, who, at the instance of the Indian Statistical Institute, investigated the Indian tax system and submitted a report on the devices by which the Government could augment its revenue. Although his proposals have rightly attracted considerable attention, it is a pity that no comprehensive attempt was made to subject them to a very careful scrutiny. This deficiency has now been made good—and that, very ably too—by the Federation of Indian Chambers of Commerce and Industry, in a brochure entitled *Kaldor's Report on Indian Tax Reform—An analysis*. The brochure, besides making interesting reading, contains much food for thought for those who devise and administer fiscal policies.

The Federation, in this brochure, analyses and comments upon the different proposals made by Dr. Kaldor, including those relating to reduction in income-tax, personal expenditure tax, tax on wealth, capital gains tax and gift tax. It welcomes Dr. Kaldor's proposal for a reduction in the top marginal rates of income-tax and super-tax but rightly holds that the proposal will lose its merit if it is combined with the numerous other taxes he has advocated. As regards expenditure tax, it emphasises the now well-known criticism that though, theoretically speaking, it may be a more equitable tax, it is "almost impossible to impose it in practice." Referring to tax on capital gains, it reiterates the view it expressed in its memorandum to the Taxation Enquiry Commission that the tax is inequitable and that it will act as a disincentive to investors.

Perhaps, the Federation's criticism of Dr. Kaldor's proposals relating to annual tax on wealth and gift tax deserves special notice, because they are less impracticable than the expenditure tax and may, as such, be engaging the serious attention of the Finance Ministry now. Dr. Kaldor, it may be recalled, proposed an annual rate of tax on wealth at varying rates—Below Rs. 1 lakh—nil; Rs. 1 lakh to Rs. 4 lakhs—1/3 per cent.; Rs. 4 lakhs to Rs. 7 lakhs—½ per cent., Rs. 7 lakhs to Rs. 10 lakhs—¾ per cent; Rs. 10 lakhs to Rs. 15 lakhs—1 per cent.; above Rs. 15 lakhs—1½ per cent. The Federation points out that, though the percentages may appear small and harmless, in practice, the tax could be a very inequitous one. It argues that if the tax is levied on the value of property, the person who has a larger income on his property will be in a better position to pay the tax than another whose investments yield little or no income. Productive enterprises have a long period of gestation and a person holding a share in a new enterprise may not receive any dividend for the first few years. He will nonetheless be liable to pay a tax based on the market value of his shares. He may thus be forced to consume his capital to be able to meet his tax liability. The Federation observes that the problems of valuation which will arise if the tax is to be administered efficiently and equitably have been grossly underestimated.

After examining the working of the system of annual tax on wealth in countries where it is levied, it reaches the conclusion that the tax is invariably associated with low rates of income-tax and the rates of property tax themselves are placed at low levels in those countries. It admits that Mr. Kaldor's proposals include both these elements, but doubts whether the introduction of the wealth tax, in the present administrative set-up, would be practicable in this country. It concludes by affirming that the tax would discriminate against genuine savings and would create difficult problems both in valuation and assessment of property. For these reasons, it suggests that the proposal should be given up.

The gift tax was advocated by Dr. Kaldor as a measure to replace the present Estate Duty. It will be a tax on all gifts including gifts *inter vivos* as well as inheritance. In contrast to the system adopted for estate duty, the tax will be assessed not with reference to the estate of the donor but that of the donee. An exemption limit of Rs. 10,000 for any single recipient is suggested. Gifts over and above that will be taxed at the rate of 10 per cent. if the net wealth of the recipient is below Rs. 1 lakh, at 15 per cent. if his net wealth is between Rs. 1 lakh and Rs. 1.5 lakhs, at 20 per cent. between Rs. 1.5 lakhs and Rs. 2 lakhs and so on, the rate becoming 80 per cent. if the total estate (including the gift) of the donee exceeds Rs. 20 lakhs. In other words, for slabs above Rs. 1 lakh, the rates proposed are double the present estate duty rates.

Commenting on Dr. Kaldor's proposal, the Federation says that a gift tax on *inter vivos* gifts is levied in the U.S., Sweden, Canada, Australia, the Netherlands and a few other countries. But, in all these cases, the tax is meant to supplement death duties and not to replace them. It is in fact an extension of the principle that gifts made within a prescribed period prior to death should be aggregated with the estate for purposes of death duty. The tax on gifts in these countries is imposed not with a view to raising additional revenue, but with a view to making the administration of death duties more effective and reducing the possibility of evasion Dr. Kaldor's proposals, however, go beyond the case for a gift tax as a supplement to death duties.

A more basic objection to the general tax on gifts, according to the Federation, is that at the present stage of administrative experience it would be a very difficult tax to put into practice. The taxation Enquiry Commission has said that the tax requires considerable experience in the operation of estate duty before it can be introduced. In view of the fact that it is hardly three years since estate duty was introduced in India, it has expressed itself not in favour of introducing a gift tax at this stage. Moreover, a gift tax coupled with a personal expenditure tax of the kind proposed, it is stated, would result in inequalities of treatment and may also involve double taxation. In calculating personal expenditure, Dr. Kaldor recommends that gifts above a certain limit only should be excluded from expenditure. Gifts below the prescribed limit would be treated as expenditure and would be liable to expenditure tax. But the same would also be charged to a gift tax in the hands of the recipient, if the latter has already received

EQUITIES COLOURLESS

UNDERTONE QUIET

(From Our Own Correspondents)

BOMBAY, *7th February*

DULL conditions prevailed on the Stock Exchange during the week under review. There was a general apathy on the part of operators to extend their commitments and business was, therefore, very much restricted, with fluctuations confined to a narrow range. The increase of ½ per cent. in the Reserve Bank's rate of interest on advances to Scheduled Banks against Government securities, did not have any effect on equity prices, but the fear that there was likely to be a corresponding rise in banks' lending rate, in which case the costs of industries would go up, had a restraining influence. The end-of-account considerations also restricted business.

The new account on Monday opened on a subdued note and prices were well marked down on that day on fears of increasing tension over the Kashmir issue. Reports of mounting stocks of cloth also depressed sentiment. From Tuesday onwards, however, there was a slight recovery on bear covering. The removal of credit restriction on cloth was a favourable factor, but this did not bring about any cheer to the market. For it is stated that a reduction in excise duty alone would help movement of cloth. The market at the close was hesitant.

In the steel section, Tata Ordinaries were marked down from Rs. 179-12 to Rs. 176-4, before they crept up to Rs. 179-8 today. The closing was, however, a shade lower at Rs. 178-12. Indian Irons, which were listed *ex*-right on the 4th inst. at Rs. 22-6, as against the previous week's closing of Rs. 29-5½ *cum*-right, dropped to Rs. 22-1½. After recovering to Rs. 22-7½, they wound up at Rs. 22-6. Indian Irons Rights were placed in the forward list today and business was done between Rs. 7-3½ and Rs. 7-2½.

Notwithstanding the recovery in the last three days, textiles were the worst affected and losses over the week were on a wide front. Bombay Dyeings receded from Rs. 570 to Rs. 552-8, but managed to recover to Rs. 564-6 today and closed at Rs. 562-8. Centurys dropped from Rs. 507-8 to Rs. 496 before regaining to Rs. 501-8. Kohinoors declined from Rs. 326-8 to Rs. 320, but the loss was more than made good when the shares closed today at Rs. 327-4. Central Indias shed over the week Re. 1 to Rs. 123, Finlays Rs. 5 to Rs. 307 and Gokaks Rs. 3 to Rs. 223-8, while Indu Ordinaries were unchanged on balance at Rs. 11. Indore Malwas were lower by Rs. 2-8 at Rs. 138-12. Morarjee Goculdas dropped Rs. 2-8 to Rs. 227-8. New Greats softened from Rs. 241-8 to Rs. 240, while New City Mills hardened from Rs. 147-8 to Rs. 151-14. Both New Great and New City Mills have maintained the dividends at Rs. 10 each for the year ended 31st December 1956. New Kaiser-I-Hinds lost Rs. 3-12 to Rs. 110 and Phœnix Rs. 2-8 to Rs. 145. Podars were done at Rs. 165 *ex-div.*, as against Rs. 170 *cum-div.* Shree Niwas held their own at Rs. 190, but Simplex drifted down from Rs. 183-8 to Rs. 180. Standards gave way from Rs. 440 to Rs. 427-8 and Svadeshis from Rs. 230 to Rs. 225-8. A drop of Rs. 3-12 to Rs. 411-4 was noted in Swans and of As. 12 to Rs. 50 in Tata Mills.

Bank shares were featureless, but the undertone was quiet, with moderate losses in some scrips. Barodas were unchanged at Rs. 103-8 and Central Banks at Rs. 54-8, while the New shares were marked down by a rupee to Rs. 58. Bank of Indias also lost a rupee to Rs. 140, as also their new shares to Rs. 141. Punjab Nationals suffered a loss of Rs. 3 to Rs. 55 and United Commercials As. 4 to Rs. 58. Union Banks were steady at Rs. 7-10.

Business in the insurance section was confined to New Indias only, which were fractionally lower at Rs. 43-8.

Barring Ahmedabad Electrics, which ruled firm on good investment support, the electricity section ruled quiet and business was on a limited scale. Following the declaration of a higher final dividend of Rs. 4 per share for the year ended 30th September 1956, as against Rs. 2-8 in the previous year (bringing the total distribution for the year to Rs. 6-8 per share, as against Rs. 5 for 1954-55), Ahmedabad Electrics shot up from Rs. 96-9 to Rs. 99-6. Bombay Suburbans were unchanged at Rs. 109-6 and Surats at Rs. 112-8. Tata Hydros declined by Rs. 3 to Rs. 121, Tata Powers by Rs. 2-8 to Rs. 1,232-8 and Andhra Valleys by Rs. 12-8 to Rs. 1,215. Andhra Valleys (New) were maintained at Rs. 1,195.

The miscellaneous section fully reflected the general apathy of the operators. In the sugar group, except for Walchandnagars, fluctuations were narrow. Belapurs moved between Rs. 231-8 and Rs. 230, before closing at Rs. 231. Bhopals shed As. 8 to Rs. 18-14, but Phaltans showed no change on balance at Rs. 148. Walchandnagars were marked down by Rs. 4-12 to Rs. 263-12. Cement shares drifted lower, A.C.C. moving down from Rs. 183 *cum-div.* to Rs. 168-4 *ex-div.* before closing at Rs. 170-8 *ex-div.* Digvijays were taken down by Rs. 2-12 to Rs. 149-8. Orissa Cements were held at Rs. 13-3. Among engineering shares, Alcocks were quiet, shedding Re. 1-4 over the week to Rs. 263-12. Tata Locomotives were hammered down from Rs. 153-8 to Rs. 148, but they staged a recovery to Rs. 150 at the close. Premier Constructions were unchanged on balance at Rs. 181-8, but Larsen and Toubros gained As. 2 to Rs. 17. In the mining group, Shivrajpurs were conspicuous with a gain of Re. 1-8 at Rs. 95, on rumours of a bonus issue. Indian Coppers were steady at Rs. 3-10½, while B.B. Petrols were colourless at Rs. 2-12.

Hindustan Motors changed hands As. 2½ lower at Rs. 8-0½ and Premier Automobiles As. 12 down at Rs. 104-12. Shipping shares also were quiet, Scindias receding from Rs. 18-15½ to Rs. 18-13 and Great Eastern Shippings from Rs. 19-1 to Rs. 18-12.

In the miscellaneous group, Bombay Burmahs were subjected to heavy selling pressure, despite the Company's announcement that the Directors proposed to issue bonus shares, if the scheme of capital reorganisation became operative and the Controller of Capital Issues and Exchanges Controller gave permission. The shares slumped from Rs. 727-8 to Rs. 706-4. After a recovery to Rs. 718-12, they again receded to Rs. 711-4. Their new shares dropped Rs. 8-2 to Rs. 268-2. National Rayons were marked down from Rs. 246-4 to Rs. 239-12, before closing at Rs. 241-4. Gwalior Rayons were done As. 2 lower at Rs. 15-10. British India Corporations were a fraction lower at Rs. 8-6. Tata Chemicals lost As. 5 to Rs. 16-1 and Tata Oils As. 4 to Rs. 45-8. Wimcos were steady at Rs. 173. Hindustan Levers were unchanged at Rs. 19-6. Texmacos were quiet at Rs. 20-12.

Calcutta Stock Exchange

CALCUTTA, *6th February*

Earlier in the week under review on the Calcutta Stock Exchange, share values moved down and the volume of transactions thinned, but on Friday a little improvement in sentiment was recorded, mainly because of the attractively low levels equity values had reached. However, on Monday again, prices moved down on selling pressure, although the volume of transactions was satisfactory. The market was closed yesterday on account of *Saraswati Pooja*.

The recovery that was in evidence for about a fortnight was arrested early in the week, following the market's disappointment over the details of the rights issue by the Indian Iron and Steel Company Ltd. Although these details had been known even as early as November last, their official announcement kept many an operator and investor athinking pondering over the prospects. First, the premium of Rs. 3-8 for the 5,183,708 new ordinary shares, which are to be issued in the proportion of one share to every one ordinary share now held, was considered too great. Secondly, the new shares would not be eligible for the dividend for the year ending 31st March 1957, and the market's presumption that the dividend on the existing shares would be maintained at 10 per cent. or Re. 1 per share was indicated when, in unofficial transactions, the new shares were quoted at Rs. 20-8 and the old ones at Rs. 21-8. No indication was available if the new shares would be eligible for dividend for the year ending 31st March 1958. But it was thought that they would and that the dividend of 10 per cent. would be maintained.

The bearish tendency gained momentum when the Reserve Bank of India announced on Thursday night the increase in interest rate to 4 per cent. from 3.5 per cent. as from 1st February on advances to Scheduled banks against Government and other eligible securities. No surprise was caused in Calcutta financial circles, in view of the dearer tendency in the money market noticeable in recent weeks. However, the earlier announcement to the effect that the Bank rate would remain unchanged at 3½ per cent. caused some surprise, but it was thought that the Bank rate would also soon be raised, although the 3.5 per cent. now existing comes to 4 per cent., if the increased stamp duty on the Bill market scheme is taken into account. As Scheduled banks would be obliged to borrow larger sums in the coming months against Government securities to finance development plans in the private sector, it is seen that for all practical purposes the Bank rate is also 4 per cent. If the Reserve Bank avoided a *de jure* announcement in this regard, it was only to prevent an impact on people's psychology.

Pakistani threats over the Kashmir issue contributed to making a re-analysis of prospects by operators. The proximity of the elections and the expectations of an increase in taxation in the coming Budget also contributed to the earlier dullness. The Labour Appellate Tribunal's award, which provides for its retrospective implementation from 26th May 1956 (the date of the last award which substantially increased the wages bills of collieries), has made a further addition to labour costs. The increase of Rs. 3 per ton in the price of coal has been found inadequate to cover the additional labour costs following the earlier award. How the Government can avoid a further increase in coal prices is difficult to see as the private sector has to ensure first that existing production is economic before embarking on expansion plans.

Among textiles, Kesorams were unchanged at Rs. 15-11, and Cawnpores declined to Rs. 7-11 from Rs. 8-1.

More selling was recorded in the coal section and, although most counters gave way, a few selected scrips looked up latterly, on buying attracted by the low levels. Thus, while South Karanpuras were pushed down from Rs. 10-6 to Rs. 10-1, Burrakurs were unchanged at Rs. 21-4 and Bengals were put through at Rs. 459, as against Rs. 456 a week ago. Western Bengals declined by As. 5 to Rs. 5-15. Central Indias receded to Rs. 6-8 from Rs. 6-12.

The decline in raw jute prices was noted in jutes later in the week. At Rs. 21, Nationals were up by Re. 1-4. Gourepores were a strong feature for the jump from Rs. 205 to Rs. 225. Another equally strong counter was Kinnisons which recovered from Rs. 135 to Rs. 140. Deltas were taken from Rs. 140 to Rs. 146, Cheviots from Rs. 142 to Rs. 150, Megnas from Rs. 77 to Rs. 80-8, and Barnagores from Rs. 103 to Rs. 110.

Engineering scrips were reflective of the general trend as referred to above. Indian Irons gave way from Rs. 29-4 to Rs. 28-11 on bull liquidation. Business in shares of Indian Irons would continue on *cum*-right basis until further notice, according to an announcement by the Stock Exchange Committee on Monday night. It is also stated that the delivery of Indian Iron shares in the clearing on 20th February would be compulsorily carried over to the clearing on 6th March at the fixed carry-over charge of one anna nine pies. Jessop & Cos. moved down from Rs. 29 to Rs. 28-8, and Guest Keens from Rs. 24-10 to Rs. 24-4. From Rs. 20-12, Texmacos had improved to Rs. 21-2 before sagging to Rs. 20-11.

Tea shares responded to selective inquiry. Bishnauths were taken to Rs. 22-1 from Rs. 21 and Ranicherras had buyers at Rs. 16-10, as against Rs. 16-3 in the beginning of the week. Tezpores hardened to Rs. 20-12 from Rs. 20-2 and Rydaks to Rs. 36 from Rs. 31-8. Methonis, at Rs. 20-4, put on an improved appearance.

Earlier in the week miscellaneous industrials were featureless, but subsequently they improved. Indo-Burma Petroleums, after scoring to Rs. 36-4, were fully steady at that rate. On interested buying, Metal Boxes were taken from Rs. 27-8 to Rs. 29-10, while Indian Aluminiums receded from Rs. 14-8 to Rs. 14-2. Indian Cables were marked down from Rs. 32-14 to Rs. 31-15. After moving down to Rs. 33-2 Orient Papers recovered to Rs. 33-10.

* * * *

Madras Stock Exchange

MADRAS, *5th February*

The firm trend noted on the Madras Stock Exchange last week abated somewhat during the week under review. In fact, the market depicted an easy note. Buying enquiries were at a low ebb, thanks to continued stringency in the money market and weakness in commodity markets. There was large-scale profit-taking. Consequently, equity values generally tended to recede.

In the textile section, Radhakrishnas encountered heavy selling and were hammered down by Rs. 15 to Rs. 315. Lakshmis dropped Rs. 3 to Rs. 262. Cannanores declined by a rupee to Rs. 177. Loyals shed a like amount to Rs. 50-12. Maduras receded by As. 4 to Rs. 46-12 *cum-div.* Cambodias eased by an anna to Rs. 14-11. Trichinopolys were neglected at Rs. 13-5. Travancore Rayons were done at Rs. 14-1, as against Rs. 14-5 last week-end. Bangalore Woollens, on the other hand, met with good buying support and rallied Rs. 17-8 to Rs. 572-8. Buckinghams and Janardhanas were favoured As. 8 higher each at Rs. 183-8 and Rs. 108-8 respectively.

Among tea shares in the planting section, Taleyars dropped As. 4 to Rs. 11-14. A similar loss was suffered by Twyfords which were quoted at Rs. 19-8. Kil Kotagiris receded by As. 3 to Rs. 6-5. Nelliampathys, however, elicited some support and put on As. 4 to Rs. 3-6. Waterfalls improved by As. 2 to Rs. 5-8. Blue Mountains were a shade better at Rs. 5-5. Deals in coffee shares were put through at slightly reduced rates. Coffee Lands eased by an anna to Rs. 24. Mysore Plantations lost nine pies to Re. 1-12-9. Rubber shares, however, elicited attention of operators and recorded some improvement in values. Highlands strengthened by As. 11 to Rs. 14-14. Tropicals hardened by As. 10 to Rs. 33-10. Midlands increased by As. 5 to Rs. 18-4 and Kallas by As. 4 to Rs. 6-2. Pullangodes and Cowcoodys were better by an anna each, the former at Rs. 2-13-6 and the latter at Rs. 7-15. Thirumbadis were firm at Rs. 2-2. Cochin Malabars, on the other hand, came in for some selling and shed As. 3 to Rs. 9-3.

Activity in the miscellaneous section continued to be restricted. Aluminium Industries drifted down by As. 4 to Rs. 19-8. Mettur Chemicals were quiet at Rs. 10 *cum-div.* Cement shares received some support. India Cements and Travancore Cements picked up an anna each to Rs. 29-15 and Rs. 9-12, respectively. F.A.C.Ts ruled firm at Rs. 6-7.

Among bank shares, Indian Overseas receded from Rs. 159 to Rs. 154-8. Indian Bank Fully Paids declined by Rs. 3 to Rs. 204. Travancores were done at Rs. 16-15.

BRADY GROUP DIVIDENDS

It is realiably understood that the directors of companies under the management of Messrs. W. H. Brady & Co., Ltd., have decided to maintain the dividends for 1956 at the preceding year's levels. Thus, the shareholders of New City Mill will get Rs. 10 per share (of Rs. 100 each), of New Great Mill Rs. 10 per share (face value Rs. 100), of Empire Dyeing Rs. 3 per share (face value Rs. 15) and of Brady Engineering Rs. 3 per share (paid-up value of Rs. 60). The dividend on the shares of the managing company, namely, Messrs. Brady & Co., Ltd., has, however, been raised from Rs. 20 per share (of Rs. 100 each) to Rs. 22-8.

NEWS IN BRIEF

THE hundredth lathe built by the Hindustan Machine Tool Factory was out on the 5th inst. The Factory achieved a record production of 24 lathes per month during November and December last. It surpassed this record by producing 25 lathes in January.

The Union Government has sanctioned an interest-free loan of Rs. 5.81 lakhs for the development of the silk handloom industry in Bihar during the financial year 1956-57. The loan is being utilised for advancing loans for share capital to 1,500 silk weavers.

The Bombay State Electricity Board has been reconstituted under the chairmanship of Mr. M. H. Hasham Premji. The other members of the reconstituted Board are Messrs. C. V. Bedekar, I.C.S., Pestonji C. Hansotia, Jamiyatram K. Modi and P. H. Bhutta. The reconstituted Board came into existence on 1st February.

Two large deposits of limestone, containing an estimated reserve of nearly 124 million tons, have been discovered in the Guntur district of Andhra State. According to the Geological Survey of India, more reserves are likely to be discovered if a detailed examination is undertaken.

In order to remove the lack of statistical data on trade and industry and also to avoid inaccuracy and delay in publication, the Bihar Government has set up a Directorate of Statistics to co-ordinate statistical work of the different departments and carry out special investigations. The Government also proposes to have a statistical section in each N.E.S. block and district statistical organisations.

Production of formulated D.D.T. in the Hindustan Insecticides, Ltd., New Delhi, during the month of December 1956, was 98.66 tons, which is the highest produced so far in any month. During the same period, 40.8 tons of technical D.D.T. was also produced. The stock position at the end of the month was 163.3 tons of technical D.D.T. and 48.19 tons of formulated D.D.T. Despatches of formulated D.D.T. during the month amounted to 42.4 tons.

The validity of schedules 'A' and 'B' attached to the trade agreement between India and the U.S.S.R., signed in December 1953 and valid till December 1958, has been extended for another year. The schedules are subject to annual renewal. The schedules have been modified to include the import of aluminium and rough emeralds into India from Russia and the export of cashew nuts, hydrogenerated oils, footwear, woollen fabrics and mica from India to Russia.

Discussions took place early this week between the representatives of the Dunlop Rubber Company (India) Ltd. and those of the Madras Government in regard to the proposed establishment of a tyre factory very near Madras City. The State Government is said to have promised to the Company to provide the facilities necessary for the acquisition of land both for factory and for sinking wells for the supply of water required in plenty for the manufacture of tyres. The factory is expected to cost Rs. 3 crores and provide direct employment to 1,000 persons.

The British India Steam Navigation Company, a subsidiary of the P. and O. Steam Navigation Company, has taken over the shipping business of Messrs. Mackinnon Mackenzie and Company, their Managing Agents since 1862. The latter are established in Calcutta and Bombay and have associated companies in Pakistan, Burma, Ceylon, Singapore, Malaya, Hong Kong and Japan, all of which are also being taken over by the British India Company. The Company has also terminated, by mutual agreement, its London agency held by Gray Dawes and Company, and has taken over its staff.

In view of reports of good rice harvests, the Government of India was examining the possibility of making some purchases of rice and paddy to build up stocks. In consultation with the State Governments concerned, preliminary arrangements were accordingly made to watch the price-level in the surplus areas, and to make purchases if prices came down to sufficiently low levels. Having regard to the present trend of prices and to avoid any possible bullish effect on the market, the Government of India has decided not to make internal purchases from the present harvest. The preliminary arrangements already made in this connection are, therefore, being cancelled.

The Development Councils for heavy electrical and light electrical industries have been reconstituted by the Union Government. The new Council for heavy electrical industries will cover industries manufacturing electric motors and machinery and equipment for the generation, transmission and distribution of electric power. Mr. N. N. Iengar, Technical Director, Tata Power Company, Bombay, will be its Chairman. The new Council for light electrical industries will cover industries manufacturing telephones, telegraph apparatus, wireless communication apparatus, electric lamps, etc. Mr. T. R. Gupta of Messrs. Jay Engineering Works, Calcutta, will be its Chairman. The functions of the two Councils remain unchanged.

Schemes for establishing 34 industrial extension centres to provide technical assistance to small-scale industries have been approved by the Union Government. Nine of these centres will be in the southern region, 14 in the western and 11 in the northern region. Schemes for the eastern region are under examination. These centres will be equipped with modern machines and machine tools. They will provide common service facilities for those artisans who cannot afford to purchase costly machinery. Each extension centre will have, on an average, machinery and equipment worth Rs. 2 lakhs. Technical officers of the centres will visit small-scale factories and workshops in the vicinity and suggest improved designs and better techniques of manufacture. The centres will also train workers in improved methods of production, management and marketing.

* * * *

From Abroad

A Greek shipowner has offered to lay an oil pipeline from Suez to Port Said, parallel to the Canal. The plan is estimated to cost £40 million and could be completed in 10 months.

Two West German building concerns have been awarded a contract worth £E5.2 million for the building of an irrigation canal in the Sudan. The canal, which is 134 kilometres long, will be the major piece of a new irrigation system in the Gezira cotton-growing area.

According to General Raymond Wheeler, Chief of the U.N. Canal Salvage Operations, about 154 kilometres (85 miles) of the waterway south of Port Said has been cleared. The salvage forces are being utilised to its maximum capacity to speed up the process of clearance.

The U.S. Tariff Commission has announced the opening of a new investigation into imports of bicycles at the request of the Bicycle Manufacturers' Association of America. It is the third time since 1951 that the tariff body is looking into imports of bicycle supplies to the U.S. market by the U.K., West Germany, Austria and Holland.

The Argentine Government has issued a decree freezing all collective labour contracts for one year in a bid to stem inflation. The decree will put an end to the chaotic situation created by protracted wage negotiations resulting in retro-active agreements which in recent months have increased wages by about 40 per cent. Another decree, issued simultaneously, gives employers up to one year's time to pay arrears.

Representatives of the six West European countries planning to form the Euratom atomic energy pool will ask the U.S. to back the development of the project. One aim of the Euratom project is to make Western Europe less dependent in future on Middle East oil and it is partly on that basis that the U.S. aid is sought. If the U.S. does not cooperate, the sponsors believe, the project will have to be greatly scaled down or perhaps even abandoned.

The Japanese Government is planning to raise the port entry tax on all ocean vessels from the present five yen per ton to eight yen and to impose a new additional tax of 10 yen per ton. While this applies to both foreign and Japanese ships, Japanese shipowners will get a simultaneous 50 per cent. cut in the one per cent. annual fixed asset tax on the depreciated value of their vessels. This will probably more than offset the enhanced entry tax burden. Since the tax is in effect shifted to foreign vessels, foreign owners will be placed at a relative disadvantage.

Japanese trade with Malaya is increasing rapidly and last year it aggregated $M591.9 million, about 12 per cent. above the previous year. Japanese exports to Malaya were up by 7.7 per cent. to $M256.4 million and Malayan exports to Japan rose by 16 per cent. to $M335.5 million. Although Malaya was the last country in S.E. Asia to admit the Japanese after the war, the tempo of trade is accelerating and the number of resident Japanese in Malaya is now 100. More Japanese business men are visiting Malayan markets than from any other country. Also, the first Japanese bank has now been established in Singapore.

The Government of Nepal has received Rs. 1 crore, the first instalment of China's Rs. 6 crores economic aid. Under the economic agreement signed last October in Peking, China offered Nepal aid amounting to Rs. 2 crores in cash and Rs. 4 crores worth of machinery. Nepal's newly constituted Planning Commission will shortly consider the question of utilisation of foreign aid. For its projected Rs. 33-crore first Five-year Plan, the Nepalese Government has received promises of aid to the tune of Rs. 24 crores from three countries—Rs. 10 crores from India, Rs. 8 crores from the U.S.A. and Rs. 6 crores from China.

Pakistan's proposal to float a joint shipping company, with capital being shared with Iraq and Iran, has made some progress. Iraq is understood to have already approved of the idea, while the consent of Iran is awaited. According to tentative plans, the capital for the undertaking would be between thirteen and fifteen million pounds sterling. Private capital would be sought to finance the venture; but, if sufficient private investors were not forthcoming, the Governments themselves would provide the money. The proposed company is expected to operate a cargo-*cum*-passenger service between Chittagong and Basra and to serve all intermediate ports.

An Electric Lamp industry Council is now being set up in Britain, as it has been decided to wind-up the Electric Lamp Manufacturers' Association at the end of this month. The latter was the subject of considerable criticism in a Monopolies Commission report in 1951 and it did not also fully represent the industry. The Council, which has as founder members all lamp manufacturers, will start functioning from 1st March. The first Chairman of the Council is Mr. J.G. Christopher of Thorn Electricals Ltd. The aim of the new body is to maintain quality standards, encourage fair trading, promote development and achieve standardisation as far as possible. To be a member, a company must have a factory licensed by the British Standards Institute.

Small atomic-power plants have just been placed on the market by a British company, Humphreys & Glasgow Ltd., which is ready to accept orders immediately for plants of up to 25,000 kw. with a completion time of two years. The plant, it is claimed, is extremely compact, occupying about the area of a tennis court. A complete power station, in the 10,000 kw. to 15,000 kw. range, installed at an average site, will cost approximately £180 per kw. Operating costs are also competitive, and electricity can be supplied at just under 1¼ pence per unit. The reactor uses enriched uranium fuel and will run for 18 months to two years without a change of fuel elements. A high degree of safety is claimed for the design. The small- and medium-sized plants, modelled on a full-scale U.S. prototype, are likely to prove most useful to communities or industrial concerns in areas where the cost of fuel is high and long-range transmission uneconomic.

PERSONAL

MR. H. V. R. Iengar, I.C.S., at present Chairman of the State Bank of India, has been appointed Governor of the Reserve Bank of India with effect from 1st March 1957.

Mr. Merghani Hamza, Deputy Prime Minister of the Sudan, who had been in India on the invitation of the Government of India, left Bombay for Beirut on Tuesday, after a two-week stay in the country.

Mr. P. C. Bhattacharyya, at present Secretary, Ministry of Finance, Department of Expenditure, has been appointed Chairman of the State Bank of India, *vice* Mr. H. V. R. Iengar.

Sir Alexander Fleck, a distinguished British scientist and Chairman of Imperial Chemical Industries, England, arrived in Delhi on Tuesday to discuss with the Government of India several expansion plans the I.C.I is undertaking during the second Plan period.

Dr. M. S. Krishnan, Mineral Adviser, Government of India, has proceeded on three months' leave preparatory to retirement. He is likely to be appointed Director, Indian School of Mines and Applied Geology, which is being reorganised to meet the shortage of mining and geological personnel in the country.

Mr. Raymond C. Firestone has been elected as the President of the Firestone Tyre and Rubber Company of the U.S. He is a brother of Mr. Harvey S. Firestone Jr., Chairman and Chief Executive of the Company, and a son of the Company's founder. He succeeds Mr. Lee R. Jackson, who has been President since 1948.

Mr. R. S. Hingorani, Technical Officer in the Mechanical Engineering Department of the Bombay State Road Transport Corporaton, is now in Britain making a special study of diesel engines at the Diesel Instruction School of F. Perkins Ltd., at Peterborough, Northamptonshire. He will stay in the United Kingdom for six months. After leaving the school, Mr. Hingorani will spend some time with the Birmingham City Transport Authority studying maintenance and workshop organisation.

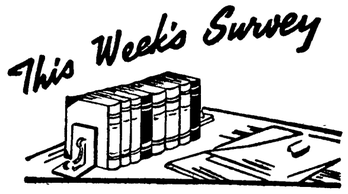
"COMMERCE" 1932

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *13th February*

South Africa and the Gold Standard

At the reopening of the South African Assembly last week-end, General Hertzog, the Premier, gave notice of a motion for the appointment of a Select Committee to inquire whether the welfare of the country demanded the maintenance of the gold standard. All exporting industries have severely criticised the South African Government for its continuance on the gold standard. By maintaining a high value for the South African pound the Government is said to have knocked the bottom out of the markets. Wool is one of South Africa's most important exports, but whereas the clip used to bring in about £20,000,000 annually, it is not likely this year to bring in more than £7,000,000. Sellers hope to do better if the country abandons the gold standard, and they are exerting great pressure upon the Government to leave it. Some people, however, blame the banks for the present exchange difficulties. The South African pound is maintaining its present level only through the imposition of severe restrictions upon exchange operations. When sterling began to depreciate the South African Reserve Bank disposed of its sterling balances with the result that the Bank has lost all its reserve fund and half its capital. It is also complained that speculators embarrassed the exchange by transferring £15,000,000 to London in anticipation of South Africa's changing over to a sterling basis. There is a volume of opinion which is strongly against satisfying the speculators. Interest payments from South Africa are due on London early each year. With South Africa still on the gold standard, £70 in that country is now worth about £100 in London. It may be that, in view of these interest payments, Government is sticking to the gold standard and that when these payments have been made, it might consider the expediency of changing over to sterling.



LEGAL SYSTEM

CONSIDERING that the rule of law is an essential element in the working of democratic constitutions, it is of the utmost importance that the laws in this country, most of which were framed in the pre-independence era, are suitably amended to reflect the spirit of our new Constitution. The Law Commission, to which this important task has been assigned, is now touring different parts of the country to gather evidence and hear the opinion of legal experts and other bodies. The work on which the Commission is now engaged was explained by its Chairman, Mr. M. C. Setalvad, in the course of his recent address at the Rotary Club, Hyderabad.

Mr. Setalvad said that, as civilisation advanced and as they were on the move towards a Welfare State, laws and regulations tended to become more complex. The Law Commission, he said, had divided itself into two sections—the Statute Revision section and the Judicial Administration Reform section. The Commission had been charged not only with bringing the laws into conformity with the Constitution but to see that they were made simple. The work of the Statute Revision section, he said, would be a long-term affair and it might take two or three decades to achieve complete revision. He revealed that the Commission had already made certain recommendations in regard to the law of limitation and the inter-State sales tax law and that legislation on the basis of these recommendations would be undertaken shortly.

As regards the problem of the reform of judicial administration, Mr. Setalvad pointed out that it varied from State to State. In some places, suits were pending for 10 or 15 years. The Commission was considering the question of simplifying the judicial system. It was also seized of the fact that the court fee was very high in certain States and the amount thus collected was spent on other purposes. He emphasised that the Commission should investigate whether the present system of legal education was adequate or whether it would be necessary to give law graduates some training after they took their degree.

A well-worn adage has it that justice delayed is justice denied. Although it is impossible to eliminate all delays—"law's delays" are proverbially irksome—a system if judicial administration should be evolved in which the delays are reduced to a minimum. The essence of the problem lies in combining speed with efficiency in judicial administration. Another aspect of the problem of judicial administration, which we hope the Commission will carefully consider, is the effect of the various laws which confer wide discretionary powers on the Executive. The question is whether such powers are not calculated to reduce the democratic content of the Constitution by which the country is governed. Despite all its subtlety and elaborate legal forms, the tyranny of the Executive could be no less cruel, no less harmful to democracy, than that of dictatorship.

CUSTOMS PROCEDURES

The Government of India's move to appoint a committee to conduct a comprehensive inquiry into customs procedures and organisation and to make recommendations for their improvement, though very much belated, will be widely welcomed. The Committee is presided over by Mr. F. C. Badhwar, retired Chairman of the Railway Board and at present Managing Director of Messrs. Bird & Co., Calcutta. The proposed inquiry, it is said, will examine, *inter alia*, procedures for clearance of goods and passengers' baggage through the customs, administration of import, export and exchange control regulations, methods of classification and valuation of goods, procedure for grant of customs refunds and drawbacks, and liaison between the customs, port trust and trade control authorities.

The findings of the Committee will be awaited with utmost interest, especially by all those importers who know best where the import control and customs procedures shoe pinches most. Innumerable instances can be cited to prove the vagaries in the administration of control and customs regulations. Suffice it to mention two most disquieting features, namely, arbitrariness over values for assessment purposes and rigid system of classification adopted by the customs authorities in their anxiety to secure maximum revenue. Particular mention must also be made of irregularities in determining agency commissions and protracted examination of individual agency agreements. Although traders and manufacturers have repeatedly brought the hardship caused by customs difficulties to the notice of the authorities ere now, the vagaries not only persist but have, in fact, increased considerably. Indeed, hardly any meeting of the chambers of commerce or trading associations or Export and Import Advisory Councils has been held without a pointed reference to the customs difficulties and irregularities. It is as a sequel to the repeated complaints and protests by the mercantile community that the Government of India has, at long last, set up the Committee for conducting a detailed inquiry into customs formalities. Announcing the appointment of the Committee, the Government says:

> "The procedures for the clearance of goods and passengers' baggage at present followed by the customs houses in India have grown into their present form over many years, during which rapid changes have taken place in the practices adopted in international trade and commerce. Although these procedures have been under constant review by Collectors of Customs, as well as by the Central Board of Revenue, basically, they are still the same as those followed more than three-quarters of a century ago. Both the Government of India and the commercial public have, therefore, felt the need, particularly in recent years, for a detailed investigation of the content and operation of these procedures so as to achieve the requisite degree of modernisation, especially in respect of speed and efficiency. An examination would simultaneously be necessary of the connected questions of adequacy and level of efficiency of the organisation and staff of customs houses."

The foregoing account will indicate the magnitude of the task entrusted to the Badhwar Committee. If the Committee is to serve the object for which it is set up, it must spare no effort to study the whole issue thoroughly and suggest effective steps to improve the working of the Customs Department. This is of the utmost importance to the country in the present context of the huge imports of manufactured goods and commodities contemplated under the second and subsequent Five-year Plans. Unless these imports are freed from unnecessary and cumbersome customs procedures and regulations, there is the danger of a setback to the pace of implementation of development schemes. It is to this aspect that the Badhwar Committee will have to address itself in right earnest.

MACHINE TOOLS

Although machine tools have been manufactured in this country for over three decades now, it is even now true to say that Indian industries still depend upon imported equipment, thanks to the wide gap between domestic production and demand. This situation is obviously the result of absence of technical know-how and an economic and continuously growing demand for machine tools. Machine tools are at once the basis and the by-product of industrialisation. In fact, there is a certain vicious circle about machine tools industry in that, while only a high level of industrialisation can help improve the industry, even the basis of industrial progress cannot be laid without an adequate supply of precision tools. India has fortunately reached a stage at which the vicious circle could be cut without much difficulty. For the progress of industries, in the recent past, and the contemplated programmes of industrial development point to a period of expanding demand for machine tools which, in its turn, should provide sufficient incentive for machine tools manufacturers.

Against this background, it will be easy to appreciate the sense of urgency with which the Government regards the progress of the machine tools industry. Addressing the first meeting of the newly constituted Development Council for Machine Tools, the Union Minister for Heavy Industries, Mr. Manubhai Shah, emphasised that the development of the industry was a "must" in India's industrial progress. The state of the machine tools industry, he said, was an index of the technological advancement of a country in its engineering industries and machinery manufacture. Deploring India's dependence on imported machine tools, he added: "This is the most important and vital part of industrialisation and we cannot tolerate such a helpless position. We do not mean to tolerate it any more." Now that the second Five-year Plan has been drawn up with a marked emphasis on industries, particularly steel and heavy industries, it is more than ever necessary to lay the foundation of enduring economic progress through the development of the machine tools industry along right lines.

To review the position of and prospects for the industry. At the end of 1956, the total number of machine tools installed in the country was estimated at 80,000. It would appear that over 50 per cent. of the machine tools was older than 10 years. This means that nearly half the machine tools in India have outlived their life of utility. It is difficult to forecast accurately the demand for machine tools. But it is known that the demand depends upon two important factors—the number of machine tools already installed and the consumption of steel. In India, taking into account the overage machine tools which require to be replaced and the prospective increase in steel consumption from the present level of about 2 million tons to 4.5 million tons towards the end of 1960-61, it is estimated that the requirements of machine tools would be doubled. For the next five years, such requirements are estimated at 170,000. At present, the country has achieved a certain measure of progress in the manufacture of lathes, drilling machines, shapers and a few other simple machines. Attempts have been made to manufacture radial drilling machines, surface grinders, tool and cutter grinders, capstan lathes, and the results are said to be encouraging.

There is already a wide gap between the demand for and the domestic production of machine tools. Although the value of output has increased from Rs. 47 lakhs in 1951 to Rs. 1 crore in 1956, the production is still insufficient to meet the demand (estimated at Rs. 8 crores) so that the gap is being filled by imported equipment. The existence of this gap, and even more, the prospect of the demand moving up to higher levels in the next few years should give more than the necessary fillip to the machine tools industry. The value of the total demand is expected to go up to Rs. 15 to Rs. 17 crores in the next five years. "Even if it were not possible to manufacture all the categories of machine tools by the end of the second Plan," Mr. Shah said, "we must plan for the production of about 75 per cent. of our annual requirements." This would mean that the country should be in a position to manufacture tools worth about Rs. 10 crores annually by 1960-61. With expansion of the three State-owned factories—the Hindusthan Machine Tools Ltd., Bangalore, the Praga Tools Corporation, Secunderabad, and the Machine Tool Prototype Factory, Ambarnath—the annual value of production is expected to go up to Rs. 5 crores by the end of the second Plan. This would leave a balance of Rs. 5 crores to be covered by the private sector in the sphere of the machine tool industry.

Perhaps, an important task which the Development Council may well perform to the country's advantage is to ensure that, as far as possible, the production schedules in the private and public sectors are suitably harmonised to meet the demand for machine tools. In this connection, Mr. Shah did well to stress the essentially "complementary" roles of the two sectors. He said: "For some time past, there has been a certain amount of doubt and hesitation, so to say, on the part of the private sector, as to the role the public and private sectors have to play in the overall development of the machine tools industry in the country. The Government's view, however, is quite clear that the roles to be played are to be complementary and not unnecessarily competitive or overlapping." He pointed out that there was enough room for both the public and the private sectors to go ahead as fast as they could in meeting the requirements of the country.

It is heartening to note that the Minister promised "all assistance" to the industry in securing the necessary foreign technical collaboration for the production of different types of heavy duty and medium duty machine tools such as lathes, drilling machines, grinding machines and milling machines. Foreign technical collaboration, though very important, is not the only need of the machine tools industry. As the Machine Tools Committee which investigated the requirements of the industry has pointed out in its report, there is need for Governmental help to the private sector both in the matter of easy availability of raw materials and of finance for purposes of installing additional plant and equipment in the interests of balanced production. The Council should study the requirements of the industry and suggest to the Government such measures as will enable it to improve and expand its output.

Finally, there is the vital consideration of quality of machine tools. Clearly, since machine tools are the basis of production, shoddy tools will have a sort of multiplier effect in that they will lead to production of shoddy goods. The Minister rightly urged the necessity for maintaining high quality and standards in the manufacture of machine tools. The Government, it may be remembered here, has already instituted a system of free inspection of graded machine tools, with a view to maintaining accuracy and precision in the manufacture of these tools. It has also accepted the recommendation of the Machine Tools Committee to the effect that there should be periodic inspection of machine tools after their installation. The implementation of this recommendation should go a long way towards the maintenance of high standards. But the Development Council has also an important role to play in setting and enforcing correct standards. Indeed, the Council, as Mr. Shah suggested, should play the role of a "watchdog" of the consumers' interests.

ARECANUT INDUSTRY

As a major commercial crop of the South and a luxury of the poor as well as of the rich throughout India, arecanut occupies an important position in the economy of the country. The annual production of this crop, on which depend thousands of agriculturists in the States of Mysore and Kerala, is not sufficient to meet the demand and the deficit is estimated at about 10 lakh maunds. In 1955-56, India imported 835,717 cwts. of arecanut, valued at Rs. 4.36 crores, from foreign countries like Ceylon, Singapore, Malaya and East Pakistan. This underlines the need for taking adequate measures to stimulate production so as to balance demand and supply and thereby effect a significant saving of foreign exchange. This aspect was particularly stressed by Dr. Punjabrao Deshmukh, Union Minister for Agriculture, in his inaugural address to the eighth annual meeting of the Indian Central Arecanut Committee held recently at Bangalore. The meeting, which was presided over by Dr. M. S. Randhawa, Additional Secretary to the Union Ministry of Agriculture, considered various schemes relating to the development, research, and marketing of arecanuts, and important decisions in this respect were taken.

Arecanut in India has remained throughout the ages a neglected crop and it is only recently that it has begun to receive the attention of the Government. The Indian Central Arecanut Committee was constituted in 1949, with the object of conducting investigations into the cultural practices, controlling arecanut diseases and improving marketing conditions. The Committee had before it a very difficult task, as it had to begin almost from scratch. Even in the other principal producing countries such as Ceylon, Singapore and Indonesia, no research work worth the name had been done and, therefore, every item of research had to be initiated and carried out without any background knowledge. In the second Five-year Plan, the Government of India has set apart Rs. 26.5 lakhs for arecanut research and development schemes and this will be utilised by the Committee. The Central Government has also offered to give assistance to arecanut development schemes of State Governments to the tune of Rs. 12.64 lakhs.

The target of production fixed in the Plan is 27.22 lakh maunds of which Kerala and Mysore are expected to account for 23 lakh maunds and Assam for about 2.5 lakh maunds. Other States like West Bengal, Bombay and Madras, which have only limited areas under arecanut, are expected to produce the balance.

Arecanut being a perennial crop, research and development work, designed to increase output, will take time to bear fruit. Attainment of self-sufficiency has necessarily to be a somewhat long-term objective. But through the supply of seedlings of guaranteed quality and improved cultural practices, it should be possible to achieve self-sufficiency within a reasonable period of time. During the second Plan period over 400 lakhs seedlings, sufficient to cover an area of 16,000 acres, are proposed to be raised and distributed.

It is with this object that the Central Research Station was started in South Canara. Since cultural and manurial practices vary from State to State, it has been proposed to start Regional Research Stations in various centres to deal with local problems. The Committee has assessed the materials available for research, surveyed the scope for development and drawn up a practical programme.

One of the major handicaps of the crop is that the demand for it comes from a single source, that is, from those who chew the nut. But technological tests have shown that it can be made to yield valuable by-products like arecanut hard-board, wool and writing ink which points to the possibilities of profitable uses of the nut. If arecanut could be utilised economically for commercial and medicinal purposes, and thereby its uses diversified, the arecanut grower can count on a profitable market. The proposed Technological Laboratory has, therefore, a very important part of play.

In the marketing of the crop also, the cultivators face many difficulties. Since arecanut is grown by small cultivators with limited resources, they have to depend upon middlemen. It is, therefore, imperative that they should form their own associations, pool their produce and market them on co-operative basis. The Minister said that the Government of India was always ready to help the growers and the protective duty imposed on imports was only a token of that attitude. The All-India Co-operative Marketing Board, which the Government is setting up, will, it is stated, do its best to help the arecanut growers also. The Central Arecanut Committee also has constituted a separate committee to plan the development of the co-operative marketing societies in Kerala.

BRITISHERS EMIGRATE

A few days ago, Mr. Harold Holt, an Australian Cabinet Minister, remarked that there was an unhealthy concentration of the Commonwealth's industrial strength in the British Isles. Characterising such concentration as "suicidal," Mr. Holt recalled that the Suez crisis had demonstrated how dangerously placed was the Commonwealth. "Our Commonwealth," to quote him, "has more than 600 million people and one-fifth of the world's total land area. But there is a fundamental weakness in our present situation. Too big a proportion of our British manpower and industry is concentrated in a small and highly vulnerable island..." In his considered opinion, good sense and national survival dictated a very much greater movement of people and resources from the heart of the British Commonwealth to its outlying parts. Mr. Holt said that Canada, Australia, Rhodesia, Kenya and others in Africa would welcome the kind of development which increased British migration and resulted in additional capital equipment. Urging the importance of a plan for making the best use of the resources in the Commonwealth, he warned: "It will be rash for us to think that time is on our side or that solutions to our difficulties will suggest themselves."

It looks as though in one respect at least the trend is already on the lines desired by Mr. Holt. Recent reports from London indicate that the rush to emigrate from Britain was accentuated by the Suez crisis and continues unabated.

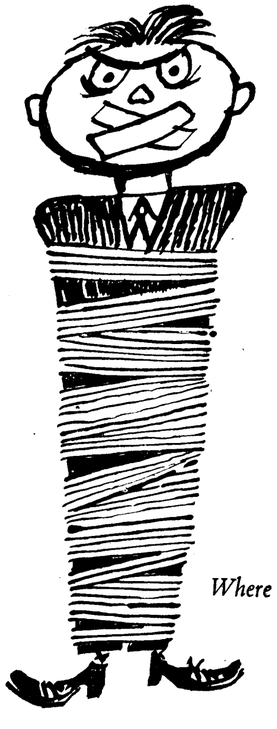
Escape? **Impossible!**



Liquids, steam and gases cannot escape from stuffing boxes, glands and cocks if they are sealed with Turner's "Firefly" asbestos packing. Use it and your worries about leakages are over.

By arrangement with Turner Brothers Asbestos Co. Ltd., England, we make "Firefly" Packings. We spin asbestos fibre into yarns, and then plait these yarns into packings which provide the perfect seal, unaffected by the temperatures and pressures normally encountered in industry.

Turner's "Firefly" Packings are just one of the many technical asbestos products that we at AM & FM make to meet the needs of India's industry. The increasing use of Asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

We supply:
- 'FERODO' BRAKE AND CLUTCH LININGS
- 'FIREFLY' ASBESTOS PRODUCTS
- SPRAYED 'LIMPET' ASBESTOS
- 'NEWALLS' INSULATION MATERIALS
- 'PATTINSON'S' BRAND MAGNESIA CHEMICALS
- 'SINDANYO' ELECTRICAL INSULATING BOARDS

AM & FM

ASBESTOS, MAGNESIA & FRICTION MATERIALS LTD.
(TURNER & NEWALL LTD.)
INCORPORATED WITH LIMITED LIABILITY IN ENGLAND
Calcutta – BOMBAY – Madras

EXTENSION OF PERIOD OF SECOND PLAN INEVITABLE

INDO-DENMARK TRADE RELATIONS

From Our Special Correspondent

NEW DELHI, *6th February*

DELHI LETTER

ALTHOUGH Government circles are busy with the latest developments relating to Kashmir, consequent upon the resolution of the Security Council directing India not to alter the status of the State as it existed before Republic Day, it will be wrong to think that other pressing problems are not receiving the attention they merit. On the contrary, work is going on as usual in an atmosphere of absolute normalcy. There has been no slackening of interest in economic matters. Talks were held this week between the officials of the Railway Board and the four-man technical delegation of the World Bank on the working of Indian railways and its schemes for expansion. The Commerce and Industry Ministry met a trade delegation from Denmark and explored the scope for expanding the trade between the two countries. The Russian proposal for manufacturing heavy machinery was being studied. A high-level conference between six top-ranking Indian industrialists and the Ministers for Finance and Commerce and Industry is currently going on. The Prime Minister also is expected to participate in these talks. The object of this conclave is to bring about a better understanding between the business community and the Government. The mercantile community is rather optimistic that this conference will serve to minimise their difficulties arising from the series of restrictive measures introduced in the last four months of 1956.

The Planning Commission and the Finance Ministry are busy rearranging the priority of various development projects, in the light of the current foreign exchange position and the availability of domestic resources. The prospects of getting any substantial measure of foreign assistance are less bright than a month ago. It is now doubtful whether India will receive as much aid from the U.S. as its planners and officials had hoped on the eve of the Prime Minister's visit to the U.S. There is not much hope of obtaining any sizable assistance from the U.K. either. The latter's economy is by no means so sound as to enable it to spare much capital for India, even assuming that there has been no deterioration in the political relations between the two countries. The position of France is no different. West German enthusiasm for participating in India's development plans is said to be cooling off. The other small European countries such as Switzerland, Sweden, Norway, Denmark and the Netherlands have become hesitant, what with India's talk of undefined socialism and its lack of warmth for the Western nation's political philosophy and economic systems.

A Delusion

Official opinion is now beginning to realise that it will be just a delusion to think that, somehow or other, foreign exchange resources can be found to implement the second Plan without any substantial modification. Despite the Finance Minister's repeated assertion that there will be no difficulty in raising domestic resources, the officials are not inclined to be that optimistic. They feel that this task is no less difficult than that of finding foreign exchange, if it is to be carried out without adding to inflationary pressures and killing the initiative of the people. There will undoubtedly be more taxation in the coming, as well as in the next (summer), budget. But this can yield only modest sums.

Scarcity of technical personnel also is beginning to assert itself. While the demand for such personnel from both the public and private sectors is steadily rising, the supply is not keeping pace with it. The promoters of new projects are finding it extremely difficult to locate suitable works managers, foremen, superintendents, chemists, etc., notwithstanding repeated advertisements in all the leading dailies of the country calling for applications. One has only to go through these papers during the past three months to realise the truth of this statement. A paper factory in Western India took several months to discover a suitable works manager. It is not only the new industries that are feeling the shortage of trained personnel, but also such well-established industries as cotton textiles and sugar. These industries, too, need more men for implementing their expansion schemes. Even trained accountants, stenographers and other administrative staff are not in sufficient supply. The neglect of the English language in educational institutions ever since independence is beginning to make itself felt now in the availability of suitable administrative and technical staff. This neglect, for which the politicians are to be blamed in the main, have very severely affected the efficiency of a large percentage of middle class young men who are just out of schools and colleges and are in search of employment.

Adjustment Inevitable

For reasons mentioned above, it is now almost certain that the second Five-year Plan cannot be completed by 31st March 1961. The first year of the Plan is rapidly drawing to a close. It would not be surprising if an evaluation of the achievements during this year were to show that the realisation is no more than 60 per cent. of what was aimed. It is becoming more and more obvious that either the period of the Plan will have to be extended or work on some of the projects will have to be deferred, unless a miracle happens and the U.S. decides to fill our foreign exchange gap. Indeed, the State Governments have already been asked to re-write their plans on the basis of a smaller outlay. Imports of steel, cement and capital goods, as readers are already aware, are also being cut. This step cannot but mean a pruning down of the second Plan. It is now politically inconvenient for the Government to admit all this in public. But it may tell the people after the elections are over that the period of the Plan has been extended. It cannot hide this fact from the public for long. The Finance Minister is, therefore, making this inevitable task more difficult and awkward than it need be by continuing to repeat in public that the Plan would be carried out without any reduction in its recently extended size and that, within five years. Does he realise that, if he were re-elected, as there is no doubt he would be, it would fall to his lot to face the facts and tell the public the truth?

Danish Trade Mission

After perambulating through New Delhi, Bombay, Madras, Calcutta, Tatanagar and Banglore for well over a fortnight, the Danish Trade Goodwill Mission left India on Wednesday last week. The Mission was in this country at the invitation of the Central Government. During its stay, it met the representatives of the Government, industry and trade, and discussed the possibilities of promoting the trade relations between the two countries. While one has to wait for the publication of the reports that the Mission will submit at a later date, there is a clear indication of brighter prospects of increasing trade relations and Danish collaboration in the industrial field of India. Speaking at a Press conference on the eve of the Mission's departure from New Delhi, Count K. G. Knuth-Winterfeldt, leader of the Mission, for instance, declared that "there is great scope for expanding the trade between Denmark and India." In support of this view, Count Knuth-Winterfeldt pointed out that markets in Denmark for some of India's wares and commodities, such as textiles, handicrafts, coffee, tea and tobacco, could be developed greatly. He also detailed the ways by which Denmark could help India in the implementation of industrial and agricultural schemes under the second Five-year Plan. Briefly summed up, the position is as follows:

Denmark can offer a wide variety of industrial and agricultural machinery required by India, as well as technical know-how. Quality machinery needed in shipbuilding, fishing, dairy industry, cement, pharmaceutical and canned goods production, and tractor manufacture is available in Denmark at competitive prices. Denmark can also build ships, tankers and fishing boats. While the latter two can be delivered within seven or eight months from the time orders are placed, ships of 8,000-9,000 tons can be delivered in 1961 or a little earlier. Denmark can also help in the implementation of the project for the manufacture of marine diesel engines. Discussions on the project have already taken place. Further, there is a possibility of Denmark sending to India breeding cattle.

While the goods that Denmark can supply to India thus are of great value, the chief handicap is foreign exchange. A look at the figures relating to trade between the two countries in the past few years will reveal that India has been having a continuously adverse balance of trade with Denmark. This is due to the fact that exports from India to Denmark have not kept pace with imports from that country. Thus, the value of goods and commodities exported from India to Denmark has risen from Rs. 1.11 crores in 1953-54 to only Rs. 2.04 crores in 1955-56, whereas that of imports has gone up from Rs. 1.63 crores to as much as Rs. 4.18 crores. Consequently, the adverse balance has widened from Rs. 52 lakhs to Rs. 2.14 crores. The gap may be expected to be larger still in the coming years, what with the increasing tempo of imports.

Viewed thus and considering the tight foreign exchange position that India is experiencing at present, the question arises as to whether Denmark cannot help India by supplying goods against long-term credits, as some of the industrially advanced countries are doing. This question was, in fact, posed to the Danish Mission at the Press conference. Replying to it, the leader of the Mission said that, being a small country, Denmark might find it difficult to give such long-term credits. He, however, felt—this is, indeed, reassuring—that credits for three to four years should not be difficult. It is obvious, therefore, that greater stress must be laid on augmenting India's export trade with Denmark, the scope for which is, as indicated by Count Knuth-Winterfeldt, great. India, for instance, can supply Denmark large quantities of textiles —bedsheets, curtain cloth, pillow cases and the like—and handicrafts, provided that the exporters take care to ensure supply of quality goods. One of the members of the Danish Mission referred to some complaints of the goods not conforming to the samples shown. Count Knuth-Winterfeldt did well to stress the need for the Indian shippers studying the requirements—measurements, designs, etc.—in Denmark. Incidentally, he suggested the establishment in that country of a full-fledged commercial office, so that the import and export markets there could be closely studied and commercial intelligence made available regularly to India.

Heavy Machinery Manufacture

The Government of India has just received from the Soviet team of experts the report on heavy machinery manufacture in the country. The contents of the report are not known, but it is understood that the Soviet experts have put forward a scheme envisaging construction of a factory capable of manufacturing 80,000 tons of heavy machinery and equipment per annum which are needed for the steel and mining industries. The proposed plant is so designed that it can be switched over to other types of machinery and equipment according to the country's needs. The plant will be set up in two stages, the production capacity at the end of the first stage being 45,000 tons of metallurgical and mining machinery and equipment per year. It will be installed side by side with the proposed factory for the manufacture of castings and forgings. The plant, when completed, is estimated to provide employment to more than 10,000 persons, including officers, most of whom will be highly skilled engineers.

The heavy machine-building project, as already stated, will be implemented in two stages, the estimated outlay on them being Rs. 42 crores and Rs. 52 crores, respectively. Of the total outlay, the foreign exchange content is expected to account for about Rs. 47 crores. The Soviet experts have suggested Ranchi as the suitable site for putting up the plant. The suggestion is based on two grounds. First, Ranchi is situated in the rapidly developing Bihar-Bengal coal-iron industrial complex. Secondly, it is in close proximity to Bokaro where the next steel plant will probably be located.

The Russian collaboration in the above project, it is said, will be on the same basis as that in respect of the Bhilai steel plant. Thus, the Russians will not only take the technical responsibility for setting up the plant but also supply the necessary equipment on long-term credit at a low rate of interest.

Meanwhile, the scheme for establishing a foundry-forge plant, as drawn up by the National Industrial Development Corporation has reached an advanced stage. Three foreign firms have already been asked by the Government of India to submit detailed reports on the project. It will be interesting to know how the Russian proposal will be reconciled and co-ordinated with this project.

PRODUCTION OF QUALITY TOBACCO

STRESS LAID AT CENTRAL COMMITTEE MEETING

ONE of the dependable ways of augmenting India's foreign exchange resources, to an appreciable extent, is through the production of better quality and greater quantity of tobacco and through export promotion. India is in an advantageous position in respect of the production of tobacco, for it is now grown on well over 921,000 acres of land, the total quantity produced every year being no less than 580 million lbs. India occupies third place among the tobacco-producing countries of the world. The first and second places, it may be noted, are held by the U.S. and China, respectively. Indian tobacco is exported to 32 different countries and fetches as much as Rs. 12 crores worth of foreign exchange every year. Tobacco's contribution as a cash crop to the internal resources of the country is no less significant. Tobacco contributes about Rs. 36 crores by way of excise duties alone to the national exchequer.

The problems that face tobacco cultivators are, first, improving the quantity and quality of tobacco through (i) better and scientific methods of cultivation and (ii) the application of effective remedies for the diseases and pests which damage tobacco crop and, secondly, promotion of exports.

Inaugurating the meeting of the Indian Central Tobacco Committee on 30th January at Bangalore, Dr. Punjabrao S. Deshmukh, Union Minister for Agriculture, threw considerable light on these aspects. He welcomed the establishment of the Committee, for that would enable the authorities to deal with the problems facing this commodity comprehensively and quickly. As in the case of certain other commodities, tobacco, too, deserved such attention. Stressing the importance of tobacco to the nation, he pointed out that the "golden weed," as tobacco was called, gave to producers alone as much as Rs. 32.4 crores per annum, on an average. Besides, the curing and processing industry provided wide employment opportunities.

Extension Work

In this context, the provision made in the second Plan for extension work in tobacco cultivation should be welcomed. The Minister stated that extension schemes were already in operation in the Virginia growing tracts of Andhra Pradesh, and that the Government was considering the initiation of extension programmes in other tobacco-growing parts of the country. The object should be, as the Minister stressed, not the quantitative yield alone, but also the quality of the product, to which buyers attach the greatest importance. Further, the Minister rightly stressed that the fact that the importing countries had either been able to get better quality tobacco elsewhere, or produce it in their own countries, was another reason for taking effective measures for increasing the quality. Moreover, foreign buyers, such as the British, were also becoming increasingly quality-conscious, and the failure of India to meet this challenge would do much harm to its economy.

Not only for raising the quality, but also for increasing the quantity, the part that research has to play is vital. Dr. Deshmukh pertinently observed in the course of his address to the Tobacco Research Workers Conference at Bangalore that it was not possible to extend the area under cultivation in order to increase the crop, because of the pressing demands of higher food production on the available area of land. He warned that it might be even necessary to reduce the area under a "luxury" cash crop like tobacco to meet those demands. Hence the paramount need for research on various aspects of tobacco cultivation and the practical application of the findings. Certain other problems, the solution of which depended on research, were the culture, processing and curing of different varieties of tobacco for different types of uses such as cigars, *bidis*, *chuttas*, pipe, etc. According to the Minister, utmost care should be taken to produce the types of tobacco "to suit the idiosyncrasies of the consumers." To be successful in this direction, one must have knowledge of research in the raising of nurseries, soil management, field culture, evolution of varieties, crop protection and details of curing and processing. It is necessary that attention should be paid to all these aspects if the right sort of physical and biochemical changes are to be produced in the product.

Quality Standards

The need for raising the quality standards of tobacco if the country wanted to expand the exports was also stressed by Dr. P. N. Uppal, Agricultural Commissioner, Government of India, and Chairman of the Central Tobacco Committee in the course of his address. Dr. Uppal referred to some of the important developments that had taken place in the field of research under the auspices of the Central Committee. Notable among them were the steps taken on the basis of the report submitted by Dr. N. R. Bhat, who visited Southern Rhodesia to study the methods of production of flue-cured tobacco. The steps included studies into the effect of soil improvement by deep tillage through incorporation of humus into the soil and conservation of moisture by mulching in order to stimulate the response of flue-cured Virginia tobacco to manuring.

Dr. Uppal also referred to the schemes sanctioned for intensification of tobacco research which fell into two categories, namely, Central schemes and State schemes. Some of the schemes worthy of special mention for which the Central Committee was responsible were the production and distribution of pure seeds and seedlings, training in improved methods of cultivation, handling and curing of tobacco and establishment of a tobacco research station at Hunsur. It is noteworthy that the first two schemes have already been initiated and the third awaits the creation of certain facilities, such as provision of land, by the State Government. Research institutes have also to address themselves to another task. The problem arises from the fact that the cultivation of tobacco in saline lands has brought down the reputation of Indian tobacco in the world market. Consequently, it has become incumbent on the authorities to discourage cultivation of cigarette tobacco in saline lands. The Central Tobacco Research Institute, according to Dr. Uppal, has taken up a general survey of the tobacco-growing areas so that lands of high salinity which are unsuitable for production of quality leaf may be mapped out and excluded. Dr. Uppal's suggestion that the possibility of utilising some of the plant breeding techniques which have been successfully exploited in other crops is worthy of special consideration.

Export Promotion

The other aspect of the industry requiring the greatest attention is export promotion. An encouraging development here is that foreign countries, especially Russia and China, are showing increasing interest in Indian tobacco. Every effort should be made to cultivate these new markets by paying proper attention to their needs. The Middle East and Africa provide a wide field for the *bidi* industry, according to the *Bidi* Delegation sent out by the Export Promotion Council. Dr. Uppal has done well to emphasise the need for improving the packing methods and the competitive position of this industry, in order to be able to capture these wide markets. Export prospects for Indian Virginia and Natu tobacco are also said to be bright in Egypt. Dr. Uppal's warning in this connection is pertinent. He said that, in view of the unsettled and fluctuating conditions of foreign trade and the shifting national policies, it would be inexpedient to count on any country remaining a stable importer of our goods. He rightly added: "We have constantly to be in touch with the market conditions in the importing countries and have to keep wide-awake to cater for external demand wherever it is to be discovered."

Dr. Punjabrao Deshmukh added a valuable suggestion for promoting exports. He expressed the desirability of growers of tobacco organising themselves on co-operative lines, so that such co-operatives could deal directly with the co-operatives in foreign countries and thus secure the best possible prices for their produce. There is, as is obvious, much to be said in favour of this method. But, having regard to lack of experience among the growers of tobacco in the intricate business of finding export markets, the feasibility of this suggestion is in doubt. Dr. Deshmukh revealed that the Central Consumers Co-operative Organisation in Russia was in favour of entering into trade agreements with similar co-operative organisations in other countries. It was also stated that Russia would deal with these co-operatives on barter basis. The Union Minister thought that if India could supply Russia with tobacco on that basis, it would not be impossible for India to obtain in return tractors, steel or corrugated iron sheets, or cement. This surely would not be an ideal arrangement. The co-operatives in Russia are not an exact replica of the co-operatives in India; the latter are no match for the former and would easily be outwitted in the barter deals, unless they are carefully supervised by persons who know the intricacies of trade. Then, there is the danger of such trade connections turning out to be convenient channels for Russian influence and communist activities spreading in this country. It is specially in order to avoid this danger that the State Trading Corporation was brought into existence. We do not, therefore, see any necessity for by-passing the S.T.C. for this purpose. If co-operatives are to do the job of marketing also, they can as well trade with the S.T.C., leaving it to the latter to handle the Russians.

Several important research schemes were adopted by the Committee. These related to the study of physical and chemical characters of *bidi* tobacco, exploratory research on cigarette tobacco in U.P., soil survey of P.C.V. tobacco-growing areas in Andhra, research in *bidi* and chewing types of tobacco in Orissa, cytological studies in Indian types of *Nicotiana tobacum*, investigation of the control of the root parasite, and leaf burn of tobacco in Kaira district of Bombay State. It is noteworthy that the Committee recommended to the Government of India the inclusion of tobacco in the list of commodities under the Agricultural Produce (Development and Warehousing) Corporations Act 1956, and the inclusion of tobacco industry, except cigarette manufacture, in the list of recognised cottage industries.

Table showing Production and Exports of Tobacco by Major Exporting Countries in the free world.

SURVEY

(*Concluded from page* 259)

thanks to hardships caused by high taxes, high living costs, gasoline rationing, job lay-offs and threats of greater austerity. Indeed, Britishers are said to be lining up daily in increasing numbers at the emigration offices. In the last eight years, it is estimated that an average of 124,000 persons left Britain each year, in order to seek new homes. Most of them have gone to the Commonwealth countries. The flow to Canada has been particularly marked, the yearly average for the last ten years being 36,000 persons. In 1956, the total number of persons who emigrated from Britain to Canada was higher at 50,000 and the number is expected to touch 100,000 in the current calendar year. As many as 1,500 inquiries a day about immigration are being received at Canada's London Office. Another country of great attraction to those who wish to leave Britain is Australia. Last year, 52,000 Britons went to new homes in Australia. Inquiries about emigration to this country during the first week of last month were as many as 3,205, as against 701 two months before. New Zealand also has received more attention, while a small number has moved into the U.S.

The continued emigration from Britain, while it is welcomed by the Commonwealth countries, is considered in the U.K. as a disturbing trend. For it is felt that many who have decided to leave Britain in the last few months are in the professions such as engineering and medicine or are those having technical skills. Until recently, it will be recalled, emigration from Britain was officially encouraged as a means of keeping British influence strong in the Commonwealth.

WEAK FINANCES OF NATIONALISED INDUSTRIES

VIEWS OF TWO MORE BRITISH BANKERS

RECENT economic thinking in the U.K. has been directed chiefly towards finding ways of reducing unproductive spending, increasing production and productivity at home, and through them fortifying the gold and dollar reserves and the pound sterling. A reference has already been made to the pertinent views expressed in this regard by a few bank chairmen. Some more equally relevant views expressed by the Chairmen of Lloyds Bank Ltd. and the Midland Bank Ltd. bear testimony to the fact that an earnest attempt has been made to reappraise the economic situation and remedy the maladies.

Sir Oliver Franks, Chairman of Lloyds Bank, for example, expresses the view, in the course of his annual statement to the shareholders, that though there are certain encouraging features in the economy, such as those reflected in the increase in personal savings, a very unsatisfactory feature of the economy is the weak financial situation of the nationalised industries. He concedes the need for heavy investment outlays to improve the capital equipment of these basic industries. But what may be criticised, according to him, is the pricing policies that render the public corporations as a whole incapable of providing even for the replacement of capital used up in their current operations, not to speak of financing new capital expenditure. Illustrating his point, he says that, in 1955, more than £300 million was needed to maintain intact the capital used in these industries. Yet the combined surpluses of the public corporations themselves covered barely half of this amount. Consequently, the remaining half, and the funds needed for new investment—to the tune of £400 million in all—had to be raised by borrowings. He pertinently asks in this connection: "What would be thought of the future of any private enterprise that failed to provide even for the maintenance of capital?" This is so, because, according to him, the nationalised industries as a group have been fixing uneconomically low prices, in relation to their costs, for their products. This tendency is particularly serious if the products in question are fuel and power, "where the seeming impossibility of raising the output of coal means that everything should be done to stimulate economy in consumption."

Price Restraint

Sir Oliver has dealt at considerable length with the desirability of price restraint. He concedes that there is a justifiable fear that any increase in prices will be made the pretext for an increase in money incomes, thereby giving a fresh impetus to inflationary spiral. He also agrees with the view that inflation itself means that the flow of voluntary savings is inadequate to finance the amount of investment that is taking place. Despite all this, unchanging prices in the face of rising costs will, he asserts, reduce the amount of savings in the form of the surpluses of public corporations or the undistributed profits of companies. Explaining this point further, he observes:

"The expedient of pegging prices is thus a hazardous one. Adopted at precisely the right moment, with everything else pulling in the right direction, it could afford us a momentary breathing space and so help in breaking the price-wage spiral. But it is bound to be a gamble; for the pegging of prices will tend to increase real purchasing power when the basic problem of checking inflation is to reduce it. Unless output is falling, rising costs mean rising incomes. And rising incomes combined with stable prices mean an increase in inflationary pressure, unless one condition is satisfied; it is that the increase in incomes should be cancelled out, or more than cancelled out, by an increase in voluntary saving. In an inflationary situation, we can safely create purchasing power only if there is real assurance that the additional claims upon output will not for a time be exercised."

Cancelling Purchasing Power

Hence, according to Sir Oliver, the problem centres on the question of cancelling out purchasing power. In the final analysis, there are two ways of doing this: (1) through budgetary surplus, and (ii) by allowing the prices to increase. The first can be done, according to him, either through direct taxes or indirect taxes, though he concedes that, under the arrangements obtaining in his country, indirect taxes will ultimately lead to rising prices. He emphasises, however, that whether price rises are effected either through indirect taxes or by producers, a rise in price may not only serve to withdraw purchasing power in general, but to curb consumption where that is most needed. He regrets that the rules of the game as they are practised in the country impel the authorities almost irresistibly to choose the method of direct taxation to effect the budgetary surplus. This method, he strongly feels is the least calculated to promote the country's well-being in the long run.

Problems of Planning

Lord Harlech, Chairman of the Midland Bank, refers at some length to the problems of planning and management in the present context in Britain. He is certain that, in the light of experience in 1956, as in 1951, 1949 and 1947, Great Britain, in its exceptional position as a great trading nation and financial centre, has insufficient liquid resources and economic resilience to absorb the shock of such unforeseen events as were witnessed last year. He admits that the margin for swift response to the challenge of the violently changing circumstances is too narrow for safety.

Alluding to the contrasting attitudes of business men towards the situation—some sceptical about the possibilities of present high level of business activity and employment to continue, and certain others confident that because of greater knowledge of events and Governmental participation in the economic activities there would not be any recurrence of depression—Lord Harlech feels that the crucial element in the determination of the ups and downs of economic activity lies in shaping and carrying through of numerous plans of public authorities and private individuals.

Role of Modern Planning

Dealing with the role of modern planning in this connection, he points out:

"It seems often to be assumed that 'planning' is the simple answer to the problem of economic instability, whereas in practice the timing and balancing of plans, in such a way as to ward off or allow for economic fluctuations, is a most delicate and difficult operation. This is true for both Government and business, even though Government, besides full authority over its own plans, has extensive powers to influence those of other public bodies and of private business. These powers the Government of our own country has repeatedly called into use in recent years—with not altogether happy results."

In this regard, according to the speaker, a prerequisite of successful economic policy is full knowledge of facts, obtained in time, to prompt any corrective action that may be found necessary. He admits, however, that much progress has been made in this direction. But a further limitation lies "in a tendency to presume that statistics are the only valid kind of information for economic planning." His observations in this connection are very interesting and valuable to this country. He says:

Impressions of People

"In fact, non-statistical information, particularly the day-to-day knowledge and impressions of people close to the fields of operation may sometimes be of greater practical help than the bare statistics in detecting a turning point in the course of affairs. A Government authority concerned in such matters should take steps to ensure constant sensitiveness to the 'feel' of things, especially, as to the development of business plans concerning capital expenditure and stocks, the prospective course of prices, sales, orders on hand and so on."

Moreover, it is also essential, according to Lord Harlech, that the authorities should be fully aware of the changes that may be taking place in the structure and processes of the business—changes that may be important in relation to working out of a new monetary policy. There is also need for "another thing, namely, human judgment." Lord Harlech states that human judgment, though well-trained and well-informed, is always fallible both in diagnosis and in treatment. He stresses that there is need for balance, without which the available data on some aspects of changing situation may attract too much attention to the arithmetical tests of success or failure in monetary policy. All these limitations lead, he says, to one conclusion. It is that "planning by central authorities to keep the national economy on an even keel, while moving in an expansive direction, is a most difficult task. Success in such a task ought not to be lightly presumed. It calls for the use of a wide variety of instruments, for provision of the fullest and most up-to-date information, and for objective comment by those who, while not directly responsible for policy, can contribute much to the attainment of its aims."

Government Intervention

Discussing the question whether intervention by the Government in economic matters through planning and adaption of fiscal and monetary policies has brought any benefit, the Midland Bank Chairman observes:

"There is much to support the view that the world-wide extension of official responsibility for shaping the course of economic affairs has reduced the probability, if it has not ruled out the possibility, of a repetition of prolonged depression such as occurred in the 'thirties. For some purposes it has been argued that this development has correspondingly reduced the risks of private business, which has thus come to reap uncovenanted benefit accruing to the owners of the equity of business undertakings, whether they be company shareholders or partners or individual traders. We may well ask, therefore, whether official "management" of the national economy as a whole has made any easier the task of "planning" in private business. It is true that business undertakings can plan ahead with greater assurance if fears of general and prolonged depression can be set aside as outdated. It is equally true, on the other hand, that major risks and uncertainties remain, and that these, moreover, are added to by the very fact and forms of official "intervention."

"A high level of business activity in general does not afford a guarantee that any particular branch of industry and trade, or any particular business undertaking, will be maintained in full prosperity. Many familiar, well-recognised risks remain—changes in demand, fluctuations in prices of raw materials, international disturbances and so on. Moreover, the maintenance of steadiness in the economy as a whole, for which Governments have responsibility, calls for measures which themselves may prove highly disturbing to particular industries or undertakings. The experience of the motor industry during the past year or so provides an illustration of this fact. What business nowadays has to face, over and above the older types of risk, is the chance of changes in official regulations affecting, for example, new capital issues or the terms of hire-purchase transaction, and of variations in taxes, such as changes in rates of purchase tax or profits tax and in depreciation allowances, imposed for reasons of economic policy."

The foregoing remarks of Lord Harlech on the prerequisites of modern planning and the significance of such planning to private enterprise as well as those of Sir Oliver on the pricing policies of nationalised undertakings have special relevance to India which is developing its economy in a manner planned by the Government.

INDIAN OXYGEN is playing a vital role in building a more powerful and self-sufficient India in the Second Five-Year Plan.

From transport to electric power, from the steel works to the oil refinery—every day our technical service is keeping the nation up-to-date with the most modern methods of metal fabrication.

COMPULSORY DEPOSITS BY COMPANIES

BOMBAY SHAREHOLDERS' ASSOCIATION SEEKS CLARIFICATION

VERY few fiscal measures of the Government of India have startled the business world and investors alike and created so much confusion as those introduced under the Finance (No. 3) Act, 1956. It is nearly two months since the Act was passed by Parliament, but no clear interpretation of its provisions, particularly that relating to compulsory deposits by companies under section 3 of the Act, has emerged, and even leading accountants and experts on taxation differ on the interpretation of the relevant clauses. The Finance Minister promised in Parliament that much of the rigour of section 3 would be taken out by incorporating more liberal provisions in the rules to be issued, but the much promised rules have yet to see the light of day. This section, coupled with the one seeking to levy penal super-tax on dividends in excess of 6 per cent., restricts the dividend-paying capacity of joint-stock companies. In the circumstances, the anxiety of investors is understandable, more so when the provisions are not clear. It is reflected in the two memoranda recently submitted by the Bombay Shareholders' Association to the Union Finance Minister on section 3 of the Finance (No. 3) Act, 1956.

As readers are aware, the amount to be deposited by companies consists of two parts; the first is a prescribed percentage, not exceeding 25 per cent., of so much of the accumulated profits and reserves as are not represented by fixed assets in the business, and the second is a prescribed percentage, not exceeding 75 per cent., of the amount by which available profits of the year, that is, profits before deduction of depreciation or development rebate less taxes payable less dividends, exceed Rs. 1 lakh. Thus, in the first part, the amount of deposits is linked to the accumulated profits and reserves other than those represented by the fixed assets. Such a linking, the Bombay Shareholders' Association says, introduces an element of artificiality, inasmuch as there would be several cases of companies which might have utilised such moneys for current requirements of the business, because, with the increase in fixed assets, a corresponding increase in the working capital automatically follows and, therefore, an increased amount of working capital ought to be maintained. In other words, the Association points out, the reserves may be represented partly by fixed assets and partly by the current assets of the company relating to the business itself. "The attack should, therefore, be on the amounts which are utilised as pure investments or utilised in buying concerns of an extraneous character, which activities may have nothing to do with the basic structure and business of the company."

Exemptions

The Association then goes on to point out the necessity of examining the current assets of a company and finding out what part of these assets represents pure investment or investments of a character which have no business connection with or bearing on the company as such. It also draws attention to the Finance Minister's statement to the effect that he would specify about 20 industries and, if the moneys were utilised for investment in such industries, the deposit scheme would not apply to a corresponding extent. The Association suggests that the solution would be found by making a provision in the rules to the effect that the amount of deposits will be further reduced in proportion to the moneys of the company which are found utilised in any one or all of the following purposes:

(a) for the normal working requirements of the company that is utilised and found reflected in either the stock-in-trade or stores and spare parts or raw materials or other current assets of the company relating to the business of the company;

(b) for the purpose of acquiring industries or shares of industrial concerns list whereof may be specified;

(c) temporary cash resources left with the company, but utilised within a period of a year or two for the rehabilitation programme of the company. For this a specified percentage may be laid out in relation to the total current assets of the company and in relation to the rehabilitation programme and its layout as planned for each future year.

Moreover, the Association points out that, since the commitments already made by various companies so far would not permit the immediate changeover or a change or a realisation of such extraneous asset items, it would be very desirable if appropriate relaxation of this part of the section were to be made. The Association contends that the provision should not be operative in an absolute manner, and that relaxation should be made in respect of present commitments, so that the financial structure of the companies in general is not hit. It also urges the necessity of making due provision in the rules for exempting either the whole or a very substantial portion of the existing layout, if it be not covered by the permitted investment in the three categories mentioned above.

Available Profits

As regards the other part of the provision, namely, a prescribed percentage of the available profits of the year, the Shareholders' Association feels that the term 'available profits' should be defined as the profits reflected in the profit and loss account, that is, after taking into consideration all the outgoings in the nature of expenditure in the profit and loss account, though for purposes of income-tax assessments the same might have been added to the assessable income. It is the actual surplus available that is material for consideration and not the assessable surplus. Even for the purposes of section 23A, a distinction has been made for the declaration of the required minimum and special consideration is given to cases where the difference arises as a result of the disallowables of certain items for purposes of income-tax assessment. The Association, therefore, desires that the rules should clarify the position in this respect. Further, it says:

"The provision of the Finance Act speaks of the total income of the company for the previous year as reduced by the amount of income-tax and super-tax payable in respect thereof. To avoid any ambiguity, a clear mention should be made that a deduction should be made for all the taxes payable by the company in respect of its assessment for the particular assessment year and the total income, which would normally mean the total income as defined under the Income-tax Act, should, instead, be taken to mean the actual available surplus as per the profit and loss account and not the total income for income-tax purposes, because, as a matter of fact, the moneys to that extent would have gone out and would not be capable of being deposited to the proportionate extent. The rules should provide for this clarification as well."

As regards the penal provision under section 3, which says that an amount equal to the sum of all the allowances made under clauses vi, via, vib or vii of sub-section (2) shall be included in the total income of the previous year, unless the company deposits the required sum before 30th June of the year succeeding the previous year, the Association desires that the rules must clarify that the amount to be forfeited should be the amount for the particular assessment year and not all the amount of depreciation and development rebate which may have been allowed to the company in the past. The latter interpretation, it says, would create an absurd position indeed, inasmuch as the company would stand to forfeit the whole of the past allowances.

Development Rebate and Depreciation

Again, in respect of the allowances that will be forfeited, the Association is of the view that a distinction is necessary between the development rebate and depreciation allowances. For, it says, whereas the former "is a pure gift to the industry and the Government would be fully justified in imposing conditions for the continuance of this allowance," so far as depreciation allowances are concerned, the position is different. The Association's argument in this connection is as follows:

"They are inherent allowances claimable by way of wear and tear of the asset or by its user and they represent expenditure which must be taken into consideration in determining the profits. The Government should consider the question in the light that, with higher allowances in earlier years the tax liability is lesser, but in later years the allowances would be lesser and the tax liability would be higher. In any event, the total allowance in respect of any asset cannot go beyond 100 per cent. of the cost even including the initial allowance. The Government may insist on funds being created to a proportionate extent, but as regards the question of deposits, the position would become very difficult for depreciation amounts. In case the company in question fails to deposit the amount, there should be ample justification to add back the depreciation amount, so that the tax payment is accelerated, i.e., there is more payment in the earlier years and the Government is able to take that much amount by way of tax earlier and, in later years, it would collect lesser, but the depreciation amount should not stand totally forfeited. It should be added to the written down value, so that the company gets the depreciation allowed in later years. What the Government wants is that, in respect of the accelerated allowances where tax is saved, the moneys do not go to the Government earlier and the process of disallowing the depreciation amount will enable the Government to recover the tax in earlier years instead of in later years. The submission in this behalf is that the depreciation amount should not stand forfeited, although the development rebate may be forfeited. The rules should, therefore, bring about this position by making a suitable provision, whereby the amount would stand added to the written down value in case of the deposit not being made and the amount being added to the assessable income of the company."

The Association has made several other suggestions to reduce the rigour of the provisions in respect of compulsory deposits. Thus, it says, the rules should provide for part allowance, if the company is able to, and makes, a part deposit. Companies, which have made borrowings either by mortgaging their fixed assets or otherwise and the investments of which are negligible in relation to the fixed assets (the margin may be fixed at 10 per cent.), should be exempted from making deposits, because such companies *ipso facto* would have utilised all the available resources for the business requirements only, as otherwise they would not resort to borrowing. The rules should also provide for allowing sufficient time to companies to make the deposit.

Opportunity To Be Given

In the meantime, the Association submits, companies should be given an opportunity to approach the Government and prove that their funds would be required to be utilised in the companies themselves for genuine purposes and that they would not, therefore, be in a position to make the deposit. In other words, the Association suggests, the procedure should be such that deposits need not necessarily be made in the first instance and then followed by application for exemption or reduction, etc. Also, the amount to be deposited and the time within which it is to be done must be agreed beforehand between the companies and the Government. In case the Government is not willing to allow companies to approach it before making deposits, as stated above, then the Government should dispose off the companies' applications within a special period of time, say, within two weeks and inform the applicants of its decision.

Similarly, the reference to the Board of Referees must have a time limit, as also the disposal of appeals by them. The rules should also provide for refund of deposits within a very short specified time, so that companies will be able to utilise them for their urgent needs. The Association also requests the Government to fix the percentages of deposits for the current year within a maximum of 12½ and 37½, that is, half of the limits prescribed in the Act, because the savings to companies as a result of the allowances and development rebate and depreciation are to the extent of about As. 8 in the rupee. The percentages prescribed in the Act, the Association says, appear to have been laid down without a consideration of the fact that the amounts involved are the tax amounts and not the allowance amounts. It may be noted, in this connection, that the Finance Minister stated in Parliament that the Government's intention was to demand a deposit of 50 per cent. only in respect of the latter deposit, as against 75 per cent. prescribed in the Act.

What are Accumulated Profits?

In the second memorandum, the Association poses two questions to the Government, seeking clarification on the meaning of (1) "the accumulated profits and reserves" and (2) the words "to the extent to which such profits and reserves are not represented by the fixed assets of the company," as the first is not clear and there is widely differing views on the latter. The Association asks whether the accumulated profits and reserves mean those shown in the balance-sheet of companies or those according to income-tax assessments. It is well known that the profits shown in the balance-sheets differ widely from those computed for the purposes of taxation by the income-tax authorities. In the latter case, how will the amount to be deposited be determined? It is well known that assessments of incomes are pending for long periods, and, if assessments are not finalised and consequently the amounts to be deposited are not known, the companies will be penalised for no fault of theirs. Giving an illustration, the Association says that, in the case of a company having the calendar year as the financial year before 30th June 1957, its total income for 1956 will have to be ascertained in income-tax assessment in order to find out the amount of retained profits. Will it be reasonable and proper to consider, and would it even be feasible, that the assessment for the year

(*Continued on page 299*)

STATE OF COTTON MILL INDUSTRY AFTER ENHANCED EXCISE DUTIES

DANGER OF MALADY BECOMING CHRONIC

By Bipinchandra M. Mehta, B.Sc. [Tech.] B.S. [Michigan], A.M.I.E.T.

AFTER the psychological shock treatment effected during the months of September and October 1956, an incentive of a rebate of excise duty at the rate of 6 pies per square yard of cloth produced by the textile mills in excess of its average monthly production during the eight months January to August 1956 was announced. The concession has been extended till March 1957. This production incentive is negligible and more or less of academic value only. The incidence of excise duty has been heavy and hardly two months had elapsed from the imposition of the duty when this incentive was announced. This is like "taking away in wholesale and paying back in retail."

The fair prices published by the Government are on the basis of the Tariff Board formula. This formula has become outdated and if at all price, and not distribution, control is intended, then it is necessary that a review of the present cost structure of the mills is made, in view of the fact that the conditions which existed at the time the Tariff Board formula was formulated are no more there, and new conditions have been created on account of bonus awards to the workers from year to year, increase in freight, increase in price of coal and other cost charges, etc. The pace of cloth production has not been consistent with that of the demand. Consequently, prices have advanced, and, with this new burden, the sacrifice which the consumer has to make has also increased. The optimism prevalent prior to August 1956 does not exist now and, because of the sharp measures taken in quick succession, trade and industry have been shocked. Practically, the entire burden of the new duties has been borne by the mills, and not passed on to consumers, and cloth prices have receded to that of December 1955 level. Stocks of cloth with mills are mounting, the rising spiral of prices has been arrested and even a downward trend is visible again. All this calls for a review of the excise duty and relaxation of credit restrictions on cloth.

There is always a fear lurking in the minds of mills and traders about the increase or reduction in excise duty, as the rate of the duty can be varied by executive order subject to the maximum limits fixed by Parliament. This has an adverse psychological effect on the merchants. It tends to cause stagnation in trade, because the trader does not risk in future ventures due to uncertainty about the future rate of excise duty. In order to stabilise the trade and for improving the sentiment, a decisive announcement as to the quantum of excise duty and its duration is required.

The Only Solution

The availability of cloth supplies in the country is not large enough to meet the growing domestic demand and still leave sufficient balance for exports. Possibly, the only remedy with reference to the law of supply and demand lies in augmenting the mill cloth production, as the handloom sector cannot expand rapidly. Further, the stiffer the controls on a particular commodity, the greater is the desire to go in for that commodity and this applies to cloth also. The good part played by the handloom sector cannot be ignored and merits credit and attention, but encouragement to this sector should not be such as to restrict the growth of the mill sector. Expedients like control on production, price, distribution and opening of fair price shops are a dismal picture of the past and the grim experience of the public about control and rationing is still fresh in our minds. The right solution to the cloth muddle lies in the expansion of the mill sector rapidly, as this is the only way to make cloth available to consumers at economic price.

There have been restrictions on the expansion of spindleage and loomage in the name of handlooms. The cloth crisis, however, has impelled the Government to sanction expansion by 2.1 million spindles and 14,600 automatic looms (for export promotion only) and 35,000 powerlooms for the handloom sector in July 1956. But this does not go far enough and the future for consumers still appears dark.

Despite the restrictions on production and other handicaps, the cotton textile industry has played its part well, as could be seen from the production figures. From the table given below, it will be evident that the production of cloth and yarn by the mills has increased over 1950 figures which were the lowest since 1946. It is estimated that, production by the mills during 1956 is a record in the history of this country :

Production by Mills

(Yarn in million lbs. ; cloth in million yards)

	Cotton yarn	*Cloth*
1950	1,174.8	3,666.8
1955	1,634.4	5,092.8
1956	*1,652.0	5,288.0

* The figures for the month of December are estimates.

The total exports of mill-made cloth from India during 1955 were 859.29 million yards, and for 1956, they are estimated to be in the neighbourhood of 776 million yards. The break-up figures for coarse, medium, fine and superfine varieties are as follows :

Total Exports

(Million yards)

	1955	1956
Coarse	184.05	200.71
Medium	618.24	535.52
Fine	35.96	22.09
Superfine	21.04	17.51
Total ..	*859.29	775.83

* The figures for the month of December are estimates.

In 1950, India's cloth exports were 1,190 million yards, a record high, and since then, they have not reached that high level. It would be evident from the aforesaid table that, in 1956, exports of cotton piecegoods fell sharply, as compared with those in 1955. Due to abolition of export duty on coarse cloth in May 1956, exports of coarse goods have shown an improvement, while there is a moderate fall in the medium category and a notable fall in fine and superfine categories. In other words, exports of medium, fine and superfine qualities have all shrunk.

Export Prospects

The future for exports of cotton textiles from India is bleak, in view of the fact that the neighbouring and other importing countries are setting up modern composite mills, with complete processing equipment. In Pakistan, it is reported, cloth is being produced at the annual rate of 455 million yards, as against a mere 127.5 million yards in 1951. The rise in production in this country has been due to expansion in the size of the industry. The loomage has grown up from 5,984 in 1951 to 26,000 in 1955-56 (estimated). The number of spindles has also increased from 333,126 in 1951 to 1.7 million in 1955-56 (estimated) and the capital invested in the industry amounts to Rs. 60 crores, approximately.

East Africa also is considering installation of a big modern cotton mill in collaboration with a leading Indian industrialist. Similarly, a mill is going up in Ethiopia. In Burma, the Industrial Development Corporation of Burma has negotiated with Japanese firms for setting up three cotton mills, each with 40,000 spindles and 200 powerlooms, as a joint venture. The total outlay is expected to be of the nature of Rs. 6 crores. The Government-owned spinning and weaving factory in Tamaing has also plans to expand from 20,000 to 40,000 spindles and from 200 to 600 looms. Increasing competition is being experienced from Hongkong, China, Japan, Russia, etc. in several markets to which India has been exporting cloth and it is reported that, in some of the markets, arrival of Russian goods has greatly increased.

Plans are afoot in England to produce fabrics which are neither woven on the loom for spun on the spindle. The concept of non-woven fabrics wherein the fabrics are bonded together by physical and chemical means is being studied by Messrs. Tootal Ltd., in Lancashire. This is an indication of the great progress made by the industry in other foreign countries with their modernised plants and techniques. Unless and until incentives are offered and healthy conditions are created, modernisation and rehabilitation of the Indian cotton textile industry will be a painfully slow affair, if not utterly impossible.

Recently, the Indian National Trade Union Council (popularly called I. N. T. U. C.), which commands 650,000 workers employed in 400 textile mills, demanded a 25 per cent. straight increase in wages. If this demand is conceded, it will add to the cost of production further. Again, it is proposed to enhance the rate of provident fund contribution by employers from 6¼ per cent. to 8⅓ per cent. If this enhancement of contribution by 2-1/12 per cent. were to take place, the increase in the total cost of the textile industry (cotton, jute and wool but excluding art silk) would probably be 0.4 per cent. as per the figures based on the Census of Manufactures, 1951. To what extent this increase will work out for the cotton textile industry alone is not clear, as separate figures are not available. Nevertheless, the importance of this factor cannot be overlooked.

The total income of a cotton mill worker in Bombay amounts to Rs. 1,760, while the national income of a family of four is Rs. 1,120 on the basis of *per capita* income of Rs. 280 for the year 1955-56, as estimated by the Planning Commission. That is to say, the total earnings of a textile worker is more than one and a half times the national income for a family of four. Similarly, the current earnings of an Ahmedabad textile mill worker is Rs. 1,668 as per the figures available from the Ahmedabad Millowners Association. It will thus be seen that the mill worker in India is already relatively well paid, as compared with the rest of the masses.

It will be noted from the foregoing account of the present state of affairs of the cotton textile industry that its economic malady will become chronic, unless appropriate measures are taken, without any further delay, to restore its health and vigour. The industry's capacity to compete in world markets is being steadily undermined by mounting costs and taxation, on the one hand, and lower productivity, on the other. It is able to sell its production in the internal market at a profit, because of near-scarcity conditions and absence of competition from foreign manufacturers. This situation is neither fair to consumers, the vast majority of whom are poor, nor to the long-range interests of the industry itself, because it is not conducive to efficiency and honesty.

INTERNATIONAL COTTON CALIBRATION STANDARDS PROGRAMME

Marking a milestone in better understanding in world cotton trade, the International Cotton Calibration Standards Committee announced this week that a set of standard tests cottons will soon be made available for merchants and spinning mills throughout the world. The international committee, which developed the programme for establishing the standards, represents the American Cotton Manufacturers' Institute, the American Cotton Shippers' Association, the International Federation of Cotton and Allied Textile Industries, the National Cotton Council of America and the U.S. Department of Agriculture. Several hundred laboratories throughout the world are expected to use the standard cottons for calibrating cotton fibre instruments.

The necessity for the standard calibration cottons came about through increasing use, by both mills and merchants, of scientific instruments to measure cotton fibre properties. These standard cotton samples enable testers to "zero in" their instruments. In other words, when fibre instruments in Memphis, Manchester and Frankfurt get the same results on their standard sample, they are more likely to be "on the beam" in their commercial testing.

The International Cotton Calibration Standards Programme has been set up to work towards better understanding in cotton trade through the use of standard cottons. The blending, preparation, and distribution of the samples will be carried out by the Cotton Division, Agricultural Marketing Service, of the U.S. Department of Agriculture. The testing and certification of the standard cottons will be the responsibility of the five sponsoring organisations and their designated laboratories.

Initially, cotton calibration standards will consist of three samples, having high, medium and low readings in the Micronaire test for fineness, and the Pressley test for strength. Later on, additional fibre property tests may be included in the programme.

Two representatives of each sponsoring organisation serve as a special committee of the American Society for Testing Materials to supervise the programme. Standard test methods of the A.S.T.M. will be used to establish the cotton calibration readings. When standard test procedures of the International Organisation for Standardisation (I.S.O.) become available, they will be used as the official test methods in the calibration standards programme.

Three laboratories in the United States and two in Europe will establish the official readings on the calibration cotton standards. U.S. laboratories include the Department of Agriculture, the U.S. Testing Company in Dallas, Texas (appointed by the American Cotton Shippers' Association), and the laboratory of the American Cotton Manufacturers' Institute in Clemson, South Carolina. The International Federation has designated the Shirley Institute in Manchester, England, and the Bremen Cotton Exchange in Bremen, Germany, as its representative laboratories.

The new test cottons will be placed on sale by the Cotton Division of the Agricultural Marketing Service by about the 15th inst.

CLOTH EXPORTS IN 1956 LOW

SLIGHT INCREASE IN YARN SHIPMENTS

From A Special Correspondent

MANCHESTER, 29*th January*

AS the months went by, during 1956, it was increasingly obvious to Lancashire traders that textile exports during the year would eventually be very much lower than in recent similar periods. The final figures now released by the British Board of Trade have, therefore, caused no surprise among those closely connected with the market. Nor at the outset of 1957 can any more promising outlook be forecast.

MANCHESTER LETTER

Last year, cotton cloth exports were at their lowest since 1945 and, therefore, smaller than in any recent peace-time year, as the following table shows:

	Cloth (in thousand sq. yds.)		Yarn (in thousand lbs.)	
	Cotton	Rayon and synthetics	Cotton	Rayon and synthetics
1949	903,578	160,708	82,061	21,469
1950	822,473	189,568	70,036	28,428
1951	864,375	217,206	65,481	28,189
1952	710,913	149,794	35,722	20,887
1953	709,905	176,826	41,920	31,497
1954	637,378	179,256	40,431	32,345
1955	554,504	183,747	35,563	30,816
1956	474,150	120,337	35,792	36,200

Cotton cloth shipments again fell by 80,000,000 square yards, an equivalent decline to that encountered in the previous year. In the past 12 months the reduction was mainly accounted for by a loss of nearly 30,000,000 yards in the West African territories of the Gold Coast and Nigeria and a further drop of 20,000,000 yards in shipments to Australia. The remainder of the decline was spread over numerous markets abroad but it is noticeable that the position was held in South Africa after a fall of nearly 30,000,000 yards in 1955.

Leading buyers were (in thousand square yards): Australia 80,118, South Africa 54,134, New Zealand 32,675, Nigeria 30,433, Rhodesia and Nyasaland 25,323 and the Gold Coast 23,537.

Yarn Sales

Exports of cotton yarns kept remarkably steady throughout the year, the figures being practically identical with 1955. The only notable increase was in shipments to India, which rose by 1,600,000 lbs. to nearly 4,000,000 lbs. Canada also took more cotton yarn but minor setbacks were encountered in several European countries, including Germany, France and Switzerland. An improvement occurred in the offtake in rayon and synthetic fibre yarns, which for the first time exceeded the exports of cotton yarns. This was largely the result of increased shipments to India, which were nearly 3,000,000 lbs. higher at 7,333,000 lbs.

The reduction in shipments of cloth made from rayon and synthetic fibres was less drastic than in cotton goods, as although exports declined by 13,000,000 square yards the fall in the previous year had exceeded 40,000,000 yards. A feature was the emergence of Rhodesia and Nyasaland as the chief consumers, taking 17,600,000 square yards and superseding Australia, the purchases of which dropped from 23,500,000 square yards to less than 15,700,000 square yards. Again, South Africa absorbed almost the same quantity at 15,820,000 square yards but purchases by New Zealand were some 3,000,000 square yards lower at 12,822,000 square yards.

Imports Rise Too

Combined totals of cotton and rayon cloth imports in 1956 exceeded the comparable volume of goods reaching this country in the previous year. Arrivals of cotton grey cloth were almost identical at 267,684,000 square yards. The quantity of rayon fabric imported increased—from 65,415,000 square yards to 74,147,000 square yards.

Features of the intake of foreign-made cotton grey cloth into Britain last year were the maintenance of almost the same quantity of Indian material for the third year running, the continued expansion in arrivals of Hong Kong cloth and the halving of imports from Japan. A substantial increase was also recorded in purchases from a number of unspecified sources, known to include Pakistan, the Soviet Union, France, China, Bulgaria and Yugoslavia.

India supplied 128,052,000 square yards, as against 130,284,000 square yards, while Hong Kong provided 55,857,000 square yards, as against 48,761,000 square yards. Arrivals from Japan amounted to 32,139,000 square yards, as compared with 63,879,000 square yards but imports from "other foreign countries" rose from 11,200,000 square yards to 30,699,000 square yards and from "other Commonwealth countries" from 137,000 square yards to 7,784,000 square yards.

Quotas from the East?

Until some official intimation of the measure of agreement reportedly reached between the leaders of the Lancashire trade mission and the Indian textile industry is made public, there must inevitably be speculation as to the terms of any pact concerning the quantity of Eastern cloth to be shipped to this country. The team representing British cotton and rayon interests certainly made its journey in the hope that some understanding could be achieved with their opposite numbers in the Asian countries visited and if initial reports prove correct there will be satisfaction in Lancashire that an agreement has been fixed up in so short a time after the many months of pressure exerted on successive British Governments for action.

Some background to the talks has lately been given by Mr. W. T. Winterbottom in a speech made in his capacity as President of the Textile Institute. As long ago as July 1954, he said, such a mission was suggested by the industry at a time when the volume of trade was much smaller than it is now and when any agreement would consequently have been more in our favour.

"At that time we were peremptorily told not to interfere as this was a matter to be dealt with at Government level," he declared. "Now, when conditions are less favourable and the Government has done precisely nothing in two and a half years, the mission goes with, I believe, Government approval."

But, in Mr. Winterbottom's view, a purely quantitative agreement is not in itself enough. "More damage can be done to the cotton industry by 50,000,000 yards a year coming in at assisted or dumping, prices than by 250,000,000 in fair competition," he added. "Any agreement made should specify, as the American-Japanese pact has done, that fair trading practices are observed. I do not think we can rely solely on the proposed anti-dumping legislation whose machinery would be too slow and cumbersome to be really effective."

New Mill Purchase

The Lancashire Cotton Corporation, which already controls 55 mills in Lancashire and Yorkshire, has acquired a Scottish chenille manufacturing company. This was announced at the annual meeting in Manchester by Mr. Roger M. Lee, the Chairman, who said that since the end of the Corporation's financial year, in October, Tullialan Fabrics Ltd., a private company employing about 160 workers at its Glasgow mill, had been taken over. He added: "We have every reason to believe that this will be a profitable investment," he told stockholders. "We are continuing our policy of seeking suitable expansion of our interests."

The £27,000,000 Corporation now has a more satisfactory order book than 12 months ago, Mr. Lee continued, mainly as a result of the greater stability now prevailing in raw cotton.

"Until all the American surpluses have been liquidated and Governments throughout the major producing countries have withdrawn from the marketing of raw cotton, it is unlikely that normal market machinery of free enterprise can function satisfactorily," he declared. "Until this can happen we shall not have adequate hedging facilities for our necessary stocks of raw materials."

Cotton Campaign

The second phase of the Cotton Board's sales promotional campaign, "Buy Britain's Cottons," will begin next month.

Teams of cotton industry representatives will visit nearly 6,000 shops and stores in the main centres of population throughout the United Kingdom in an effort to persuade retailers to sell more Lancashire-made cotton goods.

Advertising will also be intensified, leading up to the spring buying peak around Easter.

Big Plant Earnings

By volume, the quantity of textile machinery shipped from Britain last year was slightly lower than in 1955 but earnings from this source have only once before been exceeded —in 1950 when their value was over £50,000,000. Last year, the machinists exported goods worth £44,992,761.

PROSPECTS FOR RAW COTTON

RISE IN CONSUMPTION AND FALL IN PRODUCTION ANTICIPATED

NOW that half of the normal course of the current cotton season has already been run, it seems appropriate to attempt an analysis of the supply and distribution pattern of cotton for the whole season ending 31st July 1957. For the free world as a whole, the supply-demand relationship during the current season appears to have improved considerably as compared with previous seasons. Total supply is expected to stabilise itself around last season's level, while aggregate consumption is likely to register an improvement. The net result would, therefore, be a scaling down of the total carryover stock at the beginning of the next season. Production in the U.S. this season is estimated to fall by 1.5 million bales, as compared with the previous season, but this is more than offset by an increase in the carryover stock at the beginning of the season, while consumption also is expected to show a slight fall.

Production in the free world, outside the U.S., is expected to be maintained or may even show some improvement over last season's level. But this will be more than counterbalanced by an increase in consumption which is expected to be higher by about 700,000 bales (of 478 lbs. each). The gap will be made up by imports from the U.S. which will also be the major source for building up the low carryover stocks at the beginning of the current season. This means that the U.S. can count on a more or less easy outlet for its cotton in these regions. Taking all these factors into consideration, the International Cotton Advisory Committee, Washington, comes to the conclusion that the world cotton situation is presently somewhat more hopeful than in recent seasons. Control of production, according to the latest monthly *Review* of the Committee, together with a rising trend in consumption, has halted the accumulation of fresh surpluses. It further observes that there should be some reduction in existing stocks this season.

In the U.S., as has been pointed out, despite a much lower production, of the order of 13.2 million bales (December estimate), as against the previous season's 14.7 million bales, supply is much larger than in the last season. This is because of the record carryover stock at the beginning of the season which stood at 14.5 million bales. Total supply (including imports), therefore, comes to 27.8 million bales, as compared with 26 million bales in 1955-56. In refreshing contrast, there is a noticeable contraction in supply in the free world outside the U.S. which is presently expected to aggregate 24 million bales, that is, about 1.7 million bales less than last season. But the total estimated acreage and average yield show very little change this season and production would be on a par with last season's 16.2 million bales. The following table shows the estimated production in the free world outside the United States in the current season:

(In thousand bales)

Country	1955-56	1956-57
Mexico	2,240	1,855
India	3,880	4,400
Pakistan	1,425	1,545
Sudan	440	515
Egypt	1,541	1,490
Syria	410	457
Others	6,235	6,056
Total ..	16,171	16,318

As will be seen from the above table, increases in the output of cotton in India, Pakistan, Sudan and Syria, is only partially offset by lower production in Mexico, Egypt, and a few other countries, so that the total is slightly higher. It is clear, therefore, that the reduction in supply is primarily due to the very low carryover stock in both exporting and importing countries. But a factor which must be borne in mind, in this connection, is that the drop in supply outside the U.S. is offset by heavy imports from the U.S. As a result, total supply would be well over 2 million bales higher than that of the previous season.

The conclusion that emerges from this analysis, therefore, is that the main factor responsible for the improved demand-supply relationship is the expected increase in consumption, and that, too, outside the U.S. and the possibility of some build-up of stocks in some importing countries. This expectation appears to be fully justified, in view of the low carryover in some importing countries and also because the price outlook now is much less of a deterrent to forward purchases.

Consumption in the U.S. is running at about four per cent. under a year ago, and, though there may be some improvement during the rest of the season, the total for the season is expected to decline to 9 million bales, as compared with 9.2 million bales last season. Outside the U.S., however, consumption, which was of the order of 19.3 million bales last season, is expected to increase to 20 million bales in the current season. Offtake of raw cotton by mills, in the first quarter of the current season in the U.K., was about 7 per cent. under a year ago. But, with the recent improvement in the industry, a change in trend is anticipated. Aggregate consumption in Continental Western European countries had remained unchanged at 5.5 million bales during the last three seasons. But, in the current season, a distinct improvement was in evidence, except in Portugal, and, if the trend continues, there could be some increase in consumption. Japanese exports of cotton textiles were heavy during the last quarter of 1956, and present conditions appear to justify the expectation of a further rise in textile production. This is sure to be reflected in increased utilisation of raw cotton by that country and could probably rise to a new record for the post-war period. In India, textile production set a new record in 1956.

Export outlook for U.S. cotton is, indeed, bright. Exports too date are higher than what was shipped during the entire 1955-56 season. Sales under the special export programme, till the end of January, were 6.316 million bales. But a fall in the tempo of sales for export is expected, because of the limited range of qualities now available for export under this programme. It is true that an additional 6 million bales of 1955 loan cotton came into Government ownership on 1st January, but present indications are that this will be catalogued and made available for sales not earlier than 15th February or probably 1st of March. There is also no certainty whether this will be sold for delivery next season only or for delivery both this season and the next. Official ideas of exports centre around 6.5 million bales for this season. Exports, together with consumption, would, therefore, make for a disappearance of about 15.5 million bales in the U.S., that is, 2.3 million bales in excess of current production.

The following table gives the supply and disappearance position of cotton for the free world:

Supply and Disappearance of Free World Cotton

	1954-55	1955-56	1956-57
Free World:			
Opening stocks, 1st August.	19.0	20.6	22.1
Production	29.5	30.9	29.5
Total ..	48.5	51.5	51.6
Disappearance	27.9	29.4	30.2
Closing stocks, 31st July ..	20.6	22.1	21.4
U.S.A.:			
Opening stocks	9.7	11.2	14.5
Production	13.6	14.7	13.2
Imports	0.1	0.1	0.1
Total supply ..	23.4	26.0	27.8
Consumption	8.8	9.2	9.0
Exports	3.4	2.2	6.5
Destroyed	..	0.1	0.1
Total Disappearance ..	12.2	11.5	15.6
End season stocks	11.2	14.5	12.2
Free World outside U.S.:			
Stocks, 1st August ..	9.3	9.4	7.6
Production	16.0	16.2	16.3
Imports from U.S. ..	3.4	2.2	6.5
Imports from U.S.S.R. ..	0.3	0.3	0.3
Total supply ..	29.0	28.1	30.7
Consumption	18.8	19.3	20.0
Exports to U.S.	0.1	0.1	0.1
Exports to Communist Countries	0.5	1.0	1.1
Destroyed	0.2	0.1	0.1
Total Disappearance ..	19.6	20.5	21.3
Closing stocks	9.4	7.6	9.4

Increased carry over stocks on 1st August 1956, as will be seen from the table above, more than offsets the expected reduction in production. Total supply will, therefore, set a new all-time record. Consumption is, however, expected to increase by more than the increment to supply and, if this happens, the carryover stock at the end of the season should decline slightly. The aggregate supply in the next (1957-58) season will, therefore, be lower, if total free world production falls as a result of the greater response by the U.S. farmers to the Soil Bank programme. There is ground for supposing that cotton production in the U.S. next season will be considerably reduced.

It was announced on 12th December that payments on land taken out of cotton production under the Soil Bank programme will be on the basis of 15 cents per pound of Upland cotton, the same as in 1956. The yield figures, to which this basis is applied, are being increased, however, from an average of 309 pounds for the entire country to an average of 361 pounds, so that the payments at a national average of $54.15 per acre in 1957-58 will be considerably higher than in 1956-57. The national goal for cotton land under the Soil Bank programme is 3.5 to 4.5 million acres, with a maximum for each farm of 10 acres or 30 per cent. of the acreage whichever is higher, a rule which should cause the largest reductions in acreage to take place on the small cotton farms in the South-eastern part of the United States. Average yields, on which payments are made, are being established for each farm. Undoubtedly, the acreage planted to cotton will decline very considerably but this may be partially offset by more intensive cultivation of remaining acres. Drought conditions in the South-west, however, continue to be a problem. In any event, observes the *Review* of the Committee, reduced production in the United States next season should help further to reduce the cotton surplus. Total supply, however, would still be many million bales in excess of what is considered as normal, given the present and the projected rate of consumption in the future. This represents, according to the *Review*, "the extent of adjustment necessary to re-establish a more healthy relationship between supply and demand."

ALL-INDIA SECOND ESTIMATE OF COTTON

The second all-India estimate of cotton for the 1956-57 season, released by the Directorate of Economics and Statistics, Ministry of Agriculture, Government of India, places the area under the crop at 15.955 million acres, as compared with the adjusted second estimate of 15.442 million acres for the 1955-56 season, representing an increase of about 3.5 per cent. This estimate does not cover the entire area sown to the crop during the current season. Past experience has shown that the area at the second estimate stage forms roughly 75 per cent. of the acreage finally reported. The current estimate relates to the period up to the end of September 1956.

Among the different varieties of cotton, the increase in area has occurred mostly in Jarilla (including Virnar), American and Broach Vijay. Decrease in acreage has, however, been reported mostly in Malvi and Oomras varieties. As regards staple lengths, increases have been shared by medium and long-staple cotton. The following table gives details regarding the area under the crop, in terms of trade description and staple length, along with that of the second estimate of the previous season.

All-India Second Estimate of Cotton

(In thousand acres)

	1956-57 (Second Estimate)	1955-56 (Adjusted Second Estimate)
Trade description:		
Bengals	916	833
Americans	2,798	2,364
Jarilla (including Virnar) ..	3,363	2,753
Verum	273	261
H. 420	437	522
Oomras	1,949	2,207
Hyderabad Gaorani ..	1,088	1,077
Malvi	1,232	1,511
Broach-Vijay	1,199	1,071
Surti-Suvog	499	586
Dholleras	1,205	1,291
Southerns	942	912
Comillas	54	54
Total ..	15,955	15,442
Staple lengths:		
Long staple	5,002	4,767
Medium staple	7,695	7,296
Short staple	3,258	3,379
Total ..	15,955	15,422

The estimates, it must be borne in mind, relate to the old set-up of States and does not correspond to the States as reorganised on 1st November 1956.

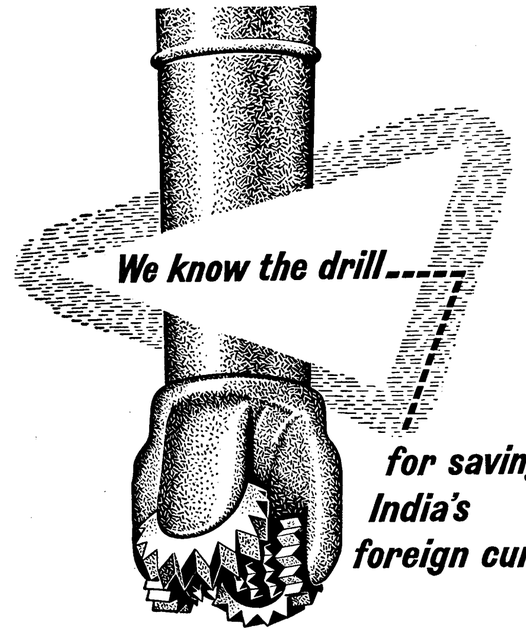
N. D. JOSHI, Manager.



Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

CHANGE IN WORLD SUGAR SITUATION

EXPORT QUOTA RESTRICTIONS REMOVED

THE International Sugar Council concluded its three-day session at London on Thursday last week. Details regarding the deliberations of the meeting and the decisions taken thereat are not yet available. The brief Press reports that have emanated from London, however, indicate that the Council has lifted all restrictions on sugar exports by member-countries during the current calendar year. Accordingly, the member-countries of the World Sugar Agreement are now permitted to unload in the sugar market any quantity of sugar at any price. The Council has also called upon all the participating countries to release immediately to the free sugar market the minimum stocks held by them under the World Sugar Agreement. It has made clear, in this connection, that, should the market price of sugar fall below 3.90 cents, the exports made by any country up to the next meeting of the Council shall not be charged against its quota when quotas become operative.

The aforesaid decision of the Council—that is, removal of export quotas—is a sequel to the changed condition in the international sugar market. Ever since the Suez crisis, the market has been ruling distinctly firm, with a sharp upward trend in prices. Spot Cuban raw sugar (f.o.b. Cuba) at New York, which stood 0.03 cent below the World Sugar Agreement minimum of 3.25 cents a pound at the end of August 1956, was quoted as high as 6.37 cents on 15th January last. Although the price has since come down to 5.80 cents (as on 30th January), thanks to some sales by Italy and India, it is still very much above the ceiling of 4.00 cents prescribed in the Agreement. Under the Agreement, it will be recalled, sugar export quotas should be lifted, if the spot price of sugar at New York continues to be well above the ceiling for 17 market days. The latest reported decision of the Council is in accordance with this condition.

Supply of Sugar

The renewed firmness in the world sugar market must be attributed to the supply of sugar being less plentiful than it has been for some years, on the one hand, and strong consumer demand, on the other. The change in the supply position, in turn, is partly due to the reduction, albeit of about 2 per cent., in the European beet crop harvested in the last few months. Consequently, Europe, which was until recently a net exporter of sugar, has almost turned out to be a net importer. This change in its status has come about at a time when the Cuban sugar surplus is much reduced. Commenting on this development, the *Financial Times* correspondent gives the following statistics:

"On 15th December 1955, Cuban stocks amounted to 1,766,000 long tons which may be compared with a final export quota for Cuba in that year of 2,109,000 tons. But, of the stocks, 1,065,000 tons formed part of the stabilisation reserve; the reserve was built up in order to control the disposal of the very large 1952 crop and this was to be released at the rate of about 350,000 tons in each of the five following years. So the stocks available last year (1956) amounted to a little over 715,000 tons. In addition to this, 2,400,000 tons of the 1956 Cuban crop were available for export to the free market. But, on 15th December 1956—the last date for which figures are available—total Cuban sugar stocks had fallen to 876,769 tons barely half as much as the previous year. Of this quantity, about 575,000 tons are expected to come on the market."

The shrinkage in Cuban sugar surplus reflects the steadily rising world consumption. A report of the U.N. Food and Agriculture Organisation estimates the aggregate world consumption of sugar for 1956 at 39.8 million tons, as against 38.0 million tons in 1955 and 36.4 million tons in 1954. The total world output of sugar during the season September 1955—August 1956 was only 39.1 million tons. The gap between world sugar production and demand thus, together with the running down of Cuban stocks, is the major cause of the rise in prices. It will be interesting to note here that the *per capita* consumption of sugar in Asia, the Near East and Africa has nearly doubled since 1951. Of the total 38.0 million tons of sugar presumed to have been consumed during 1955, the free world accounts for 31.5 million tons (30.2 million tons in 1954) and the communist bloc for 6.5 million tons (6.2 million tons in 1954).

Following the removal of all restrictions on sugar export quotas, prices are expected to come down, but it is felt that "the smaller quantity of sugar available will break the fall." This at any rate is the view of the *Financial Times* correspondent. He, of course, points out that what will happen in the immediate future is anybody's guess. For he observes:

"Although price movements have recently been much wider than they have been for years, they are not altogether surprising, since not much more than one-third of the sugar which enters into international trade comes on to the free market. What would be a comparatively small fluctuation in supply or demand if there were only one market becomes much more important when there are several regional and bilateral agreements covering a substantial part of the world trade in raw sugar. If exports from the Commonwealth producing countries came on to the world market, they would increase the volume traded at the world price from about 5 million tons to about 7½ million tons, but, under the present Sugar Act, they merely reflect world prices without being able to influence them."

In the course of an editorial, the *Financial Times* states that the running down of the Cuban sugar surplus and the estimates of a lower sugar beet outturn in Europe would of themselves lead to prices higher than those ruling throughout most of the year. According to it, for this time of the year, sugar supplies are reasonably low, so that the abolition of export quotas is unlikely to cause an immediate increase in sugar available. But, as the year progresses, additional supplies should bring down prices from their present level. Alluding to the present structure of sugar prices, the *Financial Times* feels that the recent sharp drop in sugar prices is unusual and that there is little evidence of any significant increases in supplies or any appreciable slackening of demand. To quote it: "There have been small sales by Italy and India and, at high prices, they may offer more from their stocks, but they have not yet seriously begun selling. And, on the other hand, further buying by other countries—by Holland, Japan and perhaps France—is still expected by the market." In view of the uncertainty of price movement thus, the *Financial Times* concludes that "if the decline in sugar prices continues, it is more probable that it will be caused by sales from Italy and India than by the lifting of quotas."

SUGAR PRICES

A well-worn but pertinent point which Mr. S. Muninanjappa, Chairman and Managing Director of the Mysore Sugar Company, Ltd., stressed in the course of his address at the annual meeting of the Company last week, was that a more rational method of remunerating sugarcane suppliers would be to relate cane price to the percentage of sugar recovery. This journal has repeatedly pointed out that the present system of linking cane price only to quantity irrespective of recovery per cent. is very defective, inasmuch as it does not provide any incentive to cane growers to improve the quality of their cane. The replacement of this system with the one which takes into account both quantity and quality will, as Mr. Muninanjappa pertinently remarked, create the necessary incentive in the growers to produce cane of high sucrose-content and, at the same time, ensure supply of good cane to the sugar factory. The Chairman, however, pointed out that the adoption of the system was beset with certain practical difficulties. In this context, he said:

". . . it may not be out of place, if I draw attention to a disparity between conditions in Mysore and those in the neighbouring States which has a bearing on the application of any formula for calculation of extra cane price. While factories in Mysore have to pay cess on sugarcane at a rate of Rs. 6 per ton, which is the highest rate prevailing in any part of India, the rate of cess in Madras is only Re. 1 per ton of cane, while in Andhra it is Rs. 2. This accounts for a difference of Rs. 40 to Rs. 50 per ton in the price of sugar. The existence of such widely different rates of cane cess not only results in unequal competition but also vitally affects the ability of factories to pay extra price for cane."

The difficulty mentioned by Mr. Muninanjappa is no doubt a genuine one, but it can be removed. The Government of Mysore, for instance, could effect a substantial reduction in the rate of cess on cane. The cess of Rs. 6 per ton of cane now being collected by the Government works out to as much as 15 per cent. of the price of sugarcane. Nowhere in the world is an essential raw material like cane subjected to such a heavy incidence of taxation.

Be that as it may, in his address, Mr. Muninanjappa touched on the expansion scheme undertaken by his Company. The review reveals that the sugar manufacturing plant has been augmented and balanced in many respects, though the goal of 2,000 tons crushing capacity can be maintained only after the installation of an intermediate cane carrier and mechanical unloading devices. Early action is being taken to overcome these deficiencies so as to ensure steady and comfortable working of the plant at 2,000 tons of cane per day. Mr. Muninanjappa also alluded to the proposal for the manufacture of paper out of bagasse which is now being utilised as fuel in place of coal. He revealed that a firm interested in starting a factory for producing paper out of bagasse had come forward to undertake the responsibility for supply of coal and also bear the

(*Continued on page 285*)

EXPORT OF COAL TO PAKISTAN

100,000 TONS PER MONTH AGREED UPON

THE three-year Indo-Pakistan trade agreement, which was signed on 22nd January last and which has come into force with effect from 1st February 1957, is of much significance to the Indian coal industry inasmuch as it is assured of a regular and easily accessible market. Coal figures prominently in schedule 'A' attached to the agreement, among the items available for export from India to Pakistan. It is one of the goods for which both the Governments will provide facilities for import from and export to each other's territories to the extent permitted by their respective laws, regulations and procedures. It is also one of the goods, the imports and exports of which will normally take place through ordinary commercial channels, except where either Government finds it necessary to buy or sell part or the whole of the quantity or value of any item on Government account. The two Governments have agreed to enter into special arrangements as contemplated by Article XXIV (11) of the G.A.T.T. in respect of some commodities; these commodities are set out in schedule 'C.' Coal is one of the chief items which come within the purview of this special arrangement.

Quantities Agreed

Under the scheme of special arrangements, India has agreed to supply Pakistan with 100,000 tons of coal per month, of which 30,000 tons will be exported to West Pakistan by rail only, 55,000 tons to East Pakistan by rail and river and 15,000 tons by sea or river. The agreement to provide this quantity is, however, subject to the condition that supplies are not interrupted by causes beyond human control, such as strikes, accidents, floods, etc., which are not uncommon, particularly the last mentioned natural catastrophe. There is, however, no binding on either of the two countries that the quantity mentioned above, as in the case of other commodities the specific quantities or value whereof are agreed upon, should be despatched or absorbed. The only significance of specifying the quantities under the special arrangement is that, when there is demand for these commodities, the authorities of the respective countries should issue export-import licences to the extent specified. Thus, the two Governments have agreed to permit export or import up to at least the quantity or value specified in schedule 'C,' the actual imports and exports depending upon terms, delivery periods, specifications, etc., being mutually agreed upon between the exporters and importers on either side. In other words, there is a considerable flexibility in the terms of the agreement and either country can fulfil the terms according to the exigencies of the situation. With the implementation of the targets for coal production under the second Five-year Plan and the efforts to control floods and to increase transport facilities bearing fruit, it is to be hoped that India will be able to fulfil the terms of the agreement.

Larger Exports

That the trade in coal between the two countries need not be restricted to the minimum quantities provided under the agreement and can be higher is borne out by the figures of export of coal during the period of the last agreement. The previous Indo-Pakistan trade agreement came into force on 1st September 1955 and was to be effective for a period of one year. Under this agreement, India was to provide a minimum of 30,000 tons per month to West Pakistan and 48,000 tons per month to East Pakistan, which comes to 936,000 tons per annum. Actually, however, India exported 1.10 million tons of coal valued at Rs. 2.86 crores during the year ended 31st August 1956, as compared with 0.97 million tons of the value of Rs. 2.77 crores in the previous 12 months. Of these, those exported by sea accounted for 293,675 tons and those by land for 803,093 tons, as against 148,676 tons and 822,790 tons, respectively, in the preceding year. During the subsequent four months, the exports from India aggregated 339,360 tons, as compared with only 280,279 tons in the corresponding period of 1955. It is apparently in the light of this trend that the quantity to be exported by India under the present agreement has been raised from 78,000 tons to 100,000 tons per month.

INCREASING RUBBER PRODUCTION

PLANTATION ENQUIRY COMMISSION'S SUGGESTIONS

THE Plantation Enquiry Commission's third and final report on the rubber plantation industry has now been made public. From the official Press summary of its recommendations released last week, it is gathered that the Commission has underlined the need for increasing rubber production in the country, in order to meet fully the internal requirements. In the programme for raising the output, the Commission has assigned an important role to small growers and has advocated many measures to help them play their part. One of the most important problems to be faced by the industry in fulfilling the target of increased production is that of finding the necessary finances. The Commission has not ignored this aspect. It has suggested several measures to meet the problem, of which some are on the same lines as those proposed by it for tea and coffee plantations. One of the members, Mr. K. G. Sivaswamy, who is now no more, has added a note of dissent to this report also, as he had in the case of the two other reports.

The main recommendations of the Commission in respect of rubber are: (1) 120,000 acres of land should be brought under cultivation with high-yielding rubber trees by 1965, of which 50,000 acres are to be set apart for new planting and the balance of 70,000 acres for replanting, as already sanctioned by the Government; (2) half of the areas under new planting and replanting should be earmarked for small growers holding 50 acres and less; (3) a rubber replanting fund should be created on the lines of the replanting funds for the tea and coffee industries; (4) dividends and managing agency commissions should be reduced, in those companies where they are high, to increase the internal resources for replanting and to meet labour welfare costs; (5) a surcharge of about 2 per cent. *ad valorem* should be levied on excise duties on tyre manufactures to provide for a "small holders' assistance fund"; and (6) State-partnered co-operative joint farming societies of small growers, multi-purpose primary co-operative societies and central marketing societies should be formed to assist the small growers.

Production

Rubber production in India is insignificantly small, as compared with the world output. The area under rubber is less than 2.5 per cent. of the world acreage and the output is hardly 1.25 per cent. of the world total. Nevertheless, rubber cultivation plays an important role in the economy of the Kerala State, South India, where it is concentrated. In this State, rubber plantations have been responsible for the opening of vast areas of lands and for providing direct employment for nearly 100,000 workers in the estates. Indirectly, they employ a large number of dealers and middlemen.

Though rubber cultivation is known to have been in existence for many years, it began on a commercial scale in about 1902. The invention of the pneumatic tyre resulted in increased demand for raw rubber and a large number of plantations sprang up, particularly in Kerala. By 1910, an area of 29,500 acres was brought under rubber cultivation and in 1925 it expanded to 67,297 acres. The new planting of rubber had, however, to be regulated on account of the depression of the thirties, but the Second World War created an abnormal demand for Indian rubber, since 90 per cent. of the world resources of rubber were cut off by Japanese occupation. Under this stimulus, the area under rubber witnessed the sharpest increase between 1943 and 1946, having expanded from 124,943 acres in 1942 to 169,923 acres in 1946. At the end of 1955, there was a further expansion to 207,239 acres and the output to 22,481 tons. The consumption has, however, risen steadily, with the result that, at present, not only the entire indigenous production is being consumed by the Indian rubber goods manufacturing industry but substantial quantities have to be imported to meet the industry's needs.

One of the main problems before the planters is to increase the production of raw rubber to meet the demands of manufacturers and to make India self-sufficient, as far as possible, in its present and future requirements of rubber. The Commission estimates that consumption will rise to 40,000 tons in 1960 and 65,000 tons in 1970. The extra production of natural rubber required to meet the demand by 1965, after providing for the synthetic rubber that may be available under the Government of India's scheme to set up a synthetic rubber manufacturing plant, will, according to the Commission, be about 20,000 tons. This quantity, it says, can be obtained from 120,000 acres of high-yielding rubber on the assumption that the yield will be 800 lbs. per acre. The Commission has, accordingly, suggested that the minimum area that should be brought under high-yielding rubber may be fixed at 120,000 acres.

Additional Acreage

It will be recalled that the Government of India had sanctioned a scheme for replanting 70,000 acres with high-yielding trees over a period of 10 years. The Commission has recommended that this target should be reached within seven years and a further area of 50,000 acres should also be set apart for new planting with high-yielding trees, as it feels that a certain amount of new planting will be necessary to meet the loss in production. Some of the small estates may need extension by new planting. Small holders should also be helped to own at least four acres, considered to be the minimum unit for a single tapper. Some estates may need substitute acreage. Holdings with an area of 50 acres or less constitute 89,670 acres or 43 per cent. of the total area under rubber. Thus, the small growers occupy an important place in the industry. The Commission has kept this in mind when recommending the allotment of the area to be brought under replanting and new planting. Thus, out of the sanctioned area of 70,000 acres for replanting, the Commission suggests, 35,000 acres should be allotted to estates over 50 acres and 35,000 to small growers holding 50 acres and less. The new area of 50,000 acres recommended by it should, it says, be distributed likewise.

The Commission has made a number of recommendations regarding the programme of replanting. Thus, it says that, in regulating replanting and new planting of rubber, a set of principles should be observed. The provision in the Rubber Act for licensing of replanting or new planting should be rigorously enforced. Replanting and new planting should be allowed only in areas suitable for rubber. In consultation with the estate owners, a phased programme of abandoning unsuitable areas should also be prepared. The new planting and replanting should be permitted only with high-yielding planting material approved by the Rubber Board and the Board should arrange to provide such material. In the matter of issuing licences to the large and small holders, if the applications for replanting and new planting permits exceed the target fixed for both, the Commission has suggested, the Board should give priority to smaller holders and smaller estates. The Commission is anxious to see that concentration of rubber area is not unduly increased in the hands of a few concerns. The Commission has further suggested that, besides these principles, "it is for the Government of India to consider how far it would be desirable to permit expansion of the non-Indian sector in this strategic and sheltered industry."

Effect of Shelter

Reviewing certain aspects of the industry's working, the Commission says that depreciation in rubber trees had been brought about by intensive tapping during the war. Poor cultural practices were also a factor responsible for low yields. The present plight of the industry is attributed by the Commission to the policy of price guarantee adopted since 1943 which has been unaccompanied by a regulation of production techniques and profit allocations. This made it profitable for the producers to keep even the oldest trees, despite their poor yield. As the Government has sheltered the industry by restricting imports and fixing a price, the Commission goes on to observe, the standards of estate maintenance, production costs and distribution of profits should be reviewed from time to time to ensure that inefficient and uneconomic practices do not continue.

The Commission has recommended that a phased programme of replanting for each estate to be implemented over a reasonable period should be drawn up. This programme should, it says, continue even when estates are transferred. Maximum use of future profits for a replanting programme before distributing dividends or repatriating profits will, therefore, be justifiable, according to the Commission.

Referring to new planting, the Commission says that expansion should be limited to demand and related to the production of synthetic rubber. It may not be out of place to refer here to the Commission's view on manufacture of synthetic rubber. It is not opposed to the Government's proposal on the same, but it says that the scheme should be co-ordinated with that of natural rubber, so that rubber growers may have no cause for dismay. The Commission also wants the Government to make a clear statement of policy on rubber development. At the same time, the Commission emphasises the need for reducing the cost of production to the minimum to meet the competition from synthetic rubber.

New Planting to be Regulated

The Commission is of the view that it will not be wise to permit any new planting without proper regulation. In the case of estates and the larger holdings, new plantings may be permitted in those cases where no arrears of replanting exist and where replanting is being carried out according to the programme drawn up by the Rubber Board. The Commission says that its recommendations in the reports on tea and coffee regarding regulation of sales of estates have an equal application to rubber also. It says that proper valuation of estates is particularly important, because wrong valuations may lead to over-capitalisation and may affect the foreign exchange position on account of repatriation of the sale proceeds of sterling estates.

As regards allocation of land for replanting and new planting, the Commission has, as already mentioned, suggested that 35,000 acres should be earmarked for replanting by small growers. Out of this area, it says, the Rubber Board should allocate a suitable area for replanting by holders below 15 acres. The total area that may thus be allocated to holders below 15 acres is roughly taken as not less than 21,000 acres. Out of the 25,000 acres to be set apart for new planting by smaller holders of 50 acres and below, the Commission has suggested that about 12,000 acres may be set apart as a provision for making uneconomic units of less than four acres into holdings of four acres. The Commission is of the view that the proportion fixed for new planting by small holders should not be a rigid one.

The Commission estimates the cost of replanting for large estates at Rs. 1,400 per acre and that of replanting and new planting in the case of small holders at about Rs. 1,000 per acre. On this basis, the total cost for replanting 21,000 acres (in respect of holders of less than 15 acres) and new planting of 12,000 acres (to be set aside for making uneconomic units economic) would work out to about Rs. 3.3 crores over a period of seven years.

Finance

The next important question examined by the Commission is that of finding adequate finance for replanting. It has suggested in this connection of creation of a rubber replanting fund, out of the element provided in the price of rubber for replanting. It says that this element should be separately funded with the Rubber Board to the credit of each estate and withdrawals from this fund should be allowed only for the specific purpose of replanting. In this connection, the Commission draws attention to the "tardy" progress in the matter of replanting, although financial provision for such a purpose was specifically included in the price paid to growers. It has, therefore, recommended that the amount which has been specifically included in the price structure for purposes of replanting, as well as that in the cess fund proposed to be used as replanting subsidy, should be placed in the rubber replanting fund of each estate and each holding in the case of holdings of over 15 acres. The Commission is of the opinion that, with an increase in the area of high-yielding trees, the replanting cess may be reduced from time to time. Holders of 15 acres and below should, it says, be made liable to pay only that portion of the cess which is intended to cover administrative research and other expenses of the Rubber Board, but not the element which is to cover the replanting subsidy. The Commission finds that there is no case for subsidy for replanting, except for those growers whose earnings leave no surplus for investment or are inadequate for their maintenance. Even in such cases, it says, controlled credit over a long term may in its opinion be far more useful than a charity grant.

Perhaps the most objectionable part of the Commission's recommendations, in respect of financing the replanting and new planting programmes, is its suggestion to levy a surcharge on the excise duties on tyre manufacturers of about 2 per cent. *ad valorem* to provide for a small holders assistance fund. The fund should be administered by the Chairman of the Rubber Board in consultation with the Committee of small holders. Another method of finding finance for replanting suggested by the Commission, is the reduction of dividends and managing agency commission, where they are on the high side. It says that its recommendations in this connection for tea and coffee, in order to increase the internal resources for replanting and meeting labour welfare costs, apply to rubber also.

The finances raised through the above sources will not be adequate to carry out a rapid programme of replanting smoothly. Additional funds will also be required by way of long-term loans for buildings, plant and machinery. The Commission recommends that the State Finance Corporations and the Co-operative Land Mortgage Banks of the States concerned should meet these needs. The State Finance Corporations should, it adds, appoint a panel of experts in consultation with the Rubber Board to scrutinise the technical aspects of the applications for loans. The Rubber Board, on its part, should have a Plantation Finance Committee to keep a close watch on the financial needs of the rubber industry.

Marketing

Referring to marketing of rubber, the Commission says that, as the large consumer-buyers in the market are only two or three, the sellers have often no option but to sell their better grades as lower grades. The large growers are in most cases able to sell their production without any difficulty regarding grading, while the small holders have to suffer loss arising out of such degrading of rubber. The suggestion made by the Commission to avert this loss is the stepping in of State-partnered co-operative societies which should undertake processing and marketing of small holders' production of latex. As there is no marketing agency for rubber, as in the case of coffee, the Commission feels that central marketing societies are necessary to collect latex directly and process it or collect the smoke sheets where primary multipurpose societies undertake processing. The marketing societies should, it is suggested, purchase the rubber outright and collect the charge for meeting administrative expenses and losses in marketing. When licences are granted to manufacturers for the purchase of rubber, a condition should be laid down that they should preferentially purchase rubber from these societies. These societies should be partnered by the Rubber Board and should have their warehouses and special grading inspectors.

The Commission has made some more suggestings for the absorption of all rubber produced without any loss to small producers. It recommends that licences granted for import of rubber should not be valid for imports of Grade I quality. It adds that the manufacturing industry should absorb the growers' output in proportion to the quantities produced, because the industry is benefited by the fixation of maximum prices for raw rubber. During seasons of higher production of rubber, the Commission further observes, the manufacturers should step up their purchases *quid pro quo* for the assured internal supply of rubber. The important manufacturing concerns should come to an agreement on this point. Otherwise, import licences should be issued to them on a quarterly basis proportionate to the quantum of production of raw rubber in the quarterly periods on the basis of a formula. At present, the maximum and minimum prices are fixed only on f.o.b. Cochin basis. The Commission feels that these prices should be fixed for other important marketing centres also, particularly Kottayam, as such will remove one of the obstacles in the way of a large number of small holders getting the minimum prices.

Small Holders

The Commission has devoted an entire chapter on the position of small growers and the need for helping them on a wider basis. A very large number of small holdings exist in the rubber plantation industry. While the minimum economic holding for a single tapper is four acres, the Commission finds that there are 23,364 holdings with an average of two acres and 1,948 holdings with an average of seven acres. Most of these small holdings are concentrated in the Kottayam district. Such concentration, the Commission feels, should facilitate the successful promotion of State-partnered co-operatives among them. Among the measures suggested by the Commission to help the small holders are: (1) fixity of tenures should be assured and rents on rubber lands should be frozen at the level existing before planting of high-yielding trees by the tenant; (2) besides maintaining a staff for pests control, the Rubber Board should establish a central seedlings nursery and provide instruction to small holders in less severe methods of tapping; (3) a chain of primary co-operative societies is needed to maintain smoke houses where latex of small holders would be converted into smoked sheets of uniform and better quality; (4) multipurpose primary co-operative societies should be formed to provide full finance for the crop, to implement the scheme of subsidies and assistance to holders of 15 acres and less and to introduce improved methods of rubber production and processing; (5) the Reserve Bank may consider permitting the formation of a special rubber co-operative central bank for the rubber-growing areas, as in the case of coffee; (6) State-partnered co-operative joint farming societies should be formed, as in the case of coffee, to provide long-term credit.

By joint farming, the Commission does not mean pooling of lands of small holders—cultivation in individual family holdings need not be disturbed—but removal of low-yielding trees, clearing of new areas, maintenance of nurseries, etc., on a joint basis. Thus, at the bottom there will be ordinary multipurpose primary societies and joint farming societies of small growers. These societies will be fostered by a central co-operative bank, a central supply society and a central marketing society.

Note of Dissent

In this note of dissent, the late Mr. K. G. Sivaswamy has suggested some more drastic measures than those recommended by the other two members. He has also favoured the undertaking of new planting by the State. In his opinion, there is no case for any scheme of new planting by estates, except in unavoidable circumstances when substitute areas have to be found in the case of abandonment of inherently unsuitable areas. An immediate ban, the note says, is necessary on new planting by the estate group pending investigation of unregulated expansion. Mr. Sivaswamy has also observed that there is absolutely no case for the expansion of sterling and non-Indian rupee companies and that there ought to be no new planting by these companies.

The note says that, even in spite of the difficulties in permitting new planting by estates, if the area of 25,000 acres suggested by the Commission for allocation to estates has to be brought under new planting, other methods should be devised to reach this target. It refers to the new industrial policy of the Government of India and says that new planting should be undertaken by Government bodies or the Government should take shares in existing companies which are permitted to undertake new planting on a large scale. It says, "all the new planting of 25,000 acres allotted to estates (by the main report) will have mainly to be undertaken by a Development Corporation in which Government holds 51 per cent. of the shares and the public the remainder. Private enterprise will have enough to do in replanting high-yielding trees in the existing area for which full assistance will have to be given by the Government."

FOREIGN TEA ESTATES IN CEYLON

Considerable uncertainty prevails over the future of foreign-owned tea plantations in Ceylon, because the members of the Ceylon Cabinet do not seem to be unanimously in favour of the suggestion to nationalise these estates. Three members have expressed differing views on the subject. Thus, the Minister of Lands considers it futile to adopt any policy which threatens to disturb the large tax revenue derived by the Ceylon Government from these plantations. He has even expressed the view that the estates are well managed and that the Government's energy ought not to be diverted by the issue of nationalisation from its main task of speeding up the economic development of the country.

As stated in our last issue, the Minister of Food and Agriculture is in favour of nationalisation of foreign estates, the terms of which are considered in plantation circles as confiscatory. Following the statements by these two Ministers, the Prime Minister has expressed himself against any precipitate action now on this issue. Addressing the Government Parliamentary Group meeting last week, Mr. Bandaranaike is reported to have stated that, though the Government was committed at the last general election to the nationalisation of foreign-owned tea plantations, no precipitate action was necessary. But this does not mean that the Prime Minister has devowed the suggestion of the Minister of Food and Agriculture who wants nationalisation.

As regards the terms of compensation in the event of nationalisation, the Minister of Food and Agriculture has suggested the payment of Rs. 920 or about £70 per acre for the highly developed and well managed estates. This sum is considered woefully inadequate, because it costs about £300 to open and plant the land with tea and bring it to maturity. According to Mr. W. H. Marr, Chairman of Messrs. James Finlay & Co., Ltd., a firm owning extensive tea plantations in the Island, the addition of the requisite buildings, factory, machinery, etc., on the basis of the present-day costs, would amount at least to another £150 to £250 per acre. In estimating the cost of tea plantations, therefore, he says, account must be taken of the full equipment. In his view, a new tea project cannot be undertaken today at less than about £500 per acre. By paying compensation of £70 per acre, if nationalisation is seriously thought of, the Government of Ceylon is doing more harm to itself, by cutting off all foreign investments which will be of considerable assistance to the future development of the Island.

EXPORT DUTY ON TEA CUT

The Government of India has fixed the price of tea, for the purpose of determining the export duty, at Rs. 3-15 per lb., as against Rs. 4-3 per lb. in force from 1st January 1957. At this price, the export duty during the current month will be As. 6 per lb., as against As. 8 per lb. levied during the previous month. With the announcement of the tea price for the purpose of levying export duty, the Government of India has again restored, after a lapse of two months, the old practice of mentioning the price and export duty thereon.

DEVELOPMENT PROGRAMME FOR INDIAN RAILWAYS

WORLD BANK MISSION COMMENCES ITS STUDY

A FOUR-MAN team of World Bank railway consultants, led by Mr. John E. Slater, arrived in New Delhi on 30th January last for a three-week intensive study of the programmes for the development of Indian railways and to determine the extent to which the Bank can help in their implementation. This is the result of the preliminary studies of India's economic programmes undertaken by the World Bank authorities which convinced them that transportation problems should receive top priority. This view has been specifically expressed by Mr. Eugene R. Black, World Bank chief himself, in a letter which he wrote to the Union Finance Minister, Mr. T. T. Krishnamachari, some months ago.

Mr. Black, in his letter dated 5th September last, it may be recalled, stated that the authorities of the World Bank "are struck by the extent to which the lack of adequate transportation facilities threatens to constitute a bottleneck in the country's economic development." To apprise the Bank of the precise problems of external finance in relation to India's economic plans, in general, and of transport, in particular, Mr. B. K. Nehru and Mr. P. C. Bhattacharya of the Government of India held a series of discussions with the Bank authorities which were concluded in November last. As a result of these discussions, in his letter dated 15th November last, Mr. Black promised the Bank's "early consideration" of four projects—the second expansion programme of the I.I.S.CO.; an initial loan in support of the railway investment programme; such additional projects in the field of transportation, notably ports and shipping as may, upon further investigation, prove suitable for the Bank's consideration and the Koyna and Rihand hydro-electric projects, the two new projects of the Damodar Valley Corporation and the expansion of the Trombay steam plant. He also indicated that the Bank's consultants on railways, Messrs. Coverdale and Colpitts, would visit India in January 1957 to advise the Bank on some aspects of the operations of the Indian railways and that their report "should provide a basis for a first railway loan under the second Five-year Plan."

Team of Experts

It is in accordance with this suggestion that the Bank has deputed a four-man team of experts, belonging to the firm of Coverdale and Colpitts. The experts are expected to spend about three weeks in India. They will study the operational aspect of the railway system, in general, and the schemes and projects for expansion of railway capacity, in particular. Questions of general economic nature, it is stated, do not fall within the scope of their study. Soon after high-level discussions in New Delhi, the team will leave for a country-wide tour of railway installations, including marshalling yards and workshops, various industrial and power projects, sites of the three steel plants, colliery areas and nerve-centres of railway movement. After a final round of discussions with the Railway Board on 21st February, the team is expected to leave for Washington to advise the World Bank. The Bank's decision, it is stated, is likely to be known by June next.

There is no doubt that the Bank's assistance will be of great value in the implementation of the development programme of the railways. Under the second Five-year Plan, the allotment to railways will amount to Rs. 1,125 crores. This is much lower than the original estimate of Rs. 1,480 crores, prepared by the Railway Board. The revised allocation, as is now well known, will not enable the railways to attain a capacity that will permit them to lift all the traffic that may be offered at the end of the second Plan. At the end of 1955-56, the railways had to meet an estimated demand for 120 million tons of traffic. The additional traffic that will be generated at the end of the second Plan is placed at 60.8 million tons, made up of coal 20 million tons, steel and raw materials 18 million tons, cement 5 million tons and miscellaneous traffic 17.8 million tons. Thus, the total traffic at the end of the second Plan will be about 180.8 million tons.

It is felt that, with the resources so far allocated for railway development, the railways will not be able to carry all this traffic and that the facilities provided by them may fall short of requirements by about 10 per cent. in respect of rolling stock and by about 5 per in respect of line capacity. Indeed, the shortage of railway transport may even be more acute than now feared, considering that, in certain quarters, it is believed that the overall increase in goods traffic may turn out to be more than the 60.8 million tons assumed for purposes of planning. As regards passenger services, the Plan provides for an increase of 3 per cent. per annum. This provision is also held to be inadequate. The Planning Commission itself has recognised that the provision now made "will not help much to relieve overcrowding."

Efficiency

Besides increasing the quantitative equipment of the railways, the authorities are also devising means to improve the operational efficiency. It may be interesting to note in this connection that, in 1955-56, the net ton-miles per wagon-day, a term followed internationally to measure the intensity of wagon usage, touched the new high of 541, as compared with the wartime best of 451 in 1942-43, the U.S.'s figure of 330 and the Canadian Pacific's 438. Wagon-miles per wagon-day, it is stated, are 48.49, as compared with 48.10 in the U.S. It must, however, be noted that the density of traffic is much greater on the railway system of this country than on railroads in most parts of the world. In the case of goods traffic, only the U.S., it is computed, can show a higher density. Thus, the net ton-miles per track-mile on the broad-gauge, over which 80 per cent. of goods traffic moves in this country, is 1.15 million, as compared with 1.33 million in the U.S., 0.67 million in W. Germany and 0.98 million in South Africa. In view of the high density of traffic which the railways have to carry and the fact that mere improvement in operational efficiency cannot do much to relieve the position appreciably, there is urgent need to increase the equipment of the railways to a level at which they would be able to make a substantial contribution in respect of the carriage of available traffic.

It is not known what specific projects the Bank will examine. But it is presumed that the Bank, in addition to making a thorough study of the contemplated lines of development, will make an appraisal of the foreign exchange component of the programme. Of the total outlay of Rs. 1,125 crores, approximately Rs. 425 crores, it is computed, will be required in terms of foreign exchange. The foreign exchange requirements for different programmes are: locomotives Rs. 81 crores; wagons Rs. 82 crores; rolling stock (special types) Rs. 125 crores and steel Rs. 137 crores—total Rs. 425 crores. Schemes for which World Bank loans are being sought, it is stated, relate mainly to the provision of additional transport capacity in the coal area and for serving the steel plants and projects. Among these projects are plans for electrification of the Asansol-Gomoh-Gaya-Moghalsarai, Asansol-Anara-Raj Kharswan-Rourkela and Raj Kharswan-Barajamda sections. Diesel or electric traction, it is believed, are particularly needed in these areas. Since electrification will take time, it is proposed to buy from abroad 100 diesel locomotives for early service on these sections. When electric traction is introduced on these routes, the diesel fleet can be diverted to service on other sections where engine capacity may be hard-pressed. Schemes for doubling tracks mainly in the coal and steel areas and in certain other areas, such as Ratlam-Godhra, Bina-Bhopal and Madras-Bezwada sections, construction of marshalling yards and improvement of signalling equipment are also stated to be among the plans that will be studied by the World Bank team.

PREVENTION OF RAILWAY ACCIDENTS

A number of suggestions designed to prevent accidents of the type which took place on 23rd November 1956 at Ariyalur has been made by the Commission of Inquiry which had been asked to investigate the causes of the accident and suggest safeguards against similar accidents in future. The Commission, the full text of the report of which has been published in the *Gazette of India Extraordinary* dated 19th January 1957, has taken to task the regional engineer in charge of the Trichi region where the accident occurred, the patrolman on duty at the time of the accident, the station master and the permanent way inspector and his assistant on duty. The accident has been traced to "unprecedented and unforeseen" flood in the river Marudayur which caused erosion or scour under and around the southern part of the bridge. The Commission has discounted the view that the accident was due to defective design and construction of the bridge and its abutments or was due to wrong location of the bridge.

As regards safeguards for prevention of similar accidents in future, the Commission has recommended that rules in the Railway Way and Works Manual should be rigidly observed and mere nominal compliance should be avoided. The rules in the Manual, it is suggested, should be amplified to include an appendix on river training and control of big and small rivers. The Railway Assistant Engineers and District Engineers, it is stated, should undergo a short course in river training. The other suggestions are:

(1) The foundations of abutments of bridges resting on screw piles should be strengthened and construction of rivetments or pitching of the river banks or margins on either side of the abutments to a sufficient length, should be at once undertaken. (2) On sections where railway quarters are not provided to patrolmen, at least two patrollers should be appointed for each beat from experienced gangmen, specially trained for the purpose. (3) The length of beat of patrollers should not exceed three miles. (4) Night patrolmen should have as part of their equipment a strong electric torch to enable them to observe the level of water and the strength of current flowing through the bridges or along the abutments. (5) Patrollers should be trained to take soundings, probings near abutments and piers to determine the depth of scour in order to decide whether trains should be slowed down or stopped and piloted over the danger point, and the selection of men for this work should be from people who can usefully function in this manner. (6) Stationary watchmen should be posted at the bridge during floods or heavy rainfall whether there is imminent danger to the bridge or not, until the flood water subsides and the water reaches the normal level. (7) In case of doubt, the patrolman should not allow trains to pass over bridges when the river is flowing at high velocity. (8) Signboards should be put at higher end of the bridges at adequate distance from the bridge. (9) The speed limit of the train should be restricted to 5 to 10 miles per hour over bridges whenever there is rise in the level or increase in the flow of water during monsoon. (10) Good glass should be fitted to the YP engines to make it possible for the drivers to see through the glass at a distance especially during rains. (11) Daily water reading should be taken at all important bridges during the monsoon and the register should be available for perusal by the superior engineering staff, at any time. The staff should be properly trained for the purpose. (12) The high flood level mark should be prominently marked on every bridge and a danger level mark below high flood level should be fixed by the engineering authority and marked in red. When the level is exceeded, the patrolman should be prepared to stop trains and pilot them if necessary. (13) Passenger trains should carry portable telephone instruments so that they can communicate with the nearest railway station in the event of trains being halted between stations by patrolmen.

It is to be hoped that the suggestions made by the Commission will receive the necessary attention from the authorities. The Government, on its part, has accepted the Commission's findings and has indicated that it "will, after due consideration, take such action as may be necessary on the various matters brought out in the report."

Several recommendations relating to conservation of steel and increased efficiency in the use of steel have been made by the Steel Session of the Commonwealth Standards Conference, which concluded its deliberations at New Delhi on 31st January. The Conference has recommended to the national standard bodies of the Commonwealth countries that information should be exchanged continuously on items which have an important bearing on steel economy. Delegates were of the view that co-ordination achieved through this procedure would greatly facilitate Inter-Commonwealth trade. The Session was attended by delegates from Australia, Canada, India, Pakistan and the United Kingdom. This was the first occasion when the Commonwealth Standards Organisations held a full session on steel. Mr. J. J. Ghandy, Chairman of the Structural and Metals Division Council of the Indian Standards Institution, and Mr. E. W. Senior of the British Iron and Steel Federation, were the Chairman and co-Chairman of the Session respectively.

Considerable interest, it is stated, was shown by visiting delegates in the pioneering work carried out in India on the formulation of higher efficiency standards for steel sections. It is expected that the new sections will mean a saving of 5 to 15 per cent. steel for the consumer. Steel sections conforming to this new standardisation would be produced in the new steel plants in the public sector and by the existing steel producers in India.

NEW PRODUCTS AND PROCESSES

Sealed Charge Car Battery

THE Golden Crompton car battery with a Factory Sealed Charge (F.S.C.), was introduced a short while ago by Crompton Parkinson. This feature means that motorists are assured of receiving an absolutely factory-fresh battery when they need a replacement, and that garages can have a new battery ready for use in as little as 30 minutes—instead of the 80 hours it takes to make an ordinary battery ready for service. The Factory Sealed Charge can be defined as a charge which is built into a battery during its manufacture and which, by the use of a special process and hermetic sealing, is retained until the battery is actually required for service. Only then would the seals be broken and the acid added so that the latent charge becomes active. The life of a battery commences as soon as it receives the first charge and, consequently, if a motorist buys a battery that has been charged and held in stock for months, the life he can expect from it on his car may be almost that much shorter. On the other hand, the Golden Crompton battery will be only half an hour old when it is put into the car and the motorist does, in effect, receive, without delay, a brand new undeteriorated battery which has been pre-charged at the factory with all the skill necessary to guarantee maximum life in service. In the "formation" stage in battery plate production the sets of positive and negative plates are immersed in electrolyte and an electric current passed through them for many hours. This process changes the chemical composition of the plate pastes; that on the positive plate is changed to lead peroxide, and the grey oxides on the negative plate are converted to metallic lead in a porous or spongy state. At the end of this formation process the plates are in a charged state, but upon being dried the negative plate loses this charge, and the finished battery has to go through a lengthy charging process again before it can be used. The plates in the Golden Crompton battery, however, go through a special process after formation to seal in them all the power of the original formation charge. In the finished battery this power is released for use as soon as the electrolyte has soaked into the plates. This soaking has progressed sufficiently far by the end of half an hour to enable the battery to be put into immediate use.

New Fodder Cutter

An Austrian engineer specialising in the field of mill construction, has developed a new type of hammer mill which has already yielded excellent results in practical operation. With this type of mill any kind of fodder can be cut. The customary types of hammer mills are superior to all other mill systems, when processing hard, brittle and dry material, but when cutting soft, damp or viscous types of grains such as barley and oats, clogging occurs very frequently which interrupts smooth operation. In this newly designed mill a strong air current is produced which carries the mash away from the sieve towards the outlet. The clogged material is thus disposed of during the operation and the mill cannot be fouled nor is interruption of full power operation necessary. The new machine is the only type of hammer mill fit for cutting up soft, light-weight, tough and damp material, and has such an astonishingly high output that it can process, for instance, 3,000 kg. of maize per hour or 1,000 kg. of oats. The mill has several exchangeable accessories enabling it to operate as bone, hay and fruit mill, or as beet cutter, cabbage cutter, fruit masher, straw cutter, cutter of green fodder for silos, etc. Maintenance and handling of the new mill are very simple and very little space is required for its installation.

New Type of Nuclear Reactor

What is claimed to be a new type of experimental nuclear reactor furnace, which is said to combine the advantages of a fast reactor (which has no moderator to slow down the atomic particles which keep the nuclear fire burning) and a conventional thermal, or moderated reactor has been developed by the U.S. Argonne National Laboratory. In the new design a fast reactor fuelled with enriched uranium is surrounded by what is virtually a second reactor whose uranium fuel rods are immersed in water. In the case of this second reactor furnace the water acts as a moderator. The operation of the inner fast reactor can then, it is claimed, be controlled simply by controlling the operation of the second outer reactor furnace. This outer reactor furnace is built up of a series of sections each one of which is, when on its own, too small to sustain the burning reaction in the uranium fuel.

Heat Resistant Plastic Metal

A new type of heat resistant plastic metal which can, when set, withstand a compression force of over 5,000 lbs. per square inch at temperatures of up to 400 degrees has now been developed. The material, which can be moulded into diverse shapes by pouring it into a mould while it is in its liquid form, contains approximately 80 per cent. of metal and 20 per cent. of plastic material, together with a hardening agent. The material hardens rapidly after pouring and finished parts can, it is claimed, be produced within one to three hours after the pouring. The metals used in the compound are powdered aluminium and steel and the final moulded product is a light aluminium-like material, which can be machined, or cut, with normal metal-working tools.

POWER ENGINEERS IN CONCLAVE

SEVERAL IMPORTANT PROBLEMS DISCUSSED

By R. P. Aiyer

WHEN the first All-India Power Engineers Conference met in New Delhi in February 1949, most of the major river valley projects were in the offing and, consequently, discussion largely centred round administrative and legal problems which then confronted the electric supply industry both in the public and private sectors. In contrast, in the second All-India Power Engineers Conference, which met in Bangalore during the week commencing 20th January 1957, the accent was on development, and how best power engineers and administrators could accelerate the pace.

Problems

The inaugural address by the Union Minister for Irrigation and Power (which in the unavoidable absence of the Minister was read out by Mr. A. B. Shetty, a Senior Minister of Mysore) set the tone of the Conference. The address underlined the leeway the country had to make in electricity generation and utilisation. With the country's hydro potential estimated at 35 million kw. and non-coking and steam coal resources estimated at 40,000 million tons, power resources could meet the country's requirements "for some decades to come." Nevertheless, the Atomic Energy Department were investigating the possibility of setting up a nuclear power station "at a suitable location" in the country. Unless the rural population received electricity supplies, the benefits of power development would not have been achieved by the country at large. With only 6,000 villages out of 560,000 electrified so far (a mere 3 per cent.), the problem of rural electrification is stupendous, and, as these schemes are not usually self-supporting, "some kind of direct or indirect subsidy has to be thought of." The past record of the power engineers is creditable and achievements of a much higher order awaits them in the future.

The Institute of Science, with its vast *campus* and massive structures, offered a fitting setting to about 140 delegates, representing all sections of the electric supply industry (both the public and private sectors) and connected Ministries and Government Departments, to a week-long wrestling with 42 papers, 16 resolutions and numerous visits to nearby industrial establishments.

Immense Strides

The period 1949-57 is spanned by eight short years, but the strides the country has taken in the field of electric development have been immense. The D. V. C. has marched ahead with the Bokaro thermal station and some hydro development; the Hirakud Dam has been completed; the Bhakra-Nangal project has turned the corner; the high efficiency Trombay thermal station of Tatas has commenced feeding power to the Bombay-Poona inter-connected system; the Chola thermal extensions have been completed; the Sabarmati station of the Ahmedabad Electricity Company has reached the 150 M.W. mark, with more to follow; the Calcutta power system and many others in the country have expanded to take on growing obligations; the Neiveli lignite project has come to be regarded as a reality; the possibilities of the giant Sharavati project loomed large; the long-awaited Koyna project has been sanctioned, and many other schemes, both major and minor, have begun to yield results or are on the eve of doing so. These developments were reflected in the tone and tempo of the discussions at the Conference, more especially as the power systems in the country will have to attune themselves to the responsibilities of facing up to doubling up of generating capacity, in the country every five years for the next three five-year Plans at least.

Future Development

The second Five-year Plan period visualised addition of hydro plant to the extent of 2.2 million kw. with sizable expansion in thermal generation to be followed by the third Five-year Plan envisaging the establishment of additional generating capacity of eight million kw. In this context, outspoken criticisms bearing on bottlenecks in development reverberated through most of the discussions.

Planning is a continuous process and to be sustained must be backed up by timely investigations. The Conference, therefore, had no difficulty in calling upon State Governments not to divert funds earmarked for investigation of schemes for other purposes and for establishing suitable special organisations for the purpose.

Electricity Boards

The lukewarm attitude of certain State Governments to constitute Electricity Boards under the Electricity (Supply) Act, 1948, has been a sore point, and it was, therefore, with relief that the Conference heard the announcement that all States would establish Electricity Boards. This would resolve some of the difficulties encountered in the administration of power projects.

River Valley projects with multi-purpose benefits had their own crop of troubles. Such projects, it was thought, could best be executed by Control Boards. Whether personnel from the electricity industry should be accorded representation in such Boards in future will largely depend upon the experience of the Koyna Control Board where one representative of the industry has a seat.

Co-ordination

The need for tapping the hydro resources, which otherwise would go waste, has largely governed the country's power development plans, but the Conference well saw the need for co-ordinated development of hydro and thermal power for securing the optimum benefit from the country's available resources. The river systems of the country have already been surveyed, and reports, correctly dubbed as "River Valley Bibles," are available dealing with the following regions.

Ganga Basin.	West Flowing Rivers.
East Flowing Rivers.	Rivers of Central India.

It now remains for the Central Water and Power Commission to survey suitable locations of large and efficient thermal stations, of course taking into account expansion of existing efficient stations.

Regional Emphasis

With the coming into being of the U. S. Tennessee Valley Authority, the phrase "regional development" has come into vogue. Regional development, as distinct from development of areas demarcated by artificial State boundaries, has much to commend itself, in that harnessing the resources of a river for the entire valley dominated by the waterway is a logical process. Such zonal development should secure the best utilisation of natural resources, and will have the additional merit of overcoming linguistic jealousies engendered by the creation of States based on languages and forced by historic necessity. This consummation has been brought nearer by the Conference creating a representative Technical Committee to plan power development on a zonal basis.

Rural Electrification

The Herculean task inherent in furthering rural electrification dominated a good portion of the Conference proceedings. It was a decade ago that Mr. N. V. Gadgil, the then Union Minister for Works, Mines and Power, spoke of "electric light and radio in every home." The country has had significant electric power development since, but, with only 6,000 villages electrified so far, only the outer fringe of the problem has been touched. Where could one rest the blame? It is the magnitude of the problem, which carries within itself the limitation for development. Even in the greatest advanced country like the U.S.A., subsidy to sustain rural electrification is the order of the day. Then, what of India, the villages of which require more urgently such facilities as improved sanitation, protected water-supplies and all-weather roads? The Conference, therefore, had to recognise the stark reality that subsidy in one form or another is essential if extensive rural electrification is to be accomplished.

Industrial Base

Rural electrification to be of some economic significance must be connected with development of cottage, small-scale and light industries so as to promote employment opportunities. Mere lighting of the village road or giving supply to the village headman for a couple of hours' consumption for light would not meet the situation. Siting of some of the light industries in the rural areas will offer base loads for the rural power systems, thus making them self-

(Continued on page 286)

INSURANCE OF ATOMIC RISKS

U.K. AND U.S. GIVE CLEAR LEAD

IT is always necessary that an insurer should be alive to all the new developments in science and technology. An insurer with a closed mind hardly serves his cause. He must for ever be prepared to underwrite new risks which the progress of science and its applications are continually throwing up. One such risk is that associated with the development of atomic energy and the numerous possibilities of its application. The U. K. and the U. S. have now given a lead in the sphere of atomic insurance. Insurers in these two countries, it is stated, have now clearly made up their mind to underwrite atomic risks.

Insurers in both the U. K. and the U. S. have been quick to visualise the immense possibilities in the development of atomic energy and the vast scope for the coverage of risks which such development implies. Many countries, particularly those which, like Japan, are short of coal, are interested in developing nuclear power stations, while nearly all countries are examining the scope for the application of by-products of atomic power for peaceful purposes. Among the fields in which the application of atomic energy seems to promise quick results, mention must be made of shipping. It would appear that the relatively high cost of nuclear power would not stand in the way of the development of nuclear-powered vessels. This is because such vessels carry several advantages. In the first place, they would save the space which steam vessels have to reserve for carrying fuel. Secondly there would be no re-fuelling problems, so that their turnround would be better than in conventional vessels. This respresents an instance of the possibilities of commercial exploitation of atomic energy with great profit.

Atomic Risks

Although considerable progress has been made in the acquisition of the knowledge of atomic energy and its application, the knowledge of the risks involved in the development and uses of atomic power is somewhat limited. Some of the important questions are : What are the risks of an atomic explosion ? How dangerous is such an explosion ? Or, what are the risks of a "runaway" nuclear power station? What are the risks in transportation of radioactive isotopes. Unfortunately—rather fortunately—there is little information on which an actuary may base the assessment of risks, for the simple reason that such accidents have not so far taken place in any country. Nevertheless, it is believed that the risks could be held within bounds through the adoption of an elaborate system of safety devices. Further, since the practice is to locate nuclear power stations only in sparsely-populated areas and such stations require relatively small manpower to operate them, the risks to which life and property are exposed as a result of nuclear explosion need not be regarded as particularly great.

These considerations have encouraged the British and American insurers to enter the field of underwriting atomic risks. In the U.S., three insurance syndicates have been formed to provide personal liability and property damage insurance in the atomic energy field. The British insurance market, it is stated, is now prepared to undertake the insurance of privately-owned nuclear reactor furnaces and atomic power stations both in the U.K. and abroad. Among other countries which have taken a lively interest in atomic insurance, mention must be made of Sweden, where an Atomic Insurance Pool has been formed for the insurance and reinsurance of risks connected with the production of atomic energy.

Explaining the arrangements which have been made in the U.K. in the sphere of atomic insurance, the correspondent of the London *Financial Times* says that overall insurance cover for atomic power stations, which cost £30 million to £40 millon, and for third-party risks can be arranged through the British Insurance (Atomic Energy) Committee, which has been formed under the auspices of the British Insurance Association and Lloyd's to represent the whole British insurance market in the field of atomic energy. At the same time, the U.K. is prepared to handle higher liability limits than the $50 million (nearly £18 million) ceiling for any claim for one accident fixed by U.S. insurance syndicates. Although many special problems of insurance and atomic energy have yet to be worked out such as the feasibility, or not, of loss of profits insurance due to the failure of a reactor in an atomic power station, British insurance interests, it is stated, are satisfied that it is in general easier to overestimate rather than to underestimate the risks involved in the development of nuclear energy and in particular, of nuclear power.

Safety Record

The exceptional safety record of the operation of experimental nuclear reactors in both the U.S. and the U.K.—where the powerful plutonium-producing reactors at Windscale, Cumberland, have been operated without serious failure for seven years and the BEPO reactor at Harwell for nine years—has given U.K. insurers a confidence in assessing safety factors concerning reactors that no amount of scientific data could equal. Against this safety record, however, must be set the lack of a code of practice for handling reactors in the U.K. A committee is trying to formulate such a code.

Insurance rates for plants involving nuclear reactors, according to the correspondent, are not likely to be vastly greater than those for other plants of equal value. While it is not considered that there is any great risk of catastrophe in the case of nuclear power, insurance rates would probably be affected if there were a group accident and sickness scheme in the neighbourhood. At the same time, several special risks, it is stated, are encountered in the atomic energy industry. These include the problem of radioactivity which could not only cause physical harm to many people, if accidentally released into the atmosphere, but also cause serious losses by making it inaccessible to repair crews for long periods of time. The handling of radioactive isotopes in industry and medicine, which is already widespread, is being treated by U.K. insurance companies as a normal risk.

Although India is engaged in the development of atomic power, insurers, as a class, do not seem to have evinced any special interest in the possibilities of covering the risks involved in the generation and use of atomic energy. Perhaps, this is because no great headway has been made in the use of atomic power. It is also due to the fact that the Indian insurance industry, at its present stage of development, would not be equal to the immensity of the task. But in insurance, no task can be immense, thanks to the facility of reinsurance. In any case, there can be no excuse for not studying the rich new fields offered by atomic insurance. The least that they could and should do is to undertake a study of the problem involved in atomic insurance. In this task, it is to be hoped they will receive the co-operation and guidance of the British Insurance (Atomic Energy) Committee which is actively studying all aspects of the problem.

SOCIAL SECURITY IN THE U.S.

The effect of the recent amendments made in the U.S. in respect of the Social Security Scheme is to widen the scope of the Scheme and to liberalise the provisions of eligibility. Thus, old-age and survivors' insurance has been extended to cover more than 200,000 lawyers, dentists, osteopaths and other self-employed professional groups, and only doctors of medicine remain excluded. Some 600,000 additional self-employed farmers are now covered, thanks to a liberalisation of the method of computing farm income and a redefinition of certain types of income formerly classified as rentals or as net income from self-employment. The coverage test for agricultural employees has also been modified; at present, such workers are covered if they receive cash wages of $150 or more a year or perform agricultural labour for cash wages on 20 or more days during the year. Finally, additional categories of minor Government employees now come within the scope of the scheme.

The social security amendments lower from 65 to 62 years the age at which women may qualify for old-age and survivors' insurance benefits. Women eligible for benefits as widows or dependent parents may receive full benefits at the age of 62. The benefits paid to insured women workers and to wives of insured workers, however, are subject to reduction if claimed between the ages of 62 and 65. The reduction for a retired woman worker is 5/9 of 1 per cent. and that for a wife 25/36 of 1 per cent. for each month during which the benefit is drawn before the recipient reaches the age of 65. Such reduced benefits continue to be paid after 65 as well. Disabled children may henceforth receive children's benefits regardless of their age, provided they became totally disabled before the age of 18.

The amendments provide for the first time for the payment of disability insurance benefits to totally disabled workers. To qualify for such benefits, workers must be between the ages of 50 and 65 years, have served a six-month waiting period after the onset of the disability, be fully and currently insured and have had 20 quarters of coverage out of the preceding 40. To be considered totally disabled, workers must be unable to engage in any substantial gainful activity by reason of a medically determinable physical or mental impairment which can be expected to result in death or to be of long-continued and indefinite duration. Disability shall, in general, be determined by State vocational rehabilitation agencies, which are also to provide rehabilitation services to the workers concerned. Disability insurance benefit amounts will be the same as the old-age insurance benefit would be if payable at the same time. Benefits are not provided, however, for the dependants of a disabled worker. There will be no earnings test, but workmen's compensation or other federal disability benefits received will be deductible. Deductions will also be made if a beneficiary refuses rehabilitation without good cause.

INSURANCE OF AIRCRAFT

Some light is thrown on the insurance of aircraft of the Indian Airlines Corporation by the Estimates Committee, in its forty-third report (1956-57), which deals with the Corporation. The overall question of laying down a uniform policy in respect of insuring property belonging to State-controlled undertakings is under the consideration of the Union Ministry of Production. The Corporation, however, is adopting a policy of both self-insurance and outside insurance. The self-insurance scheme operates in respect of 66 Dakotas insured to the value of Rs. 1 lakh each, 12 Vikings to the value of Rs. 2.5 lakhs each and Twin Beach to the value of Rs. 1 lakh. The Corporation insures with outside insurers six Skymasters to the value of Rs. 28 lakhs each. Other forms of insurance effected by the Corporation are: (1) Passenger legal liability (applicable to passenger aircraft only)—Rs. 50,000 per passenger including Rs. 2,500 for baggage liability; (2) freight legal liability: Rs. 50,000 per aircraft, excluding Twin Beach TV-ANJ, (3) third party legal liability: Rs. 10 lakhs in respect of each Skymaster, Rs. 5 lakhs for each Heron, Viking and Dakota and Rs. 2.5 lakhs for Twin Beach VT-ANJ; (4) mail liability: Rs. 1 lakh in respect of all claims arising out of any one event and any one aircraft.

As regards passenger insurance, the Committee understands that, so far as international services are concerned, the Warsaw Convention fixes legal liability on the international air transport companies for an amount of 120,000 gold francs in respect of each passenger. But this liability does not extend to the domestic airlines. The Committee considers that the matter of providing insurance cover to the passenger should be considered by the Corporation. The fear has been expressed that introduction of compulsory insurance may give an impression to the public that the safety factor has gone down. But the Committee feels that the safety factor would be judged by the travelling public not by introduction of compulsory insurance but by other independent means. It also feels that it would be advantageous if there was a system by which on payment of a certain sum to the Corporation the passenger would be deemed to be covered by an insurance. It recommends that this question be considered in consultation with the Life Insurance Corporation and a suitable system evolved in consultation with the insurers to provide for a certain cover for every passenger.

THE MYSORE SUGAR COMPANY LTD.

MR. S. MUNINANJAPPA'S SPEECH AT ANNUAL GENERAL MEETING

RECORD PRODUCTION EXPECTED IN NEXT SEASON

THE Twenty-third Annual General meeting of the Mysore Sugar Company, Limited, was held at the Registered Office of the Company at Bangalore on Monday, 28th January 1957. The meeting was attended by a large number of shareholders and was presided over by Mr. S. Muninanjappa, B.A., B.L., I.A.S., Chairman and Managing Director of the Company. Moving the adoption of the report and accounts, the Chairman made a speech reviewing the working of the Company. The following is the full text of the speech.

"GENTLEMEN,

"I have great pleasure in welcoming you to the twenty-third annual general meeting of the shareholders of the Mysore Sugar Company, Limited. The report of the Directors and the audited statements of accounts for the year 1955-56 have been in your hands for some time and, with your permission, I shall take them as read.

"Many important events have taken place since we last met. The administrative map of the country has vastly changed and nowhere is this change more noticeable than in our own State of Mysore. Greater Mysore, with its area and population almost doubled, now ranks as one of the leading States of India with vast industrial potential, considering its rich forest and mineral resources and the newly-acquired sea coast. Speaking with reference to the sugar industry, the new State of Mysore has within its territory four sugar factories and another four or five are expected to come up in the course of a year or two. The State will thus be fully self-sufficient in regard to sugar.

"The year under report saw the enactment of the mammoth piece of legislation dealing with the law and procedure relating to the working of joint-stock companies. Of particular significance to your Company is the creation, under the Companies Act, 1956, of what is known as 'Government Companies,' that is to say, companies in which more than 50 per cent. of the equity share capital is held by Government. Needless to say that your Company in which the Government of Mysore hold 55 per cent. of the shares, comes under this category and is, in many respects, unique among Government companies. An important provision affecting Government companies is that the auditor of such a company is to be appointed by the Central Government on the advice of the Comptroller and Auditor-General of India and the audit report on the affairs of the company is to be placed before Parliament and the State Legislature. It is on account of this that the usual business of appointment of auditors does not find a place in the agenda for today's meeting. This and several other provisions of the new Act render it necessary to make large-scale alterations in the Articles of Association of your Company. Your Directors have thought it best to adopt an entirely new set of Articles, conforming to the requirements of the Act, and they hope to take an early opportunity of convening an extraordinary general meeting for this purpose.

A Favourable Year

"The year 1955-56 was, on the whole, a favourable one for the sugar industry, free from any crisis of the nature to which it had been accustomed in the past. Sugar production reached an all-time record of 18.6 lakh tons, as compared to 15.9 lakh tons in the year 1954-55 and 10 lakh tons in the year before that. Consumption too has risen to 19 lakh tons and promises to go up higher. This is as it should be, if we bear in mind that, in order to meet this growing demand, the target of sugar production in the second Five-year Plan is put at 22.5 lakh tons. To achieve this production the installed capacity of the industry is being raised to 25 lakh tons by the licensing of a number of new units and the expansion of several existing ones. The major part of the expansion programme is confined to the Deccan and South India which enjoy natural advantages for the development of the industry. This should go a long way to meet the temporary shortages that frequently occur in the South, which is at present deficit in sugar.

"If all the factories licensed come up and when the anticipated benefits from the various development schemes begin to materialise, it may not be surprising if the actual production goes far above the target, creating new problems for the industry. Even at the present moment an important problem that is facing the industry is the large surplus stock which it is burdened with. Fortunately, the present is an opportune time for exporting Indian sugar to neighbouring foreign countries and it is a matter for gratification that the Government of India have acted quickly in releasing an initial quota of 50,000 tons of sugar for export through the Indian Sugar Mills' Association. This timely gesture of the Government will not only afford some relief to the industry but will also bring in valuable foreign exchange which the country is in dire need of at the present time. It is to be hoped that this experiment will prove a success, thus paving the way for larger exports in the years to come.

Crushing and Output

"I shall now briefly review the working of your Company. As will be seen from the report and accounts placed in your hands, the year was a normal one and the results of working were satisfactory. The factory at Mandya went into production for the 1955-56 season on 21st July 1955 and was shut down on 24th April 1956. The duration of the crushing season was 279 days which, as usual, was the longest for any sugar factory in India. The quantity of cane purchased and crushed during the season was 347,523 tons and the output of sugar was 34,798 tons, with a recovery of 10.14 per cent. These figures, I am glad to say, compare favourably with the results obtained during previous years. The year's crush was the second highest in the history of the factory, while sugar output, at 34,798 tons was the third highest.

"The total quantity of sugar sold during the year was 33,540 tons and the gross realisation therefrom was Rs. 2,78,88,375, as against Rs. 2,16,17,846 realised during the previous year from the sale of 26,957 tons of sugar. Trading conditions were throughout steady and the price of sugar ruled slightly higher than that of the previous year. But there was a drop in net realisation, consequent on the higher rate of excise duty that came into force from 1st March 1955. While there is no control as such on sugar, release of stocks from factories continues to be controlled by the Central Government. This system has been found to work satisfactorily, for, besides enabling Government to have a hold on production, the regulated releases have a steadying effect on prices.

Cane Price

"The price of sugarcane continued to be Rs. 39-2-1 per ton delivered at the factory gate and Rs. 35-11-8 per ton delivered at rail centres. Over and above these prices, fixed by the Government, there is now a tendency on the part of the cane suppliers to expect an additional price. In my address to you last year I referred to this matter and stated that the whole question of determining the share of the cane suppliers in the price realised for sugar was under the examination of an expert committee. The publication of the report of this committee is awaited with interest.

"Meanwhile, a request from the cane growers of Mandya for an extra price for cane supplied during 1954-55 was settled, as a result of negotiations, by granting an additional price of Rs. 3 per ton. The amount paid on this account was Rs. 11,19,983 and this was met by utilising a provision of Rs. 4 lakhs made in the accounts for that year and by charging the balance to the accounts of the year under report. Similar demands for additional cane price in respect of subsequent years are likely to arise, causing a serious burden to the industry. The days of high sugar price are now gone and, with prices ruling steady and showing a downward trend, there may be little or nothing to pay by way of extra price.

"A more rational method of remunerating cane suppliers would be to relate cane price to the percentage of sucrose recovery. Such a system would create the necessary incentive in the growers to produce cane of high sucrose content and, at the same time, ensure supply of good cane to the factory. The implementation of this system is, however, beset with certain practical difficulties. In this context, it may not be out of place, if I draw attention to a disparity between conditions in Mysore and those in the neighbouring States, which has a bearing on the application of any formula for calculation of extra cane price. While factories in Mysore have to pay cess on sugarcane at a rate of Rs. 6 per ton, which is the highest rate prevailing in any part of India, the rate of cess in Madras is only Re. 1 per ton of cane, while in Andhra it is Rs. 2. This accounts for a difference of Rs. 40 to Rs. 50 per ton in the price of sugar. The existence of such widely different rates of cane cess not only results in unequal competition but also vitally affects the ability of factories to pay extra price for cane.

Disposal of Alcohol

"The working of the Company on the distillery side continued to be satisfactory, though offtake of alcohol remained far behind production, necessitating occasional suspension of manufacturing operations. The problem of disposal of alcohol is becoming more and more difficult and the situation has been aggravated to some extent by the recent drastic reduction in the quotas of denatured and rectified spirits to licensees in the Mysore State. Your Directors are exploring the possibilities of entering into arrangements with large-scale consumers of alcohol for industrial purposes, as they are convinced that the only permanent solution for the satisfactory disposal of alcohol lies in its use in chemical industries, both existing and those expected to come into existence in the near future. In anticipation of this demand and, with a view to dealing with the large output of molasses, steps are being taken for the expansion of the distillery, so as to increase production from the present installed capacity of 9 lakh gallons to 12 lakh gallons per annum. The requisite licence for this expansion scheme has been secured from the Government of India.

"The accounts that have been placed in your hands are so elaborate and informative that there is hardly any need for me to dwell on them or offer any explanation. The figures give a complete picture of the working of the Company on the manufacturing, trading and management sides. The gross profit from trading during the year under report was Rs. 23,51,487-8-10, as against Rs. 19,79,593-14-6 during the preceding year. The improvement in earnings is due to the larger quantity of sugar sold and also to the lower production cost arising from better recovery, as compared to the previous year. The net profit for the year, after meeting administration expenses and after making provisions of Rs. 5,29,008-6-5 for depreciation and Rs. 5,00,000 for taxation, stands at Rs. 9,11,573-11-4. Including the surplus of Rs. 2,90,339-11-11 brought forward from last year's account, the total amount of profit available for distribution comes to Rs. 12,01,913-7-3. True to the tradition set up over a long period of years in the past, your Directors recommend, as usual, a dividend of 20 per cent. absorbing Rs. 4,35,856. As shareholders are aware, a dividend tax is now in force and the burden to your Company on account of the proposed dividend would be Rs. 70,827.

Compulsory Deposit

"Here I cannot help referring to the provision contained in the recent Finance Act making it obligatory on the part of companies to deposit with the Government of India a portion of their accumulated reserves and surplus. A considerable proportion of the reserves of our Company has already been ploughed back for financing expansion and development schemes undertaken from time to time in the past. For an undercapitalised company like ours, and having regard to the nature and magnitude of our business, the reserves provide the much-needed working capital. Even under present conditions, borrowing has become a regular feature in our finances, and we may have to resort to further borrowing in order to keep the requisite deposit with the Government.

"It is not proposed to make any additions to the reserves, but a sum of Rs. 5 lakhs is proposed to be set apart to form the nucleus of a fund for award of gratuity to employees by way of retirement benefit, over and above the existing provident fund. After these appropriations, there will be a surplus of Rs. 2,63,106-11-3 which it is proposed to carry forward.

"Labour relations during the year were not as happy as could have been expected in a company like yours with a record of fair treatment towards workers. On 13th March 1956 the workers resorted to a total strike, which paralysed sugarcane crushing operations for a couple of days. The strike itself was called off after 24 hours, following a settlement conceding some of the demands of labour. Recently, some fresh demands have been put forward and they are likely to be referred to arbitration.

"As I hinted when I addressed you on the last occasion, the current year does not promise to be a normal one for your Company. Sugar production is expected to suffer a setback due to insufficiency of cane resulting from the partial drought conditions that prevailed in Mandya in 1955. But a bumper cane crop has been raised in 1956 and we may look forward to a record production in the coming season. The plant has been augmented and balanced in many respects, though the goal of 2,000 tons crushing capacity can be maintained only after the installation of an intermediate cane carrier and mechanical unloading devices. Early action is being taken to overcome these deficiencies so as to ensure steady and comfortable working of the plant at 2,000 tons of cane per day.

Manufacture of Paper

"In this connection, I may make a reference to the proposal for the manufacture of paper at Mandya out of bagasse, the fibrous waste matter turned out by the sugar factory. Though bagasse is a valuable raw material for manufacturing paper, to the sugar factory it is a convenient fuel and is almost indispensable when it is remembered that Mandya is not favourably situated with regard to supply of alternative fuel like coal. An enterprising firm interested in starting this industry at Mandya has now come forward to undertake the responsibility for supply of coal and also to bear the cost of conversion of the sugar factory boilers so as to adapt them for burning of coal instead of bagasse. Your Directors are examining the offer carefully from all angles and hope to take an early decision on the important matter of release of bagasse for paper manufacture and the terms of such release. I need hardly assure you that the interests of your Company will be fully safeguarded in any arrangement that may be entered into with the promoters of the paper factory.

"Before concluding, I wish to take this opportunity to express my warm thanks to my colleagues on the Board for their valuable advice and co-operation. The Government of Mysore continue to give us their sympathy and support and we are grateful to them, as also to the various Ministries of the Government of India for their prompt assistance and guidance. The employees of the Company, from the General Manager downwards, have served the Company with loyalty and zeal which deserve appreciation."

• • • •

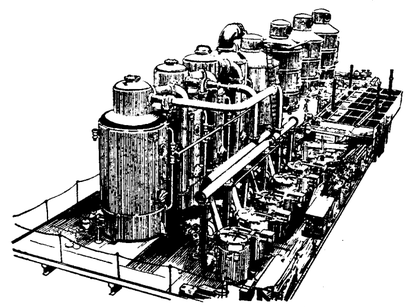
At the conclusion of the speech, questions were put by some of the shareholders eliciting information on various points and suitable replies were given by the Chairman.

After the adoption of the report and accounts for the year 1955-56, approval was accorded for payment of a dividend of 20 per cent. Mr. V. T. Krishnamoorthy, the retiring Director, was re-elected unopposed.

The meeting terminated with a vote of thanks to the Chairman.

V. M. LINGIAH,
Secretary.

BANGALORE, 29th *January* 1957.



Evaporators and Boiling Pans

sugar mill equipment to be manufactured in India

Texmaco has just concluded an agreement with Stork Werkspoor of Holland, world's leading designers and manufacturers of sugar mill machinery, for the manufacture of Evaporating Plants, Vacuum Pans, Crystallisers, Dryers and other equipment.
Texmaco, pioneer manufacturer of a wide variety of engineering products, again opens another chapter in the history of India's industrial development.

COPPER SHORTAGE FINALLY ENDED

CHANCES OF ITS RECURRENCE REMOTE

By Jack R. Ryan

THE copper shortage that finally drove prices of the metal to the highest level since the Civil War came to an end in 1956. And producers appeared convinced they could maintain a comfortable supply-demand balance at least through the coming year and probably longer. The Copper and Brass Research Association (New York) cited these factors in copper's future as making a serious recurrence of shortages seem remote.

Substantial increased capacity is expected at new mine facilities scheduled for completion by 1962, and further expansion could be undertaken, if necessary. Extensive exploration for new ore bodies continues. And three-year labour agreements concluded at all major United States mines in 1956 promise steady output from domestic sources.

"To the degree that copper supply can continue to keep pace with demand, corollary problems that have plagued the industry in the past—such as sudden price fluctuations or unusually high price levels abroad—will be eliminated," the Association said in an outlook report as the new year began.

Copper prices in the United States were the lowest in the free world early in 1956. The major domestic producers quoted 46 cents a pound, the highest since 1865—yet prices abroad ranged upwards from 54 cents—and much refined copper of foreign origin was attracted to Europe.

But then new copper came into the market from expanded operations at existing mines and from entirely new properties begun three to five years earlier. At the same time, automotive and other use of copper eased.

By the second quarter, it was becoming apparent that there would soon be more than enough copper to go around. Prices dropped everywhere, though not as much in this country as abroad.

Prices Lower

By the year-end, the United States producers' price of 36 cents was no longer the lowest in the world—it was the highest. Foreign prices were a few cents lower, and foreign producers were eager to sell their metal here. Overtime work schedules in American mines were discontinued. Government restrictions on copper exports were removed, and some metal authorities were predicting a further but modest price decline in the first quarter of 1957.

Nowhere, however, was there any evidence of any real concern that copper producers might develop top-heavy surpluses. Increasing population, higher personal incomes, rising consumer spending for durable and non-durable goods, and business expansion for plants and equipment all were expected, according to the Association, to give strength to the economy and, therefore, to copper.

In addition, major copper-using industries such as electric power and electrical manufacturing still were expanding. Utilities were anticipating more increases in electrical consumption, particularly with the spread of automation. And both the automative and overall construction industries were expected to show improvement.

One of the more dramatic newer applications of a copper alloy was in a bronze "curtain wall" to enclose a metal clad skyscraper—one that the copper industry hoped would become a prototype for similar uses in the future. Also, architect Frank Lloyd Wright used pre-oxidised sheet copper in the facade of a nineteen-storey building in Oklahoma.

A Vital Element

Copper was a vital element in the trans-Atlantic telephone cables that went into service last year, and in the particle accelerators—cyclotrons, bevatrons, and Van de Graaf generators—used in basic atomic research. The brass mill industry managed to extrude—by forcing metal through dies—shapes having larger cross-sections than had previously been thought possible. Integrally tubed sheet copper came on the market and was being used experimentally.

Metallurgical laboratories were conducting research on special property alloys made by adding more recently developed metals such as zirconium to copper. Hardened coppers obtained by bombardment with atomic particles were being investigated, and inquiries into the behaviour of copper alloys at temperatures down to minus 180 degrees Centigrade were under way.—*By Courtesy of New York Times.*

Free World's Copper Expansion

The copper mining capacity of the free world is scheduled to rise rapidly during the next five years. The table below, compiled by the authoritative Copper and Brass Research Association, shows how actual production in 1955 will be increased more than 30 per cent. by 1962 just by mine projects that are under way or have been announced.

The figures do not include excellent known prospects that could add more than 100,000 additional tons of capacity to the 1962 total if demand warranted.

(Thousands of tons)

Year	U.S.		Outside U.S.		Total	
	Capacity	Increase over 1955	Capacity	Increase over 1955	Capacity	Increase over 1955
1955	*1,014	..	*1,997	..	3,011	..
1956	†1,130	116	†2,183	186	3,313	302
1957	1,190	176	2,315	318	3,050	494
1958	1,226	212	2,391	394	3,617	606
1959	1,237	223	2,414	447	3,681	670

NEW PUBLICATIONS

Industrial Enterprises in India. By Dr. Nabagopal Das. Publishers: Orient Longmans, 17, Chittaranjan Avenue, Calcutta 13. Pages: 200. Price: Rs. 8.

THIS book, which was originally published in 1938, enters its second edition as an entirely new one. It attempts to study, within the brief compass of about two hundred pages, the legal and institutional framework within which industrial enterprises have to function in the context of the Five-year Plan and the new Indian Companies Act. It deals particularly with the problems of raising finance for industries and examines the role of the new financial agencies in fostering industrial development.

After a brief survey of the development of industries in India and a discussion of the general principles of financing industries, the author examines the system of industrial financing prevalent in a few Western countries. His conclusion is that, in view of the peculiar character of the financial and economic background obtaining in India, commercial banks cannot in practice and should not in principle attempt to meet the long-term capital requirements of industries. This is the traditional view, with which many modern bankers do not agree. The author relies on the British pattern and points out that, in the U.K., the relation between the British financial world and British industry had never been very close and the latter depended for its financial requirements on the extremely varied facilities and unrivalled financial machinery of the English capital markets. But even in England the growing needs of industry made the ordinary credit mechanism insufficient and special institutions like the Industrial and Commercial Finance Corporation and the Finance Corporation for Industry Ltd. had to be started. Even on the continent of Europe, where the German system of mixed banking has had the greatest influence, the need was felt for special institutions to cater to the long-term financial needs of industry. In India, therefore, the Industrial Finance Corporation and the Industrial Credit and Investment Corporation have to play a crucial role and this forms the subject matter of the third chapter.

After describing the managing agency system and its merits and defects, the author examines the new Indian Companies Act and its economic significances. The basic aim of the Act, Dr. Das points out, is to encourage and reasonably safeguard private enterprise in fields not marked out for the public sector. This indeed is a reasonable aim, but one only wishes that in practice also the aim continues to be one of healthy hedges rather than that of finding fetters for private enterprise.

Referring to the repeated charges against concentration of control and the growing size of industrial units, the author makes some pertinent remarks. He rightly points out that, in this age of atomic energy and automation, it is foolish to decry big industrial units. The really important issue is whether it can be usefully controlled and made to serve the general interest. An efficient government, armed with sufficient powers, he avers, could find no difficulty in doing so.

Controversial Ground

The author, however, is treading on more controversial grounds when, in the chapter entitled Savings, Investment and Capital Formation, he examines the factors inhibiting investment in the private sector and the effect of the taxation policy. The various causes listed by the Shroff Committee as preventing the flow of funds into industrial undertakings such as the threat of nationalisation, procedural difficulties and uncertainties, Government's labour policy and various forms of control and legislation are examined in this connection. The author's conclusion is that governmental policy is not detrimental to the growth of private investments. But he is able to cite only a negative proof to establish his case. A cursory glance, according to him, at the licences granted for starting new ventures or expanding existing ones shows that private enterprise has not been overwhelmed by the "so-called" adverse factors. This, of course, is an indirect tribute to the resilience and adaptability of free enterprise, but is no proof of the absence of inhibiting factors referred to by the Shroff Committee.

As regards taxation policy, Dr. Das quotes with approval the dictum of Prof. Colin Clark that, in a developing economy, the limit to taxa-

(Concluded from next column)

tion is more psychological than physical. But it should not be forgotten that a taxation policy which does not realise the limiting factor of the size of the national income and the effect on incentives of the tax measures is an unrealistic one. However, much the reformist may wish for the replacement of economic incentives with new kinds of incentives like the incentive of service and that of promoting the general welfare, human nature being what it is, a majority of men will continue to be motivated by the former.

Dr. Das's estimate of the future of private enterprise is, indeed, cautious. He associates himself with the oft-repeated remark that the destiny of private enterprise rests in its own hands. No intelligent man will deny that, in this era of the ascendancy of the common man, the future of private enterprise hinges to a large extent on the extent to which it can fit itself in the larger framework of the national economy and subserve the common interest. But the question is whether private enterprise will be allowed to play its legitimate role, or whether, on ideological grounds, the circumstances will be so devised as to give the dog a bad name as a prelude to hanging it.

The author, despite his official position as the Secretary to the Commerce and Industries Department of the Government of West Bengal, has tried to maintain throughout the discussion a scholarly objectivity and scientific detachment which contribute much to the value of the book.

TRENDS IN BALANCE OF PAYMENTS

STRAIN OF ECONOMIC DEVELOPMENT REFLECTED

DEVELOPMENTS in India's balance of payments position during the eight years from 1948-49 to 1955-56 reflects primarily the basic changes that have come about in the economy of the country. While the period covering the first four years of the period under review was characterised by inflationary pressures and shortages, the last two years were marked by accelerated economic development. Over the period, the level of imports came down from Rs. 766.3 crores in 1948-49 to Rs. 750.6 crores in 1955-56, whereas exports increased from Rs. 482.5 crores to Rs. 641.1 crores. In other words, import quantity index (1952-53=100) dropped—after touching for various reasons, the biggest level of 146 in 1951-52—from 135 in the first year of the period to 114 in 1955-56. At the same time, export quantity index rose from 106 to 115. But there was a decline in the terms of trade, as a result of the higher proportion of rise in import price index as compared with export price index, from 110 in 1948-49 to 99 in 1955-56. A very significant change took place in the composition of the trade also, chiefly in import trade. For example, among imports, those of food articles, which rose in value from Rs. 101.5 crores in 1948-49, to Rs. 133.9 crores in 1949-50, and to as much as Rs. 229.1 crores in 1951-52, came down to a mere Rs. 17.5 crores in 1955-56. At the same time, imports of machinery and iron and steel rose steeply, the former from Rs. 81.8 crores to Rs. 120.2 crores in 1955-56 and the latter from Rs. 12.9 crores to Rs. 66.5 crores. Among the exports, too, notable changes occurred in the export of cotton manufactures, tea, oils (vegetable) and others.

A Reserve Bank publication, entitled *India's Balance of Payments 1948-49—1955-56*, conveniently divides the period covered by the review into three periods. The characteristic features of the first period covering 1948-49—1951-52 were inflationary pressures and shortages. Exports rose continuously, reaching a record level in 1951-52, following the devaluation in September 1949 and the Korean war boom. The level of imports, though higher than exports, reflected wide swings from year to year as a result of a variety of factors, such as shortages of food and raw materials, strong inflationary pressures inherited from the Second World War, and changes in import policy. The high level of imports were particularly significant in the case of raw jute, raw cotton, food and machinery. Thus, a progressively rising level of imports (in terms of value) were witnessed in the two years following 1949-50, owing to price increases and to disinflationary policy adopted in 1951-52. In the final result, imports attained the highest level (Rs. 962.9 crores) for the whole of the post-war period in 1951-52. On the other hand, the value of exports during the first two years of this period was low, as compared with the latter half, mainly because of the substantial rise in prices in the latter period, especially in the prices of jute manufactures, hides, skins, cotton manufactures, etc. The upward trend in prices was due, first, to devaluation, and then, to a greater degree, to the Korean war boom. The value of exports reached the highest level at 117 (1952-53=100) in 1950-51. As a consequence of the net current deficit of Rs. 422.9 crores, and of certain extraordinary payments to the U.K. and Pakistan, the foreign exchange reserves declined substantially during the first period.

Recessionary Period

The second period covering the two years 1952-53 and 1953-54 was characterised by a slackening in the pace of economic activity abroad and a fall in demand and prices. Exports, therefore, declined during this period by 3.8 per cent. in terms of value and by 7.4 per cent. in terms of volume, as compared with the earlier period. Imports, too, declined and that to a greater extent than in exports. This was the result of several factors, chief among them being the impact of the recessionary tendencies abroad on the economic activity at home, overstocking of goods during the Korean war boom, official measures to counteract inflation at home, and the change-over from a liberal to a restrictive import policy. These factors, together with the increased output—agricultural and industrial—brought down the average annual level of imports by 18 per cent. in value and 25 per cent. in volume from that of the previous period. Besides the much smaller trade deficit caused by this trend, the net receipts by way of such invisibles as private donations and Government transactions also increased during this period from Rs. 31.7 crores in 1948-49 to Rs. 80.5 crores a year. As a result, the current account, excluding official donations, showed surpluses of Rs. 49.4 crores and Rs. 28.4 crores in 1952-53 and 1953-54, respectively. Receipts from official donations rose during the period by about Rs. 14 crores. There was, thus, a substantial addition to the foreign exchange assets.

The third period, covering the last two years, namely, 1954-55 and 1955-56, witnessed a recovery in economic activity at home and abroad. Imports, as well as exports, were substantially higher than in the previous period. The value of exports rose by nearly Rs. 100 crores over that at the end of the preceding period. The largest increases took place in vegetable oils, raw cotton and tea. Characteristically, the rise in imports was, once again, much higher, following the higher rate of developmental expenditure in the public sector and investment in the private sector and the controlled relaxation of import restriction. At the level of Rs. 750.6 crores by 1955-56, the imports stood, in terms of volume, 20 per cent. higher than at the close of the previous period. As a result, the trade deficit rose progressively to Rs. 109.5 crores. There was little change in the net receipts from invisibles, as compared with the preceding period. The current account, excluding official donations, showed small but rising deficits. Though official donations increased considerably during 1955-56, the foreign balances at the end of the year showed a slight recession over the two-year period.

During the period under review, a consistent outward movement of capital on private account was in evidence. Such movements for the entire eight-year period amounted to Rs. 92 crores, of which no less than Rs. 28.5 crores was exported in the first year. A large part of the outflow was in the nature of migrants' transfers after independence and not an ordinary capital movement. During the past four years, the outflow was of the order of Rs. 6.7 crores per annum.

Another important feature of the capital movements constituted the receipts from official loans which amounted to Rs. 84.6 crores in the first period. Of this, mention must be made of the U.S. wheat loan which accounted for Rs. 58.6 crores and the loans from the I.B.R.D. for another Rs. 21.4 crores. In the second quarter, again, the balance of Rs. 32 crores of wheat loan was drawn. In addition to this, the I.B.R.D. extended another Rs. 4.7 crores. Over the whole period, the total net receipts by way of loans in the official sector aggregated to Rs. 125.4 crores of which as much as Rs. 121 crores (U.S. wheat loan and loans from World Bank) helped to augment the resources for financing the first Plan.

Following the impact of heavy current deficits and extraordinary transfers, the country's short-term account position showed a worsening of nearly Rs. 860 crores during the first period. This, according to the review, reflects broadly the position of the country's exchange reserves. During this period the country has not only to draw from its reserves, but also borrow from the U.S. Government (Rs. 58.6 crores) and the I.M.F. (Rs. 23.9 crores). In the subsequent two periods, however, there was some addition to the reserves, despite a repurchase of Indian currency from the I.M.F. of Rs. 17.2 crores in the first period and Rs. 24.3 crores in the second period.

Position in a Nutshell

The Reserve Bank's report under reference sums up the position for the whole period as follows:

"For the eight-year period as a whole the current deficit, excluding official donations, amounted to Rs. 387.4 crores. This deficit would rise to Rs. 471.9 crores, if errors and omissions are also merged with this total. In addition, there was a private capital outflow of Rs. 92.1 crores and official long-term transactions (excluding loans) gave rise to a net payment of Rs. 405.0 crores, largely on account of partition settlements with Pakistan and purchase of pensions annuities from the U.K. The total outgo on current account, errors and omissions, private capital and official long-term transactions aggregated Rs. 969.0 crores. As against this, the combined receipts from official donations and official loans amounted to Rs. 223.4 crores. The net deficit requiring accommodation from official assets and other sources thus amounted to Rs. 745.6 crores. India's foreign exchange assets declined during the eight-year period by Rs. 720.7 crores. Over and above this, there was a net increase in foreign exchange liabilities of the country to the extent of Rs. 22.0 crores."

The Bank's review also deals with certain notable developments in the regional pattern of India's foreign trade. The share of the dollar area in India's total exports declined from 23.3 per cent. in the first period to 18.9 per cent. in the third. Even sharper was the fall in imports from that area, which retreated from 24.8 per cent. in the first period to 16.9 per cent. during the third period. This marked decline in the trade with the dollar area affected most of the principal commodities which enter into India's foreign trade. The resultant effect of these trends was that there was progressive improvement in the current balance with the dollar area, excluding official donations, from a deficit of Rs. 48.7 crores during the first period to a deficit of Rs. 13.8 crores in the second, and then a surplus of Rs. 0.8 crore in the third. The sharp contrast to this trend, however, was the trade with the O.E.E.C. countries. Their share of India's imports went up from 11 per cent. in 1951-52 to 15 per cent. and 20.2 per cent. during the second and third periods, respectively, mainly due to increased imports of capital goods. The share of exports, however, remained more or less constant at 10 per cent. The current deficit with these countries, consequently, increased from Rs. 34.8 crores to an annual average deficit of Rs. 79.9 crores in the third period.

Sterling Area's Share

The sterling area's share in India's trade registered a decline in the second period as compared to the first, but almost recovered again in the third period. Thus, while the imports moved down from 50 per cent. in the first period to 47.7 per cent. in the second, exports fell from 55.4 per cent. to 52.3 per cent. As a result, the current annual average surplus rose between the two periods from Rs. 10.1 crores to Rs. 80.6 crores. During the third period, however, the share of imports from the sterling area climbed up to 49.8 per cent. and that of exports to 54.2 per cent. with the result that the current annual average surplus, excluding official donations, came down to Rs. 48.3 crores.

An important feature of the survey relates to shifts in the trade policies witnessed during the period under review. While, in the immediate post-war period, import policy was framed to suit the requirements of sterling balances agreements, and to the needs of conserving dollar resources, subsequent to 1949, controls over imports were intensified in successive stages as a result of huge overall current deficits. Following the Korean war boom and the improvement in the payments position, however, the restrictions on imports were gradually relaxed during the latter half of 1950 and in 1951, though imports from the dollar area continued to be regulated on the strict list of essentiality. In the second half of 1952 and 1953, imports, except those of machinery, industrial raw materials, etc., were, again, tightened. A significant aspect of the import policy during the last two years of the first Plan was that there was a deliberate attempt to link import policy with the needs of development. For this purpose, a policy of progressive but controlled liberalisation of imports was adopted.

Export Front

On the export front, on the other hand, the policy came to be governed by considerations of supply at home. The shortages of various commodities felt in the post-partition period led to considerable reductions in the export quotas. There was a shift in favour of promotion of exports in 1950. With the onset of the Korean war, and the consequent increase in the prices of many raw materials, the policy was again reversed. Faced by inflationary conditions at home, overall quotas were fixed in the case of commodities where domestic demand was pressing. Heavy export duties were also levied on several others. After the Korean war, export promotion was given renewed emphasis. Subsequent to 1952, there was in evidence consistent liberalisation in export restrictions either through the adoption of free licensing procedures or enhancement of export quotas. During the last two years of the first Plan, further, export policy was geared to the needs of the Plan. Export promotion featured prominently for increasing foreign exchange resources. Export Promotion Councils came into existence for a number of commodities. A draft has also been submitted by a committee for an export promotion guarantee scheme.

During the years the first Plan had been in operation, the Reserve Bank Review states, the actual current deficit, excluding official donations, was only of the order of Rs. 125 crores, as against the estimated current deficit of Rs. 667-727 crores on the basis of 1948-49 terms of trade. Even the actual deficit was more than matched by receipts from official donations and official loans amounting to Rs. 196.3 crores. The reasons for the improvement were the lower level of food imports, the lower imports of machinery following the failure to implement the contemplated construction work on the iron and steel and heavy electrical equipment plants and, finally, the lower level of actual investment during the Plan period, as compared with what was envisaged. The cumulative effect of all these was that foreign exchange reserves declined by only Rs. 121.3 crores, as against an amount of Rs. 290 crores contemplated in the first Plan.

DEVELOPMENT OF SALT INDUSTRY

Attainment of self-sufficiency in salt, which is an essential article of consumption, and encouragement of export of this commodity to foreign countries are stated to be the main objectives of the policy of the Government of India in regard to salt. India attained self-sufficiency in salt in 1951 when the production was 74.4 million maunds. The peak production of 86.1 million maunds was achieved in 1953. Although the production in 1954 and 1955 declined to 73.9 million maunds and 81.1 million maunds, respectively, the production in 1956 increased to 88.9 million maunds, which is the highest indigenous production so far achieved. It exceeds the peak production of 86.1 million maunds in 1953. The target of salt production fixed for the second Five-year Plan period is 100 million maunds per annum.

A provision of Rs. 1,87,75,340 for the development of the salt industry has been made in the second Five-year Plan, out of which the investment in the private sector will be Rs. 1,20,75,740 and in the public sector Rs. 66,99,600. Programmes for the development of the industry in the private sector include establishment of laboratories and model farms, improvement in brine supply channels, installation of plant and machinery, provision of amenities for labour and provision of educational and medical facilities for the workers. In the public sector the rock salt mines at Mandi are to be developed on scientific lines by sinking shafts, etc., at a cost of Rs. 8 lakhs. These developments will not only meet the requirements of the Mines Act but the production of salt from this source will also increase to 4 lakh maunds per annum, as against the present production of 150,000 maunds.

As there is surplus production of salt in the country its export to foreign countries is encouraged. The main countries of export are Japan, Indonesia, Nepal, Malaya, the Maldives, etc. Exports to Japan in the year 1956 were 7.372 million maunds against 5.565 million maunds in the year 1955. Under an agreement entered into between the Government of India (through the agency of the State Trading Corporation) and the Government of the Republic of Indonesia, India is to supply 50,000 metric tons of salt to Indonesia. Out of this quantity, 10,914 metric tons have been exported to Indonesia up to the end of December 1956.

RE-EXPORT OF GOODS

The Government has decided that an applicant desiring to re-export raw material components imported for industrial manufacture in India, or heavy machinery items, should, along with the application, submit a declaration to the effect that goods had not been imported either under an actual user licence or under a capital goods licence.

It is also stated that, if the goods sought for re-export had been imported under such import licence, the applicant should furnish particulars of licences against which the goods in question were imported, the reasons for re-export, that is, whether the goods in question are surplus, unserviceable or obsolete and the effort, if any, made to dispose of the goods in the home market and with what results. This procedure, it is further stated, will be made applicable in respect of all controlled goods, even those which are licensed freely for export, and it will come into effect from 1st March.

In case of items which are licensed on merit, applications should also be accompanied by a detailed report stating the circumstances in which the goods are to be re-exported and justifying the special need for the re-export in question.

THE NATIONAL COUNCIL FOR ECONOMIC AFFAIRS

ANNOUNCES THE RELEASE OF ITS FIRST PUBLICATION

"FIVE YEAR PLAN—A CRITICAL SURVEY"

Being an objective study of over 50 Major Industries in India.

Printed on Art Paper. Pages 500. Price Rs. 25

Editor-in-Chief: Dr. P. D. SAGGI

PUBLICATIONS UNDER PREPARATION

(1) **Industrial Scope in Indian States.** Being a re-assessment of Industries in the re-aligned States in India with emphasis on the scope and development of new industries in India. Illustrated with Maps and Charts.

Printed on Art Paper. Pages 500. Price Rs. 25

(2) **Indo-International Trade 1947-1957.** Being a survey of India's foreign trade since Independence with a bird's-eye view of its scope and targets for the future. Containing exhaustive data on the Trade Agreements with foreign countries:

TIMBER TRADE GOES TO THE RESCUE OF BOMBAY BURMAH

TEA SECTION REPORTS LOWER PROFIT

THE trading results of the Bombay Burmah Trading Corporation Ltd. (Secretaries, Treasurers and Managers: Messrs. Wallace & Co., Bombay), for the year ended 31st May 1956, have stolen a march over those for the previous year, which was considered to be the most prosperous one in the history of the Company. The Company's earnings for the year under review have registered a commendable rise over those for the preceding year, which was in itself a record, to create a fresh record. The aggregate trading profit from its various branches of business amounts to Rs. 151.81 lakhs, an increase of Rs. 27.65 lakhs over Rs. 124.16 lakhs earned in 1954-55. The year under review is the third one in succession when the Company's profit has recorded a substantial increase, having risen from Rs. 53.38 lakhs earned in 1952-53. To put it in another way, the aggregate trading profit has gone up by Rs. 98.43 lakhs or 184.4 per cent. in so short a period as three years.

The net profit amounts to Rs. 49.10 lakhs having advanced from Rs. 43.93 lakhs for 1954-55 and Rs. 17.91 lakhs for 1953-54. In conformity with such gratifying results, the Directors have revised the dividend on the Company's shares by a modest rise of 2 per cent., that is, to 32 per cent. from 30 per cent. for the previous year. This makes a striking comparison with only 16 per cent. for 1953-54 and 12 per cent. for 1952-53. It may be remembered that, by raising the dividend to 30 per cent. in the previous year, the Directors had restored it to that paid for 1950-51. It follows, therefore, that the year's dividend is a further step on the steady upward trend in the level of distribution.

Results Compared

The following comparative table brings out the salient features of the Company's working results for the past four years:

(In lakhs of rupees)

—	For the year ended 31st May			
	1956	1955	1954	1953
Trading profit on—				
Timber	96.84	43.75	39.09	21.25
South Indian plantations ..	44.59	68.02	45.69	23.77
Namhsan Tea Factory ..	6.81	7.08	6.99	7.63
Sundries	3.57	4.41	0.56	0.53
Total trading profit	151.81	124.16	92.53	53.38
Other income	14.22	11.11	9.57	14.43
Establishment and other expenses	15.42	22.23	38.40	26.37
Secretaries' commission ..	24.66	20.30	16.84	11.34
Depreciation	28.45	26.39	18.92	12.99
Taxation	48.40	22.42	9.82	6.70
Net profit	49.10	43.93	17.91	10.40
Reserves	8.58	5.00	..	..
Dividend	30.24 (32%)	28.35 (30%)	15.12 (16%)	11.34 (12%)
Preferential dividend ..	10.50	10.53	2.86	..
Carry forward	0.39	0.62	0.57	0.63

It will be seen from the table that the trading results for each of the sections have not maintained the uniform all-round progress witnessed a year ago. The timber section has more than doubled its earnings, whereas all other sections have staged a decline. In fact, it is the excellent trading profit on the timber side that has not only offset the shortcomings of the other sections, but has also helped to create the fresh record in total trading profit. It will thus be noted that, unlike in the previous three years, the share of tea to the profits of the Company for 1955-56 is much less than that of timber. This important point must be borne in mind by those who have come to regard the Company more as a plantation venture and are, therefore, likely to form an impression of the fortunes of the plantation industry on the basis of the Company's profits.

Fresh Forest Leases

The Directors, in their report, state that forest work in Thailand ceased during the year and the remaining activities in the upcountry were confined to rafting stocks of log to Bangkok. The saw-mill continued working till 31st May 1956, after which it was closed. Sales of logs and sawn timber were well maintained. Negotiations for fresh forest leases were continued. As a result, an understanding has been reached, under which certain very limited forest areas will be offered to a proposed joint organisation to be formed between the Government-owned Forest Industry Organisation and five former lessees of which the Company is one. The Company's share in the total is 26 per cent. An agreement was entered into with an American collaborator for the formation of a joint company for the manufacture of high-grade tapioca starch in Thailand. The capital of the Company is Tcs. 1 million which has been subscribed in equal proportion by the two partners. Work on the erection of the factory and organisation of supplies of roots had made good progress by the end of the financial year. Production and purchases of hardwood logs at Wallace Bay in Borneo reached a total of 65,750 tons, as against 50,487 tons in 1954-55. The power house was brought into use during the year. Progress was also made in the erection of the saw-mill.

South Indian Plantations

The trading profit on South Indian plantation account, at Rs. 44.59 lakhs, falls very much below the record profit of Rs. 68.02 lakhs earned in the previous year. This has happened in spite of a bumper crop for the year under review. The States produced a record crop of 5,940,276 lbs. as against 4,876,500 lbs. in 1954-55. On account of the large crop, the unit cost per lb. of made tea fell to 18.78 annas, as compared with 20.21 annas per lb. in the previous year. At the same time, the average gross return fell by a greater extent, from as much as 41.48 annas per lb. in 1954-55 to as low as 34.24 annas per lb. in the year under review. Production of the coffee estates in Coorg amounted to 9,086 cwts., as against 7,919 cwts. in 1954-55, with satisfactory results. The closing stocks have been valued at Rs. 2-4 per point.

The Namhsan tea factory in Burma did not produce quite satisfactory results, due to adverse weather conditions in the monsoon of 1955. The output of made tea dropped to 803,763 lbs. from 914,967 lbs. in the previous year. Sales totalled 902,147 lbs. at an average price of K3.18 as against K3.41 in the preceding year. Costs stood higher at K2.54, as against K2.41 per lb. The Directors state that continued delay by the Government of Burma in the issue of sanction for remittance of past profits is a source of anxiety.

Receipts from sundry trading in Burma also stands at a lower ebb. A small number of duty-paid teak logs were salvaged and sold. In the sundries trading, receipts from the repair of small craft at the dockyard increased, but these were offset by rising costs. Other receipts also diminished, as a result mainly of controls on imports. A beginning was made with the sale of Caltex lubricating oils and greases. The erection of a plant for the manufacture of concrete pipes and similar products was completed towards the end of the year and initial production started.

The Company has procured a total of some 3,000 acres of land in the South Usambaras in Tanganyika and planting of tea has started.

The record trading profit of Rs. 151.81 lakhs has been reinforced by other income amounting to Rs. 14.22 lakhs. While this is in itself encouraging, another happy feature is that establishment and other expenses have declined from Rs. 22.23 lakhs to Rs. 15.42 lakhs.

Strong Finances

A strong financial position is disclosed by the Company's balance-sheet as at 31st May 1956. The reserves and surplus at the end of May last aggregate Rs. 435.17 lakhs, as against a paid-up capital of Rs. 94.50 lakhs. Forfeited shares stand at Rs. 83,000. The provision for taxation appears at Rs. 36.48 lakhs and current liabilities aggregate Rs. 219.31 lakhs. The gross block of the value of Rs. 398.85 lakhs has been written down to Rs. 226.92 lakhs. Additions to block account during the year were of the order of Rs. 67.56 lakhs. These are exclusive of buildings and machinery, etc., under erection shown at Rs. 34.38 lakhs. Investments in shares of subsidiary companies, other companies, Government securities and debentures, together with interest accrued, appear at Rs. 114.27 lakhs. Of these, the holdings in Government securities amount to Rs. 28.93 lakhs and those in debentures to Rs. 38.52 lakhs. It may be noted here that all the investments in debentures are only in those of oil refining companies, an investment considered as first class. The current assets aggregating Rs. 410.72 lakhs include, among other things, stores at cost Rs. 43.56 lakhs, stock-in-trade of timber, tea, coffee and sundry trading stock Rs. 64.54 lakhs, sundry debtors Rs. 58.60 lakhs, loans and advances Rs. 89.85 lakhs and cash and bank balances Rs. 153.51 lakhs. The current assets cover the current liabilities, as well as the provision for taxation, by a substantial margin of Rs. 154.93 lakhs.

The Rs. 125 fully paid-up shares of the Company are being currently quoted at Rs. 733-12 *cum-div.* On an *ex-div.* basis, the shares offer a yield of 5.67 per cent. per annum, free of tax.

As readers are already aware, a scheme for converting the preference-dividend ranking founder shares has been approved by the shareholders and is now awaiting the sanction of the High Court, Controller of Capital Issues and the Reserve Bank. If this scheme goes through, as is expected, a sum of Rs. 6,50,467 will be available for distribution to shareholders at a subsequent date by way of special dividend.

INSTITUTE OF COMPANY SECRETARIES INAUGURATED

Realising that there is a serious dearth of qualified company secretaries both in the management of joint-stock enterprises and in the Government administration, the Central Government has sponsored an Institute of Company Secretaries which was inaugurated at Calcutta a few days ago by the Chief Minister, Dr. B. C. Roy. The Institute seeks to set up a professional body of secretaries whose services have become indispensable in the management of joint-stock concerns as well as in the various administrative departments of the Government.

Inaugurating the Institute, Dr. Roy stressed the importance of the Institute to the country and said that the aim of the Institute should be broad enough to embrace the needs of different organisations, besides that of the joint-stock enterprises. According to him, the Government, which was one of the biggest "joint-stock enterprises" of the day, was equally in great shortage of trained administrative personnel.

Proceeding, the Chief Minister stated that, while the main course of study should be broad enough to meet the requirements of different types of organisations, there should also be provision for shorter training courses to provide training for particular type of organisations. Such short courses should be as varied as possible, because specialised training was essential for handling the special complications of different categories of organisations. In the selection of personnel, again, preference should be given to those who had already undergone a period of apprenticeship in different organisations for secretarial work. This would call for the co-operation of industrialists in recruiting young men for their organisation and in providing them training. This had a twofold advantage, in that, while ensuring better selection of personnel, this would remove the possibility of wastage of trained personnel of the Institute, as they would be assured of their work after the successful completion of the training. The Institute should also provide for training in different languages on account of the fact that different organisations kept their accounts in different languages. The Chief Minister also stressed the need for introducing post-graduate courses because, he said, the competency in any profession could not be fully acquired without undergoing a post-graduate course for that profession.

The new Company Law has imposed heavy responsibilities on company management and, without adequate assistance from expert secretaries, it will be difficult for them to discharge satisfactorily their obligations. The Government of India, also, had recognised at the time the new Act was enacted, that the services of a competent secretary in every company organisation would greatly help in implementing the spirit and substance of the Companies Act. The existing organisation of secretarial profession in India is hardly adequate to meet the requirements of the situation. Company secretaries are badly required and the time has come when the country should no longer depend upon outside professional bodies to supply such personnel. The Institute will be, as is only to be expected, a non-profit-making one. It has on its first Council of Management representatives of the Federation of Indian Chambers of Commerce and Industry, the Associated Chambers of Commerce, Government and experienced company secretaries. The Institute requires the support and co-operation from all sectors of public life, so that adequate facilities for practical training of the future entrants to the profession can be given.

The dearth of such trained personnel, as Dr. Roy rightly pointed out, will open up bright prospects for the graduates of the Institute and even the Government would like to give preference to such trained secretaries in the cadre of All-India Administrative Service and State Services.

INDIAN IRON AND STEEL

The Indian Iron and Steel Company, Ltd., has, at a meeting of the Board of Directors of the Company held on 28th January, decided that, in accordance with the resolution passed at the extra-ordinary general meeting of the Company on 1st December 1956, the rights offer of 5,183,708 new ordinary shares of Rs. 10 each at a premium of Rs. 3-8 per share be made to those persons who are registered as ordinary shareholders in the Company's register of members on 11th March 1957, in the proportion of one new ordinary share for every ordinary share held by each such person on the said date. The entire amount of Rs. 13-8 per share will have to be paid in one instalment on or before 31st March 1957.

For the purpose of this offer, the ordinary share register of the Company will remain closed from 21st February 1957 to 11th March 1957, both days inclusive.

N.I.C.C. REACHES NEW HIGH IN PROFIT

DIVIDEND LEVEL RAISED

THE maxim "quality pays" applies more forcefully to business than to any other walk of life. Indeed, if we go a step further, a more accurate dictum would be "quality pays, but only in the long run." Never has this dictum been more illustrative and convincing than in the case of the National Insulated Cable Company of India Ltd. (Managing Agents: Messrs. Associated Industrial Development Co. Private Ltd., Calcutta), as disclosed by its results for the year ended 31st March 1956. A comparative study of the Company's working for the past three years reveals that, for the year 1952-53, the Company earned a handsome gross profit of Rs. 43.71 lakhs. In the following year, on account of keen competition from new-comers in the field of cable industry and also due to the fact that the Company's products had not become so popular, its earnings received rather a rude setback. Consequently, the gross profit for that year fell by Rs. 25.53 lakhs to a low of Rs. 18.18 lakhs. In spite of this depressing trend, the Company stuck to its wise policy of manufacturing only quality goods, even though that might have meant a lower margin of profit in the initial stages. And it was rewarded. The next year, the gross profit more than doubled to Rs. 37.18 lakhs, and for the year under review, it reached a record figure of Rs. 67.92 lakhs.

The net profit, too, after paying a higher amount for Managing Agents' commission and more than twice the amount for taxation, stands at Rs. 30.92 lakhs, as against Rs. 17.02 lakhs in the previous year and Rs. 7.08 lakhs for 1953-54. In consonance with these encouraging results, the dividend to the ordinary shareholders has also been increased from 15 per cent. for the previous year to 20 per cent. for the year under review. It may be remembered that, for the years 1952-53 and 1953-54, the Company paid a dividend of 10 per cent., that is, Re. 1 per share. In the succeeding year, consequent on the good results, it stepped up its dividend to 15 per cent. composed of a dividend of 10 per cent. and a cash bonus of 5 per cent. The dividend for the year under review at 20 per cent. is shared by a dividend of 15 per cent. and a cash bonus of 5 per cent.

It is noteworthy that the year's enhanced dividend is on a higher ordinary capital of Rs. 40 lakhs. The entire preference share capital of the Company of the face value of Rs. 10 lakhs was redeemed on 31st March 1955 at a premium of Rs. 15 per share. After the closing of the financial year on 31st March 1955, at an extraordinary general meeting of the Company, the authorised capital was increased to Rs. 75 lakhs by the creation of a further 250,000 ordinary shares of Rs. 10 each. Having obtained the necessary consent from the Central Government, 200,000 ordinary shares of Rs. 10 each were offered to the existing shareholders.

In proportion to the rise in profits, reserves also have been strengthened. The year's allocation on this account at Rs. 23.70 lakhs is a distinct improvement on the previous year's contribution at Rs. 11.49 lakhs. A break-down of the total shows that the general reserve has received Rs. 12.50 lakhs, dividend equalisation fund Rs. 5 lakhs and reserve for expansion of schemes in hand Rs. 6 lakhs. The previous year's allocations were general reserve Rs. 8.99 lakhs and dividend equalisation fund Rs. 2.50 lakhs.

The following table will enable the reader to make a comparative study of the Company's working during the past four years:

(In lakhs of rupees)

—	For the year ended 31st March			
	1956	1955	1954	1953
Sales	277.31	N.A.	N.A.	N.A.
Other income	0.10	0.29	0.62	0.27
Closing stock	41.16	N.A.	N.A.	N.A.

N.A.—Not available.
* On a higher capital of Rs. 40 lakhs, raised by the issue of an additional 2 lakhs ordinary shares of Rs. 10 each.

While no data about the Company's sale proceeds for the past three years is available,

(*Continued on page* 285)

Points From The Chair

Classical Bank Rate Theory

"IN considering the value of the classical Bank Rate theory, and its effectiveness under present-day conditions, either in combating inflation, or restoring confidence abroad in our economy, and thus attracting foreign deposits—a problem to which I referred in my statements to you both in 1954 and 1955—it must not be forgotten that, in the year 1957, the Government has to meet maturing liabilities on previous bond issues of about £900 million and, if the present policy is continued, the cost of this conversion must make a considerable addition to the heavy burden which is already carried by the British taxpayer in respect of interest on the National Debt. And I must remind you that overseas holdings of sterling balances are to a very considerable extent invested in Treasury Bills. It has been stated that, mainly as a result of the increase in short-term rates in the United Kingdom, disbursements made on account of dividends, interest and profits transfers have risen to the extent of about £100 million per annum since the end of 1951, a great handicap surely to our efforts to establish a satisfactory surplus in our external account. Hence it may be argued that a high Bank rate does, in fact, in some degree, have an opposite effect to that which is generally regarded as part of its object. One thing is, I think clear, namely, that it is in the best interests of the Government and of the British taxpayer that every possible effort should be made by all concerned to reduce short-term interest rates without undue delay. Whether this policy, if adopted, can be made effective depends not only on drastic economy in Government expenditure, but on national and international confidence in the £ sterling."

SIR ERIC GORE BROWNE,
Alexanders Discount Co., Ltd.

The Pound Sterling

"We must not forget, however, that the reserves are those of the whole sterling area and that there have been heavy drawings by some of its members. In particular, India has reduced her balances in 1956 by £150 million or by the whole amount it was expected she would use during the period of the second Five-year Plan. In addition to this, the very fact that it was felt to be necessary to counter the seizure of the Suez canal by a blocking of Egyptian balances here was bound to create some degree of nervousness since sterling is so generally used as the leading currency in international trade, and the deficits in the following months have arisen more from a reluctance to hold sterling than from an inherently unsound trading position here. The effects of these special and temporary strains on the reserves can only be mitigated in the long run by a sound trading position throughout the whole sterling area and, in the short run, by the sort of measures the Government has taken to show its determination to defend the pound sterling."

SIR ERIC A. CARPENTER,
Williams Deacon's Bank Ltd.

Production of Sugar

"The year 1955-56 was, on the whole, a favourable one for the sugar industry, free from any crisis of the nature to which it had been accustomed in the past. Sugar production reached an all-time record of 18.6 lakh tons, as compared to 15.9 lakh tons in the year 1954-55 and 10 lakh tons in the year before that. Consumption too has risen to 19 lakh tons and promises to go up higher. This is as it should be, if we bear in mind that, in order to meet this growing demand, the target of sugar production in the second Five-year Plan is put at 22.5 lakh tons. To achieve this production, the installed capacity of the industry is being raised to 25 lakh tons by the licensing of a number of new units and the expansion of several existing ones. The major part of the expansion programme is confined to the Deccan and South India which enjoy natural advantages for the development of the industry. This should go a long way to meet the temporary shortages that frequently occur in the South, which is at present deficit in sugar. If all the factories licensed come up, and when the anticipated benefits from the various development schemes begin to materialise, it may not be surprising if the actual production goes far above the target, creating new problems for the industry. Even at the present moment, an important problem that is facing the industry, is the large surplus stock which it is burdened with. Fortunately, the present is an opportune time for exporting Indian sugar to neighbouring foreign countries and it is a matter for gratification that the Government of India have acted quickly in releasing an initial quota of 50,000 tons of sugar for export through the Indian Sugar Mills' Association. This timely gesture of the Government will not only afford some relief to the industry but will also bring in valuable foreign exchange which the country is in dire need of at present time. It is to be hoped that this experiment will prove a success, thus paving the way for larger exports in the years to come."

S. MUNINANJAPPA,
Mysore Sugar Co., Ltd.

COMPANY MEETINGS AND DIVIDENDS

BIRDS INVESTMENTS LTD. Annual General Meeting, Calcutta, 15th February 1957. Dividend: Re. 1 per share. Transfer books remain closed from 1st to 15th February 1957, both days inclusive.

ANDHRA SUGARS LTD. Annual General Meeting, Tanuku, Andhra Pradesh, 15th February 1957. Dividend: Re. 1 per share. Transfer books remain closed from 1st to 15th February 1957, both days inclusive.

SAMASTIPUR CENTRAL SUGAR CO., LTD. Annual General Meeting, Kanpur, U.P., 16th February 1957. Dividend: *Nil*. Transfer books remain closed from 9th to 16th February 1957, both days inclusive.

MYSORE KIRLOSKAR LTD. Annual General Meeting, Harihar, 18th February 1957. Dividend: 6 per cent. payable on 1st March 1957. Transfer books will remain closed from 11th to 25th February 1957, both days inclusive.

BALRAMPUR SUGAR CO., LTD. Annual General Meeting, Kanpur, U.P., 20th February 1957. Dividend: *Nil*. Transfer books will remain closed from 11th to 20th February 1957, both days inclusive

CAMPERDOWN PRESSING CO., LTD. Annual General Meeting, Calcutta, 20th February 1957. Transfer books will remain closed from 11th to 20th February, 1957, both days inclusive.

BOMBAY BURMAH TRADING CORPORATION LTD. Annual General Meeting, Bombay, 25th February 1957. Final dividend of Rs. 28-12 per share on fully paid-up shares of Rs. 125 each and Rs. 11-8 per share on partly paid-up shares of Rs. 50 each, payable on 4th March 1957. Transfer books remain closed from 9th February to 2nd March 1957, both days inclusive.

STANDARD COAL CO., LTD. Annual General Meeting, Calcutta, 27th February 1957. Dividend: As. 8 per share. Transfer books will remain closed from 13th to 27th February 1957, both days inclusive.

CHAMPARUN SUGAR CO., LTD. Annual General Meeting, Kanpur, U.P., 1st March 1957. Dividend: Re. 1 per share. Transfer books will remain closed from 14th February to 1st March 1957, both days inclusive.

AHMEDABAD ELECTRICITY CO., LTD. Final dividend of Rs. 4 per share (making Rs. 6-8 for the year), for the year ended 30th September, 1956. Transfer books will remain closed from 22nd February to 18th March 1957, both days inclusive.

MADURA MILLS CO., LTD. Dividend of Rs. 2-10 (17½ per cent.) per share, free of tax, for the year ended 31st December 1956.

K.C.P. LTD. Interim dividend of Rs. 7-8 per ordinary share and Rs. 10 per deferred share, for the year ended 30th June 1956. Transfer books will remain closed from 16th to 25th February 1957, both days inclusive.

DEVASHOLA (NILGIRI) TEA ESTATES CO., LTD. Interim dividend of Re. 1 per ordinary share, for the year ended 31st December 1956. Transfer books will remain closed from 14th to 20th February 1957 both days inclusive.

INDIAN COPPER CORPORATION LTD. Interim dividend of 1.6d. (6⅔ per cent.) per unit of stock, payable on 15th April 1957. Transfer books will remain closed from 23rd February to 2nd March 1957, both days inclusive.

COMPANY REGISTRATIONS

LAXMI ASBESTOS PRODUCTS LTD. (First Director: Mr. Gokulchand Bangur.) Business: Manufacture of asbestos products. Authorised capital: Rs. 2,00,00,000. Public company. Address: "Shriniwas House," Waudby Road, Bombay, 1.

BARODA INDUSTRIAL DEVELOPMENT CORPORATION PRIVATE LTD. (First Director: Mr. Ramanbhai B. Amin.) Business: Promotion and development of small-scale industries. Authorised capital: Rs. 10,00,000. Private company. Address. Rameshchandra Dutta Road, Racecourse, Baroda.

D. M. G. (BOMBAY) PRIVATE LTD. (First Director: Mr. Balkrishna Mehta.) Business: Manufacture of art silk, synthetic fibre, etc. Authorised capital: Rs. 5,00,000. Private company. Address: 28, Apollo Street, Bombay.

THE MODEL PROCESSING CO. PRIVATE LTD. (First Director: Mr. Rajendra J. Desai.) Business: Silk spinning, weaving, etc. Authorised capital: Rs. 5,00,000. Private company. Address: Registered office of the Company will be situated in the State of Bombay.

The Directors of the Midland Rubber and Produce Company, Ltd., have decided to drop the question of the sale of Mukampala group of estates. This, the Directors state, is in view of the "thoroughly altered circumstances now obtaining, as compared with what they were at the time the proposition was originally entertained."

ANDHRA SUGARS EARN HANDSOME PROFIT

CHAMPARUN SUGAR CUTS DIVIDEND

Andhra Sugars Ltd.

THE directors of the above Company (Managing Agents: Messrs. Rangarao and Co., Tanuku, Andhra) submit the audited accounts of the Company for the year ended 30th September 1956.

The accounts show that a profit of Rs. 13,59,518 (Rs. 2,64,760) has been made for the year 1955-56 after providing one-sixth of the basic earnings of the year 1955-56, subject to a minimum of Rs. 40 as bonus; to which sum is to be added the amount brought forward from 1954-55 of Rs. 1,43,760 (debit of Rs. 1,22,240) making a total of Rs. 15,03,278 (Rs. 1,42,520). After deducting appropriations out of the profit of 1954-55 the dividend for 1954-55 on ordinary shares at 6 per cent. Rs. 1,39,411, there is a balance of Rs. 13,63,867. Out of this the directors recommend the payment of a dividend at Re. 1 (As. 9-3/5) per share, i.e., 10 (6) per cent. for 1955-56 Rs. 3,00,000. Donations and charities expended in the year 1955-56 amounted to Rs. 600, extra amounts paid on purchase of cane during 1952-53 absorbed Rs. 67,068, brokerage paid on shares Rs. 5,362, amount transferred to general reserve Rs. 5,00,000 and amount transferred to dividend equalisation reserve Rs. 3,00,000 leaving a balance to be carried to the next year's account of Rs. 1,90,837 (Rs. 1,43,760).

During the year under report, the Company's sugar factory commenced crushing on 20th November 1955 and closed on 22nd April 1956 during which period 86,488.7 (53,934.22) tons of sugarcane was crushed and 9,374.97 (5,917.15) tons of sugar was produced. The recovery of sugar for the season was 10.84 as against 10.97 for the previous season. As mentioned in the last report, the directors are now glad to inform that the machinery for the expansion programme ordered with the manufacturers in West Germany has almost been received and installed in time. The sugar factory commenced production on 12th December 1956 for the 1956-57 season.

During the year, the directors acquired for the company shares in The Andhra Pradesh State Finance Corporation, 200 fully paid up shares of Rs. 100 each, of the total value of Rs. 20,000 and on the same, a sum of Rs. 175 has also been received as dividend.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.

Rs.	79,39,914	Rs.	79,39,914

Champarun Sugar Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Begg, Sutherland and Co., Ltd., Kanpur U.P., Kanpur) submit the audited accounts of the Company for the year ended 30th June 1956.

The accounts and balance sheet are presented in the new form required by the Companies Act, 1956. The results for the year, after making the usual provisions, charging depreciation, and adjustments, show a profit of Rs. 5,50,484 (Rs. 6,84,690). To this has been added the carry forward from the previous year of Rs. 24,019 (Rs. 24,329) making a total of Rs. 5,74,503 (Rs. 7,09,019). The directors have placed to contingencies reserve for stock realisation Rs. 1,10,000 (Rs. 65,000 for contingency reserve and to rehabilitation reserve Rs. 2,55,000 (Rs. 3,50,000) leaving at credit of profit and loss account Rs. 2,09,503 (Rs. 2,94,019). This balance, the directors recommend, should be disposed of as follows:—

In payment of a dividend of Re. 1 (Re. 1-8) per share, free of income-tax, for the year ended 30th June 1956 Rs. 1,80,000 (Rs. 2,70,000) and to carry forward to next account Rs. 29,503 (Rs. 24,019).

The quantity of cane crushed at the Barrah Factory has improved considerably over previous years and was indeed the highest crush ever taken off at this factory during the last 20 years. The crop taken off at the Chanpatia Factory was disappointing both in quantity and in quality. Barrah Factory crushed 35,52,767 (24,62,683) maunds of cane with an extraction of 9.54 (10.16) per cent. while Chanpatia Factory crushed 20,69,019 (19,21,055) maunds of cane with an extraction of 9.89 (10.77) per cent.

Barrah Factory commenced crushing operations on the 24th November 1955 and completed the season on the 5th May 1956 while Chanpatia Factory commenced crushing on the 12th December 1955 and completed the season on the 6th April 1956.

The cane price remained at the high rate of Re. 1-7 per maund at the Factory gate and Re. 1-5 per maund at outstations, and these relatively high prices encouraged farmers to grow more cane. This was a general experience throughout the Sugar Industry with the result that the sugar production in the country rose to an all-time record of 18 5 lakh tons. The result of this high production of sugar in India tended to reduce the market prices for sugar, particularly in Bihar and U.P. where factories have to compete with sugar factories nearer the port towns. This disadvantage, aggravated by a shortage of railway wagons on the N. E. Railway in the early part of the selling season, also tended to depress prices. The stocks of sugar remaining unsold on the 30th June were considerable, particularly stocks of sugar which had been sold but could not be delivered due to the shortage of railway wagons. Since the 30th June, sugar prices have fallen considerably and on that account the directors have considered it prudent to create a contingency reserve.

The efficiency of both factories has continued at a high level and in particular the capital expenditure in Barrah Factory now shows an increase in the efficiency of Factory operations, Rehabilitation reserve has been utilised to the extent of Rs. 1,75,000.

Accounts in brief are as under:—

Deccan Sugar and Abkhari Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Parry and Co., Ltd., Madras) submitted the audited accounts of the Company for the year ended 31st May 1956.

The balance sheet and profit and loss account have been drawn up in conformity with the requirements of the Companies Act 1956 and the comparative figures for the previous period have been adjusted accordingly. The net profit for the year before providing for taxation was Rs. 21,08,865 (Rs. 15,45,554) upon which taxation [including the sum of Rs. 2,30,000 (Rs. 5,40,000) transferred to taxation equalisation reserve] amounts to Rs. 9,55,211 (Rs. 5,40,211) leaving a net profit, after taxation, of Rs. 11,53,654 (Rs. 6,99,032). To this was added the surplus brought forward from last year amounting to Rs. 1,12,386 (Rs. 21,554) making the profit available for appropriation Rs. 12,66,040 (Rs. 7,20,586). The directors have transferred to capital reserve Rs. 45,000 (Rs. 20,000), general reserve Rs. 5,00,000 (Rs. 3,40,000), and to dividend equalisation reserve Rs. 2,50,000 (*nil*). Dividends, free of income-tax, for the year on preference share capital at 7 (7) per cent. absorbed Rs. 49,000 (Rs. 49,000). Interim dividend at 5 (5) per cent. on ordinary shares absorbed Rs. 99,600 (Rs. 99,600) and final dividend at 10 (5) per cent. absorbed Rs. 1,99,200 (Rs. 99,600) leaving a surplus to be carried forward to next year of Rs. 1,23,240 Rs. 1,12,386).

Review of operations:—The year under review has again brought about a very substantial increase in the profit of the Company. The purchase price of cane for the year was the same as that ruling during the previous year and cultivation of cane continued to be remunerative to the growers with the result that the requirements of both the Company's Factories were fully met.

The Government of India continued to release sugar stocks from factories in such a way as to keep markets fully supplied without overstocking, and so selling prices were maintained at a reasonable level. Distribution of sugar from the Company's Samalkot Factory was again hampered by bottlenecks on the Waltair-Madras section of the railway.

Samalkot:—Crushing for 1955-56 season started on the 19th November 1955 and closed on the 8th May 1956 after crushing 1,03,088 tons of cane with a production of 9,778 tons of sugar, the recovery being 9.485 per cent. Both the quantity of cane crushed and the sugar produced during this season constituted a record for this factory. The quality of cane was good due to improvements in the application of fertilisers and to the availability of adequate irrigation facilities throughout the year; this is reflected in the substantial increase in the recovery rate from last year's level of 8.99 per cent.

Pugalur:—Crushing for the 1955 special season commenced on the 1st August 1955 and ended on the 12th October 1955; 59,320 (86,306) tons of cane were crushed and 5,762 (7,881) tons of sugar were produced, giving a recovery of 9.7 (8.99) per cent. The 1955-56 main season started on the 24th November 1955 and continued until the 5th May 1956; during this period 1,27,696 tons of cane were crushed and 12,970 tons of sugar produced at a recovery of 10.16 per cent. The recovery rate for the main season has shown a deterioration from the previous year's level of 10.52 per cent. due to climatic conditions and to the incidence of diseases in cane. The elimination of these diseases is receiving the constant attention of the Board.

The total production of the Company's factories during the year under review was 28.510 (21,600) tons of sugar; this represents an increase of some 30 per cent. over the production in the previous year, which was in itself the highest in the history of the Company.

Reserves:—On the 31st May 1956 the capital and revenue reserves of the Company, excluding the taxation equalisation reserve, aggregated Rs. 26,71,740. The directors have appropriated to general reserve out of the profits of the year under review the sum of Rs. 5,00,000; this has been done in order to provide in part for the cost of the habilitation of the Company's plant and machinery, for the purpose of certain expansion for which Government permission is being sought, and for the purpose of conserving funds for the repayment of the loan on mortgage from the Industrial Finance Corporation of India, the first instalment of which is due on the 1st December 1956.

Financial Position:—The liquid position of the Company has improved substantially during the year, the excess of current assets over current liabilities and provisions being Rs. 19.87 lakhs as compared with Rs. 8.33 lakhs at the end of the preceding financial year.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	26,92,000	Block ...	54,58,998
Reserves ...	25,48,500	Buildings, machinery, etc., under erection ...	43,658

Clive Mills Co., Ltd.

The directors of the above Company (Managing Agents: Shree Krishna Investment Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st March 1956.

The result of the year's working was a profit of Rs. 5,33,170 (Rs. 19,51,134). Reserve for income-tax and super-tax absorbed Rs. 3,00,000 (Rs. 13,70,000) and depreciation Rs. 90,377 (Rs. 1,28,495) leaving a balance of Rs. 1,42,793 (Rs. 4,52,639). With the credit balance brought forward from last year of Rs. 1,07,142 (Rs. 9,753) there was a total of Rs. 2,49,935 (Rs. 4,62,392).

From this amount the directors paid preference dividend at 7 per cent. absorbing Rs. 56,000 (Rs. 56,000), preference dividend at 6 per cent. absorbing Rs. 48,000 (Rs. 48,000) dividend on ordinary shares at As. 8 per share Rs. 1,20,000 (Re. 1-4 per ordinary share absorbing Rs. 2,00,000 and dividend of As. 10 ps. 3 on bonus shares absorbing Rs. 51,250) and carried forward to next year Rs. 25,935 (Rs. 1,07,142).

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	40,00,000	Block ...	13,91,998

Ghusick and Muslia Collieries Ltd.

The directors of the above Company (Managing Agents: Messrs. Bhatter's Agency Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st March 1955.

Coal raisings, despatches and consumptions were as follows:—

	During the year under review		During the previous year ended 31-3-54	
	Tons	*Cwts.*	*Tons*	*Cwts.*
Raisings ...	1,38,836	1	1,51,944	10
Despatches ...	1,34,583	15	1,48,081	6
Colliery consumption ...	7,068	0	9,525	11

Capital Expenditure:—During the year under review 815 Bighas of virgin coal bearing land were purchased at a cost of over Rs. 2 lakhs and coal cutting machine and Haulage and other equipments at a cost of about Rs. 89,000 were added to the collieries.

After providing for all expenses including Rs. 59,300 (Rs. 50,000) for depreciation and also Rs. 56,011 (Rs. 15,000 for taxation) for sales-tax liabilities and rates and taxes liabilities of previous years in respect of which appeals have been pending and also income-tax and transferring a sum of Rs. 75,000 (*nil*) from the reserve fund, the available profit was Rs. 73,353 (Rs. 74,253) which was disposed of as below:—

Dividend on 5 per cent. redeemable preference shares for the year Rs. 25,000 (Rs. 12,980) and dividend on 1,00,000 ordinary shares at As. 4 (As. 3) per share, i.e., at 2½ (5) per cent. Rs. 25,000 (Rs. 50,000) and carry forward Rs. 23,353 (Rs. 11,273).

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	15,00,000	Block ...	9,52,587

		Cash	10,089
Rs.	30,63,813	Rs.	30,63,813

Tyroon Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. McLeod & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The season's working resulted in a profit, before providing for depreciation, of Rs. 8,66,864 (Rs. 16,43,214) to which was added the profit on sale of assets Rs. 8.078 (Rs. 3,408) and balance of profit brought forward from 1954 of Rs. 9,014 (Rs. 31,146) Rs. 8,83,956 (Rs. 9,21,014 including Rs. 11,058 being adjustment). Provision for taxation absorbed Rs. 2,96,200 (Rs. 6,28,876), adjustment account Rs. 2,11,084 (*nil*), obsolete stores written off Rs. 216 (*nil*), loss on farming Rs. 10,224 (Rs. 12,489) and depreciation on fixed assets Rs. 1,11,891 (Rs. 1,26,447) leaving a balance of Rs. 2,54,341 (Rs. 9,21,014). From this amount, the directors paid a dividend at the rate of 30 (60) per cent. for the year ended 31st December 1955, on 52,000 ordinary shares of Rs. 10 each, absorbing Rs. 1,56,000 (Rs. 3,12,000) leaving to be carried forward Rs. 98,341 Rs. 9,014 after transferring Rs. 3,50,000 to general reserve and Rs. 2,50,000 to building and machinery reserve.

Crop.—The saleable crop weighed out at 15,693 (14,597) maunds against an estimate of 15,000 maunds, and was disposed of at an average price of As. 38.22 (As. 50.47) per lb.

Estimate 1956.—The estimate for season 1956 provides for a saleable crop of 16,000 maunds at a total revenue expenditure of Rs. 20,42,175.

The results may be regarded as satisfactory, considering the general recession in tea prices during the period under review.

Accounts in brief were as under:—

South Behar Sugar Mills Ltd.

The directors of the above Company [Chairman: Mr. Chandradeva Prakash Sinha, Bihta (Patna)] submit the audited accounts of the Company for the year ended 31st October 1955.

The year's working shows a loss of Rs. 23,304 (Rs. 24,454).

Supply of sugarcane to the factory during the year under report was inadequate and similar to the supply during the previous decade. As an outcome of the measures taken by the factory with the active assistance of the Government of Bihar, cane cultivation is now showing an upward curve of increase and the quantity crushed in 1955-56 was 32.69 (7.28) lakhs of maunds or 120 per cent. more than the average crushing achieved by the factory in the past ten years.

The State of Bihar have, by now, advanced to the Company the sum of Rs. 19 lakhs for cane development and transport and for improvements of plant and for sinking of tubewells. About 36 tubewells have by now been brought into irrigation work and it is expected that this irrigation will augment the yield of sugarcane per acre of land and thus make sugarcane more attractive in the future to the growers.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.

Jam Shri Ranjitsinghji Spinning and Weaving Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Lalji Naranji & Co., Bombay) submitted the audited accounts of the Company for the year ended 30th June 1956.

The profit for the year after providing Rs. 1,14,210 for depreciation, amounted to Rs. 4,18,844 (Rs. 4.22,810). Adding thereto the balance brought forward from the previous year's accounts of Rs. 6,408 (debit of Rs. 1,63,302) the amount available for disposal was Rs. 4,25,252 (Rs. 2,59,508). From this sum the directors have transferred to general reserve Rs. 1,25,000 (Rs. 1,20,000 for depreciation) and to dividend equalisation reserve Rs. 2,00,000 (Rs. 35,400), leaving a balance of Rs. 1,00.252 (Rs. 1,75,400). From this the directors paid a dividend at Rs. 60 (Rs. 50) per share free of income-tax for the year ended 30th June 1956, on 1,554 shares of the Company Rs. 93.240 ₹Rs. 77,700) and carried forward Rs. 7,012 (Rs. 6,408).

In order to improve the working efficiency of the units, orders had been placed as reported last year for (1) blow room machinery, (2) dyeing plant, and (3) winding machine. The directors report that the erection of these machineries is nearing completion. During the year, the humidification system of the Ring Frame Department was renewed, and for the Preparatory Department, it is under installation. As a step further to our policy of renovation, an order has been placed for 12 Weft Frames from Messrs. Texmaco, out of which 2 frames have been already received. In order to improve the finish of the cloth, the directors have placed an order for three bowl friction calender.

With a view to increase the productive capacity of the Mills in accordance with the Government's policy, the directors have started the third shift in the spinning department and have put into working all the looms hitherto remaining idle.

Labour relations during the year remained cordial and the bonus for the year 1954-55 was voluntarily agreed upon, for which a provision of Rs. 40,000 has been made in the accounts.

In spite of the increase in cotton prices during the latter half of the year, and increase in dearness allowance of more than Rs. 2,00,000 as compared with the last year the Company was able to show this result due to more production and higher realisation of cloth and yarn.

In addition to depreciation already provided by the Company in its accounts in earlier years, the directors have further allocated a sum of Rs. 5,50,000 to various fixed assets to make the provision, in their opinion, adequate. Income-tax assessments are completed upto the accounting year 1951-52. It is estimated that there would be no further tax liability till the accounting year 1955-56, in view of carry forward of past losses and unabsorbed depreciation. Sales-tax liability in respect of the Bombay State and other States is indeterminate. As regards Bombay State, the assessments are completed upto 1st November 1952 In the opinion of the Company there is no pending liability. No provision has been made for bonus to employees for the year as it is not considered due.

Bisra Stone Lime Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bird & Co. (Private) Ltd., Calcutta) submitted the audited accounts of the Company for the half-year ended 31st March 1956.

In conformity with the provisions of the Companies Act, 1956, the Company's accounts will henceforth be drawn up on an annual basis. From now on therefore, the Company's accounts will be closed and audited as at the 31st March each year and the first annual closing will be for the 12-month period ending on 31st March 1957.

Limestone.—Raisings were on a reduced scale, the tonnage mined being 3,88,574 (4.28,051) tons as against 4,15,913 tons during the previous half-year. Sales were similarly reduced to 3,64,865 (4,02,222) tons from 4,15,797 tons owing to the decreased requirements of one of the major steel producers. The wagon supply position continued to be fairly satisfactory but it is still rather irregular and frequently below our actual requirements.

Dolomite.—Production was increased by 4.994 tons to 20,972 (16,017) tons as against 15,978 tons in the previous half-year. Sales also increased by 2,897 tons to 21,399 (13,978) tons from 18,502 tons.

Lime.—Output increased slightly by 2,429 mds., the total output being 6,32,819 (6,80,983) mds. Sales improved to 5,80,333 (4,64,419) mds. from 5,64,899 mds., an increase of 15.434 mds. Sales and output continue to be controlled by wagon supplies and during the period there was a slight improvement.

The profit and loss account after providing for all charges, and making provisions of Rs. 2,25,000 (Rs. 1,30,000) for taxation and Rs. 43,855 (Rs. 49,175) for depreciation showed a profit of Rs. 3,34,190 (Rs. 4,76,445) to which was added the balance brought forward from the previous half-year of Rs. 24,689 (Rs. 29.803) making a total of Rs. 3,58,879 (Rs. 5,06,248). The amount transferred to reserves was Rs. 2,51,200 (Rs. 87,383), to tax contingency reserve Rs. 23,000 (Rs. 20,000), to development rebate reserve Rs. 3,200 (*nil*), to mechanisation reserve Rs. 1,75,000 (Rs. 75.000) and to water supply reserve Rs. 50,000 (*nil*) leaving a balance available of Rs. 1,07,679 (Rs. 96,642). The directors utilised this amount for payment of a dividend of As. 14 (As. 14) per share, without any deduction for income-tax paid by the Company Rs. 87,500 (Rs. 87,500) and for carrying forward Rs. 20,179 (Rs. 9,142).

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	10,00,000	Block ...	25,69,068
Reserves ...	27,63,242	Capital work-in-progress	29.292
Provision for taxation ...	2,80,915	Stock-in-trade	2,22,856
Liabilities ...	16,42 051	Stores and spare gear	5,87,093
Profit and loss account ...	20,179	Stores-in-transit ...	80,244
		Debts, deposits and advances ...	18,09.980
		Investments	3,720
		Cash ...	4,17,134
Rs.	57.07,387	Rs.	57.07.387

N.B.—Figures within brackets relate to the corresponding period of the previous year.

COMPANY AFFAIRS

(*Concluded from page* 283)

that for the year under discussion stands at Rs. 277.31 lakhs. The Directors state that "the result of the year under review is satisfactory due to the cautious policy adopted by the Company as mentioned in our last year's report." Commenting on the Company's schemes of expansion and the progress achieved so far, the Directors observe thus:

"The march of progress has continued, the expansion scheme which was under contemplation for some time has now been sanctioned by the Government of India under the Industries (Development and Regulation) Act, 1951, and licence granted. The Company has placed orders in the U.K. for up-to-date plant and machinery as additional units and is going ahead with the necessary factory buildings. The scheme of expansion is to increase the productive capacity in many sections by nearly 70 per cent. It is hoped that, by the end of next year, most of the additional plant and equipment would have been installed and the Company's production will be substantially increased. The expansion programme is estimated to cost more than Rs. 3 million; we shall be able to offer employment to many more personnel. The Company's products have been introduced in new areas and it can now be said that the Company's goods are well known practically in every important place in India. Special mention may be made of a large contract received by the Company for the supply of copper conductors of large size in connection with the electrification of the Howrah-Burdwan line of the Eastern Railway. The Company possesses an up-to-date laboratory and test house where very rigid tests are carried out on both raw materials and finished goods at every stage of manufacture. A high standard of quality is being maintained. Every yard of cable produced is tested by the Inspectorate of the Government of India and all coils of cables released from the works do, therefore, carry a seal and certificate under Government authority testifying to the compliance with the standard specifications. The Company derives the benefit of technical advice and researches from Messrs. British Insulated Callender's Cables Ltd., London, one of the leading cable manufacturers in the world, by virtue of their services to the Company as technical consultants."

The Company's financial position, as disclosed by its balance-sheet as at 31st March 1956, is impressive. Its paid-up capital of Rs. 40 lakhs consists of 400,000 ordinary shares of Rs. 10 each. This is supplemented by reserves and surplus aggregating Rs. 76.35 lakhs. Secured loans against debentures and cash-credit arrangements with banks account for Rs. 67.60 lakhs, unsecured loans for Rs. 44.10 lakhs, and other current liabilities for Rs. 37.74 lakhs. The provision for taxation stands at Rs. 51.56 lakhs. The gross block of the value of Rs. 63.81 lakhs stands depreciated at Rs. 22.28 lakhs. The current assets aggregate Rs. 295.08 lakhs, and include, besides other items, stores and spares Rs. 13.50 lakhs, raw materials Rs. 63.64 lakhs, stock of finished products Rs. 32.91 lakhs, work-in-progress Rs. 8.25 lakhs, sundry debtors considered good Rs. 127.58 lakhs, loans and advances Rs. 41.41 lakhs and cash and bank balances Rs. 7.70 lakhs. The current assets cover the liabilities and provision for taxation by a fair margin of Rs. 94.08 lakhs.

The Rs. 10 fully paid-up ordinary shares of the Company are currently quoted at Rs. 26-12 *ex-div*. On the basis of the total dividend for the year at 20 per cent., the yield works out to 7.5 per cent. per annum, free of income-tax.

SUGAR

(*Continued from page* 268)

cost of converting the sugar factory boilers so as to adapt them for burning coal instead of bagasse. This is, indeed, a bold offer considering that Mandya is far away from collieries and that transport has been a big bottleneck in the movement of coal to these parts of the Mysore State. It will be interesting to know the grounds on which the said *entrepreneur* is optimistic enough to overcome this formidable difficulty.

A CLARIFICATION

It will be recalled that the deliberations of the sixth meeting of the Development Council for Sugar Industry held at Walchandnagar last month were reviewed in these columns three weeks ago (*vide* issue dated 19th January 1957). In that review, we drew pointed attention to the difference between the estimates of sugar production during the current season as made by the Council (2.05 million tons) and by the Council's Chairman (2.25 million tons). Apropos this reference, the Secretary to the Council has addressed a letter to us, in which he says that the figure of 2.25 million tons reported in the Press was a typographical error. The estimate of sugar production given by the Chairman, he says, was the same as that given by the Council, that is, 2.05 million tons. The Secretary further states that there is also no difference as regards the number of new factories expected to go into production during 1956-57, which, according to him, is 14; the figure of 22 taken by us relates to the new units which are likely to go into production in the next (that is, 1957-58) season. The figure of 17 existing factories expected to complete their substantial expansion programme also relates to the 1957-58 season and not the current season.

Notices

THE PHALTAN SUGAR WORKS LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE TWENTY-FIFTH ANNUAL GENERAL MEETING of THE PHALTAN SUGAR WORKS LTD., will be held on Friday the 1st day of March 1957 at 4.30 p.m. (S.T.), at the Registered Office of the Company, Sangli Bank Building, 296, Bazargate Street, Bombay-1, to transact the following business:

1. To adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 30th September 1956.
2. To declare a Dividend.
3. To elect Directors in place of Shri Natverlal Bhikhabhai and Shri R. B. Apte who retire by rotation but being eligible, offer themselves for re-election.
4. To elect a Director in place of Shri M. L. Apte who retires by rotation as well as under Section 261 of the Companies' Act, 1956, but being eligible, offers himself for re-election and to consider and if thought fit to pass the following as a Special Resolution of which Special Notice has been received by the Company and is hereby given.

   "That Shri M. L. Apte who retires by rotation as well as under Section 261 of the Companies' Act, 1956, be and is hereby appointed a Director of the Company."
5. To elect Directors in place of Shri Arvind N. Mafatlal, Shri Rasesh N. Mafatlal and Shri Himatlal Kantilal who retire under Section 261 of the Companies' Act, 1956, but being eligible, offer themselves for re-election, and to consider and if thought fit to pass the following as Special Resolutions of which Special Notice has been received by the Company and is hereby given.

   "That Shri Arvind N. Mafatlal who retires under Section 261 of the Companies' Act, 1956, be and is hereby appointed a Director of the Company."

   "That Shri Rasesh N. Mafatlal who retires under Section 261 of the Companies' Act, 1956, be and is hereby appointed a Director of the Company."

   "That Shri Himatlal Kantilal who retires under Section 261 of the Companies' Act, 1956, be and is hereby appointed a Director of the Company."

The reasons which make these resolutions at item Nos. 4 and 5 necessary are set out in the statement of material facts annexed to this Notice which statement shall be deemed to be incorporated in the notice.

6. To appoint Auditors for the current year and fix their remuneration.

A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself. A proxy need not be a member.

By Order of the Board of Directors,
FOR MAFATLAL, APTE & KANTILAL PRIVATE LIMITED,
L. V. APTE,
Managing Director,
Managing Agents.

BOMBAY, 25th *January* 1957.

Notes.—The Transfer Books of the Company will be closed from the 12th February 1957 to the 18th February 1957, both days inclusive.

The Dividend when declared will be made payable through The United Commercial Bank Ltd., Fort, Bombay, on and after the 4th day of March 1957. The Dividend Warrants will be posted to those shareholders whose names stand on the Company's Register on the 12th day of February 1957.

ANNEXURE

Statement of material facts and reasons in respect of Special Business in the accompanying notice dated 25th January 1957:—

Items 4 and 5.—Shri M. L. Apte, Shri Arvind N. Mafatlal, Shri Rasesh N. Mafatlal and Shri Himatlal Kantilal are associates of the Managing Agents as defined in Section 2(3) of the Companies' Act, 1956. According to Section 261 of this Act, they can only be re-elected as Directors by Special Resolutions. All these Directors have rendered valuable services to the Company and it is considered desirable that their association with the Company be maintained by their re-election as Directors.

THE STANDARD COAL COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE STANDARD COAL COMPANY, LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 10-50 a.m. on Wednesday the 27th day of February 1957, for the following purposes:

1. To consider and approve the Audited Accounts of the Company for the year ended 31st December 1956, and to receive the Directors' and Auditors' Reports thereon.
2. To declare the Dividend recommended by the Directors.
3. To appoint a Director in the place of a retiring Director.
4. To appoint Auditors and fix their remuneration.

The Share Transfer Register of the Company will be closed from 13th to 27th February 1957, both days inclusive.

By Order of the Board,
F. W. HEILGERS & CO. (PRIVATE) LTD.,
Managing Agents.

CALCUTTA, 31*st January* 1957.

Note.—(*a*) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote instead of himself. A proxy need not be a member of the Company.

(*b*) The Dividend, if declared, will be paid on or after 6th March 1957, to those shareholders so entitled whose names appear in the Company's books on the 27th February 1957, or to their mandatees. No application for Dividend Warrants will be necessary.

THE STANDARD COAL COMPANY LIMITED

AT A MEETING OF THE BOARD OF Directors held on 31st January 1957, a Dividend of 10 per cent. per annum was recommended to be paid for the year ended 31st December 1956, without any deduction for Income-tax paid by the Company.

By Order of the Board,
F. W. HEILGERS & CO. (PRIVATE) LTD.,
Managing Agents.

CHARTERED BANK BUILDINGS,
CALCUTTA.

THE INDIAN IRON AND STEEL COMPANY, LIMITED

NOTICE

AT A MEETING OF THE BOARD OF DIRECtors of the Indian Iron and Steel Company, Ltd., held today, it was decided that in accordance with the resolution passed at the Extraordinary General Meeting of the Company held on the 1st December 1956, the Rights Offer of 5,183,708 new Ordinary shares of Rs. 10 each at a premium of Rs. 3-8-0 per share be made to those persons who are registered as holders of Ordinary shares in the Company's Register of Members on the 11th March 1957, in the proportion of one new Ordinary share for every Ordinary share held by each such person on the said date.

The Ordinary Share Register of the Company will remain closed for the purpose of this offer from the 21st February 1957 to 11th March 1957, both days inclusive.

Holders of Ordinary shares under blank transfer are particularly reminded that it is necessary to lodge the Certificates of Shares with instruments of transfer duly completed in all respects before the Register is closed in order to be entitled to the Rights Offer. Authority of persons signing instruments of transfer and in cases of transfer of shares out of the names of deceased shareholders, grants of legal representation, Estate Duty Discharge Certificates or evidence of acquiring the shares by the transferees for valuable consideration must be registered with the Company, otherwise applications for transfer of shares in such cases can not be entertained by the Company.

Legal Representatives of deceased shareholders should get their legal representations immediately registered with the Company to enable them to receive and deal with the Letters of Rights on behalf of the estate of the deceased.

By Order of the Board,
MARTIN BURN LIMITED,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

29*th January* 1957.

POWER ENGINEERS IN CONCLAVE

(*Concluded from page* 273)

sufficient, if not remunerative, as early as possible. Assisting the establishment of such industries in rural areas could, therefore, be regarded as part of the rural electrification programme.

Apart from financial assistance both by way of capital and revenue subsidies one more method by which the rural electrification programme could be accelerated is by cheapening construction costs, without, of course, materially sacrificing efficiency and safety. This would need amending statutes and how best this could be done was left for the consideration of an expert Committee.

Accounting Code

Submission of statutory accounts by licensees to the various authorities is subject to one "yardstick." With undertakings varying in sizes, such "yardstick" imposes unnecessary burden on small licensees without adding much to the sum total of statistical knowledge. The Conference saw the real necessity for the early preparation—in consultation with the industry—and issue of a code for the purpose.

With general steel shortage in the country, and cement also in short supply, there was general recognition of the need for limiting the usage of these materials to the minimum level practicable. The seriousness with which the problem was considered reflected in an expert committee being constituted to investigate and to recommend ways and means of effecting maximum economy in the use of cement and steel.

Technical Personnel

The tempo with which the country's power development could be sustained will largely depend upon the availability of suitable technical personnel, a need which is sorely felt. Various Government committees have reported on the general problem of technical training but field training for technical personnel in power projects is a special problem, a study of which would not involve in duplication of labour. And so has come about another expert committee to examine the problem and make appropriate recommendations.

The eight-day session of the Conference came to a close, having offered, as its main achievement, a forum for free interchange of knowledge. The resolutions adopted were distilled essence of the vast ground covered by the discussions, and it is now left for the Government to consider the various recommendations made by the Conference, so that the Committees constituted by the Conference could carry forward the tale.

SWISS INDUSTRIES FAIR

The Forty-first Swiss Industries Fair will be held this spring between 27th April and 7th May in Basel. This will be one among the many large fairs that will be held in Europe about the same time.

The total number of exhibitors at the Fair are expected to be 2,300, occupying an area of 1,300,000 sq. ft. It is claimed that the Basel Fair offers excellent opportunity to foreign visitors to become acquainted with Swiss industrial production.

The exhibits are divided into 17 different groups, covering, among other things, applied art and ceramics, paper, textiles and clothing, footwear and leather goods, electrical industry, machinery, transport, and building industry. It is stated that the traditional export industries of Switzerland will be prominently exhibited at the Fair. The main export groups will be: watches, textiles (with the special exhibits "creation" and Madame Monsieur), textile machinery, general engineering and the electrical industry.

The Fair accommodation department arranges suitable accommodation for visitors. The reception staff are qualified and speak foreign languages. Booklets, catalogues and any other information are obtainable from the Swiss Consulate Offices in Bombay and Calcutta, Swiss Legation, New Delhi, and the Swiss Trade Commissioner, Bombay.

THE INDUSTRIES ACT

The Government of India, it is stated, will bring into force as from the 15th inst. the Act amending the Industries (Development and Regulation) Act of 1951. The amending legislation brings 34 new industries within the purview of the Industries Act to enable the Government to secure the development of those industries in conformity with the country's industrial policy.

Some of the industries covered by the amending measure are: ferro alloys and special steels, electrical furnaces, earthmoving machinery, typewriters and calculating machines, air-conditioners and refrigerators, plastic moulding industries, paints, varnishes and enamels, staple fibre, pulp, food processing industries, matches and cigarettes. It is further stated that certain minor modifications in the registration and licensing procedure under the Act have been notified in a *Gazette of India Extraordinary* for eliciting comments from the public. The Government will receive suggestions or coments on the proposed modifications until 9th February.

MONEY RATES HARDEN

(*From Our Own Correspondent*)

BOMBAY, 6*th February*

The most important development of the week, in so far as the short-term money and the Gilt-edged markets are concerned, was the announcement by the Reserve Bank on Thursday last of a rise of ½ per cent. to 4 per cent. in its rate of interest on advances to Scheduled banks against Government securities, with effect from the 1st inst. Earlier in the day, the Bank also announced that there was no increase in the Bank rate, which would continue at 3½ per cent., and that its lending rate against usance bills would also be unchanged at 3½ per cent. The effective rate of interest on borrowings by banks against usance bills as from the 1st inst., is, however, 4 per cent., following the increase in stamp duty on these bills to ½ per cent. The rise in the effective bill rate was said to be the main reason for increasing the interest rate on advances against Government securities also. By raising the advances rate against securities without increasing the Bank rate, the Reserve Bank took the unprecedented step of divorcing its lending rate from the Bank rate.

The effect of this action was an immediate hardening of the interest rates in the short-term money market, which had already been experiencing acute stringency and borrowers had been bidding funds at considerably higher rates of interest than those they had paid in any of the previous busy seasons. Inter-bank call money which had been nominally placed at 3½ per cent. was bid at 3¾ per cent. Some lenders in this section demanded even 3¾ per cent., but borrowers were reluctant to pay more than 3¾ per cent. House money at call was done at 4 to 4¼ per cent.—the higher rate for substantially large amounts—as against 3¾ to 4 per cent. in the previous week. The rates for short-term deposits also rose from 3.7/8-4 per cent. to 4-4¼ per cent.

The Reserve Bank of India statement for the week ended 1st February 1957 shows a small rise of Rs. 8.50 crores in notes in circulation and a fall of Rs. 9.01 crores in notes held in the Banking Department. The fractional decline in total notes issued is covered by a similar contraction in rupee coin. There has been a further fall of Rs. 14.91 crores in foreign securities, bringing the aggregate recession in the past three weeks to Rs. 34.79 crores. As in the previous two weeks, there has been a corresponding rise in rupee securities. In the Banking Department, deposits of the Central Government are higher by Rs. 89 lakhs, those of other Governments by Rs. 3.35 crores and of banks by Rs. 2.68 crores. The decline in foreign securities noted in the Issue Department has been offset to the extent of Rs. 10.66 crores in balances held abroad, so that the net fall in foreign assets is only Rs. 4.25 crores. Loans and advances to Governments are lower by Rs. 1.23 crores, while other loans and advances have gone up by Rs. 6.27 crores. Investments are also up by Rs. 1.81 crores. Advances to Scheduled banks against usance bills during the week amount to Rs. 13.50 crores, but repayments have been of the order of Rs. 13.94 crores.

The Scheduled banks' statement for the week ended 25th January 1957 discloses a further increase in deposits of banks, demand deposits rising by Rs. 3.73 crores and time deposits by Rs. 3.29 crores. Inter-bank borrowings are also higher by Rs. 81 lakhs and borrowings from the State Bank of India by Rs. 2.01 crores, while those from the Reserve Bank have declined by Rs. 97 lakhs. A rise of Rs. 7.40 crores is noted in advances and Rs. 2.76 crores in bills purchased and discounted. Cash balances have shrunk by Rs. 1.68 crores, while money at call and short notice have gone up by Rs. 2.06 crores.

The Gilt-edged market ruled quiet during the week under review. The effect of the rise in interest rate on advances against Government securities by the Reserve Bank, referred to above, did not have any serious effect on prices, as was initially feared as soon as the announcement came and as would have been the case if the Bank rate had been raised. There was no more than a psychological reaction. The sentiment was, however, affected and the cheerful tone noted in the previous week was completely absent. The volume of business very much dwindled, with buyers reserved. There was, however, sellers in State loans, and marked decline in prices was noted in 4 per cent. 1963 and 1964 issues.

3 per cent. 1986 Conversion Loan was marked down from Rs. 73-9 to Rs. 73-8. 3 per cent. 1970-75 also shed an anna to Rs. 87 and 3 per cent. 1966-68 suffered a similar drop to Rs. 92-4. 3 per cent. 1964 and 1963-65 were unchanged at Rs. 94-6 and Rs. 94-3, respectively. 3½ per cent. 1962 lost an anna to Rs. 97-13. 3½ per cent. 1964, 1965 and 1967 each was marked down by an anna to Rs. 98-6, Rs. 98-5 and Rs. 98-7, respectively. Among State loans, 4 per cent. 1963 and 1964 Bombay dropped by As. 4 to Rs. 100 and 1967 by an anna to Rs. 99-10. 4 per cent. 1963 and 1964 W. Bengal receded by As. 3 to Rs. 99-12, Madras by As. 2 to Rs. 99-1 and Rs. 99, respectively, and U.P. by As. 6 to Rs. 99. U.P. 4 per cent. 1967 lost As. 2 to Rs. 98 and 1968 by an anna to Rs. 97-14. 4 per cent. 1963 Bihar gave way by As. 8 to Rs. 98-8 and Madhya Bharat by As. 8 to Rs. 99 and Travancore-Cochin by As. 6 to Rs. 99.

In the foreign exchange section, the rupee continued to display a hardening tendency in terms of the U.S. and Canadian dollars, in tune with the strength of sterling abroad. Banks' selling rate of ready dollars declined from Rs. 478¼ to Rs. 478 and their buying rates from Rs. 475 to Rs. 474¾ per $100. In the case of Canadian dollars, their selling rate was reduced from Rs. 500¼ to Rs. 500, but their buying rate was kept unchanged at Rs. 494¼ per $100. In New York, spot sterling, after an initial reaction from $2.79½-2.79¾ to $2.79.11/16-2.79.13/16, hardened to $2.79.13/16-2.79.15/16. Three months' forward improved from $2.78.5/8-2.78¾ to $2.79-2.79¼ and transferable sterling from $276.65-276.75 to $276.75-276.85 cents.

BULLION TOUCHES NEW PEAK

(*From Our Own Correspondent*)

BOMBAY, 6*th February*

After a lapse of one week, the bullion market displayed, once again, buoyancy during the week under review; the prices of both silver and gold reached fresh high levels since 1951. Silver, in particular, made considerable headway on strong speculative buying and heavy short-covering and encouraging advices from Calcutta. It was stated that in both Calcutta and Bombay, a considerable long position, very much in excess of the available floating stocks, had been built in recent days. This, coupled with the fact that arrivals of Tibetan coins had considerably dwindled, pushed up prices swiftly. Fairly good offtake in the ready section also fanned the bullish enthusiasm.

Gold also displayed a firm trend, though at higher levels the tendency was somewhat hesitant. Satisfactory offtake in the ready section and reports of confiscation of large quantities of smuggled gold were the main factors for the brighter sentiment in the yellow metal.

Forward silver (15th February settlement) rallied from Rs. 183-6 to Rs. 186-6 on Saturday. After a reaction to Rs. 184-14 on Monday, the upward trend was resumed and the current settlement touched a peak of Rs. 186-11 today before closing at Rs. 186-1. The next settlement, the business in which began on Friday last at Rs. 184-6, advanced to Rs. 186-14, but finished today at Rs. 186-4.

Ready silver climbed up from Rs. 184-2 to Rs. 187, but, after a short-lived reaction to Rs. 185-8, spurted to Rs. 187-3 today. The closing was, however, lower at Rs. 186-9. The floating stocks of silver are placed at 1,300 bars. The daily average offtake was about 20 bars.

Gold for forward delivery (14th February settlement) crept up from Rs. 107-8 to Rs. 108-11 on Saturday. On profit-taking, following a shrinkage in offtake, the price dropped to Rs. 107-15 on Monday. But during the last two days again, there was a sizable improvement in demand, which pushed up the price to Rs. 108-9. The closing was done at Rs. 108-7. The March settlement closed today at Rs. 108-12, as against the opening rate of Rs. 108-3.

Ready gold advanced from Rs. 107-5 to Rs. 108-8, the highest level touched during the week being Rs. 108-11. The floating stocks of gold are estimated at 30,000 tolas. The daily average arrivals were 3,000 tolas, while the offtake was slightly higher at an average of 3,500 tolas per day.

There was no change in silver price at New York, which stood at 91⅛c. London silver prices also were unchanged at 80d. per spot and 79¾d. for forward. Gold displayed a firm tone, rising from 249s. 1¾d. to 249s. 4d.

The following comparative table shows the trend of market during the week under review:

	6-2-1957	Highest	Lowest	29-1-57
	Rs. a.	Rs. a.	Rs. a.	Rs. a.
GOLD				
Ready (.99 fine Mint)	108 8	108 11	107 7	107 5
Forward*	108 7	108 11	107 10	107 8
Sovereign	69 0	69 0	68 8	68 8
SILVER				
Ready (.996 fine Mint) ..	186 9	187 3	184 7	184 2
Forward†	186 1	186 11	183 13	183 6
London Silver Ready ..	80d.	—	—	80d.
London Forward	79¾d.	—	—	79¾d.

N.B.—Foreign bullion prices shown in the above table relates to the previous day.

METALS QUIET

(*From Our Own Correspondent*)

CALCUTTA, 5*th February*

Quiet conditions were in evidence in the metal market during the week under review. Consumers were content with purchasing small quantities to meet day-to-day needs only. From Rs. 193, electrolytic copper declined to Rs. 190-8 and the fire-refined material to Rs. 189 from Rs. 192. Scrap prices, however, were maintained at previous rates, the utensils scrap quoting at Rs. 185. The price change in regard to electrolytic copper was in full accord with the trend in London and New York. Consumers in the above foreign markets were not entering into commitments, in view of reports of a downward revision in the American price. It was anticipated that local prices, which were above the replacement costs, would fall further.

There were fewer transactions in lead, in view of the comfortable supply position, and reflecting this, the price gave way from Rs. 81-12 to Rs. 80-12. On the other hand, tin at Rs. 544 added three points. Ready material was in good demand, and recent arrivals did not alleviate the tight supply position. Fair activity was also reported in electrolytic zinc, the price improving from Rs. 74-8 to Rs. 75.

LINSEED RECEDES

(*Messrs. A. Bradley and Co.*)

CALCUTTA, 4*th February*

Linseed prices have shown a notable decline and trading has been limited, with both buyers and sellers somewhat reserved. The discount for forward delivery has narrowed slightly, but little interest is shown by upcountry sellers to make new crop sales. The main factor witholding crushers' activity has been the dull condition of the linseed oil market. In addition to poor local offtake, much quieter advices have been received from overseas, with buyers pausing even below parity level.

The latest available quotations are: February Rs. 24-12 and April-May Rs. 22-4 per maund.

COTTON FUTURES EASY

(*From Our Own Correspondent*)

BOMBAY, 6*th February*

Although earlier in the week a declining trend was in evidence in the futures section of the local cotton market, towards the close of the week, values staged a partial recovery. The earlier weakness was due to the decision of the East India Cotton Association to maintain the *status quo* in respect of By-law 55 which nullified its earlier resolve to fix the tendering differences on the basis of the spot rate. The Board of the E.I.C.A. appears to have been influenced by the growing concern of the Government over the recent spurt in cotton values. Presumably, with a view to preventing any kind of development that would provoke Government intervention, the Board has decided to keep intact the existing law. This has been bearishly interpreted in trade circles and the selling pressure that ensued brought down prices. Values, however, recovered yesterday on trade buying and both the contracts regained some of the lost ground.

M.G. Jarilla (March delivery) opened the week at Rs. 664-8 as against the previous closing of Rs. 667-12 and succumbed to selling pressure, reaching a low of Rs. 658-4 on the same day. Continued bear hammering brought the contract further down to Rs. 654 on the 2nd inst. The revival in demand witnessed in subsequent sessions pushed the contract up to Rs. 662-8 yesterday. Opening higher today at Rs. 665 it firmed up to Rs. 670 before closing a shade lower at Rs. 668.

M.G. Vijay April delivery, after having opened at Rs. 775-8, as against last week's closing of Rs. 779-4, eased to Rs. 765-8 the same day. The wave of speculative selling, touched off by reports that Government is taking a serious view of the recent rise in prices, resulted in a virtual landslide and the contract slumped to as low as Rs. 755 on the 2nd inst. It again improved to Rs. 769-8 yesterday. Opening today at Rs. 773 and having displayed a slightly firm trend, the contract eased to Rs. 770 and closed higher at Rs. 771.

The following table gives the trend of prices of the two contracts for the week:

(In rupees per candy of 784 lbs.)

	6-2-57	*High*	*Low*	29-1-57
Jarilla (March) ...	668	670½	648½	667¾
Vijay (April) ...	771	774½	775	779½

The spot section ruled steady. Mill interest was noted for ready lots of quality cotton, especially for 0394, Khandesh, Jarilla, etc. Because of the downward trend of the futures section, mills were not inclined to enter into large commitments. Export inquiries were noted for Jarilla ¾" (passable) and some business was reported to have been put through in this quality. In the foreign section, American styles attracted attention. It is reported that the Board of the E.I.C.A. at its meeting held today considered the question of discontinuance of trading in delivery contracts. The decisions taken are, however, not known. The latest available spot quotations—in rupees per candy of 784 lbs.—are given below:

Bengal *Deshi* 730: Berar Jarilla 760; Khandesh 780; Vijay 910; Oomra *Deshi* 775; Moglai 725. *Delivery Contracts*: Vijay 13/16 February 124 'ON' Vijay. Others are not being quoted.

The Joint Chief Controller of imports has announced that it has been decided not to entertain any application for the import of American cotton under Public Law 480 as the monetary ceiling allotted for the issue of the licences has been reached. This refers to licensing under Trade Notice No. 198 of the 23rd November 1956 issued by the Joint Chief Controller of Imports. However, it is generally expected that Government will make available early a further import quota for U.S. cotton under Public Law 480 although this will be possible only after the U.S. Government has issued a new Procurement Authorisation favouring India. The Indo-U.S. Aid Agreement contemplates import of 500,000 bales (500 lbs.) of U.S. cotton and Trade Notice 198 covered only about 145,000 bales (500 lbs.). Applications for import of American cotton will, however, continue to be considered against the quantity available for import under the Indo-U.S.-Burma Tripartite Agreement. This programme covers about 37,000 bales and upto the 29th of December only about 2,000 bales had been licensed.

In contrast to the bearish trend noted last week, the Karachi market ruled firm during the week under review. The firmness was due to large export inquiries and good demand by shippers. Rumours, which later proved to be unfounded, that Russia was inquiring also affected the sentiment earlier. But speculative selling based on the possibility of granting export subsidy by the U.S. Government and larger crop estimate (Pakistan) caused values to fall. The recent announcement of higher freight rates also acted as a damper. N.T.R.G. January went off the board on 31st at Rs. 83-5. The March position, which had closed at Rs. 82-4, improved to Rs. 83-1, while May delivery which stood at Rs. 82-12 on 31st January improved fractionally to Rs. 82-14. The spot section also ruled steady. The latest available rates—in rupees per 82 lbs.—for a few popular varieties of Pakistan cotton are given below:

Sind *Deshi* 93; Punjab *Deshi* 85; 4F Punjab Roller 89; S.G. 92-8; L.S.S. Punjab Roller 90-8: S.G. 94-8; N.T.R.G. 88-8; S.G. 95-8; 289F Punjab Roller 93-8; S.G. 106.

A firm trend was depicted by Alexandria cotton futures market during the week. Despite the small inquiries from abroad, the market remained strong and appreciable gains were recorded by both Ashmouni and Karnak contracts, especially the former. There was fair domestic spinner demand. The speedy clearance of the Suez Canal, it is hoped, will facilitate the shipment of Egyptian cotton, the export performance of which in the current season has

been poor. The following are the latest available quotations—in tallaris per lb.—from Alexandria:

Karnak: March 121.35; May 120-10; July 118.75. *Ashmouni*: February 87.30; April 86.65; June 86.40.

Cotton values were maintained in the Liverpool market during the week. There were some small inquiries for ready cotton and limited turnover was reported in medium and lower grades of U.S. cotton and Turkish Adana. Some business was also put through in Indian Dholleras. Earlier, although there was the fear of the resumption of U.S. dock workers' strike, no fresh business was done on this account. But later it was reported that the terms of settlement of the dispute had been agreed upon. This removed the possibility of renewal of the strike. Both the American and American type futures contracts registered only moderate improvement. The small gain was due to mill covering against yarn sales. Rates were prevented from rising by hedge selling and American liquidation. Egyptian Karnak contract was neglected and nominally unchanged while Sudan Lambert Seed eased. The following are the latest available quotations—in pence per lb.—from Liverpool:

American Cotton One Inch Staple Contract: March-April 26.35; May-June 26.10; July-August 25.68; October-November 25.32. *American Cotton Mixed Growth Contract*: March-April 26 60; May-June 26.28; July-August 25.88; October-November 25.5. *Egyptian Karnak*: March-April 60. *Sudan Lambert Seed Contract*: May-June 45.00; July-August 44.

The New York market ruled firm during the week. The firmness was aided by the support extended by trade interests for current crop months. The strength of the market was also due to the tightening up of free supplies owing to the large entry into Government loan programme. New crop buying was attributed to drought conditions in the South-West. The high spot premium was another helpful factor.

Total purchases in the fourteen spot markets for the week ended 24th January were 137,900 bales, as against 212,800 bales during the previous week. Exports up to the week ended 24th January were 264,199 bales and the aggregate figure for the season thus far 3,435,115 bales. Total exports during the same period last season were only 741,677 bales.

The following are the latest available quotations from New York, as compared with those of a week and a fortnight before:

(In cents per lb.)

	5-2-57	30-1-57	22-1-57
Spot	35.40	35.15	34.95
March	35.20	34.83	34.45
May	35.07	34.81	34.48
July	34.52	34.32	34.22

SUGAR EASY

(From Our Own Correspondent)

BOMBAY, 6th *February*

The sugar market ruled distinctly easy during the week under review. The chief bearish influence was the drop of As. 12 per bag in the ex-mill quotations for Bombay-Deccan sugar and of As. 6 per maund, for U.P. and Bihar sugar. Two other unhelpful factors were the rumour that no levy of additional excise duty on sugar was contemplated and the expectation of the issue of a normal monthly release on the due date. Several mills which had large quantities of previous season's stocks were keen sellers at a discount. Some of them were also trying to unload current season's output against the recent release orders. Arrivals of sugar into the market during the week were, as a consequence, quite large, being 18,600 bags, as against 10,600 bags in the previous week.

Spot large grain indigenous sugar fell from Rs. 94-Rs. 100 to Rs. 92-Rs. 99 per bag (inclusive of sales tax). Small grain was neglected at Rs. 88, as also medium grain at Rs. 89-Rs. 91.

In the forward section, *Fagan* delivery contract for 'C' grade sugar receded by As. 4 to Rs. 91-12 per bag (inclusive of sales tax).

RAYON YARNS BEARISH

(From Our Own Correspondent)

BOMBAY, 6th *February*

An outstanding event of the week in the yarn market was the commencement, with effect from yesterday, of business in 150D rayon yarn for April delivery. The new contract is a broad-based one, in that it covers both foreign as well as indigenous yarns in 150 and 120 bright hanks and cones. The contract has been sufficiently widened to make bright cone yarns 150 deniers 1st, 2nd and 3rd qualities tenderable at a difference of an anna per lb., 150 deniers 1st quality being the standard quality. Furthermore, even 120 deniers bright 1st, 2nd and 3rd qualities on cones are tenderable on the Exchange at a difference of As. 4 per lb. over the prices of 150 deniers bright. The new feature of this forward trading is that indigenous yarn in both 120 and 150 deniers (1st, 2nd and 3rd qualities) is also tenderable on the Exchange at the same prices as those of foreign yarns, except in the case of Travancore Rayons which are tenderable only at a discount of As. 2 per lb. In the case of bright cone yarns, the packing allowed to be tenderable is 180 lbs. to 220 lbs. per case. Besides this, even the hank yarns are tenderable (both foreign and indigenous), but the packing should necessarily be 10 lbs. bundles and 20 lbs. bundles per case.

During the week under review, the rayon yarn section depicted a bearish trend. There was considerable selling pressure induced by the reported conclusion of a bulk deal for 3.22 million lbs. of yarn which the Japanese producers have agreed to sell to the silk and Art Silk Mills' Association at 10 per cent. lower than their official prices. Consequently, rayon yarn prices in the market staged a setback. Snia rayon yarn (120 duil cones) for February delivery was hammered down by Rs. 23 to Rs. 797. 150 Bt. cones April delivery, business in which commenced yesterday at Rs. 671, was neglected at Rs. 657 today. In the spot section, 150 Japan fell by As. 2 to Rs. 4-6-6. 120 Japan dropped half an anna to Rs. 4-5. 120 Italy and 150 Italy both lost a like amount to Rs. 4-1-6 and Rs. 3-11-6, respectively. Among indigenous yarns, 150 Bt. cones first grade receded by 15 pies to Rs. 3-5-9. 120 Bt. cones first grade was dull at Rs. 3-11-6.

The staple fibre yarn section ruled quiet. Transactions put through were limited and prices moved narrowly. (40×2) April delivery was unchanged at Rs. 662. February delivery was somewhat better at Rs. 656, as against Rs. 652 last week-end. Among spot indigenous yarns (40×2), Kohinoors declined by half an anna to Rs. 3-8. New Greats were unaltered at Rs. 3-6-3, as also Citys at Rs. 3-7 and Centurys at Rs. 3-7-6. Deals in foreign yarns (80×2) were reported at lower prices, Fujis easing by 18 pies to Rs. 5-7-6 and Paramounts by 6 pies to Rs. 5-6.

Barring coarse counts which elicited support, cotton yarns generally ruled easy. Among forty counts, Moderns slipped by As. 8 to Rs. 28-8. Minaxis lost As. 2 to Rs. 27-5. Among sixtys, Moderns and Finlays shed As. 8 each to Rs. 63 and Rs. 61, respectively. Raghuvamshis were quiet at Rs. 57-12. Eighty counts Moderns came in for selling and declined by As. 8 to Rs. 77-8. Mahendras were done at Rs. 75. Twenty counts Maduras met with excellent buying inquiries and spurted by Rs. 2 to Rs. 21-12. Moderns strengthened by a rupee to Rs. 28. Ten counts Moderns hardened by As. 2 to Rs. 15-8. Podars were fully maintained at Rs. 15-8.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	6-2-1957	30-1-1957
	Rs. a.	Rs. a.
Art silk yarn (per case of 200 lbs.)—		
150 Drull Cone Snia February	797 0	820 0
150 Bt. Cones April	657 0	—
120 Japan (per lb.)	4 5	4 5½
150 Japan (per lb.)	4 6½	4 6½
120 Italy (per lb.)	4 1½	4 2
150 Italy (per lb.)	3 11½	3 12
Staple fibre yarn (per case of 200 lbs.)—		
40×2 February	656 0	652 0
40×2 April	662 0	662 0
40×2 New Great (per lb.)	3 6½	3 6½
40×2 Century (per lb.)	3 7½	3 7½
40×2 City (per lb.)	3 7	3 7
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	15 8	15 8
20s Madura	21 12	19 12
40s Gokak	27 8	27 8
60s Finlay	61 0	61 8
80s Modern	77 8	78 0

OILSEEDS REACT

(From Our Own Correspondent)

BOMBAY, 6th *February*

During the week under review, the local oilseeds market witnessed a setback in values. The chief factors responsible for this trend were the offerings from the local as well as upcountry operators, increase in the interest rates of the Reserve Bank, and fears that the Board of the Oilseeds Association might impose ceiling rates in furtherance of its efforts to control the rising trend of prices. The reaction in the castor section was more pronounced than in the groundnut section owing to lack of support and foreign advices and increased inflow of stocks from upcountry centres. The linseed and cottonseed sections were also weaker owing to lack of support.

Groundnut February contract, opening at Rs. 168-8, touched a high of Rs. 169-6 the same day before finishing lower at Rs. 166-10. Subsequently, with minor fluctuations, it consistently but slowly declined to Rs. 163-4 yesterday. Today, however, it reached the level of Rs. 167-12 before finishing at Rs. 167. Over the week it lost Re. 1-8. May contract, too, reflected a similar trend. Having commenced at Rs. 169-14 on 31st January, it touched the same day the level of Rs. 170-4. During the following days it reflected a steadily declining trend, touching the lowest level of the week at Rs. 162-4 on 5th inst., before finishing today at Rs. 165-10. In the spot section, Bold F.A.Q. lost As. 14 at Rs. 34 over the week, while groundnut oil ex-mill was lower by As. 10 at Rs. 18-10.

In the linseed section, linseed May contract having opened at Rs. 30-12, steadily receded to Rs. 29-2 on 4th inst. and to Rs. 28-12 on 5th. Today it opened at Rs. 27-15, but finished higher at Rs. 29-7. It lost over the week Re. 1-2. In the spot section, Bold was quoted at Rs. 31-4, that is, Rs. 2-12 less than a week ago. Linseed oil ready was done at Rs. 18, or Re. 1 less than last week.

Castorseed May (futures) contract reflected a steeper fall than the rest. It commenced the week at Rs. 163-4, but reacted after minor fluctuation to Rs. 157-12 on 2nd inst. It, however, climed up to Rs. 160-8 on the following day before again falling back to Rs. 156-12 the same day. Yesterday, after commencing at Rs. 156-8, it further declined to Rs. 154-4, before closing As. 4 higher. Today, however, it recovered partly to Rs. 157-12 before finishing at Rs. 157. The decline over the week was no less than Rs. 6-8. In the spot section, Bold receded by Rs. 3-4 to Rs. 32-12; and Oil B.S.S. by Rs. 2-2 to Rs. 20-4.

Cottonseed February contract was almost equally dull. Opening steady at Rs. 101, the contract sagged to Rs. 99-8 the same day. Though on the following day it went up to Rs. 101, it declined in subsequent sessions and was quoted at Rs. 96-8 on 4th inst. Today, it closed higher at Rs. 99. It lost over the week Rs. 4. The May contract, similarly, opened at Rs. 101-12 and touched the peak level of the week at Rs. 103-8 the same day. During the following days the trend was markedly downward, and it receded to Rs. 97 yesterday, before finishing up today at Rs. 99.

Among the other seeds. *kardiseed* Bold was a shade lower at Rs. 21-8 and *nigerseed* Madras was done Re. 1-4 lower at Rs. 29-8.

On 30th January, the Union Government raised the maximum limit of 100 tons on individual shipments for export of coconut oilcake to 250 tons. Thus the maximum quantity of coconut oilcake that an exporter, along with his branch or associate concern. holding the same income-tax verification certificate registration exemption, is allowed to export from all the ports is 250 tons. The trade is also informed that requests for further allotments will be considered on *ad hoc* basis, on completion of shipment of the maximum ceiling of 250 tons.

The following table shows the prices of oilseeds and oils at close as compared with those at the close of the previous two weeks:

	6-2-1957	30-1-1957	23-1-1957
	Rs. a.	Rs. a.	Rs. a.
Groundnuts—			
February 1957	167 0	168 8	168 8

PEPPER WEAK

(Messrs. Parekh & Co.)

BOMBAY, 6th *February*

During the earlier part of the week, Malabar black pepper rallied in sympathy with New York where spot improved to $0.28½ owing to demand from grinders, following the uncertainty regarding the dock strike. New York bought January at prices ranging from $0.25 to $0.25¾. Alleppey improved to Rs. 600 and garbled to Rs. 10¼. On a trading ring, February and March were done at Rs. 103 and Rs. 106 respectively. Calicut had sellers at Rs. 635.

In the later part of the week, New York, having withdrawn, prices eased. Pressure of liquidation by weak holders in February delivery owing to proximity of due date is another factor responsible for the present weakness. The market is so sensitive that a small reduction in Bombay is having its effect on the original centres as well as on New York.

Alleppey came down to Rs. 575 while garbled was traded at Rs. 97½, the demand having failed to keep pace with arrivals. Growers are bullish. They refuse to sell in sizable quantities at lower prices. But for the sake of testing the market they often sell small parcels at the ruling price.

Continuous enquiries by Russia for further purchases are, however, a supporting factor. Western Europe is reported to be out of the market for Malabar owing to its higher cost but Eastern Europe is said to be negotiating off and on for sizable parcels. Prices being lower, exporters are unwilling to keep their position blank. They, therefore, either buy first and then sell or come out to hedge their sales immediately by purchasing ready or forward according to their opinion. After an earlier shake out, Singapore is reported steady and is now quoting Str.$80 for black and Str.$105 for white.

The financial position of Indonesia being far from healthy pressure for selling from that source is reported; holders there prefer to keep their money in pepper rather than in paper currency.

The future at the moment is uncertain but lack of anxiety to sell on the part of growers is interpreted as a healthy sign for the commodity.

February-March moped down from $0.25½ to $0.25¼ while April-May-June from $0.26 to $0.25¾ with small selling. February delivery is depressed owing to pressure from weak holders in view of the approaching due date. Following are today's nominal quotations: Ready delivery Rs. 81 per Bengal maund; February Rs. 565-70 and March Rs. 575-80 per candy of 5¼ cwts.

DUST TEAS DEARER

[Messrs. Forbes, Ewart & Figgis (Private) Ltd.]

COCHIN, 1st *February*

400,000 lbs. of tea were offered in dust sale 'C' held on Tuesday, 29th January 1957. The offerings met with a strong demand and the market can be quoted irregularly dearer for all types. Colours, mediums and lowest residual types continue to be fancied, whilst best liquorng sorts were rather easier.

The combined average price realised in dust sale 'C' was Re. 1-15-4 per lb., as compared with Re. 1-9-9 per lb. in the corresponding sale of 1956.

London Market.—Sale of 28th January 1957.—

Fully firm to occasionally dearer, although light liquoring brokens slightly easier.

Sale of 29th January:—Generally firm to dearer for everything, except light liquoring brokens, which were irregularly slightly easier.

Colombo Market.—Sale of 28th January 1957:—

Black grainy dusts and black fannings dearer. Other kinds 10 to 20 cents lower. Stalky broken mixed down 30 to 40 cents.

Sale of 29th January 1957:—Highgrowns lower, following quality. Coloury low medium brokens 10 cents dearer. Lowgrowns firm. High and medium fannings appreciably lower.

Calcutta Market.—Export.—Fairly general demand at lower rates. Brokens As. 1½ to As. 2; fannings half to one anna lower.

Internal:—24,000 dust. Fair general demand upto As. 2½ easier. Bright liquoring C.T.Cs firm. Black exportable types fair support. 2,800 leaf. Fair demand. Generally As. 1½ easier.

Export Quota:—The market for export quota has been rather quiet during the beginning of the week, with business taking place at As. 3 per lb. But the market has now hardened and business has been done at 40 pies.

Forthcoming Auctions:—Dust sale 'D' will be held on Tuesday, 12th February 1957.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Sale* 3:—1.9 million lbs. Very strong general demand for all low medium and medium descriptions, with B.O.Ps As. 3 to As. 4 dearer and fannings one anna to As. 2. Good medium and best liquoring quieter demand and prices very irregular."

JUTE GOODS DECLINE

(From Our Own Correspondent)

CALCUTTA, 5th *February*

The absence of sufficient inquiries, in the face of a welcome fall in the prices of raw jute was one of the factors which contributed to a modest decline in the prices of jute goods during the week under review. Markets are closed today on account of *Saraswati Pooja*, but yesterday, while raw jute prices continued to give way, jute goods recorded a fractional rise in rates following the Government call for tender for 8,000 bales of B. twills. The market was earlier anticipating sizable buying by the Government, and more orders were expected in the near future. That overseas buyers were enjoying a pause did not cause any surprise to shippers and traders generally. For, during and after the Suez Canal crisis, foreign consumers had increased their stocks as a preparation to meet any international emergency. It should be stated here that this was the cause for arresting the decline in prices of jute goods early in November and stocks of goods with mills recorded satisfactory declines. Now that the Suez crisis has almost ended and the Canal is expected to open for navigation in the month of March, it is only natural that overseas consumers should fall back on their stocks. Covering demand during the week under review was naturally confined to small quantities here and there. Traders believed that the reduced activity on account of export would not affect stocks with mills, since they expected that internal buying both on account of Government and private industry would be substantial in the coming weeks. During recent months, stocks of hessian had fallen more noticeably than those of heavy goods, on account of higher exports for the reason already indicated, and, to bring the statistical position to a more satisfactory proportion, mills are reported to have switched over a portion of the sacking looms to the production of hessian.

This week's decline in the prices of jute goods in Calcutta has caused awe and anxiety to the Pakistani mills, which are unable to compete with India in foreign markets. For, their raw jute stocks had been built up in a rising market, and it should be stated that Pakistani raw jute prices were far higher than the Indian prices. Pakistani mills, it is now stated, desire to replenish their fibre stocks. Prices in Narayanganj have also fallen, but, as and when Pakistani mills render support, there is the apprehension that prices might go up and make production of goods all the more uneconomic to them. Therefore, the prospect of Pakistani competition to Indian goods in foreign markets is very remote in the coming weeks. Raw jute prices in Pakistan began to fall during the week, in view of the poor demand for export at the prevailing high prices. It is stated that, in Pakistan, exports of raw jute to countries other than India and the United Kingdom have been much below than usual, and these countries are probably biding time to resume buying after prices move down. Current Indian buying from East Bengal is little, and in view of the satisfactory stocks of the indigenous fibre with both the trade and cultivators, Indian mills are not expected to purchase any substantial quantity from Pakistan, if prices do not fall further.

Conflicting reports continue to emanate from Dacca as to the functions of the proposed Jute Marketing Board and the Jute Marketing Corporation. The trade there is naturally opposed to the formation of these bodies, which, if they function for purposes earlier announced and already reviewed in these columns, would place severe restrictions on and scope for private trade. The trade has understandably been representing to the Government against the desirability of the Government competing with it. The authorities in Dacca are reported to have been convinced of the force of the arguments by the trade, and it is now believed that the Board would operate only as far as exports to India are concerned. This would mean that all offers for export to India would have to be put and processed through the Board. The Board would, therefore, give trial to its existence only in relation to India. Similarly, the Jute Marketing Corporation is not likely to purchase jute from all over the country, but would restrict its buying activity in the border areas only, aimed at the prevention of jute smuggling to India.

Early in the week, when it was learnt that export inquiries had fallen, weak holders started selling. This was reflected in ready 40" 10 oz. hessian declining from Rs. 44 to Rs. 43-11. In view of the larger stocks of heavy goods with mills, the reaction in ready B. twills was more noticeable, the rate sagging to Rs. 116-12. It was noted that there would be some delay in the inauguration of forward trading in raw jute and jute goods, as a section of the gunny trade at a recent meeting had vehemently opposed the recognition accorded by the Government to the East India Jute and Hessian Exchange under the provisions of the Forward Contracts Regulation Act. It would seem most advisable for the Union Commerce Ministry to depute a personal representative to Calcutta and thus have firsthand information, with a view to quickening the commencement of hedging facilities to the industry and trade. On Thursday, prices recorded a fractional recession with B. twills being priced at Rs. 117 and hessian 40" 10 oz. at Rs. 44, following manipulation by speculators in the *fatka*. However, the absence of genuine buying affected sentiment and by the week-end B. twills had fallen to Rs. 114.12 and hessian 40" 10 oz. to Rs. 43-2. There was an improvement in sentiment yesterday following the Government tender for B. twills referred to above and the price for this construction rose to quote Rs. 115-12. Hessian 40" 10 oz., in sympathy, was fractionally better at Rs. 43-6, with the 8 oz. quoting at Rs. 35-8 f.a.s.

Raw jute was quiet. Prices declined by Re. 1 to Re. 1-8 per maund for most constructions. This was due to the small support given by mills as well as to the fall in prices of jute goods. The latest quotations with February-March delivery position for the 1956-57 crop are:

	Middles Rs. a.	*Bottoms* Rs. a.

TEA PRICES RECEDE

(From Our Own Correspondent)

CALCUTTA, 5th *February*

The general demand during yesterday's, as well as last week's, tea export sales was good, but prices were lower. It was noted that, during last week's sale in London, prices of medium and common teas declined, while those of the best quality teas ruled steady. In accord with the fall in world prices of tea recorded during the month of January, the Government of India has fixed the price of tea for determining the export duty, at Rs. 3-15 per lb. for the current month, as against Rs. 4-3 in the last month. The duty thus moves down to As. 6 per lb. from As. 8.

Despite the unanimous opposition by the industry and trade to the continuation of the West Bengal entry tax and the Assam road tax on tea and the Plantation Inquiry Commission's recommendation for the abolition of the same, the two State Governments concerned continue to levy these two taxes on the industry. On behalf of the Tripura Tea Association, its Secretary, Mr. J. C. Bhattacharyya, said in Calcutta yesterday that the withdrawal of these taxes was among the measures he would propose for according the much-needed relief to the tea industry in Tripura, which has 55 gardens spread over an area of 11,900 acres and employing 10,000 workers. He said that, in view of climatic conditions, the yield in Tripura gardens was poor and Tripura tea realised the lowest average price. He, therefore, urged the Government to accord relief in freight rates also and provide seeds, fertilisers, fuel and machinery at subsidised rates to the gardens in Tripura, in addition to the grant of loans on favourable terms.

The strongest feature during yesterday's export sale, which had on offer 66,900 chests, was bright liquoring teas, the prices of which shot up by As. 2. A slight gain was also recorded in the prices of well-made and stylish whole leaf grades. Poor support was accorded to the superior C.T.C. types and, reflecting this, prices declined. Subsequently there were withdrawals. On the other hand, good attention was afforded to the lower priced C.T.Cs, which displayed a dearer tendency. Keen competition was noted in the commonest teas, which realised prices an anna to As. 2 above brokers' valuations. However, medium and medium brokens eased by an anna to As. 1¼. Demand was better for Darjeelings. The quotations were: best C.T.C. Assam B.P. Rs. 2-9 (nominal), medium Assam B.P. Rs. 2-1, clean black pekoe Rs. 2-4, and plain B.P. Re. 1-15 to Re. 1-15-6.

From 40 pies export quota declined to 39 pies, but subsequently sellers were prepared to part with their rights at 41 pies per lb. with buyers offering 39 pies.

Export offerings during last week's sale aggregated 68,700 packages. Keen competition was offered for good medium Assams and bright liquoring teas. Prices of these were higher occasionally. A few selected lots among C.T.C. teas met with better support, but all other lots in this category eased. Withdrawals from the thin liquoring and stalky B.Ps were heavy, and prices of these recorded a rapid recession earlier. Prices of common and medium teas fell by As. 2. There was good demand for clean well-made whole leaf grades and stylish B.P. teas. Prices of the former were often higher. Prices of tippy teas improved by As. 2 on strong demand. On the other hand, due to poor demand, Darjeelings were easy. The rates quoted were: best Assam B.P. Rs. 2-9 to Rs. 2-10, medium Assam B.P. Rs. 2-1-6, clean black pekoe Rs. 2-3-6 to Rs. 2-4, and plain B.P. Re. 1-15 to Rs 2.

Despite good general demand during the internal sales held last week, prices eased. Dusts on offer amounted to 24,095 chests. As an exception to the general trend, bright liquoring C.T.C. Assams were firm. This was so, in view of the smallness of these offerings. All other C.T.Cs declined by an anna to As. 3. Black leafy teas sold well. Other offerings met with an easier market. The rates that ruled were: best Assam C.T.C. Rs. 2-1, medium Assam grainy dust Re. 1-13, and medium Dooars Re. 1-12-6.

Prices of leaf grades, offerings of which amounted to 2,950 chests, declined by an anna to As. 2½.

HIDES EASY

(From Our Own Correspondent)

MADRAS, 4th *February*

Arrivals of tanned cow hides were moderate and clearance kept pace with arrivals. Prices were a shade easier than last week, as U.K. importers held off the market, and quoted 5 per cent. lower than the asking prices at origin. E.I. tanners are going slow with their raw stock purchases, which at current levels are 7½ per cent. above tanned U.K. parity. Trading with the U.K. has been limited and is not likely to revive during the first half of this month, as several steamers are discharging cargo in the U.K. in a bunch and dressers are not anxious to enter into fresh commitments.

Shipment business in tanned skins was restrained, on account of the progress of the London auctions.

In the January London tanned skins public sales, prices of goat skins—better tannages—8/9 and 11/12 lbs. averages maintained December levels, while lighter averages and other sorts declined by 3d. to 6d. per lb. In the tanned sheep skins section, prices declined by 6d. to 12d., though stocks available were smaller than usual. As there will be larger stocks available for sale in the March auctions, it is feared that price declines are a certainty, and consignors will be hard hit, unless Continental demand forges ahead.

HIDES STEADY

(From Our Own Correspondent)

KANPUR, 3rd *February*

During the week under review, the hides and skins market ruled steady. Demand for wet salted cow of superior quality was particularly keen. Supplies of goat and sheep were ample and the main purchasers in this line were the Madras dealers. The local tanners were the main parties to effect transactions in wet salted cow and buff.

The latest available quotations are: Wet salted cow 1st grade Rs. 360, 2nd grade Rs. 300 to Rs. 340 and 3rd grade Rs. 175 per score; wet salted buff 1st grade 1 lb. 14 ozs. and 2nd grade 2 lbs. per rupee; goat 1st grade Rs. 320 and 2nd grade Rs. 315 per 100 pieces; sheep 1st grade Rs. 315 and 2nd grade Rs. 250 per 100 pieces.

FOODGRAINS RULE STEADY

(From Our Own Correspondent)

HAPUR, 4th *February*

Foodgrain markets displayed a steady trend during the past week. Despite better supplies of wheat at fair price shops, following large-scale arrivals of imported wheat from Bombay, wheat prices did not record any appreciable decline, as stockists still wanted to store in expectation of better prices in the lean period during March. Over 73,000 tons of wheat were distributed last month in U.P. Outside buying inquiry for wheat was slack and wheat stock ran down by only one *khati* during the week to 52 *khaties*. The latest wholesale prices in important markets in Uttar Pradesh are: Hapur average Rs. 16-2; farm quality Rs. 17-8; Chandausi Rs. 17-4; Kasgunj Rs. 16; Gonda Rs. 16-4 and Sitapur Rs. 17-12-6.

The standing crop of wheat is reported to have slightly suffered, due to untimely heavy rains in the middle of January. Other coarse grain crops are progressing under healthy conditions.

Rice ruled quiet during the week. The Government, in order to avoid any possible effect on the market, has decided not to make any internal purchases of rice and paddy for the purpose of building stocks from the present harvest. The prevailing prices are: *Basmati* Rs. 23 to Rs. 26-4; *Manipuri* Rs. 20-8; coarse quality Rs. 16-4 per maund.

Gram ruled quietly steady during the week at Rs. 13-6 per maund for local quality and at Rs. 13-12 for Punjab produce. The gram stock here ran down by 4 *khaties* to 31 *khaties*. Maize recorded a slight fall, due to heavy stock position—11 *khaties*—and falling seasonal demand. The all-India first estimate of maize for 1956-57 puts the current year's area at 8,223,000 acres, as against the adjusted first estimate of 8,173,000 acres for 1955-56. Other coarse grains ruled steady during the week. The quotations as on Monday were: Barley Rs. 13-2; *bejhar* Rs. 12-14; maize Rs. 13-2; *bajra* Rs. 13-12; *jowar* Rs. 11-8 to Rs. 12-12; and *guwar* Rs. 11 per maund.

Pulses further advanced during the week due to fast dwindling stocks and fairly good outside buying inquiry. Peas stock was put at one *khati* only and there is still one and a half months for the arrival of the new crop in the market. *Dara* green quality peas was quoted at Rs. 14-14 and white quality at Rs. 17 per maund. *Arhar* improved to Rs. 13-4 per maund and stocks ran down to

STOCK & SHARE QUOTATIONS

Abbreviations :—D.= Deferred shares. P.O.= Preferred Ordinary shares. Y= Accounts published yearly. H.= Accounts published half-yearly. P.= Company has Preference shares. T.= Company has Debenture. N.= Nominal quotations. x.d.=Ex. Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where given for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year.

M—Managed by the Board of Directors. † Less income-tax. s) Clive Mills have paid dividend at As. 10½ on bonus shares, for the year 1955. * Including bonus. (k) Investment (f) Made up of an interim dividend of Re. 1-12 per share on 1,50,000 shares and final dividend of Re. 1-10 per share on 2,40,000 shares of which 1,30,000 shares are bonus shares. (e) For seven months ended 31st March 1956. † New Central Jute Mills—*Dividend for 1955* is on shares of Rs. 10 each. The Albion and Lothian Jute companies have been amalgamated with New Central Jute Co., with effect from 1st December 1954. K—Fort William Jute Co. has sub-divided ordinary shares of Rs. 100 into shares of Rs. 10 each.

MARKET GOSSIP

(*Concluded from page 255*)

some other gifts and crossed the exemption limit for the purpose of the gift tax. In fact, the kind of difficulties that arise follow from the fact that a group of new taxes is proposed to be levied with a view to covering the income, expenditure, transfers of property and property itself. In conclusion, the Federation avers that it would be difficult with a series of taxes of this kind to avoid in practice taxation of the same thing twice over.

* * *

There has been a spate of announcements in recent weeks regarding fresh issue of capital by joint-stock companies. By a strange coincidence these issues are being made at a time when the money market is experiencing acute stringency and banks find it hard to attract funds even at higher rates of interest. It is not, however, suggested that the issues are ill-timed and may not find good response. On the other hand, attractive issues by well-established companies will always be taken up by discriminating investors. This is evident from the success of the recent issues by Guest, Ke

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent Who else must sweat and toil and gain but scanty fare."
William Blake

VOL. XCIV. No. 2397 BOMBAY, 16th FEBRUARY 1957 PRICE: Rs. 1/8

PAKISTAN'S ECONOMIC PLIGHT

IT is distressing to find that India's next-door neighbour, Pakistan, has made no marked progress on the economic front during the past nine years of independence. On the contrary, its economy has suffered considerable deterioration in recent years, as the pace of its economic growth has been lagging behind that of its population, which is rising at the rate of 1.4 per cent., or approximately 1.2 million, per annum, and is marred by continuous inflationary pressures. It is true that it has made notable progress in certain consumer goods industries, especially in cotton textiles and jute goods. But this has been more than offset by the failure of agricultural, especially food, production to expand to the extent necessary. Its dependence on foreign countries for both wheat and rice is out of proportion to its capacity to produce, and is resulting in a severe strain on its balance of payments position. In the initial years of independence, Pakistan used to have a surplus of wheat, and, at the time of Partition, none thought it would have to depend upon outside supply of foodgrains. It will be interesting to note, in this connection, that, though the area under wheat has gone up from 10.43 million acres in 1949-50 to 11.58 million acres in 1955-56, production has fallen from 3.88 million tons to nearly 3 million tons. Similarly, output of rice has fallen during this seven-year period from 8.17 million tons to 7.85 million tons, though the area has gone up from 21.83 million to 22.87 million acres. Clearly, the yield per acre seems to have suffered a marked deterioration.

While it is true that Nature has not been kind to Pakistan in recent years, especially in 1955-56, it cannot be denied that there has been a grievous neglect of agriculture on the part of the authorities. It would also appear that the Pakistani nationals, who took over the land from the Hindus and Sikhs in West Pakistan, following their migration to India after the Partition, have not adapted themselves into efficient farmers. This conclusion is borne out by data relating to cotton, the increase in the outturn of this crop falling behind that in acreage. Evidence of neglect of agriculture is also found in the statements of impartial foreign observers. Mr. John O. Bell, Chief of the U.S. Aid Programme to Pakistan, has come out with candid criticisms of the Pakistan Government. He has accused this Government of not properly utilising the aid given to it by the United States. He points out that Pakistan has not put to maximum use the tools and materials supplied by his country for its agricultural development. "In view of the fact that the resources of the country are not being properly utilised, there is no reason," he says, "for Pakistan for turning year after year to the U.S. and other countries for assistance." He is very much pained to see that the help given by the U.S. is being wasted. The degree of his disappointment is reflected in his grim warning that, "if this state of affairs is permitted to continue at its present rate, the Indus Valley will become a desert within less than a half century." He then goes on to add: "It is one thing in time of floods, droughts and other natural disasters to proclaim an emergency which must be met by assistance from an outside country, and quite another thing to accept and to plan food deficits and food imports as a normal state of affairs and to suggest that little can be done about it. It is indefensible to take the foreign exchange earnings produced by the cultivators to invest in the procurement of offshore supplies of foodgrains—which can be grown in great abundance here at home with far less investment."

This deterioration in the state of agriculture is due largely to lack of encouragement to tenants and actual cultivators, as also to the aggravation of feudalism. In the words of another American observer, who has been in Pakistan long enough to know what he is saying, Pakistan is "a land of backward peasants, ruled by a few rich overlords" and heavily subsidised by the U.S. Further, the Pakistan Government has taken no worthwhile steps to step up agricultural production as India has done.

In the field of industries, Pakistan has doubtless made considerable advance. Official publications claim that the country has already attained self-sufficiency in a large number of consumer goods and in a few of the basic materials. The goods that are named include coarse and medium varieties of cotton cloth, jute manufactures, woollen and worsted yarn, art silk fabrics, paper excepting high-grade paper and newsprint, cement, cigarettes, matches, soap, edible oils, footwear and other leather goods, paints and varnishes, plastic manufactures, cycle parts, rubber tyres and tubes, tin containers, electric fans and lamps, and dry cells. It is difficult to say to what extent this claim is true. But, if the trend of prices and the large volume of a variety of goods that are being smuggled into Pakistan are any indication, there seems to be an element of exaggeration in the claim. In one manufactured article, however, it is very near self-sufficiency and that is cotton goods. In 1956, Pakistan's output of cloth was of the order of 500 million yards and of surplus yarn 170 million lbs. (both the figures are approximate). Assuming that a pound of yarn is equal to 4.5 yards and that all the yarn spun is woven into cloth, which is not the case at present, the total production of cloth works out to more than 1,265 million yards. This gives a *per capita* availability of 15 yards, after allowing for exports at the rate of about 60 million yards per annum. Another industry in which Pakistan has made commendable progress is jute. Here it has reduced its dependence on India in two ways, first, by finding foreign markets for raw jute outside India and, secondly, by rapidly raising its manufacturing capacity. Out of a total export of 5.68 million bales of raw jute in the 1955-56 season, India's share was only 1.35 million bales, while as many as 4.33 million bales went to other countries. From almost nothing a few years ago, Pakistan's domestic consumption of raw jute has advanced to a million bales. In other words, Pakistan's dependence on the Indian jute mills for selling its raw jute is now no more than 20 per cent. of its annual output of the order of 6.6 million bales. This is a remarkable achievement, considering the short period in which it has been carried out.

Notwithstanding the progress made on the industrial front, the standard of living of the Pakistan masses has not improved. The latest estimates of national income, contained in the State Bank of Pakistan's *Report on Currency and Finance* for 1955-56, place the *per capita* income at Rs. 237 for 1954-55. This compares unfavourably with Rs. 241 for 1950-51. It is doubtful whether the *per capita* income for 1955-56, for which figures are not yet available, was any better. A rough estimate puts it at Rs. 250, but much depends on as to what extent it is rough. The aggregate national income for 1954-55 is placed at Rs. 1,890.30 crores, an increase of 3.6 per cent. over 1950-51. As against this increase, the population has gone up by as much as 5.3 per cent. to stand at 79.71 million.

Not only has there been no improvement in the *per capita* national income in Pakistan, but there has also been a heavy rise in the cost of living. The increase is literally crushing in East Pakistan, in particular. Thus, the general cost of living index for industrial workers in Narayanganj (base 1948-49=100) stood as high as 143 in June 1956, as against 88 a year earlier. It is a testimony to the patience of the masses in East Pakistan that, despite this enormous advance in their cost of living, they have not taken the law into their hands and are suffering silently. Be that as it may, the high cost of living reflects the scarcity of essentials of life in East Pakistan. It is no wonder then that the effect of this situation is being acutely felt in West Bengal and that people in Calcutta complain about scarcity of cloth, rice, wheat, vegetable oil, etc. These goods are being regularly smuggled across the frontier into East Pakistan.

The position in this respect is relatively better in West Pakistan. The working class cost of living index for Karachi shows only a three point rise to 108 between July 1955 and 1956, but, in the inter

was compelled by force of circumstances to devalue its currency, it did not do so to the fullest extent warranted by the fall in the purchasing power of its currency. Not only that, it even tried to exploit its near monopoly in raw jute by stepping up the export duty and fixing a minimum price, thereby compelling the rest of the world to pay the price it wanted. It is not, therefore, surprising that Pakistan failed to derive the full benefit of devaluation. The worst sufferers of this policy were the jute growers in East Pakistan, because, while they received a lower price for their crop, they had to pay more for their needs, especially rice; a good part of it was imported at a higher price.

Again, shortly after devaluation, the terms of trade went against Pakistan. The drop in the world price of cotton, coupled with higher freights and increase in the cost of plant and machinery, adversely affected Pakistan's economy. Thus, during the quarter ended June 1956, the terms of trade index (1948-49=100) was appreciably lower at 68·7, as against 80 a year before and 106.3 in April-June 1949. The rise in export prices has not been proportionate to the change in the par value of its rupee, while the import prices bore the full brunt of devaluation. Over the year 1955-56, the average index of import prices, for instance, went up by more than 51.7 per cent. to 129.6 (in the quarter April-June 1956), whereas that of export prices rose by only 30 per cent. This is what happens when a primary producing country, employing no more than primitive methods of production, tries to be clever with the rest of the world for too long a period.

The position since June last must have become definitely bad, owing to the blocking of the Suez Canal, and the subsequent rise in the cost of freight, steel, cement, sugar and capital goods. As against a surplus of £24.1 million at the end of 1955 on trade and payments account, 1956 has ended with a nominal surplus of a mere £100,000. Sterling assets of Pakistan, after going up from Rs. 38.22 crores in August 1955 to Rs. 96.98 crores in June 1956, had dropped again to Rs. 82 crores by the end of 1956. The position would have been much worse if all the trade which is taking place between India and Pakistan through smugglers were to pass through regular trade channels. An idea of the trend of this trade can be had from the fact that the unofficial exchange value of the Pakistani rupee in India is at a discount of 20 to 25 per cent., that is, 100 Pakistani rupees fetch only 80 or 75 Indian rupees. The unhappy balance of payments position of Pakistan is further evident from the fact that it is extremely difficult for foreigners doing business in that country to repatriate their earnings and profits. There are numerous instances where Indian as well as other foreign business men have not been able to withdraw from Pakistan even a small fraction of their accumulated profits and cash balances.

Although on the face of it, the foreign exchange position may not appear to be desperate, what with the continuous flow of American military and economic aid, in reality it seems to be getting worse. Otherwise, it is hard to explain the Pakistan Government's decision early this week to levy, as a part of its 1957-58 budget proposals, a 25 per cent, surcharge on foreign exchange sold for purposes of travel in foreign countries, except India and the centres of pilgrimage in West Asia. Such a levy tantamounts to introducing multiple exchange rate system and may conceivably amount to trespassing the rules of the I.M.F. Although the latest Press reports from Karachi say that the Finance Minister has abandoned this levy, its imposition must have widely undermined the confidence of people, both inside and outside Pakistan, in the Pakistani rupee. Indeed, it has already depreciated the black market value of this currency, which in turn has caused a feeling of disquiet among those who have assets in Pakistan. It is reported that unofficial foreign exchange rates in Karachi are Rs. 20 per pound sterling and Rs. 8 per U.S. dollar, as against the official rate of Rs. 13-8 and Rs. 4-14, respectively.

The fundamental causes of Pakistan's economic difficulties are two: (1) heavy expenditure on defence, and (2) unstable government. In the past eight years, Pakistan has spent no less than Rs. 660 crores on defence, according to published figures, and proposes to devote another Rs. 100 crores in 1957-58, according to the budget for that year. On an average, it has been utilising two-thirds of its revenue for unproductive defence expenditure. According to reliable estimates, which have not been contradicted by Pakistan officials, a little over 5 per cent. of its national income, as against about 2 per cent. in India, is being absorbed by defence. This is too high a ratio for an underdeveloped country and is almost the same as that incurred by several industrially advanced countries in Europe. It may be noted here that even Britain, which is spending only 9 per cent. of its large national income on defence, is finding the burden backbreaking. If an economy, which is deficient in material resources, trained manpower and lacking in industrial know-how, goes on incurring unproductive defence expenditure of this order, it is pursuing a self-defeating policy, for it is actually breeding within its own borders, a most powerful enemy, namely, inflation, which will gravely undermine the best of armed forces and demoralise the civilian population. This danger becomes greater when the Government of that country is not stable. During the past nine years of its existence, Pakistan has had six Prime Ministers, with every change in Prime Ministership bringing about a virtual change in the Government as a whole. In this respect, Pakistan seems to be Asia's counterpart of France in Western Europe. Such frequent changes in Government have a deleterious effect on the ability of administration to exercise effective controls for keeping inflation under check and to promote and implement effectively measures for raising the living standards of the masses. In such a situation, no amount of foreign aid can help a country. On the contrary, such aid will only encourage waste, recklessness and corruption and thereby hasten the country's downfall, with adverse repercussions on its neighbours.

PROTECTION FOR CYCLES

THE bicycle is aptly described as a poor man's vehicle and it is necessary that "he should get the best product in return for the hard-earned savings which he invests in a cycle." This is the acid test by which one has to judge the progress of the bicycle industry in India. This industry, as readers are aware, has been enjoying tariff protection for ten years now and the Tariff Commission has just taken up for examination the question of continuing protection beyond 31st December next. While the Commission can be relied upon to arrive at the right decisions after taking into consideration all the aspects of the case, it will be appropriate to consider whether the industry has endeavoured to fulfil the obligations of a protected industry.

A review of the progress made by the cycle industry in the past five years reveals that the industry has grown rapidly and has met the major part of the country's needs. The aggregate rated capacity (on single-shift basis) of the industry at the end of 1955-56 was as high as 760,000 cycles per annum, which compares very favourably with 120,000 in 1950-51; it means a rise of over 533 per cent. At the public inquiry into the continuance of protection held in Bombay the other day, Mr. K. R. Damle, Chairman of the Tariff Commission, placed the sanctioned capacity of the industry at 1,273,500 cycles a year, including permission accorded to some of the units to work double shifts. The number of large units producing cycles has risen from just two in 1950-51 to six in 1953 and to as many as 18 at present. It is stated that four more units have been licensed recently, with a total capacity of 234,000 cycles. The aggregate capacity of the 22 units will thus come to 1,507,500 cycles a year. In addition to large units, there are 41 small-scale producers of complete cycles and components. The sanctioned capacity of these is estimated at 219,000 cycles per annum.

Following the marked expansion in capacity, the actual production of cycles has registered a substantial improvement. During 1956, 660,000 cycles were manufactured by 14 units, as against 490,000 by 12 units in 1955, about 370,000 (7 units) in 1954 and 101,000 (2 units) in 1950-51. The production of cycles by 14 small units during the nine months ended December 1956 amounted to 22,190. There are as many as 500 units which produce cycle components.

While the expansion of the cycle industry has thus been phenomenal in recent years, the quality of the product does not seem to have improved as much as it should have, though undoubtedly some makes are said to be much better than they were two or three years ago. The cycles having larger percentage of indigenously made components are reported to be not very satisfactory. The complaints relate to poor finish, hard and difficult running, quick wearing out of fast moving parts, and poor enamelling and electroplating. It is needless to add that, so long as these defects persist, consumers' prejudice is bound to be there. Moreover, despite the marked expansion in production, the prices of cycles produced in India continue to rule high, as compared with the capacity of people to pay. If, therefore, the cycle industry is to be assured of steady expansion and development of an export market, it is of the utmost importance that sustained efforts should be made to improve quality and to reduce costs. Mr. Damle did well in drawing pointed attention to this aspect and remarking: "As an industry, which essentially caters to the needs of the common man, it can look forward to unstinted support from all sectors of the community only if it keeps the objectives mentioned earlier always in the forefront."

It is gratifying to find that most of the manufacturers have considerably reduced their dependence on imported components and that the Commerce and Industry Ministry has, while licensing new units, made it a condition that they will not be permitted to import more than Rs. 24 worth of components per bicycle even in the initial stages. It would appear that the position in regard to supply of raw materials has vastly improved and that all large-scale manufacturers, except two, have no difficulty in securing their requirements. The greatest handicap of the cycle industry hitherto has been the dependence on foreign countries for steel tubes. This is being steadily overcome and will be completely eliminated in a year or two, when two large-scale manufacturers commence production. The question of manufacturing special steels also is receiving the attention of the Government.

The cycle industry has a bright future, if only it strives hard to raise the quality of its products to British standards and to keep prices at reasonably low levels. With the improvement in the standards of living of the people in the coming years, the offtake of cycles may be expected to go up appreciably. As the Planning Commission has rightly remarked, the construction of a network of new roads, especially in the rural areas, and the expansion of trade within the country will stimulate the demand for cycles. Further, if the prices of indigenous cycles come down, as they should, when the leading producers begin manufacture on a mass scale and when imported components are replaced by those of indigenous manufacture, it will not only stimulate internal demand for cycles but also enable a reasonable volume of exports to neighbouring countries. It is on the basis of these assumptions that the Planning Commission has estimated the total requirements of cycles at the end of 1960-61 at 1,250,000 (including 150,000 for export), as against 680,000 absorbed in 1955-56.

The domestic and export requirements will be met by augmenting the production of cycles through increase in capacity of both the organised and the decentralised sector of the industry. The annual capacity of the organised sector on a single-shift basis is expected to increase from the present level of 760,000 cycles to about 895,000 with the completion of the schemes now in progress. Since all the units may ultimately work on double shift, the potential capacity of the 22 organised units (including the four units recently licensed) may be very much more than 1.5 million per annum. In addition, the decentralised sector of the cycle industry is being given encouragement to produce about 250,000 bicycles per annum by 1960-61.

To sum up, during the second half of the decade of tariff protection, the bicycle industry has justified the assistance given to it against foreign competition by raising its output and by improving its quality to some extent. It is true that, quality-wise, the industry has yet to cover substantial ground, but one should not forget that Rome was not built in one day. Its performance in the past five years sustains the hope that it will do better in the coming years. As for the question whether protection should be continued, there can be no two opinions on the view that it should be. The industry is still in a state of infancy and will wither away, if the hand of protection is withdrawn at this stage. Its confreres in Japan, the U.K., Germany, Austria and Holland, not to mention the rest of the European countries, are giants in this field who are feared by the bicycle manufacturers even in the United States. Currently, the U.S. Tariff Commission is once again conducting investigations into imports of bicycles at the request of the Bicycle Manufacturers' Association of America. The question which the Indian Tariff Commission has to decide, therefore, relates only to the quantum of protection and to the steps which indigenous manufacturers should take to safeguard the legitimate interests of consumers.

MORE ON INTEREST RATES

SMALL SAVINGS—I.M.F. LOAN—MANGANESE EXPORTS—TEA TRENDS

THURSDAY, 5 P.M.

THE share market seems to be sagging. Barring occasional support by one or two speculators and some buying by the Life Insurance Corporation of cement and steel shares, it has been devoid of sustenance. Bears seem to be merciful, in that they are not pressing hard. Renewed sales by Madras operators earlier in the week caused some uneasiness, because they are considered to be knowledgeable people. It is alleged that they successfully forestalled the Plantation Award and the now famous 30th November taxation proposals. During the last two days, there has been a mild rise from the lowest levels of the week but that is probably due to technical considerations. The series of new issues and the prospect of some more coming in the near future are weighing heavily on the market. The cost of bank credit has gone up and market circles are beginning to realise that the end of higher interest rates has not yet begun. Taxation uncertainties are real and several people are more and more inclined to believe that an increase in the tax on bonus shares is almost a certainty. Otherwise, they are unable to account for the Government's continued delay in giving permission to companies which have sent in their applications for issue of bonus shares.

MARKET GOSSIP

* * * *

There are some in this country who really believe that the authorities have done well in not raising the Bank rate in order to make the cost of bank credit dear as a part of anti-inflationary weapons. This view is not very convincing. It is argued that, if the traditional Bank rate had been raised, the Gilt-edged market would have come tumbling down and that, by not raising this rate, this development has been avoided. Those who argue thus are under an illusion. As was pointed out in these columns last week, the steadiness of Gilt-edged values is due to substantial purchases of some of the existing loans by the Reserve Bank. It was mentioned then that, since the beginning of the year, the Bank had bought from the market, including the banks and the Life Insurance Corporation, about Rs. 16 crores worth of securities. During this week, the Bank bought further large parcels of short-medium dated securities, believed to be of the order of Rs. 2 crores. By not raising the traditional Bank rate, the Government is actually pumping in more money and adding to the volume of deficit financing.

There are a few others who believe that, by keeping the Bank rate unchanged, the Government will be in a position to carry through its borrowing programme this year at the same rates as last year. This view, too, sounds hollow. The Government will have to offer higher rates on its new loans if they are to be successful, unless between now and July, when the Government usually borrows from the market, the money market eases and the rates of interest go down. The Reserve Bank itself will have to reduce the cost of its lending to banks at least to 3½ per cent., otherwise the banks will not be in a position to extend any sizable support to such loans. Surely, they cannot be expected to borrow from the Reserve Bank three months' money at 4 per cent. and lend to the Government for long term at 3½ per cent. Since the chances of money becoming so perceptibly easy as to cause a fall in short-term rates on the aforesaid lines, the Government will have to pay more on its new loans. And it will be absurd to do so without raising the Bank rate, in the hope that thereby a fall in Gilt-edged values can be avoided. If the Government's main concern is not to disturb the Gilt-edged market, the only other alternative is to give up the borrowing programme of at least the Central Government and to rely exclusively on created money. After all, the total of the 3 per cent. 1957 loan held outside the Reserve Bank cannot be more than Rs. 30 or Rs. 35 crores which can be easily repaid in cash. But to skip the borrowing programme and to repay the maturing loan in cash is to make nonsense of the present monetary policy.

Anyway, the failure to raise the Bank rate has only put the investors on guard and caused serious misgivings about the future of interest rates. The belief is growing that an increase in the Bank rate is inevitable. This has induced some of the investors to sell their holdings of Government securities when the going is good and limit the possibility of further losses in future. These investors include not only banks but also corporations, which are likely to need cash to pay the compulsory deposits or for plant and machinery. Even some of the individual investors have begun to do so. After all, they do not lose much thereby. On the contrary, they stand to gain something, apart from restricting the chances of future loss. With banks ready to pay 4 to 4½ per cent. on short-term deposits, they can earn a little more and do not have to bother about tax deductions at source, as is the case on investments in Government securities. This tendency will gain momentum, if the stringency in the money market becomes more acute.

* * * *

It is surprising that, with the all-round increase that have taken place in interest rates in recent months, the authorities have paid no thought yet to the question of effecting a corresponding rise in the rates of interest on small savings. If our memory is right, these rates have remained unchanged for [illegible] and were determined before the Bank rate was raised from 3 to 3½ per cent. in November 1951. They are thus completely out of alignment with the current interest rates. It is true that, as a result of not effecting an upward revision in the yield on small savings in consonance with the rise in the Bank rate well over five years ago, the small savings movement has not suffered a setback; if anything, it has gained considerable strength. But that should be no argument for keeping the return on these investments unchanged further. It is quite possible that this momentum will lose strength in future as the disparity is becoming more and more marked. Such a possibility should be avoided. That apart, why should not the authorities think of making the small savings more popular by offering a little higher return? In this connection, it will be pertinent to recall that large sums are finding their way into gold and silver. A considerable percentage of this money comes from classes to whom small saving certificates can be sold if a little more effort is made and the return on them is enhanced. Now is the time for the authorities to bestow some thought on this question and take a quick decision, because it is at this time of year that farmers and workers keep surplus cash which they either invest in bullion or spend away in merry-making for which the spring festivals offer plenty of opportunity.

* * * *

So, the Government of India has resorted to the International Monetary Fund, the lender in the last resort to the countries of the free world, for replenishing its greatly depleted foreign exchange reserves. A country usually goes to this source of foreign exchange supply only after it has exhausted other sources of speedy assistance. It now seems that economic aid to India from the U.S. will take a longer time than expected. Even if the U.S. Government is willing to give, the Congress has to sanction the aid. And the present is not the opportune time for making the necessary move in the Congress. Although the World Bank is taking a sympathetic interest in India's development projects, it has not finished its examination of specific projects only against which it is willing to lend. This will take time and the first loan in relation to projects now being studied may not materialise before June. Meanwhile, the sterling balances have been fast receding; by the beginning of this month they had declined to a low level of Rs. 506.36 crores. Many countries in the world had taken notice of this trend and were talking about it. Something had to be done to raise the external resources of the country.

It is these considerations which must have forced the Government of India to approach the Fund. It is encouraging to find that the Fund authorities have been quick in taking a favourable decision and giving a liberal credit line of $200 million, which is equal to 50 per cent. of this country's quota. Apparently, they did not insist upon applying to India the limitation of drawing rights to 25 per cent. of the quota within a year.

Normally, during a period of 12 months, a member country can get assistance from the Fund only to the tune of 25 per cent. of its quota, in addition to its contribution to the Fund's capital in gold and dollars. In technical language, the latter is called the gold tranche, while the former is called the credit tranche. There is also an aggregate quota limitation confined to 200 per cent. of its quota. These quota limitations do not preclude a member from securing additional assistance from the Fund, if that is required, since the Fund may waive the quota limitations specified in the Fund Agreement and has frequently done so. Recently, that is, two months ago, the Fund sanctioned Britain a credit of $1,300 million which is equal to that country's full quota. This sum consisted of two parts, namely, $561½ million representing the gold tranche and the first 25 per cent. credit tranche of Britain's quota, and $738½ million in the form of stand-by facility. In sanctioning credit of this magnitude, the Fund took the unprecedented step of releasing the whole quota of a member country on a single application, a relaxation of the Fund's rules to an extent which none had anticipated. By this action, the Fund had proved itself to be a far bigger reserve of international liquidity than it had admitted itself to be till then.

In extending credit to India now, the Fund seems to have followed more or less that liberal policy which it adopted towards Britain. Under the limitation of 25 per cent. of quota, India can draw in a year, besides its gold tranche of $27.5 million ($27,486,453.61 to be precise), only $100 million, or a total of $127.5 million. But it has actually been sanctioned an aggregate credit of $200 million. As in the case of Britain, this total is divided into two parts, the first instalment of 25 per cent. of the quota *plus* the gold tranche yielding $127.5 million, and a stand-by credit of $72.5 million. Out of the first part, $60 million was given immediately, that is, on the 7th inst., and the balance, $67.5 million, can be drawn after 30 days. The stand-by credit can be utilised at any time during the next 12 months.

The rate of interest on borrowings from the Fund is fairly high. Besides a service charge of ¾ per cent. payable only once, interest will have to be paid at rates varying from 2 per cent. to 3¼ per cent., depending upon the period for which the credit is used. Since the Fund is essentially a short-term lender, failure to repay within three years will involve payment of penal rates of interest which go up to as high as 5 per cent.

In the case of stand-by facility, only an annual service charge of ½ per cent. is involved. If and when it is utilised, interest will be charged at the Fund's scheduled rates on the amounts outstanding. If the interest burden is not to become too heavy, India must repay these loans within three years of their becoming effective. It can, however, hold on to these credits for five years, but it will have to pay interest at penal rates. Failure to repay within five years will gravely undermine the international credit of India. Under the spirit of the Fund's Agreement, its resources are to be regarded as a revolving fund to be used as needed and to be restored promptly when the need has passed.

In terms of rupees, the loans agreed to by the Fund amount to Rs. 95.20 crores. Of this, the first part is Rs. 60.69 crores, and the second part, namely, the stand-by credit, is Rs. 34.51 crores. Out of the first part, India has withdrawn Rs 28.56 crores. This is reflected in the Reserve Bank's statement for the week ended the 8th inst., where the balances held abroad have risen by Rs. 28.32 crores. The total foreign exchange reserves on that day were Rs. 534.68 crores, against Rs. 506.36 crores a week earlier.

The reason given by the Government of India to the Fund for seeking its assistance is the combined impact of (1) the second Plan, (2) disappointing crops and (3) the Suez Canal blockade on the foreign exchange resources of the country. It has informed the Fund that it proposes to press ahead with anti-inflationary measures, including higher taxes, promotion of small savings and tightening of bank credit. This explanation of the Government to the Fund should give investors an idea of the shape of things to come in the fiscal and monetary fields.

* * * *

The initial quota of 50,000 tons of sugar fixed for export, it is reported, has almost been exhausted. Further sales were possible this week, the principal buying countries being Ceylon, Burma, Pakistan, Africa and Persian Gulf ports. Enquiries are still being received from these countries and the Indian Sugar Mills Association has requested the Union Food Ministry to permit an additional quota. Considering the currently ruling high prices in foreign markets and the need for more foreign exchange, the Government is expected to concede the request. There is no need for domestic consumers to have any uneasy feeling on this score, as there is plenty of sugar in the country.

* * * *

It looks as though a new threat has arisen to India's manganese ore, one of the most valuable dollar earners. A recent report from Canada avers that a completely new method of processing the low-grade manganese ore deposits situated in New Brunswick has been evolved by one Dr. M. J. Udy. The new process is now being tested at a prototype plant installed at Niagara Falls (in Ontario) at a cost of $1.5 million. The process, it is claimed, will prove economic and will allow plans to go forward for the design of a production plant proper, with a capacity to handle 5,000 tons of manganese ore per day for an annual output of 75,000 tons of ferrow-manganese and 75,000 tons of ingot iron (a low-grade steel). The utilisation of the process on a broad scale is expected to make the North American Continent "completely independent as to the sources of manganese by making possible the treatment of the large deposits of low-grade manganese ores known to exist in the U.S. and Canada which were hitherto regarded as incapable of treatment."

Another country which has launched upon a project for developing manganese ores is Brazil. It has secured the co-operation of American capital. The project is located in the Amazonian jungle in Amapa district of Brazil, where there are rich manganese mines—the reserves of ore are estimated at 11 million tons, the purity of the ore being 45 per cent. The development scheme covers the construction of a 150-mile long broad-gauge railway for moving the ore to the Amazon river and a new port for handling the ore export. The U.S. Export-Import Bank has given a loan of $67.5 million towards the cost of the project. When fully completed, the project is expected to produce 700,000 tons of manganese ore annually. In addition to this, the U.S. Steel Corporation is developing manganese mines in the Mattogrosse district of Brazil and production here is scheduled to commence at an early date.

The aforesaid developments will, there is no doubt, adversely affect the export trade in Indian manganese ores. The steel producers in the U.S. and Canada who are now importing large quantities of manganese ore from India may not do so to the same extent. This will mean a considerable loss of precious dollars. Out of the foreign exchange earned by manganese ore exported from India every year, the share of the U.S. alone comes to nearly 33 per cent. During the financial year 1955-56, India exported to the U.S. 321,468 tons of manganese ore valued at Rs. 4.06 crores, the total exports to all destinations being 920,847 tons valued at Rs. 10.72 crores.

* * * *

Teas for export sales have been ruling quietly steady in recent weeks, with good demand at slightly easier rates. Bright liquoring teas and well made and stylish whole leaf grades have, however, been strong features, with keen competition at dearer rates, but teas with poorer appearance are fetching lower rates. Anyway, the downward trend in prices noted since the middle of December seems to have considerably slowed down, if not been arrested. This is apparently due to the seasonal improvement in quality and the reduction in the weight of offerings at auctions. Thus, at the export auctions this week, the quantity of tea on offer was 65,236 chests, as compared with 66,900 chests in last week's sale and 75,910 chests in the sale held on 22nd January. Another helpful factor

SHARES DRIFT LOWER

BUSINESS THINS DOWN

(From Our Own Correspondents)

BOMBAY, *14th February*

FOR the third week in succession equities remained depressed, with a further drop in prices. This week's recession was more pronounced and widespread than in the previous two weeks, bringing equity values to the lowest levels seen since the middle of last month. There was, however, no large-scale selling pressure. Some investment buying was forthcoming at lower levels, but this failed to stem the recession. Speculative support was conspicuous by its absence. Notwithstanding the attractive levels to which they have retreated, equities remained friendless, apparently due to lack of confidence in the near future.

The worry over the Kashmir issue is not over and there is an understandable anxiety about the ultimate outcome of the issue. The market does not seem to be impressed with the Finance Minister's statement in Guntur last week about the compulsory deposit scheme. He said: "If the private sector is opposed to depositing the surplus reserves with the Government, I want at least a guarantee from the private sector that they will utilise those reserves for the good of the country in any scheme proposed for the development of the economy of the country." Though this reflects a considerable change in the Finance Minister's attitude, it is not quite clear, whether the deposits will be allowed to be utilised in the private sector itself or will be required for use in the public sector's projects. Anyway, operators would appear to await the publication of the relevant rules which is long overdue. The accumulation of cloth stocks and the persistent stringency in money are the other depressing factors.

In the steel section, Tata Ordinaries retreated from Rs. 178-12 to Rs. 172-12, the lowest level since 11th January last, despite the report that two blast furnaces had been commissioned at Jamshedpur on Sunday, 10th inst., marking the first stage in the expansion scheme which would raise the steel output to 2 million tons by 1959-60. There was, however, a partial recovery today, when the shares closed at Rs. 175. Indian Irons gave way from Rs. 22-6 to Rs. 21-12 before gaining to close at Rs. 21-15. The main worry of operators in this counter is that of subscribing to the Rights issue. The Rights dropped from Rs. 7-2½ to Rs. 6-14.

Textiles were conspicuous in the recession. Bombay Dyeings sank from Rs. 562-8 to a low of Rs. 546-14, but crept up to Rs. 554-8 at the close. Centurys dropped from Rs. 501-8 to Rs. 489 before regaining to Rs. 493 at the close. Kohinoors came down from Rs. 327-4 to Rs. 324-8, but there was a sharp jump to Rs. 329 on Monday on reports of good working results for 1956. This recovery proved short-lived and the shares retreated to Rs. 320-8 yesterday. The closing today was better at Rs. 324. Central Indias closed Re. 1 lower at Rs. 122. Finlays shed Rs. 2 to Rs. 305 and Gokaks Rs. 3 to Rs. 220-8. Indu Ordinaries were dull at Rs. 10-11½. New Greats dropped Rs. 5 to Rs. 235, while New City Mills were stagnant at Rs. 151-14. New Kaiser-I-Hinds changed hands Re. 1-4 lower at Rs. 108-12. Shree Niwas Cottons moved down by Rs. 5 to Rs. 185. Simplex reacted from Rs. 180 to Rs. 176-8, but recovered to close at Rs. 179. Standards were done Rs. 6-4 lower at Rs. 421-4, and Svadeshis Rs. 5-12 down at Rs. 219-12. Swans lost Rs. 7-8 to Rs. 403-12, Vishnus Rs. 6-4 to Rs. 141-4 and Tata Mills As. 12 to Rs. 49-4

Bank shares were unimpressive and business was thin. Fluctuations were narrow. Barodas were steady, gaining a fraction to Rs. 103-12. Centrals were dull at Rs. 54-4, while their new shares gathered As. 8 to Rs. 58-8. Bank of Indias lost Re. 1 to Rs. 139. Punjab Nationals shed As. 8 to Rs. 54-8, as also United Commercials to Rs. 57-8. Union Banks were done As. 1½ lower at Rs. 7-8½.

In the insurance section, business was again confined to New Indias only, which, on balance, showed no change at Rs. 43-8.

Ahmedabad Electrics, Surats and Poona Electrics provided the main features of the electricity section, which otherwise ruled quiet. On investment support, Ahmedabad Electrics gained to cross the par value after a long lapse and touched Rs. 100-5. The closing was done at Rs. 100, a rise of As. 10 over the week. Surats moved up from Rs. 112-8 to Rs. 113-2. Poona Electrics were taken Re. 1-4 higher at Rs. 108-12. Bombay Suburbans were maintained at Rs. 109-6. Tata Hydros dropped Re. 1 to Rs. 120. Tata Powers Rs. 16-4 to Rs. 1,216-4 and Andhra Valleys Rs. 12-8 to Rs. 1,202-8.

A sharp rise of Rs. 12-8 to Rs. 276-4 in Walchandnagars on expectations of bonus issue was the highlight of trading in sugar shares. Belapurs receded from Rs. 231 to Rs. 228-8, but were restored to Rs. 230 at the close. Phaltans were lower by Re. 1-8 at Rs. 146-8. Kesar Sugars were done Rs. 3 higher at Rs. 43. Cement shares were featureless and the undertone was quiet. Associated Cements relapsed from Rs. 170-8 to Rs. 167-8, but partially made good the loss when they closed at Rs. 169-8. Digvijays were unchanged at Rs. 149-8. Jaipur Udyogs were done As. 2 lower at Rs. 12-1, and Orissa Cements As. 3 down at Rs. 13. In the engineering group, Alcocks reacted from Rs. 263-12 to Rs. 257-8 before regaining to Rs. 260. Premier Constructions closed with a loss of Rs. 2-8 at Rs. 179. Tata Locomotives were on offer and came down from Rs. 150 to Rs. 145-4, but closed a shade better at Rs. 147. There was abatement of buying in Shivrajpurs and they came down from Rs. 95 to Rs. 92-8 before finishing at Rs. 94-8. Indian Coppers were quiet at Rs. 3-9, as against Rs. 3-10½. B.B. Petrols were unchanged at Rs. 2-12.

Hindustan Motors were quiet at Rs. 7-15 a drop of As. 1½ over the week. Premier Automobiles were subdued at Rs. 104. Scindias were marked down from Rs. 18-13 to Rs. 18-8, but the impressive results of the Company for the year ended 30th June 1956 and the better outlook for the current year lifted the shares to Rs. 19-0½ at the close. Great Eastern Shippings were lower by As. 6 at Rs. 18-6.

In the miscellaneous group, Bombay Burmahs experienced renewed selling, moving down from Rs. 711-4 to Rs. 681-14. At the close, however, there was some hardening to Rs. 695. Their new shares were lower by Rs. 8-2 at Rs. 260. National Rayons were weak with a decline from Rs. 241-4 to Rs. 230 on long liquidation, but recovered to close at Rs. 234. Gwalior Rayons lost As. 6 to Rs. 15-4. B.I.Cs. were lower by As. 5 at Rs. 8-1. Tata Chemicals shed As. 5 to Rs. 15-12, Tata Oils Re. 1 to Rs. 44-8, while Wimcos hardened from Rs. 175 to Rs. 178-2. Hindustan Levers were quiet at Rs. 19-2 and Texmacos at Rs. 20-6.

Calcutta Stock Exchange

CALCUTTA, *13th February*

Budget fears, despite the Finance Minister's earlier promise to present a "lame duck," led to lethargic conditions on the Calcutta Stock Exchange during the week under review, and an extension of commitments was a difficult proposition. Excepting for an earlier uptrend in the jute section and for a steady tea section throughout on selective business, there was little of note. The announcement of a substantial increase in stocks of jute goods held by mills as at the end of January arrested the earlier steadiness in jutes, although the decline in raw jute prices was looked at with interest. However, export enquiries for goods continued to be poor, and it was feared that mills' stocks would continue to increase. The better trend in teas was attributed to the recent reduction in the export duty, and to expectations of an uptrend in tea prices in forthcoming auctions during the current season. Other sections, including engineerings and miscellaneous industrials, were marked down, and closing values, excepting those of the popular counters, were markedly lower on balance.

Reports of rising cloth stocks caused selling pressure in textiles, and prices moved down. Thus, Bengal-Nagpurs gave way from Rs. 8 to Rs. 7-13. Elgin Mills moved down from Rs. 26-10. to Rs. 26-4. Kesorams were fractionally lower at Rs. 15-14. New Victorias were wanted at Rs 2, as against Rs. 2-3 earlier in the week.

Coals were generally lower, but Burrakurs were for a time steady at Rs. 21-8 before giving way to Rs. 21. At Rs. 25-4, Equitables showed a loss of one point. Bengals changed hands at Rs. 462 in small lots, as against Rs. 463. South Karanpuras were quiet at Rs. 10, as were Amalgamateds at Rs. 18-10.

Although generally poor attention was accorded to jutes for reasons already indicated, the section was not devoid of features which were provided on selective buying. Nationals recorded an early rise from Rs. 20-12 to Rs. 21-5 only to fall back to Rs. 20-13. Deltas scored from Rs. 146 to Rs. 147 before closing lower on balance at Rs. 145. Northbrooks improved from Rs. 21-7 to Rs. 22-1, and Belvederes realised Rs. 111, as against Rs. 108 previously. Gourepores sagged from Rs. 224 to Rs. 222, but Anglo-Indias were fractionally better at Rs. 139.

Selected teas absorbed a good portion of the funds available in the market, and prices showed improvement. From Rs. 195, Hantaparas ascended to Rs. 205. Brooke Bonds hardened from Rs. 20-12 to Rs. 21-3 and Hansquas from Rs. 23 to Rs. 23-10. Hasimaras picked up Re. 1-6 at Rs. 28-14, and East Indias As. 4 at Rs. 23-4. In fair attention, Dibrugarhs were driven up from Rs. 23 to Rs. 23-14, and Sapois from Rs. 29-8 to Rs. 30. After being higher at Rs. 21-14, Tezpores resumed the opening rate of Rs. 21-6, Bishnauths were unchanged at Rs. 22-2.

Earlier, Burn & Cos., among engineerings, were a feature with a rise from Rs. 315 to Rs. 336. Indian Irons had recovered from Rs. 28-14 to Rs. 29-8 before sagging to Rs. 28-13 on renewed offerings. Kumardhubis were unchanged at Rs. 9-14. Texmacos were quiet at Rs. 20-8. On interested buying, Braithwaite & Cos. put on As. 8 to Rs. 28-6. Indian Galvanisings realised Rs. 19-10, as against Rs. 19-7. Jessop & Cos. were quiet at Rs. 27-14. Guest Keens were put through at Rs. 24-6, as against Rs. 24-4 a week ago.

Miscellaneous industrials were quiet. Indian Coppers were taken at the lower rate of Rs. 3-8, and India Steamships were fractionally lower at Rs. 10-2. The recovery from Rs. 33-5 to Rs. 33-12 in Orient Papers was not fully sustained as the counter met selling pressure and was pushed down to Rs. 33-9. Indo-Burma Petroleums fell from Rs. 36 to Rs. 35-12, and B.I. Corporations from Rs. 8-8 to Rs. 8-4. Niccos changed hands at Rs. 21-6 on an ex-rights basis, and Sone Valley Cements hovered around Rs. 7-12. Dunlop Rubbers were unchanged at Rs 25-13, while Rohtas Industries sagged from Rs. 19-15 to Rs. 19-10. F. & C. Osiers, however, showed an improvement of As. 2 to Rs. 8-4, but Indian Cables moved down from Rs. 31-15 to Rs. 31-2.

* * * *

Madras Stock Exchange

MADRAS, *12th February*

The Madras Stock Exchange continued to rule easy during the week under review. Operators were hesitant to enlarge their commitments, thanks to absence of any encouraging news. The stringency in the money market also acted as a restraining influence. Textiles were subjected to selling on renewed reports of heavy accumulations of stocks in several centres. Interest of operators in planting shares was also at a low ebb, despite considerations of improved prices for tea of late. The fears of fresh taxes and continued uncertainties relating to the Plantation Labour Award acted as a damper. The banking and miscellaneous sections put on a dull appearance.

In the textile section, Radhakrishnas encountered heavy selling and were pushed down by Rs. 10 to Rs. 305. Coimbatore Pioneers dropped Rs. 7-8 to Rs. 290. Lakshmis shed Rs. 4 to Rs. 258. Rajalakshmis receded by Rs. 2 to Rs. 180. Ranga Vilas declined by a similar amount to Rs. 87. Coimbatore Spinnings receded by Re. 1-8 to Rs. 87-8. Janardhanas lost a rupee to Rs. 107-8. Balasubramanias eased by a like amount to Rs. 74. Palni Andavar 'B's moved down by Rs. 5 to Rs. 215. Buckinghams were lower by As. 8 at Rs. 183 and Travancore Rayons by As. 3 at Rs. 13-14. Vijayalakshmis were quiet at Rs. 151-8, as also Vasantas at Rs. 320, Pankajas at Rs. 77 and R.C. Ambikas at Rs. 262. Dhanalakshmis, however, met with some buying enquiries and advanced by Rs. 2 to Rs. 376. Coimbatore Cottons were also favoured a rupee higher at Rs. 386.

Among tea shares in the planting section, Coonoor Teas dropped As. 4 to Rs. 25. Nelliampattys shed an anna to Rs. 3-5. Neelamalais were neglected at Rs. 6-1 and Waterfalls at Rs. 5-8. Nilgiri Teas, however, elicited some support and put on As. 6 to Rs. 9-12. Nonsuch Teas improved by As. 4 to Rs. 22-12. Talayar Teas were a shade better at Rs. 12. Among rubber shares, Kalpettas decreased by As. 6 to Rs. 24-10. Kailas declined by As. 2 to Rs. 6 *cum-div.* (interim). Thirumbadis shed an anna to Rs. 2-1 *cum-div.* Pullangodes eased by 6 pies to Rs. 2-13. Among coffee shares, Karmergodes lost As. 2 to Rs. 6-12 *cum-div.* Amalgamateds were quiet at Rs. 12-4, as also Rajendras at Rs. 11-6. Consolidated Coffees, on the other hand, were on request, their quotation advancing by As. 11 to Rs. 20-3. Coffee Lands gathered As. 2 to Rs. 24-2.

Activity in the miscellaneous section followed the general trend. India Cements were quoted As. 4 lower at Rs. 29-11 and Mysore Papers As. 3 at Rs. 16-3. Textools were neglected at Rs. 265; Binnys at Rs. 180 and Singarenis at Rs. 10-8. Travancore Cements, however, gathered As. 3 to Rs. 9-15.

In the sugar group, Cauverys suffered a drop of Rs. 5 to Rs. 35. Deccans shed As. 2 to Rs. 11-2 and Travancores As. 5 to Rs. 11-4. United Breweries and E.I.Ds were unaltered at Rs. 180 and Rs. 28-8, respectively. Andhras, however, were better by Re. 1-2 at Rs. 17-2 *cum-div.*

THE BORREA COAL COMPANY LIMITED

NOTICE OF INTERIM DIVIDEND

THE BOARD OF DIRECTORS OF THE above Company has sanctioned payment of the following Interim Dividends in respect of the year ending 31st December 1956, without any deduction for Income-tax paid by the Company.

	Per cent. per annum
On Preference Shares for half-year at the rate of	6¼
On Ordinary Shares	5

payable on or after 7th March 1957, to those shareholders (or their mandatees) whose names appear in the Company's books on 28th February 1957, as the registered holders of the above shares.

The Share Transfer Registers of the Company will be closed from 21st to 28th February 1957, both days inclusive.

By Order of the Board,
F. W. HEILGERS & CO. (PRIVATE) LTD.,
Managing Agents

CHARTERED BANK BUILDINGS,
CALCUTTA, *31st January* 1957.

NEWS IN BRIEF

ART silk yarn waste, art silk thread waste and staple fibre waste have been decontrolled and export of these will be allowed without licensing restrictions.

The existence of extensive reserves of good quality limestone in the Dehra Dun-Mussoorie areas has been reported by the Geological Survey of India. A team of geologists surveyed the limestone formation of the area in detail on a qualitative basis, carried out representative sampling and calculated the reserves. The quarriable deposits of limestone in the area are estimated at about 406 million tons.

The Union Ministry of Natural Resources and Scientific Research is contemplating the amendment of the Mineral Concession Rules, in order to attract foreign firms willing to undertake oil exploration in India. The Ministry is reported to be of the view that the present Rules are too stringent and can be liberalised in respect of both area and period of lease without infringing the letter or spirit of the latest Industrial Policy Resolution.

The Tata Iron and Steel Company put into operation the two-hundred-ton open hearth furnace on the 10th inst., marking the first stage in the gradual expansion of production which will raise the firm's steel output to two million tons by 1959-60. Against the present output of 800,000 tons of finished steel, the Company hopes to produce 900,000 tons in 1957-58, 1.2 million tons in 1958-59 and 1.5 million tons in 1959-60, which are equivalent to 2 million tons of steel ingots.

A delegation of Japanese steel interests is arriving in India next week to negotiate the purchase of five million tons of Indian iron ore over the next five years from April 1957. A broad agreement on this matter was reached between a representative of the Ministry of Commerce and Japanese steel interests in Tokyo last November. India may be willing to export additional quantities of iron ore, if the Japanese steel interests assist in the development of west coast ports such as Karwar and Honavar, through which the ore can be moved.

A five-man American trade mission, headed by Mr. Preston Forbes, Director of Foreign Commerce of the U.S. Department of Commerce, will shortly visit India to assist and advise business men in this country on commercial activities in the U.S. During its stay in India, the mission will explain to business men who are interested in the sale of their products in the U.S. the trade regulation and credit possibilities of the latter country. It will also furnish information to those interested in importing materials from the U.S.

A new direct maritime link between the Soviet ports in the Far East and India has been inaugurated under the provisions of the Indo-Russian shipping agreement of last year. The first Russian freighter reached Calcutta recently from the Soviet port of Nakhodka in the Far East. Under the agreement, there is already a direct shipping service between the Soviet Black Sea ports and India for the last one year. Russia and Indian steamers coming from the Black Sea ports go direct to Visakhapatnam to deliver steel cargo for the Bhilai plant.

A two-and-a-half-mile long iron-ore band, containing an estimated reserve of over 2 million tons, has been discovered by the Geological Survey of India at Mohendragarh in the Punjab. An analysis of the samples of this ore has shown that the ore is good enough for conversion into pig iron. However, this deposit is not sufficient to support a steel plant. It has, therefore, been suggested to investigate iron ore deposits in the neighbouring areas and, if these prove to be of the same quality and of similar character, the scattered deposits may together support a steel plant with the aid of power from the Bhakra Nangal.

Problems relating to financial and technical aid for the execution of several milk supply projects in the country like the Delhi and Calcutta milk supply schemes and also the question of supply of equipment for the Aarey Milk Colony were recently discussed at New Delhi by the members of a New Zealand mission now in the country with the officials of the Union Ministry of Food and Agriculture. As regards the International Training Hostel at Aarey, the mission accepted the idea of financing the whole project costing about Rs. 11 lakhs.

The Indo-Ceylon agreement on the avoidance of double taxation of income between the two countries has been notified in the *Gazette of India*. With this notification, all legal formalities for giving the agreement the force of law in India and Ceylon are complete. Assessments for the year ended 31st March 1953 and for subsequent years will be governed by this new agreement. For the two previous assessment years, namely, the years ended 31st March 1952 and 31st March 1951, relief will be available in accordance with the Income-tax (Double Taxation Relief) Rules, 1942, which held the field till 26th January 1950.

During December 1956, the total value of exports (including re-exports) of merchandise, gold and silver, fell short of imports by Rs. 12.24 crores. This was revealed by the provisional figures of foreign sea- and air-borne trade of India on private and Government accounts. Among merchandise, excluding transit trade of Pakistan, but including that of other land frontier countries, exports amounted to Rs. 54.85 crores. Re-exports were Rs. 60 lakhs and transit trade Rs. 2 lakhs. Imports amounted to Rs. 67.69 crores and transit trade Rs. 1 lakh. Total foreign trade was of the order of Rs. 123.14 crores.

The Tata Iron and Steel Company Ltd., will provide a six-week orientation course to over 400 young graduate engineers who have been selected by the Union Public Service Commission for the three Government steel plants at Rourkela, Bhilai and Durgapur. This orientation course is a preliminary to the foreign training arranged for the engineers by the Government of India in the U.K., U.S.A., Canada, Australia and the U.S.S.R. The course at Jamshedpur, arranged at the instance of the Union Ministry of Iron and Steel, will consist of lectures, visits to various departments of the works, and general training in the departments to which the trainees have been assigned.

The possibilities of increasing trade with India and of investment in Indian enterprises are to be examined by a nine-member Swedish trade-*cum*-goodwill mission now on a two-week tour of the country. Mr. Einar Modig, leader of the mission, said that his country was anxious to collaborate with Indian enterprises, especially in the context of the second Plan, and observed that the climate was now favourable for it. He said that Sweden was a highly competitive market having no import restrictions and interested on such Indian commodities as fruit, tea, coffee and textiles. The mission would also discuss the question of direct technical assistance to India, instead of through the U.N. as at present.

Officials of the Director-General of Shipping, Bombay, have been asked to arbitrate over the question of freight rate for salt to be sent by ships from Saurashtra ports to Calcutta. The Indian Coastal Conference which controls the entire coastal shipping had asked for a rise in the freight rate for salt from Rs. 31 to Rs. 40 per ton to meet higher operational costs. The salt manufacturers in Western India are reported to have opposed the move on the ground that such a rise in freight rates will lead to higher prices of salt in Calcutta and will affect the offtake of salt by Calcutta from Saurashtra ports. The freight rate on salt is reviewed every year, after mutual consultations between the salt manufacturers and representatives of the Indian Coastal Conference.

From Abroad

The International Paper Sales Company has announced an increase of $4 a ton for newsprint, with effect from 1st March.

The Pakistan Industrial Corporation has received inquiries from Poland for the construction by the latter of four 7,000-ton ships at an estimated cost of about £3.75 million.

Newspapers in the U.S. reached a record circulation last year, the dailies touching a total of 57 million copies per day. This represents an increase of almost one million over the 1955 figure.

Britain's first atomic-powered merchant ship will be built, according to Sir Ronald Garret, Chairman of Lloyds Register of Shipping, in about seven years from now. He said that it would be a super-tanker.

Rubber production in Ceylon during December last amounted to 11,440 tons, which brought 1956 production to 95,389 tons, as against 93,830 tons produced in 1955. Stock of rubber held at the end of December amounted to 31.771 tons.

Czechoslovakia, according to its Deputy Foreign Trade Minister, will provide Egypt with technicians and industrial equipment to help it in the implementation of its five-year plan. Czechoslovakian products will also be given in exchange for Egyptian cotton.

Gold reserves recently discovered in Egypt's Eastern Desert will help, according to Mr. Aziz Sidky, Egyptian Minister for Industry, finance the Aswan High Dam scheme. The mines are expected to provide enough funds to finance half the dam scheme, estimated to cost more than £460 million.

Imperial Chemical Industries Ltd., London, has concluded an agreement with two Japanese firms under which the latter will get patent rights for the manufacture of polyester fibre in Japan. The Japanese companies, however, will not have the right to export these products to the U.K. or any other country.

A 200 per cent. increase in the international production of man-made timber during the next two or three years is predicted by Mr. Frank C. Lynam, a Director of the Airscrew Company. Since 1950, output of man-made timber has been multiplied 50 times by the 30 producer nations, with Europe accounting for over two-thirds of the total.

Britain has expressed its inability to contribute to the Special United Nations Fund for Economic Development. Mr. D. N. Brinson, the British delegate to the Economic and Financial Committee of the U.N. told the Committee that his country was too hard-pressed to contribute to the Fund and that further strain would jeopardise the stability of British economy. France, it may be observed, has promised to give $15 million to the Fund.

The Ceylon Government is planning to manufacture cement from coral. Coral is not widely used in the manufacture of cement, but it contains calcium carbonate which is the property found in limestone, the more commonly used raw material. If the Government's experiments succeed, a factory, which will be the first one of its kind in the East, will be set up in Akural on the south coast.

PERSONAL

MR. Jorge-Govantes Y. Aguirre has been appointed Envoy Extraordinary and Minister Plenipotenitary of Cuba to India, in place of Dr. Francisco Linares Y. Blazquezke.

Dr. V. S. Huzurbazar, Professor and Head of the Department of Mathematics and Statistics, University of Poona, has been elected Fellow of the National Institute of Science of India.

Sir Gilbert Laithwaite, Permanent Under-Secretary to the Commonwealth Relations Office in London, arrived in New Delhi on 5th February on a brief visit to India.

Mr. John A. Collings has announced his resignation as Executive Vice-President of Trans World Airlines Inc. He will continue on the Board of Directors and will serve as Senior Consultant to the Board of Directors and the President. His headquarters will be in Kansas City.

Mr. J. M. E. Fell, Export Director of one of Britain's largest groups of commercial vehicle manufacturers, will be visiting India, Pakistan and Ceylon in the course of a world tour. Mr. Fell, who left London by air on 1st February, represents A. C. V. Sales Ltd., the selling organisation of Associated Commercial Vehicles Ltd.

Mr. W. J. R. Warren, Director of Export Sales for the Standard Motor Company Ltd., is now in India on a month's tour of the country. Mr. Warren's tour will include a visit to the Standard Motor Products of India Ltd., in Madras, where the assembly and progressive manufacture of Standard cars and Ferguson tractors continues to expand.

"COMMERCE" 1932

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *20th February*

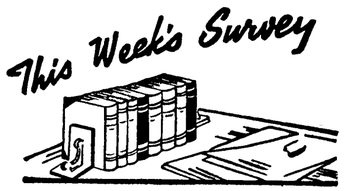
Tragedy of the Pound

The tariff proposals of His Majesty's Government are commended by Mr. Walter Runciman, President of the Board of Trade, mainly because of the anticipated function of the tariffs as protectors of sterling; but he does not lose sight of the fact that the proposed 10 per cent. import duty will, if adopted, add something like £30,000,000 to the country's annual revenue. Reviewing the history of the crisis since it began last June, Mr. Runciman said that "they had been able, partly through the integrity of their financial houses and the enterprise of their people, to maintain trade at a surprisingly high level, while the rest of the world had grown progressively poorer." Had the President of the Board of Trade travelled a little further in his explanation the effect of his utterances might have been one of thankfulness rather than of jubilation, for, as it is, only those intimately "in the know" can fully realise how narrowly Great Britain escaped disaster when the pound crashed. The history of the great collapse of 21st September 1931 contains the basic elements of a classic tragedy; to such an extent, indeed, that Paul Einzig, in the book he has just written, *The Tragedy of the Pound*, ventures to suggest that in a few hundreds of years' time, when the economic affairs of the world will presumably be regulated by international five-year plans, the twentieth century will be regarded as a highly romantic epoch. Amidst the dull regularity of a well-planned economic system our troubles, our struggles and our crises will be looked back upon in the same way as we look back upon the romantic glamour of the Age of Chivalry. An economic crisis, however sordid it may appear to those who have experienced it, will be regarded as a thrilling adventure by a generation to which economic crises will be only known through historical textbooks.

Japan is planning a five-year atomic energy programme, costing about £300 million and capable of producing 3 million kw. of electricity. Mr. Koichi Uda, Japanese Minister for Economic Planning, has said that this will alleviate a threatened electricity shortage of some 9 to 10 million kw. in 1962. In connection with this, a research-purchase team will be sent to Britain and America and a specialised atomic energy university will also be established.

A working group for co-operation with underdeveloped countries has been founded at Frankfurt, West Germany, to advise and help the West German Government in all branches of technical assistance to these countries and to co-ordinate the country's efforts in the field. This body has been sponsored by organisations representing German industrialists, bankers, farmers and exporters. Dr. Hans C. Boden, Chairman of A.E.G., has been chosen as the President of the Working Group.

The U.S. Department of Agriculture has lowered the support levels for a wide range of farm products for 1957. This will result in a saving of $200 million (about Rs. 95 crores) in the amount committed to the support programme, provided production does not outstrip the average levels. The programme had cost the Eisenhower Administration $2,994 million in the last four years, nearly three times the total Government losses in the preceding 20 years of Federal farm aid programmes. At the end of 1956 the Commodity Credit Corporation owned surplus commodities valued at $5,892 million.



CHEMICAL INDUSTRY

NEXT to metallurgical and engineering industries, the chemical industry accounts for the largest outlay in the industrial development programme drawn up under the second Five-year Plan. Thus, out of the total outlay of Rs. 1,094 crores on industrial expansion, the share of the chemical industry comes to Rs. 132 crores, or 12 per cent. An idea of the important role which Imperial Chemical Industries (England) would play in the development of this industry was given by the Company's Chairman, Sir Alexander Fleck, on his arrival at Calcutta last week. According to Sir Alexander, I.C.I. (England) has undertaken several projects of vital importance to India. These include the establishment of a plant to manufacture polythene at Rishra near Calcutta, expansion of the explosive plant at Gomia, Bihar (Indian Explosives Ltd., in which I.C.I. (India) Ltd. is the principal shareholder in partnership with the Government), and expansion of the chlorine factory at Rishra. The last-mentioned factory also manufactures caustic soda, B.H.C. insecticides, nitro-cellulose, and synthetic paints and industrial finishes. Another I.C.I. enterprise is Atic Industries Private Ltd., a company in which it has as partner Atul Products Ltd. for manufacturing vat dyes at Bulsar.

Sir Alexander felt that, in India, the demand for chemical products would become "more sophisticated and complicated" as experience widened. In support of this view, he cited the case of Australia. At one time, this country had imported 60 per cent. of its chemical requirements, but, as the indigenous industry developed, the demand for imports fell to 25 per cent., but the 25 per cent. imported was of greater value to industry than the original and less discriminating 60 per cent. demand had been. To quote him: "A similar trend towards greater and more informed discrimination in chemical imports is already becoming evident in India, and I think there will be the carefully considered import of chemical products into India for a long time to come."

Among the many products of I.C.I. is the relatively new synthetic fibre called Terylene. Pure Terylene contains no textile fibre, but many of its products consists of 50 per cent. cotton or wool. Alluding to this fibre, Sir Alexander pointed out that neither Terylene nor nylon would at any foreseeable time constitute a danger, or even a challenge, to the textile industries. He revealed that the initial dyeing problems in regard to Terylene had been solved and products, whether of pure Terylene or 50 per cent. textile mixture, could now be produced in almost any shade, colour or variety.

D.A. TO BANK EMPLOYEES

The recent decision of the Labour Appellate Tribunal of India, regarding the dearness allowance scheme embodied in the award of the All-India Industrial Tribunal (Banking Disputes), as modified by the Labour Appellate Tribunal, removes much of the confusion that surrounds this issue. The occasion for the interpretation arose when the Government of India referred the issue to the Tribunal for a decision whether the minimum and maximum limits of dearness allowance laid down in the said award could be reduced or increased when the half-yearly cost of living index number fell or rose, as the case may be, by more than ten points on the basic index figure of 144.

According to Mr. Jeejeebhoy, the minimum limit, as well as maximum, were fixed with reference to the cost of living at the time of the award. Its object was to ensure that no employee got less than a particular minimum, and, *ipso facto*, more than a particular maximum. It was illogical, therefore, to argue that this minimum should not be touched when there was a fall in the cost of living and, consequently, a proportionate decline in the dearness allowance. The same argument would apply to the maximum also.

It should be noted that the employees' contention was somewhat unsound. It was their contention that the minimum should not be touched when there was a decline in the cost of living index, but there should be an increase in both the minimum and maximum when the cost of living rose. It was a case of wanting to have the best of both worlds.

On the face of it, this is illogical and untenable. Mr. Jeejeebhoy, therefore, rightly stated that it was impossible to accept this contention. He pointed out that the scheme of the Bank Tribunal was compact and consisted of three inter-related things, namely, (1) the minimum, (2) the dearness allowance as given, and (3) the maximum. This was a co-ordinated scheme, and as a corollary, if the dearness allowance fell, the other two would follow suit. Otherwise, the minimum would continue to exist even after the justification for it had gone. Mr. Jeejeebhoy, therefore, upheld the view of the bankers that the minimum and maximum dearness allowance should "register a proportionate rise or fall according to the change in the dearness allowance" which in turn is influenced by the trend of cost of living index.

I. F. C.'S LENDING POLICY

Business men all over India would have heaved a sigh of relief on being assured by the Chairman of the Industrial Finance Corporation of India that no application for loan to the Corporation would be rejected because of paucity of funds. He added that the Corporation would find enough resources to meet the requirements of business men. It had, however, not yet decided whether to seek the help of the Government by way of larger allotments for the purpose or to raise the amount by itself entering the open market. The I.F.C. Chairman, Mr. K. R. K. Menon, made this statement in reply to the memoranda submitted by the Southern India and Andhra Chambers of Commerce in Madras last week-end. Mr. Menon had been to that city to attend the meeting of the Board of Directors of the I.F.C., when his presence was availed of by the members of the two Chambers of Commerce to discuss with him questions relating to the financial aid given by the Corporation to industrial concerns and *entrepreneurs*.

As the Southern India Chamber of Commerce pointed out in its memorandum, if the private sector is to play its role and fulfil the targets allotted to it under the second Five-year Plan, it has to be provided with long-term finances and for that purpose it has to look up to the I.F.C. for aid to a larger extent than hitherto. If the industries in the private sector are unable to attract capital from the open market on account of the Government's fiscal and other measures, naturally they have to look for long-term finances. The banking situation, according to the Chamber, is far from reassuring from the point of view of industrialists. In the circumstances, there is likely to be a greater demand on the Corporation for providing long-term loans. The Chamber urged the Corporation to take a comprehensive view of both the capital market and the banking situation and come forward with liberal assistance of long-term finance to industrial ventures.

This raises the question whether the Corporation will be able to lend to an unlimited extent, even if the loans prove to be sound and remunerative propositions. Looking back to the balance-sheet of the Corporation as on 30th June 1956, the outstanding loans and advances amounted to Rs. 14.24 crores, out of a total working capital of Rs. 15.18 crores. The balance left for future lending was less than Rs. 1 crore. Such a policy of lending to the hilt had come to be viewed with concern in some quarters. In fact, the Corporation's Chairman himself referred to this issue in his speech in September last. He then said:

"The fourth, and, in a sense, the most important factor which is likely to come in the way of expanding our activities to the fullest extent otherwise possible, is the fact that, if we succeed in inviting business at the present rate and dealing with applications for loans at the pace that we have achieved last year, our own monetary resources will soon be tapering off, thereby accelerating the advent of the day when we shall perhaps be forced to borrow under conditions which might leave us little or no margin of profit after meeting our tax obligations and our working expenses. This matter is engaging our serious attention already, and we hope that we should be able to find a satisfactory solution in collaboration with the Central Government who have been apprised of the matter. It will take some time before a final decision is taken; I mention it now merely to reinforce my point that, if the outlook is on the whole bright and we could be quite optimistic regarding the future, it behoves us also to take note of other factors which we shall have to take into account."

Mr. Menon's reply to the Chambers of Commerce mentioned at the outset is no doubt reassuring. He also gave the categorical assurance that there was no proposal before the Government of India to fix a ceiling on the loans that could be sanctioned to sugar and textile industries.

The only question to be decided by the Corporation is how to raise the necessary resources to provide larger finances to industries. Two courses are open, namely, (1) to borrow more from the Government and (2) to raise fresh capital from the market. If the Corporation is to fulfil its functions and if the Government "does not intend to kill the initiative and enterprise of the private sector, but wants it to prosper," as the Finance Minister said in Guntur a few days ago, then there is no reason why the Government should not allot some funds to the Corporation. As regards the other course, that is, to raise capital in the open market, it is doubtful whether the Corporation will be able to attract funds from the public in the present conditions of the money market at reasonable rates of interest, unless the suggestion made by the Southern India Chamber of Commerce is followed. The latter suggested that, by offering an attractive return on the share capital and also by allowing free private holding of the shares, it should be possible for the Corporation to popularise the shares and increase its capital from time to time. Mr. S. Narayanaswami also said that it was important to secure marketability of the shares of the Corporation by having them freely traded on the stock exchanges. Even this free marketing of the shares will be possible, as in the case of other leading industrial equities, only if the shares are more widely held, which in turn depends on the attractiveness of the shares. In reply, Mr. Menon said that he would pass on the suggestion for the consideration of the Government.

We, however, wonder whether this suggestion will be of much benefit to the industrial borrowers, apart from the fact that its practicability is doubtful. If the Corporation were to ensure an attractive rate of return on its capital, it would have to charge a much higher rate of interest on its advances than it does at present. But borrowers are complaining that even the current rate, which is not fetching the Corporation enough profit to pay even the guaranteed minimum dividend without a subvention from the Central Government, is high. Moreover, the Corporation having been deliberately "officialised" only recently, the Government will be very reluctant to let the private sector, again, have a say in the control and management of the Corporation.

CERAMIC INDUSTRY

In modern times, the progress of a nation is synonymous with its industrial expansion. Rising effective demand for both production and consumption, consequently, reflects the rate of expansion of industrial capacity and standard of living. If this is true, it will be no exaggeration to say that Indian economy is expanding at a fairly good pace.

An important sector of industry, which, in a way, sets a limit to the overall industrial expansion is the ceramic industry. Adequate capacity in refractories is a prerequisite for the expansion of a number of important industries, namely, iron and steel, cement, glass and ceramic, and housing. Railways, too, consume substantial quantities of refractories. Refractory industries, as is well known, is the name collectively used for the group of industries comprising fireclay, silica, magnesite, chrome-magnesite, fireclay insulating, diatomic or vermiculite bricks, sillimanite and others. These refractories are used essentially to withstand the thermal, chemical and physical effects that are met with in furnace operations.

On the occasion of the twenty-first annual conference of the Indian Ceramic Society held at Morvi on the 10th inst., the Union Minister for Heavy Industries, Mr. Manubhai Shah, gave certain indications of the measure of expansion envisaged in this sector, especially refractories and glasses, during the second Plan period. He stated that the present production of 300,000 tons of refractories would be increased to 1.1 million tons by the end of the second Plan. It may be noted that the estimated requirements of various industries are placed at 800,000 tons by the end of the second Plan. The Minister also pointed out that the present investment of Rs. 7 crores in the industry would go up to Rs. 20 crores during the same period.

In view of this large expansion envisaged in the industry, it is but appropriate that the Government should have decided to set up a standing panel for the refractory industry to look after its development. Further, the production in industries such as pottery, chinaware, sanitaryware and porcelain in the 66 factories existing has gone up threefold, according to the Minister, during the last eight years. This is expected to increase further to 200,000 tons in the ensuing five years. There is thus a need to ensure that this growth takes place on sound lines. It is to be hoped that the Panel would prove useful in ensuring a smooth and co-ordinated expansion in all these units.

Referring to glass industry, Mr. Shah expressed the view that the industry was producing adequate goods to meet the country's requirements. It is noteworthy that, before the year is out, the country would be producing rock and glass wool, unbreakable glass and building bricks. Further, Mr. Shah's announcement of the decision by the Government to set up an optical glass factory in the public sector should be specially welcomed, in view of the present large imports of optical glass. The Minister's disclosure of the plans for the establishment of a synthetic stone factory at Mettupalayam, and raising the production of asbestos sheets from the present capacity of 100,000 tons to 200,000 tons should also be welcomed. It is gratifying to hear that plans are being drawn up for conducting a survey of the asbestos resources in the South and for exploiting them.

AUTOMATION

With the growth and development of technology, automation, which forms a part of it, has been receiving rather greater attention than any other branch of technology. Mechanisation replaces human muscles, while automation seeks to replace the human brain. The fear entertained in some quarters that, in future, automation might drive people out of factories and cause unemployment when applied in certain societies is, therefore, not entirely without foundation. In other words, a country should not resort to automation irrespective of its manpower situation, simply because some other country has done so.

Speaking on this subject at the Rotary Club at Calcutta, Mr. Oliver Humphreys, Director of the General Electric Company's research laboratories, emphasised that every country engaged in industrialisation should look at the problem in the circumstances prevailing in that country and not allow considerations of prestige to influence its policy. Labour had no fear from automation, said Mr. Humphreys, if it was used properly. He opined that, while automation might suit Britain and the U.S.A., it was unsuitable for India and other countries where there was a reserve of labour. It might, therefore, be more economical for India to use human labour instead of expensive imported machinery. He felt that automation was "certainly no panacea for national economy."

These are wise words. Another instance of what is good for one is not necessarily so for another is on generation of power by nuclear energy. Mr. Humphreys thought atomic power for peaceful uses was a must for Britain but not so for the U.S., at any rate for the present. According to him, the importance of nuclear power to Britain was more pronounced than in the case of the U.S. since maintenance of a sound economy for it depended on generation of such power. This was so, because Britain's coal reserves were being fast depleted and large imports of oil would be necessary to replace coal. The position was, however, different for the U.S. which had plenty of oil. Consequently, it was studying other aspects associated with the use of nuclear energy.

SOVIET ECONOMIC PLAN

"We suggest to the West that it compete in the development of peaceful economy and not in the creation of military bases and the intensification of the destructive power of armaments." This challenge was thrown to the free countries of the West by Mr. M. G. Pervukhin, Chairman of the Soviet Economic Commission and First Deputy Premier, while presenting his report on the State Plan for the development of the National Economy of the U.S.S.R. for 1957 to a joint session of the Supreme Soviet (Parliament) early this month. Behind this challenge lies the conviction that, in respect of sheer productive efficiency, the Socialist economic system is on a par with, if not above, the alternative system based on the principle of private ownership of the means of production. That the Soviet authorities are determined to prove to the uncommitted nations of the world the soundness of this conviction is evident from the massive size of the economic Plan formulated for the current year.

The Soviet Union has entered the second year of its sixth Five-year Plan, the fifth having been completed by the end of 1955. The 1957 Plan, as Mr. Pervukhin put it, is aimed at giving Russian workers a better life and to put the Soviet industry on an equal footing with that of the West. It is designed, in particular, to satisfy the requirements, as laid down by the twentieth C.P.S.U. Congress for the Sixth Five-year Plan period, of the national economy in respect of fuel, metal, cement and other supplies and raw materials, agricultural development, expansion of consumer goods production, improvement of housing construction, etc.

The highlight of the 1956 Plan, according to Mr. Pervukhin, was that Soviet industry overfulfilled the Plan target, increasing the volume of production by almost 11.0 per cent. above that of the previous year, comprising an increase of 11.4 per cent. in the production of capital goods and a 9.4 per cent. increase in that of consumption goods. On the agricultural front also, remarkable results were achieved. During the last three years, 35.5 million hectares (1 hectare= 2.5 acres approximately) of virgin land were brought under the plough. This greatly contributed to the aggregate output of agricultural products which in 1956 was about 20 per cent. above the highest level reached in the history of Russian agriculture. Even then, production of foodgrains was not sufficient to meet the growing consumer needs.

In the current year, Soviet national income is estimated to rise by at least 8 per cent. as compared with the 12 per cent. increase registered in 1956. As regards industrial production, the Plan envisages an increase of about 7.1 per cent. Output of capital goods is to increase by about 7.8 per cent. and that of consumer goods by about 5.9 per cent. The target for coal, admitted to be a weak point of the Soviet economy, is 446 million tons, a modest increase over the 1956 figure of 429 million tons. Oil output is to go up to 97 million tons from 83.8 million tons, iron to 38.1 million tons from 35.8 million tons. Power pro-

NEW DEAL FOR NON-GAZETTED RAILWAYMEN

COST PUT AT ABOUT RS. 5 CRORES PER ANNUM

From Our Special Correspondent

NEW DELHI, *13th February*

DELHI LETTER

AS many as 170,000 employees out of the 229,000 in the non-gazetted cadres of all Government railways will be greatly benefited by the re-adjustment in pay scales and re-distribution of posts announced on Sunday last by the Union Minister for Railways, Mr. Jagjivan Ram. The announcement was made at a specially convened meeting of the representatives of the National Federation of Indian Railwaymen and top-ranking office-bearers of the recognised zonal railway unions from all over the country. A perusal of the details of the new scheme will reveal that the Railway Minister has endeavoured his best to meet the two long-standing complaints of railwaymen, namely, that the scales of pay are very low and that opportunities for promotion to higher grades are meagre. The scheme, for instance, provides for the transfer of a substantial proportion of posts in the lower pay grades to higher pay grades. Such a transfer is expected to help 16 major categories of employees, including station masters and assistant station masters. As a result, a large section of the non-gazetted employees will benefit in the shape of either increased emoluments or improved opportunities for advancement through promotion of higher grades.

The new scheme envisages an upward revision in the starting basic pay of station masters and assistant station masters to Rs. 100 and Rs. 80, respectively. The number of posts in the scale of Rs. 100-Rs. 500 will be increased by 6,000 to 9,000 and that in the grade Rs. 100-Rs. 185 by 5,000 to nearly 7,000. As a result of this revision, the number of station masters drawing a basic salary of Rs. 100 and over will rise to 40 for every 100, as against only 14 at present. The number of assistant station masters in the grade Rs. 80-Rs. 170 will be 13,500. Nearly 29,000 clerks in the Rs. 60-Rs. 130 grade can in future seek promotion in the scale Rs. 80-Rs. 220. As against 8,000 posts in the present Rs. 80-Rs. 160 grade, there will be over 14,000 posts in the new combined grade Rs. 80-Rs. 220. With regard to train examiners, the starting salary is to be enhanced from Rs. 80 to Rs. 100; their prospects of promotion will be trebled, resulting in 40 per cent. of the posts being in the higher grades, as against only 15 per cent. now. In the case of commercial clerks, the number of posts in the higher grades will be raised from 3,000 to almost 7,000 and the percentage of posts in the higher grades increased from 13 to 30 of the total cadre. The running staff will get a higher rate of running allowances as an incentive to greater output of work; the rise will range between Rs. 20 for the lower grade employees and Rs. 4 for higher grade employees.

The large-scale upward redistribution of posts in the non-gazetted cadres of railways is fully justified, especially in the present context of the increased work-load on station masters and other employees resulting from the greater pressure at which the railways are operated now. Surely, the new scheme amounts to a recognition of the heavier responsibilities and larger work-load which the workers in the non-gazetted cadres are now carrying and the still larger responsibilities they will be asked to carry in the coming years. Viewed thus, the additional cost which the railways have to incur for implementing the scheme —this is estimated at about Rs. 5 crores per annum—is not much. Indeed, it is nothing, considering that the concessions now announced will go some way towards securing greater contentment among the railway employees, thereby leading to a more efficient working of this important means of transport. It is to be hoped that the railway workers will welcome the new scheme and extend their full co-operation to the Railway Ministry in the task of meeting the vastly increased transport requirements during the period of the second Five-year Plan.

Life Insurance

What is claimed as "the unique line of life insurance on easy terms" for rural areas and industrial workers is expected to be launched by the Life Insurance Corporation of India. The details of the proposal are now being worked out by the Corporation officials at Bombay and indications are that it will not take much time before the proposal is actually finalised and made known to the public. Under the proposal as it stands now, the minimum sum assured under any policy is fixed at Rs. 250, the total sum assured not exceeding Rs. 1,000 on any one life. The latter sum will, however, be up to Rs. 3,000, if the life assured has any other policies under non-medical schemes. A striking feature of the new line of business is that there will not be any medical examination. What is more, the terms of payment for such insurance are expected to be easy. To start with, the aforesaid proposal will be implemented on an experimental basis in two areas in each zone of the Corporation—one in the rural and the other in the urban area.

The new line of life insurance business, it is believed, will cover about 105 million self-supporting persons in India, representing nearly 28 per cent. of the total population. Of these, the vast majority is concentrated in the rural areas. It will be interesting to note here that the number of persons who have insured their lives at present does not exceed 4.5 million or less than 1.2 per cent. of the aggregate population.

Assistance to Shipping

There are strong reports that the Government of India has decided to charge a higher rate of interest on loans given to shipping companies for acquiring new ships. The extent of the increase contemplated is said to be 2 per cent., that is, from 2½ to 4½ per cent. The revised rate will be applicable to all ships purchased for overseas or coastal trade. In other words, there will be no difference in the rates of interest charged on loans for overseas and coastal trades which now amount to 2½ per cent. and 4½ per cent., respectively.

The reported decision of the Government, it is stated, has been prompted by the consideration that the shipping companies are making reasonable profits and as such they cannot claim assistance on more favourable terms than are allowed in comparable cases. The following figures give an idea of the profit earned by the three leading shipping companies in the past three years:

	Year ended 30th June		
	1956 Rs.	1955 Rs.	1954 Rs.
Scindia Steamship Co.			
Net profit	48,40,882	22,72,555	23,45,300
Dividend	1–0–0	0–8–0	0–8–0
Great Eastern Shipping Co.			
Net profit	24,95,346	10,38,254	14,33,827
Dividend	1–8–0	*	1–0–0
India Steamship Co.†			
Net profit	38,72,859	1,30,182	1,76,195
Dividend	1–0–0	*Nil*	*Nil*

Net profit calculated after providing for depreciation.
* Reserves capitalised 1 : 5 in lieu of dividend.
‡ Year ended March.

Despite the improvement in profits of shipping companies, shipping circles feel that the financial position generally is not so happy as to bear a higher rate of interest on loans granted to companies for acquiring new ships. In fact, the shipping companies have been urging the Government to lower the interest rate. This plea has not been found convincing.

INDO-U.K. AGREEMENT ON TAXATION

An agreement between the Government of India and the Government of the United Kingdom for the avoidance of double taxation and the prevention of fiscal evasion with regard to estate duty was signed on 3rd April 1956. The agreement came into force in India with effect from 30th June 1956, but its provisions are also applicable retrospectively, if the accountable person so elects. The Central Board of Revenue has now prescribed by Rule 38 of the Estate Duty Rules, 1953, the procedure for claiming relief under the said agreement in cases where Estate Duty has been paid both in India and in the United Kingdom on the same property.

LOWER RATES AND TIGHTER MONEY

(From Our Own Correspondent)

LONDON, *8th February*

THE drop in the Bank rate after a year at 5½ per cent. may look queer against the aftermath of the Suez crisis and the threatened intensification of the credit squeeze. But it had been so long heralded—its coming stuck out through the bankers' speeches—that one must simply put these other factors into the general background of the reduction and analyse its causes independently. The same week that has seen the ½ per cent. fall in the Bank rate began with the announcement of a heavy gold loss in January, reducing the reserves from their end 1956 figure of about £762 million to about £744 million. As for the credit squeeze, it has not been the rates of between 6 per cent. to 6½ per cent. which the banks have been charging that have kept down the total of bank advances, but, of course, the directives issued to the banks which have forced them to look at their customers' demands with the utmost conservatism.

LONDON LETTER

The market has, however, for some time enjoyed a level of money rates which have increasingly tended to get out of touch with the Bank rate, so that the latter became merely an index which the banks applied in fixing their deposit rates and their loan rates. It was not a factor in controlling the market, e.g., day-to-day money has been around 3½ per cent.

The immediate effect of the reduction of the Bank rate to 5 per cent. is that the bankers' rate on deposit accounts is now down to 3 per cent., while they charge on loans 5½ per cent. to 6 per cent., and, of course, the whole money rate structure looks sense once again. But why, it may be asked in overseas centres, should such a reduction take place even though apparently necessary to restore the normal structure of money rates? Surely, it will be interpreted as a relaxation of the credit squeeze? Indeed, this is a valid criticism, for industrial leaders in this country have already made ill-advised comments that this means a relaxation of the credit squeeze. Such, unfortunately, is far from the truth.

Return to Old Methods

What the Treasury and the Bank are getting at here is a gradual return to the old methods of monetary control. Your correspondent referred to these in his letter last week (published this week on the next page) commenting on the speech of Lloyds Bank Chairman. The Bank rate is intended to become once again, an index of short-term market conditions and the bellwether of the market. Clearly, a crisis rate (and by long tradition anything over 5 per cent. is to the City a crisis rate) which has been maintained for a year is no longer a flexible weapon of credit control. If the Bank rate is to be restored to its traditional function, then movements in it must be capable of influencing the market. Obviously, on this occasion, it is the market which has influenced the Bank rate and this only serves to point the moral that the Bank rate had ceased to perform any useful function. The authorities, however, intend that now they have lined the Bank rate up with the market structure, they should be able to move it when they want in turn to move the market.

If this interpretation is correct, then the authorities have only begun their new measures. They must go on, as the Chairman of Lloyds indicated, to a funding operation designed to reduce drastically the outstanding volume of Treasury bills and make the bank more susceptible to control by Bank of England policy. A mild degree of funding has been in evidence from time to time but what is wanted is a very much bolder move and it is clearly in the light of whether such a move is made or not that the markets will be able to decide how seriously the Government is embarking upon this apparently new road of policy. [*The British Government has since announced a £300 million 42-47 year Funding loan at a discount of 20 per cent.*—ED.]

Only two further comments need to be made. The first, that the rise in stock market prices, which followed the announcement of the change in the Bank rate, is simply the normal adjustment of prices, particularly the gilt-edged, to a confirmed change in rate levels; the second, that the warning that the Chancellor of the Exchequer made this week in the House about the significance of the change in rate, must be taken at its face value. The Government has certainly no intention of relaxing its credit squeeze in any way and we have yet to see, in the budget to be presented in two months' time, whether Mr. Macmillan's earlier threat of heavier taxes to reinforce credit stringency will be borne out by the new Chancellor.—*All Rights Reserved.*

BANK CREDIT, TAXATION AND INCENTIVES

LONDON, *2nd February*

The credit squeeze was naturally uppermost in the minds and speeches of the Chairmen of the Big Five in this year's annual round of dissertations upon the economy. But different chairmen regard it in different ways, putting their own interpretation upon the likelihood of whether the Bank rate would stay as it is or go down—its work done—and whether that would be a good or a bad thing. But all of them were able to show that credit had been squeezed.

The speech of Lloyds Bank Chairman was, however, remarkable for his approach to the basic problems of inflation. What he said, in effect, was that one cannot really control credit by direction. The only effective means was for the monetary authorities to exercise direct control over the liquid resources of the banks. He wanted to go back to the pre-war situation when movements in Bank rate were effective and when they were supplemented by the Bank of England going into and coming out of the market. This, of course, was only possible when the Bank's activities materially affected the volume of short-term assets of the Banks and accordingly their liquidity ratios. Under modern conditions, the volume of Treasury Bills outstanding is so much that bank operations cannot normally substantially affect the liquidity ratios. Thus, many economists have urged that, in spite of the greater cost of funding the Government's short-term debt, this course should be taken in order to reduce the volume of Treasury Bills outstanding, and thereby the banks' resources for extending credit. It would certainly be an expensive price to pay for bringing the banks to heel as it were, but the Chairman of Lloyds thinks it is the only way in which it can and should be done.

The other point that Lloyds' Chairman made was to attack the generally held notion that this country ought to increase its capital investment. "Of course it ought," he said, "but only if that is matched by increased saving, whether voluntary or enforced." He, again as an exponent of private enterprise, rules out the alternative which the Opposition would adopt of physical control of investment.

But his analysis of the weakness of the system of enforced saving was cogent. The Government can force saving by a budget surplus. If they do this through increased *direct* taxation, there is no direct counterbalancing affect. If they do it through indirect taxation, then the cost of living goes up and workers demand higher wages and all the good is undone. Similarly, if the Government allows inflation to take its course and prices to rise in order to curtail spending, under modern conditions, the Trade Unions immediately press for higher wages and again the good is undone.

But *direct* taxation, the only effective alternative, carries with it the seeds of later damage to the economy, for, by stifling incentive, by encouraging the emigration of the best technical and managerial workers, the basic resources of Britain's economic strength are undermined. But the Chairman of Lloyds did not feel compelled, having posed this problem, to re-examine the doctrine for compulsory direction of resources. Yet, given the background of the Middle Eastern crisis which had interrupted the "smooth transition to a stage of monetary equilibrium," some measures had to be taken. The balance of payments could not be ignored in the formation of domestic capital and he noted that the Chancellor of the Exchequer had already given a hint of increased direct taxation to reduce purchasing power. In the light of the long-term damage which this would cause, he wanted the whole matter and manner of the contraction of purchasing power to be re-appraised "uninhibited by the shibboleths of the past." One could almost hear the Trade Unions listening for what was coming next—but nothing more was said!—*All Rights Reserved.*

AMERICAN LETTER

POSSIBILITY OF DEPRESSION NOT RULED OUT

DECLINE IN EUROPE'S EXCHANGE RESERVES CAUSES CONCERN

From Our Special Correspondent

NEW YORK, *6th February*

WARNINGS of a possible business setback in the United States and in Europe continue to be heard here with increasing frequency. Former President Herbert Hoover, who occupied the White House from early 1929 until 1933, was the latest one to voice forebodings. He says the current inflation shows signs that a depression may be breeding.

He asserted "the obvious sign of inflation is the advance of prices, wages and the cost of living." Unless checked, he added, there is danger of a depression "agony" like that which beset his own Administration at the time.

Mr. Hoover repeated the forecast of George M. Humphrey, U.S. Secretary of the Treasury, that big Federal budgets will produce "depression that will curl your hair." He concluded, "mine has already been curled once—and I can detect the signs."

Similar warnings have come from other Government sources. Testifying before the Congress, Treasury Secretary Humphrey said that present tax rates are so high that "they will in the long run hamper our economic growth." Rising receipts in terms of inflated dollars from an expanding economy will not be enough to enable the Government to reduce taxes. He again turned a critical eye on the $71,800 million Federal Budget for the fiscal year starting 1st July, 1957.

King Saud

In the political arena, the spotlight remained on the visits of foreign dignitaries to Washington. From all indications, King Saud's talks with President Eisenhower were successful. The potentate indicated that the Arab world would accept America's Mid-East Doctrine.

The Saudi Arabian monarch was much more loquacious during the closing days of his stay here than at his arrival. He suggested he felt the proposal to use U.S. arms, if necessary, to counter Soviet aggression would be acceptable to other Arab leaders "if the points I raised in Washington could be clarified to them as they have been to me."

This, somehow, left open the question whether the King would undertake himself such an explanation after his return to his native land, or whether his royal associates in Arabia should be told the exact U.S. position by emissaries from here. In the meantime, Crown Prince Abdul Ilah of Iraq arrived at Washington for some firsthand information on the Eisenhower doctrine and he conferred also with King Saud. The latter's son was treated here for cerebral palsy and an American physician will accompany him home.

German Leader to Visit

Among the foreign visitors' list for next month is West German President Theodore Heuss. He too will be the guest of President Eisenhower. The significance in this particular case would seem to lie in German rearmament and in that country's contribution to the European defence forces. Voluntary enlistments in the new German army have been lagging, because of conditions of full employment prevailing throughout the economy.

Another Russian spy ring has been uncovered here by the Federal Bureau of Investigation. A Federal Grand Jury in New York indicted three New Yorkers, Jack and Myra Soble and Jacob Albam, on charges of peace-time spying on behalf of the Kremlin. They face possible death penalty. Named as conspirators were 12 Russians, mostly diplomatic employees. All have left this country.

Such incidents do not exactly help to establish a friendlier atmosphere between the United States and Soviet Russia. Indeed they breed further suspicion and may be detrimental to the Administration's desire to conclude agricultural surplus disposal deals with such borderline Soviet satellites as Poland and Yugoslavia.

Exchange Reserves

Deterioration of the British and French gold and foreign exchange reserves is causing concern here. The January drop of sterling area holdings brings the total to only $84 million above the $2,000 million level, considered by many as the minimum safety amount for the value of the pound. There is a strong feeling, however, that, regardless of what may happen, the present value of sterling will be maintained, if necessary with help from the U.S.

The effect of the fall in European reserves is the subject of many learned discussions here and has been for some time. The latest spokesman was a well-known New York University Professor, Raymond Rogers. Economic developments abroad, particularly those created by the Middle East crisis, are hastening the end of the U.S. business boom, he said. He predicted further shortages of oil, dollars and shipping space in Europe, all stemming from Mid-East developments, would bring about decreased business activity and deflation on the Continent and these effects would be felt adversely on this side of the Atlantic.

If foreign buyers have less money to spend, foreign trade would, naturally, be affected. So far, U.S. exports and imports have been very satisfactory and the prospects seem excellent.

Exports in 1956 soared to a record of $17,300 million which was $3,000 million greater than the previous high established in 1955. December shipments alone boosted the total by $1,900 million. It was the largest for any month in American history.

This year's figures may also be influenced by the strikes of tugboat workers and the threatened walkout of longshoremen. At this writing, it seems, however, that only New York will be affected and other ports will remain open, so that the flow of foreign trade is unlikely to stop altogether.

Sale of Farm Surplus

Overseas sales of U.S. farm goods are expected to reach a record of more than $4,200 million for the 12-month period ending 30th June next. Foreign competition gets tougher, though, every week. Argentine has been a large seller of agricultural commodities recently and other nations are stepping up their exports to earn funds for the import of industrial goods. There is, therefore, an increasing tendency here to permit the Washington Government to sell raw materials against foreign currencies rather than dollars.

Another element in this picture is that U.S. wheat production in 1956 was reduced by severe drought conditions and planting curbs. Output here accounted for only 34 per cent. of the world total, as compared with 42 per cent. shortly before outbreak of the last war.

The textile goods picture is dim. Several mills have closed for lack of orders. Converters continue to bid for forward goods at prices well below the selling ideas of the mill managements. Orders for 1957 fall woollens and worsteds are small and there are only limited sales of rayon acetate goods for first quarter delivery. Outside of the weaknesses, either real or potential, mentioned above, the American economy is humming with high personal incomes and full employment.—*All Rights Reserved.*

The United States Government has agreed to give $7 million as aid to Ceylon for its development projects in 1957. This represents an increase of $2 million over the aid granted last year. It was only last year that the U.S.A. waived its embargo which had disqualified Ceylon from receiving American assistance on account of its trade with China.

IS SAVING BAD CITIZENSHIP?

SECULAR STAGNATION THEORY EXPLODED

[With the advent of the historic depression of the thirties, a habit that became the target of libel was saving. In the scale of personal virtues, thrift forfeited its former place. All this originated from the theory of secular stagnation, according to which, in an economy which has reached the level of full employment, people tend to save much more than could be utilised for productive investment, thereby leading to a fall in demand which, in turn, affects employment. Present trends in the industrially advanced countries of the world, where employment has reached the highest levels in history, reflect an entirely different picture. But the frontiers of economic expansion are far from being reached. An increasing need for capital investment is being felt, giving rise to an ever-growing demand for savings, even to sustain the ground already gained and to prevent the economy from falling back. The following brief but interesting article, taken from the December (1956) issue of The Guaranty Survey, *published by the Guaranty Trust Company of New York, highlights the urgent need for savings for present as well as future industrial expansion, with particular reference to the U.S. economy. The article is of topical importance to India, not only because this country's needs of capital are insatiable but also because its leaders, in their fervour for the vague ideals of socialism, are unwittingly undermining the value of thrift and placing a premium on spendthrifts. The result is more and more inflation.—*Ed].

LONG-RANGE economic thinking is shaped to a large extent by short-range economic conditions. Twenty years ago, when the United States, along with most other countries, was in the grip of the great depression, the theory of secular stagnation was born. The economy, we were told, had reached a state of maturity. The great divide between scarcity and abundance had been passed. The economic frontier had been reached. Never again would the industrially advanced countries experience the spontaneous, dynamic growth and expansion that had taken place in the past. A chronic condition of depression and mass unemployment was inevitable unless Governments intervened with their taxing, spending, and regulatory powers and generated enough demand to keep productive resources fully employed. So ran the theory.

Now, with a world-wide business boom under way, little is heard of secular stagnation. The demand for more consumer goods and services and for more of the means of producing them has seldom been stronger. The economic frontier looks farther away than ever. Governments are no longer concerned with the problem of stimulating demand in order to increase employment. Instead, they are wondering how to restrain demand in order to prevent inflation.

Changing Attitude Toward Saving

Among other effects, this reversal of conditions is bringing a change of attitude towards saving. The theory of secular stagnation held that, in a situation of full employment, people would try to save too much; that is, they would try to save more than could be profitably invested in new productive equipment. Hence, part of the income generated by production would be spent neither for consumption nor for investment, so that demand would fall short of output, and employment would be reduced.

As long as such ideas prevailed, and as long as current conditions could be interpreted as giving those ideas some support, there was a tendency to regard saving as bad citizenship. The age-long respect for thrift as a personal virtue was called into question. Low interest rates were made an object of governmental policy, partly because it was believed that they would discourage saving and stimulate business investment. Tax rates on individual income in the higher brackets were raised sharply, in some cases to almost confiscatory levels, in the belief that thereby income would be taken from those who would otherwise save it and transferred to those who would spend it. The Federal Government set a shining example in the anti-thrift campaign by spending some $20 billion more than it received during the decade of the nineteen-thirties.

The over-saving or under-investment theory, even in its heyday, never had much statistical support and never was unanimously accepted by economists or others. Yet, at a time when demand was weak and mass unemployment was an urgent problem, the theory had enough plausibility to be eagerly seized upon by harassed Governments and made a basis of public policy. In the light of today's conditions, its validity seems more questionable than ever. More saving, not less, is needed. Thrift has become respectable again.

The Outlook

What about the future? Is the present demand for savings merely a respite in a long-range situation of secular stagnation? Or is the economy as vigorous and dynamic as ever, and the individual impulse to save for the future matched by an economic need for saving as a means—indeed the only means—of investing, building up the stock of productive equipment, and thus satisfying the universal desire for higher standards of living? The desire obviously exists; it is one of the things that make men save. Do the physical instruments for satisfying it also exist?

Almost all current evidence points to the conclusion that the defeatist, depression-born theory of secular stagnation belongs in the realm of exploded fallacies. Barring setbacks from extraneous causes, and with allowance for the corrective readjustments that free societies require from time to time, the economy appears to be facing a period of growth and expansion as spontaneous and dynamic as any that occurred in the past—a period in which saving on a large-scale will be as indispensable to economic progress as it ever was.

For some years to come, the growth of population alone will require a considerable amount of industrial expansion. The birth rate rose during the war and has remained comparatively high ever since. This rise implies an increase in the rate of family formation in coming years, with the prospect of a relatively high birth rate extending indefinitely into the future.

The progress of industrial technology is creating more than new products; it is creating whole new industries. There seems to be almost no limit to the capacity of chemistry and metallurgy to produce new substances with physical properties needed for particular uses. Plastics, synthetic fibres, electronics, automation, atomic energy—such words suggest the dynamic character of the industrial era that the world has entered.

Prospects for Home Construction

Some serious attempts are being made to gauge past and future trends in capital formation. The National Bureau of Economic Research, for example, with the financial assistance of the Life Insurance Association of America, is engaged in an inquiry into such trends in the principal capital-using sectors of the economy—agriculture, mining, manufacturing, public utilities, residential real estate, Governments, and the foreign sector. The full results of the study of residential real estate, made with the collaboration of Columbia University, have just been published. Some of the findings for other sectors have been presented in part or in preliminary form.

As far as residential real estate is concerned, the Bureau's study tends to cast doubt on the widely held view that expenditures for residential construction in recent years have been abnormally or unduly high. On the contrary, more new homes are expected to be built in the next two decades than in any similar previous period. This expectation rests partly upon an anticipated increase in the number of new households and partly upon the fact that "demolitions, for the first time in many decades if not in the history of residential real estate in this country, seem to reach proportions calling for a large volume of new construction over and above the long-term rate of net household formation."

The forces supporting the high level of demolitions are believed to be more than temporary. "If withdrawals from the housing supply of 300,000 dwelling units per year are added to an annual average net non-farm household formation in the neighbourhood of 1,000,000, close to the median estimate derived from the projections of the Bureau of the Census, the average number of new dwelling units that would equal these two potential sources of demand by far exceeds any historical record for a similar period. In combination with a decelerated decline in the real value per new dwelling unit . . . such a level of housing starts on the average would yield total real expenditures for housing construction greater than those recorded for any previous period of 20 years."

The financial implications are clear. "Not only would mortgage investment remain a large outlet for funds, but there may be a question as to whether the supply of savings will be adequate to meet the demand for financing a high average volume of housing construction as well as the demand for long-term funds in other sectors of the economy, without an appreciable increase in interest rates."

Capital Formation in General

Despite the prospective rise in home building, capital formation in residential real estate is expected to undergo a relative decline in the nation's total productive effort. In other words, capital formation in other sectors is believed likely to increase even more rapidly. This suggests that other research groups engaged upon the Bureau's overall project are encountering similar evidence that the basic long-run prospect is not one of secular stagnation, with savings tending to exceed investment opportunities, but one of vigorous and dynamic growth, with higher interest rates needed to produce savings sufficient to meet the investment demand.

If these expectations are borne out by the actual course of events, there need be little fear of irresistible political pressure or more governmental spending merely to stimulate demand and increase employment. Unfortunately, however, recent experience has shown that the outcry for governmental intervention can arise in good times as well as bad. Interventionists are for intervention under any and all conditions. In times of inactive investment, they want intervention in the form of governmental spending. In times of high investment, they call for intervention in the form of easy money. Both of these forms of intervention are ultimately inflationary, but the latter is probably the more dangerous of the two, because its inflationary effects are more immediate.

If complaints against tight money are to be avoided or minimised, and if economic growth is to proceed swiftly and soundly, large volumes of savings are needed, now and in the years ahead. The alternatives are inhibited growth, inflation, or a combination of the two. Higher interest rates are tending to encourage saving. The monetary authorities are aiding the process by refusing to yield to popular pressure for easy-money policies that would reduce interest rates and cheapen the dollar. The Government is helping by keeping the budget in balance and promoting confidence in currency stability.

If these policies can be maintained in the face of political and popular demands for new and larger governmental handouts and easier money, the vital objective of sustained prosperity and growth without inflation may be achieved. The outlook is not unpromising. It would be even better, however, if a generation of Americans had not been taught to believe that thrift was an outmoded virtue.

BRITISH BANK RATE REDUCED

CHANCELLOR RULES OUT RELAXATION OF CREDIT RESTRICTION

THE Bank rate in Britain was cut on the 8th inst. from 5½ per cent. to 5 per cent. after being held at the former level for almost a year. It was on 16th February 1956 that the Bank rate was raised by 1 per cent. from 4½ per cent. It will be interesting to note, in this connection, that this is the first reduction since 1954 when the rate was cut from 3½ to 3 per cent., from which level there has been only successive increases to the erstwhile level of 5½ per cent. With the latest change, Britain has altered its Bank rate for the eighth time in the last six years, the change, either a rise or a reduction, having taken place every year. In 1955, it was raised twice in quick succession. The following table records the exact variations that have taken place in the British Bank rate from 1951 onward.

Date of change	(Per cent.) *From*	*To*
8th November 1951	2	2½
12th March 1952	2½	4
17th September 1953	4	3½
14th May 1954	3½	3
27th January 1955	3	3½
24th February 1955	3½	4½
16th February 1956	4½	5½
7th February 1957	5½	5

It will also be noted that, during the past six years, the longest interval when the Bank rate had been kept unchanged was only 18 months; that was between March 1952 and September 1953. Also, the sharpest rise was 1½ per cent., from 2½ to 4 per cent. in 1952, but, whenever a reduction was effected, at least during the past six years, it had been no more than ½ per cent.

The latest reduction in the British Bank rate did not cause any notable reaction in the London market, as is usually the case whenever a change in the rate is made. This was because a cut had for some time been expected. In fact, the authorities themselves had prepared the market for it, by bringing about a re-shaping of the open-market structure of short-term rates, so that they could claim now that the present cut is only a technical adjustment to the changes that had been taking place for some months now. In other words, the authorities created a situation which could justify their saying that they followed the market rather than give a lead to it.

Change in Government Attitude

This is how it happened. In the middle of December last, the Discount Market found that there was growing competition for a diminishing supply of Treasury Bills and was tempted to raise its bid. The Bank of England showed no objection to it, because it was deeply concerned over the effects of the persistent high level of interest rates on the cost of servicing the Government's debts at home and abroad. This concern is understandable, because the cost of debt servicing is about £100 million more than it was before the authorities first decided, towards the close of 1951, to use the weapon of interest rates to fight the inflation. With the change in the official attitude, the price of bills began to rise and the bill rate to fall. It declined almost continuously from over 5 per cent. to about 4½ per cent. This also brought about a corresponding reduction in other interest rates, with the result that the short-dated bonds rose and institutional investors were attracted, once again, by medium-dated stocks, and industrials grew firmer.

With the growing conviction that a cut in the Bank rate was inevitable, the upward trend gathered momentum. The New Issue market was reopened and the Government was able to sell considerable quantities of securities to the public, thus reducing the floating debt and regaining technical control over the liquidity of banks. In effect, the authorities had not only allowed the Treasury Bill rate to decline but encouraged such a trend. The authorities had, in fact, showed a change in their attitude towards the Treasury Bill rate much earlier than mid-December last, that is, in the autumn itself, but the Suez Canal crisis and the drain on gold reserves prevented any action to engineer a reduction in the Treasury Bill rate.

The change in the official attitude amounts to an admission that the restrictive monetary policy, which the Government had so long followed, had not worked smoothly. The high Bank rate would appear to have been effective only to a limited extent in restricting the supply of credit, the other steps, such as directive to banks to curtail lending and similar controls, playing the major role in enforcing credit control. On the other hand, it had some undesirable effects in other directions. Thus, the cost of servicing the National Debt rose substantially. The higher interest charge on sterling balances held by foreigners imposed an additional strain on the balance of payments. With the short-term interest rates remaining as high or higher than long-term rates, it became almost impossible to sell long-term securities to the public and banks.

Proved its Worth

The decline in short-term rates which the authorities have been encouraging since the middle of December has proved its worth. The cost of Government borrowing has come down and, by selling large quantities of securities to the public in a rising market, it has been possible to reduce the floating debt and regain technical control over the liquid assets of banks. This has been done, while keeping, at the same time, the long-term interest rates more or less at the same levels as they were before.

The present adjustment of the Bank rate to a lower level naturally raises doubts whether it amounts to a change in the Government's economic policy and whether it is an indication of the Government's desire to relax credit restrictions. Anticipating these doubts, the Chancellor of the Exchequer warned, while announcing the cut in Bank rate in the House of Commons, that it would be wrong to interpret the cut as a change in economic policy. It was not a signal, he added, for bankers and others controlling sources of finance to relax credit or to ease restrictions on lending. This reduction in the very high rate which had prevailed for the last 12 months was designed to enable the Bank of England to maintain the full effectiveness of monetary policy. The Chancellor said that he was assured that its control would not be weakened by this move.

There is also a belief, in some circles, that there will be a further reduction in the Bank rate within the next few months. These circles are of the view that the authorities are unlikely to be satisfied with such a relatively moderate reduction in short-term interest rates which has taken place so far. It seems almost certain, they contend, that, after a short pause to consolidate the progress already made, the authorities will begin to condition the money market for a further fall in short-term rates. Thus, unless the economic climate becomes so unfavourable that it is unsafe to carry out even technical adjustments within an overall tight money policy, it is believed, a further reduction in the Bank rate is possible.

Subsequent Fall in Other Rates

The expectation that there might be a further cut in the Bank rate seems to have been generated by the further trimming of interest rates following last week's cut. Thus, the London clearing banks have reduced their interest rate on seven-day deposits from 3½ to 3 per cent. and Scottish banks have also reduced it on similar deposits from 3 to 2½ per cent., except for balances held with their London branches which follow the practice of paying the same rates as the London clearing banks. The clearing banks in London pay no interest on current accounts. They have cut their rate of interest on overdrafts from 5½ to 5 per cent. for nationalised industries, from 6 to 5½ per cent. for first class industries and from 6½-7½ to 6-7 per cent. to other business concerns and private borrowers. Hire-purchase finance houses have likewise reduced the interest on money subject to three months' notice from 6 to 5½ per cent. and on deposits subject to six months' notice from 6½ to 6 per cent. The rates on borrowing by local authorities under mortgage and similar arrangements have also gone down from about 6 per cent. to 5¼-5⅝ per cent. for periods between 20 and 30 years. The rates on national savings and those paid by building societies have not, however, changed. The rates on both these classes of investments will be affected to some extent by any marked recession in interest rates. It is customary to change the rates on national savings only if a major swing in the Bank rate takes place. The building societies normally change their rates when the change in the Bank rate is of the order of one per cent. and that too after a lapse of a few months from the date of change in Bank rate.

BRITAIN ISSUES FUNDING LOAN

The British Treasury issued, on Thursday this week, funding stock of the value of £300 million, maturing in 1999 to 2004. The stock will carry interest at the rate of 3½ per cent. per annum, as against the present long-term rate of over 4½ per cent. prevailing in London. But the issue price of the stocks is at £80 per cent., that is, at a discount of 20 per cent., with the result that a buyer is assured of a capital profit of 25 per cent. at the time of redemption.

The issue of such a long-dated loan, closely following the cut in the Bank rate on Thursday last week, provides the key to Britain's present policy of monetary control. With the fall in short-term interest rates, people will be inclined to go in for long-term loans. Further, the issue of long-term loan will make the money market more tight for banks, thus placing an indirect restraint on bank lending.

SPINNING CAPACITY OF MILLS RISES

LOOMS INSTALLED, HOWEVER, RECEDE

THE modest rise in the size of the Indian cotton mill industry noted during 1954-55 was further accelerated in the cotton year ended 31st August 1956. The number of mills actually working as at the end of that year was 449, as against 434 on the corresponding date in 1954-55, according to the latest Mill Statement of the Millowners' Association, Bombay. The increase in the number of mills working was due partly to the addition of four new mills and partly to the reopening of 11 units which were lying idle in the previous year. The paid-up capital of the mills recorded a rise of Rs. 1.19 crores to Rs. 115.15 crores; the extent of the rise in 1954-55 was a shade less, being Rs. 1.07 crores.

The expansion in the cotton mill industry's size during the year under review was accounted for solely by the spinning side of the mills. The number of new spindles installed was 307,261 which compares favourably with 180,379. As at 31st August 1956, there were 12,375,805 spindles, as against 12,068,544 spindles a year before. In contrast, the weaving capacity of mills suffered a further setback, the number of looms installed decreasing from 207,347 to 206,580, or a reduction of 767 looms; in the previous year, there was a fall of only 416 looms.

The decline in loomage thus reflects the scrapping of looms worn out without being replaced by an equal number. The Government's policy of "no expansion in weaving capacity" may have contributed to this net fall in the number of looms. The continued shrinkage in weaving capacity was in evidence at a time when the demand for cloth had gathered considerable momentum, thanks to the general increase in the volume of purchasing power and rise in population. The Government failed to recognise this aspect. Consequently, production of cloth did not keep pace with the increase in demand, so that there was a continuous fall in stocks held with the mills, leading to a rise in prices. If the Government had allowed the mills to expand their weaving capacity, the country would not have faced the problem of meeting enlarged demand for cloth at an economic cost.

Progress Made

The salient features of the quantitative progress made by the mill sector in the past three years are given below:

	As on 31st August		
	1956	1955	1954
Number of mills	465	461	461
No. of mills registered and/or in course of erection	32	34	22
No. of mills idle	16	27	23
Paid-up capital (Rs. crores) ..	115.15	113.96	112.89
Spindles installed	12,375,805	12,068,544	11,888,165
Spindles working (first shift only) ..	10,723,608	10,423,075	10,502,832
Looms installed	206,580	207,347	207,763
Looms working (first shift only) ..	188,449	186,094	189,648
Cotton consumption (in bales of 392 lbs.)	4,979,890	4,797,084	4,688,866
Total No. of workers employed* ..	835,419	762,616	743,622
First shift	453,514	411,607	415,521
Second shift	282,617	261,327	261,751
Third shift	99,288	79,622	66,350

* *Indian Labour Gazette.*

The foregoing figures reveal that, despite the fall in the number of looms installed during 1955-56, the cotton mills endeavoured to make more intensive utilisation of the existing capacity. The average number of looms actually working in first shift as at 31st August 1956 was higher by 2,355 at 188,449. In the previous year, it will be recalled, there was a fall of 3,554 in the number of looms working. Similarly, the average number of spindles working (first shift only) improved from 10,423,075 to 10,723,608, a rise of 300,533, in contrast to a drop of 79,757 during 1954-55. The extent of actual utilisation of capacity (in first shift alone) was greater as compared with that in the previous year, such being 91.2 per cent. for looms and 86.7 per cent. for spindles, as against 89.7 per cent. and 86.3 per cent., respectively.

Reflecting this trend, as also the addition of four new mills and decline in the number of units remaining idle (11), the average number of workers employed (first shift only) registered an increase of 6,598, from 423,595 to 430,193. During 1954-55, the number was lower by 11,826. It may be noted here that several mills worked double shifts and a large number even worked treble shifts. According to the *Indian Labour Gazette*, which give data relating to 418 mills, as many as 230 mills worked three shifts in August 1956, the corresponding figure for August 1955 being 200 out of a total of 406 mills. The number of mills working two shifts was 149, as against 161, and that of only one shift 17, as against 24. It will be seen that there has been a substantial rise in the mills working three shifts. The effect of this change on production is clearly indicated by the rise in the mill consumption of cotton. During the year under review, about 4,979,890 bales (of 392 lbs. each) of cotton were consumed, as against 4,797,084 bales in 1954-55. The rise in cotton consumption is fully reflected in the all-time peak output of mill cloth—estimated at 5,238 million yards—and of yarn—estimated at 1,651 million lbs.—touched during the calendar year 1956.

The modest expansion in the spinning capacity of the mill sector noted during the cotton year ended August 1956 was shared by all the States (as they were before Reorganisation), barring Madhya Bharat (and Bhopal), Hyderabad and Pondicherry. The expansion was particularly marked in the State of Madras, the rise in the number of spindles being 216,595 to 2,437,579. A large part of this increase must be attributed to the rise in the number of mills in existence from 99 to 104. Bombay accounted for an increase of 32,637 spindles, of which the share of the city and island was no more than 11,948 spindles. The reduction in the number of looms installed occurred solely in Bombay and Madhya Bharat States. In Bombay alone, the reduction was 1,368 looms.

Cotton Mills Working

The following table shows the cotton spinning and weaving mills working as on 31st August 1956 (before Reorganisation):

Situation	No. of mills	Spindles installed	Looms installed	Average number of hands employed
Bombay—				
City and Island ..	66	3,113,620	64,467	111,339
Ahmedabad	71	2,039,162	41,550	71,904
Saurashtra	9	163,760	3,345	7,419
Rest of Bombay and Kutch	59	1,292,760	24,070	47,400
Total Bombay State ..	205	6,609,302	133,432	238,062
Madras	104	2,437,579	9,528	62,603
W. Bengal	39	539,034	10,652	22,609
Uttar Pradesh ..	29	832,368	13,945	24,361
Madhya Bharat and Bhopal	17	430,332	10,980	21,658
Rajasthan, Ajmer and P.E.P.S.U. ..	12	189,264	3,942	7,683
Punjab and Delhi ..	12	255,356	5,093	7,423
Madhya Pradesh ..	11	375,593	7,354	17,291
Mysore	11	236,684	3,706	12,068
Travancore-Cochin ..	10	136,504	718	3,787
Hyderabad	7	157,632	3,295	7,255
Bihar and Orissa ..	5	90,024	1,999	2,310
Pondicherry	3	77,128	2,326	3,078
Grand Total ..	465*	12,375,805	206,580	430,193

* This number does not include 32 mills which have either been registered and/or in course of erection.

It will be seen from the above statement that, despite the gradual fall in looms and spindles in recent years, Bombay continued to be the major seat of the cotton mill industry. This State accounts for as much as 53.4 per cent. of the aggregate spindleage of the entire industry, 64.5 per cent. of the loomage and over 56 per cent. of the working force (first shift only), while the percentage share in the number of mills is only 44 per cent. It is thus evident that the average size of a cotton mill in Bombay is larger than that in other States and that the mills are well-balanced composite units. In view of its predominant position, it is but natural that Bombay accounts for the major portion of the woven goods produced in India. Thus, out of the estimated mill cloth output of 5,238 million yards in the whole of India during 1956, as much as 3,565 million yards or about 68 per cent. of the total came off the looms of Bombay State.

The annual Mill Statement of the Millowners' Association, Bombay, also gives an idea of the progress made by the cotton mill industry of Pakistan during the year 1955-56. Over the year, both West and East Pakistan witnessed a rise of seven new mills, the number of mills in existence as at 31st August 1956 being 87. The number of spindles and looms installed also rose from 1,561,258 and 23,021 to 1,754,682 and 26,684, respectively. The average number of spindles working (first shift) during 1955-56 was higher at 1,649,832, as against 1,426,096 a year before, and of looms at 23,815, as against 18,868.

AMBAR CHARKA SCHEME

About 727,115 square yards of cloth were produced under the Ambar Charka programme up to 21st January 1957. An official Press note, which contains this information, does not, however, state the date of commencement of this period. The bulk of this quantity—620,500 square yards—was accounted for by cloth woven from yarn spun on Ambar Charkas, the balance being woven out of mixed yarn. The quantity of yarn spun up to that date was 277,600 lbs. Nearly 150,000 square yards of cloth are under production; yarn for this has already been distributed and weaving arrangements completed.

The number of Ambar Charkas manufactured upto 21st January 1957 was 50,026, of which 32,765 were distributed to *Parishramalayas* and 20,134 to spinners. The number of spinners who had completed their training was 26,312, out of a total of 57,205 admitted for training. Out of 3,018 candidates admitted for Ambar Charka instructors' training, 1,410 completed the training. The number of Ambar *mistries* who had completed the training was 219 out of 574 admitted. The number of *Saranjam Karyalayas* (workshops for the manufacture of Ambar Charkas) established till January 1957 was 74, the number of *Vidyalayas* (training centres) 35, and *upa-vidayalayas* 10. The number of *Parishramalayas* (work-*cum*-training centres) started during the year was 310 and *upa-parishramalayas* 691. Upto the end of the third week of January 1957, about 20,000 Ambar Charkas were available for commercial production of yarn.

Khadi to be produced from Ambar Charkas is estimated to cost on an average Re. 1-4 per yard, as against the average of Rs. 2 per yard in the case of *khadi* produced from handspun yarn of the traditional *charka*. The *Khadi* and Village Industries Board is contemplating the combining of yarn spun on the traditional *charka* with Ambar Charka yarn in the weaving of cloth, so as to bring down the price of *khadi* generally.

TEXTILE INDUSTRY IN RUSSIA

The sixth Five-year Plan of Soviet Russia envisages a further expansion in the output of fabrics, as well as a marked improvement in their quality and finish. The production target set for the different kinds of textiles in 1960 are as follows:

	Million metres
Cotton fabrics	7,270
Silk	1,174
Linen	556
Woollen cloth	363

N.B.—A metre=39.37 inches.

The above targets are expected to be reached in two ways. First, several new large mills will be established in Kamiyashin, Kherson, Cheboksary, Kansk and other towns. Secondly, equipment in mills will be modernised and many production processes automatised.

In the development programme for textiles, great emphasis will continue to be laid on the improvement of working and living conditions of workers. Large capital investments are envisaged for construction of houses. Special attention is to be focussed on the need for raising the skill of women workers. Women, just like men, are said to hold leading positions in the textile industry. About 40 per cent. of the engineers and technicians employed consists of women. Several women work as factory directors and their assistants, chief engineers, etc.

ADVANCES ON COTTON TEXTILES

The Reserve Bank of India has, as stated in our Market Gossip columns last week, withdrawn the directive, issued by it to the Scheduled banks on 13th September 1956, asking them to raise the margins in respect of limits and advances against the security of cotton textiles, including yarn. The increase in margin which had to be not less than 10 per cent. of the value of stocks, it will be recalled, applied to all advances against cotton textiles except those to textile mills or textiles meant for export. The directive was intended to restrict the credit facilities to traders in the domestic market, with a view to curbing any tendency on the part of some traders to use bank credit for speculative buying and hoarding of textile goods. The Reserve Bank's decision to withdraw this directive has been prompted by the consideration that the restrictions are not necessary now and that advances to the cloth trade having been properly regulated, there is no longer any reason to impose rigorous conditions on normal bank financing of distributors and dealers in cotton textiles.

GRANTS TO SERICULTURE INDUSTRY

The Government of India has so far sanctioned for 1956-57, 138 grants amounting to Rs. 27.98 lakhs for the development of sericulture industry under various State schemes. Loans and grants of the order of Rs. 24.92 lakhs have also been granted for 12 other schemes. The latter include the establishment of a modern filature at Malda, West Bengal, the setting up of a raw silk marketing society in Bangalore and modernisation of filature machines in Jammu and Kashmir. West Bengal tops the list of States which received grants, with Rs. 4.7 lakhs, while Jammu and Kashmir, Bihar, Assam, Mysore and Madras follow with grants amounting to Rs. 4,23,764, Rs. 3,67,932, Rs. 3,38,263, Rs. 2,39,350 and Rs. 2,27,165 respectively. 147 schemes for the development of sericulture industry during 1957-58, which have been drawn up by 12 States, are under examination.

During the first half of 1956, the Silk Board imported 109,916 lbs. of raw silk, of which 30,088 lbs. have been allotted to States, 22,813 lbs. to silk associations and 40,181 lbs. to actual users. About 16,093 lbs. have also been earmarked for export promotion purposes. It is proposed to depute five officers to Japan for training in sericulture and two officers to China for training in silk-worm seed production and silk reeling. In furtherance of measures for the development of sericulture industry in the country, a foreign Race Seed Station and a Central Sericultural Training Institute are proposed to be started in Mysore State.

EFFORTS TO REDUCE REDUNDANCY IN COTTON MILLS

FINISHING INDUSTRY PAYS MORE TO WORKERS

From A Special Correspondent

MANCHESTER, *5th February*

ON several occasions during the past year or two, it has been freely forecast that more mill deals would inevitably follow the unsatisfactory trading conditions which have prevailed in Lancashire. The final two months of last year brought no such published developments, although it now appears that negotiations must have been proceeding in connection with several fresh ventures. At all events, no sooner had 1957 dawned but a number of announcements were made, resulting in changes in several sections of the industry.

MANCHESTER LETTER

Once more, the major spinning groups have taken the lead in adapting their production to meet current circumstances. Hardly had the Fine Spinners and Doublers indicated the intention to close a mill at Stalybridge than a bid for control of the Moorfield Spinning Company was made public. If this deal is completed, the combine will secure two mills producing yarn from synthetic staple, both of which are considered to be valuable properties.

This announcement followed closely upon the decision of the Lancashire Cotton Corporation to acquire Tulliallen Fabrics, a private chenille manufacturing company in Glasgow, thus widening its sphere of activity. Another pending transaction involves an offer for the Burnley weaving concern of Harry Walton (Holdings), whose recent financial results have been far from prosperous.

Redundancy in Mills

Despite the improved trading conditions which have been evident since last autumn, the directors of some firms have felt the time was ripe to end their connection with the trade. Among these have been Samuel Buckley and Sons, the Oldham doubling concern, and Riddick, Stuttart, the Nelson weaving firm. Such action by producing units in the trade has been fairly frequent over the past few years, but similar moves by firms engaged in the finishing branch have been extremely rare. Now, however, both the Calico Printers' Association and the Bradford Dyers' Association have indicated their decision to close down individual finishing works in an effort to reduce redundancy.

In view of the strictures of the Monopolies Commission on several vital aspects of organisation in the textile finishing industry, the leading firms in this branch have lately been considering their position. Mr. James Ewing, Chairman of Bradford Dyers' Association, has for long been an advocate of organised redundancy and the move to curtail surplus plant within his own group may prove to be the forerunner of other developments of a similar nature.

This action has been officially taken owing to "the continuing diminution in the volume of textile exports." The Bradford Dyers' Association believes such measures are necessary to maintain efficient production, but it has drawn attention to the "serious excess capacity existing in all sections of the textile industry which requires concerted action by responsible leaders, if it is to be solved effectively."

New Campaign on Imports

An unusual approach to the problem of large-scale imports of cheap Indian and Hong Kong cotton cloth into this country has been made by Mr. Cyril Lord, an industrialist with mills in many parts of Lancashire He has sent a wallet containing overseas currency—including a Japanese 100-yen note, an Indian rupee and a one cent Hong Kong note—to every Member of Parliament and to members of the House of Lords. A message in the wallet points out that this country spent £27,000,000 in a year on imported textiles and comments: "Britain is the only country in the world which allows unlimited quantities of textiles to be imported duty-free."

Lancashire's cotton industry is being driven out of business by unfair prices and conditions, he contends, and money is being poured out unnecessarily.

Silk Trade's Opposition

"Permanent impoverishment" of the home textile industry might result, if Britain enters the proposed European common market plan. The Silk and Rayon Users' Association voiced this fear when it announced its opposition to further negotiations unless certain safeguards were made. "Our entry into the common market plan may result in the permanent impoverishment of our industry since it is clear that the advantages of such a scheme are likely to go principally to those countries with lower rates of wages, standards of living and defence costs, fewer social services and more effective export incentives," said the Association in a report. It urged careful consideration of issues ranging from manufacturers' selling prices to anti-dumping measures and called for agreement before negotiations on the plan on levelling of wage rates, living standards, social services and defence outlay and the ending of export incentives.

Prices in 1956

Among the most notable factors which contributed to the sharp transformation in textile trading in Lancashire which occurred during 1956 was the steep fall in yarn prices which occurred in August and the subsequent advance in quotations, following the revival in confidence in raw cotton values and the political disturbances in the Middle East. These variations in prices are duly reflected in the appropriate index numbers published by the Board of Trade, details of which are given below (the numbers are based on the figure 100 at the end of June 1949):

	American type	Egyptian type	Spun rayon yarn	Cotton cloth	Rayon fabric
1955					
May	134.2	130.8	125.0	123.5	112.8
June	134.4	128.8	125.0	123.1	112.8
July	134.1	128.2	125.0	122.8	112.7
August	133.5	128.2	125.0	122.2	112.8
September	132.1	127.2	125.0	120.9	112.7
October	130.3	124.4	125.2	120.3	112.3
November	133.4	123.4	124.2	120.6	112.1
December	132.7	123.4	124.2	120.2	112.0
1956					
January	133.4	124.2	122.4	120.4	111.9
February	134.9	128.2	122.4	121.2	112.0
March	134.1	135.5	127.2	121.3	112.1
April	134.3	139.8	127.2	121.8	112.1
May	134.4	150.5	127.2	123.0	113.1
June	134.4	151.2	127.2	123.0	113.5
July	133.2	149.9	127.2	122.0	113.6
August	125.6	148.3	127.2	118.6	113.8
September	124.5	146.4	129.0	118.5	113.6
October	124.5	146.8	129.0	118.8	113.6
November	126.5	152.2	129.0	120.8	113.6
December	128.3	154.0	129.0	121.5	113.6

The outstanding feature of these statistics is the fact that American cotton yarn prices are the only section in which values in December were lower than at the beginning of the year. Due to the sharp upward movement in corresponding quotations for Egyptian type yarn, the general trend in values has been very firm, despite the reduction which occurred in some directions during the autumn.

European Competition

A warning that Continental textile firms are already studying distribution arrangements in Britain to take advantage of opportunities offered, if the European common market project goes through, has been given by Mr. W. T. Winterbottom, President of the Textile Institute. He told the Leigh Textile Society: "Our Continental friends are already active. They estimate they can achieve a reduction of at least 10 per cent. in cost through access to the larger market, and some of them are already studying distribution arrangements in this country." "How many of our firms are studying competitive prices and distribution facilities on the Continent?" he asked.

Re-equipment of Lancashire mills with modern machinery working an intensive shift system was an essential factor, if the textile trade was to take advantage of the common market plan and boost export, Mr. Winterbottom said. The agreements to introduce shift working in spinning mills signed in December were "a most encouraging forward step in the drive for greater efficiency."

Finishers' Pay Rise

About 60,000 workers in the cotton and wool textile finishing industry have been awarded pay increases by the Industrial Disputes Tribunal. The award provides for time rates to be raised by 4*s.* a week and piece rates by 2 per cent. The new minimum rates for time workers will be 143*s.* 1*d.* a week.

The National Union of Dyers, Bleachers and Textile Workers had demanded an extra 10*s.* a week for time workers and 5 per cent. for piece workers. This was rejected by the Textile Finishing Trades' Association and the deadlock was submitted to the Tribunal for decision. Most of the workers who benefit are in Lancashire, Yorkshire, Derbyshire and Cheshire.—*All Rights Reserved.*

SUPPLY POSITION OF SHORT-STAPLE COTTON IN THE U.S.

CARRYOVER STOCKS REACH ALL-TIME RECORD

ALTHOUGH the major portion of raw cotton output in the U.S. is long-staple cotton, the short-staple variety, by which is here meant cotton of staple lengths below one inch but not below ⅞ inch (cotton below ⅞ inch is described as extra-short staple), occupies an important position in the economy of the country. In India, short-staple refers to cotton 11/16 inch and below, and what is described as short-staple in the U.S. is called medium- (11/16 inch to 27/32 inch) and long-staple (7/8 inch to 31/32 inch). In the 1955-56 season, of the total production of 14.7 million bales in the United States, the short-staple varieties, as just defined, accounted for 3.6 million bales. Since internal consumption is not large enough to absorb the entire output, foreign markets have to be sought for such cotton also. The supply position of short-staple cotton in the U.S. is of vital interest to countries like India, Pakistan, Argentina, Brazil, etc., which are major producers as well as exporters of comparable varieties. In the latest *Monthly Review* of the International Cotton Advisory Committee, Washington, Mr. J. C. Stanley, Economist of the Committee, makes an interesting analysis of the supply position of short-staple cotton in the U.S.A. which is of topical interest.

The most important source of supply of such cotton in recent seasons, according to the author, has been the large carryover stocks. At the beginning of the current season, stocks are estimated to have aggregated 4.7 million bales, more than a million bales higher than the 1955-56 production. The following table gives the staplewise breakdown of the stocks.

Carryover Stock on 1st August 1956.

Staple-length	1954	1955	1956			
			Total	Government owned	1955-56 loan cotton	Free stock and in mills
13/16"	185	219	449	124	299	26
7/8"	628	829	1,112	368	605	139
29/32"	683	918	1,000	380	531	179
15/16"	858	1,101	1,108	361	600	237
	499	629	848	330	293	225
Total ..	2,853	3,696	4,679	1,563	2,328	806

Production of American short-staple cotton in the current season is estimated at three million bales which means that total supply for the season will be about 7.7 million bales. It is true that the new export programme, which has hitherto proved to be an unprecedented success, has resulted in a scaling down of the stocks of short-staple cotton. Out of the 5.7 million bales sold for export till 15th November 1956 under the new programme, roughly 29 per cent. or 1.6 million bales were cotton of staple length below one inch. Even then, the stocks of old crop were more than three million bales which, together with the current season's estimated production, are expected to make an aggregate supply of six million bales. A point that requires special mention in this connection is that, despite the acreage control, production of short-staple cotton in the U.S. has greatly exceeded demand, and the accumulating surpluses have consequently swelled supplies to a level far above disappearance. For example, aggregate supply (production plus carryover stock) of cotton of staple length under one inch in the U.S. was only 4.3 million bales in 1951-52 of which carryover stock was as low as 310,000 bales and production 3.9 million bales. Production declined to 3.61 million bales in 1955-56, while carryover increased, by the end of the season, to 4.69 million bales. The following table gives the details regarding production and export.

Production and Export

(In thousand bales)

Production	1953-54	1954-55	1955-56	1956-57
Staple length				
13/16" and shorter ..	81	264	372	141
7/8"	673	916	862	404
29/32"	1,026	840	821	457
15/16"	1,361	1,031	1,021	737
31/32"	812	887	540	734
Total ..	3,953	3,938	3,616	2,563

(In thousand bales)

Export	1953-54	1954-55	1955-56	1956-57
Destination				
France	35	23	26	71
Germany	4	4	11	20
Italy	20	22	32	51
U.K.	155	132	154	112
Japan	350	422	237	415
Korea	30	93	163	122
Hong Kong	..	2	5	42
Formosa	73	103	111	118
Others	125	105	106	156
Total ..	819	906	845	1,116

Apart from low internal consumption, another reason why stocks have accumulated is that the U.S. has not been able to export the entire surplus over consumption. In 1955-56, its export of short-staple type of cotton was of the order of 1.1 million bales, as compared with 845,000 bales in 1954-55. The U.K., Japan, Korea and Formosa are the leading outlets for U.S. exports. But the U.S. is not the only, nor even the principal, producer of short-staple cotton. A sizable volume of American type cotton under 1 inch staple is produced outside the United States, especially in India, Pakistan, Brazil, Argentina, Paraguay and Belgian Congo. The entire production of American type cotton in India, most of the American varieties grown in Pakistan, a fair proportion of the Sao Paulo crop in South Brazil and the Mata crop in North Brazil, the bulk of the crop in Argentina and Paraguay and some of the Stoneville and Gar varieties in the Belgian Congo are cottons of comparable qualities and competitive with U.S. growth. But in the case of India, Pakistan and Argentina, the bulk of the annual production of such cotton is domestically consumed. In India, the staple length of cottons allowed for export is below ⅞ inch which is regarded as extra short-staple in the U.S. Very little of this variety is produced in the latter country. It can, therefore, be stated that India does not compete with the U.S. in world trade in cotton. Pakistan and Argentina, however, do compete with the U.S. but on so small a scale that their bearing on export prospects for comparable U.S. cottons is less than what the aggregate figure might suggest. But it is a fact that though consumption in these countries is steadily increasing, so also is production. The U.S. cannot, therefore, count on these countries as profitable outlets for its cotton. Further, production figures in these countries are important, in so far as this factor affects the size of the exportable surplus.

Not all the exports from these countries are short-staple cotton. Exports from India and Pakistan include what the U.S. calls extra short-staple. In India, in recent seasons, exports have been exclusively of cottons shorter than 13/16 inch and exports of other staples are prohibited. In Pakistan, some 15 to 20 per cent. of total exports are extra short-staple *Deshi* type of about ½ inch staple. In Brazil and Belgian Congo, only a proportion of total exports fall within the category of short-staple cotton. Aggregate exports of short-staple cotton by the free world countries other than the U.S. averages about 1-1.5 million bales, annually.

Stocks Outside the U.S.

Almost the entire exportable surplus of short-staple cotton in the countries named above has been shipped recently and stocks are, as a result, much lower than a year earlier. Stocks at the beginning of the season in Pakistan were very close to the minimum and, with not much change in production and the growing domestic consumption needs, exportable surplus of that country this season may not be much. Brazil is another most important country with which U.S. cotton has to compete. But in this country, too, stocks on 1st August 1956 were the lowest for several years. They, however, contained a large proportion of short-staple cotton, so that, if production does not decline, export availabilities may be well maintained. Argentina's exports of the varieties under review last season were almost *nil*. Production in the current season is expected to increase, but, as carryover stocks were low at the beginning of the season and internal consumption is rising, exports from this country are not likely to be much. Thus, on the whole, export availabilities of short-staples outside the U.S. are likely to decline this season.

Owing to the accumulation of large surpluses of short-staple varieties in the U.S. and the shrinking overseas demand, cotton interests in Texas where much of these types is grown are inclined to look for other methods of solving the problem. Some parties, according to the article, are for increasing the staple length to 1 or 1.1/32 inch which would mean moving into an area of greater world demand. But it also represents, at the same time, a switch-on to an area of greater supply, where competition is likely to be as intense and where countries like Mexico, Turkey, Iran, Syria and Greece are serious contenders. Nevertheless, the main argument for this inclination among Texas farmers appears to be the fact that the world trend is towards the production of higher count yarns and finer quality of cloth. It may be noted here that production of yarns of 20 counts and below in the U.S., the U.K., Western Europe and Japan is downward.

EXPORT QUOTA FOR COTTON

The Government of India has announced (on the 6th inst.) an additional export quota of 2 lakh bales of cotton, bringing the total allowed so far for the current season to 4 lakh bales. The announcement was a surprise to the trade, because it came at a time when hopes of an immediate quota were beginning to subside. The release of 2 lakh bales of cotton for export was made at a time when prices were beginning to look up on adverse reports about the size of the crop on account of cold wave and untimely showers in Gujerat. This may appear to reflect badly on the Government's critical attitude towards the recent rise in prices as reported in the daily Press. Perhaps, the authorities are so concerned with the need for earning foreign exchange that they must have decided to ignore the repercussions of their action on domestic prices.

Of the quota of 2 lakh bales of cotton, 150,000 bales are in staple length ¾" and below and 50,000 bales Bengal *Deshi*. As usual, a small quantity has been reserved for allotment to co-operative societies. The last date for submission of applications, in respect of the above quota, has been fixed at 15th February. Applications from co-operative societies, however, are to be submitted not later than 20th February. Licences issued will be valid for shipment till 30th June 1957 to any permissible destination, except Tibet and Portuguese possessions in India. Contrary to the fear generally entertained in trade circles, that the quota announcement would be followed by a simultaneous increase in the export duty, the Government has thought it desirable not to make any change in this respect. Export duties, therefore, remain unchanged at Rs. 100 per bale for Bengal *Deshi* and Rs. 50 per bale for other exportable varieties. It will be recalled that, at the time of the last announcement, the export duty on Bengal *Deshi* was raised from Rs. 50 to Rs. 100 per bale.

The trade has welcomed the step in so far as it is expected to give a fillip to the market which has of late been in a state of suspense. When the first quota was announced on 1st December it was felt that it was too small in relation to the fair export surplus expected this season and the sustained demand for Indian cotton overseas. It may be observed, in this connection, that the export quota for the whole of the last season was only 425,000 bales comprising 300,000 bales of all varieties of ¾" staple and below other than Bengal *Deshi* and Coconada, 95,000 bales of Bengal *Deshi*, 25,000 bales of all varieties of 25/32" staple cotton and 5,000 bales of Coconada.

The considerations which weighed with the Government in releasing 4 lakh bales for export this season seem to have been the expectation of a good crop of about 54 lakh bales, as against last season's 50 lakh bales and the need for pushing up exports so as to get as much foreign exchange as possible.

PRODUCTION OF COCONUTS

PRICE FIXATION BEING CONSIDERED

PEOPLE who live among coconut palms declare that the coconut tree is a *Kalpvriksha* to mankind. In fact, almost everything in this physical world can be regarded as a boon to mankind, if only we discover its true utility. But the story of coconut is different. Without any discovery worth its name, for generations the coconut tree has been found to be useful to man in innumerable ways. In about five years after the seedling is planted, man begins to derive the benefits of the tree. There are the half-riped nuts which provide sweet delicious water, which, with the present advancements in science, man has not been able to produce synthetically. The ripe nut enters trade, copra is removed and oil is prepared out of it. The coir, on the other hand, besides being used as fuel in some parts, is used to prepare a myriad things, among others, ropes, carpets, floor-matting and the like, providing employment to many people, as many as 700,000 in Kerala alone. The numerous uses of oil are too well known to need repetition. Again, the dry leaves of the tree are used either as fuel, or for roofing thatched houses. These benefits continue as long as the tree is alive—which is normally 100 years. Afterwards, the trunk is used for constructing thatched and similar houses which endure for generations. The roots are used as fuel.

Despite its importance, the coconut industry in India has remained neglected all these years. No concerted attempts were made to raise the yield or acreage. On the contrary, the acreage seemed to be declining, first because of instability of the prices of coconuts and coconut oil and secondly because other crops that could be produced in the same area fetched higher income. Absence of any systematic attempts to improve the fertility of the soil, coupled with the habits of growing in the coconut gardens various kinds of crops, have led to decreasing yields. In addition to this, there is the fact that the coconut crop is not of that type which can be produced in a year or two. It requires not a few years of careful nurturing at the beginning when no return can be expected. The cumulative effect of all these factors is that India today imports from Ceylon and Malaya 40,000 tons in terms of coconut oil, which is expected to go up to 80,000 tons in the next five years.

Acreage

Today, coconut is grown in 1,080,000 acres, accounting for 69 per cent. of total production in Kerala, 213,000 acres in Mysore (13.5 per cent.) and 131,000 acres (8.3 per cent.) in Madras. Scattered areas are also devoted to coconut in some of the other States, such as Andhra Pradesh, Bombay, Orissa, West Bengal and Assam. The principal problems facing the industry and the steps that were being taken by the Central Committee to solve them were vividly described by Dr. M. S. Randhawa in the course of his address to the meeting of the Central Coconut Committee, which was held at Bangalore last week. One of the problems is that, in the State of Kerala alone, the coconut palms in an area of about 100,000 acres are affected by root or leaf disease. The annual loss arising from this malady amounts to no less than Rs. 2 crores. Dr. Randhawa stated that, through the initiative of the Committee, a comprehensive scheme had been launched with Central assistance to spray the palms with pesticides and thus restore them to health. According to the scheme, the campaign has to be carried out for five or six years and the growers have to carry it out by themselves after three years.

A second problem is that of supplying quality seedlings and of popularising better manuring and cultivation. In this regard Dr. Randhawa dealt at considerable length on the long-term measures taken by the Committee to improve the industry. One of these measures is the setting up of two central coconut research stations in Kerala and regional research stations in Kerala, Madras, Orissa, Bombay and Andhra Pradesh. In addition, the Committee is also financing, jointly with the States, a chain of nurseries supplying the cultivators with quality seedlings at a subsidised price of As. 8 each. It is noteworthy that two more regional research stations in Mysore and some more nurseries and demonstration shops in various centres are proposed to be set up in the second Plan period in order to popularise quickly better methods of cultivation. Dr. Randhawa pointed out that the total production target for the nurseries run by the Coconut Committee and its research stations and the State Governments was about 2,000,000 seedlings. Of this, about 1,100,000 plants had been produced so far, at a cost of Rs. 16 lakhs. Obviously, these targets are inadequate if appreciable results are to be produced. There is much to be said, therefore, in favour of Dr. Randhawa's suggestion that the target should be raised 100 per cent. The recommendation of the Committee that fertilisers should be given to coconut growers as loans to be repaid in suitable instalments after three years is also worthy of special consideration, inasmuch as it would give, as Dr. Randhawa hoped, a fillip to coconut cultivation. Yet one more useful proposal, referred to by Dr. Randhawa in this connection, was that of establishing nurseries in the coconut-producing N.E.S. blocs which would help save the transport charges to the cultivators. It is noteworthy that the Committee has decided to make a start in Kerala with this programme. These measures apart, no scheme directed towards expanding coconut production would be complete without simultaneous efforts to exploit fully the possibilities of growing coconut in areas such as West Bengal, Assam, etc. To this end Dr. Randhawa made a valuable suggestion when he said that the States should come forward to give liberal financial assistance.

Instability of Prices

Yet another serious problem facing the industry is instability of prices. Referring to this, Dr. Randhawa recalled the recommendation of the Minimum Prices Sub-Committee that, in view of the close relationship subsisting between the wholesale prices of coconut, copra and coconut oil, it was sufficient to fix the minimum price of coconut oil alone, leaving the prices of others to adjust themselves, at Rs. 1,425 per ton at Cochin. Dr. Randhawa revealed that this suggestion was under the consideration of the Central Coconut Committee.

Dr. Randhawa also alluded to the functions of the Central Coconut Committee. It was responsible, among other things, for the expansion of work at the Central Coconut Research Stations at Kasargode and Kayankulam, for schemes pertaining to the setting up of regional coconut research stations at Madras and Orissa, where the task has already been accomplished, and at Mysore, for schemes for conducting surveys to estimate the area and yield statistics of coconut, for ascertaining the cost of cultivation of coconut on the west coast and for the compilation and analysis of statistical data. The Committee was also concerned with setting up in Madras, Andhra, Bombay and West Bengal parasite breeding stations to rear and liberate parasites for the biological control of *nephanite serinope*. Considerable progress has been made in all these directions.

Certain important resolutions were passed by the Central Coconut Committee at its meeting. One such resolution recommended to the Government of India the abolition of the cess of four annas per hundredweight collected at present on copra crushed in mills and the payment of a lump-sum grant every year by the Government to the Committee for its proper functioning. A more important recommendation—in favour of which there is much to be said—asked the Government to grant long-term security loans (repayable in easy instalments after the crop begins to yield income) to the growers of fresh coconut plantations involving heavy initial expenditure. This suggestion, if accepted, would go a long way towards securing an expansion of the area under coconut cultivation. The Committee's decision to appoint an Expert Reviewing Committee for the purpose of reviewing the work of the research institutions and for proper planning of research during the ensuing five years on a rational basis should be specially welcomed. The Expert Committee would also indicate clearly what results of practical value had been achieved which could be passed on to the coconut growers immediately.

Co-ordination

The question of effecting co-ordination between Central Coconut and Arecanut Committees also figured prominently in the deliberations of the Committee. The Committee, in this connection, approved the suggestions of a sub-committee which had gone into the question. One of these suggestions was to the effect that the *status quo* of the two Committees should be maintained. Besides, the suggestions that the Secretary of each of the Committees should be a member of the other and that the Director of the Central Coconut Research Station, Kayangulam, and the Joint Director of the one at Kasargode be co-opted as members of the Agricultural Research and Development Sub-Committee of the Coconut Committee were also accepted. A sub-committee was also appointed to examine the question of co-ordination between coconut and arecanut research.

Among other notable resolutions adopted were the one calling for soliciting detailed proposals from the Kerala State Government for setting up a parasite breeding station at Kozhikode, and another recommending various States to provide *taccavi* loans and fertilisers to growers to encourage coconut cultivation. To the same end was also the decision taken by the Committee to recommend to the Government to declare coconuts a food crop. In order to examine the technological problems of research, the Committee also decided to appoint a special subcommittee with Dr. D. R. Dhingla as Chairman.

It would be clear from the foregoing account that a new era has been ushered in for the coconut industry. Much depends, however, on the progress that will be made in these research institutions in developing new and more effective methods of cultivation, and in providing expeditiously loans and fertlisers to the cultivators. It may be stated, in this connection, that, though the yield per acre of coconuts in India is higher at 2,614, as against 2,000 in the Philippines, 2,133 in Indonesia, and 2,006 in Ceylon, it is possible to increase it tremendously if appropriate care is taken. Granted all these measures being taken, the core of the problems still remains, namely, the assurance of a fair and effective minimum price for the producers. This is a question on which immediate decision should be taken, if all the other measures are to yield maximum results.

INTENSIFYING SUGARCANE DEVELOPMENT

SOIL SURVEY WORK SHOULD BE UNDERTAKEN IN FACTORY AREAS

THERE are no two opinions on the view that the successful implementation of the large expansion scheme drawn up for the sugar industry under the second Five-year Plan depends on the progress in the sphere of sugarcane cultivation. The Plan envisages a rise of 20 million tons in the output of cane, from 58 million tons in 1955-56 to 78 million tons in 1960-61, an increase of 35 per cent. The additional production is expected to be achieved largely through schemes of intensive cultivation. It is only through such cultivation that it is possible to augment the per-acre yields of sugarcane having rich sucrose-content which at present are at a deplorably low level, the all-India averages of yields and recovery being not more than 13 tons and 10 per cent., respectively. The climatic factors no doubt are, to some extent, responsible for low yields and poor quality. But there is no gainsaying the fact that the adverse influence of these factors can be counteracted, to a considerable extent, by adopting suitable cultural practices, with special reference to the prevailing soil conditions. How else can one explain, for instance, the yields of cane ranging from 60 to 80 tons per acre secured by some growers even under the unfavourable conditions of North India? The importance of sugarcane soil survey and analysis has been stressed by Dr. B. K. Mukerji, a well-known sugarcane expert of India, as follows:

"The importance of soil to sugarcane has been recognised chiefly due to the realisation that further progress in securing notable increases in the yield of cane by breeding and selection can only be possible through improvements in cultural practices. The methods of appropriate crop rotation, manuring and irrigation must be relied upon to a much greater extent for securing increased yields as also the soil differences studied in detail in planning measures of improvements on rational lines. . . . A thorough and intimate knowledge of the soils alone can help planning of cane cultivation on a long-term basis for ensuring high levels of yield and quality without unduly taxing the capacity of the soils."

Progress Disappointing

Viewed thus, Mr. T. C. Puri, Joint Secretary to the Union Agriculture Ministry and Chairman of the Development Council for Sugar Industry, did well, indeed, to draw, in his speech at the recent meeting of the Council, special attention to the need for undertaking soil survey work by the technical staff of the sugar factories during off-seasons. Although this need has been repeatedly emphasised by sugarcane scientists, the progress actually achieved has been utterly disappointing. It was as early as in February 1954, it will be recalled, that the second biennial conference of sugarcane research and development workers in the Indian Union, at its session held in Jullundur, had adopted a special resolution urging the Central and State Governments and the Central Sugarcane Committee to take immediate and concrete steps in the direction of soil survey. It had been stressed at the conference that Soil Advisory Service must be developed where the cultivator can turn to for advice in the matter of variety to plant, the kind and quantity of manure and fertilisers to add, and time of their application and, when irrigation facilities are available, the quantity of water to apply. It had further recommended that an intensive survey of cane areas should be completed within three years, so that early benefits could accrue to the cultivators. In fact, the Conference had emphasised that, in the States where soil survey and soil advisory service had not yet been initiated, they should be taken up without further delay.

Two years had elapsed after this resolution, but there was no progress at all. At its fourth meeting held in March 1956, the Development Council for Sugar Industry drew pointed attention to the need for undertaking soil survey work in factories. The matter was further considered by the Central Sugarcane Committee. The Committee was of the opinion that the soil survey work was of the utmost importance. It urged that the services of the factory chemists should be utilised and, if necessary, they should be given adequate training to take up the work. With this end in view, the Committee had even arranged for the training of factory chemists in soil survey at the Indian Institute of Sugarcane Research, Lucknow. But the response from sugar factories to the offer of training has been very poor. Mr. Puri made particular reference to this and revealed that the demand received so far was only for the training of 38 chemists. Mr. Puri called upon the sugar factories to avail themselves of the facilities offered and have the soils of their zones analysed by their staff.

A New Technique

One of the important aspects of soil survey work relates to the categorisation of cane soils in the tropics and sub-tropics. In these regions, the diagnostic characteristics, Dr. B. K. Mukerji opines, may have to be very different from those recognised for classification in temperate countries. In his considered opinion, there is need for thoroughly investigating the phosphate requirements of cane crop in different soils and correctly placing the phosphate for the proper uptake of that nutrient by the growing crop. He has suggested the adoption, wherever possible, of the new technique which is now being developed for studying the nitrogen and phosphatic contents of soils by observing the reaction of radio isotopes. The technique will help arrive at a satisfactory solution of the entire problem of the nutrient requirements of the cane crop under varying environmental and cultural conditions.

In view of the vital role which soil survey work plays in the sugarcane economy thus, the sugar factories will do well to devote greater attention to the problem. Instead of each factory doing the work, it will be better if it is done on a regional basis and the regions may be supplemented by a special body of sugarcane soil workers not merely for co-ordinating the data available in the different regions but also for standardising the methods of cane soil survey and analysis.

NEW SUGAR MILLS IN BELGAUM

The Belgaum district of Mysore State will have two co-operative sugar factories in the not distant future. One of them will be located at Sankeshwar and the other at Mugutkhanhubli on the bank of the Malaprabha river. The Sankeshwar factory has already been registered and the first meeting of shareholders was held recently. The capital outlay of this venture is put at Rs. 80 lakhs, of which about Rs. 9.63 lakhs have already been collected, mainly from agriculturists. The Government of Mysore has agreed to contribute Rs. 10 lakhs to the share capital. The Industrial Finance Corporation of India is expected to grant a loan of Rs. 50 lakhs and the State Apex Co-operative Bank Rs. 20 lakhs. The proposed factory will have a daily cane-crushing capacity of about 1,000 tons.

As regards the Mugutkhanhubli factory, a preliminary meeting was held at Belgaum last month. At this meeting, nearly a lakh of rupees was collected. Efforts are being made to raise more funds towards the share capital.

SUGAR PRODUCTION AND STOCKS

The aggregate production of sugar in India during the 2½ months ended 15th January 1957 was 620,000 tons, as against 528,000 tons in the corresponding period of the previous season. Despatches of sugar during the same period amounted to 382,000 tons, as against 303,000 tons a year before. Stocks with factories as on 15th January 1957 aggregated 765,000 tons, which represent a rise of 128,000 tons as compared with the same period in 1955-56.

Out of the total production of 620,000 tons in the aforesaid 2½-month period, about 176,702 tons have already been released for sale in the free market. Of this quantity, the share of the Deccan sugar mills is 23,325 tons.

CLASSIFICATION OF COAL

I. S. I. FIXES TENTATIVE STANDARD

THE Indian Standards Institution has published an Indian Standard General Classification of Coal (tentative). This work provides a revised scientific classification of coal based on calorific value, ash content, moisture and coking property. It aims at fixing the types and grades suited for various purposes and is intended to rationalise the utilisation of coal in the country.

This Indian standard was adopted by the I.S.I. on 27th December 1955 on the endorsement, by the Chemical Division Council, of the draft finalised on 4th November 1955 by the Solid Mineral Fuels Section Committee. The work on this standard was undertaken on the advice of the Planning Commission, Government of India, which pointed out the desirability of the classification of Indian coals and the scope for its application. The Coal Grading Board, set up on the recommendation of the Indian Coal Committee, in 1925, it will be recalled, drew up a classification of Indian coals, but it was mainly for purposes of export. Subsequently, in 1944, the Coal Commissioner drew up a revised specification applicable to all coals. The Planning Commission, however, felt that a revised scientific classification should be introduced based on calorific value, ash content, moisture and coking property. It also desired that the classification should aim mainly at fixing the types and grades suited for various purposes and thus depend upon the uses to which the coal is to be put. This question, the Commission said, should be referred to a technical committee of experts familiar with Indian coals and with scientific classification in other countries. Such a classification, it added, would assist in controlling distribution and allocation of coal for different industries, as also make it possible to buy and sell in accordance with specifications.

The object of working out the standard was to evolve a classification which would enable those concerned to allocate coals rationally and to draw up specifications for the different types, qualities, sizes, etc., in the light of consumers' requirements and of the coals available in the country. It may be noted, in this connection, that the three main issues which decide the value of coal are: (*a*) the nature of the purely combustible or organic part of the coal, (*b*) the nature and quantity of impurities present, and (*c*) the size of the coal. The latest standard evolved by the I.S.I. is concerned mainly with the first of these factors, namely, the different types of pure coal substance.

Three conditions have been prominently kept in view in preparing the standard. They are: (1) the classification should make it possible to place a coal, after testing, in the right group in the classification table, i.e., to state the correct type and sub-division in terms of basic or inherent properties; (2) when there is a question of using coals for a given purpose, such as steam raising, manufacture of metallurgical coke, etc., it should be possible to specify the categories of coal which are suitable or unsuitable, or suitable only under certain conditions; and (3) the classification should not be so detailed as to be cumbersome and complicated.

The Committee responsible for the preparation of this standard had before it a number of papers relating to the proposals in other countries, including the work so far done by the Working Party dealing with the classification of European coals under the ægis of the E.C.E. Coal Committee, and on the proposal for an International Scientific System of Hard Coal Classification. (The E.C.E. has since published the report of the Working Party on International Classification of Hard Coal—*vide* page 172 of *Commerce* dated 26th January 1957.) The Committee had also a document issued by the Economic Commission for Asia and the Far East on proposals for classification of coals in Asia. It was found that the scheme for classification of coals in the U.S. was simple and yet scientifically systematic and flexible to serve as a basis for the scheme to be drawn up for the classification of Indian coals. Naturally, the kinds of coal available in India and the uses to which they should be put have been the main deciding factors in the preparation of the Indian standard.

The standard prescribes a general classification of coals in India. The three main types of coal dealt with in this standard are: anthracites, bituminous coals and lignites. There is also another type of coal, named cannels, but this is rare in India. Anthracite is a hard, compact variety of coal, almost pitchlike in appearance, but frequently showing striations. It breaks with irregular fracture, does not soil the fingers and is difficult to ignite. But when ignited, it gives intense local heat, the flame being short and nearly non-luminous. Anthracite does not coke. True anthracite does not occur in India and semi-anthracite is practically unknown. Bituminous coals are the usual coals of commerce. They burn with a yellow, often smoky, flame. They are bluish black to greyish black in colour and are usually banded, that, is, made up of alternating bands of different thicknesses of shiny coal. Lignite or brown coal is probably an intermediate stage in the formation of black or bituminous coal from peat. Lignites are usually chocolate brown in appearance, but may be light brown or even black. In their natural state as mined, the moisture constitutes often one-half to two-thirds of the material. The moisture in lignite is reduced on exposure to air to 15-20 per cent. and the lignite then tends to go to slack and become powder.

The following table shows the general classification of Indian coals and their chief uses:

Type	Group	Group symbol	Chief uses
Anthracites.	Anthracite ..	A1	Gasification, producers, domestic stoves and where intense local heat and no smoke are essential.
	Semi-anthracite	A2	
Bituminous.	Low volatile (caking).	B1	Carbonisation for metallurgical coke. Typical coking coals.
	Medium volatile (caking).	B2	
	High volatile (caking).	B3	Coking coals, gas coals, gasification.
	High volatile (semi-caking).	B4	Gas coals, gasification, long flame heating.
	High volatile (non-caking).	B5	Steam-raising, gasification, long flame heating.
Sub-bituminous.	Non-caking: Slacking on weathering.	B6	Steam-raising and gasification.
Lignites or brown coals.	Normal lignite	4	Steam-raising, briquetting, gasification, distillation.
	Canneloid lignite.	L2	

Note.—All coals may be used for combustion purposes, for example steam-raising. Minor plant adjustments may be required for good efficiency, especially with low volatile coals, such as A1, A2 and B1.

The nature and composition of the organic matter of coal basically determine the suitability of a coal for a particular purpose. All coals, however, contain impurities which limit the usefulness of the coal for service in a particular application. These impurities affect principally commercial grading which is based on questions of purity of coal and not on the type of the coal substance. The practical advantage of the method of classification used by the I.S.I. is that it is possible to assess the type and properties accurately by the ordinary tests, which can be conducted without difficulty in laboratories possessing the usual equipment.

In deciding the usefulness of a coal for a particular purpose, the I.S.I. has devoted its attention to (1) the type, as indicated by the nature of the coal substance, i.e., the unit coal; (2) impurities—the amount and nature of impurities present; (3) availability—one is frequently compelled by lack of transport facilities or by considerations of overall economy, to make use of a local coal, although it may not be ideal for the purpose; and (4) size of coal—in order that certain plant may operate at high efficiency, size specification within close ranges is necessary.

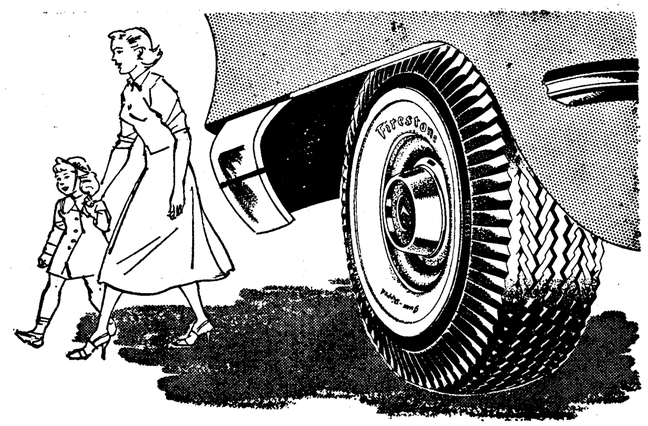
The present standard has, however, been kept tentative for a period of three years, since the subject is engaging the attention of coal technologists and coal consumers in many countries, as also since extensive plans for rapid industrialisation are being made in India. At the end of three years, it is intended to review the matter again, in the light of experience gained and of the changes in the technique in the use of coal that may develop in the meantime.

KORBA COALFIELDS

That the Korba coalfields in Madhya Pradesh is rich in coal and can be developed to produce 4 million tons per annum by 1960-61 is the considered view of the team of Russian experts. This view is expressed in a report submitted by the team to the Union Ministry of Production last week-end. The Russian experts are also of the opinion that conditions in Korba for carrying out coal mining operations through mechanised processes are quite favourable and that the coal produced at the Korba coalfield should be washable by the wet process.

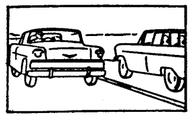
It is expected that the equipment needed for conducting quarrying operations could be made available in 1958 and that for mining operations in 1959-60, so as to enable the attainment of production target of 4 million tons per annum—2 million tons by mining and 2 million tons by open cut—before the end of the second Five-year Plan period. The Russian experts' conclusions are said to be broadly on the lines of those of the Indian team which had investigated the problem much earlier.

The Russian experts' report will be studied by the Indian experts and the Union Ministry of Production to decide on the further steps necessary to implement the scheme. Already, mining operations in two mines in Korba are going ahead and work on another will be taken up shortly.



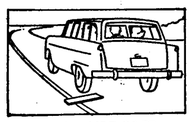
the tyre with BUILT-IN PEACE OF MIND

Now from Firestone comes the modern safety tyre—the New DeLuxe Champion Tubeless Tyre. It gives you and your family protection never before provided in any tyre at any price. It's the first and only tyre with *built-in peace of mind.*



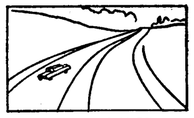
BLOWOUT SAFE

No longer any fear of dangerous blowouts—This tyre is fitted with an air-tight Safti-Inner Liner instead of a tube. There is nothing to rip, tear or explode.



PUNCTURE SAFE

The Safti-Inner Liner of the New DeLuxe Champion Tyre tightly grips puncturing objects and slows down the loss of air—so there's no more fear of having to change tyres on a busy road.



MORE MILEAGE

The New DeLuxe Champion Tyre gives longer mileage because the tough tread compound wears more slowly, and because its flatter tread wears more evenly.

COFFEE CONSUMPTION IN THE U.S.

RESISTANCE TO HIGHER PRICES

THE Indian coffee crop during the current season is expected to exceed 36,000 tons, as against the present record quantity of 33,400 tons in 1955-56. In fact, coffee production has increased considerably during the past 15 years, from 14,226 tons in 1940-41 to 33,400 tons in 1955-56. Notwithstanding this expansion, India's production constitutes only one per cent. of the total world production. The Coffee Board has, however, evolved a 15-year scheme for further expansion of coffee production to about 70,000 tons. Even such an expansion in output is not likely to influence world supplies and prices to any noteworthy extent, because the increased output at the end of 15 years will hardly constitute 2 per cent. of the world total, assuming that the present level of world production will remain constant.

While India thus does not have much influence on world coffee trade, its export trade in this beverage commodity is influenced considerably by world marketing conditions, in striking contrast to its domestic trade which is sheltered from any violent movements in world prices, thanks to State control. So far as the current year is concerned, an increase in world price of coffee is expected, because all estimates point to a substantial decline in world crop for 1956-57. The reduction is expected mainly from Brazil, the leading coffee-producing country in the world, where the crop is said to be poor. Production in Colombia and other countries, which produce mild coffee, is expected to be better, but this will not make good the fall in output from Brazil. This does not mean that growers in these countries can look forward to a boom in coffee, for any sharp rise in prices is likely to be resisted by consumers, who have become more and more price-conscious nowadays. The experience of the U.S. retail trade during 1956 shows how far higher prices affect consumption.

In the U.S., the world's leading consumer of coffee, consumption of coffee rose to touch a record level during 1956; this increase was due to two factors, namely, a rise in population and lower average prices than in the previous two years. In 1954, the retail price of coffee soared and there was a reduction in sales on account of consumer resistance. Prices started to decline in 1955, but it was not until late in the year that the housewife began to buy normal quantities. Again, in 1956, the retail prices rose by 17 cents to $1.13 per lb. by September. The first break in prices for the year occurred in November, with an average drop of 3 cents per lb. The retail price at any time during the past year was higher than that at the close of 1955, but the average price for 1956 was lower than that for the previous year.

The housewife in the U.S. is not averse to any rise in coffee price so long as it is in keeping with the behaviour of other commodities. During the past year, she was willing to follow up coffee prices, because there was a general increase in prices of all other commodities. The rise in coffee prices was gradual and not sharp and sudden as in 1954. It was generally felt that substantial consumer resistance would manifest itself when the retail price-level crossed $1.15 per lb., but this level was not reached. No doubt, there was a cut in purchases by some consumers at every rise in prices, but the decline in consumption was negligible in the overall picture. In other words, the total consumption did not suffer any recession.

The increase in price during 1956 was largely due to the higher cost of mild coffee grown in Colombia and Central American countries. The price of the basic Brazilian variety, Santos 4, was relatively steady, with the result that the price differential between the milds and the Brazilian grades widened. Normally, the Colombian varieties command a premium of 3 to 4 cents per lb. over the Santos 4, but, in 1956, it widened to over 20 cents per lb. The Colombian mild coffee is generally considered a better grade than the Brazilian Santos 4 and the two are blended to produce most of the coffee consumed. If, therefore, a greater proportion of milds is used in the blend, the coffee will be more expensive. The steady rise in prices of green Colombian coffee forced the roasters to put up their prices. When the price of roasted coffee goes up, there is an increase in retail prices. The rise in prices of Colombian coffee was due to a fall in crop, which was affected by adverse weather conditions. Towards the end of the year, new supplies began to arrive from Colombia and other Central American countries and the pressure of arrivals pushed down the prices.

Though the total consumption in the U.S. rose to a record level in 1956, the *per capita* consumption still lagged behind the high of 23.3 lbs. of green coffee consumed in 1949. It was, however, slightly higher than that of 21.4 lbs. touched in 1953. In 1954, the *per capita* consumption declined to 18.7 lbs. on account of the high prices, and it rose slightly to 19.6 lbs. in 1955.

An interesting feature of coffee consumption in the U.S. is the growing use of soluble or instant coffee, which has gained popularity after World War II. Thus, the soluble coffee which accounted for 8.1 per cent. of the coffee consumed at home in 1951, rose to 12.3 per cent. by 1953, 13.4 per cent. in 1954, 18.5 per cent. in 1955 and 20 per cent. in 1956. In other words, in just five years, the intake of soluble coffee more than doubled. This shows that Americans are not very fastidious about their taste for coffee and that, though the flavour and aroma of soluble coffee may not be as enjoyable as those of freshly ground coffee, they do not mind this drawback. So important are time and labour-saving devices for them.

In the current year, the total consumption in the U.S. is likely to increase, on account of the growth in population and national income, but the *per capita* offtake will depend, to some extent, on prices, which, as already pointed out, can be expected to go up, in view of the anticipated fall in world crop.

There is, however, a growing number of coffee-producing countries bidding to enter the world coffee market, the latest one in the line being New Guinea, part of East Indies. This country is now selling coffee extensively in Australia and small shipments have been well received in Britain, West Germany and Japan. Experts have graded the territory's product as "good mild." According to a leading exporter of New Guinea's coffee and cocoa, coffee has become a very valuable export industry for New Guinea and, within a few years, it is expected to be developed into something really big with world-wide markets.

Though the Indian coffee industry has to depend, to a large extent, on the domestic market, it can develop its export market, provided it improves the quality of its product and supplies the best quality to foreign consumers. A concerted effort in this direction by the Coffee Board and the growers will pay rich dividends to the country.

TEA CESS IN CEYLON

The Prime Minister of Ceylon reiterated in his weekly Press Conference last week that the question of nationalisation of tea estates was unlikely to be taken up at an early date. Meanwhile, the Minister of Trade and Commerce has come out with a proposal to raise the cess on tea from the present rate of Re. 1.70 per 100 lbs. to Rs. 2.20 in order to provide finance for tea propaganda. According to the Minister, at least 350 million lbs. of tea are exported annually, so that an increase in the cess to the extent recommended by him will yield an additional sum of Rs. 1.75 million. The decision of the Government on the Minister's proposal is not known at the time of writing.

The Coffee Board has released for export 1,325 tons of coffee out of the 1956-57 crop. This quantity will be made up of 971 tons Plantation 'A', 150 tons Plantation 'B', 119 tons Plantation Triage and 85 tons Arabica Cherry flats.

(Concluded from next column)

The following table, showing the statistics of gunny shipments, gives an idea of the extent to which they have contributed to the rise in stocks:

(In tons)

	January 1957	December 1956	January 1956
Hessians ...	39,195	39,619	23,946
Sackings ...	31,380	34,091	28,724

The above figures include coastal shipments and represent gross figures based on shipping bills presented. It will be noted from them that shipments of hessians have not suffered to any notable extent, while those of sackings have declined perceptibly.

STOCKS OF JUTE GOODS

SHARP RISE IN HESSIANS

JUTE shares on the Calcutta Stock Exchange have been attracting some attention during the past two weeks and business is reported at higher levels. The change in sentiment is attributed to reports that the industry's position in regard to raw material is no more discouraging and that there is no fear of any squeeze in the supply position at the end of the current season. There is a widespread belief in market circles that the combined yield of jute and mesta during the current season, along with the carryover stocks from the previous season, would be sufficient to meet the requirements of Indian mills and that the latter might manage without any further supply from Pakistan till the new crop arrives.

In the meantime, there has been a perceptible fall in raw jute prices in Pakistan also, which has engendered a similar trend in Calcutta as well. The weakness of the Pakistani raw jute market is due to accumulation of stocks with traders on account of some unexpected developments. The market was paralysed by the strike on 26th January last in observance of "Kashmir Day." This was followed by a strike on the 28th in the Adamjee Mills, one of the largest buyers of the fibre, with the result that there was more jute on offer in the market. There was also a report that on account of the stringency in the money market in Pakistan, banks are refusing to give more accommodation to balers.

Substitutes

It, however, remains to be seen how far the decline in raw jute prices would prove beneficial to mills by enabling them to produce goods at prices which will not only attract more foreign inquiries but render such goods relatively more attractive as compared with substitutes used for packing. In fact, if the present trend in raw jute prices in Pakistan continues, there is a chance of that country emanating as a stronger competitor to India in foreign jute goods markets.

The fall in raw jute prices in the last two weeks has not, however, proved to be a bullish factor for the manufactures section of the market. On the contrary, jute goods have been a little depressed, due to absence of inquiry from overseas. The Government of India, no doubt, placed orders last week for 19,000 bales of B. twills but this factor, apart from imparting a temporary boost, failed to arrest the recession. In fact, the trend gained further momentum with the announcement of the stock figures as at the close of January by the Indian Jute Mills Association. The stocks of manufactured goods at the end of last month showed a rise of 8,400 tons, as compared with those at the close of December 1956, and of 25,700 tons over those a year ago, as the following table indicates:

(In tons)

	As on 31st Jan. 1957	As on 31st Dec. 1956	As on 30th Nov. 1956	As on 31st Jan. 1956
Hessians	23,900	19,700	24,700	25,000
Sackings	68,500	64,700	67,100	45,300
Others	11,700	11,300	9,900	7,500
Total ..	104,100	95,700	101,700	78,400

The rise in stocks is probably due to an increase in production and a fall in offtake, particularly from overseas countries, where consumers have put off their purchases following the improvement in the international political situation. With the increase noted above, the downward trend in stocks witnessed in the previous three months has been reversed and stocks stand at the highest level since the end of October last.

Rise in Hessian

The bulk of the increase in stocks is accounted for by hessians which have gone up by no less than 4,200 tons, thus nearly offsetting the decline of 5,000 tons which occurred in the previous month. Notwithstanding this rise, hessian stocks are still lower than those at the end of November last—albeit by a small extent—and those a year ago. Sackings, which still constitute the bulk of the total stocks, have gone up by 3,800 tons to the highest level in the past three months. At 68,500 tons, they represent a rise of 23,200 tons over the year. Stocks of "other manufactures" have gone up by only 400 tons, but this has served to maintain the upward trend since the end of July last, when they amounted to 6,200 tons. It will thus be seen that the stocks of these varieties have mounted up by nearly 90 per cent. in six months.

POSITION OF AUTOMOBILE INDUSTRY

EVEN PROGRESS FOR ALL MANUFACTURERS OF PASSENGER CARS UNLIKELY

THE automobile industry in India consists of eight approved manufacturers. These are: the Hindustan Motors Ltd., Calcutta; the Premier Automobiles Ltd., Bombay; the Standard Motors Products of India, Ltd., Madras; Ashok-Leyland Ltd., Madras; Mahindra and Mahindra Ltd., Bombay; Tata Locomotive and Engineering Company, Ltd., Bombay; Simpson & Co., Ltd., Madras, and the Automobile Products of India, Ltd., Bombay. Of these, the first six are manufacturers of vehicles, while the last two are scheduled to make only diesel engines. It will thus be seen that Bombay accounts for four companies, Calcutta for one and Madras for three. As T.E.L.Co.'s factory is in Jamshedpur (in Bihar), Bombay has only three factories, the same as in Madras. But the aggregate productive capacity of factories in Madras is much smaller than those in Bombay as well as that of the Hindustan Motors at Calcutta.

The following statement shows the annual assembling capacity, on a single-shift basis, of the six approved manufacturers of vehicles, as declared by them in their memoranda to the Tariff Commission:

Hindustan Motors Ltd.	18,000
Premier Automobiles Ltd.	12,000
Standard Motor Products of India Ltd.	6,000
Tata Locomotive and Engineering Co., Ltd.	7,500
Ashok-Leyland Ltd.	1,500
Mahindra and Mahindra Ltd. ...	4,800
Total ...	49,800

Since the foregoing statement was submitted, the Premier Automobiles has taken steps to raise its assembling capacity to 18,000 per annum. An important point that requires to be noted, in this connection, is that the assembling capacity of a unit is generally more flexible than its manufacturing capacity and can be stepped up at short notice and without incurring substantial additional expenditure. The Tariff Commission is of the view that the assembling capacity in the country as mentioned above is sufficient to meet the future demand estimated by it.

Messrs. Simpson & Co., Ltd., and the Automobile Products of India, Ltd., have assembling capacity for diesel engines. The former is equipped to assemble 850 Perkins engines per month, that is, 10,000 engines per annum on a single-shift basis, while the latter claims to have a capacity to assemble 3,000 Meadows engines per annum on double-shift basis.

A brief reference may now be made to the position of each approved manufacturer as found by the Tariff Commission during its investigation last year.

Hindustan Motors

The Hindustan Motors Ltd., Calcutta, is under the management of Messrs. Birla Bros., Ltd. It has permission to manufacture a light car, a big car and medium petrol truck. It has agreements with Morris Motors (Britain) for the manufacture of Hindustan cars and with the Studebaker Corporation for the manufacture of Studebaker cars and trucks. The factory is situated in the district of Hooghly, eight miles from Calcutta. It started with a body shop, paint shop, assembly shop, machine shop, tool room, heat treatment shop, electroplating shop and a laboratory; a foundry and a forge shop were subsequently added. Considerable additions to the tool room and machine shop have also been made. The Company has made appreciable progress in its manufacture of engines for the Landmaster car. It now makes most of the important components of the engine, with the exception of electrical accessories, fuel pump, carburettor, air cleaner, gaskets, main bearings, radiator assembly, exhaust muffler, fuel tank, fuel lines and ventilator. It makes all the components of gear boxes, except oil seal and synchroniser parts. The rear axle, including differential and the front suspension, are also made, the only two items imported for their assemblies being oil seals and bearings.

The Company has a licence for manufacturing Baby Hindustan cars and submitted a programme to the Government four years ago which was approved by the Government as early as in November 1953. But it has not yet made a beginning with this manufacturing programme, as its foreign associates propose to introduce a completely new model of that engine, transmission, etc. As a result, no fresh licences have been issued to the Company for importing Baby Hindustan cars since January 1956.

As regards the Studebaker car and truck, the Company is making only fly-wheel, starter gear wheel, water pump body, fan drive pulley, and piston pins for its V-8 engine. It is also machining imported semi-finished components, namely, connecting rods, timing gears, rocker shafts, rocker levers, exhaust and intake manifolds and piston assembly.

According to calculations made by the Tariff Commission, about 43.7 per cent. of the value of Landmaster (on the basis of c.k.d. pack ex-factory, U.K.) is manufactured by the Hindustan Motors. If account is taken of such items as tyres and tubes, batteries, etc., which are made in India, and the cost of paint and other non-assembly allowances, about 56.8 per cent. of the value of the Landmaster (on the aforesaid basis) is made indigenously. These are the highest percentages attained by any of the domestic manufacturers.

The progress of the Hindustan Motors in the manufacture of Studebaker trucks and cars is very much behind that of Landmaster cars. As against 2,360 Studebaker trucks produced by the Company in 1955 and 733 in the first four months of 1956, only 308 and 616, respectively, contained some of the parts made by it. No indigenous engine components were used in the assembling of the remaining trucks, which were fitted with wholly imported engines. Similarly, all the Studebaker cars were fitted with imported engines. In other words, the Company is making only a small part of the components required and even that is not adequate to cover the needs of all the trucks that are assembled by it.

Since the Company proposes to manufacture the engines for Hindustan Baby car on the Landmaster version of new engines and as the Tariff Commission seems to be satisfied that this arrangement will be economical to both the Baby and the Landmaster cars, it has recommended, and the Government has agreed, that its licence for making Baby cars should not be withdrawn. The Commission has, however, turned down the proposal of the Hindustan Motors to manufacture four-wheel drive Land Rover cars, though it has no objection to the manufacture of a two-wheel drive version of the Land Rover, provided no technical difficulties are involved. It has also refused to support the Company's move to manufacture automobile diesel engines. The Government has endorsed these views of the Commission.

Premier Automobiles

The Premier Automobiles' factory is situated at Kurla on the Bombay-Agra Road. The Company has manufacturing programme for Dodge cars, Dodge trucks and Fiat 1100. It has agreements with the Chrysler Corporation in the U.S. for the manufacture of Chrysler, Dodge, De Soto and Plymouth cars as well as Dodge, De Soto and Fargo trucks, with Dodge Brothers (Britain) Ltd. of the U.K. for the manufacture of the last mentioned trucks, and with Fiat Societa Per Azini, Italy, for the manufacture of Fiat cars. It has also agreements with Monroe Auto Equipment Company of the U.S. for the manufacture of shock absorbers and with Rockwell Spring and Axle Company of the U.S. for Timken axles.

The Company has an assembly line, paint shop, body building department, press shop, machine shop, tube manufacturing plant, heat treatment department, transmission department, shock absorber department, forge shop, heavy press shop and pickling department. It has also a foundry at Wadala, six miles from the main factory.

The Company has, according to the Tariff Commission, made satisfactory progress in the manufacture of Dodge engines for which the cylinder heads and cylinder blocks are machined in its machine shop, while certain important forgings also are made in the factory. It has not yet started making castings for cylinder heads or cylinder blocks. It has developed important components for Dodge engines with the exception of electrical accessories, fuel pump, carburettors, gaskets, bearings and H.T. nuts and bolts. It makes all the components for gear box, except oil seals and synchroniser parts, as also propellor shafts, universal joints and chassis frame (including side members) for its trucks.

In the case of some of the assemblies mentioned above, the Company supplements its production by imports as and when required. It makes its own radiators, leaf springs, mufflers and exhaust pipes. Of late, as the demand for diesel commercial vehicles is steadily increasing, the Company is converting its petrol trucks into diesel-driven vehicles by fitting Perkins P-6 diesel engines supplied by Simpson & Co., Ltd., Madras. Recently, the Company has imported a few Deutz air-cooled diesel engines also. The Company has not made any great progress in the manufacture of Fiat 1100. Recently, it has submitted a revised programme of manufacture, which is under the consideration of Government.

The Company sought permission to manufacture Fiat 600, a Baby car, and also diesel engines. The Tariff Commission has disapproved of it and the Government has concurred with the Commission.

Standard Motors

The Standard Motors Products of India Ltd. is smaller in size than either of the two mentioned above. It first received permission to manufacture Standard 8 cars; this was later replaced by Standard 10. It has a factory at Vandalur, 18 miles south of Madras. It has a machine shop and an assembly shop. A gear cutting shed is under erection and some machinery has arrived. A heat treatment section also is nearing completion. Its sister concern, Unicon Ltd., is putting up a foundry in Madras, which is expected to supply all the castings. The Company has started machining several important components. It is planning to manufacture 3,000 engines a year. It has not made any of the components for Standard 10, nor has it submitted any revised programme of manufacture. Its latest scheme for the manufacture of 112" wheelbase chassis has not found favour with either the Commission or the Government.

Ashok-Leyland Ltd., Madras, has an agreement with Leyland Motors, England, for the manufacture of heavy duty trucks. It has a five-year programme for the manufacture of Leyland Comet trucks. A beginning was made in this direction a year ago, but not much progress has been made, owing to the reorganisation of the Company.

Messrs. Mahindra and Mahindra have entered into an agreement with Willys Motors Inc. of the U.S. for the manufacture of Willys jeeps. Their manufacturing activity was to have begun in the second half of 1955 and completed in three years. But no progress has been made and they are still said to be in the planning stage.

T.E.L.Co.

Next to the Hindustan Motors and the Premier Automobiles, the T.E.L.Co. figures prominently in the Indian automobile industry. Its resources, its manufacturing programme, the growing demand for diesel trucks, and its success in obtaining the collaboration of the world-famous Daimler Benz A. G. of West Germany entitle it to a bright future; it will not be surprising if, in the near future, it puts in the shade all other automobile manufacturers in the country. The Company is permitted to manufacture 3- to 5-ton class diesel vehicles. Its programme includes the manufacture of frames, front axles, springs, fuel tanks, pedals, control system, brakes, exhaust system, sheet metal parts and other related work in the first stage of manufacture which started on 1st November 1955. The Company proposes to take up the manufacture of engines at the last stage which will be completed in October 1959. Its application for permission to manufacture 6.M. 636 Mercedes-Benz diesel engine and related vehicles, including passenger cars, has failed to get the support of either the Tariff Commission or the Government.

Messrs. Simpson & Co., Ltd., have an agreement with F. Perkins Ltd. London, for the manufacture of P.6 light automobile diesel engine. This Company expects to complete the machining and assembling of all the components, except the proprietary parts, very soon. Indeed, according to its version to the Tariff Commission, it must have completed this programme by now. It has no plans yet for the manufacture of castings and forgings. It is expected to import 9,000 complete engines in the 12 months ending September 1957, as compared with its projected output of 3,000 partially manufactured engines. The refusal to accord permission for the manufacture of automobile diesel engines to the Hindustan Motors and the Premier Automobiles ensures for the Company an assured market for its engines and also throws on it the responsibility to fulfil its manufacturing programme efficiently and within the specified time limit.

NEW PRODUCTS AND PROCESSES

Control of Humidity

PHILLIPS N. V. of the Netherlands has developed a new hygrometer consisting of a precision mercury thermometer for determining the ambient temperature, and a dew-point thermometer, the action of which is based on the hydroscopic properties of lithium chloride. When a tube covered in glass wool and wound with two silver threads is soaked with lithium chloride, an electrolytic contact will be made between these threads if they are connected to the electric light main via a transformer. This produces heat, as a result of which the moisture evaporates and the current decreases, so that a state of equilibrium arises between the vapour tension of the lithium chloride and the water-vapour tension of the ambient air at a temperature which is higher than the ambient one. With the aid of a nomograph which is included the relative humidity of the air can be determined from the difference in temperatures. The measuring range of the two thermometers lies between —10°C and +60°C. The accuracy exceeds ±0.2°C for temperature measurement and exceeds ± 1°C for dew-point determination; the maximum permissible air velocity is 0.5 m/sec. The instrument requires little maintenance, consumes a minimum of current, is insensitive to dust and is not subject to wear. This hygrometer is suitable for use in the papermaking, textile, foodstuffs, pharmaceutical and photographic industries for instance, and also in departmental stores, cooling and drying chambers and hospitals and for meteorological purposes.

Tilting Lift Bridge

A Netherland firm "Engineering Works Marco" manufactures a lift bridge for cars by means of which it is not only possible to move them vertically up and down, but to turn them through an angle of 90° on their longitudinal axes. When the car is tilted, the gasoline and oil charging holes should be on the top; the air filter should be removed beforehand. Six rubber caps are provided for sealing the batteries. The cars are secured in two places by the chassis or by the springs. If this has not been done the car cannot be tilted. The tracks can be adjusted with respect to each other to the car's track width. The bridge is moved up or down by turning a switch to the right or left. Limit switches ensure automatic stoppage at the highest or the lowest position. The bridge is driven by a 3 h.p. electric motor. The advantages of this tilting lift bridge are as follows: The work can be seen much more readily and is less fatiguing to staff. No trouble is caused by falling dirt or oil or grease drips. Repairs and other jobs can be carried out better and more thoroughly. Customer and garage manager can easily check the work. The device is being patented in many countries.

Mushroom-shaped Electric Heater

A Netherland electrical equipment factory, Indola N.V. has produced a new type of mushroom-shaped electric heater. Owing to this shape and the 20-cm diameter built-in fan it gives an exceedingly good heat distribution. The design of the heater ensures a high degree of safety, especially where children and animals are concerned. The housing is of very sturdy construction and provided with a wire grill and a built-in fuse as extra safety. The induction motor of the fan does 1,300 r.p.m. for a consumption of 20 watts. The motor is suspended in rubber to absorb sound vibrations. The use of the heater does not interfere with radio or television. The heater can be connected to 750, 1,000 or 1,750 watts. Moreover, it can be so adjusted that only the fan works, i.e., for cooling in summer.

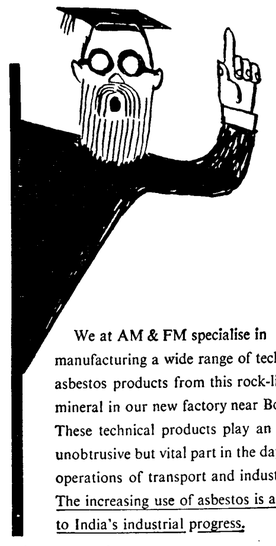
Heavy-duty Seeder

Agricultural specialists of the University of California in the United States are developing a new type of heavy-duty seeder which may replace airplanes in the seeding of rough land. Now being tested, the heavy-duty seeder can drill fertiliser and seed into the ground and cover the seed with earth all in one operation. Its advantages over the airplane for such operations are that it can perform the work in one step, eliminating discing of ground which is required before seed can be planted from the air; also that it uses only about one-half the amount of seed required by air seeders. The seeder weighs one ton and is mounted on wheels. It is not yet available for commercial use.

Sawdust as Cattle Food

Sawdust may be used as cattle food if recent laboratory experiments can be translated into an industrial process. The basis of the new process is the irradiation of the sawdust with radioactive isotopes. This brings about chemical changes in the sawdust converting the indigestible cellulose in the wood particles into a new form of material which the cattle can readily digest. The experiments have shown, it is claimed, that the treated sawdust can be digested by cows and other cattle and converted into sugar food in a perfectly normal manner. The problem at present is one of devising an efficient method of large-scale processing which will ensure that all the cellulose is properly converted into the digestible form. Further experiments are now being carried out towards the development of a small pilot plant process for this purpose.

"Hydrated Magnesium Silicate..."



...a fibrous mineral possessing resistive properties to combustion, corrosive liquids and other chemical and physical phenomena. ...or just asbestos...one of the most useful minerals known to man. It is made up of millions of tough, thin, tightly-compressed fibres, and is acid and fire-resistant.

We at AM & FM specialise in manufacturing a wide range of technical asbestos products from this rock-like mineral in our new factory near Bombay. These technical products play an unobtrusive but vital part in the day-to-day operations of transport and industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

WORKING CONDITIONS OF LABOUR IN DOCKYARDS

PROVISION MADE IN MANY UNITS TO ENQUIRE INTO GRIEVANCES

DOCK workers all over the world have, in recent years, been somewhat discontented with their conditions of service. There are few countries which have not had to face strikes and demonstrations by dock labour. Some sociologists even wonder whether there is not something in the nature of the work and conditions of living of dock workers that make them frequently restless. The workers employed in Indian dockyards are no exception to this general rule about periodic unrest in the ranks of world dock labour force. This is a matter which deserves special investigation by India's sociologists and psychologists. Perhaps, the way for such extended investigation has been paved by the Survey of the working conditions of dockyard labour, conducted by the Labour Bureau, Government of India, the results of which have been published in the latest issue of the *Indian Labour Gazette*.

The Survey is based on the replies to the questionnaire issued by the Labour Bureau to the dockyards in India. It would, however, appear that only 17 dockyards out of 22 responded to the Bureau's questionnaire. It is a pity that a few dockyards failed to reply to the questionnaire, for the Survey would have been much more comprehensive if all dockyards had responded. Be that as it may, in 1955, the 17 dockyards (three in Andhra, three in Madras, four in Bombay, one in Kerala and six in W. Bengal) which are included in the Survey, employed 36,709 workers, as against 52,809 in 1953. The fall in labour force was particularly marked in the case of contract labour. In 1953, over 18,000 workers—that is, more than 34 per cent. of the total labour force—were employed through contracts. The number declined to 1,055 in 1955 or to only 2.9 per cent. of the total labour force. The decline in the number of contract workers has been mostly in W. Bengal. The dock labour force, it may be noted here, consists predominantly of men, women constituting a mere 0.8 per cent. of the total.

Recruitment

The system of recruitment of workers prevalent in all dockyards was mostly direct and 12 out of 17 have stated that they utilised the services of employment exchanges. There was apprenticeship scheme in all the units, except four, namely, two in Madras and one each in Andhra and West Bengal. The period of training in the units varied from six months to five years. All the 13 units granted stipends to apprentices which varied from Rs. 9-12 to Rs. 200 per month. In addition, nine units gave dearness allowance and one allowed tiffin allowance at the rate of As. 4 per day. Only four units granted compensatory allowance and two units paid house-rent allowance to apprentices. Workers who had put in more than 10 years' service (till September 1955) constituted 46.8 per cent. of the total labour force. The percentage of workers who had more than five years' service to their credit was 79.4. Only 8.7 per cent. of the workers had rendered service of less than one year.

With the exception of two dockyards, where the weekly hours of work are 47½, all the remaining 15 dockyards work 48 hours a week. Most units work eight hours a day on all the six days of a week. Four units work 8½ hours and two units eight hours, 36 minutes on week days and shorter hours on Saturdays to complete the weekly limit of 48 hours. The rest interval varies from half an hour to two hours. Six units work two shifts, five units two shifts and six units one shift. The changeover of shifts is generally effected on a weekly basis.

The basic wages differ from Rs. 12 to Rs. 38 a month, while dearness allowance varies from Rs. 18 to Rs. 58-8 per month. In six units, dearness allowance is linked to the consumer price index number, in seven units it varies with income groups and in three units it is paid according to Government rates. Only in one unit is dearness allowance paid at a flat rate to all workers. One unit in Andhra pays a night shift allowance at the rate of 10 per cent. of basic wages; another unit in W. Bengal pays this allowance at the rate of 25 per cent. of the basic wage.

Other Allowances

Compensatory allowance is paid by one unit each in Bombay and W. Bengal and three units in Madras to low-paid workers. In Bombay the allowance paid varies from Rs. 5 to Rs. 15 per month, in W. Bengal it is Rs. 7-8 per month and in Madras Rs. 3 per month. One unit in Andhra pays sundry allowance (As. 10 per day), washing allowance (Re. 1 per month) to those who are supplied with uniform and ferry allowance (Re. 1-8 per month) to those who come from the town. Three units in Bombay also pay a special allowance varying from As. 10 to Re. 1 to those who are sent to work in stream on ship repair and other work. One unit in Bombay supplies woollen jersies to workers employed on ship repair work.

Special dispensaries or hospitals are maintained by 13 dockyards. All dockyards, except two, have opened canteens. In three units, they are conducted by co-operative societies of workers. In the remaining units, they are being run by contractors. The provision for creche exists only in one unit. Rest shelters have been built in five units. Schools for the benefit of workers' children are being run by the managements of three units. Scholarships for higher studies to workers' children are being granted by three units. Library and reading room facilities exist in only three units.

Grievance Machinery

It is of the utmost importance to the maintenance of industrial peace in dockyards that there should be efficient and prompt redressal of grievances. Experience in the sphere of industrial relations, in general, and in the field of dock labour, in particular, shows that even small grievances, unless they are promptly redressed, have a tendency to grow into menacing proportions. From this point of view, it is noteworthy that 16 dockyards have instituted a "grievance machinery" for purposes of redressal of the grievances of workers. In most of these units, grievances are settled either by labour officers or works committees or by both. Only in two units are they looked into directly by the management. Perhaps, some further inquiry into the working of the grievance machinery may prove valuable in that it may well throw light on efficient methods of redressing grievances of workers.

I.L.O.'S ASSISTANCE TO INDIA

An increase in technical assistance marked the activities of the International Labour Office in India during 1956. During the year, nine I.L.O. experts were in India in the fields of productivity, instructor training, manpower information and training within industry (T.W.I.). I.L.O. expert assistance in the field of productivity has been given to India on a continuing basis since December 1952. The I.L.O. mission itself recognised that the problem in a country with abundance of manpower and shortage of capital required treatment on a wholly different basis from other countries where conditions are the reverse. The Mission said: "Emphasis must, therefore, be placed upon productivity improvements requiring little or no new investments and not involving retrenchment or increase in unemployment." It, however, required a good deal of discussion before trade unions could agree that this was possible. Last year, the Mission was busy in organising the work of the National Productivity Centre, set up by the Government of India, at Bombay, as well as with work connected with productivity in certain industrial projects. Remarkable results, it is stated, were achieved in a productivity project at the central workshops of the Bombay State Transport. All-round increases in productivity were achieved through improved layout, handling and other devices. A similar project is now under way at the workshops of the Delhi Transport Service. Fellowships were awarded to two Indian officials for studies in productivity.

Three experts from the U.K. assisted in the reorganisation of the Central Instructors Training Institute of the Union Ministry of Labour, at Koni-Bilaspur. This institute, it may be mentioned here, was established, because the Government found that it could not expand training facilities without adequate supply of instructors. The Institute, which was set up in 1949, has a capacity of 140 seats in 10 trades. By June 1955, it had turned out 1,375 instructors. During the period of the second Five-year Plan, it has been decided to train three times as many instructors and also to establish another institute for training instructors. The I.L.O. is also assisting the Institutes in the matter of equipment.

Two I.L.O. experts have rendered assistance in implementing the programme of Training Within Industry (T.W.I.). Even before the first expert on T.W.I. arrived in India, the Asian Office of the I.L.O. at Bangalore, had initiated the development of T.W.I. programme in India in collaboration with the Ahmedabad Textile Industry Research Association. The T.W.I. project in India was evolved out of this preliminary work. The Government of India asked two experts, the first of whom was assigned in August 1953, to work in the Ahmedabad area. In addition to training a large number of T.W.I. trainees to ensure a systematic introduction of T.W.I. programme in interested mills, he gave special coaching to an official of A.T.I.R.A. who was later given an I.L.O. fellowship for the study of T.W.I. programmes in the United Kingdom. He also conducted a T.W.I. project in Baroda and later gave assistance to the Associated Cement Companies Ltd., with a view to introducing T.W.I. programmes in their network of establishments. The second expert, who arrived only in November 1954, organised and conducted T.W.I. Institutes for industrial and other establishments in Madhya Pradesh. Both the experts helped in meeting demands from South India for assistance in introducing T.W.I.

When the experts left in the summer of 1956, after completing their assignments, they had trained officers for approximately 100 establishments in industries such as textiles, steel, engineering, chemicals, cement, oil and mining. Some 5,000 supervisors had been trained in the programmes of T.W.I. An organised follow-up scheme was being used in more than 50 firms. By the end of the experts' mission in August 1956, about 10,000 industrial supervisors had received T.W.I. supervisory training in India. The Indian Ministry of Labour has set up a T.W.I. centre in Bombay, which is responsible for the introduction and development of the T.W.I. programme in the country. The experts have trained counterpart officials who will also be trained under I.L.O. fellowships.

It was not all one-way traffic. India also provided experts for technical assistance in other countries. Mr. N. K. Adhyanthaya is at work in Indonesia in the field of labour statistics. In the Philippines, Mr. K. Ramaiah completed a project in co-operation. Mr. M. A. Meccai and Mr. S. M. Ali were at Afghanistan and Ceylon, respectively, for assistance in the organisation of handicrafts and small-scale industries. Besides, India offered training facilities for 15 I.L.O. fellows from Burma, Japan, the Philippines, Thailand and Egypt in the fields of personnel management, employment policy, all kinds of co-operation, family living studies, social security and labour administration. An Asian Regional Training Course in Co-operation was also held at Mysore during November 1956.

The New Delhi Office of the I.L.O., besides its normal work of maintaining close contacts with the Government, employers and workers in India and publicising the I.L.O.'s activities, brought out two publications during the year.

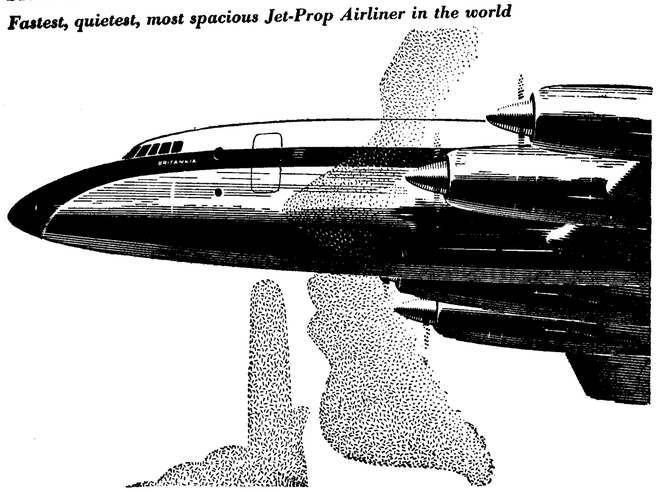
Fastest, quietest, most spacious Jet-Prop Airliner in the world



THE B·O·A·C Whispering Giant Britannia

Meet the "Whispering Giant" *Britannia* — now in service between London and Johannesburg. Its very *size* is enough to astonish you — yet it's so *smooth* in flight at nearly 6 miles a minute, you'll find it hard to believe you're moving at all. The standard of comfort is revolutionary; the spaciousness of the cabins a miracle of planning; the service beyond comparison. The B.O.A.C. *Britannia* is equipped with the latest radar for fair-weather flying all the way. At your journey's end you are as fresh as when you first stepped aboard...and you reach Australia or London *hours sooner!*

Britannia flights are additional to luxury 'Connoisseur' and Tourist Class services operated by QANTAS *Super-G* Constellations.

EMPLOYEES PROVIDENT FUNDS

RELEVANT SECTIONS OF COMPANIES ACT ANALYSED

By Premjus Roy

THE Companies Act 1956 contains the following provisions in respect of provident funds of employees:

"418. *Provisions Applicable to Provident Funds of Employees.*—(1) Where a provident fund has been constituted by a company for its employees or any class of its employees, all moneys contributed to such fund (whether by the company or by the employees) or according by way of interest or otherwise to such fund, shall be either deposited in a Post Office Savings Bank account or invested in the securities mentioned or referred to in clauses (a) to (e) of section 20 of the Indian Trusts Act, 1882 (II of 1882):

"Provided that where one-tenth part of the whole amount of the moneys belonging to such fund exceeds the maximum amount which may be deposited in a Post Office Savings Bank account under the rules regulating such deposits for the time being in force, the amount of such excess may be kept or deposited in a special account to be opened for the purpose in a Scheduled bank.

"(2) Notwithstanding anything to the contrary in the rules of any provident fund to which sub-section (1) applies or in any contract between a company and its employees, no employee shall be entitled to receive, in respect of such portion of the amount to his credit in such fund as is invested in accordance with the provisions of sub-section (1), interest at a rate exceeding the rate of interest yielded by such investment.

"(3) Nothing in sub-section (1) shall affect any rights of an employee under the rules of a provident fund to obtain advances from or to withdraw money standing to his credit in the fund, where the fund is a recognised provident fund within the meaning of clause (a) of section 58A of the Indian Income-tax Act, 1922 (XI of 1922), or where the rules of the fund contain provisions corresponding to rules 4, 5, 6, 7, 8, and 9 of the Indian Income-tax (Provident Funds Relief) Rules.

"(4) Where a separate trust has been created by a company with respect to any provident fund referred to in sub-section (1), the company shall be bound to collect the contributions of the employees concerned and pay such contributions as well as its own contributions, if any, to the trustees; but, in other respects, the obligations laid on the company by this section shall devolve on the trustees and shall be discharged by them instead of by the company.

"419. *Right of Employee to see Bank's Receipt for Moneys or Securities referred to in Section 417 or 418.*—An employee shall be entitled, on request made in this behalf to the company, or to the trustees referred to in sub-section (4) of section 418, as the case may be, to see the bank's receipt for any money or security such as is referred to in sections 417 and 418.

"420. *Penalty for Contravention of Sections 417, 418 and 419.*—Any officer of a company, or any such trustee of a provident fund as is referred to in sub-section (4) of section 418 who, knowingly, contravenes, or authorises or permits the contravention of, the provisions of section 417, 418 or 419, shall be punishable with fine which may extend to five hundred rupees."

These sections are practically a reproduction of section 282B of the Indian Companies Act 1913, which was introduced by the Companies Amendment Act of 1936. Prior to the Amendment Act of 1936, the Companies Act did not contain any provision in respect of employees' provident funds maintained by companies. The only change of substance made by the Companies Act 1956 is that, in accordance with the recommendation of the Company Law Committee, it is now provided that, where a company has established a separate trust with respect to any provident fund, it is the trustees of the fund, and not the company, which will be responsible to carry out the obligations imposed by section 418 of the new Companies Act. Section 420 of the new Act also now prescribes a specific penalty for contravention of sections 418 and 419 of the Act.

Some Difficulties

Sub-section (1) of section 418 lays down that the entire moneys of the employees' provident fund must be either deposited in a Post Office Savings Bank account or invested in what are commonly known as trust-securities. Under the proviso to that sub-section, where one-tenth of the provident fund moneys exceeds the maximum amount which may be deposited in a Post Office Savings Bank account under the rules, the amount of such excess may be kept in a Scheduled bank.

Now the first difficulty which arises is that, under the Post Office Savings Bank Rules (rule 7), deposits in Trust are not allowed and cannot be recognised. On the other hand, section 58C of the Income-tax Act prescribes, as an essential condition for recognition of a provident fund as a recognised provident fund under the Act, that the fund should be vested in two or more trustees or in the official trustee under a Trust which shall not be revocable, save with the consent of all the beneficiaries. However, the Government has tried to solve this difficulty by allowing "public accounts" being opened for a provident fund trust under rule 42 of the Post Office Savings Bank Rules, although the public accounts there contemplated do not strictly include an account such as that of a company's Provident Fund Trust.

Another, and a very real, difficulty arises in the interpretation of the proviso to sub-section (1) of section 418. The Department of Company Law Administration, Government of India, is understood to have taken the view that the provident fund moneys of a company should be kept deposited only in a Post Office Savings Bank account, and should not be kept in any account with a Scheduled bank. This view does not, however, appear to be based on a correct interpretation of the proviso, nor does it make a practical businesslike approach to the problem. The use of the words in the proviso "the maximum amount which may be deposited in a Post Office Savings Bank account under the rules" would appear clearly to indicate that what the proviso contemplates is the maximum amount of deposit prescribed under rule 10 of the Post Office Savings Bank Rules, which is Rs. 15,000 in the name of one person and Rs. 30,000 for a joint account, i.e., an account in the joint names of two persons. For public accounts, there is no maximum limit prescribed for the deposit under the Post Office Savings Bank Rules, and as such the proviso, when it uses the words "the maximum amount which may be deposited in a Post Office Savings Bank account" cannot refer to a public account which does not prescribe any maximum limit.

It may be noted here that the proviso to sub-section (1) of section 418 is a reproduction of the proviso to sub-section (2) of section 282 which was added by the Indian Companies (Amendment) Act, XIII of 1946, which received the assent of the Governor General on 18th April 1946. In the statement of "objects and reasons" given to that Act, it was stated as under:—

"The upward limit of the amount that can be kept in a Post Office Savings Bank is Rs. 5,000 which is insufficient to meet the day-to-day running expenses in the case of provident funds of big concerns. It is, therefore, proposed to amend the above section, so as to afford greater liquidity to a provident fund, where necessary, by allowing a part of its funds being kept as deposit in a Scheduled bank."

This very clearly shows what the intention of the Government was in introducing the proviso in 1946. It would also be pertinent to note that it is very clearly stated in the rules of Post Office Savings Bank accounts that such Savings Bank accounts are not to be used for the purpose of keeping a current account. Even in rule 42 relating to public accounts in the Post Office Savings Bank Rules, explanation (3) states that the prohibition of current accounts, when applied to a public account, extends to the use of the account for full details of the income and expenditure of the fund, and does not prevent the periodical credit of subscriptions or other receipts or the periodical withdrawals of money for expenditure. Not only that this explanation refers only to "periodical withdrawal of money for expenditure" which is a very restrictive provision, but, taken together with the other rules of the Post Office Savings Bank accounts such as regarding withdrawals, etc., even a public account would be thoroughly inadequate to meet the needs and requirements of provident funds of any big sized companies.

Practical Aspects

The practical aspects of the matter may now be examined. The keeping of provident fund moneys only in Post Office Savings Bank account, and not in an account with any Scheduled bank, could meet the requirements of only very small provident funds, having just a few members and very small number of transactions. In Provident Fund Trust of any good sized company having hundreds or even thousands of members, there are a number of transactions from day to day, such as temporary or permanent withdrawals from the provident fund by the members, settlement of accounts of retiring employees, purchase of investments, payment of various bills for stationery, staff, and other expenses, and the like. If the Provident Fund Trust is not to keep an account in a bank but is to keep an account only in a post office where the cheque system has not so far been introduced (though the system is being given a trial only in the General Post Office, Bombay), all transactions of the Provident Fund Trust would have to be in cash, instead of through cheques as at present. The restriction of all transactions to cash would render the conduct of the work of the Provident Fund Trust well-nigh impossible, apart from the obvious risks involved in handling large amounts of cash from day to day. It is usual for Provident Fund Trust to instruct their bankers to make purchases of Government securities, etc., in which the trustees decide to invest the funds of the Trust from time to time; this facility will not be available if no account is kept with a commercial bank. It would obviously be ridiculous to suggest that if the Trust has to invest Rs. 5 lakhs in Government securities, it should withdraw Rs. 5 lakhs in cash from its Post Office Savings Bank account for payment of value of such securities. The position, in short, would be as chaotic as if any fair-sized industrial and commercial concerns were made to transact all their business in cash, instead of through cheques.

Withdrawals

It would also be relevant to refer to the severe limitations imposed on withdrawals of moneys under sub-clause (M) of rule 42 of the Rules of Post Office Savings Bank, which is reproduced below:

"The amount of withdrawals within a calendar month from a public account is limited to Rs. 1,000 unless the person who holds the account gives notice to the post office at which the account stands of his intention to make additional withdrawals. The notice must specify the amount to be withdrawn and be given one month in advance by means of an ordinary letter addressed to the postmaster which should specify the date on which it is intended to make the withdrawal and, if it is intended to withdraw the amount in two or more instalments, specific information must be given in the notice as to the number of instalments and the amount and date of withdrawal of each instalment."

This limit of withdrawal is obviously most inadequate for provident funds of any big or fair-sized companies, where the volume of transactions of withdrawals, investments, etc., may run into lakhs in a month. Usually, it will be very difficult and even impossible to anticipate all the requirements a month in advance, nor will it be possible to postpone payments of withdrawals, or payments in settlement of provident fund accounts or payments for investment for as long a period as one month for which previous notice is required to be given to the Post Office for a withdrawal. Even if the notice on the basis of estimated requirements may be given to them, it will be difficult to determine the number of instalments in which the amount may be required to be withdrawn, for the amount of each withdrawal will depend upon the circumstances of each case. Further, a lumpsum amount cannot be withdrawn, for it appears that under section 418, a Provident Fund Trust cannot retain any amount even for a day.

It would thus appear that the only way in which the proviso to sub-section (1) of section 418 can and should be construed is that, where one-tenth part of the total provident fund exceeds Rs. 15,000 in the case of an individual Trust, the Trust should keep Rs. 15,000 in the Post Office Savings Bank account and may keep the balance of uninvested funds in an account with a Scheduled bank. To consider that the proviso is inapplicable to the case of a Provident Fund Trust which is allowed to open a "public account" in the Post Office Savings Bank is not a justifiable interpretation of the language of the proviso, and would defeat the very purpose of the introduction of the proviso. As a Provident Fund Trust, being a Trust, cannot open an ordinary Post Office Savings Bank account but could have only a "public account," it is clear that a Provident Fund Trust, however small, cannot have account with any Scheduled bank whatsoever, if the interpretation being placed upon the proviso by the Department of Company Law Administration is to be accepted. Even if the interpretation of the proviso is left alone, the practical impossibility of carrying on the day-to-day work of the Provident Fund Trust of any fair-sized company without an account with a Scheduled bank should be enough to make the authorities reconsider their view.

Retention of Cash Balances

Another point to be noticed in sub-section (1) of section 418 is that it does not allow retention of any cash balances, however small, with either the trustees or the employees of the trusts, even for meeting petty day-to-day needs of the Trust. In case the Trust, for example, withdraws Rs. 100 from its Post Office Savings Bank account for its petty needs, is the unspent balance at the end of the day with the Trust accountant to be deposited back in the Post Office Savings Bank account the same day? Since the Post Office Savings Bank account is usually closed at 3 p.m., the redeposit of the petty cash with the Trust accountant has to be made before 3 p.m., and there can be no further transactions after that time for the rest of the day. These operations of day-to-day deposits and withdrawals from a Post Office Savings Bank account would be still more difficult and hazardous if the post office is situated at a distance from the office of the Trust.

Ambiguities

We have so far discussed the provisions of sub-section (1) of section 418 of the Companies Act 1956. Let us now discuss the other sub-sections of this section. Sub-section (2) refers to "portion" of provident fund invested under sub-section (1). The sub-section does not refer to portion of an individual member's provident fund which is not invested, but is kept deposited in a Post Office Savings Bank or in a Scheduled bank. How is an allocation possible between the amounts invested and the amounts in deposit in Post Office Savings Bank and in Scheduled banks, because the same keep fluctuating from time to time? It is also not clear how an individual member's portion of provident fund is to be identified in the total investments of the entire provident fund. The investments are normally pooled and not made separately for individual employees. The sub-section also does not clarify whether the interest yield to be considered is before or after taking into account any gains or losses made or suffered on sale of any investment or any appreciation or depreciation in the market value of investments.

Apart from these difficulties, sub-section (2) does not answer the question whether, while the employees could not as of right claim to be paid a rate of interest on their provident fund exceeding the rate of interest yielded by investment of their provident funds, the employer was also prohibited from paying a higher rate of interest voluntarily to the employees. The Department of Company Law Administration, Government of India, have finally accepted the view that there is nothing in sub-section (2) of section 418 to preclude the employer from voluntarily paying on the employees' provident funds interest at a rate higher than that actually earned on provident fund investments, if the employer so desires.

Looking to sub-section (3) of section 418, it will be seen that provident funds usually adopt two different methods in respect of interest on withdrawals. The first method is that in respect of the amount withdrawn by a member, no interest is charged from the member, and interest is paid to him only at the net balance to his credit in the provident fund account, i.e., the amount at credit minus the amount withdrawn. The other method is that interest is paid on the amount at credit, whether after or without making a deduction for the amount withdrawn, but interest is separately recovered from him on the amount withdrawn. For instance, the provident fund rules applicable to recognised provident funds under the Income-tax Act prescribe that, where the amount withdrawn is repaid in 12 instalments, an instalment of interest equal to 4 per cent. of the amount withdrawn would be chargeable, and where the amount withdrawn is repaid in more than 12 but not more than 24 instalments, instalment of interest equal to 8 per cent. of the amount withdrawn would be chargeable. Where interest is charged on the provident fund, it may be credited either to the account of the member himself from whom interest is charged, or it may be credited to the general funds of the Provident Fund Trust. Where interest is charged on provident fund withdrawn, is it to be treated as a yield on investment within the meaning of sub-section (2)? Strictly construed, such interest cannot be treated as yield on investment, but then how else is it to be considered?

INDIA'S POTENTIAL IN STRATEGIC AND CRITICAL METALS

DEFICIENCY IN A LONG LIST OF BASIC METALS

By Dr. D. N. Wadia

GEOLOGICAL ADVISER, ATOMIC ENERGY DEPARTMENT

METALS form one of the earth's most important gifts in the support and development of the world's present-day civilisation. If petroleum is the life-blood of our industrial civilisation, metals form the skeletal framework of that civilisation. To the long list of vitality important metals which since ancient and medieval times have helped man directly in his various avocations, his arts and crafts, has now to be added the list of atomic metals whose use for providing nuclear energy is going to play a dominant role in the coming decades, by endowing the world with a new source of power, so versatile and responsive to human needs that it will bring into shade all the existing conventional sources of power. In the mineral economics of the world in the coming years, metals are going to play a predominant role, as more metals will be needed, as much for industrial and construction work of the world in implementing human welfare, as for the stockpiles of munitions of future destructive wars. In this context, the growing depletion of the earth's store of metals, progressively going on since the eighteenth century and culminating in the first five decades of the present century, is likely to become one of the biggest problems of the next century. The last two world wars have consumed more metals than during the preceding 18 centuries of human history. The diminishing stocks of metals such as tin, lead, zinc, nickel are nature's grim warning that man is spending away a prime treasure of the earth which is non-replenishable.

Signs are apparent that besides these four, critical shortages have already begun to appear in the accessible deposits of copper, manganese, cobalt, tungsten and antimony, and new discovery is not keeping pace with demand. The extractable stock of platinum, silver and gold left for future needs within minable depth is becoming meagre. This situation is more or less general for the world, but is becoming acute particularly for North America and Western Europe, where modern standards of life and defence munitions and armaments for preserving these against ideological and hyothetical enemies, demand an inordinate use of metals. For the Eastern world, whose consumption of metals was comparatively insignificant uptil lately, and who have so far played the role of suppliers of tin, manganese, wolfram, chromium, or a host of minor but essential metals, the situation is not so grave. This disequilibrium in the world's mineral economics calls for adjustment by wise and equitable solution and not by resort to the old policy of colonial expansion, tariff barriers or security pacts against nations.

Consumption

The *per capita* consumption of metals for the last few years has been at the rate of over 1,000 pounds in the United States, 600 pounds in the United Kingdom and 550 pounds in a young nation like Australia. In most Eastern countries, even in the more progressive ones which have got a programme of industrialisation like India, it is yet barely 15 to 25 pounds. Happily, this situation is changing fast. A growing trend towards conservation of mineral resources and their utilisation in nation-building industry in the Eastern countries, however, is going to be the most significant development of the coming decade. India has already launched an ambitious programme for industrial development, needing heavy engineering plants and machines which will make large drafts on metals. We may, therefore, examine here in some detail India's potential in metals, especially her resources in the more valuable, strategic and critical metals, that will be demanded for the specialised industries and advanced technologies for fulfilling the above objectives, as well as the main objective of all planning—the lifting of the living standards of the people at large. A long list of metals will be in requisition for this, which we may classify under the following heads:—

(i) Metals which exist in India in *surplus* amounts for present requirements and those which can be exported to foreign countries in return for other urgencies;

(ii) Metals in which India may be considered, for immediate purposes as fairly *self-sufficient*; and

(iii) The group of strategic and essential metals which are in *deficit* supply and for which India has to depend on imports from foreign sources, wholly or to a large extent.

Surpluses: Aluminium, Magnesium, Rare metals, Cerium group, Strontium, Iron, Manganese, Titanium, Thorium and Zirconium.

Sufficiencies: Beryllium, Columbium, Hafnium, Lithium, Uranium, Chromium, Copper (—), Lead (—), Tantalum, Vanadium and Zinc (—).

Deficiencies: Antimony, Cadmium, Germanium, Molybdenum, Platinum, Tin, Bismuth, Cobalt, Mercury, Nickel, Selinium and Tungsten.

Strategic Minerals include besides materials for munitions and armaments of war, all other minerals which are required for industrial self-sufficiency and preparedness for defence. Our domestic resources of many of these minerals are ample and well distributed. Such is, however, not the case with *critical minerals* and metals, that is, metals of essential use, the supply and procurement of which in adequate amount in the event of any national emergency is uncertain.

I shall now briefly review the various strategic and critical metals needed for India's second and succeeding industrial plans. To take first the minerals which are surplus in India's present requirements and sizable quotas of which can be exported with profit.

Surpluses

Aluminium: India's resources in this metal may be put at about 75 to 100 million tons of good grade ore and a considerably larger tonnage of moderate grade ore. The deposits are fairly evenly spread throughout the country. In the Jammu area, there are deposits of aluminium-ore analysing 60 to 80 per cent. of Al_2O_3. The utilisation of these resources was till late wholly neglected, but an output of about 20,000 tons of aluminium metal is planned for the next decade. The present-day requirements are 15,000 tons. Aluminium has lately come into use for nuclear power developments as an alloying substance with uranium and as a sheath for the uranium fuel rods in atomic reactors.

Iron: Reserves of high-grade (60 per cent. Fe and over) ores are of a vast extent in the Singhbhum area. The reserves are computed at over 8,000 million tons. The reserves in M.P., Orissa and Madras are also of equal size and richness. In contrast with the vastness of the ore resources, however, production of pig iron, steel and various steel products still remain small. Barely 2½ million tons of pig iron and less than 2 million tons of steel are produced today. The projected new steel plants are expected to manufacture 6 million tons of steel by 1961, together with a fair range of ferro-alloys. Even this target is low enough, as compared to the requirements of 36 million people. Ferro-Silicon,-Ch,-Ti,-W,-V are still of subordinate use in metal fabrication industries.

Magnesium: Magnesite deposits of large extent and high degree of chemical purity occur in Madras, where, near Salem, the estimated reserve is over 90 million tons, analysing 96 per cent. magnesium carbonate. Dolomite deposits are widely distributed throughout the country and can supply large tonnages of magnesium compounds. Research in the production of metallic magnesium and production of light-metal alloys, principally with aluminium and beryllium has not progressed to the desired extent.

Magnesium-beryllium alloys possess valuable properties for use in nuclear reactors.

Manganese: India has exported in the past five decades over 50 million tons of super-grade manganese ore (48 to 70 per cent.). Proved reserves of this ore are computed at about 50 to 60 million tons; the reserves of ores within the 40-30 per cent. range are several times this magnitude. A welcome development of late years is the starting of manganese ore-dressing plants which are expected greatly to add to the country's resources in this metal. Manufacture of ferro-manganese on industrial scale is another welcome development. Electro-metallurgical production of 172,000 tons of ferro-manganese has been planned as the target in the new development plan.

Rare Metals (Cerium Group): India possesses high resources in this category of metals, which mostly centre round the cerium group of rare earths and metals. The chief ore for these metals is monazite, which carries as many as 14 rare earths and metals which are now coming into various technological uses, such as their employment in carbon electrode-cores, misch metal and other pyrophoric alloys, and a variety of technical uses.

Strontium: Large deposits of remarkably pure celestite, aggregating about a million tons, occur in the Trichinopoly district of Madras, but so far this metal is not finding appreciable industrial application in India.

Thorium: The main source of this metal, next in importance to uranium at present, but likely to be of much greater potential in the future as a source of atomic energy, is monazite. Monazite is widely spread in the beach sands of the east and west coasts. The thorium content of Travancore monazite ranges from 8 to 10½ per cent., as against 5 to 6 per cent. of Brazilian and other foreign monazites. A provisional conservative estimate of total reserves of monazite in India is calculated at over 2 million tons, which is expected to yield 150,000 to 180,000 tons of thorium oxide.

Recent research in nuclear science tends to suggest that thorium will emerge in the near future as a fission fuel of greater potential than uranium. The conversion of thorium into U^{233} in a Breeder reactor is no longer a mere speculation. This fact is of greatest importance to us in India, because of India's high potential in thorium.

Titanium: The mineral ilmenite, important source of titanium, is also widely distributed in India, mainly as beach sands along the Malabar and Coromandel coasts. Ilmenite occurs as highly concentrated black sand along the 100-mile stretch on the Travancore coast, and in isolated spreads and pockets along various places on both the west and east coasts. The percentage of TiO_2 in Indian ilmenite ranges from 52 to 62. About 200 million tons of this rich ore is available in a readily accessible form at the surface, only requiring electro-magnetic separation for its processing. Some rutile (TiO_2—97 per cent.) is associated with ilmenite sands.

Titanium has been loudly acclaimed as the "wonder metal of the future" and it possesses properties—lightness, strength and resistance to fatigue and corrosion—which are likely to bring it into a wide variety of metallurgical uses. The production of metallic titanium has risen to considerable proportions in the last five years in the U.S.A., with a considerable fall in price from $25 to $3 per pound. There is, however, just at present, a tendency for production to outrun consumption.

Zirconium: The mineral zircon is the principal ore of zirconium and hafnium. India possesses an exportable surplus of zircon which occurs in the large placer deposits of ilmenite sands to the extent of 6 per cent. of the sand grains. Up to the present, the output of this mineral is highly irregular and varies from 100 to 1,500 tons per annum, mainly worked for foreign export. The metal possesses high potentialities as a structural and sheathing material in the mechanical and constructional parts of atomic reactors. Because of its high resistance to heat and corrosion, it is largely used in jet planes, rocket-nozzles and guided missiles.

Sufficiencies

These form an ill-defined group. While there is a sufficiency for all current needs and the of the immediate future in such metals chromium, beryllium, lithium, columbium tantalum, uranium and vanadium, the remaining metals included in this group (e.g., the non-ferrous metals) are distinctly in short supply for the present. They are listed with "sufficiencies" with a minus (—) sign. They are included here because there are signs that the intensive programme of exploratory work undertaken in various parts of India may result in discovery of deposits of copper, lead and zinc, which may bring some measure of sufficiency in the supply of these metals. In the centuries before the eighteenth century industrial era, India supplied its own—rather extensive requirements in these metals, both for civilian as well as military use in carrying out its internecine wars.

Beryllium: Indian beryl contains 11 to 14 per cent. BeO. Exploration during the last few years has disclosed good workable deposits of beryl in Bihar and Rajputana. The mining and production of dressed beryl from these areas has risen to over 1,000 tons per year. Beryllium and its alloys are of increasing application in nuclear power production. Beryllium oxide is used as a moderator.

Chromium: Pre-Cambrian rocks in parts of Bihar, Orissa and Mysore carry workable deposits of chromite. The annual production from this has been up to 65,000 tons. Possibilities of up-grading lean cromite ore and manufacture of ferro-chrome and chromium steels are promising possibilities. Its chief use is in stainless steels, in pigments and as a chemically neutral refractory.

Columbite and Tantalite deposits occur in association with mica and beryl in pigmatites of crystalline rocks in Bihar and Madras. At times they are uraniferous. Use: High temperature alloys for jet engines and gas turbines.

Copper: Deposits of copper are met with in several parts of India and the Himalayas, but today the only producing centre is the copper belt of Singhbhum in Bihar—some 80 miles long—which produces an output of about 7,000 tons of metallic copper, against the country's annual consumption of 30,000 tons. Some new reported deposits are under investigation together with a number of abandoned sites, where copper industry flourished till a century or two ago.

Hafnium: This rare metal is found as a more or less constant associate of the mineral zircon. Zircon from the ilmenite placer sands contains 5.1 per cent. of hafnium—a metal that has to be eliminated in the refining of zirconium for atomic uses.

Lead and Zinc: The present production of lead in India, about 2,000 tons against annual consumption of 12,000 tons, is insignificant, though two centuries ago considerable amounts of ingot-lead was produced in several parts of the country, mainly for military requirements. Promising deposits, however, have lately been indicated in continuation of the Zawar lead-zinc mines of Udaipur.

Zinc lodes of considerable size have been located at Zawar and at a few other centres (Riasi in Jammu, etc.), but no smelting of zinc is practised in India today. Slag deposits of large size at some sites suggest a flourishing zinc industry in medieval times. The annual consumption of zinc in India is at present about 35,000 tons, almost wholly met by imports. Plans for smelting zinc-ores from Zawar are being matured.

Lithium: This light metal, a likely source of helium in future thermo-nuclear fusion developments, occurs as a constituent of the minerals lepidolite and spodumene, occurrence of which in appreciable amounts is recorded from several localities in Bihar and Madras. Lithium metal is widely coming into use as an alloy metal, a considerable amount of it being now used for alloying with magnesium.

Uranium: Since 1945, the tremendous significance acquired by uranium as a fission metal has led to intensive search for this metal, and its discovery in a large number of localities in many parts of the world. In the coming atomic age, a momentous accession of atomic power is forecast, derivable from the nuclear fission of uranium atoms. It has been computed that, in the next 50 years or so, the demand for electricity to cope with the world's power requirements may increase to 9,000 billion kw.h. per year, the generation of which in thermal power stations may need 3½ billion tons of coal per year, or its equivalent in oil (about one-ninth of India's total coal reserves), a demand on the fuel resources of the world which only China or the United States can meet from year to year. The world's known uranium resources can easily meet the challenge.

Uranium occurs in India principally as a product of igneous and metamorphic sedimentary rocks. Three categories of uranium ores have been noted in India—(i) Low-grade ores in the Archean and Pre-Cambrian rocks, containing from ½ pound to 2¼ pound of uranium per ton of rock; (ii) complex uranium minerals occurring in pegmetites as niobates, tantalates and titanates of uranium. These contain from 2 to 30 per cent. U_3O_8; (iii) monazite sands on the west and east coasts of Peninsular India constitute an important source of uranium. Monazite contains from 0.2 to 0.46 per cent. of U_3O_8, besides 8 to 10 per cent. of thorium oxide. There are variants of monazite which contain much higher percentage of both Th and U. Estimates of uranium available from all these sources are computed at about 12,000 to 15,000 tons. Detailed prospecting and mining of uranium in India are in progress in Bihar and Rajasthan.

Vanadium: Considerable reserves of this metal, an important alloying element in steel manufacture, have been located in Bihar and Orissa as vanadium-bearing iron ores, vanadium content of which varies from 0.8 to 3 per cent. The reserves of vanadiferous iron ore is estimated at about 5 million tons.

Group of Deficit Metals

Against the above enumerated metals which occur in surplus amounts and those in which there is attained some measure of sufficiency, the list of metals which are in deficit in India is a long one. This group comprises the category of metals which are being employed in various specialised modern industries and technologies, but which do not occur locally and have wholly to be imported in order to meet the Indian requirements. Basic and industrial metals such as mercury, nickel, tin, cobalt, cadmium, selinium and platinum are wholly absent in India and have to be imported *in toto*; and, in the case of antimony, bismuth, cobalt, molybdenum and tungsten, a small, undependable and fitful production has been obtained from a few scattered deposits, or in the refining of associated metal compounds. Germanium has been observed in minute amounts in the ashes of some coal and lignite and in flue gases.

I have tried to present here an overall picture of India's position in respect of metals. The country's resources in the above listed strategic metals in group (i) may be considered to be of world importance. Abundant and rich ores of iron, manganese, ferro-alloy metals, titanium and vanadium, besides those of thorium, beryllium and the other rare metals, together with a proved sufficiency of strategic non-metals such as mica, monazite, bauxite, fluxes, refractories and abrasives are such as to give it a commanding, if not a controlling position in the Eastern world in times of international peace. But the disequilibrium caused by an inadequate "sufficiency" and a long list of deficits, together with the serious gaps in the supply position of petroleum and sulphur, may be a source of double danger to national security in a war emergency, when imports of rare essential commodities, e.g., petroleum, may be jeopardised and our credit-earning exports may be stopped. But there are safeguards against this. A healthy economy can be achieved by such measures as the following:

(1) Building up of a strong civilian industrial power for production;

(2) Offsetting the surpluses against deficits by exchange or barter;

(3) Stockpiling of about 13 essential minerals and raw materials; and

(4) Substitutes and synthetics in place of submarginal commodities.

Germany and Japan are two nations which had a most unbalanced economy in respect of mineral resources and yet they developed their industrial potential to such high pitch that they achieved balance and fought a world war for years. By the same means, they have regained, in large measure, their pre-war balance and industrial power.

N.B.—The foregoing account is the full text of the author's Pandya Memorial Lecture delivered at the Tenth Annual Meeting of the Indian Institute of Metals.

IRIDIUM PLATING STEEL WIRE

A new process for plating steel wire with iridium metal has been developed in a National Coal Board, Edinburgh laboratory. The process, which was described in a recent issue of the scientific journal *Nature*, coats the steel wire with a dark grey deposit of iridium, which behaves in a manner characteristic of the metal. A plating solution of ammonium fluoride, ammonium borate and iridium chloride dissolved in water is used and a small quantity of ethanol is added. The mixture is then boiled gently until the smell of ethanol can no longer be detected and filtered after which concentrated ammonia is added. The subsequent electroplating process is then carried out at room temperature.

PINT-SIZE TOOL WITH

OUT-SIZE PERFORMANCE!

— the WOLF packs a lot of Power!

Combining maximum power with minimum weight, unequalled for penetration, speed, balance and faultless performance, WOLF's Type EG2c Drill offers aircraft, motor car and furniture industries, sheet metal fabrication, light engineering assembly shops and many others—stepped-up production and reduced overheads!

To industry and the individual WOLF's offer a wide range of low priced powered tools. Write today for full details of WOLF Portable Electric Tools.

IMPORTANCE OF EXPORT PROMOTION

WORKING OF COUNCILS REVIEWED

A CLEAR picture of the stupendous gap that exists between the available foreign exchange resources and the estimated requirements of the second Plan indicates the Herculean task that lies ahead of Export Promotion Councils, business men and the Government in the sphere of export trade. Whereas during the entire first Plan period the total actual current deficit, excluding official donations, was of the order of Rs. 125 crores, during the second Plan period, the corresponding figure is estimated to be as high as Rs. 1,120 crores. The Planning Commission had estimated that, if foreign exchange resources available for the second Plan from unutilised grants, World Bank loans, as well as from loans agreed to by the U.S.A., the U.K. and the U.S.S.R. to the tune of Rs. 400 crores, and the private foreign investment of Rs. 100 crores estimated for this period were taken into account, the gap in the foreign exchange resources would be Rs. 620 crores. Since, however, it was proposed to draw down the existing foreign exchange resources to the extent of Rs. 200 crores (net), the estimated need for foreign assistance (grants and/or loans) was placed by the Commission at Rs. 420 crores. Since the publication of the Plan, however, the estimates have undergone an upward revision, pushing up further the needs of foreign exchange. The sterling balances have already been drawn down by more than Rs. 200 crores. They now stand at no more than Rs. 506.36 crores, only Rs. 106.36 crores higher than the minimum level of Rs. 400 crores.

India has already gone to the lender in the last resort in the world, namely, the I.M.F., and arranged for credits to the tune of $200 million (about Rs. 95 crores) to be drawn during the next 12 months. Of this, $60 million (Rs. 28.50 crores) will be taken immediately and another $67.5 million after a month. It may be noted that a country borrows from the I.M.F. only when its balance of payments position becomes acute.

Viewed against this background, there is no way of appropriately describing the role of export promotion. It occupies a pivotal place, for on the availability of foreign exchange resources depends to a large extent the full implementation of programmes in respect of industrialisation. Viewed in the same context, again, the progress of the eight Export Promotion Councils, set up in the last two years with Government support, reviewed at a meeting convened by the Export Promotion Wing of the Ministry of Commerce and Consumer Industries last week, can be regarded as a good beginning. The meeting was attended by the Secretaries of the eight Export Promotion Councils set up so far for cotton textiles, silk and rayon, plastics, engineering goods, tobacco, mica, cashew and pepper and leather.

Role of Councils

The real role of the Export Promotion Councils was explained by Mr. K. B. Lall, Joint Secretary, Ministry of Commerce and Consumer Industries, when he said, in the course of his address to the meeting, that the Councils were an administrative device to achieve export promotion, and that they had to create conditions in which export promotion could take place. The study of the foreign markets and of the export trade at home were their first responsibility. Indeed, the progress reports of six Councils for the period April-September 1956, reviewed at the meeting, revealed manifestly that the Councils have been doing, in a sense, pioneering work, as Mr. Lall termed it.

The Councils' main activities can be conveniently divided into two types: those pertaining to the importing countries and those relating to the home country. To the first type of activities belong survey of the markets, by delegations sponsored for the purpose and by resident representatives and correspondents in various world centres, and publicity through display, advertisement and exhibitions. So far, the Councils' attention has been concentrated on these two functions. The problems that the Councils have to solve at the exporting end are no less important, and in fact, no amount of work and progress at the receiving end can be sustained without the solution of the tasks at home. These are standardisation, quality control, examination of complaints from both exporters and importers, and compilation of data regarding the availability of exportable products. It is noteworthy that some of the Councils have already addressed themselves to this task.

Of the Councils, the progress of which was reviewed, that of the Cotton Textiles Export Promotion Council, which was the first to be set up in 1954, was notable. Among the more important features of its work is the finalisation of the standard contract form. Moreover, it agreed to co-operate with the Government in the implementation of the Indo-Burma trade agreement under U.S. Public Law 480, according to which India exports to Burma textiles against raw cotton received from the U.S. It is also noteworthy that the factual inspection scheme under which mills and exporters voluntarily submit their goods for inspection is increasingly becoming popular. This is illustrated by the fact that, during the first seven months of 1956, 50 mills in Bombay and 16 mills in Ahmedabad took advantage of the scheme. These are some of the favourable factors which should help check the continuous declining trend that has been in evidence in the exports of cotton textiles since the beginning of 1955.

Declining Market

A major problem that is facing the Council for rayon and silk industries is that the market for Indian rayon and silk fabrics has been steadily declining in countries of West Asia, such as Sudan, Afghanistan, Kuwait, Muscat, Aden, etc. The Council is now stated to be studying the reasons for the decline. There is also an important difficulty to which the Council has rightly drawn the attention of the authorities. It is the delay made in the disposal of claims for drawbacks of customs duty admissible in respect of exported fabrics. This delay, according to the Council, should especially be avoided because of the fact that the export trade in rayon and silk textiles consists of a large number of small operators and is highly competitive.

As regards quality control, the measures taken by the Cashew and Pepper Export Promotion Council deserve special mention. The Council has appointed two entomologists to inspect the factories and recommend measures for controlling the quality of the goods manufactured and exported. The Council is also stated to be examining the question of controlling the prices of cashew kernels, which are rising as a result of speculation and keen competition among producers so that the industry may obtain enough raw material for processing at reasonable prices. As regards pepper, a significant development is the completion of a tour by the delegation, sponsored by the Council, of the Central and East European countries. It is stated that the delegation has secured trial orders for Indian pepper.

In the case of tobacco, the delegation sent out by the Council to survey the West Asian and African markets found that Indian flue-cured virginia tobacco had virtually no market in those areas except in Egypt. *Bidis*, however, were found to be capable of being introduced in the Sudan, Zanzibar and Aden. The Council is stated to be considering proposals made by its sub-committee for revision of Agmark specifications for tobacco exported.

An important step taken by the Government in the drive for more exports is the appointment of a Committee of experts. The Committee is headed by an academician, Dr. V. L. D'Souza, a former Vice-Chancellor of the Mysore University, and consists of six other members. These are: Mr. T. C. Kapur, who was the Chairman of Export Credit Insurance Committee and now a special officer in the Ministry of Commerce and Industry, Mr. Karamchand Thapar, Mr. G. B. Kotah, Mr. Ratilal M. Gandhi, Mr. Nazir Hussain and Mr. Chentsal Rao, Secretary of the Federation of Chambers of Commerce and Industry, which submitted a comprehensive report on export promotion towards the close of last year. The Committee is expected to make a comprehensive study of all aspects of export promotion and make recommendations with particular reference to the nature of fiscal and other concessions to be granted to increase exports and the nature and extent of credit facilities required for the export trade. Another task to which it will address itself is the study of the working of the Export Promotion Councils and Special Commodity Boards in order to suggest the lines on which they should be developed. Transport problems and quality control also figure in its terms of reference. The Committee is expected to submit its report by June next. It is to be hoped that the report of the Committee will throw adequate light on the problems and facilitate their expeditious solution.

That apart, the various Export Councils already set up will themselves survey the foreign markets for their respective products with the Government's assistance. The Councils, it is further stated, will also undertake similar surveys of Indian industries with an export angle for the benefit of foreign importers. Further, it has also been decided that the various Councils should set up a committee to devise methods of conducting efficiently the five Indian showrooms in foreign countries, to examine whether more showrooms can be opened jointly by the Councils. The deliberations of the Councils' meeting, among other things, also pertained to taking follow-up action to take full advantage of holding such exhibitions and to the importance of supplying goods of quality according to specifications.

U.K. FAVOURS FREE-TRADE AREA IN EUROPE

In a memorandum to the Organisation for European Economic Co-operation (O.E.E.C.), published as a White Paper in London last week, the British Government has reaffirmed its view that a European industrial free-trade area could be set up and has proposed that negotiations should be undertaken in O.E.E.C. to establish such a free-trade area. The memorandum, it is pointed out in London, is a definitive statement of the U.K. Government's attitude to the proposal for a free-trade area and a customs and economic union in Europe on the eve of important negotiations in Paris, namely, the meeting of the O.E.E.C. Council this week. In it the desire of the U.K. to "strengthen the cohesion and promote the prosperity of Western Europe" is stressed.

While the U.K. is unable to join the customs and economic union because of its interests and responsibilities in the Commonwealth, it considers the establishment of free-trade over as wide an area as possible in Western Europe a matter of great importance. That is why the U.K. strongly supported the O.E.E.C. Council's decision of July 1956 to study urgently whether other O.E.E.C. countries could be associated with a customs union comprising France, the German Federal Republic, Italy, Belgium, Holland, and Luxembourg.

A working party of the O.E.E.C. Council having reported favourably on the practicability of a European free-trade area—a view shared by the U.K. Government, provided foodstuffs are excluded from its scope—the British memorandum now expresses the hope that other countries will be willing to negotiate along these lines. The main grounds for the U.K.'s advocacy of a free-trade area are that it will raise industrial efficiency by encouraging increased specialisation, large-scale production, and new technical and industrial development.

The proposals for a free-trade area aim at the removal of trade barriers over a significant portion of the world. But they do not involve the creation of any new barriers against trade with the rest of the world. The U.K. Government considers it indispensable that the free-trade area should be fully consistent with G.A.T.T. obligations and envisages the proposals as a step on the road towards a world-wide system of multilateral trade and payments.

The proposals in the White Paper, according to London observers, do not represent any sudden reorientation in the U.K.'s foreign economic policy and in no way stem from the recent developments in the Middle East. This is evident since the initiative was taken by the U.K. at the July 1956 meeting of the O.E.E.C. Council.

The White Paper sets out the U.K.'s views on the general economic problems of a free-trade area, and particularly on the methods of association with the customs union. These are questions which will clearly need considerable negotiation. The main point now is that the U.K. has made clear-cut proposals that such negotiations should be entered into. And it is the U.K. view, as to institutions, that the free-trade area should be established within O.E.E.C. and that some departure from the unanimity rule would be necessary in certain carefully defined matters.

CENTRAL BOARD FOR SALT

The Government of India has wound up the Salt Advisory Committee and delegated its functions to the Central Board for Salt. The functions of the Board, among other things, will be to advise the Government on the administration of the proceeds of the salt cess. It also makes recommendations for the development of salt industry, chiefly in respect of the setting up of research stations, model farms and factories, fixing grades and improving quality, promotion of exports, encouraging co-operatives and so on. The Joint Secretary in the Ministry of Production will be the Chairman of the Board. The Board will be composed of (1) the Deputy Secretary, Ministry of Production, concerned with the administration of salt, (2) representatives of the Ministries of Finance, Commerce and Consumer Industries, (3) the Director of the Central Salt Research Station, Bhavanagar, (4) the Chief Industrial Adviser in the Ministry of Heavy Industries, (5) one representative each of the Governments of Madras, Andhra Pradesh, West Bengal, Bombay and Rajasthan, (6) three representatives from manufacturers' associations in the country in different regions, (7) one from the Indian Chemical manufacturers Association, (8) two non-officials nominated by the Union Government, and (9) also one representative of labour employed in the industry. The Salt Commissioner will be member-Secretary.

RAMTIRTH BRAHMI HAIR OIL

Hair and brain tonic

Ensures growth of healthy hair. Removes dandruff, protects scalp, increases memory and induces sound sleep. Useful to everyone in all seasons. Rs. 3/8 for big bottle and Rs. 2/- for small bottle.

AVAILABLE EVERYWHERE

RAMTIRTH BRAHMI OIL

OUDH SUGAR REGAINS LOST GROUND

RESERVES FULLY EMPLOYED

AN improvement in the supply and quality of sugarcane and fairly smooth trading conditions in the sugar market have enabled the Oudh Sugar Mills Ltd. (Managing Agents: The Cotton Agents Private Ltd., Bombay) to recover the ground which it had lost in the preceding year and to strengthen its finances. Its profit for the year ended 31st July 1956 is higher, permitting it to set aside larger sums for depreciation and reserves and maintain the dividend with comfort. Although a higher dividend could have been declared, the Directors have wisely chosen, in the national interest, to plough back the major portion of the profit. The adoption of this policy suggests that the Company's Directors have not been perturbed by the recent pronouncements and actions of the Government in furtherance of its socialist pattern of society.

The Company's gross profit, it may be recalled, had made a modest improvement from Rs. 27.13 lakhs for 1952-53 to Rs. 30.64 lakhs for 1953-54. But in the following year, that is, 1954-55, due to heavy imports and larger indigenous production of sugar, there was a depression in the sugar market which resulted in reducing the profit margin. Consequently, the Company's gross profit for that year dropped by Rs. 7.28 lakhs to Rs. 23.36 lakhs. The improvement by Rs. 11.11 lakhs to Rs. 34.47 lakhs during the year under review could, therefore, be taken as an indication that the Company has been set, once again, on the road to better working conditions and higher earnings.

One significant feature of the Company's working is that, even though the profits have thus fluctuated, whether by a wide or narrow margin, the dividend to equity shareholders has been uniformly maintained at 11 per cent. per annum all these years, including the year under review. This is the fourth year in succession when the Company has maintained its dividend at 11 per cent. For the years 1948-49 and 1949-50, the Company had paid a dividend of only 3½ per cent. For the year 1950-51, the dividend was stepped up to 6 per cent. and maintained at that rate for 1951-52.

After making larger allocations for Managing Agents' commission, depreciation and taxation, the net profit stands higher at Rs. 12.01 lakhs, as against Rs. 8.62 lakhs for 1954-55 and Rs. 11.08 lakhs for 1953-54. The reserves, which had received nothing in the previous year, are the recipient of an amount of Rs. 2.92 lakhs this year. Of this sum, capital redemption reserve gets Rs. 2.50 lakhs and contingencies reserve Rs. 42,000. The Directors have considered it expedient to create a capital redemption reserve fund, apparently for redeeming the 4 per cent. cumulative preference shares, aggregating Rs. 12.69 lakhs, at the appropriate time. These shares can be repaid by the Company at par at any time after three months' notice. To the sum transferred from the profit for 1955-56, the Directors have added the balance of Rs. 2 lakhs standing to the credit of the dividend equalisation fund, so that the capital redemption reserve now has Rs. 4.50 lakhs.

The following comparative table will show the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st July			
	1956	1955	1954	1953
Sales	582.11	379.25	515.09	510.56
Other income	6.43	0.61	0.61	1.31
Closing stock	148.13	117.61	69.64	101.80
Expenses	585.64	404.48	452.90	476.15
Gross profit	34.47	23.36	30.64	27.13
Managing Agents' commission ..	3.51	2.34	3.06	2.71
Depreciation	10.50	7.00	8.00	11.00
Taxation	8.45	5.40	8.50	4.00
Net profit	12.01	8.62	11.08	9.42
Transfer to—				
Reserves	2.92	..	2.00	0.70
Dividend—				
Preference	0.41	0.41	0.41	0.41
Ordinary	8.52	8.52	8.52	8.52
	(11%)	(11%)	(11%)	(11%)
Carry forward	0.21	0.05	0.37	0.23

As the table reveals, the Company's sale proceeds for 1955-56 have jumped up by Rs. 202.86 lakhs, that is, from Rs. 379.25 lakhs in the previous year to Rs. 582.11 lakhs. This represents an increase of 53.5 per cent. over the preceding year. The year's satisfactory results are also due, no less, to a substantial increase in other income from a little over half a lakh of rupees to Rs. 6.43 lakhs. These have, however, been offset, to a large extent, by the steep rise in expenses from Rs. 404.48 lakhs to Rs. 585.64 lakhs.

Commenting on the Company's working for the year, the Directors in their report, observe thus:

"The Company's Sugar Mills, during the year under review, worked satisfactorily. The total cane crushed amounted to 10,526,005 maunds and the average recovery was 9.59 per cent. as against the cane crushing of 8,024,566 maunds and the average recovery of 10.03 per cent. in the previous season. The season for lower recovery is to be attributed to the abnormally long season this year, besides supply of cane from distant places. However, the loss due to lower recovery was, to a certain extent, compensated as a result of the Government granting a rebate in the price of cane purchased by sugar factories on and from 8th May 1956.

"The distillery also functioned efficiently and satisfactorily. A record production of alcohol was obtained during the year amounting to about 10,10,000 gallons against about 6,82,000 gallons only in the previous year. There was an improvement in the yield and quality of cane grown in the Company's farms. The cane crop amounted to about 633,000 maunds as against about 475,000 maunds only in previous year. Consequently, the farms have shown much better profits during the year under review.

"The *vanaspati* factory also achieved a record production during the year. The Directors, however, regret that the cost of production was much higher as a result of considerable increase in the cost of raw materials due to poor crop of oilseeds during the year while it could not be possible to increase the selling rates correspondingly on account of keen competition in the industry."

The Company has a factory at Hargaon, District Sitapur in U.P., with a crushing capacity of 2,000 tons per day; besides a distillery. It has also oil mills, hydrogenated oil and allied products factory at Akola.

In 1948, the Company increased its paid-up capital to Rs. 90.22 lakhs by capitalising reserves to the tune of Rs. 33,20,700 and issuing, as fully paid-up, ordinary bonus shares, in the proportion of three such additional ordinary shares for every four existing ordinary shares. Even after this transfer, the Company's reserves and surplus aggregate Rs. 55.30 lakhs, as against a paid-up capital of Rs. 90.18 lakhs of which Rs. 12.69 lakhs are in ordinary shares and Rs. 77.48 lakhs in 4 per cent. redeemable cumulative preference shares, as already mentioned. The current liabilities amount to Rs. 181.24 lakhs. These include Rs. 96.83 lakhs by way of secured loans from banks and Rs. 12.49 lakhs provision for taxation. The gross block of the value of Rs. 204.73 lakhs has been written down to Rs. 99.23 lakhs. Additions during the year were of the order of Rs. 19.81 lakhs. The current assets amount to Rs. 227.49 lakhs and include, among other items, stores, chemicals, spare parts, etc., Rs. 17.04 lakhs, finished products and goods-in-process Rs. 148.13 lakhs, sundry debtors considered good Rs. 9.89 lakhs, loans and advances Rs. 21.87 lakhs, farm assets Rs. 21.55 lakhs and cash and bank balances only Rs. 2.68 lakhs. The current assets cover the liabilities and provision for taxation by a fair margin of Rs. 46.25 lakhs. The low cash balance and the absence of any sizable investment in Goverment securities show that the Company's reserves are fully utilised by way of working capital. Indeed, it has already a large borrowing from banks, in order to cover the needs of such capital. As will be noted from the figures quoted here, large sums of money are locked up in stock-in-trade.

The Rs. 100 fully paid-up ordinary shares of the Company are being currently quoted at Rs. 140 *cum-div.* On an *ex-div.* basis and taking the dividend at 11 per cent., the yield works out to 8.5 per cent. per annum, free of tax.

STANDARD COAL CO., LTD.

The proposed amalgamation of the Standard and Burrakur Coal Companies, both of which belong to the Bird-Heilgers group, Calcutta, has been dropped and the Directors of Standard Coal have now decided to run it as an investment company. It will be recalled that, in June 1956, the shareholders of the Standard Coal Company had approved of a scheme for amalgamating their company with the Burrakur Coal Company, Ltd., the consideration being that the shareholders of the Standard Coal Company would receive two ordinary shares of Burrakur Coal for every share of their company.

There was, however, considerable opposition to this scheme from a section of the ordinary shareholders of the Burrakur Coal Company. In view of the present market price of Burrakur ordinary shares, it is expected that the formula of two Burrakur shares for one Standard share will not be acceptable to Burrakur shareholders while any lower ratio will be equally unacceptable to the shareholders of Standard. In the conditions obtaining now, the Directors have felt that the scheme of amalgamation would be impracticable.

The other alternative is to take the Standard Coal Company into liquidation. The Directors gave careful consideration to this alternative but ruled it out, because of some impediments in the way of doing this also. They found that there were certain legal obstacles connected with the transfer of the title of the coal properties originally owned by the Company and, in addition, certain outstanding matters such as pending tax appeals which would delay the liquidation proceedings for several years. In addition to this, recent changes in the taxation laws concerning the liquidation of companies would result in a substantial percentage of the Company's assets, represented by accumulated reserves, being dissipated by tax liabilities during the process of liquidation.

The Directors accordingly decided to convert the Company into an investment concern. Since, however, it will be undesirable to continue the membership of a shareholder if he does not approve of the new character of the Company, they have obtained the consent of Messrs. F. W. Heilgers & Co. (Private) Ltd. for buying, at the current market price of Rs. 20-12 per share, the ordinary shares of any member who wishes to dispose of his holding.

The Company proposes to dispose of its share in the Chief Mining Engineer's bungalow at Bhulanbararee and its holding of Government securities and debentures. This will leave the Company with the following assets: (1) 15,000 ordinary shares in Coal Shipments Ltd., (2) 9,275 ordinary shares in Sijua (Jherriah) Electric Supply Company, Ltd., (3) 200 ordinary shares in the Industrial Credit and Investment Corporation of India Ltd. and (4) 802½ bighas of coal-bearing land in Mouza Sowardih. The first three items yield a reasonable return, though, in the case of Coal Shipments Ltd., the profits fluctuate according to the coal export market.

It is intended to retain Sowardih Mouza as the Directors feel that the property could be worked profitably in the event of a change in the policy of the Government towards the private sector in the coal industry. Alternatively, they also hope to get a reasonable price even if it is compulsorily acquired by Government.

This will leave the Company with a fund of Rs. 18 lakhs available for investment. The Directors intend to invest this amount in ordinary shares, partly in companies under the management of Bird & Co. Private Ltd. and F. W. Heilgers & Co. Private Ltd., and partly in other companies. They state that, though it is difficult to make accurate prediction as to the future earning capacity of individual companies and the future tax liabilities of Standard Coal, it is estimated, from conservative figures which have been prepared, that it should be possible to pay a dividend of not less than 10 per cent. per annum, and possibly higher.

The accounts of the Company for the year ended 31st December 1956 show that the Company has made a net profit of Rs. 40,064 as against a net loss of Rs. 74,927 in the previous year. The dividend has been maintained at the rate of 10 per cent. by drawing a sum of Rs. 70,000, being the excess provision for taxation no longer required.

WORKING OF THE NEW COMPANIES ACT

Thirty public companies with an authorised capital of Rs. 50.65 crores and 221 private companies with an authorised capital of Rs. 57.14 crores were registered in the eastern region comprising West Bengal, Assam, Bihar and Orissa under the New Companies Act during the first nine months after the Act came into force on 1st April 1956, according to a review made by the Regional Director, Eastern Region, Company Law Administration, Calcutta. During the same period, 106 companies went into liquidation in this region.

The total number of registrations of public companies in West Bengal was 25 with a total authorised capital of Rs. 50.40 crores. The number of private companies incorporated during the same period was 199 with a total authorised capital of Rs. 6.07 crores. The above new flotations include (i) East Anglia Plastics (India) Ltd.—authorised capital Rs. 1 crore; (ii) Indo-Asahi Glass Co., Ltd.—authorised capital Rs. 65 lakhs; (iii) Bengal Sugar Mills Ltd.—authorised capital Rs. 50 lakhs; (iv) Parbati Cotton Mills Ltd.—authorised capital Rs. 50 lakhs; and (v) Techno Products Ltd.—authorised capital Rs. 30 lakhs.

The corresponding figures of public and private company registrations with their authorised capital for the first nine months period of 1955-56 were 45 public companies with authorised capital of Rs. 13.90 crores and 332 private companies with authorised capital of Rs. 9.78 crores. The number of companies that went into liquidation during the said period were 47 public limited companies, 51 private limited companies and one company limited by guarantee. Nineteen public limited companies with a total authorised capital of Rs. 3.06 crores and 11 private limited companies with a total capital of Rs. 35.5 lakhs were finally dissolved during the said period.

In Bihar, three public companies with a total authorised capital of Rs. 15 lakhs and 12 private companies with a total authorised capital of Rs. 50.28 crores were incorporated, while two public companies and two private companies with authorised capital, respectively, of Rs. 35 lakhs and Rs. 3 lakhs went into liquidation. The one giant flotation during this period in Bihar was Hindusthan Collieries Private Limited with an authorised capital of Rs. 50 crores.

In Assam, six private companies with a total authorised capital of Rs. 22 lakhs were registered during this period.

In Orissa, two public companies with an authorised capital of Rs. 10 lakhs and four private companies with an authorised capital of Rs. 5.70 crores were incorporated during this period, while two public companies and one private company with authorised capital of Rs. 10 lakhs and Rs. 2 lakhs, respectively, have gone into liquidation.

KIRLOSKAR BROTHERS EARN MORE

BONUS SHARES TO BE ISSUED

THE financial results of Messrs. Kirloskar Brothers Ltd. (Managing Agents: Messrs. Kirloskar Sons & Co., Kirloskarwadi, District South Satara), for the year ended 31st July 1956, are encouraging. The Company's business in that year recorded a fairly substantial improvement over that in the preceding two years. The gross profit of the Company, which amounted to Rs. 8.00 lakhs for 1953-54, registered a small improvement to Rs. 8.53 lakhs for 1954-55. From this level it has made a commendable advance by Rs. 4.27 lakhs to Rs. 12.80 lakhs during the year under review. Looking to the very modest—almost negligible—improvement in the previous year, the year's progress should be considered as quite satisfactory. In the words of the Board of Directors, "the business of the Company, no doubt, has shown some improvement and, if the same progress is maintained, the financial position of the Company would greatly improve." They further anticipate that, during the second Plan period, when special importance has been given to the country's industrial development, the Company would be able to secure far better business and also show its usefulness to the country. The Directors have, however, expressed concern over the transport bottleneck and shortage of raw materials like pig iron, hard coke, etc., which continue to create difficult situations at times.

After paying Rs. 1.17 lakhs as Managing Agents' commission and setting apart Rs. 4.80 lakhs on account of depreciation and Rs. 3.61 lakhs for taxation, the net profit works out to a higher figure of Rs. 3.22 lakhs and compares favourably with Rs. 1.39 lakhs for 1954-55 and Rs. 1.18 lakhs for 1953-54.

In conformity with the rise in profit, the dividend has been progressively stepped up. Thus, the dividend for the year under review is 6 per cent., as compared with 5 per cent. a year ago and 4 per cent. two years ago.

The following table will give some idea of the Company's working during the past three years:

(In lakhs of rupees)

	For the year ended 31st July		
	1956	1955	1954
Sales—Manufacturing ..	69.56	N.A.	N.A.
Closing stock—Manufacturing ..	22.96	N.A.	N.A.
Sales—Trading	47.13	N.A.	N.A.
Closing stock—Trading	5.38	N.A.	1.69
Other income	3.36	1.45	8.39
Expenses	106.47*	9.12	8.00
Gross profit	12.80	8.53	..
Managing Agents' commission ..	1.17	..	4.32
Depreciation	4.80	5.14	2.50
Taxation	3.61	2.00	1.18
Net profit	3.22	1.39	..
Transfer to—			
Reserves	1.86	0.20	0.30
Dividend	1.36	1.13	0.91
	(6%)	(5%)	(4%)
Carry forward	0.05	0.06	0.07
Rs.	(6,304)	(6,530)	(990)

* Includes also manufacturing expenses.

It will be seen that not only has the return to shareholders been raised but reserves also have been strengthened. Of the year's provision at Rs. 1.86 lakhs, general reserve has claimed Rs. 1.75 lakhs.

The Company would appear to be undercapitalised. As against a net block of Rs. 30.48 lakhs (arrived at after deducting Rs. 39.74 lakhs of depreciation from the gross block of Rs. 70.22 lakhs), the paid-up capital is only Rs. 22.57 lakhs, all in ordinary shares of Rs. 25 each. The Directors' decision to capitalise (subject to Government's consent) a sum of Rs. 7.57 lakhs from the general reserve is, therefore, fully justified. Under this proposal, a bonus share of Rs. 25 will be issued in the proportion of one share for three shares. It may be noted here that the Company's reserve position is strong enough to meet this transfer. Indeed, its reserves and surplus, aggregating Rs. 72.08 lakhs, are equal to more than three times the paid-up capital. The financial position of the Company is very satisfactory in other respects, too. Thus, its current liabilities aggregating Rs. 32.88 lakhs are well covered by current assets of the value of Rs. 97.57 lakhs, that is, by a wide margin of Rs. 64.69 lakhs.

It may be added that the proposed bonus shares, if sanctioned by the Government, will rank for dividend from the current year, namely, 1956-57, onwards.

Points From The Chair

Outlook for Steel

"THERE have been many statements made as to the likely total future demand for steel in this country; the question now is whether these are in fact reliable both as to the total quantity and the dates by which such quantities will be required. I have said on previous occasions that the demand so long as the standard of living is on the upgrade, because such a large quantity of sheet steel is used by the industries providing articles which make life easier and more pleasant. But these are the very articles which are largely controlled by political and economic expediencies; if the balance of payments is going the wrong way, one of the corrective measures is to control the consumption of consumer goods in the home market, either by the tightening up of hire-purchase arrangements, by a higher purchase tax, or by the credit squeeze, or by a combination of all three. Nevertheless, I think it is safe to assume that these setbacks, by their very nature, must be of a temporary character and that the rise in the standard of living throughout the world will continue."

RICHARD F. SUMMERS,
John Summers & Sons Ltd., Britain.

Taxation and Interest Rates

"Last year I referred to the fact that high taxation had tended to blunt the effect of the traditional method of controlling the supply of credit through movements in interest rates and, while I personally do not like direct controls being imposed through the banking system, I am more than ever convinced that the interest rate weapon cannot any longer be relied upon by itself, not at any rate unless we are prepared to see Bank rate pushed up to a level which would be harmful in other directions. For one thing, high interest rates increase the cost of Government borrowing and are thus a burden on the taxpayer. They also place an additional strain on our external payments account by increasing the cost of servicing the overseas holdings of sterling. These considerations alone make it desirable that the Government should not maintain high interest rates any longer than necessary and, I think, we may look forward to a downward movement of interest rates. As I have indicated, I do not consider that this need necessarily be accompanied by relaxation of the directive on bank lending. At the same time, however, I feel bound to add that I regard the directive as essentially a short-term expedient and at best an imperfect instrument of control. It should, therefore, be the policy of the Government to authorise its withdrawal at the earliest possible moment. For my part, I shall welcome the day when bankers are again free to consider applications for advances solely on their merits as banking propositions."

DUKE OF BUCCLEUCH AND QUEENSBERRY,
Royal Bank of Scotland.

Tube-making in India

"Last year I informed you that The Indian Tube Company's first plant—a continuous weld plant for the production of commercial quality tubes—had just started to operate. It was officially opened by the Chief Minister of Bihar on 7th March 1956. A good start was made and 17,000 tons of tubes had been produced by the end of September. Our prior training of Indian personnel in this country enables the plant to work with Indian operators only, and chiefly under Indian supervision. The continuous weld plant can, of course, produce a much greater tonnage and the Company therefore has the capacity to satisfy the expanding Indian demand for this class of tube for some time to come. Satisfactory progress has also been made with the electric resistance weld-tube plant and ancillary cold strip mill, and it is expected that these plants will start operation early in 1957 as I forecast in my speech last year. The Government of India have also sanctioned the installation of the seamless tube plant to which I referred last year. Orders have been placed for the buildings, plant and equipment and it is hoped that it will be completed towards the end of 1958. The Indian Tube Company also acts as our selling agents in India for certain of our products, in particular, those which it is likely to make in the future. Our subsidiary, Stewarts and Lloyds of India Private Ltd., continues to represent us for our other products and to fabricate and manipulate pipework in Calcutta of which it also undertakes the erection. The Company has had a successful year. Business in fabricated and manipulated pipework has substantially increased and it has been decided to extend facilities for this work."

A. G. STEWART,
Stewarts and Lloyds, Ltd., Britain.

Iron Ore Reserves

"The reserves of iron ore in the world, fortunately, seem more than adequate to cover the foreshadowed expansion of the steel industry for many years to come. The discovery of new deposits is more than keeping pace with the exhaustion of the older deposits. New mines, however, take a long time to bring into active production, particularly when they are situated in out of the way localities as many of them are. The difficulties of transporting the ore from the mines to the centres where it can be used, involving as it does both rail and sea carriage, are already making themselves evident. The rate of expansion in steel production must be determined by the rate of progress in the development of the ore fields, both old and new. Whether that development and progress are moving fast enough at the present time to keep pace with the world's demand for steel is not yet clear."

SIR ANDREW MCCANCE,
Colvilles Ltd., Glasgow.

COMPANY MEETINGS AND DIVIDENDS

ODDALEAH LTD. Annual General Meeting, Calcutta, 22nd February 1957. Dividend: *Nil.* Transfer books remain closed from 14th to 22nd February 1957, both days inclusive.

BRITANNIA BUILDING'S PROFIT LOWER

SEAJULI TEA CUTS DIVIDEND BY 25 PER CENT.

Britannia Building and Iron Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. Holmes Wilson & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st March 1956.

The net profit for the year was Rs. 1,08,001 (Rs. 2,45,547) after providing for depreciation Rs. 5,44,402 (Rs. 53,526), for managing agents' commission Rs. 20,000 (Rs. 27,525 , for directors' commission Rs. 3,240 (Rs. 7,179) and for income-tax for the year 1953-54 Rs. 66,691. No provision for income-tax for the year 1953-54 was made before, but the income-tax department disallowed certain portion of the loss in that particular year and the same will be considered in the current year. Income-tax assessment is complete upto the year ended 31st March 1955 and there is a carried over loss therein. Accordingly no provision has been made in this year's account for income-tax for the years 1954-55 and 1955-56. A sum of Rs. 1,50,000 has been transferred from reserve for doubtful debts to the profit and loss appropriation account as the reserve is not required now. The credit balance in the profit and loss account is Rs. 2,08,508 (Rs. 1,17,197) which the directors disposed of as under:—

Paid Rs. 98,929 (Rs. 1,00,000) as dividend at As. 8 (Re. 1) per share on the 1,97,857 (1,00,000) ordinary shares issued, subscribed and paid up upto 31st March 1956, Rs. 57,942 (*nil*) as dividend at 6 per cent. per annum, on the 9,657 redeemable cumulative preference shares issued, subscribed and paid up upto 31st March 1956 and carried forward to the next year Rs. 51,637 (Rs. 7,179). The directors report that some of the development schemes proposed have already been taken in hand and hope that the working results will be better in the future years.

The factory of Messrs. National Structurals Ltd., has already been acquired and extensive additions are being made there. Abount 93 Bighas land has been acquired at Rajbundh near Durgapur for putting up the Company's structural shop. Negotiations are going on with the Industrial Finance Corporation of India for securing a loan for the development of the factory.

By an agreement entered into with the West Bengal Government, the Government has purchased the Company's claim against dues from the National Cricket Club for a sum of Rs. 3,80,000 and the same amount has been received from the Government on the guarantee of Sri N. D. Agarwalla, a director, as earnest money, which will become refundable to the Government only if the Company fails to obtain any decree in its suits against the National Cricket Club or if such decrees are set aside in subsequent appeals or if the Company fails to assign the decrees to the Government.

Seajuli Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Williamson Magor and Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December, 1955.

The season's working resulted in a profit on revenue account of Rs. 1,29,792 (Rs. 3,23,198) after providing for depreciation amounting to Rs. 14,993 (Rs. 83,493). After transferring the above profit making various adjustments, charging labour bonus for 1953 and 1954 and making a provision for labour bonus for 1955 and setting aside Rs. 35,000 (Rs. 1,40,000) for taxation the profit and loss account showed a balance at credit of Rs. 65,189 (Rs. 1,41,543 after providing Rs. 75,000 for reserve account and Rs. 10,000 to staff account) from which the directors paid a dividend of 15 (40) per cent. for season 1955 absorbing Rs. 37,350 (Rs. 1,16,643) and carried forward Rs. 27,839 (Rs. 74,700).

The following are comparative statistics of sales for the past three years:—

	Lbs.	*Average sale price per lb.*
1953	390.712	Rs. 2-4-8¼
1954	368,082	Rs. 3-7-4½
1955	359,962	Rs. 2-10-10

The estimates for 1956 provide for a crop of 368,000 lbs. of tea at a cost of Rs. 2-3-4½ per lb.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Liabilities ...	2.49.000	Block ...	4,05.800
Reserves ...	2,50,000	Stock-in-trade	5,29,975
Provision for taxation ...	1.79.919	Stores ...	73,934
Liabilities ...	4,15,221	Debts, deposits and advances ...	30.901
Profit and loss account ...	65,188	Cash ...	1.18.718
Rs.	11.59,328	Rs.	11.59,328

Krishnabehari Tea Co., Ltd.

The directors of the above Company (Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The net profit on the year's working was Rs. 61,895 (Rs. 2,68,388) after deducting all expenses including depreciation etc. To this was added the amount brought forward from last year of Rs. 9,384 (Rs. 936) making a total of Rs. 71,279 (Rs. 2,69,384). Out of this amount the directors paid a dividend of 10 (25) per cent. per annum free of income-tax on the paid up capital of the Company, viz., 30,000 fully paid up ordinary shares of Rs. 10 each for the period ended 31st December 1955 absorbing Rs. 30,000 (Rs. 75,000) transferred to general reserve account Rs. 15,000 (Rs. 80,000) transferred to income-tax reserve account Rs. 23,104 (Rs. 1,05,000) and carried forward Rs. 3,175 (Rs. 9,384).

Area: The area under tea cultivation as at 31st December 1955 was 267.98 acres.

Crop and sales:—The relative figures from 1951 onwards are given in the following table:—

Year	*Crop* Lbs.	*Sale Average* Rs. a. p.
1951	234,708	1 9 2
1952	187,450	1 6 9
1953	224,478	2 0 1
1954	277,508	2 15 0
1955	314,374½	1 12 10

Tea Market:—The tea market opened with a note of despondency with little demand from overseas buyers. There was, however, some revival of activity in July but buyers were following quality very closely. The demand, however, appeared short-lived and common teas saw a landslide in value. Good quality teas which form a small percentage were readily saleable at satisfactory prices. One line of *Tippy fbop* of the Tea Estate was sold at Rs. 7-1 per lb.

The Government of India effected a change in the procedure of export duty. A slab system was introduced linking the export duty to the weighted average sale price of Indian teas in the London auctions during the previous month. Thus the price of tea and the export duty are fixed at the beginning of every month. The export duty under the new procedure varied from As. 4 to As. 8 per lb. during the year. Further the Government of India on the recommendation of the Tea Auction Committee, curtailed direct shipments to London to 140 million lbs. for the year. This fact coupled with the credit squeeze in U.K. restricted the U.K. buyers from freely operating in the Calcutta Auctions. However, in the month of February 1956, the Government removed the restrictions imposed earlier on direct shipments to London. Though the Government's decision was a belated one, the market revived but it only brought a little relief to the producers as the major portion of their teas was sold out earlier.

The system of alloting quotas at different periods of the year has encouraged speculative activities in the export quota market which is detrimental to the interest of the industry. The price of export quotas varied from As. 5 to As. 9 per lb. during the year and after the final allotment, the price went down to As. 4 per lb.

Estimate for the year 1956: Estimated crop for the year is 320,000 lbs. The price concertina between common and *c.t.c.* teas has further widened this year and it now appears that producers of common teas will have a difficult time. Enforcement of entry tax on tea by the West Bengal Government has further worsened matters and has further increased the cost of production. It was, therefore, decided to manufacture *c.t.c.* teas at the Estate and it is gratifying to note that the new machine which was on order, recently arrived from U.K. and has been brought under commission on and from 31st October 1956. Initial reports on *c.t.c.* manufactured teas are satisfactory.

Accounts in brief were as under:—

Bor Pukhuri Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Williamson Magor and Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The reason's working resulted in a profit on revenue account of Rs. 1,75,419 (Rs. 2,76,288) after providing for depreciation amounting to Rs. 29,888 (Rs. 54,281). After transferring the above profit, making various adjustments, charging labour bonus for 1953-54 and making a provision for labour bonus for 1955 and setting aside for taxation Rs. 7,000 (Rs. 1,20,000) the profit and loss account showed a balance at credit of Rs. 73,920 (Rs. 1,66,285 after placing Rs. 1,00,000 to reserve account and Rs. 2,500 to staff account). From this the directors paid a dividend of 10 (35) per cent. for season 1955 absorbing Rs. 30,000 (Rs. 1,05,000) and carried forward Rs. 43,920 (Rs. 61,285).

The following are comparative statistics of sales for the past three years:—

	Lbs.	*Average sale price per lb.*
1953	535,334	Rs. 2-3-5½
1954	480,636	Rs. 2-13-11½
1955	607,768	Rs. 2-3-5½

The estimates for 1956 provide for a crop of 640,000 lbs. of tea at a cost of Re. 1-11-2½ per lb.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	3.00,000	Block ...	7,13,500

Bishnauth Tea Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Williamson Magor & Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The season's working resulted in a profit on revenue account of Rs. 16,30,680 (Rs. 31,04,781) after providing for depreciation amounting to Rs. 1,25,021. After transferring the above profit, making various adjustments, charging labour bonus for 1953-54 and making a provision for labour bonus for 1955 and setting aside Rs. 3,85,000 (Rs. 12,00,000) for taxation, the profit and loss account showed a balance at credit of Rs. 4,79,359 (Rs. 11,27,131 after placing a total of Rs. 9,65,000 to various reserves) from which the directors paid a dividend of 20 (55 per cent. on the ordinary shares for season 1955 absorbing Rs. 3,30,000 (Rs. 9,07,500) and carried forward Rs. 1,49,359 (Rs. 2,19,631).

The following are comparative statistics of sales for the past three years:—

	Lbs.	*Average sale price per lb.*
1953	3,344,429	Rs. 2-5-1½
1954	3,758,823	Rs. 2-14-5½
1955	3,765,852	Rs. 2-7-1½

The estimates for 1956 provide for a crop of 3,880,000 lbs. of tea at a cost of Re. 1-15-1½ per lb.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	16,50.000	Block ...	31.57.500

		Cash ...	2.28.036
Rs.	1,01,31.697	Rs.	1,01,31.697

Radio and Electricals Manufacturing Co., Ltd.

The directors of the above Company (Chairman and Managing Director: Mr. K. Narayanaswamy, Bangalore) submitted the audited accounts of the Company for the tenth year ended with 31st March 1956.

The working of the Company has resulted in a net profit of Rs. 6,62,098 including the aggregate share of net profits of Energy Meter Section (Rs. 5,23,855) and Plastics Section (Rs. 1,23,044). This profit is arrived at after providing a sum of Rs. 22,000 towards a month's basic salary as bonus for the year 1955-56 to the Company staff. After adjusting the loss of Rs. 4,18,723 brought forward from last year and meeting a provision of Rs. 74,252 for income-tax and Rs. 1,203 representing donations and gifts made during the year, the directors recommend the following appropriations to be made out of the balance of net profit of Rs. 1,67,920.

To declare a dividend of 6 per cent. tax free on 2,44,463 shares of Rs. 10 each absorbing Rs. 1,46,678 and to carry forward to next year Rs. 21,242.

During the year under review 1,179 *Remco* brand radio receivers and 1,614 community radio receivers of the total value of Rs. 4,77,960 were sold. The community receivers were supplied to the Government of India.

Mention was made in the last report about the manufacture of water meters in technical collaboration with Swiss Manufacturers of repute. The directors inform that 1,000 water meters obtained in kit form were assembled and put on the market. The next stage of production of these meters on a large scale importing only such of the components as are not available indigenously will be taken up in the near future.

In regard to the manufacture of Radio components, the Engineer deputed for training in three U.K. Firms with whom the Company has entered into technical collaboration agreements has returned and a programme of production of radio components on a substantial scale has been drawn up.

Operations in the Energy Meter and Plastic Sections entrusted by Government to the Company's Management were satisfactory during the year as is evident from the financial results indicated above.

4. The Dividend when declared will be made payable at the Registered Office of the Company on and after Tuesday the 26th March 1957. The Dividend Warrants will be posted to those Shareholders whose names stand on the Register on the 15th March 1957.

EXPLANATORY STATEMENT ANNEXED TO THE NOTICE

Item No. 4—Mr. Kishore M. Premchand retires by rotation. He is also a Director and Associate of Messrs W. H. Brady & Co., Ltd., the Managing Agents of the Company who are authorised by the Articles of Association and the Managing Agency Agreement to appoint two persons as Directors to the Board. In accordance with Section 261 of the Companies Act, he cannot be appointed as a Director of the Company except by a Special Resolution and in accordance with Section 261. A Special Notice has been received by the Company under the said Section 261 from a member intimating his intention to propose Mr. Kishore M. Premchand as a Director in terms of the resolution mentioned in the said item.

Item No. 5—Mr. Nanabhoy B. Jeejeebhoy is also a Director and Associate of Messrs. W. H. Brady & Co., Ltd., the Managing Agents of the Company. The said Managing Agents are

authorised by the Articles of Association of the Company as well as the Managing Agency Agreement to appoint two persons as Directors to the Board. In order to continue his appointment, a Special Notice has been received by the Company from a member under Section 261 of the Companies Act 1956 intimating his intention to propose at this meeting the resolution mentioned in this item for confirming his appointment by a Special Resolution.

Item No. 7—Sir Joseph Kay, K.B.E., has attained the age of 73 years. He is an Ex-officio Director and Chairman of the Board for the last 36 years. ORIENT PAPER MILLS LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the ORIENT PAPER MILLS LIMITED will be held on Wednesday the 13th March 1957, at 8, India Exchange Place, Calcutta-1, at 2-30 p.m., to consider and, if thought fit, to pass, with or without modification, the following resolutions:—

As an Ordinary Resolution:

1. "RESOLVED that consent of the Company be and is hereby given to the transfer of the Coal Mining Lease dated the 19th August, 1955, granted in favour of the company by the Orissa State Government for a period of 30 years, to the Central India Coal-Fields Limited for the unexpired residue of the said term of 30 years together with the benefits, rights, liberties and privileges and subject henceforth to the payment of the rent reserved by and the performance and observations of the conditions and covenants as contained in the said Lease and payment by the Central India Coal-Fields Ltd. of the actual cost of this Company incurred in connection with the Colliery and that the Directors of the Company be and are hereby authorised to effect the said transfer and to do the needful in this connection."

As A Special Resolution:

2. "RESOLVED that the Articles of Association of the Company be altered in the manner following:

A. For Article 37, the following shall be substituted, namely:

'37. The Company shall have a first and paramount lien upon all the shares (other than fully paid up shares) registered in the name of each member (whether solely or jointly with others) and upon the proceeds of sale thereof for all moneys (whether presently payable or not) called or payable at a fixed time in respect of such shares and no equitable interest in any share shall be created except upon the footing and condition that Clause 14 hereof is to have full effect. And such lien shall extend to all dividends and bonuses from time to time declared in respect of such shares. Unless otherwise agreed, the registration of a transfer of shares shall operate as a waiver of the company's lien, if any, on such shares.'

B. For Article 38, the following shall be substituted, namely:

'38. (a) For the purpose of enforcing such lien, the Board of Directors may sell the shares, subject thereto in such manner as they think fit but no sale shall be made unless a sum in respect of which the lien exists is presently payable and until notice in writing of the intention to sell shall have been served on such member, his executors or administrators or his committee, *curator bonis* or other legal representatives as the case may be and default shall have been made by him or them in the payment of the sum payable as aforesaid for seven days after the date of such notice.

(b) The net proceeds of the sale shall be received by the company and applied in or towards payment of such part of the amount in respect of which the lien exists as is presently payable and the residue, if any, shall be paid to such member, his executors or administrators or assigns or his committee, *curator bonis* or other legal representatives as the case may be.'

C. The word 'three' appearing in line 4 of the Article No. 184 be substituted by the word 'six'."

By Order of the Board,
BIRLA BROTHERS PRIVATE LIMITED,
Managing Agents.

8, INDIA EXCHANGE PLACE,
CALCUTTA, 8*th February*, 1957.

N.B.—A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

ENGINEERING

(*Concluded from page* 320)

The Automobile Products of India Ltd. was formed for the purpose of manufacturing automobiles, but had to give up that project. It later obtained permission from Government to manufacture Lambretta motor scooters, Lockhead brake equipment, Borg and Beck clutches and Firestone brake linings. In December 1955, its programme for the manufacture of a vehicular type diesel engine was approved by Government. The Company has entered into an agreement with Henry Meadows Ltd., England, for the manufacture of 4 D.C.-330 diesel engines in the country. It has imported a few engines and has taken up the manufacture of conversion kits.

The following extract from the Tariff Commission's report is of particular importance in regard to the programmes of both Simpson and Automobile Products:

"While we do not approve of additional projects being sanctioned at this stage for manufacture of diesel engines, we would like to see effective steps taken to meet the growing requirements of these engines during the next few years, if necessary, through imports of built-up engines. As far as we are able to gather, there is a world-wide shortage of diesel engines, and it has not been denied that, owing to difficulties in the supply of raw materials and the unforeseen increase in world demand, some measure of rationing of supplies to the export markets is in existence in the United Kingdom. The position regarding Perkins diesel engines is that production has to be scheduled about 12 months ahead of deliveries, and assurances of offtake are required from indentors to ensure production according to schedule. It would appear that "extraordinary efforts" are required (and being made) to maintain supplies at 1,000 engines per month subject to the above reservations. As regards Meadows Diesel engines, we are informed that Henry Meadows' own production of 300 c.c. type of engine (which has been licensed for progressive manufacture in India) was only at the rate of 25 engines per week in 1955, and is 45 per week in 1956. In 1957, the English Company expects to increase production to 250 engines per month. Its agreement with Automobile Products of India guarantees a supply of 75 per cent. of its production to the Indian market. In these circumstances, while the Indian manufacturers of diesel engines may give assurances of their ability to meet the domestic demand, they may, in fact, find it difficult to do so. It may not be prudent to rely too much on any scheme which involves setting up of substantial additional capacity at the factory of the foreign manufacturer in order to meet Indian demand, especially when the policy is to meet the demand from domestic production within a short period. We, therefore, recommend that the position regarding the future supply of diesel engines should be kept under constant review, and that, if the domestic production of these engines cannot be stepped up in the immediate future, measures should be taken temporarily to obtain additional imports of built-up engines to avoid scarcity."

Trend of Production

The following table shows the number of vehicles produced by the approved manufacturers since 1953:

	1953	1954	1955	1956 Jan.–June
I. CARS—				
(a) *Light Cars*—				
Standard 8/Standard 10	37	449	909	654
Fiat 1100		574	2,173	1,922
Baby Hindustan	21	21	373	194
Hindustan-Landmaster	1,640	2,330	3,878	2,507
Total	1,677	3,374	7,333	5,277
(b) *Big Cars*—				
Standard-Vanguard	301	527	637	123
Dodge/De Soto/Plymouth	307	774	1,403	567
Studebaker	207	277	617	285
Total	815	1,578	2,657	975
(c) *Jeeps*	1,094	2,157	2,777	2,210
Total of all cars	3,586	7,109	12,772	8,462
II. COMMERCIAL VEHICLES—				
(a) *Petrol*—				
Light (less than 3 tons):				
Dodge/De Soto/Fargo	1,023	447	616	460
Studebaker	47	429	1,525	408
Medium (3 to 5 tons):				
Dodge/De Soto/Fargo	407	2,648	1,856	653
Studebaker	987	689	835	783
Total	2,464	4,213	4,832	2,304
(b) *Diesel*				
Medium (3 to 5 tons):				
Tata-Mercedes-Benz	93	120	2,338	2,198
Dodge/De Soto/Fargo	399	399	1,416	1,265
Heavy (above 5 tons):				
Leyland	159	305	796	428
Total	252	824	4,549	3,891
Total of all Commercial Vehicles	2,716	5,037	9,381	6,195
Grand Total	6,302	12,146	22,153	14,657

It will be seen from the foregoing statement that production of automobiles has been steadily rising since 1953. The total production of all types of vehicles increased from 6,302 in 1953 to 12,146 in 1954, 22,153 in 1955 and 14,657 in the first half of 1956. Preliminary figures for the whole of 1956 indicate that total production was over 31,000 vehicles. The production of light cars has increased more than that of big cars and, among trucks, the demand for diesel trucks has outstripped that for petrol vehicles. The output of diesel trucks which was only 15 per cent. of the total production of medium and heavy trucks in 1953 increased to 63 per cent. in 1955 and 73 per cent. in the first half of 1956.

Quality

The Tariff Commission has observed a gradual improvement in the quality of automobiles assembled in India since 1954. It is, however, of the view that, though the current series of Landmasters is of satisfactory quality and represents a great improvement over the previous one which led to a lot of complaints from the users, the Hindustan Motors should tighten up inspection in their machining and assembling shops, arrange for more careful scrutiny of the purchased components and take further steps to improve the quality of their castings. The Commission has also stated that all manufacturers should undertake full responsibility for all the parts fitted to their vehicles, without making any distinction, for the purpose of their warranties, between the parts made by them and those purchased from other sources.

The Commission is of the view that, in the coming years, the demand for commercial vehicles will outstrip that for passenger cars and jeeps and that, among commercial vehicles, diesel trucks have a better future than petrol trucks. It thinks that the manufacturers of petrol truck engines will do well to amend their programme, in view of the growing popularity of diesel vehicles. The Commission is further of the opinion that "the demand for motor vehicles would be much higher than is indicated by the current trends, if effective action were taken to eliminate the various factors which are hampering such demand. Having regard to past history, however, it is hardly realistic to expect these factors to disappear in the near future. . ." Accordingly, it estimates the annual demand for motor vehicles to increase by 1960-61 to 40,000 commercial vehicles, 20,000 passenger cars and 5,000 jeep type vehicles, making up a total of 65,000 vehicles. It expects that about 70 to 80 per cent. of the demand for commercial vehicles would be for the diesel-driven type.

Although the demand for vehicles is thus expected to go up substantially in the next four or five years, the Commission feels that it would be unrealistic to expect even progress in the case of all approved manufacturers of passenger cars. For, as against an annual demand of 20,000 cars by 1960-61, there are as many as seven makes of vehicles to participate in this demand, excluding jeeps, and three manufacturers to supply them. But the economic volume of production for any model of passenger car cannot, according to the Commission, possibly be below 5,000 cars. It, therefore, comes to the conclusion that the volume available for at least some of the approved passenger cars is inadequate and is bound to make the relative projects uneconomical in the long run.

MINERAL BENEFICIATION

A symposium on mineral beneficiation and extractive metallurgical techniques was inaugurated at Jamshedpur last week by Prof. M. S. Thacker, Director General of Scientific and Industrial Research. This four-day symposium, the sixth to be arranged by the National Metallurgical Laboratory, was attended by 110 delegates from all parts of India and several distinguished visitors from the U.K., the U.S.A., and West Germany. In his welcome address, Sir Jehangir Ghandy, Chairman of the Laboratory's Executive Council, pointed out that minerals were being used up all over the world in increasing quantities each year. Since minerals did not admit of replacement, it was important to conserve these "wasting assets." The Planning Commission had, therefore, advocated the adoption of modern techniques of mineral beneficiation, so that inferior off-grade qualities of ore, now largely wasted, might also be put to some economic use. Citing the example of manganese ore, he pointed out that, for every ton of good ore now mined in the country, two tons of inferior ores were thrown away as waste. Much work had already been done to remedy this problem and a pilot plant would shorty be established at the National Metallurgical Laboratory to carry out beneficiation trials.

Apart from manganese, beneficiation could be employed to great advantage in the case of several other minerals, particularly those required for the production of atomic energy. Referring to the mining industries, Sir Jehangir Ghandy said that, although the rapid expansion of ore exports was particularly important in the context of the present need for foreign exchange, domestic processing and utilisation of minerals was a prime necessity for integrated economic development.

Inaugurating the symposium, Prof. Thacker said that better utilisation of India's mineral wealth was vital to the country's industrial development. Techniques and methods for mineral beneficiation were well known, but their application in the conditions obtaining in India posed problems which required continuing research and study.

FINANCE (NO. 3) ACT, 1956—II

By R. K. Dalal, B. Com., F.S.A.A., F.C.A.

[*The following is the concluding portion of the aforesaid article published on pages* 216 *and* 251 *of* Commerce, *dated the* 2nd *inst. In this portion, the author discusses the changes made in the companies' rates of super-tax.*—ED.]

With regard to companies' rates of super-tax, it has been provided as follows:

(1) Companies which have made prescribed arrangement for declaration and payment in India of dividends and for deduction of super-tax from dividends paid to shareholders not resident in India—

(a) for companies referred to in section 23A(9), i.e., companies in which the public are substantially interested with total income not exceeding Rs. 25,000—1 anna 9 pies in a rupee.

(b) other companies—2 annas 9 pies in a rupee.

(2) Public companies not included in (1) (e.g., foreign public companies)—

(a) on income other than dividend from Indian subsidiary—5 annas 9 pies in a rupee.

(b) on dividend from Indian subsidiary—3 annas 3 pies in a rupee.

(3) Private companies not included in (1) (e.g., foreign private companies)—

(a) income other than dividend from Indian subsidiary—5 annas 9 pies in a rupee.

(b) on dividend from Indian subsidiary—3 annas 3 pies in a rupee.

Additional super-tax on dividends distributed by a company in excess of 6 per cent. of its paid-up capital will continue for the financial year 1957-58 with the following alteration in rates:—

(a) Dividends in excess of 6 per cent. but not more than 10 per cent. of the paid-up capital—2 annas in a rupee.

(b) Dividends in excess of 10 per cent. but not more than 18 per cent. of the paid-up capital—4 annas in a rupee.

(c) Dividends in excess of 18 per cent. of the paid-up capital—6 annas in a rupee.

Extra super-tax at two annas in a rupee for companies on the face value of bonus shares issued by them will continue to be levied.

Another most radical change is the provision that the quantum of bonus shares and excess dividend which could not be subjected to additional super-tax during the financial year 1956-57 for want of adequate total income, shall be carried forward to the financial year 1957-58. This is a revolutionary change, for it affects the computation of tax in the next year by—not what has happened or done in that year—but by what has happened in the previous year.

If super-tax is levied on a total income, it must have relation to the total income of that year only. Here an excess of super-tax which could not be levied in the absence of total income is sought to be levied on the total income of the next year.

The tax levy should be in respect of the total income of the year and no tax normally should be levied for a year in respect of the total income of another year. That would not seem to be legal.

This may raise a hare of constitutional arguments for legal pundits, but, meanwhile, the assessee is called upon, by way of taxes, to pay more than the total income itself—a proposition the Bombay High Court has held clearly *ultra vires*, that is, any tax levy shall not exceed the total income itself. To do so is *per se ultra vires*.

Under section 23A it is provided that, if a company is a company in which the public are not substantially interested, it must distribute at least 60 per cent. of the distributable profits; in default, it will have to pay an additional super-tax on the whole amount of its undistributed profits of the year. The rate of non-investment company which was 4 annas is raised to 6 annas in a rupee. The rate for investment company is retained at 8 annas in a rupee as in the previous year.

For companies engaged in an industrial activity, the statutory percentage of 60 per cent. distribution is reduced to 50 per cent.

Under the aforesaid section, if you do not distribute, you pay penalty by way of additional super-tax; if you do, then you must pay excess dividend super-tax. Either way you are sped. There does not seem to be logic in penalising both retention and distribution in the same breath. If the statutory distribution under section 23A entails an excess distribution over 6 per cent. of the paid-up capital; and since the assessee has no volition in the matter, no penal super-tax should be levied. Not to do so, sounds like running with the hare and hunting with the hound—not a very laudable thing for the legislature to do.

INDIAN RAILWAYS DURING 1956

OPERATIONAL EFFICIENCY IMPROVES

By P. C. Mathew

JOINT DIRECTOR, RAILWAY BOARD

TOWARDS the end of 1955, when the busy season for movement of goods traffic commenced, railwaymen all over India were keyed up to the task of handling additional traffic programmed to be moved and for which targets had been set. On account of a favourable monsoon in 1955, agricultural production had increased. Materials for the various multi-purpose projects and expanded industries had to be carried quickly; movement from Bombay, Calcutta, Madras and other ports of imported foodgrains, iron and steel, cement, machinery, etc., had to be stepped up and time was of great consequence. Detailed planning was done at headquarters, regional, district and staff levels. Staff at the lowest rung of the ladder was also made aware of the objectives set for attainment in 1956.

Traffic from the coalfields and from Calcutta industrial area to Uttar Pradesh and the Punjab and Western India has to move through Moghalsarai yard which is the focal point of railway operation in India. The yard at Moghalsarai was designed to move about 1,400 wagons each way. By concentrated supervision and continuous day and night vigil throughout the period, it has been possible to put through about 1,900 wagons each way through this yard during 1956. During certain months, the record has been an average of 2,100 wagons a day. The increased loadings at Moghalsarai yard have been effected without any additional yard facilities and largely through the sustained and enthusiastic effort of the yard and supervisory staff. In recognition of this meritorious work and as a token of commendation, the staff at Moghalsarai have been given an additional privilege pass each and an award of Rs. 5,000 to be utilised for staff amenities.

Wagon Chasing Body Formed

With the additional traffic being carried over the various sections, it became necessary to devise special measures to reduce detention to wagons and engines to the minimum possible. A wagon chasing organisation was developed to keep constant watch on trouble spots like transhipment points and marshalling yards. Experienced and dependable staff were selected as wagon chasers whose main work was to move about the yards and industrial areas where there was heavy detention to wagons.

In normal times, detailed supervision of the transportation work on railways is done at district, divisional and headquarters level, while the Chief Operating Superintendent and the Transportation Cell in the headquarters office closely watch the trend of movement of traffic and take corrective action according to the conditions obtaining from time to time. In view of the heavy increase in passenger as well as goods traffic and the limited resources available, however, it was felt that better results could be obtained by a close watch and daily check by the Railway Board on the day-to-day operation, particularly on wagon movement on the railways. For this purpose, important details of day-to-day working are obtained by wireless or telephone in the Board's office and reviewed by the Transportation Directorate. Difficult problems, particularly of co-ordination with the operating heads, have to be anticipated from the trends of movement and advance orders issued from the central organisation in the Board's office.

The whole picture of wagon movements on Indian railways being readily available, prompt orders are issued without delay and assistance given to individual railways according to need by intelligent interpretation of stock movements, close co-ordination of the day-to-day work and the issue of prompt orders in regard to movements on the vast network of Indian railways. The result can be seen from the satisfactory operating results during 1956.

During 1956, the number of wagons loaded as compared with 1955 increased by 7 per cent. on the broad-gauge and by 9.8 per cent. on the metre-gauge. As a result of increased loading, outstanding registrations decreased progressively and, by the end of October 1956, the total outstanding registrations on the broad-gauge sections were 11,800, representing barely a day's loading. Wagon miles per wagon-day during 1955-56 have increased to 46.3 as compared with 43.3 in 1954-55. This improvement was maintained from April onwards, a record figure of 49.7 miles having been obtained in August 1956.

The statistical figure which indicates the maximum operational efficiency is "net ton-miles per wagon day." Here, the increase from 483 miles in 1954-55 to 519 miles in 1955-56 on the broad-gauge is a substantial improvement. From April 1956 to December 1956, this figure has further increased to 541 miles on the broad-gauge and 203 miles on the metre-gauge.

More Passenger Trains

Although the emphasis in the Second Five-year Plan is on movement of more and more goods traffic, it has been possible to increase passenger train services also to some considerable extent. Passenger train miles during 1956 increased by about 4,700 miles per day as compared with 1955. The *Janata* express train was used to run between Delhi and Madras thrice a week was converted into a daily service from July 1956, and a daily *Janata* express train was introduced between Bombay and Delhi from October. Fully air-conditioned vestibuled trains have also been introduced on a bi-weekly basis between Delhi and Howrah and Delhi and Bombay. A similar service between Delhi and Madras is also being introduced from the beginning of February.

The substantial increase in the volume of traffic handled during the year has been due to a judicious combination of bold and decisive direction and the enthusiasm of the workers at the lower levels. But there is a limit to what can be done by personal efforts. Additional facilities and modern equipment are necessary, so that railways can meet the challenge of the future.

COMPANY REPORTS

(*Concluded from page 332*)

The directors inform that the Government of Mysore have, in their order dated 31st August-3rd September 1956, sanctioned the amalgamation of the Meter Section owned by them with the Company and have enhanced the limit of cash credit loan from Rs. 18 lakhs to Rs. 26½ lakhs as a consequence thereof. Since the paid-up capital of the Company is Rs. 24,44,630 only and the directors cannot, under Section 293 (d) borrow moneys in excess of the aggregate of the paid-up capital and its free reserves, a special resolution permitting the board of directors to borrow up to the limit of Rs. 26½ lakhs cash credit loan sanctioned by the Government of Mysore is being placed before the shareholders for approval.

The new Companies Act, 1956, which came into force from 1st April 1956 contains many new provisions. Under Section 617 of this Act, the Company is termed a "Government Company" by virtue of the Government of Mysore holding sixty per cent. of the share capital. As a result of this change, the auditor of the Company for the year 1956-57 has been appointed by the Government of India under Section 619 of the Act.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	24,84,556	Block ...	15,56,110
Provision for taxation ...	74,252	Stock-in-trade	7,24,774
Liabilities ...	19,56,082	Stores ...	6,409
Profit and loss account ...	1,67,920	Debts, deposits and advances ...	22,04,453
		Investments	15,027
		Miscellaneous expenditure and losses	85,970
		Cash ...	90,067
Rs.	46,82,810	Rs.	46,82,810

Tukvar Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Williamson Magor and Co., Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 31st December 1955.

The season's working resulted in a loss on revenue account of Rs. 1,54,050 (Rs. 5,17,842) after providing for depreciation amounting to Rs. 12,892 (Rs. 18,669). After transferring the above loss, making various adjustments and charging labour bonus for 1953-54 the profit and loss account showed a balance at debit of which the directors carried forward Rs. 2,40,269 (credit of Rs. 65,599 after placing Rs. 2,50,000 to reserve account and Rs. 12,200 to staff account and also paying a dividend of 10 per cent. absorbing Rs. 80,135).

The following are comparative statistics of sales for the past three years:—

			Average sale price per lb.
		Lbs.	
1953 ..	..	668,693	Rs. 2-3-6
1954 ..	..	711,945	Rs. 3-2-5½
1955 ..	..	709,403	Rs. 2-2-4½

The estimates for 1956 provide for a crop of 880,000 lbs. of tea at a cost of Rs. 2-4-11½ per lb.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	8,01,350	Block ...	11,54,000
Reserves ...	2,50,000	Stock-in-trade	4,01,656
Provision for taxation ...	40,419	Stores ...	1,64,515
Liabilities ...	11,62,443	Debts & advances ...	2,38,046
		Cash ...	55,726
		Profit and loss account ...	2,40,269
Rs.	22,54,212	Rs.	22,54,212

N.B.—Figures within brackets relate to the corresponding period of the previous year.

Managing Agents.

BOMBAY, *11th February* 1957.

NOTES IN CIRCULATION CROSS RS. 1,500-CRORE MARK

(*From Our Own Correspondent*)

BOMBAY, *13th February*

Conditions in the short-term money market were extremely stringent during the week under review. The rise in interest rates, following the increase in the Reserve Bank's lending rate against eligible securities two weeks ago, did not bring any fresh supply of funds to the market, where the available floating funds were very much short of the demand. Banks had to resort in a substantial measure to borrowing from the Reserve Bank and the State Bank of India.

The cut in Bank rate in the U.K. has not improved the position of exchange banks in respect of getting their requirements of funds. For the interest rates in Britain are still much higher than in India. It has, however, reduced the cost of whatever they used to borrow from London, after exploring all avenues of supplies in India.

Inter-bank call money continued to be placed at 3½ per cent. House money at call, as also short-term deposits for one to six months, fetched 4 to 4½ per cent.

A sharp expansion of Rs. 25.63 crores in notes in circulation is disclosed by the Reserve Bank of India statement for the week ended 8th February 1957, bringing the total rise for the last two weeks to Rs. 34.12 crores. With the rise noted during the week under review, notes in circulation have exceeded the Rs. 1,500-crore mark to stand at Rs. 1,519.65 crores. This falls short of the peak of Rs. 1,525.88 crores recorded on 11th May 1956 by a little more than Rs. 6 crores. But at the present rate of expansion, this all-time peak will soon be crossed in the current year.

Notes held in the Banking Department have declined during the week under review by Rs. 7.54 crores, with the result that the increase of Rs. 18.09 crores in total notes issued is covered by a rise of Rs. 20 crores in the rupee securities and a contraction of Rs. 1.91 crores in rupee coin. In the Banking Department, deposits of the Central Government show a fall of Rs. 1.33 crores, deposits of other Governments Rs. 3.15 crores, and of banks Rs. 3.74 crores. Deposits of others have risen sharply by Rs. 28.38 crores. On the assets side, balances held abroad have gone up by Rs. 28.32 crores. This is apparently due to the receipt of the first instalment of credit from the I.M.F. amounting to Rs. 28.56 crores (the equivalent of $60.00 million) on the 7th inst. It looks as though a small part of this credit has already been spent. Loans and advances other than to Governments have risen by Rs. 15.76 crores, of which outstanding advances to banks against usance bills account for Rs. 8.75 crores. There have been fresh borrowings by banks against these bills during the week to the tune of Rs. 21.33 crores and repayments of maturing bills have been of the order of Rs. 12.58 crores. There has been a reduction of Rs. 14.71 crores in the Reserve Bank's investment portfolio.

The Scheduled banks' statement for the week ended 1st February 1957 show that the rising trend in banks deposits has been maintained with a further increase of Rs. 8.68 crores in demand deposits and of Rs. 2.44 crores in time deposits. Borrowings from the Reserve Bank are up by Rs. 6.36 crores. Advances have gone up by Rs. 12.06 crores, and bills purchased and discounted by Rs. 2.61 crores. Cash balances also have risen by Rs. 2.88 crores.

The Gilt-edged market ruled dull during the week under review. Though many issues were on offer, prices were fairly well held, except in one or two cases. In the absence of any buyers, the volume of business was on a small scale. 3 per cent. 1986 Conversion Loan provided a feature with a rise of As. 2 to Rs. 93-10 due to short covering. 3 per cent. 1970-75 gained an anna to Rs. 87-1, at which level it attracted sellers. 3 per cent. 1966-68 was unchanged at Rs. 92-4 and 3 per cent. 1964 at Rs. 94-6. 3 per cent. 1963-65 was on offer at Rs. 94-3. 3 per cent. 1959-61 was an anna better at Rs. 97-12 due to proximity of voucher. 3½ per cent. 1962 had sellers at Rs. 97-13, and 3½ per cent. 1961 at Rs. 99-7, while buyers offered Rs. 99-6½. 3½ per cent. 1964 lost an anna to Rs. 98-5 and 3½ per cent. 1965 As. 2 to Rs. 98-3. 3½ per cent. 1967 held its own at Rs. 98-7. State loans were all on offer at quoted rates.

Government promissory notes of the following loans, interest on which falls due for payment during March 1957, will be accepted by the Public Debt Office, Reserve Bank of India, Bombay, for payment of interest from the 15th February 1957.

Central Government Loans: 3 per cent. Conversion Loan 1946, 4 per cent. Loan 1960-70, 2½ per cent. Loan 1976. *State Government Loans*: 3 per cent. Loans 1960, 2½ per cent. Loans 1961, 3½ per cent. Loans 1962, 4 per cent. Loans 1967 and 4 per cent. Loans 1968.

Holders of the above loans are advised to lodge their securities well in advance of the due dates to facilitate delivery of the securities and interest warrants on the due dates.

In view of the heavy work involved, the period for delivering securities tendered for payment of interest will be extended to four clear working days.

In the foreign exchange section, the rupee ruled a shade weaker in terms of U.S. and Canadian dollars. Banks' selling rate of U.S. dollars rose from Rs. 478 to Rs. 478½ per $100 and their buying rate from Rs. 474½ to Rs. 475 per $100. Banks were sellers of Canadian dollars at Rs. 500½, as against Rs. 500 per $100 a week ago, and buyers at Rs. 494½, as against Rs. 494. This is only in consonance with the trend of sterling abroad. Thus, in New York, spot sterling dropped from $2.79.13/16-2.79.15/16 to $2.79½-2.79¾. Three months' forward came down from $2.79-2.79¼ to $2.78.15/16-2.79.1/16. Transferable sterling receded from 276.75-276.85 cents to 276.60-276.70 cents.

SHARP FALL IN SILVER

(*From Our Own Correspondent*)

BOMBAY, *13th February*

The bullion market displayed a downward trend during the major part of the week under review, in distinct contrast to the sharp rise noted in the previous week. Today, however, the declining trend was reversed, when both silver and gold staged a sizable recovery. Nevertheless, on balance, silver was lower over the week by Re. 1-12 in the ready position and by Re. 1-14 in the current settlement. Gold, on the other hand, was fractionally higher over the week.

The recession in silver till the fag end of the week was due to nervous liquidation by bulls and absence of fresh support, following reports that a fresh consignment of Tibetan coins, equivalent to over 100 bars, had arrived in Calcutta. Fears of further receipts of silver coins chilled the enthusiasm of bulls who had been fostering the hope that import of coins from Tibet would soon stop on account of severe winter and had been rigging up the market for some weeks past. The bears now seized the opportunity to turn the market in their favour. Consequently, the carry forward charges, which were against bulls up to Thursday last week at As. 3½ to As. 4½, turned in their favour on Friday to As. 2 to As. 3 and subsequently widened to As. 6½ to As. 7½ yesterday. Today, however, they were lower at As. 5½ to As. 6¼. This shows that the volume of short-sales must have risen substantially after Thursday last week. The hardening of prices today was due to reports that the earlier expectations of further arrivals of coins had not materialised.

In sympathy with silver, gold also ruled quiet during the major part of the week. However, the continued anxiety over the Kashmir situation and fairly good demand in the ready position *vis-a-vis* the arrivals checked the pace of recession. A substantial drop in arrivals today and good demand from Madras and Calcutta pushed up the price today to an extent which more than made good the earlier loss.

Forward silver (15th February settlement) retreated from Rs. 186-1 to a low of Rs. 182-7 yesterday, before hardening today to Rs. 184-3. The next settlement (16th March) declined from Rs. 186-4 to Rs. 182-4, but part of the recession was regained today, when it closed at Rs. 183-13.

Ready silver closed at Rs. 184-13, after having drifted down from Rs. 186-9 to Rs. 183-2. The premium of ready over the current settlement widened from As. 8 to As. 10 and that over the next settlement from As. 4 to Re. 1. Such widening reflects the scarcity of floating stocks and the heavy short sales. The floating stocks of silver are reported to be 1,200 bars. The daily average offtake was 20 bars.

Gold for forward delivery (14th February settlement) moved down from Rs. 108-7 to Rs. 107-11, but rallied to close today at Rs. 108-11. The next settlement (15th March) gave way from Rs. 108-12 to Rs. 107-9 before recovering to Rs. 108-6 today. The carry forward charges which stood at As. 5 in favour of sellers at the close of the previous week turned against them this week and were quoted As. 5 to As. 6.

Ready gold finished at Rs. 109, after drifting lower from Rs. 108-8 to Rs. 108. As in the case of silver, the premium of ready over the current settlement widened from As. 2 to As. 5 and that over the next one from *nil* to As. 10. The floating stocks of gold are estimated at 30,000 tolas. The daily average arrivals were 2,500 tolas, while the offtake was 4,500 tolas.

New York silver price was unchanged at 91⅛c. while, in London, spot and forward silver dropped ¼d. to 79¾d. and 79½d., respectively. London gold, on the other hand, climbed from 249s. 4d. to 249s. 6d.

The following comparative table shows the trend of market during the week under review:

	13-2-1957	Highest	Lowest	6-2-57

LINSEED DECLINES FURTHER

(*Messrs. A. Bradley and Co.*)

CALCUTTA, *11th February*

There was a further notable decline in linseed prices and trading was very restricted. Sellers were discounting prices, particularly for forward delivery, in anticipation of lower levels in the near future when new crop supplies begin moving. Buyers were cautious for many reasons. An excellent crop, together with a carryover from last season, resulted in a bearish outlook. The conditions prevailing in the oil market were also stagnant. Crushers were working on a very limited scale, and with fair stocks of oil in hand, they were pressing sales at lower prices. The continued drop in overseas prices permitted no prospect of fresh business.

The latest quotations are: February Rs. 23-8 and April/May Rs. 21 per maund.

COTTON FUTURES BUOYANT

(*From Our Own Correspondent*)

BOMBAY, *13th February*

The most important development of the week in the cotton market was the issue of the directive by the Forward Markets Commission (F.M.C.) to the Board of the East India Cotton Association asking the latter to alter the marginal line and the rates at which deposits are calculated for payment into the Clearing House. The alterations suggested by the Commission are as follows:

A deposit of Rs. 50 per bale shall be payable if the price of the hedge contract rises above Rs. 70 (instead of Rs. 25 as at present) below the ceiling price.

A deposit of Rs. 35 per bale shall be payable if the price of the hedge contract rises above Rs. 95 (instead of Rs. 50 as at present) below the ceiling price.

A deposit of Rs. 25 per bale shall be payable if the price of the hedge contract rises above Rs. 120 below the ceiling price. The present marginal line with reference to the floor price shall, however, remain unchanged.

The new margins are evidently proposed to check any undue rise in prices of cotton futures. The reaction of the market to the Commission's directive has somewhat been strange, in that there has been a spurt in prices. This is because the bearish implicatons of the tightening up of the margins are not sufficient to offset the effect on market sentiment of the export quota of 200,000 bales announced last week-end. Another helpful factor was provided by fears of damage to the quality of the crop as a result of cold wave in the leading cotton tracts.

The uncertainty regarding By-laws 55 and 61 of the E.I.C.A. has been removed, as the Board has now decided not to make any changes in them. It proposes to run hereafter four contracts simultaneously, instead of the two contracts as at present. Transactions in the May and July contracts of Jarilla and the June and August contracts of Vijay are expected to commence shortly after the permission of the F.M.C. is received. The Board has also decided to make minor technical adjustments in Jarilla A and B descriptions. Further, the weightage in respect of Madhya Bharat Jarilla, Khandesh Jarilla and Moglai Jarilla shall be 9¾ per cent., while that in respect of other varieties tenderable against both the contracts shall continue to be 6¼ per cent. It has also been decided that a Rejection Box be prepared for Jarilla and Punjab growths on the basis of the average quality of the crop of the season and that cotton up to that standard be tenderable with an "off" allowance to be fixed by the Board.

The export quota announcement imparted considerable firmness to the cotton futures market during the week under review. Jarilla (March delivery) opened the week higher at Rs. 676, as against the previous close of Rs. 668, and advanced to Rs. 681-8 the same day. The contract gathered fresh support, thanks to reports of cold wave causing damage to the crop, and touched a high of Rs. 697 yesterday. It was, however, a shade lower at Rs. 692 today. The net gain over the week was Rs. 24.

Fluctuations in Vijay April delivery were comparatively wide. Opening at Rs. 781, as against the previous close of Rs. 771, the contract fluctuated violently on alternate bouts of buying and selling, but maintaining on the whole an upward trend, touching Rs. 825 on Monday. After declining to Rs. 795 on the same day, following speculative sales, it again improved to Rs. 825 before closing at Rs. 818. The net gain over the week was Rs. 47.

The following is the trend of prices of the two contracts during the week:

(In rupees per candy of 784 lbs.)

	13-2-57	*High*	*Low*	6-2-57
Jarilla (March) ...	692	697	670	668
Vijay (April) ...	818	825	770	771

The spot section was also active. Mill interest was centred mostly round 0394, 197/3 Punjab and Jarilla and a fair volume of business was reported in these varieties. Following the quota announcement, the prices of all exportable varieties went up. In view of the fact that the monetary ceiling in respect of import of U.S. cotton had been reached, there was no activity in that style. Licences are now available only for eligible sterling area cottons. It is hoped that the Government will make available, early enough, further quotas for import of U.S. cotton. The latest available spot rates—in rupees per candy of 784 lbs.—are given below:

Bengal *Deshi* 735; Berar Jarilla 775; Khandesh 795; Vijay 945; Oomra *Deshi* 795; Moglai 750. *Delivery Contracts*: Vijay 13/16 145 'ON' Vijay.

The Karachi market ruled easy during the week. The easiness was due to the release of 200,000 bales of cotton for export by the Government of India. It was feared that foreign countries like China and Japan, which had lately been in the market, would now buy less of Pakistan cotton. There were, besides, reports that Hong Kong, which usually purchases a sizable portion of Pakistan cotton, had contracted to buy 60,000 bales of American cotton. These factors let loose a selling spree which brought down cotton prices. March contract fell to Rs. 79-12 from the last week's closing of Rs. 83-1 and the May position slumped to Rs. 79-14. The spot rates of cotton also registered a marked decline. The latest available rates —in rupees per 82 lbs.—for a few popular varieties of Pakistan cotton are given below:

Sind *Deshi* 89; Punjab *Deshi* 81; 4F Roller 85-2; S.G. 88-10; Punjab Roller 86-10; S.G. 90-14; 289 N.T. Roller 84-10; 289F N.T. Sind S.G. 91-10; 289F Punjab Roller 89-2; 289F Punjab S.G. 102-10.

In contrast to the firm trend noted last week, the Alexandria cotton futures market presented easy conditions during the week under review.

Trading was slow, with narrow fluctuations in prices. Trade covering and professional support noted last week following reports of a big cotton deal with Russia abated and values suffered a setback. Export sales from 1st September to 15th January aggregated 310,632 bales (of 730 lbs.), as compared with 593,582 bales during the same period last season. The following are the latest available rates—in tallaris per lb.—from Alexandria:

Karnak: March 120.70; May 119.90; July 118.95. *Ashmouni*: February 87.20; April 86.05; June 85.85.

There was a drop in cotton values in the Liverpool market during the week. Trading in both American and the American type contracts was slow and prices moved within a narrow range. Demand was very slack, as local spinners had sufficient stocks to meet the requirements for several weeks. Arrivals of American cotton continued to be heavy. It was felt that, unless there was some improvement in the textile situation, demand might not revive to any appreciable degree in the immediate future. Reports of proposals for replacing the U.S. current export programme based on the competitive bid by a direct export subsidy gave rise to further uncertainties regarding U.S. cotton policy and, consequently, traders were hesitant to enter into large commitments. Egyptian Karnak was neglected and nominally unchanged, while Sudan Lambert Seed contract remained steady. The release of a further export quota by the Government of India, however, revived interest in Indian cotton. The following are the latest available quotations—in pence per lb.—from Liverpool:

American cotton 1" staple contract: March-April 26.03; May-June 25.83; July-August 25.44; October-November 24.99. *American cotton mixed growth contract*: March-April 26.30; May-June 26.03; July-August 25.60; October-November 25.15; December-January 24.99. *Egyptian Karnak*: March-April 60. *Sudan Lambert Seed*: May-June 45.00; July-August 44.00.

Sizable gains in prices were recorded in the New York cotton futures market during the week, thanks to good trade and commission house buying. The spot market was firm on tight free market supplies, owing to large entry into the loan programme.

The U.S. Secretary of Agriculture has announced the support prices for the 1957 crop. Prices are the minimum at which the Department of Agriculture will support commodity prices this year and are lower than the minimum prices in effect during 1956. The minimum price for 1957 cotton will be 28.15 cents per lb. gross weight on the basis of Middling $\frac{7}{8}$" cotton at average location. This compares with the 1956 support price of 29.34 cents.

The Bureau of Agricultural Economics has announced the mid-January parity price as 36.56 cents per lb. If the usual practice is followed, this will be the basis for the interim and minimum loan rate for the next season. Some quarters anticipate that the new loan rate may be based between 78 and 81 per cent. of parity as compared with the basis of 82½ per cent. of parity for the present crop. The mid-January parity figure, however, is one cent per lb. higher than the mid-July parity price on which the present loan rate is based. It will be recalled that the mid-January 1956 parity price was 34.84 cents on which a preliminary and minimum loan rate of 32.25 cents per lb. for Middling 1" cotton was announced. The mid-July 1956 parity rate was 35.56 cents, higher by 72 points than the mid-January 1956 parity price. Accordingly, the present loan rate was finally fixed at 32.74 cents per lb. for Middling 1" cotton—an increase of 49 points over the preliminary figure. It is reported that trade attention is presently focussed on a statement by the Secretary of Agriculture, Mr. Benson, that the Department of Agriculture is about to decide on whether to continue the present competitive bid programme for Government sales of cotton for export or shift to an export subsidy. While the National Cotton Council is in favour of continuing the present competitive bid programme, the cotton exchanges prefer an export subsidy.

The following are the latest available quotations from New York, as compared with those of a week and a fortnight before:

(In cents per lb.)

	12-2-57	5-2-57	30-1-57
Spot	35.55	35.40	35.15
March	35.38	35.20	34.83
May	35.29	35.07	34.81
July	34.70	34.52	34.32

SUGAR EASY

(From Our Own Correspondent)

BOMBAY, 13*th February*

The sugar market continued to depict an easy trend and there was a further fall in prices during the week under review. Stocks of sugar available were plentiful, thanks to heavy arrivals, aggregating 22,800 bags, as against 18,600 bags in the previous week and 10,600 bags two weeks before. Some parcels of sugar were reported to have been sold in distress. The drop in prices would have been marked but for rumours of an additional export quota and good demand from Malabar side where large-scale evasion of sales tax is alleged to be practised. A section of sugar traders in Malabar, it is said, is anticipating that the inter-State sales tax would definitely come into force with effect from 1st April next.

Large grain indigenous sugar fell by a rupee to Rs. 91-Rs. 98 per bag (including sales tax). Medium grain receded from Rs. 89-Rs. 91 to Rs. 89-Rs. 90. Small grain was dull at Rs. 88.

Fagan delivery contract for 'C' grade sugar declined from Rs. 91-8 to Rs. 90-14 but recovered to Rs. 91-4 today. The recovery was aided by rumours of a possible additional export quota of sugar.

YARNS BEARISH

(From Our Own Correspondent)

BOMBAY, 13*th February*

A bearish trend was in evidence in the yarn market during the week under review. Despite favourable reports from consuming centres, there was selling pressure, as holders were somewhat busy reducing their stocks following tightness in money market. Even expectations of enlarged seasonal demand in the coming weeks failed to induce support to the market. Consequently, yarn values continued their downward march.

Snia rayon yarn (120 dull cones) for February delivery was pushed down by Rs. 11 to Rs. 786. 150 Bt. cones April delivery declined by Rs. 4 to Rs. 653. In the spot section, 120 Italy and 150 Italy lost 6 pies each to Rs. 4-1 and Rs. 3-11, respectively. 150 Japan, however, gained an anna to Rs. 4-7-6 and 120 Japan rose by 18 pies to Rs. 4-6-6. Among indigenous yarns, National Rayons 150 Bt. cones first grade was done at Rs. 3-6. 120 Bt. cones first grade was dull at Rs. 3-11-6.

In the staple fibre yarn section, (40×2) April delivery dropped Rs. 8 to Rs. 654. February delivery was lower at Rs. 649, as against Rs. 656 last week-end. Among spot indigenous yarns, (40×2) Citys declined by half-an-anna to Rs. 3-6-6. New Greats shed 3 pies to Rs. 3-6. Centurys lost a like amount to Rs. 3-7-3. Kohinoors remained quiet at Rs. 3-8. Deals in foreign yarns (80×2) were put through at reduced prices, Paramounts receding by 21 pies to Rs. 5-4-3 and Fujis by an anna to Rs. 5-6-6.

Offtake in cotton yarns continued to remain poor, due mainly to reports of accumulation of handloom cloth in several markets. Among 10 counts, Moderns shed As. 2 to Rs. 15-6. Podars fell by As. 4 to Rs. 15-4. 20s Maduras and Gokaks were unchanged at Rs. 21-12 and Rs. 18-12, respectively. Among 40s, Minaxis fell by As. 2 lower to Rs. 27-3. Moderns and Gokaks remained dull at Rs. 28-8 and Rs. 27-8, respectively. Among 60 counts, Moderns, Raghuvamshis and Finlays were unaltered at Rs. 63, Rs. 57-12 and Rs. 61, respectively. Eighty counts Moderns were subjected to selling and decreased by As. 8 to Rs. 77. Mahendras were neglected at Rs. 75.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	13-2-1957	6-2-1957
	Rs. a.	Rs. a.
Art silk yarn **(per case of 200 lbs.)—**		
150 Dull Coms Snia February	798 0	797 0
150 Bt. Cones April	653 0	657 0
120 Japan (per lb.)	4 6½	4 5
150 Japan (per lb.)	4 7½	4 6½
120 Italy (per lb.)	4 1	4 1½
150 Italy (per lb.)	3 11	3 11½
Staple fibre yarn **(per case of 200 lbs.)—**		
40 x 2 February	649 0	656 0
40 x 2 April	654 0	662 0
40 x 2 New Great (per lb.) ..	3 6	3 6½
40 x 2 Century (per lb.) ..	3 7½	3 7½
40 x 2 City (per lb.)	3 6½	3 7
Cotton yarn **(per bundle of 10 lbs.)—**		
10s Podar	15 4	15 8
20s Madura	21 12	21 12
40s Gokak	27 3	27 3
60s Finlay	61 0	61 0
80s Modern	77 0	77 8

OILSEEDS IRREGULAR

(From Our Own Correspondent)

BOMBAY, 13*th February*

The oilseeds market ruled irregular during the week under review. It showed signs of recovery from the previous week's inactivity on the first day of the week under the spell of the spurt in cotton futures. The market, however, did not make much headway during the two following days, especially in castor, linseed and cottonseed, because of discouraging overseas advices. But the groundnut section continued to be steady as a result of the support lent by the millers. On the 11th inst., the market staged a slight rally on reports of bad weather conditions in Gujerat. But the recovery was short-lived, especially in castorseed, owing to profit-taking. Yesterday and today castors weakened further on reports of favourable weather conditions in Gujerat and lack of foreign advices. Groundnut, however, maintained its level on millers' support. Linseed and cottonseed moved in sympathy with castorseed. The undertone of the market was firm at the close today.

In the groundnut section, February contract opened the week at Rs. 167-12 and touched the same day the highest level of the week at Rs. 169-12 before closing at Rs. 168-4. Subsequently, however, the contract fluctuated between Rs. 168-2 on 8th inst. and Rs. 164-14—the lowest witnessed—on 11th inst. On enquiries, it improved to Rs. 167-14 today, before closing at Rs. 167-8. May contract displayed similar trend. Opening at Rs. 166-4, it climbed up to Rs. 168-8 the same day, but declined to Rs. 163-12 on the 8th inst. During the following days, the contract displayed again irregular movements. It touched the level of Rs. 167 on the 11th inst. but declined to Rs. 162-10 today before finishing at Rs. 164-14. While the February contract was higher by As. 8 over the week, the May contract lost As. 12. In the spot section, Bold F.A.Q. shed As. 6 to Rs. 33-10. Groundnut oil ex-mill was nominally lower at Rs. 18-8.

The linseed May contract varied between Rs. 29-12 on the opening day and Rs. 28-12 on the 12th inst. It closed today at the same level. Bold ready was done As. 8 lower at Rs. 30-12. Linseed oil ready declined by a rupee to Rs. 17.

The castor futures section, however, suffered a substantial decline in prices. September contract opened at Rs 157-8 and moved up to Rs. 159 the same day. On the 8th inst., it receded to Rs. 154-12, but recovered again to Rs. 159-12 on the 11th. Owing to profit-taking, however, it reacted the same day to Rs. 155-8 and further to Rs. 151-4 today. Over the week, the loss was no less than Rs. 4-4. In the spot section, Kanpur shed As. 4 to Rs. 32-8. Oil B.S.S. was quoted at Rs. 19-12, that is, As. 8 less than a week ago.

Cotton futures February contract reflected irregular movements. Commencing the week at Rs. 101-8 and rising to Rs. 102 on the following day, it declined to Rs. 99-8 on the 9th inst. but improved to Rs. 101 on the 11th. It, however, reacted on 12th and today, having closed the week at Rs. 97-8. May contract, again, touched the peak level at Rs. 103 on the opening day, but subsequently reflected a steadily declining trend before closing at Rs. 98-8 today. Over the week, it lost Rs. 98-8.

Among others, *kardi* seed Bold remained the same as a week ago at Rs. 21-8. *Niger* seed Madras fell by As. 12 to Rs. 28-12.

The following table shows the prices of oilseeds and oils at close as compared with those at the close of the previous two weeks:

	13-2-1957	6-2-1957	30-1-1957
	Rs. a.	Rs. a.	Rs. a.
Groundnuts—			
February 1957	167 8	167 0	168 8

Ready	17 0	18 0	19 0

BLACK PEPPER GIVES WAY

(Messrs. Parekh & Co.)

BOMBAY, 13*th February*

Malabar black pepper ruled easy during the week under pressure of liquidation of February delivery by bulls, as the final due date was drawing nearer. New York having reduced its buying price, the market at Alleppey and Cochin also gave way, though Northern Malabar was comparatively steady.

Alleppey was quoting from Rs. 556½ to Rs. 575 according to quality, while garbled was quoted from Rs. 95 to Rs. 97½. Arrivals of Russian steamers at Malabar ports having been delayed, those traders who were in the market for purchasing long forward as a hedge stood back. The necessary support was, therefore, lacking.

Singapore, after declining to Str.$77, improved to Str.$80 with little anxiety on the part of packers to press sales. The reports regarding the size of new crop Sarawak are conflicting. Some Chinese firms who have got firsthand information from the Chinese planters are more emphatic that the new crop will be small during the season. But it is too early to believe such reports. Traders are treating all estimates, whether small or large, with reserve.

In view of the impending Dock strike, spot in New York improved to $0.29, with sellers unwilling to give concession, pending a clear picture of the contemplated strike. February was done at as low as $0.24½, while March was traded up to $0.24½. April-May-June was done at $0.25. February delivery continued to mark down and is now quoted at Rs. 552.

Today's nominal quotations are: Ready delivery Rs. 80 per Bengal maund; February Rs. 552-Rs. 557 and March Rs. 561-Rs. 566 per candy of 5½ cwts.

TEAS DEARER

[Messrs. Forbes, Ewart & Figgis (Private) Ltd.]

COCHIN, 7*th February*

Offerings amounting to 1,900,000 lbs. were catalogued in Sale No. 3, which was held on Tuesday, 5th February. Quality again showed improvement, particularly amongst the low medium and medium teas, many of which were brighter and thicker in cup. The sale opened to a very strong demand for the medium and low medium teas. Broken grades advanced by As. 3 to As. 4 per lb., whilst similar fannings were an anna to As. 2 dearer, despite the fall in export duty. Good medium and best liquoring teas met with a quieter demand and prices were rather irregular. Teas with flavour advanced on last rates, but plainer types were in less demand. Whole leaf grades were fully firm. The following are the quotations:—

	1957 Rs. a. p.
Plain B.P.	2 1 8
Low medium B.O.P.	2 6 0
Medium B.O.P.	2 8 0
Good B.O.P.	2 12 0
Well made black leaf O.P.	2 7 0

The combined average price realised in sale No. 3 was Rs. 2-8-3 per lb. as against Rs. 2-2-11 fetched in the corresponding sale of last year.

London Market: *Sale of 4th February 1957*:—Good teas firm. Others irregularly 2d. to 4d. lower.

Sale of 5th February 1957:—Good teas firm. Others irregularly 1d. to 3d. lower.

Colombo Market:—Strong demand for low growings, including gulf types. Also medium slightly dearer rates. Highgrown brokens lower, except small selection best quality. High and medium fannings dearer. Off grades generally steady.

Calcutta Market: *Export*.—Except for improved liquoring sorts some whole leaf grades and more useful fannings, market irregularly one anna to As. 2 lower.

Internal.—23,000 dust. Good demand. Strongest feature best C.T.Cs and black exportable types which were generally firm to dearer. Medium Assams and dooars slightly dearer. 2,000 leaf. Good demand fairly firm rates.

Export Duty.—The "price of tea" for the month of February has been fixed at As. 3-15-0 and consequently the duty falls to As. 6 per lb.

Export Quota.—After advancing to 46 pies, the market fell away and there are now buyers at 39 pies, at which figure business has been done.

Forthcoming Auctions.—Sale No. 4 will be held on Tuesday 19th February.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Dust Sale D*:—350,000 lbs. good general demand. Commonest and best liquoring steady. Others irregularly one anna easier.

TEAS FOR EXPORT QUIET

(From Our Own Correspondent)

CALCUTTA, 12*th February*

Quiet conditions prevailed during the tea export sales held yesterday. Such a trend was in full accord with the conditions in the recent sales in Mincing Lane and in other centres of world auctions. In the London sales on 6th February, prices of the best teas fell by 2d. per lb. and those of the poorer medium varieties by 3d to 4d. per lb. However, in the earlier sales on 4th February, it was noted that good liquorings were maintained while all other teas were in poor demand.

A *Reuter* report reviewing the sales for the week ended 2nd February in Djakarta stated that, in spite of the quantity offered being small, at 1,500 packages, in view of the Chinese new year celebrations, prices of better teas gave way, while the rates for low growns were maintained steady. On the other hand, it was noted that a strong trend was in evidence in the Colombo sales held on 5th February. Prices of the best liquorings, and high and medium grown fannings were higher.

Opening on an irregular note, last week's internal auctions in Calcutta witnessed a rise in prices as the sale progressed. Dusts on offer amounted to 18,533 chests. Improved orthodox Assams, on good demand, realised higher prices, while the prices for the small powdery kinds were maintained. The strongest feature of the sales was the bright liquoring C.T.C. Assams which were fully firm. Black teas suitable for export were firm for a time after opening, but eased subsequently. On the other hand, Dooars and commons opened one anna easier, but firmed up at closing time. The rates were: Best Assam C.T.C. Rs. 2-10, medium Assam C.T.C. Rs. 2-2, medium Assam grainy dust Re. 1-14, and medium Dooars Re. 1-13-6.

Leaf teas offered aggregated 2,120 chests. Demand was good and prices were firm.

Yesterday's export offerings amounting to 65,236 chests met with good demand. Prices, however, tended to be lower. Prices of C.T.Cs gave way by one anna, but a few lots of the best liquoring types were maintained at firm rates. "Teas for price" displayed an irregular trend and were noted for an occasional fall by ½ to 1 anna. Common and medium teas possessing plain liquors eased by one anna, while broken grades recording a similar feature met with better demand. In strong demand, well-made and stylish whole leaf grades recorded an upward tendency, while teas with poorer appearance moved down by As. 2. The strongest feature of the sales was provided by bright liquoring teas which met with competition and, therefore, moved up. Darjeelings eased by As. 2 to As. 4. Stylish tippy teas were about firm. The quotations were: best C.T.C. Assam B.P. Rs. 2-8 (nominal), medium Assam B.P. Rs 2, clean black pekoe Rs. 2-4 and plain B.P Re. 1-15.

Export quota rights changed hands at 36 pies per lb. Subsequently, sellers raised the rate to 37 pies, but buyers withdrew, offering only 35 pies.

JUTES WEAK

(From Our Own Correspondent)

CALCUTTA, 12*th February*

A further decline in the prices of raw jute and manufactured goods was the feature during the week under review. The fall in the former was attributed to (1) the disinclination of mills to purchase the fibre at current rates, (2) increased arrivals from the mofussil centres, and (3) adequate stocks with mills, while that in the latter occurred consequent on the lack of business for export in fair quantities and on the announcement of a sizeable increase in stocks of all constructions with mills. At the end of January, mills possessed as much as 104,100 tons of goods, and this represented an increase of 8,400 tons over the previous month. Hessian was higher at 23,900 tons, as against 19,700 tons at the end of December, sacking at 68,500 tons, as against 64,700 tons, and miscellaneous goods at 11,700 tons, as against 11,300 tons. That foreign buyers are falling back on their stocks built up during recent months and are not entering into fresh commitments is clearly indicated in the shipment figures available for the first five days of February. Sacking shipped amounted to 5,500 tons, as against 8,700 tons for the corresponding period in January. Hessian shipped, at 7,700 tons, was lower by 8,000 tons.

The fall in the prices of raw jute has not been significant towards making mills work economically. Although the report from the United States stating that a substantial increase was recorded in the consumption of burlap for making bags in the nine months to September last, as compared to the same period in 1955, made cheerful reading, reports from other consuming countries have revealed that substitutes and bulk handling methods continue to be serious threats to jute goods. From Great Britain comes the news that an economy in consumption of bags is being effected by sending supplies to retailers and farmers in lorries. The bulk of the raw material supplies to mills in Dundee and other countries go from East Bengal, where the minimum export prices are maintained at a high rate. While this factor places the Calcutta-produced goods with the indigenous jute at a distinct advantage in world markets, countries such as Brazil where jute mills are fed with their own raw material, either in full or in part, have learnt the wisdom of meeting their baggage requirements from within the country, which are cheaper than imports.

Such a feeling in foreign countries can be stemmed and attempts at the expansion of the bulk handling methods and the use of substitutes put a stop to, if only Pakistan reorients its export policy on raw jute. On the other hand, strenuous attempts are being made by the Textile Manufacturers' Association in the United States to combat the use of paper and bulk-handling, and the Association is spending $60,000 during the current year on the bag promotion programme. Noted with great interest in Calcutta trade circles is the American report, quoted in the *Jute Bulletin* of the Indian Central Jute Committee, that the 50-lb. potato burlap bag has become very popular with farmers and that its use during the nine months ended September 1956 recorded an increase of 50 per cent. Substantial increases were also reported in the use of burlap bags for meal and fertiliser, and considerable satisfaction is expressed on the returnable burlap bag programme particularly in the farm belt.

During the week under report, New Delhi invited tenders for a further quantity of 11,000 bales of B. twills. Although this led to an initial improvement in the prices of heavy goods, the fact that the quantity fell shorter than earlier expectations soon reversed the trend. On Wednesday, ready B. twills had fallen to Rs. 113-10, and on Thursday an improvement to Rs. 114-14 was recorded following the Government tender. However, the rate soon receded and by the week-end was at Rs. 114-10. On the other hand, hessian all along displayed a downward trend. On Wednesday, ready 40" 10 oz. hessian was quoted at Rs. 42-10 and by the week-end the rate had fallen to Rs. 41-14. Yesterday, fully dull conditions prevailed, and ready B. twills were taken down to as low a rate as Rs. 113-2. The 10 oz. hessian receded to Rs. 41-2 and eight oz. to Rs. 33-10.

With the falling trend in raw jute, both cultivators and stockists became nervous, and this was duly reflected in more arrivals, most of them being *jungli* and mesta. Sellers were anxious for business, but mills purchased only small quantities. Most varieties of raw jute fell by Re. 1-8 to Rs. 2. Latest quotations for raw jute futures (February-March delivery) of the 1956-57 crop are given below with those of a week ago in brackets:

	Middles	*Bottoms*

WHEAT DECLINES

(From Our Own Correspondent)

HAPUR, 11*th February*

Steady conditions continued to prevail in the foodgrain markets during the past week. The Government of India is understood to have decided that extensive sales of wheat and rice should be enough to meet the present situation and that there is no need to impose any controls on distribution of foodgrains. Imports of wheat are reported to be satisfactory and about 200,000 tons of wheat were imported last month and the same quantity is expected in February and 250,000 tons in March. The State of Uttar Pradesh which was facing an acute shortage of wheat is reported to have been receiving heavy quantities of imported wheat daily and the position has very much eased. Consequently, wheat prices at Hapur and in other parts of the State have recorded a downward trend. Sales through fair-price shops is very regular and in some centres they are on an increased scale.

Wheat at Hapur ruled quiet at Rs. 16 per maund for average quality and farm quality was quoted upto Rs. 17-8 per maund. Outside buying enquiry was slack and wheat stocks ran down by 2 *khaties* to 48 *khaties* on Monday. The late sowing of the wheat crop due to excessive rains and floods in September and October and strong westerly winds last week and frost conditions have all adversely affected the standing crops, which is reported to be not very good. Stockists still expect better prices in the lean period of March and early April and are holding up stocks.

Rice continued to be steady. The Government has decided to continue to supply rice through fair-price shops in deficit areas. The prevailing prices of rice were: *Basmati* Rs. 23 to Rs. 26-8; *Manipuri* Rs. 20-8; and coarse Rs. 16-8 per maund.

Gram continued to be in good demand. The week's offtake was 5 *khaties*. Local produce was quoted at Rs. 13-6 and Punjab quality at Rs. 13-12. Barley and *bejhar* improved fractionally during the week, as strong gusty westerly winds were reported to have damaged the standing crops. Maize and *bajra* also ran up in sympathy with other coarse grains. The week-end prices as on Monday were: Barley Rs. 13-4; *bejhar* Rs. 13; maize Rs. 13-8; *bajra* Rs. 14; *jowar* Rs. 12 to Rs. 13; *guwar* Rs. 11-8 per maund.

Pulses ruled quiet during the week, although stock position deteriorated further. Peas *dara* green was quoted at Rs. 14-8 and white quality at Rs. 16-8 per maund. The new crop is expected in the market by the middle of March. *Arhar* was quoted at Rs. 13-4 per maund and local stock was put at 10 *khaties*. Other pulses were held steady. *Urd* was done at Rs. 18-12 to Rs. 21, *moong* at Rs. 15 to Rs. 16-8 and *massoor* at Rs. 16-8 per maund.

Pulses futures moved both ways during the week in heavy speculative turnover. The quotations as on Monday were near the opening level of the week at: Peas *jeth* Rs. 10-7-7½; peas farm *jeth* Rs. 10-10-4½; *arhar jeth* Rs. 11-1-6; *urd baisakh* Rs. 18-15.

"GUR" DEPRESSED

(From Our Own Correspondent)

HAPUR, 11*th February*

The sugar market continued to rule steady during the week. The export quota of 50,000 tons is reported to have almost been exhausted and the firmness in the current international price may encourage the Government to permit additional exports; nearly a dozen countries it is said, have approached India for sugar, West Asia being the main customer. In the State of Uttar Pradesh, a fair business for Punjab and Saurashtra was reported, but want of loading facilities hampered despatches. Crushing for the new season is in full swing and, due to a further fall in ready *gur* prices, producers are trying to pass on their cane to the factories.

The current mill delivery prices of sugar are: Jaswant: Rs. 28-14; Sinobhauli Rs. 28-13; Mawana Rs. 28-8 to Rs. 29-4; Daurala Rs. 29-12; Amroha Rs. 28-6; Bijnore Rs. 28-6; Mansoorpur Rs. 29 to Rs. 30; Rampur Rs. 31-8; retail Rs. 30-15 per maund.

The *khandsari* market was a little depressed as demand was negligible. Inferior quality were quoted at Rs. 21-Rs. 23 and fine quality at Rs. 24-Rs. 27 per maund.

Ready *gur* prices were further depressed during the week, as outside demand was slack. Daily arrivals were at an average of 4,000 to 5,000 maunds and local stock swelled to about 40,000 maunds. The latest prices as on Monday were Rs. 10-2 to Rs. 10-6 per maund according to quality.

Future *gur* prices also declined in line with spot sections. *Fagun* and *baisakh* deliveries opened at Rs. 10-14-6 and Rs. 11-7-6 on Monday last. They touched the highest in the mid-session at Rs. 10-15-6 and Rs. 11-9-6 and lowest at Rs. 10-8-3 and Rs. 11-3, respectively. They were quoted today at Rs. 10-11-6 and Rs. 11-6.

KIPS WELL MAINTAINED

(From Our Own Correspondent)

MADRAS, 11*th February*

The kip market ruled steady, though shippers of F.A.Q. types expected that prices might decline during the second half of February, as U.K. dressers had been adamant on the buying limits. Prices ruled steady and arrivals met with ready clearance. U.K. buying was selective and small in all sections, and *nil* on buff hides.

There were several inquiries for prime tanned goat skins 11/12 lbs., but sellers were quoting 3*d*. higher, as tanners had been in a well sold position on 8/9 and 11/12 lbs. averages. Light weights were easier. There was good call for lining sheep fifths and inferiors which were in short supply and prices ruled firm as a consequence. Semi prime class sheep was weak.

Shipments during January 1957 were: To the U.K.: 3,024 bales cow, 267 cow calf, 107 buff hides, 389 buff calf, 1,005 goat and 861 sheep skins. To the Continent: 5 bales cow calf 6 buff calf, 378 goat and 145 sheep skins. To the U.S.A.: 2 bales cow, 1 cow calf, 49 buffs, 11 buff calf, 46 goat and 10 sheep skins. To Japan: 133 bales sheep skins.

Notice

MADURA MILLS COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Annual General Meeting of the Company will be held in Pandyan Building, West Veli Street, Madurai, on Monday the 25th March 1957, at 4 p.m. The Share Transfer Books will be closed from 5th to 25th March 1957, both days inclusive. It is recommended that:

1. All persons holding shares on blank transfers should immediately arrange to have the shares registered in their own names, as the Company will pay any dividend declared only to the person(s) in whose name the share stands on the date of declaration of dividend.
2. Shareholders desiring dividends to be paid to Banks or other Mandatees should register the mandates with the Company before 5th March 1957.
3. Intimation of any change of address should be given to the Company immediately.

A. & F. HARVEY LIMITED,
Managers.

MADURAI, 2*nd February* 1957.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.= Deferred shares. P.O.= Preferred Ordinary shares. Y.= Accounts published yearly. H.= Accounts published half-yearly. P.= Company has Preference shares. T.= Company has Debentures. N.= Nominal quotations. x.d.= Ex. Dividend. c.d.= Cum. Dividend. i= Interim Dividend. (= Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and not for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly, dividends shown are for their financial year.

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent Who else must sweat and toil and gain but scanty fare." William Blake

VOL. XCIV. No. 2398 BOMBAY, 23rd FEBRUARY 1957 PRICE: Rs. 1/8

FILLING THE FOREIGN EXCHANGE GAP

FOREIGN exchange is number one economic problem of India today. That it would be so was quite clear to many even when the second Plan was finalised a little less than a year ago. It has not, therefore, come as a bolt from the blue. The authorities, too, have been trying to meet it for several months now, but success has been only of a limited nature. Hence the recent steps to tighten the restrictions on imports of both capital and consumer goods. How serious is the problem? It is necessary to answer this question correctly, so that people may have no illusions about it and the authorities may not repeat some of the past mistakes which have aggravated the problem to a fairly considerable extent. It is often stated by Ministers of the Central Government that the problem is not such as to cause alarm or panic. If the object of this statement is to infuse confidence among the people that the situation is under control and that they should not lose heart, it is quite understandable. It is a sign of immaturity, if people get disheartened in their efforts to raise their living standards the moment they come in contact with difficult stumbling-blocks in their way. But it would be a bad thing for the country, if the authorities were to minimise the difficulties, for they would thereby create a complacent spirit among the people and might themselves become a victim of it. The way in which some of the Ministers are reacting to the candid criticisms on the second Plan and the economic policy of the Government, in general, suggests that they are prepared neither to face the facts nor to tell the truth to the public. What else is one to say of Ministers who keep on reiterating, even after taking steps to curtail imports of capital goods and to postpone some of the projects included in the Plan, that neither the size of the second Plan would be reduced nor the period fixed for its implementation extended?

As readers are fully aware, India has already spent Rs. 200 crores of sterling balances, a sum which the planners said would be spread over a period of four or five years. There might have been special reasons for such swift drawing down of these balances, but the fact remains that sterling balances today are no more than Rs. 525.95 crores, even after adding Rs. 28.32 crores, being the first instalment of the I.M.F. loan of Rs. 95.20 crores sanctioned a fortnight ago. These balances are large enough to support the claim that India is still quite solvent on external account. In fact, as compared with many countries in the free world, India's external debts are less than appreciable. But the present size of its external assets is low enough, in the context of its second Plan commitments, to sound the warning bell. If it is conceded that India requires Rs. 100 crores of sterling balances as essential working balance, there is really not much room left for further depletion of these balances. Under the recent amendment to the currency reserve provisions of the Reserve Bank of India Act, the minimum reserve could be reduced to Rs. 300 crores, albeit with the sanction of Parliament, thereby releasing Rs. 100 crores for financing imports. But this provision is meant for covering extreme emergencies and should, therefore, be reserved for use only as a measure of last resort.

Whatever the Ministers may say in public today, the Government has shown, by its recent actions, that it views the foreign exchange position pretty seriously. First came the restrictions on imports of consumer goods, durables, and essential materials such as steel and cement. Then came the reduction in foreign exchange availability for overseas travel. This was soon followed by a drastic revision of the conditions for issue of import licences for capital goods. As a result of this revision, schemes for new development, however important and desirable in themselves, are given a very low priority. Generally speaking, import licences will be given only for those new projects which do not require payment in foreign exchange for a considerable time to come. This means that the applicants themselves should explore ways and means of reducing their immediate foreign exchange requirements to the minimum.

The Government has put forward three alternatives for getting over the difficulty caused by the serious fall in foreign exchange reserves. First, *entrepreneurs* should secure foreign capital investment in their undertakings at least to the extent of the value of plant and machinery to be imported. Secondly, they should try and get long-term suppliers' credit for a period of seven years sufficient to cover a minimum of 80 per cent. of the cost of plant and machinery. Thirdly, the applicants should try to secure credit from lending institutions in countries from where they seek plant and machinery. In the U.S., for instance, there is the Export-Import Bank, as also a co-operative credit organisation sponsored jointly by the leading American banks specifically for assisting investment in foreign countries. In the U.K., there is the Commonwealth Development Bank and the Export Credit Guarantee Department, besides some of the commercial banks, such as Lloyds and the Chartered, which are prepared to provide medium-term credits for financing exports of capital goods. West Germany has, perhaps, been the first after the last war to specialise in providing suppliers' credit of the type suggested by the Government. According to reliable reports, East Germany, too, is prepared to arrange for suppliers' credit needed by importers of capital goods in India. Almost every capital goods exporting country has thus provision for financing exports of plant and machinery. And there is nothing novel about it either; several countries have received suppliers' credit in recent years. At one time—about two years ago—they were so popular that even the World Bank President thought it necessary to warn against its indiscriminate use, lest it should distort the picture of balance of payments of the countries involved and create fresh balance of payments problems at the time of repayment.

Of late, the suppliers' credit system is not very much in vogue in some of the countries of Europe, because of inflation and high rates of interest. In the U.S., too, its popularity seems to be waning almost for identical reasons. Britain and France may be willing to provide such credit, to some extent, now that they have to prop up their exports to meet the cost of their Suez misadventure. It is, however, a moot point whether they will be very keen on extending this facility to India, as their eyes seem to be more on other markets. Nevertheless, it is possible that India will be able to obtain a fair amount of suppliers' credit from all the sources—big and small—put together, provided it is prepared to pay substantially high rates of interest and makes a proper approach to the problem. Commenting on the merits of the Government's suggestion, Mr. Murarji J. Vaidya, a prominent industrialist and the outgoing President of the Indian Merchants' Chamber, observed, in his speech at the annual meeting of the Chamber, thus:

> "There are automatic limitations to the extent to which such facilities would be available or forthcoming from the countries from which such equipments are normally available. Apart from that, it is also a moot point if such arrangements could be evolved, except on the bas

renewed every six months. Some of the banks do not consider this as a satisfactory solution, as it implies a risk of non-renewal and involves additional expense; in any case, it does not provide full cover. They, therefore, prefer a straight cover for the duration of each credit. All these are, of course, matters of detail, but they should be discussed threadbare and settled satisfactorily, so that *entrepreneurs* may be enabled to implement the suggestion at an early date.

While on the subject of suppliers' credit, it will be pertinent to recall the cancellation by the Government of India of the arrangement it had concluded with Krupp-Demag for financing the Rourkela iron and steel project. Under this arrangement, the German firm had agreed to participate in the capital of the project to the tune of 10 per cent.—roughly about Rs. 10 crores—with an option to withdraw this capital after 10 years. In effect, the arrangement was a form of suppliers' credit. In the present context of foreign exchange scarcity, the Government, it seems, was ill advised to cancel this arrangement and agree to pay in cash. The fact that the Government resorted to this step only towards the close of 1956 when the foreign exchange difficulty was quite manifest does not speak well of its judgment. The main reason for this action was that the rate of interest in Germany was so high that it unduly raised the cost of plant and machinery which the German firm had agreed to supply for the steel project under reference. This argument does not sound weighty enough to be convincing. Is consideration of interest so important as to give up the bird in the hand? If that is so, there is no point in the Government advocating suppliers' credit system now, because there has been no material change for the better in the rates of interest, the recent fall in the British and German Bank rates being only fractional.

Suppliers' credit can best be only a palliative. They do not solve the problem of foreign exchange, but only postpone it. Indeed, they may add to the country's difficulties later, if the purpose for which loans are now taken does not augment the capacity to export more, so that enough foreign exchange may be earned when the time comes for repayment. It is needless to add that failure to service and repay loans as and when they fall due will inflict serious damage on the country's credit abroad. In the anxiety to tide over the foreign exchange difficulty, there is a danger of this important aspect being overlooked. It will not be wise planning to proceed on the assumption that the future will take care of itself. Before taking on commitments by way of loans with definite time limits for repayment, it is very necessary to examine the country's capacity to honour them on the due dates.

This question is pertinent not only from the point of view of suppliers' credit but also from that of all external debts that are sought to be incurred and that will pile up between now and the end of the second Plan perod. When examined from this angle, the Plan contains a serious weakness; it has not given due prominence to export industries. Since those who are in the seats of power attach more importance to the views of foreign observers than those of domestic critics—this is apparently a case of familiarity breeding contempt and distance lending charm—let us quote the observations of Mr. Paul Bareau, a noted British economist and a specialist on foreign exchange matters, on this particular question. Mr. Bareau was one of the team of British financial journalists which visited this country as its guest and had an opportunity of seeing the second Plan in action and of discussing the problems with the Ministers. Giving his impressions of the Plan in an article to the *N.B.I. Review* of the National Bank of India Ltd., Mr. Bareau has to say this on this particular issue:

"Most of the industries that are being developed in India today are intended to serve the domestic market. It may well be that, when India produces more than 6 million tons of steel—the production target for the end of the second Five-year Plan—it will have some exportable steel with which to earn foreign exchange. There are certain articles which India is manufacturing at present for the domestic market which could be exported—sewing machines are a case in point—but there is very little evidence that the careful planning which has gone into the elaboration of the second Five-year Plan has been matched by the thought given to the encouragement of the export industries that will ensure balance of payments equilibrium in the long run. India's best industrial foreign exchange earner is the cotton textiles industry, but this industry is being handicapped in the maximisation of its export outlets by the efforts of the Indian Government to subsidise and encourage the cottage weaving industry. There are no doubt good social and political reasons for giving some encouragement to the handloom weaver. This policy gives employment and supplements the low earnings that are extracted from the soil. But, when protection of a small-scale industry (which many Indians regard as uneconomic any way) proceeds to the length of preventing efficient units to install more powerlooms, the offence against economic realism begins to outweigh all reasonable short-term political and social arguments in favour of the cottage industry."

That is the conclusion which this journal has been urging for long but to no purpose. It is to be hoped that at least Mr. Bareau will succeed where we have failed.

A more desirable way of closing the foreign exchange gap is, as we have all along contended, to encourage the flow of foreign private capital into India and of such Indian capital invested abroad as would like to be repatriated. But every year that passes sees a change in the climate which is unfavourable for the influx of such capital and favourable for the efflux of foreign capital already invested in this country. Speaking at Madras in a public gathering on the 16th inst., the Finance Minister frankly admitted the great value of foreign capital, especially equity capital, to India's economic development. He declared that the Government of India was never against foreign capital; on the contrary, it welcomed such capital, though within the four corners of its industrial policy. But such mere verbal pronouncements are no good. He has spoken in this vein on many occasions in the past, but there is no visible evidence of his speeches having induced any significant flow of foreign private capital.

Now that the foreign exchange position has deteriorated, some positive steps must be taken to attract foreign savings. The forthcoming budget offers an early opportunity for doing so. In the first place, the burden of personal taxation must be lowered. Secondly, the perquisites of foreign employees should not be tampered with to the same extent as is being done now. Thirdly, the controls on the private sector should be relaxed considerably, as they are of a sweeping nature and could be used by a future Government to wipe out the private sector overnight; a beginning in this direction could be made by giving up the system of compulsory deposits. There is no economic necessity for it and the absence of it so far has not meant any serious harm to the country. Fourthly, the Government must relax, as was pointed out by Mr. Vaidya in his speech referred to earlier, the terms and conditions, particularly in regard to royalties payable, the basis of collaboration, etc., under which foreign capital is allowed to participate with Indian capital. Giving an example, Mr. Vaidya said:

"One of the conditions sometimes laid down for permitting payment of royalties for know-how to be supplied by foreign firms is that the maximum rate of such royalty should not exceed 2½ per cent. subject to Indian tax. It will be appreciated that, if the full rate applicable to a non-resident assessee is paid on the amount of royalty, the net amount in the hands of the recipient foreign firm would be so small that it would be difficult, if not impossible, to induce any well-known and large foreign firms to enter into any financial or technical collaboration with their Indian counterparts."

Fifthly, the Government must disown all those recommendations of the Plantation Inquiry Commission which seek to place foreign capital in plantation industries at a disadvantage *vis-a-vis* Indian capital. Sixthly, India can attract a large amount of foreign capital almost immediately by offering liberal terms to foreign oil companies to discover and exploit mineral oil deposts. It is surprising that the Government of India should higgle-haggle for years with these companies in reaching an understanding and, what is more, be keen on reserving a large part of the field to itself, even though it has neither the know-how nor adequate financial resources. And, finally, the Government must recognise in public that an enlightened and vigorous system of free enterprise is an important pre-requisite for the preservation of democracy in the country. It is needless to add that no amount of wooing of foreign capital will yield fully satisfactory results, unless domestic private capital is treated with respect and affection.

COMMON MARKET FOR EUROPE

THE official reports reaching from Paris about the meeting of the Organisation for European Economic Co-operation (O.E.E.C.) on the free trade area tend to be rather sketchy and one must have access to "eye-witness" reports and some ability to read between the lines to discover what is going on. The first point of interest that has emerged, however, is that the seventeen European countries concerned have decided to turn the Chairman for the time being of the Ministerial Council into the Chairman of the Special Committee set up to co-ordinate the planning of the Common Market. The significance of this is that that Chairman is the British Chancellor of the Exchequer, Mr. Thorneycroft. Now, in spite of his predecessor's well-known affection for the idea of the Common Market, Britain is the one country opposed to the inclusion of agricultural products in the scheme for tariff reduction. But it must be remembered that most of the other seventeen countries—one may except the six who are busy organising themselves into a Customs Union—while giving full lip servce to the need for a Common Market, are also making all manner of reservations on matters affecting their own trade interests. They feel safer, therefore, to go forward under the leadership of the country which has the biggest reservation of all!

Mr. Thorneycroft's approach to Britain's position, and to that of equally wary but less outspoken colleagues, has been to explain that all that the O.E.E.C. is doing at this stage is to prepare "the plans of the house"; there has not been any attempt yet to build the house. Only when the plans have been prepared will the seventeen countries decide whether to go forward on those plans or not. Moreover, the U.K. Government is able to represent its attitude towards continued protection for agriculture in a very practical way. It points out that Britain imports more agricultural produce from Western Europe than any other O.E.E.C. member, so that, in its case, production is not a device for limiting imports unreasonably; it is only a device designed to secure a preference for the Commonwealth countries and the colonial territories, a preference which must be maintained, if the British Commonwealth is to remain associated with Great Britain in its European free trade experiment.

The French, however, have another approach. They are busy bringing in their overseas territories to form an inclusive part of the free trade area. It is supposed that they are doing this in the hope of throwing these territories open to capital investment by the other member nations, but, in any event, the French problem is entirely different—its colonial agricultural imports are not those indigenous to W. Europe.

The Ministerial Council has now decided (and this is Britain's doing) to press ahead on one committee to consider the reduction of tariff barriers on industrial products; then to set up another committee to consider the special difficulties of immature countries—Greece and Turkey are specifically mentioned—which are likely to lag behind the others in the tariff reduction programme. Finally, the British argument about agricultural products is to be relegated to a separate working party. It is the work of these three groups that comes under the co-ordination of the British Chancellor.

Among the observers at the O.E.E.C. are the American and Canadian delegates and it is always intriguing to hear the American spokesman playing his dual role of insisting that the European countries combine economically to become a viable group justifying past American economic aid and not requiring it in the future, and, on the other hand, exercising restraint on any action by the European countries which might conceivably redound against North American interests. His argument is fairly simple: it is a good thing for the European countries to get together in the matter of tariffs, provided that, when they had got together, they reduced tariffs between themselves without raising them against outside countries. Of course, what America would like to see is a sort of "most-favoured-nation clause" applied to the Common Market, the effect of which would be that tariffs should be unified on the basis of the *lowest* tariff of any member of the group or *less*. If, for example, in the Common Market scheme, there are, say, three important importers of an American product with tariff ratings of, say, 10 per cent., 20 per cent. and 30 per cent., respectively, America would feel that the Common Market was failing in its higher purpose if the unified tariff of all three countries to the rest of the world were anything higher than 10 per cent.

INVESTORS' CONFIDENCE AT LOW EBB

KANPUR INDUSTRIALIST ON ECONOMIC TRENDS

THURSDAY, 5 P.M.

THERE has been a sharp fall in equities since last week. The bears who were hesitant before have become aggressive again, taking advantage of the helplessness of the bulls. Some of the leading counters have gone even below the lowest levels recorded in the landslide in December last caused by the 30th November taxation proposals and the Finance Minister's subsequent tirade against the private sector. Confidence seems to have completely shattered. Big bulls are still suffering from indigestion. Every fall in prices aggravates their malady. Investors have been frightened. Those who have holdings must be worried over the continuous depreciation in the value of such holdings and those who have funds to spare must be reluctant to buy in a falling market. The tension in Indo-Pakistan relationship is mounting; money is stringent and interest rates are high; cloth stocks are rising on account of continued lack of demand; jute goods at Calcutta are languishing for want of business; the coal companies are losing due to an increase in their wage bill unaccompanied by a corresponding rise in their selling price for coal; industrialists are in a state of despair, because of the heavy burden of taxation and the difficulty of finding adequate capital to finance expansion of the existing industries; and establishment of new ones; the prices of foodgrains and raw materials alone keep on moving up, thereby reducing the profit-margin of manufacturers. The whole picture is thus depressing. Only the Government can bring some cheer to investors and *entrepreneurs*. The Finance Minister, however, says that he does not care whether the shares go up or go down but his caravan will go on, *vide* his speech at Madras a week ago. If this remark means anything, it is that he cares little for the private sector, because this sector cannot find the capital it needs for discharging its role in the economic development of the country if the Stock Exchanges remain depressed.

MARKET GOSSIP

There is not the slightest exaggeration in this statement. If any proof were needed, one should only look at the rapid rate at which the value of rights for new shares issued by some of the existing well-known companies has been going down. The Indian Iron rights have lost more than Rs. 2 within a short period of 17 days and are going abegging at about Rs. 5-6 on all the Stock Exchanges. At this rate, it will be pretty difficult for the I.I.S.Co. to raise the additional capital which it has been allowed. The A.C.C. and the T.I.S.Co. also have yet to receive a substantial part of the first and second instalments, respectively, of their new issues. The A.C.C. is charging a penal interest of 9 per cent. for non-payment of the instalment. The T.I.S.Co. first announced that it would charge interest on arrears at 6 per cent., and then, apparently taking the cue from the A.C.C., put it up to 9 per cent. These steps do not seem to have yielded the desired results.

* * * *

Mr. T. T. Krishnamachari continues to make great play of the rush that took place for the shares of such predominantly foreign-owned companies as Imperial Tobacco, National Carbon, Hindustan Levers and Guest, Keen Williams. He quotes these instances to substantiate his contention that there is no dearth of capital for soundly-managed enterprises. If he really believes in what he says, he is deluding himself. If he is using them merely as a propaganda against Indian enterprises, he is misleading the innocent public. Can he say that the A.C.C., the T.I.S.Co., and the I.I.S.Co., to give only three instances, are not progressive and soundly run companies? He cannot, of course. Yet their shares remain unsubscribed. Why?

The reason is simple. The Government fixed the premium on these new shares at a time when the Stock Exchanges were buoyant. Since then, it has imposed fresh burdens on the industry and upset the climate for investment, thus converting what appeared as reasonable premia then into heavy penalties now. It is the actions of Mr. Krishnamachari as Finance Minister that are primarily responsible for the present plight of the capital markets. Since he has upset the basis on which the premia on these shares were determined, justice demands that he should direct these Companies to cancel the premia on their new issues. The Government loses nothing by this directive, but it will greatly help the investors to discharge their obligation to take up new capital with ease. It will also help the drooping Stock Exchanges to recover their poise. Incidentally, the greatest beneficiary of this action will be the Life Insurance Corporation, which holds a substantial part of the share capital of **these three companies.**

As compared with the stiff terms demanded from investors in the shares of the aforesaid three leading Indian companies, Mr. Krishnamachari successfully persuaded the wholly-owned foreign subsidiaries to release a part of their shares to the investors of this country at attractively low prices which gave a yield of 9 to 10 per cent. In other words, there was an element of gift in these issues and, in order to grab the *bakshis* as much as possible, many people rushed for these shares. Most of them were well-to-do investors who applied for these scrips in several names. A large number of people sold some of their existing investments in order to buy these scrips. It is not, therefore, right for Mr. Krishnamachari to quote these instances in support of his contention that there is no dearth of savings in the country for the right type of show or that something is wrong with the companies or promoters who have not been able to match the success of the few foreign concerns. As an industrialist in Kanpur, Mr. R. L. Powell, put it this week: "it is not a healthy market for risk capital in which support is forthcoming only if the investor considers that there is virtually no risk and in which, if there is risk, he considers the limitations on possible rewards to be too severe to compensate him for venturing his savings. Industrial development through a market in such a mood can only be patchy and uneven."

It will be a good thing for the country as a whole, if the Finance Minister frankly recognises the true state of affairs of the capital market and takes suitable steps to restore its vitality. By keeping the share markets more and more depressed during the last six months, he has not gained his primary objective of keeping down the prices of foodgrains and commodities and the cost of living. In fact, this policy of his, if continued for long, will seriously hamper the progress of the Plan. Too much taxation will kill initiative and enterprise and thereby retard the pace of production. While framing his next budget proposals, he will do well to remember that the Law of Diminishing Returns will operate even in a socialist pattern of society.

* * * *

A special feature of the presidential speech of Mr. R. L. Powell at the annual meeting of the Upper India Chamber of Commerce, Kanpur, held this week, is an interesting discussion of the recent trends in the financial world. In this, he has displayed a keen insight into Indian conditions and a lively sense of humour, so rare in most of the speeches on such occasions. The central theme of Mr. Powell's survey was that, in India, there was a danger of the phrase "democratic planning" coming to mean a growing concentration of economic power in the hands of the ruling few—which would be a very fair example of Orwellian "double-speak"; such a development would hardly encourage that widespread spirit of individual independence, enterprise, self-reliance and personal liberty that was probably a nation's best safeguard of democracy. A look at the Government's economic policy since Independence will clearly reveal that the phrase "democratic planning" is being interpreted in such a way as completely to rob it of its real meaning. How else can one explain, for instance, the excessive regulation of the private sector, the denial of adequate rewards for saving and investment, the promotion of industry's increasing dependence on Government and Government-controlled agencies for capital, and the elevation of mediocrity as the social ideal? All these which flow mainly from excessive and inequitable taxation of both companies and individuals are, as Mr. Powell rightly declared, tending to weaken large-scale industry in the most productive sector of the economy. Appropriately enough, he observed:

"The left hand may grow stronger, if the right is paralysed, but two strong hands are better than one. If industry is weakened—indeed, if it is not strengthened by a wise revision of current policies—not only will the success of the second Five-year Plan be prejudiced, but also one of the strongest bulwarks of democratic thought will have been undermined. The present and prospective financial problems are both a warning of past errors and an opportunity to pause and think again. Let us make good use of them, at all levels of endeavour, to reassess ends and means. If saving and investment are rewarded, if initiative and enterprise are encouraged, the economic development of India is assured. Let us hope that, with it, will eventually come the day when every employee is also a shareholder in the company for which he works—perhaps the most effective form of co-operative commonwealth, whether or not you call it 'socialist,' that has yet been devised."

* * * *

Mr. Powell was at some pains to show how, in the formulation of Government economic policies, the short-term view is allowed too often to prevail over the long, particularly when elections block the horizon, and ideological prejudices have too much influence on economic policies. In support of this view, he cited the instances of nationalisation of life insurance, debilitation of the cotton mill sector in favour of the less efficient handloom sector, and nationalisation of Kolar Gold Fields companies. None of these, he argued, has helped India to obtain foreign exchange at a time when it is becoming clearer that success in attaining the physical targets set in the Plan largely depends on success in obtaining foreign exchange. It is in this context that he questioned the efficacy of the State Trading Corporation and warned: "India will not benefit economically, and may suffer socially, if that particular concentration of economic power merely diverts the conduct of export business from the hands of **the many to the hands of the few**, without enlarging it." This warning is, indeed, not only timely but very pertinent. Considering the swift deterioration in the foreign exchange position of India, as also the growing competition in world trade, what matters most, or ought to matter most, if the Plan targets are to be taken seriously, is, as Mr. Powell said, the increase in foreign exchange earned, not the label—public sector or private sector—borne by the agency that gathers it in.

* * * *

The Upper India Chamber President devoted a great part of his speech to the problems of finance which "are at the heart of most of our other problems." He enumerated the mounting difficulties directly felt by industry and commerce in the sphere of internal finance. Among them, the most pressing ones are those relating to stringency in the money market, with a tendency for interest rates to rise and for credit to be restricted; generally rising prices of raw materials, stores and machinery; high sales tax, excise duties, cesses and other imposts; transport delays and bottlenecks continuing to tie up large sums of money; and locking up of large sums in debts due by Government for an unduly long time. The shortage of working capital is further aggravated by the damage to confidence suffered by trade and industry as a result of too frequent alterations, and threats and rumours of alterations, in the rates of such imposts as excise duty and sales tax. Surely, production and distribution cannot proceed smoothly so long as there is no atmosphere of confidence.

As if the measures listed above are not sufficient to act as a heavy drain on working capital of industries, the Union Finance Minister has recently imposed compulsion on the companies to deposit with the Reserve Bank 25 per cent. of past accumulated profits and reserves, together with a high proportion of current net profits. This measure is very stringent and is beset with grave consequences, as the following extract from Mr. Powell's speech will show:

" . . . the Act of Parliament has yet to be devised which can extract a quart from a pint pot, and many companies just do not have either the money or the credit to pay the deposits required. In industries which are at present the hardest pressed for working capital, there will certainly be some companies which have already pledged their capital to the limit, in order to raise the money for their workers' wages. When reserves are fully invested in stocks, which, in turn, are pledged to the banks against overdraft facilities fully employed, it is difficult to see what alternative a company has (unless the prospective rules provide one) other than to accept taxation of its depreciation allowances and development rebate, which is the penalty for not making the required deposits. If that comes about, it will mean the erosion of productive capacity in that sector of the industry which produces most of India's consumer and export goods. I would think it bad for India, if only 10 per cent. or even 1 per cent.—no matter how small a proportion—of the companies now producing and giving gainful employment were thus condemned to death by slow strangulation."

There is considerable force in these observations. The withdrawal of the measure of compulsory deposits, of course, requires considerable political courage. But there is no denying the fact that "it is," to quote Mr. Powell, "the only wise course at present." Otherwise, not only will the industries be put to untold hardship for want of sufficient working capital but the capacity of the industries to raise new risk capital will also be seriously undermined. It is necessary to stress this aspect, because a large part of the industrial development that will take place in the coming years will undoubtedly have to be financed, as in the past, in the main by existing industry. Characterising such financing as "auto-finance," Mr. Powell said: "In future, that source of development finance will diminish, if companies' net profits fall and if the incentive to invest is reduced by a curtailment of dividends." In his considered opinion, even the funds made available by bodies such as the Industrial Finance Corporation and the National Industrial Development Corporation can never adequately replace risk capital supplied by shareholders, for these funds are mainly lent and only against adequate security, on rigid conditions and for a not negligible rate of interest. Nor can such corporations facilitate the varied and many-pronged advance on a broad industrial front by a large number of comparatively small companies in which stock exchanges have played so useful a part.

* * * *

Coffee shares have been a steady feature during the last two weeks in an otherwise depressed planting section on the Madras Stock Exchange. Leading scrips have attracted enquiries and are being taken up at quoted rates and in some cases even at slightly higher levels. This is due to reports that the current year's crop would be a record at 38,000 tons. Though such a bumper production raises the problem of storage facilities, the higher prices expected in world markets during the current year and the country's need for foreign exchange give room for the hope that the Government would not be slack in giving timely releases for export and in taking suitable measures for raising domestic consumption.

In the circumstances, the new issue of capital to the public by Sangameshwar Coffee Estates Ltd. is timely. The Company, as will be seen from the detailed announcement published elsewhere in this issue, is issuing Rs. 15.50 lakhs, made up of 600,000 ordinary shares of Rs. 2 each and 35,000 7 per cent. cumulative preference shares of Rs. 10 each. In addition, it offers 1,400 7 per cent. debentures of Rs. 500 each for subscription at par. Of these, the promoters, the Directors and their friends have agreed to take up 375,000 ordinary shares, 15,000 preference shares and 300 debentures. The balance of 225,000 ordinary shares, 20,000 preference shares and 1,100 debentures are available to the public. It will also be noted from the announcement that the preference and debenture issues have virtually been underwritten. For, in addition to the 15,000 preference shares and 300 debentures which the promoters, Directors and their friends have agreed to take up, the vendors have expressed their willingness to subscribe to 600 debentures and the promoters have offered to procure subscriptions or subscribe themselves the balance of 500 debentures and 20,000 preference shares. The subscriptions to the ordinary and preference shares are payable in full on application.

Though the Company has been formed only recently, it has taken over three well-known coffee estates in North Mysore belonging to the Crawford group of estates and the present issue is to finance the purchase of the three estates and to

EQUITIES UNDER BEAR PRESSURE

STEELS VERY WEAK

(From Our Own Correspondents)

BOMBAY, 21*st February*

THERE was a veritable bear raid on the Stock Exchange during the week under review. The recession noted in the previous three weeks gathered further momentum this week on heavy bear selling and nervous bull liquidation. Despite the attractively low levels touched and the good performance of industries in general, equities suffered from absolute lack of support. The persistent anxiety over the Kashmir issue, the weakness of Indian Irons, the coming into force of the Securities Contracts (Regulation) Act 1956 with effect from the 20th inst., the growing fears that the Government of India might postpone indefinitely the sanctioning of bonus issues, and absence of any encouraging news from the cloth market were all factors which came in handy for the bears. In the result, equities were taken down to the lowest levels since the first week of January. In some cases, even the bottoms touched during the December depression, caused by the supplementary Budget and the unwarranted attacks of the Finance Minister on private enterprise, were pierced this week. The undertone at the close was weak.

The sentiment in the steel section was affected by the depression in Indian Irons. The sellers in Tata Ordinaries would appear to be unconcerned with the good prospects for the Company, what with the commissioning of two blast furnaces under the expansion scheme. The shares were hammered down from Rs. 175 to Rs. 169-12 on Tuesday. After a short-lived recovery to Rs. 172-12, they slumped to Rs. 167-12, which compares with the previous low of Rs. 168 touched on 8th January last. The closing was, however, a shade better at Rs. 168-4, the loss over the week being Rs. 6-12, which is more than the aggregate loss in the previous three weeks. The forthcoming issue of Right shares by the Indian Iron and Steel Company, which would double the number of ordinary shares and would greatly reduce the scope for speculative manipulations in this counter and anxiety over finding the necessary funds for the same, induced operators to liquidate their holdings, pushing the shares down from Rs. 21-15 to Rs. 20-2½. This together with the Rights at today's rate of Rs. 5-6½ gives a *cum*-right value of Rs. 25-9, which is almost Rs. 2 down from the previous *cum*-right low of Rs. 27-8¼ witnessed in the first week of January. The Rights were marked down from Rs. 6-14 to Rs. 5-6½.
