IN sharp contrast to the dismal picture obtaining in India, the insured commercial banks in the U.S. provide no less than 27.6 per cent. of the total agricultural credit requirements of the country. The total farm debt, as at the middle of 1956 (exclusive of Commodity Credit Corporation's price support advances), stood at $18.5 billion, of which loans given by insured commercial banks accounted for $5 billion, while those by individuals, merchants and the like for about $7.7 billion, or 41.6 per cent., and financing organisations and other banks for $5.7 billion or 30.8 per cent. Thus financing organisations and all kinds of banks together supply no less than 58.4 per cent. of the finance needed for farm operations. Further, the total amount of loans from commercial banks was somewhat over twice the level in 1947, as a result, partly of an increase of over 75 per cent. on an average in the farm investment in land and other assets. Such, in brief, is the structure of farm credit in the U.S., as disclosed by the Agricultural Loan Survey, conducted by the Research and Statistics Division of the Federal Reserve Board in the middle of 1956. A series of four articles on the role of commercial banks in rural credit has appeared in the recent issues of the *Federal Reserve Bulletin*.

A noteworthy feature revealed by the Survey is that about 2·3 million or nearly one half of the operating farmers have borrowed from the insured commercial banks as at the middle of 1956. Although the banks covered nearly half the number of farmers, in terms of value their share of agricultural credit was as much as $5 billion, or 27.6 per cent. of the total. This percentage is very much higher than the comparable figure for India, where commercial banks satisfied less than one per cent., while all kinds of moneylenders including relatives and landlords accounted for about 91 per cent., of the total credit needs—which stood at Rs. 750 crores—of the agriculturists in 1953. In the U.S., banks are the major institutions that supply credit to finance operating and intermediate credit needs of the farmers, providing about three-fourths of such institutional credit, and one-sixth of all farm mortagage credit.

Distinguishing Features

The Survey reveals certain other interesting characteristics which, juxtaposed with the corresponding position prevailing in India, highlight certain distinguishing features of the American farm credit system. A purpose-wise classification of the farm loans, for example, reveals that those for seasonal operations, that is, for payment of current operating and family living expenses and purchase of feeder-livestock, accounted for 38 per cent. of the dollar amount of all the loans from the commercial banks. Though bank credit to agriculture is insignificant in India, a similar classification of borrowings of cultivating families from all sources attempted by the All India Rural Credit Survey reveals that no less than 57 per cent. of the total borrowings is for family expenditure (47 per cent.) and current farm expenditure (10 per cent). It may be noted that this does not include expenditure for the purchase of livestock. In view of the comparatively high *per capita* income in the U.S., it can be construed—since figures to that effect are not given—that family expenditure accounts for only a relatively minor proportion of the total current expenditure on agriculture in the U.S.

Purchase of Land

Loans to finance intermediate-term investment—purchase of other livestock, machinery, etc., in the U.S. accounted for 33 per cent., those to buy farmland 18 per cent., of the total borrowings. In India, on the other hand, capital expenditure which includes purchase of land, livestock and machinery account for 32 per cent., while the loans for all other purposes for 11 per cent. which includes non-farm business expenditure and for the payment of old debts. It should be noted here that, though purchase of land is one of the important elements of capital expenditure in India, the average expenditure reported per cultivating family on purchase of land was in most districts less than Rs. 100 in 1953. Of the amount so invested, however, only 65 per cent. came from borrowings.

The U.S. Agricultural Loan Survey throws interesting light on the relationship between the levels of debt and the net worth of the borrowers. The average size of the bank debt per farm borrower was $2,227. But the average outstanding debt varied in accordance with the net worth of the borrowers. For example, those with a net worth of less than $3,000, constituting 13 per cent. of the borrowers from the banks, had an average outstanding bank debt of $535; those with a net worth of $3,000 to $9,999, forming 32 per cent. of the total, had an average debt of $1,147. The corresponding figures for those pertaining to the three higher net worth groups, namely, $10,000 to $24,999, $25,000 to $99,999, and over $100,000, who formed 30 per cent., 17 per cent., and 2 per cent., of the total borrowers were $2,068, $4,234, and $16,575. Though it is possible that these debts of the borrowers were not identical to their total borrowings, nevertheless, these figures reveal one fundamental feature, namely, that the extent of debt increases with the net worth of the borrowers. Another feature disclosed by these figures is that total farmers' borrowings formed only a small proportion of their net worth.

Position in India

A comparison of these farm loans figures of the commercial banks in the U.S. with those of all the agencies in India will obviously suffer from many limitations. Subject to this, however, it can be said that the position in respect of the relationship between the outstanding debt and the cultivated holding of the cultivator is markedly different. In India, cultivated holding is by far the most important element among the assets of the cultivating family and as such determines its creditworthiness. These holdings, together with buildings, form 85 per cent. of the total value of the assets of the cultivating families in the country. Accordingly, it can be regarded as a rough indicator of the size of the business of the cultivator, and, consequently, his creditworthiness, though it may not be identical with his total assets. Thus, on a classification of the cultivators into ten deciles on the basis of the size of their cultivating holdings, and on a study of the data of debt per acre of the different deciles, it has been found by the All-India Rural Credit Survey Committee that, broadly, the burden of per acre debt on lower deciles was very much higher than that on the higher deciles, and even as between the middle and lower deciles, the burden of debt in the lower deciles was comparatively high. Thus, unlike in the U.S., the burden of debt per acre in India (which we have taken to indicate roughly the size of business of the cultivator) increased, as a rule, as the number of acres cultivated by a family decreased. It is significant, however, that the position in the U.S. of the level of the total burden of farm debt in relation to the total farm assets bears close resemblance with the corresponding position in India. In the former, the total farm debt averaged about 10 per cent. of the value of the total farm assets in the country. In India, the data of the Rural Credit Survey show that the corresponding figure is about 6 per cent. of the total assets of the cultivators for the country as a whole, and that it is less than about 25 per cent. in every region of the country among both the upper and lower strata of cultivators.

Classification of Borrowers

Among the borrowers from the commercial banks in the U.S., 69 per cent. were owner-operators, 25 per cent. were tenants and 6 per cent. were landlords. Also noteworthy is the fact that the average bank debt of the tenants was $1,347, as compared with $2,522 for owner-operators. A particularly distinguishing feature is that part-time farmers, constituting 13 per cent. of the farm borrowers, accounted for about 11 per cent. of farm loans outstanding at the banks. The Survey also reveals that chartered mortgages (or conditional sales contracts) were the most common form of security for farm loans by the banks. They constituted no less than 40 per cent. of the dollar amount of farm loans. This type of security, it is stated, was most frequent in respect of loans raised for buying machinery and durable goods. However, in the case of loans for purchasing land, or improving land or buildings, all the farm loans—accounting for 70 per cent. of the total at the banks—were secured by farm mortgages. This kind of security was also frequent in the case of loans for repaying debts. Further, between 1947 and 1956, loans secured by farm real estate for all districts covered by the Survey rose from 2,185 to 3,110. At the same time, the average size of the loan increased steadily from $680 to $1,181, while their percentage to the total loans went up from 42 to 74. During the same period, the number of loans secured by farm real estate mortgage declined from 418 to 265 and so also their average size from $3,297 to $2,726. Their proportion to the total also fell from 58 to 21.

The maturity of farm loans made by commercial banks varied considerably with the purpose of the loan. Loans for current expenses were largely short-term, two-thirds of their dollar volume being payable in six months. This kind of loans was not uncommon among intermediate-term loans. About one-third of this category of loans were of more than one year maturity. One-third of the loans taken to buy farm real estate carried maturity of six to ten years, while one-eighth had terms in excess of 10 years. As regards interest rates, it is noteworthy that the average interest on farm loans not secured by real estate was 6.4 per cent. only. This approximates to the rate at which co-operative banks in most States and the Government of India issue loans to agriculturists. A feature of farm credit in the U.S. is that, for all types of loans, there was a steady decline in the interest rate as the size of the loan increased. The average rate was 7.4 per cent. on loans under $250 and 5.3 per cent. on loans of $25,000 or more. This is, of course, a normal feature of all commercial loans.

TEXTILE INDUSTRY IN WESTERN COUNTRIES

PROSPECTS FAIRLY ENCOURAGING

AS a leading exporter of cotton textiles, India has to keep its eyes wide open in regard to the developments that take place in the textile trade of all its competitors, big and small. It meets with competition not only from Japan and the U.K. but also from the European Continental countries. Accordingly, the interesting analysis of the present pattern of and outlook for the textile industry of the U.K., Western Europe and the U.S., as contained in a recent issue of the *Index*, the monthly economic review of the Svenska Handelsbanken (Sweden), must be said to be quite timely and useful to the cotton mills in this country.

According to the review, the textile industry in Western countries which had been in the doldrums for many years is beginning to recover. The first and the most marked signs of a new upswing became evident in Continental Europe just over a year ago. The U.K. and the U.S. lagged behind and it was only a few months ago that their conditions, too, started improving. In Sweden, also, the development is of recent origin, the pick-up in demand being noticeable only during the latter half of 1956. The review, of course, finds it difficult to say whether the recovery is the beginning of a new age of prosperity for the textile industry or a mere spluttering that will die out, to be succeeded by new difficulties. But it has endeavoured to give an indication of the prospects by examining the earlier developments, particularly the reasons for the difficulties with which the textile industry has had to contend.

Textile Output

The review notes that the volume of production in the textile industry of Western countries during the last few decades has risen at a slower rate than that in other industries. In Western Europe, for instance, the rise in textile output since before the Second World War is no more than 27 per cent., while the total industrial production has gone up by as much as 80 per cent. Similarly, in the U.S., the production of textiles has barely doubled, whereas overall industrial output has trebled. The exports of textile goods from Western countries to the less industrialised nations have declined appreciably in the past two or three decades. The decline is attributed chiefly to the increasing efforts on the part of the latter countries to protect, with a view to achieving self-sufficiency in cloth supplies, their domestic textile industry by high tariff and import restrictions. Indeed, in the opinion of the *Index*, the centre of textile industry has been transferred from the industrial countries of Western Europe to the cotton-growing countries.

Incidentally, it may be noted that the recovery in textile production of West Germany has been particularly pronounced. The production index (base: 1938=100) which had receded to less than 50 in 1958 stood at 175 in 1956. The figures for the U.K., Sweden and the U.S. was more or less unchanged at about 100, 130 and 200, respectively. As compared with 1955, the production of textiles during 1956 was higher (expressed in percentage) by more than 6 in West Germany and France, 6 in Belgium, 5.5 in Norway, over 4 in Holland and Austria and 2.5 in Italy and Sweden. It was, however, lower by 5 in Denmark and about one in the U.K. and the U.S.

The loss of overseas markets is said to have severely hit the British and French textile industries. Exports of cotton cloth from the U.K. during 1955 aggregated 560 million yards, as against about 7,000 million yards before the First World War, representing a drop of 92 per cent. The other West European exporters have no doubt fared better, but the consequences have been drastic. In this connection, the review observes: "The drying-up of the export markets has resulted in surplus capacity in the West European cotton industry and the emergence of very keen competition. The situation has been further worsened by the successful entry into the West European market of such new producing countries as Japan and India. This invasion has been aided by what are, on European standards, very low labour costs. A Japanese textile worker earns about 1 shilling an hour and an Indian barely half as much."

As regards the wool industry, the trend, it is said, has not been so unfavourable for W. Europe. The review admits that the industry, too, has been subject to marketing difficulties occasioned mainly by sharp variations in the elastic demand for textile products, but claims that Belgium, France, Italy and the U.K. are still enjoying their pre-war share of about one-third of the total world production of woollen goods. These countries have raised their share of world exports from a pre-war half to about two-thirds.

Artificial Fibres

The review then refers to the impact of the rapid development of artificial fibres—rayon, nylon, etc.—which has been felt to some extent by the traditional trade in cotton and wool. The production of these fibres now account for 20 per cent. of the total output of all fibres, as against just 1 per cent. thirty years ago, and enjoys a larger share than wool. Reckoned on a *per capita* basis, the consumption of artificial fibres has more than doubled since pre-war days, while that of cotton and wool is largely unchanged. The review, however, declares that the increased use of artificial fibres has not resulted in any disadvantages for the textile trade as a whole. Elucidating this view, it says:

"The production of these new fibres, which requires a technically advanced chemical industry and large capital investments, has been largely concentrated in the highly industrialised countries of Western Europe and the U.S.A. As far as Western Europe is concerned, exports of rayon goods have partially compensated the losses due to reduced cotton goods export. Exports of rayon goods from Western Europe have risen several hundred per cent. since before the war. It is interesting to note that the United States is a net importer of rayon and that Japan is the only non-European country exporting more rayon goods than she imports."

The review also alludes to two other factors affecting textile trade. First, textile consumption has not shown any marked change in a number of W. European countries during the 1950's. Expenditure on textiles, we are told, has by no means expanded at the same rate as that on products like motor cars and TV sets. Secondly, the East European countries, in an effort to augment their holdings of West European exchange, have at times attempted to export their products at prices that did not even cover the cost of raw materials in world market prices.

Will the aforesaid "depressive" factors be apparent in the future also and, if so, to what extent? Answering this poser, the *Index* makes the following interesting remarks:

"As far as the textile industry in Western Europe is concerned, some optimism seems warranted, since the structural factors that played such a dominating role during the past few decades are now largely spent forces. Exports of textiles from Western Europe to the underdeveloped countries have sunk so low—to 13 per cent. of the total production of textiles in Western Europe—that any further large decline is impossible. Besides this, a continued decrease in the exports of cotton goods will probably be compensated—if not wholly then at least partially—by improved exports of artificial products.

"Furthermore, the demand for textiles will probably expand. Population is on the increase in most parts of the world and the general level of income is rising. However, it must be admitted that higher incomes have only been used to a minor extent for increased purchases of textiles and that such commodities as motor cars and TV sets have been more attractive to the general public. On the other hand, it is reasonable to expect that the market for these products will become more saturated in the not too distant future. Without disregarding the possibility of new products being introduced, it is possible that we now stand on the threshold of an era during which the public will display a greater interest in the purchase of clothes. It is probable that the demand for textiles in such countries as Japan and certain less industrialised countries will increase and that, as a result, textile manufacturers in these countries will be less inclined to seek foreign markets for their wares."

In conclusion, the *Index* warns that, "even if the prospects for the textile industry appear to be fairly encouraging, one must not be lulled into thinking that the danger of setbacks has been eliminated. On the contrary, there is, it says, every reason to believe that the industry will continue to be extremely sensitive to cyclical fluctuations. Nevertheless, it feels that the process of adaptation necessitated by the structural changes in the world textile market is largely complete. It accordingly expects that, in the future, the European textile industry will be able to overcome its difficulties easier than hitherto.

METRIC SYSTEM IN THE TEXTILE INDUSTRY

INTRODUCTION FROM APRIL NEXT

IF all goes well and no new hitch arises, in exactly 10 months from now—on 1st April 1958, to be precise—the metric system of weights and measures will be introduced in the cotton textile industry. A decision to this effect was taken at a meeting of the representatives of millowners and textile machinery manufacturers held in Bombay last week under the chairmanship of Mr. V. Nanjappa, I.C.S., Textile Commissioner. With effect from the aforesaid date, all purchases of raw cotton by mills will be in kilograms, instead of in lbs. as at present, while the cloth manufactured will be marked in both metres and yards. The metre will, however, be regarded as a primary unit and folding of cloth will be with reference to metres. Cloth will be sold by mills to wholesalers in metres, quantity, prices, etc., being expressed in terms of metres as far as possible. In the case of both raw cotton and cloth, the present units of lb. and yard will be permitted for some time. The meeting accepted the Central Statistical Organisation's recommendations regarding adoption of metric system in statistics. All aggregate and summary figures will be presented in metric units, as well as in the units now prevailing.

The proposed introduction of the metric system in the cotton textile industry is in accordance with the provisions of the Standards of Weights and Measures Act, under which the weights and measures now prevailing in the industry are to be replaced within 10 years by the metric system. The introduction of the metric system in the textile industry is a step in the right direction, inasmuch as it will do away with the present multiplicity of local and regional systems of weights and measures and substitute in their place a uniform system which should be easy to learn and use, unequivocal and common throughout the country. Further, it will greatly simplify calculations of diverse kinds.

May Add to Handicaps

It is, however, possible that the switch-over to the new system may add to the several handicaps that are already being faced in the drive for more exports, unless special arrangements are made for retaining the present system in so far as exports are concerned. Most of the countries to which India is now exporting cloth are following the present system of yards and lbs., and there are no signs that they will fall in line with India in the foreseeable future. Since there is keen competition in the international trade in cloth, India has to respect the wishes of its overseas customers, if it is to maintain its export trade in this manufactured item. There is no question of its reforms in weights and measures being imposed on these buyers. This question has, therefore, to be carefully examined by the authorities concerned.

While the members at the meeting were unanimous in their views on the importance of introducing the metric system, the representatives of the millowners drew attention to certain practical difficulties in the transitional period and some even favoured postponement. The spokesman of the Madhya Pradesh Millowners' Association, for instance, stated that the change-over should be very gradual and not come into force before 1st April 1960. For he said that, while it would not be difficult for the organised mills to introduce the new system, as they had the required technical personnel for the purpose, the main difficulty would be for traders and customers. In his opinion, the metric system should be introduced only after the decimal coinage was stabilised. Alluding to this point, Mr. Nanjappa observed that the adoption of decimal currency was complete and successful and, although the old coins were in circulation, they represented values in *naye paise*. The postponement of the scheme was also supported by the Nagpur Textile Mills' Association representative who said: "It is, perhaps, possible to convert measurement but not weights in the initial stages. The length of cloth can be marked by both metres and yards. The question of introducing weights in the new system may wait till sufficient experience has been gained in the conversion of the measurement side. Folding machines will continue marking in yards and, after one or two years of experience, the change-over may take place to the new system. Regarding the buying of raw materials, the change-over has to come from the supplier side."

Speaking on behalf of the Millowners' Association, Bombay, Mr. D. S. Bakhale, Deputy

"PLAN FOR COTTON" BEING FINALISED

MOVE TO SET UP A COMMISSION TO REGULATE IMPORTS OF CLOTH

From A Special Correspondent

MANCHESTER, 21*st May*

MANCHESTER LETTER

THE news that the talks between the Lancashire textile mission and Pakistan cotton trade leaders had broken down was received without much surprise here. Few among the rank and file traders in cotton textile goods had expected the delegation to achieve success in dealing with Eastern countries, which are only now turning their surplus production into export channels.

The earlier mission to India in January was able to secure a tentative agreement with Indian mill chiefs, mainly because India is already exporting about 130,000,000 yards of cloth annually to Britain and wants to keep that trade. In Hong Kong, where exports have been rising over the past two or three years, the mission found the local millowners unresponsive. Only last week, the Hong Kong Cotton Spinners Association made it clear, in a declaration, that it would take no part in any pact to restrict exports to the United Kingdom.

Indian participation in any scheme was dependent on a similar arrangement being made with other Eastern competitors. When Hong Kong rejected the British plan, the Indian trade leaders quickly announced their refusal to join in a one-sided agreement which would obviously benefit their rivals.

On their return, the Lancashire team, led by Sir Cuthbert Clegg, a Vice-President of the Cotton Spinners and Manufacturers Association, reported on the talks to Sir David Eccles, President of the Board of Trade, and to the Cotton Board. It was then decided to make the present trip to Pakistan to put trade leaders in that country in the picture.

Lancashire's case for a restriction of imports rests on the disrupting effect on prices of goods for home distribution in the face of competition from low-wage areas in the East. Already in the first three months of this year, arrivals of foreign cloth have exceeded 100,000,000 yards for the first time in any quarter.

Build-up of Supplies

One of the results of the international crisis over the Suez Canal six months ago was to focus attention on the relatively small stocks of cotton then available for distribution in this country. Supplies had been running at low levels throughout most of last year and in April were down to 140,000 bales. Realisation that transport difficulties might hamper the free flow of cotton from a number of ports, coupled with the volume of cheaper American cotton then coming on the market, brought a sharp revival in purchases towards the end of 1956.

This buying has been reflected in the figures showing cotton in visible supply in Liverpool and Manchester this year. The volume of cotton in stock and afloat for this country is now 325,000 bales, recent levels being around the highest for two years back. This includes 210,000 bales held in Liverpool, 42,000 bales in Manchester and 73,000 bales still at sea. More than half these supplies consist of American cotton, at present amounting to 186,000 bales, while the Sudan has provided 37,000 bales, Turkey 19,000 and the Argentine 12,000.

Arrivals of raw cotton into Great Britain this season are unlikely to be much in excess of the quantity imported in the previous 12 months, despite the phenomenal increase in the amount of American cotton shipped across the Atlantic. To mid-May, the volume of arrivals at 1,371,699 bales was about 200,000 bales below the imports during the whole of the 1955-56 season.

America Sends More

Supplies taken from the United States have already reached nearly 810,000 bales, as against less than 200,000 bales throughout last season and, as a result, purchases from other sources have shown a uniform decline. Only in the case of Turkey and the Argentine have bigger shipments occurred and, in some instances, there have been sharp reductions in the quantity bought.

The same trend has been reflected in forwardings of cotton to spinners in Britain. The movement of supplies to mills this season seems likely to be smaller than a year ago, in spite of the increased activity recorded over recent months. The latest forwardings total is practically 1,300,000 bales, as against more than 1,700,000 bales in the whole of last season. Supplies of American cotton have accounted for 728,400 bales, as against 218,663 bales in the 1955-56 season and the use of Mexican cotton has been halved at 107,000 bales.

European Competition

Fears that Continental competitors will find loopholes in safeguards written into a European Free Trade Agreement was expressed by Mr. Lionel F. Cockcroft, Chairman of the Ticking Group of the Manchester Chamber of Commerce, whose member firms manufacture bed coverings. Many organisations had pointed the need for safeguards in the final agreement, such as harmonisation of wage rates and working conditions, said Mr. Cockcroft.

"Other people's ideas of rules give a lot of scope for benefit to competitors and trouble for us," he told the meeting. "I feel that, if the utmost care is taken to seal up all the known and anticipated loopholes, new ones will be found or made. The active minds of our Continental competitors will exploit them to the full, to their advantage and our detriment."

Leaders of the Lancashire textile unions met Mr. Harold Wilson, M.P., in Manchester this week, to finalise details of the 30,000-word document "Plan for Cotton," which outlines the trade union conception of the Lancashire textile industry of the future. Mr. Wilson said after the meeting that he would now make one or two minor amendments which had been suggested and the document would be returned to Lancashire within a few days. It will then be sent on to individual unions for their approval.

Mr. Wilson said that "Plan for Cotton" contained 18 recommendations. These are understood to include proposals for a return to centralised buying of raw cotton and the setting up of a commission to regulate imports of cheap foreign cloth which are affecting Lancashire order books.

Cotton Needs Technologists

The Lancashire cotton industry needs better management, better planning, more brains and less drawn, according to the annual report of the Textile Officials' Association, Manchester. On capital investment in new plant, the report says: "Obviously, new plant should give better results, but, in a desparate economic situation as that in which the industry finds itself, we must look further ahead and view the industry as a whole."

Mill Firm to Merge

After trading for over 130 years, a big Manchester textile merchanting group is being forced to seek a merger with stronger units because of recent heavy losses. Mr. E. G. Turner, Chairman of Balstone, Cooke and Rayonese Ltd., announced this week that negotiations have been proceeding with several organisations, one of which had shown considerable interest in an amalgamation. "Discussions are still going on," he said, in his annual report, "but it may be some months before a decision can be taken. I see little chance of the company being able to make sufficient profit to restore the position within a measurable period of time and it has become increasingly clear that a merger with a stronger unit is highly desirable."

The value of the £1 preference share was in the region of 15s., Mr. Turner added, but the ordinary share capital had been lost and these 5s. shares had no real value. He hoped that a token offer of at least 6*d.* a share could be obtained in the event of a merger, but nothing better than that could be anticipated. "The last few years have played havoc in the cotton trade and the effect on this company, as on many others, has been disastrous, especially to the ordinary shareholders."

Balston Cooke & Co., was founded about 1824 as manufacturers of velvet cloths, merchants and exporters. An amalgamation with Rayonese Ltd. took place in 1935 and, 10 years ago, further business extensions were made, the company acquiring Barraclough Milner & Co., Ltd., textile manufacturers, owning the Rookes Mill, near Halifax and Thomas Mellodew & Co., Ltd., velvet manufacturers, owning the Parkfield and Moorside Mill, Oldham.

In 1955, the Oldham Mills were closed following an investigation into the affairs of the company and the machinery was sold piecemeal early last year. During the past 12 months, a group loss of £7,584 was incurred, following a loss of £172,093 in the previous year. Arrears of preference dividends date from the end of 1953.

REDUCED AVAILABILITY OF COTTON OUTSIDE U.S.

FACTOR RESPONSIBLE FOR LARGE EXPORTS FROM AMERICA

AN important development of recent months, so far as the world cotton situation is concerned, has been the resumption of heavy export sales in the U.S. The U.S. Commodity Credit Corporation took over on 1st January last six million bales of the 1955 crop cotton to be sold for export in the 1957-58 season on a competitive bid basis. Bids under this scheme were opened on 19th March and are still being received, while actual exports of cotton covered by these bids will commence after 15th August 1957. Under the 1956-57 programme, still in operation, over 7 million bales have already been sold for export. As a result of heavy purchases earlier in the season and the limited quantity then available for export, sales under this programme had tapered off after the turn of the year. Till 8th March last, sales were nearly 6.4 million bales and on this basis official and trade sources were estimating exports for the full season at a little over 6.5 million bales. There has, however, been an upward revision of the estimate of the probable level of exports this season since the publication of the sales made on bids received on 19th March. On that date, the C.C.C. received bids for cotton under both the 1956-57 and 1957-58 export programmes. Under the former, bids were accepted for 582,360 bales at an average price of 27.42 cents per lb. This cotton must be shipped, unless the shippers are willing to suffer penalties, before 15th August. At the first sales under the new programme, on that date, 140,506 bales were disposed of. From all this, it appears that actual exports during the 1956-57 season ending in July next might be more than what was anticipated earlier and may well aggregate 7.5 million bales.

The resumption of extremely heavy export sales in the U.S., according to the International Cotton Advisory Committee, Washington, has important implications. It may be construed as meaning, observes the Committee, that foreign buyers do not anticipate a fall in cotton prices below their present level at least in the immediate future. It may also be an indication that importing countries are building up stocks this season. In most instances, imports have exceeded consumption in recent months. If there is any sizable build-up in stocks in the net importing countries, which at present seems likely, total free world exports this season may rise to 14 million bales, as compared with 11.6 million bales in the previous season. Of this, the share of the U.S. will be about 7.5 million bales, as compared with a mere 2.2 million bales last season, and that of the free world countries outside the U.S. between 6 and 6.5 million bales, as compared with 9.4 million bales in the 1955-56 season. Exports from many countries have been lower this season, the most serious contraction in shipments being in Egypt, although there are signs of some likely improvement during the rest of the season.

Concern had been expressed in some quarters over the effects the U.S. export programme are thought to be having on exports from other countries and on the overall trade situation of cotton. The fact that the U.S. has been able to export as much as it had done so far without disrupting world markets, however, shows that the fears of those who opposed the programme were unfounded. The absorption of U.S. exports was possible because of the reduced availabilities in countries outside the U.S. on account of the very low carryover stocks and lower production. Opening stocks at the beginning of the season outside the U.S. were only 7.5 million bales, as compared with 9.4 million bales at the beginning of the 1955-56 season.

Free world production this season is expected to aggregate 29 million bales, as compared with 30.9 million bales harvested in 1955-56. Of this, the U.S. share will be 13.2 million bales and that of other countries 15.8 million bales. The March ginning report in the United States puts the 1956-57 crop at 13,150,313 bales, as compared with 14,542,040 bales in 1955-56. The average yield per acre for the entire country declined slightly, but the final figures show that, in some States, reduced acreage was more than offset by much higher yields, with the result that production there actually increased as compared with 1955. In Uganda, production estimates have been reduced slightly on reports of wet weather in the eastern and northern provinces, but the crop will still be about equal to last season's 304,000 bales. Recent information from South America would seem to confirm a probable decline in total production, mainly because of the smaller crop in Brazil this season. Production in the State of Sao Paulo is now thought to be around 700,000 bales which, together with other areas and North Brazil, would give a total crop of less than 1.5 million bales as compared with 1.7 million bales in 1955-56. Favourable weather has improved the crop outlook in Peru and production is presently expected to be fully equal to last season's 450,000 bales. In Argentina, the eastern areas were affected by drought in February. Drought has caused premature opening of some cotton and the staple length of early ginnings is on the short side.

In Egypt, production has declined this season, but the reduction in supply is mainly attributed to much lower stocks. In Brazil, supply has been affected both by reduced stocks and lower production. In each of these countries, supply is down by nearly 400,000 bales as compared with 1955-56. In Pakistan, stocks were down by 100,000 bales and production by an equal amount. Supply is also significantly lower in Peru and the Central American countries.

Very low carryover stocks and reduced production, as pointed out earlier, have resulted in a marked reduction in free world supply outside the United States this season. Stocks in other net exporting countries on 1st August 1956 aggregated only 2.5 million bales as compared with 3.7 millions a year earlier. The following table gives an idea of the supply position of cotton in some selected countries.

Supply of Cotton in Selected Countries
(In thousand bales of 478 lbs.)

Country	Supply 1955-56	Supply 1956-57		
		Stocks as on 31st Aug.	Production	Total
U.S.	25,885	14,529	13,150	27,679
Mexico	2,510	60	1,770	1,830
Central America	496	62	340	402
Brazil	2,525	650	1,500	2,150
Peru	715	135	470	605
Argentina	924	410	550	960
Egypt	2,156	305	1,470	1,775
Sudan	725	155	545	700
Uganda	344	50	310	360
Belgian Congo	295	30	250	280
Turkey	735	165	575	740
Syria	430	10	400	410
Iraq	283	25	275	300
Pakistan	1,685	165	1,320	1,485
India	6,300	1,980	4,200	6,180

As will be seen from the above table, the main reduction in supply has been in Mexico, Brazil, Egypt, Pakistan and Peru.

A point that deserves special mention, in this connection, is that, although the availability of cotton outside the U.S. has registered a decline, the overall supply position in the free world remains more or less unchanged. Total supply of cotton in the free world is estimated at 51 million bales (as against 51.5 million bales in the 1955-56 season) comprising 27.7 million bales (production plus stocks) in the U.S. and 23.3 million bales (production plus stocks) in other countries. As against this, in the previous season, of the total supply of 51.5 million bales, the U.S. accounted for 25.9 million bales, while the share of other free world countries aggregated 25.6 million bales.

The expected increase in the U.S. exports, observes the Committee, may not mean a corresponding deterioration in trade prospects in other countries. True, exports from many countries have been lower this season, but, in relation to reduced availability in the latter, the trade situation, says the Committee, is "far from discouraging." However, any significant build-up in stocks in net importing countries this season would, according to the Committee, tend to reduce total exports during the next season. The U.S., for instance, expects a marked fall in shipments in the coming season.

IMPORT OF U.S. COTTON

A striking feature of India's import trade in cotton this season is the large share which U.S. growths occupy in the total figure. This is evident from the fact that, of the total 442,972 bales (392 lbs. net) of foreign cotton imported during the period 1st September 1956 to 11th May 1957, 283,051 bales were accounted for by U.S. cotton. During the corresponding period of the previous season, import of American cotton aggregated only 12,051 bales. Arrivals of U.S. cotton during the rest of the season are expected to increase further. The Government of India announced on 22nd May that import of a further 160,000 bales of U.S. cotton would be permitted. Out of this, 100,000 bales would be under the Development Assistance Programme and the balance of 60,000 under Public Law 480. This announcement is a sequel to the issuance of a purchase authorisation by the U.S. Department of Agriculture favouring India for 50,000 bales (of 500 lbs.) of U.S. Upland cotton valued at $8.6 millions. This is part of the balance quantity (about 350,000 bales) which India is still to receive under the Indo-U.S. Trade Agreement signed in August 1956. It may also be mentioned, in this connection, that, in April last, the International Co-operation Administration made an authorisation for 83,000 bales (of 500 lbs.) of U.S. cotton for India which is presumed to be in addition to the quantity allocated under the Indo-U.S. Trade Agreement.

BUILDING UP EXPORT TRADE IN SUGAR

DEFECTS IN QUALITY, PACKING AND DELIVERY MUST BE REMOVED

IT is now clear that India is anxious to develop an expanding export trade in sugar. A fortnight ago, the Union Food and Agriculture Minister declared in the Lok Sabha that the Government wanted to export as much sugar as possible, in order to earn foreign exchange. The original quota of 50,000 tons, he said, had first been stepped up to 100,000 tons and the Government wanted to increase this figure too. Close on the heels of this pronouncement came the Finance Minister's statement that his proposal for steeply enhancing the excise duty on sugar (from Rs. 5.62 to Rs. 11.25 per cwt.) aimed at restraining domestic consumption, so that more sugar might be available for export.

Considering the critical foreign exchange position confronting the country today, as also the current level of sugar supplies which is more than necessary for meeting internal consumption, the need for building up an export trade in sugar cannot, indeed, be questioned. On every ton of sugar sent out, the country can earn foreign exchange of about Rs. 800. There is said to be good demand for Indian sugar in several countries, especially Ceylon, Burma, Malaya, East Africa, China and West Asian countries. Since India is very favourably situated and friendly with these countries and its quality of sugar is second to none, it can expect to find regular markets in these countries. Much, of course, will depend on the cost of manufacture and the efforts of the merchants engaged in export business to earn a good reputation for Indian sugar. The latter aspect requires to be specially stressed, for there are already complaints such as defective packing and short weight from some countries about the sugar supplied to them. The Indian Sugar Mills' Association (I.S.M.A.), to which the export business has been entrusted, has accordingly done well in taking steps to meet such complaints. It has, for instance, employed, at considerable expense, an internationally reputed group of surveyors who exercise a strict control on the packing and quality of all sugar meant for export both at the mills and at the ports of shipment.

Complaints Still Persist

Notwithstanding the aforesaid move of the I.S.M.A., complaints from overseas markets still persist. An idea of what these complaints are and how they could be met can be had from an interesting letter which Mr. H. Kraus of Messrs. M. Golodetz, a leading firm of sugar traders in London, has recently written to the I.S.M.A. after his visit to India in April last. This letter deals with Indian sugar exports to Malaya.

In his letter, Mr. Kraus has drawn attention to the impurities visible in the sugar shipped by India. He says: "Generally speaking, type samples are meant to represent not the incidence of impurities but rather the grain and colour of the sugar. In that respect, we have seen some of the sugar which has arrived in Malaya and those samples, which admittedly may not be representative of large tonnages, appeared to the writer to be undoubtedly well below the coloured standard laid down by the type samples, much more irregular in grain than either the original or the substitute type samples which we have received from you, and with some admixture of foreign matter (black specks)." He no doubt admits that the question of attaining a uniform product from numerous mills is a very complicated one, but suggests limiting of sugar export to such mills as have shown consistently good and uniform outturn both within India and in export markets. This suggestion is quite pertinent and merits the serious consideration of the industry and the Government alike.

Another important defect to which Mr. Kraus has drawn attention relates to the "sorry state" of packing. He even claims to have actually seen one empty bag, where there ought to have been a full one. According to him, there are numerous markings, mostly illegible, on the bags, which are clearly unsuited for ocean transport. Consequently, it has proved impossible to distinguish at times between sugar for different consignees and, as a result, some buyers of C29 have received D20 sugar and *vice versa*.

Adverse comments have also been made on the quality of sugar by several recipients of Indian sugar, more particularly Burma. Citing the example of Iraq, Mr. Kraus observes: "In Iraq, where we have sold for years substantial quantities of every type of sugar which that country bought, our clients are averse to entertaining offers of Indian sugar even at parities more than £4 below S.W.C. We ourselves have booked no business in Indian sugar for Iraq, but we are given to understand by our customers there that there has been a certain amount of disappointment over those shipments which have already reached that country." In this connection, Mr. Kraus has urged the importance of establishing uniform standards of sugar and packing which will make the product as acceptable and welcome in all markets as sugar from Taiwan or Java. To quote him: "As sugar is normally sold on description and marked in reliance on uniform colour and grain, and absence of impurities, we think that, as your export trade gets into its proper stride, you will be able to establish set, unvarying standards. This, we are certain, will stand you in very good stead and it is, in fact, a prerequisite to making your sugar popular in its own right and irrespective of the price or freight advantages which you may have to offer. In line with this standardisation, we suggest there should also go a more uniform weight of the bags which, we find is at times very considerably above the 226 lbs. stipulated. Bearing in mind that buyers count on a given quantity of sugar and frequently sell it not per maund or catty, but per bag, a uniform weight is a very desirable factor. So is, of course, the resale value of the empty bag."

Shipping Documents

Special attention has been drawn to the extremely slow arrival of shipping documents. It is pointed out that, in times when the sugar market is less firm, late receipt of documents may lead to a refusal by the ultimate buyer to take them, because the documents are stale. This is an important consideration, seeing that, on a weak or rapidly falling market, many buyers will be unscrupulous in trying to exploit any shortcoming in the fulfilment of contracts in order to escape from a commitment which may turn out to be onerous.

Another valuable point which Mr. Kraus has made refers to the appointment of international supervisors to certify the quantity and packing of sugar. His comments on this issue are as follows:

"Sugar has not in post-war years been exported from India and, as a result, there is not available within your country any laboratory which, with its own instruments and staff, is equipped to certify all the requirements under the contract. It is also not impossible that recipients of the sugar, to whom shipments failed to give satisfaction, may argue that the supervisors being appointed by yourselves without consultation or option by the buyers act, strictly speaking, as your servants. We have no intention to cast any aspersions on the zeal and care which the present supervisors are endeavouring to use in respect of your shipments, and we mention this point only for the twofold reason that, first, you asked us for details and frank comments, and, secondly, because of your understandable desire to set the highest possible standards on the reputation of your sugar and your marketing organisation, and we feel it possible that the buyers of your sugar may not necessarily share the view that, because a shipment has been passed by a reputable organisation of surveyors, it will, in fact, prove to be in exact conformity with the contracts, reputation and prestige being matters of goodwill and respect, rather than of legal rights and positions."

The foregoing account serves to emphasise that, unless the sugar industry and trade take some energetic measures to remove the kind of defects mentioned above, there is a danger of the country losing even the few sugar markets which it has won now, let alone their development and expansion. The Indian Sugar Mills' Association will also do well to keep itself fully in touch with the developments taking place in world sugar trade. The overseas buyers must be assured of sugar supplies according to the specifications and samples shown and shipments must be prompt. Sugar mills should scrupulously observe the specifications laid down for packing sugar and supply it as contracted, that is, with consistency in quality, finish and delivery.

COAL-BEARING AREAS

ACQUISITION TO COST ABOUT RS. 1 CRORE

THE Lok Sabha passed last week the Coal-bearing Areas (Acquisition and Development) Bill, after a clause-to-clause discussion on the same. As already stated in these columns earlier, the Bill seeks to establish public control over the coal-mining industry and its development by acquisition of unworked land containing or likely to contain coal deposits or of rights in or over such land. It also seeks to provide the Government with powers for the extinguishment or modification of such rights accruing by virtue of any agreement, lease, licence or otherwise. Many amendments were moved, but all of them were rejected by the House and the Bill was passed *in toto*.

An amendment to the clause relating to acquisition of unworked land in coal-bearing areas was moved by Pandit Thakurdas Bhargava, urging the Government to exclude from the scope of the Bill existing collieries and immediately contiguous areas necessary for the efficient exploitation and expansion of the collieries. The Bill at present excludes that portion of any land where coal-mining operations are actually being carried on in conformity with provisions of any enactment, etc. The amendment was opposed by the Minister for Mines and Fuel, Mr. K. D. Malaviya, on the ground that it would create many problems. He made it clear that it was not the Government's intention to deny facilities to the private sector so far as existing collieries were concerned, nor did it propose to stop men from expanding for the sake of better efficiency when the right movement for such expansion came. A target had been set for the private sector, the Minister added, and the Government did not wish to hamper the legitimate progress of collieries.

In the course of discussion on the clause relating to the power of the Central Government to direct vesting of land or rights in a Government company, Pandit Thakurdas Bhargava suggested, through an amendment, the liberalisation of the provisions of this clause so as to enable the Government to acquire land from both private and Government companies. This, according to him, would help the private sector. This amendment also was rejected by the Minister, as he considered it out of place, because the Government did not wish to create private companies under Government ægis. The object of the Bill, the Minister explained, was to create conditions under which the Government could take control of coalfields for exploitation. The amendment did not confer on the Government powers to create private companies. The Government, the Minister added, wanted both the public and private sectors to flourish.

The clause relating to payment of compensation produced some discussion and a large number of amendments were moved, but were thrown out. The speeches of some members revealed their anxiety to water down the compensation amount as much as possible. The Government spokesman, however, stood firm on the point and refused to accept any suggestion for lowering the compensation that would be available on the basis of the Bill's provisions. Mr. T. B. Vittal Rao, Communist Member from Andhra, moved an amendment suggesting that compensation need not be paid to the owner for expenditure incurred on prospecting. Interest on expenditure incurred by a lessee should also not form part of compensation. Mr. H. C. Dasappa, Congress member from Mysore, desired that the compensation amount should not exceed the total evaluation of various items of expenditure. Mr. Naushir Bharucha, P.S.P. member from Bombay, also moved certain amendments, the object of which was to prevent the Government from frittering away public money. This could be secured by limiting the quantum of compensation. He suggested that the compensation for acquisition of maps, charts and other documents should not exceed Rs. 2,000. The licensees should not be paid more than one-tenth of the expenditure incurred on prospecting. No compensation should be paid for payment of deal rent or royalty for the period in which there was no coal production.

Rejecting the amendments, Mr. Malaviya explained the underlying policy of the Government behind payment of compensation. He said that, whenever coal-bearing land was acquired or rights thereon were taken up, "reasonable and fair compensation" would be paid. The Government could not go back on this policy. He declared: "We do not want to pay

LABOUR CONDITIONS IN JUTE MILLS

EMPLOYMENT OPPORTUNITY SHRINKS

A GRADUAL shrinkage of employment opportunities in jute mills in West Bengal following the implementation of the policy of rationalisation in the industry is one of the main findings of the West Bengal Government's enquiry into the labour conditions in jute mills in the State. The enquiry reveals that there has been a reduction of permanent hands, an increase in the number of *badli* workers and a sharp drop in the number of women employees.

The enquiry was made at the instance of Mr. Jawaharlal Nehru, Prime Minister, following a memorandum submitted to him by some Communist members of the State Legislative Assembly during one of his visits to the State in 1956. The State Government's findings are based on replies received by it from 88 mills (out of 101 mills in the State) to a detailed questionnaire issued by the Labour Directorate in December, 1956 eliciting detailed information about different aspects of employment conditions in jute mills. The enquiry has received additional significance now on account of the recent closure of some mills and its possible repercussions on the State's general economic position. Though the lockout in the Kinnison Jute Mills in Titagarh, 24 Parganas, was ended on Thursday last week, after lasting for 15 days, and all the workers, numbering about 4,800, resumed work, the overall economic position of the industry as a whole is far from encouraging, what with the threat of drought to the jute crop of 1957-58 and the consequent higher cost of raw jute to mills. Any decision taken on the findings of the State Government's latest enquiry into the employment position should, therefore, take into consideration the present situation, as well as the frequent and wide fluctuations in the fortunes of the industry.

The period chosen for the enquiry covers the years from 1951 to 1956. The enquiry reveals that, during this period, the number of permanent hands has fallen by about 19,000, that is, from 214,000 in 1951 to 195,700 in 1956, while, at the same time, the number of *badli* workers has risen by 9,800 from 32,400 to 42,200. Since 1955, there has been a substantial drop in employment as a result of what is termed in industrial circles as "natural wastage" and retirement with retrenchment benefit, following modernisation in some of the jute mills. It has also been found that the number of women workers, who constituted a substantial part of the total labour force in the industry in the past, has gradually diminished from 30,400 to 19,569. This is probably the outcome of the measure of economy adopted by the industry in not recruiting fresh women employees, who, under the present labour legislations, are entitled to certain special amenities and benefits. The minimum wage fixed for the industry in October 1955 was Rs. 67-2-9, as against Rs. 63-6 in 1951 and Rs. 58-8 in 1948. In addition, women workers are entitled to maternity and other benefits, the obligation for payment of which decreases with the reduction in the number of women employees. While there has been a general fall in employment, the wage bill of the industry has gone up from Rs. 19.65 crores in 1951 to Rs. 24.57 crores in 1956.

Most of the 88 mills, the conditions in which has been studied by the State Government on the basis of the replies submitted by them, are stated to have complied with labour legislation offering benefits to workers. The enquiry has, however, revealed an unsatisfactory position in respect of housing of the jute mill labour, despite the offer of help by the Union Government in the shape of loan and/or subsidy to build houses for industrial workers. Out of about 196,000 workers in the mills, only 86,000 workers are said to have been provided with accommodation in about 48,000 tenements, and of these not all are provided with kitchens or water taps.

One of the reasons for the inadequate provision of accommodation is that workers are not willing to take up the full accommodation offered. This is because of the high rent fixed under the industrial housing scheme. Reluctant to pay the high rent, the workers, in groups of four or five, or even more, hire a room in a *bustee* at a very low rent and share the cost among themselves.

The State Government is reported to be considering a proposal to appoint an expert committee to go into the position of the whole industry with special reference to the employment position and suggest remedies. The effect of modernisation, the possibilities of internal and external markets for jute and jute goods, the question of improving the quality of the finished goods and setting up of a subsidiary industry to utilise the by-products of the jute industry, are among the problems to be studied by the committee. The proposed committee is also expected to consider how best the industry can be expanded, so that a large number of people might be employed. The standing Labour Advisory Committee, which had held only two sittings since 1947, may also be revived. Meanwhile, it is stated that the State Government has requested jute millowners to inform the Labour Directorate beforehand about the closure of any particular unit which might further affect the employment opportunity of the workers.

JUTE SUPPLIES

It is feared that, should the present drought conditions in jute-growing areas continue for another two weeks or so, India's jute crop for 1957-58 will be seriously affected. The growth of plants in the parched fields in the Eastern States has already been hampered by the absence of rain or its insufficiency, giving rise to apprehension about the crop prospects. The prospects after sowing appeared to be good and the 1957-58 crop was then estimated at 5.7 million bales, as against the country's total requirements of 6.2 million bales. On the basis of this estimate, India's dependence on Pakistan for supply of raw jute was only to the extent of 500,000 bales. Whether the position will be worse than this expectation will be known in a few weeks' time.

The arrivals of jute and mesta in Calcutta and at mills' stations during April 1957 amounted to 375,500 bales, as compared with 477,500 bales in the corresponding month of 1956. Of this quantity, Indian jute and mesta accounted for 340,900 bales and Pakistan jute for 34,600 bales, as compared with 383,500 bales and 94,000 bales, respectively, in April 1956. The total arrivals for the first ten months of the 1956-57 season amounted to 5,484,300 bales, as against 5,701,900 bales in the corresponding period of 1955-56. This quantity is made up of 4,925,600 bales of Indian varieties and 558,700 bales of Pakistan arrivals, the corresponding break-up figures for the first ten months of 1955-56 being 4,327,700 bales and 1,374,200 bales, respectively.

An analysis of the figures pertaining to monthly arrivals of Indian jute during the last four months shows that, while supplies were substantially higher in January than in the corresponding month of 1956, and well above the requirements of mills, they considerably slackened in the subsequent months, with the result that, in April 1957, they were well below those in April 1956 and even fell very much short of the mills' consumption. Nevertheless, the present stocks with mills, together with their purchases already made, will enable them to carry on till the end of July. It is also estimated that the unsold stocks in Cossipore and the upcountry centres, if made available to mills, will sustain their production up to the middle of September, by which time the new crop, if drought conditions do not prolong, will be available in fairly large quantities.

PRIVATE JUTE TRADING IN EAST PAKISTAN

Private trading in raw jute in the border belt of East Pakistan has ended, with the promulgation of an order, on 25th May 1957, by the Government of Pakistan to the effect that no jute shall be exported in *kutcha* bales except by the East Pakistan Jute Marketing Corporation. The Corporation, which is a semi-Government organisation, was recently formed, with a view to stabilising raw jute market in the interest of jute growers, and checking smuggling across the border.

The Corporation will have its own agents who will be granted dealers' licence in the border belt where every cultivator will be made accountable for disposal of jute grown and harvested by him. The defaulting cultivator will lose the grower's licence. The cultivators will have to sell initially through the Corporation to the latter's agents at *ad hoc* prices which the Government will indicate to the Corporation.

(Concluded from next column)

any, to the planters will not exceed the amount as on the date of agreement. The agreement also provides that all claims raised by either workers or their representatives relating to wages of the above categories of workers pending on the date of the agreement will be deemed to have been withdrawn.

RUBBER OUTPUT AND CONSUMPTION RISE

The production of rubber in April 1957 amounted to 2,072 tons, having gone up from 1,220 tons in the previous month, and 1,826 tons in the corresponding month of 1956. This brings the total output in the first four months of 1957 to 6,647 tons, as against 6,164 tons in January-April 1956. The consumption by manufacturers during the month under review aggregated 2,907 tons, which compares with 2,586 tons in the previous month and 2,402 tons in April 1956. The aggregate consumption in the period January-April shows a rise from 9,630 tons to 10,665 tons. The stocks with estates and dealers as at the end of the month amounted to 3,657 tons and those with manufacturers 2,532 tons, as against 2,516 tons and 2,342 tons, respectively, a year ago.

PLANTATION WAGES IN MYSORE

THREE-YEAR AGREEMENT SIGNED

THE recent events in respect of plantation labour wages in South India have confirmed that nothing is more conducive to the preservation of healthy employer-employee relationship than settlement of disputes through negotiations. References to tribunals, appeals to courts, etc., have all proved to be a long-drawn-out affair, with the result that, when awards are given, the retrospective nature of them casts a heavy burden on the employers and often they are implemented grudgingly. The efficacy of settlement by negotiations has, on the other hand, never been doubted, because of the element of human touch in it.

An important instance of this trend is provided by the recent settlement between the U.P.A.S.I. and the plantation workers in Madras State. This out-of-court agreement was arrived at at the instance of the then State Minister for Industries and Labour after the Tribunal had given an award, which was too onerous for the plantations to bear, and when an appeal against the award was pending with the Supreme Court. The latest instance of this welcome trend is provided by the three-year industrial truce signed between the representatives of labour and management of coffee, tea, and rubber plantations in the area covered by the old Mysore State and Coorg on 26th May, in the presence of the State Labour Commissioner. The truce was signed after negotiations lasting six weeks between the various labour unions, planters, the Labour Commissioner and the Labour Minister. It is noteworthy that the agreement, which seeks to raise the wage level of plantation workers, was arrived at not after the dispute was dragged to a tribunal, as in the case of Madras State, and that too within a short period of no more than six weeks.

Under the agreement, nearly 120,000 workers in various plantations will get an increase of 40 per cent. in wages with effect from 1st April 1957. They will also be entitled to provident fund benefits with effect from 1st May 1957. Male workers, for instance, who were getting a daily wage of Re. 1 in the old Mysore State before 1st April 1957 will now get Re. 1.40. The wage of a male worker in Coorg has been raised from Re. 1-2-9 to Re. 1.50 per day. A corresponding increase in wages of women and children has also been made.

For the purpose of the award the estates have been classified into two, depending on their size. Workers in coffee estates with a planted area of 50 acres and above will get slightly higher wages than those in estates below 50 acres. Tea estates with planted area over 600 acres will have to pay slightly more than those with a planted area less than 600 acres.

The following are the daily rates of wages arrived at under the agreement:

	Mysore Rs.	*Coorg* Rs.
COFFEE		
50 acres and above		
Men	1.40	1.50
Women	1.06	1.12
Adolescents	0.88	0.95
Children	—	0.75
Below 50 acres		
Men	1.35	1.35
Women	1.05	1.05
Adolescents	0.85	0.85
Children	0.70	0.70
TEA		
600 acres and over		
Men	1.50	1.50
Women	1.16	1.16
Adolescents	0.97	0.97
Children	0.78	0.78
Below 600 acres		
Men	1.40	1.50
Women	1.06	1.12
Adolescents	0.88	0.95
Children	—	0.75

Rubber plantations have to pay the same rates of wages as in coffee plantations in the respective areas of old Mysore and Coorg. In respect of tappers, however, the question will be settled by further negotiations between the parties.

The wages arrived at under the agreement are consolidated agreed wages, inclusive of dearness allowance and are deemed to include payment for the weekly day of rest. The agreement is without prejudice to the existing benefits available or provided under any statute, custom or practice. It has also been agreed that the supply of foodgrains to workers at the existing scales regarding quantity either at cost or on subsidy basis will be continued as at present in estates where this practice has been in vogue, subject to the condition that monetary loss, if

M.PS ASSAIL RAILWAY ADMINISTRATION

MR. JAGJIVAN RAM'S SPIRITED DEFENCE

IT was on the whole a very lively debate which took place in the Lok Sabha which considered the Railway Budget. Critics were vehement in their protest against what they termed the administration's extravagance in the construction of large buildings. Track electrification schemes also came in for criticism on the ground that they were not so urgent. Similarly, the members opposed the tax on railway fares. Defending the Railway Administration, the Union Minister for Railways, Mr. Jagjivan Ram, promised that every effort would be made to economise expenditure on buildings. He also assured the members that he would convey to the Union Finance Minister the suggestion for exempting from tax railway fares for some short distances. But he frankly admitted that he could not do much in the matter of overcrowding in trains.

In the course of the debate, members criticised the new practice by which the increase in railway passenger fares was effected by the Finance Minister. This, it was pointed out, was an undesirable practice. It may be mentioned here that the Union Finance Minister made a passing reference to this question in the course of the reply to the debate on the General Budget in the Rajya Sabha. He then indicated that the Constitution envisaged the levy of such a tax by the Centre. The States, he said, were expected to gain Rs. 225 crores; they might not be able to do so. He felt that, if they could not do so, the Centre would have to accept responsibility and find money and not sit back and say it was not the responsibility of the Centre. Be that as it may, the Railway Minister was content with assuring the members that their suggestion for relief from tax on passenger fares for short distances would be passed on to the Union Finance Minister. Referring to overcrowding in trains, he said: "However much I would like to lessen overcrowding, I know that, placed as we are, with shortage of fuels and materials, it will not be possible, in the course of the second Five-year Plan, to reduce overcrowding to any appreciable extent." All that could be attempted, he said, was to "equalise overcrowding" on the various sections. Even if that could be done, it would be an achievement. He then went on to add: "If I can persuade the Planning Commission to sanction funds and if the resources of the country can afford it, the railways can increase the capacity and reduce overcrowding. But I attach greater importance to the transport of goods traffic than passenger traffic because on the movement of goods hinges the success of the second Five-year Plan."

Buildings

Replying to the complaints of extravagance in the construction of buildings, Mr. Jagivan Ram revealed that, in view of the need for conserving every ounce of cement and steel, he had stopped the constructions of all "prestige buildings." Appropriately enough, this announcement was greeted with cheers from all sections of the House. As an instance of his prompt action in the matter of stoppage of fresh construction, he said: "The other day, I read in the newspapers about the foundation-stone being laid at Gorakhpur by the Chief Minister for the construction of the office of the general manager; the building was to be an expensive one. I have already directed the Railway Board to inform the general manager that that building is not to be constructed. A modest building will do." It is to be hoped that the entire building programme will be reviewed and similar prompt action taken in the interests of conservation of building materials and their diversion to more essential uses.

Some members made a fervent plea to the Railway Administration to give up the track electrification schemes, since it would save several crores of rupees and also enable the railways to give relief from fresh burdens on passengers and other users of the railways. It may be mentioned here that, in the second Five-year Plan, there is a provision of Rs. 80 crores for electrification of 800 miles of Indian railways, the scheme included in the Plan being the Calcutta suburban area, the Burdwan-Gomoh, the Igatpuri-Busaval and the Tambaram-Villupuram sections. The authorities are contemplating extension of electrification to cover another 500 miles track which would include Gomoh-Moghalsarai, Assansol-Rourkela and Rajkharswan-Barajamda sections. Justifying the track electrification programme, Mr. Jagjivan Ram argued that the congestion in the areas where the track was now sought to be electrified, affected not only that particular region but the entire country. Electrification in such areas, he said, was not a luxury but a sheer necessity. In this connection, he announced that the railways would send a small delegation to European countries to study the performance of A.C. (alternating current) traction. The tentative decision which had been taken earlier in favour of D.C. (direct current) traction was being reviewed. It would appear that the Railway Board was considering the utilisation of D.C. equipment and rolling stock ordered for the Calcutta area on some other D.C. systems such as those in Bombay and Madras.

Purchase of Stores

Finally, Mr. Jagjivan Ram announced that, in order to save on dealers' commission on equipment ordered from abroad, he proposed to rely more and more on the State Trading Corporation. He said: "I think, in the years to come, all our purchases will be directed or channelled through that Corporation and we will save a lot of commission." This announcement is somewhat disturbing, for it indicates a certain departure from the established practice in the railways. It is not clear how the State Trading Corporation which has no special knowledge or experience in supplying the stores and equipment the railways need, can deliver the goods more promptly or quote lower prices than private traders competing among themselves. There can, of course, be nothing wrong in calling for tenders, both from the private traders and the State Trading Corporation, and choosing the lowest bid. But it would be an unjustifiable policy to give the monopoly in the supply of stores to the State Trading Corporation without subjecting it to a competitive test. The railways are expected to purchase about Rs. 1,000 crores worth of stores and equipment in the course of the second Five-year Plan. Any hasty modification of the existing practice or creation of a monolithic monopoly supply organisation is fraught with serious consequences to the success of the Railway Plan.

(Concluded from next column)

porters to take advantage of protection in the fullest manner possible. On the one hand, manufacturers, he said, were required to maintain the highest standards of quality in their products, diversify production and thereby cater to the needs of larger sections of the community, maintain adequate supplies and lower prices, as and when possible. On the other hand, consumers were expected to give the fairest trial to indigenous products in the interests of the development of the national economy, while importers were expected to rearrange their programmes in such a manner as to serve the interests of consumers and the country within the resources and quotas made available to them. He stressed that the case of the diesel fuel injection equipment industry called for the united efforts of all the three sectors of the community for its onward progress.

STORAGE BATTERIES

The Indian Standards Institution has granted a licence to the manufacturers of the popular Silver Exide battery, Messrs. Associated Battery Makers (Eastern) Private Limited, Exide Works, Shamnagar, for the use of the standard certification mark of the I.S.I. on lead-acid storage batteries (dry separators) for motor vehicles, conforming to IS:395-1952. This is the first licence issued to a manufacturer of lead-acid storage batteries. The standard mark, consisting of the monogram of the Indian Standards Institution and the number designation of the Indian standard being inscribed in the top side of the monogram, will certify that the lead-acid storage batteries conform to all the requirements given in the relevant Indian standard, namely, IS:395-1952. Silver Exide motor vehicle batteries carrying the ISI Mark will convey an added assurance to the purchaser that they have been manufactured under controlled conditions and are of the quality laid down in the relevant Indian Standard. The production of motor car batteries in India is continuously increasing and the presence of the certification mark on the batteries will be of considerable assistance to the consumer in choosing batteries of ensured quality.

A new "Thermostart" aid for starting Diesel engines at low ambient temperatures was shown by a London firm at this year's British Industries Fair in Birmingham. Electrically operated, it uses standard Diesel fuel. On starting, a small quantity of fuel is allowed to flow over a heated element, which vaporizes it; on operating the engine starter, the vapour is ignited and burns in the manifold, heating the ingoing air.

DIESEL EQUIPMENT INDUSTRY

CASE FOR PROTECTION

THE view that the diesel fuel injection equipment industry was of vital importance to the development of the automobile industry as a whole, and that, as an auxiliary to the automobile and other diesel engine manufacturing industries in the country, its importance to the national economy could not be over-emphasised, was expressed by Mr. C. Ramasubban, Member, Tariff Commission, in the course of his speech at the time of the public inquiry into the question of continuance of protection to the industry, held recently in Bombay. Mr. Ramasubban felt that the demand for automobiles and other diesel engines was bound to increase during the second Plan period, so that the demand for the products of diesel fuel injection equipment industry was also bound to grow progressively.

Reviewing the history of the industry's case for protection, Mr. Ramasubban recalled that the inquiry into the industry's claim for protection was conducted by the Tariff Commission in 1954. In its report, submitted to the Government in March 1955, the Commission recommended protection to the industry upto 31st December 1956, by levying a protective *ad valorem* duty of 60 per cent. on imports. Accepting the recommendation, the Government granted protection to the industry with effect from 7th September 1955; the date of expiry was subsequently extended from 31st December 1956 to 31st December 1957. At present, protection is restricted to (*a*) single-cylinder fuel injection pumps for stationary diesel engines, and component parts of such pumps but excluding elements and delivery valves and component parts thereof, and (*b*) nozzle-holders with a clamping capacity up to 1" clamping diameter for nozzles (atomisers) for use on stationary or automobile diesel engines, and component parts (excluding nozzles) thereof. It would appear that the Development Wing has suggested that the scope of the industry may be widened so as to cover nozzles. Referring to this suggestion, Mr. Ramasubban said: "We shall examine this and see whether there is any need to include nozzles within the scope of our inquiry."

At the last inquiry, the Commission estimated the domestic demand for single-cylinder pumps at 17,000 and for nozzle-holders at 50,000. In connection with the present inquiry, the Development Wing and the Motor Industries Company, Ltd. (M.I.CO.) Bangalore, have furnished varying estimates of demand. The Development Wing has suggested that the demand for multi-cylinder pumps may also be assessed this time as it would be of help in planning the development of the industry. The estimates furnished by the Development Wing and the Motor Industries Company, Ltd., are:

	Development Wing	*M.I.CO.*
	Nos.	Nos.
Single-cylinder pumps ...	18,600	14,000
Multi-cylinder pumps ...	24,350	—
Nozzle-holders	161,700	73,800
Nozzles	446,000	240,000

As regards production, in 1954, there were three units which had been licensed for the manufacture of diesel fuel injection equipment of all types and their components, namely, the Motor Industries Company, Ltd., Bangalore, the Fuel Injections Ltd., Bombay and the Kulko Engineering Works Ltd., Kolhapur. Of these, only the M.I.CO. was then producing fuel injection equipment on a commercial scale. Its present annual capacity, on single-shift basis, is 12,000 for single-cylinder pumps, 6,600 for multi-cylinder pumps, 48,000 for nozzle-holders, 66,000 each for elements and delivery valves and 75,000 for nozzles. The capacity of Fuel Injections Ltd. is stated to be 10,000 for elements and 30,000 for nozzles. In 1956, the M.I.CO. produced 12,408 single-cylinder pumps, 34,291 nozzle-holders, 31,795 elements, 27,638 delivery valves and 1,017 nozzles. During January-March 1957, the Fuel Injections Ltd. produced 670 nozzles. It would appear that the quality of the M.I.CO.'s products is satisfactory, although one or two parties have expressed the view that there is scope for improvement.

In conclusion, Mr. Ramasubban rightly emphasised that while any scheme of protection adumbrated by Government for a particular industry only provided the necessary favourable climate for its development, its healthy onward progress depended largely on the combined efforts of manufacturers, consumers and im-

(Continued in previous column)

NEW PRODUCTS AND PROCESSES

Aligning Automobile Wheels

OWING to their independent suspensions and high speeds modern automobiles are highly sensitive to correct tracking of the wheels, so that it is desirable for every car to be regularly aligned and, if necessary, adjusted. A commercial engineering firm of the Netherlands has designed and put on the market an alignment apparatus of simple design which any mechanic can manipulate and use for taking rapid measurements. The apparatus consists of a metal frame with two parallel longitudinal bars on which the front wheels are placed, and two cross ties in the middle of which is placed a graduated rod system for each front wheel. This rod system can be adjusted to the track-width of the car. A cross-bar having a pointer and adapted to rotate hingeably about the end of the rod system is laid against the front wheel rim and indicates the position of the wheel on the graduated scale. With this device it is possible to check the toe-in, the camber, the angle of inclination of the caster and the radius of turning in a bend. A patent in respect of this device has been applied for or granted in several countries.

New Steel Furnace Process

The scaling and oxidation of steel when heated for rolling and forging is estimated to cause the loss in the U.K. alone of at least 450,000 tons of steel per annum. Only a part of this material is reclaimed as mill scale which is fed back to the steel melting furnaces, and it has been estimated that the total loss to the steel industry is probably between £13 million and £14 million per annum. A new series of processes which will, it is claimed, not only eliminate scale entirely in heating processes but in many cases will save fuel as well has recently been developed in the U.K. Some of the processes use oxygen for combustion, relying on the low cost of tonnage oxygen for their economy. Where only liquid oxygen is available, then oxygen mixed with air is used for burning the fuel gas. The operation of the process depends on the fact that the main or high temperature combustion which is only partial, envelopes the steel with a blanket of non-oxidising gas to prevent it from scaling, and the partially burnt gas is then re-used to give the steel its initial pre-heat and also to pre-heat the air for combustion.

Magnetic Inks for Typewriters

Development work on a range of new high-performance magnetic inks is being carried out in the U.K. The inks will be suitable for use in both printing processes and in the manufacture of typewriter ribbons. Work so far carried out with the new inks indicates that the production of efficient magnetic ink typewriter ribbon is fully feasible and that the typewritten characters produced will be clearly readable with modern magnetic character reading devices. One important application of the new inks is expected to be in the field of electronic banking, where the ability to use typewriters and similar ribbon-inked printing equipment to cheques and other transferable documents, as well as to record sheets, should greatly facilitate the development of fully automatic cheque clearance systems. Indeed, the lack of efficient magnetic inks of this type has been a major factor in delaying the development of such systems. Although the new magnetic inks are still at the experimental and development stage, it is expected that they will become available for commercial use within the next few years.

Plastic Lubricants

The use of plastics as lubricants seems likely to be of considerable future industrial importance. One new development in this field is the production of a new series of polyethylene based lubricants for use in lubricating synthetic and natural rubbers during processing. In this case very small quantities of the lubricants, which are about to be made available commercially, are added to the mix during the manufacture of the natural rubber, nitrile rubbers, neoprene, or butadiene-styrene copolymer compound during their processing. The result, as demonstrated in a series of comprehensive experimental tests, is said to be not only a reduction of sticking when the rubber compounds are milled and moulded but also a marked increase in calendering and extrusion speeds and a reduction in the shrinkage of milled stocks. At the same time the addition of the small quantities of lubricant required does not cause, the scientists responsible for developing the lubricants claim, any reduction in product quality. A considerable number of other new plastic lubricants are currently being developed in both Europe and the U.S.

Sheet-working Tool

An automatic, electronically controlled machine developed by a British firm for drilling, marking-out, plotting, draughting and spotting operations on sheet material of any kind made its debut last month at the Instruments, Electronics and Automation Exhibition in London. It is believed to be the first fully engineered equipment of its kind in Europe. Although developed originally for particular applications in the electronics industry, the machine can be used with considerable savings in time and costs in any industry where precision work on sheet materials is practised, the manufacturers say. The machine consists of a work-table, tool carriage and gantry, and the electronic control circuits. Operation is extremely simple, and may be carried out by unskilled personnel. An important feature is the provision for control by punched card or programme tape.

WORLD DEMOGRAPHIC SITUATION

REMARKABLE FALL IN DEATH RATE—POPULATION EXPECTED TO DOUBLE IN 40 YEARS

EVERY hour an average of almost 5,000 persons are added to the world population of some 2,700,000,000, according to the United Nations *Demographic Yearbook*, published this week. This large increase of about 120,000 per day, or 43 million per year, is due primarily to a very marked reduction in the death rate all over the world, while the birth rate has remained almost unchanged.

The experts of the United Nations estimate the world birth rate, on the basis of data relating to 1956, to be in the neighbourhood of 34 births per 1,000 persons each year, while the death rate is now about 18. This leaves a net gain of 1.6 per cent. per year—an increase calculated to double the world's population by the end of the century. These statistics are presented in the United Nations *Demographic Yearbook* for 1956, which has been prepared in the Statistical Office from official Government statistics.

The 1956 *Yearbook* contains some 750 pages of text and tables, describing the demographic situation of the world today. It includes census results covering almost 200 separate areas of the world, where some 2,325 million persons live. This issue, together with the corresponding 1955 volume, constitutes a reference volume for population-census data for all countries and territories of the world, except the U.S.S.R., which is the only large sovereign area in which a census has not been taken within the past decade.

Some demographic statistics, however, have been released by the U.S.S.R. during the past year—notably an estimate of population which places the U.S.S.R. in the position of third largest country in the world. Crude birth and death rates, 1951-55, have also been published, and these—not hitherto available—indicate a stable birth rate in the neighbourhood of 26 per 1,000 and a death rate which declined from 9.6 to 8.4 during the period.

Information now available for six other countries in Eastern Europe for which demographic data were not previously available, reveals crude birth rates ranging from 16 to 29 and death rates of 8 to 12 which are roughly comparable to those of the rest of Europe, the United States, Canada, Australia and New Zealand. However, the infant-mortality rates for Eastern European countries are markedly higher than those in the West. In Bulgaria, Czechoslovakia, East Germany, Hungary, Poland and Yugoslavia, infant deaths (deaths of infants before their first birthdays) range from 34 to 113 per 1,000 live births. These rates indicate that, on the average, about 7.7 per cent. of the babies born in 1955 died before they were one year old, while in 13 other countries of Europe, the average rate was 4.2 per cent.

In countries of Central and South America, where information is available for six countries in each region, the rates are 8.3 per cent. and 9.8 per cent., respectively. In the United States and Canada, the average infant-mortality rate is 2.7 per cent. and in Australia and New Zealand, it is only a little over 2 per cent.

Latin America Growing Fastest

One-tenth of the world's annual increase in population occurs in Latin America. This region is increasing at the rate of 2.6 per cent. or 4.4 million persons per year. Africa, South-West Asia, and Oceania are growing almost as rapidly, with rates of some 2 per cent., though part of the increase in Oceania must be credited to immigration. North America and the U.S.S.R. are growing at the same rate, namely 1.7 per cent. per year—just above the world's average —while Europe is growing least of all, with rates varying from 0.6 to 1 per cent.

Besides increasing at a fast rate, Asia can also lay claim to more than one half the population of the world. This area also accounts for the largest absolute addition to the world's population—an increase of some 24 million persons per year. Asia's distinction is also indicative of the fact that countries with high rates of population increase are experiencing an acceleration of their growth. The *Yearbook* demonstrates by means of a graph that among 60 countries with fairly good statistics, more had higher rates of increase in the period 1950-54 than in 1945-49; those with relatively low rates of increase in the earlier period more or less maintained that level in recent years; but, more important, those with relatively high rates in the earlier period had still higher rates in 1950-54.

These observations indicate a need for urgent consideration of how programmes for economic and social development can keep pace with expanding population trends, caused by birth rates varying between a high of 45 per 1,000 in Africa, Middle America, and South-East Asia (India) and a low of 18 to 21 for Europe, coupled with falling death rates.

Almost without exception, the study shows that death rates for 1950-54 were lower than those for 1945-49, and countries with the highest rates in the earliest period (Africa and Asia) experienced the greatest reduction. This phenomenal decline in mortality is the most significant demographic event of the last decade, according to U.N. statisticians, and its impact is only now beginning to be felt and its implications for the future understood.

The decline may be attributed in the main to advancements in environmental sanitation and disease control through the application of medical and public health techniques. The introduction of antibiotics in the late 30's made control of maternal mortality a possibility, as well as materially decreasing risk of death from pneumonia, tuberculosis, and other diseases susceptible to this type of treatment. With the spread during and after World War II of anti-malarial campaigns using DDT and the introduction of sanitary controls such as new water-supply systems, etc., death rates from some infectious diseases declined sharply. All of these decreases have been reflected in markedly lower current death rates which have initiated far-reaching changes in the pattern of mortality and its influence on population growth.

Life Expectancy

The revolutionary decline in mortality over the last decade has also been reflected in increased life expectancy at birth. Comparing current life-table values given in the *Yearbook* with data published in earlier years, it may be seen that, in the United States, for example, between 1945 and 1954, an increase of three years in the expectation of life at birth for white males was recorded. The increase for non-white males was five years. For females, the corresponding increases were four years for white population and six for non-white. Similarly, Hungary records large increases of 10 years for males and 11 for females, between 1941 and 1955. Chile's records show expectation of life at birth in 1952, 12 years longer for males and 14 years longer for females than it was in 1940. Portugal recorded increases of seven years for males and eight for females in the 10 years 1942-52.

The country which now records one of the lowest crude death rates, the Netherlands, records also the highest average expectation of life at birth for males and females, namely, 71 and 73 years, respectively. Females, however, can be expected to live just as long in England and Wales, where life expectancy in 1954 was 73 years. The shortest average life expectancy in a major country is found in India, where the records show 32 years for males and females, based on the censuses of 1941 and 1951.

An interesting sex differential is shown in the life expectancy values. According to the figures, males born now may expect to live an average of 70 years or more in only one country, the Netherlands, while 12 countries are able to record such high values for females, either among the total population or the largest segment of it. These figures bear out the well-established differences in the death rates for males and females, the male risk of dying being greater at almost every age after childhood.

Age of World's Population

On the basis of information from 142 countries and territories, it is estimated that, on an average, 34 per cent. of the world's population is under 15 years of age, 58 per cent. age 15-59, and 8 per cent. over 60 years of age.

By far the largest proportion of the populations in Africa, Middle America, and South-East Asia are children. In these areas, more than 40

AN INSURANCE SCHEME FOR THE COMMON MAN

CORPORATION INTRODUCES JANATA POLICY

WITH the object of carrying the benefit of life insurance to a wider section of the people by bringing it within the easy reach of the industrial and rural working population of the country, the Life Insurance Corporation of India has introduced a new insurance scheme—the Janata Policy—which was inaugurated on the 26th May, at Bombay, by Mr. Morarji Desai, Union Minister for Commerce and Industries. Speaking at the function, Mr. Desai observed that as insurance was not hitherto within the reach of the rural and industrial workers, the present scheme was striking evidence of the fruits of nationalisation in so far as no individual company could have undertaken such a gigantic scheme. Urging the people to take advantage of the scheme, Mr. G. R. Kamet, Deputy Chairman of the Life Insurance Corporation, observed that the scheme was introduced at present as a pilot project in Bombay, Ahmedabad and Sholapur in the Western Zone. It is estimated that about five million people would avail themselves of the new benefit within a short time. The Corporation has already received about 1,000 applications for Janata Policy. A number of Communist and Praja Socialist trade union leaders, who were also invited to participate in the function, assured their complete co-operation in making the scheme a success.

Step in Right Direction

By evolving the new simple Janata Policy which is tailored to the needs and capacities of the common man, the Corporation has taken a step in the right direction in popularising insurance and making it seep into the lower strata of society. According to the census of 1951, the population of India was 36.1 crores of which nearly 10.5 crores, or roughly 29 per cent., were self-supporting and 4 crores, or 11 per cent., earning dependents. Of the 10.5 crores of self-supporting persons, 7.1 crores were agriculturists and 3.4 crores non-agriculturists. The total number of insured persons at present is estimated at 0.45 crore. This shows that the ratio of insured persons to the total number requiring life insurance protection for their own benefit in old age and for the benefit of their dependents in case of early death is very low. On a conservative estimate, the potential is at least 20 times the present number of insured persons. This fact underlines the wide scope that exists for life insurance business in the country. The extent to which the Corporation succeeds in reaching out to the small peasant and industrial worker for harnessing their small savings providing, at the same time, insurance protection to them, will be a measure of the success of its activities.

Since the Janata Policy is primarily designed for the rural and industrial working population, the machinery for canvassing the business through life insurance agents, periodical collection of premiums, etc., have been considerably simplied. In order to provide unimpeachable security to the insuring public, the sums assured by all policies issued by the Corporation are guaranteed as to payment in cash by the Government of India.

Benefits Under the Scheme

Under this scheme, only Endowment Assurance Policies with or without profits will be issued. The maximum age at entry is limited to 45. The term of the policy will be 10, 15, 20 or 25 years subject, however, to maturity age not exceeding 60. The minimum sum assured under any policy is Rs. 250. No reduction in premium will be allowed for yearly, half-yearly, or quarterly mode of payment of premiums, nor will any addition be made for monthly mode of payment. The total sum assured on any one life under the scheme will not exceed Rs. 1,000 and if the life assured has any other policies under any of the non-medical schemes, the total sum assured will not exceed Rs. 3,000, taking into account all such policies and the policy to be effected under the present scheme. The following table shows the sum assured payable at the end of a specified term of years, or at death if it should occur sooner, for a premium of Rs. 12 per annum payable for the specified term as shown.

Endowment Assurance (Without Profits)

Age nearer birthday	10 years	15 years	20 years	25 years
	Rs.	Rs.	Rs.	Rs.
18—20 years	115	178	245	312
21—25 ,, ...	115	178	243	308
26—30 ,, ...	115	177	240	301
31—35 ,, ...	114	175	235	290
36—40 ,, ...	113	171	225	..
41—45 ,, ...	111	164	..	..

Endowment Assurance (With Profits)

Age nearer birthday	10 years	15 years	20 years	25 years
	Rs.	Rs.	Rs.	Rs.
18—20 years	108	162	217	271
21—25 ,, ...	108	162	215	268
26—30 ,, ...	107	161	213	263
31—35 ,, ...	107	159	209	253
36—40 ,, ...	106	156	201	..
41—45 ,, ...	104	150	..	..

Under the scheme, no medical examination is required in respect of persons aged 35 years or less at the time of entry. A brief medical report will, however, be required in the case of those above this limit. The risk will be covered in all cases for the full amount from the outset. As regards female lives, the usual restrictive clauses, if any, apply. In the case of under-average lives where an extra premium is necessary on account of personal or family history, etc., the sum assured will be proportionately reduced in lieu of the extra premium. Any occupational extra premium is payable on yearly basis.

Premiums

Premiums may be collected in stamps or in cash through agents. In the first case, the premiums may be paid in yearly, half-yearly or quarterly instalments but not in monthly instalments. The first premium shall be paid in cash at the branch office of the Corporation. On receipt of the first premium, a premium collection book will be issued to the policyholder. Subsequent premiums may be paid only by affixing stamps in the book in the manner specified therein. The stamps may be purchased from any office of the Corporation or from authorised agents. The stamps may be bought and affixed according to the convenience of the policyholder, but the date on which the stamps are defaced at an office of the Corporation and the receipt thereof entered in the book at the appropriate place will be deemed to be the date of receipt of the premium by the Corporation. The stamps will be in denominations of Re. 1, Rs. 2 and Rs. 5.

In the second case the premiums may be paid in yearly, half-yearly, quarterly, or monthly instalments. The first premium shall be paid in cash at a branch office of the Corporation. On receipt of the premium, a premium collection book will be issued to the policyholder which will contain space for recording receipt of subsequent premiums by an authorised agent of the Corporation. The premiums may be paid at a branch office or only to such of the agents of the Corporation as have been specially authorised in this behalf. The premiums should be paid in such amounts as to cover one or more instalments due under the policy. The collecting agent shall enter receipt of the premium in the book. In their own interest, policyholders should see that the receipt of premiums is acknowledged in the premium collection book by the branch office or an authorised agent of the Corporation for the amounts of premium paid.

Policy Conditions

In the case of policies issued subject to collection of premiums in stamps, the receipt of the premium shall be acknowledged at a branch office of the Corporation by the defacement and removal of stamps equal to at least a quarterly premium and entering acknowledgment thereof in the premium collection book. This may be done at any time within six months from the due date of the premium. In the case of policies issued subject to collection of premiums in cash, the premium must be paid in cash to any branch office or authorised agents within six months from the due date of unpaid premium and receipt of the premium entered in the book; provided, however, that in the case of policies issued subject to monthly mode of payment of premiums, the premium must be paid within three months from the due date and the receipt of the premium entered in the premium collection book. No notice of premium will be sent to the policyholders, nor any receipt issued except the acknowledgment referred to above.

If the receipt of premium is not acknowledged in the above manner and within the period mentioned above, the policy will lapse. A lapsed policy may be revived during the lifetime of the life assured but before the expiry of a period of three years from the due date of the unpaid premium, on payment of the premiums in arrears with interest at 6 per cent. per annum compounded half-yearly, reckoning from the due date of each premium paid late subject to a minimum charge of a quarter rupee on account of interest. Provided premiums under a policy have been paid for two years and any subsequent premium is not paid within the days of grace as mentioned above, the policy shall be automatically converted into a paid-up policy for a sum bearing the same proportion to the original sum assured as the number of premiums paid thereunder bears to the number payable, subject to such sum being not less than Rs. 50 inclusive of any attached bonus.

Surrender Value

The policy can be surrendered for cash after the premiums have been paid for at least two years. The surrender value allowable under the policy is equal to 40 per cent. of the total amount of the premiums paid thereunder excluding the premiums for the first year and all extra premiums that may have been paid. If the policy be on the with-profit scale the cash value of any existing vested bonus additions will also be allowed. A nomination in terms of section 39 of the Insurance Act, 1938, shall have to be stated on the policy. This may be altered during the currency of the policy on payment of the prescribed fee. The policy will be free from all restrictions as to travel, residence and occupation. No loan will be granted on these policies nor other benefits such as disability and double accident.

A word about publicity. It is true that door-to-door collection of premium by authorised agents or through sale of stamps, as envisaged under the scheme, will involve fairly high cost of collection but it is not too high a price if the objective of making the common man insurance-minded could be achieved. If the efforts in this direction prove successful, it will yield rich dividends in the form of large volume of business. For this what is actually needed is effective publicity and a propaganda machinery fully geared for the purpose. It would be well if the services of postmen, post offices and village school teachers were utilised in carrying the message of insurance to the villagers. The former will be only too willing to act as agents for that will be an additional means of supplementing their meagre salary.

INVESTMENT OF INSURANCE FUNDS

Mr. T. T. Krishnamachari, Union Finance Minister, disclosed the other day in the Lok Sabha that he was in favour of setting up a statutory body to look after the investments of the Life Insurance Corporation. The Minister, who was speaking on the Bill introduced in the Lok Sabha empowering Government to alter remuneration and terms and conditions of service of insurance employees, observed that investment of the funds of the Corporation as it was now managed did not seem to be "eminently satisfactory" and, therefore, he was of the opinion that it should be entrusted to a separate body statutorily devised, leaving the Corporation full time to devote itself to the main business of expanding life insurance. He said that he would place his proposals in this regard before the House in July. The Minister felt that "some alterations—perhaps even some of a radical character"—were necessary in the administration of the Corporation in the interest of efficiency. He wanted, for instance, that in due course the branch offices of the Corporation should handle everything in relation to policyholders and agents and the central offices should be made a policy-making, accounting and actuarial centre.

The Bill introduced in the Lok Sabha on 24th May replaces an Ordinance which, as readers are aware, was promulgated to validate the order that had been passed by the Corporation altering the terms and conditions of service of the employees. The Ordinance had been necessitated by the judgment of the Bombay High Court holding that the order was bad in law. Defending the Ordinance, Mr. Krishnamachari contended that if it had not been issued confusion would have ensued and the business of the Corporation would have suffered. It was not possible for an organisation like the Corporation, he said, to continue the old conditions of service because they varied from company to company not only in respect of pay scales, provident fund and retirement and leave benefits but even in such matters as retirement age, amenities and hours of work, etc. He added that the latest revision of pay scales, although it resulted in swelling the wage bill by Rs. 50 lakhs a year, was designed to elicit the enthusiastic support of the employees, as a contented staff was a precondition for the success of life insurance business.

SIGNIFICANCE OF NEW TAX PROPOSALS

PRICE FOR THE PRIVILEGE OF EARNING AN INCOME DEAR

By A. D. Shroff

[*The following is the second instalment of Mr. A. D. Shroff's speech delivered at a public meeting held under the auspices of the Commerce Graduates' Association in Bombay on 22nd May last; the first instalment of the speech was published in our last issue,* vide *page* 1028.—Ed.]

DIRECT taxation covers a very comprehensive range. It is a very clever scheme and pattern of taxation. To start with, the taxable minimum income has been reduced from Rs. 4,200 to Rs. 3,000. This is a very, very harsh step. At this time when the real value of money in terms of purchasing power suffers such a diminution, for this class of people to pay an income-tax on Rs. 250 per month will, of course, have serious repercussions on the general economy and it will set up an endless trend of demands for increased wages and dearness allowances. It will put up the cost of running businesses and industries. When the costs go up, the vicious circles start moving about and wages and salaries have again to be adjusted on a higher level.

There has been a general reduction in the rate of income-tax and super-tax at various slabs and the reduction of the maximum scales from 91.87 per cent. to 77 per cent. on earned and 84 per cent. on unearned income which would bring some relief. At first sight, it might appear that the Finance Minister has given considerable relief to those in the higher income brackets. This is a complete eye-wash. Against this relief, new taxes have been brought in, particularly the wealth tax and the expenditure tax, and, if you analyse the whole position, a fairly substantial number of people in the higher income brackets will be paying in the future more than their annual income. That will be a price for the privilege we enjoy of earning an income in India.

There has also been an increase in income-tax and corporation tax for companies. The bonus tax which was levied last year at 12½ per cent. has now been raised to 30 per cent. No prudent business management will in future issue bonus shares at this prohibitive price. There has been a little reduction in the tax on dividends which was levied last year.

Wealth Tax

It is proposed to levy wealth tax on individuals, joint Hindu families and companies. In respect of individuals, it is proposed that anyone who has wealth, as defined in the Bill, exceeding Rs. 2 lakhs shall be subject to this tax. From Rs. 2 lakhs to another Rs. 10 lakhs, it is half per cent. of the total, on the next slab of Rs. 10 lakhs one per cent. and, over that, there is to be an overall tax of 1½ per cent. On the basis of income-tax, similar adjustments have been made in the case of joint Hindu families. All joint-stock companies registered in India with the exempted limit of Rs. 5 lakhs will also be subject to wealth tax on the basis of ½ per cent. of the total wealth of the company. Wealth has been defined in the Bill and certain exemptions are granted. These should be excluded from the computation of the wealth. Some of the items excluded are motor cars, house furniture, jewellery upto an amount of Rs. 25,000, life insurance policies which have not yet been paid in cash, and art collections which are not for sale. Short of these, everything will be computed by Government. Although the items of wealth one will be called upon to declare under the Bill may be defined, the value will have to be computed on each item like this. It will call for extraordinary administrative machinery to make a proper assessment of the items of wealth of what is indicated as 26,000 individuals in this country. They will be subject to this wealth tax. If this tax is going to be administered effectively and efficiently, it could be done only under a police *raj*. As soon as the tax goes into operation, I have not the least doubt in my mind that it will set up a procedure calling upon every assessee to declare items of wealth and to have values of these items assessed by an army of officers to be appointed for administration of this wealth tax.

A tax of this character, as pointed out by a shrewd and experienced administrator like Rajaji, would go against the fundamentals of the privacy of life. So far as the incidence is concerned, in a number of cases, it is bound to be very arbitrary. But when you consider wealth tax on individuals in conjunction with wealth tax on companies, it becomes doubly inequitable. In the first place, it is a matter of serious doubt as to the basis on which the wealth of a company will be assessed. There is a clause in the Bill which indicates the form and basis on which the valuation has to be arrived. On reading it a number of times, I find that it had been left to the arbitrary decision of the assessing officer. In any case, wealth tax on companies would certainly mean double taxation, if not treble taxation in some cases, particularly in the case of holding companies. The wealth of companies is owned by shareholders, the shares of which are the property of individuals which are also subject to wealth tax. Then you have submitted the same wealth to a double tax. It has not been found unusual that, when new taxes of this character are brought, all the implications are not properly understood. It should, therefore, be the duty of the public of this country to represent effectively to the authorities concerned the implications of this tax.

Expenditure Tax

The expenditure tax is a very novel and unprecedented tax. So far as I know, it has not been tried out in any country in the world. The proposal is that anyone who has an assessable income of Rs. 60,000 per year shall be subject to this tax. A joint income of husband and wife which is exempt is Rs. 24,000 a year and, for every dependent child, there is an additional exemption of Rs. 5,000. For the first Rs. 10,000 you spend in excess of this exempted limit, you are subjected to a taxation of 10 per cent. and the slabs rise rapidly, with the result that, for an expenditure of Rs. 50,000, you pay one rupee as tax on an expenditure of every rupee. Perhaps on a proper scrutiny, this tax may be found unconstitutional. On the face of it, it is wrong and inequitable in that, while assessees having an annual income of Rs. 60,000 are made subject to this tax, any person who has an assessable income of Rs. 59,999 is not subjected to this tax and he can spend any amount. It works out to be a sort of discrimination. In any case, this is also another tax which opens out unlimited opportunity for corruption among the officials and incentives for evasion of tax. The Finance Minister has stated that, with this kind of taxation, the evasion of taxes will be checked and that the Government will be able to get five crores of rupees more on the ordinary income-tax and super-tax. It is a matter of common human experience that, when taxes go high, ingenuity of the taxpayer more than matches that of the tax collector. The Tax Inquiry Commission appointed a few years ago has clearly pointed out that one important feature of large-scale evasion of income-tax in this country is the onerous nature of taxes. Ingenious people will apply their minds and find out ingenious methods of evading taxes.

One important reason for monetary stringency which has been found particularly acute during the last six or eight months is due to the increasing tendency to settle transactions on cash basis and not through banks. Friends in the bullion market tell me that, since the announcement of the budget proposals, the most active market in India is the bullion market. Our tax collectors believe that, under the provisions of this Bill, they will be able to get at a large number of people declaring their holdings of gold and jewellery. I think they will be disillusioned.

Tax Evasion

A large number of people like us have been advocating adoption of a higher code of conduct. It becomes increasingly difficult, human nature being what it is, to persuade people to resist the temptation to resort to practices like evasion of tax when the burden of taxes becomes almost absurd and impossible. If you push the taxes to a stage where the overall burden is to absorb not only the entire annual income, but also to liquidate a part of your capital, that is, your savings accumulated during a period of several years, then human nature will certainly assert itself and ingenious methods of evasion will be adopted.

Apart from this aspect, if one examines the impact of all these proposals on the economic development of the country, one feels sad. I am often accused of using harsh language. I feel that it will not be unjust, if I say that the new taxes constitute a deliberate design to destroy the private sector. The private sector is sought to be crippled at every possible stage. The proposals bring in a burden of tax which, instead of providing scope for savings, a crude and conservative way of financing, seeks to deprive you day in and day out of your hard-earned income. Therefore, the only effect will be that the private sector, under these conditions, can only have a limited life of its own in this country. I am sorry to retract the welcome I accorded to the Prime Minister's statement some time ago. The Prime Minister said, at the A.M.I.O. meeting in New Delhi, that the private sector shall have an assured and respected place in the life of the country. In the light of the new budget proposals, I am sorry to say that these assurances have no meaning at all.

I started by saying that the budget is a gamble in planning. All the taxation proposals have been designed to find additional resources for the implementation of the second Five-year Plan. Even the Finance Minister, who is the biggest leading champion of the second Five-year Plan, has admitted that the Government are meeting with serious difficulties in working out the Plan. He admits that, apart from what is called the core of the Plan, the steel project and increase of coal production, the second Five-year Plan will have to be reshaped and he is unable to find the other resources. The second Five-year Plan, in the circumstances prevailing today, is a bottomless bucket. These additional resources which were sought to be raised from these proposals, in my judgment, will be found soon to be too inadequate for the purpose of carrying through the Plan.

Foreign Exchange

One matter in which, although the Finance Minister has been frank enough to take the country into confidence, he has not referred to with sufficient emphasis is the position of our foreign exchange. It was estimated under the second Five-year Plan that, in pulling through the Plan, our foreign balance may be reduced by Rs. 200 crores. At a time when we embarked on our second Five-year Plan, our foreign balance was a little over Rs. 710 crores. Under our currency arrangements, we have to maintain a minimum balance of the equivalent of Rs. 400 crores in sterling as a cover against our paper issue, although, recently, the Government have taken powers under the Reserve Bank of India Act that, in a case of emergency, even that minimum balance can be lowered to Rs. 300 crores. As a result of indiscriminate issue of import licences last year, this foreign balance has consistently dwindled since 1st April 1956, and a real crisis was reached at the beginning of this year when the foreign balance dropped to round about Rs. 500 crores.

We are a member of the International Monetary Fund and our membership entitles us to certain temporary assistance from it. Our Government is entitled to a loan of $200 million, of which about $127 million have been drawn during the last few months. Today our balance stands lower after using up about $127 million than when we started. When we drew the amount from the International Monetary Fund, our balance was $506 million. After using up $127 crores, our balance last week was $490 million.

What the country is not fully aware of is the startling fact that nobody today is yet aware of the outstanding commitments of this country on foreign account. The indiscriminate issue of import licences last year have today left the country in a difficult and helpless position for meeting our entire foreign commitments. There is a balance of $72 million to draw from the International Monetary Fund. One would have expected to receive, in a situation like this, continued assistance from abroad in the shape of foreign currency to import machinery and essential raw material which is badly needed for carrying through our development project. In a situation like this, one would have expected that a budget would be produced which should inspire sufficient confidence in the potential lenders of the world. I am sorry when I learn that, in the last few days, the value of the rupee is definitely going down in the international market. We are surely in a delicate situation in the foreign market. A budget of this character is bound to cause in the world serious reaction

(*Continued on page* 1123)

IMPLICATIONS OF WEALTH TAX

APPLICATION OF THIS TAX TO COMPANIES IS MISCONCEIVED

By Premjus Roy

IN the new Budget proposals, the annual tax on wealth is a new tax for this country. Discussing the proposal of a tax on total wealth, the Taxation Enquiry Commission observed that such a tax would create a better balance in the incidence of taxation among individuals than through taxation of income alone, but decided to drop the proposal for the time being for reasons of administrative difficulties. Thereafter, in the middle of 1956, Prof. Nicholas Kaldor, in his Report on Income-tax Reform, recommended the levy of wealth tax, in addition to income-tax, expenditure tax, gifts tax, capital gains tax, etc. Since the publication of Prof. Kaldor's Report, the wealth tax, like his other proposals, has been under much discussion. The Government of India has now made up its mind to introduce wealth tax. A separate Bill, known as the Wealth Tax Bill, has been framed for this purpose, because the basis of taxation on wealth is altogether different from the basis of taxation on income.

The salient features of the scheme of wealth tax may now be discussed. The tax is payable "in respect of the net wealth on the valuation date of every individual, Hindu undivided family and company at the rate or rates specified in the schedule." It is thus payable on the entire wealth of a person, whether movable or immovable. The tax is an annual tax, like income-tax, with the fundamental difference that, while income-tax is levied on annual income, wealth tax will be levied on the total assets owned by a person. The Act will come into force from 1st April 1957 and, therefore, the first assessment of wealth tax will be made for the assessment year 1957-58 on the basis of the previous year ended 31st March 1957 or an earlier date for which the accounts were closed. Three classes of persons are made chargeable to the wealth tax—individuals, Hindu undivided families and companies. The companies include both public and private companies. Other units such as firms, association of persons, local authorities, co-operative societies, etc., which form separate units for taxation of income, will not as such be liable to wealth tax. Among the companies, it is proposed to exclude banking companies, insurance companies and certain companies for financing private industrial enterprises in India, from the purview of the Act.

Assets Chargeable

The wealth tax is chargeable on the net wealth, that is, all property owned by the assessee after deducting the debts which he owes to others. All property, whether movable or immovable, will be included in the net wealth of a person, except agricultural lands. Chargeable property would include not only the assets owned by the assessee himself but also assets transferred by him to his wife or minor child (except when the transfer is made for full monetary consideration) and also any property which will have been transferred by an assessee to another person or persons under a revocable transfer.

In the case of an Indian resident, all assets of the assessee, whether within India or outside, will be included in the property chargeable to wealth tax. For instance, if any Indian national holds any property in Pakistan or Burma, the value of such property will also be included in the total property for the purpose of the charge. It is, however, further provided that, where the foreign country, in which the Indian national holds property, places any restriction on remittance of funds from that country to India, the wealth tax in respect of such foreign property will not be actually recovered by the authorities until restriction on such remittance is removed by the foreign country.

In the case of foreign individuals or companies, that is, those which are not resident in India, only their property in India would be subjected to the wealth tax, and not the property which they own outside India.

Further, the Bill prescribes certain items of property on which wealth tax will not be chargeable. These include property held under trust, interest in coparcenary property, works of art, pension or annuity from an employer, furniture, household utensils, wearing apparel, jewellery, etc., life insurance policies, professional tools, certain Government securities such as Treasury Savings Deposit Certificates, Provident Fund balances, and gallantry award. In the case of furniture, household utensils, wearing apparel, jewellery etc., intended for the personal or household use of the assessee, the exemption from wealth tax is subject to a maximum of Rs. 25,000 in value, and household effects of the value of more than Rs. 25,000 would be chargeable to the tax.

In the case of the exempted items as mentioned above, the value thereof would be included in the net wealth, but a proportionate relief from the tax would be allowed. For instance, if the total wealth of any individual is Rs. 5 lakhs, and the wealth tax thereon is Rs. 1,500, then if the value of the exempted property is Rs. 1 lakh, the tax chargeable would be Rs. 4 lakhs (unexempted portion of net wealth) divided by Rs. 5 lakhs (total wealth, including the exempted portion) Rs. 1,500 (tax on total wealth), that is, Rs. 1,200.

The valuation of the property will be made as on the date to which the accounts of the assessee are made up, and in other cases as on 31st March every year. Thus, in the case of an individual doing business, whose accounts are made up to 31st December, the property would have to be valued for the assessment year 1957-58 on the basis of the valuation date being 31st December 1956. In other cases, the valuation will be made as on 31st March 1957. The general basis of valuation is the estimated price which, in the opinion of the Wealth Tax Officer, the property would fetch if sold in the open market on the valuation date. Thus, if the valuation date is 31st March 1957, the value of a certain immovable property owned by an assessee would be the price which the Wealth Tax Officer estimates the property would fetch if sold in the open market on 31st March 1957. In the case of shares which are quoted in the market, the quotations of those shares on the Stock Exchange as on the date of the valuation would be the value to be included in the net wealth for assessment.

Running Business

In the case of a running business for which accounts are regularly maintained by the assessee, it is, however, provided that, instead of determining the value of each asset separately, the Wealth Tax Officer may determine the net value of the assets of the business as a whole, and the Wealth Tax Officer may consider the value of the assets as shown in the balance-sheet of the business, but he will be entitled to make such adjustments as he thinks proper. For instance, if in the balance-sheet of a company, factory land is valued at Rs. 5 lakhs, but the Wealth Tax Officer evaluates the land as presently worth Rs. 20 lakhs, he will be entitled to add the difference of Rs. 15 lakhs to the net value of the business as disclosed by the balance-sheet.

The valuation of assets could thus clearly give rise to enormous difficulties in the case of immovable properties, such as are not encountered for income-tax. The Wealth Tax Bill has therefore introduced a new feature in regard to this matter. It is provided that, if the valuation of any immovable property is objected to by an assessee in the second appeal, that is, an appeal before the Appellate Tribunal, the Tribunal shall refer the question of disputed value to a committee of arbitration, which will consist of two persons—one a valuer from amongst those appointed under the Estate Duty Act and another an adviser who will be apponted from amongst a list of persons familiar with property values in particular areas. Similar provision for reference to a committee of arbitration is made also in case the Commissioner of Wealth Tax enhances the value of any property in the case of an assessee from what was estimated by the Wealth Tax Officer. In both cases, the estimate of value to be made by the committee of arbitration would be binding on both the parties.

Rates of Tax

The rates of wealth tax are prescribed in the schedule to the Wealth Tax Bill. In the case of an individual, the first 2 lakhs of rupees are exempt, the next 10 lakhs of wealth is liable to tax at ½ per cent., the next Rs. 10 lakhs (i.e., the wealth falling between Rs. 12 and 22 lakhs) is taxable at 1 per cent. and the balance of the wealth (i.e., in excess of Rs. 22 lakhs) is liable to tax at 1½ per cent. In the case of Hindu undivided family, the limit of exemption is Rs. 3 lakhs, instead of Rs. 2 lakhs as in the case of an individual, but the slabs of wealth in excess of Rs. 3 lakhs are liable to the same rate of tax.

In the case of a company, the first 5 lakhs of rupees are exempt, and on the balance of net wealth, that is, all net wealth in excess of the first 5 lakhs, the rate of tax is uniformly ½ per cent. Thus, in the case of a company having net wealth, that is, the value of assets *minus* the debts, aggregating Rs. 1 crore, tax will be payable on Rs. 95 lakhs at ½ per cent., which comes to Rs. 47,500. An individual having total wealth of Rs. 5 lakhs pays wealth tax amounting to 1,500; on total wealth of Rs. 10 lakhs, he pays Rs. 4,000, and, on total wealth of Rs. 20 lakhs, he pays Rs. 13,000. In the case of a Hindu undivided family on Rs. 5 lakhs total wealth the tax is Rs. 1,000, on Rs. 10 lakhs, Rs. 3,500, and on Rs. 20 lakhs Rs. 12,000. In the case of a company, the tax on total wealth on Rs. 10 lakhs is Rs. 2,500 and on total wealth of Rs. 20 lakhs, it is Rs. 7,500.

Administrative Procedure

The administrative procedure, that is, for assessment, recovery, appeals, etc., prescribed under the Wealth Tax Bill, closely follows the procedure given in the Income-tax Act. In fact, many of the provisions of the Wealth Tax Bill are exact copies, *mutatis mutandis*, of the Income-tax Act. Two points are, however, specially worthy of note. The first is that, under the Wealth Tax Bill, any person, who is liable to wealth tax, is required to submit his return of wealth to the Wealth Tax Officer having jurisdiction in his case by the 30th June of every year. The Wealth Tax Officer will be the Income-tax Officer having jurisdiction in his case, and the assessment under the Wealth Tax Bill will be made by no other than the Income-tax Officer acting in the capacity of the Wealth Tax Officer. For assessment year 1957-58, that is, assessment to be made in the current year in respect of the previous year's wealth, the Bill allows the assessee time to submit the return upto 31st December 1957. If any person does not himself submit his return of wealth, and the Wealth Tax Officer considers that he would be liable to wealth tax, the Wealth Tax Officer may serve a notice upon such person requiring him to furnish his return of wealth. The second point of note is that the Bill prescribes that no document, which purports to transfer or assign any interest in property valued at more than Rs. 1 lakh, would be registered by the registration authorities until the production of a certificate from the Wealth Tax Officer that the person concerned has either paid or made satisfactory provision for payment of wealth tax.

Having given above the salient features of the scheme of wealth tax, it will be helpful now to discuss some of the implications of this tax. The Finance Minister, claimed in his Budget speech that this tax would "contribute towards the more effective taxation of the richer classes without diminishing incentives to earn." Prof. Nicholas Kaldor claimed that, while income-tax provides tax exemption for the socially unproductive hoarding of wealth in the form of gold, jewellery, etc., the wealth tax would make these a less attractive form of holding wealth. The advocates of the wealth tax claimed that, having regard to the basic fact that the Government needs a lot of money to finance the second Five-year Plan, it was much better to raise more taxes from the people for the purpose, instead of resorting to the device of substantial deficit financing. Granting this, in their view, the wealth tax is very appropriate, in that it touches only the wealthier classes, that is, those who have net property worth more than Rs. 2 lakhs. As the Budget proposals include lower rates of income-tax, particularly in the lower slabs of income, the additional liability for wealth tax in marginal cases is justified by the saving on income-tax in the lower reaches of income. The protagonists of the tax further argue that the second Five-year Plan and the subsequent Five-year Plans would generate such vast upsurge of industrial and commercial activity that the additional tax like the wealth tax would be like mere flea-bites. Another important argument advanced in favour of the wealth tax by this section is that this tax, alongside of income-tax, would result in checking tax evasion. Prof. Nicholas Kaldor had argued in his report that property incomes have always some tangible assets behind them, and, therefore, if taxes were assessed both on income and on property, by the same taxation authority, the administrative efficiency of the system is bound to be improved in consequence. The Finance Minister has, in fact, taken credit for Rs. 5 crores in his Budget proposals on account of extra tax on concealed incomes which would come to light as a result of introduction of the wealth tax, apart from his estimated income of Rs. 15 crores from wealth tax in the year.

The Other Side

This, however, is only one side of the picture. The additional tax has after all to come from the pockets of the people, and, as such, the wealth tax would result as disincentive to savings and capital formation, and dampening of enterprise. Thus, those who have substantial property but whose current income after meeting their current expenses and liabilities is not enough to pay wealth tax, will have no option but to sell their properties to be in funds to pay the tax. In fact, Mr. T. T. Krishnamachari, at his Press Conference after the introduction of the Budget, loudly claimed that, as a result of the wealth tax, holders of substantial blocks of property, such as property worth 20 or 30 lakhs of rupees or more, will have no option but to sell off a part of their properties at intervals of two or three years in order to meet the liability of the wealth tax, and he further asked: "If this is not a step towards Socialism, what else is it?" Apart from this breaking up of bigger estates, there is no doubt that the wealth tax would discourage forms of property or investments which either give no yield or give comparatively poor yield, such as bullion, jewellery, etc. The immediate effect of the introduction of the Wealth Tax Bill has, however, been quite the reverse, as it has led to many people buying bullion at higher prices, perhaps with a view to treating it as undeclared wealth.

The most objectionable feature of the Wealth Tax Bill, however, is its extension to companies. Even Prof. Kaldor contemplated wealth tax as leviable only on individuals, and not on companies. The tax on companies obviously leads to double taxation, because the company's property is truly the collective wealth of the shareholders, in whose hands the value of their shares in the company would in any case be treated as part of the chargeable property. The company is required to pay tax since its very inception, although it may earn no profits for many years. If a company makes a loss, it will still be liable to pay the wealth tax. The wealth tax on companies involves tax on the assets of a productive investment, and will make more shy investment, particularly, in enterprises which require a fair period of waiting before being profitable, such, for instance, as mining. The tax on companies thus constitutes a tax on capital formation and industrial expansion. While there can be arguments against big holdings of individuals, which the wealth tax is intended gradually to destroy, there can be no reasonable argument against big corporations, which alone are in a position to bring about industrial development and expansion and arrest inflation through increased production. It would thus appear that the wealth tax on companies is misconceived and can only retard industrial progress. If the Government is unwilling to withdraw the Wealth Tax Bill altogether, it is to be hoped that it will at least see the inequity and harm of imposing a wealth tax on companies.

The first cargo of refined products from the Caltex Oil Refinery has left Visakhapatnam for Calcutta by the *Caltex Gothenburg*. The shipment consists of 6,000 tons of superior kerosene and high speed diesel for the Calcutta supply area. During the current month, approximately 8,000 tons of furnace oil and high speed diesel will be supplied by the Caltex Refinery to the Visakhapatnam area as part of its distribution programme. In full operation, the refinery will manufacture petrol, diesel oil, fuel oil and kerosene to replace imported refined products. From the refinery, approximately 311,000 tons of refined products will move by rail and 282,000 tons by sea to various consuming centres all over India every year.

PROVISIONS OF WEALTH TAX BILL

SALIENT FEATURES ANALYSED

By R. K. Dalal, B.Com., F.S.A.A., F.C.A.

THE Finance Minister, Mr. T. T. Krishnamachari, has introduced the Wealth Tax Bill 1957 in the Lok Sabha the object of which is to impose an annual tax on the wealth of individuals, Hindu undivided families and companies, other than banks and insurance. The proposed tax is an important constituent of an integrated tax structure which the Government have been aiming at for some time. With income-tax, Estate Duty and a tax on capital gains already in existence and with addition of the wealth tax and a tax on large personal expenditure (separately being proposed), the direct taxes will form a composite system made up of complementary elements. The Finance Minister claims that, apart from the fact that a composite system of this type helps to satisfy the criterion of the ability to pay, it is consistent with the avowed goal of the attainment of a socialistic pattern of society.

On What is Wealth Tax Charged?

Wealth tax will be charged for each financial year commencing on and from 1st April 1957, in respect of the net wealth on the corresponding valuation date of every individual, Hindu undivided family and company at the rates specified in the schedule.

Valuation date has been defined as the last day of the previous year as defined in section 2(11) of the Income-Tax Act. Where in case of an assessee there are different previous years for different sources, the valuation date shall be the last day of the previous year immediately preceding the year for which the assessment is based.

Assets include property of any description, movable or immovable, but does not include:

(i) agricultural land and growing crops, grass or standing trees on such land;

(ii) any building owned or occupied by a cultivator or receiver of rent out of agricultural land, provided it is in the immediate vicinity of the land and which the cultivator requires as a dwelling house or a storehouse or outhouse;

(iii) live-stock, tools and implements needed for agricultural purposes;

(iv) right to any annuity or any interest in property available to an assessee for a period not exceeding five years.

How is Net Wealth to be Computed?

In computing net wealth of an individual, there shall be included:

(a) the value of assets which on the valuation date are held—

(i) by his wife to whom such assets have been transferred by the individual, directly or indirectly, otherwise than for adequate consideration or in connection with an agreement to live separately

(ii) by a minor child not being a married daughter to whom such assets have been transferred by the individual otherwise than for adequate consideration

(iii) by a person or association of persons to whom such assets have been transferred by the individual otherwise than for adequate consideration for the benefit of the individual or his wife or minor child or

(iv) by a person or association of persons to whom such assets have been transferred by the individual otherwise than under an irrevocable transfer.

(b) Where the assessee is a partner of a firm or a member of an association of individuals, the value of his interests in the assets of the firm or association determined in the prescribed manner.

Where the value of the assets is to be included in the net wealth as above, there shall be deducted from such value any debts owing on the valuation date by the transferee so far as such debts are referrable to the assets.

Are There Any Exemptions in Respect of Any Assets?

Yes. Wealth tax is not payable in respect of:

(i) any property held under trust or legal obligation for religious or charitable purposes within India;

(ii) interest in the coparcenery property of any Hindu undivided family of which he is a member;

(iii) any works of art, achæological, scientific or art collections, books, manuscripts, heirlooms not intended for sale;

(iv) the right of an assessee to receive a pension or other life annuity in respect of past service of an employer;

(v) the rights of any patent or copyright belonging to the assessee, provided they are not held as assets of business or profession and no income or benefit accrues therefrom;

(vi) domestic animals, and furniture, household utensils, wearing apparel, jewellery, provisions and other articles intended for personal use of the assessee, subject to a maximum of Rs. 25,000 in value;

(vii) right or interest in any policy of insurance before the moneys covered by the policies actually become due and payable.

(viii) tools and instruments of profession or vocation subject to a maximum of Rs. 2,500;

(ix) 10 years' Treasury Savings Deposits certificates, 15 years' annuity certificates, deposits in post office savings bank, post office certificates and post office national savings certificates;

(x) any deposit made by the assessee with the Government or in any security of the Government or of a local authority which the Government notification has exempted from wealth tax, provided the value of any deposit or security so exempted shall be included in computing the net wealth of the assessee;

(xi) amount standing to the credit of a salaried employee in a provident fund maintained by the employer to which the Provident Fund Act 1925 applies or which is a recognised provident fund by the Income-tax Act; and

(xii) the property received by an assessee from the Government in pursuance of any gallantry award approved by the Central Government.

How do you Compute the Wealth of an Individual who is not a Citizen of India?

In computing the net wealth of an individual who is not a citizen of India on the valuation date or of a Hindu undivided family or a company not resident in India, the valuation of assets and debts located outside India shall not be taken into account.

The residence and non-residence status of a Hindu undivided family or a company will be determined in accordance with the principles of control and management, the same as laid down in the Income-tax Act.

How is the Value of Assets to be Determined, is it Cost; or is it Market Value?

The value of any asset other than cash shall be estimated to be the price which, in the opinion of the Wealth Tax Officer, it would fetch if sold in the open market on the valuation date.

However, where the assessee is carrying on business, accounts of which are maintained by him regularly, the Wealth Tax Officer, instead of determining separately the value of each asset held in such business, will determine the net value of the assets of the business as a whole, having regard to the balance-sheet of such business, as on the valuation date, and making such adjustments therein as the circumstances of the case may require.

Further, where the assessee carrying on business is a company non-resident in India and a computation in accordance with a balance-sheet cannot be made by reason of the absence of any separate balance-sheets drawn from the affairs of such business in India, the Wealth Tax Officer may take the net value of the assets of the business in India to be the proportion of the net value of the assets of the business as a whole wherever carried on determined as aforesaid as the income arising from business in India bears to the aggregate income from business wherever arising during that year.

RECLAMATION BRANCH

Mafatlal House
Backbay Reclamation
Bombay 1

N. M. CHOKSHI.
General Manager.

What Authority Will Collect The Tax?

With regard to wealth tax authorities, it is provided as follows:

Every Income-tax Officer having a jurisdiction in respect of an individual, Hindu undivided family or company shall perform the function of a Wealth Tax Officer in respect of such individual, Hindu undivided family or company.

The Board may empower persons to function as Appellate Assistant Commissioner of Wealth Tax, so also persons to function as Commissioner of Wealth Tax in certain areas. The Commissioner of Wealth Tax may appoint persons to function as Inspecting Assistant Commissioner of Wealth Tax.

The Wealth Tax Officer will be subordinate to the Commissioner of Wealth Tax and the Inspecting Assistant Commissioner of Wealth Tax, within whose jurisdiction he performs his function.

The assessment procedure laid down is analogous to the procedure laid down in the Income-tax Act.

Before 30th June of the corresponding assessment year, every person liable to wealth tax, shall furnish to the Wealth Tax Officer a return in the prescribed form setting out his net wealth as on the valuation date. The first return, however, may be made at any time before December 1957.

If the Wealth Tax Officer is satisfied that the net wealth of any person is of such an amount as to render him liable, he may serve a notice requiring him to furnish, within not less than 30 days a return of net wealth as on the valuation date.

The Wealth Tax Officer may extend time for the return. An amended return may be furnished by the assessee at any time before assessment if he discovers any omission or wrong statement.

If the Wealth Tax Officer is satisfied that the return made is complete without requiring the presence of the assessee, he may determine the tax payable.

If he is not satisfied, he will serve a notice on the assessee to attend in person and produce or cause to be produced on that date any evidence on which the assessee may rely in support of his return. After hearing such evidence and such further evidence as he may require, by an order in writing the Wealth Tax Officer will assesss the net wealth of the assessee and determine the tax payable. The Wealth Tax Officer is empowered to call upon any person for making an assessment by a notice, whether he has made a return or not, to produce accounts, records and other documents as he may require. If he fails, the Wealth Tax Officer can make a best judgment assessment and determine the amount payable.

There is provision for wealth escaping assessment. If it does, by reason of omission or failure on the part of the assessee to make a return or to disclose truly and fully all material facts, action can be taken at any time without any time limitation. In other cases, the limitation is fixed at any time within six years of the end of the assessment year.

Like the Income-tax Act, this Bill also provides for penalty for concealment which is one and half times the amount of tax. Penalty can be imposed by the Wealth Tax Officer only with the previous approval of the Inspecting Assistant Commissioner of Wealth Tax.

Like the Income-tax Act, the Wealth Tax Bill also provides for liabilities in special cases like tax of deceased person payable by his legal representative, assessment of Hindu undivided family after partition, assessments when assets are held by courts of wards, administrators, etc., assessments of persons not resident in India through agents.

What are the Provisions for Appeals and Revision?

Provision for appeals, revision and references are analogous to appeals, revision and reference under the Income-tax Act.

An appeal against the order of the Wealth Tax Officer lies before the Appellate Assistant Commissioner, in the first instance, then to the Appellate Tribunal, then to the High Court on question of law. The period within which appeal is to be filed before the Appellate Assistant Commissioner is 30 days, before the Tribunal 60 days, and before the High Court within 90 days. An appeal lies also before the Supreme Court.

Provision for payment and recovery of tax are also analogous to income-tax, for there will be a notice of demand providing for recovery of tax and penalties; the mode of recovery is also set out; where properties are held by transferees, recovery may be made from such persons on whose name the asset stands of the tax in the portion of the assets value held by him.

Registration of transfers of immovable property is prohibited, unless the Wealth Tax Officer certifies that the person has paid all existing or anticipated liability under the Act.

Provision for rectification and prosecution and taking evidence on oath are on the lines of the Income-tax Act. So also the provision for service of notice, prohibition of disclosure by Wealth Tax Officer, barring of jurisdiction of Civil Court, appearance before Wealth Tax Officer by authorised representatives and power to make rules.

The power to make rules specifically provides for the manner in which the market value of any assets may be determined where it is not easily ascertainable.

What are the Rates at Which Wealth is to be Taxed?

(a) In case of individuals:

		Per cent.
(i)	On the first Rs. 2,00,000 net wealth	*Nil*
(ii)	On the next Rs. 10,00,000 net wealth	½
(iii)	On the next Rs. 10,00,000 net wealth	1
(iv)	On the balance of net wealth ...	1½

(b) In case of Hindu undivided family:

		Per cent.
(i)	On the first Rs. 3,00,000 net wealth	*Nil*
(ii)	On the next Rs. 10,00,000 net wealth	½
(iii)	On the next Rs. 10,00,000 net wealth	1
(iv)	On the balance of net wealth ...	1½

(c) In case of every company:

		Per cent.
(i)	On the first Rs. 5,00,000 net wealth	*Nil*
(ii)	On the balance net wealth	½

Where net wealth includes the value of any asset on which wealth tax is not payable, the amount of tax payable shall be an amount bearing to the total amount of wealth tax which would have been payable on the wealth if no property had been exempt, the same proportion as the unexempted portion bears to the net wealth.

Where the net wealth of an assessee, not being a company, includes any shares of any private company defined under the Companies Act 1956, the wealth tax payable by the assessee on his net wealth for that assessment year, computed in accordance with the rates specified above, shall be reduced by the amount, if any, by which the sum of the following, namely:—

(a) that portion of wealth tax payable by the assessee computed as above bears as to the whole amount of tax, the same proportion as the value of shares included in the net wealth bears to his net wealth,

(b) that portion of wealth tax paid by the Company in respect of the same assessment year, as bears to the whole amount of the said tax, the same proportion as the paid-up value of shares included in the assessment of the assessee bears to the aggregate paid-up value of the share capital of the Company as on the relevant date,

exceeds the amount calculated at the rate of 1.5 per cent. on the value of the shares included in his net wealth.

The Meaning of It

Stripped of legal jargon, the above provision comes to this:—

(1) Find out the proportionate wealth tax on the shares of private companies on the basis of the individual rates.

(2) Find out also the proportionate wealth tax payable by the company on the basis of the portion that your shareholding bears to the total paid-up capital of such private company.

Total (1) and (2) and deduct therefrom 1.5 per cent. on the value of shares included in your wealth statement.

The excess (if any) is the amount of relief available to you.

In other words, so far as the wealth tax on shares of private limited companies is concerned, the law provides that it shall not exceed the maximum rate, namely, 1.5 per cent. This is done with a view to avoiding taxing both a company and its shareholders on the same wealth, resulting in aggregate rate being much higher than the maximum rate.

Power for Progress

THE SECOND FIVE YEAR PLAN ensures continuance of the pace, set by the First Plan, for developing the tremendous hydro-eletric power potential in the country.

As representatives of leading French manufacturers, we have already been privileged to supply various mechanical and electrical machinery of power stations for various projects.

The latest orders were received from:- THE KOYNA HYDRO ELECTRIC PROJECT TO SUPPLY 4 PELTON TYPE NEYRPIC TURBINES, each rated at 87,000 BHP at 300 RpM under an effective head of 1560 feet, one house turbine of 2,250 BHP, high pressure spherical valves and other accessories.

The Andhra Valley Power Supply Co. Ltd., Bombay, for remodelling of 6 Pelton turbines, each of 17,500 BHP, for their Bhivpuri Power Station.

Neyrpic Pelton Turbine runner 105,000 BHP at 428 RpM under a net head of 2428 feet.

ROLE OF STATE TRADING CORPORATION IN EXPORT PROMOTION

EXTENSION OF ACTIVITIES WILL BE HARMFUL

WITH the question of export promotion brought under the expert examination of a committee appointed for the purpose, considerable attention has been focussed on the role which the State Trading Corporation can further play in this field. The Corporation has no doubt achieved some success since its establishment about a year ago in expanding exports and in diversifying the pattern of trade with foreign countries. Nevertheless, what must be examined dispassionately in the present context are whether (1) the activities of the Corporation can be expanded without detriment to those of private channels which have demonstrated their efficiency beyond doubt, (2) the entrance of the Corporation into more "glamorous" fields, will not shut out the enterprising firms from the more onerous fields as well, and (3) the net gain, if any, following such expansion will be adequate enough to warrant the confusion and frustration that will be engendered in trade circles with their inevitable consequences on the future of export trade.

A close scrutiny of the views expressed by various business associations on this subject indicate that they are totally opposed to any idea of extending the jurisdiction of the S.T.C. on the export front. Their views, to say the least, are not based on *a priori* considerations or expediency, but are based on sound logic and on solid ground of many years of experience. Though the functions of the S.T.C. have never been defined clearly, it will be recalled that, when the S.T.C. entered the manganese and iron ore trade nearly a year ago, it was stated that the chief objectives were, first, to check malpractices in trade and the high margin of profits enjoyed by middlemen and producers, secondly, to ensure better utilisation of transport facilities, especially in the supply of wagons, and lastly, to put Indian trade in a more advantageous position *vis-a-vis* the centrally planned economies on the question of prices. Though these measures were largely true, except that it is not totally correct to say that the manganese ore trade suffered from malpractices and excessive profiteering, nevertheless, they did not at all justify the intrusion of the Government into the trade of these ores, for they could as well have been remedied through other means the Government was capable of. It looks as though, in entering this trade, the Government has chosen a remedy which may prove to be worse than the disease.

Special Position of S.T.C.

Having thus occupied an already existing market in iron and manganese ores, the S.T.C., aided by the better transport facilities which it has been able to command because of its status as a Government-owned Corporation, has been able to achieve considerable success. In a report issued last week it has been stated, for instance, that till 1st May 1957, since its inception, the export contracts of the S.T.C. amounted to Rs. 24.48 crores of which manganese and iron ores alone accounted for over Rs. 20 crores (the quantities involved being 366,000 tons and 2,530,000 tons, respectively). Of these, the exports to Communist countries aggregated nearly Rs. 7 crores. It is stated again that of the import contracts of the Corporation valued at Rs. 12.35 crores, Communist countries accounted for Rs. 5 crores. Though these are welcome features, the fact cannot be denied that if better wagon, port and credit facilities had been provided, and if the Government had chosen to assist them in all possible ways, the private agencies could have done equally well or even better. In this connection, it should not be ignored that the export of manganese ores effected by the export trade during the year 1953-54 was of the order of 1,600,000 tons. The exports of iron ore which were no less impressive amounted to 1,300,000 tons in 1953-54, and to an equal quantity in 1955-56. Of the various non-Communist countries to which exports of these two ores were effected by the S.T.C., mention may be made of Italy, Japan, Holland, the U.S.A., England, France, and Norway. Thus, the conclusion is inescapable, and the charge of the private agencies is justified, that the S.T.C. is trying to ship ores to India's traditional markets by ousting exporters from the trade. This also proves that the S.T.C. has not succeeded to any large extent in exploring new markets.

Claim Disputed

Further, the claim of the Corporation that it has been able to fulfil the contracts with other countries fully has also been disputed by the spokesmen of the mining trade. They contend that the Corporation has failed to carry out its contracts with the U.S.A., France and Japan in the year 1956. To the extent it has been able to fulfil them, it may be underlined here, it is because of the fact—admitted by the Corporation itself—that it has been able to get over the transport bottleneck because of its close association with the Government. This, surely, is something for which the S.T.C. cannot legitimately claim any credit, for, so long as there is no appreciable improvement in the transport facilities in the country, wherever, and to whatever extent the S.T.C. is shown preference, it is at the expense of the private trader. All this means that there has been no net improvement to the country, in respect of exports, as a result of the S.T.C.'s appearance in the field. In fact, the complaint is often heard from business men that the system of movement and export quotas in manganese ore has completely failed to assist the trade; indeed, the movement quota is said to be working against the interests of the private trade. Then, is it a false claim to say that, if preferential transport facilities were given, if quotas, which are fixed with reference to wagon facilities available were relaxed and if the Government were to announce a long-term policy for the export of ores to enable the trade to enter into long-term export commitments, the private agencies would have disproved some of the serious charges of the Government?

Low-grade Ores

It is also pointed out by the traders that the S.T.C. is neither lifting low-grade ores nor opening up reserved areas. Under these conditions, to say that the Corporation has a special role to play, or that it has been playing the role of a good "samaritan," does not square with the facts. The spreading of the S.T.C.'s tentacles in the export field is pregnant with numerous harmful consequences which, in the ultimate analysis, seriously undermine the export capacity of the country. In the first place, the question to be asked is: Is the S.T.C. technically and organisationally competent to deal with export matters? The answer, as things stand, is definitely in the negative. For not all Government officials possess that degree and quality of business acumen, skill and ability that are needed in this field. Besides, it is not always easy for the States to keep a close watch on the stock position in the various markets, daily arrivals and offtake, moves and counter-moves of fellow operators and changes in price trends. A further prerequisite for success in trade is the ability to take quick, on-the-spot decisions which a State-owned Corporation, bound by set rules and regulations, is not capable of.

Another important consideration is that, while losses arising from bad management and irresponsibility in the private sector are borne by the traders themselves, similar losses in State trading are transferred to the nation as a whole. It can be argued by the pro-State-trading school that profits of State trading are also transferred to the national exchequer. But experience shows that the chances of losses in State trading are far grosser than in private trading and as such the nation may be a net sufferer. Again, it should not be forgotten that a part of the profit of the S.T.C. will only represent the taxes paid by the private trade on its earnings.

Many Varieties of Commodities

Yet another weighty point to be borne in mind while defining the future role of the S.T.C. with reference to exports is that there are so many varieties of export commodities, some of which are traditional items, and the problems of expanding markets for the old ones or creating markets for the new commodities are so stupendous and formidable that they cannot be conceivably solved by the State Trading Corporation alone. Again, some of the exports involve such limited quantities or limited markets, and certain others such larger quantities and markets, and exploring new markets needs such specialised knowledge, that there is much to be said in favour of leaving them to be handled by the individual firms and exporters who have the requisite specialised knowledge, skill, training and initiative. Nothing can be achieved by the State; on the contrary, much damage can be done to the economy, by leaving in the hands of private exporters only those exports which call for great risk, initial labours and losses, and by the State taking over all other exports where risk and labour are comparatively less and profits are easy. Such a course would discourage the private channels. Furthermore, where the State is so acutely in need of experienced administrators for developmental projects why should it starve the latter by entering fields which are being efficiently managed without the aid of the State?

I.C.I.'S NEW BUTANOLS PLANT

Imperial Chemical Industries Ltd., has started up a second large-scale carbonylation plant at Billingham, County Durham, England. This plant will be used for the production of butanols, a range of important raw materials used by many industries. The biggest consumer is the paint and lacquer industry, which uses butanols (either as such or in the form of esters) mainly as solvents or plasticisers. Other users include manufacturers of pharmaceuticals, printing inks and hydraulic brake fluids.

The raw material for the new carbonylation plant, propylene, will come by pipeline under the River Tees from the oil crackers operated by the Billingham Division at I.C.I.'s Wilton Works, in North Yorkshire. At Wilton, I.C.I. has the largest centre of petroleum chemicals production outside the U.S.A., with two oil crackers in production, and another scheduled to come into operation at the beginning of 1959.

With No. 2 carbonylation plant in full production, I.C.I.'s output of butanols is increased sevenfold. Nowhere else in the world is the carbonylation process, sometimes known as the Oxo process, carried out on such a large scale as at Billingham. Since 1952 the process has been used to produce butanols, but the demand for these alcohols has consistently been in excess of indigenous production. With the new capacity available, the need for imports will be eliminated: these imports have been coming from the U.S.A., Germany and Sweden.

The advent of No. 2 carbonylation plant will have the further beneficial effect of leaving No. 1 plant entirely for the production of iso-octanol, "Alphanol" and Nonanol. These alcohols, which are made by the same process as butanols but from different raw materials, are used in increasing tonnages for the manufacture of phthalates and other esters, which in turn are used as plasticisers for polyvinyl chloride (p.v.c.), a plastic which is in great demand for the manufacture of upholstery materials, curtains, flooring, electric flex and other commodities.

Brahmanabad

Inside a house excavated at Brahmanabad in Sind, has been found an interesting piece of earthenware tubing. A basin like altar which probably served as the seat for bathing some household deity, is connected by this tubing to a covered drain. This tubing unlike other pipework found at various sites of the Indus Civilisation, has a corrugated outer surface, obviously as a safety measure against breakage.

INDIA SUGARS AND REFINERIES' PROFIT MAINTAINED

FACTORY EXPANSION COMPLETED

A RECORD in the quantity of cane crushed, resulting in a record output of sugar, is the outstanding feature of the working of the India Sugars and Refineries Ltd. (Managing Agents: The India Sugar Agencies Private Ltd., Madras), during the year ended 30th September 1956. This welcome development has, however, not been followed by a commensurate increase in earnings. The gross profit for the year under review, for instance, at Rs. 13.26 lakhs, is only a shade better than Rs. 13.21 lakhs earned for the previous year, to which level it had risen from Rs. 12.17 lakhs for 1953-54. Although a very meagre improvement has been recorded to justify the contention that the gross profit has increased for the third year in succession, it will be more appropriate to say that the gross profit has been only fully maintained at the previous year's level. The net profit, which had gone up from Rs. 5.18 lakhs to Rs. 5.39 lakhs in the previous year, has staged a further modest rise to Rs. 5.98 lakhs for the year under review. The negligible increase in profit, as compared with the encouraging performance in production, seems to be due to fairly heavy stocks of sugar and lower price realisation on the sugar sold. Thus, it is seen from the profit and loss account that sale proceeds were down by Rs. 1.65 lakhs and that stocks of finished goods were up by Rs. 10.04 lakhs. The position would have been definitely worse had there not been a saving of Rs. 9.57 lakhs in expenses.

A dividend of 11¼ per cent. on 319,492 shares and a *pro-rata* dividend at the same rate on the 320,000 new shares has been recommended by the Directors for the year under review, as against 14 per cent. paid for 1954-55. While thus the dividend has been lowered, it must be remembered that the latest dividend is on an increased capital of Rs. 55.95 lakhs brought about by the issue of 320,000 new ordinary shares of Rs. 10 each and 4,714 bonus shares out of the 4,968 which were lying unissued. The new ordinary shares rank for dividend as from 1st July 1956 in the proportion to the capital for the time being paid-up thereon. It may be mentioned here that the previous dividend of 14 per cent. was itself on a higher capital of Rs. 31.48 lakhs raised by the issue of shares of the value of Rs. 2.80 lakhs out of the bonus shares suspense amounting to Rs. 3.29 lakhs.

The following comparative table brings out the progress of the Company during the past four years:

(In lakhs of rupees)

	For the year ended 30th September			
	1956	1955	1954	1953
Sales	97.72	99.37	90.24	1,07.28
Closing stock of finished goods..	28.21	18.17	13.06	7.77
Other income	3.06	2.81	4.82	2.07
Expenses	97.57	1,07.14	82.89	99.53
Gross profit	13.26	13.21	12.17	10.42
Managing Agents' remuneration	1.26	1.36	1.11	0.72
Depreciation	0.67	0.46	0.38	4.00
Provision for taxation and contingencies	5.35	6.00	5.50	3.75
Net profit	5.98	5.39	5.18	1.95
Refund of sales tax	0.04	..	..	..
Previous year's administrative expenses written off ..	0.10	..	..	..
Dividends—				
7½ per cent. preference ..	0.33	0.09	0.09	0.09
Ordinary	4.04	4.41	3.11	3.25
	(11¼%)	(14%)	(17½%)	(25%)
Carry forward	6.77	5.22	4.30	2.32
Cane crushed (in tons) ..	133,142	127,609	97,155	89,609
Sugar produced (in tons) ..	13,565	13,067	9,985	9,425

During the year under report, the Company's factory crushed 133,142 tons of sugarcane and produced 13,565 tons of sugar, as compared with 127,609 tons of cane crushed, producing 13,067 tons of sugar. The quantity of cane crushed has thus exceeded the record crushing of 1951-52 at 132,634 tons. Likewise, the output of sugar also is a new record high, in that it has exceeded the last year's record by 498 tons. Denatured spirit manufactured at the Company's distillery is finding increased sale in overseas markets, particularly in Ceylon.

The expansion of the Company's factory at Hospet has been completed in record time with minimum cost and the factory has commenced production with increased capacity. The Directors, however, state that, since the expansion could not be carried out in time for the current season, it may not be possible during this season either to make any significant increase in output or achieve economies in production such as would be reflected in increased profits. They have taken a rather cautious view of the current year's prospects and this is reflected in their decision to carry forward a large surplus of Rs. 6.77 lakhs to the next year's accounts.

The Salar Jung Sugar Mills Ltd. and Manjula Confectionery Private Ltd. became subsidiaries of the Company during the year. Steps have been taken to improve the working of these Companies and it is hoped that the results would be gratifying. Similarly, the expansion of the Salar Jung Sugar Mills' factory at Munirabad has also been completed and the factory is now working efficiently and economically. The Directors expect that, within the next two seasons, its operations would be stabilised so as to be a significant source of financial return.

As already stated, the paid-up capital of the Company has been increased from Rs. 32.71 lakhs to Rs. 54.34 lakhs, by the additional issue of 4,771 7½ per cent. taxable cumulative preference shares of Rs. 100 each at par and by a new issue of 320,000 ordinary shares of Rs. 10 each at a premium of As. 8 per share. The present paid-up capital is thus made up of 6,000 (7½ per cent.) cumulative preference shares of Rs. 100 each and 639,492 ordinary shares of Rs. 10 each. Of the above ordinary shares, 159,746 shares represent capitalisation of reserves in July 1954. The Company's reserves and surplus aggregate Rs. 21.67 lakhs. Besides this, there is a provision for taxation and contingencies amounting to Rs. 18.12 lakhs. The current liabilities aggregate Rs. 61.16 lakhs and include secured loans from banks for Rs. 28.56 lakhs. The gross block of the value of Rs. 33.71 lakhs has been written down to Rs. 14.46 lakhs. The current assets at Rs. 140.83 lakhs exceed the current liabilities and provision for taxation and contingencies by a margin of Rs. 61.55 lakhs. An analysis of current assets shows that loans and advances alone account for Rs. 68.65 lakhs, of which debts due from subsidiaries form Rs. 19.37 lakhs. Stocks and stores amount to Rs. 34.87 lakhs, while cash balances are at an extremely low level of Rs. 4.84 lakhs.

The Rs. 10 fully paid-up ordinary shares of the Company are being currently quoted at Rs. 15.50 *cum-div.* On an *ex-div.* basis, the latest dividend gives a yield of 8 per cent. per annum, free of income-tax.

NATIONAL CARBON'S RESULTS ENCOURAGING

The hope expressed in these columns last year that the National Carbon Company (India) Ltd. (Chairman and Managing Director: Mr. J. R. Galloway, Calcutta) would play a decisive part in the economic and industrial growth of the country, when the Company's schemes of expansion are put through, seems to have been more than justified by its excellent performance during the year ended 25th December 1956 and by the substantial progress in its schemes of expansion.

The Company's factories at both Calcutta and Madras reached a high level of production during the year and the number of cells manufactured by these units exceeded all previous records. There was a marked improvement in sales of both consumer and industrial products and this is reflected in the sale proceeds which have shot up from Rs. 451.77 lakhs to Rs. 518.94 lakhs, representing an increase of as much as Rs. 67.17 lakhs over the year. The gross profit shows a rise of Rs. 5.04 lakhs, having advanced from Rs. 94.51 lakhs in 1954-55 to Rs. 99.55 lakhs in the year under review. The net profit, after providing for depreciation and taxation, however, stands lower at Rs. 46.80 lakhs, as compared with Rs. 50.16 lakhs.

The Directors have raised the provision for depreciation from Rs. 7.69 lakhs to Rs. 9.12 lakhs and that for taxation from Rs. 36.66 lakhs to Rs. 39.18 lakhs. In addition to this, they have made a new provision of Rs. 4.45 lakhs for super-tax on dividends, in view of the Company's distribution of dividend in excess of 6 per cent. A dividend of 15 per cent. is proposed to be paid for the year, of which an *ad-interim* dividend of 7½ per cent. has already been paid. As against this, in the previous year, an interim dividend at 20 per cent. was declared before the Company was converted on 23rd December 1955 into a public organisation, followed by a second interim distribution at 12½ per cent. The second interim dividend, in effect, represented the final distribution. It must, however, be noted that the dividend of 15 per cent. for 1955-56 is on the increased capital of Rs. 2 crores, raised by the issue of fresh capital to the tune of Rs. 40 lakhs to the Indian public at the time of conversion into a public company in December 1955, while the interim distribution for 1954-55 was on a lower capital before it was raised partly through the issue of bonus shares and partly through the new issue for cash in the third quarter of 1955, and the final one was on Rs. 1.60 crores raised through these issues. The total distribution for 1954-55 represents over 20 per cent. on the present capital of Rs. 2 crores, so that the dividend for 1955-56 is a cut of 5 per cent. from that paid for the previous year. The interim and final dividends for the year under review together absorb Rs. 30 lakhs, as against Rs. 40.25 lakhs in the previous year, leaving a balance of Rs. 21.20 lakhs to be carried forward, as against Rs. 16.46 lakhs brought in.

During the year under review, several new batteries were introduced and the Company is now able to offer a complete line of "Eveready" batteries for all types of radio receivers and for various other classes of electronic equipment now in use. A matter of particular importance is the development, in collaboration with the Indian Meteorological Department, of the "Eveready" "Mini-Max" X-830 battery. This battery, it is reported, was used with outstanding success by the Indian delegation at the International Comparison of Radio Sondes held in Switzerland in 1956, and functioned perfectly at altitudes up to 18 miles. The zinc rolling mill of Metals and Ores Company, which is a division of N.C.I., was completed at Alipore, Calcutta, and inaugurated on 23rd August 1956. During the four months of its operation, 245 tons of zinc were processed and, by the end of the year, production had reached rated output. The mill is operating satisfactorily and the Directors expect that rated output will be maintained throughout the current year.

Commenting on the progress made in the Company's expansion programme, the Directors in their latest report observe:

"Substantial progress has been achieved in the expansion programme which was outlined in the report of our Directors for 1955. In addition to the zinc rolling mill of Metals and Ores Company which came into operation in 1956, construction of the flashlight case factory, which is to be located at Lucknow, Uttar Pradesh, is proceeding rapidly. An excellent site has been acquired for this unit and early delivery is expected of all equipment needed for the production of flashlight cases, in a volume sufficient to supply the growing requirements of the Indian market. Plans call for production to commence during the second half of 1957. A site for a chemicals plant to produce organic solvents, ethylene dichloride and polyethylene has been acquired on Trombay Island, Bombay, and construction is expected to commence shortly. The design of plant and equipment for this unit is being carried out by your Company's technical consultants, Union Carbide Corporation, U.S.A. They are being assisted by a group of your Company's engineers who are presently in the U.S.A. in this connection. It is anticipated this unit will come into operation in 1958."

The paid-up capital of the Company as at the end of the year of review stands increased from Rs. 160 lakhs to Rs. 200 lakhs by the issue of 400,000 shares of Rs. 10 each, at a premium of Rs. 9-8 per share, making a total of 2,000,000 ordinary shares of Rs. 10 each. This is supplemented by reserves and surplus, aggregating Rs. 99.35 lakhs. The provision for taxation amounts to Rs. 16.78 lakhs and current liabilities aggregate Rs. 63.04 lakhs. The goodwill is shown at cost at Rs. 30 lakhs. The gross block of Rs. 150.98 lakhs has been written down to Rs. 100.38 lakhs. Additions during the year were of the order of Rs. 83.75 lakhs. The current assets aggregate Rs. 248.80 lakhs. These include stores and spare parts Rs. 10.29 lakhs, raw materials at cost Rs. 96.22 lakhs, work-in-progress Rs. 19.79 lakhs, finished goods Rs. 42.57 lakhs, debts, deposits and advances Rs. 64.66 lakhs, and cash balances Rs. 14.78 lakhs. The current assets cover the current liabilities and provision for taxation by a very wide margin.

The capital expenditure for the construction of new production facilities and expansion and modernisation of existing facilities during the year amounted to Rs. 44.35 lakhs. The Directors expect that capital expenditure for the current year will be appreciably higher than in 1956, due primarily to the cost of constructing the flashlight case factory and the chemicals plant.

The Rs. 10 fully paid-up shares of the Company are presently quoted on the Calcutta Stock Exchange at Rs. 23.75 *ex-div.* On this basis, the shares provide a yield of 6.3 per cent. per annum free of income-tax.

DUNLOP RUBBER'S RIGHTS OFFER

The long-awaited new issue of the Dunlop Rubber Company (India) Ltd. has been announced. The new issue, which is underwritten, consists of 1,400,000 shares of Rs. 10 each and is offered to the existing shareholders at a premium of Rs. 5 each in the proportion of 7 for 8 shares held. This offer, it is expected, will meet with a warm response in view of the promising outlook for the Company's business.

The Company proposes to utilise the proceeds of this issue which will bring in Rs. 2.10 crores—Rs. 1.40 crores by way of capital and Rs. 70 lakhs by way of premium—for building a new tyre factory in Madras. The new undertaking, as well as the expansion which is taking place in its existing factory, will, it is expected, substantially improve the Company's earnings. Meanwhile, the Directors have decided to pay an interim dividend of 7½ per cent. which will come in handy to the shareholders for subscribing to the new shares.

DUNLOP MADRAS

The trading results of the Dunlop Rubber Company, Ltd., London, for the year 1956 show that the net profit (after taxation) has suffered a setback from £2,857,531 to £1,943,591. The transfer to the general reserve has been pruned from £850,000 to £380,000 and dividend on ordinary shares has been cut from 14 per cent. (of which 4 per cent. represents interim distribution made in December 1955) to 10 per cent. (including 2½ per cent. interim paid in December last). The preference dividends absorb £451,447, leaving a surplus of £1,501,980 to be carried forward, as against £1,498,490 brought in.

INDORE MALWA MILLS' PROFIT SHRINKS

DIVIDEND, HOWEVER, RAISED

THE introduction of the additional excise duty on cloth in September 1956 has generally affected textile mill profits for the year ended 31st December 1956 and the Indore Malwa United Mills Ltd. (Chairman, Board of Directors: Mr. K. L. Seksaria, Bombay) has proved to be no exception. The gross profit of the Company, which had shot up from Rs. 6.78 lakhs for 1954 to Rs. 27.93 lakhs in the following year, thus setting a record since 1945, has receded by Rs. 3.91 lakhs to Rs. 24.02 lakhs in the year under review. After making provision for Managing Agents' commission, depreciation and taxation, the net profit amounts to Rs. 8.89 lakhs, as compared with Rs. 7.53 lakhs for 1955.

The higher net profit, in spite of the decline in the gross profit, is due to the lower provisions made for all the three counts, namely, agents' commission, depreciation and taxation. Thus, the provision for depreciation has been lowered from Rs. 9.78 lakhs to Rs. 6.59 lakhs, consequent on the benefit of development rebate to the tune of Rs. 3.58 lakhs, and that for taxation from Rs. 8 lakhs to Rs. 7.20 lakhs. A new development reserve account has been created out of the estimated amount of development rebate in respect of the years 1954 and 1955 which was formerly credited to depreciation on plant and machinery account. This reserve has been further strengthened by the addition of Rs. 3.58 lakhs out of the year's profit, being the development rebate for 1956. The dividend equalisation fund, which had received Rs. 3 lakhs in the previous year, has not been added with anything further. The dividend is proposed to be raised to 11 per cent. from 9 per cent. for the previous year, to which level it had been stepped up from 6 per cent. paid for the previous three years. This distribution includes an *ad-interim* dividend of Rs. 5 per share paid earlier during the year. It is not known what induced the Directors to step up the dividend when the gross profit has, if anything, only declined. The Directors' recommendation to pay a higher dividend was made at a time when the dividend tax was 25 per cent. on the dividend slab 10 per cent. to 18 per cent. of the paid-up capital. The latest changes in fiscal measures has, however, proved beneficial to the Company in so far as dividend tax is concerned. It has also, to some extent, reduced the incidence of the new wealth tax on the Company.

The following comparative table provides an idea of the Company's progress since 1953:

(In lakhs of rupees)

	For the year ended 31st December			
	1956	1955	1954	1953
Sales of cloth, yarn and waste..	2,57.26	2,95.22	2,49.13	2,49.62
Closing stock of cloth, yarn, cotton and waste	78.89	60.77	84.20	85.81
Cotton, stores, etc., consumed..	1,56.69	1,34.41	1,58.93	1,37.67
Other expenses	1,05.51	1,02.05	96.68	99.50
Gross profit	24.02	27.93	6.78	16.82
Agents' commission	1.34	2.62	0.68	1.71
Depreciation	6.59	9.78	3.16	12.01
Provision for taxation	7.20	8.00	..	..
Net profit	8.89	7.53	2.94	3.10
Transfer from bonus provision..	0.16	..	..	..
To reserves	3.58	3.00	..	..
Dividend	5.50	4.50	3.00	3.00
	(11%)	(9%)	(6%)	(6%)
Carry forward	0.07	0.09	0.06	0.12

It will be seen from the above table that while sale proceeds of cloth, yarn and waste have declined by Rs. 37.96 lakhs, the cost of cotton, stores, etc., consumed has sharply increased by Rs. 22.28 lakhs and other expenses by Rs. 3.46 lakhs. This includes a sum of Rs. 1.40 lakhs provided as bonus for the year 1956 in accordance with the five-year bonus agreement entered into by the Company with the Indore Mill Mazdoor Sangh. The increase in the closing stocks from Rs. 60.77 lakhs to Rs. 78.89 lakhs reflects the serious nature of the impact of excise duty on the offtake of cloth.

The Company's reserves and surplus, as at the end of the year under review, aggregate Rs. 21.34 lakhs, as against a paid-up capital of Rs. 50 lakhs, all in ordinary shares of Rs. 100 each. This includes a sum of Rs. 30 lakhs issued as bonus shares by capitalising reserves in September 1948. The current liabilities amount to Rs. 109.82 lakhs and provision for taxation Rs. 31.56 lakhs. The gross block of Rs. 148.10 lakhs, along with additions during the year amounting to Rs. 17.26 lakhs, has been written down to a book value of Rs. 31.30 lakhs. The current assets amount to Rs. 181.42 lakhs and cover the current liabilities and provision for taxation by a substantial margin of Rs. 40.04 lakhs.

The Rs. 100 fully paid-up shares of the Company are being currently quoted at Rs. 139.50 *cum-div.* (final dividend: Rs. 6). On an *ex-div.* basis, the dividend for the year under review gives a yield of 8.2 per cent. per annum, free of income-tax.

COMPANY MEETINGS AND DIVIDENDS

ASHOK LEYLAND LTD. Annual General Meeting, Ennore, Madras, 6th June 1957. Dividend: 6 per cent. Transfer books remain closed from 22nd May to 7th June 1957, both days inclusive.

4. To elect a Director in place of Mr. Ambalal Sarabhai who retires by rotation and to consider and if thought fit to pass the following ordinary resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company.

   "RESOLVED that Mr. Ambalal Sarabhai who has completed the age of 67 years and who retires by rotation be and is hereby re-elected a Director of the Company and that the age limit, prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."

5. To elect Mr. Jayantilal R. Mehta and Mr. N. K. Petigara who were appointed additional Directors of the Company on 23rd May, 1957, as Directors of the Company and to consider and if thought fit to pass the following resolutions as ordinary resolutions:

   (i) "RESOLVED that pursuant to the relevant provisions of the Companies Act, 1956, including Sections 257 and 258, Mr. Jayantilal R. Mehta, be and is hereby elected and appointed a Director of the Company."

   (ii) "RESOLVED that pursuant to the relevant provisions of the Companies Act, 1956, including Sections 257 and 258, Mr. N. K. Petigara be and is hereby elected and appointed a Director of the Company."

6. To elect Sir Vithal N. Chandavarkar, Kt., as Director of the Company and if thought fit to pass the following ordinary resolution, of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company.

   "RESOLVED that pursuant to the relevant provisions of the Companies Act, 1956, including Sections 257 and 258, Sir Vithal N. Chandavarkar, Kt., who has completed the age of 69 years be and is hereby elected and appointed a Director of the Company and that the age limit prescribed under Section 280 shall not apply to him."

7. To appoint Auditors for the current year and to fix their remuneration.

The Transfer Books of the Company will remain closed from the 27th day of May, 1957, to the 25th day of June, 1957, (both days inclusive).

A member entitled to attend and vote at the General Meeting of the Company is entitled to appoint another person as his proxy to attend and vote instead of himself. The proxy need not be a member of the Company.

By Order of the Board,
B. K. SHAH,
Managing Director.

BOMBAY, 24*th May*, 1957.

N.B.—The Dividend when sanctioned at the General Meeting will be payable to those Shareholders whose names stand registered on the Company's Registers on the 25th May, 1957. It will be payable at the Central Bank of India, Limited, Bombay, for six months on and after the 1st July, 1957, and thereafter at the Registered Office of the Company.

Explanatory Statement Pursuant to Section 173 of the Companies Act, 1956.

Item 4:—Mr. Ambalal Sarabhai, who retires by rotation and is eligible for re-election, has attained the age of 67 years. The Company has received special notice from some members in accordance with the requirements of Section 281 of the Companies Act, 1956. Mr. Ambalal Sarabhai has been on the Board of the Company since 1927 and with his wide and varied experience as a business man and an industrialist has rendered valuable services to the Company. It is in the interest of the Company that it should continue to receive the benefit of his services and the resolution of which notice is given to the members is commended for acceptance.

Items 5 *and* 6:—Mr. Jayantilal R. Mehta, Mr. N. K. Petigara and Sir Vithal N. Chandavarkar, Kt., who were Life Policyholders' Directors of the Company, resigned from their office as Life Policyholders' Directors. Mr. Jayantilal R. Mehta and Mr. N. K. Petigara were appointed additional Directors by the Board on 23rd May, 1957. Section 260 of the Companies Act, 1956, and Article 88 of the Company's Articles of Association provide that an additional Director shall hold office only upto the date of the next Annual General Meeting of the Company. As such, Mr. Jayantilal R. Mehta and Mr. N. K. Petigara hold their office as Directors only upto the date of the Thirty-eighth Annual General Meeting of the Company, namely, 26th June, 1957. Notices regarding the above two ordinary resolutions proposing Mr. Jayantilal R. Mehta and Mr. N. K. Petigara for appointment to the office of Director at the 38th Annual General Meeting have been received by the Company as provided by Section 257 of the Companies Act, 1956.

Sir Vithal N. Chandavarkar, Kt., who has completed the age of 69 years, can only be appointed as Director of the Company by a resolution passed by the Company at the General Meeting. A notice under Section 257 and a Special Notice pursuant to Section 281 of the Companies Act, 1956, to propose Sir Vithal N. Chandavarkar, Kt., as a candidate for the office of Director, have been duly received by the Company.

Mr. Jayantilal R. Mehta, Mr. N. K. Petigara and Sir Vithal N. Chandavarkar, Kt., have been the Life Policyholders' Directors of the Company for more than fifteen years. With their wide experience in varied fields of business and industry they have rendered valuable services to the Company. It is in the interest of the Company that it should continue to receive the benefit of their services and the resolutions to elect them as Directors, of which, notice has been given to the shareholders, are commended for acceptance.

THE RAMNUGGER CANE AND SUGAR COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Twentieth Ordinary General Meeting of the Shareholders of the Ramnugger Cane and Sugar Company, Ltd., will be held at the Registered Office of the Company, 7, Wellesley Place, Calcutta, on Thursday, the 4th July 1957, at 12 noon, to transact the following business:—

1. To receive the Directors' Report and pass the Audited Accounts for the year ended 31st August 1956.
2. To declare a Dividend on Preference Shares.
3. To declare a Dividend on Ordinary Shares.
4. To elect Directors.
5. To appoint Auditors and fix their remuneration.
6. To transact any other business which may properly be brought before the Meeting.

NOTICE is also given that the Share Transfer Registers will be closed from the 15th June to 4th July 1957, both days inclusive.

By Order of the Board,
ANDERSON WRIGHT LTD.,
Managing Agents.

CALCUTTA, 22*nd May* 1957.

Note.—A member of the Company who is entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself. A proxy need not be a member of the Company.

THE BOMBAY FIRE AND GENERAL INSURANCE COMPANY, LIMITED

(Incorporated in India)

NOTICE IS HEREBY GIVEN THAT THE Twenty-second Ordinary General Meeting of the above Company will be held at the Registered Office of the Company, Henley House, Graham Road, Ballard Estate, Bombay, on Thursday the 20th June 1957, at 3 p.m. (S.T.), to transact the following business:

(1) To receive and adopt the Directors' Report and Audited Revenue Accounts, Profit and Loss Account, Profit and Loss Appropriation Account and Balance Sheet for the year ended 31st December 1956.

(2) To sanction the declaration of a Dividend.

(3) To elect Directors in place of Mr. M. A. Fazalbhoy and Mr. F. H. Kemple who retire under Article 95 of the Articles of Association of the Company and being eligible, offer themselves for re-election.

(4) To elect Mr. Bhagwandas Goenka, Mr. Surajratan Damani and Mr. S. Ramanathan, who were appointed as Additional Directors of the Company on 12th October 1956, 25th October 1956, and 8th December 1956, respectively, as Directors of the Company.

(5) To appoint Auditors for the current year and to fix their remuneration.

The Transfer Books of the Company are closed from the 31st May 1957, to the 20th June 1957 (both days inclusive).

A member entitled and vote at the General Meeting of the Company is entitled to appoint another person as his proxy to attend and vote instead of himself. The proxy need not be a member of the Company.

By Order of the Board,
K. K. DASTUR,
Manager.

BOMBAY, 20*th May* 1957.

N.B.—The Dividend when sanctioned at the General Meeting will be paid on or after 24th June 1957 to those Shareholders whose names stand on the Company's Registers on the 20th June 1957.

EXPLANATORY STATEMENT

Mr. Bhagwandas Goenka, Mr. Surajratan Damani and Mr. S. Ramanathan, were appointed Additional Directors on the 12th October 1956, 25th October 1956 and 8th December 1956, respectively, by the Board of Directors of the Company. Section 260 of the Companies Act, 1956, provides that additional Directors shall hold office only up to the date of the next Annual General Meeting of the Company. As such Mr. Bhagwandas Goenka, Mr. Surajratan Damani and Mr. S. Ramanathan, hold their offices as Directors only up to the date of the Twenty-second Annual General Meeting of the Company. Mr. M. A. Fazalbhoy has given written notice signifying his intention to propose Mr. Bhagwandas Goenka and Mr. Pallonji Shapoorji Mistry has given written notice signifying his intention to propose Mr. Surajratan Damani and Mr. S. Ramanathan as candidates for the offices of Directors. Mr. Bhagwandas Goenka, Mr. Surajratan Damani and Mr. S. Ramanathan have also given to the Company their consent in writing required to be filed with the Registrar of Companies.

JENSON AND NICHOLSON (INDIA) LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Annual General Meeting of Members of the Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Thursday, 20th June 1957, at 11 a.m., for the following purposes:—

1. To receive and consider the Directors' and Auditors' Reports and the Profit and Loss Account for the year ended 31st December, 1956, and the Balance Sheet as at that date.
2. To declare Dividends.
3. To elect a Director in place of Mr. B. J. Nicholson, who retires by rotation and is eligible for re-election, by passing the following resolution of which special notice as required by Section 281 of the Companies Act, 1956 has been received by the Company.

   "Resolved that Mr. B. J. Nicholson who has attained the age of 68 years, and who retires by rotation be and is hereby re-elected a Director of the Company and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the Companies Act, 1956 shall not apply to him."

4. To appoint Auditors and fix their remuneration.
5. *As Special Business.*—To pass, if thought fit, the undernoted resolutions:—

   (i) (*As an Ordinary Resolution.*) "That Mr. H. S. Challis be appointed an Alternate Director of the Company to act for Mr. B. J. Nicholson during his absence from West Bengal."

   (ii) (*As a Special Resolution.*) "That the consent of the Company be accorded to the holding by Mr. H. S. Challis of the office or place of profit of Secretary and Accountant of the Company notwithstanding that he be a Director of the same."

The Share Transfer Books of the Company will be closed from the 13th to 20th June 1957, days inclusive.

By Order of the Board,
H. S. CHALLIS,
Secretary.

2, FAIRLIE PLACE,
CALCUTTA, 8*th May* 1957.

Note.—A member entitled to attend and vote at the above Meeting may appoint a proxy to attend and vote instead of him. A proxy need not also be a Member of the Company.

EXPLANATORY STATEMENT

The Resolution set out under item 3 is required as Mr. B. J. Nicholson has attained the age of 68 years and hence cannot be re-appointed a Director except by a resolution in respect of which special notice has been given in accordance with Sections 190 and 281 of the Companies Act, 1956. Notice has been duly received that this Resolution will be proposed.

Mr. B. J. Nicholson will be away from India for more than three months and the Board of Directors recommend that Mr. H. S. Challis be appointed to act as his Alternate; accordingly the Ordinary Resolution under item 5 (i) has been proposed.

The Special Resolution under item 5 (ii) is necessitated by the facts therein specified and the operation thereon of Section 314 of the Companies Act, 1956.

THE BENGAL FLOUR MILLS COMPANY, LIMITED

NOTICE IS HEREBY GIVEN TO THE MEMbers of the above-named Company that the Annual General Meeting (being the One Hundred and Twenty-Third Ordinary General Meeting of the Company) will be held at its Registered Office, 21, Netaji Subhas Road, Calcutta, on Wednesday the 19th June, 1957, at 12 noon, to consider the Profit and Loss Account for the year ended 31st December, 1956, and the Balance Sheet as at that date, the Report of the Auditors thereon, the Report of the Board of Directors, to declare a dividend, and to transact other ordinary general business of the Company.

Notice is also hereby given that the Transfer Books and Register of Members of the Company will be closed from 3rd June, 1957, to 19th June, 1957, both days inclusive.

By Order of the Board,
BALMER LAWRIE & Co., LTD.,
D. MANSON,
Secretary,
Managing Agents.

21, NETAJI SUBHAS ROAD,
CALCUTTA, 22*nd May*, 1957.

Note:—A member entitled to attend and vote at this meeting is entitled to appoint a proxy to attend and vote in his stead. Such proxy need not be a member of the Company.

QUESTION HOUR IN PARLIAMENT

Gold Prices

THE disparity in the prices of gold as quoted in the market and as fixed by the International Monetary Fund is one of the main difficulties in the way of Government proceeding with the proposal for buying gold from the people for financing the Plan. The Government is bound by the gold price of the rupee fixed by the I.M.F. The value will only be Rs. 62.50 per tola, whereas the market price is considerably in excess and is going up and down. It can also be said that the market price of gold reflects the real value of the rupee, as the price is a fluctuating price dependent on speculation. Therefore, we are up against this bottleneck and we cannot proceed further.

* * * *

Sterling Balances

India's sterling balances up to the first week of May 1957 was to the tune of Rs. 496.42 crores. The statutory minimum for currency reserve is Rs. 400 crores. The balance on 30th March 1956 was Rs. 746 crores. The present balance includes the sum of Rs. 60 crores transferred from the I.M.F. to the sterling balances account. The bulk of the drawing on the account has been to meet trade deficits.

* * * *

Housing Policy

An integrated housing policy may emerge in a few months. Very possibly, the rural areas might get a subsequent sum out of this. Actually, the Rs. 120 crores are very oddly placed and spread over a very wide area. We are thinking of integrating this whole thing. The matter is now being discussed by the Ministry of Works, Housing and Supply with other concerned Ministries.

—*T. T. Krishnamachari*

Closure of Cotton Mills

The question of ordering an investigation under section 15 of the Industries (Development and Regulation) Act in respect of three textile mills which have closed down during recent months is under the consideration of the Government of India. Seven mills have issued notices of closure during recent months, and, out of these, three have actually closed, affecting 3,732 workers. Two mills withdrew the notice of closure, while one has postponed its closure by one month. The remaining mills have served notice of closure from 30th May. If the two mills are also to close down, the number of workers affected will be 3,110.

—*Morarji Desai*

Heavy Machinery Plant

The Russian experts have recommended that a site near Ranchi is the best available for locating the heavy machinery plant. The Government has not yet considered the question of location.

* * * *

Printing Machinery

The Government of India has decided not to set up any plant for the manufacture of printing machinery as such in the immediate future. The Government has come to this conclusion after making a full survey of the position, but the capacity, which will be created for making industrial machinery, should be able to branch into this field as and when necessary. In the private sector, there are three firms already engaged in the manufacture of printing machinery and some others are also showing interest.

* * * *

Orders for Textile Mill With Russia

Orders for a textile mill of 12,000 spindles will be placed with the Soviet Union on a deferred payment basis. General discussions have been taking place between the Government of India and the representatives of the U.S.S.R. regarding supply of capital goods to India on deferred payments. Agreement on this matter has not been reached so far and discussions are continuing. While there has been no discussion on a country-to-country basis with any other country, the Government's proposals in this regard have been circulated to all chambers of commerce and industry stating the terms which will be very rigidly enforced. The orders for textile mill arose from the contract with the Soviet Union for the supply of shoes. For trial purposes, India is placing an order for 12,000 spindles to begin with.

* * * *

Cement Shortage

Shortage of cement is being experienced throughout the country. The Government is taking steps to increase the production of cement and also import some more quantities. Looking to the present foreign exchange position, the imports can only be of a very limited quantity.

—*M. M. Shah*

Egyptian Cotton

There is no real shortage in the country of indigenous cotton as such. Certain varieties of cotton are, however, reported to be in short supply. The overall supply position of Indian and foreign cotton in the country during the current season is quite satisfactory. India is a traditional buyer of Egyptian cotton. It is proposed to buy a little more cotton from Egypt this year than last year.

Cashewnut Industry

No request for any special assistance to the cashewnut industry has come from the Kerala State Government.

* * * *

Jute Futures Market

A futures market for jute goods is soon to be organised by the East India Jute and Hessian Exchange, Calcutta, after its reconstitution is approved by the Forward Markets Commission. It will conduct trading in all varieties of raw jute and jute goods through the medium of futures contracts and transferable specific delivery contracts. The market will be regulated under the provisions of the Forward Contracts (Regulation) Act 1952 and controlled through the Forward Markets Commission.

Power Supply

There are no river valley projects in India where power generated is surplus to the demand. There are, however, a number of projects where demand for power is in excess of available supply. These are: Sivasamudram, Simsha, Jog Hydro-electric Power Stations in Mysore; Pykara, Moyar, Mettur and Papanasam supplemented by steam power stations and Samayanallur in Madras; eight hydro-electric power stations on the Ganga canal supplemented by the steam stations at Harduaganj and Chandausi in the U.P.; Nangal hydro-electric power system served by the Ganguwal and Kotla power stations on the Nangal canal in the Punjab and the Damodar Valley Corporation. As electricity is a concurrent subject, the initiative in matters of power rests with the States. However, the Central Water and Power Commission keeps a close watch on the power supply position in all the States in the country and renders every possible assistance in co-ordinating the schemes for power generation with the demands for power in the various States.

* * * *

Rural Electrification

The utilisation of power supplied by the Damodar Valley Corporation for rural electrification is a matter which solely concerns the State Governments of West Bengal and Bihar. The D.V.C. will supply power to these two States. It is up to them to make distribution arrangements.

Indian Business Men in Burma

The Burma Government has not yet sent a final reply to India's "approach" to it on the hardship caused to Indian business men as a result of the Registration (Importers and Exporters) Order of the Government of Burma, which came into force on 1st October 1954. Under this Order, no foreign firm can be registered unless it is registered under the Burma Companies Act and it had imported or exported any goods into or out of Burma before 1st January 1948. Under the same Order, no firm shall be registered or continue to be registered unless at least 50 per cent. of its staff whose monthly emoluments are less than kyats 500 are citizens of the Union of Burma. Many foreign firms or individuals, including Indians, doing business in Burma who are not qualified for registration under the Burma Companies Act are likely to suffer under the new regulation.

—*Mrs. Lakshmi Menon*

Sea Island Cotton

The Government of India has sanctioned a co-ordinated Sea Island cotton scheme in the States of Kerala, Mysore and Assam for a period of five years beginning from May this year to the tune of Rs. 6 lakhs. The objects of the scheme are to survey areas suitable for cultivation of Sea Island cotton in the three States and to cultivate Sea Island variety "Andrews." It is expected that cotton worth Rs. 13.38 crores will be grown under this scheme and foreign exchange to that extent can be saved by the Government. There is no need to give any subsidy, because the variety will fetch between Rs. 400 and Rs. 500 per acre.

—*A. P. Jain*

Thorium Deposits

The Indian Atomic Energy Department has located deposits of thorium and other radio-active minerals in the north-eastern parts of India. It is not considered desirable in the public interest to give out the analysis of the thorium ore and the concentration of radio-active minerals in the find. Detailed survey and prospecting work of the area is in progress with a view to assessing the nature, quality and extent of the minerals available from the deposit. The plans for the mining and processing of the ores will depend upon the final results of the investigations.

ASHOK LEYLAND RESUMES DIVIDEND

PROFIT OF COONOOR TEA SLIGHTLY LOWER

Ashok Leyland Ltd.

THE directors of the above Company (Chairman: Sir A. Ramaswami Mudaliar, Ennore, Madras) submit the audited accounts of the Company for the year ended 31st December 1956.

During the year under review, the sale of Leyland chassis has increased satisfactorily and the total sales for 1956 were nearly double those for 1955. The Company's turnover amounted to Rs. 2,86,25,473 as compared to the previous year's figure of Rs. 1,49,93,712.

The net profit for the year was Rs. 8,55,690 (Rs. 1,79,519); and the amount available for appropriation Rs. 11,34,034 (Rs. 4,19,795). The difference between these two sums is due to additions to and subtractions from net profit as shown below:—Net profit for the year is Rs. 8,55,690 (Rs. 1,79,519). The balance brought forward from 1955 is Rs. 61,965 (Rs. 2,74,800). Amount provided in previous years against a claim which is not required Rs. 61,365 (*nil*) and refund due to adjustment of income-tax Rs. 2,50,200 (*nil*) making a total of Rs. 12,29,220 (Rs. 4,54,319). Deducting the amount required for excess income-tax in 1955 of Rs. 95,186 (Rs. 34,524) there is a net available balance of Rs. 11,34,034 (Rs. 4,19,795). The directors propose the following appropriation of the above balance:—

To provision for taxation Rs. 1,60,000 (Rs. 85,000), dividend at the rate of 6 (*nil*) per cent. per annum free of income-tax for the year ended 31st December 1956 Rs. 3,96,580 (*nil*), to provision of bonus to employees Rs. 30,000 (*nil*), transfer to general reserve Rs. 1,50,000 (*nil*) and amount to be carried forward to next year's account Rs. 3,97,454 (Rs. 61,965 after paying Rs. 2,72,830 as dividend at the rate of 5 per cent. for the year 1954).

The value of Austin spares has been reduced by Rs. 1,78,419. This represents the actual value of spares which have become unfit for sale due to obsolescence or to oxidisation arising from their retention in stock since 1949.

The progress of the phased manufacturing programme, implementation of which commenced in the latter part of 1955, has been satisfactorily maintained. At the end of 1956 components representing approximately 15 per cent. of the c.i.f. value of a complete chassis were being manufactured at the Ennore Factory. This represents excess over the progress scheduled in the manufacturing programme. Progress will continue during 1957 and it is expected that actual production will continue to be ahead of that given in the programme.

The Commercial Tax Officer and the High Court of Madras having decided in the Company's favour some of the issues on appeal the contingent liabilities of Rs. 8,79,492 with regard to Madras Sales-tax has been reduced to the figure of Rs. 4,77,014 and the position as at present is that in respect of a sum of Rs. 1,38,397 the matter is being taken up on appeal before the Supreme Court of India for which Special Leave has been granted by the High Court of Madras. In respect of the balance of Rs. 3,38,617, appeals are pending before the Madras Sales-tax Appellate Tribunal.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	85,66,800	Block ...	46,94,617
Reserves ...	3,00,000	Stock-in-trade	57,78,449
Provision for taxation ...	1,60,000	Spare parts	48,07,484
Liabilities ...	1,35,00,206	Stores ...	1,19,589
Profit and loss account ...	3,97,454	Goods-in-transit ...	34,01,985
		Debts, deposits and advances ...	36,51,430
		Investments	500
		Cash ...	4,70,406
	Rs. 2,29,24,460		Rs. 2,29,24,460

Coonoor Tea Estates Co., Ltd.

The directors of the above Company (Secretaries: Messrs. Matheson, Bosanquet & Co. Private Ltd., Belmont, Coonoor) submit the audited accounts of the Company for the year ended 30th September 1956.

Tea Crop	1956	1955
	Lbs.	Lbs.
Coonoor	2,26,077	2,70,403
Adar	65,602	50,898
Bought Leaf	30,270	1,01,076
Total	3,21,949	4,22,377

It will be noted that the intake of bought leaf was approximately 70,000 lbs. below the previous year and this is accounted for by the fact that green leaf contracts were terminated by the end of February 1956. The shortfall on Coonoor is attributable to the very poor rainfall over the 7 months January-July. During the period only 17.76" of rain fell as compared with 25.90" in the previous season.

The cost of production was 165.56 cents per lb. against the estimate of 146.04 cents per lb. and the increase was mainly due to shortage in crop. The crop was sold at a net average of 223.31 cents compared with 210.01 cents per lb. obtained in the previous season.

Capital Expenditure: A sum of Rs. 92,514 was spent under this head which has exceeded the original estimate by Rs. 6,714 and this is accounted for to a great extent by the increased cost of materials such as steel and cement. The major work undertaken during the year was the construction of an additional withering loft to the Factory so that leaf from the Company's three estates may be manufactured in the Company's own Factory after the termination of the contract with the Guernsey Factory. The existing facilities in the Factory are sufficient to cope with a crop of approximately 4,00,000 lbs. of made tea per annum but when funds are available it will be desirable to purchase a new drier and to replace at least two of the old rollers. A great deal of attention is being paid to the process of manufacture and with a good standard of leaf coming into the Factory, attractive teas are being turned out.

The profit for the year after providing for depreciation, taxation, etc., was Rs. 80,468 (Rs. 90,358) to which is to be added the balance brought forward from last year of Rs. 1,107 (Rs. 77,214) making a total of Rs. 81,575 (Rs. 1,67,572). Preference dividend of 6 per cent. less income-tax absorbed Rs. 8,055 (Rs. 9,000) and interim dividend on ordinary shares at 10 (10) per cent. free of income-tax Rs. 37,782 (Rs. 24,986) leaving a balance of Rs. 35,738 (Rs. 1,33,586). The directors recommend a final ordinary dividend of 7½ (15) per cent. free of income-tax on 37,782 (24,986) shares which will absorb Rs. 28,337 (Rs. 37,479) and bonus to staff for season 1954-55 paid in excess of provision Rs. 420 (*nil*) leaving a balance of Rs. 6,981 (Rs. 1,107 after transferring Rs. 95,000 to general reserve) to be carried forward.

Estimates 1956-57:—A crop of 3,40,000 lbs. is estimated. Cost of production is estimated at 133.42 cents including 17.28 cents for manuring.

Factors contributing to the lower profit are he crop shortage, which was due to adverse climatic conditions and to some extent due to labour unrest. Strikes occurred on many Estates in South India and a general "go slow" policy was adopted which delayed plucking rounds and contributed in no small measure to the lower crop harvested.

It is the policy of the board of directors to concentrate on producing only the highest quality teas; and there can be no doubt that this policy has proved a wise one as is evident from the prices realised since the manufacture of leaf from the Company's Estates was re-started in May after certain modifications had been carried out in the Adar Factory. Coonoor Teas have been in great demand at the Cochin Auctions during recent months and have on several occasions fetched the highest price of any teas on offer.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,27,820	Block ...	19,68,101
Reserves ...	12,40,946	Stock-in-trade	1,46,852
Provision for taxation ...	11,740	Stores and spare parts	59,637
Liabilities ...	4,59,543	Export quota	5,385
Profit and loss account ...	6,981	Debts, deposits and advances ...	44,780
		Investments	2,500
		Cash ...	19,775
	Rs. 22,47,030		Rs. 22,47,030

Lucky Valley (Nilgiri Hills) Tea Estates Ltd.

The directors of the above Company (Secretaries: Messrs. Matheson, Bosanquet & Co. Private Ltd., Belmont, Coonoor) submit the second audited accounts of the Company for the year ended 31st December 1956.

Crop: A crop of 1,93,554 (2,18,124) lbs. of tea was secured against an estimate of 2,10,000 lbs. The cost of production was 159.66 (160.27) cents per pound which was sold at an average of 262.33 (242.16) cents per pound. Although the crop harvested this season is approximately 25,000 pounds less than in 1955, the average price per pound realised is 20 cents higher than in the previous year which has resulted in a slightly higher net profit. Adverse weather conditions were mainly responsible for the decrease in crop and the rainfall during the year was 58.62" as compared with 70.41" in the previous year. Moreover, rainfall distribution was not favourable. A coffee crop of 27½ bushels dry cherry was also secured during the year.

The profit for the year after providing for depreciation and for Central income-tax and Madras State Agricultural income-tax was Rs. 86,010 (Rs. 84,429) to which is added the undistributed profit brought forward from the previous year of Rs. 14,429, making a total of Rs. 1,00,439 (Rs. 84,429). The directors propose to transfer to general reserve Rs. 25,000 (Rs. 20,000) and pay a dividend of 10 (10) per cent. free of Indian income-tax absorbing Rs. 50,000 (Rs. 50,000) leaving a balance of Rs. 25,439 (Rs. 14,429) to be carried forward.

Estimates for 1957:—A crop of 2,10,000 lbs. is estimated to cost 138.07 cents including 16.45 cents for manuring.

The crop harvested for the first four months of the current season is 96,512 lbs. as against 67,620 lbs. for the same period last year.

Award of the Special Industrial Tribunal for Plantations: This award which was published on the 24th October 1956, imposed very heavy burdens on the Plantation Industry in South India and as shareholders have already been notified, an appeal was made to the Supreme Court and a stay order granted. In recent months the Minister of Labour for the State of Madras has endeavoured to arrive at a settlement between the Employers and the Labour Unions and it is through his good offices that a negotiated settlement has been arrived at, with several of the Unions, at a wage considerably below that awarded by the Tribunal. It is anticipated that the additional wage and other amenities to labour will increase the cost of production by approximately 15 cents per lb. but if prices can be maintained at their present level there should still be a reasonable margin of profit for distribution to shareholders.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	5,00,000	Block ...	8,23,510
Reserves ...	45,000	Stock-in-trade	1,30,613
Provision for taxation ...	43,178	Stores and spare parts	22,572
Liabilities ...	3,97,705	Debts, deposits and advances ...	23,989
Profit and loss account ...	25,439	Cash	2,197
		Preliminary expenses not written off	8,441
	Rs. 10,11,322		Rs. 10,11,322

Calcutta Gas Co. (Proprietary) Ltd.

The directors of the above Company (Secretaries: Messrs. Soorajmull Nagarmull, Calcutta) submit the audited accounts of the Company for the year ended 30th September 1956.

The accounts show a profit of Rs. 8,07,991 (Rs. 6,87,704) which together with a sum of Rs. 22,189 (Rs. 76,172) being the amount brought forward from the last year makes a total of Rs. 8,30,180 (Rs. 7,63,876). A sum of Rs. 6,85,601 (Rs. 5,87,658) being dividend paid to the Company for the year ending 30th June, 1955 (free of tax) on the holding of the Company in the subsidiary Company, has been duly taken credit of in the accounts of the Company. A sum of Rs. 2,25,000 (Rs. 1,80,000) has already been provided in the accounts for taxation, leaving a profit of Rs. 6,05,180 (Rs. 5,83,875) which the directors recommend to be disposed of as follows:

To payment of a dividend on 30,000 5½ per cent. (taxable) redeemable preference shares for the year ended 30th September 1956 Rs. 1,21,688 (Rs. 1,21,688), to payment of a dividend at 6 (6) per cent. on 6,50,000 "A" and "B" ordinary shares for the year ended 30th September 1956 (free of tax) Rs. 3,90,000 (Rs. 3,90,000), to write off miscellaneous expenses and losses Rs. 60,062 (Rs. 50,000) and to carry forward Rs. 33,430 (Rs. 22,189).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	95,00,000	Block ...	406
Debentures ...	30,00,000	Debts, deposits and advances ...	27,53,085

	Rs. 1,48,46,360		Rs. 1,48,46,360

Travancore Ogale Glass Mfg. Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Ogale Bros. (Private) Ltd., Alwaye) submit the audited accounts of the Company for the year ended 31st December 1956.

The Company has turned the corner and gone into profit of Rs. 32,104 (loss of Rs. 24,042) after providing Rs. 69,202 (Rs. 44,134) for depreciation on the fixed assets of the Company. The interest and repayment instalments of the loan taken from the Industrial Finance Corporation of India have been paid up to date. Sales during the year showed further improvement and are the highest so far. The market conditions continue to be good and are expected to remain so for some time to come, judged by the growing demand for our products.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	9,98,380	Block ...	9,98,127

SECURITIES DULL AGAIN

(From Our Own Correspondent)

BOMBAY, *29th May*

Persistent demand for bank credit, in the face of paucity of funds, continued to keep the conditions in the short-term money market stringent for yet another week. All available funds were keenly bid and banks' requirements had often to be met by borrowings from the Reserve Bank, with the result that interest rates were firmly held. Inter-bank call money was done at 3½ per cent. among the large banks, while the rate among the smaller banks was a shade higher at 3½ to 3¾ per cent. There was keen bidding for house money at call and short-term deposits, but the rates were unchanged at 4½ per cent. and 4½-4¼ per cent. for one to six months, respectively.

The Reserve Bank of India's statement for the week ended 24th May 1957 shows a contraction of Rs. 11.83 crores in notes in circulation and an increase of Rs. 12.41 crores in total notes held in the Banking Department. While foreign securities continue to be unchanged, the decline in foreign balances in the Banking Department is unabated, with a further fall of Rs. 8.16 crores in the week under review. Deposits of the Central Government have gone up by Rs. 4.35 crores and those of other deposits by Rs. 2.58 crores. Deposits of banks show no notable variation. Loans and advances to Governments are lower by Rs. 80 lakhs and other loans and advances by Rs. 8.46 crores, of which outstanding borrowings by banks against usance bills account for Rs. 3.63 crores. Investments have risen by Rs. 9.74 crores.

A further decline of Rs. 2.13 crores in demand deposits of banks is disclosed by the Scheduled banks' statement for the week ended 17th May 1957, while time deposits are almost unchanged. Inter-bank borrowings are lower by Rs. 66 lakhs, while borrowings from the Reserve Bank have gone up by Rs. 5.64 crores and those from the State Bank by Rs. 1.01 crores. A fall of Rs. 2.83 crores is noted in advances, and an increase of Rs. 3.67 crores in bill purchased and discounted. Cash balances have shrunk by Rs. 58 lakhs, balances with other banks in current account by Rs. 34 lakhs and money at call and short notice by Rs. 63 lakhs.

The Gilt-edged market ruled dull during the week under review, with enquiries confined to a few scrips. The slight upward tendency in prices noted in the previous week proved to be a short-lived affair and prices in select counters were slightly lower. The explanation offered for the change in sentiment is that the official support noted in the previous week was on account of some sinking and other funds and that the buying in that behalf has come to an end. 3 per cent. 1986 Conversion Loan attracted sellers 10 nP lower at Rs. 73.40. 3 per cent. 1970-75 was on offer at Rs. 87 and 3 per cent.-1966-68 had sellers 20 nP lower at Rs. 91.70. 3 per cent. 1964 continued to be on offer at Rs. 94. 3 per cent. 1963-65 shed 10 nP to Rs. 93.90, at which level it was in demand due to proximity of interest payment. 3 per cent. 1959-61 was a shade quiet at Rs. 97.72. 3½ per cent. 1962 had sellers at Rs. 97.60, while 3½ per cent. 1961 had enquiries at Rs. 99.50 due to proximity of voucher. 3½ per cent. 1964 was on offer at Rs. 98.15. Shortage of scrips kept 3½ per cent. 1965 steady at Rs. 98.15. 3½ per cent. 1967 and 3¾ per cent. 1974 had sellers at Rs. 98.45. State loans continued to be featureless, while some of the 4 per cent. issues were marked down. Thus, Madras 1968 shed 15 nP to Rs. 96.50, Mysore 1967 dropped Re. 1 to Rs. 97 and 1968, 60 nP to Rs. 96.95. Travancore-Cochin 1968 moved down from Rs. 98 to Rs. 96.90.

There was a slight hardening of the rupee in terms of the dollar during the week, in sympathy with a similar tendency displayed by sterling abroad. Banks' selling rate of ready dollar declined from Rs. 479.75 to Rs. 479.50 per $100 and their buying rate from Rs. 476.50 to Rs. 476 per $100. In New York, spot sterling weakened earlier in the week from $2.79-2.79⅛ to $2.78-15/16-2.79-1/16, but soon gathered strength to $2.79⅛-2.79¼. Three months' forward was unchanged on balance at $2.78-2.78⅛. Transferable sterling improved from 277.40-277.50 cents to 277.80-277.90 cents.

COW HIDES RECEDE

(From Our Own Correspondent)

KANPUR, *25th May*

During the week under review, prices of the main categories of wet salted cow tended to move down. While supplies were large demand was not keen. Enquiries for buff, however, were fairly good, particularly for the higher grade. The Madras dealers were keen buyers of sheep. The main purchasers were the local tanners.

The latest available quotations are: wet salted cow 1st grade Rs. 240, 2nd grade Rs. 200, 3rd grade Rs. 100 per score; wet salted buff 1st grade 2 lbs. 2 ozs. and 2nd grade 2 lbs. 3 ozs. per rupee; goat 1st grade Rs. 300 and 2nd grade Rs. 225 per 100 pieces; sheep 1st grade Rs. 350 and 2nd grade Rs. 250 per 100 pieces.

LINSEED QUIET

(Messrs. A. Bradley and Co.)

CALCUTTA, *27th May*

Conditions in the linseed market remain more or less unchanged. Both buyers and sellers are reserved. The weekly turnover is very poor. The oil section is inactive and buyers have shown very little interest, owing to lack of overseas enquiries and smaller local demand.

The latest available quotations are: May-June Rs. 22-8, June-July Rs. 22-12 and July-August Rs. 23-4 per maund.

SHARP REACTION IN BULLION

(From Our Own Correspondent)

BOMBAY, *29th May*

A reactionary trend was in evidence in the bullion market during the week under review, the downward movement noted towards the close of the previous week having gathered momentum. The keen demand for bullion which came in the wake of the new tax proposals, petered out during the week. There were also heavy arrivals of Tibetan coins, estimated to be of the order of 300,000 to 400,000 during the week. The inflow of gold, too, turned out to be large, as the high prices would appear to have encouraged upcountry centres to unload a part of their earlier purchases. At the same time, the seasonal demand tended to wane. All these factors constituted a strong damper to the white and yellow metals alike and generated a perceptible downward trend.

Thus, silver (ready) was marked down today to a low of Rs. 183-5 from the peak of Rs. 191 touched on the 21st inst., and forward from Rs. 187 to Rs. 181-9. Likewise, ready gold slumped from Rs. 112-8 (touched on the 20th inst.) to Rs. 108-5 and forward from Rs. 109-3 to Rs. 106-13. The waning demand in the ready section and larger arrivals were reflected in the narrowing of the ready premium from Rs. 4 touched at one time to Rs. 1-12 today in silver and from Rs. 3-6 to Re. 1-8 in gold.

Forward silver (June settlement) reacted from Rs. 185-13 to Rs. 181-9 during the week before closing at Rs. 181-15. The July settlement dropped from Rs. 184-3 to Rs. 181.

Ready silver declined from Rs. 188-13 to Rs. 183-5, but finished a fraction better at Rs. 183-11. The floating stocks of silver are placed at 600 bars. The daily average offtake was 15 bars.

Gold for forward delivery (June settlement) receded from Rs. 108-12 to Rs. 106-13, but gained a little to close at Rs. 107-2. The July settlement was marked down from Rs. 108 to Rs. 106-6. As the *budla* in favour of bulls stood at As. 12 at the close, a margin of Rs. 7 per tola was imposed on all outstanding purchases in gold.

Ready gold moved down from Rs. 111-10 to Rs. 108-10. The floating stocks of gold are reported to be 25,000 tolas. The daily average arrivals of gold were of the order of 3,500 tolas, while the offtake was less, at 2,500 tolas on average.

For the first time after a lapse of nearly 7½ months, the New York silver price was reduced yesterday to 90⅞c. from 91⅛c., to which level it had been raised, on the 16th October 1956, from 91c. There was, however, no change in London, where spot silver was maintained at 79½d. and forward at 79*d*. Gold was a little erratic, moving between 250*s*. 5*d*. and 250*s*. 4*d*. before closing at the latter level.

The following comparative table shows the trend of market during the week under review:

	29-5-1957	Highest	Lowest	22-5-1957
	Rs. a.	Rs. a.	Rs. a.	Rs. a.
GOLD				
Ready (.99 fine Mint)	108 10	111 9	108 5	111 10
Forward*	107 2	108 13	106 13	108 12
Sovereign	71 14	72 4	71 14	72 8

METALS IMPROVE

(From Our Own Correspondent)

CALCUTTA, *28th May*

Despite weaker advices from overseas markets, prices of base metals in the local market during the week under review recorded a slightly upward trend. This was so because of greater support from consumers and also due to the belief that the stock position of the principal base metals was likely to cause anxiety in the near future, if fresh arrivals were not received in the meantime. Consumption was rising, in view of the greater impetus industrial development was receiving. The budget proposals and the increased bank rate were also factors which strengthened the bullish sentiment. From Rs. 174.50, electrolytic copper improved to Rs. 178 with the fire-refined material also being quoted at Rs. 178. Electrolytic zinc was in good demand. There were a good number of commercial and Government enquiries, and the price was steady at Rs. 73.50. Ready supplies were not plentiful. Lead was also firm at Rs. 73.50. From Rs. 518, tin rose to Rs. 521 and closed at Rs. 519. Even at the lower level the ruling quotation was higher than the replacement cost.

HIDES OFFTAKE GOOD

(From Our Own Correspondent)

MADRAS, *27th May*

There was no change in the pattern of trading in the hides and skins market or in the U.K. Arrivals of tanned cow hides were moderate and offtake by shippers was good at unchanged levels. U.K. buying was selective and demand for lower grades was small, while sellers were anxious to couple lower grades with top selections when making offers. There was a gap of 1*d*. to 2*d*. in the prices of inferior fifths cow hides between Madras and U.K. ideas of prices.

In the skins section, there was good call for tanned goat and sheep skins (market qualities), but, as importers were offering 3*d*. less than the prices at origin, business did not result.

COTTON FUTURES EASY

(From Our Own Correspondent)

BOMBAY, *29th May*

Trading in the cotton futures market was confined to Vijay June contract only, as the Jarilla May contract went off the board on the 23rd inst., although the due date for expiry was the 25th. The closure of business in the Jarilla contract two days earlier was effected by the East India Cotton Association (E.I.C.A.) in accordance with the directive of the Forward Markets Commission. In a letter addressed to the Chairman of the E.I.C.A. Board, the Commission stated that continuation of trading in Jarilla May contract would be detrimental to the public interest. The final rate at which the contract was deemed to have gone off the board was a matter of controversy. A meeting of the E.I.C.A. Board which was held yesterday to consider fixation of closing rate could not reach any decision acceptable to all parties and the Board was reported to have instructed its solicitors to request the F.M.C. to take up the issue. Total tenders against the Jarilla May contract aggregated 2,900 bales.

Business in Vijay June was a tame affair, the speculative deals being at a low ebb. The ruling rate was much lower than the sub-ceiling of Rs. 824 at which the enhanced rigorous margin of Rs. 200 per bale becomes operative at the commencement of the delivery period, that is, 1st June. The sentiment of operators was adversely affected by the Government of India's announcement that import of 160,000 bales of U.S. cotton would be permitted. Although the announcement did not contain any reference to the type of cotton that would be imported, it was believed that it might include varieties comparable to India's long-staple cotton, the supplies of which are scarce. The bearish interpretation of this announcement, coupled with the declaration by the F.M.C. that continuation of option business hereafter would be seriously dealt with, imparted weakness to the market. Even the firmness of the spot section failed to have any effect.

M.G. Jarilla May opened the week at Rs. 680 as against the previous close of Rs. 695. After wide and violent fluctuations on alternate bouts of buying and selling, the contract was hovering round Rs. 680-Rs. 700 on the 23rd inst. when transactions were terminated. The closing rate, as pointed out earlier, has not yet been fixed.

M.G. Vijay June commenced at Rs. 813 and declined to Rs. 809 yesterday. After recovering to Rs. 814½ early today the contract closed fractionally lower at Rs. 814. The net loss over the week was Rs. 2-8.

The following is the trend of prices of the two contracts during the week:

(In rupees per candy of 784 lbs.)

	29-5-57	*High*	*Low*	22-5-57
Jarilla (May) ...	680-700*	700	670	695
Vijay (June) ...	814	818	809	816½

* 23rd May 1957.

The details of the new crop contract have been finalised and the Board of the E.I.C.A. which met today gave its formal approval to the contract. No further information is available at the time of writing. The details of the contract are expected to be submitted to the Forward Markets Commission before the end of this month. Meantime, the E.I.C.A. is reported to be considering some amendments to the Delivery contract for the next season. These include the following:—Trading in contracts should be in units of 50 bales; any forward delivery contract other than that with a textile mill be treated as transferable specific delivery contract. No 'ON' allowance be allowed for cotton tendered which is more than the basic staple length; cotton which is below the basic staple be rejected in tender. Standards for staple and grade be similar to those of hedge contract. In case of contracts, the existing provisions in By-law 69 be suitably amended to conform strictly to the definition laid down. Provisions be also made in the by-laws to ensure that such contracts are not transferred. Contracts entered with mills be considered as non-transferable specific delivery contracts. No purchase on description be allowed. In case of failure to tender, the buyer be given the option to invoice back the cotton on spot rate on due date with a penalty of Rs. 50. Trading in contracts of this kind be permitted in respect of all varieties including Bengal and Wagad.

The upward trend of spot cotton continued, thanks to sustained mill demand for available lots of quality cotton, particularly Laxmi, Jaydhar and Surti. The Government of India's permission for import of 160,000 bales of U.S. cotton did not lead to any scramble for this cotton which is at present the cheapest. For the mills were said to have already met their requirements of such cotton and they were, therefore, not enthusiastic over getting U.S. cotton. The recent fall in Egyptian cotton prices induced Indian mills to augment purchases of Egyptian cotton. It was reported that the Textile Commissioner had so far received applications for the issue of import licences for 6,400 bales of Egyptian cotton.

The following are the latest available spot rates —in rupees per candy of 784 lbs.—from Sewri:

Bengal *Deshi* 725; Berar Jarilla 820; Khandesh 870; Oomra *Deshi* 775; Vijay 1,025; Hubli Laxmi 1,020; Jayadhar 940.

Dull conditions prevailed in the Karachi cotton futures market during the week under review, prices of both the contracts registering a decline. Fears of competitions from U.S. cotton continued to persist. This brought out some speculative selling and values dropped as a consequence. The fall would have been more sharp but for some strength imparted to the market by better export enquiries and smaller crop arrivals. N.T.R.G. May went off the board on 25th May, the last known quotations for it being Rs. 76.15. N.T.R.G. July which had closed

at Rs. 78-12 shed Rs. 1-15 to Rs. 76-13. The January delivery closed lower at Rs. 78-13. The spot section also ruled easy but some varieties, especially *Deshi* styles were on demand. The following are the latest available rates—in rupees per 82 lbs.—for a few popular varieties of Pakistan cotton prevailing at Karachi:

Sind *Deshi* 87-8; Punjab *Deshi* 82; 4F Punjab Roller 77-5; S.G. 80-13, L.S.S. Punjab Roller 79-5; S.G. 83-5; N.T.R.G. 79-13; S.G. 86-13; 289F Punjab R.G. 81-13; S.G. 90-5.

In contrast to the depressed trend noted last week, Alexandria cotton futures market put on a cheerful appearance during the week under review. Following the raising of the export duty on cotton by four tallaris per cantar with effect from 1st September, there was a revival in export demand to take advantage of the reduced duty prevailing till that date. Heavy buying was noted in both the long and medium-staple contracts. The new crop contract came at the board on 18th May, the long-staple position November at 94.90 tallaris and the medium staple October at 68.85 tallaris.

Export sales of Egyptian cotton from the commencement of the season till the end of March aggregated 548,861 bales (of 730 lbs.), as compared with 844,096 bales during the corresponding period of the previous season. Shipments from 1st September till 8th May amounted to 426,961 bales as against 718,242 bales in the corresponding period of the previous season.

The latest available rates—in tallaris per lb.—from Alexandria are given below: *Karnak*: July 109.90; November 102.75. *Ashmouni*: June 76.00; August 76.25; October 73.85.

Values in the Liverpool market recorded sizable gains on a fair volume of trade fixing against yarn sales. Better spot advices was another helpful factor. Switchings from the near to the distant positions resulted in a better tone in the latter. Sudan cotton contracts continued to be neglected, following the improvement in the prospects for resumption of normal commercial relations between Egypt and Britain. The following are the latest available quotations—in pence per lb.—from Liverpool:

American 1" staple contract: May-June 26.58; July-August 26.44; October-November 26.31; December-January 26.32. *American cotton mixed growth contract*: May-June 26.75; July-August 26.61; October-November 26.49; December-January 26.47. *Sudan*: May-June 40.70; July-August 39.20; September-October 38.35.

The New York cotton futures market ruled steady. There was speculative buying based on fears that the next season's crop would be affected by prolonged rains in certain leading cotton tracts. Soil preparation was also reported to be late. The higher price realised at the recent C.C.C. sales was interpreted as indicating, better export demand. This also affected market sentiment favourably. But rates were held in check by some liquidations which was prompted by the fear in some quarters that the drive for a shift in farm legislation away from the present mandatory price supports to freer markets is gaining momentum. Spot values, however, declined.

The Commodity Credit Corporation sold under the old export programme a further quantity of 82,006 bales raising the total sold to about 7,688,082 bales. The average price accepted for basis middling 1" at average location was 27.66 cents per lb., 5 points above that of the previous sales. Under the new export programme, the C.C.C. sold a further quantity of 387,505 bales making the aggregate sold under that programme to 2,936,018 bales. The average price accepted for basis Middling 1" at average location was 27.37 cents per lb., only one point above that of the previous sale. The balance of the owned stocks of the Commodity Credit Corporation still available for sale are understood to be about 2.2 million bales.

The following are the latest available quotations from New York, as compared with those of a week and a fortnight before:

(In cents per lb.)

	28-5-57	21-5-57	14-5-57
Spot	35.45	35.55	35.35
July	35.29	35.28	34.97
October	34.44	34.19	33.90
December	34.40	34.22	—

YARNS EASY

(From Our Own Correspondent)

BOMBAY, 29*th May*

The changes in sales tax proposed by the Government of Bombay created utter confusion in the yarn market during the week under review. In particular, the proposed changes affected the commission agents in that they made them impossible to continue purchases of yarns on behalf of their clients in upcountry centres. As a mark of protest, they refrained from doing any business. Transactions were, therefore, considerably small. Rayon yarns lacked support, despite rumours of further restrictions on imports in the ensuing half-yearly licensing period. Staple fibre yarns were subjected to selling on reports of large stocks accumulating in the market, thanks to continued slackness in demand from consuming area. Cotton yarns staged a retreat, following downward revision in prices by some mills with a view to reducing their stocks and poor enquiries from handlooms and powerlooms. The undertone of the market was distinctly easy.

Snia rayon yarn (100 dull cones) for June delivery came in for heavy selling and dropped Rs. 8 to Rs. 788. August delivery was today quoted at Rs. 801, as against Rs. 806 on Friday. Spot 150 Japan declined by 12 nP to Rs. 3.97. 120 Japan was neglected at Rs. 4.03, 120 Italy receded by 11 nP to Rs. 3.94, as also 150 Italy at Rs. 3.69. Among indigenous yarns, National Rayons 150 bright cones first grade was dull at Rs. 3.42. 120 bright cones first grade, however, evoked some support and improved by 6 nP to Rs. 3.73.

Staple fibre yarns (40×2) for June delivery were hammered down by Rs. 11 to Rs. 574. August delivery, which was quoted at Rs. 588 on the 24th inst., fell to Rs. 582 today. Spot 40×2 New Greats declined by 3 nP to Rs. 3.09. Centurys lost 4 nP to Rs. 3.12. Citys were quiet at Rs. 3.12 and Kohinoors at Rs. 3.28. Among foreign yarns, (80×2) Fujis slipped by 11 nP to Rs. 5.14. Paramounts eased by a naya paisa to Rs. 5.30.

In the cotton yarn section, 10 counts Podars and Moderns were both dull, the former at Rs. 14.75 and the latter at Rs. 14.81. Among 20 counts, Moderns declined by 12 nP to Rs. 18.75. Gokaks were unchanged at Rs. 18.62 and Maduras at Rs. 19. Among 30 counts, Edwards were quiet at Rs. 21 and Indus at Rs. 21.75. Forty counts Minaxis shed 6 nP to Rs. 27.31. But moderns improved by 25 nP to Rs. 28 on special buying enquiries. Sixty counts were well favoured. Finlays advanced by a rupee to Rs. 63. Moderns put on 50 nP to Rs. 61.50. Raghuvamshis gained 25 nP to Rs. 58. Among 80 counts, Finlays changed hands at Rs. 81.50, same as last week. Moderns were on offer at Rs. 76. Mahendras, on the other hand, gathered 25 nP to Rs. 71.25.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	29-5-1957	22-5-1957
	Rs.	Rs.
***Art silk yarn* (per case of 200 lbs.)—**		
120 dull Cones Snia June	788·00	799·00
August	801·00	—
150 Japan (per lb.)	4·03	4·03
150 Japan (per lb.)	3·97	4·09
120 Italy (per lb.)	3·94	4·05
150 Italy (per lb.)	3·69	3·69
***Staple fibre yarn* (per case of 200 lbs.)—**		
40×2 June	574·00	585·00

80s Modern	76·00	76·00

SUGAR JUMPS UP

(From Our Own Correspondent)

BOMBAY, 29*th May*

The firmness noted in the sugar market last week gathered considerable momentum during the week under review and prices jumped up to touch new high levels. This was due to reports that the sugar mills were asking dealers to pay not only the full additional excise duty but even a premium of As. 4 per maund over the pre-budget ex-mill price which was itself higher than the normal price, on account of rumours of an increase in the excise duty. The marked fall in arrivals of sugar into the market also imparted strength to bullish trend; the arrivals during the week aggregated no more than 7,400 bags, as against 17,125 bags in the previous week and 25,700 bags two weeks before. These factors, coupled with the delay in the monthly release of sugar for sale in the free market, induced good buying support and sugar prices staged an impressive rally.

Small grain sugar spurted from Rs. 99 to Rs. 99½ to Rs. 102-103 per bag, inclusive of sales tax. Large grain advanced by Rs. 3 to Rs. 106-109. Medium grain was transacted at Rs. 103-105, as against Rs. 100½-101½.

Shravan delivery contracts for 'C' grade sugar registered a rise of Rs. 3-12 to Rs. 13-4; today, it was quoted lower at Rs. 102-6.

OILSEEDS BEARISH

(From Our Own Correspondent)

BOMBAY, 29*th May*

The oilseeds market ruled distinctly bearish during the week under review. The castorseed section, suffered the heaviest loss during the week under review. It witnessed a technical setback on corrective realising pressure in the earlier sessions of the week, following heavy arrivals of stocks in the latter part of last week. The downward trend gained further momentum during the rest of the week under review, as a result of discouraging advices from overseas markets, heavy liquidation by the bull operators induced by reported prospects of timely rains and weakness of the spot section. Further, all through the week the groundnut, linseeed and cottonseed sections lacked support and moved in sympathy with castor, though, towards the end of the week, linseed encountered enquiries from the shippers, which were only short-lived.

Groundnut May contract opened the week at Rs. 178.50 and, after narrow fluctuations, during which it touched the peak of the week at Rs. 179.25 on 27th, it closed today at Rs. 175.87, having thus lost Rs. 2.50 over the week. August contract opened the week at Rs. 183.50 and displayed similar variations before it closed at Rs. 178.87, which represented a loss of no less than Rs. 4.50. Spot B.F.Q. was quoted 50 nP less at Rs. 36.00. Groundnut oil ex-mill was done at Rs. 20.37, as against Rs. 21.25 last week.

Trading in the castorseed section commenced at Rs. 194.75 which retreated steadily, with variations confined to narrow limits, to Rs. 177.25, before closing a shade higher at Rs. 180.00. Over the week, it lost no less than Rs. 7.00. September contract, too, after opening at Rs. 198.00, drifted steadily to Rs. 182.75 today, before finishing at Rs. 185.50, thus forfeiting an amount of Rs. 12.75, over the week. Spot Madras quality climbed down by Rs. 2.63 to Rs. 35.62. Oil B.S.S. withdrew from Rs. 24.37 last week to Rs. 22.50 at the close today.

Linseed May contract opened the week at Rs. 30.94 and moved between that level and Rs. 30.25, touched on 25th, before finishing yesterday at Rs. 30.56. Today, however, no business was transacted in this contract. September contract, which opened the week at Rs. 31.37, crept up to Rs. 32.06 the same day. Subsequently, it slided down to touch a level of Rs. 30.06 at the close today. Over the week, the contract lost Rs. 1.06. Spot bold was quoted 50 nP lower at Rs. 30.12. Linseed oil ready was done at Rs. 17.37, as against Rs. 16.87 last week.

Business in the two cottonseed contracts was also dull during the week. May contract moved down from its opening level of Rs. 113.00 to Rs. 112 at the close today. Similarly, September drifted from Rs. 117 to Rs. 113.00. While the former lost Rs. 1.50, the latter declined by Rs. 4.00.

Among others, *kardi* seed bold was done at Rs. 22.00 and *niger* seed Madras at Rs. 28.25, as against Rs. 22.50 and Rs. 28.75 last week.

The Bombay Oilseeds and Oils Exchange Ltd., in a communication to the Finance Ministry, has expressed the view that the enhancement of excise duty on vegetable oils will raise the cost of living of the common man, and that the increase in duty on castor oil will make castor oil dearer for export purposes, because of the fact that the present rate of refund of excise duty will be too small. The Board has strongly urged the Government not to increase the excise duty on vegetable oils. It has also suggested that in the event of imposing excise duty on castor oil, the refund should be six-sevenths, instead of five-sevenths.

The following table shows the prices of oilseeds and oils at close as compared with those at the close of the previous two weeks:

	29-5-1957	22-5-1957	15-5-1957
	Rs.	Rs.	Rs.
Groundnuts—			
May 1957	175.87	178.37	177.12

Commercial (per quarter) ..	21.37	22.81	21.50
Linseed oil—			
Ready	16.37	16.87	17.00

PEPPER QUIET

(Messrs. Parekh & Co.)

BOMBAY, 28*th May*

Malabar black pepper, after showing some firmness, turned quiet for want of inland demand, following the strike by the commission houses as a protest against the new laws for submitting certain forms of sales tax by the State. New York remained selective buyer in spite of limited stock at the port. Dealers and grinders there refused to follow advance at the origins. Spot at New York established a new high level of $0.29½.

Alleppey ruled steady at Rs. 600. Futures at Cochin were listed at Rs. 104½ and Rs. 105 for July and August respectively. Singapore, after touching the highest at $75, is reported quiet round about $71 (Singapore dollars) owing to increased arrivals. Demand at Singapore from Europe and U.S.A. too was patchy. Dealers in all the consuming markets wanted concessions which origins refused to give as growers and holders were still sellers.

Recent rain in the pepper-growing belt in the Malabar coast was said to be one of the reasons for the present softness in Malabar pepper, as growers expected better crop next year, though it is too early to base any definite opinion on such early showers.

In Asta, June was done upto $0.25¾ while there were sellers for July-August-September at $0.25¾. In the delivery section, prices were down owing to accumulation of stock which is estimated to be about 15,000 bags.

Following are today's nominal quotations: Ready Rs. 84 per Bengal maund; and June Rs. 582-587 and July Rs. 592-597 per candy of 5¼ cwts.

TEA MARKED DOWN

COCHIN, 23*rd May*

[*Messrs. Forbes, Ewart & Figgis (Private) Ltd.*]

Slightly over 1,175,000 lbs. were on offer in Sale No. 11 which was held on Tuesday, 21st May. The sale opened to a strong general demand which emanated mainly from internal buyers. Black leaf brokens from low medium and medium elevations were 5 to 10 nP dearer, whilst other types were about steady. Fannings again attracted less enquiry than broken grades and must be quoted slightly easier. Best liquoring teas were irregular with buyers following quality closely. Whole leaf grades met with keen competition and prices advanced by 10 to 15 nP. The following are the quotations:—

	1957	1956
	Rs.	Rs.
Plain B.P.	1.50 to 1.55	1.62
Low medium B.O.P.	1.65	1.81
Medium B.O.P. ...	1.75	1.94
Good B.O.P.	1.90 to 2.00	2.37 to 2.55
Well made black leaf O.P.	2.35	2.22

The average price realised in Sale No. 11 was Rs. 1.72 per lb., as against Rs. 1.74 per lb. in the previous sale and Rs. 2.30 per lb. in the corresponding sale of 1956.

London Market: Sale of 20th May 1957.—Best dearer; others, particularly plainest, 1*d.* to 2*d.* easier.

Sale of 21st May 1957.—Weak demand; often 1*d.* to 3*d.* lower.

Colombo Market: Sale of 20th May 1957.—Except for best colourey highgrowns and Persian Gulf types, market easier.

Sale of 21st May 1957.—Few best fannings strong, broken mixeds down 20c. to 30c. Dusts 10c. to 15c.

Calcutta Market: Export.—No sale this week.

Internal.—Dust grades met with fair demand at 10 to 20 nP below valuation. Strongest feature very few lines best C.T.C. which were dearer.

Export Quota.—As the validity of special licence draws to a close, the market has been active. Business has been done in special licence at 17 nP and 1957-58 export quota has changed hands at 24 to 25 nP.

Forthcoming Auctions.—Sale No. 12 will be held on Tuesday 28th May.

Dust Sale 'K'.—Almost one million pounds were on offer in Dust Sale 'K' which was held on Thursday, 23rd May. The sale opened to a fairly good general demand, but at rather lower rates. Medium dusts and best liquoring types were 10 to 15 nP easier, but others were irregularly 20 nP lower. Milled dusts were the weakest feature and these types were often difficult to sell.

The average price realised in Dust Sale 'K' was Re. 1.55 per lb., as against Re. 1.62 per lb. in the previous sale and Re. 1.81 per lb. in the corresponding sale of 1956.

Export Quota.—Business is still being done in special licence at 17 to 18 nP and in 1957-58 export quota at 24 to 25 nP.

Forthcoming Auctions.—Dust Sale 'L' will be held on Thursday, 6th June.

JUTE GOODS STEADY

(From Our Own Correspondent)

CALCUTTA, 28*th May*

Steady conditions were in evidence in the jute goods market during the week under review, following shipper interest and bullish enthusiasm. Lack of rains continued to give strength to the raw jute market, and it was becoming clear that the new crop would be delayed by about a month. However, raw jute prices did not move up, as mills were believed to possess sufficient stocks. It would not matter much for mills even if the new crop was available only at the beginning of September. It was estimated that about 800,000 bales of the 1956-57 crop still remained to be marketed. In view of the heavy arrivals at the beginning of the season, it was only expected that imports from upcountry centres would register a fall. In view of this expectation, the lower arrivals in the last three months did not cause any surprise. Indian jute that reached mills' stations in April amounted to 340,900 bales, as against 440,700 in March and 525,200 bales in February, which were lower by 42,600 bales, 44,400 bales and 8,000 bales, respectively, as compared with the receipts in the corresponding months of 1956. Another reason for the fall had been the expectation of higher prices at the end of the jute season. On the other hand, Indian jute that reached mills in January last was higher at 681,800 bales, as against 532,000 bales only in January 1956.

It was noted that preliminary steps having been completed, the East Pakistan Jute Marketing Corporation would commence operations from 1st July. The Corporation would be the sole purchaser of jute in East Pakistan in the border areas. This measure is designed to prevent smuggling of jute into India. The Corporation would watch the price-trend in other parts of the country, and might extend support in order to keep prices on an even keel. Another news item of interest was that the East India Jute and Hessian Exchange, Calcutta, had almost completed the drafting of its articles of association and by-laws, in accordance with the requirements suggested by the Forward Markets Commission. There would be no delay in the approval of the articles of association and by-laws by the Commission. The Exchange is expected to commence operations as from the 1st July, i.e., the beginning of the jute year.

During the week, work was resumed in the Kinnison Jute Mills, which had declared a lockout on 7th May following labour troubles caused by the disinclination of a section of the workers to agree to reallocation of work. In Chittagong, the Amin Jute Mills which had remained closed following labour troubles on the dismissal of a worker resumed operations on Tuesday last week. It is common knowledge that in mills in India the cost of production has gone abnormally high, a considerable share of which is accounted for by the wages bill. This is amply indicated in the findings of the West Bengal Government's enquiry into the jute mill industry. The wages bill of 88 mills in 1956 aggregated Rs. 24.57 crores, as against Rs. 19.65 crores in 1951. It should be noted that this increase is, despite rationalisation in several of the reporting mills.

During the week, moderate business was done with shippers. Woolpacks were bought for being exported to New Zealand, while there were a good number of enquiries for cornsacks on Australian account. Speculators demonstrated keen interest and they noted with jubilation that shipments of hessian and sacking goods from 1st to 20th May were higher at 15,000 and 17,300 tons, as against 11,000 and 14,600 tons, respectively, in the first 20 days of last month. Early in the week, a bout of speculative enthusiasm raised ready B. twills to Rs. 117.25 and hessian 40" 10 oz. to Rs. 49.95. Bearish pressure soon followed, and on Wednesday the above two constructions sagged to Rs. 116.10 and Rs. 42.75, respectively. On the following day, good business was done and, despite profit-taking, B. twills recorded a partial recovery to Rs. 116.40 and hessian 40" 10 oz. to Rs. 42.80. At this stage, bulls turned out to be keen buyers to push up the prices to Rs. 117.10 and Rs. 43.20, respectively, on Friday. Over the week-end, hessian 40" 10 oz. was maintained at Rs. 43.20 but B. twills eased slightly to Rs. 116.90. Prices were lower yesterday at Rs. 43 and Rs. 116.25, respectively.

Paucity of rains continued to be a factor imparting steadiness to raw jute. In the low-lying areas, the young plants badly require rain. The view that India is gradually becoming less dependent on Pakistani jute becomes clear if import figures are examined. In the 10 months to April, Pakistani jute imported to India was 558,700 bales or a little less than half of what was imported in the corresponding period of 1955-56 season. In the same period, Indian jute received by mills rose to 4,925,600 bales from 4,327,000 bales. Mills showed little interest during the week. Sellers, however, anticipated that prices would improve further in the coming weeks. The latest quotations for the 1956-57 crop, May-June delivery, are:

	Middles	*Bottoms*
Pakistani:	Rs.	Rs.
District	40.50	37.50
Northern	40.00	37.00
Indian:		
Northern	34.00	31.50

Pucca bales 1st marks ready ... Rs. 195 per bale.

TEA PRICES RECEDE

(From Our Own Correspondent)

CALCUTTA, 28*th May*

The increase in freight rates and excise duty on tea affected sentiment during last week's sales for domestic consumption and prices declined. The proposed rise in the excise duty has caused considerable anxiety to the tea industry. The Tea Association of India has appealed to New Delhi to reconsider its decision. The Association has pointed out that, production being higher than demand, it is necessary to increase exports as well as internal consumption. Only cheaper tea can realise these objectives. Cost of production is already high, on account of the existing levies both by the Central Government and the States, as also of the higher labour charges.

The Vice-Chairman of the Central Tea Board, Mr. B. C. Ghose, who is also a member of the Executive Committee of the Indian Tea Planters' Association, thinks that the increased excise duties on tea and sugar would tend to restrict the internal demand for tea and that if the duties are not lowered the problem of finding markets for the surplus quantity out of a total annual production of 650 to 675 million lbs. would be difficult of solution.

Tea gardens in the Dooars and the Darjeeling districts have encouragingly noted that the West Bengal Provincial Co-operative Bank has set apart, during this year, a sum of Rs. 50 lakhs to be given as loans to these gardens. Applications for grant of loans will be considered by a sub-committee which will be appointed by the Bank and which will consist of members with special knowledge of the problems of tea gardens. The Industrial Finance Corporation, the State Bank of India and other banks usually grant loans to tea gardens, and the entry, in this sphere, of the co-operative bank is a new feature which will be widely welcomed as an additional source of financing.

It was noted that tea production in Ceylon during the month of April amounted to 37.15 million lbs., which was lower by 12.66 million lbs. as compared to production in April 1956. However, production during the three months to March 1957 was higher, at 106 million lbs., as against 84.4 million lbs. for the corresponding previous period. In the same period, South Indian production at 27 million lbs. was higher by 4.2 million lbs., as compared with the first three months of 1956. Such increases during this year in both Ceylon and South India were attributed to the even spreading of rains. However, it is very unlikely that production would continue to record increases, because, in view of the poor price tea is fetching, it is thought that the industry would necessarily resort to increased finer plucking.

Dusts on offer during last week's internal consumption sales amounted to 20,421 chests. Prices declined by 10 nP to 20 nP per lb. However, demand was fair. Medium Assams possessing good liquors gave way by 12 nP. Commons and Dooars lost by 20 nP. Darjeelings met with an irregular market, the few flavoury lots realising prices above valuation. Prices in respect of the few very best C.T.C. types were also better. The quotations were: medium Assam C.T.C. Re. 1.50 to Re. 1.55, medium Assam grainy dust Re. 1.45 to Re. 1.50, and medium Dooars Re. 1.35 to Re. 1.45. As usual best Assam C.T.Cs. were not quoted.

Buyers offered 18 nP for shipping licence, while sellers demanded 20 nP. New season's rights were on offer at 28 nP, while buyers bid them up to 24 nP only. Transferable export rights were done at 20 nP.

Most of the 9,400 packages on offer during yesterday's export sales "B" was much below standard of Sale "A" and comprised only ordinary description. Keen competition was offered to a few invoices which possessed attractive flavour and which, therefore, rose above brokers' valuations. On the other hand, other kinds eased by as much as 50 nP per lb. There were frequent withdrawals from the brokens and fannings on offer. At lower level, well made whole leaf grades met with good demand from exporters.

New season's quota changed hands at 24 nP, transferable export rights had buyers at 13 nP, and in non-transferable export rights business was done at 16 nP.

FOODGRAINS QUIETLY STEADY

(From Our Own Correspondent)

HAPUR, 27*th May*

Quietly steady conditions prevailed in the foodgrain market during the week. The Union Food and Agriculture Minister has claimed that prices of wheat and gram are definitely going down, while the prices of rice which had gone up are now more or less steady. About 22,000 fair-price shops are still reported to be engaged in distributing wheat all over the country and brisk imports are being arranged to back these sales. The Government is reported to be taking some measures to keep the price rise in check, especially to prevent hoarding. Pressure of new crop arrivals and various statements on Government behalf have checked the rising trend of prices.

Wheat ruled quietly steady at Rs. 14.75 per maund for average quality, while farm quality, being in better demand from Assam and Bihar side, was quoted slightly higher at Rs. 16.75 per maund. Daily arrivals here averaged 2,500 to 3,000 maunds and local stock was put at 24 *khaties*. Total arrivals of new wheat were estimated at 64,000 maunds, as against 54,000 maunds a year before, when average wheat was quoted at Rs. 13.62 and farm quality at Rs. 15.25 per maund. Rice recorded modest gains during the week on firm advices from the producing areas. The prevailing prices are: *Basmati* Rs. 27 to Rs. 29; *sela Mainpuri* Rs. 24; coarse quality Rs. 18.25 per maund.

Despite an increase in the overall production of gram during the year 1956-57, which, according to all-India second estimate, is put at 5,350,000 tons which is an increase of 5.4 per cent. over last year, gram prices at Hapur as well as in other centres continued to rule steady on Punjab advices. Local stock swelled to 25 *khaties*, the corresponding figure last year being 13 *khaties*. Barley and *bejhar* also continued to rule steady and some purchases of barley were made in the local market on Government behalf at Rs. 11 per maund. *Jowar* attracted good demand at unchanged price levels, while *guwar* improved due to better demand for seeds in the face of poor stocks. Week-end prices (in rupees per maund) were: Gram 11.75 to 12.12; barley 11; *bejhar* 10.87; *jowar* white 14.75 and brown 12.87 and *guwar* 12.50.

Despite heavy offtake aggregating 40 wagonsloads of peas to east U.P., Bihar and Assam side, thanks to easy loading facilities during the week, peas maintained a steady trend, as outside buying enquiry was fairly good. Local arrivals went down to an average of 1,500 maunds, as against 3,000 maunds last week-end, and local stock, after heavy offtake during the week, was put at 54 *khaties* of 800 maunds each. *Arhar* was also steady in line with peas, although local stock was increasing daily, due to daily arrivals at an average of 2,000 maunds from nearby centres and was now put at 57 *khaties*. Other pulses too, were steady. Peas *dara* green was quoted at Rs. 11.12 and white at Rs. 12.25, *arhar* at Rs. 12.6, *urd* at Rs. 19.75 to Rs. 21.50, *moong* at Rs. 15 to Rs. 17 and *masoor* at Rs. 15.25 to Rs. 16.25 per maund.

Pulses futures moved quietly both ways during the week and were now quoted near the opening level of the week: Peas: *jeth* Rs. 11.5 and *bhadon* Rs. 11.40; *arhar*: *jeth* Rs. 12.3 and *bhadon* Rs. 12.43.

SUGAR DULL

(From Our Own Correspondent)

HAPUR, 27*th May*

Dull conditions still persist in the sugar market, as business at increased prices is very slow. There are persistent rumours that after reconsideration, the Government may agree to reduce the excise duty a little. Traders, therefore, prefer to wait and watch and are unwilling to enter into long commitments. Some of the factories, it appears, are still not quoting ex-mill delivery rates. The total production of sugar upto 30th April was 1,822,368 tons, the corresponding figure last year being 1,653,000 tons, and stocks with factories on this date was put at 1,314,000 tons, as against 1,258,000 tons a year before. In order to enable the factories in the U.P. to continue crushing for some time more without any loss due to a fall in sugar percentage from cane due to hot weather, the Government of India has reduced the price of cane to be supplied to factories after 8th May.

The latest prevailing mill-delivery prices of sugar per maund are: Daurala Rs. 33.50 to Rs. 33.75; Amroha Rs. 32.62; Bijnore Rs. 32.50; Mansoorpur Rs. 33.50 to Rs. 34.75; Rampur Rs. 34.50; retail Rs. 36.25.

The *khandsari* market continues to rule steady at Rs. 26 to Rs. 30.25 per maund. The production of *khandsari* is still being carried out in some centres.

Ready *gur* rules quiet during the week, although outside buying enquiry from consuming centres is slack. Local arrivals of stocks retained by producers in expectations of better prices at the end of the season are put at 100 maunds daily and local stock is 88,000 maunds.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.= Deferred shares. P.O.= Preferred Ordinary shares. Y.= Accounts published yearly. H.= Accounts published half-yearly. P.= Company has Preference shares. T.= Company has Debentures. N.= Nominal quotations. x.d.= Ex. Dividend. c.d.= Cum. Dividend. i= Interim Dividend. f= Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

MORE ON TAX PROPOSALS

THE bargaining spirit has crept into the Union Finance Ministry also, at least in the matter of taxing the people. For some years now, the taxation proposals have been subjected to modifications in the light of criticisms by members of Parliament. It would appear that, in expectation of strong opposition to the new tax burdens, the Finance Ministers have got into the habit of first pitching their demands rather high and then showing some concessions in order to create the impression of having responded to the wishes of the House. This practice is similar to the trick said to be adopted by camel drivers in West Asia in order to make the obstinate animal carry a heavy burden without evoking stubborn resistance. Mr. T. T. Krishnamachari, too, has adopted this trick in a goodly measure. Shortly after he became the Finance Minister, nay, even before he put his foot into the Finance Ministry, he imposed a burden of Rs. 30 crores per annum on the people by enhancing the excise duty on cloth. This was done on 31st August 1956. Three months later, on 30th November 1956, he supplemented it by adding new taxes calculated to yield Rs. 16 crores per annum. Five and a half months thereafter, on 15th May 1957, he levied further taxation designed to net in Rs. 93 crores, all this in addition to the enhancement of railway freights and fares. Thus, in less than nine months, he introduced additional taxation to the tune of Rs. 140 crores.

It is not surprising, therefore, that he drew strong protests from all parts of the country when he presented his last budget proposals. The clever man that he is, he must have realised in advance that, even if he were to propose additional taxes of the order of only Rs. 50 crores, he would evoke opposition and agitation. He must have, therefore, said to himself: "Let me place the burden at Rs. 100 crores, so that, by yielding a little later, I may get at least Rs. 90 crores." That is precisely what he has done. He calculated that his new taxes would yield Rs. 93 crores per annum. He has now given a few concessions which he thinks will cost Rs. 5.78 crores, so that he is still assured of an additional revenue of Rs. 87.22 crores. The amount he has agreed to forgo is equal to only 6 per cent. of what he wanted to take from the public. He has thus won a strategic victory at a very small cost, and thereby saved not only the core of his budget but also something more. Both Houses of Parliament seem to be pleased with the gesture of response made by him to their criticisms.

There is nothing to be gained by debating over the issue whether this practice of first imposing heavy taxes and then modifying them is a good or bad one. From the practical point of view at least, there is nothing bad about it. The Finance Minister is after all a human being. He cannot weigh in great detail the pros and cons of every one of his tax proposals, before making them public. For doing so, he will have to consult a larger circle of his financial experts and technical advisers. But such a procedure carries with it the risk of leakage of budget secrets, more especially when the proposals are so numerous as those announced by him on 15th May 1957. It, therefore, looks as though the practice of post-announcement modifications has something in its favour. It at least provides an opportunity for the Government to rectify any grave injustices that may be inherent in some of the tax proposals. Even as a device to get the consent of the public for the budget, the practice may appear unobjectionable to those who contend that a politician, especially in an underdeveloped country like India, has a right to adopt appropriate tactics to carry public opinion with him.

If the last mentioned explanation is the cause for imposing some of the taxes which the Finance Minister has now withdrawn, one cannot quarrel with him. Even so, a Finance Minister who does not wish to tarnish his reputation for political and economic judgment will exercise great care in choosing the commodities and the persons for being subjected to additional taxation. There is every reason to believe that Mr. Krishnamachari did not pay much thought to this aspect while framing his tax proposals of mid-May last.

To take, for instance, the excise

in charge of that portfolio. I envy my Hon'ble colleague that coffee has spurted up. Even in tea, it is mentioned that the supply is slightly above normal. Therefore, Government have decided to withdraw entirely the increases proposed in the rates of excise duty on coffee and tea and I hope Hon'ble Members and their friends will not pay anything more for their cups of coffee and tea."

Two things are obvious from the aforesaid explanation. One is that the Finance Minister had under-estimated the public reaction to loading the tax on beverages which have become a habitual necessity in urban areas. If he were a shrewd politician, he would not have made this mistake. Be that as it may, his experience should serve as a warning to those State Governments which may be contemplating to increase their taxation on plantations, particularly tea and coffee. The other thing is that the Finance Minister was not fully aware of the state of tea and coffee markets. It is, however, hard to believe that he was ignorant of the facts that the coffee industry is faced with the problem of marketing large stocks brought about by a bumper production of over 40,000 tons and a fall in exports, that the main problem before the industry is to promote domestic consumption as well as exports, that, only a year before, the tea industry had to slow down production in order to prevent unhealthy accumulation of stocks, that world production of tea is going up, that India has to contend with steadily growing new competitors in tea, as, for instance, East Africa, that it is necessary to stimulate home consumption of tea and that heavy excise duty on packed tea, coupled with a mild duty on loose tea, leads to adulteration by unscrupulous dealers—a development injurious to the long-range interests of tea. All these aspects of tea and coffee industries were there even when Mr. Krishnamachari was the Minister for Commerce and Industry. And yet he lightly chose to subject these mild beverages, two of the heavily taxed commodities even before, to a higher dose of excise duties. It looks as though the main factor that made him give up these additional excises was the fear that the political opponents of the Congress Party would make capital out of them. Whatever the cause, there is, however, no doubt that he did well to remove the new burden on coffee and tea.

Sugar

Excepting for some minor changes in the excise duty payable by small producers of matches and in that on tobacco, the Finance Minister has firmly refused to yield ground in regard to other excise duties. He vigorously defended the doubling of the excise duty on sugar and said that he definitely wanted people to eat less sugar, so that more of it would be available for export. He was of the view that sugar consumption was going up rather too fast and required to be checked. This journal would readily concede that heavens would not fall if domestic consumers were subjected to a penal rate of excise duty, with a view to enabling the Government to get more revenue for financing the Plan or to find more sugar for export. But it is necessary to bring to the notice of the public three important points. In the first place, if consumption of white sugar has gone up, it is chiefly because of the increase in the population of the country, in general, and that in urban areas, in particular, where white sugar finds a more ready market than in rural areas. Secondly, any attempt at inhibiting consumption of white sugar by raising its cost to the consumer will have the undesirable effect of encouraging production of *gur* which is a colossal national waste. It is common knowledge to those who know anything about the economics of Indian sugar industry that extraction of sucrose from the sugarcane is much less in *gur* industry than in white sugar industry and that nobody gains by this wasteful process. Even the *Sarvodaya* school of thought had the good sense to concede this point and did not favour any impediment to white sugar manufacture in the form of a penal excise duty.

The third point we wish to make, in this connection, is that, while it is necessary to develop export markets in sugar, the method chosen by the Finance Minister is not the right one. It is the method of the complacent, short-sighted administrator and not that of the energetic and far-sighted. The right way of stimulating exports of sugar is to take steps for increasing domestic production for which there is still good scope; the country has both capacity and the raw material. It is only a question of some adjustment in the sowing of cane and in the variety of cane grown. Again, the method of general pressure on the industry to find export outlets does not necessarily lead to desirable results, for the simple reason that it will provide an inducement to export only to those inefficient manufacturers who are finding it difficult to sell their goods in the domestic market. It is needless to add that, if India is to build a sustained export market in sugar, its best sugar mills should be tempted to enter the world trade. This would happen only if a positive, instead of the present negative, incentive were given to manufacturers. It would pay the Finance Minister to study carefully whether the best managed sugar mills are participating in exports of sugar at present and if not, why not. What is happening is that, when the second class sugar mills sell for export, they indirectly make it easier for the first class mills to sell their manufactures in the domestic market. Yet, from the long-range point of view, it would be in the interests of the country if the first class mills entered the export trade.

We are afraid that Mr. Krishnamachari has blindly applied his experiment in cotton textiles—the success of which is still dubious—to sugar, forgetting that, whereas, in cotton goods, the question was one of sustaining the export markets already built up by years of hard work mainly by well-established and soundly managed mills, in the case of sugar, India has just made a beginning in export trade and that too because of certain fortuitous circumstances such as the Suez incident and its aftermath. Even now, it is not too late for the Finance Minister to retrace the step he has taken and to devise a healthy method of achieving his objective of increased exports and larger revenue for the Exchequer.

The Finance Minister had to yield to political pressure even in respect of those taxes for which there is sound economic justification. Thus, he had to give up the proposed increase in the price of post-cards, as well as parcels, and modify the tax on passenger fares by giving exemption from the tax for the first 15 miles. While the latter is only a gesture, the former is something more than that. He has, of course, given the concession to users of post-cards only at the expense of those who use envelopes. The bulk of this burden will be borne by commercial establishments. But will this bring any net addition to the revenues of the Government? While the postal revenue may go up, the income by way of direct taxation of corporations may fall to a corresponding extent, inasmuch as the rise in the expenditure of commercial establishments on postage account will bring down their taxable profits.

Direct Taxes

The opposition to lowering the exemption limit for income-tax from Rs. 4,200 per annum to Rs. 3,000 per annum can be justified only on political grounds. The reasons advanced by the Finance Minister for roping into the taxation net persons falling within the range of this income were sound. After all, it is only fair that every one must pay one's mite to meet the cost of economic development. But the Finance Minister has made the task of collecting the tax from these people somewhat complicated by providing for an allowance of Rs. 300 per child, subject to a maximum of Rs. 600. It also means that the revenue from this source will be less than anticipated. Incidentally, the fixation of a maximum limit to children allowance is in conformity with the Government's drive for family planning. It is, however, gratifying that Government did not succumb to the pressure for restoring the exemption limit to Rs. 4,200. But the Finance Minister seems to have bought peace on this front by sacrificing, once again, the interests of the intelligentsia and the hard-working section of the middle class. We have in mind here the persons with incomes above Rs. 20,000 per annum. He had already penalised them by watering down the earned income relief and stepping up the tax on their incomes from their investments made out of past savings. There was, however, some consolation for them, in that he had introduced a marriage allowance of Rs. 2,000 and exempted from tax the employers' contribution to provident fund. But now he has not only denied them the children allowance but actually withdrawn the marriage allowance. This step runs counter to the principles he himself enunciated on 15th May last. Those who are affected by this step, however, need not mind making this sacrifice, if it brings any mental consolation to their brethren with smaller incomes who have now been brought within the taxable range.

It is rather sad to find that all the sound arguments advanced against wealth tax and expenditure tax have fallen on deaf ears. It is true that all these arguments were voiced mostly outside the Houses of Parliament and that, as such, the Government is not bound to pay any heed to them. Nevertheless, those who criticised these novel taxes are not irresponsible persons and deserved to be heard. If they do not have any representation in Parliament, it is partly because they have been supporting the Congress Party all along, despite serious differences of opinion over the economic policies and actions pursued by it, and partly because of the adult franchise in a nation with a literacy of about 15 per cent. and a low *per capita* income of about Rs. 270 per annum. Further, whenever the ruling party accepted the advice of this competent minority, it has always been able to show excellent achievements to the public. This experience alone is sufficient ground for the Government to have listened to the critics of wealth and expenditure taxes.

Concessions Inadequate

While flatly rejecting the suggestions for dropping these two taxes, the Finance Minister has agreed to give a holiday of five years for genuine new companies from wealth tax and to exempt from it inter-company investments in the hands of investing company. These concessions do not go far enough; nor has the injustice of double taxation been undone. The five-year holiday for new companies is quite insufficient. There are several industrial units of great national importance which are not yet able to afford a decent return on their capital, though they have been in existence for double or treble this period. And, in many cases, their inability to do so is due, to a large extent, to the defective economic policies of the Government itself. The automobile industry is an instance in point. It is, however, to be hoped that, when the Select Committee scrutinises these tax measures, it will take a more sympathetic view of the interests of investors and also bear in mind the country's need for foreign capital.

Speaking of automobile industry, the Finance Minister's refusal to give up the increase in the excise duties on petrol and diesel oil is a typical contradiction between means and ends which abounds in the Government's economic policies. The country needs more road transport in order to move the increasing industrial and agricultural production. Yet, further tax burdens are imposed on this vital means of transport. Even before this increase, taxation of motor vehicles in India, it may be noted, constituted the heaviest in the world. It is obvious that, unless road transport expands quickly, the automobile industry cannot thrive. And, unless the automobile industry grows vigorously, the defence of the country will be at the mercy of foreign powers. Further, there is no better heavy industry than automobiles for broadening the employment opportunity in the country. Indeed, when one comes to think of the various ways in which the Government makes a mess of this vital industry, one gets overwhelmed by a sense of exasperation. The inadequate attention paid to road development is one of them. This is a deficiency in the efforts of the public sector which often makes one wonder whether there is any real planning at all in this country.

ARE THE TWO NOVEL TAXES GOOD FOR EQUITIES?

MOVE TO STABILISE COPPER PRICES

THURSDAY, 5 P.M.

THE share markets have managed to be on the right side of investors for another week. Steel and cement scrips, in particular, have scored further gains. Several miscellaneous and engineering counters also have moved up a little. Textiles, however, are not so much favoured, because the cloth market is sticky and may remain dull during the monsoon months. The Life Insurance Corporation has not yet withdrawn its support, though it is to be wondered as to how long and to what extent it can keep up this performance in view of the forthcoming new borrowing programmes of the Central and State Governments. Its purchases, however, have so far been sizable, sufficient to make a perceptible effect on the floating stock of popular scrips. This was one of the main reasons why the *badli* rates in the last settlement were low, despite the continued stringency in the short-term money market. Indeed, in the case of some shares, the bulls were able to carry forward their outstandings without paying anything to the seller. This state of affairs, coupled with the fact that the settlement rates were in favour of the bulls for the first time after a long time, has helped sustain the steady trend of the market.

MARKET GOSSIP

* * * *

With the Stock Exchanges in a better mood and the bears on the defensive, there is an inclination in market circles to lay stress on the brighter aspects of the picture. Some have even begun to contend that Mr. T. T. Krishnamachari's tax proposals are in a way bullish to equities. Messrs. Place, Siddons and Gough, Calcutta, for instance, point out that, though Mr. T. T. Krishnamachari has damaged the prospects for shares somewhat, he has shown some compensating considerations. One of these, according to them, is what they call "substantial tax relief" granted to personal income recipients. They observe, in their latest fortnightly *Share Market Report*, that the relief given to higher incomes is substantial enough as not to be wiped out by the increase in cost of living. Giving a few concrete illustrations, they add:

"A person earning Rs. 40,000 a year will get a tax reduction of about Rs. 1,000 a year. At Rs. 45,000 a year, the relief amounts to about Rs. 1,300, at Rs. 75,000 a year to about Rs. 2,100, at Rs. 1,00,000 a year to about Rs. 3,600 and at Rs. 2,00,000 a year to about Rs. 16,200 a year. These concessions cannot be dismissed as trivial and, taken by themselves, do provide basis for Mr. Krishnamachari's claim that he wished to provide incentives to work and save."

Since the above calculations were made, the Finance Minister has withdrawn the marriage allowance of Rs. 2,000 for incomes over Rs. 20,000. That apart, although there is great force in the conclusion quoted above, it must be borne in mind that the tax on unearned incomes has gone up and that most of the assessees belonging to the groups of income taken into consideration by them will be having sizable unearned incomes.

* * * *

In the wealth and expenditure taxes, too, Messrs. Place, Siddons and Gough see something favourable to equities. They thus argue: "The avowed purpose of the expenditure tax is to curb consumption, in other words, to promote saving. There is, of course, the possibility that, instead of saving the part of income which would be spent on extravagant consumption, the effect of the expenditure tax may be to discourage the earning of that much income. The tax will then act as a disincentive to work, not as an incentive to save. To what extent this effect will appear can only be known from experience of the working of the tax in practice. As India is the first country in the world to introduce this novel tax, there is no previous experience on which we can draw. The effect of the tax on earning, spending and saving depends largely on how far people in the income-groups, to which the expenditure tax will apply, are able to vary their income through increasing or decreasing their effort. It is likely that, in a large number of cases, the connection will be found to be extremely tenuous. In such cases, the possibility of people trying to escape liability to the expenditure tax by earning less may be ruled out and the choice will then be between spending and saving. If this is so, the stimulus to saving is likely to be powerful. Expenditure on what will, in all probability, be conspicuous consumption may satisfy deep-rooted psychological urges, but, when such expenditure attracts expenditure taxation at rates which may rise to 100 per cent., the deterrent effect is extremely strong. It is, of course, true that, if the income is saved and invested, it will make the owner liable to the wealth tax, but this tax cannot be more than 1¼ per cent., which will certainly be preferred to what may be a 100 per cent. tax on that amount, if it is spent. There is a strong presumption, therefore, that the expenditure tax will, in reality, work as Dr. Kaldor and Mr. Krishnamachari wish to work. It will curb undesirable consumption, stimulate saving and, in conjunction with the wealth tax, canalise the saving into profitable investment."

Commenting on the merits of wealth tax on individuals, they remark:

"Since the wealth tax is assessed on capital value and not on income, an asset having the same capital value as another, will be assessed to the same amount of wealth tax, irrespective of the income received. To take an example. Suppose, three persons have wealth to the value of Rs. 10 lakhs each. One of them holds it in bullion yielding no income, a second holds his wealth in Gilt-edged securities yielding 3 per cent., or Rs. 30,000 a year as income, while the third holds it in industrial shares, yielding 10 per cent. return, that is, an income of Rs. 1 lakh a year. All of them would pay the same amount as wealth tax. The effect is, therefore, likely to be a powerful urge to shift the wealth out of non-income yielding bullion or low income yielding Gilt-edged into the highest possible income yielding industrial equities. In this respect, the wealth tax is superior to the income-tax, which has the disadvantage that it penalises risk bearing by subjecting the high return from venture capital to high rates of tax and rewards safe investment like Gilt-edged with low tax rates. It would be a good thing for the economy and for the stock market, if it tended to coax capital out of hoards and fixed-interest bearing securities into more risky enterprises."

Proceeding, this leading Calcutta firm of share-brokers agree with the general criticism that wealth tax on companies will have a deleterious effect on joint-stock enterprise. Thus, they say:

"Apart from giving rise to flagrant double taxation, this may discourage healthy investment. It is obviously inequitable, as well as inexpedient, to require that companies should be assessed to the wealth tax on the basis of net assets, even if they have just commenced operations and have not begun to earn income, or if they have had a bad spell in which income has shrunk or vanished. The wealth tax could, perhaps, be carried by a company earning normal profits in a normal year. But, in a bad year or, worse still, a succession of bad years, it could amount to an intolerable burden which might force companies into liquidation, when, in the absence of such an impost, they may have been able to survive and eventually win through to prosperity. A system of rewards and punishments plays an important role in a competitive economy, but the trouble about heavy taxation of industries is that the rewards of success are substantially reduced, while the penalties of failure remain as great as ever. With the scales tilted in this way, it is inevitable that many potential investors will decide that the game is not worth the candle."

* * * *

Messrs. Place, Siddons and Gough have a feeling that the heavy tax on bonus shares may encourage company managements to distribute higher dividends whenever profits permit such a course. "For investors," they add, "this is not an unpleasant prospect. They may look forward to a more generous distribution policy on the part of companies than in the past. One wonders whether this is the sort of trend the Finance Minister wishes to encourage, but it does look as if that is where his policy will lead."

In conclusion, they refer to the attraction of equities as a hedge against inflation and comment thus:

"Already the dear money policy has brought about a decline in Gilt-edged prices and in those of debentures and preference share. For the moment, no doubt, equities are also in pretty bad shape and have lost something like 25 per cent. of their capital value since September 1956—a period which coincides with the tenure of the Finance Ministry by Mr. Krishnamachari. But despite the worst that he has done or may do, the expanding developing economy will continue to increase the profitability of industrial investment."

While it is pleasing to see a leading firm of share brokers taking an optimistic view of the future and while we should like to hope that their interpretation of the effects of wealth tax and expenditure tax on investment markets will be borne out by events, there are some snags in their assumptions. It is just possible, for instance, that those who are liable to wealth tax may prefer to hoard their savings rather than invest them in productive assets and pay the tax. Those, who are a little above the wealth tax line, may invest more in small savings certificates than go in for equities. The same is the case with those liable to expenditure tax. A more serious snag is the possibility of a progressive increase in the incidence of wealth tax and expenditure tax alike.

* * * *

There have been two notable developments of import to the Indian copper market this week. They are: (1) Agreement between the Anglo-American Corporation and the Rhodesian Section Trust (R.S.T.) over a joint pricing policy for copper; and (2) production setback of 10 per cent. (or about 18,000 tons) in the R.S.T. group Roan Antelope and Mufulira copper mines with effect from the 1st inst. These moves signify the determination of copper producers to prevent a further sharp break in prices. Copper prices, it will be recalled, have been moving down continuously since the past fourteen months. This metal is now quoted in the London market at about £235-5 per ton, as against the peak of £437 in March 1956 and £300 at the beginning of 1957. The quotation for copper at New York is around 30 cents per lb., as against 46 cents a year before and 35 cents at the end of 1956.

In line with the trend of the world copper market, prices in India, too, have suffered a break. Electrolytic copper which stood at as high as Rs. 295 per ton in March last year has gone down now to Rs. 180. The setback in prices must be attributed to the substantial improvement in supplies, thanks to a rise in domestic output and enlarged imports. The total quantity of copper (virgin metal) actually produced during 1956, for instance, amounted to 7,628 tons, an increase of 346 tons, as compared with 1955. Imports of foreign copper aggregated 31,275 tons, valued at Rs. 15.16 crores, the figure for the previous year being only 18,457 tons, valued at Rs. 7.81 crores.

The continued weakness in world copper prices has been the result of larger production. The current level of world output, estimated at 1.80 million tons annually, is much in excess of the total consumption by 150,000 tons, notwithstanding cut-backs in production amounting to 54,600 tons per annum already made by the three large U.S. producers—Phelps Dodge, Anaconda and Miami—and closing down of two smaller highcost U.S. mines. The basic cause of the over-supply is that output is continuing to expand at a time when demand in the main consuming countries is either falling below the peak or not keeping up with the growth in productive capacity. It is in view of this and with a view to imparting stability to copper prices that the Anglo-American Corporation and the R.S.T. have agreed upon a joint pricing policy for copper.

Details of the agreement are not available. It is, however, gathered that a "Rhodesian price" for copper will be established which will change less frequently than the daily movements in the London Metal Exchange prices, although it will be related to the latter over a period. Incidentally, a reasonable price for copper is considered to be £240 per ton in the U.K. and £250 (32 cents per lb.) in the U.S. Some metal circles in London are, however, doubtful whether these prices could be held on the strength of consumer demand alone. To quote a report: "Since copper is in plentiful supplies and consumers are not purchasing on a large-scale, the only alternative to a renewed fall in prices is action by the producers. Agreements between them about prices which are not backed by cuts may give a greater stability to prices in the short run. But, in the long run, nothing will keep the price up so long as supply continues to outstrip demand."

* * * *

As one of the key members of the Commonwealth and the sterling area, India will naturally note with more than ordinary interest the British Government's decision to join the European free trade area. Although the official spokesmen of the U.K. have assured the members of the Commonwealth that the participation of their country in the area would not in any way injure Commonwealth relations, there are serious doubts in some quarters as to whether the U.K., in its anxiety to expand trade with Europe, will recognise the need for expanding Commonwealth trade. These doubts have now been set at rest, at least to some extent, by the British Government's latest gesture to give New Zealand "greater bargaining strength" in an attempt to dispose of its dairy products. Under an agreement signed in London between the Governments of the two countries, the U.K. has undertaken to admit unrestricted imports of New Zealand dairy products for a period of ten years. Further, it has given an unqualified assurance that eggs, poultry, butter, cheese and other milk products will continue to enjoy duty-free entry into the U.K. It has also expressed its willingness to consider sympathetically adoption of appropriate measures, should the New Zealand meat trade be threatened with serious injury. The agreement forms part of the Ottawa Trade Pact and will continue to remain valid till the latter is in force.

This gesture of Britain, though it has been welcomed by New Zealand, is still said to meet the latter's request only to a very much limited extent. In the course of the negotiations, Mr. K. J. Holyoake, New Zealand Deputy Prime Minister and Minister for Agricultre, pointed out that the balance of advantage of the Ottawa Pact had moved against his country. According to him, the Ottawa meat quotas had lost their effectiveness and New Zealand's preferences in the U.K.—expressed in terms of specific duties—had lost much of this value since 1932. He, therefore, requested that only a limitation on foreign supplies to the U.K. could en-

(Continued on page 1128)

THIS ISSUE

The fortnight-old influenza epidemic in Bombay City has adversely affected production in most of its numerous factories and offices. "Commerce" has been no exception to it. The vast majority of its staff and the workers belonging to its printers have been incapacitated for work. It has not, therefore, been possible for us to include in this issue all our regular features. It is to be hoped that our subscribers will bear with us for any inconvenience caused to them as a result of this unforeseen development. Indeed, if we have been able to bring out even this attenuated issue, it is due to the whole-hearted co-operation of workers in our press and the office who were unaffected by the pestilence. To them are due our sincere thanks.—EDITOR

SHARE MARKET STEADIER

TEXTILES, HOWEVER, RECEDE

(From Our Own Correspondents)

BOMBAY, *6th June*

THE mild setback in values noted on the Stock Exchange towards the closing sessions of last week proved short-lived and a steadier trend once again came to prevail during the week under review. The chief impetus to the market was provided by the sizable support extended by the Life Insurance Corporation to some of the leading scrips. The concessions in wealth tax announced by the Finance Minister in his reply to the budget debate in the Lok Sabha on Friday, though they were of a minor character, also helped to impart a better sentiment. The concessions are: (1) Genuine new companies will be granted a wealth tax holiday for the first five years of their existence on the value of their assets; (2) investments of one company in another company will not be included for the purpose of wealth tax in the hands of the investing company. This "gesture" of the Finance Minister, coupled with the expectation of further modifications in taxes on wealth and expenditure taxes in the Select Committee stage, induced bear-covering and selective enquiries, leading to a rising tendency in prices. Textiles, however, proved an exception, in that they encountered selling, thanks to discouraging advices from piecegoods markets and fear of lower output in mills on account of absenteeism caused by the influenza epidemic.

Tata Ordinaries opened the week at Rs. 154.75, as against Rs. 155.75 last week-end, and moved up on good buying support to Rs. 159.75 on Tuesday. At higher levels, there was some profit-taking and the rate receded to Rs. 158 yesterday. They, however, recovered today to Rs. 160.50 before finishing at Rs. 159.50. The net gain over the week was Rs. 3.75. Indian Irons opened at Rs. 18.30 and, after rising to Rs. 19 today, wound up at Rs. 18.85. The net gain was half a rupee.

The textile section, as already stated, experienced selling which brought down the quotations of quite a number of shares. Kohinoors were particularly depressed, the closing rate today being Rs. 283.50, a drop of Rs. 8.50 over the week. Centurys fell by Rs. 8 to Rs. 392. Standards receded by Rs. 7 to Rs. 381. Bombay Dyeings, which had gone up from Rs. 518 on Friday to Rs. 530.50 on Monday, fell to Rs. 522.50 yesterday. After recovering to Rs. 529.50 today, they again sagged to Rs. 525 at the close. Svadeshis declined by Rs. 4 to Rs. 150 and Simplex by Rs. 2.50 to Rs. 160. New Greats and Osmanshahis lost Rs. 2 each to Rs. 218 and Rs. 56, respectively. Gokaks shed Re. 1.50 to Rs. 173.50. Indores eased by a rupee to Rs. 138.50. Tata Mills slipped back by 25 nP to Rs. 41.25, India Uniteds by 10 nP to Rs. 9.45 and Apollos by 4 nP to Rs. 2.32. Central Indias, however, evoked some investment support and hardened by a rupee to Rs. 103.

Bank shares ruled fairly steady. Bank of Indias had a few enquiries and advanced by Rs. 4.50 to Rs. 138.50. Union Banks gathered 5 nP to Rs. 7.30. Barodas were fully maintained at the last week's level of Rs. 102. Central Banks, on the other hand, were a shade easy at Rs. 51.75.

Electricity shares tended to look down, owing to lack of follow-up support. Tata Powers dropped Rs. 7.50 to Rs. 1,207.50 and Hydros were dull at Rs. 124. Bombay Suburbans declined by Re. 1.25 to Rs. 105. Ahmedabad Electrics lost 25 nP to Rs. 93.75.

In the miscellaneous section, cement shares attracted some attention at the hands of investors. Associated Cements spurted by Rs. 3 to Rs. 157.25. Dalmia Cements put on 30 nP to Rs. 12. Digvijays were firm at Rs. 141.50. Orissa Cements changed hands at Rs. 13, as against Rs. 13.05 lakhs week-end. Among sugar shares, Phaltans spurted by a rupee to Rs. 133. Walchandnagars were fully steady at Rs. 246. Belapurs opened the week a rupee lower at Rs. 218.50. After moving up to Rs. 22 on Monday, they relapsed to Rs. 216 today before finishing higher at Rs. 217. The net loss over the week was Rs. 2.50.

A spurt of Rs. 5 to Rs. 267.50 in Alcock Ashdowns was the feature of trading in the engineering and mining shares. Premier Constructions gathered a rupee to Rs. 143, but fell to Rs. 141 at the close today, due to lack of sustained support. Indian Coppers improved by 4 nP to Rs. 3.42. B.B. Petrols gained 2 nP to Rs. 2.46. Larsen and Toubros were firm at Rs. 15.30, as also Mahindra and Mahindras at Rs. 15 *ex-div*. Tata Locomotives encountered scattered selling and dropped Rs. 3 to Rs. 140.50. Shivrajpurs lost Rs. 1.25 to Rs. 77.50.

Among shipping shares, Great Easterns put on 5 nP to Rs. 19.20 and Scindias were firm at Rs. 17.85. Among automobile shares, Premier Automobiles picked up Re. 1.25 to Rs. 87. Hindustan Motors strengthened by 15 nP to Rs. 7. In the other miscellaneous group, Bombay Burmahs (old) opened the week at Rs. 526.50 and, induced by withdrawal of the increase in the excise duty on tea, advanced to Rs. 546 on the 3rd inst. After declining on profit-taking to Rs. 535.50 yesterday, they recovered to Rs. 543 today, but came down to Rs. 533, owing to fear of the Madras Government increasing the rate of agricultural income-tax. Over the week, however, the shares were higher by Rs. 3. National Rayons increased by Re. 1.25 to Rs. 216.25. Tata Chemicals rose by 20 nP to Rs. 16.50. Wimcos were neglected at Rs. 156. Tata Oils, however, declined by half a rupee to Rs. 430. British India Corporations receded by 40 nP to Rs. 5.85. Hindustan Levers eased by 20 nP to Rs. 19.45. Gwalior Rayons were weak at Rs. 11.40 nP.

Calcutta Stock Exchange

CALCUTTA, *5th June*

The modifications of Budget proposals, announced by the Finance Minister on Friday last, fell considerably short of market expectations, for which reason the Calcutta Stock Exchange continued to breathe an air of dullness. At lower levels, there was demand for first class equities, on account of bear-covering. The Life Insurance Corporation accorded support, which was interpreted in the market as a clever move on the part of the Union Finance Ministry to drive away dullness from stock markets and to create the impression that the Budget proposals for increased taxation had not, after all, affected market sentiment. Selected shares attracted investment inquiry, mainly because of low levels.

Apart from the wealth tax holiday for five years for new companies and the expectation that further concessions were likely when the Bill for the expenditure and wealth taxes reached the stage of select committee, other concessions that met with marked appreciation included cancellation of excise duty changes relating to coffee and tea and income-tax relief to persons having children. Support from the middle class people is no mean contribution to the market at any stage, and as such any incentive for this class to earn more and invest more is welcome to the market which, since the last few years, has been seeing less of the once-powerful *zemindars* and the princely order. The good speech made by Mr. H. M. L. Williams at the annual general meeting of Guest Keen Williams Ltd. on Thursday last was another event noted with satisfaction. Deliberations of the coal prices investigation committee were keenly awaited and the expectation was that the increased cost of production should lead to fixation of higher prices. Also, the coal industry required to make more profits to be used for expansion.

A marked downward trend was in evidence in cotton textiles. Dunbars were knocked down to as low a rate as of Rs. 167, as against Rs. 176.00 previously. Cawnpores declined from Rs. 5.61 to Rs. 5.50.

Coals changed hands at lower levels, as the absence of any brightening development for this industry scared buyers. Eurrakurs lost 25 nP to Rs. 22.12. Bengals fell by Rs. 2 to Rs. 213. Although the dividend for Bengal Coal Co., Ltd. for the year ended October last was 17.5 per cent. (face-value of the share Rs. 100 each), which was the same as that for the previous year, the working results compared unfavourably in view of production having declined from 2,559,083 tons to 2,320,350 tons. It was felt that the Directors' report on the prospect of the Company was the consensus of opinion as regards the future of the entire industry. For the Directors hoped that the coal industry would be placed on a sound footing so as to be able to discharge its responsibilities under the second Five-year Plan, and they awaited the work of the coal prices committee. The Supreme Court verdict on the industry's appeal was also awaited.

The strong trend in raw jute market in the face of a decline in the prices of jute goods restricted turnover in the jute section. As news of extreme interest during the week under review, it should be noted that the Singhanias have now become the managing agents for the Ganges Jute Co. Until recently, the managing agents were Macneill and Barry Ltd. Anglo-Indias were forced down from Rs. 138.00 to Rs. 133.50, and Belvederes realised Rs. 80, as against Rs. 94.00 previously.

The complete absence of buying support in the tea section even in spite of the withdrawal of the changes made in excise duty was due to the extreme general dullness. Hasimaras sagged from Rs. 22.00 to Rs. 20.50. Bishnauths were quiet at Rs. 18.50.

Among engineerings, Guest Keens occupied the pride of place, in view of the bright prospects for this firm. From Rs. 27, the shares put on strength to gain to Rs. 28. Jessop and Cos. earlier gave way from Rs. 24.31 to Rs. 23.69, but closed at Rs. 24. Indian Irons hovered around Rs. 18.45.

A note of recovery was in evidence in selected miscellaneous industrials. Indian Coppers regained to Rs. 3.39 from Rs. 3.36, and Rohtas Industries to Rs. 17.81 from Rs. 17.62. Niccos were better at Rs. 20.25, while B.I. Corporations, following a preponderance of sellers over buyers, weakened to Rs. 6.00.

• • • •

Madras Stock Exchange

MADRAS *5th June*

The easy conditions which prevailed on the Madras Stock Exchange last week gathered considerable momentum during the week under review. In fact, the market ruled distinctly bearish. The Union Finance Minister's refusal to revise his tax proposals relating to Corporate sector and fears of imposition of higher taxation on plantations, especially coffee and tea, by State Governments utterly disappointed operators. The sentiment was further shaken by discouraging reports from piecegoods market. Selling was, therefore, widespread and equity values tumbled down. Even the concessions in wealth tax, namely, exemption of genuine new companies for the first five years of their existence and exclusion of investments of one company in another for purposes of wealth tax levy, failed to enthuse operators. The withdrawal of additional excise duties on tea and coffee, too, did not have any favourable effects.

Among tea shares in the planting section, Chembras dropped 70 nP to Rs. 3.10. Blue Mountains shed 10 nP to Rs. 3.10. Chandramalais receded by 20 nP to Rs. 3.75. Devasholas declined by 37 nP to Rs. 19.50. Highlands lost 20 nP to Rs. 13.80. Kil Kotagiris eased by 8 nP to Rs. 5.85. Neelamalais retreated by 35 nP to Rs. 5.35. Ouchterlonys were quoted 12 nP lower at Rs. 4.60. Periakaramalais decreased by 10 nP to Rs. 7.15. Waterfalls fell by 55 nP to Rs. 3.45. Peermades, however, improved by 85 nP to Rs. 25.85, on reports of a final dividend of 27½ per cent., making a total of 37½ per cent. for the year ended 31st December, 1956 as against 35 per cent. for the previous year. Among coffee shares, Sheveroys declined by 17 nP to Rs. 1.80. In the rubber group, Cochin Malabars dropped 75 nP to Rs. 6.75. Kailas slipped by 40 nP to Rs. 4.30. Midlands climbed down by 90 nP to Rs. 15.50. T.R. & T.s depreciated by 30 nP Rs. 8.55. Pullangodes eased by 8 nP to Rs. 2.30. Rajagiris fell by Rs. 1.50 to Rs. 16. Thirumbadis were 18 nP lower at Rs. 1.55.

In the textile section, Metturs were hammered down by Rs. 74 to Rs. 318, on selling pressure induced by lower dividend of 20 per cent. for the year ended 31st March 1956 as against 42½ per cent. for the previous year. Rajalakshmis fell by Rs. 16 to Rs. 120. Dhanalakshmis slumped by Rs. 20 to Rs. 320. Coimbatore Cottons dropped Rs. 10 to Rs. 148. Lakshmis receded by Rs. 5 to Rs. 134. Buckinghams decreased by Rs. 2 to Rs. 166. Coimbatore Spinnings eased by a rupee to Rs. 85. Janardanas lost a like amount to Rs. 88. Maduras shed 50 nP to Rs. 40.50. Ranga Vilas came down by Rs. 2 to Rs. 84. Travancore Rayons shed 10 nP to Rs. 13.15. Loyals declined by a rupee to Rs. 47.75. Kotharis receded by Rs. 1.50 to Rs. 12.25. Palani Andavars were neglected at Rs. 147, as also Radhakrishnas at Rs. 271.

In the miscellaneous section, Indian Steel Rollings declined by 25 nP to Rs. 11. Metfur Chemicals receded by 30 nP to Rs. 9.30. Andhra Cements eased by 5 nP to Rs. 12.75. F.A.C.Ts, however, gathered 10 nP to Rs. 5.70. Spencers gained a like amount to Rs. 16.70.

In the sugar group, Travancores declined by 25 nP to Rs. 10.25. Deccans decreased by 10 nP to Rs. 7.25. E.I.Ds were quiet at Rs. 26.75, Indias at Rs. 15.50 and Mysores at Rs. 37.50.

AWARD OF INDUSTRIAL TRIBUNAL ON COLLIERY DISPUTES

The period of operation of the Award of the All-India Industrial Tribunal (Colliery Disputes), Calcutta, which granted a wage increase to workers in coal mines, has been extended up to 26th May 1958, according to a notification published today in a *Gazette of India Extraordinary*. The All-India Industrial Tribunal (Colliery Disputes), Calcutta, was set up by the Government of India in February 1954 to adjudicate on industrial disputes concerning coal mines. These related to wages of all categories of colliery workers, inclusion of pay for lend and/or lift for calculating bonus and provident fund, etc., house rent, paid festival holidays and continuance of foodgrains concessions to workers. The Tribunal's Award, which covered about 960 coal mines located in eight different States, was published in May 1956.

MARKET GOSSIP

(*Concluded from page* 1127)

sure a stable market for New Zealand's products in the U.K. This suggestion, however, did not find favour with the U.K. Government which made it clear that its policy and its international commitments precluded either import restrictions or upward revision in preferences in order to protect New Zealand's interest.

New Zealand would appear to fear that it might be excluded from its present markets in the Messina countries (of the European common market) and that, in fact, agricultural production in these countries might rise to a level where substantial surpluses for export might become available. This is not the only country which is having such a fear; several other countries, including India, have it as well. Australia, for instance, has already accepted a policy of reducing the preferences given to Britain. If the U.K. should prove unable to absorb at remunerative prices the increasing production in the Commonwealth countries, the latter may have to seek access to other markets. Speaking on behalf of his own country, Mr. Holyoake said at London the other day that, "to this end and also to assure New Zealand of a competitive price structure, New Zealand might wish in the future to proceed to a downward adjustment of the preferences granted to the U.K. Commenting on this development, the *Financial Times* remarks that the Ottawa system of Imperial Preferences is "in a period of twilight."

NEWS IN BRIEF

THE Government of India does not contemplate the appointment of a second experts committee to decide the location of the proposed oil refinery in Assam.

A sulphur manufacturing plant at an estimated cost of Rs. 1 crore is expected to be set up at Sahabad in South Bihar by the National Industrial Development Corporation.

The Bihar Government is examining a scheme for establishing a factory either at Amjor or at Dehri-On-Sone for manufacturing sulphuric acid based on pyrite deposits.

The Trans World Airlines' super G constellations linking India with Ceylon and the U.S. and other major international capitals of the world commenced operations with effect from the 4th inst.

Australia is supplying to India 2,000 railway wagons as part of its Colombo Plan contributions. The wagons will be included in India's programme of rehabilitation and development of the railway system. Delivery of more than 400 wagons would be completed by the end of this month.

The Kashmir Government proposes to set up an Industrial Finance Corporation to help the development of industries in the State. The proposed Corporation will have a share capital of Rs. 50 lakhs and a paid-up capital of Rs. 25 lakhs. Out of the paid-up capital, Rs. 19 lakhs will be subscribed by the State Government, while the rest will be open to public subscription. The Government is now working out details of the Corporation.

A post-graduate diploma course in pulp and paper technology, the first of its kind to be approved by the Government of India, will commence at the Indian Forest Research Institute, Dehra Dun, from 5th August next. The course will impart thorough practical and theoretical training to students for key technical posts in pulp and paper mills. The diploma holders will also be able to carry on technological research in the subject. The minimum qualification for admission to this course is a degree in chemical engineering of a recognised university.

The Customs Reorganisation Committee recently appointed by the Government of India to review the working of the Customs administration in this country, has issued its questionnaire. Copies are being supplied to the various chambers of commerce, trade associations, firms, etc., who had furnished the Committee with material for the framing of the questionnaire. The Committee now invites all other interests concerned to obtain their requirements of the copies of the questionnaire from the Secretary, Customs Reorganisation Committee, Central Revenues Building, near Hardinge Bridge, Mathura Road, New Delhi.

The Government of India has restricted the issue of import licences for twenty different items of steel. These include tinplate waste, waste-culls circles, strips, cuttings, tinplate taggers waste and waste terniplate primes, spring steel sile, wire spring steel, wire rope, wire galvanised telegraph, steel strips and tapes. Only actual users will, in future, be issued licences for the import of steel. In the first instance, these licensees will be issued licences only to cover the requirements of the applicants for the certified three months. The import licences will normally be restricted to those categories which are not produced within the country, the only exception being in the case of those users who had hitherto not been receiving supplies from indigenous production and had been depending on imported steel. Licensees are allowed to import steel themselves or through any of the established importers.

From Abroad

The Malayan delegation which will attend the International Rubber Study Group Conference to be held at Djakarta this month is expected to oppose a move by the French delegation for a scheme to stabilise the price of natural rubber.

The three Benelux countries, Belgium, the Netherlands and Luxemburg have agreed on the text of a draft treaty which is designed to weld their economies into a closely knit block of some 20 million people.

Prospects of extending Ceylon's tea trade to the Soviet Union are bright, according to Mr. Senanayake, Ceylonese Minister for Trade. He believes that Russia will be able to buy substantial quantities of tea and other primary products such as rubber and coconuts. At present, Ceylon has no direct trade with the Soviet Union.

The British Ambassador in Paris, Sir Gladwyn Jebb, told the French Foreign Minister, M. Pineau, recently that Britain attached the greatest importance to the speedy ratification of the common market and Euratom treaties. He added that the British Government hoped that the common market would be completed by the setting up of a free exchange zone in which Britain could associate itself in European co-operation.

The Boards of the Guardian Assurance and the Caledonian Insurance have agreed in principle to merge the interests of the two companies. The Guardian will issue to Caledonian shareholders seven ordinary 5s. shares for ten ordinary 5s. units of Caledonian. The offer is based on 90 per cent. acceptance or such lesser percentage as may be agreed and also on the Guardian shareholders' consent to the necessary increase in capital.

Under the impact of steady immigration, Australia's population is rising rapidly towards the 10,000,000 mark. In 25 years, the Australian Department of Immigration predicts 20,000,000 people will live in that island continent which is 32 times the size of the United Kingdom. About 1,150,000 immigrants have landed in Australia since World War II, roughly half of them from Britain and two-thirds of the remainder from Italy, the Netherlands, Poland, Germany and Greece.

Japan has offered to contribute about Rs. 20 lakhs to the capital of the proposed Pakistan Industrial Credit and Investment Company to finance industrial concerns in the country. It may be recalled that Mr. Amjad Ali, Pakistan's Finance Minister, announced in February last that the Government intended to set up such a Company with an authorised capital outlay of Rs. 15 crores. His proposal was that the Company would start with a paid-up capital of Rs. 2 crores, 40 per cent. of which could be made up by foreign contributions, the rest to be invested by indigenous financiers. The Japanese offer is reported to be the first response that Pakistan has received from foreign countries to this proposal. Pakistan is understood to have approached Britain, France and the U.S.A. also in this regard.

PERSONAL

DR. Jagan Nath Khosla, at present Minister-*Charge d' Affaires* in the Embassy of India, Prague, has been appointed Indian Ambassador to Czechoslovakia.

Mr. W. A. B. Lliff, Vice-President of the World Bank, arrived in New Delhi on the 7th inst. from Washington. His visit is in connection with the talks on the Indo-Pakistan canal water dispute.

Mr. T. G. Carter, Chairman of the Australian Wool Bureau, has been re-elected Chairman of the Executive of the International Wool Secretariat, and Mr. H. K. P. Wood has been elected Chairman of the International Wool Secretariat.

Mr. R. K. Sidhwa, President of the Federation of All-India Local Authorities, will lead the Indian delegation to the World Congress of the International Union of Local Authorities to be held at The Hague on the 12th inst.

Mr. G. Rajagopalan has been appointed Parliamentary Secretary to the Minister for Information and Broadcasting, Messrs. Sadath Ali Khan and Jogendra Nath Hazarika to the Minister for External Affairs, Mr. Purnendu Sekhar Naskar to the Minister for Rehabilitation and Minority Affairs, and Mr. Lalit Narayan Mishra to the Minister for Planning.

Announcing the opening of the

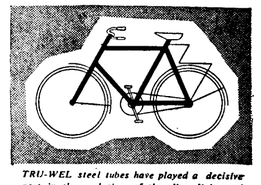
TUBE PRODUCTS OF INDIA LTD.

factory at Avadi, Madras

Production has begun of the world famous

TRU-WEL Electric Resistance Welded steel tubes

Promoted as a joint venture between Messrs Murugappa and Sons, Madras, and Tube Investments Limited, Birmingham, U.K. (through their subsidiary, Tube Products Limited, Oldbury, Birmingham), Tube Products of India's factory marks an important milestone in the progressive industrialisation of our country.



TRU-WEL steel tubes have played a decisive part in the evolution of the slim, light and immensely strong cycle of today.

Planned and developed as a specialised unit to produce ERW steel tubes, Tube Products of India Limited have commenced production of the world famous TRU-WEL Electric Resistance Welded steel tubes.

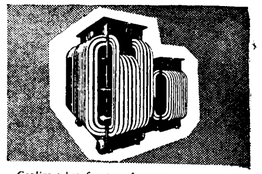
TRU-WEL—a familiar name: TRU-WEL is a familiar name in India. For nearly thirty years Tube Products Limited, Oldbury, our associates, have been the principal suppliers of ERW steel tubes to India. TRU-WEL tubes therefore, enjoy an established reputation for high quality and unrivalled service.

A versatile tube: TRU-WEL tubes combine great strength with exceptional lightness. By skilful manipulation TRU-WEL steel tubes can be made to serve a variety of our developing needs in the home and in industry. The bicycle industry is entirely dependent on it. Motor cars, locomotive boilers and transformers are some of the highly specialised industries which require ERW steel tubes in large quantities.

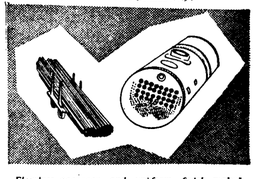
Tubular seat frames, handrails, struts, support and guard rails, which are in extensive use in body-building and interior furnishings in buses, trains and ships, are other familiar uses. Its use in home and office furniture is becoming increasingly popular.

We are happy that Tube Products of India Ltd. will play a complementary role in Indian industry in that it will serve many of our existing engineering industries and also help to promote many more in the years to come.

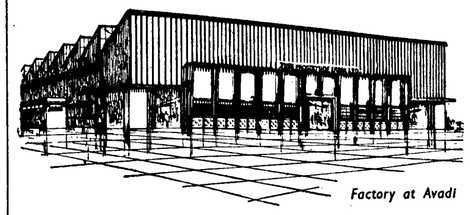
Board of Directors: Sir A. Ramaswamy Mudaliar is the Chairman. The other directors include: Sir Ivan A. R. Stedeford, K.B.E., Chairman of Tube Investments Limited, Birmingham, Mr. A. M. M. Murugappa Chettiar, and Mr. A. M. M. Arunachalam, Partners. Murugappa & Sons, F. W. Martin, Managing Director, Tube Products Limited, Oldbury, Birmingham and Hon'ble Mr. G. R. Macdonald, Director of T. I. (Export) Limited.



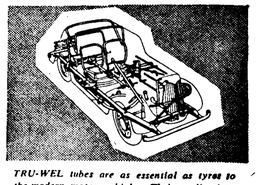
Cooling tubes for transformers - an example of electrical equipment to which TRU-WEL tubes provide a foundation of dependability.



Flawless accuracy and uniform finish make TRU-WEL tubes ideal for locomotive boilers.



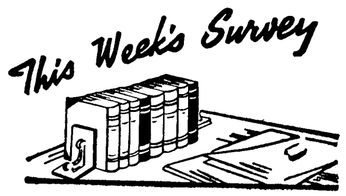
Factory at Avadi



TRU-WEL tubes are as essential as tyres to the modern motor vehicle. Their applications range from small tubes for radiator overflow pipes to outsize tubes for rear axle casings.

Tube Products of India Limited, "Swastik House", 106, Armenian Street, Madras-1

TP. 93



REQUISITIONING FOOD STOCKS

THE last act of the first session of the newly elected Parliament was the passing of the Essential Commodities (Amendment) Bill which invests the Government with special powers to check the rise in prices of foodgrains. Accordingly, the Government is now empowered to requisition food stocks on payment of the average market price prevailing in a notified area over a period of three months preceding the date of issue of notification under this new power. Hitherto, it will be recalled, the Government had the power to requisition stocks but only at the ruling market price. In the context of the high level of prices at present, this provision was considered to be inadequate to discourage hoarding and to prevent undue profiteering by traders.

While the object underlying the measure is laudable, it has, it must be said, come too late, owing to persistent complacency on the part of the authorities. Ever since May 1955, the foodgrains prices have been moving up almost continuously; the index number of wholesale prices (base: Year ended August 1939=100) of food articles which stood at 276.1 in that month reached the all-time peak of 419.2 for the week ended 11th May 1957, or a rise of over 50 per cent. The increase has been particularly marked in the past four months (that is, since the beginning of this year), being as much as 37 points or nearly 10 per cent.

Despite the deep concern over the foodgrains situation expressed by many, not excluding the Union Finance Minister, the Food Minister, his deputy and the other officials of the Ministry were all inclined to underrate the gravity of the situation. Statements were made to the effect that there was absolutely no cause for alarm about the food situation in any part of the country and that the position was, on the other hand, hopeful. But by coming out with his amendment to the Essential Commodities Act, on the ground that there was an emergency and that all formalities of procedure should be waived, the Food Minister was only censuring himself. Surely, the Minister, as Mr. N. H. Kunzru, rightly remarked during the debate on the Bill in the Rajya Sabha, ought to have known that, thanks to the policy of deficit financing, the food prices would go up. But the Food Ministry did not have the foresight to take the necessary action in advance. It was also well known, as he said, that considerable quantities of foodgrains were being smuggled across to Pakistan, but no measures were adopted to prevent it. When prices were low two years ago, the Government should have procured foodgrains at reasonable prices by actively entering the market itself or in partnership with dealers. It, however, did not do so. It, of course, entered the market in some places, but its purchases were small, halting and uncoordinated. Again, the world markets in wheat, and to some extent even in price, were quite favourable to buyers and India could have stockpiled large quantities of these grains by special arrangement with the U.S., Canada and Australia. But the Food Ministry missed the bus, apparently because it thought that the food problem had been solved. Having thus bungled, how can it now, to quote Mr. Kunzru, "bring down prices even by using the powers under the Bill?"

This is, indeed, the crucial question for an answer to which one has to wait for some time. Lest he should be accused later of not energetically exercising the special powers now vested in the Government by the amending legislation, the Food Minister stated in the Rajya Sabha that, in the present state of affairs which had led to a rise in food prices, the measure was comparatively a moderate one. He then went on to say: "The Government is determined to see that the upward tendency of prices is arrested and, if it becomes necessary and if we find we have to take more powers, I may have to come before the House for vesting Government with greater powers. ... We have many more things on which we are working and I hope that, as a result of the cumulative effect of the action we propose to have, undue rise in prices will be arrested." The Food Minister, however, made it clear that he did not have food rationing in mind. Indeed, he hastened to add that he was completely opposed to rationing and would resist it with all the strength at his command.

There was an interesting debate on the aforesaid Bill in the Lok Sabha. While both the Congress and the opposition members generally supported the Bill, special stress was laid on the need for fixing the price payable to stockists in a manner which would be most advantageous to the consumer. The Food Minister did well to assure the public through the House that the prices would be equitable to the consumer and the stockist alike, such being not questionable in a court of law. Some members criticised that the average market rate prevailing in the area over a period of three months to be payable for requisitioning stocks was too high and would tantamount to subsidising the hoarders. The Government, according to one member, would be paying 40 to 50 points more as compared with the proper price. There is some force in this contention. The average price of foodgrains over a period of the past three months are appreciably high. The Food Minister would have done well, if he had, instead of fixing this rate, merely said that the stocks of foodgrains held by hoarders would be requisitioned at a reasonable price. Apart from this defect, no criteria has been laid down in the Bill as to judge whether the stocks are held legitimately or whether they constitute hoarding.

In conclusion, it must be said that the Government should adopt a more rigorous policy for tackling the food problem. The real solution to the problem lies not in measures such as requisitions of stocks at a certain price but in augmenting production. It is gratifying to be told by the Food Minister that all the efforts of the Government were being concentrated on producing more. Reassuring also is his statement that the Government proposed shortly to announce certain "very fundamental and important measures" to give incentives for the producer to produce more and more. Let us wait and see as to what these are.

TROMBAY POWER PROJECT

At long-term loan of $9.8 million has been sanctioned by the World Bank to the Tata Hydro-Electric group of companies to finance the expansion of their thermal electrical power plant at Trombay. This is the second loan to be sanctioned by the World Bank to the Tata group for the same purpose; the first loan for $16.2 million, sanctioned in 1954, assisted the group in constructing a plant with two generating sets, having a combined maximum capacity of 125,000 kw. The present loan of $9.8 million will help the group to meet the foreign exchange cost of a third unit, with a maximum capacity of 62,500 kw. The total cost of the plant is estimated at $14 million, of which $4.2 million represents expenditure in rupees. This sum will be found by the companies from their own resources. The World Bank's loan of $9.8 million will be utilised to finance the import of boiler plant, turbine generator and condensing equipment, accessory electrical equipment and transmission extension, coal handling, coal crushing and ash disposal equipment.

The loan is repayable over a period of 18 years, the first instalment falling due on 15th April, 1960. It bears interest at 5½ per cent., including the 1 per cent. commission which goes to the Bank's special reserve. It is guaranteed by the Government of India.

The thermal power station at Trombay owes its existence to the foresight of free enterprise. It is common knowledge now how the Bombay Government—the public sector—was first strongly opposed to the establishment of this station, and how it took several years for Tatas and other power interests to convince the State Government about the imperative necessity for having this new generating station. The Bombay Government did not relent, until the experts of World Bank came to India, studied the power needs of the State and endorsed the views of the private sector. Even then, it yielded only grudgingly and agreed to the creation of only two power plants. All this niggardly approach was the result of failure on the part of Bombay Ministers to look ahead clearly and anticipate correctly the power needs of industries in Bombay-Poona region. It was also due to their over-optimism about the period within which the Koyna project could be completed. If only the Government had listened to the private sector when the project was first mooted, Bombay city and other parts of Bombay-Poona region would be having more power now and that, perhaps, at a slightly cheaper cost. It must, however, be said to the credit of the Bombay Government that, when it realised its mistake and found that the Koyna Power Project would take a much longer time than had been anticipated, it did not hesitate to ask the Tata Hydro-electric group to expand the Trombay power project by having a third set. If, instead of doing so, it had allowed prestige to stand in the way, the prospects for industrial development in Bombay region would have become very bleak.

In Trombay, power is now generated by using the by-products from the adjacent Stanvac refinery as fuel. The new unit, which is scheduled to be completed in April, 1960, will use coal from central India for fuel and will be equipped with coal crushing and handling machinery. It will also be equipped to burn fuel oil, as well as by-products, from the refinery.

The power produced in Trombay, together with that from a small plant belonging to the State Government, is being fed into the Tata system which furnishes wholesale power in the Bombay region. Even at the time of World Bank's first loan for this project, a forecast of the power demand showed that, even after completion of the first two units at the Trombay plant, there would have to be some restrictions on power use in the Bombay area, pending completion of a hydro-electric plant which the Bombay State Government had planned to build at Koyna, about 140 miles south of Bombay. The shortage of power, in the opinion of World Bank's experts, now seems likely to be even more severe than had been forecast because of the rapid growth of industry. The new or expanding industries in the area include engineering and chemical plants, a rayon plant, a fertiliser plant, further electrification of railways, port facilities and an atomic energy laboratory. Even with the addition of the third unit at Trombay, there will be, we are told, a shortage of power in the area until the Koyna plant comes into operation. The present expansion at Trombay will produce power at an earlier date than could be obtained from any alternative source and will also provide a desirable hydro-electric-thermal balance in the Tata system. It has thus a double advantage.

OUTLOOK FOR HOUSING

The rise in prices of steel and cement, as a consequence of the increased imposts on these commodities in this year's budget, is bound to affect adversely construction activity in the country. A somewhat unforeseen, and particularly undesirable, development is that, with the rise in prices of cement and steel, the prices of other building materials are also reported to have risen. Clearly, the all-round increase in prices of building materials must be a matter for grave concern to industrial establishments and private builders alike. Any slowing down of construction activity will mean reduced opportunities of employment in a sphere which, as is well known, provides jobs for a large number of relatively unskilled workers. Perhaps, it is not as widely appreciated as it should be that, while in the short run at least, the industrial and other programmes included in the Plan will give employment only to the few directly concerned with these programmes, a country-wide diffusion of construction activity is one of the potent means of solving the problem of mass unemployment and underemployment.

Further, it will be generally deplored that the rise in prices of building materials has come at a time when the shortage in housing continues to be an intractable problem. The significance of this problem was recently highlighted by the U.N.'s report to the Economic and Social Council. The report pointed out that the shortage of housing in India was so great that, by 1961, in urban areas alone, the shortage may be about 5.3 million units or a shortage of twice as many units as in 1951. This is the position, despite the fact that, during the period of India's first Five-year Plan, about 1.5 million houses were built. It is, however, not known as to how many of these represent new houses and how many replacement of old houses. The second Plan provides for an estimated total of additional 2.1 million units from all sources. It remains to be seen whether even this target, which in itself is far below the country's requirements, will be reached in the context of all-round rise in prices of building materials. The U.N.'s report, on its part, has rightly observed that few people in India can afford to build houses of their own. Maintaining that the cost of a minimum dwelling unit in India was equivalent to $1,000, the report observes: "For India, the indications are that perhaps only 5 per cent. of the rural householders and 12 per cent. of the urban population would be able to pay this amount."

So much for the prospect for building activity connected with houses built by and for individuals. As regards the no less important, though statistically less significant, industrial housing, there are really two aspects of the problem. In the first place, industrial establishments—whether new units or existing units contemplating expansion—have necessarily to engage themselves in construction for purposes of housing plant and machinery. The capital costs involved in such construction are bound to go up. Secondly, there are housing projects for industrial employees. Surely, industrial employers, already sorely pressed by increased tax burdens, including expenditure and wealth tax, cannot possibly be induced to take a lively interest in housing schemes for workers. Already there is a feeling that the response to the Government's subsidised industrial housing and the low-income group schemes is less encouraging than one might expect. Some light is thrown on the progress of these schemes by the latest report of the Ministry of Works, Housing and Supply for the year 1956-57. Under the industrial housing scheme, loans and subsidies are given by the Central Government to State Governments, statutory housing boards, workers' co-operative societies and industrial employees. During 1956-57, loans and subsidies aggregating Rs. 3.2 crores were sanctioned for construction of 12,167 tenements. The cumulative total of the aid sanctioned under the scheme since its introduction in September 1952 works out to Rs. 25.3 crores (consisting of Rs. 13.0 crores by way of loan and Rs. 12.3 crores as subsidy), covering about 89,400 tenements. Till the end of February 1957, the number of tenements completed was 51,300. Again, till the end of March 1957, actual disbursement, which is related to progress of construction, was Rs. 16.6 crores—Rs. 10.4 crores as loan and Rs. 6.2 crores as subsidy. Projects involving construction of another 20,000 tenements, estimated to cost Rs. 6 crores, are at present under consideration.

The low-income group housing scheme, which was introduced in November 1954, envisages grant of loans to State Governments for being passed on to individual and co-operative societies of individuals whose annual income does not exceed Rs. 6,000, to enable them to build and own houses. The loan bears interest of 4½ per cent. per annum, plus administration charges of State Governments which do not normally exceed 1 per cent., and is repayable in 30 annual instalments. The quantum of assistance is limited to 80 per cent. of the cost of the house, including the cost of land, subject to a maximum of Rs. 8,000. During the period of the first Five-year Plan, against the Centre's allocations aggregating Rs. 21.5 crores, the State Governments sanctioned loans to the tune of Rs. 16.3 crores to third parties, and actually drew from the Centre Rs. 11.1 crores. The number of houses to be built with the aid sanctioned aggregated 41,000.

All this touches only the fringe of the problem of housing the millions in the country. The fact is that housing activity cannot be stimulated without some impetus, wisely conceived and efficiently executed. The shortage of building materials must, of course, be first met. But, this is a long-term solution. In the short term, it is certainly not wise to render the problem for prospective builders particularly difficult through heavy imposts on basic building materials. The better solution would be to allocate the available supply of these materials on the basis of a carefully prepared scheme of priority.

ECONOMIC ANALYSIS OF UNION BUDGET

PRIVATE SECTOR'S SHARE IN COMMUNITY'S SAVINGS PROGRESSIVELY REDUCED

From Our Own Correspondent

NEW DELHI, *4th June*

DELHI LETTER

THE Union Finance Ministry has recently circulated to the members of Parliament a new document—"An Economic Classification of the Central Government Budget for 1957-58"—in addition to the usual budget papers. This valuable document, which is described as a beginning in the direction of linking up the transfers of the Central and State Governments with the economic budget for the nation as a whole, has not received the attention it deserves, in spite of the fact that it brings out more or less clearly the economic implications of the Government's budgetary transactions. Being confined to the Central Budget, the present classification is, of course, only a partial assessment of the impact of that budget on the rest of the economy by way of Government's consumption expenditure and capital formation. Even as a partial assessment, it is worth having for the present, for it will take some time before this type of analysis is extended to the budgets of State Governments, to the accounts of industrial and commercial undertakings owned and operated by the Governments and to the accounts for important sectors of the rest of the economy. The Finance Ministry is, however, not unaware of the limitations of the kind of classification it has presented. And it is recognised that "the impact of Governmental activity on the rest of the economy is felt in a variety of ways—through its regulatory and other measures, through the indirect effects of taxation on incentives and in many other ways. No system of economic classification by itself can unravel these diverse ramifications of Governmental activity."

The present economic classification pertaining to the Central Budget for 1957-58 is in the form of six accounts. The first three accounts deal with transactions in commodities and services, and transfers; here the first one gives the current account of Government administration, the second one the current account of departmental commercial undertakings and the third one the capital account of Government administration and departmental commercial undertakings (combined). Accounts 4 and 5 deal with changes in financial assets and changes in financial liabilities, respectively, under the capital account of Government administration and departmental commercial undertakings. And account 6 gives the cash and capital reconciliation account of Government administration and departmental commercial undertakings.

Account 1 shows that the direct consumption expenditures of the Central Government are Rs. 190.8 crores in 1957-58 (Budget), as against Rs. 157.5 crores in 1955-56 (Accounts) on account of wages and salaries and Rs. 213.1 crores in 1967-58, as against Rs. 127.7 crores in 1955-56 on account of commodities and services. Apart from these direct expenditures, there are current transfer payments to the rest of the economy by way of interest, grants to States and to others, subsidies, pensions, reliefs, etc. These transfer payments amount to Rs. 259.9 crores in 1957-58, as against Rs. 173.9 crores in 1955-56. On the revenue side, taxes on income and wealth bring in Rs. 159.1 crores as against Rs. 114.1 crores in 1955-56 and taxes on commodities and transactions Rs. 413.7 crores in 1957-58, as against Rs. 297.3 crores in 1955-56; income from property and enterprise (composed of profits transferred by departmental commercial undertakings, profits of the Reserve Bank, trading profit, interest receipts from State and others, and other income from property) comes to Rs. 110.8 crores in 1957-58, as against Rs. 57.4 crores in 1955-56 and fees and miscellaneous receipts account for Rs. 41.6 crores in 1957-58, as against Rs. 46.0 crores in 1955-56. The total of revenue comes to Rs. 725.2 crores and Rs. 514.8 crores, respectively, in the two years, whereas the total of consumption expenditure and transfer payments comes to Rs. 663.8 crores and Rs. 459.1 crores in the corresponding years. In the result, the balance of revenue representing the saving of Government administration available for capital formation is only Rs. 61.4 crores in 1957-58, as against Rs. 55.7 crores in 1955-56. That the expected saving on current account in 1957-58 is thus virtually the same as in 1955-56 in spite of the tremendous increase in tax and non-tax revenues, can only lead to the significant (and distressing) conclusion that the increasing tax burdens are meant mostly to cover the increasing consumption expenditure of Government administration. This conclusion is at once a refutation of the contention that increased taxation is intended as a contribution to capital formation in the public sector.

Account 2 shows that the estimated gross sale proceeds of departmental commercial undertakings (like railways, posts and telegraphs and others) in 1957-58 amount to Rs. 446.7 crores, as against Rs. 376.3 crores in 1955-56. On the expenditure side, wages and salaries and commodities and services (including those on account of repairs and maintenance) absorb Rs. 302.0 crores and Rs. 262.9 crores respectively, in the two years, whereas pension payments are Rs. 2.7 crores and Rs. 2.5 crores, respectively. Interest and depreciation account for Rs. 87.7 crores and Rs. 79.5 crores, and profits transferred to the current account of Government administration are Rs. 11.5 crores and Rs. 10.8 crores, respectively, in the two years concerned. On the other hand, the retained profits of departmental undertakings have increased from Rs. 20.6 crores in 1955-56 to Rs. 42.8 crores in 1957-58. This disproportionate increase in the retained profits and the maintenance of the profits transferred to the Government's current revenues at more or less the same level raise the doubt whether it is all meant to justify, in part, the need for additional taxation.

Account 3 dealing with the Capital Transactions of Government administration and departmental commercial undertakings shows that gross savings (composed of saving on current account of administration and retained profits and depreciation provision of departmental undertakings) total up to Rs. 151.9 crores in 1957-58, as against Rs. 122.9 crores in 1955-56 and capital transfers (composed of foreign grants and receipts from steel equalisation fund) account for Rs. 49.9 crores and Rs. 44.7 crores, respectively, in the two years, while the deficit on all transactions in commodities and services and transfers comes to Rs. 313.0 crores in 1957-58, as against Rs. 45.1 crores in 1955-56. On the disbursements side, gross fixed capital formation (through buildings and other construction and machinery and equipment including renewals and replacements) comes to Rs. 387.5 crores in 1957-58 and Rs. 176.7 crores in 1955-56. Grants for capital formation to States, non-departmental commercial undertakings and others total up to Rs. 33.4 crores and Rs. 32.9 crores, respectively, in the two years. Increase in inventories, compensation to displaced persons, etc., account for Rs. 93.4 crores and Rs. 3.1 crores in the two years concerned.

The major findings of the above three accounts and Account 4 are brought together as follows:—

	(Rs. crores)
1. Government consumption expenditure	404
2. Gross Capital formation by Government	464
3. Current transfers to other sectors	260
4. Capital transfers to other sectors	51
5. Financial investments, and loans and advances to other sectors	344
Total	1,523

This total expenditure of Rs. 1,523 crores by the Central Government in 1957-58 excludes the operating expenses of departmental commercial undertakings. The first two expenditure items amounting to Rs. 868 crores represent the total draft by the Central Government on the real resources of the community. Besides the gross Capital formation of Rs. 464 crores directly by the Central Government, there is financial provision (in the other three items of expenditure) for promoting capital formation in the other sectors of the economy through outright grants of Rs. 33 crores, contribution to share capital of companies to the tune of Rs. 79 crores and loans for capital formation of the order of Rs. 295 crores to States. In the result, a total sum of Rs. 871 crores (representing 57 per cent. of the total expenditure of Rs. 1,523 crores) is budgeted for capital formation both directly and indirectly by the Central Government in 1957-58.

THE CHANNEL TUNNEL

SUEZ LINK WITH EUROPE

From Our Own Correspondent

LONDON, *25th May*

LONDON LETTER

AT the bottom of the stock market list has sat for three-quarters of a century the shares of a little company with which stock market gamblers like to have fun. It was called the Channel Tunnel Company: its shares meant nothing in terms of dividend or capital appreciation in the normal sense of the word and they were simply one of Throgmorton Street's toys. A few gold and diamond mining shares and, before the war, a couple of South American railways, among others, kept these shares company as the sort of buy which people got it into their heads to make from time to time and as quickly unloaded when the inevitable rise came. Now the share has acquired a new interest and its prospects of capital appreciation have approached the borders of reality with the intervention of the Suez Canal Company. The latter expropriated from Egypt and looking about for something to do became attracted to the idea of a channel tunnel to link up London and Paris by rail and "talks" have been held between the two Companies.

The Channel Tunnel Company was formed in the early 1870's and, in 1881, the local British Railway Company began to bore a pilot tunnel out to sea from near Dover and the corresponding French Railway Company did the same on its side. Both pilot tunnels were several miles long—they have to start well back from the coast to give a gradual enough slope under the bed of the Channel—and though they have been sealed they are still there. The project was abandoned not for technical reasons but solely for strategic reasons. France in those days was still emerging from the position of Britain's traditional Continental enemy and neither Government liked the idea of a railway line down which the other could hustle a troop train before the alarm could be sounded.

But, with France a firm ally of Britain, the advantages of being able to move troop trains are more apparent than disadvantageous and it is admitted that there is no strategic danger, since there will be plenty of time to thwart a Continental invader either by blocking up the tunnel mouths or by blowing it up if he tried to get through. Since the steamship services are run by the same people who would operate the railway lines, the question of competition does not arise except from the point of view of the air companies, since a through train service would represent an intermediate transit time between the present surface route and the air route. But, of course, the practical advantage of a direct railway link from the point of view of merchandise is enormous and no supporters of a European Common Market can afford not to be enthusiastic about a Franco-British railway line.

There is already a group of Members in Parliament pledged to the idea of a tunnel and the present Prime Minister declared two years ago that he could see nothing against it. The Government might even actively support the project and that thought added to the support of the Suez Canal Company and, it is said, American funds, account for the interest shown in the old Channel Tunnel Company.

It would not be surprising indeed to find the pilot tunnels reopened and a new attempt made to determine the feasibility of the project. This exploratory stage would take about two years and the project itself is thought to be of the order of £100 million. It is one of the anomalies of the London Stock Exchange that the thought of such vast sums can be linked up with the original sponsors of the idea who, in fact, control only the pilot workings themselves. The project could not, of course, be undertaken by the original company which would be lucky to be allowed to become a partner in a new consortium of the interests today concerned. But, on traditional grounds, the Company will no doubt be given a part to play.

The next bull point for the tunnel would be a concrete development on disarmament between America and Russia since that will set more funds free in search of a new job and it is in an atmosphere of international *detente* that such international schemes as this will flourish.

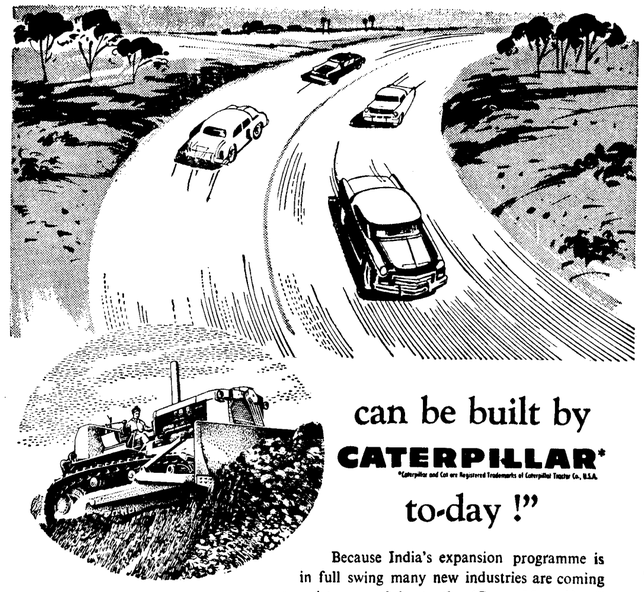
"Our highways of to-morrow...



can be built by
CATERPILLAR*
*Caterpillar and Cat are Registered Trademarks of Caterpillar Tractor Co., U.S.A.
to-day !"

Because India's expansion programme is in full swing many new industries are coming into existence and due to the 'Grow More Food' campaign more food is being produced. More and more goods are being carried by road transport.

To open up new areas, to take care of the increasing traffic, new roads must be built and old roads have to be improved.

Better roads can be built with Caterpillar equipment. You do not save time by stopping the clock. Neither do you save money by buying cheap equipment. Caterpillar equipment will save you both time and money by giving you better output with less downtime and more economical operating costs.

Invariably a first choice among Government engineers and leading contractors, CATERPILLAR will, no doubt, play a leading part in building India's future Highways.

CATERPILLAR* *Paving the way to India's progress*

HOW THE U.S. GOVERNMENT AIDS SMALL BUSINESSES

CREDITS PROVIDED THROUGH BANKS

By Arthur Hachten

DIRECTOR OF INFORMATION SMALL BUSINESS ADMINISTRATION, UNITED STATES GOVERNMENT

CONTRARY to popular belief abroad, the United States is not a nation of "big business." While it is true the nation's large corporations are strong, dynamic, and world-famous for their production and distribution techniques, the fact is that these large concerns are relatively few in number since more than 95 per cent. of all the business establishments in the United States are small.

There are today more than 4 million of these small companies, and the U.S. Government is vitally interested in seeing to it that small business remains strong and healthy. Small business has always been the backbone of the American free enterprise system, since it keeps open the door of opportunity for free people of vision and courage, people who want to go into business for themselves.

The U.S. Government recognised that, in this era of unprecedented expansion and industrial change, small business has problems for which the Federal Government should help provide solutions. That is why, in recent years, the U.S. Government has set up specific programmes in its various Departments and Agencies to assist small business.

More recently, under President Eisenhower, there has been created a special Cabinet Committee on Small Business comprised of seven officials of Cabinet level rank headed by the Chairman of the President's Council of Economic Advisers. This Committee constantly studies the problems of small business and makes recommendations directly to the President of measures that should be undertaken either by the Legislative or the Executive Branches of the Government to help small businesses get started and grow.

Typical of the recommendations that the Committee has made, and which the President already has put into motion, are those dealing with taxes, reduced paper work, competition, financial assistance, help in obtaining Government purchases of goods and services, technical management aids, and others.

An Independent Agency

The most significant action taken for helping small business, however, was the establishment by Congress, upon recommendation by President Eisenhower, of the Small Business Administration (S.B.A.). This is the first comprehensive peace-time agency devoted wholly to small-business problems and is an independent agency under the general direction and supervision of the President.

When the Congress established the Agency by enacting the Small Business Act of 1953, it had this to say:

"The essence of the American economic system of private enterprise is free competition. Only through full and free competition can free markets, free entry into business, and opportunities for the expression and growth of personal initiative and individual judgment be assured. The preservation and expansion of such competition are basic not only to the economic well-being but to the security of this nation. Such security and well-being cannot be realised, unless the actual and potential capacity of small business is encouraged and developed.

"It is the declared policy of the Congress that the Government should aid, counsel, assist, and protect, insofar as it is possible, the interests of small-business concerns, in order to preserve free competitive enterprises, to insure that a fair proportion of the total purchases and contracts for supplies and services for the Government be placed with small-business enterprises, and to maintain and strengthen the overall economy of the Nation."

A more recent indication of the present Administration's interest in the welfare of small business is contained in the following quotation from one of President Eisenhower's message to Congress:

" ... An integral part of efforts to foster a strong and expanding free economy is keeping the door of opportunity open to new and small enterprises, checking monopoly, and preserving a competitive environment.

"In the past year, the steady improvement in the economic health of business has reinforced the vitality of our competitive economy. We shall continue to help small business concerns to obtain access to adequate financing and to competent counsel on management, production and marketing problems.

"Through measures already taken, opportunities for small-business participation in Government procurement programmes, including military procurement, are greatly improved. The effectiveness of these measures will become increasingly apparent. We shall continue to make certain that small business has a fair opportunity to compete and has an economic environment in which it may prosper."

Besides the S.B.A., numerous other committees, departments, and agencies are concerned with problems of small business and are actively helping small businesses in many ways. These include the various committees of Congress, the Departments of Commerce, Labour, Justice, Defence, and Treasury, and such independent Federal agencies as the Housing and Home Finance Agency, the Securities and Exchange Commission, and the Federal Trade Commission.

Types of Assistance

The Small Business Administration has four principal types of assistance available to small firms:

1. Counseling with credit problems and helping them to obtain adequate financing and reasonable rates;
2. Providing them advice and assistance in solving management and production problems;
3. Providing financial assistance at low interest rates to owners of homes and businesses damaged by tornadoes, floods, hurricanes and other natural catastropes, and
4. Helping small concerns to get a larger share of the Government's purchases of goods and services.

In making business loans to small firms, the S.B.A. works closely with local banks, and this type of co-operation has been most successful. Through 1956 it had approved more than 5,000 loans to aid small firms.

Two-thirds of these loans have been made in co-operation with private banks. These are called "bank-participation" loans—the bank puts up part of the funds, and the Government puts up part.

The objective is not merely to help the proprietor of a small firm get a single loan that he needs, although that is important, but also to help these proprietors to establish a line of permanent credit in their home towns. That is why so much stress is put on bank-participation loans.

Recently, the Small Business Administration announced a new loan plan tailored to the term financing needs of the small retailer, wholesale distributor, and service establishment.

These concerns usually have limited tangible collateral which they can pledge for a loan. On the other hand, they may have a good earnings record, competent management and a reputation with local banks for meeting obligations satisfactorily.

Under this new plan, five-year loans can be made to very small establishments which need additional funds for expansion, modernisation, acquiring new fixtures, acquiring parking facilities, adding a second location, purchasing adequate inventory, or other purposes.

Educational Courses

The Small Business Administration's second major activity is assistance with management and production problems of small-business concerns. The programme in this field is largely an educational one designed to help a business man fill in the gaps in his knowledge and experience, and acquire a better grasp of overall business administration—in short, to become a more capable executive. As one part of this programme, the S.B.A. is sponsoring small-business administrative management courses in co-operation with leading educational institutions in all parts of the country.

In addition to these courses, the S.B.A. provides small firms, with four series of publications dealing with important management technical, production, and marketing subjects. These are practical, clearly written publications prepared largely by management consultants, university teachers, and other recognised experts in private industry.

The four series cover a wide range of subjects, such as market analysis; budgeting; business insurance; employee selection and placement; building sales volume; reducing operating costs; effective advertising; appeal procedure for income tax cases; record management; and sales forecasting.

The Small Business Administration also has trained specialists in its field offices to assist small firms with particular management or technical production problems. If its specialists cannot supply the answer to a business man's problems from their own training and experience, they seek the answer from other sources—Government agencies, universities, and industrial research groups.

Another and new S.B.A. service has already proved its worth, and holds an even greater promise for the future. It is the Products Assistance Programme. The purpose here is to help small firms develop improved products and develop and market new products. What the Small Business Administration seeks to do in the Products Assistance Programme is to help small firms overcome the great advantages in research enjoyed by larger companies, and to improve the techniques of introducing any new products on the market.

As part of this programme, the S.B.A. is helping small firms draw upon the vast wealth of non-confidential research information which is available from Government agencies, research institutions, trade associations and private industry. Through a Products List Circular, the agency calls the attention of small firms to new ideas, new and improved products, that individuals and business men have developed and would like to have put on the market.

Rehabilitation Loans

The Small Business Administration also makes loans to assist in the rehabilitation of businesses and homes which have been damaged or destroyed by natural disasters, such as storms and floods. This humanitarian function is a very important part of the work of the agency. When natural catastropes occur, the agency quickly opens temporary loan offices in the stricken areas and offer 3 per cent. loans to help in the rebuilding of homes and businesses.

The Small Business Administration's fourth major programme is assistance to small firms in obtaining a fair share of the U.S. Government's orders and contracts for supplies and services. The most important activity in this area is what is called the "joint determination" programme with other Government agencies. Under this programme, the Small Business Administration has assigned representatives to the principal Government purchasing centres in all parts of the country to review their proposed purchases and to determine which orders should be set aside entirely or in part for award to small business. To make it easy for small firms to take advantage of the agency's advice and assistance, the Small Business Administration established 40 field offices to serve small businesses in their own localities.

In order to obtain unbiased opinions and recommendations for continuing to aid small firms, the Small Business Administration has two advisory groups composed of professional and business men from all parts of the country. The two groups—the National Council of Consultants and the National Board of Field Advisers—enable the Small Business Administration to draw upon the advice of owners and representatives of small businesses in every part of the country. Thus, in shaping its programmes, the Small Business Administration has the active assistance and guidance of the very persons whom the programmes are intended to serve. The advisers are appointed by the Administrator of the agency and serve without compensation.

And, finally, the U.S. Government also is serving small business by fostering continued expansion of the national economy, by creating an economic climate which is favourable to the increased growth and prosperity of all business.

The Securities and Exchange Commission of the U.S. reports that the net working capital of American corporations at the end of 1956 reached a record level of $108,000 million, an increase of more than $5,000 million over the end of 1955. The Commission's report did not, however, include banks or insurance companies. The American corporations invested a record of $29,800 million in new plant and equipment last year. This investment has been one of the major factors in keeping the national economy at its high level.

Fifty-nine American universities are helping technical aid programmes in the underdeveloped areas, according to the International Co-operation Administration. The programmes range from the training of Government employees (in the Philippines) to the establishments of a national education system (in Nepal).

A WORLD OF CHANGE MIRRORED IN STATISTICS

REVELATIONS BY U.N. YEARBOOK

THROUGHOUT history, man has measured his fortune, or his misfortune, in relation to the world around him—in relation to the possessions, ability and strength of his neighbour. Today, this relationship, almost everywhere and practically in all fields, is measured by a universal yardstick—in the precise figures of statistics. In fact, much of modern life is guided, if not ruled, by statistics. Before a wage increase is granted, before fresh fields are ploughed, before new merchandise is put on the production line, before a multilateral trade agreement is concluded, the latest statistical tables are consulted.

The present state of the world—economically and socially—is clearly reflected in the *Statistical Yearbook 1956*, prepared by the Statistical Office of the United Nations, in co-operation with the statistical authorities of 151 countries and territories, the specialised agencies of the United Nations and other inter-governmental bodies. The 646 pages of closely printed figures, columns and tables represent the innumerable ingredients which make up our present society. In this volume, the complex relationship between man and his achievements is broken down into hard facts. At a glance it can be determined how long the average person lives, what he eats, reads or learns, what he produces and what he consumes, what resources he has at his disposal, how he travels and where he goes, how he lives and how much it costs him, what produce he harvests and how many trees he fells, whom he trades with, and how his Government balances its budget. It tells him how many people keep their nose to the grindstone—are economically active in statistical terminology—or how many are out of work. To find out whether the average man is better or worse off than before, whether he is producing more or less steel, building more or fewer ships or listening to the radio more than he used to, all he has to do is to look into this or previous editions of the *Statistical Yearbook*. Seven earlier volumes have been produced by the United Nations.

Record Heights

In comparing the trend, the eighth edition of the *Statistical Yearbook* shows that world economic activity in general reached record heights in 1955, higher than in any preceding post-war year and far above the pre-war levels. In that year, the factories and mines of the world, excluding those in the U.S.S.R., Eastern Europe and on the mainland of China, produced about twice as much as in any pre-war year; the railways hauled more than twice as much freight, the ships carried about two-thirds more cargo, and there were over twice as many motor vehicles on the roads as in 1938. Mining and manufacturing were 10 per cent. higher than in 1954. The volume of world exports was about 8 per cent. greater than in 1954 and nearly 60 per cent. more than in 1937. The average world trade prices in 1955 remained substantially the same as in 1954, or rather more than twice as high as those prevailing in 1937. As a result of the rise in prices and in the volume of exports, the value of world exports in 1955, measured in U.S. dollars, was about three and a half times as great as in 1937.

Meanwhile, there are also more people to contribute to the upward cycle of economic activity, and to benefit from it. In 1955, according to the *Yearbook* estimates, the world population was about one-third higher than in 1930 and about one-fifth higher than in 1940.

Moreover, the average man is finding that he is living longer and, in many ways, better than he used to. The *Statistical Yearbook* shows what he produces and eats; how much space he has to live in; how many books he publishes and how many newspapers he reads; whether he is likely to have a radio set and whether his children can enjoy television; and whether he has far to go to find a doctor.

The current issue is more comprehensive than previous volumes. For the first time in recent years, the statistical authorities of Bulgaria, Hungary and Poland have made available data covering a wide range of subjects, and much additional information was furnished by the Central Statistical Office of the U.S.S.R. The number of tables contained in the 1956 edition—187—is the largest ever.

The *Yearbook*, as usual, is bilingual—in English and French. But the language it speaks is universal. In terms of facts and figures, it shows how the world is progressing as a whole, and how regions and nations are doing in relation to each other. Here are some of the highlights and examples of this picture.

Population

Two thousand, six hundred and ninety-one million people. That is the total estimated population of the world according to the latest issue of the United Nations *Statistical Yearbook*. Or rather, that was the estimate for the middle of 1955. It is certainly more by now, because the world population is increasing steadily. In 1920, it was 1,810 million, in 1930 2,013 million, in 1940 2,246 million, and by 1955 it had climbed to a new record—2,691 million people.

Most of the people of the world, in fact more than half of the total, or 1,481 million, live in Asia, excluding the U.S.S.R. However, Europe is the most densely populated, with 83 inhabitants per square kilometre and a total population of 409 million. This is more than four times the average for the whole world, which is 20 inhabitants per square kilometre. Asia comes next in density with 55 persons per square kilometre. Oceania has by far the smallest population—14.6 million—and also the most elbow room, as every person has half a square kilometre to himself. The figures for the other continents are: Africa, 223 million with seven persons per square kilometre, and North and South America, with a total of 366 million inhabitants and a population of nine to the square kilometre.

Agriculture and Livestock

The increase in the population of pigs, sheep and cattle, since before the war, is just about keeping up with the increase in the human population—about 20 per cent. The pigs have made the most headway, having advanced by 32 per cent. Cattle has increased by 24 per cent. Next come sheep and asses, by 16 per cent. On the other hand, horses and mules are lonelier. The horse population has fallen by 19 per cent. This reduction reflects the rapid "industrialisation" of agriculture—the widespread replacement of draught animals by motor vehicles and tractors.

If you cannot sleep and want to count sheep, go to Australia where there are more of them than anywhere else—15 per cent. of the world total, and 18 per cent. more than before the war. The U.S.S.R. is also a good place to count sheep, with 14 per cent. of the world total. There are more sheep in the world than any of the other domesticated animals listed—a total of 884,000,000 in 1954-55.

But the cattle population is not far behind—with 855,000,000 head, most of them, relatively in the United States. When it comes to breeding cattle, the U.S.S.R. and the Chinese mainland share the second place, with 8 per cent. each.

The largest population of pigs, by far—87,920,000—is to be found on the Chinese mainland. The U.S.S.R. appears to come second, and the United States a close third, but this is not quite clear, because the Soviet census was taken before slaughter, and the United States figures were compiled after slaughter time.

The horses were less lonesome in the U.S.S.R. than anywhere else. Twenty-one per cent. of them were to be found there in 1953-54. In Brazil, which came next, they were not too hard up for company either.

And here are some examples of the rate of change in various countries and regions. The livestock population in the Soviet Union has increased considerably since 1941. The cattle stock went up by 23 per cent., pigs by 90 per cent., sheep by 56 per cent. Some of these increases may be due to a change in reporting dates. On the Chinese mainland, there were 17 per cent. more cattle and buffaloes in 1955 than in 1952 and 36 per cent. more sheep and goats, but 2 per cent. fewer pigs. Of the European countries listed, about half had more cattle than before the war, and nearly all had more pigs but fewer sheep. The United States increased its head of cattle by 46 per cent. since 1939, whereas the population of horses fell by 72 per cent., sheep by 39 per cent. and the number of pigs by one per cent.

The world—not counting the U.S.S.R.—produced more wheat in 1955 than in any post-war year, except 1952 and 1953, and 28.1 million metric tons more than on the average in the immediate pre-war years. Four countries—Canada, the United States, France and Turkey—accounted for more than 60 per cent. of the increase since before the war. Canadian wheat crops since 1951 have been about twice as large as the pre-war average crop, except in 1954. The 1955 United States wheat crop was smaller than in any preceding post-war year. Nevertheless, it was about one-third greater than the pre-war average. Turkey is now producing about twice as much wheat as before the war, but the post-war wheat crops of Argentina have generally been around or even below the pre-war average.

The world maize—or corn—crop, again excluding the U.S.S.R., was some 36.2 million metric tons above the pre-war level, in 1955. The United States, where the 1955 crop was more than half as large again as before the war, accounted for just over 80 per cent. of the total world increase. On the other hand, Argentina's post-war maize crops have been running around one half of the pre-war average, as a result of which Brazil has now replaced the Argentine as the second largest producer of maize. Yugoslavia, Europe's largest pre-war producer, reaped 17 per cent. less maize in 1955 than before the war, while Hungary harvested 26 per cent. more.

Rice production has been stepped up appreciably in recent years, and in 1955 exceeded the pre-war average level by 32 per cent. or 48.8 million metric tons. Most of this increase is attributable to larger crops on the mainland of China, but smaller increases were also registered in India, Thailand, Japan, Pakistan and Brazil. In Burma, Cambodia, Laos, Viet-Nam and South Korea, the 1955 rice crop failed to reach the pre-war level.

The potato crop throughout the world—excluding the U.S.S.R.—was small in 1955, 9 per cent. less than the post-war record in 1954, and about 1½ per cent. less than the average 1934-38 crop.

Milk Production

Milk is one of the most important of all commodities, and, for 1955, the world production of all milk—from cows, goats, buffaloes and sheep—is estimated at nearly 260 million tons, as against 220.5 million tons before the war, an increase of 18 per cent. This does not include the U.S.S.R. Of the 1955 total, cow's milk accounted for nearly 90 per cent., and of this, in turn, the United States produced almost one quarter.

As compared with the 1934-38 average, the production of cow's milk in 1955 was up 30 per cent. in the United Kingdom, 23 per cent. in France, 18 per cent. in the United States, 15 per cent. in Canada, 14 per cent. in the Netherlands and 8 per cent. in Switzerland, but it was 10 per cent. below the pre-war level in Sweden and 3 per cent. lower in Denmark. Japan's small production of milk in 1955 was nearly 3½ times higher than before the war. Italy raised her milk production by almost one half between 1937 and 1954. In 1955, West Germany produced 14 per cent. more cow's milk than in 1938, and East Germany 3 per cent. more. But Poland produced 4 per cent. less, and Czechoslovakia's output of cow's milk in 1955 was about 20 per cent. lower than in 1936.

The Wool Clip

With more sheep to shear, there is also more wool on the world market. The 1955-56 clip, excluding the U.S.S.R., amounted to about 1,925,000 metric tons of wool—more than in any of the preceding 20 years, and around 17 per cent., more than in the year 1938-39. Australia—by far the world's largest wool producer—had a record clip, 42 per cent. more than before the war. The U.S.S.R., which is not included in the world total, was the second largest wool producer in 1955-56, with 252,000 metric tons. Among the other large producers, Uruguay raised its output by 60 per cent. between 1938-39 and 1955-56, New Zealand by 41 per cent. and the Union of South Africa by 17 per cent. The United States was the world's second largest wool producer before the war, but its production has since drastically declined. Although there has been some recovery since 1951, the United States clip last year was 32 per cent.

(*Continued on page* 1167)

WORLD WOOL SITUATION

CONSUMPTION OF CARPET WOOL IN U.K. FALLS

A STRIKING feature of the world wool situation during the calendar year 1956 was the setback in the pace of rising trend of carpet wool consumption, in contrast to the increase in consumption of apparel wools almost everywhere. This is attributed principally to the recession in the United Kingdom carpet industry, thanks to the simultaneous contraction of domestic and overseas markets. The deliveries of British wool carpets and rugs during the 12 months ended November 1956 aggregated only 40.5 million square yards, as against 45.0 million square yards in the previous year, representing a fall of 10 per cent. Exports were severely curtailed, owing to import restrictions in Australia and New Zealand, the chief overseas outlets, while the domestic market was affected by more stringent hire-purchase regulations and competition from cheap imported carpets. Consequently, the intake of wool by spinners of woollen carpet yarns in the U.K. was as low as 49.0 million lbs. (clean basis), a drop of 15 per cent. over the figure of 57.8 million lbs. for 1955.

The reduction in British consumption of carpet wool has largely offset the effect of expanding activity in the other main carpet manufacturing countries. The production of woollen and mixture carpets in the U.S. rose to nearly 64 million square yards, the highest figure since 1953 and 8 per cent. above the 1955 output. A corresponding increase was recorded in carpet wool consumption which reached 143.7 million lbs. (scoured basis), as compared with 132.6 million lbs. There was a further improvement in carpet production in France, where the record output of 4.7 million square yards was 9 per cent. higher than the 1955 figure. The Belgian carpet industry also reported increased activity. It must, however, be noted here that the high usage of cotton in Belgian carpets makes it difficult to relate its intake to wool requirements.

Rise in Supplies Small

The net effect of the aforesaid changes was only a small increase in carpet wool consumption in 1956. The rise in the available supplies of carpet wool was also very small. Although the world production of non-apparel wools is said to have risen by 21 million lbs. to 1,057 million lbs. (greasy) in 1955-56, very little of this represents an addition to carpet wool supplies. The bulk of this increase occurred in the communist group of countries which together account for nearly a third of the entire non-apparel wool output, and hardly any of their wool comes into world trade. Of the remainder, some quantity is used in the producing countries for wool textile manufacture, despite its coarse character, and some quantity is too tender to be suitable for carpets, leaving only a small proportion of the total non-apparel wool available to Western carpet manufacturers. As in recent years, their principal raw materials in 1956 were crossbreds and low wools from Argentina, East Indian wools, U.K. hill wools, and a variety of wools from the Middle East and North Africa, supplemented by substantial quantities of New Zealand crossbreds.

Wool in India

The production of wool—consisting mainly of carpet qualities—in India during 1955-56 is estimated by the Commonwealth Economic Committee at 72 million lbs., same as in the previous season, although some trade sources say that supplies were larger than in 1954-55. The Government of India felt that the quantity available was more than had originally been expected and, therefore, raised the export quota for the second licensing period of 1956. Incidentally, the quota system is designed to safeguard supplies for the domestic wool textile industry by limiting exports to the quantity by which production is expected to exceed the industry's requirements. For the April-September 1956 period, shipments by established exporters were restricted to 35 per cent. of their best half-year's exports since 1951, instead of the 45 per cent. allowed in the previous licensing period. The cut in quota evoked protests from traders who complained that the stocks were in excess of the permitted quota. As a sequel to these complaints, the Government restored, for the October 1956-March 1957 period, the quota to 45 per cent., with an additional provision for new exporters to enter the trade. Exports of Indian wool during 1956 aggregated 35.06 million lbs. (actual weight of washed wool, representing nearly 49 million lbs. greasy), as against 28.18 million lbs. in 1955. There were larger shipments to both the principal destinations, the U.K. and the U.S. Russia, which was not a significant purchaser of Indian wool formerly, also bought more.

The re-exports of imported wool from India during the nine months ended September 1956 amounted to only 2.6 million lbs., as against 3.8 million lbs. in the corresponding period of 1955. Of this, 1.6 million lbs. went to the East European countries. No shipments were made to the U.K., normally the leading buyer. The fall in re-exports was due to the smaller supplies of "East India" wools. Receipts of Tibetan wool at Kalimpong were less, and it is said that a large portion of last year's clip was taken up by China. Of the Tibetan wool actually reaching India, little appears to have gone to the usual destinations; the Communist countries were the leading buyers of Tibetan wool, while the Indian blanket mills were the main buyers of greys.

Wool production in Pakistan in the past season is estimated at 32 million lbs. (greasy), which is the same as in the previous season. Exports during the first nine months of 1956 were lower at 17.1 million lbs. (actual weight of washed wool, equivalent to roughly 25 million lbs. greasy), as against 20.3 million lbs. in the same period of 1955. The decline was largely the result of reduced offtake by the U.K.

In West Asia

Carpet wool supplies in West Asian countries during 1956 are estimated to have been slightly larger. Production in Iran is placed higher by 2 million lbs. at 41 million lbs. and in Iraq by 1 million lbs. at 34 million lbs. The output consists mostly of coarse wools. It is, however, not known whether the rise in production was followed by any additional exports.

As the increase in the aggregate supplies of traditional carpet wools in recent years was only small, not being in keeping with the rise in the demand for such wool, substantial quantities of New Zealand crossbreds have come to be used in carpet manufacture. Some of the cheaper types such as locks has long been regarded as carpet material, but, in recent years, appreciable use has been made of wools normally considered as apparel types. The growing use of New Zealand wool in carpets is clearly indicated by figures relating to duty-free imports into the U.S. During the first three quarters of 1956, these imports aggregated 14.2 million lbs., more than double the imports for the comparable period of 1955. Another indication of the extent to which apparel wools are used in carpets is provided by the quality analysis of wool consumed by the British spinners of woollen carpet yarns. In 1956, no less than 31 per cent. was of qualities 46s and finer, notwithstanding decline in carpet yarn production.

The carpet wool markets ruled fairly quiet during the year 1956, in contrast to the "animated competition" and sharply rising prices noted in the apparel wool markets. It is stated that the price movements at Liverpool auctions might have been more marked but for the high prices which prevented a notable fall during the spring sales. In contrast to the practice adopted at most wool auctions, it is stated to be usual for sellers at Liverpool to set reserves very close to prices they wish to receive, with the result that a weakening of demand leads to withdrawals of lots which fail to reach these limits rather than result in sales at lower prices. Withdrawals were particularly heavy at the March auction in 1956 and, at each sale, only a small proportion of the offering was sold. Turnover was, therefore, very much restricted, being a little over 16,000 bales, two-thirds of the figure for 1955.

MANUFACTURE OF "SARIS"

In the small news item pertaining to the Textile Commissioner's circular on restrictions on the manufacture of *saris*, published in our issue of 25th May 1957 (*vide* page 1036), a mistake had crept in. It was stated there that the mills might manufacture, without applying for prior permission of the Textile Commissioner's Office, *saris* with a border or borders of more than 3" but not exceeding 5½" in width. This is wrong. The correct position is that the mills can manufacture *saris* with a border or borders of more than ¾" but not exceeding 2½" in width.

ARTIFICIAL TEXTILES IN FRANCE

PRODUCTION AND EXPORTS RISE

AMONG the numerous sectors of French economy which have registered notable expansion of late, the artificial and synthetic textile industry stands out prominently. The industry has taken a solid upswing in the last few years, despite the many difficulties besetting it. In 1955, France produced 112,769 tons of artificial textiles, as against 106,734 tons in the preceding year (representing an increase of nearly 6 per cent.), 93,000 tons in 1953 and 77,000 tons in 1952. Of this output, fibranne (twisted thread textiles) accounted for 55,839 tons and rayonne (filament thread textiles) for 56,930 tons. The increase in fibranne output during 1955 over 1954 was 8 per cent., while that in rayonne production was only 3 per cent. and applied mainly to high-strength thread. Stocks of twisted thread and filament textiles were larger at the end of 1955 than twelve months previously.

In general, sales increased to the same extent as production. The French domestic market absorbed 38,053 tons of fibranne and 38,920 tons of rayonne during 1955. The total of fibranne sales (acetate or viscose thread) rose by 3 per cent. as compared with 1954. These sales are distributed among the various types of artificial tertiles in approximately the same proportions during the last two years. The greatest increase took place in the wool industry (12,385 tons in 1955, as against 11,401 tons in 1954, or an increase of 984 tons), whereas the sales of schappes decreased appreciably from 1,055 tons in 1954 to 209 tons in 1955. Deliveries of rayonne increased by 1,168 tons, from 37,752 tons to 38,920 tons. For the whole of the traditional textile industry, the sales of filament thread increased by only 493 tons, whereas those of dry-process rayonne alone were higher by 675 tons at 13,106 tons, as against 12,431 tons in the preceding year.

The export markets on the whole have been favourable to French artificial textiles, although detailed figures show weakness at some points. Direct exports of rayonne were 14,612 tons in 1955 which compare favourably with 13,860 tons in 1954, or a rise of 5 per cent. Of this total, Asia took 7,541 tons, as against 5,490 tons, and Africa and Australia 2,567 tons, as against 2,196 tons. Sales to European and American countries and the French overseas territories, however, decreased; Europe from 3,745 tons to 2,927 tons, America from 694 tons to 310 tons, and the French overseas territories from 1,735 tons to 1,266 tons. Exports of fibranne were distributed more evenly and increased much more substantially. During 1955, shipments amounted to 15,453 tons, as against 12,917 tons only in 1954, which represent a rise of 20 per cent. Africa and Australia quadrupled their purchases (851 tons in 1955 and 201 tons in 1954). American countries bought 50 per cent. more, the quantity involved being 11,927 tons as against 8,095 tons in 1954. The United States alone imported 11,275 tons of French fibranne, as against 7,047 tons, representing a rise of as much as 60 per cent. The overseas territories also raised their orders from 688 tons to 781 tons. Exports of artificial fibres to European countries, however, dropped from 3,199 tons to 1,473 tons. To these exports should be added foreign sales of artificial threads and yarns which amounted to more than 16,000 tons.

The expansion of the synthetic textile industry continues, as will be seen from the figures given below:

	In tons
1950	1,880
1951	2,900
1952	3,300
1953	5,630
1954	7,635
1955	11,800

The modernisation and enlargement of factories producing Rilsan, Crylor, Tergal, Nylon, Rhovyl, etc., have permitted an increase of 46.5 per cent. in production during 1955 as compared with 1954.

In the domestic market, French producers delivered 10,489 tons, comprising 6,930 tons of filament thread and 3,576 tons of twisted thread; in 1954, domestic sales of synthetic textiles amounted to only 6,417 tons. Export markets also showed their favour for French synthetic textiles. Export tonnage rose from 4,799 tons valued at 6,277 million francs in 1954 to 5,447 tons valued at 9,151 million francs in 1955. The increase was 24 per cent. in the case of quantity and 45 per cent. in the case of value. The exports of millinery fabrics and articles have more than doubled; thread filaments and fibres have gained 70 per cent.

CONCERN OVER CONDITIONS IN COTTON INDUSTRY

POOR PROSPECTS FOR SMALL WEAVERS

From A Special Correspondent

MANCHESTER LETTER

MANCHESTER, 28th May

ONLY the unlikely event of a sudden switch in Government policy towards imports seems capable of averting the prospects of arrivals of foreign cloth into Britain outstripping the quantity of Lancashire textiles shipped abroad. Last month, less than 1,000,000 square yards separated the totals. The quantity of cotton cloth despatched abroad was 37,633,000 square yards, while the volume of imports was 36,694,000 square yards. Overseas trade as a whole in April showed little variation as compared with recent returns and, during the first four months of the year, shipments of piecegoods at 157,889,000 square yards are within 300,000 square yards of last year's total. Nor is there any significant change in the destinations, with Australia still the largest consumer at 22,979,000 square yards and South Africa a close second at 20,739,000 square yards.

Some improvement has lately been recorded in yarn exports, the quantity of cotton yarn being 450,000 lbs. higher this year, at 13,308,525 lbs. Australia has been mainly responsible for this recovery, taking 600,000 lbs. more than a year ago.

More impressive has been the expansion in shipments of rayon and synthetic fibre yarns. To the end of April, the shipments aggregated 16,180,273 lbs., the corresponding exports during the past three years being around 11,000,000 lbs. Australia has increased her takings by nearly 700,000 lbs., but the chief expansion has been in trade with India, which has more than doubled at 3,453,000 lbs.

Export sales in rayon and synthetic fibre cloth, however, have not followed the trend of yarn shipments. In the four months, overseas trade declined by 3,500,000 square yards as compared with last year, at 38,267,000 square yards.

Rising Imports

Arrivals of foreign cotton cloth continued to increase and to the end of April reached nearly 140,000,000 yards, as against barely 100,000,000 square yards in the same period last year. So far, India has supplied 63,460,000 square yards of cotton grey cloth, as against 46,279,000 square yards, and Japan's share has increased from 11,480,000 square yards to 18,677,000 square yards.

The anticipated expansion in shipments from Hong Kong has not materialised and arrivals for the four months at 17,568,000 square yards are only slightly higher than in 1956. Imports from unspecified sources, however, have already exceeded 20,000,000 square yards against only 7,500,000 square yards 12 months ago.

After The Mission

Sir David Eccles, President of the Board of Trade, is to be asked to receive "as soon as possible" the Lancashire cotton delegation which last week returned from Pakistan. This was decided in Manchester after the seven members of the delegation, which was led by Sir Cuthbert Clegg, had reported for nearly two hours to the Cotton Board Joint Consultative Committee. It was stated that official comment on the visit will be withheld until after the meeting with the President, but a member of the committee said: "The position is grave. Only political action can now save the industry."

Sir David will hear a first-hand report on the outcome of talks with Pakistan cotton leaders which Lancashire hoped would pave the way to voluntary limitation of cloth exports to this country by Pakistan and also by India and Hong Kong, which were visited by the same delegation in January.

According to the reports from Karachi the Pakistan representatives said that they could not agree to limit cloth exports to this country, because of balance of payments and other difficulties. Hong Kong has also refused.

Cotton Pay Claim

A demand for higher pay for 245,000 Lancashire cotton spinning and weaving workers was submitted to the employers' organisations this week. The executives of the nine unions involved in the application took only half an hour to decide on the amount of the claim at a meeting in Manchester. They had before them the report of a six-man committee set up to recommend on pay policy and the advisability of seeking compensation for mill workers who become redundant through mills closing down.

Sir Alfred Roberts, General Secretary of the Cardroom Amalgamation, said after the meeting that it would not be courtesy to disclose the amount the unions were seeking until the application reached the employers. It was later disclosed that the unions had applied for an advance of 7½ per cent. on current earnings. He announced that it had been decided not to pursue, at this stage, the more complex issue of redundancy compensation. "The wage application must have priority," he said.

The last wage increase for cotton workers was in May last year when they were awarded 1*s.* in the £ by the Industrial Disputes Tribunal, after the employers had turned down a demand for 2*s.* in the £ more. Present average weekly earnings in spinning are £10 5*s.* 3*d.* for men and £6 6*s.* 11*d.* for women, and in weaving £10 6*s.* 8*d.* for men and £6 13*s.* 3*d.* for women.

Weavers' Views

Outspoken comment on current conditions in the Lancashire cotton industry is contained in the annual report of the Amalgamated Weavers' Association, the largest trade union representing cotton trade workers. "The structure and outlook of cotton capital will have to undergo radical changes, if we are to maintain, much less improve, our existing position," the report states. "There are in Lancashire many good examples to follow and the need to do so is imperative. That Lancashire has it in her to succeed is beyond doubt. She has suffered grevious blows over the past few decades, but, if the industry is to fight back, it must do so with other weapons than mere words."

Since the 1952 recession and the sharp contraction in the size of the textile industry in this country, several prominent traders have freely forecast an even sharper decline in productive capacity. This has been called the day and age of large combines with the small man struggling to avoid absorption. The Weavers' Amalgamation report is forthright in its belief that more small family units must disappear in the long run.

It has been proved over the years, the report declares that the best of Lancashire's spinning and weaving mills compare favourably with the best in any other part of the world. Citing the reasons for the efficiency displayed in some weaving plants, the report stresses the need for a sound financial structure, with much of the profits ploughed back during prosperous years. It should also be recognised that technical re-equipment is a continuing process and that high machine efficiency is essential. Close contact should be maintained with the customer, plus a willingness to find out precisely what is wanted. The other assets to be cultivated are more market research, attention to design, accurate delivery dates and sound worker-management relationships.

Small Weaving Firms' Future

"It might be argued that all these requisites can be undertaken only by the larger firms with substantial capital reserves," adds the report. "If this be so, then the day of the very small weaving shed is passing. Indeed, if the smaller weaving shed cannot meet modern needs, the sooner they let more efficient firms take over their commitments the better."

An indication of the way in which the bigger combines can finance mill modernisation schemes has been provided by Crosses and Heatons Ltd., the Bolton spinning group. Colonel B. W. Heaton, the Chairman, has stated that, in the past 11 years, about £2,000,000 have been spent on new machinery and re-equipment of existing plant. A further £1,000,000 have been expended on general maintenance of fixed assets and revenue reserves have increased from £184,000 soon after the war to over £1,000,000.

The weavers' survey covers the year to the end of March during which time a marked improvement in trading took place. Three-shift working has been adopted in 12 more weaving firms operating automatic looms and a further six firms using ordinary looms have been given permission to operate a double day-shift system.

Several interesting points are mentioned in the report, including the fact that 1,020 school-leavers in the North-West entered the cotton industry over the Christmas holidays, representing 11.2 per cent. of the total. This compared with 871 or 9.5 per cent. 12 months previously. Another reminder of current events is that the union's membership has shrunk to barely 66,000—lower than at any time since 1892, including the war years.—*All Rights Reserved.*

TRENDS IN WHITE SUGAR SECTOR

CURRENT SEASON'S OUTPUT ESTIMATED AT TWO MILLION TONS

A FAIRLY detailed account of the recent trends in the white sugar sector of the Indian sugar economy is contained in the latest annual report of the Union Food and Agriculture Ministry (Department of Food). The review covers not only developments on the sugar front in the past season—that is, 1955-56—but also an assessment of the outlook for the current season (1956-57). The review has been prepared with a reference to the present official sugar policy. Under this policy, it will be recalled, there is no control on the prices, movement and distribution of sugar, though regulation of releases from factories is being continued. The minimum price of sugarcane crushed in the mills is fixed at Re. 1-7 per maund for gate delivery and Re. 1-5 for deliveries at rail centres.

The aggregate sugar production during the 1955-56 season touched an all-time record of 1.86 million tons, exceeding the previous season's peak output of 1.59 million tons by nearly 300,000 tons. This phenomenal increase in production was rendered possible by the availability of plentiful supplies of sugarcane to the factories, thanks to improvement in cane output and diversion of cane to mills, owing to relatively low price of *gur*. The expansion in sugar output was accompanied by a rise in domestic consumption which in 1955-56 amounted to 1,942,000 tons, as compared with 1,723,000 tons during 1954-55. In view of the sizable increase in sugar production, further purchases of sugar from abroad were stopped. Against contracts entered into during 1954, a quantity of 65,000 tons was imported from foreign countries during the period 1st November 1955 to 31st March 1956.

The Balance-sheet

The sugar balance-sheet for the 1955-56 season is compared below with that for 1954-55:

(In thousand tons)

	1955-56	1954-55
Opening stocks with factories and Government on 1st November	545	113
Production during the season	1,862	1,590
Imports	65	903
Quantity refined from raw sugar	3	62
Total available supply	2,475	2,368
Total offtake during the season	1,942	1,723
Closing stocks with factories and Government on 31st October	533	545

The above figures reveal that the total availability of sugar in 1955-56 was higher by over 200,000 tons as compared with 1954-55. The closing stock with the factories and the Government at the end of the season was more or less maintained at the previous year's level.

The prospects for sugar production in the current season are held out to be bright. The output is estimated at about 2 million tons. This estimate is quite justified, considering the distinctly upward trend in production that has been maintained since the beginning of the season. The total quantity of sugar actually produced in the season upto the end of April 1957 is put at 1,822,368 tons, as against 1,653,000 tons in the corresponding period of 1955-56. Incidentally, it may be noted that the preliminary estimates of the area under sugarcane show an increase of about 16 per cent. over last year.

In the light of good prospects for higher sugar production during the 1956-57 season and in view of the sizable carryover (533,000 tons) from the previous season, the Government of India has permitted exports of sugar. Up to the end of March 1957, over 100,000 tons were sold for export, earning thereby foreign exchange to the tune of Rs. 10 crores. Subsequently, a further quantity of 100,000 tons has been sold, bringing the total to 200,000 tons.

The Food and Agriculture Ministry's report has also indicated the extent to which the expansion scheme for the sugar industry has been implemented. During 1956, 36 applications for the establishment of new sugar mills and 39 applications for substantial expansions in existing units were received. Licences were granted for the setting up of 21 new units, including 14 co-operative mills, and for raising the capacity of 13 existing ones. The additional capacity so far recommended or licensed since the coming into force of the Industries (Development and Regulation) Act 1951 comes to one million tons, of which 638,000 tons are on account of 56 new sugar factories which include 38 co-operative mills. The balance of 362,000 tons, has been licensed for expansion in 67 existing units. Out of the additional capacity licensed since 1953, a further capacity of 250,000 tons is expected to materialise during 1956-57, besides about 100,000 tons which came into production in the previous season. During 1956, the technical officers of the Government visited a number of sugar factories, in order to ensure that no unauthorised expansions were made and to prepare correct estimates of the existing production capacity of the industry.

During the quarter ended 31st March 1957, five applications for new units—all co-operatives—were received and licences granted. The number of applications for expansion received was 12. The total additional capacity licensed in the quarter was 93,000 tons per annum.

Five idle sugar mills applied in 1956 for grant of licences for registration for carrying on the business of existing undertakings. Grant of licences has, however, been recommended only for three of them, and the two other applications are under consideration. One licensee applied for change of location for expanding the new factory; the proposal has been agreed to by the Government.

Central Control

A brief reference may be made to the Central control over the management of some sugar mills. It will be recalled that, in 1955, the working of six mills in U.P. was controlled under section 15 of the Industries (Development and Regulation) Act 1951. The management of five mills was taken over by the Central Government under section 18A of the Act, while directions under section 16 were issued to the sixth one with a view to ensuring smooth working and avoidance of production loss. During 1956, the working of these units was reviewed and Central control over four of them, including one to which directions were issued, is being continued in the current season. Besides, the affairs of another sugar factory in the U.P. were investigated and control over its management was also taken over. The supervisory control under the Essential Commodities Act 1955 has been maintained on a factory in Sugauli (Behar) and another in Bijnore (U.P.).

Referring to the quality control of sugar, the report says that about 726 samples of sugar were analysed during 1956 for grading in terms of Indian sugar standards. Attention of factories concerned was drawn to the incorrect grading done by them, as well as to cases of any shortage in the weight of sugar filled in the bags. The frequent checking, it is claimed, had a salutary effect. This is borne out by the fact that, out of 726 samples, only 11 were found to have been wrongly graded in 1956, as against 98 out of a total of 884 in 1955.

Development Council

The Development Council for sugar industry met twice during 1956. The problems considered by the Council related to introduction of a uniform standard of chemical control and reporting of technical data, export of surplus stocks of sugar, development programme for the sugar industry in the second Five-year Plan, and financial assistance to five research schemes. Six meetings of the various sub-committees were also held for examining the specific problems of the industry. The standard contract form for the sale and purchase of sugar, which had been the source of controversy between the industry and the trade for the past 15 years, has been finalised by the Council. A scheme for making payment for sugarcane on the basis of quality has been devised and this is being tried on an experimental basis in nine factories during the current season. The Council has made recommendations for short-course training at the Indian Institute of Sugar Technology, Kanpur, for unqualified staff employed in the mills and refresher course for the benefit of the qualified staff.

While the review of the trends in the white sugar sector is thus quite comprehensive, the Annual Report of the Food and Agriculture Ministry does not give any details with regard to the *gur-khandsari* sector. All that it says is this: "No control was exercised on price and distribution of *gur-khandsari* during 1955-56,

HX 49

OUTLOOK FOR NATURAL RUBBER

NEXT 50 YEARS EXPECTED TO BE PROSPEROUS

FOR the first time in the history of the rubber industry, the total world consumption of rubber exceeded 3 million tons in 1956. Of this quantity, the share of natural rubber was 1·9 million tons, as in the previous year, and there was no notable surplus of natural rubber. This was due to the fact that the demand for the natural product was so much that consumers were prepared to pay the price necessary to attract the output of the marginal producer. It must be noted, in this connection, that this demand was made at a time when there was a substantial surplus production of synthetic rubber. A closer analysis of the demand consumerwise, however, shows that the demand from communist countries increased by almost 100 per cent., while that from non-communist countries declined. In fact, had it not been for the substantially larger increase in demand from communist countries, it is likely that the natural rubber producers would not have obtained such a good price for their product.

Although there was a fall in consumption of natural rubber by non-communist countries, there was a marked increase in the use of synthetic rubber by these countries, which confirms the impression that, so long as the price of natural rubber stands above that of synthetic, there is an inducement to the manufacturer to use the substitute material. The future of natural rubber, therefore, depends on adequate supply of it at competitive price, which means that the cost of production should be lowered and the output should be increased. The main way of reducing the cost is to increase the yield, which can only be done by more replanting and new replanting of better varieties of rubber trees.

Blessing in Disguise

There are, however, some who, impressed by the rapid advance made by the synthetic rubber, are of the view that the days of natural rubber are numbered. The Chairman of the Rubber Growers' Association, London, Mr. H. T. Karsten, is not one of those who share this pessimistic view. He is, on the other hand, of the opinion that, if the rubber growers show the same enterprise as those who started this industry 50 years ago, a period of great prosperity lies ahead of them. He feels that the advances in synthetic rubber should spur the natural rubber producers to greater efforts on their part. In fact, he considers that the progress of the synthetic rubber is a blessing in disguise to natural rubber. Thus, he says:

"Improvements will, undoubtedly, be made in the quality of synthetic rubber, but it has to be made from raw materials, so that there is a minimum below which its price cannot fall. Many of the cards may be stacked in favour of synthetic rubber, but I believe that we natural rubber producers have got the ace of trumps—we should be able to beat synthetic in price. I believe, also, when I consider the recent decision of rubber manufacturers who are also synthetic rubber producers, to enter the plantation rubber industry, that I am not alone in this view. Of course, we will have our problems. The transition from the present, low-yielding areas to the high-yielding plantations we want will take time. However, as I have indicated, the very existence of our synthetic competitors will benefit us, in that there will be a floor price set for our product. In other words, synthetic rubber will serve to stabilise the price of natural, and there should be a ready market for all that those normally engaged in the plantation industry can produce. There is, in fact, no longer any need to consider artificial measures for stabilising natural rubber prices."

There have, however, been some developments in producing countries, particularly in South-East Asian territories, which make the outlook for natural rubber seem less promising. They are: (1) take-over bids by a few financiers who are not quite experienced in the line, (2) none-too-favourable treatment of foreign capital by Governments of producing countries, many of which have attained self-government in recent years, (3) political unrest which threatens the economy of the countries concerned, (4) talks of nationalisation, and (5) shortage of labour in some countries.

Those who are taking over well established estates are doing so with the object of making a quick profit, with complete disregard for the well-being either of Britain or of the producing countries. They are doing all they can to undermine a great industry, so that they can benefit from liquidating what others have created. The take-over bids are fortunately being strongly opposed on all sides, including labour unions.

So far as treatment of foreign capital is concerned, the Chief Minister of Malaya, the largest rubber-producing country, has given the assurance that there need not be any fear in the minds of those who have invested and those who contemplate investing in Malaya of any Government measure which might endanger their capital. Indonesia, one of the richest rubber-producing countries in the world, has, however, been having political difficulties. Once these political problems are solved, the country's economy will prosper, helped by its rich rubber estates. The threat of nationalisation in Ceylon has, for the time being, been stayed. It is believed that it will be a long time, if ever it happens, before private enterprise in Ceylon is replaced by Government. Borneo suffers from shortage of labour and, until this problem is solved, the replanting programme will continue to be severely handicapped.

Rubber in W. Africa

One encouraging development is the growing interest in cultivation of rubber in West Africa. It is said that the soil and climate are very suitable and the Governments of the various territories are also giving encouragement to companies to carry on planting operations. According to Mr. Karsten, the natural rubber producing industry may well prove as great a benefit to these territories as it has to those in South-East Asia.

Mr. Karsten is of the view that the ultimate success of natural rubber depends, to a large extent, on the joint effort of producers, Governments and labour. So far as the Governments' part is concerned, the Rubber Growers' Association Chairman wants them to take steps, first of all, to ensure peaceful conditions within the territories concerned, so as to ensure the smooth development of the industry. Secondly, they must so align their fiscal policies that excessive taxation by way of export duties or otherwise does not so add to costs of production as to make natural rubber uncompetitive in price with the synthetic and does not hinder the increased rate of replanting and new planting. Mr. Karsten firmly believes that, if all three parties concerned co-operate fully, not only have the natural rubber producers nothing to fear from synthetic rubber competition, but the next 50 years will bring more prosperity for the industry.

The Government of India has restored with effect from the 1st inst., the *status quo ante* in respect of excise duties on tea and coffee. These duties had recently been enhanced through the Finance (2) Bill. The procedure introduced by the Government on 15th May in regard to export of tea not otherwise specified and package tea by manufacturers and exporters other than manufacturers has been cancelled, and the procedure for the export of tea which existed before are now again in force.

The price of tea for the purpose of determining the export duty has been fixed at Rs. 2.47 per lb., as against Rs. 2.41 per lb. in force from 1st May 1957. There is no change in the existing rate of duty of 25 nP per lb.

The Government of Pakistan has made an export allotment of 30 million lbs. (avoirdupois) of tea for the year 1st April 1957 to 31st March 1958.

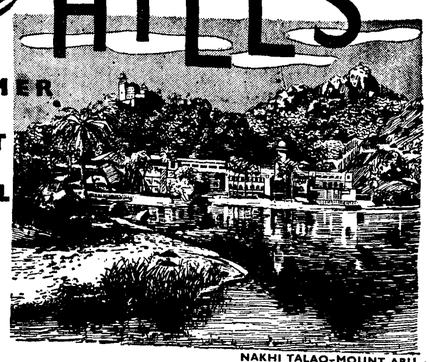
FOR A SUMMER HOLIDAY AT CONCESSIONAL RETURN TICKETS BY RAIL



NAKHI TALAO-MOUNT ABU

THE LAKE, NAINITAL

WARD LAKE, SHILLONG

THE RACECOURSE, OOTACAMUND

Cheap concessional return tickets are issued for I, II and III classes from April 1, 1957 at one and a half single journey fares for the rail portion plus two single journey fares for the road portion wherever leviable, from all stations on the Central and Western Railways to Pathankot, Simla, Solon, Dharampore (Punjab), Dehra Dun, Kathgodam (for Nainital, Ranikhet, Almora and Bhowali), Darjeeling, Kurseong, Shillong, Abu Road (for Mount Abu), Ootacamund, Cooncor, Kodaikanal Road, Kodaikanal Out-Agency, Kotagiri Out-Agency and Pipariya (for Pachmarhi) stations provided the chargeable distance between two stations is 150 miles or more.

- *Tickets will be issued till October 31, 1957.*
- *Tickets are valid for three months from the date of commencement of the journey.*
- *Break of journey allowed on the return trip only.*
- *Full particulars available at all stations.*

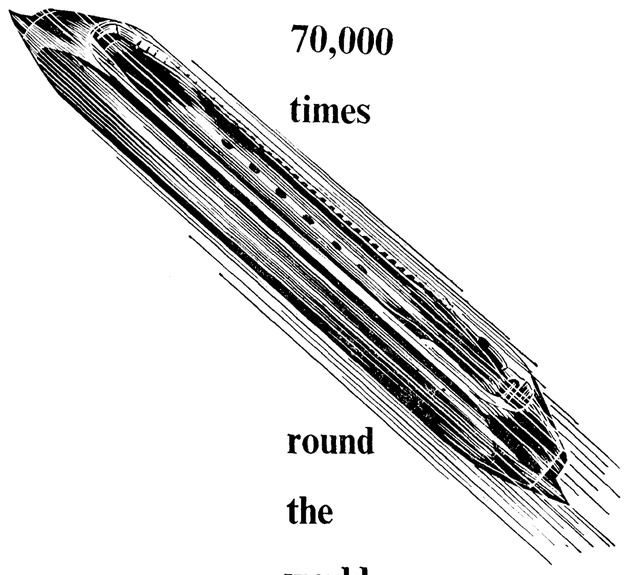
FACTS BEHIND FIGURES

Flying 70,000 times round the world



To and fro fly the shuttles in the 70,000 looms of India's 105 jute mills. Each travelling at a speed of 9,000 picks an hour (the length of a pick averages two yards), these shuttles together cover a distance equivalent to about 70,000 trips round the world, weaving 1,000,000 tons of jute cloth each year. The jute industry is India's most important foreign exchange earner; jute products form over 60% of India's dollar exports. Texmaco, pioneer manufacturer of cotton textile machinery in India, also supplies this important industry with the complete range of jute mill machinery, designed and built to established international standards, in technical collaboration with the world renowned British company, Fairbairn Lawson Combe Barbour Ltd.

FINANCING DEVELOPMENT SCHEMES OF INDIA'S MAJOR PORTS

INTERNAL RESOURCES NOT QUITE ADEQUATE

By M. A. Master

PORTS are the gateways of trade and commerce. They are vital for the security of the country. They strengthen our strategic position. They enable us to broaden our international contacts and to discharge our international obligations. A national Ports Policy, providing all-round efficient facilities such as deep approach channels, adequate jetties and berthing facilities, longer, wider and bigger transit sheds and warehouses, bigger space for dumping cargoes, an efficient flotilla for the handling and manœuvring of vessels and modern equipments to handle cargoes, etc., is essential for the quick turnround of modern ships with greater lengths, wider beams, deeper drafts and faster speed. Moreover, the location and the development of ports should precede the expected requirements of the trades and their handling capacity should always be far ahead of the total quantity of cargoes expected to move through them. The question of the execution of the development schemes of our major ports and the finance necessary for that purpose should be considered and decided from these broad viewpoints for our national reconstruction.

At the instance of the National Harbour Board, the Planning Commission examined and sanctioned the development schemes of our major ports, estimated to cost about Rs. 62 crores, during the first Plan period. They were all, however, not unfortunately executed by 1956. Several new schemes of development have been found quite essential for meeting the needs of the growing trades and for bringing our ports to modern standards of efficiency. The programme for the development of major ports in the second Five-year Plan is estimated by the Planning Commission to cost Rs. 76.4 crores. This includes the cost of the schemes carried forward from the first to the second Plan. The estimated cost of the schemes approved by the Planning Commission has, however, according to reliable information now available from the Port Authorities, substantially gone up since the Plan was published. The figures given below will show the cost, as mentioned in the Plan, and the cost as it is estimated now:

(In crores of rupees)

Port	Figures given in the Plan	Latest estimated figures of the cost	Difference between columns (3) and (2)
Calcutta	19.90	21.60	1.70
Visakhapatnam	Nil	2.72	2.72
Madras	9.20	13.18	3.98
Cochin	4.00	4.02	0.02
Bombay	29.30	37.32	8.02
Kandla	*14.00	*14.00	..
Total ..	76.40	92.84	16.44

* This does not include the cost of constructing two new berths, which was recently sanctioned by the Government.

It will thus be noted that there is a rise of nearly Rs. 16.44 crores, or say 21 per cent. in the estimated cost of the development schemes since the Plan was published.

Crucial Question

The crucial question to be decided is whether it is essential to spend such a colossal sum as Rs. 92 crores during the second Plan period for the expansion and modernisation of our major ports. "A provision of Rs. 40 crores has been included in the Plan for the entire programme relating to major ports" in the second Five-year Plan. The Estimates Committee have, however, pointed out in their Forty-eighth Report that the estimated cost of the major ports development will come to Rs. 81 crores, as against the planned allotment of Rs. 40 crores. The Committee have added that they are given "to understand that Rs. 20 crores will become available from the Port Trust funds, leaving a gap of Rs. 21 crores in respect of development of major ports, which is to be bridged up."

It is understood that, out of the estimated cost for the schemes of the Bombay Port of Rs. 37.32 crores, the expenditure of Rs. 11.30 crores will be incurred in the third Plan. Taking, therefore, the figure of Rs. 81 crores, as indicated by the Estimates Committee, the sum of Rs. 41 crores will have to be found by the ports themselves. Before we examine that vital problem, let us consider whether the execution of the development schemes, as sanctioned, is essential or not, for the growing needs of our trades, for developing an adequate handling capacity of our Ports, and for bringing the ports upto modern standards both in the interest of shipping as well as for promoting national economy.

According to the statistics maintained by the six major ports, the total quantity of cargo handled by them in 1955-56 came to 24 million tons. In addition to this normal trade, the Estimates Committee have pointed out that they were informed by the Ministries concerned that the additional dry cargoes to be carried would come to about six million tons by the year 1958. Further, the expansion of trade in dry cargoes on the coast will come to about three million tons by the end of the second Plan, and the movement of wet cargoes will witness a further rise of about 750,000 tons by 1958. As the movement of cargoes on the coast has to provide handling capacity both at the port of loading, as well as at the port of discharge, the total handling capacity that will be needed will come to about 37.5 million tons. As observed by Mr. Lal Bahadur Shastri, when he was Minister for Transport and Railways, in September 1956, "with the addition of these physical facilities, our port capacity will be increased by nearly 6.75 million tons."

Effect of Piece-rate System

When the piece-rate system is introduced at the six major ports, the handling capacity is expected to go up by 15 per cent. The piece-rate system will obviously be not applicable to the handling of wet cargoes. It will, therefore, be apparent that, with the execution of all the development schemes during the second Plan, and with the increased output of labour, as a result of the piece-rate system, the total handling capacity might reach about 34 million tons. One cannot be dogmatic about this estimate. The handling capacity may be affected by the manner in which the ships arrive at the port. It will also be affected by the manner in which the clearance of cargoes keeps pace with the speed at which the same is discharged. According to the estimates prepared by the Government spokesmen themselves, the handling capacity is not likely to go beyond about 34 million tons as against the handling capacity that would be needed, as shown above, to the extent of about 37.5 million tons. The Estimates Committee have made the following observation, in this connection, in their Forty-eighth Report:

"The Committee are, however, not quite so sure that the anticipated increased facilities at Indian ports will be adequate to meet fully the requirements of increased imports and exports traffic during the second Plan."

The conclusion, therefore, is inescapable that all the development schemes mentioned in the second Plan, must be executed during the second Plan period so that our major ports may be able to handle effectively the cargoes that are expected to move through them to the largest extent possible.

It is of supreme importance that the arrival of ships carrying boat-loads of Government cargoes should be so phased, consistent with the timely and economic carriage of such cargoes to different regions, where they are required, as may avoid congestion of ships at ports, such as we are at present experiencing at Bombay, secure the fullest use of their handling capacity and ensure the quick turnround of ships. A comprehensive and integrated policy of directing —at any rate—chartered ships to call at certain ports for discharge or in case of necessity to divert them to other ports will have to be evolved for making the most economic and efficient use of the available handling capacity of our six major ports. We understand that the Government have appointed a committee to do so. We would strongly urge the association of non-official representatives of shipping interests with this Committee. It is difficult, and perhaps not practical, to bring within the orbit of this policy, the ports of call of the ships of the liner companies. While the impact, therefore, of the movements of such ships on the fullest utilisation of the handling capacity of all ports cannot be fully avoided, we do think that the working of such an integrated policy will make an appreciable contribution for ensuring the maximum possible use of the handling capacity of our six major ports.

Let us now examine the question of finance. As stated above, out of the total expenditure of Rs. 81 crores, mentioned in the Report of the Estimates Committee, Rs. 40 crores will be advanced as loans by the Government and Rs. 41 crores will have to be found by the Port Authorities. It will be interesting to note here as to how the development schemes were financed during the first Plan period. It has been stated by the Planning Commission that "the programme for the development of ports undertaken during the first Plan period is estimated to cost Rs. 62 crores. The details of the programme were finalised late in the Plan period and an expenditure of Rs. 31 crores has so far been incurred against the provision of Rs. 45 crores." It is unfortunate that the figures that were given to the National Harbour Board do not tally with the figures mentioned in the second Five-year Plan. We have, however, based the following figures on the particulars given in the Report of the Estimates Committee and on the information received from the ports:

(In crores of rupees)

Name of the port	Estimated cost of the schemes during the first Plan	Amount actually spent	Amount financed from loans given by the Government	Amount provided by the port
Calcutta	12.07	3.48	3.47	0.01
Vizagapatam	0.88	Not available	*	....
Madras	9.37	1.40	0.60	0.80
Cochin	3.13	0.58	0.58†	Nil
Bombay:				
(a) Marine Oil Terminal	9.86	7.95	7.95	Nil
(b) Other development schemes ..	12.43	2.56	Nil	2.56
Kandla	13.76	Not available	‡	....

* The working of the Vizagapatam Port is entrusted to the Ministry of Transport.
† The port of Cochin is directly administered by the Central Government through an Administrative Officer.
‡ The creation and the development of the Kandla Port is the responsibility of the Central Government.

It will thus be realised that, out of the sum of Rs. 15.29 crores spent by the ports of Calcutta, Madras and Bombay, which are not directly controlled by the Central Government, but are managed by the statutorily created Port Trusts, the sum of Rs. 12.02 crores was financed from the loans received from the Central Government. Bombay alone has financed the development schemes, other than that of the Marine Oil Terminal, from its own resources. It is a fairly good amount that they have spent, which came to Rs. 2.56 crores. The particulars given above will give some indication of the ability of the ports to finance the development schemes in the second Plan from their own resources.

Internal Resources

The Estimates Committee have stated in their Forty-eighth Report that they "are given to understand that Rs. 20 crores will become available from the Port Trust funds, leaving a gap of Rs. 21 crores in respect of development of major ports, which is to be bridged up." They have further added that "the major Port Authorities have been requested to explore the possibility of raising additional funds through their own resources by adjustment of port charges to the extent possible." To find capital expenditure out of revenues, the ports must have substantial surpluses as the result of their working year after year. As a result of the study of the Administration Reports of the five major ports for the years 1950-51 to 1954-55, we find that the total surplus accruing to each of these five ports was as under:—

Name of the Port	Surplus Rs.	Deficit Rs.
Calcutta	..	49,66,297
Vizagapatam	27,31,004	..
Madras	19,91,501	..
Cochin	43,78,563	..
Bombay	3,92,36,145	..
	Rs. 4,83,37,213	49,66,297

The above particulars reveal that the total surpluses of the five major ports came to Rs. 4,33,70,916 during a period of five years from 1950-51 to 1954-55. As Cochin and Vizagapatam are under the control of the Central Government, the policy in regard to the raising of the finance necessary for the development schemes of those ports will be the responsibility of the Government of India. So far as the other three ports—Calcutta, Madras and Bombay—are concerned, they are managed by statutorily created Port Trusts. They had an aggregate surplus of Rs. 3,62,61,349. From what we have stated above, it will be noted that the estimated cost of the development schemes of the three ports of Calcutta, Madras and Bombay will come to Rs. 72.10 crores during the second Plan period. Of this, the amount of Rs. 11.30 crores will be spent by Bombay during the third Plan period. The balance, therefore, of Rs. 60.80 crores will have to be spent by the three ports during the second Plan period. We understand that the Government have tentatively agreed to grant a loan of Rs. 3.60 crores to Madras and Rs. 8.00 crores to Calcutta during the second Plan period. So far as Bombay is concerned, no decision has yet been taken as to how the Government are going to help that port to finance its schemes. As the Government will have to spend Rs. 20 crores for financing the development schemes of the three major ports under their control, the balance left would come to only Rs. 20 crores. It will, therefore, be obvious that the three major ports of Calcutta, Madras and Bombay will have to raise the sum of Rs. 40 crores out of their own resources during the second Plan period. The total surplus of these three ports, as mentioned above, came to only Rs. 3.62 crores during the period 1950-51 to 1954-55. It will, therefore, be next to impossible for them to raise a surplus of Rs. 40 crores during the second Plan period.

No Loans To Be Raised?

It should not be forgotten that the Port Trusts are not commercial organisations. They are not working for profit. As stated by the Estimates Committee, the "policy of the Government is to administer the ports on a self-supporting and a non-profit-making basis. The Port Authorities generally balance their budget by adjusting the dues of vessels and charges for goods." They have to provide economic and efficient services to shipping and trade. That is the fundamental policy which governs the working of major ports in foreign countries. The Port Trusts in India have raised loans in the past to finance capital expenditure. We reliably understand that the Government will not now allow the Port Trusts to raise loans in the market for financing their development schemes. Is it, however, possible for the three ports of Calcutta, Madras and Bombay to raise the sum of Rs. 40 crores, as mentioned above, out of their own resources, to finance their development schemes during the years 1956-57 to 1960-61?

It has been often contended that the present generation must not impose uncalled for burdens on the next generation by spending large sums of money by way of capital expenditure met by creating new debts. Not only is the present generation not imposing any such burdens; on the contrary, it has actually been bearing larger burdens today than could be legitimately imposed on it at present. For example, a careful study of the accounts of the Bombay Port Trust will show that, during the period of the first Plan, that is, from 1st April 1951 to 31st March 1956, the surpluses resulting from the working of the Bombay Port came to Rs. 6,31,05,589. This surplus has been arrived at after debiting the sum of Rs. 4,49,16,758 by way of interest charges, provision for sinking funds and repayment of debts, or provision for the repayment of debts, and the sum of Rs. 2,13,17,010 provided for depreciation and credited to the renewal and replacement fund. It will thus be noted that the present generation is not only repaying the amounts of the loans raised with interest, but it is also providing an amount equivalent to the cost of the asset during the life of that asset. The extent of the sacrifice, so far as the Bombay Port is concerned, will be visualised from the fact that, in addition to the above provisions, the Bombay Port Trust spent a sum of Rs. 4.06 crores from its own revenues to meet the cost of the development schemes and other capital works during the first Plan period. To ask, therefore, the ports to raise their surpluses more than eleven times is a task impossible to fulfil.

Moreover, ports cannot continue to raise their charges on shipping and goods. The serious repercussions of such increasing charges on the ability of the country to sell their goods in the international markets will have to be carefully weighed. While we would, therefore, endorse the suggestion made by the Estimates Committee that "as the major ports require large amounts for development purpose, the Committee would like the Ministry to examine whether it would be practicable for Port Authorities to levy charges in such a manner as to enable them to build up sufficient reserves," we would earnestly urge that the viewpoints mentioned above should be carefully weighed by the Ministry in arriving at the final decision on the subject.

National Harbour Board

It has now been universally recognised that, unless India develops rapidly adequate transport capacity for movement of goods by rail, by road, and by sea, the success of the second Plan cannot and will not be achieved. It is a matter for satisfaction that the Railway Ministry have been making great efforts to increase their transport capacity by raising extra funds by increasing the rates of freight on the goods carried by them. They are also negotiating with the World Bank for securing a substantial amount to meet the needs of the foreign exchange they require. The major ports do not seem to be as fortunate as the railways. They are not able today to handle all the imports and exports as rapidly and as economically as we all would desire. Moreover, no final decision has been taken, so far as we reliably understand, by the Government in determining the question of finance required for the execution of the development schemes sanctioned by the Planning Commission. The first year of the second Plan is over. Two more months of the second year are coming to an end. The problem of finance has not even been examined by the National Harbour Board. That body has been specially constituted for evolving a National Port Policy and for promoting co-ordination and integration between all the ports of the country. It is now more than 18 months since the last meeting of the National Harbour Board was held. One cannot understand why the meetings of such special organisations are not called at regular intervals. We would, therefore, strongly endorse the suggestion of the Estimates Committee that the decision of the National Harbour Board, at its very first meeting, that "the Board shall meet ordinarily once in six months" should be implemented.

Loans From World Bank

The real problem today is that the Planning Commission has agreed to allot Rs. 40 crores towards the cost of the execution of the development schemes of major ports. As pointed out above, it will be next to impossible for the Port Trusts of the three major ports, Calcutta, Madras and Bombay, to raise the sum of Rs. 40 crores from their own internal resources during the second Plan. The crucial question, therefore, is how to find the finance to the extent of Rs. 41 crores for the satisfactory execution of these schemes. They have to be executed. Otherwise, the required handling capacity will not be secured. That will be a tragedy at a time when the tempo of industrial production has been increasing and when the movement of the goods passing through our ports has been rapidly advancing. We do not know what representations have been made by the Transport Ministry to the World Bank, for securing assistance from it for meeting the cost of the development schemes. The answer, however, which was given only a few days ago in the Lok Sabha, that the World Bank has selected for early consideration four projects in India for rendering assistance and that they include the schemes for the development of ports and shipping, inspires the hope that a serious beginning has been made for securing the necessary finance for the development of major ports. We would, therefore, strongly appeal to the Ministry of Transport that they should immediately call a meeting of the National Harbour Board and examine carefully what immediate steps could be taken for finding finance for executing the schemes already sanctioned, and what integrated policy could be adopted for co-ordinating the efforts of the major ports for handling the rapidly increasing quantity of goods moving to and from India, so that the second Plan may not fail.

(*Concluded from next column*)

COVERED ALUMINIUM CONDUCTORS

MANUFACTURE UNDERTAKEN BY "ALINDA"

A PIONEERING effort in the sphere of transmission of electricity is the acting up of a plant for manufacturing covered aluminium conductors which has been installed by the Aluminium Industries Ltd., Kundara (Kerala). The plant went into production on 26th April 1957. The Company, as is well known, is a major manufacturer of aluminium conductors and accessories. Its capacity to meet the growing demand for these conductors will be augmented when its new project at Hirakud, designed to add to its facilities for the manufacture of rods and cables, is completed. Meanwhile, the Company has set up a plant for producing covered aluminium conductors for house service overhead system and indoor wiring purpose.

The manufacture of covered aluminium conductors marks yet another stage in the entry of aluminium into the electrical field dominated so far by copper. The use of aluminium as a conductor of electricity, as such, is not new, but the use of this metal as an insulated conductor is a relatively new development. The Aluminium Industries Ltd. has now undertaken to pioneer this new line of advance made by aluminium. Its excellent electrical conductivity (61 per cent. of copper), relative abundance and reasonable price, it is stated, justify the use of aluminium in insulated conductors. So far as India is concerned, the country is deficient in the supplies of copper, whereas it is fortunately endowed with large natural resources in aluminium ore. This factor makes it imperative that aluminium should be increasingly pressed into service for replacing copper, wherever such replacement could be effected without endangering the ultimate utility to the consumer. The new plant, which was inaugurated at Kundara, is the first of its kind in India, in the sense that, for the first time, aluminium conductors are insulated with a plastic material for use in the tropics. This conductor is expected to replace to a larger and larger extent the rubber insulated copper cables. The plastic material used for insulation is "Polythylene" or "Polythene," a tough, flexible, plastic material, marketed by Imperial Chemical Industries under the trade name "Alkathene."

The covered aluminium conductors plant, now operated by the Company, consists of (1) a wire drawing machine and high speed stranders for making the conductor core from aluminium rods; (2) extruders for insulating with polythene and applying the poly-vinyl-chloride sheathing; (3) testing equipment for continuous testing of the insulated core and a patching equipment for effecting repairs; (4) a taping machine and cotton braiding machines; (5) a compounding equipment for impregnation; (6) an automatic coiling machine; and (7) all the auxiliary and ancillary equipment for handling the cable at various stages and for preparing any reclaimed plastic for reuse. The plant is at present equipped for an annual output of approximately 3 to 5 million yards of covered aluminium cable (in terms of single core output). Aluminium wire received from the cable mill is redrawn to the finer sizes required and annealed to the correct temper. The wire is later stranded into seven strand and multi-strand cable. Polythene insulation is then applied on an extruder and the covered wire cooled off in water. It is then tested on a spark tester where a voltage ranging from 600v. to 10,000v. (depending upon size) is applied. Any weakness in insulation is indicated on the controls, and the machine stops automatically. The precise point of vault is thus located.

The use of aluminium in transmission of electricity is expected to lead to considerable saving in expenditure. In this connection, some interesting calculations were made by Mr. H. K. Ramaswami, Deputy Chief Engineer, the South Madras Electric Corporation Ltd. In the second Five-year Plan, he said, the outlay on electrical expansion would be of the order of Rs. 500 crores. Of this amount, the cost of distribution and services would be about Rs. 200 crores. On a conservative estimate, the portion that would be accounted for by insulated cables, according to him, would be about Rs. 20 crores. The users of electricity would have to spend on internal wiring at least Rs. 40 crores. Thus, the total outlay on insulated cables might be of the order of Rs. 60 crores. Now, on overhead transmission lines, the saving effected by aluminium conductors was of the order of 30 per cent. Assuming that the same percentage held good on covered conductors also, the national saving that could result from the use of aluminium, instead of copper, would be some Rs. 18 crores. Mr. Ramaswami added: "The figures given are rough and I think definitely an underestimate." But this calculation brings out, clearly enough, the importance of the new line of manufacture, undertaken by the Aluminium Industries Ltd., to national economy.

(*Continued in previous column*)

IMPLICATIONS OF EXPENDITURE TAX

CONSIDERABLE MODIFICATIONS WILL BE NECESSARY TO MAKE IT ACCEPTABLE

By Premjus Roy

EXPENDITURE Tax is a new tax included in the Budget proposals recently announced by the Finance Minister of the Government of India. Prof. Nicholas Kaldor first advocated it for England in place of the present tax on income, because in his view expenditure was a better base for taxation than income. The Government in England, however, did not accept Prof. Kaldor's suggestion. Tax on expenditure has not so far been tried in any country in the world, and India is the first country to introduce it.

The Expenditure Tax has not been included in the Income-tax Act, but 'a separate Bill, known as the Expenditure Tax Bill, has been framed for the purpose, because the Expenditure Tax adopts expenditure as the basis of tax, unlike the Income-tax Act which adopts income as the basis for taxation. The proposed Expenditure Tax will supplement, and not replace, income-tax.

The salient features of the Expenditure Tax may now be stated. The tax is chargeable "at the rate or rates specified in the Schedule in respect of the expenditure incurred by any individual or Hindu undivided family in the previous year." An important condition, however, is that no Expenditure Tax is payable by any person in respect of any assessment year if his total income assessable to income-tax under the Income-tax Act during the previous year does not exceed Rs. 60,000. Thus, whatever may be the total expenditure incurred by a person in a particular year, if his income assessable to income-tax in that year does not exceed Rs. 60,000, he will not be liable to any Expenditure Tax. Also, if a person has an income assessable to income-tax of over Rs. 60,000 in a particular year, he will be liable to Expenditure Tax in respect of that year, but, if, in a subsequent year, his income assessable to income-tax falls below Rs. 60,000, he will not be liable to Expenditure Tax in respect of such year.

Assessment Year

The Expenditure Tax Bill is made to commence from 1st April 1958, and the first year of assessment will, therefore, be the assessment year 1958-59, based upon the previous year, namely, the one ending 31st March 1958, or any other date to which the accounts of the assessee will have been made up. If an assessee keeps regular accounts and his previous year for the purpose of his income-tax assessment is taken to be the year ending 31st December, then for Expenditure Tax the chargeable year would also be the year ending 31st December. If, on the other hand, an assessee has different previous years for different sources of income for the purpose of his income-tax assessment, then the previous year with reference to which the expenditure tax would be charged would be the year which expired last before the commencement of the assessment year. For instance, if an assessee adopts the year ending 31st December for his business income, and the year ending 31st March for his interest income, the chargeable year for the Expenditure Tax would be the year ending 31st March.

Only individuals and Hindu undivided families are made liable to the Expenditure Tax, and no other entities such as companies, firms, associations of persons, etc., which form separate units of assessment under the Income-tax Act are made chargeable to expenditure tax. In the case of an Indian citizen, all expenditure, whether incurred in India or outside, would be considered for Expenditure Tax, but, in the case of a person who is not a citizen of India, any expenditure incurred outside India from any funds outside India, would not be considered for the purpose of assessment to Expenditure Tax in India.

The basis of taxation to Expenditure Tax is expenditure, in excess of certain prescribed allowances, incurred by a person during the previous year for which the tax is chargeable. "Expenditure" has been defined as the aggregate of all sums in money or money's worth spent or disbursed by an assessee, and includes certain amounts which, though not incurred by the assessee himself, are required to be included in taxable expenditure. Clause 4 of the Expenditure Tax Bill, which is a very important clause, runs as under:—

"In computing the expenditure liable to tax under this Act, the following amounts shall be included, namely, any expenditure incurred, whether directly or indirectly, by a person other than the assessee in respect of any obligation or personal requirement of the assessee or any of his dependants which, but for the expenditure having been incurred by that other person, would have been incurred by the assessee."

To take an illustration, if the hotel bills or the washerman's bills of the assessee are paid by his employer or some friend, the amounts so paid would be treated as part of the taxable expenditure of the assessee, because the assessee would have had to incur such expenditure if the payment had not been made by the employer or the friend.

Items to be Deducted

There are, however, certain items which are to be deducted from chargeable expenditure. These include business expenses (but not personal expenses) of the assessee, expenditure on immovable property, investment in deposits, loans, shares and securities, capital contribution to a firm in consideration of a share of profits, repayment of borrowed money, gift or donation for the benefit of any other, life insurance premiums paid, and contributions to provident fund or pension fund. Apart from these exemptions, there are also certain other exemptions which include duties and taxes paid to Government or a local authority (subject to certain exceptions) and expenditure on the marriage of any dependant of the assessee upto Rs. 5,000.

Capital expenditure on purchase of jewellery, ornaments, furniture, and other household goods, motor cars and other conveyances or any other article for the personal use of the assessee or any dependant, is spread over a period of five years, and only one-fifth thereof is included in the chargeable expenditure in the year in which it is incurred.

Basic Allowance

Apart from these exemptions, a basic allowance is given which is Rs. 24,000 for the assessee and an allowance of Rs. 5,000 in respect of each dependant. "Dependant" is meant to include in the case of an individual assessee, his son or daughter wholly or mainly dependant on the assessee for support and maintenance, and, where the assessee is a Hindu undivided family, it means every coparcener other than the Karta, and any other member of the family who is entitled to maintenance from the joint-family property. Thus, if an individual assessee has a wife and three children he will be entitled to the basic allowance of Rs. 24,000 in respect of himself and of Rs. 15,000 for the three children at Rs. 5,000 each, and no separate allowance will be given to him for his wife.

This basic allowance is, however, made subject to two conditions. In the case of a dependant who has any separate income, the basic allowance would be reduced by the amount of such separate income. For instance, if the assessee's son has an income of Rs. 2,000 of his own, the allowance in respect of him would be reduced to Rs. 3,000, instead of Rs. 5,000. The second condition is that, if the basic allowance in respect of a dependant will have been allowed to an individual assessee as a deduction from his taxable expenditure, the allowance in respect of the same dependant in the assessment of a Hindu undivided family of which he is a coparcener shall be limited to Rs. 2,000. As an instance, if for a particular child his father has received an allowance of Rs. 5,000 in his individual assessment to Expenditure Tax, then for the assessment of a Hindu undivided family of which that child is a member, the allowance in respect of the child in the case of the H.U.F. will not be Rs. 5,000, but only Rs. 2,000.

The rates of Expenditure Tax prescribed under the Bill are as under:—

"In the case of every individual and Hindu undivided family, on that portion of the taxable expenditure—

	Per cent.
(i) which does not exceed Rs. 10,000..	10
(ii) which exceeds Rs. 10,000, but does not exceed Rs. 20,000	20
(iii) which exceeds Rs. 20,000 but does not exceed Rs. 30,000	40
(iv) which exceeds Rs. 30,000 but does not exceed Rs. 40,000	60
(v) which exceeds Rs. 40,000 but does not exceed Rs. 50,000	80
(vi) which exceeds Rs. 50,000	100"

How It Works

To take an instance, if an individual has two children, and his chargeable expenditure amounts to Rs. 80,000 for the year, then the basic allowance in respect of him would be Rs. 24,000 for himself and Rs. 10,000 for the two children, or Rs. 34,000. His expenditure over the basic allowance of Rs. 34,000 would become liable as under:

	Rs.
First Rs. 34,000	Nil
Expenditure from Rs. 34,000 to Rs. 44,000 at 10%	1,000
Expenditure from Rs. 44,000 to Rs. 54,000 at 20%	2,000
Expenditure from Rs. 54,000 to Rs. 64,000 at 40%	4,000
Expenditure from Rs. 64,000 to Rs. 74,000 at 60%	6,000
Expenditure from Rs. 74,000 to Rs. 80,000 at 80%	4,800
Total Expenditure-tax payable ..	17,800

It will be seen that, if the chargeable expenditure exceeds the basic allowance available to the assessee having regard to the number of his dependants, it does not matter from which source or how the chargeable expenditure was met by the assessee. The assessee may have incurred the expenditure from his capital or from tax-free income, but this will be absolutely irrelevant for purposes of the Expenditure Tax. If the expenditure exceeds the prescribed minimum, it will be taxable, although the expenditure was met, not from income left after payment of income-tax, but from funds belonging to the assessee in India or from funds held by him outside India, or from agricultural income or interest on tax-free securities which are not liable to income-tax.

So far as the method of assessment to Expenditure Tax is concerned, the assessment will be made by the Income-tax Officers along with income-tax assessments. All persons liable to the Expenditure Tax are required to file their returns of expenditure for the purpose of the charge before the end of June every year, and in the case of those who do not file the returns themselves, the Expenditure Tax Officer will be entitled to serve notices for filing the returns, as for income-tax. The Expenditure Tax returns will be checked by the Income-tax Officers in the usual way. For other administrative procedure, i.e., for assessment, recovery, appeals, etc., the provisions under the Expenditure Tax Bill closely follow those of the Income-tax Act. In fact, many of the provisions of the Expenditure Tax Bill are exact copies *mutatis mutandis* of the Income-tax Act.

Having outlined the salient features of the Scheme of Expenditure Tax, let us now consider the more important implications thereof. Prof. Nicholas Kaldor, in his report, had stated that "tax on expenditure is a most potent weapon for inducing economies in personal spending among the well-to-do classes... Luxury consumption is in fact the only part of the national expenditure that could be compressed for the sake of releasing resources for a higher rate of capital accumulation; and a graduated progressive tax on personal consumption is undoubtedly the ideal instrument for attaining this end." The Finance Minister in his Budget speech acclaimed the tax as "a potent instrument for restraining ostentatious expenditure and for promoting savings." In the "Statement of Objects and Reasons" appended to the Expenditure Tax Bill, it is stated that "such a tax, in addition to being a deterrent to excessive personal expenditure and an incentive for savings, also forms a significant part of an integrated tax structure." It is also considered that this tax, like the Wealth Tax, would be a check on evasion of tax, such as is possible under the system of tax on income alone.

Shift in Tax Burden

There is no doubt that the introduction of the Expenditure Tax would result in a considerable shift in the tax burden as between relatively high spending and relatively high saving taxpayers. The tax would certainly have the effect of reducing consumption among the well-to-do classes. It will, however, be difficult to assert that this will give a fillip to the economic growth of the country. Economic growth is tantamount to increased production, and, if there is increased production, there must also be increased consumption, for, otherwise, there will merely be an increased accumulation of the goods produced. The Finance Minister claimed that the Expenditure Tax would not affect the incentive to work and to save, but that the reduced tax on income, coupled with the Expenditure Tax, would encourage more work and saving. The critics of the measure, however, claimed even with greater conviction that the tax would act as a strong disincentive to work. It would appear that the deleterious effects of the tax would not be removed by merely shifting the tax base from a tax on income to the tax on expenditure. The Expenditure Tax supplements, and does not supplant income-tax, and the Government would get very much more money from Expenditure Tax than the little it would lose by a slight reduction of tax on income. The taxpayer would look at all direct taxes from one angle only, namely, how much he has to pay by way of these direct taxes, whether it is by way of tax on income, tax on expenditure, tax on wealth, tax on capital gains or any other tax, and it is not of much consequence for him on what base the tax is levied.

Details of Expenses

One special difficulty about the Expenditure Tax is that people would resent having to give details of their expenses. Generally, people are negligent about, and resent being lectured upon, the necessity of keeping accounts of their expenses. As, Dr. A. R. Prest of Cambridge said, "there is the political problem of whether it is reasonable for the State to require such a degree of information as would be needed from the taxpayer about his activities." Prof. Kaldor realised this objection against the Expenditure Tax, but he suggested that the taxpayer would not be asked to give a direct account of his personal expenses, and the amount chargeable for the Expenditure Tax would be arrived at as a residual after deduction of various items from the receipts. There is, however, no doubt that the Expenditure Tax Officer has the power to ask for details concerning particular items of expenditure, for, without such power, the Tax Officer will not be in a position to check the accuracy of the computed figure of expenditure as shown by the assessee.

The Expenditure Tax would be regarded by the foreigners in India as particularly irksome. Apart from the complete unfamiliarity with the tax, they would resent having to give details of their expenditure to the Tax Officer. Many foreign experts, who would otherwise have agreed to serve in India and assist in the development of the second Five-year Plan, would perhaps be disinclined to do so by reason of the Wealth Tax and the Expenditure Tax. Apart from this, as Dr. Prest of Cambridge observed, difficulties would arise as the Expenditure Tax would operate in India but not in other countries. For instance, people might save heavily for a number of years and then emigrate in order to avoid taxation on their dis-saving.

Social Necessities

Another difficulty which would arise is with regard to agricultural income, which is not taxable under the Income-tax Act. Even agricultural income, if expended above the limit of the basic allowance, would become liable to Expenditure Tax. It is not certain that such levy on agricultural income would be legal or constitutional, but even if it is, the propriety of it is open to question. Yet another difficulty which the Expenditure Tax Bill creates is with regard to certain ceremonial expenses which are regarded as socially necessary or inevitable. Only marriage expenses upto Rs. 5,000 for a dependant of the assessee is exempted under the Bill. The limit of Rs. 5,000 for a marriage is placed too low, particularly having regard to the fact that the class of persons who are likely to be affected by the Expenditure Tax are accustomed and even expected, having regard to their social status, to spend much more on such occasions. Further, marriage is not the only social necessity, and there are other occasions which are deemed equally necessary in the society in which the assessee finds himself, such as birth and death ceremonies, sacred thread ceremonies, annual *pujas*, etc., for which no allowance is given under the Bill. It is conceivable that the effect of the Expenditure Tax would be to bring about a certain change in the spending habits of the well-to-do classes, but spending on ceremonials does not involve personal spending and may be regarded as an act of social benefit. The Expenditure Tax makes an inroad on several social customs and social ceremonies, and it is doubtful how far a taxation measure is justified in attempting such invasion. It appears that the Select Committee will have to make considerable modifications in the Expenditure Tax Bill before it could be treated as reasonably acceptable.—*All Rights Reserved.*

PROVISIONS OF EXPENDITURE TAX BILL

MAIN FEATURES OUTLINED

By R. K. Dalal, B.Com., F.S.A.A., F.C.A.

ALONG with "Wealth Tax," the Government has introduced also the much discussed and debated Expenditure Tax. The object of the Expenditure Tax Bill is to impose an annual tax on personal expenditure, above a prescribed level, of individuals and Hindu undivided families. Such a tax, claims the Government, besides being a deterrent to excessive personal expenditure and an incentive for savings, also forms a significant part of an integrated tax structure.

Expenditure Tax shall be charged for every financial year commencing on and from 1st April 1958, at the rates specified in the Schedule in respect of expenditure incurred by any individual or Hindu undivided family in the previous year.

There is a provision, however, that no Expenditure Tax shall be payable by an assessee in respect of any assessment year if his total income under the Income-tax Act during the previous year does not exceed Rs. 60,000.

The term "previous year" means previous year as defined in section 2 (11) of the Income-tax Act. Where in case of an assessee there are different previous years for different sources of income, the previous year shall be the previous year that expired last before the commencement of the assessment year.

In computing the expenditure liable to tax, the following amounts will be included, namely, expenditure incurred, whether directly or indirectly, by a person other than the assessee in respect of any obligation or personal requirement of the assessee or any of his dependants which, but for the expenditure having been incurred by that other person, would have been incurred by the assessee.

Dependants

'Dependants' means: (i) where the assessee is an individual, a son or daughter wholly or mainly dependant on the assessee for support and maintenance.

(ii) where the assessee is a Hindu undivided family

(*a*) every coparcener other than a *karta*, and

(*b*) any other member of the family who under any law or order or decree is entitled to maintenance from the joint property.

Exemptions

No Expenditure Tax is payable in respect of—

(*a*) Any expenditure, current or capital, incurred wholly or exclusively for purpose of business, not including personal expenditure.

(*b*) Any expenditure incurred in the acquisition or construction of immovable property.

(*c*) Any expenditure incurred by way of investment in current and fixed deposits, loans, shares and securities.

(*d*) Any expenditure incurred by way of contribution as capital to a firm or association in consideration of a share in the firm or association.

(*e*) Any expenditure by way of repayment of any loan or other borrowing.

(*f*) Any expenditure incurred in respect of gift and donation or settlement on trust or otherwise for the benefit of any other person.

(*g*) Any expenditure incurred for paying premium in respect of any policies of insurance on the life of the assessee or any of his dependants in respect of any health, accident or disability policies of insurance.

(*h*) Any expenditure by way of contribution to a provident, thrift or superannuation fund.

(*i*) Any expenditure incurred by an assessee, who is not a citizen of India, outside India, from any income or capital accrued or realised outside India.

Where any expenditure is not wholly and exclusively incurred for purposes specified as above, it shall apply in respect of so much of that expenditure as is reasonably attributable to any such purpose.

Allowances

In computing the taxable expenditure, the following allowances shall be made—

(*a*) Any taxes including Expenditure Tax, cesses or fees paid to Government, but not including fees in respect of any conveyance or movable asset intended for personal use, customs duty on imported articles for personal use, and any fine or penalty in respect of any offence relating to the levy of taxes, duty, etc.

(*b*) Any marriage expenditure of any dependant to the extent of Rs. 5,000 for each dependant.

(*c*) Four-fifths of any expenditure incurred by way of capital expenditure on the purchase of jewellery, ornaments, works of art, furniture and other household goods, motor cars and other conveyances for personal use of the assessee and his dependants.

Where a deduction as aforesaid is made one-fifth of the said capital expenditure shall be deemed to be incurred in each of the four years succeeding and no deduction shall be made in the assessment for any succeeding year in respect of expenditure so deemed to have been incurred in any earlier years.

(*d*) A basic allowance of Rs. 24,000 and a further allowance, if claimed, of Rs. 5,000 in respect of each dependant. If the dependant has a separate income, the allowance shall be reduced by the separate income of the dependant, but not so as to exceed Rs. 5,000 in any case.

Further, where any expenditure is claimed by any individual as having been incurred in respect of any of his dependants and has been allowed as a deduction from his taxable expenditure, the allowance permissible to Hindu undivided family of which the dependant is a coparcener should be Rs. 2,000.

Administration

Expenditure Tax will be administered by the Income-tax Officer having jurisdiction or exercising powers as such under the Income-tax Act in respect of any individual or Hindu undivided family.

The Central Board of Revenue may empower persons to exercise powers of the Appellate Assistant Commissioner of Expenditure Tax and on being so empowered they will function as Appellate Assistant Commissioners for such areas and such class as the Board may direct.

The Board may empower persons to function as Commissioners of Expenditure Tax and on being so empowered, they shall function as Commissioners of Expenditure Tax for such areas and such class of persons as the Board may direct.

The Commissioner of Expenditure Tax may empower persons to act as Inspecting Assistant Commissioners of Expenditure Tax and on their being so empowered they shall function as such.

All Expenditure Tax Officers shall be subordinate to the Commissioner of Expenditure Tax and Inspecting Assistant Commissioner in whose jurisdiction they function.

All officers employed in the execution of the Act shall observe and follow orders, instructions and directions of the Board. No orders, however, will be given to the Appellate Assistant Commissioner so as to interfere with his discretion in the exercise of his appellate functions.

Assessment Procedure

Assessment procedure is analogous to income-tax procedure under the Income-tax Act.

Every person, whose expenditure for the previous year was of an amount rendering him liable to Expenditure Tax, shall, before 30th June of each year, furnish to the Expenditure Tax Officer a return in the prescribed form and verified in the prescribed manner, setting forth the expenditure for the previous year. If the Expenditure Tax Officer is satisfied that the expenditure of any person for a year is such an amount as will render him liable to Expenditure Tax, he may serve a notice on such person to make a return within a period, not less than 30 days, setting forth particulars of expenditure as required in the notice of the previous year.

The Expenditure Tax Officer may, if he thinks fit, extend the date for delivery of the return.

If a person does not furnish a return within the time allowed or furnishes a return in which he discovers any omission or a wrong statement, he may furnish a return or a revision return at any time before assessment is made.

If the Expenditure Tax Officer is satisfied, without requiring the presence of the assessee or production of any evidence, that a return made is correct and complete, he shall assess the taxable expenditure and determine the amount payable as Expenditure Tax.

If he is not satisfied, he shall serve a notice on him, requiring him to attend in person at his office on a date specified or produce evidence on which he relies in support of his return. After hearing such evidence as is produced or requesting such further evidence as he may require, the Expenditure Tax Officer will assess and determine the amount payable as Expenditure Tax by an order in writing.

Whether a person has or has not made a return, the Expenditure Tax Officer may serve a notice on him, requiring him to produce accounts, records or other documents as he may require. If a person fails to comply with the terms of the notice, the Expenditure Tax Officer shall make the assessment to the best of his judgment and determine the amount payable as Expenditure Tax on the basis of such assessment.

There is provision for taxing expenditure escaping assessment. If the Expenditure Tax Officer has reason to believe that, by reason of the omission or failure on the part of the assessee to make a return of his expenditure or to disclose fully and truly all material facts, the expenditure chargeable to tax has escaped assessment, he may take proceedings at any time without any time limitation. If in consequence of any information in his possession, although there is no omission or failure as referred to above, that the expenditure chargeable to tax has escaped assessment for any assessment year, he may take proceedings at any time within six years of the end of the assessment year and assess or re-assess such expenditure.

Penalty for concealment is one and a half times the amount of such tax. Penalty can be levied only with the prior approval of the Inspecting Assistant Commissioner, but the assessee must be given an opportunity of being heard before the penalty is imposed.

Liability in Special Cases

There are provisions, as in the case of income-tax, for liability, in special cases, such as tax of the deceased person, which is payable by legal representative, and assessment of Hindu undivided family after partition.

Appeals, Revisions and References

Appeals, revisions and references are also on the lines of the Income-tax Act. Thus, first appeal will lie before the Appellate Assistant Commissioner within 30 days of the receipt of notice of demand. Then, an appeal to the Appellate Tribunal will lie within 60 days of the date on which the order is served. On any question of law, an appeal can be made to the High Court within 90 days of a reference. Provision for appeal to the Supreme Court is also provided.

Miscellaneous

At any time within four years of the order by the Expenditure Tax Officer, Commissioner of Expenditure Tax, Appellate Assistant Commissioner, Appellate Tribunal, any mistake apparent on the record may be rectified, either on his own motion or at the instance of the assessee.

There is a provision for prosecution for false return. The Commissioner of Income-tax has, however, been given power to compound an offence before or after institution of proceedings.

The Expenditure Tax Officer and other authorities under the Act have been vested with power to take evidence on oath.

Provisions relating to information in return, effect of transfer of authority on pending proceedings, computation of periods of limitation, service of notice, prohibition of disclosure by Expenditure Tax Officer, barring of jurisdiction of Civil Court, appearance before Expenditure Tax Officer, authorities and power to make rules are the same as under the Income-tax Act.

Finally, the Schedule fixes the rate of Expenditure Tax as below.

In case of every individual and Hindu undivided family on that portion of taxable expenditure:

		Per cent.
(i)	which does not exceed Rs. 10,000 ...	10
(ii)	which exceeds Rs. 10,000 and not Rs. 20,000	20
(iii)	which exceeds Rs. 20,000 and not Rs. 30,000	40
(iv)	which exceeds Rs. 30,000 and not Rs. 40,000	60
(v)	which exceeds Rs. 40,000 and not Rs. 50,000	80
(vi)	which exceeds Rs. 50,000	100

PROTECT YOUR VALUABLES

in a Khira steel cabinet!

AS good as a safe, this pleasant-looking cabinet houses all your precious possessions in home or office, and costs remarkably little to buy.

Strong, tamper-proof, and resistant to heat, damp, rust and insects, Khira cabinets are good-looking enough to play an important role in the decoration of your surroundings, too.

They can be fitted with shelves, lockers, pigeon holes, hanging rods or mirror at slight extra cost.

*Perma-finish enamel for lasting lustre

*Three-way locking device for extra safety

*Specially treated sheet steel guards against corrosion and rust

TITANIUM DIOXIDE INDUSTRY

CONTINUANCE OF PROTECTION UNDER EXAMINATION

THE Tariff Commission has taken up for consideration the question of extending protection for five years to the titanium dioxide industry. Protection was first granted to this industry for one year from 1953, when the existing revenue duty was converted into protective duty. Under the Finance Act of 1954, a surcharge amounting to one-fourth of the prevailing duty was introduced as a revenue measure, raising the effective duty from 35.2 per cent. *ad valorem* standard and 25.2 per cent. *ad valorem* preferential to 31.5 per cent. *ad valorem* and 44.0 per cent. *ad valorem*, respectively. An *ad hoc* extension of protection was subsequently granted upto 31st December 1955. This was followed by another inquiry by the Tariff Commission, on the recommendation of which protection was continued upto the end of the current calendar year. The rate of duty was also raised to 44 per cent. *ad valorem* standard and 34 per cent. *ad valorem* preferential.

The demand for titanium dioxide—an important pigment—has been increasing very fast since the last enquiry. The actual sales of the domestic product plus imports during the last three years were 910 tons in 1954, 1,428 tons in 1955 and 1,859 tons in 1956. These supplies were still short of the demand for the product. Estimates of current demand vary widely. As against 1,100 tons of demand, comprising 900 tons of anatase and 200 tons of rutile, estimated by the Commission at the time of the last enquiry, the current demand is placed by the Travancore Titanium Products Ltd. at 2,400 tons. The Development Wing of the Government and Messrs. T. T. Krishnamachari & Co.—who are the sole distributors of the product—have, on the other hand, put the current demand at 2,600 tons and 2,000 tons, respectively.

As against this estimated demand, the Travancore Titanium Products Ltd., which continues to be the sole manufacturer of titanium dioxide in the country, produced during the three years since 1954, 1,369 tons, 1,808 tons and 1,700 tons, respectively. During January-April 1957, however, the production was only 409 tons, or annual rate of 1,236 tons. The company's production has been confined to the anatase variety only. The present capacity of the company is 1,800 tons a year and it has plans on hand to raise the capacity to 3,600 tons a year, half of which is for the production of rutile and the other half for anatase. The expansion plan also includes a plant for the production of sulphuric acid with a capacity of 50 tons a day.

Quality Improved

During the period of protection, the quality of the anatase pigment produced by the Travancore Titanium Products Ltd. has improved considerably, and the consumers continued to show satisfaction on that score. Besides, it is also stated that the special grades of the pigment required by the vitreous enamelware and rayon industries could be met by the industry. In respect of the colour and texture of the product, however, it is found that there is yet much to be done to bring the quality of the product in line with the imported product.

As regards imports of titanium dioxide, licences were being given since 1955 only to actual users on an *ad hoc* basis. Actual imports declined from a level of 285.70 tons, valued at Rs. 7.8 lakhs in 1955, to 239.20 tons of the value of Rs. 7.75 lakhs in 1956. In the months of January and February 1957 imports stood at 30.55 tons, valued at about a lakh of rupees. On the other hand, exports of titanium dioxide amounted to 437 tons in 1954, 663 tons in 1955 and 131 tons in 1956.

It will be recalled that the consideration which weighed with the Tariff Commission in granting protection to the industry in 1953, was the bright future the industry had before it. Consequently, the Commission did not hesitate to recommend even the grant of a subsidy. Since then, the industry has witnessed considerable expansion. The increasing demand for the pigment in various industries, such as paint, rubber, vitreous enamelware, printing ink, rayon, linoleum, soap and textiles has been expanding rapidly and it may even outstrip the contemplated expansion in the capacity. In view of the large deposits of ilmenite in the country—it will be noted that as many as 283,000 tons of ilmenite were exported in 1956, as against a domestic consumption of only 4,000 tons—the future holds bright prospects for the industry. The only manufacturer engaged in this industry, as mentioned above, has prayed for an extension of production for five years.

INDUSTRIAL PRODUCTION

Industrial production in India during 1956 was higher at 7 to 8 per cent. above the level registered in 1955. This rate of expansion is the same as that witnessed in the closing years of the first Five-year Plan. A noteworthy feature was that the increase was shared by most of the major industries.

Among the various industries that witnessed substantial increase in their output, mention must be made of cement (8.9 per cent.) and steel (6.3 per cent.). Another feature was the brisk activity in the engineering industries as a whole, thanks to the growing volume of demand and the increased availability of steel. Many engineering firms, it may be noted here, worked on a multiple shift basis. A large number of applications under the Industries (Development and Regulation) Act was received during the year either for expanding the existing industries or for setting up new undertakings.

A number of other industries also registered notable increase in their output. Chief among them were: automobiles, tyres, diesel engines, electric motor, sulphuric acid, bleaching powder, and liquid chlorine. A matter of special significance in this connection is that certain items like some important dyes and drugs, and certain types of tools were produced for the first time.

The production of cloth by both mills and handlooms increased further during 1956. The monthly average of cloth produced increased from 424.5 million yards in 1955 to 442 million yards. The production of jute textiles, however, was only maintained at the 1955 level. A development worthy of special mention in this connection is that the Government has begun to operate a scheme for the grant of financial assistance to jute and cotton mills for the purpose of modernising their equipment through the National Industrial Development Corporation.

The production of tea, coffee and rubber was also satisfactory; tea production during the year increased slightly from 612.4 million lbs. in 1955 to 664 million lbs. in 1956. Coffee output shot up from 24.948 tons in 1955 to 34,946 tons in 1956.

A noteworthy feature of the industrial progress during the year was that a great deal of attention was given to the new projects envisaged for development in the Plan period. In the case of a number of industrial projects in the public sector, significant progress was noted. In respect of certain others, the National Industrial Development Corporation was used as the agency to make the preliminary technical and economic studies which must precede the execution of the project.

Further, project studies were initiated, and more or less completed, during the year for the following: (*a*) heavy castings and heavy forgings; (*b*) heavy machine building; (*c*) heavy structural works; (*d*) heavy plate and vessel works; (*e*) heavy machine tools; (*f*) alloy and special steels, (*g*) aluminimum; (*h*) synthetic rubber; (*i*) newsprint; (*j*) intermediates for drugs and dyestuffs; and (*k*) cinema and X-ray film.

In the development of small-scale industries the Central Government's responsibility is mainly to define the lines of development, to provide a technical service agency for these industries and to give financial assistance to State Governments for the implementation of the schemes framed. During the year, 14 Industrial Estates were sanctioned, bringing the total to 25. Twenty small Industrial Estates are also being started in consultation with the Ministry of Community Development. Special welfare schemes primarily designed to enable womenfolk of the lower income group to supplement their incomes are being taken up. It is interesting to note that the programme of technical assistance through Small Industries Service Institute and Industrial Extention Centres was continued during the year. Technical training abroad through the assistance of the Ford Foundation will also be given to persons actually working in small-scale units.

The National Small Industries Corporation, set up in February 1955, continued to do useful work and has expanded its activities. Its scheme of hire purchase of machinery has been very popular. It maintains liaison with Government departments and has procured orders for small units in certain items. It is also interested in finding an export market for the products of small-scale industries.

ESTIMATES OF NATIONAL INCOME

"PER CAPITA" INCOME HIGHER

THE national income of India at 1948-49 prices was Rs. 10,420 crores in 1955-56 and Rs. 10,280 crores in 1954-55, as compared to Rs. 10,030 crores in 1953-54, says a Press note issued by the Government. The *per capita* income at 1948-49 prices correspondingly rose from Rs. 268.7 in 1953-54 to Rs. 271.9 in 1954-55 and Rs. 272.1 in 1955-56. This is revealed by the fourth issue of the annual paper on national income just released by the Central Statistical Organisation. The estimates for 1954-55 included in this paper are based on the detailed method of estimation followed for the earlier years and show an upward revision over the preliminary estimates published last year. The estimates for 1955-56 are, however, based on partial material and are subject to revision.

The table below indicates the trend of national income (or net national output) at 1948-49 prices since 1948-49:

Year	Net national output at 1948-49 prices	*Per capita* net output at 1948-49 prices
	(Rs. crores)	(Rs.)
1948-49	8,650	246.9
1949-50	8,820	248.6
1950-51	8,850	246.3
1951-52	9,100	250.1
1952-53	9,460	256.6
1953-54	10,030	268.7
1954-55	10,280	271.9
1955-56 (preliminary)	10,420	272.1

On the whole, during the first Five-year Plan period (1951-52 to 1955-56), the national income in real terms increased by 17.7 per cent., as against the original Plan target of 11 per cent. The corresponding rise in the *per capita* income was 10.5 per cent.

The absence of any pronounced rise in 1955-56 over 1954-55 was mainly due to the fall in agricultural production revealed by the latest available crop figures. The total contribution to national income at 1948-49 prices by 'agriculture' showed a decline of Rs. 50 crores in 1955-56 over 1954-55, as compared with a rise of similar magnitude in 1954-55 over 1953-54. There was no appreciable change in the yearly increase in the overall contribution by other sectors.

Expressed at current prices, the national income stood at Rs. 9,650 crores in 1955-56 and Rs. 9,620 crores in 1954-55, or Rs. 830 crores and Rs. 860 crores lower than the 1953-54 level. The *per capita* income at current prices correspondingly declined from Rs. 280.7 in 1953-54 to Rs. 254.4 in 1954-55 and Rs. 252.0 in 1955-56. The fall in the national income at current prices in 1955-56 and 1954-55 was entirely due to price changes, the national income in real terms having shown a rise in both the years. The level of agricultural prices, in particular, was considerably lower in 1955-56 and 1954-55, as compared with 1953-54 and this also accounted for the sharp decline in the income at current prices originating in the agricultural sector.

As the estimates are presented in the paper in terms of rupees abja (100 crores) corrected upto one decimal place, changes smaller than rupees five crores are ignored. Though there was some progress during 1955-56 in small sectors like 'mining', 'organised banking and insurance', etc., it was not large enough to be disclosed by the figures presented in this paper.

MONTHLY STATISTICS OF FOREIGN TRADE

Several important changes in the foreign trade statistics of India have been made from January 1957 by the Department of Commercial Intelligence and Statistics, Calcutta. In the place of the monthly bulletin entitled *Accounts Relating to the Foreign Trade and Navigation of India*, the new publication entitled *Monthly Statistics of the Foreign Trade of India*, is being issued. The trade classification in use prior to January 1957, provided for the separate specification of only 1,717 items in the foreign trade statistics. The new classification, called "Indian Trade Classification," which provides for the specification of 4,850 articles, is based on the Standard International classification. The basic statistical year is also changed from that of the financial year to calendar year. Further, owing to the change in the classification, the practice of publishing figures for the corresponding periods of the previous two years has had to be given up. Another important change is that, instead of separate statistics for the land, sea and air-borne trade, combined figures for all the three forms of trade are given. It is to be hoped that this welcome change will not result in any undue delay in the publication of the data. Some of the tables, such as those pertaining to overall balance of trade, index numbers of volume and average unit of declared values of exports and imports and summary tables of a number of items, have been omitted. It is likely that these tables may form part of a separate publication. This will be a change for the better, if it means that the public will get this information earlier than it does now.

INDIA-CHINA TRADE AGREEMENT RENEWED

The Trade Agreement between India and the People's Republic of China was renewed on 26th May, following the exchange of letters between the representatives of the two Governments.

The Indo-Chinese Agreement, which was originally signed on 14th October 1954, was valid for a period of two years. Negotiations have been going on for some time past between representatives of the two Governments for the renewal of the Agreement. It has now been decided that with certain modifications the trade relations between India and China should continue to be governed by the provisions of the original Agreement.

These modifications mainly relate to payment procedures and arrangements for conversion of rupees into sterling being effected only through the account maintained by the People's Bank of China with the Reserve Bank of India. These new payment arrangements will come into force with effect from 1st July 1957. The renewed agreement will be valid up to 31st December 1958. Letters were also exchanged for encouraging closer contact and co-operation between Chinese trading organisations and those of India.

INDIA'S BEST TOBACCO CUSTOMER

The first estimate for Indian tobacco acreage for 1956-57 is 826,000 acres—17,000 acres more than the corresponding adjusted estimate for the previous season. The Commonwealth Economic Committee, which gives this figure in its quarterly *Tobacco Intelligence*, says that in Andhra Pradesh alone, which accounts for nearly all the flue-cured output, the area under tobacco has increased from 312,000 to 323,000 acres.

Heavy shipments in the third quarter of 1956 brought the total of exports by sea of manufactured Indian tobacco in April-November 1956 to 80,300,000 lbs.—9,200,000 lbs. more than in the same period of the previous year. Consignments to the United Kingdom, at 29,200,000 lbs., were 5,100,000 lbs., more than a year earlier. Britain, in fact, remained India's best tobacco customer, China being second. In the first quarter of 1957, India bought 42,000 lbs. of cigarettes from Britain—a jump of 15,000 lbs. over the corresponding quarter of 1956.

LIGHTWEIGHT CARS

A leading British manufacturing company (Villiers Engineering Co.) has completed tests on a new two-stroke 250°cc. twin-cylinder engine developed for lightweight three- and four-wheeled cars. This gives the "go-ahead" signal to several all-British miniature car makers who had been held up for lack of a suitable engine, the manufacturers say. Described as one of the most advanced engines of its kind, it incorporates a four-speed gearbox, an electric starter-generator, and a turbo-blower cooling system with twin fans, one on each side of the engine. These blow through an aluminium-alloy cowling which envelops the cylinder and directs a constant blast of cool air to the hottest parts of the engine. Road tests have shown the engine to possess an extremely lively performance, with top speeds of 60 to 65 m.p.h. and cruising speeds of 50 to 55 m.p.h., the manufacturers say. They also claim that the twin silencers completely eliminate the familiar harsh two-stroke exhaust note without detracting from the performance of the unit.

ELECTRO-MAGNETIC PUMPS

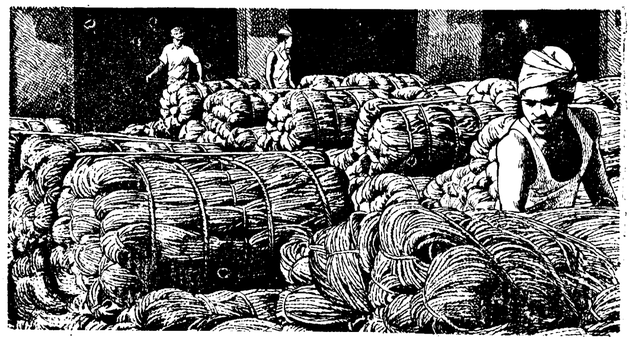
Forty-eight electro-magnetic pumps have been installed to handle the liquid sodium that will extract the heat from Britain's "fast breeder" nuclear reactor at Dounreay, in the north of Scotland. These pumps, operating on the principle of the three-phase induction motor, produce a pumping force wholly by electro-magnetic means. They have no moving parts and no glands. When the liquid metal in the reactor core becomes radioactive, the heat is transferred to secondary liquid-metal circuits—in which the liquid metal is not radioactive—by means of heat exchangers. The primary circuits are heavily shielded. The complete pump operates within a steel tank provided with a vertical access column. Slotted stators carrying a three-phase electrical winding can be lowered down this column and clamped on to the flat pump-tube (which forms part of the liquid-metal circuit) by remote means. This enables them to be replaced without disturbing the hydraulic circuit.

India, with purchases totalling £701,728, was the second largest buyer of British aircraft and æronautical equipment during April. Britain's total sales for the month—valued at £8,474,779—were the fifth highest ever recorded in a single month and almost £750,000 up on April 1956. The largest buyer was Sweden.

British exports of æronautical equipment in the first four months of this year aggregated nearly £33,000,000, of which æro-engines accounted for over a third.

PC-438

How banking serves the COIR INDUSTRY



INDIA is the world's chief producer of coir and coir products, her yearly output being around 130,000 tons. More than half this output is exported, earning about ten crores of rupees in foreign exchange. The coir industry, which is exclusively South Indian, is concentrated in Malabar and Travancore-Cochin, and employs over six lakhs of workers.

Banking has greatly helped in the rapid growth of this industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the coir industry.

We at Palai are proud that so many leading coir goods manufacturers of South India employ the complete banking service we offer.

Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans and Overdrafts — Confidential Credit Reports, etc.

* * *

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI—TRAVANCORE

A LEADING BANK IN SOUTH INDIA

BENGAL COAL'S GROSS PROFIT LOWER

FINANCIAL POSITION SOUND

A SUBSTANTIAL decline in production of coal, accompanied by a steep fall in despatches, labour unrest and last but not least, the Award of the All-India Industrial Tribunal for colliery disputes which came into effect at the end of May 1956, all these have cumulatively contributed to a sizable decline in the earnings of the Bengal Coal Company Ltd. (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) for the year ended 31st October 1956. The gross profit, which had advanced by Rs. 27.53 lakhs, that is, from Rs. 67.80 lakhs for 1953-54 to a high of Rs. 95.33 lakhs for 1954-55, after having fallen from Rs. 73.37 lakhs for 1952-53, has receded by Rs. 10.64 lakhs to Rs. 84.69 lakhs during the year under review. In fact, the fall would have been much greater but for a marked increase in "other incomes" which have nothing to do with the trading for the year.

The lower profit has meant smaller savings for the Company and lower income for the Government. Thus, the provision for depreciation stands lower at Rs. 25 lakhs, having been lowered from Rs. 26.27 lakhs a year ago. Similarly, the provision for taxation and cesses which had been very nearly doubled from Rs. 17.19 lakhs to Rs. 31.45 lakhs in the previous year has been substantially pruned to Rs. 21.37 lakhs. In view of these lower allocations, the net profit is a shade higher at Rs. 33.99 lakhs, as compared with Rs. 32.82 lakhs in the preceding year, and is the best to be seen during the past four years. The maintenance of the net profit at a slightly better level, though not due to satisfactory trading conditions, has enabled the Directors to sustain the transfers to reserves and the dividend account. Accordingly, the reserves, which had received Rs. 13.23 lakhs in the previous year, have been strengthened further by the addition of Rs. 13.69 lakhs. A breakdown of this total shows that general reserve gets Rs. 2 lakhs, reserve against reduction in valuation of stores and coal stocks Rs. 8 lakhs and provision for royalties Rs. 3.69 lakhs. The distribution to shareholders has been maintained at 17½ per cent., to which level it had been stepped up in the previous year from 15 per cent. for 1953-54, by raising the bonus part of the distribution by 2½ per cent. While the return for shareholders has been maintained, it differs in one respect from that for the previous year, in that the bonus part has been merged with the dividend. Thus, the entire return of 17½ per cent. is in the form of dividend. Usually such a change means that the Directors are confident of maintaining the return at the current rate in the years that fall within the foreseeable future. But, in this case, such an inference does not seem to be justified, as trading conditions are not conducive to profitable results. It looks as though the Directors have maintained the dividend more in the hope of better conditions in future than by any rational analysis based on the facts of the situation.

The following comparative table indicates the Company's progress during the past four years:

(In lakhs of rupees)

	For the year ended 31st October			
	1956	1955	1954	1953
Sale proceeds	5,88.33	6,61.77	6,04.15	6,37.82
Other income	44.45	13.69	9.27	16.56
Stocks	13.92	8.63	9.62	19.24
Coal purchases	30.88	46.17	44.20	45.60
Freight, shipping charges, etc.	1,52.39	2,24.26	1,83.53	2,18.13
Mining, establishment and other expenses	3,48.74	3,09.30	3,07.68	3,21.63
Gross profit	84.69	95.33	67.80	73.37
Managing Agents' remuneration	4.33	4.79	3.04	3.61
Provision for—				
Depreciation	25.00	26.27	24.21	23.86
Taxation and cesses	21.37	31.45	17.19	21.05
Net profit	33.99	32.82	23.36	25.35
To reserves	13.69	13.23	7.76	10.00
Dividends—				
4½ per cent. preference	0.66	0.66	0.66	0.66
Ordinary	17.50 (D. 17½%)	17.50 (D. 10% +B. 7½%)	15.00 (D. 10% +B. 5%)	16.25 (D. 10% +B. 6½%)
Directors' commission	..	0.13	0.18	0.17
Carry forward	9.45	7.32	6.07	6.29
	Tons	Tons	Tons	Tons
Raisings	2,320,350	2,509,787	2,341,030	2,353,700
Despatches (including purchased coal)	2,559,083	2,809,167	2,672,529	2,625,340

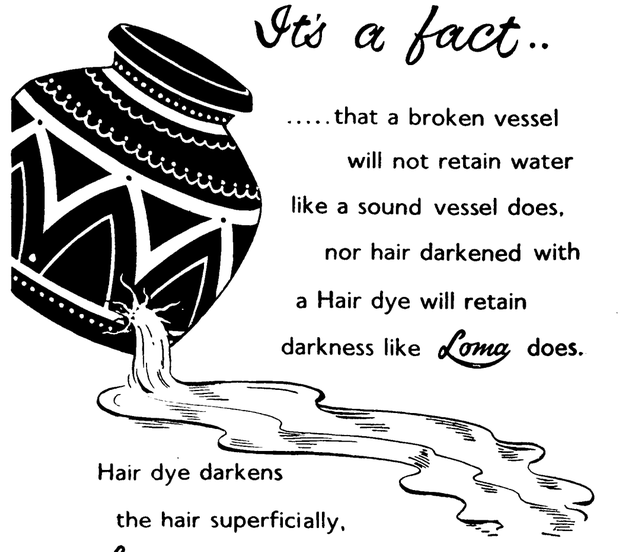
The total of 17½ per cent., it may be noted here, consists of an interim of 7½ per cent. and a final of 10 per cent. The interim dividend was at the rate of Rs. 15 per share of Rs. 200 each. This was paid in October last. Since the close of the year—in February 1957, to be precise—the face value of the share has been reduced from Rs. 200 to Rs. 100 by splitting one share of Rs. 200 each into two shares of Rs. 100 each. The final dividend is, therefore, at the rate of Rs. 10 per share of Rs. 100 each.

The above table reveals that raisings of coal during the year declined by 189,437 tons from that for the previous year; so also, the despatches by no less than 250,084 tons. It will also be seen that the raisings as well as the despatches for the year are the lowest for the four-year period under report. With regard to the first, namely, raisings, the Directors say that production would have been substantially higher but for a strike which affected the Company's collieries in West Bengal for a period of about four weeks from the middle of September 1956. This brought about a serious dislocation in the production of coal. The position became worse when the award of the Industrial Tribunal came into effect at the end of May last, resulting in a substantial increase in the cost of production. This, however, was not followed by any interim increase in the statutory selling price of coal until the beginning of July 1956. Consequently, the Company had to bear the full impact of the Award, without any increase in the selling prices for a period of about five weeks. The fall in despatches of coal, together with an unremunerative selling price, has brought down the proceeds from sale by as much as Rs. 78.44 lakhs. This is also reflected in the stocks which have risen from Rs. 8.63 lakhs to Rs. 13.92 lakhs. Mining, establishment and other expenses are higher by Rs. 39.44 lakhs and this is partly accounted for by the rise in wages of colliery workers, consequent on the award of the All-India Industrial Tribunal for Colliery Disputes. The only welcome feature is the rise in "other income" from Rs. 13.69 lakhs to Rs. 44.45 lakhs. This, the Directors explain, is due to certain credits taken into the profit and loss account "which are unrelated to the trading for the year." They add further that it is only due to these credits that they have, after careful deliberation, recommended payment of the final dividends as mentioned above.

On the outlook for coal industry, the Directors have expressed the hope that, once the issues arising from the decision of the Labour Appellate Tribunal are settled by the Supreme Court and the Committee recently constituted by the Government to revise coal prices complete its work, the industry would be placed on a sounder footing.

The Company's financial position as on 31st October 1956 is strong. Its reserves and surplus aggregate Rs. 169.73 lakhs, as against a paid-up capital of Rs. 120 lakhs, made up of Rs. 20,00,000 in 4½ per cent. (taxable) cumulative preference shares of Rs. 100 each and Rs. 100,00,000 in ordinary shares of Rs. 100 each. The provision for taxation stands at Rs. 19.14 lakhs and that for cesses at Rs. 9.42 lakhs. The current liabilities amount to Rs. 151.99 lakhs. There has been an addition of Rs. 21.01 lakhs to the gross block during the year bringing its total value to Rs. 610.17 lakhs. This has been written down to Rs. 190.43 lakhs. The current assets aggregate Rs. 279.86 lakhs, made up of stores and spare parts Rs. 101.72 lakhs, stocks of coal Rs. 13.92 lakhs, debts, deposits and advances Rs. 136.98 lakhs and cash balances Rs. 14.13 lakhs. The excess of current assets over current liabilities and provision for taxation and cesses is as much as Rs. 99.30 lakhs.

The Rs. 100 fully paid-up ordinary shares of the Company are being currently quoted at Rs. 213 *cum-div.* (final dividend Rs. 10). On an *ex-div.* basis, the shares provide a yield of 8.6 per cent. per annum, free of income-tax. Such a high level of yield on the shares of the best coal company reflects partly the lack of confidence amongst investors in equities, in general, and partly the highly uncertain outlook for coal industry, in particular, thanks to the dog-in-the-manger policy of the Government of India.



MINERVA MAINTAINS DIVIDEND

SMALL IMPROVEMENT IN EARNINGS

ONE encouraging feature of the results of the Minerva Mills Ltd. (Managing Agents: Messrs. N. Sirur & Co. Private Ltd., Bombay) for the year ended 31st December 1956 is that, despite unfavourable trading conditions in the cloth and yarn business, the Company's turnover has made a fairly substantial improvement of Rs. 7.67 lakhs over that in the previous year. Again, it is gratifying that, this improvement is even better than the corresponding rise of Rs. 6.43 lakhs registered in the previous year, when trading conditions were far more satisfactory. The result has been a modest rise in the gross profit from Rs. 6.80 lakhs for the previous year to Rs. 7.13 lakhs for the year under review, in refreshing contrast to the loss of Rs. 1.55 lakhs suffered two years ago.

The net profit at Rs. 2.93 lakhs is, however, slightly lower, as compared with Rs. 3.03 lakhs a year earlier. This is due to the higher provision for depreciation at Rs. 3.59 lakhs, as against Rs. 3.18 lakhs, and a small rise in the commission for Managing Agents from Rs. 59,471 to Rs. 61,208. No provision for taxation has been made as in the past two years. A sum of Rs. 1.12 lakhs has been allocated towards provision for gratuity, as against Rs. 1.05 lakhs. The reserve fund, which had received in the previous year a modest contribution of Rs. 13,678, after a lapse of five years, has again been neglected. But the Directors have transferred a sum of Rs. 49,915 from the labour colony fund to reserve fund; this sum represents the expenditure on construction of quarters for labour during the year under report. The dividend has been maintained at 6 per cent. to which level it had been stepped up in the previous year from 5 per cent. for 1954. But it is still below the 7 per cent. distributed in 1953, the only difference being that the return for that year included a cash bonus of one per cent.

The following comparative table shows the progress of the Company during the past four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1956	1955	1954	1953
Sales of yarn, cloth and waste	1,39.33	1,31.76	1,25.33	1,43.90
Stocks of yarn, cloth and waste	40.96	32.82	32.04	24.79
Cotton, stores, etc., consumed	97.37	83.51	87.30	85.65
Wages and other expenses	43.56	42.94	50.03	42.56
Gross profit (+) or loss (—)	+7.13	+6.80	—1.55	+6.39
Managing Agents' commission	0.61	0.59	..	0.66
Depreciation	3.59	3.18	2.41	3.54
Taxation	..	..	..	0.28
Net profit (+) or loss (—)	+2.93	+3.03	—3.96	+1.93
To provision for bad and doubtful debts	..	..	0.04	..
To reserves	..	0.14	..	..
To provision for gratuity	1.12	1.05	..	..
Transfer from reserves and provisions written back	..	..	5.45	..
Dividend	1.77 (D. 6%)	1.77 (D. 6%)	1.48 (D. 5%)	2.07 (D. 6% +B.1%)
Carry forward	0.20	0.17	0.09	0.12

As stated at the outset, and as will be seen from the above table, the Company's sale proceeds for the year have advanced from Rs. 131.76 lakhs to Rs. 139.33 lakhs. Wages and other expenses have only made a modest increase from Rs. 42.94 lakhs to Rs. 43.56 lakhs, but the rise of Rs. 13.86 lakhs in the cost of cotton, stores, etc., consumed is, indeed, sharp. Naturally, this must have been responsible for the modest rise in gross profit which is not proportionate to the fairly substantial improvement in turnover. To what extent the excise duty has affected the offtake of cloth, etc., can be gauged from the closing stocks which have mounted up by Rs. 8.14 lakhs over the year.

Commenting on the conditions of trading in cloth during the year under review, the Directors in their latest report observe thus:

"Trading conditions during the early part of the year were satisfactory, but with the increase in excise duty on cloth from 1st March 1956, the demand for cloth slackened. The position became worse when there was a further steep and sudden increase in the excise duty which was made effective from 1st September 1956. To facilitate clearances, the mills had to bear half the increase in duty against pending contracts which adversely affected the realisations. Conditions since then have deteriorated to such an extent that profit margins have been practically wiped off and sales in bulk of some of the qualities even at below cost have become very difficult."

The Company's reserves and surplus as on 31st December 1956 amount to Rs. 19.78 lakhs, as against a paid-up capital of Rs. 29.81 lakhs, in shares of Rs. 100 each. The current liabilities aggregate Rs. 85.52 lakhs and provision for taxation Rs. 91,158. The gross block of Rs. 92.42 lakhs, which includes an addition of Rs. 2.85 lakhs during the year, stands reduced at Rs. 39.05 lakhs. The current assets amount to Rs. 96.97 lakhs, having been increased from Rs. 84.20 lakhs a year ago; the increase is mainly accounted for by the rise in stocks of cotton, cloth, yarn, etc., from Rs. 46.07 lakhs to Rs. 58.94 lakhs.

The Rs. 100 fully paid-up shares of the Company are being currently quoted at Rs. 84 *cum-div.* On an *ex-div.* basis, the latest dividend provides a yield of 7.7 per cent. per annum.

Points From The Chair

Government Spending

"ONE important sphere of inflationary pressure has not come within the broad sweep of Mr. T. T. Krishnamachari's measures—the positive influence of rising public expenditure. No amount of restraint on consumption or on credit would be of avail if the magnitude and the pace of Governmental spending is not diminished. The volatile spenders, both State and Central, need to be kept in check under a strong leash if the delicate balance of stability is to be achieved. The distinguished Governor of the Bank of England stated recently that 'the economic machine could not be driven with one foot on the accelerator of public expenditure and the other on the brake of credit restriction.' Mr. Cobbold went on to add that it was not for the Bank to suggest where public expenditure should be cut. That was a political judgment, but it was his prime duty to 'sound warning bells when Government and near-Government spending is putting too heavy a burden on the country's resources.' How true it is of our present economy. We look to the Finance Minister to exercise enough persuasion with his colleagues, so that political judgments conform to dire economic necessity of the moment."

K. C. MAHINDRA,
Mahindra and Mahindra Ltd.

Private Enterprise in India

"Last year and the year before I referred to the difficulty we were finding in determining the place of private enterprise in India's 'socialist pattern of society,' because verbal encouragement was not being matched and, indeed was being contradicted by legislative and executive measures. There were further instances of such measures last year, for example: the seventh amendment to the constitution legalised the setting up of State Trading Corporations to compete with normal private enterprise. The resolution on Industrial Policy, to which I have already referred, deprives private enterprise of the opportunity to develop the country's natural resources except as an instrument of Government. The Finance (No. 3) Act of 1956 contains provisions under which a company cannot qualify for the benefits of depreciation allowances for income-tax purposes unless it deposits a substantial part of its current and accumulated profits and reserves, not represented by fixed assets, with the Reserve Bank of India. Any release of the deposits requires the approval of Government. Each of these measures could directly and adversely affect our business and their cumulative effect is such that it must be taken into account whenever we have to consider investing further capital in India."

SIR KENNETH B. HARPER,
Burmah Oil Co., Ltd.

Gold

"There are important considerations to be borne in mind when investment in gold-mining is weighed against possible alternative forms of investment. Gold is a universally acceptable commodity, the indispensable residual element in the settlement of the balance of payments between countries, and it enjoys an unlimited market at guaranteed prices. International monetary arrangements are today more firmly based on gold than they have been since the Great Depression of the 'thirties. The trials through which the world has passed in the last two decades have given gold a significance it did not possess in less arduous times. A feature of every post-war international crisis to date has been the purchase of gold as a hedge against currency depreciation, and as a means of holding liquid funds in a form less vulnerable to the hazards of war, or possible war, than paper money or bank balances. The period of international tension that has prevailed during the past year as a result of events centering round the Middle East has been no exception. Governments and individuals alike look to gold, when they distrust the strength of their own currencies and the perils of international tension. The gold-mining industry greatly gains from the existence of this unlimited market for its product, but the extent of that gain is affected by one circumstance which is a part of existing monetary arrangements—the fact that the dollar price of gold has remained unchanged since 1934. In the case of other commodities, prevailing monetary conditions, whatever they may be, affect both the selling price of the product and the cost of production. In the case of gold alone, costs of production are free to change, whilst the sale price has remained fixed for over two decades—a period that has witnessed a price revolution. Even though all the gold produced can be sold without difficulty, the fact that the sale price is rigid, places an unfair limitation on the profits derived from gold mining."

SIR ERNEST OPPENHEIMER,
Orange Free State Investment Trust Ltd.

COMPANY MEETINGS AND DIVIDENDS

INDO-BURMA PETROLEUM CO., LTD. Annual General Meeting, Calcutta, 10th June 1957. Dividend: Re. 1.00 per share (final). Transfer books remain closed from 27th May to 10th June 1957, both days inclusive.

BENGAL POTTERIES LTD. Annual General Meeting, Calcutta, 18th June 1957. Transfer books remain closed from 7th June to 1st July 1957, both days inclusive.

BENGAL FLOUR MILLS CO., LTD. Annual General Meeting, Calcutta, 19th June 1957. Dividend: Rs. 2.50 per share (includes interim dividend of Re. 1.12 per share). Transfer books remain closed from 3rd to 19th June 1957, both days inclusive.

TIDE WATER OIL CO. (INDIA) LTD. Annual General Meeting, Calcutta, 19th June 1957. Dividend: Re. 1·25 per share (includes interim dividend of Re. 0.50 per share). Transfer books will remain closed from 10th to 19th June 1957, both days inclusive.

BENGAL COAL CO., LTD. Annual General Meeting, Calcutta, 20th June 1957. Dividend: Rs. 25.00 per share (includes interim dividend of Rs. 15.00 per share). Transfer books remain closed from 6th to 20th June 1957, both days inclusive.

MONOGRAM MILLS CO., LTD. Annual General Meeting, Ahmedabad, 22nd June 1957. Dividend: Rs. 14.00 per share (includes bonus of Rs. 2.00 per share). Transfer books remain closed from 1st to 22nd June 1957, both days inclusive.

VICTORIA MILLS LTD. Annual General Meeting, Bombay, 25th June 1957. Dividend: Rs. 20.00 per share inclusive of bonus. Transfer books will remain closed from 12th to 25th June 1957, both days inclusive.

DUNBAR MILLS LTD. Annual General Meeting, Calcutta, 25th June 1957. Dividend: Rs. 6.00 per share. Transfer books will remain closed from 17th to 25th June 1957, both days inclusive.

COIMBATORE MURUGAN MILLS LTD. Annual General Meeting, Coimbatore, 26th June 1957. Dividend: Rs. 12.00 (12 per cent.) per share. Transfer books will remain closed from 12th to 26th June 1957, both days inclusive.

RAJA BAHADUR MOTILAL POONA MILLS LTD. Annual General Meeting, Bombay, 27th June 1957. Dividend. Rs. 6.00 per share. Transfer books will remain closed from 17th June to 13th July 1957, both days inclusive.

BHARTIA ELECTRIC STEEL CO., LTD. Annual General Meeting, Calcutta, 28th June 1957. Transfer books will remain closed from 14th to 28th June 1957, both days inclusive.

DARJEELING PROPERTIES LTD. Annual General Meeting, Calcutta, 28th June 1957. Transfer books will remain closed from 14th to 28th June 1957, both days inclusive.

PEERMADE TEA CO., LTD. Annual General Meeting, Pathirappally (Kerala State), 28th June 1957. Transfer books will remain closed from 15th June to 1st July 1957, both days inclusive.

HARINAGAR SUGAR MILLS LTD. Annual General Meeting, Bombay, 29th June 1957. Transfer books will remain closed from 22nd June to 6th July 1957, both days inclusive.

RAMNUGGER CANE AND SUGAR CO., LTD. Annual General Meeting, Calcutta, 4th July 1957. Transfer books will remain closed from 15th June to 15th July 1957, both days inclusive.

SHREE NIWAS COTTON MILLS LTD. Annual General Meeting, Bombay, 8th July 1957. Dividend: Rs. 12.00 per share, payable on or after 8th July 1957. Transfer books will remain closed from 10th June to 8th July 1957, both days inclusive.

SHREE DIGVIJAY CEMENT CO., LTD. Annual General Meeting, Sikka, 11th July, 1957. Dividend: Rs. 9.00 per share, payable on and after 11th July 1957. Transfer books will remain closed from 24th June to 6th July 1957, both days inclusive.

SRI VENKATESA MILLS LTD. Dividend of Rs. 12.50 (25 per cent.) per share, for the year ended 31st December 1956. Transfer books will remain closed from 13th to 29th June 1957, both days inclusive.

MALABAR SPINNING AND WEAVING CO., LTD. A tax-free dividend of Rs. 8.00 per share (4 per cent.), for the year ended 31st December 1956. Transfer books remain closed from 1st to 14th June 1957, both days inclusive.

HIGHLAND PRODUCE CO., LTD. A final dividend of Re. 1.37 per share (making a total of Rs. 2.00 for the year) for the year ended 31st December 1956. Transfer books will remain closed from 2nd to 8th July 1957, both days inclusive.

COMPANY REGISTRATIONS

REPETITION PARTS PRIVATE LTD. (First Director: Mr. Kuljasraj Bhatia.) Business: Importers and Exporters. Authorised capital: Rs. 5,00,000. private company. Address: 104-14, Frere Road, Sugar Market, Bombay.

SHAH MINING CO. PRIVATE LTD. (Managing Director: Mr. Amritlal J. Shah.) Business: General mining. Authorised capital: Rs. 5,00,000. Private company. Registered office of the company will be situated in the State of Bombay.

RESULTS OF BENGAL FLOUR QUITE ENCOURAGING

TIDE WATER RAISES DIVIDEND

Bengal Flour Mills Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. Balmer Lawrie & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December 1956.

These accounts have been prepared for the financial year 1956, in accordance with the provisions of Article 86 of the Articles of Association of the Company which, by a special resolution passed on 23rd October 1956, replaced the Original Articles 86 and 87. The accounts have been drawn up in conformity with the provisions of the Companies Act, 1956.

The profit for the year (including items relating to previous years) after providing for taxation and depreciation, was Rs. 5,13,605 (Rs. 3,54,494) to which is added provision for taxation in excess of ascertained liability Rs. 1,46,444 (*nil*) and balance brought forward from 1955 Rs. 76,830 (Rs. 92,336) making a total of Rs. 7,36,879 (Rs. 5,46,830 which includes Rs. 1,00,000 transferred from dividend equalisation fund). Out of this total, the Board paid an interim dividend of 11¼ (15) per cent. on 22nd October 1956, amounting to Rs. 1,35,000 (Rs. 1,80,000). The Board has transferred Rs. 1,46,000 (*nil*) to tax contingency reserve and Rs. 2,00,000 (Rs. 2,00,000) to general reserve, leaving a balance of Rs. 2,55,879 (Rs. 1,66,830) available for distribution, which it is recommended be dealt with as follows:—

To final dividend of 13¾ (7½) per cent. absorbing Rs. 1,65,000 (Rs. 90,000) and leaving a balance to be carried forward of Rs. 90,879 (Rs. 76,830).

The tax contingency reserve has been strengthened to increase the provision for the future tax liability which will arise as a result of the special depreciation allowances on new plant.

From September 1956 onwards, Mills in Calcutta were not permitted to use indigenous wheat and were solely dependent on allocations of imported wheat by Government.

Towards the end of the year measures of restricted flour milling were introduced to overcome the scarcity and high price of residual *atta* in the Calcutta market. In an endeavour to assist the West Bengal Government the Company increased substantially the extraction of residual *atta* resulting in an almost equal reduction of flour. This action contributed greatly towards making *atta* available to the public at reasonable prices.

Considerable new milling plant was installed during the year which has not only improved the quality of the finished products and increased the overall capacity of the Mills, but has enabled the mills to run much more economically and with greater flexibility.

Accounts in brief are as under:—

Rs.	39,53,500	Rs.	39,53,500

Monogram Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Marsden Bakubhai & Sons Private Ltd., Ahmedabad) submit the audited accounts of the Company for the year ended 31st December 1956.

After debiting managing agents' commission Rs. 5,85,995 (Rs. 5,40,887), depreciation Rs. 1,71,952 (*nil*) and providing Rs. 4,50,000 (*nil*) for taxation, the Company has made a profit of Rs. 7,79,503 (Rs. 15,07,628). Adding thereto, the balance of Rs. 19,131 (Rs. 18,517) brought forward from the last year's account, the total profit amounts to Rs. 7,98,634 (Rs. 15,26,145). Out of this amount the directors have made the following appropriations:—

To development and rehabilitation reserve account Rs. 50,000 (*nil*), to gratuity account Rs. 50,000 (Rs. 50,000), to general reserve account Rs. 5,00,000 (Rs. 4,25,000) and to Uttejak fund account Rs. 5,000 (*nil*). The above appropriations leave an available balance of Rs. 1,93,634 (Rs. 2,01,145 after providing Rs. 5,00,000 for taxation) which the directors recommend to dispose of as follows:—

To payment of a dividend at Rs. 12 (Rs. 12) per share and bonus at Rs. 2 (Rs. 2) per share on 13,001 ordinary shares absorbing Rs. 1,82,014 (Rs. 1,82,014) leaving to be carried forward to next year's account Rs. 11,620 (Rs. 19,131).

It was the practice of the Company to value the stocks at below cost while making up annual accounts. However, it was considered advisable to value the stocks at cost or market value whichever would be lower. Accordingly, necessary adjustment was also made in the opening stock as on 1st January 1956. The effect of the revaluation in the opening stock, amounting to Rs. 17,20,778 has been credited to reserve fund of the Company. The directors have also transferred Rs. 6,21,248 from the reserve fund of the Company to the building and machinery depreciation fund account to meet the deficit of the fund. They have also transferred Rs. 2,58,526 from the reserve fund to the development and rehabilitation reserve account, which has been newly created.

During the last quarter of the year under report, a bearish trend prevailed in the cloth market and has particularly affected the prices of cloth manufactured from medium counts. However, the directors believe that inspite of the adverse times, the results of the Company are satisfactory.

The mercerising and singeing machines, which were ordered during the year under report have arrived and have been installed and new varieties of cloth are being manufactured and there are every hopes of taking the best advantage of the said machines. The Mills have 26,228 ring spindles, 1,232 doubling spindles, 528 looms and complete dyeing and bleaching plants.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	26,00,200	Block ...	23,41,936
Reserves ...	33,13,526	Stock-in-trade ...	73,03,267

Rs.	1,36,34,261	Rs.	1,36,34,261

Tide Water Oil Co. (India) Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st October 1956.

The accounts show a profit, after charging all expenses, of Rs. 1,84,154. Provision for taxation after deducting excess provision for taxation in previous years, now written back of Rs. 50,000, amounts to Rs. 23,000 leaving a balance of Rs. 1,61,154. The balance brought forward from last year was Rs. 28,582 making a total available for appropriation of Rs. 1,89,736. The directors have transferred to general reserve Rs. 57,100 and paid an interim dividend of As. 8 (As. 8) per share on 14th August 1956 absorbing Rs. 30,000 (Rs. 30,000). They now recommend a final dividend of 75 (50) Naye Paise [12 (8) annas] per share absorbing Rs. 45,000 (Rs. 30,000) leaving a balance to be carried forward of Rs. 57,636.

While gross sales show an appreciable increase over the previous year, this improvement has been largely offset by the higher prices paid for imported lubricants, consequent on increases in world prices and ocean freight rates.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.

Ahmedabad New Cotton Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Narottam Chandulal & Co., Ltd., Ahmedabad) present the audited accounts of the Company for the year ended 31st December 1956.

The profit for the year is Rs. 3,45,600 (Rs. 5,07,315). After providing Rs. 6,34,778 (Rs. 5,00,000 for depreciation), for depreciation and development and rehabilitation and Rs. 4,50,000 (Rs. 3,85,000) for tax provision, and including the last year's balance brought forward of Rs. 11,921 (Rs. 744) making a total of Rs. 3,57,521 (Rs. 5,08,059). From this sum the directors have transferred to reserve fund Rs 25,344 (*nil*) and to dividend equalisation fund Rs. 75,000 (Rs. 1,80,000) leaving an available balance of Rs. 2,57,177 (Rs. 2,28,059 after placing Rs. 1,00,000 to contingency fund). From this the directors recommend the payment of dividends as follows:—

To dividend at Rs. 5-8 (less income-tax) per share on 4,000 5½ per cent. cumulative preference shares for the year ended 31st December 1956 Rs. 16,225 (Rs. 16,225), to dividend at Rs. 4-8 (less income-tax) per share on 6,000 4½ per cent. redeemable cumulative preference shares for the year ended 31st December 1956 Rs 19,912 (Rs. 19,913), to income-tax free dividend of Rs. 20 (Rs. 30) per share on 10,000 (6,000) ordinary shares for the year ended 31st December 1956 (Rs. 2,00,000 (Rs. 1,80,000) and to carry forward to next year's account Rs. 21,040 (Rs. 11,921).

Further progress was made on mills' reorganisation and renovation programme during the year. A sum of about Rs. 8,78,000 was spent on extension of buildings and installation of new machinery and equipment. The main items covered by this expenditure include two *Schlafhorst Super Speed Cone* and *Cheese Winding Machines*, six *Carding Engines*, one *Rapid Extractor Drier Machine*, one *Stentering Machine*, one *Warp Tying Machine*, extension of the existing dyeing department and new office building During the year, an application was made to the Ministry of Heavy Industries, Government of India for installing additional automatic looms for the manufacture of cotton cloth for export and the licence for installing 96 automatic looms has been granted to us under terms and conditions as laid down in the said licence. The directors hope to finalise orders for the said number of automatic looms, one *Sizing Machine*, 4 *Pirn Winding Machines* and building to house the machineries at an aggregate cost of about Rs. 15 lakhs.

By a special resolution passed at the general meeting of the Company held on the 29th September 1956, a sum of Rs. 4,00,000 being the part of the undivided profits of the Company standing to the credit of the reserve fund was capitalised and 4,000 ordinary shares of Rs. 100 each were issued, which were entitled to dividend from the 1st January 1956, and which ranked *pari passu* in all other respects with the then existing 6,000 ordinary shares of Rs. 100 each. And therefore, the directors have recommended the said dividend for the year in respect of the said shares also.

The installed capacity of the mills is 22,516 ring spindles, 840 doubling spindles and 488 looms with complete dyeing and bleaching plants.

By operation of law, the office of the Managing Agents, Messrs. Narottam Chandulal & Co., Ltd. was due to expire on 15th January 1957. By special resolution passed at the general meeting of the Company held on 29th September 1956, they were reappointed as managing agents for a further period of ten years from 15th January 1957, subject to the approval of the Central Government. The approval of the Government was received by the second week of January 1957, and accordingly they have been so reappointed.

The directors have reviewed the amount as it stood at the end of the previous year at the credit of the depreciation fund and after providing a fair amount under this head at normal rates of Income-tax Act, the balance which represented extra provision of Rs. 5,34,286 made for depreciation for the previous years has been transferred to a reserve to be named development and rehabilitation reserve and the amount of Rs. 15,50,000 standing to the credit of machinery renewal fund has been transferred to reserve fund.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.

Assam Saw Mills and Timber Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bird & Co. (Private) Ltd.) submit the audited accounts of the Company for the year ended 30th September 1956.

The profit and loss account after providing for all charges and making provision of Rs. 1,55,239 (Rs. 1,78,488) for depreciation shows a profit of Rs. 19,015 (loss of Rs. 97,045). From this amount is deducted the debit balance brought forward from the previous year of Rs. 5,14,537 (Rs. 4,17,492) leaving a debit balance of Rs. 4,95,522 (Rs. 5,14,537) to be carried forward.

Despite the somewhat better results which show a small profit after depreciation in place of the substantial losses of recent past years, the directors regret to report that there are no signs of an increased demand for the Company's product.

During the year under review although production increased to 513,964 sets of panels which enabled the better results to be achieved, sales declined from 493,483 sets to 448,173 sets resulting in a substantial carry forward of stock into the current year in which, as already stated, no improved demand for sets of panels has been noticed.

The directors report that both the North-Eastern Frontier Agency and Government of Assam have been most helpful in trying to deal with the transport problem and construction of a road on a new alignment has been authorised.

As the directors have reported on many occasions, indigenous capacity remains heavily in excess of demand and with unapproved panels still finding a market, they cannot view immediate future prospects with any optimism.

Accounts in brief are as under:—

*Reserves are shown after adjusting the loss of Rs. 4,95,522 in the profit and loss account.

Saraspur Mills Ltd.

The directors of the above Company (Managing Agents: Messrs. Lalbhai Dalpatbhai Sons & Co., Ahmedabad) present the audited accounts of the Company for the year ended 31st December 1956.

The profit for the year after providing Rs. 5,41,825 (Rs. 4,10,000 depreciation only) for depreciation and development and rehabilitation and Rs. 11,00,000 (Rs. 9,35,000) for tax provision amounts to Rs. 9,19,166 (Rs. 10,96,276). Adding to this the balance brought forward from the previous year's account of Rs. 22,532 (Rs. 6,169), there is a total of Rs. 9,41,698 (Rs. 11,02,445). From this amount the directors have transferred to reserve fund Rs. 2,95,411 (Rs. 2,00,000), to dividend equalisation fund Rs. 1,50,000 (Rs. 1,50,000), to contingency fund Rs. 50,000 (Rs. 2,00,000) leaving an available balance of Rs. 4,46,287 (Rs. 4,02,445 after placing Rs. 1,50,000 to machinery and building renewal fund). From this the directors recommend payment of a dividend on 6,000 4½ per cent. cumulative preference shares for the year ended on 31st December 1956 (less income-tax) Rs. 19,913 (Rs. 19,913) and payment of a dividend of Rs. 20 (Rs. 30) per share income-tax free, on 20,000 (12,000) ordinary shares for the year ended on 31st December 1956 Rs. 4,00,000 (Rs. 3,60,000) leaving to be carried forward to next year's account Rs. 26,374 (Rs. 22,532).

By a special resolution passed at the general meeting of the Company held on the 29th September 1956, a sum of Rs. 8,00,000 being the part of the undivided profits of the Company standing to the credit of the reserve fund was capitalised and 8,000 ordinary shares of Rs. 100 each were issued, which were entitled to dividend from 1st January 1956 and which ranked *pari passu* in all other respects with the then existing 12,000 ordinary shares of Rs. 100 each. And therefore, the directors have recommended the said dividend for the year, in respect of the said shares also.

The installed capacity of the mills is 36,044 ring spindles and 846 looms.

By operation of law, the office of the managing agents, Messrs. Lalbhai Dalpatbhai Sons & Co., was due to expire on 15th January 1957. By special resolution passed at the general meeting of the Company held on 29th September 1956, they were reappointed as managing agents for a further period of ten years from 15th January 1957, subject to the approval of the Central Government. The approval of the Central Government was received in the last week of December 1956, and accordingly they have been so reappointed.

The directors have reviewed the amount as it stood at the end of the previous year at the credit of the depreciation fund and after providing a fair amount under this head at normal rates of Income-tax Act, the balance which represented extra provision of Rs. 12,47,692 made for depreciation for the previous years has been transferred to a reserve to be named development and rehabilitation reserve, and the amount of Rs. 23,00,000 standing to the credit of machinery renewal fund, the amount of Rs. 2,25,000 standing to the credit of insurance fund, the amount of Rs. 50,000 standing to the credit of bad debts reserve, and the amount of Rs. 2,000 standing to the credit of workmen welfare fund totalling Rs. 25,77,000 have been transferred to reserve fund.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	26,00,000	Block ...	32,59,261
Reserves ...	94,96,663	Stock-in-trade	42,78,527
Provision for taxation ...	19,66,587	Stores and fuel ...	5,95,974
Liabilities ...	25,09,717	Debts, deposits and advances ...	68,99,348
Profit and loss account ...	26,374	Investments	4,16,366
		Cash ...	11,49,865
Rs.	1,65,99,341	Rs.	1,65,99,341

Blackwoods India Ltd.

The directors of the above Company (Managing Director: Mr G. V. Raman, Calcutta) submitted the audited accounts of the Company for the year ended 31st March 1955.

After providing an amount of Rs. 1,10,835, the usual depreciation, the working of the year has shown a loss of Rs. 2,02,670. The year under review was one of difficult trading periods similar to the previous year and in spite of the directors' having taken timely precautions in reducing expenses, the competition was acute resulting in considerable narrowing of profit margins, besides, to a great extent the turnover was also affected on account of import restrictions.

The manufacturing arrangements in respect of partial or wholly manufactured goods and complete assembly of some of the products have to a great extent helped to contribute to the present turnover especially in the Paragon Department where the turnover has been stepped up by over 20 per cent. The steps already taken by the directors in reducing expenses in two of the major items, viz., distribution and export expenses and establishment charges have together contributed to a reduction of over Rs. 6,70,000. By these and other means, the directors are taking every possible step to enable the Company to adjust itself to the new conditions especially the unavoidable setback generally caused by the conversion of a trading Company into a manufacturing Company.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	16,87,500	Block ...	13,11,730
Reserves ...	9,84,508	Stock-in-hand	12,14,892

THE ATUL PRODUCTS LTD.

CHAIRMAN'S REVIEW OF EXPANSION PLANS

PRESIDING over the Ninth Annual General Meeting of the shareholders of the Atul Products Ltd., held at Ahmedabad on 27th May 1957, Mr. Kasturbhai Lalbhai, Chairman, observed as follows:

"GENTLEMEN,

"The Directors' report, the statement of accounts and the other papers relating to the working of the Company during the year 1956 have been circulated to you, and have been in your hands for some time. So, if you will kindly agree, we will take them as read.

"It will be seen from the statement of accounts that the Company has maintained its progress. Sales this year have increased by Rs. 54,17,924 over those of the last year, and profits also have a corresponding increase of Rs. 10,34,024. It is unfortunate that the various schemes we had in hand, namely, Naphthols, Cibagenes, Sulfur Black, Coramine and Vioform could not contribute to the working of this year. But these plants are now in operation, and will augment our sales and profits for the year 1957. I should, perhaps, also draw your attention to the fact that, owing to various reasons, we have still not reached that position which will result in the maximum utilisation of the existing plants. But, as the results indicate, we are aware of this problem, and are improving our conditions of working progressively.

"The profits for the year, before making provision for depreciation, have been Rs. 30,95,549. The depreciation that we have to provide for the normal wear and tear of the assets during the year amounts to Rs. 12,68,490. But, as you are aware, we have large arrears of depreciation. Therefore, your Directors have thought it advisable to provide a larger sum of Rs. 19,60,486 for depreciation, leaving the distributable profits at Rs. 11,60,595. I may mention that, on account of the arrears of depreciation just referred to, the Company will not be called upon to pay income-tax on these profits.

Progress Satisfactory

"I hope you will find the progress that the Company has been making and the results of this year as satisfactory. Perhaps, we might have done better. But, personally, I am satisfied with what we have so far achieved, and am confident that the future of your Company is bright. In the speech of a previous year, I had referred to the fact, that sufficient data about the annual consumption of dyes in the country was not available, and, therefore, we could not easily decide on our production targets. Recently, however, the Development Wing of the Ministry of Commerce and Industry has made the following estimates for the consumption of various types of dyes in the country and also agreed that we—Atul and Atic—may plan jointly to attain levels of production shown under their names.

Group of dyes	Consumption as per Ministry of Commerce and Industry	Atul-Atic
	Tons	Tons
Azo dyes	3,000	1,725
Basic dyes	750	500
Naphthols	1,250	400
Bases	1,250	400
Vat dyes	1,200	600
Sulfur Black	2,150	1,350
Other Sulfur dyes	225	225
Organic pigments	..	200
Acid Anthraquinone dyes	..	25
Alcian dyes	..	165

"You will be glad to know that your Directors have agreed to accept this suggestion and, accordingly, will soon undertake the necessary expansion of the various plants. I hope you will approve of this decision of your Directors.

New Plans

"In an earlier speech I had also referred to an imperative need for our going into the manufacture of intermediates. That need is all the greater now. The Ministry of Commerce and Industry also has now been able to come to a conclusion regarding the ways in which this sector of the industry should develop. The plan, in brief, is that the State will have a centrally State-owned plant to deal with some chemicals which are basic and of a more general nature. Dyes manufacturers, including overselves, will have to make arrangements to look after the subsequent processing of these chemicals, and also to undertake the manufacture of others which may not be included in the Government's scheme. Accordingly, here also Atul and Atic have submitted to the Government a plan of manufacture which is both ambitious and extensive. Naturally, this development will have to be spread over a number of years; your Directors will, however, make every effort to see that this period is as short as possible. Your Directors are also confident that, when this development is completed, your Company will have a well-established position in the chemical industry.

"Obviously, this is not something which we can do alone or only with our own resources. This can be well appreciated from the fact that the schemes of such manufacture would cover more than a hundred products, and would require very large investment. As you are aware, your Company and the I.C.I. have been gradually trying to get nearer each other. One of the reasons behind this step was the realisation that a project of this magnitude could be more effectively organised only by a suitable combination of resources. Your Directors are happy to report that they are hopeful of an early and successful termination of these negotiations. They believe that they will be able to submit complete detalis, in a short time, for your approval."

PROCION DYESTUFFS

The one-year old I.C.I. Dyestuffs Division's range of Procion dyestuffs "is proving a vigorous child indeed. The initial three Procions (Yellow R, Brilliant Red 2B, Blue 3G), supplemented two months ago by Procion Brilliant Orange G, now leaps to ten, with the introduction of a bright greenish-yellow, a new brilliant red, a reddish blue, a bright turquoise blue, and two brilliant greens. The six new Procions, like the earlier four, are characterised by their outstanding brightness of shade, excellent fastness properties and great simplicity of application. As with the earlier Procions, their principal value will be in the dyeing and printing of cellulosic fibres, with which they actually combine chemically, and in which respect they remain unique. Subsidiary but still very important uses are found in the printing of chlorinated wool and silk and in the dyeing of silk and nylon.

The expanded Procion series, covering as it does an extremely wide tinctorial range, now enables textile printers to produce all-Procion styles by all conventional application techniques, and is equally suitable for designs of the traditional types and for the vivid but technically exacting designs now in such vogue. The benefits in terms of simplification and shortening of processes and in the wider tinctorial range available, will be obvious to the practical printer. The Procions are not dischargeable, but lend themselves readily to resist styles by simple recipes. For the printing of silk and chlorinated wool, Procions are likely to prove invaluable for the production of novel effects hitherto unobtainable. In printing behaviour, the new Procions are very similar to the earlier brands, and the same flexibility and amenability to control characterise the whole range. They may all be fixed either by steaming or non-steaming processes and are adaptable to the needs of the small screen printer and big-scale printer alike.

Three of the new Procions—the two greens and the Brilliant Red H3BS—are not for the time being recommended for dyeing applications, but this scarcely affects the very wide shade range obtainable from the remaining seven. All the seven, with the exception of Procion Brilliant Blue H7G, for which a hot batch-dyeing process is required, are applicable by the established processes—pad-bicarbonate-dry, pad-steam, and cold batchwise methods and are compatible with each other, making possible a very wide range of intermediate and mixture shades.

NEW INDIA'S RESULTS ENCOURAGING

DIVIDEND RAISED

WHEN life insurance was nationalised last year, the shareholders of the New India Assurance Co., Ltd. (Managing Director: Mr. B. K. Shah, Bombay), which was then a composite office, were somewhat perturbed, for they wondered whether the Company would be able to maintain its dividend after the loss of its life portfolio. It was, therefore, with no small satisfaction that they learnt from the management that the dividend level was not likely to be affected adversely. The management was as good as its word. For the year 1955, the dividend was maintained at Rs. 2-8 per share. It is even more encouraging to note that, for the year ended December 1956, covered by the latest directors' report and statement of accounts of the Company and which represent almost the first full year of the Company's working without life portfolio, the management has been able to raise the dividend to Rs. 3 per share. It is noteworthy that this has been done without entailing the overall allocation to reserves which, at Rs. 19.10 lakhs, is higher than the Rs. 18.46 lakhs they accrued in 1955.

By far the most encouraging feature of the working of this leading composite office during 1956 is that the premium income, crossed the Rs. 5-crore mark to stand at Rs. 5.63 crores, as against Rs. 4.97 crores in 1955. The impressive rate at which the Company has progressed in the last decade will be evident from the fact that, in 1946, the premium income of the Company stood at no more than Rs. 1.38 crores. The increase in premium income is particularly encouraging, in view of the downward revision in premium rates which was effected in 1955 and 1956. Further, the increase in premium increase has been shared by all the three departments. The following table brings out the salient features of the working of the Company during the three years ended 31st December 1956:

(In lakhs of rupees)

	1956	1955	1954	1953
Premium Income:				
Fire Department	289.7	274.1	250.3	233.3
Marine Department	130.0	114.5	100.7	84.0
Miscellaneous Department ..	144.1	108.9	85.5	72.3
Total of all Departments ..	563.8	497.5	436.5	389.6
Funds:				
Fire Department	188.0	181.0	168.0	159.0
Marine Department	165.0	156.0	141.8	125.0
Miscellaneous Department ..	92.0	74.0	62.0	55.0
Total of all Departments ..	445.0	411.0	371.8	339.0
Free Reserves:				
General Reserve	100.0	100.0	85.0	75.0
Premium on Shares	36.2	36.2	36.2	36.2
Dividend Equalisation Reserve	22.0	20.0	20.0	17.0
Exchange Reserve	5.0	5.0	9.9	11.1
Investment Reserve	22.0	9.0	9.0	..
Total	185.2	170.2	160.1	139.3

As on 31st December, 1956, besides the free reserves of Rs. 175 lakhs, additional reserves held in the underwriting departments amounted to Rs. 137 lakhs.

There has been no significant variation in the commission and expenses ratio. It was 44.8 per cent., as against 43.0 per cent. in 1955 in the fire department, 24.2 per cent., as against 22.3 per cent., in the marine department and 33.3 per cent., as compared with 35.3 per cent., in the miscellaneous department. The claims ratio remained practically unaltered at 37.6 per cent., in the fire department. It was, however, somewhat higher in both marine and miscellaneous departments, the ratio being 76.7 per cent., as against 75.6 per cent., in the former and 53.0 per cent., as compared with 49.6 per cent., in the latter. The reserve for unexpired risks has been maintained at 41.7 per cent. level in the fire department, at 40.0 per cent. level in miscellaneous department and at 100 per cent. level in the marine department. Besides these reserves, additional reserves are being maintained in all the three departments.

The fire department has continued to make the largest contribution to the earnings of the Company. During the year under review, the department's profits have moved up from Rs. 43.1 lakhs to Rs. 47.7 lakhs. After strengthening the additional reserve by Rs. 1.6 lakhs, the balance of Rs. 46.1 lakhs has been transferred to the profit and loss account. In the marine department, the need for maintenance of the reserve for unexpired risks at 100 per cent. of the premium income has resulted in a deposit of Rs. 5.28 lakhs, after transferring Rs. 6.4 lakhs from additional reserve. The deficit, however, is less than what it was in 1955 when it amounted to Rs. 7.92 lakhs. The profits of the miscellaneous department have been

(Continued in previous column)

(Concluded from next column)

maintained at Rs. 8.0 lakhs. After strengthening additional reserves in the department by Rs. 4.1 lakhs, a sum of Rs. 4.1 lakhs has been transferred to the profit and loss account.

Departmental profits aggregate Rs. 44.83 lakhs and, after providing for other income and outgo, a sum of Rs. 40.85 lakhs has been transferred to profit and loss appropriation account which, together with Rs. 1.03 lakhs brought in from previous year, makes in all Rs. 41.88 lakhs. The Directors have transferred Rs. 35,000 to reserve for doubtful debts, Rs. 13 lakhs to investment reserve, Rs. 3.75 lakhs to reserve for taxation and Rs. 2 lakhs to dividend equalisation reserve. The payment of a dividend of Rs. 3 per share absorbs Rs. 21.36 lakhs, leaving Rs. 1.42 lakhs to be carried forward.

The excellent financial position of the Company is fully reflected in its capital and reserves position. Besides a capital of Rs. 1.07 crore, the Company has reserves and funds aggregating Rs. 6.30 crores, inclusive of fire fund of Rs. 92 lakhs, miscellaneous fund of Rs. 1.65 crore and marine fund of Rs. one crore.

QUESTION HOUR IN PARLIAMENT

Compulsory Deposits

THE interest payable on company reserves under the scheme of compulsory deposits will be regulated by reference to the prevailing Bank rate. It is not contemplated that any loan will be given to companies against the reserves deposited by them.

—*T. T. Krishnamachari*

Gold Smuggling

Of late, there has been some increase in the smuggling of gold across the Indo-Pakistan border. The latest information available with the Government has indicated this. Apart from the loss of revenue, the general effect of large-scale smuggling of gold will be to impose additional strain on the foreign exchange reserves of the country and hamper, through hoarding or other unproductive use, capital formation for productive purposes. Various and progressively intensive steps are being continuously taken by the Government to combat this smuggling across the border.

* * * *

Insurers' Bonus

Investigations are in progress about the non-earning capacity of various insurers. In the light of these investigations, the question of classification for policies under section 49(2) of the Life Insurance Corporation Act for the purpose of differential bonuses will be taken up.

—*B. R. Bhagat*

Automobiles

The number of motor vehicles assembled or manufactured in India during 1956 was 32,138, as against 23,084 in 1955, 14,462 in 1954 and 13,926 in 1953. The Government has agreed to a further increase in the price of the Hindustan Landmaster car and the enhanced price is likely to come into effect. This car is being sold at a loss, according to the report of the Tariff Commission. The increase is sanctioned to remove the loss totally.

—*Morarji Desai*

No More Jute Mills

There is no question of expansion of jute mills, because the country has much more surplus capacity than the jute produced. The Government of India has not received any request from the Bihar Government for setting up a jute mill to utilise the jute produced in North Bihar.

—*Nityanand Kanungo*

Synthetic Rubber and Aluminium Plants

The proposed synthetic rubber plant and the aluminium plant costing about Rs. 40 crores will be set up in Uttar Pradesh during the second Plan period. The project reports of the two plants are ready.

* * * *

Russian Credit

The Government proposes to utilise the Russian credit of 500 million roubles for a heavy machine building project, a mining machinery project, development of the Korba coalfields, a power plant for the Neyveli lignite project, an optical glass plant, and equipment for balancing and reconditioning the methanol plant at Sindri.

—*M. M. Shah*

Oil Drilling

Oil drilling operations in well No. 2 of Moran (Assam) have now been completed and commercial production can start when transport facilities become available. The possible daily output from the well has not yet been assessed.

* * * *

Mineral Royalties

The Government has increased the royalty on the mines in all States, with the object of bringing the royalty rates in line with the general rise in the level of prices, rentals and wages.

* * * *

Remittances Abroad By Oil Companies

The gross remittances made abroad during 1956 by oil companies and refineries operating in India are: Burma Shell Rs. 32.58 lakhs; Assam Oil Company Rs. 55 lakhs; Standard Vacuum Oil Company Rs. 10.74 lakhs; Caltex (India) Ltd. Rs. 5.72 lakhs; Stanvac Refinery Rs. 9.46 lakhs. These figures, however, are not complete, as particulars are not available for certain months in the case of some companies.

* * * *

Oil Survey

The team of Canadian oil experts which carried out an aero-magnetic survey of certain areas in the country has just submitted a report to the Government. The report is now being studied. The areas surveyed by the team were the Indo-Gangetic basin, part of Rajasthan and a very small portion of the Punjab. The survey will give an assessment of the depth of earth from what is known as 'mother rock' up to the surface of earth. The survey will be of help in drawing up oil prospecting programmes. Indian technicians were associated with the survey.

—*K. D. Malaviya*

Purchase of Windmills

No windmills have been purchased by the Government of India from Australia. 160 windmill pumping sets are, however, being procured through the India Supply Mission, Washington, for the National Water Supply and Sanitation Programme of the Ministry of Health. The Programme is being financed by the U.S. Government under the International Co-operation Administration Programme. A contract for the supply of these sets has been entered into with a firm in Australia. One windmill head mechanism was purchased in 1956 by the Council of Scientific Research for experimental purposes.

* * * *

Navigation Facilities in River Valley Projects

There is no provision which requires that navigation facilities should be provided in all river valley projects in India. Navigation facilities have, however, been provided in some of the canals of the Damodar Valley and Tungabhadra projects. The Damodar Valley project has provided 22 locks in the navigation canal from Durgapur barrage to the Hoogly, a distance of 85 miles. There is no other navigation canal with provision for locks in the new river valley projects.

* * * *

Flood Committee

The selection of one or two American experts for appointment on the high-level Flood Committee is still under the consideration of the Government. The Committee will examine the overall question of flood control in the country.

—*S. K. Patil*

Lignite for Iron Manufacture

The Government is examining the prospects of utilising lignite for the manufacture of iron in India. The experiments, however, are still in a very rudimentary stage.

—*Sardar Swaran Singh*

Visakhapatnam Port

As a part of the second Five-year Plan, it is proposed to provide additional berths and mechanical equipment for handling of ores at Visakhapatnam Port. Some equipment has already arrived and dredging work for additional berths is about to commence. At present, the Port has four quay berths for ores and general cargo, three jetty berths for bunkering, four mooring berths, and two quay berths for oil tankers.

* * * *

National Highways

During the current year, 150 miles of missing links in the existing system of National Highways are proposed to be constructed, about 800 miles of existing sections improved and about 300 miles of improved sections widened to two-lane carriageway.

—*Raj Bahadur*

Works and Orientation Centres

The object of the scheme of work and orientation centre is to assist educated unemployed persons to equip themselves to take advantage of the avenues of employment other than white-collar jobs. The orientation and instruction provided at the centre at Pusa in New Delhi is designed to increase their employability and capacity for self-employment. Physical training and manual work form part of the daily routine at the centre. The trades in which instruction is imparted include light mechanics, wood work, house-wiring, maintenance and servicing of household appliances, and building construction. Instruction is given in both the theory and practice of trades. Another work and orientation centre has been opened at Kalamasseri in Kerala and third centre is proposed to be opened in West Bengal. At each centre, 250 persons will receive orientation at the same time. The opening of more centres will depend on the success achieved at the existing work and orientation centres, which have been started on a pilot basis.

—*Abid Ali*

SUGAR

(*Concluded from page* 1138)

and the same policy is being continued in 1956-57. Export of sugar has been freely allowed since January 1955. A quantity of 21,096 tons of *gur* was exported during 1956, as against 24,545 tons in 1955." Such a brief reference is certainly unfortunate, considering that the *gur-khandsari* sector plays a vital role in the country's economy. It consumes the major portion —as much as 55 per cent.—of the cane grown in the country, produces Rs. 100 crores worth of *gur* and *khandsari*, and provides employment to no less than 2.1 million persons on a reasonable basis and to 70,000 tons all round the year. In view of the importance thus, the Food and Agriculture Ministry will do well to review, in its future annual reports, the progress registered in this field, as a result of the policies and programmes implemented by it.

more food for more people

As mechanized farming brings more land under crops . . . as powerful bulldozers and other equipment labour day and night to build dams to water the thirsting earth . . . as roads and rails reach farther to bring food to the market place . . . so the need for oil—fuels and lubricants—grows. Caltex is irrevocably linked with the plans contributing to the well-being of India's millions. At Visakhapatnam the new Caltex Refinery is nearing completion—a tribute to free enterprise. Soon, from here, will flow Caltex quality petroleum products to accelerate India's progress.

OIL is the Lifestream of Progress

LENDERS STILL SCARCE

(From Our Own Correspondent)

BOMBAY, *5th June*

There has been no improvement in the state of the short-term money market from the borrowers' point of view. The demand for money is still there, although the traditional busy season is practically over. Repayment of trade advances is very slow and what little comes in gets absorbed by the market. Consequently, lenders are scarce and the short-term interest rates continue to rule firm. Inter-bank call is nominally quoted at 3½ per cent. House money fetches anything between 4 and 4½ per cent., the bigger the amount the higher being the rate. One to three months' money also earns 4¼ to 4½ per cent. Some of the big Indian banks are not keen on having six months' deposits but Exchange banks prefer to have them to House money or one to three months' deposits.

The latest Reserve Bank's Statement relates to the week-ended 31st May 1957. As compared with that for the preceding week, it shows a drop of Rs. 8.39 crores in notes in circulation and of Rs. 1.59 crores in notes held in the Banking Department, so that the total note issue is down by Rs. 9.98 crores at Rs. 1,596 crores. This recession is only temporary and a usual feature in the last week of almost all months. The drop has been balanced on the assets side of the Issue Department by a cut of Rs. 10 crores in rupee securities offset by a rise of Rs. 1.69 lakhs in rupee coin.

Although there is no change in the foreign assets held by the Issue Department, balances held abroad under the Banking Department have once again receded by as much as Rs. 14.34 crores, thereby bringing down India's total foreign currency reserves to Rs. 455.07 crores. This level compares with Rs. 504.90 crores a month before, Rs. 526.82 crores two months before and Rs. 705.34 crores a year before.

The Central Government's cash balance has gone down by Rs. 57 lakhs to Rs. 53.64 crores, but those of other Governments are a little better by Rs. 1.17 crores at Rs. 6.83 crores. Bankers' balances have spurted by Rs. 5.87 crores and yet the money market shows no break in the stringency that has characterised it for several months now. There has also been a fall in "other loans and advances," most of which represent those given to banks, from Rs. 111.26 crores to Rs. 106.55 crores, a drop of Rs. 4.71 crores. Of these, the advances against usance bills to Scheduled banks amount to Rs. 58.16 crores; a week before, they were higher at Rs. 59.65 crores.

There is a surprisingly large increase of Rs. 27.34 crores in the investments of the Banking Department of the Reserve Bank. A part of it could be due to purchases of the existing loans of the Government of India from the open market.

The Scheduled banks' statement for the week ended 24th May 1957 shows, over that for the previous week, a rise of Rs. 11.04 crores in demand deposits, and of Rs. 2.71 crores in time deposits. Advances have declined by Rs. 3.84 crores, while bills purchased and discounted are up by Rs. 6.98 crores, so that there has been a net rise of Rs. 3.14 crores in the credit accommodation provided by banks. But because of the rise in deposits, the banks have found it possible to reduce their loans from the Reserve Bank by Rs. 9 crores and those from the State Bank by Rs. 2.35 crores. The total cash balances of all the Scheduled banks have shrunk by Rs. 4.32 crores, apparently because of the large repayments made to the central banking institution.

The Gilt-edged market is extremely dull, with very little business passing. The trend is distinctly quiet, with the medium and long-dated loans of the Central Government having lost over the week 5 to 10 Naye Paise. The Conversion Loan has actually lost 20nP. There has scarcely been any business in State loans.

In the foreign exchange section, the rupee is a shade lower in terms of U.S. dollars, with banks selling rate for T.T. and O.D. standing higher at Rs. 479.75 per $100, as against Rs. 479.75 a week ago. Similarly, the banks' buying rate too has moved by 0.25 rupee to Rs. 476.25. Thus, the spread between the buying and the selling rate has remained unchanged at Rs. 3.50. Rupee has weakened in terms of Canadian dollars also by Re. 0.50, in that a buyer of this currency has to pay Rs. 504.75 per 100 Canadian dollars, whereas a week ago he got them for Rs. 504.25. The rupee remains practically unchanged in relation to other currencies.

The fractional weakness of the rupee *vis-a-vis* dollars is the result of a corresponding fall in the value of sterling. Thus, in New York, spot sterling was quoted yesterday at $2.79-2.79½, as compared with $2.79½-2.79¼ a week before. Three months' forward sterling was standing 1/16 cent lower at $2.78 1/16-2.78 3/16. Transferable sterling also was down at 277.45-277.55 cents, as against 277.80-277.90 cents on 28th May 1957.

LINSEED DULL

(Messrs. A. Bradley and Co.)

CALCUTTA, *3rd June*

Quieter conditions prevailed in the linseed market during the week. Crushers were reserved, despite lower offerings from sellers. Trading was very poor and many of the local mills were reported to have stopped crushing linseed, owing to the disparity between seeds and oil prices and continued lack of buyers for linseed oil, both local as well as overseas.

The latest available quotations are: Ready-June Rs. 22-2, June-July Rs. 22-6 and July-August Rs. 22-12 per maund.

MIXED TREND IN BULLION

(From Our Own Correspondent)

BOMBAY, *5th June*

The bullion market displayed a mixed trend. Over the week, silver shows a rise of about Re. 1-12, but gold is down by about Re. 1-10. Again, the trend was irregular in both the sections. Although both the metals finished well above the lowest levels of the week, gold tended to be quiet but silver ruled distinctly firm.

Generally speaking, the feeling that seasonal demand would soon be over dominated the minds of operators in both the sections. But this was not uniformly reflected in the behaviour of white and yellow metals. The reason for this is the fact that, with the floating stocks of silver being extremely limited, the bulls could easily manœuvre the price of white metal whenever they like. After the shake-out witnessed last week, the bulls in silver lay low for a while but began to squeeze the market again a little. This gave a push to silver prices.

In the case of gold, the reiteration by the Finance Minister that the rupee would not be devalued chilled the enthusiasm of the bulls and encouraged some of the bears to wag their tail. The demand for spot gold was also slack, while there was a slight expansion in the flow of smuggled gold. Towards the close, however, ready demand improved somewhat following enquiries from South India and this enabled the metal to stand at well above the lowest levels for the week.

The Jeth settlement silver began the week firm at Rs. 182-2, as against the previous close of Rs. 181-13. On the next day, it fell to Rs. 181-12, only to rise gradually in the succeeding days and finish at Rs. 183-10. Ashad silver opened As. 6 higher at Rs. 181-4, touched a low of Rs. 181-0 on Friday 31st May 1957 and, after moving within a narrow range of about a rupee and touching a still lower level of Rs. 180-10 on Monday, closed today at Rs. 181-12. Spot silver was in the neighbourhood of Rs. 184 throughout the week till yesterday, whereafter it began to rise and wound up the week at Rs. 185-4.

The highest levels for gold were seen on the first day of the week at Rs. 107-11-6 for Jeth, Rs. 106-12-6 for Ashad and Rs. 109-1-6 for spot. The trend thereafter was downward until yesterday afternoon, when the lowest levels for the week were seen at Rs. 105-4, Rs. 105-0 and Rs. 105-10, respectively. The revival of buying in the spot section yesterday evening and today brought about some improvement and enabled Jeth to finish at Rs. 106-4, Ashad at Rs. 105-12 and ready at Rs. 106-12.

There was no change in the New York and London silver markets. Only, gold in London was a shade higher at 250s. 6½*d.*, as against 250s. 4*d.* a week before.

The following comparative table shows the trend of market during the week under review:

	5-6-1957	Highest	Lowest	29-5-1957
	Rs. a.	Rs. a.	Rs. a.	Rs. a.

BASE METALS RALLY

(From Our Own Correspondent)

CALCUTTA, *4th June*

Prices of base metals showed a marked improvement during the week under review, under the influence of strong overseas advices. The impetus followed the American announcement which called for offers of lead and zinc to meet stockpiling needs. In trade circles, opinion was reserved as to whether the Government's forthcoming import policy would restrict fresh arrivals of base metals, in view of the country's difficult foreign exchange position. It is well-known that India is dependent on imports for meeting a good portion of its requirements of base metals, non-ferrous, in particular. The country is equipped to produce only fire-refined copper, and as such the entire requirements of the electrolytic material are imported. Without imports, therefore, industrial development, in general, and electricity development, in particular, would be impeded. In view of this situation, it is felt that the new policy would not restrict imports of base metals.

During the week, electrolytic copper rose from Rs. 178 to Rs. 180. Increased activity was shown by consumers who thought that the uptrend was likely to continue for some time. Support from official quarters was sizable. Tin scored a gain of Rs. 9 to Rs. 528. The rate was considerably higher than the replacement cost and, the supply position being what it was, a reversal of the trend was not anticipated for some time to come. Fresh arrivals continued to be readily booked. Virgin lead was better by half a point at Rs. 74 and electrolytic zinc rose from Rs. 74.50 to Rs. 75.50.

COTTON FUTURES DULL

(From Our Own Correspondent)

BOMBAY, *5th June*

Limited turnover with prices showing a sagging tendency characterised trading in the cotton futures market during the week under review. As there was no fresh development of import to the market, operators evinced very little interest in fresh business. The introduction of the heavy margin of Rs. 400 per candy on transaction at or above Rs. 824 with effect from the 1st inst., also acted as a damper. On top of these, there was the disappointment over the frequent intervention in cotton trade by the Government. Transactions put through were, as already stated, limited. The undertone of the market was easy.

Vijay June contract—the only contract currently running—ruled distinctly easy during the first two days of the week and, after experiencing violent fluctuation in prices on Monday, remained dull in the subsequent sessions. The earlier weakness was due to the heavy margin of Rs. 400 per candy which became effective from the 1st inst. The bulls were naturally averse to paying such prohibitive margin and were, therefore, hesitant to push up prices. On Saturday, the first notice day, tenders for about 1,500 bales were issued which were considered fairly large and this led to heavy bull liquidation, resulting in a break in values. The sentiment was also adversely affected by the fact that the expectation that the meeting of the Forward Markets Commission's Chairman with the East India Cotton Association Board held on Friday would lead to some relaxation of Government control did not materialise. Discouraging advice from oilseeds market was an additional damper. On Monday, however, the contract staged an impressive recovery, induced by frantic bear covering, thanks to the small volume of tenders on Monday, the second notice day. The contract slipped back again yesterday due to renewed selling pressure, but tended to improve slightly today.

M. G. Vijay June opened the week at Rs. 813, and touched a low of Rs. 800½ on the 1st inst. After recovering to Rs. 820 on Monday, it again eased to Rs. 808 yesterday. Opening today at Rs. 810, the contract firmed up to Rs. 815 before closing lower at Rs. 813. The following is the trend of prices of the contract during the week:

(In rupees per candy of 784 lbs.)

	5-6-57	*High*	*Low*	29-5-57
Vijay (June) ...	813	820	800½	814

At the meeting of the E.I.C.A. Board on Friday which was attended by Mr. W. R. Natu, Chairman of the F.M.C., the Board was reported to have appraised Mr. Natu of its view that, as a result of the frequent official interference in the day-to-day working of the market, the traders had lost faith in the futures market and that the volume of business was dwindling rapidly as a consequence. Mr. Natu, however, was understood to have justified the official intervention of the Government on the ground that forward business in cotton as conducted at present prevented the healthy functioning of the ready market. At the aforesaid meeting the E.I.C.A. Board decided to determine the rates of the non-transferable delivery contracts of the coming season not absolutely but in relation to the new hedge contract, on the basis of 'on' calls.

Mr. Nityanand Kanungo, Minister for Commerce, stated in the Lok Sabha the other day that an announcement regarding the floor and ceiling prices for cotton during the coming season would be made shortly. Cotton traders are eagerly awaiting this announcement. It is generally expected that the floor prices will be revised upwards by Rs. 50 per candy, as recommended by the Cotton Advisory Committee in April last.

Despite the absence of a number of traders presumably due to the 'flu epidemic, brisk activity continued in the spot section. There was sustained mill demand for all popular varieties the prices of which were well maintained. Enquiries were particularly noted for Vijay, Wagad, Kala Kalyan, Jayadhar and Laxmi even at advancing prices. In the foreign section, Southern mills were interested in Egyptian styles. The possibility of large-scale purchases in such cotton was, however, ruled out as Indian mills were fairly well supplied at present with Sudan, American and East African cotton. The expectation of a further fall in Egyptian cotton prices at Alexandria also discouraged the mills from going in for larger quantities of Egyptian cotton.

At the forthcoming meeting of the Export Advisory Council, the trade representatives are expected to acquaint the Government with the difficulties which the shippers have had to face in the current season in respect of export of cotton. It is understood that they would urge the release of the export quota for the coming season only after the crop prospects became clearer with a special plea that once such quota is released it should under no circumstances be cancelled.

The latest available spot rates—in rupees per candy of 784 lbs.—from Sewree are as follows: Bengal *Deshi* 725; Berar Jarilla 820; Khandesh 870; Oomra *Deshi* 780; Vijay 1,025; Hubli Laxmi 1,020; Jayadhar 960.

The Karachi cotton futures market put on a depressed appearance during the week under review, notwithstanding reports of smaller crop arrivals. There was heavy speculative selling, induced by expectations of good crop in the current season and continued fears of competition from U.S. cotton. Consequently, cotton values suffered a sharp fall. N.T.R.G. July dropped Rs. 4-6 to Rs. 72-7. January position fell by Rs. 3-10 to Rs. 75-3. Spot values of cotton, especially Punjab *deshi* styles, also declined considerably. *Desi deshi* and Sind *deshi* which were quoted at Rs. 87-8 and Rs. 82 respectively last week-end declined to Rs. 84 and Rs. 79-4, respectively. The following are the latest available rates—in Pakistani rupees per 82 lbs.—for a few other popular varieties of Pakistan cotton prevailing at Karachi: 4F roller 72-15; S.G. 76-15; Punjab Roller 76-7; S.G. 79-7; 289F N.T. Roller 76-7; 289F N.T. Sind S.G. 83-7; 289F Punjab Roller 80-7; 289F Punjab S.G. 85.

The fourth official estimate of cotton crop in Pakistan in the current season puts the area and production at 3,569,000 acres and 1,708,000 bales (of 392 lbs.) respectively, as against 3,537,000 acres and 1,670,000 bales reported in the corresponding estimate of the previous season. The increase in production is attributed to favourable weather during the period of growth of plant.

The Alexandria cotton futures market ruled easy during the week under review. There were apprehensions among traders that the recent upward revision in the export tax on long staple cotton by 1½ tallari per cantar and that on medium staple cotton by ¾ tallari would affect overseas business. The reports that the cotton crop was progressing satisfactorily also adversely affected the sentiment of operators. Some selling was, therefore, in evidence and prices tended to move down. The following are the latest available rates—in tallari per lb.—from Alexandria:

Karnak: July 107.85; November 98.50.
Ashmouni: June 75.00; August 75.00; October 72.25.

The Sudan Gezira Board has discontinued with effect from 28th May 1957 selling cotton by tender and reverted to auction sales.

An easy trend was depicted by the Liverpool cotton futures market during the week under review. The volume of business in both the American and the American type contract was very small, as no immediate material change in the C.C.C. selling price was expected and prices moved narrowly. The Liverpool Sudan contract evoked heavy selling and staged a retreat. The following are the latest available quotations—in pence per lb.—from Liverpool:

American cotton 1" staple contract: July-August 26.40; October-November 26.28; December-January 26.28; March-April 26.28.

American cotton mixed growth contract: July-August 26.60; October-November 26.50; December-January 26.47; March-April 26.46.

Sudan: July-August 39.20; September-October 38.35; November-December 38.25.

Steady conditions prevailed in the New York cotton futures market. The commission House liquidation and hedge selling prompted by uncertainties regarding the farm policy met with trade buying based on hopes that any major change in farm legislation in the current session of the Congress was unlikely. Adverse weather conditions in certain leading cotton tracts also imparted strength. There was, of course, some switching from near to distant months which resulted in a slight fall in value in the near July delivery contract. Spot values, however, declined.

The following are the latest available quotations from New York, as compared with those of a week and a fortnight before:

(In cents per lb.)

	4-6-57	28-5-57	21-5-57
Spot	35.40	35.45	35.55
July	35.25	35.29	35.28
October	34.50	34.44	34.19
December	34.48	34.40	34.22

YARNS FIRM

(From Our Own Correspondent)

BOMBAY, *5th June*

A firm trend was in evidence in the yarn market during the week under review. The firmness was aided by the amicable settlement of the issue relating to payment of sales tax by commission agents. Rayon yarns met with good buying support, induced by fears of scarcity of supplies in the coming months; the fears were based on expectations of further restrictions on imports of foreign yarns in the ensuing half-yearly licensing period. Staple fibre yarns were also well favoured, notwithstanding slow demand from consuming centres where there was accumulation of stocks and reduction in offtake of 2/40 grey bright yarns on account of switchover of purchases to 20 bright yarns. The buying fervour in this section was fanned by the latest decision of the Central Government to allow free exports of staple fibre yarn within a ceiling of 1.5 million lbs., during the current half-year. Cotton yarns ruled fully steady. The expectation of the restoration of cut in electric supply to mills in Salem and Coimbatore districts (which means increase in the production of yarn) would appear to have had no effect on the market.

Snia rayon yarn (120 dull cones) for August delivery encountered excellent buying support and climbed up by Rs. 19 to Rs. 820. June delivery advanced by Rs. 14 to Rs. 802. Spot 120 Japan moved up by 6 nP to Rs. 4.09. 120 Italy gathered 3 nP to Rs. 3.97. 150 Italy was firm at Rs. 3.69. 150 Japan, however, declined by 3 nP to Rs. 3.94. Among indigenous yarns, National Rayons 120 bright cones first grade was firm at Rs. 3.73. 150 bright cones first grade put on 3 nP to Rs. 3.45.

Staple fibre yarns (40×2) for June delivery rallied by Rs. 11 to Rs. 585. August delivery hardened by Rs. 7 to Rs. 589. Spot (40×2) New Greats improved by 2 nP to Rs. 3.11. Citys rose by 3 nP to Rs. 3.15. Centurys were fully maintained at Rs. 3.12. Kohinoors, however, were a shade lower at Rs. 3.27. Among foreign yarns, (80 x 2) Paramounts were firm at Rs. 5.31 Fujis were quoted at Rs. 5.13.

In the cotton yarn section, ten counts Moderns were fully steady at Rs. 14.81, as also Podars at Rs. 14.75. Among twenty counts, Maduras were firm at Rs. 19, Moderns at Rs. 18.75 and Gokaks at Rs. 18.62. Thirty counts Edwards were quiet at Rs. 21 and Indus at Rs. 21.75. Forty counts Moderns were firm at Rs 28, while Minaxis declined by 21 nP to Rs. 27.10. Among sixty counts, Finlays advanced by a rupee to Rs. 64. Moderns improved by 50 nP to Rs. 62. Raghuvamshis were firm at Rs. 58. Eighty counts Mahendras changed hands at Rs. 71.25, same as last week. Finlays were bought at Rs. 81.50. Moderns, however, eased by 25 nP to Rs. 75.75.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	5-6-1957	29-5-1957
	Rs.	Rs.
Art silk yarn (per case of 200 lbs.)—		
120 dull Cones Snia June	802.00	788.00
August	820.00	801.00
120 Japan (per lb.)	4.09	4.03
150 Japan (per lb.)	3.94	3.97
120 Italy (per lb.)	3.97	3.94
150 Italy (per lb.)	3.69	3.69
Staple fibre yarn (per case of 200 lbs.)—		
40×2 June	585.00	574.00
August	589.00	582.00
40 ×2 New Great (per lb.)	3.11	3.09
40 ×2 Century (per lb.)	3.12	3.12
40 ×2 City (per lb.)	3.15	3.12
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	14.75	14.75
20s Madura	19.00	19.00
30s Edward	21.00	21.00
40s Gokak	—	—
60s Raghuvamshi	58.00	58.00
80s Modern	75.75	76.00

SUGAR EASY

(From Our Own Correspondent)

BOMBAY, *5th June*

The firmness noted in the sugar market during the past fortnight abated somewhat in the week under review. In fact, the market ruled easy, thanks to the release of 165,000 tons of sugar for sale in free market, announced on Wednesday last. Even the reports that the sugar mills had further raised the premium over the pre-budget ex-mill price from As. 4 to As. 8 per maund had no effect; the mills were said to have succeeded in holding on to their prices, on account of good demand from way-side stations in the interior. For traders were unwilling to enter into any fresh transaction at the high levels, apprehending a sizable fall in prices in the monsoon months. The continued drop in arrivals of sugar into the market also failed to impart strength. The arrivals during the week aggregated just 3,600 bags, as against 7,400 bags in the previous week and 17,125 bags two weeks before.

Medium grain sugar receded by a rupee to Rs. 103 from Rs. 104 per bag, inclusive of sales tax. Large grain lost a like amount to Rs. 105-Rs. 109. Small grains was unchanged at Rs. 102.

Shravan delivery contract for 'C' grade sugar declined from Rs. 102-6 to Rs. 101-10; today, however, it was quoted higher at Rs. 103-2.

SUGAR QUIET

(From Our Own Correspondent)

HAPUR, *5th June*

Following a further release of 165,000 tons of sugar for sale in free market, the sugar market, which had recorded a firm trend since the imposition of increased excise duty on 15th May, ruled quiet during the week under review. Buyers were not as anxious as they appeared to be before the release was ordered. Trading was slack and some of the ex-mill delivery prices were not yet quoted. A fractional fall was recorded in the ex-mill delivery prices of some of the factories towards the week-end.

Ready *gur* ruled steady during the week, as despatches were responsible for diminishing the local stocks. The week's offtake aggregated 12 wagonloads and local stock was put at 77,500 maunds, as against 47,000 maunds on this date last year. Arrivals slightly increased to an average of 150 maunds, as most of the producers were not in a position to retain their stocks in the coming rainy season and were bringing their produce to the market. The prevailing prices were Rs. 11.50 to Rs. 12.37, *kotha* dry and wet Rs. 11.25 per maund.

Future *gur* declined during the week on bear pressure. *Gur asar* was done at Rs. 11.27 and *fagun* at Rs. 11.72.

OILSEEDS WEAK

(From Our Own Correspondent)

BOMBAY, *5th June*

The bearish trend noted in the oilseeds market last week gathered further momentum during the week under review. There were apprehensions of Government taking drastic measures to check the rising tendency in commodity prices; the fears were induced by the assumption of special powers by the Government under the Essential Commodities (Amendment) Bill to requisition food stocks at the average market price over the past three months instead of the ruling market price. On top of this, the castorseed section was depressed, thanks to reports of a drop in castor oil prices in the U.S., the U.K. and the Continent and fear of growing competition from Brazil, where the castorseed crop is expected to be a bumper one this season. These factors induced heavy unloading by bulls and fresh short-sales. Consequently, prices suffered a sharp fall. The recession would have been steeper still but for the subsequent news of communist countries having purchased a fair quantity of Indian castor oil and some American enquiries for commercial quality oil around 18.75 cents per lb.

The groundnut section experienced selling pressure, following heavy offers by upcountry interests in the wake of slack demand from vanaspati manufacturers. The linseed section, too, ruled bearish, despite reports of linseed oil export deals with communist countries. In sympathy with the general trend, cottonseeds and other seeds suffered a break in values.

Castorseeds September (1957) delivery contract which stood at Rs. 185.50 last week-end was subjected to a continuous wave of selling and moved down to Rs. 172.50 on Saturday. After recovering to Rs. 180 on Monday, following news of Russia being in the market for substantial quantities of castor oil, it again relapsed to Rs. 175.50 before finishing at Rs. 180. The net loss over the week was Rs. 5.50. Spot Madras quality declined from Rs. 35.62 to Rs. 34.75. Ready Kanpur lost a rupee to Rs. 33.50. Oil commercial quality fell by 62 nP to Rs. 20.75. Oil B.S.S. was done today lower at Rs. 22.12, as against Rs. 22.50.

Groundnut September opened easy at Rs. 177, as against Rs. 178.87 and moved down to as low as Rs. 172.12 yesterday. It, however, recovered to Rs. 176.75 today before finishing at Rs. 176.62. Spot bold F.A.Q. eased by half a rupee to Rs. 35.50. Coromandel quality shed a similar sum to Rs. 37.25. Groundnut oil ex-mill was unchanged at Rs. 20.37.

Linseed September contract encountered selling and went down from Rs. 31.06 on Wednesday last to Rs. 30.19 on the 1st inst. After recovering to Rs. 30.69, it closed lower at Rs. 30.56. Spot bold receded from Rs. 30.12 to Rs. 29.62. Linseed oil was subjected to speculative sales and fell from Rs. 16.37 last week-end to Rs. 14.57 yesterday. It, however, evoked considerable buying support at the lower level and staged an impressive rally, today's closing rate being Rs. 16.75.

Cottonseed September contract which stood at Rs. 113 at the close of last week fell to Rs. 110 on Saturday. After recovering to Rs. 111.50 today, it wound up lower at Rs. 111.25.

Among others, *kardi* seed bold ready declined by half a rupee to Rs. 21.50. *Niger* seed Madras was done at Rs. 27.75, as against Rs. 28.25.

The following table shows the closing prices of oilseeds and oils today as compared with those at the close of the previous two weeks:

	5-6-1957	29-5-1957	22-5-1957
	Rs.	Rs.	Rs.
Groundnut—			
September, 1957	176.62	178.87	183.37

GOOD CLEARANCE IN KIPS

(From Our Own Correspondent)

MADRAS, *3rd June*

Trading in the kip market was reasonably good during the week. Arrivals of cow hides were moderate which found active clearance at the hands of exporters as steamers were readily available for shipments. Demand was mostly for light and medium weights; and top marks were in good request. Inquiries for buff calf and cow calf were patchy. Inferior cow hides were in good demand for local trade and U.K. buying was also in evidence to a small extent.

There was good call for superior tannages in sheep skins and prices hardened. Demand for goatskins from the Continent was slow, because shippers were quoting unworkable prices.

Shipments during May were: 3,957 cow hides, 486 cow calf, 22 buffs, 657 buff calf, 1,256 goat, 624 sheep to U.K. ports; 6 cow hides, 5 cow calf, 40 buff calf, 708 goat, 198 sheep to the Continent; 72 buffs, 101 buff calf, 112 goat to the U.S.; 5 goat and 305 sheep to Japan.

JUTE GOODS GIVE WAY AT CLOSE

(From Our Own Correspondent)

CALCUTTA, *4th June*

The good news of the week under review was the heavy showers experienced in this part of the country on Friday last. Cultivators of jute had been delaying sowing operations in the highlands for lack of rains and, although stocks of raw jute in the bazaar, with the jute mills, and with the cultivators themselves were estimated at levels to maintain the current rate of production well up to the end of September, lack of rains so far had given a sound cause to those interested in creating artificial scarcity conditions. Prices of both raw jute and jute goods had touched high levels. The occurrence of rains was noted with satisfaction and, although raw jute prices were maintained, it was believed that the uptrend had abated. Jute goods, on the other hand, commenced a slow recession. These rains did not, of course, alter the earlier estimates of new crop arriving late by about a month. It was realised by mills that the industry would have to depend on the old crop till September. But the rains affected the market psychology and this was an indication of the availability of fair quantities of fibre.

In view of the widespread belief in rural areas that jute prices would further move up—the cue for cultivators for believing so has been reports of scarcity conditions, artificial though they are, and

(Continued on page 1160)

MARKET REPORTS

(*Concluded from page 1157*)

prevalence of steady conditions in raw jute since the past two months—it was expected here that the current sowing would be fairly heavy. Thus the forthcoming crop would be higher, provided no abnormal floods intervened. The efforts made by the Agriculture Departments of the Governments of the jute-growing States should also be reflected by a further improvement in quality.

Figures relating to shipments of jute goods continued to cause satisfaction. These figures were made up to date up to 25th May. During the period, hessian shipped was higher by 8,000 tons at 20,000 tons and sacking goods by 5,000 tons at 22,000 tons. On Tuesday last, prices of goods improved, following fair business done for export. Australia was the principal buyer of heavy goods. Ready B. twills moved to Rs. 116.50 on Tuesday last from Rs. 116.00 in the previous day and ready hessian 40" 10 oz. to Rs. 43.05 from Rs. 43.00. At this stage, speculators evinced keen interest and, on Wednesday, the above two constructions were pushed up to Rs. 116.65 and Rs. 43.06, respectively. On Thursday, the market could not operate, in view of the general *hartal* to protest at the taxation proposals, since modified. On re-opening on Friday, prices were fully steady, despite heavy selling pressure on account of *Fatka* operations for due date settlements. Ready B. twills at Rs. 116.70 recorded a further rise, and a similar trend was in evidence in ready 40" 10 oz. hessian at Rs. 43.10. Prices, however, sagged yesterday when these two constructions were quoted at Rs. 115.50 and Rs. 43.00, respectively. The 8 oz. hessian was quoted at Rs. 34.75.

Raw jute prices were steady. Sellers were reserved and mills were disinclined to support higher prices. The latest quotations for the 1956-57 crop, June-July delivery, are:

	Middles Rs.	*Bottoms* Rs.
Pakistan:		
District	40.50	37.50
Northern	40.00	37.00
Indian:		
Northern	34.00	31.50

Daissee *mesta*	30.00	27.50
Bimli f.a.q.	Rs. 26.00	

Pucca bales 1st marks ready: Rs. 195.00 per bale.

CLEAN LEAF TEAS FIRM

(From Our Own Correspondent)

CALCUTTA, 4*th June*

The most outstanding event of importance to the tea market this week was the Finance Minister's announcement of the withdrawal of the changes in excise duties on tea proposed in the Budget and expected to accrue an additional revenue of Rs. 2.45 crores. The duties now revert to the old rates, that is, loose tea 6.25 nP per lb.; package tea (converted from duty-paid loose tea) 18.75 nP per lb.; and package tea 25 nP per lb.

The Assam Tea Planters' Association in Calcutta has expressed profuse satisfaction for this decision of New Delhi, and gives vent to the consensus of opinion among the industry when it states that the entire industry feels relief. No doubt, it will not be before some time retailers will restore to consumers the prices prevalent prior to the announcement of the Budget proposals. If Government were to attempt to "rope" in the increased illegal profits made by unscrupulous stockists and retailers, that would be an ideal step towards stemming inflation and lessening the strain on the country to the extent of the sum that could be released to the Plan. Such a measure is, of course, easily said, but is very difficult to be implemented.

A notification issued in New Delhi contains no change in the export duty on tea for the month of June, which is 25 nP per lb. The price of tea for determining the export duty is fixed at Rs. 2.47 per lb., as against Rs. 2.41 for the last month. The price is fixing taking into consideration the London rates for the previous month. In the Mincing Lane auctions held last month, prices were unexpectedly better, and that accounts for the increase in price for determining the export duty, although, in Calcutta auctions during May, prices were easy. The trade and industry have often pointed out to the unfairness of this system.

Conditions in the internal sale held on Tuesday last week were better and the dusts on offer aggregating 19,769 chests recorded slightly higher prices, as the auction developed. Medium C.T.C. Assams possessing useful liquors were occasionally sought at higher rates, while the best C.T.C. Assams met with less support. All clean leaf teas were about firm, although buying for the Middle East was restricted. An irregular tendency was recorded in the dullish teas, representing end-of-season character. The quotations were: Medium Assam C.T.C. Re. 1.55 to 1.65, medium Assam grainy dust Re. 1.50 to 1.55 and medium Doors Re. 1.40 to 1.45, the C.T.C. best Assams being unquotable.

Prices of the leaf grades on offer amounting to 325 chests were easy.

FOODGRAINS STEADY

(From Our Own Correspondent)

HAPUR, 3*rd June*

Quiet conditions were witnessed in the foodgrains market during the week under review. Requisitioning of food stocks at the average prices for the last three months instead of at the current price has been decided by the Government and, for this purpose, the Government has armed itself with necessary legislation. The possibility of tightening the credit squeeze to make it difficult for traders to earn undue profits is under the examination by the Ministry of Food and Agriculture in consultation with the Finance Ministry and the Reserve Bank of India. As traders view these moves with serious apprehensions on account of their far-reaching implications, they are now unwilling to enter into large commitments.

Wheat at Hapur was mostly unchanged during the week. Average *dara* quality was quoted at Rs. 14.50 per maund and farm quality at Rs. 16.50. Daily arrivals were at an average of 2,000 maunds and local stock under *khaties* was put at 31 *khaties* of 800 maunds each, besides some quantity stored outside for early despatch. Some despatches were made during the week to Gujerat and total arrivals of wheat here from the beginning of the season were 80,000 maunds, the corresponding figure last year being 68,000 maunds when local stock was estimated at 53 *khaties*.

Rice continued to rule steady. There were reports that the Government apprehended that substantial stocks of rice had passed out of the producers' hands to those of traders and that rice would be the first grain to be requisitioned. The prevailing prices of rice are: *Basmati* Rs. 27 to Rs. 29, *Mainpuri sela* Rs. 24 and coarse quality Rs. 18.25 per maund.

Despite a fall in gram prices in the most producing areas of Punjab, gram at Hapur continued to be steady, due to loading restrictions from Punjab. Local stock was put at 30 *khaties*, as against 12 *khaties* a year before. Barley recorded modest gains during the week, thanks to paucity of local stocks, while *bejhar* fractionally eased, as stocks had gone up to 11 *khaties*. Jowar was mostly unchanged, while some gains were recorded in the price of *guwar*, due to increasing demand. The latest prevailing prices were: Gram Rs. 11.50 to Rs. 12; barley Rs. 11.6; *bejhar* Rs. 10.37; *jowar* white Rs. 14.75 and brown Rs. 12.87; *guwar* Rs. 12.62.

Peas continued to be steady, due to continued good buying enquiry from the main consuming areas of Assam and Bihar and, as local daily arrivals were at an average of 1,000 maunds daily, local stock ran down by 3 *khaties* during the week to 51 *khaties*. *Arhar* was, however, depressed, as outside demand was slack and stocks were daily increasing, due to arrivals at an average of 1,000 maunds. Other pulses were quoted at almost unchanged prices. The prevailing prices (in rupees per maund) were: Peas *dara* green 11.25 and white 12.50; *arhar* 11.87; *urd* 18.75 to 21.50; *moong* 15 to 17; *masoor* 15 to 16.

Pulses futures ruled quiet during the week. Peas *bhadon* was quoted at Rs. 11.47 and *arhar bhadon* at Rs. 12.20, as against the week's opening level of Rs. 11.39 and Rs. 12.46, respectively.

The Japanese Finance Ministry officials have issued a warning that Japan's textile industry is now facing a crisis. In a Survey published by the Ministry, the officials say that the Japanese economy is showing several danger spots, with the textile industry in the most serious position. Overproduction, power shortage and transportation difficulties are cited as the major handicaps. The recent increase in interest rates by the Bank of Japan is not considered to be the cause for the current economic troubles of the textile industry, though it is maintained that higher money rates will soon show their effects on the entire Japanese economy.

An increase in the amount of money to be spent on research, especially in the further development of improved qualities of wool textiles, and worldwide intensification of all promotional activities, were among the decisions reached at the annual meeting of the Executive of the International Wool Secretariat, just concluded in London. The meeting also agreed to an extension of the joint promotion campaigns with wool industry and wool trade of the world, and consolidation of the work of the 13 branches of the International Wool Secretariat and the Wool Bureau, Inc., of U.S.A.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.= Deferred shares. P.O.= Preferred Ordinary shares. Y= Accounts published yearly. H.= Accounts published half-yearly. P.= Company has Preference shares. T.= Company has Debentures. N.= Nominal quotations. x.d.= Ex. Dividend. c.d.= Cum. Dividend. i= Interim Dividend. f= Dividend for first half of year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings machinery and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

TAX PROPOSALS MODIFIED

THE Finance Minister, Mr. T. T. Krishnamachari, announced in the Lok Sabha on Friday last, a number of changes in the budget proposals made by him on 15th May 1957. The changes are as follows:

Excise Duties: The increases proposed in the rates of excise duty on tea and coffee have been withdrawn. With regard to matches, it is proposed to give adequate protection to small producers. The question of relief in respect of excise duty on tobacco is being examined and the difficulties that have been pointed out and found to be genuine will be remedied by administrative action.

Postal Rates: The increases in the rates of post cards, including local cards and on parcels, have been dropped. It is now proposed that the initial slab of weight for inland letters, including business reply envelopes, should be raised from one tola to 1½ tolas and the rates for such inland letters should be raised from 13 nP to 15 nP. The additional weights will also be computed in 1½ tolas, instead of 1 tola as at present, and the rate will be increased from 6 nP to 10 nP.

Railway Fares: Exemption is proposed to be granted from the tax on passenger fares for the first 15 miles. But there will be a tax of 5 per cent. on journeys above 15 miles and upto and inclusive of 30 miles. The other slabs will remain as proposed in the Finance Bill.

Income-tax: While the minimum taxable limit will remain at Rs. 3,000, it is proposed to make a further addition to the marriage allowance already provided for. There will be an allowance of Rs. 300 per child subject to a maximum of Rs. 600. But this allowance will not be admissible to persons with incomes above Rs. 20,000. In these cases, the marriage allowance of Rs. 2,000 provided for in the budget proposals will be withdrawn.

Wealth Tax: A wealth tax holiday is proposed for the first five years from the date of incorporation on the value of the assets pertaining to an industrial undertaking of a new company. However, such an undertaking should not be formed by the splitting up or the reconstruction of business already in existence or by transfer to a new business of buildings, machinery and plants already used in an existing business. It is also proposed that investments of one company in another company should not be included for the purpose of wealth tax in the hands of investing company.

DELHI LETTER

(*Concluded from page 1132*)

If the Government's expenditure in 1957-58 out of the year's estimated national income of about Rs. 11,870 crores constitutes 12.3 per cent., Government's contribution to the national product (through wages and salaries on the administration side, net output of departmental commercial undertakings and wage and salary component of Government outlay on construction) constitutes 4.5 per cent. As capital formation directly and indirectly by the Central Government constitutes 7.3 per cent. of the national income, such capital formation which is overwhelmingly in the public sector may be said to absorb at least three-fourths of the savings of the community as a whole if the rate of savings in 1957-58 is liberally assumed at 9.5 per cent. of the year's estimated national income. The lesson is obvious: the private sector is having less and less of the community's savings to draw upon for its expansion. How, in the circumstances, the private sector could reach its investment targets under the second Plan is anybody's guess. If the direct impact of the Central Budget on the economy is of this serious magnitude, one may well infer what the indirect effects of taxation on incentives would be.

Twenty-two Government intermediate colleges in Uttar Pradesh will be converted into multipurpose colleges from the next academic session, according to a plan which is being finalised by the State Education Department. Metal crafts of higher technological type, overseers course, textile technology, and commercial and industrial education will be introduced in the proposed multipurpose colleges.

VOL. XCIV. No. 2414 BOMBAY, 15th JUNE 1957 PRICE: Re. 1.50

KERALA'S FIRST COMMUNIST BUDGET

THE accession of the Communist Party to power in the Kerala State two months ago came as a shock to the protagonists of democracy in India and elsewhere in the world. It was, however, noted that the Communists captured power through constitutional means and that, however much one disliked the basic creed of communism, it would go against the grain of democracy to try to dislodge them from power through unconstitutional methods. The Congress Party is fully aware of this principle and the fact that it readily allowed the Communists to form a Government in the Kerala State despite their slender majority is proof of its respect for this principle. The view has often been expressed that the Communists in Kerala will soon lose their hold on Government by their own excesses. This may prove to be mere wishful thinking, for the principles, the policies and the practices of the Congress Party itself can be very conveniently used by the Communists not only to retain the power they have already secured but also to expand their influence over the masses. Indeed, there is even a strong possibility of their ideals gaining ground within the Congress Party itself, much the same way as those of the Socialist Party has done in the past few years.

The Communists in Kerala have made a good beginning in beating the Congress Party with its own stick. Thus, in the State budget for 1957-58, they have shown themselves to be braver than the Congress at the Centre in wielding the weapon of confiscatory taxation. They have also boldly announced that they will soon have a separate State Trading Corporation through which will be channelled the exports of commercial crops from Kerala. They have stated that the object of this Corporation is "to ensure reasonable prices for the agricultural products exported from the State." But there is no certainty that they will not use this Corporation later for enhancing the revenues of the State and for strengthening their influence over the masses and the traders as well. Just as the Congress Party has succeeded in retaining the support of the mercantile community through its system of checks and controls, there is every possibility of the Communists also trying to do the same thing. State trading, it may be noted here, is a convenient instrument for both conferring and curtailing favours and privileges. When Mr. T. T. Krishnamachari first established the State Trading Corporation, he sought to silence his critics by saying that it was necessary to prevent the spread of communism into the country, through India's trade contacts with Russia, China and Eastern Europe. The S.T.C.'s main function has, however, been to take over the business from the hands of established traders without paying a single pie by way of compensation. There is no doubt that the Communists in Kerala will also use their State Trading Corporation for similar purposes.

The present Finance Minister is the principal architect of the Congress Party's latest formula of getting control over commercial undertakings without nationalising them, which requires payment of compensation. It was he who propounded the idea that social control is superior to social ownership. Thwarted in their attempts at nationalising plantation estates held by foreigners, the Communists seem to be copying the methods adopted by Mr. Krishnamachari, in order to realise their objectives, so that the Centre can raise no legitimate objections. They would appear to have stuck to constitutional propriety in the new taxes they have proposed as well as in deciding to have a separate State Trading Corporation for regulating the external trade of the State in commercial crops. Indeed, they claim that they are entitled to approbation for having more than adequately covered a revenue deficit of Rs. 225.24 lakhs in their 1957-58 budget and producing an actual surplus of Rs. 7.33 lakhs, a performance which no other State Government has so far done. After all, did not the Prime Minister chide the State Governments at the last meeting of the National Development Council for presenting deficit budgets and depending upon the Centre more and more for additional funds? Naturally, in imposing additional taxation on the people, the Kerala Communists can proudly claim that they have only carried out the behests of the Prime Minister and that, too, in the same pattern as that adopted by the Centre itself this year. If, therefore, the Centre feels embarrassed by what the Communists have decided to do in Kerala, it has only itself to blame.

The tax proposals of Kerala are in close parallel to those of the Centre for 1957-58. The Centre introduced a wealth tax on non-agricultural properties and investments. The Communists in Kerala have applied this tax to agricultural properties and investments; thereby they hope to get Rs. 16 lakhs a year. The Centre increased the tax on corporations in a number of ways. Kerala has sought to do the same thing to companies with agricultural incomes; thus, it has decided to impose an additional super-tax ranging from one anna to four annas on companes with agricultural incomes between Rs. 25,000 and Rs. 10 lakhs or over. This measure is expected to bring in Rs. 65 lakhs per year. These imposts are on top of a burden of Rs. 98.61 lakhs arising from the unification of the land revenue system in Travancore-Cochin and Malabar and the extension of the basic land tax and agricultural income-tax to Malabar also. Thus, out of new taxation estimated to yield Rs. 232.57 lakhs, the share of agriculture alone is Rs. 179.61 lakhs. In addition, agriculture is called upon to pay, along with other professions, a special surcharge for covering the mounting expenditure on education. This surcharge is 5 per cent. on agricultural income-tax and super-tax, and 2½ per cent. on sales tax payable by traders with a turnover of Rs. 30,000 or over, as well as on profession tax of those with an income of Rs. 250 or over per month. As against this, the education cess of three annas per rupee on land revenue prevalent in the Malabar area is to be abolished. This educational surcharge is expected to fetch Rs. 12.96 lakhs. Unification of sales tax in the two integrating units (T.-C. and Malabar) and the extension of the tax on travellers and parcels in buses prevalent in Malabar to Travancore-Cochin area are expected to yield Rs. 20 lakhs each. In effect, therefore, integration of Malabar with Travancore-Cochin has provided the rulers of the integrated State a convenient method of finding additional revenue of the order of Rs. 140 lakhs. Well, since the Keralites asked for a linguistic State, they cannot complain about the extra tax they are now asked to pay.

That, however, is only an incidental comment. The more serious issue is the effect of the new tax proposals on the economy of the country as a whole. Agricultural companies in Kerala—and almost all of them belong to the plantation group—have already been paying an agricultural income-tax of As. 4 plus a super-tax of As. 2. Henceforth, they will have to pay as much as As. 10½ in the rupee, if their income is Rs. 10 lakhs or more. In the case of companies with lower income, it will be between a little over As. 7 and As. 10½, depending upon the level of income. These rates compare with the recently enhanced maximum of a little over As. 8 payable by companies with non-agricultural income. In the case of a large number of plantation companies, the rate of taxation will be higher than that payable by their industrial counterparts. Thus, the Communist Government in Kerala has gone a step ahead of the recommendation of the Taxation Enquiry Commission which only wanted the tax on agricultural incomes to be brought on par with that on non-agricultural incomes. It should not be forgotten, in this connection, that, in addition to the enhanced taxation of agricultural incomes, the plantation companies will have to pay a wealth tax as well.

Considering that agricultural incomes are a gamble on the monsoon—this is particularly so in regard to such rain-fed plantation crops as tea, coffee, rubber, and cashewnuts—there is very good reason why the taxation of such incomes should be on a somewhat lower scale than that applied to fixed incomes and incomes from manufacturing activities. This is an aspect which the Taxation Enquiry Commission had ignored, but it does not cease to be worthy of consideration just because the Commission did not recognise it. In view of the widely fluctuating character of agricultural incomes, it is only but just that the recipients of such income should be enabled to set aside a sizable part of their profits during the prosperous years to meet the lean years and to provide for replanting. Another consideration to be borne in mind in taxing plantation companies is that it takes several years for the plants to yield an income and, after a particular period of active life, they cease to yield a return. This is particularly true of rubber and pepper.

By ignoring all these important considerations, the Kerala Government has made investments in plantation industries an unattractive proposition. It is well to remember, in this context, that the cost of production of all plantation crops has gone up considerably, owing to several labour welfare measures, amenities, higher wages and bigger bonuses, as well as to increased prices of fertilisers, stores, machinery, etc. The various taxes payable by them have also gone up in recent years. The new imposts may, therefore, serve as the proverbial last straw on the camel's back. Accordingly, the new taxes,

coupled with the threat of State Trading in commercial crops, will adversely affect the flow of savings into plantation industries, in general, and those in Kerala, in particular. This, in turn, will endanger, in course of time, India's export trade to which Kerala's commercial crops make a substantial contribution. Another adverse repercussion will be on the foreign exchange resources of the country, in that the action of Kerala Government will provide a strong impetus to repatriation of foreign capital invested in plantation industries not only in Kerala but also elsewhere in South India. Further, it constitutes one more deterrent to the inflow of foreign capital. Thus, the Communists in Kerala are indirectly achieving one of their cherished objectives, namely, to force the exit of foreign private capital already invested in this country and to prevent any fresh inflow of such capital from the free world. It is needless to add that this is part of their grand design to get India drawn into the communist orbit, by cutting off its connections with the free world. The tragedy of it is that the Congress Party itself has shown the way to the Communists as to how they could bring about this result through constitutional means.

Apart from their proposal to take over the export trade in cash crops, the gross annual value of which is put at Rs. 122.30 crores, the Communists' hostility to free enterprise is evident from their attitude towards road transport and taxation of middle class. The Finance Minister of Kerala has declared that he will not allow private road operators to pass on the incidence of tax on travellers and parcels to passengers and the owners of parcels. This means that the bus-owners must reduce their profit-margin and, where they cannot do so, they are welcome to close their business. Referring to the middle class, he is reported to have said that a monthly income of Rs. 250 could not be regarded as a middle-class income. Apparently, in his opinion, even those who draw a salary of Rs. 250 per month in Travancore-Cochin State are rich people and should be taxed as such. The only inference that one can draw from this statement is that it is an invitaton to all the talented and ambitious young persons of Kerala to quit their State in search of opportunities elsewhere. It is amusing to hear after all this that the Kerala Government seriously expects private enterprise to take an active part in the industrialisation of the State.

STATE TRADING

EXPERIENCE in all free countries shows that State trading, which may show some glittering results in the beginning, almost always ends in considerable loss to the public exchequer and destroys that "foreign" confidence on which a country's export and import trade ultimately rests. It would be surprising if the experiment in State trading, now being carried on in this country, turns out to be a successful model of this kind. It is true that the State Trading Corporation, the body formed by the Union Government to undertake State trading, has confined its activities only to a few commodities. Even so, the range of its activities is expanding. And what is, perhaps, particularly deplorable, there is no knowing what trade it will not enter nor what trade it will not monopolise for itself. India's business community has to live in perpetual dread of being dispossessed of its means of living. This is, in itself, a serious development. But what makes it even more reprehensible is that the Corporation's ambitious expansion plans may prove detrimental to the country's export trade.

We had occasion recently (*vide Commerce* dated 25th May) to point to the failure of the State Trading Corporation in the matter of arranging for imports of cement, though it has merrily continued to profit by the margin loaded into the retail price of cement based on considerations of high-priced imports of this commodity. On the export front, the Corporation has shown a special fascination for ores—iron and manganese ores. After a brief experiment in State trading in these ores, the results of which have not been the subject of any impartial inquiry, the Government has decided to change the pattern of trading in these commodities in a way that suits the Corporation's interests best. For iron ore, the Corporation will be the sole agency for export. An official Press note avers that the Government has come to the conclusion that, "if the exports of iron ore are to be maximised, it will be necessary to canalise its exports through a single agency to be nominated by the Government." This procedure, it is claimed, would "prevent fragmentation of quotas, facilitate bulk movements, help co-ordination of rail movement with shipping programmes and, above all, make it possible for the development of mining to be synchronised with the availability of transport." This is a laboured *apologia* for State trading in iron ore which is hardly likely to be convincing. Indeed, if truth is to be told, the Government wants to take over trading in iron ore, presumably because it feels that it is a profitable line of business, and is now at some pains to advance some specious arguments in justification of its new policy. All this is a strange, if not also crude, method of laying down policies for State trading.

Be that as it may, the Government has decided to entrust the responsibility for canalising the exports of iron ore to the Corporation with effect from 1st July 1957. The Corporation is, however, expected to ensure that "every established shipper and mine-owner is given an opportunity to participate in the business relative to his performance during the four-year period ended December 1956 and that the interests of mine-owners who are not shippers are duly safeguarded." In this connection, the Government, it is stated, is keen "to ensure that established trading and mining interests participate fully in the business." Actually, this is making a virtue of necessity. For, as is well known, the Corporation does not possess any organisation which can effectively displace established trade channels without which it cannot carry on the functions assigned to it.

As regards manganese ore, the Government has announced that, during the period July 1957 to June 1958, exporters and mine-owners will receive quotas on the basis of 60 per cent. of their exports made in 1955 or 1956. Quota-holders will be required to utilise at least 60 per cent. of the quota issued to them for the export of the ore containing 42 per cent. manganese and below. This restriction will, however, not apply to mine-owners who establish to the satisfaction of the export trade controllers that their mines do not produce manganese ore containing less than 42 per cent. manganese and to those shippers and mine-owners who have outstanding commitments for higher grades. The State Trading Corporation, it is stated, will be allotted an adequate quota to enable it to maximise the exports of manganese ore. Announcing this procedure, the official Press note adds: "The Corporation is being advised to seek the co-operation of established trading and mining interests to make this effort a success. In particular, the Corporation will be expected to encourage co-operative mine-owners to participate in the export of their produce." Export of low grade manganese ore from Garividi-Srikakulam, Bobbili, Salem and Raigad areas will continue to be licensed freely on production of foreign sale contracts.

It is thus clear that, while the Corporation will be the sole agency for channelling exports of iron ore, it is being groomed for an increasingly important role in respect of exports of manganese ore. Apparently, the Government has not stopped to inquire whether private traders have failed to maximise exports, and, if they have failed, whether the position could be improved only by giving the Corporation monopoly facilities in respect of ore exports. These are vital questions. And the Government ought not to ignore them.

Naturally enough, the trading community has been sorely exercised over the recent decisions of the Government in the sphere of export trade in ores. It would appear that the Western India Minerals Association has withdrawn its representative on the Liaison Committee appointed by the Ministry of Commerce and Industry. While we appreciate the Association's sense of righteous indignation—it is stated that its representative's views have not been "properly listened to or respected"—we wonder whether the situation warrants the extreme step of non-co-operation taken by the Association. It is to be hoped that the Government and the business community will be drawn closer together and the Liaison Committee will, as its name implies, function really as a liaison body, serving as an effective link between the Government and the public.

Meanwhile, the Government will do well to clarify its policy in relation to State trading. So far, this policy has been shaped, rather misshaped, by *ad hoc* decisions taken in respect of commodities selected at random. The business community has a right to know where it stands in relation to the Corporation. This is not an entirely domestic matter either, for it affects India's trade relations with foreign countries. Generally speaking, the Corporation can play a constructive role in taking upon itself the responsibility for trading with countries with centralised economies. At the recent meeting of the Export Advisory Council, the Union Minister for Commerce and Industry, Mr. Morarji Desai, said: "I have been gratified to see that the effort put in by the State Trading Corporation to build up a mutually invigorating partnership with the trading community is slowly bearing fruit. The Corporation has in the first year of its existence succeeded with the co-operation of the business community in helping to diversify the country's foreign trade, to maximise the export of some difficult items, and to enlarge the scope for bulk deals in mineral ores." Clearly, this sentiment is not shared by the business community, as witness the recent withdrawal of the Western India Minerals Association of its representative on the Liaison Committee and the general fears about State trading voiced by some members of the Council. At the meeting of this Council, the fear was expressed that great harm might be done to the country, if the Corporation entered export fields indiscriminately. This is a genuine fear. And the Government cannot allay it by continuing to arm the Corporation with monopoly powers and assigning to it special responsibilities for which it has no technical competence and which can be more efficiently discharged by the mercantile community, given the necessary facilities in the matter of transport. In the long run, it will be found that the country has had to pay heavily for ideological changes in the sphere of foreign trade.

GAS PRICE

ECONOMICALLY speaking, the Bombay Gas Company's case for an increase in the price of its gas is so strong that it is somewhat surprising that the Government of Bombay should continue to dodge the issue. For one thing, the pent-up demand for gas in the city is already great. Secondly, this demand, if anything, is likely to grow, thanks to the altered status of the city as the capital of a larger bilingual State and the steady improvement in the living standards of its citizens. Thirdly, gas plays so vital a role in kitchen cleanliness, and in the educational, medical and scientific spheres that any measure designed to increase its output should be welcomed as a measure of social welfare. These considerations should certainly induce the Government to facilitate the improvement of gas output by the Company.

The Chairman of the Company, Mr. B. L. Jalan, in the course of his speech at the annual meeting of the Company, held this week, returned to this now familiar theme of increase in gas price. He adduced further weighty arguments—that is, in addition to those advanced in the past—in support of an increase in gas price. Mr. Jalan could point to a commendable increase in the output of gas by the Company; in 1956 it was 1,529 million c.ft., as against 1,511 million c.ft. in 1955 and 1,115 million c.ft. in 1946. But all this effort avails the Company little. For it continues to face increase in production costs necessitated by the Rs. 3-increase in the price of coal with effect from 1st July 1956, surcharge on coal freight and the increased wage bill. A further increase in coal price is in prospect and, when this materialises, the Company's costs are bound to go up even higher.

It would appear that the Government of Bombay has at last agreed to appoint a committee to go into the question of gas price. But the question has been complicated by the Government's insistence that the Company should finalise the issue relating to the price of sludge gas it must buy from the Municipal Corporation for purposes of mixing with its own gas. Mr. Jalan does not naturally want these two issues to be mixed up, for the Company's production costs started going up long before the sludge gas issue came up. It is to be hoped that a satisfactory solution to this problem will be found. In any case, the larger question of an equitable price for gas deserves early and sympathetic consideration in the light of the Company's valid case for such an increase and the growing demand for gas. A sign of this demand is to be found in the fact that the public is prepared to pay Rs. 3.78 per therm of oil refinery gas, as against the Rs. 0.905 charged for its gas by the Company. Surely, the investors in the Company who have served to save in the past ten years over Rs. 94 lakhs in foreign exchange, which would have been lost if the Company had continued to be foreign-owned, deserve a better deal than the one they have got.

EQUITIES TEND TO SAG AGAIN

STERLING—INTEREST RATES—INSURANCE OILSEEDS—COTTON

THURSDAY, 5 P.M.

AFTER presenting a steady to firm trend for three weeks in succession, the share markets all over the country have begun to sag again. Almost all the leading scrips in Bombay have wound up the week with losses in varying degree. Textiles have been the worst sufferers. Movement of cloth and yarn is not as good as it ought to be at this time of the year. Stocks with the mills are accumulating. While cost of production has gone up, mills' selling prices have not, so that their margin of profit has been progressively shrinking in the past few months. Tata Steels are quiet, because of reports from influential quarters that the dividend for 1956-57, due to be announced next month, will be no more than Rs. 8 per share; some feel that it may be only Rs. 7-8. Indian Irons have retreated in sympathy from the higher level touched earlier. There have been some speculative selling in A.C.Cs. Values in the Bombay market would have actually suffered more but for the consistent support extended by the Life Insurance Corporation to steels, cements and a few selected miscellaneous counters.

MARKET GOSSIP

The first budget of the Communist Government in Kerala, coupled with its move to have a say on exports of commercial crops from the Kerala State by establishing its own State Trading Corporation, has given a fresh jolt to investors. Bombay Burmahs in the local market were badly shaken by this development, though its tea estates are in Madras State. Apparently, operators decided to play for safety, lest the Madras Government, too, should follow the example of its confrere in Kerala. The fear of the Bombay Government introducing a stiff rate of agricultural income-tax in its forthcoming budget has led to some selling in Deccan sugar shares, such as Belapurs, Phaltans and Walchandnagars.

The Madras Stock Exchange has fixed minimum prices for all the plantation shares in order to avoid a severe slump. There are serious apprehensions that the Madras and Mysore Governments may follow the example of Kerala and subject agricultural incomes to higher taxes and agricultural assets to Wealth Tax. It is to be hoped that they will desist from doing so. The Centre and Kerala together have done enough damage to investors' confidence. If, on top of this, they too were to impose additional taxation, the plight of investors, most of whom are middle-class people, would become very serious. There might even be a collapse of investment markets, in which case neither the State Governments nor the Central Government would be in a position to put through their borrowing programme successfully. Even as it is, the prospects for their proposed loans are not quite bright; they would become worse, if they depressed the equities further by imposing fresh taxes. They will do well to follow the example of West Bengal, Assam and Orissa which have left their revenue deficits uncovered and propose to reduce the gap by tightening the loopholes in the collection of existing taxes.

The Wealth Tax and the Expenditure Tax may or may not have a bullish import to equities in the long run. But, in the shortrun, they are, according to many leading share brokers, bound to have a bearish effect, because those who are liable to these taxes will have to sell a part of their investments in order to meet their liability. Even assuming that only one-third of Rs. 15 crores which the Finance Minister hopes to collect this year by way of Wealth Tax represents the share of individuals, the share markets should be in a position to absorb Rs. 5 crores of disinvestment, and that on top of such new rights issues as may be offered by some of the existing companies, as, for instance, the Dunlop issue, and the proposed offer of "Telco" which has already depressed the market value of this scrip from Rs. 143 to Rs. 137 in less than 10 days. It is contended by these circles that the markets will not be able to absorb this load without a further marking down of value, unless, of course, the Life Insurance Corporation comes to their rescue. It remains to be seen whether the Corporation will readily oblige them. But a rumour claims that the Government has given directions to the Corporation to keep a close watch over the trend of equities and pick up good scrips whenever they happen to be offered at attractive levels. There are indications sufficient to infer that the Central Government is not in favour of any further fall in equity values.

* * * *

The pound sterling has again tended to weaken against the American dollar, the latest available spot rate (New York on London) being $2.78.13/16-2.78.15/16, as against $2.79¼-2.79¼ a fortnight ago. This is not surprising, considering the disappointing position of the sterling area gold and dollar reserves as revealed by the latest official monthly statement released in London. The total reserves during the month of May rose by a very negligible sum of $25 million to $2,345 million, which increase compares very unfavourably with $111 million and $62 million in the previous two months, respectively. Even this improvement was brought about solely by an increase of as much as $34 million in receipts from the European Payments Union and of $1 million in aid and special payments or credits. But for these increases, the reserves at the end of May would, indeed, have been lower by $10 million, that is, the loss in direct dollar balance.

Despite the prospect of a "tailing off" in expenditure of dollars on oil in the coming months, the gold and dollar reserves of the sterling area are expected to show a downtrend. This expectation is based on the likelihood of pressures on sterling exercised by (*a*) the overvaluation of the French franc, (*b*) the continued inflationary trend in the U.K., thanks to excessive wage increases and widening gap in balance of payments, and (*c*) the persistent investment demands of other members of the sterling area, particularly of India.

Nevertheless, the position is not considered to be serious or grave. That there is no exaggeration in this view is in a way evident from the relaxation in restrictions on British travel to the dollar area announced by the U.K. Government the other day. The basic travel allowance of £100 a year per person will be available in future for travel to the dollar area also, in the same manner as for travel in the transferable account area. This concession is expected to be soon followed by an upward revision in the business allowances for the dollar area from £14-10 to £18 per day. The concessions, however, do not involve any heavy "real" drain on the sterling area's dollar reserves, inasmuch as the loss of dollars will be outweighed by the benefit to the U.K. of better relations and trade with the U.S. and the Commonwealth.

While it is difficult to forecast with any degree of certainty as to how far and to what extent the pound sterling will be subjected to pressure in future, this much can be said, namely, that prospects of an early return to currency convertibility are very dim. The British Government is reported to feel that it will not be possible to contemplate formal convertibility for the pound until the early 1960s "at the earliest." Even Western Germany, which has gold and dollar reserves aggregating about 50 per cent. more than that of the central pool of sterling area countries, is believed to be still holding back. This is attributed to the fear that "any European country that goes alone for convertibility may find its trade and payments suffering, because the other countries will thereafter use its currency **for the purpose of acquiring** dollars from it rather than for buying its goods."

Considering the dim prospects of early currency convertibility thus, it may sound somewhat surprising to hear that Mr. E. M. Bernstein, Director of the Research Department, International Monetary Fund, had told the International Chamber of Commerce recently that "notable progress" had been made over the past few years towards convertibility "in the formal sense." But there is considerable force in this contention. For, as Mr. Bernstein rightly observed, while only ten members of the Fund—all in the dollar area—have as yet made their currencies convertible in accordance with the Fund's Articles of Agreement, most of the great trading nations have now acquired a high degree of *de facto* convertibility. For a considerable time now, the transferability of sterling has been extended practically to all non-dollar countries, while other important European countries have given their currencies equal or nearly equal transferability. At the same time, these currencies have been steadily approaching official parity rates in the free exchange markets. Notable progress is also said to have been made in the direction of abandoning discrimination against dollar goods imported into the U.K. and some West European nations and, in most of the sterling countries, a substantial proportion of imports are now made on a competitive price basis rather than on a currency area basis.

* * * *

The Bank for International Settlements, in its latest report, covering 1956 and the first few months of 1957, has emphasised the need for resolute action by European countries for countering inflation and tackling the balance of payments difficulties, which threaten the considerable progress made so far towards the achievement of general currency convertibility and the liberalisation of trade. An indication of the degree of disturbance caused to the economies by these two features is given by the fact that, during the period covered by the report, as many as twelve European Central banks changed their official discount rates. Outside Europe, too, similar changes were witnessed, as, for instance, in the U.S., Canada and India.

In all these countries, except in the U.K. and West Germany, where a reduction was effected in recent months, the revision of discount rates was in an upward direction. It is noteworthy, however, that the number of changes in discount rates, as well as the number of important commercial countries that restored to them, was smaller during the period under review, as compared with 1955. The reduction in the number of countries using this weapon was found, at the same time, to have been accompanied by an increase in countries which revised the minimum reserve requirements to be observed by the credit institutions. This shift in emphasis was perhaps due to the insufficient success in the use of discount rate weapon in controlling the inflationary pressures. Thus, though volume of money supply was controlled through dear money policy, prices continued to increase due to the increased velocity of circulation of money. Apparently, it was for arresting this trend that a resort was made to increasing use of the weapon of minimum reserve requirements.

These developments thus bring into bold relief the increasing realisation on the part of the Governments of two aspects of the problem. First, there is the need for the budgetary policy and monetary policy to go hand in hand. Explaining this point, the report observes: "Indeed, even if a budget deficit is financed by recourse not to the banks but to the public, it may make monetary policy more difficult since it absorbs funds which would otherwise have been available for the financing of private investment, so that a tighter monetary policy is required in order to keep saving in line with investment. And even a balanced budget, if the level of public expenditure is very high, may have the same effect."

The second aspect is the widespread loss of faith in the efficacy of dear money as a disinflationary weapon. This is so, according to certain competent London financial circles, chiefly because the real rate of interest which the borrowers have to pay tends to be lower in real terms than what it appears to be on the face of it. This is so "because of the tendency for the value of money to fall so persistently that a borrower often finds that he has to pay back less in real terms than he gained when he took up the advance even after allowing for interest charges."

In this connection, an examination of the movements in the real rates of interest made by the B.I.S. report will be of interest. The report analyses, for this purpose, the effect of the fall in the value of money on the position of investors in fixed interest securities. The analysis reveals that, in the U.S., during the last decade, the annual rate of depreciation of money amounted to 3.7 per cent., whereas the annual yield on U.S. long-term Government bonds was only 2.2 per cent. This feature is not confined to the U.S. alone.

The B.I.S. report, however, points out that the rise in interest rates which took place everywhere in 1955-56 and the measures taken to hold inflation under check justify the hope that not only the nominal rate but also the real rate of interest will be positive in future. This, obviously, depends on the success achieved in controlling inflation over a wide front in the world.

Another noteworthy feature of the B.I.S. report is that, as a result of different degrees of inflationary pressures and balance of payments difficulties the countries covered by the report experienced, the uneven distribution of gold and foreign exchange reserves became even more uneven during the period under review. A notable example of this is provided by West Germany, which witnessed the biggest increase—of the order of $953 million—in its gold and dollar holdings last year. This amount was more than the combined loss of the Continental European countries. France alone, among these countries, lost no less than $451 million.

* * * *

One of the best inducements that can be provided for stimulating savings is to assure the saver that what little he conserves through abstinence from current consumption will be left intact for his future enjoyment. The subtleties of the modern monetary economies are such that they can, by the ingenious device of inflation, take away much of the real value of savings, leaving their monetary value unchanged. Savers in every country will, therefore, greatly welcome an assurance to the effect that their savings will not be eroded by the advancing tide of price inflation. Some of the Continental European countries have been trying to do so. And, what is more important, the idea is spreading to other countries also. Thus, in Israel nine local insurance companies have put forward a plan for issuing life insurance policies linked in value either to the official cost-of-living index or to the official rate of exchange of the Israel pound to the dollar. The project is designed, it is needless to say, to encourage savings by guaranteeing the value of the premiums paid. It is in full consonance with the policy adopted by the Israel Government in issuing debentures linked either to the cost-of-living index or to the dollar. The 'linked' policies will be issued, in amounts ranging from I£1,000 to I£10,000, at 85 per cent. of face value valid for 10 years, for a single payment. At the end of the 10-year period, the insured person will receive the value of his premium pegged to the dollar or cost-of-living index. In case of death of the insured, the heirs will be entitled to get the amount. Most of the funds raised in this way are to be reinvested by the insurance companies in the Palestine Electric Corporation. The foreign insurance companies operating in Israel are, however, reported to be averse to such a scheme, as these are opposed to the linking principle.

* * * *

The weakness of the world vegetable oil markets continues practically unabated. Groundnut oil is now quoted in the U.K. at about £125 per ton, as against £149 a year before, or a drop of £24. Soyabean oil and linseed oil are quoted at £121, as against £142-£143. The persistent weakness in recent days has been due to the marked expansion in supplies, following the continuously rising trend of output. The aggregate world production of oils and fats during 1957 is estimated by Mr. J. C. A. Faure of Messrs. Unilever Ltd. at 29.2 million metric tons, which represents an increase of 1.85 million tons as compared with the output of 27.35 million tons in 1956. Production in 1955 was 26.66 million tons and in 1954 about 25.86 million tons. The anticipated output of 29.2 million tons is, it is said, in excess of actual consumption by 500,000 tons. The expanding output, however, may not exercise too much pressure on prices in the coming months, because consumption is also rising. It may be noted here that, while the world production of vegetable oils in the past seven years has gone up by 20 per cent., the world trade in these oils has increased by 35 per cent. There is thus no possibility of appearance of any burdensome surplus of vegetable oils in the world.

* * * *

Delegates and observers from 52 countries were in conclave recently at Istanbul to deliberate upon world cotton problems. The occasion was the sixteenth Plenary Session of the International Cotton Advisory Committee, Washington. The Session happily coincided with a time when the international cotton economy showed visible signs of health.

SHARE MARKET TURNS EASY AGAIN

SIZABLE FALL IN TEXTILES

(From Our Own Correspondents)

BOMBAY, *13th June*

THE Stock Exchange turned distinctly easy during the week under review, in contrast to the steady trend witnessed in the previous week. In particular, textiles were very much depressed, thanks to apprehensions of reduced earnings of mills in the past year, following the continued slump in the piecegoods markets ever since the enhancement of excise duty on cloth with effect from 1st September 1956. As if to prove that these apprehensions were well founded, the Directors of the Simplex Mills Co., Ltd., announced a cut in dividend to Rs. 8.50 per share for the year ended March 1957, from Rs. 12 distributed last year. Further, the Chairman of the Indore Malwa United Mills, in his speech at the annual meeting, struck a note of pessimism with regard to the outlook for cotton mills in 1957. Steel shares ruled easy, as advices from Calcutta were not encouraging. Cement, sugar, engineering and other miscellaneous industrials also staged a retreat, on account of selling pressure and poor buying enquiries.

Tata Ordinaries opened the week on a subdued note at Rs. 153.75, as against the previous day's closing of Rs. 159.50. They came in for persistent selling and moved down to Rs. 155.25 on Tuesday. At lower levels, some support was forthcoming and the scrip steadily recovered to Rs. 158.25 today. Towards the close, however, it was again subjected to selling and receded to Rs. 157 before closing at Rs. 157.50. The net loss over the week was two rupees. Indian Irons opened 5 nP lower at Rs. 18.80 and, after declining to Rs. 18.05 on the 11th inst., recovered to Rs. 18.50 yesterday, but relapsed again to Rs. 18.30 today. The net loss was 55 nP.

There was a sharp fall in prices in the textile section. Centurys were the worst sufferer, the quotation having come down by Rs. 15.50 to Rs. 376.50. Bombay Dyeings fell by Rs. 12.50 to Rs. 512.50 and Kohinoors by Rs. 12.25 to Rs. 271.25. Khataus dropped Rs. 10 to Rs. 160. Svadeshis and Finlays declined by Rs. 8.50 each to Rs. 173 and Rs. 260, respectively. New Greats slipped back by Rs. 7 to Rs. 211. Shree Niwas suffered a similar loss to Rs. 160. Simplex were on offer Rs. 6 lower at Rs. 156. Elphinstones went down by Rs. 5.25 to Rs. 54.75. Central Indias and Indore Malwas decreased by Rs. 3.50 each, the former to Rs. 99.50 and the latter to Rs. 133. Gokaks eased by Rs. 3 to Rs. 170.50. Standards lost a like amount to Rs. 373. Tata Mills declined by 75 nP to Rs. 40.50 and India United Ordinaries by 30 nP to Rs. 9.15.

Activity in the banking section was subdued. Bank of Indias receded by Re. 1.50 to Rs. 137. Central Bank new shares lost 50 nP to Rs. 54. Union Banks eased by 10 nP to Rs. 7.20. Punjab Nationals were unaltered at Rs. 54.50, as also Barodas at Rs. 102. Central Banks, however, evoked some special support and rose by Re. 1.50 to Rs. 53.25. United Commercials were favoured 25 nP higher at Rs. 53.75.

Electricity shares were dull, with prices tending to look down. Andhra Electrics dropped Rs. 3.75 to Rs. 1,197.50. Tata Hydros moved down by Rs. 2 to Rs. 122. Bombay Suburbans fell by a rupee to Rs. 104. Ahmedabad Electrics receded by 50 nP to Rs. 93.25. Tata Powers were quiet at Rs. 1,207.50.

In the miscellaneous section, cement shares lacked support and suffered losses. Associated Cements dropped Rs. 3.25 to Rs. 154. Dalmia Cements declined by 30 nP to Rs. 11.70. Orissa Cements were dull at Rs. 13.05. Digvijays, however, met with special buying enquiries and hardened by a rupee to Rs. 142.50. Sugar shares came in for selling and prices staged a retreat. Walchandnagars went down by Rs. 7 to Rs. 239. Belapurs and Phaltans shed Rs. 4 each to 213 and Rs. 129, respectively.

There was heavy selling in the engineering and mining section. Alcock Ashdowns were depressed at Rs. 262.50, as against Rs. 257.50 last week-end. Tata Locomotives fell by Rs. 3.50 to Rs. 137. Shivrajpurs receded by a rupee to Rs. 76.50. B.P. Petrols shed 16 nP to Rs. 2.30. Indian Coppers declined by 12 nP to Rs. 3.30. Larsen and Toubros were quiet at Rs. 15.30, as also Mahindra and Mahindras at Rs. 15.

Automobile shares staged a retreat. Premier Automobiles dropped Rs. 3 to Rs. 84. Hindustan Motors declined by 35 nP to Rs. 6.65, despite reports that the Company was entering into an agreement with General Motors for the manufacture of a variety of General Motors products in India. Transactions put through in shipping shares were very much restricted, with values moving narrowly. Scindias eased by 45 nP to Rs. 17.40, while Great Easterns were dealt 5 nP higher at Rs. 18.40.

Among other miscellaneous industrials, Bombay Burmah Olds encountered pressure of selling induced by fears of enhanced levy of agricultural tax and slumped from Rs. 533 last week-end to Rs. 509 on Tuesday. After recovering to Rs. 527 yesterday, they again relapsed to Rs. 518 today, but improved to Rs. 530 before finishing lower at Rs. 525.50. The net loss over the week was Rs. 7.50. National Rayons were on offer Rs. 4.75 lower at Rs. 211.50. Wimcos fell by Rs. 3 to Rs. 153. Tata Oils declined by Re. 1.50 to Rs. 41.50 and Tata Chemicals decreased by 35 nP to Rs. 16.15. Port Cannings retreated by Re. 1.91 to Rs. 4.34. India Investment Trusts slipped back by Re. 1.25 to Rs. 69 and Killicks by Re. 1 to Rs. 155. Hindustan Levers shed 55 nP to Rs. 19. British India Corporations lost 25 nP to Rs. 5.60.

Calcutta Stock Exchange

CALCUTTA, *12th June*

In the absence of any new development providing incentive to investors, the drift in equity prices continued on the Calcutta Stock Exchange during the week under review. The speech of the Union Commerce and Industry Minister at the Import Advisory Council meeting left no doubt of the import cuts in store, and it was feared that further restrictions on cash imports of new equipment, replacements and spare parts would affect industrial working. The prospects in this regard affected sentiment. The introduction in Parliament of the Retrenchment Compensation Bill was another factor which chilled the enthusiasm of investors. It was stated that most closures of industrial and trading concerns followed heavy losses; it was said that to force a concern closing down under the pressure of losses to pay retrenchment compensation to workers was a cruel measure. In West Bengal, of the recent closure of four jute mills, two had taken this recourse for economic causes. This was stated in the Assembly by the Labour Minister, Mr. Abdus Sathar. The least that investors expected of Government was inclusion of a provision in the Bill to protect the interests of shareholders in case of closure for economic reasons. If, in such cases, the concerns affected were asked to pay compensation to workers, shareholders feared, the share capital would be affected.

Very few transactions were recorded in the jute section. The increase in hessian stocks held by mills and the strong trend in raw jute prices scared buyers. Howrahs were quiet at Rs. 13.75. Northbrooks declined from Rs. 20.31 to Rs. 19.37. Anglo-India's were marked down to Rs. 132, from Rs. 134.50. Agarparas realised Rs. 7.37, as against Rs. 7.87 previously.

Coals closely followed the heels of jutes and occupied a quiet corner of the market. In the meantime, operators noted the New Delhi report that the Coal Prices Inquiry Committee would go into the question of the cost of production of coal taking into account the awards. The Committee was expected to submit its report within two months. Bengals at Rs. 204 were lower by several points. New Beerbhooms were pushed down to Rs. 13.56, from Rs. 14.37.

Among engineerings, Indian Irons received support from the Life Insurance Corporation. On this account, the share price had improved to Rs. 19.03, before moving down to Rs. 18.24 on profit-taking. A reverse trend took down Jessop and Cos. to Rs. 19.75, from Rs. 22.87, while Guest Keens were maintained fully steady at Rs. 28.

Teas were deserted counters. From Rs. 22.62, Jayabirparas moved down to Rs. 22.12, with Bishnaths encountering support at the unchanged rate of Rs. 18.56.

* * * * *

Madras Stock Exchange

MADRAS, *11th June*

The outstanding event of the week under review was the fixation of minimum prices for all the ordinary shares of planting companies by the Management Council of the Madras Stock Exchange, the minimum being the rates that prevailed at the commencement of business on Monday. This decision was a sequel to the heavy decline in prices that had occurred in the last few weeks and the situation arising from the steep increase in taxes proposed in the Kerala Government budget for 1957-58, presented to the State Assembly on the 8th inst. The tax on agricultural wealth and the new graded surtax on agricultural incomes ranging between Rs. 25,000 and Rs. 10 lakhs or over sapped the morale of the market. The proposals were interpreted to mean a great blow to capital formation and investment in corporate enterprises. The dampening effect of these proposals was so severe that operators were busy liquidating their stocks and getting out of the market, while buyers were extremely scarce. Equity values, as a consequence, tumbled down on Monday. It was in view of this and with a view to arresting a further sharp break in values that the Stock Exchange authorities fixed, as already stated, minimum prices for plantation shares. Even at very low rates, there were no buyers at all. In sympathy with plantings and thanks to reports of sluggish conditions in piecegoods markets, textiles also came in for heavy selling and suffered large losses. The sugar and miscellaneous industries were neglected.

Rubber shares were depressed under the impact of panicky bull liquidation and considerable bear pressure. But for minimum prices, there would have been a precipitous drop in values today. Malankaras fell by Re. 1.75 to Rs. 27. Rajagiris climbed down by Re. 1.50 to Rs. 15.50. Travancore Rubbers receded by a rupee to Rs. 15. Cochin Malabars and Kailas declined by 50 nP to Rs. 6.55 *cum-div.* and Rs. 3.95, respectively. Thirumbadis lost 20 nP to Re. 1.40 and Pullangodes 12 nP to Rs. 2.20.

Among tea shares, Parksides dropped Re. 1.50 to Rs. 13.50. Peermades receded by Re. 1.10 to Rs. 24.75 *cum-div.* (final). United Nilgiris shed a rupee to Rs. 16. Kalaas fell by 65 nP to Rs. 13.25, Nonsuch Teas by 62 nP to Rs. 20.50, Twyfords by 50 nP to Rs. 15.75, Periakaramalais by 38 nP to Rs. 6.90 and Devasholas by 37 nP to Rs. 19.50. Chandramalais declined by 30 nP to Rs. 3.55. Neelamalais eased by a like amount to Rs. 5.20. Nilgiri Teas decreased by 28 nP to Rs. 8.60, Kil Kotagiris by 27 nP to Rs. 5.65. Blue Mountains by 25 nP to Rs. 2.87 and Highlands by 20 nP to Rs. 13.80 *cum-div.* (final).

Deals were put through in coffee shares at reduced prices. Consolidated Coffees fell by 40 nP to Rs. 21.90. Coffee Lands slipped by 20 nP to Rs. 24.60. Puthutottams lost 15 nP to Rs. 3.05. Sheveroys eased by 12 nP to Re. 1.70.

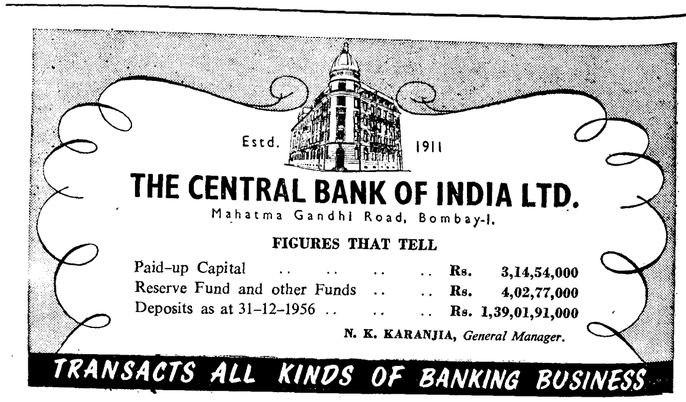
In the textile section, Dhanalakshmis were subjected to panicky selling and slumped by Rs. 30 to Rs. 200. Rajalakshmis climbed down by Rs. 12 to Rs. 112 *cum-div.* on heavy selling induced by cut in dividend from 20 per cent. for the year 1955 to 15 per cent. for 1955. Rajapalayams and Janardhanas dropped Rs. 9 each to Rs. 140 and Rs. 80, respectively. Coimbatore Cottons fell by Rs. 8 to Rs. 142. Pankajas and Premiers finished Rs. 5 lower, the former at Rs. 65 and the latter at Rs. 180. Coimbatore Pioneers receded by a similar sum to Rs. 27. Bangalore Woollens retreated from Rs. 170 to Rs. 166. Saradas and Lakshmis declined by Rs. 3 each to Rs. 90 and Rs. 132, respectively.

Among miscellaneous industrials, Aluminium Industries dropped 55 nP to Rs. 12.60. India Cements slipped down by 30 nP to Rs. 5.40. Spencers shed a like amount to Rs. 16.40 *cum-div.* (final). Mysore Chromes eased by 25 nP to Rs. 4.50.

A BANK MERGER

The Chartered Bank is to absorb the Eastern Bank Ltd., according to a decision arrived at by the Directors of both the Banks this week. The Chartered Bank proposes to make an offer to acquire the whole of the issued share capital of the Eastern Bank Ltd. on the basis of £9 fully paid stock of the Chartered Bank for every two shares of £10 each (£5 paid) of the Eastern Bank Ltd. Full particulars relating to the offer will be set out in a circular letter from the Chartered Bank to the shareholders of the Eastern Bank Ltd., which will be sent to them not later than 22nd June 1957 under cover of a circular letter from the Chairman of the latter bank. The offer will be expressed to be conditional upon, *inter alia*, its acceptance by the holders of 90 per cent. of the issued shares of the Eastern Bank Ltd., or of such smaller percentage as the Chartered Bank may agree to accept.

The main advantages expected to result from the proposed merger of the two Banks are improved opportunities of expansion and the establishment of a combined organisation to operate throughout the Middle East and the Far East. The Directors of the two Banks particularly desire to emphasise that the proposed merger will in no way adversely affect the conditions of service (including pension rights) of their staffs and is not expected to involve any redundancy.



NEWS IN BRIEF

CONTRACTS for a total of 260 buses worth more than £500,000 have been placed with Leyland Motors of Britain by three Indian transport concerns. Of this, 60 buses have been ordered for the State of Bombay. Calcutta is to have 25 double-deckers and 75 single-deckers, to be operated by the West Bengal State Transport.

The Hindustan Machine Tools Factory surpassed all previous production records by turning out a record number of 36 machine tools during May. With this record, it has not only achieved but also far surpassed the annual production target of 400 machine tools fixed for 1960-61 under the original programme four years ahead of schedule.

A consignment of 20 diesel locomotives is expected to leave New York next month for India. These locomotives will be utilised on the Dhanbad-Gaya and Gaya-Moghalsarai sections of the Eastern Railway. Eight more diesel locomotives will be received by India and these will be utilised by the South-Eastern Railway on the new Phusro-Muri line which is under construction, as also on a number of existing sections.

At a meeting of the representatives of various associations of textile machinery manufacturers and merchants dealing in textile machinery held with the Textile Commissioner last week, it was decided to organise an exhibition of textile machinery, indigenous as well as imported, in Bombay during November this year. The object of this exhibition is to spotlight new items of textile machinery and mill stores and to popularise machinery manufactured in India.

The Coal Price Revision Committee, which was constituted last month by the Government of India under the chairmanship of Mr. S. Bhoothalingam, Secretary to the Union Ministry of Steel, Mines and Fuel, to investigate the prices of coal, began its fact-finding mission on the 10th inst., with a two-day visit to a number of collieries in West Bengal and Bihar. The Committee met the representatives of the Colliery Owners' Associations and labour unions in Calcutta.

The Rs. 1.6-crore steel tube mill—the joint venture of Indian and British *entrepreneurs*—was declared open at Avadi on the 7th inst., by the Governor of Mysore. The mill is designed to manufacture annually 12 million feet of electric resistance-welded steel tubes primarily for the cycle industry, but later on for tubular furniture, transformers, boilers and buses as well. The tubes are now made of imported Sheffield steel, but the factory is expected to make use of Tata steel soon when a suitable variety becomes available.

The Kashmir Government will shortly set up a cement manufacturing plant near Srinagar at an estimated cost of Rs. 15 lakhs. The cement factory, which will manufacture between 30 and 60 tons of cement per day, forms part of the State's second Five-year Plan. The Planning Commission approved of the schemes submitted by the State for the establishment of cement, pottery, brick and tiles factories. The Commission has also approved of the expansion and renovation of some of the existing industries, such as silk and woollen textiles, and increase in the local production of raw materials required for these factories.

The Government of India has increased the prices of wire and wire products by approximately Rs. 84 per ton with effect from 25th May 1957. The increase has been necessitated by the uniform increase in the price of various controlled categories of prime steel by Rs. 70 from 16th May 1957. Wire and wire products are made from prime steel. The difference in the prices of prime steel and wire and wire products is attributable to the wastage in the manufacturing process of wire and wire products. The revision in prices, however, does not affect the schedule of extras, and the general and special conditions of sale remain the same as before.

Immediate seismic survey for mineral oil in areas outside those leased to the foreign oil company in Assam is being undertaken by the Oil and Natural Gas Commission. The Director of Geophysics is proceeding to Assam with a team of officers to start work. It has also been decided to depute a team of officers of the Commission to make an on-the-spot study in West Bengal basin, where drilling for mineral oil is being carried out by the Indo-Stanvac project. The Commission finalised the survey programme for the Ganga Valley and is awaiting Government's sanction. Aero-magnetic survey of the area was conducted last year by a team of Canadian experts under the Colombo Plan.

Systematic geological mapping of over 6,000 sq. miles was completed by the Geological Survey of India during 1955-56. The areas included parts of Andhra Pradesh, Assam, Bihar, Bombay, Madhya Pradesh, Madras, Orissa, U.P. and West Bengal. According to the annual review of the activities of the Department, detailed mapping was undertaken in important mineralised areas in Bihar, Madhya Pradesh, Mysore and Rajasthan. Among the detailed investigations carried out by the Department was the drilling in South Karanpura and North Karanpura coalfields for the establishment of State collieries under the second Five-year Plan. In South Karanpura, 107 holes were drilled and eight in North Karanpura. The total depth was about 40,800 feet.

The Government of India is likely to institute shortly a zonal system of food distribution and give farmers a general assurance that grain prices will be maintained at a reasonable level. The proposed measures are in addition to the threefold policy of building stocks, maintaining fair price shops and regulating bank credit for dealing with the food problems. The zones tentatively contemplated at present for restricting foodgrains movements are: Madras, Mysore and Andhra Pradesh; Bombay, Madhya Pradesh and Rajasthan; Uttar Pradesh, Punjab and P.E.P.S.U. Kerala and Bihar are not being considered for inclusion in the zonal system, since they are highly deficit States and are to be fed by imports. Similar considerations may weigh in keeping Assam, West Bengal and Orissa out of the regional scheme.

From Abroad

Turkey produced 24,763 tons of copper in 1956, as against 23,800 tons in 1955. Export rose from 15,848 tons in 1955 to 17,995 tons in 1956.

The U.S. Export-Import Bank has announced a $23-million loan to Iran to strengthen economy and help maintain adequate defence forces. The loan is part of a general agreement which also includes an outright grant of $13.6 million.

An agreement has been signed between Pakistan and Saudi Arabia for minting the Saudi Arabian coins in the Pakistan mint at Lahore. Saudi Arabia is the third Arab country for which Pakistan is minting coins, the other two being Syria and Sudan.

A. U.S. Senate Appropriations Sub-committee voted on the 6th inst. the proposal to keep alive the Soil Bank programme beyond this crop year, as requested by the Administration. The Senate, however, voted to place a $500-million limitation on the amount of contracts.

Under a new Japanese-Swedish one-year trade agreement just concluded, Sweden will adopt a trade liberalisation policy towards Japan's exports. In return, Japan will give imports from Sweden non-differential treatment similar to that given to imports from the sterling area.

Most of Japan's textile industries are planning to curtail their operations, because prices are falling with increasing rapidity in many markets. Production cuts in rayon, rayon staple, cotton and wool spinning are likely to cause unemployment in many sections of the industry.

Increased production facilities, including the construction of a number of blast furnaces, are expected to result in the production of 25 million tons of steel in West Germany this year. This would mean an increase of 1.8 million tons of steel over the 1956 production and 3 million tons over that in 1955.

The Egyptian Finance Ministry has announced an immediate issue of import licences for £6 million worth of sterling goods which were ordered before Egypt's sterling balances were frozen in July last. This follows Britain's undertaking to release from the blocked balances a corresponding amount.

The London banking firm of Messrs. Baring Bros. & Co., Ltd., is trustee of a loan to India of nearly $10 million which has been advanced by the World Bank for the expansion of a thermal electric power plant at Trombay, near Bombay. The loan is guaranteed by the Indian Government and is secured by a trust deed.

More than 65 million passenger cars, trucks and buses were registered in the United States in 1956. The figure indicates a four per cent. increase—or 2,518,691 vehicles—over those registered in 1955. Included in last year's total were 54,332,295 passenger cars, 10,625,536 trucks and 254,679 buses. The West Coast State of California has the highest registration of motor vehicles, aggregating 6,534,982.

In order to stimulate foreign oil companies' interest in Turkey, the Turkish National Assembly has modified the oil law to allow foreign concerns both to buy pipelines through the country and to construct refineries. The revised law will enable explorers to purchase land leased to them for their operations. It also stipulates that the State's share, including taxes, shall not exceed 50 per cent. of the foreign licensees' net income and profits.

The Government of Pakistan has established a Standards Institution to prepare and to promote general adoptions of standards on a national and international basis relating to materials, commodities, processes, practices, etc. The work of the Institution will be distributed among various Divisional Councils. There will be five such Councils, to start with, of which one, namely, the Textile Divisional Council has already been set up under the chairmanship of the Textile Commissioner.

The final draft of the Benelux Economic Union Treaty will be signed this month or early in July. The Treaty embodies the principle of a free exchange of goods, services and capital, as well as a co-ordinated, economic, financial and social policy between the signatories. It stipulates a target of high employment and high standard of living with due regard to monetary stability. The Treaty will be in force for 50 years with a possiblity of renewal.

A new trunk pipeline capable of transporting 70 million tons of crude oil a year from the West Asian producing areas to the Mediterranean seaboard is being considered by international oil companies, including British, American, French and Dutch concerns. The aim of the scheme is to improve the operating efficiency and flexibility of oil transportation from West Asia. Several committees are now considering the possible routes and capacities of the pipeline, engineering and construction problems, and financial and legal questions.

PERSONAL

SIR Richard Aliwihare, the new High Commissioner for Ceylon in India, has arrived in India.

Mr. T. N. Singh, M.P., has been appointed Chairman of the Committee on Public Accounts for 1957-58.

Dr. Wilhelm Melchers, Ambassador-designate of West Germany to India, arrived in New Delhi last week. He succeeds Dr. E. W. Meyer.

Mr. K. Krishna Rao has taken over charge as Financial Adviser to the *Khadi* and Village Industries Commission.

Mr. Balvantray Gopaljee Mehta, M.P., has been appointed Chairman of the Committee on Estimates for the period 1st June 1957 to 30th April 1958.

Mr. Hansraj Hariram, a leading sugar merchant of Bombay and member of the Bombay Sugar Merchants' Association, has been appointed a member of the Development Council for Sugar Industry.

Mr. Maneklal Ujamshi, Mr. Chunilal Manekchand and Mr. Jhamandas Thakurdas Talreja have been elected President, Vice-President and Honorary Secretary, respectively, of the Bombay Sugar Merchants' Association Ltd. for the current year.

Mr. Y. N. Sukthankar, I.C.S., Secretary to the Central Cabinet and the Planning Commission, has been appointed Governor of Orissa *vice* Mr. Bhimsen Sachar who will succeed Mr. Chandulal Trivedi as the Governor of Andhra Pradesh. Mr. Trivedi is likely to be appointed member of the Planning Commission.

"COMMERCE" 1932

FROM OUR FILES OF TWENTY-FIVE YEARS AGO

CALCUTTA, *18th June*

India's Tariff Policy

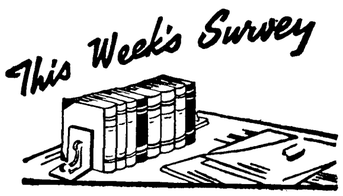
The Government of India's policy hitherto has been based on a single-decker tariff, consisting mainly of purely revenue duties but containing certain duties imposed in pursuance of the policy of discriminating protection for Indian industries. In the case of two classes of imports, namely, articles manufactured from steel and cotton piecegoods, differential rates of duty are at present in force upon goods of British and those not of British manufacture. These differential rates of duty were, it may be stated, incorporated in the tariff in the interests of the consumer in India. All commercial treaties and trade agreements into which India has entered with foreign countries are, in the matter of tariffs, confined to the reciprocal grant of most-favoured-nation treatment, that is to say, India undertakes in them to grant to the other party treatment in respect of imports and exports not less favourable than that given to any other foreign country. No treaty or trade agreement has hitherto been entered into on a bargaining basis, by which is meant the grant of a preferential rate of import duty in India in return for the grant of reciprocal benefits by the other party to the agreement.

The U.S. Government has announced $95 million worth of economic aid to Poland. An agreement to this effect was signed in Washington after 3½ months' negotiations. About $48.5 million of this aid, covering surplus farm commodities and mining machinery, will be extended immediately; of this, $30 million will be in the form of a line of credit to be administered by the U.S. Government's Export-Import Bank. About $19 million have been provided for the sale of cotton, fats and oils.

The Japanese Government has announced its 13th shipbuilding programme, the largest since the war. It provides for 46 ships, including 26 cargo liners, 14 large tampers, three of them ore-carriers, and eight medium tampers and four oil tankers—a total of 414,000 gross tons, as against 307,000 gross tons last year. Because of this greatly expanded programme, the proportion of the Japan Development Bank's deferred interest loans in the total cost of the ships has been reduced.

The U.N. and seven of its specialised agencies carried out last year the biggest technical assistance programme since operations were begun in 1950, according to the annual report of the Technical Assistance Board. Records were set in the level of contributions from 77 countries and in the number of experts provided. Aid was given to 103 countries and territories and a total of $25.3 million was spent on direct field operations, about $4 million more than in 1955. Assistance provided included services of 2,346 experts and grant of 2,128 fellowships, including study grants.

The P. and O. Line, which pioneered passenger services to India, Ceylon, the Far East and Australia, is to enter the North American market in spring next year, when the 28,000-ton liner *Himalaya* will make a "test voyage" from Sydney to San Francisco and Vancouver, and back. The vessel's voyage will be integrated into the sailings of the P. & O.'s sister company, the Orient Line, which two years ago extended its services across the Pacific from Australia. Ultimately, the service will be joined by fast big ships which each line has on order.



EXPANDING GAP

AGAINST the background of a constantly growing foreign exchange gap, the reconstituted Import Advisory Council and the Export Advisory Council met last week in Delhi to examine the possible ways of closing it. With the prospects of pruning the Plan to suit the readily available financial resources having become dim, the problem of foreign exchange is, obviously, amenable to attack only from two angles, namely, the cutting down of imports, and promoting exports. How far these two methods can prove successful time alone can determine. For, in the present nature of things, even these have their own limitations.

The impact of developmental expenditure on the economy is such that, while imports have been expanding at a fast pace, exports have tended to remain static, or even decline. The average monthly value of imports, for instance, rose from about Rs. 54 crores in 1955 to more than Rs. 67 crores in 1956. On the other hand, the corresponding value of exports declined during the same period from around Rs. 50.50 crores to Rs. 49.80 crores. Consequently, the average monthly adverse balance of trade in merchandise steeply rose from Rs. 3.43 crores in 1955 to Rs. 17.55 crores in 1956. For the whole year 1956, the adverse balance of trade at Rs. 210 crores was over double the level in 1955. This is reflected in the precipitous fall in sterling balances of as much as Rs. 269 crores over a period of 17 months beginning from January 1956.

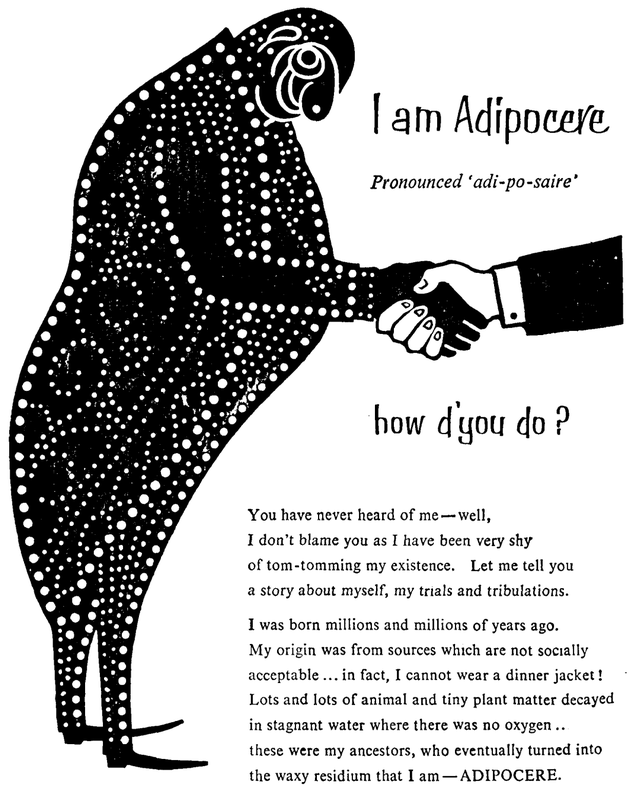
This has admittedly given rise to a situation in which, as Mr. Morarji Desai has very aptly pointed out in the course of his address to the Export Advisory Council, "speeches and resolutions are of no value unless they are followed by concrete action." The two aspects of the situation on a close examination seem to be capable of varying degrees of change. On the import front, for example, imports of machinery, steel and metals—which, in 1956, were of the order of Rs. 150 crores, Rs. 123 crores and Rs. 35 crores, respectively—are so important for the fulfilment of projects on hand and those envisaged that little scope is left for any modification. If there can be any, it should be in the direction of liberalising the import licensing system in regard to imports of capital goods. For, as is well known, the terms of deferred payments that the intending importers are required to fulfil are practically too rigid to enable expansion of business on a large scale. A somewhat helpful sign, however, is the fact that shorter period of repayment of the loan is allowed in certain types of projects, which will start earning foreign exchange within the specified period. But the fact cannot be ignored that this system of deferred payments has been coming in the way of expansion of industries, such as cotton textiles, whose products readily find their way into export markets. Viewed in this light, it is somewhat encouraging that, though Mr. Morarji Desai has discountenanced the idea of any general relaxation of these terms, he has agreed to consider favourably the requirements of those industries which have already installed a good proportion of plant and machinery they need and whose product is of special importance to the country. Despite these concessions, the chances of making much headway with the deferred payment scheme are bleak, unless some institutional arrangements to provide certain guarantees in support of the scheme are evolved. It is gratifying to note, therefore, that this question is under the active consideration of the Government.

Even so, the scope for a further reduction in imports of raw materials and intermediates required by industries, without occasioning a depression and unemployment in the industries affected, is very narrow. Curtailment of imports, however, can be effected in some items—such as pharmaceuticals—which are hitherto regarded as essential. But, in the final analysis, these do not seem to be capable of making appreciable difference to the overall level of imports, especially because of the almost unavoidable need for import of foodgrains of sizable quantities in the years ahead.

On the export front, on the other hand, some progress could be had provided constant efforts of the right type are made. But it is an uphill task. The fact that not only exports have not increased in 1956, but have actually declined, particularly in the context of expanding export trade in the world, has given rise to the need for a thorough examination of the question. It is noteworthy that manufactures, ores and tea have fared well in 1956, together accounting for an increase of Rs. 25 crores in exports. This improvement, however, was more than offset by the decline in the exports of agricultural commodities. The yield from cotton and cotton waste, for example, has fallen, as compared with 1955, by Rs. 9.5 crores. The corresponding declines in pulses and grains, and groundnuts are Rs. 6 crores, and Rs. 18.5 crores, respectively. As Mr. Morarji Desai has pointed out, the reasons for this fall were fall in domestic production in the face of an increase in consumption, and the consequent high internal prices. This underlines the need for taking more effective measures than hitherto for raising production to levels adequate to meet export demands without creating a marked scarcity at home.

Apart from this, the need for making more intensive efforts in the direction of expanding the exports of Indian manufactures, especially those of steel, leather, engineering, and electrical and of pharmaceuticals, is paramount. This is closely allied to the direction of export trade. In this sphere, however, progress has not been very impressive, though exports with certain countries such as the U.K., Russia, Japan, Italy and Egypt have expanded in 1956. This is brought out by the fact that not only there has been a disconcerting decline in India's exports to certain European countries and the U.S., but also no significant advance has been made in developing the export trade with India's neighbours in West and East Asia.

In this context, it will be interesting to see what steps are advocated by the Export Promotion Committee. Essentially, the solution will depend upon the speed and the extent to which the Government will move in the direction of (1) simplification of export regulations, (2) removal or reduction of export duties, (3) supply of raw materials to export industries, and (4) provision of better transport and port facilities. It will also depend in no small degree on business men's initiative in regard to improving the quality of export goods, and exploring new markets by systematic study and research. Meanwhile, some of the developments referred to by Mr. Morarji Desai in the course of his address will, it is to be hoped, have a salutary effect on this problem. In the first place, a State-owned corporation, with the object of insuring exporters against the risk of export business, is being set up. Secondly, substantial improvements have been effected in the working of commercial publicity organisations, and Trade Commissioners' services abroad. Again, efforts are being made to simplify export procedures, and, lastly, a Foreign Trade Board, composed of Joint Secretaries concerned with foreign trade, is being set up in order to assist the trade in utilising different service organisations to the best advantage of the country. It is to be hoped that the deliberations at the meetings of the two Advisory Councils will soon show concrete results and arrest the downward trend in India's foreign exchange reserves.



I am Adipocere

Pronounced 'adi-po-saire'

how d'you do?

You have never heard of me—well,
I don't blame you as I have been very shy
of tom-tomming my existence. Let me tell you
a story about myself, my trials and tribulations.

I was born millions and millions of years ago.
My origin was from sources which are not socially
acceptable ... in fact, I cannot wear a dinner jacket!
Lots and lots of animal and tiny plant matter decayed
in stagnant water where there was no oxygen ..
these were my ancestors, who eventually turned into
the waxy residium that I am—ADIPOCERE.
I have no ancestral wealth, and I could never own a
castle—but I am fabulously rich in fatty acids,
and I don't think you could do without me.
I am flabby, shapeless and ungainly—
all the same I am quite happy.

That's me—ADIPOCERE, the ancestor
of that Prime Mover—Oil.

STANVAC—*the name that stands for progress*

THE N.I.D.C.

Although more than 2½ years have elapsed since the National Industrial Development Corporation (N.I.D.C.) was set up—it was registered on 20th October 1954—the progress made so far would appear to be not very satisfactory. It was only recently that the Corporation completed, with the help of some foreign technical teams, the preparation of preliminary project reports for a few industries, including heavy foundry and forge unit, production of newsprint from bagasse, manufacture of intermediates for dyestuffs, synthetic rubber, alloy and tool steels, etc., and establishment of a new unit for producing aluminium. Only now it is said to be engaged in the task of taking steps for the execution of such of those schemes as may be approved by the Government of India; negotiations between the Corporation and many foreign firms for their collaboration in the execution of the major projects, it is said, have reached an advanced stage.

Even with regard to the grant of rehabilitation assistance to the jute and cotton textile industries, the progress has not been appreciable. The loan given to the jute industry, for instance, is not more than Rs. 55 lakhs, the number of mills receiving it being only two; applications from 14 other mills are still under scrutiny. In the case of cotton textile industry, it was only at the meeting of the Corporation held at New Delhi on Wednesday last week that loans aggregating nearly Rs. 1.95 crore were approved for six mills; 30 more units have applied for loans and enquiries are under way. By the way, the loans given by the N.I.D.C. bear interest at the rate of 4½ per cent. and are repayable in 15 annual instalments.

It is stated that the N.I.D.C. has received detailed project reports from four firms—one each from the U.K. and Czechoslovakia and two from West Germany—for the manufacture of heavy castings and forgings required for heavy machinery production. It has also received preliminary reports from firms in Czechoslovakia, France, Italy and the U.K. for a project to produce special alloy and stainless steels required for the manufacture of industrial plant and machinery. Discussions are now in progress regarding the size of the project and the method of its implementation. The N.I.D.C. is carrying on negotiations with a number of important manufacturing groups on the setting up of a 10,000-ton aluminium plant and a 20,000-ton synthetic rubber plant (at Bareilly in Uttar Pradesh), the technical and economic aspects of which have been examined by some well-known American firms. There are four other projects on which the N.I.D.C. is carrying on negotiations with foreign firms. These are (1) manufacture of cinema films, X-ray films and photographic paper; (2) establishment of a 30,000-ton plant at Shakarnagar in Andhra Pradesh for producing newsprint out of bagasse; (3) production of tungsten carbide which is used in the manufacture of cutting and mining tools; and (4) manufacture of the more important intermediates, including primary intermediates, required for the organic chemical industries like drugs, dyestuffs and plastics.

From the foregoing review of the activities of the N.I.D.C. so far, it will be seen that the Corporation is paying greater attention to the establishment of new industries than to rehabilitation and modernisation of existing ones.

BRITISH WAGE POLICY

The British Chancellor of the Exchequer and the Minister of Labour had a series of discussions recently with representatives of employers, trade unions and nationalised industries with the principal object of deciding whether an independent body might help to throw light on the different aspects of price stability and on the need for greater productivity which is highly essential for ensuring higher standard of living. The inspiration for the move would appear to have been the recent recommendation of the Jack Court of Enquiry—the body that adjudicated on the dispute between the workers and management in the engineering and shipbuilding industry—that a body should be set up to look into the wider problems of wage policy in the setting of an inflationary economy. Official quarters, however, point out that, even before the Jack Court was appointed, Government thinking was running on these lines and that it in fact had given some thought to the best methods of bringing home to the country, in as detached a manner as possible, the economic facts which have to be faced and which should condition wage and price policy. Of course, the Jack Court's suggestion pinpointing the importance of establishing an authoritative body for examining the whole question in a comprehensive manner would seem to have provided an immediate stimulus to speedy action in this regard.

The reaction of British labour unions, to this proposal, judging from the pronouncements of individual union leaders, appears to be one of hostility. The very fact that the employers are inclined to consider the proposition favourably has bred suspicion in the minds of labour leaders. Whether the inclusion of prices, profits, dividends as well as wages in the terms of reference of the proposed body would allay the fears of labour leaders nobody can say at present. Opinion is divided among the unions themselves. One section, the Post Office Workers and the Shop Workers unions, for instance, favour some degree of wage planning as part of a generally planned economy, while the other, represented by the Transport and General Workers, stands for what is termed in some quarters as "Unrestricted free enterprise for wages but for nothing else." It would appear that the employers are generally of the view that the experiment is one worth trying; whether the employees can be made to co-operate with it, remains to be seen. Commenting on this, the *Financial Times* observes editorially: "It is indeed difficult to see how any form of wage planning can be effective without a considerably strengthening the powers of the Trade Union Congress over member-unions—as in Sweden and in the Netherlands. But this involves a voluntary surrender of sovereignty which few of the major unions are prepared to make at this stage." The paper further points out that the resolution carried unanimously by the T.U.C. at last year's Congress opposing any form of wage restraint makes it difficult for union leaders to offer any co-operation with the proposed "wages court." The intensity of feeling with which any form of wage restraint is looked upon by the majority of unions is evident from the fact that the recent action of the Amalgamated Engineering Union in accepting a wage increase with what is termed as "strings"—especially a 12-month wage standstill—has been violently criticised by some of the leading trade union leaders as conniving at a "wage freeze."

FISHING HARBOURS

An interim report on the development of fish harbours in India, now being prepared by the two F.A.O. fishing harbour specialists, Mr. Carl Gustov Bjuke and Mr. C. Ragnar Bjuke of Gothenburg (Sweden), who recently left India after a stay of 18 months, is expected to be sub-

Euclids move BIG loads from the pit

The role of steel in modern civilisation is immeasurable. Without steel, industry would come to a standstill. The modern comforts we enjoy today would not exist.

Without coal there could be no steel. Consequently coal plays an equally important part in world progress.

To cope with the ever-growing necessity for more coal, strip mining has been developed; so truck haulage has now become a major factor in the production and distribution of coal to meet thousands of industrial needs. In this new phase of coal production, Euclids are playing a leading part, moving materials efficiently and economically.

INCOMES AND OUTPUT

PRODUCTION TREND ENCOURAGING

From Our Own Correspondent

LONDON, 1st *June*

LONDON LETTER

AT last, the stagnation in British industrial production is being broken as the wreckage of Suez and the oil shortages is swept away and forgotten. Against a first quarter production index for 1955 of 135 and for 1956 of 137, the index for the current year shows 137 and for April 136½ (April 1955 and 1953 both 136). Where is the progress? Simply that, in both March and April this year, strikes in the engineering and shipbuilding industries cost over six million working days and the production indices could not have held their own, if there had not been a substantial rise in output in industry generally. With strikes settled and pay increases general, the weather seems set fair for a resumption of the upward production curve which was so rudely interrupted last summer.

The reduced output in 1956 is now seen to have been responsible for a rise in unit costs in industry of some 10 per cent., according to the British Treasury's latest *Bulletin for Industry*. This follows a 3 per cent. rise in 1955, following a stable period in 1953 and 1954. In both these latter years, output per man-year rose by 6 per cent., keeping pace with annual earnings per employee. In 1955, output per man-year fell very slightly, but wage increases pushed up annual earnings somewhat. Annual earnings continued to rise in 1956, but output fell dramatically (against the normal steady rise of 5 to 6 per cent., it dropped to 2 per cent. below the previous year's level). The reason? Simply that firms hit by the credit squeeze and by Suez held on to their labour as far as possible to be ready for the turn in the tide. Indeed, it is reckoned that 90 per cent. of last year's inflationary rise in prices was due simply to this increased unit cost.

Independent data shows that gross output rose by only 1½ per cent. in 1956, while wages and salaries rose by 9 per cent. and even gross profits rose by 4 per cent. That was inflation with a vengeance and it is against that background that the evidence of a rise in output in the first four months of this year makes encouraging reading.

But it is really not very illuminating of the Treasury to assure its *Bulletin* readers that the course of 1957 prices will depend upon the relation between incomes and output. That is only too painfully obvious. What is in question is what the trend of these two factors will be, and, so far, wage increases must have given a greater fillip to total money incomes than anything has given to production. The Government is, however, determined to increase the financial incentives to greater production. But whether this policy will succeed in reducing unit costs and so end the inflationary spiral is still the undecided question of 1957.—*All Rights Reserved.*

* * * *

NO SUPREME COURT OF WAGES

LONDON, *8th June*

The idea of a special body to work out a wages policy has been carried much further this week but has undergone substantial transformation. A week ago, the Prime Minister announced that the Chancellor of the Exchequer and the Minister of Labour were both to consult the representatives from both sides of industry about the setting up of an independent body to examine all the factors influencing price stability and higher productivity. The reaction of the labour unions was not at all favourable to the original proposal and the Prime Minister's statement left everyone still guessing as to just what he had in mind.

The country was still left in the dark after meetings with the Employers' Federations and with the Chairmen of the Nationalised Industries. It was clear that the Government wanted no report to get abroad of their proposals until they knew the reactions of the Trade Unions. The manner in which the Government has been approaching the interested parties is a clear enough indication of the ticklish nature of their subject.

But at the end of the week, after meeting the representatives of the Trade Union Congress, the Government at last let details of their proposals slip out. The first thing that is clear is that any idea the Government might have had, following on the recent disputes in the ship-building and engineering industries, to set up a body to make recommendations about stabilising wages or establishing an agreed wages policy, have been abandoned. There is no thought in what is now proposed of a Supreme Court of Wages with which it was rightly feared that the Unions would have nothing to do. Instead, there is to be a continuous review with periodic reports which will be made public of the levels of prices, wages, profits and of their affect on costs, investment and productivity. This continuous review would be carried out by a small permanent committee independent of the Government and industry, and no doubt nominated by both sides (or the three sides if one takes into account the Nationalised Industries) of industry and approved by the Government.

The Court of Enquiry into the engineering and ship-building disputes had reported that the body to be set up should give direct guidance on wages policy, but the Government have wisely concluded that their aspirations would be better advanced if the permanent committee were to assemble and present in their proper relationship all the facts bearing on productivity. Let the facts be published clearly, say, once a quarter, and when wage disputes arise at least the findings of this impartial body should be acceptable to both sides on the *facts* of whether conditions in industry in general, and in the industry in dispute in particular, would support a wages claim. It is hoped that this impartial body would avoid the argument that goes on at present enquiries as to exactly what the industrial picture is showing. This is undoubtedly a wise move, because it would be extremely difficult both to make a representative body, however impartial it might try to be, make an unanimous recommendation and also to get any such unanimous recommendation unanimously accepted by both sides of industry.

And it is of course all to the good from the point of view of public knowledge of the economic facts behind industrial disputes that there should be an authoritative survey of dividends and profits (our information on these topics at present is derived from only two private sources) as well as all the more easily ascertained figures on wages and prices. However, while the British employers and the Nationalised Industries are fully supporting the Government's proposals, the Trade Unions are to give careful consideration *to them in the course of the month*; so it will still be a little while before the body can be actually set up with precise terms of reference.—*All Rights Reserved.*

PAYMENT BY EGYPT FOR BRITISH EXPORTS

While the Anglo-Egyptian financial talks in Rome stand interrupted to enable the heads of the two delegations to consult their Governments, reports from Cairo have spoken of an "agreement" by the United Kingdom to release some £6,000,000 from Egypt's No. 1 (Current) Account with the Bank of England so as to enable Egypt to pay for British exports to Egypt contracted for before Egypt's seizure of the Suez Canal Company. It is pointed out in London that it is inaccurate to say that the U.K. has undertaken to permit such a release from Egypt's No. 1 Account for this purpose. The facts are that there has been an agreement in principle that Egypt should pay for these contracts, subject to verification of their validity, out of her No. 1 Account.

The Cairo reports have also said that Egypt has agreed to resume payment of pensions to British subjects. It is stated in London that this was one of many points discussed during the Anglo-Egyptian exploratory talks held in Basle, Switzerland, on 6th and 7th May prior to the Rome talks. It has not yet been taken any further.

HOLIDAY THIS SUMMER IN

Kashmir

CONCESSIONAL RETURN TICKETS BY RAIL-OFFERED

Concessional Rail-Cum-Road and Rail-Cum-Air Return Tickets, at one and one-third single Rail journey fares for I, II and one and one-half single journey fares for third classes for the Rail portion and Rs. 27/- per seat for the Road journey and Rs. 76/- for Air journey between Pathankot and Srinagar are issued to Srinagar via Pathankot from the following stations:

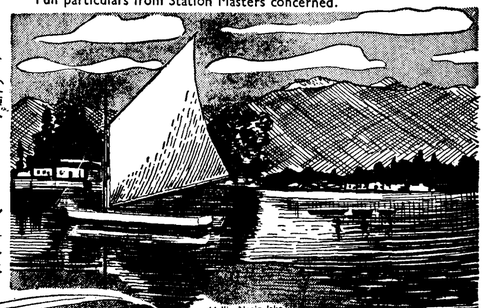
Central Rly. Stations.		Western Rly. Stations.	
		General Offices Booking office, Churchgate, Bombay.	
Bombay V. T.	Begampet	Bombay Central	Jaipur
Byculla	Hyderabad (Dn)	Surat	Rajkot
Dadar	Kacheguda	Baroda	Jamnagar
Poona	Gwalior	Ahmedabad	Ajmer
Nagpur	Bhopal	Bhavnagar Terminus	Agra Fort
Jubbulpore	Sholapur	Indore	Mhow
Agra Cantt.	Saugor		
Raja-ki-mandi	Kurnool Town		
Agra City	Secunderabad		

Tickets will be issued till October 31, 1957, valid for 3 months from the date of commencement of the journey.

Children—Half fares for Rail journey and full return fares for road journey and half fares for Air journey.

Those who desire to visit Kashmir are requested to make their own arrangements for securing the permit from the District Magistrate or the authority concerned for entry into Kashmir.

Full particulars from Station Masters concerned.



CENTRAL AND WESTERN RAILWAYS

AMERICAN LETTER

DISARMAMENT TALKS NOT DISCOURAGING

SEESAW OF ECONOMIC FORCES

From Our Special Correspondent

NEW YORK, *5th June*

POLITICAL news dominated the thinking of the financial and business community in recent weeks. All of it has deep economic implications, at least potentially. The disarmament talks at London have not been discouraging. Mr. Harold Stassen handled the negotiations for the United States. After Mr. Stassen's big mistake in denouncing Vice-President Nixon shortly before the last election, he is re-emerging with new stature because of his skill which was evident at London. Some real steps toward disarmament would, of course, be a real boon to all people. The defence portion of national Budgets would shrink and taxes could be reduced.

In an unprecedented radio interview from the Kremlin, Soviet Prime Minister Khrushchev took a similar position. The very fact that such an interview of newspaper correspondents was permitted to take place with simultaneous telecasting of the event over networks here, must be interpreted as a somewhat radical departure from previous Soviet attitudes.

Russian consent to a plan whereby mutual aerial inspection of military installations may be permitted would also speak for the assumption that the Moscow Government has taken a more liberal view. This is still being disputed by hotheads, but such steps as the Kremlin has taken recently certainly can no longer be compared with measures of the Stalin regime.

If American public opinion may be summed up about the appearance of the Soviet head of State on television screens here, it is that he may have made many friends if alone for the novelty of a broadcast from the Kremlin. It is equally certain that Mr. Khrushchev very skilfully avoided to answer questions and certain contradictions in his statements about peace and war were also evident.

Atomic Power

Another hot subject is that of the development of atomic energy for whatever purpose, internationally, the question of control and tests. The tests, particularly, have become a ticklish subject. In the tests in the Pacific, international shipping and air traffic is involved. Considerable atomic fallout has been measured in the United States hundreds of miles from the testing grounds. There is not very much which can be done about it.

The development of atomic power has already found useful peace-time application and tests presumably are necessary to find virtues and defects in the various processes. As more and more nations are making use of the atoms, another big problem to be faced is the disposal of atomic waste. If too much of it is allowed to go into the oceans or into the atmosphere, harm to life may be great, indeed.

The attack by Formosan nationalists on United States diplomatic property and personnel came as a deep shock to many people here, as John Foster Dulles, Secretary of State, admitted. An even worse blow was dealt by British extension of trade with Communist China which is bitterly opposed by Washington.

Battle of Budget

In U.S. home affairs, the Battle of the Budget continues. President Eisenhower's two personal television pleas to approve the proposed Budget have had some results in the Chief Executive's favour. The House of Representatives voted for a cut in military spending, not quite as large as contemplated at first, but large enough to make the President "not happy." The decisive roll call vote was 242 for, including many Republicans, against 151. Pending Senate action, the military bill for the ensuing fiscal year stands at $33,500 million.

What the repercussions of the resignation of Treasury Secretary George Humphrey will be, is difficult to say at this time. He has been one of the President's closest advisors. The 67-year old Secretary will presumably return to his previous coal, ore and steel interests in Cleveland and Canada.

Mr. Humphrey's successor, Robert Bernerd Anderson, has been a very successful man and he was chosen presumably to continue Humphrey's policies. Financial and business circles feel that this remains to be seen. Mr. Humphrey came to Washington from Ohio. He gave up an annual income of $300,000 to take the Cabinet post which then paid $22,500 a year and has since been raised to $25,000.

Mr. Anderson, originally a Texas Democrat for Eisenhower, served as Secretary of the Navy and then became Deputy Secretary of Defence. He left the Government in 1955 and became President of Ventures Ltd., Toronto, a mining properties' holding company. He is a resident of New York now and has changed his party registration to Republican.

Boom and Gloom

The seesaw of the economic forces continues in the U.S. Boom and gloom, justified or otherwise, are riding side by side. The Stock Exchange, which is supposed to be the barometer of hopes, wishes and despair, reached a level at the end of May which was quite near the highs for 1957. Oil stocks, particularly, have been in good demand recently. They have led the list of the most active stocks for weeks.

Building and construction are having a rough time. One authoritative report speaks of a drop of 20 per cent. in non-residential construction awards. Such highly specialised reports, however, do not tell the whole story. A full-fledged modernisation boom is under way at the same time. It is an offset to the decline in housing starts which cannot be fully measured in figures since much home modernisation is in the do-it-yourself area.

Qualified sources say, for example, that the 1957 market for additions, remodelling and repairs in the residential field alone will reach $10,000 million. This would be about 10 per cent. above the $9,000 million chalked up in this field last year. Modernisation activities are said to *enjoy the best year ever recorded.*

Automobile sales are not holding up, but savings are. People saved more money in 1956 than in any year of the post-war period, about $14,600 million. This compares with $7,600 million in 1955 and with $12,900 million in 1952, the previous peak. Reports from the depressed textile field are that customers' inventories are believed to have been pared to the point where sustained demand may be expected in July and August. Home appliance sales also seem to be snapping out of their previous slump, at least temporarily.—*All Rights Reserved.*

"...and an aluminium house we'll build"

Aluminium houses are so light and easy to erect...no wonder our young friends feel that even they could do it.

Prefabricated aluminium houses and aluminium building materials are rapidly gaining popularity in India because they are light, strong, durable and require no maintenance.

At Hirakud in Orissa, close to large resources of hydro-electric power and bauxite, Indian Aluminium Company is installing a new 10,000-ton smelter which will make more aluminium available for our homes, farms and factories.

INTERNATIONAL MONETARY FUND

FUNCTIONS AND ACHIEVEMENTS REVIEWED

By Ivar Rooth

[The International Monetary Fund is sometimes criticised for its lack of activity. That this criticism is unjustified is well brought out by Mr. Ivar Rooth, who was Managing Director of the Fund till recently, in the course of an interesting article contributed to the latest quarterly review of the Skandinaviska Banken. The analysis of Mr. Rooth is not only comprehensive but also lucid. Besides giving a description of the history and set-up of the I.M.F., he has examined its functions and achievements in a dispassionate manner. Since the review is by one who was connected with the I.M.F. for a fairly long period and who, in his capacity as its Managing Director, has greatly contributed to its progress, we are reproducing the article on this page. We have no doubt that readers will be interested to know the reflections of this retired Managing Director of the Fund. The article is also of some topical value, in view of the fact that the annual meeting of the Fund is due to be held at Washington in a couple of months from now.—ED.]

AFTER lengthy preparations, representatives from 44 countries met at Bretton Woods N. H. in July 1944, about a year before the end of the Second World War. The Danish Minister in Washington had been invited to take part in the deliberations. This conference drew up the Articles of Agreement of the International Monetary Fund and the Agreement for the International Bank for Reconstruction and Development (often called the World Bank). The inaugural meeting was held in Savannah, Ga., in 1946.

The aim of the Fund was to bring about permanent co-operation on international monetary problems. It was hoped, through stabilisation of currencies, to promote international trade, to contribute towards a high level of employment, improved living conditions, multilateral payments and a successive abolition of exchange restrictions, and to prevent competitive depreciation. The World Bank should assist with the post-war reconstruction and with investments mainly in underdeveloped countries.

Russia took part in the Bretton Woods conference, but did not join the organisations. Poland and Czechoslovakia were not communist countries when they joined the Fund and the Bank. They have since left both organisations. Yugoslavia is still a member of the Fund and the Bank. At present, 60 countries are members of the organisations, including most of the countries in Europe. Exceptions, besides the East European States, are Ireland, Portugal, Switzerland and Spain. All the countries in North, Central and South America, Australia and most of the African and Asian States are members. New Zealand remains outside.

When a State joins the Fund, it is allotted a certain quota, expressed in dollars. The countries must pay 25 per cent. of the quota in gold and 75 per cent. in their own currencies. A reduction of the gold payment can be made under certain circumstances. The sum of the quotas is about 9,000 million dollars. At the end of October 1956, the Fund had at its disposal almost 1,900 million dollars in gold and more than 1,900 million in U.S. and Canadian dollars.

Voting Rights

Voting rights at the annual meeting and on the Executive Board stand in a certain relation to the quotas. Only the representatives of the member States are entitled to vote. The Managing Director, who is Chairman of the Executive Board, has no vote. Besides him, the Board consists of 17 persons, each with an Alternate appointed by the ordinary member. The five States with the largest quotas, U.S.A., Great Britain, China (Formosa), France and India are each entitled to appoint one director. The Latin American countries elect three members between them. The other countries elect nine members. At present, besides the five permanent members, the Board consists of representatives from Argentina, Brazil, Salvador, Australia, Belgium, Canada, Denmark, Egypt, Germany, Italy, Japan and the Netherlands. Each of the elected Board members—except the Canadian and the German ones—represents one or several other countries; for example, the Danish member represents Finland, Iceland, Norway and Sweden.

The first Managing Director of the Fund was Camille Gutt, formerly Belgian Minister of Finance. He was succeeded by the author of this article. The present chief is Dr. Per Jacobsson, who was for 25 years Economic Adviser to the Bank for International Settlements at Basle. The present Deputy Managing Director is H. M. Cochran, a former American ambassador.

The Fund has a certain jurisdiction over exchange rates and payments transactions of member States. Import restrictions, customs duties and similar trade barriers do not come within the Fund's jurisdiction, but in that of the General Agreement on Tariffs and Trade (G.A.T.T.). There is a close co-operation between G.A.T.T. and the Fund. Members must come to an agreement with the Fund on a par value for their currency. Certain countries, as, for example, Greece, Italy, Indonesia and Uruguay, have been permitted a respite before introducing a par value. The Fund's consent is required, if a country wants to change its exchange rate by more than 10 per cent. of the original par value. Member States are supposed to maintain stable exchange rates. Their spot rates should not fluctuate more than 1 per cent. above or below par. There are no regulations for forward rates.

Three countries, Canada, Peru and Bolivia, have informed the Fund that, temporarily, their exchange rates cannot be kept within the stipulated limits, and the Fund has raised no opposition to this. Mexico had a fluctuating exchange rate in 1948-49, before re-establishing a fixed rate. The reason for the Canadian application was a huge inflow of American capital. Peru had previously abolished her currency restrictions and it seemed that their reintroduction could be avoided only if the exchange rate was permitted to fluctuate, if needed.

Some countries have a system of multiple exchange rates, as Germany had in the 1930s. In these cases the rate at which "free market" transactions can be made is usually a fluctuating one. Countries with multiple exchange rates must obtain the Fund's consent before any one of them is changed, before a new rate is introduced and before there is any change in the regulations as to which rate is to apply for different kinds of payments.

Freezing Exchange Rates

The Fund is sometimes criticised for "freezing" exchange rates and thus causing an excessive rigidity in the economic system. This is not correct. The primary aim is to attempt to prevent competitive exchange depreciations such as took place during the 1930s and caused serious difficulties for international trade. Instead, when this is necessary in order to correct a fundamental disequilibrium, the Fund tries to persuade the country to make an orderly change from one rate to another. We had a typical example of this in September 1949, when sterling was devalued and a large number of countries altered their exchange rates simultaneously.

The Fund's consent is also required, if a country wishes to introduce new exchange restrictions for current payments. Members may, however, decide on restrictions for capital payments without seeking the Fund's approval.

When the Fund began its activity in May 1946, most countries had imposed exchange restrictions in an attempt to deal with their foreign payments problems. According to the Fund Agreement, these restrictions should be successively abolished. Since 1951, the Fund has had to hold yearly consultations with the countries that have exchange restrictions. Then is discussed i.a. to what extent it will be possible to abolish exchange restrictions and discriminatory regulations, e.g., those concerning payments to dollar countries. In these matters, as well as in trying to persuade countries to get rid of their bilateral trade agreements, the Fund works along the same lines as the Organisation for European Economic Co-operation (O.E.E.C.). The final aim is convertibility for current payments.

Delayed Payments

It sometimes happens that, in a country where an importer has obtained permission to buy goods abroad, he later finds himself unable to buy currency at the official rate. These delayed payments, known as arrears, are a serious type of exchange restrictions. In such cases, the Fund discusses the problem with the member country and tries to persuade it to move gradually towards the establishment of a prompt remittance system.

In order to help countries to achieve these aims the Fund grants short-term credits. Only members can borrow from the Fund, and only if they need foreign currency for current payments, that is, to cover a temporary deficit in the balance of payments. A member can also get assistance to maintain or reintroduce convertibility. Most loans have been made in dollars. Transactions in pounds sterling, German marks and Belgian francs have also taken place.

Grant of Loan

A loan from the Fund is made in the following way. The member buys one or several foreign currencies and pays the corresponding value in its own currency. For instance, if Sweden were to buy dollars from the Fund, the Fund's account at the Riksbank would be credited with the corresponding amount in kronor. Repayment, which must take place within three to five years, is made in gold or dollars to the Fund's account at the Federal Reserve Bank of New York. Then the Fund's account at the Riksbank is debited with the corresponding amount in kronor. If at the end of the Fund's accounting year, the 30th April, the Fund's holding of a country's currency has increased and if the country's holding of gold and convertible currencies has increased, the member is obliged to repurchase part thereof.

When a country buys a foreign currency from the Fund, a service charge of ½ per cent. of the amount is made. If the Fund's holding of the country's currency exceeds its quota, interest is normally paid. The interest rate increases the longer the period for which the loan is outstanding and the greater the proportion of the quota that has been borrowed.

The following rules also apply to borrowing. A country may borrow the amount that it has paid in in gold. Sweden, for instance, has a quota of 100 million dollars and can thus borrow 25 million dollars. The Fund is on principle favourably inclined, if a member wishes to draw another 25 per cent. of its quota. According to the statute, a member may not draw more than 25 per cent. of its quota during a period of twelve months. This rule has, however, often been waived in recent years. A country may not borrow more than 100 per cent. above its quota. Exceptions can be permitted, but, so far, no such request has been made.

Some countries were initially allotted rather low quotas, in some cases lower than they had asked for. Every fifth year, the size of the quotas is reconsidered. Some countries with small quotas have had them raised. Countries with larger quotas could at present probably not expect an increase.

Stand-by Credits

In some cases, the countries are not interested in a loan, but want to be certain that, if necessary, they will be able immediately to dispose of a certain amount, for instance, because it is feared that an exceptional demand for foreign currency may arise during the coming year. If they get a guarantee that, if necessary, the money will be immediately available, they may either avoid introducing new exchange restrictions or limit them to a minimum. The Fund has, therefore, developed a system of "stand-by" credits. These are granted for a period of 6-12 months but can be extended. Even in cases where it was not necessary to make use of them, they have been of great importance in creating confidence in the country's currency. Such "stand-by" credits have been granted, for example, to Peru, Mexico, France, Great Britain and India. When the Fund opened the stand-by credits to Peru and Mexico, the United States also granted them stabilisation credits. Sometimes, one or several American banks have at the same time opened similar credits.

The Fund began its lending activity in March 1947. Since then, up to the end of 1956, more than 1,900 million dollars have been lent to thirty different countries. Of this, more than 1,060 has been paid back. The lending activity has fluctuated considerably. In 1947-48, it amounted to 675 million dollars. No loans were made in 1950, but, in 1956, over 690 million dollars were drawn. Up to the end of 1956, stand-by credits had been granted to eleven countries, amounting to almost 1,200 million dollars, the largest sums towards the end of 1956.

In order to be able to carry out its duties, the Fund must continuously follow the developments in member countries. Each country submits regular reports to the Fund and maintains an intimate contact with it not only at the yearly discussions but also in between. At least once a year, the Fund writes a report on the economic situation in every member country.

Decisions about loans, sales and new restrictions must be made quickly, usually within three days. Generally the Fund has had previous discussions with the member concerned. In order to have an opportunity of studying the actual situation in more detail than would be possible in a couple of days, the Fund has requested the countries to inform the Managing Director confidentially about their plans some time before making an official application for a loan or a change in the rate of exchange or in their currency regulations.

The Fund issues a number of publications, including, on the occasion of each annual meeting, a report on the world economy and the payments situation in the various countries. This, of course, contains an account of the Fund's activity during the year. A year-book on exchange restrictions is also issued, with a fairly detailed account of the situation in the various countries. The Fund publishes monthly its valuable *International Financial Statistics*, which gives current information on the monetary situation, international trade, prices, Government expenditures, etc., for most countries. The Fund continues the publication of the balance of payments in different countries that was started by the League of Nations. It is issued in loose leaves as soon as the figures are received. The Fund also collects and edits the information on various countries' exports and imports that is found in the *Direction of International Trade*, published by the United Nations in co-operation with the Fund and the World Bank. The weekly publication, *International Financial News*, is supplied without charge to persons interested. The Fund's other publications can be subscribed to.

Monetary Policy

In its dealings with the economic problems of its members, the Fund tries to convince them to introduce a more effective financial and monetary policy. A very important part of its work, therefore, consists of giving technical advice. If necessary, the Fund sends a group of experts to study the situation. Upon request, one or more of these officials is placed at the disposal of the Government or central bank as an adviser. Not infrequently, these officials co-operate with representatives from the World Bank or experts sent out by the United Nations.

The Fund organises annual courses for about 20 officials from central banks or Governments of member countries. Most of them come from underdeveloped countries. They study chiefly monetary, statistical and balance of payments problems. Over and above the Board members and their Alternates, the Fund had at the end of 1956 about 420 employees from more than 40 different countries. The Fund has only one branch office, which is in Paris. Its job is to maintain a close contact with O.E.E.C. and its various departments, above all the European Payments Union (E.P.U.), and with other international organisations in Europe.

One seldom hears anything about the Fund. This is because its effectiveness is greater if it carries on its work in confidential negotiations with its members. Premature publicity can lead to speculation and cause serious damage. Most of the investigations that are made—and they amount to a considerable number each year—are for this reason not published but sent only to the members for confidential information. Some are, however, published in the *Staff Papers*.

Criticisms Unjustified

The Fund has sometimes been criticised for its lack of activity. Such critics have usually forgotten the following facts. The world in which we live after the Second World War is not the world that was hoped for at Bretton Woods. There have been wars in Korea, Indo-China and the Middle East, and, besides these, we have had the cold war with all its undesirable political and economic effects.

Shortly after the war, it became clear that the countries needed not only short-term credits from the Fund but also loans for a longer period and of a magnitude that was beyond the resources of the World Bank. Then there came first the large American and Canadian loans to Great Britain and in 1948 the Marshall Aid. This has been followed by American aid in various forms to countries in different parts of the world. All this has, of course, considerably diminished the demand for assistance from the Fund and the World Bank.

The currency situation in most countries has improved in recent years, mainly as a consequence of the increased world trade and American aid. The members have been able both to enlarge their currency reserves and to pay back most of what they had previously borrowed from the Fund. After the Suez crisis at the end of 1956, a new situation has arisen, characterised, *inter alia*, by the abovementioned stand-by credits to France and Great Britain, totalling 1,000 million dollars. Besides this, Great Britain has bought over 560 million dollars. Requests for financial aid from other countries have also increased.

Stabilisation Measures

The Fund has—often in co-operation with O.E.E.C.—contributed towards a gradual reduction of exchange restrictions and bilateral agreements, diminished discrimination in payments and increased transferability of many currencies. As already mentioned, it has assisted in important stabilisation measures, not only in the Latin American countries and Asia but also in Europe.

One reason why the European members have not made more use of the Fund than they have done until the last quarter of 1956 is that they have preferred to use their automatic credit in the European Payments Union. Whereas repayment to the Fund must be made in gold and dollars, any surplus of a member's currency automatically diminishes its debt to E.P.U. It has often been easier for a country to earn, by its exports, a surplus of pounds than of dollars. Now, however, this may change since of the deficits in E.P.U. 75 per cent. have to be paid in gold or dollars—as compared with 50 per cent. previously—and as diminished credit possibilities and increased dollar payments have reduced the relative advantage of a credit from E.P.U.

Also, some countries have entertained fears that a purchase of currency from the Fund would be regarded as a proof of a serious crisis and could thus set off a wave of speculation. Such fears would become less frequent, if the members used the Fund more regularly when a country's currency reserves are sinking. At present, the tendency seems to be in this direction.

It is an obvious fact, but one that is frequently overlooked, that the Fund cannot abolish currency restrictions or carry through stabilisation measures. This depends entirely on whether the country's own authorities are willing to pursue such economic and monetary policies as would make these measures possible. The Fund can only analyse the situation, make clear what has to be done to bring about internal and external balance, try to convince the persons concerned of the necessity of taking these measures, and place foreign currency at their disposal to bridge over temporary payments difficulties. Sometimes, it is only after repeated discussions that the country is willing to take one or another step in the right direction. In such cases, monetary measures such as raising the rate of interest or restricting credit in one way or another are as a rule not sufficient. The budget deficits of Governmental and local authorities may, as a rule, have to be cut, sometimes by an increase in income and, in most cases, by a reduction of expenditure. It is also necessary to refrain from financing these budget deficits or part thereof except for short periods through the central bank. Wage increases exceeding the rise in production should be avoided. If consumption has risen too rapidly, the increase in consumption may have to be slowed down. In some countries, expenditure on social services has risen more than economic resources permitted. In order to be able to maintain a reasonably stable value of the currency, it is—until a better balance has been restored by increased production—essential that new expenditure of governmental and local authorities should be avoided except where absolutely necessary. The possibility of postponing some of the expenditure that have already been decided on should also be studied.

All Packings marketed by Dick's Asbestos and Insulating Co. Ltd. London, are manufactured from the finest of materials, and the variety of types will be found to meet almost every Engineering and Industrial application.

GOVERNMENT TO ALLOW MORE SPINDLES

ADDITIONAL YARN OUTPUT, HOWEVER, WILL BE EARMARKED FOR EXPORT

A NOTABLE pronouncement made by Mr. Morarji Desai, Union Minister for Commerce and Industry, at the Export Advisory Council meeting held at New Delhi on Friday last week, was that the Government of India was considering the question of putting up more spindles for increasing yarn output. The additional production, he added, would be earmarked for export. Mr. Desai revealed, in this connection, that the Government would soon issue orders for liberalising export of yarn, with a view to helping mills having accumulated stocks. Immediately following this statement, the Government announced that the exportable yarn quota of a mill remaining unutilised in a quarter would be assessed in the next quarter and freely licensed to exporters on a first-come-first served basis in the following quarter. It said: "Cotton textile mills are at present allotted quarterly yarn export quotas from their production in excess of their output in 1955. Quotas thus allotted under the present procedure are to be exported by the mills themselves or through their nominees. It has been noticed that some of the yarn export quotas remain unutilised and are not utilised, because the mills are not interested in export, the internal prices being sufficiently attractive."

The move of the Central Government to allow installation of more spindles in the mills deserves to be widely welcomed, though the proposed condition, namely, that the additional production should be earmarked for export is irrational. While drawing up the development programme for the cotton textile industry in the second Five-year Plan, the Planning Commission assumed that the actual installation of 1.4 million spindles, out of the 1.8 million licensed but unutilised at the end of the first Plan, together with the 170,000 spindles representing normal expansions and modernisation schemes, would be sufficient to achieve the targetted output of yarn—1,950 million lbs. Following the revision in textile policy of the Government in June 1956, however, it was decided to raise the spinning capacity of mills by 2.1 million spindles which, it was said, would be adequate to produce an additional 1,400 million yards of cloth. Subsequently, this figure was revised upwards to 2.3 million spindles.

Capacity Needed is More

Even the aforesaid revised spinning capacity must be said to be a conservative one, inasmuch as it is fixed on the basis of incorrect estimates of the additional requirements of cloth from the three sectors—the mills, the handlooms and the powerlooms. The additional requirements of cloth at the end of the Plan are estimated at only 1,700 million yards, including 300 million yards earmarked for production from Ambar Charka yarn. This quantity is said to be sufficient to give a *per capita* consumption of 18.5 yards, after allowing 1,000 million yards for export. The estimated *per capita* consumption of 18.5 million yards is, in the opinion of experts, on the low side and compares adversely with 22 million yards assumed by the millowners in their calculations. Taking the rise in *per capita* consumption from 18.5 yards to 22 yards and export demand at 1,000 million yards, the overall additional requirements of cloth at the end of the Plan will work out to 3,400 million yards, double the figure now assumed. On the basis of 5½ ozs. of yarn of average count of 20s per spindle-shift and of two shifts working for 300 days in a year, the additional spindleage required would be of the order of 5.6 million spindles, that is, 1.3 million spindles more than those now licensed to be installed. This will be higher still, if the Government really wants to establish a permanent export trade in yarn.

It will thus be seen that the proposed decision of the Government to stipulate that the additional production of yarn out of the installation of new spindles that will be allowed will be earmarked for export is, as already stated, illogical. It will, of course, take some time for these new spindles to be installed and put into production. Who can say at this stage as to what will be the conditions in yarn export markets then? The question will naturally arise as to what would happen to the additional production of yarn, if the export markets were to slump and Indian yarn became unsaleable. Will the Government levy, as it has decided in the case of exports of cloth produced from automatic looms, a penal excise duty on the production utilised either for weaving cloth in the mills or for being released for use by handlooms, powerlooms, etc.?

Moreover, the history of cotton textile industry all over the world shows that it is a risky business to expand the spinning side of a mill on the assumption that export markets will provide an outlet for the yarn. With every country planning to have cotton textile industry on vertical lines, the scope for yarn exports will become more difficult than that for cloth. It is common knowledge that the neighbouring countries in Asia where there are handlooms and powerlooms are also trying to become self-sufficient in yarn by expanding their own spindleage. Again, if it is not right for a country with heavy unemployment to export raw materials which it can easily convert into finished goods, how is it right to export such materials in a semi-finished form? In saying all this, we do not mean that we are opposed to the Government's decision. Indeed, we welcome it, despite its defects, because it will add to the spinning capacity and this, in turn, will compel the authorities to allow an expansion in the weaving capacity of the mills later, if and when their calculations about exports of yarn go awry. A wise Government, however, will recognise that economic forces cannot always be shaped to its needs and try to tackle them in a straightforward and positive manner, instead of through *ad hoc* decisions and devious ways.

Yarn Supply Position

To revert to the position as it is today, the Government's decision to liberalise the policy governing cotton yarn exports, is, it is said, designed to help the mills not only to liquidate their stocks of yarn but also to produce more yarn for the handloom industry. Thanks to the restricted export policy hitherto followed, exports of yarn have gone down considerably, the actual shipments during the year 1956 being not more than 13 million lbs., as against 21 million lbs. in 1955. Consequently, of late, heavy stocks of yarn have accumulated with the mills, several of which have taken recourse to "distress sales." The total quantity of yarn lying unsold with the mills at the end of April 1957 amounted to as much as 20 million lbs., as against 4 million lbs. in August 1956 and 12 million lbs. in April 1955. The following table indicates the supply position of yarn during the years 1955 and 1956:

(In million lbs.)

	1956	1955
Production at spindle point	1,671	1,630
Consumption—		
In composite mills for weaving cloth	1,192	1,154
For manufacturing hosiery and other articles ..	13	12
Delivered for—		
Export	13	21
Civil consumption and other purposes	412	434
Yarn available for consumption by handlooms, power looms, etc.	453	443

The supply position in respect of yarn at present is more comfortable than what it was last year. The production of yarn has registered a marked expansion. During the first four months of the current calendar year, for instance, more than 601 million lbs. of yarn came off the spindles of mills, as against 530 million lbs. in the corresponding period of 1956. On this basis and assuming that the trend is maintained in the coming months also, the aggregate output of yarn for the whole of 1957 may be estimated at 1,803 million lbs., which compares very favourably with 1,671 million lbs. in 1956 and 1,621 million lbs. in 1955. The improvement in production would appear to have not been accompanied by a similar rise in offtake by handlooms and powerlooms, so much so that stocks have, as stated already, accumulated with mills.

It is gratifying that the Government has allowed traders also to participate in the yarn export trade. The policy of allowing only the mills to export cotton yarn had evoked a bitter protest at the hands of the trade. Such a policy, it had been pointed out, was highly detrimental to the export trade in general. With the liberalisation of the policy now announced, the traders feel that they can have a wide choice in purchasing yarn from mills at competitive rates, thus enabling them to conclude larger business in the foreign countries. Although the overseas demand for Indian cotton yarn is at the moment subdued, the position may improve in the coming months. It is, however, necessary to emphasise that, if India is to succeed in building up a sizable export market in cotton yarn, it must be in a position to provide an uninterrupted supply of the goods. Importing countries will have little incentive to buy Indian yarn, if they have an impression that, after some months, the Government of India may, once again, place restrictions on exports thereof, in order to conserve supplies for domestic consumers. Nor will the exporters of this country have any heart to enter this trade, if they are not sure of its continuity. The Government must, therefore, make up its mind now and tell the traders here and abroad that it will always allow a reasonable quantity of yarn to be exported.

U.S. WOOL TEXTILE IMPORTS

President Eisenhower has announced that imports of woollen textiles into the U.S. in excess of 14 lbs.—or 5 per cent. of the average domestic production—during the current calendar year will be subjected to the imposition of the full 45 per cent. *ad-valorem* duty permitted by the Geneva reservation. This decision is a sequel to the representation made by the indigenous woollen textile manufacturers who had complained of threat of imported woollens and worsteds.

One of the countries most adversely affected by the decision is the U.K. The British Government's disappointment at the decision has recently been conveyed to the American Ambassador to the U.K. by Mr. Selwyn Lloyd, Britain's Foreign Minister. Mr. Lloyd has clearly pointed out that the U.S. move will produce uncertainty and dislocation in the British textile industry. It is pointed out that, in view of the U.K.'s need to earn dollars in order to finance its large purchases in the U.S., the quota could have been more in line with the actual performance in 1956, that is, about 6.5 per cent. of the average domestic production in the U.S., instead of 5 per cent. The American Ambassador has promised to report the British Government's viewpoints to the U.S. Government.

TEXTILE INDUSTRY IN YUGOSLAVIA

A fairly ambitious scheme of expansion and modernisation has been launched by the textile industry of Yugoslavia. The scheme envisages an annual increase of 10 per cent. in output over the next five-year period, thus exceeding the 1955 level by 50 per cent. at the end of 1961. The targets of production fixed are 261 million square metres (0.914 square metre=one square yard) for cotton fabrics, 18 million square metres for woollen fabrics, 45 million square metres for ready-made clothing, underwear, etc., and over 45 million pairs for stocking. In order to ensure the fuller utilisation of the existing capacities, special attention is paid to the reconstruction and modernisation of factories the machine plant of which is obsolete and run down. This primarily refers to mills erected in Serbia, Slovenia and Croatia before the Second World War. Many mills built in the inter-war period also need reconditioning. According to some estimates, the scheme entails an investment of about 29 million dinars. Only 5 billion dinars will be spent on the construction of new capacities.

EXPORT OF SILK WASTE

The Central Government has released for export a quota of 284,000 lbs. of Madras-Mysore silk waste for the current half-year, the actual shipment being allowed up to the end of September next. The quota will be licensed in the following manner:

A portion of the quota will be allowed for export by the Director of Sericulture in Mysore, Bangalore, or his nominee.

Established shippers will, on application, be granted allotments up to 21 per cent. of their established basic exports, subject to a minimum allotment of 3,000 lbs. per shipper.

The balance will be distributed among newcomers and internal dealers who were granted quotas against the release of 300,000 lbs. for the year 1955; their quotas will be in proportion to the actual shipments by each of them up to the end of December 1955, subject to a minimum of 3,000 lbs. per shipper.

In exercise of the powers conferred by section 15 of the Industries (Development and Regulation) Act 1951, the Central Government has ordered an investigation into the affairs of three textile mills, namely, the Huthising Manufacturing Company, Ltd., Ahmedabad, the Shri Sayajee Jubilee Cotton and Jute Mills Company, Ltd., Sidhpur, Bombay State, and the Gopal Mills Company, Ltd., Broach, Bombay State. The investigating body is presided over by Mr. Arvind Mafatlal and consists of Messrs. Indravadan Oza, M.L.A., H. L. Daulatzada and K. R. Aravamuthan (member-Secretary).

The Government of India has decided that loans sanctioned to apex weavers' co-operative societies as working capital for marketing of handloom cloth should be repayable in nine (instead of five) equal annual instalments, the first instalment becoming due on the second anniversary of the date of drawal of the loan by the State Government.

FRESH EFFORTS TO MEET LABOUR SHORTAGE IN MILLS

OUTPUT OF MAN-MADE FIBRES FALLS

From A Special Correspondent

MANCHESTER, 4*th June*

SIR David Eccles, President of the Board of Trade, has agreed to meet members of the Lancashire textile mission which recently returned from Pakistan in London today (Tuesday). The meeting had been asked for by the Cotton Board.

MANCHESTER LETTER

The Lancashire mission, which earlier this year also visited India and Hong Kong, flew to the Far East to urge voluntary limitation of the large-scale exports of cheap cotton cloth to the United Kingdom. It has been reported from Karachi that Pakistan millowners declined to enter into a "gentleman's agreement" along these lines, because of balance of payments and other difficulties.

For the first time for nearly three months adjustments were made this week in prices of yarns spun from American type cotton. Irregular movements occurred in selling rates, spinners charging more for the finer counts, with advances ranging up to about ½d. per lb. Reductions in the lower numbers resulted in cuts in quotations of up to ¾d. per lb. in some instances. Recent sharp reductions in the price of Egyptian type cotton yarn, amounting in some cases to over 5d. per lb., were announced last week and, in the circumstances, users have been hesitant about committing themselves far ahead. Many spinning firms in Lancashire retain extensive order lists, but the flow of fresh business over the past few weeks has not been on as large a scale as early in the year.

Partnership Pays

Labour is a scarce commodity in Lancashire, despite, or perhaps because of, the difficult times experienced in recent years when employment has been far from continuous. Many are the methods now being adopted by managements to secure workers for an industry whose spinning and weaving manpower has declined from a peak of 320,000 barely five years ago to the present total of 245,000.

Individual employers have their own views on how this problem should be tackled. Mr. W. A. Grierson, Chairman of Hayeshaw Ltd., the spinning group which employs some 2,000 operatives, make a modern approach on the lines of co-partnership. To bring the firms workers into the picture, they each receive a simple explanation of the annual accounts showing the money earned and how it is spent. "We believe that a successful business today must be a partnership of management, workpeople and shareholders," declares Mr. Grierson. "Ways are being sought of enlisting greater co-operation in the raising of productivity. Until the economic 'facts of life' of a business or industry are more widely made known to workpeople, it is unlikely that the harmful inflationary trend can be retarded and real purchasing power increased."

In the mills of the combine, progress has been persistent during the past decade. Mr. Grierson quotes figures showing that, in 1948, it required 24.84 operative-hours to produce 100 lbs. of yarn working old ring spinning machinery on traditional methods. Now new ring spinning machinery, coupled with work-study processes, needs only 10.55 operative-hours per 100 lbs. of production. This, he points out, compares with the last reported average performance in good United States mills of 11.49 operative-hours.

Many mills in Lancashire would be happy to echo the experience of Hayeshaw Ltd. in recruiting 124 juveniles during the past year, while only 25 workers retired on pension. The ability to secure young labour to take the place of older operatives is a vital factor in the battle ahead.

Fibre Deliveries

Output of man-made fibres, after reaching the highest level for 12 months past in March, showed a decline in April, mainly because of the shorter working month. Production of staple fibre in March, however, was at a new record level of 24,400,000 lbs., while continuous filament yarn aggregated 20,600,000 lbs. April output was 2 per cent. higher than in the same month a year ago, the increase in staple fibre production so far this year being 3 per cent. above the 1956 level, but this has been offset by a reduction in filament yarn.

Deliveries to home users during the first quarter of the year showed a sharp advance in consumption compared with the same period in 1956 and recent quarterly averages. Deliveries for home and export distribution amounted to 72,393,000 lbs., as against 66,519,000 lbs. in the first quarter last year and the quarterly average of 62,222,000 lbs. in 1956.

More staple fibre was absorbed by all the various spinning industries, with the exception of flax, the main expansion being in the cotton and woollen trades, where takings of 26,922,000 lbs. and 16,145,000 lbs., respectively, were recorded. Exports of staple, however, showed a marked reduction, being 6,665,000 lbs. in the first quarter this year, as compared with 10,422,000 lbs. in the same three months of 1956.

Deliveries of continuous filament yarns so far this year were very similar to those recorded in the early months of 1956, but the total to the end of March of 61,853,000 lbs. compared with a quarterly average last year of 55,430,000 lbs. Little change has occurred in the quantities absorbed by the various types of consumer in the home market, but exports of yarn showed a further increase to 9,853,000 lbs., as compared with 7,898,000 lbs. in the final quarter last year and 6,226,000 lbs. in the first three months of 1956.

Further wage increases are being sought for employees in different sections of the cotton textile industry in Lancashire. Higher earnings are being claimed by supervisory staffs, following the adoption of a resolution by the delegate conference of the Textile Officials' Association. This called for the submission of a claim for extensive advances to the Master Cotton Spinners' Federation. Under the terms of the resolution, the increases demanded should "level up differentials which have been in existence for many years but have now been narrowed." In some cases, the Association claims the differentials have ceased to exist.

Quickly following the general application for a wage advance already submitted by representatives by the 245,000 spinning and weaving operatives has come a similar application for enginemen, firemen, mechanics and electrical workers. The unions concerned have lodged a demand for "a substantial increase" in wages with the Master Spinners' Federation and the Cotton Manufacturers' Association. Some 4,000 workers are involved in this demand.

Fine Cotton Supplies

Perhaps, it is not entirely a coincidence that the first direct communications from Egypt for six months should be received at the same time as announcements are made relating to the next Egyptian cotton crop. The rivalry among the leading growers of long-staple cotton is clearly coming to a head and it is interesting to compare the tactics being pursued by the participants in the struggle. Higher export taxes are to be imposed on the new Egyptian crop possibly as a move to encourage interest in current supplies which are not affected by the proposals. The higher duty will add an extra 5½ tallaries per cantar to long-staple cotton and 4¾ tallaries for medium varieties.

Advices from Alexandria admit that sales abroad have not so far been as large as in the previous season and the carry-over is expected to be higher than twelve months ago. To the end of the first week in May, exports from Egypt had aggregated 428,478 bales, as compared with 724,946 bales in the previous season.

The attitude of the authorities in Egypt towards foreign trade still remains a mixture of threats and pleadings. "There would seem to be a real need to be filled in long-staple cotton in America and also elsewhere in spinning centres which is a healthy sign," states one market review. "On the other hand," it adds, "our authorities are on the alert to counteract whatever adverse circumstances which may happen to endanger the stability of our market. Already, there are many measurs and activities—bilateral agreements, special discounts for hard currencies, business missions, etc.—which are being constantly devised to protect the growers and the economy of the country. Others are on file to be used if and when necessary."

Conditions in the Sudan are far from stable. Raw cotton supplies at the beginning of the current season were offered by auction, with basic prices to protect the farmers. Because of the restricted demand, sales by private tender were reintroduced, but this venture has proved no more successful and auctions have restarted, with reserve prices about 9*d.* per lb. lower than the former level.

In view of these various conflicting developments, it is small wonder that users of long-staple cotton, not only in this country but in other consuming areas, are disinclined to anticipate their needs far ahead. Stability in prices and some prospect of continuity of supplies are essential features of confidence and, without such trust, it is unlikely that business will broaden in the near future.—*All Rights Reserved.*

REGULATION OF DELIVERY CONTRACTS

OUTLINE OF A NEW SCHEME

THE Board of the East India Cotton Association, Bombay, has been having under consideration for some time now the question of regulation of Delivery Contracts. This subject has been examined by the Sub-Committee appointed to go into the question of changes, if any, to be effected in the Hedge Contract for the next season and also by the Board at its various meetings. After elaborate discussion, the Board has formulated a scheme in the form of an outline providing for non-transferable specific Delivery Contracts. The scheme is only a tentative one and final shape will be given to it only after considering the various suggestions that might be put forward by the different interests concerned. The scheme that might be finally adopted will then be submitted to the Forward Markets Commission for approval as early as possible, as the Commission desires to have definite proposals for regulating Delivery Contracts before granting permission for trading in the new crop contracts. The following is the outline of the new scheme, as officially circulated by the Association:

Under the scheme trading in the following types of Delivery Contracts only will be permitted:—(a) Sales and purchases between members or between a member and a non-member on private types or sealed samples or on stamped bales either on 'on call' or 'fixed price' basis in respect of all varieties tenderable under the Hedge Contract and/or included in the Textile Commissioner's Schedule. There will be no settlement clearings in respect of these types of business. (b) Sales or purchases between members or between a member and a non-member on description in respect of the varieties tenderable under the Hedge Contract which may be permitted by the Board, either on 'on call' or 'fixed price' basis. Payment of differences through the Clearing House as envisaged hereunder, shall not apply to such transactions in which one of the parties is a mill but the transactions should not be cancelled.

Delivery Orders

Delivery orders should not be passed on from party to party. Delivery should be taken by the buyer from his immediate seller and then given to the mill or the next party. Transactions on description shall be for the particular staple stipulation as may be permitted by the Board from time to time. Such transactions, however, may be settled if the parties mutually agree. No havalas are to be allowed. No purchase or sale in Delivery Contracts other than on the abovementioned terms and conditions, shall be allowed under the by-laws of the Association. There shall, however, be no restriction of business in respect of cotton having a staple more than 1" as well as those which are not included in any of the abovementioned two Schedules. Transactions in respect of Bengal, Assam Comilla, Oomra Deshi, Mathia, and Mungari and other varieties not included in the Hedge Schedule or in the Textile Commissioner's Schedule may be on 'fixed price.'

Daily rates on 'on call' and 'fixed price' basis shall be fixed by the Daily Rates Committee for the varieties permitted by the Board to be traded in Delivery Contracts on descriptions, subject to a right of appeal to the Board. The right of making the call shall be at the option of the buyer, unless otherwise stipulated in the contract. The person entitled to demand fixation of the price may do so during hours when trading is open in the Trading Ring or give a valid havala of the Hedge Contract, if demanded. When the buyer is entitled to fix the price and the seller intimates to him that he is buying a Hedge Contract against fixation, and when the seller is entitled to fix the price and the buyer intimates to him that he is selling a Hedge Contract against fixation, the price at which the cotton called, against which such hedge is bought or sold, shall be fixed on the price of such hedge so bought or sold. The call price shall be fixed within a fortnight before the commencement of the delivery period of the contract or within a fortnight before the commencement of the delivery month of the Hedge Contract, whichever is earlier. However, if the price in the Hedge Contract added to the rate of 'on call' touches the ceiling rate fixed by the Textile Commissioner for that particular description, then the call price shall be deemed to be automatically fixed at the ceiling rate on the date of such occurrence at that rate by mutual consent or the buyer should give a Hedge Contract at the rate referred to above and the seller shall be bound to accept the same.

Delivery Contracts between a merchant and a mill shall not be subject to settlement clearing. Delivery Contracts between members or between a member and a non-member on private types, or sealed samples or on stamped bales shall also be not subject to settlement clearing. Settlement clearings in respect of other Delivery Contracts shall not be on weekly clearings basis, but they shall be as under:—

In respect of 'on call' transactions on description if the 'on call' rate fixed by the Daily Rates Committee on any day for a particular description is more or less than the 'on call' rate fixed by the Committee for the first time for that description or more or less than the previous settlement rate for a particular description by Rs. 25 per candy, then the parties shall pay or receive the differences accordingly through the Clearing House for that particular description at the immediately following weekly settlement clearing.

Fixed Price Transactions

In respect of transactions on description at fixed prices and in respect of 'on call' transactions for which the call price has been fixed, if the rate fixed by the Daily Rates Committee for a particular description on any day is more or less than the rate fixed by the Committee for the first time for that description or more or less than the previous settlement rate for a particular description by Rs. 25 per candy, then the parties shall pay or receive the difference in respect of such transactions for that particular description, through the Clearing House at the immediately following weekly settlement clearing. The differences arising out of final settlement shall also be paid or received through the Clearing House at the immediately following settlement clearing. The rates shall be based on the rates fixed by the Daily Rates Committee subject to a right of appeal to the Board. The balance-sheet in respect of settlement clearing for Delivery Contracts as above shall be submitted separately and not included in the balance-sheet in respect of Hedge Contracts. However, the amount due to be paid or received under either balance-sheet shall be permitted to be set off.

The due date in respect of Delivery Contract on description, between members or between a member and a non-member other than transactions between a member and a mill shall be 25th of the month and in respect of transactions between a member and a mill or between a non-member and a mill shall be the last day of the month. Due date for the transaction of Delivery Contracts on stamped bales, private types or sealed samples will be according to the stipulations of the contract. No 'on' allowance for class or staple shall be allowed. Cotton tendered upto one grade 'off' to be allowed. Cotton tendered which may be below the basic staple or more than a grade 'off' in class shall be rejected.

Delivery of Cotton

It shall be obligatory on the seller to deliver the cotton or face consequence of failure to tender. It shall not be in order for him to ask the buyer to buy on his account in case of his inability to deliver cotton according to his contract. Having sold cotton under a Delivery Contract on specific types or sealed samples or stamped bales or on description, it is obligatory on the seller to give delivery of actual cotton. If the cotton tendered is rejected in arbitration it shall be invoiced back at the spot rate of the cotton contracted for, fixed for the day following the date of the final award together with a penalty at the discretion of the Board not exceeding Rs. 25 per candy. In the case of failure to tender the cotton shall be similarly invoiced back at the spot rate of the cotton contracted for, fixed for the due date together with a fixed penalty of Rs. 25 per candy. Application for fixing invoicing back price in both the above cases to be made under By-law 34A. The right of buyer to buy on account to remain as at present in both cases.

It is felt that the above regulations in respect of Delivery Contracts can be effectively enforced, only if these regulations are made uniformly applicable to all transactions in Delivery Contracts whether either of the parties thereto is a member of the Association or not. It will, therefore, be necessary for Government to apply the provisions of Chapters III and IV of the Forward Contracts (Regulation) Act 1952 throughout the Indian Union to transactions in non-transferable specific delivery contracts also in order to regulate and control such transactions.

EXPORT OF COTTON

Figures relating to export of cotton from the beginning of the current season till the 18th of May show that the export performance of Indian cotton during the period has been very poor. Exports to different destinations during the period aggregated 215,799 bales (of 392 lbs.) as against 524,801 bales during the corresponding period of the previous season. This reduced shipment was due partly to the fact that the quantity allowed for export—4 lakh bales—was comparatively small, thanks to the tight supply position of cotton and partly to the closure of the Suez Canal. Further, the sudden ban on export of cotton imposed on 26th March forbade further sale of cotton against the quota already announced. The following table gives the destinational break-down of cotton shipped from India during the period under reference:

(In bales of 392 lbs.)

	1st September to 18th May	
	1956-57	1955-56
Japan	130,961	266,512
Hong Kong	31,583	34,174
Continent	25,174	100,071
U. K.	21,076	62,752
China	3,427	54,200
U.S.A.	2,359	3,776
Others	759	2,026
Total ..	215,799	524,801

As will be seen from the table, Japan accounted for the major portion of cotton shipped by India, followed by Hong Kong, the continent of Europe and the U.K. A striking feature of this season's export trade is the sharp drop in the offtake of Indian cotton by continental countries and Britain. The former purchased only 25,174 bales during the period under review, as against 100,071 bales during the same period last year. Similarly, the share of U.K. dropped from 62,752 to 21,076 bales. The main obstacle to trade with these countries, it is needless to say, was the break-down of traffic through the Suez Canal.

EGYPTIAN COTTON

Despite the fact that the Indo-Egyptian trade agreement signed in April last provides for import by India of 20,000 bales of Egyptian cotton under a special payments procedure, the offtake of Egyptian cotton by India has not been up to expectations. This is attributed to the fact that the mills which, apart from being more or less well supplied with East African and Sudan cotton, have developed a "wait-and-watch" attitude as they anticipate a further fall in Egyptian prices which have of late been showing a declining trend.

Offers in the Bombay spot market for Karnak T. 154 variety ranges between 54½d. and 55d. per lb. Though this is more or less in line with the price ideas of Indian mills as indicated earlier, the latter are not much enthusiastic about putting through deals at this rate. This lack of interest in Egyptian cotton is also due to the relative cheapness of comparable Sudan cotton. Further, Egyptian cotton is used for the production of fine and superfine cloth, and the trade in these varieties does not show signs of any immediate improvement. This is another reason for the lack of enthusiasm among mills for acquiring Egyptian cotton.

Meanwhile an idea of the current supply position of Egyptian cotton can be had from the following table:

Supply Position of Egyptian Cotton

(In bales of 720 lbs.)

Variety	Carry over on 31-8-1956	Crop	Total supply	Exports and consumption till 22-5-1957	Stocks on 22-5-1957
Karnak ..	36,022	292,003	329,015	206,580	122,435
Menoufi ..	7,918	113,586	121,504	74,480	47,024
Giza 30 ..	29,401	180,540	209,941	110,018	99,923
Ashmouni ..	31,144	381,029	412,173	239,640	172,533
Others ..	22,350	23,201	45,551	34,724	10,827
Total ..	127,735	990,449	1,118,184	665,442	452,742

LONG-STAPLE COTTON

Since India has been importing long-staple cotton of the value of about Rs. 40 to Rs. 50 crores yearly, any attempt at increasing the production of long-staple cotton within the country is to be greatly welcomed. It is happy tidings, therefore, to cotton people to know that the Government of Bombay, in co-operation with the Indian Central Cotton Committee, will shortly embark upon a scheme, costing Rs. 1 lakh, for the establishment of a pilot research station to grow long-staple American and Egyptian cotton near Talod in Sabarkantha district of Bombay State. In the neighbouring district of Mehsana, experiments conducted in the hybridisation of Sea Island cotton and the C.O. 2 variety has yielded encouraging results.

At Talod, agricultural experts, assisted by local cultivators, will study climatic and agronomic factors conditioning the growth of long-staple cotton. The Director of Agriculture and other experts of the Government of Bombay recently visited Talod for an on-the-spot investigation of the possibilities of implementing the scheme. The cost of the pilot scheme will, it is understood, be jointly borne by the Government of Bombay and the Indian Central Cotton Committee on a 50-50 basis.

They are in the best hands when they fly!

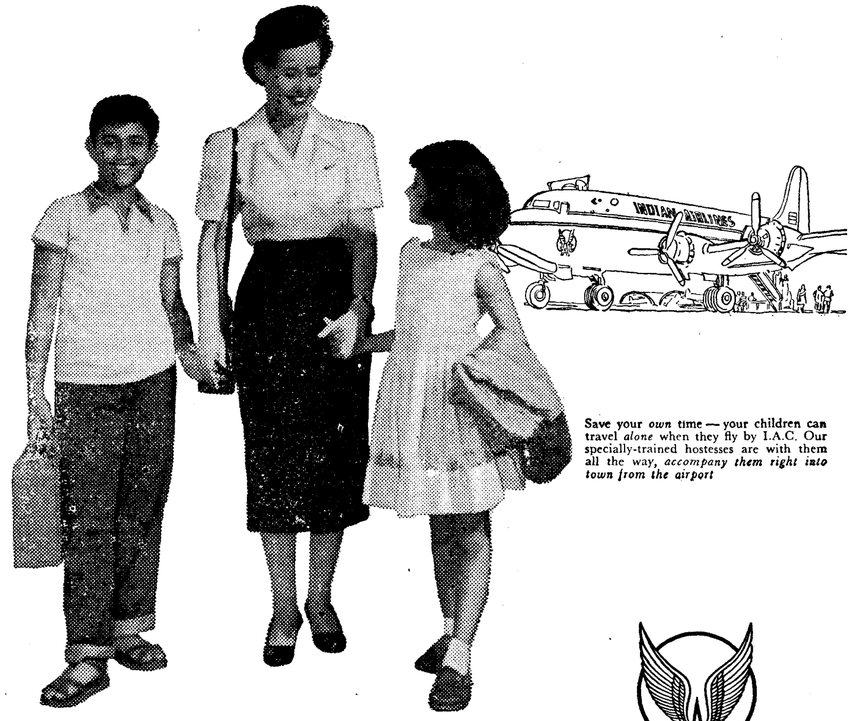
Let your children travel back to school by IAC—at special reduced fares!

LET them enjoy the *whole* of their holidays—I.A.C. will fly your children back to school, swiftly and comfortably. . . at a special 25% reduction!

And children are so well looked after when they fly by I.A.C.! Our crews take special care of them, our air hostesses are specially trained to look after them—*and they accompany them right into town from the airport,* aboard I.A.C.'s own luxury coaches!

Only air travel offers all these facilities . . . so let I.A.C. take your children back to school—you'll find it's so quick, so convenient, your children enjoy it so much!

For full information about I.A.C.'s special fares and arrangements for children and students, contact your nearest I.A.C. office,



Save your *own* time—your children can travel *alone* when they fly by I.A.C. Our specially-trained hostesses are with them all the way, *accompany them right into town from the airport*

ACTIVITIES OF COAL BOARD

STOWING RECEIVES SPECIAL ATTENTION

ALTHOUGH the latest Annual Report of the Coal Board (Chairman: P. M. Nayak, I.C.S.) —that for 1955-56—relates to a period which is more than 14 months old, it is nevertheless of some importance, inasmuch as it gives a fairly detailed account of the working of the Board, with particular reference to the steps taken by the Board for improving the conditions on the coal front. Thus the report covers developments in practically all aspects of coal industry—production, stowing, washing, opening and re-opening of coal mines and seams in working collieries, depillaring and grading.

As in the previous years, so also during the year ended March 1956, the raisings of coking coals of selected A and B grades as well as grades 1 and 2 continued to be restricted by fixation of a ceiling on output of individual collieries. The original objective of a progressive reduction in output, however, was given up, in view of the increased requirements anticipated in the country's expansion plans for the metallurgical industry; instead, a policy of regulated and phased increase in production was forecast by fixing the production ceilings for 1955 at levels slightly higher than in 1954. The ceilings were 7.32 million tons for selected A and B grades, 3.95 million tons for grade 1 and 3.05 million tons for grade 2, or a total of 14.32 million tons. While fixing the output ceilings of individual collieries, no reduction was effected from the 1954 ceilings, except in cases where the actual output in 1954 was well below the permitted ceiling. But, subsequently, increases were granted on the merits of each case, until, finally, the aggregate of individual ceilings for 1955 rose from 14,227,000 tons (initial) to 14,385,000 tons, as against 14,377,000 tons for 1954. The actual output in 1955 was, however lower at 13,355,000 tons.

Ceilings and Actual Output

The following table shows the ceilings (initial and revised) and the actual output of the different grades of coal during 1955:

(In thousand tons)

	Ceiling		
	Initial	*Revised*	*Production*
Selected A and B. grades ...	7,294	7,378	6,994
Grade 1 ...	3,890	3,952	3,699
Grade 2 ...	3,043	3,055	2,662
Total ...	14,227	14,385	13,355

In accordance with the decision taken earlier that stowing should be adopted or enforced, if necessary, for depillaring the seams where the ordinary method of pillar extraction was not likely to yield a reasonable percentage of recovery or where such a method of extraction was likely to damage overlying or underlying coal seams, the Coal Board directed eight collieries to take immediate steps to introduce stowing. This brought the total number of collieries under orders for stowing as on 31st March 1956 to 15.

Except in two or three cases, the collieries were either undecided about their plans for stowing, or very slow in working out the plans and following them up with the earnestness and urgency which the conditions of the mines demanded. The Board had, therefore, to take stock of the position and, in doing so, it decided that the continuance of depillaring without stowing was a definite contravention of the Board's orders defeating the objects of conservation. Such depillaring should, therefore, be prohibited and the production ceiling of the collieries concerned should be reduced to the extent of the rate of output from the depillaring areas. It was, however, considered that each case should be examined in detail before depillaring was stopped or production ceiling was cut down, as such a step was likely to have a vital effect on the economy of the colliery concerned and might also cause some displacement of labour. A detailed review of each individual case was, therefore, taken up, and continuance of depillaring without stowing was allowed only when the Board was satisfied that further extension of time should be given to the collieries to make arrangements for stowing, and that any step to stop depillaring in the circumstances would create fresh difficulties for the collieries and retard the prospects of stowing. Action to stop depillaring was taken only in one case, namely, in the case of Geslitan Colliery.

The Coal Board continued investigations into the feasibility of a combined sand supply scheme for the collieries in the central Jharia field, but gave up the idea of a single ropeway to connect all the collieries. It also gave renewed attention to the question of stowing in the Jambad and Kajora seams. As the supply of sand requires considerable outlay which neither the Board nor the collieries were willing to undertake, the problem of extraction of the seams remained unsolved. The Board reviewed the progress of stowing in the Jharia field and found that it was not very satisfactory. It decided to give full encouragement to the collieries which proposed to install their own plants and also to the preparation of schemes for the supply of stowing materials to collieries which could not themselves install the plants, such supply being made to central dumps situated near chosen groups of collieries. Further, it felt that it might be necessary for the Board to acquire all sand rights for this purpose without in any way disturbing the existing sand supply installations, and that a quick survey should be made of the availability of sand.

Two Other Measures

The two other important measures taken up by the Board for the encouragement of stowing are:

(1) Decision to grant an increased rate of monetary assistance effective from 1st April 1955 for stowing for conservation in certain cases at the rate of 85 per cent. of the actual checked-up cost, subject to a maximum of Re. 1-8 per ton of material stowed, as against 75 per cent., or a maximum of Re. 1-5 in the case of stowing for safety.

(2) Sanction of the cost of removing over-burden in quarrying coal (where the over-burden so removed was also used for stowing in underground working elsewhere in the same colliery) as part of stowing cost eligible for assistance in cases where the depth of the over-burden was beyond the normal economic limits of open-cast mining.

During 1955-56, financial assistance amounting to over Rs. 61.41 lakhs was given for voluntary stowing in 80 collieries. The number of collieries which actually carried out stowing was, however, only 61, consuming a total quantity of 5,261,790 tons of stowing materials. Of these, 30 collieries producing coking coal stowed 2,483,678 tons and 22 collieries producing non-coking coal stowed 2,778,112 tons.

Washing

A notable suggestion which the Coal Board made to the Government of India during the year under review was that relating to washing. All coking coals, it was suggested, should be washed within the next few years either in private washeries for which necessary assistance and encouragement should be given or in washeries to be set up by the Board or any other central authority. The Government of India accepted this suggestion, but decided that it should be achieved in stages after considering the practical problems and actual needs that might arise from time to time. As for the immediate requirements of coking coal for the projected steel plants, the Government proposed to meet part of the demand from Bokero-Kargoli washery, and the balance from washeries that might be set up by collieries in the private sector. An assessment was, therefore, made by both the Coal Board and the newly set up Ministry of Iron and Steel of the possibility, if any, of collieries setting up washing plants for the supply of washed coal in time for the steel works. The prospect did not seem to be very reassuring; and the question of the Government setting up washeries to meet the requirements of metallurgical coal for the steel plants in the second Five-year Plan period was under study.

In the private sector, the washing plant at Lodna Colliery went into operation, bringing the total number of washeries in India to three. It was understood that some of the owners of collieries were also seriously examining plans for setting up washing plants at their collieries, but no definite proposals were received, except one from the Kharkharee Colliery and another from the Dhori Colliery, which were under the consideration of the Board. The Board also considered and approved during the year a proposal for the establishment of a multi-type group washery of 100 tons per hour capacity at Nowrozabad (Vindya Pradesh) for washing the non-coking coal of Nowrozabad and Kotma Collieries for the cement works of the Associated Cement Companies, Limited.

During the year under review—with effect from July 1955, to be precise—the Coal Board was empowered to exercise control over the opening and re-opening of coal mines and seams in working collieries; formerly this was one of the functions of the Coal Commissioner. The number of pending applications and new applications received by the Board was 58, of which 44 were considered. In many cases, the Board had to postpone decision, pending a final decision of the Government on the production target for the private sector of the coal industry. Permission was granted only subject to two conditions. First, the opening or re-opening of a seam in a working colliery was required for the maintenance of output. Secondly, the opening of the seam was acceptable considering the requirements of safety and conservation.

With regard to depillaring without stowing or splitting pillars as a final mining operation, the Coal Board adopted as a general rule the principle that a seam which was more than 15 feet thick could not be extracted without waste unless stowing was adopted. Where the pillars were weak and there was a chance of spontaneous combustion but stowing was impracticable due to non-availability of material, etc., it insisted on construction of proper non-combustible barriers before depillaring. A proper sequence of depillaring in panels was also suggested in other cases. Where the loss due to depillaring was likely to be heavy or the upper schemes were likely to be damaged, the Board withheld permission to depillar and asked the collieries to make arrangements for stowing. The number of cases dealt with during 1955-56 was 33.

Grading of Coal

The grading of coal, which had been done since 1945 by the Coal Commissioner, was transferred to the Board in July 1955. The Board laid down rules and procedure for the submission of applications for grading, drawing of coal samples and analysis of samples, submissions of cases to the Board and prescribed standard forms of application. It was decided not to charge any fee for the initial grading of coal. But in cases where samples were to be drawn to review a grade at the request of a colliery, the levy of a fee was justified in order to meet the cost of analysing samples; the fee to be deposited with each application for upgrading was fixed at Rs. 120.

The Coal Board examined in some detail the system of grading and the alterations proposed by the Fuel Research Institute, the Fuel Economy Enquiry Committee and the Coal Washeries Committee. In this connection, it considered the need for grading coals of the coalfields of Assam, Madhya Pradesh, Orissa, Hyderabad, Vindya Pradesh, etc. The system of grading, though it followed an empirical basis, did not appear, on careful study, to be irrational and, as a matter of fact, it seemed to be the nearest approach to a very scientific basis. The Board, therefore, came to the conclusion that no revisions of the basis of grading was called for, except to provide for some special grades of coal which might be produced by washing. It also thought that the coals of the outlying fields must be graded according to the specifications for the Bengal and Bihar fields.

The report under review reveals the interesting information that the Committee appointed by the Board to review and standardise the methods of investigation in the coal reserves and re-estimate the actual reserves of coal in the country could not make any progress, as the Government decided to reconstitute the Committee on broader basis by including more experts from scientific institutions and the coal industry. It would appear that the Government has taken no further action in this connection and that, as a result, the whole issue is pending.

COAL WASHERY AT KARGALI

The coal washery to be set up at Kargali at an estimated cost of Rs. 2.5 crores is expected to produce 550 tons of coal per hour. The washery will wash the entire annual output of nearly 2.2 million tons of coal in the Bokaro and Kargali collieries. The coal washed at Kargali will meet the major portion of coal requirements of Rourkela and Bhilai steel plants. A contract of the value of nearly Rs. 1.73 crores was placed with a firm for the supply, installation and commissioning of the washery by January 1958. One-fourth of the plant and equipment has so far been received at the site and the remaining portion is expected to be received within the next few months. Fifty per cent. of the structural work has also been completed at the site. Japanese engineers and technicians have arrived at Kargali to supervise the work.

CANE PRICES IN U.P. AND BIHAR

NO REDUCTION ALLOWED

RECENTLY some Press reports from Uttar Pradesh and Bihar suggested that the authorities had allowed the sugar mills to pay for their cane purchases a price lower than the minimum fixed by the Central Government, namely, Re. 1-5 per maund for cane delivered at railway centres or Re. 1-7 for cane supplied at the factory gates. These reports are, however, quite incorrect. Replying to a question in the last session of Parliament, the Deputy Minister for Food, Mr. M. V. Krishnappa, emphatically declared that no reduction in cane price had been allowed in Bihar; last year, however, due to the fall in recovery, a reduction of As. 3 per maund in the minimum price of cane was allowed with effect from May 1956. In the case of U.P., he said, the price of cane had been linked to sugar recovery with effect from 8th May 1957, as was done last year.

The Government's move to link cane prices to sugar recovery in the U.P. State, though it applies to a very short period in the current season, must be welcomed. It is common knowledge that sugar recovery begins to fall from the beginning of May, due to inversion of sucrose-content in cane on account of heat. If the recovery falls below a certain limit, the sugar factories naturally find it uneconomic to continue crushing. They, therefore, refuse to work, unless a necessary reduction in the price of cane is made. Mr. Krishnappa did well to draw attention to this point and to remind the House, at the same time, that the Government had no power to compel the sugar factories to work at a loss. According to him, the basic limit for sugar factories in U.P., where cane surpluses generally occur, is taken as 9.6 per cent. When the recovery falls below this limit, "it becomes unavoidable in the interest of growers to link the price of cane with recovery." This is done on the basis of a prescribed schedule. It may be noted here that the average price of cane paid by the factories in U.P. was nearly Re. 1-3 per maund in May 1956 and Re. 1-1-9 in the following month.

The area under sugarcane in U.P. during the current (1956-57) season is reported to be higher by 19 per cent., as compared with the 1955-56 season. It will be recalled that, in order to avoid the possibility of factories having to continue to crush late in June-July, as was the case last year, steps were taken to persuade the mills to commence crushing early. Thus, all mills which started crushing operations by 4th November 1956 were given a concession at the rate of As. 5 per maund of cane crushed by them up to 12th November; of this concession, As. 2 was met by the Central Government, As. 2 by the State Government and one anna by the cane grower in the form of a cut in the minimum price. As a result of this concession, 16 factories started crushing by 4th November, as against one a year before. Further, in view of the fact that some factories in West U.P. had to continue crushing both in June and even in July 1956, the cultivators were warned in the beginning of the season itself that they should make necessary arrangements for utilising their surplus cane for *gur* manufacture.

Alluding to the early start of crushing operations by mills, the Deputy Food Minister rightly pointed out that it was not economical to commence crushing earlier than the first week of November. For the sugar recovery in the second fortnight of October does not generally average more than 7 per cent. It is about 8 to 9 per cent. in November, as against 11 per cent. in the peak months of January and February and 9.5 to 10 per cent. for the season as a whole. The recovery in May is on the whole higher than that up to the middle of November.

In the course of his statement, the Minister reviewed the position with regard to the working of sugar industry in the U.P. and Bihar States. The review reveals that, up to 7th May, the sugar mills in U.P. crushed 10.13 million tons of cane, as against 8.71 million tons in the corresponding period of the previous season. About

(*Continued on page* 1193)

YOU SHOULD KNOW

HOW THE RECENT INCREASES IN EXCISE DUTIES AFFECT YOU

When you buy SUGAR, remember that the increase in duty is 5 nP per lb. or 10 nP per seer.

VEGETABLE OILS produced by ghanis or by small producers are exempt from duty and should not, therefore, cost more. Even for vegetable oils from large mills the increase in duty is only 2 nP per lb. This small increase may very well be absorbed by the trade in view of the 10 to 20 nP per lb. rise in price during the last year.

If you smoke, please note that you need not pay more on any brand of cigarettes other than those manufactured exclusively from Indian TOBACCO such as "Char Minar" or "Shah-i-Deccan." On these the effect of the rise is between $\frac{1}{2}$ to 1 nP per packet of 10. 100 biris will cost only 1 nP more. The price of hukka tobacco should not in any case increase by more than 13 nP per lb.

For your MATCHES, do not pay more than 4 nP per box of 40 sticks and 6 nP per box of 60 sticks. This includes reasonable profit for trade as well as increase in duty.

A quire of Ordinary Writing PAPER (8 lbs.) should, if at all, cost only $1\frac{1}{2}$ nP more.

TAXATION POLICY NOT CONDUCIVE TO SAVING AND INVESTMENT

MR. B. L. JALAN'S SPEECH AT BOMBAY GAS COMPANY ANNUAL MEETING

THE Annual General Meeting of the Bombay Gas Company, Ltd., was held in Bombay on 11th June, 1957, with Mr. B. L. Jalan, Chairman, presiding. In his address to the shareholders, Mr. Jalan made a critical analysis of the new taxation policy of the Government of India. He was of the opinion that the new taxes were not conducive to saving and investment and would not serve the basic objective of the country's economy as one object offset the other. He maintained that the reduction in the highest rate of income-tax and super-tax from 92 per cent. to 84 per cent. was only illusory as such reduction had been offset in other ways. Mr. Jalan also made a pointed reference to the gas pricing policy of the Bombay Government which completely ignored the need for an economic return on the capital invested. He pointed out how, despite a sharp increase in the cost of production of gas, the State Government was prevaricating over the management's demand for a suitable increase in the selling price of gas.

The following is an extract from the interesting speech of Mr. Jalan:

"Since we assembled here last, the international relations have witnessed many convulsions. The nationalisation of the Suez Canal once threatened a large-scale conflagration. Thanks to the efforts of our Prime Minister and President Eisenhower, a reassuring calm has returned. The Middle East, however, continues to be in turmoil at one centre or another. The world tension has also increased with renewed activity in the development of nuclear weapons. A race for ever new achievements is under way, one power trying to outstrip the other. But let us hope that, in the not very distant future, more lasting peace will be established.

"Nearer home, the Kashmir question was revived. The Jarring Commission Report, which also referred to 'the changed context,' is yet to be debated by the Security Council. Meanwhile, it has brought about further deterioration in the relations with our neighbour and also affected our economic relations with that country. The visa problem between the two countries has worsened beyond recognition. Notwithstanding a lack of full realisation, it has been demonstrated once more that good-neighbourly relations are absolutely essential for mutual benefit.

"In the midst of these none-too-happy developments abroad, India has crossed another milestone in her advance towards more effective democracy by completing the second General Elections.

"The progress of industrial programmes during the last few years has been fairly encouraging. It is contemplated that the production of several important industries will be increased manifold during the second Plan.

Economic Situation

"The fulfilment of the ambitious industrial programmes requires both economic stability and favourable investment climate. You will recall that, commenting on the second Plan, I had observed, in my last address to you, that I was afraid 'the investment potentialities and needs of the country have been exaggerated; the outlay in the public sector is far too excessive; and some real risks involved in the heavy doses of deficit financing have been ignored.' The first year of the Plan was out only last month and it appears that the new strains developed by the economy have not belied my fears.

"The Economic Adviser's general index of wholesale prices stood at 421.3 for the week ended 4th May 1957. This represents an increase of about 8 per cent. over the level a year ago. The rise has not been spread over uniformly on all groups of commodities, so that new imbalances have been created, all of which are, unfortunately, unfavourable to the industrial sector. Between March 1956 and March 1957, the prices of raw materials increased by about 9 per cent. and of food articles by 14.5 per cent. but the index of manufactured goods advanced only by 2.5 per cent. In other words, the cost of industry have increased, without a corresponding increase in the revenues of industry.

"A very serious deterioration in the balance of payments position has been a still more disquieting feature during the first year of the second Plan. Our external payments suffered a deficit of Rs. 300 crores. India's sterling balances have already touched a level which has to be maintained as minimum currency reserve. We have also drawn a credit of Rs. 60 crores from the International Monetary Fund and the solution to the problem is not yet in sight.

"The money market appears to be passing through a drought of capital and the stock market through a crisis of confidence.

"There is one stream of national income and savings from which both the sectors have to draw their funds. Having planned for an extremely bold programme with undue emphasis on the State sector, very meagre resources have been left at the disposal of the private industry. The sources of revenues of the State are rigid and claim the first priority. Whether one likes or not, taxes have to be paid. The private industry, however, has to draw on the residue of resources, and the means which it can employ are definitely voluntary. The entire brunt, therefore, of the inadequacy of resources to fulfill a given plan has to be borne by private industry.

Twofold Evil

"Heavy taxation is a twofold evil. It dries up the capital fund available to industry. It also creates disincentive for investment. The situation becomes worse if, as in the present case, taxation is levied beyond the taxable capacity of different sections of the people and the form of taxes is biassed against savings and investments.

"In the name of the Plan, the last few budgets imposed several new and enhanced taxes. Some taxes were justified on grounds of restraining consumption, others on fighting inflation, reducing inequalities of incomes or foreign exchange deficits, and still others on raising adequate revenues for the Plan. The piecemeal approach to different items of taxation has not served the basic objectives of our economy as the one object offsets the other.

"Since the publication of the reports of the Taxation Enquiry Commission and Prof. Kaldor, the Government have found an easy pretext for several new taxes. In an attempt at comprehensive tax reform, the two expert reports naturally suggested such untapped resources but they made it unequivocally clear that these suggestions formed an integral part of their new taxation pattern and any tax suggested by them lost all its vitality if a system of reliefs and concessions recommended by them was not adopted. Whereas the Government have found it convenient to swear by these expert opinions, the second integral part of reliefs and concessions has been completely ignored.

"I do not wish to dwell at length on individual budget proposals, but I must observe that the wealth and expenditure taxes do not serve the interests of our planned economy. They are likely to increase the harassment of the assessees and jeopardise the basis and privacy of our family life. The wealth tax will, of course, liquidate existing capital and act as disincentive to the formation of fresh capital, but even the expenditure tax will militate against the objective of increased savings and investments. The ultimate object of incomes is expenditure and if the taxpayer is effectively restrained from expenditure even in future, he will as well not save at all.

Reduction Only Illusory

"Those who still believe that some of the proposals of the budget will promote capital formation—as the highest rate of income-tax—super-tax has been reduced from 92 per cent. to 84 per cent. must be squarely told that, at certain levels of income, the assessees will pay more than 100 per cent. tax of their incomes, by whatever name we may call it, income-tax, super-tax, expenditure tax, or wealth tax. One cannot understand how we can promote savings and investments if we must tell the assessee that, if he earns 100 units of income, we will take away, say, 105 units or even more. From this practical point of view, one can easily follow how reduction in the income-tax—super-tax rates is only illusory.

"The direct effect of expenditure tax will be that a car purchased at, say, Rs. 20,000 will cost the assessee Rs. 40,000 (taxes of Rs. 20,000 being payable in five years) if his spending exceeds a certain specified income, which is not very high either. This will also seriously distort the relationship between 'cost to producer' and 'price to consumer' and inter-commodity price relationship within the economy. Thus a radio priced at Rs. 500 will cost Rs. 500 to one, Rs. 600 or Rs. 700 or even Rs. 1,000 to others.

"But this is only one side of the picture. It was contended that more reliance will be placed on institutional and corporate savings than on individual savings in future. But the burden of taxes on companies has been increasing at no mean a pace. Thus, the corporation and income-taxes have been increased, section 23A has been retained, excess dividend tax and bonus taxes have been imposed and wealth tax on companies has been introduced.

Compulsory Savings

"In this connection, may I suggest that the deposits of profits and depreciation should be constituted as a current fund for industry. The surplus funds should be lent to industry irrespective of the quantum of such deposits of individual units for legitimate industrial needs, medium and short term. This will at least check the loss of capital resources in a tight money market by this new scheme of deposits.

"I will also suggest that the Government can introduce compulsory loans. Thus, the amount payable by the assessees in respect of expenditure tax and wealth tax may as well be collected in the form of loans. The basis of computation and collection will remain the same. That is, the assessees (including companies in case of wealth tax) will declare their expenditures and wealth and compute the tax payable on them. But they will pay this amount as loan subscribed to the Government against appropriate securities and not as tax.

"This will have a tremendous psychological effect on the investment climate in the country. It will also give an opportunity to the taxpayers to borrow further capital against these securities and thus they will not be handicapped for lack of funds which is so essential for the fulfilment of the second Plan.

Company's Results

"As you will have seen, the working results of the Company show that the steady improvement in production, which has been the keynote ever since this Company came to the present management, has been maintained during the year under review. It has been raised to 1,529.2 million cubic ft. from 1,511.8 million cubic ft. in 1955 or an increase of 1.15 per cent. The year's production was 37 per cent. higher than what it was in 1946. In order to refresh your memory, I would like to quote the yearly production statistics for 1946 and the recent years:

Year	*Total gas production* (Cu. ft.)	*Percentage increase over* 1946
1946	1,115,949,000	..
1955	1,511,849,000	35.5
1956	1,529,221,000	37.0

"Last year, I had told you that the scheme for the expansion of the retort house had been taken in hand. I am now glad to report that this expansion has been completed within the scheduled period. Gas making on the new retort beds started in last December. With this increase in the capacity, the production will reach a figure equal to about 60 per cent. higher than the production in 1946 after the new gas connections have been fully installed.

"The Government were advised that the Company was in a position to provide gas connections to additional 2,500 consumers. We have so far received sanction from the Government to give 960 connections as at 31st May 1957.

"In spite of this improvement in the working of the Company, I am sorry to say that the financial results are rather disappointing. The surplus shown by the revenue account of the Company has dropped to Rs. 1,16,227 from Rs. 10,98,667 in 1955. The main reasons for this steep fall in profits are not far to seek. The price of coal was raised by Rs. 3 per ton from 1st July 1956, which alone accounts for an increase in the expenditure by Rs. 1,04,481 in six months. Another sum of Rs. 1,06,302 is accounted for by the increase in the surcharge in freight at Re. 1-6 per ton of coal from April 1956, higher terminal tax at twelve annas per ton of coal from 15th October 1956, and change in the rate of provident fund contribution under the Act passed by the

ANY QUESTIONS
on air travel?

The man to answer all your travel questions is your B.O.A.C. Appointed Agent. To make your journey really carefree (and at no extra cost), leave everything in his capable hands. He'll tell you about currency, passports, customs, etc. He'll make your booking, fix your hotel reservations, even get a car to meet you on the other side of the world!

10 QUESTIONS OF THE KIND YOUR B.O.A.C. AGENT CAN ANSWER

1. How soon can I be in . . . ?
2. How much luggage can I take? What does that allow me to pack?
3. Can I take a typewriter on board the aircraft?
4. What's the best time of the year to visit . . . ?
5. What should I wear in . . . in October.
6. Can I get an inclusive air tour of Europe?
7. Can I take a baby of 18 months on a long air journey—and what fare do I pay?
8. What's the rate of exchange in . . . ? How much can I take?
9. Do I need a visa for . . . ?
10. Will I have to be vaccinated?

If it's a question of air travel—see your B.O.A.C. Appointed Agent or B.O.A.C. office at Bombay, Calcutta, Delhi or Madras

World leader in air travel

RAMTIRTH
BRAHMI OIL

FOR LONG, LUSTROUS HAIR

Use RAMTIRTH BRAHMI OIL. Ayurvedic Medicine (Regd.). It ensures growth of healthy hair, removes dandruff, protects scalp, increases memory and induces sound sleep. Useful to every one in all seasons. Rs. 3/50 for big bottle and Rs. 2/00 for small. Send M.O. for Rs. 6/00 for big and Rs. 4/00 for small bottle including postage and packing. No V.P.P. sent.

SHRI RAMTIRTH YOGASHRAM
DADAR (C. RLY.) BOMBAY 14.

YOGIC ASANAS

To be healthy and to keep fit ask for our attractive Chart (Map) showing YOGIC ASANAS which will be sent on receipt of M.O. for Rs. 1/00. These ASANAS can be easily performed at home.

YOGIC CLASSES are regularly conducted from 7-30 to 9-30 a.m. and in the evening from 6 to 7-30 p.m. at the above address. Lectures on every Sunday at 10 a.m.

POWER RESEARCH AND OUTPUT GO HAND IN HAND

HOW DOUNREAY FITS INTO U.K.'S ATOMIC SCHEME

By A. W. Haslett

THE United Kingdom Atomic Energy Authority's station at Dounreay in Northern Scotland was conceived primarily as an engineering research station, and the fast-breeder power reactor, which is its most impressive installation, is itself a tool for research. In both respects, Dounreay differs from both of the two most widely known sites of the Authority—Harwell, where research is on earlier stages of development, and Calder Hall, whose reactors are primarily producers of plutonium, and also have served as prototypes for the further development of gas-cooled power reactors.

In order to view the Dounreay experiment in perspective, it is necessary to consider the probable long-term development of the British power programme. As is now generally known, it is a characteristic of reactors developed from the Calder Hall type that they use natural uranium fuel, while as a by-product of their operation, plutonium for future use is accumulated. This plutonium may be used in part for recycling, and in part in future reactor types that require enriched fuel. But if full nuclear value is to be obtained from uranium, and a base laid for an expanding programme of nuclear power generation, it will be necessary to use part at least of this plutonium in fast-breeder reactors.

Plutonium is, however, a difficult element for the metallurgist, while the problems of the fast-breeder power reactor are themselves formidable. Hence these two aspects are being tackled separately in the first place. On the one hand, there is research into the metallurgy of plutonium and its alloys, initiated at Harwell. On the other, experience of the problems of the fast-breeder type as such will be gained with a reactor—the one at Dounreay—in which the fuel elements will, in the first instance, be formed from highly enriched uranium.

The reactor has, however, been designed to be as flexible as possible in experiment. It will be feasible to try out experimental plutonium fuel elements, while still using enriched uranium as the main fuel; and when satisfactory plutonium fuel elements have been arrived at, it will be possible to change entirely to this fuel.

Self-contained Unit

A further general point is that Dounreay is a self-contained station, equipped to do other work for the Authority. Thus, it has its own materials testing reactor, of which the shell and casing are already complete and the core in course of assembly. This is similar to Harwell's Pluto reactor. It will be used in initial tests of fast reactor materials. But it will also do materials testing for all reactors which are direct commitments of the Industrial Group of the Authority.

Mechanical laboratories are already in use. They are making the fuel elements for the two Dounreay reactors, and will do the same job for certain overseas reactors. There are also chemical laboratories, research and development laboratories, and a chemical separation plant. The site as a whole is thus a large one—some 3 kilometres long by 2 kilometres deep, facing the northern ocean.

A fast-breeder reactor consists essentially of a small central core containing fissile material, in which fission by unmoderated neutrons is self-sustaining, and a surrounding blanket containing fertile material—uranium 238 or thorium—from which more fissile material is bred than is consumed.

In the Dounreay reactor, the overall shape of the core is a hexagonal prism, some 53 centimetres high and the same across. It is made up of several hundred fuel elements, which are of annular shape and form a close packed vertical array.

Each element contains at either end a length of natural uranium which provides the upper and lower sections of the surrounding blanket. The blanket is completed by surrounding the central portion with some 2,000 natural uranium rods, 2.4 metres long and about 3.1 centimetres in diameter.

In a fast-breeder power reactor, the two most difficult problems are the control of the reactor and the removal of heat from the core at the high heat rating. At Dounreay, 60 megawatts of heat will be generated. This corresponds with an average rate of heat transfer from the fuel elements of two-thirds of a kilowatt per square centimetre. So high a heat rating imposes severe restrictions both on the cooling system and the material used for canning. Cooling is by liquid sodium-potassium alloy.

Requirements for the canning material are that it should have good thermal conductivity, that it should not interact chemically with molten sodium and potassium, and that it should retain its shape against distortion of the fuel material by the formation of fission products. The choice for the initial fuel elements has fallen on niobium—an element new to engineering.

Control, the other main problem, is effected by moving one or more groups of fuel elements out of the core. In their operating position, these control groups are supported electromagnetically, so that an interruption of supply automatically shuts down the reactor.

Because of the high heat rating, the system by which the sodium-potassium alloy is circulated is of prime importance, and many precautions have been taken in its design.

Failure A Near-Impossibility

The first is that heat removal is shared between twelve independent units. Circulation is by electromagnetic pumps, and each unit has its own electrical supply, so that any general failure is close to impossible. In addition, there is a thermal system of heat removal to take care of the residual generation of heat which takes place even when the reactor is shut down.

Because the liquid metal circulated through the core is likely to be contaminated with fission products it must be contained within the cylindrical concrete shield which provides protection for workers on the plant. Its heat is, therefore, transferred through primary heat exchangers to a secondary liquid metal system. Each of the twelve heat-removing units comprises two primary circuits and one secondary circuit, a steam-raising plant and a dump condenser for the absorption of heat when steam is not being raised.

The heat exchangers which transfer heat from the primary to the secondary metal circuits are of tube and annulus design. In the steam-raising heat exchangers there is the special requirement that leaks between the sodium-potassium and the water circuits would lead to violent chemical reaction. For this reason the stainless steel tubes carrying the two circuits are bonded in a common copper matrix. While providing good transfer of heat, this allows a leak from either system to escape into the atmosphere.

Spectacular Feature

The most spectacular feature of the reactor is the great sphere, some 40 metres in diameter, by which it is surrounded. Made of mild steel plate varying in thickness between 2.5 and 4.8 centimetres, this is one of the largest pressure vessels yet built.

It serves two purposes. One is to localise any release of fission products. The other is to provide a precaution against the consequences of a liquid metal fire. The shell has been so designed as to withstand the extra pressure which would build up should an accident in the operation of the reactor lead to a fire of this kind. Access to the reactor is by a lift, and entry by an air-lock door which communicates with a gallery, level with the top of the upper shielding above the reactor and the primary heat exchangers.

The secondary heat exchangers and turbines, rated at 15 megawatts output, are outside the protective shell. Arrangements have been made for the output to be fed into the National Grid system. Regarded as a power station, however, Dounreay will be primarily a prototype, operated as an instrument of research, and a steady generation of electricity is not intended. It is due to begin operation during the first half of 1958. With a fast-breeder reactor frequent removal and processing of the fuel elements is necessary, while the breeder elements require also to be treated.

Fuel elements are moved vertically in or out of the reactor by a charge machine. This is heavily shielded, and is provided with a cooling system. There is a gas-tight door at its base, and the machine as a whole is transported by a rotary crane to a canning station at the side of the reactor vault. Fuel elements are removed to the chemical processing plant in stainless steel containers. They are there mechanically stripped, dissolved in nitric acid, and passed separated by solvent extraction into uranyl nitrate, plutonium nitrate, and fission products waste. Highly active waste is concentrated by evaporation and stored in stainless steel tanks. There is provision for the installation, at a later stage, of a plant for the recovery of caesium 137 and strontium 90, which have medical and industrial uses. Low active effluent will be discharged, first into holding pits, and thence to sea. Because of the difficult sea bed and strong tides, the pipeline for this sea discharge will be carried in a tunnel which is now being built.

BRITAIN'S LEAD

The Secretary-General of the United Nations, in his report to the Economic and Social Council due to meet in Geneva on 2nd July 1957, has complimented Britain on its achievements in the field of nuclear power. He says that Britain leads the world in the economical production of electricity from the atom with its cost roughly competitive with coal-produced power. In the introduction to this report, it is stated that, though in the long run, atomic energy is likely to bring about important changes, its economic impact in the near future will necessarily be limited. But the report adds that "little doubt exists, that, with further technological development, nuclear power will become commercially feasible—that is competitive on a widespread basis. Nuclear power cannot be disregarded even now in planning economic development. In the future, power supply programmes both for developed and underdeveloped areas may be expected to turn increasingly to the use of nuclear energy."

Fully conscious of the importance of nuclear power, several countries are trying to equip themselves with the necessary plant and material. Since Britain is ahead of all other countries in the world in the peaceful application of atomic power, they are invariably turning to that country for the supply of equipment and know-how. A few weeks ago, a report from Tokyo claimed that Japan proposed to buy from Britain a Calder Hall type reactor in order to make a beginning in producing electricity from atom. This decision is said to have been taken despite the advice that the reactor which the Americans are designing is superior to the British in many ways.

Apparently, the Japanese have been impressed by the fact that, whereas Britain has a full-scale power reactor in operation, the Americans are still experimenting with it. It is, however, possible that, as soon as the Americans succeed in establishing, on a commercial scale, a workable reactor, they will offer stiff competition to Britain; because they are in a better position to give financial assistance to the countries that wish to buy atomic reactors.

Another instance of a country wishing to buy British assistance and equipment for putting up nuclear power reactors is Italy. A State-controlled Italian Oil Corporation—Eni-Agip—is reported to be conducting negotiations with Britain to secure licences for building in Italy British-type nuclear power reactors. This group has already established a subsidiary, called the Agip Nucleare, for the production of nuclear power. Italy's ambition is not confined to producing electricity from nuclear power but also includes manufacture of small reactors for export. It is, therefore, planning purchases of British-made reactors and also formation of a partnership with British manufacturers for making nuclear power equipment.

NEW MACHINE FOR ANALYSING COMMERCIAL DATA

A revolutionary, high-speed machine for processing, recording, and printing information from round holes punched in accounting-machine cards has been developed in Britain. Its speed is so great, it is claimed, that it can complete most tasks in far less time than would be taken by even the greatest number of human operators who could be economically employed. It can feed, for instance, the cards at 300 per minute and accept therefrom over 50,000 digits, if necessary, for adding or subtracting. The recording unit can print up to 140 characters in one line, at the rate of 300 lines a minute. This works out at 700 characters a second.

The machine continuously checks its own calculations, and is incapable of giving a result which is incorrect in relation to the information fed into it. These enormous speeds, combined with the machine's accuracy and versatility, mean that it can produce for trade and industry figures and analyses which could not otherwise be attempted. These are produced at a speed which makes them immediately usable, so they can be instantly referred to and do not merely serve as a historical record.

In order to achieve these very high speeds, the designers had to abandon the conventional methods of printing by means of type and employ a new method. The machine "writes" the characters by means of a stylus which reciprocates, at the enormous speed of 305 strokes per second, to produce each character as a pattern of dots. As to versatility, the machine is adjusted to operate in European languages with 26-letter alphabets, but with a simple modification it can write equally well in Swedish, which has 29 characters.

The first export order has gone to the Berlin Electricity Company, where a machine is already in operation for billing purposes. Another will be delivered to Swedish railways, and further orders are in hand for a number of oversea countries.

NEW PRODUCTS AND PROCESSES

Heat Exchange in Diesel Engine

BOTH the temperature of the cooling water and of the lubricating oil are important in ensuring efficient operation of a diesel or a petrol engine. If the temperature of the lubricating oil is too high its viscosity becomes too low and its lubricating value decreases. Too low a temperature of the lubricating oil may increase its viscosity too greatly, and the oil will not be able to spread adequately over the surfaces to be lubricated. Moreover, too low a temperature may cause water of condensation to form and hence emulsification of the lubricating oil. A radiator factory at Amsterdam, the Netherlands, has developed a device in which the lubricating oil is brought to and maintained at a favourable temperature by the hot cooling water. The cooling water coming from the engine is conveyed through the device via either the by-pass (when the thermostat is closed) or the radiator (when the thermostat is open), passing through a bundle of tubes around which runs the lubricating oil which is heated or cooled. The use of this device improves the running of the engine and thus leads to lower maintenance costs and a longer life. Since the oil and water connections are different for almost every type of engine the manufacture of these devices is only practicable if about twenty are ordered of one given type.

Reducing Factory Noise

New techniques for reducing industrial noise in factories and in individual machine tools, conveyors and other types of plant are being developed in both Europe and the U.S.

One feature of the new noise reduction techniques is the use of a number of newly developed types of sound-absorbing materials and the development of a number of novel types of specially designed and lined partial enclosures for plastic and metal cutting machines and scrap metal conveyors.

Experiments recently carried out in the U.S. have shown, for example, that considerable improvements in production efficiency can be obtained by placing specially designed noise shields between noisy machines and their operators.

Two additional features of the noise reduction research in which rapid advances are also being made are the redesign of the machines themselves with a view to noise elimination, and the production of new types of improved efficiency selective ear plugs. Some of these latter ear plugs can now be made so that they will cut out all painful, or obnoxious, noise while at the same time passing through to the ear speech of normal speaking volume.

Butyl Rubber Tyres

A manufacturing firm of Melbourne, Australia, claims that a tyre and valve it makes of butyl synthetic rubber has most of the advantages of a tubeless tyre. Because butyl rubber will hold full pressure for a considerable time, it is not necessary to have "bleeder" grooves round the valve. The valve has a rubber sealing washer which beds down on the rim. In fitting one of the new tubes it is necessary to bleed air from between the tube and tyre, then screw down the valve-sealing washer. Because the valve is an airtight seal against the rim, air is held within the tyre even if it is punctured. Butyl tubes and valves are produced for Mircorp, Safety Wheel Manufacturers, of 138 Burnley Street, Richmond, Melbourne.

Measuring Cable Height

Post office engineers are currently testing out new instruments for measuring the aboveground height of power wires. The new instruments are basically optical height measuring devices by which the engineer can, whilst standing beneath a power wire, ascertain its precise height above the ground. Their development is due to the fact that when erecting a new telephone line which crosses the route of an existing power line engineers have to assess the height of the existing wires in order to ensure proper clearance. Recently a fatal accident occurred, due to a measuring tape, which was being misused, touching a power line. Experiments with prototype instruments have been so successful that it is hoped to adopt one of them for general use.

Drilling Holes in Concrete

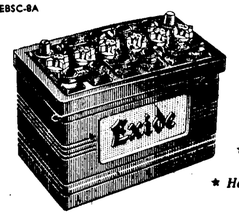
A tool factory, The Netherlands Tool Manufacturing Company, has designed and put on the market a vibrator attachment for drilling holes in concrete; it can be clamped into a normal electric drilling machine with a 13-mm. (½-inch) chuck. The 12 hardened and wear-resistant teeth in the vibrator attachment cause about 9,000 vibrations per minute which are transmitted to the revolving hard-metal drill. The tool is capable of drilling holes of from 4 to 25 mm. at a high speed in any type of concrete. A special design enables the vital parts of the tool to be easily replaced should it become worn by prolonged and intensive use.

Titanium Sandwich

Titanium forms the basis of a new type of fireproof sandwich which has been developed for use in aircraft. The sandwich structure, which is being used for the construction of firewalls in helicopters manufactured by the Bell Helicopter Corporation of the U.S., involves the bonding of titanium and fibre glass skins to an aluminium honeycomb structure. This will be, it is claimed, the first full-scale application of a bonded titanium component for any kind to a commercial product.

Advantages claimed for the new type of firewall for use in aircraft include light-weight, resistance to high temperatures and an efficient fire-resistant behaviour.

EBSC-8A



PORVIC has eliminated the commonest cause of premature battery failure

★ *Porvic Separators:* Microporous plastic that is virtually indestructible in service.

★ *CB 95 alloy plate grids:* In combination with Porvic they now show their full lasting capabilities.

★ *Hard Rubber Container:* Tough, leak-proof and shock-resistant.

WORKER PARTICIPATION IN MANAGEMENT

STUDY GROUP FAVOURS PERMISSIVE LEGISLATION

THE pragmatic turn which the entire philosophy of industrial relation has taken since the dawn of the present century has enabled labour to be seen in its true perspective. It is now fairly widely recognised that labour is not merely a factor of production the exchange value of which—wage—is subject to determination by the free play of the forces of supply and demand but a human factor, meriting a human consideration. This recognition has thrown open a long vista of labour-management co-operation in that collective enterprise called production. The Philadelphia Declaration reaffirmed the principle that labour is not a commodity and asserted the primacy of the social objective in international policy, the objective being defined as the attainment of conditions in which all human beings have the right to pursue both their material well-being and spiritual development in conditions of freedom and dignity. One of the specific objectives listed by the Philadelphia Declaration was the co-operation of management and labour in the continuous improvement of productive efficiency and the collaboration of workers and employers in social and economic measures.

Explaining the basic philosophy of industrial relations envisaged for the country, the second Five-year Plan observes: "A socialist society is built up not solely on monetary incentives but on ideas of service to society and the willingness of the latter to recognise such service. It is necessary that the worker should be made to feel that, in his own way, he is helping to build a progressive State. The creation of industrial democracy therefore is a prerequisite for the establishment of a socialist society. For the successful implementation of the Plan, increased association of labour with management is felt to be necessary. The latter will promote increased productivity, better understanding of the workers' role in the working of the industry and the process of production. It will also satisfy the workers' urge for self-expression, thus leading to industrial peace, better relations and increased co-operation."

Industrial Relations Under the Plan

The aforesaid objective could be achieved, according to the authors of the second Plan, by providing for councils of management consisting of representatives of management, technicians and workers. The policy is quite sound, but the subject is a complex one and requires most careful handling when it is sought to be translated into actual practice. The Government of India, be it said to its credit, it fully aware of it. This is obvious from the fact that in order to get a first-hand idea of the many problems of detail which might arise while giving practical shape to the above policy, it deputed a ten-member Study Group, consisting of representatives of employees and employers and Government officials, to study the working of the machinery of workers' participation in management in certain European countries. The Study Group reached Paris in October 1956 and held a series of conferences with employers, representatives of trade unions and Government officials. The Group also visited London, Brussels, Stockholm, Bonn, Belgrade, Geneva, etc., and its report, entitled *Report of the Study Group on Worker Participation in Management*, has now been published. The report consists of three main parts. The first one gives a bird's-eye view of the existing systems for workers' participation in management in vogue in the United Kingdom, France, Sweden, Belgium, Federal Republic of Germany and Yugoslavia. The second part, by far the most important part of the report, deals with an evaluation and appraisal of the systems in these countries; in this section, the authors have concentrated on features which provide lessons which can with advantage be adopted in India and those that would better be avoided. In the third part, some general conclusions are drawn from the evaluation and an attempt is also made to answer some of the questions facing India in this respect.

The method of workers' participation in management in the different countries which the Study Group visited differed widely in respect of the range of subjects handled by the participation machinery, in the degree of authority exercised with regard to these subjects and in the method of selection of workers' representatives. In France, for instance, though the functions of the Works Committees are generally advisory, as in the United Kingdom, welfare schemes are usually administered by them. Workers' representatives are often selected by the general body of workers by secret ballot, but in some countries the election is limited to the list of candidates drawn up by the Union. It would thus be interesting to note, in some detail, the various practices current in some of the European countries.

British System

Workers' participation is practised in the United Kingdom through joint consultative committees set up for this purpose both in the private and the public sectors of the industry. The formation of these consultative bodies is based on agreements between the management and the trade unions but their structure varies widely. The majority of firms have a single committee which may be having sub-committees. The committees consist normally of representatives of management and employees, the employees' representatives being elected by secret ballot and the management representatives appointed by the chief executive. The functions of the joint consultative committees generally include the following:

(1) The safety, health and welfare of employees.

(2) Questions of training, education, works rules, codes of discipline and other personal problems.

(3) Improvement of the methods of production, efficient use of the maximum number of production hours, economy in the use of material.

(4) Encouragement of suggestions for improvements within the factory.

The Study Group claims that there is a growing practice on the part of managements in the U.K. to consult these bodies on the financial policy, production programmes, distribution of profits, etc. But questions relating to wages, conditions of employment and other matters which are normally the subject of negotiation and collective bargaining are excluded from the competence of these committees. An examination of British practice has convinced the Study Group that, for workers' participation to be successful, there should be flexibility in the formal arrangements for participation; there should be extensive, preferably joint, efforts for education and training; joint consultation should embrace all levels; organisations for joint consultation should be developed by joint consultation.

French System

In France, joint consultation was given the sanction of law in 1945 which prescribed that all non-State organisations must have Works Committees if 50 or more workers are employed and workers' delegates if 10 or more workers are employed. In the public sector, most of the nationalised industries have workers' representatives on their management boards and there is provision also in the majority of cases for Works Committees and workers' delegates.

French Works Committees have advisory as well as administrative functions. In the former sphere, their functions include co-operation with the management in the improvement of conditions of work and living, examination of suggestions for increasing production and improvement in output. The Works Committees are also consulted on questions concerning the organisation, management and general running of the undertaking and are entitled to give opinion on price increases. Supply of information to the Works Committee concerning profits made by the undertaking is compulsory and the Committee may make suggestions in respect of their utilisation. Administrative functions of French Works Committees include powers in respect of social, provident and mutual aid schemes, consumers' co-operatives, housing allotments, medical services, etc.

The principle of workers' participation has been carried a step further in the French public sector. The boards of directors of nationalised institutions of an industrial or commercial character are composed of representatives of the State, representatives of the staff nominated by the most representative trade unions and representatives of the general interest of the country chosen, in most cases, by trade union federations, large-scale family associations or groups of consumers and users.

The Group's impression of the French system of workers' participation is that it is rather formal and rigid. There is indifference and even hostility on the part of many employers which has yet to be got over and it is pointed out that, over the whole field hangs the cloud of division in the ranks of workers. However, there are features in the French system, which, in the opinion of the Study Group, are worthy of emulation. They include: (1) provision made for welfare and general success which has been achieved in its joint administration; (2) the work done by trade union organisations in preparing members for effective participation.

German System

In Germany, workers' participation is known as co-determination which has three distinct aspects, namely, economic co-determination, personal co-determination and social co-determination. The first and the most important aspect of economic co-determination relates to management policy, the second relates to personnel policy including recruitment, transfer, discharge, etc., and the third relates to determination of piece rates, working hours, vacation, accident prevention, etc. There are legal provisions to cover all the three aspects. Germany, observes the Report, is evolving a new form of industrial relations somewhere between the traditional relations under a system of private property and those under complete socialisation. This has involved a change in trade union attitudes. The organisations and the attitudes evolved are very much the result of German conditions and are not necessarily suitable to another milieu. A number of features which are peculiar to Germany has made the system work. Although there is no concrete proof that it has led to better productivity, it has at least provided, according to the Study Group, satisfaction to workers.

Auto-management

The Yugoslav system has been described as auto-management. Here the workers themselves constitute the management and there is no question of consultation or sharing of powers with representatives of private capital. The law conferring these rights on the workers proclaims that the factories, mines, communications, transport, trade, agriculture, forestry, municipal and State economic enterprises as national property. They are to be managed by the workers' collectives in the name of the community within the scope of the State economic plan. The workers' collectives manage these enterprises through the workers' councils and management boards.

In Yugoslavia, according to the Study Group, the experiment is as unique as are the

WEALTH TAX AND EXPENDITURE TAX

A CRITICAL ANALYSIS

By Dr. Rustom C. Cooper, M.Com., Ph.D. (Econ.), F.C.A., F.S.A.A. (Hons.)

THE object of the Wealth Tax Bill 1957 is to impose an annual tax on the net wealth of individual, Hindu undivided families and companies. The proposed tax, according to Mr. T. T. Krishnamachari, is an important constituent of an integrated tax structure. As a result of this tax, the direct taxes, it is claimed, will form a composite system of complementary elements and will satisfy the criterion of ability to pay. It is also regarded as being consistent with the socialistic pattern of society.

In introducing the Wealth Tax and the Expenditure Tax, the Finance Minister has clearly put the cart before the horse. He has relied, to a very great extent, on the Kaldor Report but only when it suited him to do so. The Kaldor Report is in itself an integrated scheme for direct taxation. One cannot pick and choose individual items from it, without doing considerable harm to the country's economy as a whole. The proposals outlined in Kaldor Report aim at broadening the tax base through the introduction of an annual tax on wealth and a personal expenditure tax (the last in partial substitution of the present super-tax on income). Unfortunately, the Finance Minister forgot to read the words in brackets, or having read them, for reasons best known to himself, decided to ignore these words. The Kaldor Report's most important pre-requisite to introduction of Wealth Tax and Expenditure Tax, namely, that the maximum rate of tax on income should not exceed 45 per cent., as against the present 92 per cent. appears to have completely escaped the attention of the Finance Minister. This is the most important single feature of the present budget proposals which robs them completely of all merit.

While suggesting the maximum rate of tax on income at 45 per cent. instead of 92 per cent. as hitherto, Mr. Kaldor observes: "When the marginal rate of income-tax is 90 per cent., the net profit to the taxpayer on any particular concealment is 900 per cent. of the post-tax income. From every point of view, it is far better to have a fool-proof system of taxation with a moderate rate schedule." Kaldor has suggested that Wealth Tax be levied on agricultural properties also, by amending the Constitution, if necessary. Kaldor wants Wealth Tax to be a comprehensive measure. This was suggested to ensure a broad-based structure of taxation. It is not understood why the Finance Minister should have roped in companies in the private sector in the Wealth Tax but, at the same time, not implementing this part of Kaldor's proposal. It may be that this was done from a purely political angle.

Arguments for and Against Wealth Tax

The Wealth Tax is sought to be justified in many quarters on the grounds of equity, revenue, earning capacity and administrative efficiency of the tax. I would venture to submit that the tax as a whole has to be considered in the context of all its pros and cons. If this is done, it will be observed that there are more arguments against the imposition of Wealth Tax at the present juncture than in its favour. To my mind the following are the main arguments against imposition of Wealth Tax:

(a) The Wealth Tax makes no distinction between productive and unproductive wealth. Not all properties yield an income and, therefore, they cannot all be taxed on a uniform basis and at the same rate.

(b) Wealth Tax on business will be payable even when there are losses.

(c) Wealth Tax would be a discouragement to saving and productive enterprise. Business would be starved of working capital.

(d) In case of Wealth Tax on business and companies, the incidence of tax may sometimes be shifted on to the consumer, according to the competitive capacity of the business.

(e) There are various administrative difficulties involved, namely, (i) difficulty of discovering true owners of property; (ii) difficulties of valuation; and (iii) considerable scope for corruption.

(f) Assets cannot be sold without violent disturbances in markets. Wealth Tax would compel such forced sales to the detriment of the property market.

Wealth Tax is Premature

I have already stated before that, in imposing Wealth Tax, the Government is trying to put the cart before the horse. I feel it is so for the following reasons:

(a) The maximum tax on income has not been brought down to an equitable level of 45 per cent.

(b) The present municipal records of urban property are admittedly defective and incomplete, ownership is difficult to ascertain.

(c) The extensive Indian practice of buying and selling of shares on blank transfers would make evasion easy. This system does not exist either in the United Kingdom or in the U.S.A.

(d) In case of Government securities also the present system is equally defective from the point of view of Wealth Tax.

(e) In case of other properties the problem of *binami* holdings would be formidable.

Some Important Statistics

The Hon'ble Finance Minister observed, in the course of his statement on 23rd May 1957: "Again India is not alone in imposing the Wealth Tax on companies. In West Germany, it is levied on domestic companies at the rate of 3/4 per cent., Norway 3/5 per cent., Sweden 3/4 per cent. and Finland 3/4 per cent. Property Tax is also levied on investments and companies in many States in the U.S.A."

With due respects to the Finance Minister, I would like to point out that his statement does not convey a correct idea of the true position.

Since the Finance Minister has referred to Wealth Tax in Sweden, I would like to point out that he might as well have told us that, in Sweden, the top marginal rate of income-tax is only 66 per cent., as against 92 per cent. in India. In Sweden, there is complete exemption for realised capital gains from assets held for more than five years. In Sweden, Wealth Tax on business is linked up with the net profit on capital employed and certain basic net profit of, I think, 3.3 per cent. on the capital employed is taken as the minimum necessary. I further understand that, in Sweden, domestic companies have been exempted from Wealth Tax which is applicable only to foreign companies.

The Finance Minister has also told us that, in Norway, the rate of Wealth Tax is 3/5 per cent., i.e., 0.6 per cent. Once again subject to correction, I would say that my enquiries reveal that, in Norway, the rate of Wealth Tax is only 0.2 per cent. and not 0.6 per cent., as stated by the Finance Minister. Further, Mr. Krishnamachari would have done well to tell us that, in Holland, Wealth Tax is not applicable to companies.

Position in the United Kingdom

Some time in 1919 Great Britain considered, for the first time, the idea of introducing some sort of Wealth Tax, but only to drop it. At that time, the British Labour Party was constrained to admit that a graduated levy on estates from £5,000 to £1,000,000 would involve not less than 2½ years of work on valuation alone. It was also realised that the expected yield would be trifling, as compared with the expenditure on collection and valuation, administrative difficulties and adverse economic repercussions.

Again, in 1951, the idea of Wealth Tax cropped up in the U.K. at the initiative of a brilliant Civil Servant, Mr. S. P. Chambers. However, it was again dropped on Mr. Chambers' coming to the conclusion that the tax which cannot be collected until 1955, was not much good for financing the expenditure of 1951. I would submit that this is a very relevant consideration in the context of the financial requirements of our second Five-year Plan. What use would be the Wealth Tax if the levy for 1957 cannot be fully collected till much after the end of the second Plan?

Wealth Tax on Companies

The Finance Minister has been ill-advised to impose Wealth Tax on companies for the following reasons:

(a) Mr. Kaldor has clearly suggested in his report that Wealth Tax be imposed on individual taxpayers only. He has nowhere suggested this levy on companies.

(b) Wealth Tax on companies leads to double taxation in all cases and sometimes even three or four times where there are subsidiary companies. The company would have to pay Wealth Tax on its own wealth, while the shareholder will pay Wealth Tax in his holdings of shares in the company.
(*Note*: Since this note was prepared, the Finance Minister has announced certain concessions to prevent triple tax in case of subsidiary companies.)

(c) This tax is most unjust for new companies, as it will have to be paid irrespective of profits.
(*Note*: Since this note was prepared, the Finance Minister has announced concessions in respect of new companies for the first five years.)

(d) It will deplete further the capital resources of companies, coming as it does on top of such other measures as compulsory deposits, increase in rates of Income-tax and Corporation Tax on companies, increase in Bonus Tax from 12½ per cent. to 20 per cent. and the Excess Distribution Tax. To this extent it may be regarded as a deliberate attempt to handicap the progress of the private sector in the second Five-year Plan.

(e) The Finance Minister has time and again recognised that the need for corporate savings is as great as ever. Yet, he thinks that Wealth Tax on companies is necessary in the peculiar economic structure of India. This is a curious paradox.

Even today, the Government of India do not have adequate statistics of the rate and quantum of capital formation and corporate savings. The Finance Minister, therefore, has no idea of the corrosion which is taking place in corporate capital as a result of these proposals. I would venture to suggest that, in effect, the Wealth Tax on companies is nothing else but a tax on capital formation and industrial expansion.

Cost of Collection

We are informed that, at the present juncture, Wealth Tax is to be administered by the Income Tax Department. It will be necessary to expand adequately the staff at various levels of the Departmental cadres. The estimated additional cost including payment of remuneration to valuers will be Rs. 40 lakhs per annum. However, we are told that this figure does not take into account additional capital expenditure of construction of office and residental accommodation of officers.

Expected Yield

The Finance Minister has taken credit for Rs. 15 crores as additional revenue from this source for the current year. He has, however, not stated whether this Rs. 15 crores will have to be collected by the time the second Five-year Plan ends or even later. If our experience of Estate Duty is a criterion, there will be formidable delays in completion of assessments and collection of revenues. Nearly 26,000 individual assessees, 4,000 Hindu undivided families and 6,000 companies are estimated to be liable to this tax. This would mean that there will be about 36,000 Wealth Tax assessments to be completed every year.

Date of Commencement

The Wealth Tax Act is deemed to have come into force from 1st April 1957 and will apply to previous year's wealth. This means that it would be leviable in respect of the assessment year 1957-58 on the basis of the previous year which ends at any time between 1st April 1956 and 31st March 1957.

Property not Liable to Wealth Tax

For the purposes of Wealth Tax, property of every description is included, both movable and immovable, except the following:

(a) Agricultural lands, growing crops, grass or standing trees on such land.

(b) Building owned or occupied by a cultivator or receiver of rent or revenue out of agricultural land, provided it is used as a dwelling house, store-house or out-house.

(c) Livestock, tools and implements for raising agricultural produce.

(d) The right to any annuity or any interest in property where such annuity or interest is available to an assessee for a period not exceeding five years. In case of annuities receivable for more than 5 years, the Wealth Tax Officer will have a right to estimate its capital value, probably according to an actuarial valuation. Therefore, it will be liable to Wealth Tax and the annuity will also be liable to Income-tax.

What is net Wealth?

The Wealth Tax is payable on the net wealth. It means the amount by which the aggregate value (computed in accordance with the Act) of all the assets is in excess of the aggregate value of all debts owed by the assessee (other than certain debts prescribed under section 6). I strongly feel that, if a Wealth Tax is at all to be imposed, it should not be made payable by a company, unless it earns a net profit of at least 5 per cent. on capital employed.

What is the Valuation Date?

The assessment of Wealth Tax is to be made on the wealth owned on what is called the valuation date. The valuation date means the last day of the assessee's previous year for income-tax purposes. Where, however, the assessee has different previous years under the Income-tax Act for different sources of income, the valuation date for the purposes of Wealth Tax will be the last day of the previous year immediately preceding the year for which the assessment is to be made. Thus, where there are more than one previous years, the last day of the previous year which ends last will be the effective date.

Mode of Valuation for Wealth Tax

All assets, except cash, are to be valued by the Wealth Tax Officer at the price it would fetch if sold in the open market on the valuation date. In case of businesses for which accounts are properly maintained, however, the Wealth Tax Officer, instead of valuing each asset separately, may value the business as a whole, having regard to the balance-sheet on the valuation date, after making such adjustments as may be necessary.

The question of valuation of assets for Wealth Tax purposes raises several fundamental issues:

(a) For instance, in case of business, the Wealth Tax Officer is given power to make such adjustments as he considers necessary.

(b) The Wealth Tax Officer may enhance the values of business assets where they are understated for the purposes of secret reserves —properties, book debts, etc.

(c) In his report, Prof. Kaldor has suggested that "*the best method to follow is according to the normal accounting rules, i.e., to value each particular item of property at its 'book value' until it is sold.*" This would mean that, in case of business, the Wealth Tax Officer need not disturb the book values until absolutely essential. This appears to be a sound suggestion.

Goodwill

(d) Another difficulty would arise about valuation of goodwill. The Bill is silent on this point. But the following considerations will have to be borne in mind:

(i) In many balance sheets, goodwill does not appear at all.

(ii) Where it does, it may not provide any indication of its correct value, e.g., where heavy losses are made by the company.

(iii) It will not be proper to include goodwill only when it figures in the balance-sheet.

(iv) In case of professional firms like lawyers, doctors, accountants, etc., goodwill is purely personal—attached to individual.

(v) In view of these uncertainties, the Government would be well advised to provide under the Act or the Rules that for Wealth Tax purposes, goodwill will not be taken into account till actually realised.

(e) In case of valuation of immovable properties in the hands of individuals and Hindu undivided families, who are not entitled to depreciation for income-tax purposes, I would suggest that they may be annually allowed to deduct depreciation at prescribed rates at least for Wealth Tax purposes. This would considerably facilitate valuation procedure and avoid the necessity for annual valuations resulting in corresponding disputes.

Where the assessee carrying on the business is a company not resident in India and a computation in accordance with (a) above cannot be made by reason of the absence of any separate balance-sheet of Indian assets, the Wealth Tax Officer may take the net value of the Indian assets to be that proportion of the net value of the assets of the business as a whole in the same proportion as the Indian income bears to the aggregate income of the business.

Wealth Tax Return

Every person liable to Wealth Tax on the valuation date shall before 30th June of the corresponding assessment year, furnish to the Wealth Tax Officer a return in the prescribed form. For the assessment year 1957-58 return may be submitted at any time before 31st December 1957. The Wealth Tax Officer may call upon a person to furnish such return within a period of not less than 30 days. Section 16(5) provides for best judgment assessment where a person fails to make a return.

Liability of Non-Residents

Under section 22, where a person liable to Wealth Tax is not resident in India, the tax may be levied upon and recovered from his agent. This is equivalent to section 43 of the Income Tax Act.

Exemptions

Regarding exemptions under section 5, it is very important to note that rule 1 of the Schedule of Rates, provides as under:

"Where the net wealth of an assessee includes the value of any assets on which Wealth Tax is not payable, the amount of tax payable by the assessee shall be an amount bearing to the total amount of Wealth Tax which would have been payable on the net wealth had no property been exempt the same proportion as the unexempted portion of the net wealth bears to the net wealth."

This, however, will not apply to items mentioned in section 2(f) which appear to be completely out of computation of net assets, viz., agricultural property, livestock and right to annuities not exceeding five years. The position regarding items mentioned in section 5 is not quite clear. Under section 5, only one item is to be taken for rate purposes and not all. There appears to be some conflict between the section and the schedule which may be clarified by the Government.

Shareholders of Private Companies

The schedule also provides rule 2. This refers to the assurance of the Finance Minister to owners of large interests in section 23A companies that the Wealth Tax would be so levied that its total incidence on their estates did not exceed 1½ per cent. In short, this provision appears to protect shareholders of private companies from double taxation from Wealth Tax. It is not understood why this partiality on the part of the Finance Minister towards shareholders of private companies. It would be interesting to point out that the words used in rule 2 are "private companies" under section 3 of the Companies Act, 1956. Thus, it does not include all section 23A companies.

I would like to ask the Finance Minister as to how a 51 per cent. holder in a private company is worse off than a 51 per cent. shareholder in a public company as far as double taxation under Wealth Tax is concerned.

Expenditure Tax

The object of the Expenditure Tax Bill 1957 is to impose an annual tax on personal expenditure, above a prescribed level, of individuals and Hindu undivided families. Such a tax, in addition to being a deterrent to excessive personal expenditure and incentive for savings also forms a significant part of an integrated tax structure.

According to the Kaldor Report, the suggestion was merely to replace the higher rates of super-tax on personal income with a super-tax on personal expenditure. However, the Finance Minister has decided to retain the higher personal super-tax rate and also levy a high rate of tax on personal expenditure. Although the fact that this tax does not exist in any other part of the world by itself, could not be an argument for not levying it, one feels that this is certainly not the right time to try such an experiment without properly preparing the ground for it.

The annual Wealth Tax and Expenditure Tax as propounded by Dr. Kaldor are complementary and self-checking in character. The concealment or understatement of items in order to minimise the liability of one tax may involve an added liability with regard to the other, once the total income is determined for income-tax purposes. Yet, human ingenuity being what it is, and on account of extreme native intelligence of our peoples in the sphere of tax evasion, the possibilities of evasion are still present.

I am opposed to the imposition of Expenditure Tax, especially at the present juncture, for the following reasons:

(i) There will be considerable scope of tax evasion through a strong simultaneous circulation of cash currency and cash transactions which will mean loss of revenue to the Centre and the States in shape of avoidance of all taxes, including the Sales Tax, Income Tax, Wealth Tax, Expenditure Tax and Estate Duty.

(ii) As Mr. Kaldor rightly observes in his report, "in the particular context of India, it would not be practicable to impose an expenditure tax on the top of the present taxes on income, since this would make taxation altogether too severe."

(iii) The Expenditure Tax would be administratively more difficult to handle than Income Tax.

(iv) As expenditure met out of agricultural income would have to be exempted from taxation, it would encourage people to debit the maximum part of their expenditure against their agricultural income.

(v) The Expenditure Tax in its present form would contain a major loophole since gifts are completely exempt from Expenditure Tax as per the Finance Minister's proposal. Attempts will be made to avoid Expenditure Tax by making gifts to persons of low-income groups in return for such persons meeting a part of the taxpayer's expenses or debiting a substantial part of personal expenses to business accounts.

(vi) The weapon of Expenditure Tax in the hands of unscrupulous and corrupt officials may mean considerable harassment and encroachment on personal and private affairs of the assessee. Details concerning the mode of living, number of servants, number of rooms occupied, travelling, motor cars, furniture and so on may enable the Tax Officer at times to dictate his own terms at the expense of both the assessee and the revenue.

Some Necessary Reliefs from Expenditure Tax

I feel that the Finance Minister ought to incorporate in the Expenditure Tax Bill the following exemptions from tax, so that the measure may fall less harshly on the assessees than it does as at present proposed:

(i) Funeral and birth expenses; (ii) medical expenses; (iii) expenses on account of severe physical disabilities; (iv) fines imposed by Courts of Law; (v) expenses due to fire, burglary, theft, flood damage, etc.; (vi) unavoidable legal expenses.

I may add that many of these reliefs were proposed by Mr. Kaldor himself in his report.

Another very important suggestion which Mr. Kaldor had made and which is particularly important in the context of the large size of families in India is the need for taking into account differences in the size of the family which the taxpayer has to support. Whereas, Mr. Kaldor clearly refers to all dependants (old father, mother, unmarried sisters, etc.) with reference to a taxpayer, Mr. T. T. Krishnamachari has defined a dependant as only a son or daughter and no one else.

Cost of Administration

The Expenditure Tax will be administered by the present Income Tax Department. The additional expenses of administration are calculated to be approximately Rs. 8 lakhs per annum. The estimated number of total assessments is 6,000—being 4,500 for individuals and 1,500 for Hindu undivided families.

It may be observed that, whereas the Wealth Tax is made applicable to the whole of India, the Expenditure Tax is made applicable to the whole of India, except the State of Jammu and Kashmir. This is obviously a mistake. Either both the taxes would apply to the whole of India, or excluding Jammu and Kashmir.

No Expenditure Tax will be payable where in respect of any assessment year the total income under the Income Tax Act during the previous year does not exceed Rs. 60,000. However, where the income is above Rs. 60,000, the Expenditure Tax will be payable *not only in respect of expenditure out of such income but all expenditure* during the year, i.e., even out of capital. There may, therefore, be a certain amount of tax evasion where persons are so able to manage their affairs as to earn in one year and incur expenses in shape of withdrawals in cash from bank account in another year.

SUGAR

(*Concluded from page* 1185)

930,000 tons of cane remained to be crushed on that date, the figure for the same date last year being 1,240,000 tons. With a view to ensuring the utilisation of the entire outstanding cane as early as possible, the State Government took all possible steps to divert cane supplies from surplus areas to factories closing early. As a result, the number of factories expected to continue crushing in the current month is 26 and three or 4 in the next month, as against 32 and 15, respectively, in the same month of last year. In Bihar, the total quantity of cane crushed up to 7th May 1957 was 3.25 million tons, a rise of 92,000 tons, as compared with the same period last year. Only a quantity of about 60,000 tons (or 1.2 per cent. of the total) remained to be crushed, as against 75,000 tons. Out of 28 mills working in Bihar, 25 have closed. Of the remaining three, two completed crushing all the cane available in their zones by the end of May and the third continued for one or two days in June.

THE INDORE MALWA UNITED MILLS LIMITED

MR. KUDILAL GOVINDRAM, CHAIRMAN, FERVENTLY SUPPORTS NEW TAXES

OUTLOOK FOR MILLS CONSIDERED PROMISING

THE following is the full text of the speech delivered by the Chairman, Mr. Kudilal Govindram Seksaria, at the Fiftieth Ordinary Annual General Meeting of the Company held on Monday, 10th June 1957, at Seksaria Chambers, 139, Medows Street, Fort, Bombay:

"GENTLEMEN,

"I really consider it my privilege to welcome you all here today to the fiftieth annual general meeting of the Company, which is an auspicious occasion of the Golden Jubilee of your Company. The Directors' report and the annual accounts of the Company for the year ended 31st December, 1956 have been in your hands for some time and, with your permission, I take them as read.

"You are fully aware of the dynamic changes that your Company has undergone during all these years, and especially after my father, late Seth Govindram Seksaria, took up the Managing Agency of the Company. From year to year, your Company has gained strength, so much so that I would humbly venture to claim that its rich potentialities today make it not only a premier textile unit of Indore or Madhya Pradesh, but the whole of India.

Plan and the Budget

"Since we met last, much water has flown under the bridge and, though it is not my intention to enumerate the events at home or abroad, I must comment upon some of the worst jolts that we all experienced in the pulse of the world economics. The temporary blockade of Suez not only created a political chaos but it disrupted the economy of various countries, especially the Asian ones, including ours, which are so vitally linked with its passage. This paralysis of the Canal passage has spelt an unprecedented additional cost to our second Five-year Plan and made the problem of foreign exchange unfortunately more acute. But thanks, however, to our Prime Minister, by virtue of whose instrument of Panchshila, the boiled waters have calmed down.

"At home, hardly a month back, the new Union Budget, probably the most controversial one since independence, has been presented, whose guiding star has been obviously to find out the resources for the implementation of the second Five-year Plan, and as a result of which the popular impression has gained ground that the Kaldor Report has become the Bible of the Union Finance Ministry. The Honourable Finance Minister Shri T. T. Krishnamachari, has been metaphorically called a fisherman casting his net far and wide and in presenting his bold and imaginative measures he has been frequently accused of 'killing the goose that lays the golden egg.' But, with such a Herculean task before him, I sincerely believe none-else would have fared better.

"The critics have termed the new Plan to be too ambitious and have expressed their doubts about its success. It is feared to involve many a danger and risk, but, in this connection, I entirely agree with our worthy Prime Minister Nehru that all these have to be faced in the process of revitalising the country. He seems to have well said, 'It is only the dead that carry no risks.'

Not Overambitious

"Both from expected and unexpected quarters the criticism has continued to be made that the Plan has been drawn up in an overambitious spirit and that it must be revised in order to make the implied burdens less heavy for the people. The one question which is being repeatedly asked is whether the Plan cost could not be cut to suit the size of the resources cloth. Without indulging into economic and political reasons, I feel that the real crux of the problem is that our people are not fully Plan-conscious today. True it is that we face today certain fundamental problems, which dishearten us and present a very dark picture of our dreams, but the world itself is passing through a crisis and India is no exception. Food problem causes the most alarming situation. The imbalance of foreign exchange is another big hurdle. Absence of personnel for the management of the public sector is also a great handicap. All these evidently persist to shatter our faith in the implementation of the second Five-year Plan, but, surely, that is no reason why we should not march ahead. We have already gone half-way on the road to economic progress and there is no return without ruin.

"The industrial core of the Plan, involving heavy burdens of steel, coal, transport and ancillary power, should not be confused with arguments about the economy in Government expenditure or avoiding waste and the like. I agree that economies should be effected and probable waste avoided. Talking of waste which is apprehended to be a maximum of 10 to 15 per cent. in the new plan, I may submit that it is not only rampant in the public sector, but it is equally found in the private sector also. You, I and all others in the private sector are fully aware of it. And even if a great drive was made, a few crores of rupees might be saved. But it would not touch the basic question very much. The basic problem is that 'big sums' have to be spent on the steel plant and other industrial undertakings. For this, we require money and it can come only through taxes or savings. Everyone in the country has to share burdens and make sacrifices, and I, on my part, shall always be happy to accept my share and perform my duties with no regrets or complaints.

"Though I was born a capitalist, I have always thought in terms of a socialist. Somehow or other, I am also naturally inclined to be optimistic in my views and, even with dark clouds over our heads today, I have an undaunted faith in India's future. We have been rendered materially poor in the process of centuries of slavery, but, I still consider India to be rich in the great potentialities of its vast natural resources and gigantic manpower. Their exploitation is capable to overcome any hurdles that might come in its path of the socialistic goal of the society. I have myself pledged to this goal and, at any cost or sacrifice, shall continue to make my humble contribution in the achievement of the goal.

Moving with the Times

"Coming to the affairs of your Company, I wish to speak a few words about the revolutionary changes that your Company has undergone last year. You are aware that, after the resignation of your Managing Agents, the Board delegated its power of management to a committee of whole-time Directors. I cannot, however, on this occasion of the Golden Jubilee of the Company, miss the opportunity to pay my glowing tributes to your late Managing Agents, Messrs. Govindram Seksaria, whose invaluable services and contributions have rejuvenated the very life of your Company. It is due to them that our enterprise today occupies a premier position on the map of the Indian textile world. However, in deference to the views of the Government, your Company abolished the managing agency system and appointed this committee of whole-time Directors for which the Central Government has been duly moved to accord its formal approval. You will appreciate that this has meant a substantial saving to your Company in remunerations as compared to that paid to the Managing Agents.

"A second step which all of you will most welcome is in your Directors deciding to take up a Labour Director and Technical Director on the Board of Directors, for which I am happy to inform you that necessary permission has already been obtained from the Central Government to increase the maximum number of Directors from seven to nine. I hope to have as my colleague a Labour Director and a Technical Director in the near future. This was also a step marching along with the changing times and you will be proud that your Company has not lagged behind.

"As usual, our relations with the labour have been very cordial last year also, there being no strikes or stoppages of work. The ties between the labour and management are bound to be further strengthened after their participation is available even in the management of your Company.

Results Satisfactory

"Turning to the profit and loss accounts, you will observe that, despite the adverse factors, which I shall presently mention, the gross profits of your Company have been well maintained last year. Although the gross profits had shot up to their peak heights in 1955, a record set up since 1945, they have very nominally receded last year. The figures rose from Rs. 6.78 lakhs in 1954 to Rs. 27.93 lakhs in the following year and Rs. 24.02 lakhs last year. The year 1956 started with a cheerful and healthy atmosphere and there was also almost a boom in the textile industry during the first six months, so much so that, looking to the all-round features of your mills and steadiness of the textile industry, your Directors were induced to raise the *ad-interim* dividend to 5 per cent., as compared with that of last year's 3 per cent., thus making the total dividend up to 11 per cent., as compared with 9 per cent. of the previous year. Had it not been for the additional excise levied with effect from 1st September 1956, I am sure, the results would have been far better than even in the previous year and a new record in profits would have inevitably been set up. I hope, this explanation and the enthusiasm on the occasion of the Golden Jubilee of the Company will amply justify the increase in the dividend. By virtue of the timely distribution of the dividend, the latest changes in the fiscal measures have coincidently proved beneficial to the Company in so far as the dividend factor is concerned. It has, also to some extent, reduced the incidence of new wealth tax on your Company.

Effect of Enhanced Excise Duty

"A glance at the audited accounts for the year 1956 will show that the Company has made a net profit of Rs. 12,50,744-13-2, after providing sufficiently for depreciation and development rebate. As I have stated before, though the gross profits last year have receded from Rs. 27.93 lakhs in 1955 to Rs. 24.02 lakhs in comparison with the last year, the net profit is higher than that for the previous year. After making provision for remuneration to whole-time directors and selling agency commission, depreciation and taxation the net profit amounted to Rs. 8.89 lakhs, as compared with Rs. 7.53 lakhs for 1955. The higher net profit, inspite of decline in the gross profit, is due to the lower provision made on all the three counts, namely, agents' commission, depreciation, and taxation, the details of which are given in the Directors' report and the accounts. The stocks of cloth bales with your mills have considerably increased which would be quite evident from the balance-sheet as at 31st December 1956 showing them at about Rs. 58½ lakhs from about Rs. 31 lakhs as at 31st December 1955. It was due to the upward revision in excise duty with effect from 1st September, 1956 that the cloth market became weak and this factor, coupled with acute stringency in the money market, resulted in the poor offtake of cloth and, consequently, the mills had to carry larger stocks.

"You are aware that your mills are mostly manufacturing coarse and medium qualities, the excise duties on which have been increased from one anna per sq. yard to an anna and a half and from one anna to two annas, respectively. As a result of this, your Company had to pay over Rs. 4.5 lakhs during the months of September to December 1956. It is feared that, unless the demand and offtake of cloth—both improve substantially thus restoring the shattered confidence of the textile world—this burden of excise duty and the high prices of raw cotton may tell heavily upon the result of the Company for this year.

"The Directors' report has already dealt with all the detailed particulars of the accounts and they will give you a sufficiently clear picture of the financial position of your Company.

Freight Advantage

"Despite the disadvantages of an upcountry mill, a salient feature which particularly your mill enjoys, is the saving in freight charges, which issue is becoming of growing importance to your country as it exerts a considerable influence on your competitive position in the market. The mill consumes roughly 40,000 bales of cotton in a year and almost all of it is available locally, thus saving a lot of freight charges. The transport difficulty is another serious bottleneck these days in our national economy and the cost

PROTECTION TO ANTIMONY INDUSTRY

EXTENSION GRANTED FOR ONE YEAR AT ENHANCED RATE

FOLLOWING the Government's acceptance of the recommendation of the Tariff Commission, which submitted its report in November last, the tariff protection to the antimony industry has been extended for one year, that is, till the end of December 1958, and that at an enhanced rate. Thus, the protective duty on antimony, other than crude antimony, has been raised to 60 per cent. *ad valorem* with effect from 1st June. On crude antimony, however, the Government has not accepted the Commission's recommendation. The Commission had expressed the view that the protective duty on crude antimony should be retained at 21 per cent. *ad valorem*, and that even this duty should be removed if it was found to act as a hindrance to crude antimony being imported as raw material for production of antimony. But, actually, the duty on crude antimony has been rounded off to 25 per cent. *ad valorem* under the Finance (No. 2) Bill 1957. The Government's view on this recommendation is that a reduction or abolition of this duty will be considered if and when the circumstances warrant such a step. The Government, however, has not been able to accept, for financial, administrative and other considerations, the recommendation made by the Commission as an alternative to extending protection to the industry by way of customs duty. This recommendation says:

"The imports of antimony should be canalised through the State Trading Corporation which should set the targets for production and imports according to circumstances from time to time. The Corporation should also endeavour to secure imports of ore or crude antimony from foreign sources at economic prices. This arrangement may be reviewed when supplies of ore are available locally or from the traditional sources at competitive prices."

Among the other suggestions of the Commission which the Government has taken note of, and is expected to bear in mind at the time of formulating import policies, two may be mentioned. First, imports of antimony should be licensed liberally so as to ensure adequacy of supplies. Secondly, antimony should no longer be subject to import control in its present form, except to the extent necessary for balance of payments reasons. It is noteworthy that the Commission has also stressed the need for making more vigorous efforts to locate deposits of antimony ore within the country. The Government has agreed to take suitable action in this direction as early as possible.

Genesis of Protection

Tariff protection to the antimony industry was granted, in the first instance, for a period of two years, in March 1947, by converting the then existing revenue duty of 30 per cent. *ad valorem* on antimony into a protective duty at the same rate. Simultaneously, a protective duty of 20 per cent. *ad valorem* was imposed on crude antimony. Since 1949, protection has been extended from time to time, the last extension in the series, which is to expire by the end of December 1957, being in 1956. The rates of duty hitherto were 31½ per cent. and 21 per cent. *ad valorem* on antimony and crude antimony, respectively.

The estimates of current and future domestic demands for antimony in the country made by various parties varied widely. The Tariff Commission, for example, calculated in 1954 that the domestic demand during the three following years for various purposes would be of the order of 550 tons per annum. Further, estimates of current demand ranged from 550 tons to 1,000 tons. Actual consumption during the three years from 1953 to 1955, however, was 202.7 tons, 578.6 tons and 551.8 tons, respectively. In the case of demand during the next three years, while the Development Wing of the Ministry of Commerce and Industry placed it at 700 tons per annum, the Indian Non-Ferrous Metal Manufacturers' Association put it at 1,200 tons per annum. After a careful examination of all the relevant data, the Commission has, however, come to the conclusion that the domestic demand for virgin antimony is in the neighbourhood of 700 tons at present and that it is likely to increase to about 1,000 tons per annum in the course of the next three years.

As against this, the rated capacity of the Star Metal Refinery, the sole producer, is estimated at 1,000 tons a year on a triple-shift basis. The actual production of antimony, however, was 130.2 tons in 1953, 539.1 tons in 1954, 504 tons in 1955 and 403.7 tons in the period January-September 1956. The fall in production in the last two years was occasioned by the closure of the plant towards the end of 1955 and disturbances in docks which affected clearances of shipments.

Supplies of Ore

The Indian antimony industry is at a serious disadvantage as compared with foreign producers like the U.K. and Belgium, on the question of supplies of antimony ore. Hitherto, India has been importing ore from Latin American countries at as high a price as Rs. 1,339 per ton. Recently, however, new sources of ore have been found in Turkey at somewhat less price. But, what is of importance is the fact that other countries have been able to get their supplies at much cheaper prices from places like South Africa and Belgian Congo. Prices of ore in China and Russia also are said to be very low. But efforts to obtain ore from these sources have been in vain. These disparities in the prices of antimony from different sources are, according to the Commission, due to the fact that certain important markets are insulated from world competition by agreements or other special arrangements. In this connection, the Commission has expressed the view that, in the present unstable international situation in the prices of antimony ore, every effort should be made to secure supplies of antimony ore from China or Russia. It has also stressed the need for building up adequate stocks of antimony metal in the present advantageous circumstances. In both these cases, the Commission is further of the view that the State Trading Corporation can play a useful role. In addition, it has also stressed that the present duty of 21 per cent. *ad valorem* on imports of crude antimony should be done away with, if it proves to be a hindrance to importing cheap antimony from China.

The Commission has also examined the present import policy relating to the imports of antimony ore. It has found that the existing system of rigid import control, according to which no licences are granted to actual users unless they satisfy the Development Wing that their requirements cannot be satisfied from domestic sources, cannot be regarded as necessary. The fact that there is only one unit in the industry, and that the interests of the consumers depend on the decisions taken by it in regard to purchases of ore, render, according to the Commission, a review of the import policy necessary, to safeguard the interests of the consumers. Consequently, the Commission has recommended that in the present circumstances, the policy of relying almost exclusively on a single unit to meet the entire domestic demand for antimony should be discontinued and that antimony should no longer be subject to import control in its present form except for balance of payments reasons.

Measure of Protection

For ascertaining the measure of protection that will be necessary to the indigenous industry, the Commission has calculated that the fair selling price of indigenous antimony works out to Rs. 166.00 per cwt., as against the landed cost, ex-duty, of Chinese antimony of Rs. 105.81 per cwt., the difference between the two being as much as Rs. 60.19 or 57.2 per cent. The Commission has taken Chinese antimony for comparison, because adoption of Belgian antimony prices would be unrealistic so long as the Chinese metal is so much cheaper. As against the difference indicated above, namely, 57.2 per cent., the present rate of duty is only 31.5 per cent. In recommending that the rate of duty should be raised to 60 per cent. *ad valorem*, the Commission has certain considerations in mind. It has conceded that a protective duty of 60 per cent. *ad valorem* will impose on the consumer a burden of Rs. 69 per cwt. of which the value added by manufacture, which might be taken to represent the gain to the economy, comes to Rs. 30; while the balance is represented by the excess of cost of materials, power and fuel over the price of imported metal. The Commission is of the view that the net burden on the consumer will continue to increase as the output expands in this industry, as long as the cost of materials, power and fuel is higher than the c.i.f. price of the imported metal.

Notwithstanding this feature, there are three factors, according to the Commission, which tend to bring down the cost of materials. In the first place, the present instability of relationship in the international prices between the metal and ore is likely to give place to a normal relationship in due course. Secondly, the Star Metal Refinery is making efforts to obtain ore at cheaper prices. Lastly, the Geological Survey may succeed before long in locating deposits of ore in the country and it is necessary, meanwhile, to keep the industry in existence. Further, the Commission is emphatic that an important industry like this which has been built up with so much effort and sacrifice should not be allowed to suffer losses merely on account of certain external factors which may not last long. These considerations, therefore, would justify according to the Commission, a measure of protection to the industry which will only enable the Company to maintain its output at reasonable level but not to expand the industry.

Dual Objective

To attain the dual objective of maintaining the industry's output at a reasonable level and of importing the balance of the requirements from the cheapest source, the Commission has found that the State Trading Corporation provides the best solution. According to the Commission, the S.T.C. is definitely superior to import control, because it will lead to more definite results. Secondly, it is preferable to a high protective duty, because it would ensure adequate supplies without resulting in higher import costs. It is also more flexible than import controls. Besides, more than 50 per cent. of the total supply is consumed by the Government, and a large part of the business handled by the S.T.C. will, therefore, be directly on Government account. Again, purchase by a single organisation of antimony ore will give it strength to influence the cost of the ore. The S.T.C. will also have, according to the Commission, greater bargaining capacity in purchasing abroad metal and ore alike.

For these reasons the Commission has strongly recommended that the imports should be channelled through the State Trading Corporation. But, at the same time, it stated that if the Government found this solution impracticable, the protective duty should be raised from 31.5 per cent. *ad valorem* to 60 per cent. *ad valorem*. Surprisingly enough, the Government preferred the latter to the former on the ground that it was not in a position to ask the S.T.C. to undertake the function for financial, administrative and other considerations.

ENRICHMENT OF LOW-GRADE GRAPHITES

A process for the enrichment of low-grade graphite to nearly 97 per cent. purity has been developed at the College of Engineering and Technology, Jadavpure University, West Bengal. Although deposits of mineral graphite are found in various places in India, indigenous production is small, because the bulk of graphite ores are low grade and have to be demineralised as a preliminary to industrial use. Owing to difficulties in demineralisation, most of the known deposits have not been worked.

Graphite in its pure form is employed in the production of crucibles, muffles, pouring nozzles, designed to withstand high temperatures, in the manufacture of electrodes and as a pigment in paints. Apart from import of pencils, crucibles and lubricants, 500 to 1,000 tons of purified graphite are imported into India every year, mainly for use as a pigment for paints.

The new process has several advantages. Besides enrichment of graphite, it has also been found applicable to the demineralisation of coals, beneficiation of pyritic minerals and dehydration of oil-based pigments.

MINERAL EXPORT LARGER IN 1956

It is noteworthy that India earned nearly Rs. 7 crores more on exports of minerals during 1956, as compared with the preceding year. The total value of mineral exports during the year was Rs. 38.7 crores, as against Rs. 31.9 crores during 1955. Further, mineral exports which fetched foreign exchange worth nearly Rs. 200 crores during the first Plan period showed a significant improvement in 1956.

The improvement in the export position was brought about by a larger export of iron ore which accounted for an increase of Rs. 3.5 crores in the total foreign exchange earnings through mineral exports. The amount of iron ore exported during 1956 was 1,692,626 tons, as compared with 1,198,458 tons in 1955. The increase in foreign demand for iron ore is mostly attributable to the larger output and higher prices of steel in producing countries.

The quantum of manganese ore exported, on the other hand, decreased by 140,000 tons to 700,000 tons, but the value of exports increased by Rs. 1.2 crores, in 1956, as compared with the preceding year. The shipment of mica was higher in 1956, contributing an increase of Rs. 80 lakhs to the value of exports. Exports of ilmenite registered an all-time record of 283,000 tons consistent with the peak production of 334,000 tons during the year.

METTUR INDUSTRIES' PROFITS DOWN

DIVIDEND LOWERED—FINANCES SOUND

THE sharp fall in the quotation for the shares of Mettur Industries Ltd. (Managing Agents: Messrs. W. A. Beardsell & Co. (Private) Ltd., Madras) soon after the announcement of its dividend for the year ended 31st March 1957, is indicative of the serious disappointment of investors. The quotation was practically unchanged at Rs. 392 during the last week of May, but, on the 30th ultimo, when news came that the dividend had been more than halved, they came down by Rs. 12 to Rs. 380; later they fell further to as low a level as Rs. 318. The Company has declared a dividend of only 20 per cent., as against 42½ per cent. for the previous year, the highest distribution made so far. This drastic reduction in the distribution was quite unexpected and the reaction is seen in the low quotations to which its shares have tumbled.

The proposed dividend of 20 per cent. has been influenced by the marked fall in earnings for the year under review, consequent on the power cut, increased taxes, higher bonus for workers and rise in cost of raw cotton. The gross profit for the previous year at Rs. 60.75 lakhs, the highest earned by the Company since 1948-49, has fallen by Rs. 13.91 lakhs to Rs. 46.84 lakhs for the year under review and is only slightly better than that for 1954-55 at Rs. 45.64 lakhs. With this fall, the upward trend noted in the gross profit during the past three years has been reversed. Although the gross profit has thus declined, the provision for taxation has gone up from Rs. 21.77 lakhs to Rs. 23.50 lakhs. It is stated that this provision includes Rs. 3 lakhs relating to the previous year. Apparently, such an adjustment has become necessary because of the changes made in the taxation policy of the Government.

The net profit also has come down from Rs. 31.68 lakhs for 1955-56 to Rs. 17.52 lakhs for 1956-57, a drop of Rs. 14.16 lakhs. It may be interesting to note here that the present fall in net profit has immediately followed the peak for the past two decades seen in the preceding year. After setting aside a sum of Rs. 5.94 lakhs for payment of bonus to staff, the sum available for distribution, including the surplus of Rs. 45,835 brought in from the previous year, is Rs. 12.05 lakhs. The Directors have declared a lower dividend of 20 per cent. free of income-tax, absorbing Rs. 12 lakhs, as compared with 42½ per cent. for the previous year, to which level the distribution had been stepped up from 35 per cent. for 1954-55 and 22½ per cent. (made up of a dividend of 12½ per cent. and a bonus of 10 per cent.) for 1953-54.

The following comparative table gives an idea of the Company's progress during the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1957	1956	1955	1954
Sale proceeds	1,51.27	1,56.19	1,53.99	1,32.93
Closing stock of process and finished goods	1.74	1.87	1.80	1.55
Cotton consumed	55.30	50.98	63.92	54.16
Other expenses	52.31	47.28	47.00	44.39
Gross profit	46.84	60.75	45.64	37.26
Managing Agents' commission ..	3.91	5.42	4.22	3.92
Provision for—				
Depreciation	1.91	1.88	1.92	1.66
Taxation	23.50	21.77	13.50	9.20
Net profit	17.52	31.68	26.00	22.48
Refund of E.P.T. (net) ..	..	..	..	6.81
To reserves	..	..	..	6.50
„ bonus	5.94	7.15	4.07	9.57†
„ dividend	12.00 (D. 20%)	25.50 (D. 42½%)	21.00 (D. 35%)	13.50 (D. 12½% +B. 10%)
Carry forward	0.05	0.46	1.43	0.50

† Includes Rs. 2.53 lakhs being compensation paid for involuntary unemployment due to power cut in 1952-53.

The Company's sale proceeds of cloth, yarn and waste have dropped by Rs. 4.92 lakhs. The cost of cotton consumed is higher by Rs. 4.32 lakhs, in view of the increase in raw cotton prices during the year. Despite this increase, the Directors deemed it desirable in the interests of the public to maintain the Company's selling prices at the previous year's levels. This policy proved successful and there was no accumulation of stocks at any time. This is reflected in the closing stocks which are lower at Rs. 1.74 lakhs, as compared with Rs. 1.87 lakhs in the previous year. The mills' products, we are told, continued to be popular and the organisation for distribution maintained its usual efficiency. Administration and other expenses increased from Rs. 47.28 lakhs to Rs. 52.31 lakhs and this is mainly on account of salaries, wages and bonus which rose from Rs. 25.51 lakhs to Rs. 28.13 lakhs.

The Company's financial position, as disclosed by its balance-sheet as at 31st March 1957, is quite sound. Of its paid-up capital of Rs. 60 lakhs, all in ordinary shares of Rs. 100 each, as much as Rs. 30 lakhs or 50 per cent. is represented by the amount capitalised out of a part of the reserves in February 1951. Even after capitalising such a large amount and, in spite of the fact that no additions have been made to the reserves in the past three years, the reserves and surplus aggregate Rs. 69.19 lakhs. Of these, the general reserve accounts for Rs. 38 lakhs, raw material fluctuation reserve Rs. 10 lakhs, fixed assets replacement reserve Rs. 11 lakhs and dividend equalisation reserve Rs. 10 lakhs. The provision for taxation stands at Rs. 20.52 lakhs. The current liabilities amount to Rs. 28.72 lakhs. The gross block of Rs. 65.94 lakhs—there were no major additions to fixed assets during the year—has been well written down to Rs. 20.05 lakhs. The current assets amount to Rs. 158.38 lakhs and are equal to more than three times the current liabilities and provision for taxation. Of the current assets, investments in Government securities alone account for Rs. 57.65 lakhs, stores and spare parts for Rs. 16.24 lakhs, stock-in-trade at cost for Rs. 40.38 lakhs, debts, deposits and advances for Rs. 29.14 lakhs and cash balances for Rs. 14.20 lakhs.

The Rs. 100 fully paid up shares are being currently quoted at Rs. 310 *cum-div.* On an *ex-div.* basis, the latest dividend gives a yield of 6.9 per cent. per annum, free of income-tax.

DUNBAR MILLS LTD.

The audited accounts of the Dunbar Mills Ltd. (Managing Agents: Messrs. Kettlewell Bullen & Co., Ltd., Calcutta) for the year ended 31st December 1956, show that the Company's gross profit has fallen to Rs. 9.14 lakhs from Rs. 16.85 lakhs for the previous year, registering thereby a drop of Rs. 7.71 lakhs. In view of the fact that the Company was not faring well in the past few years, the earnings, though lower, should be taken as not discouraging. In tune with the gross profit, the net profit, too, after providing for Managing Agents' remuneration and depreciation, stands lower at Rs. 3.26 lakhs, as against Rs. 12.13 lakhs for the previous year.

The amount provided for depreciation is higher at Rs. 4.27 lakhs, as against Rs. 1 lakh, but the remuneration to Managing Agents has been lowered to Rs. 1.61 lakhs from Rs. 3.72 lakhs. No provision has been made for taxation as in the past two years. The net profit for the year 1955 was utilised to wipe out the loss incurred in previous years, the amount thus remaining to be written off being Rs. 9.27 lakhs. This left a credit balance of Rs. 2.85 lakhs to be carried forward to the current year's accounts. The net profit for 1956, together with the surplus from the preceding year, has enabled the Directors to transfer a sum of Rs. 1 lakh to the reserves and also declare a dividend. Thus, a dividend of 6 per cent., requiring Rs. 1.14 lakhs, has been proposed for the year under review, as against a modest distribution of 2½ per cent. for the half-year ended 31st December 1955. The latter, which absorbed Rs. 47,500, was evidently paid out of the unallocated surplus of 1955. It may be of interest to know that the last dividend prior to those mentioned above was for the half-year ended June 1951, when a dividend of 14 per cent. per annum was paid.

The Company's sale proceeds from woven goods, yarn and cotton waste improved from Rs. 152.95 lakhs to Rs. 160.87 lakhs and, so also, other income from Rs. 1.46 lakhs to Rs. 10.81 lakhs. Against these, the expenses rose by only Rs. 5.26 lakhs, that is, from Rs. 57.12 lakhs to Rs. 62.38 lakhs. The diminution in gross profit, in spite of the favourable trends, must, therefore, be due to the large stocks of cotton purchased during the year and lying unused as at the close of the year to the tune of Rs. 36.59 lakhs, as against a stock of Rs. 21.47 lakhs in the preceding year.

The Company's paid-up capital of Rs. 19 lakhs, in ordinary shares of Rs. 100 each, is strengthened by reserves and surplus aggregating Rs. 29.68 lakhs. The provision for taxation stands at Rs. 28,581 and current liabilities amount to Rs. 100.99 lakhs. The gross block of Rs. 115.17 lakhs stands written down to Rs. 40.49 lakhs. The current assets aggregate Rs. 109.47 lakhs and cover the current liabilities and provision for taxation by a comfortable margin.

The Rs. 100 fully paid-up ordinary shares of the Company are being currently quoted at Rs. 162 *cum-div.* On an *ex-div.* basis, the shares provide a yield of 3.84 per cent. per annum.

SCINDIA STEAM NAVIGATION CO., LTD.

An extraordinary general meeting of the Scindia Steam Navigation Company Ltd. will be held in Bombay on the 26th inst. to consider the issue of bonus shares. The Board of Directors of the Company, it will be recalled, have recommended the capitalisation of Rs. 1,87,99,620 out of the sum of Rs. 1,98,37,585 standing to the credit of the share premium account by issuing bonus shares at the rate of one fully paid-up share for every five shares held. The number of new shares of Rs. 20 each to be issued is 934,881. These shares will rank *pari passu* with the existing shares as regards dividends and in all other respects.

INDO-BURMA EARNS LESS

DISTRIBUTION HALVED

A LOWER trading profit, despite an increase in sale proceeds of petroleum products, is the result of working of the Indo-Burma Petroleum Company, Ltd. (Managing Agents: Messrs. Steel Brothers & Co., Ltd., Calcutta), during the year ended 31st December 1956. Indeed, the profit has been so low that even to pay a dividend of 20 per cent. as against 40 per cent. in the preceding year, the Directors have found it necessary to draw upon the general reserve.

At Rs. 55.56 lakhs, the gross profit for 1956, compares unfavourably with Rs. 60.61 lakhs for 1955 and Rs. 56.25 lakhs for 1954. The profit for 1955, it may be noted, was a record high since 1949. After providing for Managing Agents' remuneration, depreciation and taxation, the net profit, too, stands substantially lower at Rs. 17.89 lakhs, as compared with Rs. 24.14 lakhs a year ago and Rs. 24.10 lakhs two years earlier.

The provision for depreciation has been lowered from Rs. 4.82 lakhs to Rs. 3.91 lakhs, while that for taxation has been maintained at Rs. 28.92 lakhs (Rs. 28.90 lakhs for 1955). The remuneration to Managing Agents has increased from Rs. 2.75 lakhs to Rs. 4.84 lakhs.

A sum of Rs. 5 lakhs has been withdrawn from general reserve to strengthen the sum available for disposal. The dividend at 20 per cent. for the year under review absorbs Rs. 20 lakhs, leaving about Rs. 68,000 to be carried forward. This dividend includes an interim of 10 per cent. paid earlier. It will be interesting to note that the total distribution of 20 per cent. for 1956 compares with 40 per cent. for 1955 to which level it had been raised in four successive years from 10 per cent. for 1951. The distribution for 1955 was in the nature of a dividend of 30 per cent. and a cash bonus of 10 per cent. With the year's dividend at 20 per cent., the return to shareholders is back again at the 1953 level.

The Company's sale proceeds and commission have increased from Rs. 224.02 lakhs to Rs. 235.36 lakhs, followed by a rise in "other income" from Rs. 113.88 lakhs to Rs. 117.54 lakhs. But this has been more than offset by the expenses which have recorded an increase of Rs. 20.05 lakhs, having sharply gone up from Rs. 277.29 lakhs to Rs. 297.34 lakhs. Of this, cost of products handled and direct charges thereon account for a rise of Rs. 16.25 lakhs and salaries, wages and bonus for Rs. 2.04 lakhs.

During the year, with the consent of the Government, the Company entered into a joint venture with Messrs. Steel Brothers & Co., Ltd., in prospecting for oil in England. Two wells were drilled in Lancashire but they failed to prove oil or gas in commercial quantities and were abandoned. The Company's share of expenditure on this account was Rs. 5.93 lakhs. Preparations are now on hand to test another structure which is considered to have reasonable prospects.

The paid-up capital of the Company is unchanged at Rs. 150 lakhs, divided into 1,000,000 ordinary shares of Rs. 10 each and 50,000 seven per cent. taxable cumulative preference shares of Rs. 100 each. This is supplemented by reserves and surplus aggregating Rs. 144.34 lakhs. The provision for taxation stands at Rs. 43.13 lakhs and current liabilities amount to Rs. 250.60 lakhs. The gross block of the value of Rs. 79.77 lakhs, including an addition of Rs. 14.41 lakhs made during the year, stands at the written-down value of Rs. 32.74 lakhs. Investments (at book value), together with interest accrued, aggregate Rs. 262.81 lakhs and other current assets Rs. 192.51 lakhs. Of the latter, cash balances account for Rs. 84.13 lakhs.

A great bulk of the investments are in equities. The Company holds 20,800 ordinary shares of Balmer Lawrie & Co., Ltd. These were acquired at Rs. 62.33 lakhs, but their market value on 31st December 1956 was only Rs. 31.20 lakhs. Another equity investment is in Burma Oil Company. The amount involved here is Rs. 72.36 lakhs, the shares being not quoted. Investments in British Government securities amount to Rs. 103.34 lakhs, the market value of which in December last was Rs. 90.30 lakhs.

The Rs. 10 fully paid-up shares of the Company are being currently quoted at Rs. 26.50 *ex-div.* On this basis, the year's dividend works out a yield of 7.54 per cent. per annum.

Points From The Chair

Plan-consciousness

"THE critics have termed the new Plan to be too ambitious and have expressed their doubts about its success. It is feared to involve many a danger and risk, but, in this connection, I entirely agree with our worthy Prime Minister Nehru that all these have to be faced in the process of revitalising the country. He seems to have well said: 'It is only the dead that carry no risks.' Both from expected and unexpected quarters, the criticism has continued to be made that the Plan has been drawn up in an overambitious spirit and that it must be revised in order to make the implied burdens less heavy for the people. The one question which is being repeatedly asked is whether the Plan cost could not be cut to suit the size of the resources cloth. Without indulging into economic and political reasons, I feel that the real crux of the problem is that our people are not fully Plan-conscious today. True it is that we face today certain fundamental problems, which dishearten us and present a very dark picture of our dreams, but the world itself is passing through a crisis and India is no exception. Food problem causes the most alarming situation. The imbalance of foreign exchange is another big hurdle. Absence of personnel for the management of the public sector is also a great handicap. All these evidently persist to shatter our faith in the implementation of the second Five-year Plan, but, surely, that is no reason why we should not march ahead. We have already gone half-way on the road to economic progress and there is no return without ruin."

KUDILAL GOVINDRAM SEKSARIA,
Indore Malwa United Mills Ltd.

Lead and Zinc Markets

"As regards the markets for lead and zinc, . . during the past year, the operations of the U.S. stockpile have dominated both markets. The setback in zinc consumption in the U.S.A. due to the mid-summer steel strike and the falling off in automobile production, coupled with a sharp downturn in U.K. car production, caused deliveries to the stockpile to reach very large tonnages. We have, therefore, constantly before us the problem that would emerge, if there should be a change in U.S. official policy. There is little doubt that current production, particularly of zinc, would be more than industry could immediately absorb, even if a return to the 1955 rate of consumption were to take place. We believe, however, that, whilst the underlying tendency of world inflation continues and determined efforts are being pursued to raise the living standards of undeveloped countries, the position should, in due course, again be in balance. There may, however, be a period when this lack of balance will adversely affect metal prices and we must be prepared for the consequences."

L. B. ROBINSON,
New Broken Hill Consolidated Ltd.

World Tea Output

"The world output of tea in 1956 was a little higher than in 1955, despite the fact that plucking in North India was stopped on 20th November, ten days to three weeks earlier than usual. It is still generally believed that production is running ahead of demand, though the estimates of excess production are now more modest than the 90 million lbs. per annum which was being mentioned a year ago. The latest combined figure of stock in London and about to be landed at 171.73 million lbs. is higher than a year ago by 54.84 million lbs., but is 2.53 million lbs. less than the figure at the corresponding date in 1955. It may further be remarked that, despite the longer Cape route by which the teas are now arriving, the weight of tea afloat is actually 6.21 million lbs. lower than at the beginning of May 1956. Even if a marked excess does not already exist, it is quite certain that, with much young tea coming into bearing in the various producing areas, annual outturns will increase steadily and a world surplus of tea will inevitably materialise, if consumption does not increase to a similar extent. While we all hope for a steady expansion of consumption throughout the world, the industry's long-term salvation really lies within the boundaries of India, the biggest producer. With its vast population of potential tea drinkers, the increased consumption of a few ounces of tea per head per annum would ensure a healthy market and I earnestly hope that the Indian Tea Board will succeed in intensifying and improving its propaganda. Another essential safeguard for the industry as a whole is the renewal of the International Tea Agreement in respect of which unfortunately no headway has been made during the past year."

SIR JAMES JONES, C.I.E.,
Consolidated Tea and Lands Co., Ltd.

Outlook for Textiles

"While the general outlook for textiles remains uncertain, I hope the results for this year will show a small but steady improvement, as the most energetic steps continue to be taken to reduce costs and improve efficiency, without impairing quality. As regards the three mills for which we act as agents in India, the results have been very good. The Finlay and Gold Mohur Mills improved on the previous year's working, although the Swan Mill's profit was rather lower. Immediate prospects for 1957 are not quite so bright, as prices of imported raw cotton have remained at uneconomical levels, although there are now indications of a downward trend. I am of the opinion that the tendency towards an improvement in the standard of living in India as a result of the Five-year Plans should create an increased market for the superfine cloths which are the main products of these mills. There is no doubt that the output of superfine cloth in India has been considerably reduced recently and, taking a long view, I am optimistic that trading conditions will improve."

SIR JAMES JONES, C.I.E.,
James Finlay & Co., Ltd.

COMPANY MEETINGS AND DIVIDENDS

MALABAR SPINNING AND WEAVING CO., LTD. Annual General Meeting, Kallai, Kozhikode, 14th June 1957. Dividend: Rs. 8.00 (4 per cent.) per share. Transfer books remain closed from 1st to 14th June 1957, both days inclusive.

SWADESHI COTTON MILLS CO., LTD. (KANPUR). Annual General Meeting, Kanpur, 24th June 1957. Transfer books will remain closed from 17th to 24th June 1957, both days inclusive.

JAGATJIT COTTON TEXTILE MILLS LTD. Annual General Meeting, Calcutta, 26th June 1957. Transfer books remain closed from 14th to 26th June 1957, both days inclusive.

METTUR INDUSTRIES LTD. Annual General Meeting, Madras, 26th June 1957. Dividend: Rs. 20.00 per share. Transfer books remain closed from 10th to 26th June 1957, both days inclusive.

MAHABOOB SHAHI KULBURGA MILLS CO., LTD. Annual General Meeting, Bombay, 26th June 1957. Transfer books remain closed from 13th to 26th June 1957, both days inclusive.

TRAVANCORE RAYONS LTD. Annual General Meeting, Rayonpuram, Kerala State, 27th June 1957. Dividend: Re. 1.00 per share. Transfer books will remain closed from 20th June to 3rd July 1957, both days inclusive.

NEW BEERBHOOM COAL CO., LTD. Annual General Meeting, Calcutta, 27th June 1957. Dividend: 37 nP per share (final). Transfer books remain closed from 13th to 27th June 1957, both days inclusive.

VAIKUNDAM (TRAVANCORE) RUBBER CO., LTD. Annual General Meeting, Quilon (Kerala State), 27th June 1957. Dividend: Rs. 2.00 per share (final). Transfer books will remain closed from 24th to 27th June 1957, both days inclusive.

RAMPOORIA COTTON MILLS LTD. Annual General Meeting, Calcutta, 28th June 1957. Transfer books remain closed from 15th to 28th June 1957, both days inclusive.

PEERMADE TEA CO., LTD. Annual General Meeting, Pathirappally (Kerala State), 28th June 1957. Dividend: Rs. 2.75 per share (final). Transfer books remain closed from 15th June to 1st July 1957, both days inclusive.

DEORIA SUGAR MILLS LTD. Annual General Meeting, Calcutta, 28th June 1957. Transfer books will remain closed from 19th to 28th June 1957, both days inclusive.

SRI VENKATESA MILLS LTD. Annual General Meeting, Udamalpet, 29th June 1957. Dividend: Rs. 12.50 (25 per cent.) per share. Transfer books remain closed from 13th to 29th June 1957, both days inclusive.

COCHIN MALABAR ESTATES LTD. Annual General Meeting, Kozhikode, 29th June 1957. Dividend: 15 per cent. Transfer books will remain closed from 20th to 29th June 1957, both days inclusive.

PALANI ANDAVAR MILLS LTD. Annual General Meeting, Udamalpet, 3rd July 1957. Transfer books will remain closed from 20th June to 3rd July 1957, both days inclusive.

SHREE NIWAS COTTON MILLS LTD. Annual General Meeting, Bombay, 8th July 1957. Dividend: Rs. 12.00 per share, payable on or after 8th July 1957. Transfer books remain closed from 10th June to 8th July 1957, both days inclusive.

INVESTA MACHINE TOOLS AND ENGINEERING CO., LTD. Annual General Meeting, Bombay, 12th July 1957. Transfer books will remain closed from 1st to 12th July 1957, both days inclusive.

BALANOOR TEA AND RUBBER CO., LTD. Annual General Meeting, Madras, 13th July 1957. Dividend: Re. 1.75 per share. Transfer books will remain closed from 8th to 13th July 1957, both days inclusive.

DEVON TEA AND PRODUCE CO., LTD. Annual General Meeting, Madras, 13th July 1957. Dividend: Re. 1.75 per share. Transfer books will remain closed from 8th to 13th July 1957, both days inclusive.

MANAR ESTATES LTD. Dividend of 9 per cent. for the year ended 31st March 1957. Transfer books will remain closed from 27th June to 7th July 1957, both days inclusive.

RAJALAKSHMI MILLS LTD. Dividend of Rs. 7.50 (15 per cent.) per ordinary share for the year ended 31st December 1956. Transfer books remain closed from 13th to 26th June 1957, both days inclusive.

ALCOCK ASHDOWN & CO., LTD. Dividend of Rs. 15.00 per share, for the year ended 31st December 1956. Transfer books will remain closed from 18th June to 1st July 1957, both days inclusive.

ALEMBIC CHEMICAL WORKS CO., LTD. Dividend of Rs. 10.00 per share, for the year ended 31st December 1956. Transfer books will remain closed from 5th to 25th July 1957, both days inclusive.

THE TRAVANCORE CEMENTS LTD.

OUTPUT AT RECORD HIGH LEVEL

THE Tenth Ordinary General Meeting of the Travancore Cements Limited was held at 4 p.m. on Monday 27th May 1957, at the registered office of the Company, Nattakam, Kottayam. Addressing the meeting, Mr. C. S. Loganathan, Chairman of the Company, observed as follows:

"GENTLEMEN,

"It is my privilege to extend to you a cordial welcome to the tenth annual general meeting of the Company. The Directors' report and audited accounts for the year 1956 have been in your hands for some time, and with your permission, I will take them as read.

"You will recall that, in my speech last year, reference was made to our representations to the Government of India regarding full restoration of our selling price, to the level that was prevailing prior to November 1955. I am pleased to inform you that the Central Government sanctioned an increase of Rs. 4 per ton in our selling price from 22nd September 1956. Even though the increase granted fell short of our expectations, it is gratifying to note that the Government do appreciate the special features in the set-up of this factory. Again, in response to our representations to restore the original price, we have been informed that the question of cement prices has been referred to the Tariff Commission, and I have no doubt that the Commission will take into consideration the special factors relating to this factory in making their recommendations.

"The year 1956 has been a record one to your Company, in both production and sales. We have produced 53,560 tons of cement and sold 55,209 tons. Out of this, 34,365 tons have been supplied to Government and quasi-Government departments and 20,844 tons to the private sector.

Efficiency of Operation

"The constant efforts of the Company to improve the efficiency of operation are being offset by the rise in prices of essential materials like coal, spare parts, etc. During the past year, we have had to meet with a steep rise in the price of coal, by Rs. 3-8 per ton, and an increase in freight of Re. 1-9 per ton. It must, therefore, be a matter of satisfaction to you that, in spite of these handicaps, the Company has been able to show a reasonable profit.

"In my speech year before last, I had mentioned to you of our proposal for the manufacture of white cement. I am glad to inform you that the requisite machinery has now been shipped and is expected to arrive at our site some time in July this year. It is hoped that production of white cement will commence by the end of the year or early next year.

"Under the State Trading Scheme in cement introduced by the Government of India with effect from 1st July 1956, your Company has been allowed a fixed price of Rs. 73 per ton from 22nd September 1956, excluding packing charges. The production of the Company is being marketed by the S.T.C., and as their selling agents, we are getting a remuneration of Re. 1-8 per ton.

"The net profit for the year, after providing for depreciation, is Rs. 4,71,299 and, after taking into account the balance brought forward from the previous year, the amount available for disposal is Rs. 10,08,101. The Directors recommend a dividend of 6 per cent. free of income-tax, leaving a balance of Rs. 7,08,101 to be carried forward.

"During the year under review, our relationship with labour and staff has been cordial. I should like to express, on your behalf and mine, our appreciation of the services rendered by them."

Note:—This does not purport to be a record of the proceedings of the annual general meeting.

RESULTS OF PEERMADE TEA SATISFACTORY

MALABAR SPINNING RESUMES DIVIDEND

Peermade Tea Co., Ltd.

THE directors of the above Company (Secretaries: Messrs. Aspinwall & Co. (Travancore) Ltd., Pathirapally, Kerala State) submit the audited accounts of the Company for the year ended 31st December 1956.

The accounts are being presented this year in a new form to comply with the provisions of the Companies Act 1956. The net profit is Rs. 5,84,517, compared with Rs. 4,87,543 in 1955. The usual provisions for depreciation on buildings and machinery have been made. Provision for taxation covers taxation on dividends in excess of 6 per cent. in respect of dividend payments during the year under review.

Crop:—Crop harvested was 18,87,956 (18,54,907) lbs., which is 33,049 lbs. more than the 1955 crop, though below crops secured in the two earlier years. For 1957 the Manager has estimated for a crop of 19,00,000 lbs. at an Estate Expenditure of 136.56 cents per lb. a figure which, under todays circumstances, can only be regarded as provisional.

The year's working has resulted in a net profit of Rs. 1,11,629 (net loss of Rs. 14,343) after writing off depreciation of Rs. 99,125 (Rs. 1,05,312) and after paying a sum of Rs. 25,616 (*nil*) as gratuity to workers and another sum of Rs. 22,677 as lay-off compensation to workers in respect of the years 1952-53. The directors propose to transfer Rs. 50,000 from the general reserve fund to the profit and loss account. Deducting the debit balance of Rs. 1,13,415 brought forward from last year a sum of Rs. 48,213 is available, which the directors propose to deal with as follows:—

To pay to the shareholders a dividend at 4 (*nil*) per cent. (free of income-tax) Rs. 48,000 (*nil*) and to carry forward to the next year Rs. 213 (debit of Rs. 1,13,415).

For three months in the year there was restriction on use of electric power hampering the Company's production considerably. A number of old workers have been superannuated during the year by payment of gratuity under an agreement.

Cotton and yarn prices were steady during the year, but the prices of stores and electric power increased considerably during the year.

The weaving department worked fairly well during the year. But due to the steep increase in Central excise duty from 1st September 1956 cloth stocks have continued to accumulate since then and the directors had to give considerable concessions to the buyers and make reduction on prices, which have affected the profits. In spite of this there was a large accumulation of stocks at the end of the year and these conditions still obtain.

The Company's secretaries, treasurers and agents ceased to hold office with effect from 15th January 1957 as per provisions of the Companies Act, 1956 and an application has been made to the Central Government to get their approval for the appointment of managing agents for the Company and the application is pending.

The Company has applied to the National Industrial Development Corporation for financial assistance for the purpose of rehabilitation and modernisation of machinery. This application is under consideration of the above Corporation. The directors wish to state that modernisation and rehabilitation of the plant is necessary to meet the increasing competition from new units and improve the earning capacity of the mills.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	12,00,000	Block ...	10,26,652
Reserves ...	3,67,363	Stock-in-trade	12,13,063
Liabilities ...	9,28,108	Stores and spare parts	80,633
Profit and loss account ...	213	Debts, deposits and advances ...	1,12,908
		Investments	59,700
		Cash ...	2,728
Rs.	24,95,684	Rs.	24,95,684

This year's crop of 18,87,956 lbs. represents an overall yield of 1,212 lbs. per acre. The usual comparison statement of yields per acre is given below:—

Estate	1954	1955	1956
Pirmed	1,152	1,158	1,177
Lone Tree ...	1,339	1,225	1,246
Company ...	1,246	1,192	1,212

Electric power is expected to be available in the near future, and partial electrification of Pirmed factory machinery is now in progress. Electrification of Lone Tree factory will be considered by the Board after experience has been acquired in the working electrically in Pirmed factory.

Cost of labour has been higher, and further increases are to be apprehended. The Employees' Provident Fund Act came into force on 31st July 1956 in respect of Estate factory labour only, but from 1st May 1957 field labour will be included. Bonus to labour for 1955 and 1956 is still under dispute in the State. Shareholders will also be aware that an as yet unsettled dispute as to labour wages in the State of Madras exists, and repercussions in Kerala State are to be regarded as inevitable.

Apart from these incalculable additional expenses, world tea prices, which have fluctuated sharply during the year, continue to do so, making any sort of accuracy in forecast of profit impossible.

The total amount available for distribution is Rs. 8,05,523 (Rs. 8,41,463), from which is to be deducted Rs. 9,000 (Rs. 9,000) and Rs. 1,70,000 (Rs. 2,12,500) representing respectively 6 per cent. dividend paid on the preference shares and interim dividend of 10 (12½) per cent. on the ordinary shares, and Rs. 772 (*nil*) transfer to capital reserve. The sum of Rs. 2,900 (Rs. 20,000) is being contributed to non-executive staff retirement fund, and the Board now recommend payment of a final dividend of 27½ (22½) per cent. on the ordinary shares, absorbing Rs. 4,67,500 (Rs. 3,82,500) leaving the sum of Rs. 1,55,351 (Rs. 2,17,463) to be carried forward.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	18,50,000	Block ...	22,00,171
Reserves ...	9,79,347	Stock-in-trade	10,51,240

Liabilities ...	10,69,370	Nursery stock	5,265
Profit and loss account ...	1,55,351	Debts, deposits and advances ...	2,41,234
		Investments	10,64,818
		Cash ...	1,33,192
Rs.	48,30,084	Rs.	48,30,084

Malabar Spinning and Weaving Co., Ltd.

The directors of the above Company (Chairman: Mr. V. K. Eradi, Kallai, Kozhikode) submit the audited accounts of the Company for the year ended 31st December 1956.

As regards the Company's "white cement scheme," the entire machinery will arrive by June this year, and it is expected that the factory would go into production of "white cement" before the end of this year.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	50,00,000	Block ...	60,48,398
Liabilities ...	33,93,927	Stock of cement	2,12,559
Profit and loss account ...	7,08,101	Stock of raw materials	66,488
		Stores and loose tools	17,16,789
		Debts, deposits and advances ...	7,35,150
		Cash ...	3,22,644
Rs.	91,02,028	Rs.	91,02,028

New Beerbhoom Coal Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st October 1956.

The accounts show a profit, after charging all expenses, of Rs. 2,22,544 of which taxation provision requires Rs. 1,17,000. The balance brought forward from last year was Rs. 94,383, making a total available for appropriation of Rs. 1,99,927. The following interim dividends were paid on 4th October 1956: 3½ per cent. on preference shares Rs. 7,000 and As. 6 per share on ordinary shares Rs. 66,609. The directors now recommend a final dividend of 3½ per cent. on preference shares absorbing Rs. 7,000 and 37 naye paise per share on ordinary shares absorbing Rs. 65,720 leaving a balance of Rs. 53,598 to be carried forward.

Raisings for the year ended 31st October 1956, totalled 4,48,242 tons as compared with 4,79,087 tons in the previous year and 4,44,569 tons in the year ended 31st October 1954. Despatches, which included purchased coal, totalled 4,55,573 tons as compared with 4,81,599 tons in the previous year and 4,64,951 tons in the year ended 31st October 1954. Raisings would have been substantially higher but for a strike which affected all the Company's collieries for a period of about four weeks from the middle of September, 1956. The Award of the All India Industrial Tribunal (Colliery Disputes) came into effect on the 26th May, 1956, and, whilst appeals from this Award were pending before the Labour Appellate Tribunal, this unwarranted and unnecessary strike was launched causing coal production to be seriously dislocated.

Although the Award mentioned above came into effect at the end of May resulting in a substantial increase in the cost of production, an interim increase in the statutory selling prices of coal was not put into effect until the beginning of July, 1956. The Company consequently had to bear the full impact of the Award without any increase in selling prices for a period of about five weeks.

The Labour Appellate Tribunal has since given its decision and the issues are now before the Supreme Court. It is hoped that once these issues are settled and the Committee recently constituted by Government to revise coal prices complete their work, the coal industry will be placed on a sounder footing so as to be able to discharge its responsibilities under the second Five-year Plan.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	19,76,230	Block ...	32,76,824
Reserves ...	19,51,814	Stock of coal	1,31,046
Provision for taxation ...	4,91,130	Stores and spare parts	9,25,548
Liabilities ...	28,05,276	Debts, deposits and advances ...	23,48,978
Profit and loss account ...	53,598	Investments	4,447
		Cash ...	5,91,205
Rs.	72,78,048	Rs.	72,78,048

N.B.—Figures within brackets relate to the corresponding period of the previous year.

Notice

THE SENDRA COAL COMPANY LIMITED

AT A MEETING OF THE BOARD OF Directors held on the 31st May 1957, a Dividend of 2½ per cent. per annum was recommended to be paid for the year ended 31st December, 1956, without any deduction for Income-tax payable by the Company.

By Order of the Board,
F. W. HEILGERS & CO. (PRIVATE) LIMITED,
Managing Agents.

CHARTERED BANK BUILDINGS,
CALCUTTA.

Travancore Cements Ltd.

The directors of the above Company (Managing Agents: Essel (Private) Ltd., Kottayam) submitted the audited accounts of the Company for the year ended 31st December 1956.

The accounts showed a profit of Rs. 4,71,299 (Rs. 5,62,144) for the year 1956, to which was added the amount brought forward from 1955 of Rs. 5,36,802 (Rs. 5,88,054) making a total of Rs. 10,08,101 (Rs. 11,50,198). The directors paid a dividend at 6 (6½) per cent. per annum (free of income-tax) for the year 1956, which absorbed Rs. 3,00,000 (Rs. 6,13,396 which includes Rs. 3,12,500 being 6½ per cent. dividend for the year 1954) leaving to be carried forward to the next year Rs. 7,08,101 (Rs. 5,36,802).

Mention was made in the last year's report, that representations had been made to the Government of India regarding reduction in the controlled selling price of cement produced by the Company's factory. The directors are glad to be able to inform that the Government of India have been pleased to

TAXATION POLICY NOT CONDUCIVE TO SAVING AND INVESTMENT

(*Concluded from page 1186*)

Central Government from 8¼ per cent. on basic salary to 6¼ per cent. on basic salary and D.A. from October 1956. Moreover, the Company had to pay during 1956 bonus for the years 1952 to 1955 and this took away another big slice of Rs. 5,92,331.

"A major portion of the increase in the expenditure during 1956 is of recurring nature and its full impact will be reflected only in the accounts for the current year. It has been estimated that the full effect of the additional burden on the yearly accounts when compared with the actuals in 1955 would amount to an approximate sum of Rs. 9,32,000.

"Besides there would be additional expenditure on coal freight, diesel fuel, cement and sales tax on imports, estimated at about Rs. 1,80,000 annually, as a result of the budget proposals this year. A further increase in the price of coal at the rate of Rs. 2 per ton is under active consideration on account of the impact of additional expenditure resulting from the Labour Appellate Tribunal's decision. The situation will, therefore, be all the more bleak for the current year, unless relief is granted to the Company by a corresponding increase in the price of gas.

Revision of Price

"We made an application to Government on the 12th September 1956 for the appointment of a Gas Advisory Committee to revise the price in accordance with the recommendations of the First Gas Advisory Committee and, in spite of our best endeavours, it was not until the first week of May this year that we could get an assurance of the Government, in the course of personal discussions at the highest State level, that instructions had been issued to appoint the Committee and the names of the personnel had been finalised. After about three weeks, a complication has been brought in by making it a condition that the price at which we are prepared to accept the sludge gas from the Municipal Corporation should be finalised. The question of sludge gas has been under consideration and negotiation for a long time. The sludge gas in the form in which it is proposed to be supplied to us will have to be reformed, so that it can be mixed with the existing gas supply of the Company. The capital investment involved is about 29 lakhs of rupees and this gas will be available to us partly before September 1958 and fully not before December, 1960.

"Gentlemen, the price of gas after the utilisation of sludge gas and the price of gas as produced today are two different issues and cannot be mixed up at this stage as the sludge gas will not be available to us until late next year. While the price for sludge gas is under negotiation, I am unable to see the correlation between the two, as our costs actually started going up about a year back. The appointment of the Committee on our specific application against increase in costs, which cannot be disputed, ought to be a matter of routine, but it has already taken nine months. The Committee itself has not yet been constituted and it may take a lot of time for such Committee, when appointed, to consider the issues before it and make recommendations. This complication will further delay the whole matter for quite a considerable time and, in the meantime, the Company will continue to lose heavily—a loss which will not be compensated in any way, as the gas price, when and if revised, cannot possibly be put into effect retrospectively. We are continuing our efforts to make the Government agree to appoint the Committee, with instructions to recommend an interim increase in the price which is now overdue by about a year.

Issue Dealt With Too Lightly

"In the course of a meeting with the Minister in charge last year in February 1956, we had been advised that the Company should undertake expansion and then the question of revision of price of gas would be considered. Apart from the fact that its costs have since increased tremendously through no fault of ours, we have also carried out the advice given to us last year. The revision of price, however, is still an issue and the matter is apparently being dealt with too lightly, without consideration to the reasonable demands of the Company and the effect on its finance resulting from their non-acceptance. This is evident from the fact that even the demand to appoint the Gas Advisory Committee to consider revision of price is not readily acceptable to the Government, without attaching to it conditions which have no immediate relevance to the application of the Company for revision of price of gas on the increased costs which are already being incurred for a year. I am really unable to understand the reasons for this. By having secured the control of the Company, the Indian management has caused no harm to anybody; on the contrary, it has saved an amount of Rs. 94,49,373 which was remitted during the ten years immediately prior to the transfer of control to India and which, in fact, would have now amounted to a much higher figure.

"The oil refineries in Bombay are now producing Burshane gas at an approximate price of Rs. 3.78 per therm, as against Rs. 0.905 per therm which is the price of our gas. Thus, while, on the one hand, the Government of Bombay are so cautious and in fact extremely reluctant to revise our price in relation to the actual costs, on the other, they appear to have no objection to allow others to sell the gas at practically four times the prices allowed to us which in its tune is today lower than the price in 1926. Besides, the marketing of Burshane is being allowed in spite of tremendous foreign exchange cost of cylinders, at a time when foreign exchange is so scarce that it is not being made available even for the urgent needs of capital equipment for various industries.

"I sincerely hope that the Government would take all these factors into account and now appoint the Gas Advisory Committee and revise the price in relation to costs so as to save this Company from serious financial losses, which would retard its further development."

Note:—This does not purport to be a record of the proceedings of the annual general meeting which will be sent separately to shareholders.

Notices

THE ONDAL COAL COMPANY LIMITED

NOTICE IS HEREBY GIVEN TO THE members of the abovenamed Company that an Annual General Meeting of the Company will be held at the Registered Office, Chartered Bank Buildings, Calcutta, on Thursday, the 4th July 1957, at 10-30 a.m., for the following purposes:—

MONEY UNCHANGED

(From Our Own Correspondent)

BOMBAY, 12*th June*

There has been no perceptible change in the state of the short-term money market as described in these columns last week. The position is still one of stringency. It cannot even be said that there has been some easing of the situation. It is true that trade advances of a seasonal nature are being slowly repaid. But this has made no marked difference to the supply of funds at any given time, because the demand for accommodation from manufacturing concerns has been insatiable. The banks find that whatever money they receive by way of repayment of trade advances soon gets absorbed in industrial advances.

In view of this state of affairs, there is little change in the rates of interest. Inter-bank call money is quoted at 3½ per cent. The rate is only nominal as hardly any business of worthwhile size is reported. House money has been changing hands at 4 to 4½ per cent. The same rate is offered for one to three months deposits also.

According to the statement of affairs of the Reserve Bank for the week-ended 7th June 1957, notes in circulation have jumped up by Rs. 17.94 crores, in marked contrast to the decline of Rs. 8.39 crores in the previous week and Rs. 11.83 crores in the week before that. This increase is not surprising, because a sizable expansion in note circulation is a common occurrence in the first two weeks of every month on account of payment of bills, wages and salaries. It may be recalled, in this connection, that, in the fortnight ended 10th May 1957, the note circulation went up by Rs. 33.45 crores.

Despite the sharp increase in notes in circulation during the week under review, the total notes issued show only a modest rise of Rs. 8.24 crores because of a fall of Rs. 9.70 crores in notes held in the Banking Department. The addition to the total notes issued has been balanced by an increase of Rs. 9.94 crores in rupee securities as against which there has been a fall of Rs. 1.70 crores in rupee coin. Since the recession in the last mentioned item represents an outflow, the total currency in circulation, that is notes and coins, has gone up by as much as Rs. 19.64 crores during the week under review.

On the liabilities side of the Banking Department of the Reserve Bank, only minor changes are seen. Thus, the deposits of the Central Government are up by Rs. 1 crore, while those of other Governments have gone down by Rs. 5.42 crores. Bankers' balances are higher by only Rs. 38 lakhs and so also deposits of others by Rs. 1 crore.

On the assets side of the Banking Department, loans and advances to Government show a rise of Rs. 5.3 crores and so also other loans and advances by Rs. 2.56 crores. Investments also are up by Rs. 6.11 crores. But balances held abroad have declined again by Rs. 8.60 crores. With this decline, the total of India's foreign exchange reserves stand at no more than Rs. 446.47 crores.

An increase of Rs. 5.44 crores is disclosed by the consolidated statement of the Scheduled banks for the week ended 31st May 1957. Most of this increase seems to have been utilised to strengthen their cash position which is better by Rs. 4.45 crores. Advances of these banks are slightly lower by Rs. 73.31 lakhs. Foreign bills purchased and discounted in India are also lower, but by as much as Rs. 7.36 crores. Inland bills purchased and discounted, however, are a little higher by Rs. 65 lakhs. Investments have gone down by Rs. 2.71 crores. The banks would appear to have utilised a good part of these inflows (that is, reduction in advances, foreign bills and investments) to repay their borrowings from the Reserve Bank. Thus, this item shows a fall of Rs. 5.48 crores. Borrowings from the State Bank of India are also down by Rs. 54 lakhs. A small part of the inflows has been utilised by lending at call, as witnessed by a rise of Rs. 1.52 crores in money at call and short notice.

The trend of the Gilt-edged market continues to be quiet, with turnover being greatly restricted. Sellers once again dominated the market, the only big buyer being the Reserve Bank. Conversion Loan has dropped another 25 nP to stand at Rs. 72.95. It is stated that the Reserve Bank still supports this loan at Rs. 73. But since its purchases are confined only to institutional sellers, the market rate has gone below the Bank's support price. Among the dated loans, there is no change in the short-dateds. Among the medium-dateds, both 3 per cent. 1963-65 and 1966-68 have gone down by 15 nP and 5 nP to Rs. 93.80 and Rs. 91.70, respectively. There has been a drop of as much as 25 nP in 3 per cent. 1970-75 (closing quotation Rs. 86.75) and 20 nP in 3½ per cent. 1964 (Rs. 97.90) as also in 3½ per cent. 1965 (Rs. 97.90). A drop of 15 nP is noted in 3½ per cent. 1967 which closed at Rs. 93.35. Among the State Loans, there were sizable offerings in the Madras and Andhra 4 per cent. loans issued last year. Thus, 4 per cent. 1968 Madras closed at Rs. 96.25, as against Rs. 96.60 last week. Similarly, 4 per cent. 1968 Andhra came down by 15 nP to Rs. 95.75. There was scarcely any business in other State loans.

In the foreign exchange market, there has been a further slight recession in the value of rupee in terms of U.S. dollars. Thus, the banks' selling rate for T.T. and O.D. has gone up by 25 nP to Rs. 480 per 100 dollars. The banks' buying rate, too, has gone up by that extent to Rs. 476.50. In fact, earlier in the week, the rupee had weakened by as much as 50 nP. Naturally, the Canadian dollars, also have become costlier by As. 8, the banks' selling and buying rates being Rs. 505.25 and Rs. 498.50, respectively.

This weakness of the rupee in terms of the aforesaid hard currencies only reflects the deterioration in the exchange rate for sterling. In New York, the spot sterling gradually declined from $2.79-2.79¼ in the beginning of the week to a low of $2.78.1/16-2.78.13/16 on the 8th inst. Thereafter, there was a slight recovery to $2.78.13/16-2.78.15/16. After falling to $2.77.13/16-2.77.15/16, three months' forward sterling closed at $2.78-2.78¼ which is about 1/16 of a cent less than that a week before. Transferable sterling, however, firmly held its position at 277.45-277.55 cents.

BULLION RETREATS

(From Our Own Correspondent)

BOMBAY, 12*th June*

A distinctly downward trend prevailed in the bullion market during the week under review, with both silver and gold registering a loss. Silver, of course, suffered more than gold, because of heavy bull liquidation. Fall in spot demand, coupled with heavy arrivals and prospects of still heavier arrivals in the coming weeks, was the main reason for the drop of nearly Rs. 2 in both forward and ready silver. Some of the big bulls in Calcutta who had been manipulating the market in recent weeks are said to have liquidated a good part of their purchases. The *budli* rate for carrying forward the outstandings from the maturing forward settlement to the next one widened to as much as Rs. 3 this week. It is stated that the Calcutta bulls left their hold on the market only after taking this heavy *budli*.

As compared with silver, the downward trend in gold was more gradual, the net loss over the week being about As. 14 in ready gold and about Re. 1-6-0 in the *Ashad* (2nd) settlement. This recession is attributed partly to the setback in silver and partly to the fear that the impending relaxation of the economic sanctions against Goa might lead to an increase in the flow of smuggled gold into the Bombay market. Demand for ready gold, however, was quite good and the entire lot of Mysore gold meant for the week under review was quickly absorbed even in the initial days of the week.

A feature of the week's trading in this market was the imposition of special margins on the outstanding purchases in both gold and silver on account of a broadening of the *budli* rates beyond the limits specified under the by-laws of the Bullion Exchange.

The scarcity of floating stocks of both silver and gold continues. In the Bombay market, there are said to be no more than 300 bars of silver and 10,000 tolas of gold. The gold arrivals were of the order of 7,000 tolas a day and were more than matched by an offtake of equal magnitude. The daily offtake of silver is estimated at 20 to 25 bars, while arrivals were about 30 to 35 bars.

The following comparative table shows at a glance the trend of the market during the week under review:

	12-6-1957	Highest	Lowest	5-6-1957
	Rs. a.	Rs. a.	Rs. a.	Rs. a.

BASE METALS RECEDE

(From Our Own Correspondent)

CALCUTTA, 11*th June*

Prices of base metals gave way during the week under review, following weaker advices from foreign markets. Advices from New York suggested that the earlier report that the Commodity Credit Corporation would resume buying of lead and zinc was baseless. Actually there was no knowing as to when the Corporation would commence buying, it was stated. There was, however, a subsequent report that the United States would accept barter deals for foreign lead and zinc. It was also known that the Rhodesian mines of Roan Antelope and Mufulira had announced a cut in production of copper by 10 per cent. as from the 1st inst., in order to strengthen copper prices.

In Calcutta, electrolytic copper eased from Rs. 179 to Rs. 176. There were no fresh arrivals and importers stated that, due to paucity of shipping space, prospects of new arrivals in the near future was not bright. Virgin lead declined by a rupee to Rs. 73. A fair quantity changed hands. Tin at Rs. 523 was lower by Rs. 5. Offtake by consumers was good. Fresh arrivals even while they were on the high seas continued to be booked. Electrolytic zinc was unchanged at Rs. 75.

HIDES EASY

(From Our Own Correspondent)

KANPUR, 2*nd June*

The hides and skins market ruled easy during the week under review. Supplies of the main categories of goods were ample. The chief purchasers were the local tanners led by Messrs. Cooper Allens. The country tanners were interested only in inferior cow, whereas the Madras dealers effected a number of transactions in goat and sheep.

The latest available quotations are: Wet salted cow, 1st grade Rs. 240 and 2nd grade Rs. 220 per score; wet salted buff, 1st grade 2 lbs. 1 oz. and 2nd grade 2 lbs. 3 ozs. per rupee; goat, 1st grade Rs. 225 to Rs. 300 and 2nd grade Rs. 200 to Rs. 250 per 100 pieces; sheep, 1st grade Rs. 350 and 2nd grade Rs. 250 per 100 pieces.

COTTON FUTURES FULLY STEADY

(From Our Own Correspondent)

BOMBAY, 12*th June*

The cotton futures market presented a dull appearance during the first three days of the week, but picked up strength on Monday which persisted till the close today. The earlier dullness was due to absence of any fresh development and continued uncertainty with regard to the closing rate of the expired Jarilla May contract. The Forward Markets Commission which had been requested by the East India Cotton Association to decide the closing rate of the contract is now understood to have directed the E.I.C.A. to settle the question itself. On Monday, the market, as already stated, picked up strength, thanks to small volume of tenders (about 850 bales) issued and rumours of an export quota for Bengal *Deshi*. These factors touched off a wave of fresh buying which led to an improvement in prices. The undertone of the market was fully steady.

M.G. Vijay June opened the week at Rs. 810, as against the previous close of Rs. 813. After rising to Rs. 813 on Friday, it again eased to Rs. 812, at which rate it stood till the close on Saturday. The contract met with good buying support on Monday and advanced to Rs. 820. After declining by Rs. 3 to Rs. 817, it again recovered to Rs. 819 before closing at Rs. 818. The net gain over the week was Rs. 5. Total tenders issued till Monday amounted to 3,300 bales, comprising 850 bales Punjab American, 50 bales Jayadhar A, 1,200 bales Jayadhar B, 1,150 bales Laxmi A and 50 bales Cambodia.

The following is the trend of prices of the contract during the week.

(In rupees per candy of 784 lbs.)

	12-6-57	*High*	*Low*	5-6-57
Vijay (June) ...	818	820	810	813

Cotton traders are eagerly awaiting the announcement of official permission for commencement of trading in new crop cotton contract. The E.I.C.A. has finalised the new contract and submitted it for the approval of the F.M.C. The F.M.C. is reported to have told the E.I.C.A. that it desires to have definite proposals regarding regulation of delivery contracts before granting permission for trading in the new crop contract. The E.I.C.A. has circulated for eluciting the views of the various interest concerned a new scheme for regulation of delivery contracts; details of this scheme are given elsewhere in this issue. Meanwhile, attempts are being made to persuade the F.M.C. to give permission for trading in the new contract before the expiry of the current contract. Market circles are expecting the new contract (based on Fine Moglai 25/32") to open at Rs. 710 to Rs. 715.

The Government of India has decided that the floor and ceiling prices of Indian cotton during the 1957-58 season should be maintained at the same level as for the 1956-57 season. Floor and ceiling prices for Jarilla with stapling 25/32 inches are Rs. 495 and Rs. 820 per candy and those for Vijay with stapling 25/32 inches Rs. 565 and Rs. 925 per candy.

The spot section continued to rule firm, with sustained mill demand evident even at advancing prices. Jayadhar, Laxmi, Surti, Kalyan, etc., were particularly sought after. Following rumours of an export quota for 25,000 bales of Bengal *Deshi*, there was revival of interest in exportable styles. By the way, at the meeting of the Export Advisory Council held at New Delhi on the 7th inst., Mr. Morarji Desai, Union Minister for Commerce and Industry, turned down a request for revalidating export quotas recently cancelled by the Government. He said that he would give, if necessary, new quotas to others. The Minister also made it clear that he wanted to stop the sale of quotas and licences and to fix a ceiling on the quota of established shippers. He wanted the newcomers who are fully conversant with cotton to enter the export trade.

Interest in Egyptian cotton is expected to revive, following a further fall in Egyptian cotton prices. Karnak T154 variety is now being offered at prices ranging between 54½d. and 55d. per lb. The quantity applied so far under the Indo-Egyptian Agreement is estimated at 9,500 bales. The licensing procedure for import of American cotton has not yet been announced, although the decision was made known more than three weeks ago.

The latest available spot rates—in rupees per candy of 784 lbs.—from Sewri are given below. Bengal *Deshi* 730; Berar Jarilla 820; Khandesh 870; Oomra *Deshi* 785; Vijay 1,025; Hubli Laxmi 1,020; Jayadhar 950.

The Karachi cotton futures market presented an easy trend during the week under review, despite smaller arrivals. Export demand was not bright; advices from Tokyo were particularly unhelpful. There were also reports of unsold stocks. Ready demand, too, was poor. N.T.R.G. July declined by As. 7 to Rs. 72. January position, however, evoked some support and improved by As. 4 to Rs. 75-7. In the ready section, barring *deshi* styles, which evoked good buying enquiries and registered a rise in prices, the other varieties staged a retreat.

The following are the latest available rates—in Pakistani rupees per 82 lbs.—for a few popular varieties of Pakistan cotton:

Sind *Deshi* 84-12; Punjab *Deshi* 80-8; 4F Punjab R.G. 72-8; S.G. 74-8; L.S.S. Punjab R.G. 76; S.G. 79; N.T.R.G. 76; S.G. 83; 289F Punjab R.G. 80; S.G. 85.

An irregular trend was depicted by the Alexandria cotton futures market during the week. While the near-month long-staple Karnak contract ruled easy on selling induced by lack of overseas demand and favourable weather reports, the distant delivery attracted some buying presumably on expectations of a revival in demand from Egypt's traditional customers consequent on the resumption of normal commercial traffic through the Suez Canal. Sentiment was also favourably affected by reports that Japanese spinners had proposed to make bulk purchases of Egyptian cotton for distribution among themselves on the basis of their individual require-

ments. Near month Ashmouni elicited some support, while the distant delivery was neglected. The latest available forward quotations—in tallaris per lb.—from Alexandria are given below:

Karnak: July 107.05; November 100.15. *Ashmouni*: June 75.10; August 75.15; October 73.05.

A fair volume of hedge selling against shipment purchases of American cotton imparted easiness to the American type contracts, in the Liverpool cotton futures market this week. Marked growth contracts, however, staged an improvement on trade buying and professional support. Since prospects of an early reduction in the C.C.C. sales price was considered unlikely, the possibility of any sizable fall in cotton prices in Liverpool was generally held to be remote. This also helped to aid market sentiment. Liverpool Sudan contracts were neglected. In the spot section, inquiries were mainly confined to better quality U.S. growths. Despite reduced shipment offers of Pakistan cotton, these qualities continued to remain uncompetitive with medium quality U.S. cotton, the local stocks of which are sufficiently large. The latest available quotation—in pence per lb.—from Liverpool are as follows:

American 1" Staple Contract: July-August 26.05; October-November 26.05; December-January 26.21 and March-April 26.30. *American Cotton Mixed Growth Contract*: July-August 26.60; October-November 26.50; December-January 26.53; March-April 26.57. *Sudan*: July-August 38.50; September-October 37.05; November-December 37.55.

The steady trend noted in the New York cotton futures market last week gathered fresh momentum during the week under review. This was due to persistent buying orders prompted by reports of delay in completion of planting in the South-west and parts of the Central belt, following further unfavourable rains. The belief entertained in some quarters that there would not be any major change in farm legislation in the current session of the Congress was another favourable factor.

At the C.C.C. sales held on 26th May, 35,930 bales of 1954 crop Government-owned cotton, as well as 295,321 bales of 1955 crop cotton, were sold for export. The 1954 crop sales were made at an average price of 27.73 cents per lb. basis middling one inch cotton while the average price of the 1955 crop cotton was 27.33 cents. The total sold of 1954 crop cotton under the 1956-57 disposal programme so far amounts to 7,703,177 bales. This cotton must be exported before 15th August 1957. The amount sold so far of 1955-crop cotton under the 1957-58 disposal programme amounts to 3,203,287 bales. This cotton cannot be exported until 15th August next.

The following are the latest available quotations from New York, as compared with those of a week and a fortnight before:

(In cents per lb.)

	11-6-57	4-6-57	28-5-57
Spot	34.45	35.40	35.45
July	35.31	35.25	35.29
October	34.52	34.50	34.44
December	34.50	34.48	34.40

YARNS DULL

(From Our Own Correspondent)

BOMBAY, 12*th June*

The Central Government's decision to make available to shippers the unutilised cotton yarn export quotas of mills, announced this week, failed to have any effect on the yarn market. In fact, cotton yarns ruled very dull and prices of finer counts even tended to look down. For overseas demand for Indian yarns was subdued. Traders felt that export business on any large scale would be difficult, thanks to keen competition from other countries, particularly Pakistan. Staple fibre yarns were also sluggish, notwithstanding the recent decision of the Government to allow free exports within a ceiling of 1.5 million lbs. in the current half-year. Prospects of sizable exports were considered to be not bright, unless there was the necessary incentive in the form of refund of excise duty on raw staple fibre as well as yarn, grant of drawback of import duty on fibre used in the production of yarn meant for export, and extension of the shipping period. Rayon yarns, however, were well supported on fears of cut in imports in the next half-yearly licensing period. There would, indeed, have been a marked improvement in values but for unhelpful advices from the rayon piecegoods markets.

Snia rayon yarn (120 dull cones) for June delivery picked up Rs. 3 to Rs. 805. August delivery hardened by Rs. 2 to Rs. 822. Spot 150 Japan rallied 18 nP to Rs. 4.12. 120 Italy rose by 6 nP to Rs. 4.03 and 120 Japan by 5 nP to Rs. 4.14. 150 Italy gathered 3 nP to Rs. 3.72. Among indigenous yarns, National Rayons 120 Bt. cones 1st grade strengthened by 8 nP to Rs. 3.81. 150 Bt. cones 1st grade were fully maintained at Rs. 3.45.

Staple fibre yarn (40x2) for August delivery was subjected to heavy selling and dropped Rs. 9 to Rs. 580. June position fell by Rs. 6 to Rs. 579. Spot Kohinoors lost a naya paisa to Rs. 3.26. New Greats were quiet at Rs. 3.11, as also New Citys at Rs. 3.15 and Centurys at Rs. 3-12. Among foreign yarns (80x2), Fujis receded from Rs. 5.13 to Rs. 5.12, while Paramounts encountered some support and put on 5 nP to Rs. 5.36.

In the cotton yarn section, forty counts came in for selling and staged a retreat. Minaxis declined by 27 nP to Rs. 26.87. Moderns eased by 25 nP to Rs. 27.75. Deals in sixty counts Raghuvamshis were put through 25 nP lower at Rs. 57.75. Moderns were quiet at Rs. 62. Finlays, however, had buyers and improved by 50 nP to Rs. 64.00. Among 80s, Mahendras shed 25 nP to Rs. 71. Moderns were unchanged at Rs. 75.75, but Finlays gathered 50 nP to Rs. 82. Thirty counts were unchanged, Edwards being quoted at Rs. 21.00 and Indus at Rs. 21.75. Among 20s, Gokaks receded by 12 nP to Rs. 18.50. Moderns were dull at Rs. 18.75. Ten counts Podars lost a naya paisa to Rs. 5.12. Podars were quoted at Rs. 14.75, same as last week.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	12-6-1957	5-6-1957
	Rs.	Rs.
Art silk yarn **(per case of 200 lbs.)—**		
120 dull Cones Snia June	805 00	803 00
... ... August	822 00	820 00
120 Japan (per lb.)	4 14	4 09
150 Japan (per lb.)	4 12	3 94
120 Italy (per lb.)	4 03	3 97
150 Italy (per lb.)	3.72	3.69
Staple fibre yarn **(per case of 200 lbs.)—**		
40 x 2 June	579 00	585 00
40 x 2 August	580 00	589 00
40 x 2 New Great (per lb.) ...	3 11	3 11
40 x 2 Century (per lb.) ...	3 12	3 12
40 x 2 City (per lb.)	3.15	3.15
Cotton yarn **(per bundle of 10 lbs.)—**		
10s Peter	14 75	14 75
20s Gokak	18 50	18 62
30s Edward	21 00	21 00
40s Minaxi	26 87	27 10
60s Raghuvamshi	57 75	58 00
80s Modern	75.75	75.75

CASTORS MOVE DOWN FURTHER

(From Our Own Correspondent)

BOMBAY, 12*th June*

The weakness of the oilseeds market noted in the past fortnight continued unabated during the week under review, barring groundnuts which ruled steady, thanks to good demand from *vanaspati* manufacturers. Castorseeds were subjected to heavy selling pressure, induced by slack enquiries from abroad. This trend was accentuated towards the close of the week by reports of fair weather conditions in upcountry centres. The extension of the free export licensing period of castor oil till the end of December had no effect on the market, since it was in line with market expectation, in view of tight foreign exchange position. Despite some foreign demand, linseed remained slightly easy. Cottonseed, too, was weak.

Castorseed September contract opened at Rs. 177.50 and slided down to Rs. 172.25 on the following day. After climbing up next day to Rs. 179.75, on reports of demand from the U.K., it was again subjected to heavy selling pressure and fell to Rs. 169.50. The net loss over the week was no less than Rs. 10.50. Spot Madras declined by 88 nP to Rs. 33.87. Oil B.S.S. receded by 62 nP to Rs. 21.50.

Groundnut August contract commenced the week at Rs. 176.75 and crept up, following demand from crushers, to Rs. 180.57 on the 10th inst. At this level, profit-taking set in and the rate receded to Rs. 176.62 today. Spot Coromandel was quoted 25 nP higher at Rs. 35.50. Groundnut oil ex-mill improved by a like amount to Rs. 20.75.

Linseed September contract opened the week at Rs. 30.56, and fluctuated during the week between Rs. 30.69 and Rs. 30.06, before finishing today at Rs. 30.44. Over the week, it was thus lower by 12 nP. Spot Bold ready was maintained at Rs. 29.50. Oil ready, however, was a shade higher at Rs. 16.87.

Cottonseed September contract eased from its opening level of Rs. 112 to Rs. 111 on Friday, but recovered on demand to Rs. 113.50 on the 11th inst., before finishing today at Rs. 111.50. Over the week it lost 25 nP.

Among others, *kardi* seed bold maintained the last week's level of Rs. 21.50. *Niger* seed Madras, however, encountered support, and improved by 75 nP to Rs. 28.50.

The Government of India has abolished, with effect from today, the export duty on cottonseed oilcake, both decorticated and undecorticated.

The following table shows the closing prices of oilseeds and oils today as compared with those at the close of the previous two weeks:

	12-6-1957	5-6-1957	29-5-1957
	Rs.	Rs.	Rs.
Groundnut—			
September, 1957	176.62	176.62	178.87
Bold ready (per cwt.) ..	36.25	35.50	36.00
Coromandel	37.50	37.25	37.75
Linseed—			
September, 1957	30.44	30.56	31.06
Bold ready (per cwt.) ..	20.50	29.50	30.12
June-July	—	29.62	30.31
Castorseed—

Ex-mill Ready (per quarter) ..	20.75	20.37	20.37
Castor oil—			
Commercial (per quarter) ..	20.25	20.75	21.37
Linseed oil—			
Ready	16.87	16.75	16.37

SUGAR ADVANCES

(From Our Own Correspondent)

BOMBAY, 12*th June*

The sugar market ruled distinctly firm during the week under review. There was a rise in the wholesale prices of sugar in the terminal markets, following a further rise of As. 4 to As. 12 per maund in the premium over the pre-budget ex-mill prices. It is reported that the mills have been holding on to their stocks, with a view to taking advantage of the low stocks with merchants. Arrivals of sugar into the market have, as a consequence, continued to be low; they aggregated 7,000 bags during the week under review. This is no doubt higher than the arrival of 3,600 bags in the previous week, but is appreciably below the usual quantity.

Spot medium grain sugar advanced by Rs. 2 to Rs. 104-Rs. 105 per bag, inclusive of sales tax. Small grain put on a rupee to Rs. 102-Rs. 103. Large grain was quoted at Rs. 106-Rs. 108, as against Rs. 105-Rs. 109 last week.

The upward trend in sugar prices, sugar circles contend, indicates that not only has the full burden of the additional excise duty been passed on to the consumer but, in fact, a sizably greater burden is being imposed on them. Attention is drawn to the Finance Minister's statement in the Lok Sabha on 30th May that the mills had on 6th May a balance of "free stocks" amounting to about 60,000 tons, which, together with the release of 163,000 tons on the same day, brings the total to 225,000 tons; free stocks with mills as on 15th May were 127,005 tons and only this quantity will bear the increased excise duty. In other words, about 96,000 tons moved out of the mills between 6th and 15th May without the impost of the additional excise. Sugar Circles, therefore, point out that the sugar mills are "reaping a rich harvest" by sitting tight on their stocks and bargaining for higher prices by starving the terminal markets. These circles are believed to have drawn the attention of the authorities to the "unconscionably high retail prices of sugar" in the interior and urged them to step up supplies into the market, so that "the normal factors of demand and supply may freely operate."

BLACK PEPPER SPURTS

(Messrs. Parekh and Co.)

BOMBAY, 12*th June*

After a period of stonewalling for more than a fortnight, Malabar black pepper spurted in sympathy with New York, where spot was raised to $0.30½, in view of shortage of ready stock and on reports that Sarawak crop this year would be very much reduced. Some brokers, after their return from the yearly Convention, circulated reports that Sarawak crop for the year 1957 would be not more than 10,000 tons. New York did considerable buying, accepting all offers from India from $0.29½ to $0.28 for ready, afloat and for shipment by named steamers. After this buying, however, New York withdrew and was now reported asking for some concessions.

Singapore went up from $73 to $80 under pressure of buying from both Europe and the U.S.A. where dealers did not buy in anticipation of lower prices on the movement of Sarawak crop.

Alleppey improved from Rs. 600 to Rs. 637½, while Garbled at Cochin changed hands from Rs. 106 to Rs. 116 for July-August delivery.

In A.S.T.A. section, business in June and July-August-September was done upto $0.28. Today, however, nominal quotations were down by half a cent.

The future of the market depends upon the final size of Sarawak crop. If the crop really turns out to be smaller as is now rumoured in New York, there are chances of further improvement, in view of approaching consuming season in the U.S.A. and Europe and comparative shortage of supply in both India and Singapore. Much, of course, depends upon the buying policy of New York. Any aggressive demand is sure to push up the prices.

In the delivery section, there was a lot of short-covering and prices improved by Rs. 24 per candy of 5¼ cwts.

Today's nominal quotations are: Ready delivery Rs. 85 per Bengal maund, June delivery Rs. 594-Rs. 599 and July delivery Rs. 604-Rs. 609 per candy of 5¼ cwts.

DEMAND FOR TEAS STRONG

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 7*th June*

Just under one million pounds were on offer in sale No. 13 which was held on Tuesday, the 4th inst. Quality showed little change, with the exception of high-grown teas which were rather plain. The sale opened to a strong general demand which was, once more, mainly from internal buyers. Black leaf brokens and fannings were in keen demand and prices advanced by 5 to 10 nP. Low medium brokens were irregularly dearer and similar fannings were 10 nP dearer. High-grown teas were generally easier, with high-grown fannings attracting more support than brokens. Whole leaf teas again met keen competition and must be quoted 10 to 15 nP dearer. The following are the quotations:

	1957	1956
	Rs.	Rs.
Plain B.P.	1.55	1.50
Low medium B.O.P.	1.60	1.66
Medium B.O.P.	1.70	1.75
Good B.O.P.	1.90	2.19
Well made black leaf O.P.	to 2.00	to 2.31
	... 2.50	2.12

London Market—Sale of 3rd June 1957.—Better demand, particularly good liquors. Plain sorts hardened, as sale progressed.

Sale of 4th June 1957.—Best about steady. Others very irregular. 2d. to 4d. lower.

Colombo Market—Sale of 3rd June 1957.—Dimbula Dickoya brokens were lower by 20 to 40 cents. Quality mediums encountered strong demand and were five to ten cents dearer. Low-growns declined by five cents. High and medium fannings, except plainest active, 15 to 20 cents dearer.

Sale of 4th June 1957.—Strong demand. Firm to dearer, especially better liquoring sorts.

Calcutta Market.—There was no export sale this week. As regards internal sale, 20,300 packages of dust fair tea were offered. General demand strengthened, as sale progressed. Medium Assams

C.T.C. strongest feature upto 10 nP dearer. Orthodox Assams steady. Remainder generally easier. Middle East types weakest feature.

The Government of India has announced that the 'price of tea' for the purpose of determining export duty for the month of June is given as Rs. 2.47, as against Rs. 2.41 for the previous month. The duty thus remains unchanged at 25 nP. In respect of the recent increases in excise duty made in the Budget, the Government has restored with effect from the 1st inst. the *status quo* in respect of the excise duty on tea and coffee.

The export quota market has been a little quieter and there are small buyers at 23 nP.

Offerings in dust sale L held on Thursday the 6th inst. aggregated 850,000 lbs. There was very good general demand and prices were often dearer. Milled dusts were generally lower, but medium grown fine dusts met with keen competition. There was improved enquiry for high-grown dusts.

Sale No. 14 will be held on Tuesday the 11th inst. Dust sale M is scheduled for Thursday the 20th inst.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No.* 14.—950,000 lbs. offered. Good general demand. Stalky and lower grades easier. Medium and good medium brokens fully firm to dearer, but fannings somewhat lower. Whole leaf very strong and dearer."

MEDIUM ASSAM TEAS FIRM

(From Our Own Correspondent)

CALCUTTA, 11*th June*

During last week's internal sale, tea dusts on offer amounted to 20,394 packages. There was fair demand. The strongest feature was provided by medium C.T.C. Assams which rose by 10 nP per lb. Orthodox teas from Assam, the offerings of which were limited but which possessed clean black leaf and bright liquors, closed firm, after opening easy. All other teas were featureless, clean black leaf teas hardly gathered attention. The quotations were: Medium Assam C.T.C. Re. 1.60 to Re. 1.70, medium Assam grainy dust Re. 1.50 to Re. 1.55, and medium Dooars Re. 1.40 to Re. 1.45, while best Assam C.T.C.'s were unquotable.

No leaf sale was held.

The report from Chittagong that the tea trade there expected poor times for the industry did not cause any surprise here. For production in Pakistan was running at a higher level. Unless output was restricted and efforts were made to improve quality, it was not seen as to how a crisis could be avoided. Last year, the Pakistani tea industry had recorded satisfactory results. Tea exported amounted to as much as 8 million lbs. and the higher figure was obtained following the inclination of foreign buyers to increase their offtake on apprehension of troubles in the Suez Canal area.

It was noted that, in the London sales held last week, conditions were better, following fair demand. An improvement in the statistical position and the current break in the auctions due to the Whitsun holiday—the next auctions are scheduled to be held on 17th inst. only—were factors which aided sentiment. During the internal dusts sale held in Cochin on Thursday last, general demand was good. High-grown dusts were in constant inquiry, with keen competition being offered to medium grown fine dusts. The next sale in Cochin is scheduled to take place on the 20th inst.

During yesterday's export sale, exporters hardly accorded support and most of the buying was done on account of internal buying. Offerings amounted to 27,390 chests. Buyers paid fair attention to whole leaf grades and stylish B.P.Ss. Among Darjeelings, the flavouury lots met with ready buyers, but the ordinary kinds were paid less attention. Firm prices were realised by teas representing early quality. Among teas without quality and in fanning grades, withdrawals were heavy. The only quotation that was available was that of plain B.P. at Re. 1.75.

Export quota changed hands at 21 nP. Subsequently, however, buyers offered only 20 nP.

JUTE STEADY

(From Our Own Correspondent)

CALCUTTA, 11*th June*

Steady conditions were in evidence in both the raw jute and the jute goods markets during the week under review. There had been recurrence of rains, which, however, did not affect raw jute prices. In jute goods, fair interest was shown by shippers and internal buying was also brisk. It was this increased activity which prevented a fall in prices of jute goods over the week-end, when details of the increased stocks at the end of May were released by the Indian Jute Mills Association. In line with market expectations, hessian stocks at 40,400 tons recorded a substantial increase of 5,300 tons. On the other hand, the huge business done in sacking goods last month is reflected by a decrease of 600 tons to 57,700 tons. Miscellaneous constructions were lower by 200 tons at 10,600 tons. The increase overall was 4,500 tons at 108,700 tons. Exports last month were higher as compared with April, but were considerably lower than those in March. Hessian shipped in May was 26,600 tons, as against 25,400 and 35,400 tons in April and March, respectively, the figures for sacking goods being 30,200 tons, 27,500 and 45,500 tons, respectively.

In view of the increase in hessian stocks, it was considered possible that mills would transfer some hessian looms to heavy goods. Reports from New York had an encouraging effect, since these suggested that inventories were light, following recent limited purchases. It was thus considered possible that American interest would broaden in the near future. In the meantime, small quantities of hessian were lifted. In sacking goods, a Government tender for 15,000 tons for June delivery was reported. Further, there was business done with the Governments of Ghana and Burma. Sudanese and Indonesian buyers also showed interest and, in addition, domestic buying was believed to be fair.

The jute goods market opened fully steady on Tuesday last on reports of fair business done in heavy goods. Ready B. twills scored from Rs. 115.60 to Rs. 116.10. In sympathy, hessian 40" 10 oz. was fractionally better at Rs. 43.00. Export inquiries in heavy goods continued to be received, and the Government invited tenders for B. twills. B. twills improved further to Rs. 116.50 on Wednesday and hessian 40" 10 oz. to Rs. 43.06. At this stage, there was keen speculative buying, which pushed up B. twills to Rs. 116.85. On the other hand, ready hessian 40" 10 oz. gave way to Rs. 43. Mills continued to sell heavy goods at the higher rates, but, on Friday, buyers resisted the rise. Speculators began to unload. The combined effect on ready B. twills was a fall to Rs. 116.40 on Friday. Over the week-end, the price hovered around Rs. 116.35, with hessian 40" 10 oz. being steady at Rs. 43.10. Yesterday, the steadiness in raw jute pushed up goods prices further. Ready B. twills touched Rs. 117.00, with the 10 oz. hessian being quoted at Rs. 43.50 and the eight oz. at Rs. 35.12

Despite more rains, raw jute prices were maintained at higher levels. This was due to the reserve attitude displayed by stockists. At the same time, mills did not show interest. The latest quotations for the 1956-57 crop, June-July delivery, are:

	Middles Rs.	*Bottoms* Rs.
Pakistani:		
District	40.50	37.50
Northern	40.00	37.00
Indian:		
Northern	34.00	31.50

Bimli f.a.q.		Rs. 27.00

Pucca bales 1st marks ready Rs. 195.00 per bale.

WHEAT RISES SLIGHTLY

(From Our Own Correspondent)

HAPUR, 10*th June*

Steadier conditions were witnessed in the foodgrains markets during the week under review. At its last meeting, the National Development Council agreed to the fixation of minimum prices of foodgrains, with a view to giving an incentive to producers. The Union Government is likely to announce shortly minimum prices for ensuing *kharif* crops. Mr. A. P. Jain, Union Food Minister, has announced that there will be no return to food controls and, in order to bring down the prices of foodgrains, the Government has framed a four-point programme. The measures contemplated are: zonal restrictions on movement of foodgrains, limitations of advances by banks, the recent Government notification empowering State Governments to require any stockist to sell his stocks at average price for the past three months, and maintenance of stocks of imported rice and opening of fair price shops. Out of these, the Reserve Bank has already issued a directive to banks to bring down substantially their present advances against foodgrains.

Call and Fixed Deposits accepted at attractive rates.
F. K. F. NARIMAN,
General Manager.

Wheat registered small gains during the week, following purchases by the Government-initiated purchase and sale co-operative society. Daily arrivals were at an average of 2,000 maunds and local stock was put at 33 *khaties*, the corresponding figure last year being 66 *khaties*. Total arrivals from the beginning of the season were put at 90,000 maunds. The food situation in the eastern districts of Uttar Pradesh is bad enough and, on a representation by the State Government, the Centre has agreed to the opening of another 500 fair price shops, besides 1,100 already working, in nine eastern districts of the State. The Central commitment is accordingly being increased by 50 per cent. to 22,500 tons. The provisions of the new amendment to the Essential Commodities Act through which the Government can ask stockists to sell their stocks at average price for three months has been extended to 12 States, including the U.P.

Rice ruled quiet, thanks to better supply position in the face of good consumers demands. The prevailing prices towards the week-end were: Wheat *dara* Rs. 14.50, farm quality upto Rs. 16.75, rice *basmati* Rs. 26 to Rs. 29.25, *sela Mainpuri* Rs. 23.75 and *sela Etwah* Rs. 25 per maund.

Although the western districts of U.P. are deficient in gram and most of the local stocks put at 33 *khaties* are from Punjab, the State Government has thought it advisable to purchase gram here at Rs. 12 per maund, instead of purchasing it from the neighbouring surplus State of Punjab. Purchases on behalf of the State Government are also taking place for barley and bejhar and this has accounted for a hardening trend in the prices of coarse-grains here. *Jowar* and *guwar* scored some gains, due to falling stocks in the face of good demand. The prevailing prices towards the week-end were: *Gram* Rs. 11.62 to Rs. 12.12, barley Rs. 11, *bejhar* Rs. 10.75, *jowar* Rs. 13 to Rs. 15.25 and *guwar* Rs. 13 per maund.

Pulses recorded an easy trend during the week, due to slack outside demand at higher rates and increasing local stocks. Arrivals of peas and *arhar* went down to an average of 800 maunds daily. Peas and *arhar* receded by about 25 nP per maund. Peas stock was put at 51 *khaties* and *arhar* stocks at 81 *khaties* of about 800 maunds each. Other pulses were mostly quiet and were now quoted at (in rupees and nP per maund): Peas *dara* 11 and white 12.12; *arhar* 11.37; *urd* 19.75 to 21.50; *moong* 15 to 17; and *massoor* 15 to 16.

Pulses futures declined steeply during the week on bear pressure influenced by an appreciable fall in ready sections. The latest quotations were near the lowest levels of the week. Peas *bhadon* was quoted at Rs. 11.8 and *arhar bhadon* at Rs. 11.73.

SUGAR QUIET

(From Our Own Correspondent)

HAPUR, 10*th June*

The sugar market ruled quiet during the week, because of lack of buying support, though there was demand for small quantities. The undertone was still subdued and the supply position was reported to be easy following releases of 165,000 tons of sugar for sale in free market by the Government last week. The production of crystal sugar is now expected to touch new heights (above 2.0 million tons). Up to 15th May, it amounted to 1,913,000 tons. Despite increased production from last year, the stocks with the factories on 15th May were put at 1,270,000 tons as against 1,261,000 last year, as consumption of sugar in the country has increased and 100,000 tons had been exported.

Ready *gur* eased by 50 nP per maund during the week, due to poor outside buying enquiry. Most of the outside purchases were now from Muzaffarnager and Agra-Muttra side where prices were comparatively low. Local stock was put at 77,000 maunds, the corresponding figure last year being 43,000 maunds. The standing new cane crop is reported to be very adversely affected by Salai pest. The prevailing prices are: Dry Rs. 10.50 to Rs. 11.25 and *kotha* dry wet Rs. 10.62.

Future *gur* also declined appreciably in line with ready prices. *Asar* was quoted at Rs. 10.65 and *fagun* Rs. 11.42, as against the week's opening of Rs. 11.25 and Rs. 11.87, respectively.

The Pakistan Government and the Pakistani Sun Oil Company, a subsidiary of the Sun Oil Company of Philadelphia, have signed an agreement allowing the Company to undertake a survey for oil over a 10,000-square mile area in the south and south-western portions of West Pakistan. Under the contract, the Pakistani Government will share with the Company the initial exploratory and development expenses on a 25-75 per cent. of the oil found and the agreement provides for a 50-50 distribution of the profits of the Company. Already, several foreign oil companies are working on a similar basis, exploring the Indus River Valley and parts of East Pakistan.

Machinery is now being installed in a new £65,000 tea factory at Ragati (Kenya), which will produce tea grown by Africans of the Kikuyu and Embu tribes. The factory is the first to be built in Kenya solely for African-grown tea. Designed to process the product of over 2,000 acres of tea, its maximum output will be worth about £320,000 a year. By September this year, the Kikuyu tea-growing areas and the Kerugoya area of the Embu district will have 210 acres of tea in partial bearing, with another 240 acres planted. The targets for these areas is about 2,000 acres, but whether this will be achieved depends on the progress of the land consolidation schemes now going ahead in Kikuyuland. Eventually, each grower will have about one acre of tea. This will bring in at least £80 per acre, making it a valuable addition to the district's list of cash crops.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.=Deferred shares. P.O.=Preferred Ordinary shares. Y=Accounts published yearly. H.=Accounts published half-yearly. P.=Company has Preference shares. T.=Company has Debentures. N.=Nominal quotations. x.d.=Ex. Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

M—Managed by the Board of Directors. ‡ Less Income-tax. s) Clive Mills have paid dividend at As. 10½ on bonus shares, for the year, 1955. * Including bonus. (k, Investments.
(l) Made up of an interim dividend of Re. 1-12 per share on 1,20,000 shares and final dividend of Re 1-10 per share on 2,40,000 shares of which 1,20,000 shares are bonus shares. (s) For seven months ended 31st March 1956.
† New Central Jute Mills—Dividend for 1955 is on shares of Rs. 10 each. The Albion and Lothian jute companies have been amalgamated with New Central Jute Co., with effect from 1st December 1954.
K—

MARKET GOSSIP

(Concluded from page 1171)

This was echoed in a "Statement on the World Cotton Situation" issued by the Committee which particularly stressed the improvement that has occurred in the statistical position of cotton this season. The imbalance between production and disappearance, which has been a constant source of headache to the cotton trade in recent years, is likely to be corrected in the season fast coming to a close. After successive years of excess production since the 1950-51 season, disappearance, including cotton shipped to countries behind the Iron Curtain and the amounts not necessarily consumed, may exceed production by one million bales during the current (1956-57) season. This is the combined result of a decline from 30.8 million bales (of 478 lbs. each) to 28.8 million bales in the free world's production of cotton as well as an increase of about 500,000 bales in consumption amounting to roughly 28.95 million bales. It has long been recognised that one of the prerequisites for resolving the world cotton surplus problem is to restrict production. Major significance, therefore, attaches to the marked reduction in cotton production during the present season. Holding virtually the entire surplus and responsible for nearly half the total free world production, the United States was expected to show the major adjustment in production. This expectation would appear to have materialised. With the smallest acreage planted to cotton since as far back as 1389 and despite the maintenance of near-record yields, production in that country has declined by 1.5 million bales, as compared with the 1955-56 season. Unfavourable weather has aided the downward trend in free world production, but the acreage restriction, especially in the U.S., has been the most decisive factor. Control of acreage in that country has been, and is likely to continue to be, fundamental to the eventual restoration of equilibrium between cotton supply and demand.

Nevertheless, despite the improvement in the statistical picture of cotton, stocks are still high and expected to aggregate 21.1 million bales on 1st August next. Barring the U.S., where the Commodity Credit Corporation's policy of selling cotton for export at prices lower than the domestic price has brought about a reduction in stocks by over 3 million bales, stocks in other net exporting countries are expected to be higher by 500,000 bales and those in net importing countries by about 1.5 million bales on 1st August 1957.

The delegates to the Conference at Istanbul could not reach any agreement regarding control of the international production of cotton. Most delegates were, however, in favour of pressing the U.S. to stop exports of excess stocks for the time being. Should this prove impracticable, it was suggested that excess stocks should be disposed of in an orderly manner by spreading sales over a long period of time. The consensus of opinion was that it was desirable that world cotton prices should be maintained at the present level. In view of the many undesirable aspects of the dual pricing system now in force in the U.S., most delegates favoured the reintroduction of a single-price system in the near future. It was generally agreed by the delegates that only a progressive increase in consumption, coupled with restriction of production, could provide a real and lasting solution to the international cotton problem.

* * * * *

The time-table for ministerial negotiations on the European free trade area project has been put back. The Organisation for European Economic Co-operation (O.E.E.C.) has announced postponement of the Council's meeting originally scheduled to be held next month until "as early a date as is practicable in the autumn." The postponement has been necessitated by two factors. First, since the subject is one of great complexity and is closely connected with arrangements for a common market provided for in the Rome treaty, which has not yet been ratified by all the signatories, it is felt that some time must elapse before definite proposals will be available for consideration by Governments. Secondly, some of the Continental negotiators desire to see the common market treaty signed first.

Notice

RAMPOORIA COTTON MILLS LIMITED

NOTICE IS HEREBY GIVEN THAT THE Fourteenth Annual Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company, 147, Cotton Street, Calcutta, on Friday the 28th June 1957, at 2 p.m.

(a) To receive and pass the Directors' Report and Audited Accounts for the year ended 30th June 1956,

(b) To declare Dividend on Ordinary Shares and Deferred Shares,

(c) To elect Directors,

(d) To appoint Auditors of the Company and to fix their remuneration,

And

(e) To transact any other business that may be brought forward.

The Share Transfer Register will be closed from 15th June to 28th June 1957, both days inclusive.

By Order of the Board of Directors,
NATHMULL RAMPURIA,
Director.

147, COTTON STREET,
CALCUTTA, 5th *June* 1957.

"For Commerce, though the child of Agriculture, fosters his parent Who else must sweat and toil and gain but scanty fare."
William Blake.

VOL. XCIV. No. 2415 BOMBAY, 22nd JUNE 1957 PRICE : Re. 1.50

FEAR IS ALL THE INCENTIVE PRIVATE SECTOR HAS

IT is good to see the spokesmen of the Government stressing the importance of co-operation by business men with the Government for the successful implementation of the second Plan. In all the speeches delivered by Mr. Morarji Desai, Minister for Commerce and Industry, at Bombay and Bangalore this week, the need for such co-operation was the main theme. Mr. T. T. Krishnamachari, Minister for Finance, is also reported to have made this point in the course of a meeting at Calcutta with leading business men. These appeals for co-operation imply that both the Ministers at least recognise that business men have something to contribute to the economic development of the country. We have no doubt that every business man in India will readily respond to this call. All of them are alive to the fact that their existence depends on a free economy and that their prosperity is closely bound up with that of the nation as a whole. In fact, there is no evidence of business men not co-operating or not wanting to co-operate with the Government. It is common knowledge that almost all of them gave liberal support, monetary and otherwise, to the Congress Party at the last General Elections. Again, it is in a spirit of co-operation that the leading industrialists and traders sought an interview with the Finance Minister at Calcutta, in order to explain to him, once again, their views on the new tax proposals. It is true that some business men do criticise the policies and practices of the Government. But, surely, in a democratic society, such criticisms cannot be regarded as amounting to non-co-operation. These criticisms are made with the best of intentions and to help the Government realise the drawbacks in its decisions and actions. Mr. Morarji Desai himself admitted, in his speech at Bangalore early this week, that the Government was liable to make mistakes. That being the case, he should be the last person to resent well-intentioned and valid criticisms.

One, however, wonders whether, while asking for the co-operation of business men, the Government spokesmen are fully conscious that true co-operation cannot be one-sided and that those who seek the co-operation of others must be willing to accommodate the standpoints of those whose co-operation is sought. To ignore this principle and to impose on them burdens after burdens and restrictions after restrictions with the help of Parliamentary majority is tantamount to using coercion. In making this statement, one is not so naive as to fail to realise that taxation and controls cannot always be had with the consent of the people concerned. But is it right to legislate for confiscatory types of taxation and restrictive controls, the effect of both of which is to put the private sector in a strait jacket and in a distinctly disadvantageous position, and then ask that sector willingly and quietly to submit itself to such a situation? The post-budget appeals of the Government and the leaders of the Congress Party to business men to co-operate with them, without offering any worthwhile relief in the tax burdens and/or the restrictions imposed earlier, therefore, sound hollow and unconvincing.

Mr. Morarji Desai may contend that business men had accepted the socialist pattern of society earlier and as such they have no cause for grouse at the recent steps taken by the Government in pursuance of that policy. This argument has no force in it, because the Congress Party never precisely defined its conception of socialism, except in very, very broad terms. In any case, the socialist pattern which the business men thought the Congress Party had in mind was different from the one now being forced on the public. What the business men supported was a Socialist Welfare State through a mixed economy in which free enterprise would be given great scope, freedom and incentive for raising the economic strength of the nation. It is, therefore, incorrect to say that they accepted a socialist pattern of society in which the first place is given to measures designed to achieve the object of greatly narrowing down, if not completely wiping out, inequalities in income and wealth, instead of to steps which would lead to increased production. Expropriatory taxation and confiscation of the wealth of the rich through an annual capital levy may appease the have-nots and strengthen the political popularity of the ruling party in a highly illiterate democracy with adult franchise. But it threatens the existence of free institutions, impairs the incentive for hard work and thrift, and accentuates the difficulty in getting foreign capital from the free world, all of which will retard economic development on sound lines. In retrospect, it appears that commercial bodies such as the Federation of Indian Chambers of Commerce and Industry which blindly extended their support to the vague type of socialism will be well advised to reconsider their stand on this subject and disassociate themselves with the type of socialist pattern now being put into force by the Congress Party.

In his meeting with business men at Calcutta, Mr. Krishnamachari is reported to have reiterated once again that there was nothing in the new tax proposals which should discourage the initiative to invest. He is also said to have added that the Government's policy towards the private sector had not changed during the past one year or eighteen months. Since this version remains uncorrected, we take it that it represents a correct account of his observations. Are these claims borne out by actual developments? We feel that they are not. Let us take the reactions of Mr. G. D. Birla, one of the staunchest supporters of the Congress Party and the Government in the business community. Even in his mild, indeed very mild, criticisms of the budget, he was constrained to remark that the Wealth Tax on companies would inhibit productive wealth. He appeared to share the apprehensions of a large number of people that this tax, together with the Expenditure Tax, would lead to harassment of people by officials. He was of the view that valuation of assets would lead to a lot of difficulties and favoured the exemption of certain items like personal effects, etc., from the Wealth Tax. He was also of the opinion that the tax on expenditure would have to be modified in favour of assessees if it were to be acceptable to them.

To take the views of another equally staunch supporter of the ruling party, Mr. Kasturbhai Lalbhai. In his speech to the shareholders of the National Rayon Corporation last week, Mr. Kasturbhai made the following point:

"It is a recognised fact that, for some years past, industrial enterprise in India has been handicapped by lack of adequate capital, and whatever expansion has taken place in recent years has been made possible by prudent and conservative ploughing back of the annual profits. The increased Income-tax and Corporation Tax, the imposition of Wealth Tax on companies and the substantial addition to the tax on bonus issues will have the cumulative effect of causing a heavy drain, year by year, on the resources of companies. I take this opportunity of earnestly appealing to Government that, in order to maintain the tempo of industrial development in the country, they should reconsider these proposals, with a view to ensuring adequate financial resources for companies and to stimulating further fresh investments in industry."

Here are the reactions of two prominent business men of India both of whom are the personal friends of the Finance Minister and loyal supporters of the Congress Party. Both of them are convinced that the new tax proposals of the Government will hamper the economic development of the country. In other words, Mr. Krishnamachari has not carried conviction even to his own friends in the business world, let alone his critics.

In the new tax proposals, there is, of course, no incentive for hard work and investment in productive assets. The taxation on corporations has been stepped up from a little over 43 per cent. to 51.5 per cent. In the case of those good companies which are in a position to pay a dividend of over 18 per cent. because they were prudent and thrifty in the past, the incidence of taxation goes up to well above 80 per cent. Then there is the obnoxious Wealth Tax. The relief given to individuals in the income group between Rs. 30,000 and Rs. 1,00,000 is negligible, after taking into account the effect of new taxes on cost of living and on their past savings. It should not be forgotten, in this connection, that most of the persons in this group are likely to be having a total wealth exceeding Rs. 2 lakhs and as such will be victims of tax on wealth.

In one sense, however, the Finance Minister is right in claiming that there is incentive to progress in his budget proposals as well as in the Government's economic policy. And that is the fear element, the fear of outright elimination of the private sector, if the business community withheld co-operation, and the fear that, unless one worked hard, saved more and invested more, one would not be able to get even the little in-

come that one manages to earn now. The feeling that something is always better than nothing and that nothing should be done which will result in the loss of even that "something" is all the incentive that the private sector now has in this country. The incentive value of this fear complex is heightened by the fact that communism has begun to thrive in China and threatens to spread to most of the neighbouring lands. But fear as an incentive has limited value. It cannot produce sustained results. Further, fear has the nasty habit of invariably coming true.

Again, while fear may work with domestic investors, it will not with foreign investors. Apart from deterring the inflow of foreign capital, it will induce such foreign capital as is already invested to move out of the country. Now, even the Finance Minister and the Prime Minister have admitted the need and the value of foreign capital for rapid economic development, but their policies and actions are definitely unhelpful for this purpose. They may say that what they want is mainly loans from foreign Governments. But, even for this purpose, the climate has been fouled by the step-motherly treatment given to free enterprise and by the foreign policy of non-alignment with either of the two power blocs. The fear that, unless the present Government of India is enabled to succeed with its economic development programmes, democracy will fail in India is the chief factor that has evoked help from the U.S., the U.K. and other Western countries all along. The potentiality of this factor is still there, though it has, of late, begun to weaken for the same two reasons just mentioned. The way in which free enterprise is being constantly mauled and maimed by the Government and the support given to the communist countries and to their friends in the recent international controversies have raised serious doubts in the Western world about the future of democracy in India. The Communist Party's success in Kerala has only helped to strengthen these doubts.

The other claim of Mr. Krishnamachari that the Government's policy towards the private sector has not changed in the past one year or so is also correct in a way, because it had been decided long ago by the powers-that-be that the public sector shall progressively expand its activity in the economic sphere, so that it may hold a dominating position. The budget proposals are only in keeping with this basic policy and so also the Finance Minister's observation in one of his speeches that it "would not be unreasonable to assume that a slight slowing down for a short period in the private sector will not, in the present circumstances, be undesirable." The public sector must have priority over the private sector and the latter must always eat out of the hands of the former. It will not be difficult to understand the meaning of the various tax proposals, including the latest policy of most favourable treatment of savings invested in the public sector, if they are viewed against this fundamental objective of the Government. It does not seem to have been widely realised that, besides raising the rate of interest on National Plan Savings Certificates which has always been tax-free, the Government has exempted investment in these certificates from Wealth Tax also. The Government has also taken power to exempt from this tax any of its other loans or those of local authorities. This most-favoured treatment to Gilt-edged securities, if liberally followed, will place the private sector at a great disadvantage as compared with the public sector in raising finance from the capital market.

MR. U NU'S CANDOUR

WITH a refreshing candour, which people in this country have learnt to associate only with Gandhiji, the Burmese Premier, Mr. U Nu, admitted, early this month, his "terrible mistakes" in the past, claiming that he himself was the "principal offender." Addressing a meeting of Government officials and political workers, Mr. U Nu frankly averred that he did not like the idea that the Government should have its finger "in all sorts of economic pies." In effect, he dismissed as unrealistic the grandiose vision of a State trying to usurp every function that properly belonged to the private sector, neglecting its own function as the guardian of law and order and of those responsibilities which have, for a long time, been universally regarded as the traditional sphere of the State. His speech, which is like some welcome confession of a new convert in a romantic fiction, indicates what is perhaps the first authoritative swing to the right in South East Asia. It is the more significant, because it comes from the head of a country which has been rocked by extremist political ideas for well over a decade. And it is perhaps good for human affairs that economic and political weather is not an unalterable phenomenon. Burma's turn to the right closely fits in with the recent trends even in some of the more well-organised centrally planned economies, including Russia itself, where the authorities have discovered anew that the assumption of all responsibility for economic progress by the State is not the best way of ensuring such progress.

To turn now to Mr. U Nu's speech. The Burmese Premier felt that the two chief mistakes which had been committed by the authorities were: (1) Planning had been undertaken before law and order had been established and (2) there was inadequate planning and hasty action; due to lack of managerial skill, losses and wastages had occurred and "accounts were more or less in a mess." In these circumstances, the Government was determined to concentrate on restoration of law and order. It would not attempt any new activities in the economic and social fields. After emphasising that they could not "unduly hasten" their Plan, he said that only those projects which were indispensable would be allowed to proceed; all others would be suspended and measures taken to remedy the defects in existing projects. Indian readers will not fail to notice the similarity in this approach to the principle of adherence to the "hard core" of the Plan to which India's Finance Minister referred. But the difference lies in the fact that, while the Burmese Premier has already initiated action along these lines, the authorities in this country have, for all practical purposes, stuck to the "whole Plan or nothing" attitude.

Explaining the Government's industrial programme, Mr. U Nu stated that the Japanese war reparations payments, amounting to Kyats 10 crores per year, and the money to be made available from Japanese business men for investment in Burma, to the tune of Kyats 2½ crores, would be spent on a hydro-electric project now under construction and on railway bridges. Adequate supply of consumer goods would be ensured. The surplus money out of the reparations payments would go towards the establishment of cottage and medium industries. Before the end of this month, the officials and Ministers are expected to draw up a new four-year plan on the lines the Premier has indicated.

Of particular interest is Mr. U Nu's attitude towards private enterprise and foreign capital. Mr. U Nu stated that, except for certain key projects, the rest of the economic field should be entrusted to private enterprise. Many industrial and mining enterprises, he said, would be opened up to those with "profit motive." He welcomed the arrangement under which the Government was a sleeping partner in the Burma Corporation, in which actual management was under experienced foreigners. The Government, he said, would work mines only on such a basis. Otherwise, the working of the mines would be transferred to indigenous private investors. In the absence of suitable private investors, the working of the mines, he said, would be suspended. Referring to foreign capital more specifically, Mr. U Nu stressed that foreign business men would be given opportunity to invest in Burma "both for their own and the country's benefit." He added: "For a variety of reasons, it is impossible to deny economic rights to these foreigners. If it is possible to do so, I will be the first person to exclude them from the economic field. But such action has more demerits than merits." In his attitude towards private enterprise and foreign capital, the Burmese Premier has thus shown a sense of realism which deserves to be more widely emulated by governments in all parts of Asia in the interests of orderly economic development of this ancient continent.

AUTOMATION

ALTHOUGH the introduction of automation in most countries has not assumed the size and significance that raise its social and economic implications to political levels, increasing attention is being paid to its impact on the employment situation and the general pattern of industrial development. Automation is only one form of technological change. Enlightened opinion everywhere would agree that, in studying its implications, especially those relating to labour, automation must be viewed in its true perspective as one of the many developments gradually altering the nature and structure of industry and commerce. The tendency in some quarters to over-dramatise recent automation developments into an imminent and total robot revolution betrays lack of a scientific perspective.

Underdeveloped countries, eager to catch up with changes taking place in the advanced West, are naturally interested in developments in this field. The earnest plea put in by Mr. S. Thondaman, President of the Ceylon Workers' Congress, to the Fortieth I.L.O. meeting held recently at Geneva, for a special effort to study problems arising out of automation and atomic energy in less developed regions, although not a reflection on the preparedness or otherwise of underdeveloped countries to welcome automation, bears witness to the new-found interest of the latter in automation and its implications. He urged the I.L.O. to undertake a thorough investigation of all the vast and complex problems emerging from the effort to usher in an age of plenty through atomic energy and automation. Before any underdeveloped country could be persuaded to take to automation, he further added, it must be shown that it was the best way of liquidating the unemployment problem. This, according to Mr. Thondaman, can be established only by study and experience and pilot schemes in particular areas which might be useful to illustrate, in practice, the advantages of advanced technology.

None would dispute the importance of a thorough study of the different economic and social consequences of automation, but Mr. Thondaman's stand, which might find many supporters elsewhere also, that, in order to welcome automation, it must be shown that it is the "best way of liquidating the unemployment problem" is difficult to comprehend. For it is useless to look forward to automation as the immediate panacea for the intractable problem of unemployment in underdeveloped regions. As the report prepared by Mr. David A. Morse, Director-General of the I.L.O., on the social and labour implications of automation and atomic energy, pointed out, the latter and other related technological developments make it possible to produce many goods and do many things which could not have been produced or done before. They offer great promise for the development of the industrially backward countries. They create new employment opportunities and new skill requirements. But, like all technological innovations, automation causes labour redistribution within the undertaking and also from one industry, occupation and undertaking to another and sometimes from one place to another. It will also involve considerable savings in labour cost.

At the same time, automation will result in higher output, shorter hours of work and some temporary unemployment or a combination of the three. The problem is to arrive at a satisfactory combination of the first two and to minimise, as far as possible, the third. For many countries, as Mr. Morse pointed out, the main cause of unemployment may arise not from too rapid but from too slow progress in automation and other developments. There is no need to regard industrial disturbance and social unrest as inevitable consequences of technological changeovers. Careful advance planning on the part of management, with adequate consideration of the human problems of the change-over, full prior consultation with the workers and their representatives, efforts to develop and take advantage of opportunities for transfer of the displaced labour to other jobs, provision for re-training facilities, etc., all these can make introduction of automation, or for that matter any other technological innovation, a smooth and beneficial affair.

Japan, an over-populated country like India, seems to have adopted the right policy in regard to automation. In Japan, automation is still in its initial stages and has not developed its characteristic snowball effect. It is gradually being adopted not only in such industrial processes as oil refining and chemicals but also in such basic industries as automobiles, food, tele-communication and electric power as well as in finance and other clerical sectors. Simultaneously, steps are being taken to cope with short-term effects of automation such as "frictional" unemployment, and changes in the organisational structure of industries. Mr. Shutaro Matsuura, Japanese Minister for Labour, told the aforesaid meeting of the I.L.O that, with these factors in mind, his Government had formulated a five-year overall economic plan, created a standing employment policy council and a labour welfare project corporation to help smoothen the introduction of automation. Countries interested in higher productivity and rapid industrialisation may do well to learn from Japan.

REASONS FOR SPURT IN EQUITIES

TAXES IN FUTURE—PUBLIC BORROWING

COMMONWEALTH CONFERENCE

THURSDAY, 5 P.M.

MARKET GOSSIP

THE downward trend witnessed in shares last week has proved to be a short-lived affair. The fortnightly settlement clearly showed that the market was short of floating stocks and that the bears had not fully covered their sales. The carry-forward charges in the case of leading counters were either nominal or against the bears. This state of affairs at a time when the money market was extremely stringent and when even demand deposits were fetching all over four per cent. is a striking commentary on the extent to which the markets had become oversold. When the healthy nature of the technical position of the market thus became evident, the bulls bucked up some courage and made a modest entry into the ring. The bears, too, began to cover part of their outstandings. The markets thus began to look up again.

Another factor that cheered the markets was the continued buying of good shares by the Life Insurance Corporation. The latter's purchases were broad-based by including a few more counters and by extending greater support to Calcutta than in recent days. Rumours are afloat that the Corporation will keep on buying for some more time and that it has earmarked no less than Rs. 10 crores for buying up the equities. No one, of course, knows at what levels the Corporation will withdraw from the market. If values move up too quickly due to speculative activity, it may stay its hands. It is, however, stated on reliable authority that the forthcoming new loans of the Central and State Governments would not stand in the way of the Corporation supporting the equities, as it has sufficient funds for both the purposes.

Yet another factor responsible for the revival in the upward trend in equities is the optimistic feeling that the new direct taxes might be modified in favour of investors. The talks between the Finance Minister and the industrialists at Calcutta on Tuesday on this subject are said to have gone well. The Finance Minister is reported to have assured the spokesmen of industries that their hardships would be looked into and that some minor reliefs would be given in respect of wealth and expenditure taxes.

It is even suggested in certain quarters that there would be no further increase in direct taxation and that there might even be a relief in the tax on dividends in the next budget. It is not advisable to set much store by these reports. They may be mere wishful thinking or nebulous assumptions on the basis of some vague hints dropped by the Finance Minister in the course of his informal conversations with some of the business men. It will be worthwhile recalling the fact that these very quarters were entertaining optimistic hopes in the eve of the budget which later turned out to be just wishful thinking. In fairness to the Finance Minister, it must be mentioned that he is reported to have plainly told the industrialists who saw him at Calcutta that the broad structure of new taxation would remain. This means that he would not give up the wealth tax on companies, as has been unanimously demanded by all sections of business men. Some, however, say that this tax would be so modified as to make it innocuous. It is to be hoped that they will not be disproved by events in a few weeks' time.

* * * *

At the Calcutta meeting of business men with the Finance Minister, Mr. G. D. Birla, one of the participants, is stated to have observed that better publicity should be given to the following remark of T.T.K. in the course of his last budget speech on 15th May 1957:

"I have in effect outlined the tax structure of the Plan period. There will, undoubtedly, have to be some adjustments in this structure from year to year, but I expect that these adjustments will be relatively small. For the rest of the Plan period, our aim will be to watch how the changes we have initiated this year work in practice and how the system can be improved upon—to the benefit of the taxpayer no less than in the interest of the tax-receiver. Within this broad framework, I believe, all concerned can proceed with their plans with confidence and assurance of sympathetic consideration by Government of any genuine difficulties."

Why did Mr. Birla make this specific point? Was it because he felt sure that, in future, there would be nothing more than minor changes in taxation? Or was it because he wanted to pin down T.T.K. more firmly to that observation?

But, while wishing to draw the attention of the public to a comfortable part of T.T.K.'s speech, Mr. Birla seems to have overlooked the fact that, at a Press conference held three days after the presentation of the budget, the Finance Minister had almost taken back the said statement. He then said that there would be an "unfilled gap of Rs. 525 crores in the resources needed for the second Plan" which would have to be "bridged up by fresh taxation or loans." In any case, even the portion quoted by Mr. Birla, almost with a sense of relief, it would seem, is full of loopholes through which T.T.K. or his successor can easily wriggle out. It would be interesting to know from the Finance Minister or Mr. Birla whether he would regard increases in the rates of Wealth Tax or Expenditure Tax in the next budget as a major or minor change. Further, how many of such vague assurances to private enterprise as the one of T.T.K. quoted above have been faithfully fulfilled by the Government in recent years?

Despite all these doubts, however, the fact remains that Mr. Birla's pointed reference to the supposedly unnoticed comforting statement of T.T.K. on the future of taxation has had a bullish effect on the market. It seems to have induced some operators at least to take a hopeful view of the outlook for equities.

* * * *

Three more developments during the week have helped the revival of the bullish fervour. One, contrary to the fear born of the Kerala budget, the Mysore Government has not imposed any fresh taxes and has kept the taxes on agricultural income unchanged. This has given rise to hopes that Madras too may not enhance the agricultural income-tax and that the Bombay Government may, once again, postpone this impost. Consequently, Bombay-Burmah and Deccan sugar shares have registered handsome gains over the week.

Second, the Government has extended the time for making compulsory deposits by companies out of their undistributed current profits from 30th June to 31st August 1957, or any date within six months of the relevant accounting year whichever is later. Now that the Government has taken so long a time as nearly seven months to work out the details of only one part of the proposed scheme and none has suffered any adverse consequence as a result of this delay, will it be sporting enough to drop the entire scheme? Many advantages will accrue to the country if the Government follows this advice, the most important of them being the restoration of confidence among foreign investors.

The third development is the willingness of the Finance Minister to take effective measures for easing the stringency in the money market. This has given rise to hope that he will increase the money supply in the coming weeks. It remains to be seen how he will bring about this result, now that he proposes to borrow from the capital market anything up to Rs. 150 crores to Rs. 200 crores in the second or third week of next month.

* * * *

Meanwhile, the supply of funds in the short-term money market is improving, thanks to the return of trade advances from upcountry centres at a good pace. The restrictions placed on advances against foodgrains last week have also helped the inflow of funds to gather some momentum. Most of the big banks have already prepared themselves for taking up their share of new loans. In this, they were generously helped by the Reserve Bank which took over from them large parcels of the existing loans for cash. The Insurance Corporation also is ready to make its contribution to the success of the borrowing programme. There are also large sums on account of depreciation and provident fund accounts. All in all, the Centre may be in a position to rope in a gross subscription of Rs. 100 crores. The terms of the issue will, however, have to be in line with current yields, that is, the rate of interest may be 3¾ per cent. for a 12-to 14-year loan with the issue price at a slight discount, so that the yield may be 4 per cent., or the rate of interest may straightaway be fixed at 4 per cent. with the issue price at par.

The impression in market circles is that a loan of Rs. 150 crores, including conversion facilities for the maturing loan, will be rather difficult, unless the Reserve Bank takes up a very big block.

The proposed State loans, said to be of the magnitude of Rs. 50 crores to Rs. 60 crores, are going to be the biggest headache for the capital market. It will be interesting to see what final decisions are taken at the conference of State Finance Ministers with the Union Finance Minister and the officials of the Reserve Bank scheduled to be held in Bombay this week-end. The issues to be decided at the conference are the following:

(1) The amount to be raised;

(2) the rate of interest to be offered;

(3) should the States borrow separately their individual requirements or allow the Centre to raise the funds on their behalf and distribute the amount thus raised on a previously agreed basis?

If the loans are to succeed, the yield on them must be not less than 4.25 per cent. It would, however, appear that some of the States are ready to pay even 4.50 per cent. It will be a great relief to institutional investors, if the Centre undertakes to borrow on behalf of all the States, for they will then be free from the pressure of the various State Governments which, as past experience has shown, is an embarrassing business.

* * * *

Although the Commonwealth Premiers' Conference, scheduled to meet in London next week, threatens to have a somewhat thin attendance, thanks to the abstention of representatives from two or three member-countries, there is no doubt that its deliberations will be watched with special interest in this country. In some ways, the Conference is of crucial significance to India, in that it is taking place at a time when the country is passing through a period of extreme economic difficulties, not to say a virtual economic crisis. Hopes are entertained that something may come out of the Conference, that some way may eventually be found out of the woods of capital shortage and balance of payments difficulties. Whether these hopes will materialise or not remains to be seen. But, if the Conference succeeds in creating a climate in which this country's problems will come to be viewed with more genuine interest leading to concrete manifestation of Commonwealth co-operation, it will have made a distinct contribution to winning the battle for economic survival of the 370 and odd million people of this country.

It will, however, be idle to deny that the odds against India are heavy. They are both political and economic. Apart from the recent differences of opinion between India and the U.K. over political issues, which it would be unrealistic to overlook and easy to exaggerate, there is the stark reality of the communist regime in Kerala which has not concealed its hostility to foreign investors. Leaving political differences alone, there are quite a few economic obstacles. In the first place, the view is widely held in British economic circles that this country's difficulties are, at least partly, of its own making in that it has refused to cut down its ambitious Plan to more manageable proportions. Secondly, and in part arising out of the first, this country is drawing upon its sterling balances at a much faster rate than they can be replenished; these balances are now drawn down, even after availing a credit of about Rs. 100 crores from the I.M.F., to a perilously low level of Rs. 474 crores, as against Rs. 695 crores a year ago. Thirdly, India's economic policy is not quite favourable to attracting foreign capital from free countries. This policy is too restrictive to the freedom-loving private capital in the western part of the world. The taxation is too heavy and the return available on investments in India compares unfavourably with what can be had in the rest of the free world which is equally in need of foreign capital. Fourthly, Britain itself is engaged in a struggle for freeing its economy from the ill-effects of inflation and the Suez crisis. Fifthly, there are too many claimants for the savings that are available in Britain for export and naturally capital flows into those countries where the climate is congenial and foreign capital is welcomed by offering attractive returns. And, sixthly, suggestions in India that it should leave the Commonwealth and the inability or unwillingness on the part of the Ministers totally to disassociate themselves with them have adversely affected the prospects of India raising a loan in the London market.

* * * *

Despite these difficulties, reports from London continue to emphasise that India may make strenuous efforts to get Britain better interested in this country's economic affairs. Thus, according to one report, India will sound Britain and the U.S. about borrowing up to 600 million dollars to save its second Five-year Plan. Indian and Western diplomats, it is stated, aver that India has little or no prospect of raising anything like that sum in the tight British money market. According to them, Mr. Nehru's best hope seems to lie in Washington, where both the World Bank and the U.S. Government itself may be in a position to help. The report says that India's feelers in London and Washington, and perhaps other capitals too, have coincided with the withdrawal of a final 72-million-dollar instalment of a 200-million-dollar credit recently given by the International Monetary Fund.

Besides the attempt to get a loan, India is said to be making a bid for long-term credits. It would appear that long-term credit is being negotiated in London for specific projects that have been already processed partially and also possibly for some that might come up in future; the former category of projects includes heavy plate and vessel works for the heavy machine building industry and the heavy electrical plant in Bhopal. It remains to be seen how far India's efforts in this direction will succeed.

It may be recalled that this question figured prominently in the discussions which Sir Norman Kippling of the Federation of British Industries had with Indian interests when he was here recently. He then remarked that there was little likelihood of India succeeding in getting credits spread over a period of seven years for import of capital goods. He, however, expressed the hope that India could look forward to getting British credit for executing several projects which would be able to pay for themselves and save and earn foreign exchange in the course of the next few years. There is, however, one development which may possibly induce British exporters of capital goods to take a more favourable view of India's case for long-term credit. It lies in the fact that the premier industrial finance body in this country, the Industrial Finance Corporation, is reported to have decided to underwrite such credits. It must, however, be added that this can only be of limited value, because the whole issue depends upon the confidence which foreign lenders have in India's ability to service such credits and repay the principal on the due dates. At the moment, because of the depletion in India's foreign currency reserves and the large commitments which India has already undertaken, this confidence is at a low ebb. An effective solution to the problem can, therefore, be found only if the Governments of the U.K. and the U.S. come to India's rescue and sanction a big credit of the magnitude indicated earlier.

* * * *

It is not unreasonable to expect that, at the Commonwealth Premiers' Conference, the issues relating to the setting up of the Commonwealth Bank and Britain's participation in the European Free Trade Area will be discussed. The British Government, it may be recalled, has already contacted the Commonwealth countries about the suggestion for a Commonwealth Bank. It would, however, appear that the first reactions of the countries to the proposal have not been favourable. Thus, according to Mr. Cuthbert Alport, Under-Secretary for Commonwealth Relations, in reply to a question in the House of Commons, stated that the countries were doubtful of the value of an

SHARE MARKET RULES BUOYANT

IMPRESSIVE RISE IN VALUES

(From Our Own Correspondents)

BOMBAY, 20*th June*

BUOYANT conditions prevailed on the Bombay Stock Exchange during the week under review. The buoyancy was due chiefly to the continued excellent investment buying by the Life Insurance Corporation of India. The technical position of the market was also conducive to a rise. The bulls were inclined to be active on hopes of a favourable revision in wealth and expenditure tax proposals. These hopes were based on the Union Finance Minister's indication at this week's Calcutta meeting of business men and industrialists that the Select Committee would sympathetically consider the plea for adjustments in the aforesaid two taxes. At the meeting, the Finance Minister is reported to have hinted at the possibility of a progressive reduction in dividend tax. These reports, coupled with the Finance Minister's assurance that the Reserve Bank and the State Bank would continue to take steps to ease the monetary stringency, helped the market to recover its poise and induced some of the bears to cut their sales. In fact, today's closing quotations for some of the scrips were higher than those prevailing before the announcement of the new tax proposals on 15th May last. The undertone of the market was distinctly bullish.

Steel shares encountered good enquiries and registered a rise in values. Tata Ordinaries opened the week firm at Rs. 158.25, as against Rs. 157.50 last week-end, and steadily moved up to touch Rs. 164 today before finishing at Rs. 163.75. The net gain over the week was Rs. 6.25. Indian Irons opened firm at Rs. 18.35 and advanced to close at Rs. 19.55 today, the net rise over the week being Re. 1.25.

Sizable purchases by bulls and some bear-covering characterised the trading in the textile section. Centurys were particularly sought after and the quotation spiralled up by Rs. 30.50 to Rs. 407. Bombay Dyeings were also favoured well. They opened the week Rs. 2.50 higher at Rs. 514 and advanced to Rs. 537.50 today before closing at Rs. 535. Over the week, they were thus higher by Rs. 22.50. Standards rallied Rs. 23 to Rs. 401. Shreenivas spurted by Rs. 14 to Rs. 174, Finlays by Rs. 13 to Rs. 273, Kohinoors by Rs. 12.25 to Rs. 283.50 and Svadeshis by Rs. 10.50 to Rs. 183.50. New Greats strengthened by Rs. 9 to Rs. 220. Khataus picked up Rs. 7.50 to Rs. 167.50. Indores were done at Rs. 135 *ex-div.*, as against Rs. 135 *cum-div.* last week. Gokaks hardened by Rs. 4.50 to Rs. 175. Simplex gathered Rs. 4 to Rs. 160. Central Indias improved by Rs. 3 to Rs. 102.50. Tata Mills put on Rs. 2 to Rs. 42.50. Models were firm at Rs. 180 and Morarjis at Rs. 210.

The banking section continued to present a quietly steady trend. United Commercials rose by 25 nP to Rs. 54. Bank of Barodas were fully maintained at Rs. 102, as also Central Bank new shares at Rs. 54, while old shares receded by 50 nP to Rs. 52.75. Bank of Indias eased by 25 nP to Rs. 137.75. Union Banks shed 20 nP to Rs. 7.

Selling was in evidence in electricity shares and there was a further fall in values. Andhra Electrics dropped Rs. 7.50 to Rs. 1,190. Tata Powers declined by Rs. 2.50 to Rs. 1,205 and Hydros slipped back by Rs. 2 to Rs. 120. Bombay Suburbans lost 50 nP to Rs. 103.50. Ahmedabad Electrics, however, met with some support and gathered 50 nP to Rs. 93.75.

Cement and sugar shares in the miscellaneous section elicited good attention and recorded a handsome improvement. Among the former, Associated Cements commenced the week at Rs. 154.50, as against the previous close of Rs. 154, and advanced to Rs. 158.75 today before finishing at Rs. 158.25. The net gain over the week was Rs. 4.25. Digvijays rose by Rs. 2.50 to Rs. 145. Dalmia Cements increased by 30 nP to Rs. 12. Among sugar shares, Belapurs were in the limelight. They opened the week Rs. 2 higher at Rs. 215 and climbed up to Rs. 221 today, representing thus a gain of Rs. 8 over the week. Phaltans spurted by Rs. 6 to Rs. 135. Walchandnagars were bought at Rs. 244.50, as against Rs. 238.70. Bhopals, however, eased by 30 nP to Rs. 17.70.

The engineering and mining section experienced good buying enquiries which lifted up prices, Alcock Ashdowns rallied Rs. 10 to Rs. 272.50. Tata Locomotives advanced by a like amount to Rs. 147. Premier Constructions evoked sustained investment support and climbed up by Rs. 9.50 to Rs. 151.50. Shivrajpurs were bought Rs. 3 higher at Rs. 79.50. Indian Coppers hardened by 30 nP to Rs. 3.60. B.B. Petrols firmed up by 18 nP to Rs. 2.48. Larsen and Toubros were fully maintained at Rs. 15.30. Mahindras and Mahindras, however, were done lower at Rs. 14.25, as against Rs. 15 last week-end.

In contrast to the sagging tendency last week, automobile shares were in demand and recorded a rise in prices. Premier Automobiles scored a gain of Rs. 2.50 to Rs. 86.50. Hindustan Motors hardened by 45 nP to Rs. 7.05. Shipping shares were also in demand. Scindia Steamships strengthened by Re. 1.10 to Rs. 18.50. India Steamships put on 15 nP to Rs. 10. Great Easterns gathered 10 nP to Rs. 19.35.

A sharp rise of Rs. 31 to Rs. 556.50 in the quotation for Bombay Burmah olds was the feature of trading in miscellaneous industrials. National Rayons were keenly bid at Rs. 217 *ex-div.*, as against Rs. 211.50 *cum-div.* The net advance over the week was as much as Rs. 19.50. Alembic Chemicals spurted by Rs. 6.25 to Rs. 131.25. Tata Oils increased by Re. 1.25 to Rs. 42.75 and Tata Chemicals by Re. 1.20 to Rs. 17.35. Killick Industries improved by a rupee to Rs. 156 *ex-div.* British India Corporations rose by 45 nP to Rs. 6.05. Hindustan Levers strengthened by 30 nP to Rs. 19.30. Wimcos were fully maintained at Rs. 153, as also Industrial Investments at Rs. 69 *ex-div.* and Port Cannings at Rs. 4.34.

* * * *

Calcutta Stock Exchange

CALCUTTA, 19*th June*

Till Friday last, the Calcutta Stock Exchange treaded on a dull and dreary path, but, since Monday, conditions changed for the better, as, in most sections, especially in industrials and engineerings, support was forthcomnig mainly because of the attractive lower levels touched in continued dullness. The discussions which the Union Finance Minister had with industrialists and business men at Calcutta yesterday on the new taxation proposals, which Parliament was expected to consider in the next session, imparted a ray of hope, inasmuch as Mr. Krishnamachari now possessed the considered views of the commercial community on the subject. Further modifications in the proposed wealth and expenditure taxes were considered a possibility.

The closing down of the Waverley Jute Mills for financial reasons, the uptrend in fibre prices, the continued drought postponing sowing of jute, and the announcement of discouraging results for the Andrew Yule group of jute mills for the half-year ended November last scared buyers from the jute section, although business in jute goods for export was fair. In teas, however, there was a note of broadening of activity, following reports of lower production in May, 1957, the total output up to the end of that month being 45.68 million lbs., or a fall of 9.08 million lbs. as compared with the corresponding period in 1956. Earlier in the week, on rumours of payment difficulties, shares in the Mundhra group were hammered down, but, subsequently, a recovery set in on fulfilment of payment.

Madras Stock Exchange

MADRAS, 18*th June*

Immediately after the fixation of minimum prices for plantation shares by the Management Council of the Madras Stock Exchange with effect from Tuesday last week, business in the planting section almost came to a standstill. In the subsequent sessions of the week, however, the sentiment of operators improved somewhat, thanks to absence of any tax proposals in the Mysore Government budget for 1957-58. Although there were still apprehensions of additional taxation in the Madras budget, some in the market thought that the State's Finance Minister might follow the lead given by the West Bengal, Assam and Mysore Finance Ministers. There were also expectations of some favourable revision in the new tax proposals, following the Union Finance Minister's discussions with industrialists and business men, which are now being held at Calcutta as these lines are written. All these factors induced some support to planting shares, although the rise in values was very modest. Textile shares continued to rule dull, with prices drifting lower. There was no buying support, thanks to reports of continued slackness in piecegoods markets. The sugar and miscellaneous sections were neglected.

Among tea shares in the planting section, Blue Mountains improved by 13 nP to Rs. 3. Chembras advanced by 15 nP to Rs. 3.75. Neelamalais increased by 10 nP to Rs. 5.30. Ouchterlonys gathered a like amount to Rs. 4.50. Talayar Teas remained firm at Rs. 10.55. Among coffee shares, Balmadies were unchanged at Rs. 3.35. In the rubber group, Pullangodes hardened by 10 nP to Rs. 2.30. Thirumbadis went up by 17 nP to Rs. 1.57. Midlands were steady at Rs. 14.75, Rajagiris at Rs. 15.50, Travancore Rubbers at Rs. 15 and Vaikundams at Rs. 29.40.

In the Textile section, Premiers slumped by Rs. 10 to Rs. 170. Vasantas receded by Rs. 4 to Rs. 285. Bangalore Woollens decreased by Rs. 3 to Rs. 163. Buckinghams lost Rs. 2 to Rs. 162. Coimbatore Spinnings shed a rupee to Rs. 83. Rajalakshmis eased by a like amount to Rs. 111. Metturs retreated by Rs. 3 to Rs. 313. Kotharis and Cambodias finished each 25 nP lower, the former to Rs. 12 and the latter to Rs. 11.25.

More than 20,000 of the 27,000 employees of the E.S.S.O. Standard Oil Company in the U.S. are stockholders in the parent Company, the Standard Oil Co. The average holding of each employee-stockholder is 95 shares, having a cash value of approximately $6,000 and an annual dividend return of about $200. During 1956, the number of employee-stockholders in E.S.S.O. increased by nearly 50 per cent.

MARKET GOSSIP

(Concluded from previous page)

associated Commonwealth Bank to which Commonwealth Governments would contribute and which would invest in development schemes. He added: "A considerable contribution to the economic development of some Commonwealth countries has already been made by others, but, having regard in particular to the fact that the U.K. is the only Commonwealth country which is a net overseas investor, most Governments point out that a Commonwealth development agency and a bank would not in themselves increase the availability of capital for investment in the Commonwealth. It is our intention, however, to continue to seek, in consultation with the Commonwealth Governments, other practical means of furthering our common objectives in the field of Commonwealth economic development." It remains to be seen whether the Commonwealth Bank proposal will be allowed to rest here, or further consultations will take place at the Conference over the question.

As regards the other issue, namely, the impact of Britain's participation in the proposed European free trade scheme on Commonwealth economy, it is reassuring to know that the British Government is unwilling to sacrifice Commonwealth preference system for the sake of such participation. Asked in the House of Commons whether the acceptance of the proposed European free trade area agreement permitted Britain to continue to grant preferential concessions on Commonwealth produce, Mr. Nigel Birch, Economic Secretary to the Treasury, stated that Britain wanted to retain preferences for the Commonwealth and it was because of this consideration that they had said they could not enter into agreement unless agriculture was excluded from its purview.

* * * *

It is, perhaps, natural for Commonwealth countries to look to Britain for lending a helping hand in their economic progress. Britain has been the traditional exporter of capital. In 1913, British overseas investment (private) was estimated at £3,763 million (about £15,000 million at present-day times). Practically all this money had been lent for development purposes. The Commonwealth countries were an important, though not the major, beneficiary of this investment. The two world wars, however, made it necessary for the U.K. to realise a good part of its foreign investment (£850 million in 1914-18 and £1,000 million in 1939-49) and to incur foreign debts in order to pay for its war effort. Estimates of British overseas investment in post-war years vary. But, according to a recent study of A. R. Canan, quoted by Mr. Andrew Shonfield in an article in the London *Financial Times*, British investment in the sterling Commonwealth during the period 1946-55 was a total of £1,650 million, out of which South Africa received £500 million, Australia £350 million, the Colonies £450 million, Rhodesia £250 million and India £100 million. The figures relating to India, it must be mentioned here, give an exaggerated picture, as they do not take into account the large repatriation of capital that has taken place during this period.

The average net long-term investment, according to another estimate, has been of the order of £160 million. This compares with a figure for the U.S. of £250 million last year. But, if one takes into account the fact that the U.S's national income is much larger than the British, the latter's effort would seem to be more massive than the U.S's. In any case, Britain's overseas investment is a continuous process. Through the International Bank, through special credits to Middle Eastern countries and through contributions like the construction of steel works in India, the investment will both continue and increase.

It is difficult to assess correctly the level of British investment in this country at present. An official estimate placed the level of such investment, as at the end of 1953, at Rs. 78.4 crores (direct investment), in addition to Rs. 39.17 crores being the value of shares of companies held by Britons. Since then, there has been both disinvestment and fresh investment. Since investments are bound to vary from time to time, no particular estimate can have any great validity for more than a limited period of time. Be that as it may, some indication of the level of British investment in this country is available from a recent study of India's liability on investment income account made by the Reserve Bank. India's total liability on this account, according to the study, was Rs. 28.66 crores in 1952 and Rs. 38.58 crores in 1953. Country-wise, the main beneficiary was the U.K. with aggregate receipts of Rs. 19.54 crores for 1952 and Rs. 28.43 crores for 1953; the U.S's share was Rs. 5.07 crores and Rs. 6.29 crores, respectively. Incidentally and contrary to the belief in certain politically prejudiced quarters, these figures show that the so-called drain on account of foreign investments in this country is a mere trickle, as compared with India's total foreign trade.

These figures also show—even after making allowance for more recent flow of foreign capital—that India can afford to take in more foreign capital for productive purposes, in the sense that it will not find serious difficulties in repaying the interest on such investment. But it is necessary for India to offer attractive facilities in order to induce foreign investors to invest their funds in this country. Such facilities, if they are to yield results, should be more favourable than those offered by other rival claimants for foreign investment. Also, India should be more realistic on what it can achieve in the economic sphere, consistent with available resources. After all, a foreign investor is interested in the economic solvency of the country in which he invests. He cannot be expected to make his savings available to a country which seems all but determined to wreck its economy on the rocks of an over-ambitious Plan.

NEWS IN BRIEF

THE balance of standby credit to India, amounting to $72.5 million, out of a total of $200 million granted by the International Monetary Fund in February 1957, was availed of on the 12th inst.

Coal production in the Singareni collieries has increased by about 100,000 tons in the last six months, as compared with the corresponding period last year. Production up to the end of May this year was 750,000 tons, as against 656,000 tons a year before. During May, the collieries produced 148,796 tons, as against 110,638 tons in May 1956.

It is proposed to construct during the second Plan period 100 lighthouses, 15 radio stations, three harbour control radars, eight decca navigator stations, 100 lightbuoys, ten life-boats and a 1,500-ton new lighthouse tender. During the first Plan period, 30 lighthouses, three radio stations, 22 lightbuoys and five beacons were set up.

The Geological Survey of India has recommended geo-chemical prospecting in order to assess the copper mineral content in the Khoh-Dairba area of Alwar district in Rajasthan. The Department investigated the area during the last two field seasons for determining the nature and extent of mineralisation and to prepare a scheme for exploration.

A four-member U.S. machine tool industry advisory group arrived in Delhi on Friday last week to make a two-month study of the Indian machine tool industry's development plans. The group is headed by Mr. George E. Merryweather, of the Motch and Merryweather Machine Company of Cleveland, Ohio. The survey is sponsored jointly by the Governments of India and the U.S.A.

The production of gold in Kolar gold mines has gone down from 16,272 fine ounces in April 1956 to 14,330 fine ounces in April 1957. The causes for the fall in production were the marked fall in the grade of ores in all mines, a rapid depletion of reserve ore in the Mysore mines, a serious fire in the Champion Reef mine, resulting in the sealing of its south zone, and a four-day strike in January last.

Tea estate workers in Assam will receive a total of approximately Rs. 1½ crores to Rs. 2 crores as bonus for 1955 and rice-cut compensation. The rice-cut compensation covers the period 1952 to February 1954. The maximum bonus share for each adult worker is fixed at Rs. 67 and the rice-cut compensation at Rs. 39. A minimum of 240 days for a male worker and 175 days for a female worker during the year will entitle them to get the bonus.

The Industrial Finance Corporation of India, which is now advancing loans to both old and new industrial concerns for the purchase of machinery and other equipment, proposes to give in future guarantee to foreign firms agreeing to supply machinery on a deferred payment basis. A Bill to amend the Industrial Finance Corporation Act with a view to empowering the Corporation to give such guarantees has already been prepared and is expected to be introduced in the next session of Parliament commencing on 15th July next.

India produced 430,000 tons of manganese ore during the first quarter of 1957. This quantity represents an increase over the output of the previous quarter, namely, October-December 1956. As compared with the corresponding quarter of last year, the production is lower by 69,000 tons. The opening stocks in January 1957 were 1,309,000 tons, as against 1,034,000 tons in January 1956. Orissa accounted for a production of 108,000 tons, Bombay for 88,000 tons, Madhya Pradesh for 85,000 tons and Andhra Pradesh and Mysore for 65,000 tons each.

The Government of India has decided to allow export of cotton yarn up to 78 counts freely within a ceiling of 5,000 bales on "first-come-first-served" basis to all permissible destinations, except the Portuguese possessions in India. Licensing will be done on shipping bills, which will be valid for a period not exceeding 15 days from the date of passing or till 30th September 1957, whichever is earlier. Exporters have been warned not to enter into long-term commitments, as licensing will be stopped as soon as the ceiling is reached.

A conference of business men has been convened by the President of the Federation of Indian Chambers of Commerce and Industry, Mr. Babubhai M. Chinai, to help the business community to "concretise" their suggestions in respect of rationalising the sales tax structure and administration. The President of the Indian National Congress, Mr. U. N. Dhebar, is being approached to inaugurate the conference which is to be held sometime in the third week of next month. The various State Governments have been invited to nominate their representatives to participate in the conference.

Under the arrangements which have been agreed upon by the Governments of India and Afghanistan, transit facilities have been provided for Indo-Afghan trade. Subject to a ceiling of Rs. 3.35 crores for the first year, facilities will be afforded to the registered traders in Afghanistan and approved parties in India, who have participated in Indo-Afghan trade during the four years ended 30th June 1956, to supply fruits (both dry and fresh) and asafœtida to India. These supplies will be paid for in Indian rupees. The Government of Afghanistan will, on its part, afford facilities for the import from India of goods such as cotton textiles, green and black tea, *bidi* and tobacco manufactures, spices, jute manufactures, art silk piecegoods and woollen manufactures, leather and leather goods, including footwear, films, machinery and building materials, chemicals, rubber goods, bicycles and motor cycles, paper and stationery, aluminium goods, iron and steel products, and sugar.

* * * *

From Abroad

Fifteen more foreign insurance companies have been granted a maximum of five years to comply with the Egyptianisation Law.

The U.S. Export-Import Bank has earmarked $25 million for a loan to the South Viet Nam Republic to help its 1957 economic development programme.

The technical and economic problems of atomic propulsion of merchant ships is to be studied by a new foundation floated in Amsterdam. Among the founders are the leading Netherlands shipbuilders.

An Egyptian economic mission, headed by Mr. Abu Nosseir, Minister for Commerce, will shortly visit Italy, Yugoslavia, Spain and Portugal for exploring the possibilities of increasing trade with these countries.

Ceylon is contemplating legislation for establishing State Corporations to administer projects for the manufacture of salt, sugar, cotton yarn and cloth, cement, fertilisers, etc. A study of iron ore resources with a view to setting up an iron and steel industry is also planned.

Representatives of four giant West German industrial concerns are currently on a visit to Israel to discuss the possibilities of investment of German capital in Israel as well as the utilisation of German patents by Israeli concerns.

The Australian wool clip in 1956-57 is estimated at 1,530 million lbs., according to a survey issued by the Australian Primary Industry Department. This compares with the previous year's record of 1,410 million lbs.

The Dutch Government has decided to adopt the embargo on trade with China, Northern Korea, and North Viet Nam to the control system prevailing for trade with some East European countries. The Belgian Government will also revise its trade restrictions on strategic goods exports to China, in order to bring them in line with the control over trade with countries of Eastern Europe.

Ceylon has cut the price of all grades of sheet rubber by ten cents per lb., with effect from the 18th inst. The current price is Re. 1.15 per lb. The cut follows the general decline in rubber prices in world markets and the consequent revision of prices paid to Ceylon by China under the long-term agreement between the two countries. This is the second price reduction made this year. Earlier, rubber price was brought down to Re. 1.25 from Re. 1.40.

An Egyptian company, with a capital of ££500,000, has been constituted at Cairo to undertake all reinsurance for Egyptian concerns which hitherto depended on foreign companies for such services. The capital of the concern has been subscribed by 17 Egyptian insurance companies and Government bodies concerned with provident and saving funds. It is estimated that the company will enable Egypt to save foreign exchange to the tune of ££500,000 a year in foreign currencies, principally sterling.

Work at the Senkora gold mines in Tibet, till recently exploited by private owners, has been stopped by the Chinese Government. The owners of the gold mines were exploiting the mines on payment of a royalty to the Dalai Lama. The Chinese Government thought that the mines were being "wastefully and unscientifically" worked. The Chinese mining experts are at present conducting a survey of gold deposits in the areas around the gold field.

Japan and Germany have emerged as the serious challengers to the supremacy of the U.K. as shipbuilders, according to *Lloyds Register of Shipping*. Of the increase of 1¼ million tons gross in launchings, the largest annual increase in the post-war period, four-fifths was due to Japan, and the remainder was accounted for by Germany, Italy, the Netherlands, Norway, Spain and Yugoslavia. Of the traditional shipbuilding countries, only the U.K. and Sweden show a falling off.

Research, mechanisation and sound business policies have increased the productive efficiency of the U.S. coal industry. Output per miner has increased to 17 tons a day, as against 11 tons last year and 3-4 tons 10 years ago, and about 1¼ ton a day in Europe. Price of coal at the mine is $5.00 per ton, same as in 1948, although costs have increased and wage rate is $21.45 per day—an increase of 50 per cent. since 1948. Proportion of labour costs to average mine prices is 50 per cent., as compared with 70 per cent. in the 1930's.

The U.S. Department of Agriculture has launched two projects designed to make cotton a more attractive textile for the world's consumers. One of the projects calls for the development of softer, smoother and more lustrous fabrics which would permit the use of heretofore rather stiff cotton in such items as jacket and coat linings, undergarments and soft-draped dresses. The other seeks to perfect methods of applying crease-retaining qualities to cottons with standard dry cleaning equipment. Both projects are already under way. They are being developed under department contracts with private organisations.

The American economic aid to Pakistan for 1957 has been reduced by over $20 million, as compared with $106 million given last year. Pakistan will get this year $64 million as commodity aid and about $20 million as project assistance. An important item added to the commodity aid list is special machinery aid programme for which $10 million have been provided. This sum is expected to be utilised for establishing new industries. It is for the first time that any reduction has been effected in the U.S. aid to Pakistan since it started in 1952. The reduction, however, is expected to be more than made up by economic assistance through the Eisenhower Doctrine for West Asia and the Baghdad Pact economic programme.

The shipping lines operating between Britain, Europe and the East have withdrawn the 5 per cent. freight surcharge on all shipments already on board or about to be loaded at individual ports. Surcharge previously applied will, however, remain on shipments made already at previous loading ports. This applies to the lines constituting the outward U.K. and Continental Conferences to India, Pakistan and Colombo and Homeward trades to Britain and Europe from India and Pakistan. Others to remove the 5 per cent. surcharge are the East African Conference Lines (outwards and homewards) and the Conference Lines loading outwards to Port Sudan. The U.K.-Aden Conference and the members of the Continental Aden Rates Agreement have also announced the withdrawal of the surcharge in trade from the U.K. and the Continent to Aden and a similar announcement is made by the British Lines serving the Red Sea ports.

A leading U.S. oil executive, Mr. Augustins C. Long, Chairman of the Texas Oil Company, has predicted that the oil industry in the free world will invest $60,000 million during the next five years to meet the rising demand for petroleum. According to Mr. Long, about $30,000 million of the total figure may be invested in countries other than the United States. Foreign oil production, principally that of West Asia, will be the primary source. The estimated enormous commitment of capital to expand oil output cannot, however, be made unless the political and financial climate both in the U.S. and abroad is conducive to overseas investment of such substantial funds. The countries the records of which are stained by broken contracts and instances of bad faith, Mr. Long declares, are not good business risks; developing countries, if they wish to improve their living standards, should realise that potential investors—whether in the petroleum industry or any other industry—can do business only with those Governments which are absolutely reliable with regard to the fulfilment of their commitments.

PERSONAL

MR. Chester A. Ronning, High Commissioner-designate for Canada in India, arrived in Bombay on Thursday last to take up his new assignment in Delhi. He succeeds Mr. Escott Reid.

Mr. Hansraj Hariram has been elected as the fourth representative of the Development Council for Sugar Industry on the Sugar Industry Sectional Committee of the Indian Standards Institution.

Mr. P. N. Talukdar, Managing Director, Hindusthan General Insurance Society Ltd., has been elected President of the Bengal National Chamber of Commerce and Industry, Calcutta, for 1957-58.

Mr. L. N. Mishra, Parliamentary Secretary to the Union Minister for Planning, has been appointed Parliamentary Secretary to the Union Minister for Labour and Employment. Mr. Gulzarilal Nanda is both Planning Minister and Minister for Labour and Employment.

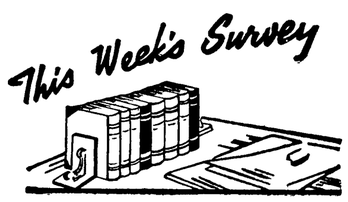
Mr. Jawaharlal Nehru, India's Prime Minister, left New Delhi on 14th June for Damascus on the first lap of his four-week tour which will take him to the Scandinavian countries and to London where he will participate in the Commonwealth Prime Ministers' Conference.

Mr. Gopaldas Aggarwal has been elected President and Mr. Abheraj Hirachand Baldota, Senior Vice-President of the Bombay Metal Exchange Ltd. for the ensuing year. Mr. Raj Kumar Bagri has been elected Vice-President of the Exchange.

Mr. T. C. Kapur, a Member of the Export Promotion Committee, left Bombay for London on Thursday last week. He has been deputed by the Government of India to attend a meeting of the Berne Union, an association of export risks insurance organisations, now being held at Edinburgh.

Mr. A. K. Mitra, an Assistant Commercial Superintendent of the South Eastern Railway, has taken over as the Railways' Public Relations Officer from Mr. S. K. Khanna. Mr. Mitra had previously worked for a long time in the Calcutta Railways' Public Relations Organisation.

Dr. B. Mukerji, Director, Central Drug Research Institute, left Lucknow for Delhi last week *en route* to Geneva to attend the meeting of the Food Additives' Committee, jointly sponsored by W.H.O. and F.A.O. of the United Nations. He is also expected to visit important centres of drug research and industry in France, Switzerland and England.



RATIONALISATION AND RETRENCHMENT

EVEN in Western countries, which have a long tradition of collective bargaining, the problems arising out of modernisation and rationalisation in industrial establishments have not been solved satisfactorily. Workers have always viewed with suspicion any attempt to streamline productive processes. And wherever modernisation, or its more recent form, automation, has been attempted, it has always evoked the workers' protest and led to serious strikes. Against this background, it is hardly to be wondered at that, in India, rationalisation should be regarded with genuine fears by the workers. Both in India and abroad—though rather more in India than in the West—the workers' fear has been that technological changes would result in large-scale retrenchment and heavier workloads. But what is generally ignored is that rationalisation and modernisation are necessary in the interests of industrial expansion, higher productivity and creation of wider markets for goods through reduction, in production costs.

From this point of view, the attempt made by the Government of India at evolving a model agreement on rationalisation is to be welcomed. The draft agreement which is to be placed before the next session of the Indian Labour Conference, scheduled to meet in New Delhi on 11th and 12th July next, recognises the need for mutual consultation and co-operation between management and labour to facilitate operation of schemes of rationalisation. The agreement provides that, before introducing any technological change, which may result in a diminution of the total number of employees, the management shall give reasonable notice, ranging from three weeks to three months, to the workers' union of its intention to effect the change. The notice shall contain full information regarding the nature of the proposed change, the date from which the change is to be introduced, proposed duties of workers covered and expected earnings. The representatives of both mangement and labour will thereafter meet and discuss the proposal. If there is agreement between the parties, the employer may introduce the change on the date agreed upon by them. If, as a result of the introduction of the technological change, some employees are likely to be rendered surplus, the draft agreement provides that steps should be taken to expand, if possible, the activities of the plant or the unit of production so as to absorb these persons. No employee shall be retrenched if other jobs are available in the same plant or under the same employer which carry a comparable pay, subject to the fitness of the employee for the alternative job. Differences between the parties on any matter covered by the agreement shall be referred to arbitration. For this purpose, the agreement provides that a panel of arbitrators acceptable to both parties should be maintained by the employer.

While the draft agreement will be welcomed in so far as it breaks some new ground in what is obviously very difficult terrain, it may be wondered whether it offers anything like an enduring solution to the problem of rationalisation. If the draft agreement is examined carefully, it will be seen that it does not state clearly as to what will happen in the event of the failure of the two parties to reach an agreement over rationalisation. After all, all modernisation involves heavy capital expenditure. And no management will undertake such expenditure, unless it feels that it can retrench surplus labour or reorganise the workloads in the interests of lower production costs. If a labour union takes up the position that not a single worker should be retrenched or that no reorganisation of workloads should be attempted, it will create a situation in which rationalisation cannot be carried through. The question is whether labour unions should be allowed to enjoy the power of veto over all attempts at modernisation. As it now stands, the model agreement does not seem to show a way out of a difficult situation that may well be created by a recalcitrant, obstructionist, short-sighted labour union.

It is not as if the entire issue is of mere academic significance. Many, if not nearly all, of India's industries are miles and miles behind their Western counterpart in the matter of technological efficiency. This divergence in technological levels is bound to react adversely on the fortunes of our industries, particularly on those of our export industries like jute and textiles. Already, rationalisation has been a live issue for some time past in these industries. Some units have had to close down due to uneconomic working. Perhaps, if an inquiry were held into these units, it would reveal that the situation might have been retrieved through prompt introduction of modernisation schemes. In any case, the Government must ensure that rationalisation is not altogether blocked by intransigent unions. It is better to face limited unemployment that may result from modernisation of industrial units than to condemn them to slow death and final extinction which must come from technological backwardness. The least that the Government should do is to stand firm in respect of rationalisation wherever the management contemplating it can show that it can carry it through without much tears.

FOOD PROBLEM

After a fairly long spell of persistent complacency, the authorities have now acknowledged the gravity of the situation on the food front. A clear testimony to this acknowledgment is borne out by the haste and speed with which the Union Food and Agriculture Minister got the Essential Commodities (Amendment) Bill passed in both Houses of Parliament at their recent session. Close on the heels of the passing of the Bill came the directive by the Reserve Bank of India to the banks to bring down substantially their advances against foodgrains. The salient features of the directives are maintenance of a margin of 40 per cent. of the value of foodgrains; fixation of the aggregate level of credit at 66⅔ per cent. of the level obtaining a year before for paddy and rice and 75 per cent. for other foodgrains; and limitation of fresh credit to any party up to only Rs. 50,000. Four days after the directive was issued, the Government of India announced imposition of inter-zonal restriction on the movement of wheat and wheat products. The details of the scheme are given below:

Three wheat zones have been created—(1) the Punjab, Himachal Pradesh and Delhi, (2) Uttar Pradesh, and (3) Rajasthan, Madhya Pradesh and Bombay (excluding the City of Bombay). Exports from and imports into the zones are prohibited except under permits issued by the State Governments concerned, while movement of wheat and wheat products within a zone will be free and unrestricted. The cordon around Delhi has been withdrawn and wheat from Punjab is allowed into Delhi without restriction. Cordons around the cities of Bombay and Calcutta, however, will continue. The existing restrictions on movement of wheat from and to these cities also remain unaffected, as the Union Government will continue to meet the entire requirements of these cities from imports. The demand of Bihar for wheat does not now operate on the markets of the wheat-producing States of the Punjab, Uttar Pradesh, Madhya Pradesh, and Rajasthan. The Centre has accepted full responsibility for feeding this State from imported stocks. Steps, it is said, have already been taken to accelerate movement of wheat to Bihar from port towns.

As regards the rice-consuming areas, the Union Food Ministry is still considering the question of creating zones. The Government of Madras has suggested the creation of a zone, consisting of Andhra Pradesh, Madras and Mysore. It has also represented that the food requirements of Kerala should be met by the Centre. The Union Food Ministry is, however, reported to be of the view that such an arrangement is beset with some difficulties. It seems to favour the formation of a zone, including Kerala also, provision being made for meeting any shortfall in the food supply of the zone from the Central stocks. Final decision on this question is expected to be taken at the joint conference of the Ministers of the southern States and the Central Food Ministry scheduled to be held at New Delhi sometime next week.

The zonal arrangements for foodgrains, though they are welcome in the present context of high prices, cannot in themselves solve the real problem, that of shortage. At best, they may be expected to arrest a further steep rise in prices through avoidance of speculative and wasteful movement of foodgrains from one part to another and assistance in assessing the regional food balances so that easy and free disposal of stocks can be made whenever there is a tendency towards an increase in prices.

In less than a week after the restrictions on bank credit and creation of wheat zones were announced, Mr. Ajit Prasad Jain, Union Minister for Food and Agriculture, declared at New Delhi that the food situation was showing distinct signs of improvement, and the prices of wheat and rice had shown a downward trend in important cities like Calcutta and Bombay. This claim may no doubt be justified to some extent but cannot be accepted fully. If at all the series of measures announced by the Government have brought down the prices of foodgrains, it is due more to the psychological effect of these measures than to any real and lasting improvement in the food situation as such.

It is too premature to say whether the downward trend in foodgrain prices will persist in the coming months. For much depends on the question whether the authorities will be in a position to ensure adequate and regular supplies of foodgrains in all parts of the country. Efforts must be made to expedite receipt of wheat from the U.S. Under the agreement signed with this country, India is to get 3.5 million tons of wheat on a long-term credit basis from the U.S. farm surplus; of this quantity, about one million tons had actually arrived up to the end of May last. It is, indeed, gratifying to be told by Mr. Jain that the Government of India is negotiating with the U.S. Government for further supplies of foodgrains from its farm surplus on a long-term credit basis.

The real solution to the food problem, of course, lies, as this journal has stressed ere now, in augmenting production. It may be recalled that, in his reply to the debate on the Essential Commodities (Amendment) Bill in Parliament, the Food Minister had revealed that the Government proposed shortly to announce certain "very fundamental and important measures to give incentives for the producer to produce more and more." The announcement has still not been made. All that the Government has said subsequent to the aforesaid statement of Mr. Jain is that it will not allow prices of foodgrains and other agricultural commodities to fall below "economic levels" and will take suitable steps from time to time towards this end. This assurance is, to say the least, only of academic importance, considering that there is absolutely no possibility of any substantial fall in the prices of foodgrains, what with the impact of huge development outlay and the continuously rising trend of population. Further, whatever value this assurance may have is neutralised by the use of the vague expression "economic levels."

EDUCATING THE CONSUMER

An eminent writer once said that, where a man could give a better sermon, or build a better house, than his neighbour, the world would make a beaten path to his door. This reflects human nature. The fact, however, remains that the world should know where it can get a better sermon, or the builder of a better house. It is precisely this knowledge which advertising seeks to bring to the people today. If there were no media through which people can acquire knowledge of the existence and availabilty of the numerous things produced by the industries, it would be as if such things were not produced at all. Thus, advertising and publicity in the modern world—which must be distinguished from propaganda because of the "poisoning" effect it has on people's minds—constitute an essential part of production itself; and the investment in it is as important as that in any other branch of production.

Under the spur of scientific and technological advancements, of ever-increasing number of products of industries and, what is more, of the constantly widening markets, the methods of advertisement and publicity have grown enormously. In essense, a perennial "advertisement-war," if it can be so termed, goes on among the producers to educate the consumers about the quality of their products, to expand the markets and, thereby, to reduce the cost of production. This is illustrated by the fact that, as much as £300 million, that is, nearly 2 per cent. of the national income, in the U.K., and around 2½ per cent. of the national income, or 9 billion dollars (in 1956) in the U.S., is being spent on advertisement alone every year.

It is, therefore, a matter for considerable gratification to note from the presidential address of Mr. Dharamsey M. Khatau at the fifth annual meeting of the Indian Society of Advertisers that Indian manufacturers are becoming more and more conscious of the need for publicising their goods. With the advent, however, of a large number of advertisers into the field, there is every likelihood of the art being used to the detriment of the consumers' interests, and without regard to the magnitude of the costs. It is heartening to note that the advertisers themselves, through the Society, the aim of which is to promote, maintain and uphold sound economic principles of advertising, have been endeavouring to establish scientific standards and practices in the field. It is also noteworthy that, realising the hold which the various media of advertisement have on the people, the Society has set very high ethical standards.

Advertising and publicity have a special role to play in promoting exports. Very often, trade missions sent out to survey foreign markets have blandly confessed that many Indian manufactures are comparatively unknown in many foreign countries. Hitherto, as Mr. Khatau has stated, while a large part of India's foreign trade has been confined to a couple of countries, only three commodities, namely, tea, textiles and jute manufactures have dominated the exports. Consequently, there is need for diversification of exports, both country-wise and commodity-wise. The extent of success that can be achieved in this direction, therefore, depends, besides the quality of goods, on the efficiency with which foreign markets and the different tastes of the consumers are surveyed and publicity is conducted in the most appropriate manner. Two considerations, as Mr. Khatau stated, have to be borne in mind, namely, the need for continuity in advertisement, and the need to regard advertisement as an essential investment. Advertising which does not have these two requisites is wasteful.

In this connection, two suggestions advanced by Mr. Khatau deserve consideration. Firstly, the establishment of a research body on the lines of the British Export Trade Research Association or its associate body, the British Export Trade Advertising Corporation. Secondly, giving the Society adequate representation in export promotion councils. It is to be hoped that the Government, in recognition of the role of advertising, will also consider favourably the scheme for commercial broadcasting which the Society proposes to submit shortly.

DECISION ON DU PONT'S CASE

The verdict of the U.S. Supreme Court on the case the U.S. State *vs.* du Pont, delivered about a fortnight ago, created a stir in business circles of the country. The judgment, which reversed the earlier decision of a Chicago judge, was the result of an anti-trust suit filed against du Pont by the U.S. Government in 1949 under the Clayton Act of 1914. According to this Act, no corporation can acquire stock in another corporation where the effect "may be" to restrain trade "or tend to create a monopoly of any line of commerce." The complaint of the Government was that the holding by du Pont, a giant company producing chemicals, paints and fabrics, of 23 per cent. of the stock of General Motors, which again, is a colossus in the automobile field, constituted a violation of the provisions of the aforesaid Act. The fact that du Pont acquired 23 per cent. of latter's stock, the market value of which today is no less than $2.7 billion, as far back as 1917 did not affect the case, which was that such holding was intended to make G.M. a substantial consumer of du Pont's products in preference to the products of du Pont's competitors.

The Chicago Judge had ruled earlier that the Government had failed to prove its charge. The Government came in appeal to the Supreme Court. The majority of four judges, which included Chief Justice Earl Warren, were satisfied, on the evidence of records, that the bulk of du Pont's production had always gone to meet the largest part of the requirements of the one customer in the automobile industry connected to du Pont by a stock interest. They found that du Pont's commanding position was promoted by its stock interest and was not gained solely on competitive merit, even though other consideration were not overlooked by either of them.

A point emerging from the decision is that the Clayton Act applies at any time after the acquisition of the interest, if such stock interest appears likely to result in restraint of trade. Another far-reaching outcome is that the Act applies to "vertical" as well as "horizontal" acquisition.

The two dissenting judges, on the other hand, observed that there was no evidence to show that General Motors purchased only du Pont's products, nor that the latter succeeded in its efforts to sell a wide range of other products to the former. They also pointed out that there was nothing to support the contention that the Clayton Act was applicable to vertical acquisition.

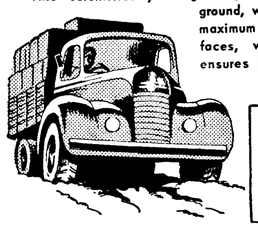
Two considerations, however, seem to have mitigated the dramatic effect of the decision on business circles. In the first place, some months will elapse before the "equitable relief necessary" in this case is determined. And, secondly, the fact that only four judges of the six present wrote the majority decision holds out the hope that, when the full bench of nine presides over another similar case, the decision may be different.

For Pukka roads, Kutcha roads and off the road...

INDIA SUPER

All Purpose Tyre

This scientifically designed tyre is equally at home on soft ground, when its heavy shoulders give maximum traction, and on paved surfaces, where the centre riding rib ensures long life and smooth riding.



Now with RAYON casing for cooler running... greater mileage

INDIA TYRE & RUBBER CO. (INDIA) PRIVATE LIMITED

SECURITY PRINTERS

FOUNDED 1872

Established in 1872, the House of Claridges, after years of experiment and research, have now a very efficient staff, trained in modern methods and up-to-date machinery, to look after your security printing.

Our customers include some of the largest Banking and Insurance Institutions in the country. Lakhs of Cheques, Demand Drafts, Debenture Certificates, Policy Forms, etc., etc., of high quality are produced by us for these customers year after year. The fact that they continue to place their business in our hands is proof in itself of their confidence in us.

We are desirous of making these facilities available to as many as possible. May we have the privilege of serving you also?

CO-OPERATIVE VS. INDIVIDUAL FARMING

SOME REVEALING FACTS OF PRACTICES IN CHINA AND JAPAN

From Our Own Correspondent

NEW DELHI, 18*th June*

HOW to achieve a continuous increase in agricultural and industrial productivity and in real standard of living is one of the most crucial problems of any economic system, be it socialist or non-socialist. The statement of the problem in this manner is suggested by one of the full reports, released in recent weeks by the Government of India, namely, that of the Patil Delegation which studied co-operative and individual farming techniques in China and Japan and the Sarabhai Delegation which studied the productivity movement in Japan. As far as India is concerned, the problem logically leads to the poser: Will the experiences of Communist China or those of Democratic Japan weigh decisively with the Planning Commission and ultimately influence the course of agriculture and industry in this country? Any answer to this can only be in the nature of a prognostication, which, however, is not attempted here.

DELHI LETTER

What may be of immediate interest to readers of *Commerce* is an objective narration (and, where necessary, interpretation) of the most relevant factual findings of the two delegations. These findings in respect of Japan (which is far more of an open book than China) are found in Chapters VIII and IX of the Patil Report and Chapters 7 and 8 of the Sarabhai Report. Only the findings of the Patil Report are considered here, for the theme of the dispatch is Co-operative farming. The Patil Report records that about three-fourths of the peasant households in Japan cultivate less than 2.5 acres each; the average holding of a farm family is 2.17 acres (as of 1952); Japan has the highest average yield (2,400 lbs.) of rice per acre in Asia; and the *per capita* annual income of those engaged in agriculture is Rs. 883 (as of 1953).

The Japanese now concentrate their attention on improved seeds and fertilisers for increasing productivity, as more than 90 per cent. of the area under paddy has come to have a good system of drainage and irrigation. These improved strains of paddy generally require 800 lbs. of fertiliser per average acre. Five million tons of fertilisers are used in Japan, as against 0.8 million tons and 1.8 million tons, respectively, in India and China, where cultivated area is 15 to 20 times larger. Large quantities of compost, green manure and night soil are also used in Japan.

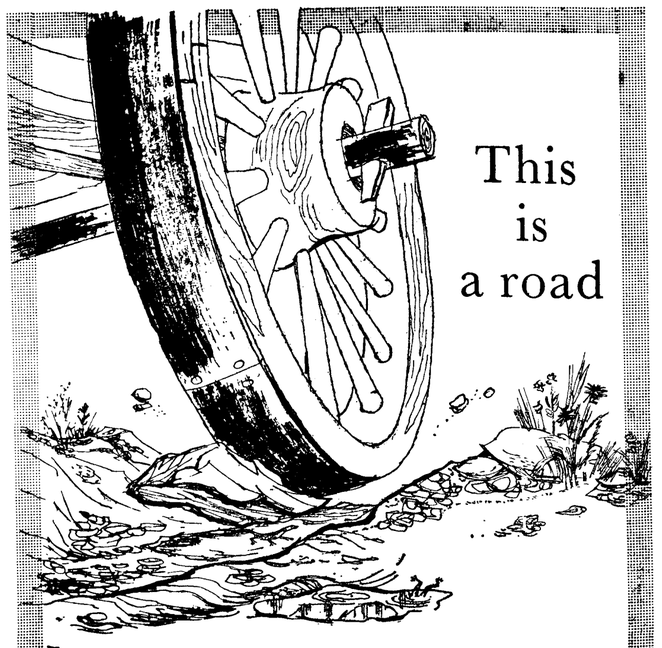
Cultivators in Japan are increasingly using electric or diesel motors, threshing machines and power hulling machines. Between 1935 and 1953, the number of electric and diesel motors in that country has increased by 17.2 times and 6.7 times, respectively, and the number of power hulling machines and threshing machines by 13.8 times and 5.2 times, respectively. Mechanical ploughing by small tractors is also tending to become popular, their number having increased from about 15,000 in 1951 to about 35,000 in 1953.

These facts and figures concerning the small-holder agricultural economy of Japan should be sufficient to convince anybody that co-operative joint or collective farming is not necessary for the supposed purpose of increasing productivity or even for mechanisation. What is true of Japan today can well be true of India tomorrow, for ours too is a predominantly small-holder agricultural economy, which, again, is a largely rice economy like Japan's. Still, the Patil Delegation, its majority, to be precise, wonders why co-operative farming has not been seriously attempted in Japan, even though the size of holdings is so small. And the Report further records that the present atmosphere in Japan is not conducive to the growth of producers' co-operatives. If the contention that "co-operative cultivation will not only protect the interests of small farmers but also raise the productivity" is true, surely nothing can stand in the way of Japanese farmers taking spontaneously to such joint cultivation. Japanese farmers are no strangers to co-operation, for the fact remains, as the Patil Report itself records, that Japan has a highly developed co-operative structure in the field of credit, marketing and supply. If they still display no enthusiasm for co-operative farming, it must be because, as practical farmers, they have the realism and shrewdness to appreciate that intensive cultivation (which requires individual attention and interest) *plus* co-operative credit, marketing and supply can and do mean greater productivity and better returns for the farmer than any system involving pooling of land and joint cultivation.

Incidentally, the remarkable progress of the service co-operatives in Japan (which has the distinction of having no co-operative farming society) brings out clearly how robust pragmatism is any day superior to impractical idealism or doctrinaire radicalism. Facts and figures gleaned from the Patil Report itself tell their own story. Thus, more than 95 per cent. of the total farm households are members of co-operative primary societies which supply 39 per cent. of the total agricultural finance and hold 65 per cent. of the total savings of the farm households; and 96 per cent. of the surplus rice and 25 per cent. of the surplus wheat and barley are marketed through co-operatives. Nearly 40 per cent. of all the primary co-operative societies are multi-purpose societies. Cultivating farmers are enrolled as full members and non-cultivating farmers as auxiliary members, and the former constitute nine-tenths of the total membership of multi-purpose societies.

The average primary society has a membership of 600; the average paid-up capital per member is Rs. 45; and an average primary society usually transacts a business of Rs. 3 lakhs per annum on account of loans and has 11 whole-time employees. The primary co-operatives hold very large sums in the shape of deposits. Figures available for 12,000 (out of the total 35,000) societies show that they hold (as of 1955) as much as Rs. 390 crores, of which just under half is in fixed deposits and the total loans due to these societies represent just under 60 per cent. of the value of their deposits. The operations of the credit structure are also closely integrated with the system of marketing (of surplus farm produce) and supplies (to farmers of other commodities and requisites). The co-operatives market foodgrains and other farm produce worth nearly Rs. 500 crores (as of 1954-55), and this is possible because almost all the primary societies have their own warehouses, with a total storage capacity of 4.2 million tons. On the supplies side, primary societies now supply 71 per cent. and 44 per cent., res-

(*Continued on next page*)



Call it what you will—a kutcha track, a cattle-path. It is a *road*. It leads somewhere. It is a vital line of communication. Perhaps, where you live, roads stretch out straight and firm on every hand. Perhaps you take roads for granted. But it is not so everywhere. Over large tracts of India, there is a crying need for more roads, safer roads, faster roads. Roads are the arteries of civilised life. Without roads, the modern world couldn't tick. And without *bitumen* the road engineer of to-day would lose a tough ally. *Bitumen*, a petroleum product, is of immense value in road-making. It provides a smooth but tremendously durable surface. Water rolls off it. Scorching sun and biting cold have little effect on it. Under the increasing loads and speeds of modern vehicles, *bitumen* flexes invisibly and recovers itself time after time after time. It is one of the world's most economical and practical construction materials. We make available many tons of *bitumen* each year to P.W.D. authorities and contractors up and down the country. We also make available the skill and experience of our *bitumen* engineers. Wherever you travel in India, you are pretty sure to be travelling at some time or other on *bitumen* supplied by Burmah-Shell.

BURMAH-SHELL... *in India's life and part of it.*

PLANTATIONS IN KERALA STATE

IMPACT OF NEW TAX PROPOSALS HEAVY

By S. Narayanaswamy

THE Communist Government of Kerala have presented a balanced budget. They have thus carried out the edict of the Prime Minister of India that improvidence at State levels was intolerable and that resource-raising must be done at top gear, if Central sympathies were to be retained. Is it not praiseworthy that, while Congress Governments, as in West Bengal, have ignored the Delhi admonition, the sole non-Congress State Government in India should have afforded such substantial co-operation in the implementing of the Plan? But, obviously, the Union Finance Ministry, in its deadly sophistication, sees more in this balanced Kerala budget than an effort to obtain the Prime Minister's pat on the back.

Almost the first act of the Kerala Communist Ministry on assuming office was to declare their intention to nationalise "foreign-owned" plantations. The members of the Politburo outside Kerala were no less vociferous about this programme. When Delhi chose to receive this proposal with marked frigidity and expressed its strong disapproval of a step that meant deploying precious plan project funds, dissipation of our limited foreign exchange resources and loss of goodwill of those countries, from which we expect aid, or at any rate long-term credits for plant and machinery supplies, the Kerala Ministry must have in its pique decided on an alternative programme.

It is difficult not to believe that the Ministry, having been baulked of its pet project, decided on a crushing tax burden on plantations in Kerala. The levy on plantations heretofore at the State level was an income-tax of 4 annas and a supertax of 2 annas. An aggregate of 6 annas in the rupee was a heavy enough burden. The recent budget has added a further supertax ranging from 1 to 4 annas according as profits exceed Rs. 25,000 and Rs. 10 lakhs. There are intermediate slabs between these rates, details of which have not been made available in the budget. There is, besides this impost, a surcharge on income and supertaxes of 5 per cent. The aggregate agricultural tax impost will thus be 66 per cent. of the profits of a company with profits exceeding Rs. 10 lakhs. In the case of a rubber company the profits of which are not subject to Central taxation, the residue of profits available for allocation and distribution would be 34 per cent. In the case of a tea company which attracts Central income-tax on 40 per cent. of its profits, the tax will be 66 per cent. on 60 per cent. of the profits and 53 per cent. on the residual 40 per cent. of its profits, taking account of the latest enhancements in Central company taxes.

Idea Incorrect

The idea that the bulk of the plantations of Kerala are "foreign-owned" is incorrect. It is true that there are a few sterling companies the shares of which are owned by well-known British groups. They have latterly become fewer, as, in the last 10 years large European-owned estates, corporate as well as proprietary, have been bought by enterprising Indian planters on a fairly heavily capitalised basis. These estates have become the property of rupee companies whose shares are, by and large, owned by middle class and small income group Indian investors. An examination of the pattern of shareholding will demonstrate conclusively to Government two things, namely, (1) the large number of small shareholders holding below Rs. 5,000 face value shares, and (2) the overwhelmingly Indian nationality of the shareholding. Another impression that seems to persist is that, merely because the managing agency houses of several rupee plantation companies are European, the estates or companies are "European-owned." In fact, very large formerly-European owned blocks of shares have changed ownership and Indian stake in plantations under European managing agency has enlarged very considerably over the last 10 years.

For some eight years now, shareholders' associations, chambers of commerce and stock exchanges have been bringing home to the Central Government, by an analysis of the registers of members of representative public companies all over India, the simple fact that the middle-class and the small income groups constitute between 85 and 90 per cent. of the shareholders in the companies and that every time an effort was made to increase company imposts or curtail dividends, the income of the small man was reduced. The Government of India are now fully aware of the pattern of shareholding in public companies, though some of their recent efforts to soak the rich, inflict vicarious punishment on the middle class shareholder also.

Ideological Animosity

The Kerala Government, in cultivating an ideological animosity to "European-owned" plantations, are forgetful of some basic and inescapable historical facts, which it is quite unlike the Communists to do, because they are nothing if they are not diligent students of history. Onwards of a hundred years ago, pioneering bands of hardy and bold Europeans braved malaria-infested jungles in the high and middle ranges of Indian hills, particularly in the south-west and north-east of India. They cleared the woods, mobilised labour, planted tea, coffee and rubber, braved a general hostile climate and waited for seven or eight years to get results. There were no roads, no electricity, no telephones, no post offices, in fact, none of the amenities that are so facilely taken for granted by those that visit a modern plantation, with its spacious bungalows, hospitals, water-supply, grain stores and labour lines. The plantation industry is exclusively of European origin in India. No Indian agriculturist accustomed to cash in on quarterly and half-yearly harvests was prepared to invest large sums and wait seven or eight years for results. The plantation industry is still the largest single employer of labour in India, labour to which free housing and several other free amenities are afforded—which several of the more progressive urban industries have not yet found possible to do. Tea has become the single largest earner of foreign exchange for India since we devalued the rupee in 1949—even jute taking a second place. India is the world's largest tea producer. These gains in employment, in large wealth-creating units of economic activity and in export markets we owe to that pioneering band of European planters. Wherefore this effort to punish men who have created these assets for us and this war-whoop about their being exploiters?

Stake of Indian Investor

To come back to the impact of the new tax on plantations, the stake of the non-Kerala Indian investor in Kerala plantation shares is considerable. Today the investor in planting shares is in a bad way. The depreciation in his holdings between September 1956 and mid-June 1957 is 60 per cent. This is in great part due to causes extraneous to Kerala. However, the investor has to face the grim prospect of a sharply reduced dividend income from Kerala planting companies consequent on the new tax impost. The announcement of the Kerala taxes was the signal for the Stock Exchange in Madras to fix minimum prices for planting shares. This is a measure of the demoralised condition of the stock market obtaining at the time of the announcement and of the need to arrest further price declines, if the investor is not to be wiped out.

There is little effort to dispute the crippling effect of the tax on distributed profits of companies, particularly when the tax comes on top of increases in Central income-tax. The shrinkage in dividend income and the inevitable fall in capital values represent a double injustice to the middle class investor. Kerala has asked for a large allotment of Central funds for her plan projects. Kerala has also invited outside capital and enterprise to come and establish industries in Kerala. If the taxation policy of the State should give so rude a shock to existing investment in Kerala companies, what are the chances of their being able to coax more non-Kerala capital to come into Kerala? The new tax has created a feeling of basic insecurity among investors. Will the Kerala Government re-examine the tax from the viewpoint of the large number of helpless middle-class Indian investors who today bear the cross of depreciation and reduced dividend income?

PROPERTY FOR SALE

PROPERTY OF THE ENGLISH & SCOTTISH JOINT COOPERATIVE WHOLESALE SOCIETY LTD.

A Group of Estates in North Wynaad, totalling 6,389.61 acres gross and 2,667.90 acres under consisting of Cherakara, Jessie, Talapoya (including Thavanjal Division) and Tatamala. A comprehensive medical service. All estates linked by private telephone system. Protected water supplies and adequate labourers' accommodation of a high standard. All well found estates with good yields. For further details apply KING & PARTRIDGE, Solicitors, Regal House, McLean Street, Madras 1.

JUTE INDUSTRY IN DUNDEE

The post-war modernisation programme of the Dundee jute manufacturing industry has been implemented very successfully. The total sum spent by the industry on re-equipment since 1945 comes to £9.6 million—£7.8 million on machinery and equipment and the balance on buildings—according to the latest annual statistical survey carried out by the British Jute Trade Federal Council. This amount, it is claimed, represents a substantial part of the capital invested in relation to the size of the industry and reflects the determined drive for productive efficiency. During 1956, capital expenditure was a record for the post-war period; spinning mills spent over £1.4 million and weaving factories more than £500,000.

As a result of the modernisation programme, the old type machinery is said to have virtually disappeared and is now only 3 per cent. of the total. Consequently, the productivity of labour has gone up by 42 per cent. since 1949. In the weaving sector, the number of automatic looms is steadily rising and now accounts for one-third of the total looms in operation. Five concerns have special weaving sections equipped with circular looms. Simultaneously with improvement in productivity, the basic wages of workers have registered a notable rise, the actual extent of the increase since 1945 being 116 per cent. for women and 98 per cent. for men.

DELHI LETTER

(*Concluded from previous page*)

pectively, of the total fertiliser and insecticide requirements of the Japanese farmers.

By all accounts, therefore, Japan (which, in spite of a high level of industrialisation, has 50 per cent. of its population dependent on agriculture) has organised the system of agricultural production in a better way than China, where, too, the availability of cultivated land per agricultural household is about the same as in Japan. Incidentally, the fact that the availability of cultivated land per agricultural family in India is about thrice that in China or Japan strengthens the view that individual farming supported by service co-operatives can well be as prosperous in this country as in Japan. In the context of conditions prevailing in Japan, the Patil Delegation's defence of Co-operative farming in China turns out to be a laboured *apologia*.

The vague impression of the Patil Delegation that a fair part of the increase in production in 1955 in China is due to the co-operative form of cultivation does not stand close scrutiny. For one thing, the 13 per cent. increase in 1955 of food crops over 1953 can only be attributed to three (combined) factors, namely, a 2 per cent. increase in the net cultivated area, a 12 per cent. increase in irrigated area and a 5 per cent. increase in area cropped more than once. Even this increase in production has not been reflected in a corresponding increase in per-acre productivity, because the increase in yield of food crops in 1955 is only 7.5 per cent. over 1952. In the circumstance, no part of this increase in productivity can be attributed to Co-operative farming societies (of the elementary type which covered two-thirds of all agricultural households by the end of 1955). This interpretation is also confirmed by the finding of the earlier Krishnappa Delegation to China on Agricultural Planning and Techniques that the average yields in China (on co-operative or collective farms) are still lower than the figures for normal pre-war years.

If Co-operative or Collective farming, by itself, cannot bring about an increase in productivity, what else can be a good enough justification for such a revolutionary reorganisation of agriculture? Can it be that the ease with which anything from 20 to 25 per cent. of the gross produce can be squeezed out of the farmers by the State (as in China) provides that justification? As the Patil Delegation has not sought to justify the need for Co-operative farming on this ground but has only recommended the organisation of 10,000 demonstration co-operatives in India in the next four years on a purely voluntary basis and with freedom for a member to opt out, the case for Co-operative farming on the Chinese model is virtually given away, whatever be the protestations of Prime Minister Nehru. And this is good in so far as it goes.

DISPENSATION OF RURAL CREDIT—I

CO-OPERATIVES THE MOST SUITABLE MEDIUM

By A Student of Co-operation

BEFORE the last session of Parliament was prorogued, the Finance Minister, Mr. T. T. Krishnamachari, exploded a bombshell in the Lok Sabha, when he declared that he proposed to transfer to the State Bank of India some of the present functions of the Reserve Bank which were in the nature of "pure commercial or co-operative banking." The object of this proposed change, in the words of the Minister, is "that the Reserve Bank should remain a bankers' bank, that it should be the eyes and ears of the Government of India, that it should be the topmost financial institution in the country controlling practically every movement in finance and that it might be divested of day-to-day banking work." "It is my intention," he added, "to make the Reserve Bank the supreme adviser in all matters of money, credit and banking."

The above statement confirms the rumours that have been afloat to this effect for some time past. The rumours had caused understandable anxiety among those both actively and passively associated with the development of co-operative activities, in general, and of rural credit, in particular, because of the keen awareness on their part of the implications of the far-reaching change contemplated by the Finance Minister. That such a change should have been envisaged hardly before two complete years have elapsed after the acceptance by the Government, Parliament, and the Co-operative Movement, after prolonged deliberations, of the main recommendations of the Rural Credit Survey Committee, and just at a time when the implementation of the integrated scheme, which has been hampered considerably till recently owing to States reorganisation, is proceeding apace, is all the more disturbing. Furthermore, to those who are anxious to help raise agricultural output so that it may be in a position to meet the expanding needs of the country, by providing timely credit and marketing facilities to the farmer, the proposed change is nothing short of a bolt from the blue, inasmuch as it is bound to upset the rural credit schemes under implementation. In fact, having realised that the rumours were not unfounded, the conference of State Co-operative Banks of India held at Delhi on 10th and 11th May had expressed, in unequivocal terms, the view that, if the proposed change were put through, "it would cut at the very root of rural credit which has been the kingpin of rural development programme launched by the State."

"Supreme Adviser"

It is appropriate, therefore, to examine carefully the Finance Minister's statement in all its aspects. It is not quite clear, in the first place, what he had in mind when he stated that the Reserve Bank should be the "supreme adviser" to and the "eyes and ears" of the Government. Obviously, it is not possible to make the advice of the Reserve Bank, which is already the supreme financial institution, statutorily binding on the Government. Then, if his objective is to increase the control of the Bank over credit, money and banking in the country, the question to be asked is whether the proposed change in the functions of the Reserve Bank is conducive to its attainment. Indeed, is it not more probable that, in a predominantly agricultural country like India, the suggested change will render the institution less useful and weaker than it can be? Secondly, does the provision of agricultural credit by the Reserve Bank through the co-operative banks constitute a departure from the central banking principle of being a banker's bank? Again, does such a function impair the efficiency of the Bank? And lastly, is the State Bank of India qualified, functionally, structurally and by tradition to take over this function? The answers to these questions can be found in the nature of the role that has been assigned to the central bank of this country in the field of rural credit. This role itself has to be examined in the context of (1) the nature, extent and criteria of agricultural credit, and (2) the type of the agency best suited for dispensing it.

Certain distinguishing features of agricultural credit in India, as in the case of other underdeveloped countries, impose almost inescapable limitations of economic and practical nature on the activities of commercial banks and the State in this field. The sharpness of these features is highlighted by the fact that, whereas in an advanced country like the U.S. all kinds of commercial banks and financial institutions together provide about 54 per cent. of farm credit every year, in India, commercial banks including the State Bank have been able to provide less than one per cent. and the State about 3 per cent. of the total borrowings. By its very nature, agricultural credit is rural, and, therefore, usually the least institutional and the most dispersed of all types of finance. The conditions in which the agricultural production takes place are such that the cultivator finds it impracticable to make use of credit to the same degree of efficiency as industry generally.

Diverse Conditions

These conditions are as diverse as the uneconomic size of the holdings, vagaries of the seasons, perishable nature of certain agricultural products and long duration of agricultural operations. For example, of the total number of cultivators of over 54 million, as much as 70 per cent. cultivate about 42 per cent. or about 328 million acres under crops, while the remaining 30 per cent. cultivate 58 per cent. of land. Fragmentation of large holdings has received a fresh impetus as a result of the land reform policies that are being pursued by the State Governments. The *per capita* area under cultivation is only 84 cents. Consequently, cultivators of small and medium size holdings hold the key to agricultural improvement. Another handicap the farmer suffers from is that he does not fix the prices of his produce, as is the case in industry. Consequently, he suffers losses more often than he gets profits. This gives rise to the need for granting loans at low rate, as compared with those to trade. In addition to these, the standard of living of the farmer is very low; and he has to borrow large amounts to meet his current consumption expenditure.

Thus, in the agricultural sector, there are too many small farmers, their borrowings involving too small individual sums, with too inadequate creditworthiness from commercial banking standards, and with too uncertain returns, to attract the attention of commercial banks in India. The State, too, has neither the money nor the necessary administrative machinery to deal with so large a number of small farmers. This position is very precisely described by Mr. Maurice Zinkin when he says, in his book, *Development for Free Asia*, "The imagination boggles at the organisation the State would require... to lend hundreds of millions of pounds to tens of millions of peasants, at a few pounds per peasant, a few shillings per occasion of lending." Moneylenders, however, have provided the money—they had provided no less than 70 per cent. of total borrowings in 1953—but certainly not the right type of credit at the right price and for the right purpose. The moneylender is not concerned with the purpose of the borrowing, nor is there any supervision. As. Mr. Maurice Zinkin has aptly observed in the aforesaid book, "A man with a starving baby or a daughter to marry will pay any rate of interest. A man borrowing for a productive purpose will calculate his risks." This is illustrated by the fact that, of the 57 per cent. of the total borrowings of cultivating families in 1953 for current expenses, as much as 47 per cent. was for current consumption alone, almost all of which was provided by the moneylending class.

Criteria for Credit

It will be appropriate now to examine the extent of agricultural credit requirements, and the sound criteria for such credit. The needs of farm credit are, obviously, governed by such factors as the rate of interest on the loan, the use to which the loan is intended to be put, the nature of crop that is proposed to be raised, and not the least important, the expected rate of return. In 1953 alone, the total actual borrowings were of the order of Rs. 750 crores, though only about 6.5 per cent. of it was provided by co-operatives and the State together at rates averaging the "co-operative rates." The rest of the loans were obtained at much higher rates from moneylenders. For example, 70 per cent. of loans given by private agencies in Orissa were at rates higher than 25 per cent. The corresponding percentage in some of the other States was 40 per cent. in West Bengal, 29 in U.P. and 27 in Bihar. Obviously, if loans are made available at reasonable rates of interest and for productive purposes—which is essential because of the fact that larger agricultural production is the aim of national policy—the requirements of agricultural credit will expand fast in future.

Besides, a sound system of agricultural credit requires that (1) it should be granted for a period commensurate with the length of the operation which it is intended to facilitate; (2) the rate of interest should be low; (3) the type of security should not be necessarily material, but should be based on the farmer's integrity and efficiency; (4) it should be related to the average yield on the farm, (5) it should be accompanied by supervision as to its productive use; and, lastly, it must form an integral part of the programme for making the agriculturist creditworthy by encouraging him to use better techniques of production, improved implements, seeds and fertilisers, in order to raise the productivity of the land.

Advantages of Co-operation

In fine, the nature, extent and requirements of agricultural credit are such that all the three agencies mentioned above, namely, the commercial banks, the private agencies, and the Governments are excluded from playing a purposeful role individually to any significant extent in this field. These obvious considerations necessarily point to the need for an institutional type of credit system closely associated with the policies of the State. Such a system need not be an entire substitute for the existing agencies, but could be an effective alternative to them. The institutional base which can fulfil these objectives is found to exist in the association of cultivators on co-operative basis, which, because of the success it has achieved wherever it has been worked efficiently, both in India and elsewhere, has come to be regarded as the only hope of the small farmer. The co-operative society, if worked properly, solves all the problems of lending to the small cultivators. It gives them credit and creditworthiness, which they do not possess individually. It has the advantages of a moneylender but not his disadvantages. Being an association of borrowers, the society knows the personal standing of each of them. This ensures effective supervision over their expenditure. Consequently, it can lend in small amounts, at all odd times and can recover the same in similar amounts, however numerous. There is no profit motive and the overhead charges are small, unlike in the case of a commercial bank, and, therefore, it can lend at low interest rates. This is also facilitated by the fact that it can borrow at low rates of interest large sums from the central co-operative banks depending on its owned funds and/or on the value of the property of its members. Moreover, the principles of the society are such that extravagance is discouraged while savings are encouraged.

Because of the overwhelming advantages of co-operation, various authorities have accepted in various contexts that co-operatives constitute the most suitable form of institutional system to subserve the needs of agricultural credit.

In practice, however, co-operative societies have not made any uniformly impressive headway during the last 50 years of their existence. This is mainly due to the fact that co-operation has had to function in predominantly 'urban' attitudes and environment. Added to this setting was the chronic and oppressive indebtedness of the cultivator, which always played him into the hands of the moneylender-*cum*-trader, in the absence of (1) "creditworthiness" even from the existing co-operative standards and (2) co-operative marketing facilities to complete the aim of co-operative credit. A second important reason was that agricultural credit was not co-ordinated either with a general programme of agricultural reorganisation or other economic activities like marketing and processing. Further, the pyramid of co-operative credit organisation, from the village society to the apex bank, was structurally weak for want of adequate capital resources, organisationally feeble due to the uneconomic size of the societies and banks and inadequacy of trained personnel, both for the purpose of management and supervision, ideologically static for want of dynamism in the leadership. Added to this inherent weakness was the fact that the whole movement was

ECONOMIC TRENDS IN WESTERN EUROPE

INDUSTRIAL EXPANSION RECEIVES A CHECK

HOW the political crisis in West Asia has hit the economic development of Western Europe is vividly described by the Economic Commission for Europe (E.C.E.) in its latest annual *Economic Survey of Europe*, namely, that covering the calendar year 1956. The year witnessed, for instance, a slowing down, albeit slight, of industrial expansion, a small increase in industrial costs, some restrictions on household consumption of liquid fuel, and a lowering of motor car purchases. The year also witnessed various shifts in balance of payments, tending to weaken the position of countries already facing difficult problems and to worsen the dollar balance of Western Europe as a whole. Nevertheless, the economic outlook, it is said, has not suffered any marked setback. Emphasising this aspect, the E.C.E. points to the comparative stability of raw material prices, the continuance of earlier encouraging employment trends, and the steadiness of second-hand car prices. It observes:

"Except in the United Kingdom, where the pressure on the pound sterling caused anxiety for a few weeks, the predominant view has been that the present crisis is of a transitory nature, entailing no necessity for fundamental changes in policies. While some important decisions by business enterprises may have been postponed until less uncertain political conditions are restored, there would appear, on the whole, to have been no change in the earlier place. Thus, the indirect repercussions of the crisis remain limited."

The rate of industrial expansion in Western Europe slowed down during 1956, the overall rise in production being only 5 per cent., as against 10 per cent. in both the preceding two years. This was due largely to the slackening in the manufacturing operations of metal industries and partly also to a fall in the output of chemicals in the earlier months. Textile production, however, which had been stagnating since the middle of 1954, staged a definite recovery in the second quarter of 1956.

Danger Signal

The upward drift of prices in the earlier part of the year was mainly the result of the pressure of domestic demand on already fully employed resources and only to a very slight extent due to the external influence of import prices. This, together with balance-of-payments difficulties in some countries, was taken by most Governments as a danger signal leading them to reinforce existing measures, or to take new steps, to restrain the growth of demand. Of the countries where deflationary policies had been in force longest, the United Kingdom experienced a levelling off and, recently, an absolute decline in industrial production.

Among the countries where rapid expansion continued, it was only in France, Switzerland, the Netherlands and Belgium that further growth was reported to be coming up against physical obstacles. Although no specific bottlenecks developed in other countries, the rate of growth, which was rendered possible in the past though the existence of manpower reserves and underutilised capacities, could no longer be maintained, once a phase of full employment had been entered. Most countries applied restrictive policies, in order to reduce the pressure of demand on resources. Information about the utilisation of physical productive capacity is non-existent for most countries and too inadequate for the remainder to provide a clear picture. In some areas, capacities may have been less fully utilised at the end of 1956 than a year ago, because, on the one hand, the high level of investment in recent years had added to existing capacities and, on the other, the pressure of demand on the investment goods sector—where capacity limits had frequently been reached—has eased in many countries.

As regards the supply of basic materials, little further progress was made in West Europe's coal production during 1956, thanks to difficulties in attracting mining labour or even retaining it in some countries. Most of the major producing countries, excepting W. Germany which reported an improvement, barely succeeded in maintaining output at the 1955 level. The trend of prices was upward in both the producing and the importing countries, while, in the international market, the tendency among the European exporters to align their prices on the landed cost of American coal in each importing country continued. Output of steel in W. Europe continued to increase in 1956, albeit at a reduced rate. There might have been a distinct improvement but for the limit of capacity having been reached and shortage of scrap and coke. Commenting on the latter aspect, the E.C.E. observes:

"Short supplies of scrap may retard the longer-run growth of steel output in the countries of the European Coal and Steel Community, but the position will be eased by larger imports from the United States. The Highest Authority of the E.C.S.C. is apparently of the opinion that a lasting solution to the scrap problem can be found only by substituting pig iron to some extent. An agreement on a new organisation of the market for scrap, which would stimulate the transformation, has recently been reached. The lower rate of expansion in steel output in 1956 coincided with a slowing down of expansion in important steel-consuming industries, so that steel supplies do not seem in general to have constituted a bottleneck to industrial progress in Western Europe in 1956. The reduced rate of increase in automobile production has made the position for steel sheets much easier. The shipbuilding boom, on the other hand, intensified by the closure of the Suez Canal, has caused a severe shortage of ship-plates."

Investment expenditure showed a considerable expansion over the 1955 level in W. Germany, France, the Netherlands and Switzerland. The pattern of investments varied greatly from country to country.

Housing

In a number of countries where economic policies aimed at slowing down overall expansion, housing was selected for particular action so as to release resources from dwellings to industrial construction and thus to avoid an excessive impact on long term industrial expansion. In addition to the effect of overall credit restrictions in many countries, reduction in housing subsidies and direct restrictions on building credits have limited the construction of dwellings in Denmark, Norway and the United Kingdom. Difficulties of obtaining finance and high building costs have slowed down house building in Finland, and the lack of skilled workers, as well as high building costs, have been the difficulty in Austria.

The rise in money earnings was accelerated in 1956, as compared with 1955, in practically all the countries, thanks to an excess demand for labour, adjustment to rises in the cost of living and autonomous wage increases due to the strong bargaining position of trade unions. The rise was steepest in Belgium and Finland. Since cost of living increases also speeded up in the first half of 1956, the rise in the average level of real earnings of industrial workers between 1955 and 1956 was smaller than in the previous year, except in Belgium, the Netherlands, France and W. Germany. The volume of total private consumption moved, on the whole, in the same direction as the industrial wage bill, and the rise slowed down in all countries, with the exception of the Netherlands, Switzerland, Western Germany and probably Belgium, but, in view of the incompleteness of income data, divergencies in the scale of change in the two series must, of course, be expected in all countries. Moreover, these divergencies differ from country to country, depending on the relative importance of other incomes, particularly agricultural incomes.

Reflecting the slowing down of industrial expansion in many countries of Western Europe, the upward trend in the imports into this region persisted during 1956, though at a reduced rate. This was true of all countries, barring the U.K. and Ireland, where imports dropped below their 1955 level. Increases were particularly sharp in France, the Netherlands and Finland, where the pressure of demand on resources continued to be intense. The impact of the slower rate of growth of imports varied between different exporting areas. Imports from overseas, which had risen much more slowly than intra-European trade or industrial production until about the middle of 1955, then speeded up considerably, as spare capacities in W. Europe became more fully utilised. But, during 1956, the levelling off of domestic expansion reduced the rate of growth, both of imports from overseas and of intra-European trade. Imports from the U.S. rose most rapidly between 1955 and 1956, but the rise was not so great as that recorded between 1954 and 1955 (almost 40 per cent.). The increase in 1956 was mainly accounted for by coal imports, and petroleum imports were also an important factor. There was also a sustained high rate of growth in imports from the predominantly mineral-producing countries overseas.

The volume of W. Europe's exports during the first nine months of 1956, as compared with the same period in 1955, was higher by 9 per cent. The rise was in marked evidence in the case of shipments to the U.S. All the major exporting countries, barring France, shared in the improvement. In particular, exports of machinery and transport equipment registered a sharp expansion, the actual extent of expansion for the 10 major countries being about $400 million for each of the two groups.

The rapid upswing in 1955 had brought only a small deterioration in W. Europe's balance of trade with overseas countries and 1956 showed little further change in the overall net result. Before the Suez crisis, foreign exchange reserves of W. Europe as a whole increased, but, if the large additions to West German exchange reserves are excluded from the total, the loss of reserves by other countries in 1956 exceeded their gains in 1955.

Developments in the dollar balance of W. Europe have been rather favourable. During the first nine months of 1956, gold and dollar reserves of W. European countries increased by about $900 million or by about as much as in the same period of 1955. This increase occurred in spite of a sharp decline in U.S. non-military grants and loans to W. Europe and an increase in the trade deficit. Only a small part of this deterioration was offset by an increase in the U.S. military expenditure and by receipts on services account, and the more important change was a sharp rise in the outflow of U.S. private capital to W. Europe, which more than trebled between the first nine months of 1955 and the same months of 1956. The upward trend in private capital movements started by about the end of 1955 and was stimulated by the high interest rates prevailing in most W. European countries, and possibly also by the confidence created by the continued economic expansion in W. Europe.

Economic Policies

Economic policies in 1956 were determined by the concern of Governments at the effect of excess demand on balance of payments and also of continued price and wage increases, considered both as a danger in themselves and, indirectly, also as a threat to balances of payments.

As a result of the various manifestations of inflationary pressures reflected in the balance of payments position and in rising levels of costs and prices, restrictive policies are now being applied in almost all the industrial countries of W. Europe. It would appear that, at first, reliance was placed mainly on monetary and credit policies in most countries.

Central Bank discount rates were raised in all countries which had embarked on a restrictive course, with the exception of France—in some instances several times—but, since it had become common experience that variations in the cost of credit by themselves do not greatly influence investment decisions in industry during a period of continued upswing, this measure was supplemented by a series of others aiming to reduce liquidity. Greater use was made of open market operations. Bank liquidity and, therefore, the possibility of making advances were further influenced by increases in minimum reserve requirements or liquidity ratios and by restrictions on re-discounting facilities.

Prospects for 1957

Commenting on the prospects for 1957, the *Economic Survey of Europe* expects a sharpening of the dilemma in which most W. European countries now find themselves. Whether to embark on a continued expansion of their economies, together with the acceptance of some price increases and possibly a weakening of their balance of payments or to curb domestic demands which will check price increases but at the cost of some slowing-down of expansion. Although the present difficulties are experienced by all European countries, their importance varies considerably from country to country. The gains which the Scandinavian countries and the Netherlands will obtain in their external transactions will represent a positive advantage that may outweigh such disadvantages as would result from higher import prices. West Germany seems to be the least affected of all countries, and its position contrasts with that of France and the U.K.

In conclusion, the *Survey* points to the Governmental delay in policy changes, thanks to uncertainty regarding the final impact and duration of political crisis in West Asia. The cautious attitude adopted by them prevents them from relaxing deflationary measures even where inflationary pressures seem to be easing. The *Survey* accordingly expects that, in some countries, production may for a time lag behind a level which it would otherwise have been possible to achieve.

INTERNATIONAL FIBRE SITUATION

IMPORTANCE OF RAYON AND MAN-MADE FIBRES RAPIDLY GROWING

THERE is no exaggeration whatever in the statement of the International Cotton Advisory Committee (I.C.A.C.) that, in the free world, the competition among fibres for textile markets is more intense than ever before. The importance of man-made fibres has been rapidly increasing and production capacity is being stepped up daily. Although the share of cotton is still predominant, being nearly twice as large as that of rayon and wool combined, it has been continuously on the decline. Expressed in percentage, the drop in cotton's share has been from 77 in 1937-38 to 71 in 1948 and 65 in 1956, while the share of man-made fibres has expanded from 10 to 15 and 24, respectively. All kinds of man-made fibres have participated in the trend towards increased production, but the largest gains in the last two years have been in staple fibre, with a substantial rise also in the newer synthetics.

The following table indicates the trend of consumption of man-made fibres, wool and cotton (production of man-made fibres is taken as equivalent to consumption) in the free world during 1956, as compared with 1955, 1954 and 1949:

(In million bales of 478 lbs. each)

	1956	1955	1954	1949	Percentage rise from 1949 to 1956
Man-made fibres—					
Rayon and acetate yarn ..	4.2	4.4	3.9	3.3	27
Rayon and acetate fibre ..	5.1	4.6	4.1	1.8	183
Total ..	9.3	9.0	8.0	5.1	82
Other fibres	1.5	1.2	0.9	0.2	650
Total ..	10.8	10.2	8.9	5.3	104
Wool	4.9	4.5	4.3	4.5	9
Cotton	28.8	27.8	27.3	22.2	30
Grand Total ..	44.5	42.5	40.5	32.0	39

The foregoing table shows that, since 1949, the aggregate world consumption of the major textile fibres—cotton, wool and man-made fibres—has gone up by 12.5 million bales or 39 per cent. This improvement is much greater than the rise in population, thereby indicating an increase in the *per capita* consumption of textiles. Nevertheless, the fibre consumption has lagged behind the gain of 54 per cent. in the United Nations index of industrial production. In other words, this means that the fibre and textile industries have not been as successful as some of the others in capturing the increase in purchasing power in the free world in recent years. The bulk of the rise in fibre consumption since 1949 is accounted for by cotton, the actual extent of the rise being 6.6 million bales or 30 per cent. Man-made fibres accounted for a rise of 5.5 million bales (104 per cent.) and wool for 400,000 bales (9 per cent.). From 1954 to 1956, however, consumption of man-made fibres rose more than that of cotton, being 1.9 million bales, as against 1.5 million bales of cotton.

Projected Expansion

The construction of additional plants for producing man-made fibres is expected to raise the aggregate capacity from 13.0 million bales in March 1956 to 14.6 million bales by December next, as the figures given below show:

(In million bales of 478 lbs. each)

	March, 1956	December, 1957	Increase
Rayon and acetate yarn	5.3	5.6	0.3
Rayon and acetate fibre	6.0	6.9	0.9
Others	1.7	2.1	0.4
Total ..	13.0	14.6	1.6

Most of the projected expansion in capacity is for staple fibre and is concentrated in three countries, namely, Japan, the United Kingdom and the United States. The newer man-made fibres, including Nylon, Dacron, Terylene, Orlon, Vinylon and a number of others are now at a stage where they are becoming important quantitatively. In fact, if the present trend were to continue, they would account for most of the expansion in the production of man-made fibres in future. The production of these newer fibres is at present concentrated mainly in the U.S., but capacity is being stepped up rapidly in the other major industrial countries.

The reduction in cotton prices in the last two years has gone a long way towards eliminating the price advantage previously enjoyed by rayon staple fibre. Although this development should enhance the competitive position of cotton, there is not yet much in the way of statistical proof for it. Lower cotton prices have been accompanied by smaller reductions in prices of rayon staple in a number of countries, including the U.S., Italy and Japan. At present, U.S. Middling 1" cotton delivered at mills in the U.S. sells for 36.2 cents per lb., as compared with 29.0 cents for viscose rayon staple. The corresponding prices in the U.K. are 26.9*d.* and 24*d.* and, in Japan, they are 30.8 cents and 24.7 cents. Rayon thus has still a definite advantage in cost per pound, particularly considering the differences in waste factors.

Prices of rayon yarns in the U.K. were raised by 10 per cent. in January last for the first time since 1951, following rising costs. For the same reason, prices were raised in the U.S. during December 1956. The prices of other man-made fibres have generally remained unchanged in the past year and a half, except for small increases in the U.S. and a reduction in Japan. There has, however, been a general cut in the price of nylon yarn. All these fibres continued to be priced much higher than cotton or rayon, and it is generally believed that the profit margin in producing them is much greater than for rayon. The man-made fibre industry continues to devote great resources to research and development work, with a view to improving existing products and augmenting their adaptability to end-uses.

More Intense Competition

The competition among fibres for textile markets, as stated at the outset, is more intense than ever before. Elucidating this view, the International Cotton Advisory Committee points out that, in the U.S., the rayon industry attempted to increase the price of rayon fine yarn early in 1956, but was forced not only to retract the increase but actually to reduce the price to below the original level, thanks to the fall in the price of nylon. According to the Committee, the price reduction, combined with reduced sales, particularly of fine yarn, led to a very substantial decline in the profits in industry. All indications are that the cost of producing rayon staple fibre is increasing, but the growing competition from imports, new domestic plants, and possibly cotton forced a price reduction from 31-32 cents to 29 cents a pound in March 1957. Currently, profit margins (per pound) for producing rayon staple in the U.S. are considered to be the lowest for many years. Meanwhile, consumption of rayon textile yarn in the U.S. has declined by 40 per cent. from its peak in 1951, because of intensified competition from the newer synthetics and cotton.

In the opinion of the Committee, consumption of man-made fibres, is of the greatest relative importance in the industrialised areas of North America, Western Europe, and Japan, and it is here that most of the gain in consumption of man-made fibres has taken place in recent years. In Japan, although cotton consumption has gained 1.8 million bales since 1949, consumption of man-made fibres has gained by the same amount and now comprises 40 per cent. of the consumption of the major textile fibres, the largest for any of the important textile countries. In the U.K., cotton consumption has declined by half a million bales since 1949, while the man-made fibres have gained 300,000 bales. In Italy, textile consumption has shown little change in recent years, but cotton's share has declined, while rayon's has increased. In France, consumption of all major fibres was at a peak in 1956, but, here again, rayon's share increased at the expense of cotton. In the U.S., consumption of man-made fibres is 1.3 million bales larger than in 1948-50, while that of cotton is at the same level. An exception is the Federal Republic of Germany where, although consumption of man-made fibres has increased in recent years, the gain in cotton consumption has been greater.

In Underdeveloped Countries

The underdeveloped countries of Asia, Africa and Latin America account for a "very substantial part" of the increased consumption of cotton in the last few years. The consumption of man-made fibres in these areas is no doubt rising, but the rise has not been as much of a competitive factor as in the industrialised countries. Such a trend is attributed to 2 factors, namely, (1) the end-use requirements for textiles; and (2) the greater difficulty of raising capital and providing technology and raw materials for man-made fibre plants, not to speak of cotton being a basic agricultural crop in many countries. In India, for instance, cotton consumption has increased by nearly 800,000 bales since 1949, as against less than 150,000 bales in that of rayon. The percentage share of cotton in the market for the major textile fibres is currently put at 93, the figure for rayon and wool being 6 and 1, respectively. The climatic conditions in Asia, particularly India, constitute a favourable factor for cotton.

The synthetic fibres are not ideally suited for making clothing material required in tropical and semi-tropical countries for day-to-day wear. Another factor in favour of cotton is the low level of national incomes which permits the use of synthetic textiles by the vast majority of population only as a luxury. In India, the price of cotton is pegged at well below the world levels, while staple fibre and other synthetic fibres are relatively more expensive on account of heavy import duties, restrictions on imports and the high cost of production of domestic manufactures. This factor also places cotton fabrics at an advantageous position *vis-a-vis* the synthetic fabrics. It would, however, appear that industrial uses offer unlimited possibilities for synthetic fibres in India, especially for the newer types which are superior in strength to cotton.

AMBAR CHARKHAS

The Government of India has decided that 180,000 more Ambar Charkhas should be manufactured and brought into production during 1957-58. Out of these, 150,000 Charkhas will be distributed to trained spinners for commercial production of yarn, the balance being utilised for training more spinners. These 180,000 Charkhas will be in addition to the 75,000 Charkhas put into operation under the 1956-57 programme.

A target of 65 million yards of cloth to be woven out of Ambar yarn has been fixed for 1957-58. Under the second Plan, it may be recalled, 300 million yards of cloth have been earmarked for production from Ambar yarn out of the total additional production of 1,700 million yards.

A total provision of a little over Rs. 10 crores has been made in the budget for the current year for implementing part of the programme. Out of this, the Government has released immediately Rs. 2 crores—Rs. 1.5 crores as a loan and Rs. 50 lakhs as a grant—to the *Khadi* and Village Industries Commission for going ahead with the programme. The programme for the current year has been approved after a review of the progress made in executing the programme in 1956-57, the first year of the Ambar Charkha scheme.

It is claimed that the progress made in the execution of the scheme during the first year was steady. As against the target of 75,000 Charkhas, the actual number manufactured was 76,784. Of these, nearly 46,000 Charkhas were distributed to trained spinners for yarn production. The quantity of yarn produced was over 700,000 lbs., as against the target of 600,000 lbs. The production of Ambar cloth during the year amounted to over 1.53 million yards; the target for this was 2.25 million yards. Commercial production was organised in 258 production centres. The progress made in building up the organisation required for implementing the Ambar Charkha programme was more marked. As against the target of 50 workshops for manufacturing the Charkhas, 77 had actually been set up by the end of 1956-57. Twenty-eight training institutions had been started, as against the target of 30, and 303 training-*cum*-production centres were in existence, as against the target of 300. Over 2,500 instructors to train spinners in operating the Charkhas had been trained, as against the target of 2,400. Carpenters trained in the production of the Charkhas numbered 753—153 more than the programme envisaged. The number of spinners trained was nearly 49,000, as against the target of 70,000.

RAYON INDUSTRY

Addressing the members of the Silk and Art Silk Mills' Association at Bombay last week, Mr. Manubhai Shah, Union Minister for Industry, revealed that the Government of India might soon make an *ad hoc* announcement on drawback of export and excise duty. Mr. Shah did not indicate the industries which would benefit from such a drawback but only declared that the Government would bear in mind the difficulties of the rayon weaving industry. He congratulated the industry for having achieved a "phenomenal growth." Certainly, the industry deserves the congratulation. The number of looms installed which was just 278 in 1934 has gone up to as many as 40,000 today. The production of fabrics has registered remarkable expansion. Beginning with a modest figure of about 5,000 yards, the output steadily rose to 113 million yards in 1950 and to 193 million yards in 1956.

In the course of his welcome speech, Mr. M. S. Kapadia, Vice-Chairman of the Association, urged the Government to evolve a "constructive import policy," so that the industry could get sufficient yarn supplies. Replying to this plea, the Minister revealed that India imported about Rs. 18 crores worth of rayon yarn last year. He recalled the Planning Commission's recommendation that, in view of the wide disparity between the yarn requirements of the industry and indigenous produc-

TEXTILE MISSION'S REPORT UNDER GOVERNMENT CONSIDERATION

SOME TOP-LEVEL HELP TO MEET COMPETITION EXPECTED

From A Special Correspondent

MANCHESTER, 11*th June*

THE "inquest" on the fruitless visit to the Far East by the Lancashire textile mission in search of an agreement with India, Pakistan and Hong Kong on the limitation of cloth shipments to Britain, far from being over, is really just beginning. The mission, led by Sir Cuthbert Clegg, has made a detailed report to the President of the Board of Trade, Sir David Eccles, on the negotiations with textile leaders in the three countries and, in a written reply in the House of Commons, Sir David admitted that the report "gave rise to many important points." These, he said, were being considered along with his colleagues. This announcement, in itself, seems to offer no more hope of Government action to curb imports than the admission by the President's predecessor, Mr. Thorneycroft, that repeated Lancashire delegations to Whitehall on the same issue had made out a good case. But the very fact that the Government is prepared to re-examine the situation in Lancashire resulting from cloth imports creates hopes of some sort of top level help.

MANCHESTER LETTER

A call to the Government to wake up before it is too late and the bulk of Lancashire's cotton industry has been lost to the inroads of Eastern competition was made by Mr. Joseph Hollas, Chairman of Hollas Textile Holdings Ltd., the large weaving group. "A century of technical development in the production of fabrics is being frittered away," he declared in his annual report. Average imports of cotton grey cloth from India, Hong Kong and Japan over the past three years was 254,000,000 yards per annum, representing production of about 25,000 looms. In Lancashire, an average of over 30,000 looms had closed down in each of the last two years, and weaving capacity was shrinking at the rate of 8½ per cent. annually. "These are only figures to many people," said Mr. Hollas, "but they are almost heart-breaking to many engaged in the trade. Because the industry is not being given a fair chance it is not attracting sufficient young people."

Yarn Profit Margins

One of the first industries which is scheduled for investigation under the Restrictive Trade Practices Act is that engaged in the production of cotton yarn. The agreement, which has operated for some ten years to regulate profit margins for spinners, has been the subject of criticism in other sections of the trade and the Government has included it in the first series of inquiries to be held before the Restrictive Practices Court.

Before he relinquished his office as President of the Yarn Spinners' Association in favour of Colonel J. B. Whitehead, Managing Director of the Lancashire Cotton Corporation, Mr. John Lindley gave some details of the action taken to deal with the agreement before its registration under the Act. The whole terms of the agreement were examined to ensure that any non-essential matters which might conflict with the provisions of the Act were excluded or amended, he said. The Association is preparing its case to defend the price regulation scheme and the contention of the spinners is that they have a sound case to argue before the Court.

"We shall use every means in our power, every source of evidence available from recent and historical records and the most competent legal minds to justify our activities," Mr. Lindley told the annual meeting of the Association.

Revisions Pending?

In the meantime, consideration is being given to a revision of the basis for operating costs marginal rates. The present margins, according to Mr. Lindley, reflect the cost experience in 1953, adjusted only by the actual wage awards made to operatives and increased fuel charges imposed in 1955. Costs of mill stores, rates, transport and many other expenses have materially increased since 1953 and only a comprehensive cost investigation can determine whether increased efficiency in the industry has enabled these increases to be absorbed.

Another matter which the Association has had under discussion is the possibility of improving the method of assessing cotton prices to provide the basis for its symbol on which yarn selling rates are established. Representatives of the Liverpool Cotton Association have collaborated with the spinners in these talks. Under current conditions, however, the Association is not ready to relinquish control of the basic symbol price, but a pledge has been given that, in the event of a change in the situation providing an accurate reflection of day-to-day trends in actual cotton buying prices, the Committee will not hesitate to take suitable action.

Union Supports Millowners

Support for the principles of the Yarn Spinners' scheme of minimum profit-margins was expressed by Mr. Charles Schofield, General Secretary of the Operative Spinners' Amalgamation, one of the three largest cotton unions. "Whatever the outcome of the inquiry, it must be made abundantly clear that a return to the conditions which will allow the re-institution of bad spinning on anything approaching the scale of the 1920's and 30's will be contested with the utmost vigour," said Mr. Schofield in a report to members.

The scheme fixes a margin of profit on spun yarn below which spinners must not charge. It arose, said Mr. Schofield, from the experiences of the late 1920's and early 30's when vast sums of money were virtually given away in the scramble to secure the limited amount of business available. Selling of yarns below cost was rampant, mills continued to cut each others prices until closure faced the owners, mills became scrap and—the most tragic part of the sorry business—large numbers of workers were consigned to the unemployment lists. Mr. Schofield said later: "We should be very concerned if the Court ruled that the scheme must go. It prevents cut-throat competition and people are entitled to a fair return for their efforts."—*All Rights Reserved.*

TEXTILES

(*Concluded from previous page*)

tion, additional plants should be set up and the existing ones expanded. He disclosed that the licences issued to the industry were for 68 million lbs. and hoped that, in the next two or three years, the country would be able to produce about 10 million lbs. more yarn, including certain fine denier counts.

CONFIDENCE IN WOOL

Growing world consumption of textile products should be strong enough to maintain the demand for wool. This is the opinion expressed by Mr. W. L. Heywood, Secretary of the National Association of Unions in the Textile Trade, in the annual report presented at the Association's meeting held at Bradford on the 1st inst. According to Mr. Heywood, while there is some concern about the rising production of artificial fibres, some of the pronouncements appear to spring more from instinctive apprehension than from a reasonable assessment of the possibilities. Consumption of apparel fibres is increasing faster than world population. The percentage consumption of man-made fibres per person has risen, but the actual consumption of natural fibres has not decreased in the same period. Eight per cent. of the raw material used by the wool textile industry at present is man-made fibre. It seems reasonable to expect that the growing world consumption of textile products would be strong enough to maintain the demand for wool. Nobody supposes that we shall witness a revolution in wool textiles akin to what has twice happened in women's hosiery. Women abandoned wool stockings for stockings made of rayon, and from rayon they went to nylon. Happily, the wool textile industry does not face a prospect of that kind.

NYLON NETS FOR FISHING

The excellent catches made by Indian fishermen using a mechanised boat and nylon nets, demonstrated to them by the experts of the Food and Agriculture Organisation, it is claimed, is creating a strong demand for modern fishing boats and gear. According to Mr. G. S. Illugason, an Icelandic master fisherman who is on an assignment for F.A.O. in Madras State, the Fisheries Department of the Madras Government hired out last month the F.A.O. 22-ft. Danish motor boat and 14 nylon gillnets to some fishermen in Kilakarai. They landed 7,628 lbs. of fish, valued at Rs. 1,089-15-3, in 12 days' fishing. They have been so impressed by the results obtained that they have written a letter to the Fisheries Department of the Madras Government urging it immediately to make available such boats and nets. The second F.A.O. Danish boat in India with 14 nylon nets was similarly hired out to fishermen at Pamban. They landed 8,067 lbs. of fish after 18 days of fishing. Their catch fetched Rs. 1,209-0-6.

Nylon gillnets, we are told, can also be used in fishing from local log-rafts and small sail or rowing boats. There are thousands of such craft in India, which offers a very good chance of quickly increasing the Indian fish catch, if nylon nets can be widely introduced.

OUTLOOK FOR WORLD COTTON

CONTINUED PRESSURE ON PRICES LIKELY

THE sixteenth plenary meeting of the International Cotton Advisory Committee (I.C.A.C.), Washington, held at Istanbul recently and briefly referred to in our last issue, has provided a welcome opportunity for cotton experts the world over to review the global situation of the fibre and to discuss some of the problems facing it. To coincide with this meeting, the I.C.A.C. published an Annual Survey of the world cotton situation in its latest monthly review. The Survey provides an analysis of the supply and distribution position of cotton in the current season (1956-57) which is about to come to a close. Although it is too early to make any assessment of the prospects for the next season beginning on 1st August, an attempt is also made to piece together whatever information is available at present as a guide to what the situation is likely to be in the various segments of the cotton economy in that season.

Total free world production of cotton in the current season is expected to aggregate 28.8 million bales (of 478 lbs. each), representing a decline of 2 million bales over the last season's figure. According to the Survey, a major significance must be attached to the marked reduction in cotton production during the current season, because it has long been recognised that one of the prerequisites for resolving the world cotton surplus problem is to restrict production. Holding virtually the entire surplus and responsible for nearly half the total free world production, the U.S. was expected to show the major adjustment in production. This expectation would appear to have materialised. With the smallest acreage planted to cotton since as far back as 1882 and despite the maintenance of near record yields, production in the U.S. declined by 1.6 million bales to 13.1 million bales this season. Control of acreage in that country has been and will continue to be fundamental to the eventual restoration of equilibrium between cotton supply and demand. Of equal significance has been the decline in aggregate acreage and production in other countries also. After a period of continuous expansion, which previously had offset, to some extent, acreage controls in the U.S., cotton acreage in the free world outside the U.S. has declined by roughly one million acres to 46.3 million acres and production by 500,000 bales to 15.7 million bales in 1956-57, as compared with the previous season. The factors responsible for this fall in production were: (1) conscious, direct Governmental action especially in Egypt and Mexico, (2) anticipation of a fall in price, and (3) fortuitous factors like weather. The effect on supply of the marked reduction in production was offset, to a large extent, by the increase of almost 1.5 million bales in the opening carry-over, so that the supply during the season was lower by only some 600,000 bales. The carry-over stock at the beginning of the season was 22.1 million bales which, together with production estimated at 28.8 million bales, made a total visible supply of 50.9 million bales, as compared with 51.5 million bales in the previous season. The following table gives the free world supply and distribution position in the past three seasons:

Supply and Distribution

(In million bales)

	1954-55	1955-56	1956-57
Stocks (1st August)	19.1	20.7	22.1
Production	29.6	30.8	28.8
Total supply	48.7	51.5	50.9
Consumption	27.6	28.5	29.0
Net export to communist countries	0.2	0.7	0.6
Destroyed	0.2	0.2	0.2
Total disappearance	28.0	29.4	29.8
Stocks (31st July)	20.7	22.1	21.1

The pattern of distribution of stocks as on 1st August 1956 has been an important factor influencing the flow and direction of international trade in cotton. The existence of a carry-over of 14.5 million bales in the U.S. explains that country's efforts at recapturing a larger slice of the world market. Minimum stocks elsewhere has been one factor in the marked increase in imports in net importing countries, as well as the main reason, along with lower production, for the much smaller exports from outside the U.S. this season.

Consumption

Of even greater significance is the continued increase in consumption. Although consumption in the U.S. has declined by about 500,000 bales to 8.7 million bales, aggregate free world consumption is expected to exceed the 1955-56 figure by about 500,000 bales and set a record of about 29 million bales. Cotton consumption in Western Europe is expected to touch a new high. This is attributed to stable cotton prices at lower levels and the impetus to textile production following the Suez crisis. Japan, India and other Far East cotton consuming countries all registered sizable increases in consumption.

Rising consumption in Western Europe and the Far East, coupled with stock replacement, has resulted in a marked expansion in the volume of international trade this season. Total free world exports may well amount to 14 million bales, as compared with 11.6 million bales in 1955-56. This, according to the Survey, is tangible proof of the importance of price stability in achieving a high level of world trade and consumption. The mandate under the special export programme to make U.S. cotton competitive, the continued financial assistance accorded by the U.S. Government and the decline in export availabilities in other cotton exporting countries have all contributed to the huge increase in exports from the U.S. this season which is expected to be of the order of 7.5 million bales, as compared with a mere 2.2 million bales during the previous season. Assuming total free world exports of around 14 million bales, exports from countries other than the U.S. would aggregate about 6.5 million bales or at least 3 million bales less than in 1955-56. A marked decline in exports in these countries was inevitable because of reduced export availabilities. For instance, lower production, reduced carry-over and rising consumption in nearly all countries reduced the export availability to under 7.5 million bales, as compared with 9.5 million last season. These considerations, according to the Survey, appear to warrant the conclusion that the volume of trade has not been seriously affecetd by heavy exports from the U.S., though the reduction in prices has cut deeply into cotton earnings.

Prospects for Next Season

As disappearance is likely to exceed production, the end-season stocks, after several years of heavy accumulation, will decline, may be, by as much as one million bales to 21.1 million bales, as against 22.1 million bales at the beginning of the current season. This is, indeed, encouraging, for in it lies the hope that production adjustments and rising consumption can eventually eliminate the present surplus problem. As regards production prospects in the coming season, the Survey points out that, in the U.S., the acreage allotment for 1957-58 has been increased slightly to 17.6 million acres; but, out of this, about 3 million acres would be temporarily taken out of production under the Soil Bank Programme. Therefore, unless there is a substantial improvement in average yield, there would be a further significant fall in production. Rain has improved the outlook for cotton production in Mexico. Preliminary reports point to a slight increase in overall acreage and a possible increase in production. Egypt will apparently continue to restrict cotton acreage next season.

In the free world outside the U.S., there are many factors which would seem to indicate the maintenance of a high level of production in most countries and there appears, according to the Survey, to be little or no grounds in most countries for supposing that there will be any significant reduction in cotton acreage next season. But, on the other hand, uncertainties as to future trade and prices may temper any expansionary tendencies. Lower free world stocks and a smaller crop in the United States should result in a further reduction in total free world supply next season.

As regards consumption, observers in the United States hope for some improvement in the textile outlook which may be reflected in higher offtake of cotton. In Western Europe, as the Suez crisis was one of the factors sustaining a higher level of textile production this season, there might be some readjustment of production schedules in the coming season. Also, rayon and the synthetics continue to forge ahead. Lower cotton prices and increased promotion and research, however, are expected to enhance cotton's competitive position in the future. After a period of dynamic growth, policy in Japan is geared more to stability of cotton textile production while putting greater emphasis on rayon and synthetic fibres. Although cotton consumption, therefore, may not yet have reached the optimum, it seems that any future increase would be more limited. In India, plans under the second Five-year Plan, as is well known, are for a continued expansion of cotton textile production, but whether this will result in increased cotton consumption in 1957-58 remains to be seen. Outside these main areas, consumption in the aggregate is still expanding but at a slower rate than previously.

Trade

International trade is very largely a function of consumption and stock policy in net importing countries and, on both these scores, prospects at the moment, says the Survey, seem to be for some reduction in cotton exports next season. It is unlikely that total free world exports will reach such record levels as in 1956-57 and, if purchases were to be only for current consumption, there would be a significant decline. In these circumstances, continued heavy exports from the United States might be more prejudicial to other countries' interests, particularly if there is any increase in export availabilities. One thing, asserts the Survey, is certain. As long as present surpluses persist, cotton trade will continue to be highly competitive.

The price policy adopted by the United States will, once again, exert a major influence on the world price structure. The two-price system in the U.S. will persist. Sales under the new export programme for delivery after 15th August are being made at approximately the same price as under the old but at over a cent per pound higher than at the beginning of the present season. No commitment, however, has been made as to future policy. In the face of heavy export sales in the United States, other exporting countries will be compelled to remain competitive, and the short-term outlook, according to the survey, is for continued pressure on cotton prices. But, at the time of writing, the new crop positions in the New York cotton market are ruling quite firm, due to reports that the crop in the 1957-58 season would be much lower than earlier expectations on account of adverse weather conditions, especially in Texas.

SUGAR OUTPUT THIS SEASON PUT AT 2.02 MILLION TONS

DROP IN SUGAR RECOVERY FROM CANE

REVIEWING the recent trends in the white sugar sector in these columns two weeks ago —*vide* page 1138—we observed that the production estimate of two million tons for the current season (1956-57) was quite justified. This statement is more than amply borne out by the final official estimate of sugar output directly from cane in vacuum pan factories for the season. A little over 2.02 million tons of sugar are expected to come off the crushing plants of mills, as against 1.86 million tons actually produced during 1955-56, representing an increase of 159,000 tons or 8.5 per cent. This is an all-time record in the history of the Indian sugar industry. The number of factories reported to be working in the season was 149, as against 143 in 1955-56. Except two factories—one in Bombay and the other in Rajasthan—all other factories which were in operation during 1955-56 were also working in the current season. In addition to these, eight new units—five in Bombay and three in the Punjab—came into production.

The marked improvement in output must be attributed to the availability of plentiful supplies of sugarcane to the factories, thanks partly to improvement in cane output and partly to diversion of cane supplies to mills, owing to the relatively low price of *gur*. The total quantity of cane crushed in mills is estimated at about 26.7 million tons, which compares very favourably with 18.9 million tons. The rise in sugar production would have been higher still but for the setback, albeit slight, in the recovery of sugar in cane which for 1956-57 is put at 9.76 per cent., as against 9.83 per cent. for 1955-56.

Sugar Production in States

The salient features of the trends in sugar industry during the last two seasons are given in the statement at the foot of the page. It will be seen from the table that the rise in production during 1956-57 has been shared by all the States with the exception of Mysore, Bihar, Andhra and West Bengal. The rise is particularly substantial in the States of Uttar Pradesh and Bombay, the actual increase being of the order of 77,900 tons and 50,600 tons, respectively. Sugar production is estimated higher by 33,400 tons in the Punjab and by 10,600 tons in Madhya Pradesh. The anticipated rise in sugar output in the aforesaid four States is put at 12,000 tons, 11,000 tons. 1,100 tons and 1,000 tons, respectively. The U.P. accounts for more than 52.8 per cent. of the country's total output, followed by Bihar and Bombay; the percentage of the former is 15.2 and of the latter 12.1.

Following larger supplies of cane, the duration of the crushing season was quite long, the average number of working days being 143, as against 144; this figure is much higher than that for 1954-55, namely, 129 days. A State-wise analysis shows that the actual duration of the season in the U.P. was higher by six days at 153 days. In Bombay and Andhra, on the other hand, the actual duration was shorter by 16 days, being 126 and 149, respectively. It was also lower at 130 in Bihar, as against 134.

The frequency distribution of factories according to the number of days of actual crushing shows that, in 1956-57, the duration of the season ranged from 150 to 220 days and over in the case of 71 factories, as against 63 factories in 1955-56. Again, the number of factories which worked for less than 100 days was only 11 in 1956-57, as against 26 in the previous season. The duration of the season ranged from 100-149 days in respect of 67 units, the figure for 1955-56 being 58.

The crushing season started on 5th October 1956, although two units had commenced working earlier, and continued till the end of June; some mills in West U.P. were reported to be working even in the beginning of this month.

The percentage of recovery of sugar from cane during 1956-57, as already stated, suffered a setback; the all-India average amounted to 9.76, as against 9.83 in 1955-56. The recovery of sugar fell in all the States barring Madras, the Punjab and Madhya Pradesh which reported some improvement. The decline was very steep in West Bengal and Orissa—from 10.46 and 9.05 to 9.00 and 8.00, respectively. Bombay accounted for the highest percentage recovery, the average being 11.41, followed by Mysore with 9.99, Uttar Pradesh with 9.67, Bihar with 9.58 and Madhya Pradesh with 9.57.

SALES TAX ON SUGAR IN MADRAS

A disquieting trend in the sugar trade in Madras State is the unsocial practice of a section of traders to import sugar from outside the State in fictitious names and then to sell the bulk of it without bills, thereby avoiding payment of sales tax. This practice, it is said, has not only resulted in the loss of revenue to the Government—the loss is estimated at not less than Rs. 27 lakhs per annum—but also proved detrimental to the interests of genuine merchants. Attention to this tendency has been drawn in the course of a joint memorandum submitted to the Finance Minister of Madras by the South Indian Sugar Mills Association, the Tamilnad Foodgrains Merchants Association, Madurai, and important sugar dealers in the city. The memorandum says:

"As it is, only sugar factories in this State collect on every bag sold the single-point and first stage multi-point tax and remit it to Government. These factories find it most difficult to compete and oust these tax evaders, because the difference is about Rs. 6 per bag which the factories can hardly afford to lose. For instance, sugar is today sold in Madras City without bills at Rs. 102 per bag. For a factory to sell at the same price, it should quote Rs. 96.42 plus sales tax which comes to Rs. 5.58 per bag. The tendency, in these conditions, is for sugar manufactured in Madras State to be exported to places outside the State to avoid the incidence of the heavy rate of sales tax here. The sugar imported from outside rarely pays any sales tax. Thus, Government lose revenue both on local and outside sugar. In this manner, the initiative in the sugar trade has passed into unscrupulous hands."

The memorandum has urged the Madras Finance Minister to curb such a tendency. It commends the adoption of the sales tax system followed by the Government of West Bengal. The salient features of the system are as follows:

Every sugar dealer must get himself registered with the sales tax authority. When a dealer receives a rail receipt or a bill of lading either through a bank or direct from the mills, a form has to be filled in triplicate mentioning the sales tax registration number and submitted to the Sales Tax Officer concerned for issue of a permit for the release of the goods from the railway station or from the harbour. A specimen of the form is attached. The Sales Tax Officer who maintains records of all sugar transactions of the registered dealers retains one copy of Form IV in his office and returns the other two copies to the dealer endorsing them by his office stamp and signature and mentioning the permit number. The dealer then surrenders a copy of the permit to the sales tax authority posted at the delivery point before taking delivery of the consignment from the railway station or the port. The third copy of the permit is kept by the dealer for his record. On the basis of the transactions recorded during the month, sales tax due to the Government is deposited with the Reserve Bank of India and the receipted challan submitted by the party to the Sales Tax Officer along with the monthly return.

States	Number of factories working		Average number of working days		Sugarcane crushed (1,000 tons)		Sugar produced (1,000 tons)		Recovery per cent.	
	1955-56	1956-57	1955-56	1956-57	1955-56	1956-57	1955-56	1956-57	1955-56	1956-57

COAL IN THE U.K.

OUTPUT AND OFFTAKE MOVE UP

COAL miners in Britain are working more efficiently now than ever before, thanks to better conditions and higher pay for workers, according to the latest Annual Report of the National Coal Board which covers 1956. The aggregate output of coal during the past calendar year amounted to 222.1 million tons, which represents a rise of half a million tons over the previous year. As compared with 1947, the first year of nationalisation, the production in 1956 was higher by 26.3 million tons, or an increase of nearly 13 per cent.

The improvement in coal output is attributed to mechanisation and adoption of new techniques. Mechanisation at the coal-face, it is claimed, has increased the total tonnage of power-loaded coal from about 4 million tons in 1946 to more than 36 million tons in 1956. By the end of last year, 400 miles of tunnels were in existence and plans were under way for 3,000 miles of tunnelling in the next 15 years. New and safer mining techniques introduced included blasting of coal under water pressure, and experiments on breaking coal by high-pressure blasting were in progress. A new central engineering establishment was virtually completed in 1956. Many new techniques were being introduced in the management side, too.

Thanks to mechanisation and new techniques, the *per capita* man-shift output of a coal-face worker has gone up, the figure for 1956 being 3.3 tons, as against 2.8 tons 10 years before. The industry's tonnage per man-year is also higher at 298, as against 262. The average weekly earnings of all adult males in the coal industry has doubled in the past 10 years, from £8 16s. to over £16. As a result of mechanisation of coal-mining, manpower has decreased slightly, although it tended to rise again and stood at 703,000 at the end of 1956. Indeed, recruitment to the mines during 1956 was the highest since 1952 and, with fewer men leaving the industry, there was a net rise of 3,500 in manpower, in contrast with a fall of 5,200 in 1955. Nevertheless, at the end of 1956, the coal industry still had immediate vacancies for 9,000 men, mainly in South Yorkshire, the Midlands and South Wales.

Working Conditions

Incidentally, the coal industry has endeavoured to improve working conditions through provision of better welfare facilities, much greater safety and more medical attention. During 1956, for instance, £16 million had been spent on new pithead bath facilities, making them available to 90 per cent. of the miners, while the older bath installations were being modernised. The yearly total of men killed and injured in accidents had been reduced.

Coal output in the U.K., as already stated, went up in 1956 to 222½ million tons, half a million tons more than in 1955. Higher opencast production accounted for the increase; deep-mined output fell slightly, there being on the average rather fewer men at the pits during 1956, with output per man-year remaining virtually unchanged. Losses caused by disputes—1.8 million tons—although the second highest since the war, were 900,000 tons lower than a year ago, but this is more than accounted for by the fact that there was a strike in Yorkshire in May 1955 which cost nearly one million tons. Gains in comparison with 1955 from lower losses by disputes and from greater output per man-shift were counterbalanced by lower Saturday output and higher absenteeism.

The expansion in coal production noted last year was accompanied by a similar rise in domestic consumption which aggregated 218.2 million tons, as against 215.0 million tons. Despite the check caused by the crisis in West Asia, there was, however, the continued shift from coal to oil. There was also a continuation of the trend from primary fuels to coke, gas and electricity. To be more precise, inland coal consumption rose by 3 million tons in 1956. Power stations and coke ovens together used 5 million tons more coal than in 1955, while industry and the collieries used nearly 2 million tons less. There was little other change in consumption in spite of the colder weather. Exports of coke were higher than in 1955. Deducting coke exported and put to stock, inland consumption of coal was only one million tons higher in 1956. Stocks were maintained at a high level. Imports were reduced by over 6 million tons and exports (including ships bunkers) by 4 million tons.

THE
CHARTERED BANK
(Incorporated in England by Royal Charter, 1853)
(Liability of Stockholders Limited)
Capital (Paid-up) - £3,500,000
Reserve Fund - - £5,000,000
Branches throughout India, Pakistan and the East
AFFILIATED BANK IN INDIA
THE ALLAHABAD BANK LTD., with over 70 offices in India
The Bank offers a complete Overseas Banking Service and provides exceptional facilities for financing every description of trade with the East.
Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application.
The Bank's London Office undertakes Trusteeships and Executorships.

NO IMPROVEMENT IN JUTE INDUSTRY

PRODUCTION HIGHER—STOCKS MOUNT UP

IF there is any industry in India which is in a state of depression, it is the jute industry. Despite all the economic expansion that has taken place in India and elsewhere, this industry has been unable to regain its vitality. And there are no signs of it doing so in the near future. So depressed is this industry now that even a slight increase in its output and/or stocks causes concern among those engaged in it. Indeed, as things are today, this industry can hardly make any significant addition to the national income of the country. What is more depressing is that a feeling of defeatism seems to have set in even among the Ministers, at any rate of the Central Government. Not long ago, Mr. T. T. Krishnamachari, for instance, declared that, in future, he cannot count upon the jute industry for providing any sizable addition to India's foreign exchange earnings. Yet the Government has been largely responsible, through its fiscal and labour policy, for the present sad plight of this industry. By keeping up the export duties on jute goods at fantastically high levels in the past, the Government of India enabled Pakistan, Japan and several other countries in the West and the East to establish jute mills successfully. When it realised its mistake, it was too late to undo the harm it had inflicted on the domestic industry.

It may be argued that all this is old history. But it is necessary to recall this development in order to remind the authorities that they continue to make similar mistakes in other fields of economic activity also. At the last meeting of the Export Advisory Council, Mr. Morarji Desai, Minister for Commerce and Industry, however, stated that the Government had made up its mind not to repeat the aforesaid mistake again. While this remark is reassuring, it is not borne out by facts. The Government's labour policy as applied to the jute industry, to give an instance, is still the same and it is greatly impeding the progress of modernisation schemes. This policy is also standing in the way of eliminating the uneconomic units in the industry. The Industrial Disputes (Amendment) Ordinance, recently promulgated by the Central Government, has actually made the position worse. And yet there is no doubt that, unless the industry is rid of the old and uneconomic units and is reinforced by improving and modernising the well-managed economic units, its future will continue to be bleak. It should not be forgotten, in this connection, that the cost of production does not depend on the price of raw material alone but also on the efficiency of men and machines alike. The jute millowners, who never tire of pleading for bringing about a reduction in the price of raw jute, do not seem to realise that this is more easily said than done. Their arguments are doubtless sound, but, if they are realists, they will quickly see that this solution will take a long, long time to yield satisfactory results and that they should, therefore, think of other ways in which the costs could be brought down within a reasonably short period.

Rationalisation of production and modernisation of jute mills require not only a readjustment of labour policy but also investment of large capital. Unfortunately, the tax policy of the Government is a stumbling block in this direction. Its policy of heavy taxation has led to a flight of considerable foreign capital from the jute industry and a changeover in the ownership of mills to hands not all of which are efficient and/or capable of attracting fresh capital from investors. The depressed trading conditions in jute goods constitute yet another factor that discourages the flow of fresh capital into this industry. The National Industries Development Corporation, which was asked to render financial assistance to the industry, has so far lent only Rs. 55 lakhs, the number of mills which have received this amount being just two. The fault for this slow progress may not be entirely that of the Corporation and may be due to the reluctance of the mills themselves to avail of the facility. If that be the case, the mills cannot be blamed for it, because their reluctance to get into debt when the future for the industry is uncertain is quite understandable.

The jute industry is thus caught in a vicious circle from which it cannot be rescued without the active help of the Government. In view of the fact that the Government is largely responsible for the present hardship of the industry, it has a moral obligation to this industry. Further, the economic health of the overpopulated and the refugee-plagued West Bengal will deteriorate further, if the jute industry is not rescued and strengthened. Certain bold measures such as provision of liberal credit facilities and special tax concessions are, therefore, called for. But we realise that, to ask for these from a socialist Government with a pronounced bias against capital, is like crying for the moon. Accordingly, the jute industry seems to be destined to suffer a slow and painful shrinkage. It is true that domestic market for jute goods is gradually expanding. But it could grow faster and better if only the industry is enabled to reduce its cost of production.

The production of jute goods which had gone up from 84,700 tons in March 1957 to 86,800 tons in April, was higher again at 87,300 tons in May 1957. It is, of course, much less than the 101,700 tons produced in May 1956, but this is due to the restoration of the cut in September 1956, in the number of looms in work which had been taken off in two stages early last year in expectation of Russia placing large orders for Indian jute goods. This expectation did not fully materialise. The following table shows the trend of production under the principal varieties:

(In tons)

	May, 1957	April, 1957	March, 1957	May, 1956
Hessian	35,600	36,200	36,000	35,800
Sacking	45,000	44,800	43,100	59,600
Others ..	6,700	5,800	5,600	6,300
Total ..	87,300	86,800	84,700	101,700

It will be seen from the table above that there has been a fall in hessian output, that the rise in sackings is small and that it is only in 'others' there has been an increase of 900 tons. At 6,700 tons, production of 'other' jute goods is higher than that even in May 1956 when production of all jute goods was better by 14,400 tons. This reflects a gradual shift in the type of jute

DEVELOPING INLAND WATERWAYS

ESTIMATES COMMITTEE'S SUGGESTIONS REVIEWED

ALTHOUGH India possesses large inland waterways, it is somewhat deplorable that no systematic attempt should have been made to develop them for purposes of transport. This is in strange contrast with the position in the West, particularly in Europe, where the rivers Rhine, Seine, Volga, Danube and Don are extensively used for navigation. Normally, one would expect India to be keen on developing the navigational uses of its rivers. For one thing, its road and rail transport are inadequate so that rivers could be a useful adjunct to its means of transport. Secondly, river transport is less costly than road or rail transport in that the water transport vehicle costs less than road transport vehicle or railway transport and the cost involved in the maintenance of riverways is not as heavy as the upkeep of roads and rail track. Thirdly, India is more fortunate than Europe in being blessed by a river system that does not freeze in winter. These considerations would lead one to expect a more systematic exploitation of India's rivers for navigational purposes. And yet so little has been done in this sphere. Appropriately enough, the Estimates Committee, in its report entitled "Inland Water Report," has spotlighted the importance of inland waterways to national economy and has made a number of useful suggestions which deserve early implementation.

The following table gives the extent of the use of rail, road and waterways in India and some overseas countries:

Forms of Transport

(In miles)

	Rail	Road	Waterways
Austria	3,753	19,068	230
Belgium	3,108	57,500	970
France	25,888	450,000	8,268
W. Germany	19,091	155,000	2,662
India	34,705	239,801	5,500
Ireland	2,566	50,399	456
Italy	10,298	122,188	1,498
Netherlands	1,991	8,622	4,324
Sweden	9,431	85,355	758
Switzerland	1,978	28,976	13
U.K.	19,334	187,348	2,396
Yugoslavia	7,288	57,788	1,271

The history of the Government's interest in waterways dates back to 1828 when one H. T. Prinsep, the then Secretary of the East India Company, submitted a note on the introduction of steam navigation in India's rivers. In 1872, Sir Arthur Cotton, the great architect of the Cauveri and the Godavari canal works, in his evidence before a Parliamentary Committee, emphasised the need for canals for irrigation and navigation. The Indian Industrial Commission, in its report submitted in 1916, laid emphasis on the desirability of the improvement of the then existing waterways. The Commission said that it could not help thinking that, in the absence of a representative specially charged with the interests of the waterways, "the vested interests of railways have prevented waterways in India from receiving the attention that has been given to them in other large countries with such satisfactory results."

As regards the existing position of inland water transport, it is mainly confined to Assam, W. Bengal, Bihar, Uttar Pradesh, Orissa, Andhra, Madras and Kerala. The estimates of the length of navigable rivers in India vary. But all estimates show that the length is not inconsiderable. Mr. J. J. Surie, the U.N. inland water expert, who visited India in 1952, estimates the length of navigable waters in India at 5,144 miles. The Ministry of Transport has estimated the length at 5,500 miles. The Central Water and Power Commission places the length at 5,760 miles, consisting of (1) rivers navigable by steamers, 1,537 miles; (2) rivers navigable by large country boats, 1,475 miles and (3) canals and backwater navigable by country boats 2,748 miles. Summing up the position, the Estimates Committee remarks that India's waterways have "deteriorated much owing to the neglect of water transport since the introduction of railways and need considerable improvement as well as extension."

Conference in Delhi

The Government has not altogether been oblivious of the need for improving water transport. In August 1949 the Ministry of Transport convened a conference in Delhi attended by the representatives of U.P., Bihar, W. Bengal and other concerned Ministries of the Government of India. Different matters relating to use of waters in rivers for navigational purposes were discussed. Another inland water transport conference was held in 1951 with Mr. K. Santhanam, Minister of State for Transport and Railways, in the chair. The Chairman remarked that, in the past three years, members of Parliament had expressed dissatisfaction with the slow development of water transport. He said he himself thought that these criticisms were not without basis. An outcome of the conference was that the Government decided to constitute a Ganga-Brahmaputra Board.

During the period of the first Plan, an important programme which was taken up for implementation was the Ganga-Brahmaputra Water Transport Board which was set up in 1952. It was agreed that the Central Government and the State Governments concerned, namely, those of U.P., Bihar, W. Bengal and Assam should finance the scheme which was mainly designed to tackle problems relating to navigation on the Ganga, the Brahmaputra and their tributaries. A provision for payment of Rs. 10 lakhs was, therefore, made in the first Plan for payment of contribution to the Board. In the second Plan, a provision for Rs. 3.4 crores has been made for the development of inland water transport. The contemplated programmes include: equipment required for Assam ferry and river projects Rs. 12 lakhs; contribution to the Ganga-Brahmaputra Water Transport Board Rs. 20 lakhs, capital expenditure on the development of works on the Ganga-Brahmaputra region Rs. 90 lakhs, development of inland port facilities Rs. 49.5 lakhs, development of Buckingham Canal Rs. 115 lakhs and development of West Coast canals Rs. 43 lakhs. The Committee has remarked that the provision of only Rs. 43 lakhs for the development of West Coast canals "appears to be inadequate" and that the "feasibility of increasing this provision may be examined."

Specific Suggestions

The Committee has made certain specific suggestions for the improvement of inland water transport. Thus, it has called attention to the importance of improving the Buckingham Canal within the period of the second Plan and of linking it with the harbour. In 1938-39, the canal carried Rs. 134 lakhs worth of goods, mostly foodgrains, fish, salt, firewood and building materials; in 1951-52, the value had increased to Rs. 20.73 crores. Again, the Committee has suggested that the scheme of navigation on the Mahanadi should be pursued. It would appear that this subject was studied by a French mission which submitted a valuable report. At the instance of this mission, investigations were taken in hand. But later, they were discontinued under instructions of the Central Board of the Hirakud Project. The Committee has recommended that these investigations should be pursued as originally contemplated as early as possible. Two other suggestions made by the Committee are: (1) The feasibility of connecting the Kurnool-Cuddapah canal of the Tungabhadra project with some commercial and industrial centres should be examined; (2) The possibility of navigation on the canal constructed by the Damodar Valley Corporation should be examined. Among other specific suggestions made by the Committee are:

(i) Schemes should be drawn up with a view to studying the navigation potentialities of the various rivers and canals throughout India; the carrying out of improvements and extensions thereto should be taken in hand without further delay and the work completed within a period of, say, two/three years. (ii) Special efforts should be made to obtain expeditiously the craft and other equipment required for the Upper Ganga pilot project, and the project put into operation as early as possible in order that the results of its working may be available for guidance in other places. (iii) The problem of channel conservancy measures required at various places should be carefully examined and provision of funds obtained for non-recurring and recurring expenditure on this account. (iv) The requirements of dredgers and other machinery required for deepening the canals and rivers which have silted up through neglect during the last many years and of suitable craft and equipment required for service thereon should be estimated sufficiently in advance to enable adequate funds being obtained during the third Five-year Plan period. (v) The requirements of various facilities such as beacons, radio-telephone communications, jetties, equipment for the berthing of vessels and mechanical handling of cargo floating or shore outposts with residential and office accommodation, etc., should similarly be estimated well in advance so as to be included in the third Five-year Plan. (vi) Arrangements should be taken in hand for the training of crew and other personnel required for inland water transport. (vii) Future construction of canals in the country should be designed with due regard to the provision of navigational facilities side by side, wherever the same are feasible and required in the wider interest of the country. (viii) The West Coast should be explored early for providing river navigation facilities as in the case of north-east, east and soth.

Master Plan

The Committee has expressed the hope that detailed investigations on the Master Plan for navigation schemes, drawn up by the Ministry of Irrigation and Power, will be "pursued with vigour." The Plan, it may be noted here, envisages five schemes:

Scheme I: Linking the Ganga river system with the west flowing rivers to provide a continuous waterway from West Coast (Arabian Sea) to East Coast (Bay of Bengal). The scheme would provide a continuous waterway from Western India to Northern and North-east India via Central India. The C.W. & P.C. has already studied this scheme from the topo-sheets and from the information received from States, and has prepared four proposals for preliminary investigation. These proposals are: (a) Connecting the Narbada with Sone (a tributary of the Ganga) via the Johilla (a tributary of the Sone). (b) Connecting the Narbada with the Sone (a tributary of the Ganga) via the Hiran and the Katni Nai (tributaries of the Narbada and the Sone respectively). (c) Connecting the Narbada with the Chambal (a tributary of the Yamuna) via the Karam (tributary of the Narbada). (d) Connecting the Narbada with the Yamuna via the Bearma and the Ken (tributaries of the Ken and the Yamuna).

Scheme II: Connecting the Narbada with the Godavari river system.

This would provide a continuous waterway from the West Coast to the East Coast through the hinterlands of Bombay, Madhya Pradesh and Andhra. The C.W. & P.C. has already studied this scheme from the topo-sheets and proposed for the preliminary investigations of the same.

Scheme III: Linking the Tapti with the Godavari system via the Wardha, a tributary of the Godavari. This will provide an alternative waterway connecting the West Coast with the East Coast.

Scheme IV: Linking the Ganga river with the Mahanadi via the Sone and the Rihand (tributaries of the Ganga and the Sone respectively) and the Hasdo (the tributary of the Mahanadi). This will provide a continuous waterway between Northern and North-East India, and Orissa via Raipur district of Madhya Pradesh.

Scheme V: Inland coastal waterway connecting Calcutta with Madras via Cuttack along the East Coast connecting up to the existing canals and backwaters of Travancore-Cochin (Kerala) and to Mangalore via backwaters and new canals.

If a line of water communication, as mentioned above, could be achieved it will provide a chain of waterways along the whole length of the East Coast of India and for about 435 miles of the West Coast and this will connect all the rivers of Orissa, Andhra and Madras flowing into the Bay of Bengal. This will link all the waterways proposed to be developed in Schemes I-IV and will afford a continuous waterway grid passing through all the important regions of the country.

Among the investigations undertaken in recent years into the problem of inland water navigation, mention must be made of the study of the problem by Mr. J. J. Surie of Holland whose services were made available to India by the U.N. Technical Assistance Administration. Mr. Surie recommended two projects, namely, a project for the development of shallow draught navigation with smaller craft on the feeder rivers of the Brahmaputra and of a diesel-operated ferry vessel on the Brahmaputra. These are estimated to cost Rs. 8 lakhs and Rs. 4 lakhs respectively and have been included in the scheme of financial assistance agreed to by the Planning Commission during the second Five-year Plan period. Surveys are now in progress for drawing up specifications of the craft required for the Assam feeder river project and the specifications for the diesel ferry vessel across the Brahmaputra are being finalised. The Committee regretfully observes that although nearly four years have elapsed since Mr. Surie submitted his report, the crafts recommended by him for the Ganga, the Gogra and the Brahmaputra rivers have not yet been received and put into operation and that surveys are still in progress for drawing up specifications for the diesel ferry vessel across the Brahmaputra. The Committee feels that the need for operating modern craft on the shallow waterways of India is very urgent and that no time should be lost in carrying out necessary investigations and surveys, obtaining the craft and placing the same in service.

Gokhale Committee

Apparently, the whole subject of inland water transport continues to be the subject of study. The Ministry of Transport informed the Committee that, although it has convened regional conferences from time to time and initiated certain measures for the development of inland water transport, there has been no comprehensive enquiry so far, on the results of which a detailed Plan for the future can be

(*Continued on page 1267*)

NEW PRODUCTS AND PROCESSES

Mineral Wool

A PROCESS for the production of mineral wool has been developed at the Shri Ram Institute for Industrial Research, Delhi. The process is based particularly on press mud from carbonation sugar factories, a waste material, whose disposal entails considerable expense to sugar manufacturers. While press mud from sulphitation sugar factories is used as a fertiliser, mud obtained from carbonation factories does not find any use worth the name. A sugar factory crushing 1,000 tons of cane, discards 10 tons of press mud daily and accumulates 1,200 tons in a working season of 120 days; this accumulation can form the raw material for production of mineral wool. The process of manufacture of 'Mineral Wool' basically consists in mixing the press mud with river sand in requisite proportions together with a fluxing agent. The mixture is melted in specially designed high temperature furnace. The molten mass which comes out at about 1000°C. is atomised using high pressure steam or air into tiny globules which travel with high velocities and attenuate themselves into fine fibres. These fibres are collected in a chamber and taken out continuously over a belt conveyor. Mineral wool obtained by the above process consists of fine resilient mineral fibres which are fire proof, rot proof, and vermin proof. It is perfectly safe to handle and easy to install. One ton of wool can cover 25,000 sq. ft. surface one inch thick. Mineral wool is an excellent sound proofing material for exhaust silencers of engines, studios, cinemas and concert halls. It has sound absorption of 90 per cent. for frequency range of 250—8,000 cycles per second for 2" thick pad of mineral wool. Substantial quantities of mineral wool from press mud have been prepared at the pilot plant, and supplied to user industries. Know-how for the production of loose mineral wool on a large scale has been perfected. Such loose wool being flexible can be used as a filler between partition wall cavities, and can be given desired shape according to requirements. Mineral wool can also be bonded into boards, half-round pipe sections and other shapes using special synthetic resins and adhesives. Investigations are in hand to work out the know-how for the bonding of mineral wool to the required shapes. Parties desirous of undertaking the commercial development of the process are invited to correspond with The Secretary, National Research Development Corporation of India, Mandi House, Lytton Road, New Delhi.

New Photographic Machines

A firm at The Hague, the Netherlands, exporting photographic laboratory and dark-room appliances has put on the market a new rotary glazing and drying machine. These machines can be supplied in two models which mainly differ in the size of the glazing cylinder. The diameter of both models is 43 cm., the length of the cylinder is 34 cm. and 68 cm. respectively. The machines are suitable for both deep-gloss finishing and matt-finishing all sizes of prints. The seamless brass cylinder has a highly-polished chromium finish. The driving rollers and the rubber feed roll run on ball bearings. The machine is electrically driven and the glazing and drying cylinder is also electrically heated. The heating for the small type of cylinder has three positions: 500, 1,000 and 1,500 watts, that for the large type of cylinder has six positions: 500, 1,000, 1,250, 1,500, 1,750 and 2,000 watts. Pilot lamps indicate which combinations of elements are switched on. The small model can glaze and dry 900 and the large model 1,800 prints per hour of ordinary amateur photographs.

A New Type of Battery

A type of battery that can remain inert in storage for ten or more years and then be brought to full power within one-tenth of a second will soon go into production here and will be available for industrial trial early in 1958. The battery is activated by ammonia vapour shot in by a trigger-ing device under pressure. It is said to operate efficiently at temperatures ranging from zero to 165 degrees F. Meanwhile, an electronic device that checks conventional automotive storage batteries during assembly before any activating acid is added has been perfected. Previously, dry-charge batteries could not be readily tested until acid was added by the serviceman at the time of sale and there could be no assurance that such production errors as reversed cells, shorted plates and defective separators were entirely eliminated until a battery was installed. The new inspection device permits complete check of a dry-charged battery as it rolls off the assembly line without adding acid and is said to be equally reliable in checking batteries being assembled for shipment with the acid already added.

Fully-automatic Record Player

Philips N.V. of Holland has produced a new fully-automatic 45 r.p.m. record player. All one has to do is to slip the record into a slot. This pushes away a pin and the mechanism is started up: the motor starts and a centring pin rises and holds the record centrally. The pick-up element then drops so that the sapphire stylus enters the starting groove, the stylus pressure being governed by a spring. Music then begins to play without a single button having been touched. When the record is finished and the stylus has reached the last groove, the mechanism is reversed by means of a cam. The pick-up element is raised, the pick-up arm springs back to its original position, the centring pin falls and the record is pushed out just far enough to be removed with ease. The motor then stops and the record player is ready for the next record.

INCREASE IN PREMIUM INCOME OF UNION INSURANCE SOCIETY

THE HON. C. BLAKER'S STATEMENT

THE Annual General Meeting of the Union Insurance Society of Canton Ltd. was held in Hong Kong on 24th May 1957. In the course of his statement, accompanying the report and accounts of the Society, the Hon. C. Blaker, M.C., E.D., reviewed the progress of the Society in its various departments. He referred to the fact that there was a further satisfactory expansion in premium income. But the year under review, he said, was generally one of more than usual difficulty. The results reflected in the Society's revenue accounts, according to the Chairman, were less satisfactory than those they had become accustomed to expect.

The following is the full text of Mr. Blaker's statement together with the Directors' report:

"The year under review was generally one of more than usual difficulty. Although our overall premium shows a healthy increase which testifies to the keenness of those concerned throughout our organisation, the results reflected in our revenue accounts are less satisfactory than those we have become accustomed to expect.

"The sequestration of British insurance companies' properties by the Egyptian authorities had little effect on our business.

"In the marine department, premium written increased by £172,782 to £3,585,944, while claims paid during the year accounted for 77 per cent. of the premium, as against 68 per cent. during 1955.

"The year brought its quota of marine casualities notable amongst which was the loss of the s.s. *Andrea Doria* but the bulk of our increased claims payments was accounted for by the incidence of partial losses.

"In particular, claims for hull repairs, because of the increased cost of labour and materials, continue to rise and this is a feature inseparable from hull business in years when inflation is general. Following liquidation of certain oldstanding claim liabilities, the marine fund, at 156 per cent. of the year's premium, is considered adequate to meet all outstanding liabilities and £140,000 has been transferred to the profit and loss account.

"The fire department results, though profitable, have been adversely affected by those of Canada and the United States of America. Although there were no catastrophes in these countries of the proportions of the previous years, fire damage was higher; other contributory factors were increased acquisition costs and intensive competition.

"The premium income shows further satisfactory expansion.

"The income in the accident department at £4,548,214 is £953,095 higher than in 1955. One of the attendant problems of this large increase in premium income is the financing of the requisite higher reserve for the liability for unexpired risks. The sum involved in this respect is £383,580. Consequent upon this provision for unexpired risks and a higher claims ratio, the operations for the year resulted in a loss of £189,442.

"Attention has been drawn on many occasions in the past to the unprofitable results in the motor section of the accident account. In order to provide complete insurance service it is necessary to accept from our constituents all the business which they have to offer including motor car business and our endeavour must be to view accounts in the broader perspective of their value in relation to the whole field of underwriting in the various departments.

"Although our motor income in Canada showed little variation on that of the previous year, the claims experience has deteriorated. In 1957 we should see some amelioration of the position as higher premiums are now in force in Canada but whether the new rates will be sufficient to meet the present shortfall between profit and loss remains to be seen.

"Our income from Europe also produced an unprofitable balance but steps have been taken to remedy this.

"Last year, in my statement to the shareholders, I reported that despite the depreciation which had taken place in many stock exchange securities, there continued to be a substantial margin between the market values of our stock exchange investments and the values at which they stood in the balance-sheets.

"During the past year there has been a further depreciation in many securities of all classes and it is therefore very gratifying for me to be able to report that the valuation made at the end of the year showed that the market value of our assets was still well in excess of the figures at which they stand in the balance-sheets.

"Your Directors have decided to recommend that the existing capital structure of the Society should be altered from 200,000 shares of £10 each to 2,000,000 shares of £1 each and you will be asked to pass a resolution to this effect at the annual general meeting.

"At the present time, our shares are one of the most expensive Insurance shares in the world and it is felt that a split of each £10 share into ten £1 shares will enhance the popularity of the Society and widen its list of shareholders.

"Useful liaison has been maintained between head office and branches by visits by head office executives. In January of this year the General Manager Mr. L. B. Stone, conferred in Sydney, Melbourne and Auckland with our managers of the Australian and New Zealand branches, and with the General Manager for Australasia, Mr. C. R. Kingsland. Mr. Stone also visited our London branch during his home leave last year.

"I wish to acknowledge the loyal services of our staff and agents throughout the world and the valuable assistance afforded to us by our Advisory Councils and Committees and the Boards of Directors of our affiliated companies."

Directors' Report

The Directors submit to shareholders the report, accounts and balance-sheets of the Society for the year 1956, including therein the transactions of the subsidiary companies, the British Traders' Insurance Company, Ltd., the North Pacific Insurance Company, Ltd., the Beaver Insurance Company and the British Oak Insurance Company, Ltd.

The net premiums for the year amounted to £3,585,944. After releasing £140,000 to profit and loss account the marine fund stands at £5,628,849.

The net premiums for the year amounted to £3,955,085. £153,019 has been transferred to profit and loss account. The fire fund stands at £2,197,667.

The net premiums for the year amounted to £4,548,214. £189,442 has been transferred from profit and loss account. The accident and general fund stands at £2,072,872.

Dividends

An interim dividend of £1 per share was paid on 20th November 1956. The Directors now recommend the payment of a final dividend of £1-2-6 per share, payable on 24th May 1957.

Interest and dividends amounted to £548,431 and transfers from underwriting accounts to £293,019. After charging outgoings not brought into account elsewhere, transferring £189,442 to the accident and general account, making provision for taxation, and allowing for the minority interests of the outside shareholders of a subsidiary company, the profit for the year appertaining to the Society is £354,727. After deducting profit retained in subsidiary companies £11,757, there remains a distributable profit of £342,970. To this has been added the balance brought forward from the previous year of £363,164. After providing for the dividends and transferring £24,000 to exchange and investment fluctuation account, there remains a balance of £363,384 to be carried forward.

It is considered that outstanding taxation at 31st December 1956 is fully covered by the provision of £489,439 included in the consolidated balance-sheet under provisions for taxation and contingencies £608,664.

Messrs. Lowe, Bingham and Matthews, Chartered Accountants, and Messrs. Peat, Marwick, Mitchell & Co., Chartered Accountants, retire, but offer themselves for re-election.

Directors

Since the last annual general meeting, Mr. G. T. Tagg resigned from the Board in November 1956.

In accordance with the Articles of Association, Mr. G. M. Goldsack and Mr. H. Owen Hughes retire, but offer themselves for re-election.

LIFE INSURANCE BUSINESS IN 1955
NO PERCEPTIBLE EXPANSION ACHIEVED

THE report of the Controller of Insurance, Government of India, on insurance business written in 1955, contained in the *Indian Insurance Year Book*, 1956, is of more than usual interest because 1955 was the last complete year in which life business was carried on by private insurers. The following year saw a momentous development affecting Indian insurance, namely, nationalisation of life insurance business in India. From 1st September 1956 all Indian insurers and provident societies excepting two composite insurers under Administrators ceased to transact life business anywhere, while all foreign insurers ceased to carry on life insurance business in India. The volume of life insurance business which existed on that date—the entire business of Indian insurers and provident fund societies and Indian business of foreign insurers—was vested in the statutorily constituted Life Insurance Corporation of India which was entrusted with the exclusive right of carrying on life business in future.

An analysis of the figures presented in the *Year Book* reveals that, as compared with 1954, the volume of new business done during which year registered spectacular rise over the previous year, new business done in 1955 showed only a slight improvement. Total new business done by all insurers in 1955 aggregated Rs. 238.3 crores, as against Rs. 236.3 crores in 1954. In sharp contrast to the previous year, foreign insurers accounted almost wholly for the increase in life business in 1955. Thus, while new business of Indian insurers increased only fractionally from Rs. 220.1 crores to Rs. 220.9 crores, that of foreign insurers rose from Rs. 16.2 crores to Rs. 17.4 crores. The following table gives the trend of new life business for the decade ended 1955.

New Business

(In crores of rupees)

Year	Indian insurers	Non-Indian insurers	Total
1946	140.9	12.9	153.8
1947	126.5	13.1	139.6
1948	121.7	12.9	134.6
1949	130.0	12.2	142.2
1950	125.8	13.7	139.5
1951	131.4	16.5	147.9
1952	130.3	16.4	146.7
1953	138.2	17.0	155.2
1954	220.1	16.2	236.3
1955	220.9*	17.4*	238.3*

* These figures are incomplete.

From the above table it would appear that the volume of new business underwritten during 1955 was practically the same as that during 1954. The figures for 1955, it must be borne in mind, do not include the returns of some insurers. The Controller, however, observes that if the returns of some of the insurers which were not received in time for inclusion of their figures in the *Year Book* had been included, the new business of 1955 would have shown a noticeable increase over that of 1954. It should also be remembered, in this connection, the Controller further points out, that staff schemes, under which several insurers actively wrote business, were discontinued towards the middle of 1955.

The amount of total business in the books of Indian insurers at the end of 1954 was Rs. 949 crores, as against Rs. 833 crores at the end of 1953, so that the net increase in 1954 was of the order of Rs. 116 crores. At the end of 1955, the total business stood at Rs. 984 crores. The net increase in that year was therefore Rs. 35 crores. The following table gives the total business figures at the end of each year of the past ten years ended 1955:

Total Business

(In crores of rupees)

Year	Indian insurers	Non-Indian insurers	Total
1946	550	101	651
1947	603	103	706
1948	621	103	724
1949	662	103	765
1950	671	109	780
1951	755	118	873
1952	796	126	922
1953	833	133	966
1954	949	137	1,086
1955	984*	139*	1,123*

* These figures are incomplete.

A noteworthy feature revealed by the above table is the progressive fall in the rate of net increase in the business of foreign insurers. From Rs. 6 crores in 1950, the pace gathered momentum, for a while, to Rs. 9 crores in 1951, but thereafter it gradually fell to Rs. 8 crores in 1952, Rs. 7 crores in 1953 and Rs. 4 crores in 1954. The decline was marked during the year under review, the increase in net business being no more than Rs. 2 crores. This shows that the share of Indian companies in the expanding volume of insurance had been progressively increasing. The main reason for this, apart from political considerations, has been the fact that the activities of foreign insurers have been confined to big cities where there are foreigners in large numbers, whereas Indian insurers are steadily expanding their business in the interior where the money incomes are expanding.

Lapses

The combined experience of Indian insurers showed that lapses continued to be heavy. It was thought that the lapses occurring in any particular year would be a useful indication of the economic condition of the country in that year. For this purpose, a ratio for Indian insurers of the total amount of lapses in 1955 to the mean gross direct business in force (sum insured) during the year was calculated. The ratio works out to 9.0 per cent., as against 8.5 per cent. for 1954. However, this ratio, which depends upon the distribution of the business in force according to duration, is not a very reliable index but it is not entirely without statistical significance.

Foreign Business

Foreign business of Indian insurers continued to be an important item of invisible exports in 1955 also. The net amount of life insurance business effected outside India by Indian insurers during the year under review amounted to Rs. 20.33 crores, representing an increase of Rs. 2.68 crores over 1954, the total amount of business in force at the end of 1955 aggregating Rs. 92.04 crores, as compared with Rs. 86.23 crores at the close of the previous year.

The net rate of interest realised on mean life insurance funds of all Indian insurers has been progressively increasing in recent years and the trend continued in the year under review also. From 3.33 per cent. in 1951, it steadily rose to 3.52 in 1954 and further to 3.56 in 1955. If the climate for the interest rates was thus favourable to Indian insurers, the overall expense ratio continued to show a marked upward trend. The total expenses of management of Indian insurers, expressed as a percentage of their premium income, was 33.4 in 1955, as compared with 29.4 in 1954, 27.4 in 1953 and 27.2 in 1952 and 1951. Thus, the year 1955 witnessed a marked jump in the expense ratio of Indian insurers. But if half a dozen insurers having the largest premium income are excluded, the corresponding ratio for the remaining insurers would be higher at 33.5 per cent. in 1955, as compared with 29.9 per cent. in 1954 and 28.3 per cent. in 1955. The renewal expense ratio for the year 1955 for all Indian insurers combined, calculated on the basis of Rule 25 (*b*) of the Insurance Rules, 1939 was 17.3 per cent. as against 14.7 per cent. for the previous year. The corresponding ratio for the half a dozen insurers having the largest premium income was 15.6 per cent., while that for the remaining was 19.8 per cent. as against 12.7 per cent. and 17.2 per cent. respectively for the previous year.

In contrast, the year 1955 was a good one for non-Indian insurers as their expense ratio registered a decline while the rate of interest realised showed a remarkable improvement. The expense ratio of non-Indian insurers—that is their total expenses of management expressed as a percentage of their premium income—was 21.3 during the year under review as compared with 21.4 in 1954 and 20.7 in 1953. The net rate of interest realised in India on mean life insurance funds of all non-Indian insurers showed a significant improvement to 3.21 per cent., as compared with only 3.06 per cent. in 1954. The net rate of interest realised on mean life insurance funds in the year 1955 by Indian insurers, non-Indian insurers in respect of business in India and provident societies combined, was 3.51 per cent. In respect of life insurance business, the total expenses of management of Indian insurers, non-Indian insurers in respect of business in India and provident societies combined for the year 1955 was 31.82 per cent. of the premium income.

Income and Outgo

Income of Indian insurers during 1955 aggregated Rs. 64.07 crores, inclusive of a premium income of Rs. 50.52 crores and income from interest, dividends and rents of Rs. 10.01 crores, the corresponding figures for non-Indian insurers were Rs. 9.94 crores, Rs. 7.75 crores and Rs. 1.61 crores, respectively. The outgo of Indian and non-Indian insurers aggregated Rs. 36.94 crores and Rs. 7.63 crores respectively. The various items of outgo for Indian insurers, the figures in brackets referring to those for non-Indian insurers, were (in crores of rupees): Claims by death 4.38 (0.82); claims by maturity 10.78 (2.59); annuities 0.19 (0.10); surrender values 2.53 (1.46); expenses of management 16.86 (1.65); depreciation and transfers to investment reserves, etc., 1.60 (0.08); miscellaneous 0.22 (0.87); transfers to shareholders' reserve and dividends 0.38 (0.06). The excess of income over outgo, representing increase in life fund, was Rs. 27.13 crores for Indian and Rs. 2.31 crores for non-Indian insurers.

The total assets of Indian insurers, as on 31st December 1955, aggregated Rs. 366.89 crores of which Rs. 325.75 crores were assets of life business and Rs. 41.14 crores assets of non-life business. The total assets in India of non-Indian insurers as on 31st December 1955 aggregated Rs. 62.55 crores consisting of Rs. 54.98 crores, being assets of life or composite companies and Rs. 7.57 crores, being the assets of purely non-life companies. The following table gives the distribution of the assets of Indian insurers at the end of 1954 and 1955:

Assets of Indian Insurers

(In crores of rupees)

Particulars	1954 Amount	1954 %	1955 Amount	1955 %
Central Government securities ..	134.30	38.6	137.29	37.4
Securities of Part A States	20.35	5.8	25.46	6.0
Securities of Part B States	4.38	1.2	5.13	1.4
British, Colonial and Foreign Government securities	5.87	1.7	7.42	2.0
Municipal, Port Trust and Improvement securities	18.42	5.3	20.99	5.7
Mortgages on property	15.66	4.5	15.08	4.1
Loans on policies	27.46	7.9	27.98	7.7
Loans on stocks and shares ..	0.16	..	0.15	..
Other loans	2.04	0.6	2.32	0.6
Debentures of Indian companies, etc.	20.79	6.0	20.21	5.5
Preference shares of Indian companies, etc.	12.16	3.5	13.98	3.8
Ordinary shares of Indian companies, etc.	23.15	6.7	25.33	6.9
Land and house property	18.73	5.4	17.49	4.8
Agents' balances, outstanding premiums, interest, etc.	16.50	4.7	18.55	5.1
Deposit, cash and stamps	20.94	6.0	20.53	5.6
Miscellaneous	7.20	2.1	8.98	2.5
Total ..	348.11*	100.0	366.89*	100.0

* These figures do not include accrued interest, preliminary and organisation expenses and contra items.

It will be seen from the above table that insurers' investment in Government and semi-Government securities constitute about 52.5 per cent. of the total assets, while those in debentures, preference shares and ordinary shares work out to 16.2 per cent. The rest of the assets is held mainly in the form of mortgages on property, loans on policies, land and house property, agents' balances and deposits.

UNION INSURANCE SOCIETY OF CANTON

The outstanding feature of the working of the Union Insurance Society of Canton Ltd. (Chairman: Hon. C. Blaker, M.C., E.D., Hong Kong) during the year ended 31st December 1956 is a sizable increase in the net premium income which improved from £10.76 million to £12.09 million. It is also noteworthy that all the departments participated in this increase in premium income. Thus, the net premium income in the marine department increased from £3.41 million to £3.59 million, while that in the fire and accident departments moved up from £3.75 million and £3.60 million in 1955 to £3.96 million and £4.55 million, respectively, in 1956. The return to the shareholders has been maintained at £2 2½s. per share of £10 each.

Although the year thus brought with it higher premium incomes, it was, as the Chairman points out in his statement, "one of more than usual difficulty." The underwriting profit in the marine as well as the fire department was reduced to £140,000 and £153,019 from £205,000 and £256,742, respectively, in 1955. The working of the accident department in 1956 resulted in a loss of £189,442, as compared with a profit of £198,932 earned in the previous year. These results, as the Chairman said, are "less satisfactory" than those they had become accustomed to expect. A convincing account of the reasons for the less satisfactory results was given by the Chairman himself. It would appear that in the marine department the year had its quota of marine casualties, notable among which was the loss of the s.s. *Andrea Doria*. Besides, there was a heavy incidence of partial losses. Further, claims for hull repairs are proving costlier than formerly, thanks to the increased cost of labour and materials.

In the fire department, the underwriting results have been adversely affected by experience in Canada and the U.S., though there have been no catastrophes of the kind which occurred in previous years. In the accident department, claims experience continues to be unfavourable in the motor section. Experience of general insurers in this country, so far as motor insurance is concerned, is not very different in this respect. They will, therefore, be interested in the Chairman's reference to this

(*Continued on page 1267*)

THE INDIAN BANK
celebrates its
GOLDEN JUBILEE
Next August

Started in 1907, in a modest way, by men of courage and vision, its present stability and strength have been reached by a policy of prudent management and discriminating participation in trade and commerce. With a paid-up capital of Rs. 64,70,045; deposits of Rs. 32.26 crores and working funds of Rs. 54.91 crores and its network of branches in important areas, the Bank is fully equipped to render its constituents every kind of banking service.

D. P. Parthasarathy,
Secretary.

We do business with the nicest people...

And we are deeply interested in these nice people: in *you*! That's why we have a special Market Research Department that devotes itself to finding out what you like and don't like, why you buy—or don't buy.

Our teams of interviewers travel all over the country, calling on families in city, town and village, and noting your growing needs and changing preferences. This fact-finding process enables us to introduce new products like Rinso, or change a familiar one in some way—the perfume of Lux Toilet Soap, for instance.

Many of our products are, perhaps, already your household friends, and you appear on the charts and reports compiled by our interviewers. But you are more, much more, to us than facts and figures . . . you are the very people we do business with.
We spare no trouble in trying to meet your needs, in offering you the very best value for your money.

NATIONAL RAYON CORPORATION LIMITED

MR. KASTURBHAI LALBHAI'S ADDRESS AT ANNUAL MEETING

RECONSIDERATION OF NEW TAX PROPOSALS URGED

A CLEAR warning that the increased income-tax and corporation tax, the imposition of wealth tax on companies, and the substantial addition to tax on business issues would have the cumulative effect of causing a heavy drain, year by year, on the resources of companies was given by Mr. Kasturbhai Lalbhai, Chairman, National Rayon Corporation, Ltd., when he addressed the Tenth Annual General Meeting of the Company held at Bombay on Thursday, 13th June 1957. It was a recognised fact, he declared, that, for some years past, industrial enterprise in India had been handicapped by lack of adequate capital, and whatever expansion that had taken place in recent years had been made possible by prudent and conservative ploughing back of the annual profit. He, therefore, earnestly appealed to the Government to reconsider the new tax proposals, with a view to ensuring adequate financial resources for companies and to stimulate further fresh investments in industry.

The following is the full text of Mr. Kasturbhai Lalbhai's speech at the Annual Meeting:

"GENTLEMEN,

"I have great pleasure to welcome you here this afternoon and to present to you for adoption the tenth annual report and the audited statement of accounts of your Company. The report and the statement of accounts for the year ended the 31st December 1956 have been in your hands for over a month now, and so I hope, with your permission, I can take them as read. The report covers fairly fully, all the salient points with regard to the working of the Company during the year under review, and I do not, therefore, propose to traverse the same ground again. I would, however, like to make a few observations on some items in the statement of accounts.

Balance-sheet

"You must have noticed from the balance-sheet that the net block has increased by Rs. 201.50 lakhs to Rs. 681.21 lakhs. This increase is accounted for, in the main, by the further expansion of the main plant and the putting up of the caustic soda plant. The sales effected by your Company during the year of report were of the order of Rs. 422.38 lakhs, while the gross profits amounted to Rs. 144.94 lakhs, as against Rs. 342.50 lakhs and Rs. 108.29 lakhs, respectively, in the preceding year.

"The amount of excise duty of Rs. 80,221 shown in the profit and loss account needs explaining. It represents the difference between the excise duty paid to the Government for the month of December 1956 and that recovered from the customers. The amount of Rs. 1,32,529 shown in the profit and loss account under the head of 'miscellaneous income in respect of previous years' is the refund of insurance premium which became due to the Company, following the fixing up of these rates by the Fire Insurance Association, with retrospective effect.

Compulsory Deposits

"Since the publication of the report, the Government of India have published draft rules with regard to the new provision made in the Income-tax Act for deposits with the Reserve Bank of India of a portion of the Company's reserves not represented by assets and undistributed profits. Certain provisions thereof need still further clarifications, but, as far as we can make out of the proposed rules and amendment of the relevant section of the Income-tax Act, your Company may not, in fact, be required to deposit any amount with the Reserve Bank of India this year. You must also have noted that the Government have proposed to increase the rates of income-tax and corporation tax. I believe, the provision made in the accounts for payment of taxes is adequate to take care of this increase in incidence. However, the proposed increase will affect your preference shareholders, inasmuch as it will reduce the net amount of dividend payable on the taxable preference shares of the Company. This would necessitate a slight change in some items of appropriations. I am, accordingly, amending suitably, the usual resolution for the adoption of the report and the statement of accounts.

"The new taxation proposals announced on the 15th May last have evoked considerable criticism throughout the country. I will only refer to those proposals which affect our Company along with other industries. It is a recognised fact that, for some years past, industrial enterprise in India has been handicapped by lack of adequate capital, and whatever expansion has taken place in recent years has been made possible by prudent and conservative ploughing back of the annual profits. The increased income-tax and corporation tax, the imposition of wealth tax on companies and the substantial addition to the tax on bonus issues, will have the cumulative effect of causing a heavy drain, year by year, on the resources of companies. I take this opportunity of earnestly appealing to Government that, in order to maintain the tempo of industrial development in the country, they should reconsider these proposals, with a view to ensuring adequate financial resources for companies and to stimulate further fresh investments in industry.

Rayon Tyre Cord Plant

"You might have noticed in the report that it is proposed to install a rayon tyre cord plant with an annual capacity of four million lbs. In this connection, I am happy to inform you that one of your Directors, Mr. R. J. Chinai, is already in the States, exploring possibilities of obtaining credit, of course, within the framework of the Government's new policy of deferred payments, as also acquiring the equally important 'know-how.' His negotiations, both in the States and on the Continent, indicate that it is difficult to obtain credit for a period of seven years.

"Our application for additional capital to partly finance the new project by the issue of equity shares, in the proportion of one for every two of such shares held by the shareholders, is pending with the Controller of Capital Issues, New Delhi.

"On account of the closure of the Suez Canal for steamer traffic for about six months since October last year, many of the shipments were delayed, thereby upsetting, to some extent, the installation work and the production schedule of our expansion programmes. As a result of the Suez episode, the freight bill on capital goods and on imported raw materials went up.

Imports of Yarn

"It is evident that there has been an increase in the quantity of foreign yarn imported. During the nine months, April to December, the imports of rayon yarn amounted to 47.62 million lbs. If the flow of imports continues at the same rate during the remaining three months of the financial year, the total imports, together with the indigenous production of 30 million lbs., would raise the quantum of available supplies to about 93 million lbs. which is considerably in excess of the normal requirements of the weaving industry in the country, now estimated at around 45-50 million lbs. The landed cost in the case of 150 deniers, on the basis of the present quotations of foreign manufacturers, comes to Rs. 3-11-0, as against the price for N.R.C., namely, Rs. 3-6-0 per lb. The Indian units, which have been concentrating on the production of the most popular deniers of 150 and 120, are in a position to meet the entire demand in these deniers estimated at over 50 per cent. of the total requirements of the weaving industry.

"As hitherto, the coal position continues to be unsatisfactory, and wagons for transport from the coal pits are still not being made available in sufficient numbers. The authorities, both at Calcutta and at Bombay, are being constantly requested to make satisfactory arrangements in this connection.

"The increased requirements of electric power for our expansions were met when the Trombay Plant went into commission. We are now not drawing any electric energy from the Power Pool at the higher rate. Our additional requirements, consequent upon the launching of further frames and caustic soda plant, have already been applied for, and it is hoped, they would be met by the power companies in full.

Designing and Engineering

"It will interest you to know that the considerable experience gained in the working of our plant has enabled the management to open a special designing and engineering department, which has been responsible for the entire designing and engineering of the new expansions. In the result, we have been able to get quite a few items locally fabricated, thereby effecting considerable saving on the total equipment, using our own materials, training our own engineers in the process, and, lastly, conserving some valuable foreign exchange. Recently, we have broadened the activities of this department, and have obtained a licence from the Central Government for the manufacture of machinery for rayon, sulphuric acid, carbon-disulphide and caustic soda, as well as water filtration and softening plants and auxiliary equipments. We have already made a beginning with the sulphuric acid plant, and are in a position to offer a complete contact process unit on a turn-key-job basis.

"You will agree with me that, in an organisation of our type, it is necessary to have a well-equipped research department to keep in line with the changing techniques. This department will be mainly concerned with manufacture of viscose yarn and rayon tyre cord on a pilot plant scale. Again, as our caustic soda plant, which will go into operation shortly, will release a fairly large quantity of chlorine, research work is proceeding apace, with a view to its practical use, and this may lead to the production of such chlorine compounds as can be readily and profitably marketed. Laboratory experiments carried on in this respect are quite successful, and pilot plants are being put up to carry on further research in this direction also.

Labour

"The Employees' State Insurance Act, as you may be aware, confers on workers, among other benefits, medical and maternity benefits, and these are proposed to be made available to the members of workers' families. The Government propose to meet the additional cost by increasing the rate of employer's contribution from 1¼ to 3½ per cent. While higher and higher charges are levied from industrial concerns, as far as workers are concerned, they do not get the services which companies like ours have been rendering to them. Efforts, legislative and otherwise, towards the creation of sound industrial relations and a due recognition of the human factor in industry are, no doubt, welcome.

"Before I conclude, may I express my sincere appreciation of the very good work put in by the workers and staff, technical and non-technical alike, but for whose efficiency, loyalty and co-operation, it would not have been possible to make the progress that we have already achieved."

NEW SYSTEM OF DIRECT TAXATION X-RAYED—I

SOME CONSTRUCTIVE SUGGESTIONS FOR MAKING IT EQUITABLE

By Russi Jal Taraporevala, B.Com., M.B.A. (California), M.Sc. (Econ.) (London)

AS a result of the proposals contained in the recent budget of the Government of India presented by the Finance Minister, India has now got the so-called 'integrated' system of direct taxation. It is, therefore, necessary to discuss the rationale of this new system of personal taxation and to assess carefully the effect of the new and novel taxes on the economy.

The aim of tax policy is determined by the moral, social and political views of a nation or the Government in power. A commonly accepted goal of taxation these days is the reduction of inequalities of wealth and income as between persons. With this aim in view India and most Western countries had a system of progressive personal taxation based on income. It is now claimed that this system of taxation has failed to achieve its goal of a substantial redistribution of wealth and income. Thus, the Kaldor Report points out that, "in the United Kingdom, though the combined income and surtax rates for the last 15 years have exceeded 90 per cent. in the top brackets, and estate duties reached a maximum of 80 per cent., vast new fortunes are still being made, and the degree of concentration in the ownership of wealth... has not been reduced." A similar state of affairs prevails in the U.S.A. and many other European countries.

The reasons for the failure of progressive taxation of income to attain its objectives are many. First, income, as defined for tax purposes, excludes a number of important accruals like capital gains and, therefore, provides a number of loopholes for tax avoidance. Second, the income-tax returns or forms only require the disclosure of a fraction of the data concerning an individual's overall financial position and so facilitate tax avoidance. Third, income taxation ignores the fact that the ownership of wealth confers a benefit on the owner over and above the income derived from such wealth. The lack of taxes on capital or net wealth facilitates the continuation and growth in the concentration of the ownership of wealth. Finally, various provisions of the income-tax laws, such as the provisions for the free allowance of business expenses and business losses and the recognition of various types of transfers of property, provide convenient loopholes for lightening the load of income taxation.

The Alternative

The recognition of the failure of income taxation to reduce the inequalities of wealth and income has led to the advocacy of an integrated system of personal taxation, in order to attain this goal. An integrated system of taxation can include income-tax, a tax on wealth, a tax on capital gains, a personal expenditure tax and a *gifts tax*. With the exception of the gifts tax, all these taxes have now been introduced in India.

An integrated system of taxation, by bringing within its orbit all types of gains and wealth, can remove the inconsistencies and discriminations which are to be found in the system of pure income taxation. Thus, as a system of personal taxation, the integrated tax set-up can be good and beneficial, provided it conforms to certain other requirements. The most important requirement is that the burden of taxation under the integrated set-up should provide sufficient incentives for work, initiative, enterprise and saving. Thus, the rates of the various taxes are of paramount importance and should be carefully adjusted to take into account the total tax burden imposed on individuals, as also the timing of the imposition of such tax burdens. As will be pointed out later, the Finance Minister's proposals unfortunately do not meet this requirement—and this is their worst failing. The second requirement for the success of the integrated system of taxation is that it should be administratively efficient. It is against this background that the various taxes imposed by the budget has to be evaluated. A comparison between the Finance Minister's proposals and the recommendations of the Kaldor Report will also be made, because the Finance Minister has adopted many of Mr. Kaldor's suggestions and has justified his tax proposals by many of the arguments contained in the Kaldor Report.

Note.—The author of this article is a former Flood Foundation Fellow in Business Administration at the University of California (Berkeley) and a Lecturer in Finance at San Francisco for some time.

Income-tax and Super-tax

If a system of integrated taxation is introduced, the rates of income-tax and super-tax (applicable to personal taxation) must be substantially lowered, in order to compensate, at least partially, for the increased tax burdens on account of the annual tax on wealth, the capital gains tax and the personal expenditure tax. Indeed, the adoption of the integrated system of taxation flows from the recognition that "it is useless to push the marginal rates of income taxation to levels at which the tax can only be endured, because it can be so largely evaded or avoided," as pointed out by the Kaldor Report. The fundamental idea of an integrated system of taxation is to introduce taxes at lower rates but on a considerably broadened tax base as compared with the income-tax levied on the narrow tax base at a high rate.

The Finance Minister was fully aware of these considerations. In his budget speech he said: "I have come to the conclusion that our existing rates of direct tax at top levels deprive the tax structure of all flexibility... They tend to diminish the incentive for work but I am aware that they encourage large-scale evasion. It is now recognised that very high rates of direct taxation in the top income brackets in many countries of the world are in practice tolerated or tolerable only because of considerable evasion that takes place. In other words, the high rates tend to be applied to a corroded tax base."

"Unfortunately, the budget proposals contain only a small reduction in the rates of income taxation, a reduction which is negligible as compared with the additional burdens imposed by the annual tax on wealth, the capital gains tax and the personal expenditure tax. Table A on this page shows the burden of income-tax and super-tax under the budget proposals for personal taxation as compared with the burden of these taxes as in the previous year.

Misleading Claim

The Finance Minister made much of the point that, under his proposals, "basic rates... apply to the person who earns his income, that is, sweats and toils for it, and that others who derive their income from property and investments, that is, without making any direct effort, ... pay more by a surcharge." Yet, the relief given by the budget in income-tax and super-tax on even earned incomes as shown in the table is so insignificant that it should be construed more as a political gesture to salary earners rather than a real relief to them. The relief in income-tax and super-tax on earned incomes varies from 0.5 per cent. to 3.5 per cent. of the gross income and is hardly likely to give cause for rejoicing amongst salary earners living in an economy in which the cost of living is expected to rise (partly due to the additional excise duties levied by the budget). On the other hand, the income-tax and super-tax on persons with unearned incomes between Rs. 40,000 and Rs. 1,00,000 have actually been increased as compared with last year. And yet these same persons are those who will be most affected by the annual tax on wealth and the personal expenditure tax on a recurring basis.

The reduction in the marginal rates of income-tax and super-tax on incomes above Rs. 1,00,000 is so small that even to consider the proposition that it will provide some relief to compensate for the burdens of the other direct taxes would be superfluous. Indeed, as is clearly shown in Table B on the next page, persons with incomes above Rs. 1,00,000 (i.e., owning more than Rs. 16,00,000 net wealth) have overnight been saddled with a fantastically high tax burden which is quite out of all reasonable proportion to the taxes which they were previously paying. Thus, the Finance Minister has ignored the fundamental requirement of a system of integrated personal taxation to maintain sufficient incentives for work and saving by not reducing the rates of income taxation to sufficiently low levels to offset at least partially the burden of his other imposts in the field of direct taxation.

By keeping the rates of income taxation at high levels and introducing the annual tax on wealth, the Finance Minister has imposed a scheme of taxation which amounts to a recurring confiscation of private capital (as is shown later). The Kaldor Report recommended that "assuming a comprehensive tax-base, the marginal rate of income-tax ought never to exceed ... something of the order of 40-50 per cent. for income that is both earned and saved." The entire Kaldor Report is based on the recommendation that the maximum rate of income-tax (including super-tax) should be 45 per cent. Whilst imposing most of the additional direct taxes recommended by the Kaldor Report the Finance Minister has conveniently overlooked the assumption behind them that the maximum rate of income taxation would be 45 per cent.

Annual Tax on Wealth

The Finance Minister proposes to introduce an annual tax on wealth on persons on the lines and at rates similar to those recommended by the Kaldor Report. The arguments in favour of this tax can be considered. First, it can be contended that income is an inadequate yardstick of the taxable capacity of individuals. If the tax structure is to be progressive in relation to the taxable capacity (or the means or spending power) of persons, it should take into account the possession of wealth which confers additional taxable capacity or spending power on its owners. Second, Mr. Kaldor has claimed that "the great advantage of taxes assessed on property value as against taxes assessed on income is that a property tax does not discriminate against the risky employments of capital in the same way as an income-tax." Since the tax on wealth would fall equally on productive and non-productive assets or property, there would be an incentive to invest capital in productive assets (so as to offset, partially at least, the burdens of this tax). Finally, it can be argued that the annual tax on wealth, by requiring a detailed declaration of the various aspects of the financial position of assessees to be made to the tax authorities, would make tax evasion more difficult.

The most important argument against the annual tax on wealth relates to the gigantic task of administration which it involves. Various countries including Great Britain have refrained from imposing this tax after realising the tremendous difficulties involved in its administration. These difficulties will be discussed later.

The theoretical concept of the annual tax on wealth on persons may not be a bad one. But if such a tax is to maintain the incentives to work and save, it should be a tax on the accrual from capital and should not be tax on the capital itself. The annual tax on wealth should be considered as a partial substitute for income-tax.

The Finance Minister has proposed an annual tax on wealth on a progressive scale—the rates rising from ½ per cent. to 1½ per cent. of net wealth. The proposed rates are comparable with the rates suggested by the Kaldor Report which ranged from ½ per cent. to 1½ per cent. Thus, on the initial Rs. 22 lakhs of net wealth of individuals, the Kaldor Report suggests a net wealth tax amounting to Rs. 20,250, as compared with Rs. 15,000 under the budget proposals. Beyond the initial Rs. 22 lakhs of net wealth, the rate of tax recommended by the Kaldor Report and the rate proposed by the Finance Minister are identical—1½ per cent. of net wealth.

Kaldor Excelled

For the sake of convenience, it is assumed that the rates of the annual tax on wealth as introduced by the budget proposals are identical with those recommended by the Kaldor Report and are, therefore, used in the calculations in Table B. Table B shows the burden of income-tax and super-tax of the previous year's budget (1956-57) as compared with the burden of income-tax, super-tax and the annual tax on wealth under the recent budget proposals and with the burden of these taxes at the rates recommended in the Kaldor Report. The annual gross income has been calculated at the assumed rate of a 6 per cent. yield on net wealth. Earned income is not taken into consideration (but an adjustment in the table for it can be made by individual assessees). The table shows the net residual amounts left in the hands of individual assessees after the payment of income-tax, super-tax and the annual tax on wealth out of their gross income (derived from capital). The rates for unearned incomes of income-tax and super-tax of the last year's budget (1956-57) and the recent Union budget (1957-58) are used. The income-tax and super-tax rates under the Kaldor Report are taken as identical with the rates proposed by the recent budget for incomes upto Rs. 25,000 per annum after which a flat maximum rate of 45 per cent. as recommended by Mr. Kaldor is used in the calculations.

The table brings out the crushing burden of taxation which the recent budget proposals imply as compared with the tax burden prevailing previously. Under the budget proposals, an individual possessing about Rs. 15,00,000 net wealth retains the maximum amount from his gross unearned income after paying these taxes. Thereafter, the net amount retained by an individual after these taxes have been paid, diminishes rapidly with the increase in net wealth and is a fraction of the net amount retained under the last year's taxation. Indeed, a point is reached (around Rs. 80,00,000 net wealth) where the individual has absolutely nothing left out of his unearned gross income after paying income-tax, super-tax and the annual tax on wealth as proposed by the Finance Minister. Beyond this point, the individual presumably has to pay increasing amounts out of this capital in order to meet these taxes! Compare this position with the burden of the previous year's budget as shown in the table and the conclusion becomes apparent—overnight the budget has crushed persons with wealth in excess of Rs. 15,00,000 or gross unearned incomes in excess of Rs. 90,000 per annum.

Confiscation of Private Capital

Such a position was never envisaged by Mr. Kaldor. Under the rates of taxation proposed by him, the net amounts retained by individuals out of their gross incomes after paying income-tax, super-tax and the annual tax on wealth rise continuously with the increase in wealth possessed. The Kaldor Report had clearly stressed that the annual tax on wealth should be "well within the total accrual from property" and should "take into account the other taxes on accruals, in particular, the income-tax." This the recent budget proposals have failed to achieve.

These budget proposals, because of their confiscatory nature, are likely to have a most serious and damaging effect on the incentives of the investing classes to work and to take risks. The sheer suddenness with which the new tax burdens have been imposed is likely to shatter the confidence of the investing classes. It is difficult to understand how the Finance Minister can expect *entrepreneurs* to shoulder risks boldly, when their maximum net return on capital, after paying the income-tax, super-tax and the annual tax on wealth appears between Rs. 30,000 and Rs. 35,000 and when the net return declines rapidly with an increase in their net wealth. In effect, these budget proposals imply a steady confiscation of private capital through taxation by the Government with all the dangerous implications inherent in the slow disappearance of private wealth and the private sector in the Indian economy. It is, therefore, strongly urged that either the proposed income-tax and super-tax rates or the rates of the annual tax on wealth on individuals should be substantially reduced, so that the combined effect of these taxes is not an immediate and recurring confiscation of private capital by the Government.

Agricultural Property

Certain important aspects of the Wealth Tax Bill (1957) may now be discussed. Agricultural property is excluded from the scope of the Bill, presumably because of the Constitutional provisions which put the taxation of agricultural properties within the jurisdiction of various State governments. However, this is likely to cause a certain amount of confusion and discrimination, as it will tempt some States to impose a wealth tax on agricultural property (as has been done in Kerala), whereas other State governments may refrain from imposing this tax. Such a pattern may lead to important regional disparities in taxation as between various States and this will have direct influence upon the location of economic activity within the country. The exclusion of agricultural property from the annual tax on wealth amounts to a discrimination in its favour and against other types of property like industrial assets and urban buildings. The Kaldor Report had recommended that, "for the sake of equity, as well as administrative efficiency, it is necessary that the tax should be comprehensive—i.e., extending to all forms of property. The inclusion of agricultural property in this connection may require a Constitutional amendment..." This recommendation should be implemented.

Wealth tax is not payable by an assessee under the Bill in respect of "domestic animals and furniture, household utensils, wearing apparel, jewellery, provisions and other articles intended for the personal or household use of the assessee, subject to a maximum of twenty-five thousand rupees in value." Presumably, the Government considers that these articles above the Rs. 25,000 value limit constitute capital assets or net wealth and are not consumption goods—hence the wealth tax is levied on them. Yet, as a direct contradiction, expenditure on such assets is not exempt for the purposes of personal expenditure tax. Hence, for the purposes of the Expenditure Tax Bill, these assets are treated as consumption goods. Here is a glaring contradiction which may be deliberate, in order to impose double taxation on the expenditure devoted to such articles. It is suggested that such articles should be completely exempted from the wealth tax, irrespective of their total value (especially if they are not exempted from the expenditure tax). This will also simplify the administration of the wealth tax and will remove the fear of harassment and of violation of personal privacy which today is shared by many assessees.

Private Sector

Wealth tax is not payable under the Bill by an assessee in respect of "the right or interest of the assessee in any policy of insurance" (which may be of any value) and "ten-year treasury saving deposit certificates, fifteen-year annuity certificates, deposits in post office savings banks, post office cash certificates and post office national savings certificates held by the assessee." The tax is also not payable in respect of "any security of the Government or of a local authority... which the Central Government may, by notification in the official *Gazette*, exempt from the wealth tax." There is and can be no justification for these exemptions. These exemptions smack of gross discrimination against the private sector. They imply a deliberate intention of attracting savings into the public sector and away from the private sector by giving undue tax advantages. These provisions of the Bill may have serious adverse effects on the capital market and the flow of savings into the private sector may gradually dry up due to the diversion of such savings into the public sector. These exemptions should be reconsidered and either removed or be made conditional.

Valuation

The greatest difficulties are likely to be encountered in respect of the administration of the wealth tax. Barring, the exempted property or assets, a complete valuation will have to be made of all movable and immovable assets. The Wealth Tax Bill takes the market value on a particular date as the basis of valuation. This means that every year the entire process of a complete valuation of all assets or property will have to be repeated. It has been said that the valuation of assets is an art and not a science. There are no mathematically precise rules about valuation. A large measure of personal opinion or bias of the valuer is inherent in the process of valuation. The Wealth Tax Bill has entrusted this process of valuation almost exclusively to the tax officials who have thus been endowed with tremendous discretionary powers which could easily be used to harass assessees. Surprisingly, the role of independent valuers as provided in the Wealth Tax Bill is of a very minor character and is confined to the valuation of immovable property. It is difficult to understand why this has been done or the reason for entrusting the valuation of all movable property or assets exclusively to the tax officials.

It can be argued that even the process of initially discovering the real ownership of and valuing of all assets or property may be an

(*Continued on page 1287*)

TABLE A

TABLE SHOWING THE PROPOSED RATES OF INCOME-TAX AND SUPER-TAX AT A GLANCE AS COMPARED WITH LAST YEAR'S TAXATION

Gross income	Total tax for 1956-57 if the income is earned.	Total tax for 1956-57 if the income is unearned.	Total tax for 1957-58 if the income is earned.	Total tax for 1957-58 if the income is unearned.	Difference with last year in the tax on earned income.	Difference with last year in the tax on unearned income.
Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
4,200	Nil	Nil	18	18	+ 18	+ 18
4,500	75	117	27	27	— 48	— 90
4,800	86	131	36	36	— 50	— 95

1,00,000	55,026	55,026	51,471	58,824	— 3,555	+ 3,798

Note.—This table applies to married individual assessees with more than one child. I am indebted to Mr. V. G. Mehta for the above table which was specially prepared by him.

TABLE B

TABLE SHOWING THE NET RESIDUAL AMOUNTS RETAINED BY INDIVIDUAL ASSESSEES OUT OF THEIR GROSS INCOMES (CALCULATED AT 6% OF NET WEALTH PER ANNUM) AFTER PAYING INCOME-TAX, SUPER-TAX AND THE ANNUAL TAX ON WEALTH

Net wealth of an individual.	Net residue after paying income-tax and super-tax as per last year's (1956-57) budget.	Net residue after paying income-tax, super-tax and the annual tax on wealth as per the recent (1957-58) budget.	Net residue after paying income-tax and super-tax at the rates recommended in the Kaldor Report and the annual tax on wealth.
Rs.	Rs.	Rs.	Rs.
5,00,000	22,878	21,876	22,026
10,00,000	35,817	30,176	36,026
15,00,000	43,177	31,576	48,526
20,00,000	47,911	29,376	60,026
30,00,000	53,770	26,976	79,026
40,00,000	58,645	21,576	97,026
50,00,000	63,520	16,176	1,15,026
60,00,000	68,395	10,776	1,33,026
70,00,000	73,270	5,376	1,51,026
80,00,000	78,145	— 24	1,69,026
90,00,000	83,022	— 5,424	1,87,026
1,00,00,000	87,900	— 10,824	2,05,026
2,00,00,000	1,36,680	— 64,824	3,85,026

Note.—The figures given above are slightly different from those published in my article in the *Times of India* of 2nd June 1957, as they take into account certain marginal adjustments in the rates of tax introduced recently by the Finance Minister.

AMENDING THE NEW COMPANIES ACT

SOME DEFICIENCIES FROM LEGAL POINT OF VIEW INDICATED

By F. R. Ginwalla, B.A., LL.B.

THE Companies Act, 1956 is the largest piece of legislation in India and is more ambitious in its object and purpose than any other corresponding legislation in any other part of the world. It is composed of 658 sections, 12 schedules and numerous forms and is intended to help the development of the companies in India on healthy lines and to put down the abuses which were noticed in the working of the retiring Act of 1913. It is one of the Acts passed by the Government whose policy is an adjustment of the society to a socialistic pattern and to ensure that particular pattern is maintained.

There are many defects, deficiencies and imperfections in the Act, when looked at from the point of view of business men, company promoters, directors, shareholders, auditors, managing agents, secretaries and treasurers, but, what is more important from the legal point of view, is the unsatisfactory drafting of the Act which bristles with complexity of formulation, intricacy of detail and extensiveness of purpose. It is this aspect of the Act that I venture to analyse by pointing out its provisions which suffer from want of clarity and need adjustment in the light of legal experience and judicial pronouncements. It is necessary to bear in mind the exact conception of the aim, scope and object of the Act while analysing its provisions with a view to suggesting amendments as may be found essential for removing the defects or deficiencies as may have been experienced by the lawyers while advising their clients on the various aspects of the Act.

I may preface my analysis with some brief general observations. They are as follows:—

(1) It is the province of the statesman and not of the lawyer, to discuss and determine what is best for the public good, and of the legislature to provide for it by proper enactments.

(2) It is the cardinal rule to give an Act of Parliament the ordinary and natural meaning of its words, when there is nothing in the relevant provisions to modify, alter or qualify that meaning.

(3) The rule of true construction is not to leave the intention of the legislature to be gathered by any doubtful inference. It must be manifest with reasonable clearness.

(4) It cannot be said that the legislature always foresees every possible result that may ensue from unguarded use of some words.

(5) In construing the present Act, it is permissible to take into consideration the judicial decisions on provisions of the repealed enactment of 1913 if they are reproduced in substantially identical terms. This rule is not applicable when it appears that, in the process of consolidation and amendment, there has been some dislocation and change.

(6) The distinction between a strict construction and a more free one has, in modern times, almost disappeared (*vide* CRAIES, 5th Ed., p. 502).

(7) Modern rules of construction do not favour any great importance being attached to the distinction sometimes drawn between a saving clause or an exception and a proviso in a statute. Even in case of a saving clause, both the enacting clause and the saving clause should be read together to ascertain the intention of the legislature.

(8) It is the rule that exposition must be *ex visceribus actus;* that, in construing the terms of a provision in a statute, consideration should always be given to any other part of the same provision and the whole portion of it should be read as a consistent enactment.

(9) The relevant provisions of the Indian Companies Act, 1956 and the English Companies Act, 1948 are not strictly in *pari materia.* They differ in their scope. The word "par" in this context should not be confounded with the word "*similis.*"

(10) Text books do not make the law. They show more or less whether a principle or construction has been accepted by the courts. Text books on English Company Law must be read as applicable strictly in the context and sphere in which they are expressed, though, by themselves, they are very useful sources of information and guidance.

(11) The courts are more to be trusted as interpreters of the law, but, in India, to the extent to which the Constitution of India leaves the power of judicial review to the courts, the courts may in effect be legislating and not merely interpreting the law.

In the context of the foregoing observations, I shall venture to analyse some of the important provisions of the Act as under:

Section 2(11) read with Section 10 and Section 622

Section 2(11) defines the Court while section 10 deals with the jurisdiction of the courts. There is no reference to the court of a Presidency Magistrate or of a First Class Magistrate in the foregoing sections. Section 622 provides that no court inferior to that of a Presidency Magistrate or a Magistrate of the First Class shall try any offence against the Companies Act, 1956. Section 2(11) should, therefore, be suitably amended so as to include the court of a Presidency Magistrate or of a First Class Magistrate for the purpose of section 622.

Section 2(7), Section 3 also Section 4

Section 2(7) states that "body corporate" or corporation includes a company incorporated outside India but does not include a corporation sole. Section 3 defines "company," "existing company," "private company" and "public company." Section 4 indicates the meaning of "holding company" and "subsidiary." Reading the foregoing sections together, a question may arise as to whether the expression "a private company which is a subsidiary of a public company" occurring in the various sections of the Act means a private company which is a subsidiary of an Indian public company or whether the said expression includes a private company which is a subsidiary of a "body corporate" which by reason of section 2(7) includes a company incorporated outside India. A considered legal opinion is in favour of the view that the said expression does not include a private company which is a subsidiary of a body corporate. The reasons in support of this view are that the provisions of section 3 only mean the companies formed and registered under the Act or under the previous company laws of India and that they do not include a company incorporated outside the Union of India. If this is a correct view, a private company which is subsidiary of a public foreign corporation incorporated outside India will not be affected by the various provisions of the new Act. If in the expression "a private company which is a subsidiary of a public company" the words "or a foreign corporation" had been added, then a private company incorporated in India which is a subsidiary of a foreign corporation would have been governed by the various sections of the Act on the same footing as a public company.

Section 6 : Definition of a "Relative"

A relative is defined by section 6 of the Act and it indicates four groups of relatives besides the husband and the wife. The first group comprises the statutory relatives of the husband. The second group comprises the statutory relatives of the wife. The third group comprises the statutory relatives of the "other" and the fourth group comprises the statutory relatives of the spouses of the "other." These four groups cover a wide range of possible relationships numbering from 65 to 89. This section should be so amended as to include a limited range of relatives within the meaning of this definition after giving due consideration to the principle which the legislature had in mind while enacting this section.

Section 24

Section 24 empowers the Registrar to make necessary alterations in the certificate of incorporation in the case of a change of name of a company which was a private company or limited company immediately before the commencement of the Act. The foregoing section does not empower the Registrar to amend the certificate of incorporation if there is any change in the name after the commencement of the Act. Section 24 should, therefore, be suitably amended to give such a power to the Registrar.

Section 33

This is a procedural section, in respect of the registration of the memorandum of the company, its articles, and the agreement, if any, for the appointment of managing agent or secretaries and treasurers. Sub-section (3) empowers the Registrar to retain and register the articles, memorandum and the agreement, if any, if he is satisfied that all the requirements of sub-sections (1) and (2) are satisfied. Section 33 does not empower the Registrar to refuse to retain and register the documents set out in sub-section (1) if they are contrary to the provisions of the Act. Section 9 merely states that the provisions of the memorandum or the articles are void to the extent to which they are repugnant to the provisions of the Act. Section 9, therefore, only indicates the consequences which may arise if the provisions in the memorandum or the articles are contrary to the Act. The Registrar has no power to check those companies who make ingenious attempts to escape the rigour of the law. Though the legislature while enacting section 33 may not have thought advisable to confer such powers on the Registrar in view of section 9, it is submitted that the consequences resulting from the absence of such powers in section 33 should be properly considered in the light of experience gained after the Act came into force.

Section 49

This section is with regard to the investment of company to be held in its own name. The term "investment" should have been defined for the purpose of this section.

Section 49, Sub-section (4)

Sub-section 4 of section 49 exempts investments of companies whose principal business is the buying and selling of shares or securities (*vide* sub-section 5 also). It is debatable whether this exception contained in sub-section (4) is consistent with the language of the section as a whole.

Section 61

Section 61 of the Companies Act provides that the terms of a contract referred to in the prospectus cannot be varied except with the approval of, or on authority given by the company in general meeting. A question may arise whether the consent of the company in general meeting is necessary when the rights of holders of any special class of shares are proposed to be altered. Can it be said that, when the rights are so altered, there is a variation in the terms of a contract referred to in the prospectus?

The rights of the holders of each special class of shares are defined in the memorandum and articles of association of the company, and though, under section 36 of the Act, the articles may be said to constitute a contract between each member and the company, it is open to doubt whether such a contract can be deemed to be a contract referred to in the prospectus as provided in section 61.

Though it is doubtful whether section 61 can be held to apply, the consent of the company in general meeting would nevertheless appear to be necessary as an alteration of the rights of any special class of shares would, *ipso facto*, involve an amendment of the relative regulation contained in the articles of association.

In any case, there appears to be some room for ambiguity and the position should, therefore, be clarified.

Section 76

It is necessary to consider whether any previous agreement between a company and a person entitled to receive any payment as commission in consideration of his subscribing or procuring subscription of shares of the company is void to the extent it is repugnant to the provisions of section 76. The section should clearly indicate in plain words the exact intention of the legislature. If such an agreement is repugnant to the provisions of section 76 the intention of the legislature would be more comprehensive by deleting the words "capital moneys" occurring in sub-section (2) and substituting the foregoing words by the words "moneys capital or otherwise."

Section 88

Section 88 of the Companies Act prohibits the issue of shares with disproportionate rights. It states that, after the commencement of the Act, no company shall issue shares which carry voting rights or *rights in the company* as to dividend, capital or otherwise which are disproportionate to the rights attaching to the holders of other shares.

A question may arise whether, if a company has issued a class of equity shares guaranteed as to dividend or capital by a bank or by an investment corporation or by any other agency, it is competent to the company to issue subsequently shares of the same class similar in all respects except in the matter of guarantee. In other words, the point is that, if the new issue proposed to be made does not carry the guarantee as to dividend or capital available to the original issue, can it be said that there is a disproportion in the rights attaching to the new issue?

It may be noted that the reference in the section is to "*rights in the company* as to dividend, capital or otherwise." If a guarantee is given by a bank or by an investment corporation, does that amount to a right in the company? If it is to be so construed, it would follow that any further issue of capital of the same class must also be similarly guaranteed. This would make it difficult for companies to increase their capital even when they are well-established, because each issue would have to be guaranteed even when such guarantee is of little value.

In any case, the section is of doubtful meaning and the ambiguity must, therefore, be clarified.

Section 106

Section 106 of the Companies Act prescribes the procedure to be followed for altering the rights of holders of special classes of shares. There are two alternatives. Under clause (*a*) of sub-section (1), the rights attached to any class of shares may be varied with "the consent of the holders of any specified proportion, not being less than three-fourths, of the issued shares of that class." Under clause (*b*), the variation may be made subject to "the sanction of a resolution passed at a separate meeting of the holders of those shares, and supported by the votes of the holders of any specified proportion, not being less than three-fourths of those shares."

A doubt may arise as to how the words "supported by the votes of the holders of any specified proportion, not being less than three-fourths, of those shares" occurring in clause (*b*) are to be construed —whether they mean not less than three-fourths of the issued shares of the class whose rights are proposed to be altered or three-fourths of the shareholders of that class present in the meeting.

In this connection, the following points may be observed:—

(1) First, the words in question do not occur in the corresponding section 66A of the old Companies Act. As the preceding portion of clause (*a*) of section 106(1) of the new Act has been reproduced *verbatim* from section 66A of the old Act, the addition that has been made must be with some purpose.

(2) Secondly, the language of clause (*a*) differs from that of clause (*b*). Clause (*a*) speaks in terms of "*the issued shares*" of the class whose rights are proposed to be altered, whereas clause (*b*) refers to a "specified proportion, not being less than three-fourths, *of those shares.*" If the intention underlying clause (*b*) is that holders of at least three-fourths *of the issued* shares of the class concerned must support the resolution, it may well be asked why the language of clause (*a*) has not been repeated in clause (*b*).

(3) Thirdly, some indication of the intention underlying clause (*b*) of section 106(1) may be gathered from Regulation 3(1) of model Table A contained in Schedule I to the Act. This regulation provides that the rights attached to any class may, subject to the provisions of sections 106 and 107, "be varied with the consent in writing of the holders of three-fourths of the issued shares of that class, or with the sanction of a special resolution passed at a separate general meeting of the holders of the shares of that class." The first alternative is in accordance with clause (*a*) of section 106(1). The second alternative provides for a special resolution and under sub-section (2) of section 89, a resolution is deemed to be a special resolution when the votes cast in favour "are not less than three times the number of the votes, if any, cast against the resolution by members so entitled and voting." In other words, if Regulation 3(1) of Table A is read with section 189, clause (*b*) of sub-section (1) of section 106 appears to provide that variation of the rights attached to any class of shares may be made subject to the sanction of a resolution supported by the votes of not less than three-fourths of the holders of those shares present in the meeting.

The foregoing points are, however, not conclusive. As a matter of fact, opinion is sharply divided on the two possible interpretations and it would, therefore, be advisable to amend clause (*b*) of section 106(1) so as to clarify the underlying meaning with reasonable clearness.

Section 111 : Power to Refuse Registration

Articles generally give a direction to the Board of Directors to refuse to register a transfer of any share or interest thereon or of any debenture of the Company. This right of the Board of Directors is recognised by section 111 of the Act. The aggrieved party has a right of appeal to the Central Government if the Board of Directors refuse registration pursuant to powers conferred upon it by the articles. The peculiarity of this section is that, in the absence of the provisions in the articles relating to powers of directors to refuse registration, no remedy is available by way of appeal to the Central Government if the directors refuse registration.

Section 111 does not indicate as to what would be the consequences if the company refuses registration even when an order is made by the Central Government in appeal.

Again, section 111 appears to be only an enabling section and not an obligatory one. It is presumed that recourse to a court of law for redress by the aggrieved party is not ruled out. A question may arise whether the aggrieved party may simultaneously apply to the Central Government and also to the court of law. If answer to this question is in the affirmative, it may well be further asked as to what would happen in the event of the Central Government and the court giving different findings. Section 111 does not indicate any answer to this query.

Sections 138 and 139 : Satisfaction of Charges

Sub-section (5) of section 138 provides for recording of satisfaction of charges when the Registrar is satisfied from sources other than the mortgagee company that the charge has been satisfied in whole or in part. A question may well be asked whether the Registrar is competent to refuse to record satisfaction of the charge on the report of the mortgagee company. In other words, whether a refusal on the part of the Registrar to exercise the discretion conferred upon him under sections 138(5) and 139 is justified in law? The answer to this question is not free from doubt as the report of satisfaction of charge by the mortgagee is not specifically covered either by section 138 or the Return in Form No. 17.

Section 147

Section 147 provides for the publication of its name by a company as mentioned in clause (*c*) of sub-section (1). It is usual for business or manufacturing concerns to advertise their goods or products by their trade names without mentioning the names of their companies. Technically speaking, such an advertisement to push sales may fall under clause (*c*) of sub-section (1) and, if a company fails to mention its name in such an advertisement, it becomes liable for an offence punishable under sub-section (3). Obviously, this does not seem to be the intention of the legislature. Thus, clause (*c*) of this section seems to suffer from want of clarity.

Section 205 : Dividends and Depreciation

Section 205 provides that a company shall pay dividend only out of profits. The Act does not define the expression "profits." It even does not say as to what is included in the connotation of the expression "profits." Section 349, however, indicates as to how the "net profits" of a company in any financial year should be computed for the purpose of section 348 which limits the remuneration of a managing agent to 10 per cent. of net profits. It is suggested that it is desirable to state clearly as to what is meant by the expression "profits" in this section.

The expression "profits" raises another controversial question, namely, whether it is open to directors, if they so think fit, to declare a dividend without providing for any depreciation. In the absence of any specific provision in the Act as to the amount and the basis of depreciation to be provided and adjusted in the accounts before the declaration of dividend, it is difficult to answer this question and it must await judicial consideration.

Section 262 : Casual Vacancies Among Directors

Under sub-section 1 of section 262, appointment of the person to fill in the casual vacancy among the directors is subject to the provisions in the articles. Most of the companies provide in the articles for the retirement of the person so appointed to fill in casual vacancy at the time of the annual general meeting. But, under sub-section 2 of this section, the person appointed to fill in casual vacancy has to retire at a time the director in whose place he is appointed would have in natural course ceased to have been a director. This inconsistency between the two sub-sections should be carefully considered.

Section 295 : Loans to Directors

Loans to directors, etc., granted before 1st April, 1956 are required to be recovered by section 295 within a specified period, "notwithstanding any agreement to the contrary." This may raise a question as to who is to pay the penalty for breach of agreement?

Section 293 : Temporary Loans

Section 293(1)(*d*) provides that temporary loans obtained from the Company's bankers in the ordinary course of business are to be excluded while calculating the borrowings of the company. Section 293 does not state what are deemed to be "temporary loans" obtained by the company from its bankers in ordinary course of business. It may be observed that bank advances are generally repayable on demand and they are not "temporary advances." "Temporary advances" cannot be said to be "temporary loans."

Section 293(1)(e)

The language of clause (*e*) of sub-section 1 of section 293 also suffers from want of lucidity. It should clearly indicate the causes for which the board of directors of a public company and a private company which is a subsidiary of a public company can contribute to funds. It should, for instance, say whether the directors can donate funds for helping any national cause, encouraging sports or for constructing works of general public utility.* The intention of the legislature cannot be allowed to be gathered from doubtful inference. It must be manifest with reasonable clearness.

Section 314

The stricter provisions of section 314 should be relaxed so as to exclude (1) relatives holding posts of small remuneration, not exceeding Rs. 150 in basic pay, (2) a private company not being a subsidiary of a public company and (3) non-profit-making company.

Section 299(3) : Disclosure of Interests by Director

Under section 299, every director is required to disclose his interest as a director or member of a specified body corporate or a member of a specified firm and is to be regarded as concerned or interested in any contract or arrangement which may be entered into with that body corporate or firm. A director is really interested in a contract with a body corporate of which he is a director or a firm of which he is a partner. But, generally, he is not interested in a body corporate of which he is merely a shareholder except that for receiving dividend. In many cases, directors purchase the shares and sell the same and it may become rather inconvenient to intimate the company whenever they purchase or sell the shares. This sub-section should be amended so as to include only body corporates of which he is a director or a firm of which he is a partner.

It is likely that a relative of the director might be employed under the company or its subsidiary. If a director is common in both the holding and subsidiary companies and a relative is employed only in a subsidiary company, a special resolution of a subsidiary company would be necessary, but it does not stand to reason as to why a special resolution of the holding company would be necessary when the relative of that director is not the employee of the holding company. Accordingly, section 314 should be suitably amended to remove this ambiguity.

The Position of an Auditor

It is a debatable issue as to whether a director would be affected by the provisions of the section 314 if he happens to be the relative of the auditor. The auditors are appointed by the company in general meeting and not by the directors and, therefore, it is doubtful whether the director incurs disqualification merely because he happens to be a relative of a director within the meaning of section 6 of the Act.

Section 348

Section 348, which specifies the remuneration of managing agents (at 10 per cent. of net profits), contains the words "or in any other capacity." Let us consider what would be the effect on this section if the foregoing words are dropped from it. The section with the aforesaid words dropped would be capable of two different interpretations. The first interpretation is that the absence of the aforesaid words from section 348 would make no difference to the meaning of that section. This interpretation is based upon the assumption that the legislature used the aforesaid words by way of abundant caution. The second interpretation is that it would make a substantial difference to the meaning of section 348. It is in this sense that the 10 per cent. remunerations mentioned in section 348 would then be limited and confined to the services rendered by the managing agents as such and not otherwise. If the second interpretation is presumed to be correct, the result is that the absence of the said words in section 309 dealing with the overall remuneration payable to managing agents, director, manager, etc., produces an effect which may be contrary to or inconsistent with the view of the Bombay High Court in a special case under section 90 of the Code of Civil Procedure (*Ramaben* vs. *Jyoti Limited and others*, 1956, Bom. L.R., p. 67).

Section 359

Sub-section 2 of section 359 provides that every contract and all particulars relating thereto shall be entered in a separate register maintained by the company for the purpose but it does not say what are the particulars to be entered in the register. The sub-section (2) should be more specific regarding particulars.

*Re: *Indian Iron and Steel Co., Ltd.*, A.I.R. 1937 Calcutta, 234.

Sections 356 to 360

The question whether it is an offence not to maintain the registers specified in sections 356 to 360 is not free from doubt. But the offence is punishable under section 163 if the inspection demanded by a member is refused.

Section 362

Section 362 which provides for the inspection of the documents specified in sections 356 to 360 does not indicate the penalty in case the requisite registers are not maintained or their inspection refused. Section 614, which gives power to the Registrar to enforce the duty of company to make returns, etc., does not apply to this case. One must look to the language of section 362 itself. Section 362 provides that the registers referred to in sections 356 to 360 shall be open for inspection and extracts may be taken therefrom and copies thereof may be required by any member in the same manner and to the same extent and on payment of the same fees, as in the case of register of members. Now the register of members is open to inspection under the provisions of section 163. It, therefore, follows that refusal of inspection of these documents may amount to an offence punishable under section 163. A sub-section should, therefore, be added to section 362 indicating penalty as mentioned in sub-section 5 of section 163.

Section 370

Section 370 regulates loans to companies under common management but it does not provide for similar loans already made before the commencement of the Act.

Section 417

Section 417 requires employees' securities to be deposited in a Scheduled bank. A question may well be asked whether this section permits the employing company to retain the moneys or securities with itself in a special account if such employing company is itself a Scheduled bank. The opinion is divided. One view is that the retention of the moneys or securities by the bank with itself in a special account opened for the purpose is a sufficient compliance with section 417. The other view is that it is not. The later view seems to be reasonable and also consistent with the plain language of the section.

Section 418

The amount of provident fund contributions is required by section 418 to be deposited in a post-office savings bank account or invested in trust securities, referred to in clauses (*a*) to (*c*) of section 20 of the Indian Trust Act, 1882. The legislature, while enacting this section, seems to have overlooked the fact that post-office savings bank accounts are of restrictible nature.

Section 599

Section 599 imposes a civil disability on a foreign company if it fails to comply with the provisions of Part XII of the Act. This is entirely a new section and suffers from want of lucidity. It raises a question whether the compliance with the provisions of Part XI of the Act by a foreign company is a condition precedent to bringing any suit, claiming any set-off, making any counter-claim or instituting any legal proceeding in respect of any contract, dealing or transaction. Legal opinion is divided. One view is that the compliance with the provisions of Part XI is a condition precedent. The other is that it is not. But, having regard to the language of the section, the former view, however strict and unreasonable it may be, seems to be correct.

"Remuneration of Directors"

The phrase "remuneration of directors" is not defined in the Act. The meaning of this phrase has to be gathered from the Act itself or from other sources. Such a definition should have been inserted in the Act.

Further, the pivotal provisions of the Act as regards managerial remuneration and prohibition against granting of sole selling or buying agencies to managing agents, are contained in two groups of independent provisions. They are likely to create difficulties in interpretation and understanding.

Forms

The multiplicity of forms which are required to be filed by the companies and their directors in the course of day-to-day administration of corporate finance should be reasonably reduced both from the view of number as well as expenditure of company's funds. The reduction, however, should not be to such an extent as to encourage ingenious attempts to escape the rigour of the law.

Penal Provisions

The present Act provides for a large number of offences arising out of contravention of its mandatory and other provisions. They may be conveniently divided into five groups, namely,

(1) offences punishable with fine for every day the default continues;

(2) offences punishable with fine only;

(3) offences punishable with imprisonment;

(4) offences punishable with fine and imprisonment; and

(5) offences punishable with fine or imprisonment or both.

The foregoing groups cover about 164 different kinds of offences and out of these there are about 43 continuing offences. The present Act is intended to be intelligently and sympathetically administered

Notice

BENGAL JUTE MILL COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE 26th Annual General Meeting of the Members of the Company will be held at the Registered Office of the Company at 8, Dalhousie Square East, Calcutta, on Monday the 8th July 1957, at 4-30 p.m., for the purpose of receiving the Directors' Report, passing the Audited Accounts, declaring the Dividend recommended by the Directors for the year ended 30th June 1956, electing Directors in place of the retiring Directors, appointing Auditors and for transacting any other business of the Company that may be transacted thereat.

1. To appoint and/or approve the appointment of Sri M. L. Jalan pursuant to Section 261 of the Companies Act, 1956, who was appointed a Director at the Board Meeting held on 17th December 1940 and if thought fit to pass the following resolution as Special Resolution. The relative Explanatory Statement concerning which as required by Section 173 of the said Act is annexed hereto.

"Resolved that pursuant to the provisions of Section 261 and other applicable provisions (if any) of the Companies Act, 1956, the appointment of Sri M. L. Jalan a Director of the Company, who is also a partner of Messrs. Soorajmull Nagarmull the Managing Agents of the Company, be and is hereby made and/or approved as required by the provisions of the said Section."

2. To appoint and/or approve the appointment of Sri N. K. Jalan pursuant to Section 261 of the Companies Act, 1956, who was appointed a Director at a Meeting held on 10th May 1954 and if thought fit to pass the following resolution as Special Resolution. The relative Explanatory Statement concerning which as required by Section 173 of the said Act is annexed hereto.

"Resolved that pursuant to the provisions of Section 261 and other applicable provisions (if any) of the Companies Act, 1956, the appointment of Sri N. K. Jalan a Director of the Company, who is also a partner of Messrs. Soorajmull Nagarmull the Managing Agents of the Company, be and is hereby made and/or approved as required by the provisions of the said Section."

3. To appoint and/or approve the appointment of Sri B. L. Jalan pursuant to Section 261 of the Companies Act, 1956, who was appointed a Director at a Meeting held on 20th April 1955 and if thought fit to pass the following resolution as Special Resolution. The relative Explanatory Statement concerning which as required by Section 173 of the said Act is annexed hereto.

"Resolved that pursuant to the provisions of Section 261 and other applicable provisions (if any) of the Companies Act, 1956, the appointment of Sri B. L. Jalan a Director of the Company, who is also a partner of Messrs. Soorajmull Nagarmull the Managing Agents of the Company, be and is hereby made and/or approved as required by the provisions of the said Section."

4. To consider and if thought fit to pass the following resolution as a Special Resolution, the relative Explanatory Statement in respect of which as required by Section 173 of the Companies Act, 1956, is annexed hereto:

"Resolved that the provisions of the Memorandum of Association of the Company with respect to the objects of the Company be altered in the manner following:—

(i) That the existing sub-clause (25) of clause (3) of the said Memorandum be deleted and the following sub-clause be added after the existing sub-clause (25) of clause (3) of the said Memorandum as sub-clause (25) and (25A)—

(25) To provide for the welfare of Directors or employees or ex-employees of the Company or its predecessors in business and the wives, widows and families or the dependents or connection of such persons by building or contributing to the building of houses or dwellings or quarters or by grants of money, pensions, gratuities, allowances, bonuses, profits-sharing bonuses, or benefits or any other payments or by creating and from time to time subscribing or contributing to provident and other associations, institutions, funds, profits-sharing or other schemes, or trusts and by providing or subscribing or contributing towards places of instruction and recreation, hospitals and dispensaries, medical and other attendance and other assistance as the Company shall think fit.

(25A) To subscribe or contribute or otherwise to assist or to guarantee money to charitable, benevolent, religious, scientific, national, public, political or any institutions, objects or purposes or for any exhibitions.

5. To consider and if thought fit to pass with or without modification the following resolutions and the relative Explanatory Statements concerning which are annexed hereto as required by Section 173 of the said Act:—

(i) *As an Ordinary Resolution*:

"Resolved that consent of the Company be and is hereby given to the Board of Directors with effect from the date of commencement of the Companies Act, 1956, to contribute and/or subscribe from time to time to any national, political, charitable, benevolent, public or general and other funds not directly relating to the business of the Company or the Welfare of its employees, such amounts as may be considered proper by it notwithstanding that such amounts in any financial year may exceed Rs. 25,000 or 5 per cent. of the Company's average net profits, as determined in accordance with the provisions of the Companies Act, 1956, during the three financial years immediately preceding whichever is greater."

(ii) *As an Ordinary Resolution*:

"Resolved that pursuant to sub-section (I) (b) of Section 293 of the Companies Act, 1956, the Company hereby consents with effect from the commencement of the Companies Act, 1956, to the Board of Directors of the Company borrowing moneys for the purpose of the Company from time to time notwithstanding that the moneys so to be borrowed together with the moneys already borrowed by the Company (apart from the temporary loans, if any, obtained from the Company's Bankers in the ordinary course of business) will exceed the aggregate of the paid-up capital of the Company and its free reserves, that is to say, reserves not set apart for any specific purpose."

6. Any other business that may be brought forward.

EXPLANATORY NOTE

Item No. (2) of the Notice, Section 261 (1) (f) of the Companies Act, 1956, read with sub-section 7 (4) of the same section of the Companies Act, 1956, requires the re-appointment of any Director retiring by rotation who is an associate of the Managing Agents to be made by a Special Resolution.

And since it is desirable for the benefit of the Company to avail of the valuable advices of Mr. M. L. Jalan, at present a Director of the Company, who is an associate of the Managing Agents, by retaining him as a member of the Board of Directors of your Company, it will be desirable that the above proposed Special Resolution, Special Notice of which has been received by the Company, be passed.

In respect of Item No. (2) of the Notice, Section 261 (1) (f) read with sub-section (4) of the same section of the Companies Act, 1956, requires the appointment of any Director who is an associate of the Managing Agents to be made by Special Resolution.

And since it is desirable for the benefit of the Company to avail of the valuable advices of Mr. N. K. Jalan, at present a Director of the Company, who is an associate of the Managing Agents, by retaining him as a member of the Board of Directors of your Company, it will be desirable that the above proposed Special Resolution, Special Notice of which has been received by the Company, be passed.

In respect of Item No. (3) of the Notice, Section 261 (I) (f) read with sub-section (4) of the sub-section of the Companies Act, 1956, requires the appointment of any Director who is an associate of the Managing Agents to be made by Special Resolution.

And since it is desirable for the benefit of the Company to avail of the valuable advices of Mr. B. L. Jalan, at present a Director of the Company, who is an associate of the Managing Agents, by retaining him as a member of the Board of Directors of your Company, it will be desirable that the above proposed Special Resolutions, Special Notice of which has been received by the Company, be passed.

In respect of Items Nos. 4 and 5 of the Notice, sub-clause (25) of Clause 3 of the Memorandum of Association of the Company runs as follows:—

To establish and support, or aid in the establishment and support of associations, institutions, funds, trusts and conveniences calculated to benefit employees or ex-employees of the Company or its predecessors in business or the dependents or connections of such persons and to grant pensions and allowances and to make payments towards insurance and to subscribe or guarantee money for charitable or benevolent objects or for any exhibition for any public, general or useful objects.

This sub-clause deals with two different classes of objects to which the Company may contribute funds; one to charitable and public objects and institutions of benefit to the Company, and the other relates to the grant of pensions and benefits to employees and their relatives. As these are two distinct objects, it is desirable that they should be set out separately. It is also felt that the clause, in so far as it relates to support of and subscriptions to charitable, public and beneficial objects and institutions is stated in a form which is rather restricted not to suit modern conditions. The industrial policy of Government under conditions today is of vital importance to most industries, and particularly to a key industry like the Jute industry. It is, therefore, in the interests of the Company to be able to contribute to the funds of political parties also which in the Company's opinion will serve the interests of industry in general and of the Jute industry in particular.

Section 293 (I) (e) of the Companies Act, 1956, clearly recognises the right of a Company to contribute to funds not directly relating to its business or the welfare of its employees by providing that the contribution of the company in such cases shall not exceed 5 per cent. of its average net profits or Rs. 25,000 whichever is the higher. In the discussion in the Lok Sabha on this subject it was recognised that this provision covered contributions to political funds and purposes.

It is believed that the existing clause in the Memorandum might enable the Company to make contributions to a political fund, but it is desirable to eliminate any doubt on the subject by a specific provision in the Memorandum of Association enabling the Company to contribute to such political objects and purposes.

It is, therefore, proposed, in place of the present sub-clause (25), to provide two sub-clauses, one for the grant of benefits to employees and their families, and another for subscription or contribution to charitable and other objects (including political objects).

In respect of Item No. 5 (ii), the Company has occasionally to borrow money from Banks which may on occasions, exceed the aggregate of the paid-up capital of the Company and its free reserves, that is to say, reserves not set apart for any specific purposes; under Section 293 of the Companies Act, 1956, the Board of Directors of a Public Company cannot, except with the consent of the Shareholders in General Meeting, borrow moneys after the commencement of the Act, where the moneys to be borrowed, together with the moneys already borrowed by the Company (apart from temporary loans obtained from the Company's Bankers in the ordinary course of business) will exceed the aggregate of the paid-up capital of the Company and its free reserves, that is to say, reserves not set apart for any specific purpose.

Although the Directors of the Company are of the opinion that the borrowings of the Company fall within the category of temporary loans which do not require the consent of the Company in General Meeting, they are advised that it would be better for the Company to place the matter beyond reasonable doubt and to secure the consent of the Shareholders of the Company for the borrowing of moneys in excess of the aggregate of the paid-up capital of the Company and its free reserves.

The Share Transfer Registers of the Company will remain closed from the 1st July 1957 to the 8th July 1957, both days inclusive.

By Order of the Board,
For & on behalf of
BENGAL JUTE MILL CO., LTD.,
SOORAJMULL NAGARMULL,
Managing Agents.

8, DALHOUSIE SQUARE EAST,
CALCUTTA, *Dated the 4th June*, 1957.

N.B.—You are entitled to attend and vote at the Meeting by a Proxy who need not be a Shareholder of the Company. If it is desired to use the Proxy the same should be completed in manner prescribed by Section 176(5) of the Companies Act, 1956, and delivered at the Registered Office of the Company at least 48 hours before the time fixed for the Meeting.

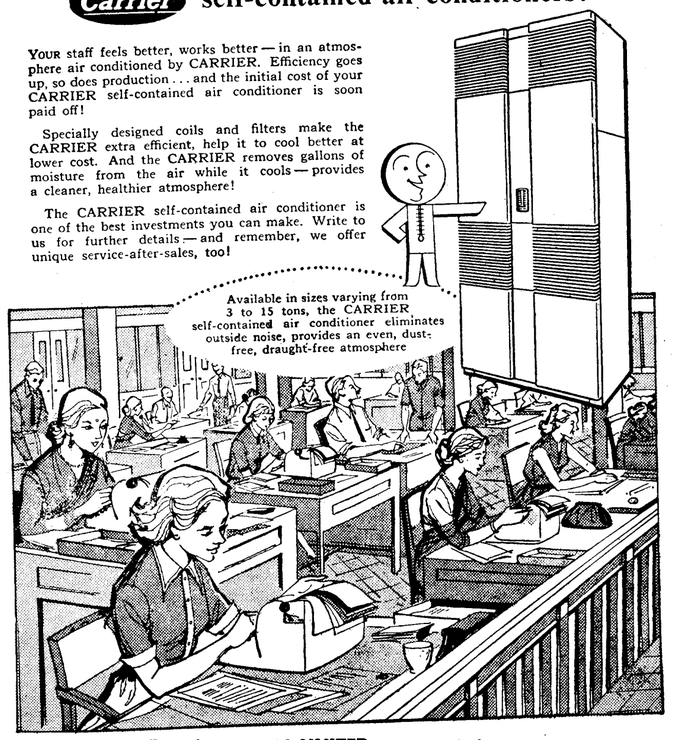
Efficiency goes up
...in premises cooled by
Carrier self-contained air conditioners!

YOUR staff feels better, works better — in an atmosphere air conditioned by CARRIER. Efficiency goes up, so does production ... and the initial cost of your CARRIER self-contained air conditioner is soon paid off!

Specially designed coils and filters make the CARRIER extra efficient, help it to cool better at lower cost. And the CARRIER removes gallons of moisture from the air while it cools — provides a cleaner, healthier atmosphere!

The CARRIER self-contained air conditioner is one of the best investments you can make. Write to us for further details — and remember, we offer unique service-after-sales, too!



Available in sizes varying from 3 to 15 tons, the CARRIER self-contained air conditioner eliminates outside noise, provides an even, dust-free, draught-free atmosphere

CALTEX PETROLEUM PRODUCTS

TREND OF INDIA'S TRADE WITH SELECT COUNTRIES—I

OUTLOOK FOR EXPORTS TO WEST ENCOURAGING

INDIA'S adverse balance of trade in merchandise during 1956 was over double the level of Rs. 105 crores witnessed in 1955. This was due, as is now well known, primarily to the expanding imports of machinery, steel and metals, for the execution of development projects. The average monthly value of imports steeply rose from Rs. 54 crores in 1955 to over Rs. 67 crores in 1956. At the same time, the corresponding value of exports declined during the same period from around Rs. 50.50 crores to Rs. 49.80 crores. This fall in exports was attributable to a myriad causes, such as fall in the production of export commodities in India, competition from foreign products to Indian exports, fall in world prices of certain commodities, increasing use of synthetics and, not the least important, inability of Indian exporters to meet foreign demand due to inadequate transport, both rail and shipping, and port facilities at home. Nevertheless, according to the reports submitted by various Commercial Attaches to our Embassies abroad, export prospects for the current year are generally encouraging. This is primarily so, because of the fairly rapid expansion in economic activity that is in evidence in various countries. The reviews of the Commercial Attaches have been brought together in a supplement to the latest issue of the Commerce and Industry Ministry's official publication, entitled the *Journal of Industry and Trade*. In this and the succeeding two articles, it is proposed to bring out the essence of these reviews. The trade with Britain, the U.S. and Canada will form the subject matter of this article.

A characteristic feature of India's trade with the U.K. in 1956 was that its imports of British goods increased substantially from £130.2 million in 1955 to £167.8 million, while its exports to it decreased from £159 million to £141.5 million. Consequently, India had an adverse trade balance of £26.4 million with the U.K., as compared with a favourable trade balance of the order of £28.8 million in the preceding year. It is noteworthy that, in 1956, the post-war trend of decline in India's imports of consumer goods from the U.K. continued. This was in sharp contrast with the higher rate of imports of machinery, steel, chemicals and other capital items. At the end of 1956, India ranked as the biggest market for British machinery, other than electric, with Australia and South Africa as second and third, respectively. Thus, its imports of these items were valued at £45.3 million in the year under review, as against £32.5 million in 1955.

Drop in Exports

The drop in the value of India's exports to the U.K. was accounted for by price lag in tea, reduced export earnings from items like jute manufactures, leather, grey cloth and manganese ore. To take one example, the quantity of tea exported in the year increased by 16.2 million lbs. to 299.7 million lbs.; its value, however, declined by £6.6 million to £68.9 million, as compared with 1955. Increased earnings were, however, recorded from certain items, chiefly tobacco, linseed oil, cotton yarn and fabrics other than grey cloth. Linseed oil exports, for example, receded from 968,814 cwts. in 1955 to 801,291 cwts. in 1956, but their value rose from £4.7 million to £5.1 million during the same period. In this field, according to the authors of the report, the prospects for 1957 seem to be bright, what with the expected fall in the linseed output in Argentina in 1957 and the continued demand in the U.K. The latest overseas advices, however, point to a fall in linseed prices due to liquidation of stocks by the U.S. Commodity Credit Corporation and to prospects of a bigger linseed crop in Canada where the acreage for the current season is higher at 3.48 million, as against 3.09 million in the previous season.

To revert to India's exports to Britain in 1956. The U.K.'s imports of Indian-made cotton yarn, too, increased moderately, though grey cloth exports reflected a slight decline owing to competition from Hong Kong. India's exports of tobacco also increased by 3.6 million lbs. to nearly 40 million lbs. in 1956. Consequently, its earnings were higher by £1.0 million at £8.2 million. Viewed against the background of reduced tobacco imports into the U.K., this performance during the year can be termed fairly good. Rhodesian exports of this commodity for the current year are said to be bright. In the case of manganese ore, on the other hand, though exports to the U.K. declined substantially in 1956, British importers are stated to be prepared to take all the ore India is prepared to supply. India's ability to do so, however, depends on better transport facilities.

Trade With U.S.

India's trade with the U.S. followed a similar pattern as that with the U.K. Though general boom conditions and expanding business activity prevailed during the year in the U.S., its imports from India declined significantly, while its exports to India registered a sizable increase. Thus, while India's exports, in terms of rupees, fell from Rs. 91.06 crores in 1955 to Rs. 84.78 crores in 1956, its imports rose from Rs. 89.81 crores to Rs. 94.24 crores in the same period. During the first ten months of the year 1956 alone, India had an unfavourable trade balance of $18.1 million, as against a favourable trade balance of $34.4 million for the whole of 1955. The major declines in exports from India to the U.S. occurred in tea—by 2.7 million lbs. to 94.2 million lbs. in the first 11 months of 1956—and manganese ore, from 4,427 million lbs. in 1955 to 3,050 million lbs. in the first nine months of 1956. The fall in respect of tea was due to quality differentials and fluctuations in the price. In the case of manganese, it is stated that high price quotations and lack of promptness in deliveries were responsible for the fall in demand.

Again, though the volume of pepper exports at 15.3 million lbs. in the first three quarters of 1956 was larger and constituted no less than 55 per cent. of the U.S. total imports of this item, as compared with 47.4 per cent. for the whole of 1955, the dollar value declined considerably, because of a sharp fall in pepper prices during that period. In the case of cashew nuts, on the other hand, imports declined in volume from 62.75 million lbs. in 1955 to 42.2 million lbs. for the first 10 months of 1956, but this decline was more than offset by a rise in prices. It is also noteworthy that the year witnessed an increase in Indian exports to the U.S. of unmanufactured wool, jute and jute manufactures, and also saw the beginnings of the flow of shrimp. Further, shellac did not fare well partly because of competition from Thailand and partly because the U.S. importers began to prefer increasingly seed lac and stick lac. Mica was another important item. Its imports into the U.S. amounted, in the first 10 months of 1956, to 19.3 million lbs. valued at $5.6 million. Though this quantity accounted for nearly 86 per cent. of the total imports of mica into the U.S., its dollar value was only 56 per cent. One of the reasons for this was that as much as 60 per cent. of India's exports consisted of waste which was priced very low.

Export prospects for mica, especially for high quality material, are stated to be very bright. The demand for jute goods, in view of the Federal Road Building Programme, for manganese, in view of the major expansion taken in hand in the steel industry, and that for cashew nuts are expected to be quite good during the current year.

Canada

Canada is another country the trade of which during 1956 expanded substantially, but the imports of which from India declined markedly. Imports from India valued at $35.1 million in 1955, declined to an estimated level of $30.6 million in 1956. Despite this steep fall, Canada's imports of tea from India, which is the chief supplier of this item, fell slightly from 19.5 million lbs. in 1955 to an estimated level of 19.3 million lbs. But, due to price decreases, the value of such imports had fallen more steeply by about $3 million to $9.8 million in the year. Ceylonese tea, however, is said to have fetched better prices because of better quality. Coffee is another competitor to tea. Another reason for a fall in the Canadian imports of tea is stated to be the continued fall in inventories. The value of jute imports from India also declined by about $1 million to an estimated level of $9.4 million in 1956. This fall, despite the increasing demand for packing material, was attributed to the increasing use of substitutes like paper for packing purposes. In order to raise the exports of jute goods to Canada, the report from the Indian Embassy calls for the formation of a promotional organisation in that country.

Canada's imports of cotton textiles from India, however, increased both in value

(*Continued on page* 1251)

INDO-AUSTRALIAN TRADE

PROSPECTS EXAMINED

THE view that, as a result of the Australian Trade Mission's recent visit to India and Ceylon, Australia's trade with these countries would "conservatively increase by a continuing £2 million a year" was expressed by Mr. John G. Hurley in the course of an article to a recent issue of the Sydney *Financial Review*. An important proviso to the fulfilment of this hope, however, was the maintenance of export availability in items like steel and wool. Two of the most important prerequisites for expanding Australian exports to India and Ceylon, according to him, are greater publicity and regular and reliable shipping service. Incidentally, Mr. Hurley expressed satisfaction that the mission had achieved outstanding success in correcting the lack of awareness in these countries of Australia as a source of supply for the many items they now needed. He was also glad that the fleet of three shipping companies of Australia would be expanded shortly.

Referring to the significance of the composition of the mission, Mr. Hurley said that its thirty-seven members represented more than 300 Australian manufacturers, exporting and importing agencies, a majority of whom were offering for sale a wide range of manufactured goods entirely distinct from the traditional items. Among such items, mention must be made of air-conditioning, telecommunication, refrigeration, and radio equipment; plastics, motor vehicles, automotive spare parts, heavy engineering and construction, machine tools, cement-making equipment, wool tops, and dairy products. The character of the mission demonstrated very clearly, according to the leader of the delegation, "the increasing confidence and the growing awareness on the part of more and more Australian firms that the difficulties confronting the building up of a greater export trade with a type of product hitherto confined to local use are not insurmountable and, with effort and on-the-spot investigation, can be overcome." This fact, he felt, was more important than the solid achievement of the mission in writing an estimated £3 million worth of on-the-spot business, with a fair expectation of consolidated orders of £2 million a year in future.

Another important success of the mission pointed out by the leader was the extension of its activities to exporting capital. He recognised that one of the major needs of both India and Ceylon was for new capital investment—a need which was more pressing than in Australia. He pointed out, however, that Australia's ability to export capital was conditioned by its own needs. Despite these limitations, he thought that there were distinct possibilities of three organised ventures extending their activities to India. These, according to him, are an automotive spare parts factory, a plant for the manufacture of road-making equipment and a series of small cement-making plants. The cement plants, he explained, were intended to decentralise industry, with the objectives of bringing more employment opportunities to the thickly populated rural sections of India and of easing the heavy pressure on the rolling stock.

Alluding, in this connection, to the balance-of-payments problems facing Australia, he remarked that its problems in this respect had never been a tenth as serious as those against which India was currently struggling. India, he added, had to import enormous quantities of equipment to execute the developmental programmes. Deliveries, which were delayed due to world-wide shortages earlier, flooded into the ports in a short period, resulting in a rapid depletion of foreign exchange reserves. This state of affairs gave rise to the use of the device of deferred payment scheme, and a feeling among some European countries that "they had India on the hip." Further, this scheme had the effect of making the final cost of plant and machinery prohibitive—as much as 45 per cent. higher at the time of final payment, than at the time of agreement. From the point of view of Australian foreign trade, the balance of payments situation was not as alarming as might seem at first, according to Mr. Hurley. He expressed the belief that the difficulties arising from its foreign trade could be ironed out in the near future when, with the establishment of the Export Credit Guarantee Scheme, Australian exporters would find themselves on a par with those in other democratic countries.

COCHIN MALABAR'S PROFIT LOWER

BOTH GOVERNMENT AND SHAREHOLDERS GET LESS

A STEEP fall in the crop of rubber harvested, followed by higher costs of production, resulting in a sharp rise in expenses, has been responsible for a sizable reduction in the earnings of the Cochin Malabar Estates Ltd. (Managing Agents: Messrs. Peirce, Leslie & Co., Ltd., Kozhikode, Kerala) for the year ended 28th February 1957. The fall in earnings has brought in its wake a lower dividend which, at the proposed rate of 15 per cent. represents a cut from 25 per cent. declared for the previous year. The Directors are fully justified in taking this step, since the gross profit of the Company for the year under review has fallen to Rs. 11.52 lakhs from Rs. 13.92 lakhs earned in the previous year. The net profit, at Rs. 5.81 lakhs, is Rs. 1.35 lakhs lower than that for the previous year. Lower trading profit has naturally meant lower provision for taxation which at Rs. 3.70 lakhs is Rs. 1.50 lakhs less than the previous year's provision of Rs. 5.20 lakhs. The transfer to depreciation has been enhanced from Rs. 1.13 lakhs to Rs. 1.18 lakhs. The Directors have also set aside a higher sum of Rs. 3.50 lakhs to the general reserve, which had received Rs. 3 lakhs in the previous year.

The dividend on ordinary shares, as already stated, has once again been lowered to 15 per cent. from 25 per cent., to which level it had been stepped up from 15 per cent. for 1954-55. It may be of interest to note that even the dividend for the latter year at 15 per cent. represented a cut from 25 per cent. per annum paid consecutively for 1953-54 and 1952-53. In other words, the Company's dividend level has been pushed back to that which obtained for 1954-55.

The Company's progress during the past four years is fully reflected in the following comparative table:

(In rupees)

	For the year ended February			
	1957	1956	1955	1954
Sale proceeds	37,70,066	24,88,425	19,09,888	18,11,231

Carry forward	71,795	79,711	1,19,669	1,02,250
Crop harvested (in lbs.) ..	1,764,786	1,853,088	1,510,886	1,605,848
Cost of production per lb. ..	Cents 115.5	Cents 92.5	As. 14.24	As. 13.00
Average price realised per lb.	174.6	164.3	23.18	22.17

Attention may be drawn to two noteworthy features disclosed by the aforesaid table. The first relates to the appropriation policy of the Government. It is significant that, despite the new taxation policy of the Government which clearly seeks to penalise conservation of profits by way of high taxation of bonus shares and tax on total wealth, the Directors' enthusiasm for strengthening the reserves of the Company has not received any setback. On the contrary, they have actually set aside a larger proportion of the profit for this purpose. The second feature relates to the Government's share in the Company's income. This share, as already mentioned, has gone down. It is obvious that, if, for any reason, the profit margin of industries goes down, it is not the shareholders alone who suffer but also the Treasury. In its enthusiasm to heap more burdens on employers, the Ministers often seem to forget this aspect.

Both Dame Nature and Labour behaved in a manner unfavourable to the interests of the Company. The lower production was the result of severe drought, pest damage and labour unrest. The last cause was most evident during the highest yielding months, namely, October-December, 1956. The cost of production, too, was higher, which, on a lower output, meant relatively more per unit of rubber. The f.o.b. Cochin cost was 115.5 cents per lb., as against 92.5 cents in the preceding year. The impact of these adverse developments on the Company's profit would have been more marked but for a higher realisation on the rubber sold. Thus, the average price realised (sales *plus* valuation of stocks on 28th February, 1957) was higher by more than 10 points, 174.6 cents per lb., as compared with 164.3 cents in the previous year.

The Company's estate consists of 9,130.08 acres, of which the area under mature rubber is 5,540.62 acres and that under immature rubber 1,414.13 acres. The area replanted during the year was 55.20 acres, bringing the total immature replanted area in budded variety to 763.65 acres, or 11 per cent. of the planted area. It may be noted here that, in the area under mature rubber, budded variety accounts for 1,532.98 acres.

The financial position of the Company has become quite sound, thanks to the judicious policy adopted by the Directors of ploughing back a sizable part of the Company's profit year after year. Thus, even after the capitalisation of Rs. 7.18 lakhs in March 1952, the reserves and surplus, as at the end of the year of review, stand at Rs. 25.22 lakhs, as against a paid-up capital of Rs. 19.07 lakhs, divided into 2,266 seven per cent. tax-free cumulative preference shares of Rs. 50 each and 598,062 ordinary shares of Rs. 3 each. There has been an addition of Rs. 3.63 lakhs to the gross block during the year. Of this, the expenditure incurred on staff and labour quarters, including improvements to the factories, accounts for Rs. 1.39 lakhs, additions to machinery for Rs. 78,392 and development and maintenance of immature new clearings for Rs. 86,200. With this addition, the gross block amounts to Rs. 52.61 lakhs and the net block Rs. 47.01 lakhs. The current assets amount to Rs. 13.28 lakhs, while the current liabilities including the proposed dividends(Rs. 11.22 lakhs), and the provision for taxation (Rs. 4.77 lakhs) together aggregate Rs. 15.99 lakhs.

The crop for the current year is estimated at 2,000,000 lbs. at an f.o.b. cost of 113 cents per lb. The Company's visiting agent reports that the estate have been maintained in good order and that the development programme is being well executed.

The Rs. 3 fully paid-up ordinary shares of the Company are being quoted on the Madras Stock Exchange at Rs. 6.65 *cum-div.* On an *ex-div.* basis, the latest dividend gives a yield of 7.25 per cent. per annum.

COMPANY LAW ADVISORY COMMISSION

From 1st March 1956 to 31st May 1957, 1,727 applications relating to appointments of managing directors and managing agents, variations in managing agency agreements, changes in constitution of managing agents, etc., were referred by the Central Government to the Company Law Advisory Commission. Of these, the Commission disposed of 1,712 cases. Of the remaining 15 cases, five have since been disposed of, two are pending because of the investigations into the affairs of the companies by inspectors appointed by the Central Government, five are still under consideration of the Commission and the remaining three are awaiting further information asked for from the companies concerned.

The Commission meets, on an average, once a month when all important cases are discussed and disposed of, cases not presenting any complicated questions being meanwhile disposed of by circulation of papers. The average time taken by the Commission in disposing of such references is three to four days per case.

The table below shows the month-wise disposal of applications by the Commission from March 1956 to May 1957:

Month and year	Total number of applications received from Government	Total number of applications disposed of	Total number of applications pending
1956			
March	88	88	Nil

May	143	134	9
Total ..	1,727	1,712	15

The Department of Company Law Administration has clarified the position in regard to trusts or trustees described as such and entered in the share registers of some companies as members. According to this clarification, shares in a company, being the property of a trust, can be held in the names of its trustees, being individuals, corporations, companies or societies registered under the Societies Registration Act, 1860, without the addition of the statement that they are trustees. Such shares, however, cannot be held in the name of the trust as such, unless it is a separate legal entity such as a registered society. Companies are, therefore, requested that, wherever necessary, their share registers should be rectified so as to comply with the law as explained above.

B.I.C. FARES BETTER

SMALL DIVIDEND ANNOUNCED

AFTER two years of unfavourable working conditions, of which the previous year proved to be the more adverse, the working results of the British India Corporation Ltd. (Managing Director: Mr. W. H. J. Christie, Kanpur) for the year ended 31st December 1956 seem to indicate that the Company has turned the corner and that its prospects have been switched on, once again, to an era of better earnings. The Company has earned a gross profit of Rs. 28.58 lakhs, in refreshing contrast to the gross loss of Rs. 15.24 lakhs suffered in the previous year for the first time after many years, and the very modest profit of Rs. 5.20 lakhs made for 1954. In fact, the previous year's working proved to be so unfavourable that the Company had to hold in arrears even the dividend on its preference shares for the first time since the early thirties. When that was the fate of the preference shares, it is quite obvious that the dividend on the ordinary shares had to be skipped over. The year's profit, together with the amounts written back from certain provisions no longer required and income from other sources, has enabled the Company to pay off the arrears, as well as the current dividend on its preference shares and also declare a small, almost token, dividend of 2 per cent. on its ordinary shares.

The net profit, after setting aside Rs. 11.52 lakhs for depreciation, as against Rs. 15 lakhs for 1955, amounts to Rs. 17.06 lakhs, and compares well with the net losses of Rs. 30.24 lakhs for the previous year and Rs. 4.80 lakhs for 1954. This favourable trend, after two years of successive losses, coupled with the assurance of the Directors that "they will continue to spare no efforts to bring about a further improvement," should infuse confidence among the Company's shareholders about the future.

The sum written back from provisions no longer required amounts to Rs. 52.84 lakhs and the profit on realisation of investments and surplus on revaluation of stores, etc., and sale of machinery accounts for Rs. 14.65 lakhs. After writing off the debit balance on the profit and loss account brought forward from last year, amounting to Rs. 27.37 lakhs, a sum of Rs. 35.85 lakhs has been transferred to the reserves. A breakdown of this transfer shows that the reserve for future taxation takes up Rs. 20 lakhs, investments reserve Rs. 5.85 lakhs (the full amount of the profit on realisation of investments), reserve for bad and doubtful debts Rs. 5 lakhs and rehabilitation reserve Rs. 5 lakhs. The dividend at 2 per cent. or 10 naye Paise per ordinary share of Rs. 5 absorbs Rs. 6.50 lakhs, leaving a balance of Rs. 1.22 lakhs to be carried forward.

The salient features of the working results of the Company for the past four years are compared in the following table:

(In lakhs of rupees)

	For the year ended 31st December			
	1956	1955	1954	1953

* For 1955 and 1956.

The Corporation's sale proceeds for the year show a substantial improvement of Rs. 145.91 lakhs over those for the previous year. This was due to the traditionally high quality of Lalimli and Dhariwal woollen goods which was maintained and improved upon wherever possible, and their continued favourable reception by the market. Other expenses increased by Rs. 109.55 lakhs but this was offset, to a great extent, by the raw materials and manufacturing charges which have fallen by Rs. 185.86 lakhs.

The efforts made by the Corporation's staff to improve the working of the Cawnpore Cotton Mills achieved some measure of success by the end of August 1956. But, the additional excise duty on cotton cloth with effect from September, led to a deterioration in offtake and unsold stocks steadily mounted up, despite reductions in selling prices to unremunerative levels. Rationalisation continued to be prevented, and the locking up of money in unsold stocks aggravated the Company's shortage of working capital and restricted its ability to finance the purchase and installation of new machinery. The Directors state that the trading results of the branch for the year were unsatisfactory.

The Corporation's leather and footwear branches also had to cope with great difficulties during the year. Excise duty on footwear, from which cottage and small-scale industries are exempt, continued at the rate of 10 per cent. and fell mainly on the producer. The quality of hides continued to deteriorate. However, the Corporation's efforts to reduce the cost of production and also to maintain and improve the quality and range of its products offered for sale, continues unhindered. A welcome development during the year was the receipt of orders for a substantial quantity of footwear for export. This, however, came too late in the year and, hence, could not offset the effect of other unfavourable factors of trading for the year. The Directors hope that this will help increase exports during the current and future years with corresponding improvement in working results of the leather and footwear branches.

The Company has a paid-up capital of Rs. 406 lakhs, divided into 81,000 preference shares of Rs. 100 each and 6,500,000 ordinary shares of Rs. 5 each. This is supplemented by reserves and surplus aggregating Rs. 156.78 lakhs. Loans from banks, secured against stores, stocks and investments amount to Rs. 340.76 lakhs. The provision for taxation stands at Rs. 2.28 lakhs and other current liabilities amount to Rs. 118.68 lakhs. There has been an addition of Rs. 23.52 lakhs to the gross block during the year, bringing its total value to Rs. 300.58 lakhs. This stands well written down to Rs. 73.18 lakhs. This is inclusive of expenditure on buildings and machinery in course of construction and installation amounting to Rs. 6.41 lakhs. Investments in Government securities and shares of companies account for Rs. 180.08 lakhs and other investments for Rs. 2.44 lakhs. The current assets aggregate Rs. 768.79 lakhs and include, among other things, stores and spare parts at Rs. 92.50 lakhs, stock-in-trade at Rs. 399.77 lakhs, sundry debtors at Rs. 109.09 lakhs, loans and advances at Rs. 125.41 lakhs, and cash balances at Rs. 36.05 lakhs.

The Directors report that the capital expenditure programme for the modernisation of the Company's plant and machinery continues to be executed as quickly as resources permit. Shortage of working capital affected the activities of the Company throughout the year but this is receiving the serious attention of the Directors at present.

HIGHLAND PRODUCE MAINTAINS DIVIDEND

The statement of accounts of the Highland Produce Company Ltd. (Managing Agents: Messrs. A. V. Thomas & Co., Ltd., Alleppey), for the year ended 31st December 1956, discloses a minor improvement in gross profit from Rs. 7.26 lakhs for the previous year to Rs. 7.83 lakhs. This profit is, however, substantially lower than Rs. 13.04 lakhs earned in 1954, to which level the profit had sharply increased from Rs. 5.98 lakhs for 1953. Despite this, the year's results should be considered encouraging, since any improvement is better than a decline. After making slightly higher provisions for Managing Agents' remuneration, depreciation and taxation, the net profit is a shade lower at Rs. 3.69 lakhs, as compared with Rs. 3.71 lakhs for 1955.

The provision for taxation has been increased from Rs. 2.40 lakhs to Rs. 2.89 lakhs and that for depreciation from Rs. 47,166 to Rs. 51,794. In view of the fact that the earnings for 1956 and 1955 have been lower than those for 1954, the Directors have not found it possible to allocate any amount to the reserves for these years, which had been credited with Rs. 2 lakhs from the earnings in 1954. The dividend has been maintained at 20 per cent., to which level it had been lowered in the previous year from 25 per cent. paid for 1954, after having been doubled from 12½ per cent. for 1953. The dividend on the ordinary shares absorbs Rs. 3.60 lakhs which very nearly equals the net profit of Rs. 3.69 lakhs. Thus, the distribution on the ordinary and preference shares has been made possible only by the small surplus carried into the year's accounts from the previous year's profit. The dividend consists of an interim of 6¼ per cent. already paid, and a final of 13¾ per cent.

The Company's sale proceeds of tea, cardamom and minor produce for the year amounts to Rs. 21.04 lakhs, as compared with Rs. 21.15 lakhs for 1955. The closing stocks have risen from Rs. 2.44 lakhs to Rs. 3.39 lakhs, as also expenses from Rs. 13.95 lakhs to Rs. 14.66 lakhs.

The Company's estates consist of 2,047 acres, of which tea in bearing accounts for 885.75 acres, new clearings for 37.74 acres, coffee interplanted with pepper for 15 acres and cardamom for 160 acres. A total tea crop of 1,049,800 lbs. was harvested during the year, as against 1,018,000 lbs. in the previous year. The total crop harvested was 124,800 lbs. more than the estimated quantity and 31,800 lbs. above that secured in 1955. The all-in cost was Re. 1-12-5 per lb. as against Re. 1-10-7 in the previous year, the net average price realised being Re. 1-15 as against Re. 1-13-11. The quantity of cardamom harvested during the year amounted to 10,050 lbs. as against 15,100 lbs. The average sale price realised was Rs. 9-9 per lb. as against Rs. 8 per lb. for 1955.

On the future outlook for the Company, the Directors sound a rather pessimistic note, in view of the higher costs of production resulting from increased amenities to labour and the imposition of new taxes. They say that these additional imposts will adversely affect the future profits of the Company.

The paid-up capital of the Company as at 31st December 1956 shows no change at Rs. 21 lakhs and is divided into 180,000 ordinary shares of Rs. 10 each and 30,000 six per cent. tax-free cumulative preference shares of Rs. 10 each. As against this, the reserves and surplus aggregate Rs. 10.33 lakhs. The provision for taxation stands at Rs. 2.98 lakhs and current liabilities amount to Rs. 6.18 lakhs. The gross block of Rs. 25.87 lakhs stands depreciated at Rs. 20.55 lakhs. The current assets aggregate Rs. 19.94 lakhs and are equal to more than twice the current liabilities and provision for taxation.

The Rs. 10 fully paid-up ordinary shares of the Company are being currently quoted at Rs. 13.80 *cum-div.* (final dividend Re. 1.37). On an *ex-div.* basis, the shares provide a yield of 16 per cent. per annum.

Points From The Chair

New Tax Proposals

"THE new taxation proposals announced on the 15th May last have evoked considerable criticism throughout the country. I will only refer to those proposals which affect our Company along with other industries. It is a recognised fact that for some years past industrial enterprise in India has been handicapped by lack of adequate capital, and whatever expansion has taken place in recent years has been made possible by prudent and conservative ploughing back of the annual profits. The increased income-tax and corporation tax, the imposition of wealth tax on companies and the substantial addition to the tax on bonus issues will have the cumulative effect of causing a heavy drain, year by year, on the resources of companies. I take this opportunity of earnestly appealing to Government that in order to maintain the tempo of industrial development in the country, they should reconsider these proposals with a view to ensuring adequate financial resources for companies and to stimulate further fresh investments in industry."

KASTURBHAI LALBHAI,
National Rayon Corporation Ltd.

Private Industry

"There is one stream of national income and savings from which both the sectors have to draw their funds. Having planned for an extremely bold programme with undue emphasis on the State sector, very meagre resources have been left at the disposal of the private industry. The sources of revenues of the State are rigid and claim the first priority. Whether one likes or not, taxes have to be paid. The private industry, however, has to draw on the residue of resources, and the means which it can employ are definitely voluntary. The entire brunt, therefore, of the inadequacy of resources to fulfil a given plan has to be borne by private industry. Heavy taxation is a twofold evil. It dries up the capital fund available to industry. It also creates disincentive for investment. The situation becomes worse if, as in the present case, taxation is levied beyond the taxable capacity of different sections of the people and the form of taxes is biassed against savings and investments. In the name of the Plans, the last few budgets imposed several new enhanced taxes. Some taxes were justified on grounds of restraining consumption, others on fighting inflation, reducing inequalities of incomes or foreign exchange deficits, and still others on raising adequate revenues for the Plan. The piece-meal approach to different items of taxation has not served the basic objectives of our economy as the one object offsets the other."

B. L. JALAN,
Bombay Gas Co., Ltd.

Outlook for I.C.I. Products

"I should like to say a little about the current year's trading. So far, turnover has been on a higher level than in 1956. In the middle of last year, there was some noticeable hesitation in those parts of our business serving industries making durable consumer goods, such as motor cars and household appliances. The marked recovery made this year by the motor car industry, in particular, is helping us to overcome the setback experienced last year in those sections of our organisation. The current year is, of course, bringing its own problems. Fortunately, the general level of activity is high, and in most cases new plants coming into production are immediately and fully occupied. The demand for 'Terylene,' in particular, is most active. So far this year, exports have been of the same order as last year, but, if costs of production in the United Kingdom continue to rise at a rate greater than those of our principal competitors, it will become more difficult to place our exports. Your Company is greatly dependent upon the export business—not only its own direct exports, but also indirectly through the exports of its customers in the United Kingdom. Unless the nation's competitive position in world markets can be strengthened, some of the great opportunities will be missed and the country will fail to achieve its long-term objective of a healthy and expanding economy."

SIR ALEXANDER FLECK,
Imperial Chemical Industries Ltd.

SHREE DIGVIJAY CEMENT CO., LTD. Annual General Meeting, Sikka, 11th July 1957. Dividend: Rs. 9.00 per ordinary share, payable on and after 11th July 1957. Transfer books will remain closed from 24th June to 6th July 1957, both days inclusive.

BALANOOR TEA AND RUBBER CO., LTD. Annual General Meeting, Madras, 13th July 1957. Dividend: Re. 1.75 per share. Transfer books will remain closed from 8th to 13th July 1957, both days inclusive.

METAL BOX CO. OF INDIA LTD. Annual General Meeting, Calcutta, 18th July 1957. Dividend: Re. 1.12 (11¼ per cent.) per share, final, tax-free. Profit for the year is Rs. 66,04,570 as against Rs. 62,82,608 in the previous year.

COMMERCE AND INDUSTRY

(*Concluded from page* 1248)

and quantity in 1956, as compared with 1955. The estimated increase in such value was of the order of $240,000 to $2.6 million. Scope for further increase in these exports is stated to be bright. The need for providing better quality goods is underlined in this connection. Smart increases were also witnessed in the imports of manganese and mica ores from India. The value of the former rose from $1.8 million to an estimated level of $2.4 million. This was attributed to increased compliance by Indian exporters of the specifications of the importers. Among other items which made substantial headway, mention must be made of cashew nuts, canvas shoes, carpets, and coir products.

Certain other general causes for the decline in the imports into Canada from India are said to be the tight money policy that was in force in the country during the period, and the insistence of Indian exporters on letter of credit payment basis, which meant that importers should lock up their capital for long periods. Further, the international situation and the paucity of shipping facilities had also their share of impact. The general outlook for India's trade with Canada in 1957 is, however, found to be very optimistic, in view of the strong demand for goods and services arising from the boom conditions in the country.

PALANI ANDAVAR RAISES DIVIDEND

RESULTS OF BHARTIA STEEL SATISFACTORY

Palani Andavar Mills, Ltd.

THE directors of the above Company (Managing Agents: Messrs. Baghyalakshmi & Co., Udamalpet) submit the audited accounts of the Company for the year ended 31st December 1956.

After deducting all working expenses and interest and providing Rs. 2,16,653 (Rs. 1,56,954) for depreciation, the year's working has resulted in a net profit of Rs. 12,00,275 (Rs. 5,62,943). From this sum Rs. 1,72,501 (Rs. 1,34,518), Rs. 6,825 (Rs. 3,456) and Rs. 15,028 have been expended for bonus for 1955, charity and donations, and income-tax, respectively. With Rs. 14,609 (Rs. 9,122), the balance brought forward from 1955, there is a sum of Rs. 10,22,530 (Rs. 5,68,609) to the credit of the profit and loss account, and the directors recommend to dispose of the same as follows:

Transfer to machinery replacement reserve Rs. 1,50,000 (*nil*), to dividend equalisation reserve Rs. 2,00,000 (*nil*), to contingency reserve Rs. 1,50,000 (Rs. 50,000), to provision for taxes Rs. 2,60,000 (Rs. 2,50,000), to pay a tax-free dividend of 7 per cent. to preference shareholders Rs. 14,000 (Rs. 14,000) and to pay a tax-free dividend of 30 (24) per cent. to ordinary shareholders Rs. 3,00,000 (Rs. 2,40,000) leaving to be carried forward to next year Rs. 8,530 (Rs. 14,609).

In the year of account, 12,000 spindles were brought into use thus bringing the total spindleage to 41,200. In 1957, 3,600 additional spindles are in the course of erection and are expected to go into production in the second half of the year. Further, 2,400 spindles are expected shortly. Combers and air-conditioning plant are in the course of erection.

The increase in the profits of the year of account is mainly due to the good margin of profit in the sale of 60's yarn.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	12,00,000	Block ...	40,10,332
Reserves ...	13,00,000	Stock-in-trade	23,89,990
Provision for taxation ...	2,00,000	Stores and spare parts	1,82,167
Liabilities ...	45,64,100	Debts, deposits and advances ...	6,46,546
Profit and loss account ...	8,530	Investments ...	1,000
		Cash ...	42,595
	Rs. 72,72,630		Rs. 72,72,630

Bhartia Electric Steel Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Bhartia Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st December 1956.

After providing Rs. 15 (Rs. 7) lakhs as depreciation and Rs. 10 (Rs. 3.5) lakhs for taxes in respect of the year under review, there is a balance of Rs. 3,26,885 (Rs. 1,17,212) to which is added the sum of Rs. 3,95,940 (Rs. 2,03,728) brought forward from previous year, making a total of Rs. 7,22,825 (Rs. 3,20,940) available for distribution. Out of this amount, the directors recommend payment of a dividend of Rs. 1.25 (Rs. 1.25) per share absorbing Rs. 6,25,000 (Rs. 6,25,000) leaving a balance of Rs. 97,825 (Rs. 2,03,728) to be carried forward.

The working of the Company during the year has been satisfactory and has shown considerable improvement over the performance of the year 1955 as would be evident from the following figures of production:

	1955 Tons	1956 Tons
Steel	14,580	15,851
Steel castings	4,264	5,412
Rods and bars	17,505	19,890

On and from 8th July, 1956 the re-rolling mill work at the Ballygunge Works was completely stopped and all re-rolling mill work since then is being done only at Khardah. The plant installation work at Khardah Works was continued during the year and as at the time of writing this, most part of this installation work has been completed. Some ancillary equipment still on order remains to be received and the directors expect that a major part of this equipment will have been received and installed during the year 1957. In their opinion, the rolling mills plant, when fully installed, will compare favourably with the best rolling mill plants working in the country.

The supply of billets during the year 1956 had somewhat improved which is reflected in the higher production of rods and bars during the year 1956 as indicated above, but has declined this year due to various causes particularly due to foreign exchange shortage and admission of about 50 additional re-rollers to rolling from billets at a time when billet supplies were already declining and prospects for next few years are none too bright.

A committee under the chairmanship of Shri B. B. Saksena was appointed in 1956 by the Government of India to examine the present and the future position of re-rolling mills, steel foundries and electric furnaces. It is understood that this committee has now completed its work and its report will be submitted to the Government shortly. One of the directors, Shri R. L. Bhartia, was associated with the activities of this Committee in the matter of re-rolling mills. The directors hope that the decisions of the Government on the findings, and the recommendations of the Saksena Committee will pave the way for a healthy and well-regulated development of the industries examined by the Committee.

The retention prices for rods and bars and electric furnace billets produced by the Company are statutorily controlled by the Iron and Steel Controller. After examination by the Tariff Commission retention prices were fixed by the Government in 1953 and these prices with suitable adjustments to provide for fluctuations in the prices of raw materials, were effective upto 31st December 1956. On and from 1st January 1957, retention prices will be fixed anew and the Tariff Commission is expected to commence its enquiry in the very near future. The directors hope that the Tariff Commission will consider the requirements of the industry sympathetically and fair prices will be fixed.

The work at the Ballygunge Works, where the Company's electric furnaces and the steel foundry are located was also satisfactory during the year. Compared with 1955, the production from the electric furnaces recorded a rise of 8.7 per cent. and that of steel castings recorded a rise of 26.9 per cent. in moulded output. There was a very considerable improvement in quality also. Some of the latest foundry techniques have been introduced in the works and the directors are looking to the future with hope and confidence.

The increased operations at both of the factories have considerably strained the available financial resources and, but for the great help which the managing agents and their associates gave to the Company by providing large loans on current account, it would not have been possible to achieve such good results. As at 31st December 1956, the Company's indebtedness to the managing agents and their associates and friends amounted to Rs. 22,25,000 and, as on date, this amounts to Rs. 27,83,500.

Accounts in brief are as under:

Liabilities	Rs.	Assets	Rs.
Capital ...	50,00,000	Block ...	43,10,718
Reserves ...	16,00,000	Stock ...	25,27,400

Liabilities ...	46,30,948	Work-in-progress ...	14,95,823
Profit and loss account ...	7,22,825	Debts, deposits and advances ...	27,62,639
		Investments ...	36,055
		Cash ...	1,66,310
	Rs. 1,31,05,943		Rs. 1,31,05,943

Kamani Engineering Corporation Ltd.

The directors of the above Company (Managing Agents: Messrs. Kamani Brothers Private Ltd., Bombay) submit the audited accounts of the Company for the year ended 30th September 1956.

During the year the Company made a profit of Rs. 4,43,119 (Rs. 5,42,179). The directors have transferred to depreciation fund Rs. 2,89,962 (Rs. 3,21,296), to reserve for doubtful debts Rs. 10,000 (Rs. 10,000) and to gratuity reserve Rs. 40,000 (Rs. 40,000) leaving a balance of Rs. 1,03,157 (Rs. 1,70,883). This amount together with the surplus of Rs. 16,007 (Rs. 10,124) brought forward from the last year makes a total of Rs. 1,19,164 (Rs. 1,81,007) which the directors recommend to be utilised as follows:—

To payment of dividend on 5½ per cent. (less income-tax) cumulative preference shares of Rs. 100 each for the year ending 30th September 1955 (for two years 1953 and 1954) at Rs. 5-8 per share absorbing Rs. 82,500 (Rs. 1,65,000) leaving a balance to be carried forward to next year's account Rs. 36,664 (Rs. 16,007).

Manufacture and galvanisation of steel transmission line towers.—Upto the last year, the Company had to face many difficulties in securing orders for towers and other structures at very much reduced rates due to keen competition from foreign firms. During the year under review the Company secured orders for structures and towers aggregating to 4,295 tons which include important orders for steel structures for Bhilai Project and transmission line towers for Utran Baroda. During the current year the Company has secured further orders for transmission line towers for Koyna, Korba-Bhilai, Chambal and Rihand Hydel Schemes aggregating to 12,880 tons. The directors hope that this encouraging factor would ensure the Company's prospects for development and bring satisfactory results. The contracts for erection of transmission line towers as secured by the Company along with some of the above orders cover about 388 miles route.

Wagon assembly plant at Okha.—The Company assembled and supplied 4,574 wagons to the railways within ten months during the period under review. The balance which now remains to be delivered is very small and will be completed within a month. Thereafter continuation of this plant will be dependent upon the Government of India's import policy for wagons.

Manufacture of road rollers.—The production is being maintained which is at average of six *road-rollers* per month. About three *road-rollers* have been exported outside India. Efforts are concentrated to exploit export market for the same.

Agency business.—The Engineering Sales Division of the Company has done well in securing substantial orders from private enterprises as well as from the Government to be placed on its principals for various types of heavy electrical and mechanical equipments including locomotives and rolling stock. The volume of business is likely to sustain and increase provided the Company can suitably arrange with its principals to supply equipments on deferred payments as per policy of the Government of India due to shortage of foreign exchange.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	59,93,125	Block ...	36,63,990
Reserves ...	2,57,559	Stock-in-trade	32,21,685

Liabilities ...	91,64,887	Debts, deposits and advances ...	67,62,685
Profit and loss account ...	36,664	Investments ...	50,601
		Cash ...	3,88,159
		Lahore assets	8,32,805
	Rs. 1,54,70,185		Rs. 1,54,70,185

Tungabhadra Industries Ltd.

The directors of the above Company (Managing Agents: The Cotton Agents Private Ltd., Bombay) submit the audited accounts of the Company for the year ended 30th September 1956.

The profit and loss account shows a profit of Rs. 2,03,098 (Rs. 5,04,206), subject to provision for depreciation, and it has been adjusted against the debit balance brought forward from the last year. It is regretted that depreciation could not be provided for during the year under reference due to inadequate profits.

In view of the financial position of the Company, the directors have requested the managing agents for waiving their claim to the commission as well as the remuneration payable to them for the year under report.

The directors regret to report that due to imposition of excise duty on manufacture of groundnut oil, the working of the oil mill was uneconomic. The shortage of raw material and lower realisations as a consequence of keen competition in the market, were mainly responsible for unfavourable results. The factory had to remain closed for two months due to shortage of raw materials at the tag end of the season. The production of *vanaspati* and *refined oil* during the year was about 13,200 tons as against about 14,300 tons in the previous year. About 2,950 tons of *hydrogenated* and *salad oils* were exported as against 3,300 tons during the previous year. However, efforts are being made to improve the working results during the current year.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	30,58,950	Block ...	64,34,539
Debentures ...	15,03,000	Stock-in-trade	9,06,638

		Debts, deposits and advances ...	10,69,486
		Investments ...	25,451
		Cash ...	1,45,888
		Profit and loss account ...	7,20,974
	Rs. 1,03,35,046		Rs. 1,03,35,046

Bengal Assam Steamship Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the year ended 31st October 1956.

The accounts showed a profit, after charging all expenses, of Rs. 5,25,194 (Rs. 10,17,127) of which the provision for taxation requires Rs. 3,00,000 (Rs. 8,90,000) leaving a balance of Rs. 2,25,194 (Rs. 1,27,127). The balance brought forward from last year was Rs. 55,826 (Rs. 99,699) making a total available for appropriation of Rs. 2,81,020 (Rs. 2,26,826). From this amount the directors recommend the following dividends:— On preference shares at 7 (7) per cent. per annum Rs. 21,000 (Rs. 21,000), and on ordinary shares at Rs. 7.50 (Rs. 7.50) per share Rs. 1,50,000 (Rs. 1,50,000) leaving a balance to be carried forward of Rs. 1,10,020 (Rs. 55,826).

Freight earnings were less than in the previous year but, having regard to the conditions of trade by inland water transport between India and East Pakistan, were not unsatisfactory. 14,98,547 maunds of jute were carried to India as compared with 14,33,089 maunds in 1955, but coal carried to East Pakistan was less than in the previous year.

Since the closing of the accounts jute exports to India have been disappointing and show little sign of future improvement. The level of coal exports by water to East Pakistan is being maintained, but freight on coal carried to Pakistan without return cargoes of jute is not itself sufficient to maintain and utilise fully the Company's fleet. The possibility of extending the Company's services elsewhere is under consideration.

The greater part of the Company's earnings are at present received in East Pakistan and a remittance of part of the freight earned was made during the year. Since the closing of the accounts a further remittance in respect of hire charges due for craft under charter to The Pakbay Co., Ltd., has been received.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	23,00,000	Block ...	1,05,79,935
Reserves ...	1,00,69,622	Stores ...	12,545

Liabilities ...	8,88,374	Investments ...	2,55,000
Profit and loss account ...	1,10,020	Cash ...	27,19,848
	Rs. 1,37,47,749		Rs. 1,37,47,749

Budge-Budge Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta, submit the audited accounts of the Company for the half-year ended 31st October 1956.

The accounts, after charging all expenses and writing back provisions no longer required for anticipated losses on Jute, show a profit of Rs. 10,979. After making provision for taxation of Rs. 27,000 and provision against West Bengal sales-tax in respect of previous years of Rs. 21,161 there is a net loss of Rs. 37,182. The directors have transferred from general reserve Rs. 40,000 and from dividend equalisation reserve Rs. 31,500. With the balance brought forward from the last half-year of Rs. 1,336 there is a total available sum of Rs. 35,654. The directors recommend a dividend on preference shares at Rs. 3.50 per share absorbing Rs. 31,500 leaving a balance to be carried forward of Rs. 4,154.

In accordance with the working time agreement of the Indian Jute Mills Association the mill worked 48 hours per week with 5 per cent. of the total looms sealed until 15th July, 1956. But in view of the highly unsatisfactory stock position an additional 2½ per cent. of the total looms were sealed with effect from 16th July, 1956, and a further 5 per cent. from the 17th September, 1956. Trading during the period continued to be very difficult owing to the disparity between the prices of raw jute and those of manufactured goods.

Hitherto half-yearly accounts have been issued by this Company to its shareholders, but in the opinion of the Board of directors this is no longer practicable in view of the provisions of the Companies Act, 1956, regarding annual general meetings and the accounts to be presented at such meetings. Accordingly yearly accounts will be issued in future, commencing with those for the year ending 31st October, 1957. This will not preclude the payment of half-yearly dividends, subject to the Company's results permitting, as the Company's Articles authorise the payment of interim dividends. It is therefore the Board's intention to consider the payment of interim dividends in the light of the Company's results upto 30th April each year.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	45,00,000	Block ...	44,65,574
Reserves ...	21,09,926	Stock ...	30,68,412
Provision for taxation ...	6,168	Stores, spare parts and loose tools	8,67,816
Liabilities ...	23,99,642	Work-in-progress ...	3,34,396
Profit and loss account ...	4,154	Debts, deposits and advances ...	2,00,913
		Investments ...	77,297
		Cash ...	5,482
	Rs. 90,19,890		Rs. 90,19,890

National Pipes and Tubes Co., Ltd.

The directors of the above Company (Managing Agents: The Associated Industrial Development Co., (Private) Ltd., Calcutta) submitted the audited accounts of the Company for the year ended 30th September 1956.

After providing Rs. 1,65,679 (Rs. 1,78,110) for depreciation in the manufacturing account and Rs. 4,372 in the profit and loss account, Rs. 49,630 (Rs. 18,750) as interest on the Company's debentures, bank overdrafts and other loans, the account for the year showed a profit of Rs. 12,10,904 (Rs. 8,66,885). To this was added Rs. 35,405 (Rs. 1,020) being carried forward from last year, thus making a total of Rs. 12,46,309 (Rs. 8,67,905) which was disposed of as under:—

Taxation reserve Rs. 5,05,000 (Rs. 4,15,000), transfer to general reserve Rs. 3,50,000 (Rs. 1,00,000), payment of dividend on cumulative preference shares at 5½ per cent. per annum, free of income-tax Rs. 55,000 (Rs. 55,000), payment of dividend on ordinary shares at Rs. 2 (Re. 1-12) per share, free of income-tax Rs. 3,00,000 (Rs. 2,62,500) and balance carried forward Rs. 36,309 (Rs. 35,405).

The working result for the year under review has been satisfactory. Demand for the Company's products continued to be good during the period. This helped the Company to secure orders for substantial quantities. Production during the year also increased. The Company produced different types of intricate sections to rigid specifications and have been meeting the increasing demand of the country for such sections.

The metal market has had wide fluctuation during the period under review which has been a disturbing factor in the planning of production. However, with the helpful import licencing policy of the Government of India and with increased demand arising out of the second Five-year Plan, the Company could reasonably look forward to future with confidence. The prospects for the current year are considered to be good.

Accounts in brief are as under:—

Notices

HERCULES INSURANCE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE TWENTY-SECOND ANNUAL GENERAL MEETING of the Hercules Insurance Company, Limited, will be held at the Registered Office, 16, Hare Street, Calcutta, on Tuesday the 16th July 1957, at 3-30 p.m., for the purpose of:

1. Considering the Accounts, Balance Sheet and the Reports of the Board of Directors and Auditors for the year ended 31st December 1956.
2. Declaring a Dividend.
3. Appointing Directors in the place of those retiring.
4. Appointing Auditors and fixing their remuneration.

As Special Business

5. Sanctioning the payment of Rs. 31,644 to the Directors as their fees for services rendered during the year ended 31st December 1956.

The Share Transfer Books will be closed from the 1st to the 16th July 1957, inclusive.

By Order of the Board,
G. RAMABADRAN,
Secretary.

CALCUTTA, *14th June*, 1957.

Note.—1. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

2. The dividend when declared will be paid only to those shareholders whose names appear on the Company's Register as on the 16th July 1957.

Explanatory Statement Regarding Item 5

Under Section 309(1) of the Companies Act, 1956, shareholders' sanction is necessary for payment of fees to the Directors. The sum of Rs. 31,644 is computed on the same scale as in previous years, namely:

	Rs.
At Rs. 200 p.m. per Director for 12 Directors of whom for part of December 1956, only for Mr. Indradaman Amritlal Shah ...	26,536
Extra for the Chairman and Deputy Chairman at Rs. 2,000 each per annum	4,000
Extra for Investment Committee constituted by the Chairman, Deputy Chairman and Rai Bahadur M. L. Tapuriah upto 20th March 1956 and thereafter by the Chairman and Deputy Chairman at Rs. 500 each per annum	1,108
Total	Rs. 31,644

THE GOUREPORE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT A General Meeting of the Members of the abovenamed Company will be held at the Registered Office, 2, Fairlie Place, Calcutta, on Wednesday, the 10th day of July, 1957, at 11-00 a.m., to consider and if thought fit, to pass, with or without modification, the following Resolution:—

(*As a Special Resolution.*) "That Article 114 of the Articles of Association of the Company be deleted and the following new Article be substituted therefor:—

114. With effect from the 1st April, 1957, each Director or his alternate shall be paid out of the funds of the Company by way of remuneration for his services in attending meetings of the Directors a fee of Rs. 200 for each meeting of the Board attended by him."

By Order of the Board,
MACNEILL & BARRY LTD.,
J. H. G. WHITFIELD,
Acting Secretary,
Managing Agents.

2, FAIRLIE PLACE,
CALCUTTA-1, *12th June*, 1957.

Note.—A member entitled to attend and vote at the meeting may appoint a proxy to attend and vote on his behalf. A proxy need not also be a member of the Company.

RESERVE BANK OF INDIA

APPLICATIONS ARE INVITED FOR THE posts of Research Officers in the Bank's Department of Research and Statistics at Bombay.

Scale of Pay: Rs. 375-55-815 E.B. 55-925-60-1,045. In addition to pay, the selected candidates will be eligible to draw Local Pay, House Rent Allowance and Dearness Allowance at the rates prescribed by the Bank from time to time.

Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scale.

Appointments to the above posts will be made on a temporary basis in the first instance but are likely to be made permanent.

Candidates should not ordinarily be over 30 years of age as on 1st June 1957. The age limit may be extended upto 35 years in the case of candidates with exceptionally good qualifications and/or research experience of value to the Bank.

Qualifications: First or high second class Master's degree in Economics or Commerce of an Indian or Foreign University or a Doctorate degree in Economics of an Indian or Foreign University, **and** a period of research work in one or more of the following subjects: (*a*) Monetary Economics, (*b*) Banking theory and practice, (*c*) International Finance and (*d*) Agricultural Economics. A period of practical banking training will be an additional qualification in respect of applicants with specialisation in (*a*) and (*b*) above.

Applications should be in a special form obtainable from any office of the Reserve Bank of India. All the applications should be accompanied by copies of certificates regarding age and educational qualifications and two testimonials (originals should not be sent, the Bank does *NOT* accept responsibility for returning the originals if sent through oversight) and should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay, so as to reach him on or before Saturday the 13th July 1957. *Candidates already in service must submit their applications through their employers.* Candidates belonging to the Scheduled Castes/Scheduled Tribes should mention this fact prominently on their applications and also enclose a copy of certificate to that effect from a competent authority.

Applicants must remit along with their applications an application fee of Rs. 7.50 (Rs. 1.75 in the case of Scheduled Castes'/Scheduled Tribes' Candidates) by Postal Order, *Cheque or Bank Draft on a Scheduled Bank payable at Bombay.* The application fee is in no case refundable. *Bonafide unemployed* Refugee candidates applying through any of the Government Employment Exchanges are exempted from payment of the application fee.

Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into any correspondence with them.

Canvassing in any form will be regarded as a disqualification.

MINERVA MILLS, LIMITED

NOTICE OF 22nd DIVIDEND

NOTICE IS HEREBY GIVEN THAT A Dividend of Rs. 6 per share of Rs. 100 for the year ended 31st December 1956 sanctioned by the Shareholders at the Thirty-seventh Annual General Meeting held on the 17th June 1957 is made payable at the State Bank of India, Bombay, on and after Monday the 24th June 1957 to those shareholders whose names stood on the Register of Members on the 13th May 1957 and who have paid all dues to the Company whether in respect of calls on their shares, interest thereon or otherwise.

By Order of the Board,
N. SIRUR & Co. PRIVATE LTD.,
Managing Agents.
V. N. CHANDAVARKAR,
Managing Director.

Notices

ALEMBIC CHEMICAL WORKS COMPANY, LIMITED, BARODA

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Fiftieth Annual General Meeting of the Shareholders of the Alembic Chemical Works Company, Limited, will be held at the Office of the Company at Baroda (Alembic Road, Industrial Area) on Thursday the 25th July 1957, at 4 p.m. (S.T.), to transact the following business:—

1. To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ending 31st December 1956.
2. To declare Dividends.
3. To appoint Auditors for the current year and to fix their remuneration.
4. To appoint a Director in place of Dr. K. T. Gajjar who has attained the age of 65 years and who retires from office by rotation. Dr. K. T. Gajjar offers himself for re-election. For his re-election the passing of the following resolution as a Special Resolution will be also necessary of which special notice under Section 281 of the Companies Act 1956 has been received by the Company:

   "RESOLVED that pursuant to the provisions of Section 281 and other relevant provisions, if any, of the Companies Act 1956, Dr. K. T. Gajjar who has attained the age of 65 years and who retires from office by rotation, be and is hereby re-elected a Director of the Company and it is hereby specifically declared that the age limit prescribed for Directors under Section 280 of the said Act shall not apply to him."

   Explanatory Note (from the Company):—Dr. K. T. Gajjar, who has attained the age of 65 years, retires by rotation but is eligible for re-appointment and he offers himself for re-election. A special notice under Section 281 of the Companies Act 1956 has been received by the Company from a shareholder of his intention to move the above resolution as a Special Resolution.
5. To elect a Director in place of Dr. Mangaldas J. Shah who retires from office by rotation but is eligible for re-election.
6. To consider and if thought fit to pass the following resolution as Ordinary Resolution:

   "RESOLVED that the Registers, books and documents of the Company required to be maintained and kept open for inspection under the provisions of the Companies Act 1956 and particularly under Sections 49, 118, 136, 143, 144, 150, 151, 152, 159, 161, 163, 193, 196, 301 to 304, 307, 356 to 360, 362 and 372 and Schedule VIII of the said Act, be kept open for such inspection by the persons entitled thereto to the extent and in the manner and on payment of the fees, if any, specified in the aforesaid provisions, at the Registered Office of the Company between the hours of 11-30 a.m. and 1-30 p.m. on any working day except when the Registers and books are closed under the provisions of the said Act or the Articles of Association of the Company. Provided, however, that the Register required to be maintained under Section 307 of the Act shall be open for inspection of the members and by holders of debentures, if any, of the Company, as aforesaid between the hours above mentioned during the period prescribed by subsection 5 (a) of Section 307 of the Act."

   Note:—Under the various sections of the Companies Act 1956, it has been provided that as regards inspection of the Registers, books and documents to be maintained under the said sections by the persons entitled thereto, the Company in General Meeting may impose reasonable restrictions so that such Registers, books and documents shall be open for inspection for not less than two hours in each day, during business hours. The restrictions sought to be imposed by the said resolution are reasonable and desirable from the administrative point of view.
7. To pass the following resolution as a Special Resolution with or without modification:

   "RESOLVED that out of the shareholdings of the Company in the Alembic Glass Industries Ltd., the sale of 1,800 shares of Rs. 100 each sold to various persons at Rs. 100 per share including 1,570 shares sold to the Associates of the Managing Agents of the Company be and are hereby confirmed, as also the retention by them of the supplementary dividend declared thereon on the 27th December 1956."

   Explanatory Note:—The Company has sold 1,800 shares of Rs. 100 each out of the shareholdings of the Company in the Alembic Glass Industries Ltd., at Rs. 100 per share. Out of these 1,570 shares were sold to the Associates of the Managing Agents; such a sale, the Company is now advised, requires the approval of the General Meeting as provided by Section 360 of the Companies Act 1956. The Alembic Glass Industries Ltd., to avoid the penal provision of Section 23A of the Income Tax Act, made a supplementary distribution of dividend on 27th December 1956, to which the purchasers became entitled. The resolution seeks to confirm the sale as also the retention of dividend declared after the sale.

Note:—Any member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and such proxy need not be a member of the Company.

The Transfer Books of the Company will remain closed from Friday the 5th July 1957 to Thursday the 25th July 1957, both days inclusive.

By Order of the Board,
For BHAILAL AMIN & SONS (PRIVATE) LTD.,
Managing Agents,
RAMAN B. AMIN,
Director.

BARODA, *4th June* 1957.

Note:—The Dividends when sanctioned will be made payable at the Office of the Company at Baroda, on or after the 1st August 1957 to those shareholders whose names stand on the Register of the Company on the 25th July 1957 and to whom the Dividend Warrants will be posted.

Shareholders are requested to notify, at once, any change of address.

THE EQUITABLE COAL COMPANY LIMITED

MONEY SHADE BETTER

(From Our Own Correspondent)

BOMBAY, *19th June*

There has been a slight improvement in the short-term money market from the point of view of borrowers. The supply of funds has been somewhat better, while there has been no increase in the pressure of demand for bank credit. The return of trade advances, especially from Calcutta and Kanpur sides, has been at a slightly higher pace. Many banks are ready lenders in the inter-bank call section. But this has not brought about any fall in the inter-bank call money rate which stays put at 3½ per cent. House money also continues to be quoted at 4 to 4¼ per cent. But it has been rather difficult, especially during the last two days, to find borrowers at the higher rate. Actually, some business was done today for higher amounts at 4¼ per cent.; a week ago, the same money would have easily fetched no less than 4¼ per cent. There is no change in the rate for one to three months' deposits which is 4 to 4¼ per cent.

After the sharp increase of Rs. 17.94 crores in notes in circulation in the first week of the current month, there has been a decline of Rs. 7.38 crores during the week ended 14th June 1957. Instead of cancelling this inflow, the Reserve Bank has merely added it to the notes held in the Banking Department, the exact increase here being Rs. 7.63 crores. There has been an inflow of Rs. 25.32 lakhs in rupee coin which accounts for the increase in notes held in the Banking Department, being higher than the fall in notes in circulation. There has been no change in rupee securities and also in foreign securities. Balances held abroad have, however, gone up by Rs. 27.24 crores. This is evidently due to the withdrawal from the International Monetary Fund of the balance of the standby credit which India obtained from that body in February 1957. It will be recalled that, out of a total credit of 200 million dollars, India had used up $127.5 million before the close of March last. This had left a balance of $72.5 million which has now been availed of.

The deposits of the Central Government with the Reserve Bank have gone down by Rs. 2.20 crores and so also those of other Governments and banks by Rs. 22 lakhs and Rs. 3.79 crores, respectively. Deposits of others have gone up by as much as Rs. 33.32 crores. This increase reflects the rupee credit given to the I.M.F. against the withdrawal of dollar credit as mentioned above. There has been a perceptible fall of Rs. 11.05 crores in other loans and advances. This seems to be due to repayment of the loans taken by banks. Investments are higher by Rs. 8.16 crores. The explanation for this is to be found in the fact that the Reserve Bank has been buying Government securities in order to ease the stringency in the money market.

The latest available Scheduled banks' statement relates to the week ended 7th June 1957. As compared with that for the previous week, this statement shows a decline of Rs. 18 crores in demand deposits and a rise of Rs. 15.80 crores in time deposits. Inter-bank borrowings of both demand and time nature have declined by Rs. 1.17 crores and Rs. 73 lakhs, respectively. A small rise of Rs. 1.49 crores is disclosed in borrowings from the Reserve Bank. The State Bank's demand loans to the banking system have also gone up by Rs. 72 lakhs to Rs. 9.77 crores. Advances in India and inland bills purchased and discounted have both gone up by about Rs. 4 crores in the aggregate, but foreign bills purchased and discounted have gone down by Rs. 93 lakhs. Investments are slightly lower by Rs. 41 lakhs. Money at call and short notice is also lower, but by as much as Rs. 2.74 crores. As a result of all these changes, the total cash position of the banks is better by Rs. 4.43 crores.

The Gilt-edged market is weak, in expectation of an increase in the rates of interest on the new loans contemplated by the Central and the State Governments. The main sufferers have been the long-medium and long-dated loans. A big drop of 70 nP has occurred in 3 per cent. 1966-68 and 3 per cent. 1970-75 which closed at Rs. 91 and Rs. 86.05, respectively. 4½ per cent. 1958-68 has lost As. 8 and 3½ per cent. 1967 As. 4. A decline of 15 nP has been registered by 3½ per cent. 1964 as well as 1965. 3 per cent. 1963-65 also has suffered a similar fall and 3 per ent. 1964 has actually gone down by 20 nP. A loss of 10 nP has been suffered by 3½ per cent. 1961, 3½ per cent. 1974 and 4 per cent. 1960-70. 3 per cent. Conversion Loan is still being supported by the Reserve Bank, but only in sums of Rs. 2 lakhs and over. As there are, however, several small sellers, the market rate is 5 nP below the Reserve Bank's support price of Rs. 73.

The market for State loans has been extremely narrow, with hardly any transactions, except in the Madras loan issued last year which has gone down further by 10 nP to stand at Rs. 96.15.

In the foreign exchange market, the rupee is a shade better in terms of U.S. dollars, thanks to an improvement in sterling in the New York market. The banks' selling rate for dollars has come down from Rs. 480 to Rs. 479.25 per 100 dollars and so also the buying rate from Rs. 476.50 to Rs. 475.75. There has been a corresponding adjustment in the value of rupee *vis-a-vis* Canadian dollars. The banks' selling and buying rates for this currency is now Rs. 504.50 and Rs. 496.75, as against Rs. 505.25 and Rs. 498.50, respectively, a week ago.

As already stated, in the New York market, spot sterling has gone up from $2.78⅜-2.79 to $2.79⅛-2.79⅜. There has been an improvement of 5/16c. in the three months forward rate which stands at $2.78-5/16-2.78.7/16 at the time of writing. Surprisingly enough, transferable sterling, however, has lost 0.20c., the rate available at the time of writing being 277.25-277.35 cents.

BULLION LOOKS UP

(From Our Own Correspondent)

BOMBAY, *19th June*

The downward trend in bullion witnessed during the previous week seems to have been halted. If anything, the position of the market is slightly better and the closing rates for the week show a slight gain in gold and silver alike. There has been a perceptible improvement in the offtake of gold and, generally speaking, the absorption of both gold and silver has been greater than the inflow.

The market, however, presented a colourless picture, as the speculative elements were somewhat quiet. This is not surprising, because, in the initial days of a new contract, both bulls and bears invariably prefer to go slow.

Between the two sections, gold was more active than silver during the major part of the week under review. In fact, on many an occasion, silver could sustain its strength merely because of the firmness of gold. The brighter tone in gold was chiefly due to good demand in the face of limited floating stock and lower arrivals. On an average, daily arrivals of gold were no more than 3,500 tolas, but the offtake ranged in the neighbourhood of 4,500 tolas. As a result of this better demand, there has been a widening of the spot premium from about 14 annas in the beginning of the week to as much as Re. 1-12-0 at the time of writing. The gain over the week is Re. 1-2-0 in spot gold and As. 10 in forward.

Initially, the silver section tended to be rather quiet on fears of heavy arrivals of China coins in the near future. Later, however, it looked up in sympathy with gold. Arrivals tended to diminish progressively while the offtake was on the upgrade. Thus, from 30 bars on Thursday, the daily arrivals declined to 10 bars by Monday, though it was a shade higher at 15 bars on Tuesday. As against this, the offtake, which was reported to be 30 bars on the first day of the week and 12 bars on the second day of the week, increased to 20 bars and then to 25 bars. It fell again to 6 bars on Tuesday, but it was better at 16 bars today. On an average, while the offtake was a little over 16 bars a day, the arrivals were only about 14 bars.

In view of this and as in gold, the premium for ready silver also improved from Rs. 2-8-0 to Rs. 2-12-0. The change in silver over the week works out to a loss of As. 7 in the case of spot silver and a gain of As. 3 in the case of forward. The trend of the market at the time of writing is distinctly firm, the prevailing rates being well above the closing levels.

Transactions in *Jeth* settlement in silver came to a close on Thursday, the 13th inst., at Rs. 182-1-0 and dealings in *Shravan* settlement began on Friday at Rs. 178-5-0. Today's closing rate for *Shravan* at Rs. 178-3-0 shows a fractional loss of 2 annas. The turnover in this new settlement has been quite light. With the exit of the *Jeth* settlement, *Ashad* represents the first settlement. It began the week at Rs. 179-10-0 and, after a momentary fall to Rs. 179-1-0 on the initial day, gradually moved forward to close at Rs. 179-11-0. It had, however, suffered a setback on Tuesday, when it dropped to a low of Rs. 178-10-0. The improvement of forward on the last day of the week was due to the firmness of the ready section.

In gold, *Jeth* went off the board on the last day of the previous week at Rs. 104-14-0. Its place was taken up by *Ashad* at the commencement of the week at Rs. 104-9-0, as against the previous closing of Rs. 104-4. During the first two days, the settlement ruled firm, with the rate rising up to Rs. 105-7-0. Thereafter, a mild recession set in and the lowest level of Rs. 104-4-0 was seen early yesterday. Fresh support was forthcoming at this level, in view of the continued good demand for spot gold; and this pushed up the rate to Rs. 104-14-0. No dealings have yet commenced in *Shravan* settlement.

Among the foreign bullion markets, spot silver in New York was marked down from 90½c to 90¼c early in the week, but, subsequently, there was a fractional improvement to 90½c. In London forward silver dropped from 78½d. to 77⅞d. during mid-week, but finished better at 78d. Spot declined from 78½d. to 78¼d. but, unlike forward, closed at the lower level. Spot gold in London moved in sympathy with the sterling-dollar cross rate. As spot sterling gained about ⅜ cents, ready gold declined from 250s. 10½d. to 250s. 6¾d., after seeing a high of 250s. 11½d. early in the week.

The following comparative table shows at a glance the trend of the market during the week under review:

	19-6-1957	Highest	Lowest	12-6-1957

FUTURES TRADING IN NEW CROP COTTON

(From Our Own Correspondent)

BOMBAY, *19th June*

Cotton traders are anxiously awaiting official permission for the commencement of trading in new crop contracts. It is understood that the Board of the East India Cotton Association (E.I.C.A.) has fixed, subject to the approval of the Forward Markets Commission (F.M.C.), 22nd June as the day for starting business in I.C.C. Moglai, March 1958, the new Hedge Contract. The *moorat* trading is expected to be performed at 9 a.m. that day. Although the F.M.C. has yet to give its formal approval to the new contract, its assent is more or less taken for granted. Regarding the prospects of the new contract, the general feeling is that it will have a smooth running provided the authorities desist from any undue interference so long as the price moves within the official floor and ceiling.

Meanwhile, trading in the maturing Vijay June contract continued to be devoid of all interest during the week under review also. The volume of business dwindled to a mere trickle, the daily turnover, on an average, being no more than 500 bales. But the price trend was fully steady. The main reason for this was the tight supply position of cotton and the sustained firmness of the spot market. Traders were, however, reluctant to push up rates because on all transactions put through at or above Rs. 824 per candy they were required to deposit a heavy margin at the rate of Rs. 400 per candy. The quotations for the contract, therefore, ruled one to two points below this sub-ceiling, reflecting the reluctance of traders to pay the high margins.

M.G. Vijay June commenced the week at Rs. 817, one rupee higher than the previous close, and improved to Rs. 818. After ruling at that rate the following day also it climbed up to Rs. 823 on Monday. The market remained officially closed yesterday on account of the death of a member. Opening at Rs. 823 today, the contract eased to Rs. 822 and closed at that rate. The net gain over the week was Rs. 4.

The following is the trend of prices of the contract during the week:

(In rupees per candy of 784 lbs.)

	19-6-57	*High*	*Low*	12-6-57
Vijay (June) ...	822	823	818	818

The three-week-old controversy over the closing rate of the expired Jarilla May contract was resolved by the E.I.C.A. on the 14th inst., by declaring Rs. 715 per candy as the closing rate of the contract on 23rd May, the date of expiry. At this rate, the outstanding contracts in respect of the Jarilla May contract are deemed to have been closed out.

The spot section, though quiet, continued to rule steady. Mill demand slightly slackened as most of the mills seemed to have covered their more immediate requirements. The scarcity of quality cotton was felt throughout and hence prices were well maintained. As a result of the rumour that an export quota for Bengal *Deshi* was likely, shippers' interest was noted in Bengals, Oomra *Deshi*, C.P. I and C.P. II.

In the foreign section, following reduced offers for Egyptian cotton, mill demand for Egyptian styles tended to revive. Karnak T154 variety is now offered at 53½ to 54 cents per lb., as against one cent higher earlier. Some Ahmedabad and Bombay mills were interested in Egyptian cotton. Although it is about a month since the announcement permitting import of 160,000 bales of U.S. cotton under Public Law 480 and the Development Assistance Programme was made the Government has not yet issued the relevant trade notice detailing the licensing procedure, contracting and shipping periods. The notice is eagerly awaited.

There was considerable disappointment in trade circles over the Government's decision to maintain the *status quo* in regard to the floor and ceiling prices of cotton in the new season. It was generally expected that the Government would accept the Cotton Advisory Board's recommendation that the floor be raised by Rs. 50. The main consideration which weighed with the authorities in keeping the floor and ceiling unchanged appears to have been the fear that if cotton prices were raised it might result in a shifting of acreage from under food crops to cotton. Such a development, at a time when the food problem is sufficiently acute, is considered undesirable.

The latest available spot rates—in rupees per candy of 784 lbs.—from Sewri are as follows: the figures in brackets being last week's closing rates.

Bengal *Deshi* 730 (730); Berar Jarilla 820 (820); Khandesh 870 (870); Oomra *Deshi* 785 (780); Vijay 1,025 (1,025); Hubli Laxmi 1,020 (1,020); Jaydhar 950 (950).

In contrast to the easy trend noted last week, the Karachi cotton futures market presented a firm trend during the week under review. The firmness was induced by active mill buying and purchases by East Pakistan shippers. Better cable advices from New York imparted further strength to the market. N.T.R.G. July which had closed at Rs. 72 firmed up, on good support, to Rs. 73-5. The January position put on Re. 1-6 to Rs. 76-13. The spot section also was active. Barring *Deshi* styles, the rates for which were maintained, quotations for most varieties registered an improvement. The following are the latest available rates—in rupees per 82 lbs.—for a few popular varieties of Pakistan cotton prevailing at Karachi:

Sind *Deshi* 84-12; Punjab *Deshi* 80-8, 4F Punjab R.G. 73-6; S.G. 76-14; L.S.S. Punjab R.G. 77-6; S.G. 80-6; N.T.R.G. 77-6; S.G. 84-6; 289F Punjab R.G. 81-14; S.G. 86-14.

Cotton futures values fluctuated within a narrow range in the Alexandria cotton market

during the week under review. While quotations for long-staple Karnak contracts were maintained those of Ashmouni registered a decline. Although the expectation that with the opening of the Suez Canal, there would be a revival of demand from Egypt's traditional customers in Western Europe persisted, prolonged lack of overseas demand and reports of favourable weather adversely affected the sentiment of traders. The following are the latest available quotations—in tallaries per lb.—from Alexandria: *Karnak*: July 107.15 ; November 100.05. *Ashmouni*: June. 75.05; August 73.95; October 72.05.

In a further effort to boost its cotton export, Egypt is reported to have worked out plans for associating Germany, in a larger measure, with the export trade of the former. The earlier preference of Egypt for East European customers would appear to be gradually dying out. Egyptian authorities, in association with their counterparts in Germany, are presumed to have finalised arrangements with the following provisions: (1) Egypt will supply cotton to Germany at competitive prices, (2) supplies to Russia and its satellites will be elimited to quantities which the latter can use themselves and (3) Germany will assume the role of re-exporters of Egyptian cotton to markets of the West.

While the near deliveries of American cotton contracts ruled easy in the Liverpool market during the week, those of the mixed growth contracts were steady. The distant deliveries of both contracts, however, showed some improvement, due to firmness of cotton prices in New York. The Sudan contract declined as a result of a considerable volume of spot house selling. The following are the latest available quotations—in pence per lb. from Liverpool:

American cotton 1" *staple contract*: July-August 26.01; October-November 26.03; December-January 26.20; March-April 26.32. *American cotton mixed growth contract*: July-August 26.60; October-November 26.50; December-January 26.60; March-April 26.65. *Sudan*: *July-August* 38.25; September-October 37.25; November-December 37.30.

A firm trend was depicted by the New York cotton futures market during the week under review. Distant months were particularly firm due to strong buying support prompted by the growing conviction that the full Soil Bank Programme would apply in the new season. Near deliveries also moved up in sympathy. The apprehension that adverse weather in leading cotton tracts might affect the crop in respect of both size and quality was another bullish factor.

As regards crop conditions, excessive rainfall in almost every section of the belt is considered generally unfavourable. It has delayed planting and field work and given a late start to the crop. Continuation of clear warm weather over the entire belt is necessary. More fertiliser has been used this year. Weevil has made its appearance earlier than normal in southern parts of the Eastern belt—Georgia, Alabama and South Carolina. The season is about a week late in the Far Western Belt, about two to three weeks late in the Western and Central Belt, but a little more advanced in Atlantic coastal States of the Eastern Belt.

The following are the latest available quotations from New York, as compareed with those of a week and a fortnight before:

(In cents per lb.)

	18-6-57	11-6-57	4-6-57
Spot	35.45	34.45	35.40
July	35.33	35.31	35.25
October	34.65	34.52	34.50
December	34.63	34.50	34.48

STAPLE FIBRE YARN STRONG

(From Our Own Correspondent)

BOMBAY, 19*th June*

The rayon and staple fibre yarn sections presented a distinctly firm trend during the week under review, while cotton yarns ruled easy. The firmness in rayon yarns was aided by fears of a drastic cut in the import quota for the July-December licensing period and rumours of the continued imposition of ban on rayon textile imports. Staple fibre yarns were very strong, on expectations of lower indigenous production and hopes of export business with foreign countries. The cotton yarn section, however, ruled easy, thanks to subdued demand from both within the country and overseas markets. Even the Government of India's decision to allow exports of cotton yarns up to 78 counts freely, within a ceiling of 5,000 bales, failed to have any effect on the market.

In the spot rayon yarn section, 120 Italy advanced by 13 nP to Rs. 4.16. 120 Japan rose by 9 nP to Rs. 4.23. 150 Japan put on 7 nP to Rs. 4.19. 150 Italy gathered 3 nP to Rs. 3.75. Among indigenous yarns, National Rayons 120 Bt. cones 1st gradie spurted by 17 nP to Rs. 3.98. 150 Bt. cones 1st grade were quoted 3 nP higher at Rs. 3.48. Snia rayon yarn (120 dull cones) for June delivery hardened by a rupee to Rs. 806 yesterday, but receded to Rs. 804. August delivery improved from Rs. 822 to Rs. 823. Today, however, it was lower at Rs. 821.

Staple fibre yarn (40 x 2) for August delivery evoked good buying enquiries and climbed up by Rs. 14 to Rs. 594. June delivery spurted by Rs. 11 to Rs. 590. Spot New Greats gathered a naya paisa to Rs. 3.12. Citys, Kohinoors and Centurys picked up 2 nP each to Rs. 3.17, Rs. 3.28 and Rs. 3.14, respectively. Among foreign yarns (80 x 2), Fujis put on 3 nP to Rs. 5.15. Paramounts were better by 2 nP at Rs. 5.38.

In the cotton yarn section, ten counts came in for selling. Moderns declined by 6 nP to Rs. 14.75. Podars receded by 13 nP to Rs. 14.62. Twenty counts Gokaks retreated by 13 nP to Rs. 18.37. Moderns were neglected at Rs. 18.75. Maduras were quoted at Rs. 19.12. Among thirty counts, Indus were unchanged at Rs. 21.75 and Edwards at Rs. 21. Forty counts Minaxis decreased by 12 nP to Rs. 26.75, but Moderns improved on special buying support by 25 nP to Rs. 28. Among sixty counts, Raghuvamshis dropped 50 nP to Rs. 57.25. Moderns were dull at Rs. 62. Finlays, however, moved up by 50 nP to Rs. 65. Eighty counts Finlays changed hands at Rs. 82, same as last week. Mahendras were on offer at Rs. 71, but Moderns rose by 25 nP to Rs. 76.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	19-6-1957	12-6-1957
	Rs.	Rs.
Art silk yarn **(per case of 200 lbs.)—**		
120 dull Cones Snia June	804.00	805.00
August	821.00	822.00
120 Japan (per lb.)	4.23	4.14
150 Japan (per lb.)	4.19	4.12
120 Italy (per lb.)	4.16	4.03
150 Italy (per lb.)	3.75	3.72
Staple fibre yarn **(per case of 200 lbs.)—**		
40×2 June	590.00	579.00
40×2 August	594.00	580.00
40×2 New Great (per lb.)	3.12	3.11
40×2 Century (per lb.)	3.14	3.12
40×2 City (per lb.)	3.17	3.15
Cotton yarn **(per bundle of 10 lbs.)—**		
10s Podar	14.62	14.75
20s Gokak	18.37	18.50
30s Edward	21.00	21.00
40s Minaxi	26.75	26.87
60s Raghuvamshi	57.25	57.75
80s Modern	76.00	75.75

OILSEEDS BEARISH

(From Our Own Correspondent)

BOMBAY, 19*th June*

Prices in the local oilseeds market continued to rule bearish during the week under review. A noteworthy feature of the trends in the market was that the groundnut section which was an exception to the general weakness in the market last week, became a victim to it this week, despite considerable demand from vanaspati manufacturers. This was due to reports of favourable weather conditions in the producing areas. Other sections of the market were equally affected by these reports. In the case of the castorseed section, however, the combined impact of these reports and absence of encouraging overseas advices was particularly pronounced. Cottonseed and linseed lacked support.

Reports from London for the week ended 12th inst. also suggest that overseas markets were not encouraging. The Commodity Credit Corporation of the U.S. is reported to have disposed of 770,000 bushels of linseed oil recently at prices that were 5 cents lower than the bids rejected by the Corporation in May. This was stated to be due to increased acreage of linseed in the Prairie Provincess of Canada which was estimated at 3.5 million in this season as against 3.1 million last year. Groundnut oil and castor oil also lacked support; in the case of the latter it was reported to be chiefly due to the talk of substitutes.

Groundnut August contract opened the week at Rs. 175.62 and moved erratically between Rs. 176.12 and Rs. 172.62, before closing today at Rs. 175.00. This represents a loss of Rs. 1.37. Spot Bold was quoted 25 nP lower at Rs. 36.00. Groundnut oil railway receipt, too, was nominally lower at Rs. 20.50.

Business in castorseed September contract commenced at Rs. 168.25. On bear covering, the price rose the same day to Rs. 170.00. Subsequently, however, prices witnessed wide fluctuations, during which the low of Rs. 161.50 was touched. It closed today at Rs. 164.75, which was Rs. 4.75 lower than a week ago. Spot Madras, too, retreated by Rs. 1.37 to Rs. 32.50; and Oil B.S.S. was 63 nP lower at Rs. 20.87.

Linseed September contract, which opened the week at Rs. 30.50, moved during the week between Rs. 30.81 and Rs. 30.25, before finishing today at Rs. 30.37. This was somewhat lower than last week. Spot Bold ready was maintained at Rs. 29.50. Oil ready, too, was done 37 nP lower at Rs. 16.50.

Cottonseed September contract steadily moved down, with variations confined to narrow limits, from its opening high of Rs. 111.50 to Rs. 109.25 at the close. It lost, thereby, no less than Rs. 2.25, over the week.

Among others, Kardiseed bold was on demand at Rs. 22.00, that is 50 nP higher. Nigerseed Madras was maintained at Rs. 28.50.

The following table shows the closing prices of oilseeds and oils today as compared with those at the close of the previous two weeks:

	19-6-1957	12-6-1957	5-6-1957
	Rs.	Rs.	Rs.
Groundnut—			
September, 1957	175.00	176.62	176.62
Bold ready (per cwt.)	36.00	36.25	35.50
Coromandel	37.25	37.50	37.25
Linseed—			
September, 1957	30.37	30.44	30.56
Bold ready (per cwt.)	29.50	29.50	29.50
June-July	—	—	29.62
Castorseed—			
September, 1957	164.75	169.50	180.00
Madras (per cwt.)	32.50	33.87	34.75
Cottonseed—			
September, 1957	109.25	111.50	111.25
Groundnut oil—			
Ex-mill Ready (per quarter) ..	20.75	20.75	20.87
Castor oil—			
Commercial (per quarter) ..	19.75	20.25	20.75
Linseed oil—			
Ready	16.50	16.87	16.75

SUGAR RALLIES FURTHER

(From Our Own Correspondent)

BOMBAY, 19*th June*

The firmness of the sugar market noted last week continues unabated, despite discouraging spot offtake and consumer resistance at higher prices. This state of affairs must be attributed to the fact that the latest official figures relating to sugar offtake have tended to remove all fears of huge carry-over expressed by mill interests early in the season. The total despatches of sugar from mills up to the end of May last amounted to 1,227,000 tons, as against 954,000 tons in the corresponding period of the previous season, and the closing stocks with the mills as on 31st May aggregated 1,271,000 tons, as against 1,245,000 tons. Incidentally, the total output in the period is put at 1,975,000 tons, a rise of 189,000 tons as compared with the same period last year. Influenced by the very encouraging domestic offtake and also by bright export prospects, the sugar mills would seem to be in no mood to part with stocks below the currently prevailing price. In fact, the ex-mill quotations have been raised further by As. 8 per bag.

Spot large grain sugar rallied from Rs. 106-Rs. 108 to Rs. 108-Rs. 109½ per bag, inclusive of sales tax. Medium grain advanced by Rs. 2 to Rs. 105-Rs. 107. Small grain spurted by a rupee to Rs. 103-Rs. 104.

Arrivals of sugar into the market during the week aggregated about 7,300 bags, those for the previous week being 7,000 bags.

SUGAR FIRM, "GUR" WEAK

(From Our Own Correspondent)

HAPUR, 17*th June*

The sugar markets in Northern India continued to record a firm trend and, due to good bull support from consuming areas, mill delivery prices recorded a rise of 12 nP to 50 nP per maund. Demand from Gujerat and Saurashtra was reported to be heavy and, as the inter-State sales tax was to come into force from 1st July, the dealers were anxious to get their supplies before that date.

Production and despatches of sugar up to 31st May amounted to 1,975,000 tons and 1,227,000 tons, as against 1,786,000 tons and 9,540,000 tons, respectively, in the corresponding period last year. Stocks with factories on this date stood at 1,271,000 tons, as compared with 1,241,000 tons a year before. Out of the total production, over one million tons have been produced in the State of U.P. alone, and some of the factories are still working, although the season is practically closed.

Ready *gur* was depressed during the week, although daily arrivals were considerably less, the average being 75 maunds. Outside demand was very slack and local stocks, mostly in *kothas*, was put at 75,000 maunds, the corresponding figure last year being 35,000 maunds. Outside buying enquiry was being met from Agra side where prices were more favourable for the purchasers. Prices at Hapur are: Dry Rs. 10.50 to Rs. 11.50 and *kotha* dry wet Rs. 10.50 per maund.

The standing cane crop has been very much adversely affected by Salai pest and is now in need of rains.

Future *gur* moved both ways during the week on speculative bouts of buying and selling. The week-end prices were near the opening level of the week. *Gur asar* was quoted at Rs. 10.69 and *fagun* at Rs. 11.47.

BLACK PEPPER QUIET

(Messrs. Parekh & Co.)

BOMBAY, 18*th June*

Malabar black pepper ruled quiet during the week under review in the absence of any notable foreign demand. New York, after buying a fair quantity last week, withdrew and was bidding ½ to 1 cent lower than the asked level.

There are conflicting reports from Singapore as to the size of the Sarawak new crop. The majority of traders are treating the estimate given out by New York brokers with reserve. They, however, agree that the crop this year is late and that the pressure of arrivals may not be felt before 15th July. If it is so, there are chances of good demand developing for Malabar black by the end of June or the beginning of July, as the New York dealers will have to replenish their stock which is already low for their autumn requirements.

Singapore is quietly steady round about $77. There are reports that the Lampong crop this year will be larger in size and will be harvested earlier.

June and July-August-September was nominally quoted at $0.26½. July delivery was listed at Rs. 593.

Alleppey moved narrowly between Rs. 610 and Rs. 600. Garbled for July-August delivery in the forward ring at Cochin changed hands at about Rs. 110.

Today's nominal quotations are: Ready Rs. 85 per Bengal maund; July Rs. 594-Rs. 599 and August Rs. 604-Rs. 609 per candy of 5½ cwts.

TEAS EVOKE GOOD DEMAND

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 13*th June*

Almost one million pounds were on offer in sale No. 14 which was held on Tuesday, the 11th inst. The recent changes in excise duy have caused considerable confusion as a result of which buyers discounted teas which had paid 10 nP excise duty, no information having been received with regard to a refund being made of the amount of additional duty paid. Despite this, there was good general demand. While low and stalky types were easier, medium and good medium brokens were firm to dearer. Fannings grades tended lower than last sale. High-grown teas were irregular but any with quality were about steady. Whole leaf teas were again stronger and dearer.

The following are the quotations:

	Rs.	Rs.
Plain B.P.	1.48	1.50
Low medium B.O.P. ...	1.50 to 1.55	1.62
Medium B.O.P.	1.65 to 1.70	1.72
Good B.O.P.	1.90 to 2.00	2.12 to 2.25
Well made black leaf O.P. ...	2.55	2.12

London Market.—There were no sales this week, due to holidays.

Colombo Market—Sale of 9th June 1957.—Active demand. Prices of all descriptions generally about 10 to 15 cents dearer.

Sale of 10th June 1957.—Strong general demand. All descriptions five to 10 cents dearer.

Calcutta Market—Export.—First sale new season started very disappointingly, with poor demand. Whole leaf grades were the strongest feature. Nearly 40 per cent. withdrawn, mostly fannings.

Internal.—19,800 packages dust, of which 6,100 packages of new season's met with fair general demand. Old season's generally easier. Limited number of new season's Darjeelings and best C.T.C. dearer. Remainder below valuation. Some withdrawals.

Export Quota.—The market has again been easier and there are sellers at 20 nP with buyers at 19 nP.

Forthcoming Auctions.—Sale No. 15 will be held on Tuesday, the 18th inst.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd., wire as follows:

"*Sale* 15.—900,000 lbs. offered. Good general demand. Steady at the bottom. Low medium and medium easier by 5 nP to 10 nP. Black leaf fully firm. Best liquoring and whole leaf stronger and dearer."

TEA SALES FEATURELESS

(From Our Own Correspondent)

CALCUTTA, 18*th June*

Tea sales continued to be featureless. Prospect of overproduction haunted the market, with the result that prices realised were below brokers' valuations. Heavy withdrawals could not, therefore, be avoided. There were fears that, world supplies being in excess of demand, prices in export markets would be depressed, thereby acting as a great discouragement to stockists.

Last year, North Indian production was kept down by voluntary restriction of output on the part of gardens. It was felt in the market that, in the current year also, conditions were leading towards the same direction. There is at present no international tea agreement regulating exports from producing countries, and, if India alone restricts production and consequently exports, too, it will not have any effect on the international markets, since the ground lost by India can be gained by other countries where production is higher and increasing exports is aimed at.

During last week's internal sale here, dusts offered amounted to 19,782 chests, which included 6,116 chests of new season's teas. Conditions were weak and prices realised were below brokers' valuations. The old season's teas were of ordinary description. The only interesting feature was that fair prices were realised for the limited number of new season's Darjeelings and the best C.T.C. Assams. All other offerings were featureless, medium Dooars being nominally quoted at Re. 1.45 to Re. 1.50.

Leaf grades offered comprised 141 chests of the new season's tea and 87 chests of the old season's. Prices were easy.

It should be noted that, in contrast to the trend in Calcutta, last week's sales in both Colombo and Chittagong registered a dearer tendency. In the Chittagong sale held on the 10th June, prices advanced on strong demand from North America and Great Britain. In Chittagong, the sale held on the 12th June was the first in the new season. The quantity of leaf teas on offer was a meagre quantity of 2,888 chests, in view of slow arrivals. Prices improved by As. 4 to As. 6. Dusts on offer were 347 chests, which were, however, sold at below valuations.

Mixed conditions were in evidence during the export sales held yesterday. Most of the support came from internal buyers, export buyers operating in a restricted way. There was better demand when the sales opened, but, as sales progressed, a weakening tendency set in. Offerings aggregated 15,614 chests, of which the flavoury Darjeelings and bright liquoring teas were keenly sought by internal buyers. Plain Dooars B.P.s gained 5 nP per lb. on good demand. The strongest feature was provided by stylish well-made leaf grades, gaining 20 nP per lb. Tippy teas were steady, while there was a decline in prices of P.Fs, and withdrawals in this category were heavy. The quotations were: Plain fannings Re. 1.60 to Re. 1.65, clean black pekoe Rs. 2.30 to Rs. 2.40, and plain B.P. Re. 1.75 to Re. 1.80. The absence of representative teas restricted the types for which nominal quotations have been given.

Export quota changed hands at 18 nP per lb., with sellers demanding 19 nP.

JUTE GOODS RECOVER AT CLOSE

(From Our Own Correspondent)

CALCUTTA, 18*th June*

Fully steady conditions prevailed in both the raw jute and the finished products markets during the week under review. Contrary to earlier expectations and weather forecasts, the monsoon has not yet set in in this part of the country. After a few showers a week ago, the weather has again gone hot and dry, and is as gruesome and sticky as ever. In the area already sown with jute, the young plants badly require rain and, because of the continued drought, the fear that outturn in the area already sown would be affected was entertained. The new crop would definitely, be late, but the view that there is sufficient jute in India to enable mills to carry on until the arrival of the new crop in September is as strong as ever. According to some quarters, it is too early to say whether following continued drought, the crop will be lower.

During the week, production figures for the month of May was announced. The total output was 87,300 tons, being higher by 500 tons as compared with April. Actually, hessian at 35,600 tons declined by 600 tons, but sacking at 45,000 tons increased by 200 tons and miscellaneous constructions at 6,700 tons by 900 tons. The number of working hours was the same as in April, that is, 209. However, absenteeism was higher in May, on account of the influenza epidemic and the unusually hot and dry weather last month. Stocks of finished goods at the end of April were 104,200 tons. These, together with the production of 87,300 tons in May, brought the total availability to 191,500 tons. The stocks at the end of May being 108,700 tons, market circles noted that the demand during May was of the order of 82,800 tons which was lower than production for the month. This was a factor which made speculators unusually active and contributed its share to the steady trend, in view of expectations of more business.

From the 16th inst., the Waverley Jute Mills belonging to McLeod & Co. and situated in Shamnagar ceased working for financial reasons. The operatives and other employees, numbering 1,600, have been transferred to another mill belonging to the same Managing Agents. The Waverley is the fifth mill to be closed down in recent months. Of the five mills now closed down, the self-effacement of three was attributed to continued heavy losses in trading and the other two were subjected to mismanagement prior to closure. Recent closures of mills have been naturally causing anxiety to the West Bengal Government which has told the Indian Jute Mills' Association that rationalisation is permissible only to the extent that it does not lead to unemployment. The increased wage bills and the high cost of the fibre have put up the output costs of the jute mills industry during recent years, and rationalisation has been thought of as a possible solution to the production of better goods with less labour cost. If the policy of rationalisation is to be implemented without reducing the labour force, modernisation will not serve any purpose, inasmuch as labour costs will not go down. If such a policy is insisted upon, more closures for economic reasons in the future will not be a surprise to the industry and the market.

On Tuesday last, the jute goods market opened fully firm. Considerable business was put through for forward delivery positions and, in this, speculators were keen buyers. At the rise, mills sold fairly large quantities and booked profits. Ready B. twills advanced from Rs. 116.75 to Rs. 117.20 and 40" 10 oz. hessian from Rs. 43.40 to Rs. 43.70. Support from shippers was also forthcoming on Wednesday and the announcement of lower output of hessian in May made speculators keenly look out for hessian, the 40" 10 oz. of which scored to Rs. 44.10. B. twills were also better at Rs. 117.50. On Thursday, the uptrend continued, with B. twills at Rs. 118.00, touching the highest level for the week, and ready 40" 10 oz. hessian at Rs. 44.40, being fully steady. Speculators made sizable additions to their stocks, but, on Friday, the profit-taking tendency set in to lower B. twills to Rs. 117.70 and hessian 40" 10 oz. to Rs. 44.25. Towards the week-end, the rates were further down at Rs. 117.40 and Rs. 44.12, respectively. Yesterday, however, there was a recovery which pushed up B. twills to Rs. 117.87 and hessian 40" 10 oz. to Rs. 44.44.

With sellers being reserved, raw jute was fully steady. The latest quotations for the 1956-57 crop, June-July delivery, are as follows:

	Middles	*Bottoms*
Pakistani:	Rs.	Rs.
District	40.50	37.50
Northern	40.00	37.00
Indian:		
Northern	35.00	32.50
Assam Upper	35.00	32.50
Assam Lower	35.00	32.50
Orissa	37.50	35.00
Western	34.50	32.00
Murshidabad	32.50	30.00
Jungli	31.50	29.00
Daissee	36.50	34.00
Uttar Pradesh	31.50	29.00
Daissee mesta	32.00	29.50
Bimli f.a.q.		Rs. 28.50
Pucca bales 1st marks ready	...	Rs. 200

BASE METALS STEADY

(From Our Own Correspondent)

CALCUTTA, 18*th June*

Prices of base metals were steady during the week under review, although the London Metal Exchange continued to despatch poor advices. The interesting news this week was the announcement that the U.S. Department of Agriculture would consider barter deals in farm surpluses for strategic materials from abroad. Such deals, however, will only be entertained in cases where sales for dollars are not displaced. The listing of strategic materials included lead, aluminium, zinc, copper and antimony. The fact that the barter deals would be put through in a restricted scale, inasmuch as these deals should indicate to the American Government that trades of cotton, wheat and foodgrains would result in a net gain in exports rather than substituting for sales that could be negotiated in any way, was the cause for quietness on the London Metal Exchange.

In Calcutta, electrolytic copper closed better at Rs. 178, after opening at Rs. 176. The firmness was due to consumers lifting a higher quantity. All fresh arrivals were absorbed in no time. Virgin lead was unchanged at Rs. 73. Electrolytic zinc opened at Rs. 83 and closed lower at Rs. 78. There was fair demand, but, the supply position being comfortable, the price gave way. Tin at Rs. 524 continued to be higher than the replacement cost. The supply position was tight.

FOODGRAINS QUIETLY STEADY

(From Our Own Correspondent)

HAPUR, 17*th June*

Quietly steady conditions were witnessed in the foodgrains market during the week under review. The Union Food Minister declared the other day that the food situation in the country was showing distinct signs of improvement as a result of the number of measures taken by the Government, and prices of wheat and rice had shown a downward trend in important cities like Bombay and Calcutta. The measures taken by the Government included the formation of wheat zones, amendment of the Essential Commodities Act and restriction by banks on credit against foodgrain stocks. The formation of three wheat zones has been officially announced. They are: the Punjab, Himachal Pradesh and Delhi; Uttar Pradesh; and Rajasthan, Madhya Pradesh and Bombay (excluding the City of Bombay). The movement of wheat and its products will be free and unrestricted within a zone, but exports from and imports into the zone will not be permissible except under a permit. The Government is still considering the question of creating zones for the rice-consuming areas.

Wheat at Hapur ruled steady during the week. Average *dara* quality was quoted at Rs. 14.50 per maund, while farm quality was transacted up to Rs. 16.75. The Government-sponsored Marketing Co-operative Society has purchased some wheat and, before the formation of wheat zones on the 14th inst., about eight wagons of wheat were despatched to Bihar. The U.P. State's reaction to the formation of wheat zone is that it has come too late, as U.P. had pressed for the zonal scheme some months ago and a substantial quantity of wheat had already gone out of the State. Local arrivals of wheat averaged 1,500 maunds daily and local wheat stock was put at only 37 *khaties*, the corresponding figure last year being 80 *khaties*. Total arrivals into Hapur from the beginning of the season were put at 98,000 maunds, as against 88,000 maunds a year before. Rice continued to be steady and was quoted at: *Basmati* Rs. 27 to Rs. 30; *sela Mainpuri* Rs. 24; Etawah Rs. 23 per maund.

Gram continued to rule steady, thanks to the State Government's purchases, and most of the quantity offered to the Government was brought here from the Punjab. Local gram stock was put at 38 *khaties*, including the quantity owned by the State Government. The Government is also purchasing barley and *bejhar* and this has accounted for the steady trend in all coarse grains here. The week-end prices—in rupees per maund—were: Gram 11.81 to 12.6; barley 11; *bejhar* 10.75; *jowar* 13 to 15; *guwar* 13.12.

Peas prices declined during the week, as outside buying enquiry was practically dormant and local stock was put at 50 *khaties*. Arrivals averaged 1,000 maunds daily, the total since the beginning of the season being 120,000 maunds.

AMENDING THE NEW COMPANIES ACT

(*Concluded from page* 1245)

and followed. It is therefore suggested that the penal provisions of the Act should be regrouped under appropriate but limited number of sections. The regrouping of the penal provisions will reduce the size of the Act and make it more intelligible to those who are daily connected with company management and administration.

The foregoing is not an exhaustive analysis from the legal aspect of the numerous complex and intricate provisions of the Companies Act, 1956. The Act impinges on company executives, company managers, shareholders and auditors in different ways. I have deliberately refrained from indicating their viewpoints and practical difficulties, as my object is to give an overall picture of the legal aspect of the Act. We all recognise that the Act is not without its blemishes. As we go along in the light of legal experience and judicial pronouncements, we must continually improve on the present Act by amending its provisions. This, indeed, has been the experience of many countries, which have undertaken legislation similar to ours. The Act has as its background the cautions experimentation of Parliament. It is with this purpose in mind that the Central Government has appointed an *ad hoc* committee to consider amendments to the present Act. It is the duty of every one concerned to assist the Committee in its formidable task.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.=Deferred shares. P.O.=Preferred Ordinary shares. Y.=Accounts published yearly. H.=Accounts published half-yearly. P.=Company has Preference shares. T.=Company has Debentures. N.=Nominal quotations. x.d.=Ex. Dividend. c.d.=Cum. Dividend. i=Interim Dividend. f=Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

MONEY AND DEMOCRACY

IT is of the utmost importance that a young democracy like India should be particularly interested in the continued preservation of democratic values. Because democracy in the West has spread by slow degrees, it has had time to strike deep roots in national traditions. The love of freedom was first imbibed by the upper classes who were dissatisfied with the tyranny of the kings and, in course of time, the middle and, still later, the poorer classes imbibed it. Franchise was only gradually extended, women coming at the end of a long queue of those who were enfranchised. Indian democracy has jumped straight from comparative serfdom into full-fledged freedom without passing through the intermediate stages which, in other free countries, marked the people's battle for the vote. An insidious threat to a young democracy may come from the power of the purse to influence political opinion. This danger has not so far manifested itself in this country, because the richer classes, having aligned themselves wholeheartedly with the fight for political freedom, have been among the best supporters of the democratic system of government. Even so, a situation may well arise in the future when the problem will be how best to prevent votes being bought.

Appropriately enough, the issues relating to the influence of money on political life were briefly discussed last week, by the Chief Justice, Mr. M. C. Chagla, and Mr. Justice Desai of the Bombay High Court, in the course of their judgment upholding the decision of Mr. Justice Tendolkar in allowing the Tata Iron and Steel Company, Ltd., to change its memorandum of association so as to enable it to contribute to the funds of political parties. Dismissing the appeal preferred by three shareholders of the Company from the decision of Mr. Justice Tendolkar, their Lordships held that the Company could contribute to funds of political parties, if, in its opinion, such parties served the industry, in general, and, in particular, the industry of the Company. Their Lordships, however, directed the Company to publish at the end of each financial year a complete statement of all the contributions and donations made by it to any political party or institution.

Dealing with the proposal of the Company, their Lordships said that the lower court had applied its mind to the various factors of the case and had come to the conclusion that, in law, it was bound to confirm the alteration sought by the Company. In support of the plea of alteration of the memorandum, the Company had urged that it would enable the Company to carry out its object of earning profits and running the Company more economically and more efficiently. The Company had felt that its safety, security, future expansion and profits were all linked up with the continuance of the Congress Government at the helm of affairs, and that the Company should, therefore, see to it that that Government continued in power. Hence arose the necessity for the Company to contribute to political funds. Their Lordships saw nothing unlawful in the Company making contributions to political funds just as individuals could do. Their Lordships also observed that, if they were to refuse confirmation of the proposed alteration of the memorandum, there was nothing to prevent the Company from reconstructing itself and having a new memorandum empowering itself to have the power to make contribution to political parties, as had been done in the case of several newly-formed companies.

In the course of their judgment, their Lordships made some notable general observations. Thus, their Lordships said that it was their duty to draw the attention of Parliament to the great danger inherent in permitting companies to make contributions to the funds of political parties. They added that it was a danger which might grow apace and which might ultimately overwhelm and even throttle democracy in this country. Democracy would be vitiated, their Lordships said, if results were to be arrived at not on merits but because money played a part in bringing about the decision. The history of democracy had proved that, in other countries, democracy had been smothered by big business and money bags playing an important part in the working and influencing of the democratic institutions. Their Lordships, therefore, felt that it was the duty not only of the politicians and citiz

restrictions on internal production, etc., or (3) special financial assistance in the form of loans either from its own funds or from such institutions as the industrial finance corporations sponsored and backed by the State, it must necessarily contribute to the funds of the ruling party. For any official support the enterprise gets on these lines should be viewed as a matter of right, a recognition of its role in the economic development of the country and its ability to ensure the well-being of the people rather than a favour which should evoke grateful acknowledgment and contribution to party funds. Indeed, it may even be embarrassing for joint-stock companies, as distinguished from individual business men, to tie themselves to any political party, for the political complexion of the Government is bound to be changing in a democratic country.

It may be asked, for instance, as to what is the way out of a situation where extremist political parties, which are determined to destroy the free enterprise system, capture power in a State or two and come forward to support the private sector for purely strategic reasons. If such a party were to extend help to the companies in the private sector on lines similar to those followed by the Congress Governments, would it not be entitled to expect and receive monetary contributions from these companies for fighting elections? And would the companies be right in subscribing to the funds of such parties, which, though they may be friendly towards them for the moment, are wedded to a political and social philosophy totally opposed to democracy? The solution lies in educating the electorate, in convincing it that free enterprise is an essential prerequisite of democracy and that private initiative can deliver the goods, and in building up a political party in which people who believe in free enterprise can willingly join. So long as all elements in the national life are prepared to abide by the rules of the democratic game, there should be no insuperable bar in the way of free enterprise convincing people of the intimate relationship between the things it stands for and democratic values. From this point of view, the real danger to democracy in this country, to which the learned Judges referred, may come not from the right, but from the left. The real danger to democracy will come from those who advocate policies calculated to undermine the sense of national discipline and the authority of free institutions and who decry the institution of private property which gives the citizen the security and the freedom to criticise the Government freely and fearlessly.

CONTROL OVER RESERVES—WHY NOT DROP IT?

IN an informal chat with the Press in Bombay on Sunday last, Mr. T. T. Krishnamachari, the Union Finance Minister, is reported to have elucidated the Government's main objective in introducing the system of strict controls over the reserves of joint-stock companies. The chief objects of this measure, according to him, are to ensure that managements of companies with plenty of reserves do not use them (the reserves) for acquiring other companies and to put down certain other evils. "The spirit of acquisition," to quote him, "goes on and they want to expand their empire." In other words, what the Government wishes to do is to prevent inter-company investments of what appears to it to be of an undesirable nature, as also snatching of controlling interests of well-managed companies by "money bags" without either the requisite knowledge of management or business integrity or both. Another objective of the Government is to see that the funds of companies are not invested in projects unconnected with the plan for the economic progress of the country. The Finance Minister also gave the reassuring undertaking that the scheme of compulsory deposits would be so implemented as not to interfere with the development progress or the day-to-day working of companies. Further, the Finance Minister sought to justify this scheme of control by referring to what other countries have been doing in this direction "These measures," he said, "are not new-fangled ideas, nor does the Government want to stifle private enterprise. They have not done anything like what the U.S. has done in respect of certain monopoly organisations. They are just *ad hoc* remedies, and they may be altered, changed, modified or given up." In thus referring to the U.S., he seems to have had particularly in mind the Anti-Trust Act and the recent verdict of the Supreme Court on du Pont's control over General Motors.

The Finance Minister's assurance that the measure is not intended to stifle the private sector, and that it would be administered in such a way as not to cause any hardship to companies genuinely working on desired lines is really welcome. There is enough evidence that he is quite sincere about it. The delay in enforcing the particular section of the Income-tax Act is due more to his anxiety to implement the scheme without hardship to companies than to the inability on the part of his Department. It may be noted that the draft rules have been framed only in respect of one part of the scheme, namely, that relating to the control over the provisions from current profits; even these have not yet been finalised. The second part of the scheme, namely, control over the reserves accumulated in the past is yet to be worked out in detail and the rules framed. If the Finance Minister's intention was to stifle private enterprise, he could have easily carried it out by enforcing the powers he has assumed. His difficulty is one of having the cake and eating it. Unkind critics may, therefore, say that he is trying to make a virtue out of necessity, for he knows full well that, if he were to force the scheme blindly on the private sector, he would only cause a slow down in production, aggravate the stringency in the money market and give a fresh impetus to price inflation.

Any way, the truth is that even the partial implementation of the scheme, which was to have come into force on 30th June 1957, has been postponed to 31st August 1957. And it is a fruitless effort to enquire whether this deferment is due to a desire to render the scheme workable without any adverse effect on companies or to make the forthcoming borrowing programme of the Central Government a success. What is more important is whether the scheme is at all necessary. Despite all that Government spokesmen have stated so far, we still maintain that it is not necessary and that the Government's stature in both India and the Free World will go up if it drops the scheme. The Government has not produced any data, beyond making vague charges, to substantiate that the evil of acquiring, with the help of the reserves of companies, control of other companies has been widespread. Nor has it shown that, wherever there have been such acquisitions, they are of an undesirable nature, leading to monopolies, oligopolies and cartels. If the Government expects the public and the Press to accept such claims and support the step taken, it must take them into confidence and give full information.

Even assuming, for argument's sake, that the evil exists in a serious form, the Government should try to remedy it through other methods, which will not put the honest companies to any inconvenience. With the nationalisation of life insurance, whatever scope there was for getting control of other companies has been greatly minimised. Again, no company management will be in a position to take control of other companies without the help of bank credit. Fortunately, the Reserve Bank has now enough powers to prevent bank credit being used for such purposes. And we understand that the Bank has been keeping a close watch over the advances of its member banks against shares. Incidentally, the Reserve Bank was vested with the necessary authority long before the control on company reserves was proposed by the Finance Minister. Then, there is the new comprehensive Companies Act, in which there are special provisions for regulating inter-company investments and change of hands in the controlling interests of companies. When the new Act was on the anvil, considerable attention was paid to this question and several safeguards were introduced. The Act is going to be amended again and, if these safeguards require to be strengthened, it could be done then. Or, if the Government feels that the situation cannot brook any delay, it has enough emergency powers to amend the Company Law through an Ordinance.

From such information as is available it appears to us, the evil of business men acquiring other companies with the help of reserves of companies already under their management is not so widespread as to merit a drastic measure of control over the reserves of all companies. In recent years, there have no doubt been some changes, especially in the ownership of companies established and managed by foreigners. But these were mostly with the help of bank finance which has now come under the strict control of the Reserve Bank. Nevertheless, a question that is quite pertinent, in this connection, is: Why were the foreigners anxious to repatriate their investments in this country? Was it not due largely to the economic and social policies of the Government? It will be interesting to note here that, in the case of a large majority of foreign concerns which changed hands in the past three or four years, the transfer took place with the consent of foreigners. If there was any cornering of the shares of concerns under foreign management on the Stock Exchanges, it was with the connivance of such management. Be that as it may, most of the horses have already bolted and the few that are still in the stable are there because they seem to like staying here. There is, accordingly, no need to place any fetters on the reserves of companies. Indeed, to do so would be to tempt the few foreign investors who are still in this country to move out and to deter the coming in of fresh foreign investors.

The Finance Minister's comparison of the control on reserves with the legislation against monopolies in the U.S. is not on all fours. There may be a similarity in so far as the objective is concerned, but there is a world of difference in the method chosen to achieve it. In the U.S., the Congress passed the legislation, leaving it to the judiciary, completely independent of the administration, to enforce the law. The U.S. Government has, of course, been on the look out for offenders under the Act, but it does not punish them. It takes them to the Court and leaves the case to be judged by the highest independent tribunal in the land. Thus, the U.S. method for preventing monopolies and business-vampires is democratic, whereas that adopted by India is absolutely authoritarian. The Indian method, as explained by the Finance Minister, the judiciary will not be called upon to decide the issue; it is the administration that will pronounce the verdict.

If the main aim of compelling companies to deposit a good part of their current allocations to reserves and the major part of their past reserves with the Reserve Bank, subject to the condition that they cannot be utilised except with the consent of the Government, is to prevent monopolies and concentration of economic power in a few hands, as the Finance Minister says it is, why not initiate an anti-monopoly and anti-restrictive practices legislation? That is what the U.S. and the U.K. have done. If India, too, were to do so, the objective could be achieved without upsetting the confidence of foreign, as well as domestic, investors and penalising the vast majority for the sins of a few.

There has already been a waste of precious man-power and money in the preparation of the scheme and of the ways and means of enforcing it. Again, in the application of this negative control, there will be a further recurrent waste of these scarce resources not only in the Government but also in business concerns. Some of the senior officials, who can very well be utilised for implementing the various productive projects which the public sector has undertaken, will have to be devoted to the successful and smooth operation of this unproductive control. Similarly, the companies affected will also have to employ their senior executives to comply with this control on their side. And both will be wasting maunds, if not tons, of paper which can be used either for export or for printing text books so badly needed by the children of this land. The postal and telegraph offices will have to perform additional duties in carrying and delivering the correspondence involved. The Indian Airlines Corporation's aircraft will, perhaps, wear out sooner than otherwise in carrying company executives to New Delhi and back to their places of work, who will find it necessary to make these trips in order to get the Government's prompt consent for exemptions or withdrawal of deposits. Likewise, some of the Government officials may find it necessary to visit the important business centres of India to iron out difficulties. This line of argument can be extended further. But sufficient has been said, we hope, to show how unnecessary and wasteful this control is.

All is said and done, how much money does the Government hope to net in through the application of this control? At one time, it was believed that the amount would be about Rs. 15 crores. But now it is expected to be no more than Rs. 2 crores, after all the exemptions now contemplated are given effect to. Is the game then worth the candle, having regard to the immense damage it has done to the confidence of investors and the heart-burning it has caused amongst the members of private sector? It is now proclaimed from the house-tops that the Government is keen on effecting economy in expenditure. Abolition of this control will doubtless be one of the best ways of doing so. And the sooner it is done, the better.

SHARE MARKETS STILL BUOYANT

MR. MUNDHRA IN L.I.C.—KEYNES' ADVICE RECALLED—CANADIAN WHEAT

THURSDAY, 5 P.M.

MARKET GOSSIP

THE reported statements of the Finance Minister on the implications of his new tax proposals and on the intentions of the Government so far as the private sector is concerned have had a tonic effect on the share markets all over India. It would appear that the operators have been taken in by his statement both to the Press and to the representatives of business men who met him in two separate delegations that the tax on dividends and the control on reserves of companies are only temporary measures and that they may be altered or withdrawn. They are also optimistic that the Finance Minister will effect some substantial modifications in the Wealth Tax and the Expenditure Tax before they are finally presented to the Lok Sabha sometime next month.

An impression has come to prevail in market circles that the Finance Minister was quite receptive and sympathetic to the various suggestions put forward by the spokesmen of business men. From that flows the conjecture that the worst is over in so far as taxation is concerned.

The Finance Minister is also reported to have said that he was not out to kill the private sector or to place any impediments in its way, that he was anxious to help the private sector, that he valued and needed its co-operation for the economic development of the country, that the pattern of taxation for the Plan period had been evolved and settled, and that, in future, the Government would have to think in terms of providing incentives for more production and savings.

All these are only reported statements, but, since they have not been contradicted by the Finance Minister, they may be taken to be correct. Further, he made more or less similar statements at an "informal" Press conference held on Sunday last at his suite in the Taj Mahal Hotel. He, however, dropped a hint to the Press men that it would be an erroneous impression if one were to jump to the conclusion that, soon after his return to New Delhi, he would withdraw either the dividend tax or the controls on companies' reserves or give any substantial tax relief.

• • • •

Our reading of the situation is that no material change will occur in the tax proposals, unless the Prime Minister is convinced of the need for it. We do not think that the Finance Minister, having initiated all the new taxes, will care to plead with the Prime Minister the case of the business community. It must be an embarrassing job for him. He may, however, effect some refinements in the Expenditure Tax. He seems to be reluctant to do anything about the Wealth Tax on companies, except some minor adjustments. It remains to be seen to what extent the Select Committee can be persuaded by the business community to listen to its views. At the moment, business men are busy preparing memoranda for submission to the Select Committee. There is also a possibility of some of them either personally appearing before the Committee or seeking interviews with the other senior members of the Central Cabinet.

From some of his statements in Scandinavia and London, it is apparent that the Prime Minister is quite alive to the fact that the success of the second Plan depends, to a very large extent, on the availability of foreign capital. It would appear that the question of economic aid to India would figure in the conference of Commonwealth Prime Ministers and in private talks which the Prime Minister and his advisers are sure to have with their British counterparts. There are good reasons to believe that the economic experts in Whitehall and the Bank of England share the view that taxation in India is too heavy to permit a smooth development of the economy. And it is likely that they may tactfully convey their impressions about India's latest fiscal policy to the Prime Minister and his advisers. There is thus some chance of the Prime Minister returning to India in a mood that may be favourable to the private sector.

The Prime Minister's visit to London may also improve the chances of India getting foreign economic help. It seems that, unlike in the past, he is in a mood to make a definite request to Britain and the U.S. for financial assistance. Despite the differences of opinion between him and the Governments of these two great countries in the free world on certain international issues, he still commands their respect and affection. His requests to them are, therefore, unlikely to go unresponded. India is still a good risk both politically and economically. It is also a big country which cannot be lightly let down for strategic reasons. It would be most unfortunate for the cause of democracy in Asia, if Britain, Canada, and the U.S. failed to come to the rescue of India at this crucial hour and leave the situation to be exploited by the Russian leaders.

• • • •

To return to the Finance Minister's statements in Bombay early this week. One will do well not to nurse any optimistic hopes, if disappointments in future are to be avoided. There are no indications that the Government will prune the Plan to a realistic size. There is still an uncovered gap of about Rs. 900 crores to Rs. 1,000 crores. We do not, therefore, see how the Finance Minister can refrain from taxing the people more, let alone give any relief in the taxes he has already imposed. He is only sugar-coating the pill when he says that the dividend tax is only a temporary feature of the fiscal policy, so that the people may swallow the pill without offering too much resistance. It would be interesting to know what he means by the word "temporary". It would not be surprising, if he were to say that it means the second Plan period. Since the second Plan is to be followed by the third Plan and the latter by a fourth Plan, each of which may exceed its predecessor in size, it would be nothing but moonshine to talk of relief in taxation or to hope that the worst is over in regard to the tax burden. One should also not forget Mr. Krishnamachari's statement at the last A.I.C.C. meeting that they (he and his colleagues) would establish socialism in India in their lifetime.

• • • •

An important function which the Finance Minister carried out during his visit to this City last week-end was to decide the borrowing programmes of both the Centre and the States. It would appear that he has succeeded in persuading the State Governments to accept the Reserve Bank's advice to them to drop the idea of borrowing from the open market this year, in view of paucity of funds in the organised money market. All State Finance Ministers, who met the Union Finance Minister at a conference with the Reserve Bank Governor and the Deputy Governors, have returned to their headquarters convinced, so it seems, that it is better to abide by Mr. Krishnamachari's suggestion that they should try to find their requirements of capital by concentrating on small savings, which have now been made more attractive by an increase in the rate of interest and by exempting them from Wealth Tax. The latter is a valuable concession to rich people. By stressing this advantage alone, the State Governments should be able to gather large sums from the well-to-do citizens in the urban and rural areas alike.

The Central Government proposes to raise Rs. 100 crores, of which Rs. 38 crores will represent conversion of the maturing loan. It is still somewhat early to anticipate the terms of the new issue, as the Government is unlikely to approach the capital market before the last week of July or the first week of August, by which time conditions in the money market are expected to improve further in favour of borrowers.

The supply of funds in the short-term money market is steadily rising. Money advanced to sugar, cotton, cloth, hardware and foodgrain trades is returning at a good pace. The substantial support given by the Life Insurance Corporation to the share markets has also injected more cash into the market. The marked rise in equity values is, in a way a good augury for the success of the Central Government's forthcoming new loan.

• • • •

Since Monday onwards, the Life Insurance Corporation has been out of the share markets. This may be due to two reasons. First, the rise in equity values since the post-budget depression has been so substantial that it is but natural that the Corporation should leave the market to stabilise itself. Secondly, the Corporation has, it is reliably learned, taken over a large block of shares from Mr. H. D. Mundhra. This investment is said to consist of shares of almost all the companies the control of which he acquired in recent years from British investors. The exact amount involved in this straight deal is not known, but reliable sources place it at between Rs. 1.25 crores and Rs. 1.50 crores. Nor are details of the names of shares and the purchase prices of scrips known. It is, however, common knowledge that the Mundhra group of companies include the following well-known companies: The B.I. Corporation, Jessop & Co., Richardson and Cruddas, Alcock Ashdown, Brahmaputra Tea and Osler & Co.

It is obvious that, before investing in the shares of these concerns as large an amount as that mentioned above, the authorities of the Life Corporation must have made satisfactory arrangements in regard to the administration and the working of these concerns.

The news of this deal has had a bullish effect on the market value of the shares of the aforesaid concerns. B.I. Corporations, for instance, which had gone down to as low a level as Rs. 4.95 on 10th June, are now quoted at Rs. 6.80, after going up to Rs. 7. The following comparative table will give an idea of the recovery in the scrips of the Mundhra group:

	Latest	*Lowest after budget* 16-5-57	*About a year before* 12-7-56
	Rs.	Rs.	Rs.
B.I.C.	6.80	4.93*	11.12
Jessop	25.50	22.25	36.25
Richardson and Cruddas ...	14.50	15.25	25.87
Alcock Ashdown	276.25	240.00	348.75
Brahmaputra Tea	6.12	5.87	9.00
Oslers	5.25	3.00	4.69

*On 10th June 1957.

Opinion in market circles on the Life Corporation's deal with Mr. Mundhra is sharply divided. Some are highly critical, while others think that the Corporation has done a good thing, in that it has saved the capital market from a serious crisis which was in the offing.

All credit institutions are conservative in their investment policies and insurance companies the world over are particularly cautious in investing their funds. This is only to be expected, considering that insurance offices have to look upon their role as investors mainly as the trustees of policyholders' money. Apparently, even conservatism, as Mr. Kenneth Moore of a British life office, namely, the National Mutual Life Assurance Society, pointed out, in effect, in the course of his speech at the last annual meeting of the Society, held in London, could be carried too far. Mr. Kenneth Moore looked back over past history and recalled references to the investments made in the 1920's by the Society's Chairman, the late Lord Keynes, one of the brilliant economists the world has produced. Mr. Moore pointed out that Lord Keynes then argued the case for investment in ordinary shares "within the due bounds of prudence." He went on to add that the Society's progressive lead at that time was materially divergent from the practice of other life offices, but, 30 years later, what was regarded as a distinctly unorthodox development of investment policy had now become common practice. This, Mr. Moore said, had operated in the national interest, and, for policyholders, as a most valuable hedge against the evils of inflation; it had particularly benefited the holders of with-profits policies and was partly responsible for the handsome bonuses which had accrued to them.

The brief reference made by Mr. Moore to the late Lord Keynes' views on investment has induced "Candidus" of the London *Investors Chronicle* to review, at some length, the great economist's observations on investment by insurance offices, made as far back as in 1928. Lord Keynes advanced two reasons for favouring ordinary shares. Arguing the case for investment in ordinary shares, Lord Keynes said that one reason why he favoured it lay in the "advantage of spreading the fund between assets such as bonds expressed in terms of money values and assets representing real values." He dismissed real estate as unsuitable for insurance offices. But he thought that the "public joint-stock company has taken a tremendous leap forward and now offers a field for the investment of funds which simply did not exist even 20 years ago." These companies, he said, "represent the live large-scale business and investment world of today, and any investment institution which ignores or is not equipped for handling their shares is living in a backwater."

At the time Lord Keynes made these observations, and for several decades prior to that, insurers regarded only the railways and public utilities as respectable equity investments. Lord Keynes was convinced, even as early as in 1928, that industrial and commodity companies had far outstripped in size the investment favourites of the insurers of the day. He said: "The centre of gravity of business and, therefore, of investment is not where it was. A 'conservative' investment policy is apt to mean in practice backing the enterprises which were in the van 50 years ago, instead of backing the new ones which are characteristic of the best business brains of today." Yet another reason why Lord Keynes favoured business shares was that they were "undoubtedly undervalued relatively to bonds after making all due allowance for risk and other relevant considerations." He stressed the point that the policy of ploughing back part of a company's profits each year "introduces a cumulative, compound interest element which is often overlooked."

So much for the great economist's views on investment by insurance offices. In this, as in many other things he wrote, Lord Keynes has been proved correct by events. Insurers the world over have shaken off some of their former disinclination to invest their funds in equities. Indeed, they are constantly on the look out for good ordinary shares. In India, too, the trend, till the time of nationalisation of life insurance, had been towards an increasing investment in ordinary shares. And, if the insurers could not do more for ordinary shares than they actually did, it was at least partly due to the severe statutory restrictions on investment by life offices. The precise trends in investment during the period following the nationalisation of insurance have not been published. But it is well known that the Life Insurance Corporation has not lost its interest in equities. Indeed, it has been an active supporter of these in recent weeks, more especially after the Central Budget on 15th May 1957, which heavily depressed the Stock Exchanges.

From the point of view of the capital market and joint-stock companies, there are, of course, two vital differences, between investment in equities by the former life offices and the present Corporation. In the first place, joint-stock companies could always get a better deal in a situation where investing life offices competed among themselves for buying really good equities than in a context in which there was only one powerful buyer, the Life Insurance Corporation. Secondly, there is always the fear that the Government, working through the Corporation, may try to influence the policies of joint-stock companies, the shares of which the Corporation buys. But it must be said to the credit of the Government and the Corporation that, so far, they have shown that such a fear is baseless. If, however, the political complexion of the Government changes and a party which is more to the left than the Congress comes into power, or if the Congress party itself becomes more leftist than it is now, it may well be that the Corporation may turn out to be a busy body in the affairs of joint-stock companies, the shares of which it acquires. It may then pave the way for nationalisation of industries by the back door—a threat which the protagonists of privately-owned life insurance have always seen in nationalisation of this important business.

• • • •

The success of the Progressive Conservative Party, led by Mr. Diefenbaker, in the recent general elections in Canada is a development of some significance to this country. In the context of the

EQUITIES MOVE UP FURTHER

SPURT IN SUGARS

(From Our Own Correspondents)

BOMBAY, *27th June*

THE Bombay Stock Exchange continued to depict a firm trend during the week under review, though there was a slight setback today on account of heavy profit-taking. The buying support lent by the Life Insurance Corporation was quite sustained till mid-week, which, in turn, led to extensive bear-covering. Good investment buying was also in evidence, thanks to favourable interpretation of statements made by the Union Finance Minister in the course of his discussions with the industrial and business community held in the city early this week. In particular, three statements of the Minister were noted with satisfaction. First, the measures like excess dividend tax and compulsory deposit scheme are temporary expedients, liable to change in the light of changing circumstances. Secondly, the viewpoints of the business community on the wealth and expenditure taxes would be sympathetically considered by the Select Committee of Parliament. Thirdly, the Government has no desire to stifle private enterprise; on the contrary, it will do all it can to encourage productive enterprise.

The aforesaid assurances of Mr. Krishnamachari, together with the absence of any fresh tax proposals in the Bombay Government budget for 1957-58 presented this week, and firm advices from Calcutta, imparted much strength to the market and values of shares continued to maintain their upward march. Today, however, the market, as already stated, staged a slight setback, following heavy profit-taking. Consequently, a part of the earlier gains was erased. Nevertheless, the closing rates were markedly higher than those at the end of last week.

Tata Ordinaries in the steel section opened the week firm at Rs. 164, as against Rs. 163.75. They were keenly sought after, despite uncertainty regarding dividend, and taken up to Rs. 174.75 yesterday. At this level, profit-taking set in and the scrip receded today to Rs. 170. The net gain over the week was Rs. 6.25. Pending the announcement of dividend by the Company, the Stock Exchange authorities have directed that, for settlement purposes, a provisional deduction of Rs. 10.50 per share be made for dividend on shares. Indian Irons opened at Rs. 19.50 and rose on good enquiries to Rs. 20.50 yesterday, but declined to Rs. 19.90 today before recovering to Rs. 20.05 at the close.

As in the previous week so also during the week under review, trading in the textile section was characterised by strong bull support and bear covering, the cumulative effect of which was further handsome gains in prices. Edward Textiles jumped up by Rs. 35 to Rs. 290. Centurys rallied Rs. 19 to Rs. 426. Bombay Dyeings opened at Rs. 534 and advanced to Rs. 560 before finishing today lower at Rs. 550.50, the net rise over the week being Rs. 15.50. New Greats spurted by Rs. 15 to Rs. 235, Standards by Rs. 13 to Rs. 414, Central Indias by Rs. 9.50 to Rs. 112, Gokaks by Rs. 7.25 to Rs. 182.25 and Swans by Rs. 6.75 to Rs. 361.25. Simplex hardened by Rs. 6 to Rs. 166, notwithstanding a cut in dividend for the year ended March 1957, following reduced profit. Morarjis put on Rs. 5 to Rs. 215. Elphinstones and Shreenivas rose by Rs. 4 each to Rs. 54 and Rs. 178 respectively. Indores strengthened by Rs. 3.50 to Rs. 138.50. Swadeshis gained a like amount to Rs. 87. Kohinoors were done Rs. 2.50 higher at Rs. 286. Tata Mills gathered Rs. 1.50 to Rs. 44 and Finlays Re. 1 to Rs. 274.

Bank shares attracted good attention and recorded an improvement in prices. Central Bank new shares moved up by Rs. 2 to Rs. 56 and old shares increased by 75 nP to Rs. 53.50. Bank of Indias hardened by Rs. 1.25 to Rs. 139. Barodas and United Commercials rose by 50 nP each, the former to Rs. 102.50 and the latter to Rs. 54.50. Union Banks gathered 30 nP to Rs. 7.30.

Electricity shares were well supported. Tata Powers picked up Rs. 11.25 to Rs. 1,216.25 and Hydros Rs. 2.50 to Rs. 122.50, a reflection of the satisfaction over the final dividend paid for the year ended March 1957. Andhra Electrics advanced by Rs. 5 to Rs. 1,195. Bombay Suburbans put on a rupee to Rs. 104.50. Ahmedabad Electrics were fully steady at Rs. 93.75.

Sugar shares in the miscellaneous section elicited considerable buying support induced by the absence of a levy on agricultural income in the Bombay budget. Belapurs were specially sought after and their value forged ahead by Rs. 17 to Rs. 238; at one time yesterday, it had even touched Rs. 242. Walchandnagars climbed up by Rs. 14.25 to Rs. 258.75. Phaltans increased by Rs. 8 to Rs. 143. Bhopals were better by 55 nP at Rs. 18.25. Cement shares, however, ruled somewhat dull. Associated Cements opened at Rs. 158.75 and, after rising to Rs. 160.75 yesterday, slipped back to Rs. 157.75 today before finishing at Rs. 158. Digvijays registered a gain of Re. 1.25 to Rs. 146.25. Dalmia Cements were fully maintained at Rs. 12.

The firmness of engineering and mining shares noted last week continued unabated and there was a further improvement in values. Premier Constructions rallied Rs. 9.50 to Rs. 161. Tata Locomotives picked up Rs. 5.50 to Rs. 152.50. Alcock Ashdowns spurted by Rs. 3.75 to Rs. 276.25. Shivrajpurs increased by Rs. 3 to Rs. 82.50. Mahindra and Mahindras gathered 25 nP to Rs. 14.50. B.B. Petrols were better by 14 nP at Rs. 2.62. Indian Coppers, however, dropped 18 nP to Rs. 3.42, owing to selling pressure induced by a 10 per cent. cut in the dividend for 1956 to 20 per cent. (on the enhanced capital), from 45 per cent. (including a bonus of 25 per cent.) for 1955.

Among automobile shares, Premier Automobiles improved by Rs. 2.50 to Rs. 89. Hindusthan Motors were firm at Rs. 7.05, same as last week. Deals in shipping shares were put through at higher prices. Scindia Steamships advanced by 70 nP to Rs. 19.20. Great Easterns increased by 35 nP to Rs. 19.70. India Steamships were better by 15 nP at Rs. 10.15.

Among miscellaneous industrials, Bombay Burmah Olds encountered persistent enquiry from professional circles. They opened at Rs. 551.50 and moved up to Rs. 582 yesterday before finishing at Rs. 570 today, the net rise over the week being Rs. 31.50. National Rayons spurted by Rs. 7 to Rs. 224 on good buying support induced by persistent rumours of a cut in imports of foreign yarns during the July-December licensing period and hopes of higher prices. British India Corporations firmed up by 75 nP to Rs. 6.80. Wimcos were bid at Rs. 157, as against Rs. 153. British India Corporations firmed up by 75 nP to Rs. 6.80. Tata Oils hardened by a similar sum to Rs. 43.50. Tata Chemicals rose by 20 nP to Rs. 17.55. Killick Industries, however, came in for some selling and declined by a rupee to Rs. 155. Hindustan Levers were a shade easy at Rs. 19.25.

* * * *

Calcutta Stock Exchange

CALCUTTA, *26th June*

Following increased activity, share values recorded a good measure of recovery during the week under review. The Union Finance Minister's readiness to examine difficulties in the application of his taxation proposals contributed to better sentiment. The support by the Life Insurance Corporation was also a helpful factor. The Corporation's support was considered to be part of the Government's integrated plan to ease money market conditions. Encouragement was further derived from Mr. Krishnamachari's assurance to a deputation of Bombay business men that the Government did not desire to stifle private enterprise and that it would do all in its power to encourage productive enterprise. His statement that the Government did not want to develop the public sector at the expense of the private sector was particularly welcomed.

In accord with the general trend, coals recorded a slight improvement. Operators felt that the Coal Prices Inquiry Committee, taking the cost structure, could not but recommend increased prices. Burrakurs were fractionally better at Rs. 21.87, with Equitables recovering from Rs. 20.12 to Rs. 21.62. At Rs. 22.12, East Indians put on Re. 1.87.

It was not expected that raw jute prices would decline in the next one or two months, irrespective of the trend in the jute goods market. On the other hand, buyers were not prepared to support higher prices for jute goods. That being so, the current accounting period for mills was not expected to produce encouraging results. Naturally, jute shares sagged. Nationals eased from Rs. 19.70 to Rs. 19.60. Deltas were hammered down to Rs. 109, from Rs. 123.50.

* * * *

Madras Stock Exchange

MADRAS, *25th June*

The Madras Stock Exchange put on a cheerful appearance during the week under review. The chief impetus to the market was provided by the Union Finance Minister's reassuring observations at the meetings held with business men at Calcutta and Bombay. His statements that the compulsory deposit scheme and excess dividends tax were only temporary expedients, liable to change in the light of changing circumstances, and that the Government did not intend to develop the public sector by stifling private enterprise were bullishly interpreted. Some buying enquiries shown by the Life Insurance Corporation also helped to enliven sentiment. Equity values, as a consequence, tended to look up. The undertone of the market was firm.

Among tea shares in the planting section, Periakaramalais improved by 35 nP to Rs. 7.45. Kil Kotagiris advanced by 30 nP to Rs. 5.95. Chandramalais increased by 20 nP to Rs. 3.75. Devasholas were firm at Rs. 19.50, Nilgiri Teas at Rs. 8.60 and Talayar Teas at Rs. 10.55. Among rubber shares, T.R. & T's were quoted 35 nP higher at Rs. 9. Pullangodes hardened by 5 nP to Rs. 2.85. Rajagiris were fully steady at Rs. 15.50, Thirumbadis at Rs. 1.57, Travancore Rubbers at Rs. 15, Woodlands at Rs. 9.50 and Woodcotes at Rs. 1.70.

In the textile section, Coimbatore Cottons were pushed up by Rs. 18 to Rs. 160. Metturs improved by Rs. 7 to Rs. 320 *cum-div.* Ranga Vilas rose by a like amount to Rs. 89. Coimbatore Spinnings put on Rs. 4 to Rs. 87. Buckinghams spurted by Rs. 3 to Rs. 165. Lakshmis and Rajalakshmis rose by Rs. 2.50 each to Rs 142.50 *cum-div.* and Rs. 113.50 *cum-div.* respectively. Bangalore Woollens and Radhakrishnas gained Rs. 2 each, the former to Rs. 165 and the latter to Rs. 273. Loyals went up by Re. 1.50 to Rs. 49.

MARKET GOSSIP

(Concluded from previous page)

shortage of food supplies in this country, which is now being made good by imports, it will be generally welcomed that, in Canada, which has a large surplus of wheat, there is now a political party in power which is pledged to promotion of Common-wealth trade. It may be recalled that one of Mr. Diefenbaker's campaign pledges was that, if elected, one of his first acts would be to call a Commonwealth trade conference. Canada, with its surplus wheat which must be exported, has not generally looked with favour on the U.S.'s surplus disposal programme, more particularly its special efforts designed to "give away" wheat and to sell wheat for local currencies on long-term credit arrangements. Not having been able to persuade the U.S. to make a significant alteration in surplus disposal policy, Canada, it is stated, is itself prepared to follow the American example in the matter of disposing of its own surplus wheat. Some of Mr. Diefenbaker's colleagues are, in fact, known to favour giving or selling Canada's surplus grain to Commonwealth countries like India, Pakistan and Ceylon which are in need of it.

Although Canada was able to increase its exports at the time of the Suez crisis, its exports are said to have fallen off in more recent months. Stocks have accumulated. And there is some pressure by farmers on the Government. It may, however, be doubted whether Canada will be able to adopt entirely American methods of surplus disposal, considering that Canadian economy is less strong and less varied than the American. But it will not be averse to following a modest variation of the American programme. Alternatively, or along with some modified version of the American methods of surplus disposal, Canada may adopt a more flexible price policy which will help speed up exports. But the chief danger involved in any reduction in wheat prices is that it may further depress world wheat prices.

It is, perhaps, fortunate for wheat-importing countries that not only freight rates but wheat prices have declined in recent months. Thus, Chicago wheat July is currently quoted at 205½c., as against 283⅜c., early this year and Liverpool wheat futures (July) is quoted at £26 4s., as compared with the quotation of £29 15s. for March futures early in January last. Among the factors which have brought about a general decline in foodgrain prices, mention must be made of the U.S. concessional sales. Total U.S. shipments of wheat this season are expected to reach 11 million tons. The fact is that the U.S., despite the implementation of the Soil Bank programme, continues to face a situation in which large wheat surpluses will remain, thereby creating problems for export trade. The estimated supply for the 1957 marketing year is placed at 1,825 million bushels, 56 per cent. above the amount needed to satisfy normal demand. Despite the fact that a little more than one-fifth of the national allotment of 55 million acres was withdrawn from the Soil Bank, the prospective yield is placed at 971 million bushels, or only 2.7 per cent. less than the 997 million bushels harvested in 1956. Weather conditions have been favourable, so that the winter crop this year is estimated to yield 735.7 million bushels, as compared with 734.9 million bushels last year; the estimates of per-acre yields are, respectively, 23.6 bushels and 20.6 bushels. The spring wheat crop is placed at 234.8 million bushels, as compared with 262.2 million bushels last year.

In an effort to prevent further accumulation of surpluses, the U.S. Department of Agriculture has agreed to pay farmers some $231 million for withdrawing about 12 million acres allotted to them for growing wheat. Based on the supply estimate for the 1957 year which is only 26 million bushels below last year's, the cost to the Government, it is computed, will come to about $9 per bushel of wheat held off the market through the Soil Bank. This shows how costly is the operation of the Soil Bank programme, though it must be admitted that, in the absence of this programme, the crop might have been much larger than last year.

So far as India is concerned, the chief problem is not availability of wheat in world markets but the foreign exchange needed to buy it. Last year, India imported food to the tune of 1.42 million tons and, this year, imports are likely to be of the order of 1.76 million tons, though a large proportion of these imports has already arrived. If these imports have not had any significant adverse effect on the foreign exchange position, it is because they are largely coming in under the U.S. aid agreement. India will get 3.5 million tons of wheat from the U.S. under this agreement, of which one million tons have already arrived and another two million tons will be received before May next.

Surely, a similar arrangement with Canada is bound to prove beneficial to this country's economy. Nor need any such arrangement be confined only to wheat. For Canada is in a position to offer a fairly wide range of several other raw materials and finished goods which India needs. It may, therefore, be useful to explore possibilities of entering into a long-term credit arrangement, in the light of India's needs and Canada's resources.

NEWS IN BRIEF

THE all-India final estimate of dry chillies for 1956-57 puts the current year's area and production at 1,450,000 acres and 354,000 tons, as against the partially revised estimate of 1,490,000 acres and 355,000 tons, respectively, for 1955-56.

An amendment to Section 27 of the Hyderabad Agricultural Income-tax Act, 1950 proposes to extend the period of four years to five years within which the Agricultural Income-tax Officer can serve notices and proceed to assess or reassess suppressed agricultural incomes for the years 1952-53 and 1953-54.

The Government of India has agreed to provide facilities to six officers of the Burma Railway Accounts Department for training in railway accounts procedure on the Indian Government railways. The six officers will come in rotation for a period of three months each. The first of these officers has already arrived in India and has commenced his training at Calcutta.

An amendment to the Central Provinces and Berar Sales Tax Act, 1947, proposes to limit the operation of the provisions regarding suits and prosecutions against Government servants only. Section 26(2) of the Act prescribes three months as the period of limitation within which a suit or prosecution can be instituted against any person in respect of anything done or intended to be done under the Act.

The total number of automobiles produced during 1956 was 32,138, as against 23,084 in 1955. The break-up of the production was: Cars 12,989, station wagons 677, jeeps and similar vehicles 4,328, and trucks 14,144. As against 13,813 automobiles sold in 1954, 26,065 vehicles were sold in 1955. The sales in 1956 went up to 31,486. By 1960-61, the demand for cars and trucks is expected to rise to 65,000 per year.

The Government of India has authorised the Assam Oil Company to conduct a physical survey for the construction of an 800-mile pipeline for transporting crude oil from Assam to Calcutta. The Pipeline Construction Company of the U.S. will undertake the survey which will be completed towards the close of this year. The proposed pipeline will stretch across 850 to 920 miles from Nahorkatiya and Moran oilfields to Calcutta.

The Rajasthan Government has appointed a nine-man Sales Tax Advisory Committee, with the Commissioner for Industries as Chairman, to maintain proper liaison with trade and industry. It will suggest measures for the smooth and efficient administration of sales tax laws and rules, advise on matters relating to genuine grievances of traders in the administration of tax, and examine and advise on any matter relating to sales tax referred to it by the Government.

The Government of India has raised the rate of interest on all post office savings bank accounts by half per cent. with effect from the 1st inst. The revised interest on deposits up to Rs. 10,000 in individual accounts (up to Rs. 20,000 in joint accounts) is 2½ per cent. and, on balances in excess thereof, as also on public accounts, 2 per cent. The other savings bank accounts will also have a similar increase of ½ per cent. over the rate of interest admissible to them prior to 1st June 1957.

With a view to ensuring better conservation and exploitation of mineral wealth, the Government of India has decided to fix a ceiling on the area for which a prospecting licence in respect of any mineral or any prescribed group of minerals can be granted to private parties. This ceiling is likely to be 50 square miles. At present, there is no maximum limit prescribed for the grant of prospecting licences. A Bill embodying the ceiling is expected to be brought before Parliament at the ensuing session. The Government also proposes to assume powers to reduce or enhance the maximum area of ten square miles which can be held on a mining lease, if the step is finally found to be advisable in the interest of the mineral development of any State.

An advance team of shipyard experts from Britain will arrive in New Delhi within the next few weeks to carry out a preliminary survey in regard to the establishment of a second shipyard in India. This team will be followed by another in September. Both the teams are being sent by the British Government under the Colombo Plan. The teams will visit various probable sites for the location of the yard and have talks with officials of the Government of India on the type of ships to be built in the proposed yard. Among the sites proposed are Bhatkal (Mysore), Cochin (Kerala), Paradip (Orissa), and a site near Calcutta (West Bengal). The Government of India intends to build tankers and ships of more than 10,000 tons in the second yard.

In order to allow sufficient time to the State Governments to amend, where necessary, their sales tax laws to accord with the new provision of Section 15 of the Central Sales Tax Act, 1956, the Government of India has postponed the date of enforcement of the section to 1st October 1957. The new provision seeks to restrict the powers of the State Governments to levy tax on declared goods of special importance to inter-State trade or commerce only at the stage of last sale or purchase in a State and at a rate not exceeding 2 per cent. of the sale or purchase price thereof. It also provides that no tax under the State Law shall be levied on such goods, if they are intended for despatch to another State. The postponement now effected, however, will not in any way alter the enforcement of the levy of tax under the Act with effect from 1st July next.

The Government of India has set up a committee, with Mr. Asoka Mehta as Chairman, to investigate the rise in foodgrains prices. The other members of the Committee are Mr. Thirumala Rao, a former Central Deputy Food Minister, Mr. S. F. B. Tyabji, M.P., Raja Surendra Singh, a former P.E.P.S.U. Minister, Mr. V. N. Tivary, ex-M.P., Dr. B. K. Madan, Economic Adviser to the Reserve Bank, and Dr. S. R. Sen, Economic and Statistical Adviser to the Union Food and Agriculture Ministry. The terms of reference of the Committee include a review of the present food situation and examination of the rising trend of prices since the middle of 1955. In the light of this analysis, the Committee will recommend measures to ensure a level of prices which would provide the necessary incentive to the producer with due regard to the interests of the consumer and maintenance of a reasonable cost structure in the economy. While assessing the likely trend in demand and availability of foodgrains over the next few years, the Committee has been asked to take into account the impact of growing development expenditure and increase in population and urbanisation, as well as the availability of foodgrains from abroad.

From Abroad

The U.S. Government estimates that American travellers will spend more than $1,800 million abroad this year. Last year, Americans spent $473 million in Europe and the Mediterranean area.

The U.S. Agricultural Department's Crop Reporting Board has forecast a wheat crop this year of some 971 million bushels, about three per cent. below last year and some 14 per cent. below average.

A jury in the U.S. District Court has acquitted three companies—Vanadium Corporation of America, Union Carbide and Carbon Corporation, and its subsidiary Electro Metallurgical Sales Corporation—on a charge of conspiring to monopolise and fix prices on vanadium between 1933 and 1946.

The Colonial Development Corporation in the U.K. has agreed to lend £1.17 million to Malaya's Land Development Authority. An agreement will be signed shortly. The terms have not yet been finalised, but they are expected to be liberal and repayments will be spread over a number of years.

The American Export Lines has applied to the Federal Maritime Board of the U.S. for permission to increase its subsidised service to India an to include calls in the Persian Gulf. Citing the relatively low participation by American-flag vessels on this route, the Company has sought additional subsidy to permit it to increase its frequency of service to between 34 and 50 per year.

PERSONAL

DR. Julinsz Suchy has been appointed Ambassador Extraordinary and Plenipotentiary of Poland to India.

Mr. Khatau G. Dayal has been elected President of the Bombay Small-scale Industries Management Association for the current year. Mr. J. T. Jani is the Vice-President of the Association.

Mr. P. N. Thapar, I.C.S., Secretary to the Union Ministry of Food and Agriculture, has been appointed Chairman of the Economy Committee set up in the Ministry to review the methods of work and suggest economies in expenditure.

The United States led the world during 1956 in total gross tonnage of shipping under its flag, according to *Lloyd's Register of Shipping*. The U.S. had 22.47 per cent. of the world flag distribution of shipping, exclusive of shipping on the Great Lakes. Great Britain was second with 18.58 per cent., followed by Norway which accounted for 7.64 per cent.

A Ministerial Committee, headed by the Director of the Economic Division of the Israeli Foreign Office, has been appointed by the Government of Israel to study the effects of the European Common Market and Free Trade Area on Israel's economy. In view of geographical proximity and the fact that a substantial part of Israel's exports go to the Common Market Countries, considerable importance is attached to the move.

Shift working round the clock has been advocated as the most efficient way, to lower prices by Mr. Lancelot Spicer, Chairman of Messrs. Spicers, Paper Merchants of Manchester. According to him, the lighter industries of the country should introduce the practice. It is an economic necessity for machines to work longer hours, as capital expenditure on plant is so heavy. In light industries machines often work only 40 hours a week out of a possible 168 hours.

Employment statistics for May in the U.S. have confirmed that the U.S. economy was suffering what was generally described in economist circles as a mild recession in manufacturing. But Commerce and Labour Department figures show that non-farm employment was at a record for the month and that the total unemployment remained unchanged at a relatively low figure of 2,715,000. The manufacturing recession, however, was revealed by the fifth successive monthly decline in the number of factory jobs and another decline in average hours worked in factories to the lowest level since September 1954.

SECURITY PRINTERS

FOUNDED 1872

Established in 1872, the House of Claridges, after years of experiment and research, have now a very efficient staff, trained in modern methods and up-to-date machinery, to look after your security printing.

Our customers include some of the largest Banking and Insurance Institutions in the country. Lakhs of Cheques, Demand Drafts, Debenture Certificates, Policy Forms, etc., etc., of high quality are produced by us for these customers year after year. The fact that they continue to place their business in our hands is proof in itself of their confidence in us.

We are desirous of making these facilities available to as many as possible. May we have the privilege of serving you also?

G. CLARIDGE AND COMPANY LIMITED

CAXTON WORKS, FRERE ROAD, FORT, BOMBAY

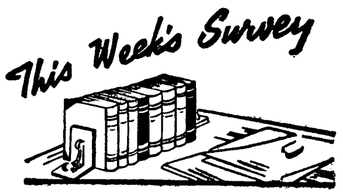
Managing Agents: W. H. BRADY & CO. LTD., BOMBAY



INDUSTRIAL HOUSING

IT is becoming clearer with every passing day that housing shortage in urban areas is becoming more, rather than less, acute. Nor is it as if the authorities are unaware of this problem. For the Planning Commission, on the basis of the trends in the growth of population and the current rates of increase in housing, has itself estimated that, in the absence of effective measures and carefully formulated programmes of urban development, the shortage in housing by 1961 may be twice as much as it was in 1951. It is true that, since 1951, some progress has been made in construction of new tenements, thanks to private and co-operative efforts and the Government's subsidised housing schemes for industrial workers and low-income group. Even so, it is to be feared that the position has not greatly improved. Small wonder, then, that the State Governments which have to find some means for solving the housing problem facing the citizens are often compelled to resort to drastic remedies. One such remedy is to compel industrial employers to divert the available resources to providing houses for their employees.

In Bombay, this remedy has had a long and interesting history. About seven years ago, the Government of Bombay announced that it had decided to make it compulsory for industrialists to provide housing facilities for at least 25 per cent. of the labour they employ in their new undertakings. Subsequently, it was decided to apply this policy in the entire State, and not to Greater Bombay only. In 1951, it decided that industrial concerns in Bombay City alone were required to provide for the housing of 60 per cent. of additional labour employed. Two years later, the Government reduced the percentages of labour for which housing should be provided from 60 to 40. At that time, it was generally understood that these conditions applied only to factories situated within city limits. But, later, the Government seems to have decided that the restriction should be applied to Greater Bombay area and that building permits for extension of existing factories or for the establishment of new units would not be given unless the employers agreed to provide residential accommodation for at least 40 per cent. of the workers or additional labour to be employed, provided the number of such workers exceeded 20.

Apparently, the Government is not satisfied with the pace of implementation of the industrial housing programme. The new State Minister for Housing, Mr. S. G. Kazi, stated in the Legislative Council, last week, that the Government not having received "much co-operation" from the new industrial managements in the matter of housing for workers, had decided to compel promoters of new industries to construct houses for their workers within two years of starting their units. The Minister said that, if this also did not have any effect on these industrialists, the Government would consider the question of adopting more stringent measures in order to compel the employers to build tenements for their employees. He further revealed that the Government was also examining the question of taking action against established industrialists who had not yet provided their workers with houses. "If industrialists can keep their iron and steel in air-conditioned rooms," he declared, "I find no reason why they should not provide shelter to their workers, who are after all human beings and are partners in production and equal in the eyes of the law."

While the Minister's indignation is understandable, in that it stems from a well-meant desire for promoting social welfare, it is perhaps well to recognise certain fundamental considerations. In the first place, it is an oversimplification of the problem of housing shortage to suggest that the provision of houses for industrial workers will solve it. Secondly, the proposition that industrial employers must necessarily provide workers with houses is not accepted in all countries. The fact is that, generally speaking, the Government should not transfer the responsibility for constructing houses to the employers, any more than it can be called upon at all times to provide houses for its servants. It is the business of industrialists to start industries. And when it is difficult to find the capital requirements for this purpose, it will add to the difficulties of *entrepreneurs* if they are also asked to find the additional capital necessary for industrial housing. In this connection, it must be remembered that the investment on housing does not yield an adequate return so that a certain investment-loss is necessarily involved in such construction. In the absence of specific fiscal and other incentives, it is idle to expect that employers can undertake the entire, or even a significant part of the responsibility for industrial housing. Nevertheless, it must be said to the credit of industrial employers in this country that they have not abdicated this responsibility; in fact, some of them have constructed houses which are a model of their kind in any country. But any general or rigorous insistence on such conditions will retard industrial progress and thereby affect adversely employment opportunities in the State. Indeed, industrial housing is best treated as an all-India subject.

Fourthly, if the Government's intention in insisting upon industrial housing is, as it may well be, to bring about dispersal of industries, the objective can be better realised through wider provision of power and other resources which determine industrial location. Finally, the Government cannot be unaware of the fact that even if industrial employers are both willing and able to undertake extensive housing programmes, there will still be the problem of finding building materials. Not only are they, especially cement and steel, costly and even artificially costly, but they are also not easily available. If the State Governments protested vigorously against the Centre's policy of maintaining the prices of these materials at artificially higher levels and succeeded in reversing the Centre's policy, they will have done a real service to all sections of the population, to industrial employers as well as prospective house-owners.

BOMBAY'S FINANCES

Two considerations would appear to have weighed with the Finance Minister of Bombay, Dr. Jivraj N. Mehta, in deciding not to announce any fresh taxes in his budget statement for 1967-58 which he presented to the State Legislative Assembly on Tuesday this week. First, the tax load on the public is already very heavy and any further addition to it will only act as the last straw on the camel's back. As the Finance Minister himself admits, the Government has not only fulfilled its target of taxation fixed in the first Plan but has actually exceeded it, and the public of Bombay State has also to bear a large share of the additional taxation recently proposed by the Centre which, measured by collections in the State, would come to 40 per cent. Secondly, the Finance Minister expects more liberal assistance—loans and grants— from the Centre, as a result of the final recommendations of the Finance Commission. Dr. Jivraj Mehta alludes, for instance, to his Government's plea for larger distribution of income-tax, central excise duty and estate duty and also for an annual grant of Rs. 3.25 crores to meet the deficit of some of the component units of the State, the growing Plan expenditure of all the areas of the new State, and the increased expenditure arising from problems of integration such as uniform pay scales.

The budget estimates for the current year disclose an uncovered revenue deficit of Rs. 3.17 crores, which represents a rise of Rs. 80 lakhs, as compared with the deficit shown in the budget presented in March last. The increase in deficit has occurred, despite the improvement in revenue receipts which are now placed at Rs. 109.44 crores, as against Rs. 106.32 crores. But the improvement has been more than neutralised by a marked rise of Rs. 3.92 crores in expenditure, from Rs. 108.69 crores anticipated earlier to Rs. 112.61 crores now estimated. The deficit of Rs. 3.17 crores is in striking contrast to the surplus of Rs. 24 lakhs shown in the 1956-57 budget of the State before reorganisation. This is due to the fact that, though the revenue receipts of the bigger Bombay State are estimated higher by Rs. 31.34 crores, the expenditure is expected to go up even higher, by Rs. 34.75 crores to be precise.

The budget statement of Dr. Jivraj Mehta does not contain any indication of the overall deficit—both revenue and capital accounts together—for 1957-58. This is only to be expected, considering the several uncertain factors which the Finance Minister has not been able to assess at present. Special mention may be made of the uncertainty regarding the Government of India agreeing to give further grants in respect of plan schemes, as urged by the State, and the Finance Commission's award. Nevertheless, Dr. Jivraj Mehta has expressed his confidence that the overall deficit "will be met without difficulty from our resources, though we have to face many transitional difficult problems involving large financial commitments on account of the formation of the new State."

The total capital expenditure of the Bombay Government for 1957-58 is expected to be of the order of Rs. 46.51 crores. The estimate is inclusive of amounts provided by means of supplementary demands but excludes expenditure on State trading. Of this amount, irrigation accounts for Rs. 17.30 crores, roads and buildings for Rs. 11.95 crores and the Koyna project for Rs. 6.86 crores. The Finance Minister's reference as to how the capital expenditure of Rs. 46.51 crores will be met is rather vague, as will be seen from the following extract of his speech:

"It is proposed to meet the capital expenditure from loans and grants totalling Rs. 15.94 crores (Rs. 14.57 crores loans and Rs. 1.37 crores grants) from the Government of India, from our share in small savings, by withdrawal of Rs. 2 crores from the fund for development schemes, and from Rs. 4.24 crores from the balances in the State road fund, milk fund, sugarcane cess fund, ports development fund, etc. Attempt will be made to meet the balance of requirements by open market borrowing in consultation with the Government of India."

Although the above extract does not indicate what the State's share in small savings will be, the Finance Minister stated earlier in his speech that, "if the recommendation of the National Development Council is implemented, the State's share in small savings in Bombay State based on the net collections of last year, namely, Rs. 16.5 crores, will, in 1957-58, increase from Rs. 6.5 crores to Rs. 11 crores." Taking this sum into account, it is seen that he has found, or hopes to find, resources of the order of Rs. 33.18 crores, as against the estimated total capital expenditure of Rs. 46.51 crores, leaving a gap of Rs. 13.33 crores. Does this mean that he proposes to cover the whole of this balance by open market borrowings? An answer to this question will be known in a few days.

MR. N. H. TATA ON AUTOMATION

Last week, we had occasion to comment upon automation and similar technological changes in the context of underdeveloped countries. It was pointed out in that connection that, in examining the implications of automation, it was necessary to view it in its true perspective as one of the many developments gradually altering the organisational nature and technological structure of industries. The importance of studying the human and economic problems of the change-over was also stressed. A scientific appraisal demands that its effects should be assessed from different angles with a view to ascertaining whether, in the ultimate analysis, it is beneficial or baneful to the economy adopting it.

This aspect was particularly stressed by Mr. N. H. Tata, Indian Employers delegate to the Fortieth International Labour Conference held in Geneva, in the course of his remarks on the Director-General's report on automation and atomic energy. Mr. Tata rightly maintained that any commentary on this vital subject would be incomplete so long as it arose from looking at it only from one angle, ignoring the other aspects of the problem. Those who focus their attention on the problem of unemployment through automation, overlooking, at the same time, all the benefits likely to accrue to the consumer and to the national economy, as also those who approach the problem from a purely regional angle in their belief that automation would spell suicide for economically underdeveloped regions, cannot be expected to pronounce an impartial verdict. Such a dogmatic attitude, Mr. Tata said, "emanates from the mind which, having fixed its gaze on an imaginary target, refuses to take any notice of the surrounding terrain. Such concepts, confined to predetermined conclusions, do a lot of injustice to our deliberations."

Mr. Tata believes that, in a country like India, which can neither be termed as exclusively agricultural nor as industrially advanced, the question as to whether automation is advantageous or disadvantageous cannot have an over-simplified solution with a "yes" or "no" answer. There is no denying the fact that India is confronted with a serious problem of overpopulation and unemployment. With the advent of the atomic age and introduction of automation, there may be repercussions involving unemployment in the initial stages. But even then, it would not justify a blindfolded, instinctive "no" to introduction of automation. Such an unimaginative move, Mr. Tata remarked, would put India at a disadvantage, as compared with other industrial countries through denial of benefits likely to result from automation in promoting a healthy export trade. While the immediately right capital cost involved in the introduction of automation would always act as a deterrent for economically backward countries, it would be suicidal for India, said he, to keep completely out of the picture by over-emphasising its dangers and underestimating the benefits. The best policy for India in the circumstances, according to him, is, therefore, to embark on an experiment by establishing an industry *ab initio* well suited for the adoption of progressive methods of automation and to study, in a practical manner, its merits and demerits under Indian conditions rather than condemn the system untried. A bold experiment with a completely new unit would give the best available data to the Government and the industry concerned. It would also enable one to evaluate as to how far automation is an inevitable development and unavoidable in the larger interest of the country.

As regards the plea for the reduction of hours of work, Mr. Tata said that, in so far as underdeveloped countries were concerned, the time was not opportune for considering the problem. But, unfortunately, the employer's resistance to such a proposal was often misunderstood and stigmatised as prompted by selfish motives of personal profit. He reminded those who pressed the demand that the national economy was not compounded of only two elements, the worker and the employer, and that the consumer and the society at large were equally concerned in the matter. The Government of the country, as custodians of the national economy and the consumer, could not ignore a country-wide move for a reduction in working hours, without securing a proportionate increase in productivity or a decrease in wages. Any step of this kind is bound to throw out of gear the price index of consumer goods and commodities, as also the wage structure of agricultural, and plantation workers. It will deny the Asian economy the opportunity for achieving a higher standard of life, although it might benefit a small minority of workers. What is more serious, in a country like India where the plans of developments are in full gear, a reduction in working hours, by curtailing output and thereby raising the per unit cost, would upset all cost calculations and render the Plan difficult of fulfilment.

Mr. Tata said that, while a healthy spirit of collective bargaining prevailed at the various committee meetings of the Conference, it was not reflected on the national level and many countries had yet to learn to rely on collective bargaining to maintain healthy industrial relations. He deprecated the tendency for dictating labour laws through legislative decrees and ordinances, particularly when elaborate tripartite machinery existed in many countries. It is a pity, Mr. Tata said, that the inclination to promote industrial relations through legislative fiats seems to grow more and more through "a feeling of guardianship" towards the workers. Associating himself with the observation of the veteran Canadian trade union leader, Mr. Jodoin, that "free collective bargaining, unhampered by compulsory Government arbitration, is the best guarantee for the creation of a climate of opinion in which industrial peace can prevail," Mr. Tata rightly observed that no legislative measure could extend protection of the type the laws lay down, unless it was a product of mutual agreement through collective bargaining.

MACHINE SCREW INDUSTRY

It must, indeed, be said to the credit of the machine screw industry that it has endeavoured its best to fulfil the obligations of a protected industry. Since the grant of tariff protection in 1951, more especially since 1954, the industry has achieved remarkable progress, both quantitatively and qualitatively. The figures cited by Mr. K. R. Damle, I.C.S., Chairman, Tariff Commission, while opening the public inquiry into the question of continuing protection to the machine screw industry beyond December next, held in the City last week, reveal, for instance, that the aggregate production of the industry has gone up from a bare 224,000 gross in 1954 to 1,036,000 gross in 1956, representing a rise of as much as 362 per cent. Alongside of augmenting output, the industry has also taken special care to improve the quality of the product through the introduction of quality control and installation of better and additional machinery. There seems to be, according to Mr. Damle, general satisfaction with the quality of the domestic product.

The substantial increase in the production of machine screws in recent years has been rendered possible by a marked expansion in the installed capacity of the industry. The capacity (on single-shift basis) in 1956 aggregated 1,383,000 gross, as against 379,000 gross in 1954, or an increase of nearly 270 per cent. There are at present nine units engaged in the manufacture of machine screws and four new units, which have already been licensed, are expected to commence production in the coming years. With the completion of the new projects and the expansion of the Universal Screw Factory at Chheharta, the total annual installed capacity of the industry (on single-shift basis) is expected to expand to 2,461,000 gross. It is rather difficult to say whether this capacity will be sufficient fully to meet the consumption requirements, because the estimates of these requirements vary very widely. The estimates range from 1.3 million gross to 5 million gross for 1960-61; the Development Wing expects the demand to increase to 4-5 million gross per annum by 1960-61, as against the current estimated demand of about 2 million gross.

The machine screw industry, as stated earlier, has succeeded in producing screws of satisfactory quality. An important consumer, however, has stated that the quality leaves much to be desired. He has pointed out that, in one recent supply, the rejections were as high as 75 per cent., due to the diameter of the screw being different from what was intended. Quoting this instance, Mr. Damle did well to emphasise that the quality of machine screws was of vital importance from the standpoint of the serviceability of the machines and other apparatus in which they were fitted. The extent of the improvement in the quality of machine screws, it is needless to mention, depends, in turn, on the quality of mild steel annealed wire (14 SWG to 5 SWG), the principal raw material. The domestic supply position of the wire of required quality, it is said, continues to be difficult.

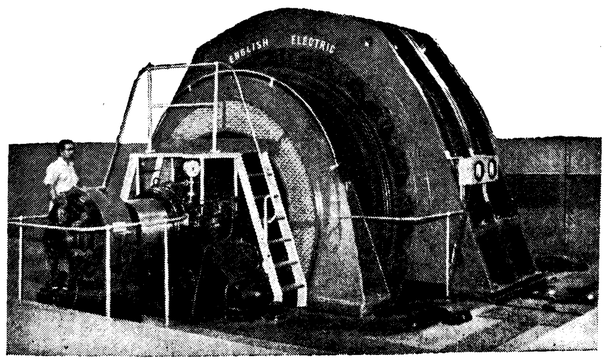
While the progress achieved by the machine screw industry is thus noteworthy, there is still considerable scope for further progress, what with the growing large demand for screws arising from the accelerated pace of development of the engineering industries, not to speak of export prospects. In view of this, as also considering that the industry should stabilise itself and improve the quality of its products further, the question of extending protection for a further reasonable period may be sympathetically considered. The actual degree of protection is, of course, a matter which should be examined in the light of the disparity between the imported cost of foreign machine screws and the cost of the indigenous product. There is, however, no justification for the plea, put forward by a leading manufacturer, for a blanket ban on imports of all varieties of machine screws. For such a ban will, by ensuring a fully protected market for the industry, kill all incentive on the part of the industry to produce quality machine screws at an economic cost, besides placing the consumer at its mercy.

INLAND WATERWAYS

Problems relating to the transport on inland waterways were discussed at a conference, held recently at Calcutta. The Union Minister of State for Transport, Mr. Humayun Kabir, is said to have initiated the discussions at the Conference at which representatives of trade, shipping companies and railways were present. The discussion, it is stated, centred on difficulties experienced by operators of inland vessels in the matter of getting coal and trained crews and the absence of repair facilities for the vessels. A representative of a steamer company is understood to have pointed out that several Pakistani nationals were employed as crew in the vessels and that a strict enforcement of the Foreigners Act would cause the loss of trained personnel. It was also pointed out that inland shipping companies generally found their trade on the Calcutta-Bihar route unremunerative. Another complaint was that no facilities were available in Calcutta for repair of the vessels and that the berthing and jetty facilities for inland steamers in Calcutta port were inadequate. The need for financial assistance to inland transport companies, it is stated, was stressed by some of those who participated in the discussions.

'ENGLISH ELECTRIC'

EQUIPMENT FOR THE STEEL INDUSTRY



The illustration shows the 6650 H.P. Motor for the 40" Blooming Mill at the Indian Iron & Steel Works, Burnpur. In addition, the Company has supplied over 100 motors of various ratings to these Works.

The English Electric Co. Ltd. has specialized for many years in the design and manufacture of electrical distribution equipment and motors for every type of duty in the Steel Industry.

NATIONAL INCOME DATA ANALYSED

C.S.O. SHOULD TAKE UP STUDY OF CAPITAL FORMATION IN PRIVATE SECTOR

From Our Own Correspondent

NEW DELHI, *25th June*

THE Central Statistical Organisation of the Cabinet Secretariat has issued a brief statistical paper (without any interpretative comments), giving estimates of India's national income during the period 1948-49 to 1955-56. The estimates for 1955-56, though preliminary, complete the statistical picture for eight years which can be taken as the first Plan period, in view of the fact that, though the Plan began formally on 1st April 1951, most of the bigger projects forming part of it had been under actual implementation during the previous three years as part of the post-war development programmes of the Central and State Governments and, with the help of revenue reserve funds built up in war-time. As it is a misnomer to describe the first Plan as a Five-year Plan (while, in fact, it was largely an eight-year plan) and as it would, therefore, be misleading to split up the period into the so-called pre-Plan and Plan periods and make comparisons on that basis, the actual growth of national income from 1948-49 to 1955-56 may have to be taken as a reasonably reliable measure of the economic progress registered under that Plan. This is the approach of this despatch.

DELHI LETTER

At the outset, a broad idea of the economic progress in real terms since 1948-49 may be had from the following figures of net national output at factor cost (that is, national income) at constant (1948-49) prices:

(In Rs. 100 crores)

	1948-49	1949-50	1950-51	1951-52	1952-53	1953-54	1954-55	1955-56
1. Agriculture, animal husbandry, forestry, fishery, etc.	42.5	43.6	43.4	44.4	46.0	49.8	50.3	49.8
2. Mining, manufacturing and small enterprises	14.8	14.6	14.8	15.2	15.8	16.5	17.0	17.5
3. Commerce, transport and communications	16.0	16.4	16.6	17.3	17.9	18.3	19.1	19.7
4. Other services	13.4	13.8	13.9	14.3	15.0	15.7	16.4	17.2
5. Net domestic product at factor cost	86.7	88.4	88.7	91.2	94.7	100.3	102.8	104.2
6. Net earned income from abroad	—0.2	—0.2	—0.2	—0.2	—0.1	0.0	0.0	0.0
7. Net national output at factor cost = national income	86.5	88.2	88.5	91.0	94.6	100.3	102.8	104.2

The above figures show that real national income has registered in 1955-56 (the last year of the first Plan) an increase of 20.4 per cent. over 1948-49. In other words, the growth of real national income in the eight-year period has been at an average annual rate of about 2.5 per cent. If, on the other hand, the figures for the formal Five-year Plan period (1951-52 to 1955-56) are separately considered, it is seen that the rate of growth has been at an annual average of about 3 per cent. Again, according to the figures, the 1955-56 income from the primary sector represents an increase of 17.2 per cent. over that of 1948-49, that from the mining and manufacturing sector 18.2 per cent., that from the commerce and transport sector 23.1 per cent. and that from other services 28.4 per cent. The plausible conclusion that can be drawn from these figures is that the rates of growth in agriculture and industry have been about the same in the first Plan period.

This conclusion, unfortunately, is contrary to experience all the world over, for it is known from the U.N. and F.A.O. statistical publications that the rate of agricultural growth generally tends to be far lower than the rate of industrial growth. This is borne out by the fact that, in the last decade, world agriculture has registered an increase of only 20 per cent. over the 1934-38 level of production, whereas, in the same period, world industrial production has increased by about 75 per cent. over the pre-war level. In the light of this evidence, one would have to take it that the estimates of primary sector income in India in the years 1948-49 to 1952-53 are under-estimates. Here may be recalled a few relevant sentences from this correspondent's despatch on food (*vide Commerce of* 1st June 1957): " . . . the *annavari* crop estimates throughout the country in the years of control and intensive procurement (upto 1952-53) should have been under-estimates, for it was common knowledge in those days that the *patwaris* (village accountants) were influenced by producers in several ways to under-estimate yields in order to reduce their obligations under the grain procurement schemes. In other words, a part (anything from a fifth to a fourth) of the production of those years was concealed from the paper estimates . . . ". As the estimates of primary sector income are based on the official crop estimates (as they were announced in the years of control and intensive procurement since 1948-49), it should be clear that those estimates would have to be revised so as to take into account the concealed production of those years in respect of rice and wheat in particular.

Such possible revised estimates of primary sector income may well be Rs. 4,500 crores for 1948-49, Rs. 4,600 crores each for 1949-50 and 1950-51, Rs. 4,700 crores for 1951-52 and Rs. 4,800 crores for 1952-53. With this revision, the figures of real national income for the corresponding five years would become Rs. 8,900 crores, Rs. 9,060 crores, Rs. 9,110 crores, Rs. 9,360 crores and Rs. 9,660 crores, respectively. This would mean that the 1955-56 income from the primary sector represents only 10.7 per cent. over that of 1948-49, while the growth of real national income in the eight-year period has been at an annual average rate of about 2.0 per cent. It would, therefore, appear that this figure of 2.0 per cent. alone—not 2.5 per cent.—can be taken as a more reliable measure of the performance of the Indian economy in the period from 1948-49 to 1955-56. When the national income figures are revised (as indicated above) it also turns out that *per capita* net output at 1948-49 prices was Rs. 252 in the base year (1948-49), while it was Rs. 272 in the final year (1955-56). This would mean that *per capita* real income in the final year of the first Plan represents a net increase of 7.9 per cent. (not 10.2 per cent. as worked out in the C.S.O.'s paper) for the whole eight-year period; this, again, would mean that *per capita* income has increased at an annual average of just 1 per cent. in the entire eight-year period.

As it now looks reasonably certain that the investment outlay (both in the public and the private sectors) in the five-year period of the second Plan will actually fall considerably short of the targets, he should be a rash prophet who would say that the rate of growth of national income (at 1948-49 prices) will be at an annual average of 5 per cent. in the second Plan period. If anything, it may not be more than 3.5 per cent. to 3.75 per cent.; in the same way, the average annual rate of increase in *per capita* income may not exceed 1.5 to 1.8 per cent. The official (and, in some cases, unofficial) tendency to exaggerate the expansionist trends in the Indian economy may thus be known for what it is.

The C.S.O.'s paper is also somewhat revealing in its figures pertaining to the Government share in generation of net domestic product, Government share in national expenditure and Government draft on private income. Taking Government share in generation of net domestic product first, one finds that the net output of Government enterprises (at current prices) is 3.7 per cent. (of net domestic product) in 1954-55 and the net output of Government administration 5.4 per cent., while the net output of the private sector is 90.9 per cent. in the year concerned. As for Government share in net national expenditure (being Rs. 10,240 crores at market price in 1954-55), it is found that the current expenditure of Government administration on commodities and services represents 6.5 per cent. of national expenditure in 1954-55 and the Government capital formation 4.2 per cent.

As for Government draft on private income (being Rs. 9,740 crores at current prices in 1954-55), it is seen that direct taxes account for 2.5 per cent., indirect taxes 5.3 per cent. and miscellaneous fees 1.1 per cent. of private income in the year concerned. It may be noted here that taxes and fees, in absolute terms, have increased from Rs. 690 crores in 1948-49 to Rs. 870 crores in 1954-55; this represents an increase of about 26 per cent. At the same time, Government capital formation has increased from Rs. 210 crores in 1948-49 to Rs. 430 crores in 1954-55; this represents an increase of about 105 per cent. In the same period, net domestic product has increased by 15.5 per cent. Whether the rate of increase in taxation and the rate of increase in Government capital formation can be so much more than the rate of increase in domestic product without drastically curtailing, in the process, the domestic savings available for capital formation in the private sector, is a question to be seriously pondered and examined. It is, indeed, regrettable that the magnitude of capital formation in the private sector has not been estimated by the Central Statistical Organisation.

SHEET GLASS INDUSTRY

Following the claim made by the sheet glass industry for continuance of protection beyond 31st December 1957, when the present protection is due to expire, the Tariff Commission has taken up the public inquiry into the industry. It may be recalled that the industry was first granted protection for two years in 1950 when the existing revenue duty of 45 per cent. *ad valorem* was converted into an equivalent protective duty. Subsequently, the protection was extended from time to time, the last extension having taken place in January 1955 for a period of three years at an enhanced rate of 70 per cent. *ad valorem*.

During the period of protection, the industry has made satisfactory progress. The number of units in the industry today is four, as against two at the time of the first inquiry in 1949. Further, the installed capacity of the industry has increased from 86.60 million sq. ft. in 1953 to 111.60 million sq. ft. in 1957. At the same time, production of sheet glass rose steeply from 22.78 million sq. ft. in 1953 to 46.86 million sq. ft. in 1956. In other words, the industry has utilised 63 per cent. of its installed capacity in 1956, as against only 35 per cent. in 1953. The corresponding proportion for 1957 is said to be as high as 75 per cent.

The estimates of current and future demand for sheet glass made by various agencies, however, vary widely. Those of current demand vary from 35 million sq. ft. to 50 million sq. ft. and those for 1960 range from 40 million sq. ft. to 75 million sq. ft. Moreover, on the basis of the trend of past imports and production of sheet glass in the country, the Development Wing of the Ministry of Commerce and Industry has placed the current demand and that for 1960 at 50 million sq. ft. and 75 million sq. ft., respectively. Thus, an important task before the Commission now is to arrive at a fairly accurate estimate of current and future demand for the product in the country.

The problems facing the industry are chiefly in regard to raw materials. The quality of the sand supplied to the industry is said to be poor, while the price of heavy soda ash is high. The most serious difficulty, however, arises from irregular supplies of coal due to shortage of wagons. It is stated that a factory had to be closed down due to shortage of supplies of coal. Thus, the industry faces certain disadvantages *vis-a-vis* its foreign competitors.

As regards quality, the consensus of opinion seems to be that there has been an improvement and that the indigenous sheet glass compares favourably with the imported product. Complaints are not lacking, however, that some of the defects the indigenous product suffers from relate to waviness, uneven thickness, bubbles and unsatisfactory packing, which were pointed out by the Commission in 1954. In this connection, it is noteworthy that the Indian Standards Institution has recently evolved a draft standard for sheet glass and that it has decided to cover for the time being only one grade suitable for glazing and framing purposes. A sub-committee of the Institution is also said to be investigating the desirability of incorporating durability, breaking strength and thermal shock tests in the draft.

AMERICAN LETTER

CONCERN OVER PRESIDENT'S HEALTH

SOIL BANK SCHEME PROVING COSTLY

From Our Special Correspondent

NEW YORK, *19th June*

PRESIDENT Eisenhower's indisposition, earlier in June, had a severe repercussion in the stock markets. Prices fell as much as 10 points in the first hour after the announcement was made. Recovery followed soon and since that time all losses have been more than eradicated. If this incident proved, or showed anything, it is this. After two serious setbacks in the President's health during his terms of office, the slightest suggestion that all is not well at the White House conjures up fears for the worst.

That apprehension is so great, a good many people, rightly or wrongly, do not expect the President to outlive his last term. Behind this feeling, coupled with the volatility of the American mass temperament, there is a widespread dislike of Vice-President Nixon who would automatically become President in the event of Mr. Eisenhower's death.

There is no ready explanation for these popular attitudes. Mr. Nixon has represented the United States well, indeed, all over the world and he certainly has made few *faux-pas* than other Cabinet members, such as John Foster Dulles and Secretary of Defence Wilson.

Some of Mr. Wilson's public statements have been laughable and quite undiplomatic, even though they may have been well meaning and sincere. Mr. Dulles's personality never did elicit any favourable popular response.

Foreign Policy

Even more so, U.S. foreign policy has come under increasing public criticism. This is especially the case, so far as the Middle East is concerned. It all started with U.S. refusal to have anything to do with the building of the Aswan Dam. It antagonised President Nasser of Egypt and set off the chain reaction which led to the closing of the Suez Canal. Meanwhile, about one million Arab refugees have been leading a subsistence vegetation in camps, mostly in Jordan, for the better part of nine years.

Virtually nothing has been done about it and, as long as that sore spot remains, peace in the Middle East can hardly be expected. As the chief Administration exponent of Washington policy, Mr. Dulles bears a part of the blame for this fiasco.

The question is frequently asked why President Eisenhower has not done anything about it. The answer probably is the great loyalty Mr. Eisenhower feels for all those around him whom he has chosen himself. It is part of his life-long Army training and background.

He did not have to cope with civilian politics in the past and, at first, he was hurt by and impatient with the unpleasantries to which he was exposed in his present position. He has overcome this handicap a good deal since and his temper is no longer as short as it used to be.

So far as internal politics are concerned, the biggest criticism levelled against present policies concerns the height of the proposed Budget. A recent public opinion poll shows that, as a result, the President had lost about 17 per cent. of his previous popularity.

Interest Rates

Interest rates are still creeping up. Rates for commercial paper and bankers' acceptance rose fractionally in recent weeks. The Federal National Mortgage Association was obliged to put a 4½ per cent. coupon on a $100 million debenture issue. It was the highest rate paid by that Federal agency in its existence.

Business and industrial spending for improvements and expansion remains high. Such outlays are projected at the annual rate of $37,900 million in the third quarter, as compared with $37,300 million in the second quarter and £35,900 million in the first quarter. It may be noted, however, that about half of the increase is no real boost in volume, but merely reflects price increases.

However, the spending for new plant and equipment is substantial and a main prop under the economy. Only one broad group of business spent less than last year, the commercial one. It embraces banks, stores and restaurants. This year's outlays may reach the record $37,400 million projected earlier in the year which would be 6.5 per cent. above 1956 expenditures for the same purpose.

Employment

Fluctuations in employment have been relatively minor. Civilian employment gained 900,000 from mid-April to mid-May. The change was about normal. Factory employment, however, fell to 12,831,000, off 200,000 for the year. It was the fifth consecutive monthly decline in this area and it reflects the spottiness in the business situation.

Steel capacity which is still about 87 per cent. of capacity is expected to drop to about 70 per cent. this summer as a result of mass vacations and retooling. While the sales of foreign cars in the U.S. has doubled, sales of U.S. cars are still lagging behind expectations.

Agriculture

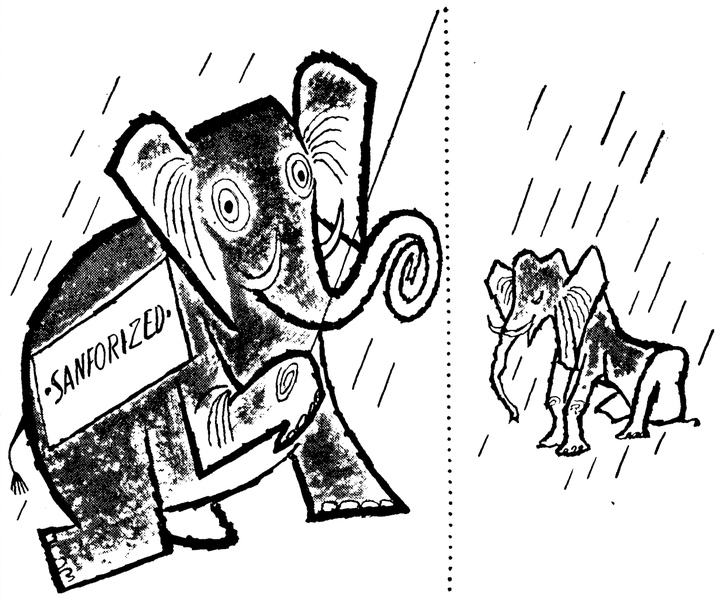
In the field of agriculture, the much heralded soil bank has proved to be a very expensive experiment. It was supposed to stem overproduction. The Department of Agriculture forecast the 1957 wheat crop at 970,533,000 bushels. This would be about 21 million bushels more than estimated market demand.

Reserve stocks now total nearly 960 million bushels. Original hopes were that the crop would drop by 100 million bushels. It is, of course, possible that, despite all human planning and particularly after so many years of good harvests, the weather may turn out to be unfavourable and reduce the crop. Despite the present experience of accomplishing little, the U.S. Senate voted the other day a $3,700 million farm bill which would continue the soil bank plan for another fiscal year.

The House of Representatives voted previously to kill the bill. The views of the lower and upper legislature will now have to be reconciled. As the *New York Times* put it editorially, "Government agencies on 1st April had $89,100 million in unspent appropriations. This may furnish some ammunition for the Budget cutters in Congress. Unused appropriations would be down to $69,800 million by 30th June," the end of the fiscal year.—*All Rights Reserved.*

PORTABLE ATOM PLANT

A 100-ton nuclear power plant that could be flown to its intended site in eight or fewer airplane loads was described at a meeting of the American Nuclear Society at Pittsburg recently. The plant is being developed by the Reactor Division of the Martin Company of Baltimore. Tests of the planned reactor will be made early this autumn under an Atomic Energy Commission contract. A company engineer told the scientific group that a complete unit could be built by 1959 or 1960. The reactor, using uranium-235, could operate a year and a half without refuelling.

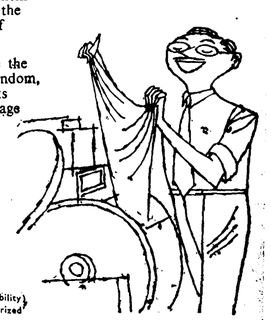


The secret of Popular Poplin—Sanforized sells!

ADVERTISEMENTS take the public into the shops, make them ask for cloth with the trade mark 'Sanforized'. Experience teaches them always to look for the label... but your customers don't know the 'behind the scenes' story that ensures the complete *reliability* of cloth labelled 'Sanforized'.

Anytime, unannounced—our expert visits a mill licenced to use the trade mark 'Sanforized'. There he selects samples of cloth at random, subjects them to the rigorous international wash-test, and reports on his findings. Only cloth which passes the strictest anti-shrinkage test can carry the trade mark 'Sanforized' on every yard!

It's this kind of constant care which lies behind the success of cloth with the mark 'Sanforized'—which makes it such a seller. Such a profit-maker for *you!*



Look for ·SANFORIZED· REGD. TD. MK. on the label

Issued by Cluett, Peabody & Co. Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information 'Sanforized' Service, 95, Marine Drive, Bombay 2.

DISPENSATION OF RURAL CREDIT—II

RESERVE BANK BEST SUITED TO PROMOTE CO-OPERATIVES

By A Student of Co-operation

VIEWED against the background of what has been stated in the previous article, it becomes clear why the role assigned to the Reserve Bank, as the Central bank of the country, under the Integrated Credit Scheme, is of paramount importance. The primary considerations that weighed with the authors of the Scheme in assigning such crucial role to the same, as one sees them, are, among other things, the need for (1) the creation of a "climate" in which co-operative institutions will effectively function in the interests of rural production and for the benefit of the rural producer; (2) actively assisting the reorganisation of the co-operative credit structure on the basis of State-partnership in the capital structure of the institutions at various levels; (3) meeting the fast expanding needs of rural credit at concessional rates of interest; and (4) imparting sound advice to States on problems of agricultural indebtedness and co-operative movement generally, and to ensure that its advice is heeded, and that the planned programmes in regard to reorganisation of co-operative credit institutions are implemented expeditiously. The need, for effectively co-ordinating the supply of credit with the developmental policies in regard to agricultural credit of the Central and State Governments, on the one hand, and with the programmes for the development of rural economic activities on a co-operative basis, and of warehousing and storage of agricultural commodities, on the other; and for making arrangements on a long-term basis for the provision of increasing number of trained personnel, is no less important.

Obviously, the only institution that can fulfil all these considerations is the Reserve Bank of India. It is common knowledge that co-operative banking and commercial banking widely differ in principles, aims and practices, that they serve, very inadequately at present, two distinct but equally important sectors of the economy, each of which is on the threshold of stupendous expansion the limits of which are not known, and that they are complementary to each other in the larger context of the national economy. If this point is conceded, it is easy to see why the Reserve Bank, as the Central bank of this country, as a non-profit seeking institution, as one "neutral" between the commercial banking and co-operative banking, and as one directly responsible for the execution of the Government's financial and credit policies, should take upon itself the task of positively assisting the development of both of them, according to well-conceived plans in the interests of the national economy. It is this feature of the Reserve Bank which enables it to have an equally intimate relationship with, and to be the focal point of, both the sectors of banking. Besides enormously strengthening the Bank by enabling it to acquire its "full personality," under Indian conditions, it is this position of the Central bank that creates the "climate" in which co-operative credit, in particular, and other co-operative activities, in general, can thrive. For, it is in a climate such as this that not only co-operatives receive protection from the competition of commercial banks and those agencies that derive strength from them, but also obtain positive assistance for their development through a well-designed and co-ordinated expansion of commercial banking. Furthermore, it is in this environment that success can be ensured to the co-operative economic activities, so closely integrated with credit, because of the strength it imparts to them *vis-a-vis* trading interests which now dominate the field, drawing their support from the commercial banks.

Assisting States

Under the Integrated Scheme, the Reserve Bank has been called upon actively to assist the State Governments, who are primarily responsible for the implementation of planned programmes of rural credit development, in drawing up and implementing the plans for reorganisation of co-operative credit institutions at the primary, central and apex levels, on the basis of major State-partnership. To enable the States to participate in the capital structure of these institutions, the Bank gives long-term loans from the National Agricultural Credit (Long-term Operations) Fund, created for the purpose. This task of assisting reorganisation of co-operative credit institutions cannot be divorced from the central banking institution, without doing irreparable damage to co-operation itself, inasmuch as the larger aim of creating a favourable climate for the development of co-operation itself depends, to a greater extent than is apparent on the surface, on this function being performed by the Reserve Bank alone. As a Central bank and, consequently, as a banker and adviser to the States, and as one possessing all those qualifications, including its direct concern for the development of both the types of banking, which combine to make its position supreme, it is only the Reserve Bank that has the potentialities to induce the State Governments to invest huge sums of their moneys in the capital structure of enormous number of existing institutions, including primary societies, central banks and apex banks, and of those that are yet to be established, under the reorganisation programmes, and to persuade the States to carry through such programmes expeditiously. What is more important is the profound impact such direct concern of the Bank will have on the co-operative movement itself, which, left to itself, is wholly incapable of improving itself.

Logical Development

Furthermore, the task entrusted to the Bank in this respect is only a logical development of its activities in the past, in the field. Though, as far back as 1937, the Statutory Report of the Bank observed that "all that the Reserve Bank can do is to help the provincial co-operative banks to tide over a temporary shortage of funds," nevertheless, under the pressure both of public opinion and of the changed context of political and economic conditions, remarkable change has come about, especially after independence, in the attitude of the Bank towards rural finance. Thus, by 1953 itself, the Bank had witnessed a number of procedural changes, amendments to the Act, evolution of dynamic approach and, above all, the mobilisation of resources in men and money. Consequently, by 1953, the Bank was enabled to treat the state co-operative banks on a par with the scheduled banks in regard to purchase, sale, or rediscount of bills of exchange and promissory notes arising out of *bona fide* trade and commercial transactions; to provide accommodation for the seasonal "agricultural operations" which include activities ancillary to agriculture, for a period of 15 months; to finance, through the state co-operative banks and state financial corporations, the production and marketing activities of cottage and small-scale industries, subject to guarantee by State Government, and, lastly, to give medium-term accommodation for agriculture (subject again to guarantee by the State Government) up to a maximum of Rs. 5 crores. As a result of the numerous changes, procedural and otherwise, the financial accommodation obtained by the state co-operative banks increased from a mere Rs. 1.25 lakhs in 1945-46 to as much as Rs. 1,190.37 lakhs as at the end of June 1953.

Meanwhile, the Bank had also evolved certain standards with regard to different aspects of co-operative banking and its administration, including the pattern of its structure, system of supervision, inspection, etc., and had been assisting co-operatives to adopt sound principles and practices. Moreover, a Standing Advisory Committee on Agricultural Credit consisting of officials and non-officials was brought into existence in 1951 to advise the Bank on matters pertaining to Agricultural Finance. Thus, the Bank was well equipped, both technically and "psychologically," by 1953 itself, to undertake the function envisaged under the Scheme; and, through its activities, in co-ordination with other departments such as the Department of Banking Development, the Agricultural Credit Department of the Bank had become an important organ of the Bank.

It is equally important to note, in this connection, that the functions envisaged in this regard for the Bank are such that they not only agree with its responsibilities as a Central bank, but also that, in discharging them, it actively promotes the main principles and purposes underlying the pyramidal structure of co-operative rural credit. In other words, its role is largely a logical projection to an all-India level of the main principles of the pyramidal structure. This structure, for each State consists of the thousands of primary societies in direct contact with hundreds of thousands of borrowers at the base, and a number of central banks at the intermediate level, and one apex at the State level, the institutions at each of the levels performing certain distinctive functions. The institutions at each one of the three levels are so absolutely interconnected with and dependent on those of the other two, the dependence being for finance, leadership and supervision from the bottom upwards and for strength from the top downwards, that the structure should either flourish or perish as a whole. The interdependence is illustrated by the fact that, as at the end of 1955-56, of the Rs. 79 crores of working capital of as many as 160,000 primary credit societies, as much as Rs. 43 crores came by way of borrowings, chiefly from the central banks. Further, the latter, numbering 478, had no less than 60 per cent. of their working capital of Rs. 92.7 crores in the shape of deposits. The 24 apex banks, on their part, collected 58 per cent. of their working capital of Rs. 63.3 crores through deposits. This was the picture when the reorganisation scheme had hardly begun. Moreover, the organisational interdependence is also organic, the institutions at each of the three levels deriving their strength from the members—forming the level immediately below them—affiliated to them.

Backbone of Rural Credit

It goes without saying, therefore, that the existing co-operative credit structure is the backbone not only of institutional rural credit but also, in its larger context, of co-operation itself. If this is to be promoted, the best way conceivable in the circumstances is to continue to allow the apex banks to have direct access to the "lender in the last resort" of the country, only under whose protective wings they can flourish. This protection has become essential, because they are not, as already stated, commercial banks in any sense of the term. For, any other way—as the one suggested by the Finance Minister now—which involves introduction of an agency extraneous to the co-operative field in between the co-operative apex banks and the Reserve Bank will result in two things: first, cutting off the co-operative credit structure, and so the movement, from its life source; second, raising the cost at which credit can be made available to the farmer. Further, in order to obviate the latter in such an eventuality, it is not unlikely that attempts will be made to bypass the pyramidal structure, which will prove fatal to the whole movement.

This brings us to the question of adequacy of rural credit and such credit being supplied at rates that are low, as compared with those applicable to other fields. As pointed out in our first article, the total rural credit requirements, which stood at Rs. 750 crores in 1953, are fast expanding. The co-operatives and the Government together were able to supply only a fraction of these requirements in 1953. By 1960-61, however, as much as Rs. 150 crores of short-term credit, Rs. 50 crores of medium-term credit and Rs. 25 crores of long-term credit, as against Rs. 30 crores, Rs. 10 crores and Rs. 3 crores, supplied, respectively, in 1955-56, are planned to be provided to the rural sector through the co-operatives to help raise agricultural production and develop cottage and small-scale industries. Consequently, the programmes of reorganisation of the co-operative institutions now under way will raise considerably the credit limits of the institutions, resulting in a heavy pressure for funds on the Reserve Bank. The outstandings of the State co-operative banks with the Bank, which were as high as Rs. 23.27 crores in February 1957—as against Rs. 5.38 crores in 1950-51—will rise further in the second Plan period. The fact that the Reserve Bank is the custodian of national credit and currency, banker to the banks and to the Governments, and the lender in the last resort, points to the inescapable conclusion that it is the only institution competent enough to cope with the increasing pressure for funds.

What is still more important is the need for keeping the interest rate low, which the Reserve Bank alone can accomplish, as it has been doing, by providing loans at concessional rates and by directly dealing with the state co-operative banks and, thereby, strengthening the cheap and efficient pyramidal co-operative credit structure in the States. Inseparable from its role in the credit field is the one of providing cheap remittance facilities for the development of co-operative banking in the rural areas through a well-conceived programme of extension of branches of commercial banks through the agency of the State Bank of India. No less important are its functions under the Scheme as the principal participant in drawing up the programmes for the development of rural economic activities, such as marketing and processing, in association with the National Co-operative Development and Warehousing Board, and in those for training of co-operative personnel under the Central Committee for Co-operative Training. These two activities, once again, cannot be divorced from the Bank's strategic role in the field of co-operative credit. Another important function of the Bank in this regard is in connection with studies of the problems relating to rural indebtedness and the co-operative movement and tendering of expert advice thereon to State Governments. These functions of the Bank under the Integrated Scheme together combine to make its role crucial, which no other institution in the country has the requisite stature to fulfil.

It may be appropriate now to examine the methods followed by the Reserve Bank for financing the co-operative credit system. It deals only with the state co-operative banks—which number about 24 now—as against a much larger number of commercial banks—for financing current rural economic activities and insists, where necessary, on Government's guarantee as to principal and interest. The security for these loans is the promissory notes of co-operative societies endorsed by their apex banks and drawn for financing the production and/or marketing of crops. Loans can also be obtained against Government securities on the same basis. Safeguard has been provided against the vagaries of the seasons through the National Agricultural Credit (Stabilisation) Fund, out of which the apex banks can obtain loans for periods extending from 15 months to five years, to enable them to pay in time the dues of the Reserve Bank arising in connection with crop loans. Moreover, for financing cottage and small-scale industries the state co-operative banks have the facility of rediscounting approved bills of exchange and promissory notes with the Reserve Bank, provided the period of maturity is not in excess of one year. These banks can also borrow against trustee investments, bills of exchange, promissory notes, etc., guaranteed as to principal and interest by the State Government. Bills of exchange and promissory notes arising out of *bona fide* commercial transactions are also eligible to be rediscounted by the apex banks, provided they bear two or more signatures, including the one of the apex bank, and mature within 90 days from the date of rediscount. In addition, the Reserve Bank can grant loans to warehousing corporations established under the Agricultural Produce (Development and Warehousing) Corporations Act, 1956, for not more than 90 days against Government securities and upto a limit of Rs. 3 crores, in the case of the Central Warehousing Corporation, and against Government securities, bonds and debentures of the Corporation, and for 18 months, in the case of State Warehousing Corporations.

Long-term Loans

The other aspect of the Bank's credit policy is that of extending long-term loans to the State Governments from the National Agricultural Credit (Long-term Operations) Fund, in order to enable them to participate in the capital structure of the institutions. The sate co-operative banks also can get loans from the Fund for intermediate periods against certain approved securities for certain purposes. Again, the central land mortgage banks are eligible for loans from the Fund for a period of 20 years, against Government guarantee and the Reserve Bank can buy their debentures when the principal and interest are guaranteed by the State Governments. These activities prove beyond doubt that the Bank, in discharging its function as the supplier of finance for current agricultural operations or otherwise, is neither departing from the principle of being a banker's and Government's bank, nor from sound central banking practices. In fact, in performing these functions, it is right on its way to being what a Central bank of this country ought to be.

If, however, some of the functions it has to shoulder under the present arrangements are not strictly those of a Central bank, according to orthodox and Western standards, it is no reason why the central banking institution of a predominantly agricultural country like ours, with peculiar problems and conditions of its own, should not perform them. Indeed, in doing so, the Reserve Bank has the sanction of expert opinion. As far back as 1940, for instance, the Report on Rural Marketing and Finance by the National Planning Committee (published in 1947), complaining against the Reserve Bank's insistence on certain conditions being fulfilled by the co-operative banks before they could be eligible for obtaining accommodation from the former, observed: "In short, it (the Bank) has been asking for a complete rehabilitation of the Co-operative Movement as a condition for any such accommodation. It is inclined to overlook the vital consideration that it can itself lend a helping hand in bringing about the rehabilitation which it demands. . . The Reserve Bank, as the ultimate custodian of the country's credit policy, has not only the right to lay down the lines along which the Movement would be reorganised, it has also the responsibility to do all that is within its power to bring about the necessary reorganisation. To wait till the Movement has reorganised itself through its own efforts, would be to wait too long."

No Guidance from West

Opinion in this direction gathered momentum from time to time. The Central Board of Directors of the Reserve Bank itself stated in its Report for 1952: "In no other sphere perhaps as in that of rural finance is it of so little use, in Indian conditions, to turn for guidance to the Central banking practices evolved in the highly industrialised countries of Western Europe." The keen disappointment that the Central bank of a country was not playing its due role in agricultural finance was not confined to India alone. Not long ago, addressing the International Conference on Agricultural and Co-operative Credit held at Berkeley, California, in 1952, Dr. De Vries of the World Bank expressed himself thus:

"... So agricultural-development institutions (such as co-operatives) have to apply to the financial superstructure and often have to say demurely, 'Please, may we have some money for our agricultural development?' Central banks too often are not readily inclined to make capital available for agricultural development. I believe that there are many central banks who live so completely upstairs in their superstructure that they don't go down to earth to see how agriculture really is financed in their country. . . . The commercial banks are in a very close relation with the Central bank. Brokers, traders, middlemen, owners of processing industries get much of their working capital from commercial banks. And I have found no country where the Central bank or the commercial bank thinks this inappropriate. Rather, it is very easy for an ordinary middleman in a village to get through his bank, and that small bank again from higher up, a lot of working capital to buy paddy and mill the rice, or buy the coconuts and prepare the copra, or the cocoa beans and prepare the cocoa . . ., whereas for agricultural institutions, it takes a lot of argument to get only 10 per cent. of these aggregate sums to finance the farmer directly."

The fact that, in increasingly participating in agricultural finance, India's Central bank has been moving in the right direction is illustrated by the testimony given by a foreign expert in his memorandum to the Planning Commission a few years ago, when he said that the Reserve Bank had been giving new life and potent leadership to the co-operative credit movement in recent years. "Probably, no other Central bank in the world," he remarked, "is doing as much to help develop and finance co-operative rural credit institutions."

In so doing, the Reserve Bank is performing no more than what the overall objectives of the country's economic policy dictate. If the Central banks in the West have kept themselves aloof from this field, it is because conditions there were entirely different; and commercial banks themselves, as was pointed out in the previous article, have been able to satisfy a large proportion of the needs of agricultural credit, leaving for the Central banks the function of meeting only marginal needs. There is thus something of a lack of realism and logic in the view that India's Central bank should not undertake any more functions than what others are doing elsewhere. Institutions do not exist in vacuum, much less the principles that govern their activities. When a dynamic approach to economic development has been adopted by the Government, it is logical that the institutions through which we seek to attain that goal should also be progressive and dynamic. What is wrong, then, in rendering the Bank more progressive-minded?

Such adaptation of the principles of the Bank to the changed needs is all the more essential, especially when it makes the institution stronger and much more useful. That the Reserve Bank has been able to participate in the field of rural finance increasingly without in any way impairing its position as the monetary authority of this country responsible for the custody of national credit and currency has been demonstrated by its performance since independence, and more particularly since 1950. Furthermore, the direct connection with the fast expanding rural sector, and, consequently, the direct control over, and the firsthand knowledge of, credit conditions in the agricultural sector will certainly increase the status and usefulness of the Reserve Bank. In fine, the discussion in this article leads to the irresistible conclusion that the Reserve Bank alone is the most suitable agency to undertake the function of reorganisation of co-operatives and supplying rural finance; and that, even from a narrower angle, the few state co-operative banks, as compared with numerous commercial banks, have as much right as any other to approach direct the Central bank of the country for funds. How the State Bank of India is not suitable to take over these functions and the repercussions that will follow from such a change will form the subject matter of the next, that is, the last article in this series.

I.F.C'S INVESTMENT IN BRAZIL

The International Finance Corporation has decided to invest, subject to completion of necessary legal formalities, $2 million in *Siemens do Brasil Companhia de Electricidade* (owned by Siemens of West Germany) for expansion of the Company's manufacturing operations in Brazil. The Corporation's investment, together with the equivalent of $8.5 million being invested by Siemens of Germany, will be used to expand the plant facilities and business of *Siemens do Brasil* for the manufacture of electricity generating equipment, switchgear, transformers, large motors and accessories for utility and industrial application as well as telephone equipment. The I.F.C.'s investment of $2 million will be in "Notes," bearing interest at 6 per cent., maturing in 15 years, with amortisation beginning at the end of the 11th year. The "Notes" are to be retired in equal annual amounts by maturity. In addition, the I.F.C. has received a 15-year option on shares equivalent to the complete conversion of its "Notes" based on the stock at par and the cruzeiro at its present U.S. dollar value. The investment is unsecured, but the contract between *Siemens do Brasil* and the I.F.C. will contain the usual protective covenants. The "Notes" will be redeemable at par at any time. Disbursement of the investment will be in instalments as required, with Siemens paying a customary commitment fee on the undisbursed portion of the $2-million commitment.

To Be Shortly Released

TAXATION OF COMPANIES

(their directors, managers, employees and shareholders)

By **GIRISH CHANDRA SHARMA**, M.Sc., LL.B.

and

SHRI R. BHARGAVA, B.A. (Hons.), LL.B.

Editor-in-chief, "Taxation."

Company taxation is becoming more and more complicated every day. Here is a book, the first of its kind, covering more than 500 pages, which deals exhaustively with the various problems which companies and their officers have often to deal with, and covers all changes uptodate **including those of the budget session 1957-58.** Divided into 10 chapters it contains many appendices, charts and tables and all statute, rules, C.B.R. circulars (Public) of practical utility with a large number of numerical problems dealing with the practical side of company taxation in various situations. The book is indispensable for companies and their tax advisers, chartered accountants and advocates, answers all queries, e.g., assessment of loans and advances, latest position of section 23A companies, liability of non-resident exporters, problems arising out of surrender of managing agencies' commission, assessment of directors and managers and all reliefs specially allowable to companies under the law as amended uptodate with latest case law reference upto 1-6-1957.

Price Rs. 25/- ***(Pre-publication Price Rs. 20/- upto 25-6-1957)***

Postage extra.

TAXATION, 3-DARYAGANJ, DELHI-7

EXPORT TRADE IN COTTON TEXTILES

REASONS FOR SHRINKAGE—SUGGESTIONS FOR IMPROVEMENT

COTTON textiles constitute one of the staple earners of foreign exchange for India. The total value of exports of these during the calendar years 1955 and 1956 was Rs. 63 crores and Rs. 61 crores, respectively. This is expected to be substantially higher in the second Plan period, the annual average being Rs. 75 crores. or Rs. 375 crores for five years. In view of the importance of cotton textiles as the earner of exchange thus, one can expect that they will be one of the items which will elicit the special attention of the Export Promotion Committee. The task of the Committee in so far as the examination of the issues relating to cotton textile exports is concerned has been rendered very easy by the replies of the Millowners' Association, Bombay, to its questionnaire. The replies are not only comprehensive in their approach but also contain some interesting constructive suggestions for augmenting exports. It is proposed to refer in these columns to the general observations of the Association, leaving for consideration in the next issue its views on export policy and assistance to exports.

At the very outset the Association emphasises that the problem of promoting exports of cotton textiles—piecegoods and yarn—should be considered from both the short- and the long-term points of view. The short-term objective, according to it, is the recapture of markets lost to India, while the long-term aspect must be how to gear the textile exports and thereby augment foreign exchange resources which are so essential for the successful implementation of the second and successive five-year plans. It has made special mention of the setback to India's export trade in textiles in recent years. The setback is attributed chiefly to four important factors. First, the volume of international trade has itself shrunk, mostly due to the emergence of indigenous industry in countries which were formerly importing cloth from outside. Secondly, there is the unsettled state of affairs, including unsatisfactory living conditions, in some of the South-East Asian countries which could otherwise absorb good quantities of cloth. Thirdly, the communist countries have re-emerged as suppliers of cloth to countries which were normally drawing supplies from the free world. Finally, cheap rayon goods manufactured in Japan and other countries are offering competition to cotton textiles in countries which were formerly using cotton textiles.

Formidable Competition

An analysis of the distribution of India's export trade in textiles *vis-a-vis* that of the U.K. and Japan in the past few years will reveal that India's main outlets for cotton piecegoods lies in the countries bordering on the Indian Ocean, namely, Asia and Africa. It is precisely in these markets that the Indian textile industry has to meet the most formidable competition from Japan, and, of late, China and Pakistan also have stepped in. In Africa, competition comes from both the United Kingdom and Japan, the latter particularly in East Africa.

Apart from the factors that have been affecting the world trade, in general, India's export trade in cotton textiles has also been adversely affected by tariffs and other measures such as quotas taken by individual overseas countries. Particular reference is made to (1) the withdrawal of preferential or privileged treatment hitherto enjoyed by India in certain territories; (2) the barter arrangements entered into by some of these territories with other countries whereby the latter are assured of fixed quotas which have worked to the detriment of India; and (3) the upward revision in import duties on goods of Indian origin in certain territories.

The Millowners' Association has given the instances of five countries—Sudan, Iran, Burma, Afghanistan and the Federation of Rhodesia and Nyasaland—to show how the aforesaid factors have adversely affected exports of cotton textiles from India. The review reveals that Sudan has been one of India's traditional markets for cotton textiles in the post-war years. Till the end of 1954, India enjoyed more than half the share of this market, due to existence of a ban imposed by that country on the import of Japanese textiles. The ban was lifted in December 1954, which made it possible for Japan to re-enter the Sudanese market where it enjoyed a pre-eminent position before the Second World War. Further, with the independence of Sudan and its closer association with Egypt, Egyptian textiles are being allowed into Sudan free of duty. On goods of other origin, a 10 per cent. duty is charged. That apart, the Egyptian Government is also reported to have recently started subsidising exports to Sudan by a rebate to the extent of 5*d.* per yard on exports exceeding 100,000 yards. These two concessions have resulted in more Egyptian goods finding their way to Sudan. India buys Sudan cotton, while Egypt does not. Further, increased supplies of prints have been reported from Russia and Poland.

The decline in exports of Indian textiles to Iran is due, among others, to Italy securing an import quota for cotton thread and fabrics and mixed fabrics under the Italo-Iranian trade agreement of September 1954. Further, the Iranian Government which was charging import duty at 40 per cent. *ad valorem* on all imported textiles recently changed over to duty based on the weight of cloth. In the case of coarse and medium cloth which forms the bulk of India's exports to Iran, the revised duty works out at 70 to 80 per cent. of the value of goods, and has thus rendered Indian prices most uneconomic. Of all the exporting countries, India is the worst sufferer, as the bulk of Indian exports to Iran consists of coarse and medium goods. The change-over in the basis of duty on the part of Iran is reported to have been prompted by its desire to give protection to the local industry which concentrates on the production of coarse and medium fabrics.

Exports to Burma

Up to July 1954, India was the largest supplier of cotton textiles to Burma. In that month, India was displaced from first place by Japan, due to abolition by Burma of the preferential rates of duty which Indian exports hitherto enjoyed in that market. Under the Indo-Burma Trade Agreement of 1941, Indian textiles were assessed at 10 per cent., and Japanese textiles at 50 per cent. As a result of tariff revision in July 1954, a flat rate of 30 per cent. was imposed on all imports of cotton piecegoods, irrespective of their origin, which meant an increase of 20 per cent. duty on Indian textiles and a reduction of 20 per cent. in the case of Japanese goods. A further setback was received by Indian piecegoods in Burma by the abolition of the Burmese O.G.L. which thus brought textiles under licensing. Of late, the Burma Government seems to be desirous of reducing, and ultimately abolishing, imports of piecegoods by developing within the country cotton mills of sufficient capacity to produce its internal requirements. Two mills are already in existence, with a capacity of 30,000 spindles and 400 looms, producing mostly coarse goods, and it is reported that an understanding had already been reached by Burma with certain Japanese parties to put up two mills, Japan investing at the rate of 5 million American dollars per year in the next 10 years and interesting itself in the technical management. The Burmese Government intends to set up another four to six mills with a capacity of 40,000 spindles each for the production of medium goods.

Afghanistan was for many years drawing the bulk of its supplies of textiles from India. In fact, India was contributing as much as 70 per cent. of its requirements of cotton textiles. This was possible on account of the age-old trade accord between the two countries and the large intake by India of Afghan products like dry fruits. This position, however, is reported to have changed in 1954, following a trade agreement between Afghanistan and the U.S.S.R. under which trade between these two countries came to be carried on on a Government-to-Government basis, and large quantities of textiles are imported from the U.S.S.R. under this agreement.

Despite all these developments, the Millowners' Association feels that exports of cotton textiles from India can be stepped up to the target of 1,000 million yards laid down in the Plan. It, however, stresses that, in view of internal and international situation, special efforts are called for, efforts which necessitate certain incentives at Government hands. There is considerable force in the observation of the Association that the key to the export problem lies in price and, unless the competitive ability of the cotton textile industry is improved and stabilised, none of the efforts which are at present being made—establishment of Export Promotion Council, pre-export inspection and reduction or abolition of export duties—can produce satisfactory and sustained results. For the textile industry, the Association points out, and rightly so, is suffering from "compulsory cost inflation" due, among others, to the low efficiency of equipment, most of which is old and out-moded, as well as direct and indirect labour costs.

Modernisation

If Indian textiles are to compete more effectively in the world markets, it is essential that the industry should be rationalised and modernised, in order to increase and cheapen its products. This aspect has been forcefully emphasised by the Association. Referring to the plan for installation of automatic looms, the Association alludes to the conditions attached to the policy and points out that these conditions are so onerous that even the mills which have been regularly exporting huge quantities have not been able to benefit from the scheme. "International market in cotton textiles," to quote it, "is governed by so many uncertain factors over which Indian mills have no control, and it is futile to pin down mills to the condition of maintaining 87½ per cent. of their exports in any of the preceding three years, besides exporting the full production of automatic looms." In view of the neck-to-neck competition in world markets from countries which have considerable advantage in the shape of technical efficiency of production, the Association has done well to drive home the fact that what the Indian industry at present needs, on account of its cost disability, is a positive export incentive, besides relaxation of the above condition. It has suggested grant of a subsidy —at an anna per yard—to mills in respect of any increase in exports over that of any one of the three preceding years. The subsidy is estimated to cost the exchequer about Rs. 2 crores to boost exports to 1,000 million yards "which is not too high a price to pay for earning valuable foreign exchange."

With regard to automatic looms, the Association has also put forward two other suggestions. They are: (1) It will be more desirable to install automatic looms at those centres which have considerable export business, rather than to attempt an equitable allotment of such looms at centres spread all over India. (2) Permission should be freely given for import and installation of special types of looms and machinery such as wide-width automatic looms, drop-box looms, better finishing and processing machinery which are calculated to improve the quality of production; it may facilitate matters, if manufacturers of textiles are allotted, say, 10 per cent. of the value of goods sold by them for export to import machinery and raw materials.

Other Suggestions

The Millowners' Association emphasises next the need for ensuring adequate and regular supplies of raw cotton to mills. It is doubtful of the fulfilment of the productive target for cotton, namely, 6.5 million bales, and urges the adoption of a flexible import policy so as to allow large imports of cotton of the required staple lengths. In this connection, it pleads for a suitable rebate of excise duty in respect of cloth produced out of that cotton for sale in India, so that an equivalent quantity of cloth produced from indigenous cotton may be utilised for export. The Association has also suggested that the possibility of large-scale utilisation of cotton waste within the country, particularly for production of finished products for export, should be explored, and suitable inducements must be offered for installation of waste plants to convert waste into finished products for export.

The Millowners' Association has some interesting suggestions to make regarding the variety-wise exports of textiles. Since the bulk of exports is accounted for by medium counts, it observes that efforts should be made to diversify exports so as to raise sales of fine and superfine categories; as there is severe overseas competition in this field, higher incentives for promoting their exports are called for. In the opinion of the Association, if more cloth in the coloured, printed and dyed category is exported, exchange resources can be enlarged. This also calls for certain incentives. Mention is made here of the need for making special arrangements for agreements to be concluded with countries like British West Africa, permitting exports of processed goods.

DECLINE IN YARN AND CLOTH OUTPUT

CURB ON FLOW OF IMPORTS URGED

From A Special Correspondent

MANCHESTER, 18*th June*

ONLY a few hours after the members of the recent Lancashire trade mission to the East had reported on their discussions to the President of the Board of Trade, one of their members, Mr. J. S. T. Hawke, gave his views on what should be done to break the deadlock which exists on the imported cloth problem. Mr. Hawke, as Chairman of the Cotton and Rayon Merchants' Association, told the annual meeting that a definite programme for curbing the flow of foreign cloth into Britain for use in the home market should be drawn up. He emphasised that any such proposal would cover only cloth scheduled for consumption in the home trade and suggested that the Government should impose a total quota at about the present level of imports from Commonwealth sources, within which India, Pakistan and Hong Kong could compete for their share of the business, just as they are already doing.

MANCHESTER LETTER

This recognition by the chief spokesman for the merchanting community of the need for a restrictive policy on imports is in contrast to some of the views expressed by his colleagues in the past. In fact, Mr. Hawke jokingly reminded his audience that the meeting they were attending did consist of merchants and not of spinners or manufacturers.

A Warning

After all, distributors in the long run must rely on producers for their supplies and, if the productive capacity of Lancashire continues to contract as it has done over the past few years, the merchants will suffer, if not perhaps in ratio, at least to an appreciable extent. Nor is it possible to forecast what may happen in the textile industries of rival nations.

Mr. Hawke pointed out that Pakistan had no real exportable surplus at the moment and Hong Kong needed November-December delivery. "If India with her teeming millions were to open the taps in her home market by cutting her harsh duties, the position could well change and, in two or three years at the present rate of erosion in Lancashire, there would not be enough cloth to go round," he warned.

Production Lower

Cotton cloth and yarn production by the Lancashire textile industry fell sharply in April, according to the Cotton Board's output figures. Weekly output of cotton, man-made and mixture cloths from the mills averaged 44,860,000 yards, as compared with 48,390,000 yards in the previous month and 46,440,000 yards in April 1956. Production of cotton and mixture yarns averaged 16,590,000 lbs. weekly, as compared with 18,160,000 lbs. the month before and around 17,000,000 lbs. in the corresponding month a year ago.

Manpower in the spinning and weaving sections of the industry fell by just over 400 during the month to 245,070.

Whether sufficient has been done to modernise Lancashire's mills in order to face increasing competition from abroad has been a matter of controversy for many years. The latest defence to be submitted on behalf of British traders has come from Sir Ralph Lacey, Vice-Chairman of the Fine Spinners and Doublers Ltd., and the former Chairman of the Raw Cotton Commission. In a contribution to an American journal, he has pointed out that the difficult trading conditions encountered in the last few years not only emphasises the importance of searching for every possible economy but discourages all but the most optimistic from entering into heavy forward capital commitments. "In the British cotton industry since the war there has been heavy expenditure on new capital equipment," he declares. "The replacement of mules by modern ring spindles, development of larger packages and high drafting techniques, mechanical transport, high speed winding and beaming, automatic sizing control and installation of automatic looms designed for particular uses have all received vigorous attention."

Expenditure on New Plant

Figures recently given by the President of the Board of Trade show that expenditure on new plant last year was, in fact, lower than at any time since the 1952 recession. Manufacturers' deliveries of machinery for processing cotton or staple fibre yarn to the home market were valued at £5,200,000 for spinning and preparatory processes and £2,000,000 for weaving plant. This compared with £6,100,000 for spinning machinery and £2,400,000 for weaving in 1955.

Sir Ralph Lacey has reminded Lancashire's detractors that modernisation and re-equipment in a long-established industry raise problems which do not apply to a new expanding trade. Existing buildings which have many years of useful life before them may not be ideally suited to house modern equipment. Although shift working should accompany efforts to take the fullest advantage of new equipment, it can, as he says, be wasteful to pursue such an objective with a limited labour force up to a point where still useful assets have to be abandoned.

"There has during recent years been an unobtrusive but significant revolution in approaches to work study and labour deployment," adds Sir Ralph. "With the intelligent and co-operative assistance of the trade unions, work study has become a common form. When time and motion study are first applied where they have not been used before, improvements can be spectacular—as much as 40 per cent. saving."

One of the biggest sensations—and a still unexplained mystery—in the textile trade for some time has been the decision announced on behalf of Mr. A. V. Symons to relinquish the post of Chairman of Tootal Ltd., the big Lancashire group which has a capital of some £10,000,000. Mr. Symons issued the statement indicating that he would not seek re-election at the next annual meeting, usually held in September, and will then resign not only as Chairman but also as a Director of the group.

At the headquarters of the combine in Manchester, no further information was available and the future leadership of the group remains undisclosed. Mr. Symons has been in charge of one of the most famous names of the Lancashire textile industry for the past five years, leading a company with world-wide customers. He was 49 when he followed Sir Kenneth Lee as Chairman in 1952 and had then taken a leading part as a pioneer of new-style dress fabrics.

Staying in Business

Mr. E. G. Turner, Chairman of Balstone, Cooke and Rayonese, the Manchester textile merchanting group, told the annual meeting that, because of the recent announcement that it was seeking a merger, there was a feeling in the trade that the group was thinking of going out of business. "That is not so. The position at the moment is by no means discouraging," he stated. The reference to a merger was intended to indicate that the rate of improvement might take a long time and a merger might therefore be desirable.

Negotiations had been going on for some time, but the credit squeeze had affected their completion. Nevertheless, this was only a postponement and a decision was expected in September or October.

Mr. Turner told the ordinary shareholders in the Company, which last year reported a group loss of £7,584 after a loss of £172,093 in the previous year, that they must consider their capital lost, and there was no hope of anything more than a token payment of about 6*d.* per share. A "small comfort" for ordinary shareholders was, perhaps, the fact that Mr. A. N. de Thier, the former Chairman, had recently developed a fabric with special characteristics and a small company had been formed to protect the name given to the fabric. There were hopes that this development might prove to be a profitable one and, if this were so, it was hoped that ordinary shareholders in the group would be given shares in the Company on a *pro rata* basis.—*All Rights Reserved.*

WORLD WOOL CONSUMPTION

Total consumption of raw wool in the free world during 1956 is estimated to have been an all-time record and about 7½ per cent. greater than in the previous year, according to Mr. D. Hamilton-Russell. World production of tops last year appeared to have been nearly 12 per cent. larger than in 1955, while yarn output rose by 6 per cent. Production of woven tissues was estimated to have risen some 5 per cent. The country showing the greatest proportionate increase in activity was Japan, whose consumption of raw wool was around 40 per cent. greater than in 1955. Substantial improvements were also recorded by Belgium, France and Italy, but, in the United States and Western Germany, there was a slowing down in the rate of increase. Consumption in the United Kingdom, contrary to the general trend, remained at almost exactly the same total as in the previous year.

The rise in wool consumption in 1956 was accompanied by a further growth in the industry's usage of other raw materials, particularly man-made fibres, but the proportion of raw wool to other materials used was rather higher in 1956 than in either of the two previous years. The volume of international trade in raw wool and wool goods continued to expand in generally satisfactory manner during 1956.

NEW COTTON HEDGE CONTRACT

MAIN FEATURES OUTLINED

THE Forward Markets Commission has approved of the revised hedge contract as formulated by the East India Cotton Association (E.I.C.A.) for the 1957-58 crop cotton and transactions in the new settlement were permitted with effect from Saturday the 22nd inst. The *moorat* trading was held on Sunday 23rd June, at 10-15 a.m., that day being declared a trading day with business hours limited to one hour commencing from 10-15 a.m. For the new season, according to the amendments effected to the By-laws of the E.I.C.A., there is only one hedge contract, called the Indian Cotton Contract. The basis of the contract is Fine M. G. Moglai Jarilla 25/32" staple. Delivery months are March, May and August. Trading in the new crop hedge contract shall be subject to the amendments made to the By-laws of the Association and shall be within the floor and ceiling prices fixed by the Government for the 1957-58 season, i.e., Rs. 495 and Rs. 820 for Fine Jarilla 25/32" staple, the same as in the previous season.

The return to an omnibus contract, after one year of unsuccessful experimentation with the double-contract system, would appear to have been prompted by the marked fall in production of cotton in the current season and the expectation of a continuation of the trend in the new season also. At the beginning of the 1956-57 season, it was expected that a commercial crop of about 5.4 million bales would be harvested. This estimate was progressively revised downwards subsequently, and recent estimates place the crop at no more than 4.7 million bales. Since the anticipation of a larger crop this season has not materialised, the Forward Markets Commission requested the East India Cotton Association to formulate proposals for the revision of the hedge contract for the 1957-58 season in the light of the changes that have taken place in the statistical position of cotton. The Board of the E.I.C.A., accordingly, appointed a sub-committee to examine the question and to suggest suitable modifications. Basing its proposals mainly on the recommendation of the Sub-Committee, and after extensive discussion and consultation with the various interests concerned, the Board suggested a number of amendments to the By-laws of the E.I.C.A. These amendments have now been approved by the Forward Markets Commission. The main features of the hedge contract are:

For the purpose of hedging, there shall be a single hedge contract, styled "The Indian Cotton Contract." The basis of the contract is Fine M.G. Moglai Jarilla 25/32" staple, as per standard to be prepared from Jarilla cotton grown in former Hyderabad State tenderable upto two classes 'on' and upto "Good to Fully Good" and upto 2/32" 'on' and 1/32" 'off' for staple. Months of delivery are March, May and August. Trading in hedge contract is not permitted above Rs. 30 below the ceiling price fixed by the Textile Commissioner for basic cotton, except for liquidation of outstanding transactions or jobbing business during the delivery period. No fresh business is permitted during delivery period, but liquidation of outstanding business and jobbing business, provided the position at the close of the day is not altered thereby and no such transaction is carried forward for the next day, are permissible.

There shall be no margin payable but the Forward Markets Commission has power to introduce margin, if it considers it necessary to do so. A deposit on the following scale shall be payable on outstanding purchases as under:—(i) If the price rises above Rs. 70 below the ceiling price before the delivery period, the rate shall be Rs. 25 per bale on net outstanding purchases shown in the statement; (ii) If the price rises above Rs. 70 below the ceiling price on or after the first day of the delivery month, the rate shall be Rs. 200 per bale on all the outstanding purchases on the day of such occurrence; (iii) If the price rise referred to above shall have taken place before the delivery month and is continued on or after the first day of the delivery month, then the deposit on all open outstanding purchases on the first day of the delivery month, shall be at the rate of Rs. 200 per bale, after adjustment of the deposit lying with the Clearing House. The deposit so paid can be adjusted as and when purchases are liquidated or reduced before or during delivery period against any further deposits to be paid subsequently or if no such adjustment is required it shall be refunded to that extent in the clearing immediately following such reduction or liquidation of long position. There shall be no weightage.

Tendering differences, that is, premia or discounts shall be fixed on the basis of the prices at which the basic and other descriptions of cotton tenderable are sold in the Bombay spot market taking into account the spot prices of the respective descriptions of cotton in the interior markets with power at the discretion of the Special Committee and the Board to adjust such premia or discount by adding to the premium or reducing the discount to the extent of 50 per cent. of the difference between the hedge contract rate and the spot rate of basic cotton. The invoicing back cotton rejected in survey under By-law 61 shall be on the basis of the spot rate of basic cotton together with the penalty of Rs. 3 per candy. If at any time the price of the basic cotton rules above the price of any Jarilla growth, then the spot price for basic cotton shall be fixed at a rate not above the ruling spot price of Madhya Bharat Jarilla.

The standards shall be renewed every year as hitherto. The standards shall be prepared by the surveyors and passed by the Standards Committee subject to a right of appeal against the same to the Standards Appeal Committee. Provision has been made for a super-appeal against the award of the Panel of Surveyors to a Super-Appeal Committee consisting of five persons from the trade, one of whom shall be the Chairman of the Board. The Super-Appeal Committee will be constituted of three members out of the five members. The fee for super-appeal shall be Rs. 250 and if the appeal is successful a sum of Rs. 125 shall be refunded.

Cotton tendered against the hedge contract for the first time may be certified according to the final award in arbitration. The seller shall specify in the Delivery Order Forms 5 to 6 in respect of cotton tendered against hedge contract, the particulars regarding press marks, press running numbers and any other marks on the bales. A controller appointed by the Association shall be selected for drawing of samples and for submission for survey. The controller shall draw samples in the presence of the representatives of the seller and the buyer. His name shall be intimated to the parties while forwarding the delivery order to the buyer and while intimating the name of the last buyer to the seller. The cotton so tendered shall be certified according to the final award in arbitration under by-laws 36 and 37 and the controller shall verify the press marks, press running numbers and other marks on the bales at the time of weighment by the buyer and affix a stamp on each bale showing the number of the certificate.

THE NATURE OF THE COMMONWEALTH

VOLUNTARY PARTNERSHIP OF LIKE-MINDED NATIONS

By Christine Comber

[The Conference of Commonwealth Prime Ministers which began in London on 26th June 1957 is the eighth post-war meeting. With Ghana joining the ranks of the Commonwealth this year, the membership of the Commonwealth has risen to nine. Mr. Harold Macmillan as Prime Minister of the host country, presided over the present meeting. It was attended by the Prime Ministers of India, Australia, Canada, Pakistan and Ghana. The Prime Minister of the Federation of Rhodesia and Nyasaland also participated in the Conference as usual, by special invitation. New Zealand's Prime Minister could not attend for reasons of health, while the South African Prime Minister has chosen to abstain. Ceylon was represented by one of its Ministers, as the Prime Minister of that country was said to be preoccupied with certain urgent national problems. In view of this Conference, the article on the nature of the Commonwealth appearing on this page is of considerable topical value. Its author is a specialist on Commonwealth affairs. It is followed by a synopsis of the economic importance of each country represented at the Conference.—ED.]

THE informality of the Prime Ministers' Conference reflects the adaptable nature of the Commonwealth association—so simple to its members but so difficult to analyse and explain. The facts are plain enough. The Commonwealth is a free association of nine sovereign, independent States—the United Kingdom, Canada, Australia, New Zealand, South Africa, India, Pakistan, Ceylon and Ghana, together with their dependencies. The Prime Minister of the Federation of Rhodesia and Nyasaland, set up in 1953, also attends the Commonwealth Prime Ministers' meetings. This had already been the position in the case of Southern Rhodesia for many years before the Federation came into being.

The Commonwealth as a whole, including the dependent territories, covers, roughly speaking, a quarter of the world's land surface and contains about a quarter of its population.

Varying widely in history, size, geographical position, race, language, religion, composition of population, industrial development, and international importance, each of the Commonwealth nations has developed along its own lines. Canada, for example, has economic and defence ties with the United States; Australia and New Zealand are linked with Pakistan and the United Kingdom in the South-East Asia Collective Defence Treaty (S.E.A.T.O.) and with the United States in the Pacific Security Treaty (A.N.Z.U.S.); the United Kingdom has obligations to Western European neighbours under the Brussels Treaty and, with Canada, to the North Atlantic community through N.A.T.O.

Asian Members

The Commonwealth membership of the three Asian nations has been a valuable addition to the strength and importance of the Commonwealth and today they act as valuable interpreters between Asia and the West. Australia, too, as a country which is of the West but not in it, in the East but not of it, is also a valuable interpreter between the two. Similarly, by virtue of its geographical position, Canada can act as an interpreter between the United States and the Commonwealth.

Every member of the Commonwealth enjoys unfettered control over its own affairs, and none can dictate to another in any matter whatsoever; neither is any Commonwealth nation under any obligation to underwrite the responsibilities undertaken by any other Commonwealth nation. The meaning of the Commonwealth status was very aptly described by Mr. Peter Fraser when he was Prime Minister of New Zealand as "independence with something added and not with something taken away."

Thus, each Commonwealth country determines its own foreign and domestic policies, defines its own citizenship and immigration regulations, makes treaties with other nations, maintaining its own diplomatic service and deciding for itself the issues of peace and war.

World War II provided a striking example of this. In 1939, Australia, New Zealand, Canada and South Africa each made its own declaration of war, the last only after a proposal of neutrality had been debated and defeated in a free vote of its own Parliament. Eire, then a member of the Commonwealth, decided to remain neutral, and continued to maintain diplomatic relations with Germany, Italy and Japan, with which the rest of the Commonwealth was at war, and that decision was accepted by the rest of the Commonwealth.

Freedom of Choice

Members are free to join international organisations or not, irrespective of the actions of the other members. Thus, while all are members of the United Nations, only the United Kingdom and Canada belong to N.A.T.O.; the United Kingdom and Pakistan belong to the Baghdad Pact; all, except New Zealand (and at present Ghana), are members of the International Bank for Reconstruction and Development and of the International Monetary Fund; and all, again except Ghana but including the Federation of Rhodesia and Nyasaland, are contracting parties to G.A.T.T. (the General Agreement on Tariffs and Trade).

The Commonwealth has no central government, defence force or judiciary and no rigid rules and commitments. Like the United Kingdom, it has no written constitution, but all its members are united by a common sense of values and ideals, and all have certain constitutional features in common. In spite of the wide diversities of race and tradition, they all have a broadly similar pattern of legislative, executive or judicial institutions.

Relationship with the Crown

Seven of the Commonwealth members are monarchies; two—India and Pakistan—are republics within the Commonwealth, and Ceylon has announced its intention of following suit. Since the Prime Ministers' Conference held in London in April, 1949, to consider constitutional issues arising from India's decision to become a republic while desiring to continue full membership of the Commonwealth, the Sovereign has been accepted by all as the symbol of their free association "and as such the Head of the Commonwealth." The Queen has, therefore, in the case of countries accepting her as their monarch, a relationship with the individuals comprising each country and also a relationship with the nation as a collective entity. In the case of the two republics, she has only the latter relationship.

The Queen is a constitutional sovereign—that is to say, a reigning, not a ruling monarch; she provides the element of continuity in the administration of her countries, and the importance of her influence and example would be hard to overestimate. She is represented in each of the member countries—except India and Pakistan—by a Governor-General, appointed on the recommendation of the Government of the country concerned. Nowadays he is more often than not a citizen of that country. Throughout his term of office he is wholly independent of the Government of the United Kingdom, acting solely on the advice of the Government of the country in which he holds office.

Every nation in the Commonwealth association is there entirely of its own choice. In 1947 Burma decided to become a republic outside the Commonwealth. In 1949, Eire chose the same path, and became the Irish Republic.

But the members of the Commonwealth do not for the most part think in terms of the right to secede. If it were not a basic assumption that the Commonwealth is not only a voluntary and friendly but also a lasting partnership, long-term planning would be meaningless.

Mr. Nehru, speaking at a banquet held in New Delhi on 27th December 1950, in honour of the Australian Prime Minister, said: "While member nations of this Commonwealth sometimes disagree, sometimes have interests conflicting with each other, sometimes pull in different directions, nevertheless, the basic fact remains that they meet as friends; try to understand each other, try to accommodate each other, and try, as far as possible, to find a common way of working.... That friendly approach, that sympathetic approach, that attempt to understand, that attempt, in so far as one can, to go in step, and at the same time enjoy the complete knowledge that one can take any step—a combination of these two factors had led, I suppose, to the success of this rather remarkable experiment."

* * * *

COUNTRIES REPRESENTED AT THE CONFERENCE

The United Kingdom is one of the most highly industrialised countries in the world. With a population of 51,000,000 to its area of 94,000 square miles, it is also the fourth most densely populated (after Japan, Belgium and the Netherlands). It is the world's second largest trading country, accounting for about 10 per cent. of total international trade and one-fifth of world exports of manufactured goods. Main exports are machinery and electrical equipment; road vehicles; aircraft and ships; chemicals; iron and steel; textiles; metal manufactures; petroleum products. The United Kingdom is the banker for the sterling area. The pound sterling is used in the finance of nearly half the world's international transactions.

Canada, with an area of nearly 4,000,000 square miles, is the largest country in the Commonwealth and the second largest (after the U.S.S.R.) in the world. It harvests the world's largest wheat crop, produces over 90 per cent. of the free world's nickel, half the platinum, two-thirds of the asbestos, and more than half of the newsprint. It is the second largest producer of gold and zinc, the third of silver and the fourth of copper. Canada was constituted a federation in 1867. There are ten provinces and two Territories. The capital is Ottawa, and both English and French are official languages.

Australia, the smallest continent and the largest island in the world, has an area of roughly 3,000,000 square miles. Its prosperity depends mainly on its primary products—wool, of which it accounts for one-quarter of world exports; wheat and barley, meat, dairy produce, fruit, gold and base metals. Large hydro-electric projects have been developed since the war, notably that on the snowy River. Constituted in 1900, the Commonwealth of Australia is a federation of six States and two Territories. The federal capital is Canberra.

New Zealand lies almost at the Antipodes of the United Kingdom. Its capital is Wellington. Chief primary industries are sheep and dairy farming; chief exports meat, dairy produce, wool, hides and skins. The United Kingdom takes 70 per cent. of the exports and supplies nearly half the imports. New Zealand was the first Commonwealth country to introduce a comprehensive Social Security Act (1938); it has a very low infant mortality rate and the longest expectation of life in the world.

The Union of South Africa has a single Government uniting its four provinces. Cape Town is the legislative and Pretoria the administrative capital. South Africa is the world's largest producer of gold, and many of the finest diamonds ever mined have been found there. Uranium is produced from gold tailings under the auspices of the South African Atomic Energy Board. Afrikaans and English are both official languages.

India, which became an independent State in 1947 and a republic in 1950, has a federal government with its capital at New Delhi. All adult citizens enjoy the franchise. With an area of more than 1,250,000 square miles, India is more than half the size of Europe without the U.S.S.R.; population is roughly 377,000,000. Principal exports are tea, jute and cotton manufactures, and a steel industry (which now produces over 1,000,000 tons a year) dates from before World War I. But agriculture still employs about three-quarters of the working population and contributes half the national income. India's second Five-year Plan of economic development, launched in 1956, involves extensive hydro-electric, irrigation, steel and industrial development.

Pakistan came into existence as a separate State in 1947, with Karachi as its capital. It is divided into two parts—East and West Pakistan—separated by Indian territory. It became a republic in 1956. About 80 per cent. of its economically active population is engaged in agriculture. It supplies about 90 per cent. of the world's jute and is the largest exporter of raw cotton in the Commonwealth. The Government's aim is to diversify the economy by fostering industrialisation, at the same time strengthening agriculture by irrigation, land reclamation and other measures.

Ceylon became an independent member of the Commonwealth in 1948. Its capital is Colombo. Two-thirds of the cultivated land are taken up by tea, rubber and coconut, which provide a living—in production or allied manufactures—for two-thirds of the population, and account for 90 per cent. (by value) of the island's exports.

Ghana became an independent member of the Commonwealth on 6th March this year. It is the first tropical African country to achieve this status. Formerly known as the Gold Coast, Ghana has an area of just over 90,000 square miles and a population of about 5,000,000. Ghana produces over a third of the world's cocoa, which accounts for over two-thirds of its exports. It has also valuable timber resources, and gold, manganese, diamonds and bauxite.

The Federation of Rhodesia and Nyasaland, created in 1953, is fully self-governing in internal affairs. It is constitutionally unique, in that it is a federation of one self-governing territory (Southern Rhodesia) with two protectorates (Northern Rhodesia and Nyasaland). The federal capital is Salisbury. Minerals constitute the main wealth. Northern Rhodesia is the largest source of copper in the Commonwealth and the second in the world. Southern Rhodesia's most valuable minerals are asbestos and gold. The principal cash crop is tobacco, of which about two-thirds comes from Southern Rhodesia, and cotton and tea, both mainly from Nyasaland.

SUGARCANE RESEARCH IN U. P. STATE

VIGOROUS DRIVE TO INTENSIFY IT

PRESS reports from Uttar Pradesh aver that the Agricultural Department of the State Government has launched a vigorous drive for intensifying sugarcane research. This move is certainly commendable, considering that U.P. is the biggest cane and sugar (white and brown) producing State in India. Thus, out of the total area of 4.53 million acres (second estimate) sown to sugarcane during the current season (1956-57), this State alone accounts for over 2.70 million acres, or as much as 59.7 per cent. The share of this State in the aggregate production of cane, *gur* (brown sugar) and sugar (white) comes to 51 per cent., 50 per cent. and 53 per cent., respectively. The following table gives the estimates of cane, *gur* and sugar output in U.P. during 1956-57, as compared with those for the whole of India:

(In million tons)

	All-India	*U.P.*	*Percentage share*
Sugarcane	58.91	30.10	51
Gur	3.24	1.61	50
Sugar	2.02	1.07	53

The importance of sugarcane to the economy of Uttar Pradesh is thus obvious. It is but natural, therefore, that cane should have been one of the earliest crops to receive systematic attention so far as research work is concerned. The foundation of cane research in this State was laid as far back as 1912, when, at Shahjehanpur, Mr. George Clarke, the then Agricultural Chemist, did a good deal of work on the testing and acclimatisation of cane varieties and cultural methods, especially green manuring. Despite this long period of research work, the progress actually obtained in sugarcane cultivation has been very poor. In fact, the conditions today are none too happy. The average per-acre yield of cane grown in U.P. is a bare 11.1 tons, as against the all-India average of 12.99 tons, 27.39 tons in Bombay, 29.18 tons in Andhra and 26.01 tons in Madras. Similarly, the percentage of recovery of sugar in cane is very low, being 9.67, which compares unfavourably with the all-India average of 9.76, 11.41 in Bombay and 9.99 in Mysore.

Diversity of Climate and Soil

The continued none-too-happy conditions in cane cultivation in U.P. must be attributed to the diversity of climate and soil. unlike the peninsular South where soil and climatic conditions have permitted the use of a single variety such as Co 419 to be cultivated with success for many years. An idea of this diversity of climate and soil can be had from the following extract culled from an article published in the *Pioneer*, Lucknow:

"From east to west, the sugarcane cultivation belt extends to about 600 miles and has a width of over 200 miles. In the western part of the State, the soils are generally richer, rainfall is moderate, and ample supply of irrigation water is available. The eastern part of the State, on the other hand, possesses poorer soils, little resources of irrigation and is beset with floods during the rainy season. Besides, there are other large pockets having soil and climatic condition of their own. Thus, for instance, parts of Faizabad, Bahraich and Gonda are heavily waterlogged and present difficult problems of red rot and other diseases and need varieties not only suitable for waterlogged conditions but also resistant to red rot and capable of producing high yield and good recovery. Similarly, the area of Naini Tal Tarai, constituting a large sugarcane tract, has a perpetual problem of low sugar recovery, which, in the past, resulted even in the shifting of a factory to a more suitable location in Bulandshahr district. Part of Saharanpur, Muzaffarnagar and Dehra Dun present the problem of frost attack quite frequently. Then there are tracts of saline or alkaline and sandy areas subject to frequent floods. All these widely varying conditions under which sugarcane is cultivated in the State make it necessary to lay greater emphasis on the need for special research work in the problem areas themselves."

The present research organisation in the State consists of the main Sugarcane Research Station at Shahjehanpur and two full-fledged sub-stations at Gorakhpur and Muzaffarnagar. With a view to evolving varieties suitable for the waterlogged areas of Faizabad, Bahraich, Gonda, etc., a small research centre was started at Ghagraghat (Bahraich) in 1956. Another research centre was established at Phoolbagh in Naini Tal Tarai to tackle the problems of insect pest disease, weeds and low recovery of the area. For the *gur* and *khandsari* belt of the State, two small sub-stations have been opened at Etawah and Banaras. There are said to be in all 50 zonal research centres and 64 ten-acre blocks spread over the State. At these centres, replicated trials are laid out in the cultivators' fields or factory farms, in order to test the superiority of varieties selected at the main Research Station or sub-stations and the manurial and cultural treatments evolved at the Research Station. Subsequently, well-established results are passed on to the Cane Development Department which carries out hundreds of field demonstrations for the agriculturist, so that he can see and adopt the improved methods and practices in his own fields and thereby augment his profits.

Research Work

A brief reference to the research work now in progress in the various sections at the main Sugarcane Research Station of Shahjehanpur may now be made. The Agronomy Section is engaged in the task of selecting high-yielding and high-standard sugared varieties of cane out of the hybrids received from Coimbatore. Some varieties are also received from Bihar, the Punjab and other States. These are multiplied and tested in large numbers, against the standard early and late varieties. Experiments are also in progress to study the responses to the different reasons of plantings, growing of leguminous and other crops, along with cane. Further manurial trials in plant and ratoon canes are carried out. The Botany Section is conducting studies on the control of weeds and exploring the possibilities of raising sugar recovery, while the Chemistry Section assesses the juice quality of cane varieties in different varietal trials and the effect on the yield, juice, quality and soil composition when nitrogen is supplied from different sources. The Physiology and Mycology Sections are also doing good work. The former is equipped with standard meteorological instruments and a crop weather scheme is in progress. The object of the Mycology Section is to evolve methods of protecting cane crop against the common diseases; the resistance of varieties selected is tested against smut and red rot, the two most important diseases. The Entomology Section studies the biology and ecology of insect pests of cane, as well as their control methods, including cultural, mechanical and chemical. The Soil Science Section is responsible for conducting soil survey and soil analysis work in the different factory zones, in order that suitable manurial schedules for the different factory areas may be recommended. Soil survey work has already been completed in 20 factory zones and work is in progress in Saharanpur, Maholi and Jarwal Road.

Agronomy (*Gur*)

The Shahjehanpur Sugarcane Research Station is also doing useful work, so far as the decentralised sector of the sugar industry is concerned. A scheme of research work in the *gur* and *khandsari* areas of U.P., consisting of 17 non-factory districts in the Southern belt, was initiated in 1956. For this work, two sub-stations have been set up at Etawah and Varanasi. Incidentally, it may be noted that the *gur* and *khandsari* areas differ from factory areas both climatically and from the point of view of soil types. Again, while sugarcane varieties which are suitable for *gur*-making will be acceptable to sugar factories, the reverse is not true.

The designing, analysis, and interpretation of all the experiments conducted by the aforesaid sections of the Shahjehanpur main Station at the sub-stations and zonal centres are done by the Statistical Section. The section also carries out studies on the sampling technique for different types of investigations and long-term fertility studies on a permanent uniform trial plot. It helps, too, in planning and analysis of soil, yield and disease surveys. Short courses are conducted in the methods of cane cultivation and control of diseases and pests, besides training the staff of the Cane Development Department, extension workers of National Extension Service Blocks, etc. Moreover, the section undertakes advisory work for cane growers and factories on the better methods of cane cultivation, as well as control of diseases and pests. It participates in exhibitions and shows of agricultural importance. The results of research work are published in the standard journals.

RISE IN PRODUCTION COSTS OF COAL

PLEA FOR HIGHER SELLING PRICES JUSTIFIED

BOTH the producers and the consumers of coal are eagerly awaiting the report of the Coal Prices Revision Committee (Chairman: Mr. S. Boothalingam, I.C.S.) which is expected to be submitted to the Government of India shortly. When the Committee was appointed early last month, it was asked to submit its report within two months. The Committee has already visited the producing areas and met the representatives of colliery owners. It must have, therefore, collected sufficient data by now. But no indications are so far available as to whether the Committee has completed its enquiry. It is, therefore, not possible to say anything about the recommendations which this Committee will make. Nevertheless, it may be hoped that the coal industry's case for a reasonable upward revision in prices will be sympathetically considered by the Committee. Looked at from any angle, the plea for higher coal prices is fully justified.

That there is no exaggeration whatever in this statement is amply evident from the brief but pointed reference made by Mr. D. F. Macmillan, Chairman of one of India's leading coal-producing companies, namely, the Bengal Coal Company Ltd., in the course of his speech at the Company's annual meeting held at Calcutta on Thursday last week. A perusal of his speech will clearly reveal that, for a considerable time now, the coal industry has been called upon to bear increased costs of production from out of the selling prices statutorily fixed. Apart from the enhanced labour cost—the largest single element of cost in the coal industry—pressures on production costs have been exercised in an increasing degree by various other factors, such as increased prices of steel, cement, machinery and timber, and the implementation of new rules governing the operation of mines. According to Mr. Macmillan, between 1950 and 1956, the price of pig iron rose by over 100 per cent., of steel by 90 per cent. and of cement by 50 per cent., while the price of coal went up by only 18 per cent.

Finance for Development

This is certainly unfortunate, considering that the financial reserves of several coal companies are too inadequate to finance the implementation of development schemes. Incidentally, it may be noted that the target of additional output for the private sector under the second Five-year Plan is 10 million tons. out of a total of 22 million tons. This increase in output cannot be achieved unless the industry is accorded facilities for building up developmental reserves and paying reasonable dividends without which fresh capital cannot be found. In fixing the price of commodity like coal, the price of which is officially controlled, due consideration must be paid to the need for a special element for covering, partially at least, the cost of development. When the Government has accepted this principle in the case of steel and cement, there is no reason why it should not apply it to coal prices. The Boothalingam Committee will, therefore, do well to put forward this viewpoint in its report.

Apart from the consideration of finance for development, there is the no less vital consideration that must be borne in mind in fixing coal prices, namely, that the industry is not a perennial or continuous industry. It is common knowledge that coal mines are not inexhaustible. It is but natural that the original capital invested in the enterprise should be returned to the owners before the mining operations cease to be profitable.

New Element of Doubt

To revert to Mr. Macmillan's speech. He drew special attention to the new element of doubt regarding the field within which the private sector of coal industry can work, as a result of the newly enacted Coal Bearing Areas (Acquisition and Development) Act. The Act, it will be recalled, empowers the Government to acquire rights of private lessees over unworked coal-bearing areas found surplus to the requirements of the private sector. Expressing his disappointment at this legislation, Mr. Macmillan observed:

"The protection offered to private producers would seem to exclude coal-bearing lands contiguous to working collieries in which no work is being carried on at present, that is to say, land constituting a reserve area for subsequent development. This might considerably restrict the capacity of private collieries to expand into con-

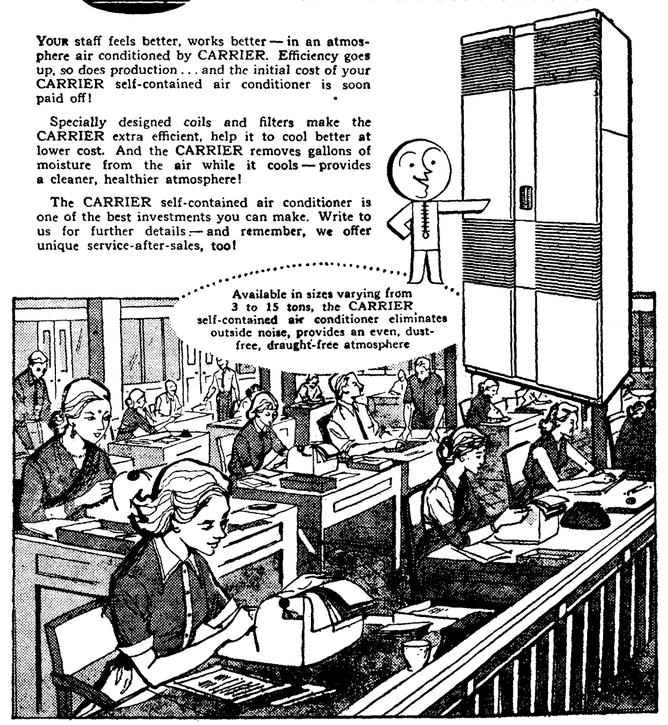
Efficiency goes up
...in premises cooled by
Carrier self-contained air conditioners!

YOUR staff feels better, works better — in an atmosphere air conditioned by CARRIER. Efficiency goes up, so does production ... and the initial cost of your CARRIER self-contained air conditioner is soon paid off!

Specially designed coils and filters make the CARRIER extra efficient, help it to cool better at lower cost. And the CARRIER removes gallons of moisture from the air while it cools — provides a cleaner, healthier atmosphere!

The CARRIER self-contained air conditioner is one of the best investments you can make. Write to us for further details — and remember, we offer unique service-after-sales, too!



Available in sizes varying from 3 to 15 tons, the CARRIER self-contained air conditioner eliminates outside noise, provides an even, dust-free, draught-free atmosphere

THE MODERN ECONOMIC SYSTEM AND THE MARXIAN MODEL

KARL MARX DISPROVED BY EVENTS

By W. S. Woytinsky

ABOUT a century ago Karl Marx gave a sonorous, truly apocalyptic picture of the approaching end of the capitalistic world. Marx believed in the 1860's that he saw the beginning of the end of the capitalistic system in England, then the most developed country, the image of the future of the rest of the world.

Nearly two decades later, in his preface to the English edition of *Capital*, Friedrich Engels corrected the error of his illustrious friend. Marx's mistake, Engels explained, was only in timing; the collapse of capitalism in England had been delayed for some reason but was now decidedly in sight.

When today's Marxians herald the approaching collapse of the existing economic system, they are following faithfully the steps of Marx. They have changed only a minor detail in his prophecies. He was most concerned about the fate of England as the main stronghold of capitalism. Today's Marxians are most eager to discover signs of the imminent economic collapse in the United States.

Two questions arise: (1) Why was Marx so sure that the capitalist system was bound to collapse in the country where it appeared to be particularly strong, and later in the rest of the world? (2) Why did this system survive?

Both Marx and Engels studied the capitalist economy in an abstract form, in a model that was supposed to portray the natural laws of capitalist production but actually denounced the evils of capitalism. Having established their model of capitalism, they studied its behaviour until they persuaded themselves that it was bound to break down very soon.

Where They Went Wrong

To some extent they were right: if their model had been correct, the economic system it represented would have disintegrated long ago.

The Marxian model of capitalism is developed in *Capital*, mainly in the first volume, which describes production of surplus-value, its conversion into capital and its accumulation. Starting from the assumption that the only source of value is human labour, Marx defines surplus-value as the difference between the *value* created by a worker and the value of *maintaining* his labour power.

Actually, the concept of surplus-value is heavily loaded with definite emotional and moral value judgments. The clue to this concept is the notion that the individual worker has a right to the whole product and the surplus-value is *extracted* from him.

The rate of surplus-value, writes Marx, is "an exact expression for the degree of exploitation of... the labourer by the capitalist," and he compares the capitalist to the vampire which "will not lose its hold on the labourer so long as there is a muscle, a nerve, a drop of blood to be exploited."

This is an excusable outburst of indignation, if one assumes that the capitalist, who has no right to the product, is cheating and robbing his workers. Denouncing rather than describing the capitalist system, Marx declares that machinery is only a means for extracting more surplus-value from the workers.

Marx was right when he wrote that machinery became "in the hands of capital the most powerful means, in the industries first invaded by it, for lengthening the working day." But he did not foresee that this trend soon would be reversed. However, this new tendency began to develop before the middle of the nineteenth century, largely under the pressure of the rising labour movement.

Adam Smith

The eighteenth century Scottish economist Adam Smith had foreseen the role of labour unions in the capitalist system. He saw that, even in his time, wage rates and the length of the working day were determined by a contest between employers and workers, just as commodity prices were determined by a contest between sellers and buyers. He emphasised that such a contest conforms to the supply-and-demand mechanism of the market.

Marx, however, misunderstood the role of the contests between labour and capital. His revolutionary temperament overpowered his scientific judgment when he described the normal process of the determination of the working day as a protracted civil war. He made his picture of the capitalist system even gloomier by stressing the impact of industrial crisis and continuously rising unemployment on wages.

The final result of capitalism, wrote Marx, is "the misery of constantly extending strata of the active army of labour and pauperism."

If this statement were true, there would be more paupers in England than in the Balkans and, of course, more paupers in the United States than in India or China.

Middle Class

The oversimplified and subjective character of Marxian theory is illustrated by its handling of the middle classes. Marx was aware, of course, of the existence of the middle classes in capitalist society. He himself was a middle-class man and so were almost all his friends at the top of the International Workingmen's Association. In his writings, he occasionally mentions the middle classes, but they are conspicuous by their absence in his model of the capitalist system.

It recognises only two groups: capitalists and workers. The first group diminishes steadily as a result of the concentration of capital, each capitalist "killing" many other capitalists. The second group grows steadily as a result of the accumulation of capital and expansion of capitalist production, and it becomes better organised by the process of capitalist exploitation.

Granted these Marxian assumptions, sooner or later a point must be reached where a handful of vampire-like exploiters who hold the world in misery will be overpowered by their rebellious slaves.

What have been the actual trends in the modern economy?

More than a century has elapsed since Marx developed his theory. In the interim, the world has been swept repeatedly by revolutions. Empires have crumbled, dictators have risen and fallen. Workers have played a conspicuous role in these upheavals.

But not a single revolution has followed the Marxian blueprint—a revolt of the majority of working people against the handful of capitalists! The two great revolutions of modern time, whose leaders pretended to follow Marx's theory, took place in regions where capitalism was not fully developed—Russia and China—and were effected by armies: in Russia, by a distintegrating army that refused to support or obey a weak democratic government; in China, by an army raised in the course of a protracted civil war. In countries where capitalism has advanced, it proved to be unexpectedly flexible and developed along lines strikingly different from the Marxian model.

Fallacy Proved

The fallacy of the theory of progressive concentration of capital in the hands of a steadily diminishing group of capitalists is proved by the experience of the United States. The number of factories and other industrial and commercial establishments has been steadily increasing since the days of Marx and is still rising—from 3,029,000 in 1929 to 4,252,000 in January 1956.

True, the relative weight of big business has been increasing steadily, but most of the modern firms are corporations, and their stock shares were distributed among some 10 million stockholders at the end of 1955. In addition, many unincorporated enterprises are owned by several partners. The total number of employers and self-employed persons, including farmers, family workers, part owners and stockholders in the United States may range up to 20 million. Moreover, the big corporations usually are operated by an hierarchy of managers and directors with a large technical staff—people who have taken over the functions of capitalists of older times and are as stout supporters of the existing system as the capitalists themselves. Thus, the basis of modern capitalism not only does not narrow, but becomes broader.

Not Two But Many Layers

History has proved also that contradictions and strains of the modern economic system cannot be reduced to a contest for power between two—and only two—classes: the workers and their exploiters. Steadily increasing complexity is a characteristic of the modern economic system. It consists of many layers and their role in production becomes increasingly intricate.

In the United States, for example, the employed civilian labour force in October 1956 included 66.2 million men and women. Roughly, there were among them 16.5 million proprietors and more or less independent producers or technical employees; 17.6 million white-collar (office) employees, craftsmen and foremen; 22.2 million operatives, manual labourers and farm hands (including unpaid family workers), and 9.8 million sales and service workers, whom Marx treated as parasites.

The number of unskilled and service workers comprised only 20 per cent. of the labour force in 1956, as compared with 36 per cent. in 1910, while the group of professional workers had increased from 4 per cent. to 10 per cent. of the total during the same period. Highly developed capitalism demands more and more engineers, chemists, designers, lawyers, managers, public relations men, and employees with a general education.

Thus the trend is not toward the polarisation of society divided between two antagonistic classes but toward the development of a long social ladder with many intermediary steps between the top and the bottom.

History has vindicated Adam Smith's theory that "workmen combinations" are a natural and legitimate means of self-defence for workers and strikes are a normal phase in wage determination.

Role of Labour Unions

In modern, free-enterprise countries, labour unions have become a part of the economic system. They represent the workers not only in bargaining but also in supervising the execution of contracts. They have their stewards in almost every workshop, handle the grievances of workers, and represent labour before legislatures and administrative bodies. In many countries—for example, the United States, Canada, United Kingdom, Sweden, Norway, Denmark, Australia and New Zealand—all workers in leading industries must be union members.

In his passionate plea against the capitalist system, Marx accused it of *four* basic crimes: an intolerably long *working day*; insufficient *wages*; *unhygienic* labour conditions; and ruthless exploitation of *women and children*.

By the time *Capital* was published, some of these evils in England had been checked by the Factory Acts, but these did not go far enough and public opinion demanded more radical measures. Marx did not realise, however, that the early Factory Acts were the modest beginning of a process that would transform the whole economic system without breaking it.

The progress of the modern economic system has been characterised by increasing productivity of labour that has made possible gradual shortening of the working day and a rise in wages. At the same time, hygienic and safety standards in places of work have been improved, child labour has practically disappeared, and employment of women in heavy and dangerous occupations has been limited.

Working Hours Reduced

The trend in the working day illustrates the general tendency. Beginning in 1889, the international labour movement for years sought a 48-hour standard work week. Now a 40-hour standard work week is firmly established in the United States, Canada, Australia and New Zealand; a 44-hour work week prevails in Great Britain, France and the Scandinavian countries. U.S. factory workers, on the average, work 40.2 hours a week, but receive higher overtime pay for hours worked in excess of 37.6 hours. U.S. labour is now seeking a 35-hour standard work week, with higher pay rates for overtime work.

People have learned that smooth operation of the capitalist system does not depend on a reserve army of labour, and that mass unemployment is an indefensible waste of human resources. Unemployment insurance spread in industrialised countries after World War I. Since the depression of the 1930's and its tragic conse-

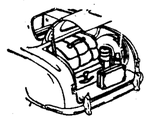
When buying a Car the considerations are

Performance

Thousands of Landmaster owners can vouch for Landmaster's big-car performance with small car economy, —smooth effortless power,—sparkling acceleration.

Spaciousness



Comfortable seating accommodation for six adults and large 16 cu. ft. capacity luggage boot make Landmaster the ideal car for family motoring.

Comfort

Latex foam cushioning, richly upholstered interior, seats cradled between the axles plus enough leg, head and elbow room make motoring in Landmaster a pleasure.

Styling

Landmaster wins the admiration of the owners and others alike for its beautifully proportioned lines, air-flow contours and modern styling that keep it ahead for years.

—the choice obviously goes to . . .

ESTIMATES COMMITTEE ON PROBLEMS OF MOTOR TRANSPORT

REDUCTION IN TAX BURDEN ON VEHICLES URGED

EMPHASISING that all means of transport—the railways, shipping and motor transport—should be allowed to develop as rapidly as possible, the Estimates Committee, in its report entitled "Ministry of Transport—Motor Transport and Miscellaneous" has dealt comprehensively with the problems of motor transport in the country. Notable among the various suggestions and recommendations made by the Committee, all of which are designed to expand and improve the motor transport service and also to place it on a firm footing, is the one relating to the need for reducing the heavy incidence of taxation on motor vehicles. There is no doubt that taxation of motor vehicles is an important aspect of the problem of the motor industry and motor transport service. And, unless the incidence of the present unconscionably heavy burden of tax on motor vehicles and motor transport is brought down, there can be no real or permanent improvement in motor transport in this country. Or to put the matter in another way, the reduction in taxes on motor transport and the adoption of a realistic policy towards it by the Government will pave the way for the expansion of the automobile industry and motor transport service, lead to wider employment and also bring in, in the long run, a larger revenue to the Government.

The Committee has stressed that all means of transport in India are now inadequate to meet the rapidly increasing requirements of the country, thanks to the rising tempo of agricultural and industrial production. It points out that the railways have "overshadowed" the other means of transport as a result of encouragement given to the former by official policies adopted over a hundred years. It adds: "The revival of interest in other means of transport has still to acquire momentum. There is, therefore, an urgent need for enunciating a national transportation policy." In enunciating such a policy, the Committee urges that the principles for inland transport co-ordination recommended by the International Chamber of Commerce might be adopted by the Government with as few modifications as are absolutely necessary. These principles, it may be mentioned here, are:

(1) Production and distribution are dependent upon efficient and economical transport, and transport in turn depends upon flourishing production and distribution. The problem is thus twofold and should not be considered only from the standpoint of transport. (2) To ensure the application of this principle there should be arrangements in each country for consultation of the various forms of transport with their users (agriculture, industry, trade) on rates, charges, services, conditions of carriage and all other economic aspects of the problem. (3) The user should enjoy unrestricted freedom of choice among the means of transport. (4) Transport "for own account" should be unrestricted. (5) The user should enjoy unrestricted freedom of choice, with a view to determining all the elements of the cost of each form of transport in each country. (6) Whether the different forms of transport are either separately administered or centrally controlled by a statutory body, they should be free to compete. Healthy but not wasteful competition should be encouraged and for this purpose, the different forms of "professional transport" should be placed on a comparable competitive basis by revising and easing statutory obligations, keeping also in view the interests of transport for "own account." Structure of charges should reflect the cost of providing the services and should be framed so as to obtain the maximum economic efficiency of each form of transport. (7) Nothing should be done which would hinder the development of any particular form of transport or disguise the advantages it could offer or which would discourage its use in order to provide artificial support for any alternative form of transport. The basis of co-ordination must be dynamic, not static. (8) In the interests of defence or the general national welfare, it may be necessary, in very exceptional cases, to maintain certain forms of transport at a minimum level. The losses on such operations should not throw additional charges on transport users as such; they should be nationally borne.

The Automobile

Among the means of inland transport, the automobile, the Committee rightly points out, has considerable economic advantages. Motor transport is very flexible in that a more individual type of service can be given than with any other type of transport. It can provide "door-to-door" service. Further, there are no terminal and transhipment delays as in the case of railways. Again, coastal shipping and inland river navigation are limited by geographical factors and rail transport is suited generally for bulk cargo and long hauls. On the other hand, motor transport can render valuable assistance to the country, especially if its 550,000 villages are inter-connected by roads.

Motor Transport

The problems facing the motor transport industry have been examined by a number of committees in the past few years. The salient features of the conclusion of these committees are: (1) The taxation rates are generally very high; (2) there are too many restrictions on the movement of vehicles both within the States and on inter-State routes; (3) the pace of nationalisation should be slow; (4) the automobile industry should be properly organised and placed on a sound footing. The Estimates Committee has quoted statistics to show that the level of taxation in India is much higher than in other countries. The rate works out to Rs. 1,232 per vehicle in India (1948-49), as compared with Rs. 417 in the U.K. (1948-49), Rs. 377 in France (1947), Rs. 289 in South Africa (1947) and Rs. 398 in the U.S. (1948). Broadly speaking, in India, there are three types of taxes on motor vehicles: (1) Central tax which consists of customs and excise duties on motor vehicles, tyres, tubes and accessories and on motor spirit. (2) State taxes such as vehicle tax, tax on passengers and goods, permit fees, sales tax on vehicles and parts thereof, and (3) local taxes such as wheel tax, tolls and terminal taxes. The general level of all the taxes is said to amount to 20 per cent. of the cost of operation and is as high as 35 per cent. in one or two States. The Committee, therefore, recommends that "efforts should be made to impart uniformity in taxes levied by the States and to bring down the incidence of taxation on motor vehicles.

The operation of motor transport in India is regulated chiefly by the Motor Vehicles Act and also by the "Code of principles and practices in the regulation of motor transport" which has been evolved by the Central Government after a series of discussions with the States. In connection with the regulation of motor transport in India, the Committee has done well to recall the recommendations made by the Study Group (Transport Planning) in 1955 for relaxation of certain restrictions imposed by the Code. The Group pointed out, for instance, that private carriers should be given far greater freedom of movement and public carriers operating in areas not served by railways should be free from restrictions relating to "compact area" imposed under the Code. The Group's suggestions have been accepted by the Transport Advisory Council. At its meeting held last year, the Council agreed that relaxations of the Code should be considered in relation to specified routes or areas and recommended that the States should send proposals for such relaxation. It would, however, appear that no such proposal has been received so far from any State Government. Commenting on the general nature of the problem of regulation of motor transport, the Committee observes that a certain amount of such regulation is necessary in the interests of ensuring "safe, reliable and efficient service." But it has stressed that care should be exercised, in order to see that "such regulation and control does not become so excessive as to hamper the growth of the industry itself."

Nationalisation

As regards nationalisation of motor transport, the Committee notes that complaints have been voiced that the fear of nationalisation has had a restrictive effect on the rapid and substantial growth of road transport in India. The present position is that while 22 States have already nationalised passenger transport services, freight transport has been nationalised by only six States. Except for Himachal Pradesh, Kutch and Bombay, where nationalisation of passenger transport is practically complete, and in Uttar Pradesh and Hyderabad, where the progress of nationalisation has been substantial, in all other States nationalised services represent only a small part of the road transport services as a whole. Freight transport is left more or less completely to private operators in all States except Himachal Pradesh, where complete nationalisation has been achieved. However, in view of the increasing trend to nationalise road transport, the motor transport interests in the country asked for a clear statement of policy by the Central and the State Governments on this issue. The outlines of such policy were decided upon by the Planning Commission, in consultation with the Ministry of Transport, and communicated to the State Government in September, 1954. The main features of the policy decided upon are:

Goods Transport.—(i) The schemes for nationalisation of road freight services will not be considered for inclusion in the Plan until 1961, i.e., the end of the second Five-year Plan. (ii) Permits should be granted freely for periods of not less than three years in accordance with the provisions of the Motor Vehicles Act 1939. (iii) Special incentive should be given to viable units by granting them permits for a maximum period of five years under the provisions of the Motor Vehicles Act.

Passenger Services.—(i) State Governments desiring to nationalise road passenger services should be required to prepare phased programmes of their schemes upto 1960-61, i.e., the end of the second Five-year Plan for consideration by the Planning Commission for inclusion in the Plan provided (ii) and (iii) below are accepted by the State Governments. (ii) In the areas that would be left outside the approved nationalised schemes, permits would be granted freely for periods of not less than three years in accordance with the provisions of the Motor Vehicles Act, 1939. (iii) Within the areas which are included in the approved nationalisation schemes permits would be granted for the longest period permissible under the expansion schedule, but within the maximum limit set by the Motor Vehicles Act. (iv) Where Government participation is contemplated, a tripartite organisation in which State Governments, railways and private operators will participate should be set up under the Road Transport Corporation Act, 1950. In areas to be left entirely to private operators, special encouragement should be given to the formation of viable units.

Clear Indication of Policy

The Committee very much appreciates the enunciation of the policy by the Planning Commission regarding the nationalisation of road transport. It, however, wonders if it could not be carried a step further. The progress of the setting up of the Transport Corporations has been extremely slow. Considerable ground has yet to be covered regarding the nationalisation of a passenger transport. It is, therefore, doubtful, according to the Committee, whether the States will be in a position to take the added responsibility of nationalising goods transport in the third Plan period also. It adds: "If, therefore, after consultation with the State Governments, the policy in regard to the nationalisation of goods transport is chalked out up to the end of the third Plan period, it will act as a great fillip to private enterprise." After pointing out that the life of a goods vehicle is about 8 to 10 years, the Committee says: "If, therefore, private enterprise is given a clear indication of the policy till 1965-66, considerable expansion of goods transport can take place in the private sector. This will materially assist in relieving the transport bottleneck in the country."

Commercial Vehicles

The development of motor transport is dependent upon adequate availability of commercial vehicles. The present demand for commercial vehicles in India is estimated at about 13,000 a year. The demand for all types of commercial vehicles is expected to go up to 40,000 vehicles per year towards the close of the second Five-year Plan. The Government has permitted certain firms to undertake the manufacture of commercial vehicles and chassis in progressive stages. The present installed capacities of these firms are: *Heavy vehicles*—Premier Automobiles (petrol vehicles) 5,000; Hindusthan Motors (petrol vehicles) 9,000; Tata Locomotive (diesel vehicles) 6,000. *Light vehicles*—Ashoka Leyland (diesel vehicles) 3,000. The Transport Ministry informed the Committee that 75 per cent. of the demand for commercial vehicles is for the diesel type. The representative of the Ministry also stated that, by the end of the second Plan, it was expected that India's requirements would be met by domestic production. The Committee, after recounting the recommendations of the Tariff Commission which examined the automobile industry's case for protection and the Government's decisions thereon, has expressed the hope that the implementation of the Government's decisions "will put the automobile industry in the country on a sound footing."

A specific issue pertaining to motor transport, to which the Committee has drawn pointed attention, is the case of trailers. The use of trailers, though a recent development, has become an established practice in many countries. The Committee says that employment of such multiple-unit vehicles as articulated vehicles, truck-trailer and tractor-trailer combinations has, however, not caught the imagination either of the Government or the trading community to any appreciable extent. It adds: "With the use of trailers, it is possible to carry with the same motive power larger loads than is possible on one chassis making transportation by tracks more economical and comparable to railway freights." The Committee has suggested that, in view of the economy inherent in the use of trailers, the Ministry of Transport should "encourage the manufacture and use of trailers both by the private and public sectors."

Bullock Cart

Although motor transport is bound to play an increasingly important role in India's transport economy, it must be admitted that, at least in the immediate future, the bullock cart, as a means of transport, cannot be eliminated altogether. The Committee has, therefore, done well to devote a section of its report to the consideration of bullock cart transport. It is estimated that there are about 10 million bullock carts in India, of which about 700,000 to one million ply in, or near, cities. It is further estimated that the number of bullock carts has been increasing at a rate of about 200,000 a year. In urban areas, the net cost of transportation by these carts has been placed at 120 pies per ton-mile, as against the general level of 40 to 48 pies per ton-mile in the case of lorries.

The Committee has thought it fit to emphasise the importance of improving bullock carts. It points out that the narrow iron tyres of bullock carts do considerable damage to roads. After conducting a large number of experiments, the Indian Roads Congress has evolved a new type of wheel in which the width of the iron tyre is about 3½", as against the present average width of about 2"; the saving in wear and tear of road surfaces through the use of the new wheel has been estimated at 35 per cent. The Central Road Research Institute is also carrying out research on improvement of bullock cart wheels and experiments in the use of rubber fixtures in the hub assembly of the wheels. The use of pneumatic tyres for bullock carts has been ruled out for three reasons: (1) if kept unused for a considerable part of the year, the tyres and tubes would rapidly deteriorate, leading to heavy loss; (2) service facilities cannot be provided in all rural centres and (3) on rough rural tracks, the pneumatic tyre would require greater tractive effort. The Committee has rightly emphasised the importance of research in this sphere. Thus, it has expressed the view that expert examination of the problem of improving the bullock carts and positive steps towards that end are urgently called for, separately for rural and urban areas.

IRON PLANT IN SALEM

Although iron ores are found in South India, particularly in Salem district in Madras State, there has been no development of iron and steel industry in this part of the country, because the ores are of the low-grade variety. It would, however, appear that, by the use of certain modern processes, it is possible to utilise such ores also. A Press note issued by the Government of Madras states that the Government of India has granted a licence to a private industrialist for the installation of a small pig iron plant in Salem, pending a decision to set up a large plant to be worked with low-grade coal or even lignite. The note says that some industrialists had come forward to set up small pig iron plants in the Salem area with a capacity not exceeding 15,000 tons per year; the capital outlay on such projects would be about Rs. 40 lakhs. With the concurrence of the State Government, the Union Government had granted a licence to one of them running a textile machinery industry in Coimbatore.

The official Press note stated that the Company's proposal was to crush and concentrate by magnetic separation at site the iron ore found in Salem and to reduce the concentrated ore in its factory at Coimbatore. More such small pig iron plants would be feasible, the Press note said, and added that Government would welcome proposal in this regard from industrialists. Though the iron ore deposits in Salem were "fairly extensive," they were, "on the whole, of low grade," and it would not be an economic proposition to convert the low-grade ores into iron by the conventional blast furnace method. However, since it had been known that in Germany and other countries a method had been found for turning even the low-grade ore to account by reducing them in what is called "a low-shaft furnace," the Government of India had recently sanctioned the installation of a pilot plant for the manufacture of iron from low-grade ores in the National Metallurgical Laboratory, Jamshedpur. Bulk samples of Salem ores had been sent to the laboratory for preliminary tests on sintering and reduction. The pilot plant would take some time, and it was hoped, the Press note said, that by then lignite from the Neyveli mines would be available, making it possible to take a final decision on the installation of full-scale iron manufacturing plant in the Salem district.

NEW PRODUCTS AND PROCESSES

Preserving Timber

A SUCCESSFUL commercial method of preserving timber under high pressure has been developed at the Forest Products Laboratory of the Commonwealth Scientific and Industrial Research Organisation, Australia. Test results of treated timbers, mainly railway sleepers, show that impregnation at high pressure is economically desirable. In Australia few, if any, species of hardwood eucalypt timbers can be preserved by conventional methods because the density of the timber fibres is such as to resist the penetration of the preservative at the usual pressures employed overseas. Investigations by the Division of Forest Products of the C.S.I.R.O. have conclusively demonstrated, however, that at high pressure preservatives penetrate them satisfactorily. The success of these laboratory experiments led to the design of a pilot high-pressure preservation cylinder, large enough to demonstrate its commercial practicability. Equipment to treat appreciable quantities of timber in the form of sleepers, cross-arms and poles is necessarily heavy, complex and relatively costly, and thus the costs of treating a unit are appreciably influenced by the time taken to do so. Comprehensive tests have shown that the duration of treatment may be only 60 minutes, or even less, according to the species of timber and its cross-section. A pressure cylinder with an internal diameter of 25 in. and 10 ft. long was designed for a working pressure of 1,000 pounds a square inch. Its most important characteristic is a quick-opening door with a hydraulic seal. After the cylinder is loaded the door is closed, and for five minutes a vacuum is applied to remove the air from the timber. Liquid creosote preservative is then applied at approximately 160 degrees Fahrenheit for about 30 minutes. A final short vacuum treatment is applied to remove free creosote from the sleeper surfaces.

Machine for Brick Making

Nearly all the bricks produced in India are made by hand-moulding at present. The resulting product is not uniform in size and shape due to high drying shrinkage and defective moulds. A hand-operated brick and block making machine has been developed, at the Central Building Research Institute, Roorkee, which overcomes these defects by moulding bricks in a well shaped steel mould, and at a lesser moulding moisture, thereby reducing shrinkage and other defects. The machine is most useful for the production of stabilised bricks, where hand-moulding is slow due to the semi-plastic nature of the soil. It works on a continuous cycle of operations by means of hand levers fixed on either side of the machine and a set of cams. It is an improvement over existing machines which work on an interrupted cycle of operations involving application of pressure and its subsequent release by working the screw or the lever forward and backward thereby resulting in a loss of output. The new machine has been fabricated with simple structural mild steel and is sturdy in performance. The tips of the roller, etc., which take the greatest wear are heat treated. The machine presses two bricks at a time, with four men working on the machine, two for turning the lever, one for filling the mould and one for removing and stacking the bricks. The output per man/hour is about 62 which means an output of about 2,000 bricks per day.

The machine has been tried on a pilot plant scale at the Institute. Trials by independent parties are in progress and reports so far have been satisfactory. The machine allows bricks to be produced on a cottage industry basis and is likely to find considerable use in community project areas.

Parties interested in undertaking the commercial development of the process may contact the Secretary, Natural Research Development Corporation of India, New Delhi.

Copying Machine

A machine described as "the world's fastest completely dry copying machine" has been announced by Minnesota Mining and Manufacturing Company of the U.S. Called the "Secretary" brand copying machine, it is small enough to be used on an office desk. It makes error-proof, dry copies of originals in about four seconds from printed, written or drawn originals—transparent or opaque and printed on one side or both—regardless of the colour of paper on which the original is printed. The copying machine is recommended for use in any business or department where extra copies of existing originals may be needed, whether they be copies of correspondence, records, cross-file references, sketches, diagrams, newspaper clippings, administrative forms or other papers. The "Secretary" is 17 inches wide by 17 inches long by nine inches high. It operates from any 110-volt A.C. outlet employing a special light in the machine and a special copying paper—there are no liquids, negatives or master copies involved. It copies in one step direct from the original in the open office or plant—regardless of lighting conditions—and can be operated after only a few minutes' instruction. The machine results in office economy by eliminating two-thirds of the cost of copying. Four pages of solid typing—about 2,000 words—can be copied in less than one minute with the "Secretary"; a typist capable of 60 words per minute would require more than 33 minutes if she typed without error. The new desk-top unit is sold internationally through authorised distributors.

Anti-Malaria Drug

Ordinary table salt combined with two tested anti-malaria drugs may be the most effective means yet developed to rid the world of malaria on a permanent basis. The medicated salt was developed by the United States Public Health Service and has already proved its effectiveness in extensive tests. It consists of ordinary table salt fortified with Daraprim and Chloroquine, two drugs which widespread experience has shown to be virtually 100 per cent. effective in eradicating malaria and, when used continuously, in keeping patients free from a recurrence of the disease.

The World Health Organisation of the United Nations may test the anti-malarial salt on a world-wide scale in all malaria-ridden areas. The tests conducted by the U.S. Public Health Service have shown that human volunteers, purposely exposed to multiple bitings by malaria-bearing mosquitoes, escaped malaria sickness as long as they used the medicated salt, and for a comfortably safe period after they stopped using the salt. The amount of the medicated salt needed to control malaria is no more than the average amount of regular salt which a person uses daily in preparing and eating his food. When used by inhabitants of malarial areas, the medicated salt would simply be substituted for plain table salt. Its daily use in this manner, the testing programme has demonstrated, should keep the users permanently free of malaria sickness, no matter how many times in the past they have been bitten by malaria-carrying mosquitoes or how many times they may again be bitten.

New Loom

The U.S. Agriculture Department recently announced the development of a new loom device which will produce wind- and water-resistant cotton fabric. The resistance will last for the life of the fabric.

The new development is termed a boon to cotton growers and textile manufacturers since it has opened a whole field of new uses for cotton textiles. The new process will make possible the manufacture of a cotton fabric which will keep a wearer dry in the hardest rain while, at the same time, he will remain comfortably cool since the fabric is porous enough to permit cooling air to circulate through it.

Water resistance in the cotton fabric, according to the Department, cannot wear off because the resistance is due to the cloth's tight weave and not to external treatments which clog fabric pores and make the cloth uncomfortable in humid weather. An industrial use of the fabric has been demonstrated over a five-year period by the use of the specially-loomed material as a tarpaulin covering for a sports field. The field, in New Orleans, remained dry during the heaviest rains when covered by the tarpaulin. The Agriculture Department said the new device can be attached inexpensively to standard cotton textile looms.

Cooling Pack

A product recently introduced on the Australian market, Pack-Ice, preserves food, drinks and other perishables in the hot weather. It is a boon to travellers and picnickers. Pack-Ice is a sterile material enclosed in a compact cylindrical container with a plastic skin. When frozen or semi-frozen in an ice chest or refrigerator it stays cold for a long time. Pack-Ice is used by health authorities, who describe it as hygienic, non-toxic and odourless, and may be safely used as a cold pack in the sick-room. As the material cannot melt, there is no danger of wetting the food with which it is packed. Pack-Ice is manufactured by E.P. Keogh Laboratories, of 402 Swanston Street, Melbourne, and 105 Elizabeth Street, Sydney.

Insulating Material From Waste Products

A new process to make insulating material from waste products like groundnut or paddy husk, banana stem, coir or bagasse has been evolved at the Central Food and Technological Research Institute, Mysore. This insulating material has been found to possess properties similar to cork at present being imported. The Institute is now engaged in standardising conditions for the production of this insulating material. It is also conducting tests to study performance of the product. This experiment was undertaken at the Institute with a view to manufacturing heat insulation boards, cushion pads and sound-proof boards from waste material.

Fastest Thermometer

A thermometer that registers temperature changes a billion times faster than the ordinary thermometer has been developed by Cornell Aeronautical Laboratories, U.S., to measure temperatures on aircraft and missile models undergoing tests in their 10,000-mile-an-hour hypersonic shock tunnel. A test run in the shock tunnel takes about one-thousandth of a second, and standard thermometers are useless for such short periods of time. The new thermometer's sensing agent is a film of platinum, only four-millionths of an inch thick, imprinted on a glass base. The platinum film picks up or loses heat instantly as surrounding temperatures vary.

Instant Battery

A new battery which remains inert in storage, but which can be activated almost instantly, has been developed by the Eastman Kodak Company. The battery can provide up to 6,000 volts and can be sized and shaped for almost any use from flash-light to autos, says the firm. It is activated by ammonial vapour released under pressure in a hermetically-sealed container and consists of a cathode and anode joined by a blotter-like "bridge" plus an ammonia-vapour triggering device.

Spirometer

A simple new instrument for detection of chronic diseases of the lungs was described before a recent meeting of the American College of Physicians. The instrument, called the "Spirometer", measures the breath to detect lung irregularities. A Philadelphia doctor said the spirometer will soon be as standard as the stethoscope or the blood pressure cuff in every physician's office and will revolutionise the detection and treatment of asthma.

A RATIONAL WAGE POLICY FOR THE PLAN

LABOUR CONFERENCE TO STUDY QUESTION

THE fifteenth session of the Indian Labour Conference, scheduled to meet at New Delhi in the second week of July, is expected to undertake a comprehensive examination of the wage policy laid down in the Plan, with a view to determining the principles on which the proposed tripartite wage boards for various industries should fix the wages for workers. Also figuring prominently on the agenda is a Model Agreement, which we commented upon last week, to guide employers in regard to rationalisation. This model has been drawn up by the Government of India for the consideration of the Conference. In view of the great emphasis laid in the Plan on stepping up industrial production, these questions which have a direct bearing on the pace and pattern of industrial development in India, are of vital importance.

It may be recalled that at the time of the formulation of the second Plan, the I.N.T.U.C. had put forward a plea for a 25 per cent. increase in the wages of workers to keep pace with the increase in productivity. Several other organisations of labour also supported this plea. The entire question of wage policy and the machinery for determining wages had been under the consideration of the Planning Commission, the Government of India and the Labour Conference. The second Plan, as is well known, envisages the establishment of wage boards representing the interest of employers, workers and consumers. The setting up of a Wage Commission has been demanded by the workers but the Government of India would appear to have been of the view that this could await the results of a proposed wage census. Meanwhile, an official Study Group was appointed to examine the question. The group has now submitted some notes to the Conference in order to enable it to reach conclusions on the subject which will then be forwarded to the wage boards for their guidance in the fixation of wages.

Tripartite Wage Boards

The Study Group's suggestion is that the wage policy should be so designed as to secure a continuous improvement in the living standards of workers and reasonable returns for the employers. It must also be in conformity with the social and economic objectives of the country. These considerations are, of course, interdependent and in theory at least there is no conflict between them. A realistic wage policy should strike a balance between these factors. But, according to the Group, experience has shown that, in this delicate balance, the workers were often left behind, due mainly to their weak, bargaining position. It, therefore, maintains that a balance between the three elements could best be achieved by tripartite wage boards in which all the three interests could be represented.

None would question the justness of a demand for a fair wage for workers; but, at the same time, it should not be forgotten that no industry can afford to pay a wage rate which is beyond its capacity. The Study Group rightly recognises this aspect. It questions the suggested antithesis between higher wages and greater employment and is of the view that, as long as wage increases are reasonable, there is no reason to suppose that higher wages and greater employment could not go together. Although, in the context of widespread unemployment, there is an urgent need for enlarging employment opportunities, it is held that there could be no real gain in multiplying the number of discontented employees. Each employed person should therefore be assured of, and paid, a fair wage. If the experience of industrially advanced countries is any guide, observes the Group, pressure of unions for wage increases has always been a powerful factor in bringing about improvements in technological efficiency.

The capacity of industry to pay, it is common knowledge, depends upon its output which in turn is determined by productivity. The group claims that a study of the net factory output and the wages of factory workers undertaken by it has revealed that, during the period 1948-53, while the absolute figures of the earnings of workers have increased, the rise has not been proportionate to the increase in net productivity. The share of wages in net factory output rose significantly between 1948 and 1950, but there was a decline over the subsequent three years. Another conclusion that emerged was that, industry-wise, the percentage of wages to net output in 1953 was highest in the textile industry (62.42) and lowest in cement (23.31).

According to the Study Group, in industries in which the rate of increase in wages has not kept pace with the improvement in productivity, there is a *prima facie* case for a wage boost. But it concedes that workers could not expect to be compensated fully for the increase in productivity, because in a country where the demands for capital formation are heavy and would continue to be so for a long time to come, workers would have to be content with wage increases smaller than is warranted by increases in productivity. At a time when all-round austerity is called for, it is only fair, it rightly maintains, to expect workers also to contribute their share to the collective sacrifice.

Consumers' Interest

An important aspect that has not unfortunately received the attention it should in this country in formulating labour and pricing policies is the consumers' interest. The latter goes usually unrepresented. Since consumers lack organisaton, their case is not generally championed in forums where matters vitally affecting them are discussed. It is true that, in a world where aggressive sales propaganda and competitive advertising designed to create demand have become the order of the day, it may not be correct to say that the consumer is the king as he was supposed to be in olden days. Nevertheless, no economic enterprise can run smoothly, unless the interests of those who, in the ultimate analysis, keep the productive machinery, moving is also taken into account in policy-making. It is, therefore, imperative to see that a part of the benefits accruing out of higher productivity be passed on to consumers also in the form of lower prices and better servicing of goods. It is to be hoped that this point of view will be borne in mind by those who participate in the Conference.

Wage Differentials

The capacity to pay a given wage should be judged, it is suggested, on a region-*cum*-industry basis. In other words, it should not be based on a single unit, or on industries as a whole in the country. A scientific wage policy should also provide for wage differentials which is a necessary concomitant of wage system in modern industrial organisations. It may be noted, in this connection, that the I.L.O. productivity team which visited India in 1952 had reported that the *ad hoc* differentials established by the various awards were unscientific and had produced many anomalies distorting the relationship between the work put in and the reward obtained, thereby affecting incentives adversely. To remedy this defect, it had recommended the establishment of wage differentials on the basis of proper job evaluation as in Western countries. Referring to this, the Group says that, as there is always a tendency on the part of workers to insist on the maintenance of current differentials, a pragmatic approach to the question will have to be adopted with the active participation and co-operation of the workers and employers.

The Study Group has some pertinent observations to make on the much wider issue of the economic and social consequences of a wage policy. It emphasises that, from the purely economic point of view, a wage policy should avoid exerting inflationary pressures or pressures on the balance of payments, promote productivity and help to create a favourable climate for savings and capital formation. On the social side, it must move in the direction of reducing inequalities of income and wealth and a more even distribution of the national product. The method of achieving the social objective is levelling up and not levelling down. In other words, inequality should be minimised not by reducing wages from the top, but by increasing it from the bottom. While the economic and social objectives might clash in wage determination, says the Group, it should be borne in mind that economic efficiency is both a resultant of and an essential condition for the satisfaction of legitimate social aspirations.

INDUSTRIAL DISPUTES IN MARCH

The climate of industrial relations in India, judged by the number of man-days lost due to industrial disputes, showed a slight deterioration in March last for the time-loss increased during the month as compared with the previous month. The total time-loss during March was 268,945 man-days, as against 240,702 during February. The index of industrial relations for the manufacturing industry group (Base 1939=100) for the month was 426.7 as compared with 471.1 (revised) for the preceding month and 101.1 for the corresponding month of the previous year. Total time-loss during the month was, however, lower than the monthly average time-loss of 594,709 man-days during 1956 by 54.8 per cent. One hundred and ten disputes were current at any time during the month, involving 40,488 workers. In the previous month the number of disputes was 132 involving 110,198 workers. The average duration of disputes current at any time during the month was 6.6 days as against 2.4 days during the previous month.

Thirteen of the disputes resulted in lockouts. West Bengal accounted for six lockouts, Madras three, Bombay two, and Bihar and Kerala one each. Eighty-one disputes terminated during the month of March. Of these 59 lasted for not more than five days and only eight lasted for more than 30 days each. The workers achieved complete or partial success in 35 cases, and failure in 27 cases. The main reasons for disputes were wages and allowance, bonus and personnel.

Among the industry groups, the time-loss increased in "Manufacturing" from 133,686 in the previous month to 147,621 in the month under review; in "Electricity, gas, water and sanitary services" from 1,464 to 48,068 and in "Services" from 26,431 to 27,820. In the remaining group, the time-loss declined. State-wise, Bihar recorded a time-loss of 101,185 man-days during the month which was the highest among all States. Next in order came Bombay, West Bengal and Mysore with a time loss of 60,871, 42,657 and 32,500 man-days, respectively. As compared with the previous month, the time-loss increased in Bihar, Bombay, Kerala, Mysore and Delhi, while it decreased in others.

EMPLOYMENT ACT

It is proposed to amend the Industrial Employment (Standing Orders) Act, 1946, in its application to Bombay State. The amending Bill, which has been published in the *Bombay Government Gazette* of 15th June seeks to extend the provisions of the Act to a larger number of workers by bringing under its purview all establishments employing more than 50 persons and enlarging the definition of "employer" to include owners of establishments employing labour through contractors or on contract basis. It also provides for penalty for contravention of the provisions of the Act and authorises the court to require an employer to pay adequate compensation to workmen who are directly or adversely affected by contravention or illegal modification of the Standing Orders for which the employer may have been convicted. The amendment further seeks to provide for the age of retirement or superannuation of workmen and expedite the process of certification of standing orders. It also seeks to extend the application of amendments to the whole of the new Bombay State.

Taxila

What looks like an oil pipeline is, in fact, part of a 9" earthenware pipe laid in Taxila sometime in the 2nd century B.C. It was originally encased in stone and appears to have been used for sewage disposal. The work of the unknown tubemakers of Taxila has withstood the ravages of time for over twenty centuries.

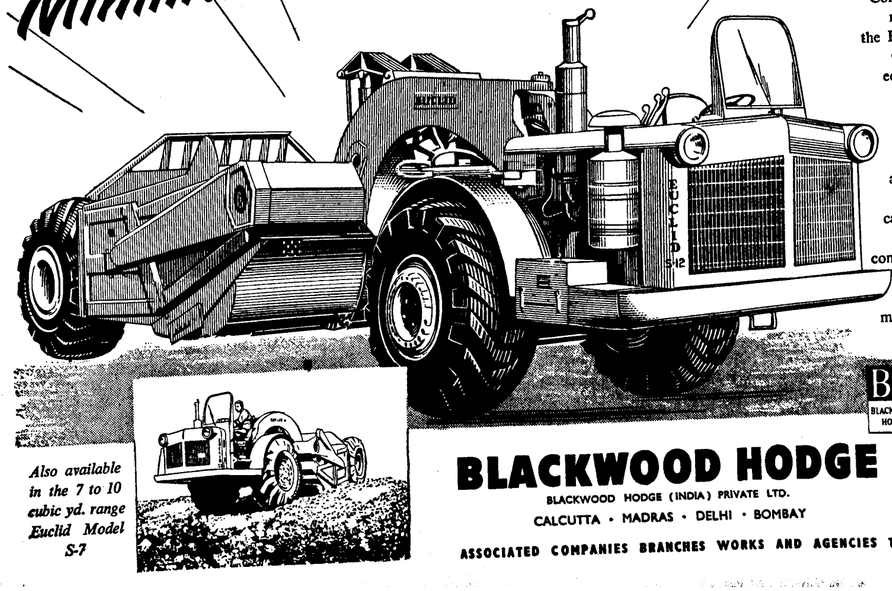
Minimum earth-moving costs!



Compact and engineered for rugged, on-the-job service, the Euclid S-12 Hydraulically Operated Scraper is unequalled for performance, maintenance, accessibility and design.

Power packed with a 218 h. p. engine...featuring a wide, shallow bowl with sectional cutting edges that can be arranged to suit the job...complete hydraulic controls which eliminate cable breakage etc. ... with large, big capacity tyres for maximum flotation—the S-12 cuts earthmoving costs to the minimum.

Also available in the 7 to 10 cubic yd. range Euclid Model S-7

NEW SYSTEM OF DIRECT TAXATION X-RAYED—II

EXPENDITURE TAX DESERVES TO BE DROPPED

By Russi Jal Taraporevala, B.Com., M.B.A. (California), M.Sc. (Econ.) (London)

THE expenditure tax was introduced by the Finance Minister in the recent budget. The case for this novel tax, as put forward by economists and notably by Mr. Kaldor, will be examined in this article. The entire case for the expenditure tax is made out on the basis of its being a substitute for the income-tax. Since the budget proposals have not reduced the rates of income-tax and super-tax sufficiently to offset the levy of the expenditure tax, they cannot be defended even by the case normally made out for the introduction of an expenditure tax.

The case for a personal expenditure tax as a substitute for the income-tax has been argued recently by Mr. Nicholas Kaldor in his book, *An Expenditure Tax*. The arguments in favour of the introduction of this tax will be outlined and their criticism by leading economists will then be discussed.

Equity Considerations

The first argument in favour of the introduction of the expenditure tax is based on considerations of equity. It is argued that income as defined for income-tax purposes, is a defective index of the taxable capacity of individuals, because it excludes accruals like capital gains, bequests and gambling winnings and may include exceptional accruals like royalties from a best-selling book or exceptionally high dividends which are not likely to continue. Thus, "with progressive taxation, the recipients of temporary or fluctuating incomes are more heavily taxed (in relation to their taxable capacity) than those who receive their income evenly spread over time." It is therefore, claimed that the actual expenditure or spending of individuals is a better index of their long-run taxable capacity than is provided by their income. Further, "during a period when the general price level is changing comparisons between individuals may legitimately be made in money terms in respect of their relative spending. . . . But, when income is chosen as the base for taxation, there is the additional problem that the relationship between the real savings of different individuals is not measured by their savings in terms of money value in times of changing prices." Mr. Kaldor, therefore, claims that "no definition of income, which is a plausible one for purposes of tax assessment, can measure taxable capacity. Accruals from the various sources cannot be reduced to a common unit of spending power on any objective criteria." An expenditure tax is superior to income-tax, because "a tax based on actual spending, rates each individual's capacity according to the yardstick which he applies to himself"—that is, his actual expenditure.

The argument on equity considerations can be criticised on many grounds. "Kaldor's treatment suffers considerably from a tendency to compare an idealised expenditure tax with the income-tax as it exists, which is inappropriate"; a perfected expenditure tax should be compared only with a comprehensive and perfect income-tax, as has been pointed out by Professor William Vickrey. A comprehensive income-tax could be made to include various accruals like capital gains and gambling winnings. By introducing a system of 'spreading' or averaging the tax burden over the years, an income-tax can take into account properly the taxable capacity of individuals over a period of time. Indeed, as pointed out by the famous British economist, Mrs. Ursula K. Hicks:

> "In order to make his expenditure tax more palatable, Mr. Kaldor introduces 'spreading' of the tax burden. . . . It is obvious that an expenditure tax discriminates against fluctuating expenditure (just as an income-tax discriminates against fluctuating income. . .). But fluctuations in expenditure are likely to be much more widely and fortuitously spread than fluctuations in income; they will always arise with the purchase of consumers' durables and are likely to arise whenever a family emergency occurs. Mr. Kaldor proposes to deal with the first type of fluctuation by spreading liability over a number of years, and the second by making insurance easy. If these concessions are to be assumed practical for an expenditure tax, they must also be assumed practical for an income-tax."

Against Mr. Kaldor's claim that, "once actual spending is taken as the criterion, all the problems created by the non-comparability of work-incomes and property-incomes, of temporary and permanent sources of wealth, of genuine and fictitious capital gains resolve themselves," it should be pointed out, as has been done by the famous American economist, Professor Richard A. Musgrave, that, under the expenditure tax, "we are saddled with a new problem, not encountered in the income-tax, of having to distinguish between consumption and saving. . . . The conceptual difficulties and the need for arbitrary demarcation . . . are about as great" as under the income-tax.

The argument that, in an inflationary period, expenditure is a better tax base than income rests on the assumption made by Mr. Kaldor that "whether prices are rising or not, it may be assumed that equal expenditure in terms of money value in any given period represents claims of equal real value on goods and services." This is a very rash assumption. Moreover, this argument ceases to be applicable in a period of price stability.

It can be concluded that questions of equity, which are essentially matters of taste, involve social value judgments, so that there can be no single choice which can be claimed as *the* right choice in these matters.

Incentive to Save

The second, and perhaps the most potent, argument in favour of the expenditure tax is that income-tax (at high rates) "differentiates against saving and in favour of spending", whereas an expenditure tax would promote savings and curb personal spending. It is claimed by Mr. Kaldor that the very high taxation of income has encouraged the wealthy classes to cease saving and has made them dis-save or spend out of their capital, because the sacrifice of future net income (after paying income-tax) in relation to the capital consumed is negligible. On the other hand, an expenditure tax, it is further argued, would stimulate saving by exempting the amounts saved from taxation until they are consumed. This argument seems to have impressed the Finance Minister considerably. In his budget speech, he mentioned that the expenditure tax is "a tax which, given effective administrative arrangements, can be a potent instrument for restraining ostentatious expenditure and for promoting savings."

The defects of this argument are many. First, although Mr. Kaldor has claimed that "the wealthy classes in Britain have ceased to save, and dis-save on a considerable scale" and the recommendations of the Kaldor Report imply the existence of a similar state of affairs in India, Mr. Kaldor has been unable to prove this statistically. The internationally renowned British economist and management expert, Professor Sir Arnold Plant, pointed out that "Mr. Kaldor admits that there are absolutely no data on which to base even an intelligent guess as to the extent of dis-saving" by the wealthy classes in the British economy. The Kaldor Report noted that "there are unfortunately no statistics available in India, even on a sample survey basis, of the consumption expenditure of the top income groups." Yet, the Report mentioned that "some observers put the expenditure of the upper classes in India at over Rs. 500 crores a year—an amount which is considerably in excess of the total of net incomes after tax of all income recipients with incomes of over Rs. 10,000." The Kaldor Report shows the number of income-tax assessees with income in excess of Rs. 10,000 per year at 114,000, having a total income of about Rs. 263 crores, which, after deduction of income-tax, can be taken as Rs. 200 crores net. This would imply an annual dis-saving of Rs. 300 crores by the wealthy classes in India. According to the estimates in the Wealth Tax Bill (1957), the Finance Minister has mentioned that there are probably 26,000 individuals in India with net wealth in excess of Rs. 2,00,000 each and 4,000 Hindu undivided families having net wealth in excess of Rs. 3,00,000 each—giving a total of 30,000 assessees who presumably constitute the wealthy classes in India. Assuming that it is these assessees who are in a position to consume amounts out of their capital, the estimate of "some observers" contained in the Kaldor Report would imply an average dis-saving per year of Rs. 1,00,000 per assessee! If the wealthy classes are taken as those assessees whose incomes exceed Rs. 41,000 per year, the annual dis-saving per assessee would be an average of Rs. 2,36,500 approximately (the number of such assessees as per the Kaldor Report being 12,684). Persons familiar with India will certainly realise that these figures appear to be a gross exaggeration of the alleged dis-saving of the richer classes in India. Indeed, it can be claimed that, in the absence of any evidence or statistics, there is little justification for assuming that the wealthy classes in India are consuming their capital.

Second, Mr. Kaldor's contention that an expenditure tax would be superior to the income-tax for promoting savings can be challenged, as has been done by many leading economists. If the same total revenue is collected, the substitution of an expenditure tax for the income-tax is unlikely to stimulate savings to any appreciable extent. Mr. Kaldor is prepared "to believe that the savings of non-property owners who save up for emergencies, or to have a minimum security for old age, are relatively unaffected" by the income-tax. He has claimed that the expenditure tax would be superior to the income-tax for promoting savings among the wealthy classes, i.e., it would promote savings which are made with the desire to accumulate indefinitely, with no expectation of spending, unless by one's heirs. But the incidence of death duties has considerably weakened the urge for mere accumulation of wealth. Inflation provides a further disincentive even for the very wealthy to save. Professor Plant has pointed out that "the rich are not alone if they prefer more goods for their money today to fewer goods for the same money next year, and still fewer as far ahead as they can see." Then, the expectation, especially in India at the moment, that, once an expenditure tax is introduced, its rates of tax will probably be raised over the years will provide a powerful incentive for the rich to dis-save. It is, therefore, doubtful if the substitution of an expenditure tax for an income-tax would act as a powerful spur to personal saving.

Incentive to Entrepreneurship

The third argument in favour of the expenditure tax is that it will encourage greater risk-bearing than is done by the income-tax. The taxation of income at very high rates reduces the net rewards of risk-bearing and, therefore, discriminates against the assumption of risks by the investing classes. On the other hand, "an expenditure tax may be . . . said to discriminate not against the assumption of risks, but against the spending of income obtained through the assumption of risk."

This argument is defective, since it compares the existing income-tax with the perfect expenditure tax. It has been shown by such leading economists as Professors Rolph, Musgrave, Domar and Vickrey that a true or perfect income-tax which includes all gains and losses in the tax base and which has a provision for 'spreading' of the tax burden over a sufficiently long period would not discourage risk-bearing since the rate of return on the capital risked remains constant as the tax rate rises or falls.

Incentive to Work

Mr. Kaldor admits in his book that on *a priori* grounds it cannot be claimed that an expenditure tax is superior to an income-tax for providing the incentive to work. However, he gives some plausible reasons why the expenditure tax may provide greater incentive to work: "under the expenditure tax, a man can *save* on more favourable terms than under the income-tax" and "the advantages of possessing saved-up resources" will promote greater work, since, "if a man can set aside the *whole* of his earnings from additional work, he will, therefore, regard that as more valuable than if he can only set aside his earnings less the marginal tax on it."

But the effects of an income-tax on the incentive to work will vary between different persons, depending upon relative personal preferences for work as against leisure. The effects of an expenditure tax on the incentive to work will depend upon personal preferences between work, saving, spending and leisure. Mr. Kaldor's "general conclusion, therefore . . . that a progressive expenditure tax would be less of a disincentive to work than a progressive income-tax" has no 'general' applicability. Indeed, it is possible to arrive at exactly the opposite general conclusion as Mrs. Hicks has claimed for Great Britain: "on balance, an expenditure tax . . . is less work incentive than British income-tax; and, secondly, . . . British income-tax is not seriously disincentive. . . ."

Taxation and Economic Growth

There is the 'functional' argument for the expenditure tax which claims that the very purpose of taxation is to check spending, promote saving and spur economic progress. Mr. Kaldor writes that "taxes on income as such discriminate against savings, and are, therefore, likely to have a lesser restraining effect on spending than equivalent taxes on expenditure"—hence the expenditure tax is a more efficient tax than the income-tax. Also, the expenditure tax on account of its likely direct short-run effects on spending may be a superior instrument of fiscal policy for controlling cyclical fluctuations than the income-tax. "Even budgetary deficits and surpluses are unnecessary for the stabilisation of the economy, since the investment-saving relationship could, in principle, be always stabilised by a suitable combination of saving taxes and investment subsidies."

The criticism by Mrs. Hicks of Mr. Kaldor's 'functional' claims in favour of the expenditure tax may be noted. Says she:

> "Mr. Kaldor and the 'functional' financiers' define the primary objective of taxation as the avoidance of inflation. In a developing country, this consideration is of prime importance for growth, since inflationary pressure is likely to be very high where the development programme is large relatively to the size of economy, and voluntary saving negligible. As Professor Lewis has shown, the prime necessity in such an economy is that the tax structure should be geared so that the marginal rates of tax are always higher than average. . . In principle, the simplest type of tax which satisfies this condition is a general progressive income-tax, but, in primitive conditions, this is not easy to achieve, and recourse must be had to outlay taxes which have some of the same effects. Thus expenditure taxes have an important part to play in curbing inflation in primitive conditions, but to be effective they must be assessed on things of which people buy more as they get richer, and must cover the purchases of as large section of the population as possible. This is, of course, far from Mr. Kaldor's expenditure tax."

The most potent argument against the introduction of the expenditure tax is its administrative impracticability which is discussed later.

It can be concluded that the case made out by Mr. Kaldor in favour of the introduction of the expenditure tax *as a substitute for the income-tax* is far from overwhelming or even convincing. It has failed to convince most of the leading economists and Mr. Kaldor failed to convince the economist members of the British Royal Commission on the Taxation of Profits and Income of the merits of the expenditure tax. Unfortunately, this novel tax appears to have appealed to the Finance Minister as an interesting device for extracting greater revenues in his heroic efforts to finance the second Five-year Plan of India.

Computation of the Tax

Mr. Kaldor has pointed out that "comprehensive records of personal expenditure are in fact unnecessary for the administration of the tax, since expenditure could, in principle, be computed as the difference between certain money incomings and outgoings." His formula is:

> Expenditure=cash and bank balances at the beginning of the year PLUS all receipts including gifts, bequests, winnings, etc. + borrowings + sales proceeds of investments MINUS loans made + investments purchased + cash and bank balances at the end of the year.

The rules for computing the gross expenditure for the purposes of the Expenditure Tax Bill (1957) have not yet been framed but it appears from the various provisions contained in the Bill that the Finance Minister will probably adopt Mr. Kaldor's formula for computing gross expenditure.

Regressive Tax on Larger Families

The budget proposals for the expenditure tax involve the levy of the tax on the family as a unit. They propose an exemption allowance of Rs. 24,000 for the assessee and his wife and an allowance of Rs. 5,000 per dependent child per year (or Rs. 2,000 for a dependent who is a coparcener in a Hindu undivided family). Beyond the exemption limits, the expenditure tax has to be paid on the excess expenditure incurred by the assessee *irrespective of the size of his family*. The tax, therefore, discriminates against larger families, without any justification whatsoever, and is a regressive tax in this respect. Further, the Expenditure Tax Bill does not make any allowance for dependants other than the children of the assessee. This is most inequitable, especially under Indian conditions, where many rich assessees have a number of poor relations who are economically dependent upon them. The expenditure tax should take into account the greater needs of assessees who support a number of poor dependants like their aged parents, uncles, and other relatives. In these matters, the Expenditure Tax Bill runs counter to the recommendations of the Kaldor Report. In his book Mr. Kaldor had stressed that "the burden of an expenditure tax should vary with the standard of living, and that the standard of living is more a matter of expenditure *per head* than of expenditure *per household*." The Kaldor Report had recommended the adoption of the "quotient system" under which the expenditure "of all members of the family is first aggregated and then divided into a number of parts, depending on the number of persons in each family, and the tax is charged separately on each part. Children may count as one-half unit each. . . . Apart from wife and children, it may be permitted to add other family members living in a joint household to the conception of the 'family.'" The Expenditure Tax Bill should be modified to incorporate these recommendations of the Kaldor Report.

Exemptions

Under the Expenditure Tax Bill, expenditure tax is not payable in respect of certain exempted items. First, business expenses and capital outlays (like expenditure for constructing buildings, financing industries and investments) are exempted from liability to the expenditure tax, since these items do not constitute personal consumption. Second, savings are exempted from the tax. The Bill provides for the exemption of "any expenditure incurred for paying premiums in respect of any policies of insurance on the life of the assessee" and "any expenditure incurred by way of contributions to a provident, thrift or superannuation fund."

The Expenditure Tax Bill makes some provision for 'necessitous' expenditure, which has been described by Mr. Kaldor as including those "kinds of expenditures [which] ought to be specially exempted on the grounds that they arise out of misfortune or unavoidable obligations of some kind and are not part of a person's 'voluntary' expenditure on which his standard of living depends." The Bill provides for the exclusion of "any expenditure incurred by the assessee in respect of the marriage of any of his dependants, to the extent of Rs. 5,000 in respect of each such dependant" from the computation of taxable expenditure. It is difficult to understand the reason for not including within this exemption expenses which the assessee may incur in respect of his own marriage—unless the Finance Minister expects assessees to control their urge to get married in the interests of saving the expenditure tax or controlling the rapidly increasing population of this country!

The Bill makes provision for expenses due to illness, accident or disability by exempting from the tax premiums paid in respect of health, accident and disability insurance polices of the assessee and his dependants. This is, indeed, a minor concession. All benefits or payments received by the assessee in respect of such insurance policies and all expenditure incurred by him therefrom should be exempted from the expenditure tax. Moreover, the scope for fully insuring against illness, accident and disability is limited in India. Many assessees may prefer not to insure against such contingencies. They should be given exemption in respect of actual expenditure incurred by them on account of illness, disability and accident. The Bill does not provide for funeral and birth expenses, the costs of education and fines imposed on the assessee by courts of law. These 'necessitous' expenditures should certainly be exempted from the tax.

"Spreading" the Tax Burden

The Expenditure Tax Bill provides for the 'spreading' of "any expenditure incurred . . . on the purchase of jewellery, ornaments, works of art, furniture and other household goods, motor cars and other conveyances or any other article for the personal use of the assessee or any of his dependants" of a capital nature over a period of five years for the purpose of computing the taxable expenditure. It can be argued that articles like furniture, household goods of the durable variety, motor cars and other conveyances, constitute consumer goods from which benefits are enjoyed by the assessee and his dependants over a period of time. Therefore, the provision for 'spreading' the expenditures on such items for the purpose of computing the taxable expenditure can be justified as accounting for the disparity between the expenditure and the consumption of such goods. But jewellery, ornaments and works of art are not "consumed" over a short period (like the five years provided in the Bill)—the life of such assets may extend to centuries. Therefore, outlays on such articles should be treated as capital outlays and entirely excluded from the computation of taxable expenditure, more especially as the value of such articles is included in net wealth for the purposes of the annual tax on wealth.

The rates of expenditure tax proposed in the budget refer to the expenditure in excess of the exemption limit. For such excess expenditure the rates of tax are: Upto Rs. 10,000 expenditure, 10 per cent.; between Rs. 10,000 and Rs. 20,000, 20 per cent.; between Rs. 20,000 and Rs. 30,000, 40 per cent.; between Rs. 30,000 and Rs. 40,000, 60 per cent.; between Rs. 40,000 and Rs. 50,000, 80 per cent. and for expenditure above Rs. 50,000, 100 per cent. These rates, however, are calculated on the net annual expenditure, after deducting the expenditure tax—a method of calculation which cleverly disguises the rates and makes them appear politically acceptable. The real burden of the tax can be gauged only by converting these rates of tax to rates calculated on the gross expenditure (i.e., taxable expenditure before deducting the expenditure tax). The rates proposed by the budget are equivalent to 9.09 per cent., 16.66 per cent., 28.57 per cent., 37.5 per cent., 44.44 per cent. and 50 per cent., respectively, of the gross expenditure (before tax). [An example to show how the same tax burden can be expressed by different percentage rates when calculated on the net expenditure and the gross expenditure may be given. Let us assume that the gross expenditure amounts to Rs. 100 and the tax amounts to Rs. 75. Then the rate of tax on the gross expenditure is 75 per cent. But the rate of tax on the net expenditure (after tax), i.e., on Rs. 100 minus Rs. 75 or Rs. 25 is 300 per cent.]

The Kaldor Report had suggested that "there should be an exemption limit of Rs. 10,000 per adult and expenditure in excess of this amount should be charged according to the slab system of graduation, starting from 25 per cent. on the lowest slab (i.e., on expenditure between Rs. 10,000 and Rs. 12,500) and rising gradually up to a maximum of 300 per cent. on expenditures in excess of Rs. 50,000 per head." The exemption limit is thus similar to that proposed in the budget, but Mr. Kaldor's tax rates are to be applied on the basis of the "quotient system" whereas the Expenditure Tax Bill introduces the assessment of the family as a unit irrespective of the number of dependants. The scale of progression for the rate of tax which Mr. Kaldor had in mind for India can be inferred from the suggestions given in his book. The rates of tax on net expenditure *per head* would be: on expenditure between Rs. 10,000 and Rs. 12,500, 25 per cent.; between Rs. 12,500 and Rs. 20,000, 50 per cent.; between Rs. 20,000 and Rs. 25,000, 75 per cent.; between Rs. 25,000 and Rs. 40,000, 100 per cent.; between Rs. 40,000 and Rs. 50,000, 200 per cent. and on expenditure in excess of Rs. 50,000, 300 per cent. These rates appear indeed very high. But Mr. Kaldor has also used the convenient device of calculating the rates on net expenditure (after tax) for making the rates politically acceptable. His rates would be equivalent to 20 per cent., 33.33 per cent., 42.85 per cent., 50 per cent., 66.66 per cent. and 75 per cent. on the gross expenditure (before tax).

The Tax Burden

The burden of taxation imposed by the Finance Minister can be compared with that recommended by Mr. Kaldor. The rates of expenditure tax proposed by the Finance Minister vary from 9.09 per cent. to 50 per cent. of gross expenditure whilst the rates envisaged by Mr. Kaldor vary from 20 per cent. to 75 per cent. of gross expenditure—giving a maximum difference in the rates of the budget and those envisaged by Mr. Kaldor of about 25 per cent. of gross expenditure. On the other hand, it must be remembered that the heavier rates of the expenditure tax recommended by the Kaldor Report are on the basis of "the replacement of the higher ranges of super-tax on personal income with a super-tax on personal expenditure" and the reduction of the income-tax and super-tax, so that the maximum rate of such taxes would be 45 per cent., whereas the budget proposals provide for the maximum rate of income-tax and super-tax of 84 per cent.! Thus, the expenditure tax, as proposed by the Finance Minister, is not a substitute for the higher brackets of super-tax on personal income. The imposition of the expenditure tax at rates ranging from 9.09 per cent. to 50 per cent. of gross expenditure can hardly be called a substitute for the reduction of the taxes on income by a mere 7 per cent. There can be absolutely no justification for the imposition of the expenditure tax on top of the income-tax and super-tax as proposed by the budget.

Administrative Difficulties

The administrative difficulties likely to be encountered in the working of the expenditure tax may now be discussed. Mr. Kaldor has explained that "an expenditure tax assessment would necessarily depend on *full* information

BENGAL COAL COMPANY, LIMITED

RED FLAGS AND RED-TAPE HANDICAP PRODUCTIVE EFFORTS

MR. D. F. MACMILLAN ON PROBLEMS OF COAL INDUSTRY

ADDRESSING the Annual General Meeting of the shareholders of the Bengal Coal Company, Limited, held at Calcutta on 20th June 1957, Mr. D. F. Macmillan, Chairman of the Company, observed as follows:

"GENTLEMEN,

"It is over a year and a half since members were addressed from this chair, when my predecessor reviewed the Company's affairs for the half-year ended April 1955. With the introduction of the new Companies Act, the accounts before you are for the year ended 31st October 1956 and my review today will cover that period. You will see that the accounts have been compiled in the form prescribed by the new Companies Act. It is for shareholders to judge whether the new form gives them a clearer picture than the form to which they have been accustomed in the past, and perhaps this will be revealed by any questions which may be put by shareholders on these accounts and my ability to explain.

"The year under review was a difficult one for the coal industry and your Company had also to bear its share of the troubles. These have been referred to in the Directors' report and I shall develop on them this morning. The trading results of the Company for the year consequently compare somewhat unfavourably with those for the previous year, and it is an indication of the inherent strength of your Company that your Board, after careful consideration, have been able to recommend final dividends which make the distribution for the year the same as that for the year ended October 1955. Since the end of the accounting period, the ordinary shares of the Company, which stood at Rs. 200 nominal, have been divided into twice that number of shares of Rs. 100 nominal. Consequently, while the interim dividend was declared on the two-hundred rupee shares, the final dividend will be paid on the one-hundred rupee shares and I hope it is clear to shareholders that the total distribution for the year on the ordinary shares is at the rate of 17½ per cent. As there appears to be a good deal of confusion of thought in otherwise well-informed quarters about dividends expressed as a percentage of nominal capital, it may be well for me to point out that shareholders have received a return of exactly 6 per cent. on the capital employed in this Company's business.

"Raisings during the year ended 31st October 1956 totalled 2.32 million tons which fell short of production in the previous year by 189,000 tons. I have no doubt, however, that we would have been able to outstrip the preceding year's figure had not the Company's collieries in West Bengal been affected by a strike which lasted for a period of about four weeks from the middle of September 1956.

Labour

"The All-India Industrial Tribunal (Colliery Disputes), which had been set up as long ago as 1954 and had been reconstituted a year later, after protracted deliberations and detailed examination of all the issues involved, finally published its Award on the 26th May 1956 and its terms became operative as from that date. Whilst the employers in the coal industry did not agree with all the conclusions arrived at in the Award, to promote general stability in the industry, they decided not to go on appeal and their decision was shared by a large section of the labour organisations operating in the coalfields. Some of the smaller trade unions, however, decided to appeal and, once they had done this, the other unions also thought it advisable to join in. Consequently, they also participated in the proceedings before the Appellate Tribunal.

"Whilst the appeals were being heard and the entire subject was being argued afresh, production in a vital section of the Raneegunge field was brought to a standstill by a strike which was totally unwarranted and unnecessary. In addition to your Company's collieries other large pits were affected, and it is estimated that, as a result, the loss in output amounted to 300,000 tons at a time when every ton was needed to meet the growing industrial requirements of the country. Some of the repercussions of this ill-conceived strike are still in evidence about eight months after its termination. During the strike, for instance, heavy rain caused the water level to rise rapidly in one of your collieries, and efforts to rush additional pumping machinery to the pit were largely frustrated by the heat and passions of the prevailing situation. As a result, the colliery workings were completely inundated. The process of rehabilitation which is now going on is a slow and laborious task, and it will still take some time before normal production levels can be attained again at that colliery.

"I wish to pay a well deserved tribute to the Company's staff who, from the most senior to the most junior, bore the strain of this strike, often under conditions of personal danger, with cheerfulness and absolute loyalty—may I say very simply that they served the Company and the country well under most trying conditions.

Red Flags and Red-tape

"It is unfortunate that at a time when the efforts of all should have been concentrated on increasing production, the emotions of labour were exploited in such a reckless manner. The Communist elements took full advantage of the situation and tried to utilise it for their avowed purpose of infiltrating into an area which, with its collieries, steel works, other industries and the growing industrial complex at Durgapur, is one of the most important industrial regions in the whole country. In view of this, it is particularly important that the responsible elements in the Trade Union movement should rise above their factional struggles for power, which have been such a marked feature in this area for many years, so that industrial stability can be achieved in this vital sector of the nation's economy.

"The first year of the current Plan did not witness any dramatic spurt in raisings from the country as a whole, and against 38.2 million tons produced in 1955, the total output in 1956 amounted to 39.4 million tons. This was not due to any lethargy on the part of the producers. The strike which seriously dislocated production in the Raneegunge field was a contributory factor, but an important reason was the fact that many valuable months were allowed to drift by before a clear indication of Government's policy was made known to individual producers who had been most urgently asked to submit their plans for increased raisings as early as January 1956. Only in the second half of the year was it known that Government did not contemplate according specific approval to individual plans, and that the producers could take all such plans as having general approval, except when specific approval was required under law as, for instance, in the case of opening of new mines. Your Company's productive efforts during 1956 thus got enmeshed in a tangle of red flags on one side and red-tape on the other.

New Uncertainty

"Just when the uncertainties had been resolved, a new element of doubt appears to have crept in regarding the field within which the private sector can work. Parliament has recently passed the Coal Bearing Areas (Acquisition and Development) Bill. In the Statement of Objects and Reasons attached to the Bill, it was explained that, since the use of the Land Acquisition Act, 1894, was no longer appropriate, this Bill was necessary for the acquisition of the rights of private lessees over unworked coal-bearing areas which were found surplus to the requirements of the private sector. The statement went on to explain, in this connection, that, out of the additional production of 22 million tons per year envisaged in the Plan, the public sector was required to produce 12 million tons, the balance being allocated to private industry for production from existing collieries and immediately contiguous areas.

"This Statement of Objects and Reasons does not, however, appear to have been reflected in the operative part of the Bill which empowers the Government, should it so desire, to take over any land falling within the scope of the Bill except land in which coal mining operations or any process ancillary thereto are actually being carried on. The protection offered to private producers would, therefore, seem to exclude coal-bearing lands contiguous to working collieries in which no work is being carried on at present, that is to say, land constituting a reserve area for subsequent development. This might considerably restrict the capacity of private collieries to expand into contiguous areas.

"It was after prolonged discussions throughout 1955 and the early months of 1956 that the private sector was given a definite place in the Plan, and it was clear that the success of the Plan would depend on full facilities being given to both the sectors so that each could attain its allotted target. It is unfortunate, therefore, that this new legislative measure should appear to restrict further the scope of collieries under private ownership which have such a responsible role to perform, and I hope an early opportunity will be taken to clarify the position.

"It is vital that the mutually complementary roles of the two sectors should be fully accepted not only at the top where policy is formulated, but by Government representatives at all levels. The success of a policy is ultimately measured by its application in ordinary day-to-day decisions which have to be taken in such mundane matters as allotment of wagons as between State and private collieries, or in the allocation of steel and cement which are both in short supply. We are assured from time to time that no discrimination is made in such matters against the private collieries, but this is not always apparent. I have always understood that one of the fundamental tenets of the administration of justice is that not only should justice be done, but that it should appear to be done. I would suggest, therefore, that full facts on matters of importance to the coal industry should be made known to all sections of it periodically, so that the corroding effects of doubts and hesitations may not be allowed to detract in any way from the combined efforts of all to attain a new momentum in production.

Life of Existing Workings

"Your Company has for over a century been engaged in a continuous process of development—development to increase production and development to replace the wasting asset. It has today, as it has had in the past, the technical management, the experienced administration, and the resources to continue this tradition and to accelerate the process. The plans for increased production which we submitted to Government in January 1956 included the opening up of four new collieries in our reserve coal-bearing areas to produce new production of some half a million tons per annum from 1960, as well as increased production of just under one million tons from more intensive development of areas already being worked. Government have refused permission to the Company to open up the proposed four new collieries, because the areas to be developed do not conform with Government's interpretation of contiguous areas. They are, however, agreeable that we should accelerate exhaustion of our existing working areas by increasing production from them by nearly one million tons a year and this we shall do. Bearing in mind that the entire private sector is limited to an additional production ceiling of 10 million tons a year by the end of the present Plan, this Company's plans to raise output by one million tons without breaking new ground bear testimony to our eagerness to participate at least as much as we are permitted in the industrial growth of the country. Shareholders of this Company need not be concerned at the prospect of early exhaustion of existing workings, as I am able to tell you that the Company's most recent developments alone—the new Girimint and Chinakuri collieries—are designed and equipped to raise between them 100,000 tons per month for at least the next fifty years.

Availability of Materials

"The past year has seen almost a continuous state of anxiety regarding availability of materials which are essential for coal production. On the basis of figures obtained from 125 of its members, the Indian Mining Association has calculated that in 1956, against 41,000 tons of cement applied for, only about 6 per cent. were actually received at the collieries. The situation has improved somewhat this year, but there is still a dangerous gap between requirements and supplies. The position regarding iron and steel is very similar and items like rails for tram lines are hardly available at all. In this connection, the setting up of the Progress Review Committee a few months ago has been a move in the right direction. This Committee can render valuable service by keeping under constant scrutiny these and other allied matters such as the problems connected with Government's licensing policy. In a basic industry like coal, there exists a strong case for relaxing the provisions governing imports, particularly in respect of essential items required for normal production. As regards additional items made necessary by new mining regulations, Government should consider postponing the implementation of such of these regulations as involve the use of foreign exchange.

Transport

"Among your Company's records there is a telegram sent to Calcutta by its representative at Raneegunge which reads: 'You say send coal I say send wagons—only seventeen arrived.' This telegram, gentlemen, was sent on the 18th of June 1857—almost exactly 100 years ago today! The fact that I have to refer now to the transport question bears a special testimony to the tenacity of a problem with which the coal industry has had to contend throughout its history in India.

"Speaking the other day in the Lok Sabha, when introducing the Railway Budget, the Railway Minister said that there was general recognition of the fact that transport capacity could not lag behind other developments envisaged in the Plan, and that the very success of the Plan would depend on the timely creation of the additional capacity required.

"When the current Plan was drawn up, it was estimated that, by 1960-61, goods traffic would increase by about 61 million tons to a total of 180.8 million tons. To cope with this, as well as with the anticipated growth in passenger services, it was thought that an outlay of Rs. 1,480 crores would be needed. Provision could, however, only be made for Rs. 1,125 crores which was sufficient for an additional 42 million tons of traffic only. Of these 42 million tons, 25 million tons would be absorbed by the movement of coal and other raw materials for the new steel plants, 6 million tons by coal for all other purposes and 4 million tons for cement, leaving only 7 million tons for the general industrial and agricultural production of the country.

"The first year of the current Plan has seen a significant increase in traffic and it is clear that the impact of the Plan has already made itself felt. The view is widely held that transport and communications should have been the prime objective of this Plan and that the allocation of finance to transport in the Plan is inadequate. Even given the full finance required, there is another limiting factor, namely, Time. In this view, there is a real danger that a steadily deteriorating transport situation will develop, which will assume serious proportions after 1958, when traffic arising from the new steel plants is expected to increase rapidly. Such a contingency will naturally react adversely on the Plan as a whole, and, in particular, on its coal segment which hinges so precariously on transport availability.

Railways Praised

"Within these overall limitations, however, the railways are making commendable efforts to tackle the problems confronting them. Amongst these, I would mention the remodelling of the Moghalsarai yard which, over the years, had assumed a special notoriety as an embodiment of frustrated hopes in coal transportation; the electrification of 800 route miles, including the Calcutta suburban area and the main line section from Burdwan to Gomoh; the possibility of further extending electrification from Gomoh to Moghalsarai and from Asansol to Rourkela; and the doubling of lines on many difficult sections including about 370 miles on the South Eastern Railway. The completion of these and other projects will materially assist in the movement of coal, but, in the meantime, many urgent transport problems remain with us.

"The proceedings before the Tribunals to which I have referred earlier were closely concerned with the cost of labour since it constitutes the largest single element of cost in the coal industry. This naturally raises the general question of the industry's total cost of production in relation to its selling prices which are statutorily fixed.

"For a considerable time now, this industry has been called upon to bear increased costs of production from within these fixed prices. As regards the labour element in cost, a price increase of Rs. 3 per ton was allowed in the case of the West Bengal and Bihar collieries following the Award of the All India Industrial Tribunal (Colliery Disputes) in May, 1956. The price increase did not, however, become effective until the first week in July, and for a period of about five weeks the full impact of the Award had to be shouldered by the industry without any adjustment in prices. Since then, the Appellate Tribunal has further increased the amounts payable to workers, and the issues are now pending before the Supreme Court. When these issues are finally resolved, the price structure will have to be examined a fresh to ascertain the extent to which it corresponds to the labour costs ultimately fixed.

"Apart from labour, however, pressures on production costs have been exercised in an increasing degree by various other factors such as enhanced prices of steel, cement, machinery and timber and the implementation of new rules governing the operation of mines. As a result, the longstanding problem of prices in relation to costs has now attained new proportions of gravity and urgency.

Industrial Costs

"Any mention of the need to increase coal prices gives rise in certain circles to a somewhat undefined apprehension that it will have violent effects on industrial economy by distorting the structure of industrial costs. Similar apprehensions do not seem to be voiced when prices of steel and cement go up, although they are of as basic importance as coal. Between 1950 and 1956, the price of pig iron has increased by over 100 per cent., of steel by over 90 per cent., and of cement by over 50 per cent., whilst the price of coal has gone up by only about 18 per cent. Indian coal is said to be the cheapest in the world and a revision of Government's price policy is urgently called for, so that the coal industry can receive a fair return on its enterprise and be able to revitalise its financial reserves. These reserves have to play a most important part in financing new developments not only to attain the target of 60 million tons under the Second Plan, but to pave the way for the more exacting demands of the Third Plan which some consider will call for substantially over 100 million tons. I am glad to see that this question is now under examination by the Coal Prices Revision Committee recently constituted to report on this particular problem. Its findings will be awaited with the utmost interest.

"I have already paid a well merited tribute to your staff during the period of the strike. This crisis came upon the Company at a time when your Chief Mining Engineer, Mr. Rosser, was on leave, and the top responsibility in the coalfields devolved upon Mr. Massmann, the Deputy Chief Mining Engineer, who worked tirelessly to overcome the special problems which the strike brought in its wake. Mr. Rosser is with us today and I would like to congratulate him and his staff on the speed with which production was brought back to normal after the problems immediately following the strike had been dealt with. Apart from the technical efficiency apparent in the working of the collieries themselves, I was impressed, on a recent visit, with the further advance in promotion of the measures for the education, training, housing, hygiene, health and general welfare of the workers to which the Company has always attached great importance. In Mr. Rosser and his senior staff, you have very able administrators and most capable technicians and our thanks are due to them for their sterling work on behalf of the Company."

NEW PUBLICATIONS

Germany's Comeback in the World Market. By Professor Ludwig Erhard. Published by George Allen & Unwin Ltd., Ruskin House, Museum Street, London.

THIS is the story of the West German economy in the post-war era in its relations with the outside world. The internal development of the economy—a story by itself—is not given except incidentally in relation to the book's theme; but, what is given in the book is sufficient to bring into focus the recuperative power of the German economy.

Germany emerged from the war facing, besides war ravage and inflation common to all nations, problems special to itself—division of its territory, first into four and then into two zones, and allied occupation. In the earlier stages, allied policy regarding West German economic development was not clear, and the acknowledgement that Germany could survive economically only as an industrial nation was tardy and grudging. Even when the fact was recognised, obstacles were placed by the occupying powers in the way of West Germany's attempts to regain its original exporting status. As regards this policy, Prof. Erhard does not fail to draw parallels with the post-First-World-War policy of the allies in order to drive home the point. By 1948, inflation had so progressed that cigarettes were more commonly used as money than currency.

Once currency reform was carried out and currency given its value, and the right to determine economic policy passed into German hands, German recovery was rapid and large. Production recovered rapidly, and with it, trade. Even the initial deficit in foreign trade, owing to West Germany's need to build up stocks of raw materials, was rapidly changed to surplus, creating towards the end of the period covered by this study a Deutschemark gap.

To what would one attribute this remarkable recovery of production and trade? Prof. Erhard attributes it to economic conditions prevailing during the period and to economic policies followed by the West German Government—predominantly to the latter. West Germany is a producer and supplier of capital goods, for which the demand has been the largest in the post-war era. Its main market is Europe, which, thanks to the Marshall Plan, could make its demand effective. The enterprising and hard-working Germans made full use of this opportunity.

Prof. Erhard argues that the West German Government's economic policy was so framed as to encourage enterprise and hard work. The basic Government policy was to reduce controls on production and trade to the minimum, setting the people to produce and trade as they liked. Economic control was exercised purely through the market mechanism and, a fact only passingly referred to by Prof. Erhard, a tight control on credit. The policy worked so effectively as to yield results beyond any originally conceived. Nothing succeeds like success, and Prof. Erhard does not hesitate to read lessons to others from the West German experience.

This thesis tends to break out at every point in the book—that *laissez faire* and freedom of trade are absolutely necessary for maximum production and trade. He emphasises these values with the eloquence of Adam Smith. To this extent, the book is a testament of faith—faith in values which can only slowly be regained. Prof. Erhard is prepared to bear all the consequences, however adverse, of such policy. Thus, he argues that a common market plan for Europe should not exclude particular commodities from its scope, nor should it be used as a pretext to raise duties against imports from outside. He also agrees that underdeveloped areas should be enabled to industrialise even though this may cut off the markets for the products of the advanced countries.

Prof. Erhard's enthusiasm springs from the success of the German economy, though conjuncture has played a greater part in this success than Prof. Erhard would allow for. Prof. Erhard's panacea is not universally applicable—it is not certain that the U.K. problem would yield to the Erhard solution. The U.K. is more reliant on export of consumer goods than West Germany, and its labour is more keen on getting value for its work. Throughout, Prof. Erhard avoids referring to the distributive efficacy of the system he advocates, and this today is a major consideration in determining economic policy.

Prof. Erhard's is a challenging book. He expounds a philosophy, and has results to show to its credit. The book is a comprehensive treatise on the post-war economic history of West Germany in its relations with the world. It should be equally useful to the scholar who wants basic data and to the administrator who wants policy criteria.

American Industries. By Dr. Stanley Vance. Published by Prentice-Hall Inc., Englewood Cliffs, N.J. Pages: 626.

This is an introductory book on American industries written perhaps for the undergraduates—as the problems and questions at the Chapter-ends indicate—by a Professor of Business Administration. The author believes, and rightly so, that it is necessary for a modern citizen to have some knowledge of the economic system in which he participates whether as a producer, labourer, trader or consumer. This book seeks to give its readers such knowledge. Twenty-five industries have been encompassed by the book. This is a sufficient coverage to include every important industry of the U.S. The book starts with the coal industry which occupies a naturally important place in a highly industrialised country like the U.S. The significant difference between the coal industry of the U.S. and that of India is that the coal resources in the former are spread over a number of States covering 14 per cent. of the country's area. They are also found in thousands of privately owned parcels of land—a fact that facilitates competition and incidentally explains, as it brings about, the fluctuations in the number of enterprises with the fluctuations in the general business conditions. The threat to the coal industry is not so much due to any internal factor like monopoly or increase in costs as due to extraneous causes such as decline in demand. This decline is supposed to originate in the fact of substitution of coal by other fuels, especially in the railways.

This threat, however, need not materialise. For, in the first place, even in this atomic era, if coal is replaced by other materials as a source of fuel, it will continue to be used, as British industrial scientists have opined, as a source of chemicals. That perhaps ensures for coal a place of even greater importance.

Even otherwise, the demand for coal is not likely to taper off as the American steel industry, like its counterpart in many other countries, is poised for expansion. Unlike the coal industry, the American steel industry is localised in comparatively narrower areas and is dominated by comparatively few producers—giving rise to the "Pittsburgh Plus." However, the old label "feast or famine industry" applied to steel seems today inept because in the first place the steel industry has tended to even out its profits and losses in the post-war years and, secondly, the net return in the steel industry was about half the profit rate in all manufacturing industries. In the post-war era, in particular, earnings in steel have been lower than those in some other industries such as automobile, chemicals, and tobacco.

The automobile industry has in fact come to occupy the most important place in the American economy and its production is a significant indicator of the level of economic activity. No wonder, therefore, that there is a tremendous effort to sustain and to increase the production of automobiles by stimulating, even artificially, the demand for automobiles. There is, for instance, the fact of expenditure of millions of dollars on research and it has been estimated that the adoption of a significantly changed model involves retooling cost up to $100 million. This is regarded as wasteful competition. But it is argued that without such periodic changes in models it is not possible to maintain and increase the demand for automobiles and, therefore, to sustain the automobile industry.

Prof. Vance then goes on to describe chemicals, petroleum, paper, cotton textiles, sugar and other industries in more or less uniform manner which makes the book give good information but not a reader's pleasure. One cannot blame the author for having discussed the subject in a rather summary fashion—he has to treat 25 industries in about 600 pages. He has, as he explains in the preface, tried to achieve a blending of microscopic and macroscopic methods of analysis. He has given at the end of each chapter a significant incident in the industry which either brings out the peculiarity of that industry or highlights a particular problem. It is a descriptive book, essentially meant for undergraduate students of Commerce—a good book for that matter, if one does not expect much of economic analysis.

Statistical Statements Relating to the Co-operative Movement in India, 1955-56. Published by Agricultural Credit Department, Reserve Bank of India. Pages : 124. Price : Rs. 3.

The publication under review provides a statistical assessment of the co-operative movement in its various aspects in the country. The statistical data are presented, as in the case of earlier publications, in three sets of tables, namely, the general statements giving detailed statistics relating to the operations of different types of co-operative societies, the abstract tables summarising salient data taken from the general statements, and the appendices giving comparative data for earlier years. An important feature of the publication is that it is enriched with the inclusion of a number of illustrations, graphs and diagrams to illustrate the data.

The publication reveals that during 1955-56, the co-operative movement has made considerable headway in various directions. At the end of 1955-56, the total number of all types of societies were as many as 240,395, as against 219,288 in the preceding year, representing an increase of 9.6 per cent. Of these, primary credit societies alone numbered 159,939—or 67.6 per cent.—as on 30th June 1956, as compared with 143,320 in the preceding year. The working capital of all types of societies went up steeply from Rs. 390.52 crores to Rs. 468.82 crores or 20.1 per cent., during the year under review. This was nearly twice the rate of increase witnessed in the previous year. Furthermore, the membership of primary societies increased from 16.02 million as on 30th June 1955 to 17.62 million a year later, or nearly 10 per cent. Assuming that an average family consists of five members, it may be estimated that 88.1 million or 22.8 per cent. of the population, as compared with 80.1 million or 21 per cent. of the population at the end of the preceding year—have been brought into the co-operative fold. Yet another striking feature is that the total advances of primaries rose by 27 per cent., that is, from Rs. 111.15 crores in 1954-55 to Rs. 140.78 crores in 1955-56. The percentage of overdues dropped from 17 to 15.1 per cent.

Similar phenomenal expansion was also witnessed in the activities of the State and Central co-operative banks. An important feature of this growth was the strengthening of the share capital structure of these institutions by Government contribution. Such contribution to the share capital of apex banks amounted to Rs. 188.04 lakhs as at the end of June 1956, as compared with Rs. 126.04 lakhs at the close of the previous year. The working capital of apex banks, numbering 24, rose from Rs. 47.63 crores to Rs. 63.34 crores, during the year under review. Loans from the Reserve Bank to the apex co-operatives also increased during the period, the outstandings in respect of such loans having risen from Rs. 8.44 crores to Rs. 14.07 crores. The total advances of these banks rose from Rs. 50.24 crores in 1954-55 to Rs. 67.86 crores in 1955-56.

The year witnessed a process of rationalisation in central banks and banking unions. The working capital of these banks which numbered 478 rose from Rs. 73.69 crores to Rs. 92.67 crores during the period under review. At the same time, the membership and working capital of agricultural credit societies alone went up from 6,565,416 to 7,790,850 and Rs. 62.93 crores to Rs. 79.10 crores, respectively, during the year 1955-56.

Significant expansion was recorded by non-credit and other societies. The publication, however, sounds a note of warning in regard to two important features. First, the increase in the funds and deposits of all types of institutions has not been commensurate with their borrowings other than deposits; secondly, the increase in the absolute figure of their overdues at the end of the year shows the need for making advances after due scrutiny of each case.

Law Relating to Estate Duty. By Messrs. M. M. Thakore and K. D. Jhala. Published by C. Jamnadas & Co., 132, Princess Street, Bombay 2. Pages : 584. Price : Rs. 15.

An important measure of taxation adopted by the Indian Parliament in recent years is the Estate Duty Act 1953. The Act, it is generally agreed, is one of the most complicated pieces of legislation. Appropriately enough, the authors of the book under review have attempted to deal with the law relating to Estate Duty in a way that is calculated to make the law intelligible to the layman and also useful to the professional lawyer. Each section of the Act is stated, its finer points elucidated and the relevant judgments cited. All the forms prescribed and the rules framed under the Act have been reproduced. Copious extracts from the United Kingdom Finance Acts and the Indian Acts with a bearing upon the Estate Duty Act, like the Married Women's Property Act and the Insurance Act, have been included in the book. An exhaustive index further enhances its value.

THE CENTRAL WAREHOUSING CORPORATION

(ESTABLISHED UNDER SECTION 17(1) OF THE AGRICULTURAL PRODUCE (DEVELOPMENT AND WAREHOUSING) CORPORATIONS ACT, 1956)

ANNOUNCEMENT

The Central Warehousing Corporation has decided to issue 100,000 shares of the value of Rs. 1,000 each as its first issue out of the total authorised capital of Rs. 20 crores. Ten percent of the face-value of the shares will be received with share applications and another ten percent on allotment. The share list will open on the 27th June, 1957 and will close on the 18th July 1957. The Central Government have guaranteed repayment of the principal (i.e., shares of the Corporation) and the payment of annual dividend at the rate of 3½ percent.

2. The shares of the Corporation can be subscribed by (i) the National Cooperative Development and Warehousing Board; (ii) the State Bank of India; (iii) Cooperative Societies; (iv) Scheduled banks; (v) Insurance Companies, investment trusts and other classes of financial institutions, and (vi) Recognised associations and joint stock companies dealing in agricultural produce.

3. Applications for share capital and other details may be obtained from the Vice-Chairman, Central Warehousing Corporation, C/o Ministry of Food and Agriculture (Department of Agriculture), New Delhi.

4. This supersedes the announcement that appeared in this paper on the 30th March, 1957.

DUNLOP RUBBER COMPANY'S RESULTS GRATIFYING

OVERSEAS ACTIVITIES HELP SUSTAIN PROFITS

LORD BAILLIEU'S SPEECH

THE Fifty-eighth Annual General Meeting of the Dunlop Rubber Company, Ltd., was held on 17th June in London.

The Rt. Hon. Lord Baillieu, K.B.E., C.M.G., Chairman, in the course of his speech said:

"The results for the full year 1956 reveal the gratifying recovery which occurred in the second half of the year. The difficulties in the first half-year were clearly indicated by the Directors in the statement which they issued on 4th October 1956 and the reasons for the considerable reduction in profit were stated at that time.

Fluctuations in Rubber Prices

"The principal reason was the steep rise immediately followed by a steep fall in the price of rubber, the latter occurring between September 1955 and June 1956. During this period, the price fell from 43d. per lb. to 24d. per lb. Also, throughout this time, industry, in general, was being exhorted to hold selling prices despite increasing costs. In the past, we have experienced the serious effect of the fluctuations in the price of rubber on our working capital position, but the combination of this with the other major difficulties all at the same time was unusual and unfortunate.

"I would like to emphasise that our general buying policy, not only for rubber but for other raw materials, is based on the minimum quantities required to operate our factories. In other words, there has been no element of speculation in our rubber buying; but, because of the drastic and unexpected cut back in the requirements of the British motor industry in the early part of last year, our normal inventory and forward cover position inevitably became extended.

"These excessive fluctuations in the price of natural rubber affect producers, the rubber manufacturers and the consuming public alike. However desirable it might be to try to formulate a scheme to prevent these fluctuations, there seems little prospect of doing so. On the other hand, the increasing need for synthetic rubber, to meet the world demand in total for rubber, considerably helps in stabilising and averaging the cost. With our increasing use of synthetic rubber, we are benefiting from this.

Why Net Profit Lower

"In our report, we have illustrated the extent to which our fortunes improved in the second half of the year, and you will see that the Group trading balance for July-December 1956 was higher than for either of the two half-years in 1955. The net profit, after all charges except taxation for this period in 1956 at 5 per cent., was slightly lower than in 1955. This arises from the fact that, in 1956, our depreciation provision was higher and we also had to meet the interest charge for a full year on the £12 million 4½ per cent. debenture-stock of the parent Company and the interest on a new issue of debentures in a subsidiary overseas. Thus, although there was a considerable improvement in the trading profit of the last six months of the year, we did not quite recover our 1955 net profit position.

"I have already referred to the effect of the recession in the British motor industry on our rubber inventory and forward cover, but, in addition, the loss of sales volume adversely influenced our production costs and profit margin. This position continued for much of the year and affected not only tyres but also wheels, Dunlopillo, and other accessories which we supply to the motor industry.

"For the reasons which I have already mentioned, our trading results in the United Kingdom were not satisfactory and the resultant profit was extremely low. In fact, had it not been for our widespread overseas activities resulting from the policy of your Board in building up this geographical diversification over the last 30 years, the picture I would have presented to you today would have been very different and far less satisfactory.

Expansion Overseas

"Our overseas trading has continued to expand and a great contribution to the Group results has been made both from our United Kingdom exports and from our manufacturing units overseas. Yet competition has not been any less severe in the overseas markets. In fact, it is becoming intensified as our competitors both in this country and abroad seek more and more export business and set up more and more local manufacturing subsidiaries.

"Despite this increasing competition, the value of turnover was again higher, although the effect of competition and higher costs resulted in slightly reduced margins. Economies were, however, effected and the return to the parent Company compared not unfavourably with the return in recent years. The contribution to the total Group profit from our overseas operations was the highest yet recorded for the Group.

Taxation Burden

"I must again refer to taxation, the charge for which in 1956 was considerably lower than in the previous year because of the lower level of profit. Nevertheless, it again represented 56 per cent. of the profit before tax. In my speech last year I referred to the increase in profits tax which had then recently been announced, and the figures quoted in our report this year very clearly indicate the unfair burden which this tax in general, and the increased rates in particular, have imposed. You will see that despite the fact that the ordinary shareholders will receive £444,000 less in the form of dividends, the gross amount of distributed profits tax payable by the Group is actually higher than in the previous year.

"This cannot be regarded as just under any circumstances, particularly as the burden of this tax falls eventually on the ordinary shareholders, whereas preference shareholders and recipients of interest bear none of it. The Chancellor of the Exchequer has many demands for taxation relief, but such unfair discrimination and considerable burden clearly call for the abolition of profits tax, or if this is not possible, then for a flat rate on all profits in order to avoid the present discrimination. The Chancellor's recent proposals for the extension of earned income relief and for raising the level at which surtax commences in certain cases are welcome, and this will in some small measure help to restore the incentive to executives whose efforts and desire to stay in this country are absolutely vital to the nation's economic welfare.

Need for Further Relief

"You will remember that, in a prevous year's review, I expressed the view that the point had been reached in taxation where the law of diminishing returns was applying; I hope this recent Budget is the forerunner of further relief and reductions which will remove that fault from our fiscal policy. The restoration of investment allowances is also necessary to industry, or, alternatively, a more forward-looking attitude towards wear and tear allowances. Some contribution towards the replacement cost of fixed assets is acknowledged in other industrial countries, and this country still requires encouragement for the modernisation and re-equipment of factories. With the increasing tempo of world competition and of technological developments, it is imperative that the industries of this country should be maintained in the most efficient and modern condition and that our factories should install the most-up-to-date equipment available.

"You will expect me to make reference to the change announced by the Chancellor as regards the introduction of overseas trade corporations. The legislation which was recently published requires most careful study before all its implications can be assessed, but, as it stands at present, it does not appear that any great advantage will accrue to our Group. In the past, we have established overseas control for most of our overseas companies, and, accordingly, the profits of these companies already are not subject to United Kingdom taxation, unless and until dividends are declared. Certain minor changes in our overseas management arrangements may be desirable to enable us to benefit from the new legislation.

"As a final point on our published accounts I suggest that the figures which show that over 70 per cent. of stockholders, that is, some 41,000, hold less than £250 worth of stock are particularly interesting and indicative of the place your Company holds as an investment medium today.

"The Company has continued to carry out a vigorous research policy during the last 12 months on new processes, products and raw materials.

Tribute to Employees

"It is customary for me to ask you if I might send to all Dunlop employees a message of thanks for their work throughout the year. This is no mere formality. They are to be congratulated upon their achievements towards the past year's results which placed an unusually heavy burden on all concerned. May I, on your behalf, thank them? Your message will encourage them for their efforts in the year to come.

"You will have appreciated that the year under review was a very difficult one for the Group—perhaps the most difficult one in the home market it has had for very many years. I am pleased to say, however, that the improvement already reported in the last half year of 1956, particularly in our overseas affairs, has been well maintained."

The report and accounts were adopted.

SWISSAIR

Backed by more than 35 years of flying experience and, encouraged by their success in this country, Swissair, the airline of Switzerland, extends its traditional Swiss courtesy and hospitality to an even wider range, with the inauguration of its Tokyo Service *via* Calcutta on 8th July next. Swissair started its first service from Switzerland to India and the Far East, terminating at Tokyo, on 24th April last, operating through Bombay. The second service from Switzerland to India and Japan will be inaugurated on 6th July. This service will, however, pass through Calcutta, instead of Bombay.

Operating with luxurious four-engined Douglas DC 6B airliners, the Bombay service leaves every Wednesday evening on its Eastbound run passing through Bangkok and Manila on its way to Tokyo. The Eastbound service through Calcutta will leave the airport there every Saturday evening, stopping at Bangkok and Hongkong before terminating at Tokyo on Sunday evening. On its Westbound flight, Swissair will leave Calcutta every Tuesday afternoon, arriving in Geneva and Zurich on Wednesday morning, while the Bombay service leaves every Saturday evening, arriving in Geneva and Zurich on Sunday morning.

DUNLOP RUBBER CO[illegible]E WITH —II

OVERSEAS ACTIVIT[illegible] MIDDLE EAST SUSTAIN PR[illegible]XPORTS

LORD BAILLIEU[illegible]

THE Fifty-eighth Annual General Meeting of the Dunlop Rubber Company, Ltd., was held on 17th June in London.

The Rt. Hon. Lord Baillieu, K.B.E., C.M.G., Chairman, in the course of his speech said:

"The results for the full year 1956 reveal that gratifying recovery which occurred in the second half of the year. The difficulties in the first half that year were clearly indicated by the Directors in the statement which they issued on 4th October 1956 and the reasons for the considerable reduction in profit were stated at that time, for which [illegible]cated, mention[illegible]

Fluctuations in Rubber Prices

"The principal reason was [illegible] fats, cashew [illegible] light electrical products. [illegible] immediately followed by a steep [illegible] of rubber, the latter occurring [illegible] ber 1955 and June 1956. Dur[illegible]hed above, the most price fell from 43d. per lb. [illegible]. German industrial throughout this time, ind[illegible]ak level in 1956. Its being exhorted to hold the third place in the increasing costs. In th[illegible] attained the level of enced the serious effec[illegible] resulting in a large trade price of rubber on o[illegible]M. 2,400 million, nearly twice but the combination[illegible]. Against this background, difficulties all at t[illegible]e, too, expanded stupendously. unfortunate[illegible]ny, however, that, whereas Ger[illegible]

"I would [illegible]from India declined from DM. 268.2 buying polic[illegible]55 to DM. 177.6 million for the first raw materia[illegible]ths of 1956, its exports to India went ties requir[illegible] DM. 598.8 million to DM. 747.7 million words, th[illegible]ame period. Consequently, the balance in our [illegible]e deficit for India widened from DM. 321.6 and u[illegible]n to DM. 570.1 million between 1955 and the [illegible]first eleven months of 1956. Thus, West las[illegible]rmany alone was responsible for the greater [illegible]art of India's total adverse trade balance in [illegible]he past year or two.

Rising Imports

This increasing deficit with Germany was due to the progressively rising imports of capital goods, machinery and other industrial raw materials for economic development. It will be interesting to note that India was the only country, besides Burma, which had an adverse balance of trade with Germany in 1955 and 1956, while other Indian Ocean countries had substantial surpluses.

An important feature of India's export trade with Germany is that a large proportion of it takes place through indirect channels, principally through the U.K. and the Netherlands. Only about 45 per cent. of Indian goods reach Germany direct. This is regarded as a matter for utmost concern; and it is emphasised that every effort should be made to cultivate direct contacts with German business men. Absence of such contacts is stated to be the principal reason for the slow progress of India's export trade with that country. Further, the establishment of a Chamber of Trade has also been suggested for studying the market conditions in Germany, to canvass business and procure trade. By this means, it is emphasised that much demand can be found for various Indian goods, including tea, coffee, mill-made textiles, jute manufactures, spices, tobacco, mineral ores, and handicrafts. The desire of German industrialists to stockpile raw materials is also stated to be very helpful for promoting Indian exports.

Trade with France

France is another country on the European sea-board which had a substantial surplus in its trade with India. Exports to India were valued at Frs. 12,825 million in the first nine months of 1956, as against Frs. 15,425 million in 1955. Imports from India for the corresponding periods were Frs. 6,959 million and Frs. 8,202 million, respectively. France's favourable balance of trade with India was thus Frs. 5,866 million for the first three quarters of 1956, as against Frs. 7,223 million for the whole of 1955. An important feature of Indian imports from France was that, in 1956, iron and steel alone constituted 50 per cent. of their total value. Synthetic and artificial yarn was another notable item. Other prominent items were machinery, chemicals and aircraft material.

[illegible]rench imports of manganese ore from [illegible]a, which has been the principal supplier of [illegible]s item for long, have been increasing fast [illegible]during the last few years. Despite the competition from the U.S.S.R. and South Africa, the demand for manganese ore is expected to be high in the current year, in view of the plans for expansion of steel production taken in hand. Prospects are also considered to be better for the imports of cashew-nuts, low grade tobacco, carpets, scarves, small ivory goods and other ornamental articles manufactured by artisans in India.

With Italy, too, India had substantial adverse balance of trade in 1956. Its imports from India rose only from 7,397 million lire in the first three quarters of 1955 to 11,902 million lire for the corresponding period of 1956. During the same period, however, its exports to India steeply rose from 13,700 million lire to 29,296 million lire. Consequently, Italy's favourable balance of trade with India increased from 6,303 million lire to 17,395 million lire between the two periods.

A significant feature of this trade is that though Italy's imports from India constituted only 4.7 per cent. of its total imports from Asian countries (as against 3.4 per cent. in the corresponding period of 1955), India was the principal market for Italian goods in Asia. One of the items of Indian exports to Italy which witnessed considerable expansion in 1956 was cashew kernels. This was due to unfavourable crops of almonds in Italy. With the scarcity of almonds continuing, and with the ban on the use of cashew kernels for certain purposes removed, prospects for marketing this item are stated to be bright. In this connection, the need for adequate publicity is underlined. Another notable item is raw hemp. Its demand in Italy is expected to rise in the future as a result of the reduction in the area under its cultivation. The Italian Association of Hemp Industrialists are reported to have urged the Government to abolish the customs duty on imported hemp in order to enable them to import hemp at cheaper prices. In the case of coir fibres, however, though the demand for them increased in Italy, the benefit of such increase went to Ceylon, because of its cheaper prices. As regards coir yarn India had a virtual monopoly of exports to Italy.

High Price of Coffee

Another item, the high price of which has led to lower imports from India into Italy, was coffee. It is hoped, however, that competition for markets among coffee-producing countries in the world will be less in the current year as a result of the expected fall in the production of coffee, especially in Brazil. Nevertheless, the need for adopting more competitive prices is stressed. Similarly, more effective and sustained publicity on the part of Indian tea exporters is suggested for raising the imports of tea into Italy. India is also a principal exporter of manganese ore to Italy. The favourable trend of the Italian iron and steel industry is expected to afford good prospects for increased Indian exports of iron and manganese ores. The scope for the imports of seed oils into Italy is also found to be encouraging.

Prospects of trade with certain North European countries also seem to be fairly good. For example, India's exports to Sweden of textiles, nuts, fruits, and spices showed a great spurt in 1956. Though the demand for textile fibres and minerals is found to indicate a slight setback, beverages are likely to maintain their position. India's exports to Denmark of ready-made clothes, tobacco and beverages also improved in 1956. Moreover, the demand for beverages, hides and skins, coir yarn and jute cloth and vegetable oils is stated to be encouraging in Finland.

The report from Iran states that Iran is a potential market for many of India's other than traditional manufactures, such as chemicals, machinery and vegetable oils. Iran's recent embarkation on an ambitious developmental programme is expected to increase its imports of machinery, cement, railway stores, iron and steel goods, all of which can be supplied from India. In this connection, there is said to be great need for establishing contacts with business houses in Iran and for publicity. Greater attention is also called for maintaining exports of tea to Iran. In addition, Indian electric goods, engineering stores and mechanical equipment, vegetable oils, motor accessories, etc., are stated to be in good demand in Iraq. Delivery terms and packing, besides competitive prices and quality, are considered to be the governing factors in determining these imports into Iraq.

In West Asia, generally, there is stated to be a growing market, in varying degrees, for equipment for development purposes, especially to improve and extend agriculture, building, transport and communications, irrigation, water storage and distribution, and industries designed to supply cheap consumer requirements. There is also increasing demand for consumer goods. The report from Aden, in particular, calls for greater promptness on the part of Indian exporters in executing orders and more attention to the complaints and suggestions received from that country.

ESSENTIAL OIL INDUSTRY IN INDIA

The essential oil industry in India was once at its peak and Indian perfumers were renowned for their skill in the art of extraction and blending of perfumes. The position has changed in recent years, the industry in India having received a setback. Indian aromatic oils are known for their sweet and delicate aroma. Sandalwood oil, lemongrass oil and palmarosa oil are among the important essential oils produced in the country. Nearly 100 tons of sandalwood oil are annually produced in Mysore, about 750 tons of lemongrass oil in Kerala State; and 85 tons of palmarosa oil in Khandesh, Hyderabad and Madhya Pradesh.

There are, however, many oils which have to be imported. India imports annually essential oils worth Rs. 75 lakhs, important among them being peppermint oil, bergamot oil, lavender oil, camphor oil and citrus oil. In addition, synthetic aromatics to the value of about Rs. 40 lakhs are imported every year.

Researches have been carried out in many laboratories for the development of essential oil industry in India. One such laboratory is the Drug Research Laboratory, Jammu, where systematic studies have been carried out for the introduction of indigenous and exotic plants in the selected areas of the Jammu and Kashmir State. Successful cultivation of Japanese mint, wormseed oil plant, camphor basil, lavender, sage, parsley and a number of other useful plants has been achieved there. The essential oil contents of exotic plants cultivated in its drug farms have developed to the same extent as in their country of origin. Details about this plant are given in the supplement to the May issue of the *Journal of Scientific and Industrial Research*. The different aspects of the aromatic plant resources of Kashmir State are also reviewed in it.

LEATHER INDUSTRY

At the E.C.A.F.E. meeting on small-scale industries, held recently at Madras, considerable attention was paid to the problems of marketing leather and leather products produced in Asia and the Far East. The consensus of opinion among the delegates was in favour of establishing some kind of standards for leather exports. It was emphasised at the meeting that the trade and the Governments should exercise vigilance in order to ensure that sound reputation for the products was established from the start.

The U.N. Session also considered the question of introducing better techniques at the places where first flaying and curing of the hide took place. In this connection, it was emphasised by certain delegates that technical groups visiting villages to demonstrate new techniques should camp at the village sites for a sufficient number of days in order to enable the villagers to acquire the new techniques. It was also pointed out that the villagers should be convinced of the superior technique demonstrated to them.

An important feature of the session was the "market clinic" at which a committee of leather experts gave prescriptions for specific problems which are being encountered in leather production by tanners and merchants. The committee of experts also examined some specimen leather products from various countries. Leather products from Burma, for instance, are found to be damaged by improper flaying and curing. Indian glazed kid is said to be of the highest quality; so also is East Asian tannage. The use of buffalo leather for soles of foot-wear, however, is regarded as a problem.

INDO-TIBETAN TRADE

The traditional trade taking place between India and Tibet through the six passes near Garhwal and Almora is stated to have remained unaffected after the China's occupation of Tibet. This reflects the smooth working of the agreement India entered into with China in April 1954 on trade and intercourse between Tibet and India. Among India's imports from Tibet, that of wool is reported to have fallen. Exports to Tibet, however, are found to have risen significantly. The value of total exports in 1956-57 is placed at Rs. 3.17 crores, as against Rs. 2.71 crores in 1955-56 which was the same as the level in 1954-55. Tibet is in need of, among other items, stationery, salt, kerosene oil, mustard oil, cement and hats.

My life *by Adipocere*

Pronounced 'adi-po-saire'

What a life I have had. To add to my troubles, I keep being attacked by little microscopic things which you call bacteria, but which I call a curse. Little do they know that I am immortal, as in spite of this terrific onslaught I continue to live, albeit in different forms.

When the bacteria attack me, my body releases hydrocarbons—light, medium and heavy. The corresponding physical states of these are gas, liquid petroleum and wax. The petroleum part of me is squeezed into any contiguous porous material, usually sand or limestone, where it remains until some crazy geologist from an oil company decides to look for me.

LIONEL EDWARDS (PRIVATE) LIMITED

TRAVANCORE RAYON REPORTS RECORD PROFIT

DIVIDEND LEVEL RAISED AGAIN

HIGHLY encouraging results are disclosed by Travancore Rayons Ltd. (Managing Agents: Messrs. Emcete and Sons (Travancore) Private Ltd., Rayonpuram, Kerala State) for the year ended 31st December 1956. Indeed, the results are so very satisfactory that they have helped set up a new record in earnings. The production of rayon yarn and cellulose film, in terms of weight, rose by 1,301,000 lbs. to a new peak of 7,070,000 lbs. To express it differently, the production of rayon during the year registered a rise of about 30 per cent. over 1955 and that of cellulose film about 8 per cent. While the sale proceeds at Rs. 193.60 lakhs are a little short of the previous year's record of Rs. 195.43 lakhs by Rs. 1.83 lakhs, they are not by any means discouraging, in view of the fact that the supply and demand position had, according to the Directors, corrected itself by the end of the year by an improvement on the supply side. Expenses have also gone up by Rs. 23.73 lakhs to a new high of Rs. 159.42 lakhs. The gross profit has made a strident advance of Rs. 15.43 lakhs to Rs. 70.36 lakhs. The net profit at Rs. 32.50 lakhs is a fresh record and represents an increase of Rs. 7.10 lakhs over that for 1955.

In conformity with the encouraging progress, as aforesaid, in the working of the Company, the Directors have stepped up the dividend on the ordinary shares for the third year in succession to 10 per cent. from the maiden distribution of 5 per cent. for 1953. It is noteworthy that the increase in the dividend for the year under review has been made only after setting aside as much as Rs. 20 lakhs to general reserve. This represents the maiden credit to this fund. No amount has been credited to deferred taxation reserve account which had received Rs. 14 lakhs a year ago and Rs. 12.75 lakhs two years ago.

The following comparative table will give some idea of the salient features of the Company's results for the past four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1956	1955	1954	1953
Sale proceeds	1,93.60	1,95.43	1,61.65	1,52.97
Closing stocks	61.22	25.76	31.00	40.71
Expenses	1,59.42	1,35.69	1,04.02	96.93
Gross profit	70.36	54.93	47.98	40.68
Managing Agents' remuneration	3.57	2.45	2.07	1.81

Ordinary	10.00	7.50	6.24	5.00
	(10%)	(7½%)	(6¼%)	(5%)
Carry forward	2.64	2.64	1.23	0.41

* For the five years 1949 to 1953.

During the first half of the year of review, both the cellulose film machines were in operation. Slackness in demand for the film was, however, felt in the second half, due to a glut in the market created by the Company's increased production. The market was saturated further by imports. Hence, the Company was constrained to shut down one of its cellulose film plants from July onwards. The end of the year, however, brought about an improvement in the position. The full complement of the rayon yarn spinning machines were in operation almost up to the end of the year. But, during December, accumulation of stocks necessitated production being slowed down again. The Directors report that the market is now improving. One chief contributory factor for the very satisfactory results for the year under review was the fair measure of stability in the prices of raw material. The Company's dependence on imports for rayon-grade caustic soda was reduced, thanks to a neighbouring factory which was in a position to supply a part of its requirements. The Government of India is paying serious attention to the problem of producing pulp in the country. The Directors of the Company say that "a rayon grade chemical pulp plant is likely to come into being in South India."

On the expansion side, the Directors expect to put into operation six more new Butterworth rayon spinning machines by the end of the current year, which will raise the total installed capacity for rayon to 8.6 tons a day. Attention is being paid to further expansion on the rayon side. On the cellulose film side, an event of importance is the Company's success in producing moisture-proof heatsealing anchored film of standard quality. Looking to the present trend, the Directors hope that further expansion in the line also may not be far off. The Chairman of the Company says that this moisture-proof film has become popular with tobacco manufacturers who use it to wrap their cigarette packets and tins. Since all the above schemes of expansion have had to be financed out of the Company's current resources and accumulations of some of its finished stocks, it met with a certain amount of strain in regard to working capital.

The Company's balance-sheet as at 31st December 1956 reflects the position of a concern, belonging to a nascent industry, still in a period of vigorous growth. Thus, its reserves are small and its liabilities are high, most of which are secured loans. Against a paid-up capital of Rs. 150 lakhs (in 500,000 five per cent. cumulative preference shares of Rs. 10 each and 1,000,000 ordinary shares of Rs. 10 each) the reserves and surplus aggregate only Rs. 52.79 lakhs. Of this, the share of the general reserve is only Rs. 20 lakhs, while Rs. 30 lakhs are on account of deferred taxation reserve. The current liabilities aggregate Rs. 126.32 lakhs, of which loans (secured and unsecured) from the State Government and banks account for Rs. 81.46 lakhs. Besides this, there is a debenture liability. The gross block of Rs. 385.56 lakhs includes additions during the year of Rs. 3.83 lakhs. This stands written down to Rs. 223.13 lakhs. The current assets aggregate Rs. 127.47 lakhs and are just sufficient to cover the current liabilities.

The Rs. 10 fully paid-up ordinary shares of the Company are being currently quoted at Rs. 12.70 *cum-div.* On an *ex-div.* basis, the yield on the shares works out to 8.5 per cent. per annum.

NATIONAL RAYON CORPORATION LTD.

The shareholders of the National Rayon Corporation Ltd. have reason to feel gratified at the speech of Mr. Kasturbhai Lalbhai, the Chairman, at the tenth annual meeting of the Company held in the city a few days ago. For, in the course of his encouraging speech, the Chairman revealed that the Company had embarked on a scheme for manufacturing machinery and a wide range of raw materials required for the factory. The Company, we are told, has obtained a licence from the Government for the manufacture of machinery for rayon, sulphuric acid, carbon-disulphide and caustic soda, as well as water filtration and softening plants and auxiliary equipment. It has already made a beginning with the sulphuric acid plant and is in a position to offer a complete contact process unit on a turn-key-job basis. Mr. Kasturbhai also referred to the proposed installation of the rayon tyre cord plant with an annual capacity of 4 million lbs. One of the Directors of the Company, we are told, is already in the U.S., exploring the possibilities of obtaining credit within the framework of the Government's new policy of deferred payments and acquiring know-how; his negotiations both in the U.S. and on the Continent indicate that it is difficult to obtain credit for a period of seven years. Mr. Kasturbhai alluded, too, to the special designing and engineering department in the factory. The department, according to him, has been responsible for the entire designing and engineering of the new expansions, so much so that the Company has been able to get quite a few items locally fabricated, thereby effecting "considerable" saving on the total equipment, using the Company's own materials, training its own engineers in the process, and, lastly, conserving some valuable foreign exchange.

The N.R.C. Chairman touched briefly on the rayon yarn supply position. He put the total supply of rayon yarn available during the financial year ended March 1957 at 93 million lbs.—30 million lbs. indigenous and 63 million lbs. imported—which "is considerably in excess of the normal requirements of the weaving industry in the country, now estimated at around 45.50 million lbs." He also revealed that the landed cost of 150 deniers on the basis of the present quotations of foreign manufacturers comes to Rs. 3-11 per lb., as against Rs. 3-6 for the yarn produced by National Rayons. Indeed, Mr. Kasturbhai claimed that the Indian units have been concentrating on the production of the most popular deniers of 150 and 120, and were in a position to meet the entire demand in these deniers which accounted for over 50 per cent. of the total requirements of the weaving industry.

On the basis of the aforesaid figures, the total stocks currently lying unsold with the mills and the traders may be estimated at 30—40 million lbs. In view of the comfortable supply position thus, it is not surprising that the rayon yarn market has not been affected by the persistent rumours of a cut in the import quota for the ensuing half-year.

(*Concluded from next column*)

start writing direct business in these territories within a short time. If this hope materialises, the Company's foreign portfolio is bound to be an increasingly important source of premium income.

RESULTS OF BOMBAY FIRE AND GENERAL

OVERSEAS PORTFOLIO TO BE EXPANDED

A SIZABLE increase of Rs. 3.10 lakhs in net premium income is revealed by the Bombay Fire and General Insurance Company, Ltd. (General Manager: Mr. K. K. Dastur, Bombay), for the year ended 31st December 1956. The premium income advanced from Rs. 12.37 lakhs in 1955 to Rs. 15.47 lakhs in the year under review, all the three departments, namely, fire, marine and accident, having participated in the increase in premium income. The return to shareholders has been maintained at Rs. 3 per share on the Rs. 40 paid-up shares and As. 12 per share on the Rs. 10 paid-up shares.

The net premium income in the fire department increased from Rs. 8.38 lakhs in 1955 to Rs. 9.52 lakhs in the following year, while that in the marine and the accident department, which stood at Rs. 2.16 lakhs and Rs. 1.83 lakhs in 1955, improved to Rs. 3.43 lakhs and Rs. 2.52 lakhs, respectively, in the year under review. The following table gives the progress of the Company during the three years ended 31st December 1956:

(In rupees)

	For the year ended		
	1956	1955	1954

Commission and expenses ..	1,30,648	93,763	95,672
Accident fund	1,27,475	92,814	93,824

Claims ratio in the fire department moved up from 20.09 per cent. in 1955 to 29.12 per cent. in 1956. But it is gratifying to note that the expenses ratio was somewhat lower at 54.40 per cent. The fire fund has been maintained at 50 per cent. level. The underwriting profit in the department was Rs. 1.10 lakhs, as against Rs. 2.07 lakhs in 1955. Some cautious underwriting has obviously taken place in the marine department which shows a welcome reduction in both claims and expenses ratio which at 51.46 per cent. and 37.60 per cent. in 1956 are lower than in the previous year when they were 57.90 per cent. and 52.46 per cent. respectively. In order to maintain the marine fund at 100 per cent. level, the Directors have had to transfer Rs. 1.05 lakhs from the profit and loss account, whereas the department yielded an underwriting profit of Rs. 15,815 in 1955. Experience in the matter of claims and expenses, as in the case of several insurers in this country, has been unfavourable in the accident department. Thus, claims ratio was higher at 45.40 per cent. as against 39.41 per cent. and expenses ratio was similarly higher at 51.85 per cent. as compared with 51.34 per cent. In order to maintain the accident fund at 50 per cent. level, the Directors have transferred Rs. 25,653 from the profit and loss account; in 1955, the department showed a small profit of Rs. 9,875.

After closing the departmental accounts, the profit and loss account showed a credit balance of Rs. 14,186 which, together with Rs. 3.39 lakhs brought forward from the previous year's account, make in all Rs. 3.53 lakhs. The provision for taxation absorbs Rs. 83,924 and payment of 7½ per cent. dividend Rs. 31,467, leaving a balance of Rs. 2.38 lakhs to be carried forward. The financial position of the Company is strong. Besides a capital of Rs. 4.20 lakhs, it has reserves and surplus aggregating Rs. 17.49 lakhs, including fire fund of Rs. 4.92 lakhs, accident fund of Rs. 1.27 lakhs and marine fund of Rs. 3.43 lakhs.

The Company derives a substantial part of its premium income from its overseas portfolio. Thus, in 1956, out of its total premium income of Rs. 15.47 lakhs, the foreign business accounted for Rs. 6.35 lakhs, the respective figures for the previous year being Rs. 12.37 lakhs and Rs. 4.0 lakhs, respectively. It would now appear that the management has decided to extend further the Company's operations in overseas countries. In this connection, the Chairman of the Company, Mr. Maoobhai Doongursee, revealed, at the recent annual meeting of the Company, that registration formalities have already been completed for entering Indonesia, Ceylon, East Africa and Holland, for insurance business. The management, he stated, is engaged in appointing suitable representatives in foregn countries. He also expressed the hope that the Company would

(*Continued in previous column*)

SHREE NIWAS MILLS' EARNINGS LOWER

DIVIDEND, HOWEVER, MAINTAINED

A SPECIAL feature noticeable in the annual reports of all textile mills for the year 1956 is the general complaint about the imposition of additional excise duty on cloth, with effect from September of that year and the resultant decline in earnings. This is not surprising for, in these days of shortage of capital and the necessity for modernisation and expansion of capacity, which company would like to have a large part of its liquid resources locked up in unsold stocks of finished goods? That has been the experience, unfortunately, of the several units, the working of which has already been reviewed in these columns. One more example of this nature is provided by the working of the Shree Niwas Cotton Mills Ltd. (Managing Agents: The Marwar Textiles Agency Private Ltd., Bombay) during the year ended 31st December 1956.

The gross profit of the Company for the year at Rs. 31.96 lakhs shows a decline of Rs. 2.26 lakhs from Rs. 34.22 lakhs for the previous year, the highest earned during the past four years.

The net profit at Rs. 15.22 lakhs is, however, substantially higher than the Rs. 9.73 lakhs recorded in the preceding year. This is due to the fall in the managing agents' remuneration from Rs. 4.25 lakhs to Rs. 2.73 lakhs as well as in the provision for taxation from Rs. 14 lakhs to Rs. 6 lakhs. The provision for depreciation, however, stands raised from Rs. 6.24 lakhs to Rs. 8.01 lakhs. The dividend on ordinary shares has been maintained at the previous year's rate of 12 per cent. to which level it had been cut from 14 per cent. for 1954. It must, however, be noted that the dividend of 12 per cent. proposed for the year of review and paid in the past year is on the increased capital of Rs. 80 lakhs raised during the latter year by the capitalisation of Rs. 20 lakhs from the reserve fund, so that it represents a distribution of 16 per cent. on the old capital. No allocation to the reserves has been made this year also. Instead, the Directors have been content with transferring a sum of Rs. 10 lakhs from the contingency reserve and Rs. 7 lakhs from renewal and replacement reserve to general reserve. It is not clear why the Directors have thought it necessary to carry forward a large sum of Rs. 6.91 lakhs as surplus, as against only Rs. 1.47 lakhs a year ago. One possible explanation for this is that the Company has not assessed, nor has it made any provision for, its liability on account of service gratuity to mill operatives which the Industrial Court gave in its award of November 1956, with retrospective effect from 22nd January 1954.

The following comparative table gives an idea of the Company's progress during the last four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1956	1955	1954	1953

* Only approximate.
† Comparative figures not available.

As mentioned at the outset, the working of the Company during the year under review was adversely affected by the heavy increase in excise duty. There was a sharp decline in the sale proceeds of cloth, yarn and waste, accompanied by a marked accumulation of unsold stocks of cloth. This will be clear from the table above which reveals that sale proceeds for the year declined by Rs. 26.68 lakhs, while the value of stocks mounted up by no less than Rs. 39.57 lakhs. The position was aggravated further by the steep rise in expenses from Rs. 338.82 lakhs to Rs. 377.75 lakhs. The main items which contributed to this increase are the cost of raw materials consumed which rose from Rs. 171.71 lakhs to Rs. 193.52 lakhs and the wage bill from Rs. 117.70 lakhs to Rs. 126.87 lakhs.

The Directors state that the working of the Shree Madhusudan Mills, a subsidiary of the Company, was also adversely affected for the self-same reasons. During the year under report, the Directors took charge of a small textile unit at Kotah, known as Shree Gopal Industries Ltd., which is now a subsidiary of this Company. This unit is a very old and uneconomic one, consisting of 7,596 spindles and 160 looms. Efforts are being made to renovate and modernise the unit and also expand its spinning capacity so as to make it economic. The Directors hope that this unit will prove a beneficial addition to the Company in due course.

The Company's paid-up capital of Rs. 84.80 lakhs, of which ordinary shares of Rs. 100 each account for Rs. 80 lakhs and 4 per cent. tax-free redeemable cumulative preference shares of Rs. 100 each for Rs. 4.80 lakhs, is strengthened by reserves and surplus aggregating Rs. 55.11 lakhs. Of these reserves, the amount standing to the credit of reserve fund is Rs. 38.70 lakhs. Secured loans from banks amount to Rs. 95.32 lakhs. The provision for taxation, after making advance payments for 1957-58, stands at Rs. 4.57 lakhs. Other current liabilities aggregate Rs. 51.11 lakhs. The gross block of Rs. 112.06 lakhs, including additions during the year of Rs. 23.16 lakhs, has been depreciated to a book value of Rs. 50.58 lakhs. Investments in Government securities, shares and debentures of joint-stock companies and other subsidiary companies amount to Rs. 20.35 lakhs. The other current assets aggregate Rs. 219.99 lakhs. The latter cover the current liabilities and the provision for taxation by a margin of Rs. 68.99 lakhs.

The Rs. 100 fully paid-up ordinary shares of the Company are currently quoted at Rs. 173.50 *cum-div.* On an *ex-div.* basis and assuming that the dividend would be repeated unchanged next year, the shares give a yield of 7.43 per cent. per annum, free of income-tax.

COMPANY MEETINGS AND DIVIDENDS

CHEVIOT JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 8th July 1957. Dividend: Rs. 2.00 per share. Transfer books remain closed from 25th June to 8th July 1957, both days inclusive.

ORIENT JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 8th July 1957. Dividend: Rs. 2.00 per share. Transfer books remain closed from 25th June to 8th July 1957, both days inclusive.

DELTA JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 8th July 1957. Dividend: Rs. 5.00 per share. Transfer books remain closed from 25th June to 8th July 1957, both days inclusive.

BELVEDERE JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 8th July 1957. Dividend: *Nil*. Transfer books remain closed from 25th June to 8th July 1957, both days inclusive.

BENGAL JUTE MILLS CO., LTD. Annual General Meeting, Calcutta, 8th July 1957. Transfer books will remain closed from 1st to 8th July 1957, both days inclusive.

RAJNAGAR TEA CO., LTD. Annual General Meeting, Calcutta, 10th July 1957. Dividend: Re. 1.00 per share. Transfer books will remain closed from 3rd to 10th July 1957, both days inclusive.

SASSOON AND ALLIANCE SILK MILLS CO., LTD. Annual General Meeting, Bombay, 19th July 1957. Transfer books will remain closed from 10th to 22nd July 1957, both days inclusive.

CALCUTTA STEAM NAVIGATION CO., LTD. Annual General Meeting, Calcutta, 23rd July 1957. Dividend: Re. 0.65 per share (6½ per cent.). Transfer books will remain closed from 10th to 23rd July 1957, both days inclusive.

ALEMBIC CHEMICAL WORKS CO., LTD. Annual General Meeting, Baroda, 25th July 1957. Dividend: Rs. 10.00 per share, payable on or after 1st August 1957. Transfer books will remain closed from 5th to 25th July 1957, both days inclusive.

SHREE SHUBHLAXMI MILLS LTD. Annual General Meeting, Cambay, 29th July 1957. Transfer books will remain closed from 20th to 29th July 1957, both days inclusive.

TRAVANCORE CHEMICAL AND MANUFACTURING CO., LTD. Dividend of Re. 1.00 per ordinary share, for the year ended 31st March 1957. Transfer books will remain closed from 4th to 10th July 1957, both days inclusive.

KALASA TEA AND PRODUCE CO., LTD. Dividend of 15 per cent. for the year ended 31st March 1957.

KADRI MILLS (CBE) LTD. Dividend of Rs. 15.00 (15 per cent.) per share, free of tax, for the year ended 31st December 1956. Transfer books remain closed from 28th June to 12th July 1957, both days inclusive.

INDIA UNITED MILLS LTD. Final dividend of Re. 0.12 per deferred share and Re. 0.30 per ordinary share, for the year ended 31st December 1956.

SIMPLEX MILLS CO., LTD. Dividend of Rs. 8.50 per share, for the year ended 31st March 1957, payable on or after 24th July 1957. Transfer books remain closed from 24th June to 8th July 1957, both days inclusive.

LARSEN AND TOUBRO LTD. Dividend of Re. 1.00 per ordinary share, for the year ended 31st March 1957, payable on 2nd August 1957. Transfer books remain closed from 21st June to 15th July 1957, both days inclusive.

TEXTILE MACHINERY CORPORATION LTD. Dividend of Re. 1.25 per ordinary share, for the year ended 31st December 1956. Transfer books will remain closed from 1st to 16th July 1957, both days inclusive.

Points From The Chair

Experience Ignored

"YOUR Company has for over a century been engaged in a continuous process of development—development to increase production and development to replace the wasting asset. It has today, as it has had in the past, the technical management, the experienced administration, and the resources to continue this tradition and to accelerate the process. The plans for increased production which we submitted to Government in January 1956, included the opening up of four new collieries in our reserve coal-bearing areas to produce new production of some half a million tons per annum from 1960, as well as increased production of just under one million tons from more intensive development of areas already being worked. Government have refused permission to the Company to open up the proposed four new collieries because, the areas to be developed do not conform with Government's interpretation of contiguous areas. They are, however, agreeable that we should accelerate exhaustion of our existing working areas by increasing production from them by nearly one million tons a year and this we shall do. Bearing in mind that the entire private sector is limited to an additional production ceiling of 10 million tons a year by the end of the present Plan, this Company's plans to raise output by one million tons without breaking new ground, bear testimony to our eagerness to participate, at least as much as we are permitted, in the industrial growth of the country. Shareholders of this Company need not be concerned at the prospect of early exhaustion of existing workings, as I am able to tell you that the Company's most recent developments alone—the new Girimint and Chinakuri collieries—are designed and equipped to raise between them 100,000 tons per month for at least the next 50 years."

D. F. MACMILLAN,
Bengal Coal Co., Ltd.

Oils for Atom

"As from 1st January 1956, this principal subsidiary Company became responsible for the marketing of the Group's industrial, marine and electrical oils in the United Kingdom, and I am pleased to report that the integration of these trading activities has been an unqualified success in the beneficial interests of the Group. Stockholders will be interested to learn that Wakefield-Dick Industrial Oils Limited will supply the lubricants for the turbine being installed at the Chapel Cross Atomic Power Station which is due to commence operations early next year, and has also been accepted as the sole supplier of the lubricating oil requirements of the Berkeley Nuclear Power Station in Gloucestershire. In addition, this subsidiary retains its position as the foremost supplier of transformer and switch-gear oil to the electrical industry in the United Kingdom and its Ilo transformer oil is already in service at Calder Hall. In the marine field the recent development of the Group's international servicing facilities is proving a material benefit."

L. W. FARROW,
C. C. Wakefield & Co., Ltd., London.

African Tea

"The year under review has been a profitable one for tea, more particularly those in the front rank of producers, such as ourselves, but the same does not apply to many estates with poor mid or low country gardens, and the effect on others is far from happy where the high cost of production, coupled with an extremely heavy export duty, allows but a slender margin and such teas are doing little more than cover the cost of production. The sudden closure of the Suez Canal has not proved the difficulty then anticipated and Ceylon has been fortunate in being able to dispose of its crop during 1956, but there are many factors that can well give rise to anxiety as to the future. One of these is the fact that tea production in Africa is now becoming a very serious menace to Ceylon, and in season 1956 crops from Africa amounted to some 71 million lbs., with the certainty that production of tea there is likely to increase very rapidly in the next few years, with a fairly large quantity of land being planted up year by year."

G. H. MASEFIELD,
Ceylon Tea Plantations Co., Ltd., London.

Role of Newspapers

"We believe that it is our first duty to make each of our papers prosperous, for if any paper is not able to pay its way, although it may be subsidised for a time, it will ultimately die. No newspaper can assume that society owes it an existence—especially if it is unprofitable. We are conscious that there is apparently no common denominator for success in our kind of publishing; papers can prosper or fail irrespective of their circulation, their selling price, their seriousness or their frivolity. Newspapers are a reflection of the public they serve and they must, without any lowering of standards, change as public interest and public taste change. The *Daily Mail* of Lord Northcliffe, brilliant as it was, would not be accepted by the *Daily Mail's* public of today and I am sure, too, that the *Daily Mail's* readers in 20 years' time would not for one moment accept this morning's paper which will be eagerly read by more than five million people. For ourselves, therefore, we will endeavour to sense the public taste and interest and to rely in the future as we have in the past on the greatest possible degree of journalistic enterprise and good management."

LORD ROTHERMERE,
Associated Newspapers, Ltd., London.

BARAREE COKE PRUNES DIVIDEND

RESULTS OF ANDREW YULE GROUP JUTE COMPANIES

Bararee Coke Co., Ltd.

THE directors of the above Company (Managing Agents: Messrs. Jardine Henderson Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th September 1956.

The profit and loss account shows, after charging depreciation of Rs. 18,000 (Rs. 39,864), a balance of profit of Rs. 1,50,738 (Rs. 2,22,869) to which has to be added the balance brought forward from the previous half-year, viz., Rs. 45,399 (Rs. 12,449), transfer from provision for doubtful debts Rs. 20,136 (Rs. 6,746) and adjustment in respect of material in process as at 31st March 1956 Rs. 14,963 (*nil*) making a total of Rs. 2,31,236 (Rs. 2,43,454 including Rs. 1,390 being dividends forfeited). Out of this sum there has been written off for claims considered irrecoverable Rs. 866 (Rs. 6,746) and provision for taxation Rs. 80,000 (Rs. 1,05,000) leaving a balance available for disposal of Rs. 1,50,370 (Rs. 1,31,708) out of which the directors recommend there should be paid a dividend on the share capital of 5 (7) per cent. without any deduction for income-tax payable by the Company, absorbing Rs. 60,000 (Rs. 84,000) leaving a balance of Rs. 90,370 (Rs. 22,708 after placing Rs. 25,000 to general reserve) to be carried forward to the next account.

For the purpose of these accounts provision has been made for remuneration payable to the managing agents calculated on the basis which is intended to be applicable under a new managing agency agreement. The revised remuneration is in conformity with the provisions of Sections 198 and 348 of the Companies Act, 1956, and has been sanctioned by the Central Government. The proposed agreement will be submitted to the Company for approval at a general meeting to be held in July 1957, and of which due notice will be given.

Manufacture and despatches during the half-year were as follows:—

	Manufactured Tons	*Despatched* Tons
Coke	29,481 (28,071)	30,058 (28,584)
Tar and pitch	1,365 (1,242)	1,338 (1,169)
Sulphate of ammonia	164 (238)	325 (152)
	Gallons	Gallons
Benzol	3,045 (4,271)	6,995 (6,132)

Reference was made in the last previous report of the directors to the failure up to the date of that report to reach an agreement with the Company's workers regarding an increase in wages which became necessary consequent on the Award of the All-India Industrial Tribunal (Colliery Disputes). Despite the further efforts which were made to reach an amicable settlement, it was eventually found necessary to make a joint application to have the matter referred to an Industrial Tribunal, the relevant notification for which has now been issued by the Government of Bihar.

Efforts to increase Hard Coke production, based on plans referred to in the last previous report, have not so far been successful, and it is now evident that increased output will only be obtained on the completion of very extensive repairs to the Company's coke ovens. These ovens are now very old and their maintenance in working condition imposes a heavy strain on the personnel at the Works. Unfortunately, the necessary repairs cannot be immediately effected as their timing is dependent upon both the availability of fire bricks from indigenous sources and the import of a substantial quantity of silica bricks from abroad. The estimated cost of these extensive repairs will absorb a large part of the Company's cash resources, and it is evident from the estimated results for the subsequent half-year ended 31st March 1957, that a substantial fall in manufacturing profits is unavoidable. In the circumstances, the directors have felt obliged once again to recommend a reduced dividend. The Company's ability to maintain the dividend at the reduced rate proposed will largely depend upon the extent to which production is interfered with by the coke oven repair programme and on the cost thereof when it is finally ascertained.

Accounts in brief are as under:—

Rs.	30,61,205	Rs.	30,61,205

Caledonian Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th November 1956.

The accounts, after charging all expenses, providing for sales-tax and writing back provisions for anticipated loss on jute made during the previous half-year and excess provision for taxation, show a profit of Rs. 54,252 (Rs. 11,796). The balance brought forward from the last half-year was Rs. 1,328 (Rs. 74,452) making a total available for distribution of Rs. 55,580 (Rs. 86,428). The directors recommend payment of a dividend on preference shares at Rs. 3.50 (Rs. 3.50) per share absorbing Rs. 35,000 (Rs. 35,000), leaving a balance to be carried forward of Rs. 20,580 (Rs. 6,248 after paying dividend on ordinary shares at Rs. 2.50 per share absorbing Rs. 45,000).

In accordance with the working time agreement of the Indian Jute Mills Association the mill worked 48 hours per week with 5 per cent. of the total looms sealed until 15th July 1956. But in view of the highly unsatisfactory stock position an additional 2½ per cent. of the total looms were sealed with effect from 16th July 1956 and a further 5 per cent. from the 17th September 1956. Trading during the period continued to be very difficult owing to the disparity between the prices of raw jute and those of manufactured goods.

Hitherto half-yearly accounts have been issued by this Company to its Shareholders, but in the opinion of the Board of Directors this is no longer practicable in view of the provisions of the Companies Act, 1956, regarding annual general meetings and the accounts to be presented at such meetings. Accordingly yearly accounts will be issued in future, commencing with those for the year ending 30th November 1957. This will not preclude the payment of half-yearly dividends, subject to the Company's results permitting, as the Company's Articles authorise the payment of interim dividends. It is therefore the Board's intention to consider the payment of interim dividends in the light of the Company's results upto 31st May each year.

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	28,00,000	Block ...	42,39,940
Reserves ...	26,46,234	Stock ...	20,76,123
Liabilities ...	23,52,978	Stores & loose tools ...	7,58,301
Profit and loss account ...	20,580	Work-in-progress ...	2,03,042
		Debts, deposits and advances ...	4,94,766
		Investments	46,888
		Cash ...	732
Rs.	78,19,792	Rs.	78,19,792

Cheviot Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule and Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th November 1956.

The accounts, after charging all expenses, making certain adjustments in provisions for anticipated loss on jute, providing for sales-tax and writing back tax overprovided in previous periods, show a profit of Rs. 24,078 (loss of Rs. 48,959). The directors have transferred from dividend equalisation reserve Rs. 50,000 (Rs. 1,00,000). The balance brought forward from the last half-year was Rs. 1,387 (Rs. 54,374) making a total available for distribution of Rs. 75,465 (Rs. 1,01,415). The directors recommend payment of dividends on preference shares at Rs. 3.50 (Rs. 3.50) per share absorbing Rs. 35,000 (Rs. 35,000) and on ordinary shares at Rs. 2.00 (Rs. 4.00) per share absorbing Rs. 31,900 (Rs. 63,800) leaving a balance to be carried forward of Rs. 8,565 (Rs. 2,615).

The directors point out that it has been possible for them to recommend an ordinary dividend at this time only because they have drawn on general reserve during the last two accounting periods to the extent of Rs. 5,00,000 in order to equalise the losses of those periods. They have decided therefore that part of those drawings on general reserve should be replaced and have therefore transferred thereto Rs. 2,50,000 from dividend equalisation reserve. At the same time they have transferred the marine insurance fund, no longer required as such, to general reserve.

In accordance with the working time agreement of the Indian Jute Mills Association the mill worked 48 hours per week with 5 per cent. of the total looms sealed until 15th July 1956. But in view of the highly unsatisfactory stock position an additional 2½ per cent. of the total looms were sealed with effect from 16th July 1956, and a further 5 per cent. from the 17th September 1956. Trading during the period continued to be very difficult owing to the disparity between the prices of raw jute and those of manufactured goods.

PROPERTY FOR SALE

PROPERTY OF THE ENGLISH & SCOTTISH JOINT COOPERATIVE WHOLESALE SOCIETY LTD.

A Group of Estates in North Wynaad, totalling 6,389.61 acres gross and 2,667.90 acres under consisting of Cherakara, Jessie, Talapoya (including Thavanjal Division) and Tatamala. A comprehensive medical service. All estates linked by private telephone system. Protected water supplies and adequate labourers' accommodation of a high standard. All well found estates with good roads. For further details apply KING & PARTRIDGE, Solicitors, Regal House, McLean Street, Madras 1.

Delta Jute Mills Co., Ltd.

The directors of the above Company (Managing Agents: Messrs. Andrew Yule & Co., Ltd., Calcutta) submit the audited accounts of the Company for the half-year ended 30th November 1956.

The accounts, after charging all expenses, providing for sales-tax and writing back provisions for anticipated loss on jute made during the previous half-year, show a profit of Rs. 1,34,493 (Rs. 73,808). The directors have transferred from dividend equalisation reserve Rs. 20,000 (*nil*). The balance brought forward from the last half-year was Rs. 2,564 (Rs. 94,604) making a total available for distribution of Rs. 1,57,047 (Rs. 1,68,412). The directors recommend payment of dividends on preference shares at Rs. 2.50 (Rs. 2.50) per share absorbing Rs. 12,500 (Rs. 12,500) and on ordinary shares at Rs. 5.00 (Rs. 5.00) per share absorbing Rs. 1,40,000 (Rs. 1,40,000) leaving a balance to be carried forward of Rs. 4,547 (Rs. 15,912).

The directors point out that it has been possible for them to recommend an ordinary dividend at this time only because they have drawn on general reserve during the last accounting period to the extent of Rs. 3,90,000 in order to euqalise the losses of that period. They have decided therefore that this drawing on general reserve should be replaced and have therefore transferred thereto Rs. 3,90,000 from dividend equalisation reserve. At the same time they have transferred the marine insurance fund, no longer required as such, to general reserve.

In accordance with the working time agreement of the Indian Jute Mills Association the mill worked 48 hours per week with 5 per cent. of the total looms sealed until 15th July 1956. But in view of the highly unsatisfactory stock position an additional 2½ per cent. of the total looms were sealed with effect from 16th July 1956, and a further 5 per cent. from the 17th September 1956. Trading during the period continued to be very difficult owing to the disparity between the prices of manufactured goods.

Accounts in brief are as under:—

Sendra Coal Co., Ltd.

The directors of the above Company [Managing Agents: Messrs. F. W. Heilgers & Co. (Private) Ltd., Calcutta] submit the audited accounts of the Company for the year ended 31st December, 1956. This is the first annual closing of the Company's accounts. These accounts have been drawn up in conformity with the Companies Act, 1956.

Karanpura Mining Syndicate.—During the year ended 31st December, 1956, 1,55,692 tons of coal were raised and 1,55,830 tons despatched. The secretaries report that during the year under review the coal was downgraded in quality by the Coal Board and it was therefore felt that it was in the best interest of the proprietors that the raising and selling of the coal be placed in the hands of a managing contractor. This arrangement was completed towards the close of the year and at the time of writing the arrangement is working satisfactorily.

The profit and loss account after providing for all charges shows a loss of Rs. 7,337 (Rs. 40,940). From this amount is deducted the balance brought forward from the previous year of Rs. 7,503 (Rs. 38,443) leaving a balance of Rs. 166 (debit of Rs. 2,497). To this is added the amount transferred from general reserve of Rs. 25,000 (Rs. 30,000) making a total of Rs. 25,166 (Rs. 27,503). The directors propose to dispose of this amount by payment of a dividend at the rate of 2½ (2½) per cent. per annum without any deduction for income-tax payable by the Company Rs. 20,000 (Rs. 20,000) and by carrying forward Rs. 5,166 (Rs. 7,503).

Accounts in brief are as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	8,00,000	Block ...	23,624
Reserves ...	5,09,216	Investments	7,26,216
Liabilities ...	3,52,885	Debts, deposits and advances ...	7,03,007
Profit and loss account ...	5,166	Cash ...	2,14,420
Rs.	16,67,267	Rs.	16,67,267

Jagatjit Cotton Textile Mills Ltd.

The directors of the above Company (Managing Agents: Messrs. Karam Chand Thapar & Bros., Private Ltd., Calcutta) present the audited accounts of the Company for the year ended 31st January 1957.

Working: During the period under review efficiency in production was maintained. Production of hosiery yarn on a mass scale was also started. The quality of this yarn is well appreciated by the Hosiery Trade.

During the first half of the year, production usually remained sold much in advance. However, with the announcement of an increase in the excise duty on *cloth* as from 1st September 1956, the cloth and yarn markets began to be depressed with the result that the off-take was poor and the Mills had to reduce their prices to attract the buyers. Since April, however, there has been a revival of demand in cloth. Stocks have started moving and the prices also in certain cases have shown somewhat upward trend.

Cotton Purchases: Cotton production in the country at one time was expected to exceed the previous year, but as a consequence of floods in some of the cotton growing areas, the estimates of the crop were revised downwards which pushed up the cotton rates as the season advanced despite various measures adopted by the Government towards checking the rise of the market. The directors however, were fortunate to have covered a major portion of their requirements for the year at comparatively favourable rates from different Punjab cotton markets.

Machinery: The cheese dyeing and beam dyeing plant of which mention was made in the last report, has since been erected. So also a major portion of the second instalment of spinning machinery consisting of about 10,000 spindles, has since been erected and is also working. The erection of the balance is likely to be completed during the course of the next couple of months.

Some of the humidification plant units have since arrived at the Mills and a part of it is likely to go into operation in the current season subject to power being made available. Sprinkler installation as well as hydrant service have also been installed to the extended areas. To meet the additional demand of steam of the various production departments, a Lancashire boiler has been added. Four cloth inspection machines, two automatic dyeing jiggers, one creasing machine, several power reels, as well as a new hydraulic yarn bundling press have been added.

The directors report that licence has been granted for 432 automatic looms. Orders for the same together with the required preparatory machinery have also since been placed. The directors also report that a licence for a second unit of this Mill consisting of 25,000 spindles at Rajpura has been granted to the Company. The initial planning of the orders etc., is ready. Steps to implement the project will be taken in hand immediately after sanction of the Rehabilitation Ministry for loan applied by the Company.

During the year under review, the Company made a gross profit of Rs. 48,87,766, as against Rs. 40,80,615 in the previous year. After providing for interest on debentures and other interest, managing agents' and directors' remuneration, Rs. 24,68,539 (Rs. 19,92,184) for depreciation and Rs. 2,40,470 (Rs. 5,08,182) by way of development rebate, the accounts show a net profit of Rs. 14,11,012 (Rs. 7,72,933). After setting aside Rs. 8,25,000 for taxation, there remains Rs. 6,52,964 including last year's carry forward which, the directors propose to distribute as follows:—

To dividend on preference shares for the years ended 31st January 1952 to 31st January 1957 at 5 per cent. per annum free of income-tax Rs. 4,54,194, to Dividend on equity shares at 5 per cent. per annum free of income-tax for the year ended 31st January 1957 Rs. 1,92,457 and to carry forward Rs. 6,313.

Accounts in brief were as under:—

Liabilities	Rs.	Assets	Rs.
Capital ...	56,57,215	Block ...	74,75,665
Debentures	30,00,000	Stock-in-trade ...	20,93,001
Development rebate fund ...	9,23,652	Stock-in-process ...	4,29,345
Provision for taxation ...	8,25,000	Stores and spares ...	71,47,217
Liabilities ...	1,05,08,045	Debts, deposits and advances ...	16,88,485
Profit and loss account ...	6,313	Investments	17,74,201
		Cash ...	3,12,311
Rs.	2,09,20,225	Rs.	2,09,20,225

COAL

(*Concluded from page 1284*)

tiguous areas. It was after prolonged discussions throughout 1955 and the early months of 1956 that the private sector was given a definite place in the Plan, and it was clear that the success of the Plan would depend on full facilities being given to both the sectors, so that each could attain its allotted target. It is unfortunate, therefore, that this new legislative measure should appear to restrict further the scope of collieries under private ownership which have such a responsible role to perform, and I hope an early opportunity will be taken to clarify the position."

There is considerable force in this statement of Mr. Macmillan, as also in his remark that it is vital that the mutually complementary roles of the public and private sectors in the coal industry should be fully accepted not only at the top where policy is formulated but also by Government representatives at all levels. After all, the success of a policy, as he rightly emphasised, is ultimately measured by its application in ordinary day-to-day decisions which have to be taken in such mundane matters as allotment of wagons between State and private collieries, or in the allocation of steel and cement, both of which are in short supply. Referring, in particular, to the latter aspect, Mr. Macmillan revealed that, as against 41,000 tons of cement applied for during 1956 by 125 member-firms of the Indian Mining Association, only about 6 per cent. was actually received at the collieries. Although this situation has improved somewhat in the current year, there is still said to be "a dangerous gap" between requirements and supplies. The position regarding iron and steel is also said to be similar and items like rails for tram lines are hardly available at all. In this connection, the Bengal Coal Company Chairman commended the setting up of the Progress Review Committee as a move in the right direction.

COTTON

(*Concluded from page 1282*)

Notwithstanding anything to the contrary contained in by-laws 36 and 37, if the same bales are tendered again against the hedge contract, the buyer shall be bound to weigh over the same without any rearbitration, subject, however, to an allowance of 1 per cent. payable by the seller to the buyer on the invoice value for August delivery only in respect of Vijay, Ankleshwar and Surti descriptions; provided, however, they bear the press marks, press running numbers, the controller's marks and any other marks, which shall tally with the particulars mentioned in the certificate. In the case of upcountry delivery, the cotton certified as above shall be tenderable in Bombay. The controller's fee shall be fixed by the Board from time to time and shall be borne by the parties equally.

NEW INDIA ASSURANCE COMPANY LTD.

CODE OF CONDUCT SUPPORTED

ADDRESSING the shareholders at the Thirty-eighth Annual General Meeting of the New India Assurance Company, Limited, held at Bombay on 26th June 1957, Mr. Ambalal Sarabhai said that 1956 had been a very difficult year for the Indian general insurance business. Nationalisation of life assurance gave a rude jolt to the base of every composite company, leading to a severe dislocation of the entire organisational set-up. A complete reshuffle of the organisation and realignment of the administrative patterns was an uphill task for all the units, but particularly so far those with a large life portfolio—like the New India.

Mr. Ambalal Sarabhai observed that, in order to explore and utilise the vast potential which existed in the field of general insurance in India, it was absolutely imperative to have a well-organised and integrated general insurance market, composed of strong indigenous units, having high administrative standards and capable of rendering efficient service. The procuration cost had also to be brought down, so that premium rates could be made more attractive. The industry had made vigorous efforts, through self-discipline and self-denial, to eliminate wasteful competition. Till now, reliance was mainly placed on publicity and fear of public criticism but without satisfactory results.

The Executive Committee of the General Insurance Council, therefore, introduced a revised Code of Conduct, earlier this year. Mr. Ambalal Sarabhai thought that, if the Code were properly supported by the members and enforced by the Executive Committee, it should put the general insurance industry in India on a sound and healthy basis.

"The basic idea behind the Code," said the Chairman, "is that rebates should stop, and procuration and administrative costs should be reasonable and within legal limits."

Reviewing the working of the Company, Mr. Ambalal Sarabhai expressed his satisfaction that the premium income of the Company touched a new high at Rs. 5.64 crores in 1956, representing a marked improvement of about Rs. 66 lakhs over the previous year. This, he felt, was particularly commendable, in view of the fact that operations of the Company were adversely affected by the nationalisation of life business, which completely disrupted its organisational set-up, and other factors like the reduction in premium rates for two consecutive years, and loss of more and more business to the pool and syndicates. The miscellaneous department played an outstanding part in stepping up the premium income of the Company in 1956. Its premium income, at Rs. 1.44 crores, showed a marked rise of Rs. 35 lakhs, as compared with a rise of about Rs. 15 lakhs recorded by both the fire and the marine departments.

On the disbursement side, claims increased by 1.7 per cent. to 50.6 per cent., while commission, expenses and tax ratio remained constant at 38.0 per cent. The profits, inclusive of interest earnings of the departmental funds, amounted to Rs. 43.9 lakhs, maintaining the level reached in 1955. As a result of the year's operations, the departmental funds stood at Rs. 4.45 crores as against Rs. 4.11 crores in the preceding year.

The overall result of the operations in 1956 led to a further strengthening of the financial resources by Rs. 52.9 lakhs. The capital and reserves stood at Rs. 7.60 crores.

Referring to the compensation available to the Company under the Life Insurance Corporation Act (Rs. 48,72,443) and under the Life Insurance (Emergency Provisions) Act (Rs. 1,50,983), Mr. Ambalal Sarabhai said that the Company had referred the compensation under the Life Insurance Corporation Act to the Tribunal constituted under the said Act. He felt that the Company was also entitled to higher compensation under the Life Insurance (Emergency Provisions) Act. Regarding the issue of one fully paid-up bonus share of Rs. 15 for every three shares held, he informed the shareholders that the Directors were pursuing the matter with Government.

Note:—This does not purport to be a record of the proceedings of the annual general meeting.

Notices

THE BENGAL PAPER MILL COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the Members of the abovenamed Company will be held at the Registered Office of the Company, 21, Netaji Subhas Road, Calcutta, on Monday, the Fifteenth day of July, 1957, at 11 o'clock in the forenoon, to consider and, if thought fit, to pass the following resolutions, namely:—

1. (*As a Special Resolution*)—"That the requirements of Article 124 of the Articles of Association of the Company be not complied with in respect of the half-year ended 30th June, 1956."
2. (*As a Special Resolution*)—"That the Articles of Association of the Company be altered in the manner following:—
   (*a*) That Articles 54 and 55 shall be deleted and the following new Article 54 substituted therefor:

   'In addition to any other meetings, general meetings of the Company shall be held within such intervals as are specified in Section 166(1) of the Companies Act, 1956, and subject to the provisions of Section 166(2) of that Act, at such times and places as may be determined by the Board of Directors. Such general meetings shall be styled "Annual General Meetings" and shall be specified as such in the notices convening these meetings. All other meetings of the Company shall be styled Extraordinary General Meetings.'

   (*b*) That Article 62 shall be deleted and the following new Article 62 substituted therefor:

   'The ordinary business of an Annual General Meeting shall be to receive and consider the Profit and Loss Account, the Balance Sheet and the Reports of the Board of Directors and of the Auditors, to appoint Directors in place of those retiring by rotation, to appoint Auditors and determine the manner in which they shall be remunerated, and to declare dividends. All other business transacted at an Annual General Meeting and all business transacted at an Extraordinary General Meeting shall be deemed special business.'

   (*c*) That Article 124 shall be deleted and the following new Article 124 substituted therefor:

   'At every Annual General Meeting the Board of Directors shall lay before the Company a Profit and Loss Account made up to the 31st December in the preceding year and a Balance Sheet as at that date and such Profit and Loss Account and Balance Sheet shall comply with the requirements of Sections 210, 211, 212, 215 and 216 and of Schedule VI to the Companies Act, 1956, so far as they are applicable to the Company, but save as aforesaid, the Board of Directors shall not be bound to disclose greater details of the result or extent of the trading and transactions of the Company than they may deem expedient.'

   (*d*) That Article 128 shall be deleted and the following new Article 128 substituted therefor:

   'The Company at each Annual General Meeting shall appoint an Auditor or Auditors to hold office until the next Annual General Meeting and their appointment, remuneration, rights and duties shall be regulated by Sections 224 to 227 of the Companies Act, 1956.'"

By Order of the Board,
BALMER LAWRIE & Co., LTD.,
D. MANSON,
Secretary.

The Dividend will be payable on and after Saturday the 3rd August, 1957.

By Order of the Board of Directors,
D. R. THOM,
General Manager.

BOMBAY, 25*th June*, 1957.

SUPPLY OF FUNDS BETTER

(From Our Own Correspondent)

BOMBAY, 26*th June*

There has been no significant change in the trend of the short-term money market, except that the supply of funds has improved further. The repayment of seasonal advances by traders has received further momentum. It is stated that loans and advances given to the sugar, cotton, piecegoods, hardware, and foodgrain trades have been steadily going down and that the banks are conserving these repayments for subscribing to the proposed new loans of the Government of India.

Despite the improvement in the floating stocks of funds, there has been no material change in interest rates. Inter-bank call money continues to be quoted at 3½ per cent. and so also house money at the self-same rate of 4 to 4½ per cent. This means that the increase in supply has not yet been so large as to affect the rates. Some banks, especially the exchange banks, are still keen borrowers.

There has been a perceptible fall of Rs. 21.32 crores in notes in circulation during the week ended 21st June 1957. The total notes issued by the Reserve Bank, however, have fallen by Rs. 8.84 crores only, as notes held in the Banking Department have gone up by Rs. 12.84 crores. There has been an influx of Rs. 1.16 crores in the rupee coin held by the Bank. This, coupled with the fall in total notes issued, has enabled the Bank to reduce its rupee securities in the Issue Department by Rs. 10 crores.

There has been no change in foreign securities held in the Issue Department, but balances held abroad in the Banking Department have shrunk again by Rs. 9.33 crores, thereby bringing down India's total foreign exchange reserves to Rs. 464.38 crores.

Reflective of the improvement in the supply of funds in the money market is the fact that the deposits of banks with the Reserve Bank have, during the week ended 21st June 1957, gone up by Rs. 6.69 crores and that the loans and advances taken by them from the Bank have been reduced by Rs. 4.60 crores. Only a small increase of about a crore is reflected in the deposits of the Central Government and of Rs. 1.11 crore in those of other Governments. The Bank's investment in the Banking Department have gone up by Rs. 8.81 crores, while its loans and advances to Governments have gone down by Rs. 2.03 crores.

The Scheduled Banks' statement for the week ended 14th June 1957—the latest available at the time of writing—discloses, as compared with that for the previous week, a small increase of Rs. 1.65 crore in demand deposits and a modest rise of Rs. 5.18 crores in time deposits. Inter-bank borrowings of demand nature are lower by Rs. 77 lakhs, while those of time nature are higher by Rs. 84 lakhs. Borrowings from the Reserve Bank are down by Rs. 12.25 crores, as also those from the State Bank by Rs. 2.81 crores. Both advances and inland bills purchased and discounted have shrunk, the former by Rs. 2.68 crores and the latter by Rs. 3.05 crores. Foreign bills purchased and discounted, however, have recorded a slight rise of Rs. 60 lakhs. Investments have declined by Rs. 5.34 crores. Money at call and short notice is practically unchanged. The total cash position of the banks is down by Rs. 2.75 crores at a little above Rs. 100 crores.

The Gilt-edged market has become a dull and drab affair, pending the announcement of the Central Government's new loan. The tone of the market, however, is slightly better, in that the vast majority of the loans are steady at the previous week's levels. In fact, the Conversion Loan, which was quoted at Rs. 72.95 last week, has come up to the Reserve Bank's support level of Rs. 73. There has also been a rise of 5 nP in 3½ per cent. 1965 and 3½ per cent. 1974. There has, however, been a perceptible fall of 40 nP in 3 per cent. 1970-75 which finished at Rs. 85.65. Among the State loans, the Madras 4 per cent. 1968 has dropped further, albeit 5 nP to Rs. 96.10. 4 per cent. 1970 Bombay loan has also gone down by 10 nP to Rs. 99.30. There has not been much change in other State loans.

Following the weakness of sterling in the New York market, where spot sterling has gone down by quarter of a cent, the rupee dollar rate has moved against India. Thus, the banks' selling rate in T.T. and O.D. has gone up from Rs. 479.25 to Rs. 479.50 and the banks' buying rate for T.T. from Rs. 475.75 to Rs. 476.25. The rate for Canadian dollars has also moved to a higher level. Thus, the banks' selling and buying rates for this currency have risen by 25 nP to Rs. 504.75 and Rs. 498.00, respectively.

HIDES STEADY

(From Our Own Correspondent)

KANPUR, 24*th June*

The hides and skins market ruled steady during the week under review. Supply and demand were evenly matched. Demand for high grade goat was particularly strong. The main purchasers of the main categories of wet buff or cow were the local tanners. The Madras dealers were not keen buyers during the week.

The latest available quotations are: Wet salted cow, 1st grade Rs. 240, 2nd grade Rs. 210 and 3rd grade Rs. 110 to Rs. 130 per score; wet salted buff, 1st grade 2 lbs. 2 ozs. and 2nd grade 2 lbs. 4 ozs. per rupee; goat, 1st grade Rs. 300 and 2nd grade Rs. 325 per 100 pieces; sheep, 1st grade Rs. 350 and 2nd grade Rs. 250 per 100 pieces.

BULLION SLACK

(From Our Own Correspondent)

BOMBAY, 26*th June*

This has been a dull week for the Bullion Exchange. The trend of prices has been irregularly downward. The premium for spot has narrowed down considerably in both the metals but more perceptibly in silver. This has been due to smaller offtake and larger arrivals and the resultant increase in floating stocks. Speculative activity is at a low ebb and the turnover in the spot section is very much down. The undertone at the time of writing is distinctly quiet, reflecting the fact that, with the arrival of the rains, the traditional slack season for bullion has set in.

There was a spurt in speculative activity from Thursday the 20th to Monday the 24th inst. Most of it was in silver, and gold simply followed suit, albeit reluctantly. Speculation in silver was based mainly on the actual arrival or prospects of arrivals of Chinese silver coins. On the first day, forward silver went up by As. 10 to As. 11 on account of short-covering. Gold, too, rose by As. 3. On the next day (Friday), there was a drop of As. 11 on profit-taking by bulls, induced by heavy arrivals and light offtake. Spot silver lost over a rupee on that day. Gold receded by As. 7 in forward and As. 9 in spot. On Saturday and Monday, silver was firm again and went up by nearly Re. 1-8, though spot appreciated by only a rupee. Only a minor rise of As. 4 to As. 5 took place in gold during these two days. On Tuesday, the market was a shade quiet, and today it was easy, due to continued excess of arrivals over the offtake.

Over the week, the premium for ready silver over the first settlement has come down from Rs. 2-12 to only a rupee and that for gold from Re. 1-9 to Re. 1-2.

Arrivals of silver averaged 20 bars a day and offtake 9 bars. In gold, arrivals were 5,800 tolas per day, as against which offtake was only 3,000 tolas.

Among the foreign bullion markets, silver in New York remained unchanged at the previous week's closing rate of 90½c per fine ounce. There was no change in the London silver market either, where spot silver stood at 78¼*d.* and forward at 78*d.* There was a minor rise in the price of gold in London. Thus, spot gold gradually improved from 250*s.* 6¼*d.* to 250*s.* 8¼*d.* Later, after declining to 250*s.* 8*d.* on the 25th inst., it spurted again to finish at 250*s.* 9¼*d.*

The South African gold mining industry had a record output in May last when 1,450,668 ounces were mined, as against the previous record of 1,405,422 ounces in March 1957 and the April output of 1,398,667 ounces. The value of production in May was £18,115,217.

The following comparative table shows at a glance the trend of the market during the week under review:

	26-6-1957	Highest	Lowest	19-6-1957
	Rs. a	Rs. a.	Rs. a	Rs. a.
GOLD				
Ready (.99 fine Mint)	105 14	106 12	104 9	106 7
Forward*	104 12	105 2½	104 9	104 14
Sovereign	70 0	70 0	69 12	70 4
SILVER				
Ready (.999 fine Mint)	181 6	182 11	181 8	182 5
Forward†	180 6	181 2	179 5	179 11
London Silver Ready	78¼*d*	—	—	78¼*d*
London Forward	78*d*			78*d*
London Gold	250*s.* 9¼*d.*	250*s.* 9¼*d.*	250*s.* 6¼*d.*	250*s.* 8¼*d.*
New York Silver	90½c.	—	—	90½c

* 11th July settlement.

BASE METALS RECEDE

(From Our Own Correspondent)

CALCUTTA, 25*th June*

A fractionally downward trend was in evidence in the prices of base metals during the week under review. The market paid no credence to rumours which envisaged the possibility of some base metals being removed from the open general licence and coming under the quota system. Nevertheless, the import policy was keenly awaited. It was realised that the foreign exchange position was causing anxiety, but, in view of the metal industry's dependence on imports for its raw materials and its important role in the country's development, market circles hoped that the Union Commerce Ministry's axe on imports would not fall on non-ferrous metals.

Reports of a strike in the Roan Antelope copper mines in Rhodesia did not affect market sentiment, inasmuch as world supplies were greater than demand. In fact, the voluntary cut in production by Rhodesian and American producers would reduce output by 72,000 tons a year. Locally, there was increased activity, as consumers covered their requirements against Government orders. Electrolytic copper was steady at Rs. 178. Virgin lead changed hands at Rs. 72.50. A fair quantity changed hands and, as in the London Metal Exchange, the cut in the selling price of lead from 15 cents to 14 cents a pound by an American smelting firm did not have any effect here. Tin was unchanged at Rs. 523. Stocks were increased by fresh arrivals, but there was no abatement in demand. Following poor advices from London and substantial fresh arrivals, electrolytic zinc was hammered down by Rs. 6 to Rs. 72.

NEW CROP FUTURES TRADING COMMENCED

(From Our Own Correspondent)

BOMBAY, 26*th June*

The long-awaited permission of the Forward Markets Commission to begin transactions in new crop contracts was at last given and the *moorat* trading took place on Sunday the 23rd June, that day having been declared a trading day with hours of business limited to an hour commencing from 10.15 a.m. The opening quotation for the new contract, I.C.C. Jarilla, basis Fine Moglai 25/32", in the *moorat* session was Rs. 690 and after advancing to Rs. 691 the contract closed fractionally lower at Rs. 690½. After showing a slight improvement the following day, it eased yesterday. This trend persisted today also. Although the volume of business on the first day amounted to about 10,000 bales, in subsequent sessions it declined to an average of about six to seven thousand bales. The general feeling is that until a clearer picture of the new crop emerges the volume of business and the price trend are unlikely to show much change.

The Forward Markets Commission notified the East India Cotton Association on the 24th inst. that the Vijay June contract would be declared as expired on 24th June, at that day's closing rate, although the normal maturity date was 25th inst. Explaining the reason for such a step, the Commission, in a Press note, said that it had decided, on the 17th April 1957, that no trading should be permitted in the Jarilla July 1957 and Vijay August 1957 deliveries and that trading in the Jarilla May 1957 and Vijay June 1957 contract should be brought to an orderly close, as the By-laws under which the hedge contracts were then functioning had become unworkable since the expectations of a larger cotton crop this year had failed to materialise. "As one of the measures taken to bring the running contracts to an orderly close," said the Press note "maximum prices of Rs. 754 and Rs. 878 were fixed for the Jarilla May 1957 and Vijay June 1957 contracts, respectively, under By-law 52. Since it was inexpedient to allow the maximum price fixed to become infructuous on the due date, the Commission has notified the E.I.C.A. that the Vijay June 1957 contract would be closed out at the close of business on 24th June 1957, at the last closing rate of the day." Accordingly, the contract went off the Board on the 24th inst., the closing quotation for it being Rs. 873. The Commission wisely ordered the closure late in the night of 24th June. It thus avoided the uncertainty and controversy regarding the closing rate which, in the case of the expired Jarilla May contract, had been an unsettled issue for about a month.

Vijay June contract depicted a distinctly bullish trend during the four days of the week preceding the day of closing. This was due to frantic covering of outstanding sales by shorts in view of the proximity of the settlement. No tenders were issued on the 20th inst., the seventh tender day. This further fanned the buying spree and the contract shot up from Rs. 830 on the 22nd inst. to Rs. 872 the following day, despite the operation of the rigorous margin at the rate of Rs. 200 per bale. The trend persisted till the close on the 24th and the contract was last quoted at Rs. 873.

I.C.C. Jarilla opened on the 23rd inst. at Rs. 690 and after having advanced to Rs. 694 the next day, eased to Rs. 687¾ at close today. Vijay June opened the week at Rs. 822 and on frantic bear covering flared up to Rs. 873 on 24th and expired at that rate. The following is the trend of prices of the two contracts during the week:

(In rupees per candy of 784 lbs.)

	26-6-57	*High*	*Low*	19-6-57
M.G. Vijay (June) ...	*873	873	822	822
I.C.C. Jarilla Moglai (March 1958) ...	687¾	694	686	†690

*Closing rate on 24-6-57.

†Opening rate on 23-6-57.

In the spot section there was a slackening of mill demand. It appeared that the persistent demand which was a distinguishing feature of the spot market in recent months had tapered off, temporarily at least. Most of the varieties were quoted a shade lower.

The Government of India notified, on Friday last, the import procedure and staple length of 160,000 bales of American cotton (100,000 bales under the International Co-operation Administration Agreement and 60,000 under Indo-U.S. Trade Agreement (U.S.P.L. 480)) to be imported as per the announcement made on 22nd May. U.S. growths of staple length 1-1/16" and above can be imported. The liability of the importers is to pay for the cotton at the fixed rate of Rs. 480.25 per 100 U.S. dollars. The contracting and shipping periods are also specified. Following the notification, inquiries were noted for U.S. styles especially from Ahmedabad and Bombay mills. In the export section interest was mainly confined to Bengals, Dholleras and *Deshi* varieties. The latest available spot quotations—in rupees per candy of 784 lbs.—are given below, the figures in brackets being last week's closing rates:

Bengal *Deshi* 750 (730); Berar Jarilla 810 (820); Khandesh 860 (870); Oomra *Deshi* 770 (780); Vijay 1,020 (1,025); Hubli Laxmi 1,000 (1,020); Jayadhar 925 (950).

The firm trend noted in the Karachi cotton futures market gathered fresh momentum during the week under review. There was an extension of mill demand and better overseas inquiries. The firmness was further aided by speculative buying in nearby July prompted by the upward trend in futures prices in New York. N.T.R.G. July which had closed at Rs. 73-5 spurted to Rs. 75, while the January contract improved over the week by As. 3

to Rs. 77. Spot values also made handsome gains. *Deshi* styles were, however, not much in demand. Nevertheless, their prices were maintained. The following are the latest available quotations—in Pakistani rupees per 82 lbs.—for a few popular varieties of Pakistan cotton prevailing at Karachi:

Sind *Deshi* 84-12; Punjab *Deshi* 80-8; 4F Punjab R.G. 75; S.G. 78; L.S.S. Punjab R.G. 78-8; S.G. 82; N.T.R.G. 79; S.G. 86; 289F Punjab R.G. 83-8; S.G. 88.

According to the latest estimate, production of cotton in Pakistan in the current (1956-57) season is estimated at 1,708,000 bales (of 400 lbs.), as against the final estimate of 1,738,000 bales in the previous season. Production of American seed cotton is estimated at 1,476,000 bales and that of *Deshi* varieties at 232,000 bales.

A firm trend was depicted by the Alexandria cotton futures market during the week. Better export inquiries were in evidence. The medium-staple Ashmouni contracts, in particular, attracted a fair volume of speculative buying and firmed up as a consequence. This was based on the expectation that Japan would take larger volume of Egyptian cotton following the reported offer of larger discounts to that country by Egypt. Although Japan has determined to cut imports of cotton by 200,000 bales during the first six months of the current fiscal year, it was thought that if Egyptian prices were sufficiently attractive it would help prevent any marked reduction in the Japanese off-take of Egyptian cotton. The continuous upward trend of New York cotton prices was another encouraging factor. The following are the latest available rates—in tallaris per lb.—from Alexandria:

Karnak: July 108.90; November 100.00. *Ashmouni*: June 76.60; August 74.40; October 72.55.

Cotton futures in Liverpool recorded handsome gains during the week under review. Trade buying in nearby positions led to an improvement in their quotations, while the distant crop months continued to rule firm under persistent speculative support. This was mainly influenced by the bullish interpretation of U.S. crop news. The comparatively lower acreage planted to cotton this season, coupled with the Soil Bank programme, was expected to make the supply position of U.S. cotton tight. This, it was thought, would affect Liverpool prices. Firm New York advices were another helpful factor. Better tone in the yarn and apparel fabrics market assisted sentiment further. Both the American cotton and the mixed growth contracts moved up. The Sudan contract also advanced due to the firmer trend of prices at the Sudan Gezira Board auction; at its latest auction sales, the Board was able to realise its reserve price. The following are the latest available rates—in pence per lb.—from Liverpool:

American cotton one inch staple contract: July-August 26.30; October-November 26.30; December-January 26.46; March-April 26.57. *American cotton mixed growth contract*: July-August 26.73; October-November 26.75; December-January 26.90; March-April 26.98. *Sudan*: July-August 39.25; September-October 38.25; November-December 38.25.

Last week's firm trend picked up further strength in the New York cotton futures market during the week. The anticipation of higher loan rate for the new crop and the expectation that there would be no major change in cotton policy in the immediate future (as it was decided to extend the Soil Bank programme to cover the 1958 crop also) served to impart strength to the market. Distant positions were particularly strong. The spot quotation, **however, showed a slight** fall.

As regards crop condition, it is reported that in California, Arizona and New Mexico warmer weather is beneficial, cotton making rapid growth. In southern parts of Texas districts of the western belt, crop progress has been good; but in some States in the north reports are not satisfactory. Continuation of showers and wet fields in Missouri and Arkansas **of the central** belt may result in some acreage abandonment. In the eastern belt plants are generally in good condition; showers favour weevil infestation and hamper insect control measures.

The following are the latest available quotations **from New York, as compared** with those of a week and a fortnight **before:**

(In cents per lb.)

	25-6-57	18-6-57	11-6-57
Spot	35.40	35.45	34.45
July	35.47	35.33	35.31
October	34.99	34.65	34.52
December	34.89	34.63	34.50

YARNS STEADY

(From Our Own Correspondent)

BOMBAY, 26*th June*

A steady trend was in evidence in the yarn market during the week under review. Rayon yarns elicited good buying support induced by renewed fears of a cut in import quotas for the July-December **period. There would,** indeed, have been a marked rise in prices but for discouraging reports from the rayon piecegoods markets. Staple fibre yarns were strong on expectations of a fall in indigenous production and hopes of export business with overseas countries. Conditions in the cotton yarn section, however, were listless. Advices from consuming centres were not quite helpful. Nor were operators inclined to be optimistic about the possibility of foreign countries purchasing Indian cotton yarns up to 78 counts now allowed to be exported subject to a ceiling **of 5,000 bales,** thanks to competition from other countries, particularly Pakistan.

Snia rayon yarns (120 dull cones) for June delivery advanced by Rs. 3 to Rs. 807. August position improved from Rs. 821 to Rs. 826. In the spot section, National Rayons 150 Bright Cones first grade spurted by 14 nP to Rs. 3.62. 120 Bright Cones first grade was better by 2 nP at Rs. 4. Among foreign yarns, 150 Japan was firm at Rs. 4.19, as also 150 Italy at Rs. 3.75. But 120 Italy lost 4 nP to Rs. 4.12. 120 Japan was a shade easy at Rs. 4.22.

Staple fibre yarn (40×2) for June delivery met with good buying enquiries and rallied Rs. 6 to Rs. 596. August delivery hardened by a similar amount to Rs. 600. Spot New Greats and Kohinoors gathered 2 nP each to Rs. 3.14 and Rs. 3.30, respectively. Centurys put on one naya paisa to Rs. 3.15. Citys were firm at Rs. 3.17. Among foreign yarns (80×2), Fujis gained 2 nP to Rs. 5.17. Paramounts were fully maintained at Rs. 5.38.

In the cotton yarn section, ten counts Moderns were dull at Rs. 14.75. Podars, however, advanced by 13 nP to Rs. 14.75. Twenty counts Maduras were quiet at Rs. 19.12, as also Moderns at Rs. 18.75 and Gokaks at Rs. 18.37. Among thirty counts, Indus rose by 12 nP to Rs. 21.87. Edwards were dull at Rs. 21. Forty counts Moderns declined by 25 nP to Rs. 27.75. Among sixty counts, Finlays receded by 50 nP to Rs. 64.50, but Raghuvamshis increased by 50 nP to Rs. 57.75. Eighty counts Moderns slipped back by 25 nP to Rs. 75.75. Mahendras were neglected at Rs. 71. Finlays, however, elicited special support and picked up 50 nP to Rs. 82.50.

The following table gives the prices of rayon, staple fibre and cotton yarns quoted today, as compared with those a week before:

	26-6-1957	19-6-1957
	Rs.	Rs.
Art silk yarn (per case of 200 lbs.)—		
120 dull Cones Snia June	807·00	804·00
.. .. August	826·00	821·00
120 Japan (per lb.)	4·22	4·23
150 Japan (per lb.)	4·19	4·19
120 Italy (per lb.)	4·12	4·16
150 Italy (per lb.)	3·75	3·75
Staple fibre yarn (per case of 200 lbs.)—		
40×2 June	596·00	590·00
40×2 August	600·00	594·00
40×2 New Great (per lb.)	3·14	3·12
40×2 Century (per lb.)	3·15	3·14
40×2 City (per lb.)	3·17	3·17
Cotton yarn (per bundle of 10 lbs.)—		
10s Podar	14·75	14·62
20s Gokak	18·37	18·37
30s Edward	21·00	21·00
40s Minaxi	27·44	26·75
60s Raghuvamshi	57·75	57·25
80s Modern	75·75	76·00

CASTORS EASY

(From Our Own Correspondent)

BOMBAY, 26*th June*

The local oilseeds market displayed divergent trends during the week under review. A distinctive feature of the market, however, was the easy tendency witnessed in the castors section, due to the expectations of favourable monsoon. The groundnut section was subject to narrow fluctuations, but was well maintained over the week as a result of the demand from upcountry houses. The linseed section remained featureless, despite the notification regarding the free export of linseed oil issued last week. Cottonseed lacked support.

According to a notification, cottonseed oil will be licensed freely for export up to the end of December 1957. Licensing will be done on shipping bills supported by evidence of valid firm sale contracts.

Trading in groundnut August contract commenced at Rs. 176.62. On the same day, prices touched the high of the week at Rs. 179.25 on good support. During the rest of the week, however, the contract fluctuated between that level and Rs. 173.75, before finishing today at Rs. 176.12, which represented an improvement of Rs. 1.12 over the week. Spot Bold, too, was 87 nP higher at Rs. 36.87. Groundnut oil ex-mill was maintained at Rs. 20.75.

Castorseed September contract opened the week at Rs. 166.50 and crept up the same day to Rs. 169.50. On the following days, it reflected an almost steady decline, having touched today the low of Rs. 159.25, before closing slightly higher at Rs. 160.50. Over the week the contract lost no less than Rs. 4.25. Spot Madras quality shed 75 nP to Rs. 31.75. Oil B.S.S. was quoted at Rs. 20.37, as against Rs. 20.87 last week.

Linseed September commenced the week at Rs. 30.37, and moved between Rs. 30.75 and Rs. 30.06, during the week, before finishing at Rs. 30.12. Over the week it lost 25 nP. Spot Bold, however, was nominally higher at Rs. 29.62. Linseed oil ready, again, declined by 25 nP to Rs. 16.25.

Cottonseed September contract displayed, once again, irregular movements; yet the trend was downward **during the week.** Having opened the week at Rs. 110, it rose the same day to Rs. 111. The easy trend that set in soon after persisted, and **the contract closed today at Rs. 108** which is only 25 nP higher than the lowest touched during the week. Over the week, it was Re. 1.25.

Among others, Kardi Bold was 25 nP higher at Rs. 22.50. Nigerseed Madras, however, was 25 nP lower at Rs. 28.25.

The following table shows the closing prices of oilseeds and oils **today as compared with those at** the close of **the previous two weeks:**

	26-6-1957	19-6-1957	12-6-1957
	Rs.	Rs.	Rs.
Groundnut—			
September, 1957	176.12	175.00	176.62
Bold ready (per cwt.)	36.87	36.00	36.25
Coromandel	37.25	37.25	37.50
Linseed—

Castor oil—			
Commercial (per quarter) ..	19.25	19.75	20.25
Linseed oil—			
Ready	16.25	16.50	16.87

SUGAR FIRM

(From Our Own Correspondent)

BOMBAY, 26*th June*

Despite expectations of a further release of sugar for sale in free market being announced before the month is out and downward revision of As. 6 per maund in the ex-mill quotations for despatches after 1st July next, the sugar market continued to rule distinctly firm. Stock position in the City was so very small that even the increase in arrivals of sugar into the market during the week was considered to be inadequate; arrivals aggregated 9,500 bags, as against 7,300 bags in the previous week. Traders felt that the supplies of sugar in the City would be appreciably lower in the coming weeks, thanks to slow movement of sugar on account of rains. Buying support was, therefore, sustained and sugar prices tended to move up further.

Spot small grain sugar rose by As. 8 to Rs. 103½-Rs. 104 per bag, inclusive of sales tax. Large grain put on a like amount to Rs. 108-Rs. 110. Medium grain was fully maintained at Rs. 105-Rs. 107, same as last week.

The ex-mill quotations for despatches of sugar from 1st July next onwards, as already stated, will be lower by about As. 6 per maund as compared with those now quoted for ready despatches or delivery. The fall in price is due to the enforcement of the inter-State sales tax imposed by the Union Government.

• • • •

(From Our Own Correspondent)

HAPUR, 24*th June*

Although demand from consuming centres was not encouraging, rumours of further exports to the extent of 300,000 tons imparted firmness to the sugar market during the week under review. Even reports that sugar production during the current season had already touched 2.05 million tons and, with 530,000 tons being carried over from the previous year, the total availability of sugar worked out to 2.58 million tons, had no effect.

The *khandsari* market also ruled firm. Owing to good demand **for the** marriage season, prices recorded fractional gains during the week, to be quoted at Rs. 26 to Rs. 31 per maund.

Ready *gur* advanced slightly during the week, as arrivals were put at about 75 maunds daily. Dry quality was lifted by exporters, while wet quality was purchased for *khandsari* manufacture. Local stock, mostly of *kotha* quality, was put at 70,000 maunds, as against 29,000 maunds a year before.

The standing cane crop in west U.P. is in need of rains. It has been adversely affected by the Salai pest. The prevailing prices are: Dry arrivals Rs. 11.62, wet Rs. 10.50, *kotha* quality mixed dry and wet Rs. 10.50, selected dry *kotha* Rs. 11.25 per maund.

After moving both ways in heavy speculative turnover, *gur* futures declined towards the week-end. *Gur asar* was done at Rs. 10.50 and *fagun* at Rs. 11.45.

BLACK PEPPER QUIET

(Messrs. Parekh and Co.)

BOMBAY, 25*th June*

Malabar black pepper experienced one more quiet week, with prices in both Asta and delivery tending downward, in view of poor demand from New York and in sympathy with Singapore where both Lampong and Sarawak were easier. Singapore is quoting Sarawak black at $72 (Singapore dollars). Arrivals of Sarawak pepper in Singapore are on an increase and, with the passing of time, more pressure is likely to be felt. Lampong is underquoting both Malabar and Sarawak, as catch crop of about 500 tons has already arrived during June. Main Lampong crop will start coming in next month. Singapore importers of Lampong black are anxious to liquidate, as the Indonesian Government has recently introduced a new inducement certificate system for encouraging foreign export.

Alleppey was quiet at Rs. 587½ sellers, while garbled at Cochin in hedge market was quoted at Rs. 105 sellers for July-August, as against Rs. 110 last week.

Under pressure of liquidation by tired bulls and selling by shorts, Asta July-August-September was done at $0.26 to $0.25½ sellers. Bulls were unwilling to give support, as the market once again became uncertain, in view of selling pressure of Lampong.

In the delivery section, there was pressure of liquidation by bulls and selling by shorts. July delivery came down to Rs. 552, as against Rs. 594 last week.

Today's nominal quotations are: Ready Rs. 82 per Bengal maund and July Rs. 553-Rs. 558 and August Rs. 563-Rs. 568 per candy of 5¼ cwts.

EXPORT TEA WELL SUPPORTED

(From Our Own Correspondent)

CALCUTTA, 25*th June*

There was improved demand during export sales yesterday. The lower output figure for the month of May was a factor which made buyers active. Reports of steadier trend in Mincing Lane auctions also had a favourable effect. In the London sales held on Wednesday last, best quality teas attracted considerable attention on strong demand. Tea stocks in Great Britain for the week ended the 14th inst. were 153 million lbs. or higher by about 1 million lbs., as compared with the previous week.

During last week's sales for domestic consumption, demand was good. Dusts on offer aggregated 5,070 chests which included 755 chests of the old seasons tea. C.T.C. Assams were a strong feature as were flavoury Darjeelings. Leafy orthodox teas were quiet. Medium Dooars were nominally quoted at Re. 1.45 to Re. 1.50. Leaf on offer was a meagre quantity of 116 chests.

Offerings during yesterday's export sale amounted to 17,362 packages, the quality of which was more satisfactory than the last sale. As stated, there was good demand and prices of all descriptions advanced. The brighter liquoring C.T.Cs and medium Assams in strong support gained by 40 nP per lb. On the other hand, C.T.Cs possessing green first flush liquors were quiet. Medium B.Ps rose by 5 to 10 nP. Fair attention was paid to stylish whole leaf grades and flavoury Darjeelings. The quotations were: Best Assam C.T.C. fannings Rs. 3.40 to Rs. 3.80, best Assam C.T.C. B.P. Rs. 3.20 to Rs. 3.50 (nominal), medium fannings Rs. 2.10 to Rs. 2.30 (nominal), medium B.P. Rs. 2.00 to Rs. 2.20, clean black pekoe Rs. 2.40 to Rs. 2.50, plain B.P. Rs. 1.85, and plain fannings Re. 1.65.

JUTE MOVES UP

(From Our Own Correspondent)

CALCUTTA, 25*th June*

Both jute goods and raw jute evoked fair support during the week under review. Business in raw jute was done for old as well as new crops. Apart from slight rains here and there, there were sufficient signs of the setting in of the monsoon in the Gangetic West Bengal. It was expected that, by about the end of this month, heavy rains would have fallen and reports of rains would be originating. There were reports of satisfactory sowings from the jute districts. Sowings are almost completed and are as large as last year's. It can, therefore, be assumed that the crop would be almost the same as that of 1956-57, provided no unusual floods occur. These considerations led to a slightly downward trend in raw jute prices towards the end **of the week under review.**

The upward trend in jute goods was arrested, as buyers withdrew support. Even then, the loss in prices of jute goods was only fractional. On the other hand, report from New York that burlap consumption in the United States during May at 71.90 million yards was higher by 3.90 million yards as compared with April, was noted with satisfaction. In hessian, there was good demand from shippers. Encouragement was also derived from shipment figures. Up to 15th June, hessian shipped was 19,100 tons, as against 13,800 tons between 1st and 15th May. On the other hand, sacking shipped was only 14,300 tons, as against 16,500 tons.

Early in the week, rates firmed up on bullish pressure, ready B. twills being priced at Rs. 117.90 and hessian 40″ 10 oz. at Rs. 44.60. Despite profit-taking, the higher levels were maintained. The feature on Wednesday was liquidation by bulls in the *fatka* market. This affected the rates, and shippers continued to evince interest, with B. twills realising Rs. 117.70 and hessian 40″ 10 oz. Rs. 44.36. Prices continued to give way on speculative manœuvrings, and by Friday B. twills had sagged to Rs. 116.80 and hessian 40″ 10 oz. to Rs. 43.90. At lower levels, shippers and speculators lent support, and this resulted in the recovery of B. twills to Rs. 117.00 and hessian 40″ 10 oz. to Rs. 44.10. Yesterday, the trend was reversed when B. twills fell to Rs. 116.75 and hessian 40″ 10 oz. to Rs. 44.

The feature in the raw jute market was the commencement of forward selling in the new crop. The new crop was freely offered at Rs. 32 for August-September delivery. The new crop was anticipated to begin arriving towards the end of August. Arrivals of the 1956-57 crop continued to be satisfactory. Prices were unchanged. The latest quotations of the latter for June-July delivery are:

	Middles Rs.	*Bottoms* Rs.

TRADING IN LINSEED LIMITED

(Messrs. A. Bradley and Co.)

CALCUTTA, 24*th June*

There was no material change in the linseed market during the week and the general undertone was quietly steady. Trading was very limited, with buyers and sellers equally reserved. Supplies of seeds from upcountry were barely sufficient to cover a much diminished local demand. Prospects were not favourable, owing to possible restriction on movements in the coming months. Turnover in the oil market was negligible, but, with the prevailing scarcity of stocks, prices were maintained.

The latest available quotations are: Ready Rs. 22-10, July-August Rs. 22-12 and August-September Rs. 23 per maund.

FOODGRAINS STEADY

(From Our Own Correspondent)

HAPUR, 24*th June*

Foodgrains prices continued to rule steady during the week. Despite formation of wheat zones, with restriction on inter-zonal movement except under permits, and U.P. being formed a separate zone, wheat continued to flow out of the State on Government account. The Bihar Government purchased about 20,000 maunds of farm quality wheat at Hapur during the last fortnight for seed purposes. The U.P. Government is very much worried over the delay in the arrivals of imported wheat from ports, as demand on Government reserves is increasing, with the addition in the number of fair-price shops in east U.P. As against the monthly quota of 40,000 tons of wheat promised to this State by the Centre, actual arrivals during the current month have scarcely exceeded 15,000 tons.

Wheat at Hapur continued to rule steady at Rs. 14.75 per maund for *dara* average quality, while farm quality was transacted at Rs. 17 per maund. The State Government's requirements for seed purposes were also purchased upto Rs. 17.25 per maund for farm produce. Local arrivals were at an average of 1,200 maunds and stocks were estimated at 42 *khaties*, the corresponding figure last year being 83 *khaties*. Rice continued to rule steady. *Basmati* was quoted at Rs. 27 to Rs. 30, *sela Mainpuri* at Rs. 24 and *Etawah* at Rs. 23 per maund.

The U.P. Government purchased about 250,000 maunds of gram from the local market. The purchase imparted steadiness to gram prices. Most of the quantity was brought here by traders from the Punjab for Government delivery and local stock of gram at 40 *khaties* was mostly owned by the State Government. As the State Government also purchased barley and *bejhar* here, prices of these grains were also held steady. *Jowar* and *guwar* ruled mostly unchanged and the week-end prices (in rupees nP per maund) were: Gram 11.75 to 12; barley 11; *bejhar* 10.75; *jowar* 13 to 15.25; *guwar* 13.12.

Peas ruled quiet, as demand even from Bihar subsided and the heavy quantity of peas already purchased for Bihar was awaiting despatch from here for want of loading facilities. Arrivals of peas were lower, the average being 750 maunds daily, and local stock was put at 51 *khaties* of about 800 maunds each, the corresponding figure last year being 58 *khaties*. Demand for *arhar* was dormant and stock position swelled to 100 *khaties* and prices ruled quiet. Other pulses were listless, the latest quotations being: Peas *dara* green Rs. 10.87 and white Rs. 12; *arhar* Rs. 11.44; *urd* Rs. 19.75 to Rs. 21.75; *moong* Rs. 15 to Rs. 16.50; *masoor* Rs. 15 to Rs. 16 per maund.

Pulses futures eased slightly during the week on bear pressure influenced by depressed conditions in the ready section. The latest quotations were: Peas *bhadon* Rs. 11.15 and *arhar bhadon* Rs. 11.72.

BRITANNIA AIRLINER

Britannia 310 turbo-prop airliners, which are operating on the London-Australia air route three times a week with halts at Karachi and Calcutta, are in great demand the world over. Two have been ordered for late 1958 by a Cuban airline, Compania Cubana de Aviacion. The airline already operates Viscounts on its Caribbean routes, and has chosen the Britannias for the longer stages. "The choice of the Britannias for the longer stages emphasises the tremendous popularity of the turbo-prop-powered airliner with the travelling public," the Managing Director of Bristol Aircraft, Mr. Peter Masefield, pointed out. There are now 68 Britannias on order. This brings the total of turbo-prop aircraft on order in the world to 602, of which 395 (66 per cent.) are British—well over 200 of them delivered already. The first of five Britannias ordered by Northeast Airlines (of the U.S.A.) has made its first flight at Belfast. Short Bros. and Harland, who built this aircraft, have orders for 25 Britannias. Today, 10 Britannias are in an advanced stage of construction in Belfast. The next Britannia from Shorts is expected to fly within a few weeks.

STERLING AREA DOLLAR EARNINGS

BRITAIN'S SHARE

By Robert Collin

A SURPRISING but important point about the pattern of sterling area trade last year is that, in general, Britain did rather better than her partners. In 1956, Britain managed to keep imports down, while those of other sterling area countries tended to rise. She managed to increase the value of her exports sharply, while those of several other sterling area countries were affected by the weakening of commodity prices in the first half of the year. The United Kingdom balance improved: that of several other sterling countries worsened.

The outlines of this picture are, however, familiar enough. It is the details—particularly where trade with the dollar area is concerned—which are rather surprising. Britain normally imports more from the dollar area than she can pay for with visible exports. She meets the gap partly by earning a sizable surplus on invisible dollar trade, partly by bringing into the accounts her trade surplus with the rest of the sterling area. But Britain's exports to the dollar area last year were greater than those of all other sterling area countries put together. The deficit in her own balance of payments current account with the dollar area was only some £20,000,000.

One is drawn to this conclusion by the latest balance-of-payments statistics, which suggest that, while dollar exports by other sterling countries remained fairly constant last year, Britain's dollar exports jumped up sharply. These payments figures, of course, are only estimates, and estimates on a different basis from the trade statistics.

Trade Statistics

But the trade statistics—the latest ones now make it possible to compare the whole year 1956 with the year 1955—have the same story to tell. Over this period, the value of British exports to the dollar area rose by 24* per cent., while those of other sterling area countries rose hardly at all. In money terms, Britain's dollar exports rose from £417,000,000 to £519,000,000*; those of other sterling countries showed little change. Thus Britain took the lead.

The relatively disappointing performance of exports from the other sterling area countries to the dollar area was due partly to price-falls in copper, rubber and cocoa. Thus, cocoa earnings only rose slightly, although the quantity sold to the dollar countries increased by 19 per cent. Again, rubber and copper earnings fell proportionately more than the quantity sold. Despite a reduction in earnings from wool sales to the dollar area, total earnings from wool increased, as did also the total earnings from exports of copper, lead, dairy products, wheat, tea and coffee. But only in the relatively unimportant case of lead was this general improvement noticeable in the sphere of dollar trade.

Increase Widely Spread

On the other hand, Britain was able to increase its dollar exports very considerably, in terms both of value and quantity. The increase —except for whisky, which is classified as a food —was almost entirely concentrated on exports of manufactured goods, which rose during 1956 by £104,000,000.

The increase was very widely spread: even textiles (mainly woollen textiles) did well, with a rise of nearly £3,000,000. The bulk of it, of course, consisted of engineering products. Shipments of all kinds of machinery rose strongly, and there was a sharp jump in deliveries of aircraft to the United States market and of ships to Canada, and to the dollar countries—Liberia and Panama—which brandish flags of convenience. On top of this, there was a good increase in the export of steel manufactures to Canada, a general improvement in the export of non-ferrous metal goods, and a widespread increase (amounting to £36,000,000 over the year) in exports of miscellaneous manufactured goods.

In short, Britain's dollar exports are still booming, and the United States is once again Britain's largest single export market—a position which it last held in 1895.

*The figures in this article exclude repayments of silver bullion by Britain to the U.S.A., amounting to £22,500,000 in 1956, against a war-time Lend-Lease borrowing.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.= Deferred shares. P.O.= Preferred Ordinary shares. Y= Accounts published yearly. H.= Accounts published half-yearly. F.= Company has Preference shares. T.= Company has Debentures. N.= Nominal quotations. x.d.= Ex. Dividend. c.d.= Cum. Dividend. i= Interim Dividend. f= Dividend for first half of the year.

Shares :—If a company has different classes of shares—as for example, 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns "Paid-up Ordinary Capital" and "Paid-up per share."

Accounts :—Figures in the "Accounts Closed" column represent the months of the year in which the respective companies close their accounts. 6 and 12, for instance, indicate the months of June and December respectively. Reserves include general and other reserves and all other funds, which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed, less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

M—Managed by the Board of Directors. ‡ Less income-tax. s) Clive Mills have paid dividend at Rs. 10½ on bonus shares, for the year, 1955. * Including bonus.
(k) Made up of an interim dividend of Rs. 1-12 per share on 1,20,000 shares and final dividend of Re. 1-10 per share on 2,40,000 shares at which 1,20,000 shares are bonus shares. (c) For seven months ended 31st March 1957.
† New Central Jute Mfg.—Dividend for 1956 is on shares of Rs. 10 each. The Albion and Lothian jute companies have been amalgamated with New Central Jute Co., with effect from 1st December 1954.
‡—Fort William Jute Co. has sub-divided ordinary shares of Rs. 100 into shares of Re. 10 each. Dividend for 1956 is on shares of Re. 10 each. P.—Bengal Coal Co. Dividend from 1953 to 1956 are on shares of Rs. 100 each.
For 1956 the dividend of Rs. 17-8 includes an interim dividend of Rs. 7-8 per share. In 1956 the shares of Rs. 500 were split into shares of Rs. 100 each.

NEW SYSTEM OF DIRECT TAXATION X-RAYED—II

(*Concluded from page 1293*)

concerning the totality of affairs of a particular taxpayer." In addition to the information now required for assessing the income-tax and super-tax, a correct declaration of the following items would be necessary for the assessment of the expenditure tax: "(1) The purchase and sale of capital assets during the year; (2) money borrowed or lent, or loans repaid or borrowings returned in the course of the year; (3) the state of bank balances at the beginning and the end of the year; (4) bequests, gifts, capital payments received from life insurance, gambling and betting winnings," and (5) cash balances at the beginning and end of the year. It has been pointed out that "the present methods of registration and control over ownership of property" are so irregular and defective that even the initial discovery of the true ownership of many capital assets or property (for the purposes of the wealth tax assessment) may be difficult or even impossible. It will, therefore, be even more difficult, if not impossible, to trace the purchase and sale of property and all capital assets. Mr. Kaldor suggested the adoption of a cumbersome administrative process for enabling the tax authorities to keep track of all transfers of property or assets but this reform has not been introduced. Thus, the t
